"Well, sir, the view we hold is that we have read with great care the speech you made to the members of the Mine Workers' Union, together with the discussion that followed, and there is no need for me, on behalf of the industry, to elaborate the gravity of the situation. That was made perfectly plain at that meeting, and Mr. Hendrikz realised it then, and realises it again to-day, so I need not elaborate that point at all.

"You suggested an amendment in the mining regulations, and, while that amendment would be of assistance to the industry in arriving at that degree of efficiency that we have got to arrive at between us—while it would be of assistance, in our view, it does not go nearly far enough, and it does not carry with it more than the germ of a solution for the present grave situation.

"At the moment, the industry and the gold producers are obtaining a premium, but it has dropped, and signs are not wanting that it will drop still further; but even with the considerable premium that exists to-day, you have two huge concerns, like Randfontein on the West and the E.R.P.M. on the East, employing 3,000 white men, neither of which last month paid their standing charges, wages and staff.

The Highest Importance.

"Well, we feel that the amendment you have suggested, even if it were accepted, would, of itself, achieve not a great deal. What is in the development of the industry a matter of the highest importance is the obtaining from the workmen—the native workman and the white workers—a full day's work. But we feel this, and I want to state it quite frankly, so that there shall be no misunderstanding. We feel that other issues will be involved and are involved in the present situation, apart from the regulations altogether, and apart from any consideration between you and ourselves, except, of course, that the Government is the protector of the community as a whole. Well, sir, even if that amendment were accepted—it is in the development of the situation and the putting into force of underground reorganisation (which we believe is essential if we are to get back to a safe position) that we should come into conflict with what would be described as 'trade union restrictions.' . . .

"The status quo agreement, as you know, is an agreement entered into in 1917, when a strike was threatened or took place for a short time on the question of coloured drill sharpeners on one of the mines, and it was found that certain natives were doing certain kinds of work on certain mines, whereas on other mines white men were employed doing that kind of work.

"The Union's argument was that, where natives were employed on work like drill sharpening, they should be relieved and white men put in. Our argument was that the native should maintain the positions he had obtained.

"Well, after a great deal of discussion we arrived at that status quo agreement, which governs certain classes of work, not in all classes of work, but in some classes of work of a semi-skilled character, or partially-skilled character.

We believe it will be necessary in the men's interests, as well as our own, to abandon that status quo agreement.

White Labour's Position.

"There may be other agreements that will have to be reviewed or revised. Well, you will say at once that this involves the colour question, that it may mean the retrenchment of a certain number of white men, but we want to meet the position as fairly as we can. We have suggested to you that the mine managements should be at liberty to allocate and distribute and use their labour in whatever direction it is thought fit, without the operation of any trade union restriction, and the unions may say that that leaves the ground too open for us to dispense with as many of the white men as we think fit. I think the term 'colour bar' is applied much too loosely, and it conveys the impression that the whole of the white workmen are to be swept out. That is quite wrong, but to meet that point we would be prepared to consider—if it is agreed that we are to proceed on the lines I have indicated—we would be prepared to consider some ratio as between the number of natives and Europeans throughout the industry, in order that a considerable measure of protection should be afforded to efficient white workmen.

Inadequacy of the Amendment.

"That is a very brief statement of what the Chamber feels on this matter, and I have made it in order to show you, sir, and these gentlemen that, in our view, to find a remedy for the situation that faces us at present and will become more acute as time goes on (and unemployment will result as time goes on) that more is necessary, much more is necessary, than the mere amendment of a regulation.

"The solutions to which Mr. Hendrikz has referred, we have discussed before. We discussed them and investigated them, along with representatives of labour, with great care, and these points occupied a great deal of time at the meetings of the Low Grade Mines Commission. They include

the alleged shortage of compressed air, and the inability of white workmen underground to exercise authority over their natives; also the food question, on which we shall welcome investigation; but I think you will find that there is no question of the native not having sufficient food available. It is available for him, and the whole native diet is open to the closest investigation."

Other Views.

We quote hereunder extracts from some of the other speeches made at the meeting:—

Mr. Hendrikz: I shall give you one solution of the question in our opinion, which will mean the employment of more white men, more efficiency among the natives, a larger tonnage for the mines, and perhaps also a better profit for the miners: that is, the Chamber of Mines employs extra men whose duty will be—well, I will put it this way. During the night shift, the examining shift, the man is appointed to go through certain working-places during the night. He takes a gang of boys with him, puts each stope in order, dresses it down and sees to it that it is safe, and he goes on to the next stope in the same way and does the same work there till he has completed his eight hours. When the ganger comes on the next day for breaking the rock everything is ready for him and for the trammer, and he can go on right through his shift without any delay. This solution will mean the employment perhaps of a few extra men.

"We are now faced with the unemployment question. Well, we contend that this will do a lot to solve that, and, what is more, it will give the Chamber a larger tonnage. They will have the full eight hours of native labour, and it will mean an increase in their profit as well.

Mr. Pate and Native Ratios.

Mr. Pate (Springs): "The ratio of blacks and whites should be, in my opinion, a national concern. That being so, and this industry being a national one, I think the ratio question properly settled would alter the necessity of having the word 'personal' in the regulations. My meaning is this: that at present we have 8.2 natives employed to one white person on the mines. That includes all white persons in your mines, including the manager, and I dare say the directors appertaining to the mines.

"I would suggest that the ratio be on a national basis, namely, the population of the country as blacks are to whites, or the population of the province of blacks as to whites.

"I am of opinion that the efficiency of the mines would be greatly increased where there is better white supervision and a lesser number of natives to whites employed. At present a trammer is called upon to supervise from 100 natives down, and over a large area. It is quite within reason to suggest that a trammer hardly has time to see every one of these natives during his shift. I would suggest that in bringing this into force a trial be given on a property such as the Government Gold Mining Areas. The Government are largely concerned in that mine, I understand, and a trial could be given in a section of that mine with suitable men and suitable natives to see the practicability of that scheme.

Man and Machines.

"I for one believe that there are too many machines allocated to one man. We have continually argued this point with the Chamber of Mines and their representatives, and the schemes put up individually from numbers of ourselves on the different mines are never given a fair trial. I contend that one white man to one machine would be an efficient way of working the mines, especially on the Far East Rand, where it could be given a trial for a start.

"I am prepared to be that demonstrator, if necessary, as a practical miner. And if this system of employment of natives as to whites according to the population of the country is given a trial, then, I think, you would be going a long way towards solving the unemployment question and the efficiency question.

"I am quite satisfied that the mines have not got sufficient enterprise. They do not try sufficient schemes whereby

efficiency can be got. It is more a matter of seeing how many natives they can squeeze into a mine, and how few white men they can put in. That seems to me to be the position.

"As I said before, the men cannot supervise a large number of machines efficiently, and if, as the cry of the Chamber of Mines is that there is a shortage of native labour—I notice lately they have quoted the highest figures they have had for a considerable time, so it is no great concern at present; but when the natives drop again it would be necessary, in my opinion to keep the production of the mines up to the highest standard, and in view of your remarks that there is a likelihood of a shortage of natives through the Mozambique Convention, and through the refusal of the Mozambique people to give us as many natives as we desire for the industry—I consider that it would be very necessary from the Government's point of view to insist that these trials be made in or about the mines, particularly underground.

Overhead Charges.

"I would suggest, further, that the question of overhead charges be gone into very seriously on all properties. That is a matter which cost the mining community a considerable amount of money. Probably it will be worked out on the tonnage basis, and it will not look very much. We, as workers, do not look upon it from the point of view of profit on the individual mines; we look upon it more or less from a national standpoint.

"... We are looking for employ for our out-of-workers, and we feel that it is the Government's duty, if necessary, to pool the whole of the industry and see it worked from a national standpoint on a ratio of five or six natives, whatever that ratio may be, to one white man, and then there would be no qualms about the removal of the word 'personal.'"

After further discussion it was agreed to constitute a small working sub-committee to discuss these matters in detail now, and try and come to some conclusion.

It was agreed that this committee should consist of eight members—two from the Government, two from the Chamber of Mines, two from the Mine Workers' Union, and two from the Industrial Federation.

The results secured by this Committee are now well known and are commented on in a leading article in this week's issue.

How Development on the Far East Rand is Progressing. A Valuable Diagram.

The above chart graphically represents the positions of the principal mines of the Far East Rand. The development in each case is that stated in the last quarterly report of the mine concerned. The percentage of payability and ore reserves have been computed on the present basis of working costs, and should any reduction in this item of expenditure be made in the future, then both the ore reserves and percentage of payability will be proportionately increased.

SPECIAL ENGINEERING SECTION.

This portion of the "S.A. Mining and Engineering Journal" is devoted to articles of interest to engineers on engineering subjects. The Journal is the oldest engineering publication in the country, and it is intended to increase the usefulness of this section of the paper and more and more to make these pages representative of engineering activities of all kinds throughout the Union and Rhodesia.

Engineering Works and Foundries in South Africa.

WRIGHT BOAG & COMPANY, LIMITED., MECHANICAL ENGINEERS AND FOUNDERS.

In this issue we commence a special series of illustrated articles on engineering works and foundries in the Union. It is our intention to deal first of all with Rand enterprises of this nature, and thereafter to publish articles on foundries and engineering works, etc., in the Transvaal and in other parts of the Union and Rhodesia.

The engineering works of Wright, Boag & Co., Ltd., cover a block of ground between Delvers and Polly Streets, with their offices centrally situated at No. 6, Troye Street, Johannesburg. A passer-by in that neighbourhood would view the drab, brick, wood and iron buildings, which cover a big stretch of ground, with indifference, little thinking that within the wheels of industry are busily engaged supplying the various needs of the industrial activities of this country. The exploitation of the natural resources of any country is always attended by a certain measure of depreciation of the machinery employed, and for the good of the country such depreciation must be

met by the substitution of new parts for the old and worn in the industrial machine. The importance of mechanical means and engineering methods in facilitating and improving the efficiency of modern methods of production need hardly be mentioned, as its results are obvious, even to the most inexperienced. South Africa is a young country, and in the development of its mining and other industrial activities a great demand for engineering products has arisen. Such demand was largely met by outside competition in the earlier stages, but it is gratifying to note that enterprising local engineering firms sprang up, as it were, and expanded together with the development of the country, and are to-day in a position not only of supplying the worn-out parts of the industrial machine, but also manufacturing the requirements of any new industrial undertaking. The engineering works of Wright, Boag & Co., Ltd., is one example of engineering progress accompanying the development of this country, and to-day stands as an important factor in the industrial expansion of South Africa.

The engineering works of Messrs. Wright, Boag & Co., Ltd., have been erected on a large piece of ground, and housed in substantial buildings of brick, steel and galvanised iron construction. The work conducted by the company may be divided and considered under the following departments:—Designing, pattern making, founding, forging, boiler making and erecting.

Designing.

Although this department has not developed to any extent in these works, as will be explained later, a certain amount of attention is paid to it and work of that nature carried on to a limited extent. By designing is meant the planning, calculating and drawing of any structure, machine, or part of a machine. It is the work of the technically trained engineer and draughtsman, and its importance cannot be overestimated. The strength and reliability of any structure or machine depends primarily upon the person responsible for its design; hence any work of this description has to be executed with the greatest of care.

Local engineering firms cater chiefly for the mining industry, and the latter all have their engineering and designing departments. It follows then that the mines prepare all their own plans and designs, and submit these to the engineering firms whenever work is required. For this reason the designing departments of the local producing firms have not developed to any large extent. The plans or designs for any structure or machine are usually submitted in both assembled and detail form. By the latter is meant that each part of the structure or machine is separately drawn, and the several parts manufactured as specified. Different parts of a machine are sometimes made of different kinds of material. For example, some parts may be made of cast iron, while other again of steel, mild steel or wrought iron. Parts may have to be either cast into the shape required, or forged, and if necessary machined. All machine parts thus owe their origin to the foundry or forge.

Pattern Shop.

Before an article can be cast into shape a mould has to be made, and from the mould the final article takes its shape. The mould is thus a very important unit in the production of a casting, and great care has to be observed in its making. The mould is usually built out of a specially prepared moulding sand to a pattern which is a representation, usually in wood, of the article to be cast. The pattern shop, where these wooden patterns are made is, as it were, the birthplace of the article finally produced. Although the great importance of the pattern shop can be understood, it does not represent a very large space when compared to the remainder of the works. It is fitted with wood-working machines driven by mechanical power. In the construction of patterns allowance is made for shrinkage which takes place in castings on solidifying or cooling. When a pattern has been made, it is forwarded to the foundry, where the moulds are made.

Foundry.

In the foundry work in both cast iron and brass is carried out. Castings of anything up to 10 tons in weight can be executed, and overhead electric travelling cranes are provided to cope with the heavier articles. Local as well as imported pig iron is employed in making castings, and it is gratifying

to note that the locally made article is of excellent quality and eminently suitable for this type of work. Some notable castings have been executed in this foundry. Large numbers of the Robeson-Davidson tailings and slimes pumps have been made here, and an array of the working parts of these was seen. Amongst the heavy work this company had recently completed, the enlargement of two winding drums for a local mine specially figured. In the latter case the finished article weighed over 60 tons. It was cast in sections, and two of these were executed. Another winding drum, measuring 14 feet in diameter and weighing 20 tons, has also been cast recently. The pig iron used in the foundry is melted in three cupola furnaces, which are supplied with compressed air from an electric turbine blower. The molten pig is run into ladles, and these conveyed by travelling crane to that portion of the foundry where the moulds have been made. Some difficulty is being experienced in obtaining suitable moulding sand, but it is expected that suitable supplies will undoubtedly be discovered in this country.

Forging Shop.

Articles or machine parts required to be made out of material which cannot be cast are usually rough shaped in this shop. Its equipment consists of two steam hammers of five and fifteen hundredweights respectively. The material to be treated is heated in furnaces and then hammered into the required shape. The jobs executed in this department include general heavy mine work.

Machine Shop.

All work which has been cast into shape in the foundry, or rough forged in the forging shop, that requires further and more accurate shaping, is treated in the machine shop. The machine shop equipment consists of lathes, of which one of the biggest has a 12 ft. radius; planers, capable of taking jobs up to 4½ tons in weight; shapers, slotting machines, special gear-cutting machines and milling machines. The scope of this department is very wide. Articles from the smallest motor wheels to a winding drum 18 feet in diameter and weighing about 60 tons, can be handled and worked in this department.

Boiler-making and Plate-working Shop.

In this department all articles which require to be made out of steel or wrought iron plates are handled. The shop is equipped with shearing, rolling, bending and punching machines. In it plates, etc., are cut into required shapes prior to being assembled in the erecting shops. Work of the following character is usually carried out: general plate work, colliery plant, picking belts, boilers, mine skips, cages and tanks.

Erecting Shop.

Here all parts belonging to a machine or structure are finally assembled, and the finished article in general turned out. The shop is provided with overhead travelling cranes of 10 tons and 5 tons capacity. These facilitate the handling of large and heavy finished parts. Of the many articles which have been assembled in this department, the following may be mentioned: large hauling engines, portion of the chlorination plant of the gold refinery, winding engines, skips and cages, colliery plant, picking belts, jiggers and screening plant, the Delagoa Bay coal tippler, and Robeson-Davidson tailing pumps.

Raw Materials.

The raw materials used at these works consist of both local and imported materials. The local pig iron used in the foundry has given excellent results, but local manufacturers in raw materials are urged to produce steel and wrought iron plate as well as the other products. At present imported plate is used, and often considerable waste occurs in the cutting up of such plate, as its size is often such as to render waste unavoidable. Plate locally manufactured could be made to specified sizes, and thus affect considerable saving in some directions.

It is gratifying to note that such a large engineering undertaking as that of Wright, Boag & Co., Ltd., is making full use of the product of the basic industries of South Africa, and further urges the production from them of steel plate. It is only by such co-ordination between the various industries of this country that a firm industrial footing can be gained.

The Durban--Maritzburg Electrification.

SOME DETAILS OF THE FIRST STEP IN THE ELECTRIFICATION OF THE SOUTH AFRICAN RAILWAYS.

In our last issue we announced the decision of the Railway Board to proceed with the electrification of the Durban-Pietermaritzburg section of the S.A. Railways. This section, of course, forms part of the larger Durban-Glencoe section, which was reported upon in the following passages by Messrs. Merz and McLellan:—

The traffic on the section between Durban and Glencoe, which, including the line to the Bluff, is about 249 miles long, consists principally of goods trains conveying coal from the Natal coalfields in the neighbourhood of Glencoe to Durban, and of a certain number of through goods trains containing imports of machinery and general merchandise for the Transvaal and elsewhere. There is also the through passenger traffic between Johannesburg and Durban, which is fairly heavy during certain seasons of the year. Owing to the conformation of the country the line in many places

marshalling of trains during the journey of 240 miles. For example, according to the statistics supplied to us relating to a short period of observation, the average daily numbers of trains in the down direction on each of the six portions of the line mentioned above were 16, 22 1, 26, 23 1, 11 0, 26 1, in the order given.

Increase of Traffic.

In accordance with your instructions, we have taken into account in our estimates an increase of 50 per cent in both goods and passenger traffic. The total gross tonnage of down goods trains to be provided for is therefore approximately 20,000 tons per day. If the present system of working is continued, for example, on the Mooi River-Maritzburg portion of the line, the increased traffic will consist of about 39 goods trains in each direction per day, and something like

Sketch Map of the Durban-Maritzburg Section, showing probable extension to Glencoe.

contains exceptionally steep gradients and sharp curves, the maximum gradient being 1 in 30, and the minimum radius of curvature 300 feet. Durban is, of course, at sea level, and the altitude of Glencoe is about 4,300 feet. This, however, is not the highest point, the maximum altitude between these two places being over 5,000 feet. The rise from Durban to Glencoe is far from uniform, there being many reverse gradients, which create difficulties in working the traffic. In general it may be said that this section, on account of the heavy traffic and the special nature of the line, is by far the most difficult of all the sections in the South African Railways, and in consequence the one in which the advantages of electrification show up most plainly.

Dealing first with the goods traffic, the total gross tonnage despatched under present conditions from Glencoe to Durban is about 13,000 tons per day. The line as it is worked at present is divided up into six portions, viz.:—Glencoe-Ladysmith, Ladysmith-Mooi River, Mooi River-Maritzburg, Maritzburg-Thornville Junction, Thornville Junction-Cato Ridge, Cato Ridge, Durban; and, owing to variation in the ruling gradients, the average load per train differs for each section, thus necessitating frequent breaking up and re-

eight passenger trains of one kind or another. Thus the daily train service will include 94 trains in both directions, some of which will have to be assisted by banking engines. This is clearly beyond the working capacity of a single line, even with crossing places spaced on the average three miles apart. It will be obvious, therefore, that in the normal course of events very extensive alterations to the line will have to be taken in hand if the increased traffic is to be dealt with on the present system. As will be seen from what follows, no such alterations are necessary if electric working is introduced, the capacity of the existing single line being quite sufficient for the much smaller number of trains required.

Durban-Maritzburg Alterations.

Between Durban and Maritzburg certain alterations have already been decided upon, and are now in course of construction. These are as follows:—(1) A new deviation between Pentrich and Umlans Road, in which the maximum gradient against the loaded traffic will be 1 in 100 compensated, and against the return trains 1 in 70. (2) A new deviation between Cato Ridge and Clairwood, in which the maximum gradient against the loaded traffic is 1 in 150,

and against the return trains 1 in 66 compensated. (3) A new marshalling yard at Booth Junction, where trains will be made up for Durban and the Point, and for the Bluff. Alterations consequent upon this reorganisation of traffic will be made to the shunting yard at Durban.

The general question of increasing the capacity of the line to enable the increased traffic to be worked by steam has been considered by the Divisional Superintendent at Durban, and we are advised that, with certain alterations, it is possible to get the traffic through. These alterations are as follows:—(1) The completion of the new deviations between Durban and Maritzburg will enable the traffic to be dealt with on this section. (2) The construction of a new deviation between Cedara and Nottingham Road would enable the traffic to be worked from Maritzburg to Mooi River, trains being banked between Fountain Hall and Nottingham Road, and on the down journey between Merrivale and Cedara. (3) The doubling of the line between Estecourt and Ladysmith would enable the traffic to be worked from Mooi River to Ladysmith and on to Glencoe. As there are already two alternative routes on certain sections, these alterations would be practically equivalent to providing a double track over the whole distance from Durban to Ladysmith.

Except on the Durban-Maritzburg section, where the ruling gradients will be much reduced by the completion of the new deviations, the alterations detailed below will have little effect in reducing the number of trains. The doubling of the line will, however, eliminate delays at crossing places, and the easing of the gradients between Cedara and Nottingham Road will reduce the amount of banking necessary between those points. Between Durban and Maritzburg we have assumed that the loads of all down goods trains will be made up to 950 tons, and the average loads of up goods trains about 400 tons. This will reduce the number of goods trains passing over the section from a maximum of 78 per day to 42. In estimating the cost of working the increased traffic by steam we have taken this improvement into account. Similarly we have made allowance for the reduction in banking and the elimination of delays at crossing places on the Maritzburg-Ladysmith section.

Some Effects.

With electric working the arrangement of the goods traffic would be greatly improved due to the introduction of much more powerful and adaptable locomotives. Block loads of 1,200 tons would be made up at Glencoe and would be hauled through without alteration to Booth Junction. The trains would be assisted by single-unit banking locomotives between Ladysmith and Estecourt and by double-unit locomotives between Nottingham Road and Merrivale, but the train engines would remain attached to the trains for the whole

distance, the crews being changed at Maritzburg. We are informed that this arrangement would greatly simplify the working of the traffic, especially by cutting out delays at the principal intermediate stations, viz., Ladysmith, Mooi River, and Maritzburg. By this reorganisation the annual train mileage of through goods trains would be reduced from 4,683,400 with steam to 3,013,400 with electric working. At the same time the average speed of travel would be increased, the total time for the double journey from Glencoe to Booth Junction and back being reduced from about 56 hours to about 26. These figures will provide an explanation of the power of electrification to increase the capacity of a line and to reduce the expenditure on the wages of engine men and guards.

The bulk of the goods traffic on this line consists of through goods trains. Intermediate traffic would be provided for by pick-up trains, which would collect and distribute the local traffic as required. There would be 4 such trains between Ladysmith and Maritzburg and 2 between Maritzburg and Durban, and those would be worked electrically. Between Ladysmith and Glencoe there are a number of private sidings, and on this account it would be simpler, for the time being, to work the pick-up trains between these points by steam engines.

We understand that provision should be made for a general increase of 50 per cent. in the passenger traffic. At present there are, on the average, 6 up and 5 down trains daily, with special arrangements during the Durban season. These trains contain on the average 8 coaches each, weighing in all 306 tons, excluding the locomotive.

(To be continued.)

Low Temperature Carbonisation of Coal.

It is claimed that the problem of low temperature carbonisation of coal has at last been solved. This is the outcome of twenty-one years of experimental work in the face of almost incredible difficulties at a plant at Barnsley. Over forty different types of retorts were erected and experimented upon, and over 200,000 tons of coal utilised.

The process of low temperature carbonisation may be said to be conducted on the same principle as ordinary coking practice except that temperature of carbonisation is much lower. It ranges about 550 degrees Centigrade inside the retorts, while in coking practice the temperature is in the neighbourhood of 1,000 degrees.

The result of this lower temperature is that the complicated series of chemical reactions resulting in the decomposition of the coal is quite different in character from that of high temperature carbonisation, a portion of the volatile matter being still left in the coal forming the well-known smokeless fuel "coalite," while the yield of valuable liquid products, especially motor spirit, is much higher. The essential figures for each of the three processes are as follows—

Products from 1 Ton of Average Coal.

	Low Temperature Carbonisation.	High Temperature Carbonisation.	
		Gas Works.	Coke Ovens.
In retorts	14 cwt. of smokeless fuel coalite	13½ cwt. soft coke	14-14½ cwt. hard coke.
Gas	6,000 cubic feet rich gas (700.750 B. Th. U. per cubic foot)	12,000 cubic ft. of gas, 550 B. Th. U. per cubic foot	11,500 cubic ft. of gas, 450 B. Th. U. per cubic foot
Liquid products	20 gallons, including 3 gallons motor spirit and Diesel, lubricating and fuel oils	10 gallons	8 gallons
Sulphate of Ammonia	15 lbs.	25 lbs.	28 lbs.

That is to say, the yield of liquid products (coalite oil) is very much higher than the coal tar of high temperature carbonisation, and also the composition is different. Coalite oil does not contain the higher and more complicated organic compounds such as naphthalene and anthracene, and a much greater proportion of the simpler organic compounds, benzols, toluols, creosols for creosote oil, etc., as compared with coal tar, and is a liquid of much greater commercial value.

A Cheerful Fire.

As regards coalite itself, this is already well known for its valuable properties, and the only difficulty has been to make it. It is a bright, crisp, clean porous solid, which burns with a cheerful fire without smell, but with the emission of a great amount of radiant heat, and entirely without smoke. From the point of view of household fuel, the radiant efficiency of the ordinary average fire is 22-24 per cent., and taking into account the small amount of converted heat and the warming of the brickwork surrounding the grate the total efficiency is probably about 30 per cent.

Since household grates heat chiefly by radiant heat, it will be obvious that coalite is a fuel of the greatest value. The radiant efficiency of a coalite fire is very high, about 35-37½ per cent., making a total efficiency of about 45-47½ per cent. In my opinion, taking everything into consideration, the different qualities of household coal on the market and the different types of grate in use, I think that a conservative figure is that one ton of coalite is equal to 1¾ tons of coal.

Difficulties Overcome.

As regards the technical difficulties that have been solved at Baruch by the new retorts patented throughout the world, the chief of these has been that when coal is carbonised at low temperatures it swells up and becomes viscous or sticky, so that it will not come out of the ordinary

retort without the greatest trouble. When extracted it bursts into flame in the air and when quenched with water (as with coke) it falls to dust. Also the fire-clay retorts are porous and the gas penetrates the sides and ignites on the outside, rendering the proper temperature control impossible.

The whole of these and other difficulties have now been solved by the new retorts patented throughout the world. These retorts are divided down the centre by adjustable iron plates so that there are two layers of coal only about 5 inches thick, and the coalite formed is absolutely homogeneous. When the carbonisation is finished at the end of the 7-8 hours the two plates are brought close together in the middle, and the coalite then drops out of the bottom without the slightest trouble in the way of sticking.

Engineering Triumph.

The trouble due to the porosity of the retorts has been got over in the most ingenious manner by applying the suction of the exhausters to the top of the retorts so that the pressure in the retorts is balanced by this suction and there is no tendency for the gas to pass through the walls of the retort. It should be pointed out that the ordinary gas retort, or coke oven, is absolutely useless for the production of coalite. If the temperature of these retorts is lowered the result is not coalite at all, but a mixture, chiefly of coke on the outside of the mass and unburnt coal inside. A mixture of half-baked coal and coke has no resemblance whatever to coalite, which is a homogeneous product, with 12 per cent. volatile matter in a definite physical condition of porosity and texture.

A final point of the greatest importance is that in the first place it is not necessary to use all-coking coal in the process, and mixtures containing up to 70 per cent. non-coking coal are quite satisfactory, while all the small slack, both coking and non-coking, now practically a waste product of the collieries, can be utilised.

The S.A. Iron Industry.

AVAILABLE IRON ORES—PHYSICAL CONDITIONS—IMPORTANCE OF GEOGRAPHICAL POSITION IN RELATION TO MARKET—MATERIALS AND PRODUCTS.

By E. E. Buttner, D.Ch.

Raw Materials.

A recent survey by Dr. P. A. Wagner, Government geologist, has definitely shown that South Africa has vast reserves of iron ores, which appear to place her second only to Brazil as far as both quantity and quality are concerned. Our iron deposits include three of first magnitude in the siliceous ironstone horizon of the Pretoria series, the titaniferous magnetites of the Bushveld Complex, and the haematite deposit on Farm Buffelshoek No. 151 and adjoining farms in the Rustenburg district of the Transvaal, and the Blinkklip breccia deposits of Griqualand West, all of which can be ranked as great iron ore deposits of the world, while other important deposits include those of the Pretoria town lands, on the farm Kromdraai, of South-West Africa, and Natal. South Africa has missed a tremendous opportunity by not developing her iron industry during the war, and every year lost reduces her inherent advantages over other countries, so that artificial ones have to be made in the shape of Government assistance. At the present day progress is, of course, being made, and when considering the establishment of an iron industry the following considerations are vital. The value, from a commercial point, of an iron ore does by no means depend chiefly on the content of metallic iron, and for anybody to hold up the percentage of iron in a stone as evidence for success is extremely misleading. Many other impurities, though small in amount, greatly affect its value. An ore may be too rich to work satisfactorily by itself, as it may not have enough gangue to furnish a sufficient slag volume. Although many iron-making districts have available varieties of ores to furnish a suitable mixture in this respect, the trouble is to get a mixture that will give the correct slag. After the iron and silica in an ore, sulphur is the most important element to consider. If the sulphur is not readily oxidised, the ore is useless for iron making, no matter how desirable it may be otherwise. Otherwise an ore rich in sulphur means roasting, and this implies extra plant and outlay. The percentage of phosphorus allowable depends on the purpose for which the pig iron is to be used. Then it is necessary to ascertain whether the silica is present as quartz or shale, and in any case the pure silica, not merely the insoluble residue or siliceous matter, should be shown. It must be shown whether the lime is present as carbonate or silicate; whether the sulphur is present as calcium or barium sulphate, or as pyrites; whether the iron exists as ferrous oxide, ferric oxide, or the

magnetic oxide. The foregoing basis of valuation is from the standpoint of composition only. Of very great importance is also the physical condition of the ore. In general, fine ores are undesirable because they do not work well in the furnace, causing serious irregularity in operation. The reducibility of the ore is an important factor, because it affects the fuel consumption and the rate of driving and output. The red hematites are the most desirable ores. Although titaniferous ores were rejected once, new methods of smelting have reduced their disadvantages. A prime consideration determining the value of an ore or its availability is its geographical condition or location with reference to mining, to fuel, to markets, and to transportation either of the raw materials or of the finished product or both. The distributing centres of the products are looked upon as the best sites for the plants in the Middle West of the United States, the ore being conveyed over rail to the plants. In America the development of the markets further west than Pittsburg has resulted in a much greater development of the industry in the Chicago district and the shifting of the market determining the availability of an ore for a given location. The same factor of proximity to markets causes English and German industries to fix their plants in England and Germany instead of Spain, Norway or Sweden, where the high-grade ore is imported from. Reduced tariffs on ore exported from Sweden to America have not transferred the furnaces to any other point than the American markets. It is impossible for anybody to form a definite idea of the future of any venture or adventure in the smelting of new ores without having first made laborious experiments on a commercial basis; other experiments are unreliable.

Plant.

From the foregoing it will be seen that the plant has to be erected on a site that is as close to the centre of distribution of products to the markets as possible, if the products are mainly destined for the market. In South Africa the centre of distribution is, of course, the Rand, where the greatest concentration of our population exists. If, however, the main products should be made for the Government, to be delivered only to the siding, then proximity to markets will not be so urgent. If the main products are to be exported, proximity to the sea will have a great influence. Since South Africa can scarcely hope to compete for long in the world's market, proximity to the market locally is more urgent than in most countries. Conditions in the com-

mercial world are getting more normal every year, and a young country like South Africa could not reasonably, with cheap and therefore inefficient labour, dare to compete with older countries where no such inefficient labour as that of our natives is used. When treating ores whose behaviour in the furnace is unknown, it is most desirable to commence smelting on the smallest commercial scale possible, the aim being to prove the case, and not dividends. In case the ores prove a failure from a commercial view, the loss will not be so appalling than if operations were on a larger scale. To open up an iron industry in these days is an extremely delicate undertaking for even the specialist, as there are so many variable factors that have to be accounted for. Once small-scale experiments have proven the feasibility of establishing an iron industry, the next step should be the immediate erection of a plant of the largest possible and most moderate style so as to be able to sell the products at least locally in competition with outsiders. It is the greatness of foreign industries that reduces costs so as to enable export into countries making the same goods. Then again, a small plant will, during the course of experiments, enable the accumulation of raw iron which could be cast into parts for the following large plant, thus killing two birds with one stone, and reducing the cost of the larger plant. The nature of valuable experiments are such that would presumably ruin any furnace, and seeing that inventions and cheapening improvements are often made by such drastic experiments, the desirability of a small plant is emphasised all the more.

Materials and Products.

Besides ironstones, the composition and locality of coal, flux and others, such as refractories and steel-improving elements like vanadium, chromium, nickel, copper, etc., have to be considered; the latter not being vitally important. Not every coal of a low sulphur content is of satisfactory physical condition when coked. Hardness and strength of coke are essential. Soft coke cannot well support the burden of the charge and is too readily dissolved by carbon dioxide, localising the action of the furnace and preventing intense temperature where it is needed. Some cokes are hard and brittle, while others are soft and strong. Certain Transvaal and Natal coals give a suitable coke. The larger the furnace the more is strength and hardness desired. The purity of coke is also important. The carbon must be high; the ash and sulphur must be very low. Where the iron industry fluctuates much, the beehive coke oven is very flexible and adaptable for irregular working; its initial cost is low, also that of maintenance, together with simplicity of operation, needing less skilled labour. It also produces the best coke possible. The retort ovens yield extra by-products, need skilled labour, and cost more to build and erect, as well as to maintain. Whether limestone or dolomite is best as a flux depends on the content of alumina in the ironstone; bad results of magnesia showing more decidedly in the presence of high alumina.

Whether the products and by-products can be sold depends upon proximity of markets. Rails and railway materials are taken by the Government at the place of manufacture, but mining and agricultural machinery must be made close to the central distributing station such as Germiston. It is certain that Germiston will hold this place for a long time. The Rand would be considered as the market. A young country like South Africa must have some peculiar advantage if its iron industry is to succeed. Cheaper labour is very misleading, as the case of the boot factories have taught us to our cost. The only real advantage that would enable us to hold our own consists of Government assistance in the form of special railway rates and preferential patronisation in the matter of its orders, or special tariffs levied on imported iron goods. The assumption that the known extra-African sources of iron ore of present-day commercial grade are within measurable distance of exhaustion is no advantage because Russia and China have huge untouched deposits as well as other countries, besides coal, and labour in China is cheap and good. It must also be remembered that a plentiful supply of water is essential, and of electric power very desirable.

In conclusion, it has been repeatedly shown by specialists and experts that it is easily possible to construct in South Africa a flourishing iron and steel industry. Australia and India are giving us an example of how to make money.

Concerning Mines and Men.

MORE ABOUT NEW RAILWAYS & HARBOURS.

THE LURE OF ZULULAND—DELAGOA INTERESTS—AN OPPORTUNITY FOR A LEADER.

By a Special Correspondent.

The absolute necessity for a new harbour and railway to enable the Eastern Transvaal and Northern Zululand to develop their natural resources is recognised by all, and we here give a few more details of these districts.

Northern Zululand.

The North Coast Railway runs to Somkele, about 25 or 30 miles from St. Lucia Bay. The distance from Durban to the terminus is 167 miles. Some of the richest sugar lands at present developed are at Empangeni, 122 miles from Durban, but practically all the country north from Somkele to the Portuguese border is known to be equal to the finest at present worked. Colonel Reitz in his recent tour amply confirmed this. This large area of good land is, roughly, 100 miles long by more than 30 miles wide, or equal to almost 2,000,000 acres.

The Zulus are a cattle-loving nation, and most of this area is hot bush country, and therefore there are comparatively few natives in it. The natives prefer the higher and more open country. Under the Natal Native Ordinances parts of Zululand are set aside for native occupation, but this area is not, for the above reasons, the favoured one. For tropical farming it is, however, of the best, and the white settlers already near it are proving that climate is no bar to their progress.

In sugar output we are only just able to supply ourselves, even when getting the surplus output from Mozambique.

If South Africa is to expand and her population is to increase as we all wish, then the development of more sugar, cotton and grazing lands must be kept in view, and this part of Zululand and Natal contains the only large potential areas of such undeveloped land we have in the Union.

Coal.

The only great expansion of population which may be looked for for many years is in connection with mineral wealth, and our greatest mineral wealth is in our vast coalfields.

The axis of our best coalfield may be taken as a line running from Witbank to Vryheid past Bethal and Ermelo.

How Railways will Develop Markets.

Without a new northern railway sugar from Zululand will require to be brought *via* Durban, 680 miles at least, to the Rand markets, and 600 miles to the coalfields. With a new line constructed to Piet Retief the distance to the coalfields will only be 250 to 300 miles, and about 400 miles to the Rand.

Northern Zululand is to-day almost valueless owing to distance and lack of communication. Its possibilities are well known, but lack of railways and markets prevents its development.

This area is all Crown lands, and the increase in value through being given railways would almost wholly pay for these lines.

Then there is the long rich valley of the Pongola, fertile and well watered, at present only winter grazing for High Veld stock and natives and baboons in summer. Shrewd business men like Rouillard are getting in, knowing full well it is only a question of time till this huge country is opened up.

Competitive Distances and Rates.

A railway alone will do all that is necessary for the agricultural industry in Zululand, but for the mineral wealth of the Ermelo, Piet Retief and Wakkerstroom districts nothing but a new harbour will serve. Taking Sheepenoor as a point in the coal belt from which to measure distances, the distance to Durban by existing railways is 431 miles, and to

Delagoa Bay about 300 miles. Hlobane Collieries are 311 miles from Durban; Enyati, Buffalo and Northern Navigation are a little more. Even with the most favoured mileage rate in normal times these collieries no doubt found it hard enough to compete with collieries at Glencoe and other districts with a much lower rate. The day is fast approaching when each and every class of traffic on the S.A.R. will require to be self-sustaining, and neither Sir W. Hoy nor anyone else will ever be able to give a rate for a colliery at 450 miles from a market to enable it to compete with one at 250 miles.

Laurencø Marques, 300 to 350 miles away, may also be ruled out; the railway to Delagoa Bay is difficult and expensive to operate. Delagoa, moreover, is a foreign port. But apart altogether from this is the outstanding fact that technically and politically it is an impossible position to depend on a foreign port, however good it may be and however friendly its owners are at the moment, and by doing so to neglect a huge tract of the very best agricultural land in our own country, and to penalise by at least 100 miles of railway carriage one of the finest coalfields in the world.

A Notable Article.

In the much-discussed article by Mr. Danks, published last May, he advocated burial of all parochial prejudices and going straight for the best harbour possible for our mineral exports. The Government to-day seems to be following this policy, and it is to be hoped no pressure will divert them from the straight path.

The Portuguese and other interested parties are, in the daily Press, making a lot of fuss about broken promises in connection with the Swazi railway, and the loss they have incurred on their Goba line. The Portuguese want their progressiveness in connection with their port affairs. If they are as smart as they wish us to believe, how is it they have failed to make economic use of this Goba line? Here is a railway in flat, fertile country, and they say its construction has been a dead loss to them.

Another Scrap of Paper?

As for Lord Milner's promise, Mr. Danks in his article contended that this free country cannot be bound forever by his acts. There is nothing in our Act of Union binding us to acts of past rulers. Amongst ourselves many an act of the Milner *régime* was scrapped as soon as the Transvaal Government got responsible government: the retrenchment of civil servants after having been induced to leave other and high-paid services to come here is a case in point.

Besides, has the management of the Portuguese port and the forwarding of goods always been so perfect that they should continually nag and pin-prick about broken conditions and promises?

What do they think we are that they always hang the threat of withdrawal of native labour over our heads? And what a flimsy excuse they make when they say they require the labour for the development of their own territory? Where do they market their sugar and the other products of their province? Do they for one moment imagine that they can erect a fence at Kessano Garcia which will keep in the natives and still have a gate through which to let through their produce? Let our Portuguese neighbours once and for all dismiss from their minds any idea they may have that they could keep back the natives. The "boys" have tasted the fleshpots of Egypt, and no wages the Portuguese could pay them, with our markets closed, would keep the boys down there once the craving for the high wages of the Rand seized them.

The Financial Aspect.

For a project having such a potential value to the Union as has the new harbour, there should be no trouble with finance to begin with; there would be half a million acres of Crown lands brought within ten miles of the new railway. This land is known to be the finest sugar land in the Union. Its value could not be assessed at less than £3,000,000, so there is in this a nice nest-egg to start off with. A township for the new harbour would bring in another large sum.

As the coalfields by this new line would be the nearest in Africa to a seaport, and the railway specially designed to carry coal, like the Prince Rupert Canal, at a minimum cost, a lower rate than obtains from the present collieries would pay its way. The difference could be put on as an export tax, and the proceeds set aside for amortisation purposes.

Some months ago you published that strong and thoughtful article, "The Land Without a Leader." Let us have the leader, the strong man, in this. Let General Smuts openly proclaim that he intends to develop the mineral resources in the Eastern Transvaal, and funds will be forthcoming. Should there be any trouble about finance, remember times change and we change with them. Reverse the policy of only developing by Government railways and harbours, and proclaim that in this instance they would accept tenders for construction and operation for a number of years, and there are at least half a dozen responsible firms who would be in the rush to tender. But by whatever means it comes about, let us get a move on and get it done. Give us a lead, and give us a leader.

B. G.

An Automatic Railway Coupling.

An automatic coupling for railway purposes, which it is claimed will mean saving the lives and limbs of shunters, has been invented by Mr. A. E. Hamblin, member of the staff of the Grahamstown Veterinary Laboratory. Shunters frequently have to stand between the carriages or trucks in order to link up the coupling. Hamblin's invention renders this operation by the shunter unnecessary. The invention involves a trigger block fitted in the buffers, and when one truck approaches another to be coupled the link operates the trigger block of the opposing buffer and releases the coupling pin, which automatically drops into position. The working parts are extraordinarily simple, and the inventor claims that the device can be fitted to any of the various forms of buffer in use on South African railways at a cost of a few shillings per buffer. Negotiations are proceeding with the Railway Administration for a demonstration of the invention to take place at an early date in Uitenhage railway workshops.

The Castolin Auto-Chemical Welding Process.

A SIMPLE, CHEAP AND EFFICIENT DEVICE.

We have had an opportunity during the week of looking into the merits of the "Castolin" auto-chemical welding process which is now on the market. The first point about the "Castolin" method of welding is that it does not, as in the case of other processes, require specially-skilled operators—the work can be done by a smith or handyman. Any kind of iron and steel, and most of the other metals in commercial use, can be welded each to itself or to the others. "Castolin" is therefore invaluable in the workshop of industrial establishments, and especially to those—as in outside districts—not having easy access to repair shops. Not only can all ordinary breaks be welded by the "Castolin" process, but it is also admirably adapted for the filling up of faults, cracks, blow-holes and other defects; the adding of metal to weak, wasted, worn or porous parts; building-up lost parts; reinforcing weak castings with steel, and constructional work with fresh materials. Articles of all sizes, from typewriter parts up to large castings and other parts of engines and machines, can be welded by the "Castolin" process. Those too large to be manipulated on forges are dealt with by means of the

pistons, glands, cog-wheels, sidebars, typewriter parts and other pieces of precision, can be welded without deformation of the metal. No annealing away from the weld is necessary when articles are welded by this process. The cost of the "Castolin" welding materials is under three-pence per square inch of surface to be welded. The time occupied in the actual welding is but little more than that required for properly heating and cooling the piece to be welded.

It may be added that the process is in use by the Admiralty, the War Office, the Port of London authority, the Thames Conservancy, the London County Council, etc., etc., and in a large number of constructional, repairing and industrial works connected with marine and land engineering. The makers are the Castolin Chemical Works, of which the South African agency address is Box 2265 or Phone 4404, Johannesburg. The agents will be pleased at any time to arrange demonstrations of the process.

Railway Electrification.

Elsewhere in this issue will be found an illustrated article on the electrification of the Natal portion of the S.A. Railways from Durban to Glencoe. An official statement on the subject is eagerly awaited, and will, we understand, be forthcoming this week-end. There is reason to suppose that the Railway Board has had under consideration the question whether first to electrify the Durban-Maritzburg section or the Glencoe-Maritzburg section. In view of the fact that the former is now practically duplicated, it may be that the greater benefit to the whole section, regarded as a coal-carrying line, would result from first electrifying the Glencoe-Maritzburg section, leaving the Durban-Maritzburg section till later.

The Complete "Castolin" Outfit.

"Castolin" blowpipe, or in temporary furnaces built up with fire bricks, sheet iron, etc. It is noteworthy that the nature of the joint made is a weld and not a "brazed"; there are great and essential differences between a "Castolin" weld and a brazed joint; the latter will stand no definite test, a "Castolin" auto-chemical weld will. Breaks welded by "Castolin" become the strongest part of the casting welded, and will not break again in the same place. "Castolin" welds withstand tensile strains per square inch of over 10 tons in the case of cast iron, and over 20 tons in the case of steel. The temperature required is "cherry red" or, say, a temperature between 1465° Fahr. and 1740° Fahr. or 800° Cent. and 950° Cent. It follows, therefore, that the "Castolin" process does not involve the deterioration of the mechanical and chemical properties of iron, steel, etc., which is inevitable in the case of high temperature methods of welding. There is, moreover, no distortion of the articles operated upon; such things as engine cylinders,

Production of One Million Volts and Tests.

Cables recently appeared in the daily papers stating that in America they have produced for the first time alternating current potential of one million volts. We now learn that successful generation of electric power at more than one million volts at commercial frequencies was accomplished for the first time in the history of the transmission of electrical energy at the High Voltage Engineering Laboratory of the Pittsfield Works of the General Electric Company at Pittsfield, Massachusetts, U.S.A., on September 13. During the course of the experiments much valuable data was gathered, indicating the feasibility of considerably higher transmission voltages. Physical laws applying to high voltage phenomena were found to hold good at these enormous potentials. In the course of the experiments the gap spacings for sphere and needle spark gaps were carefully checked up and prolongation of existing curves (750,000 volts and below) were found correct up to 1,000,000 volts. Arc over-tests were also made on strings of standard 10in. suspension insulators up to 1,100,000 volts. The laws of corona were checked at similar potentials, and found to hold. A short transmission line was tested for corona conditions, and results indicated that a line using 4in. diameter conductors or larger would be necessary at 1,000,000 volts.

The successful conclusion of the tests is the result of more than 30 years of constant experimentation, during which time transmission voltages have risen steadily from the first 15,000 volt line built in Pittsfield in 1891 to the present record-breaking voltage of 220,000 volts, equipment for which was recently shipped from Pittsfield and is now being installed on the Pacific Coast. The tests at Pittsfield confirm the belief of the engineers there that it will be commercially feasible to use considerably higher voltage in the transmission of power, and indicate the extension of long-distance transmission beyond limits heretofore believed possible. Electrical engineers are now in a position to forecast results.

In commenting on the achievement Dr. Charles P. Steimnetz, chief consulting engineer of the General Electric Company, said:—"One million volts is so far beyond the comprehension of the ordinary layman that it is interesting to recall how rapidly high voltage development in this country has progressed. It is about forty years since Edison first transmitted electricity at constant voltage. He used 110 volts, and later 220 volts. At this pressure electricity can be sent economically for about a mile. In these forty years voltages have increased until now we are actually using 220,000 volts, a pressure just a thousand times greater than that which was considered the safe pressure when Edison began his experiments. This voltage of 220,000 volts is to be transmitted 250 miles, and is to be utilised in California. Now we have the interesting announcement of a million volts which the General Electric Company has just attained. While electricity, as these tests show, can undoubtedly be transmitted in large bulk, if so desired, for possibly thousands of miles, it is probable that the millions of horse-power available at various points—such as Niagara, for instance—would find a market and be consumed within a few hundred miles of their source."

F. W. Peck, jun., laboratory director at the Pittsfield Works, under whose direction this achievement was accomplished, says of the experiment:—"For some time engineers have been able to predict with certainty the corona and spark-over characteristics of high-voltage transmission. These predictions were based on laws of corona established by crucial tests made up to about 250 k.v. and on spark-over curves established on needle and sphere gaps and line insulators at somewhat more than double this voltage. Commercial apparatus has already been built for 220 k.v. operation. It was of great present theoretical and probably future practical interest to determine experimentally if there was a discontinuity in the established laws and curves at a million volts or over. Although no deviation was expected,

we could not be certain until actual tests were made. We might, for instance, speculate that because of the great length of lightning sparks the air must be relatively weaker at the very high voltages. Tests up to about 1,100 k.v. were made on the various elements entering a transmission line as follows: (a) The spark-over curve between points showed no discontinuity. The spark-over at 1,000 k.v. was found to be about 105 inches. (b) The spark-over curve between 75 c.m. spheres showed no great deviation from calculated values. (c) Tests were made on strings of line insulators, and the spark-over voltages were as expected; for instance, a string of 18 standard suspension insulators arced over at about 900 k.v., while a string of 22 insulators did not arc over at more than 1,000 k.v. (d) Visual corona tests were made on 3½in. diameter brass-tube lines operating a single phase. The corona starting voltage (about 900 k.v.) checked with the calculated value."

Mining Men and Matters.

Our old friend, Mr. E. H. A. Cohen (familiarily known throughout three continents as "Alphabetical Cohen"), has been appointed consulting engineer to the Bethlehem Oil Syndicate. Mr. Cohen has had a great deal of field work experience on oil formations, particularly in America and North-West Canada, and his practical knowledge should be of the greatest value to the syndicate in question.

* * *

Mr. G. M. Clark has been appointed a member of the Advisory Board of Science and Industry.

* * *

The death is announced of Sir Douglas Fox, the celebrated civil and mechanical engineer, who was associated with the building of the Capetown-Wellington and Capetown-Wynberg railways. He was joint engineer on the Rhodesian and Mashonaland railways, the first consulting engineer to the Cape Government railways, and designer of the world-famous bridge over the Victoria Falls.

The Crown Mines Dispute.

The position with regard to the Crown Mines dispute took a grave turn on Thursday night, when a meeting of the Joint Executives of all the unions in the mining industry was held at the Trades Hall, Johannesburg. Over sixty representatives were present and the discussions lasted for two hours. At the conclusion of the deliberations, the following official statement was made for publication:—"The Mine Workers' Union stated their case with the ultimate result that the unions unanimously agreed that they should be supported. But as a last effort to settle the dispute without extending the strike, it was decided to request the Federation to demand an immediate Board of Reference in terms of its agreement with the Chamber of Mines. A serious complication has arisen owing to the dismissal of six mechanics on the Crown Mines, who were ordered by their union to refrain from doing work regarded as scab work. This automatically involves other unions in the dispute. Unless a settlement is arrived at before the week-end, a ballot to strike would appear to be the inevitable outcome of the deadlock. The decision of the Commission of Enquiry (with regard to Walthew) was not considered either equitable or acceptable."

EDITORIAL.

THE RESULT OF THE CONFERENCES.

It is a matter for all-round congratulation that a way—and a satisfactory way—has been found out of the *impasse* threatened by the Mine Workers' representatives in regard to the much-needed amendment of that portion of the Mining Regulations which deals with the number of hours worked underground by Rand mine boys. After the tone adopted by Mr. Hendrikz at the opening conference, and after the enunciation of the economically impossible "National Ratio" requirements of Mr. Hendrikz's associates, one feared that the passage of this new Bill through the Legislative House of the Industry would be a stormy one, if indeed Labour did not altogether obstruct the suggested alteration.

The conferences held in Johannesburg during the past few days, at which the position of the mining industry has been so fully and frankly discussed by the Prime Minister, representatives of the Government, the Chamber of Mines, and the workers, have been of vast importance to the Rand and to South Africa as a whole; and in view of this we have devoted in another portion of this issue considerable space to a review of the essential points which have been debated at these meetings. No one, not even the most extreme of the Labour representatives, has attempted to deny the seriousness of the situation on the Rand. The only question has been how best to introduce a measure of remedy which will have a beneficial and immediate effect. Indeed, it is held in many quarters, by those who are in intimate touch with the industry, that a mere amendment of the Mining Regulations will not go sufficiently far in order to pull the Rand round again into channels of prosperity and industrial stability.

At Tuesday's conference Sir Evelyn Wallers eloquently represented this view. Sir Evelyn claimed that underground reorganisation is essential if the industry is to get back to a safe position. He spoke very frankly and wholly to the point in regard to the restrictions imposed on the industry by trades unions and contended that something much more than a mere amendment of the Mining Regulations is required to put gold mining on the Witwatersrand on a sure basis of prosperity. In the course of his speech the Past President of the Chamber remarked: "... We feel that that question has to be faced by you and ourselves quite frankly. We do not think, if it is not faced frankly, that we shall really achieve salvation as far as the permanent employment of the greatest number of white men in this industry is concerned. The trade union restrictions, as they operate to-day, are making management in some directions difficult, and more and more difficult as time goes on, and, in the view of our managers and ourselves, after consideration of the subject, are obstructing the road to that efficiency that we have to achieve."

Sir Evelyn continued: "I need not particularise the various directions in which reorganisation would be necessary. They are many. The contract system is one; the number of machines to be worked by one white man is another; and there is a variety in other directions. Then there is another point, and that is the agreement that exists between the Chamber of Mines and the Mine Workers' Union described as 'the *status quo*.' We feel that it is necessary, and will be necessary, if you are to achieve what we are after and what you are after too, that it will be necessary to abandon that agreement in so far as it applies to classes of work underground that are usually described as semi-skilled."

These views are in reality only an elaboration of what this journal has preached consistently in and out of season for months past. Long ago we urged that the Chamber should take a firm stand in connection with reducing working costs and in regard to the arrogant autocracy of trades union demands. What with a surfeit of Governmental legislation on the one hand and the continual restrictions of trades unionism on the other, this low-grade industry of ours—and it is in reality nothing more—has no chance of expansion or of earning profits at all commensurate with the sums of money invested in it. If expansion of operations is to be obtained—if, indeed, restriction of the present scale of operations is to be avoided—efficiency must be improved, the cost of working will have to be reduced, and managers will have to be allowed a greater latitude in regard to the manner in which they seek to work and earn profits from the mines under their control.

The average manager on the Rand to-day has little time to attend to the technical direction of a mine. He is so occupied with grandmotherly legislation and with averting strikes and threats of strikes that he must often deplore the years and the money that have been spent on his mining education and wish rather that he had been trained in the legal profession, that he had mastered Carl Marx instead of Le Neve Foster, and that he had graduated in Sociology, Collective Bargaining, and the other official language of the Union instead of in mining and metallurgy.

We are not surprised that at Tuesday's conference Sir Evelyn Wallers should have sounded a note of anxiety in regard to the new Regulations and should have asked for a clear understanding on both the spirit and the letter of the substituted paragraph in order that the amendment should not be followed by fresh industrial trouble.

The Regulation concerning the inspection in advance of working places is stated in the lengthy article appearing elsewhere in this issue on the subject of the conferences. It is a matter for congratulation that this much-needed amendment of the Mining Regulations has been secured. As it stands in its final form it suggests a specialised attention to the condition of the underground workings which should satisfy the most exacting of the champions of "Safety First." And theoretically, at any rate, the additional hours which the native will now be able to work should substantially increase tonnage and bring about some reduction in working costs. All this is, as General Smuts remarked, "very satisfactory," and for what has been accomplished the industry owes a great debt of gratitude to the Prime Minister who, by his tactful and patient handling of the matter, has in a few days secured more probably than the mistrusted Chamber of Mines would have obtained after perhaps weeks of bargaining punctuated by days of strike fever. But whilst we are extremely grateful to General Smuts for his timely intervention and able chairmanship at the conferences, and whilst we gladly accept the measure of relief proffered by the result of these conferences, let us make no mistake about it—the mere amendment of the Mining Regulations is not going to so transform our industrial position that we can claim immediate salvation from the morass of perilous uncertainty into which the mines have for so long been drifting. We need more, much more, than increased working hours from the native before we can truly sight the haven of safety and prosperity; and primarily we need the close co-operation of the white miner in a whole-hearted effort to reduce working costs to such a degree that the Rand may be independent of the gold premium. Our real industrial salvation lies in the direction of being able to earn profits commensurate with the capital involved from ores that yield as little as twenty shillings per ton. When we have achieved that—and not until then—we may indeed shout that we are out of the wood that at present darkens the whole of our outlook.

Notes & News.

Spaarwater in Liquidation.

Amongst the latest companies to be placed in voluntary liquidation we note the Spaarwater Gold Mines, Ltd., which had a nominal capital of £700,000. The company, it will be remembered, was a Barnato flotation with rights over the farm Spaarwater, in the Heidelberg district. The liquidation means that the rights are being abandoned in view doubtless of the difficulty of raising capital nowadays to develop a deep level proposition of this sort. Speaking at the first annual meeting of the company, the Chairman, Mr. John Munro, said, *inter alia*:—"The property consists of the perpetual undermining rights of three farms comprising Spaarwater No. 154, the combined area of which is 5,718 morgen 572 square roods, or about 11,500 English acres, adjoining the Sub Nigel Mine. The Sub Nigel Company recently struck the reef in the new shaft, which is situate not far from our south-eastern boundary. Where struck, it did not give payable values, but it is well known that, although the whole reef in this district contains some gold, enrichments occur in well-defined shoots or zones, and I have no doubt development from this shaft will expose some of these rich shoots. Then, again, work has been re-started on the farm Maraisdrift by the Amalgamated Props. with every confidence of success, and as this farm contains the outcrop of the reef dipping into our property, we await the result with interest. On the advice of Professor Lawn, the Board of Directors has decided to await developments in this district. We are to-day in possession of a large sum of money, which is earning interest at good rates, and the

policy of your Board will be to leave the company's funds on deposit until such time as developments in our immediate vicinity justify the expenditure that will be necessary to explore and open up the reef on your property."

A Postmas Reconstruction.

We understand that the Postmas Diamond enterprise is to be reconstructed with additional capital, which will enable it to enter the producing stage when the diamond market recovers. Influential London support has been enlisted, and it is hoped that the mine may yet justify the high hopes of its prospects originally entertained.

Frank Smith Diamonds and Options.

The ordinary general meeting of this company will be held on Tuesday, November 29th, at 12.15 o'clock, followed by a special meeting, at which a resolution will be submitted extending the period of the options over "new shares in the company during a period of three years expiring on the 28th February, 1923, in terms of the option certificates issued by the company, dated 1st March, 1920, and accordingly that the rights granted under the said option certificates be extended from the 28th February, 1923, either by a period of two years or by a period equal to the time the mine remains closed down, whichever of such two periods may be the less. In the event of the latter period being applicable, notice of re-startment of the mine shall be given by the Board by advertisement in newspapers in Johannesburg and London." From the directors' report we learn that the total weight of diamonds recovered during the washing period was 4,002 carats, which was slightly reduced upon re-weighing when amalgamated into one parcel and increased by a few small finds before operations began in November, 1920, to 4,041½ carats. The directors received an offer of £20,000 cash for these diamonds, and in view of the saving of interest on the loan which was thus secured, and the fact that no other market could be found for the stones at as good a price, they deemed it in the best interests of the company to accept the offer, and the deal was, therefore, put through. The amount received averaged £4 19s. 0d. per carat.

Lace Proprietary.

The annual meeting of this company will be held on Tuesday, November 29th, at 11.45 in the forenoon. No mining work has been done on the company's farms during the year, the directors deeming it prudent to conserve the company's funds pending developments on neighbouring properties.

Coal Trade Statistics.

In the course of its latest monthly report, the National Bank gives the following brief review of South African coal trade statistics:—The total tonnage exported overseas during the eight months ended August, 1921, was 1,186,027 tons, an increase of 322,883 tons compared with the similar period in 1920. During September 74 collieries were producing in the Union, the total tonnage mined being 1,187,527 (tons of 2,000 lbs.), a decrease of 44,570 tons as compared with August. By-products produced were Tar, 10,883 gallons, and coke, 2,041 tons. Total coal sold amounted to 990,315 tons, to the value of £420,469 (at pit's mouth), a decrease of 45,179 tons, and in value £27,579 as compared with August. During the latter month 192,956 tons of coal were shipped at Durban, compared with 187,485 tons in July, while 118,490 tons were shipped at Delagoa Bay, as against 75,188 in July. Since our last report the price of coal and freight have dropped considerably in England, and this has re-acted on prices in South Africa. Coal for export purposes has been reduced by 4/- per ton, and a reduction in railage of 1s. 3d. per ton will be made as from November 1st. With keen competition from England, however, it is not anticipated that these prices will be low enough to secure new business. At the present moment orders for export and bunkers are very scarce, particularly the former, and the majority of collieries take a somewhat serious view of the prospects of obtaining sufficient business in the immediate future to keep their mines fully occupied.

Springs and Its Mines.

The minute of the retiring Mayor of Springs (Mr. Evan Evans) has the following interesting reference to mining in the district. Mr. Evans says:—"The year has been one of anxiety, culminating with the closing of Daggafontein and one of the shafts at West Springs. A commission was appointed, at the request of the Council, to go into the question of the closing of Daggafontein, and statements were made that the sole reason for closing was the exhaustion of available funds and the impossibility of raising further capital at that time. It is sincerely trusted, with an easier money market, that this property will be reopened at an early date. We are buoyed up with hopes that within the next year or two Grootvlei will be an active mining proposition, and this may lead also to the opening up of other properties to the north and east of Springs."

* * *

The Crown Mines Strike.

Up to the time of going to press the Crown Mines strike had not been settled, but there is every reason to believe that by the time these words appear in print a settlement will have been reached. An official enquiry into the causes of the dispute was begun on Tuesday under the presidency of Major U. P. Swinburne, Chief Inspector of Mines, assisted by Mr. Grey, the Inspector of Mines for the Johannesburg district. The mine was represented at the enquiry by Mr. A. J. Walton (General Manager) and Mr. Healy, who has been acting for him during his absence. Mr. E. S. Hendrikz (acting General Secretary) represented the Miners' Union, and the leaders of the Strike Committee were also present. The chief witness was the shift boss Mr. R. Walthew, whose dismissal was the immediate cause of the trouble. Lengthy evidence was led regarding the dispute between Mr. Walthew, Mr. De Castle, the Mine Captain, and Mr. Kellett, the Underground Manager. A perusal of the evidence would go to show that there seems no insuperable reason why the matter may not be amicably settled by the exercise of a little "give and take" on both sides, and we hope the well-known tact of the Government Inspectors will be successful in bringing the parties together. The intervention of the Government is due to the fact that the Chamber of Mines did not regard the dispute as one for a Board of Reference, as the principle at stake, in the view of the Chamber, had already been decided.

* * *

Zululand Mining.

The *Natal Mercury's* Melmoth correspondent writes: "It would seem as if Melmoth, after many years of waiting, was actually coming to the fore, judging by reports that the Austin Syndicate on the farm Konigsbern is really doing good work. Gold is being produced, although labour at present is scarce. However, when matters are in thorough working order, great things are expected. Mr. Marks, from Johannesburg, who has been in this district frequently of late, after an absence of some years, and whose visits have been the subject of various speculation in connection with the different mining industries, is now stated authentically to be associated with Mr. W. Cooper in the opening up of the copper property in the Umhlatuzi Valley. It is situated about 18 miles from Melmoth, near the junction of Melmoth and Umhlatuzi, and would have come forward sooner had it not been delayed owing to the War. The last report registers 22 per cent. copper. A discovery of coal is also reported."

* * *

Tati Company, Limited.

The annual meeting of Tati Co., Ltd., held in mail week in London, was of more than usual interest this year owing to the fact that the chairman, Mr. A. Dodds Fairbairn, accompanied by the secretary, Mr. T. P. Patterson, have recently returned from a visit to the company's property in South Africa. They received a cordial reception from the

settlers, who stated that they had always been treated fairly by the company. After consultation, the Board has decided to adopt a new policy to attract small settlers, and for this purpose an area of about 50,000 acres, consisting of farms already surveyed lying to the north of Francistown and mostly to the west of the railway line, has been specially set apart. The prices fixed for these farms vary between 9s. and 12s. 6d. per acre, according to situation. Under the company's ordinary permit of occupation agreement, the rent payable is 6 per cent. per annum of the purchase price, which need not be paid for 10 years, and a further agreement will be entered into with each new approved settler, whereby he will receive stock on loan. The mineral prospects of Tati are also promising. If the territory is incorporated into Rhodesia, a greater mining activity would take place, as the company would receive all the benefits, by way of claim licences, royalties on gold and timber, as well as improved trading. At the last session of the Rhodesian Legislative Council, the question of incorporation with Rhodesia was brought up, and met with unanimous approval, and a petition will be sent to the Colonial Secretary. No objection was raised when the subject was discussed with the Commissioner for the Bechuanaland Protectorate.

* * *

Delagca's New Coaling Plant.

We understand that the new coaling plant for Delagoa Bay, for which Messrs. Head, Wrightson and Co., Ltd., are the contractors, is now complete in so far as the work of manufacture is concerned. The sub-contractors both on the Rand and in Durban have done their work with commendable promptitude, but the fact that the foundations for the plant at Delagoa Bay are not yet ready will cause some delay. Every effort, however, is being made to expedite the latter portion of the work.

FOR SALE.

TWO CAMPBELL TREBLE RAM PUMPS.

Rams 10 inches diameter, 15 inches stroke, each capable of delivering 25,000 gallons per hour when running at 35 revolutions per minute against a total head of 190 feet, including suction, delivery and calculated friction due to 1,320 yards of pipe 9 inches diameter.

TWO CAMPBELL OIL ENGINES

for above, complete with water tanks. Speed, 210 revolutions per minute, diameter and stroke of piston, 12 inches by 22 inches, specified to develop 42 B.H.P. maximum or 37 B.H.P. minimum at or about sea level on heavy fuel oil.

The whole of the above were manufactured by the Campbell Gas Engine Co., Halifax, England, and were inspected and passed by the Crown Agents for the Colonies previous to despatch.

The pumps and engines were never erected and are in perfect condition as delivered. Adequate spares included.

Full particulars and specifications may be obtained from the Director of Public Works, Zanzibar Government.

S. P. BLAND,

Ag. Director of Public Works, Zanzibar.

The Week in the Sharemarket.

GOLD LOWER—THE MINING CONFERENCE—SELLING FROM LONDON.

The fact that the gold "premium" continues to fall—touching £5 3s. 9d. on Tuesday—offset the good effect of the result of the mining conference. Had it not been for the selling from London, due to the drooping price of gold, the market would doubtless have responded at once to the settlement reached on Tuesday night. Business up to Wednesday was practically stagnant, the second test cricket match providing members with a welcome and convenient excuse for awaiting the result of the round-table conference. Wednesday's market was, however, irregular and disappointing, and Thursday's was only a little better. One good feature of the position is the more reasonable attitude being displayed generally by white labour on the Reef, and this despite the trouble at the Crown Mines. The effect of the Prime Minister's intervention seems to have brought home to the men the seriousness of the position, and it is hoped that this improvement will continue to make itself felt. The native labour supply, in point of numbers, is also more satisfactory. Apart from gold shares, Transvaal Silvers were something of a feature and improved sensibly on good news from the mine, the public evidently becoming educated up to the fact that development in galena properties is subject to fluctuations. Diamonds are dull, but better prices for base metals, as cabled, may prove the herald of some revival in tin shares. The quotations for the week were as follows:—

Letters to the Editor.

THE ORIGIN OF THE DIAMOND.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—There are many statements in the article by Mr. J. Ennis in your issue of the 12th inst. which require elucidation, but as I do not wish to trespass unreasonably on your valuable space I will refer, with your permission, to a few only of the points which I think call for comment and interrogation. Mr. Ennis, if I understand him correctly, terms himself "the discoverer of the parent rock of the diamond." Are we, then, to understand that he has discovered something new and unknown to geological science, and that kimberlite is *not* a parent rock of the diamond? Are we also to understand that on account of his self-claimed discovery the genesis of the diamond cannot be traced to any other rock except that which he claims to have discovered?

The photograph you publish is supposed to illustrate the "birth of a diamond." I must say I am unable to accept the photo as evidence of "the birth" without some accessory facts relating thereto. May I, in the first place, invite Mr. Ennis to state with certainty, if he can, the nature or name of the rock which contains the diamond? He declares that the crystallisation of the diamond in the photo is "manifestly genetic." Before accepting that statement, I would like to know something about the rock itself, and also an explanation of the following: "The expulsion of the elements of the diamond through the interstices of the rock is equally manifest." If the "element" (carbon) has been expelled, how is the presence of the diamond to be explained? And how does Mr. Ennis follow the "expulsion" of the carbon through the "interstices" of the rock?

He states that "it would seem feasible to imagine that the diamond has its home of production." I think we may accept this as a fact requiring no "imagination" whatever; but Mr. Ennis accuses the world of science of having overlooked the fact for "want of perception." He continues: "Unassailable data is now extant in the discovery of the parent rock and evidence of the complete crystallisation of the gem," which statement suggests that the complete crystallisation of millions of diamonds in kimberlite or any other rock is a matter of secondary importance in his estimation. Indeed, his views are tantamount to the dictum that kimberlite is *not* a parent rock of the diamond. This is an old view, held years ago by a number of geologists for various reasons, but the later discovery of many diamond-bearing kimberlite fissures has, I think, caused the old view to be entirely discarded.

The next passage perplexed me considerably, as Mr. Ennis leaves the reader entirely in the dark as to the geological features of the country he writes about, and the age of the formations he refers to. As I wish to follow Mr. Ennis as closely as possible in the expounding of his views, I trust he will be as explicit as possible. If I rightly understand him, there must have been quite a lot of lava or "heated magma" flowing about the country on top of the (?diamondiferous) alluvial gravels. He says: "Out of the granitic magma, surcharged with all the constituents of the alluvial gravel in all its varied forms, and endowed with the remarkable variety of mineralisation, a superficial lava has issued forth from gash and deeper-seated veins. Flowing over the heated magma, the gravel or pebbles have segregated out, each with its characteristic type of mineralisation. Nature has hidden her secret in complete dissimulation." I think Mr. Ennis ought to favour us with a little of his inside knowledge about this "dissimulation," which has so completely escaped every other observer. From the context of what follows I am inclined to think Nature has been playing a little game of "hide and seek" with Mr. Ennis, and left him thinking! If this is not so, he would surely not place so much importance on the "red brick" gravel formed partly by the cementing action of hydrrous iron oxide; nor would he place any importance on what he

terms a "pseudo-line formation," which he quite erroneously believes to be due to some extraordinary "sulphuretted influence which has converted the lava into a compact sheet of hard or variable soft line in appearance." It is quite evident that Mr. Ennis is not aware of the fact that the calcareous tufas of the South-Western Transvaal and Barkly West district (to which I presume he refers) are due very largely, if not entirely, to capillary action on the Dwyka beds which overlie (or have overlaid) so much of the country in which the diamondiferous gravels are found. Moreover, a period of many millions of years has intervened between the sulphuretted exhalations of the Ventersdorp lavas of that region and the deposition of the lime tufa and alluvial gravels. His reference also to "pebbles" in the lava having "segregated" suggests that he is confounding the amygdalae of the lavas with the pebbles and weathered-out amygdalae found in the gravels.

If Mr. Ennis is not really having a little game of "hide and seek" all on his own he might give an explanation of the serious allegation made against the geological world in the following remarkable effusion (the italics are mine): "The assumption geologically entertained that gravel is the detritus of rocks water-worn and rounded by sub-aerial conditions is *crude to the imagination* of anyone who has studied the otherwise perfectly characteristic typification of the gravel on the alluvial fields. Gravel found on the elevated kopjes is a *phenomenon* no longer demanding an explicit explanation of its presence and origin. So perfectly undisturbed are the gravel patches and areas that *to the studious mind each pebble is recognised to be in situ* where sub-aerial influences have been withheld, favouring conditions preventative to its disturbance. The prevailing recognition of the rotten granite on the part of the alluvial diamond-seekers as *the formation* favouring that where diamonds may be found *clearly supports the opinion* that the *granitic formation* is that in which the *contemporaneous veins* have discharged the *superficial lava*." What granitic formation? What contemporaneous veins? What superficial lava? And what has all this got to do with the genesis of the diamond and its presence in alluvial gravel?

With regard to the granite, I would ask Mr. Ennis to state clearly what area of rotten granite he refers to, and I invite a reply to the following leading question: Does he really believe that the underlying granite referred to is the source of the diamonds which were found in the gravels overlying it?

There are many other contentious points in the article, but I will not trespass further on your space by discussing them.—I am, yours, etc.,

"MYSTIFIED."

WHITE vs. NATIVE LABOUR.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—I perused your issue of the 5th inst., containing an article on the above subject, by Mr. J. E. Parker, and I am of the same opinion as yourself, that one cannot agree with many of the suggestions he makes. I certainly hold no brief for the native, but I do know that, properly used, he is South Africa's greatest industrial asset. Regarding mining as known on the Rand, I am not in the position to be able to give my opinion on some of the points raised by Mr. Parker. However, as an ordinary farmer, I can assure him that white labour, for a wage, will never pay, as even the most indifferent sort of white labour works out at 5s. per diem, whereas coloured labour only works out at 2s. per diem, and the class of work you get accomplished for these two values is about on a par.

South Africa, from a farming point of view, cannot be classed with either Canada or Australia; for the simple reason that, owing to the difference in the climatic conditions, these two countries can produce more per acre than we can; they can also run more stock to the acre than we can. In making this statement, I am, of course, only generalising, as there probably are very small sections in

this country at present of which the foregoing doesn't hold good. To all intents and purposes we are to-day 6,000 miles away from the markets of the world, and to be able to compete with other countries which have not this drawback, we have naturally to cut down expenses somewhere, hence the native labour at 2s. per diem—a living wage for the native, but a starvation wage for the white labourer. Dealing with State enterprise for any industry, mining, pastoral, irrigation or manufacturing, I would like to ask Mr. Parker to point to any really successful proposition, run by the State entirely, apart from such institutions as the Post Office or Railways. One has only to look at the experiences lately in Australia, New Zealand, Canada, England, and even here in South Africa, to come to the conclusion that State Control of any industry is not a success. Enterprises, on the other hand, which have had State financial assistance, but private control, have come through very well as a whole. The reason for this is, of course, that there is not the same keenness in running an industry for the State as there is in running a thing for oneself.

Then again, can Mr. Parker point to any State which has been able to solve its own labour problems? I think that the experience of the world at large goes to prove that the less the State interferes with matters of this sort, the better for all sections of the community. There are no short cuts to the solutions of economic problems. I think that here in South Africa we may toy with the idea of segregation, and an all-white labour community, but we will find that the correct solution to things will evolve quite naturally, resulting in a grading up of the workers all round, the introduction of native labour into semi-skilled branches eventually, the consequent lessening of the cost of production, which will eventually lead to the expansion of all our operations.

I don't profess to know much about mining, but do a bit of asbestos mining on my farm, when there is a market for the stuff. Latterly I have had occasion to make several adits and clear several faces. Competent mining men who have seen the work reckoned that it was well done and exceptionally cheaply executed. This work was all done by natives, paid 2s. per diem, and supervised by natives paid 3s. per diem. With all the drawbacks that the asbestos industry has to encounter in these outlandish parts, such as donkey transport, railage, oversea freight, etc., I think that the use of white labour would just make the difference between showing a small profit and a small loss, and as an outside observer I think that the same applies to the low-grade mines we are hearing such a lot about at present.—Yours, etc.,

W. B. COLLINS.

"MANCHESTER GUARDIAN COMMERCIAL."

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—I am sending you a copy of the Manchester Year Book, compiled by the *Manchester Guardian Commercial* and published by the Manchester Guardian, Ltd. I hope you will find it interesting enough to review in your columns. There is little doubt that many of your readers have direct business relations with Lancashire, and might be glad to know of the Year Book's existence. It is, strangely enough, the first comprehensive publication of its kind dealing with this part of the world. The price of the book is 6s. post free, and a fair proportion of copies have been set aside to meet the overseas demand.—Yours, etc.,

K. RUSSELL BRADY,
Business Editor.

June 23rd, 1921.

WHERE THE GOLD GOES.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—In your issue of 24th September your correspondent, "Engineer," asks me if I can furnish data showing the amount of gold consumed annually in the arts and industries and hoarded in the East. The following figures, covering five-year periods, are given by Joseph Kitchen in *The Times* (Annual and Commercial Review), 28th January, 1921 (in millions of pounds of gold):—

	India,	Egypt,	Balance	Total
	Industry, & China,	for Money.	Output.	
1900-1904	79	48.7	178.2	305.8
1905-1909	95	63.5	272.3	430.7
1910-1914	120	130.1	246.2	469.7
1915-1919	87	66.8	272.6	426.4

—Yours, etc.,

S. J. SPEAK.

BRITISH INCOME TAX REFUNDS.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—Although as the result of my previous letters I have had the pleasure of advising many of your readers as to what claims for repayment of British income tax they were entitled to make, I find that there are many who have been misinformed by their advisers in this country and are ignorant of the fact that they can reclaim a considerable sum. For the benefit of these readers may I trespass upon your valuable space to point out again that: (1) Every British subject resident out of the United Kingdom is entitled to recover a proportion, if not all, British Tax paid since April 5th, 1920. (2) Every person who has served the Crown or a Protectorate of the Crown or a missionary society, or is forced to reside abroad for the sake of his health or that of any member of his family, can claim a refund as above since April 5th, 1918. (3) Every person, British subject or otherwise, in receipt of British War Loan interest or dividends from non-British funds and companies, *e.g.*, India Stock, Canadian Pacific Railway, Rand Water Board, etc., can recover every penny of tax deducted since April 5th, 1918, even where the securities stand in the names of trustees. (4) Where British and Colonial income tax is paid in respect of the same source of income, a refund can be obtained. If anyone interested in the above matter will write to me, I shall be pleased to advise them, without charge, exactly how they stand.—Yours, etc.,

WILFRED T. FRY.

24th October, 1921.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material & Engineering Trades

BUSINESS QUIET BUT HOPEFUL—WORKING COSTS QUESTION MORE CHEERFUL—IRON AND STEEL
—TIMBER AND BUILDING MATERIALS—ELECTRICAL GOODS—UNION & BRITISH TRADE STATISTICS
—UTILISATION OF WASTE PRODUCTS FOR GAS PLANTS—METAL MARKET.

General Review.

The result of the Miners' Conference last Tuesday, when an important regulation affecting underground working and the more efficient working of natives was adopted, has been well received in mining and commercial circles. The successful issue of the Premier's efforts in this respect has been welcomed as foreshadowing a real and earnest endeavour on the part of all concerned to bring down working costs to such a level as will enable us to carry on profitable operations. It would seem as if the miners' unions on behalf of the men are alive to the perilous position of the industry in the very near future unless drastic measures are adopted to reduce the present high costs of working and to ensure a higher level of efficiency by the workers. Commercial circles hope that there will be fewer academic quibbles over unimportant details and that the miners will realise the gravity of the situation as it exists to-day and co-operate wholeheartedly in an endeavour to bring working costs down to a level which will allow the industry economically to exploit the millions of tons of low-grade ore now awaiting treatment. Despite previous disappointments, it is thought that the miners will, in the event, see the present position of the industry in its true light and follow the lead so successfully given by General Smuts at the recent conference. Business during the week under review has on the whole been rather quiet, although signs are not wanting of a better tendency generally; inquiries have been distinctly encouraging and warrant the belief that better conditions may prevail within a few month's time. In the opinion of a prominent commercial man, the Government appears inclined to divert a portion of the recently raised loan to various departments in order to develop our resources, which will, of course, tend to improvement in business generally. Prices are being well maintained, in fact some lines are inclined to show slight increases if anything. It must not be forgotten that some articles, of which we had very large stocks, are by the law of attrition getting down to normal again to-day, and merchants generally are not so anxious to sell at a loss as they have been of late owing to this resumption of normal conditions. It is true that cutting of prices still continues on the Commercial Exchange, which is due more or less to the paucity of inquiries and to the desire of some merchants to make a certain turnover at whatever sacrifice. The authority before referred to finds quite a number of lines opening out into the old channels, due largely to the speculative element in business having been eliminated during the past six months. Merchants, he said, are looking hopefully to the New Year to see an improvement in the volume of business and in prices ruling, provided a satisfactory solution is found to the labour question. There may be a dull period experienced in December, due largely to stocktaking along the Reef, as storekeepers do not care to bring in too much stock into their balance-sheet when balancing their books at the end of the year, but with the turn of 1921 we should see signs of greater activity, provided always that matters political in Europe improve, or, at any rate, become no worse.

Iron and Steel.

Business has been rather quiet during the past week, although inquiries have been somewhat better than of late, especially for cast steel, which is somewhat harder in price.

The general opinion is in commercial circles that the New Year will usher in an improvement in business conditions. Fencing material has been firmer at increased prices owing to cost of replacement being even higher than local quotations.

The African Iron and Steel Products, Ltd., have installed a plant to prepare the sand-moulds required for the casting process in connection with their patent steel alloy known as the Sheeley steel mixture, which is in great demand as a liner for tube mills on account of its peculiar hardness and resistant properties against the attrition of the pebbles which are used in the tube mills as grinders. This means that hand-moulding will now be a thing of the past. Although tube mill liners-end and shell liners, screws and grids, constitute the largest feature of the company's activities, they are also developing many other lines, such as truck bearings, cart-wheel bushes, builders' sundries, etc. The Sheeley mixture is so hard that it cannot be chipped like ordinary iron, and all rough edges have to be ground off with emery wheels. The prospects of building up an important local industry are very great indeed. Experiments are continually

in progress so that the works may keep well abreast of the latest requirements of the mines and industries generally.

Engineering Shops.

Business continues fairly active generally in our local engineering shops, but no great development is anticipated until after the turn of the year. It must not be forgotten that a large amount of the work presently being done would have been looked upon as unsatisfactory a few years ago.

Second-hand Machinery.

With regard to the second-hand machinery market there is still a large demand for all mine requirements and a scarcity of many lines, particularly second-hand battery spares. New machinery has not been coming through in such large quantities, and it is predicted that there will be a scarcity of many mining requirements before long. It is understood that the mines are making up their orders for the coming year and better times, it is confidently expected, will be seen in business next year. Boilers and engines are always inquired for, but as stocks have depreciated considerably during the past two years, and there is a scarcity of this particular class of machinery, prices have maintained a high level. There is a scarcity of 3-16th second-hand plates and other sizes, so that requirements have to be met by purchasing new, although stocks are very depleted. Several new mines on the Far East, those which are in the constructional state at present, are buying pretty freely, particularly girders and steel plates. Second-hand rails have had a big fall owing to the large quantities of German material imported now coming into the market, and it is depressing to merchants that imported English grades cannot be landed here at anything near the price of German.

Tin Plates.

London advises that home users of tin plates are showing more interest and are covering near requirements. The oversea demand is more widely distributed. In iron and steel the home position is unchanged, but export business is improving. Cleveland pig iron No. 3 is now ruling at 110s.

American Notes.

Cotton is likely to rise somewhat in price shortly owing to this season's attenuated crop which is estimated at 1,588,000 metric tons. Rubber goods also are inclined to harden; recently there were some very considerable reductions in rubber goods generally, but no further decline is anticipated for a long time to come. Business in the United States is improving slightly and the factories are getting back to normal with increasing outputs, and generally the outlook is more hopeful for next year than it was at the commencement of 1921.

Fencing wire is again up in America from 1 dollar to 3 dollars per ton for plain and barbed wire. A leading American importer said wire was still being sold here considerably under landed cost. Stocks at the coast had been extensively reduced. He himself had disposed of all his stocks at the coast four or five weeks ago at a better price than

he was getting three months ago. He said that within a few months the mines would have to replace their stocks, which they are now getting at landed cost, at a much higher price, especially steel plates and similar commodities. The United States Steel Corporation recently announced a new steel price of 40 dollars per ton for rails. The sheet and wire goods market is active, operations in the heavier productions are, however, small. Pittsburgh district operations are about 40 per cent. of capacity compared with 18 per cent. in June and July last.

In the States the question is constantly being asked why do not conditions mend? The answer is simple. Credit is lacking. Nothing is so timid as money. Money is not scarce in America, but credit is. Never was there so much gold in the United States. If it keeps pouring in at the rate it has been coming for the past two years, there will be cause for worry while other countries are being stripped of the yellow metal. It is not safe for one country to have an over-balance. America has been increasing its hoard enormously for more than a year. Soon she will have half the gold of the world. The flow must be corrected. The twelve Federal Reserve Banks show net earnings available for dividends for the first six months of 1921 at the rate of 108 per cent. per annum on the capital paid in. If they ever are going to reduce their discount rates they should do it now. In some sections not a few banks are doing little more than marking time. That is bad. It delays recovery. Business will begin to come back when it gets credit at the bank. There will have to be a reversal of the long time practice of the banker, loosening up to the utmost limit in flush times, and tightening up like a drum when there is a sign of trouble. There would not be so many business concerns in the hands of bankers to-day if prudence had been displayed by the financiers in the time of wild extravagance and vaulting prices. Conditions are sound in America, but the legions of business need the support of credit confidence, and credit can work a mighty change within 12 months. These remarks to a certain extent apply also to the Union of South Africa.

Timber and Building Materials.

Business has been fair during the past week, but shows signs of slackening off in view of the approaching Christmas holidays. The building trade, however, has been better during the last two or three months than previously and a big improvement is looked for about next February.

Prices: 3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver board, 4 $\frac{3}{4}$ d.; floorings, 6 $\frac{3}{4}$ d. to 7d.; ceilings, 4 $\frac{3}{4}$ d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 7s. 6d. to 8s.; corrugated iron, 9 $\frac{3}{4}$ d. to 10 $\frac{1}{2}$ d. Furniture timber: Burmah teak, 18s. 6d. per cube here for first quality, 14s. 9d. for second, at the coast; American oak and Japanese oak, 1s. 2d. at the coast; West African mahogany, 1 in. to 4 in. thick, 27s. per cube at the coast; Rhodesian mahogany, 8s. 6d. per cubic ft. at the mills; Honduras mahogany, 30s. per cubic ft.; American yellow pine, 1s. 8d. to 1s. 9d. per ft. of 1 x 12 here; American pine shelving,

to 1s. 9d. per ft. of 1 x 12 here; American pine shelving, 1s. per ft. Bricks unchanged at 70s. for blue stock; 60s. mixed; £4 10s. to £5 for wire cuts; £5 for pressed per 1,000 at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag, 8 lb. bag 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s. 6d., 46s. 6d., 55s. for 1 to 3-ply.

Second-hand Iron and Timber.

Things remain very quiet in the second-hand iron and timber yards. Stocks are abundant; prices are 6d. to 7d. for iron and 9d. to 10d. for timber.

Electrical Goods.

The improvement noted during the past month or six weeks continues, and dealers appear to be fairly busy as compared with recent months. Stocks held are plentiful and continue to arrive here in fair quantities. Prices, merchants state, appear at present to be balancing themselves both at Home, Germany and Holland. America, as previously stated, is very seriously handicapped on account of the Exchange. Although there are no big contracts going at present, there is a fair daily amount of house-wiring, people apparently having come to the conclusion that the present offers a good opportunity to fix up small orders without waiting for further falls in prices of material and labour. The price to-day of house wiring is 25s. to 40s. a point, as compared with about 32s. 6d. to 45s. which obtained for some considerable time, but has now declined to the present figure. For a double storeyed house the price is about 40s., but for a single storeyed house, thrown together quickly, about 25s. to 27s. 6d. is the price.

Proportion of British to Foreign Merchandise Imported.

7 MONTHS ENDED 31st JULY, 1921.		
		%
From United Kingdom	£17,846,358	54.1
From other British possessions	3,287,990	10.1
From Foreign Countries	11,864,226	35.9
Total	£32,998,574	100
7 MONTHS ENDED 31st JULY, 1920.		
		%
From United Kingdom	£28,035,501	55.5
From other British possessions	5,888,826	11.6
From Foreign Countries	16,630,934	32.9
Total	£50,555,261	100

It will be seen from the above that from May last onwards the total monthly imports have remained at about 3½ millions, and exports, with the exception of July, at 4½ millions. Comparing the respective periods of eight months ended 31st August, it will be seen that there has been a decline in imports of 39 per cent. this year and in exports of 36 per cent. Exports, however, now exceed imports by rather more than £1,000,000, as against a balance of close upon £500,000 the other way in 1920.

October Trade Statistics.

The Board of Trade returns for October, which show that the imports were £81,000,000, compared with £149,000,000 in October, 1920, and exports £62,000,000; compared with £112,000,000.

Re-exports amounted to £10,000,000, compared with £16,000,000 in October last year.

The imports of raw cotton and wool each declined by nearly £1,000,000 and the exports of manufactured goods by £45,000,000, while in cotton goods the decline amounted to £15,000,000.

The decrease in iron and steel manufactures was £7,000,000 and in woollen manufactures nearly £6,000,000.

Gas Engine Plants and Utilisation of Waste Products.

Investigations for the more economic utilisation of coal and the substitution of other sources of power have led to some astonishing results in the use of all sorts of hitherto waste substances which, when dealt with by modern methods, have been found to have a high calorific value. This will prove of great value to South Africa, especially in districts far removed from the coal fields. Apart from the engines and plants to run on anthracite coal or charcoal, gas engines and plants for the utilisation of bituminous coal, loco. smoke-box char, green wood, mealie cobs, sugar-cane refuse, spent wattle bark and practically any negotiable refuse not containing more than 50 per cent. moisture are now being manufactured. Also airless cold starting engines from 20 h.p. upwards to run on mineral oils, such as crude, residual, semi-refined and vegetable oil, such as monkey nut, cotton seed and palm oil, are being sold in ever-increasing quantities. The Lonely Mine (Rhodesia) has decided to discard its steam engines and to instal three 44 h.p. horizontal multi-cylinder engines for running alternators in parallel and one 333 h.p. for direct coupling to an air compressor. The gas plants to be employed consist of four suction producers, cross-coupled and gasifying the local Rhodesian woods. Three of those engines and plants have been in commission for some months and are reported to be giving the utmost satisfaction. Many other gas plants have been installed in South Africa which are running on wood and products other than coal.

Motor Spirit from Straw.

Dr. Hargreaves, Director of Chemistry in the South Australian Industrial Department, states that there is produced annually, within a 100-mile radius of Adelaide, upwards of 500,000 tons of straw, practically all of which was allowed to go to waste, but from every ton of which 80 gallons of alcohol could be obtained, or 40,000,000 gallons of alcohol produced from the straw wasted—in other words fourteen times as much as all the petrol imported into South Australia. He knew of no other proposition for producing motor spirit which was so promising as straw.

Collieries and Electrification.

Notwithstanding the present gloomy outlook of the coal industry in Britain one large colliery company has decided to spend over £1,000,000 on extending electrical working in its various mines. The intention is to extend the main power house until it becomes the largest private electric power station in the country and completely electrify all plant in the pits which can be suitably operated by electric power. The reduction in working costs will, it is expected, be very considerable.

Agricultural Implements.

Although business is better now than it has been for the past six months, it yet leaves a lot to be desired, said a prominent importer. The farmer's desiderata are, of course, more rain and more money, both in credit facilities and in the price of products.

Motor Car Industry Improving in Britain.

That the motor-car industry in Britain is recovering from its recent lethargy is evidenced by the attendance of 50,000 persons at the International Motor Show at Olympia. Motor agents have secured large orders for the immediate future, one Welsh firm alone ordering 300 cars, another firm 600 at an average of £400, and further sales and orders are announced amounting to over £1,000,000.

The Gravity Petrol Jet Control.

The Gravity Petrol Jet Control is an invention to produce a varying mixture to give a varying piston head pressure which will automatically maintain a fixed speed over any road gradient that the car is capable of taking with a fixed throttle: say that on a steep hill climb your car required the maximum power one gas to eight atmospheres, which should give approximately 160 lb. pressure per square inch on piston head. On rounding the hill top the gravity jet control automatically weakens the mixture, reduces the piston pressure, and still maintains perfect combustion. The variation due to mixture alone has a range from 60 lb. to 160 lb. per square inch, so that if use is made of that range, the petrol bill will be reduced by 20 per cent.

Railway and Harbour Earnings. Week ended Nov. 5.

The weekly statement issued by the S.A.R. and H. for the period ending November 5 shows that the approximate earnings on the railways were £423,012, or £12,190 less than the estimates; and by the harbours £21,867, or £1,147 less than the estimates. There was a falling off of £27,102 in the coal traffic.

S.A.R. and Coal Traffic.

The latest bulletin issued by the General Manager of the S.A.R. has the following, *inter alia* :—

Railway earnings for the three weeks ended 15th October, 1921, showed a slight improvement, although still much below the estimate. Earnings for the week ended 22nd October declined to £395,663, or £39,539 below the estimate and £80,330 less than the earnings for the corresponding week last year. The decrease was principally due to a falling off in passenger and coal traffic. Although very large stocks of maize and meal are on hand at up-country stations, there has been a steady falling off in this traffic, despatches having dropped from an average of 32,000 bags daily at the end of August and the beginning of September, to 4,000 to 5,000 bags daily during October. From 1st July to 25th October last, 2,289,281 bags of maize and meal were railed to the various ports, while 1,722,602 bags were shipped, leaving a balance of 540,642 bags on hand at the ports and 26,037 bags in transit. The falling off in maize and meal traffic has led to decreased demands on truckage generally, of which there is at present a surplus. On 26th October there were 41,091 tons of coal on hand at Durban, 26,020 tons at Delagoa

Bay, and 29,559 tons at Table Bay. 187,511 tons of coal were shipped at Durban during September, compared with 192,956 tons in August, while 84,924 tons were shipped at Delagoa Bay, compared with 118,490 tons in August. Low freights for export coal from Great Britain, coupled with reduced prices for Welsh coal, has resulted in a set-back to the South African coal trade. Owing to the shortage of orders many of the mines have only been working part time. From 1st to 24th October a considerable number of mines closed down for periods varying from one to seven days. On 11th October, only 6,000 tons of empties were required to meet the requirements of the Natal mines, compared with the usual order for 15,000 tons daily. New collieries at Hlo-bane are being developed and it is anticipated that an output of from 300 to 400 tons per day will be available for export shortly. One company is said to have concluded a contract with one of the principal South American Railways for a minimum of 100,000 tons of coal per annum with an increasing yearly quantity up to 300,000 tons, the contract extending over a number of years.

THE POSITION OF THE E.R.P.M.

A GOVERNMENT ENQUIRY PROCEEDING—RETRENCHMENT RUMOURS—THE PARLOUS FLIGHT OF THE PROPERTY—UNPROMISING OUTLOOK FOR BOKSBURG—THE LESSON OF KIMBERLEY.

A Government Commission of Inquiry is now investigating the position of the East Rand Proprietary Mines. It is common knowledge that the E.R.P.M. has been skating on thin ice for many months past, and that but for the gold premium the company would long ago have had to suspend operations. Numerous chairmen's speeches and engineers' reports have made it quite clear that the great constellation of Near East Rand mines is to-day in an exceedingly perilous position.

Skating on Thin Ice.

The E.R.P.M. is what may be termed a £5 per oz. proposition. In other words, it costs round about one hundred shillings to produce an ounce of gold, and it must be obvious that when the price of the product falls below this figure the company is operating at a loss. The present price of gold is perilously near this bed rock figure. With its large debenture debt and high overhead operating charges, the E.R.P.M. cannot afford to do this.

Retrenchment Inevitable.

It is not surprising, therefore, to learn that the position of the company is again being most carefully investigated, and particularly so with a view to retrenchment. It may be possible to effect retrenchment gradually so as to lessen the burden of hardship on the employees and the community at large. But it seems that little short of a miracle can place the proposition on a satisfactory basis. It will doubtless be possible to continue productive operations on a large but modified scale for some time to come. But unless some tremendous effort is made by the employees to pull the mine round, and even now it may be too late, we fail to see how the E.R.P.M. can continue to carry on for any length of time. And the E.R.P.M., it should be made clear, is one of the largest employers of white labour in the country.

£700,000 a Year in Wages.

The wages bill of the E.R.P.M. is in the neighbourhood of £700,000 per annum. Stoppage of work at the property

A Scene on the Cason Section of the E.R.P.M. in the days of the company's prosperity.

Scattered Ore Reserves.

The proposition is a difficult one to work. It is essentially a low-grade venture, and the only remaining blocks of comparatively good grade ore are so scattered that the cost of mining cannot but be high; under present working conditions it is so high that it is difficult to see how the property can continue working except on a much reduced scale of operations. The general public have heard so much about the plight of this mine, once regarded as one of the Consols of the Rand, that they have come to regard talk of closing down the E.R.P.M. as a cry of Wolf. But the true facts of the case are that unless there is a sharp rise in the price of gold or a very substantial reduction in working costs the outlook for the East Rand Proprietary is well nigh hopeless.

would be an unprecedented misfortune to the whole district, but the economic calamity would not stop at that, as within a few months the neighbouring mines would be flooded unless arrangements had been made to cope with the water. Even curtailment of operations will have a well nigh ruinous effect upon Boksburg, and this in turn will react on Johannesburg, the Reef, and the country generally.

The Moral of Kimberley.

The lesson of Kimberley should hang over our heads here in Johannesburg and make us realise that just as Kimberley depends upon diamonds for its prosperity so do Johannesburg and the Reef towns depend upon gold. And unless something is done, and done speedily, to arrest the rot and

to destroy the canker which is gnawing at the vitals of the gold industry the Reef may very quickly become as depressing and poverty-stricken a place as Diamondopolis is at the present time. But the effect of any wholesale suspension of mining operations on the Rand would be far more disastrous to the whole country than has been the collapse in the diamond industry. And there is only one way in which the position can be remedied, and that is by reducing working costs, not by a penny or two per ton, but by several shillings per ton.

Where Our Industrial Salvation Lies.

As we said in our last issue, the mere amendment of the Mining Regulations is not going to so transform our industrial position that we can claim immediate salvation from the morass of perilous uncertainty into which the mines have for so long been drifting. We need more, much more, than increased working hours from the native before we can truly sight the haven of safety and prosperity; and primarily we need the close co-operation of the white miner in a whole-hearted effort to reduce working costs to such a degree that the Rand may be independent of the gold premium. Our real industrial salvation lies in the direction of being able to earn profits, commensurate with the capital involved, from ores that yield as little as twenty shillings per ton. When we have achieved that—and not until then—we may indeed shout that we are out of the wood that at present darkens the whole of our outlook.

A Geological Survey.

The Age of the World—An Interesting Lecture by
Mr. T. N. Leslie.

On Monday evening Mr. T. N. Leslie lectured at the Scientific and Technical Club on "Problems in Local Rocks and Storms." In the course of his address Mr. Leslie remarked that the dolomite—the magnesium limestone of this country—was immediately below these series. It was the great water-storing rock of South Africa, and for that reason was most important. It was also important from an economical point of view; it was important geologically, and for the connection with one of the gold-bearing rocks—the

black reef. There was a strip of South African country 300 miles in extent, which was the history at present of the dolomite. The formation was not pure limestone, but had about ten per cent. of silica or quartz intermixed, thus giving its valuable water-storing characteristic. A number of slides were shown indicating the glacial conglomerate, and exhibiting specimens of plant fossils of types distinct each from the other in the Northern and Southern Hemispheres. The lecturer, dealing with meteorological conditions in South Africa, showed several interesting slides illustrative of cloud forms, which were the precursor of storms.

Dr. Orenstein, who presided, expressed thanks to Mr. Leslie, which were cordially endorsed by those present.

In the past there had been many attempts made to show how old the earth really was. A new method had replaced Kelvin's, which brought a computation of from 20 to 100 millions of years. Other well-known scientists had since discussed the question. Lord Raleigh pointed out that radioactive substances had been discovered of which Kelvin had no conception whatever. The age of the carboniferous rocks had been since estimated at something like 550 million years. The primary rocks—the introductory to the book of Geology—were much older. The lecturer, dealing with the surface measures of the Transvaal and Free State, mentioned that they were older than most of the other rocks in the Northern Hemisphere, of which the mountains were built. While the great change of conditions was going on—continents in the north being built up and in the south being lost—the total effect of climate itself had remained stationary through the enormous periods of time. There was very little difference in its type. "The whole of South Africa has been planed down," Mr. Leslie said. We had only one or two chapters of the first volume of the history. The second, third and fourth were missing. But in this country there was, to the lecturer's knowledge, one recent incident of the building up that was in constant progress. He spoke of the site of an old-world lake near Vereeniging. In a thickness of seven feet to ten feet of recent deposits, over the most ancient forms, were found specimens of the handiwork of prehistoric man. Mr. Leslie illustrated with lantern slides some interesting facts concerning the coal measures and associated rocks of South Africa. The Karroo Series, highly developed over the Cape Province, he remarked, were representative of the permo-carboniferous rocks of Europe.

Retrenchment on the Diamond Mines.

PLIGHT OF KIMBERLEY AND JAGERSFONTEIN—OUTLOOK IN THE PRETORIA DISTRICT.

From both Kimberley and Jagersfontein comes news of further retrenchment on the diamond mines in view of the continued depression in the market. The New Jagersfontein mine is, of course, controlled from Kimberley, and the policy of its directors is dictated by De Beers. It appears that, as far as Jagersfontein is concerned, working expenses are to be cut down by one-third, this being effected by a reduction in white wages and the discharge of a number of natives. Apparently much the same policy will be pursued at Kimberley, though we have no official statement on the subject. De Beers declare that during the past year they have paid out a million sterling in order to maintain in employment a thousand men on non-reproductive work, and in view of the absence of any sign of an early revival in the diamond market they are forced to adopt a drastic policy of economy. The local Chamber of Commerce has, naturally, taken fright at this prospect and has interviewed the board of directors of De Beers, from whom it was elicited that the drain on their capital resources had been such that their funds are "nearing the danger point" and they are "painfully and reluctantly" compelled to retrench. In doing so they give the assurance that they will sympathetically remember the claims of old servants. One thing is clear, that the position in the diamond mines, unless it improves, will be immediately reflected among the commercial community of the diamond fields and that to the

already large ranks of unemployed there will be serious additions. Evidently the Chamber of Commerce realises that the industry is the victim of world circumstance, for it has publicly expressed "sympathy with De Beers in their trouble" and assured them of its earnest desire to co-operate with the Board in combating the danger of unemployment.

Position at the Premier.

Although no announcement has been made, it is safe to surmise that the Premier people will have to follow the De Beers example and still further cut down expenditure. This will naturally mean further curtailment of the present restricted scale of operations at the mine. The plain explanation of the whole thing is, of course, that the depression is so prolonged and shows so little prospect of amelioration that the diamond companies must trim their sails to meet the altered conditions. In other words, they must plan to make their rapidly dwindling cash resources go further, and, in the circumstances it is difficult to see that they have any other alternative. The lesson must not be ignored by the communities and the Government which live and depend for so much of their revenues upon the diamond mines, and all that can now be done is to pray for some rift in the clouds that now darken the diamond markets of the world.

A Remarkable Balance Sheet.

FINANCES OF THE ROGERSTON COLLIERIES—SOME PERTINENT QUESTIONS.

A copy of the balance sheet and report of the Rogerston Collieries, Ltd., for the year ending 30th June, 1921, has come into our possession. This is such a remarkable document that we feel bound to comment on it. The financial statement is enough to make one gasp. First of all, however, to deal with the operations of this company, which has been in existence for many years and from which, so far as we know, shareholders have never received a penny in profit. The report states:—

“As intimated in the previous reports the company secured a substantial interest in the Grootpan Collieries, Ltd., transferring to the new venture the complete outfit of the mine closed down at Onspoed, and holds 8,824 fully paid shares in an issued capital of £20,000. The equipment of Grootpan Mines is now completed, drives are opened up from an incline hauling shaft, and coal of an excellent quality is being marketed. This colliery is adjacent to Minnaar station, on the Johannesburg-Delagoa Bay line, loaded and empty trucks being handled by the Railway Department there, rendering haulage by the company unnecessary—an obvious advantage from an economic point of view. The seams of coal appear to correspond with those of Tweefontein, the nearest colliery, about three miles distant, which is a big producer. The prospects for Grootpan are therefore very satisfactory. One of your directors, Mr. Hay, has been elected chairman of the new company.

“The investment of £2,500 in S.A. Iron & Steel Corporation, Ltd., amply justifies the confidence of your directors, allocation of shares in the re-floatation being at the rate of two new for one original share, the Rogerston Company therefore receiving 5,000 shares in the new company. Mr. Romyn, who has so long been associated with the Rogerston Company directorate is chairman of what promises to be one of the greatest industrial undertakings in the Union.

“The policy steadfastly pursued by directors for a number of years in conserving the assets has resulted in placing the company on a firm footing, in spite of discouragements arising from the failure of the original coal propositions, both at Waterval and Onspoed. The former heavy indebtedness has been replaced by investment in an admirable coal property, and an iron industry which are certain of future success, the patience of shareholders being rewarded by securing a sound value for their shares. The future prosperity of the company is now practically certain, so far as can be ascertained.”

For the shareholders' sakes we sincerely trust that the optimistic expressions of opinion regarding the S.A. Iron & Steel Corporation will be justified by future results, but inasmuch as the corporation has never yet done anything more than talk about what it is going to do one day, we ourselves can hardly echo the exuberant note sounded by the directors of the Rogerston Collieries.

The Company's Expenditure.

Turn now to the financial aspect of the concern. The report states that during the financial year ending with June 30, 1921, the Rogerston Collieries, Ltd., made a book

loss of £64 1s. 6d. and that the income from all sources including the balance of £186 17s. 9d. carried forward from last year amounted to £692 10s. 11d. The profit and loss account for the year shows on the debtor side the following items of expenditure:

Travelling Expenses	£17 0 0
Charges	70 12 2
Salaries	150 0 0
Bonus	50 0 0
Directors' Fees	250 0 0
Audit Fees	10 10 0
Interest	76 0 3
Commissions	132 10 0
	£756 12 5

Questions which need Answers.

What are the “Charges” referred to above? To whom was the £50 bonus paid, and why? And what is the explanation of the item, “Commissions, £132 10s.”?

The company's income for the year, including £186 17s. 9d. carried forward from the previous year, is stated to be £692 10s. 11d., and in view of this and the fact that last year's operations resulted in a loss of £64, one may pertinently ask whether the directors' remuneration is not too large, and just exactly why the expenditure in regard to “Bonus,” “Charges” and “Commissions” was contracted and to whom payment of the amounts mentioned was made?

FOR SALE.

TWO CAMPBELL TREBLE RAM PUMPS.

Rams 10 inches diameter, 15 inches stroke, each capable of delivering 25,000 gallons per hour when running at 35 revolutions per minute against a total head of 190 feet, including suction, delivery and calculated friction due to 1,320 yards of pipe 9 inches diameter.

TWO CAMPBELL OIL ENGINES

for above, complete with water tanks. Speed, 210 revolutions per minute, diameter and stroke of piston, 12 inches by 22 inches, specified to develop 42 B.H.P. maximum or 37 B.H.P. minimum at or about sea level on heavy fuel oil.

The whole of the above were manufactured by the Campbell Gas Engine Co., Halifax, England, and were inspected and passed by the Crown Agents for the Colonies previous to despatch.

The pumps and engines were never erected and are in perfect condition as delivered. Adequate spares included.

Full particulars and specifications may be obtained from the Director of Public Works, Zanzibar Government.

An Improved Method of Treating Zinc-Gold Slimes.

HOW WORKING LOSSES CAN BE REDUCED IN THE REDUCTION WORKS OF SOME MINES — DESCRIPTION OF A NEW PROCESS.

By a Special Technical Correspondent.

Much has been said and written of late with regard to reducing working costs on the gold mines. As the greater portion of working costs is incurred by work underground, attention has lately been focussed on that department, and surface works have been comparatively neglected. It is also generally taken for granted that the surface works have reached a state of perfection, and that little or no improvement can be made in that department. However, this article shows that not inconsiderable losses do occur in the reduction of gold, and the investigator has gone into the matter very fully, and claims that substantial savings can be effected by the adoption of the process here described. A saving in costs amounting to 1.5 pence per ton of ore treated is not to be lost sight of at the present time, and an improvement of this description is well worthy of the attention of the industry.

Briefly, the process consists of the following: Wet zinc-gold slimes are subjected to the action of steam and heat in a specially designed plant whereby the metallic zinc present is oxidised and rendered more soluble in the acid or ammonium carbonate treatment that follows. The more complete removal of the zinc from the slimes lessens the losses of gold in smelting and cupellation, and thus the saving, claimed by the originator of the process, is affected.

The main objects of the process are as follows:—

(1) The Complete Elimination of Zinc from Gold Slimes Prior to Smelting.

That the Tavener process now in use exposes the gold to great risks of loss through volatilising is acknowledged by many metallurgists, such loss being due to the presence of zinc in the gold slimes to be smelted.

With regard to these losses I would draw your attention to the following: These tests are the work of Professor Furness, and represent work on an assay scale, similar to the Tavener process on a larger scale.

- (a) Average loss without zinc in cupellation, 0.296 per cent. of gold contained.
- (b) Average loss with zinc in cupellation, 6.76 per cent. of gold contained.
- (c) Average loss with zinc in cupellation, following scorification, 5.265 per cent. of gold contained.

On a local mine, with output 170,034 ounces cyanide gold:

- At .296 per cent. loss of gold = 503.3 ozs. per year.
- At 6.76 per cent. loss of gold = 11,494 ozs. per year.
- At 5.27 per cent. loss of gold = 8,960 ozs. per year.

(2) Less Handling of the Rich Product.

The plant is automatic, and therefore the handling losses are centralised and localised, and are recoverable.

W. T. HALLIMOND,
CONSULTING MINING ENGINEER.

Having left 43, Central House, messages for appointments may be left at

No. 12, Norwich Union Buildings,
Fox Street,
Johannesburg.

(3) Quicker Recovery of the Gold.

The time being estimated at 2½ days.

(4) Less Locking Up of Gold in Furnaces.

This locking up occurs in the Tavener process to-day, due to the corrosive action of lead on the bricks of the furnace.

(5) Cheaper Recovery.

The present costs equal 2.05 pence per ton treated.

In comparison with this the only costs incurred by this process, taking labour as equal in both cases, would be the cost of coal and steam. Moreover, the recovery of zinc oxide, lead nitrate and ammonium carbonate, are further saving factors.

A modest estimate of cost saved would be in the neighbourhood of 1.5 pence per ton of ore treated.

(6) Reduction in Bulk of Gold Slimes to be Smelted.

With sulphuric acid treatment, 12 lb., oxidised product reduced to 1.5 lb.

With ammonium carbonate treatment, 12 lb., oxidised product reduced to 1.8 lb.

(7) Immunity of Theft.

(8) Bigger Recovery of Gold.

Taking the losses under the different percentages over 1,945,000 tons treated:

- At 0.296% loss of gold = 0.31 pence per ton treated.
- At 6.76 % loss of gold = 7.09 pence per ton treated.
- At 5.27 % loss of gold = 5.50 pence per ton treated.

The above tables are submitted to show that a process in which there is a theoretical possibility of these enormous losses is dangerous in the hands of non-technical men.

This process was brought to the notice of the Mines Trials Committee and commented upon favourably. It was passed for more exhaustive trials to be conducted under the auspices of that body. Through doubts as to the oxidation of the zinc being possible by the methods suggested, it was finally discarded.

These doubts having been dispelled and the reasons of incomplete oxidation having been proved, it is the wish of those responsible for these further trials of the process that it should be tried on a larger scale on one of the mines in the Witwatersrand, as it is quite certain that the enormous saving in costs to the mining industry which have been indicated will then be fully demonstrated.

THE "CASTOLIN"

Auto-Chemical Welding Process

REGISTERED

The "CASTOLIN" process is in use by the Admiralty War Office, Port of London Authority, Thames Conservancy, London County Council and in a large number of Constructional, Repairing and Industrial Works connected with Marine and Land Engineering.

ENGINEERING SECTION.

E. W. Tarry and Company, Limited.

MINING MACHINERY, IRON AND BRASS FOUNDERS, AND GENERAL ENGINEERS.
AUSTRAL IRON WORKS.

E. W. Tarry & Company, Limited, the well-known Rand engineering firm, have their workshop situated at the eastern end of Anderson Street, and have selling departments at 23, Simmonds Street, and 42, Joubert Street. The engineering works depend to a large extent upon the gold mines for the greater portion of their work, but also undertake engineering work for other industrial concerns such as cement works, acid works, and coaling plants. Innumerable pistons in cast iron as well as special aluminium alloy for motor cars have also been executed in these works. The firm's advancement has to a large extent gone hand in hand with the development of the gold mining industry, and at present to a certain extent feels the depression under which the latter industry is suffering. The conditions which have been brought about by the war forced industrial undertakings to rely to a greater

It has been cited by local engineers that orders for very big work come in so seldom that the installation of special machine tools to handle such big work is not worth the while. Occasionally such big work has been undertaken and executed to the credit of the engineering industry, and if such is possible in isolated cases, then more orders of that nature should be placed with the local engineering firms in order to enable them to stabilise that branch of their work and make the installation of the necessary big machinery a commercial success.

The engineering works of E. W. Tarry & Company, Ltd., are situated on a large block of ground, and housed in substantial brick, wood and iron buildings. All the essential departments of an engineering works of this

Tarry's Foundry (Eastern end).

extent upon local engineering firms for the manufacture and supplying of their needs, and the magnitude of the work locally executed has gradually increased. This state of affairs has definitely proved to the people of this country that our local engineering works are fully capable of supplying all their wants, and that there is very little justification in placing orders with overseas firms when the work can be executed in this country. The future prosperity of this country is largely dependant on its industries, and it is only with closer co-operation between these that more rapid strides towards that ideal can be achieved. It is thus hoped that, with the revival of the mining industry, our engineering firms will not only be looked upon to supply the needs of the already existing mines, but also be called upon to supply the whole plant, or as much of it as they are capable of producing, of any new industrial undertakings of the future.

Portion of Machine Shop (Western end).

description are included, and are made up of the following: Offices, Pattern Shop and Loft, Foundry, Smith Shop, Machine Shop and Boiler Shop.

Offices.

A noteworthy feature in connection with the offices is the complete record which has been kept of all patterns and work executed in the works. Such records date as far as twenty years back, and supply all details concerned with its making. In connection with these records a very useful compilation—known as "List of Patterns of Spur, Mitre, Bevel and Helical Gearing Wheels"—has been made up by the management. The book has been circulated amongst the mines, and contains all the detail necessary in specifying any required gearing wheels. For instance, if a mine requires a gear wheel of some description, the one suiting their requirements is locked up in the book, where details such as diameter of pitch circle, pitch, etc., are given, as well as an index number. All that is necessary then is that the figures

stated in the book be sent to the works, and from them all the details concerned in the production of the last article of that description can be obtained in a very short space of time. The pattern last used in that case can also be obtained at a few minutes' notice by consulting the index numbers, and the work can be executed with a minimum of delay.

Pattern Shop.

The pattern shop is an indispensable department where pattern work of any description is done. Here the shape of the finished article is wrought in wood and other suitable materials, and very great care has to be executed in its making. Any fault in the pattern is reproduced in the finished casting, and in order to save unnecessary expenditure all work here has to be done with utmost care.

was melted in two cupola furnaces, and when molten, was run into two ladles. These, when full, were conveyed by means of an overhead travelling crane to the mould, and pouring conducted from two sides. The finished casting is allowed to remain in the mould for 48 hours in order to cool and contract properly.

The pig iron used in making castings consists of Scotch, Australian, Bengal, as well as local pig. The supply of moulding sand available is not too satisfactory, and could be better. Suitable sands can be obtained from the coast, but the cost of transportation on the railways prohibits their use, and local foundries have to make the best of the supply available here.

Winding Drums for Modder Deep (40 tons each), constructed by Tarry's.

All patterns made in this shop are given an index number and name, and these are carefully filed in the office. When the work required of them has been cast they are stored in the pattern loft, where they remain till further use is required of them. A visit to the pattern loft displayed thousands of patterns, which had been used as far back as twenty years ago, and were ready for use should occasion arise.

Foundry.

In the foundry castings in cast iron weighing up to 11 tons have been executed. At the time of visiting, a casting weighing about 9 tons was in progress, and formed part of a winding drum for the State Mines. The actual casting had taken six men seven days to produce. The cast iron used

Casting work in lead, brass, and special aluminium alloy is also conducted at these works. With regard to lead castings, it is interesting to note that the oleum (sulphuric acid) plant at the dynamite factory was made in these works. In this connection work in lead totalling 120 tons in weight was made, of which the largest casting weighed 6 tons. A large number of motor car pistons are cast in this foundry in both cast iron and special aluminium alloy, the latter being an alloy of aluminium with smaller amounts of copper, nickel, and magnesium.

The smith shop is equipped with both a heavy and light steam hammer, and the furnaces are all coke fired. The machine and boiler shops adjoin the smith shop, and the former is fitted with all the necessary machine tools to meet

requirements. Lathes, both large and small, planers, shapers, milling machines, and bevel wheel-cutting machines are all to be found. Work in rawhide is also conducted, and a large stock of rawhide pinion blanks are in stock. The boiler shop contains shearing, punching and bending machines, as well as a pneumatic rivetting and other tools. Work recently conducted in this shop consists of large single and double-deck cages for the West Springs Mines.

Mcrtar Boxes for Robinson Deep, turned out by Tarry's.

The magnitude of some of the work done by this engineering firm is specially noteworthy. This clearly demonstrates that local engineering firms are capable of producing and completing large jobs. The photographs reproduced herewith fully bear out this statement. The electrical winches for the Delagoa Bay coaling plant rank among some of the achievements of E. W. Tarry & Co., Ltd.

Built at Tarry's—16 ft. diameter Pit Head Sheave.

Lowmoor Iron.

**MESSRS. SAMUEL OSBORN (S.A.) LTD.,
SOUTH AFRICAN AGENTS.**

Messrs. Samuel Osborne (S.A.), Ltd., the well-known Sheffield steel and hardware manufacturers (represented in South Africa by Mr. W. Raeburn Snow, of Cott's Buildings, Johannesburg), have been appointed agents in South Africa and surrounding territories for the sale of the world-famed Lowmoor iron. Engineers and mining men are well acquainted with Lowmoor iron, which claims to be "the best iron in the world." Lowmoor iron is used for all important work where life and limb depend on it, and this iron has upheld this high reputation without interruption since 1790—a long stretch in the industrial life even of the Old Country—when it was first manufactured at the world-known Lowmoor Works, near Bradford. A special ore and coal is the basis of this iron, both of which can only be obtained from the company's own mines. In this connection it is interesting to note that both the coal and ore requisite for the manufacture of Lowmoor iron are found on the estate on which the company's works are situated. The discovery of the iron ore was not made until years after the coal seam manifested itself. It will doubtless interest users of the metal to know that it is made by a special process, whereby the metal is all times under perfect control, and samples are taken during the process which afford accurate information regarding the degree to which the phosphorus, sulphur and other impurities have been eliminated. The resulting metal is then puddled and converted into wrought iron. Afterwards it is piled, heated, and hammered and rolled into faggots, approximately two inches square, which, in turn, are piled and cross-piled, heated three times, and hammered after each heat; finally becoming a bloom for the rolling mill, when it is rolled into the necessary sections required. Lowmoor iron, as supplied in the finished section, is as pure as it is mechanically possible for it to be, as will be seen from the approximate final analysis.

C.	Si.	S.	P.	Mn.
.06/.08	.08/.1	.008/.010	.07/.1	Trace.

It should be mentioned that a little time since Messrs. Robert Heath and Co., Ltd., absorbed the Lowmoor Company, Ltd., and the joint title of the firm now is Messrs. Robert Heath and Low Moor, Ltd. As before mentioned, the sole South African agents of the new firm are Messrs. Samuel Osborn (S.A.), Ltd., whose headquarters in this country are Cott's Buildings, Johannesburg.

The Glencoe-Maritzburg Electrification

SOME DETAILS OF THE FIRST STEP IN THE ELECTRIFICATION OF THE SOUTH AFRICAN RAILWAYS.

In view of the decision of the Railway Board to make a start with the electrification of the S.A.R.—as announced exclusively by us in a recent issue—we print the following further extracts from Messrs. Merz and McLellan's now historic report dealing with the electrification of the Glencoe-Durban section of the line. The announcement in our last issue that the Glencoe-Maritzburg section would be the first to be dealt with has been confirmed during the week by the Pretoria correspondent of a daily contemporary. The decision of the Railway Board is generally welcomed as wise and far-seeing, and as proof of confidence in the industrial future of the country. To Sir William Hoy in particular credit is due for his powerful advocacy of the scheme.

With electric working we should not propose to increase the number of trains, but to add four more coaches, in order to provide the necessary additional accommodation. On the other hand, we have assumed that with steam working the number of trains would have to be increased by not more than 35 per cent. to provide for the 50 per cent. increase in traffic anticipated. The local trains between Maritzburg and Merrivale would continue as at present. It is proposed to institute a new suburban service between Durban Marian Hill on the Cato Ridge-Clairwood deviation, and the costs of working this have been included in the comparative estimates of working expenses.

Shunting.

A large amount of shunting by special engines is carried on at present at Durban, The Point, and The Bluff. With the completion of the new marshalling yard at Booth Junction the bulk of this work will be transferred to this place. There is also a considerable amount of shunting at Glencoe, Ladysmith and Maritzburg. At the two last-mentioned places the amount of work to be done would be much reduced by the adoption of electric working, but not entirely eliminated.

Rolling Stock.

For dealing with the through goods traffic between Glencoe and Booth Junction we estimate that 41 double-unit locomotives would be required; for banking between Ladysmith and Estecurt 8 single-unit locomotives would be sufficient, and 7 double-unit engines for banking on the Nottingham Road-Merrivale section. For the goods traffic between Booth Junction and Durban, The Point and The Bluff, 4 single-unit locomotives would be needed, and for the pick-up trains between Booth Junction and Ladysmith 8 single-unit engines.

On account of speed restrictions due to curves and the comparative short distances between stations, we are of opinion that there would be very little advantage in providing engines of the express passenger type, as recommended for Division 1, for dealing with the passenger traffic in this section. It would be simpler and better in many ways to use single or double-unit goods engines according to the weight of train to be hauled. We estimate that even with these comparatively slow speed locomotives the time of travelling from Durban to Glencoe could be reduced from about 14½ hours to about 11½ hours. The interchangeability of all locomotives employed on the section (with the exception of special shunting engines) is also a considerable advantage. For working the main line passenger service 10 double-unit locomotives would be required, and for the local and

suburban passenger service 5 single-unit engines. The total amount of shunting to be worked is 1,550,000 engine miles per annum. We estimate that 54 special shunting engines would be sufficient for this, of the same design as those recommended for use at Capetown. Of this number, 42 would be stationed at Booth Junction, 1 at Maritzburg, 5 at Ladysmith, and 3 at Glencoe.

The total number of new electric engines would therefore be 137. The number of existing steam engines allocated to the service at present is 218, of various classes. Of this number six would be released by the elimination of banking on the new Cedara-Nottingham Road section on the completion of the new deviation between these points, leaving 212 to be released on account of electrification. For the additional traffic a considerable number of new steam locomotives would be required, and we are advised that these would consist of 49 of the 12th class, 6 of the 14th class, and 4 of the 16th class. The saving in new wagons due to the acceleration of service would be very considerable. We estimate that this would amount to approximately 423 40-ton wagons or the equivalent. Similarly a saving of 93 40-ton wagons would result from the reduction in fuel consumption.

The principal engine shed for this section would be situated most advantageously at or near to Booth Junction. Goods train engines would run from there to Glencoe and back with a short interval at Glencoe for examination and adjustment if necessary. Passenger train engines would also be stationed at Booth Junction, but would pick up their trains at Durban. Running sheds would be necessary at Maritzburg and Ladysmith for the accommodation of banking and shunting engines, and at Glencoe for inspection of the main line train engines. We have made provision in our estimates for the erection of a completely new shed at Booth Junction and for alterations to the existing sheds at Maritzburg, Ladysmith and Glencoe to make them suitable for the reception of the electric locomotives.

Power Supply.

The proposed arrangements for power supply for this section have already been fully dealt with. Sub-stations in which high tension alternating current would be transformed to direct current at about 3,000 volts for distribution to the trains would be situated at fairly regular intervals along the line. In view of the large amount of work to be done at Booth Junction, we consider it advisable to erect one of the sub-stations at this point. This would supply power for the lines to Durban and the Bluff, as well as that going towards Maritzburg. At Maritzburg, Ladysmith and Glencoe, the main line is joined by branch lines, which may at some later date be electrified. We recommend, therefore, that a sub-station be erected at each of these places. Others would be provided at suitable intervals between these points.

Estimates.

The cost of line equipment would amount to £779,700 and of sub-stations to £660,000. The expenditure on electric locomotives would be £1,302,000, but this is offset by the credit for steam locomotives and new wagons, there being a small credit balance of £163,050. The estimated cost of the track alteration, *i.e.*, the Cedara-Nottingham deviation and the doubling of the track between Estecurt and Ladysmith, is £751,137, which is included in the general estimate as a credit item. The net capital outlay, including contingencies and engineering expenses and other small items, is £952,713.

Details of the annual working expenses with steam and electric working are given, from which it is seen that the total cost for steam is £835,550, which, compared with £451,140 for electric working, leaves a balance in favour of electrification of £384,110, representing a return of 10.3 per cent. on the net capital outlay.

S.A.R. Electrification Costs.

COMPARATIVE PRICES—COPPER FLUCTUATIONS—ROLLING STOCK THE CHIEF ITEM.

In the course of their report on the electrification of the South African Railways—with which a beginning is now being made—Messrs. Merz and McLellan write:—

In working out the estimates in detail, it has been necessary to consider what price basis to adopt. At the present moment it is impossible to foresee what current prices are likely to be at the time when contracts may be placed for the generating plant, locomotives and other material requisite for carrying out the electrification of any section. Towards the end of 1918 prices which had been steadily going up during the whole period of the war had reached a level approximately 100 per cent. above the pre-war level, the cost of some materials having risen rather more than this and of others less. In the future it is reasonable to anticipate that prices will sooner or later go down again; but it may be taken for granted that they will not in the immediate future, if ever, return to the general pre-war level. After careful consideration we have thought it best to work out all the estimates on the basis of an all-round increase of 50 per cent. on pre-war prices, except where the cost of any work depends to a large extent on the price of copper, such as that of the distribution system. Prior to the war, the basis price of electrolytic copper was in the neighbourhood of £60 to £70 per ton. During the war the basis price was for some time above £130 per ton. For the purpose of our estimates we have assumed that drawn copper wire suitable for transmission and distribution lines would be purchased at the rate of £120 per ton, including delivery to South Africa. This rate would correspond to a basis price for electrolytic copper of about £90 to £95 per ton depending on freight charges and other factors.

Copper Prices.

In considering the estimates it will be useful to be able to calculate how far the cost of the distribution system will be modified by reason of any variation in the price of copper from the assumed value of £120 per ton delivered. We have, therefore, inserted a figure which shows the tonnage of copper required for the distribution of that section.

Locomotives and Wagons.

For the prices of new and existing steam locomotives and wagons we have assumed the same ratio of increase above pre-war values, viz., 50 per cent. New locomotives are charged for at 50 per cent. above the pre-war contract prices for each class, including the cost of transport to South Africa and of re-erection in the railway workshops. The credit for existing locomotives is calculated on their present book value (*i.e.*, original cost less depreciation) plus 50 per cent. In most of the sections considered there would be a large number of engines released. At the present stage it is difficult to form any close estimate of this credit, as individual locomotives are sometimes transferred from one division to another, and frequently work for only part of their time on any particular section. We have thought it advisable, therefore, to assume a uniform figure for the depreciation of all engines displaced, and we have taken this at 50 per cent. Thus the credit for a locomotive costing originally £6,000 has been taken as £3,000, plus 50 per cent., *i.e.*, £4,500. The cost of new wagons will depend to a certain extent on the type of wagon purchased. We understand that the large majority will be high capacity coal wagons suitable for a load of about 80,000 lbs. From particulars and prices supplied to us by the Chief Mechanical Engineer it would seem that an average figure for modern wagons used in South Africa was before the war about £9 per gross ton (tare plus load). We have, therefore, based our estimates on an average price of £13 10s. independent of the type of wagon selected.

The principal item in the gross outlay is the cost of rolling stock, and, further, the net outlay on rolling stock

after deducting the credit on account of steam engines and wagons is very small. As both the gross outlay and the credit for rolling stock are affected to an equal extent by the assumed increase above pre-war prices, it is clear that so far as the principal item of new material is concerned the exact ratio of increase assumed is comparatively unimportant.

Comparative Estimates of Working Expenses.

In order to arrive at the estimates of saving in working expenses to be expected as the result of electrification, it is necessary to take into account only those items of expenditure which are affected by the change of system. The costs for each section are given, and are dealt with under the following heads, some of which apply to steam working, some to electric working and others to both:—

- Coal for locomotives.
- Water for locomotives.
- Electrical energy.
- Wages of drivers, firemen and guards.
- Running shed expenses.
- Lighting and heating charges.
- Repairs of locomotives.
- Depreciation of locomotives.
- Depreciation, maintenance and working expenses of sub-stations.
- Maintenance of track equipment.
- Shunting.

The costs for steam working have been calculated throughout on the basis of figures supplied to us by the Expenditure Office in Johannesburg, modified in certain sections to allow for alterations in the working of the traffic, *e.g.*, by the completion of new deviations now in course of construction. These modifications are referred to in detail in the sections dealing with the traffic arrangements in each division.

Electrical Energy.

The power required for electric locomotives and trains is calculated in detail for each section from the amount of traffic—goods, passenger and shunting—to be dealt with in accordance with the figures supplied to us. The annual train mileage of each class of traffic is shown, and the average weight of trains is given separately. Due allowance is made in all cases for the gradients and curves, the direction of movement of the loaded traffic, and the possibility of reducing energy consumption by regeneration

A New Type of Secondary Crusher.

A CONTRIBUTION TO THE "NEW METALLURGY" BY A SPECIAL TECHNICAL CORRESPONDENT.

For years past engineers, mine managers, and contractors have felt the want of an economic secondary crusher. Many attempts have been made by investors to evolve a secondary crusher on the lines already in existence, and utilised in primary crushers of to-day. But with the exception of the various patterns of rolls, the results have been disappointing to all. These are some of the chief reasons why success has not been attained in the past.

No. 1. In a jaw crusher, and even in a gyratory crusher, as used to-day to crush materials to, say, 2in. to 1½in. mesh, a swinging movement is imparted to one of the crushing surfaces and as long as this movement is of sufficient magnitude, a certain amount of impact is imparted into the moving member. The more of this force we have to deal with in any crusher the more efficient the crusher becomes. In other words, the sharper the "impact" the better the results. For this reason it is, that if we close up any type of jaw crusher, until it will deliver, say, a product of 1in. mesh maximum, the impact is lost, and the whole operation becomes one of crushing by "sheer force" and this is expensive both in power required as well as wear and tear per ton of material crushed.

One of the results of the above experience has been the introduction of rolls for secondary crushing, and rolls if properly designed as secondary crushers certainly save a considerable amount of power per ton crushed, yet the saving has not been sufficient to displace the gravity stamp, for the simple reason that the gravity stamp, with all its drawbacks, makes use of the impact. And the value of this impact has been sufficiently great to deal with all the materials subjected to crushing from, say, 2in. mesh down until it pushed the rolls out on account of higher efficiency. This then proved that the gravity stamp stood supreme as the most efficient all-round apparatus for secondary and final reduction of the ores, until finally the rival in the shape of the tube mill challenged the position held by the gravity stamp in being able to make the final reduction of the ores more economically. This was at once taken advantage of, in the following manner: coarser screens were put on the mortar boxes, and thus the tube mill established itself as the supreme finisher of the process. This then puts the gravity stamp into the position of simply an intermediary or secondary crusher.

The Factor of Impact.

If we analyse the position it will be found that impact is the chief factor again. The finer the screens on the mortar boxes the less the impact becomes of the stamp, for the reason that some of the already partly crushed materials act as a cushion for this impact, thus reducing effective results in a 10 stamp mill running at 92 drops, there would be 920 impacts per minute. Now look at the tube mill of standard size, say, 5ft. 6in. and 22ft. 6in., running at, say, 30 revolutions per minute with sufficient pebbles of, say, 3in. to 1in. mesh; a simple calculation will show that there are at least 14,000 to 16,000 effective impacts per minute. And this is the chief factor of success with the tube mill. Each individual impact does its quota of work as regularly as the power is put in to rotate the mass, and thus provide fresh surfaces for it to act upon. The proof of this is if a tube mill is run at too low a speed until the impact is lost, the output at once becomes reduced to such an extent that the tube mill under these conditions would never have become a competitor with the gravity stamp. Allowing that this argument so far is correct, it naturally follows that the more force there is exerted at the point of impact the greater the results, always provided that this force is in harmony with existing conditions.

In the tube mills of to-day quite a good percentage of pebbles are allowed to work out at the end of discharge. These pebbles vary in size from about 1½in. to 2in. mesh, and are to-day taken back to the gravity stamp for further

reduction, and then put back into the tube mill for final reduction. If they were put back in the tube mill again before crushing the results would be that in the end they would accumulate in the mill until there would be no room for the largest pebbles to form any impact. And the impact made by these small pebbles is not sufficient to do any crushing, owing to their light weight. Hence abrasion would be the only reducing agent, and that is too slow and too costly in power. For this reason I maintain that it is not good practice to feed a tube mill with too coarse a material; there would be too large a percentage of spent pebbles. The power factor would at once increase, and the output be reduced. Based on the above conclusions gained during a long and varied experience, the ideal reduction plant would be as follows:—

Primary crushers from 1½in. to 2in.

Secondary crushers from ½in. to sand.

Tube mill sand to slimes.

Having delegated the gravity stamp to a secondary crusher only, it becomes a costly and inefficient apparatus. And it is my firm conviction, that in the future it will be replaced by a more economical and efficient apparatus, which will utilise the value of impact in the full sense.

To Replace the Gravity Stamp?

Such a machine is already in existence and is now being tried out. I have great hopes that in the end it will replace the gravity stamp entirely. For smaller propositions it certainly has a great field as it is. It may be described as a horizontal steam stamp requiring no foundations or other preparation. A boiler being available, it is just coupled up to the steam pipe and all is ready. Two hammer pistons, floating in a perfectly lubricated cylinder, deliver a blow at each end of the stroke, thus making the crusher double ended and duplex in action.

Each blow is transmitted through a dolly on to a pitman. The material to be crushed is fed in between the movable pitman and a fixed anvil block at the end. Here the material is crushed by the sharp impact of the blow delivered by the floating piston. Both crushing faces are placed in a vertical position so that as soon as the material is crushed it falls down, and out, while more material takes its place ready for the next blow from the pistons. Thus there is a constant flow of material through the crusher. By arranging the anvil blocks to suit the products required, any size product can be obtained. Thus for contractors dealing with concrete work the machine supplies a long felt want, as it will deliver both sand and aggregate in any ratio desired. Another feature in connection with this machine is that it is universal in its application. For asbestos it has been found excellent for cobbing the smaller seams. For tin ores it will also be excellent. It can be used wet or dry as occasion demands, is simple, inexpensive and portable, and there is a large field for its use.

At present the number of blows delivered by the piston equals 230 of crushing face, and as there are 4 faces the total number of impacts is 230 x 4, or 920 per minute—just the same as a 10 stamp mill. While the area of crushing surface in a 10 stamp mill would be approximately 600 square inches, the crushing area of this crusher is at present approximately 120 square inches. (This will be increased to approximately 200 square inches in our next crusher.) The output of this crusher approximates a 5 stamp mill, which all tends to show that the impact is again proving its superiority.

ANSWERS TO CORRESPONDENTS.

"HOME."—Nos. 1 to 5 are, we believe, valueless, and three, at any rate, of these companies are in liquidation. We have never before heard of No. 6 Whitehill Estate and G.M. Co. and have no knowledge of the Canadian Coal Co.

The World's Largest Electric Steel Furnaces.

In view of the installation of electric steel furnaces on the Rand, the following description of electric furnaces, which represent a ten-fold increase in capacity over the first commercial furnace of the sort operated in the States, will be read with interest.

To France we all accord the honour of being the birth-place of the modern electric steel refining furnace, chiefly through the work of Dr. P. L. T. Heroult, but the United States is in a position fully as well established in electric furnace development and application.

The tapping of the first heats from the two 40-ton Heroult steel refining furnaces at the U.S. naval ordnance plant, South Charleston, W. Va., on February 2, 1921, marked a considerable step forward in the electrometallurgy of steel and iron, and consequently is of great interest and value, not only to the electrical engineer, chemist and metallurgist, but, in this specific case, to those concerned in the manufacture and application of ordnance and armour.

In the early days of electric steel furnace development there were conflicting opinions respecting the relative merits of arc and resistance heating, and this difference of opinion continues to the present time. The arc furnace, however, steadily demonstrated its superiority for general work and soon out-distanced the induction furnace in number and output. This relationship may be changed in the future for special applications, as the 2-ton furnace recently completed a run of 555 heats on one lining at the Pittsfield Works of the General Electric Company. This is an exceptional performance, specially when we consider that each heat consisted in melting high silicon steel scrap on a magnesite lining; but as the desired results could not be obtained in any other way, it was necessary to follow this apparently incongruous practice. Assuming that the same results could be obtained with the arc furnace, the lining cost of induction furnace is considerably below the single item of electrode cost in the arc furnace while the figures for power consumption are comparable.

The first commercial electric furnace in the United States for melting and refining steel was a single-phase, 4-ton, 2-electrode equipment installed at the Halcomb Steel Company, Syracuse, N.Y., from which the first heat was tapped on April 5, 1906. Other important installations of the Heroult furnace in the United States were:—

Location.	Capacity.	Date when heat was tapped.
Halcomb Steel Co.	4 tons	April 5, 1906.
Illinois Steel Co.	15 tons	May 10, 1909.
Carnegie Steel Co.	25 tons	November 17, 1916.
U.S. Naval Ordnance Plant	40 tons	February 2, 1921.

The Halcomb furnace was supplied with power from a 60-cycle, single-phase, General Electric generator driven by a reciprocating steam engine. After approximately eleven years of operation, the generating equipment was replaced by a 500-kv.a. transformer taking power from an 11,000-volt, 25-cycle circuit. Later on this transformer was replaced by a 900 kv.a transformer, the increase in power being in line with developments up to the period referred to.

The original Thury regulator, after a long period of successful operation succumbed to the wear inevitable in a steel plant and was replaced by a General Electric electrode regulator in which the voltage and current were both used to control the electrodes. It is interesting to note that Siemens used an automatic regulator in his experiments of 1880, recognising at that early date the necessity of eliminating the human element in controlling the power and allowing the operator the fullest benefit of this source of heat in his metallurgical operations. Even with this splendid example of foresight, there still exist those who believe there are some objections against automatic control,

such as higher cost, but the superiority of the automatic control is graphically illustrated by a wattmeter record of two furnaces of the same design making the same product, the upper curve showing the good results of the automatic control while the lower shows the bad results of hand control.

Several electric steel furnaces have been built and operated at the Schenectady Works, and extensive research has been conducted in the development of satisfactory control equipment, transformers, switches, cables, etc. This research has placed the Company's engineers well in advance of commercial electric steel furnace practice and they were well prepared to specify and design the electrical equipment for the two 40-ton Heroult furnaces at the South Charleston naval ordnance plant when the order for this equipment was received.

These furnaces are operated in conjunction with two 75-ton basic open hearth furnaces using natural gas of 950/1000 B.t.u., and after dephosphorising the molten steel is transferred to the electric furnace to be desulphurised, deoxidised, and brought to the final temperature.

Due to using a considerable quantity of scrap from the electric furnaces, the molten steel coming from the open hearth furnaces occasionally goes as low as 0.009 per cent. phosphorous and 0.008 per cent. sulphur. The phosphorous content is not changed by the electric furnace but the sulphur content on rare occasions is reduced to 0.006 per cent. The steel is tapped from the electric furnace at a temperature of 1650 deg. C., and is then poured from the ladle into the ingot molds through a 2-in. nozzle. It is of interest to note that the metal losses, including slag losses, handling metal, etc., in the open hearth furnace are 8 per cent. to 12 per cent., while in the electric furnace they are $\frac{1}{2}$ to $1\frac{1}{2}$ per cent. Both open hearth furnaces are being operated with basic linings at the present time, but on account of the purity of the scrap from the electric furnace product it is possible that one of the open hearth furnaces will be operated with an acid lining, in which case final treatment in the electric furnace may not be necessary for part of the product.

The metallurgical results are justifying the selection of the electric furnace for this important task, the quality exceeding all expectations.

Each furnace is normally rated at 40 tons holding capacity, each charge being handled separately so as to keep the metal as clean as possible, and large ingots will be formed from two ladles through two runners. One of the furnaces is fitted with 24-in. carbon electrodes and the other with 14-in. graphite electrodes, thus giving current densities of 46.8 and 137.5 amperes per square inch respectively, with the transformer at its maximum output of 21,200 amperes per phase. On the basis of 2500 kv.a., giving 13,130 amperes per phase, the heat generated in a 100-in. length of electrode is respectively 21.5 kw. and 28.3 kw., amounting to 1 per cent. and $1\frac{1}{3}$ per cent. of the total input respectively on the basis of 85 per cent. power-factor—a small amount but contributing to the total useful heat in the furnace.

The electrical equipment for each furnace consists of one transformer, one switch and instrument panel, one electrode regulator panel, one operator's panel and three electrode motors and a tilting motor.

Each transformer is of the 3-phase water-cooled oil insulated type, supplying 17,300 amperes per phase, with 110 volts between phases, or a total of 3,300 kv.a., the high voltage winding being designed for operation from a 6600-volt, 3-phase circuit. Taps are provided in the high voltage windings so that full input can be obtained at 100 or 90 volts as desired, the last connection giving 21,200 amperes per phase. Although not the largest 3-phase transformer built by the General Electric Company for electric furnace work, it is unusually well adapted for this particular furnace installation.

For transformers of such large current capacity the efficiency of 98.2 per cent. is still high enough to indicate a very careful electrical design.

Each switchboard consists of a switching and instrument panel, an automatic regulator panel and an operator's panel. On the instrument panel are mounted three ammeters, one voltmeter, one indicating and one curve-drawing wattmeter, one watt-hour meter, and one power-factor indicator, together with various relays and switches for controlling the solenoid operated 15,000-volt., 500-ampere oil switches.

The automatic electrode regulator is so well known as not to require description; and the same is true of the operator's panel.

The tilting motors are of 35-h.p. capacity at 725 r.p.m. and take power from a 230-volt direct-current circuit. They are provided with drum controllers for reversing and with solenoid brake.

The electrode motors, whose important duty it is to control the movement of the electrodes in response to the action of the electrode regulator, are designed to deliver 5 h.p. at 1,150 r.p.m. when taking power from a 230-volt direct-current circuit. They are totally enclosed and provided with self-lubricating bearings.

All the electrical equipment used with these furnaces is practically standard and it is a comparatively simple matter to increase the capacity when circumstances decide that such action is necessary. It is not difficult to picture installations in the immediate future containing units of double or treble this capacity, perhaps having six or more electrodes and becoming more and more effective against its only real competitor, the open hearth furnace.

Some Advantages of Oil when used as a Fuel in Boilers and Engines.

Speaking at a meeting of the S.A. Institute of Engineers the other day Prof. Dobson stated that one of the results of the Great War was the unexpected and extraordinary development and activity in the use of oil for power production. Then followed the spur of the coal strike in Great Britain, and for several months ordinary coal supplies for the industries of the country were entirely stopped and the lack of fuel exercised such a strangle-hold on industry that great concerns all over Great Britain were forced to take up the question of the use of oil for the production of power.

Oil Superseding Coal.

In many instances oil fuel was rapidly and permanently superseding coal. The relative cost of coal and oil is the

principal factor which decides the financial and economical aspect of the use of one or the other for steam-raising. Owing to the higher wages and stores paid in coal mining now as compared with pre-War conditions, and owing to the higher calorific value of oil and the greater efficiency of combustion obtainable, and the other numerous advantages, such as certainty of composition, easy storage, greater saving in labour for stoking, cleaning and handling, and the great flexibility and no standby losses and the absence of smoke and ashes, oil fuel can show financial and economical advantages over coal when oil costs twice or even three times as much as coal.

Advantages to Railways.

In railway working, in addition to the principal advantages already referred to, there is the great advantage that full steam pressure can be attained much more rapidly than with coal, and there is entire absence of smoke; and what is more important in many parts of the world is the elimination of plantation and other fires caused by coal-fired locomotives.

It is generally recognised that the only way to obtain the maximum value from liquid fuel is by applying it directly to the cylinders of the Diesel type. Its economic use in this respect is, of course, primarily limited by the relative cost of oil fuel as compared with coal. The advantages will be appreciated when it is remembered that no boiler-house is required, and in the case of ships, as well as on land, the supply arrangements are very simple and cheap, requiring a minimum of handling and storage charges as compared with the coal and the resulting ashes in any steam scheme.

The Diesel Type.

The Diesel engine operates on the slow combustion principle. There are numerous types of Diesel engines as made by the army of manufacturers now devoting their skill and experience to this class of prime mover.

Under existing conditions in South Africa there is no possibility of oil being used as fuel for steam raising in lieu of coal. It is within the range of possibility, however, that the future regular lines of mail ships, etc., plying between England and South Africa may be fitted out with Diesel engines, replacing steam.

Possibilities in South Africa.

A good case can be made out for the use of Diesel or semi-Diesel engines in all South African coastal craft, such as tugs, pilot boats, trawlers, dredgers, launches, etc., and also where plant is required at or near the coast for anything up to 3,000 or 4,000 horse power.

The semi-Diesel engine is also proving of great value to various small municipalities of South Africa relatively near the coast, and particularly in parts of Cape Colony where coal is expensive. Overall capital expenditure on semi-Diesel engine plants is much smaller than for either steam or gas producer plants.

THE CRISIS IN THE MINING INDUSTRY.

The industrial situation on the Witwatersrand is still under a cloud at the moment of writing. It may undergo a material change before these lines appear in print, but the position at present is that all the mine workers on the Crown Mines have been called out on strike in sympathy with the men involved in the Walthew case at No. 5 shaft, and, moreover, it seems not altogether improbable that the trouble will not be confined to the Crown Mines alone, but may extend to the Reef generally. And so whilst we are faced with the prospect of curtailment of operations

at other mines on account of high working costs and poor labouring efficiency, whilst the pitiable plight of Kimberley stares us in the face and teaches, or should teach every one of us, that when the mines in the vicinity of a town which is in reality nothing more than a glorified mining camp cease or curtail operations, that town and its inhabitants and survivors suddenly come face to face with poverty, whilst Sir Lionel Phillips and Professor Lawn are uttering grave warnings as to the sombre outlook for the Rand and the whole country unless there is a large and immediate improvement in the industrial position, whilst all this is in progress the extremists of the Labour Party are threatening a general dislocation of the industry. It is clear from what Mr. Hendrikz said of the members of the S.A. Industrial Federation who waited upon the Transvaal Chamber of Mines, and from the more dignified reply of the Federation to the criticisms of Mr. Hendrikz, that there is a serious split in the ranks of labour. Not only is this evident on the Witwatersrand; it has also been evident at Durban and in other portions of the Union—and altogether it seems clear that there is a large body of labour secessionists desirous of breaking away from the existing Unions and the policy of unending industrial strife to which these Unions seem to be wedded. The fact that there are still moderate minded men in the Union Executives is of course a satisfactory feature. But this is more than counterbalanced by the presence of a large number of extremists in the Union and by the regrettable fact that some of these extremists, who were dismissed by their Unions because of the part played by them in the senseless strike at the Consolidated Langlaagte in the earlier months of the current year, are now apparently locked upon as the leaders of organised labour. It is at any rate clear that these extremists have secured a large, if not a representative, following, and it is too equally obvious that so long as the policy preached by these demagogues falls upon credulous ears, there can be no spirit of co-operation amongst the mine workers of the Witwatersrand, no real industrial peace, and no honest or sustained effort to pull the mines out of the mire into which they have sunk largely on account of unwarranted concessions granted to the workers in the past.

The Crown Mines strike is merely symptomatic of the spirit of unrest which is abroad on the Reef to-day, and has indeed been abroad ever since the first serious labour troubles of fourteen years ago.

Having failed to bring off a big anarchical coup in 1913 and again in 1914, the policy pursued by labour agitators on the Rand during recent years has been to indulge in a series of pinpricks aimed one day at the East Rand, another day at one of the Central Mines, and another day at the West Rand, and always behind the localised strike is the threat of a general insurrection of workers from Randfontein to Springs. If the Crown Mines strike is settled to-morrow, it is a moral certainty that before the month is ended there will be further trouble at another mine. The Rand is becoming exhausted by this never-ceasing unrest. The whole community is tired of it. As Professor Lawn said at the Johannesburg meeting, we shall not surmount our difficulties by crying Peace, Peace, when there is no peace, but only by recognising the position and facing it frankly. It has come to this then. The present position of the industry is both intolerable and impossible. A complete change of front is required. If the workers choose to quarrel with their own bread and butter, and to listen to the harangues of the agitators (which are denounced as rash by the Labour Federation of the country), well, then, it is best that the mines should at once, in the language of Professor Lawn, recognise the position and face it frankly. Moreover, it seems to us that the unsettled dispute at the Crown Mines and the threats of an extension of that strike give the Chamber a very good opportunity for endeavouring to set our industrial house in order, once and for all, by means of far more drastic remedies than have as yet been attempted to reduce the cost of working, to have freedom from unnecessary Trades Union restrictions, to improve efficiency, and to dispense with the services of a large number of costly inefficient and mischief-makers.

THE JOHNNIES MEETING.

The annual meeting of the "Johnnies" Company, otherwise the Johannesburg Consolidated Investment Co., is always rightly regarded as one of the principal Board Room events of the year in Johannesburg. For the J.C.I. ranks with Rand Mines, Ltd., and other controlling companies with headquarters in South Africa, as one of the principal industrial concerns of the country, and the remarks made by the chairman of Johnnies always merit attention and command interest. At this year's gathering Professor Lawn presided, and spoke very much to the point on the dependence of the gold mines on the premium, the intolerable pin-pricking policy of labour, and the necessity that exists for reducing working costs and improving the efficiency of labour on the Reef. Professor Lawn very rightly declared that it is in respect of white labour that there is the greatest room for a reduction of the cost of working our mines. This view would seem to be in conflict with the expression of opinion voiced by the Prime Minister at the recent Mining Conference; but it is nevertheless the more accurate one.

Professor Lawn did not mince matters. He declared that there are more white workers employed on the mines than are necessary, and he reiterated what this journal has urged for months past when he said:—"The constant and unending agitation and hunt for grievances, the constant harassing of the mine managers and other officials, the frequent sectional strikes, are all evidences of the position. There is great talk of co-operation and mutual bargaining, but it has mostly been one-sided. It has been a case of concession after concession on the part of the mines until the position has become well nigh impossible, and is only sustained at all by virtue of the gold premium. It is quite clear that a large number of white men must always be employed—both in skilled work and in supervision—but every unnecessary white man means a high wage and increased costs in native wages and stores. Indeed, it would be much cheaper for the industry to support these men in idleness at the coast than to keep them on the mines. In spite of a situation bristling with difficulties, I have every faith in the common sense of those interested in the industry, both directly and indirectly, and believe that the difficulties will be surmounted; but it will not be by crying peace, peace, when there is no peace, but by recognising the position and facing it frankly."

With these words we most heartily agree. The time for concessions on the part of the Chamber has long since ended. We are exceedingly glad to have this plain and straightforward statements from the joint managing director of one of the largest mining corporations in the country on this point, and we sincerely trust that the Chamber will be encouraged to resist all future demands that may be imposed upon the industry, and if necessary to fight to the bitter end for the salvation of the mines.

Professor Lawn reviewed the operations of the subsidiary companies at considerable length, and dealt with the plight considerable length, and dealt with the plight of the diamond industry and also with the slump in the coal trade. With regard to the gold mine subsidiaries of the group, Professor Lawn said of the Consolidated Langlaagte Mines, Ltd., that for the year ending December 31, 1920, the mine made a profit of £166,585. With the exception of the month of February, when a strike occurred on this mine, the profits have been maintained. Development has been more encouraging lately. As to Government Areas, the profit for this mine last year was £1,697,973. Although the monthly profit has been fluctuating on account of the gold premium, the tonnage milled has been maintained, and for the last four months the plant has been working to full capacity. The sinking of the circular ventilating shaft has been decided upon, and its cost will amount to £125,000. Development continues to be satisfactory and values are well maintained. The profit of the Langlaagte Estate and Gold Mining Co. for 1920 was £148,867. During February and March of this year profits were not satisfactory on account of the strike, but by July improvement had taken place and a 5 per cent. dividend was declared. Development continues to be satisfactory, and on the whole the position of the mine is encouraging. The 1920 working profit at Randfontein

Central was £158,100. Considerable improvement has been shown during the current year, but the full effect of the reorganisation has not yet been felt. The delayed delivery of the new electric hoist for the south shaft has held up operations. Two new inclined shafts are being sunk to open up the battery reef. The work of sinking the two shafts of New State Areas was completed before the end of 1920. Careful consideration is being given to the question of ventilation. The main connecting drive is expected to be complete by March next. On the whole the results of development have been very satisfactory and give every promise of a profitable mine being opened up. The success of the experiments at Springs Mines on the elimination of the stamp mill and all sliming has led to a decision that this process will be adopted at New States. It is hoped that a considerable saving in capital expenditure will be affected. A reduction plant is being designed with a capacity of 50,000 tons per month.

With regard to the coal interests of the group, Professor Lawn said that the hopes that were entertained with regard to the coal trade have not altogether been realised. England has again entered the world market, and acute competition prevails. South African coal trade is handicapped by high railway rates and working costs. The three Transvaal collieries of the company are now working at a small profit, which will be considerably augmented when the output can be increased. The Natal Cambrian Collieries, Ltd., has a well-equipped colliery developed and capable of producing a considerable tonnage per month; but here again the difficulty is to find a steady outlet for the production.

Professor Lawn's address was listened to by a large and attentive audience. It was a plain and unvarnished account of the company's operations during the financial year, and a telling denunciation of the crippling methods adopted by labour in South Africa. For this latter reason, at least, we commend the remarks of the chairman of Johnnies to the public generally, and particularly to the men employed by this great gold industry, which has now reached a critical stage—perhaps the most critical stage—in its history.

THE HANDLING OF RAND LABOUR.

The mine manager of the present day Rand has, as we remarked in our last issue, exceedingly little time to devote to the purely technical aspects of his job. The greater part of his work nowadays has to be devoted to the settlement of industrial disputes, the averting of strikes, attendance at Boards of Reference, and the thousand and one other problems of industrial sociology inseparable from a world "made safe for democracy," which in other words means a planet despoiled by the despotism of trade unions.

As time goes by and the world progresses or retrogresses, it becomes more and more evident that the handling of men is a most important—perhaps the most important—function of a manager of a mine, a foundry, a shipbuilding works, a cement factory, or in fact any other branch of industry. And this is particularly true of the Rand. This fact was fully recognised by the Transvaal Chamber of Mines when the Executive of that body appointed Mr. H. O. Buekle to the important position of paid and full time President of the Chamber. Mr. Buekle is not a mining man. But he has had a vast and valuable experience of that cantankerous branch of the *genus homo* which is known as the Rand mine worker. The urgency of the human element problem of the industry has, too, been further recognised by the appointment of an official styled the Labour Adviser to the Chamber of Mines. This leads us on to the point we wish to make here. And that point is simply this: that it would well be worth while for each mine—each large mine at any rate—to have a senior official whose sole duties would be concerned with the keeping of industrial peace amongst the white employees. We are not quite sure as to the type of man required for this position. Presumably he should be a tactful, pleasant mannered, bilingual person, preferably with a sense of humour. Perhaps the type of man represented by a former Bishop of a Rhodesian See, who combined the properties of a good, kind and gentle Churchman with an expert knowledge of how to use his fists, would appeal to the Reef. We are not quite sure on

this point. But we do believe that the suggestion here thrown out is worthy of some consideration. On every large mine to-day there is a controller of natives underground. And we think that an official acting in a similar capacity in respect of white labour would constitute a most valuable adjunct to the management and would allow of the technical men attending more to their technique than they can at present do. In so far as white labour is concerned, such an official would not, of course, be styled a controller. He would rather be a mediator and peace-maker, whose express purpose in life would be to smooth away difficulties as between the management and the men and as between various departments of service on the mine. A really tactful man filling such an office might have prevented the present deplorable strike on the Crown Mines. For the Crown Mines *impasse*, like many other industrial disputes, had its beginnings in a situation which might easily have been controlled by a little diplomatic handling at the start. It has now grown to a very serious business indeed, and the only satisfactory feature of the strike is that the Chamber of Mines appears to be taking up a firm attitude in the matter.

Notes & News.

Mine Benefit Societies.

At a meeting held last week the question of amalgamation of mine benefit societies, which has long been hanging fire, was discussed, and a decision of far-reaching importance arrived at. A full report on the whole question of amalgamation of mine benefit societies was laid before the meeting, which showed that the position is now a critical one. The committee have been unable to obtain the necessary 60 per cent. of acquiescence by members stipulated for by the Chamber of Mines as one of the conditions in its offer of support to the amalgamated societies if the scheme goes through. So far only 55 per cent. of the members of the societies have expressed themselves as in favour of the scheme. The lowness of this percentage was partly due to the objection of the executive council of the South African Mine Workers' Union, conveyed through its shop stewards, to the representation of the employers on the central executive body of the proposed amalgamated society. The executive at that time issued an instruction to its members not to take any part in the ballot, which was held to determine whether amalgamation should be put through on the basis of the draft constitution or not. The constitution committee subsequently interviewed a sub-committee of the executive of the Mine Workers' Union and asked for a conference with their executive council, but the reply was received that no good purpose would be served by holding such a conference, as the council had resolved that it could recommend no scheme of amalgamation in which the employers were represented on the managing body. It is believed by those interested in the scheme that had it not been for the attitude of the Mine Workers' Union it would have gone through by a big majority. It is further pointed out that owing to the representations made from time to time by the Mine Workers' Union, the proposed representation of the Chamber of Mines on the managing body has been reduced from four down to one. Thus the control of the amalgamated benefit societies would practically be vested in the members on the same basis as is the case with the societies at present.

Consolidated Goldfields' Finances.

In its annual report for the year ended June 30 the Consolidated Goldfields of South Africa, Ltd., state that in the absence of a dividend on the holding in New Consolidated Goldfields, Limited, the total income for the year amounts to £3,608 6s. 5d., to which must be added the balance brought forward from last year, namely, £162,635 12s. 3d., a total of £166,243 18s. 8d. Against this has been charged dividends on the first and second Preference shares totalling £108,901 6s. 5d., leaving £57,342 12s. 3d. to be carried to the credit of the current year's profit and loss account.

New Consolidated Goldfields, Limited, announce that the realised profit on the operations for the year ending 30th June, 1921, is mainly derived from dividends received on investments, and after deducting all outgoings shows a balance to credit of £371,451 12s., from which South African and French Government taxes have been provided, leaving £360,515 1s. 4d. To this balance has been added the sum of £20,528 6s. 2d. brought forward from last year, showing a credit balance of £381,043 7s. 6d. Against these profits have been charged a depreciation of £92,286 17s. 9d. in order to reduce holdings to market prices in the case of quoted securities or to their estimated value in the case of unquoted securities, leaving a debit balance of £111,213 10s. 3d. to be carried forward to the ensuing year. The directors regret that the position, which is entirely caused by the severe fall in values during the year, necessitating the writing off of the amount referred to above, precludes the payment of a dividend. The company's investments show on current market prices and on an estimate of unquoted investments a large unrealised profit. Investments stand in the books at average cost or under, and are taken into account at prices at or below those current at the date when the accounts were made up. The annual general meeting of shareholders has been fixed for Thursday, the 1st December.

Mr. D. C. Greig and the Gold Premium.

In the course of the discussion that followed the chairman's speech at the annual meeting of the New Modder the other day, Mr. D. C. Greig remarked: "The decline in the gold premium will affect this company, though not to the same extent as other companies. We saw in the Press to-day a reference to the Conference, which has recently been sitting in Pretoria. This brings forward in a very prominent way the fact that the return to the gold standard is a practical question now before the Government and before the country, and I wish to point out that if adopted it would mean the abolition of the premium. Of course, theoretically, as you know, this ought to be offset by the cost of our imports, and by a consequent reduction in working costs. On the other hand, by placing ourselves in a position with regard to exchange similar to that ruling between New York and London, we would turn from a position of comparative stability to one of instability which would affect all our exports, including gold. I think it is quite fair to recognise that there would be an increase of unemployment in this country which would be offset by a decrease of unemployment in Great Britain. That is probably from an Imperial point of view, a first-class thing; but I think it is our duty here to look after our own interests. The Chamber of Mines, which always looks after our interests, should see that nothing is done hastily or without proper consideration, and that all people should recognise what the results of such a change would be, so that they may be able to face them, knowing the facts. I would strongly insist that those who advocate the return to the gold standard should state explicitly in pounds, shillings and pence, the advantages of that change. The disadvantages are perfectly clear, but the advantages are never explicitly stated by the advocates of the gold standard."

* * *

Rapid Development.

What is believed to be a record in rapid development has been accomplished by the Durban Navigation Collieries Ltd., of Dannhauser, Natal. A distance of over 600 feet has been driven in a developing drive in a month of 26 working days, which represents an average of over 28 feet per day. This has been done at the company's No. 2 pit, which is under the management of Mr. J. C. Ferguson.

DAVIS-MADE MEANS HIGHEST GRADE.

HERE IS THE DAVIS - BIRAM ANEMOMETER.

It is constructed on the principle of the revolving fan, and offers several advantages over its predecessors. The air enters, as usual, from the back of the instrument, and instead of passing in a straight line through the protecting ring, is deflected outwards by a cone through port-holes. The friction of the air passing through the instrument to the outer air is practically nil. So constructed, it is possible to bring the instrument in front of the operator, and experiments have proved that, if held 18in. from the body, there is no hindrance to the free current of air, and that the accuracy of the readings is not interfered with. Thus, what was previously considered impossible has been achieved. The Davis-Biram Anemometer has several other distinct advantages which place it ahead of all others. May we send you full particulars?

The Shale and Coal Oil Industry.

SOME NOTES ON ITS EARLY HISTORY AND DEVELOPMENT A SUBJECT OF GREAT IMPORTANCE TO SOUTH AFRICA.

We are indebted to Messrs. A. F. Craig & Co., Ltd., Caledonia Engine Works, Paisley, for the following interesting notes on the early history of the shale and coal oil industry. In sending us these notes, Messrs. Craig & Co. write:—

"You have published several informative articles on the shale oil industry, indicating that there is wide interest therein, and, in particular, that the working of the Natal shales is under consideration. We have reason to believe that in some districts the local conditions there are more favourable than those with which the Scottish industry is surrounded. For instance, the shale is more easily mined, and the residue after treatment more easily disposed of. The oil contents are greater. Imported oil is handicapped by freight charges and import duty. The Natal shale can be treated successfully by the Pumpherton retort, differing in this respect from shales which have physical and chemical characteristics making their treatment in any existing type of retort difficult or even impracticable. One unfavourable condition may be the absence of a market for ammonia. In your issue of 11th June, 1921, Mr. J. E. Mills Davies described very fully the modern plant and methods of the Pumpherton Oil Company in Scotland; and it has occurred to us that this might be usefully supplemented by a brief outline of the early history of this industry and the coal oil industry from which it grew. Our excuse for presuming to offer you the following notes on that subject is that we have had close connection with the shale industry since 1880, when we erected the first retorts for the Clippens Oil Co. This connection has been maintained ever since. We have furnished plant to all the Scottish shale oil companies which have operated during that period and also to foreign companies. In all we have supplied, and in many cases erected complete, including the brickwork, over 100 benches of oil shale retorts, and a large amount of oil refining and wax extracting and refining plant, including recent developments in these lines."

In 1681 a patent was obtained by Becher & Searle for making pitch and tar from coal. In 1694 Edele Hancock & Portlock made "pitch tar and oil out of a kind of stone from Shropshire," England. In 1761 oils for medicinal purposes were distilled from black bituminous shales. In 1781 the Earl of Dundonald distilled oil from coal. About 1812 it was known that an oil resembling turpentine, and also varnishes, could be distilled from coal tar. In 1815, near Sunderland, England, Featherstone produced "petroleum" and ammonia from coal. In 1830 Laurent distilled paraffin from bituminous shale, and in 1833 suggested working the Autun shale in Saône-et Loire, France. Soliguet took the hint, manufactured products from this shale, and obtained patents for the manufacture of paraffin. He made considerable progress before 1845, and even manufactured ammonium-sulphate. The shale oil industry is still carried on in France, but has not developed to anything like the extent of the Scottish industry. About 1851 paraffin oil was produced from shale in Germany.

Scottish Oil Industry.

Probably the first extraction of oil from shale in Scotland was as described in the *Glasgow Weekly Herald* of 18th November, 1865. A coal miner, Douglas, was attracted by the appearance of some samples of shale known as "Sealy Blaes." He filled a clay pipe with small pieces, covered the charge with moist clay, and placed the bowl in a fire. He soon had, issuing from the stem, first gas, and then a dropping black fluid which he suspected might contain paraffin. He could not verify this himself, and, preferring to keep his secret, his experimental success was not followed by practical working.

The commercial use of Scottish shale for producing oil came about as a sequel to the use of various grades of coal for that purpose. The pioneer in this industry was Mr. James Young, of Kelly, in Renfrewshire, who, beginning his

working life as a carpenter, studied chemistry in the evenings, became an assistant professor and demonstrator, and then held positions of responsibility in chemical works. About 1843 his attention was directed to oil oozing from fissures in sandstone in a colliery at Alfreton, in Derbyshire. He leased the oil-bearing section of the colliery, and with the assistance of a former fellow student, Meldrum, produced from the crude oil of the colliery in 1848 a light oil for lamps and a heavy oil for lubricating.

Young took out a patent (No. 13,292 of 1850) "for obtaining paraffin oil, or an oil containing paraffin, and paraffin, from bituminous coals." Extensive use was made of his processes in the United States, and by some companies organised in England also, until the competition of the natural petroleum from wells made the business unprofitable. His supply of colliery oil was exhausted in 1851. He had anticipated this and set himself to imitate artificially the natural process which he believed had produced the oil, namely, subterranean heat acting on coal. He made a series of experiments, and in 1850 obtained oil from cannel coal. Then his attention was directed to "Boghead" coal, also known as "Torbanehill Mineral," and he got from it as much as 120 to 130 gallons of oil per ton of coal. He continued his experiments and found a number of coals from Fifeshire that gave good results. Works were erected at Bathgate and began to produce oil in 1851.

Some of the paraffin separated out automatically in the process, and this was burned as fuel or as waste. The remainder was left in the oil as sold. By 1854 the extraction of the paraffin by artificial cooling was begun and it was stored up against the time when a satisfactory process for refining it should make it saleable. John Galletly, chemist, devised a practicable method in 1858, and in the following year the paraffin was on the market. In 1851 oil was being produced in small works at Crofthead, but in 1852 the Bathgate works alone were operating in Scotland. In 1853 the Clydesdale Chemical Co. started at Cambuslang. They carried on for about nine years and then had to give up because they infringed Young's patents. They dealt first with "Parrot" coal, and later with "Boghead" coal.

It is reported that Robert Bell, while searching for coal at Broxburn in 1859, found large shale beds, and erected experimental retorts which led to the systematic manufacture of mineral oil from shale in 1862. This constitutes the virtual beginning of the Scottish shale oil industry on a practical commercial basis.

Meanwhile Young, aware that the "Boghead" coal was nearing exhaustion, was seeking a substitute, and settled on the Addiewell shales which he found had a larger percentage of burning oil than the other available shales. He completed his Addiewell works about the end of 1865. His friend, Dr. Livingstone, the missionary and explorer, laid the corner stone of these works.

After 1860 many new companies were organised, no fewer than 38 in the year 1864 alone, when Young's patent expired. About this time the importation of kerosene from the United States began to affect the Scottish oil industry adversely by forcing prices down, and a fierce struggle for survival followed. In 1866 the well-known Young's Paraffin Light and Mineral Oil Co. was formed with a large capital to take over Young's business while retaining his services.

In the first 45 years of the industry in Scotland, at least 117 coal or shale oil works were started. Most of them had a short life. There remain to-day about six companies, all controlled by Scottish Oil, Ltd., closely associated with the Anglo-Persian Oil Co. These companies have been able to continue through most trying times by persistent effort to improve and control their processes so as to obtain their products in such proportion as would yield the best financial results in the prevailing market conditions. Sulphate of ammonia and paraffin became of prime importance and oil came to be considered almost a by-product.

In the distillation of shale a suitable type of retort is essential. This apparatus has to be designed to distil the oil vapours at a temperature of about 900 deg. Fahr. and also to further subject the shale to a temperature of about 1,300 deg. Fahr. to recover the ammonia. The modern retort has been evolved as the result of a long series of experiments by trial and error. It has enabled the Scottish oil industry to persist through many and severe trials, although the shale yields only from 20 to 30 gallons of oil per ton and is subject to the competition of foreign oils derived from natural wells and imported duty free.

The order of development of the retorts was roughly as follows:—

(1) Horizontal retorts in a great variety of shapes and sizes. At Bathgate Young began with "D" shaped horizontal retorts as used in gas works, each fitted with a slowly revolving longitudinal screw. The coal was fed into a hopper at the front end and discharged when spent into a water trough at the back end.

(2) About 1853 Young erected at Bathgate a group of three cast iron vertical retorts, circular in cross section, 18 inches in diameter and about 11 inches high. They were enclosed in a common furnace and had separate hoppers at the top, and their bottom ends projected into a water trough. Very much better results were got from these than from the horizontal retorts, but there was trouble from the coal clogging in the retort and having to be freed and forced down by the use of long iron bars from the top.

(3) The next step was to make the retorts tapered with the large end down. Each was fitted with a central screw revolving very slowly. This was a great advance and was used for about eight years. An additional screw apparatus for removing the spent shale from the bottom was tried but abandoned because of the high cost of upkeep.

(4) Next A. C. Kirk devised a retort with flat sides and rounded ends and with a very pronounced taper the long way of the ellipse. This gave a large heating surface in proportion to the amount of material contained and a reduced thickness of material through which the heat had to penetrate. The taper was intended to prevent clogging and the feeding screw was dispensed with. A larger amount of oil of higher quality was obtained and less fuel was required. The superiority of the vertical over the horizontal form was established.

(5) About 1860 it was found that the introduction of superheated steam near the bottom of the vertical retort increased the oil product nearly 50 per cent. The steam was practically useless in horizontal retorts, merely passing over the surface of the contents.

(6) The McBeath retort was intended to economise fuel by deriving the heat for distillation from carbon in the spent shale, but it had defects which prevented its adoption.

(7) The Henderson retort employed as fuel both the carbon in the spent shale and also the incondensable gas from the distillation. There were four retorts in each group. They were flat sided with rounded ends like Kirk's retort. Provision was made for easy charging and discharging. A saving of about one-third of the labour and half of the fuel was effected. The oil vapours were drawn downwards through the shale on their way to the condensers, and a larger amount of finished products was obtained except ammonia which was much less.

(8) Bielby's retorts had cast iron upper parts jointed to fire clay lower parts. To these again cast iron bottom parts were jointed with their lower ends dipping into a water trough. They were circular in plan. Variations of temperatures caused cracks in the fire-clay portions, furnace gases leaked into the retorts and caused explosions. The retorts were not economical of labour and not commercially successful. They went out of use in 1883.

(9) William Young got out a retort very similar to Bielby's, but of cast iron throughout. The lower part quickly burned out. It was never used except experimentally.

(10) William Young and Bielby in collaboration in 1882 brought out retorts, sometimes called the "Pentland." They were an advance on all previous designs.

These retorts were circular in plan, in groups of four, connected to one distilling chamber at the top. The upper parts were cast iron jointed at their lower ends to lower parts built up of fire brick. The firing arrangements were such that ammonia was recovered from the coal fuel as well as from the shale, which was a new gain. A later method was to build these retorts entirely of brick, 24 in. diameter at the top and 36 in. at the bottom, and 50 ft. high from the ground to the top. Results were satisfactory and the cost of running lower than with the Henderson. The production of crude oil was slightly less than with the Henderson, but of ammonia nearly four times as much. This retort came into extensive use.

A modification of this retort was adopted at Philipstoun by James Ross & Co. and was known as the "Crichton" or "Philipstoun" retort. The principal difference was in the method of removing the spent shale at the bottom of the retort. The refuse was drawn by hand-operated shafts passing through the bottom hopper equipped with suitable scrapers. This was not economical in working and did not command extensive use.

There have been developed from all these various designs three modern types of retort which have been commercially successful. These are the Pumpherton, the Henderson, and the Young & Fyfe. They all have cast iron upper parts and fire brick lower parts and are of much greater size than the earlier retorts, standing as much as 60 ft. from the ground to the top of the hoppers.

The Young & Fyfe is a modified Young & Bielby. Mechanical means are provided at the top for poking the shale downwards to prevent clogging, and at the bottom for regulating the discharge of the spent shale. The modern Henderson retorts have flat sides and rounded ends. The spent shale is removed at the bottom by slowly revolving spiked rollers. The Pumpherton, also known as the Bryson, the joint design of Messrs. Bryson, Jones & Fraser, is extensively used. It has a very simple effective device for withdrawing spent shale, which keeps the whole mass of shale moving slowly, and minimises clogging and wear and tear. Under the bottom of each retort there is a circular iron table which supports the charge of shale. Through this table a vertical shaft projects carrying a steel arm immediately above the table. The shaft is slowly revolved by ratchet gearing causing the arm to sweep out the spent shale at a rate which is under complete control. The shale escapes around the circumference of the table between it and the brick work of the retort, and falls into a closed hopper. From there this refuse is emptied at intervals into dump wagons to be transported to the spent shale "bings."

It may be of interest to add that the recovery of ammonia from the water drained from the condensers originated in an accidental way. Up to 1865 this water had been run as waste into streams. Mr. Robert Bell, of Broxburn, having come under the censure of a River Pollution Commission, turned the effluent on to a field. It was soon noticed that the growth of grass in this field was very vigorous. Investigation showed that the water contained ammonia—a fine fertiliser. Mr. Bell began to manufacture sulphate of ammonia and had it on the market in May, 1865, a very opportune time to assist in the competition with imported oil.

PAUKWAB TINS LIMITED.—WANTED.

A good practical man, with experience of Tin Mining and Recovery (alluvial and reef), as Mine Manager for the Company's property at Okombahe, District of Omaruru, Protectorate of South West Africa.

Write, giving full particulars of experience, testimonials, age and salary required, to—

THE SECRETARY,
C/o East London Board of Executors
and Trust Co., Ltd.,
P.O. Box 254, East London.

RHODESIAN SECTION.

The Goldfields Rhodesian Development Coy's Year.

The report of the Goldfields Rhodesian Development Co., Ltd., to May 31 last states that realised net profit on year's operations amounts to £114,064; adding balance brought in, £111,906, and deducting interim dividend of 6d. per share paid May 20 last, amounting to £62,855, and Rhodesian income-tax, £1,267, there remains available £161,908. Directors recommend cash dividend of 6d. per share, less tax, making 1s. per share, equal to 10 per cent. for year, leaving £99,052 to be carried forward.

In accordance with terms of arrangement made in 1916, Lord Harris and Messrs. H. G. Latilla and H. C. Porter are resigning, but are eligible, and offer themselves for nomination as directors. The Consolidated Goldfields of South Africa, Ltd., will give effect to the nominations as expressed by the votes of the shareholders in general meeting. Attention of shareholders is drawn to resolutions which will be submitted with the object of bringing the company's articles of association into accord with the practice of the last few years, respecting the election of directors by shareholders, and extending the engagement of the Consolidated Goldfields of South Africa, Ltd., as managers of the company.

A list of the company's principal investments as at May 31 last shows: Asp Gold Mining, 75,214 shares; British South Africa Co., 50,000 shares; *British Central Africa Co. (8 per cent. debentures), £12,000; De Beers Consolidated Mines (50s. shares), 1,500 shares; *Falcon Mines, 52,198 shares; *Falcon Mines (6 per cent. debentures), £78,092; Planet-Arcurus Gold Mines, 274,755 shares; Rhodesia Gold Mining and Investment Co., 15,044 shares; *Rhodesian and General Asbestos Corporation, 124,000 shares; Rhodesian King Asbestos Co. (10s. shares), 51,110 shares; *Shanva Mines, 301,211 shares; Standard Arsenic (South Africa), 9,000 shares. Except where otherwise stated, the above shares are £1 each, fully paid. Those marked * are dividend or interest-paying.

The general manager, after a lengthy review of the period, says: "In conclusion, the company may, I think, congratulate itself on the results attained in a year which has presented so many difficulties. Fortunately, the losses attendant on the industrial troubles of February and March last, and the increased working costs on the different mines, were to some extent offset by the premium on gold, and it is to be hoped this will continue. As regards fresh business, though

our engineers have lost no opportunity of inspecting properties which seemed to hold out good prospects, nothing sufficiently attractive was put before us during the past year. In a country so highly mineralised as this is, one can reasonably look for fresh discoveries of value during the next year or two on other than 'old workings'—which have been the source of practically all the mines in operation to-day and since the inception of the mining industry—or the satisfactory opening up of claims now only in the early prospecting stage; and your company will, no doubt, be able to acquire interests in any such discoveries, should they be of a sufficiently promising nature. A considerable number of farms have been taken up during the year by new settlers, and though there is little demand for land to-day, owing to the prevailing depression, your farm holdings may be looked upon as increasingly valuable assets, while on your Kenilworth Estate you have the nucleus of a really promising herd of beef producers. As for the country generally, the outlook for the next twelve months does not appear to be as hopeful as usual, with falling metal prices, the severe slump in the grain, as well as beef markets, the general slackness of trade, and the difficulty of securing capital for promising enterprises. Rhodesia has, however, successfully emerged from such periods of depression in the past, and no doubt an era of prosperity will again set in once industrial conditions at home and throughout the world become normal, and capital is again available. We have at times had differences of opinion with the railway company and the Government over various matters; but they, like ourselves, have many difficulties to contend with, and I have always found both ready to listen sympathetically to our troubles, and help as far as they could, and for their frequent assistance I would desire to express my appreciation."

The consulting engineers' report concludes as follows: "Although the cost of stores and labour has mainly continued upwards, the mines we manage have yielded profits during the year, with the exception of the Falcon. Expenditure on the Slate-Arcurus is severe, owing largely to coal, but this item is now being slightly reduced. It is, however, a property where costs are likely always to range high, unless railway rates fall materially. Stores and labour have now, we think, reached their highest mark, and should in the future tend to fall."

A New Asbestos Find.

IMPORTANT DISCOVERY IN MASHABA DISTRICT.

A correspondent of the *Bulawayo Chronicle* writes from Mashaba as follows:—Considerable interest is being shown in the location of a very large strike of asbestos in this district. Mr. G. Epstein, of Shabani, spent a considerable amount of time in examination of the field, and he reports that he has defined a practically unbroken strike of six miles, commencing in the Olga claims, and continuing on to and through the Sapiaenia extensions. At the Olga work has been done to a depth of 35 feet and at that level a crosscut has proved the width to be 80 feet, with several very fine two inch seams exposed. At the Sapiaenia work has been done to a depth of 70 feet, at which depth water was struck, but the fine asbestos is still going down; a crosscut of some 150 feet on this property shows over 50 seams of marketable fibre, of which a very large proportion is half-inch and over.

The fibre is of exceptionally fine quality. The section of the strike which has created the present excitement is the central portion which is held by Mr. E. Francis, of King's Mine fame. This section has shown extraordinary fibre, several three-inch seams close to the surface being visible, while a great number of one-inch seams are in evidence, and the fibre is of the same high quality which characterises the whole strike. Mr. Francis was the original pegger of the King's and he confidently expects to repeat his luck. The whole strike has been pegged by various interests and work is proceeding apace. Prospectors are still busy in the locality, and further discoveries are expected. Some of the fibre recovered has been put through the mill at the Eva Mine, and experts declare the product to be a very superior fibre.

The "Joburg" No 1

—another Climax Success

THE JOBURG 1 is a sturdy little Hand Hammer Drill for Wet or Dry Drilling and is constructed to get the most work out of low pressure. Fitted with Spool Type Valve. Weight, 43 lbs. Can be mounted on cradle for driving.

The Week in the Sharemarket.

DULL AND RESTRICTED—AWAITING LABOUR DEVELOPMENTS—NEW UNION LOAN.

Labour troubles have overshadowed the market during the week and greatly restricted business. The warnings issued by Sir Lionel Phillips and by Professor Lawn have been the chief topics of conversation, and it is recognised that they may do much to clear the air. The next few days may have momentous issue for the Rand, and, naturally, there is little disposition to deal in shares till the outlook clears. The "Johnnies" meeting drew a large audience of bankers, brokers and mining men, and the chairman's remarks on the position of the gold, diamond and coal industries were carefully noted and greatly appreciated. It would seem that the coal trade is, like the diamond industry, passing through a time of severe trial, and the prospects of an early improvement are none too bright. Diamond shares are, of course, very much out of fashion, and De Beers are back again at a low level, the Preference shares having fallen below £10. Transvaal Silvers have been a feature of the week, registering a considerable improvement on the excellent development returns. The ex-enemy share settlement has not affected the prices of the stocks chiefly concerned, as it is recognised that the financing of the purchases has yet to be arranged. Among industrials S.A. Alkalis and Pretoria Portland Cements fell away during the week, and there does not seem to be much support in the market for anything, at however tempting levels. Among debenture issues, to which more attention has recently been given, it may be noted that Consolidated Diamonds are quoted at £105; East Rand Props., £85; Modder East, £86; Randfontein Estates, £80; and Rand Water Board, £95—all buyers. The only features of the market on Thursday were a steadiness in gold stocks and a pronounced weakness in diamonds, due doubtless to the depressing news from the diamond fields. A satisfactory feature of the week was the issue of a Union six million loan at 9½%, bearing interest at 6 per cent. The loan will be used to take up maturing Treasury notes and other short-dated bills. The week's quotations are as follows:—

Boarding Houses in Kimberley Fifty Years Ago.

FURTHER RECOLLECTIONS BY W. P. TAYLOR.

We put up a small canvas home. It was all canvas tacked on to wood. There were many of them: some were shops, other diamond offices. Ours was our home. The floor was gravel. At night we unrolled our blankets and caught fleas. Fleas! At first we searched for them, afterwards they were welcome. They invaded us with the determination of aliens. We could not put the law against them, and they became our bed-fellows. The boarding-houses were mostly great military marquee tents. Their owners came from Kingwilliamstown, and they all claimed to be 1820 settlers. We had tried the "Pig and Whistle" and "Blue Posts," but both were expensive and distant, and so we settled down to the Tidmarsh tent. Pa Tidmarsh was really a cobbler on the loose. There were about six Tidmarshes, from Miss Tidmarsh to Baby Tidmarsh, and the *deus ex machina*, who worked the whole thing and whom you hardly ever saw—poor Ma Tidmarsh. I saw you slaying; the sight shocked my poor little system. It was not enough that you should have borne and brought up that horde of Tidmarshes, but how you survived some thirty boarders on top of them and grubbed 17 hours daily in that fearful improvisation of loose sheets of iron called a kitchen, I never could understand; but nobly, and without complaint, you did it. Miss Tidmarsh and the two smaller sisters waited. Pa Tidmarsh, with all the importance of his class, was owner, and sometimes waited. Miss Tidmarsh spoke of society and balls, and Pa Tidmarsh of "larst night at the club." Sometimes his appearance confirmed his statement. I think it was the second appearance of Ma Tidmarsh that decided us to leave. Poor Ma Tidmarsh, you were the most willing slave I ever saw. In heat and dust, and cold and wet, you kept those Tidmarshes clothed and respectable, and you fed your boarders. It was a one-sided bargain, and it struck my young heart as unfair. It wasn't cricket. Afterwards, seeing Pa Tidmarsh holding up a verandah post and imploring Heaven with black eye and loose neck gear, I sighed, for my heart beat hard for Ma Tidmarsh. Biddy came from King. Her husband had carried the stripes. Her home was in Tipperary, and, as the sodger boys sing, it was a long way off. Biddy's tent was full of sunshine, for sure, wasn't Biddy in it, and didn't she carry the sunshine everywhere? We were happy with Biddy. She nicknamed us: she called the dour, dark man St. Paul, and there were the Apostles, and then there was Johnny Cope, the butcher. It was a good thing Johnny Cope came, for Biddy never could have boarded those great eating miners and made her tent pay. Then she nursed the sick. The second son of a lord, who had the best of manners, burnt his tissues with Martell's brandy. Biddy made mending broths for his destroyed digestion, and when he died she sighed for the poor boy and found flowers to strew on his heavenly path. Johnny Cope came to the rescue and married Biddy.

Then there was the Bisset family. Maggie and George were sweethearts; they both came from dear old King. Maggie was a lovely Scotch lassie, and George a braw lad. Perhaps I should give as clear a picture of the Bisset *menage* as possible. Their boarding-house and bar was directly opposite our little canvas crib. Maggie was a perfect specimen of a Scotch lassie at her best. She had dark brown hair and lovely dark Scotch eyes; a litiesome figure, and came out in bright coloured print. She was just the vivid relief that all eyes sought in that gruesome sand and heat, and it was one of the first pictures of human romance and tragedy my little eyes fell upon. Any man would have been justified in singing "Annie Laurie" or "Tales of Araby" to Maggie, for she was a dear little embodiment of home brightness. George Benning, her lover, served at the same bar; he had a partnership in it. Fenwick, the young remittance man, would show Maggie his meerschaum pipe and get her to polish it with the soft side of a glove. Old Iving Watson would come and recite Bret Harte, and Nicholson

would sometimes drop in; then they would make him sing "Polly Perkins" or "The Girl that Served Behind the Railway Bar." The storekeeper of Knox's store sat opposite in the sunshine, smoked his briar and pulled up his great belt with a sigh, as he watched Maggie cleaning her glasses. Dan Hurley and Randall loitered over their whisky, and Mephistopheles, with red whiskers and fixed eyeglass, focussed Julius Pam, as he showed Maggie his parcel of rare white glassy stones. At first it was quite a clear, bright atmosphere, and as calm a picture on the surface as one of Maeterlinck's rural scenes painted on the banks of a river's placidity, with a background of oaks and elms and high-reaching poplars, the centre of the scene filled with hay-tossing lads and lassies, and flitting swallows skimming in God's heavens. Only Mephistopheles was here, and then there was that damned eyeglass. Richardson, the novelist, lets go at whiskers and waistcoats. I don't like the eyeglass; seen in the young it is flat and possible to peer through, but with age it becomes aggressive, and it positively looks through you. I don't like it in men, and less in women, and it upset Maggie and George. Maggie grew skittish, wore a brooch (not George's), a ring (not George's), and when it came to a bracelet, there was thunder. The intruder had a black eye as well as a glass one, and George went back to King. Maggie drooped. The stranger left, and we moved from Bisset's. Its later history was saddened by Maggie's death. Years afterwards I saw George Benning; he owned an hotel at Umata. When I asked him if he still remembered Maggie Bisset, he moved like a shot stag.

Ah, Peggy! There was a mess, as we called it in our later civilised moments. James Beningfield was the chairman, and sat at the head of the table. It was run on wonderful lines. We never saw the hostess. Peggy always brought notes and spoke to the chairman. You are curious to know about Peggy. Those wonderful old English prints of Morland's show you the old hostel and the maid. In any English country town she is still there, but time has robbed her, as it has everyone else, of old world characteristics; but the homeliness of the old country is allied with its domesticity, and the maid stands out first in our anticipations of reception. Alas, our Peggy was not as these; our Peggy was black—a smiling Zulu boy—and had a wooden leg, and we named him Peggy because he pegged along. Peggy was a find. Alone, he waited on twelve of us. No orders were given; Peggy knew everything. In all our days there was no complaint. Yes, there was, when Peggy got drunk. Peggy took off his leg and tried to brain a Kafir. Then his leg was taken from him and he became helpless.

There was Mrs. Barker's and then there was Playford. "Drawn on you for thirty pounds; coming up by transport wagon."—Louis. As I opened and read the telegram, my mind travelled over the names of all the girls I knew. It was serious; it was real; directed to me and signed by Louis. I was open about it. I showed the telegram to friends, and I got chaffed unmercifully, and so I waited developments. The draft arrived signed by Louis Playford. A year previously, in a billiard room at his father's house at Malden, I had playfully consented to look after him if his father died. Herbert Playford died, and Louis worked his way out on a tramp loaded with dynamite. He holds his two fingers up to-day and swears she was struck twice by lightning before she reached East London. There he deserted. George Farrar found him, and when he heard his name was Playford, George thought he had something at last to knock Charlie Cronin out of the sculls, but after Louis had smashed one or two outriggers he was booted, and came up country with my thirty pounds. An amusing thing occurred en route. The lad had promised his mother to make a Christmas pudding wherever he was, and think of her as he eat it. In his pocket book were all the instructions. He got suet

WILLIAMS' "VULCAN" DROP-FORGED HOIST HOOKS AND WIRE ROPE SOCKETS.

HOISTING service requires dependable apparatus—no makeshift appliances or parts should ever be tolerated.

Williams' product is all drop-forged—not cast or welded—from specially selected steel and, hence, is absolutely dependable. All "VULCAN" Hooks are heat-treated and each is proof-tested to 50% **beyond** its rated safe working load. Repeated tests show "VULCAN" Sockets are far stronger than the strongest wire rope each will accommodate.

Shank and Eye Hooks with safe working loads of $\frac{1}{2}$ to 25 tons. Open and Closed Sockets for $\frac{1}{4}$ to $1\frac{1}{2}$ inch wire rope. Booklet on request.

and raisins; no flour, so he took mealie meal; milk, orange rind, and lastly, six eggs. The pudding was mixed, the cloth to boil it in in readiness, and then he had to put in the eggs. He broke one. It went off like a motor back-fire, and he had to shift his seat up wind. He broke a second, and shifted his seat again. A third, another move, and then he prayed. Good youth, he had promised his mother. The last three eggs went into that pudding with closed eyes. To this day he does not know whether they were good or bad, and he eat his pudding. He was a simple soul and fond of rest. He would lie abed until within a few minutes of his time; then rush through his ablutions, throw on clothes, run to his breakfast, bolt his food, scamper to office, walking in just on time. We cured him of this by simply altering the clock once or twice. Our warnings about sleeping with open doors he scorned. One morning he was minus his one and only suit. At first he thought it great fun, but when he realised he really was without a rag, he begged for clothes. We took pity on him and lent him some black Sunday clothes. He looked perfect in his sorrow.

Verdite Mines.

Many of our readers will be interested to learn that a new gold-bearing lode has been discovered on this mine, and that a trial crushing during this month gave the most gratifying results. We understand that a syndicate in England has proposed to take over the sole right of selling and manufacturing this company's tale in Europe, and that the export of this mineral may shortly be resumed on a much larger scale than hitherto.

Mozambique Mineral Concessions.

The statutory meeting of the Mozambique Oil and Mineral Concessions, Ltd., was held on January 20 last, and, in April, the managing director, Capt. Lionel Cohen, D.S.O., M.C., left for the company's territory in Mozambique, Portuguese East Africa. Since his arrival he has been engaged on the company's business, and in organising various prospecting expeditions. He cabled news regarding six of these, describing the prospects as favourable and the country as very mineralised. A large deposit of bauxite was struck near Angoche, and also a lode of graphite—the latter 40 ft. wide and 1 mile long. There is rich tin at Pequerra, blanket reef at Guernea, and indications of oil at Larde. The prospects in regard to tin are exceptionally good. Some 74 miles north of Angoche, a tin lode is reported that "exceeds all previous discoveries in Africa." There is some uncertainty as to the concessions for oil, but this is not likely to interfere with the company's programme. The vendors have secured a most important oil concession in Angola, and contemplate forming a company with a capital of £1,000,000, £450,000 being reserved as working capital, and 150,000 fully-paid £1 shares will be transferred to Mozambique Oil and Mineral Concessions, Ltd. The most powerful international oil group in the world endeavoured to obtain this property when offered by tender, but, owing to the energy and the efforts of the vendors and the Portuguese director (Dr. Populin), that submitted by the English group carried the day. The directors speak enthusiastically of this property, to which it is evident that they attach the greatest importance. The board has been strengthened by the adhesion to it of Mr. Ernest Mansfield and Mr. Noel B. Davis.

Transvaal Silver.

Recent developments on the Dwarsfontein property of the Transvaal Silvers have been distinctly more favourable. In the third level east of No. 1 shaft the lode has been struck seven feet wide, giving good values. In the second level west of No. 1 shaft a good looking lode has been encountered with payable bands. In No. 2 shaft, where recent quarterly reports have shown disappointing results

The Blast Furnace at the Transvaal Silver Mines.

the third level west has got into a lode from 8 to 10 feet, also showing good values. It is, of course, most encouraging to find these good developments in depth, and also that the ore body at the third level is opening out into a wide, well-defined lode carrying good values. The desulphurising plant and first unit of the smelting plant are running smoothly and the concentration plant is rapidly nearing completion.

Letters to the Editor.

GENESIS OF THE DIAMOND.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—I regret your correspondent "Mystified" is unable to accept the photo published in your issue of the 13th inst. as evidence of the actual crystallisation of the diamond unless he can obtain accessory facts or "inside knowledge" acquired by me through prolonged investigation. He will realise how difficult it is to convey impression to the sceptical mind. Mayhap the photograph would lie to any who are unacquainted with its significance. The one reference I made to Kimberlite in my article was a quotation from the late Sir William Crookes: "Does not this fact point to the conclusion that the blue ground is not their true matrix?" I expressed no personal opinion. That the true matrix of the mine stone will be recognised I have no doubt. My considerations are confined to the discovery of the genesis of the diamond as pertaining to the alluvial gem. The string of questions "Mystified" has submitted are quite irrelevant to the point at issue. To prejudice interests preparatory to laboratory investigation is foreign to my purpose. There the facts will be sifted. I have sufficient confidence in the evidence I have collected to be sanguine of satisfactory results.—Yours, etc.,

JAMES ENNIS.

Johannesburg Consolidated Investment Company, Limited

(Incorporated in the Transvaal).

CAPITAL AUTHORISED — £4,500,000
CAPITAL ISSUED — — £3,950,900

REPORT OF THE DIRECTORS AND STATEMENT OF ACCOUNTS

FOR YEAR ENDED 30th JUNE, 1921.

REPORT OF THE DIRECTORS,

Submitted to the Shareholders at a Meeting held in the Board Room, Johannesburg Consolidated Investment Company, Ltd., Consolidated Building, Fox Street, Johannesburg, on Wednesday, the 23rd day of November, at 11 o'clock in the forenoon.

ACCOUNTS.

1. The Company's Balance Sheet and Profit and Loss Accounts for the financial year ended 30th June, 1921, are submitted herewith.

PROFITS.

2. After providing for depreciation, English and Colonial Income Tax, and other charges, the profit for the year, including £191,453 8s. 4d. brought forward, amounts to £579,411 13s. 8d.

DIVIDEND.

3. On the 23rd June the Directors declared a Dividend of 10 per cent., free of income tax, payable to Shareholders registered as at 30th June, 1921. This distribution (excluding provision for income tax) absorbs £395,000, leaving a balance of £184,411 13s. 8d. to be carried forward to next account.

VALUE OF SHAREHOLDINGS.

4. The Company's shareholdings have (where necessary) been written down to their market value as at 30th June.

FINANCIAL POSITION.

5. The financial position of the Company continues to be very satisfactory, and as opportunity occurs the Company's interests are being extended and developed.

MINING INTERESTS.

6. The usual reports issued by the various gold mines under the Company's control afford all necessary detail as to their position. The following general information may, however, be of interest to this Company's Shareholders:—

Government Gold Mining Areas (Modderfontein) Consolidated, Ltd.—This property continues to make excellent returns. The tonnage milled for 1920 amounted to 1,515,000 tons, which was an increase of 154,000 tons, and the number of fine ounces of gold recovered was 603,239, an increase of 33,857 fine ounces when compared with the previous year. In view of the Company's large ore reserves, amounting to over ten million tons, the policy of the Company is to maintain the ore reserves at this figure.

Van Ryn Deep, Limited.—The ore reserves are over three million tons of an average value of 9.7 dwts. over 72 inches, both tonnage and grade showing an improvement as compared with the previous year. The development of the Western section of the mine shows improvement.

Randfontein Central Gold Mining Company, Ltd.—The scheme for the reorganisation of this mine is now nearing completion, but progress has been retarded by strikes and other obstacles beyond the control of the management. It should be borne in mind that the work which required to be undertaken has been practically equivalent to the opening up of a new deep-level proposition at the bottom of the former workings. There is every reason to anticipate that substantial

benefits will shortly accrue from the reorganisation of this property.

The taking over of the Randfontein Deep, Ltd., property, referred to in last year's report, has been completed, and mining operations in this area have been carried on for the last twelve months. It is anticipated that ore from the Randfontein Deep section will be sent to the mill at an early date.

Randfontein Estates Gold Mining Company (Witwatersrand), Ltd.—In the Company's previous report reference was made to an action successfully brought by the Randfontein Estates Company against Sir Joseph B. Robinson, which resulted in the Randfontein Estates Company being awarded £215,000, plus interest at 6 per cent. as from February, 1907. In respect of this judgment a payment of £391,155 11s. 6d. on account has been made to the Randfontein Estates Company. The latter's solicitors have since been served with a notification that Sir Joseph B. Robinson has applied for permission to appeal to the Privy Council against this judgment.

New State Areas, Ltd.—The work of sinking the two shafts on this property is now completed, the South Shaft having been sunk to a final depth of 4,071 feet and the North Shaft to a final depth of 3,768 feet. The reef intersected by the South Shaft gave the extremely high average value of 89.8 dwts. over 18.9 inches. The reef intersected by the North Shaft was found to be faulted and disturbed by numerous quartz intrusions, and therefore no reliable assay value has yet been possible. Development is rapidly proceeding, and there is every reason to anticipate that the New State Areas will prove a most valuable property.

WORKING COSTS.

7. It has for some time been obvious that existing circumstances no longer justified a continuance of the high scale of wages paid to the miners in South Africa. It is therefore satisfactory to report that an amicable arrangement has been concluded between the Transvaal Chamber of Mines and the Trade Unions concerned resulting in an immediate reduction of wages, with the probability of further reductions in the near future.

GOLD PRODUCTION.

8. The value of the gold produced by the Company's group of mines during the year under review amounted to £9,926,943, the average price obtained being approximately £5 11s. per fine ounce.

COAL INTERESTS.

9. As mentioned by the Chairman on the occasion of the Company's last Annual Meeting, the Company has acquired considerable coal interests in South Africa. The equipment of the mines is nearing completion, and they will be capable of producing a large quantity of coal. Your Directors are hopeful that the Company will eventually derive material benefit from this new enterprise, more particularly when the necessary railway facilities have been obtained.

Johannesburg Consolidated Investment Company, Ltd.—Continued.

DIAMOND MINES.

10. Regarding your Company's interests in the leading Diamond Mines in South Africa, it may be mentioned that during the period under review the falling off in the demand for stones has been met by a drastic curtailment of production. This is no new feature in the history of the diamond industry, and it is confidently anticipated by those who control the policy of the diamond mines that an improvement in the position may be expected in the near future, and of such improvement indications are already apparent.

ESTATES AND TOWN PROPERTY.

11. Sales of building sites on the Company's residential estates continue to be effected.

VISIT OF THE PERMANENT CHAIRMAN TO SOUTH AFRICA.

12. Early in the year Mr. S. B. Joel, the Permanent Chairman, went out to South Africa on the Company's business. His visit was very valuable, as it

enabled him, in consultation with the Directors, to deal with many matters of considerable importance and urgency.

DIRECTORS.

13. In terms of the Articles of Association, four of the Directors, viz., Sir John S. Purcell, K.C.B., J. Emrys Evans, C.M.G., J. Friedlander and Isaac Lewis, retire by rotation, and offer themselves for re-election.

ELECTION OF AUDITORS.

14. Messrs. W. Fergusson and S. Thomson, the Auditors of the Company in Johannesburg, and Messrs. Kemp, Chatteris, Nichols, Sendell & Co., the Auditors in London, retire from Office and offer themselves for re-election.

By Order of the Board,

W. H. MARDALL,
THOMAS HONEY, Secretaries.

Enemy Shareholdings.

SETTLEMENT IN SIGHT.

AGREEMENTS BETWEEN UNION CUSTODIAN AND BRITISH PUBLIC TRUSTEE.

Negotiations to be Completed by end of January.

The question of disposal of South African enemy shareholdings is a matter which has engaged the attention of the Government, the public, and the mining houses on both sides of the water for a considerable time past. On various occasions it has been announced that an agreement has been arrived at, and on just as many occasions hopes of a settlement of the difficulty have been disappointed. It is now, however, reported from London, apparently from an official source, that complete agreement has been reached on all points between the Public Trustee and Sir Hamilton Fowle, Union Custodian of Enemy Property, in connection with the allocation of enemy shares in companies working in South Africa, and on all other outstanding matters of procedure.

A scheme has also been agreed upon regarding the disposal of enemy shares in mining companies, under which all enemy shares in any company will be offered in one block, and first to group companies. Negotiations regarding such sales in connection with companies incorporated in England will be conducted by the Public Trustee and in connection with companies incorporated in South Africa by the Union Custodian. The Public Trustee's Department is preparing certain statistics which are expected to be ready for despatch to South Africa at the end of December.

Negotiations for the disposal of the whole of the enemy holdings will be commenced immediately the statistics arrive. It is hoped that the negotiations will be satisfactorily completed by the end of January. Sir Hamilton Fowle sailed by the "Arundel Castle" last week.

The principal blocks of "enemy" shares held in South Africa are as under:—

Company.	No. of Shares.

FAIRBANKS

Vulcabeston Renewable Disc Valves.

Asbestos Fibre, as everybody knows is not affected by heat or acids.

Vulcabeston is a compound of Asbestos Fibre saturated with rubber and other materials and vulcanised under Hydraulic pressure. It is the ideal material for a valve seat, and you can get it only in Fairbanks Valves with Renewable Discs.

There is another marked difference about the Fairbanks Valve and that is in the quality. A trial and comparison will convince you.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material & Engineering Trades

BUSINESS QUIET. BUT MERCHANTS ANTICIPATE EARLY RECOVERY—IRON AND STEEL—AGRICULTURAL IMPLEMENTS—TIMBER AND BUILDING MATERIALS—ELECTRICAL GOODS—GERMAN TRADE ACTIVITIES—PROPOSED NAVAL DISARMAMENT EFFECTS ON STEEL WORKS—OIL NOTES—UNION'S COMMISSIONER FOR COMMERCE—METAL MARKET.

General Review.

Business has been quiet this week, but the undercurrent is of an encouraging character. Trading on the Commercial Exchange has been fairly good, with, however, little volume. The consensus of opinion in mining circles is that stocks are becoming depleted more and more; indeed, in some lines shortages are already apparent, showing that the weak holders are gradually being weeded out. It is generally expected that the next few months will see an all-round improvement in business. At the moment, of course, labour troubles are the disturbing factor and are preventing the industry from departing from its enervated hand-to-mouth policy of obtaining supplies. The commercial community is beginning to think that it is time to have a clean up, to get to bedrock and know more or less the general economic position. Provided the present unsettling labour conditions are improved and the cost of production materially decreased, there appears little in the way of a slow but gradual recovery in business conditions. The gold premium has again declined somewhat and with it a corresponding appreciation in the sterling exchange with America. For the first time in six months, the rate has advanced to over four dollars, which, however satisfactory it may be in respect of the European economic position generally, warns us with no uncertain voice that it is imperatively necessary for the Rand gold mining industry to lose no time in effecting drastic reductions in working costs if the bulk of our mines are to continue operations in the near—some authorities consider in the very near—future. As regards building operations, big inquiries are about for material for new works, if not for just now, at any rate for a time to be reckoned in weeks, as people are now seriously thinking of tackling propositions which have been too long delayed in the hope of lower costs. This hope, however, appears to be fallacious, at any rate as regards building materials, which are now without doubt on the upward grade; timber has advanced overseas considerably of late, with every indication of a still further rise shortly, and other building materials are in somewhat like case. The rates of wages will, and must, come down, but the negotiations to that end will, in their very nature, be bound to be of a protracted nature; hence the general inclination to put a period to the present stagnation and catch up the arrears of building work so long needed. The flow of money from the Government Departments, which it is expected we shall soon see, will automatically give an impetus to business generally. Prices of mining and building materials locally show on the whole little change from last week, but remain firm with an upward tendency. Inquiries in commercial circles have elicited the fact that, notwithstanding the Premier's recent statement, the banks are still keeping a firm hold of the reins in regard to financial facilities, and that until the labour difficulties shall have been satisfactorily settled little help may be expected from those quarters. But, given a satisfactory solution of those difficulties, the opinion is generally optimistic that we shall see improving business conditions early in the New Year.

Iron and Steel.

Business, as is usual at this time of the month when the mines' requirements have been satisfied, has slackened off. Trade conditions are again exceedingly quiet, and although

there are some extensive inquiries floating, the general experience unfortunately is that very few of these mature. However, there appear to be prospects of revival, which, though all too gradual and slow, should develop during the ensuing months, so that by the middle of next year a more sanguine report should not be out of place. There are mooted a number of projects of considerable magnitude in extensive pipe lines and Municipal power schemes, including large quantities of steel poles. The National Trading Co., who are the agents for the Mannesmann Tube Works, report a measure of activity not only in the above lines but also in another of their specialities, viz., sirius oxy-acetylene metal welding and cutting plants, for which a number of orders have recently been received from the country, where the autogenous process of welding metals is finding increasing favour and is being gradually recognised as the most useful help, particularly when large engineering shops can only be situated at a considerable distance. Owing to the financial stringency and labour troubles, consumers, both

CALLENDER'S CABLE & CONSTRUCTION CO., LTD.
BRITISH THOMSON-HOUSTON CO., LTD., etc., etc.

mines and engineering firms, are at present only buying from hand to mouth. Many tenders that have been asked for construction and other purposes have not yet been given out, for obvious reasons. The S.A.R. are asking for tenders for the enormous quantity of 714 long tons of reinforced bars to be used in connection with the new elevators. The Railway are also asking for tenders for the supply of copper tubes for the ensuing year. Merchants are pleased at this, because many orders for the larger sizes go direct to the High Commissioner in London, leaving them without an opportunity of quoting for them. The new Railway buyer, Mr Lyddon, who has been appointed as from February next, will, it is hoped, see to this and allow local merchants to quote for everything that is required by his Administration. This matter, in the view of a leading importing merchant, should by reason of its great importance be taken up by our Chamber of Commerce.

Latest quotations.—Dunswart iron 22s. 6d. per 100lb. basis price; Union Steel Corp., Ltd., 30s.; imported iron and steel flats, small, 35s. to 42s. 6d.; larger sizes, 32s. 6d. to 40s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 39s. 6d.; $\frac{3}{8}$ in. iron, 32s. 6d. to 34s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in. iron, 33s.; steel, 39s.; $\frac{3}{4}$ in. round iron, 32s.; steel, 35s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 32s.; channels and joists, 37s. 6d.; shafting, $\frac{3}{8}$ in., $\frac{1}{2}$ in. and $\frac{3}{4}$ in., 9d. per lb.; 1 in., 8 $\frac{1}{2}$ d.; 1 $\frac{1}{4}$ in. to 2 in., 7d.; larger sizes, 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{8}$ in., 24s. to 25s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 47s. 6d.; to 52s. 6d. per 100 lbs.; $\frac{3}{8}$ in. and $\frac{1}{2}$ in., 45s. to 50s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lbs.; rivets, $\frac{1}{2}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lbs.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d. per lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb.; $\frac{3}{8}$ in., 2s. 11d. per lb.; 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ to 1 $\frac{1}{8}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{1}{2}$ d.; 1 $\frac{1}{2}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 35s. to 47s. 6d.; shovels, 60s. to 65s.; wheelbarrows, 47s. 6d.; picks, 37s. 6d. to 67s. 6d.; pick handles, 35s.; barbed wire, "Shorthorn," 69 lbs., 13 $\frac{1}{2}$ gauge, 21s. 6d. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bulb tee fencing standards, 14 lb., 28s. 6d. per

doz.; 12 lb., 25s. per doz.; black baling wire, 14 gauge, 22s. per coil, 100 lb.; screening 3s. to 9s. 6d. per sq. yard; cyanide for outside mines, 1s. 6d.; zinc shavings, 1s. per lb.

Newcastle Iron and Steel Co., Ltd.

The directors held their quarterly meeting at Newcastle recently, at the same time inspecting the progress of the assembling of the plant, and found that a great deal had been done since their last visit. The completion of the plant is now in sight; ore and coke are now being brought to the property, and it is hoped that it will not be long now before production of pig iron in South Africa for commercial purposes will be an established fact. The foundry, which has been established for the company's own castings and also the brick-making plant have proved invaluable; many tons of castings have been and are being made for the company's own use, and that, together with the bricks made by the company, has saved them much time and many thousands of pounds in money.

Second-hand Machinery.

There is not much to report this week, and curtailed orders are anticipated for the next few weeks; the mines are not disposed to take over large stocks, and consequently orders are on the quiet side. With regard to rails, these have come down considerably on account of the German invasion of Mannesmann. As an instance, there was a big order in the market the other day for a very large tonnage of rails for Delagoa Bay and district. A price was quoted for about 400 tons delivered Delagoa at about £11 10s. per ton, but the order was snapped up by a German firm at £9 2s. 6d. landed in Delagoa Bay. A 10 h.p. electric motor was sold during the War at about £110 second-hand, and before the War for about £60. These are being offered by the German makers landed Johannesburg at £55. Piping also has been largely purchased from Germany, hence the drop in the second-hand product. A contract was given out for piping by the Rand Water Board, and the difference between the English and German tenders was £180,000. But it is felt that this cutting of prices by German firms is not to last long, as is evidenced by the announcement in the press of a strike in one of the German steel works, where the men are demanding 100 per cent. increase of wages, and prices should come to what they should be. Quietness is expected to rule in the second-hand machinery market next month and indeed well into the New Year.

Welsh Tinplate Industry.

According to latest*oversea advices, the position of the Welsh tinplate industry is regarded as more satisfactory in consequence of large European and Asiatic orders and also a very large contract for British Columbian packers, obtained in the face of severe American competition.

German Steel Works Closed.

A strike has occurred in the iron and steel works in Westphalia, owing to the operatives claiming an increase of 100 per cent. in wages, which was refused by the masters.

Suspension of Large Tinplate Firm.

A firm trading largely in the East in tinplates, galvanised sheets, etc., has, it is announced from London, suspended payment, with liabilities amounting to £900,000. A scheme is being arranged to re-organise the company.

Agricultural Implements.

There is very little doing in these at the moment, the farmers, owing to the low prices ruling for their produce, being unable to buy what they need, and need rather badly. There has recently been a sharp fall in prices of farming implements in Canada, whence a large portion of our agricultural implements come, which averages 15 per cent. to 20 per cent. This decline will, however, not affect next season's local prices, as large stocks have been imported for such demand, and these must be worked off before the farming community can avail itself of the lower prices. Farmers are, it is well known, well to the fore in purchasing up-to-date machinery when the result of their farming operations allows them to spend money, but recently there has been no such opportunity when, instead of profits, farmers have been making losses. Consequently they have to do the best they can with their old machinery, and importers are saddled with huge stocks which they cannot at present dispose of. The Canadian fall will undoubtedly have the effect of reducing prices of local stocks in the near future, as merchants cannot hold stocks indefinitely and will eventually have to turn them over at a sacrifice. As a matter of fact, in some cases farming implements are now being sold under cost.

Timber and Building Materials.

Prices have been firmer in Scandinavia and Finland for timber during the past three months with an upward tendency, and a considerable advance has taken place in the f.o.b. prices quoted by Swedish mills. Large shipments of timber recently received from the Baltic were bought before the recent advances, but at present selling quotations leave importers with little or no profit. The tendency in the near future will therefore undoubtedly be for timber to rise in price.

Prices: 3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver board, 4½d.; floorings, 6½d. to 7d.; ceilings, 4½d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 7s. 6d. to 8s. 6d.; corrugated iron, 9½d. to 10½d. Furniture timber: Burmah teak, 18s. 6d. per cube here for first quality, 14s. 9d. for second, at the coast; American oak and Japanese oak, 1s. 2d. at the coast; West African mahogany, 1 in. to 4 in. thick, 27s. per cube at the coast; Rhodesian mahogany, 8s. 6d. per cubic ft. at the mills; Honduras

mahogany, 30s. per cubic ft.; American yellow pine, 1s. 8d. to 1s. 9d. per ft. of 1 x 12 here; American pine shelving, 1s. per ft. Bricks are unchanged at 70s. for blue stock; 60s. mixed; £1 10s. to £5 for wire cuts; £5 for pressed per 1,000 at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag, 8 lb. bag 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s. 6d., 46s. 6d., 55s. for 1 to 3-ply.

There is nothing new in the building trade, things quietening down in view of the approaching holidays. There is still a little building going on, which is keeping hands fairly well employed. As previously stated, a spurt is anticipated about February next.

Second-hand Iron and Timber.

Things are at present not too bright in the second-hand iron and timber yards, and it is generally expected that they will get worse before they are better. Inquiries are good, but orders, in the absence of financial backing, are very scarce. Prices are as last reported and appear to be stabilised, viz., 6d. to 7d. for iron, and 9d. to 10d. for timber.

Electrical Goods.

Business continues quite fair in town and country, and has been so far the last fortnight; country orders are coming in at a satisfactory rate and for quite a large quantity of wares. There are no alterations to report in prices, and dealers generally do not expect any declines for some time to come. Germany, it seems, cannot reduce her prices lower, and England and America find it impossible to do so in view of the wages question. Stocks in all lines are now abundant. Building operations are going ahead a little better, said a prominent dealer, but of course nothing like they ought to be and what the present scarcity of accommodation warrants, but leeway is expected to be made up next year. The banks, he said, are rather easier now than previously, but still careful; he thought that financial facilities would later on become still easier and be a great help to building operations. The power station are adding a few extra connections, but they are afraid to overload the plant at present awaiting auxiliary plant early next year.

Electrical Conversion.

The preliminary work in connection with the Krugersdorp electrical conversion scheme is now in hand. Prof. Buchanan and the engineers of the Victoria Falls Power Co. have arranged the route and the points of delivery of power.

German Competition in Mining Requisites.

Germany is now delivering cyanide at from 10 to 15 per cent. below the price at which British manufacturers can quote. In shoes and dies she is under-quoting local industrialists, who had been turning out the mine requirements

satisfactorily both as regards quality and price, the latter just below the British, thus ensuring the retention of the trade in the country. Now Germany is offering at £30 per ton against £40 per ton quoted by Britain. The trade in these articles amounts to over £200,000 per annum. As regards rails, Germany is now offering these at £18 per ton, compared with £24, the price ruling here for some time past. There is only one solution to this, and that is a drastic cut in wages, without which our markets will be lost to us irrevocably.

Use of White Lead.

A cable from Geneva states that on the resumption of the discussion of the report of the White Lead Committee at the Labour Conference, Mr. Gemmill, the Joint Secretary and Actuary of the Transvaal Chamber of Mines, protested against the prohibition of white lead, and pointed out the effect it would have on our gold mines if such were carried out. He was, however, overruled by 76 votes to 3, and the use of white lead (with certain exceptions) was prohibited in interior and exterior painting under regulations protecting workers using pigments.

Washington Naval Disarmament Proposals and Effect on Steel Works.

Disarmament, if carried out, will undoubtedly very seriously affect the shipbuilding and iron and steel industries. It is reported that already owing to the progress of negotiations at the Conference some contracts regarding capital ships in the Clyde shipbuilding yards have been suspended, which is necessarily affecting some Glasgow steel works. At least three years' work, with wages totalling £15,000,000 sterling, is being held up. An announcement has been made that the Parkhead forge has been closed. Naturally, until further progress has been made in the negotiations, nothing definite can be done, but it is understood that instructions have been issued from the Admiralty to those firms engaged in naval construction to hold their hands pending further advices. Sheffield and Birkenhead are also suffering from the temporary cancellation of subsidiary orders. The President of the American Iron and Steel Institute, Mr. Schwab, declares that disarmament might involve loss to armament makers, but if permanent peace were possible he would gladly see the war-making plants of his companies sunk to the bottom of the ocean.

Oil News: Oil Fuel Growing in Favour.

A cable from New York announces that shareholders in the Delaware Union Oil Co. have ratified an amalgamation with the Royal Dutch Shell Transport Company. The new company will be capitalised at ten million shares without par value, the Dutch Company receiving 72 per cent. and nominating 15 directors, the Union Company taking the remainder of the shares and nominating four directors.

African Oil Corporation.

The work of testing the property during the past few months under the supervision of an engineer of the Royal Dutch Company, is progressing very satisfactorily. The width of shale for mining purposes exceeds, it is stated, the original estimates formed by the company's own engineer, and the results published as to values have been exceeded by recent assays. A boring contract has been entered into by the Royal Dutch Company with the McNamara Shot Drill Co., Ltd., and boring operations are to commence forthwith, results of which are being eagerly looked forward to.

German Reparation.

Sir Henry Strakosch, in an article in *The Times* on the subject of the German indemnity and its ruinous incidence on Allied countries in the way of unequal competition, suggests that goods delivered as part reparations should be devoted to purposes of a capital character, such as the erection of plant and equipment, central electric power stations in the neighbourhood of coalfields, and for the improvement of the harbours of Britain, which would, he thinks, be very advantageous. He says that such goods would not compete with current market commodities, and that the erection of the plant would provide employment in Allied countries. Further, that cheaper means of production in future would yield increased revenue for the liquidation of national debts. Sir Henry Strakosch suggests that the scheme should embrace the whole British Empire, and should be run by private enterprise, those receiving such goods guaranteeing payment plus a percentage of profits or small rates of interest to the Government.

Disposal of South African Products to Germany.

Colonel Mentz, together with Mr. Canham, the Union Trade Commissioner, and Mr. Boshof, have visited Berlin for the purpose of finding means of disposing of South African products—wool, maize, hides and skins—and have had several conferences with the German foreign office and others. Colonel Mentz is convinced of the great demand for these products, and is satisfied with the progress already made in this connection.

S.A. Reserve Bank.

The weekly statement, dated November 19, shows the ratio of cash reserve to liabilities to public as 73.2 per cent.

Union's Commissioner for Commerce.

It is announced that the Government has selected Mr. Karl A. Spilhaus, of Capetown, as the Commissioner for Commerce, who will assume duties on January 1 next. His province will embrace most of the Western and Northern European countries, such as Holland, Belgium, France, the Scandinavian States, Germany, etc. Mr. Spilhaus has extensive knowledge both of the products of the Union and Continental requirements. His headquarters will be at Rotterdam. The necessity for this appointment has been keenly felt in the Union, and the selection meets with general approval.

ASSETS, PROSPECTIVE PRODUCTION AND PROFITS.

Freehold and Mineral Rights over	8,960 acres.
Mineral Rights	2,432 "
Grenfel Colliery, Five-sixths Interest	5,692 "
Contracts of Option over	9,697 "
	23,645 acres.
Working Capital, Development and Plant	£105,000.
Rich Torbanite on Mooifontein—Estimated Tonnage	2,000,000 tons.
Estimated Profit—Value of Torbanite on Treatment by Ironside Process	£3 per ton.
Ordinary Oil Shale—Estimated Tonnage	20,000,000 tons.
Estimated Profit on Ordinary Oil Shale on Treatment by Ironside Process	£1 per ton.
Coal—Estimated Tonnage	168,000,000 tons.
Estimated Profit on Coal	2s. 6d. per ton.

In actual working tests made by the Ironside process, described below, the yield from the Mooifontein Torbanite averages 60 gallon of crude oil per ton. The crude oil is of fine quality. This result indicates a minimum profit of 60s. as above. From this Torbanite material alone, therefore, the Corporation should earn a profit estimated at £6,000,000.

Ironside Oil and By-products Distillation Process for Oil Shales and Bituminous Coals, invented by Mr. T. G. Ironside, M.A., B.Sc. (Edin.) constitutes a completely new method of extracting the oils and other valuable by-products from oil shales and bituminous coals. By this method the oils are extracted with extraordinary rapidity. Within half a minute after the shale or coal is placed in the distilling chamber the oil begins to run out through the condenser pipe. The capital cost for a distillation plant on this method will be only a small fraction—probably not more than one-eighth or one-tenth of the cost for a plant on the old retorting method. An estimate for a plant built on the old method to treat 50 tons per day comes to £28,000. The cost for a distillation plant to treat 50 tons a day by the Ironside method will probably not be more than £3,000 to £3,500. Moreover, the extraction of the oils is more complete and satisfactory. A larger yield of the higher grade oils is assured, owing to the even and comparatively low temperature which can be easily maintained throughout the operation.

The Ironside process bids fair to make it possible to produce crude oil from such shale and bituminous coals at costs which will allow competition on level terms with oil from wells. In that invention, therefore, it may be said that South Africa has "struck oil." The Transvaal Coal and Oil Corporation holds in the Grenfel area, and the great areas adjoining on Mooifontein and Bloemfontein, practically inexhaustible supplies, not only of highly bituminous coals and of ordinary oil shales carrying 20 to 30 gallons of oil per ton, but also an estimated tonnage of at least 2,000,000 tons of the rich Torbanite mineral described in the Prospectus, yielding up to 70 gallons of Crude Oil (specific gravity 0.880 at 20° Centigrade) per ton—unique almost in the world.

The Company is about now to erect the first Ironside Retort at Grenfel, and it is expected to be producing crude oil by about March next. It will therefore be the first producer of oil on a commercial scale in South Africa, and the pioneer in an industry which before long may rival the gold industry in magnitude and value.

PRIMARY REFINING PLANT.

It is estimated that a primary refining plant costing approximately £5,000 would treat the crude oil products from an Ironside Retort with a capacity of 50 tons per day. From Mooifontein Torbanite yielding 60 gallons per ton the output would be 3,000 gallons of crude oil per day. It is estimated that the primary refining plant would produce the following products from each 60 gallon of crude oil, i.e., from each ton of 60-gallon Torbanite treated:—

(1) Benzol or Petrol	12 gallons at 2s. 3d.	£1 7 0
(2) Light Burning Oil for Paraffin Lamps	12 gallons at 1s. 9d.	1 1 0
(3) Crude Creosote for Sheep Dips, etc.	18 gallons at 2s. 0d.	1 16 0
(4) Tar	9 gallons at 1s. 6d.	0 13 6
(5) Pitch	9 gallons at 0s. 6d.	0 4 6
		£5 2 0

Equal to a value of £5 2s. per ton of Torbanite, calculated at prices for these primary products far below these ruling at present. For all these primary products there is a constant and large demand in South Africa. The total mining and producing costs by means of the Ironside process is not likely to exceed £1 per ton of Torbanite leaving a margin of £4 2s. per ton profit instead of the £3 estimated.

AT THE CROSS ROADS OF INDUSTRY.

HOW THE RAND HAS REACHED THE CRUCIAL POINT OF ITS EXISTENCE—WHICH PATH WILL IT TAKE?—SIGNIFICANCE OF THE CROWN MINES STRIKE—SOME TELLING FACTS AND FIGURES.

The gold mining industry of the Witwatersrand has now reached the cross-roads of its existence. Either it must regain the high road of the prosperity which it formerly enjoyed or else it will languish and decline until a row of tumble-down headgears and smokeless stacks denote the existence of a once flourishing mining field.

One Road or the Other.

It must either take one path or the other; it cannot continue indefinitely to halt at the parting of the ways and to survey timorously and with indecision the two roads which are open to it. It may well be that when we look back upon the past from the vantage point of the future, the historians will see in this Crown Mines strike and its larger developments the turning point in the career of the Rand, and will note the ebb in the tide of concessions, abnormally high working costs, and little labouring value given in return for such expenditure, as the crucial point in the life of the gold mines. We sincerely trust that this will indeed prove the turning point. If not, then the present will denote an unhesitating tread along the road to ruin, with its consequent dire effects for Johannesburg, the Reef, and the whole of the country.

The Golden Harvest which Feeds us All.

These of us who do not actually and directly derive our livelihood from the mines are very apt to think of the gold

which to establish an industry if the purchasing power of the gold mines was seriously impaired.

Johannesburg without its Mines.

We are thus forced back to the irrefutable conclusion that it is the gold industry, and the gold industry alone, which keeps Johannesburg and the Reef going. Each smiling villa in Parktown and on the Houghton Estate, each block of flats, each shop and each warehouse in town, each row of miners' cottages and each store along the Reef, each motor car that dashes up Twist Street, and each trolley that toils along the Reef, are in the first degree dependent on the business of making conglomerates, yielding only a few dwts. per ton, pay. And if we cannot make them pay, Johannesburg will contract as Cœlgardie has contracted, and will be brought face to face with abject poverty just as other mining towns—Kimberley in the Cape Colony and Redruth in Cornwall—are facing poverty to-day. Moreover, the baneful influences of a curtailment of mining operations on the Rand would react over the whole country, bringing in their train diminished revenue, an increasing burden of taxation, and economic disaster to all other industries.

The Low-grade Mines and their Disbursements.

We have written these things many times before. Generally speaking, such counsel falls upon deaf ears. The gold mines are supposed to be vastly profitable concerns

The New Modder, the Rand's Show Mine. Unfortunately we possess few New Modders, and the accompanying article makes it clear that our future is bound up in the low-grade ventures.

industry as something apart from our privy purses and individual lives. There are those who profess to believe in a Johannesburg existing without the golden harvest of the mines. It is hard to visualise this glorified mining camp of ours, which we call the Golden City, existing as a prosperous community without the weekly pay slip and the monthly cheque of the mines. The Rand of which Johannesburg is the centre is paying out money at the rate of over two and a half millions per month in respect of wages and stores. The mines in the immediate vicinity of this town are spending over three-quarters of a million a month; of this the Crown Mines alone disburses a quarter of a million.

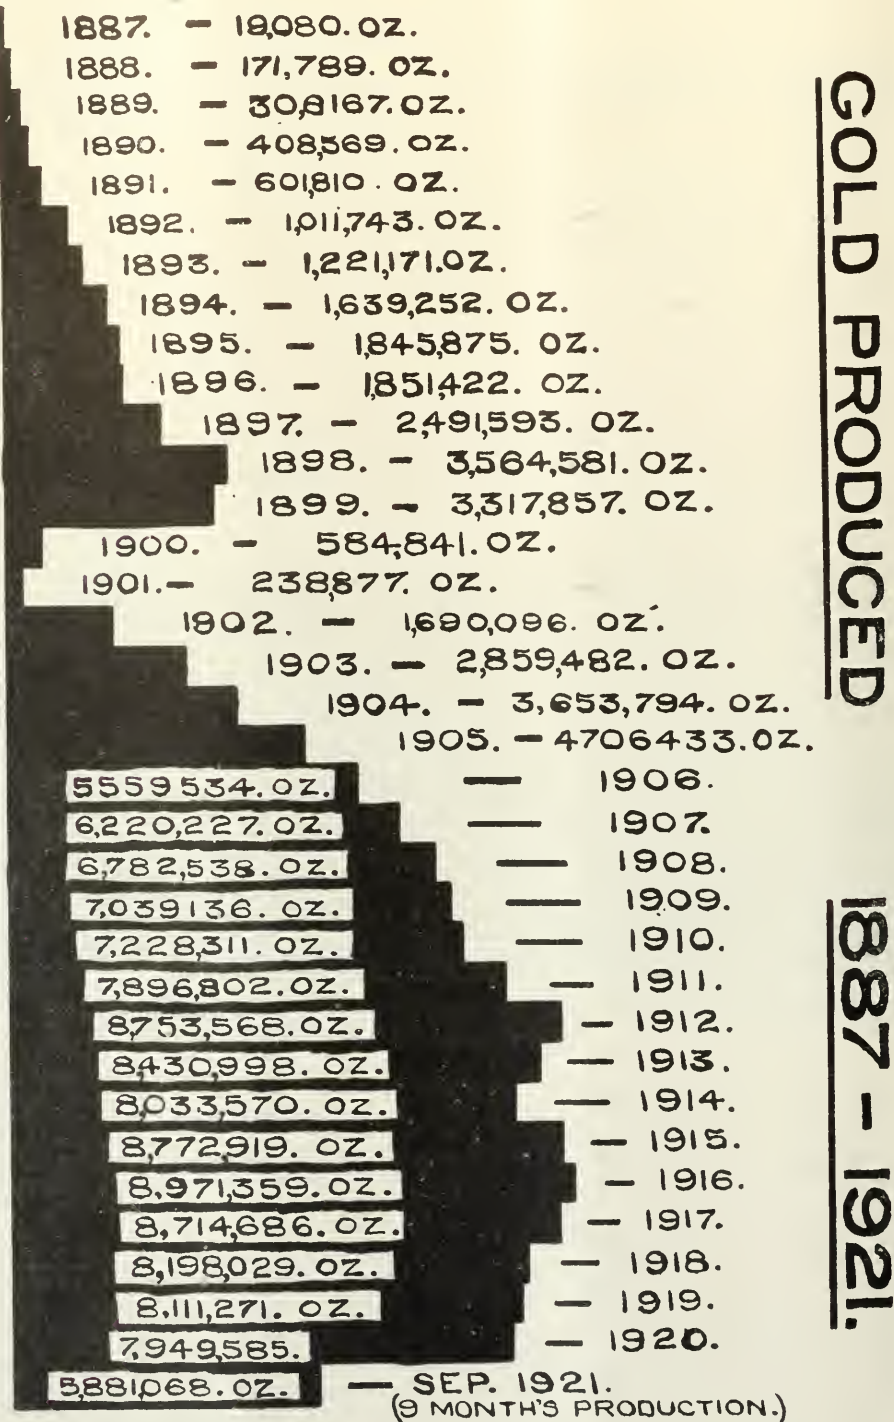

The Fable of Industries.

If this spending power was taken away from the community, even if it was largely curtailed, Johannesburg could not exist except on a very much diminished basis of population and prosperity. Our local industries are all dependent on the mines, and if the Rand fell from its high estate as the leading gold field of the world, who would dream of establishing an industry here? We are without raw materials, we have no cheap transport such as would be provided by a river system, we are far from a seaboard, and we employ the most highly-paid and inefficient white "labourers" in the world. A merchant prince seeking new avenues for the employment of his wealth would, we should imagine, regard Johannesburg as the last place on earth in

enriching a select coterie at the expense of the community. This is not true. It is true that there are half a dozen mines on the Reef which take rank amongst the richest and most profitable ventures on earth. But these rich mines, although they yield the bulk of the dividends, expend only a small proportion of the working costs upon which the people of the Rand, and in a material degree the inhabitants of South Africa, live.

A few facts and figures in this connection are worthy of emphasis. In the first half of the current year the total dividends paid by all the mines of the Witwatersrand amounted to £3,201,277. Of this amount £2,168,068 were distributed by the following half-dozen companies:—City Deep, Government Areas, Modder B, Modder Deep, New Modder, Van Ryn Deep. The remaining 33 companies, with an aggregate capital in issue of thirty-five and three-quarter millions, paid only £1,033,209 in dividends for the first six months of the present year, or an average yield of 5.8 per cent. per annum on the issued capital. One can obtain a higher rate than this from Government Bonds. On the other hand, the high-grade mines enumerated above only distribute 23 per cent. of the Rand's monthly outlay on wages and stores. In September the Rand's working costs amounted to £2,510,062. Of this, the half-dozen rich mines paid out £571,264, and the poor mines £1,935,798. The company circulating the largest amount of money amongst

How the Rand Gold Mining Industry has expanded and how it is contracting.

Graphs showing Gold Production of the Rand, 1887 to September, 1921.

Note.—The values of 1921 are estimated assuming that the output up to September, 1920, represents three-quarters of the total output for 1921.

the community in September was the Crown Mines, now in the throes of an absurd strike. This mine, until the other day, was distributing money at the rate of over three millions per annum. It is one of our town mines immediately adjoining Johannesburg on the west, and we of the Golden City can

Another Rich Mine on the East Rand.

ill afford to dispense with such a monthly cheque or to see our livelihood dissipated by a few agitators. Next to the Crown Mines on the list of money spenders come the E.R.P.M. and Randfontein, which between them expend more than four millions sterling and distribute nothing in dividends. It is clearly our business to reduce working costs to such a level that the mining of low-grade ores on these fields can again be made remunerative and attractive. Only by this means can there be any real prospect of salvation for the mines. There can be no permanence of outlook for an industry which is dependent on the incidence of such an ephemeral and abnormal factor as the gold premium.

The Rand's Great Need.

The first essentials for the attainment of such an ideal are lower working costs, larger output, and freedom from irksome and unnecessary Trades Union restrictions. The mines should—nay, must—be allowed to work out their own destinies without interference from professional agitators, who preach dissent in order to justify their own existences. If consulting engineers, managers, and other technical men were freed from the burdens imposed on them by a surfeit of trades union demands, there would be more time and disposition to attend to technique and to better existing practice.

Big Technical Improvements Possible.

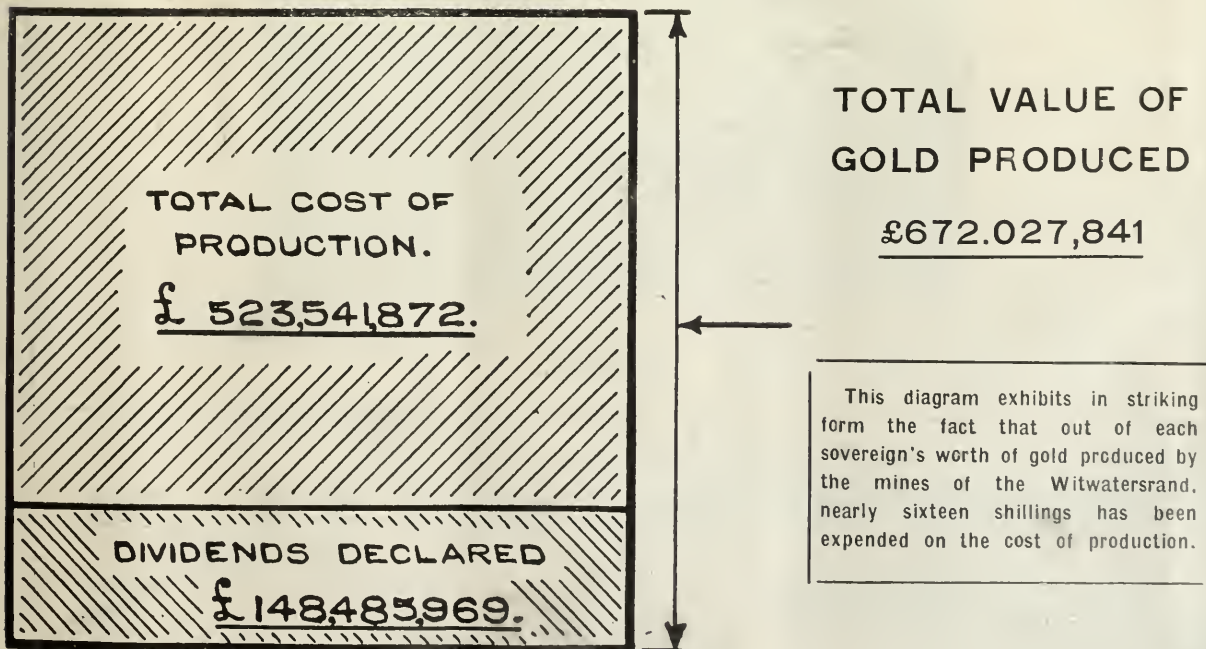

For it is fairly certain that the last words have not yet by any means been said either in regard to above or below ground practices. There is still plenty of scope for improvement, and if the industry were not constantly harrassed by labour troubles, these technical men would be more encouraged to experiment in new directions and to apply the results of their researches to the mines.

A Waning Industry and What It Has Done.

As it is to-day, the great gold mining industry of the Rand is waning. Since 1887 these mines have produced £672,027,841 of gold, and of this colossal total £523,541,872 has been spent on stores, wages and taxation. Continuation of the industry on a large scale depends in the main on the ability of the mines to work low-grade ores at a profit without the fictitious relief of the gold premium.

Fateful Decisions.

The industry stands indeed at the cross-roads. The decision as to which path it is going to take in the future depends in large degree upon the workers, the policy which will in future be pursued by the Chamber of Mines, and by the voice and decision of the public of the Union at large.

THE UNION'S COAL TRADE.

REDUCTION OF SIXPENCE PER TON IN RAILWAY RATES—HOW THE POSITION OF OUR COLLIERIES IS CONDITIONED BY TRADE GENERALLY.

It is announced that a reduction of sixpence per 2,000 lbs. will be made in the railway rates for export cargo coal and for coal utilised in bunkering ships carrying full cargoes of export coal shipped by vessels sailing on or after December 1, 1921. This measure of relief is sadly needed by the collieries, for official figures make it abundantly clear that in the past three months there has been a very material falling off in the coal trade of the country. In August the collieries of the Union reached their high-water mark of sales. They disposed of 1,035,494 tons for a value at pit's mouth of £448,048. The quantity sold in that month was over two thousand tons more than the previous best sales output in December of last year, when the value was £441,979. The highest selling value recorded was in respect of January of this year, when 979,990 tons were sold for £465,764.

Question of General Trade.

Whilst this reduction in rates will be helpful, it must be fairly clear that there can be no real revival in the coal export and bunkering trades of the Union until there is a general commercial revival. South African coal is produced

very cheaply at pit head, and it is of good quality. But it is not, generally speaking, of first class grade, and by the time it has travelled the long haul to the coast, its cost at the port hardly makes it a cheap coal by comparison with other coals at to-day's competitive prices.

In other words, South African coal does not provide such excellent value that ships will go far out of their way to secure it, and it is therefore clear that a lively coal trade infers a favourable condition of trade generally with ships calling at our ports to land imports or take away exports.

Recent Tonnages and Sales Values.

The Rand Refinery.

BRIEF DESCRIPTION OF THE BUILDINGS AND OPERATIONS OF THE REFINERY.

The Rand Refinery, which is now nearing completion, may be described as the most important gold refinery in the world. It is situated near India Junction, Germiston. The reasons for the selection of this site were its proximity to Germiston on account of it being an important railway junction, and to an electric power supply from the Victoria Falls and Transvaal Power Co., Limited, good environment, facility for drainage, comparative freedom from dust and vibration, ample room for quarters, facilities for railway siding, and easy delivery by road. A private railway siding was erected near the South Rose Halt on the Rand Mineral Line, and work was begun on the site towards the end of June, 1920, when the erection of the first buildings, viz., the Stores and Coke Bins, was taken in hand. The buildings comprised under the general term "Refinery" were started in August, 1920, and consist of:—Refinery Office, Assay Office, Rough Gold Melting House, Silver Reduction and Gold Refining Branch, Power House and Workshops, Chlorine Generator House,

Balance Room.

The ingots from the Rough Gold Melting House are accurately weighed (weight after melting) and samples taken for the Assay Office. In the case of deposits the assay of which is satisfactory, the bullion is sent to the Gold Refinery at convenient times. When the assay is unsatisfactory, *i.e.*, when the bullion contains base metals which render the assay results unreliable, the bullion is returned to the Rough Gold Melting House for a preliminary refining (toughening) with air, chlorine, nitre, etc., to remove base metals which produce unevenness in samples. After this treatment the bullion is again weighed in the balance room and another set of samples is taken for the Assay Office.

Gold Refining Branch.

After the weight and assay have been determined, the bullion is forwarded to the Gold Refinery. Here it is made up into lots of about 700 ounces each. Each lot is melted in a 4-pint clay crucible, which stands in a plumbago guard crucible, using borax as a flux. When the bullion is melted a clay pipe stem is introduced into the molten metal and

The Rand Refinery at Germiston.

Store Rooms, Coke Bins, Coal Bunkers, Switch and Transformer House, Garage and Police Guard Rooms, all of which are enclosed by a boundary wall covering an extent over 5 acres of ground.

Refinery Office.

The bullion received is weighed in the presence of the depositor, the numbers and marks on the ingots are noted, a refinery number is given to the deposit, a receipt showing weight and refinery number is handed to the depositor, and a ticket showing weight and refinery number is placed with the gold, which is sent to the Rough Gold Melting House.

Rough Gold Melting House.

The bullion is check weighed, marks and description of ingots in each lot noted. Each lot of bullion is melted in a plumbago crucible with suitable fluxes; after melting bullion is cast into "slipper" ingots, deposit number stamped on each ingot, ingots freed from slag, etc. The crucible used in melting scraped, flux and scrapings crushed and panned off. The scrap gold so obtained is called the "end," and its weight is included in the "weight after melting" of the deposit.

chlorine and air passed through the molten mass. The chlorine converts the silver and base metals into chlorides, part of the base metal chlorides volatilise, the remainder with the silver chloride rise to the surface of the gold and are bailed off by means of a small clay crucible and poured into a mould placed on the furnace top. The passage of the chlorine is continued until a colour test of the issuing fumes with a cold pipe stem shows that no more chlorides are being formed. A light brown or yellow colour is obtained. The bulk of the chlorides is then removed by bailing, and the balance is removed by absorption with bone ash. The fine gold is stirred, remelted in large tilting furnaces, sampled and cast into bars of about 400 ounces each for export. The fine gold ingots are forwarded to the balance room for final weighing. When the assays are made the fine gold ingots are forwarded to the Refinery Office for export.

The chlorides of silver and base metals removed by bailing contain small quantities of gold; to remove the gold the chloride is made up into lots of 300 ounces each, melted in plumbago crucibles with bi-carbonate of soda and borax. This operation reduces a portion of the silver chloride, which produces silver, and this falling to the bottom of the crucible carries the gold with it. The crucible with contents is then removed from the furnace and allowed to cool till the metal

at the bottom of the crucible has solidified. The chlorides, being still liquid, are poured off, cast into chloride cakes about 1 in. thick, and are gold free. The metallic button so obtained is again refined with chlorine.

The chlorine gas used is generated from manganese dioxide, common salt and sulphuric acid in an Edward's generator.

All pots, ashes, pipe stems, etc., used in the Refinery go to the grinding room. They are ground in ball mills to pass through a 60 or 80 mesh. Large metallics remain in the ball mill and are removed. All metallics recovered are returned to the Refinery for treatment with chlorine. The tailings are treated in lead and cupellation furnaces for further extraction of precious metals, and the residues from this operation are exported from the Refinery.

Silver Refining Branch.

The chloride cakes produced in the Refinery are crushed in a rock crusher to about 1 in. cubes. Five to six cwts. of this crushed chloride are placed in a barrel, capacity about 60 gallons, and treated with a hot saturated salt solution. This treatment removes the base metal chlorides by solution in the brine. When these are removed, the solid silver chloride is taken out of the barrels, placed in a reducing vat between iron plates, covered with a dilute solution of sulphuric acid and heated with steam. This operation transfers the chlorine from the silver to the iron and produces sponge metallic silver. This sponge silver is returned to the barrels, washed with hot dilute sulphuric acid and water to remove soluble iron chloride. The sponge silver is dried, melted and cast into ingots of about 1,000 ounces, or it may be necessary to melt and stir potassium nitrate into it to remove impurities, before casting into 1,000 ounce ingots for the market. Gold free silver is thus obtained. All solutions produced in the wet reduction of the silver chloride are passed over scrap iron to precipitate the silver and copper contents. This residue is dried, sampled and sent to a smelter.

Assay Office.

Both dip and clip samples of rough gold bullion are assayed to ascertain the gold and silver content of the deposits. Dip samples for fine gold and silver bullion are used. All assays are made in duplicate on different samples by different assayers using different furnaces, apparatus, etc., and making weighings by different systems of weights, etc.

Residential Quarters.

These consist of 23 houses situated near the Refinery.

ANSWERS TO CORRESPONDENTS.

W. Johns.—We suggest that you get in touch with the colliery in question.

ASBESTOS

HOBDELL WAY & CO., LTD.
MINORIES, LONDON.

Cables: "HOBNAILS,"

Mining Men and Matters.

Mr. B. I. Campbell, of Nigeria, is on a visit to the Rand.

The thirteenth annual meeting of the S.A. National Union will be held at the Carlton Hotel, on Friday next, the 9th instant, at 3.30 p.m.

Mr. J. Kennedy Tullis, Director of Messrs. John Tullis & Son, Ltd., belting specialists, of Glasgow, has arrived on a visit to the Rand.

The following certificates have been issued by the Mines Department for the period ended November 26, 1921:—
Mine Overseers.—Metalliferous Mines: G. Burrows, C. A. Cowen, J. Swingewood. Collieries: A. Shirlaw. Non-fiery Collieries: T. L. Campbell. Mechanical Engineers.—Mines: W. Dunn, J. W. Ellwood, J. T. McCauley, H. S. Northey, W. J. Petersen (Honours), J. W. Ramsden, P. J. Rosevear. Works only: A. Banks, F. C. Bleackley, J. F. Brown, J. G. Davison, W. G. Edward, G. Hall, J. T. McCauley, G. E. Phillips, F. J. Redman. Electrical Engineers.—Mines: A. H. T. Ablett, B. F. Hewitt. Works only: C. W. Curry, E. O. Jones, E. F. Rendell.

The E.R.P.M. Enquiry.

The Minister of Mines has ordered an enquiry into "the reasons for the reduction in the number of white persons employed upon the E.R.P. Mines." The chairman is Major U. P. Swinburne (C.I. Mines), and the members are Messrs. E. E. J. Meyer (Manager, E.R.P.M.) and W. Price (representative South African Industrial Federation).

Johannesburg Board of Executors.

A REMARKABLY SOUND POSITION—GROWTH OF THE COMPANY'S BUSINESS—PUBLIC CONFIDENCE EXHIBITED IN TELLING FIGURES.

The 32nd annual ordinary general meeting of shareholders of the Johannesburg Board of Executors and Trust Company, Limited, was held in the board room of the company, 97a, Commissioner Street, Johannesburg, last week.

Mr. C. H. Barclay, who presided, referred with regret to the unavoidable absence of Mr. Llewellyn Edwards, the vice-chairman, who invariably occupied the chair.

There were also present, either personally or by proxy, Messrs. S. J. Wilks, D. F. Gilfillan, R. Niven, C. A. Wentzel, A. R. Lowick, A. P. Lloyd, H. Curtis, G. A. Jones, W. H. Thorne, T. Beeforth, J. T. Goldsbury (manager), A. Howat (assistant manager), and A. H. Robertson (secretary), 8,438 shares being represented out of a total issued capital of 25,000.

The auditors' report having been read, the chairman said: Before moving the adoption of the directors' report, balance-sheet and profit and loss account for the year ended September 30, 1921, which are now before you, I will, with your permission, make the usual reference to the salient features disclosed in the accounts.

Steady Growth.

One most gratifying feature is the confidence of the public in our company, which is demonstrated by the steady growth of funds placed in our hands for investment on behalf of clients. The figures for the last seven years are as follows:—

Year	1915	£215,250
"	1916	229,000
"	1917	240,000
"	1918	245,000
"	1919	288,500
"	1920	369,000
"	1921	430,000

This steady growth of public confidence, pleasing as it is, is not undeserved. There are not many public companies who can say as we can, that any client of ours can obtain his securities and cash at any time he thinks fit to ask for them. From our balance-sheet it will be seen that the amount due by us to clients is £31,275, against which we have cash at our bankers £35,072, so that in the remote contingency of all our clients desiring to be paid at once, we could meet them without any difficulty, a position we always intend to maintain.

The branch of our business dealing with the administration of estates is also steadily increasing, the advantages of appointing our institution as executors, trustees or administrators, being more and more appreciated. This is a point I should like to emphasise. Of necessity no individual, with his own affairs to attend to, can possibly give the same attention to executorial and trustee duties such as a well organised company can give, and there is, in addition, the all-important factor of security.

Stability in Bad Times.

So much for our clients and the public generally. We will now glance at the profit and loss accounts, which interest you as shareholders. As the directors' report informs you, the net profit for the year under review is £6,568—this is £2,136 less than the corresponding figures for the previous year, but as was pointed out to you on the last occasion on which we met, those figures included a special item of £1,708 profit on the sale of Victoria Mansions. Eliminating that item, you will see that our earnings on the ordinary business of the company have been maintained almost at high water mark, which, considering the difficult times through which this community has been passing, is an achievement with which you will no doubt be well satisfied.

The capital of the company is unchanged, viz., £25,000 issued and £5,000 in reserve. Against the £25,000 you have landed property £6,845—this is book value only; the realisable value is very considerably in excess of that. Further, you have the company's investments under bonds and other headings, totalling over £40,000, and due provision has been made for any possible loss that may be sustained in this connection.

Remarkable Position.

It is evident that your company is in an extraordinarily strong and stable position. For all practical purposes it has no liabilities at all, its realisable assets are more than double its issued capital, and you possess the goodwill of an old-established business which is constantly and steadily increasing.

The suggested allocation of the profits is detailed in the directors' report. We propose to pay the usual dividend of 10 per cent., plus a bonus of 1s. 6d. per share, which will make a distribution for the year of 17½ per cent. We shall add £1,000 to the reserve fund, and carry forward to next year's accounts the remaining £2,207, which, added to our ordinary and special reserves, will make our total reserves £20,754.

In the present condition of world turmoil, it is of no avail to prognosticate. We are content to know that we have the confidence of the public, and our position and methods are such that we need have no misgivings as to the future. Our special thanks are due to the manager (Mr. Goldsbury), the assistant manager (Mr. Howat), the secretary (Mr. Robertson), and all the staff, who have worked in your interests loyally and effectively. I now beg to propose the adoption of the directors' report, balance-sheet, and profit and loss accounts.

Business Done.

The motion was seconded by Mr. D. F. Gilfillan, and unanimously adopted.

The directors' proposal to pay a dividend to the shareholders at the rate of 10 per cent., plus 1s. 6d. per share bonus, equal in all to 17½ per cent., was adopted.

The chairman stated that Mr. S. J. Wilks was the retiring director in terms of the articles of association, but was eligible and offered himself for re-election. There was no other nomination, and Mr. Wilks was declared duly elected.

It was proposed by Mr. C. H. Barclay, and seconded by Mr. R. Niven, that the retiring auditors, Mr. H. F. Watson and Messrs. Alex. Aiken and Carter, be reappointed for the ensuing year. This was carried, and the remuneration for the past audit was fixed at £150 each.

Mr. A. R. Lowick recommended that the matter of awarding a bonus to the staff receive the consideration of the directors.

Mr. Gilfillan said that he would like to urge upon all shareholders the desirability of bringing to the notice of their friends the advantages of appointing such an institution as this executors and trustees in the administration of estates. The financial position of the company was unique, clients had undoubted security, and a well-trained staff ensured economy and efficiency. Mr. Gilfillan further stated that as far as he was concerned, both in his professional and private capacities, he invariably recommended his clients and friends to nominate the company executors under their wills.

With a vote of thanks to the chairman, the proceedings terminated.

Wages on the Mines.

COMING READJUSTMENTS. Reductions on Gold and Coal Properties.

In terms of the arrangements agreed on between the Chamber of Mines and the South African Industrial Federation four months ago, rates of pay on the mines will be amended as from the beginning of the New Year.

The wages of mechanics, improvers and apprentices on the mines will be reduced as from January 1, 1922, in accordance with the automatic scale for the adjustment of wages agreed upon between the Chamber of Mines and the South African Industrial Federation in August. Prior to that it was agreed that the wages of mechanics should not be reduced before the end of the present year. Formal notice has now been given to the unions concerned, through the Federation, of the coming reduction.

In September last the Chamber of Mines agreed that the wages of winding engine drivers should be stabilised to the same extent as the wages of mechanics. Formal notice has now been given through the Federation to the South African Amalgamated Engine Drivers and Firemen's Association that the wages of winding engine drivers will be reduced as from January 1, 1922, in accordance with the automatic scale above referred to.

The Automatic Scale.

The recommendations agreed to at the conference early in August between the Chamber and the Federation regarding the adjustment of wages on the mines were as follows:—

Future adjustments of wages to be based on the rise or fall in the cost of living, on a scale approximately corresponding to that rise or fall, i.e., in lieu of the £2 8s. increase there shall be substituted in the case of workmen earning, without those increases, 15s. per shift or over, an increase of 3s. 6d. per shift in respect of the first 21 per cent. increase in the cost of living, and an additional increase of 6d. per shift in respect of each 4 per cent. increase, or portion thereof, above 21 per cent., until (at 57 per cent.) an increase of 8s. per shift is reached. This scale to operate only between increases of 3s. 6d. and 8s. Variations beyond these limits not to be subject to fluctuation with the cost of living, but to be considered if and when the necessity arises.

In applying this sliding scale, wages to be adjusted quarterly, and to be based on the average increased cost of living figures of the last but one preceding quarter. Thus, as the average increased cost of living during the quarter January-March last was 43.6 per cent., the addition to wages during the quarter July-September would have been 6s. 6d. per shift, i.e., a reduction of 1s. 6d. per shift on the previous rates.

In order to adjust to this scale the wages of those who (without the increases) are earning less than 15s. a shift they will receive an addition bearing the same proportion to the addition received by the others as their wage, without any addition, bore to 15s.

Overtime, leave pay, etc., to be as at present, but based upon whatever rate is in force at the time.

The above scales may require some small modifications to adapt them to the case of apprentices.

The percentages above referred to are those shown in the periodical publications of the Director of Census with regard to the cost of food, fuel, light and rent.

Adjustments to take effect quarterly, on the first day of October, January, April, July and so on.

The scale not to apply to mechanics until after December 31, 1921.

The conference definitely recognised that circumstances over which neither the unions nor the Chamber can exercise any control may at any time necessitate a reconsideration of the whole position.

The decrease which the wages of mechanics and a certain section of the members of the Engine Drivers and Firemen's Association will undergo from the beginning of next year will, it is estimated, probably be 4s. 6d.

Colliery Wages.

The reductions of wages on the collieries will come into force on January 1, 1922. The effect of the reduction will be that a man who has been receiving 30s. will receive 25s., and a man whose pay has been 24s. 6d. will receive 21s. 7d., the reductions being 5s. and 2s. 11d. respectively.

The rent charged for married quarters on the coal mines is £3 2s. 9d. per month, and for single rooms 10s. 8d. per month. These rentals include fuel, sanitary service, water and, where available, light.

Rents on the collieries have not been raised since the end of 1914.

There's just as much difference

between the work that can be performed by using a file that has been "sand-blasted" and one which has not been subjected to this process as there is between using a sharp saw and a dull one. It has been demonstrated by thorough tests that a "sand-blasted" file will remove at least one-third more metal in a given time than a file which has not been "sand-blasted." If, therefore, you want the best of good, quick, clean and true work, insist on having those patent "sand-blasted"

Government Mining Leases Inspector's Report.

OFFICIAL REVIEW OF POSITION AT FAR EAST RAND MINES.

From the reports of the Government Inspector of Mining Leases for the quarter ended September 30 we take the following:—

Springs Mines, Ltd.

The ore reserves as at the 30th June, 1921, were estimated during the quarter, the pay limit adopted being 5 dwts. over a stoping width of 55 inches. The figures show the satisfactory increase of 276,803 tons in the payable reserves during the six months' period, the corresponding total average width being approximately one inch less, while the value remains the same. The present reserves include one small block of ore with an average width of 51 inches. The increase in the payable reserves by development is equivalent to a replacement of 2.28 tons for every ton mined from the reserves during the six months' period. The further opening up of the payable zone towards the eastern end of the east haulage has contributed about one-third of the total increase in the reserves, the balance being more or less distributed over the remaining portion of the mine. Certain connections of development ends in the above-mentioned zone made during the six months' period have been the means of transferring a considerable tonnage from the formerly unavailable to the present available reserves. The average working costs for the six months January to June were 30s. 4.7d. per ton. To meet these costs and making the necessary allowances for sorting and residues, and taking gold at its normal pre-war value, the lowest reserve block limit required is approximately 6½ dwts. In order to make 5-dwt. rock payable to mine with the above working costs gold must realise £5 14s. 6d. per ounce. About 23 per cent. of the total reserve tonnage has a value below 6½ dwts. There was a reduction of approximately 2½ inches in the actual stoping width and external waste width mined in the payable ore reserves during the six months compared with the widths estimated.

No. 3 Shaft.—During the quarter 203 feet have been accomplished in connection with station headings, together with 1,126 feet of development, which latter footage is included under that head. The erection of the permanent steel headgear, which has recently been delivered on the property, will be proceeded with shortly.

No. 4 Shaft.—The erection of the steel headgear is completed. The plant and surface equipment necessary for the resumption of sinking operations is now complete.

Of the total footage developed, 1,126 feet were driven from the No. 3 shaft. The greater portion of this footage was off reef, and of the footage sampled, amounting to 280 feet, 14.3 per cent. was payable, the average value and width being 42.8 dwts. over 10 inches. Compared with the previous quarter, there has been an increase of 624 feet in the footage developed and 10 feet in the footage sampled. The payable percentage of the footage sampled has decreased from 54 per cent. to 43.1 per cent., but the average value has increased from 516 inch-dwts. to 653 inch-dwts.

The headings north and south forming the north-west haulage have been connected up. This opens up a direct airway on the western side of the mine between the No. 1 upcast shaft and the Nos. 2 and 3 downcast shafts, and should materially improve conditions in the workings of that portion of the mine.

The rock broken in the mine according to survey measurements amounted to 148,403 tons. In addition, 37,391

tons were dumped as waste. The rock came from the following sources—

	Tons.	Percentage.	Dwts.	Sample value.
Payable ore reserves	109,269	73.6	9.93	
Other than payable ore reserves	12,049	8.1	5.79	
Development	27,085	18.3	4.27	
Total	148,403	100.0	8.56	

Average stope width, 58 inches; average reef channel width, 27 inches; average stope width in payable reserves, 58 inches.

Compared with the previous quarter there has been a decrease of 1,895 tons in the tonnage mined. A breakdown of the hoisting plant at the No. 2 shaft in September adversely affected operations.

The average value and width of the ore mined from the payable reserves, according to data adopted in the estimation of reserves as at the 30th June, 1921, were 8.70 dwts. over 61.43 inches, whilst the payable reserves as a whole at that date averaged 8.76 dwts. over 62.53. The face sampling value of the ore mined from the payable reserves after allowing for the difference in stoping width was about 7 dwt. higher than the corresponding block estimate. It is satisfactory to record that a further reduction of the average stoping width has taken place, thus minimising the percentage of waste rock reaching the mill. In the payable ore reserves the external waste estimated to be carried has been reduced by over 10 per cent. As the mine can keep the mill fully supplied, every ton of waste that can be kept out of the mill helps to improve the milling grade of the rock. Compared with the previous quarter, the tonnage milled shows a decrease of 9,650 tons, a breakdown in the hoisting plant during September interfering with the rock supply. The gold obtained shows a decrease of 1,207 ounces.

State Mines.

A summary of the development work is as follows—Drives, 2,476 feet; winzes and raises, 2,440 feet; haulage-ways, 1,215 feet; crosscuts, etc., 5,301; total, 11,432 feet. Footage on reef, 4,446 feet; footage sampled, 4,170 feet; footage payable, 2,970 feet (equal 66.1 per cent.). Average reef channel width payable footage, 52 inches; average reef channel value payable footage, 15.2 dwts. The development sampled at each of the shafts was—North-west shaft: Total feet, 1,180; percentage, 26.4; payable, 650 feet; percentage payable, 55.1; channel width payable, 59 inches; channel value payable, 13.5 dwts. North-east shaft: Total feet, 1,010; percentage, 23.3; payable, 520 feet; percentage payable, 50.0; channel width payable, 45 inches; channel value payable, 9.1 dwts. South-west shaft: Total feet, 1,100; percentage, 24.6; payable, 1,010 feet; percentage payable, 91.8; channel width payable, 46 inches; channel value payable, 18.5 dwts. South-east shaft: Total feet, 1,150; percentage, 25.7; payable, 790 feet; percentage payable, 68.7; channel width payable, 57 inches; channel value payable, 16.3 dwts. Totals and averages: Total feet, 1,170; percentage, 100.0; payable, 2,970 feet; percentage payable, 66.1; channel width payable, 52 inches; channel value payable, 15.2 dwts. Compared with the previous quarter there has been an increase in the total footage developed of 2,372 feet, and in the footage sampled of 610 feet. The payable percentage of the footage sampled has increased from 53.6 per cent. to 66.4 per cent., and the average value from 723 to 791 inch-dwts. The sampled footage is fairly evenly distributed over the four shafts. The ratio of crosscuts, etc., to the total development footage is higher than for previous

quarters owing to the system of carrying a larger percentage of the primary development in footwall in order to facilitate the eventual handling of the stoped rock. This entails an increased amount of crosscutting to tap the reef. The average value and width of ore mined from the payable ore reserves, according to data adopted in the estimation of reserves as at 31st December, 1920, were 8.13 dwts. over 78 inches, whilst the payable reserves as a whole at that date averaged 8.19 dwts. over 76.5 inches. The face sampling value of the ore mined during the quarter from the payable ore reserves was 85 inch-dwts. higher than the corresponding estimated block value. This increase is most marked in the south-west shaft section of the mine, where the sampling value was 189 inch-dwts. in excess of the estimated value. This is equivalent to practically 2½ dwts. over the stoping width.

Of the total revenue from gold, the sum of £223,458 0s. 5d. represents the estimated premium, being at the rate of 26s. 4d. per ounce, and equivalent to 10.516s. per ton milled. The estimated premium for the previous quarter was equivalent to 8.054s. per ton milled. Compared with the previous quarter, the working profit shows an increase of 2.932s. per ton milled, but excluding the gold premium and exchange, the working profit shows an increase of 0.621s. per ton milled.

New Slate Areas.

A summary of the development work is as follows:—Drives, 1,537 feet; raises, 943 feet; winzes, 574 feet; crosscuts, etc., 1,573 feet; total, 4,657 feet. Of the above total, 1,929 feet and 2,728 feet were accomplished at the north and south shafts respectively. Footage on reef, 1,624 feet; footage sampled, 1,610 feet; footage payable, 870 feet (equal 54 per cent.). Average reef channel width payable footage, 26 inches; average reef channel value payable footage, 30.5 dwts. The development sampled at each of the shafts was:—North shaft, Total feet, 1,060; percentage, 65.8; payable, 320 feet; percentage payable, 30.2; channel width payable, 30 inches; channel value payable, 12.0 dwts. South shaft: Total feet, 550; percentage, 34.2; payable, 550 feet; percentage payable, 100.0; channel width payable, 24 inches; channel value payable, 43.9 dwts. Totals and averages: Total feet, 1,610; percentage, 100.0; payable, 870 feet; percentage payable, 54.0; channel width payable, 26 inches; channel value payable, 30.5 dwts. Of the total footage developed, 606 feet were in connection with the shaft stations and off reef. Compared with the previous quarter the total footage developed shows an increase of 1,014 feet. The values met with in the reef exposures in the north shaft are encouraging, as 30 per cent. of the development on reef averaged in value 360 inch-dwts. It will be remembered that this shaft intersected the reef in a very poor zone, the value being about 5 inch-dwts. Faulting in the south shaft has caused a certain amount of displacement of the reef, but wherever exposed the reef has proved payable, the average value for the quarter being 1,054 inch-dwts.

The capital expenditure amounted to £95,661, made up as follows:—Shafts and equipment, £13,277; development, £44,580; equipment mine, £7,224; compressor plant, £13,726; additions to compounds, £6,283; other surface works, buildings, etc., £10,571; total, £95,661.

West Springs.

No. 1 Shaft.—Work has made satisfactory progress at this shaft. The main station approaches and return ways are practically completed. A transformer chamber has been cut and its equipment is in progress, and four main development headings have been commenced.

No. 2 Shaft.—The borehole from the bottom of this shaft was sunk a further 732 feet during the quarter to a total depth of 1,068 feet, making the bottom of the hole 4,004 feet below the shaft collar, at which depth drilling was stopped. The amygdaloidal diabase was entered at a depth of 3,958 feet. In the No. 1 shaft the footwall of the reef was intersected at a vertical depth of 840 feet below

the top of the amygdaloidal diabase, and assuming a similar vertical thickness of strata between these two points at the No. 2 shaft, then the reef should be encountered at a depth of about 4,800 feet. When sinking ceased the bottom of the shaft had reached a total depth of 2,940 feet. The development sampled from No. 1 shaft, West Springs, and from the Springs Mines property is as follows:—West Springs shaft: Total feet, 260; percentage, 63.4; payable, 35 feet; percentage payable, 13.5; channel width payable, 35 inches; channel value payable, 8.56 dwts. Springs Mines shaft: Total feet, 150; percentage, 36.6; payable, 105 feet; percentage payable, 70.0; channel width payable, 13 inches; channel value payable, 47.59 dwts. Totals and averages: Total feet, 410; percentage, 100.0; payable, 140 feet; percentage payable, 34.1; channel width payable, 19 inches; channel value payable, 29.17 inches. Compared with the previous quarter, there has been an increase of 1,314 feet in the total footage developed. The payable percentage of the footage sampled increased from 21 per cent. to 34 per cent., but the average value decreased from 576 to 541 inch-dwts.

Ventilation is receiving careful attention, and all the main headings are divided throughout their length by a 9in. brick wall forming an intake and return airway. The foul air and fumes from blasting are exhausted from the faces by means of electrically-driven fans installed at the shaft station, and ascend the shaft through the three northern compartments, which are bratticed off to form the upcast. The working conditions are good and the mine is working double shift.

Brakpan Mines.

The ore reserves as at the 30th June, 1921, were estimated during the quarter, the pay limit adopted being 5 dwts. over a stoping width of 50 inches. The following table gives the particulars of the reserves as at the 30th June last and the 31st December, 1920, when the previous estimation was made for purposes of comparison:—Payable reserves: Available, 30th June, 1921, 2,184,338 tons; stope width, 69.70 inches; value, 8.87 dwts; available, 31st December, 1920, 2,182,926 tons; stope width, 70.13 inches; value, 9.01 dwts. Unavailable, 30th June, 1921, 170,174 tons; stope width, 67.45 inches; value, 7.36 dwts.; unavailable, 31st December, 1920, 156,241 tons; stope width, 65.61 inches; value, 7.06 dwts. Pillars, 30th June, 1921, 195,113 tons; stope width, 72.85 inches; value, 8.83 dwts.; pillars, 31st December, 1920, 187,350 tons; stope width, 73.60 inches; value, 8.84 dwts. Totals and averages: Tons, 30th June, 1921, 2,549,625; stope width, 69.78 inches; value, 8.77 dwts.; 31st Dec., 1920, 2,526,517 tons; stope width, 70.08 inches; value, 8.88 dwts. The above figures show an increase of 23,108 tons in the payable reserves during the six months period; the average stoping width and value both show a slight decrease. The ore brought into the reserves during the six months is practically all situated in the south-western portion of the mine. The development in the south-western area was either off reef or in low-grade rock, and very little additional tonnage has been opened up in this district.

The average working costs for the six months January to June, 1921, were 27s. 11.4d. per ton milled. After making the necessary allowances for sorting and residues, and taking gold at its normal pre-war value, the lowest reserve block limit required to meet these costs is approximately 5.9 dwts. In order to make 5-dwt. ore payable to mine with the above working costs gold must realise £5 1s. 8d. per ounce. About 22 per cent. of the total reserve tonnage has a value below 5.9 dwts. The actual stoping width and external waste width mined in the payable ore reserves during the six months closely approximated the widths estimated.

Compared with the previous quarter, there has been an increase of 863 feet in the total footage developed, and an increase of 70 feet in the footage sampled. The payable percentage of the footage sampled has increased from 38 per cent. to 40 per cent., but the average value has decreased

from 555 to 578 inch-dwts. Of the total footage developed, 191 feet in haulage ways were accomplished at No. 1 shaft, but no payable reef was disclosed.

Of the total revenue from gold, the sum of £87,476 7s. 6d. represents the estimated gold premium, being at the rate of 26s. 3d. per ounce, and equivalent to 10s. 0.59d. per ton milled. The estimated premium for the previous quarter was equivalent to 8s. 0.92d. per ton milled. Exchange for the quarter amounted to £1,057. compared with £2,204 17s. 6d. for the previous quarter. Compared with the previous quarter, the working costs show a decrease of 1s. 10.181d., and the working profit an increase of 1s. 8.364d. per ton milled. The working profit, excluding the gold premium and exchange, shows a decrease of 0.952d. per ton milled. To the working profit of £138,855 8s. 7d. may be added the sum of £1,070 11s. 3d., representing the difference between the estimated premium and the actual premium on gold for the three months 31st August, 1921.

Modderfontein East.

Compared with the previous quarter, there has been a decrease of 1,009 in the total footage developed. The payable percentage of the footage sampled increased from 46.2 per cent. to 52.4 per cent., but the average value decreased from 354 inch-dwts. to 326 inch-dwts. The percentage of payability in the No. 2 shaft has improved considerably; in the No. 1 shaft it has fallen, whilst in the No. 3 shaft it has remained about the same. The rock broken in the mine, according to survey measurements, amounted to 77,300 tons. The rock broken came from the following sources:—Payable ore reserves, 56,785 tons; percentage, 73.5; sampled value, 10.63 dwts.; other than payable ore reserves, 6,519 tons; percentage, 8.4; sampled value, 4.36 dwts.; development, 13,996 tons; percentage, 18.1; sampled value, 2.99 dwts. Totals: 77,300 tons; percentage, 100.0; sampled value, 8.72 dwts. Average stope width, 56 inches; average reef channel width, 36 inches; average stope width in payable reserve, 57 inches. Compared with the previous quarter there has been a decrease of 3,230 tons in the tonnage mined and an increase in the average value of 0.66 dwts. The rock broken in the payable reserves during the quarter increased from 62.6 per cent. to 73.5 per cent., and the average value decreased 0.66 dwt. The rock taken from development decreased from 37 per cent. to 18.1 per cent., and the value increased 0.4 dwt. Only 300 tons, or 0.4 per cent., of rock was broken in other than payable ore reserves during the previous quarter. The average face sampling value of the ore stoped in the payable reserves is about $\frac{1}{2}$ dwt. below the estimated value of the corresponding blocks. This is the first quarter since milling operations commenced that the face sampling value has fallen below the block estimate, but, as pointed out in my March quarterly report, this falling off was not unanticipated. The average value and width of ore mined from the payable reserves, according to data adopted in the estimation of reserves, as at the 30th June, 1921, was 11.14 dwts. over 57.71 inches, whilst the payable reserves as a whole at that date averaged 7.7 dwts. over 56.7 inches. Overmining has, therefore, taken place to the extent of 206 inch-dwts., or approximately $3\frac{1}{2}$ dwts. over the stoping width. The average stoping width was practically the same as for the previous quarter, but the external waste mined was reduced in width by over an inch. Compared with the previous quar-

ter there was an increase of 4,850 tons in the tonnage milled, and an increase of 2,018 ounces in the gold obtained; the value of the ore before milling was slightly higher. The percentage of waste sorted decreased from 20.6 per cent. to 17.9 per cent., as there was less tonnage drawn from surface dumps and less waste mined.

The total cost of development was £37,429 8s. 10d. The fixed charge was 5s. per ton from stopes for July and 6s. per ton for stopes from August and September. The expenditure under surface transport includes the sum of £8,239 15s., equivalent to 2s. 1.58d. per ton mined, for transport of ore between the mine and the Apex plant. Compared with the previous quarter, the mining costs, excluding development, show an increase of 2s. 6.79d. per ton mined. This increase is more apparent than actual, due to the unit of cost adopted being "per ton mined." During the quarter under report 81.9 per cent. of the rock mined came from stoping, whereas only 63 per cent. was derived from that source during the previous quarter. Development in both quarters accounted for the balance of the rock, amounting to 18.1 per cent. and 37 per cent. respectively. As the costs of shovelling and tramping, winding, pumping, and other charges are distributed in proportion to the tonnages derived from mining and development, it will be seen that the former carries a considerably greater proportion of these charges this quarter than for the previous quarter. The higher price of explosives is also a factor bearing on the increased cost.

Of the total revenue from gold, the sum of £42,133 18s. 7d. represents the estimated premium, being at the rate of 26s. 1.27d. per ounce, and equivalent to 10s. 8.57d. per ton milled; therefore the premium more than accounts for the working profit. Compared with the previous quarter, the total working expenses show an increase of 2s. 2.208d. per ton milled. This increase is due chiefly to the higher cost of mining and development, these heads having increased respectively 10.95d. and 1s. 7.29d. per ton milled. General expenses, mine and reduction costs both show a decrease. There is a decrease of 3.48d. per ton milled in the working profit, but if the gold premium is excluded the decrease becomes 2s. 5.68d. per ton milled compared with the previous quarter.

The capital expenditure amounted to £26,569, made up as follows:—Mine equipment, £7,939; development, £16,677; surface works, buildings, etc., £7,365; total, £31,981; less credit, £5,412—£26,569.

The average number of coloured labourers at work during the quarter was 2,027, compared with 2,319 for the previous quarter.

The ground to the north of the present workings has recently been tested by means of drilling. Three boreholes have been put down to the reef, with, unfortunately, disappointing results as regards values.

Of the issue of £400,000 registered 8 per cent. debentures for the purpose of redeeming the outstanding $6\frac{1}{2}$ per cent. debentures falling due on the 31st July last, £65,000 were taken up by shareholders and the holders of the $6\frac{1}{2}$ per cent. debentures. Practically all these $6\frac{1}{2}$ per cent. debentures outstanding have been presented for redemption.

PAUKWAB TINS LIMITED.—WANTED.

A good practical man, with experience of Tin Mining and Recovery (alluvial and reef), as Mine Manager for the Company's property at Okombahe, District of Omaruru, Protectorate of South West Africa.

Write, giving full particulars of experience, testimonials, age and salary required, to—

THE SECRETARY,
C/o East London Board of Executors
and Trust Co., Ltd.,
P.O. Box 254, East London.

GOVERNMENT EXAMINATIONS.

MINE MANAGERS' EXAMINATION

Total certificates (metal) granted to date 1921 — 36
Secured by students of Messrs. Lucas & Wolfe — 15
Balance for S.A. — 15

In addition to above we obtained 5 coal certificates
last two examinations

OVERSEERS' EXAMINATION

During 1918 and 1919 we secured the majority of the certificates granted. 21 certificates in 1920, and 23 certificates to date 1921 (metal and coal)

SURVEY EXAMINATION

We have obtained practically all the certificates granted by the Mines Dept. during recent years and have secured 62 certificates to date

EDITORIAL.

LESSONS OF THE STRIKE.

The Crown Mines strike should provide an object lesson for the whole of South Africa. We do not propose to reiterate the history of the events which have led up to this deplorable industrial catastrophe, nor do we intend to recapitulate the various arguments and suggested compromises brought forward at the various conferences, which unfortunately broke down on Monday night. The company is very rightly fighting for a principle which, if surrendered, would be fatal to discipline on the mines and would further embarrass an industry already languishing under the heavy burdens imposed on it by Trades Union restrictions,

inordinately high costs and poor labouring efficiency. We rejoice in the fact that the Chamber of Mines has taken up a firm stand in this matter. But we are extremely sorry that the men have not listened to reason and have assumed an attitude which has compelled the management virtually to close down the proposition. The Crown Mines distributes over three millions per annum in wages and stores. It is the largest of our town mines, and prolonged inactivity at the property will most seriously and adversely affect Johannesburg and indeed the whole of the country.

It is little short of amazing that in the face of an alarming increase in the numbers of the unemployed consequent on retrenchment resulting from the present depression, the workers on the Crown Mines should throw away their comfortable livelihoods over a dispute in which they are wrong, and manifestly wrong. These men, and perhaps the public generally, do not adequately realise that the Rand mining industry is in large degree carrying the whole country on its back, and that if the gold mines are tampered with, the Union generally will speedily feel the dire result. There is a disposition in some quarters to believe that the mining enterprises of the country other than those of the Witwatersrand are able to absorb large numbers of mine workers. Nothing is further from the truth. The Labour returns issued by the Mines Department show that nearly 5,000 less white men were employed by mines, alluvial diggings and metallurgical works in October of this year than in October of 1920. The coal mines slightly increased their complement, but there were substantial reductions in the numbers of European employed by copper and tin mines as between these two dates. The diamond mines, on account of the collapse in the gem market, had to well nigh halve their white labour force whilst the numbers of Europeans on alluvial diggings and prospecting concerns declined in the same period from 7,100 to 4,200. The gold mines, on the other hand, employed just as many Europeans in October, 1921, as they did twelve months previously. And of the 30,887 whites employed by all the mines of the Union, over 21,000 were at work on the Rand. The actual number of white persons in the service of the Witwatersrand gold mines on the last full working day of the month was 20,958, and the total amount disbursed to white persons in the service of Witwatersrand gold mines during the month was £847,253, including £40,342 as leave pay and £5,746 as bonus.

In other words, the mines of the Rand are paying out in wages alone over ten millions sterling per annum. These figures conclusively show that without the Witwatersrand the mining industry, and in fact the whole of the Union, would be in a most parlous plight to-day. The statistics quoted above should, too, make it abundantly clear that ill-timed and senseless strikes, like that now in progress at the Crown Mines, are bound to jeopardise the finances of the State and to embarrass every inhabitant of the country.

THE FUTURE OF THE GOLD PREMIUM.

There is still a perplexing difference of opinion among the authorities in regard to the future of the gold premium. In their prophecies regarding the fluctuations of the premium, most of the experts have shown themselves singularly at sea, and it may be that the premium will continue to move contrary to their anticipations. The premium, we all know, is bound up with the course of the dollar exchange, and the latter is in turn conditioned by the state of trade between England and America, and the international war debts. Asked why the price of gold continued to decline, one authority stated recently: "Because the trade position of England with regard to America continues to improve daily. In other words, the English pound note will buy more of the world's goods—America's included—than it would a month ago." "This," he proceeded, "is partly due to a fall in prices in England, created by wage-cutting, which, in turn, has come about through international competition for the world's markets. The balance of trade as between England and America is gradually being restored. This tends to bring the pound back towards the pre-war exchange rate compared with the dollar, and consequently fewer shillings

are required to-day to purchase an ounce of gold than was the case last month, when the pound sterling was worth less."

Against this we have a reported revival in American trade which may result in a corresponding rise in the dollar, with a consequent increase in the gold premium. The whole question, it will be seen, is much too complicated to tempt one to prophesy. The Rand, which is so vitally interested in the fluctuations of the premium—over which apparently it has no control—can only "wait and see" what the future may bring forth.

Notes & News.

Transvaal Silvers.

We understand that development operations on the Transvaal Silver and Base Metals continue to disclose satisfactory values over a good thickness of ore.

* * *

Position of the Lace Proprietary.

At the annual meeting of the Lace Proprietary Mines held in Johannesburg during the week, Professor Lawn, who presided, stated that the company is in a strong financial position. The cash on hand amounts to £135,233 and the only policy which the company can pursue is to conserve the finances of the company and await developments. The board is, however, keenly alive to boring and development results in adjacent propositions, and in his speech Professor Lawn made an interesting reference to data recently secured in neighbouring propositions. The full speech appears elsewhere in this issue.

* * *

Mr. Jagger and the Nurahs.

The discussion between the Minister of Railways and the National Union of Railway and Harbour Servants on the question of wages, privileges, and hours, which has been going on for some time, took an interesting turn this week. The "Nurahs" have had a general congress at Bloemfontein; and as a result a deputation of their representatives waited on the Minister, Mr. Jagger, on Monday with a set of categorical questions relative to the attitude of the Administration. The Minister, very properly we think, refused to answer these point-blank questions verbally, but promised to do so in writing at his convenience. The deputation thereupon unceremoniously withdrew. On Tuesday the Minister replied in detail and in writing to the deputation, reaffirming the attitude of the Administration on the questions at issue. General opinion is in entire agreement with the Minister, who, it is recognised, very rightly refuses to be bullied or browbeaten in regard to the railway economies rendered absolutely necessary by the present general conditions of the country.

* * *

Johannesburg Board of Executors.

A statement that must be very gratifying to the shareholders was presented at the annual meeting of the Johannesburg Board of Executors last week. A full report of the meeting will be found elsewhere in this issue, from which it will be seen that the company is in an extraordinarily strong and stable position. As Mr. C. H. Barclay, who presided, pointed out, it has, for practical purposes, no liabilities at all, its realisable assets are more than double its issued capital, and it possesses the goodwill of an old-established business which is constantly and steadily increasing. The company thoroughly deserves the confidence of the public which it has won in such a large measure, and the figures show that the funds placed in its hands for investment on behalf of clients have doubled in the past seven years. An important branch of the business

carried on is the administration of estates, and the public are learning to appreciate the advantages of appointing so long-established and sound an institution as trustees and administrators. A perusal of the chairman's speech in this issue may be recommended as an antidote for pessimism.

Another Shaft-sinking Record.

Particulars are to hand of another shaft-sinking record. At the Chief Consolidated Mine, in the Tintic district, Utah, the Water Lily vertical shaft was sunk 427½ ft. during the 31 days from July 15 to August 15. The first 367 ft. passed through a porphyry formation, and the last 60 ft. through a moderately hard close-grained limestone. The shaft has three compartments, each measuring 4 ft. 4 in. by 4 ft. 6 in. The surface equipment consists of two small hoists and two air-compressors operated electrically. Hoisting was done through two compartments. Timbering was done as the work proceeded by means of a suspended steel bulkhead hung from each last set, so that drilling and hoisting could be done continuously. The average number of holes drilled each round was 23.9. The particulars supplied do not include the depths below surface of the start and finish of this trial.

* * *

The Year with Witbank Colliery.

For the year ended August 31 last Witbank Colliery earned a profit of £155,952. In the course of his annual report, the Consulting Engineer, Mr. Stuart Martin, writes:—The despatches for the year are the highest so far recorded, and show an increase of 122,091 tons over the preceding year. The number of shifts worked decreased 17 at Witbank and increased 145 at Uitspan. It is noteworthy that practically the whole of the increased output consisted of round coal. The sales of Duff diminished and a considerable quantity was dumped on the surface. Development in both sections of the colliery has been fully maintained, and coal of typical thickness and calorific value continues to be opened up. The shortage of rolling stock on the railways continues to limit the company's ability to produce the maximum output. Capital expenditure for the year totalled £21,800. There are no important liabilities on capital account for the current year. Fair progress can be recorded from the by-products plant, as the products are becoming known to consumers. The underground workings, machinery and plant are all in first-class condition and order. The management and staff are to be congratulated on their successful year's work.

* * *

Medical Research on the Rand.

Everybody knows that the South African Institute for Medical Research has rendered, and is rendering, magnificent service to the country. In its bacteriological research department Sir Spencer Lister's work in connection with pneumonia has been of tremendous value, and particularly so to the mining industry, and in respect of industrial hygiene it is known that Dr. Mavrogordato has been conducting research work in regard to silicosis of the very highest importance for the last two years. Having regard to all this, one is sometimes tempted to wonder whether the fullest and best use is being made of the data secured, and whether sufficient publicity is given to the results of the investigations. We observe, for instance, in an editorial appearing in a recent issue of *The Lancet* on the subject of silicosis that reference is made to data secured in South Africa so long ago as 1915. It is not asserted in *The Lancet's* article that such data represent the last words on the subject. But the article suggests to us the possibility of much more up-to-date light being thrown on this highly important aspect of industrial hygiene by the Johannesburg Institute, which should at any rate lead the world, not only in its investigations, but in its publications as well, in regard to an industrial disease which has been more prevalent on the Rand than in any other mining field.

CROWN MINES STRIKE.

BRIGHTER PROSPECTS—THE CHAMBER'S TERMS—TIME LIMIT EXTENDED TILL TO-DAY.

The situation regarding the Crown Mines strike took a distinctly better turn on Thursday, when, as the result of the Joint Executives' meeting the previous day, the S.A. Industrial Federation wrote to the Chamber of Mines on the "five shifts for one" proposition, and received, in reply, a clear statement of the terms the Chamber was prepared to offer.

The terms are those proposed by the Minister of Mines and Industries, and are as follows:—

The Terms.

That the strike be called off immediately on the following conditions:—

1. That it be accepted by both sides that officials shall not be represented by workmen's unions in any dispute, whether the official be a member of such union or not.
2. That a conference be held to settle the application of this principle as it may affect some borderline cases.
3. No victimisation on either side, and the men to be re-employed as rapidly as work can be provided.
4. Strikers not to be required to sign on as new hands, but leave privileges will be continued subject to the provisions of the existing regulations, the word "five" being substituted for "ten" (for this occasion only) in Regulation No. 10.
5. After work has been resumed, Mr. Walthew should be given an opportunity to interview the management of the Crown Mines in the presence of a Government official nominated by the Minister. This interview to take place within two days of the men returning to work.

Federation Re-opens Correspondence.

The Federation's first letter to the Chamber on Thursday morning was as follows:—

J. Boyd, Esq.,

Assistant Secretary, Department of Labour,
Chamber of Mines, Johannesburg.

Dear Sir,—At the Joint Executives meeting, held yesterday, of the unions concerned in the mining industry, there appears to be some misunderstanding as to whether the Chamber of Mines actually agreed at the conference with the Minister of Mines, to the compromise of the holiday leave regulations of a 5 to 1 instead of 10 to 1 as laid down in the regulations.

The following resolution was passed, which I was directed to submit to you, and I should be glad if you would let me have a reply as early as possible:—

"That steps be taken at once to ascertain whether the Chamber of Mines is agreeable to substitute five shifts to one for ten shifts to one in relation to the penalties under the leave privileges."—Faithfully yours,

(Signed) J. GEDDES, Acting General Secretary.

The Chamber's Reply.

This brought an immediate reply, the Chamber writing:—
The Acting General Secretary,
South African Industrial Federation,
Johannesburg.

Dear Sir,—With reference to your letter of even date, at Monday's meeting the Chamber's representatives intimated to the Minister that, if the union accepted the compromise proposed by him on the matter of leave, the Chamber would not stand out. Since, however, the union's representatives, after consultation in private, definitely rejected the proposal, this undertaking, of course, lapsed.

Nevertheless, the Chamber will be prepared, not to alter its holiday leave regulations, but to agree, in this particular case only, to the Minister's proposal, provided that the strike is at once called off and the men return to work to-morrow morning (Friday, the 2nd instant).

In order that there may be no misapprehension, I attach a copy of the settlement the Chamber will accept.—Yours faithfully,

(Signed) J. BOYD, Asst. Secretary, Dept. of Labour.

Extension of Time Asked.

The Executive of the Federation sat on Thursday, but as it was almost impossible to call the necessary meeting for the consideration of this offer on Thursday afternoon, Mr. Geddes wrote, asking the Chamber if they would extend the time for the men returning to work until Saturday morning. On this point the Chamber answered:—

"In reply to your second letter of this date on the above subject, the Chamber is prepared to extend the time for the men returning to work until Saturday morning, the 3rd instant. I would, however, point out to you that this will mean that the majority of the men will not be required until Monday, as on Saturday it will not be convenient to provide occupation for any except certain timbermen, skipmen and trammers, and possibly some others.—Yours faithfully,

(Signed) J. BOYD, Asst. Secretary, Dept. of Labour.

Whether the Chamber's offer, as now reaffirmed, will be accepted or not, remains to be seen, but it is certain that yesterday's steps offer a greater possibility to settlement than any taken during the whole course of the dispute.

A further batch of boys left the Crown Mines on Thursday

THE SOUTH AFRICAN MINING AND ENGINEERING JOURNAL.

SPECIAL ENGINEERING FEATURES. ..

¶ This section of the Journal is being much^{er} extended in scope and usefulness.

MANY IMPORTANT ARTICLES ARE IN
CONTEMPLATION.

ENGINEERING SECTION.

The British General Electric Co., Ltd.

THE COMPANY'S NEW BUILDING "AN ENGINEERING ACROPOLIS"—HOW THE BUSINESS HAS GROWN—A RECORD OF CONTINUOUS PROGRESS—OLD AND NEW JOHANNESBURG—EVERYTHING FROM A TURBO-GENERATOR TO A BELL PUSH.

It is with pleasure we record another forward step in the commercial activities of South Africa. We refer to the immense strides made by that well-known South African firm, the British General Electric Company, Limited. In the early days of Johannesburg, to be exact, 1896, with a very small store and office in Commissioner Street, this firm started; 1904 saw them occupying a wood and iron building on the present site—a building typical of that period in Johannesburg. This building soon proved inadequate for the growing business, and a large brick structure was erected in 1910. 1920 witnessed yet another building. To-day we have "Magnet House" at the corner of Leveday and Anderson Streets, a truly palatial and fitting home for such a firm as the "B.G.E.C." as they are familiarly styled.

Having heard a good deal about Magnet House, and with a view to securing information, a representative of this journal recently paid the B.G.E.C. a call, and under the guidance of their genial Managing Director, Mr. W. B. Phelps, and his obliging staff, was able to gain a fairly comprehensive understanding of one of South Africa's large business organisations.

A new building symbolical of engineering progress in South Africa has just been completed in Johannesburg. It is a striking edifice of magnificent proportions, as the accompanying photograph shows. It is styled Magnet House, and it is the new headquarters of the British General Electric Co., Ltd. The British General Electric Co. are the direct representatives in South Africa of the world-famous General Electric Co., Ltd., of England, the largest electrical manufacturing concern in the United Kingdom, with large works in Birmingham, Manchester, Coventry, Newcastle, Southampton and London, which give employment to nearly 20,000 people. They are also the proprietors of Fraser and Chalmers' Engineering Works at Erith. These factories embrace the whole range of electrical plant and supplies of every description, from the steam turbo generator to the humble bell push.

How the Business has Grown.

The head offices and stores of the British General Electric Company are situated at the corner of Leveday and Anderson Streets, Johannesburg, and the sub-branches and stores are at 89, Castle Street, Cape Town, and 56, Field Street, Durban, respectively. The company's activities go, however, much further than this. The B.G.E.C. service

extends in fact throughout the sub-continent, and they have agents at Port Elizabeth, East London, Pietermaritzburg, Bulawayo, Delagoa Bay, Mozambique, Dar-es-Salaam, Zanzibar, Beira, Mombasa and Nairobi.

The company first started operations in Johannesburg in 1896, with a small store and office in Commissioner Street. With the growth of business the Cape Town branch

PHOTOS THAT TELL AN ELOQUENT TALE OF PROGRESS.

The B.G.E.C., Johannesburg, in 1904.

The B.G.E. Co.'s Johannesburg Headquarters in 1910.

was started in 1903, and the Durban branch was opened at the beginning of 1921.

The Johannesburg store and office were removed to the present site in 1904, on which then stood a wood and iron building, typical of old Johannesburg. These premises,

however, soon proved inadequate, and they were pulled down and a larger brick structure was erected in 1910.

Subsequently, owing to the wonderful increase of the company's business, plans were got out for the further extension of the building in 1914, but, owing to the war breaking out, the extensions were held up.

The new building was begun towards the end of 1920, and has just been completed. It is indeed a structure of which any city might be proud, and it constitutes a remarkable testimony to the growth of the B.G.E.C.'s business in the Golden City and throughout the country. The building is constructed throughout of reinforced concrete, and has four floors, *i.e.*, ground floor, and three floors above. These floors are served by an automatic push-button electric lift, manufactured by the Express Lift Co., of London, one of the subsidiary companies of the parent concern.

In the Show Rooms.

In the engineering showroom are displayed the various types of dynamos and motors, starting gear, switchboards, high tension oil switch cubicles, high and low tension switchgear, measuring and testing instruments, lightning arrester gear, portable electric tools, lift controller gear, electric fans, etc., etc. There is also an interesting display of semi-automatic electric house lighting plants and small oil engines for farm use.

The electro-medical showroom, which is undoubtedly the finest of its kind in South Africa, displays to advantage all the latest inventions in electro-medical apparatus as manufactured by Messrs. Watson and Sons (Electro-Medical), Ltd., London, for whom the company are the sole agents in South Africa. A complete installation of X-ray ap-

Magnet House, the magnificent New Premises of the British General Electric Co., in Johannesburg.

A Wonderful Display

The ground floor provides accommodation for the heavy engineering stocks, such as dynamos, motors, switchgear, and also the packing and despatch departments. On this floor is the very latest type of overhead travelling crane for handling the heavy machinery, and by this means every portion of the floor can be reached with a minimum of labour.

The first floor is devoted entirely to the offices and show-rooms. These latter consist of a suite of three spacious apartments for fittings and glassware, electrical plant and supplies, and electro-medical apparatus respectively.

The fittings showroom is elaborately fitted up, and displays to great advantage the very latest designs of electric light fittings and glassware, as well as electric cooking apparatus, and the latest inventions for electric heating.

paratus, consisting of 10 k.w. transformer, switch control table, couch and tube stand is fitted, and practical demonstrations are given daily to the medical profession.

The second and third floors are devoted to stock rooms for various departments of the company's organisation, and everything in connection with care and control of stock is arranged in a most systematic manner.

A Wide Field of Operations.

The company's operations in South Africa cover the whole field of electrical engineering and supplies, including steam turbines, Turbo compressors, Turbo blowers, dynamos, motors, transformers, switchgear and switchboards, portable electric tools, electric lifts, electric fans, electric lighting supplies, cable and wires, measuring instruments, telephone and telegraphic apparatus, mining bells and signalling apparatus, insulators, heating and cooking apparatus, electro-medical apparatus, magnetos, etc., etc.

Large stocks are held at the company's stores at Johannesburg, Capetown and Durban, and the mining industry is specially catered for.

Large Contracts on Hand.

The firm specialises in the complete equipment of power and lighting installations for mines, municipalities, factories, etc., under the supervision of its engineering experts. Many large contracts have been carried out in South Africa. Among contracts at present on hand may be mentioned

From the foregoing our readers will readily realise the British General Electric Company, Limited, of South Africa is an organisation of no mean proportions. Representing these immense manufacturing activities, they are naturally in the unique position of having first-hand information and trading knowledge embracing the whole range of electrical plant and supplies, and in conclusion we would suggest that any of our readers specially interested should pay a visit to Magnet House, where not only an interesting but a profitable hour can be spent.

A View in the Engineering Show Room.

three 3,000 k.w. Turbo alternators and high tension transformers and switchgear for the Pretoria Municipality, and a steam-driven Turbo compressor 30,000 cubic feet capacity for the Randfontein Estate G.M. Co.

Times at present may be bad; they are bad. But we are not incorrigible pessimists. We believe that the clouds which hang over our heads in sunny South Africa will soon be dispelled. The country will come into its own again, The growing scope and usefulness of electricity will help again to galvanise life into languorous industries, and in the epoch of activity that is coming the British General Electric Company is destined to play a great part. But whether times be good or bad, the B.G.E. Co. is here to stay. The magnificent building just completed—it is a veritable electrical engineering aeropolis—is an earnest of this, and the wide range of stocks which the company carries provide tangible evidence of the B.G.E. Co.'s belief in the country and in their ability to play a large and increasing usefulness in the country's engineering progress.

TENDERS CALLED FOR.

Tenders are invited by the Natal Navigation Collieries and Estate Co., Ltd., for the supply and erection of plant under the following contracts:—

Specification No. 1—Contracts Nos. 1 and 2: Supply and erection of generating plant and switchgear.

Specification No. 2—Contracts Nos. 3 to 9: Supply only of haulages, motors, cables, transformers, pumps, overhead equipment and pipe line. Copies of general conditions and specifications may be obtained from the company at 28, Natal Bank Chambers, Natal, or from Messrs. G. M. Clark and Partner, 10-12, Meischke's Buildings, Johannesburg, on deposit of two guineas for each specification, which will be refunded on receipt of a bona fide tender.

Denver Engineering Works.

CONSTRUCTIONAL ENGINEERS. IRON AND BRASS FOUNDERS. LOCOMOTIVE AND ROLLING STOCK REPAIRS. SMITHS. BOILER MAKERS. CRUCIBLE AND CAST STEEL FOUNDERS.

The Denver Engineering Works (Chisholm Stevenson and Company, Limited), situated on the Main Reef Road, Denver, have been in existence since 1916. Shortly after the Boer War their present premises were owned by Hubert Davies and Spain, who conducted engineering work there for a few years. Subsequently they closed down, and after nine years of inactivity the present owners took over the works and founded the Denver Engineering Works. The works cover 6½ acres of ground; and all the buildings are of steel and galvanised iron construction. The works are very conveniently situated in the proximity of Denver station, and are connected to the main railway line. Railway lines run through the property and workshops, and provide admirable transport facilities not enjoyed in less favourably placed localities.

spans. The materials for these bridges will come from oversea and the construction of the parts will also take place there. From this it does not follow that the work could not have been constructed here, in fact the management asserts that the construction of these bridges is within their capacity, but that they lack the necessary materials required for the work. This again clearly bears out the fact that it is a matter of vital importance to the engineering works of this country that all the necessary raw materials should be produced locally, and that efforts in that direction should not be spared by our producers of iron and steel.

Power.

All power necessary at the works is obtained from the V.E.P. Current at 20,000 volts is transformed down to 525

General View of the Works.

Special attention has been paid in these works to locomotive repairs and construction. Work in this connection is undertaken for the railways, mining and private companies, as well as contractors. In all about 90 locomotives have passed through these works, and of these 40 to 50 have been completely rebuilt. The works are also capable of designing, constructing and erecting complete mining plants; and general engineering work of any description comes within the range of their possibilities. Recently a contract with the Public Works Department has been undertaken for the erection of 12 road bridges with 150 to 200 feet

volts in a 750 kilo Watt transformer, and represents 1,000 horse power in all. A 100 h.p. compressor supplies compressed air for the pneumatic tools as well as light and heavy hammers in the smith shop.

Designing.

The company does all its own designing work when necessary. A special department has been set aside for this important branch of the works. The mining industry is

Tender Tanks for South African Railways, built by the Denver Engineering Works.

specially catered for in this department, and plans and specifications for complete mining plants can be drawn up. By designing is meant the planning, calculating, and drawing of any plant, structure, machine, or part of a machine. It is the work of a technically trained engineer and draughtsman, and its importance cannot be overestimated.

Pattern-making constituted the next step in the manufacturing of machine parts which have to be made in cast iron or other metal. The pattern is usually a model of the finished cast article.

14 ft. Headgear Sheave for Brakpan Mines.

Foundry.

Castings weighing up to 9 tons have been executed in these works, and while they were in the hands of Hubert Davis and Spain, a 15 ton casting was made. Local pig iron as well as scrap is used in making castings, and the No. 1 pig produced by the Pretoria Iron Works has given every satisfaction. Castings in brass and other alloys are also made. A special feature of these works is the fact that work in crucible cast steel can also be executed. Special furnaces working under draught from a 120 foot stack have been constructed. These furnaces are fired with hard Natal coke, and although this coke is satisfactory in every other respect, high sulphur content is one of its disadvantages. This seems to point to the fact that coke producers should exercise greater care in the washing of the coal they use for coke production in order to eliminate as far as possible this objectionable constituent. The steel foundry is provided with two annealing furnaces which are used for subjecting castings in steel to the necessary heat treatment in order to make them ductile.

Machine Shop.

The machine shop is very well equipped with all the latest types of machine tools. It contains 22 lathes, of which the largest has a 15 ft. 6 in. diameter. The largest planing machine in this country is to be seen in these works; it has a 21 foot travel, and is capable of taking work measuring 6 ft. x 6 ft. x 21 ft. There are 7 shaping machines, 2 milling machines, slotting machines, 5 radial drills, other drilling machines, a 30 in. and 7 ft. boring mill, and grinding machines. The machine shop and locomotive boiler shop are served by 4 overhead 10 ton cranes.

Boiler Shop.

There are two boiler shops at the works equipped with a full supply of the latest machines used in that department. One of these shops is used exclusively for locomotive boiler work, while the other is used for general plate and constructional work. At the time of visiting a cupola casing was in the process of making, and several locomotive tenders were nearing completion in the general shop. In the locomotive shop a fire box for a locomotive was being completely rebuilt, and other boiler work in course of construction. The machines in the general shop consist of the following: A Buffalo plate splitting machine capable of cutting and punching up to 1 in. plates; 3 large double ended punches and shears; 3 sets single-ended punches and shears; 2 sets plate bending rolls; 1 set plate straightening rolls; angle iron cutters, and metal saws. Complete oxy-acetylene and electric welding plants are also to be found in the boiler shop.

The works are at present feeling the prevailing depression. Under normal conditions of working the European staff numbers about 140 people, but at present there is sufficient work to justify the employment of about 100 Europeans only.

New Rolling Stock for S.A.R. Electrification.

ALTERNATIVE TYPES AND METHODS CONSIDERED—DESIGN RECOMMENDED FOR PROPOSED GOODS AND PASSENGER LOCOMOTIVES.

Now that the S.A.R. Administration has definitely decided upon electrification, the interesting question arises regarding design of rolling stock and locomotives to be adopted. In this, as in other questions relating to electrification, Messrs. Merz and McLellan's expert advice will doubtless be followed. In the course of their recommendations on the subject they write:—

For the working of trains on an electrified railway there are in general two methods of dealing with the rolling stock, one by substituting electric for steam locomotives, the other by equipping a certain number of coaches in each train with motors, the necessary accessories including control apparatus, and electrically driven compressors or vacuum pumps for the operation of the brakes. The former is for obvious reasons the only method applicable to main line traffic, whether goods or passenger, but for suburban passenger traffic for which special coaches are set apart, both methods are available, and it is necessary to consider the relative advantages of each before deciding which should be adopted. The second method is generally referred to as the "multiple unit" system, and is described in detail below.

Characteristics of Locomotives.

For dealing with main line traffic, whether goods or passenger, on any electrical system, one or more types of electric locomotive are required, and in deciding upon the characteristics of each type, a number of important considerations must be taken into account.

The two principal considerations which go to determine the characteristics of any locomotive are:—

- The draw-bar pull that must be exerted, and
- The maximum and average speeds of travel.

Both of these factors are to a certain extent under the control of the designer, but economic considerations have an important bearing on the matter. For any given power of locomotive it is possible to take a light load at a comparatively high speed, or a heavy load at a comparatively slow speed. In practice, owing to the presence of gradients, it is the general rule where goods traffic is concerned, to take as heavy a load as the locomotive is able to haul up the maximum or ruling gradient, provided the brake equipment of the train as a whole is capable of controlling the speed down the steepest gradient. In South Africa, where all vehicles are fitted with air brakes, the controlling factor is the draw-bar pull required to haul the train up the ruling gradient. With steam locomotives the load has to be limited to such a value that the draw-bar pull required is not beyond the maximum capacity of the locomotive as determined by the weight on the driving wheels available for adhesion. In the case of electric locomotives, however, which are not limited in the same way as steam engines as regards power or total weight available for adhesion, the limiting factor is to be found not in any characteristic of the locomotives themselves, but in the strength of the standard draw-gear of the rolling stock.

We have discussed this matter with the Chief Mechanical Engineer, and we understand that with the heavy type of draw-gear already in use on some of the goods wagons, and with which it is proposed ultimately to equip all the rolling stock, the strength of the draw-bar is sufficient to enable a train of 1,800 short tons to be hauled up a gradient of one per cent. This corresponds to a pull of about 48,000 lbs. The heaviest locomotives at present in use on the South African Railways are able to exert continuously a tractive effort of 53,750 lbs. These engines, however, which are of the Mallet articulated type, cannot in practice travel at more than a very moderate speed, and for this reason their utility is somewhat limited.

Tractive Effort of Proposed Goods & Passenger Locomotives.

We have carefully considered the question as to what draw-bar pull the standard electric goods locomotive should be designed for, and on the basis of the strength of the draw-gear mentioned above, and bearing in mind that with an

electric locomotive there is less danger of couplings being broken due to snatching, we recommend that the weight available for adhesion should be about 120 long tons, and that the driving equipment should be designed to give a tractive effort (*i.e.*, draw-bar pull plus tractive force required to propel the locomotive itself) of 48,000 lbs. for the usual test period of one hour, and of 64,000 lbs. for short periods such as during the start of a train. The latter figure in relation to the weight on the driving wheels, *viz.*, about 120 tons, corresponds to an adhesion coefficient of 1 to 4.2 which is well within the limits of practice with electric locomotives. This recommendation has already been put before the Chief Mechanical Engineer, and we understand that it meets with his approval.

In working out our estimates of working costs of haulage in the different divisions with electric operation we have, therefore, assumed that loaded trains would be made up to such weights as can be dealt with on the various ruling gradients by standard locomotives of the capacity mentioned in the foregoing paragraph.

So far we have dealt only with goods locomotives. In the case of passenger locomotives it is usually only necessary to exert a draw-bar pull which is well within the capacity of the draw-gear. Considerations of platform and station accommodation generally limit the number of coaches per train to a maximum of 15 or 16 and, assuming an average weight per coach of 40 short tons, the maximum load of a passenger train may be taken at about 600 tons. Now the maximum gradient on any of the sections under consideration on which a special passenger locomotive would be used is

1 in 40. The draw-bar pull required to haul a passenger train of 600 tons up a gradient of 1 in 40 would be about 40,000 lbs., which is within the strength of the draw-gear mentioned above. Even so, however, it would be uneconomical to design the standard passenger locomotive for this pull; it would be better to use a banking engine in addition to the train engine for taking the heaviest train up the maximum gradient as the sections containing gradients such as 1 in 40 are comparatively short and few. It is therefore a matter of judgment what draw-bar pull the passenger locomotive should be designed for. We have carefully considered all the conditions, and we recommend that the weight on the driving wheels should be about 72 long tons, and that the driving equipment should be designed to exert a tractive effort of about 30,000 lbs. for the usual one hour test period, and a maximum corresponding to an adhesion coefficient 1 to 4.2, of 38,400 lbs. With this capacity a single locomotive would be able, without assistance, to haul a 600 ton load up a gradient of 1 in 60 compensated, and this should be amply sufficient for all probable requirements.

In the matter of speed, there can be no question that with electric working the most economical condition is obtained when the train travels at the highest permissible speed. The Engineer-in-Chief has advised us that the speed of goods trains should not be allowed to exceed 40 miles an hour under any circumstances. On the other hand, we have ascertained from actual tests that this speed is reached in practice with trains of 1,200 tons and over, though with trains of 1,600 tons we understand that lower speeds are more usual.

Speed Characteristics of Proposed Goods and Passenger Locomotives.

We therefore consider it desirable that the standard electric goods engine should be capable of hauling a 1,200 ton train composed of loaded wagons at a speed of about 40 miles per hour on the level, or a train of 1,800 tons at not less than 30 miles per hour. Further, we recommend that full advantage should be taken of the special characteristics of electrical operation by providing for a speed of about 20 to 23 miles per hour up the ruling gradients. This obviously implies a very substantial increase in the general speed of goods trains, and requires powerful locomotives. The actual horse power of the proposed standard goods locomotive under these conditions works out at about 2,800 (on a usual one-hour test basis). This may be compared with the capacity of the present steam locomotives, which is in the neighbourhood of 1,000 to 1,400 h.p.

For passenger trains, we are advised that apart from restrictions due to local conditions, the speed should not be allowed to exceed 60 miles per hour. We consider it

advisable, therefore, that provision should be made in the design of the express passenger locomotive for a normal speed on the level with a train of fifteen main line coaches of not less than 55 miles per hour. With this condition the motors would exert their full power of climbing gradients at a speed of about 28 to 29 miles per hour, and we are of opinion that this would tend to the most economical working, taking all considerations into account.

An Automatic Railway Coupling.

The above invention by Mr. A. Heale, of Piet Retief, has recently been patented, and represents a device which is claimed to be unfailingly automatic in action. The following gives a description of the coupling:

According to this invention a buffer has, in its interior, an inclined surface sloping towards front to rear, and of substantially semi-circular cross section. At the top of this inclined surface is a slot in which the member uniting two buffers can lie and beyond the slot there is a cavity which is so formed as to accommodate the end of the aforesaid member, said end being of such a shape as to prevent the member slipping through the slot, the rear face of the inclined surface taking the pull.

Means are provided whereby the end of the uniting member can be lifted up so as to pass over the slot when it is desired to uncouple the vehicle.

In one form of this invention the uniting member consists of a rod with a spherical portion at each end, the top of the incline being slotted to receive the rod, the cavity beyond the slot receiving the spherical portion. In the bottom of this cavity is an ejector which can be caused to rise, thus raising the spherical portion from its position and allowing it to be pulled over the slot in the act of uncoupling.

One method of ejection is by connecting the ejector to a lid-like fitting on the top of the buffer whereby the assistance is given in keeping the spherical portion in its position normally, but when the lid is raised by any appropriate means such as a lever fitted on the end of the vehicle, the ejector is also raised and the spherical portion allowed to pass over the slot as above described.

Problems in Railway Electrification.

PRACTICE IN SWEDEN.

A MATTER OF INTEREST TO SOUTH AFRICA.

By a Special Correspondent.

In this time of saving money by the electrification of the railways and by production and distribution of the power therefrom from a central steam-power station, it may be interesting to know if a portion of this saving "the coal" cannot be operated on the steam engine locomotive itself.

In Sweden, where, owing to the high price of the imported coal, the system of electrification of the railways by single-phase current and from water-power stations, is the most advanced in Europe (two-thirds of the farms of the whole country being in the same time already electrified) it has been thought that the capital required for the total railway electrification is so great that a large saving of the fuel on the steam locomotive must first be tried.

This has now been in a practical way solved by the Ljungstrom steam turbine condenser locomotive, on which the ordinary compound piston steam engine is replaced by a Ljungstrom or so-called "stal" steam turbine, and the condenser is placed on the tender.

This condenser consists of radiation tubes in which the condensation is obtained by the surrounding cool air, and the hot water is used again in the boiler.

The first locomotive of this type constructed has, without any preliminary experiments, drawn an express train of 12 cars with a maximum velocity of 56 miles per hour and with a saving of fuel over the ordinary engine of 50 per cent.

From Stockholm to Malmö, 350 miles, the ordinary engines take coal and water four times. This new machine takes its provision once for the whole journey. The journey is achieved in perfect silence, no steam being blown out by chocks through the chimney from which the smoke alone is escaping in a continuous stream without sparks and thus without any danger to the surrounding forests.

This first giant locomotive is said to be almost perfect, as shown from the first trials, although some details need perfection.

There is no doubt that it means a revolution in steam locomotive construction all over the world.

East Rand Gold, Coal and Estate Co.

Mr. J. H. L. Manisty presided at the annual general meeting of shareholders of the East Rand Gold, Coal and Estate Co., Ltd., on Thursday, in Johannesburg.

The Chairman, in proposing the adoption of the reports and accounts for the financial year ended June 30, 1921, stated that the net profit on coal-winning account for the year under review amounted to £3,711, as compared with a profit of £313 for the previous year on 91,082 tons sold. The total quantity of coal sold this year was 100,301 tons of rounds and nuts.

A great feature of this increase, the Chairman proceeded, is that the whole of the saleable output consisted entirely of rounds and nuts, whereas during the previous year a large quantity of duff was sold. This duff, consisting of about 30,000 tons, was sent to the waste heap.

This profit, though satisfactory, would have been much better had it not been for shortage of orders throughout the whole year, the continuance of high cost of materials, high wages and shorter working hours. Deducting the loss on farming, there remains the sum of £1,920 to be carried to appropriation account. This amount, together with the amount unappropriated at June 30, 1920, and before providing for depreciation, makes a total of £8,777.

The cash and cash assets total £25,585 against liabilities amounting to £7,977, leaving a balance of £17,608; the reserve shows a balance of £3,730.

Since the annual reports were taken in hand, an accident has occurred in the shaft, necessitating the closing down of operations to enable the manager to effect the necessary repairs. This will mean that we shall lose our output for about a month, and the expenditure is estimated at £1,500.

When this work is completed I think we may regard our position as a very sound one, and, provided we can procure orders for about 9,000 tons or upwards and effect a gradual decline in the cost of stores and wages, we may certainly look forward to good profits in the forthcoming year.

I referred at the last annual meeting to the great future for South African coal, the demand at that time for export purposes being very great, and it appeared likely to continue for some considerable time to come.

Mechanical Advantages of Electric Locomotives compared with Steam.

By Sir Vincent Raven, K.B.E., M.Inst.C.E.

The following note was included in an address given by Sir Vincent Raven, at the 1921 Engineering Conference held at the Institution of Civil Engineers. The address, by its conciseness and lucidity, seems to us a valuable contribution to a subject of great present importance.

In a comparison between steam and electric locomotives there are a number of prominent features in both types that are perhaps best expressed by the terms "for and against" or "advantages and disadvantages."

Admittedly the practical experience of locomotive engineers in this country has been almost exclusively confined to the steam locomotive, and for that reason it would probably be well to enumerate in the first instance the mechanical limitations and disadvantages which, every engineer will agree, exist in the steam locomotive and which, it may be argued, are overcome to a very considerable extent by the adoption of the modern and more up-to-date system of electric traction.

The mechanical disadvantages of the steam locomotive may be briefly summarised as follows:—

The locomotive being a complete independent unit, its power cannot be greater than the capacity of its boiler.

To increase the boiler capacity obviously implies increased dimensions and weight, both of which offer grave difficulties in regard to clearances and strengthening of bridge structures.

It is known that on many railways in Britain the limit of weight has been reached, and further development of power is only possible at enormous expense.

The boiler, cylinders, valve-gear, crank-shafts and all reciprocating parts are costly to maintain.

Turntables, fuelling plant and water supply appliances must be provided.

The cab is small and open to the weather, involving discomfort to the locomotive crew.

The locomotive radiates heat and uses coal all the time steam is up, that is, during many hours when it is doing no work, and either standing by or coasting.

The wear and tear of the locomotive on the track is considerably increased by the impossibility of accurately balancing the reciprocating parts.

The case for the electric locomotive may be set out by the brief statement that it is not hampered by any of the above-mentioned objections. In addition, one might point out that it possesses other important qualifications, such as:—

Simplicity of mechanical construction and operation.

Increased power of acceleration.

Higher scheduled speed due to the possibility of heavy short period overloads, resulting in more frequent service and increased use of existing tracks.

Uniform turning effort resulting in better factor of adhesion at starting and on gradients.

Absence of all reciprocating movements and accurate balance of all rotating parts.

Facilities for driving from either end of a locomotive.

Accessibility of mechanical and electrical parts.

Better accommodation for locomotive crew by reason of increased cab area and by closing in and heating the cab.

Possibility of coupling two or more locomotives together under the control of a single driver.

Owing to the limitations of this note, probably sufficient is here put forward to invite a full and exhaustive discussion, but two special points may be referred to, namely, the fuel economy made possible by the use of electric locomotives, and the cost of maintenance.

Fuel Economy.

The production of energy in a power station rather than on the locomotive leads to a very substantial economy of fuel. On a steam locomotive fitted with all modern improvements, it is not practicable to work at less than about 2½ lbs. of best quality coal per B.H.P. hour, and very few engines are capable of doing this for any length of time. Taking into account additional fuel required for lighting up, standby losses, periods of uneconomical working and other factors continually met with in practical working, the average consumption is more like 3½ lbs. per B.H.P. hour for passenger engines, and 5 lbs. for goods engines.

On the other hand, with electric locomotives, whether passenger or goods, and with up-to-date power station and sub-station plant, it is possible to reduce the consumption of fuel to 1¼ lbs. per hour, or even less, of low quality coal per B.H.P. produced on the locomotives. In other words, electrification enables the fuel consumption to be reduced to one-half or one-third, the fuel employed being of a quality unsuitable for steam locomotives.

Cost of Maintenance.

Our own experience with regard to the cost of repairs of electric locomotives working between Shildon and Newport shows that this cost is approximately one-third that of maintaining the steam locomotives which worked this traffic previous to 1915.

The difference in America, however, is much greater, as Mr. Armstrong, chairman of the Electrification Committee of the General Electric Company, gives figures showing the cost of repairs per mile of three American railways varying from 6.3 cents to 14.6 cents, as compared with a cost of 60 cents per mile for a 2-8-8-2 Mallet steam engine, which is the class of engine that would have to be used to haul a similar train to that taken by the electric locomotive, the cost of repairs of which is 14.6 cents, or one-fourth that of the steam engine.

The Week in the Sharemarket.

STEADY AND QUIET—AWAITING A SOLUTION OF THE LABOUR TROUBLE AND EX-ENEMY SHARE QUESTION—TRANSVAAL SILVERS FIRM.

The market during the week may be described as steady but quiet, awaiting a solution of the Crown Mines trouble and of the ex-enemy share question. At the time of writing the strike position at the Crown Mines appears as far from solution as ever, but hope of a settlement is much brighter, and there is every reason for expecting the men to return to work, and we can only hope that the good sense of the majority of the men may yet prevail and the situation saved from becoming worse. The ex-enemy share question is another factor affecting the market, and the London financial papers, indeed, seem to regard it as the chief restraining influence at the present moment. It is to be hoped that the question of price of the shares concerned will soon be settled and the matter brought to an early conclusion. The economic position of Germany and the Irish crisis do not make for market activity, but these troubles will doubtless right themselves in time. The local market has, for all these reasons, remained stagnant, and as far as gold stocks are concerned there is practically nothing to report. Diamonds continue to ease off, and Tins are little dealt in. Transvaal Silvers were the only bright feature of the week, and kept firm despite the prevailing lack of business. The few changes of interest in the list of quotations for the week were as follows:—

The Base Metal Outlook.

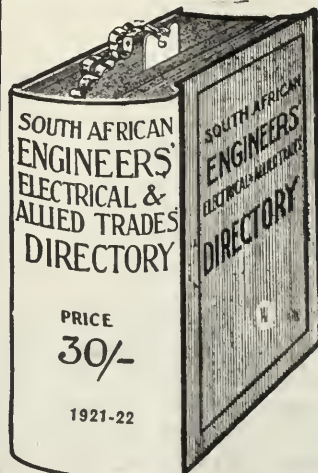

The outlook for base metals continues obscure, and is well described by Messrs. H. Bath & Sons, Ltd., in the following paragraph from their latest report:—"What the future holds for trade in general and for metals in particular is still obscured by big political and international affairs which must first be settled before a revival in trade can be expected. Meantime it is satisfactory to note the withdrawal of the American railway strike notices and the acceptance by the home engineers of a lower scale of wages. Certainly there is more trade doing now than was the case a few months ago, but there is naturally a great absence of enterprise under present conditions."

Letters to the Editor.

THE UNION AND ITS COLOURED LABOUR.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir.—Recently General Smuts has pointed out the impossibility of the Union being directed by any particular part of its community. It's a funny thing, but that's just what has been the trouble all along. As far as the mines are concerned, some 24 per cent. of the world's gold comes out of the 40 per cent. low-grade mines of the Rand, and ten thousand, or less, labour autoerats have caused the directors of these mines to work out their gold to the absolute loss of their legitimate owners, the shareholders, and to the direct gain of labour, trade and Government. There are moments in the world's history when great sacrifices are made to attain an ideal. During the early part of the last century great reformers unceasingly pleaded for the release of the black man from slavery, and much blood was spilt to achieve his freedom. In this country the early Dutch never forgave England for depriving them of their slaves. It was held that here, at least, the black man was well treated and contented. The echo of strife generations later still registered a protest that had not yet died, and yet again there is the aspect of the Prime Minister appearing on the scene to release the black man from new slavery. The pinning down of a man because of his colour to all that is rough, hard and degarding, whilst his captor manœuvres the situation and draws unearned pay, is but a repetition of what the world had to claim release from in the past.

The marketing of one hundred thousand blacks by a neighbouring State is also a repetition of that old control of white over black.

The domination of traffic through the sale of labour is but another phase of slavery in a new and subtle form. The foreigner in his laws exploits the native, the miner exploits him, and the world looks on.

The moment calls for a strong man. There are opportunities—many of them. The Union wants release from the enslavement of black men, whether they be its subjects or its neighbour's subjects. It requires release from bargains that place embargoes on its ports. The Prime Minister has stated he can procure labour within the State. Let there be no more traffic in black skins; let us get our own labour, and free the country from foreign dictation.

The constant reports of new ports on the eastern coast gives encouragement to the hope that future traffic will find its way through them and thereby definitely relieve the Union for all time from the necessity of having to buy its way under foreign conditions.

It is release from any special part of the community, and their dictates, that is required. There is the hand of autoeracy denying individual efforts; there is the delay in pushing the development of gold discoveries; there is the leaning towards capital as the only means of carrying on—and whether the power be a foreign dealer in black skins or a

labour task-master, whether it be Government inaction or the dictates of capital, they are all questions of supremacy, and it will be interesting to see whether there is strength enough to give the country its much-wanted relief, or whether weak settlements will throw us back into the old slough of despond.—Yours, etc.,

EMOYENI.

ORIGIN OF THE DIAMOND.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—As the genesis of the diamond appears to interest certain of your readers, kindly allow me space for a word or two on this very interesting subject, as I abhor lengthy epistles. Some years back in conversation with myself, Mr. Frank Watkins, a gentleman of high chemical attainments, suggested carbonic acid gas under pressure, as in a diamond pipe with its lid on. That is to say a pipe which had not burst through the earth's surface, and whose kimberlite, as it is termed, had slowly cooled down below. When denudation had taken place, in course of ages, then for a certainty that pipe would be found to contain diamonds in payable quantity. In the case of blind pipes, the gas had escaped, and although they contain exactly the same matrix—"ikona" diamonds. Good idea, thought I; he's struck it! Later on, looking through Dana's "Manual of Mineralogy and Lithology," 1879, page 109, I came across the following note: "Carbonic acid, under pressure, becomes a liquid, and with pressure and cold, a white snow-like solid." Our diamonds, thought I! From that time on I have been inquiring of my mechanical engineering friends for a suitable compressor, etc., to manufacture them by the ton; but none appear to be sufficiently inventive. Hence, using my old motto, I write that "To know the truth is a great thing for thyself, but to tell the truth to others is a great thing for the world"—so let the world concern itself if it chooses. I have also a gaseous idea as to how Nature makes gold, but, as filthy paper is taking its place for the moment, perhaps it may be as well to leave this little matter in abeyance.—Yours, etc.,

SCOTT ALEXANDER,

"Rand Stratigraphist."

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material & Engineering Trades

BUSINESS QUIET—FUTURE PROSPECTS CHEERFUL—IRON AND STEEL—TIMBER AND BUILDING MATERIALS—ELECTRICAL GOODS—PREMIER ON POSITION—REDUCTION IN COAL RATES—BRITISH TRADE—UNION'S RAILWAY ELECTRIFICATION.

General Review.

The feature this week, dominating all else, has, of course, been the Crown Mines dispute, which still remains unsettled. With the exception of a few essential services, work on the mine has ceased, and the natives are being dismissed. The latter point is a most important one and has only been resorted to as the last resource, but it is impossible to keep thousands of natives in idleness at an expense of over £2,000 per day. The penalisation question is now being fought out, and it is hoped that sane councils will prevail.

Familiarity, we are told, breeds contempt, but the feeling in commercial circles at these recurrent disputes is arousing both contempt and disgust. As a leading merchant said, and with justice, how can we expect financiers to invest in our propositions when every month sees something approaching South American conditions of a few decades ago. That these epidemic troubles are most unsettling for business goes without saying, and merchants are nervously awaiting the upshot of the present disturbing factor in commercial life. They think, and rightly, that the vanishing premium on gold is—or, at any rate, should be—a sufficient pointer to the miners that the present moment is, to say the least, not a happy one for the ventilation of minor differences. The day is bound to come, perhaps before we have time to prepare for its full effect, when the disappearance of the present premium on gold will have a paralysing effect on our gold mining industry. The present premium of about 17s. per ounce above normal, which is enabling many of our mines to give employment to hundreds of workers and to distribute large amounts of money in the shape of wages, etc., without in many cases giving a profit to shareholders, will undoubtedly be looked upon in time to come (leaving the previous higher level quite out of the question) as a godsend to our history. Is it asking too much that our workers should realise the present and future position, which is only too apparent to keen and well-wishing observers? Prices are much the same as before, but the tone is undoubtedly better. Though materialisation is slow, and, under the circumstances, expected, inquiries are much better now than they have been for some considerable time, and merchants are unanimous that we shall see a decided betterment in business generally early next year, provided always that the labour question can be once and for all satisfactorily settled. The cheaper level of prices at Home in the heavy lines is beginning to make itself felt locally, especially in iron and steel goods, and merchants are adjusting prices accordingly. A well-known authority in the commercial world said his impression was that we had gone through recently a very depressing time, but that the horizon was undoubtedly clearing, and, failing any unforeseen difficulties, we were heading to improving business conditions. Nobody, he said, in this stock-taking and holiday month expected big things, but after the turn of the year we should, he thought, make very satisfactory progress. The Commercial Exchange during the past week has been stimulated by the usual monthly requirements of the mines, but on the whole business has been quiet and about the average of recent months.

Iron and Steel.

The requirements of the mines at this time of the month have caused the usual spurt in business, but the Commercial Exchange reports that apart from this usual and expected fillip, nothing of consequence has transpired.

Second-hand Mining Material.

There have been several large orders placed, both by the mines and country clients, for second-hand piping. During the War period the mines would buy piping and fix it up themselves, nowadays they only accept second-hand piping that has been properly done up, such as having proper flanges put on, sockets to be in good condition, etc. There is a parcel knocking about of 20 lb. rails; the quantity is

stated as 600 tons. As there have been several large mine enquiries lately for this size rail, no doubt the holder will soon be able to place his parcel. A judgment of great importance to merchants and the general public has just been given in the local courts, the plaintiffs being a firm of auctioneers and defendants local mining material merchants. Plaintiffs advertised for sale a quantity of new Jackerie Dies. Defendants purchased these dies at the sale. A day after the sale they found out that these dies had been through a fire and were therefore second-hand, and consequently refused to accept delivery of the dies. The plaintiffs then advertised a resale of the dies, holding defendant responsible for the difference in price between the first purchase and the resale. On the second occasion the goods only realised one-seventh of their original purchase price. The defendants proved clearly in evidence that the goods, which were sold as new, had gone through the fire of Orenstein Arthur Koppel during the anti-German riots. The magistrate gave judgment in defendants' favour, holding that the goods had been misrepresented at the sale, because having been in a fire they were not new. A person selling a new article must deliver in the same condition as it left the manufacturers.

Iron and steel in the United States and Canada show an improvement, and negotiations are in progress for an extensive tonnage in steel rails. Owing to lower prices, agricultural products are progressing rapidly. Crude oil prices have advanced sharply.

Timber and Building Materials.

Prices are practically unchanged. Business has slackened off a little and, in the opinion of experts, will continue quiet until after the New Year. Stocks of timber are fair, but 3 x 9 long lengths are presently very scarce. The indications are, taking the Baltic position into account, that prices of timber will advance.

Prices: 3 x 9 deals, 1s. 1d. to 1s. 1 $\frac{1}{2}$ d.; scantlings, 11d.; beaver board, 4 $\frac{3}{4}$ d.; floorings, 6 $\frac{3}{4}$ d. to 7d.; ceilings, 4 $\frac{3}{4}$ d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 7s. 6d. to 8s. 6d.; corrugated iron, 9 $\frac{3}{4}$ d. to 10 $\frac{1}{4}$ d. Furniture timber, Burnah teak, 18s. to 18s. 3d. per cube here for first quality, 14s. 6d. for second, at the coast; American oak and Japanese oak, 1s. 2d. at the coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 3d. per cube at coast; Rhodesian mahogany, 8s. 6d. per cubic ft. at mills; Honduras mahogany, 30s. per cubic ft.; American yellow pine, 1s. 8d. to 1s. 9d. per ft. of 1 x 12 here; American pine shelving, 1s. per ft. Bricks remain the same at 70s. for blue stock; 60s. mixed; £4 10s. to £5 for wire cuts. £5 for pressed per 1,000 at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag, 8 lb. bag 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Second-hand Iron and Timber.

Business is much the same as it has been for some weeks past, quiet and little doing, and indeed no improvement is expected before next year. Prices are unchanged at 6d. to 7d. for iron and 9d. to 11d. for timber, but owing to increasing scarcity of stocks these prices are inclined to harden. A merchant in a large way of business said inquiries are quite good, but orders are slow. Stocks are gradually being depleted.

Lower Building Wages in Capetown.

Certain sections of the building trade in the Peninsula have agreed to accept a reduction to 3s. 2d. per hour, except coloured bricklayers, who will be dealt with pro rata. Painters' wages are to remain the same as before. This reduction in wages is expected to give a fillip to local building operations.

Electrical Goods.

Business, in the opinion of a leading importer, remains good, with, if anything, an improving tendency; people, he said, seem to have gained heart of grace and recognised that prices have about reached bottom—for a time, at all

events. Clients are now, he said, paying their old outstanding accounts. Prices are unaltered, but in view of advices from oversea an upward trend seems inevitable. A prominent dealer in electrical wares, with large connections with Britain and the Continent, gave it as his opinion that Germany was at the end of her tether as regards lower prices. She cannot, he thought, do more than she has done, and gave as an instance the fact that several German manufacturers' agents here had been cutting prices against each other so much that eventually some of them had acknowledged to him that they could go no lower in their quotations. This authority said the reading of the international barometer showed undoubtedly at the moment that bottom in respect of prices had been reached, and he did not expect any alteration, except in an upward direction, for some time to come. Prices had, he thought, about reached bottom and cannot get cheaper without a radical reduction in wages; in fact he thought the possible trend in the immediate future was towards a higher level. There is nothing big going at the moment in the shape of contracts, but a steady line of small jobs is giving fair employment at the moment and encouragement to future operations. As an illustration of the better tendency in the electric and building business my informant said nothing could be more telling than the fact that last week he had received payment for a fairly large amount which had been owing for over two years.

Premier on the Position.

At the Congress of the Free State South African Party last week, General Smuts referred, *inter alia*, to the difficulty in which the Government found itself in regard to present problems. In regard to the wool farmers' troubles the Government had taken measures to meet the difficulties, and General Smuts said that Colonel Mentz had in Germany done his utmost to bring about a satisfactory solution. The Premier affirmed the appointment of Mr. Carl Spilhaus as Trade Commissioner, whose appointment, owing to his outstanding ability, would be of real service to the country. On the labour position General Smuts was very pronounced. If, he said, the present unreasonable attitude were persisted in the mines could not possibly carry on. The position with regard to the short working hours could not be tolerated. Native affairs had to be placed on a sound and practical basis, and it was hoped that the aims of recent conferences to that effect would be achieved.

British Trade.

Mr. Stanley Baldwin (President of the Board of Trade) stated at Liverpool there were more indications of a trade revival than the reverse. It was generally thought that the corner had been turned in the United States, while the bottom had been reached in India, and there were signs of revival in Japan.

Fall in British Living Costs.

On October 1, owing to a substantial decline in the cost of foodstuffs, which are now 103 per cent. above pre-War prices, there has been a decline of seven points compared with September 1, and of 73 points compared with November last year, which was the highest reached.

Railway Electrification—Union's Start.

It is announced that the Railway Board has decided to electrify the Natal section of the South African Railways between Glencoe Junction and Maritzburg, which covers a distance of 171 miles. It is hoped to have the first section in operation within two years' time and the whole scheme within four years. Electrification will undoubtedly eventually tend towards lower railway rates. The total cost of the transmission will, it is reported, be well over £3,000,000.

German War Debt Scheme.

The special committee of the Federation of British Industries and German Reparations suggests the transference of the obligation between Governments into obligation between individuals, by the creation of mortgages on German railways, shipping and other industries. The committee also suggests the utilisation of German energies under allied experts in the restriction of the railways in Central

Europe and Russia, and the construction of public works in undeveloped regions of Africa, South America, and Asia.

Potash.

America, it may be noted, is at the moment very interested in potash, and is rather proud of the fact that she can show a proposition giving 9 per cent., but it is stated that there has been a discovery in the Transvaal showing from 10 per cent. to 11 per cent. in large bodies. We shall have more to say about this discovery later.

Ockiep Copper Mine.

Operations on this mine have now, it is reported, been definitely abandoned.

Persian Oilfields.

A 50 years' concession has been granted to the Standard Oil Co. to exploit oilfields in the northern provinces of Persia. This measure is expected to revive business in re-opening trade north to foreign enterprise.

International Conference to Deal with Unemployment Problem.

The Labour Conference at Geneva, following upon a cable from Mr. Gompers, President of the American Federation, has passed a resolution in favour of the convocation of an international conference to examine and discuss remedies for world-wide unemployment.

Natal Navigation Collieries and Estate Co., Ltd.

Tenders are called for the electrification of Nos. 4 and 5 shafts as per specifications given.

Wireless.

A wireless service between England and Australia has been arranged. Branch stations are to be established in the Commonwealth and in England and Canada. The charges for such service will range from 3d. to 2s. a word. A capital of £1,000,000 has been provided.

JOHANNESBURG.

Union Loan.

A new issue has been floated of the Union of South Africa £6,000,000 consolidated 6 per cent. stock at 96½. The new loan is mainly for the purpose of redeeming Treasury bills to the amount of £3,000,000 due on December 1, 1921, and £2,000,000 of Treasury bills due on February 8, 1922. This loan has been mentioned in City financial circles.

Wage Reduction in Collieries.

The Chamber of Mines have notified a reduction in wages of colliery employees to take effect from January 1, in respect of which the Federation Department of Mining is taking a ballot.

Metal Market.

Latest London quotations: Standard copper, £67 10s. cash, £68 10s. forward; electrolytic copper, £75 10s. cash, £77 forward; standard tin, £163 12s. 6d. cash, £165 7s. 6d. forward; quick silver, £10 7s. 6d.; bar silver, 37½d; bar gold, 103s. per oz. Metals show a rise during the week on the conviction that present prices will respond to any favourable circumstances.

Union's Mineral Industry

The following are the principal items to be noted in connection with the statistics for the month of October, 1921, issued by the Mines Department of the Union:—

Labour.

	Whites. No. in Service.	Coloured. No. in Service.
Diamond Mining	2,425	5,108
Diamond Alluvial, Diggers and Prospecting Concerns	4,207	14,006
Coal Mining	2,100	37,547
Copper Mining	108	937
Tin Mining	69	1,262
Other Base Mineral Mining	235	2,802
Grand Totals	30,887	245,787

Output.

	Fine ounces.	Value.
Gold—Witwatersrand (Transvaal)	696,384.117	£2,958,052
Other Districts	18,702.930	£479,445
Other Provinces	6.000	£25
Total	715,093.047	£3,037,522
Silver	74,882.861	£11,233

	Carats.	Value.
Diamonds	49,692.91	£177,776
Tons.		
Coal (Sales)	902,586.000	£384,277
Copper Ore and Concentrates (Sales and Shipments)	—	—
Tin Concentrates and Metallic (Sales and Shipments)	84.000	£6,981
Other Base Minerals (Sales and Shipments)	—	£7,882
Total Value		£3,625,671

Totals for Ten Months from January, 1921.

	Fine ounces.	Value.
Gold—Witwatersrand (Transvaal)	6,582,093.947	£27,958,959
Other Districts	162,576.436	£690,580
Other Provinces	6.000	£25
Total	6,744,676.383	£28,649,564

Silver	676,893.124	£104,518
Carats.		
Diamonds	717,687.88	£2,799,208
Tons.		
Coal (Sales)	9,564,302.000	£4,264,965
Copper Ore and Concentrates (Sales and Shipments)	158.270	£6,524
Tin Concentrates and Metallic (Sales and Shipments)	1,257.094	£120,850
Other Base Minerals (Sales and Shipments)	—	£115,509
Total		£36,061,138

Totals, if gold taken at estimated increased value, £35,926,800. Total value, £43,338,374.

†Value calculated at the standard rate of £4.24773 per fine ounce. The Transvaal Chamber of Mines estimates the value of the October gold output at £5.150 per fine ounce, which would represent an increase of £645,207 in the total value of the month's output.

Quarterly Reports.

S.A. TOWNSHIPS GROUP.

Operations of Subsidiaries for the Quarter ended Sept. 30.
S.A. Coal Estates (Witbank), Ltd.

Output, 168,488½ tons; estimated profits, £15,000. Cassel Section—Landau: Conditions underground continue good. Navigation Section—Bailey Shaft: Development still being pushed ahead and coal opening out well. Machinery and plant working satisfactorily. Navigation Shaft: Conditions underground very good; development still proceeding from air-shaft; erection of screening plant is well forward.

Leeuwpoort (African Farms) Tin Mines, Ltd.

During the quarter 4,561 tons of ore were milled and 3,496 tons of tailings treated, resulting in the recovery of 93 tons of concentrates of an average grade of 50.43 per cent. A total of 1,186 feet was developed and the expenditure on development, machinery plant, etc., amounted to £7,196 11s. 3d.

McCreeley Tins (Swaziland), Ltd.

Owing to the continued low price ruling for tin, the Board considered it judicious to temporarily suspend sluicing operations on the property.

West End Diamonds, Ltd.

During the quarter satisfactory progress has been made with erection of permanent plant, which is approaching completion.

Theron Diamonds, Ltd.

Mining, hauling and flooring of blue mixed and yellow ground has been continued during the quarter—a total of 30,080 loads having been floored during the period under review—making to date a total of 52,845 loads floored.

A Note on Drill Steel.

In a contribution to the discussion in Mr. E. A. Wright's paper on the standardisation of mining materials, before the Institution of Mining and Metallurgy recently, Mr. G. H. Gilman said: "Mr. Wright's paper bespeaks a great deal of painstaking research applied to a subject in which I am particularly interested. It was my privilege to contribute a paper on the Heat Treatment of Rock-drill Steel at the New York meeting of the American Institution of Mining and Metallurgical Engineers in February last. Mr. Wright's reference to the American suggestion for chemical composition of drill steel, prompts me in advancing the information that, prior to the War, a very large percentage of the hollow drill steel employed in America was imported from Sweden, and marketed in that country by A. Milne and Co., of New York City, under the trade symbol of F.J.A.B. Steel. This material was procurable in two tempers—No. 7 and No. 10. The former contained a carbon content of from 0.70 to 0.80, and the latter from 0.95 to 1.10. Comparative tests of these steels conducted under widely varying conditions have shown the No. 10 temper to possess shock and wear-resisting qualities that were superior to those of the No. 7 temper, but on account of the higher carbon content, considerably greater care was found to be necessary in its working, and especially as applied to its heat treatment, whereas the No. 7 temper would withstand more abuse by the drill steel smith. Conditions resulting from the entry of America into the War practically eliminated the Swedish product from our market, and American producers were forced to rely upon their own resources, with the result that two prominent steel companies adopted the specifications referred to by Mr. Wright, which I believe are representative of our best practice at the present time, although the F.J.A.B. Steel in the higher carbon content is now available."

FRICITION—
*the unseen enemy of Production
in your plant.*

"Power-Loss Insurance"

MODERN INSURANCE covers every hazard of industry except, perhaps, one
We suggest—

**A lubricating policy
for your entire plant.**

If you have correct lubrication for your cylinders, but not for your shaftings, you are only "half insured" against preventable friction—and expensive power loss.

If your turbines are correctly lubricated and other bearings incorrectly lubricated, you are suffering a serious "partial loss" of productive power—and production.

Only by correct lubrication throughout your plant can you insure yourself against—

—**loss of Fuel** : correctly-lubricated machinery requires less fuel.

—**loss of Power** : preventable friction slows down machinery and invites costly repairs.

—**loss of Production** : the machine that slows down, slows down your output.

—**loss of Profit** : after all, this is the important net loss.

The premium you pay for correct lubrication may be a few pence more per gallon of oil. This few pence a gallon represents not added expense but a marked saving in expense. It protects your machinery, while it speeds your output. Generally it reduces actual oil consumption.

If you are interested in insuring your plant against needless power losses, production losses, and profit losses, we suggest that you get in touch with our nearest branch.

Our lubricating recommendations are based upon—

- 1.—Experience gained through more than 50 years in manufacturing lubricating oils of highest quality.
- 2.—Our engineers' close contact with the efficient operation of all types of running equipment throughout the world.

Stocks are carried in principal cities throughout the country.

The Week's Meetings.

FRANK SMITHS.

PROPOSED SALE OF LAND.

Slack Demand for Diamonds.

Professor J. G. Lawn, C.B.E., presided at the ordinary general meeting of shareholders in the Frank Smith Diamond Estates and Exploration Co., Ltd., held in the board room, Consolidated Building, Johannesburg. Others present included Messrs. J. Munro, J. H. Crosby, P. Dreyfus, L. J. Woolf, R. J. Gill, A. J. Beaton, J. A. Cohen, H. Adler, A. D. Viney, Alex. Leal (representing the secretaries), and E. H. Francis (representing the transfer secretaries).

In submitting for approval and adoption the directors' report and balance sheet for the year ended June 30, 1921, which had been circulated to shareholders, together with a report by the manager, the chairman said:—

At the time of the last annual meeting of the company we met together in a hopeful frame of mind, as the plant had just been completed, and washing had commenced on November 8, 1920.

There was one small cloud above the horizon, and that was that the demand for diamonds at the time was somewhat slack. It was, however, thought that this was only a temporary depression, and that the market would soon right itself again. Unfortunately the market did not improve, and the cloud of depression became larger. As a result, De Beers and Jagersfontein Mines closed down, and your directors felt that there was no chance of keeping your mine running, especially as the company was in debt, and so it was closed at the end of February last.

A Disappointing Yield.

During the four months that work was carried on 164,000 loads of blue ground were washed and 4,002 carats of diamonds recovered. This was a disappointing yield, as it only amounted to 2.44 carats per 100 loads, whereas the average yield during the last seven months that the mine was worked in 1914 was 3.77 carats, and for the six months previous to that was 3.57 carats.

In diamond mines there are usually richer and poorer zones, and they generally run vertically. As the blue ground was taken from the same level as in 1914, it was evident that a poorer zone of the mine had been reached. It would only have been possible to work the same zone as in the previous working by getting down to a lower level. This would have been done if it had been possible to keep the mine working, and I have no doubt that a similar yield to that previously obtained would have been secured. Even the yield of 2.44 carats would have paid for working, when the mine got properly going, had the diamond market held.

In September last there were sales of diamonds on a moderate scale, and hopes were entertained that a turn in the tide had come. Since then, however, the improvement has not been maintained, and the market is again dull. Under these circumstances there is nothing to be done but to pursue a waiting policy, and hope for better times.

The company has a large area of land bordering on the Harts River, and it is the policy of the directors to sell this if possible and so reduce the debt; but, as you know, farming is also in a state of depression at the present time, and land is difficult to sell.

Mr. Woolf asked to whom the diamonds were sold—£20,000 being mentioned.

The chairman: To Mr. Joel, when he was out here.

Replying to another question on the same point, Professor Lawn said the directors went into the matter, and felt that it was a good offer, and as events had proved it had been so.

Mr. Adler: They would not fetch the price to-day.

The chairman: No; to-day I don't think we would get any offer at all for them.

The report and accounts were adopted. The appointment of Mr. Paul Dreyfus as a director of the company was confirmed, Messrs. G. Inroth and G. Sonn, retiring directors, were re-elected. Mr. W. Fergusson was re-appointed auditor of the company.

Extending Options.

An extraordinary general meeting of shareholders in the company was then held, the same members being present.

The chairman said it had been called at the request of a large body of outside shareholders. He submitted the following resolution:—"That, having regard to the fact that the mine of the company closed down on March 1, 1921, and is still closed down, it is desirable to extend the option to subscribe for new shares in the company during a period of three years expiring on February 28, 1923, in terms of the option certificates issued by the company, dated March 1, 1920, and accordingly that the rights granted under the said option certificates be and the same are hereby extended from February 28, 1923, either by a period of two years or by a period equal to the time the mine remains closed down, whichever of such two periods may be the less. In the event of the latter period being applicable, notice of re-startment of the mine shall be given by the Board by advertisement in newspapers in Johannesburg and London."

Mr. Adler said he thought it was fair that shareholders should have an opportunity of recouping themselves. The mine was closed down at an inopportune time. Was it contemplated selling some of the company's land?

The chairman: We did.

Mr. Adler said he thought the proposition was an excellent one.

Replying to another shareholder, the chairman mentioned that the company had 40,000 acres of land altogether. About 5,000 acres would be reserved for the working of the mine, the water supply, and so on, and there would probably be about 35,000 acres available for disposal.

The resolution was adopted.

WITRAND COLLIERY.

SOUND HOPES FOR THE FUTURE.

The second ordinary meeting of shareholders in the Witrand Colliery Company, Limited, held in the Consolidated Building, Johannesburg, was presided over by Professor J. G. Lawn, C.B.E., who moved adoption of the directors' report and accounts for the year ended September 30, 1921.

"This company has had an exceedingly difficult year," said the chairman. "In the first place the equipment cost more than had been anticipated, largely owing to difficulties with the Railway Administration, who insisted on costly alterations

to the siding. Then there was great difficulty in placing the coal owing to the arrangements which had been made not proving satisfactory. Towards the end of August a contract was entered into with the Transvaal Coal Owners' Association. The allotment received is very small, but we are hoping that we shall be able to keep the colliery running at a small profit until such time as the larger output can be obtained. There is no doubt that the colliery will prove a profitable proposition on any reasonable output."

The report and accounts were adopted. Those present at the meeting included Messrs. J. Munro, J. H. Crosby, J. A. Cohen, W. M. Munro, Frank Hall (representing the secretaries), and E. H. Francis (representing the transfer secretaries).

A PROFIT BEING EARNED.

THE NEW SPRINGS COLLIERY.

Submitting the directors' report and accounts for the year ended September 30, 1921, to the second ordinary meeting of shareholders, New Springs Colliery, Limited, in the Consolidated Building, Johannesburg. Professor Lawn C.B.E. (chairman), said the profit made in coal mining during the past year was small. This was due, in the first place, to the fact that the railway siding was only completed in January last. In the second place the output was small. Towards the end of August a contract was entered into with the Transvaal Coal Owners' Association, and although the allotment of tonnage was small, a profit was now being earned. The colliery had opened up an excellent seam of coal. The equipment, although not elaborate, was sufficient, and when the output could be somewhat increased, satisfactory profits would be earned.

The report and accounts were approved.

THE BURNSIDE COLLIERY.

SHAREHOLDERS' MEETING.

Presiding at the first ordinary general meeting of shareholders in the Burnside Central Colliery, Ltd., held in the boardroom, Consolidated Building, Johannesburg. Professor J. G. Lawn, C.B.E., moved the adoption of the directors' report and accounts for the year ended September 30, 1921.

He said: Two circulars were issued to shareholders during the year, one on June 27 and the second on September 20. These, together with the report of the consulting engineer, circulated with the directors' report and accounts, explain the position fully. It is doubtful whether even in prosperous times the area owned by your company would make a profitable colliery, and in times such as we are facing to-day it would certainly be unwise to incur expenditure in developing and equipping the property.

Wise to Mark Time.

Under these circumstances it was felt that the wisest policy was to mark time for the present and to conserve the cash resources of the company. The directors of the company have agreed to forego their fees and expenses have been cut down to a minimum. The cash on hand at the end of the financial year was £20,870, and, as pointed out in the directors' report, £20,000 of this amount has been placed on fixed deposit. It

has been suggested by one shareholder that the interest on the cash should be paid out as a dividend, but naturally such a dividend would be very small, and I would suggest that this matter be left to the discretion of the directors.

The directors' report and balance-sheet were adopted.

The appointment of Messrs. J. G. Lawn, C.B.E., John Munro and Jack Andrew Cohen, as directors in place of Lieut.-Colonel G. A. Morris, C.M.G., D.S.O., and Messrs. W. J. Shaw and A. P. Smith (resigned), was confirmed. The appointment of Messrs. Jas. Anderson (since resigned) and James H. Crosby as directors was confirmed. The retiring directors, Messrs. J. G. Lawn, C.B.E., and J. Munro, were re-elected, and the company's auditors reappointed for the current year.

Those present at the meeting in addition to the chairman were Messrs. J. Munro, J. A. Cohen, J. H. Crosby, W. M. Munro, F. E. Irving, Frank Hall (representing the secretaries) and E. H. Francis (representing the transfer secretaries).

CONSOLIDATED COLLIERIES LIMITED.

75,000 TONS A MONTH OUTPUT.

A shareholders' meeting of the Consolidated Collieries, Ltd., was held last week, when Mr. J. G. Lawn, C.B.E., presided. There were also present: Messrs. John Munro, W. M. Munro, J. H. Crosby, J. A. Cohen, H. Williams; Mr. Frank Hall (representing the secretaries), and Mr. E. H. Francis (representing the transfer secretaries).

The Chairman said: I have pleasure in submitting for your adoption the directors' report and audited accounts for the year ended September 30, 1921. Your company was formed to take over two collieries, the Cape Colliery and the Carlechu Colliery. The Cape Colliery was fairly well equipped, but underground little development had been done. The Carlechu Colliery had only a very imperfect screening plant, but was much more extensively developed underground than the Cape. A new screening plant has been erected at the Carlechu Colliery, and other equipment has been added to both collieries, in particular an electric power plant at the Cape sufficient to serve both collieries. The collieries are now capable of an output of 75,000 tons per month. The profit on coal mining

during the period under review was small, principally owing to the breakdown in the arrangements which had been made for selling the coal. Towards the end of August a contract was made with the Transvaal Coal Owners' Association, and, although the allotment received by this colliery was very small, a profit is now being earned. There is no doubt that this is a very fine proposition, and when an adequate output can be attained substantial profits will be earned. I now beg to propose that the directors' report and accounts for the year ended September 30, 1921, be adopted.—Carried.

The retiring auditors, Messrs. Alex. Aiken and Carter, were reappointed.

LACE PROPRIETARY MINES

SHAREHOLDERS' MEETING.

Vlakfontein Intersection of the Reef.

At the 15th ordinary general meeting of shareholders of the Lace Proprietary Mines, Ltd., held in the board room, Consolidated Buildings, Johannesburg, on Tuesday, November 29, Professor J. G. Lawn, C.B.E., presided. There were also present Messrs. J. Munro, W. M. Munro, J. H. Crosby, E. M. Hind, J. Jeppe, A. Barker, J. S. Brown, D. R. Christie, R. Hedding, A. B. E. Johnston, E. Molyneux, D. O'Regan, and G. B. Pascoe, together with Mr. Alex. Leal, representing the secretaries, and taries.

In moving the adoption of the reports Mr. E. H. Francis the transfer secretary and accounts the Chairman said:—I have pleasure in submitting for your adoption the directors' report and audited balance sheet for the year ended August 31, 1921. No mining work or prospecting has been done on either of your two farms during the year under review, but there have been some developments in the neighbourhood of Vlakfontein which are of interest. Immediately to the north of Vlakfontein lie the properties of West Springs, Limited, and of Springs Mines, Limited. At Springs Mines No. 3 shaft, which is at present the southernmost shaft of that mine, the reef was intersected at a depth of only 3,466 feet, thus giving rise to the hope that the reef on Vlakfontein possibly occurred at a shallower depth than had been indicated by the borehole put down on the farm. More recently a borehole was put down by the New Consolidated Gold Fields near the north-eastern boundary of Grootfontein, a

farm adjoining Vlakfontein on the east; this borehole struck the reef at a depth of 3,340 feet. The evidence of this borehole tended in the same direction as that of No. 3 shaft Springs Mines. On the other hand the south shaft of West Springs, Limited, did not strike the Kimberley shale at the depth at which it was expected, and consequently the shaft was stopped and a borehole was put down at the bottom of it. This borehole indicated that the reef would only be struck at an approximate depth of 4,800 feet, whereas it had been previously anticipated it would be struck at a depth of about 4,000. So that it seems clear that between the north and south shafts of West Springs, Limited, there is either a fault or a sudden steepening of the reef. The direction of this disturbance probably runs to the east of south, but almost certainly it affects the depth of the reef on Vlakfontein. Developments in this district are being carefully followed, but there is no doubt that the wisest course at the present time is to refrain from doing any actual work until the position becomes clearer.

Repurchase of Spaarwater.

Since the close of the financial year the Spaarwater Gold Mines, Limited, has been placed in liquidation, and your directors agreed to repurchase the mineral rights of the Spaarwater Farm from the Spaarwater Company, the purchase price being the discharge of your company's right to participate in the liquidation distribution of the Spaarwater Company. This practically amounted to your company taking back the mineral rights of Spaarwater for the same consideration as it received when it sold them to the Spaarwater Company. As no work has been done on the property by the Spaarwater Company, the transaction was a fair and equitable one.

It will be seen that the cash position of the company is a strong one, and that there is £135,233 in hand. The only policy to pursue at present is to await developments and conserve the funds of the company.

The motion for the adoption of the reports and accounts was seconded by Mr. J. Munro, and on being put to the meeting was carried unanimously.

There being no other nomination, the retiring directors, Messrs. J. G. Lawn, C.B.E., and J. Munro, were re-elected.

There being no other nomination, the retiring auditor, the firm of Messrs. Page and Fry, was reappointed, and the fixing of the remuneration for the past audit was left in the hands of the directors.

This concluded the business of the meeting.

DIRECTORY OF SOUTH AFRICAN MANUFACTURERS.

Fifth Edition, 1921.

A copy of the above very useful publication has just come to hand. It is issued by the South African National Union, and is obtainable from bookstalls at a popular price. The purpose of the book is to inform people in the Union and elsewhere of the variety of articles now being made and from whom they can be obtained. The demand for such information is clearly evident from the number of inquiries received for a list of firms able to turn out goods in commercial quantities. There is an increasing desire for such

information by traders and agents. The publication will be of great assistance to manufacturers in placing their products in a larger number of markets than at present. The consumers will be likewise assisted, as they are enabled to place precisely where any article is obtainable, and thus save much time in unnecessary searching. To the producer of raw materials it provides very useful information concerning the factories which are likely to utilise such raw materials. In a young country like South Africa, where very many industries are in the primary stages, the importance of such information can hardly be overestimated. It is only by making known to the public what the country is capable of producing that a firm industrial footing can be gained

More Facts about the Rand Refinery.

GENESIS OF THE UNDERTAKING—"FINEST REFINERY IN THE WORLD"—WHAT IT MAY SAVE THE INDUSTRY—EXAMPLES FROM OTHER COUNTRIES—HOW WAR CONDITIONS EMPHASISED ADVANTAGES—NECESSITY OF A MINT—MOMENTOUS STEP IN HISTORY OF THE INDUSTRY.

In our last issue we gave a brief technical description of the Rand Refinery, now nearing completion at Germiston, to deal on a co-operative basis with the output of the Rand. In the following article we give some particulars of the history of the undertaking and the reasons why the industry decided to embark on the expense of its establishment.

A brief description of the Rand Refinery at Germiston, which appeared in our last issue, has aroused considerable public interest and evoked many inquiries regarding the origin and history of the undertaking. During the week, moreover, the proprietary company known as the Rand Refinery, Ltd., held its first annual meeting under the presidency of Mr. H. O. Buckle, who made no bones about describing the new Germiston institution as "the finest refinery in the world." Mr Buckle explained that the idea of establishing a refinery here had been mooted at intervals for a long time, but it was not until 1917 that it was taken up seriously. On a request being then received from the Union Government for comments on the proposal to establish a mint and refinery, Dr. W. A. Caldecott, who had for many years taken an interest in the subject, wrote an extremely interesting memorandum, indicating that the matter was well worth further investigation. Mr. Samuel Evans then took the matter in hand, and after going into it thoroughly, produced an exhaustive report, in which the subject was considered from every point of view. As a result of Dr. Caldecott's and Mr. Evans' researches, and in view of the Union Government's decision, in 1919, to establish a branch of the Royal Mint in South Africa, the Chamber of Mines made arrangements to erect and equip a gold refinery on the Witwatersrand, where the gold from the mines would be collected and refined and in due course despatched to Pretoria, where, absurdly enough, said Mr. Buckle, the mint was to be situated. Mr. Buckle did not mention the fact that expert advice sixteen years ago was strongly against the idea of a local refinery, but conditions have, of course, materially changed in the meanwhile, and to-day no impartial observer of all the facts can fail to perceive the wisdom of establishing a refinery with its essential adjunct, a mint.

Lessons from Elsewhere.

Mr. Samuel Evans, it may be remembered, in his historic memorandum on the subject—to which Mr. Buckle referred—advocated that the producers of gold in South Africa should be put in the same favourable position as the producers of gold in Australia and Canada; that is, that the industry should be allowed to make its bullion immediately marketable instead of having to incur the expense involved in sending it to England, Canada or Bombay to be refined and coined. A glance at some of the facts brought forward

in support of that plea may be of interest at this juncture, when the refinery is on the eve of entering the stage of actual production.

Some Questions.

The first question to be asked is:

Is it really necessary to send Witwatersrand bullion to England, Canada or India to be refined and minted?

Cannot the gold produced on the Witwatersrand be refined and minted locally at a lower cost than the 1s. to 1s. 10d. per fine oz. which in actual practice it has been costing?

The second question is: With a refinery in Johannesburg and a mint at Pretoria, what would be the charges which the gold mining companies of South Africa would have to pay in order to convert their gold bullion into sovereigns? To answer these questions it is necessary to examine what is being done elsewhere and at what cost.

It appears to have been the practice in the U.S.A. to have refineries and mints in every State which produced gold in any quantity. In Australia gold refineries and mints were established as branches of the Royal Mint at Sydney in 1855, at Melbourne in 1872, and at Perth in 1898. A mint and refinery were established at Ottawa in 1907. This establishment was considerably enlarged during the War in order to treat South African gold. A gold refinery and mint have just been established at Bombay. The following table shows the overwhelming importance of South Africa as a gold-producing country compared with other British Dominions where gold refineries and mints have been established:—

	1917.	
	Value of Gold Output.	Percentage of World's Output
	£	(£88,693,860).
Transvaal	38,306,381	
Cape and Natal	1,294	
Total for Union	38,307,675	43.2
Rhodesia	3,495,353	3.9
Total British S. Africa	41,803,028	47.1

	1917.	
	Value of Gold Output.	Percentage of World's Output
	£	(£88,693,860).

More Regular Work.

It must be remembered that a refinery in Johannesburg would have more work, and more regular work, than any other gold refinery in the world. Consequently, the costs ought to be lower than they are elsewhere. As far as one is able to ascertain, the work in most gold refineries and mints is extremely irregular, and, as a result, unduly costly. For instance, the issue of gold coins from the Royal Mint in London in the ten years ended December, 1915, varied between a minimum of £12,165,000 and a maximum of £33,350,000 per annum. Only £1,554,000 of gold coins were minted by the Royal Mint, London, in 1916. The U.S.A. mints converted 10,000,000 ozs. of gold into coin in 1904 and only 59,503 in 1917. In 1901 they converted into coin 26,727,000 ozs. of silver and only 2,312,000 ozs. in 1911. The Australian refineries and mints, and more particularly the Perth establishment, are the only refineries and mints working under conditions approximately similar to those which would be applicable to a refinery in Johannesburg. Even in the case of the Perth refinery and mint there are considerations which make for higher costs than would be likely to obtain here. At Perth a large number of small deposits of bullion have to be handled, and the total quantity of bullion treated is small compared with what would be the case in a Johannesburg refinery.

The authorities publish no figures as to the capacity of the Perth refinery, but it is reported to be equal to treating the total output of Western Australia, the value of which in 1903 was £8,770,719. It is claimed for the Sydney and Melbourne mints that they have a capacity equal to dealing with the total gold output of Australasia, which in 1903 totalled £18,333,000 in value. In June, 1900, the Secretary of State for India estimated the cost of building a new mint for gold at Bombay at £12,933.

Points about a Refinery.

As regards the cost of building and equipping a refinery only, one authority wrote from America:—

"I understand that at all the Australian mints the chlorine process is being used. At Ottawa the original installations were the Moebius and Wohlwill electrolytic processes, but in 1914, owing to the increased quantities of bullion to be handled, the more rapid chlorine process (Miller's) was introduced. At the U.S. Assay Office in New York the Moebius and Wohlwill electrolytic processes are employed. The capital cost for either process is comparatively small. Metallurgist W. C. Smith (already referred to) estimates the cost of a Wohlwill plant only, with building, to refine 10,000,000 ounces per annum at about £15,000, New York. The cost of the temporary building and chlorine plant put up at Ottawa to treat South African bullion, with capacity of similar quantity per annum, was about £9,000, and it is worth mentioning here that this addition was entirely completed in eight weeks. Had the arrangements been of a permanent nature more money would doubtless have been spent, especially on a better system for washing fumes. . . . The cost of the plant only at the U.S. Assay Office, New York, for both Moebius and Wohlwill processes was £15,000—also with capacity of 10,000,000 ounces per annum. The building cost I have not been able to ascertain, but, if we use Metallurgist W. C. Smith's figure of £10,000 for building, the total cost of the Assay Office, New York, would be £25,000."

To sum up.

It would be a conservative estimate to place the total realisation charges, including the payment to the Bank of England, at 1s. 2½d. per oz. of fine gold under pre-war conditions, which, on the output of South Africa for 1917, namely, 11,250,000 of bullion would mean, under pre-war conditions, over half a million sterling. Put in another way: That the actual cost of refining and minting in Western Australia is 1'422d. per oz. of bullion.

	Pre-War Conditions.
The total realisation charges per annum for British South Africa have been	£555,236
The cost of refining and minting if done in Johannesburg should not exceed	100,000
Difference	£455,236

which is approximately what the gold producers of British South Africa would stand to gain yearly were a mint and a refinery established in Johannesburg. In other words, every month's delay in providing a local refinery and mint involves a loss to the gold producers of British South Africa of about £67,000 under war conditions and about £38,000 under pre-war conditions.

An Argument Refuted.

The argument usually advanced against refining and coining in South Africa is that our currency requirements constitute only a small fraction of the gold output of the country, and that we have to send the bulk of our output to England, even if we did refine and coin it here. A little consideration will demonstrate the fallacious character of this argument. Let us examine what happens when gold bullion is sent from South Africa to England. In the fifty years ended 1913 the average value of the gold bullion and specie imported into and exported from the United Kingdom per annum was:—

Imports	£25,238,760
Exports	21,183,915
	£4,054,845

and of the latter a considerable portion was eventually exported in the form of jewellery, goldware, etc. It has been estimated that less than 5 per cent. of the Rand gold sent to England constitutes a permanent addition to the currency of the United Kingdom. Roughly, what took place before the War was this: Rand bullion was sent to England to be refined and partly coined, and then the bulk of it was distributed all over the world, to the Continent, to the U.S.A., to Egypt, to India, Japan, South America, etc. What happened during the War was: South African bullion was sent to Canada and India to be refined and partly coined. The refinery and mint at Ottawa were purposely enlarged in order to treat South African bullion, and a new gold mint was established at Bombay, apparently also in order to treat South African gold. When refined and coined at Ottawa or Bombay South African gold was re-shipped to Spain, U.S.A., Egypt, Japan, South America and China, which adopted the gold standard. It is obvious that when the gold is refined and, if necessary, minted here, it can be distributed direct to the countries requiring it, effecting a very large saving. "The fact is," as one authority put it, "it would be difficult to conceive a more unbusinesslike and extravagant arrangement than the one which has hitherto prevailed as regards the disposal of South African gold."

A Mint Essential.

An important point is that there must be a mint as well as a refinery established, and that the former be a branch of the Royal Mint in London in order to completely eliminate the Bank of England charge of 1½d. per standard oz. and obtain the benefit of the provision appearing in Proclamations creating branches of the Royal Mint, which says that "gold coins coined under such Proclamation shall be deemed to have been issued from the Royal Mint." It does not follow that all the bullion refined will be coined into sovereigns and half-sovereigns. Portion, no doubt, will be formed into ten ounce bars of standard fineness for export to India, China, and other countries which have to import gold for their mints.

The foregoing are some of the main reasons why the Rand Refinery, "the finest in the world," is now on the eve of becoming an accomplished fact.

roads traversing the State and with the aid of King Petrol providing a tremendously important adjunct to the railways.

The Indian Example.

Take, for instance, India. There they have a main trunk road running from Peshawur to Calcutta right across India, from the Khyber Pass on the west to Assam on the east. It is a road magnificently maintained by the Government of India and it provides a main artery right through the country, an artery running parallel with the great snow-capped mountains to the north from which India draws her economic life-blood through the medium of her magnificent rivers.

Other Countries.

In North America and in Europe there are similar main thoroughfares. France, for instance, has a wonderful system of roads and an excellent method of maintaining them in good order—a method which we propose to comment on in a further article.

Yet we in South Africa are little ahead of Central American republics in the matter of roads.

Wanted, a Main Road.

There should be a main trunk road traversing the Union from end to end—certainly from Capetown to Pretoria. Such a thoroughfare might well be extended northwards into the territory of our northern neighbours. From this main trunk branch roads should be extended to the various industrial centres of the country and to the coast ports. These branch lines would in turn be linked up with less important feeder lines and the whole network of communications would thereby galvanise life and activity into a country of immeasurable resources which is being starved through lack of leaders possessed of any imagination or constructive policies. The Railway Administration is to-day virtually without funds. Unemployment is rife and is extending. The railways are unable to construct the branch lines which are so urgently needed to open up rich and undeveloped districts.

Roads and the Out of Works.

The unemployed want work. It is no use squandering the Union's slender financial resources on doles and on useless relief work. But employment for the growing army of the out-of-works upon a main trunk road system traversing the whole country from Table Bay to the Limpopo would be the commencement of a step which would ultimately give to the Union an asset of vast value. Such an undertaking would with its feeder lines acting in consort with the railways give a tremendous fillip to commerce. It would also stimulate the motor trade of the country, and it would perhaps induce many overseas visitors to spend time and money on long motoring excursions in South Africa, a country blessed with good climate and scenery and with many other advantages which conspire to make the Union one of the most attractive motoring countries in the world—if only we had the roads.

How the Scheme would Benefit the Collieries.

Construction and maintenance of this main trunk road would provide our collieries with an immense market for the inexhaustible quantities of tar which they could produce from low-grade and waste coals. We have frequently observed in the course of visits to the coal fields of the Union that a vast amount of low-grade and fine coal is being dumped as waste. According to the managements of these collieries, there is no sale for this coal. Frequently we have been told that the collieries would be only too glad if some one would take the waste coal away. They could have it for nothing.

A Big Market for Tar.

When it is pointed out that this coal contains valuable by-products, and particularly tar, the invariable reply is: 'And who is going to buy the tar?' The market for tar in South Africa is exceedingly small. If we put up a tar plant we could not sell what we produced. The point is that an

enterprising road policy such as has been briefly outlined in this article would provide an ample market for innumerable tar plants. The main trunk road and its branches must be well metalled and a good surface maintained. Here, then, is an undertaking which would not only give useful employment to the out-of-works of the Union, but would also provide a profitable market for many thousands of tons of coal which are to-day going to waste. And of the advantages of such a road system to the country at large there can be no question whatsoever.

Strategical Value of the Road.

In addition to the points mentioned above, it would have a great strategic value, and in the case of a railway strike it might well prove the salvation of the Union. In England the great railway strike of 1919 was broken by the employment of mechanical transport on the excellent roads of the Island Kingdom. How much more important is it to the inland centres of the Union, situated at great distances from the coasts that there should be a good road route right through the country—a road which would be a valued coadjutor of the railways in normal times and which could if need be take the place of the railways during any possible period of industrial unrest.

Measuring One Thousandth of a Second.

Part of the work of observatory depends upon a means of measuring extremely short periods of time. For example, in receiving any signal by wireless telegraph or otherwise, it is vitally important that the precise time of receipt as recorded by a clock should be known. In order to facilitate this highly accurate determination, a British observatory has developed an appliance based on the Oscillograph, itself a British invention. This apparatus can register clock times of any signal accurately within one thousandth part of a second.

Oil from Shale.

THE IRONSIDE PROCESS DESCRIBED.

The process is the original invention of a young Scottish chemist, Mr. T. G. Ironside, M.A., B.Sc., Edin. Mr. Ironside has left with Mr. W. R. Burch, M.L.A., for England in connection with the business and financial arrangements that are now being made for establishing the process in England, America, France, Germany and other countries where oil shales and bituminous coals occur.

The outstanding advantage of low temperature carbonisation lies in the production of a quantity of oils almost double that obtained at high temperatures, as in gas works. Further, a large percentage of these are light oils suitable for internal combustion engines; the remainder are suitable for Diesel engines. The main requirements of a low temperature carbonisation process are:

(1) That the distillation is carried out at the lowest possible temperature which will break up the bitumens.

(2) That sufficient heat be present to distil off the volatiles produced by the decomposition of the bitumens.

(3) That the vapours which are formed are removed as rapidly as possible and with the minimum of contact with highly heated surfaces.

In any externally heated retort none of these conditions can be even approximately realised, for it is obvious that the walls of the retort must be at a relatively high temperature in order to get heat to pass inside the retort at a rate sufficient to make the process practicable. There is therefore a gradation of temperature from the walls of the retort to the centre, and the newly-formed vapours have abundant opportunity of coming in contact with the highly heated walls and with heated lumps which are hotter than the vapours themselves. The extreme conditions here set out are generally modified by the injection of steam, which tends to make the temperature more uniform in any one region of the retort; but, if the injection of steam were anything more than a palliative, the Mond producer would be the last word in low temperature carbonisation, which admittedly it is not.

In order further to cut down the temperature of the walls of the retort, these retorts are made of a cylindrical shape, so as to get a bigger surface, which will pass in the required quantity of heat at a lower temperature. The ideal would be an infinite surface at just above the right temperature.

In regard to the size of the particles being retorted it is obvious that ideal conditions will be attained when, and only when, each and every smallest speck of substance is in immediate contact, at every point of its own surface, with the heated surface, *i.e.*, the shale or coal, or other retorted substance must be in powdered form.

In the Ironside process the powdered shale is preferably pre heated until it is just about to begin giving off vapours. In the retort it is mixed with hot sand introduced at another point of the retort. The sand and shale are mixed by mechanism inside the retort, by which means the shale is raised to the temperature necessary for complete carbonisation under low temperature conditions, while the sand is just a shade hotter, and there is still sufficient heat present to distil off the volatiles. The process therefore approximately realises the ideal conditions. The powdered shale, every speck of which is in contact with an infinite surface of heating medium, is subjected as nearly as possible to the ideal temperature for each stage of the process. The mixing mechanism also performs the function of guiding the residue to an outlet where it drops into a sealed receptacle.

So far the process has been tested with a makeshift retort whose only recommendation was that it had two holes in the top for introducing sand and shale respectively, and

one in the bottom by which the residue might be extracted. These tests made clear the following points:

(1) The process is speedy. A given quantity of sand and shale once introduced into the retort is exhausted in something like a minute.

(2) The process will reduce the cost of the retorting plant (owing to the large capacity of this retort) to about one-tenth.

(3) The process gives a high yield, *viz.*, so far, from Waaiboek Cannel coal, liquids equal to 20 per cent. of the weight of the coal, while from the Mooifontein torbanite a yield of crude oil up to 40 per cent. of the weight of the material has been obtained.

Mr. T. G. Ironside, M.A., B.Sc. (Edin.), inventor of the new process which promises to revolutionise the production of oil from bituminous materials. Mr. Ironside graduated with first-class honours in mathematics, and during part of the War was engaged at Nobel's Explosives Works in Ayrshire. He came to this country as chemist to the S.A. Nitrate and Potash Corporation in 1919.

(1) The reaction is complete.

(5) As there is never much in the retort at any moment, and the retort may be built completely of iron, the process may be interrupted or the plant closed down whenever necessary.

(6) The carbonised residue from the process forms an ideal medium to replace sand, so that the process produces its own heating medium.

(7) No steam is required to moderate excesses of temperature, *i.e.*, coal required to raise such steam is saved and much less condensing plant is required.

(8) All heat required can be applied in an efficient manner, as the method of transferring heat to the sand

is not limited by the presence of shale, as in ordinary retorts.

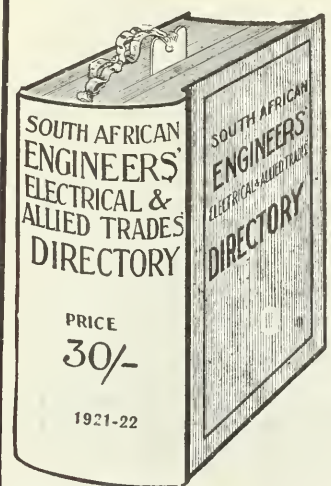

(9) The Waaihoek Cannel coal used on these tests has been reported on as not being suitable for Scottish retorts, owing to its clinkering tendencies. No sign of clinkering of the material was observed in these tests.

The tests referred to above were made in a small experimental retort of only 9 inches diameter. A new retort 3 feet in diameter has now been constructed. The height of the retort is about 2 ft. 6 in. This retort has been constructed by Messrs. Rowe and Monfries of this town. They have done their work excellently, both in regard to the castings and the interior mechanism. The detail mechanical drawings were executed by Mr. Kelly.

The completed retort has been despatched to the Grenfel Colliery, near Ermelo, where it will be erected and put into commission by the Transvaal Coal and Oil Shale Corporation, Ltd. The first material to be treated will be the rich torbanite from that company's property—the Carlis portion of Mooifontein. It seems certain that to the Transvaal Coal and Oil Shale Corporation will belong the honour of first producing oil on an industrial scale in South Africa.

Railway Electrification.

We understand that Messrs. Merz and McLelland, the consulting engineers, have advised all tendering firms to put in revised figures (in view of the fall in prices) within ten days, and the contract will be given out by the end of the month of December.

Britain Not Beaten!

WHERE QUALITY, NOT PRICE, TELLS.

When quality, not price, counts, British engineering is not yet beaten, as witness the following which we are privileged to extract from a letter from the head office of Messrs. Edgar Allen and Co., Ltd., of Sheffield:—

“Trade is improving and the troubles with workmen are fewer, but we are not working at our full capacity in the foundry and steel departments. The machinery and tramway departments are working full time. We have recently taken considerably over £20,000 worth of tramway work from Sweden, and more to follow, against German competition. *We got this on quality, not on price.* We have just completed the largest gyratory crusher ever made by a British firm. Its weight is 80 tons and the total height from foundation 17ft. 2 in., the diameter from the Hopper portion being 12 ft. 9 in. It was designed for breaking hard chalk for a cement company, and should break about 250 tons of chalk per hour, reducing lumps of about the size of a man to pieces 1 in. cube and under. The crusher surfaces are easily renewable, and made of our ‘Imperial’ Manganese steel.”

A RECORD ROPE.

What is believed to be the longest coil of moving steel wire rope, manufactured in one length without splice or joint, has just been completed at the Birmingham works of Messrs. J. and E. Wright, Ltd.

This rope is a new tramway cable for the Glasgow Subway Railway, and measures 36,300 feet long by 4½ in. circumference.

The Glasgow Corporation, with their reputation for always being abreast of the times, have decided on the most modern type of rope and have accepted a special flattened strand construction designed by Messrs. J. and E. Wright, Limited. The weight of the rope is approximately 65½ long tons.

The manufacturers, who believe that this is the very first fine ropes of flattened strand construction have been employed on tramway work, have also recently completed a large rope in the ordinary construction for the Melbourne tramways. This rope was 23,000 feet long, 4 inches in circumference and weighed approximately 30 tons.

The local agent for Messrs. T. and E. Wright, Ltd., is Mr. H. Aiers Hankey, of Standard Bank Chambers.

The South African Institute for Medical Research.

HISTORY OF THE INSTITUTE—PHTHISIS RESEARCH—WORK OF THE MEDICAL BUREAU.

Members of the Chemical, Metallurgical and Mining Society of South Africa were the guests of the S.A. Institute for Medical Research on Saturday morning. The visitors were hospitably received by the Director of the Institute, Dr. W. Watkins-Pitchford, and the staff, and were conducted through the various departments and laboratories. Before commencing the tour of inspection the Director lucidly explained the origin and functions of the institution. The South African Institute for Medical Research was established in 1912 by agreement between the Government of the Union of South Africa and the Witwatersrand Native Labour Association (acting on behalf of the mining industry of the Transvaal), for the purpose of carrying out researches and investigations with a view to the prevention and treatment of human diseases. The Institute occupies a commanding site, in extent just over four acres, adjacent to the

work formerly carried on in the Government Bacteriological Laboratories of the Transvaal, which, by virtue of the agreement under which it was founded, the Institute is required to carry on.

The most prominent line of research which, up to now, has been pursued in the Research Division is that in respect of the prevention of pneumonia, a disease which, until recently, accounted for most of the sickness and mortality amongst the native labourers on the mines of South Africa, as well as recent researches in connection with miners' phthisis and the problem of mine ventilation.

Apart from the work of the Research Division, the Institute, in the "Routine" Division, carries out a large amount of diagnostic investigations for hospitals and the medical profession, in addition to the usual bacteriological services

The Institute—Looking from the East.

Johannesburg Hospital, and bounded by Hospital, de Korte and Joubert Streets, the main entrance (when the full scheme of the laying-out of the grounds has been completed) being designed to face Hospital Street. The site for the buildings, which overlooks the central area of Johannesburg, was donated by the Government, whilst the cost of the buildings and their equipment, amounting to about £45,000, was borne by the mining industry. The cost of maintenance of the Institute is borne by the Government and the mining industry in equal proportions up to a limit of £10,000 per annum, and, in addition, a substantial revenue is earned from the performance of bacteriological and pathological services—other than research work—for the Government, the mining industry, public bodies and the general public through the medium of the medical profession.

The work of the Institute is carried on in two main divisions—"Research" and "Routine," the latter including all the bacteriological, pathological and medico-legal

required for the Government, the mining industry and municipalities. Since the establishment of the Miners' Phthisis Medical Bureau in August, 1916, its work has been carried out in the Institute buildings, a portion of which has been allocated for the purpose. Under the Miners' Phthisis Act of 1916, every applicant for employment underground on the mines of the Witwatersrand is required to submit himself for medical examination at the Bureau, the object being to exclude from work underground any person who is infected with tuberculosis. In addition, all miners employed underground must be similarly examined at intervals of six months to ascertain whether or not they are suffering from either tuberculosis or silicosis, or both. The examination conducted at the Bureau is a very thorough one, and embraces both clinical and X-ray investigations.

The association of the work of the Bureau with that of the Institute has proved of mutual advantage; the numerous pathological investigations required by the Bureau are

carried out without any loss of time in the adjacent laboratories, and unique facilities for investigating miners' phthisis are thus provided.

A conception of the excellent work which has been achieved in the Bureau can be obtained from the following statements which were made by the Director during the course of his address to the visitors. "Up to the year 1916 the whole question of silicosis was in a most confused, chaotic state. It was known that large numbers of men who did not get silicosis at all had received large sums for compensation. It was also widely advertised that men who had silicosis had not received compensation.

Silicosis or miners' phthisis is the most important disease of South Africa, from the point of view of health and economy generally. Therefore, everything that could be known about the disease should be the care of this Institute.

The result has been, in the five years in which the Bureau has been associated with us, that we have now a clearer conception of silicosis than ever existed before. We know exactly what it is; it can be recognised. More important: this is the only place in the world, as far as I know, that it can be said with certainty whether a man has got silicosis or not. There is a rigid examination of all recruits for underground service. This has resulted in a very marked rise in the health of the underground workers.

"Since the Medical Bureau was started, 8,000 of these men have been passed. Of this number not one has developed silicosis. That fact alone would justify the association of a medical bureau with an institute for medical research."

Further testimony of the Bureau's work is furnished by the following extract from the report of the Miners' Phthisis Board for the eight months ended July, 1920. The total number of clinical examinations and investigations was 42,030, an average of 140 examinations and investigations for each working day. The annual totals of examinations and investigations for each year since the establishing of the Bureau in 1916 have been: 28,853; 35,579; 32,730; 42,030. For the twelve months now being reported upon, there has been an increase in the work of the Bureau of about 45 per cent. over that for the first year. During the year a total of 29,062 radiographic negatives (12 in. by 10 in.) have been prepared. The percentage of rejected negatives was 6.5. The Bureau accepts as evidence only those radiographs which reach a definite standard of technical quality.

The work of marking each radiograph with the serial number of the individual has been simplified and improved by the use of an appliance devised by Dr. W. Steuart, the medical radiographer, and the chairman. This appliance produces an indelible radiographic stencil of the serial number, the class of examination, and the date, upon the heart shadow of the examinee. Its use has been productive both of saving of time and greatly increased clearness and accuracy in the identification of the radiographs.

Recovering Lime from Waste Solutions.

The utilisation of solutions containing zinc on the gold mines is a problem which has been commented on by chemists and metallurgists on the Rand for some time past. A large amount of zinc goes to waste annually in these solutions, and a process which can economically utilise this zinc in some form or other should prove to be of some value to the mining industry. In the Kominsky process, a method for converting the zinc in solution into paint pigments is put forward, and briefly consists of the following: The zinc solution used is that which results from the acid treatment of gold zinc slime, and usually contains about 5 per cent. metallic zinc, a small quantity of ferrous iron salts, and excess acid. The iron salts have to be removed, otherwise they find their way into the zinc compounds precipitated subsequently, and cause discolouration. The removal of the iron has been made possible by the Kominsky process. The acidity of the solution is controlled by the

addition of lime. Iron is converted from the ferrous to the ferric state by means of sodium chromate. Sodium hydroxide is now added, and precipitates impure zinc hydroxide from a small quantity of the original solution. The zinc hydroxide is made into a paste and added in considerable excess to the original oxidised solution. Excess of sulphuric acid is neutralised by some of the zinc hydroxide, and the remainder precipitates ferric and chromium hydroxides from the neutralised solution. An equivalent portion of zinc hydroxide goes into solution. The whole solution is filtered in a filter press. The sludge containing some zinc hydroxide is reused for precipitation, while the clarified solution is now free from iron. The zinc is next precipitated from it by means of a solution of sodium chromate, producing a precipitate of zinc chromate which when filter pressed, washed, dried, and crushed produces the paint pigment zinc-yellow. By precipitating the zinc as carbonate and calcining this product zinc-white is produced.

* * *

October Gold Output.

The official figures issued by the Chamber of Mines show:—

WITWATERSRAND:

Tons crushed	2,041,581
Declared fine ozs.	690,348
Dwts. per ton	6,708
Working revenue	£3,511,275
Working costs	£2,529,678
Working profit	£981,597

The working profits for October were £169,530 lower than those for September. This drop was due to the fall in the gold premium from £5 10s. in September to £5 3s. in October. The tonnage crushed was 44,495 tons higher in October than in September, and working costs were 5d. per ton lower. Both the greater tonnage crushed and the lower working costs have to a certain extent counteracted the adverse effects of the fall in the premium, but much more has to be done in that direction in order to stabilise the position of the gold mining industry.

OUTSIDE DISTRICTS:

Tons crushed, 30,243; yield, 17,477 fine ozs.; working revenue, £66,205; working costs, £52,689; working profit, £13,516.

BARBERTON GOLD STATISTICS.

The following particulars of mining in the Barberton district for the month of October are supplied by Mr. L. G. Deglon, secretary to the Barberton District Mine Owners' and Managers' Association:—

No. of Mines producing	8
No. of Stamps working	100
Tube Mills	2
Tons of ore treated	5,742
Fine Gold (ozs.), recovered	2,351,344
Value at £1/24/73	£9,988
Small Mines and Miscellaneous, fine gold ozs., 219,270, value	£932
Total output, fine gold, ozs., 2,570,614, value	£10,920
Labour—Whites, 176; coloured, 2,123.	
Chamber of Mines estimated value per fine oz.	£5 15 0
Claims held for month ended 31/10/21:	
Prospecting Permits	50
Prospecting Claims	2,124
Diggers' Claims	249
Base Metal Claims	25,191
Total Claims	27,564
Days (24 hours) milling	—

The Resources of the Harrismith District.

(By a Correspondent).

The following brief account of the mineral and industrial possibilities of the Harrismith district directs attention to a promising and little known area of the Free State.

The south-eastern corner of the Free State Province is not so well known as perhaps it deserves to be. For a number of years on many different occasions sporadic attempts have been made by divers syndicates and companies to exploit the mineral resources of this area, but for various reasons most, if not all, of them have come to grief. One recalls memories of oil prospecting syndicates, the Clocolon, Ladysmith, and other concerns which operated over a considerable area and by means of shaft sinking, boreholes, etc., endeavoured, always unsuccessfully, to locate the oil reservoirs which the promoters fondly imagined to exist at moderate depths below the surface.

Outside the search for oil, diamonds have claimed the attention of other adventurers. Who has not heard of the fabulous wealth in diamonds of that, at present, *terra incognita*, Basutoland? Meanwhile, until this Naboth's vineyard is thrown open to the prospector he is content to confine his activities to the Free State border areas, and many a marvellous diamond find has been located—needless to say wholly in the imaginations of the promoters of bogus concerns—which have been successful in extracting money from the pockets of the public in order to develop the properties and thus to create new Kimberleys for coming generations of South Africans.

However, putting aside the chimeras of oil wells and diamond mines, the district of Harrismith is not wholly deficient in minerals of economic importance which, if judiciously developed and capitalised, ought to give the public "a fair run for their money."

Coal, oil shale, lime, certain mineral salts, clay for the manufacture of bricks, including a valuable deposit of fire-clay, used in making bricks for withstanding the great heat of smelting furnaces; good building stone is abundant, and the ingredients for the manufacture of cement are to be found in the locality.

In and around the town of Harrismith coal exists which is spread over a very considerable area. Until the railway was constructed no particular attention was paid to the possibilities of coal seams being worked. Latterly the desire has been manifested that the coal resources should be exploited in the interests of the town and district. There is at present considerable demand for coal for both domestic and industrial purposes which cannot yet be satisfied from local resources. Practically all the coal used comes from Natal, and the local price of fuel is consequently high owing to the high costs of mining in Natal and the freightage.

Several new industries are arising at the moment. one of these, a wool factory—for the building of which tenders have lately been asked for in the Johannesburg papers—is to be established on a somewhat ambitious scale. The capital is £300,000 all subscribed locally and practically altogether by the farmers, thus proving incidentally the shallowness of the plea of poverty put up by this class when any question of adequate taxation for them is raised in Parliament. There are also creameries and butter factories in actual operation, and a municipal power station with a possible output of 750 k.w. of energy is also in operation.

Flour and mealie plants are also in operation as well as several engineering plants. Altogether the local fuel demand is of sufficient importance to make the opening up of the coal measures a matter of urgency.

Should payable seams of oil shale be found in the neighbourhood, a big fillip would be given to industrial enterprises, as there is ample local capital available for this

purpose. The limestone found in this neighbourhood is of good average quality; owing to lack of railway facilities it is somewhat difficult to exploit successfully at the moment. but the matter of railway extension is shortly to be taken seriously in hand, when the lime—89 per cent. CaCO₃ by analysis—will be available for the market.

Since several good clay beds are known to exist in the district, the question of the establishment of local cement works is only a matter of time, as all the necessary ingredients are at hand and water power and water for manufacturing purposes is abundant. It is fairly certain that nitrates will be found in this district, samples of these have been submitted for analysis, and have shown a fairly high nitrogenous content; no serious attempts have yet been made to work the deposits.

Other mineral salts have also been located on certain farms; owing to the apathy and indifference of investors no attempt has been made to open them up. All the above-mentioned deposits have been brought to the notice of the writer, and it is very probable that systematic prospecting would disclose other mineral prospects of economic importance.

A word as to the available sources of water power in this neighbourhood may not be out of place. A number of high hills—mountains would perhaps be a better term—are found in this district. They are outliers of the Drakensberg range and are spread over an extensive tract of country. Streams of water issue from points either near to or on the summits of these mountains, and, falling in a series of cascades down their precipitous sides, finally exhaust themselves and form large water courses whose combined waters make up the bulk of the Wilge and other rivers. By the erection of suitable dams, and in other ways, enough power could be developed to provide a considerable supply for all purposes; one such stream seen by the writer would easily develop 2,000 horse power if properly harnessed, and there are several others equally valuable.

Tree planting has been markedly successful on a large scale in the district; millions of trees are now growing, chiefly under Government control. While in no sense a mineral deposit, timber is a very necessary aid to mining and may reasonably be brought into discussion as an adjunct to the mining possibilities of the area in question.

It may therefore be concluded that, while in no sense an Eldorado, the Harrismith district is one which fairly offers an opening for a moderate investment of capital for mining and industrial purposes, and with the possibility of further finds of useful minerals in the future. Having a railway connected with the large industrial areas in both directions, it is easily accessible for investigation purposes and for the forwarding of stores and equipment if required. It is hoped that more attention will be paid to it by persons with the necessary capital and energy to exploit its resources.

FOR SALE OR TO LEASE.

ASBESTOS MINE.

Proved Property, comprising four blocks of Claims in the best section of the famous Mashaba District. Two-mile strike. Width proved to date over 170 feet. First-quality fibre in abundance. Property still being developed with 50 odd boys, and recovering over ton daily rough cobbled fibre. Can be very cheaply worked and large tonnage fibre recovered. Examination invited. * Loss.

Crown Mines, Ltd.—Owing to the strike which commenced at No. 5 shaft on the 9th of November and extended to all producing sections of the mine on the 25th of November, the results obtained for the month are abnormal. The actual working costs per ton milled show no appreciable increase because 41,300 tons of accumulated rock were removed from stopes during the strike period and the breaking charges on this rock had been incurred previously. Working revenue per ton milled was higher for the following reasons: The mine grade showed an improvement due to rich fines being swept from idle stopes. 190,400 tons of slimes and sands were treated in the cyanide works, thus producing cyanide gold for 19,400 more tons than were milled. Similarly the amount of gold recovered from steaming launders and tube mills was the same as would have been recovered in a full month's run."

Wolluter G.M., Ltd.—Milling operations were suspended for three days, due to breaking mill motor driving shaft.

General Note.—The valuation of gold has been taken at £5 0s. 9d. net per fine ounce, which is 1s. per ounce less than the previous month.

CONSOLIDATED MINES SELECTION GROUP.

The following are the results of operations for the month of November, 1921:—

	Stamps Working.	Tons Milled.	Working Costs per Ton Milled.
Brakpan Mines	120	57,000	26/10:323
Springs Mines	80	45,000	27/10:704

Totals and averages 200 102,000 27/3:786

	Value of Gold declared.	Yield per Ton.	Working Profit based on standard value of Gold.	Working Profit per Ton.
Brakpan Mines	£98,327	34/6:009	£21,775	7/7:686
Springs Mines	79,887	35/6:062	17,130	7/7:358

Totals & averages... £178,214 34/11:327 £38,905 7/7:541

Estimated Premium taking Gold at £5 3s. 0d. per fine oz. less exchange on remittance—

Brakpan Mines	£18,599	£40,374
Springs Mines	15,271	32,401

Totals and averages 33,870 £72,775

Note.—Brakpan placed to gold reserve 4,230 fine ounces; total reserve at date, 16,588 fine ounces.

WITWATERSRAND DEEP, LIMITED.

The estimate of results for the month of November, 1921, is as under:—Tons milled, 35,000; gold recovered, 10,035.724 ozs.; average of stamps running, 180; stamps running time, 20,904 days; tube mills, 5. The working expenditure, including head office charges, for the month is £44,025, or 25s. 2d. per ton. The estimated working revenue based on an estimate of £5 2s. per fine oz. (less 1s. 3d. realisation charges) is £50,555, or 28s. 11d. per ton. The estimated working profit is £6,530, or 3s. 9d. per ton, from which is to be deducted the capital expenditure for the month of £1,355, leaving a surplus of £5,175.

UNION CORPORATION GROUP.

Particulars of operations on the producing mines of this group for the month of November, 1921:—

Company.	Stamps.	Tons Crushed.	Fine Ozs.	Revenue (Including Sundry Rev.) Total.	Per ton
Geduld Proprietary ...	100	46,000	17,363	£88,579	38/6
Modder Deep	70	43,300	23,728	120,077	55/6

Totals and averages 170 89,300 41,091 £208,656 46/9

Company.	Total.	Costs Per Ton.	Profit (Incl. Sundry Rev.) Total.	Per ton
Geduld Proprietary... ..	£50,703	22/0	£37,876	16/6
Modder Deep	45,651	21/1	74,426	34/5

Totals and averages.. £96,354 21/7 £112,302 25/2

The above results are arrived at by calculating the gold produced at £5 2s. per fine ounce. Realisation charges in excess of normal are debited direct to revenue.

CONSOLIDATED GOLD FIELDS.

The following are particulars in regard to the outputs for the month of November, 1921, of the undermentioned companies of the Consolidated Gold Fields Group:—

Company.	Stamps Running.	Tube Mills.	Tons Crushed.	Gold declared, Fine ozs.	Profit.
Simmer and Jack ...	320	7	60,000	14,632	£8,458
Robinson Deep... ..	150	9	60,500	20,040	22,703
Sub Nigel	30	2	10,400	5,994	6,000

Totals 500 18 130,900 40,666 £37,161

Total gold in reserve (fine ounces): Simmer and Jack, 1,200; Robinson Deep, 1,495; Sub Nigel, 2,108; total, 4,803.

The revenue derived from gold for the month of November is calculated at the rate of £5 2s. per fine oz., less estimated gold realisation and exchange charges of 1s. 6d., or a net figure of £5 0s. 6d. per fine oz.

GENERAL MINING & FINANCE GROUP.

The following information regarding the November operations of the producing mines of this group has been supplied:—

Company.	Tons Crushed.	Total Cost.	Cost per Ton.	Total Revenue.	Profit.
Aurora West ...	10,730	£13,398	24-97	£14,261	£863
Meyer & Charl.	14,600	18,148	24-86	43,250	25,102
New Goch ...	16,500	18,519	22-45	18,618	99
Rood. United ...	17,650	18,444	20-90	19,046	602
Van Ryn Est. ...	32,600	41,132	25-23	47,171	6,039
West Rand Con.	33,000	41,193	24-97	45,222	4,029
	125,080	£150,834	24-12	£187,568	£36,734

In calculating the revenue, gold has been taken at a value of £5 2s. per fine ounce, less estimated realisation charges.

BARNATO GROUP.

Operations for the month of November, 1921:—

Mine.	Tons Crushed.	Revenue from Gold
Consolidated Langlaagte ...	45,000	£66,692

Randfontein Central...	165,044	27-280	15,642
Van Ryn Deep ...	66,230	23-910	86,043
Witwatersrand ...	46,460	21-761	10,009

Totals and averages ... £569,830 ... 23-580 ... £315,424

October totals ... £567,728 ... 23-990 ... £306,797

Note.—The above results are arrived at by calculating the gold at £5 2s. per fine ounce.

GLYNN'S LYDENBURG.

The following are the particulars of the output for the month of November, 1921, in respect of the above company: Tons crushed, 3,600, yielding 1,349 fine ozs.; estimated value of month's output, £6,752; estimated profit for month, £1,218. Note.—The above figures are exclusive of expenditure on shaft sinking, special development and capital expenditure amounting to £976. The month's results are based on value of gold of £5 0s. 3d. net per fine oz.

TRANSVAAL G.M. ESTATES

The following are the particulars of the output for the month of November, 1921, in respect of the above company: Central Mines: Tons crushed, 12,300, yielding 3,133 fine ozs. Elandsdrift Mine: Tons crushed, 1,500, yielding 936 fine ozs. Vaalhoek Mine: Tons crushed, 530, yielding 302 fine ozs. Estimated value of month's output, £21,906. Estimated loss for month, £776. Note.—Loss due to lower grade at Central Mines and closing down of Vaalhoek mill greater portion of month for repairs, cost of which is included in working expenses. The month's results are based on value of gold of £5 0s. 3d. net per fine oz.

FAIRBANKS**Vulcabeston Renewable Disc Valves.**

DISC RING

Asbestos Fibre, as everybody knows is not affected by heat or acids.

Vulcabeston is a compound of Asbestos Fibre saturated with rubber and other materials and vulcanised under Hydraulic pressure. It is the ideal material for a valve seat, and you can get it only in Fairbanks Valves with Renewable Discs.

There is another marked difference about the Fairbanks Valve and that is in the quality. A trial and comparison will convince you.

METAL REPORT.

We are indebted to Messrs. Henry Bath & Son., Ltd., for the following report, dated November 16:

Copper.—There has been a steady improvement in standard copper, the closing quotations of which show an advance on the fortnight of 7s. 6d. to 10s. per ton. Good advices continue to come from America where large sales are taking place, the quantities disposed of during October being on a larger scale than for some considerable time. Domestic requirements have absorbed a fair quantity, while export orders are well maintained. Home consumption is

showing a slight improvement but there is still plenty of scrap material available. Some 8-9,000 tons of copper, rough and refined, forming the balance of stocks held by the Government were sold by tender on the 7th inst. and it is understood that most of this copper is destined for the United States. According to the Metal Exchange returns, the stocks of copper in warehouse on the 31st October were: 9,158 tons refined, 12,518 tons rough, and 183 tons unclassified, together 21,859 tons against a total of 19,485 tons on the 30th September.

OFFICIAL QUOTATIONS.

	16th November.	1st November.
Standard Copper (cash) ...	£66 ³ / ₄ —£66 ³ / ₄	£66 ¹ / ₄ —£66 ³ / ₄

Manufactured ...	£101	£103

Tin.—At the commencement of the fortnight the tendency was rather uncertain and on the 2nd inst. prices declined to £155 cash and £157 three months. During the next few days a much better tone developed and under good buying values advanced sharply until £159 cash and £161 10s. three months were touched by the 8th inst. Since then there has been a slight set-back, but the tone remains firm. Supplies are still plentiful, but there is an improving demand for the home trade, while America is also showing signs of buying. A fair demand is maintained from the Continent. Moderate sales are taking place in the East. The Metal Exchange statistics for tin are not yet available.

OFFICIAL QUOTATIONS.

	16th November.	1st November.
Standard Tin (cash) ...	£157 ³ / ₄ —£158	£155 ¹ / ₄ —£155 ³ / ₄
Do. (3 months) ...	£159 ³ / ₄ —£160	£157 ³ / ₄ —£158

Lead.—Prices in this market have maintained a steady advance under moderate trading, near positions especially being in demand. Arrivals continue on a small scale, but are being eked out by small shipments from America. Nevertheless the supplies of lead are hardly sufficient to meet current requirements, and the present meagre stocks may yet show a further reduction. Business with home consumers is quiet, but the Continent is still taking lead from this country. The Metal Exchange statistics show stocks on 31st October as 5,161 tons against 9,883 tons on the 30th September, a decrease for the month of 4,722 tons.

Spelter.—English, quite nominal.

Pig Iron.—No quotations are available.

Antimony.—£35 to £38 per ton for English Regulus. Ore nominal.

Wolfram Ore.—12s. 6d. to 13s. per unit per ton for 65 per cent. tungsten acid e.i.f.

Quicksilver.—£9 12s. 6d. per flask.

Bar Silver.—38³/₄d. prompt and 37¹/₄d. two months forward.

Discount.—The Bank rate was reduced on the 3rd inst. to 5 per cent.

FOR CYLINDER LUBRICATION

IN graphitic lubrication, the graphite is depended upon as the lubricating agent, the oil as the carrier. Thus one may use both a cheaper grade and a smaller amount of oil.

Here is how one user of Dixon's Flake Graphite checked up his double saving. He now uses a grade of oil costing 8d. a gallon less and uses 23 quarts less per week of 120 hours than when he did not use Dixon's Graphite. His Lubrication is better—his engines and compressors are giving better service—and his actual costs are over 50 per cent. lower.

DIXON'S TICONDEROGA FLAKE GRAPHITE has many valuable applications as a lubricant for cylinders, air compressors, valves and bearings, either alone or mixed with oils and greases.

Write for Booklet No. 156 C explaining the use of graphite for cylinder lubrication and how it may be fed.

There is no field of engineering in which pure theory counts for less than that of the mechanical handling of materials.

The teachings of experience and experiment cannot be improvised nor imitated by even the best of offhand work on the draughting board.

Into every ROBINS device is incorporated every refinement of design, manufacture and material, that has demonstrated its value in efficiency, reliability and low operating cost.

Which refinements are worthwhile, and which are not, are best decided by long experience and hard research work on many installations of varied character.

Thus ROBINS equipment combines the best engineering practice with a freedom from expensive and unworkable frills.

EDITORIAL.

THE RAILWAYS REPORT.

The report issued by the General Manager of the South African Railways and Harbours for the year ended with March last is, as usual, much more than a statement of progress, expenditure and revenue on the railways and at the ports of the country. It is an extraordinarily informative blue book dealing with practically every phase of trade and industry in South Africa. No department of the Government has its finger more closely on the commercial pulse of the Union than the S.A.R. & H., and Sir William Hoy's report deals exhaustively both in fact and

figure with every branch of railway and harbour activity, traffic costs, accidents, engineering aspects, accounts and statistics. It contains plans of the principal harbours of the country, numerous diagrams, and many excellent photographs. In so far as the engineering features of the report are concerned we have drawn fairly extensively on those sections in the engineering pages of this week's issue and it here remains briefly to touch on the more general aspects of the report. At the outset Sir William shows that the total capital expenditure of the railways at 31st March last was just under one hundred millions sterling, whilst that in respect of harbours was over ten and a quarter millions. Yet this, the great State-owned asset of railways and harbours, increased its accumulated deficit from £1,549,000 to £2,599,000 during the year under review. In other words, the railways made a loss of £1,272,972 and the harbours a profit of £318,156.

"The year under review was a remarkable one in many respects," states the report. "It marked the turning point in the steady upward tendency of prices that had been going on since the early days of the War, and the arrest—only temporarily it is hoped—of the wave of commercial and industrial prosperity which South Africa has enjoyed for several years. The earlier part of the year was one of general prosperity and unprecedented traffic, and the latter part one of difficulty and trade depression."

The revenue for the year was the record figure of £23,618,457, an increase of 125.89 per cent. as compared with 1909, but, after allowing for interest on capital, cost of living allowance, has resulted in the above deficit. Working expenditure increased by £12,971,254, or 228.54 per cent., since 1909. During the year the S.A.R. carried 64,069,138 passengers and 16,434,541 tons of goods, minerals and coal. The returns for the first five months of the current financial year ended August 31, 1921, show a further deficit of £886,348. Higher wages and shorter working hours had nullified the repeated increases in rates and fares. The latter cannot be further increased, having reached in almost every case the utmost economic limit, and in some cases have had to be reduced to prevent loss of traffic. Under the circumstances, the General Manager says, there is no alternative means of balancing accounts than to reduce working expenditure. This has been done by the doing away with the cost of living allowance, which will disappear on December 31 this year, and which will effect a saving of £3,200,000. Non-essential work has been eliminated and greater efficiency and economy had been introduced. Owing to the financial position it was considered necessary to postpone many development works in progress or in contemplation, and to restrict the new programme of capital works to the narrowest possible limits. As against this picture of gloom the future is not without rays of hope. Some big schemes are ahead, of which the principal are the decision of the Government to proceed immediately with the electrification of the Glencoe-Maritzburg section of the Natal railways, and the erection of grain elevators, which will entail the expenditure of many millions, and a great deal of it in this country, in the shape of wages and material, thus easing the unemployment problem of the moment. Other large development projects also are said to be in contemplation.

Amongst many other instructive pages in the report are those devoted to a review of the mineral industries of the country, which give in summarised form the outstanding statistics of the mineral output of the Union. Labour questions enter very largely into the report. Sir William has a great deal which is very much to the point to say in regard to the eight-hours' day. The report quotes from an article which recently appeared in the *Railway Gazette* on the subject of the eight-hours' day, which seems succinctly to sum up the position. In the course of this quotation it is stated: "Apart from the decreased efficiency due to inexperience there is in many cases a serious degree of compulsory idleness. There can be cited on every system certain small stations where there is only one train in the morning and one in the evening, but where the number of employees has had to be doubled because the interval between the passage of the trains

exceeds the legal working day. This situation is not only prejudicial to the railways but is also most harmful to the workers in other industries. . . . The evil effects of the eight-hour law as applied to railway service are so numerous and so evident that the only practical solution is obvious—the conditions under which the law is applied to the railways must be revised. The railway service is a complex service which accommodates itself as badly as possible to a rigorous allocation of working hours."

The report constitutes an abundant justification for the policy recently adopted by the Administration in the direction of economy. The true facts of the position are that the railways are losing money. Rates have been raised to such a degree that it is economically impossible to increase them further, and it is therefore imperative in the interests of the whole country that measures should be taken to reduce expenditure. The trouble with the railways is that they, like the mines, are hampered by working expenses which are too high and by efficiency which is far too low. Abnormal wages, shorter hours and overstaffing have all conspired to bring about a financial result which requires the pruning knife, and the whole country should be grateful to Mr. Jagger for his determination to arrest the financial rot in a great State asset.

Sir William Hoy's report makes it quite clear that the Railways and Harbours Administration has been passing, and still is passing, through very difficult times, and having regard to all these circumstances we consider that Sir William and his subordinates are to be congratulated on the able manner in which they have administered the department. Our railways are often the butt of public condemnation and censure. The Administration has been blamed for all manner of things. It has been abused by colliery owners, farmers, passengers and employees; by a great percentage of the inhabitants of the Union in fact. But if these critics took the trouble to analyse the report now before us they would probably realise that the greater portions of their censures are absolutely unfounded. And if they travelled on, despatched goods by, or worked for certain other railway administrations which we could mention, they would find that S.A.R. does not mean "Slow And Rotten" after all. As an American visitor recently pointed out, Sir William Hoy manages more miles of railway line than any other man on earth, and we think that a careful perusal of his latest report will show that he and his staff have carried out their large responsibility during a very trying period with conspicuous ability.

GOLD AND EXCHANGE STABILISATION.

Mr. H. G. Wells, however much he may have fallen foul of our French Allies, has certainly deserved well of the world for reminding us of the failure of the Washington Conference to discuss the paramount question of currency and exchange stabilisation. As far as South Africa is concerned, it may not be generally known that an important conference on the subject was held at Pretoria on Wednesday, when the heads of the banks and several of our other leading financiers considered our monetary problems. No official statement is yet forthcoming regarding the result of these deliberations, but it is satisfactory at any rate to know that the Government is alive to the importance of the issues. Our own view, from which we have not wavered, despite a marked absence of interest and support in high places, is that the problem should be approached from the point of view of the Transvaal, as the world's largest gold producer, whose productive capacity is now threatened with restriction, and that our endeavour should be to secure in the welter of conflicting interests a fixed higher price for our product than the old pre-war one, to which it now seems inevitably sinking. A London contemporary to hand by this mail thus excellently puts the matter:—"Stabilisation of exchange is a possibility, restoration of a gold standard is a possibility, but what is impossible is the restoration of the former gold standard. This is a point of view which has not yet entered into the consciousness of the financial world, but it is a sound one. To-day no country has a practical gold standard. To-day the currency of every country has a

definite relation to gold for the day. To stabilise the exchanges of the world, all that is necessary is to have a conference to agree that the rate of exchange at the close of the bourses of the capitals of the world, on a certain day, shall be the relation of those currencies to gold. The price of gold on October 16th was £5 5s. 4d. per ounce in London, and in the capital of every country of the world it had a definite price in the currency of that country. To stabilise the exchanges, all that is necessary is to fix this relation to gold, and for each country associated in the agreement to have a small reserve of gold so as to be able to pay in gold, if desired by another country. . . . The gold reserve of the world must now be regarded as a flywheel of trade, and be apportioned to the various members of the Conference adopting a gold standard in proportion to their external trade. The quantity of gold that each of such countries must hold having been determined, the Conference would arrange the terms upon which countries holding more than their share of gold would part with it to those holding less than their share of gold." Without repeating what we have more than once written on this subject, we may state that the foregoing fits in with our own simple solution of the whole complex question—a solution which, moreover, for us has the paramount merit of meaning the salvation of our low-grade gold producers.

Notes & News.

Luipaardsvlei No. 10.

The borehole which is being sunk on this West Rand property by the Coronation Syndicate has encountered the Randfontein Leader at a depth of 834 feet. The value disclosed is 727.2 dwts. over 2 ins., equivalent to 30.3 over 48 ins. The drill is being continued to cut the West Reef, which it is expected to encounter at a depth of 1,150 ft.

Nylstroom and Railways.

Mr. J. W. Jagger, Minister of Railways, and Mr. J. Rissik, of the Railways Board, visited Nylstroom on Wednesday in connection with the proposed railway from Nylstroom to the Bushveld, via Zandrivers Poort. Mr. Jagger undertook to give the fullest consideration to the proposed railways from Nylstroom to the Bushveld.

The Consolidated Gold Fields Meeting.

The cabled summary of the Chairman's speech at the annual meeting of the Consolidated Goldfields fails, of course, to do justice to the long and detailed review of the company's affairs which it is wont to contain. We hope to print the speech in our columns in due course, and in the meanwhile may note one or two of the outstanding features. Lord Harris referred to "the terrible figure of depreciation" in the year's accounts, namely, £492,000, of which he said over one-third represented the writing down of Robinson Deep shares. The accounts showed a debit balance of £111,000, but the cash position of the company was good, the amount being £709,000. He defended the diminution of the company's holdings in South African mining interests, and showed that the retention of many of the Rand shareholdings would have led to a great decrease in the dividends from them as compared with 1913. Lord Harris dwelt on the position of the Robinson Deep, where he regarded the outlook as most hopeful. The Chairman's speech was followed by one of Mr. Aubrey Hyman's characteristic orations, the chief point in which seems to have been an appeal for "the infusion of fresh blood" into the administration of the company. As far as its interests in this country are concerned, however, there does not seem to be much force in Mr. Hyman's remarks, as the management's business seems to lie in the direction of conserving the company's assets rather than in assuming fresh responsibilities. Still, this is the age of free speech, and we are all in favour of shareholders being encouraged to "have their say." Much better and manlier that they should do so in this fashion than that they should vent their spleen on unoffending secretaries or, as so many do, anonymously through the Press.

Mozambique Portland Cement.

We understand that the Managing Director of this enterprise, who has been in Europe expediting shipment of the remaining portions of the necessary equipment, has been entirely successful in his endeavours, and is now on his way back. The outlook for the company has, therefore, greatly improved.

* * *

The Clydesdale Dispute.

With reference to the trouble on the Clydesdale Collieries, it is reported that at a meeting of the joint executives of the District Federation, held at Witbank on Tuesday afternoon, it was decided to invite the Chamber of Mines, Johannesburg, to a further conference before taking drastic action.

* * *

The Crown Mines Case.

As agreed in the terms of the strike settlement, ex-Shift Boss Walthew interviewed the general manager of the Crown Mines (Mr. A. J. Walton) on Wednesday in the presence of a Government official. The official chosen was Mr. R. H. Miller, Inspector of White Labour.

We understand that Walthew's attitude at the interview was that he could not have acted otherwise than he did, as, having been definitely instructed by the Miners' Union not to go to see Mr. Healy, he could not disobey that instruction.

Mr. Walton, in reply, could not see how an official who would take instructions from a union in direct conflict with the instructions of a superior could hold an official position. While satisfied that Walthew's explanation was correct from his (Walthew's) point of view, he did not see how he could possibly be reinstated as a shift boss—in addition to which there was no vacancy in that capacity at the moment.

Walthew declined to follow Mr. Miller's suggestion that he should apply for a job in another capacity, and so the interview terminated.

* * *

African Oils.

Dealings have been allowed on the London Stock Exchange in the shares of the African Oil Corporation, whose issue is 237,000 10s. fully paid-up shares. Testing of the properties of the Corporation in the Wakkerstroom district has been carried out during the past few months under the supervision of Mr. Van Tijn, an engineer of the Royal Dutch Company, which has an option to re-constitute the company. Operations have been confined so far to extending existing drives, making new drives and sampling the shale exposed in these workings. The results thereby disclosed have been exceedingly satisfactory. A boring contract has now been entered into by the Royal Dutch Company with the McNamara Shot Drill Co., Ltd. Arrangements have been made for a bulk test of the shale in Scotland, for which purpose about eighty tons will be sent.

* * *

East Rand Gold, Coal and Estate Co., Ltd.

In another part of this issue will be found the full report of the speech made by Mr. J. H. L. Manisty at the annual meeting of the East Rand Gold, Coal and Estate Co., Ltd. As its name implies, the company is one of many-sided activity, coal mining and farming being for the time being the most prominent. The Chairman's speech deals with these activities in detail, and may be commended to the notice of those interested in other estate companies in the country. As the Chairman well put it in his speech at the annual meeting last year, "With the important natural resources at our command we would be neglecting our opportunities did we not, particularly in times like these, turn them to productive account. The satisfactory results won show what can be done by a bold agricultural policy, and encouraged by that we hope and expect to do better in the coming year. By so doing we believe we are not only benefiting ourselves, but setting an example that may profitably be followed by other land companies in the Transvaal." These words are no less applicable to-day than when spoken a year ago, and the excellent example set by this company may well be commended to the attention of other and even larger land-owning enterprises in the Transvaal.

The Minister of Finance on the Outlook.

Mr. Burton, the Minister of Finance, reviewed the position of the Union revenue and expenditure at Ladysmith on Wednesday night, and had a very dismal picture to present. Despite the anticipated big deficit budgeted for on the current year and the ruthless application of the pruning knife in all departments, the position is worse than expected, and the end of the fiscal year promises to reveal a further heavy deficit. The revenue has not been coming in each month at even the reduced rate expected, and against this, the expenditure for the year is likely to be something like £1,000,000 in excess of the estimate, as more money will have to be provided to meet the railway and irrigation works programme. Mr. Burton urges the utmost economy—both public and private—to meet the critical times ahead, and certainly the figures he quotes will come as a shock to the country at large, and should provide a serious warning in regard to the future. There is a limit beyond which taxation cannot be increased if enterprise is not to be stifled; and that limit has, apparently, already been reached.

* * *

Witwatersrand Geology.

We have received from the Geological Survey Department of Mines and Industries of the Union of South Africa a brochure on the geology of the country surrounding Johannesburg and Sheet 52, which the brochure explains, by Dr. E. T. Mellor, with a chapter on underground water in the dolomite areas by Dr. Du Toit. In an introductory note, dated Pretoria, August 16th, Dr. Rogers, Director of the Geological Survey, writes:—"The area occupied by the Witwatersrand beds was mapped by Dr. Mellor, with the exception of the outcrops in the south-eastern corner of the map, the lines of which were taken from work done by myself. Dr. Du Toit, Geologist to the Irrigation Department, kindly furnished many important details in the areas occupied by the Transvaal system, and we owe to him the discussion (Chapter X) of the underground water in the dolomite; we are indebted to the Director of Irrigation for allowing Dr. Du Toit to contribute these valuable additions to the work. The late Mr. Kynaston and Dr. W. A. Humphrey surveyed most of the country occupied by the pre-Witwatersrand and Transvaal formations respectively. A larger scale (1: 60,000) map of the Witwatersrand Goldfields surveyed by Dr. Mellor was published in 1917, and it is hoped that a map of the Heidelberg area to the south of the limit of that map will be issued during this year." We propose to comment on this valuable geological sheet and brochure in our next issue.

* * *

The Coming Mining Conference.

It will be remembered that at the momentous conference between the Prime Minister, the Chamber of Mines representatives and the trade union leaders the other day Sir Evelyn Wallers declared that the industry could only continue undiminished if the white labour attitude on certain questions was profoundly modified. It is understood that a conference will be begun in the near future—it must necessarily be of a protracted nature—and the three main points for consideration will be: (1) Revision of the contract system; (2) abolition of the "status quo" agreement; (3) removal of trade union restrictions. The two last of these, it will be seen, reach down to the foundations of present labour conditions on the Rand, and nothing but the profound disturbance of the industry due to the falling gold premium could justify throwing them back again in the melting pot. The plight of the industry owing to the drop in the price of gold may, however, at any moment become desperate, and such situations require desperate remedies. Let us hope that in the end, after a full and frank discussion of the problem it will yield, as other no less serious problems have yielded, to the logic of hard facts and common sense.

Magnet House, Johannesburg.

THE recently erected commodious Home of the British General Electric Company, Limited—South African Branch of The General Electric Company, Limited, of England.

THE activities of "Magnet House" cover the installation of complete Power Generating Plants—Steam Turbines, Turbo-Compressors, Turbo-Blowers, Turbo-Alternators and Electrical Plant and Supplies of every description.

SPACIOUS Showrooms invite your inspection of modern Electrical Plant, High and Low Tension Switchgear, Portable Electric Tools, Measuring Instruments, Fans, Electric Light Fittings and Glassware, Electric Cooking and Heating Apparatus, X-Ray and Electro-Medical Apparatus, Telephones, etc., etc.

ENGINEERING SECTION.

Rowe, Jewell and Company, Limited.

ENGINEERS, IRON, BRASS AND SEMI-STEEL FOUNDERS.

The engineering works known as Rowe, Jewell & Co., Ltd., are one of the oldest established concerns of this nature in Johannesburg. They are carrying on business at the present day on the site of the first foundry which worked on the Witwatersrand gold fields. They have grown up side by side with the gold mines and afford an excellent example of the dependence of one industry upon another. Immediately one industry springs up then another surely follows in order to supply the various needs of its forerunner. It is usually said that the development of a country follows the tracks laid down by railway expansion. In this case, however, the converse was true, and it was the lure of the gold fields, and the development of its allied industries which preceded railway construction. We find, then, that the original building and cupola, which were used at these works were brought from Kimberley by ox wagon by Mr. Kennedy, when Rand railways were still a thing of the future. This business was afterwards floated into a company, of which Mr. Sidney Farrar was managing director. The late Mr. J. J. Rowe and Mr. Jewell took over the works in 1893, and the former became sole proprietor shortly before the Boer War. He

formed the present private company in 1912, of which Mr. C. J. Clark is now managing director and Mr. J. A. Durie is the manager and also a director. Mr. C. M. Polmar is their well-known Reef traveller, and Mr. R. H. Smith is manager of the Brakpan Branch.

The Johannesburg works, known as the Old Rand Foundry, are situated at the corner of Main and West Streets. With the ever-increasing demand received by this company for mining, industrial, agricultural, and other items, it became necessary for the directors to consider the problem of expansion. The gold mining industry had expanded chiefly in the eastern direction, and the directors decided to open up branch works on the Far East Rand. The site was admirably chosen, and is within easy reach of the expanding mines of that district. Brakpan was chosen as the site for the branch works, which were opened in 1917. The company provided themselves with ample room for expansion, and owns in all five acres in the industrial portion of the township. At present the greater portion of the work turned out by this company is for the gold mines, but work for industrial and other companies has also been undertaken.

Pump Castings in Acid-resisting Metal—weight 3,500 lbs. each.

Raw Materials.

The development of the iron industry in this country should to a large extent influence the expansion of local engineering firms by producing a good quality and inexpensive pig iron. It is gratifying to note that the better qualities of pig iron produced in this country have proved satisfactory in every respect, and the No. 1 grade of the Pretoria Iron Works has given satisfaction in the foundries. The Pretoria plant was run on an experimental scale and managed to produce good pig iron. Local foundries are thus looking forward to the time that they will be able to obtain supplies of pig iron from South African blast furnaces, and judging by progress made at Newcastle, in Natal, that time will not be of the distant future.

The tonnage of coke consumed by local foundries must be large, and yet it is remarkable to see that complaints are still made with regard to high sulphur content. The allowable limit of sulphur content amounts to .75 per cent., and anything above that produces harmful effects in the iron melted with such coke. Coke producers should pay more attention to the washing of their coal, and reduce the sulphur content of their coke to the possible minimum.

Foundry.

The Johannesburg works of Rowe, Jewell & Co., Ltd., are equipped with three cupolas for foundry work, three brass furnaces for brass and aluminium castings, a fully-equipped turning and fitting shop, and blacksmith shop. The foundry is capable of turning out castings in iron, brass, aluminium and semi-steel. Casting up to nine tons in

Spur Wheel, 2½ tons, cast by Rowe, Jewell & Co., Ltd.

View in Machine Shop at Rowe, Jewell & Co., Ltd.

Pitman for Crusher, 2½ tons, and Roll for Steel Works, 2½ tons, cast by Rowe, Jewell & Co., Ltd.

weight have been executed, and larger articles can be turned out if required. During the War, in addition to much heavy and intricate work for the mines, over 400 tons of castings were supplied to the Rand Water Board at Vereeniging. Much of the plant required by Kynochs for the extension of their works at Umbogintwini, Natal, was cast and machined at these works. One of the specialities of this foundry is the making of castings for brick, tile, and pipe companies. At the time of our visit, in addition to a variety

Small Centrifugal Pump, moulded and finished complete by Rowe, Jewell & Co., Ltd.

of small castings, the following articles had been cast and were in the process of being machined: A spur wheel for a tube mill weighing 2½ tons, a tube mill end weighing 3 tons, a pitman for a rock crusher weighing 2¼ tons, and a roll for the Union Steel Corporation weighing 2½ tons. Other achievements by this firm are: Castings in acid-resisting metal for Sulzer pumps, weighing as much as 3,500 lbs. each; centrifugal pumps, moulded and completely finished by them; and a wood-working band saw, completely manufactured here. The latter machine was presented by the firm to the War Market, and is an excellent example of local engineering skill.

The company has always been noted for the excellence of its castings. This is not to be wondered at when one

considers the record of the company and the fact that the works were established by men with long and varied experience in moulding and engineering gained in England, America and Australia.

In common with other long-established concerns, this company can be proud of its record in respect to the long service of its employees in both the foundry and machine shop. Many have service amounting to over 20 years. Altogether 70 Europeans are employed at these works. The foundry's scope is as diversified as its field is wide-spread. Amongst its customers are mines and railways, cement and lime concerns, irrigation works and milling companies, and its activities have extended far beyond the Union's borders into Rhodesia and the Congo.

THE PHOTOS DEPICTING SPUR WHEEL AND PITMAN AND ROLL WERE TAKEN AS THE CASTINGS LEFT THE FOUNDRY.

Wood Working Band Saw manufactured in Johannesburg and presented to the War Market and shown as an example of what can be made locally.

The New Era in Durban Harbour Development.

BRIEF ACCOUNT OF NEW WHARFAGE, OIL SITES, DREDGERS, DOCKS AND GRAIN ELEVATOR.

In the course of his annual report Sir William Hoy writes regarding Durban harbour as follows:—83 vessels of a total tonnage of 217,591 were berthed at Congella. Two steamers of 5,061 and 6,551 tons were berthed at the cold storage sites at Congella to load meat for oversea. This marks a new era in development in this part of the harbour. The average working depth of the harbour entrance was 36 feet 3 inches L.W.O.S.T., an increase of 3 inches over the previous year. The berthage was increased by 505 feet during the year, 12,606 feet being now available, viz., 6,266 feet at Point, 2,365 feet at Bluff, and 3,975 feet at Congella, with depths varying from 23 feet to 38½ feet. The accommodation at the harbour was severely taxed during the months of July, August, September, and October. The

average number of steamers in port during the month of October was 54, and the largest number in port on any one day, 59. The floating dock was placed out of commission for overhaul on 23rd September, 1920, and was recommissioned on 23rd May, 1921. 675 vessels of an aggregate tonnage of 1,124,132 tons have been docked since the last overhaul in September, 1913. Originally the lifting capacity of the dock was 8,500 tons. This was reduced to 4,600 prior to overhaul, but has since been increased to 6,500 tons. 3,269,345 tons of spoil were dredged during the year, an increase of 387,397 tons. 1,659,500 tons were removed from the oil site channel. 101,102,536 tons of spoil have been dredged at Durban harbour since 1884. The new dredger "Walrus" arrived in Durban harbour on 27th March, 1921.

Bucket Dredger "Walrus," of the S.A.R. & H. Administration, which arrived at Durban in March, 1921.

View of New Oil Sites at Bluff, Durban.

Three large Oil Tanks of two million gallon capacity have now been completed and filled with crude oil for the fuelling of Oil-Burning Steamers.

The 180 feet extension eastwards and the greater portion of the reclamation have been completed, whilst the further extension of 600 feet is rapidly nearing completion, 99 per cent. of the work having been done. Berthage has been dredged to a depth of 35 feet. A commencement has been made with the 750 feet extension westwards. The preparation of oil sites was retarded through labour shortage. The total spoil deposited as reclamation in connection with the work amounts to 112,200 cubic yards. 9,000 tons of oil were pumped to the storage tanks on 7th June, and 7,000 tons on 25th June last. The 1,200 feet wharf extension at Congella is practically completed, providing a depth alongside of 32 feet 6 inches for 920 feet, and 25 feet L.W.O.S.T. for the remainder of the distance. Of the 800 feet wharf extension, 35 lineal feet were completed during the year. This, with the two jetties previously constructed, brings the total length of wharfage completed under this scheme to 1,150 feet. Good progress has been made with the foundations for the grain elevator, 17 per cent. of the work having been completed. The reclamations of 60 acres was commenced at Congella in January, 1914, and during the year 2½ acres were reclaimed, bringing the total up to 63¾ acres. The reclamation of a further area of 60 acres was commenced in September, 1917, and up to the end of July last 12 acres had been levelled and hardened. The progress of the work on the new graving dock was hampered by late delivery of plant from Europe, and, for a time, by shortage of labour. The total quantity of material excavated to 31st July last was 218,832 cubic yards, fully one-third of the total; 1,100 feet of trench for side walls has been excavated to a depth of 30 feet, and 200 feet to the full depth of 49 feet below L.W.O.S.T. Concrete foundations for 120 feet of side wall have been laid. Fifteen acres of valuable ground in the vicinity of the dock have been reclaimed with the excavated material. Six 4-ton electric cranes are on order for Durban harbour, two of which have arrived.

A Novel Box Spanner.

It is remarkable to observe how improvements continue to be made on engineering accessories which have been familiar since engineering was born. The box spanner, for example, is one of those simple tools which one is inclined to take for granted, but even it can be made better for many purposes by the exercise of a little ingenuity. A British firm has brought in a new type which can be used conveniently in a great variety of awkward positions. The box head is connected with the shank by a universal joint, which allows the shank to be tilted so as to clear the projections which might interfere with the use of the spanner.

A Remarkable Electric Run-about Crane.

British cranes of every type are well known all over the world, and it is not surprising to find a constant improvement being made in various directions. At a recent exhibition held in London a new type of run-about crane, propelled and operated by an electric battery, was shown. The crane itself lifts 15 hundredweight at the rate of 20 feet per minute, and is stable in any position without anchorage. The jib has a rising and falling motion only, slewing action being obtained by rotating the whole machine on the ground. The structure carrying the jib is placed on a chassis which is roughly circular and has driving wheels at each side driven by separate motors, as well as steering wheels fore and aft. These wheels are so arranged that the whole truck will rotate in a circle little over 6 feet in diameter. The battery, which acts as a counterpoise, is capable of propelling the loaded crane at 300 feet per minute. Nothing more convenient for dock and warehouse work could well be conceived.

Stainless Steel for Turbine Blades.

Stainless steel, which was discovered in the research laboratory of a British steel works, has been developed recently in quite a number of engineering directions. One of the most successful is in connection with the blades of steam turbines. Hitherto these blades have been made of 5 per cent. nickel steel, which was the best known substance for the purpose. Nickel steel, however, was found to corrode and wear away under the action of the steam, and it occurred to the inventors of stainless steel that it would be worth while trying whether the new material would stand up better than nickel steel. Accordingly several stainless steel blades, together with some new nickel steel blades, were inserted in a steam turbine more than a year ago. When the turbine was again opened recently the stainless steel blades were found as clean and smooth as on the day they had been inserted, while the nickel blades were deeply pitted and their edges badly worn away. A British electrical engineering firm made a similar experiment for a longer period with the like result. As the pitting of turbine blades reduces the efficiency of the machine and involves costly replacement, it is practically certain that stainless steel will supplant nickel steel for this purpose. Apart from engineering uses, the most popular new application for stainless steel appears to be in connection with golf clubs. For this purpose stainless steel is ideal. Other familiar uses include mirrors, fenders, fire-irons, knives, scissors, and surgical instruments.

The Workshop Equipment of the S.A.R.

A BRIEF REVIEW OF THE CHIEF FEATURES—NEW WORKS AND EXTENSIONS CONTEMPLATED— THE QUESTION OF MATERIAL.

From the annual report of Mr. D. A. Hendrie, the Chief Mechanical Engineer of the S.A.R., we take the following account of the railway workshops:—

Salt River.

The new locomotive erecting shop has been completed and the foundations are well in hand for the additional extension to this shop recently authorised, and the steel structural material for same has been ordered from overseas. The new boiler shop has been completed and is being utilised to its full capacity, but as this shop was only completed towards the end of the year, the full advantages to be derived therefrom and the increased output will not be apparent to any appreciable extent until the coming year. The new steel underframe shop and boiler machine shop schemes are now nearing completion. The new pattern shop and pattern store have also been completed and are now in full working order with satisfactory results, particularly in providing adequate accommodation for the proper storage of valuable patterns, etc. The extension to the foundry and the extension to the smiths' shop are now well in hand. Additional machine tools have been installed in the various shops with beneficial results. The new points and crossings shop and equipment for same have now been authorised. An additional bay to machine shop for the accommodation of electroplaters and brassfinishers has been sanctioned. Schemes for the conversion of old boiler shop into tender shop, the conversion of old tender shop into coppersmiths', tinsmiths', and plumbers' shops and additional accommodation for millwrights have also been authorised. New offices for mechanical engineer's and railway storekeeper's staffs are required and should receive early and favourable consideration. A quantity of urgently required machine tools have been authorised and ordered.

Durban.

The extension to the locomotive machine shop has now been completed, and the second 50-ton overhead electric travelling crane for the recently completed extension to locomotive erecting shop has arrived and has been installed. The steel structural material for the new bays for wagon repair shop has arrived and is now in course of erection. The new oil and waste reclamation plant has been completed. A number of new machine tools have been installed with satisfactory results. An extension to the locomotive machine shop to provide wheel shop has been authorised. The existing boiler shop accommodation is inadequate for the present-day requirements of this depot, and serious consideration will have to be given at an early date to the installation of a new boiler shop to remedy this. The quantity of urgently required machine tools has been installed with good results.

Pretoria.

The work in connection with the removal of the old and re-erection of the new paint shop is now well in hand. The new boiler shop has been authorised and the necessary steel structural drawings are in hand for the building. The steel structural building for the new steel foundry has been delivered and is now in course of erection; almost all of the equipment for this shop has been delivered from overseas, and a commencement has been made with its installation, and it is anticipated that the new steel foundry will be completed and producing castings in about six months' time. The scheme for the removal and re-erection of carpenters' shop to a more convenient site has been sanctioned.

A number of new machine tools have been installed, and also a number of new machine tools have been sanctioned and ordered.

Uitenhage.

The extension to the foundry is well in hand. Several new machine tools have been installed and the new 7-ton crane for wagon yard has arrived and has been put into commission with satisfactory results. The hydraulic installation and hydraulic machinery referred to in my last report have now been completed and working satisfactorily. A new steel underframe shop has been authorised and the steel structural drawings for same are now in hand. Extensions to foundry and paint shop have also been authorised. The remarks in my previous reports in regard to additional locomotive erecting shop facilities still hold good.

Pietermaritzburg.

Tenders have been called for the steel structural work for the extension to locomotive erecting and machine shops, and it is anticipated the contract will be placed at an early date. A quantity of new machine tools have been installed and a further quantity authorised and indented for. An extension to provide accommodation for points and crossings shop and shop for retyring plant has been sanctioned, and an extension to provide accommodation for tinsmiths, millwrights, tool store, etc., has been sanctioned.

Bloemfontein.

The steel structural work for the main block of buildings for the new workshops scheme has arrived and is now in course of erection, and the machinery, etc., for the equipment of the new workshops is beginning to arrive from overseas. Tenders have been called for the steel structural work of the auxiliary buildings of the new workshops, and it is anticipated the order for same will be placed shortly. The scheme for the extension to the wagon yard has been completed with good results.

East London.

The electrification scheme is now in hand and the sub-station in connection with same is being erected, and the material and machinery on indent for the electrification scheme is coming forward from overseas. An extension to wagon repair shop has been sanctioned to provide additional accommodation for the erection and repair of carriages and wagons, etc.

Material.

During the year efforts have been directed to bettering the position with regard to material in arrears, with the main object of preventing delay in the output of both new and repaired stock. Supplies have come to hand more readily, but the placing into traffic of many vehicles has been held back owing to the non-arrival of necessary fittings, such as vacuum-brake cylinders and Gould's couplers. As a consequence, arrangements were made to tap a wider source of supply for some of the more specialised items, and beneficial results should accrue from the arrangement. The position with regard to buffers was serious for some time, and owing to the congested state in the railway workshops, sufficient help could not be given from this source to meet demands. Undue delay occurred in the delivery of certain sizes of tyres. The effects of this were accentuated owing to previous shortages in this direction. It cannot yet be said that the pre-war standard of quality of supplies in general has been regained, though, as the results of strong representations, coupled with the keener competition now prevailing, an improvement in respect of future orders is anticipated. A quantity of approximately 100 tons of pig-iron was obtained from local sources at Pretoria during the period under review, and this has been used in the production of castings with very satisfactory results.

Engine Power on the S.A.R.

LOCOMOTIVE STOCK OF THE RAILWAYS—MR. HENDRIE'S REPORT.

The total locomotive stock of the S.A.R. Administration at end of March, 1921, consisted of one thousand seven hundred and eight 3-ft. 6-in. and fifty-four 2-ft. gauge engines, a total increase of sixty-two 3-ft. 6-in. gauge and a decrease of two 2-ft. gauge engines as compared with the number existing on 31st March, 1920. These figures are taken from the annual report of Mr. D. A. Hendrie, Chief Mechanical Engineer of the S.A.R. *Inter alia*, Mr. Hendrie also writes:—

Repairs to engines during the year have been of a very heavy nature; 1,019 engines passed through the workshops, as compared with 979 during the previous twelve months. The large number of class 14 C engines which had to be restayed and retubed was an unfortunate feature of these repairs. In addition, seventy new engines were erected at various depots. A fair amount of night-shift and overtime work has had to be resorted to in order to cope with the work. I should like to emphasise that the number of engines quoted above as repaired in the workshops does not truly reflect the quantity of work undertaken, as the average repairs necessary to an engine at the present time is very much in excess of pre-war requirements. This is an inevitable result of the shortage of material which has obtained during the war and post-war period. A large number of engines have simultaneously reached the stage where abnormal repairs are imperative, and the average cost is heavily inflated.

The Boiler Position.

In addition to the above, the boiler position is very acute. During the war period, with its shortage of copper-plate, fireboxes were repaired by putting in steel half-plates and generally everything was done to keep boilers fit to work. The general position to-day is graphically reflected by the following figures taken from the records of one depot alone:—

Year.	Material used in Repair of Boilers.	
	Copper Bar.	Copper Firebox Plates.
1918-19	42,410 lb	49
1919-20	83,240 lb	100
1920-21	110,040 lb	146

Not only do the above figures represent an approximate increase in material of 160 per cent. and 200 per cent. respectively over 1918-19 quantities, but they clearly indicate the additional labour required for manufacture and fitting of stays and firebox plates. As our capacity for repairing boilers is the controlling factor in the output of repaired engines, the heavy nature of our boiler repairs has an adverse effect on the general position. On consideration, it is therefore evident that although the number of repaired engines is only about 8 per cent. above the corresponding number of 1918-19, the actual work accomplished for the two periods bears an entirely different ratio, not reflected by the engine output. Attention is drawn to the destructive effects on copper firebox plates by inferior waters in the Transvaal and Cape Western and Midland Systems. A main line experimental engine, class "G.A." type, was placed in service on the lower section of Natal line at the beginning of February last, but as the mileage was only 1,504 to end of March, it is too early to pass any definite remarks on the working of this engine, but it shows indications of proving a success. The eight class M.J. engines (being balance of order for ten placed with Messrs. Maffei, Munich, prior to the war) were placed in service during the year, and have proved satisfactory. The other two engines of original order were received prior to outbreak of the war. Assistance has been obtained in the repairing of engines by private firms. The policy of installing more machine tools and plant in the larger steam-sheds to facilitate running repairs is beginning to show beneficial results by enabling engines to be retained in traffic for a longer period before

being sent into the various workshops. The comparatively small number of coaches completed in the workshops was due to non-arrival of essential material from overseas, coupled with the necessity of concentrating energies on repair work. The repairs to wagon stock have been exceedingly heavy, and a very large number of repairs have been undertaken which practically amount to rebuilds. There is a substantial increase in the number of repaired wagons, but, as in the case of engine repairs, the extra quantity does not truly reflect the increase in the work

New Main Line Engine: Type 12a. Weight of engine in working order, 148 tons; greatest axle weight, 17 tons 6 cwt.; tractive force, 40,744 lb.

done. A large number of wagons have received new floors and sides, and this fact is illustrated by the following figures taken from the returns of one depot:—

	Steel Plate Used.
1918-19	317,166 lb
1919-20	423,683 lb
1920-21	778,457 lb

Similar conditions prevail more or less at all depots. You will readily appreciate not only the extra cost of material and labour indicated by the above figures, but also the increase in number of repaired wagons which would have been effected if normal conditions had prevailed. The mechanical work at the harbours in connection with the appliances and floating craft was heavy during the year, and the provision of separate harbour workshops at Durban will be of great assistance. Considerable repairs have been carried out at the coastal workshops to ships belonging to the Administration, but in many cases it has been necessary to place contracts with private firms specialising in marine work so as to avoid detention of the ships.

The Week in the Sharemarket.

STEADY—BETTER OUTLOOK—DIVIDEND ANTICIPATIONS.

Notwithstanding the lugubrious speech by the Minister of Finance, the tone towards the week-end is distinctly better, though business remains quiet and restricted. Dividends will be declared next week, and will, it is anticipated, be fairly satisfactory. The news from Washington and the Irish settlement are, of course, bull points, though they may have the indirect effect of still further reducing the gold premium. The last, of course, remains the big factor in the local industrial situation, and if it goes on falling away the most drastic steps will be necessary if the poorer mines are to be saved. Further conferences are to be held, and the facts will have to be faced for the sake of all concerned. All the gilt-edged Far Eastern stocks were firmer during the week on dividend prospects, and though it is too much to hope for an active Christmas market, things may go better by the close of the year. In diamonds and fms the market remains stagnant, but Transvaal Silvers continue to prove the bright feature of the market. On Thursday they were 26s. buyers, and their recovery of 10s. within ten days affords tangible proof of life in this stock. Colliery shares remain quiet, and there is some talk of a strike at Witbank, which may or may not materialise. On the whole, quotations seem to have touched bedrock, and there is reason to hope that business all round will improve in the new year.

Mining Men and Matters.

Mr. V. J. Ronketti, of the Union Corporation, has returned from England.

Mr. John Munro, joint managing-director of the "J.C.I.," has returned from his six months' trip to England.

Sir Robert Kotze, Government Mining Engineer, left for the coast on Thursday last on holiday, and will not return until the end of January. Major U. P. Swimburne will act during Sir Robert's absence.

Tunnelling Officers: Corps of Royal Engineers.—The third annual dinner will be held at the Carlton Hotel on Saturday, 17th December. Ex-officers who wish to attend are requested to communicate with the Secretary, Captain V. F. Brodigan, if they have not already done so.

LABOUR ADVISERS.

To the Editor, S.A. Mining and Engineering Journal.

A Kimberley correspondent writes:—

In your journal dated November 26, 1921, there appears a suggestion that each large mine should have a representative, who would be styled the labour adviser to the Chamber of Mines, and whose duty would be concerned with the keeping of industrial peace. The idea is a good one, and would be the means of checking a good deal of industrial trouble in the future.

Lord Orammore, at a meeting of the Delagoa Bay Development Company, gave an account of his recent visit to Lourenco Marques. He expressed confidence that a great and prosperous future lay before Lourenco Marques. A magnificent new hotel was in the course of erection, and it was hoped that when opened it would become a favourite winter resort for people from Johannesburg and Pretoria.

OTAVI MINES AND RAILWAY COMPANY.

The company has now resumed full activity at its mines and smelter in South-West Africa. For the six months ended September 30, 1921, shipments totalled 19,000 tons of ore, 830 tons copper matte, and 150 tons metallic lead. In the corresponding period of last year the figures were respectively 10,100 tons, nil, and nil.

Letters to the Editor.

THE VRYHEID COKE COMPANY, LTD.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—In your article on the Denver Engineering Company, you say: "These furnaces are fired with hard Natal coke, and although this coke is satisfactory in every other respect high sulphur content is one of its disadvantages. This seems to point to the fact that coke producers should exercise greater care in the washing of the coal they use for coke production in order to eliminate, as far as possible, this objectionable constituent."

If you had confined your remarks to the particular coke which you are referring to I should not have written to you, but when you generalise, then in justice to the company I represent, I am obliged to take exception to both the statement and the advice.

There are, it is true, several coke producing companies in Natal whose coke assays well over 1 per cent. of sulphur, but in the case of my company's coke, our assays over 9 or 10 years never go above 0.70 per cent., and are usually between 0.50 per cent. and 0.60 per cent. Anything up to 1 per cent. is generally regarded as not being deleterious.

The cause of high sulphur contents in coke is not necessarily careless washing. Sulphur occurs in coal in Natal in at least two forms, viz.: It is inherent in the coal itself and it also occurs in the form of pyrites. In the latter case careful washing will remove a large percentage of the sulphur. In the former case it is extremely difficult, if not impossible, to get rid of it.

Yours faithfully,

CHAS. A. O. BAIN,

Managing Director, Johannesburg,

The Vryheid Coke Co., Ltd.

[We much regret that the paragraph in question should, in consequence of its generalisation, have in any way caused Mr. Bain annoyance. We know that the coke produced by the company represented by Mr. Bain is of exceptional quality and purity, and in case there may be any misunderstanding on this point we are pleased to give his letter publicity.]

ORIGIN OF THE DIAMOND.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—In your issue of November 12 this subject was dealt with at some length, but, unfortunately, the writer camouflaged whatever knowledge he may have of the genesis of the diamond by a callous sacrifice of sense on the altar of verbosity. It was not to be wondered at that, in the following issue, your correspondent who aptly signed himself "Mystified," should ask for an elucidation of the cryptic contribution. Our old friend, Mr. Scott Alexander, in your last number, makes a very welcome appearance in a new rôle, and it is his letter that I wish to briefly deal with. Notwithstanding the dictum of the text books that "the diamond is the purest form of carbon," I have long been of the opinion that further investigations would prove the diamond to be an oxide of carbon, for the following reason, viz.: One of the salient features of the diamond is its high specific gravity—3.5 (as compared with carbon 2.2). May this not be accounted for by the suggested oxide hypothesis? Let us take another gem, the ruby or sapphire, the composition of which (Al_2O_3) is the very light metal aluminium (specific gravity 2.5) plus oxygen. It is not often that the oxide of a metal is more dense than the metal itself, but it is so with the ruby group; therefore, is it not permissible

to assume that the combination with oxygen has brought about the change from the low density carbon to the adamantine crystal with its high specific gravity? There are other weighty considerations which tend to the conclusion that the diamond is an oxide, the chief of which is that carbon, in either the solid or gaseous form, could not exist in an environment of the nature of "Kimberlite," which is one of the seats of origin of the diamond; "Kimberlite" is composed of the oxygen saturated compounds, the carbonates and oxides of various metals and earths, which would readily yield some oxygen to the carbon which has so great an affinity for it. Additional factors, the study of which should justify my contention, are the specific heat, atomic weight, and index of refraction of the carbon oxides as compared with the diamond, and I would urge the necessity of due consideration being given to these physical features by those who care to investigate this most fascinating subject. As to the genesis of the diamond, once the foregoing hypothesis is assented to, it becomes quite understandable; the molten mass in the crater, after the escape of the bulk of the gases from deep seated regions, becomes quiescent, solidification sets in at the surface, thus preventing the escape of the remaining gas contents, which perforce collect in groups varying in quantity, and as solidification proceeds downwards these gases, CO_2 or CO , or possibly other oxides, are crystallised under enormous pressure, not the pressure of mass or weight, but the pressure which results from the expansion which all minerals undergo in the transition from the fluid to the solid state, an expansion which, in the case of some minerals, is as much as eight per cent. Evidence of this almost incalculable stress is to be seen in the *in situ* condition of the different crystals, so many of which are crushed and fractured. I should much have liked to have treated the subject at greater length, but I fear to make too great a demand on your space. However, my purpose will have been served if this letter will but lead to further investigation—Yours, etc.,

LEWIS WATKINS.

ANOTHER VIEW OF THE GOLD PROBLEM.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—I have recently seen it stated that the price of gold in pounds sterling is likely to rise on the payment early next year of, I think, £50,000,000 interest on the British indebtedness to the U.S.A. From the point of view of supply and demand this would seem feasible. On the other hand, apparently the price of gold in dollars has never varied, *i.e.*, it is merely the exchange rate which gives gold a higher value in pounds, the normal rate being 4s. 2d. to the dollar and at present it is about 5s., which accounts for the approximate 20 per cent. gold premium. This being so, then on payment of interest the rate of exchange is likely to move in favour of great Britain, hence the price of gold in pounds sterling will be less. I take the latter view, but it would be interesting to know what the experts think.—Yours, etc.,

A. J. C.

A CORRECTION.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—Please insert in your next issue the following correction: Frank Watkins should have read Lewis Watkins in my letter of last week.—Yours, etc.,

SCOTT ALEXANDER.

We regret that an inaccuracy appeared in our November 26th issue under the heading "New Mining Patents":—"George Desmond Richard MacCarty and Solin Butter—Improvements tube mill liner." This should read—"George Desmond Richard MacCarthy and Colin Butler—Improvements mortar box liner."

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material & Engineering Trades

BUSINESS QUIET BUT HOPEFUL—IRON AND STEEL—AMERICAN NOTES—GENERAL OUTLOOK—TIMBER AND BUILDING MATERIALS—UNION RAILWAYS USE OF SOUTH AFRICAN TIMBER—GENERAL MANAGER OF RAILWAYS REPORT FOR YEAR—OIL NOTES—SHIPPING NOTES—UNION LOANS.

General Review.

Last week closed satisfactorily with the removal of the Crown Mines difficulty, which, though generally expected, was none the less received in commercial circles with relief. Such action on the part of the trades unions and miners augurs well for their acceptance of the Chamber of Mines proposals regarding wage reductions at the commencement of the New Year. This week has also not failed to furnish a pleasant and welcome surprise in the announcement from London that agreement had been reached between the Government and Sinn Fein, which, in view of the unfavourable state of negotiations right up to the last moment, was unexpected and came as a welcome surprise. Full particulars are now eagerly looked for. It will be very pleasant reading for, among others, General Smuts, to whose patriotic efforts in initiating the preliminary pourparlers no little measure of the success of the difficult and protracted negotiations may rightly be attributed. With regard to the Crown Mines settlement, people look upon it as a decided victory for the Chamber of Mines, and leaves them in no doubt as to the attitude the Chamber will adopt when the time arrives for tackling the economic position of the gold mining industry in a bold and fearless manner. In the meantime the premium on gold is steadily falling and calls for early and drastic measures on the part of the industry to adjust itself to the falling away of this adventitious aid to the value of our product. The great factor to-day, however, is the vital necessity of increased efficiency of the workers, and if this be introduced, together with radical reductions in wages and eventually lower costs of stores, little fear need be held that vast quantities of ore are going to be profitably exploited for many generations. Prices of mining materials are gradually going down, merchants here having to keep pace with the Home market. Timber, on the other hand, is somewhat firmer, and a slight upward movement is expected shortly. The constant depreciation of gold is having anything but a stimulating effect on the local position. Still we have no alternative but to wait for an improvement in trade conditions. Sooner or later the mines will have to come into the local market for their requirements. The market in turps is very bad at present, due to the absence of stocks here at the moment.

Iron and Steel.

The beginning of the month inquiries have not been so numerous as were witnessed during the past three months, owing probably to the recent labour trouble and to this stocktaking period, and there is no doubt that the holiday influence is already making itself felt. The feeling, however, is more hopeful, and undoubtedly several lines are getting scarce, which will tend to steady the market eventually. Owing to our labour troubles and the unsettled position of European affairs merchants have naturally refrained from indenting to any great extent, and consequently it is anticipated that a good many lines will soon become more and more scarce. An influential importer of mining material stated that he had this week heard from his correspondents that most of the Belgian works had closed down or were only partly working; wages, however, are coming down, and this may have the effect of many of the mills restarting shortly. German works are full up for a month ahead, so his agents reported, and are coolly repudiating contracts,

alleging that the depreciation of the mark has increased their cost of production, adding that thereby the German makers were losing their late reputation for straight dealing. "You may," they say, "probably have heard that the Germans are working like Trojans, but our recent trip to Germany did not confirm this. There are strikes everywhere, due to the increased cost of living through the fall of the mark. They are sticking tenaciously to the eight-hour day, but complaints are heard on all hands that the men are not working anything like so hard as in the old days."

Second-hand Mining Machinery.

There has been very little doing in the second-hand machinery business this month, and very few inquiries from outside, most orders being held back until the commencement of the New Year. Stocks have run down very low for second-hand goods, and second-hand steel plates of any consequence are very scarce, particularly 3-16ths and $\frac{1}{4}$.

FOR THIRTY YEARS AND OVER

THE JOHANNESBURG BOARD OF EXECUTORS AND TRUST COMPANY, LIMITED, has had under its care many and varied forms of Trusts—as Executor, Trustee, Administrator, etc.

Its wide experience, the well-known ability of the officials who are responsible for its management, and high regard in which its patrons hold it, are attributes which commend this Company to you.

WILLS appointing the Company Executor can be held in safe custody free of charge.

In addition to handling of Estates, the Company acts as Agent for Absentees, and undertakes—

- Secretarial Duties,
- Purchase and Sale of Landed Property,
- Collection of Rentals,
- Investing of Capital,

and generally every Trust and Agency, including Insurance in all branches.

Money advanced against the security of
First Mortgages.

Engineering Shops.

These report a fair amount of business on hand, which, however, is by no means causing any strain on their resources, but by engineers are looking forward with others to improved conditions at the turn of the year.

The Union Steel Corporation (S.A.) Ltd.

The Union Steel Corporation (S.A.), Ltd., report that everything in connection with their industry is progressing very satisfactorily. Shoes are now being forged by them; many are already in use, are giving the greatest satisfaction, and are, it is stated, beating the imported article both as regards price and quality. There appears to be a tendency, more pronounced than ever before, the Corporation stated, of the Government's intention to support local industries, provided price and quality are equal to imported. This intention, if translated into deeds, will cause great satisfaction to local industrialists, who allege that in the past they have not been treated with that fairness which their establishment of costly concerns in the Union and the quality of their products deserved at the hands of the Government. The Corporation are making cast steel liners for the Sheeley process in the form of sectional plates for tube mill lining. Now that Mr. Isaac Lewis, the managing director, has returned to Johannesburg the Corporation are looking forward to increased activities. The next development, it is stated, will be the production by them of heavier rails, and within a few weeks 45 lb. rails will be produced. As will be noticed elsewhere, the Corporation has reduced their prices from 30s. to 22s. per 100 lbs. basis.

Continental Trade Activities.

During the greater part of this year there has been a marked advance in the competition of German goods, more particularly in electrical material, steel and wrought-iron piping and steel poles. In addition to the local firms which prior to the War represented German manufacturers, many representatives of Continental agencies have arrived here to deal directly with such business. It is noteworthy also that a Belgian company has now entered the field in respect of electrical machinery and train material. In many cases British connections have been alienated in consequence of the much lower prices tendered by the Continental makers.

Agricultural Implements.

Importers state that the present period is slackier than it has been for some considerable time. Weather conditions are favourable to the farmer, but unfortunately he has got no money, and the facilities for obtaining same are, in the face of the present prices for produce and the general restriction of monetary advances, of a rather gloomy nature.

American Notes.

In the course of a chat with a leading American importer he stated that prices in America were getting a little firmer, and that the output was approaching more and more to normal capacity, but that this had not yet been achieved; some of the United States steel mills had been down to 25-30 per cent. of their capacity, and none had yet got back to 75 per cent. Especially had an improvement been noted in barbed and plain wire, the price of which had advanced sharply recently. In regard to Johannesburg, he thought that the worst of the depression, as far as extremely low prices are concerned, was over, because merchants cannot go on for ever selling lines below cost of replacement. He said merchants were all doing this still, but not at the low prices previously obtaining, which was, in his opinion, a most encouraging feature in the position. Things generally, he said, were now in a sounder position than heretofore, not so much perhaps in regard to mining material as in other lines. Better prices could now be obtained, for example, in barbed and plain wire in particular, as well as in steel plates—not much better, but 5 to 10 per cent. higher, and the tendency generally he considered to be a little better. Steel plates were now 21s. to 27s. 6d. according to thickness and size; larger sizes as high as 29s. to 30s. for 12 x 6 of certain thicknesses.

American Trade with the Union.

Trade in October between the United States and the Union increased by 362,000 dollars, as compared with September. American exports were 1,500,000 dollars, compared with 900,000 dollars in September, while imports of South African products declined from 400,000 to 162,000 dollars in the same period. The striking features of American trade conditions, reports the American Trade Commissioner, Mr. P. J. Stevenson, are irregular prices, increasing production, and unemployment, which, however, is now decreasing. Foreign trade, both imports and exports, is stationary.

General Outlook.

In conversation with an influential merchant this week he said that, although things were undoubtedly quiet at the moment, everybody anticipated an improvement in business conditions after the turn of the year. December was, for obvious reasons, always a poor month, but the spring was bound to relax early in the New Year. He thought prices in some lines were tending to firm up a little. People generally are nervous about importing, because of the uncertainty existing as to future happenings on the Continent respecting the Exchange question. There was no doubt whatever that under the present depreciation of the mark German goods can knock British goods out all the time. Timber, he said, was beginning to firm up a little, which, in his opinion, was due to the completion to a great extent of the liquidation of surplus stocks. The settlement of the Crown Mines trouble had created a better feeling, and the general opinion was more optimistic; it now looks, he said, as if the trade unions are going to accept the reduction of wages at the end of the year, which has been announced by the Chamber of Mines, without much trouble, which should tend to clear the air a lot and help to a healthier outlook and better business conditions.

Timber and Building Materials.

Timber has a firming tendency, and indications point to a temporary slight upward movement, owing to the recent advance in the Baltic and the loss of a timber ship last week, which will cause inconvenience to merchants for a time. A lot of timber bought before the late rise is coming along, and the expected advance may only prove to be of a temporary nature, but eventually, of course, timber must reach higher levels, as present prices are, if not below, at any rate perilously near replacement costs.

Prices: 3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver board, 4½d.; floorings, 6¾d. to 7d.; ceilings, 4¾d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 7s. 6d. to 8s. 6d.; corrugated iron, 9¾d. to 10½d. Furniture timber, Burmah teak, 18s. to 19s. 3d. per cubic here for first quality, 15s. 6d. for second, at the coast; American oak and Japanese oak, 1s. 2d. to 1s. 3d. at the coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cubic at coast; Rhodesian mahogany, 9s. per cubic ft. at mills; Honduras mahogany, 30s. per cubic ft.; American yellow pine, 1s. 9d. per ft. of 1 x 12 here; American pine shelving, 1s. to 1s. 3d. per ft. Bricks are unchanged at 70s. for blue stock; 60s. mixed; £4 10s. to £5 for wire cuts, £5 for pressed per 1,000 at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag, 8 lb. bag 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Second-hand Iron and Timber.

Business, owing to the approaching holidays, remains very quiet, with a fair number of inquiries, but few firm orders booked; no activity is anticipated until the New Year. Prices are unchanged at 6d. to 7d. for iron and 9d. to 11d. for timber.

Railways and Use of South African Woods.

The annual report of the General Manager of Railways disposes of the criticism recently levelled at the Administration for not availing itself more freely of South African timber. Sir William Hoy states that since 1917 a special committee has been instituted as a Timber Committee. In co-operation with the Mechanical Department no fewer than

149 different classes of wood had been used or examined for railway purposes. During the last two years 198,711 cubic feet, 7¾ tons, and 95 lengths of South African timber had been delivered at the several workshops, of which 62,171 cubic feet, 60½ tons, and 88 pieces had been used. In addition, 273,000 cubic feet of standing timber had recently been purchased at the Tokai plantation, and 25 tons of blue gum had been purchased at Hilton Road (Natal). About 30,000 lineal feet of *Pinus insignis* from Tokai had been cut into deals for 25 first-class coaches. South African timber is also being used exhaustively by the Engineering and Transportation Departments and at the harbours. The Administration had since Union purchased timber to the value of £66,616 for sleepers and other purposes, as compared with £2,950 in 1910. The General Manager states that the new seasoning kiln erected in Pretoria is now in operation, and various tests had been carried out in conjunction with the Forest Department in the seasoning of South African timber, with, so far, most encouraging results. If the treatment proves as successful as initial experiments indicate, it will give a great impetus to the use of South African timber. The above facts prove that the Railway Administration is keenly alive to the importance of the fullest possible use of South African woods.

Oil Notes.

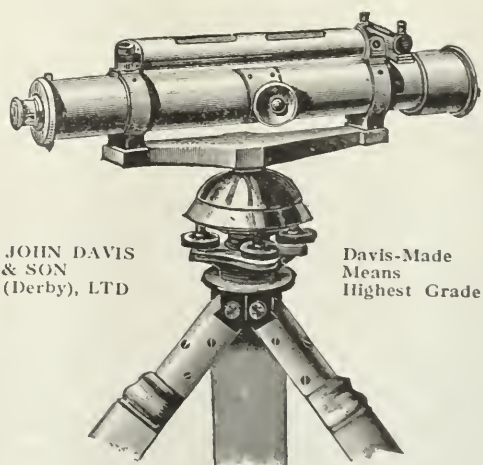

It is reported from America that a company with a capital of two thousand million dollars is being formed to absorb oil companies throughout the world. The Standard Oil interests will, it is stated, be merged in this huge trust, which will be called the World Commerce Company.

Difficulties have arisen in regard to the concessions taken over in the Northern Province of Persia by the Standard Oil Company. These rights were formerly held by the Anglo-Persian Company, but were repudiated by the new Persian Government. The two companies concerned are now invest-

tigating the position, and a reasonable compromise is anticipated. The suggestion is scouted as absurd that there will be any clash of interests between America and Britain in these regions.

London reports that dealings have been allowed in the shares of the African Oil Corporation, which has issued 257,000 ten shillings fully paid up shares.

Petrol and Paraffin: New Maximum Prices.

A new order in the *Gazette* supersedes that of October 26 *re* the maximum selling prices of petrol and paraffin. The wholesale price of petrol at the ports is fixed at 27s. per case (all brands), Shell brand at 30s. 9d., and Pegasus and Zenith at 30s. 6d. The prices (wholesale) elsewhere are as above plus charges. The retail prices at the ports are 27s. per case plus 15 per cent., 4s. 3d. per imperial gallon, Shell 4s. 9d., and Pegasus and Zenith 3s. 9d. Prices elsewhere 27s. per case plus 15 per cent. plus charges; smaller quantities at the rate of 4s. 10d. per gallon, Shell brand 5s. 3d. per gallon tin, Pegasus and Zenith 4s. 2d. per tin. Prices of paraffin are: Wholesale at the ports, 16s. 9d. per case of two large tins. Elsewhere, price as above plus charges. Retail at the ports and all centres less than 400 miles from them, 19s. per case, or 9s. 6d. per tin, or 23s. 6d. per case of small tins, or 2s. 5d. per such tin. At places 400 miles or more from the ports, 19s. 3d. per case, 9s. 8d. per tin or 23s. 9d. per case of small tins, and 2s. 5d. per tin plus charges. 125 degree paraffin to be 3d. less a case. Bottle prices: At the ports, 6d.; elsewhere, 7d.

Electrical Goods.

Trading conditions, helped by the usual Christmas orders, are quite fair, and dealers have little to complain of in this respect. Contractors are fairly busy; there are a good many small contracts on just now, nothing big, of course, but people are now ordering materials suitable for Christmas presents—kettles, pots, plates, etc.—a little more than usually. A large importer of electrical appliances said that business just now could fairly be described as good all round. Prices for shades have declined about 10 per cent. during the week—glass shades, from 3s. 6d to 7s., to 3s. to 5s. 6d.; enamel iron shades have gone down 3d. to 1s. a dozen according to size; opal shades have receded 1s. to 2s. 6d. according to size, and are now selling at from 1s. 6d. to 2s. 6d. each. Most of these glass shades come from Czecho-Slovakia, of which Prague is the centre. The drop in price has been caused by the arrival of big consignments from Prague, Koblenz, etc. With these exceptions, prices remain stationary, and are expected to continue at their present level for a time, but eventually a reduction will be seen in them. Stocks are coming in all right from Britain and Germany, but those from the latter destination are tightening up in price and the tendency is for them to rise. American stuff is also coming along fairly freely, and in some respects is cheaper than the British article notwithstanding the Exchange.

Tenders for Railway Work.

At a dinner in London the other day Sir Edgar Walton warned his hearers regarding tenders for railway work, etc. He stated that foreign tenders were much lower than those of British firms, and though he, of course, wanted to see every penny spent in Britain, the difficulties in the way under the circumstances were very great.

Coal Notes.

A fall of 2s. per ton has been announced in the price of our coal.

Underselling of French Coal by British.

Considerable surprise has been caused in the French northern coalfields by the appearance there of British coal, which has actually been sold on rail at Calais at 95-50 francs per ton, as against the French product of corresponding quality on rail at Comines at 106 francs per ton. To combat the British invasion the French mineowners are trying to reduce wages, but this cannot be at once effected. The present coal wages in France are five times higher than they were in 1914. A possibility exists that the Belgian mineowners may also cut in and even undersell British merchants.

British Coal Wages.

Wages in the South Wales coalfield are gradually being adjusted and approaching the minimum of 20 per cent. on the average earnings in July, 1911. At present the percentage is 28.95 on the 1915 standard rates. The drop for November amounted to from 4s. to 5s. per day as compared with September. Miners' wages for November in Yorkshire, Notts, Derby, Leicester, Warwick, and Cannock Chase will be reduced 29.64 per cent. on basis rate compared with October. The November rate will, it is stated, be 110.53 per cent. on the basis.

Commonwealth's Steamers.

Lord Incheape, chairman of the P. and O. and other allied lines, has, it is stated, expressed his willingness to recommend the Shipping Conference to buy the Commonwealth Line. Mr. Hughes, although strongly in favour of the retention of the line, is seeking the House of Representatives' decision in the matter.

Sale of ex-Enemy Ships.

Lord Incheape's Committee, it is announced, disposed of 117 ex-enemy ships during the year for nearly £20,000,000 sterling, and is now offering 16 cargo boats of 4,000 tons upwards, which are still under repair in German yards preparatory to receiving the highest class of the German Lloyd's.

German Shipping.

The Nord-Deutscher Lloyd Company, whose capital has been doubled this year, announces a further increase of capital from 350 millions to 600 millions of marks, the directors stating as a reason for such increase that the depreciation of the mark has caused the compensation paid by the Government for vessels lost during the War to become inadequate to its original purpose.

African Steamship Company.

A meeting of this company authorised the directors to issue 500,000 6 per cent. cumulative preference £1 shares for the purpose of replacing ships lost during the War and for the provision of up-to-date passenger vessels for the West African trade.

Union Government's 6 per cent. Loan.

It is announced from Pretoria that up to date £7,660,000 has been invested in the Government 6 per cent. Loan, of which £1,650,000 is new money. Conversions have been made of the 5 per cent. 1921-36 stock to the extent of £5,710,000, and of Treasury Bills to the amount of £900,000. The loan will, it is believed, shortly be closed.

Union Loans.

The Union 6 per cent. Loan is quoted at £96 10s. and the New Union Loan at $\frac{3}{4}$ per cent. discount.

New Issue of British Treasury Bonds.

The new issue of Treasury Bonds, which is being issued at 99, compared with 98 for the last series, has been obtained at $5\frac{1}{2}$ per cent. The Bonds are redeemable in 1930.

S.A. Reserve Bank.

The weekly statement issued by the South African Reserve Bank on December 3 shows ratio of cash reserves to liabilities to the public of 74.9 per cent.

The Week's Meetings.

EAST RAND GOLD, COAL AND ESTATE CO., LTD.

Presiding at the annual general meeting of shareholders of the East Rand Gold, Coal and Estate Co., Ltd., on December 1, the chairman, Mr. J. H. L. Manisty, said:

The directors' report and audited balance sheet and profit and loss account for the year ended 30th June, 1921, are now submitted for your consideration and approval.

COLLIERY.

You will note that the net profit on coal winning account for the year under review amounted to £3,711, as compared with a profit of £313 for the previous year on 91,092 tons sold. The total quantity of coal sold this year was 100,301 tons of rounds and nuts; a great feature of this increase is that the whole of the saleable output consisted entirely of rounds and nuts, whereas during the previous year a large quantity of duff was sold. This duff, consisting of about 30,000 tons, was sent to the waste heap. Had there been a market for it, this would have represented a value of £2,600, a remarkable waste of value and revenue.

This profit, though satisfactory, would have been much better had it not been for shortage of orders throughout the whole year, the continuance of high cost of materials, high wages and shorter working hours. Deducting the loss on farming, there remains the sum of £1,920 to be carried to appropriation account; this amount, together with the amount unappropriated at June 30, 1920, and before providing for depreciation, makes a total of £8,777.

Your directors decided to write off an amount of £1,463 this year for depreciation, for which account has been taken as follows:—

Headgear, screening plant, etc.	£1,000
Farming machinery and implements	463
	1,463

added to this is the expenditure on boring operations, viz., £1,279, the result of which I shall refer to later, leaving a credit balance carried to appropriation account of £6,036.

The cash and cash assets total £25,585 against liabilities amounting to £7,977, leaving a balance of £17,608, the reserve amount shows a balance of £3,730. A shortage on last year's figures is accounted for principally by the heavy capital expenditure involved, which was forecasted by me in my remarks at the last annual meeting.

The capital expenditure covers the purchase of the coal cutter, hauling motor, a large number of mine trucks, in addition to a general reconditioning of buildings and erection of native hospital.

SHAFT TROUBLE.

I have to report that since the annual reports were taken in hand an accident has occurred in the shaft, some of the timber giving away, necessitating the closing down of operations to enable the manager to effect the necessary repairs. This will mean that we shall lose our output for about a month, and the expenditure is estimated at £1,500. When this work is completed I think we may regard our position as a very sound one, and, provided we can procure orders for about 9,000 tons or upwards per month, and effect a gradual decline in the cost of

stores and wages, we may certainly look forward to good profits in the forthcoming year.

It has been most unfortunate that the financial year has had to carry such an abnormally heavy burden, but this could not have been avoided if the colliery and plant are to be maintained in working condition. Practically no renewals and very little maintenance had been effected during the past few years, it having been the policy in the past to conserve our cash assets as much as possible, with the result that the breaking point was at last reached, and to put things right sums which should have been spread over a term of years all fell under the present financial year; as it is, the plant has for the most part been put in good working condition, and we are able to take advantage of any sudden increase of orders as they come.

THE COAL TRADE.

With the continuance of the export trade, in which we participated last year, we have continued to benefit by increased orders for our coal, which we are still able to execute and at a satisfactory rate of profit. In order to cope with any further demand, and at the same time endeavour to reduce costs as far as possible, and secure as great a portion as possible of the waste, it was decided to instal a coal cutter. This, as you will see from the manager's report, is now at work and is proving, I am pleased to say, an unqualified success. It has already been the means of reducing costs very materially and at the same time reducing the waste coal from 30 per cent. down to 12.6 per cent., and with the renewal of orders I feel confident we shall thereafter make good profits and soon be on a dividend-paying basis.

I referred at the last annual meeting to the great future for South African coal, the demand at that time for export purposes was very great, and it appeared likely to continue for some considerable time to come. Unfortunately, notwithstanding repeated representations, the Railway and Port Authorities failed to realise the importance of rising to the occasion, and instead of supporting the collieries, increased their rates, subsequently, however, reducing them, but too late to avoid a serious loss to the trade.

HIGH WORKING COSTS.

High working costs also prevailed, and it may be of interest to you if I give you a few actual figures of what that advance means in the working costs of our mine.

White and native wages are responsible for a total increase of £2,000 for the year; explosives, £2,100; stores, £2,000.

or an average of £500 a month, that is to say, under pre-war conditions the last year's working would have cost for the year's tonnage £6,100 less than under current conditions. These increases bring the cost to 57.76 over pre-war costs, at which increased figure it now stands. The increase in mine stores and explosives over pre-war rate vary between 40 per cent. and 300 per cent., according to the class of article. As against this, of course, the selling price of coal has advanced, but not in proportion to the increased cost of working.

BORING OPERATIONS.

I refer you to the manager's report on this subject. In my remarks last year I drew your attention to the board's

decision to undertake drilling operations with a view to ascertaining the thickness and value of our coal areas before deciding on sinking a new shaft. The primary object, of course, was to prove definitely the area and quality of workable coal lying to the south-west of the property, and to eliminate the long haulage with which we have to deal in the present mine. The results have been to prove conclusively that we have a large area of quite good coal, the thickness being 7ft. 9in, giving a calorific value of 10.52, the final results going to prove that we have a basin or field of about 600 acres in the south-west corner of the property, which, with an average thickness of 7ft., would give 6,300,000 tons or, including the pillars, a life of 21 years at 1,000 tons a day.

Your board, however, has decided not to carry out the idea of sinking a new shaft for the present, but to wait further developments as regards the future of the coal trade. The area dealt with represents, of course, only the south-west corner of the property, but I would like to point out that there still remains a large section of the property eastward and northward which undoubtedly has coal underlying same; it is only a question of quality and thickness, which must be proved by more extensive boring. It is, however, the intention to open up the old main east drive, which was abandoned some years ago, and driving a prospecting place from near the face of it into new ground, going northward and eastward. As it will be in a coal seam, we shall be able to procure sufficient coal to cover the cost of our prospecting, and should we be fortunate enough to turn out good quality coal, the distance from the shaft being less than our present haulage, will undoubtedly tend to cheapen the cost of working it and enormously enhance the life of the mine.

The idea of testing the ground for the Van Ryn series was postponed indefinitely; boreholes, however, in the coal area—the continuance of which would, we believe, intersect these series—have been carefully plugged so that at some future date we can proceed to put down another drill.

FARMING OPERATIONS.

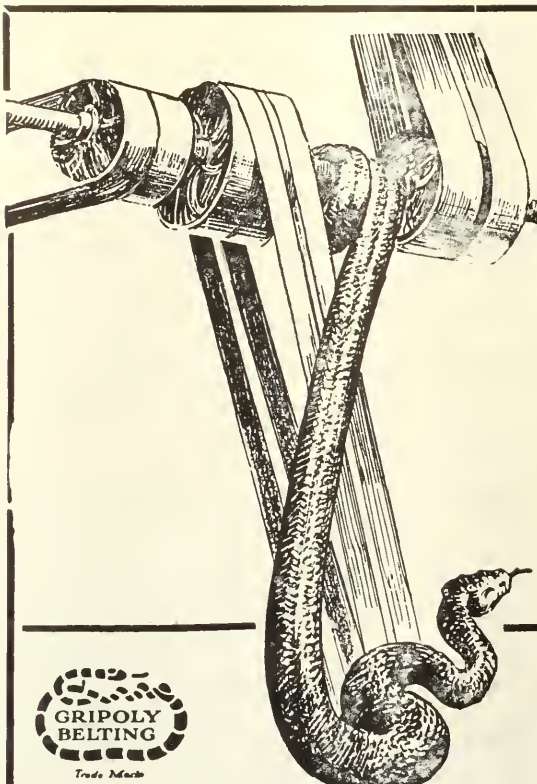

For details of farming operations I refer you to the manager's report. We show, unfortunately, a loss on this year's operations; I think, however, you are all fully aware that the season has been most disastrous for all farmers throughout the Union. Drought in the early part of the season, heavy rains and hail later when the grain was ripening, and the serious drop in the price of the produce, has all militated very much against our operations. Prospects this year, I may say, however, are more encouraging; more ground is being broken up, and I feel sure we shall see a decided improvement next year.

Our livestock generally is in first-rate condition and on the increase. The value of your herd's at to-day's prices (although appearing in the books at £1,600) can be taken at well over £3,000.

Your thanks are due to the mine manager, Mr. A. G. Maclatchy, and his staff; to Mr. A. Vernon, the farm manager; and also to the head office officials for their services during the past year.

I now beg to move the adoption of the reports and accounts as submitted.

The reports and accounts were passed unanimously and the meeting terminated.

The Ferreira Deep Disaster.

A WONDROUS STORY OF HEROISM AND ENDURANCE.

Never in all its history has the Rand been so saddened and thrilled as it has been during the past week by the calamitous events which have been happening 2,000 feet below the surface of the earth in the Ferreira Deep. The fire which started in this famous old mine last week and which has resulted in the virtual suspension of operations except those devoted to rescue work, has had as its sequel a chapter almost unparalleled in the story of mining perils, endurance and courage. Time after time hope of extricating the entombed men has been dissipated, only to be revived by some sudden change for the better in the underground conditions.

No more poignant story has ever reached our ears than the account of Mr. Selby's leave-taking with his entombed men on Wednesday. Then the smoke cleared and Mr. Stuart Martin and Mr. Ivor Rees led fresh rescue parties into the dangerous workings where Johnston and Lagan were pinned.

Mr. Martin, Mr. Paul Selby, Mr. Brett, and Dr. Donaldson, who was able to partially examine the injured men, Mr. Ivor Rees, Mr. Anderson of the Rand Mutual, Mine Captains Adams, Brinton and Fisher, Shift Bosses Old and Prebert, and the other members of the rescue gangs have done splendid and heroic work. The rescue parties have indeed lightened the tragedy of this terrible disaster by the grand and unselfish exhibition of courage which they have exhibited.

We are unable this week to give the full measure of praise to these heroic comrades of the brave men entombed, but we hope next week to publish a special illustrated article which will fully review the whole misfortune and which will also provide some little memento of a display of heroism and endurance which could well be blended into an epic.

At this juncture we would tender our heartfelt sympathies to the bereaved, and we would say that the Rand is this day proud of these miners of the Ferreira Deep as well as it is saddened by the story of the catastrophe.

One of the most tragic occurrences in the history of Rand mining occurred last Sunday night, when five miners were entombed by the collapse of No. 7 station at No. 1 shaft of the Ferreira Deep Mine. The collapse of the station is the result of the fire which was raging in a stope between the 7th and 8th levels. The fire was discovered about 10 o'clock on Wednesday night, the 7th.

The Fire Spreads.

At first the fire did not seem to be an alarming affair, and it was thought that it would soon be possible to get it under control and that the work of the mine would not be impeded so far as the lower levels were concerned. There seemed no reason to anticipate danger. So the European shift working on all levels below the first, except No. 9 level, went down as usual, the boys having been previously lowered. No. 1 shaft was not used, as this is the up-cast

shaft and smoke from the burning timber was finding its way up. It was about 9 o'clock or 9.30 that there was the first intimation of danger. It was seen that smoke was breaking across towards No. 2 shaft, and at the same time it was reported that certain individuals had been affected by fumes. The two mine captains, Messrs. Fisher and Adams, with assistant mine captain Brinton and others, at once went forward to investigate, and they saw some natives lying gassed in one of the roadways. As the rescue party proceeded, in a place which was comparatively clear of smoke, they themselves suffered three casualties from gassing in about ten seconds. It then became apparent that this portion of the mine was flooded with the deadly carbon monoxide gas from the fire, and under the instructions of the manager, Mr. Paul Selby, steps were immediately taken to get the whole of the white and native shifts out of the mine. About 12 o'clock every living soul was out of the mine, the manager—clad in muddy overalls and battered felt hat—being the last man up.

Down the Smoking Shaft.

Meanwhile No. 1 shaft, which is the up-cast shaft, had become like a chimney, up which rolled volumes of smoke

2,000 feet Underground in A Rand Mine.

with an evil, earthy smell. When a tally could be taken, it was suspected that there were about five natives who could not be accounted for, but it was not until some time afterwards that there was any reason to think there was any white man below. With the mine empty of the shift, the efforts to get at the actual scene of the fire were continued. At two o'clock Mr. Selby headed a party of three or four men, who made the descent of the smoking No. 1 shaft in an effort to reach No. 9 level. But this time, although the volumes of smoke rolling up the shaft were thicker than ever, the levels below the fire had become clearer—probably by reason of the draught caused by the hot fumes rising in the shaft. But it proved impossible to approach the scene of the fire. Any attempt to move in that direction was frustrated by the presence of carbon monoxide. It was impossible to locate the exact spot where the fire centred. All the members of the party were more or less affected by the fumes when they came up, but by this time it was no longer in doubt that an employee named Jardin was somewhere in the mine and it was not long before they made still another descent.

Fighting the Flames.

Equipped with smoke helmets the rescue party pushed through to the spot where the gassing of the first investigating party took place. Heroabouts on the 9th level and about 70 feet from the station, No. 2 shaft, they came upon the body of Jardin, who must have been dead some hours. It

was nearly 6.30 when his body was brought to the surface at No. 2 shaft. By seven o'clock the fire had not reached the shaft, and the shaft timbers were being kept wet to minimize the danger. The fire was located, attacked, and was

The disaster occurred while the five men were on the 7th level of No. 1 shaft fighting the fire. A fall of hanging took place, and, as more threatened, they took shelter under the main station, when the whole structure fell in. The five

Mr. Paul Selby (x) (Manager). Ferreira Deep, about to descend to investigate.

considered to be under control. It was possible by this time for the men engaged in these operations to work on No. 7 level, and as the fire is situated in stopes between No. 7 and No. 8, this gave them the advantage of being above the fire.

Sunday Night's Disaster.

At 10 p.m. on Sunday the circumstances accompanying the fire took a very tragic turn when the whole station at the 7th level of No. 1 shaft fell in and entombed five miners.

men were: George William Johnston, foreman timberman, married; Arthur Clark Logan, shaft timberman, married; Christoffel Jacobus van Tonder, reclamer, married; Leopold Dary Seeligsohn, sampler, single; Augustus Parau, single. A native came up by way of No. 2 shaft some while afterwards, stating that there had been a fall, and that he had found himself alone and in darkness. Amongst those who went down almost immediately were mine captains Adams and Brinton; but although they approached as near as practicable to the scene of the disaster, they found no signs of

The Safety Museum of the Rand Mutual. Exhibits with an added and poignant interest in view of the Ferreira Deep Disaster.

anyone being alive. Their calls and signals brought no response, and they returned to the surface. Rescue operations went on the whole of Monday, and the efforts of the men were in no sense diminished by reason of the fact that they expected to recover only bodies.

Another Dramatic Turn.

Later it was possible to ascertain by means of sounds that certain of the entombed men were still live. The speaker was apparently Johnston, and it was stated that Logan and Seeligsohn were with him and were alive. It was estimated that there was about 10 feet of rock between the entombed men and the rescuers. Rescue work was pushed on at all speed in spite of this fact. As time passed on the rescuers gradually got closer to the sufferers; any material removed had to be replaced by props or struts to obviate the occurrence of a collapse such as might bury finally both the sufferers and the rescue party. By 1.15 a.m. on Wednesday both Johnston and Logan had been given nourishment, which greatly improved their state, and it was hoped to complete the work of rescue by 2.30 a.m. Meanwhile in the early hours of the morning the fire, which it was hoped had been successfully brought under control, broke out again and smoke and fumes poured into the workings where the rescuers were working. This it was that seemed finally to seal the fate of the two poor fellows who had made such a gallant fight for life. The rescuers, reluctant as they were to withdraw, were compelled to leave the workings, for it would have been certain death for them to stay in the gradually growing cloud of smoke and gas. The news of the abandonment of rescue operations was cabled to the London office of the company.

Hope Not Abandoned.

After the rescue party had been driven from the scene of the disaster, the smoke filled shaft began to clear in the afternoon. Another rescue party, with Mr. Stuart Martin, the company's consulting engineer, and one of the best shaft sinkers on the Rand from the Crown Mines, Mr. Rees, went down, and it was reported that both Logan and Johnston were still alive. At 3.25 p.m. on Wednesday the following was officially issued: "Rescue parties have resumed operations, and fortunately find that the two men are still alive. There is still hope of rescue." The rescue operations, directed by Mr. Rees, the shaft sinker from Crown Mines, was progressing favourably. Johnston was keeping comparatively well, but Logan was gradually growing weaker.

Death of Logan.

The shift that came up at 1 a.m. on Thursday brought the sad news that Logan had died some hours earlier. Johnston was alive at 1 a.m. and comparatively well.

Johnston's Magnificent Fight.

All day on Thursday the rescue parties worked unceasingly to save the last survivor. But their splendid efforts were in vain. Mr. Johnston, we regret to say, died in the mine at about four o'clock on Thursday afternoon, after having been entombed for 90 hours.

Smokeless Fuel.

For many years a vast number of inventors in Great Britain and elsewhere have been trying to solve the problem of producing from coal a smokeless fuel which can be satisfactorily burnt in the ordinary open grate. The method adopted is to distill the coal at a lower temperature than is used in the ordinary gasworks. When this is done, gas is produced together with valuable oils and other by-products, leaving a material which is roughly midway between coal and ordinary coke in composition. Many difficulties were encountered in the attempt to make this process mechanically good and commercially sound. These difficulties seem to have been overcome in a large installation now at work in Great Britain, capable of treating about 36 tons of coal per day. The fuel produced is hard enough to withstand ordinary transport and it burns brightly in a grate, giving off a large mass of radiant heat, and showing no trace of smoke. The success of this installation depends mainly upon an ingenious arrangement of the retorts. When coal is distilled at the low temperature mentioned it expands, and this expansion in the retort is apt to make the resulting coke very friable. In the new installation, however, the retort is fitted with a double internal partition; and as the coke expands the two parts of the partition are brought together giving room for the expansion and enabling the coke to retain a firm structure.

* * *

Electric Railway Boom in Great Britain

Remarkable activity is being shown by British railways in connection with the conversion of lines, especially in the neighbourhood of London, from steam to electric traction. The Great Eastern Railway Company, which carries an enormous volume of traffic from the city to the east and north-east of London, has prepared a scheme of electrification and other improvements which will involve a capital of about £10,000,000. The London Brighton and South Coast Railway is bent upon electrifying practically the whole of its system between London and Brighton, and the "Underground" group in London has prepared a scheme for spending £6,000,000 on the development of its tube railways and allied transport services. The South Eastern and Chatham Railway has also made several plans for the conversion of its suburban system. One of the methods of propulsion laid before this country by a British engineering firm has some highly novel characteristics. It is proposed to propel the trains by means of internal combustion locomotives generating electricity, which in turn drives the motors on the locomotive or other parts of the train. The system is equipped with the usual overhead line or third rail which in this case, however, acts merely as a power interchange line. When a train is running down hill it returns current to the line; and when it is standing at a station the engine continues to run and to pump current into the interchange line. In this way additional power is afforded to trains which are ascending gradients or starting at stations. It is claimed for this system that it saves a large amount of capital expenditure and is very economical especially on systems where traffic is not dense enough to justify the construction of large power stations and transmission mains.

* * *

New British Air Service.

In spite of the difficulties which surround the development of a novel form of transport, the regular aeroplane service organised in Great Britain continues to expand. In the near future an additional service between London and Paris will be started. It is intended to arrange four regular services each way per day with British aeroplanes. These services will involve some portion of the journey being made in darkness. Improved lighting arrangements have been introduced at the aerodrome in order to enable night flying to be carried on in safety.

HEAVY FALL IN THE GOLD PREMIUM.

THE OUTLOOK OVERSEAS IMPROVES AND AFFECTS THE RAND'S INDUSTRIAL POSITION—OUR MINES IN GRAVE PERIL—HEAVY LIQUIDATIONS ON THE SHAREMARKET—A MOMENTOUS CONFERENCE.

At the moment of writing the latest advice in regard to the premium is that gold has fallen to 98s. 9d. There has been heavy liquidation in big gold shares on the Stock Exchange, and at last it seems to be realised that the Rand is on the brink of a big catastrophe unless something can be done to retrieve the position.

Speaking only a little over a month ago, the Prime Minister said: "If the price of gold were to fall from 104s., where it is to-day (November 4), to 100s., the result would be that the following mines would have to work at a loss: The Geldenhuis Deep, the Robinson, the New Goch, the Aurora West, and the E.R.P.M."

The price of gold has now fallen to 98s. 9d., which is below the fateful figure mentioned by General Smuts. The Witwatersrand, therefore, at the present moment is faced with the fact that the mines mentioned have practically reached the border line of profit, and are in danger of closing.

The E.R.P.M.

How serious a matter it will be if the E.R.P.M. closes down can be indicated by repeating the words of General Smuts uttered on the occasion referred to. He said: "I found from the report of the Low Grade Mines Commission that if the E.R.P.M. closes down five other mines will have to follow suit. The report says that about three million gallons of water are pumped daily into the E.R.P.M. at an annual cost of about £100,000, and unless that water is pumped away the water will rise in those mines until afterwards it floods neighbouring mines, and there will be no stoppage of the mischief until you get right on to the Geldenhuis Deep. And the Low Grade Mines Commission reported that if the E.R.P.M. were to close down, and pumping were to stop on this mine, then the following mines would also go under, that is to say, the Witwatersrand Deep, the Witwatersrand, the Knights Deep, the Knight Central, and the Rose Deep. Practically a wash-out of the Witwatersrand from the Geldenhuis mine on to Benoni. Well, I need not tell you what that is going to mean. To cut out a section of the Witwatersrand like that, and to see these mines go under will be a serious state of affairs, and there will be very few who are sitting here who would be prepared to contemplate a situation like that."

As the Premium Goes.

Having indicated what would happen if the gold premium fell to 100s., the Prime Minister went on: "If there is another fall of 5s., that is, if the price of gold came down to 95s., the following mines will be working at a loss and running the risk of closing down: the West Rand Consolidated, the Nourse, the Durban Deep, the Knight Central and the Luipaardsvlei. If there is another fall of 5s., say to 90s., then the following mines will have to close down: the New Kleinfontein, the Wolluter, the New Unified, the Simmer and Jack, the Witwatersrand Deep, the Randfontein, and the Witwatersrand. And if the premium disappears entirely, that is, if the exchange falls again to 85s., the normal price per fine ounce, the following additional mines will go under: the Village Deep, the Rose Deep, the Consolidated Main Reef, the New Primrose, the Van Ryn Estate, and the Robinson Deep. Twenty-four out of the present 39 producing mines are in danger of going under when this premium disappears."

The West Rand.

Referring to the West Rand, General Smuts said: "You have a similar situation that will arise on the West Rand in case of the fall of the premium and the closing of the mines. You know that several mines have already closed down there. The Roodepoort United is in process, by slow degrees, of closing down. The Durban-Roodepoort is still going on, but really with curtailed operations. There you

have a case on the West Rand where a big area—all the Roodepoort area, with good gold in it, capable of being worked at a decent small profit for years and years to come—yet owing to the present situation all that area will probably close down if there is this fall in the gold premium, under present conditions."

The Conference.

In view of these unpalatable facts, the very greatest importance attaches itself to the further conference which was commenced on Thursday. The aims and objects of the conference have been very clearly set forth in the following letter which was recently despatched by the Chamber of Mines:

"With reference to the recent conference between the Prime Minister, the representatives of your Federation and this Chamber, at which the Prime Minister emphasised the grave position in which the gold mining industry finds itself, and at which certain suggestions for alleviating the position were put forward, you will recollect that the Prime Minister only dealt with the alterations to the mining regulations, and suggested that other proposals should be discussed by the Chamber and the Unions concerned in the mining industry.

"I am directed to request a meeting with your Federation at an early date, in order to discuss these important points.

Mines Making Losses.

"The Chamber would point out that, since the conferences with the Prime Minister early in November the price of gold has steadily fallen, with the result that mines which were then on the borderline of profit-making are now making losses; and should gold fall still further, more and more mines will cease to make profits. The present position is such that, should gold fall, as it seems likely to do, to its normal price of 85s. per fine ounce without a very material reduction in the cost of production, no less than 24 out of the 39 producing mines now remaining on the Witwatersrand would be making a loss which they are unable to bear. The result would be that over 10,000 Europeans would be thrown out of employment.

Three Means of Alleviation.

"The Chamber considers that there are three means whereby some alleviation of the position may be obtained which, although probably not saving all the mines, would certainly go a long way towards saving some of them. The means which the Chamber would propose are (1) an alteration in the system of underground contracts; (2) the modification of the status quo agreement; and (3) a rearrangement of underground work.

"In regard to underground contracts, it is the Chamber's opinion that the prices paid for this work are out of all proportion to the value of the work done, and are so high as to cause discontent among other employees of the mines, and thus upset the discipline and good conduct which are so necessary to successful working. The Chamber proposes to introduce a 'no cost' form of contract, with a view to reducing the earnings of underground contractors to a figure more in keeping with the earnings of other employees on the mines.

Status Quo Agreement.

"In regard to the status quo agreement, the Chamber is of opinion that the time has arrived when this agreement should be limited to skilled occupations only, and that the mines should make greater use of experienced native labour in semi-skilled occupations. It is not the intention of the Chamber to suggest that natives should replace Europeans in skilled trades and occupations, such, for example, as those of mechanics, miners, etc., but that they should be employed instead of white men in those semi-skilled occupations which natives are well able to, and in some cases actually do, perform, such, for example, as those of pump attendants, cleaners, greasers, rough pipefitting, sanitary service, wastepacking, and so on.

"It is not the Chamber's desire or intention to affect in any way the employment of tradesmen and skilled Europeans on the mines, but rather to secure for such employees wider opportunity of employment, by ensuring that the mines will continue to work when the price of gold falls. I am desired to emphasise most strongly that it is only by some very drastic reduction in the cost of production that the mines can be kept going, and to urge on your Federation and the Unions the necessity of accepting the Chamber's suggestions, unless disaster is to overtake the Witwatersrand. The proposed modifications would (on the assumption that the existing mines continue) involve, over a period of months, if not years, a reduction, not necessarily all by retrenchment, of, at most, 2,000 in the number of unskilled and semi-skilled Europeans at present employed; and probably much fewer. On the other hand, if the present conditions are allowed to persist, the certain result will be the premature closing down of mines and loss of employment to over 10,000 Europeans, skilled and unskilled.

"Further, unless working costs can be reduced to a figure which will show a reasonable return on capital, even when gold has dropped to its normal price, the ordinary process by which exhausted mines are replaced by the opening of new ones will entirely cease."

Letters to the Editor.

UNITED STATES PATENTS.

To the Editor, *S.A. Mining and Engineering Journal*.

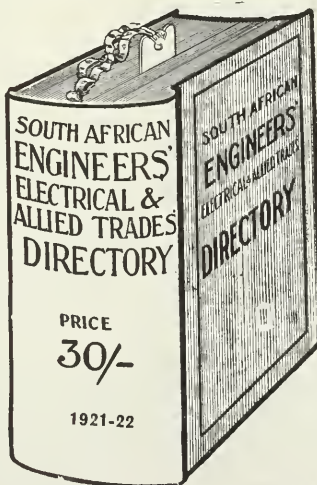

Sir,—Statements have recently appeared in the press that it "usually takes from two to five years" to secure the acceptance of specifications of patentable inventions in the United States and that it constitutes "a record" to have obtained a grant in the space of eleven months. There are in this town a great many people, interested in the subject of patents in the United States, by whom these statements will be read with considerable surprise, and if they are allowed to go forth unchallenged they will cause much needless alarm to others. May we, therefore, be permitted to say that in the course of an experience covering a period of more than thirty years, and a very large number of United States cases, we have no record of the allowance taking over four years to secure, and when the delay is considerable it is more often due to the applicant than to the United States Patent Office. The average time taken to secure allowance in the United States of America in the last fifty accepted cases handled by us, works out at a little more than a year, as the following table shows:—Under 6 months, 7; over 6 months and under 1 year, 13; over 1 year and under 18 months, 11; over 18 months and under 2 years, 9; over 2 years and under 3 years, 6; over 3 years and under 4 years, 4. In one instance the time occupied was under two months from date of filing, and we have just recently had a case accepted within three months.—Yours faithfully,

D. M. KISCH & CO.
Chartered Patent Agents.

UNITED STATES TRADE WITH SOUTH AFRICA.

Trade in October between the United States and British South Africa increased 362,000 dollars over September, according to a cable from the Department of Commerce in Washington to the American Trade Commissioner, Mr. P. J. Stevenson. American exports were 1,500,000 dollars, as compared with 900,000 dollars in the preceding month, while imports of South African products declined from 400,000 dollars to 162,000 dollars in the same period.

The striking features of American trade conditions are irregular prices, increasing productions and unemployment, which is on a large, but decreasing scale. Foreign trade, both imports and exports, is stationary.

AN EXPERIMENTAL MINE.

HOW TO GET DOWN TO BEDROCK FACTS—CLEARING UP CONTENTIONS.

(By a Special Correspondent).

Whilst all are agreed on the necessity for doing something to save the industry and of doing something speedily, there is no unanimity of opinion as between employers and employees in regard to the relative values of the various reforms suggested and as to the general economic effects of such reforms. Some people will tell you that there is no hope whatsoever for the low grade mines of the Central Rand, that they are worked out, and that working costs can never be reduced to a degree which will admit of them being again worked at a profit except in the remote contingency of the price of gold again reaching £6 per ounce. Those who are more optimistically inclined contend, however, that there is still a vast future for the Witwatersrand, and that, to use the exuberant declaration of a few years ago which was employed before the dire prospect of grass growing in our streets was envisioned, that mining will still be in progress on the Rand a century hence. One school of thought urges stabilisation of gold at, say, £5 10s. an ounce, and contends that herein lies our only salvation. But whether

The Obvious Remedy.

Having arrived at this point, there is disagreement on the ways and means by which low grade ores can be made to yield a profit, and on the general economic results of the most obvious method of achieving this, that is by reducing rates of wages, retrenching surplus men, abolishing or amending the contract system, and substituting black for white labour in some departments of mining. Any suggestions of this nature are, however, received in labour circles with profound suspicion. The conclusion is immediately come to that this is the thin end of the wedge in a conspiracy which aims at the complete breaking down of the colour bar and of the eventual economic and social ruin of South Africa. Such a view finds many champions outside the spheres of labour. There are, in fact, many people who are not directly connected with the industry who contend that Johannesburg, the Reef, and the country at large will not benefit by a low grade policy for the mines.

Construction work in progress on a big Rand Mine. A photo of the more prosperous times of a few years ago which we all should like to see return.

this is economically practicable no one seems to know. Our greatest financial pundits disagree over elementary questions of currency, and the world is sharply divided as between deflationists and inflationists, sane currency disciples and the champions of illimitable credit.

The Puzzle of the Premium.

None can foretell what is going to happen to the gold premium. Even our experts in the Chamber of Mines have made big mistakes in anticipation of its course. But, as we have often said, and as most clear-thinking critics and students of the kaleidoscopic Rand are agreed, the soundest policy is to leave such an ephemeral thing as the incidence of the American exchange out of the question altogether. We have got to get down to bed-rock facts and work out our salvation on the standard price of gold.

The Experimental Mine.

Having regard to all this conflicting welter of contentions, it seems to me that it would be an excellent idea to select one of the low grade mines which is in danger of having to close down and to test on a practical working scale the efficacy and economic effects of the various solutions which are being suggested as remedies for the ills from which the mines at present are suffering. I suggest that one mine of the Rand— I am not prepared to say which— but one mine which is now hovering on the border line of payability with gold at under £5 per ounce, and which will be forced into idleness if gold falls further in price and there is no concomitant reduction in expenses, be set aside as a property devoted to experiment.

Where Problems Might be Solved.

This could be done without impairing present operations. The output could be maintained and development continued.

Shareholders would have little or nothing to lose by such an experiment, for it is assumed that the mine selected would be one of those in danger of having to put its shutters up. The practical translation into actual practice of the various remedies suggested for the mining industry as a whole, the valuable data that would result from the actual testing of the various contentions in actual practice, might easily not only put this particular mine on a sound footing, but would render signal service to the whole Reef through the procuring of actual results. If only the experimental mine helped to establish the little appreciated truth of the axiom that it is better to do more work for less pay than to have no work and no pay it would achieve a great deal. But I think that a great deal of matter which is at present contentious and which gives rise to heated debates and harmful prejudices might be brought out of the present nebulae of debate into the clear light of proven knowledge by such an experimental mine. Some of our technical experts and leaders of industry declare, for instance, that given freedom from trade union restrictions and more latitude in regard to the employment of native labour on semi-skilled work costs in a typical mine can be reduced to well under a pound a ton without making any serious inroads into European wages. The experimental mine should be able to demonstrate the accuracy or the fallacy of this view. Exact data would be available as to what saving can be effected by the introduction of the reforms in question, and if it could be shown in actual practice that a mine which has to-day a cost bill of, say, £40,000 per month and is in danger of closing down can by reducing its bill to £25,000 per month be able to give continued employment to, say, 300 white men at an average wage of so much per month and distribute money expended on native labour and stores, in addition to earning a fair profit for the shareholders, it would indeed be a big step in the direction of putting our industrial house in order.

Management.

Such an experiment would have to be undertaken by all the parties concerned in a broad give-and-take spirit and with an unprejudiced determination to arrive at actual results. The mine in question might come under a committee of management elected by the Government Department of Mines, the Chamber of Mines, and the Labour organisations.

An Idea Meriting Consideration.

I am fully aware of the fact that the suggestion is open to criticism. It may very properly be pointed out that conditions vary in different mines, and that results secured in one proposition may not be capable of anything approaching exact reproduction in another property. All the same, I submit that the idea of an experimental mine merits consideration, especially so in view of the hard fact that it is not difficult to-day to select a proposition for a large experiment of this nature without adversely affecting

shareholders' interests, because there are several mines which, with gold at less than five pounds an ounce, are unprofitable on the present basis of working expenditure.

[We comment on this contribution in a leading article in this issue].

Mr. Karl Spilhaus.

Opinion is sharply divided on the wisdom of the Government's appointment of Mr. Karl Spilhaus to be the Union's Trade Commissioner on the Continent of Europe. In some commercial circles the appointment has roused a storm of protest. The Government, however, defends its action, and shows no intention of reconsidering the matter. We are told that this is no time for silly slobbering sentiment. The War is over, and Mr. Spilhaus, we believe, took out papers of naturalisation last year. Up to a certain point we quite agree with this view. But the thing can go too far, and this appointment has undoubtedly tended to estrange a vast amount of loyal public opinion previously staunch to the Government.

No one questions the good business brains of Mr. Spilhaus, but we do seriously question the ability of Mr. Karl Spilhaus to further the interests of Union trade in the countries of our former allies on the Continent, and particularly in that country of long memory, France. And surely there are men in the Union, British-born or Dutch-born, whose business abilities are not inferior to those of Mr. Spilhaus. There are many who contend that from a business point of view the Government has made a wise selection. But, on the other hand, a great number of South Africans, and particularly those who made vast sacrifices a few years ago, view the appointment with amazement, and consider that the Government has made a very big and astounding blunder.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we this week commence a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

Pretoria Silvers.

The annual meeting of Pretoria Silvers was held this week, Mr. Chas. A. O. Bain being in the chair. The company has been in existence since September of last year, during which period good progress has been made with the opening up of the property. Bad luck with the main or No. 1 shaft has caused some unforeseen delay and expense. The excess of liquid cash in hand over current liabilities at September 30 last was £9,473, the actual cash at bankers being £6,525. Plainly, the company will require some further financing before it can be brought to the producing stage. A noteworthy point is that it is not the intention to erect treatment plant, but to sell the ore as it is mined. Preliminary arrangements have been made with the neighbouring Transvaal Silver Co., who have a first-class plant, to sell to them the Pretoria Silver ore.

* * *

De Beers Finances.

In another part of this issue we deal with the main points of the speech made by Sir David Harris at the annual meeting of De Beers. The financial position of the great Kimberley undertaking merits separate treatment. The balance sheet shows a general reserve fund of £700,000. In addition, there is a special reserve fund for the stabilisation of the diamond trade amounting to £2,476,899. This fund is invested in the shares of other diamond mining companies and kindred interests, and is included in an amount of £2,926,899 shown on the assets side of the balance sheet. The company has paid during the year to preference shareholders the usual dividend of 20s. per share and to deferred shareholders 10s. per share. The actual profit for the year, after taking diamonds into stock at a merely nominal figure, amounted to £228,522. The state of the diamond market is such that the directors have decided not to declare any interim dividend to either preference or deferred shareholders for the half-year ending 31st December, 1921.

THE SOUTH AFRICAN IRON AND STEEL CORPORATION, LTD.

The balance sheet and directors' report of this company for the year ended June 30th, submitted to shareholders at the second ordinary general meeting held in the company's Board Room, Corner Estate Buildings, 203 Pretoria Street, Pretoria, on Wednesday, the 14th day of December, states, *inter alia*, that since the last report 350,000 shares of £1 each, fully paid, have been issued. The capital account now stands as under:—Issued: The Pretoria Iron Mines, Ltd., as consideration for certain assets, 200,000 shares; sundry subscribers, 150,000 shares; in reserve, 1,150,000 shares; total, 1,500,000 shares. The transfer to the company of the property and assets taken over from the Pretoria Iron Mines, Ltd., has been duly completed. In addition to these the company acquired during the year under review various properties specified in the report.

Under the heading of Operations, it is stated that the experimental blast furnace was blown in for the first time by the company on the 26th July, 1920, and was in operation continuously up to the 29th April, 1921. During this period 2,656 tons of pig iron were produced. Before blowing in, the whole of the plant was thoroughly overhauled, a new cooling system was installed and an additional heater built. The results of the running of this experimental plant have given valuable information technically and commercially. The foundry is now complete. The whole of the coal area has been prospected under expert supervision. Over 2,500 acres were drilled in detail by fourteen boreholes, roughly half a mile apart. The tonnage of good coking coal in this area can be safely reckoned 20,000,000 tons.

Accounts.—The following is a statement of the receipts and expenditure to 30th June, 1921:—Receipts: Working capital, 150,000 shares of £1 each, £150,000; less calls in arrear, £356 5s.—£149,643 15s. Expenditure: Buildings, machinery and plant, £10,754 5s. 6d.; property, claims and options, £101,651 10s. 7d.; prospecting and development, £11,295 16s. 1d.; technical reports, etc., new works, £7,359 15s. 4d.; general and administrative expenditure, £23,702 15s. 8d.; preliminary expenditure, £5,126 18s.—£159,891 1s. 2d.; investment, £1,590; stores and materials, etc., £18,884 16s.; furniture and fittings, £635 11s. 2d.; sundry debtors and payments in advance, £1,644 5s. 3d.—£22,754 12s. 5d.—£182,645 13s. 7d.; excess of expenditure over receipts, £33,001 18s. 7d.; made up as follows: Sundry creditors, £3,711 13s.; bank overdraft, £29,296 11s. 9d.; less cash on hand, £6 6s. 2d.

It is common knowledge that the company cannot proceed with its ambitious scheme unless large sums of capital are raised. The report shows that 1,150,000 shares are held in reserve. It was understood at the time of flotation that these shares were underwritten. Even if the £1,150,000 represented by these shares was forthcoming, the capital so available would not be sufficient for the company's ambitious schemes. As it is, the company had at the end of June a bank overdraft of £29,296 11s. 9d. and owed £3,711 13s. to sundry creditors, whilst the cash in hand amounted to the magnificent sum of six pounds six shillings and twopence.

De Beers' Annual Meeting.

SIR DAVID HARRIS REVIEWS THE POSITION OF THE INDUSTRY—REPLY TO THE CRITICS.

Sir David Harris presided at the annual meeting of De Beers last week, and delivered a long and interesting address. The keynote of his speech was given in the following passage:—"This Board is not infallible—we probably make mistakes, but these are the fault of the head, and not of the heart. Attacks on the Board, misrepresentation, unfair criticism, or abuse will neither mend matters nor assist the industry in the slightest degree. The only thing that will help is the sale of diamonds. For all concerned—directors, managers, staff, workpeople, shareholders, and all their families—I hope the day of revival is not far distant." Dealing with the actual position in the diamond market, Sir David said:—"The American trade is buying in the cheapest market. If this was the result of the discovery of a new mine in Russia we would be very much alarmed, but as this supply is only of a temporary character, and, we hope, will probably come to an end some time next year, we look forward with confidence to the renewal of trade with our best customers, the Americans. The returns from America show that, although there has been a great decrease in importations during the 14 months ended 30th June, 1921, there has not been an entire cessation of buying; on the contrary, diamonds have been imported regularly, as the following official figures will show:—For the 10 months 1st July, 1919, to 30th April, 1920, America imported diamonds valued at 80,714,000 dollars, in round figures an average of 8,000,000 dollars per month. During the 14 months ended 30th June, 1921, the total amounted to 36,790,000 dollars, roughly averaging 2,630,000 dollars per month. It will therefore be seen that for the 14 months I have mentioned the American purchases did not average one-third of those made during the preceding 10 months. You will realise how vitally the condition of affairs in America affects our industry. This is reflected in this company's returns for the year ended 31st December, 1920, in which our total receipts from the sale of diamonds amounted to £4,628,882, but from the 1st January, 1921, to 31st October, 1921, we have delivered only £618,936, while our expenditure for the same period was £2,019,249—a deficit of £1,400,313. Had it not been for the policy of control instituted by this company many years ago, and followed by all the big producers, during the present world-wide depression, the results to the diamond industry would have been disastrous. This policy will be maintained and adhered to. We do not despair of the recovery of the diamond industry, but, in the meantime, we are compelled, in the interests of all concerned—employees, shareholders, and Kimberley generally—to husband our largely decreased reserves. The necessity for retrenchment was forced upon us; we put off the evil day as long as possible, but owing to the long and continued depression in the diamond market the company, as mentioned in the directors' report, was reluctantly compelled to curtail its operations and to close down."

A Reply to the Critics.

Sir David directed a considerable portion of his speech to refuting certain critics of the company. In particular, he dealt with Sir Robert Kötze's recent statements in his annual report. By a process of what Sir David could only designate as "juggling with figures," Sir Robert Kötze arrived at the conclusion, and published it in a Government report, that at a time when De Beers' shares were standing at £10 the company were paying substantial dividends amounting to 14·3 per cent. on deferred shares, and it only

remained for Sir David Harris to point out that such a conclusion could only be drawn by eliminating the four years during which De Beers paid no dividends at all. The only fair method of basing the return to shareholders is on the average market price of the shares over the same period that the dividends were declared. Such a groundless attack was hardly less unjustifiable than the foolish one made by the "budding politician of Stellenbosch," who made free use of another Government publication to circulate statements which even the man-in-the-street would have no difficulty in proving to be utterly devoid of truth. So far from the products of the alluvial diggers being, through necessity, disposed of to the buyers of the big mines, and that De Beers' diamonds, for which this self-imposed critic says there is less demand, thus derive an unfair preference on the market, Sir David had only to state what is common knowledge, viz., that De Beers have never bought or had an interest in the purchase of alluvial diamonds.

Sir David concluded:—"The criticisms of Sir Robert Kötze, and the groundless attack of the Stellenbosch fabricator both bore the Government imprimatur in that the first was published in the annual report of the Government Mining Engineer, and the second in the *South African Journal of Industries*. I do not believe the Government saw these statements before publication, but as the public place great reliance on that which appears in official journals the Government should at least exercise some supervision to prevent statements appearing of an inaccurate and damaging character."

FOR THIRTY YEARS AND OVER

THE JOHANNESBURG BOARD OF EXECUTORS AND TRUST COMPANY, LIMITED, has had under its care many and varied forms of Trusts—as Executor, Trustee, Administrator, etc.

Its wide experience, the well-known ability of the officials who are responsible for its management, and high regard in which its patrons hold it, are attributes which commend this Company to you.

WILLS appointing the Company Executor can be held in safe custody free of charge.

In addition to handling of Estates, the Company acts as Agent for Absentees, and undertakes:—

Secretarial Duties,
Purchase and Sale of Landed Property,
Collection of Rentals,
Investing of Capital,

and generally every Trust and Agency, including Insurance in all branches.

Money advanced against the security of
First Mortgages.

Oil Shale Activities.

An INFORMATIVE CIRCULAR—AN AMERICAN VIEW OF SOUTH AFRICAN DEPOSITS.

We are in receipt of a very valuable circular of information issued by Mr. Victor C. Alderson, President of the Colorado School of Mines, on the subject of recent world-wide progress in oil shale development.

In the course of this Mr. Alderson reviews oil shale progress in various parts of the world and says, *inter alia*:—

A comprehensive and world wide view of the situation suggests a few striking facts.

1. The supply of well petroleum cannot be depended upon to supply indefinitely the needs of industry and advancing civilisation for oil and its derivatives.

2. The oil shale deposits throughout the world are virtually inexhaustible and supply a "second line of oil defence" as it were.

3. The main problems to be solved are:

(a) The perfection of a retort of large capacity, fool-proof in operation, and designed on correct scientific principles, that will produce the maximum amount of good oil.

(b) The refining of the crude shale oil, not into a long list of chemical curiosities, but into a few standard products for which there is a steady market, and

(c) The co-ordination of the various elements so that as a business project the whole will be an economic success.

4. There is a world-wide interest in oil shale—financial, economic, technical, chemical, and practical—that augurs well for its early development into an important factor in the economic advancement of the entire world.

The oil shale deposits of South Africa are recognised in four well defined areas, *viz.*, the Ermelo district of the Transvaal; the Wakkerstroom district of the Transvaal; the Utrecht district of Natal; and Impendible county of Natal. The oil shales of the Ermelo district occur in three veins; the lowest has a thickness of 20 to 24 feet; the middle one, 19 feet; and the top one from two to three feet, with some very thin streaks. Unfortunately, the lowest and middle veins produce little oil. The top vein yields 30 gallons of oil and 64 pounds of ammonium sulphate. Only a small amount of prospecting has been done, so that the actual value of the field is not known. The thinness of the top vein should not alone bar the district from consideration because the district is crossed by the Breyton-Ermelo railway and therefore has better transportation facilities than any of the other oil shale districts.

The main bed of the Utrecht district has a maximum of thickness of 22 feet, composed of a series of beds from two and a half to five feet in thickness. These beds are not uniform throughout the district, but, in places, thin out and enlarge. A test of the shale at the City Central Laboratory, London, gave 40.6 gallons of oil and 57 pounds of ammonium sulphate to the ton; and 1.71 per cent. sulphur. The distance of this deposit from a railroad is disadvantageous, but other advantages would probably justify a branch railroad from Wakkerstroom.

The oil shale deposits in Impendible county, Natal, occur in the Molteno beds and are best exposed on Crown lands in the Umkomas valley. E. H. Cunningham-Craig, of London, reports this shale to yield 27.10 gallons to the ton. Little development has been done, but what has been done indicates a valuable deposit worthy of further consideration.

In the Wakkerstroom district, the oil shales are found chiefly on four farms, *viz.*, Kromhoek No. 76; Virginia No.

371; Goedgeronden No. 77; and Ijzermeyn No. 280. The deposit has been opened for a distance of three miles by open cuts 200 yds. apart, sufficient to show the full section of the deposit with roof and floor. Until recently control has been held, and development made, by the African Oil Corp., Ltd. A test of the shale at the Pumpherstons Works in Scotland gave 31.75 gallons of oil and 37.18 lb. of ammonium sulphate to the ton. The test also showed that the Scotch retort was suitable for treating the shale. Recently the Royal Dutch Shell interests, after a favourable report of their engineer, have taken an option for six months on the property of the African Oil Corporation. The advent of this company into the oil shale industry is an epoch making event, as it assures development and financing on a worthy scale. Also it shows the appreciation by those interested in oil production from wells, that, in the future, they must depend upon oil shale as the source of oil.

These interests are also examining the Sakalava oil shale deposits in Madagascar.

In other parts of South Africa oil shale deposits are reported, e.g., in the beds of Basutoland; in the so-called Black shale group in Southern Rhodesia; and in the Matatiel Division of Griqualand East, Cape Province. A test of this shale, made in the Government Laboratory at Cape Town, yielded 25 gallons of oil to the ton.

The absence of a domestic supply of well petroleum, the consequent importation of oil and oil products and their high price, a large local demand, the presence of substantial deposits of oil shale, all followed by the active interest of such a colossus of financial strength as the Royal Dutch group combine to indicate an early development of the oil shale industry into a successful commercial basis in South Africa.

Prospecting for Coal near Britstown.

OPERATIONS IN THE KARROO.

Prospecting operations have recently been in progress near Vogelgeraas, about 19 miles from Britstown, on the De Aar-Prieska line, for coal. A large acreage of ground has been taken up under option, and a shaft has been sunk to a depth of over 50 feet through shales to a band of carbonaceous shale. The obvious attraction of these properties from a mineral point of view is their potential value as producers of fuel. The discovery of coal of good quality in this district of the Union of South Africa would be of great importance and would have an influence on the whole industrial aspect of the Cape Province. The only coal fields at present being worked in the Cape Province are those around Stormberg, Indwe and Molteno, 150 miles to the east of De Aar. These Britstown farms lie at a mean altitude of about 3,500 feet, in a basin surrounded by low lying kopjes. Water of a slightly brackish or alkaline nature is encountered at a comparatively shallow depth in this locality.

General Considerations: The Cape Coal Fields.

Owing to the inferior quality of the coal, the Cape coal fields as at present exploited are considered to-day as being the least important of any of the coal fields in the Union of South Africa, and production has declined from 89,000 tons in 1911 to 5,700 tons in 1920. These coal fields have, in the past, when other coal was not available, served a useful purpose, but the extension of the railway system into other coal fields has enabled a supply of better coal to be obtained, with the result that the Cape coal mining industry has lately declined to vanishing point.

The coal seams vary considerably in thickness, and occur in shales in an irregular manner.

The most important coal deposits in the Cape Province occur in the neighbourhood of Molteno, Cyphergat and Indwe, where the shales carrying the coal seams outcrop in the Stormberg beds along the mountain sides. At Molteno one section of the seam is as follows: Top coal, nine inches; shale, five inches; and coal, one foot, two inches. At Indwe the top coal varies from two feet to three feet, then comes a band of shale several inches in thickness, followed by the bottom coal three feet to four feet thick. It will be evident that this interbedding of shale with coal is a condition not at all conducive to uniformity of thickness or easy and cheap mining conditions.

It is, however, a fact that the coal fields of South Africa belong to a collection of beds known as the Karroo system, so called on account of being characteristic of the Karroo district of the Cape, where they are also better developed than in any other Province of South Africa, for there they attain a probable thickness of at least 15,000 feet, and it has for long been held in certain quarters that extensive and systematic borings of the Karroo measures in the Cape Province would disclose the presence of extensive and valuable coal measures.

It is stated that several boreholes have been sunk to substantial depths on these Britstown properties by a former option holder or holders, and that on the data secured in and by these borings a large cash offer was made for the mineral rights of these farms.

Coronation Syndicate.

The annual meeting of this enterprise is being held this (Saturday) morning, when a very favourable statement on the borehole results to date will doubtless be made by the acting chairman, Mr. A. Mackie Niven. It is hoped that the West Reef may be struck by the morning of the meeting, and that results therefrom may be available.

Reviews.

THE GEOLOGY OF THE COUNTRY SURROUNDING JOHANNESBURG.

By E. T. MELLOR, D.Sc.

The above publication has just been issued by the Department of Mines and Industries, and is intended to serve as an explanation of Sheet No. 52 of the Geological Survey Map of the Transvaal. The area included in the map, which extends for 30 miles east and west of Johannesburg, embraces the whole of the country usually referred to as the Witwatersrand, as well as portions of adjoining districts. The author describes the area and physical features of the country embraced by the map: The whole of the area forms part of the "high veld" and lies from a little below 5,000 to close upon 6,000 feet above sea level. The principal geological formations occurring are mentioned and briefly described. Among the formations represented the Witwatersrand System assumes greater importance on account of the immense economic importance of the gold deposits associated with it. With regard to the Witwatersrand System in the Heidelberg District, the author states that the system presents much the same characters as in the Witwatersrand, except that both the system as a whole and many individual members in particular are less strongly developed. As in the Eastern Rand, the Main Reef group of conglomerates is represented by a single member—the Main Reef Leader. With regard to the relation between the Witwatersrand and Ventersdorp systems in the Heidelberg areas, Dr. Mellor states that: "Where the Ventersdorp volcanic rocks lie upon the lower Witwatersrand rocks they frequently show a very marked unconformity to the beds of that system, and they may be underlain by boulder beds and conglomerates. At the same time, in the Witwatersrand and Heidelberg areas, the Ventersdorp volcanic rocks are everywhere conformable to the Elsburg beds, upon which they rest in these localities."

THE PETROLEUM YEAR BOOK, 1921. Founded and edited by Sydney H. North, Assoc. Inst. P.T. The Saint James's Press Co., Ltd., 15 Henrietta Street, Covent Garden, London.

The increasing importance of the oil industry in every part of the world, and the excellence and utility of the book itself, sufficiently explain the welcome this work has received at the hands of geologists, chemists, producers and users of crude oil and its products. It contains a mass of information upon its subject, concisely and well arranged, and the book cannot but prove useful to those engaged in the various processes of petroleum technology. Among its contents one finds the statistics of production, imports, exports and prices of crude oil, fuel and lubricating oils and benzine; articles on the geological characteristics of the oil-fields of the world by Mr. E. H. Cunningham Craig, F.G.S., on oil-field plant and equipment, and the situation, area and output of various oil properties. A chapter on the characteristics of petroleum deals with chemical composition, specific gravity, calorific value, etc., of crude, fuel oil and distillates, and with percentages of products from the world's oils, flash points, boiling points, etc. The application of petroleum is discussed by Eng.-Lieut.-Commander F. T. Addynan, R.N. (ret.), M.I.M.E. Storage and distribution questions are amply dealt with, and under the heading "miscellaneous" are pages devoted to the regulations for carrying and burning fuel oil, specifications for fuel oil, import duties on petroleum and products, conversion tables, foreign weights and measures, etc., etc. Altogether one receives abundant value and information of a kind that has involved a great deal of trouble and thought in the collecting thereof, for the modest figure of half-a-guinea. Copies of the book may be obtained from the office of this paper.

Report of Executive Committee of the Transvaal Chamber of Mines.

The report of the Chamber for the quarter ended with November, to be presented at the ordinary meeting on the 19th inst., has just come to hand, and supplies among other points the following information:—

Native Labour.

With regard to native labour the returns furnished by the Witwatersrand Native Labour Association, Ltd., show the following result for November: Number of natives employed by members of the Association on the last day of month, 191,092.

Definition of Official.

In the past misunderstandings have been caused by the absence of a generally accepted definition of the term official. An investigation is proceeding with a view to deciding, in agreement with the various organisations affected, exactly what classes of employees are to be regarded as officials on the mines, with special reference to the "border-line" type of occupations.

Adjustment of Wages.

The wages of mechanics, improvers and apprentices, and certificated winding engine drivers on the Witwatersrand gold mines were stabilised by agreement till the end of 1921. The various unions concerned have been notified through the S.A. Industrial Federation that the wages of these classes of employees will be reduced from 1st January, 1922, in accordance with the automatic scale for the adjustment of wages agreed upon between the Chamber and the Federation.

As from 1st October, a further reduction of 4s. per shift was made in the wages of mine employees (other than mechanics, certificated engine drivers, and apprentices and improvers in the mechanical trades) in accordance with the terms of the August agreement.

Christmas Day.

As Christmas Day falls this year on a Sunday, it has been arranged to substitute Monday, 26th December, as the special holiday on the gold mines.

Adjustment of Wages on Collieries.

The adjustment of wages on collieries has been the subject of negotiations between the Collieries Committee of the Chamber and the Federation during the past three months without agreement being reached. At the end of November the following notice was posted on the Collieries:

"Notice is hereby given that as from 1st January, 1922 the wages of day's pay employees and contractors on this

colliery will be reduced in accordance with the following scales, namely:—

"That adjustments of wages shall be based on the rise or fall in the cost of living on a scale approximately corresponding to that rise or fall in the Johannesburg area as published by the Director of Census.

"(1) That in lieu of the £3 per week increase granted in August, 1920, there shall be substituted in the case of workmen earning without that increase 20s. per shift or over, an increase of 4s. per shift in respect of the first 20 per cent. increase in the cost of living, and an additional increase of 6d. per shift in respect of each 3 per cent. increase or portion thereof above 20 per cent., until (at 56 per cent.) an increase of 10s. is reached. Variations beyond these limits not to be subject to fluctuation with the cost of living, but to be considered if and when the necessity arises.

"(2) That in lieu of the 40 per cent. increase on the basic rates of pay granted in August, 1920, to colliery employees other than those who receive the £3 per week increase, there shall be substituted an increase of 20 per cent. on the basic rates in respect of the first 20 per cent. increase in the cost of living, and an additional increase of 1 2/3 per cent. on the basic rates for each 3 per cent. or portion thereof increase in the cost of living above 20 per cent. The operation of this scale to be limited, *mutatis mutandis*, in the same manner as that referred to above.

"In applying these scales, wages to be adjusted quarterly and to be based on the average cost of living figures of the last but one preceding quarter as published by the Director of Census in respect of the Johannesburg area, *i.e.*, in the quarter January-March the adjustments will be based on the average of the July-September quarter, namely, 25.6 per cent."

Increased Efficiency and Reduced Working Costs.

On the 10th November and again on the 15th General Smuts presided at a conference between representatives of the Government, the Chamber of Mines, and the workmen's unions. The proceedings resulted in a fairly satisfactory amendment to the Mining Regulations, permitting of certain further rearrangements of underground work. Other matters of importance referred to at the conference, such as trade union restrictions and revision of the underground contract system, were left to be decided between the Chamber and the unions.

Income Tax Act.

Judgment has been given against the Van Ryn Deep, Ltd., in its appeal against the assessment of the Commissioner for Inland Revenue on the question of the inclusion of the Provincial Gold Profits Tax as a working cost for the purposes of the Income Tax Act. It has been decided not to take any further action in the matter.

The Chamber of Mines Building Company, Ltd.

The Chamber's new building is nearing completion, and it is expected to be ready for occupation about the end of February next.

EDITORIAL.

THE CONFERENCE.

The price of gold continues to decline. The latest quotation is 98s. 9d., and at this figure a number of our mines are in jeopardy unless working costs can be substantially reduced. A small reduction in working expenses along the Reef was effected last month. This may be due to a slight increase in efficiency. The recent conferences perhaps have already borne some fruit. The Central Mining Rand Mines group, for example, worked at 25s. 4d. in November, as compared with 25s. 5d. in October, and the mines under J.C.I. control reduced working costs from 24s. per ton to 23s. 7d. Other groups show similar small reductions. But as

against this the premium fell to a much larger degree than that by which working expenses were reduced.

The Corner House mines, for instance, took the valuation for November at £5 0s. 9d. net per fine ounce, which is 1s. per ounce less than in the previous month. The Barnato group adopted the figure of £5 2s. the C.M.S. group £5 3s., less exchange on remittances, and the Consolidated Goldfields £5 2s., less estimated gold realisation and exchange charges of 1s. 6d. It seems strange to us that there is no uniformity of policy amongst the mining groups as to fixation of the selling price of the product during any particular month. That, however, is not the point which we wish to make here.

The outstanding fact is this, that whilst costs are being reduced by pennies the premium is falling by shillings. This way lies ruin, not only for the low grade mines, but for the whole country, which, as Mr. Burton very rightly pointed out the other day at Ladysmith, is riding on the back of the gold industry, a phrase which we too only recently employed. On all sides it is admitted that there is the most urgent need of reduction in working expenditure. There are indeed evidences that even the most rabid of the trade unionists have at last seen the peril that lies in our present path.

On Thursday a Conference was held in the interests of the industry, Johannesburg, the Reef, and in fact the country at large, to consider ways and means to save the low-grade mines from closing down, with all the untold hardships that this would entail. With regard to commenting on the initial session of this Conference we are somewhat handicapped in consequence of being a weekly paper and having to go to press considerably before the dailies. We assume, however, that the Labour leaders will show some opposition to the reforms suggested by the Chamber.

These modifications of existing personnel and practice are stated elsewhere in this issue, and in order that there shall be no misconception as to what the Chamber of Mines is after, it should be made quite clear that there is no intention or desire on the part of the management to abolish the colour bar. The reformations which the Chamber are at present very rightly pressing for involve at the utmost the retrenchment of perhaps 3,000 white men who until recently were agriculturists rather than miners and who are engaged on semi-skilled work. There may be some hardship in the retrenchment of these men. But the alternative holds out nothing but the certainty that much greater hardships will have to be borne by the skilled miners as well as the unskilled men and by the community at large as well as by employees of the mines.

Gold has already fallen to a price which makes it impossible for several mines to carry on. Largely in consequence of the deliberations of the Washington Conference, the Irish settlement, and the generally improved outlook in Europe and America, the British pound has made a sudden and large leap towards pre-War parity with dollars. The price of gold accordingly has fallen, and in the opinion of many it will fall further. One, therefore, can only hope that the Conference at present sitting will arrive at some agreement which will have far-reaching and beneficial consequences. Elsewhere in this issue a correspondent suggests that one of the low-grade mines should be devoted to experiment along the lines advocated by the Chamber. There is something in the suggestion, but we do not think it goes far enough. With gold falling by shillings a week and costs declining by pence a month, the industry is galloping along the road to ruin at such a pace that nothing but a drastic and wide sweeping reform from Randfontein to Springs can save us from an industrial disaster of the first magnitude.

TWO GRAVE BLUNDERS.

In recent months the Government of the Union of South Africa has, in our opinion, made two very big mistakes. Doubtless it has made other errors. *Errare est humanum*. Governments, after all, are but the essence of humanity

and we fully admit that it is infinitely easier to criticise than it is to carry out what is usually termed constructive statesmanship. But there are, to our way of thinking, two blunders of which General Smuts' Cabinets have been guilty and which could easily have been avoided. The first of these was the ratification of what is known as the Steel Contract with the Pretoria Iron Mines, now merged in the S.A. Iron and Steel Corporation, in August of last year, and the second blunder has been the recent appointment of Mr. Karl Spilhaus as Union Trades Commissioner on the Continent of Europe. There is no connection between these two *faux pas* of statecraft; the one has nothing to do with the other, and we do not attempt to appraise the relative demerits of these two mistaken acts of commission.

To deal with the earlier error first, it will be recalled that, after a debate extending over the greater part of two days, the agreements entered into between the Minister of Railways and the Pretoria Iron Mines, Ltd., otherwise the South African Iron and Steel Corporation, Ltd., were ratified and confirmed in the House of Assembly on August 9th. The chief clause in these contracts was that the Railway Administration agreed to take from the Corporation one-half of its output of rails and other iron and steel requirements, and in confirming and ratifying this agreement our Parliament of the People partially committed the iron and steel requirements of the Railways of the country to the South African Iron and Steel Corporation, Ltd., for a period of 17 years; and this notwithstanding the existence of an agreement of a very similar nature entered into by the Government with the Union Steel Corporation at Vereeniging eight years previously, and which latter agreement still had eight years to run. The Select Committee on Railway and Harbours, in their seventh report, recommended that the agreement should not be confirmed.

Writing at the time, we said: It is not often that this journal finds itself on the side of Labour, but in this particular instance we are quite in sympathy with Col. Creswell, Mr. Boydell and Mr. Sampson, who, with the majority of Sir Thomas Smartt's party, strenuously opposed the ratification of the contract. Whilst we dissociate ourselves from Labour's usual hysterical demand for nationalisation, we are nevertheless in full sympathy with the Unionists and with Colonel Creswell and his lieutenants in asking that the agreement should not be ratified and in pointing out the many pitfalls and perils which may result from the signing of the contract. For if this agreement does not constitute a monopoly it constitutes something perilously near it, and at a time too when South Africa is just beginning to realise its iron and steel producing potentialities. The S.A. Iron and Steel Corporation is not the only enterprise in this country which proposes to manufacture iron and steel in South Africa from South African ores. . . . Whether the warnings of some members of the House will materialise and will cause the Government in the fulness of time to regret the new contract which it has entered into with the Pretoria Corporation remains to be seen. The chief criticism of the Government's action in this matter is that the Ministerialists have rushed through the House legislation in conflict with the findings of the Select Committee, which advocated that the Railway Administration should intimate publicly that it would be prepared to purchase its requirements in South Africa without binding the Administration to any one manufacturer. There are many other aspects of this matter which press for consideration and which will be dealt with at a later date. For the present the cardinal fact which dominates all others in connection with the establishment of an iron and steel industry is that Pretoria, that most favoured city of the Union, has secured a preference to the probable detriment of other centres which are endeavouring to inaugurate an iron age in this country. True, the iron is there. But the history of the steel industry in other countries seems to make it clear that it is often better policy to bring the iron ore to the coal fields than to transport coal to the iron mines.

Since that article was written we have on various occasions examined the affairs of this Iron and Steel Corporation and have never been very optimistic as to the company's ability to carry out its contract with the Government. And

now the publication of the second balance sheet and report of the company presented to shareholders at the meeting held in Pretoria during the week does not make us any more hopeful on the point. That balance sheet is commented on in our financial columns in this week's issue. *Inter alia*, it shows that out of a capital of £1,500,000, 350,000 shares have been issued and 1,150,000 are in reserve. Even if all these shares were issued, it would not be sufficient to carry out the corporation's ambitious projects. The amount of capital involved in the original scheme, of which not a quarter has been issued, was a year ago declared to be insufficient. The scheme favoured by English experts is a 75,000-ton iron and steel works, which it was estimated by the chairman in December last would cost two and a half millions. It may be that even that will not suffice; in some quarters it is contended that a sum of three and a half millions will be necessary to complete the Corporation's ambitious programme. The balance sheet further shows that at the end of June last the company had an overdraft of £29,296, presumably with the National Bank, and that its cash in hand amounted to the magnificent sum of £6 6s. 2d.! We assume, too, from the report that the iron works have been idle since April 29th.

One would imagine that it would have been just as well to await the time when the Corporation was producing before committing the Railways to an undertaking to purchase half the Corporation's output, even though the Corporation was generous enough to agree to remit one-third of its profits in excess of 10 per cent. to the Railway Administration. There are other matters arising out of this Iron and Steel Corporation and its contract. According to the report of the Transvaal and Delagoa Bay Investment Company for last year, that concern agreed to participate to the extent of £40,000 in the guarantee of working capital of the S.A. Iron and Steel Corporation, Ltd., and in the report of the same company for this year which has just been published we read: "*Under the guarantee of working capital for the South African Iron and Steel Corporation, Ltd., referred to in the last annual report, 2,012 shares were taken up at par. Subsequently, however, owing to the times being considered unpropitious, it was decided to postpone a further issue, and your company has no more interest in or liability under the guarantee.*"

Who were the other guarantors in this million and a half venture, which we are now told will require not less than two and a half millions of money? We have asked that question before, and we now ask it again. If the million and a half was guaranteed and underwritten, it would appear to be the duty of the Government in the interests of the country at large, and particularly in the interests of the Railways for the fulfilment of the contract, to call upon the company to provide capital to the end that the Corporation may at the earliest opportunity attain to a position which will enable the Pretoria Iron Works to make good its undertakings. Perhaps there was some protective clause in the financial agreements which rendered it not obligatory for the sponsors to put up the capital upon which the company was registered. If this be so it may be asked whether it is policy for the State to enter into a preferential contract with a private concern which has not so far been able to carry out its undertakings with an important administrative department of the State. The whole business at least merits an impartial commission of inquiry; indeed, from our point of view there has been no indication of ability to fulfil the undertaking, and the contract should be nullified.

As to the appointment of Mr. Karl Spilhaus as Trades Commissioner in Europe for the Union of South Africa, the Government's unfortunate choice has aroused a chorus of disapproval throughout the country. Since our last issue went to press there have been several indignation meetings and numerous resolutions of protest have been forwarded to the Government on the subject of this appointment. The most noteworthy of these meetings was held at Capetown on Monday night, when the appointment was publicly condemned and strong speeches were made. Returned soldiers committees have been equally emphatic in their condemnation of the appointment, which as a matter of course is bound to irritate men who served on the Allied side during

the War. Whatever the abilities of Mr. Spilhaus may be, we consider that the Government could have made an equally satisfactory appointment from a business point of view by appointing a British or Dutch-born subject. The Trade Commissioner, it should be remembered, will not only be a commercial envoy to Germany. He is, we take it, to endeavour to improve business relations as between the Union and our former European Allies, and the French at least can hardly view such a Dominion ambassador as Mr. Spilhaus with approval.

And from a sentimental and patriotic point of view there can be no question whatsoever that the Government's ill-considered choice has greatly offended a large section of the community and has tended to estrange the feelings of a large number of General Smuts's most ardent supporters.

It would be little use condemning the Government's action in these two matters if there were no possibility of the blunders being rectified. But in regard to the Spilhaus appointment we believe that, despite the Government's avowal to stand firm it is not too late to admit that the choice is now known to have been impolitic, and that if it is necessary to have a Trades Commissioner in Europe some other name will be substituted for that of Mr. Spilhaus.

And so with the Steel Contract. If it is not possible to rescind this by a special Act of Parliament it surely should be quite practicable for the Government to admit that the warnings of 15 months ago were not without reason and to rectify the injustice that was then done other actual and potential producers of iron and steel by giving them the same encouragement to progress with a basic industry as was then given to a corporation which at the end of last June had £6 6s. 2d. in the bank and an overdraft of nearly £30,000, and which at the present time seems to be almost further off ability to deliver the goods than it was more than a year ago.

The Government will be well advised to listen to advice in these two matters. For if some effort is not made to placate public opinion both in regard to the Steel Contract and the Spilhaus appointment the Ministers of the present Cabinet will have to prepare able defences of their actions in these two matters when Parliament assembles.

THE PRICE OF DIAMONDS.

Quite a controversy has arisen during the week in regard to the policy of the big diamond producers in maintaining the price of their products. The matter arose out of the statements made by Sir David Harris at the De Beers meeting last week in explanation of the position of the diamond market. De Beers and the associated big companies are usually credited with knowing their own business best, but the *Cape Times*, backed up later by the *London Daily Mail*, has come out with the proposal that in the interests of all concerned, viz., the producers, Government, and people of South Africa, the price of diamonds should be lowered and what is considered a bigger and more profitable market thus be tapped. We must confess that we have no sympathy whatever with this suggestion. The case for the producers is that since the big lull in the demand for diamonds last year, the world generally has been passing through a period of severe depression, which has been felt most acutely in the diamond industry. For many months there was a complete cessation of sales by the Syndicate of diamonds purchased by them from the four large producers, and up to now no sales of any importance have taken place. In consequence of the stagnation in the diamond market and of representations by the Diamond Syndicate, meetings of the four large producers and the Diamond Syndicate were held at Capetown in March and May of the present year, when matters were discussed, and a satisfactory arrangement as to future deliveries was come to. The severe and continued depression compelled the industry to take steps to curtail operations and to economise wherever possible, which unfortunately necessitated the retrenchment of large numbers of employees, both European and native. All mining work was stopped, and expenditure in every department was greatly reduced. A slight improvement in the diamond market has been noticeable recently,

but it is still necessary to exercise patience and economy for the depression through which the industry is passing makes the present a difficult period. The policy of the big producers has year after year been publicly explained and defended by its spokesmen, and the Union Government has been thoroughly convinced of the wisdom of that policy and has given to it entire support. We have read the arguments of the *Cape Times* and the cabled summary of those in the *Daily Mail*, and can find nothing in them in the least likely to cause those responsible for the diamond industry to change their views. The diamond trade of the world—the great luxury trade—is a very delicate and complex mechanism, and its working is properly known only to the experts. Well-meaning efforts to improve it by suggestions that run contrary to the hard-won experience of years can, we believe, only result in embarrassing those who have their fingers on the pulse of it.

TRANSVAAL AND DELAGOA BAY INVESTMENT COMPANY, LTD.

The Transvaal and Delagoa Bay Investment Co., Ltd., which owns the Transvaal and Delagoa Bay and the Douglas Collieries, has had another excellent year, as will be seen from the speech of Mr. S. C. Black, fully reported in this issue. The company is in an exceptionally strong financial position, and has paid 25 per cent. in dividends for the year. Both the collieries of the company are doing well, despite the recent unfavourable developments in the coal trade, and the company has other valuable assets in the shape of undeveloped coal-bearing areas and considerable real estate at Delagoa Bay. The company, it may be noted, paid its first dividend in 1903, and has paid regular dividends ever since. On the broad aspect of labour, Mr. Black made a brief but significant statement. He said: "With regard to the labour position generally, a great deal of unrest is fomented on the question of a reduction of wages from the high water mark of a year ago. But the white workers of South Africa must recognise that they are not a privileged class above economic laws, and when all the world over, the reduction of wages follows on the fall in the cost of living, they too will be subject to the same cause and effect." Wages on the collieries are, of course, now under discussion, and doubtless Mr. Black would have had much more to say on the subject but for that fact. Mr. Isaac Hodges, who has just returned from England, paid a tribute to the successful administration of the company, and expressed confidence in its ability to meet the hoped-for expansion in trade. The history of the company, indeed, goes to show that it is one of the soundest and best managed of its kind in the country, and all concerned are to be congratulated on its continued success.

Notes & News.

East Rand Gold, Coal and Estate.

Owing to a printer's error, a line in the speech of the Chairman, at the annual meeting of the East Rand Gold, Coal and Estate Company, dealing with white wages, was given incorrectly. The passage under the heading of working costs should have read as follows: White and native wages are responsible for a total increase of £2,000 for the year; explosives, £2,100; stores, £2,000, or an average of £500 month, that is to say, under pre-War conditions the last year's working would have cost for the year's tonnage £6,100 less than under current conditions. These increases with reference to white wages bring the cost to 57.76 over pre-War costs, at which increased figure it now stands. The increase in mine stores and explosives over pre-War rate varies between 40 per cent. and 300 per cent. according to the class of article. As against this, of course the selling price of coal has advanced, but not in proportion to the increased cost of working.

Transvaal Silvers.

A full report of the annual meeting of Transvaal Silver and Base Metals, Ltd., will be found in another part of this issue, and should make most satisfactory reading for the shareholders. The year's work has developed what was but a very favourable prospect into a highly promising mine, equipped with an excellent plant. The company continues to be financed by the General Mining and Finance Corporation, and the latter has agreed to meet the financial requirements until such time as regular production enables the revenue to provide for expenditure. In other words, the parent corporation will stand by the Transvaal Silver Company up to the producing stage. Mr. Errol Hay, in the interesting remarks wherein he supplemented the chairman's speech at the meeting, put the present value of the bullion product at £41 per ton, and estimated working costs at £21 per ton, including realisation, shipment and transport, as well as mine charges. The capital of the company, it may be noted, was increased during the year to £300,000, firstly by the exercise of 69,740 options issued with the original shares, and secondly, in May last by the creation of 160,080 new shares issued to provide further necessary working capital. In view of the excellent nature of the latest developments at the mine, the capital, even with the further obligations to the General Mining, is moderate, and the future of the company seems assured.

Phosphates in the Union of South Africa.

The Bulletin of the Imperial Mineral Resources Bureau entitled *Phosphates* furnishes the following information with regard to the occurrence of phosphates in the Union:—So far as is known at present, the only deposits of phosphate-rock of any considerable commercial importance in the Union of South Africa are the aluminous phosphates of Saldanha Bay, on the south-west coast of Cape Province. Analyses of samples of the phosphates obtained show from 10 to 23 per cent. of phosphorus pentoxide, from 16 to 77 per cent. of silica, and from 7 to 37 per cent. of iron oxide and alumina. Other districts within the Union where phosphates are known to occur are Weenen, in Natal, where the deposits are of low grade, carrying only about 8 per cent. of phosphorus pentoxide, and Lulukop, in the Zoutpansberg district of the Transvaal. Lulukop is an isolated hill of very pure limestone which carries considerable quantities of apatite and magnetite. The apatite is reported to amount to about 10 per cent. of the rock in places. The deposit lies in a remote and unhealthy district, and it does not seem probable that any considerable supply will be obtainable from this source.

* * *

New Mine Rescue Apparatus.

Ever since the invention of the miner's safety lamp by Humphry Davy, Great Britain has devoted keen attention to the subject of safety devices in mines. Experiments recently conducted by the British Scientific and Industrial Research Department have resulted in the design of two new types of rescue apparatus which are proving most successful. Both types of apparatus are what is known as "regenerative": that is to say, the air expelled by the lungs is purified, supplied with oxygen, and returned to the lungs. Therefore, when a man wears this apparatus he is able to enter smoke or poisonous atmosphere without suffering ill effects. The apparatus and the lungs really formed a closed circuit, and the lungs serve as a pump to circulate the air round that circuit. In one type of apparatus the oxygen is supplied from liquid air and in the other type it is obtained from a solution of compressed gas. Both types of apparatus are designed to enable the wearer to undertake continuous heavy physical exertion for at least two hours. As a matter of experience, they can satisfy all the breathing needs of the wearer for three hours.

The Bailey-Jeppe Group.

Annual meetings of the companies of the Bailey-Jeppe group were held on Thursday, but owing to the exigencies of going to press before the holiday we have to withhold comment till next week.

Another American View of the S.A.R.

Mr. Joseph T. Mannix, a well-known American journalist who is visiting Johannesburg, has expressed the opinion that our railway service is particularly up to date, more especially with regard to the smoothness of the travelling and the care shown in the upkeep of the rolling stock. He finds South Africa advancing, despite the rough country, steep gradients and narrow gauge, which so seriously handicap the South African engineer. He thinks the S.A.R. far better than Australia, with a mileage double that of the Union. He also testifies to the courtesy with which he was treated by officials of all grades. He deprecates the tendency among a section of railwaymen to depreciate South African railway conditions and those of the British service. He found railway employees and others unduly pessimistic with regard to the future, politically and otherwise. Mr. Mannix drew attention to the necessity for more advertisement.

Consolidated Gold Fields Report.

The annual reports of the Consolidated Goldfields have reached us, and a longer review is held over till next week, when doubtless the chairman's speech will be available. The following extracts from the report of the Johannesburg manager, Mr. D. Christopherson, are of especial interest at this juncture:—The total expenditure on working costs on all the producing mines on the Witwatersrand for July, 1921, was £2,572,000, which represents on the 2,010,000 tons milled 25s. 7d. per ton, writes Mr. Christopherson. For July, 1914, this figure was £1,904,000, or 16s. 9d. per ton on 2,275,000 tons milled, a difference of 8s. 10d. per ton. The expenditure of £2,572,000 can be estimated to be made up as follows: White wages, 35 per cent.; native wages, 18 per cent.; stores, 40 per cent.; sundries, 7 per cent. So far as white wages are concerned an agreement has recently been arrived at whereby wages will be reduced to a certain point, on a sliding scale, according to the cost of living figure as compared with pre-War cost. Thereafter the agreement provides that further reductions are to be subject to discussion. When that time arrives, conditions are likely to be such that it will be clear to all concerned that in order to avoid disaster and unemployment on an unprecedented scale further reductions in wages must be faced.

New Machinery for Breweries.

At a recent exhibition in London, England, many new types of plant for use in breweries and allied industries were displayed. One of these was a large bottle-filling machine which handled 24 bottles simultaneously. The bottles travel on a band conveyor which automatically places them under the filling heads; as soon as a bottle is in position it is raised by a plunger so as to make a tight joint with the filling head. Gas is then admitted to raise the pressure in the bottle and a valve opens to admit the beer or other liquid, which fills up the bottle quietly without frothing. When filled, the bottles are automatically removed on the band conveyor. This machine can fill 220 dozen quart bottles per hour. Another interesting exhibit was a series of tanks and other vessels made of aluminium which has the property of not disturbing the delicate processes of fermentation. Moreover, aluminium does not affect the flavour of the liquor. An important improvement in the manufacture of casks was also shown. A machine has been designed to force the hoops on to casks, and it is capable of driving the six hoops on each of three standard 40-gallon barrels in one minute.

Mr. E. J. Way's Bioscope Improvement.

The first annual meeting of Bioscope Improvements, Ltd.—the new company formed on the Rand to exploit Mr. E. J. Way's patent to obviate the rewinding of bioscope films—was held this week. Sir Wm. Dalrymple was in the chair, and his brief speech was supplemented by a lengthy statement from the managing director, Mr. E. J. Way, on the prospects of the patent. It would certainly seem to the uninitiated that the innovation has a great commercial future.

Railway Electrification Questions.

Considerable correspondence has appeared in the Press in recent months (says Sir William Hoy in his latest bulletin) in regard to the merits of the three-phase system of electrification said to have been standardised throughout Italy. In the light of what has been stated, the following extract from the *Electric Railway and Tramway Journal*, of August 12 last, will be of interest: "The electrification of the Sampierdarena-Ovada-Alessandria and the Milan-Bologna lines has been authorised. The former enterprise will be carried out by the maintenance departments of the State Railways, while the work in connection with the latter will be done by private enterprise. The route of the primary main intended to feed the plants from which the Benevento-Foggia line is being electrified was also approved in principle, the system to be employed being that of continuous current at high tension. This main, which, in its turn, will be fed by plants belonging to private industry as well as from the plant now under construction by the State Railways, is so planned that it will also serve the Sulmona-Castellannare-Adriatico and the coast line as far as Foggia, when these lines are electrified." A recent issue of the *Railway Engineer* contains a summary of electrification progress on the Japanese railways in the environs of Tokyo, wherein it is stated, *inter alia*, that developments have taken place progressively since 1905, and that the "direct current" system has been adhered to.

A New Hand Tool.

The breast drill is one of the most familiar of small hand tools in engineering shops, and many engineering people will therefore be interested in a novel form which has been brought out by a British firm. This tool provides four separate speeds. The usual toothed crown wheel is replaced by a disc with four concentric circles of conical holes. On the drill spindle there is a pinion which meshes with one circle of these holes. In order to change the speed of the drill the pinion is moved from one circle of holes to another. At all speeds the gearing runs very smoothly yet rigidly, and the whole tool is remarkable for its lightness.

The Latest Oil-Fuel Burner.

The number of types of oil fuel burner is legion, and the engineer who has to choose among them often finds it extremely difficult to decide among so many closely competing claims. It is interesting therefore to come across a new type which is radically different in its design from all the others. The purpose of an oil burner is to reduce the oil to a fine spray and to mix that spray so thoroughly with air that the oil will be completely burned. As a rule the oil is forced through fine orifices or some other fixed contrivance to "atomise" the oil. In the new form a rotating cone is employed. This cone is fitted at the end of the oil pipe and is rotated at a high speed by means of a small fan operated by the system of air in which the oil is ultimately burned. The oil, in emerging from the pipe, trickles down to the inner surface of the spinning cone and spreads out under centrifugal action into a thin film which travels forward to the outer edge of the cone. This edge is finely serrated and breaks up the oil film into an extraordinarily fine spray, which is carried into the furnace by the stream of air already mentioned. By a simple adjustment the form of the flame can be altered to suit any purpose, so that the burner can be employed for ordinary boiler work or for forges and special furnaces, in addition to domestic and central heating. This burner has been fully tested under working conditions and has proved most satisfactory and economical in every way.

WALWORTH SPRING PLUG COCKS

THE SUPERIOR INVERTED PLUG AIR COCK

Tested with Compressed Air *under Water* and recommended for 125 lbs. working pressure. Furnished with either iron or brass plug. Equally good for Steam service or with liquids.

BUILT TO STAND SEVERE SERVICE CONDITIONS

WALWORTH MANUFACTURING COMPANY

Oldest continuous manufacturers in the United States (since 1842) of a complete line of Valves, Fittings and Tools for Steam, Water, Gas, Air and Oil. Originators of the GENUINE WALWORTH STILLSON WRENCH and the KEWANEE UNION.

WAKEFIELD'S HIGH-CLASS LUBRICANTS.

**The Economy of Paying
a Higher Price.**

Were we to assert that we could get a good satisfactory engineering job at a low price or that a cheap machine is as good and will do equally good work and be as economical as a first class one.

What would you say or think?

**Why not be your own
Judge?**

Put WAKEFIELD'S LUBRICATING OIL to the test. If a gallon goes further, gives better working results and reduces danger of breakdown, your very pride in your work will decide the matter apart from all selling talk.

**TRUE CHEAPNESS IS DECIDED BY THE
AMOUNT AND QUALITY OF THE WORK DONE.**

New S.A.R. Works and Improvements.

POINTS FROM THE ANNUAL REPORT OF THE CHIEF CIVIL ENGINEER.

From the annual report of the Chief Civil Engineer of the S.A.R. we take the following:—

Increase in traffic in Natal necessitated deviations and doublings, particulars of which are included below.

Cato Ridge—Clairwood: Deviation.

On the 14th February, 1921, the line was opened for coal traffic in order to afford early relief to the accumulation of this class of traffic on the old main line. This deviation is 40 miles 12 chains, being very slightly longer than the existing main line between Cato Ridge and South Coast Junction. The completion of the single track, to secure this relief, was accomplished in face of great difficulties in the supply of cement and permanent way material. Construction work is still in progress while the line is used for traffic purposes, but even in spite of the fact that the Transportation Department have only partial occupation it is affording very great relief. The decision to double the track between Booth Junction and Mount Vernon and between Cato Ridge and Cliffdale, required so much work to be done that it could not be opened for traffic by the middle of February when the single line was opened. The finishing off of the single line was impossible where the doubling was being carried out so that when traffic began the line was far from complete. The track-laying in the big yard at Booth Junction was much behind at the date of opening, but every effort has been made to push on with the work and at an early date full facilities will be available for dealing with the increased traffic which can be brought down the line. Rapid progress is now being made with the buildings and quarters, which in 1920 were delayed by a scarcity of artisans. The installation of signalling had to be postponed till the track was in place, but is now proceeding without delay. Water supplies for locomotives have been put in at Marianhill where the water is pumped from the Umblatuzan to a large storage reservoir, and at Cliffdale where the water is led by gravitation from a small stream to a reservoir at the station. The construction of cuttings of the magnitude required on this deviation, especially where the strata have been much disturbed by faults, has resulted in a number of large and small land slides, which have considerably increased the amount of work to be done and the cost of the line. When opened for all classes of traffic the saving of engine power will be considerable, as the coastward load would be limited more by brake than tractive power, and it is anticipated that from 1,000 to 1,200 tons with 100 axles can be handled with one 14th class engine, which is approximately 100 per cent. more than can be handled *via* the old route. The section between Shongweni and Dassie Hoek is very heavily tunnelled; "Delville" and "Shongweni" tunnels are 1,001 and 993 yards long respectively. The total length of the ten tunnels aggregates 2¼ miles. This deviation embraces the heaviest piece of railway construction in the Union and must certainly rank high in the records of railway construction in any part of the world. But although the construction work has been of such magnitude the real engineering problem was the survey, and is certainly the most brilliant piece of location ever done in South Africa. It will always remain an eloquent testimony to the railway engineering skill of this country.

Cedara—Nottingham Road: Deviation.

With few exceptions contracts for the earthworks and concrete have been let over the whole length of 30 miles. The native labour supply having somewhat improved, satisfactory progress is at present being made.

Improvements: North Coast Line, Natal.

The earthworks from Umgom to Tongaat are well advanced and little remains to be done between Tongaat and Chakas Kraal. The tunnels between Umgom and Duffs Road are nearing completion and good progress is being

made with a third tunnel between the same places. A fourth tunnel is under construction, and the fifth and largest (472 yards), between Ottawa and Verulam, was pierced during the year. The progress of the work generally has been hampered by limited supplies of material and by shortage of labour.

Glencoe—Vryheid: Relaying.

The section of line between Glencoe and De Jagers Drift (25¼ miles), including four deviations sanctioned in 1919, has now been completed. Work from De Jagers Drift to Vryheid East was begun in June, 1920, but up to the end of February, 1921, 13½ miles of relaying and ballasting only had been completed. In March, however, the native labour supply improved and five miles were relaid, bringing the total for this section up to 18½ miles. The increase in the coal traffic on this branch has been great, and in order to expedite the working of trains the construction of five new crossing stations between Glencoe and Vryheid was authorised. Two of these have already been opened for traffic, and it is expected that the remaining three will be ready by the end of June, 1921.

Ladysmith—Umbulwana: Deviations.

This work comprises three deviations:—No. 1—South of Umbulwana, length 31 chains, improves grade from 1 in 40 to 1 in 66; No. 2—South of Umbulwana, 29 chains long, improves grades and curves and shortens line; No. 3—North of Umbulwana, length 25 chains, improves grades and curves and shortens line. These deviations include the provision of a double line tunnel of 200 yards, and provide for double line formation and culverts from 183 miles to 185½ miles. Contracts were let in October, and the work is in progress.

Doubling Line: Nottingham Road to Tendega.

Surveys have been made and estimates prepared for doubling the following sections:—Nottingham Road—Mooi River, Chieveley—Ennersdale, Umbulwana—Ladysmith, Matiwane—Elandslaagte, Wessels Nek—Wasebank, Wallsend—Glencoe, Glencoe—Dundee, Scheepers Nek—Tendega. Surveys of intermediate sections are in progress.

TRANSVAAL.

Roberts Heights Line.

This line, approximately 6 miles long, has been put in hand on behalf of the Defence Department. Work began in November with white unskilled labour. At the end of March the earthworks and masonry were nearly completed and the track was being laid.

Lydenburg—Olifantspoortje Relief Works.

The earthworks for a line of railway from Lydenburg to Olifantspoortje are being constructed as relief works for out-of-work Europeans out of funds placed at the disposal of the Administration by the Government from the unemployment vote. Work was begun in February, 1921, and at the end of March sixty-five European labourers were employed.

Regrading: Kaapmuiden—Komatipoort.

The Malelane deviation, 84½ miles to 87 miles, was opened for traffic on the 19th July. The western portion of the Hectorspruit deviation, 78½ miles to 76½ miles, was opened for traffic on the 11th October. The eastern portion of the same deviation, 74½ miles to 76½ miles, was opened on the 29th November. The temporary triangle at Malelane has been removed to Hectorspruit, thus reducing the length of a cross trip to 38 miles, 19 each way. By these improvements the load per train over the section Waterval Boven to Hectorspruit has been increased from 870 to 1,200 tons. Probably the whole of these works would have been completed several months earlier but for the delays in the delivery of cement. Wood sleepers have been laid through-

out these deviations and the undeviated portions of the line have also been relaid with wood sleepers. In December, 1920, authority was given for regrades at 63 $\frac{3}{4}$, 65 $\frac{1}{2}$, 67 $\frac{1}{4}$, 72 $\frac{1}{2}$, and 73 $\frac{3}{4}$ miles, also for a deviation between 69 $\frac{3}{4}$ and 72 $\frac{1}{2}$ miles. This will complete the regrading to Komatiport. Work upon these has already been begun. A temporary deviation in connection with the reconstruction of the bridge near the Crocodileport station at 112 miles was begun in December. During the year a survey was made for a remodelling of the station yard at Waterval Boven.

Aper—Witbank: Doubling.

This work has been carried out between Welgedacht and Sundra and between Kendal and Oogies. On the former section the earthworks and culverts are nearing completion, and the platelaying has already been completed. On the latter section earthworks, platelaying, and culverts have been completed, and ballasting is in progress. The summit at Oogies has been lowered, making an easy approach to Oogies station on a 1 in 600 grade, and doing away with a sharp reverse grade. With the exception of a section of 3 $\frac{1}{2}$ miles between Sundra and Eloff and 4 $\frac{1}{2}$ miles between Aber and Kendal, the line is now doubled from Welgedacht to Oogies. A new colliery line, 1 $\frac{1}{2}$ miles long, from Kendal Station to Kendal Colliery has been put down and opened.

Aper—Springs: Doubling.

Estimates for this work have been prepared.

Marshalling Yard, Kendal.

Plans, sections, and estimates are in course of preparation for this work.

Danswart—Aper: Deviation.

This deviation has been staked out and plans prepared.

Fourteen Streams—Klerksdorp: Relaying.

The relaying of this section of the line with 80 lb. B.S.S. material was continued through the year, and Bloembof was reached about the end of March, when, except for ballasting, the work was stopped for lack of rails and further funds. At the end of November white labour replaced the natives on this work.

Cape Western Main Line: Improvements.

The deviation and regrade between 107 miles 56 chains and 109 miles was completed in July. Minor improvements in grade and curvature were also effected or in hand during the year at 68 $\frac{1}{4}$ miles to 68 $\frac{3}{4}$ miles, 117 miles 27 chains to 118 miles, 160 $\frac{1}{2}$ miles to 161 $\frac{3}{4}$ miles, 176 miles to 176 $\frac{3}{4}$

miles, 206 $\frac{1}{2}$ miles, north approach to the Blood River Bridge near Ketting, 292 miles to 293 miles 60 chains, 301 miles to 302 miles 10 chains, 328 miles 60 chains to 329 miles 40 chains.

Cape Midland Main Line: Improvements.

A survey, plans, and estimates were made for deviating the line between Mimosa and Alicedale, securing a 1 in 80 grade in lieu of the existing 1 in 40. The deviation would be about 20 miles in length.

Deviation of Line and Station Improvements: Queenstown.

Investigations were made for deviating the main line, and providing a new layout for traffic and locomotive working at Queenstown.

Grain Elevators.

The work on the foundations of the terminal elevator of 42,000 colonial tons capacity at Congella was let by contract on the 1st March, 1921, and work was commenced shortly afterwards. These foundations consist of reinforced concrete monolithic slabs supported by reinforced concrete piles varying from 36 feet to 25 feet in length. The contractors for the excavations and footings of the Capetown terminal elevator started work on the foundations on the 24th January.

Bloembfontein: New Workshops.

About 80 per cent. of the site has been levelled and the culvert, including both inlet and outlet, has been completed. Platelaying is nearly complete and half the ballasting has been done. One-third of the fencing has been finished. Work is well advanced with the buildings. Most of the concrete work of the main block has been done. The erection of the steelwork has been let out to contract. None has actually been erected, but the assembling and riveting is in progress. The building for the electric power station is complete, including floors, but excepting roof. The foundations of the accumulator house are completed. Excavations for the foundations of the electrical workshops are also complete and concrete being placed in position. The excavation and foundations for the mechanical engineer's offices are complete and the brickwork up to the underside of the stoep roofs. It has been decided to augment the water supply by an additional 4-inch pipe to an underground concrete tank of 75,000 gallons capacity from which water is to be pumped to an elevated tank of 20,000 gallons capacity for the supply to the air compressors and from which it can gravitate to supply part of the shops.

The Week in the Sharemarket.

WEAKER ON THE FALLING PRICE OF GOLD AND THE LABOUR POSITION.

The falling price of gold continues to be the dominant factor in the market, and prices of all gold shares were affected by it during the week. The latest price, dated London, 14th December, is £4 18s. 9d., which is a rise of 7d. on the lowest figure touched during the week. Since the date in 1919 when it became possible for the gold mining companies to realise gold in the open market, it has ranged from 98s. to 127s., and the prospect is that the rehabilitation of the pound sterling may soon bring back gold to its 1918 figure. The latest cabled reports of a world financial conference—however excellent in itself—must mean another drop in the gold premium, and everything points in that direction. The gold share market on Thursday seemed to have touched bottom, and there seems to be a slight reaction on local selling as London quotations came better. The market was closed on Friday, which may allow nervous people to take stock of the situation. Even Transvaal Silvers, despite the satisfactory annual meeting, are weaker in sympathy with the general market, but recovered slightly. Diamond shares, in view of the latest news of the market, remain quiet at low levels, and colliery shares, in view of the possibility of a strike, are also out of fashion. Until the result of the Conference between the Chamber of Mines and the trade union leaders becomes known no interest in the market is likely; and even good dividend declarations are not expected to help matters. The approaching holidays, of course, will make for a quiet and inactive market till the New Year.

Mining Men and Matters.

Sir Abe Bailey, Bart., has returned to South Africa.

* * *

Sir H. Ross Skinner has returned to the Rand.

* * *

The friends of Monsieur Eugene Renaud, who was until 1919 the Johannesburg representative of the Credit Mobilier Francais, Paris, will hear with deep regret of his death, which took place the other day at Santiago, South America. M. Renaud arrived on the Rand in February, 1912, and left South Africa in the latter part of 1919. He made many friends during his sojourn in Johannesburg who will all deplore his demise and recall his geniality, courtesy and kindness of heart.

REVIEWS (BOOKS RECEIVED).

Tutorial Land and Mine Surveying.

By Thomas Bryson, A.R.T.C., M.I.Min.E. Price, 10 6 net. Publishers: Sir Isaac Pitman and Sons, Ltd., Parker Street, Kingsway, London, W.C.2.

The book embodies a systematic study of land and mine surveying in which the plan is to discuss briefly and generally the scope of each part of the subject, and afterwards present the details through the medium of answers to questions which have been set at the colliery managers' examinations and the examinations of educational institutions, such as the City and Guilds of London Institute, London University, and the Union of Lancashire and Cheshire Institutes. The scope of the book is necessarily limited, and consequently an endeavour has been made to present the essentials of the subject to meet the particular requirements of mining students in as concise a form as possible. The construction and testing of instruments has been treated in detail, and the last chapter contains notes of a survey of underground workings.

The Crocodile River Iron Deposits.

RUSTENBURG'S HIGH GRADE HEMATITES.

The report by Dr. Wagner on the Crocodile River iron deposits has just been published. It forms an exceedingly interesting compilation, and should be studied by all who are interested in the development of the iron industry of this country. The following extracts have been taken therefrom:—

The deposits of high-grade hematite, with which the present report is more particularly concerned, are situated in the northern part of the Rustenburg District of the Transvaal in a rugged mountainous tract of country traversed by the Crocodile River between latitudes S. 24° 35' and S. 24° 40'.

The precise limits of the deposits have not as yet been determined. The ore has been proved to occur on Buffels-hoek No. 151, Wachtenbietjesdraai No. 829, Donkerpoort No. 830, Kwaggashoek No. 759, Grootfontein No. 145, Klipgat No. 672, and Rosseauspoort No. 32, workable deposits being apparently confined to the four first-named farms.

The iron area is at the present time rather inaccessible, particularly during the rainy season, when the roads are quite impracticable to motor traffic. The nearest point on the railway is Warmbaths station, distant approximately 68 miles from Buffelspoort. The distance to Brits station, the nearest on the Pretoria-Rustenburg line, is approximately 83 miles.

Chemical Composition

The ore is of great purity and, except for one exposure, is of Bessemer grade throughout, analyses showing from 60 to 69·5 per cent. of iron, from 45 to 6·32 per cent. of silica, and from 0·06 to 0·05 per cent. of phosphorus. It appears to be quite free from sulphur.

The following partial analyses of samples from different parts of the area are of interest as showing the uniformly excellent quality of the ore:—

	I.	II.	III.
Fe	65·0	67·4	67·75
SiO ₂	2·28	1·08	1·6
P	·03	·05	·01

Available Reserves.

The available reserves of high-grade ore in the area must be very considerable. Taking, for example, the stretch of ore exposed on the crest of the northern range on Kwaggashoek No. 759. This, as previously stated, has a length of 880 yards, and the thickness of the ore-body ranges up to 40 feet, probably averaging about 20 feet. Assuming that this is the average thickness at the outcrop, and that the deposit is regularly wedge-shaped, and only persists to a depth measured along the dip equal to half its length, then the single stretch of ore would represent some 38,000,000 cubic feet, equivalent to over 4,600,000 long tons.

Granting that the assumptions on which the estimate is based are quite unjustifiable—they probably err largely on the conservative side—the figures are none the less of interest as affording some indication of the potentialities of the deposits, particularly when it is borne in mind that many large ore-bodies not exposed at the surface probably await discovery by underground exploration.

Prime Necessity of a Railway to the Deposits.

It cannot be too strongly emphasised that, until a railway is built to the deposits, their exploitation will be quite impracticable, as the cost of getting the ore to rail under existing conditions would be prohibitive.

Mining Conditions.

Conditions, on the whole, are extremely favourable to cheap mining. Apart from the *talus-ore*, which will probably be used in the first instance, all the hematite exposed

at the surface is capable of open-cast or adit mining, and as the outcrops are in most instances situated at a very considerable distance above the adjacent valleys, it will be very many years before the necessity for underground mining proper will arise. The ore is very hard and tough, and will be difficult to drill and break. Power drills and blasting gelatine will, however, doubtless overcome this, and conditions otherwise are so favourable that quarrying costs should not exceed 3s. per ton, and the cost of adit mining 7s. 6d. per ton.

Rough sorting, with cobbing, will be required at the quarries to get rid of unreplaced remnants of banded ironstone occurring in the ore. These are of distinctive appearance, so that the sorting will be a very simple matter, and should not cost more than 6d. per ton. With reasonable care, there should be no difficulty in maintaining a grade of over 60 per cent. of iron.

The Ore from the Metallurgical Point of View.

The ore, as already indicated, is of almost ideal purity, and, except for one exposure on the eastern part of Donkerpoort No. 830, appears everywhere to be of Bessemer grade, *i.e.*, to contain less than 0·05 per cent. of phosphorus, which renders it suitable for the acid Bessemer process of making steel.

It is, however, very dense and close-grained, and if smelted by itself—some slight addition of siliceous ore would in any case be necessary—will require a very high blast furnace and coke of exceptional strength.

The hematite is also admirably suited for decarburising and refining in the basic open-hearth and electric-furnace processes of making steel, and will doubtless be very largely used for this purpose.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material & Engineering Trades

BUSINESS QUIET BUT FIRM—IRON AND STEEL—TIMBER AND BUILDING MATERIALS—ELECTRICAL GOODS—OILS AND COLOURS—UNION'S IMPORTS AND EXPORTS. NINE MONTHS TO SEPTEMBER 30, 1921—BRITISH TRADE RETURNS—EXPORT TRADE CREDITS—SHIPBUILDING. 1920-1921—INCREASING USE OF OIL FUEL—COAL REDUCTIONS AND PROSPECTS—METAL MARKET.

General.

In view of the continued drop in the gold premium (mid-week's quotation being 98s. 10d. per oz.), the result of this week's Conference between the Chamber of Mines and the Industrial Federation—fraught as it is with such vital consequences to the industry and to the miners—is eagerly awaited. All indications at the moment point to a further decline in the price of gold, and although that decline may not be a big one for some little time, it still adversely affects at least half-a-dozen of our low grade propositions. A further decline in the rate will automatically put *hors de combat* several others. It is, therefore, absolutely necessary for the mine workers, if they are going to save the position generally (in the case of a few of our mines it will probably be impossible to save them), to accept with a good grace the reforms proposed by the Chamber of Mines and bring about such a radical reduction in the cost of production as will enable us to work our low grade mines at a fair profit. It must not be forgotten that the Rand is not going to be kept alive and prosperous by the exploitation of such mines as the Government Areas, New Modders, Van Ryn Deeps, etc., but that its *raison d'être* exists and is bound up with the bulk of the mines, the majority of which are low or lower grade, but which under fair conditions of production should see many years of fairly profitable development—to the advantage of shareholders, the miners, the Rand in particular and South Africa generally. The obverse of the shield—the trade unions and workers refusing to recognise the gravity of the present position and accepting the sacrifices which will adequately meet the case—is unthinkable, and the community hopes and thinks that the crisis will be met and tided over by the ultimate acceptance by the workers of such conditions as will enable the industry to carry on operations in the face of the eventual return of the price of gold to normal. "Wait and see" was the phrase used by a famous statesman, and we do not doubt that the wait will be of short duration and that we shall eventually see a satisfactory solution to the present disturbing situation. Apart from the cost of wages, that of material is certainly helping the industry; there is at present no sign of advancement therein, but rather the other way about. A responsible merchant in conversation this week said that a radical reduction in workers wages, important as it undoubtedly is, is probably not the biggest factor in the present position. The proposed extra two hours to be got from the natives would, he thought, prove to be of even more importance. The industry employed, he estimated, about a quarter of a million of boys, and if we obtained from them an extra two hours' work per diem this would mean, approximately, the labour of an additional 60,000 boys per day—a very big point and one which, he thought, was not generally taken into account. Given this additional work on the part of the natives, lower wages of the white miners, and greater efficiency on the part of the latter, there was nothing, in his opinion, to prevent the industry looking with complacency to the resumption of the normal price of gold and to the profitable working of most of our mines for many years to come. This December month is never good for the mining community, and no large turnover is expected, but inquiries elicit the fact that, though things are quiet, prices and the tendency are firm, and provided satisfactory arrange-

ments are come to with the mine workers as regards wages and the introduction of the much-needed reforms underground, there are good prospects of improving business conditions after the New Year. The only feature in the course of a rather dull week has been a demand for and increase in the price of hammer handles. The market in turps is very firm, stocks being rather low; the price is about 12s. 6d. per imperial gallon. The announcement last week of a tentative agreement on the Irish question has been followed during the past few days by the conclusion at the Washington Conference of the Four-Power Agreement, which has been enthusiastically welcomed on all sides and is, without doubt, of far-reaching importance to the world's future. The Ferreira Deep tragedy has cast a gloom over the community, which otherwise, in the face of the important decisions arrived at oversea and the approaching holiday season, was inclined to be very cheerful and hopeful.

Iron and Steel.

As was expected, business has been rather quiet during the week, but prices have remained firm, and the general

tendency is good, auguring well for increased activity and a bigger volume of business early in the New Year. Some merchants report that in many lines they are now obtaining much better prices than previously, and that some commodities are becoming scarce, with an upward tendency as regards prices. This is not unexpected, as the labour troubles this year have certainly had a deterrent effect on extensive indenting on the part of merchants.

Engineering Shops.

Business in these is quiet just now, but after the holidays increased activity is generally anticipated.

Engineering Opinions.

In engineering circles, now that wages are likely to see a lower level, it is anticipated that the Railway may early next year launch out in regard to some schemes which have been pending for some time. An influential engineer said that in his opinion the time was now propitious for carrying out the Kalahari Desert reclamation scheme advocated by Professor Schwartz, which would give employment to thousands of unemployed men. The brains and everything requisite for the carrying out of such a scheme, which would probably alter the plan of Africa, are here within a radius of Johannesburg. Although numerous people are pouring cold water on the scheme, particularly the official class, no Government engineer being willing to consider any scheme in which he has no part himself, and does not want to push unduly anything in regard to which he would not reap the maximum praise, there seems to be nothing against Professor Schwartz's plan being put in execution. In times like these, or, in fact, at any time, the Government, he thought, need not fear that such a policy would not win popular approval, even if to some extent unsuccessful. The Government, if it went in for such a scheme, would find its popularity enhanced rather than decreased. As a start, an independent Commission, unfettered to the smallest extent by officialdom, should be appointed to consider all the available data. Other countries, such as the United States, would carry out such a scheme with the greatest of enthusiasm and in the shortest time, and here on the Rand we have the most stupendous industrial accomplishments, as evidenced by some of our huge mine installations. It only needs the technical and practical collaboration of the brains and unlimited navy labour of the country set in motion to carry such a scheme to completion, with probably the result that the whole climate over extended areas would be beneficially affected.

Latest British advices report some improvement in the iron and steel trades, as a result of the reduction in the Bank rate, which has to some extent relieved financial stringency. The tone is decidedly hopeful, but few large orders are being placed. The Scottish Steelmakers' Association have decided to decontrol prices of shipbuilding material and makers will fix their own minimum prices and return to a competitive basis as in the pre-war period. Pig-iron manufacturers are anxious for business, and are cutting prices so severely that French pig-iron competition has received a check, there being now only a few shillings difference per ton between Midland and French products. As the quality is similar buyers consider purchases of home material more advantageous at present. There is strong pressure for delivery, consumers' stocks being exhausted. The galvanised sheet trade is showing activity with increasing business.

A steel manufacturer in Sheffield has brought to the notice of the Chancellor of the Exchequer an extraordinary state of affairs obtaining there owing to the high rate of out-relief afforded by the Board of Guardians. His workmen, he says, are all finding it more remunerative to be unemployed than at work. He is able to employ his men for only two days per week, at a total wage of 45s. 9d. per week, while those of his workmen totally unemployed receive from the Board of Guardians 35s. 6d. per week, in addition to 15s. per week unemployment insurance, making a total of 50s. 6d., or 4s. 9d. per week more than those who are working for two days of the week. This high rate of outdoor relief, which is in several districts of London considerably higher still, is not unnaturally encouraging unemployment.

A great engineering feat is presently being carried out at St. Paul's Cathedral, in the direction of strengthening the huge fabric. While the south transept arch is being repaired the mighty dome has to be held up. This is being done by a steel structure weighing about 150 tons supporting about 4,000 tons, which is about an eighth of the total weight of the dome. The cost of the raw steel for the structure amounts to £7,000, and exceeds that of the actual repairs to be executed.

Owing to excessive dumping of goods from Germany, the Australian steelworks are threatening to close down, and

MAGNOLIA ANTIFRICTION METAL

"FLOWER" BRAND.

HAS THE LOWEST CO-EFFICIENT OF FRICTION.

KEEPS down the bill for lubricants, making BEARINGS smooth as glass and keeping them COOL under heaviest pressures and highest speeds.

Agents for South Africa: FRASER & CHALMERS, Ltd., Johannesburg,
Bulawayo and Salisbury

are demanding higher duties, combined with legislation against dumping. A motion has been introduced into the House of Representatives, Australia, favouring the resumption of trade with Germany.

In the United States iron and steel, according to latest reports, show an improvement in production and orders. Negotiations are in progress for extensive tonnage in steel rails. The price trend is more stabilised in many important industries, with a tendency to advance. Crude oil prices have had a sharp advance.

Timber and Building Materials.

Business has been fairly good during the past fortnight, people wishing to get as much building work done as possible before the holidays. The loss of the timber ship "Losna" recently has caused much inconvenience here. Stocks of timber on hand are not too plentiful, and fresh consignments, several of which are afloat, will be welcomed. The demand for timber in Britain is still very large, and an upward movement in the price may be witnessed within a few weeks.

Prices: 3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver board, 4½d.; floorings, 6½d. to 7d.; ceilings, 4½d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 7s. 6d. to 8s. 6d.; corrugated iron, 9½d. to 10½d. Furniture timber, Burnah teak, 18s. to 19s. 3d. per cube here for first quality, 15s. 6d. for second, at the coast; American oak and Japanese oak, 1s. 2d. to 1s. 3d. at the coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic ft. at mills; Honduras mahogany, 30s. per cubic ft.; American yellow pine, 1s. 9d. per ft. of 1 x 12 here; American pine shelving, 1s. to 1s. 3d. per ft. Prices for bricks remain about the same at 70s. for blue stock; 60s. mixed; £4 10s. to £5 for wire cuts, £5 for pressed per 1,000 at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag, 8 lb. bag 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Second-hand Iron and Timber.

There is no change to report in this section, the approaching holidays having the effect of causing business to come more or less to a standstill; no activity is looked for until after December is behind us. Iron is 6d. to 7d. and timber 9d. to 11d. Stocks are plentiful.

Electrical Goods.

Business, though fair, is not quite up to previous Christmas standards, and general expectations have so far been disappointed. A prominent dealer said people have not the heart this year to launch out; the Jews, he said, usually spend a lot of money on decoration for Christmas, but up to now there has been no activity in this respect, nothing but talk of strikes and bad times; people come in and ask about prices, and go out without buying. There is still a little business doing with the country, the exiguousness of which, in contrast with former times, is sometimes striking. For example, this week a large importer was commissioned to send out to Vereeniging per passenger train goods to the value of 7s. 3d., the expenses of which amounted to 3s. Prices of electrical wares remain much about the same, and no alterations are expected either upward or downward at the moment. In common with other industries, a quiet time is expected to rule until after the New Year.

Oils and Colours.

White lead in oil, small sizes, 10½d. lb., 39s. per 50 lb. kegs; English red lead, 10d. lb., 9d. lb. in 50 lb. kegs; dry white lead, 1s. 6d. lb.; linseed oils, raw or boiled, small bottle 1s. 6d. each, 7 lb. tins 8s. each, 4 imperial gallons 37s. 6d.; spirits of turpentine, small bottle 2s. each, 10s. 6d. per imperial gallon; turpentine substitute, 5s. 6d. per tin, each 5-6th imperial gallon; oxide in oil, 25s. to 45s. per 50 lbs.; oxide dry, 14s. 6d. per 100 lbs.; putty in 100 lb. drum bulk 4½d. lb., in bladders 6d. lb.; colours ground in oil, 42s. 6d. to 75s. per 50 lbs.; dry colours, 6d. to 10s. 6d. lb.; colours ground in water, 1s. to 2s. lb.; in turpentine, 3s. to 10s. 6d. lb.; in gold size, 3s. to 6s. lb.; ready mixed

paints, 1s. 6d. lb., 1s. 4d. per lb. in 70 lb. drums; roof paints, 11 lb. tin 16s. 6d., 70 lb. drum 75s.; varnishes, 27s. 6d. to 47s. 6d. per imperial gallon; pumice stone, 1s. 3d. lb.; bees wax, 1s. 3d. lb.; alum, 9d. lb.; creosote, 4s. 6d. per 5-6th imperial gallon; gum, 3s. 6d. to 8s. 6d. lb.; methylated spirits, 5s. 6d. per tin 5-6th imperial gallon, bottle, 1s.; resin, 8d. lb.; plaster of Paris, 24s. per 100 lbs.; caustic soda, 1s. 3d. lb.; seccotine, 1s. tube; coal tar, 17s. 6d. per 1 imperial gallons; Stockholm tar, 47s. 6d. per 5 imperial gallons; common glue 10d. lb., good quality 1s. 3d., finest Russian 1s. 6d.; gold leaf, English plain 3s. 9d. per book, transferred 4s. 3d. per book; aluminium leaf, plain 1s. 9d. per book, transferred 2s. per book.

Union's Imports and Exports for Nine Months to September 30, 1921.

Imports were £42,512,273 to the end of August, as compared with £68,756,850 for the corresponding period of 1920. Exports £40,403,083, compared with £62,595,317 for the eight months of 1920. For September month imports amounted to £5,750,000, or a little more than £500,000 more than August, and some £5,250,000 less than September last year. Exports exceed those of the corresponding month in 1920 by £200,000 and are over £1,000,000 in excess of August, 1921, figures. As a matter of fact, the month of September has produced the highest monthly export total so far this year. Imports for the nine months ended September are 28½ millions lower than the corresponding 1920 period, or 41 per cent. The principal decreases were in soft goods, including boots and shoes 56 per cent. less, food and drink 65 per cent. less, motor cars 77 per cent. less, iron and steel manufactures 46 per cent. less, wood and timber 48 per cent. less. Imports of manufactures and of mining machinery show increases of 52 and 75 per cent. respectively. The total machinery imports, excluding locomotives and agricultural machinery, were valued at £3,845,000, as compared with £2,874,000 in the 1920 period. Of our total requirements the United Kingdom has supplied 53.9 per cent., the Dominions 10.2 per cent., and foreign countries 35.9 per cent., as compared with 55.1, 12.1, and 32.8 per cent. respectively last year. The United States sent us goods to the value of 6½ millions, as against 11¼ millions during the first three quarters of last year, representing 16.6 and 16.4 respectively of our total imports. The United Kingdom took the bulk of our exports, 36¼ millions, or 78.4 per cent. of our total exports. Foreign countries took just under 7 millions, or 15 per cent., the United States being first with slightly under 2 millions, 4.2 per cent., and Germany a little over 1½ millions, 3.6 per cent. proportion of the total. The exports are nearly 21½ millions lower than in the 1920 period, the principal declines being in wool, diamonds, and hides and skins, of ten, eight, and three millions respectively. Food and drink exports show an improved value of a little over 2½ millions, maize, sugar and fruit shipments of 1¾ millions, £672,000 and £283,000 respectively.

GOVERNMENT EXAMINATIONS.

MINE MANAGERS' EXAMINATION

Total certificates (metal) granted to date 1921 -- 36
Secured by students of Messrs. Lucas & Wolfe -- 21
Balance for S.A. -- 15

British Trade Returns.

The British Board of Trade returns for November show imports to be £89,000,000, compared with £144,000,000 for November last year, and exports £63,000,000, compared with £118,000,000 for 1920. There is, however, an improvement of £5,000,000 in imports and £1,000,000 in exports compared with October month. Up to the end of June British exports had declined from 79 millions in January to 33 millions, but with returning confidence in July exports had progressively climbed to 62 millions in October. This notwithstanding, the decrease in exports and imports for the ten months was 115 millions, compared with the same period for 1920.

Possibilities of Export Trade Credits.

A well-known engineering authority with South African connections says that British and South African firms are neglecting their opportunities by not availing themselves of the possibilities afforded by the new policy of oversea export trade credits instituted by the Board of Trade. He says thereby one can be sure of a satisfactory deal and save delay in cross references and other guarantees without putting one's hand in one's pocket, but this *bona fide* chance is apparently not being utilised to the extent it deserves. In the meantime export coal to France, Italy and elsewhere is being financed under the scheme, and now that it is applicable to practically every country an extension of its sphere of operations may be looked for.

Empire Exhibition.

Three members representing the Executive Council of the British Empire Exhibition, 1923, are visiting the Dominions early next year, beginning with the Union of South Africa. They will visit practically every part of the Union and Rhodesia, and will consult the respective Governments with regard to a number of technical details. The Board of the British Trade Ship has decided to reduce the charges to exhibitors to one-third.

Shipbuilding, Year 1920-1921: Increasing Use of Oil Fuel.

In the annual report of Lloyd's Register of Shipping mention is made of the closing of many American yards, including Hog Island, opened during the War, which contained some fifty building slips side by side. In the United Kingdom and on the Continent many contracts for new tonnage were cancelled, and in recent months an unprecedented slump had occurred in new orders for tonnage. A noteworthy feature was the number of ships using oil fuel. The new tonnage classed during the year ended June last totalled 911 vessels, of 3,245,130 tons, or 25 per cent. less than in the preceding twelve months. Of these 911 vessels, 240, of 1,219,270 tons, were built in the United States and 439, of 1,163,590 tons, in the United Kingdom. The oil tankers of all types built to class during the year amounted to 112, of 614,464 tons, and 353 vessels, of 1,867,110 tons, or 58 per cent. of the total tonnage of new ships classed during the year, were fitted for burning oil

fuel. The report states that the figures given indicate that industrial conditions generally during and subsequent to the War have given a tremendous impetus to the supersession of oil over coal for the purpose of combustion. For the first time it is recorded that of the steamers built to class during the year those propelled by means of oil fuel exceeded those fitted with boilers for the use of coal.

Need for Lower Costs.

In a speech this week, Mr. Patrick Duncan, Minister of the Interior and of Education, touched upon the need of cutting costs and the necessity of co-operation between workers and employers. It was obvious to everybody, he said, that if South Africa was to maintain her industrial position costs must come down, and the problem could only be solved if all parties, workers, employers, and the Government realised that everyone has to give something and to regard his own interests as subsidiary to the interests of the whole. The present problem called not for strikes but for co-operation, and the time had arrived, he thought, for the workers to sit around a table and try to arrive at a solution in the interests of all. The Government should hold the balance between workers and employers and see that industrial conditions were brought down so as to allow the industry to take its proper place in the world. With regard to the necessity for the Government encouraging development, Mr. Duncan, in referring to the electrification of a section of the Union railway, said this was only a step towards a great industrial future and to developing the resources of the country.

Coal Reductions and Prospects.

Owing to scarcity of business and the keen competition from England, collieries have still further reduced their prices for export by 5s. During the past few days some large orders have been secured for export at 20s. f.a.s. But even with this reduced price there is not sufficient business to keep the collieries fully employed; many of them are working half-time only.

The General Manager of Railways has announced that as and from January 1st, 1922, reductions will be made in the rates for bunker coal of 4s. 6d. per 2,000 lbs. to Durban and Delagoa Bay, and 5s. 6d. per 2,000 lbs. to Cape ports.

The present price of second-grade Welsh coal f.o.b. Cardiff is 24s. per ton, having declined to the extent of 51s. per ton since December last, as compared with a 27s. 3d. per ton decrease in the price of Natal coal. Even after allowing for the reductions in rates operative from 1st November and 1st January next, the bunker coal rates will be higher than pre-war rates by 169 per cent. to Durban, 166 per cent. to Delagoa Bay, and 77 per cent. to Capetown. Had the Railway Administration not reduced the shipment coal rates as much as it did, the greater portion of the foreign coal trade would have been lost, meaning a serious position for the railways and unemployment at the collieries. South Africa must keep in line with the world's coal prices or lose the business.

The Luchenza-Nyasa Railway.

It is said that there is every probability of this projected railway being made a standard line in preference to laying it down as a narrow gauge line. Preparations, it is understood, are being made in London for the calling of tenders for the construction of the line.

S.A. Reserve Bank.

The statement of the S.A. Reserve Bank for the week ended December 10 showed the ratio of cash reserve to liabilities to the public as 74.9.

Consequent on the agreement arrived at over the Irish question, the tone of the London Stock Exchange improved during the week, a feature being the buying of Government securities.

African Wireless.

The official scheme for an Imperial wireless chain is progressing well. Material is now being despatched to Egypt for the Cairo station, which is the second link in the chain. The plans for the other overseas stations are also being pushed along, and should shortly be complete.

Reduction in Freights.

Homeward freights from New Zealand have, it is announced, been reduced by 11 to 25 per cent.

Metal Market.

Latest London quotations: Standard copper, £66 17s. 6d. cash, £67 17s. 6d. forward; electrolytic copper, £74 cash, £75 10s. forward; standard tin, £171 7s. 6d. cash, £173 2s. 6d. forward; foreign lead, £25 15s. cash, £25 2s. 6d. forward; quicksilver, £10 7s. 6d.; bar silver, 35½d. per oz., and bar gold, 98s. 10d. per oz.

The Municipality of Salisbury, Rhodesia, have, on the advice of their consulting engineers, Messrs. Clifford-Jones and Searle, of this town, accepted tenders for a new electrical generating plant for the Municipality, consisting of Dowson and Mason mixed draught producers, Browett Lindley four-cylinder vertical gas engines, and Electric Construction Co.'s three-phase alternators. The whole of this plant, together with the auxiliaries for same, has been ordered from Messrs. Hubert Davies and Co., of this town. The main switchgear has gone to Sykes and Co., and will be of the Reyrolle iron-clad type. The converting plant has gone to Messrs. Bruce Peebles and Co. for their well-known La Coer converter. The total cost of the new plant installed is in the neighbourhood of £50,000. The fuel used will be Wankie bituminous coal, and is guaranteed not to exceed two lbs. of coal per unit of electricity generated, as against 7½ lbs. of coal for the present steam plant. It is hoped to have the new plant installed and running within twelve months, and no doubt its progress will be watched with great interest by engineers, as it is the first electrical generating plant for town lighting burning bituminous coal in South Africa.

Coupons may be presented any day (except Saturday), and must be left four clear days for examination.

By Order of the Board,

THE CONSOLIDATED MINES SELECTION
COMPANY, LIMITED (England.),
Secretaries.

Per J. H. GRATTON.

Special Note.—The estimated profit for the year, including £100,000 transferred from Gold Reserve, amounts to £616,000. Of this total, £103,000 has been appropriated for Government Taxation, £228,500 for Capital Expenditure and Development Suspense and £255,000 for Dividends Nos. 19 and 20, each of 15 per cent., leaving a balance of £29,500 which, added to the unappropriated profit brought forward from last year, makes a total of £63,500 to be carried forward.

SPRINGS MINES, LIMITED.

(Incorporated in the Transvaal.)

DECLARATION OF DIVIDEND No. 6.

NOTICE IS HEREBY GIVEN that a Dividend of 7½% (Seven and one-half per centum), equal to 1s. 6d. (One Shilling and Sixpence) per share, has been declared by the Board of Directors for the half year ending the 31st December, 1921, which will be distributed free of Union Dividend Tax.

The Dividend will be payable on a date to be hereafter notified to all Shareholders registered in the Books of the Company at the close of business on the 31st December, 1921, and to holders of Coupon No. 6 attached to Share Warrants to Bearer.

The Transfer Registers of the Company will be closed from the 1st to the 7th January, 1922, both days inclusive.

Dividend Warrants will be issued to South African Registered Shareholders from the Head Office, Johannesburg, and to European Shareholders from the

London Office, 5 London Wall Buildings, Finsbury Circus, London E.C.2.

Holders of Share Warrants to Bearer are hereby informed that they will receive payment of a Dividend of 1s. 6d. (One Shilling and Sixpence) per share—on or after a date which will be notified later—on presentation of Coupon No. 6 at the Head Office, Johannesburg, or at the London Office, 5 London Wall Buildings, Finsbury Circus, London, E.C.2. Coupons may be presented any day (except Saturday), and must be left four clear days for examination.

Special Note.—The estimated profit for the year 1921 amounts to £407,000. Of this total, £59,000 has been appropriated for Government Taxation, £131,500 for Development Suspense and £197,500 for Dividends Nos. 5 and 6, each of 7½%, leaving a balance of £19,000 which, added to the unappropriated profit brought forward from last year, makes at total of £78,000 to be carried forward.

During the year the Consolidated Mines Selection Company, Limited, was called upon to subscribe for 60,000 shares at £3 per share to provide funds for capital expenditure in terms of the Government Lease Agreement.

Rand Selection Corporation, LIMITED

(Incorporated in the Transvaal.)

DECLARATION OF INTERIM DIVIDEND No. 44.

NOTICE IS HEREBY GIVEN that an Interim Dividend of 12½% (Twelve and one-half per centum), equal to 2s. 6d. (Two Shillings and Sixpence) per share, has been declared by the Board of Directors for the half year ending the 31st December, 1921, which will be distributed free of Union Dividend Tax.

The Dividend will be payable on a date to be hereafter notified to all Shareholders registered in the books of the Corporation at the close of business on the 31st December, 1921, and to holders of Coupon No. 44, attached to Share Warrants to Bearer.

The Transfer Registers of the Corporation will be closed from the 1st to the 7th January, 1922, both days inclusive.

Dividend Warrants will be issued to South African Registered Shareholders from the Head Office, Johannesburg, and to European Shareholders from the London Office, 5 London Wall Buildings, Finsbury Circus, London E.C. 2.

Holders of Share Warrants to Bearer are hereby informed that they will receive payment of an Interim Dividend of 2s. 6d. (Two Shillings and Sixpence), per share, on or after a date which will be notified later, on presentation of Coupon No. 44, at the Head Office of the Corporation, Johannesburg, or at the London Office, 5 London Wall Buildings, Finsbury Circus, London, E.C. 2. Coupons may be presented any day (except Saturday), and must be left four clear days for examination.

The Week's Meetings.

TRANSVAAL SILVER AND BASE METALS, LTD.

Report of the proceedings at the second ordinary general meeting of shareholders, held in the board room, General Mining Buildings, Johannesburg, on Thursday, the 8th day of December, 1921.

In the absence of the chairman of the company, Sir George Albu, in Europe, Mr. Leopold Albu presided.

The chairman, in moving the adoption of the report and balance sheet, said:

Gentlemen, — Owing to the absence of your chairman, Sir George Albu, whose stay in Europe, due to a combination of business and health reasons, has been prolonged to a date somewhat later than he intended on leaving South Africa, the duty of presiding at this meeting has devolved upon me.

In reviewing the affairs of your company, I will first deal with the financial side, as reflected by the accounts and the report of the directors.

The capital of the company, which at October 31, 1920, stood at £70,180, was increased during the past year to £300,000, firstly by the exercise of 69,740 options issued with the original shares, and secondly, in May last, by the creation of 160,080 new shares, which were issued in order to provide further funds for the carrying out of the programme of development and equipment of your property.

The total funds provided by the issue of shares, including premium on the issues which were made during the year under review, amount to £317,480. At October 31 last these had all been spent on the acquisition and development of your property, and your company owed besides sums amounting in all to £13,092, mainly for stores and machinery, which were paid for during November. The funds for this purpose was advanced by the General Mining and Finance Corporation, which will finance the immediate requirements of your company until such time as regular production will enable it to provide for all expenditure out of revenue. On present indications this should be the position in the near future; in fact, had it not so happened that the completion of the plant was delayed to some extent by the late arrival of some of the material, we should have reached the producing stage a few months ago, in which case the funds raised by capital issues would have been sufficient for the requirements of your company.

Company's Expenditure.

On the other side of the balance sheet you will notice that property has been increased by £8,608, consisting of £4,000 paid for the mining rights on Snyman's portion of the farm Dwarfontein, No. 145, in extent 518 morgen, and £4,608, being the purchase price of the freehold of Roets's portion of the same farm, in extent 361 morgen. The latter is the portion on which No. 1 shaft and the reduction plant are located. It will therefore be seen that we now hold the mineral rights of the whole of the ground on which Nos. 1 and 2 mines are situated. Then there is the expenditure on development, shaft sinking and equipment, which totalled at October 31 last £214,097 as against £48,384 to the same date in the previous year. This expenditure covers the bulk of the equipment necessary on the present scale of working, the only portion of any importance unfinished at October 31 being the concentration plant, the completion of which is definitely looked for within a few

weeks. Although the completion of the plant has unfortunately been somewhat delayed, it is a matter for congratulation that the expenditure incurred falls within the estimates, in some cases showing a small saving on the amounts originally voted.

Shipping of Bullion.

Sundry general expenses since the inception of the company, including preliminary expenses, transfer duty, interest, rentals under prospecting contracts, and general expenses at mine and head office, amount to £38,691, from which must be deducted £3,215, representing receipts from trial shipments of ore and discount on stores purchased.

The more liquid assets of the company consist chiefly of stores on hand £12,074, and cash £1,091, while payments in advance amount to £7,357. Of this total £4,390 represents cost of dumping ore on surface, which is available for treatment as soon as the concentration plant is ready, while £1,845 is accounted for by charges on the trial run of the desulphurising and smelting plant on hand-picked ore. The bullion resulting from this trial run was shipped to Europe about the middle of November, but the value—approximately £3,600—will only be taken in as revenue in the accounts for the current year.

Satisfactory arrangements have been made for the shipping of the bullion to Europe, and it is hoped that regular shipments will commence in January.

Development Policy.

Turning to the technical aspect of your company's affairs, you will see, on reference to the manager's report, that the past year has been devoted chiefly to carrying out a comprehensive development policy on the main lode of Dwarfontein, to opening up the old Brakfontein Mine, and to the erection of our new plant.

So far as development is concerned, the total footage accomplished was 8,761 feet on the main lode, and 157 feet on the Brakfontein lode, or 8,918 feet in all. Of this footage, 6,790 feet represents work actually on the lode, values being available for 6,470 feet.

On the main lode at No. 1 mine, for 4,410 feet sampled, payable values are indicated for 1,870 feet, or 42.4 per cent., which must be considered distinctly satisfactory, particularly so since the average intrinsic value of the ore exposed, at 12.4 per cent. lead and 11.4oz. silver is, at present prices, approximately 100s. per ton. At this mine, ore of high value already has been proved over a distance on the strike of some 1,800 feet, and to the dip of over 300 feet. Perhaps one of the most encouraging features of recent development is that at the third level, which is the deepest working of the mine, the lode instead of pinching out and becoming valueless, as some predicted, has actually widened to a marked extent, and is, perhaps, better defined and of higher value than at any other point under attack at the present time.

An Encouraging Strike.

Another gratifying feature of recent development is that the second level drive west, which for some months has been passing through an unpayable zone, corresponding to that met with on the first level recently, has encountered a wide lode carrying excellent values. I need hardly say that this strike, in the western end of the property, following on the good values met with to the dip on the third level, is most encouraging.

At No. 2 mine, the proportion of pay-

ability, viz., 15.7 per cent., has been low, due almost entirely to the fact that, east of the shaft, the lode has pinched, and, with the exception of an area between surface and the first level, is practically valueless. West of the shaft, however, development has shown more hopeful features, and the shoot of high grade ore exposed by T.W. 1 winze sunk from surface has given definite signs of opening out on the lower levels. Whether or not this is a sign of a new mine existing in depth, I am not yet in a position to say, but it is most encouraging to note that, within the past few weeks, the lode on the third level drive west has widened to from seven to nine feet, and that excellent values are shown over the full width. This drive is being extended in the direction of the third level drive east of No. 1 shaft, where, as already mentioned, similar phenomena are being encountered, and, although the faces of the two drives are approximately 2,500 feet apart, the prospects of a substantial body of high grade ore being opened up between the present working points, and also to the dip of the existing workings, are undoubtedly good.

Brakfontein Lode.

I need hardly remind you that the main lode is by no means the only mineral occurrence on your property. As you are aware, extensive prospecting work, carried out during the previous year, exposed the outcrops, over a very considerable distance, of other mineralised bodies, such as the Brakfontein, Boschpoort, East, Spies and Le Grange lodes. It is obviously impossible, with the means at our disposal, to commence shaft sinking and development at all these points at once and, apart from work on the main lode, we have, therefore, confined ourselves in the meantime to opening up the Brakfontein lode, leaving the other occurrences for future exploitation. On this lode the old shaft of the Brakfontein mine has been recovered, stripped to three compartments, and sunk to the second level, a total depth of some 220 feet. In order to carry out this work, the shaft was equipped with temporary hoisting, pumping and air compressing plants, and, within the last fortnight, the Tangye air compressor has been removed from No. 1 shaft, where it has been superseded by the new Ingersoll compressor, and, together with the necessary boiler plant, has been erected at Brakfontein with the object of carrying out a development programme on this lode. Following on the unwatering of the workings, the old first level of the mine was re-sampled and gave the following results over that portion of the lode which was exposed in the drive:—

Payable: 70 feet, having an average value of 12.0 per cent. lead and 12.6oz. silver over 35 inches.

Unpayable: 60 feet, having an average value of 0.8 per cent. lead and 0.9oz. silver over 42 inches.

The proportion of payability shown above, at nearly 54 per cent., must be considered satisfactory, and it is noteworthy that the samples were, of necessity, taken only over that portion of the lode which was exposed, and that further lode matter exists both in the hanging wall and footwall of the drive, the width at this point being considerable. Within the past few days the lode has been intersected by the second level station crosscut; values are not yet available, but it is evident from its appearance that they will be satisfactory. It is, of course, too early to make predictions regarding the future of the Brakfontein lode, but there are strong reasons for thinking that the conditions

which are found on the main lode, as regards continuation in depth, are equally likely to apply in the case of Brakfontein.

Ore Reserves.

Turning to the question of ore reserves, you will see from the Manager's report that the fully developed and payable ore consists of 103,115 tons, valued at 10.53 per cent. lead and 9.76oz. silver, the intrinsic value of which, at to-day's prices, is roughly 85s. 4d. per ton. This estimate takes no account of a further 21,838 tons of ore, which, pending completion of certain winze connections, it has been deemed advisable to exclude from the payable ore reserve, although, so far as we can judge, a considerable proportion will be payable. The estimate also excludes the ore developed at the Brakfontein Shaft, since, until ventilation arrangements have been made, this ore is not available for mining. Omitting the blocks of ground mentioned, the ore available for mining and treatment comprises not only the ore reserves, amounting, as already mentioned, to 103,115 tons, but also the ore in development dumps, which, on a conservative basis, is estimated at 4,000 tons, and in an old seconds dump, containing 2,700 tons. In all, therefore, the payable ore available for mining and treatment may be stated at, roughly, 110,000 tons. This quantity may appear somewhat small, after the colossal figures to which we are accustomed in the case of our gold mines; but, bearing in mind the high grade and relatively small capacity of the plant, it must be considered quite satisfactory.

Reduction Works Equipment.

In regard to the reduction works, you will remember that at our last meeting your chairman informed you that it had been arranged to erect the first unit of the plant with a capacity of 4,000 tons per month. Since that time the general outlook for the company led us to revise our original decision, and to proceed at once with the erection of a somewhat larger unit, capable of dealing with 7,500 tons per month. Estimates and plans were prepared accordingly, and after the plans had been submitted to Dr. Heberlein, who was advising us in a metallurgical capacity, the orders for those items which had to be obtained from overseas were placed forthwith.

The first portions of the plant to arrive were the desulphurising pots and small smelting furnace, erection of which was put in hand during May, the plant being completed and running by the middle of October, when a start was made on smelting hand-picked ore. Excellent results were obtained, the extraction being 95.3 per cent. for the lead and 96.6 per cent. for the silver.

Towards the beginning of August a start was made on the erection of the sorting and crushing station, which was completed early in November, and is now running satisfactorily.

The only outstanding portion of the reduction works viz., the concentration plant, was delayed to some extent by late deliveries, with the result that erection was started only towards the end of September last. This work has been pushed ahead with all possible speed, and is now practically completed, so that the full plant should be in operation within the next few weeks.

At the Producing Stage.

Bearing in mind the difficulties which have had to be faced, I feel you will agree with me that the time taken to bring the company to a producing stage is remarkably short, particularly in comparison with the five to seven years' interval to which we have grown accustomed in the case of our gold ventures, and I think that we can congratulate ourselves on the progress which has been made.

I have already said that the first unit of the reduction plant is designed for a monthly capacity of 7,500 tons of ore, and you have been informed previously that the smelting plant, when running to full capacity, is capable of turning out some 750 tons of bullion per month, worth at to-day's prices, approximately £31,000. This basis is adequate for our requirements at the present time, and in fact, an increase to the capacity would not be justified until the ore reserve had been considerably augmented. I need hardly point out, however, that if the satisfactory features of development, which recently have manifested themselves, are to be continuous, the question of additional plant is one which will have to be taken into account.

The present width of the lode in our deepest workings, viz., the third level east of No. 1 shaft and west of No. 2 shaft, is averaging about eight feet. At this width, each foot of driving develops, approximately, 90 tons of ore, which means that the insignificant distance of only 84 feet of payable driving per month is sufficient to develop ore equal to the capacity of the plant. I do not wish to enlarge upon this statement, neither do I desire to minimise the fact that the present width of the lode in these workings is unusually high. I merely mention it in passing to show the enormous importance to the mine of the recent developments, and to indicate the vast possibilities should the present favourable indications continue.

Well-Known Geologist.

With the object of leaving no stone unturned which may conduce to the ultimate success of the company, we have recently considered it advisable to engage the services of Mr. Theo. Kassner, a geologist of international repute, who will be remembered in this country for his researches into the geology of the Rand some years ago. In the interests of shareholders, we consider it inadvisable to publish Mr. Kassner's report in detail at the present time, and I propose, therefore, only to quote his final conclusions. In the summary at the end of his report, Mr. Kassner says: "The various indications on your holdings lead me to conclude that the whole mineralised zone is attached to an earth movement which forms a cleft line running many miles through the country. The fact that you have already established a considerable amount of argentiferous galena ore in true fissure veins proves that your property has numerous possibilities, and it tends to the assumption that we will locate much larger bodies of ore in depth than hitherto anticipated. This fact is corroborated by the development of the ore bodies in shafts Nos. 1 and 2, which I have illustrated in plan No. 2.

"The earth movements, which naturally have to be taken into account, should not give reason for disappointment. The whole trend of rich ore chimneys indicates especially that a greater concentration lies in a deeper zone between shafts Nos. 1 and 2. The aim of development for the supply of your plant should therefore be in an eastern direction from shaft No. 1, and in a western direction from shaft No. 2 in the deeper levels. The mode of occurrence which I have illustrated and described will repeat itself all along the line where the opening and shutting of the cleft is clearly noticeable in the larger scale.

"There is already an ore reserve of about 100,000 tons developed in your mine which should supply the plant for nearly one year. Although there is at present a considerable amount of unprofitable work to be done in order to pass the disturbed zone, there are at the same time promising regions for ore. There is, however, no doubt that you should

always have sufficient ore to feed your plant.

"I see no reason for supposing that the galena ore should abruptly come to an end, or that the fractured line should be the reason for limiting the mineral. On the contrary, it is proved that in your deepest levels in shaft No. 2, where you have had throughout disappointing results, the lode opens up exceptionally well in a width of about nine feet. Also in the fracture line in shaft No. 1 one notices that the galena is absent, but occurs in small patches repeatedly, which shows that it leads to the true fissure with payable ore again. In addition, there is the Brakfontein lode developing very favourably, and which is in reserve for expanding the undertaking. Further, there is Boschpoort, where the lodes are proved to be galena-bearing.

"I may conclude that your present undertaking in the area should prove lucrative to your company, and will no doubt become of great benefit to the country in general."

Well, gentlemen, there is but little more to add to the remarks I have already made. When your chairman addressed you at the last annual meeting the mine was still in the initial stages, and, although the outlook was most promising, the quantity of development work accomplished did not justify our regarding the property as more than a very favourable prospect. The past year's work, however, has put quite a different complexion on affairs, and although, even now, we have barely commenced to open up the undoubtedly vast resources of the company, there can be no doubt that what, a year ago, was a prospect, is now rapidly becoming a mine.

More than that I do not care to say at the present juncture. We do not know the extent of the ore deposits, and we cannot foretell the eventual possibilities of the concern until work has progressed even considerably beyond the present stage. It would be unwise, therefore, to make statements which, later on, might prove to be unduly optimistic, and so we propose to take the more desirable course of saying little and pushing development ahead with all possible speed. In the meantime you will see that we are by no means letting the grass grow under our feet in our handling of the company's affairs. We started out to found an industry in this country, and we are leaving nothing undone which will assist us in this direction. It was with this idea in view that we engaged Dr. Heberlein, one of the leading metallurgists in Europe, to give us expert advice regarding the lay-out and details of the plant. It was in furtherance of this idea that we more recently engaged Mr. Kassner to investigate our holdings from a geological point of view, and it is most encouraging to know that these gentlemen have even more than confirmed the opinion we hold regarding the enormous future possibilities of the company.

In conclusion, it gives me much pleasure to express, on behalf of your board, their appreciation of the services of your technical adviser, Mr. Errol Hay, and your manager, Mr. J. Ritchie, to whom, as well as to the officials and men on the mine, our thanks are due for the progress which has been made during the year under review.

Questions and Replies.

The chairman invited questions.

Mr. J. I. Benjamin asked the chairman whether he could give the shareholders any idea what the cost of producing bullion would be inclusive of realisation, shipping, transport and other charges. Mr. Benjamin also asked for further particulars of the item of £38,000 sundry expenditure.

The Chairman: Mr. Errol Hay will reply to the first question. As to the second one, I think you will find it fully explained in the balance sheet.

Mr. van Zyl: I notice from the balance sheet that the company owes money to the General Mining and Finance. Can you tell the meeting how the company is to be financed in the future.

Mr. Errol Hay, in replying to Mr. Benjamin's first question, that in regard to the question of costs reckoned per ton of bullion, it was of course impossible to say exactly what they would be, because that depended very largely on the grade of the ore they were going to expose in the future, but so far as they could tell from the ore exposed at present their cost per ton would be about £21. It meant that if lead fell to £21 the whole of the silver would still be profit, which was a very large item, the silver contents of a ton of bullion being worth about £20. In regard to the payability of ore reserves, a statement had been made that they were originally calculated at £15 per ton of lead. They had never been calculated at £15; the lowest they had ever been taken at was £22, and naturally the company calculated their limit of payability on the value of the metals at the time. It was exactly the same procedure that the General Mining and Finance adopted in regard to their gold mines; they stated that the ore reserves had been valued on the basis of gold at so many shillings per fine ounce. Obviously they could not take lead at £15 per ton when it was now £25. The payability was calculated, as it had always been, on the prices of metals at the present time. He did not think that shareholders need be afraid that if lead went down a few pounds a ton it would make any material difference to the result. There was rich ore and there was poor ore, but the quantity of ore that was on the margin of non-payability was almost negligible, so that the company's ore reserves would not be affected by any small drop in the price. In regard to working costs, the figure of £21 included realisation, shipment, transport, as well as the mine charges. The present value of bullion was somewhere in the neighbourhood of £11 per ton.

Mr. Farquharson, in replying to Mr. Benjamin's question about the item of £38,000 for sundry expenditure from the inception of the company till October 31, said he thought it was well known that the practice on the Rand always had been that the general administration of a mine during the construction stage was charged to general expenses. Naturally those expenses were fairly heavy and out of that £38,000 an amount of £21,000 was accounted for by the manager's salary and the office of the mine and head office expenditure, insurance, and all that sort of thing. The remainder was accounted for by transfer duty which the company paid on the properties and the renewals of the prospecting leases. Those were the main items. Then there was the fee they paid for bringing out the expert mentioned in the chairman's speech.

On the question of the financing of the company, the chairman quoted from his speech showing that the company was financed by the General Mining and Finance Corporation, and added that the Corporation would continue to finance the requirements of the company until such time as a regular production would enable it to provide for all expenditure out of revenue.

Upon it being put to the meeting the report and accounts were adopted and confirmed, as was likewise the appointment of Mr. Leopold Albu as a director of the company.

Mr. H. G. L. Panchaud was re-appointed auditor.

The meeting closed with a vote of thanks to the chairman.

THE TRANSVAAL AND DELAGOA BAY INVESTMENT CO., LTD.

The annual general meeting of share holders of the Transvaal and Delagoa Bay Investment Co., Ltd., was held on December 13th, 1921, Mr. S. C. Black presiding. In the course of his speech the Chairman said:—

The report and statement of accounts now submitted for your adoption show a very satisfactory result for the year under review. The Company's capital stands at £300,000, of which £22,500 are held in reserve. You will recollect that it was increased from £185,000 in November, and details are set forth in the report. The realised net profit after writing off £7,647 9s. 2d. for depreciation, and making provision for Government and other taxes amounts to £98,046 16s. 10d. We brought forward from last year £29,314 14s. 11d., making together £127,361 11s. 9d. Interim dividend No. 19 of 2s. per share absorbed £27,750, and the balance to credit of profit and loss account thus stands at £99,611 11s. 9d. The profit again shows improvement compared with that of the previous year.

The interim dividend of 10 per cent. was paid in June, and we recommend a final dividend of 15 per cent., making in all 25 per cent. free of Union of South Africa Dividend Tax, for the financial year. After payment of this final dividend, which will absorb £41,625, there remains a balance of £57,986 11s. 9d. to the credit of profit and loss account.

Improved Financial Position.

The financial position has been further improved which, I feel sure, is as gratifying to shareholders as it is to the Board. Cash and equivalent assets, less sundry creditors, total £196,295 17s. 3d. and shareholdings £95,058 12s. 2d. All shares are reckoned at or under cost, but in no case above the prices ruling at August 31, 1921.

The item "Contingent Liabilities," which last year figured at £42,723 14s. 8d., is now reduced to a sum of £1,794 13s. 4d. This is principally due to the South African Iron and Steel Corporation, Ltd., having decided to postpone the issue of further capital, in consequence of which our guarantee lapses.

The Transvaal and Delagoa Bay Collieries' output of 936,177 tons is somewhat less than for the preceding 12 months, but as we obtained a better price for overseas coal during a portion of the year, this is not of great consequence.

You will remember that at our last annual meeting, I had occasion to refer to the irritating delays in the delivery of certain machinery and plant. I am now glad to state that the new electrical power plant, as well as the electrical coal cutters, have arrived, were promptly erected, and are at work. The cost of same and other additions to permanent works, chiefly housing accommodation for our employes, amounted to £31,286 3s. 3d. We had previously made provision to the extent of £25,000 in respect of the electrical machinery and plant and, as is our custom, we have written off liberally for depreciation during the current year, so that the whole of our permanent works, shafts, plant, machinery, water service, locomotives, etc., now stand in the books at the very moderate sum of £51,177 6s. 4d.

The manager's report gives the usual information as to the state of the mine, works and plant generally.

A Promising Coal Mine.

The Douglas Colliery, whose report and balance sheet to June 30, 1921, are laid on the table, has had a satisfactory year, and its financial position is much improved. A colliery is being opened up and equipped to work its freehold farm

Leeuwpoot, in extent 4,147 acres, and eventually also some outlying portions of our farms Driefontein and Blesboklaagte. The new installation is designed for an output of 50,000 tons per month, machinery and plant are of the most modern type, and their efficiency should be second to none in South Africa. The first unit of its plant was finished at the end of October last, and the other two units will be completed by about the middle of March next. The company's funds should be sufficient to meet the cost of the installation, including the new railway line. The mine itself is most promising in every respect. It is well laid out for economical working, and the coal which was struck at no great depth is about 12 feet in thickness, and of high quality, and we shall have every facility for production on a large scale. Hitherto, it is true, we have not always been able to work the existing plant of the Transvaal and Delagoa Bay Collieries to its full capacity, owing to insufficient orders or scarcity and irregularity of railway trucks, but we are looking forward to, and preparing for, a time when the demand for good coal and the facilities for transport may increase.

The Transvaal Coal Owners' Association, of which both our collieries are members, continues to do efficient work, the total quantity of coal distributed by it for the 12 months ended June 30, 1921, being 6,943,463 tons. The association has been, and is, sparing no effort to extend the coal trade wherever possible, and it has earned a well-deserved reputation, especially in shipping circles, by supplying a sound stable quality and by prompt delivery at the different ports.

At the present moment the outlook for the 1922 export trade is none too favourable. We are faced with competition from many quarters, but we feel confident that, with lower shipping freights and sympathetic consideration on the part of the South African Railways in the matter of further reducing railway rates, both the export and bunker coal trade should not only be maintained, but may be expected to show expansion.

On October 29 last year our Government appointed a commission to inquire into and report upon the question of grading and pooling of South African coal intended for export or bunkering purposes, so that only coals of good quality shall be exported. Also the safeguarding of the supply of coal for local consumption, and for the use of the South African Government railways. The Transvaal Coal Owners' Association was represented on the commission by its chairman, Mr. John Roy, and I take this opportunity to acknowledge the excellent services he has rendered to the coal industry through his intimate knowledge of the trade.

Other Countries' Examples.

There is no change of importance, except the addition of some 966 acres of a freehold coal bearing farm, purchased during the past 12 months. Last year I touched on the subject of the large number of options acquired on farms for the purpose of prospecting. Many of these, on being tested, proved disappointing, but our operations have revealed information useful to a company such as ours, whose business it is to be well informed on the extent and value of the coal bearing areas of the Transvaal. The prospecting work in Upington district of the Cape Colony for pyrites is proceeding, but until more definite information, which we hope to possess shortly is available, the potentialities of this undertaking remain undetermined. At Delagoa Bay, which port I visited in August, I found signs of distinct progress in many directions. The authorities are fully alive to the necessity of many urgent undertakings to increase the business of the port, but it is

hardly surprising that they find that the present time is not propitious for incurring large public expenditure. However an important improvement, with regard to additional plant for loading of coal, is being carried out. The advantageous position and excellence of the harbour will no doubt in time find adequate recognition, and our company should eventually derive proper returns from its large and valuable land holding in and near the town of Delagoa Bay.

The board looks with satisfaction to the past history of this company. We declared our first dividend in 1903, and we have continued to pay regular dividends ever since. This year, for the first time, we departed from the practice of declaring only one dividend per annum, because directors felt that when ready money was scarce, shareholders would welcome the payment of an interim dividend.

With regard to the labour position generally, a great deal of unrest is fomented on the question of a reduction of wages from the high-water mark of a year ago. But the white workers of South Africa must recognise that they are not a privileged class above economic laws, and when all the world over the reduction of wages follows on the fall in the cost of living they too will be subject to the same cause and effect.

Before concluding, it is a pleasure to express the board's appreciation of the excellent services of your general manager of the collieries, Mr. James McPhee, M.Sc., M.E., who, in addition to his ordinary duties, has given a great deal of care and attention to the new construction work on the Transvaal and Delagoa Bay Collieries, as well as to the new plant and installation of the Douglas Colliery. We also tender our thanks to his staff and workmen generally, and to our office staffs, both in Johannesburg and in London.

PRETORIA SILVER LEAD.

Annual Meeting.

The annual general meeting of the Pretoria Silver Lead Co., Ltd., was held on Wednesday under the chairmanship of Mr. Chas. A. O. Bain, chairman of the company. There was a fairly large number of shareholders present, and from the Chairman's speech, in moving the adoption of the report and balance sheet, we make the following extracts:

We have been obliged, said Mr. Bain, to call this meeting in order to conform to the Company Law, but I should have been better pleased if it could have been held a month later. By that time I should have been able to disclose to you a more interesting position than I can do to-day, because the results of the development work now being carried on would by then be available; but the law compels us to hold a meeting before the end of this year, and so I shall tell you how the development work stands now and am glad to be able to meet you with cheering news. Before, however, dealing with the mining and technical side, I would just like to refer briefly to the

accounts. The issued capital of your company is a very small one, being only £80,030, and your property, which is paid for and upon which there is no liability of any kind, is a large one, consisting of about 1,600 acres. It is situated about three to four miles from Argent Station, adjoining the Transvaal Silver Company's property, and, in fact, being portion of the same farm. The mine is connected with the station by a road which has lately been a good deal improved by the Transvaal Silver Company and by ourselves, but which still leaves much to be desired in wet weather. In conclusion, regarding this item, one need only remark that you have a very large property and a very small capital.

The cash in hand amounts to £6,525 odd, and that, with other liquid assets, represents a sum of £9,473 15s. 4d. This sum of money, unless something unforeseen occurs, should enable us to sink our main shaft to the first level at 130 feet crosscut to our reef and carry on development for some distance. It is too early as yet to give any indication as to what steps will be taken to provide more money permanently, because our programme will depend on the values disclosed in development and the arrangements made for the disposal of our ore, but should more money be temporarily required, there will be no difficulty about having the sum required advanced. I mentioned just now that I had cheering news of our mine to give you. Mining work is always subject to fluctuations and delays and the work on your mine has been no exception to the general rule. We pushed ahead as fast as possible, and in spite of heavy rains and awful roads, and having to transport machinery and materials from all parts of the Transvaal during the rainy season, we were ready to start sinking, and in fact did start sinking, the main shaft at the end of March. Up to that time we had done what development we could on the lode itself by means of winzes, and the results amply confirmed our reports and assays as to the richness of the lode. When it was found necessary to stop sinking the winzes for the time being until the main shaft had reached the first level, we took out a quantity of ore from the lowest point touched in the winze and sent a ton of fair average value in to town to be smelted and tested.

The test was most satisfactory, and I will read you a few words from the report which was handed to us by the analyst, Mr. Rex Rundle, consulting metallurgist, who kindly helped us in this matter and took no end of trouble and great personal interest in the test.

Mr. Rundle says the furnace was a roughly-built blast furnace devoid of many conveniences which would have increased its efficiency.

The quantity of ore treated was 2,450 lbs., or nearly one ton and a quarter, and the assay value was 48 per cent. of lead and 6oz. of silver per short ton.

The ore was a mixture of galena and carbonate, and it proved to be very

nearly self fluxing. It ran down with great ease and the quality of lead recovered was excellent, being very soft.

The silver lead bullion recovered weighed 890lb., and contained 106oz. of silver per short ton.

This shows an extraction of 75 per cent. of lead and 83 per cent. of silver and it can safely be assured that on a large scale and under better conditions the lead recovery will be 90 per cent. with a much higher recovery of silver.

Mr. Rundle concludes by saying that he was greatly impressed with the purity of the ore and the ease with which it can be treated.

This, you will agree, is an extremely satisfactory statement, especially when it is known that the ore was smelted just as it came from the winze without sorting, crushing or concentrating, and also when taken in conjunction with the report just issued of the operations of our neighbours, the Transvaal Silver Mines, wherein we are informed that their No. 1 shaft is down 382 feet and their No. 2 shaft 314 feet, and in both they have got good values in depth. We can reasonably expect, therefore, that our lode and our values will be no worse.

I now come to the Brakfontein lode, upon which the Transvaal Silver Company has sunk their No. 3 shaft, which has been sunk down to the second level, which, Mr. Abu informed us at the meeting last week, was a depth of 220 feet, at a distance of from three to four hundred yards east of our present workings. Mr. Oliver King believes that this lode traverses our property from north to south, but no work has been done to confirm this opinion, and for the present we are quite satisfied to confine our attention to our main lode.

As to the future, we must be guided by our progress and by circumstances. If it is necessary, and if it will be profitable to extend our programme and find more money, do not fear that we shall not come to you and ask you to share with us the responsibility and profit of finding it.

That is all I have to say to you to-day. You have a large property and a rich property, and the unfortunate delay in opening it up does not in any way detract from its richness, and I feel confident that our development will now go steadily ahead.

Mr. Shimwell seconded the adoption. Mr. Bielski asked when the company would be turning out ore, and the Chairman replied that he expected the first development ore to be sent up in about six to eight weeks' time.

The report and balance sheet were then passed and the auditor re-elected, his fee being fixed at seventy guineas.

The Chairman said: Before closing the meeting I should like to read you the latest news which I have just received from the mine. The manager, Mr. Calder, says: "In my letter of the 10th instant I ventured the opinion that we had passed the danger zone, and now I go further. Our shaft troubles are behind us. We have now, as far as I can see, a clear run for sinking and development."

B.S.A. Annual.

We have received a copy of the 1921-22 edition of this publication. The Annual maintains the high standard it has set in former years—in fact, this year's publication is better than ever. There are informative articles on all phases of mining, commercial, and agricultural activities in Southern Africa, and the varied nature of the literary contents of the Annual can be judged from the fact that the contents include "Witchcraft in Angola," "Clubland on the Rand," and "The Turf in South Africa." There are many magnificent photographs and a beautiful coloured plate depicting Plettenberg Bay. The whole of the book—including the front cover and the supplement plate—was designed and

printed by the proprietors and printers, Messrs. Hortors Limited, at their works, 78 Bree Street, Capetown, and their efforts reveal a high standard of craftsmanship in the Union. The *B.S.A. Annual* makes the best of Christmas cards to send to friends overseas. It is altogether a magnificent production.

SWAZILAND TIN.

The following are the results of the operations of this company for the month of November, 1921:—Concentrate recovered, 18 tons; estimated net profit for the month, including credit adjustments on previous shipments (taking tin at £160 per ton), £91.

A MECHANICAL DIAMOND CUTTER & POLISHER.

Mr. S. Schonken, New York, is the inventor of a machine which, if all the advantages claimed for it are found to be correct, may revolutionise the world's diamond-cutting industry entirely.

The object of the invention is to ensure as nearly as possible mathematical accuracy in the polishing of the facets, irrespective of the size of the gem to be polished.

In the present-day method of polishing the facets in a diamond it has been found advantageous to divide the operatives into three groups: the "turners," who set the stones in the lead; the "eight-square" cutters; and the "brillanders," who make the eight star facets and sixteen girdle facets above the girdle and sixteen girdle facets below the girdle. It requires long practice and skill to bend the copper wire to give the "dop" the proper angle of inclination.

The "eight-square" operative can only handle four tongs at the same time, whilst the "brillander" can only work with one stone at a time, as, there being so little to take off, it would entail a risk of waste to attempt to make more than one facet at the same time.

The new invention requires no division of the facet work, nor does it require the services of a turner. The stone comes from the "bruter" already set and fastened in a pot; directions on a tag attached to the pot tell the polisher just what he has to do, and there is no possibility of polishing a facet too deep with the consequent loss of weight to the stone, for the reason that the arm holding the dop is stopped automatically when the facet is completed. The machine permits one operative to work with nine or more stones at one time and can cut equally well primary facets, star or girdle facets.

According to the *Journal of Industries*, persons who wish to get further information about this invention can consult all the documents concerning it at the Office of the Industries Division, 451 Market Street, Pretoria.

NATAL COAL RETURNS

The coal return for the Natal Province for October, 1921, is as follows:—

	Coal sold. Tons of 2,000 lbs.

**A REDUCTION IN PREMIUM
INSURANCE
AGAINST THE UNSEEN ENEMY
FRICTION.**

MODERN INSURANCE covers every hazard of industry except, perhaps, one
We suggest—

**A lubricating policy
for your entire plant.**

If you have correct lubrication for your cylinders, but not for your shaftings, you are only "half insured" against preventable friction—and expensive power loss.

If your turbines are correctly lubricated and other bearings incorrectly lubricated, you are suffering a serious "partial loss" of productive power—and production.

The reduction in the gold premium demands that working costs and losses shall be reduced in every direction.

Only by correct lubrication throughout your plant can you insure yourself against—

—loss of Fuel: correctly-lubricated machinery requires less fuel.

—loss of Power: preventable friction slows down machinery and invites costly repairs.

—loss of Production: the machine that slows down, slows down your output.

—less of Profit: after all, this is the important net loss.

The premium you pay for correct lubrication may be a few pence more per gallon of oil. This few pence a gallon represents not added expense but a marked saving in expense. It protects your machinery, while it speeds your output. Generally it reduces actual oil consumption.

If you are interested in insuring your plant against needless power losses, production losses, and profit losses, we suggest that you get in touch with our nearest branch.

Our lubricating recommendations are based upon—

- 1.—Experience gained through more than 50 years in manufacturing lubricating oils of highest quality.
- 2.—Our engineers' close contact with the efficient operation of all types of running equipment throughout the world.

Stocks are carried in principal towns throughout the country.

Lubricants

A grade for each type of service

New Era Consolidated, Ltd.

(Incorporated in the Transvaal.)

DECLARATION OF DIVIDEND No. 13.

NOTICE IS HEREBY GIVEN that a Dividend of Ten per centum (10%), equal to 6d. per share, has been declared by the Board of Directors for the year ending 31st December, 1921, which will be distributed free of Union Dividend Tax.

The Dividend will be payable on a date to be hereafter notified, to all Shareholders registered in the Books of the Company at the close of business on the 31st December, 1921.

The Transfer Registers of the Company will be closed from the 1st to the 7th January, 1922, both days inclusive.

Dividend Warrants will be issued to South African Registered Shareholders from the Head Office, Johannesburg, and to European Shareholders from the London Office, Primer's Hall, Austin Friars, London, E.C.2.

By Order of the Board,

THE CONSOLIDATED MINES SELECTION
COMPANY, LIMITED (England).

Per J. H. GRATTON.

How to Expand our Coal Trade.

See Article in this Issue.

The South African Mining & Engineering Journal

THE ONLY WEEKLY MINING PAPER IN THE CONTINENT OF AFRICA.

Established 1891.

Vol. XXXII., Part II

JOHANNESBURG, TRANSVAAL, SATURDAY, DECEMBER 24, 1921.

No. 1578

Will there be a Coal Strike?

Our Frontispiece this week depicts a scene at one of the T. and D.B. Collieries in the Witbank District. The T. and D.B. is one of the most successful and well managed coal mining concerns in the country and its affairs and those of another large and important colliery enterprise—the S.A. Coal Estates—are dealt with in a leading article appearing in this issue, which reviews the position of the coal trade generally. Interest in the collieries of the Union is intensified at the moment by the prospect of a coal strike. The ballot of the colliery employees on the proposed reduction of wages has resulted in an overwhelming majority against acceptance, and a further conference was held yesterday afternoon to consider the serious position that has arisen.

THE S. A. COAL ESTATES MEETING.

MR. JEPPE THROWS OUT A VALUABLE SUGGESTION.—THE COMPANY'S PITS; POSITION AND PROSPECTS—LARGE OUTPUT CAPACITY.

At the meeting of the S.A. Coal Estates (Witbank), Ltd., held in Johannesburg the other day, Mr. Julius Jeppe, who presided, made a lengthy and effective speech, in which he reviewed the present position and prospects not only of this company, but of the South African coal trade generally. In the course of his remarks, Mr. Jeppe stated that he would welcome some understanding with the Railway Administration which would in some way provide an automatic rise or fall of rates of carriage according to the condition of the market for bunker and export coal.

It seems to us that the point made by Mr. Jeppe in this respect is worthy of mature consideration by the Government, the Railways, the shipping interests, and the coal owners.

Our overseas coal trade is conditioned by many intricate and fluctuating factors wrapped up in the general outlook for world commerce. What is wanted is a close co-operation between producers, transporters and consumers, in other words, as between the collieries, the railways and the ships which purchase our coal. And this co-operation should be capable of the very finest adjustment, and, moreover, an adjustment which shall synchronise with fluctuating conditions. It may be that the coal trade of this country would function more successfully and would respond more readily to the incidence of present and future demand if the Government created an establishment or a Commissioner specially to watch and regulate this aspect of our coal trade.

We deal with this matter more fully in a leading article in this issue. This week, too, we reproduce Mr. Jeppe's speech in full, and hereunder we give some extracts from his statement in regard to the position at the mines.

Speaking at the S.A. Coal Estates meeting, Mr. Jeppe, in the course of his remarks, stated: At the Bailey pit the whole of the shaft sinking and the machinery, plant and equipment is now, after passing through a troubled area, proceeding normally and satisfactorily, the quality of the coal being excellent. The present output from the pit is about 15,000 tons a month, which can be increased to 40,000 tons, the plant being designed for that quantity, but in view of the restricted market at present, and it being naturally more economical to produce from two pits rather than three, it is intended to haul our allotment as soon as possible entirely from the Landau and Navigation pits, leaving the Bailey pit as a stand-by, and to meet any expansion in the demand which may occur. In pursuance of this policy, we have recently only been working the morning shift at the Bailey pit.

At the Navigation pit since the close of the period under review the shaft-sinking machinery plant and equipment has also been practically completed, and in a short time we will be able to haul sufficient coal from this pit and the Landau to complete our monthly allotment. The development in this pit is well advanced, and the quality of the coal is excellent, averaging, as it does, about 13 calorific value. During the sinking of the main shaft for this pit four seams of coal were passed through, three of them being of good thickness and quality, the other seam being of fair quality and promising to be a valuable asset later on, though it will be very many years before this seam will be called upon for production. Two of the four seams of coal are within 7 feet of each other, the lower being 6 feet wide and the upper 18 to 20 feet, of which the bottom 12 feet will be worked; the quality of both seams is the best, and it is intended to work these seams together, thus reducing costs.

There is nothing of special importance to remark about the Landau pit; it is in a perfectly satisfactory condition, producing coal of first-class quality, the machinery and plant is in good condition, and the general manager, by certain adjustments of the working conditions, has increased its capacity to more than it has ever produced before—namely, to about 43,000 tons per month.

The total output of saleable coal from the three pits for the month of November was 62,053 tons, but we are in a position to easily supply up to 120,000 tons a month from the present three pits at short notice and on the single shift basis.

The Landau Colliery of the S.A. Coal Estates: General View of Plant from West Side.

On your portion of the farm Volvekrans, 2,120 acres in extent, a series of boreholes was sunk with the object of proving the extent and value of the coal, with the result that in the main seam the lower nine or ten feet gave 12.84 calorific, and the upper seam, about 8 feet thick, averaged 12.5 calorific.

I may here state that with the exception of the area on Bosmanspruit, the whole of your properties are adjacent to each other, and the fact that Volvekrans is at the farthest end of your holdings, a considerable distance from your present pits, augurs well for the values in the intermediate area.

In addition to the present Landau pit situate on the farm Klipfontein, you have another area on the same farm sufficiently large to provide an entirely new pit. The area of coal-bearing ground in the new district is estimated at about 2,200 acres, containing a seam the lower 10 feet of which has been proved by numerous boreholes to contain coal possessing a calorific value between 12.5 and 13. The

greater portion of this area can be attacked by adits, while the rest would require shallow shafts, so that it could be worked at a low level of costs.

The total area of your holdings, freehold and leasehold, is just under 46,000 acres, of which about 38,000 acres may be taken as coal-bearing, and the coal which has been proved is of excellent quality. To estimate the life of your properties as a coal mining proposition is a difficult matter. There are several seams of coal on your properties, but for the purpose of considering your life only the two seams at present being worked will be taken into account. On this basis we find that in the areas commanded by your present pits it is estimated there are about 4,800 acres of coal-bearing ground of first-class quality, totalling about 70 million tons of marketable coal. This alone even at the maximum rate of production of 120,000 tons a month, will last for nearly 50 years.

Then, again, there is the area on Klipfontein adjoining the present Landau Colliery of 2,200 acres, and the other on Wolvekrans of 2,100 acres, both of which I have just referred to, in which the total can be put at about 52 million tons.

Landau Colliery: Trucks coming out of the Incline Shaft.

To this must be added your other properties which either from a certain amount of boring or from their situation in relation to proved areas may be considered as partially proved; these areas total about 21,500 acres, and on a conservative basis may be estimated to produce 164 million tons.

Lastly, there is the farm Bosmanspruit, in extent 7,059 acres, under practically the whole of which it is known that the coal measures extend, but in regard to which in the absence of any borings thereon or in the neighbourhood no estimate of tonnage can be made.

The total estimated tonnage contained in the company's properties, excluding Bosmanspruit, may be put at 280 to 300 million tons, and this is without taking into account the other seams which run through your property, and which will some day be of commercial value.

Van Ryn.

The chairman, at a meeting of the Van Ryn Gold Mines in London during the week, stated that as a set-off to the increased value of gold produced, the working costs were £92,866 more than last year, but the net result was satisfactory, inasmuch as the profits from mining were £112,855, an increase of £8,051 as compared with last year. The chairman declared the crux of the whole position lay in a gradual reduction of working costs, approximately in proportion to the decrease in the gold premium, but he was certain progress would be painfully slow. An interim dividend was declared of 1s., free of income tax.

Letters to the Editor.

THE FERREIRA DISASTER.

A Tribute from Kimberley.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—I have just received a copy of your esteemed journal (December 17th), and cannot express to you the feeling of national pride with which you must inspire not only myself, but the whole nation, in the few words which preface your account of the Ferreira Deep Disaster. Such men are real noblemen and the salt of the earth. The deep grief we all feel here and the heartfelt sympathy we have with those bereaved, you will, I know, understand.—Yours faithfully,

A. W. WEATHERBY.

Federal Hotel, Durban.

THE GENESIS OF THE DIAMOND.

To the Editor, *S.A. Mining and Engineering Journal*.

A correspondent writes:—

Carbon takes a peculiar place among the elements, not only because it forms the most important bricks in the edifice of animated nature, but nature in a gaseous state, like its relative, nitrogen. The cause of its abnormal appearance lies, perhaps, in the complicated construction of its molecule. Since the atoms of most of the other elements form extremely simple structural connections (the atoms of most gases form pairs in each molecule, the atoms of the other non-metals do not exceed eight to each molecule), the molecule of carbon possesses probably thousands of atoms, and resembles, in form, the cell of a bee's hive, being hexagonal. During synthetic construction more and more sides continually form and unite, under high temperatures, comb-like. Even during analysis and separation of molecules, one gets chemical unions, the bodies of which suggest the same inference. Look at the honey-stone, mellite, a yellow mineral existing in lignite measures, which was formed through gradual oxidation of the coal. Its chemical constitution suggests plainly the former cellular construction. This complicated structure is perhaps the cause why carbon is insoluble in common solvents, and the reason why it yielded later than other elements to liquefaction. Is the diamond related to the mellite?

ANSWERS TO CORRESPONDENTS.

"Z" (Federal Hotel Durban).—The stock first mentioned is purely speculative, but we regard it as an attractive gamble. Genuine indications have, we believe, been discovered. With regard to the second-named stock, we do not regard this with favour. It seems to us that a reconstruction of this company on terms not favourable to present shareholders is almost inevitable.

A Nigél Reconstruction?

A cryptic cable message from London states: "A poll of shareholders of the Nigél Gold Mining Company resulted in the acceptance of the scheme for the conversion of shares." We have had no public intimation on the subject from Maritzburg, but doubtless it will arrive in due course.

Mr. J. L. Siddall, Secretary of the Central Mining and Investment Corporation in London, who has been on a lengthy visit to South Africa, leaves on his return next week.

THE FERREIRA DISASTER.

RECOVERY OF BODIES—THE COUNTRY DEEPLY STIRRED—H.R.H.'s INTEREST AND SYMPATHY.

Just before going to press last week the curtain was rung down on the disaster at the Ferreira Deep by the death of Mr. Johnston, the last survivor of the catastrophe, after having been entombed in the mine for 90 hours. Since then the work of extricating the bodies has continued, but naturally enough, after there was no possibility of saving life, the dangerous work has proceeded with more caution.

It is impossible in a matter of this kind to bestow a full measure of praise for the boundless courage and devotion exhibited by the rescue gangs. In our last issue we stated the names of some of the leaders in the gallant but unsuccessful fight to save the lives of the entombed men....Many others—too numerous to mention—and natives as well as white men, worked splendidly day and night and at great personal risk. It is impossible to give the names of all these underground heroes, but we would here repeat what we briefly stated in our last issue, that the Rand is proud of these Ferreira miners, and mourns with the bereaved families the loss of life that this terrible disaster has entailed.

The bodies of two of the unfortunate mine-workers who met their death in the Ferreira Deep disaster were recovered on Sunday.

That of Christopher Jacobus C. van Tonder (reclaimer), who was killed outright when the collapse of rock occurred, was brought to the surface about daylight.

Mr. Ivor Rees, who superintended rescue operations at the Ferreira, with some of his men, who created a shaft sinking record at the Crown Mines.

The body of Mr. Johnston was extricated on Monday

The remains of Mr. Parau have also been recovered, and were interred on Tuesday. At the time of going to press Mr. Seeligsohn's body had not been found.

The body of Arthur Clark Logan (shaft timberman) was reached before noon. The remains were conveyed to the Government mortuary, and were interred on Monday.

The tragic story of Logan's sufferings, pinned down in the rock barrier, has been told. With Johnston (foreman timberman) he was found alive when the rescue party reached the position and were able to communicate. He was the first to die, after 77 hours' suffering, and Johnston lasted fifteen hours longer. It was impossible with the most heroic efforts to extricate either alive.

The late Mr. Johnston, a victim of the Ferreira Disaster.

Logan was always nearest the rescue parties, but was wedged down more badly than his comrade, and was pinned face downwards.

The workers below were at the beginning of the week still struggling with the position, and shifts were continuously going on as before, the unceasing objective being first to recover the remaining bodies of the five Europeans killed. Operations had perforce to be cautiously undertaken, but the utmost expedition was used under the dangerous circumstances.

The heart of the public was stirred profoundly by the tragedy at the Ferreira Deep, and numerous messages of sympathy and condolence have been received by the management of the mine. H.R.H. the Governor-General, in a letter to the mine, expressed his deep sorrow at the occurrence, and suggested that the management should transmit to the Government the names of men who heroically toiled in the effort to extricate the victims, in order that these gallant miners should have an opportunity of being recommended for the King Edward Medal—the miners' V.C. In expressing his sympathy with the relatives of the victims,

The Ferreira Deep Disaster.

An Anxious Crowd at the No. 2 Shaft Head.

Smoke Issuing from the Burning Shaft.

H.R.H. sent a donation of £10 towards any relief fund that might be initiated. "The Star" inaugurated a relief fund.

The Prime Minister, General Smuts, telegraphed, "Will you convey to those who have been bereaved through the recent disaster at the Ferreira Deep the most sincere sympathy of myself and colleagues. We greatly regret their sad loss. I wish to congratulate all who were concerned in the heroic attempts at rescue and deplore that their efforts were unavailing."

The Private Secretary to the Minister of Mines and Industries wired: "The Minister of Mines and Industries desires to express his very great regret at hearing of the serious occurrence at the Ferreira Deep, and his deepest sympathy with the relatives of the men who met their death in the heroic work of fighting the fire in the mine."

From the Mayor of Germiston the following wire was received: "The disaster has cast a gloom over Germiston. Kindly express heartfelt sympathy with the widows and relatives."

Similar expressions have been received from the Mine Managers' Association and many other public bodies and municipalities.

Rescue Party Preparing to Descend.

The Mayor of Krugersdorp wired: "On behalf of the citizens of Krugersdorp and Randfontein, I wish to tender you their very deepest sympathy in the awful tragedy which has swept five valuable lives away. We watched with pride and heartfelt sympathy the very gallant efforts of the employees on the property made to rescue life even at great risk to their own."

Mine Officials' Association.

The Underground Officials' Association wrote expressing sympathy with the management, officials and men of the mine, and conveyed to the relatives of the dead heroes the deep sorrow of the members in their bereavement, and recorded the pride of the members of the association in the courage and devotion of all when the call of danger came. "We share the disappointment of those who laboured so strenuously that their efforts were in vain," the letter added.

At the annual general meeting of the Mine Surface Officials' Association of South Africa, held in the Technical and Scientific Club, Fox Street, Johannesburg, on Saturday evening, on the motion of Mr. Wunch, seconded by Mr. J. H. Johnson, the meeting expressed its sympathy with those who suffered in the recent disaster at the Ferreira Deep.

New Views on Mineral Concentration.

VALUABLE PAPER BY MR. MORDEY.

A feature of the ordinary general meeting of the South African Institute of Electrical Engineers held last week was the paper on "Mineral Concentration by Alternating Currents," read by Mr. W. M. Mordey.

Mr. Mordey broke new ground in his paper, and pointed out that he was only dealing with the preliminary study of certain effects, and not with developed practical processes. The concentration of minerals by taking advantage of their magnetic properties is a subject well known to the student of ore dressing. Minerals have been arranged in groups of decreasing magnetic susceptibility known as strongly magnetic, feebly magnetic, non-magnetic, and diamagnetic. The last group is exceedingly small and unimportant, and so far no practical attempts have been made to utilise that property of magnetic repulsion in mineral concentration. However, there are several machines which are capable of concentrating minerals falling under the first three groups, in successful operation.

Mr. Mordey's work has opened up an entirely new phase of concentration in a magnetic field. He explained how it was possible, even in the case of highly magnetic materials, as well as with some feebly magnetic materials, which had hitherto resisted treatment by ordinary methods, to obtain a concentrating effect not by attraction but by repulsion. The repulsion was not what had hitherto been known as a "diamagnetic effect," which was a feeble repulsion that a magnet exerted on certain materials which were negatively magnetic, but a new effect which he termed "Hysteretic Repulsion." The effect was due to a utilisation of the property of magnetic hysteresis which was possessed in various degrees by magnetic substances. Mr. Mordey described his experiments, showing how, by making use of this effect, it was possible to cause even strongly magnetic materials to retreat from a strong magnetic field as if they were not magnetic. This was the result of placing these materials in the magnetic field set up by multiphase alternating current magnets. He explained how this principle might possibly be applied to practical purposes by causing such a field to act on a stream of pulp or slime running down a channel or launder. There were no moving parts at all in this apparatus except the stream itself, which, as a result of the invisible magnetic and brushing action, arrived at the end of the channel with the concentrates on the one side and the tailings on the other side of the stream.

THE MINING CONFERENCE.

MINES' POSITION—LOWER COST FACTOR—THE CHAMBER'S THREE PROPOSITIONS—LABOUR'S REPLY.

In the recent conference between the Prime Minister, the Chamber of Mines and the S.A. Industrial Federation, the Prime Minister only dealt with the alterations to the mining regulations, and suggested that other proposals should be discussed by the Chamber and the Unions concerned in the mining industry. The suggestion led up to the conference held on Thursday, the 15th, at the New Law Courts.

There were present Mr. H. O. Buckle (in the chair), Sir Evelyn A. Wallers, Sir William Dalrymple, Messrs. J. G. Lawn, P. M. Anderson, C. E. Farquharson, S. Evans, F. R. Lynch, D. Christopherson, A. French, H. R. Hill, F. G. A. Roberts, E. L. R. Kelsey, and J. Boyd, representing the Chamber of Mines.

Representing the South African Industrial Federation there were Messrs. J. Thompson (president), J. Geddes (acting secretary), W. Price, Geo. Brown, J. H. Hume, D. McIntosh, J. Robertson, E. S. Hendrikz, W. H. Smith, W. Butler, J. Hobson, J. G. van Gass, J. McDowall, M. Dunne, G. W. Johnston, G. W. Greener, A. Leask, H. Day, J. Lewis, J. Garbutt, E. R. Hippert, B. Davies, J. Pickavance, R. Temant, R. Oelfse, J. Naysmith, J. George and H. Silburn.

business, is carried on for profit, and if instead of making profit it makes losses, it must close. The mines which would close when gold returns to normal employ more than half the European employees of the mining industry, so that the gravity of the position cannot be exaggerated. There is only one alternative, and that is to change the present losses into profits by lowering the cost of production. Another aspect well worthy of consideration is the following: Gold mining is a very speculative business and not likely to attract capital unless the profits are very substantial—much larger than those obtainable from regular investments. In the development of new fields no one will put money into the scheme on the faith of a fluctuating premium. The mines must be able to produce gold at much less than 85s. per ounce in order to set the industry on a firm footing.

The three propositions made by the Chamber with the hope of bringing down working costs were sent to the Federation by letter, and are as follows: The first point brought forward was the alteration of the underground contract system. Under the present system the contractors' wages average £66 per month, as compared to £38 for the day's pay men who are doing practically the same work. The mines propose to substitute some form of "no cost" contract; that is to say, a contract where payment is made on fathomage (or footage), but where the cost of native labour and of stores is not included, though probably with a bonus for economy in those respects. The second point brought forward was the *status quo* agreement. The workers were asked to terminate that agreement. There are con-

This "graph" shows the trend of production, working costs and profits during recent years. The 1921 results are based on those secured for the first 10 months of the year.

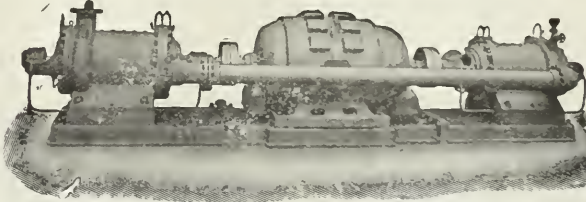

Mr. Buckle addressed the gathering, and briefly explained the gravity of the present situation. He pointed out that the price of gold in London on Tuesday was 98s. 2d. per ounce, and further that before it reaches the mines here, realisation charges and exchange have to be deducted, leaving about 96s. as the price per ounce received by the mines. This meant that the following mines would be working at a loss:—Durban Deep, E.R.P.M., Geldenhuis Deep, Luipaards Vlei, New Goch, Robinson, Roodepoort United and Wolhuter.

A return of the price to 85s. per ounce would mean that under present working conditions about 15 mines only would be working at a profit. Gold mining, as well as any other

siderable classes of unskilled or semi-skilled work which can be done by natives, and it is uneconomical to employ white men on such work. This does not involve any threat to the position of skilled craftsmen or efficient miners, but there is a considerable amount of European labour which is inefficient or redundant, and the mines cannot afford to carry that labour any longer.

The third point brought forward was the question of organisation. If those mines on the margin of unpayability are to pull through, the managements must have a free hand to utilise their labour complement to the best advantage. "The recognition of the principle of 'one man one job,'" said Mr. Buckle, "which you have so frequently pressed for, is impossible now. I cannot even try to indicate in what particular directions other reorganisations will work out; that must be left to individual mines. In fact, I may say that you will observe that, while point No. 2 is a definite one (we want you to definitely abandon the *status quo* agreement), the first and third points are a suggestion for an attitude of mind rather than for any particular agreement. The whole principle is that of 'no cost' I have already indicated. Similarly on the question of reorganisation: obviously the alterations will have to be suited to the circumstances of each particular mine. But what we do want to indicate is that, if these mines are to carry on, it can only be by the unions co-operating with the alterations the managements desire to make and not by obstructing them. In a great many cases I am sure the men themselves on the mines concerned will be prepared to stretch a good many points sooner than see the mine closed, and what we want is that the unions should encourage that attitude and not oppose it."

Mr. Buckle further pointed out that, firstly, all the mines would not be saved by these steps being taken, but some effort had to be made. Secondly, the figures which were given in the letter to the Federation of possible retrenchments were, of course, based on the assumption, or rather the hope, that all the existing mines could carry on. If they cannot, of course when any mine closes the whole of its employees go and have to be added to the number stated, and, thirdly, when a mine is absolutely on the edge of extinction, it is not possible to predict what may have

to be done. The management of such a mine will have, in conjunction with the men, simply to see what can be done to make it possible to carry on at all, and restrictions of every kind will have to go. This concluded a rough outline of the Chamber's proposals.

Mr. Hendrikz, on behalf of the Miners' Union, replied as follows: With reference to point 1, this was a matter for the rank and file, and they would be the deciding factor. In reference to point 2 he had no hesitation in saying that they could not agree to it. No. 3 was also a matter for the rank and file. He also stated that he had been instructed by his executive to open no discussion there. They wanted the Chamber of Mines to give full details of the three proposals.

Sir Evelyn Wallers said that the individual mines had to deal with matters of detail. However, the workmen's union further pressed for details, to which the chairman replied that it was not possible to supply more information. He had explained the difficulties, and he would again emphasise that in proposals Nos. 1 and 3 the Chamber was not asking for a definite pledge. After some further discussion the meeting was adjourned.

A further meeting was held on Tuesday, when the delegates sought to arrive at a definition of the word "official."

The Pretoria Mint.

Though it is contended in some quarters that the Pretoria Mint is now unnecessary, in view of the continued withdrawal of gold from circulation, good progress continues to be made with the construction work. It is pointed out that though gold coins may not be required for a year or more, the Mint will find plenty of work in coining silver. As the obnoxious ten shilling notes are soon to be withdrawn from circulation and replaced by silver, coinage of extra quantities of the latter will be required. Of course, the Mint should have been located beside the Rand Refinery at Germiston, and extra expenditure will be involved in transporting the refined gold and silver to Pretoria. The Government, however, is now too far committed in the matter to alter its plans, and the new Mint will soon be added to the important public institutions of Pretoria.

The Status of the Reduction Officer

By a Metallurgical Correspondent.

The position of the Reduction Officer is being encroached upon by the Mechanical Engineer to such an extent that it looks as if the Reduction Works Superintendent will become an office of the past. It has been advocated not once, but on several occasions, before the South African Association of Engineers, that all mechanical operations, both on the surface and in the mine, should be under the control of the Mechanical Engineer. In a measure this has already been accomplished, because in some cases we find all mechanical operations in the mine under the control of the Underground Engineer, who has his own staff. From all accounts this system is not a success. Here is an illustration. A breakdown occurs in the air supply at so and so level. The Mine Captain, failing to find the Underground Engineer, tells a fitter of the mishap and that operations on that level are suspended for want of air. Mr. Fitter informs the Mine Captain that he was told to finish so and so job, and the level remains held up. As the Mine Captain's duties are to win ore, all mechanical operations are subordinate to that end, and the Underground Engineer controlling the maintenance of ordinary wear and tear simply creates a position which may or may not work harmoniously with mining operations.

On some of the large mills the maintenance of the Butter's Filter Press is under the Mine Engineer, who appoints his own fitter. There is also the cyanide fitter, tube mill fitter, battery fitter and crusher fitter under the Engineer. From our experience and investigation of the system we are informed that it is not by any means an improvement over the older system of one superintendent. The old saying that two heads are better than one, though undoubtedly correct, does not work unless a friendly co-

operation exists. This is where the system fails, and the Reduction Officer is just in the position of the Mine Captain where operations are held up and he has no power to give an order. A diploma in the metallurgy of gold and 15 years' experience in reduction works practice ought to be sufficient for the Reduction Officer to control his own department. The Mechanical Engineer, however, through close organisation, is forging ahead, and with the possibility of the elimination of amalgamation plates for the recovery of gold and the abandonment of sand tanks, the Mechanical Engineer is striving to control this branch of engineering with a chemist to assist him in the cyanide treatment of the ore. Even the Consulting Metallurgists of the different groups are subordinate to the Mechanical Engineer, and what is wrong with the majority of the mills is that the Chief Metallurgist did not have enough of his own way in the design, and in that connection we might remind the Chamber of Mines that the majority of serious errors in reduction works design was not the work of the Metallurgist.

The Government, in being confronted with irregularities in reduction works practice or design in the past, did not hesitate to call in a metallurgist to make a report.

We admit that the qualification of the Mechanical Engineer is a high one, and with a period of underground service we see no reason why the laws should not be altered to enable the Mechanical Engineer to obtain a mine manager's certificate. We must not overlook the fact, however, that the Witwatersrand is a field for specialisation, and the mere holding of a mechanical engineer's certificate is no qualification to make a report either upon gas engines or cyanide works without the necessary experience.

DAVIS - MADE

JOHN DAVIS & SON (DERBY), LIMITED.

THE DAVIS SELF-RECORDING STEEL TUBE MERCURY THERMOMETER OR PYROMETER

with Flexible Connecting Tube. Supplied in nickel-plated iron case, 9in. outside diameter, 8in. chart; arranged for 12 or 24 hours' record as required. For super-heated steam this instrument is provided with an iron protection tube 6in. long and screwed $\frac{3}{4}$ in. gas, but extra length can be provided at an additional cost. The tube is filled with mercury or iron filings, but can only be used in a position where it can be suspended vertically, not horizontally or inverted. To specify Davis Thermometers is to take no risks.

The Week in the Sharemarket.

PRACTICALLY UNCHANGED DIVIDENDS SATISFACTORY POSITION POSSIBLY "WORSE BEFORE IT IS BETTER."

Prices at time of writing are practically unchanged when compared with those of last week, and business remains stagnant. In view of the approaching Christmas holidays—the market will be closed from Friday afternoon till Wednesday morning—there is little disposition to do business, and some bear covering on Friday is the most that can be expected. The dividend declarations are generally regarded as satisfactory, but they are offset by the falling price of gold—97s. 8d. at time of writing—and the attitude of Labour towards reduction of working costs. If the Labour people refuse to co-operate as desired in the interest of the majority, doubtless mines will have to close down, and this may convince them in regard to the sincerity of the repeated warnings they have received. One market authority opines that the position may be "worse before it is better," and what with threats of colliery strikes and the Rand miners' attitude towards essential economies, the New Year may usher in a period of some anxiety and unrest. However, the ultimate result cannot fail to make for good. Gedulds, on the news of a strike of reef going two ounces over 28 inches in the horizon of the No. 7 shaft, firmed up a little, and people say the mine may yet prove in its lower levels "the jewel-box of the Rand." Transvaal Silvers were also a firm feature on the news that the treatment plant was running most satisfactorily, and Pretoria Silvers firmed up in sympathy. Diamonds, Tins and Colliery shares remain becalmed awaiting a favourable wind. And on this peaceful note we may close, wishing the readers of this column a cheerful and contented Christmas.

Mining Men and Matters.

Mr. F. P. Memmel, the well-known Rhodesian geologist, is on a professional visit to the territory lately known as "German East."

* * *

His many old friends on the Rand will regret to hear of the death in England of Mr. Strangman Hancock, formerly manager of the Jumpers Deep.

* * *

His many friends on the Rand will regret to hear that Sir Henry Strakosch has been laid up for some days at a local nursing home with a slight touch of pleurisy.

Mines Department Changes.

It is notified that from and after January 1, 1922, the following areas will be included in the district under the supervision of the Inspectors of Mines as follows:—(1) Inspector of Mines, Pretoria: The magisterial districts of Zoutpansberg, Pietersburg, Waterberg, Rustenburg, Pretoria except the farm Zuurfontein No. 369, Middelburg, Lydenburg, Baberton, Carolina, Ermelo, Piet Retief, Wakkerstroom, Standerton, and Bethal. (2) Inspector of Mines, Germiston: The whole of Germiston magisterial district; farm Zeurfontein No. 369, Pretoria magisterial district; the whole of Boksburg magisterial district, except the farm Witpoortje No. 12; the southern portion of Heidelberg magisterial district, bounded on the north by and including the farms Rooikraal No. 257, Prosit No. 54, Rietvlei No. 186, Eendracht No. 267, Heidelberg town lands, Poortje No. 123, Groenfontein No. 122, Frischgewaagd No. 337, Hartebeestfontein No. 193, Modderbult No. 328, Leeuwbank No. 67, Klipdrift No. 179, Wildeals Kraal No. 147, Gegund No. 109; and Cornelia Colliery, Orange Free State. (3) Inspector of Mines, Brakpan: The whole of Benoni magisterial district, farm Witpoortje No. 12, Boksburg magisterial district; the whole of Springs magisterial district; and portion of Heidelberg magisterial district not included in Section 2 of this notice. (4) Inspector of Mines, Bloemfontein: Cornelia Colliery transferred to Germiston inspectorate.

Robins Five Pulley Troughing Idlers

HAVE MANY FUNDAMENTAL ADVANTAGES :

1. TOTAL ABSENCE OF SPILL OF ROCK OR OVERFLOW OF SURPLUS WATER.
2. MAXIMUM CAPACITY AT A GIVEN BELT SPEED.
3. TOTAL ABSENCE OF DAMAGE TO CONVEYOR BELT DURING ITS ENTIRE LIFE.
4. PERFECT TRAINING OF BELT TO RUN STRAIGHT, THUS ELIMINATING GUIDE IDLERS.
5. SUPPORT OF BELT IN CIRCULAR TROUGHED SHAPE, GIVING IT THE RIGIDITY OF A BEAM, ELIMINATING SAG BETWEEN IDLERS, AND REDUCING POWER CONSUMPTION.
6. DURABILITY FAR SURPASSING ORDINARY BALL-BEARING IDLERS.

EDITORIAL.

A MINING EPIC.

"There is a great and lofty virtue that we call courage, taking our name from the heart. It is the greatness of a great heart, the repose and confidence of a man whose soul is rested in truth and principle," wrote an Englishman of letters in bygone years.

The words "courage" and "endurance," and all the fine qualities they denote, have been much on the lips of the people of the Witwatersrand during the past few days. We have watched with anxiety, tempered by admiration, the grim battle for life that has been fought out in the bowels of the Rand, and the grief that fell upon the whole community when it was known that the rescue work had proved

unavailing has been softened by the knowledge that in these days of industrial discord and strife and bleeding the spirit of self-sacrifice is not dead on these goldfields.

It is a fine and inspiring definition of the quality of courage—that which we give at the commencement of this article. Yet heroism is such a volatile and elusive element that perhaps no mere words can define or befit it. There have been miners who have shirked the glamorous horrors of warfare just as there have been explorers who, having braved the ice-packs or the wild beasts and men of Equatoria, have, on return to civilisation, trembled before a simple audience.

And of this we are sure: that there are those who have won the Victoria Cross in cavalry charges who would have shuddered at the prospect of descending into the smoke and fire and treacherous ground at the Ferreira Deep last week.

We in no way wish to minimise the valour of those many deeds, thrice glorious, which were accomplished by soldiers and sailors in the Great War, but we do feel certain of this: that it requires a specially valorous form of courage to toil 2,000 feet in the depths of the earth in a mine that is on fire and in which many thousands of tons of rock are moving, with the object of succouring those who have been entombed. There is none of the glamour of battle in this work, and even modern warfare still has a certain measure of glamour. It is a perilous task, enacted without the saving grace of God's sunshine.

The victims of the Ferreira Deep disaster came by calamity in an endeavour to fight the flames and to rescue those who had been smitten in the first of the chapter of accidents. Their comrades, in turn, knowing the perils which beset them, slaved day and night under terrible and harrowing conditions to save the unfortunate men who were buried when the shaft station collapsed. It is regrettable that, although the rescuers were able to talk and in some way minister to two of the men, there was no survivor of this catastrophe. But whilst we grieve with the bereaved ones, we find a magnificent consolation in the fact that men, both white and black and of various nationalities, have not spared themselves in a great effort of self-sacrifice and devotion.

Miners, whether they be managers or the least remunerated of the day's pay men, all the world over have always shown a magnificent courage under the most difficult and hazardous of circumstances. In the present welter of harsh words and industrial turmoil we have perhaps come to overlook this trait in the character of those who go down into the deep in skips and cages. And we are all the more proud, therefore, of the knowledge which we have gained that this mundane Rand still has miners who possess "this great and lofty virtue that we call courage, taking our name from the heart."

THE UNION'S COAL TRADE.

Two of the principal collieries operating in the Witbank district, namely, the Transvaal and Delagoa Bay Investment Company, Ltd., and the S.A. Coal Estates have within the past few days held their meetings in Johannesburg, and some study of the chairmen's speeches at these meetings enables one fairly accurately to gauge the present state of the South African coal trade and its outlook. Both these companies are paying dividends. The Transvaal and Delagoa Bay, as we pointed out in our last issue, has been a steady and prolific distributor for the last 18 years, and the dividend of 10 per cent. paid out last June is now being supplemented by a 15 per cent. declaration, which brings its total for the year up to 25 per cent. free of Union dividend tax. The Coal Estates Company, which is an amalgamation of the old profit-earning companies, Anglo-French and Cassel, makes its initial declaration of 5 per cent., or 1s. per share.

These results have been secured by sound management rather than by any large expansion in the overseas market for South African coal, upon which the prosperity of our

collieries mainly depends. It is true that the South African coal trade has benefited by the misfortunes of the Motherland during the past year, and particularly from the protracted and calamitous coal strike in Great Britain of a few months ago. But competition is now making itself felt.

As Mr. S. C. Black remarked at the Transvaal and Delagoa Bay meeting, the outlook for the 1922 export trade at the present moment is none too favourable. The collieries are faced with competition from many quarters, but it is felt that, with lower shipping freights and sympathetic consideration on the part of the South African Railways in the matter of further reducing railway rates, both the export and bunker coal trade should not only be maintained, but may be expected to show expansion.

It is clear, too, that the coal miners must toe the line with the workers on other mining fields and bow their heads to the inevitable. The costs of working demand reduction on the coal mines just as much as they require reduction along the Reef. Our coal export trade recently has been falling off owing to the high figure of ocean freights; in fact, since the British mines are once more in vigorous and economical working there is danger of its being totally lost. And this may well have a big effect on the whole industrial aspect of the country unless something can be done to reduce the costs of production.

Obviously, if the export cannot be maintained, the relatively higher cost of a reduced production will compel the coal companies to raise their price to the South African consumer. Either there must be cheaper working or pits must be shut down; those excepted which the limited house trade requires.

The companies have proposed reductions which will still leave the coal miners higher wages than those presently earned on the gold mines; for instance, men drawing 30s. a shift are asked to come down to 25s., and those getting 26s. to 23s. 1d. The men are willing to forego only 2s. per shift, and hence the deadlock which may result in a strike.

At the S.A. Coal Estates meeting, Mr. Jeppe also ably stated the view of the collieries in regard to relations existing between the employer and the worker and made an eloquent plea for peaceful and cordial relations between both. It is clear that our collieries, like our gold mines, are facing difficult times, and if they are to weather the storm of the present depression it is essential that there shall be a whole-hearted effort on the part of all concerned—Government, Railways and employees, as well as the collieries themselves—to retain the present quota of the export and bunkering trades and to keep the coal trade in such a state of efficiency that when any expansion of the market offers our collieries shall be able to take full advantage of the opportunities that may offer.

And in this connection Mr. Jeppe, at the Coal Estates meeting, threw out a very valuable suggestion when he said that he would welcome some understanding with the Railway Administration which would in some way provide an automatic rise or fall of rates of carriage according to the condition of the market for bunker and export coal. Mr. Jeppe went on to explain the importance of such an arrangement. He said: "For instance, it often happens that when tendering for large contracts it is found impossible to quote a low enough price, as it would necessitate a small reduction in the rail rate, and this requires negotiation with the Railways, which means considerable delay and the possible loss of the contract to South Africa, whereas if a basis could be arrived at it would mean that the required reduction to obtain that contract, coupled, of course, with a reduction in the coal owner's profit, would be automatic."

This idea, we submit, is deserving of the most careful consideration. Our internal coal trade is comparatively small and the collieries of the country in large degree depend upon the sales of coal for export and bunkering purposes. This overseas trade is conditioned by a host of complex factors dependent on fluctuations in the volume and distribution of world commerce. The overseas demand is thus evanescent. A sharp demand for South African

coal at the ports will spring up with the rapidity of a breeze and as quickly vanish if the highly complex machinery of supply and transport is not instantly ready to satisfy the demand.

What is wanted, so it seems to us, is some organisation representative of producers, transporters, and purchasers capable of fine adjustment with a pre-arranged policy in regard to carriage rates and an ability to synchronise with the varying market conditions. The Government has already taken a hand in the regulation of our coal trade in respect of pooling and grading at the ports. And we therefore throw out the suggestion that it might be advantageous to all concerned to create an establishment or to appoint an official with plenary powers specially to watch and direct the export coal trade of the country. An office of this nature in touch with the High Commissioner and with trades representatives, with its finger on the pulse of commerce and working in co-operation with the coal exporters and the Railways might do much to avoid friction between suppliers and transporters, to minimise delays in the acceptance or refusal of contracts and to ensure that all the machinery necessary for the establishment and retention of the overseas coal trade was able to function in synchronisation with the incidence of demand.

THE GOLD FIELDS REPORT.

Features of the Gold Fields' report are dealt with in other parts of this issue, and we hope next week to print some extracts from the speech of the chairman, Lord Harris. As usual, the major portion of the reports printed consists of the annual review of the South African interests of the company by the manager in Johannesburg, Mr. Douglas Christopherson. As Mr. Christopherson's report is dated August 24, it necessarily confines itself to the general conditions of the year ended June 30 last. In that period, of course, the gold premium bulked largely, and though it is not easy to say anything that is both new and true on the subject, Mr. Christopherson does manage to put the known facts in a simple and impressive form. Speaking of the fluctuations of the premium, Mr. Christopherson says:—"It is generally expected that each year the fluctuations between maximum and minimum will show a flatter curve with a reducing average price. The effect of the complete disappearance of the gold premium may be instanced by stating that had the gold won by the industry for July, 1921, been calculated at Mint par value the profits for that month would have been reduced by £900,000 to a sum of £275,000, that is assuming there was no reduction in the July working costs. As still further evidence of what this would mean, of the 39 producing companies concerned 10 would have made losses varying from £5,000 and over per month, 10 would have made losses varying from £2,500 to £5,000 per month, 4 would have made losses varying from £1,000 to £2,500 per month, and only 15 mines would have earned profits." He concludes:—"It can, of course, be safely assumed that the very factors which contribute to the return of gold to Mint par value will operate to reduce the cost of production, so that the cost of stores will be further reduced and there will be a general all-round reduction in the price of commodities, and consequently in the cost of living, but even allowing for this there will remain the urgent need of effecting large economies in these and other directions, especially in the case of low-grade mines. There is no reason, if all will co-operate towards that end, why working costs should not be reduced, if not to the pre-War figure, to something approaching it."

Devoutly do we wish that as a result of the conversation now taking place Mr. Christopherson's hope will be realised. Mr. D. Wilkinson, the consulting engineer to the group, contributes a brief and severely business-like analysis of the position of the different subsidiaries as at June 30 last, and refrains from generalising on the mining situation. The new industrial and commercial interests of the "Gold Fields" are still too young to bear fruit, but with the expected revival of business next year they will doubtless justify their acquisition.

Notes & News.

The "Mining Journal" wishes its many readers and supporters the compliments of the season, and heartily reciprocates the various greetings which have been conveyed to us by the Chairman and Committee of the Witwatersrand Commercial Exchange, the Baldwin Locomotive Works, and other firms and individuals.

* * *

The Coronation Syndicate.

In another part of this issue will be found a full report of the speech made by Mr. Mackie Niven, the Acting Chairman of the Coronation Syndicate, at the annual meeting of that enterprise last week. The speech is of extraordinary interest, inasmuch as it reflects the activities of this undertaking, which is doing exploratory work of great value and importance on either extension of the Reef. That work must appeal to all who have imagination enough to see that there must be a future for the Far East and Far West extremities of the Rand. Work on the Far South-East property of the company has been suspended to allow of efforts being concentrated on the exploration of Luipaardsvlei, No. 10 on the West Rand; and it must be admitted that the results won by the Syndicate from drilling up to the present have been surprisingly good. It is satisfactory to note that the "J.C.I." people are co-operating with the Coronation Syndicate in their pioneer work, and that the technical resources of the House of Barnato are at the disposal of the Syndicate in its praiseworthy efforts to open up new areas of the Rand. The Acting Chairman's speech should have an excellent effect in London, where it is understood that efforts are now being made to raise further capital for the work of the Syndicate.

* * *

The Silver Market.

In view of the growing silver-lead industry of the Transvaal, the course of the silver market has become a matter of greatly increased interest for us. In connection with the silver situation the "Financial Times" recently had this to say: "To what extent speculation has been responsible for the recent advance in silver, which has just touched 43½ per ounce, the highest price since last December, it is difficult to say, but there have been certain changes in the world conditions during the last few months which have undoubtedly tended to favour a rise in the price of the metal, and it is only natural that these should have been taken advantage of. The recent buying is reported to have come mainly from China, but it is difficult to find any economic reason for an increase in the demand from that source, except that stocks have been allowed to run rather low and an effort is being made to re-establish them. There is no mystery with regard to the previous fall in silver. The two principal causes were admittedly the sudden setback in the trade prosperity of India, and indeed of the Far East generally, coupled with the amount of the metal released by the dilution—to use a polite term—of our own subsidiary coinage, together with that of most of the other principal European countries. These two causes have begun to lose their effect. Since July the trade balance has again turned in favour of India, while the quantity of silver released through the substitution of nickel in our own coinage has mainly been absorbed."

* * *

S.A. Alkali.

The finances of the S.A. Alkali, Ltd., reflect the protracted but successful fight that has been put up by the company to evolve a process for the exploitation of its property. Put briefly, the profit and loss account is in debit £71,551, to which a further sum for depreciation has yet to be added. Before any dividends can be paid, this accumulated debit will have to be paid off out of profits, with or without the aid of the share premium account. The S.A.T.M. & F. Corporation, together with "certain other parties," have agreed on terms to find up to £50,000 for the

further development of the deposit and the discharge of the company's present indebtedness. Parliamentary ratification is required of the new and extended lease which the Government is now prepared to grant the company, and thereafter, with the successful solution of the technical difficulties that have hindered progress, there promises to be a prosperous future for this new industry.

FIELD-MARSHAL HAIG'S PRAISE.

We take from the London *Times* of November 24 the following article entitled "Mining Engineers in Warfare—Earl Haig's Tribute."

Field-Marshal Earl Haig yesterday afternoon visited Cleveland House, City Road, the headquarters of the Institution of Mining Engineers and the Institution of Mining and Metallurgy, where he unveiled two memorials erected in honour of members of those associations who fell in the Great War.

The mining engineers' memorial is the work of Mr. Allan G. Wyon, and consists of a bronze figure of Remembrance blessing the memory of those whose names are inscribed on the neighbouring alabaster tablets. The figure stands on a bronze bracket, and is backed by marble onyx, on the lower part of which is a gold mosaic representing the rising sun.

The mining and metallurgy memorial, by Lieutenant-Colonel P. N. Nissen, a member of the Institution, consists of the Engineers firing a mine. The upper part of the pedestal is of malachite, and bears four bronze friezes showing various subjects connected with mining and mine warfare.

Earl Haig, who was accompanied by Lady Haig, said in reply to an address of welcome that the first reason which urged him to be present that day was that he was able to pay a personal tribute to a section of the many thousands of brave men who fought under his command in France, and paid the last and greatest sacrifice that love of King and country could demand from true and loyal citizens. The second and more particular reason was the opportunity of saying a few words of especial thanks to a body of men whose work in France seldom drew upon itself much notice or glory at the time, but was surpassed by none in the demand it made on the skill, courage, and resolution of the individual concerned, or the services it rendered to the Army as a whole.

Mighty Explosions.

One thought naturally of the Battle of Messines, and the mighty series of explosions which tore great gaps in the German lines on June 6, 1917, and gave the signal for one of the most successful of our attacks. That was the work to which the Institutions sent so many gallant men, and it was indeed a signal triumph of British mining in warfare. Yet few outside those who took part in that work, or benefited by its results, realised the immense amount of steady and persistent toil, in every circumstance of peril that might well appal the stoutest heart, which went to the preparation of that triumph. Few realised how vast and important to the safety of our troops was the work of our miners, little commented on by the Press, that went on day by day and year by year, all along the British front. There was no truce at any time in the warfare underground, no respite, only periods of redoubled activity, or more than common strain.

He was glad to thank them, not for himself only, but on behalf of the whole Army, for that body of gallant men.

The unveiling was followed by a solemn silence for one minute, after which Earl Haig pronounced the words, "Their name liveth for evermore," and "The Last Post" and the "Reveille" were sounded by trumpeters of the Honourable Artillery Company.

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

Gold Fields Finances.

The detailed annual report of the Consolidated Goldfields, to hand by last mail, supplements the cabled figures given in a recent issue. The revenue of the operating subsidiary—the New Consolidated Goldfields—is about £94,000 less than that of 1919-20, but nearly half a million has to be written off for depreciation, which absorbs not only the earnings, but leaves a debit balance of £111,200 to be carried forward. The financial position, however, is one of exceptional strength. Cash and short loans and debtors total £617,800, and advances and mortgages £295,300. After deducting amounts due to sundry creditors, a surplus of £653,200 is shown. This sound position is obviously due to the realisation of War Bonds and similar securities. Notable changes in the investment list comprise the reduction in V.F.P. preference shares, and the acquisition of shares in South African industrial undertakings, which, the directors opine, will lay "the foundation for profitable future business." The list of investments includes the following of interest in this country:—

African Agricultural Estates 10 per cent. debts.	£53,207
African Land and Investment ord.	83,320
African Land and Investment 6 per cent. cum. pref.	20,770
*African Land and Investment 5 per cent. debts.	28,100
Albany Brick Tile and Potteries	19,950
Allen, Waack & Shepherd 10 per cent. part. pref.	12,780
Allen, Waack & Shepherd ord.	19,170
*Anglo-American Corporation of South Africa ...	16,500
Consolidated East Coast Engineers	48,750
*Crown Mines, Ltd. (10s.)	5,372
*De Beers Consolidated Mines (£2 10s.) def. shares	6,000
*Elandsfontein Estate	11,753
*Gold Fields Rhodesian Development (10s.) ...	531,571
Gold Mines Investment Co.	34,084
*Government Gold Mining Areas (Modderfontein) Cons.	74,000
*Johnson, Matthey and Co. (£5) ord.	10,000
Jupiter Gold Mining Co. (in liquidation) ...	160,604
Knights Deep (in liquidation)	110,946
National Mining Corporation (10s. paid) ...	50,000
*New Modderfontein (10s.)	83,648
*Nourse Mines	19,865
*Robinson Deep " " cum. pref. (1s.) ...	219,934
Robinson Deep " B " ord.	349,122
*Simmer and Jack Proprietary	841,508
*Simmer Deep, Ltd. (in liquidation), 7 per cent. prior lien debts. (75 per cent. paid) ...	58,875
*Simmer Deep, Ltd. (in liquidation), 5½ per cent. first debts.	141,700
*Sub Nigel	170,264
*Van Ryn Deep	27,500
*Victoria Falls and Transvaal Power 6 per cent. cum. pref.	53,252

* Dividend payers or interest bearing.

A company known as Harrismith Townlands Development Syndicate, Ltd., has been registered, with a capital of £7,600. The office is at 158-160, Exploration Buildings.

Geduld Options: A Reminder.

An official notice has been issued warning holders of Geduld Options that the latter expire on December 31 at noon. The options, if will be recollected, give the right to take up shares at 40s. The dividend recently declared will be payable on all shares issued for options exercised.

Gold Fields Rhodesian.

The report of the Gold Fields Rhodesian Development Co., Ltd., for the year ended May 31 last shows a profit of about £112,000, against nearly £128,000 for 1919-20, not, however, a serious falling off allowing for recent difficult times for finance concerns. After again making up the total dividend for the year to 1s. per share there will be £99,052 to be carried forward, as compared with £111,966 brought in. The net liquid assets amount to nearly £270,000, against the issued capital of £1,257,110 in 10s. shares, so that the company is in an exceptionally strong position to take advantage of any attractive new business which may offer later on. The investments are entered in the balance-sheet at a book cost of £814,965, against £674,647 a year ago.

**EXPLOSIVES
FUSE
DETONATORS
ACIDS
CHEMICAL PRODUCTS
SHEEP DIP
CATTLE DIP
ETC., ETC.**

CAPE EXPLOSIVES WORKS, Ltd.,

P.O. DYNAMITE FACTORY,
SOMERSET WEST, C.P.

Gaika G.M. Company.

As the result of the treatment of a somewhat larger tonnage of ore at a lower average cost, the Gaika Gold Mining Co., Ltd., is able to report a profit for the year ended June 30 last of £31,243, against £28,396 for 1919-20. The directors recommend a final dividend and bonus of together 1s. 6d. per share, making a total for the past financial year of 2s. 6d., as compared with 1s. 6d. for its predecessor. There will be £6,921 to be carried forward, against £9,865 brought in. The ore reserves at June 30, after including some blocks of low-grade but payable ore are put at 9,000 tons higher than a year previously, namely, 73,000 tons, averaging 13·2 dwts. per ton.

Ex-Enemy Shares.

The Custodian of Enemy Property for the Union has returned to South Africa. The full text of the official statement issued in mail week on the subject of enemy shares is now to hand. It states that a complete agreement has been come to on all points between the Public Trustee in England and the Union Custodian in connection with the allocation of enemy shares in companies working in South Africa and all other outstanding matters. Further, a scheme of procedure has been agreed upon with regard to the disposal of enemy shares in the mining companies. Under this arrangement all enemy shares in a company will be offered in one block, and, in the first instance, to the groups and companies respectively concerned. Negotiations with regard to such sales in connection with companies incorporated in England will be carried on by the Public Trustee, and with regard to shares in companies incorporated in South Africa by the Custodian for the Union. The Public Trustee's Department is now preparing certain statistics, which are expected to be ready for despatch to South Africa by the end of December, and as soon as they arrive negotiations for the disposal of the whole of the enemy holdings will be commenced, and it is hoped that these negotiations may be satisfactorily completed by the end of January.

RAND GOLD MINING DIVIDENDS TO DATE.

It is too early to attempt to compile a complete list of the dividends declared for the second half of the year, but mention may be made of some of the more notable declarations already announced. The Brakpan distribution is 15 per cent., or 3s. per share, which compares with 30 per cent. for the corresponding half of last year. City Deep pays 17½ per cent., as compared with 20 per cent. for the same half of last year. Consolidated Main Reef pays 5 per cent., against 8½ for the second half of last year. Crown Mines pay 22½ per cent., against 50 per cent. for the same half last year. Consolidated Langlaagte is 7½, or 1s. 6d. per share, which is at the same rate as for the same half of 1920. Government G.M. Areas dividend is 30 per cent. or 6s. per share, which is also the same as that declared this time last year. Geduld pays 10 per cent., or 2s. per share, as this time last year. Langlaagte Estate pays 7½ per cent., as last year. Meyer and Charlton pays 50 per cent., against 70 per cent. for the December half of last year. Modder Deep pays 85 per cent., or 4s. 3d. per share, as last year. Modder B pays 55 per cent., against 50 per cent. for the December half of 1920. New Modder pays 50 per cent., against 57½ for the corresponding half of last year. Nourse Mines pay 3¼ per cent., against 5 per cent. for the second half of 1920. New Kleinfontein, which last year at this time paid 5 per cent. after a silence of three years, again makes a 5 per cent. distribution. New Primrose pays 7½, against 5 per cent. last year. New Unified distributes the same amount as last year, viz., 5 per cent., or 1s. per share. Springs Mines pay 7½, or 1s. 6d. per share, against 15 per cent. for the corresponding half of last year. Robinson pays 1 per cent., which is exactly half of the distribution made this time last year. Rose Deep pays 7½ per cent., against 17½ per cent. for the second half of 1920, and Village Deep pays 6¼ per cent., against 7½ for the same half of last year. Van Ryn pays 5 per cent. for the half-year, against 7½ per cent. for the same half of last year. "Knights" pay 15 per cent., the same as last year, and Van Ryn Deep pays

30 per cent., or 6s. per share, against 40 per cent. last year. The Simmer and Jack 2½ per cent. (the same as last year) and the Sub-Nigel 5 per cent. (as against 7½ per cent.) complete the list to date.

TRADE ENQUIRIES.

With a view to being of service to its advertisers and readers, *The South African Mining and Engineering Journal* publishes the following notices, which have been furnished by the American Trade Commissioner, Mr. P. J. Stevenson. Firms that are interested in any of these matters should communicate with Mr. Stevenson either by mail (P.O. Box 6989, Johannesburg) or in person at 42, Standard Bank Chambers, when further particulars will be made available to inquirers:—

A firm manufacturing sheet metal products, including corrugated and galvanised sheets, roofing, siding, specialties and similar lines, is interested in securing representatives in the principal cities of the Union. Their output is described as being of high quality.

A firm that manufactures a special metal for roofing and walls wishes to secure selling agents in South Africa. This product has three coatings over a core of specially annealed steel, asphalt, asbestos, and waterproofing. It is used for the same general purposes as corrugated iron, and is especially adaptable for the coal and chemical industries and in the railway field.

A manufacturer of good quality ash shovel handles wants to get in touch with a responsible broker with a view to opening up business in long shovel and "D" handles.

A company that are large producers of tubular goods, boiler and ship plates, well supplies and plumbers tools wishes to secure a firm to act as selling agents to importers of these lines. While consideration will be given to firms that import material for stock and conduct a wholesale business, preference will be given to a firm not engaged in a wholesale way.

GEDULD PROPRIETARY MINES, LTD.

(Registered under the Limited Liability Laws of the Transvaal.)

**NOTICE TO HOLDERS OF
OPTION CERTIFICATES.**

Holders of the above Option Certificates giving the right to subscribe for £1 (One Pound) shares of the Company at the price of £2 (Two Pounds) per share, are hereby reminded that the Option will expire at 12 o'clock noon on the 31st instant, after which time the Option Certificates become valueless.

Application Forms which must be completed in connection with the exercise of these Options can be obtained at the Head Office of the Company.

The recent dividend declared will be payable on shares issued for Options exercised at or before 12 o'clock noon on the 31st instant.

By order of the Board.

ENGINEERING SECTION.

CHRISTOPHER AND SHILLITO, LIMITED.

GENERAL ENGINEERS.—IRON AND BRASS FOUNDERS.—STEEL STRUCTURE CONTRACTORS.

The engineering business known as Christopher and Shillito, Limited, was purchased from the United Engineering Company in 1915. In November, 1918, the business was acquired by H. Shillito, H. Morrison and T. P. Smith. The works are situated at the corner of Fifth and Miller Streets, New Doornfontein, on the north side of the Johannesburg-Germiston railway. They are situated over 21 stands, and are housed in substantial buildings of brick, steel and galvanised iron construction. The works provide employment for over 80 Europeans and about 150 natives. The works have their own native compound.

The nature of the work undertaken by Christopher and Shillito, Ltd., consists of all classes of general engineering and structural work. Roof trusses, mine headgears, and bridge construction are done. Foundry work of all descriptions in both cast iron and brass is also undertaken.

Raw Materials.

The works generate their own electric power and are thus in the fortunate position of enjoying a constant and reliable source of power. The raw materials used here consist of imported hematite pig iron, and girders, beams, and angle

80-ton Ammonia Compressor installed at Newtown in 1919. Designed, manufactured, and erected by Messrs. Christopher and Shillito.

irons of both local and overseas manufacture. The coke used is supplied by the Vryheid Coke Company and is most favourably reported upon in every respect. The quantity of sulphur present in this coke has never been found to be in excess of .7 per cent. An interesting point mentioned by the management on the removal of sulphur from the coke

is it possible that some or other of these forms of sulphur present are rendered leachable, and when coke is exposed to the action of rain the sulphur is to a certain extent removed? Again, does the residual sulphur in the coke oxidise while the coke is exposed to the action of rain water and air, and form soluble compounds which are removed by the water?

(1) Structure manufactured and erected by C. and S., Ltd. (2) Ore roaster of 2,500 tons. (3) Part of the stock and erection yard of the Steel Construction Department, the main works being on the other side of the trees on the left.

was the following: He stated that if the coke is exposed to the action of rain that the quantity of sulphur was diminished. This point should provide some interesting discussion, and might possibly be the source of research. The sulphur in coal has been determined to exist in two forms, namely, organic sulphur and mineral sulphur. When in the latter form it has been found present as iron sulphide as well as calcium sulphate. During the process of coking

Departments.

These works are fully equipped in the following departments: Designing the structures, pattern making, founding, forging, fitting, and steel construction working.

The importance of designing need hardly be dwelt upon more especially so in certain types of the work con-

ducted here. For instance, in the design of roof trusses and super-structures reliability and safety are primary considerations, and the work has to be conducted with the greatest of care.

Pattern making is an operation whose importance cannot be lost sight of and which always precedes the operations conducted in the foundry. In this department castings in both iron and brass are executed, and for the purpose of melting these metals the foundry has been provided with three cupolas and one brass furnace. Castings weighing anything up to 12 tons can be handled in these works.

Forging is conducted in the smith shop, and in order to facilitate the working of this department another steam hammer has recently been installed. A small set of rolls for rolling out small and light bars has just been added to the equipment.

In the machine shop the firm have added several new lathes, and several other improvements which they have found necessary. Their equipment is thus of the most modern, and fully capable of coping with all the work demanded of it. Other items of interest in the machine equipment of these works are: A Ryerson high-speed friction saw which is capable of cutting through a 12 in. by 6 in. girder in half a minute, a set of 14 foot plate-bending rolls operated by two steam engines, and three punching and shearing machines.

In the steel construction yard all structural work in steel is conducted. Roof trusses, super-structures, mine headgears, and bridges all rank among the items which can be turned out in this department. In the photograph depicting the steel construction department can be seen some skips, tips, and roof trusses, as well as the enormous stocks of steel girders, beams, angles, etc., held at these works. The engineering works also include a large weighbridge with a capacity up to 15 tons, supplemented by 6 other scales distributed about the works.

Achievements.

On a tour of inspection round the works many articles of general engineering interest were to be seen. Among these there was an eighty ton ammonium compressor, a sinking platform, and 450 sections of tubing for lining a circular shaft. Other notable engineering achievements of these works are a 30-ton ammonium compressor for the Benoni Ice Company, and an 80-ton compressor which has now been running for the last two years at Messrs. Angen and Piel's Cold Storage, Newtown. This machine is capable of a 25 per cent. larger output than that for which it had been rated. Headgears have been built for several Rand gold mines as well as Natal collieries. The steel work for the Bijou Theatre was also constructed at these works. The company has also turned out a rotary roasting furnace which is being used for treating refractory gold ore on the Machavie Gold Mining Company. This roaster has a capacity of 2,500 tons per month.

Progress of the Government Vaal River Barrage.

Excellent progress is being made with the Vaal River Barrage, and according to Mr. W. Ingham's latest report, the whole of the 36 gates are now at the Barrage. Several sets of the operating gears have been delivered, and the remainder will be delivered by the end of the year. Four gates are completely assembled and two are being assembled. The Goliath crane has now been erected, and the Barrage will be completed about the end of April next year.

Rand Water Board New Works.

According to the latest report by Mr. W. Ingham, the Chief Engineer of the Rand Water Board, the following tenders are now being dealt with or are due on the dates referred to below:—Steam turbines and pumps for River Station, Vereeniging; generating sets, etc., for Main Station, Vereeniging, and engine and boiler houses, etc., for Main

Station, Vereeniging—these tenders will be reported to the Committee on the 18th instant; weighbridge for Vereeniging Main Station—5th December, 1921; boilers, stokers, etc., for Main Station, Vereeniging—22nd December, 1921; steel roof trusses, etc., for engine and boiler house, Main Station, Vereeniging—6th January, 1922; pipes for the pipe line from River Pumping Station to Main Station, Vereeniging—6th January, 1922.

A New Copper Flotation.

The Supply of Steel Ropes to the Rand Water Board.

BRITISH Versus GERMAN TENDERS.

The official minutes of the last meeting of the Rand Water Board contain an extraordinarily interesting reference to the acceptance of the tender of a German manufacturer for steel pipes for the conveyance of water from Vereeniging to the Rand. In the course of a report on the subject it is stated:—

With regard to the tenders for the supply of cast-iron pipes, the lowest complete tender was that submitted by Capt. R. R. Kennedy, acting on behalf of Le Société Anonyme des Hauts Fourneaux et de Fondéries de Pont-a-Mousson, Nancy, France. It was estimated, however, that the cost of the cast-iron pipes for which alternative tenders were invited, based on Capt. Kennedy's offer, would be approximately twice the amount payable for a similar length of steel piping. The consideration of these tenders, therefore, resolved itself into a question of the purchase of steel pipes for the purposes of the Vaal River scheme, and an examination of the tenders showed that the lowest tender received for steel pipes made to the Board's specification was that submitted by the National Trading Company, who offered steel pipes to be manufactured by the Mannesmann Tube Company, of Dusseldorf, Germany. Messrs. Stewarts & Lloyds (S.A.), Ltd., submitted the lowest tender for steel pipes of British manufacture, but it will be seen from the following comparison that this tender appreciably exceeded that of the National Trading Company:—229,300 feet of steel piping (assorted sizes as per specification), including 80,000 feet of Hessian wrapped steel piping: Stewarts & Lloyds (S.A.), Ltd., £392,476; National Trading Company, £275,686; difference in favour of the National Trading Company, £116,790. If allowance were to be made for the extra cost of jointing Messrs. Stewarts & Lloyds' pipes, due to the shorter length of the tubes offered by them as compared with the Mannesmann tubes, the above-mentioned difference would be increased to about £120,000 in favour of the National Trading Company's tender.

Terms of Payment.

The prices tendered by the National Trading Company are firm prices, excepting in so far as they may be affected by any variations in the current South African railrage rates and Customs duty. Any increases or decreases in these charges applicable to deliveries under the contracts in question would be for the account of the Board. The tender is made on a British sterling basis, and will not, therefore, be affected by fluctuations in the value of the German mark. Furthermore, the National Trading Company accepts the Board's terms of payment on condition that payments are made on a par basis as between South Africa and London. These terms provide for the payment in Johannesburg of 80 per cent. of the value of each consignment on delivery to the Board in good order and condition, and 20 per cent. within six months after the complete delivery of the materials. As regards the period required to carry out these contracts, the National Trading Company undertakes to commence delivery about the middle of March next, and to make the final deliveries during the month of November, 1922.

In concluding his report (No. 120, dated October 17, 1921) dealing with these tenders, which was considered by us on the 21st ult., the chief engineer stated that no tenders, or combination of tenders, had been submitted for pipes of the dimensions specified by the Board which were lower than those of the National Trading Company. Subject to the decision of the Board in regard to the question of policy involved, the chief engineer recommended the acceptance of the National Trading Company's tender for the piping required under these contracts.

Some Considerations.

In the course of our review of the tenders for the supply of pipes, we realised that no exception could be taken, from a technical point of view, to those submitted by the National Trading Company, which were for material to be manufactured in Germany. On examining the matter from the financial aspect, however, it was seen that the lowest tender for pipes of British manufacture exceeded the National Trading Company's tender by £120,000 approximately, a sum representing, in respect of interest and redemption, an annual charge of about £11,000 a year for a period of 27 years. Taking this comparative position into consideration, there would have been no hesitation in arriving at a decision in this matter had it not been for the question of policy involved and the unsettled conditions at present obtaining in Germany. We had to recognise, however, that no financial loss to the Board would be involved in the acceptance of the National Trading Company's tender. It has already been mentioned that the contract price would be paid in British sterling, free of all fluctuation in the value of the German mark; and, further, that no payments would be made by the Board until the materials had actually been delivered to the Board at selected railway stations along the route of the pipe-lines. As the question naturally arose regarding the possibility of difficulties arising in Germany which might interfere with or prevent the National Trading Company from delivering the required material to the Board, and thus cause a delay in the completion of the first unit of the Vaal River scheme, exhaustive inquiries were made in this direction before a decision was arrived at. Our inquiries in this regard failed to elicit any information of a nature which, in our opinion, would have justified the Board in declining the favourable offer submitted by the National Trading Company. In view of all the circumstances, and after the most careful investigation, the tender of the National Trading Company was accepted.

Making Bridges out of Old Ropes.

We have received from Mr. C. M. Rasmussen, rigger, of P.O., Linden, Johannesburg, the following account of a bridge which he has constructed in the Eastern Transvaal out of disused wire rope. It seems to us that transport conditions in the outlying districts could be substantially bettered by the employment of methods such as are discussed in the accompanying brief article.

Swinging Bridge over Crocodile River.

Swinging Bridge across the Crocodile River when in Flood, near Barberton.—The structure is very strong. A bridge of this nature will carry several tons weight, and can be erected to carry any weight desired for wagons, etc. It can be erected in a very short time and at a very small cost; this bridge was erected complete in one week, with about five natives, from discarded 1 in. wire ropes several hundred feet long.

Method of Construction.—First, two posts were cross-braced about 15 feet apart and 30 feet high (according to the height of the river when in flood) and were erected on each side of the river. Next, two strong wire ropes were stretched across the river suspended on top of tressles; all four ends were anchored, and the bridge was then erected, hanging in the wire ropes. Bolts according to strength of bridge required are bolted on to the wire ropes every 6 feet, and to the bottom part of bolt is a railway sleeper or any other wood. Across the sleepers longways are planks nailed or bolted on. A bridge of this type can be erected very cheaply if native wood is utilised, and discarded wire ropes can be bought at small cost from any mine. A bridge like this will last for a century and more and cost very little for upkeep. If such bridges were more widely known, they would be extensively erected, not only privately, but also by the Government for tapping the railway communications.

The Rhodesian Cement Company.

The Rhodesia Portland Cement Company is temporarily to suspend operations owing to lack of demand for the product and a large accumulation of stock at the works. The chairman at the annual meeting said that the dumping of cheap Continental cement at African ports was partly responsible for absence of activity of the company, and slackness at Katanga was also a contributing factor. The company, nevertheless, was in a sound position. The meeting confirmed an interim dividend of 10 per cent. paid previously, and passed approved dividends of 10 per cent. It is understood that about a dozen white employees will be suspended. Last year the company circulated practically £50,000 locally in wages and stores.

FAIRBANKS

Vulcabeston Renewable Disc Valves.

Asbestos Fibre, as everybody knows is not affected by heat or acids.

Vulcabeston is a compound of Asbestos Fibre saturated with rubber and other materials and vulcanised under Hydraulic pressure. It is the ideal material for a valve seat, and you can get it only in Fairbanks Valves with Renewable Discs.

There is another marked difference about the Fairbanks Valve and that is in the quality. A trial and comparison will convince you.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material & Engineering Trades

BUSINESS QUIET BUT IN HOPEFUL MOOD—IRON AND STEEL—TIMBER AND BUILDING MATERIALS—ELECTRICAL GOODS.

General.

Things wholesale, especially in mining materials, inevitably slacken off towards the end of the year, giving place to the retailers, who reap their best harvest. It is a time when merchants naturally take stock of their possessions and of possibilities immediately confronting them. Under these circumstances there is no call to dip into last week's transactions, which were quiet and on the scarce side. But, underlying the present paucity of business, one gathers, in no uncertain manner, during one's peregrinations that the general tone of commercial affairs is absolutely sound, and, provided that a satisfactory arrangement is arrived at between the Chamber of Mines and the Trades Unions as to future working costs and greater efficiency on the part of workers underground—to which at the moment everything seems to point (the continued drop and probable further decline in the price of gold will only add weight and cogency to the mineowners' attitude on the question)—the mining community is unanimous that early next year we should see improved business conditions. A very prominent commercial man said that, in his opinion, people were beginning to properly appreciate the continued drop in the price of gold, and that there was only one radical cure for it, and that was a drastic cut in costs of production. The slash in wages, which was imperative, should not be confined to the miners, but should operate in like fashion with salaries—in other words, the cut should be made from top to bottom. That was, he said, the only way to prevent the eventual incidence of the drop of the premium to normal affecting our mines, or most of them, detrimentally. The prices of stores were gradually declining (notwithstanding a temporary slight advance in timber), and were likely presently to go lower, and this, together with the anticipated decline in salaries and wages, and above all increased efficiency of the workers underground, should tide us over most of our mining propositions' difficulties. With regard to the price of timber and the recent upward movement, there is no gainsaying the fact that in the face of the increased prices in England merchants to-day are not taking advantage of this, but are selling their old stocks at about recent levels, but as soon as those stocks already afloat are landed and disposed of there can be no question that prices must rise in consonance with oversea prices. With this exception building materials appear to be at zenith, and lower costs are confidently anticipated. The turps market remains firm at last week's prices.

Iron and Steel.

The market during the past week, as is usual at this season, has been standing, and very little business has been put through. The holidays may be said to have started with Dingam's Day, and their influence will be felt until after the turn of the year. Steel plates are firming, and there are shortages in small lines already, which will be accentuated within a few weeks. The tone of the market, although very quiet, is undoubtedly firm and hopeful.

The Iron and Steel Corporation.

At the second ordinary general meeting of the above the chairman, Mr. A. C. Romyn, stated that at the last meeting he had advocated the erection of a 75,000 tons p.a. iron and steel works, electrically driven and capable of extension. He stated that, unfortunately, universal financial stringency had compelled them to postpone the immediate execution of their technical programme. In view of unfavourable markets the board awaited more favourable times for exploiting the company's interests. Mr. Delfos, the company's managing director, is conducting negotiations.

Second-hand Machinery.

Trading this month has been by no means dull, as companies have been compelled to buy, having allowed their stocks to run down too low in the endeavour to tide over the present year, but necessity has caused many to replace, and when second-hand stuff can be had it is economical to purchase. New steel plates have come down to such an extent that the mines are practically turning up their noses at second-hand stuff unless it is exceptionally cheap. A good deal of second-hand plate has been sold at practically scrap prices. Battery spares are very scarce, particularly

for certain sizes, and those old companies which continually purchased second-hand have drained the market to such an extent that there is a scarcity of the sizes required by some outcrop mines. It is predicted in second-hand circles that at the commencement of the year, and until further companies close down (save the mark!) and sell their plant, there will be a scarcity of second-hand requirements. There is no getting away from the fact that the Germans are flooding the market with necessitous goods and bringing down prices considerably. When are the British firms going to compete with this dumping? Not until the British workman learns that his bread and butter is being taken away from him by the Germans and is really again working to regain what he has lost. Steaming boilers, certain sizes, are still scarce, and what are in the market are fetching high prices.

Timber and Building Materials.

In view of the holiday in the building trade, which started last night (23rd inst.), a fair amount of building has been expedited during the past fortnight, and merchants have not been in bad humour during that period in respect of sales. It is stated on all hands that as soon as we are well in to 1922 a lot of building contracts will be given out, and everything seems to point to very increased business during the first months of the year. It is learnt also that the master builders are proposing a further reduction in wages after the end of the present month, to which, it is anticipated, there will be no great opposition.

Prices: 3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver boards, 4½d. to 4¾d.; floorings, 6¼d. to 6¾d.; ceilings, 1¾d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 6s. 6d. to 7s. 6d.; corrugated iron, 9d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second at the coast; American oak, 1in. 10½d., 1½in. 11d., 2in. 11½d. at coast; and Japanese oak, 1in. 1s. 1d., 1½in. 1½d., 2in.

1s. 2d. at coast; West African mahogany, 1in. to 1in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per foot. Prices for bricks, although remaining about the same, have a hardening tendency, and should we have heavy rains the tendency will be upward. Brickmakers report business better now than it has been some years at this season. Things are expected to improve a lot in January next, or February at the latest. Blue stock, 70s.; mixed, 60s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000 at kilns. White lime, 7s.; unslaked, 10s. 6d. per 180lb. bag, 8lb. bag 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Electrical Goods.

Business, in contrast with previous Christmas weeks, has been very poor; people, a leading agent said, are not to-day going in for previous Yule-tide celebrations. There is a fair amount of trading with the country, but nothing big, but indications, my informant said, point to very big things next year.

Mr. Buckles Quarterly Review.

Coming so soon after his "straight talk" at last week's round table conference with the men, Mr. Buckle's quarterly review of the industry this week was necessarily in the nature of a repetition of the facts as they are. Mr. Buckle did not pretend to say anything new on the subject, but his speech provides a useful summary and succinct review of the situation. If the community of the Rand and the country at large are not now fully alive to the seriousness of the position to-day, it certainly is not the fault of the President of the Chamber of Mines.

The Week's Meetings.

FUTURE PROSPECTS OF THE COAL TRADE.

SOUTH AFRICAN COAL ESTATES, (WITBANK), LTD.

Mr. Jeppe's Able Review.

A Valuable Suggestion.

Immense Tonnages of Coal.

The New Clewer Township.

The first Ordinary General Meeting of shareholders in the South African Coal Estates (Witbank), Limited, was held on Thursday, December 15th, in the Board Room, the Jeppe Arcade, Johannesburg. Mr. Julius Jeppe, C.B.E., presided, and amongst those present and represented by proxy were: Sir Abe Bailey, Bart., Messrs. Alfred Barker, J. G. Carter, J. G. Currey, C. C. Curtin, W. E. Drummond, W. J. Gau, W. H. Harris, E. M. Hind, L. Ludlow, G. B. Pascoe, Ralph Ryan, Gordon Sandilands, B. Southwell, M. A. Sutton, and W. H. Sutton, with Mr. A. Woodrow, Secretary, representing in all 523,585 shares out of an issued capital of 925,505 shares.

The Chairman said:—
Gentlemen,—In moving the adoption of the Report and Accounts which are in your hands, I must remind you that the period covered is for six months only, from January 1 to June 30, 1921, this Company having, you will remember, purchased the business of the Cassel Coal Company, Limited, and the Transvaal Navigation Coal Estates, Ltd., as from the beginning of this year.

Finance.

Perhaps it will be as well to recall to you that your Company is registered with a capital of £1,000,000, of which £702,000 in fully paid shares was issued as purchase consideration to the selling companies, £140,407 was subscribed as working capital, leaving a further £140,400, an option over which at 20s. per share is held by the subscribers of the initial working capital, and of which the option over 83,093 shares has been exercised, and £17,193 in reserve, which are also under option at the same price.

In the Balance Sheet you will notice the capital appears at £850,716; this includes, as you will see, 2s. per share on the 83,093 shares just referred to, the option upon which was exercised by the South African Townships, Mining and Finance Corporation, Ltd., in order to enable your Company to comply with the provisions of the Companies Act, 1909, and that is the reason why only 2s. per share has been paid up on these shares.

"Sundry Creditors" at £103,362; more than half of this is due to the purchase of the Welgedacht plant and its removal and re-erection, the remainder being for ordinary merchants and other accounts and Government taxes.

"Capital Reserve Account" £8,327 represents the profits earned by the selling companies between January 1 and the date of the incorporation of your Company, such profits being part of the assets taken over and therefore of a capital nature.

Property Shareholdings.

Turning now to the Assets, you will find "Property Account" stands at £386,721; this includes the various freehold and leasehold properties as enumerated in the Directors' Report, equivalent to 45,989 acres, and are the same as taken over from the selling companies with the exception of the freehold of a portion of Volvekrans, which has been purchased since the amalgamation and the value set down in the balance sheet is in accordance with the price paid to the selling companies.

"Machinery, Plant, Buildings, etc.," at £374,763, represents not only assets taken over, but an additional cash expenditure since the beginning of the year of about £100,000, which I will refer to again.

Of the other items on this side of the balance sheet, I might mention "Shares in other Companies" at £59,333 represents, in addition to the usual shareholdings in the Coal Owners' Association, the Insurance Company, and the Native Labour Association 100,000 fully-paid shares in the Cassel Clydesdale (Springs) Gold Mines, Ltd., as well as 50,000 more on which 2s. per share has been paid. This Company owns two freehold portions of the farm "Daggafontein," No. 25, in the Far East Rand district, in extent 600 morgen, as well as a myn-pacht of 120 morgen, equal to 173 mining claims. The Board has power to increase the capital of that company to £1,000,000 (it is now £300,000) in order to provide further working capital in the event of the company being successful in obtaining a lease of additional ground from the Government. As you will be aware, the ground owned by this company is in a good gold area adjoining the Springs Mines and close to the New State Areas' ground.

"Preliminary Expenses and Commission on Shares" at £17,031. The principal item in this sum is the underwriting commission on the working capital shares, which accounts for £14,040; of the remainder £2,772 was paid to the Government in duties on the formation of the company.

"Sundry Debtors" £22,471, principally consists of the amount due at the end of the month from the Coal Owners' Association for coal sold during the month.

The other items on this side of the balance sheet require no special comment.

The appropriation account shows a profit of £19,364 from revenue and expenditure account. This has been dealt with by allocating, as previously stated, £8,327 to capital reserve account, these being the profits of the selling companies earned prior to the registration of this company; and by carrying the balance of £10,536 (after providing for income tax) forward to the current year.

A Period of Difficulty.

The period covered by the report and accounts has been one of difficulty, due to the depression in the coal trade.

As you are aware, the old Navigation pit was sealed on account of the fire which took place in the early part of 1920, and in consequence of this it was decided to open up two fresh pits on that section of the property, and the sinking, development and equipment of these pits is naturally spread over a considerable period of time, so that though the Bailey pit was hauling some

coal in January it was only able to put out 14,302 tons in the month of June, and in the Navigation pit in that month the main shaft was still being sunk, the air shaft having been completed and development commenced. The extra capital expenditure of £100,000 which I referred to in dealing with the accounts was practically all absorbed in this construction and development work, and in overhauling and adding to the plant at the Landau Colliery. With the exception, therefore, of an average monthly output from the Bailey pit of about 10,000 tons, your company's output during this period was produced from the Landau pit.

Had it not been for the fact that your directors were able to obtain plant and machinery from the Welgedacht Colliery the period of non-production on the Navigation section of your property would have been considerably longer.

Not only was your company suffering from the effects of non-production during the necessary construction and development period on this section, but your business was also affected by the acute depression which suddenly overtook the coal trade just before the beginning of the period under review. You will remember that towards the end of 1920 the prosperous period which the trade had been enjoying for some time quickly took a turn for the worse in consequence of the serious slump in shipping freights all over the world combined with the decrease in the export of manufactured goods from Great Britain, which resulted in coal being carried from that country to the East—our competitive markets—practically as ballast in ships which otherwise would have gone out empty in order to bring back the return cargoes to England. The effect of this naturally was to considerably decrease both the export and bunker trade of South Africa, and to compel a reduction in price in order to meet this competition.

Railway Rates.

The railway rates had also been raised considerably above pre-war-rates, so much so that had these not been lowered the bunker and export trade would have been killed; however, I am glad to say that the Railway Administration was quite reasonable on this matter when approached and have by successive steps considerably reduced the rates for carriage, but they are still very much higher than before the war, and it seems clear to me that further reductions must be made if we are to keep our markets. So far as I am personally concerned, I would welcome some understanding with the Railway Administration which would in some way provide an automatic rise or fall of rates of carriage according to the conditions of the market for bunker and export coal. For instance, it often happens that when tendering for large contracts it is found impossible to quote a low enough price, as it would necessitate a small reduction in the rail-age rate, and this requires negotiations with the railway, which means considerable delay and the possible loss of the contract to South Africa, whereas if a basis could be arrived at it would mean that the required reduction to obtain that contract, coupled, of course, with a reduction in the coal owner's profit, would be automatic.

Position at the Pits.

I would now like to give you some information with regard to the present position at your property. At the Bailey Pit the whole of the shaft sinking and

the machinery, plant, and equipment thereof has been completed and development is now, after passing through a troubled area, proceeding normally and satisfactorily, the quality of the coal being excellent. The present output from the pit is about 15,000 tons a month, which can be increased to 40,000 tons, the plant being designed for that quantity, but in view of the restricted market at present, and it being naturally more economical to produce from two pits rather than three, it is intended to haul our allotment as soon as possible entirely from the Landau and Navigation pits, leaving the Bailey Pit as a stand-by, and to meet any expansion in the demand which may occur. In pursuance of this policy, we have recently only been working the morning shift at the Bailey Pit.

At the Navigation Pit since the close of the period under review the shaft sinking machinery plant and equipment has also been practically completed, and in a short time we will be able to haul sufficient coal from this pit and the Landau to complete our monthly allotment. The development in this pit is well advanced and the quality of the coal is excellent, averaging, as it does, about 13 calorific value. During the sinking of the main shaft for this pit four seams of coal were passed through, three of them being of good thickness and quality, the other seam being of fair quality and promising to be a valuable asset later on, though it will be very many years before this seam will be called upon for production. Two of the four seams of coal are within seven feet of each other, the lower being six feet wide and the upper 18 to 20 feet, of which the bottom 12 feet will be worked; the quality of both seams is the best and it is intended to work these seams together, thus reducing costs.

There is nothing of special importance to remark about the Landau Pit; it is in a perfectly satisfactory condition, producing coal of first class quality, the machinery and plant is in good condition, and the general manager, by certain adjustments of the working conditions, has increased its capacity to more than it has ever produced before, namely, to about 43,000 tons per month.

The total output of saleable coal from the three pits for the month of November was 62,053 tons, but we are in a position to easily supply up to 120,000 tons a month from the present three pits at short notice and on the single shift basis.

On your portion of the farm Wolvekran, 2,120 acres in extent, a series of boreholes was sunk with the object of proving the extent and value of the coal, with the result that in the main seam the lower nine or ten feet gave 12.84 calorific, and the upper seam, about eight feet thick, averaged 12.5 calorific.

I may here state that with the exception of the area on Bosmanspruit, the whole of your properties are adjacent to each other, and the fact that Wolvekran is at the farthest end of your holdings, a considerable distance from your present pits, augurs well for the values in the intermediate area.

In addition to the present Landau Pit, situate on the farm Klipfontein, you have another area on the same farm suitably large to provide an entirely new pit. The area of coal-bearing ground in this new district is estimated at about 2,200 acres, containing a seam, the lower 10 feet of which has been proved by numerous boreholes to contain coal possessing a calorific value between 12.5 and 13. The greater portion of this area can be attacked by adits, while the rest would require shallow shafts, so that it could be worked at a low level of costs.

The total area of your holdings, freehold and leasehold, is just under 46,000 acres, of which about 38,000 acres may be taken as coal bearing, and the coal which has been proved is of excellent quality. To estimate the life of your properties as a coal mining proposition

is a difficult matter. There are several seams of coal on your properties, but for the purposes of considering your life only two seams at present being worked will be taken into account. On this basis we find that in the areas commanded by your present pits it is estimated there are about 4,800 acres of coal-bearing ground of first class quality, totalling about 70 million tons of marketable coal. This alone, even at the maximum rate of production of 120,000 tons a month, will last for nearly 50 years.

Then, again, there is the area on Klipfontein adjoining the present Landau Colliery of 2,200 acres, and the other on Wolvekran of 2,100 acres, both of which I have just referred to, in which the total can be put at about 52 million tons.

To this must be added your other properties which, either from a certain amount of boring or from their situation in relation to proved areas, may be considered as partially proved; these areas total about 21,500 acres, and on a conservative basis may be estimated to produce 164 million tons.

Lastly, there is the farm Bosmanspruit in extent 7,059 acres, under practically the whole of which it is known that the coal measures extend, but in regard to which in the absence of any boreholes thereon or in the neighbourhood no estimate of tonnage can be made.

Vast Tonnages.

The total estimated tonnage, therefore, excluding Bosmanspruit, may be put at 280 to 300 million tons, and this is without taking into account the other seams which run through your property, and which will some day be of commercial value.

I might also mention to you that in order to ensure an adequate water supply throughout the year from the permanent springs which exist on the property, your board decided to construct a storage dam; this dam, which is now in course of construction and nearly completed, will store 50 million gallons of pure water, and will thus ensure a constant water supply more than sufficient to provide for your company's requirements, and in addition to ensure an adequate supply for the purposes of the township which I will refer to later. I may add that the difficulty previously experienced by the Landau Colliery in consequence of the acidity of that colliery's water supply has been entirely removed since the amalgamation by the use of the pure water obtained from the sources on the Navigation property. Had it not been for this and the large sums of money we have spent since the amalgamation in overhauling and adding to the plant and machinery, this colliery would have experienced very considerable difficulty in providing its old output, which by the steps taken has now been considerably increased.

Question of Working Duff.

There is a further question which I might refer to, and that is a matter of reduction of costs of production. It is only at present in course of detailed examination, and I cannot say what action in this direction will be taken by your board when the experts have presented their conclusions. At present the motive power for the working of your colliery is produced by burning saleable coal, and we are considering whether by utilising our waste product, that is to say the duff that has to be dumped every month, motive power of a different nature cannot be produced at a very much lower cost.

All I can say at present is that the problem is engaging the earnest attention of the Board, the more so as it is highly desirable that costs of production must be lowered in this, as in all other industries, wheresoever it can be done.

Before the amalgamation took place

your Board went thoroughly into the question of reorganisation. We were fortunate in securing the services of Mr. J. R. Thom as general manager of the combined concern, and under his management and advice the reorganisation of the concern has been successfully carried through. There is no doubt that there will be considerable gain to shareholders by the amalgamation, not only by the centralisation of offices, but on account of the elasticity of the operations which has been attained, thereby enabling the management to produce their required output at the least cost by concentrating on two pits, and leaving the third to provide any excess which may at any time be required, and in addition, so far as the Landau Colliery is concerned, by removing the difficulties consequent upon the acidity of that company's water which I have already referred to.

Clewer Township.

Now, I must say a few words to you about the new township which has been laid out upon your property in the near vicinity of your pits, and within reasonable distance of several collieries. Your Board considered that, while filling a much-felt want in the district, it would also provide a healthier and pleasanter place of residence for your company's employees, and having decided to lay it out on garden city lines, they offered prizes for the best design. The first prize was awarded to the plans sent in by Mr. Harold Porter, of Johannesburg, and these plans are now in course of being carried into execution. The site of the township is one of the finest and healthiest in the Province, and is laid out in zones of residential, commercial, and industrial stands, as well as agricultural small holdings. The township proper is divided into two portions, and in the first instance only stands in the eastern portion are being sold, the whole of which has been surveyed and laid out. The title granted is freehold, subject to the usual restrictions required by the Provincial authorities in such townships. Brugspruit Station, on the Pretoria-Lourenco Marques line, is within a quarter of a mile of the township, which has been named 'Clewer' township, and the Johannesburg-Witbank line is within a mile and a half. An unlimited supply of pure potable water is laid on to the township, and electric current is also provided. The company has donated 200 morgen of ground for town lands, and another 200 morgen for grazing. In the centre of the township a large park has been provided, and adjacent thereto ground has been reserved for recreation grounds. Sites have also been laid out for such necessary institutions as Town Hall, Court-house, hospital, schools, and market. Purchasers desirous of building can also obtain bricks upon the property at reasonable prices.

There are about 1,057 stands in the whole township, excluding the agricultural plots.

On the 5th of last month a public sale of the stands in the eastern portion of the township was held, and I am glad to be able to inform you that you were very largely attended by keenly interested purchasers, and the results were very satisfactory, a considerable number of residential and commercial stands being sold at good prices, and since that date inquiries have been numerous, and sales continue to be effected. I have no hesitation in predicting that Clewer Township has a very successful future before it.

Competitive Factors.

In conclusion, I should like to address you as to the future prospects of the coal trade in South Africa. I may say at once that I am not disheartened by the rather strenuous competition we have had to encounter in export markets during the last 12 months. This period has coincided with the worst of the depression in Great

Britain; conditions have existed which have compelled shipowners to carry coal at any rate they could get, and coal-owners to sell coal for export at very low prices, owing to various reasons, such as the accumulation of coal following the settlement of the coal strike and the decrease in the industrial and household demand. Several factors antagonistic to our own coal industry made their appearance at one and the same time, but already there are signs that these will not long continue. As soon as Britain resumes normal exports to the East shipowners will no longer carry coal practically as ballast, nor can shipowners make their industry pay at the present low freight rates; moreover, as trade in Great Britain recovers there will be an increasing demand for industrial coal, which will have a natural tendency to raise the export price. There is also the additional well-known fact that the collieries in Great Britain are at present being run at a loss, which cannot long continue; either their costs will have to go down appreciably or prices will have to go up. Of one thing I think we may rest assured, and that is that unless a very great change takes place in the efficiency, or rather want of efficiency, in relation to output of the British miners, pre-war prices for British coal will never return. At the end of 1913 second grade Welsh coal was sold at Cardiff at 17s. per long ton, and upon that figure the collieries made a good profit; to-day the same coal is placed on board at round about 24s. a ton, and the collieries are making considerable losses, in which the shipowners are also sharing.

At the same time there is no use concealing from ourselves that in order to achieve and keep our rightful position in the world's coal trade, we shall have to ask for assistance from all parties engaged in the business. For instance, it seems to me that labour must be asked to contribute to this desirable end by reducing the cost of production by an increase of efficiency and a reduction in remuneration. The former is quite as important as the latter when considering costs of production, and should, at any rate, be easier of attainment. For instance, a few months ago it was estimated that the American miner on the average produced a very much greater quantity of coal in a given period than the British miner, and the American, it is well known, gets high wages. So much so has this been the case that America has captured markets abroad which hitherto have been considered Britain's preserves, and it all depends on the British miner whether these markets are permanently lost or not. Cannot a lesson be read from this by the Transvaal miner? By an increase in efficiency of output costs could be reduced without reducing wages so much as they otherwise will have to be, and with reduction of costs markets for our coal abroad can be captured, which at present is impossible. I would also say to the miners that these frequently recurring sectional strikes or threats of strikes also cause unsettlement and uncertainty, and therefore affect efficiency, and the further investment of capital in the industry. Peaceful and cordial relations between employer and employee are just as essential to industrial development and progress as similar relations between the nations are necessary for the development and progress of international trade, and I would urge the miners to do all they can to attain this desirable end, and towards which the employers will be only too willing to assist on any reasonable grounds.

I say the same thing to the shipping companies, who, however, have always dealt very fairly with us, but with regular communication with certain markets at low rates of freight, other markets, such as South America, might be opened up.

And then there is the question of the port. As you are aware, all our coal is

shipped through the port of Lourenco Marques. There is room for improvement in the handling appliances there; frequent stoppages of the plant occur, so that the coal and trucks are held up, ships are detained longer than necessary, and, in short, efficiency in the conveyance of coal from the truck to the ship does not at present exist in as high a degree as is reasonably expected. The existing plant there is not up-to-date nor of sufficient capacity. It is time that the authorities recognised this; some time ago a new plant was promised to be ready last June, but up to the present this has not been realised, nor do we know when it is likely to be ready. Again, the charges which are made there by the Portuguese Administration for the handling of the coal are, in the opinion of the industry, higher than need be, and might well be somewhat reduced in the interests of both parties.

Mr. Jeppe Hopeful.

The above remarks apply to the shipping trade. It must also be remembered that our internal trade is dependent upon the industrial demand, and that until new South African industries are created to take the place of those gold mines which during the next few years will close down, we must, for any increase in our local trade, look to expansion in our present export markets and the exploitation of new ones, and this can only be done by lowering the cost of production. Taking all things into consideration, however, I am confident that with the revival of European trade, and a sincere and effective co-operation between miners and coal masters, a wise treatment by railway and shipowners, we are assured of a prosperous future for the industry, in which your property, containing, as it does, coal of the very best quality, and for all practical purposes unlimited in quantity, will undoubtedly share to the fullest extent.

In conclusion, I wish, on behalf of the Board, to convey our thanks to the efficient and zealous staff for the loyal way in which they have supported the general manager, Mr. Thom, during the past year.

I also have pleasure in stating that the directors have decided to declare a dividend of 5 per cent.

The directors' report and accounts were adopted; the appointment of Mr. Bailey Southwell was confirmed, and he was re-elected a director of the company; and Messrs. A. F. Brotherton and F. W. Diamond & English were appointed auditors for the ensuing year. A dividend of 5 per cent. was declared.

The proceedings then terminated.

CORONATION SYNDICATE, LTD.

RECENT RICH STRIKES ON EAST AND WEST RAND.

Important Reef Extensions Proved.

The sixteenth annual ordinary general meeting of shareholders of the Coronation Syndicate, Ltd., was held at the head offices, 29-32, Bettelheim Buildings, Johannesburg on Saturday, December 17th. Mr. A. Mackie Niven presided.

In moving the adoption of the report and accounts, Mr. Niven said, gentlemen, I have to apologise for the absence of the chairman, Mr. Gustav Sonn, who has been in Europe for some months, and who, when the last mail left London, was busy on your company's affairs. Mr. Harry Gramann, another of the directors, is also in London, and at no distant date, your board hope to be in a position to report to you that satisfactory arrangements have been made to provide the further funds required to develop the valuable properties which you have already acquired and which I will refer to later.

The accounts which are now presented, are made up to June 30 last, and differ but little, from those submitted at the annual meeting held a year ago.

Van Ryn Reef Located.

What is of much more interest to shareholders, however, is the work done, the results obtained and the prospects of the more recently acquired undertakings of the company. When the present directorate took control there was, and we thought deservedly so, a great deal of interest being taken in the development of the Far East Rand. The board acquired for the company on favourable terms two interests in that quarter.

In the Balfour district, south-east of Heidelberg, we own what we call the 1,000 claim block, situated mainly on the farm Wilgepoort, and as to the acquiring of which you were advised a year ago. When a good equipment had been erected on the two prospecting shafts, these had been enlarged to hauling shafts, work was continued for many months. The work done is fully reported on by the company's general manager, Mr. J. A. Thornburn, in a report attached to the directors' report and accounts.

Happily, there is no dispute as to the reefs which have been sunk upon and opened up, all competent mining men agreeing that here we have the Van Ryn or Modderfontein reef, which has made the reputation of the rich gold mines of the Far East Rand, the New Modder, Modder B, Modder-Deep, Brakpan, Government Areas, Springs, and other mines, the mines which have to carry the gold mining industry when the older mines of the Central-Rand are on the wane.

As pointed out in the directors' report, assays on some parts of the reef run very high. The assay plan has been prepared to include all results obtained from samples taken from just below the surface soil downwards. The exclusion of the sampling results from points near the surface of the shafts gives a higher average in inch dwts. Unfortunately, the company's funds were insufficient to enable work to be continued on this property, as well as at the same time to prove the West Rand ground to be referred to later. All work was, therefore, stopped in June last. What we have done, however, is to prove (1) that our large claim area contains the very valuable Van Ryn or Modderfontein reef; (2) that these carry gold, as on the properties from which the reef gets its name.

The limited amount of work done, while proving quite payable values, has not cut one of the rich shoots which is the characteristic feature of this reef elsewhere. There is no reason to doubt, however, that when funds are provided, and development undertaken on a scale adequate to the great extent of the property, we should be able to open a payable mine capable of carrying a very large crushing unit.

Randfontein Extension Proved.

I now come to the West Rand property known as Luipaardsvlei No. 10. A year ago the chairman said that the company had undertaken a big task in trying to prove the extension of the Witwatersrand reefs on the Far East Rand, as well as on what may be called the Far West Rand. He claimed then that we had succeeded on the Far East Rand, and this, as I have said, has been confirmed by the work we have done during the year under review.

On the Far West Rand we have, however, succeeded beyond our most sanguine anticipations. At last meeting, although the first borchole on the property was reported as being down nearly 1,700ft., no success had been met with, two small leaders only of no value having been cut. To-day we have a very different tale to tell.

No. 1 Borehole (A) was stopped at a depth of 2,260ft., the strata having been disturbed, and the reef displaced. The information gained, however, was most valuable, and, together with trenching operations, which disclosed the footwall shales, enabled your technical advisers to choose what proved to be a favourable site for the second borehole (B). This borehole was discontinued at a depth of 1,180ft., having apparently missed the Randfontein leader through the thickening of the dolomite, but at 770ft. it cut a very rich reef, now recognised as the West Reef of the Randfontein series, with the very satisfactory value of 10.4dw. over a stopping width of 48in. Although the lower portion of the Randfontein series had been completely proved in this borehole beyond any doubt, to make assurance doubly sure, the site of a third borehole was selected (C). The depth reached by the drill last night was 1,150ft., and we should cut the Randfontein West Reef very soon now.

Thirty-Six Ounces to the Ton.

At a depth of 834ft. in this borehole the Randfontein leader was cut, assaying 36oz. to the ton over a width of 2in., which, calculated over a stopping width of 48in., gives the very highly satisfactory value of 30.3dw. This reef, usually in the Randfontein mines, has a width of from a streak only to 4in., and is so rich as to give a payable value over 48in. As the dip of the strata is 40deg., I need hardly remind you that it will be quite possible to carry a stope 36in. wide on such a dip, and that the value over the narrower width would be considerably higher.

What we have now proved therefore is (1) That both the Randfontein Reefs are in our property, and (2) that they are very rich in gold contents. These reefs can, with the information now gained, as the result of the boring operations, be located nearer the surface. I may mention in passing that these Randfontein Reefs have nothing to do with the Black Reef Series as has been suggested. The Black Reef formation is on a different horizon, and is to be found outcropping in quite a number of places on this and the adjoining farms. The Black Reef Series was cut quite near to the

surface in each of your boreholes. We have therefore practically an outcrop proposition, on which a mine can be opened quickly and at much less cost than the modern deep level proposition.

The latest development of the all slimming method of ore treatment by means of crushers and tube mills, instead of the very costly gravitation stamp battery method of reduction, should enable a fully equipped mine to be established at a much less outlay than was thought possible even six months ago. Under the Gold Law your company will be entitled to a minepart of 20 per cent. of the area of the farm of 3,205 morgen, which equals 641 morgen, or 923 reef claims, an area extensive enough to carry a very large reduction plant. In addition there will be a grant for a further number of discoverers' claims by way of reward for the successful boring operations. Under the Mineral Leases Act it will be possible also to secure additional ground from the Government on profit sharing terms.

I think, therefore, one may safely predict a successful and profitable future for the company on a very large scale. Shareholders are to be congratulated on the very good results from our recent operations. It has been a long wait, but as soon as the negotiations for the providing of additional funds are completed, and I am satisfied this will be very soon now, the future progress of the company should be completely assured.

Effect on Gold Mining Industry.

May I, in conclusion, refer to the possible effect of this company's work not only on the West, but on the Far East Rand. Our claims at Balfour are twenty miles beyond Heidelberg, and the result of our success there should lead to the opening up of a stretch of country many miles in extent to the great benefit of the community generally. What we have accomplished on the West Rand is to prove the connecting link, so long sought for, between the Randfontein Company's properties and the valuable farms of the West Rand Estates, proved to be rich by quite a number of boreholes.

Already there is considerable activity on the line beyond Luipaardsvlei No. 10

on the part of prospectors and others, and the Western Rand Estates.

Easy Mining Proposition.

Who knows but what the discovery of the pay reef so often talked of, extending from Randfontein to Klerksdorp, may not soon be realised? What the opening up of new payable lines of reef on the Far East and Far West Rand will mean to the people of the Union and the Government finances I need not enlarge upon. The country is badly in need of a fillip of this kind and your company is fortunate in being one of the pioneers in this direction at both ends of the Rand. Thanks are due to Mr. J. A. Thorburn for his untiring efforts in shareholders' interests, not only on the claims at Wilgepoort, but especially as supervisor of the boring operations on Luipaardsvlei No. 10. The disappointment of all concerned on the non-success of the first borehole, following on the failure of all our predecessors to locate the reef, although some seventeen boreholes were put down in the neighbourhood, was enough to damp the enthusiasm of the most optimistic. Mr. Thorburn, however, who years ago had been associated with some of the former ventures, was never downhearted, and the location of the now successful boreholes was the result of his careful study of the available geological evidence and the correlation of the work of his predecessors. He has also had the valuable help of the consulting engineer, Mr. J. M. Calderwood, who has made a close study of the extension of the Witwatersrand formation both East and West.

Our thanks are also due to Professor Lawn and the technical staff of the Randfontein Company, whose properties are immediately north of us, for information and assistance freely given at all times. I now beg to move the adoption of the reports and accounts.

Colonel J. Donaldson seconded, and the report and accounts were unanimously approved.

Messrs. Gustav Sonn, A. Mackie Niven, Harry Graumann, M.L.A., and Harry Hargreaves were re-elected directors, and Messrs. Aiken and Carter, and Messrs. Douglas, Low and Co., re-elected auditors.

New Type of Concrete Road.

Concrete roads have become quite familiar in many parts of the world, especially where highways capable of carrying very heavy traffic are required. The making of a satisfactory concrete road is, however, a matter of great skill; and in many cases disappointing results have been achieved. One of the drawbacks of concrete as a road material is that it contracts to a certain extent in setting and also as the temperature falls. Again, when concrete of the usual kind is laid in position the scum always works to the surface and forms a layer which when dry prevents a proper junction being made between different portions of the roadway. The consequence is that cracks appear in the roadway, especially at places where the laying of the concrete has been arrested, as in the case of the end of a day's work. A British road engineer has developed a new method which he claims obviates these difficulties. He lays the concrete in alternate portions and does not fill the intervening spaces until the material in the first portions has set and contracted. Further, he makes the edges of each portion exactly vertical by means of special appliances. This ingenious method results in the roadway being split up into straight close joints instead of a number of irregular cracks. When the coating of tar is applied it fills up these narrow joints, which act really as expansion joints. In actual practice the joints are not straight across the road but at an angle, in order to prevent the whole weight of a heavy load resting on the edge of one slab. Reinforcement is of course employed to strengthen the concrete, but in no case is it taken across the joints.

The Marvels of Aluminium.

Ever since aluminium was produced in a commercial form the greatest interest has been taken in its application to various engineering structures where lightness with strength is desirable. It was soon found that when aluminium was alloyed with other metals its strength was greatly increased without any great change in weight. Various alloys of aluminium have been used in the structure of airships and aeroplanes, and the results have been so promising that a special committee was formed in Great Britain to undertake systematic research of the properties of aluminium alloys. A report recently issued by this committee embodies the results of seven years of research conducted in the National Physical Laboratory, which is subsidised by the British Government. This research has resulted in the discovery of many alloys which are of great promise for practically all kinds of engineering, particularly motor-car manufacture, railway rolling stock, internal combustion engines, and steam engineering. The only problem awaiting solution is the production of these alloys on a commercial scale. Already a beginning has been made in this direction by a British Government factory; and British manufacturers are looking closely into the possibility of producing some of these wonderful substances for regular use in place of steel.

Why Costs Must Be Reduced.

Deep Mining: Problems and Achievements.

THE WORLD'S DEEPEST MINES—CHAMPION REEF, VILLAGE DEEP AND ST. JOHN DEL REY—TURF SHAFT BEING SUNK TO THE THIRTY-THIRD LEVEL—WORKING CONDITIONS AT 6,200 FEET—COSTS OF WORKING CONTRASTED—THE CITY DEEP PROSPECT—THE RAND'S DEEPER LEVEL FUTURE DEPENDENT ON OPERATING EXPENSES.

The subject of mining at great depths is always of great interest. There is a spectacular and almost romantic value in the conception of man's ability to probe into the bowels of the earth and to bring up from a depth of a mile or more an ore which will yield its metallic content at a profit to the adventurers—the old Cornish word for mine shareholders seems to have a singularly fitting application here—who have financed the stupendous and speculative undertaking. From an economic standpoint the question is of prime importance since the easily accessible minerals lying at shallow depths are being rapidly exhausted, more particularly in districts where the mining industry is highly developed.

Below Sea Level.

The Rand already can lay claim to one of the deepest shafts anywhere in the world. The Turf Mines shaft of the Village Deep, situated near the southern end of Eloff Street Extension, Johannesburg, has reached a vertical depth of 6,200 feet below surface. It thus rivals the deep workings of the Michigan copper fields and has been regarded as probably the deepest metalliferous mine in the world.

It is not particularly easy to visualise such an enormous depth, but to help one to appreciate the magnitude of this deeper level achievement it may be stated that the depth is not far short of a mile and a quarter, and this Turf shaft sunk on the high plateau of the Witwatersrand has penetrated far below sea level. The City Deep new southern shaft will, however, be sunk to an even greater depth than this, and in his valuable paper read some little time ago Mr. E. H. Clifford, the company's consulting engineer, described the arrangements made to work ore at a depth of 7,000 feet.

Which is the Deepest Mine?

Hitherto it has generally been understood that the deepest metalliferous mines of the world were situated in the Michigan copper fields, where the Calumet and Hecla Company is mining ore through the Red Jacket shaft for over 5,000 feet vertically below the surface, and is planning to make the 8,100 feet line of the inclined shafts a main haulage way, with subsidiary shafts to open levels to a depth of 10,000 feet. In the same district at the Quincy mine, the Pewabic amygdaloid lode, which has a dip of 54 degrees flattening a mile down on the slope to 40 degrees, is to be mined to a depth on the dip of 10,000 feet, being already worked for a length of three miles and a depth of over a mile.

In his paper on the City Deep project Mr. Clifford stated: "The greatest depths yet reached in mining are at the Morro Velho mine in Brazil, the Ooregum mine in Mysore, and the Village Deep mine at Johannesburg. It is a curious coincidence that all three are gold mines are of nearly the same depth, viz., 6,000 feet, the two former being somewhat greater and the latter some 100 feet less than this figure."

It was pointed out at the time that the Village Deep southern shaft (the Turf Shaft) had then reached a depth of 6,093 feet. Since then a further hundred feet have been sunk and we were of the opinion that either this shaft or one of the shafts of the St. John del Rey in Brazil had penetrated to a greater depth than any other metalliferous shaft in the world.

The Carmichael Shaft, Mysore.

But in an article on mining economies appearing in this issue of the Journal Mr. Hegarty, formerly mine captain of the Champion Reef Company on the Kolar gold fields, states that the Carmichael shaft of that property has been sunk to 6,500 feet vertical depth. The subject is of so much economic and general interest that we shall welcome from our readers in various parts of the mining world authoritative facts and figures regarding actual depths, cost of

working, and earth temperatures, and with a view to obtaining further information on the subject we give herewith some data which should prove of interest.

Conditions in the Turf Shaft.

We are indebted to Mr. Whitehouse, the manager of the Village Deep, for the following particulars of present mining operations in the Turf shaft of that company, which has penetrated to a greater depth than any other mine in Southern Africa. Sinking is now proceeding from the

Headgear at the Turf Mines Shaft of the Village Deep: The deepest shaft on the Rand.

thirty-second level to the thirty-third and a vertical depth of approximately 6,200 feet from surface has been reached. The strata at the bottom of the shaft are dipping at an angle of about 33 degrees to the south, and it is worth noting that the dip in the upper workings of this deep level proposition was 26 degrees. Thereafter the angle of inclination steepened to 40 degrees and as greater depth was attained it has flattened to 33 degrees, but at a depth of 6,200 feet the dip of the strata is about 7 degrees nearer the vertical

than it was in the upper levels of the mine, a fact which is in conflict with the general conception held a few years ago of the Witwatersrand conglomerates as a synclinal basin with a consistent tendency towards a flattening of strata as greater depths are reached.

At the thirty-third level the economic limit of hoisting on the basis of present hauling arrangements will be reached and further stage hoisting will be necessary. Two subsidiary hoists will therefore be installed at the thirty-third level. The temperature at the bottom of the shaft is 84 degrees dry and 81½ degrees wet. In Mr. Hegarty's article it is stated that ore is broken and hoisted from a depth of 6,500 feet at a cost of 8s. per ton. We scarcely think that this figure admits of any close comparison with Village Deep costs; we are not sure as to what items are included in Mr. Hegarty's figure and whether these items are the same as those of the Village Deep Company.

Deeper Level Costs.

It will, however, here be worth while to state the underground costs of the Village Deep, Ltd., which company is dealing with ore at a depth of 4,500 feet to over 6,000 feet from surface. Costs per ton mined:

	s.	d.
Breaking	5	7
Shovelling	1	3
Tramming	1	3
Hoisting	2	10
Pumping	0	9
Timbering	2	4
	14	0

Doubtless there are other charges to be added to this total. As we have already stated, we are unable to draw any close comparisons between Rand and Mysore costs in respect of hoisting gold-bearing ores from a depth of over a mile from surface. The Indian field has, however, apparently a substantially lower expenditure per ton than the Witwatersrand.

Dependent on Costs.

The prospect of winning gold from the auriferous conglomerates at even greater depth than have yet been reached is conditioned by the quantity and selling value of the gold in the ore and by the cost of winning it.

Engineering Problems.

Just after the Boer War Mr. Hans C. Behr, at that time consulting mechanical engineer to the Consolidated Gold Fields of South Africa, read his "Magnum Opus" on the subject of winding from great depths. At that time the Rand was commencing on its deeper level projects. The heyday of outcrop propositions had been reached and the success encountered in the preliminary development of the first row deeps had encouraged the controlling houses to proceed with the development of the propositions which had been taken up to the south right along the Rand. Maintenance of gold values, earth temperatures, ventilation, and the human factor called "industrial fatigue," were not considered to present any material obstacles to working at a depth of a mile or more from surface. The great problem was the haulage of ore from such depths and the down and up trips

of men, tools and stores. Mr. Behr's noteworthy paper, which provoked a tremendous amount of discussion from Messrs. H. H. Webb, Henen Jennings, A. M. Robeson, and other technical giants of those days, went to show that by the adoption of stage hoisting and the most modern types of winders there were no insurmountable obstacles to hoisting from the deeper levels of the Witwatersrand, and all that has happened since has proved the accuracy of Mr. Behr's estimates, amplified and supported by the bulk of the Rand's technical experts.

The Human Factor.

But it must be admitted that whilst the mechanical factor has given no cause for qualms the economic situation has not changed for the better. The values in the deeper levels have not come up to expectations, costs have been steadily rising, labour's demands have increased, and unfortunately efficiency has not kept pace with these demands for more pay and less work. Efficiency has, in fact, declined and the problems which confront the mines on the Rand as a whole, and the deeper mines in particular, are rather of the economic and human type and not of the mechanical kind.

We cannot determine or regulate the value per ton of the ore that lies in the deeper reaches of the great Rand basin, and we must therefore, if we wish to continue to win gold from great and increasing depths, so adjust the other factor—that of cost of production—that this ore yields a profit when it is brought to the surface and made to disgorge its precious, but low-grade, content.

It all resolves itself to this then, that the cost of working must be reduced if the deeper level projects of these fields are to prove successful. No man, no body of men in possession of sanity, can be particularly enthusiastic about sinking money in an undertaking a mile below the surface of the earth unless there is a fair prospect of securing a good return from such a tremendous speculation. And with working costs at their present high level the prospect of securing such a good return simply does not exist.

Mining Economics: Some Lessons from Other Fields.

HOW AUSTRALASIAN AND ASIATIC PRACTICES COMPARE WITH RAND METHODS—MINING FROM 6,500 FEET IN MYSORE—RUNNING MINES WITH FOREMEN AND COLOURED LABOUR—A STUDY IN COSTS—CARMICHAEL SHAFT OF THE CHAMPION REEF DEEPER THAN THE TURF SHAFT.

(By W. A. Hegarty.)

The following article, which has been specially written for the "Mining Journal" by a practical mining man who has had a wide and varied experience, contains several points which should have a valuable interest for the Rand at the present time when gold mining in the Transvaal stands at the cross roads of industry. Mr. Hegarty had a large experience of mining on the Witwatersrand before he was employed on the various mines he describes in this article, and as a practical man his comparisons are of value. The article shows how the big Australian metal producers have fared during the past three difficult years, and it also describes the methods of mining and the systems of labour control at some big Asiatic properties where coloured labour is employed under efficient European supervision. Mr. Hegarty's statement that the Carmichael shaft of the Champion Reef Company has reached a vertical depth of 6,500 feet will come as a surprise to most of our readers. We have been under the impression that either the Turf Shaft of the Village Deep or the St. John Del Rey mine in Brazil constituted the deepest workings for gold in the world, and we refer to this question in another article appearing in this issue.

In view of the possibility of a number of the low grade mines of the Reef ceasing operations owing to the increasing cost of production, falling premium, high wages, inefficiency, etc., it may be interesting if some notes on the mining industries of other countries at the present time were given by one who has worked for the past eight years as miner, shift boss, foreman and mine captain in Australia, India, New Zealand and South Africa.

How High Costs Have Closed Down Many Australian Mines.

Australia: During the war the mining industry was at its zenith. Broken Hill, N.S.W., where the famous silver lead mines are situated, and which is probably the biggest mining field in Australia, was employing between nine and ten thousand men. Wages were high, contractors were making big money, metals soared to a price never dreamt of, and things were going along swimmingly. Then the Armistice was announced. Within a few days metals had taken a turn, the price of lead falling from £35 per ton to £23, spelter following suit. Broken Hill companies, after a few weeks, came to the conclusion that, it being impossible to carry on, they should close down many of the mines pending a readjustment of wages; contract prices were to be revised, hours of working were to be gone into. A conference was arranged between the representatives of the union and the Mine Managers' Association, and after a good deal of argument on both sides, neither would give way; subsequently the whole of the mines closed. To-day, what is the position? Only the mines with a richer percentage of metals can carry on, all the low grade mines at the present have ceased operations, and this once prosperous mining field which employed 10,000 men, to-day gives employment to 2,000; and until such time as there are considerable reductions in the price of materials and a revision of the whole of wages agreement, both with the staff and the worker, I am afraid these mines will remain unproductive.

The Rand and Broken Hill Compared.

The Rand mining position to-day is much on a par with Broken Hill. It may be information to those in Africa who have practically acquired what mining knowledge they possess in this country if I were to give a little outline of the methods of mining adopted on the Barrier. Broken Hill has a line of lode in extent about 10 miles. The system of working is back stoping. I may mention that some of the stopes from foot to hanging are from 200 to 300 feet in width. Stopes that are being depleted are filled with sand, and the backs caught with bulks. Contracts are set fortnightly or monthly, as the case may be, at so much per ton. The minimum wage is 16s. 8d. Contracts vary in price according to the ground. There is no such word as inefficiency on this field. Every man gets paid for what he earns. Broken Hill has been the greatest technical college the Australian miner has ever had. His experience has varied from running ground to the hard sulphide. "No specialising" is practiced and the miner must be prepared to take any job on, from the "brace" to the "well."

Mount Morgan, Queensland's one great mine, is in the same position as Broken Hill, viz., closed down. It had over 2,000 employees. The monthly return from this great mine was from 10,000 to 12,000 ozs. and 300 tons of copper per month. The causes of closing down as given by the company were high cost of production, the low price of copper, cost of materials, high wages, etc. The company is asking for a 20 per cent. reduction in wages and, according to my last mail, there is every chance of a settlement and the mine reopening. The cost of production per ton has risen since 1914 by 50 per cent.

Many other big mines have closed, comprising Mount Boppy (gold), all of the Cloncurry field (copper), Great Cobar (copper) and a number of the Tasmanian mines.

New Zealand and Burma.

Waihi, the big mine of the North Island, is still carrying on; Reefton, in the South Island, also. It may be stated in New Zealand wages did not increase much during the war in the mining industry.

After finishing my trip to New Zealand I was offered, and accepted, a position with the Burma Mines Corporation, to proceed to the Northern Shan States, Upper Burma. This mine is situated 650 miles north of Rangoon and practically on the borders of China and Thibet. It would be hard to believe that in such an isolated position that on my arrival I was to view one of the most up-to-date mines it has been my lot to see, and at the same time one of the cheapest worked mines in the world.

In giving a description of the mine, a recent American visitor stated it was one of the most modern and up-to-date he had seen, even surpassing the American mines. In the report of the mine superintendent for 1920 the estimated reserves were 5,000,000 tons of crude ore, containing 28 per cent. lead, 17 per cent. zinc, and 30 oz. silver per ton.

The mine itself is worked by adit. The bottom adit, which is $1\frac{3}{4}$ miles in length, and is in size 15 by 12, is 900 feet below the summit of the hill, giving a height in backs of over 700 feet. The system of working is by square set on a rill of 45 degrees. The ground, being very heavy, requires bridging, back-lathing, and in places it is necessary for face-boards to be used. The labour used is Chinese, and for this particular class of work they are unequalled. What struck me most was that in a mine of these dimensions, with a tonnage or, at my time, 10,000 tons per month, the underground department had only nine whites, comprising the superintendent, two foremen, and five shift bosses and one sampler.

The cost of production per ton, put in the outside bin, which has a holding capacity of 10,000 tons, was four rupees. The mine was worked two shifts, and each shift had one foreman and two shift bosses, that is to say three men had the control of between 400 and 500 boys, with probably 70 working stopes and other development. The rate of pay for the white bosses varied from 350 rupees to 550, mostly covenanted.

Gold Mining at 6,500 feet.

After a year's engagement with this company, I resigned with the intention of returning to South Africa, where the money was more and a lot easier to be got, but fates decided otherwise. Whilst waiting for a boat at Rangoon I got into communication with the different superintendents on the Kolar goldfields, with the result that I accepted a position on the Champion Reef Gold Mines, Mysore State, Southern India, where more surprises awaited me. Not hearing much of this goldfield, I expected to see the usual things found on fields without any history. Champion Reef's main circular shaft is down 4,400 feet and has a circumference of 52 feet, 6-ton skips for ore hoisting, and two riding skips, each having a carrying capacity of 40 boys. The secondary shaft in "A" section, Carmichaels, has reached a depth of 6,500 feet vertical.

The mechanical appliances comprise overhead electric lift, which is attached to the headgear for handling timber, machinery, etc., into the skips, and is one of the finest, no man-power being required.

Rival Costs and Staff Conferences.

The organisation on the different mines is of a very high standard, each mine vying with the other to obtain the best results. Mine superintendents, chief engineers and chief mine agents meet every Monday morning in conference. In the afternoon the chief mine agents call the mine captains together and a general discussion takes place on any knotty problem that may arise for the economic work of the mine or the safety of the men employed.

In comparing South African and Indian mining from an efficiency point of view, South Africa must take a back seat. Very many men are sent from England to the Kolar goldfields, every man is covenanted. He signs on for three years, the rates of pay vary from 250 to 700 rupees, and he must hold the best credentials as a miner.

The system of working is underhand and rill back stoping. The stopes are not opened to a great length, as the open stope has a tendency to create air blasts. It has been proven that the quicker a stope is filled after the ore is beaten out is the safer plan. Therefore, even at the deepest parts of the mine, filling is the general rule.

In comparing costs with the Rand mines, I find a great difference. Whereas the Rand's costs are abnormally high, I find in "A" section, Carmichael's, Champion Reef, for one month a total tonnage of 4,434 tons were broken and sent to bins, at a cost of 8s. per ton. Appended cost sheets for verification. During this month a daily tally of 1,500 coolies were employed; native contractors, 9; No. of stopes working, 32; developing places, 13, under the supervision of 5 white timbermen-miners, 1 shaft timberman and mine captain.

A Practical Man's View.

In conclusion, I may say that the situation of the gold mining industry of South Africa does not appear to me to be a difficult proposition. What can be done in one country can be done in the other, especially in South Africa. Of all the mining countries I have visited the system of mining as adopted by the South African mines is the easiest, but apparently the most expensive. As this article has been written before the conference between the Chamber of Mines and unions, it is the earnest hope of the writer that a solution will be found to keep the wheels of the only industry that the country possesses revolving.

A REDUCTION IN PREMIUM INSURANCE AGAINST THE UNSEEN ENEMY FRICTION.

MODERN INSURANCE covers every hazard of industry except, perhaps, one
We suggest—

A lubricating policy for your entire plant.

If you have correct lubrication for your cylinders, but not for your shaftings, you are only "half insured" against preventable friction—and expensive power loss.

If your turbines are correctly lubricated and other bearings incorrectly lubricated, you are suffering a serious "partial loss" of productive power—and production.

The reduction in the gold premium demands that working costs and losses shall be reduced in every direction.

Only by correct lubrication throughout your plant can you insure yourself against—

—**loss of Fuel:** correctly-lubricated machinery requires less fuel.

—**loss of Power:** preventable friction slows down machinery and invites costly repairs.

—**loss of Production:** the machine that slows down, slows down your output.

—**loss of Profit:** after all, this is the important net loss.

The premium you pay for correct lubrication may be a few pence more per gallon of oil. This few pence a gallon represents not added expense but a marked saving in expense. It protects your machinery, while it speeds your output. Generally it reduces actual oil consumption.

If you are interested in insuring your plant against needless power losses, production losses, and profit losses, we suggest that you get in touch with our nearest branch.

Our lubricating recommendations are based upon—

- 1.—Experience gained through more than 50 years in manufacturing lubricating oils of highest quality.
- 2.—Our engineers' close contact with the efficient operation of all types of running equipment throughout the world.

Stocks are carried in principal towns throughout the country.

Figures that Talk.

THE POSITION OF THE MINING INDUSTRY IN STATISTICS AND DIAGRAM—WHY COSTS MUST BE REDUCED—THE RAND ON THE BRINK OF AN INDUSTRIAL ABYSS.

The following statistical statements which have been forwarded to the S.A. Industrial Federation by the Chamber of Mines, in response to the request of the former for amplification of the Chamber's proposals, show how enormously working costs have risen on the mines of the Rand and how urgent is the necessity for a reduction in working expenditure.

Statement No. 1 gives, among other figures, the following:—

Working Costs per ton.

Working costs per ton milled		Working costs per ton milled	
s. d.		s. d.	
1910	17 7	1916	18 1
1911	18 0	1917	19 2
1912	18 8	1918	21 7
1913	17 11	1919	22 11
1914	17 1	1920	25 8
1915	17 5		

Native and coloured wages: £655,073; percentage of 1914, 12·2.

Stores: £4,068,946; percentage of 1914, 39·8.

Totals: £8,909,211; percentage of 1914, 39·2.

Number of tons milled: 1,898,560 (decrease).

Number of Europeans employed: 793 (increase).

Tons milled per European employed: 126 (increase).

Number of natives and other coloured employed: 4,310 (increase).

Tons milled per native employed: 14 (decrease).

Statement No. 4 shows that the 17 mines which closed down between 1915 and November, 1921, crushed during 1915, 4,933,787 tons, and were employing in June, 1915, 3,547 Europeans and 35,639 natives.

Earnings of Contractors.

Statement No. 5 shows the number and average earnings of contractors employed on the Witwatersrand gold

£21,354,166.

WORKING COSTS 1914.

The World's First Motor Liner.

The first liner to be driven by oil was recently completed in Great Britain. She is a vessel of 8,000 tons and is equipped with two oil engines each with 8 cylinders designed to develop a total of 6,600 horse-power. All the

auxiliary machinery in the engine-room and elsewhere is driven by electricity. As this vessel will be required to make regular non-stop runs for long distances, the propelling machinery has been subjected to very severe tests which it has passed with complete satisfaction.

Hydromax - *for rapid economical Driving*

THE IDEAL Air Feed Raising Drill

Our New Tappet Casing entirely eliminates leakage of water over the operator or back into the cylinder. It is the only type which does this.

Why not give it a Trial?

It will give you the highest efficiency, lowest cost of maintenance, and further, is practically dustless.

Minerals in the North-West Cape Province.

VARIOUS MINERALS DISCOVERED—THE ASBESTOS INDUSTRY—OPTIONS GALORE.

(By a Special Correspondent).

Many parts of South Africa have seen far more money sunk in prospecting work and option payments than has been recovered from mining, and this is very true of the North-West of the Cape, the district stretching from south of Prieska to Upington and from Kenhardt across to Griquatown. There is hardly a farmer there who has not received option rentals at some time or other (often for years on end), and hardly a mineral that has not been sought for—yes, and found. To date, however, only one of the varied assortment has proved payable, namely, blue asbestos (amphibole asbestos or crocidolite of the mineralogist.)

The Asbestos Workings.

This substance is so typical of the Griquatown shales or jasper shales of the geological system now known as the Transvaal series, that the low ranges of hills composed of these shales which run from south of Prieska to north of Griquatown are marked on many maps as the Asbestos Mountains (the old Dutch farmers called them "Gift-Bergen," from the number of poisonous plants that were at times to be found growing thereon). The Transvaal system, with its asbestos deposits, runs right away to the north of the Transvaal. The mining of the blue asbestos started about 1891, the Cape Asbestos Company, formed very largely through the influence of the late Mr. Oates of De Beers, starting work in that year on the farm Koegas. There were many difficulties to contend with, the great distance from the railway (150 miles to De Aar), the thinness and somewhat erratic nature of the reefs which made ordinary mining methods unpayable, and the quality of the products. Manufacturers used to white asbestos were very chary of using blue, as although much stronger than the white, it is much harsher and requires special machinery to work it. The obstacles to be overcome in finding a market for this product may be judged from the facts that about 1899 some 300 tons of blue asbestos were dumped into the sea at Port Elizabeth to save storage charges, and on another occasion a claim for some £2,000 was made by a German firm for damage to their machinery through having tried a consignment of the material. However, through the energy and perseverance of Mr. Oates, ably backed up by the manager, Mr. Rundle Olds, these difficulties were overcome; a cheap method of mining was adopted by which each native worker got as much asbestos as he could and sold it at a fixed price to the company, facilities for manufacturing the crude fibre were started in England, Italy and Germany, and the blue asbestos slowly but steadily pushed into public notice and favour. The company has always pursued a conservative policy, dividends being considered of secondary importance to sound development and a secure financial position, and today the Cape Asbestos Company is, for its size, one of the strongest and most powerful concerns in the Union. Asbestos is found on practically every farm in the asbestos ranges, and there is hardly one where debris heaps are not visible on the hillside showing the position of old or present workings; only on a few, however, has anything approaching real mining been done, usually the work is little better than rabbit-burrowing.

Extension of the Field.

For many years this work was confined to the Prieska District, but of late numerous ventures have been started round Kuruman, and one or two in the Northern Transvaal. It should be noted that blue asbestos is found in quantity in no other part of the world, the quantity mined at present is about 6,000 tons per annum, which is very small compared with the output of white asbestos. There is no doubt that this output could be very largely increased; there is also little doubt but that the demand will increase also

when normal times again arrive. There ought to be a good future for the blue asbestos industry, especially if more efficient methods of mining can be adopted. At present it is practically all hand-labour, for although several mechanical installations have been tried for crushing and stamping the products, so far they have not been successful to any great extent. The problem of mechanical stamping is, however, surely not insoluble.

Some of the asbestos reefs are silicified, especially in disturbed areas, and the very ornamental stone known commonly as "crocidolite" or "tiger-eye," blue, yellow or brown occurs. When first discovered this material was despatched to England and Germany in small packets by parcel post and realised as much as five shillings per ounce. Then certain people, anxious for "get-rich-quick" results, sent it over in sackfuls and killed the market. At present there is practically no demand for crocidolite, which seems a pity as it is a very handsome stone.

Copper and Lead.

Copper is widely distributed over the north-west, both in the Transvaal series and in the older formations to the west. Most of the deposits are very small, though the ore

Opening up a Diamond Prospect in the North-Western Cape Province.

is rich and has tempted many prospectors and speculators to spend money on developments. There are several shafts 70 to 100 feet deep sunk in these veins in the hope of striking something better. There are two or three much larger lodes in the granitic areas to the west, notably at Vogelstruisbult and Areachap, but up to the present none of them have been thoroughly proved. Galena also occurs in places rich enough to encourage serious prospecting, but the results so far have not been satisfactory.

The Elusive Diamond.

Equally elusive has been the search after diamonds. Some farms are literally honey-combed with prospecting pits; every indication of a diamond mine is present except the mine itself, surface deposits, so typical as to strike the eyes of even a casual passer-by, well-marked fissures, even occasional diamonds, lying on the surface—still no mine found after years of active search. Many diamonds have been picked up in various parts of the district, both south and north of the Orange River. At least one farmer carries a diamond licence habitually (last year he picked up a stone weighing 55 carats and this year one of 34), and experts declare these stones to be mine stones—not river stones. In 1905 an enlargement of one of the fissures was discovered on the farm Sanddrift, and it was thought that the mine was at last located. There was great excitement in Prieska, a small syndicate was formed, and diamonds were actually obtained. The promoters could have sold

out at a handsome profit, but they refused to part. The work went on through 1906 and 1907; in March of the latter year 253 diamonds were registered, weighing altogether 36½ carats; the "mine" proved to be only about one claim in extent, the diamonds were not only small but of poor quality and the company ceased operations.

Saltpetre.

Deposits of saltpetre in the asbestos ranges have been known for many years to the farmers; the first attempt to work them commercially was in 1890, when a syndicate of Port Elizabeth business men took options over a number of farms. In 1899 Dr. Hahn, of Capetown, the brothers Struben, and a well-to-do prospector named Maidments, who travelled the country with his wife in a gaily-painted caravan, were all actively working on the saltpetre deposits, the two former floating companies for the purpose. The Struben Company still exists, I believe, and owns some farms near Griquatown, but it long ago gave up saltpetre and turned to ranching.

On the outbreak of the war, in 1914, with the consequent scarcity of potash salts, attention once more fell on the Prieska saltpetre, and several syndicates, some local, others financed from Johannesburg, started operations. In 1918 most of these were merged in Mr. Bleloch's Company, the South African Nitrate and Potash Corporation. Unlike its predecessors, this company worked on the rocks themselves, instead of the soil and detritus, but the results were equally disappointing. Altogether several hundred tons of saltpetre have been obtained at various times, but so far it has been found impossible to discover deposits consistent enough to work on a large scale.

Gold and Oil.

Two or three farmers have ruined themselves, and a good deal of Johannesburg money has been spent in the search for gold around Marydale, but there is nothing to show except useless shafts and fine samples and assays; no real reef was ever discovered. Most of the big mining concerns of Johannesburg and Kimberley have been actively interested in some parts of this district at one time or another, and have spent large sums in prospecting, or have acquired properties. There are several other minerals to be mentioned, but they only require passing notice. White asbestos has been worked towards Upington, but the quality is poor and the quantity limited; mica of good quality has been located, but so far no actual work has been done; heavy spar occurs in quantity, but the demand is limited and the price to be obtained is very low. The bold oil-drilling experiment at Carnarvon is just across the boundary of the district, and should that prove successful

it will undoubtedly stimulate a search around Prieska where indications of petroleum have been observed in the Karoo shales which abut in several places in the Griqualand formations. There are vast deposits of rich iron ore now lying neglected, which would become valuable if oil or coal were discovered anywhere near them.

NEW PATENTS.

- William Grant.—Improvements in or relating to the construction of buildings.
 Leon Robert.—Improvements in or relating to machine tools.
 Willem Johannes Bezuidenhout.—Balance gearing operated by horse or other gear for operating pumps worked by windmills and the like.
 James Henry Stuthridge.—Improvements in tube mills and the like.
 African Iron and Steel Products.—Improvements in linings for tube mills and the like.
 Percy Leonard Chapman.—An improved form of carburettor for internal combustion engines.
 Michael John Thorp and Alexander Jeremiah Orenstein.—Improvements in connection with scraping and dressing amalgamated plates.
 John Thomas Hird and Charles Henry Longridge.—Temperative safety device.
 Alfred Aaron Kloot.—Process for the manufacture of tiles and building materials from spent wattle bark.
 Gert Jacobus Jordaan.—A machine for drilling and pumping water.
 Harold Eustace Deyes.—Interlocking concrete device.
 Morris Green.—Improvements in separating metals from their salt solution.
 Coenraad Marthinus de Jager.—New and improved automatic coupling for railway rolling stock and like.
 James Richard Armstrong-Kelly.—Improvements appertaining to shovels and the like.
 William Edwin Bleloch and Harry August Stockman.—Improvements in means or apparatus for crushing or reducing minerals, ores and other materials.

GOVERNMENT EXAMINATIONS.

MINE MANAGERS' EXAMINATION

Total certificates (metal) granted to date 1921 — 36
 Secured by students of Messrs. Lucas & Wolfe — 21
 Balance for S.A. — 15

In addition to above we obtained 5 coal certificates last two examinations

The Miners' Phthisis Bureau.

A CRITICAL NOTE.

(By a Special Correspondent.)

The report of the Miners' Phthisis Medical Bureau for year ended 31st July, 1920, recently appeared in your columns. It is a work full of information on one of the most important aspects of mining life in South Africa. The work accomplished by the Bureau in the period under review has been tremendous, and comprises 42,030 clinical examinations and investigations, with the addition of 29,062 radiographic negatives 12 x 10, in addition to other work.

The Bureau examined 4,613 youths and men of European blood as candidates for underground work, but the legal definition of "The Anti-primary Stage" has now brought up the percentage of rejections to the highest point yet reached. It cannot be doubted that this special selection of picked men will shortly produce a considerable lowering of the incidence rate of Silicosis. Of the 4,613 candidates examined, 70.26 per cent. were of South African birth, and 29.74 per cent. were born oversea. Fifty-seven per cent. of all the candidates were permanently rejected on account of respiratory defect, or other physical unfitness, while 16 per cent. were temporarily rejected with the option of applying again for another examination.

When we come to the disease prevalence rates, we cannot help feeling that a great deal yet remains to be done to give us more satisfactory figures. During the year under review when 15,468 "working miners" were examined, the prevalence rate for tuberculosis was found to be 297 per 100,000. The prevalence of the anti-primary stage of silicosis was found to reach the high figure of a prevalence of 3,633 per 100,000. The examinations of the 15,468 "working miners" showed that the prevalence rate of primary and secondary stage silicosis uncomplicated by tuberculosis was 5,236 per 100,000, "the highest rate so far reached."

While the report suggests that conditions are better underground than formerly, we cannot feel cheerful over the showing that the average period which it took to acquire a decisive stage of the disease was—

1917-18	9 years 1 month
1918-19	9 " 2 months
1919-20	9 " 5 "

The speed is very slow when the matter is so vital!

It may be that machines are still at the root of the trouble, for the report states "that although underground conditions of work, as a whole, have undergone improvement for several years, the conditions of machine drilling work have not participated equally and simultaneously in the advance."

The attached report of the Miners' Phthisis Board contains one very interesting fact of use to all who contemplate farming at the termination of their mining career. It had cost the Board the total sum of £1,150 19s. 10d. per settler, at the end of 3 years and eight months, in respect of an average holding of a 75 morgen plot!

TUNNELLING OFFICERS CORPS OF ROYAL ENGINEERS (SOUTH AFRICAN BRANCH).

The third annual dinner was held at the Carlton Hotel, Johannesburg, on the 17th instant. Ex-officers representing most of the British Tunnelling Companies from all parts of the Reef and several outside districts took part in a pleasant reunion, before going on to the Empire. Major Kinahan was in the chair, and the duty of proposing the King's health fell upon Lieut. Tute, who had come from White River. Lieut.-Col. Pam referred in well-chosen words to the many tunnellers killed in the War, whose memory was honoured by a silent toast.

Letters of regret had been received from all parts of the Union, Rhodesia, and the Congo, and it was mentioned that great interest in the local dinners is taken by old tunnellers in England and Canada, who live too far apart to permit of

reunions. It is hoped that the good wishes of those present to the ones in this country who could not attend, and the old friends overseas, may reach them by means of the report in this journal.

Capt. Brodigan, who had volunteered to undertake the arrangements for the dinner, was suitably thanked for a successful evening, and Capt. MacWilliam, of the Robinson Deep, was elected to organise next year.

Those present included: Lieut. C. Albu, Capt. G. M. O. Barclay, Lieut. R. Bendall, Lieut. H. F. Brand, M.C., Capt. V. F. Brodigan, Capt. Bryant, Capt. W. G. P. Cobbet, Capt. E. P. Cowles, M.C., Capt. A. A. English, M.C., Capt. T. L. Farthing, Capt. N. W. Graham, Lieut. W. W. Hammond, Capt. C. C. Henwood, Capt. A. Hildick-Smith, Lieut. E. H. A. Joseph, Major B. A. D. Kinahan, M.C., Capt. K. J. There's just as much difference

between the work that can be performed by using a file that has been "sand-blasted" and one which has not been subjected to this process as there is between using a sharp saw and a dull one. It has been demonstrated by thorough tests that a "sand-blasted" file will remove at least one-third more metal in a given time than a file which has not been "sand-blasted." If, therefore, you want the best of good, quick, clean and true work, insist on having those patent "sand-blasted"

FILES

which are made from the best warranted crucible cast steel by SANDERSON BROS. & NEWBOULD, Ltd., OF SHEFFIELD.

The Financial Aspect of 1921.

UNION LOANS—THE RESERVE BANK—GOLD PREMIUM AND EXCHANGE VAGARIES—SHAREMARKET PRICES.

From the financial point of view the year that closes to-day must be written down as most disappointing. Not only has it failed to realise the high hopes entertained at its commencement, but it has witnessed a continued sagging away of public credit, the gold premium, and almost the whole list of sharemarket quotations. The price of gold a year ago was 116s. per oz., and there were hopes that the diamond market would recover. In both cases the tendency has been downward, and there seems little hope for immediate improvement. What may best be described as the chaotic state of the German exchange, and the confusion that has arisen therefrom in the financial and commercial conditions of other countries are, of course, mainly to blame for our financial troubles. The outlook is, of course, not without its good features. The net result of the Washington Conference must be a reduction of national expenditure and relief from a crushing burden of taxation. This, with the prospect of a settlement of the Irish trouble, may help the world to recover from the severe financial crisis. That crisis revealed itself in a universal slump in the values of commodities, and the upheaval in the exchanges which had a chastening effect on every class of trade. The channels of commerce have been clogged by exchange difficulties, and the coming international economic conference will have no easy task to unravel them. South Africa suffered, of course, with the *debacle* in British trade and industry, and our post-War boom was dissipated during the year. As mining and agriculture are our staple industries, they suffered most of all, and we have had twelve months' progressive decline in those and the other branches of industry and commerce dependent upon them.

Union Loans.

New Union loans have been issued during the year, both in London and locally. The former was successful, though the amount raised was absorbed in paying off other forms of public indebtedness. The loan issued locally is still open to public subscription. The new Reserve Bank was none too successful in its appeal to the public, and its initial operations have so far had little effect on the financial position.

A Year of the Sharemarket.

As in every other department of finance, the year has been most disappointing in the sharemarket. The trend of prices has been stationary where not steadily downwards, and business has been of the most meagre description. The general world conditions already referred to have, of course, been at the root of the matter, but there have been certain more local causes as well. Sectional strikes and labour troubles on the mines, consequent on the necessary efforts to reduce working costs and establish pre-War discipline have been a disquieting feature of the year, and it would seem that the men's unions are not yet willing to recognise that wages must come down and efficiency be restored if the mining industry is to be saved. The close of the year sees matters at last coming to a head, and naturally the market in shares and the attitude of investors is profoundly affected. Until finality is reached on the questions at issue, we must expect stagnant markets and an absence of enterprise. In diamond shares the market has gone from bad to worse during 1921, and in face of the reports from the world's markets for the stones, of course it could not be otherwise. Tin shares have fallen away on the sagging in the price of the metal, and the suspension of mining operations on the Transvaal properties. Colliery shares on the troubles of the coal trade have naturally eased off, though there has been no great pressure to sell. Transvaal Silvers, though firmer of late, experienced a big drop on the price a year ago, and Pretoria Silvers have fluctuated in sympathy with them. Industrials, such as Pretoria Cements and Hume Pipes, have not escaped the general decline, but they remain firm at the lower levels. The best commentary on the fluctuations in the

year's prices is afforded by a comparison of those at the beginning of the year and on the 28th of the current month, when the market re-opened for the closing days of the year.

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

Central Mining Dividend.

A good impression has been created in London by the declaration of a dividend of 6s. by the Central Mining people, involving a distribution of £127,500. The final dividend for 1920 was 6s., making 12s. for the year; in 1919, 18s. was paid, of which 6s. was a bonus, and in 1918 the distribution was 10s.

Luipaardsvlei Estate Finances.

The Luipaardsvlei Estate holds its annual meeting usually in London, but as a typical Rand low-grade mine its position is of financial interest. The outstanding Debentures were reduced during last year to £55,950, and by 1st January next the Board expect to bring the outstanding amount down to about £48,000. They have again written off a large amount—namely, £17,584—for depreciation on machinery, plant, buildings, etc. Cash in hand and gold in transit stood at £38,700, as against £16,667 last year, a very substantial improvement. The improvement in the profit and loss account as compared with the two previous years was considerable. There was a net profit of £22,960, compared with a loss during the previous year of £2,596, and a loss of £5,316 during the year before. This result was partly due to the effect of the price which was obtained for the gold, the average for the year having been £5 12s. 1.07d. It was further due to the fact that they had virtually suspended development from 1st July, 1920; also to the retrenchment scheme, which, in agreement with the mine workers, was instituted in May of last year, and which had brought about a considerable reduction in the number of white men employed in the mine. Another factor was a slight reduction in the cost of stores and materials, which had made further progress during the current financial year. The gradual reduction of working costs, both as to labour and stores, might be regarded as permanent, but development could not, of course, be suspended indefinitely, and, in fact, they had already, since 1st July last, resumed development and were paying for it out of monthly revenue. They had a total reserve representing nearly four years' crushing. It was the intention to give increased attention in the near future to the development of the Battery Reef sections of the property. Mr. E. Turk, replying to questions at the meeting, said that he did not altogether agree with the suggestion that had been made that working costs were coming down by 7s. or 8s. per ton, but if they only came down by 3s. or 4s. per ton it would be an enormous advantage to their company, seeing that, on their crushing of 250,000 tons a year, every shilling saved meant £12,500, or 5 per cent. on the capital. They were not in the position of some companies, with a debit balance; as soon as the financial position justified it they would be in a position to distribute dividends.

Kamfersdam.

The accounts of Kamfersdam Mines for year ended 30th June, 1921, show a loss of £7,613, making total debit of

£218,814. The annual meeting was held at Gresham House, London, E.C., on December 8th.

S.W. Africa Company.

The report of South-West Africa Company for 1920 states that company has claimed payment at pre-war rate of exchange of all amounts owing by debtors in Germany and cash assets in Germany which had been sequestered by the German Government, and proceeds of sale of certain securities belonging to company sold by that Government, together with compensation. Amounts totalling about £590,000 have been received in respect of these claims since 31st December, 1920. No provision has been made for depreciation on investments. Investments standing in balance-sheet total £1,284,457. Part of investments represented by British, Colonial and foreign (other than ex-enemy) securities stood in books at £624,689. Market value of these securities on 31st December, 1920, was about £478,000. Arrangements have been completed for purchase by company from Public Trustee of ex-enemy shareholdings in company amounting to about 1,200,000 shares. Union Government has recognised company's title under its Damaraland concession to whole of its unsold freehold, amounting to about 1,600,000 acres, and has extended until 17th November, 1923, period within which company retains sole right to prospect for minerals within area of Damaraland concession. Active exploring operations are being undertaken in various parts of area within which company temporarily retains sole mining rights, with a view to securing such properties as may appear desirable. Otavi Exploring Syndicate continues operations on mottramite (vanadium ore) occurrence mentioned in last report. Up to present about 700 tons of high grade ore or concentrates have been marketed.

Increased Insurance Rates.

It may not be generally known that as from January 1 all fire and motor-car insurance offices in this country have agreed to raise the minimum premium to 7s. 6d. instead of 5s. This will apply to renewals as well as new proposals. The reason given for the change is the great increase in the cost of general administration.

THE LOCAL SHAREMARKET.

Steadier After Christmas Holidays—Industrial Crisis Causes Setback.

When the market opened on Wednesday after the holidays, a much steadier tone prevailed than when it had closed on the preceding Friday. Most gold dividend payers were steady, some of the gilt-edged Far East shares even higher. Business, however, remained on a restricted scale and the holiday feeling pervaded the market. The result of the colliery conference was not known till after the market closed, and it naturally put a damper on business on Thursday. Coming on top of it, the Chamber of Mines message to the Rand miners and the V.F.P. attitude towards its employees caused a flutter, and provided the topic in the market, to the exclusion of business. It is recognised that the Chamber of Mines could not reasonably adopt any other course in the ultimate interests of the industry, and it is hoped that the common sense of the men on the gold and coal mines will prevail against the menacing attitude of the trade union leaders. At any rate the next few days should see the matter decided one way or another, and we can now only await events. The year in the sharemarket is reviewed in another part of this issue, and a table of comparative quotations is given, reflecting the changes of the twelvemonth. The Stock Exchange will be closed on Monday next.

EDITORIAL.

THE INDUSTRIAL OUTLOOK IN THE NEW YEAR.

Once again the industrial situation on the Transvaal mining fields is fraught with all sorts of unpleasant possibilities. The year-end conferences, both as regards the gold and coal mines, took a dramatic turn on Wednesday, when the final effort to settle the colliery wages dispute broke down, and when the Chamber of Mines brought discussions which recently have been in progress regarding the gold mines to a head by sending to the S.A. Industrial Federation notice of the termination of certain wage agreements and of intention to withdraw from the *status quo* agreement.

The letter from the Chamber of Mines gave formal notice that each of the existing agreements re piecework and guaranteed payment underground, or underground contract

work, would cease and determine as from the date upon which the working place or places concerned was next measured subsequently to January 31, 1922, and would be replaced by day's pay or by a "no cost" form of contract, details of which would be intimated at a later date. The Chamber also intimated that as from February 1, 1922, it withdrew from the *status quo* agreement.

Simultaneously the Victoria Falls and Transvaal Power Company declined to enter into further conference with the S.A.I.F. to discuss the increased minimum rates of pay recently demanded by the trade unions; and the engineers, boilermakers and moulders employed in the town engineering shops decided at a meeting to repudiate the notice given by the employers of a reduction of wages to operate from January 1.

In view of the letters from the Chamber of Mines and the V.F.P., and the seriousness of the colliery position, the Executive of the S.A. Industrial Federation announced that a meeting of the Joint Executives would be held on Friday at the New Trades Hall.

By reason of being a weekly paper and having to go to press the day before publication, we are unable to comment on the deliberations of the Labour Executives at this meeting, nor can we attempt to foreshadow the trend of events in this kaleidoscopic field of industry during the next few days. At the moment of writing, however, it seems certain that there will be a strike on the Transvaal coal fields on Monday, and it is quite possible that in consequence of the other decisions referred to above the trouble may not be confined to the Collieries. We understand that for some days and nights past the Railways have been rushing coal trains through from Witbank to the Rand and that the power stations have a substantial supply on hand. We take it, too, that the Railways have also made provision for emergencies. So far there is no threat of trouble from the Nurahs, and had there been any deeply-laid conspiracy to foment a general strike the Railway workers would scarcely have lent their aid to the employers by transporting coal. Of course, if there is anything in the nature of a general commotion along the Reef much of this coal will not be required. But there again we are speculating in unknown quantities. No one can tell at this juncture what the next few days may bring forth, and there does not seem to be any assurance as to the ability of the Government to adequately police and protect the Reef and the coal fields if the situation develops into a nasty one.

Writing on the matter under the disadvantage of not being endowed with the fine sense of prophetic instinct which is necessary to foresee the events of the next few hours in this country of surprises is not a satisfactory task. It will be better if we confine ourselves to the facts of the several cases as they present themselves at the present moment. And here we are on much more certain ground. Broadly speaking, the crux of the whole situation is simply this, that the miners, both on gold and coal properties, and the workers in allied industries like the Victoria Falls Power Company and the engineering shops are, at the instance of their paid agitators, refusing to look economic facts in the face. The Union's oversea coal trade is in jeopardy of being lost because competitive factors have come into the markets, and unless the cost of production can be reduced we shall lose what little grip we retain of the bunkering and export trades which have been built up so laboriously during the past few years. Similarly the gold premium is waning, and unless there is a general reduction of costs right along the Reef numerous mines will have to close down—some of them never to be re-opened.

To our way of thinking this is not the time for further conferences or for arbitration. The facts are patent and no amount of talk and exchanges of letters can alter them. In the councils of labour Time apparently is a factor of no consequence. No doubt the men's leaders would be prepared to argue from now until Doomsday on the questions of economics upon which our gold and coal mines must make a decision immediately if a tremendous catastrophe is to be averted.

We hold no brief for the Chamber. We have, in fact, frequently attacked the central organisation of the mines for procrastination and weakness in the past. But we now commend its present attitude of determination to save the mines of the country from ruin.

Strikes and deadlocks are unpleasant things. The employers certainly do not desire or seek them. But workers on the South African mines have simply got to realise the hard and sober necessity for coming into line with mine workers in other parts of the world, and in the face of falling costs of living and general trade depression accepting rates of pay which bear some economic relation to the ability of the mines to pay such wages and at the same time to earn an adequate interest for shareholders.

South African mine workers, in common with most other people in the world, have been living in a fool's paradise for the past few years, and we earnestly trust they will realise that the proposals of the Chamber of Mines, both in respect of gold and coal miners, are only reasonable, and that the Chamber's actions in regard to bringing these long-standing controversies concerning wages to an end will be in the best interests of the community at large—a term which, of course, includes the miners themselves.

THE YEAR WITH THE MINING INDUSTRY.

I.—The Rand.

The year which has now come to a conclusion has not been one of happy memories for South African mining. It must, in fact, be regarded as a period during which depression has gradually grown until at the end of the twelve months we find that practically every branch of the mineral industry, in common with all other branches of trade activity, is under a cloud.

The year 1920 was marked by political and industrial unrest, chaotic financial conditions and by general unsettlement and insecurity all the world over. South Africa did not entirely escape the turmoil born of the War, and although this country felt the effects of the great conflict less than almost any other country in the world we found that towards the close of 1920 the pendulum of time was swinging the Union backwards from unexpected prosperity to a period of severe financial stringency, coupled with unemployment.

These conditions, which are the joint outcome of circumstances arising out of the Great War and of labour unrest, have been accentuated during 1921, and they have left a deep impression on the mining industries of the country. The gold premium has undoubtedly been the outstanding feature in the situation on the Rand. Had the mines received the old standard price for their product there would, in the face of recent labour demands and additional taxation, have been an industrial catastrophe which would have engulfed the whole Reef. As it is to-day we are faced with the fact that gold has declined in price to 98s. per oz., and on the present basis of costs a large number of our mines are working at a loss.

What apparently is happening is simply this, that the old world is gradually putting its house in order. Trade and credit conditions as between Great Britain and America are improving, and the British pound recently has made something in the nature of a leap towards parity with the American dollar. This has brought about a depreciation in the gold premium, that ephemeral and accidental factor which has saved the mines of the Rand. In Europe and America the costs of living are declining; they are declining here, too, and just as the expenses entailed in the production of an article are coming down overseas so is it absolutely essential that the costs of production of the gold mines of the Rand—the industry which is virtually carrying the whole country on its back—should likewise be reduced. Happily for the whole country, the gold industry during 1921 has carried on with little curtailment of production. There has been nothing in the nature of a general downing of tools, and the ill-advised strikes of the election period,

and more recently at the Crown Mines, were not allowed to continue for any length of time or to extend into commitments of first importance, simply because the bulk of the workers are opposed to throwing away their bread and butter at the behest of a few agitators. After the fiasco of February the Chamber of Mines abolished the stupid practice which it had adopted during the War period of collecting doles for the trade unions to fatten on—a piece of maladministration which this journal severely criticised. And in August, after numerous conferences and the exchange of lengthy letters, the Chamber, despite its mis-handling of the factor of the gold premium, obtained a small reduction in wages on the mines. In November the industry gained a further appreciable, though not magnificent, advantage in respect of an amendment of the Mining Regulations which admits of more work being obtained from native labour.

All this has been helpful, but it is insufficient to save many lower grade properties from inability to work except at a loss. There appears to be a widespread illusion that mines, unlike other industries, possess some magical properties which enable them to continue to lose large sums of money and yet to keep working. This, of course, is an absurd and utterly impossible view to take of the situation. The year end finds the industry in the throes of another dispute, and no better presentation of the facts and figures can be given than those advanced by the Chamber of Mines the other day in substantiation of their case for the reduction of costs. We reproduce in another portion of this issue some of these statistics, and would earnestly commend them to the attention of our readers.

It is not surprising to find that during a year of depression such as that through which we have just passed there has been little accomplished in the direction of expanding our field of gold mining industry in the Southern Transvaal. The closing of Daggafontein and the despatch of the now famous Heidelberg cables have tended to damp enthusiasm in so far as the eastern annexe of the Rand is concerned. On the other hand, interest in the Far West Rand has been stimulated by the borings on the farm Luipaardsvlei No. 10, and it may be that in the not far distant future this property, and perhaps the Western Rand Estates to the south, will bulk fairly largely in the picture of future expansion.

As to the mines already working, the only large proposition which is assured of entry into the list of producers within the next year or two is the New State Areas. Against this must be set the fact that several of the older propositions of the Central Rand are approaching exhaustion, and that unless costs are materially reduced a number of other mines which still possess substantial unworked claim areas will have to cease production on account of the low-grade character of the ore. Technically speaking, the past year has not brought forward very much in the nature of improvements in underground practice, but in metallurgy the experiments undertaken by the Consolidated Mines Selection group at Springs and Brakpan have resulted in an inclination of thought towards the ideal plant, which will be without the gravity stamp battery and will embrace the principles of all-sliming. The New State Areas equipment will be modelled on these lines.

It must not, however, be gathered from the foregoing that we have said the last words in respect of either above or below ground technique on the Rand. On the contrary, it is probable that one of the developments of the near future will be a fitting and proper appreciation of the fact that centralisation and standardisation of technical practice has been overdone and that substantial economies and improvements may be effected by working our mines as individual units, all members of a group or groups of control, but requiring at the same time divergent methods of handling according to variations in size, gold contents depth, and a host of other factors.

In concluding this necessarily brief review of the year's events on the Rand one cannot but refer to the disaster at the Ferreira Deep, which has cast such a gloom over the whole Reef at the close of the year. But, whilst we all

deeply grieve with the dependants of the brave men who lost their lives in this calamity, the whole country takes pride in the magnificent courage exhibited by the rescue parties.

In our next issue this review will be continued so as to embrace the diamond, coal, and base metal industries of the country.

Notes & News.

Swaziland Tin.

The working results of this company for the current half year have, by reason of the depressed condition of the metal market, shown no profit. The directors have in consequence been reluctantly compelled to pass the dividend which, under happier circumstances, would have been declared per 31st December, 1921.

Oil Shales.

It is well known that oil shales have been worked for the production of oil for a number of years in Scotland, France, and a few other countries, but lately deposits in the Kimmeridge clay in England have been receiving attention, whilst those in Norfolk are under development. Much research has also been undertaken on the vast oil shale deposits in the United States, especially those of Utah, Colorado and Wyoming, those at De Beque, Colorado, being actively developed. Interesting information on the subject of this source of oil is given in a volume entitled "Oil Shales," by H. B. Cronshaw, B.A., Ph.D., A.R.S.M., just issued in the series of monographs produced under the direction of the Mineral Resources Committee of the Imperial Institute. It is published by Mr. John Murray at 5s. net. The monograph first describes oil shale and the similar material torbanite; the mining and distillation of oil shale; and the composition and properties of shale-oil. Descriptions follow of deposits of oil shale and torbanite in various parts of the British Empire, including those in the Utrecht district of Natal, Wakkerstroom district of the Transvaal, Albert County in New Brunswick, Pietou County in Nova Scotia, Blue Mountains in New South Wales, and Mersey district in Tasmania. Accounts of foreign deposits are given next and include those of the United States, France, Bulgaria and Brazil. A map showing the oil shale deposits of the world and a bibliography conclude the volume.

Union's Mineral Production in November.

The following are the principal items to be noted in connection with the mineral statistics of the Union for the month:—Output: Gold, Witwatersrand, 690,892-416 fine ozs., value £2,934,724; other districts, 15,341-599 fine ozs., value £65,167; total, 706,234-015 fine ozs., value £2,999,891. Silver, 82,971-871 fine ozs., value £14,289. Diamonds, 47,607-84 carats, value £159,188. Coal (sales), 916,688 tons, value £375,436. Copper ore and concentrates (sales and shipments), nil. Tin concentrates and metallic (sales and shipments), 151-312 tons, value £13,300. Other base minerals (sales and shipments), value £9,305. Total value, £3,571,499.

Glynn's Lydenburg.

One of the interesting facts emphasised by Mr. Max Honnet, the chairman, at last week's annual meeting of Glynn's Lydenburg was that it cost the company 92s. 7d. to produce an ounce of fine gold last year. With the drop in the price of gold the company will, of course, have to economise in the current year. As regards the vital question of mine life, the chairman said the present ore reserve, with the addition of further ore which they might reasonably expect to develop, would enable them to carry on profitably for a few years to come. On the advice of Mr. R. A. Barry, the new consulting engineer, the Board had initiated a comprehensive scheme of development and exploration. Of this the principal feature would be the sinking of a vertical shaft in the southern extension of the Werf Mynpacht mine to explore that important region. "Our mining advisers all agree it is here that our main hope for the future lies."

said the chairman. He concluded: "The steps we are taking to secure the future of the company are, in our opinion, absolutely necessary and in the interests of shareholders, and we will devote our energies and resources to the accomplishment of that end. In doing so we will husband our funds, by which I mean that the prosecution of the work I have outlined will be our first care, and that we will suspend or curtail dividends to such an extent as may be found necessary, until such time as we have put the company into a position of reasonable security for the future."

African Oils.

In order to comply with the requirements of the Committee of the London Stock Exchange, the African Oil Corporation, Ltd., has issued the following public statement:—"The purchase consideration paid to the vendor, Mr. Arthur Pratt, for prospecting and option contract over the farms Virginia and Kronhoek, and certain 29 prospecting claims known as Pongola Bush, was £1,200, in cash and allotment of 110,000 fully-paid shares and an option to acquire at par within three years of the date of the registration of the Company shares to the nominal value of £139,000, out of which 75,000 shares of 10s. each (equals £37,500) have been called up. Additional property was acquired on the 5th December, 1919, for which £500 cash and 40,000 fully-paid shares were paid to acquire a contract on two further farms, Ijzermijn and Goedgevonden, adjoining Virginia and Kronhoek. The farms embrace a total area of 4,517 morgen 428 square roods. The contracts secure to the Company prospecting rights for a period of five years in each case and thereafter leases for a further period of 55 years. In the terms of the leases to be entered into the Company can mine oil shale and coal, subject to the payment of a royalty of 6d. per ton in respect of oil shale and 2d. per ton in respect of coal, the minimum rental payable under each lease being £1,000 per annum. Surface and water-rights are secured for all mining purposes. The borrowing powers for the purpose of the Corporation conferred on the Directors are unlimited, but up to the present no money has been borrowed. The Corporation was formed to acquire and to exploit the rights over the above-mentioned four farms situate in the Wakkerstroom District of the Transvaal, and also the coal and oil shale area in Natal mentioned above, Pongola Bush, adjacent to the Wakkerstroom District.

The late Mr. H. Wilson Fox, M.P.

London papers to hand by this mail comment at considerable length on the much regretted death of Mr. Henry Wilson Fox, M.P., a former editor of the S.A. MINING JOURNAL, which occurred in London on November 22. *The Times*, in a sympathetic and appreciative reference, says of the deceased gentleman:—

Born in London on August 18, 1863, he was the second son of Wilson Fox, M.D., physician in ordinary to Queen Victoria. He was educated at Charterhouse, Marlborough, University College, London, and Trinity College, Cambridge, of which he was exhibitioner and scholar, obtaining honours in the Natural Sciences Tripos. He was called to the Bar in 1888 by Lincoln's Inn, of which he was an equity scholar. In the following year he went out to Johannesburg on the staff of the Consolidated Gold Fields of South Africa, and in 1892 he edited the SOUTH AFRICAN MINING JOURNAL, and assisted Mr. John Hays Hammond in drafting the Rhodesian mining laws. He was appointed Public Prosecutor of Rhodesia, and during the rebellion in Matabeleland and Mashonaland in 1896-7 he served as Director of Transport and Commissariat for the Salisbury force, being mentioned in dispatches and receiving the medal with clasp.

Returning to England in 1897, Mr. Wilson Fox was appointed in the following year manager of the British South Africa Company, of which he became a director in 1913. He took a prominent part in the formation of the Charter Trust and Agency, and represented the Chartered Company on the principal Rhodesian directorates. He was also the inventor and patentee of a system of hydraulic storage. At a by-election in February, 1917, he was returned unopposed as a Unionist for the Tamworth Division of Warwickshire, and was again unopposed at the General Election of 1918 as the Coalition candidate.

Lord Harris Reviews the "Goldfields" Year.

STRONG CASH POSITION—SEVERE DEPRECIATION AND ITS CAUSES—REPLY TO CRITICISM.

A brief cabled summary of the proceedings at the "Goldfields" meeting in London has already appeared in our columns, and the features of the directors' annual report have also been reviewed. The mail brings the detailed report of the lengthy speech made by Lord Harris at the meeting, and we take from it some extracts dealing with the most interesting points. Lord Harris made extended reference to the cash position, in the course of which he said:—The cash position is quite good, the combined figures are £709,000 odd, as compared with £741,000 odd last year. The accounts of the old company call for little comment. In the absence of a dividend on the shares in the New Consolidated Gold Fields, our only income is the interest on the few assets we retain, £3,600, to which has to be added the amount brought in from last year, £162,600, a total of £166,243; against this have been charged the dividends on the two classes of preference shares, and this leaves a balance of £57,342 to carry forward to next year. The total assets of the two companies, after deduction of liabilities, are £4,446,000, to which must be added the unrealised appreciation of share holdings, unflated properties, stands and buildings, which we estimate to amount to a very big figure.

Depreciation.

What I have said I think explains to you the position. It is very unfortunate that, notwithstanding the very large revenue we have received, you do not receive a dividend, as we are bound, much as we dislike it, to use our profits in meeting depreciation. I would further add this. In the case of quoted securities, we have, of course, no difficulty in arriving at the amount of depreciation, but in the case of unquoted securities we must use such knowledge as we have and give consideration to every factor which in our opinion governs the situation and the value of the investments, and I think I can fairly say that, in view of the unsettled state of business throughout the world, we have perhaps been more drastic than we should have been in ordinary times.

Causes of the Depreciation.

Perhaps it would not be out of place to refer here to what has mainly caused our heavy depreciation. Curiously enough, it was one of our stand-bys, and the one South African share which we determined to retain. No less than one-third of your depreciation this year is due to our holding in Robinson Deep. Unless our experts are altogether wrong, the price to which Robinson Deep "A" share has fallen is entirely without justification, but it is a quoted stock, and therefore it is our duty to write them down to the market price, and this has been done. Let me remind you that on engineering advice, with which all parties to the deal were absolutely satisfied, an amalgamation took place between the Robinson Deep and the Beoyens property. The Robinson Deep shareholders were amply protected by the issue to them of cumulative preference shares which were estimated, and are still estimated, to return to them at least as much, but probably a great deal more than they could have realised by working Robinson Deep on its own. From the Robinson Deep point of view the policy of amalgamation has been amply justified by subsequent events. The mine, as you are aware, is situated at a very short distance from the town of Johannesburg, and is among the mines which have suffered from subsidences, accompanied by serious earth tremors. To make a long story short, all the working shafts of the old Robinson Deep have suffered to such an extent that they have practically become unworkable, and had it not been for the foresight of our technical advisors in sinking the deep shaft on the Beoyens property, which it was possible to connect with Robinson Deep workings, the latter would long ere this have become unworkable, and the mine would have had to be closed down. Surely there has been no lack of enterprise there. From our point of view the amalgamation was an insurance against total loss, and a very useful insurance it has proved to be. The mine is now making good, but as the ultimate results must

naturally depend on the so-called gold premium it is impossible for me to make any definite forecast. The outlook, however, is distinctly hopeful. Now let me follow this up, as it is a fair example of how our revenue has been affected, and of how we have been affected, and of how we have been temporarily hit by market depreciation, and remember that the asset I am speaking of is considered a perfectly good one. At date the Robinson Deep owes us no less than £222,000 by way of cumulative dividends overdue on our holding. We have every reasonable hope that we shall receive this revenue in time, but meanwhile we have, in order to reduce holdings to market prices, had to write down this asset by the appalling amount of £160,000—more than one-third of the total amount of depreciation. That surely must convince some of our critics that we were not without reason when we sought for more baskets than the South African for our investments.

South African Industrials.

As regards our industrial investments in South Africa, we have, of course, had to face the bad times that every other commercial company or house has, and, in certain cases, we have considered it wise to write down our original stake, but except in the case of our coal proposition, there is no reason whatever why these investments should not become remunerative as prosperity returns to the trade of South Africa and the world. As regards the coal property, to which I referred last year, and about which I was at the time rather hopeful, work was started on the property, an incline shaft was sunk to cut the seam of coal previously intersected in boreholes, and some development was accomplished at the bottom of this shaft. There was at this time a serious decrease in the demand for export coal in South Africa, and, in view of the results obtained in the small amount of development done, we considered it advisable to suspend operations until there was evidence of a growing demand for this class of coal. Critics may say that if we had held our hands and left our money in Treasury bills, we should have been better off to-day, and that is essentially the criticism which falls under the category of being wise after the event.

Mr. A. Hyman's Criticism.

Mr. Aubrey Hyman strongly criticised the policy and management of the Company, and Lord Harris replied to him in detail. The matter is summed up in the following letter to Mr. Hyman, quoted by the Chairman:—

"My Dear Sir,—I have informed my colleagues, I hope correctly, if not do not hesitate to put me right, of your views, wishes, and intentions as regards the board of Consolidated Gold Fields. You hold, so I gathered, a very poor opinion of the ability of our management in South Africa, and of the enterprise of the Board, and you are satisfied that you could be of great service to the company if you had a seat on it; of which you are ambitious and ask us to further your wishes, failing which it is your intention by organisation and propaganda, in which you are prepared to go to great expense, to solicit the votes of the shareholders in your own behalf, and also on behalf of such number of your friends as will ensure you, if and when successful, a dominating position. We have given respectful consideration to your proposal, but fail to see how your experience of South African mining can be of much, or perhaps any, assistance to the company, having regard for our diminished and diminishing interests in that country, nor are we aware that you have any such experience in mining and other business in other parts of the world as would be of assistance to us. You will not expect us to agree with you as to your opinion of our having not shown sufficient enterprise, and I am confident I shall be able to show the shareholders at the general meeting that it is due to our foresight as regards the prospects of South African mining and our enterprise elsewhere that we have been able to preserve the very considerable revenue shown in the accounts.—Believe me, faithfully yours,

(Signed) HARRIS."

Mine Surface Officials' Association.

VARIOUS VIEWS ON MINING ECONOMICS.—THE CONTRACT SYSTEM DISCUSSED.

The Mine Surface Officials' Association of South Africa, which has a membership of approximately 2,000, held their third annual general meeting recently in the Scientific and Technical Club, Fox Street.

The President, Mr. J. H. Mader, in the course of his speech, stated that at the last general meeting the Association had been unsuccessful in its endeavour to obtain for its members on certain mines retrospective application in regard to their wages. Persistence and tact, together with good arguments, gradually overcame the Chamber's opposition, and eventually the schedule was adopted with fall retrospectivity to October, 1919.

Reductions in Salaries.

Last December, as they were aware, the cost of living had risen approximately to its highest point—57 per cent. Then the Association, in common with like organisations, requested a review of the position, but was shortly thereafter confronted with the fact that in conformity with the price of gold the cost of living was gradually reflecting the betterment in the world's supply of commodities, and as a consequence the employer was enabled to represent the necessity for a decrease in the cost of living allowance.

It was just at this juncture that the necessity for closer co-operation between the two Officials' Associations became imperative, and although closer relationship between themselves and the Underground Officials' Association had been somewhat attained, nothing very practical had resulted. As a culminating point in the desires of the joint membership the suggested amalgamation was modified, and the existing arrangements, empowering a joint committee to act, were adopted. Meantime the Chamber of Mines had been in negotiation with the workmen's unions, and as a consequence thereof all day's pay employees had their consolidated pay reduced in August.

The M.S.O.A. and U.O.A. were advised by the Chamber that as a sequence of the above, officials' allowances would have to be reviewed, and it was suggested that the application of the reduction should operate as from October 1, 1921. Following this intimation, pourparlers were immediately arranged, and, as illustrating the soundness of a uniform policy, the joint committee satisfactorily negotiated a very difficult position by obtaining a time log of three months in the application of any reduction.

This matter was again under review, and in congratulating the joint committee he trusted their present endeavours would be a matter for further congratulation.

Dismissal of Old Employees.

The Association had at times felt that old employees were sometimes rather arbitrarily dismissed, and as in the majority of cases the individuals are totally unadaptable for other work, such dismissal constitutes a catastrophe, and efforts are being concentrated upon some scheme for the compensation of such officials. It was also not inopportune to refer to the belatedness of service increments, which under ordinary circumstances would have been automatically granted by the employer. He submitted it was now time for the employer to recognise where efficiency had demonstrated itself, and interpret the schedule of wages agreed upon in its natural application, and not by making the minimum wage agreed upon the maximum.

Unfortunately the Association had been unable to rectify the anomalous position created by the management of the Victoria Falls Power Co. This Corporation slavishly followed the policy of the Chamber of Mines in dealing with its employees up to a certain point. Latterly, however, they had been confronted with a complete *volte face* by this Company, which had introduced a scheme, the tendency of

which is the degradation of officials to a workman's basis. This policy must react, and, as a result, inefficiency and dissatisfaction would be the reward.

Even at this late date, he again represented the justice and equity of the arguments put before this management, and trusted that tardy recognition of the same would, to a great extent, remove the difficulties he had forecasted.

Collieries, Hospitals, etc.

Their members employed on the various collieries had benefited very considerably by the Association's activities. The time log in the introduction of the cost of living allowance to colliery employees had been recognised by the employers, and the justice of an equivalent period for the reduction of the allowance had been agreed to.

During the year the Hospital Superintendents' Association decided to throw in their lot with this Association, and several important matters had been dealt with on their behalf.

There had been considerable improvement in organisation among branches, resulting in greater efficiency. Pilgrim's Rest branch had been granted local autonomy on the same lines as granted to the Hospital Superintendents' branch. During the coming year it was probable that the Compound Managers would be constituted as a separate branch of this Association, with local autonomy.

The Contract System.

"It has long since been generally realised that one of the factors responsible for high working costs is the very high rate of earnings under the contract system appertaining on nearly all the mines, and I view with much scepticism the Chamber's proposal to substitute therefor "No-cost" contracts, where the incentive to the miner to do good work is based upon bonuses.

"I believe that the miner is influenced to exercise some measure of economy in the use of stores and labour when he has to pay for them, whilst he would probably give far less consideration to economy if he is only indirectly taxed for extravagance through a possible diminution of his bonus. The bonus-sharing scheme which has been applied in one form or another on several struggling mines in the past, and now in force on the Simmer and Jack and Ferreira mines, offers far more real prospect of economy combined with efficiency than a "no-cost" system.

Profit-sharing Systems.

"There are many varieties of so-called "profit-sharing" systems. I am, however, referring to two sub-divisions only as applied on these fields. The first aims at automatically curtailing the possible abnormal earnings of the contractor by an increasing proportion of excessive profits being paid back to the company; the second provides for a division of portion of the excess over a figure recognised as a good rate of earning among day's pay workers in the mine, thus ensuring the co-operation of the latter in the endeavour to secure greater general efficiency and economy, and it is the latter form which I contend holds the best possibilities for any substantial reduction in working costs."

ANSWERS TO CORRESPONDENTS.

Powdered Fuel, Mount Ngwibi.—The article was written by the editorial staff of this paper and the information was obtained from various technical exchanges. Would you care to approach us further in the matter?

Official Reply to Nurahs.

NO REVERSAL OF POLICY.

THE ECONOMIC NECESSITIES MUST BE FACED.

With reference to the recent interview between the Minister of Railways, the Railway Board and the National Union of Railway and Harbour Services, the following letter has been despatched to the National Union by the Secretary to the Minister for Railways, in reply to the memorandum handed in by the deputation:—

“ With reference to the deputation which waited upon the Minister and the Railway Board on the 28th instant, I am directed to inform you that the Minister and the Board have considered the memorandum handed in, and I am instructed to reply as follows:—

“ To agree to the requests contained in the memorandum would mean the complete reversal of the policy which the Government and the Administration have been compelled to follow during the last six months, and which is entirely due to the financial position of the Railways. At the end of March, 1921, the accumulated deficit in railway working was £2,598,884. During the first six months of the current financial year, *i.e.*, from April 1 to September 30, this loss was further increased by £1,037,000.

Fallacy of Further Rate Increase.

“ To meet increased expenditure rates have been increased during the last four years, and to-day stand at an average of over 40 per cent. above what they were prior to the War. On the basis of the 1920 traffic this means taking a sum of £7,165,000 extra out of the pockets of the users of the railways.

“ It has been suggested that the Administration should again raise rates and fares to meet the deficiency. To do this would not only not bring an increased revenue, but would undoubtedly result in additional falling off in traffic and would also be a grave injustice to the majority of the people in the Union whose earnings and incomes have dropped to or below pre-war level. Take, for instance, the maize grower, the cattle farmers, and others who are to-day selling their products at less than pre-war prices, and at the same time have to pay more for the cost of transportation of such products to the market than they did prior to the War.

“ To meet the position the Administration has consequently been compelled to take steps to reduce working expenses, and with that object has taken off the cost of living allowance, modified the eight-hour day, and reduced the number of staff. But after making these reductions the staff will, taking an average right through, be still in receipt of emoluments some 33 per cent. higher than they were prior to the War. The Administration, however, has not confined its efforts in reducing expenses solely to the staff. It has reduced the train mileage, especially on branch lines, withdrawn many concessions from the public, cut down the cost of supplies, and curtailed services wherever possible.

“ With regard to:

Points of Administration.

“ 1. The question of the so-called double trial, the Administration's attitude in regard to this matter has been explained so frequently both in Parliament and elsewhere that it is unnecessary to deal with the matter again here.

“ 2. The question whether, when the Administration requires additional staff, it will give those retrenched the first chance of re-employment, I am to say that provided their services were satisfactory and their record was good, their applications for re-employment will be the first to receive consideration.

“ 3. The Conciliation Board. The Administration is not aware that its constitution or functions have been in any way interfered with, and so far as its recommendations are concerned, the Minister who is responsible to Parliament for the administration of the railways must reserve the right to accept or reject them, and cannot accept the position that amendments in conditions of service made at the instance of the Conciliation Board or otherwise should necessarily be unalterable.

“ 4. The allegation of grade depreciation, the Administration is not aware that any undertaking in this connection has been departed from.

Rate Reduction.

“ 5. The policy of rate reduction referred to in your memorandum, the Administration presumes that reference is made to the reductions effected recently in coal rates. No reductions have been made in the rates for coal conveyed to the gold mines or for factories, or, in fact, for any local consumption, but the Administration has been compelled to make reductions in the bunker and export rates to enable South African coal to compete against Welsh and English coal which, during the last few months, has dropped to a low figure. Had these reductions not been made, South African coal would have been entirely out of the bunkering and export markets, thereby entailing a loss of traffic to the railways, leading to a further reduction in staff and compelling some of the coal mines to close down. At the same time the coal mine owners materially reduced their prices for similar reasons.

“ The Administration had also made certain reductions in the rates for cements to the ports to enable the locally produced article to compete there against imported cement. When making this reduction the Administration, however, made it a condition that the price of cement at the ports should also be considerably reduced.

“ In so far as the status of European labourers is concerned, it is not possible for the Administration to guarantee permanency in rates of pay and other conditions.

“ Railway servants must admit that during the past few years they have been liberally dealt with, and the Administration feels that under existing conditions it is justified in calling upon them to make sacrifices in common with the rest of the community. It cannot, therefore, hold out any hope of a reversal of the policy which has been forced upon it by the present depression.”

Mining Men and Matters.

Mr. W. W. R. Jago, Secretary of the Mine Managers' Association, has returned from a visit to England.

* * *

Mr. W. Gemmill, Actuary and Labour Adviser to the Chamber of Mines, arrived in Johannesburg from England last night

* * *

After six months in Europe and the United States, Mr. I. W. Schlesinger, Managing Director of the African Theatres and African Life, returned to Johannesburg this week.

Letters to the Editor.

TRADE WITH CENTRAL EUROPE.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—As a loyal and patriotic South African, I must agree with the strictures uttered by yourself and many others ancient the Government's choice of a Trades Commissioner for Central Europe. But in all the articles and letters I have read, one most essential and important matter seems overlooked. What advantages are expected and looked for from this appointment, whether it be Mr. S——— or another? I may be labouring under an illusion; if so, I shall be very glad to have it dispelled, but I cannot see any great possibilities of profit to South Africa as a whole from increased trade with Central Europe under present conditions. I certainly see great possibilities of profit to the importers of German manufactures, but as far as the farmer and the ordinary citizen are concerned I see nothing very alluring in the prospect. It is undoubtedly a great chance to be offered to Germany to regain much of the ground lost during the War, but what will be the benefit to South Africa as a whole? I shall be very glad if some of your readers more widely versed in economic problems will explain exactly what is hoped from this appointment. I will state my own point of view in a few sentences:—

(1) Trade was reopened with the Central Powers, so we were told a few months ago, largely because if Germany, etc., could not trade she could not possibly pay her War indemnities.

(2) Although free trading (or almost free trading) has been going on for some time, Germany now declares that she cannot pay the next instalment of the War debt—in other words Germany (official Germany that is) is more or less bankrupt, and the reason for free commerce with that country is no longer valid.

(3) According to newspaper reports (all most of us have to depend upon) commercial Germany is in a highly prosperous condition.

(4) Owing to excellent organisation, docile and industrious workers, and above all to the favourable conditions of exchange, Germany (short for Central Europe) can undersell and is underselling every other manufacturing country in the world, and bids fair to regain all, and more than all, she lost by the War, besides causing wholesale unemployment in other countries.

(5) The person who sells cheap cannot buy dear; if he does he treads the rapid road to ruin. The only South African exports to Germany are mealies, wool, hides and possibly asbestos, copper and other minerals. If the exchange at present allows the German trader to sell cheaply, it will react on him when he attempts to buy, and the German trader is too astute to ruin himself (Germany may be officially bankrupt, but commercial bankruptcy is quite a different matter). What therefore is South Africa to expect from increased trade with Central Europe? Cheap manufactured goods giving a large profit to the importer, but beyond that nothing. We seem to be entering into a very one-sided bargain, in which Germany has everything to gain.

Sir Henry Strakosch proposed that instead of payment in money, Germany should be forced to hand over power plants, railway material and so forth free. His scheme has met with severe criticism, and rightly so. Many people have suggested that the War debts, Germany's and others, should be cancelled. This also seems a one-sided bargain, as the United States would be an enormous loser, while the Central Powers would gain to an almost equal amount. My own suggestion, made with all diffidence, is that instead of boosting German trade by the appointment of an expensive official, is that South Africa erects a tariff wall round German exports, to such an amount as will counteract the artificial rate of exchange; if people wish to trade with

Germany and use German goods they will then have to pay about the same price as for British, American or South African manufactures of the same kind; the whole country will then really benefit by the revenue from these duties instead of a minority only. I do not suggest a prohibitive tariff, but one that will bring the German manufactures just a little below the similar goods from other countries; this will enable the persevering German to continue trading to some extent, but will prevent him swamping the market, and also will prevent profiteering by other manufacturers. The revenue thus derived could be used, if thought desirable, to pay bonuses on exports of wool, hides and other South African produce sent to Germany. I cannot see, as I said before, how under the present exchange rates Germany can buy wool or anything in South Africa at a price that will tempt a seller.)

Perhaps any scheme, like Sir Henry Strakosch's, is more or less visionary and open to fatal objections. At any rate, the South African Customs officials in Johannesburg attempted to enforce something of the kind when they held up consignments of fancy goods from Germany a few weeks ago, on the plea that the duties payable on the absurdly low prices at which the goods were invoiced were not sufficient to warrant their being released. The prices of German goods at present, when changed into British currency, are absurd, there is no gainsaying it. Numberless instances could be given, but one will suffice: the glass apparatus for a certain South African college if bought in England would have cost £240 (two hundred and forty pounds); it was actually bought in Germany for £27 (twenty-seven pounds). South Africa wants money, Germany wants business, my scheme seems to provide for both, without allowing any one section of South African business men to reap undue advantages at the expense of the rest of the community.—I am, yours, etc.,

E. G. B.

FOR THIRTY YEARS AND OVER

THE JOHANNESBURG BOARD OF EXECUTORS AND TRUST COMPANY, LIMITED, has had under its care many and varied forms of Trusts—as Executor, Trustee, Administrator, etc.

Its wide experience, the well-known ability of the officials who are responsible for its management, and high regard in which its patrons hold it, are attributes which commend this Company to you.

WILLS appointing the Company Executor can be held in safe custody free of charge.

In addition to handling of Estates, the Company acts as Agent for Absentees, and undertakes—

Secretarial Duties,
Purchase and Sale of Landed Property,
Collection of Rentals,
Investing of Capital,

and generally every Trust and Agency, including Insurance in all branches.

Money advanced against the security of
First Mortgages.

A GEOLOGICAL SURVEY.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—In your journal of 26th November I notice that the age of the carboniferous rocks is given as 550 million years, as measured, according to the lecturer, by the new "radio-active substance" method. This figure, however, must be the maximum one, the medium figure being 340 million years. It is known that the element uranium continually changes or subdivides into other elements according to a definite plan of subdivision. It turns, for instance, into radiouranium, ionium, radium, and further, into emanation, helium, radiolead, polonium and lead. Now, uranium occurs in many minerals of granite, syenite, pegmatite, gadolinite, monazite, and especially pitchblende, its commercial source. Since no link of this uranium chain is durable or constant (the life or existence of each member may be as short as a few seconds, and as much as several thousand years), one has to expect the continual subdivision of new members in minerals containing pitchblende, and the continued appearance of more members to occur. This expectation does actually come to pass. Further, one finds that, in the unchanged mineral between uranium and radium, an equilibrium of weight appears, provided neither can join or disunite, because uranium, on the way over radium, changes into helium and ultimately into lead, and, since the annual mass of helium forming out of uranium is known, one can easily measure or calculate the age of the mineral out of the relationship of the easily measured mass of helium to that of uranium. Of course, it is essential that the helium examined must have come from the uranium only; in other words, that the mineral must not originally have contained helium, and that between the examined substance and its environs, no interchange of uranium and helium must have occurred.

Since one cannot verify the accuracy of these suppositions, especially since one never knows if all of the formed helium remained on the spot, this method of calculation only gives minimum values. If one, however, considers the relationship of uranium to the formed lead which is decidedly more constant and stable than the inert gaseous helium, one gets much higher values—maximum values. The average age of some important geological formations is, according to this lead-reckoning as follows: Pre-Cambrian, 1,100-1,640 million years; Silurian, 430 million years; Devonian, 370 million years; Carboniferous,

340 million years. The corresponding minimum values of the helium-reckoning are: Devonian, 145 million years; Carboniferous, 141 million years; Eocene, 31 million years. The above methods of radio-calculation are by no means beyond debate, but it is on the highway towards more exact methods of measuring our earth's age.—Yours, etc.,

E. E. BUTTNER.

INCOME TAX RELIEF TO RESIDENTS ABROAD.

To the Editor, *S.A. Mining and Engineering Journal*.

Many enquiries have reached me from, or on behalf of, individuals resident abroad, with reference to the reliefs allowed from British Income Tax in the circumstances set out in my letter of September last. As it is apparent that in many cases repayment of tax will be claimable for three years (the limit allowed), may I point out to your readers generally that no claim for the year 1918-19 will be admitted after 5th April, 1922.—Yours, etc.,

W. R. FAIRBROTHER,

Income Tax Specialist.

London, E.C. 2.

TRADE AND INDUSTRIES SECTION.

Week and Year in the Mining Material and Engineering Trades.

GENERAL OUTLOOK—IRON AND STEEL—TIMBER AND BUILDING MATERIALS.

General.

The topic to-day dominating all else is the attitude of the colliery workers towards the proposed 5s. (roughly) reduction of wages per shift. The exigencies of going to press so early in the week prevent us from dealing with this important matter as fully as we should like in this issue. The gravity of the position is only too apparent in face of the recent ballot of the coal workers in a majority of 18 to 1 in favour of a strike against the proposed cut. The intervention of the services of Mr. Patrick Duncan, the Minister of the Interior (in the absence of the Prime Minister) assures the commercial community that this important key industry will be treated with the respect it deserves, and leads to the hope that this difficulty (like so many previous ones) will eventually be satisfactorily solved. In the meantime the power stations here, Germiston and Vereeniging are augmenting their supplies of coal with a view to carrying out arrangements as per schedule. It would be a parody to speak of business this week as concerning the mining material and engineering trades. At this season nothing is doing nor expected, but the underlying current towards betterment, provided the coal question and other important points are satisfactorily settled, is firm. Given a satisfactory solution of the coal question and that of the underground problem, with increased efficiency on the part of white workers, merchants are looking hopefully to the new year. As regards prices those subjoined are those ruling, but there is a certain resiliency in respect of some lines which is determined of course by size and credit. In retrospect the year which closes to-day has been an unfortunate one for merchants generally; the cutting of prices on Change has been more severe than has been witnessed here for many years, and merchants will only be too glad to close their ledgers with, unhappily, big debit balances, and look forward to better business in the coming year. This notwithstanding, the commercial community is seeing 1921 out without much regret and with liveliest hopes and expectations as to what next year will usher in. The past year has been characterised by a hand-to-mouth policy of buying on the part of the mines, caused by the extreme financial stringency prevailing during that period (and accentuated by the usual end of the year closure) and the continued drop in the price of gold, which, although it has been of incalculable value in restoring the balance of currency in Europe, has proved disastrous to some of our lower grade mines and will, if no counter measures are taken in respect of lower costs of production, give the death blow to many of our struggling propositions. The crucible is now on the fire, and the flux is awaited with mixed feelings. The coal crisis is not a favourable pointer, but even in this key industry a favourable outlook is awaited. The Christmas box looked for on all hands is the inauguration from tomorrow of such a scale of wages on the part of the miners, backed up with a greater efficiency in underground work, as will meet the inevitable downward trend of gold to normal. It is unnecessary to dwell upon the decline during the year of steel plates, which are now pretty nearly at second-hand levels, nor upon other lines which have been sacrificed during the past twelve months. Suffice it to say that the "scalping" sacrifice which has been in progress during the past twelve months, and which in a more or less re-

stricted measure is still in progress, has been productive of one saving clause, that in some lines commodities are getting scarce, with a probably bigger scarcity in the absence of any big indent business on the part of our merchant princes.

Iron and Steel.

Prospects in steel circles in Glasgow, notwithstanding the disarmament agreement which disturbs many current arrangements, are still good. Several thousand tons of plates and sections, it is stated, have been placed at Moss End, where work has been partially resumed. It is expected that early in the coming year half of the normal staffs will be employed there. With a view to enliven the iron trade the Cleveland blast furnacemen have suspended the sliding scale of wages, which have fallen from 170 to 77 per cent. during 1921, and have accepted a reduction as from January 1 to 36 per cent. of the so-called base rates. That the disarmament agreement now being arranged in Washington will have an alarming effect on Sheffield and other large manufacturing centres in Britain is shown by the statement that before the conference ships estimated to cost £32,000,000 were already under contract, which work will of course be cancelled should events in America go as it is generally thought they will go. Of the total cost of the ships £23,000,000 would represent wages, affecting about 5,000 men this year and upwards of 25,000 in the new year. In this connection it is stated that work in the steel department of Messrs. Beardmore's forge at Parkhead, Glasgow, has been closed down. This development will be a big blow to the Clyde, wiping out with one stroke of the pen years' work involving a wage bill of something like £15,000,000, which would have gone a long way towards relieving the unemployment problem. The outlook at Barrow and Wallsend, with decreasing orders, is also said to be very gloomy.

Timber and Building Materials.

Building operations, owing to the building holidays, have been quiescent.

Prices: 3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver boards, 4 $\frac{1}{2}$ d. to 4 $\frac{1}{4}$ d.; floorings, 6 $\frac{1}{2}$ d. to 6 $\frac{1}{4}$ d.; ceilings, 4 $\frac{1}{2}$ d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 6s. 6d. to 7s. 6d.; corrugated iron, 9d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cubic here for first quality, 16s. 6d. for second at the coast; American oak, 1in. 10 $\frac{1}{2}$ d., 1 $\frac{1}{2}$ in. 11d., 2in. 11 $\frac{1}{2}$ d. at coast; and Japanese oak, 1in. 1s. 1d., 1 $\frac{1}{2}$ in., 2in. 1s. 2d. at coast; West African mahogany, 1in. to 4in. thick, 26s. 9d. to 27s. 6d. per cubic at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelling, 1s. per foot. Prices for bricks, although remaining about the same, have a hardening tendency, and should we have heavy rains the tendency will be

upward. Bricks are about 70s.; mixed, 60s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000 at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180lb. bag; 8lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Second-hand Machinery.

A prominent dealer said that during the current month of December he had dealt with more business than during the previous six months. The mines, he stated, were compelled to purchase, and he looked forward to a good time early in the new year.

Oil.

At the annual meeting of the Anglo-Persian Oil Company the chairman stated that the profits for the past year amounted to about £5,000,000. Prospects for the coming year were very encouraging.

SHELL OIL.—The production, we are given to understand, this year is 60 per cent. over last. We understand that the capital of this company is about to be increased.

Coal.

In Scotland the coal-owners are coping with a rush of orders, unequalled for many years. In South Wales the prices are stiffening on a rush of foreign orders.

Reduction in Ship Wages.

A further reduction of £3 per month has been announced from overseas, affecting sailors and firemen.

FALLING FREIGHTS.—Australian freights have fallen, according to a Wellington cable, from 11 to 25 per cent.

The North German Lloyd S.S. Company have increased their capital from 250,000,000 marks to 600,000,000 marks.

British Shipping.

Some 700 to 800 British ships, representing a tonnage of 3,000,000, are, it is announced, at present lying idle, as it is found less costly to lay them up than to run them, although this is about £15 per ship per day, or a weekly total of some £100. Some 25,000 of the *personnel* are thereby affected.

German Developments.

The annual report of the German Electrical Company shows vast improvements in trading developments during the past financial year. The capital of the company has been increased from 200,000,000 marks to 850,000,000 marks, but, this notwithstanding, has paid a dividend of 16 per cent. The board of directors is asking for a further 250,000,000 marks.

The Mannesmann Tube Works, with a capital of 89,750,000 marks, has increased its dividend from 20 to 30 per cent. This company, it is well observed, is interested in the Rand Water Board undertaking.

The report of Krupps, Ltd., shows a profit of 98,000,000 marks, compared with 97,000,000 last year.

The Coal Strike.

COLLIERIES AFFECTED—THE ECONOMIC FACTS OF THE CASE—LESSONS OF THE STRIKE IN GREAT BRITAIN.

At the time of writing the Transvaal coal strike is in progress. A fair amount of work is, however, being carried on and at several properties coal winning is being accomplished by the native workers and the mine staffs. At some properties no hauling is being done, but at others a more or less normal output is being maintained. The centre of the strike area is, of course, the Witbank district, but in the outlying areas such as Springs, Vereeniging, Ermelo and Breyten, the colliers are idle. The mines affected are:—

Witbank District: Anglo-French, Clydesdale, Coronation, Transvaal and Delagoa Bay Colliery, Middelburg Steam Colliery, Station Colliery, Tweefontein Colliery, Witbank Colliery, Outspan, Schoongezicht, Oogies, London and Vaalbank.

Kendal District: Kendal Colliery and Kendal United Colliery.

Vereeniging: Cornelia Mine, Vereeniging Estates.
 Springs District: Springs, Largo, Apex and Vischkuil.
 Ermelo District: Bellevue and Grenfell.
 Breyten District: Breyten Colliery.
 Balfour District: South Rand Collieries.

In connection with the economic aspects of the strike the following statistics relating to the coal mines of the Transvaal are taken from the Government Mining Engineer's reports, and show how substantially costs have risen:—

	1914.	1920, over 1914.	Percentage Increase 1920
Output—Tons	5,157,268	7,180,124	
Value of Coal at Pit's Mouth—			
Total	£1,150,746	£2,187,681	
Per ton	4/5.55	6/1.12	36.55
Expenditure—			
Salaries and White Wages—			
Total	£219,954	£474,143	
Per ton	0/10.24	1/3.85	54.79
Native Wages—			
Total	£262,571	£469,145	
Per ton	1/0.22	1/3.69	28.40
Stores—			
Total	£342,895	£841,851	
Per ton	1/3.96	2/4.14	76.32

1918	228,423	8.51	7.2
1919	248,756	9.01	7.0
1920	304,982	10.19	7.2

* Out of Dividends provision must be made for amortisation of capital, a coal mine being a wasting asset.

In connection with the cause of the dispute—the reduction in wages—it is pointed out by the coal owners that the coal miners contend that the 5s. cut is too high as compared with the reduction in the cost of living. But in October, 1920, they accepted an increase of 10s. per shift on pre-War rates, and at that time the percentage increase in the cost of living, according to the figures of the Director of Census, was 57 per cent. The latest figure (November, 1921) is 22.5 per cent. Obviously, as the percentage increase in the cost of living has fallen from 57 per cent. to 22.5 per cent., the cut should have been 6s. per shift instead of 5s. per shift.

Lessons of the British Strike.

At this juncture it may not be amiss if we draw attention to some of the facts and figures concerning the great British coal strike of last year and particularly the lessons which that industrial catastrophe taught the people of Great Britain.

The coal miners of Great Britain, after 13 weeks of ruinous idleness, resumed activities on June 16, 1921. The settlement terms for the reduction of wages were agreed to between the Government, the owners and the miners, as under:—

Broadly speaking, the miners gave up the demand for a national pool and nationalisation of the mines, while the owners, on the other hand, forewent the determination to cut wages in a drastic manner, in some cases amounting to 45 per cent., which originally brought about the dispute.

Peace was secured for a minimum period of eighteen months. The following was the basis of settlement:—

- July: Reduction of 2s. a shift.
- August: Reduction of 2s. 6d. a shift.
- September: Reduction of 3s. a shift.

Afterwards the permanent arrangement came into force for at least a year, and it will then be terminable by three months' notice on either side.

Expenditure per ton on the Collieries. The "Remainder" per ton on the Collieries.

The Debit Side of the Strike.

It is impossible to estimate the damage to British industry during the 88 days' stoppage of the mines, but it

was unquestionably colossal, and its ramification has been felt in every walk of life.

The miners themselves lost 60 million pounds in wages alone, and despite the settlement this is not the full extent of their loss.

British coal production was 140 million tons less last year than during the year before the War.

Unemployment has grown tragically as a result of the stoppage. Other unions have become bankrupt.

The cost of the coal dispute to industry, commerce, and wage-earners could be reckoned, according to some statisticians, at hundreds of millions sterling.

In June Britain produced less than 19,000 tons of steel and pig iron. In May, 1920, the two classes of metal totalled 1,585,000 tons. The failure of the coal supply accounts for the difference in the two totals.

In the month of May, 1921, the steel and pig iron output of the States was 2,720,000 tons, or nearly double the English figure of last year, when the boom was at its height. And this total of nearly three million tons in the States is, so far as the steel figures are concerned, only about 50 per cent. of the steel tonnage for 1920. The pig iron production of the United States was 37 million tons last year.

These figures show how competition from other countries has taken advantage of the British miners' post-War attitude towards capital. The facts and figures here given have their moral for South Africa. We can only hope that the lesson of the British strike will not be lost upon the colliers of this country.

DIVERSION OF SHIPPING.

In consequence of the coal strike the Union is already in danger of losing a considerable portion of its overseas coal trade. As a matter of fact even the shadow of the strike has been highly detrimental to the colliery interests of this country. Weeks ago steamers proceeding to South African ports commenced coaling at Madeira in anticipation of a shortage of fuel on arrival in South Africa.

The first of the serious reactions on trade occasioned by the coal crisis was announced in a statement issued by the Chamber of Mines on Tuesday relative to the case of eleven steamers waiting in Delagoa Bay for 81,000 tons of coal.

The statement is as follows:—

"There are in Delagoa Bay to-day eleven steamers waiting for 81,000 tons of coal. To meet this demand there are at Delagoa Bay and in transit only 21,500 tons. If the strike continues, therefore, there will be a shortage of almost 60,000 tons. Arising out of this matter, a cable message was received this morning from the charterers of these vessels in London to the effect that unless some assurance can be given that the coal will be forthcoming as usual these steamers will be immediately diverted elsewhere. This means an immediate loss of 60,000 tons of shipping trade, and it will certainly be many months before that trade can be recovered. Consequently the colliery representatives desire it to be clearly understood that unless the strike terminates and normal operations are resumed before these ships leave, it will be impossible for the collieries to re-employ the same number of men as hitherto.

"In addition to this, the loss of oversea trade cannot fail to be reflected by the employment of fewer Europeans on the railways and at the ports.

"The oversea trade referred to has been secured against world competition at prices below which the collieries cannot go and continue to pay even the wages offered, against the acceptance of which the men have so unreasonably gone on strike."

ANSWERS TO CORRESPONDENTS.

R. Fotheringham, Nairobi.—We have passed your letter on to the people concerned, who will, doubtless, reply to you direct.

South-West Transvaal Diamonds.

A Bloemhof correspondent writes:

The October return of the alluvial diggings show that Blesbok heads the whole list with £5,600, and has only 190 registered claimholders. With the present price of diamonds this is very good. Someone must be finding fine diamonds to make up such good returns. Blesbok is a very extensive property, and the whole of it more or less bears diamondiferous gravel. Rich patches may be opened up as the farm is further developed. The correspondent adds: "I met a digger this morning (a Mr. Kruger) who told me he had found and sold a 24½ carat for £505. I heard of another beautiful stone of 29½ carat, and of many smaller ones; so some diggers are doing all right, but, of course, they are in the minority."

Coal Mining in the Transvaal.

Facts and Figures about our Coal Trade.

WHY EXPORTS MUST BE MAINTAINED AND COSTS REDUCED—ECONOMIC ASPECTS OF THE STRIKE.

Although the South African coal industry has shown considerable expansion during the last ten years, and although the value of its produce is, next to gold and diamonds, the third highest amongst the mineral products of the Union, the output of our collieries is very small compared to that of the rest of the world, as the following figures show:—

Country.	Output of Coal (tons of 2,000 lb.).	Latest year for which figures available.
United States of America	556,516,000	1920
United Kingdom	229,295,000	1920
Germany (excluding Ruhr and Upper Silesia)	131,346,000	1920
Ruhr	88,250,000	1920
Japan	33,970,000	1919
Upper Silesia	31,686,000	1920
Belgium	22,413,000	1920
France	21,863,000	1919
India	21,759,000	1919
Canada	14,450,000	1920
Australia	11,790,000	1919
Union of South Africa	11,473,452	1920
Spain	6,135,000	1918
Holland	3,402,000	1919
Italy	1,158,000	1920
Malay States	191,000	1920

South Africa occupies a similarly humble rank when its total coal resources are compared to those of the rest of the world. These are, in fact, only about 1 per cent. of the world's total.

While South Africa may occupy a low position in the list of coal-producing countries, the value of the recent

The relationship in the Railway receipts between coal and other traffic for the year 1920 was as follows:—

	£	%
Goods and Minerals (other than coal)	9,665,913	42.1
Passengers	6,049,916	26.3
Coal	5,201,183	22.6
Livestock	721,409	3.1
Parcels	631,754	2.8
Miscellaneous	623,065	2.7
Other Traffic Receipts	80,182	0.4
	<hr/> 22,973,452	<hr/> 100.0

From this point of view alone it appeared to the Coal Commission that every reasonable step should be taken not only to maintain this important industry, but to strengthen and expand it in every possible way.

The position of South Africa as an exporter of coal relatively to other countries is shown in the following table:—

	(Tons of 2,000 lb.)	
	1912.	1917.
United States of America	19,811,680	—
United Kingdom	67,035,848	37,800,705
Germany	34,321,852	—
Canada	1,583,782	1,954,024
France	—	—
Belgium	5,081,000	—
India	874,199	832,332
Japan	3,470,000	—
Australia	2,152,385	646,552
China	—	—
Union of South Africa	389,410	591,754

At a Transvaal Colliery.

output is of considerable importance to the country, and this production is now being jeopardised by the strike.

The Railway revenue derived from coal during the year 1920 was	£5,201,183
While the income derived by the Collieries from coal sold was	£4,506,572
or a total of	<hr/> £9,707,755

By far and away the greater proportion of this ten millions of money was expended on wages and stores in South Africa.

These figures show that while in 1912 South Africa produced 0.65 per cent. of the world's output, it accounted in that year for 0.3 per cent. of the coal exported from all countries. In 1920 the export of South African coal had risen to 1,394,793 tons, but statistics for other countries are not available. Bunker coal is not included in these figures.

The growth of the South African export and bunker trade, including coal shipped to Union ports during the

past dozen years is shown by the following figures in tons of 2,000 lb.:—

	Transvaal.	Natal.	Total.
1909	4	1,388,596	1,388,600
1910	155,296	1,757,794	1,913,090
1911	113,667	1,808,997	1,922,664
1912	363,270	1,835,297	2,198,567
1913	669,249	1,886,570	2,555,819
1914	579,419	1,594,595	2,174,015
1915	458,996	1,361,970	1,820,966
1916	738,358	1,708,405	2,446,763
1917	861,761	1,555,561	2,417,322
1918	767,146	1,340,440	2,107,586
1919	789,099	1,382,192	2,171,291
1920	1,122,500	1,774,912	2,897,412

This export and bunkering trade is essential to the Collieries, and it is now being imperilled by the strike.

The export and bunkering coal trades of the country have recently been adversely affected by competition overseas, and if the market, or even a portion of it, is to be retained the costs of production will have to come down. In other words, wages must be reduced. Failure on the part of the coal owners to achieve this reduction will mean:—

(1) The complete loss of the value of the cargoes for the eleven steamers waiting at Delagoa Bay.

(2) The loss of future cargoes of coal, for it very soon becomes known that delivery is uncertain at any port, and ships avoid such ports.

(3) The rise in the price of our inland coal for industrial production owing to the fact that the Transvaal industry relies for its profit on export coal and does not make its profit at present out of internal coal.

(4) A reduction in local industry which always follows rising costs of fuel would take place.

(5) In a few months' time, even if the men were able to retain temporarily one or two shillings out of the proposed reduction, there would be a gradual closing of a considerable percentage of the collieries owing to the diminished output.

(6) Loss of Railway revenue.

(7) A generally adverse influence upon finance, commerce, trade and industry.

New Company Registrations.

The following is the list of new companies registered at Pretoria during December:—

Beaufort Mansions, Ltd., Aegis Buildings, 32, Loveday Street, Johannesburg; Capital, £3,000.

Silberman Stores, Ltd., 222, St. Andries Street, Pretoria; Capital, £6,000.

Durban Trust, Ltd., 427, Fourteenth Street, Vrededorp, Johannesburg; Capital £500.

Steyn's Garage, Ltd., 227, Pretorius Street, Pretoria; Capital, £3.

Windsor Hall Company, Ltd., Glynn's Reserve, Sabie, Transvaal; Capital, £600.

The Goch Buildings, Ltd., 94, Cullinan Buildings, Main Street, Johannesburg; Capital, £40,000.

Park Lane Mansions, Ltd., Aegis Buildings, Loveday Street, Johannesburg; Capital, £2,000.

Komnick Impieiment Company, Ltd., 102, President Street, Johannesburg; Capital, £1,000.

Eagle Trading Company, Ltd., 53, Sinmonds Street, Johannesburg; Capital, £10,000.

Star Bakery, Ltd., 30, Beaufort Street, Troyeville, Johannesburg; Capital, £5,000.

American Advertisers (S.A.), Ltd., 2, Sauer's Buildings, corner Market and Loveday Streets, Johannesburg; Capital, £100.

Arton Copper Company, Ltd., 3rd Floor, National Bank Buildings; Capital, £50,000.

Concrete Reinforcement and Fire Hose, Ltd., corner Von Weilligh and Anderson Streets, Johannesburg; Capital, £5,000.

Klipfontein Brickworks, Ltd., 16, Trust Buildings (2nd Floor), 98, Fox Street, Johannesburg; Capital £300.

Bye-Products, Ltd., 15-16, Ascot Building, corner Fraser and Commissioner Streets, Johannesburg; Capital, £10,000.

Noxal Company (South Africa), Ltd., Trust Buildings, Fox Street, Johannesburg; Capital, £3,000.

Sutton, Ltd., corner Church and Boom Streets, Klerksdorp; Capital, £5,000.

Concrete Construction Company, Ltd., 40, Permanent Buildings, Harrison Street, Johannesburg; Capital £300.

Witwatersrand Land and Investment Company, Ltd., 15, New Court Buildings, Market Street, Johannesburg; Capital, £750.

Rietfontein Stores, Ltd., 65, Delarey Street, Vrededorp, Johannesburg; Capital, £1,000.

Natal Investment Company, Ltd., 65, Delarey Street, Vrededorp, Johannesburg; Capital, £400.

The Premier Box and Trunk Factory Company, Ltd., 123a and 125, Market Street, Johannesburg; Capital, £1,500.

Potgietersrust Trading Company, Ltd., Hoofd Street, Potgietersrust, Transvaal; Capital, £500.

Arthur Cooper and Company, Ltd., 25, Exploration Buildings, Commissioner Street, Johannesburg; Capital, £1,000.

Premier Timber Company, Ltd., 128, Main Street, Johannesburg; Capital £5,000.

Union Mining, Finance and Investment, Ltd., 90-4, Exploration Buildings, Commissioner Street, Johannesburg; Capital, £50,000.

New Oil-Gas Burner.

A demonstration was recently given in London, England, of a new type of burner for use with oil. The oil is first converted into gas in a chamber filled with nickel gauze heated by the flame. The oil gas then passes through a regulating valve and issues as a jet which carries with it the air required for combustion. The mixture then passes into another chamber, where it is still further heated; and it issues from orifices arranged according to the services required. No carbon forms in the burner, and it does not require cleaning. This invention can easily be adapted either for heating or for lighting in conjunction with an incandescent mantle.

Tenders are invited by the Kimberley City Council for the supply of steel or cast iron water pipes, valves, and specials. Specifications, schedule of quantities, and form of tender may be obtained at the City Engineer's office upon deposit of £2 2s., which will be refunded upon receipt of a *bona fide* tender and after return of all contract documents provided by the City Engineer. Tenders, enclosed in sealed envelopes, and endorsed "Water pipes and specials contract No. 3," must reach the Town Clerk on or before the 16th January, 1922.

The Year's Dividends.

RAND GOLD MINING COMPANIES.

The following is a complete list of the Rand gold mining company dividends for the year 1921, compared with those for 1920. The total, it will be seen, shows a decrease of £1,111,663 on the year. The "outside" companies also show a substantial reduction, due to the absence of the T.G.M.E. from the list.

COMPANY.	Capital £	Total for Year.		Total Last Year.

The Case of the Rogerston Collieries.

A SHAREHOLDER PRESSES FOR INFORMATION—DORMANT CONCERNS—WHY THEY SHOULD BE LIQUIDATED.

In our issue of November 26th we referred to the remarkable balance sheet of the Rogerston Collieries, Ltd., and asked a number of pertinent questions concerning certain items appearing in the accounts, which items in our opinion called for explanation. We have not been favoured with any official reply to these queries but we are glad to learn that a large, and unfortunate shareholder has been induced to "worry" the Company's office—we use the word advisedly—for information regarding the Company's finances and the date of the last meeting. We refrain from publishing the correspondence which we have been privileged to inspect in the matter, but we would like to supplement our correspondent's queries by asking the Board (a) if it is true that the farm Waterval has been sold for £14,000; (b) how much money the directors of this company have drawn during the past 23 years?; (c) have all fees been drawn from capital account?

The case of the Rogerston Collieries is, we fear, not a solitary example of this sort of thing in South Africa. We have on various occasions pointed out that there are several moribund South African mining and land companies which should be liquidated in the interests of ordinary shareholders. In this connection the following letter which we recently received from a reader of the Journal appears to be worthy of notice.

"Dear Sir,—I notice that there are a great many gold mining and land companies which are now moribund and the shares of which are seldom quoted on the Stock Ex-

change. I happen to be a shareholder in some of these companies. The directors have from time to time informed us (the shareholders) that the companies have closed down for want of sufficient capital to carry on operations. In other instances we are informed that the difficulty of coping with the water trouble is the cause of mining operations ceasing. We receive year in and year out the reports of the directors and the usual speeches made by the various chairmen; in the meantime the cash in hand is gradually dwindling away and being spent on directors' fees and other expenses, and I suppose when all the funds have been frittered away the shareholders will be called together to consider the advisability of liquidation. Now, sir, what I want to know is this: how can shareholders at a distance air their grievances? Is there any body in Johannesburg that would undertake to represent shareholders and bring about a liquidation of these moribund companies before all the cash has been spent? I noticed some time ago that you gave in your issues of the paper the cash balances of various companies, clearly showing that if their assets were realised and added to the cash in the bank that quite a decent amount could be paid out to shareholders. Now if the directors know that it is impossible to raise sufficient money to carry on these mines which are closed down for various reasons, surely it would be wise to call a meeting of shareholders and put the proposition before them and thoroughly explain that by hanging on all the cash assets will gradually be eaten up in fees and expenses. Let it be pointed out that by liquidating the shareholders would be able to receive in cash so much per share.

I notice quite a number of these almost forgotten and closed down mines would pay a decent sum of money to shareholders if all their assets were realised. Any number of them have sufficient cash in the bank to pay 5s. per share, and yet the market quotations probably stand at 1s. to 3s. on the Stock Exchange. Can you make any suggestion to assist the shareholders at a distance?"

We certainly think that something should be done to force liquidation of some of these dormant companies, and we shall be interested to hear from shareholders who find themselves in the position of the correspondents quoted above.

NEW PATENTS.

- Joseph Lewis.—An improved catch for linking the ring of a curtain rod and the curtain pin or curtain.
- Baptist Hogsett and Frank Stephens.—A combined coat and vest.
- William Daly.—Improvements in securing bodies to shafts and the like.
- Charles Edward Manners.—An improved tube mill shell liner.
- Stephanus Isaias Terblanch.—A suction carburettor for motor cars and motor cycles.
- Aidan Nicholas Henderson.—A machine for use in the construction of concrete walls.
- Charles John Wiekee.—Improvements in and relating to the cooling of liquids and solids.
- International General Electric Co., Inc.—Improvements in and relating to dynamo protective systems.
- Walter Krouse.—Improvements in pipe couplings.
- Henry Selby Heleshaw and Ernest Tribe.—Improvements in containing vessels.
- Ivar Juel Moltke Hansen.—Electrical heating arrangements.
- Frank Gillam Bailey.—The Rand patent automatic fly-proof sanitary appliance.

The following certificates have been issued by the Mines Department for the period ending 31st December, 1921:—
 Mine overseers (metalliferous mines): D. Collison, C. H. Kennedy, D. F. J. MacRae, M. N. Smith. Mine surveyors: J. Levieux, M. Ramsay. Assayers: J. Cussons, J. de Villiers, R. R. Falck, D. Naude, G. Ross, H. Thomas, W. Webb.

Strike Developments.

REPORTS FROM VARIOUS CENTRES— POSITION BECOMING MORE DIFFICULT.

It is impossible in the space at our disposal to deal with all the events concerning the strike which have occurred during the past week, but in the following paragraphs will be found a digest of some of the developments which appear to be conspiring to bring about a general strike in the Transvaal's Industrial areas.

The Big Ballot and the Conference.

Ballot returns from branches of the unions—"Yes" or "No" on the question of strike action—are to be handed in to the central offices by 5 p.m. on Sunday (to-morrow).

After the count, the decision will remain with the executives of the combined unions should a strike be favoured by the majority, as to exactly when it shall come into operation.

The result of the ballot is expected to be known early on Monday.

If a decision to strike is made public on Monday the Union's may still negotiate at Tuesday's conference.

Arbitration Fails.

An attempt to bring the two parties in the collieries dispute together was made on Wednesday by Major Trevor, Chief Inspector of Mines, but the only result achieved was that the strikers definitely allied themselves with the larger issues which are now under consideration on the Reef.

Major Trevor met the Strike Committee just previous to the public meeting at Witbank, and stated that he wanted to put certain propositions before them. He said he wished to know whether they were still agreeable to submit their case to arbitration, and what conditions they wished to impose. He added that he was prepared to present their views on this matter to General Smuts.

Need for Public Services.

Another point he emphasised was the importance to the community of maintaining public utilities, and he asked if the strikers were prepared to agree to allow certain collieries to work for that purpose. The mines which it was suggested should be left working were the Cornelia Colliery (Vereeniging) and the Largo, both of which are associated with the Victoria Falls Power Company's generating stations, and two large mines in the Witbank district.

After the public meeting the colliery workers held an aggregate meeting in the Masonic Hall, which Major Trevor also attended.

He gave the men to understand that he intended rigidly to enforce the Mines, Works and Machinery Regulations, and that as from January 4 he would undertake to punish all offenders against those regulations.

Major Trevor also gave the strikers to understand that he will not issue any temporary tickets during the period of the strike excepting to men whose qualifications are higher than those required for a mining blasting certificate.

Stoppage of Coal Getting.

The enforcement of the regulations in the manner stated is considered by some to be tantamount to closing the mines.

The men considered the proposition put before them by Major Trevor, and came to the decision that they could not sever themselves from the general question involving

the other unions on the Reef, namely, the V.F.P. question, the "ultimatum" to the workers' unions in regard to the *status quo*, wages agreements and underground contracts, and the question of wages to workers in the Reef engineering shops.

Finally a resolution was carried to the effect that they were not at present willing to go to arbitration on the question of the proposed reduction of 5s. per shift on the collieries unless and until all the ultimatums to other workers were withdrawn.

Government Asked to Intervene.

The miners laid their case before a big meeting of residents at the recreation ground at Witbank on Wednesday afternoon. Many of the men came in from the outlying mines to be present at the meeting, and the business section of the community was also well represented.

The Mayor of Witbank (Mr. Norman Scott) presided, and there were with him on the platform Mr. J. Hobson, president of the strike committee, Mr. Davis, Mr. W. Butler of the Engine Drivers, and others.

Eventually the following resolution was carried unanimously:—

"That this mass meeting of citizens of Witbank desires to protest against the action of the Chamber of Mines Colliery Section in refusing to arbitrate on the present dispute and by their action bringing about a strike, and calls upon the Government to bring pressure to bear on these employers to agree to a third party being called in to endeavour to bring about a settlement. Further, that the attitude adopted towards the rank and file by certain members of the Surface and Underground Officials' Association is receiving the serious consideration of the strikers and may result in the employees concerned refusing to work with those officials on the termination of the strike."

At Vereeniging.

The following letter has been sent to the mine manager at the Vereeniging Estates:—"We, the Strike Committee, beg strongly to protest particularly against the action of two members of your clerical staff who are now employed by you driving the loco and in mining operations respectively. We have set ourselves the task of exercising all due restraint on our fellow-workers, and we feel that the action of which we here complain renders our task unduly difficult. We trust, therefore, that you may see it to be your duty to make some modification in this direction."

This letter had the desired effect, and the clerk was withdrawn from the locomotive.

It is reported that the Union Steel Workers came out on Wednesday morning. The bricklayers are out on strike, and the remainder of the workers were locked out owing to lack of coal.

The Strike Committee has agreed to leave the question of working the V.F.P. crushers at the Cornelia battery in abeyance, because it involved public services in Johannesburg.

Underground Officials' Position.

A meeting of the Executive of the Underground Officials' Association was held in Johannesburg on Wednesday night, when two important resolutions were carried.

The first was favouring arbitration in the matter of the collieries' dispute.

The second concerned the present working of the collieries, and it was resolved to issue immediate instructions to all underground officials on collieries not to assist in any "productive" work during the present strike unless the principle of arbitration is accepted.

The Year with the Ferreira Deep.

YIELD MAINTAINED, BUT LOWER TONNAGE CRUSHED—PRICE OF GOLD THE MAIN FACTOR.

From the annual report of the Ferreira Deep, just issued, we learn that the net profit was £200,902.

The consulting engineer, Mr. A. J. Brett writes, *inter alia*:—The working profit earned during the period under review was £13,792 in excess of that of the preceding year, due entirely to the higher price obtained for gold.

The yield per ton of ore treated remained practically constant, but working costs were 7d. higher at 26s. 7d. per ton.

Notwithstanding a reduction of 2 per cent. in the rate of sorting, the tonnage milled represents a further decline, due mainly to the shortage of native labour, particularly in the first quarter of the year; the position improved somewhat in this respect at the beginning of January, but a further set-back was experienced in February when operations were suspended for a week by reason of a strike of white miners.

The yield obtained per ton milled is considerably lower than that to be deduced from the average value of the ore reserves, the reason being that about one-third of the total tonnage mined is drawn from sources not included in the reserves. Apart from the fact that the limited number of points of attack available precludes the possibility of relying to a much greater extent upon the ore reserves proper for the supply of rock to the mill, this "other source" tonnage, although of a lower grade, is mined at a profit, and adds considerably to the life of the mine.

No further payable areas have been discovered on the pyritic lode during the year, but judicious prospecting will be carried out on this body from time to time as circumstances warrant. Apart from this work development in the future will be confined almost entirely to the area recently acquired from the Village Main Reef Gold Mining Company, Limited (in Liquidation), and to that held on tribute from the Village Deep, Limited.

Ore Reserves.—The ore in reserve at 30th September, 1921, was estimated at 780,314 tons of an average value of 7.7 dwts. per ton. This total includes 267,375 tons in pillars not immediately available for stoping, and 168,400 tons of broken ore in the form of packs.

Provided there is a satisfactory supply of native labour available during the ensuing year and that operations are not hampered by accidents or industrial troubles, it should be possible to effect some reduction in operating costs, but the profit to be earned will be determined primarily, as in the year just concluded, by the selling price of gold.

In the course of his annual report, Mr. Paul Selby, the Manager, writes:—The method of supporting stopes by means of reef packs was continued during the year, the combined area of the packs so built being 42 per cent. of the

total area stoped as compared with 41 per cent. for the previous year. The average monthly tonnage reclaimed from packed areas exceeded the tonnage packed by approximately 2,100 tons.

Earth tremors were fewer in number and generally less severe than during previous years.

The work of mining the joint boundary pillar between the Ferreira Deep and Robinson Deep was continued during the year, and approximately 90 per cent. of this pillar had been mined by the end of the year.

The area leased under the tributing agreement with the Robinson Gold Mining Company, entered into in September, 1916, produced a revenue of £256, bringing the total revenue from this source for five years up to £483.

The tributing agreement entered into with the Village Main Reef Gold Mining Company in August, 1918, was cancelled by mutual arrangement and the mining area previously held under tribute was purchased from said company for a consideration of £37,500, the new arrangement took effect from the 31st December, 1920, and in addition certain other mining claims were purchased for a further sum of £2,500. Survey and legal fees brought the total cost of the transactions to £41,041. Satisfactory results have been obtained to date.

A further tributing agreement was entered into with the Village Deep, Limited, in May, 1921, which gives the Ferreira Deep the right to mine certain South Reef adjoining this Company's boundary on a royalty basis of 2s. per ton mined. A small tonnage has already been mined from this area which has resulted in sufficient profit to warrant the further development of the area, which work is now in hand.

The average number of employes working during the year were 344 whites and 2,496 natives as compared with 375 whites and 2,569 natives for the previous year.

Following the policy adopted during the past three years, advantage was taken of good prices obtainable for certain disused machinery and plant, the total sum realised in this way being £9,421.

The miners declared a sympathetic strike early in the morning of the 7th February, which lasted seven working days, and seriously affected the Company's operations and profit for that month. The strikers had no grievance against the Ferreira Deep.

I am pleased to record that during the year I have received able and loyal assistance from the staff and employes.

The great Coal Strike in Britain last year cost the miners more than 60 million pounds in wages. Despite the settlement, this is not the full extent of their loss. Thousands of men will probably never be absorbed at all. Unemployment has grown tragically as a result of the stoppage. Other unions have become bankrupt. The cost of the coal dispute to industry, commerce and wage-earners could be reckoned, according to some statisticians, at hundreds of millions sterling. The moral is clear, don't strike!

ADAPTING CONVEYING EQUIPMENT TO CONDITIONS

☞ ROBBINS Conveying Machinery is built in a variety of types, each designed to best render a particular service.

☞ For example, the regular line of Robins Five Pulley Idlers include the following types :—

Standard—12 in. to 60 in. widths
Heavy—30 in. to 60 in. widths
Extra Heavy—30 in. to 60 in. widths
Cast Steel—30 in. to 60 in. widths
Heavy Roller Bearing—24 in. to 60 in. widths
Extra Heavy Roller Bearing—30 in. to 60 in. widths
Ball Bearing—18 in. to 60 in. widths
Heavy Ball Bearing—18 in. to 60 in. widths
Self Adjusting—24 in. to 60 in. widths
(for reversible conveyors)
Low Angle—24 in. to 60 in. widths
Heavy Low Angle—24 in. to 60 in. widths

☞ Other types include Flat, Flat Ball Bearing, Flat Chain-Oiling, Sorting.

☞ Why keep on breaking and wearing out idlers which do not suit your conditions? The above types can be obtained quickly at reasonable prices.

THE STRIKE.

The strike of colliers in the Transvaal, which commenced at the beginning of the year, is still in progress, and at the moment of writing there is no indication of a speedy settlement. On the contrary, there seems to be every likelihood of the trouble spreading to the gold mines, power stations and engineering shops of the Witwatersrand. As is generally known, the cause of the trouble on the coal mines has been the refusal of the men to accept a reduction of five shillings per shift in their wages. The coalowners contend that such a cut is absolutely essential if the collieries are to retain the small measure of overseas trade left to them in the face of severe competition. Moreover, such a reduction in pay is only in keeping with the tendency towards lower wages which is now practically world wide in its application.

The economic facts and figures of the position are set forth in special articles, statistics and diagrams which appear elsewhere in this issue. So far several of the collieries, particularly those with incline haulages, have managed to more or less maintain outputs by means of officials working in conjunction with the natives, an achievement which has caused considerable indignation amongst the workers, who apparently take no cognisance of the Government's statement, made before the strike started, that in the interests of the whole community every effort would be made to produce an output of coal sufficient to maintain the essential services of the country. The strikers have alleged breaches of the mining regulations, but these statements have been repudiated by the Government. Major Trevor, of the Mines Department, and other inspectors have been placed on special duty in connection with the strike in the Witbank District. Attempts made by Major Trevor on behalf of the Government to refer the matter to arbitration have failed. The strikers decided to refuse any offer of negotiation unless and until all the ultimatums to other workers are withdrawn. Attempts to secure a guarantee of unhampered outputs from certain collieries for the maintenance of public services have likewise proved futile, and the rigorous enforcement of the mining regulations may soon result in some of the mines being brought to a complete standstill. Happily for South Africa our collieries are not deep. They have no difficult pumping problems to cope with, as the British collieries had to deal with in the disastrous coal strike and its aftermath of last year. At several mines coal can be won through incline shafts without white miners or engine-drivers.

In these respects there are encouraging features. But as against this has to be set the facts that several collieries with vertical shafts are unable to hoist coal, and that the overseas coal trade already has been seriously affected. Eleven steamers which have been waiting at Delagoa Bay for coal will be diverted to other ports where fuel can be obtained. As far as the internal consumption is concerned, Vereeniging, with its large power station and numerous industries, is already on short rations, and the strikers are endeavouring to implicate the railways. All coal hauled by non-union men is, in the estimate of the strikers, "scab" coal, and one has only to carry this method of reasoning a little further to regard the power required to operate the gold mines as scab power. It is, however, highly probable that the colliers will not have to terrorise the gold workers into sympathetic action by employment of this dreaded word. The big ballot which is being taken by the S.A.I.F. on the subject of a general reef strike, which will implicate mechanics and engine drivers as well as other workers in addition to miners, is returnable to-morrow. The enlarged executive of the Federation, regardless of the true facts of the case and of the urgent need for a re-organisation of the industry on a basis of economy and efficiency, is making all the capital it can out of the false allegation that the Chamber of Mines is seeking to bring about a wholesale substitution of coloured for European labour. In the meantime the price of gold is still falling. The latest quotation is 97s. 9d., and the problem of keeping the lower grade mines going is becoming more acute each day.

In the estimate of many moderate-minded men who are not prone to prophetic hysteria, the situation is an ugly one, and has all the makings of a general industrial commotion. From our point of view it will be all for the good of the country in the long run if there is a general, instead of a series of sectional strikes in which one branch of labour remains at work and supports those who have downed tools. The atmosphere needs clearing. The clouds have been banking up for a long time past, and if there has yet to be a storm, it is best to get it over as speedily as possible, provided of course that the Government is able to maintain law and order and can prevent sabotage and lawlessness in this industrial volcano of the Southern Transvaal. General Smuts visited Johannesburg on Wednesday in connection with the industrial situation, but what ensued at the discussion at which the Prime Minister was present at the Law Courts is not known. Police are being rushed to the Rand area from all over the country, and doubtless the Government has taken other measures to protect the community in the event of the situation taking an ugly turn.

TWEEFONTEIN UNITED COLLIERIES, LIMITED.

More than usual interest attached to the annual meeting of the Tweefontein United Collieries the other day. Mr. William Pott presided, and in a long and detailed speech dealt with the affairs of that company in particular and of the Transvaal coal industry in general. The Tweefontein, of course, is one of the best managed and most prosperous coal companies in the Transvaal, and its finances are in a flourishing condition. Its coal-bearing area has been augmented during the year, giving it practically an unlimited life. The total dividend for the year is 6 per cent. on both ordinary and preferent shares. The tonnage of coal produced during the year was 1,132,612 as compared with 1,067,415 for the previous year. The plant and mines, both at Oogies and Tweefontein, have been re-organised, and the Oogies and Tweefontein power plants connected up by a high tension power line. Mr. Pott had much of interest to say regarding the coal export trade and the collier's lot, which has a very direct bearing on the strike now in progress. He showed that out of the 37 producing collieries in the Transvaal, the average dividend is not 7 per cent., and he exposed the fallacies of Mr. Moore's statements on the subject. "White workers have never in the world's history been so well paid in colliery work as they have been latterly on Transvaal mines," said Mr. Pott. "The average over all whites employees, excluding managers only, is over £500 per head per annum, and 85 per cent. of them have excellent houses, light, water and sanitary services at less than £50 a year. They can keep fowls, a cow or horse, and grow their own vegetables free of any charge by the company, and in South African sunshine and healthy climate, with free education by Government at their door step, their position is infinitely superior to that of any other colliery workers in the world. Several of their employees left for the Old Country, meaning to settle there, having accumulated considerable means here; they did not stay away long, but were back eager for their old position which we were able to give them. With common sense and co-operation between employers and employees and frank discussion on points of variance, I have no fear, said Mr. Pott, as to Transvaal coal maintaining its position as the cheapest all-round coal obtainable up the East Coast of Africa and round the shores of the Indian Ocean."

Mr. Pott summed up the whole matter by declaring:—"They had thick seams, no gas, little water, good roof, seams are seldom over 200 feet below the surface, and with all these natural advantages and that estimable fellow, Mr. Bantu, who does all the hard work cheerfully for least pay, if we cannot hold the trade it is only due to gross stupidity on someone's part. Economic laws are immutable, and woe betide those who seek to violate them. Shareholders must get reasonable and fair returns on capital invested or that industry will pine and die. Our workers have latterly had more and shareholders less than equity demands. They have cut prices enormously, and the railways in return reduced their prices, too, to enable the trade to be held." Despite this and the many similar warnings issued to the workers during recent weeks, they have, since the date of Mr. Pott's speech, actually gone on strike, and the issues are now therefore being left to the decision of this wasteful method of industrial warfare.

THE YEAR WITH THE MINING INDUSTRY.

II.—Minerals other than Gold.

In so far as minerals other than gold are concerned there has been a general curtailment of production during the year. The coal mines have not of course had to restrict operation to any such marked degree as the diamond and base metal ventures. The gold mines, railways and municipal and industrial power stations constitute a more or less

permanent market for the South African coal so far as internal consumption is concerned. In these directions, however, there is little prospect of colliery expansion, and the prosperity of the coal mines in the main depends on the oversea trade, that is to say, the export and bunkering business at the coast ports of the country. This market is of an essentially evanescent and fluctuating nature. It is dependent on general trade conditions and the influence of competition by other countries. On account of the great British coal strike in the earlier months of the year South African pits reaped a profitable harvest. It is contended by the coal owners that they would have been able to dispose of much more of their produce if railway rates had been lower, and this question of the incidence of freight charges in relation to our oversea coal trade was debated at considerable length in the early portion of the year and resulted in reductions being effected by the S.A.R. and H. Administration. Then for a time the coal mines enjoyed a period of moderate prosperity; but with the settlement of the strike in England and a material reduction in costs of producing, transporting and marketing British and American coal the factor of competition has reasserted itself in the region which South Africa has come to consider as a market for Union colliery produce. For some time past the overseas coal trade of the country has been dwindling and with a view to retaining the small amount which is left the coal owners have been seeking to secure a reduction in costs of working. After protracted negotiations the wages dispute has been brought to a head by the decision of the colliery owners to reduce wages by five shillings per shift and it is in consequence of this decision that the Transvaal colliers decided to down tools as from the first day of the New Year.

The Natal Collieries are not immediately affected by this wages reduction. The agreement between employers and employes in the mines of the Garden Colony does not expire until the end of January.

The past year has witnessed the completion of numerous Colliery installation construction of which had been initiated during the more prosperous and promising periods which prevailed in regard to the South African coal some time ago.

Amongst these new equipments the S.A. Coal Estates plants in the Witbank District call for special remark. In Natal the Navigation Company has opened up new pits and there has been considerable activity in the Vryheid District.

The year has been a sterile one in respect of by-product operations in South Africa. At Witbank a tar plant has been in operation and experimental work has determined data of considerable value. The Natal Ammonium Company at Mount N'Gwibi, in the Vryheid district, on the other hand has ceased operations. Additional coke ovens have been constructed at several propositions, notably by the Dundee Company, which for some time past has been engaged in the erection of a large by-product equipment. The Vryheid Coke Company has continued to sell a product of exceptionally high-grade quality. There are, it must be admitted, signs of a gradual awakening in South Africa in regard to the scientific usages of coal, but the Union has a long way to go yet before it approaches older manufacturing countries in regard to obtaining from coal its varied and exceedingly valuable by-products. Closely wrapped up in this question of the scientific utilisation of coal values is the subject of iron and steel making. In this respect, too, the year has been disappointing. The Union Steel Corporation at Vereeniging has continued to render exceedingly valuable service to the country generally by manufacturing rails and various other requirements of industry from scrap, and at the end of the year there has been additional furnace plant put into operation. At Newcastle, too, a large blast furnace together with all accessory plant has been erected, and if the Government fosters this nascent industry and gives the Newcastle people the same measure of support which was accorded the unfortunate South African Iron and Steel Corporation, there is no reason why an important key industry should not be put on a sound basis in Northern Natal.

Copper and tin mining in South Africa have in consequence of the low prices of metals declined almost to vanishing point in so far as production is concerned. The output of copper for the Union during the first 11 months of 1921, was worth £6,521, and that of tin £134,240. These figures compare with £418,269 for copper, and £435,680 in respect of tin, for the year 1920.

The most encouraging feature of the year in regard to base metals has perhaps been the steady record of progress exhibited by the Transvaal Silver and Base Metals Company in the Pretoria District. This proposition is now smelting. Adjoining this property is the Pretoria Silver and Lead Company's mine, and here, too, fair progress has been made despite difficulties.

Good deposits of asbestos have been opened up in various parts of the Transvaal and Cape Province, and nickel and talc deposits of very promising appearance and extent have been exploited in the Barberton District. The general financial depression has militated against these discoveries being exploited on an adequate basis of development with a view to production, but with a revival in general trade conditions these ventures, or some of them at any rate, should become successful. There has been much activity in regard to the exploitation of bituminous shales in various parts of the country, particularly in the Wakkerstroom and Ermelo Districts of the Transvaal, where the African Oil Corporation and other important interests have been busily engaged in establishing the existence of a large field containing shale of comparatively high oil content. Bituminous shales are also being opened up in Griqualand West and in the Underberg District of Natal. Prospecting operations for oil have been in progress in the Carnarvon District of the Cape Colony and in the Bethlehem District of the Orange Free State.

The diamond industry, second only to gold in respect of gross aggregate value to date, has suffered a most severe set back during the year. Trade depression and world wide financial stringency have brought about an almost unparalleled slump in the price of gem stones, and this condition has been aggravated by the dumping of large quantities of jewels upon the market by the bankrupt aristocracies of Russia, Austria and Central Europe.

Retrenchment at the big mines at Kimberley, the Premier and Jagersfontein, has been carried out on an almost unprecedented scale. Most of the smaller mines and prospecting syndicates have ceased operations, and there has been much distress on the alluvial diggings.

Looking at the year which has just passed into the limbo of yesterday we cannot but experience a feeling almost of relief that it is over. It has been a period of disappointments and setbacks in almost every branch of the mineral industry. In this respect the Union has merely responded to conditions in other mining fields and countries. One cannot, however, resist the conclusion that with better business brains at the helms of State and industry in this country of illimitable resources that the Union would have weathered the storm better than it has done. It is our fervent hope that in the year which has just begun mining in this land without a leader will, after the industrial turmoil which has ushered it in, enter once again upon a period of at least comparative prosperity.

Notes & News.

Transvaal Consolidated Lands.

The Directors of the Transvaal Consolidated Land and Exploration Co., Ltd., at a meeting on December 22nd, 1922, decided to convene a meeting of the shareholders in April, 1922, at which a resolution will be submitted to distribute 2s. 6d. cash per share and reduce the capital of the company by this amount.

The "Young" Case.

A decision, important to trade unionists, was given on Saturday in the Witwatersrand Local Division of the Supreme Court by Mr. Justice Ward, when Elijah Alfred Young was awarded £150 damages against six members of the South African Council of the Amalgamated Engineering Union for wrongful expulsion from the Union. The defendants were T. Matthews, E. E. McGrath, W. S. McQueen, G. W. Walker, S. T. Parker and G. Young.

* * *

Ferreira Deep Inquiry.

The finding of the Court of Inquiry appointed to take evidence relative to the recent disaster at the Ferreira Deep Gold Mine was issued on Saturday by Dr. J. G. Heath (magistrate for inquests) and Mr. J. D. Marquard (inspector of mines, Johannesburg), who conducted the investigation.

It records that on December 11th Henry Bowden was injured, Christoffel Jacobus van Tonder and Augusta S. Parau and a native, Andrea, were killed, and Arthur Clark Logan and George William Johnston were entombed by successive and excessive falls of rock in the neighbourhood of No. 7 and No. 8 stations, No. 1 incline shaft, Ferreira Deep Mine.

"We find," the investigators reported, "that courage and almost continuous attempts to extricate alive Logan and Johnston were made without success, and that they succumbed to shock and exposure on December 14th and 15th respectively.

"Leopold d'Arceir Seeligsohn was also entombed. His body has not been recovered and his death must be presumed.

"The evidence does not show that the occurrence was due to an act of omission of a criminal nature, or contravention of a statute or statutory regulation on the part of any of the deceased or any other person."

* * *

Cape Copper.

The report of the Cape Copper for last year states, *inter alia*:—Report for the year to April 30 last in South Africa, and August 31 last in London and India, states that owing to world-wide disorganisation which so disastrously affected, most industrial and mining concerns, the results of the company's operations for the past year show no improvement over the preceding year's. The deficit shown is attributable to serious losses in realisations and revaluations of copper stocks, to heavy charges for interest, to maintenance expenses connected with the company's establishments in South Africa and Briton Ferry, and to unfavourable conditions in India, resulting in a loss in working Rakha Hills Mines. Mining operations in South Africa have remained suspended during the year. The O'okiep Mine was kept unwatered until March last, when an exceptionally severe thunderstorm occurred, resulting in flooding lower workings. Instructions have recently been issued to discontinue pumping at this centre. Estimated reserves at Nababeep Mine remain at the same total as at the close of the previous year—90,000 tons of 5 per cent. copper, wet assay. Drilling operations at Koperberg West and Carolusberg West were continued. Some sections of core obtained at the latter place indicate large quantities of ore of an estimated value of 4 to 5 per cent. copper. Since the close of the Colonial year, in the same locality, ore has been passed through carrying copper of an average assay of 5.15 per cent. for 87 ft. These discoveries are not far from the surface. Important information has also been gained for guidance in future deeper drilling. At present one drill is being worked. The landing and shipping departments and the necessary railway service to meet the needs of the community have been continued throughout the year.

* * *

Oceana Consolidated and a New Copper Company.

The report of the Oceana Consolidated Company for the year ended 30th June, 1921, states that cash, together with loans and sundry debtors for land sold, etc., amounted at

that date to £341,836, an increase of £13,898. Shares and debentures appear at £367,488, against £340,334 at 30th June, 1920. Net profit is £61,361, plus £31,938 brought forward. Directors have declared a dividend of 10 per cent., less tax, and recommend placing £25,000 to general reserve, bringing the fund to £115,000, and that the balance of £32,405 be carried forward. In addition an interim dividend of 2½ per cent., less tax, has been declared in respect of the current year. The profits arising from the sale of shares of Piccadilly Hotel are not included in the accounts presented (except so far as 40,000 shares are concerned), but since the close of the year the balance of the purchase price has been received. During the year 119,002 acres of land have been sold on deferred payments at satisfactory prices. The working option given to the Anglo-French Exploration Company over the farms Artovilla and Uitenpas for the purpose of exploring the mineral deposits thereon has been exercised, work done during the option period having disclosed copper deposits of a very encouraging character. A company has been registered with a capital of £50,000, in 50,000 shares of £1 each, of which 15,000 shares are to be allotted in consideration of the expenditure already made; 15,000 shares are to be allotted to the Oceana Consolidated Company by way of purchase price for the farms; a further 20,000 shares are available for working capital, of which this company will subscribe £10,000 and the Anglo-French Exploration Company £10,000. It is anticipated that the expenditure of this money in further exploratory work will result in the opening up of payable ore bodies.

* * *

Tuesday's Conference.

As our evening contemporary, *The Star*, very properly points out, there is a danger of forgetting that a conference is to be held on Tuesday next on the points in dispute on the gold mines—namely, the *status quo* agreement, the underground contract system and the rearrangement of underground work. No suggestion has been made on the part of either side to postpone this conference. It ought to have been held this week, but at the request of the South African Industrial Federation it was postponed until next week.

There is no question, we are informed, that at this conference such matters as the classes to be affected by the proposed abolition of the *status quo* agreement and the probable effect of that abolition will not be fully gone into with a view to an agreement being arrived at. That is what the conference is for.

The ballot paper issued by the Federation has been so worded that the impression has been gained that an ultimatum has been thrown at the heads of the men employed on the mines on the question of the employment of white labour. It is contended in employers' circles that there is no question of any ultimatum at all, but that it was the only way the Chamber of Mines had of giving formal notice if it did not want the subject to be kept dragging on month by month.

There is so great a danger of the issues being confused that employers and employees alike are apt to forget that before any strike ballot was issued at all the conference between the Chamber and the Federation had been arranged.

* * *

Industrial Conditions in Great Britain.

We have been privileged to read the following letter, which has just been received by a gentleman in this town from a big industrialist in the North of England:—"With regard to trade here, the coal trade is no worse than last month. Of course, we are now at the season when coal for domestic use is in request. Smalls are all far down in price on account of the iron and steel industry being practically at a standstill, but house coal runs from 27s. or 28s. to 32s. 6d. per ton, and for special qualities up to 40s. per ton at pit, but this last price is rare. The workmen are now more submissive, and I am sorry for the above-ground labourers, who are now broken to 6s. per day or thereabout. With the cost of living as it is, they must have a difficulty in pulling through. There is very little doing in iron or steel

works, and engineering works are finding it hard to keep going, even with depleted staffs and short time. For instance, a firm had a pre-war record of something like 10,000 men working full time. Now there are 5,000, and the management says there must be a long New Year holiday. Another instance—a job quoted for a year ago at £1,080 was not placed then. Enquiries sent out recently for same job was quoted for by same firm at £520. The job is not yet placed. All round the world, including South Africa, seems to be suffering, and according to what you say if a strike should happen with you, the workers may cut up rough. I hope that may be averted. One little company, of which I am a director, made a loss for the year ending 31st August last of £4,500, almost wholly owing to depreciation in values. The wood trade has suffered severely, and chiefly owing to high freights and increased carriage coupled with increase in wages, which have not been reduced in accordance with prices.

* * *

Financial, Colliery and Miscellaneous Dividends.

In addition to the gold mining dividends, the following financial, colliery and miscellaneous dividends are payable for the half-year ended December 31, compared with those for the half-year ended June 30, 1921:—

	FINANCIAL:			December.		June.	
	No.	%	Amount.	No.	Amount	No.	Amount
Anglo-American Corpn. ...	Dividend passed.			3	1/-		
Rand Mines ...	37	35	1/9	36	1/9		
Rand Selection ...	44	12½	2/6	43	3/-		
S.A. Townships ...	22	10	1/-	—	—		
New Era ...	13	10	6d.	—	—		
COLLIERIES:							
Apex ...	31	5	6d.	30	6d.		
Clydesdale ...	24	7½	1/6	23	2/-		
Natal Navigation ...	38	5	1/-	37	1/-		
		2½	*6d.		*1/-		
S.A. Coal Estates ...	1	5	1/-	—	—		
MISCELLANEOUS:							
Pretoria Portland Cements	28	10	2/-	27	2/6		
Swazi Tins ...	Dividend passed.			28	1/6		
			*Bonus.

Geduld Development.

We understand that the improvement in the lower levels of the Geduld, disclosed in the last quarterly report of the company, is being fully maintained.

* * *

The December Output.

The mining companies have estimated the price of gold for the December output at 95s. 6d. per fine ounce, less charges, as against 98s. per fine ounce, the price of gold in London on December 30, 1921. In order to avoid any misapprehension, the Chamber of Mines wishes to point out that gold is not finally realised until approximately one month after dispatch from Johannesburg, and as the price of gold is falling, it is desirable to assume a somewhat lower price as being obtainable one month hence than is obtainable now—more especially as the rapid fall in the price of gold that has taken place recently has absorbed any surpluses held by companies from previous under-estimates during a period of rising value of gold. The extent to which actual gold prices have been below recent estimates is shown thus: Estimated price per fine ounce on which output was valued: September, £5 10s.; October, £5 8s.; November, £5 2s. Ruling London price at end of each month: September, £5 11s.; October, £5 14s.; November, £5 2s. 11d. Price realised per fine ounce: September, £5 6s.; October, £5 2s. 5d.; November now estimated at say £4 18s. Amount over-valued per fine ounce: September, 4s.; October, 7d.; November, 4s.

All War is Waste.

Industrial War is the Worst Form of Waste!

Base Minerals.

PRODUCTION IN THE UNION.

1921 FIGURES.

The Union of South Africa's base mineral production for the first eleven months of last year was worth only a little over a quarter of a million sterling, basing figures on the statistics as to sales and shipments issued by the Mines Department. This was made up as follows:—

	Transvaal.		Cape.		Union of S.A.
	Tons.	Value.	Tons.	Value.	Value.
Tin	1,399	£133,222	8.7	£149	£133,371
Copper	45	£1,420	113	£5,104	£6,524
Other minerals					£123,814
					£263,709

The recent break in the prices of tin, copper, lead and zinc—and particularly the first two—creates a serious problem for producers and the shareholders in the various mining companies concerned.

The following comparison of metal prices at the end of February, on the 19th May, 1920, and for a month ago is given to show clearly the enormous depreciation of values, unprecedented in so short a space of time, that has taken place:—

	1920.		1921.	
	End February.	May 19	December 9.	
Copper	£121 0 0	£87 10 0	£68 10 0	
Tin	418 0 0	283 0 0	168 5 0	
Spelter	61 0 0	44 15 0	26 15 0	
Lead	51 0 0	37 5 0	25 10 0	

Such movements cannot occur without causing serious loss in the trades and industries using and dealing in these metals.

If they were confined to metals, the reasons for them might be of little general importance, but similar and even worse demoralisation dominates practically every market in

the world, and the root causes are not far to seek. In so far as England is concerned, a leading authority has stated that these are as follows:—

- (1) Over-speculation.
- (2) Industrial unrest.
- (3) The mere discussion of a levy on capital increment since 1914, however gained, has produced a widespread feeling of alarm that, if it gets beyond discussion, the financial fabric of this country will stagger.
- (4) Acting on the instigation of the Chancellor of the Exchequer, the banks all over the country are stated to have withdrawn certain facilities to their customers, and apprehension, probably unjustified, has been occasioned.

As regards the four metals quoted, it may be confidently stated that the prices to which they have now sunk are below the average cost of production of the world's needs, and the outputs will certainly be affected should they endure for any length of time. This would be unfortunate, as the best opinion appears to be that there is still a large potential demand awaiting satisfaction, and this will be apparent as soon as the wreckage of speculation is cleared and the other causes of anxiety are removed.

Cassel Cyanide.

In the course of its annual report, the Cassel Cyanide Company states, *inter alia*:—"Shipments to South Africa have been on a much smaller scale compared with last year, due mainly to consumers living on their stocks, a policy which can be understood in view of falling prices and the uncertain outlook for the low-grade mines. The Australian market is going from bad to worse, the consumption of cyanide there being only one-third of what it was pre-War. In Northern Ontario there is some activity; but, taken as a whole, the state of the world's gold mining industry is by no means encouraging. Our hope is that there will be some recovery in the near future. The outlook for silver mining, however, is better, and in this direction we expect an improved demand for cyanide."

Geological Society of South Africa.

The next monthly meeting of members of the Geological Society of South Africa will be held in the Main Hall, 1st Floor, Scientific and Technical Club, 100 Fox Street (between Rissik and Loveday Streets), Johannesburg, on

Monday, 9th January, 1922, at 8.15 p.m. The minutes of the ordinary monthly meeting of members held on 28th November, 1921, will be read. The following papers will be open for discussion:—"On the Asbestos Occurrences near Kaapsche Hoop, in the Barberton District," by A. L. Hall, M.A., F.G.S.; "On a New Occurrence of Steatite, from the Barberton District," by A. L. Hall, M.A., F.G.S.; "The Carboniferous Glaciation of South Africa," by A. L. du Toit, D.Sc., F.G.S.; "The Nepheline Rocks of Sekukuniland," by S. J. Shand, D.Sc., Ph.D.; "The Geology of a Small Area East of Bulawayo," by A. M. Macgregor; "Note on the Rocks from Adriaans Kop, South of Pietersburg," by A. L. Hall, M.A., F.G.S.; "The Igneous Complex of Leeuwfontein, Pretoria District," by S. J. Shand, D.Sc., Ph.D. The following papers will be read:—"Recent Additions to Our Knowledge of the South African Coalfields," by E. T. Mellor, D.Sc. (This paper will be illustrated by lantern slides.) "The Konkop Formation on the Borders of the Namib, North of Aus," by P. F. W. Beetz, Ph.D.

The present industrial trouble in the Transvaal is simply due to the refusal of the workers to face economic facts and to toe the line with employees in other parts of the world.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

The S.A.R. Deficit.

During the first seven months the railways and harbours deficit increased at a very rapid rate. From the beginning of April to the end of October—the period covered by the returns—the ordinary working expenditure of the railways amounted to £9,261,768. To this sum must be added £68,921 for renewals and £972,809 for depreciation, thus bringing the total working expenditure to £10,303,499. The total earnings for the period amounted to £12,584,046, so that the revenue account has a credit balance of £2,280,546. Against this amount must be set £2,252,053 for interest on capital, and various other charges, such as £142,386 for interest on superannuation and other funds and £1,020,341 for the Abnormal Cost of Living Allowance. These charges amount in all to £3,467,496. There thus remains a net railway deficit for the seven months of £982,759. For the same period the harbours account shows a deficit of £63,311. The only credit item in the joint harbours and railways account is in respect of the Government's steamships, the earnings of which, it is satisfactory to record, resulted in a net balance for the seven months of £42,204. The railways deficit, the harbours deficit, £57,750, paid into the Pension Fund to reduce deficiency, and £58,333 for Betterment charges make up the debit items of the joint account, which shows a total deficit for the seven months of £1,119,919. Taking into consideration the accumulated deficit at the close of the last financial year—namely, £2,598,883—the total Railways and Harbours deficit down to the end of October now amounts to £3,718,833.

S.A. Diamond Corporation.

Mr. C. F. Rowsell, presiding at a meeting of the South African Diamond Corporation, Limited, mentioned that the national diamond factories at Brighton were considering a reduction of capital in accordance with the advice of their new technical directors that the work should be concentrated in on the factory at Brighton. The corporation would thus benefit by a return of a portion of the capital invested in the factories.

The Copper Outlook.

American advices state that the outlook for the copper mining industry is now more promising than it has been for the last three years. Sales of refined copper for October

were 140,000,000 lb., which is considerably above any other monthly aggregate this year. Meanwhile, production of the leading mines in the U.S.A. continues restricted to about 25% of normal capacity. The effect of this improvement in sales and of the restriction of production upon surplus stocks should be most pronounced. The surplus in the U.S.A. last spring was estimated at 750,000,000 lb., while there was a further 300,000,000 lb. of scrap metal in England. The latter, as recently announced, has been taken over by the British Metal Corporation for division amongst American, British and German refineries, deliveries to be extended over the greater part of next year. That this indicates the turning of the tide we readily concede, but the price of the metal appears slow to respond, and high costs still obtain. The latter, being chiefly based on wages, fuel and freight, tend to fall, but the irreconcilables hold the field still to a peculiar extent on the world's copper mines—and also on the American railroads. Consequently costs fall slowly and profit margins must remain small on such properties as are being operated. The outlook is, in our opinion, but little brighter for those that have yet to be re-opened.

The Afrikaner.

Commenting on the Afrikaner lease, the Klerksdorp paper says:—"It has been known for some time past that a private Syndicate had been negotiating for the acquisition of the right to mine and work the property of the Afrikaner G.M. Co. at Rietkuil, and that Mr. John Wessels, formerly manager of the Robinson Deep, and other gentlemen connected with the Rand mining industry were concerned in the enterprise. The Company is now an accomplished fact, and the property has been taken over by the lessee Company. Mr. John Wessels is now on the spot as manager of the concern, and preliminary operations have been commenced. It is the intention of the Company to move the ten stamp mill already on the property to the top of the kopje contiguous to the main incline shaft, and add thereto ten additional stamps. The ore, as it is drawn from the mine, will be moved from the shaft to the battery by a belt conveyor to admit of sorting en route. From the mill the sands and slimes will pass into steel cyaniding tanks. The tanks are on order, and already large supplies of coal are being transported to the mine, which will soon present a scene of busy activity. We have had personal knowledge of the property and its possibilities from the time mining operations were first begun over thirty years ago, and we feel very sanguine as to its successful future. We cordially wish Mr. J. Wessels and his partners every success and prosperity in their enterprise."

The Year with the Wankie Colliery.

The annual report of the Wankie Colliery Company shows that Operations for year to August 31st last, after allowing for depreciation, resulted in a profit of £69,986. Further dividend of 5 per cent., making 10 per cent., less tax, for the year. Sales of coal and coke amounted to 314,121 tons and 123,135 tons respectively. During year 574,160 tons of coal were mined and raised to the surface. In addition, 18,570 tons were taken from old dump. Estimated coal reserves proved by development are: Solid coal in pillars, 2,678,000 tons; solid coal in situ, proved by main drives, 3,670,000—6,348,000 tons. Shaft sinking on new colliery is in progress, 789 ft. of driving on incline shaft having been completed during year. The position in regard to native labour continues to improve. Stoppages to screening plant throughout the year due to failure of truck supply represented in times lost five and a-half weeks on day shift and fourteen weeks on night shift. The railway company were, however, able to bring more engines into commission during May of this year, since which the truck supply has considerably improved.

The Outlook.

Speaking at the annual meeting of the East Rand Mining Estates in London, the other day, Mr. C. F. Rowsell said:—World conditions at the present time are so extraordinary that it is impossible for the best-informed to give a forecast of the future with any degree of certainty, and I for one should be loath to attempt to do so. It seems to be absolutely essential that those who control the destinies of the great European States should use all the ability which they possess to formulate some scheme which will eventually stabilise exchanges and make the wheels of the trade in the world once more revolve, and until this is done I for one do not anticipate any prosperity.

Van Ryn Estate.

Further details are now to hand in regard to Van Ryn Estate's operations last year. The report for the year ended June 30th last states that the net profit from all sources amounted to £90,393. To this is added balance brought forward from the previous year, £33,497, making a total available profit of £123,890, which has been appropriated as follows: Written off for depreciation, £11,841; in payment of dividend No. 34, £37,500, and dividend No. 35, £37,500, leaving a balance to be carried forward of £37,049. During the year 381,230 tons of ore were treated, yielding 108,866.97 fine ounces of gold, which realised £604,147, equivalent to a recovery value of 31s. 8.336d. per ton. Working expenditure amounted to £491,292 (25s. 9.288d. per ton), leaving a mining profit of £112,855.

A comparison of these results with those of last year shows material increases in gold recovered of £100,898, in working expenditure of £92,866, and an increase of £8,032 in the profit from mining. The large increase in the value of the gold recovered is due partly to the higher grade of ore crushed and partly to the increased price received on the realisation of the gold. The increase in working costs is due to a variety of causes arising out of the abnormal conditions prevailing during the period. Higher wages, both of white and black employes, the high cost of stores and materials, and heavier taxation are the principal items contributing to this increase. Dividends Nos. 34 and 35 (each of 7½ per cent.), amounting to £75,000, were paid during the year. The dividends paid since the inception of the company total £2,782,000.

Ore Reserve.

The ore reserves at the end of the financial year are calculated upon two bases: (1) On the standard price of gold, 864,583 tons of an average value of 6.1 dwt. over a stopping width of 48 in.; (2) on the price of 112s. 6d. per fine ounce for gold (which was the figure prevailing at the end of the financial year), 1,257,639 tons of an average value of 5.5 dwt. over 48 in. It is difficult to make comparisons in this respect with previous years, as under existing conditions the tonnage is automatically increased or decreased as fluctuations in the price of gold raise or lower the payable limit, and enable large tonnages to be included in, or necessitate their exclusion from, the ore reserves. As heretofore, no credit appears in the balance sheet for these reserves, the cost of which has been met out of past profits.

As the result of the sand-filling scheme inaugurated some time ago, and now in full operation, 165,781 tons of ore, representing 33.31 per cent. of the total ore mined, have been drawn from reclamation in the old workings. The policy of sand-filling is being pursued on a large scale, and is expected to result in further large tonnages being reclaimed from the old workings. The capital expenditure incurred during the year amounted to £11,498 (net), which has been written off mine equipment account to the debit of appropriation account.

Diamond Fields of Africa.

Mr. W. E. Bleloch's latest diamond venture is the Diamond Fields of Africa Exploring Co., Ltd. The company has an authorised capital of £110,000 in shares of 2s. 6d. each, of which 780,000 have been issued. It is intended to increase the capital to £400,000 in shares of

2s. 6d. each, of which 1,000,000 shares will be issued to vendor companies under sale agreements. The company has recently entered into agreements for amalgamation with the Makganyene Diamond Mining Co., Ltd., and the Postmas Diamond Mining Prospect, Ltd., under which it acquires all the assets and liabilities of those two companies. The company's properties will, as a result of the amalgamation, comprise approximately 1,000 acres of freehold land in the Postmasburg district, 18 prospecting areas on the Postmasburg commonage, and contracts confirming the right to purchase further areas of approximately 71,500 acres in the Hay and Kuruman districts.

African and European Investment.

During the year to June 30 last conditions have been anything but favourable for land and investment undertakings in the Transvaal; and they are reflected in the report and accounts of the African and European Investment Co. From the profit and loss account it will be seen that dividends, debenture interest, and sundry profits (less interest charges) amounted to only £22,130, as compared with £32,543 for the preceding period, while rentals and farm revenue are about the same at £16,395. Expenses are higher, but there is a saving under taxation, the profit carried to the balance sheet being thus nearly £10,000 less at £21,684. Turning to the balance sheet, Government stock, shares, and debentures in other companies stand at £553,682, as against £448,898, owing to purchases of Anglo-American Corporation of South Africa, Rhodesia Gold Mining and Investment, and Transvaal Farms and Finance shares, and loans and payments in advance (including loan to East Rand Extension Gold Mining Co.) at £153,578, as compared with £114,805. Money on deposit against security has risen from £265,250 to £283,400. On the debtor side loans and deposits have risen by £147,750, to £493,200, and sundry debtors and receipts in advance have declined by £7,316, to £5,818. Adding the profit (which is subject to corporation profits tax and Union income tax), the credit to profit and loss is raised to £108,483. The usual list of investments is appended to the report, but the auditors point out that the market value of these quoted is £78,602 less than the figure given in the balance sheet, while the unquoted securities stand at £98,376. They are also unable to form an opinion as to the value of the security deposited with the company for a loan of £40,000. With regard to the share interests, good progress is reported by the South African Breweries, the Union Steel Corporation (of South Africa), the Lonely Reef, Vereeniging Estates, and Anglo-American Corporation. The land holdings remain practically the same as a year previously, *i.e.*, about 1,393,734 acres, and it is evident that times have not been propitious for the carrying out of the progressive policy in regard to this asset, which it was announced at the last annual meeting was to be inaugurated.

Cape Electric Trams, Ltd.

The accounts of the Cape Electric Tramways, Limited, for the year ended June 30th last, show a moderate recovery in the profits earned during that period as compared with the preceding twelve months, the total being £81,724 as against £77,280. After providing for Debenture interest, redemption on Debentures, and including the amount brought forward, the net credit balance comes out at £60,046, as against £47,763. The reserve receives £6,000 more on this occasion, namely, £18,000, as against £12,000, leaving a divisible balance of £42,046, which goes against £37,763 a year ago. The dividend on the Ordinary share capital is raised from 5 per cent. to 6 per cent., and after providing for same there remains the sum of £12,573 to be carried forward, as against £11,141. During the year the tramways carried 29,773,587 passengers, giving a return of £397,124, as against 25,921,629 passengers, earning £325,085, in 1919-20. The report adds that after protracted negotiations the Municipality of Capetown at last came to the decision not to proceed with the proposal for their acquisition of the company's Capetown system. The concession will therefore run on until 1925, when the Council can again exercise the right of expropriation.

ENGINEERING SECTION.

Newcastle Iron and Steel.

COMPLETION OF BLAST FURNACE—PROTECTIVE TARIFF REQUIRED TO HELP A YOUNG INDUSTRY —THE AUSTRALIAN EXAMPLE.

The Newcastle Iron and Steel Company's plant is now completed and the accompanying photograph taken the other day depicts the blast furnace as it stands in its finished state.

The directors of the company have had a hard uphill struggle to bring the plant to completion, but by dint of experience and perseverance, equipment has been installed at a remarkably low cost. The plant was visited the other day by the Prime Minister, who was much impressed with the work that had been achieved.

Now that this equipment has been completed, it should be the bounden duty of the Government to encourage by every means in its power the growth of this key industry.

In this respect the example of the Commonwealth Government might well be followed. In Australia protective tariffs have been established to admit of the iron and steel industry being able to compete with overseas competition, and particularly that of Germany. Largely in consequence of this action the industry "down under" has grown to a remarkable degree.

As an indication of the effect of manufacture of iron and steel in Australia, the following tonnages of imports for the years 1913 and 1919-20 (the latter figures in brackets) are given:—Pig-iron, 54,197 (2,681); bars, rods, angles, tees, etc., 131,692 (18,358); ingots, blooms, slabs, etc., 9,497 (956); plates and sheets, corrugated and galvanised, 54,610 (41,951); girders, channels, joists, 47,717 (10,772); plates and sheets, other than above, 111,054 (51,350); wire, 65,785 (19,765).

Items of interest in the Customs Tariff as approved by Parliament early in June, 1921, are:—

	British	
	Preference.	General.
	Per ton.	Per ton.
Pig-iron	20s.	40s.
Ingots, blooms, slabs, etc.	32s.	65s.
Bars, rods, angles, tees, etc.	44s.	80s.
Girders, channels, joists, etc.	48s.	90s.

Heavy duties are imposed on plates and sheets, etc., on and after January 1, 1922, ranging from 48s. to 72s. per ton British Preference and 85s. to 110s. General.

The Blast Furnace at Newcastle.

Automatic Train Control.

Many inventions have been brought out for the purpose of giving the driver of a locomotive an automatic warning that the signals are against him, and also for applying the brakes at the same moment. A new form of train controller was recently tested with success on an important British railway. The apparatus consists of an interceptor placed between the rails and connected with the ordinary signals, together with a set of gear on the locomotive which operates the whistle, puts on the brake, and if desired also

closes the engine regulator. The interceptor takes the form of a curved metal plate hinged near one end and supported at the other end by a weight in such a way that the highest point of the curve is about 5 inches above the rail level. If the signals are clear the interceptor is depressed by the locomotive passing over it, but if the signals are not clear the interceptor remains at danger and gives the signals already mentioned. This and other British inventions are being studied by a special committee of the British Ministry of Transport.

The Economic Operation of Superheater Locomotives.

(By F. W. Brewer, A.I. Loco. E.)

In the very nature of things, the locomotive is at best a compromise between certain known advantages and disadvantages. One outstanding fact is that in a general way we cannot utilise the full power of the engine without coming into conflict with what, from some points of view, may be looked upon as scientifically desirable. In order to save coal the engine must be well linked up—the steam must be used expansively. But this linking up always corresponds, by contrast, with a reduction in power. Even if bigger cylinders or more than two cylinders be employed to give a higher total mean effective pressure, the result is the same; the available power with an early cut-off is utilised in only a comparatively limited degree. Steam and coal are saved at the expense of hauling capacity. For the fact remains that heavier loads per engine could be taken if a greater proportion of the potential power were made use of by employing a later cut off in the cylinders. In the case of goods engines this cut off may be put at from 60 to 65 per cent., and in the case of express engines at from 50 to 55 per cent.

It is obvious, nevertheless, that scientific application, rather than brute force, is decidedly preferable, if not indeed imperative. A compromise between the two policies is necessary. With an unusually late cut-off the terminal pressure is unduly high, while the resultant heavy blast action tends to lift the fire and to cause the fire-box, tubes, and boiler generally to be worn out more quickly than would otherwise be the case. Neither the steam nor the fuel is used in an efficient manner. Although greater power is developed at the draw-bar, yet the steam is exhausted whilst there are still many units of work left in it. Clearly, then, a very late cut-off is inadvisable. A middle course must be adopted.

So far, we have considered the matter only in relation to saturated steam locomotives. When we come to deal with it in connection with superheater engines we shall find that the conditions are somewhat paradoxical. An especially short cut-off can be, and usually is, employed in such engines; yet it is in those same engines that it is possible to have a fairly late cut-off without necessarily sacrificing the economy. In fact, within reasonable limits, the later the cut-off the higher will be the degree of superheat and the greater will be the relative saving in fuel and water. It must be remembered that for equal quantities of steam and at the same cut-off the work done by the expansion of superheated steam is less than that performed by saturated steam. The disparity increases with the degree of superheat and with the shortening of the cut-off. At first sight it might appear that this loss of work militates against superheating. But it does not, for the reason that, while a slightly greater number of cubic feet of superheated steam, as compared with saturated steam, are required to do a given amount of work, yet the weight of the former is very much less than that of the latter, the result being, in the case of high superheating, a large economy in water, which, in turn, means a smaller total heat expenditure. This is accounted for partly by the vaporisation of all the water particles suspended in the steam when passing through the superheater, and partly by the prevention of condensation in the cylinders. Further, as superheated steam has a greater volume than saturated steam of the same weight, the weights of the former is less than that of the latter for the same cut-off. Since the superheated steam falls in temperature from the point of cut-off, its volume then also decreases, and the actual gain in this respect will be approximately one-half that deduced by theoretical calculations, and it is usually taken to be somewhat about 10 per cent. If we add 30 per cent. as the saving due to the elimination of cylinder condensation—the amount varies, of course—we get a total average water economy of approximately 40 per cent. It will be seen, therefore, that although super-

heated steam does less work by expansion than saturated steam at the same cut-off, still there is a considerable economy, as the difference between the quantity and weight of steam used—two very different factors—is entirely in favour of the first-named steam. The saving in coal is less than the economy in water, because it is largely governed by the constantly varying conditions incidental to everyday working. Sometimes it is as much as 25 per cent.

Having regard to the fact that the superheater locomotive gives the greatest relative economy when hard pressed, it may be doubted whether expansion should be carried to the limit dictated by theory alone. Tractive efficiency is the first consideration, and it should not be sacrificed for the sake of direct economy purely and simply. Greater power can only be obtained by getting more steam into the cylinders, not by trying to keep it out. From the economic standpoint it does not signify how much the superheated steam locomotive is forced, since its efficiency increases with the increase in superheat, which follows the augmentation in draught due to working the engine, whether temporarily or generally, with a later cut-off. In the case of a saturated steam locomotive just the opposite takes place. As the quantity of fuel consumed per square foot of grate area increases, so the quantity of water evaporated per pound of coal decreases, and although the total quantity of water converted into steam in a given time is greater, it is obtained by a comparatively wasteful expenditure of the heat generated by the fuel. Moreover, the steam becomes wetter and wetter. Assuming a comparison between a superheated steam locomotive and a saturated steam locomotive on a basis of equal weights, and with cylinders and steam pressure alike in both engines, then, by working the superheater engine with a longer cut-off than in the non-superheater, it could not only be made to develop more power, but it could be made to do so on a much smaller consumption of coal and water than would be possible in the case of the "wet" engine for the same ratio of expansion. The usual practice has been to employ larger cylinders in conjunction with reduced boiler pressures, yet it seems to be out of the question, unless the tractive potentialities of the superheater engine be sacrificed, that a comparatively short cut-off can usefully be adopted in such circumstances. A moderately late cut-off would mean a reduction in the direct saving in coal, but the increased consumption of fuel would, in the case of highly superheated steam, be more than offset by the greater work done at the draw-bar, and it would still be relatively low.

For the foregoing reasons it is manifest that superheating should not be restricted to tender engines or to what may be described as main-line work. As a matter of fact, it should be applied to any class or type of locomotives required for heavy duty, including the running of suburban passenger trains and shunting. Engines engaged in the two latter services may not, owing to the comparatively frequent opening and closing of the regulator, give quite so high a steam temperature as those in which a sustained tractive effort is maintained for longer periods; but, even so, they will show economy in coal and water, and will, besides, be much smarter at their work than saturated steam locomotives. The suburban tank engine cannot be linked up much, and the shunting engine, generally speaking, not at all, and these are the very conditions in which superheating may be taken to show to special advantage. The idea has been held that any work of an intermittent character is inimical to superheating, but practice will probably soon prove such an idea to have no real foundation. At any rate, except in cases where the average horse-power output is insignificant, the use of highly superheated steam is strongly advisable, and in proportion as the output per unit is increased, so will the gains from superheating become more and more evident and substantial. In short, any and every condition which makes for inefficiency in the saturated steam locomotive can, in the superheater engine, be turned to good account.

* From the *Engineer*.

The Week in the Sharemarket.

AWAITING THE LABOUR ISSUES—GOLD AT 97s. 9d.—QUOTATIONS EX-DIVIDEND.

The strike on the Transvaal coal mines from January 1, and the growing prospect of a strike on the gold mines naturally affected the market during the week. Gold, according to the latest cables, stands at 97s. 9d., and London seems content to leave South African shares alone until the outlook clears. Private advices received from the other side are to the effect that dealings in our shares are of the most meagre description and the markings of "business done" represent merely nominal transactions. The dividend declarations for the half-year are, of course, regarded as satisfactory in the present circumstances. The year opens with question of cost reduction on the mines more insistent than ever, and at the time of writing opinion is divided as to whether the men will force the matter to the lengths of a general strike. In the meanwhile local sharemarket dealings are entirely confined to the professionals, who find it difficult to resist the low levels at which so many shares now stand. The next week should see the strike uncertainty cleared up, and it is unnecessary therefore to say more on the subject for the moment. One good factor is the probability that the ex-enemy share question may be settled this month. As regards diamond and base metals, it is opined in well-informed quarters that some improvement may come just when least expected; and in this connection it is pointed out that as gold goes back to normal, reflecting a recovery in world trade conditions, diamonds and base metals may be expected to enjoy a revived demand. Thus the general outlook, dark though it seem for the moment, is not without its reassuring features. The quotations for the short holiday week are given below, being ex-dividend as from January 1.

One E.R.P.M. is worth two New Modders to the community. If the low-grade mines like the East Rand Proprietary and Randfontein close down, it will be a national calamity. These mines pay no dividends, but they give direct and indirect employment to thousands of people. If they closed down the shareholders would not care very much. But every person on the Rand would very quickly begin to feel the draught!

THE DAVIS SLIDE RULE

—WITH CELLULOID FACINGS—
FOR ALL TECHNICAL CALCULATIONS

THE calculations that may be performed by the aid of the slide rule are endless in number. In addition to the ordinary process of multiplication, evolution and involution, it may be used for a variety of technical calculations, in which its use effects an enormous saving of time. Thus, the engineer may compute the strength of beams, moments of inertia, horse-power of engines, hydraulic formulae, areas of circles and ellipses, cubic contents, weights, conversion of British into metric and other systems of measurement, without putting down a single intermediate quantity. The electrical engineer may solve all problems involving the application of Ohm's law of the relation between current, electro-motive force, and resistance. The surveyor may plot surveys by rectangular co-ordinates and set out curves.

This Davis-made 10-inch Slide Rule can be supplied from stock.

Letters to the Editor.

Re " Grave Warnings " issued by Government:
See D.F.A., dated 30th instant.

To the Editor, *S.A. Mining and Engineering Journal.*

Sir,—Just as the persons responsible for the diamond control appear to be fighting for their own salvation, so the coal owners, backed by the Government, are fighting for theirs. But in all that two-column statement by the Government no reference is made to the possible existence of a " greater industry " than diamonds or coal ever were. We seem to centralise on things we think we know something about, and do not devote any attention whatever to the more substantial values which can be exploited in this country.

The reduction of wages and the possible stoppage of all payments must affect thousands of men and their families. If wages are to be reduced, then give the men who have produced the millions an interest in the business and a fair working wage, and I am sure all troubles will cease.

All hot air such as was voiced at the meeting of the citizens of Beaconsfield the other night about what has not been done by the Government and what *has* been done by others should be left out, and the greater question of irrigation and railways talked about, and possibly oil.—Yours, etc.,

A. W. WEATHERBY.

THE ORIGIN OF THE DIAMOND.

To the Editor, *S.A. Mining and Engineering Journal.*

Sir,—The Rand Stratigraphist has provided Mr. Lewis Watkins with a source of amusement. A pipe with a lid on, from whence no gas has escaped, must eclipse the Witpoortje break from whence so much " gas " as to render that area of no longer any stratigraphical importance. What a glorious opportunity for the " Callous Sacrifice of Sense on the Altar of Verbosity."

Professor Bonney detected the mineral (diamond) in a fragment of eclogite taken from the Newlands Mine, West Griqualand, which he inferred here to be its parent rock. This fragmentary evidence has been considered of sufficient importance to be quoted in most text-books. In Brazil, itacolumite is the matrix in which diamonds are found. What other evidence can the text-book authorities bring to bear on this important subject? I considered that the discovery of the Complete Crystallisation of the diamond in its true matrix on the alluvial areas to be of sufficient importance to place on record. Possessed with the conviction and courage of my opinion I registered a photograph of one of the specimens in my possession in the Copyright Office, Pretoria, on the 19th of April, 1921. This stands as a record of this discovery and the onus rests upon those whom it may concern to refute the evidence of its integrity and mine.

Vermeul is producing the Synthetic ruby and sapphire through the agency of what is essentially a vertical blow-pipe. Pure alumina constitutes the basis for production. Chromium the colouring agency in the ruby, and in the sapphire, magnetic oxide of iron and titanite acid. If along these lines the constituents of the diamond receives investigation the analysis will become subsidiary. " To tell the truth to others " may be a great thing for the world, but under certain conditions, based on favourable assumption, would it be a " great thing " for the diamond World?

To tax your space, in reply to " Mystified," as to whether the country underlying the quartzite, shale and melaphyre (which enclose the diamond pipe) is quartz porphyry, congruous with the intrusive granite porphyry on the alluvial areas, is side-tracking the issue. These areas are open to investigation. Nature and text-books do not always agree. One of the " weighty considerations " Mr. Watkins would do well to study is the distinctive feature of the diamond in respect to carbon—the cleavage plane.

I am,

Yours, etc.,
JAMES ENNIS

FAIRBANKS

Vulcabeston Renewable Disc Valves.

Asbestos Fibre, as everybody knows is not affected by heat or acids.

Vulcabeston is a compound of Asbestos Fibre saturated with rubber and other materials and vulcanised under Hydraulic pressure. It is the ideal material for a valve seat, and you can get it only in Fairbanks Valves with Renewable Discs.

There is another marked difference about the Fairbanks Valve and that is in the quality. A trial and comparison will convince you.

RHODESIAN SECTION.

The Uranium and Radium of Katanga.

(By M. H. Buttgenbach).

*In 1913, in the course of development work done by the Belgian company known as the Union Minière du Haut Katanga at the Luswishi copper mine, situated a few kilometres north of Elisabethville, an important discovery was made. Several small veins, at the most 30 centimetres wide, filled with a mineral of unusual appearance, were exposed. The vein-filling consisted chiefly of uranium oxide.

Since then I have examined specimens of this ore, which occurs in the form of compact lumps; it has a density of 5.08; it scratches calcite; in colour it is orange-red, and it includes grains of a black mineral several millimetres thick. On the outside these lumps have the appearance of

two days. From this same ore I was able to obtain several decigrammes of barium chloride distinctly radio-active.

The complete analysis of an orange-red lump, as made by M. C. Gillet, on a specimen that had been carefully selected, gave the following results:

Uranium	68.203%
Lime	10.360
Lead oxide	6.388
Barium oxide	1.655
Copper oxide	0.145
Silicia	2.804
Combined water	9.449
			99.004%

A Trommel Unit in the Belgian Congo. Joplin Jigs under Thatched Roof in Foreground.

being the result of the alteration of cubic crystals that have been agglomerated; however, they are covered with a coating the colour of which shades from yellow to yellowish green; this coating extends occasionally into the minute cracks that traverse the orange-coloured lumps.

By means of photographic tests I ascertained that each of the three substances—the black grains, the orange lumps, and the green coating—were radio-active, but with an intensity varying in the order indicated. The black grains produced an impression on the plate in a few hours only, whereas the green coating required an exposure of nearly

The oxide of uranium indicated is the dioxide, UO_2 , calculated after the precipitation of all the uranium as sodium uranate, but it is probable that the uranium occurs in the ore partly as UO_2 , partly as UO_3 .

In density, colour, hardness, and composition this mineral resembles "gummite," which may be considered as a product of decomposition from pitchblende, and to which Foullon gives the formula

The analyses given for this mineral in textbooks moreover show that its composition is very variable.

*Translated by the Editor of the *Mining and Scientific Press* from "Le Mouvement Géographique."

The green part that covers the gummite has a composition even more complex. In general, the content in silica increases and in uranium decreases. The following result of an analysis, likewise made by Mr. Gillet, gives an idea of its composition, but I ought to add that it was not possible to collect as pure a sample as in the case of the gummite.

Silica	15.266
Uranium	45.515
Lime	6.340
Lead oxide	3.897
Copper oxide	1.386
Cobalt oxide	2.500
Nickel oxide	1.520
Oxides of iron, aluminium, and manganese	8.480
Combined water	12.103
			97.007

This green matter frequently has a lustre that is greasy or waxy, but occasionally it turns into minute acicular crystals. Under the microscope, these needles, which attain at the most a thickness of five hundredths of a millimetre, show a lovely yellow tint, without appreciable dichroism. These needles give the colours of polarisation below the blue of the second order; they become less bright longitudinally, following the optical axis; a negative section is perpendicular to the face of the plane surface, which appears to be a cleavage plane. Another cleavage, less easy, appears to make an angle of 87° with the direction of length. The crystals are sometimes terminated by one face, not in agreement with the second cleavage, and make an angle of 54° with the line of length.

I consider this mineral to be composed of "uranotil," the chemical composition of which, according to Genth, can be expressed by the formula

The Luswishi ore then is composed chiefly of gummite, resulting from the alteration of pitchblende, of which there still remains intact in the lumps some portions in the shape of black grains. The gummite itself has yielded uranotil.

It is conceded nowadays that the ores of uranium contain radium in the proportion of 320 milligrammes of metallic uranium per ton. One ton of the Luswishi ore, at 60.2% of uranium dioxide, therefore, would contain 601.17 kilogrammes of uranium and 192 milligrammes of radium. It is true it seems that the proportion indicated above of uranium to radium is not exact except for the primary minerals of uranium and that the proportion diminishes in the minerals resulting from their decomposition. However that may be, the Luswishi ore is extremely radio-active, as proved by the experiments I made with the electroscope. One knows that the radio-active power is measured by the velocity of discharge of that instrument when under the influence of the mineral reduced to a powder and compared with that of the black oxide of uranium, UO_2 . The mean of six trials showed a power of 2.969, the standard being based upon 0.202 of uranium oxide.

The investigations conducted at the Luswishi deposit were interrupted by the War. However, in 1915, a similar discovery was made in a deposit at Shikolowe (Kasolo), situated south of Kambove. Whereas at Luswishi the veins containing the uraniferous ore are very narrow, at Shikolowe the vein assumes the shape of a rosary, with swellings and pinchings. The enclosing beds, with a strike N.70°E., are composed of the rocks usual to the copper deposits of that region: talcose schists, dolomites, breccias. These beds are much disordered and cut by faults, and there are found impregnations of ores containing copper, cobalt, and manganese. Generally the beds dip northward, whereas the uraniferous veins dip to the south at an angle ranging from 20° to 45°. In the swellings the vein is almost entirely filled with an orange-red mineral which is referred to gummite; in the pinchings the gummite gives

place to a mineral in micaceous flakes which may be chalcocite or autunite. But, not having as yet received specimens of this deposit, I cannot say what is to be thought of this phosphatic ore, the like of which has not been found at Luswishi.

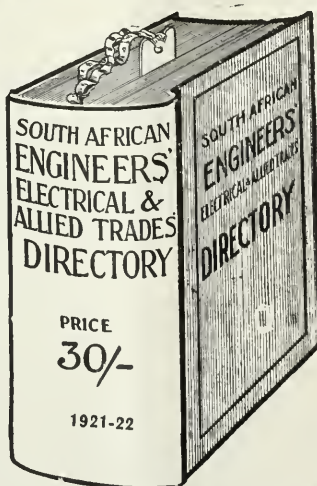

The known deposits of uranium and radium may be classified as follows:

1. Deposits of pitchblende (uranate or uranyl) in the form of veins with a complex filling.
2. Deposits of autunite (hydrous phosphate of uranium and lime) filling crevices in pegmatite.
3. Deposits of carnotite (vanadate of uranium, potash, and lime) consisting of sandstone impregnated with this mineral.
4. Deposits of betafite (niobo-titanate of uranium) consisting of concentrations in pegmatite.

It is very probable that the uraniferous and radio-ferous orebodies of Katanga ought to be referred to the first type. The prospecting operations are being continued. It is unnecessary to direct attention to the importance this discovery may acquire, for the introduction into Belgium of a new chemical industry enabling, by the aid of ores coming from the colonies, the obtaining of a product the use of which is limited by its scarceness, and of which among others medicine, experimental as well as clinical, demands without ceasing larger quantities.

Rhodesian Cement.

At the annual meeting of the Premier Portland Cement Co. (Rhodesia), Ltd., Bulawayo, the Chairman stated that Continental cement was being dumped at the ports of Africa to-day at 15s. 6d. per cask of 400 lb. gross, which meant that so far as the company was concerned, it was entirely out of the market in Portuguese East Africa. It was common knowledge that the German Government, while retaining a high price internally by means of a tariff wall, was subsidising the export of its surplus products. Germany was fully alive to what she had lost in the way of export trade during the War, and was leaving no stone unturned at the present moment to make up leeway. Every factory in British South Africa was feeling the effect of this European policy, and that company, through this process of dumping and the general financial stringency of the times, had also been affected.

Rhodesia's Mineral Output.

DETAILS FOR NOVEMBER—SMALL DECLINE IN GOLD OUTPUT—BASE MINERAL PRODUCTION DOWN £10,000.

We have received for publication from the office of the Rhodesia Chamber of Mines the following detailed statement of the mineral output for the month of November, 1921, with comparisons and values:—

Gold.

MATABELELAND.

ON A MATABELELAND GOLD MINE.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material and Engineering Trades.

STRIKE TENSION RETARDS BUSINESS THIS WEEK—IRON AND STEEL—BUILDING AND TIMBER MATERIALS—AMERICAN NOTES—OIL NOTES—REDUCTION IN DETONATORS AND FUSE—BREVITIES.

General.

Business, of course, has not yet got into its stride, the recent holidays having thrown things considerably out of gear. On the official resumption of business in the early part of the week merchants and employers appeared somewhat disinclined to settle down, and it will not be before the commencement of next week that serious work will be generally tackled. Added to the lethargy caused by practically a fortnight's lull in wholesale trading is of course the present crisis in the gold and coal industries. Mining circles appear to be pretty unanimous that the long and short of it will be the acceptance by the workers of such a radical reduction in the cost of production as will enable the industry to exploit the many millions of tons of ore awaiting treatment on a reasonably fair extraction basis, and thus ensure employment to many workers for years to come. The gold premium is at present 98s., but a further fall of 10s. would bring it perilously near to normal. Nor need we be surprised if in face of the big international questions now being settled on the other side and the undoubtedly better trend of business universally, the price of gold declines shortly and perhaps at no distant date, the workers may then appreciate at its full value the satisfaction of half a loaf instead of no bread. In the meantime the resumption of the Conference between the miners and the Chamber of Mines next Tuesday is eagerly awaited, as upon the result of the workmen's decision will probably depend the future of something like the half of our industry. It is, of course, unwise to attempt to prophecy, but gauging the opinions of the mining community and others, the vote plumped for is that after some kicking against the pricks, the miners will eventually look the facts in the face and accept terms which alone can keep a lot of our mines alive and provide employment for the workers at the same time. The ballot returnable on Sunday next will, it is generally thought, be overwhelmingly in favour of a strike. An unfortunate feature, which is of the very greatest importance, has been the withdrawal on the part of the Central Strike Committee of all workers on pumping, lighting and public utility purposes, which means of course that all Union men are now withdrawn from the mines. This disquieting factor is more or less safeguarded by the Government's determination to enforce the mining regulations, and it is satisfactory to note that the Prime Minister has postponed his departure for Capetown and, together with Mr. Warrington Smyth, Secretary for Mines and Industries, and Mr. Trevor, Chief Inspector of Mines for the Pretoria District, is in touch with the Unions. What the present coal crisis means to Union trade is brought home very forcibly to us by the announcement that 11 steamers are now waiting in Delagoa Bay for 81,000 tons of coal. Of this quantity not more than about 22,000 tons are available at that port, and unless some immediate settlement is arrived at in the coal dispute, some 60,000 tons will be lost to the Union shipping trade, as the charterers of these vessels will be obliged to divert them to other suppliers. A market like this, so difficult to secure, so easy to lose, is extremely difficult to regain.

A very shrewd and canny merchant, in the course of a chat this week, said as far as he could gather the feeling amongst workmen generally was that they must come down to proper levels in respect of wages to meet the altered

circumstances. He gave it as his opinion that even at a much lower wage level, taking the lower living costs which must sooner or later prevail, the workman would eventually be better off than to-day. But that lower production costs must operate now and at once there was no gainsaying.

Given this desideratum, he thought that about March or April next we might see a big improvement in business conditions. Many big contracts, he said, had been held back for many months in view of the present big wage-cut decision, particularly in the building trade and reconstruction work along the Reef. Latest accounts from London as to demands on manufacturers are very favourable; money is easier, and day-to-day loans have been as low as $1\frac{1}{2}$ per cent. The $5\frac{1}{2}$ per cent. Treasury Bonds have been successful, the price having been raised from 97 to 99. Treasury Bills, on the other hand, on reduced offers, have steadily declined to $3\frac{1}{4}$ per cent., resulting in ordinary discount rates receding from 3.5-16 to $3\frac{3}{4}$ per cent. A further reduction in the Bank of England rate early this month to $4\frac{1}{2}$ per cent. is generally anticipated. The recent increase in the American

Exchange is attributed to investments of American funds abroad, which is bound to assist in the rehabilitation of business. Generally, gilt-edged English securities have recently enhanced in price.

Iron and Steel.

Business is practically at a standstill after the holidays, and nothing of consequence is expected to occur for the next few days. In other words, merchants are awaiting the result of the present coal strike and the decision of the gold miners in regard to lower wages.

Latest quotations.—Dunswart iron, 22s. per 100 lb. basis price; Union Steel Corp., Ltd., 22s.; imported iron and steel, flats, small, 33s. to 40s.; larger sizes, 30s. to 38s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 37s.; $\frac{3}{8}$ in. iron, 30s. to 32s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in. iron, 31s.; steel, 37s.; $\frac{3}{4}$ in. round iron, 30s.; steel, 33s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 30s.; channel and joists, 35s. 6d.; shafting, $\frac{3}{8}$ in., $\frac{1}{2}$ in. and $\frac{3}{4}$ in., 9d. per lb.; 1 in., 8 $\frac{1}{2}$ d.; 1 $\frac{1}{4}$ in. to 2 in., 7d.; larger sizes, 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{8}$ in., 22s. to 23s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 45s. to 50s. per 100 lb.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 43s. to 48s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lb.; rivets, $\frac{1}{4}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lb.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d. er lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb.; $\frac{3}{8}$ in., 2s. 11d. per lb.; $\frac{1}{2}$ in., 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ to 1 $\frac{1}{2}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{1}{2}$ d.; 1 $\frac{1}{4}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 35s. to 47s. 6d.; shovels, 52s. 6d. to 57s. 6d.; wheelbarrows, 47s. 6d.; picks, 37s. 6d. to 67s. 6d.; pick handles, 35s.; hammer handles, 14 in., 17s. 6d.; 18 in., 9s. 6d.; 24 in., 13s. 6d.; 30 in., 18s. 6d.; 36 in., exceedingly scarce, 35s.; barbed wire, "Shorthorn," 69 lb., 13 $\frac{1}{2}$ gauge, 21s. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bulb tee fencing standards, 14 lb., 28s. 6d. per dozen; 12 lb., 25s. per dozen; black baling wire, 14 gauge, 22s. per coil, 100 lb. (wire has touched bottom and is firming); screening, 3s. to 9s. 6d. per square yard; cyanide, 1s. 7 $\frac{1}{2}$ d.; zinc shavings, 1s. per lb. Asbestos, white, $\frac{3}{8}$ in. to $\frac{1}{2}$ in., £35 per ton; $\frac{1}{2}$ in. to $\frac{3}{4}$ in., £50 per ton; $\frac{3}{4}$ in. to 1 $\frac{1}{4}$ in., £80 per ton; 1 $\frac{1}{4}$ in. to 2 in., £175 per ton; Blue, No. 3, £25 per ton; No. 2, £34 per ton; No. 1, £45 per ton; short, £20 per ton. Recently there has been a slight revival in inquiries in this market. Copper is steady at about £66 15s. per ton cash, £67 15s. per ton three months. Tin has had an upward move to £174 10s. cash, but it is generally expected that the present price, which has receded to £173 3s., will shortly be exceeded.

I.C. Steel Coke Tin Plates.—The market is steady. I.C. 14 x 20, 112s., 108 lb.; coke quality, 21s. per box. I.C., 28 x 20, 112s., 216 lb.; coke quality, 42s. per box.

The end of the year saw the following prices in the Metal Market.—Electrolytic copper, £74 cash; £75 forward; lead (foreign), £24 7s. 6d. cash, £24 2s. 6d. forward; quicksilver, £10 7s. 6d.; bar silver, 34 $\frac{1}{2}$ d., and bar gold, 98s. per ounce.

Timber and Building Materials.

Pending resumption of business next Monday, the building trade is quiescent. Prices remain much about the same. Speculation is rife as to the upshot of the present labour disputes.

Prices.—3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver boards, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; floorings, 6 $\frac{1}{2}$ d. to 6 $\frac{3}{4}$ d.; ceilings,

4 $\frac{3}{4}$ d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 6s. 6d. to 7s. 6d.; corrugated iron, 9d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second at the coast; American oak, 1 in., 10d.; 1 $\frac{1}{2}$ in., 11d.; 2 in., 11 $\frac{1}{2}$ d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1 $\frac{1}{2}$ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per foot. Prices for bricks remain the same, with, however, a hardening tendency, viz.: mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaker, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

American Notes.

With the fourth quarter of 1921 well started, the tone prevalent was much better than at the end of 1920. Though production and other activities had not materially increased as compared with a year ago, an undercurrent of optimism is appreciable, a realisation that the worst of the current depression has passed. It is felt, however, that recovery will be slow. A factor of no small importance in this connection, and very applicable to South Africa, is the willingness of labour to give a fair day's work for a fair day's pay. A tendency to radicalism, which appeared to increase as wages went up to the peak of two years ago, has waned to nothing but a shadow. Though wages have not been readjusted to the pre-war basis, the improvement in quantity and quality of work delivered has been most marked. There has also been a willingness on the part of common labour to make an effort to become skilled.

That the mere possession of gold does not bring prosperity to the holder is well illustrated by the present position of the United States. More gold lies in the vaults of the Federal Reserve Banks of the United States and the Treasury than has ever been accumulated in one country—over 40 per cent., it has been estimated, of the total stocks in the world. Economists and bankers are puzzled over the benefit to be derived from the possession of so much precious metal, and it is held to be a foregone conclusion that a good measure of this accumulation ultimately will be and can be released without harm to America's financial structure.

The iron trade in America is on the whole rather dull. One important improvement is noted in railroad buying. Steel production is ranging 40 to 45 per cent. of capacity, but prices are somewhat lower. Black sheets and galvanised sheets have declined. Bars, shapes and plates are a trifle firmer. The market in pig iron is dull and prices have yielded a little.

American Motor Car Revival.

Latest reports are to the effect that the automobile business, helped thereto by steadily increasing sales of motor trucks, is progressing very satisfactorily, and that business is advancing well from bed-rock figures. Gains in sales made during the second quarter show increases of from 40 to 100 per cent., and in respect of the heavier vehicles as much in some cases as 500 per cent. over the first quarter was registered.

WRIGHT'S ROPES

H. ALERS HANKEY - - - Sole Agent.

The Standard Oil Company is busy developing oil prospects in the Elk Hills oil field of California. During 1921 twenty-five wells in that district were contributing 50,000 barrels daily to the production of the State.

Latest American metal reports show that copper has been the feature, the price advancing continuously. The zinc market has eased off, showing a slight decline; lead continues steady, and tin has continued to advance. The market for forward copper continues very firm, very little metal for prompt shipment being sold.

Oil prospects in Australia, apart from the oil shales being worked in a perfunctory manner, are not very brilliant. The Commonwealth Oil Refineries, Ltd., in which the Anglo-Persian Oil Co. and the Commonwealth Government are associated, is proceeding with the erection of reservoirs for the storage of crude oil in Sydney and Melbourne, and refineries will probably be installed this year. The crude oil will be imported from Persia until local sources are developed.

Japan Importing Persian Oil.

A contract for 50,000 tons of crude oil per annum has been made by the Teikohn Oil Company of Japan with the Anglo-Persian Oil Company. For the transportation of this oil two ships of 8,800 tons each have been constructed.

Hume Pipe Industry.

There are signs of recrudescence of business in the shape of more inquiries. It would appear that several public bodies are contemplating works which will involve the use of this company's products.

The British South African Explosives Co., Ltd., advise the reduction of the price of detonators as from the 1st January, as follows:—No. 6D detonators, in case lots of 10,000, from 55s. to 53s. 4d., less 2½ per cent. per 1,000 delivered to the mines on the Witwatersrand; and of Nobel's safety fuse by one penny per coil, viz., from 10d. to 9d. per coil, less 2½ per cent. delivered on the mines of the Witwatersrand.

Electrical Goods.

Dealers report that December was a very fair month as regards business, but not comparing advantageously with the similar period of recent years. There are no alterations to record in prices, materials are arriving regularly from Britain and the Continent, and also from America rather slowly. German stuff is firming up, as they are now having to pay for raw materials, which are more or less controlled by the Allies.

Kenya Timber Resources.

Professor Troupe, a Colonial office expert, reports very favourably upon Kenya timber resources:—Kenya timber was unsurpassed and in large quantities, and some of the indigenous timber of Kenya ranked with the finest in the world. Its possibilities for pencil cedar were, in view of the world's present dwindling supplies, tremendous, and large profits from the development of Kenya timber were certain.

Raw Rubber.

The Times announces an invention for utilising the raw rubber surplus in a permanent liquid form. This liquid rubber, it is stated, is a splendid non-conductor, and can be used for cold storage purposes.

Imperial Wireless Chain.

It is expected that the first link in the Imperial wireless chain between Britain and Cairo will be completed this month.

S.A. Coal Estates.

The finances of the S.A. Coal Estates — the Bailey £1,000,000 merger of last year—are of unusual interest to-day because of the unexpectedly trying times the coal companies are experiencing. Of the globular registered capital £702,000 was issued in fully-paid shares as purchase consideration to the selling companies, £140,407 was subscribed as working capital, leaving a further £140,400, an option over which at 20s. per share is held by the subscribers of the initial working capital. Of this, options over 83,093 shares have been exercised, and the balance are under option at the same price. The prospects of the company are, of course, bound up with the prospects of the coal trade of the Province, and these are now on the knees of the gods!

Synthetic Gold.

Professor Irving Fisher—who ought to know better—has been making our flesh creep by talking darkly of a German professor's solution of the age-old problem of transmuting base metals into gold. Even eminent American economists, who set out to solve the world's monetary problems, are doubtless not to be taken too seriously in what are meant to be humorous asides in otherwise dry-as-dust lectures, but we do protest against the staple products of this country, viz., gold and diamonds, so often being singled out for the attention of these ponderous jokers. Perhaps, after all, there is an element of jealousy behind these attempts to belittle the natural monopolies with which Nature has endowed South Africa.

NOTICE TO SHAREHOLDERS.

NOTICE IS HEREBY GIVEN that the Twentieth Ordinary General Meeting of Shareholders for the year ended 30th September, 1921, will be held in the Board Room, Second Floor, The Corner House, Johannesburg, on THURSDAY, THE 2nd MARCH, 1922, at 11 a.m., for the following business:—

1. To receive and consider the Balance Sheet and Accounts for the year ended 30th September, 1921, and the Reports of the Directors and Auditors.
2. To elect Directors in the place of those retiring by rotation or otherwise, in accordance with the provisions of the Company's Articles of Association.
3. To determine the remuneration of the Auditors for the past audit and to appoint Auditors for the ensuing year.
4. To transact any other business which ought to be transacted at an Ordinary General Meeting, or which is brought under consideration by the Report of the Directors.

The Share Transfer Books of the Company will be closed from the 24th February, 1922, to the 2nd March, 1922, both days inclusive.

Holders of Share Warrants who desire to be present or represented at the Meeting shall produce their Share Warrants (or may at their option deposit same), at the places and within the times following:—

- (a) At the Head Office of the Company in Johannesburg, at least 24 hours before the time appointed for the holding of the Meeting;
- (b) At the London Office of the Company, No. 1, London Wall Buildings, London, E.C.2, at least 30 days before the date appointed for the holding of the Meeting;
- (c) At the Office of the Credit Mobilier Francais, 30 and 32 Rue Taitbout, Paris, at least 30 days before the date appointed for the holding of the Meeting;

and shall otherwise comply with the "Conditions as to the issue of Share Warrants" now in force.

Upon such production or deposit a Certificate, with Proxy Form, will be issued, under which such Share Warrant holders may attend the Meeting either in person or by proxy.

By Order of the Board,

RAND MINES, LIMITED,
Secretaries.

Vol. XXXII., Part II

JOHANNESBURG, TRANSVAAL, SATURDAY, JANUARY 14, 1922

No. 1581.

A Strike Scene in Johannesburg.

The Reef is once again in a state of industrial chaos. On Monday morning the employees of the Gold Mines, the Victoria Falls Power Company, engineering shops and kindred enterprises ceased work, and at the moment of writing there seems little prospect of an settlement. On Monday the mines will commence the repatriation of mine boys. The coal strike, which has been in progress for two weeks now, continues. The effects of this industrial impasse are lamentable in the extreme, and are fully commented on in this issue. The photograph given above shows the New Law Courts, Johannesburg, where the last conference before the breaking off of negotiations, was held during the early part of this week.

THE GREAT STRIKE.

THE WHOLE REEF INVOLVED—HOW THE MEN BALLOTTED—FEDERATION AND THE GOVERNMENT—THE QUESTION OF THE NATIVES—MR. CRAWFORD'S RETURN AND RE-ELECTION.

All the mines from Randfontein to Springs, all save one of the Victoria Falls and Transvaal Power Company's stations, and the private engineering shops ceased work at seven o'clock on Monday morning under the operation of the S.A.I.F. general strike notice.

The Ballot.

The full official return of the ballot has now been issued; the figures of the various unions being as follow:—

	For.	Against.
Engine Drivers' and Firemen's Association	914	159
Ironmoulders' Society	123	37
S.A. Boilermakers' Society	262	9
S.A. Reduction and Surface Workers' Association	1,525	273
A.S. Woodworkers, Witbank	29	2
A.S. Woodworkers, Head Office	434	107
S.A. Mine Workers' Union	7,554	375
A.E.U.	1,282	375
B.W.I.U.	69	18
Total	12,192	1,336

Spoilt papers: S.A. Mine Workers' Union, 27; B.W.I.U., 2.

22,000 Men Out.

Over 22,000 men went on strike, comprising miners, reduction workers, engineers, engine drivers, moulders, woodworkers and builders employed in the affected industries. The colliers, of course, went on strike some days previously.

The Chamber has given notice of its intention, if the strike continues, to start repatriating the natives next Monday, and to discharge all workmen not required for essential services.

The pumpmen on the Village Deep were called out in consequence of a dispute regarding the employment of two change house attendants.

Endeavours to Extend the Dispute.

On Wednesday, too, the following resolution was unanimously adopted by the Executive Committee of the South African Industrial Federation at its morning sitting:—

"The Executive of the S.A.I.F. requests all organisations of labour throughout South Africa to take the necessary constitutional steps to enable them, if called upon, on Monday, January 16, at 7 a.m., to strike; but "under no circumstances shall anybody take action until advised by the Executive Committee of the S.A.I.F."

The Federation and the Premier.

The one move on the part of the Federation Executive during Tuesday was to write to General Smuts suggesting a conference. The Federation wrote:—

January 10, 1922

The Right Hon. J. C. Smuts,
Prime Minister, Pretoria.

Dear Sir,—Enclosed please find copy of the basis on which my Executive are prepared to discuss with employers

Idle Days on the South African Mines.

Essential services were at the beginning of the week maintained, the Rosherville station of the V.F.P. being allowed to run on reduced load to give power for pumping and lighting. On Wednesday there was an indication that the essential services on the mines might not be allowed to continue.

The Federation on Tuesday wrote to General Smuts and asked him to call a joint meeting of the employers concerned and the S.A.I.F.

the terms of settlement. I am further directed to request that you call a joint meeting of employers concerned and the S.A.I.F. for the purpose of going into the questions involved in this dispute.—Yours faithfully,

J. GEDDES,

Acting General Secretary

The enclosure stating the terms was as follows:—

SOUTH AFRICAN INDUSTRIAL FEDERATION.

The basis on which the Unions are prepared to discuss terms of settlement:—

1. Coal Mines.—Withdrawal of the ultimatum and an adjustment of wages on the basis of no greater reduction than half the amount proposed by the employers, and no further reductions until the margin between the assumed and actual increase in cost of living has disappeared, or alternative arbitration.

2. Gold Mines.—The withdrawal of the notices issued by the Chamber of Mines regarding underground contracts, status quo agreement, and re-arrangement of underground work. The question of contracts and re-arrangement of underground work to be decided by agreement between the Chamber and the Unions concerned.

The policy of eliminating white workers and replacing them by cheap coloured labour be departed from and a definite ratio of coloured to white in the industry be fixed.

3. V.F.P.—The withdrawal of the letter intimating that the company was not prepared to meet representatives of the Unions for the purpose of discussing the question of basic rates, and an adjustment to be made in the basic rates as fixed by agreement between the V.F.P. Co. and the S.A.I.F., plus the 21 per cent., an increase equivalent to the increase in cost of living.

4. Engineering Shops.—The withdrawal of the notice issued by the employers re reduction in wages, and any adjustment of wages to be a matter for discussion and mutual agreement between the employers and the Unions concerned. Further, a guarantee to be given by the employers that the terms of the agreement will be strictly observed.

5. In each case there are to be no further reductions in wages until the margin between the assumed increase in cost of living and the actual increase in cost of living has disappeared.

The Industry and the Natives.

That the native question is one of the serious aspects of the strike was brought home on Tuesday by the issue of a statement by the Chamber of Mines in reference to the repatriation of the boys. The Chamber says:—

"It is intimated for public information that it is the intention of the mines to retain on pay as many natives as possible until Monday, the 16th instant, after which, if the strike continues, it will be necessary immediately to commence repatriating the natives and to discharge all workmen who are not required for essential services."

Further, the Director of Native Labour and all Native Commissioners have been informed by the Government that native labourers who wish to offer themselves for employment on the mines should not be sent forward at the present time, either from Portuguese East Africa or the Transkei or within the Union. The Director (Colonel Pritchard) has instructed all centres not to furnish travelling passes, and has requested the Portuguese officials to co-operate in this direction.

The Premier's Message.

The Prime Minister has issued a message to the natives in the strike areas in the following terms:—

"Greeting.

"You are aware that there is a strike on the coal mines, gold mines, and in certain other industries, and that work has consequently ceased at present. A great many of you cannot, therefore, be employed on your ordinary work. Other work may be found for some and others may have to remain idle for some time.

"I am sending this message to you to assure you that you need in no way be alarmed or disturbed about these conditions. The matter in dispute between the white workers and their employers will be settled without any necessity for anxiety on your part. Remain quietly in your compounds and obey the orders of the Government given you through the Director of Native Labour and compound

managers. By so doing you will receive the necessary protection. On the other hand, any disobedience or disorder will be promptly and severely dealt with.

"I feel sure that this message will find you ready listeners and that your conduct will remain law-abiding and obedient until work is resumed on the mines.—(Sgd.) J. C. SMUTS, Prime Minister and Minister of Native Affairs."

Mr. Crawford.

One somewhat encouraging feature of the position is that Mr. Crawford has been re-elected Secretary of the Federation. The following is the result of the ballot for the secretaryship of the South African Industrial Federation:—

FIRST COUNT.	
Crawford	1,141
Price	643
Kendall	638
Spoilt papers	45
	2,467
SECOND COUNT	
Crawford	1,327
Price	1,072
Exhausted and spoilt papers	68
	2,467
Majority for Crawford	255

Mr. Crawford has just arrived in Johannesburg after a prolonged stay in Europe, due to his attendance at Geneva at the League of Nations Conference, where he represented some sixty thousand workers. A man of moderate views, his influence has in the past been appreciably felt in conflicts between employer and employee, and his timely return may assist to ease the present tense situation.

Oil Shale Resources.

A valuable monograph on oil shales has recently been issued by the Imperial Institute. The survey treats of the oil-shale resources of the world. Estimates are given of crude-oil extraction per ton, which are substantially the result of the laboratory analysis of samples. Needless to say, the figures do not admit of arbitrary inference—the extent, thickness, uniform quality and accessibility of the deposits are factors that have also to be considered. Some of the areas in Canada, Australia, and elsewhere are now in process of development. A summary statement of the yield of oil and ammonium sulphate per ton of shale in some of the chief British deposits is annexed:—

	Oil. Gals. per ton.	Ammonium Sulphate. Lb. per ton.
Scottish Oil Shale Deposits	19.0—20.0*	—
Kimmeridge (Dorset)	22.3—40.6	20.4—32.4
Corton (Dorset)	13.4—29.9	11.8—28.5
Norfolk	45.0—55.0	60.0
Donington Station (Lincoln)	1.3—16.4†	—
Ballycastle (Ireland)	23.0—31.0	—
South Africa—		
Wakkerstroom	14.0—30.0	—
Kiekvorschfontein	60	—
Ernelo	30.0—32.5	64 (max.)
Utrecht (Natal)—		
Winderplaats	24.5‡	—
Spruitfontein	20.0‡	—
Unkomaas (Natal)	27.1	—
Matatiele (Griqualand)	25.0	—

* Estimated average yield of whole shales.

† Per ton of dry shale.

‡ Estimated average yield over an area.

Mr. A. S. Rome, manager of the Rezende Mines, is taking over the management of the Cam and Mctor from Mr. E. H. Buluan.

New State Areas.

DESIGN OF THE NEW PLANT—SUBSTANTIAL SAVING IN CAPITAL EXPENDITURE.

We understand that good progress is being made in connection with the preparation of plans and diagrams for the construction of the 50,000 tons per month plant of the New State Areas mine. It will be recalled that this company contributed to the cost of experiments at Springs Mines which were initiated with the hope that the stamp battery could be eliminated and a cheaper form of reduction plant adopted. The experiments were so successful that it was decided to adopt the all-sliming method of ore treatment, and it is hoped that in this way a considerable saving in capital expenditure will be effected. The plant is being designed for a capacity of 50,000 tons per month, with the possibility of extension for a larger tonnage. It is hoped that the plant will be running early in 1923.

In reply to queries from correspondents in regard to this company, the following data may be of interest: Capital (issued), £1,051,000 in £1 shares; (2s. paid) 494,000 £1 shares. Cash at December 31, 1920, £346,800. Property: 2,049 claims, adjoining Brakpan, Government Areas, Geduld, Springs, and West Springs. Two shafts have been sunk to the reef. The north shaft struck on December 22, 1920, at 3,578 feet, 1 dwt. over 6 inches in faulted and disturbed ground; while the south shaft struck on October 19, 1920, at 3,676 feet, 89.9 dwt. over 18.9 inches, or 1,697 inch dwt.

From the position of the mine it is reasonable to anticipate that enriched areas will be encountered, as the technical opinion is that the rich shoots from Brakpan,

Government Areas and Geduld enter this property at various points. Taking this opinion into consideration, it is advisable when making a calculation of the future possibilities of the mine to allow a generous basis of, say, two-thirds of the profits to the Government and one-third to

750

shareholders. The formula used is $Y = 80 \frac{X}{750}$, X being

the ratio of profit to recovery and Y the Government's share. Unlike the Government Gold Mining Areas lease, this company's profits are subject to mining taxation; therefore the approximate one-third to shareholders will be modified accordingly. Present price of shares about 19s. 6d.—20s.

It is estimated that the direct and indirect loss daily sustained by workers and the community during the first week of the strike will be as follows:—

Employees: Loss of wages, £35,000 per day.

Employers' direct loss: Standing charges and native expenses for first week, £35,000 per day.

Community's direct loss: Amount expended by mines in wages, stores, etc., £90,000 per day.

If the strike continues after the first week the amount under the heading "employers' direct loss" will be reduced by reason of the repatriation of the natives.

Precarious Plight of the Low Grade Mines.

TWENTY-ONE MINES IN JEOPARDY.

The following mines would all cease operations if gold fell to normal and costs remained as at present:—

MINE.	December, 1921, Actual Working Costs.	December, 1921, Output at normal price of gold (85% per fine oz.	Loss.	In December, 1914, these Mines made the modernized Profits.

The S.A.R. and H. Administration is now engaged upon the construction of a new line in South-West Africa, viz., from Windhuk to Gobabis. In connection with this undertaking Tenders are invited for: (a) The Earthworks required for a section of 2½ miles in length—comprising about 65,000 cubic yards of Excavation, together with Pipe Laying and Concrete in Pipe Faces and Culverts on this section—the work to be divided into Three Contracts; (b) for Pipe Laying and Concrete (some 400 cubic yards) in Pipe Faces and Culverts required for other section of 2½ miles.

On and after 28th December, 1921, the conditions of contract, specifications and drawings can be inspected, and upon payment of a deposit of £3 3s. a copy of tender forms can be obtained at the office of the Chief Civil Engineer, Johannesburg; the Assistant General Manager, Capetown; and at the Construction Office of the Acting Director of Railways, Windhuk.

No tender will be considered unless the Tenderer has inspected the sites of the works.

On receipt of a bona-fide tender the Contractors will be entitled to a refund of the deposit, also a refund of one-half of the fare paid for the return journey over the railways owned by the South African Railways Administration in connection with the inspection which intending contractors are required to undertake.

If the Chamber's proposals are not accepted and a really big effort is not made to save the low-grade mines, what will be the result? As things have been going for some time past, the day is not far distant when nearly half the mines of the Rand will have to be closed down because they do not pay, and 10,000 men will be thrown out of work.

The Farmers and the Strike.

HOW THE WAGES DISPUTE ON THE MINES AFFECTS THE AGRICULTURIST.

THE MINERS TRYING TO RAISE THEIR STANDARD OF LIVING AT THE EXPENSE OF THE FARMERS.

"The plea of the Labour leaders against a reduction of wages would be sound if wages were being reduced below the level of prices ruling for the product of labour, or below the general compensation of the great body of workers outside of their own organisations. The trouble at the present time is that what the labour leaders are protesting against has already happened to more than one-half the workers of the world. These leaders are trying to maintain the pay of a minority, at the expense of the majority. The farmers and producers of practically all primary products and raw materials have taken reductions of approximately one-half the value of their products. The prices of their products are back to the pre-war level. They have lost a great proportion of the purchasing power they have been using in recent years, and the market for the services of all the workers who have been supplying them has been curtailed accordingly. This is the fundamental cause of the unemployment which has spread over practically the whole world in the last year, since cotton, corn, oats; livestock, rice, wool, hides, dairy products, flax seed, the principal metals and other primary products began to fall. It is true that as factory-workers and others were thus forced out of employment the evil effects have been increased, but the original impulse and the main influence comes from this great body of people who extract wealth directly from nature and who are largely dependent upon world markets. Moreover, there is no prospect of a recovery of farm products to the levels of war time. Doubtless they are now unduly depressed and will swing back to a normal level with improvements in general conditions, but any expectation that they will recover to the war level, or to the present general level of wages and manufactured goods, is wholly unwarranted. *The sooner war-time prices and wages are forgotten the better. They are not normal in times of peace.*

The Equilibrium in Industry.

"Moreover, the essential thing is not the general level of all wages and prices, but right relations between wages and prices, and between the different groups of producers, so that they can trade with each other. The farmers have nothing but the products of their labour and of the soil with which to buy the products of the other industries. They will give their products as far as they will go, but there their buying ends. Whatever affects any great group of consumers and throws industry out of balance, so that the normal exchanges are disturbed, and normal consumption is curtailed, is bound to affect trade, industry, transportation, banking and every kind of business unfavourably. Nobody gains by it; everybody loses by it. The Labour leaders overlook another fact, which is that the aggregate of wage-payments has been reduced already, and the loss in consuming power on the side of the wage-earners which they wish to avoid has already taken place. The problem now is to equalise it, and find compensation for it in lower prices for what the wage-earners consume. The wage-earners as a class are interested in the restoration of the normal state of balance, in which all of them can be steadily employed. It is not to their advantage to have wage rates so high that large numbers cannot have employment, or can have it only part of the time. It is unfair and oppressive to the consumers who are obliged to curtail their purchases, and without benefits to the wage-earners as a whole. It is not even beneficial to those who are so fortunate as to have employment, for it keeps the cost of living to them above the natural level. It is an artificial situation which cannot be permanently maintained.

The Public the Real Employer.

"There are several misconceptions of the wage question which appear persistently in everyday discussion. One is the common assumption that wages are an issue between employers and employees, with nobody else involved.

Of course, the public is the real paymaster, and in the last analysis the public is composed chiefly of the wage-earners themselves. Whatever they do to the public they do to themselves. The employer is simply an intermediary who plays a useful part by organising industry and undertaking to pay a fixed wage, but unless he gets full reimbursement from the public he is soon out of business. Another common mistake is that which lays all emphasis upon money wages. The value of money is in what it will buy. The standard of living is not fixed in the wage scale; it consists of a certain standard of comfort, certain supplies of consumable goods. The real compensation of the worker for his own labour comes in the products and services of others. While prices were advancing the Labour leaders were quick to claim that money was nothing but a medium of exchange and did not represent their real compensation. They insisted upon wage increases to compensate for loss of purchasing power, and got them. Now the situation is reversed. The farmer is in the same situation that they were then. His purchasing power has fallen off, and his standard of living has been lowered. The labour leaders are not fighting to defend their own standard of living, but to raise it permanently at the expense of the farmer. That may not be their deliberate intention, but it is the effect of what they are trying to do. Moreover, the full effect is not beneficial even to the wage-earners, for it disrupts the exchanges and paralyses industry."

The foregoing is taken from an American exchange, but it fairly accurately defines the state of affairs prevailing in South Africa as well as in other parts of the world.

Agriculturists would do well to ponder on the irrefutable argument which is contained in the foregoing. Farmers may think that this industrial convulsion on the Rand bears no relation to them, and that they can survey the situation from afar with equanimity. They, in common with all other members of the community, are bound to feel the evil effects of a curtailment of the Rand's spending capacity, and if the unsound conditions which have existed on the mines for months past are perpetuated, the farmer will suffer thereby, for the Labour leaders are fighting to raise the standard of the miner's living at the expense of the farmer.

Agriculturists all over the Union have therefore a large and distinct interest in having this calamitous strike settled in a manner which will be advantageous to the mining industry.

The Chamber of Mines proposes to retrench rather less than 1,400 of the semi-skilled redundant and border-line occupation workers in the near future and, over a lengthy period, to dispense with, perhaps, 2,000 men. By this means the mining industry of the Rand will be very largely helped. It may indeed be that, in consequence of this and other needed adjustments in regard to underground work, the Rand will once again enter upon a period of prosperity which will so benefit South Africa that a large number of those men whom it is now intended to gradually lay off will in the near future be absorbed into other channels of trade and commerce.

The Chamber's proposals in no way affect the status of the skilled craftsman. His position can be very adequately safeguarded by the application of a system of ratios to the number of European and coloured employees of the mines.

The Chamber of Mines has no intention of assailing the positions occupied by men who by apprenticeship, experience or diligence, have acquired proficiency in their work. What it objects to and intends to oppose is the fastening upon the industry of redundant persons who, having failed in other occupations, now seek to shelter behind the "status quo" agreement and certain of the mining regulations, to the detriment of the mines and the country generally.

The Case of the E.R.P.M.

COMMITTEE'S REPORT.

The second interim report of the committee of inquiry concerned with the East Rand Proprietary Mines (issued by the Department of Mines and Industries) is as follows:—

The results up to date of this voluntary inquiry confirm the information gathered at previous inquiries and from our official reports extending over a considerable period. It should be impressed upon the persons or associations who asked for this inquiry that the whole matter of retrenchment has been inquired into and reviewed by neutral parties more than once during the current year. The mine owners, through their agents, have submitted details of retrenchment and these details on the whole have not been challenged. It has been shown that:—

(1) The original proposed reduction in the number of white workers was modified owing to an agreement between the management and men for longer hours underground and the relaxation of certain union rules.

(2) Retrenchment, however modified, still continues due largely to the fall in the price of gold.

(3) Late in October 2.2 per cent. of the total whites in the service were marked for retrenchment. This 2.2 per cent. included both officials and men as under: Clerical 7, mechanical 13, mining 10, reduction 3.

Below the Pay Limit.

(4) Further retrenchments of white workmen will follow any fall in the price of gold, and the exhaustion of the Hercules and Comet is considered the pay-limit of the East

Rand Proprietary Mines and the ore reserves of the Hercules and Comet sections are on the point of exhaustion and will shortly be relegated to the position of purely reclamation areas.

(5) The workmen have full access to the management re retrenchment discussions, sub-committees of the shop stewards committee meeting their manager in the company's time. The official mine staff or their representatives have also full access to the management to discuss any retrenchment proposals.

Overhead Charges.

I am of opinion that the white employees of the East Rand Proprietary Mines recognise the need for retrenchment and do not cavil at the general principles now being carried out, recognising their necessity. The men and their unions, however, consider that too little is being done to make the more highly paid consulting engineers and general managers share in the general depression and that a cut in the number of white employees should start from the top grades and not only affect workmen and junior officials. The representative of the South African Industrial Federation on this inquiry clearly intimated that the Federation accused the East Rand Proprietary Mines of excessive overhead charges and extravagant management, while admitting that an investigation into its charge would be far beyond the scope of the present inquiry. The Low Grade Mines Commission inquired into what practically amounts to the same charge and was of opinion (see pages 8 and 9 of the report) that these overhead charges could not possibly affect the position of the low grade mines.

(Signed)

U. P. SWINBURNE.

Chairman.

Lubricants

"A grade for each type of service"

IF FRICTION COULD SPEAK, it would confess, "I am robbing you of power, of production, of profit."

If your machines were human, they would tell you that friction is pain—and pain is the forerunner of trouble.

What will guard you against wasteful friction? Correct lubrication—and that only. The subject is well worth your most serious thought.

Production's Sly Enemy

FRICTION—

the unseen enemy of production in your plant.

We are in a position to reduce the wear and tear on your machinery—to reduce power waste and so increase your useable power.

This increased power means increased production without added power cost. It means improved profit. It will protect your pocket-book from friction theft.

We can bring to bear on your plant the most complete fund of lubricating experience in existence. It embraces thorough engineering knowledge and wide practical experience.

We suggest you get in touch with our nearest branch

New Transvaal Coal Fields.

EXTENDING OUR KNOWLEDGE OF RESOURCES—EXTENSIVE DRILLINGS IN THE AREA S.-E. OF WITBANK—A THOUSAND MILLION TONS OF GOOD COAL ADDED TO OUR RESERVES—VALUABLE LECTURE BY DR. MELLOR.

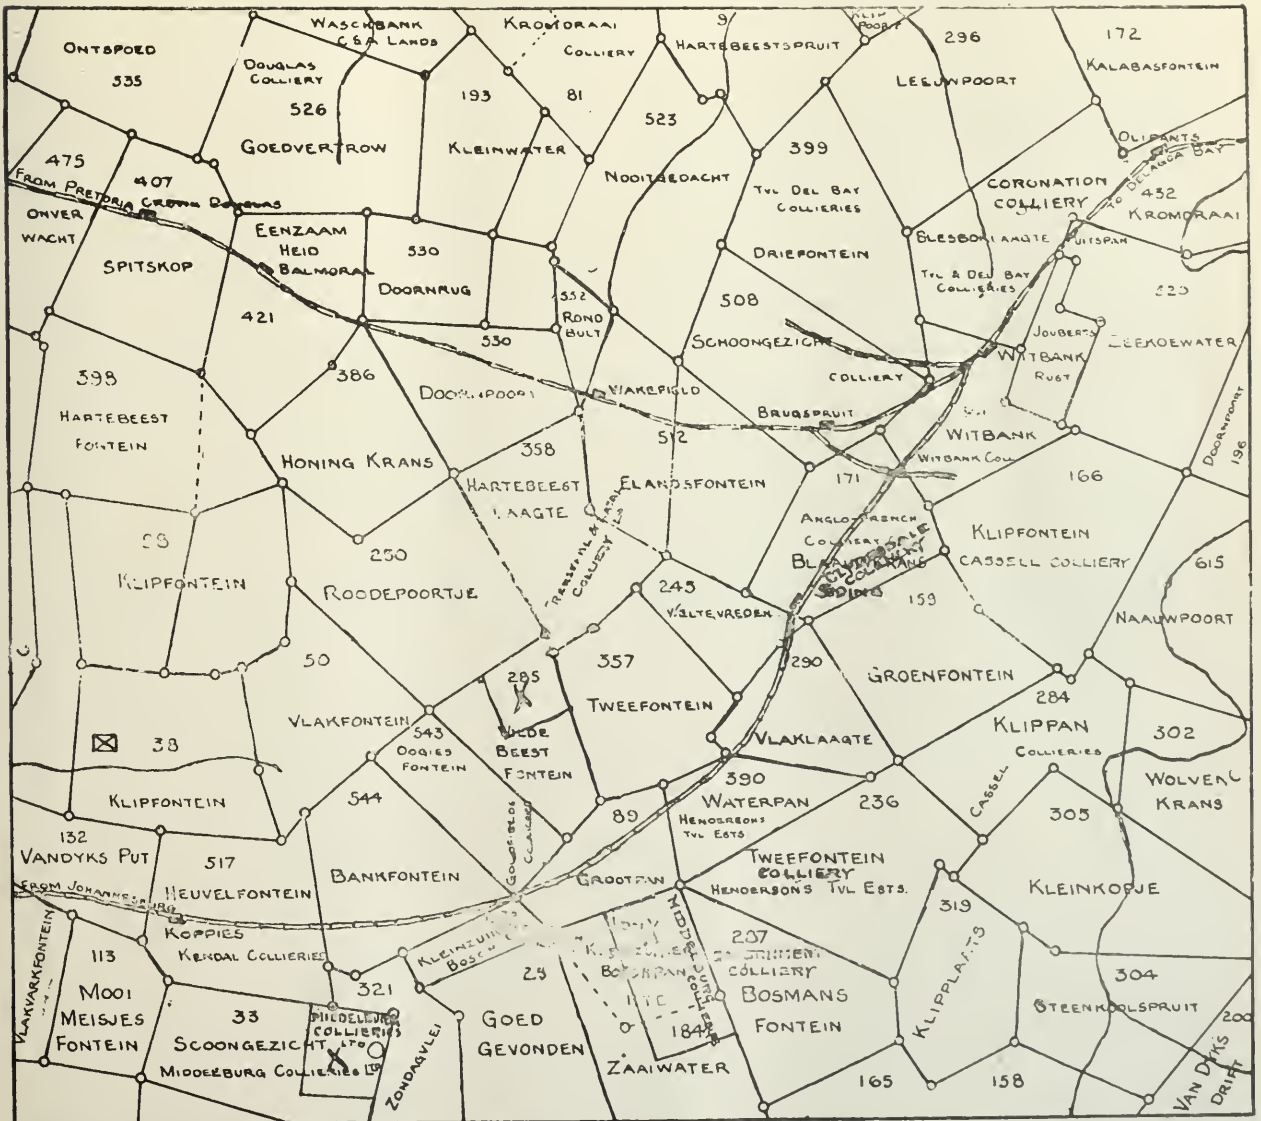

On Monday night Dr. E. T. Mellor read a paper on the Coal Fields of South Africa, in which he referred at length to the data recently secured in the district to the south-east of Witbank. He concluded his valuable and instructive lecture by making a timely reference to the prospects of expanding the Transvaal's coal trade by building up a larger export business through a new port in British territory and with a new railway or railway lines to feed such a port.

Dr. Mellor's lecture was delivered before a large and interested audience, and it is probable that had the atmosphere not been so electrified by the tension of the strike, it would have elicited discussion. We feel certain, however,

that when the paper is reproduced in its final form and circulated amongst the members of the S.A. Geological Society, before whom it was read, that the many interesting and extremely valuable points contained in the lecture will receive a very full measure of debate and appreciation.

Natal and Transvaal Conditions.

In the course of his lecture Dr. Mellor gave a brief outline of the geology of the South African coal fields and repudiated the idea that our coal measures owe their origin to drift agencies. He contrasted the coal fields of Natal with those of the Transvaal, and laid particular stress on the fact

Coal Mines of the Witbank District, Steenkoolspruit, and Van Dyk's Drift, referred to by Dr. Mellor, are in the lower right hand corner of the map.

that the coal beds of the middle and Eastern Transvaal are not nearly so fractured by dykes and igneous intrusions as are those of the Garden Colony.

The New Fields.

The most important part of his lecture dealt with the exploratory work which recently has been carried out in the district lying to the south-east of Witbank by several of the large mining corporations of South Africa. Dr. Mellor stated that the results of this work had greatly added to our knowledge of the coal measures of the Transvaal, and that in the light of the data obtained by extensive borings in this region the extent of our coal reserves must be reckoned at considerably more than they hitherto have been assessed at. This view, it may be recalled, was expressed in the second Special Coal Number of the *S.A. Mining and Engineering Journal*, issued a few months ago.

Many Acquisitions.

It has been known for some time past that the Corner House people have been actively engaged in examining coal

Proving Coal Seams in the Witbank District by means of drilling.

occurrences in various parts of the Transvaal and Natal, and particularly in the region of Witbank. Dr. Mellor and able engineers have investigated the possibilities of numerous properties in this district, and many scores of analyses and steaming and by-product value determinations have been made on the coal of these localities.

At the Rand mines meeting held at the end of May last Sir Harry Ross Skinner, who presided, made some interesting reference to recent activities of the Corner House in regard to coal. He said investigations in conjunction with the Central Mining and Investment Corporation, Ltd., for the acquisition of coal mining interests have progressed satisfactorily. "Up to the present over 270 separate farms in the Transvaal and Natal have been inspected. As a result an area of approximately 8,500 acres in the Witbank district has been acquired on the farm Wolvekrantz, and extensive drilling has disclosed the existence on this area of wide seams of coal easily worked and of excellent quality. Two other areas in the Witbank-Middelburg district, totalling approximately 13,000 acres, have also been acquired under satisfactory lease arrangements, and when conditions become more stable, consideration will be given to opening up one or more of these three areas as coal producers."

Adding to Our Reserves.

Dr. Mellor referred to the farm Van Dyk's Drift of the T.C.L. Company, and Steenkoolspruit of the Iron and Steel Corporation. He said that extensive and systematic borings by means of shot drills in the coal field to the south-east of Witbank had resulted in not less than one thousand million tons of good grade coal being added to our known fuel resources. Dr. Mellor said that 300 shot drills had been sunk in this district and that data of most valuable nature had been secured thereby.

New Railways and Harbours.

He made a reference to the possibility of new railways to serve these extended fields (particularly a railway from Minnaar towards Carolina) being constructed in the near future. Dr. Mellor dwelt, too, on the value to the Transvaal's future coal trade of Kosi Bay. The lecture was illustrated by many excellent lantern slides depicting drilling operations, stratigraphical sections, etc.

[Since writing the foregoing we have received an abstract of Dr. Mellor's paper, and we propose to deal with this at some length in our next issue.]

Labour in Australia.

That the extortionate demands being made by labour unions is the worst advertisement for Australia, and is preventing the best class of people from immigrating to the Commonwealth, is the opinion of Mr. J. M. Niall, who returned to Melbourne after a tour of Great Britain and Europe. Mr. Niall said that trade was bad in Great Britain, there being a scarcity of orders, and a good deal of unemployment, more particularly in coal centres, such as Durham. Shipbuilding in Great Britain was practically suspended, the only work in hand at the time of his visit being Government contracts, which, he understood, had since been cancelled. Ships could now be bought in Great Britain at much less than the cost of construction. "A great deal of interest was displayed in Great Britain," added Mr. Niall, "at the visit of Lord Northcliffe to Australia, and the articles which Lord Northcliffe had contributed to 'The Times' on the need for immigration in Australia were widely read. Everyone knows that Australia is in need of population, but the trouble is to get the right kind of population. We do not require people who want to live in the cities, but people who will settle in the country and help to produce. The wrong kind of immigrant is easy to get in Great Britain, but it is hard to obtain the right kind, as the people realise that labour conditions in Australia are very unsettled. For instance, the announcement that the Coal Miners' Federation was seeking a 27½-hour week at the face was regarded by the people in Great Britain as disastrous, and beyond the bounds of reason. The better class of workmen in Great Britain realise that the world has got to get back to hard work, and there will be great difficulty in getting the class of immigrant Australia needs, in view of the turmoil and industrial strife that have been rampant in Australia in the last few years."

GOVERNMENT EXAMINATIONS.

MINE MANAGERS' EXAMINATION

Total certificates (metal) granted to date 1921 — 36
Secured by students of Messrs. Lucas & Wolfe — 21
Balance for S.A. — 15

In addition to above we obtained 5 coal certificates last two examinations

OVERSEERS' EXAMINATION

During 1918 and 1919 we secured the majority of the certificates granted. 21 certificates in 1920, and 23 certificates to date 1921 (metal and coal)

SURVEY EXAMINATION

We have obtained practically all the certificates granted by the Mines Dept. during recent years and have secured 62 certificates to date

A Memorial to the Tunnellers.

FIELD MARSHALL HAIG'S ELOQUENT TRIBUTE—SOME LINES THAT WILL LIVE.

So many South African mining men played big parts in the tunnellers during the Great War that the following complete account of a memorable ceremony in London will doubtless be read with deep interest.

On November 24, Field-Marshal Earl Haig unveiled the memorials erected in the honour of the members, associates, and students of the Institution of Mining and Metallurgy, and of the members of the Institution of Mining Engineers who fell in the Great War.

After brief introductory remarks by Mr. F. W. Harbord, president of the Institution of Mining and Metallurgy, and by Colonel W. C. Blackett, president of the Institution of Mining Engineers, Earl Haig said:—

“Two good reasons urged me to accept your invitation to come here to-day to unveil these two memorials to your gallant dead.

“The first, and more general one, is that on all such occasions I am able to pay personal tribute to a section of those many thousands of brave men who fought under my command in France, and under my command paid the last and greatest sacrifice that love of King and Country can demand of true and loyal citizens.

“The least that I can do, I, who acting myself in the execution of my duty, asked and obtained so much from them in the execution of theirs, is to join with those who knew and loved them in honouring their names.

“My second and more particular reason for wishing to come here is that you afford me the opportunity to say a few words of especial thanks to a body of men whose work in France seldom drew upon itself much notice or glory at the time; but was surpassed by none in the demands it made upon the skill, courage, and resolution of the individual concerned or in the service it rendered to the Army as a whole.

“One thinks naturally of the battle of Messines, and of the mighty series of explosions that tore great gaps in the German line on June 7, 1917, and gave the signal for one of our most successful attacks. That was the work of the special services to which you sent so many gallant men; and it was indeed a signal triumph of British mining in war. Yet few, I think, outside those who took part in the work or saw and benefited by its results, realise the immense amount of steady and persistent toil, in every circumstance of peril, surrounded by danger in a form that might well appal the stoutest-hearted, that went to the preparation of that triumph. Few, I know, realise how vast and how important to the safety, comfort, and success of our troops, was the other work of our miners; work that was little commented upon in the Press, but yet went on steadily and continuously day after day and year after year all along the British front.

“There was no trace at any time to the warfare that went on underground; no respite from the toil that the needs of the Army imposed upon those who were the masters of the art of digging underground. Only, there were periods of redoubled activity, or more than common strain. Every offensive undertaken by us, right up to the days of the last great series of advances, meant a fresh call upon the energy, industry, and courage of these special services upon whom the due preparation of those offensives so largely depended. Tunnelled approaches had to be constructed for great distances, dug-outs built for headquarters, dressing-stations, and shelter generally. Every big offensive made

demands of this kind. An immense amount of work was done for the Somme. The preparations for the battle of Arras attracted little attention compared with those for the Messines battle, but were no less valuable. Then, later, when the day of the elaborately mounted attack was over, the tunnelling companies found a new work, hardly less arduous or dangerous, in the discovery and removal of many thousands of German mines.

“I am talking to those who themselves know something of these things; but it is right that others should know, too, and here where you are met to pay a last honour to comrades, members of your Institutions who actually accomplished these things and died nobly in the doing of them. I

The Memorial erected by the Institution of Mining and Metallurgy.

am glad to thank anew—not for myself only, but on behalf of the whole Army—a most gallant body of men.

“This is an occasion for deep sympathy with those who have lost so much and see in these memorials the commemoration of their private sorrow. It is an occasion, too, for admiration and gratitude towards men who gave so much, all that men could give, for the liberty and honour of their fellow-countrymen. It is more even than that. It is an occasion for us who remain to take courage from the example of those who have so bravely gone before us. The cause for which these honoured dead gave the last full measure of their devotion is still ours to uphold. The task to which they gave their lives is laid upon us and our children to complete.

"Therefore as days go by we should look upon these memorials with quiet sorrow, but with lasting pride. They should be to us lessons not only of what men have done, but of what true men can do. Then shall we and generations to come after us draw hope and inspiration from the memory of what these men accomplished in the strength of their faith and patriotism. So that in the days of difficulty, now and hereafter, the great commonwealth of nations to which we all belong, which we all love, shall never lack for men who will—as did these whose names are here written—count their own lives as nothing in their country's service."

The memorials are installed in the library of the new house of the two institutions in City Road. That of the Institution of Mining Engineers consists of a mural plaque of marble, on which is a draped female figure in bronze. Underneath is a bronze plate bearing the dedicatory inscription, and on the marble are carved the names of the fallen. The rising sun about the base of the figure is done in gold mosaic. The sculptor was Mr. Alan G. Wyon. The memorial erected by the Institution of Mining and Metallurgy was designed and executed by Colonel Peter N. Nissen, a member of the Council of the Institution. The main figure in Colonel Nissen's design is a second lieutenant in the act of exploding a mine. The best description of the memorial is contained in the following verses written by a visitor who was present at the unveiling ceremony:—

THE MEMORIAL

erected by the

INSTITUTION OF MINING AND METALLURGY

To their Glorious Dead.

Would they, the brave ones early dead and gone,
Desire that we should carve their names in stone,
Erect memorials in their honour, and
Inscribe their deeds upon the roll of fame?
With humble self-effacement they might say
That they did not regret the sacrifice,
They only fought for duty, not for praise,
That those who fought and lived deserve
An equal recognition; or they might
Prefer the glory to be given to Him
Who sent them strength and heart to lay the foe
And so preserve the freedom of the world.
Thus is the monument designed to show
The work the miners did throughout the War,
That both their friends and those who follow on
Shall look on it with thankfulness and pride.
To render glory unto God we need
No sculptured figure with symbolic aim;
Sufficient is the record of good deeds,
Portrayed by deft and reverential hands.
But best of all to please both dead and quick
Is that the monument should be designed
By one who was himself upon the field
And could present the actual scenes of war.
High on a pedestal of malachite
Stands a young officer of engineers,
With strained attention ready to explode
The charge and force the climax of attack;
The boots, the mud, the sandbags, and the tins
Show the environment in which he worked.
The sculptor has recorded other scenes,
Familiar to the miner in the War,
In bas-relief in panels 'neath the plinth;
Field and machine guns, scouting aeroplanes,
A Flanders road with all its trees destroyed,
A bridge to span a Belgian waterway,
A tunneller listening with the geophone,
A warship, and a poison chemist's den;
The habitations on the firing line
In which the men took cover or sought rest;
The unseen hut, the dug-out and the house
Battered by shell and falling to the ground.
On silver plates are cut the names of those
Who died, with glowing words of true regret.

The bronze, the malachite, the silver, all
Suggest the missions of the fallen men
Before the battle called them to the front.
Complete it stands upon a base of oak,
Oak, British oak, that still denotes the strength
And steadfastness of Britain's sons.
Farewell! Yet not farewell, ye noble dead,
Your name shall surely live for evermore!

THE WORLD'S COAL INDUSTRY.

In the course of a report on the world's coal industry the German Coal Association states:—With regard to the future developments of the world's coal markets, a matter of great importance is not the actual output at the moment, but the capacity of output of the chief coal-producing countries. For England the output attained in December, viz., 23.6 million tons, is of significance. It represents an output for one year of 283.2 million tons, a quantity which exceeds the 1920 output by 50 million tons, and is only smaller by 8.8 million tons than that of 1913. The U.S.A., taking the average of the months September to December, had an output of 53.2 million tons; this corresponds to an annual output of 638.4 million tons, which exceeds the actual 1920 output by 53.1 million tons. Germany, since from the middle of March last the extra shifts in the Ruhr district were discontinued, has to reckon on a diminished output. Taken as a whole the world's output capacity for the current year may be estimated at about 100 million tons greater than the actual 1920 output, a quantity which exceeds the highest output yet attained, viz., in 1913, by about 40 million tons of pit coal. The effect of this increased supply was interrupted by the English coal strike, which broke out in April and lasted until the beginning of July last; that this effect has been most marked is seen by the fact that in spite of the great loss of output owing to the strike, American prices for export coal only slightly increased.

The chief rivals in the world's coal market at the present time are England and the United States, whose coal export has been as follows, in million tons:—

	Great Britain.	U.S.A.
Average 1910-1914	68,030 ...	15,758
1915	46,321 ...	18,782
1916	42,013 ...	21,631
1917	38,501 ...	25,349
1918	34,634 ...	23,053
1919	39,302 ...	23,051
1920	29,752 ...	40,036

England's export accordingly is less than half that of pre-war years. The export of the United States has more than doubled, and in 1920 exceeded that of England by more than 10 million tons. American coal has penetrated in large quantities into England's most profitable markets. Before the war America sold 434,000 tons of coal in Europe, but in 1920 12.9 million tons, or thirty times as much. The South American market, which before the war was dominated almost exclusively by England, is now almost entirely supplied by the United States.

Arising out of a demand by the Unions in September, 1918, for the dismissal of coloured drill sharpeners, the Chamber, while refusing the demand, offered to recommend to its members that the "status quo" as existing on each mine with regard to the relative scope of employment of European and coloured employees should be maintained: that is to say, that no billets which are held by European workmen should be given to coloured workmen, and vice versa. This offer was accepted by the Unions. The men affected by this agreement are engaged on semi-skilled work and are on what are known as border-line occupations.

In seeking to repudiate this status quo agreement, the Chamber does not wish to break down what is known as the Colour Bar. The Chamber of Mines could not dispense with many of its European employees even if it wished to.

As the gold and coal mining industries were up to this week practically carrying the Union on their backs, the above graphic illustration of the actual figures involved may be of interest at this juncture.

Gold Output for 1921.

DECREASE OF £1,090,734 ON 1920.

TOTAL VALUE OF TRANSSVAAL OUTPUT TO DATE,
£709,467,217.

During 1921 the Transvaal mines produced 8,114,586 oz. of fine gold valued at £42,017,350, as against the total of 8,154,172 oz., value £43,108,084, declared for 1920. This is a decrease of 39,586 oz. in weight and of £1,090,734 in value. The total gold output of the Transvaal since the commencement of the fields in 1884 is 163,251,210 oz., value £709,467,217, which includes the receipts from the gold "premium."

The following are the total gold outputs of the Transvaal since the commencement of fields, in ounces. The figures are compiled from Government blue books and Chamber of Mines' returns.

Year.	Oz.	Year.	Oz.
1884	2,376	1904	3,773,517
1885	1,414	1905	4,909,541
1886	8,171	1906	5,792,823
1887	39,880	1907	6,450,740
1888	227,749	1908	7,056,266
1889	350,909	1909	7,295,108
1890	440,152	1910	7,527,108
1891	688,439	1911	8,249,461
1892	1,069,058	1912	9,107,512
1893	1,290,218	1913	8,798,336
1894	1,805,000	1914	8,394,322
1895	2,017,443	1915	9,093,902
1896	2,025,510	1916	9,296,618
1897	2,743,518	1917	9,018,084
1898	3,823,367	1918	8,418,292
1899	3,637,713	1919	8,331,294
1900	348,761	1920	8,154,172
1901	258,032	1921	8,114,586
1902	1,718,921		
1903	2,972,897	Total	163,251,210

Including the "premium," the following are the Transvaal totals for the past ten years:—

	Oz.	Value.
1912	9,107,512	£38,686,250
1913	8,798,336	37,372,949
1914	8,394,322	35,656,814
1915	9,093,902	38,628,437
1916	9,296,618	39,489,522
1917	9,018,084	38,306,381
1918	8,418,292	35,758,636
1919	8,331,294	35,383,974
1920	8,154,172	43,108,084
1921	8,114,586	42,017,350

Union Minière Record Output.

Formal meetings of the Tanganyika Concessions and Zaubesia Exploring Co. were held in mail week in London to ratify certain matters in connection with the extension of the concession. Mr. Tyndale White, who presided, mentioned the interesting fact that the Union Minière production should reach over 30,000 tons this year, which will be a record output.

The status quo agreement was entered into by the Chamber of Mines and the Unions during the abnormal period of the War. It was a provision suitable to a wholly unusual period, and its perpetuation to-day, more than three years after War ended, is helping to bring ruin to the poorer mines of the Rand, which in large degree keep Johannesburg, the Reef and the country at large from bankruptcy.

To Encourage Commercial Research.

During the last few years much has been done in Great Britain to encourage scientific and industrial research in one form or another. The latest and in some ways the most original scheme is in connection with the British Empire Exhibition to be held in London, England, during 1923. The British Chambers of Commerce are offering Commercial Research Fellowships of the value of not less than £500 and including a first-class return ticket to a Dominion or Crown Colony. Winners of these fellowships (in open competition) will proceed to a selected Imperial region overseas and report upon the best means by which its trade can be stimulated and its raw materials and other resources developed. The best method of representing these resources at the British Empire Exhibition will also be considered.

Railway Revenue Falling.

BIG LOSS FOR SEVEN MONTHS—THE COAL TRADE—GENERAL MANAGER'S BULLETIN.

The latest bulletin of Sir William Hoy, general manager of the S.A. Railways, shows that during the first seven months of the present financial year the total losses on the railways amounted to £982,759, and on the harbours £63,312.

The railway losses ranged from £268,827 in May to £69,312 in October. The harbours returned a profit in April and August; otherwise losses varying from £32,596 to £5,575. The steamships were run at a profit except in September, when there was a balance on the wrong side of £13,791.

The total loss on railways, harbours and ships, after providing for contributions to betterment and pension funds, was £1,119,950.

Railway earnings showed a slight advance for the week ended December 10, totalling £425,953, which is the highest figure reached since the week ended October 1. They were, however, still £9,249 below the estimate and £78,777 lower than for the corresponding week of last year. Passenger traffic accounted for the improvement, the revenue from which has not been exceeded since the first week of July last.

Revenue and Expenditure.

From April 1 to October 31, railway earnings came to £12,584,046, a decrease compared with the corresponding period of the previous financial year of £764,465, or 5.8 per cent. During the same period the working expenditure of the railways was £10,303,500, a decrease of £263,245, or 2.5 per cent. Expenditure has been reduced, adds Sir William, but it has been impossible to bring it down sufficiently to compensate for the heavy falling off in revenue.

Reference is made to the fact that the railway rate for coal shipped by vessels sailing on and after December 1 was reduced by 6d. per 2,000 lb., this being in addition to the decrease of 1s. 3d. per 2,000 lb., which operated from November 1.

Wool continues to be forwarded in increasing quantities. The following shows the number of bales received at Durban during the months of October for the last six years, viz.: 1916, 7,086 bales; 1917, 16,263; 1918, 6,763; 1919, 7,293; 1920, 2,387; 1921, 12,530.

Bales received at East London during the three months ended October 31 since 1916 are as follows: 1916, 19,609 bales; 1917, 27,598; 1918, 13,794; 1919, 18,264; 1920, 9,000;

1921, 38,770. If not a record, the number of bales received at East London during the three months ended October 31, 1921, is the highest since 1916.

The estimated revenue from railway sleeper plantations for the next financial year is 58 per cent. of the expenditure. Revenue from these plantations is steadily increasing, and in a few years should more than balance expenditure. The

A Scene on the S.A.R.

trees which are left after the thinning and lopping process is completed will still be available for meeting part of the Administration's sleeper requirements.

During the three months August to September 884,620 tons of coal were bunkered, exported overseas and shipped to other Union ports of S.W.A., as against 856,132 for the corresponding months of 1920. The purely coastal trade was an insignificant item, the vast bulk being bunkered or exported overseas. In October the total was 247,808 tons against 306,148 in October, 1920.

If this strike is prolonged there will be a general collapse of the Rand mining industry. Unemployment, both here and throughout the country, will grow enormously, the State will be face to face with national insolvency, property will fall enormously in value, the farmer will be unable to sell his produce, and the merchant his goods. There will be widespread distress and suffering. Everyone will be poorer; no one will be richer.

Reviews.

EMPIRE MINERALS MAP.

We have received from the Imperial Institute a map exhibiting the chief sources of metals in the British Empire, with diagrams of production for 1918. This valuable chart has been prepared under the direction of the Mineral Resources Committee of the Imperial Institute. The following metals and ores are dealt with and their sources within the Empire located upon the map: Gold, silver, platinum, copper, tin, lead, zinc, antimony, aluminium ore, bismuth ore, iron ore, manganese ore, chromium ore, nickel, tungsten ore, molybdenum, vanadium ore, mercury. The key is printed in grey, which gives greater prominence to the symbols and initials, which are in black, vermilion and green. The size is 35½ x 44 inches. Prices: Paper, 5s. 6d. (postage 4d. extra); mounted on cloth, rollers and varnished, 12s. 6d. net (carriage extra).

The map consists of three sections—a general map of the world on Gall's Projection, a series of inset maps of British countries, and a separate set of diagrams of metal

production. On both general and inset maps British possessions are shown in red, mandated territories in light red, and foreign countries in yellow. Deposits of metals are indicated by special letters, and their approximate localities by symbols of different colours; worked deposits being distinguished from unworked. The letters are sufficiently large to be visible several feet from the map. In the general map are tabular lists of the principal metallic deposits in each part of the Empire. The inset maps, all drawn to a uniform scale of 160 miles to the inch, include South Africa, British Columbia and Yukon, Eastern Canada, the British Isles, Southern India and Ceylon, Burma, British Malaya, Eastern Australia and New Zealand. The diagrams of production give the outputs of 18 principal metals in each country of the Empire for the year 1918, the amounts being illustrated by red coloured rectangular strips. The outputs of the world are similarly shown, the proportion of total British production being indicated.

The map, which is invaluable for purposes of reference, and also for educational purposes in connection with the teaching of the commercial geography of the Empire, is procurable from George Philip & Son, Ltd., 32, Fleet Street, London, or from the Imperial Institute.

DESIGN OF COMPLETE MATERIAL - HANDLING INSTALLATIONS.

Almost invariably, contracts for complete installations placed with the Robins Conveying Belt Company call for complete detailed designs of conveying machinery, chutes, and supporting structures, because :

1. ROBINS PLANS are completed very rapidly and yet are free from inaccuracies and mistakes which would cause field delays. The Robins Engineering Department, like the Robins Shops, is a highly specialised organisation.
2. ROBINS PLANS embody in every detail that perfection of arrangement and choice of machinery which can only come with long experience and close touch with operating conditions.
3. ROBINS PLANS, by careful standardisation, secure maximum economy in structural design and convenience in erection.
4. The use of ROBINS PLANS secures unity of responsibility and an un-conditional guarantee of successful operation.

EDITORIAL.

THE STRIKE AND ITS CONSEQUENCES.

All other events and incidents in the local mining world during the past week have, of course, been completely eclipsed by the big strike which commenced on Monday and which involves 22,000 men employed by the gold mines, the Victoria Falls Power Company, the engineering shops and associated industries. Even the coal strike and the efforts of the coal mines in the Witbank, Vereeniging, and Far East Rand coalfields to maintain a supply of fuel for essential services have sunk into insignificance by comparison with the much bigger issue of the strike on the Reef. And this in turn may possibly be overshadowed by the greater effort of the Federation to engineer a sympathetic strike all over the country. But we are not inclined to the view that the Federation will succeed in this design.

The mines have given notice that the repatriation of natives will commence on Monday, and to counteract this move the Federation would no doubt like to see the railways idle. The problem of repatriation of natives would then become more difficult, though not insuperable. But, as a matter of fact, we do not think that there is much disposition on the part of the Nurbas to throw in their lot with the men now on strike on the Rand and on the coalfields of the Transvaal. The railwaymen in any case could certainly not complete a ballot by Monday—it would take at least a fortnight to canvas all the scattered employees of the railway, and the Federation in its appeal to all other "workers" makes a point of it that "constitutional steps" should be taken to enable all organisations of labour throughout South Africa to strike if called upon on Monday next at 7 a.m. We do not think, then, that the Federation will succeed in its endeavours to widen the front of the present industrial battle. During the past week many speeches, some of them of an excited nature, have been made along the Reef, but so far, although there have been interferences with essential services at the Village Deep, Kleinfontein, and Springs Mines, there has been nothing in the nature of rioting or violence. The Rand is now well policed, and it is generally believed that there can be no repetition of anything approaching the calamitous events of 1913. It is difficult to foresee the next move of the Federation. The men's leaders must know that they cannot stand a protracted struggle, and rather than allow themselves to be starved into submission an attempt may be made to create some kind of a diversion in the quiet but grim battle which is being fought out. But it is difficult to see in what direction a useful move can be made unless the Federation is prepared to admit that the economic facts are against them and that the Chamber's proposals for saving a waning industry are the best that are possible having regard to all the facts of the case.

The Federation is not prepared—not yet prepared at any rate—to endeavour to effect a settlement on the facts of the case. The appeal of the Federation to the Prime Minister to re-open discussion was not worded in a manner which suggests that the Strike Committee are in a mood to admit the urgent and immediate requirements of the industry. The Chamber of Mines has offered to postpone operation of the action contemplated by the managements, of which due notice was given for a week, but after the final meeting on Monday, when the unreasonable attitude of the men's representatives was clearly defined, hope of a settlement before the strike could do an immense amount of damage to the mines and irreparable damage to some mines, dwindled to vanishing point.

It is calculated the Rand is losing directly £160,000 per day. Of this £35,000 represents the men's wages, and cessation of amount expended in wages and the purchase of stores means £90,000 to the community. The natives' pay for the first week of the strike is £200,000, but this item will, of course, decrease as the repatriation of the mine boys proceeds. The position, therefore, is anything but satisfactory. The effects of this strike will not only greatly increase unemployment and distress on the Rand, but they will have a calamitous effect on the whole country.

The action taken by the Chamber of Mines on behalf of the struggling gold mines principally objected to by the men's leaders has undoubtedly been the Chamber's notice given "without prejudice to discussion" to terminate what is known as "the Status Quo Agreement." This agreement entered into by the Chamber of Mines and the Unions during the abnormal period of the War was a provision suitable for a wholly unusual period, and its perpetuation to-day, more than three years after the War ended, is helping to bring ruin to the poorer mines of the Rand, which in large degree keep Johannesburg, the Reef, and the country at large from bankruptcy.

It may be recalled that, arising out of a demand by the Unions in September, 1918, for the dismissal of coloured drill sharpeners, the Chamber, while refusing the demand, offered to recommend to its members that the "Status Quo" as existing on each mine with regard to the relative

scope of employment of European and coloured employees should be maintained; that is to say, that no billets which are held by European workmen should be given to coloured workmen, and *vice versa*. This offer was accepted by the Unions. The men affected by this agreement are engaged on semi-skilled work, and are on what are known as border-line occupations. In seeking to abolish this "Status Quo" Agreement, the Chamber does not wish to break down what is known as the Colour Bar. The Chamber of Mines could not dispense with many of its European employees even if it wished to.

What the Chamber of Mines has proposed is to retrench rather less than 1,400 of these semi-skilled redundant and border-line occupation workers in the near future, and, over a lengthy period, to dispense with a maximum total of 2,000 men in all. By this means the mining industry of the Rand will be very largely helped.

The Chamber's proposals in no way affect the status of the skilled craftsman. His position can be very adequately safeguarded by the application of a system of ratios to the number of European and Coloured employees of the mines, and the Chamber has given guarantees to this effect. The Chamber of Mines has no intention of assailing the positions occupied by men who, by apprenticeship, experience or diligence, have acquired proficiency in their work. What it objects to and intends to oppose is the fastening upon the industry of redundant persons who, having failed in other occupations, now seek to shelter behind the "Status Quo" Agreement and certain of the Mining Regulations, to the detriment of the mines and the country generally.

In the interests of all concerned, it is essential that some way out of the existing deadlock should be found. But it can only be found if the men will be prepared to frankly face the economic facts and toe the line with employees in other parts of the world. Everywhere wages are being reduced and economies effected, and in the face of the falling selling price of the product of the mines it is absolutely imperative that the mines of the Witwatersrand should be retrieved from the impossible position into which they have fallen.

Notes & News.

Monteleo Diamonds.

The secretary of the Monteleo Diamonds, Limited, reports the following results of washing operations of the company for the month of December, 1921:—Blue ground washed nett, 3,821 loads; diamonds recovered, 631½ carats, equal to 16.52 carats per 100 loads.

West Rand Developments.

Mr. Harry Graumann, M.L.A., has left England for South Africa. He stated to Reuter, before sailing, that negotiations had now been completed for the acquisition by the Coronation Syndicate of the mineral rights on the farm Luipaardsvlei No. 10 and that the requisite capital for the development of the Randfontein series, recently located on the property, had been provided. It appears from this statement that new and important interests are about to take a hand in the development of the West Rand.

The Rhodesian Mining Outlook.

The Bulawayo correspondent of the *Pretoria News* says: The mining outlook is disturbing. The chrome and asbestos mines are shut down, and some of the lower grade gold mines are threatened. It is held that wages generally are too high to permit of economic work. The opinion is current that the owners are contemplating a general reduction of wages, especially as the recent enquiry into the cost of living has shown that costs are but 23 per cent. dearer than before the war. According to a very guarded forecast in the local *Chronicle*, the owners intend to give long notice of the contemplated reduction.

A Colliery Plant for Sale.

Attention is directed to an advertisement appearing in this issue regarding the sale of the plant of the Uitkyk coal mine, which is to take place on the property on January 27. The Uitkyk plant is extensive and in perfect order and comprises engines, boilers, smoke stack, air compressor plant, coal bunkers, conveyors, screening plant, haulage machines, pumps, rock drills, rails, workshop tools, etc. A list of the principal items for sale appears in our advertising columns.

The Grain Elevator Contract.

According to a Reuter cable, the Industrial Correspondent of the *Daily News* announces that the contracts for the thirty-six grain elevators in South Africa, the construction of which will shortly be begun by Messrs. A. W. Menkens & Co., of New York, have been placed with English firms. Messrs. Spencer & Co., Ltd., of Melksham, have received the order for the whole plant for the terminal elevator at Durban, which will have a capacity of 42,000 tons and a loading capacity of a thousand tons per hour, and also for smaller collecting elevators in different parts of the country, which will feed the terminals at Durban and Capetown. Messrs. Henry Simon & Co., of Manchester, will equip the big elevator at Capetown with machinery. The whole of the steelwork required for the construction of the elevator will be supplied by the Furness Shipbuilding Co., Middlesbrough. We are informed that Mr. W. Littlejohn Philip, the Consulting Engineer to the S.A.R. Administration in regard to the installation of these elevators, is—or was—a director of Messrs. Spencer & Co., Ltd. Perhaps some of our readers will enlighten us on the point. While we all rejoice that the sub-contracts should have gone to English firms, we would welcome some further details of the original tendering, and the reasons why the American firm was successful.

Indian Gold Mines.

As bearing on the article in our last issue on gold mining in India, it may be noted that at a recent meeting of the Champion Reef Mr. Edgar Taylor gave a detailed description of the underground position, especially mentioning a new ore shoot which is being opened up in Carmichael's secondary shaft, showing high values but somewhat narrow widths. "This," he said, "is satisfactory so far as it goes, but we look to the further new development revealing a lode to correspond more with the widths we have been accustomed to in this property, and such as we are now opening up in the adjoining Ooregum mine at similar depths." In this connection, Mr. Taylor mentioned that quite recently in what is known as Oakley's No. 2 vertical shaft of the Ooregum mine (immediately to the north of Champion Reef) and at a depth of close upon 6,000 ft., there has been intersected a run of ore 2 ft. wide assaying over 1 oz. to the ton, and to the north again of this point, in the same mine from the 57th level downwards to the 64th, they have been opening up a shoot of quartz from 450 to 550 ft. in length of good workable width and highly payable values. It has been remarked by a mining engineer of wide experience that there is no mining field where the policy of continued development in the face of adverse results has been so consistently adhered to as in the Kolar field—a policy which has been amply rewarded and justified in the past. It is this feeling that inspires the Champion Reef Co.'s technical advisers to urge that development should be carried on at the lower levels with the maximum of effort consistent with economy in cost. The deepest point in the Champion Reef mine is a little over 6,000 ft. vertical.

The Flotation Process in South Africa.

An interesting sidelight on the progress of flotation in South Africa was afforded by the chairman of Minerals Separation, Ltd., in the course of his speech at the annual meeting of that company. *Inter alia*, he said: As regards our business in South Africa, flotation has for some months been in commercial operation at the Cam and Motor gold mine, and we have already received our first royalty pay-

ment therefrom. We have also recently concluded a license agreement with the Transvaal Silver and Base Metals, Ltd., an important base metal producer, and our plant is now on the point of commencing operations. I told you last year that we intended to organise a laboratory in South Africa and to establish our own representative there. He only arrived at Johannesburg at the end of February in the current year, but since that date a fully equipped modern laboratory has been installed in that city, and has been for some time in working commission; a great number of ores have been examined, and as the result of tests carried out an increasing number of inquiries are being received for the installation of our plants. Our representative informs us that the keenest interest in our processes is being displayed by the gold mining companies on the Rand. Preliminary negotiations have already taken place relative to the erection of flotation installations, while arrangements have been discussed with two leading undertakings for the carrying out of detailed examination of their ores, with a view to the installation of flotation on a large scale. I anticipate that we shall soon have a number of plants, large and small, operating in South Africa.

* * *

Bwana M'Kubwa Reconstruction.

The Secretary of the Bwana M'Kubwa Copper Mining Company, Ltd., says in a circular the successful further development of the mine in depth will enable arrangements to be made to provide the necessary reduction plant for the production of copper on a large scale. A well-known group recently had the company's property reported on by an eminent engineer, Mr. A. B. Emery, who has presented a most satisfactory report. He was accompanied there by an experienced staff of his own selection, and he subjected not only the mine as now developed, but also the country rocks within which the ore bodies occur to an investigation which the directors believe to have been of the most searching character. The following information is extracted from the report: The primary ore (that is, the unaltered ore from which the oxidised ores found on the upper levels of the mine have been derived) is of deep-seated origin. The tonnage of ore estimated and classed as assured and reasonably to be expected, counting down only to the 450 ft. level, is 3,000,000 tons. It is assumed that 1,000,000 tons will be developed for each 150 ft. in depth below the 450 ft. level. The average grade of the ore is 4 per cent. copper. After the provision of the necessary plant an output of 20,000 to 30,000 tons of ore monthly can be maintained. Mr. Emery had also the opportunity of subjecting the ore to a working scale test on the plant of Minerals Separation, Ltd., installed at the mine, and reports highly favourable results confirming those previously obtained. In this connection it is also satisfactory to know Minerals Separation, Ltd., after their own tests on the ore and with their world-wide experience in such matters, are strong supporters of the reorganisation of the company on the lines set out below. The directors have now succeeded in arranging for the reconstruction, and an agreement will be submitted for the approval of the shareholders. A new company to acquire the assets and undertaking is to be formed with a capital of £400,000, divided into 1,600,000 shares of 5s. each, holders of the present issued 925,053 shares being entitled to receive one share of 5s., credited with 2s. 6d. paid up in the new company for each fully-paid 10s. share held, the remaining liability of 2s. 6d. per share to be paid in five instalments, viz., 6d. on allotment and 6d. every four months thereafter, thus spreading the amount over sixteen months. Arrangements have been completed for the underwriting of the issue of the 925,053 shares of 5s. each credited 2s. 6d. per share paid up, the underwriters of such issue being entitled by way of commission to 15 per cent. on the amount of the cash assessment and a call at par for two years on one share for every six shares underwritten, and a call at par for four years on one share for every six shares underwritten, the subscribers of the 925,053 shares having similar calls, and the group that sent Mr. Emery to report on the property to have similar calls on a total of 58,245 shares. The

directors have approached the largest shareholders, and have been promised their support. They now recommend the scheme to the favourable consideration of all shareholders.

Drilling Speeds and Air Pressures.

In a recent issue of the "Colliery Guardian" Mr. H. M. Seamon gives data collected during a series of tests made at the property of the United Verde Copper Co. to determine the most economical air pressure for the operation of hammer drills under the varying conditions of use, and to investigate the variation in drilling speed at different air pressures. About 1-500 tests were made on 12 models of drills, at gauge pressures ranging from 40 lb. to 130 lb. No effort was made to bring theory and practice into accord; but rather to formulate sundry empirical rules covering the average variation of the results obtained. However, these rules on the performance of hammer drills, based on the air pressures as in the main variable are not necessarily of universal application; they apparently satisfy the results obtained in this particular series of tests.

The drilling conditions at this property vary widely. An average of 21 machine shifts to a 3 ft. round is necessary in some of the development work; while an advance of 56 ft. has been made in seven shifts in the "oxide" ground. This wide range of conditions precludes the adoption of one type of drill as a standard; consequently almost every kind of hammer drill sold in the country has been tested during the past few years. At the present time 16 different models of drills are in use, of which two types of the heavy (150 lb. to 160 lb.) mounted drills, one of the light mounted drill, one stopper and two hand-plugging drills are considered as standard.

Inspection of the several tabulated results shows that:—

- (1) There is little or no increase in mechanical efficiency of the drills above 90 lb. pressure.
- (2) The distance drilled per air indicated horse-power is a maximum for the jackhammer type at 90 lb. and increase at a slow rate for the other machines at the higher pressures.
- (3) The average thermal efficiency is a maximum at about 95 lb.
- (4) The factor of desirability, while increasing as the pressure, shows a comparatively slow rate of increase for pressures above 100 lb.
- (5) The average drill is made to be used at a pressure of 80 lb. or less, and the use of pressures much exceeding this would invalidate the present replacement agreements with the manufacturers, thereby increasing the unkeep cost.
- (6) The increased breakage at the higher pressures, with the consequent greater loss of time of the drill runner in changing or repairing the machine, would tend to reduce the factor of desirability.
- (7) The increased breakage of drill steel would tend to limit the pressure, although there are not sufficient data on this point to determine the maximum.

From the foregoing, it would seem that under the conditions obtaining at this property, about 95 lb. is the most economical gauge pressure.

We regret to record the death of Mr. Alexander Heymann of this town, which occurred on Wednesday. Mr. Heymann, who was 54 years of age, was educated at the Moscow University and had practised as an analytical chemist on the Reef for thirty years. He was a prominent Mason and at one time a member of the Council of the Chemical Mining and Metallurgical Society. Mr. Heymann took a prominent part in discussions on miners' phthisis, and was a member of the commission that was appointed to deal with mining regulations and ventilation. He was an occasional contributor to the technical columns of this journal.

* Loss.

Ferreira Deep, Limited.—Loss due to a fire which occurred underground on December 7, followed by a fall of rock in No. 1 Shaft four days later. Mining operations were suspended on December 9, and were resumed on a restricted scale on December 21. The tonnage milled was in consequence 14,800 tons lower than that of the preceding month, and working costs per ton were abnormally high.

Crown Mines, Limited.—Results again abnormal on account of continuation of strike of underground employees, which terminated on December 5.

General Note.—The results are affected generally by loss of tonnage occasioned by the December holidays and the decrease of 7s. per ounce in the valuation of gold, which has been taken at £4 13s. 9d. nett.

CONSOLIDATED MINES SELECTION GROUP.

The following are the results of operations for the month of December, 1921:—

	Stamps Working.	Tons Milled.	Working Costs per Ton Milled.			
			s.	d.		
Brakpan Mines	120	53,000	28/5	3/00		
Springs Mines	80	42,000	28/7	8/05		
Totals and averages	200	95,000	28/6	4/09		
	Value of Gold declared.	Yield per Ton.	Working Profit based on stand-ard value of Gold.	Working Profit per Ton.		
		s.	d.	s.	d.

UNION CORPORATION GROUP.

Particulars of operations on the producing mines of this group for the month of December, 1921:—

Company.	Stamps.	Tons Crushed.	Fine Ozs.	Revenue	
				(Including Sundry Rev.) Total	Per ton s. d.
Geduld Proprietary	100	46,000	17,065	£81,849	35/7
Modder Deep	70	41,600	22,997	110,209	53/0
Totals and averages	170	87,600	40,062	£192,058	43/10
Company.	Total.	Costs Per Ton.	(Incl. Sundry Rev.) Total.	Profit Per ton.	
Geduld Proprietary...	£50,222	21/10	£31,627	13/9	
Modder Deep	45,424	21/10	64,785	31/2	
Totals and averages	£95,646	21/10	£96,412	22/0	

The above results are arrived at by calculating the gold produced at £4 15s. 6d. per fine ounce. Realisation charges in excess of normal are debited direct to Revenue.

CONSOLIDATED GOLD FIELDS.

The following are particulars in regard to the outputs for the month of December, 1921, of the undermentioned Companies of the Consolidated Gold Fields Group:—

Company.	Stamps Running.	Tube Mills.	Tons Crushed.	Gold declared. Fine ozs.	Total Profit declared including Sundry Revenue.
Simmer and Jack ...	320	7	59,200	14,203	£1,432
Robinson Deep... ..	165	10	62,000	18,897	9,407
Sub Nigel	30	2	10,700	6,511	6,756
Totals	515	19	131,900	39,611	£17,595

Total gold in reserve (fine ounces): Simmer and Jack, 1,200; Robinson Deep, 1,495; Sub Nigel, 2,108; total, 4,803.

The revenue derived from gold for the month of December is calculated at the rate of £4 15s. 6d. per fine ounce, less estimated gold realisation and exchange charges of 1s. 6d., or a net figure of £4 14s. per fine ounce.

GENERAL MINING & FINANCE GROUP.

The following information regarding the December operations of the producing mines of this group has been supplied:—

Company.	Tons Crushed.	Total Cost.	Cost per Ton.	Total Revenue.	Profit.
Aurora West ...	10,550	£13,273	25.16	£13,785	£512
Meyer & Charl. ...	14,500	18,302	25.24	40,709	22,407
New Goch ...	15,700	18,839	24.00	18,409	Loss 430
Rood. United ...	17,100	16,914	19.78	17,392	478
Van Ryn Est. ...	32,750	41,562	25.38	46,581	5,019
West Rand Con. ...	33,000	43,319	26.24	44,403	1,084
	123,600	£152,209	24.63	£181,279	£29,500
				Less loss	430
					£29,070

In calculating the revenue, gold has been taken at a value of £4 15s. 6d. per fine ounce, less estimated realisation charges.

BARNATO GROUP.

Operations for the month of December, 1921:—

Mine.	Tons Crushed.	Revenue from Gold
Consolidated Langlaagte ...	43,000	£60,624
Government G.M. Areas ...	141,000	286,488
Langlaagte Estate ...	45,000	64,702
New Primrose ...	22,200	24,459
New Unified ...	11,900	12,151
Randfontein Central ...	118,500	161,339
Van Ryn Deep ...	54,000	132,174
Witwatersrand ...	15,200	53,187
Totals and averages ...	480,800	£795,124
November totals ...	483,300	£878,908

Mine.	Total Working Costs.	Working Costs per Ton Milled Shillings.	Gross Profit including Sundry Revenue.
Consolidated Langlaagte...	£51,931	24.153	£9,236
Government G.M. Areas...	147,149	20.799	110,093
Langlaagte Estate ...	55,635	24.727	9,477
New Primrose ...	21,265	19.157	3,412
New Unified ...	11,055	18.579	1,202
Randfontein Central...	162,665	27.454	Loss 105
Van Ryn Deep ...	67,915	25.154	65,620
Witwatersrand ...	48,745	21.569	5,485
Totals and averages ...	566,360	23.559	£234,420
November totals ...	569,830	23.580	£315,424

Note.—The above results are arrived at by calculating the gold at £4 15s. 6d. per fine ounce.

TRANSVAAL GOLD MINING ESTATES, LTD.

The following are the particulars of the output for the month of December, 1921, in respect of the above company:—

	Tons crushed.	Yielding fine ozs.
Central Mines ...	12,200	3,181
Elandsdrift Mine ...	1,640	990
Vaalhoek Mine ...	2,250	602

Estimated value of month's output, £22,876; estimated loss for month, £2,264.

Note.—Loss mainly due to low grade at Central Mines and Vaalhoek Mine, also to fall in price of gold and certain abnormal expenditure. The gold output for the month is valued at £4 13s. 6d. per fine ounce net, after allowing for exchange and realisation charges.

GLYNNS LYDENBURG.

The following are the particulars of the output for the month of December, 1921, in respect of the above company:—Tons crushed, 3,920; yielding 1,468 fine ounces; estimated value of month's output, £7,038; estimated profit for month, £1,179.

Note.—The above figures are exclusive of expenditure for the month upon shaft sinking, special development and capital expenditure amounting to £2,017. The gold output for the month is valued at £4 13s. 6d. per fine ounce net after allowing for exchange and realisation charges.

WITWATERSRAND DEEP, LIMITED.

The estimate of results for the month of December, 1921, is as under:—

Tons milled ...	35,380
Gold recovered ...	10392.795 ozs.
Average of stamps running ...	180
Stamps running time ...	21.075 days
Tube mills ...	5

The working expenditure, including head office charges, for the month is £44,813 or 25s. 4d. per ton. The estimated working revenue based on an estimate of £4 15s. 6d. per fine ounce (less 1s. 9d. realisation charges) is £48,716 or 27s. 6d. per ton. The estimated working profit is £3,903 or 2s. 2d. per ton, from which is to be deducted the capital expenditure for the month of £1,384, leaving a surplus of £2,519.

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

New Debenture Issues.

London advises market report that the Union-Castle and Clan lines are contemplating debenture issues, and that that of the former will probably be about £3,000,000 sterling.

American Trade with South Africa.

American exports to South Africa during the month of November were \$1,700,000, the highest figure during the past half-year, according to cable advice from the Department of Commerce in Washington to the American Trade Commissioner, Mr. P. J. Stevenson. The November total was about 14 per cent. above that for October, and almost 100 per cent. above the low point that was reached in September.

American imports during November were \$200,000, which is about 25 per cent. higher than the October figure. As imports generally are increasing, it is to be expected that the American demand for local products will increase.

On the other hand, domestic conditions in the United States are not as favourable as they have been in recent months. Production, which has been on the increase, is slackening. Commercial failures are more numerous, although the money market is reported as being easier. Prices which last month were reported as irregular are now declining. Experts are also falling off, the improved exchange rates not yet having had time to effect an upward tendency as is expected.

Decimal Coinage for the Union.

It is understood that during the ensuing Parliamentary session the Government will introduce a Bill to establish the decimal coinage system in the Union. A sovereign now represents 240 pennies, or 960 farthings. In the new system the sovereign will represent 1,000 farthings (or cents). The florin, or 2s., will be continued; but the half-crown will disappear. A florin will be worth 100 cents, and will be divided into a half-florin (50 cents) and a quarter-florin (25 cents)—roughly representing our present shillings and sixpences. This secures the decimal system with little deviation from the present. Instead of silver ticeys there will be nickel coins worth 10 and 5 cents. These will, of course, differ slightly from our pennies and half-pennies, since 1,000 cents will equal in value 960 farthings.

A Loan for South-West Africa.

The most absorbing topic at the moment is the report that the Administrator has succeeded in negotiating a loan of £300,000 from a more or less private source, and that this sum will be expended on the erection of a cold storage plant at Walfish Bay and on harbour improvements (states the Windhoek paper). The matter was considered by the farmers at a meeting on Thursday, and a committee has been formed which will discuss the scheme with Mr. Hofmeyr. At the moment it is difficult to grasp what is involved in the scheme, though it is clear from the Admin-

istrator's circular that certain concessions are expected by the lenders of the money. No doubt in due course the matter will be thoroughly thrashed out, and it is to be trusted that the project will materialise into something of benefit to the country. It may not be out of place at this stage to utter a word of warning. The country is in the grip of depression, and any scheme for the betterment of conditions should not lightly be discarded. It may be in the interests of the country to make concessions of a strictly temporary nature in return for the benefits which will be derived. We trust that the greatest caution will be exercised, and that the authorities will not allow their natural anxieties to stampede them into concessions of a sweeping nature, which will hamper the country's future growth. In the meantime, we think a word of congratulation is most certainly due to the Administrator for the success which has attended his negotiations.

The Finances of the Union.

At a time like this it may be opportune to review the finances of the Union. The report of the Commissioners appointed under the Public Debt Commissioners Act, 1911, for the financial year ended March 31st, 1921, gives the following statement of liabilities showing the amounts and different classes of funds dealt with by the Commissioners, the investments held and the increase or decrease that has taken place during the year: Sinking funds and other sums for redemption of debt, £11,284,200, increase £1,306,164; general Government deposits (including reserves, etc.), £16,242,153, increase £1,565,350; Railway and Harbour Administration deposits, £5,460,506, decrease £878,538; other funds, £123,304, decrease £3,496; totals, £33,110,164, increase, £1,989,480.

The increase in Sinking Funds, etc., is due to interest on investments and contributions from revenue. It includes £460,425 17s. 10d., the balance of the surplus for 1920-21, which has since been repaid to revenue. The increase in general Government deposits is mainly due to pension fund contributions, additions to Guardian's Fund, and deposits of diamond revenue on account of the South-West Protectorate. The decrease in Railway and Harbour deposits is due to heavy withdrawals during the year. The decrease in other funds is due to repayments of advances made from Arme Burger, Amortisation, and Onder steuning Funds. The amount invested in British Government securities was £1,441,082, a decrease of £285,998, due to the realisation of national war bonds to meet railway withdrawals, and to the redemption of £50,000 Exchequer bonds on maturity. Union Government securities domiciled in London amounted to £17,162,667, an increase of £1,303,521. The increase was due principally to the purchase of Transvaal stocks for sinking funds. Securities domiciled in South Africa totalled £10,938,572, the increase of £2,096,000 being due to subscription to the further issue in February, 1920, of 4½ per cent. and 5 per cent. local stock, 1920-39, to the purchase of 5 per cent. local stock, 1921-36, and to temporary investments in Union Treasury Bills.

Other assets were: Securities of other Colonies and Dominions, £2,545,466; S.A. municipal stocks and loans, £190,197; other stocks and shares, £156,653; mortgages, £547,735; properties, £12,957; cash, £80,179; other items, £234,051. The total investments amounted to £33,110,164, an increase of £1,989,480 compared with the previous year. The average rate of interest earned over all the funds administered by the Commissioners as invested at March 31st, 1921, is 4 3s. 8d. This may seem unduly low compared with the rate which can be obtained now on prescribed investments, but the explanation is that advantage can only be taken of the higher rate as funds become available for investment. Moreover, the amount of fresh money available annually for investment is small

compared with the total amount already invested, so that the higher rate now obtainable has to be averaged with the lower rate from the greater proportion of investments which were made at a time when all investments yielded a much lower return. The investments and cash held for sinking funds and redemption of debt at the end of the year amounted to £11,284,200 13s. 7d. Of this sum, £2,366,730 0s. 1d. is held by the Commissioners, and £8,917,470 13s. 6d. by other trustees, chiefly in connection with the Transvaal Guaranteed Loans. The public debt of the Union on March 31st last was £178,607,938.

The Value of Chartereded.

Should Rhodesia come into the Union, the question would arise, what is the value of Chartereded shares? "It would mean to the Chartered Company," says the circular of a well-known stockbroker, in attempting an estimate, "the payment of the Cave Award of about £4,500,000, less land sales of £835,000, £3,665,000; public work, building, etc., in last balance sheet at £2,400,175; total, £6,065,175, equal to about 13s. 6d. a share. The large assets of the company are: Cash in hand (about), £250,000; first-class investments, about £1,200,000; other investments, about £2,500,000; movable assets, about £500,000; livestock (including 88,487 cattle), about £550,000; sundry accounts and advances to Rhodesia Land Bank, about £650,000; Northern Rhodesia, £1,250,000; ranches and farm lands, about 4,000,000 acres having been cultivated and developed, ought to be worth quite £1 per acre, £4,000,000; total, £16,965,175; less debentures at price of redemption, £1,312,500; leaving a net total of £15,652,675, equal to about 34s. 6d. per share. Mining shares, debentures, mineral rights and many assets not valued."

Cam and Motor Gold Mining (1919).

The report to June 30 last states that no profit and loss account is included in the present accounts. The reorganised plant was only started up towards the end of 1920, the first declaration being made in January last, so that the period to June 30 covered approximately six months' working. During this initial period, owing to unusual difficulties encountered in starting up the treatment plant, a comparatively small tonnage was put through. Since June 30 the financial position has improved, and repayments have been made on account of the loan referred to in the last report. Development results at depth have been particularly satisfactory. No. 11 level, Motor mine (1,260 ft. from surface), has been extended to the south since June 30 a further 337 ft. Widths and values for the last 206 ft. driven to the end of November, as advised by cable, were: August, 85 ft., average value 86s. over 57 in., reduced to 40s.; September, 53 ft., average value 43s. over 53 in., reduced to 68s.; October, 33 ft., average value 65s. over 57 in., reduced to 55s.; November, 36 ft., average value 154s. over 68 in., reduced to 68s. A crosscut put in to the east at 553 ft.

south has exposed a total width at that point of 15 ft. with average values of 68s. per ton (the first 14 ft. averaged 602s., reduced to 68s.), and a winze at 528 ft. south sunk 7 ft. averaged 494s. at 5 ft. over 52 in., reduced to 68s. The main shaft, Motor mine, is now down 1,381 ft., or 121 ft. below No. 11 level. The consulting engineer, in his report, states that the returns from the mine for the period under review are: Tons milled, 58,010; total yield, £57,519; from premium reserve, £3,000; total revenue, £60,518; working costs (including depreciation), £98,409. In addition to revenue as above, gold premium reserve account stood at £13,512 and gold reserve account at £2,054 at June 30. Cost of working per ton has been higher than anticipated, but such is due to an increased rate of wages to artisans, increased railway rates (33½ per cent.), and the high cost of ball mill spares. Arrangements are in progress for certain structural alterations to the ball mills, which will reduce milling costs effectively. Ore reserve, 600,000 tons; average value, 38·21s.; against 653,000 tons, average value 37s. per ton. With the completion of structural alterations to the ball mills, as well as the completion of drying arrangements for flotation concentrates, it is expected that during the coming year the company will show profitable operations. In view of the decrease in the cost of living, it is advisable that the wage question should be revised at an early date.

British Concrete Machinery.

At a recent exhibition held in London, a remarkable display of concrete machinery of various kinds was made by a large number of British firms. One of these machines was a concrete block maker capable of turning out 1,000 blocks in an 8-hours' working day, or 130 partition slabs per hour. When used on a house building contract two of these machines turned out on the average 2,400 blocks per day of 8 hours for a period of two months. On one day the two machines actually produced 3,320 blocks in 8 hours. Another machine designed for making concrete slabs for paving purposes averaged between 40 and 50 slabs in the hour, and has produced as many as 60 per hour under service conditions. A third machine is capable of producing everything in the way of material that a builder or anyone undertaking repairs to property may require. Blocks of various sizes, bricks, window-sills, steps, hearths, mantelpieces, wall-coursing, and so on, can all be produced by this machine.

Successful Mauss Invention.

Amongst the new patents registered in the United Kingdom are: The Mauss Continuous Clarifying Centrifugal for sugar juices. Experiments have been carried out by Messrs. Reynolds Bros., Ltd., at their Sezela factory, Natal, with the Mauss continuous juice clarifying machine; and Mr. E. Camden-Smith, manager of the mill, has reported favourably on the results obtained. He states that, using this machine, 35-40 h.p. should be ample to operate the clarification department of a mill producing 100 tons of sugar per day. It is unnecessary here to emphasise the advantages such a system of operating (if economical and efficient) would have in comparison with the present mode of subsiding in tanks and filter-pressing the mud. Production of glycerine from sugar products, by fermenting sugar solutions containing a mixture of about equal weights of alkali bisulphite and sulphite. Evaporation utilising thermo-compression. A new filter, consisting of thin plates with elongated slots, adjacent plates being arranged so that the slots of one are at right angles to those of the other. Manufacture of invert sugar syrup from dates, etc. Recovery of potassium salts from distillery slops. The following are amongst the new patents registered in the United States: Filter for sugar liquors; an apparatus for reducing the adhesion of any slimy sedimentary matter to the cloth sufficient to form an obstructing layer. Simultaneous clarification and evaporation apparatus, the use of settling tanks being eliminated. Activation of carbon by treating the charcoal in a long inclined cylinder lined with fire-brick and mounted on rollers.

December Output.

REDUCED RETURNS.

More than usual interest attaches to the returns from the gold mines for December. In the month 681,847 ozs. of gold were produced, which is 22,389 ozs. less than the total for November, while the value of the product shows a decrease of £335,784 owing to the estimated fall of 7s. per ounce in the premium. The price of gold for December has been calculated at £4 15s. 6d. per ounce as against £5 2s. in November. The milling results were affected by the holidays, the strike on the Crown Mines and the fire and fall of rock in the Ferreira Deep.

Native Labour.

The number of natives employed on the gold mines in December was 177,836, an increase of 2,505 compared with the previous month. The following figures show the native labour position during the past three months:—

	October.	November.	December.
On gold mines	175,331	176,410	177,836
On coal mines	13,936	13,465	13,230
On diamond mines	1,223	1,217.	1,224
Totals	190,490	191,092	192,290

GENERAL BANKING BUSINESS transacted at all Branches and Agencies; DEPOSIT and CURRENT ACCOUNTS opened; PURCHASE and SALE of INVESTMENT SECURITIES effected, etc.

SAVINGS BANK ACCOUNTS opened on terms, particulars of which may be obtained on application.

The BANK is in close touch with TRADE and INDUSTRIAL CONDITIONS, both local and overseas, and special attention is given to COMMERCIAL ENQUIRIES from customers.

EXECUTOR and TRUSTEE business undertaken.

Over 390 Branches and Agencies in Africa.

Agents and Correspondents throughout the World.

ENGINEERING SECTION.

A Novel Application of the Cementation Process.

The following valuable notes on a novel application of the cementation process to a battery foundation were contributed by Mr. B. Schlesinger to a recent meeting of the C.M. and M. Society of South Africa.

When starting up a new stamp battery in the Heidelberg District it was found after 48 hours' work that the foundation, and with it the whole of the superimposed construction, began to rock so dangerously that operations had to be suspended. An inspection pit was sunk to the underlying shale-foot, and by washing the face of the concrete block so exposed, the writer found that a thin horizontal crack had developed, completely severing the top three feet from the lower nine feet portion of the block. The cause of the mishap was badly prepared and badly stamped concrete. Stones, the size of a man's fist, were seen lying loose in large cavities in the body of the foundation. For further investigation the writer had the mill re-started, with the result that portions of the concrete began dropping out of the block into the inspection pit, in much the same fashion as if the stamps were pounding on tightly packed rubble. Repairs seemed quite out of the question and it appeared at first sight that the whole of the plant would have to be dismantled and again re-erected upon an entirely new foundation, at a cost prohibitive to the mine owners. Before dealing this death-blow to his Board the writer decided to attempt saving the foundation by pumping pure cement into it under high pressure. He entrusted the work to the Francois Cementation Syndicate of this town, who lost no time in despatching to the property the necessary plant. This consisted of a steam pressure-pump with a nine-inch diameter steam cylinder and a two-inch water delivery, a small wooden mixing barrel for cement, which served as an intake for the pump, and an all-important pressure gauge capable of registering pressure up to 10,000 lb. to the square inch. The pump was served by a boiler delivering steam at 100 lb. pressure.

The Process: Nine holes of 7-8th in. diameter, and 5 ft. depth, were drilled into the foundation. The top 9 in. of each hole were enlarged to take a 2-inch pipe 24 in. long, and screwed at one end. Such pipe was cemented into each of the holes and the cement allowed to bind over night.

The next morning hole No. 1 was connected to the delivery-end of the pump, and clean water forced through before the actual cementing operations was commenced. Thereupon a thin mixture of pure cement and water was pumped into the foundation. At first the liquid entered the concrete block without encountering any resistance whatever, and 17 bags of cement were absorbed before the pressure-gauge on the pump began to show signs of life. The indicator then gradually rose to 100 lb. and 200 lb. per square inch. Simultaneously, with the increasing pressure a tiny stream of water and cement could be observed oozing out of the thin crack previously referred to.

At this stage pumping was discontinued to allow the cement to settle, and hole No. 2 was put into commission and subjected to the same treatment as hole No. 1. After allowing a practically free passage to five bags of cement, the pressure rose rapidly to 800 lb. when pumping was stopped for 12 hours. Before injecting the remaining seven holes, hole No. 1 was re-treated after freeing it from partially solidified cement by drilling. Two bags of cement sufficed to send the pressure up to 1,000 lb., this being considered the dangerous limit above which the block may have burst. While it required 26 bags of cement and 22 hours of work to complete the first two holes, the remaining seven holes absorbed only fifteen bags of cement and eighteen hours' work. After completion of the foundation proper the writer decided, as a matter of safety, to solidify the ground surrounding the block. For this purpose six eight-foot holes were drilled about eighteen inches from the foundation, and injected in turn by a mixture of one to one cement and slimes. Some interesting phenomena could be noticed. When the pressure on the first outside hole rose to 150 lb. the gauge indicator suddenly dropped to nil, and it was found that the cement solution had broken through to the surface about ten yards from the position of the hole.

One bearing-block of the line shaft, which was only 24 inches in the ground, became injected from one of the outside holes twelve feet away. In proof of this, cement solution forced its way six inches above the surface through a tiny crack in the block. It took six days to complete the whole of the process, and 48 bags of cement were used up. The total costs amounted to roughly £200, inclusive of the charges of the Cementation Syndicate. After allowing ten days for the injected cement to harden the stamps were again dropped, with entirely satisfactory results. The plant has now been in full swing for some time, and the foundation is as firm as can be desired.

MAGNOLIA ANTIFRICTION METAL

"FLOWER" BRAND.

HAS THE LOWEST CO-EFFICIENT OF FRICTION.

KEEPS down the bill for lubricants, making **BEARINGS** smooth as glass and keeping them **COOL** under heaviest pressures and highest speeds.

Manufactured and Sold By—

**THE MAGNOLIA ANTI-FRICTION
METAL CO. OF GREAT BRITAIN, LIMITED**
48, QUEEN VICTORIA STREET, LONDON, E.C.

Agents for South Africa: **FRASER & CHALMERS, Ltd., Johannesburg,**
Bulawayo and Salisbury.

The Week in the Sharemarket.

STAGNANT—AWAITING STRIKE ISSUES—DEALING PURELY PROFESSIONAL.

The end of the first week of the strike on the gold mines and of the second week of the coal strike sees the sharemarket stagnant, dealing being purely professional. Quotations have remained quietly firm, and up to the time of writing there has been no pressure to sell. What may happen next week remains to be seen, and the market will, of course, be governed by the issue of events. London is naturally also "waiting to see," and in financial circles, the cables tell us, the progress of events on this side is being carefully watched. It is recognised that, in the words of one City authority, "the great hope of the Rand mines is a reduction of working costs, which is likely to be permanent, whereas the gold premium must always be evanescent." Apart from our troubles, the general world conditions, as reflected in the London market, are much more favourable. The settlement of the Irish trouble and the postponement for ten years at least of the menacing question of the Pacific are "bull" factors of no mean order. In addition, the Cannes conference seems likely to result in restoring the *Entente* to that position which is desirable from the point of view of both France and Britain. Given an early return to sanity on the part of our people now on strike, there would be reason to hope for an all-round revival in the sharemarket. The diamond market remains featureless, but the outlook for base metals seems a little brighter. According to the latest mail advices from London, "the feature in the metal markets has been the substantial rise in tin, on strong buying. The statistical position showed a slight diminution in stocks, owing to heavier deliveries. This is indicative of an improved trade demand, which, coupled with reduced production, should gradually result in remunerative prices being obtained. Copper has been somewhat affected by the rise in the American exchange, which has prevented quotations advancing. There is, however, a healthy sentiment in the metal, and higher values are anticipated in the New Year. Lead has also advanced slightly, the demand for spot and near positions being particularly keen. Spelter came in for a good deal of attention and advanced appreciably. The general tone of the markets is hopeful."

The Successful Motor Lorry.

One of the reasons for the pre-eminence of British motor wagons is that open competitions are held between the different makers every year. A trophy is awarded annually for the most successful performance in any certified trial for a total distance of over 1,000 miles. The successful vehicle at the last trial gave an average running speed of nearly 16 miles per hour, with a consumption of motor spirit of 13 miles to the gallon. The lorry was fully loaded, its total running weight being 5 tons 6½ cwt. The oil consumption worked out at 504 miles per gallon, and throughout the whole of the 10 days' trial no adjustments were effected except the cleaning of a choked petrol cock.

New Form of Stainless Steel.

The early forms of stainless steel were not such as could be easily worked, but a British firm of steel makers has been carrying on a series of experiments with a view to producing a steel which will retain rust resisting properties and can be worked without difficulty both in the hot and in the cold state. These experiments have been successful. The new plastic rustless steel can be stamped, punched, pressed, chased, or engraved cold; and it can be bent cold to a diameter equalling its own thickness without showing any signs of fracture. It may be polished silver bright, and this polish will remain in any atmosphere. In many cases a piece of this steel has less than half the weight of a brass or nickel piece of the same strength.

Regulations for Water-tube Boilers.

The voluntary work done in Great Britain in connection with standardisation is known all over the world, and it has been supplemented by a considerable amount of enterprise in arranging rules and regulations in connection with the proper use of engineering equipment. One of the most recent examples is the set of rules prepared by a British committee governing the installation of water-tube boilers in merchant vessels. These rules have received official approval, and will therefore become standard practice. This committee intends to continue its labours in other directions where unified rules are likely to be of advantage.

Letters to the Editor.

MR. SCOTT ALEXANDER HITS OUT!

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—It pleases me to think that my short letter to your esteemed journal of December 3, on "the genesis of the diamond," and my tip how to make them with human ingenuity, has, according to a correspondent, Mr. James Ennis, in your last issue, caused some amusement on account of my unscientific language in describing a "sub-crustaceous" diamond pipe as "a pipe with a lid on."

I am afraid I am too old now to change my style of writing to suit certain would-be scientists, or the educated ignorant either, by peppering my stratigraphical effusions with geological 'ites, 'tites, and 'dotes, etc., from text-books, in order to impress the layman with one's great ability, when, as a matter of fact, I long ago discovered that most men who do so do so to camouflage their lack of it.

What "the Witpoortje-break," which Mr. Ennis inappropriately drags into his letter, has to do with the diamondiferous subject under discussion, I fail to perceive. Nevertheless, I thank him for the opportunity he has given me of again informing those whom it may concern, in spite of all that so-called orthodox geologists have written to the contrary, that there is no such break in existence; and that Main Reef Series, such as it is out west, trends in quite a different direction to that adhered to by them. For miles and miles it is very cunningly covered by our highly auriferous Black Reef age, which nature built up and completed millions of years later to spoof the inexactitudinarians who came hither from Europe after these fields had been discovered with only one object in view—! which object, thank goodness, has never been mine, even though I may be heading for an unfamed grave by "telling the truth to others," which "Ennis" appears to regard as criminal. "Taut mieux," sir, for "truth carries its own conviction," whether it comes off in my time or after.—I am, etc.,

SCOTT ALEXANDER,
Rand Stratigraphist.

Johannesburg,
January 8th, 1922.

UNITED STATES PATENTS.

REPLY TO MR. E. J. WAY'S LETTER.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—We have read Mr. E. J. Way's letter of the 30th ult. To avoid misunderstanding, it must be clearly understood that our criticisms have nothing whatever to do with the merits of his invention, as such. We are concerned merely with the two erroneous and very misleading statements made in the published report of his company, that:—

- (a) It "forms a record" to have secured the grant of a patent in the United States within a period of approximately 11 months;
- (b) "usually United States patents have taken from two to five years before issue";

and with the inferences suggested or to be drawn therefrom.

As Mr. Way no longer refers to (a), we assume that he admits its incorrectness. With regard to (b), he is sceptical of the harm the statement may do, if left unchallenged, and thinks he was justified in making it because the average time which elapsed between the date of application and the date of grant, as disclosed by 100 United States specifications in his possession, was three years eight months. Your readers will probably have gained from this statement the impression that his 100 cases, which he says are "not selected in any way," are cases actually lodged and prosecuted by himself, or with the prosecution of which he has been in some way associated; and that they may, therefore, fairly be compared with the figures we gave concerning the

last 50 accepted U.S.A. cases lodged and prosecuted by us. We are sure it was not Mr. Way's intention to convey this impression, but as a fact his letter has been so interpreted by various persons who have spoken to us on the subject. We suggest, however, that he was alluding, not to 100 U.S.A. applications of his own, but merely to 100 specifications cited by the U.S. examiners and sent to him, in response to one or more applications made by himself, to indicate the state of the art—which is a very different thing. It is quite true that such specifications are not selected by him, but they certainly are selected by the examiner; they usually embrace a wide period of years and they form an utterly fallacious basis for estimating the average time required to obtain a grant. When, as is presumably the case here, they deal with a somewhat complicated art, the result is more misleading than ever.

Another Table.

As, however, Mr. Way refuses to be convinced by our own experience, we give below another table prepared from the monthly journal published officially by the U.S. Patent Office. The date given by the journal is that of the actual grant, which is anything from one to seven months later than that of acceptance, upon which our previous table was based.

We have taken 100 consecutive cases from the beginning of the journal (a recent one, taken at random from our files), and 100 consecutive cases from the end, and the amalgamated result is as follows:—

Granted within 6 months	20
Granted under 12 and over 6 months	47
Granted under 18 and over 12 months	48
Granted under 24 and over 18 months	42
Granted under 30 and over 24 months	18
Granted under 36 and over 30 months	10
Granted under 42 and over 36 months	1
Granted under 48 and over 42 months	5
Granted under 54 and over 48 months	5
Granted under 60 and over 54 months	3
Granted over 60 months	1

200

It will be seen that 57.5 per cent. of all these cases were granted within anything from six to eighteen months and no less than 78.5 per cent. within two years from date of application, while, as our experience has proved, there are isolated instances of grants occurring within two or three months. The average time for the whole 200 is 21 months. The journal from which this table has been prepared can be seen at our office by anyone interested.

Your readers can now decide for themselves whether an unchallenged public statement, to the effect that it is likely to take from two to five years to obtain a grant for a patentable invention in the U.S.A., is or is not disturbing to interested parties, from the fact that, owing to the nature of the examination carried out in that country, before allowance takes place, the patent, when issued, is generally regarded as presumptive evidence of novelty. Mr. Way himself, has derived great satisfaction from the knowledge that his U.S. application has been allowed, and yet he thinks it strange that other inventors, and those who are jointly concerned with them in exploiting their ideas, should be upset at hearing that instead of the comparatively reasonable time of 12 to 18 months which they have been assured is likely to elapse before they know the fate of their U.S. application—which is somewhat in the nature of a test case—they are likely to have to wait from two to five years, and that a grant within a year is "a record."

Further Comment.

We have one further comment to offer. In referring to the time taken to secure the acceptance of an application, the intention seems to have been clearly to suggest that rapid allowance in a country like the United States of America may be taken as an indication that the official search has failed to disclose any serious obstacle. We have already stated that we are not concerned with the merits

or demerits of any particular case, and nothing we say must be interpreted as a reflection in the slightest degree upon the value of Mr. Way's invention or the efficiency with which his application has been prosecuted. But here also it is utterly fallacious to convey—even if unintentionally—the impression that the time occupied by the proceedings can be regarded with any degree of accuracy, as an index of novelty except where there have been no citations at all and the patent issues at once. It is the practice of the examiners in all "searching" countries to cite such prior specifications as are held to suggest or anticipate, wholly or in part, the idea sought to be patented, and it stands to reason that the surest way to expedite the grant is to surrender, in the face of official opposition, claims which by proper argument could and should be maintained; in other words, that a patent which has taken two years to secure may be much more valuable than one which has taken, say, nine months to secure, because, in the one case, you have got what you set out to get, and in the other you may not have done so. There is no general rule applicable to such cases. Each must be considered entirely on its own merits and the acid test of value is, and always must be, the margin of novel and patentable subject-matter left in the claims, as finally granted, and the practical relation of that matter to the art. This will be better understood when it is added that any valuable and patentable feature omitted or eliminated from the claims becomes dedicated to the public; while, on the other hand, claims drawn too wide are a serious menace to the patentee's security. An example of the latter evil occurred in the case of The Cassel Gold Extracting Co., Ltd., v. The Cyanide Gold Recovery Co., *e.a.*, decided in England, but well known here; and of the former in a case concerning the Welsbach mantle, decided in Germany, where it was found that a really novel and valuable feature was contained in a claim which had been abandoned in the face of the examiner's objections and thus lost for ever.—We are, etc.,

D. M. KISCH & CO.,
Chartered Patent Agents.

SCRAP THE GOLD LAW. LESSONS FROM RHODESIA.

To the Editor, *S. A. Mining and Engineering Journal*.

Sir,—The President of the Chamber of Mines has stated that "in order to save the low-grade mines a drastic reduction in the present number of semi-skilled white underground workers is inevitable." He further states that in any case some of the mines must close very shortly as a result of the lowering of the gold premium and that the result will be to render a number of skilled mineworkers idle. It has been suggested that doubtless a number of the retrenched workers will migrate to the farms and resume their former occupations as agriculturists. It is also a possibility that they may elect to stay in the towns and add considerably to the problem of the "poor whites." One might enlarge *en passant* on the effect of such a foreshortening of white labour on the prosperity of the trading community, and indeed of its ultimate effect on the economic progress of the Union. Ministers have not hesitated to state deliberately that the economic welfare of the Union hangs on the mining industry of the Witwatersrand. While not subscribing *in toto* to that enunciation, one may admit that the maintenance of the gold mining industry is a vital present factor in our progress, and any measure which promises a continuation of its activities is worth the serious attention of all men.

It would seem as though the industrial welfare of the Rand can only be secured by the centralisation of the gold production within a well-defined area and subject to the equipment of huge plants dealing with immense tonnages of gold-bearing ore. Doubtless the present basis of the Rand mining industry demands all these appliances as essential factors in gold production, and carrying in their train

expensive administrations and all the heavy overhead charges incidental to such. Assuming the correctness of present-day assumptions, we may as well face the facts and declare that the days of the Rand gold mining industry are numbered and that unless other industries are brought to fruition the Reef will in a comparatively short time return practically to the state of the Kimberley or the Barberton of to-day. Our deposits of high-grade gold bearing ores are extremely limited. On a basis of 84 shillings and sixpence an ounce gold, and with working costs reduced to 20s. per ton, we require approximately 5 dwt. ore to cover expenses. Gold ore above 5 dwts. must then be exclusively mined to enable the industry to subsist. A large number of our mines cannot mine this grade on present costs nor even on the 20s. per ton basis. Must we then lay it down that all reef under 5 dwts. is economically worthless? It may be answered that cheaper processes of extraction will some day make them profitable, but can we afford to wait for such a consummation? One cannot calmly consider such a possibility, and a better way ought to be and must be found to deal with low-grade ores. After all, the term low grade is purely arbitrary and relative. It is so far from being a fixed quantity that, out of the 15 mines declared unpayable under the present system, about 12 of them are again at work by means of syndicates or small companies with strictly limited capital.

It is evident therefore that, given relief from excessive overhead charges of all kinds, it is possible, even under our present obstructive gold law, to make ore of less than 5 dwts. grade a payable proposition. Here then is a glimmer of hope for our low-grade mines, and consideration of the new possibilities of intelligent mining combined with severe economy will afford food for much thought on the ways of mining on the Rand. But this is not enough, while proving that our big mines are extravagantly and uneconomically mismanaged, despite high salaries for technical knowledge applied to mining problems, and organisation presumed to be up to date in all departments, the small ventures are limited in extent and in scope for further expansion by reason of the circumscribed areas allotted to them and because they can only mine derelict ground. Why, if under difficult conditions these small syndicates can produce gold at a profit, cannot other ventures be encouraged to enter the field and exploit the untold wealth of the Rand? Even the veriest tyro in geology knows that we have not one but a series of gold-bearing blanket ore bodies running north and south of the Main Reef series and practically parallel with them. Except in a minor degree no effort has been made to exploit these gold carriers.

Attention has been concentrated on the one series which from its inception offered the maximum profit to the adventurers. No blame attaches to them for this restrictive policy. The Main Reef series of the Witwatersrand has become a household word over the whole of the civilised world, and the pioneers of the industry, together with their successors, have earned a large debt of gratitude from mankind for their successful creation of the stupendous gold mining industry of the Rand. The Union of South Africa, the British Empire, and the world are all their debtors; all honour to them. But we are entering upon a new era, *autre temps autre travailleurs*, to alter somewhat an apt phrase. The present day calls for drastic alterations in mining matters, and the way must be paved for the exploitation of all the gold reefs without let or hindrance, hence the necessity for scrapping the present gold law. The minerals of South Africa are inherently vested in the State as trustees for the people of the Union. Under various pretexts the mineral wealth of the country has been filched from its rightful owners and has become attached to the land. One pernicious result of this betrayal of the public good by the trustees—to wit, the Government—is that a considerable proportion of the wealth of the country is only accessible to citizens, under heavy fines and penalties, and is only to be exploited at the whim and pleasure of the owners of surface titles, Government licences, and onerous dues of many kinds. Payments for options, leases, or purchase of the minerals made to private individuals, and

the right—freely exercised—of such persons to absolutely prohibit the winning of minerals on lands belonging to them:—this arbitrary power vested in individuals is altogether detrimental to progress and paralyses the energies of those who would venture monies and labour in the hope of discovery of workable minerals.

In this way practically all the gold bearing Rand ores are withheld from public exploitation. The surface owners, being in most cases the mine owners, absolutely refuse individuals the right to mine gold on such areas, alleging interference with present-day mining operations and such like trivialities to prohibit ventures of any kind. Wayleaves, royalties, licences and right of prohibition all together make mining in such areas impossible. While sufficiently close to us here to constitute a grave injustice to the people of the Rand and elsewhere, exactly similar conditions militate against mining progress throughout the Union.

In Britain the minerals have reverted to the State because it has been found impossible to correlate private avariciousness with the public interests. It is only a matter of time before the same paramount necessity for the protection of the national rights of the people of the Union will also lead to a restoration of the mineral wealth of South Africa to their rightful owners. In this, as in many other ways, the extremely liberal mining law of Rhodesia gives us a lead which we would do well to follow. It is there enacted that "any white person resident in the territory may apply for a prospecting licence at any mining commissioner's office and that such licence will be granted on payment of one pound sterling." Armed with this document, the prospector can enter upon any land, public or private, in the territory, and seek therein for minerals and such like natural deposits. Provision is made for the homestead and for cultivated lands in that pegging is prohibited at any point nearer than 300 yards of such places. Outside these limits the miner is free to act as he wishes. If he locates a reef or deposit, he safeguards himself by putting up a temporary discoverer's notice, and under cover of this he is given 31 days wherewith to prospect his area of 1,000 square yards. He is also allowed free grazing for his cattle and access to water and timber, etc. Should he desire to locate a block of claims, he is allowed ten claims, each 150 x 600, for any one licence; he can make his own survey—a rough measurement is accepted, together with a rough plan of the claims, and on payment of an additional 5s. this block of ten claims becomes vested in himself with right of transfer.

It will be seen therefore that for a payment of one pound, plus 5s. registration fee, anyone may secure a block of ten claims, which in most cases will suffice for a five-stamp mill or a Tremayne mill. To ensure working the property the law provides for a minimum development yearly under pain of a fine, and if unworked after three years for forfeiture. This ensures adequate exploitation of the property and prevents locking up of minerals for private greed. A small royalty is further charged by the Government on all minerals won by the mineowner. It will be seen then that under such a law a great impetus is given to mining by small syndicates or by individuals. It is this method which has dotted the northern territory with a large number of small mines and has made Rhodesia a factor in the world's gold producers, ranking to-day fifth or sixth in the list. Apart from the liberal provisions of the gold law, another factor figures prominently in the successful mining of gold, etc., in the north. Most prospectors are poor men, who of themselves are quite unable to provide for the equipment of their properties. The Government assists them liberally with technical advice and will sometimes advance small sums of money. The mainstays, however, of the small miner are the various traders and mining machinery houses, who render enormous assistance to the miner in this direction.

Given that the prospector is a decent citizen and fairly credible, he need have no hesitation in approaching a trader or machinery merchant for help in making his mine a success. Literally hundreds of men have been provided with the necessary plant to produce gold, and with the credit needed to tide over the preparatory period before milling

operations commence. A pre-arranged monthly repayment of such sums as may be advanced is sufficient to ensure support. It says much for the high standard of honesty amongst Rhodesians that less than 1 per cent. of the beneficiaries fail to meet their obligations.

Here then is the way out. The prospectors of Rhodesia are recruited from all ranks and professions, and a very large majority have made good despite the limitations due to lack of mining knowledge of such men. The writer has in mind the case of an ex-storekeeper who twenty years ago started as a mineowner on a 2 dwt. rubble and quartz proposition in Mashonaland. He has prospered exceedingly, and he himself with his wife and a family of twelve daughters have made good and to-day possess a splendid farm well stocked with cattle, an excellent motor car, and a large measure of the amenities of modern civilised life, and he is only one out of many who started penniless and have "arrived."

What is being done in Rhodesia can be equally well done here. Give men a chance to make good, open up the mineral wealth of the country, dot the Rand and elsewhere with small mines, and prosperity will continue to smile upon us for generations to come. We can afford to be optimists. We only need a constructive policy on the part of the Government to transform the Union and to make it the home of countless contented workers who, unharassed by vexatious mining restrictions from Government, controlling houses or unions, will work out their own destinies themselves, and in the end build up a contented and industrious white nation in South Africa.—Yours faithfully,

W. H. JONES.

Railway Extension in the South-West.

Since March of last year the railway line connecting Windhuk with Otjiwarongo has been in process of construction. Despite unforeseen difficulties and the practical cessation of work for nearly six weeks, when the natives employed on the work were laid down by influenza, the work was steadily pushed on.

The length of the track now completed is 45 miles, and over this a bi-weekly train service will be run. This extension will open up the vast hinterland, as planned in pre-war days. The present scheme of construction has followed very closely upon the plan originally made. From Otjiwarongo to Kilo 44 a light type of rail has been used, and from thence forward a heavy gauge track has been laid.

During the course of building the line two large bridges were erected over the rivers (which are not always dry at present). One bridge is found at Kilo 9 and the other crosses the Ugab River. Water is found in abundance at Kilo 9 and again from wells in Outjo, but efforts to locate water by boring elsewhere have, so far, proved unsuccessful. The nature of the land does not hold out much prospect of finding a supply rapidly or easily.

The country simply teems with game. The herds of gemsbok, koodoo and flocks of guinea fowl bear witness to the solitude of the place. Jackals, of course, are found in abundance. The spoor of lions have been seen quite close to the new line, and a story was circulated of a lioness which attacked a group of native labourers who had ventured into the bush on one occasion.

During the building operations 17 white men were employed on the work, together with close upon 350 natives. In round figures the cost of building the extension runs to £30,000. The work of building was done during the dry season, and fortunately the heavy rains have held off so that the task has come to a successful end.

The station at Outjo and the various public buildings were sumptuously decorated for the opening ceremony by His Honour the Administrator (Mr. Hofmeyr).

The mining industry contributes about 60 per cent. of the revenue of the country. The mines have been paying in wages alone, before this disastrous strike commenced, at the rate of ten millions sterling per annum.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material and Engineering Trades.

STRIKE POSITION—IRON AND STEEL—UNION'S GRAIN ELEVATORS — TIMBER AND BUILDING MATERIALS—OILS AND COLOURS—ELECTRICAL GOODS—AMERICAN NOTES—PROPOSED WIRELESS STATION IN UNION—METAL MARKET.

General.

In view of the Chamber of Mines' decision to grant the S.A.I.F. a month from 9th inst. for further negotiations, despite the overwhelming majority of the miners' ballot, the strike which commenced on Tuesday last came somewhat as a surprise to the community. At the moment all the mines from Randfontein to Springs are closed down, and, in the opinion of some people, one or two of them may never re-open. The Rosherville station of the Victoria Falls and Transvaal Power Co. is alone working to supply essential services. Over 22,000 men are on strike, comprising miners, reduction workers, engineers, engine drivers, moulders, wood workers and builders employed in the affected industries. The Chamber of Mines has given notice of its intention, if the strike continues, to start repatriating the natives next Monday and to discharge all workmen not required for essential services. The Federation has submitted to General Smuts the basis on which the Unions are prepared to discuss terms of settlement. In some circles the hope is expressed that even now a solution of the dispute may yet be arrived at, while in others, seeing the determined stand taken up by both parties, it is feared that the trouble may become more acute and last longer than is generally expected. Is the strike this time to be fought out to the bitter end—as inevitable as it is obvious—or are we again going to justify our name as being a land of compromises? There are not wanting those who think that a compromise of some sort will eventually be adopted, and that any reductions imposed upon the rank and file of the miners should also be shared by those in higher places. In the meantime we can rest assured that the Government will leave no stone unturned in endeavouring to bring the dispute to as speedy an end as possible, bearing always in mind the present grave state of the mining industry and the absolute necessity of effecting lower working costs. Evidence is apparent on all sides that as soon as the present labour dispute shall have been satisfactorily settled and a proper level of production cost reached, a lot of work held back pending such a decision will be given out. Along the reef there are many contracts

in suspense, and as soon as the atmosphere clears, it is expected that building operations on a very large scale will be commenced, as building materials, which have dropped considerably during past months, are, in the opinion of most, about as low as we are likely to see them for some time to come. Timber is inclined to harden slightly, while mining material shows a somewhat sagging tendency.

Iron and Steel.

The New Year has belied expectations in regard to mining requirements; business there is practically none, and no improvement can be looked for until the labour dispute has been settled. One prominent importer said the only thing for mining material merchants to do now was to send their representatives to outlying districts—Cape Colony, Natal, etc.—to do business, as during the strike there would be nothing doing here. The following prices are as approximately correct as can be given, but the tendency in some lines, especially heavier, is slightly easier.

Latest quotations.—Dunswart iron, 22s. per 100 lb. basis price; Union Steel Corp., Ltd., 22s.; imported iron and steel, flats, small, 33s. to 40s.; larger sizes, 30s. to 38s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 37s.; $\frac{3}{8}$ in. iron, 30s. to 32s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in. iron, 31s.; steel, 37s.; $\frac{3}{4}$ in. round iron, 30s.; steel, 33s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 30s.; channel and joists, 35s. 6d.; shafting, $\frac{5}{8}$ in., $\frac{3}{4}$ in. and $\frac{7}{8}$ in., 9d. per lb.; 1 in., 8 $\frac{1}{2}$ d.; 1 $\frac{1}{4}$ in. to 2 in., 7d.; larger sizes, 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{4}$ in., 22s. to 23s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 45s. to 50s. per 100 lb.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 43s. to 48s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lb.; rivets, $\frac{1}{4}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lb.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d.

*Here's a Sinker drill
of the 'Joburg' type*

We call it the Joburg No. 3 Sinking Drill, and its got all the good points of the Joburg "Family." For shaft sinking in the hardest rock it will do better in speed and low running cost than the best sinking drill you've ever used.

Made for high efficiency on all pressures and fitted with that famous little spool type valve. End your sinking troubles with the Joburg No. 3.

per lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb.; $\frac{3}{8}$ in., 2s. 11d. per lb.; 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ in. to 1 $\frac{1}{8}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{3}{4}$ d.; 1 $\frac{1}{4}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 35s. to 47s. 6d.; shovels, 52s. 6d. to 57s. 6d.; wheelbarrows, 47s. 6d.; picks, 37s. 6d. to 67s. 6d.; pick handles, 35s.; hammer handles, 14 in., 17s. 6d.; 18 in., 9s. 6d.; 24 in., 13s. 6d.; 30 in., 18s. 6d.; 36 in., exceedingly scarce, 35s.; barbed wire, "Shorthorn," 69 lb., 13 $\frac{1}{2}$ gauge, 21s. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bulb tee fencing standards, 14 lb., 28s. 6d. per dozen; 12 lb., 25s. per dozen; black baling wire, 14 gauge, 22s. per coil, 100 lb.; screening, 3s. to 9s. 6d. per sq. yard; cyanide, 1s. 7 $\frac{1}{2}$ d.; zinc shavings, 1s. per lb.; asbestos, white, $\frac{3}{4}$ in. to $\frac{1}{2}$ in., £35 per ton; $\frac{1}{2}$ in. to $\frac{3}{4}$ in., £50 per ton; $\frac{3}{4}$ in. to 1 $\frac{1}{4}$ in., £80 per ton; 1 $\frac{1}{4}$ in. to 2 in., £175 per ton; Blue, No. 3, £25 per ton; No. 2, £34 per ton; No. 1, £45 per ton; short, £20 per ton.

I.C. Steel Coke Tin Plates.—The market is steady. I.C. 14 x 20, 112s., 108 lb.; coke quality, 21s. per box. I.C. 28 x 20, 112s., 216 lb.; coke quality, 42s. per box.

Union's Grain Elevators.

The *Daily News* announces that the contracts for the thirty-six grain elevators in South Africa, whose construction will shortly be begun by Messrs. A. W. Menkins & Co., have been placed with English firms. The order for the terminal elevator at Durban, which will have a capacity of 42,000 tons and a loading capacity of a thousand tons per hour, and also for smaller collecting elevators in different parts of the country, which will feed the terminals at Durban and Capetown, has been given to Messrs. Spencer & Co., of Melksham. Messrs. Henry Simon & Co., of Manchester, will equip the big elevator at Capetown with machinery. The whole of the steelwork required for the construction of the elevator will be supplied by the Furness Shipbuilding Co., Middlesbrough.

Timber and Building Materials.

Business in these is practically at a standstill; there is a little work going on in the building trade, but during the strike nothing much will or can be done.

Prices.—3 x 9 deals, 1s. to 1s. 1d.; scantlings, 11d.; beaver boards, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; floorings, 6 $\frac{1}{2}$ d. to 6 $\frac{3}{4}$ d.; ceilings, 4 $\frac{1}{2}$ d. to 5d.; Oregon, 6s. to 7s.; pitch pine, 6s. 6d. to 7s. 6d.; corrugated iron, 9d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second at the coast; American oak, 1 in., 10d.; 1 $\frac{1}{2}$ in., 11d.; 2 in., 11 $\frac{1}{2}$ d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1 $\frac{1}{2}$ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per foot. Prices for bricks are: Mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 5s. to 55s. for 1 to 3-ply.

The building trade artisans at the Cape are much perturbed by the announcement that the master builders have given notice to reduce, after the expiration of three months, the new wage scale which has just come into force.

Blue Building and Plaster Lime.

Trade in this section has fallen off somewhat, due mainly to the builders' holiday and also to the state of business in general. With the advent of the strike, sales are bound to drop further, as for the present we cannot expect an expansion in the building trade.

Standard quality building lime is being sold at 3s. 9d. bag, whilst the plaster lime is fetching 4s. 9d. bag. There is still a certain amount of inferior lime to be had at cheaper prices, but contractors are not anxious to purchase products of doubtful quality.

A new company about to be formed called the Union Lime-Sand Brick Manufacturing Co., Ltd., has issued a prospectus for private circulation. One of the main objects of the company is to manufacture a lime-sand brick. The sand can be obtained from any mine dump and the process only takes about ten hours to produce the finished article. In America and Germany this brick has met with much success and has proved itself more efficient than the ordinary clay brick. When this company is producing it will mean greater business for the blue lime producers, who are therefore awaiting the result of their venture with much interest.

Second-hand Iron and Timber Yards.

There is little or nothing doing in these, awaiting the result of the strike. Prices remain at 6d. to 7d. for iron, 9d. to 10d. for timber.

Oils and Colours.

White lead in oil, 10 $\frac{1}{2}$ d. lb., 39s. per 50 lb. kegs; red lead, 10d. lb., 9d. lb. in 50 lb. kegs; dry white lead, 1s. 6d. per lb.; linseed oils, raw or boiled, small bottles, 1s. 6d. each; 7 lb. tins, 8s. each; 4 Imperial gallons, 37s. 6d.; spirits of turpentine, small bottle, 2s. each, 10s. 6d. per 83 Imperial gallon; turpentine substitute, 5s. 6d. per tin, each 5-6lbs Imperial gallon; putty, finest linseed oil, 4 $\frac{1}{2}$ d. lb. in 100 lb. drum bulk; English putty, in bladders, 6d. lb.; colours, ground, in oil, 1s. 6d. to 4s. 6d. lb.; dry colours, 6d. to 10s. 6d. lb.; colours, ground, in water, 1s. to 2s. lb.; in turpentine, 3s. to 10s. 6d. lb.; in gold size, 2s. 9d. to 6s. lb.; ready mixed paints, 1s. 6d. lb.; roof paints, 16s. 6d. 14 lb. tin, 75s. per 70 lb. drum; varnishes, 30s. to 47s. per Imperial gallon; alum, in powder, 9d. lb.; creosote, 4s. 6d. per 5-6lbs Imperial gallon tin; gum arabic, 3s. 6d. lb.; resin, 8d. lb.; coal tar, 17s. 6d. per 4 Imperial gallons; Stockholm tar, 47s. 6d. per 5 Imperial gallons; common glue, 10 $\frac{1}{2}$ d. lb.; good quality, 1s. 3d.; finest Russian, 1s. 6d.; gold leaf, 3s. 9d. per book; transferred, 4s. 3d. per book; aluminium leaf, plain, 1s. 9d.; transferred, 2s. per book.

Electrical Goods.

Dealers report that during the past fortnight there have been scarcely any orders from the country. Until quite recently it was quite common to receive, say, from Kimberley daily orders, but there is nothing doing now. From Brakpan, Springs, etc., a few orders trickle in, but not of much importance, and inquiries are very scarce. Town orders at the moment are of an insignificant character and do not keep importers warm. There are no alterations in prices to report. Electrical materials are arriving freely and full stocks in nearly all lines are held.

American Notes.

Oil shares in America have recently been in demand, the taking up of stocks of those transportation companies that have demonstrated their ability to earn their dividends through the recent period of depression having caused revived interest in these concerns. The probabilities of enhanced values on market prices are considered very good, as the outlook for the American oil industry is very bright. Prominent oil men look for an advance soon in the price of Mid-Continent crude oil of about 25 cents a barrel. A cable from New York reports the receipt of advices from Sahara, Asiatic Turkey, that oil concessions in Northern Persia have been granted to the Standard Oil Co. for 50 years, the Persian Government receiving 12 per cent. of the gross profits.

The American Steamship Owners' Association reports immediate reductions in the wages to crews, amounting to 15 per cent. and upwards, in order to meet foreign competition; officers' pay will be reduced by a similar amount.

Exports and Imports—America, Britain and Germany.

Washington reports that the values of merchandise exported to the various quarters of the world during October fell to fractional parts of the totals for the same month last year, while decided drops in imports were noted by the Commerce Department in its monthly summary of foreign trade.

Exports to Europe during October aggregated \$196,000,000 compared with \$423,000,000 in the same month last year, while imports amounted to \$67,000,000 against \$88,000,000. During 10 months ended with October exports to Europe were \$2,056,000,000 against \$3,720,000,000 for the corresponding months of 1920, while imports for the same period aggregated \$622,000,000 compared with \$1,078,000,000.

Great Britain exported \$85,000,000 against \$160,000,000; imports, \$19,000,000 against \$34,000,000.

Germany exported \$26,000,000 against \$32,000,000; imports, \$7,600,000 against \$7,900,000.

Wireless Station in the Union.

The Marconi Wireless Telegraph Co. have made a proposal to erect in the Union at their own cost, at an expenditure of not less than £400,000, a wireless telegraph station capable of conducting messages to Britain and elsewhere if required, the same to be completed within eighteen months. Alternatively, they offer to build stations and conduct same on joint account for the S.A. Government, on a basis similar to that approved by the Australian Parliament. These schemes open up big possibilities.

British Coal Wage Cuts.

The Times states that in the Northumberland coal field the reductions on October rates range from 5s. 2d. to 2s. 9d. a shift. In Scotland the daily wage has dropped from 13s. 10d. to 9s. 8d.; in South Wales a decline of 3s. 5d. a day has been registered, the daily wage of labourers falling to 6s. 5d. In Cumberland wages are reduced from 48 to 30 per cent. upon base rates. Few miners, however, are working a full week. Despite reductions of from 1s. 6d. to over 3s. per shift, many of the West Yorkshire pits are not yet on an economic basis; and many thousand coal miners in the United Kingdom are idle.

The Great Western Railway Co. has recently announced a reduction of 10s. in the charge for conveying motor cars through the Severn Tunnel.

A proposal has been made to extend the City and London Railway beyond Clapham Common terminus to Tooting, Streatham and Southfields.

South African Reserve Bank.

According to the statement of this bank for the week ended January 7, the ratio of cash reserve and liabilities to the public was 72.7.

Metals Market.

Latest London advices: Standard copper, £65 17s. 6d. cash and £66 15s. forward; electrolytic copper, £73 10s. cash and £74 10s. forward; standard tin, £166 17s. 6d. cash and £168 17s. 6d. forward; foreign lead, £24 7s. 6d. cash and £24 7s. 6d. forward; quicksilver, £10 7s. 6d.; bar silver, 35½d.; and bar gold, 97s. 6d. per ounce.

The mines cannot retain their large complements of native labour in idleness for more than a few days if the European workers do not return to their jobs. In the interests of the public peace and safety, and because of the inability of the mines to keep on paying idle boys, they will have to repatriate the "boys." Many of the natives so repatriated will take months to procure again, even if they ever return.

A Neat Gas Engine Accessory.

It often happens that when the spark apparatus of a gas engine fails the magneto is alleged to be at fault, whereas the trouble is due really to imperfect insulation. A British firm has brought out a simple appliance for testing the insulation without dismantling. This appliance consists of a handle carrying a stem on which an insulator plug and a pivoted lever are united by means of simple connections. The magneto may be tested for spark and the pole-piece for leakage.

THE GREAT STRIKE.

NEGOTIATIONS RESUMED—DELIBERATIONS OF THE CONFERENCE—COAL DISPUTE FIRST—
A DIARY OF PROCEEDINGS DAY BY DAY—

STOPPAGE OF ESSENTIAL SERVICES—FLOODING OF THE MINES.

An important and favourable development took place in the strike situation on Friday night, the Federation agreeing to the Government's suggestion of a conference with the employers "untrammelled by conditions." A conference on the Federation's conditions was rejected by all the employers' organisations concerned. The new proposal of a conference of five representatives of each side was first made by Mr. H. L. Lindsay, Chairman of the Unemployment Commission, and was accepted by the Federation. Mr. Warrington Smyth, Secretary for Mines and Industries, wrote to all parties to the dispute later, making the same suggestion on behalf of the Government. The Federation replied at 11 o'clock on Friday night agreeing to the conference, and hoping for "early progress towards a settlement." The Chamber expressed its willingness to participate in a conference without conditions. All essential services on the mines were stopped by the Federation as from 7 a.m. on Monday. The V.F.P., however, opened two more power stations—Brakpan and Vereeniging being run by officials. Essential services are at certain mines being carried on by the staff, but at one or two properties the position is that in consequence of the withdrawal of pumpmen and engine drivers the workings are being flooded.

Modder East Flooding.

The livelihood of the 200 white men employed on the Modder East Mine has, for instance, been jeopardised by the action of the Strike Committee at Benoni in pulling out the employees of the Kleinfontein power station. This action has prevented necessary pumping from being carried out on the mine, with the result that it is now flooding. The water is up to the 23rd level, and when it reaches the 22nd, the electric hoists will be flooded out. The financial position of this company is such that if the mine continues to flood, it is doubtful if the property will ever be able to restart again. It is stated that even if the six engine drivers on the property had been allowed to continue work, which they were willing to do, the mine could have been saved by baling in place of pumping. These men, however, were not permitted to carry on.

The water in the Village Deep is steadily rising, but it is not expected that it will reach the main pumps for several days. The pumps are of a somewhat elaborate and complicated design and are not easy to handle, excepting to those engineers thoroughly accustomed to the plant. Three levels in the mine are now flooded. Water is rising, too, in the E.R.P.M.

Position of Underground Officials.

With reference to the maintenance of essential services on the mines, it may be pointed out that two important resolutions were carried at a largely attended meeting of members of the Underground Officials' Association held in the Selborne Hall on Saturday evening. They were as follows: (1) That this meeting endorses the action of the Executive Committee in sending forward to the Government the following resolutions: (a) Favourable consideration from the two sides to the dispute on the coal mines having been gained by the Association for an impartial inquiry into the causes of the strike on the coal mines, that the Government be pressed for such an inquiry. (b) That pending the decision of the inquiry, underground officials on the collieries be permitted to respond to the Prime Minister's appeal, with a view to maintaining essential services. Essential services will be defined by a special committee as early as possible. In the meantime the Government's definition will be accepted, but services considered unessential will be eliminated in consultation with others concerned. The second resolution read: (2) That the action of the Executive as set forth in the letter dated January 10 to the

Government be endorsed, and that the interpretation of the Council resolution to cover all essential services on the gold mines be recommended to members by this meeting.

The Conference between the S.A.I.F. and the representatives of all the industries concerned in the present strike—gold, coal, power and engineering—commenced its work at the New Law Courts on Monday morning, and sat until five o'clock in the afternoon. The Conference con-

The Turf Shaft of the Village Deep, where the water is steadily rising.

sists of seven representatives of the employers and an equal number of the workers. After the conclusion of Monday's sitting the following official report was handed to the Press: The Conference opened this morning under the chairmanship of Mr. Justice Curlewis, and immediately got down to business. On the question of procedure, it was decided that the Conference should sit from 10 a.m. until 12.45 p.m., and from 2.30 to 5 p.m. The representatives of the Federation proposed to deal with the points in dispute in the

following order: (1) Proposed reduction of wages on the coal mines; (2) V.F.P. dispute; (3) Town shops dispute, which embraces the employees of the Engineers' and Founders' Association and the Motor Traders' Association; (4) (a) contract system on the gold mines; (b) status quo agreement, including colour bar questions and the re-arrangement of underground work. The representatives of the Chamber of Mines wished to deal with the gold mining questions first, but did not press the point, and ultimately it was agreed to follow the course proposed by the Federation. Having dealt with the question of procedure, and agreed upon the order in which the various points in dispute should be dealt with, the Conference proceeded to deal with the dispute on the coal mines. Mr. Thompson put forward the case on behalf of the workers, and was supported by Messrs. Butler, Curran and others. Mr. John Roy, in reply, set out the position from the employers' side, and dealt largely with the economic position of the coal industry. Considerable discussion followed which was participated in by members representing both parties to the Conference. At the afternoon sitting the Conference resumed on the coal mines dispute, but no agreement was arrived at before the Conference adjourned at five p.m.

Tuesday's Meeting.

The Chairman (Mr. Justice Curlewis), in opening the proceedings on Tuesday, asked whether either side had any progress to report. Mr. Roy opened the discussion by submitting statements regarding various aspects of the economic position of the coal industry. Mr. Buekle urged submission of the dispute to a Conciliation Board, pointing out that arbitration was impossible from the employers' point of view on this question, as it was a vital matter for the industry, whereas conciliation held no vital objection from the workers' point of view. Mr. Thompson replied on behalf

of the workers, pointing out that the workers had volunteered to accept a reduction of 2s. 6d. per day. He further stated that if the employers would agree to arbitration the workers would be prepared to accept the decision of the arbitrator even if it meant a reduction of more than 5s. per day. The Conference adjourned for fifteen minutes to allow the workers' representatives to consider the question of referring the coal dispute to a Conciliation Board. On the Conference resuming, the workers submitted a proposal which was under discussion when the Conference resumed at 3 p.m., and discussion was continued throughout the afternoon session. The possibility of arriving at an agreement appeared still hopeful.

The Conference resumed at 10 a.m. on Wednesday and discussions were continued on the subjects which were being discussed when the Conference adjourned the previous afternoon. The afternoon session of the Conference resumed at 2.30, and adjourned at 5.35. No agreement has as yet been arrived at. It is anticipated, however, that a decision will be arrived at on the coal question to-morrow.

It is understood unofficially that on Wednesday the coal question was still under discussion, and the point seems to have emerged in the discussions that whatever settlement was arrived at, it would be impossible for all the men at once to be re-employed.

February 16 was suggested as the date up to which the managers of the coal mines should have the right to employ either a portion of the men who went on strike or to take on the whole of them. The workers' representatives, it is understood, wanted full payment for any men taken on under the second alternative, and that the Federation should be consulted as to which men should be taken on or put off. The Chamber of Mines representatives could not agree to either suggestion.

A SCENE AT THE MODDER EAST.

Owing to the absence of power to run the pumps the water is steadily rising in this mine. This is a most serious business in view of the Modder East's financial position.

Repatriation of Mine Boys.

A SERIOUS DECISION TO WHICH THERE IS NO ALTERNATIVE.

On Wednesday there was a further drain on the native labour force of the Reef, some half-dozen special trains conveying over 3,000 boys back to their homes. The dispersal was continued apace each day this week. On Thursday there were at least five trains; and as far as can be ascertained their complements were:—

East Coast	900
Umtata (morning train)	1,000
Swaziland	450
North Transvaal (Pietersburg)	700
Umtata (second train)	1,100

"We are not pressing the boys to go," said an official concerned in the matter. "We can't keep them back. They have no work and no pay, and I think more of them would be going if the trains were provided." At the present rate of dispersal it is calculated that 35,000 boys will have left the Reef by next Wednesday.

The boys who are being repatriated are time-expired labourers who have latterly been working on the mines on a voluntary basis. A week's notice was given to 65,000 such boys at the beginning of last week, and now they are free to go as they choose.

The position of the contract boys has been a little obscure—at least to the native mind—during the last few days; but the matter seems to have been cleared up by the communication of Mr. H. M. Taberer (of the Native Recruiting Corporation) to the Knights Central boys that for the present they were to be paid.

So, for the time being, the contract boys are in the happy position of receiving "skoff" and wages for nothing. The position is probably an admirable one—for the natives—but the financial considerations involved form a grave problem to a number of mines which are only just able to keep their heads above water in times when they are in full operation.

which will unlock the sealed store-house of the heart of the Dark Continent, and will pour millions in copper, lead, zinc, tin, coal, meat, rubber and tropical produce upon the West Coast—a good five days nearer England than Capetown. But it has been so long in building, and its effects have been talked of for so many years, that the world has grown weary of waiting for the consummation. To most people the Lobito Bay line is like the Channel Tunnel, the generation of electric power at the Victoria Falls, or the sounding of the Last Trumpet—something that may happen some day, but is a powerful long time coming. And yet it is a fact that a goodly portion of this line has been completed. Within ten years it is safe to say that the new route to England will well nigh revolutionise the trade of a great deal of Africa south of the Equator. It will bring Northern Rhodesia and the Congo five days nearer the markets of Europe, and its competitive influence cannot fail to be felt by all parts of Southern Africa from Beira to Table Bay.

Chingura to the Atlantic.

At present the railhead of this line is at Chingura (see map). From Chingura the line runs to Lobito Bay, a steep descent for a greater part. From the plateau, 1,808 metres above sea-level at Chingura, to the coast, a portion of the distance is covered by a rack rail. Beyond Chingura on the eastern side the rails are laid. Four or five kilometres from the station they terminate abruptly on the veld, as if workmen had left bolting the last section on hearing the dinner bell, and grass is growing between the sleepers. Some day (perhaps in the near future) the line will be continued to the border, and then on to join the Chemin de Fer du Katanga. The chief engineering feat has been done in the rail climbing upwards from Benguella. No trifling feat was this. The iron road takes bends of hairpin shape as it creeps and turns on the steep mountain face. From its present ending to beyond Portuguese territory it will be almost level lying. From the top of

Steep Gradient on the Benguella Railway.

the great divide on the south-eastern side the land slopes downwards gently. On one side of the plateau is the watershed of the Congo, on the other of the Zambesi. Dividing Angola from the Congo Belge is the Kasai, which empties into the Congo, after running northwards for miles, by a bend in the direction of the big stream. The railway is five hundred and nineteen kilometres in length, and drops into Lobito Bay alongside the big ships in that marvellous harbour, built by nature with a view to accommodating the largest vessel man may build. There is a long arm of sand and reef outstretched to protect a fleet as large as the largest naval Power has yet budgeted for, and for ten years past, an inhabitant declares, there has been no storm outside that arm that has disturbed the peace of that vast sheet of water inside the harbour.

At present Lobito Bay is merely a clearing station. Goods come from other parts of the world, are transhipped to the railway, and carried 300 miles into the interior, thus

finishing the work of the Bay. When the railway joins the Belgian line, who can foresee the limit of Lobito's expansion of trade? To-day there are good houses for the railway employees, a few stores and warehouses, a large one in course of erection, plenty of sand lying around, and that is all. Living is cheap, judging from the hotel tariff. There is a Railway Hotel, and the charge is five shillings per day.

When enough money is found to continue the well-made road to the border of Portuguese territory and the Belgians make the 150 miles from the Angola border to Musonoi, there will be one continuous motor road right from the post office, Elisabethville, to the ship-side in Lobito Bay, the last three hundred miles being open for traffic on the railway.

The following facts and figures regarding Lobito Bay and the line should prove of interest here:—

Lobito Bay is 4,930 miles from Southampton, and has deep water to within a few feet of the shore. The harbour, the best on the West African Coast, is protected by a sand spit some $1\frac{3}{4}$ miles in length, running parallel with the shore and about $1\frac{1}{2}$ miles out. A wooden jetty about 170 yards long has been built, alongside of which ocean-going vessels are able to discharge direct into railway trucks at any state of the tide. This harbour enjoys the great advantage over its future eastern rivals that goods passing through it will be free from Suez Canal charges.

The Benguella Railway; Lobito Bay to Katanga.—This railway of standard 3 ft. 6 in. gauge, due to the enterprise of Mr. R. Williams, working under a concession granted by the Portuguese Government in November, 1902, is under construction from Lobito Bay to Katanga, a distance of about 1,100 miles. The line cannot fail to play an import-

ant part in the economic future of Central Southern Africa, not only as a means of communication with the great mineral district of Katanga, but also as a portion of a transcontinental railway of which the centre is already connected by radiating lines with all parts of South Africa. Its importance was not overlooked by Germany, whose efforts to obtain financial control were successfully met by the concessionaire.

On the line are: Lengue, 31 miles 361 feet, at the foot of a picturesque gorge, up which a rack railway is laid to S. Pedro (34 miles 820 feet). The line now passes through

cultivation, carried on almost entirely by natives, continues as far as the line has been constructed.

At Longonge, 214 miles (4,651 feet), the ascent of the Lepi Mountains commences and at 241 miles the line attains an altitude of 6,180 feet, the highest so far included in the survey. The line, which follows the old Boer road across undulating country, proceeds to Huambe, 266 miles (5,566 feet), which has grown up since the advent of the railway and is now an important administrative, trading and railway centre.

In the Wonderful Harbour of Lobito Bay.

barren, waterless scrub, known as the "Thirsty Country," which, prior to the construction of the railway, was a serious interruption to trade and intercourse with the interior. At 59 miles (2,950 feet) it crosses the first watershed, and at 84 miles (2,585 feet) a second, from both of which there are fine views of mountainous, inhospitable country. Between the coast and Sapa River, 100 miles (2,930 feet), there are no less than 38 bridges and viaducts.

After Cubal, 123 miles (2,976 feet) there is more moisture and native cultivation commences. At 158 miles (4,100 feet) the upper waters of the Catumbella River are crossed, which, even here, is quite a large body of water. Cuma, 198 miles (4,708 feet), is a considerable trading centre, beyond which

Chingura, 324 miles (5,930 feet), lying well within the Bibé Plateau, is the terminus (1,921), but earthworks have been completed for another 60 miles to Belmont, whence to the Congo Border, the work will be considerably lighter. To effect a junction with the Katanga railway system, a further 799 miles from Chinguro remains to be constructed.

The completion of the line to Katanga, which was due in 1917, has naturally been delayed by the War, but the receipts (except for 1915) have continued to show a steady increase.

Since 1920, construction has been commenced from a point on the Capetown-Bukama line, Tchilonga, where the section to Ruwe, 52 miles, is in hand.

Electric Cable.

An interesting sidelight was thrown on the market in electric cable by the tenders received recently by the Johannesburg Municipality in response to its inquiry for cable required to meet the increasing traction load, and the 550 '6 x '6 sq. in. concentric cable are for the completion of the Central Sub-Station Scheme. The matter was reported to the Tramway and Lighting Committee as follows:—" '6 S.C. Traction: The lowest tender is that of Messrs. The Griffin Engineering Co. for cable manufactured by the A.E.G., Germany, at 13s. per yard, delivery in three months. A covering letter has been submitted, stating that the cable offered is strictly in accordance with the British engineering standards, as called for in the specification. The second lowest tender is that of The Metropolitan-Vickers for cable manufactured by Messrs. W. T. Glover & Co., England, at 13'96s. per yard. Delivery in three to four weeks at works, British engineering standards are guaranteed, but prices are subject to confirmation. The third lowest tender is that of Messrs. Henley's S.A. Telegraph Works for cable manufactured by Henley's, England, at 14s. 7½d. per yard. Delivery four weeks at works, subject to prompt acceptance, failing which tenderers reserve the right of adjustment in accordance with market fluctuations of copper and lead." As a final result the Town Council, on the recommendation of the Tramway and Lighting Committee, accepted the following tenders: (a) Metro-

politan-Vickers Electrical Co., Ltd. (most suitable): 2,000 yards '6 sq. in. single-core traction cable, at 13'96s. per yard, £1,396 (firm price, but subject to confirmation), and in the event of the Metropolitan-Vickers Co. failing to get confirmation, that the next lowest tender be accepted, viz., Messrs. Henley's S.A. Telegraph Works, Ltd.: 2,000 yards '6 sq. in. single-core traction cable, at 14s. 7½d. per yard, £1,462 10s. (b) Henley's S.A. Telegraph Works Co. (lowest): 550 yards '6 x '6 sq. in. concentric H.T. cable, at 23s. 9d. per yard, £653 2s. 6d. (firm price, subject to confirmation; penalty clause deleted).

According to the decrees of the labour organisations a rock-drill worker who can't get on with his job because the air or water pipes are broken must not dare touch those pipes. That is the pipe fitter's job, and therefore according to the senseless and tyrannical edicts of organised labour the machine-man must do nothing until the pipe fitter is disposed to put in an appearance. Similarly the pipe fitter, although he may be working under a dangerous piece of hanging, must on no account attempt to trim down the loose rock or to usurp the functions of the timberman whose particular job is to put a prop or stick under the dangerous ground. But what of that? What does it matter if the pipe fitter is killed so long as there is no departure from the great fiat of "Every man to his own job and one job only"?

“WITTON” Fractional Horse Power MOTORS

In standard sizes from $\frac{1}{50}$ to $\frac{1}{2}$ H.P. for D.C. & A.C. Circuits.

Suitable for all low power drives.

For Driving:—

Recent Additions to Our Knowledge of the South African Coal Fields.

The following is from the lengthy and detailed paper read last week by Dr. E. T. Mellor on the subject of the South African Coalfields.

In introducing his subject, Dr. Mellor said:—During the past few years, probably more exploratory work has been done on the South African coalfields, especially those of the Transvaal, than in any similar preceding period. Several causes contributed towards this activity. Conditions during the War, and perhaps still more those of industrial unrest which succeeded it, opened up, temporarily at least, new markets for South African coals, particularly for bunker and export trade, which had not previously been available. A further stimulus to investigation was the widespread interest which has been aroused throughout the world in fuel questions in general, and also in the many avenues of development connected with by-product industries.

The coal exploration work of the past few years in South Africa has resulted in a very great extension of our knowledge of our coalfields, not so much perhaps with regard to the general geology, which was already fairly well known, but more particularly with respect to the extent and character of the coal seams in some of our principal fields and of the quantity and quality of the coal of which those seams are composed.

This exploratory work has now reached a stage when a definite review of the important results obtained can be made, and it is the object of the present paper to indicate the extent of such exploratory work, to summarise its results, and briefly review the present position of our coal resources. My paper will deal more particularly with the Transvaal, where perhaps activity during recent years has been greatest, and where the greatest additions to our known coal reserves have been made.

Through the courtesy of the various mining houses by which the exploratory work has been carried on, I have been able to inspect nearly all the results of recent boring operations, including the analyses of the coal seams; so that the conclusions given in the present paper, as to the quality and quantity of the coal which has been proved, are based upon direct evidence of a positive kind afforded by the very large number of boreholes recently put down all over the area dealt with.

Data from Three Hundred Boreholes.

The projected extension of the railways in the Middelburg district by the addition of a line from Minaar, eastwards, to Carolina, across the extensive coalfield lying to the south-east of Witbank, and by a line crossing the eastern portion of the same area from Middelburg, southwards, to Bethal, has stimulated the exploration of this extensive tract of known coal-bearing country. During the past two or three years, boring on a very large scale has been undertaken, and the more promising areas, near the anticipated routes of the railways, have been systematically prospected. In the course of this work, which has been carried on by several large mining corporations, some 300 boreholes have been sunk, the results have been carefully recorded, and the possibilities of the field worked out in great detail by the engineers concerned.

As a result of this exploratory activity, the known area of good coal-bearing country in the Witbank field has been greatly extended, and the proved coal reserves enormously increased. While, however, this is generally realised, anything in the nature of a definite estimate of the quantity and quality of these additions to our known coal reserves has not yet been put forward.

A Thousand Million Tons.

The extent of the boring operations in the Witbank-Middelburg area is shown by a plan on which are indicated the majority of the holes recently put down. As a result of the operations, several extensive areas of high-grade coal have been definitely proved. At a conservative estimate, these areas contain an aggregate of 1,000,000,000 tons of export grade, taking primary extraction alone, while the tonnage of coal of lower quality, but of considerable economic value, is still greater.

Dr. Mellor concluded his paper with a consideration of the best means of utilisation of these coal reserves as follows:—

It will be clear from the foregoing sections of this paper that the exploratory work of the past two or three years has definitely proved the existence in extensions of the Witbank coalfield of great reserves of coal of a grade equal to or better than the present standard of export coal. Compared with the position a few years ago, the proved supplies of first grade have been enormously increased.

Owing to the comparative variability of the South African seams as compared with those of the British type, it was not advisable, without actually proving the seams, to make any but the most conservative estimates of the coal reserves in untried areas, and there is no doubt that the estimates which have been made from time to time of the country's coal reserves can, in the light of recent developments, be very greatly increased. As a result of recent operations, it is probably well within the mark to say that, in the Witbank district alone, 1,000,000,000 tons of coal of a calorific value of 12.5 and over have been proved, of which at least 50 per cent. has a value in the near neighbourhood of 13.0. These figures refer to primary extraction alone, apart from further reclamation work. With the previously known supplies, this would be sufficient to maintain the present Transvaal output from the Witbank district alone for a period of a hundred years or more, leaving out of account enormous quantities of coal of somewhat lower grade already proved, as well as the coal contained in the large tracts of coal-bearing country which remain untouched. Moreover, the proved reserves referred to are not buried under great thicknesses of overlying rocks which would make their recovery a slow and costly operation, as is the case with the reef in many of our gold mines, but are extremely accessible, and lie ready to be opened up from many points of attack with an ease unknown in most other coal-producing countries.

The Export Trade.

Bearing these facts in mind, the question naturally arises as to the best means of utilising these huge reserves of proved coal of high quality. The history of nearly every young country shows that its development has been greatly aided in the early stages of its history by the exploitation of its mineral resources, which have materially helped to provide the means for developing the country until the more permanent industries could become established. South Africa has been no exception to this rule, and the full extent of the indebtedness of the whole country to the mining industry is probably realised by only a very small proportion even of those directly connected with mining pursuits. Compared with the gold mines, particularly those of the Rand, the part played by the great coal reserves of the country as a source of profit has been comparatively insignificant and largely indirect. With the diminution in the production of gold, which appears likely to occur in the near future, there is no reason why our coal resources should not be turned to better account in the employment of labour and the production of revenue derived from sources outside the Union.

South African coals, in respect of cost of production and many other conditions, are very favourably circumstanced as regards an export trade in certain markets. The internal consumption of coal is not likely to increase materially for some time to come. At the present time indeed the two principal consumers—the railways and the gold mines—show no signs of making substantial increases in their demands. Indeed the present day tendency towards the establishment of large central power-stations, and the electrification of sections of the railways, will probably result in the consumption of a larger proportion of medium grade coal which does not figure in the estimates given above, thus leaving a proportionately greater quantity of

the higher grades free for other purposes, including export. It would, therefore, be greatly to the advantage of the country if additional outlets could be created for our coal, since, under existing conditions, the abundant reserves already definitely proved must lie dormant for many years, and the aid which they might otherwise afford in the general development of the country as a whole will be lost.

It is difficult to foresee the developments which may take place in the use of fuels in the future. For many years to come, however, our higher grade coals are likely to be in good demand for export purposes, and it would, therefore, appear wise, if our large resources are to be used to the best advantage of the country, to at once endeavour to establish an export trade on a scale commensurate with the large supplies which await easy exploitation.

The position to-day is that we have practically unlimited quantities of coal of proved quality and good commercial value, which lies ready to hand, and which can be opened up and worked under conditions as favourable as those prevailing in any other country in the world. There are, however, two main obstacles to the proper development of an export trade—inadequate and uncertain means of transport to the coast, and still more inadequate and uncertain provision for the handling of the coal between rail and ship.

Question of a New Port.

At present the Transvaal coalfields are connected with their main outlet for export by the slender thread of a single line of rails, while at Delagoa Bay the loading arrangements are outside the control of the people principally concerned in maintaining their efficiency. Besides being quite inadequate to deal with the existing export trade, these port arrangements have been a frequent source of delay from other causes.

With an additional railway free from the many disabilities of the existing line, and with a port under Union control properly equipped to deal rapidly with large quantities of coal, the situation would be very different, and there

would be a fair prospect of great expansion in the present export and bunker trade, which, without such facilities, can never attain the dimensions which we might reasonably expect. With something like 1,000,000,000 tons practically awaiting removal as soon as a suitable outlet is found, one, at least, of the conditions necessary to provide our railways with an abundance of traffic for a great many years to come may be regarded as fully assured.

Of suggested new routes to the coast, that to Kosi Bay, in the extreme north of Natal, appears to be the most favoured. It has been examined and found to present no serious engineering difficulties, while its situation in British territory would remove many of the uncertainties and disabilities attaching to a foreign port. The opening of such a route appears to be the best means of providing a suitable outlet for our surplus coal reserves, and of establishing on a firm basis an export trade which would be an important factor in the future development of this country.

The Chamber's proposals, which involve the greater utilisation of more experienced native labour on semi-skilled and partially skilled jobs, contemplate the gradual retrenchment of 2,000 men, and perhaps less. The insistence by the S.A.I.F. on the maintenance of the "status quo" conditions means that if gold continues to fall and costs remain as at present, 24 out of 39 mines must shut down permanently and 10,000 men be thrown out of employment. The real question for the worker, therefore, to decide is this: In view of the fact that the white worker will be safeguarded under the ratio plan, which is the better scheme, that of the leaders of the industry, which contemplates the gradual retrenchment of 2,000 men, or that which means the dismissal of 10,000?

A New Rock Drill.

A new rock drill has been invented and patented by Messrs. W. E. Nettle, P. Selby, J. Blythe, and J. H. Holman, of Ferreira Deep, Ltd., Johannesburg, South Africa. In a percussive rock drill, in which water is fed through the piston-rod and tool by a tube, leakage of the water into the cylinder is prevented by a small compressed-air chamber arranged in the interior of the piston and closed by a bush which is a loose fit on the feed tube. Compressed air is supplied to the chamber from the front of the piston during its backward stroke by means of a port, and from behind the piston during its forward stroke by passing between the bush and the feed tube.

South Africa's Trade and Gold.

Some valuable statistics relative to the trade and financial conditions of British South Africa are contained in the Monthly Review of the Standard Bank of South Africa, dated 31st December, 1921. The carefully compiled statistics contained in this report show that our exports during the nine months ended with September 30th of last year and for the same period of 1920 were as under:—

	Nine months ending Sept. 30.	
	Value 1921.	Value 1920.
Total South African Produce	£43,460,498	£61,915,725
Imported Goods Re-exported	2,958,852	3,574,050
	£46,419,350	£68,489,775

The value of raw gold exported in these two periods was

1921	£27,338,607
1920	29,223,828

Gold Contributing 62 per cent.

In other words, the proportion of gold to total South African produce was as follows:—

1921 period	62 per cent.
1920 period	45 per cent.

This means that, whereas in 1920 industries other than the gold mining industry were able to contribute eleven shillings out of every pound's worth of South Africa's produce, they were, on account of trade depression, only able to produce less than eight shillings worth in the pound of total produce during the first nine months of last year. During this latter period our gold yielded more than 12s worth in each pound of total production.

Carrying the Country on its Back.

These figures clearly show how absolutely dependent we are for our national livelihood upon gold. They indisputably demonstrate the truth of the statement that the gold industry is carrying the whole country upon its back, and they show that whilst all other branches of South African produce have fallen enormously, the Rand, despite its heavy burdens and difficulties, has managed to keep its head above water and to save South Africa from insolvency. And this is putting no exaggerated construction upon the case.

A good many people in various parts of South Africa think they have no direct or indirect interests in the gold mining industry of the Witwatersrand. It may therefore be worth while pointing out that the revenue of the Union benefited directly to the extent of over £800,000 last year from one gold mining lease alone. The direct revenue from other mines in respect of profits tax was, of course, infinitely more, but just consider this one item only—£800,000 from one Government Gold Mining Lease! This is nearly 10s. per head of white population, and if this sum had not been provided by the Government Gold Mining Lease it would have had to come out of the pockets of the taxpayers of the country. In the tax year 1918-1919 79,000 individuals paid income tax, and this sum of £800,000, if not contributed from a Gold Mining Lease, would represent an additional payment of over £10 per head by the taxpayers. The whole of this large sum of £800,000 was paid by one mine—the Government Gold Mining Areas (Mcderfontein), Ltd., which, in addition to contributing this huge sum directly to the coffers of the State, has been distributing £150,000 per month, or £1,800,000 per annum, in working costs. The Government's share of profits of the Government Gold Mining Areas in 1920 was £882,975; in addition income tax was £18,369 and Provincial gold profits tax £15,085, or a total of £916,429.

DAVIS-MADE MEANS HIGHEST GRADE.

HERE IS THE DAVIS - BIRAM ANEMOMETER.

It is constructed on the principle of the revolving fan, and offers several advantages over its predecessors. The air enters, as usual, from the back of the instrument, and instead of passing in a straight line through the protecting ring, is deflected outwards by a cone through port-holes. The friction of the air passing through the instrument to the outer air is practically nil. So constructed, it is possible to bring the instrument in front of the operator, and experiments have proved that, if held 18in. from the body, there is no hindrance to the free current of air, and that the accuracy of the readings is not interfered with. Thus, what was previously considered impossible has been achieved. The Davis-Biram Anemometer has several other distinct advantages which place it ahead of all others. May we send you full particulars?

EDITORIAL.

THE STRIKE.

The strike of Rand mine workers, employees of the Victoria Falls Power Company, and engineering shops, which commenced on January 8th, just one week after all the Transvaal colliers had downed tools, has dragged on with a weary and destructive monotony throughout the past week. Contrary to the expectation of many people, and contrary to the hopes and desires of what may be termed the North-West Frontier tribes, that is to say, the hooligan element who inhabit a portion of the north-western area of Johannesburg and who were responsible for much of the looting and bloodshed of 1913, there has up to the time of writing been no violence or sabotage.

The Government appears to have taken the precautions necessary to protect property and prevent lawlessness, and so far the strike has been a grim economic struggle enlivened by outbursts of bitter and misleading eloquence on the part of the Labour leaders and by a firm and steady stand on the unassailable position of facts and figures taken up by the Chamber of Mines. As we fore-shadowed in our last issue, the call to arms issued by the Federation has met with a half-hearted response from the other trade unions, and particularly so from the "Nurabs," the Railway and Harbour employees, who may truly be said to hold the keys to the situation in their hands.

The men involved in this calamitous dispute are clearly fighting a losing battle, in which the strongest weapon of their opponents is not the firmness and strength of purpose at last exhibited by the Chamber of Mines, but the impregnability of the economic facts upon which the case for the mines is based. The Federation's forces of deception have been mainly engaged upon the propagation of the false assertion that the leaders of the industry are intent upon destroying that artificial social distinction which is termed the colour bar. It cannot be too strongly emphasised that the Chamber of Mines has no intention of removing the colour bar, and could not do so even if it desired its removal. But the Chamber very rightly wishes to save the low-grade mines and proposes to retrench a limited number of redundant and semi-skilled employees, at the same time guaranteeing to safeguard the position of the skilled workmen by the application of a system of ratios to the European and native employees of the mines. And the Chamber, too, desires to modify certain other features of underground work which will assist in the reduction of working costs, an absolutely imperative essential if numerous mines are not to be shut down, several of them for ever, simply because they can no longer carry on at a loss.

The Federation, no doubt because of its failure to bring about a general strike throughout the country, and realising that the funds of the union are not sufficient to stand a long and protracted struggle, has endeavoured to intensify the ruin which this struggle is causing by curtailing the essential services on and in the mines and power stations. Although the Underground Officials' Association has undertaken to assist in carrying on these services, the Village Deep and Modder East mines are fast being flooded. Benoni has been in darkness since the beginning of the week, and Johannesburg itself will probably be in a similar plight to-morrow. The direct loss, not only to the employees and the employers, but to the Government and the community at large, has been estimated at £630,000 per week; the direct and indirect losses combined are far greater, and continuation of the present dispute cannot fail to do almost irreparable damage to the whole country.

The hopes raised during last week-end at the announcement of a renewal of negotiations between the two parties and also during the week as a result of the deliberations of the Conference over which Judge Curlewis has presided appear to have been based on an unduly optimistic view of the ability of this Conference to find a way satisfactory to both disputants out of the present deadlock. To our way of thinking, the men's leaders are in the wrong, and the only solution of the trouble is to be found in the direction of accepting the Chamber of Mines' proposals with a guarantee that will adequately protect the status of the skilled craftsman. There must be no patched-up peace, no postponement of a frank and candid acknowledgment of the truth, and the verifiable truth, of the economic facts of the situation. Whilst we are about it let us get this long-standing bitterness of controversy over once and for all. The Rand can no longer continue to exist under a regime of industrial Red terror.

Meanwhile large batches of natives are being repatriated, and the outlook at the moment of writing is black indeed. It may, of course, take a change for the better at any moment, but it requires a considerable degree of optimism to see sunshine in the clouds which are banked up all round us.

THE FALLING PRICE OF GOLD.

A point which it appears is being lost sight of in the present calamitous industrial dispute is the probability that before this struggle is brought to a conclusion the price of gold will be less than when the strike started. Commenting on this, the Standard Bank of South Africa in its monthly Review issued from Capetown at the end of the year says: "The price of gold, which was over 115s. per ounce in July last, has fallen below 100s., and future movements are difficult to forecast. The exchange value of British sterling in relation to the United States dollar, which mainly governs the price of gold, has steadily appreciated and is now well over the 4 dollar mark, the usual downward movement at this time of the year, through Britain's seasonal produce importations from America, being on this occasion more than counteracted by other influences.

"It is interesting to note that while the index numbers of wholesale prices in Great Britain continue to decline, an opposite tendency is in evidence in the United States, and if there should be an expansion of credit in the latter country, for which the gold reserves held there afford an ample base, the resulting inflation should tend to further improvement in sterling exchange quotations." In other words, this means that there is a considerable likelihood of gold falling still further in price."

The latest quotation is about 97s. 6d. per oz., and if this strike is protracted it may well be that the mines which are able to survive the staggering blows which are being dealt the industry by the present dislocation of work will have to consider the question of re-starting work on the basis of a substantially less sales price for their product than when they shut down. This is an important point, and should not be lost sight of. The Standard Bank in its monthly review calmly and dispassionately reviews the industrial position on the Rand in the following words:

"Some of the mines already report a loss on working, and it is stated that if gold returns to its normal price of 85s. per fine ounce, 24 out of the 39 mines on the Witwatersrand at present producing will, failing material reduction in working costs, have to close down. The consequences would be far-reaching, as the resulting unemployment and curtailment of expenditure on wages and stores would react on all sections of the community. The proposals put forward by the Chamber of Mines as a basis for discussion are: (1) An alteration in the system of underground contracts; (2) a modification of the *status quo* agreement; (3) a re-arrangement of the underground work. It is stated that the proposed changes might result in a reduction, over a period of months, of about 2,000 in the number of unskilled and semi-skilled white workers, and the saving in this and other directions would bring within the margin of payability large quantities of ores which cannot be worked on the present basis of costs. The position as it now stands is recognised as being very unsatisfactory, largely depending as it does on the uncertain factor of the gold premium, and if disaster is to be averted some modification of existing arrangements is essential."

And we might add immediate modification is essential. The conference has now been sitting for four days, and at the time of writing may or may not have settled the first item on the agenda—the coal dispute. The Chamber of Mines wanted to tackle the bigger item of the gold mines dispute first, but to this the Federation objected. Meanwhile the Rand is drifting into a position which it will take many months to recover from.

Notes & News.

Our Busy Man's Page.

Owing to the unexplained delay in the arrival of the mail boat at Capetown this week, our Busy Man's Page feature must be again omitted. The mail is not expected to arrive

here till next Monday, and it will be necessary, therefore, to hold over our compilation for the Busy Man's Page till our next issue.

Kleudgen, Ltd.*, with a capital of £50,000; *Lancaster Central G.M. Co., Ltd.*, with a capital of £15,000; and *Platinum Explorations, Ltd.*, with a capital of £20,000.

* * *

The Bantjes to Close.

The following circular dated Johannesburg, January 16th, has been sent to shareholders:—

Dear Sir or Madam,

The work accomplished in the 11th level west drive by the Consolidated Main Reef Mines & Estate, Ltd., during the quarter ended 31st December, 1921, was as follows:—

Reef	Footage Advanced.	Footage Sampled.	Reef Width Inches.	Reef Value Dwts.
Main Reef Leader	193	110	8	28.4

Shareholders were notified in the report of directors for the year ended 31st December, 1920, and also at the last annual meeting held on the 27th May, 1921, of the Board's intention, notwithstanding the poor values previously encountered, to continue the driving of the 11th level drive from the Consolidated Main Reef Mines & Estate, Limited, boundary for a further distance of 500 ft. beyond the dyke encountered at about that time, and that should the results obtained prove unsatisfactory, and the Board be of the opinion there is no hope of procuring payable values, shareholders would be called together to consider the question of placing the company in voluntary liquidation. The 500 ft. of driving west of the dyke has now been accomplished without any tangible result. In all 2,271 ft. of driving have been done from the company's eastern boundary; the average reef disclosures over 1,195 ft. on reef being 20.8 dwts. over 6 inches, or 125 inch-dwts.

In view of the very small percentage of payability disclosed throughout this drive, the consulting engineer, Mr. H. Stuart Martin, has recommended to the Board that the work should cease. Having given the matter full consideration, the directors are satisfied that there is no hope of discovering payable values. They are also of opinion that any attempt to re-open the mine (which was closed down at the end of 1918) for the purpose of working the small remaining ore reserve is not warranted, by reason of the heavy expenditure involved in dewatering the mine and the general re-conditioning of plant. Accordingly they have now decided to discontinue the drive referred to and to call meetings of shareholders to consider resolutions for placing the company in voluntary liquidation. The notices convening such meetings will be issued to shareholders at an early date.

* * *

The late Mr. Charles Marx.

With deep regret we have to record the death, early in the week, of Mr. Charles Marx, the well-known and highly-respected director of the "J.C.I." Co., Ltd., and its associated group of companies. Mr. Marx was one of the pioneers of the Rand, and had long occupied a foremost position in the mining, social and sporting world. In addition to being a director of the Barnato group of companies, he was chairman of the Argus Company, and for many years had been chairman of the Johannesburg Turf Club. A large and representative gathering at the graveside on Tuesday testified to the widespread esteem in which the late Mr. Marx was held.

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

The Union's Budget.

The actual deficit of the Union of South Africa on last year's operations will, it appears, be a million and three-quarters. The public debt and provincial expenditure are very heavy in the early part of each year, but lighter in the latter part, and instead of the expenditure reaching 32 millions sterling it will be quite two millions less. In the nine months interest on the public debt amounted to £6,300,000, which, according to the estimate for the year, leaves £1,363,000 still to be paid. On the revenue side the receipts from income tax are expected to be very heavy in the last quarter. The revenue from the gold mining leases, which will be taken into ordinary revenue account this year instead of going into the loan account, will exceed the estimate of £600,000 by £200,000. This revenue is expected to be paid in February. The excess profits duty has led to another windfall for the Government. So far a million and a half have been recovered. The estimate, in fact, has been exceeded under this heading by a quarter of a million. The revenue from the Customs is a long way short of the estimate, but the deficit will to a large extent be set off by the unexpected increases in excess profits duty and in the revenue from mining leases. A forecast of the financial position at the close of the year is: Estimated revenue, £29,150,000; balance, 1920 surplus, £460,000; total, £29,610,000. Original estimate of expenditure, £29,544,000; surplus for current year, £56,000; deficit from 1920-21, £400,000; on original estimate deficit at March 31, 1922, £344,000; probable additional expenditure, £750,000; probable drop on estimates of revenue, £900,000. The total probable deficit is therefore £1,794,000, as compared with the estimated deficit of only £344,000.

Gold and the Exchange Problem.

A recent issue of the *London Mining Journal* contains an article by Mr. H. Abbati advocating a free market in gold as a solution of the exchange problem. This would reduce the national debt in terms of gold, and increase revenue in terms of paper. Conditions for export would be much increased. Mr. Abbati argues that the reason why the value of gold has been subject to such wide fluctuation since the War is solely because it has been diluted with paper and credit as a substitute. Owing to the exigencies of the situation brought about by the War, huge gold debts have been contracted, to an extent far exceeding the amount of gold in the world. In fact, were there such a quantity of gold in the world, gold would then be so diminished in value as to be unsuitable as a standard. As it is, to cover up the insolvency of the debtors, legal restrictions have been put in the gold market, which practically means that it can only be handled by Governments; and the Governments, again, only handle it in such a manner as to cause them the least possible embarrassment towards their respective electors. The value of gold would very soon return to pre-war if there were a free market in gold, and if the various peoples of Europe, including England, realised how

little, ultimately, the paper currencies will be worth. A return to a sound basis for currency would make a demand for gold in England and pave the way for marketing goods in America. There being no market now in England for gold, the metal, instead of goods, is exported. Commenting on Mr. Abbati's statements, the *Mining Journal* says editorially: "We take it that the main distinction between conditions to-day and before the War is largely the absence of any international basis of values. Gold stocks are entirely immobilised. The world, being heavily in debt to the United States, cannot afford to buy gold from her, while Great Britain has set the fashion to the rest of the world by refusing to allow gold to be exported. As the gold is not used for currency here, this means that for the time being gold in the country is of no practical value. We have by this embargo on export, therefore, reversed what has been the trade policy of the country at any rate from the beginning of industrial times, and in doing so have for the time being stopped the operation of what was always described before the War as the automatic check on inflation or deflation—the 'governor,' as it was frequently termed, of fluctuating trade loads. Why, it may be asked, do we not revert to it? We have little doubt that Mr. Abbati is right when he attributes the cause to the reluctance of the authorities, Governmental and financial, to face the fact that for the purposes of the War we depreciated our currency. In the old days the Sovereigns of England and other European countries were wont to do this by debasing the metallic currency; in these days we have given up the metallic currency, and have produced the same result by diminishing the gold reserve against paper. What the real value of gold should be to-day it is impossible to say, the only standard we have is that of American currency. That, however, would appear to be too low, because gold mining in the United States cannot be carried on at a profit, while here the relation of the paper pound to the gold pound is a fluctuating one."

Rhodesia Consolidated.

The accounts of this company for the year to March 31 last show loss of £5,155, as compared with a profit of £2,185 in previous year. This debt is more than accounted for by loss on book values realised by sale of some of the company's shareholdings. In accordance with resolutions passed in December last year, the company's capital has been changed from shares of 10s. each into ordinary shares of 4s. each and deferred shares of 6s. each. The issued capital is now 1,948,800 ordinary shares of 4s. each, £238,960; 1,194,800 deferred shares of 6s. each, £358,440; total, £597,400; 513,000 ordinary shares of 4s. each are available for issue, but, on account of the depressed condition of the mining market during the whole of the year, it has not been possible to proceed with the issue of further capital as foreshadowed by the Board at the last general meeting. The Nevada Mine, which was leased on tribute, was given up during the year, and efforts are being made to find another tributer as well as for leasing the company's other claims. Several inquiries have been made, and when the present high cost of mining makes working reasonably profitable, the company should be able to find tributers for several of its properties. Asp Mine, in which this company holds a substantial interest, has been let on tribute to responsible parties, and it is anticipated crushing operations will be commenced by the end of this year. Recent reports and development work indicate that previous reports as to asbestos deposits covering a very large area of ground were in no way exaggerated. At present, however, demand for both asbestos and chrome has much fallen off, due to the stagnant condition of trade, and the company must await a general revival before the anticipated profits from this business can be realised. East Rand Mining Claims.—The

results of the joint borehole at the junction of farm Grootfontein and this company's Vogelstruisbult claims were communicated to the shareholders from time to time as received. The striking of the reef has proved the great potential value of the company's Vogelstruisbult claims. It is anticipated that when mining costs are reduced to something approaching a normal figure, there will be a considerable revival in mining activity, and it will be possible to make satisfactory arrangements with owners of adjoining claims for a comprehensive scheme of development of combined property.

South African Diamond Corporation.

The report for the year to June 30 last, presented at the meeting, states that the accounts show a loss of £144,360, and deducting credit balance of £20,927 brought in, a debit of £123,433 is carried forward. The great depression in the diamond trade and the heavy fall in share values which took place during the last six months of the year under review have seriously affected the financial position of the company. Conditions have not been favourable for share dealings, and the operations in diamonds resulted in a loss for the whole year. It became necessary, in order to reduce the company's liabilities, to realise a substantial portion of the company's holdings, particularly on the Far East Rand, with the result that although a heavy loss had to be faced, the liabilities of the company, which at the date of the last balance-sheet stood at £296,488, were reduced to £203,204.

National Diamond Factories (Bernard Oppenheimer), Ltd.—The depression in the diamond industry also considerably affected this business. Owing to the death of Sir Bernard Oppenheimer, Bart., the managing director of the company, the Board considered it advisable to obtain the advice of one of the leading firms of continental cutters, and accordingly Messrs. Rozelaar and Zonen were approached. After going closely into the position at the works they recommended that the cutting of diamonds and all other work in connection therewith should be concentrated in one building, in order to enable the work to be carried out on the most economical lines. After very careful consideration this advice was accepted by the Board of the National Diamond Factories, and Messrs. Roselaar and Zonen have been appointed managers of the works, and in pursuance of their recommendations the work is being concentrated in one factory, and the number of workmen employed has been considerably reduced. There is, however, ample accommodation in the large factory for again increasing the number of workmen employed so soon as the demand for diamonds again becomes normal.

British South-West Africa.—Reference was made by the chairman at the last general meeting to the acquisition of certain interests, which he anticipated would be of great value to the company. These interests, some of which have now been definitely acquired, and others which are still under option, consist of a very large number of diamond claims in British South-West Africa. The properties have recently been visited by Mr. C. B. Kingston, the well-known consulting engineer, who has formed a very high opinion of their possibilities.

London and Rhodesian Mining and Land.

The directors' report states that accounts for the year to June 30 last show, after meeting all working expenses and other charges, a credit balance of £718, which has been added to balance brought forward, making £22,948. As against this a loss of £7,752 made on forced realisation of certain securities, has been dealt with through the appropriation account. After dealing with the company's various interests the directors state that mining interests since the date of the accounts have been considerably increased as a result of the taking over of the assets of Rhodesia, Ltd. The property is the Sabiwa mine, on which there are some 150,000 tons of ore of an average value of 11 dwt. opened up. A considerable amount of plant and equipment is situated on the property, but the whole plant will require reorganising and a new main shaft sunk before the mine can be brought to a producing stage. A number of other properties were also taken over, some of which have been tributed, and now produce a steady revenue from royalties.

Progress of the Mozambique Cement Industry.

In the course of a communication to the Press, the Secretary to the Mozambique Portland Cement Co. writes:

The activities of the company up to date have resulted in the following constructions, viz.: The construction of a railway siding connecting the works with the main line to Lourenço Marques, which is approximately one mile in length, as well as two lines on the property. A private telephone line is constructed connecting the company's works with the Central Exchange at Lourenço Marques. Very fine staff quarters, consisting of bedrooms, a large dining hall, kitchen with range and hot and cold water installation, three bathrooms, pantry, and mosquito-proof verandah, built on the most hygienic and up-to-date methods. Offices—a building consisting of three rooms, with verandah and mosquito-proof netting, containing engineer's office, secretary's office and drawing office. A huge construction shed of corrugated iron has been erected, which is, in the meantime, being used for the storage of material as well as temporary workshops. Kiln foundations are completed and consist of four blocks of Ferro concrete, measuring 27,000 cubic feet. Raw solo mill foundation is completed and consists of 12,000 cubic feet of Ferro concrete. Coal pulverising mill foundation—This is completed and consists of 9,000 cubic feet of Ferro concrete. Chimney stack—This is nearly completed and is constructed in Ferro concrete, measuring 164 feet in height and 11 feet in diameter at the base. Cement mill foundations—The excavations for this are completed and the foundation is now in course of completion, and consists of 12,000 cubic feet of Ferro concrete. Cement plant—The whole of the cement plant is on the property except a small consignment which is now being discharged per s.s. Reitfontein. This completes the whole of the cement plant. The power plant has been purchased from the Brush Electrical Engineering Company, and consists of 1,100 kilowatt set "Ljungstrom Turbine," with 30 odd motors, condensers, switch gear, cables, etc. The boiler plant is manufactured by the firm of Babcock and Wilcox, and will be fitted with mechanical stokers, superheaters, economisers, water softeners, etc. The steel structure for the housing of the plant, measuring about 513 feet by 112, complete with glass and corrugated iron sheeting, is being supplied by the Glasgow Steel Roofing Co., Ltd., and shipment will commence this month and will be completed by the end of April. The erection engineer of Messrs. Polysius (the manufacturers of the cement-plant) is sailing during this month for Lourenço Marques, and the erection of the cement plant will not take longer than four months, whilst the power plant will be completed and erected under the supervision of the manufacturers' erection engineers. The company has secured the services of a well-known and experienced cement maker, who is sailing for Lourenço Marques during April. Dr. Watson, a member of the firm of Messrs. W. A. Brown and Pooley, Ltd., London, our consulting engineers, will be sailing for South Africa towards the end of March or beginning of April, and this gentleman, who has had world-wide experience in the starting up of cement factories, will be giving the company his extensive experience in the constructing and starting up of the factory. This will prove that the company has, right from its commencement, employed the best brains in the world to construct and equip its factory in order to eliminate the period usually occupied in experimenting. The work done so far has been in charge of our resident engineer and Captain Pooley, of London, who visited Lourenço Marques during the latter part of September and checked all work done up to that date, approved of same, and complimented the staff on the work done, and we have the assurance of our consulting engineers that, nothing unforeseen happening, the factory should be started up during August of this year. The cement produced by the company will be of the highest quality and the selling price such as to eliminate any outside competition, due to the fact that the factory, when completed, will be the most up-to-date cement factory in the world. It must be borne in mind that the Mozambique Portland Cement Company's works will be one of the largest industrial undertakings in the Province of Mozambique, and will prove a great source of revenue to the Government and the people of the Province in general, and Lourenço Marques in particular.

The Week in the Sharemarket.

FIRM ON LONDON SUPPORT—SPECIALITIES BETTER—DIAMONDS IMPROVE.

After an uncertain start, the market firmed up at the middle of the week on some support from London. Special lines like New Modders, Gedulds and States were in demand, and in face of the uncertainties of the situation it is surprising how steady quotations have remained. Of course, the volume of business is very small, but there is no pressure to sell, and holders seem now content to see things through to a finish. The immediate future is obviously bound up with the fate of the Conference now sitting, and at the time of writing nothing definite is known in regard to the results of its deliberations. In the diamond market things seem to be looking a trifle brighter, and all diamond shares seem a little firmer as a consequence. We must be careful, of course, not to exaggerate the importance of every little flicker of life in the diamond market, but at a time like the present we must be thankful for small mercies. Transvaal Silvers have been a firm feature during the week, the latest news from the property being that the plant is giving us utmost satisfaction. In other lines there is practically nothing to report for the week.

Owing to the possibility of there being a shortage of power at the printing works on account of the industrial position, this issue of the "Mining Journal" has to go to press several hours earlier than usual.

ANSWERS TO CORRESPONDENTS.

"Rosemead."—We think the shares will prove a good investment at the price you paid for them. See an article on this mine which appeared in our last issue.

We understand that Mr. W. Ingham, M.Inst.C.E., M.I.Mech.E., Chief Engineer, Rand Water Board, has been elected Chairman of the Civil Engineering Section of the British Engineering Standards Association (S.A. Branch), with Mr. M. Udwin, B.Sc., as honorary secretary.

Speaking at the conference over which the Prime Minister presided on November 11 at the New Law Courts, Johannesburg, when both sides discussed the industrial position fully, Sir Evelyn Wallers remarked: "I think the term 'colour bar' is applied much too loosely, and it conveys the impression that the whole of the white workmen are to be swept out. That is quite wrong, but to meet that point we would be prepared to consider—if it is agreed that we are to proceed on the lines I have indicated—we would be prepared to consider some ratio as between the number of natives and Europeans throughout the industry, in order that a considerable measure of protection should be afforded to efficient white workmen."

THE "CASTOLIN"

Auto-Chemical Welding Process

REGISTERED.

The "CASTOLIN" process is in use by the Admiralty War Office, Port of London Authority, Thames Conservancy, London County Council and in a large number of Constructional, Repairing and Industrial Works connected with Marine and Land Engineering.

DEMONSTRATIONS ARRANGED.

ENGINEERING SECTION.

High Voltage Switchgear.

(By W. A. Coates).

The Metropolitan-Vickers Electrical Company, Ltd., are manufacturing a complete line of high voltage switchgear which they are prepared to build for all voltages now in commercial use. As is well-known, the majority of really high voltage equipments installed to-day are of the outdoor type. Even on the Continent, outdoor switching stations have been installed, despite the official veto of the V.D.E., which does not recommend outdoor apparatus for pressures exceeding 30,000 volts. Stations in France, Italy and Spain are all operating with outdoor equipment, on systems over 100,000 volts, and in Norway similar equipment is in use on 50,000 volt systems, this being the highest pressure on which extensions have been made in Norway during the

terminals are of the well-known condenser type, which are both mechanically strong and are easily protected from the weather. Owing to the introduction of the condenser principle the dielectric in these terminals is worked at maximum efficiency throughout its depth, and the terminals are consequently of unusually small diameter. This being so, ring type transformers mounted over these terminals will give a very much better ratio curve than those used with the more usual oil filled or bitumen filled porcelain insulators. A further point of great value with the condenser type terminal is, that with this design the voltage distribution is definitely controlled over the whole length of the terminal, thus giving an exceptionally high flash-over value as com-

Fig. 1.—General View of Colfax Station, Duquesne Power Company, Pittsburg, Pa., U.S.A.

last few years. The majority of these European equipments employ the same type of apparatus as is now made by the Metropolitan-Vickers Company.

The principal feature of an outdoor switching installation is, of course, the oil switch, and here the Metropolitan-Vickers Company have adopted a design which is in successful operation in all parts of the world. The essential feature in such switches is to house the equipment in such a way that it is at once thoroughly protected from the weather, while being readily accessible for maintenance purposes. The switch mechanism is assembled on a removable bracket which can be lifted "en bloc" from the switch frame. All link-work and operating rods are carried through heavy steel piping and the operating solenoid is within a cast-iron case. In the illustration (Fig. 2) is shown a completely assembled 73,000-volt oil switch of this type. The

pared with terminals of the filled porcelain type. For pressures over 73,000 volts the switch tank is of such size as to make it preferable to stand it on the floor. In this case it is customary to arrange an oil piping system serving all switch tanks from a central storage tank and filter equipment, so as to minimise the amount of handling in the course of maintenance. Manholes are provided to permit of ready access to the contacts in position.

In conjunction with the oil switches, complete series of accessory apparatus such as isolating switches, choke coils, bus-bar supports, etc., have been developed, thus giving the possibility for the first time of securing an All-British extra high voltage installation.

An illustration is given of a very recent installation in America—132,000-volt switching equipment at the Colfax Station of the Duquesne Power Company, Pittsburg (Fig. 1)

This gives a very good idea of the construction which is adopted in outdoor switching stations. As will be seen, the whole of the apparatus is carried on light steel framework, which seldom costs more than would the steelwork for a building of sufficient size to enclose the switchgear in accordance with the older practice. The Colfax Station is perhaps

American power companies have discovered that a very valuable source of revenue lies in the numerous farms over which their transmission lines pass. To serve such isolated consumers they have developed transformer stations having extremely simple and efficient control gear. For this purpose, and indeed for the control of power circuits up to

Fig. 2.—73,000-volt Outdoor Type G.11 Circuit Breaker.

of particular interest as indicating the entire reliability of service with outdoor switches. The climatic conditions in Pittsburg are probably unequalled in any city in Great Britain, except perhaps in Sheffield or Manchester.

The ground space occupied by outdoor switching equipments can very often be kept down to the same area as would be required for a building to house corresponding indoor equipment. In some power stations it has even been found possible to reduce the area by locating the high voltage apparatus on the flat roof.

2,000-kVA. normal capacity, it is now common practice to employ horn break switches and fuses to control the high tension circuits. Such apparatus is commonly mounted either on the top of a special tower inserted in the run of the transmission line or on a light steelwork structure placed to one side of the line on to which tap connections are taken.

The Metropolitan-Vickers Company are prepared to build the well-known Burke type of horn switch with its accessory apparatus, in the form of fuses, lightning arresters, etc. These devices are commercially and widely used on systems

Fig. 3.—Railway Sub-station with Outdoor Hornbreak H.T. Switchgear.

up to 66,000 volts and for special conditions have been applied on circuits up to 110,000 volts. It is probably safe to say that the Burke type equipment is more widely used than any other of the numerous competitive types now on the market. In the Colonies there is already a considerable demand for equipment of this type, and with our own rapidly developing high voltage transmission systems there is little doubt that the day of the outdoor sub-station in Great Britain has arrived.

There is a popular but entirely inaccurate impression that the operation of horn switches sets up violent surges on the line. If anything, an oil switch is more likely to do this, since the arcing time is so much less. In a horn switch the break is gradually lengthened, inserting more and more resistance, until finally rupture occurs.

The Burke switch embodies a novel principle in that the main contact arm is jointed, so as to obtain a toggle action, pressing home the main contact brush. When opening, this toggle exerts a wrenching movement on the contact, breaking any ice which may have formed thereon. The horns, which have a fixed angular relation to each other at all times, lead the main contacts when closing and thus take all arcing.

An illustration is given of a railway automatic sub-station (Fig. 3), in which it will be noticed that the transformers controlled by Burke type switches and protected by lightning arresters with the typical triangular choke coils, are all placed on a very simple structure out of doors, and the small building is used to house only the rotary converter and its switchboard. Equipments such as these can often be employed in positions where more expensive equipment would not be commercially justified.

The Metropolitan-Vickers Company are approaching the task of development to meet the high voltage switchgear market in the British Empire. They are peculiarly well situated in having access to the working experience of associated companies abroad so that the purchaser is relieved of the fear that he is being used as a "laboratory" for the development of an experimental apparatus. The engineering staff in charge of this development includes several men who have been concerned for many years in the design and application of very high voltage apparatus in America and on the Continent.—From "The Metropolitan Vickers Gazette."

A MILLION POUNDS ORDER.

Big S.A.R. Electrification Contract.

We understand that the contract for eighty electric locomotives, amounting to £880,000, has been placed by the S.A.R. with the Metropolitan-Vickers Electrical Co., Ltd. Messrs. Dowson and Dobson, Ltd., are the managers in South Africa for this company, which, it will be remembered, absorbed the British Westinghouse Co. some time ago; and they are to be congratulated on their success in securing this important order in connection with the electrification of the South African Railways.

In round figures the value of the contract may be placed at £1,000,000. The locomotives will each weigh from 70 to 80 tons, and they will all be manufactured in England. The names of the successful tenderers for the other portions of the contract will probably be made known in a few days.

The S.A.R. Administration has accepted the following tenders:—No. 324, incandescent lamps, Hubert Davies & Co., Ltd., Johannesburg; British General Electrical Co., Johannesburg. No. 328, brass piping, Hubert Davies & Co., Ltd., Johannesburg; brass sheet, Wm. Hosken & Co., Ltd., Johannesburg; copper sheet, Reunert & Lenz, Ltd., Johannesburg. No. 329, electrical cables and wires, Rice, Wilson & Herd, Johannesburg; Telegraph Manufacturing Co., Johannesburg; Henley's (S.A.) Telegraph Works Co., Ltd., Johannesburg. No. 332, glass (plate and sheet), H. Evans & Co., Johannesburg; R. Wood Glass Co., Durban; The Plate Glass Beveling and Silvering Co., Capetown. No. 342, antifriiction grease, Union Chemical Works, Ltd., Johannesburg.

Special Ventilation in Mines.

A NEW TYPE OF SCREW BLOWER PARTICULARLY ADAPTED TO LOCAL CONDITIONS.

In putting through long-distance development drives with a single heading, and in all cross-cutting and raising, the efficiency of the miner and his natives undoubtedly falls off before the limits imposed by the Mining Regulations are reached, unless special means are adopted for ventilation.

Fig. 1.—Schlotter-blower with a free shaft-end. View of the fan or air propeller.

We have in mind a case in point, where, on a flat reef, mostly in soft picking ground, the monthly footage was trebled with the same labour force, due solely and entirely to the provision of a fan and pipe line.

In the case of blasting ground the exhaust from the machines cannot compensate for a supply of fresh air, and it is established by test that the most efficient means of supplying this necessary air is by means of an electrically-driven fan. Setting aside therefore both air and water jet blowers, we have two types, from which to choose, namely, screw-blowers and centrifugal blowers.

As screw-blowers can only furnish a low working pressure, in comparatively long conduits, it would be necessary to arrange several fans in series at definite distances apart.

Fig. 2.—Schlotter-blower with free shaft-end. View of the guide blades.

If the permissible length per blower is exceeded the volume of air moved drops considerably and the drive becomes overloaded—probably resulting in a burn-out of the motor.

For long conduits, and where comparatively large volumes of air have to be moved, centrifugal blowers have hitherto generally been employed. Blowers of this type have a characteristic curve the converse of the screw-blower. When the back pressure falls the energy consumption increases, as for instance when the conduit is too short. Thus to follow a face with ventilation from a blower of this type, several changes of speed are necessary.

A blower which avoids the above disadvantages has been developed by the firm of Siemens-Schuckert, and it has recently been adapted to the special requirements of mining. The "Schlotter" blower is a screw-blower with air-guiding apparatus, combining with the usual advantages of its type (*i.e.*, axial propulsion of the air and a high number of revolutions) an extraordinarily high efficiency, 80 per cent.; and the production of comparatively high pressures, 7½ in. water gauge and over.

The blower consists essentially of a propeller of five blades and a stationary guide-drum with eight or ten blades, both of which can be seen in Figs. 1 and 2. The blades are shaped to a true helix and their essential characteristics are:

- (1) That the development of the edge of the vane at the circumference is approximately equal to the plan projection of the generating line; and
- (2) That the elevation development of the generating line forms with the axis an acute angle.

The novel feature of the guide vanes is that the edges at the inlet side do not coincide with the outlet edges of the propeller vanes as usual, but that the two intersect one another at right angles throughout their length. The current of air issuing from the propeller will thus be radially subdivided by the individual guide-vanes, and received by them without shock.

The curvature of the guide vanes increases in the direction of rotation of the propeller, which feature results in a further acceleration of the air in the stationary guides, so that a considerable portion of the axial thrust is developed in these, a very favourable point as far as the construction is concerned. Owing to inertia the threads of air issue

Fig. 3.—Schlotter-blower type SGOR 42.5/3000. View of the motor.

slowly revolving and convergent to the axis, so that assuming unobstructed motion of the air, the smallest jet area will be situated beyond the guide vanes at a distance equal to about half the diameter. With increasing counter-pressure, the rotation naturally increases and with it the radial com-

ponent, while the axial component becomes smaller, so that, beginning at a certain counter-pressure the further concentration past the guide-vanes ceases completely.

This design of blower is distinguished from all centrifugal and the hitherto known screw blowers by an unapproached high degree of efficiency, which remains uniform over a wide load range. At the same time, the consumption of energy at a definite speed remains the same over almost the entire load range. Thus where the counter pressure cannot be exactly predetermined or where the length of the delivery conduit is varying, as the drive progresses, an adequate volume of air can be continuously relied upon without any danger of overloading or burning out the driving motor.

Fig. 4.—Schlotter-blower inserted into a conduit.

As shown in Fig. 3, the blower is combined into a single compact and light unit with a motor running at 3,000 r.p.m. The motor is usually a three-phase squirrel cage unit, totally enclosed, and thus effectively protected from the deposits so common at the inlet of a blower. The fan inlet is protected by coarse meshed screening, preventing the entry of foreign bodies likely to damage the machine. Ball bearings with grease lubrication are fitted, ensuring absolute safety of working, combined with a minimum of attention, and permitting the unit to work in an inclined position, up to an angle of about 10 deg. without any detrimental effect.

The blower may be used either for pressure supply to, or to exhaust from, a conduit, or it may be arranged within the conduit, so as to exhaust and compress simultaneously. For the latter arrangement see Fig. 4. In every case the delivery must be fitted with a converging branch of definite shape wherein the kinetic energy of the air is converted into static pressure. If the blower is set at the inlet end of a pressure conduit, the latter must not contain a bend near the blower, but should be straight for about 30 feet beyond the blower.

When using galvanised sheet piping with inserted joints, air leakage become a very serious source of loss in a long line. A considerable reduction in leakage loss can be effected by using the type of blower illustrated in Fig. 4, and, given the total length of pipe line through which it can deliver its rated volume of air, by arranging it, for pressure working up to half this length, and then carrying the pipe line the remainder of the distance as a suction. If the ultimate distance over which ventilation is required exceeds the capabilities of the blower, a similar set may be inserted in the pipe line, thereby doubling the range of the installation.

Summarising, the advantages of this type of blower are briefly as follows:—

- (1) Compact axial construction, permitting placing the unit in a straight line with and at one end of the pipe line, or alternatively inserting it in the line.
- (2) High speed, resulting in a small driving motor.
- (3) High Efficiency (80 per cent.), whence low energy consumption.
- (4) Uniform energy consumption, with any conduit length (with varying delivery), whence no danger of overloading the motor whether the line be too short or too long.

Fig. 5 shows an actual installation ventilating a mine heading, and illustrates clearly how conveniently the unit may be mounted, on a bracket high up on the site of the drive. Both blower and pipe line are clear of tramping and travelling and consequent damage.

Fig. 5.

The smallest size blower of this type will deliver 400 cf. m. through a 10 in. pipe 750 feet long with 0.5 h.p. electrical input, and the largest size will give 3,200 cf. m. through 3,600 feet of 24 in. pipe, or twice this quantity through 850 feet of the same pipe with an electrical input of 7.5 h.p.

J. B. B.

British Ocean Records.

The conversion of the "Aquitania" from coal-burning to oil-burning has resulted in an appreciable increase of speed, and on a recent eastward voyage the vessel touched

the speed of 26.66 knots, a figure previously reached by the "Mauretania." Now that the "Mauretania" itself is undergoing conversion to oil-burning, a still higher record is expected to be achieved.

Railway Electrification Advantages.

MANY AND GREAT—SAVING IN WORKING COSTS—MECHANICAL DEMERITS OF STEAM.

By Sir Vincent L. Raven, K.B.E.

The following valuable article by the Chief Mechanical Engineer of the North-Eastern Railway, who has had considerable experience of electric traction, is of peculiar interest to South Africa to-day on the eve of railway electrification. The North-Eastern's passenger service around some of the busiest suburban districts of Newcastle has been worked electrically for the past 17 years.

The steam locomotive is a machine with which we find it difficult to part, but, outside sentiment, our principal reason for adhering to it is the comparatively great cost in changing from one system to another. Before this can be put down as insurmountable, it is right that the savings and disadvantages of electricity should be clearly stated against the expense involved in the substitution of electric for steam operation. Taken as a whole, it will be seen that the advantages can all show a definite financial economy in operating expenses.

One essential difference in operation between an electric and steam locomotive, where the former can show a very definite advantage, lies in the preparation and setting by of the locomotive. An electric locomotive is always available for service at a moment's notice, since the electric motors only require that they should be kept clean, lubricated and provided with brushes in order that they may be always ready for immediate use by simply connecting them to the distribution line. When the day's work is over nothing has to be done except ordinary examination, oiling and cleaning for next trip.

Hours of Service.

On the other hand, the process of preparing a steam engine for duty involves considerable time and labour. About three hours before the driver and fireman come on duty the steam raiser has to make up and light the fire and attend to it until the driver takes charge, after which it takes the driver and fireman about 60 minutes to complete the preparation of the engine for its day's work. After the day's work is finished the fire has to be thrown out and fire-bars cleaned, smoke-box ashes to be thrown out of the smoke-box, and the tubes have to be cleaned by compressed air. About every sixth trip the boiler washer has to clean the boiler to keep it fit for producing steam. The boiler-smith has to examine and renew many of the other small repairs to the boiler in order to enable the engine to run its stipulated mileage. The shed fitters have a large number of working parts to keep in order which have no corresponding part on an electric locomotive.

Then, again, when the electric locomotive has been put into service it can remain at work continuously for at least 20 hours in every 24, as the lubrication and the small amount of cleaning that is necessary for the electrical equipment can be given by the crew at wayside stops during running and between trips. Therefore, an electric locomotive need only go into the sheds in the ordinary way for cleaning and inspection of certain of the less accessible parts between the frame. On the steam engine the boiler, fire and smoke-box, in addition to the much larger number of mechanical parts such as cylinders, valves, link motions, etc., are responsible for a considerable amount of time taken up in examination and attention which might otherwise be utilised for hauling traffic.

On Driving Skill.

Due to preparation for service and ordinary service attention, the electric locomotive can be longer in revenue earning service than the steam locomotive; thus, provided traffic conditions will permit, the electric on these two counts alone is capable of dealing with a considerably larger ton mileage than the steam locomotive.

The fundamental difference between an electric locomotive and a steam engine lies in the fact that while the latter generates its own power, the former is only a transformer of the power which is generated at the power station or stations into haulage power on the track. One consequence of this difference is that the working of a steam engine depends to a large extent on the skill of the crew in generally nursing the engine so as to get the best out of it. The working and condition of an electric locomotive is not nearly so dependent upon the skill of the driver and his assistant. Full power is always available, and the power and speed which can be developed at any moment are only limited by the initial design of the electrical equipment and by the mechanical construction.

The driver of an electric locomotive need never hesitate to exert the full power for the sake of nursing the locomotive, and all trains within the limit of load for which the locomotive is designed can be hauled up the maximum gradient at full speed.

Boiler Capacity.

The limitation of boiler capacity in the case of a steam engine combined with the different characteristics of steam and electric locomotives gives the latter an additional advantage in the question of speed on gradients. As the governing factor in the power of a steam engine is the capacity of the boiler, which is practically a fixed quantity, the horse power output of the locomotive is approximately constant over a wide range of speed. In other words, the maximum pull of an electric locomotive can be maintained until a certain definite prearranged speed is attained; whereas a steam locomotive can only exert its maximum pull at the moment of starting, after which the pull is reduced as the speed increases, and the speed of the train falls to a marked extent whenever the train has to climb a gradient.

This reduction of speed on a gradient is not nearly so marked in the case of the electric locomotive, for there being no similar limitation to the amount of power available, the relation between speed and tractive effort is quite different, and the demand for greater tractive effort is supplied by a higher output from the power supply system. In comparison with the steam engine working, where the speed is

greatly reduced on a gradient, this enables a much higher average speed to be maintained over the whole line, which is equivalent to saying that with electric working the general average speed can be considerably increased without any increase in the maximum speed.

Better Traffic Working.

If other factors permit, this characteristic of electric locomotive operation would allow goods trains to travel at an average speed more nearly approaching that of passenger traffic. The result of this would be a more regular flow of traffic over the line, and the necessity for side tracking of the goods trains to allow passenger trains to pass would be reduced. It is a fact that a higher general average speed of travel increases the total capacity of the line.

A further advantage which can be obtained owing to this increased average speed of travel is better traffic working. In dealing with the traffic carried a greater number of trains can be run, and these trains complete their journeys in less time than with steam working, thus enabling better use to be made of the available rolling stock. This is particularly true in the case of goods wagons.

Mr. Becukes, the electrical engineer to the Chicago Milwaukee and St. Paul Railway, has estimated from actual records that electrification has enabled about 30 per cent. more tonnage to be dealt with in about 80 per cent. of the time formerly required under steam operation, which means an effective increase in the capacity of the line due to electrification of 32.5 per cent.

Saving in Fuel.

A very serious disadvantage of steam operation is that the steam engine radiates heat and uses coal all the time that steam is up—that is, during many hours when it is doing no work, and either standing by or coasting. On the other hand, the electric locomotive uses no power unless actually running and doing work. It is quite evident that for this reason electric operation makes possible a very considerable saving in fuel as compared with steam operation. This saving is all the more important in proportion as the duty performed by the engine is the more intermittent, especially since the electric locomotive has a much higher efficiency, when only partly loaded, than the steam engine.

This saving in fuel is one of the greatest advantages to be obtained by electrification, and a number of comparisons have been made in the United States between the coal consumed for a certain service as worked by steam and electric locomotives. With electric operation, a much

smaller tonnage of coal has to be carried over any line—for the same traffic—and this quantity is carried to fewer unloading points—namely, the power stations. This results in the clearing from the line of a number of local trains. A number of wagons will also be set free which, with steam operation, would have to be employed in carrying coal.

Maintenance Economies.

Resulting from the experience which has been obtained in America, it can be definitely stated that electric locomotives show a considerable advantage over steam engines in the cost of repairs and maintenance. One reason for this saving in maintenance cost lies in the simplicity and robustness of the electric locomotives. Spare parts can be substituted so easily that heavy repair work is practically confined to cases of serious breakdown or accident—if tyre turning is not included. The shops required for maintaining a given number of engines need be much less elaborate than would be required for an equal number of steam engines.

I believe that supply companies should be able to generate electric power much cheaper than a railway company, as they ought to be able, generally, to get a much better load factor; and the desire should be that electric current will be produced at such a cost as to ensure that the price for current, plus the maintenance of the railway equipment, shall not exceed the present coal and water bill. If this is done, undoubtedly electrification should proceed rapidly.

A Simple "Hydrohoist."

One of the simplest forms of pump consists of an endless chain in the links of which, owing to their peculiar shape, the water is trapped and raised. The mechanism, in fact, operates as a water hoist. In order to make it more efficient a British firm has introduced a very ingenious modification. A wire rope is used, and on this rope are threaded a series of small steel cups, each with a thimble at its centre to keep it at the right distance from its neighbours. When the rope runs at 600 feet per minute this hoist will deliver 3,500 gallons per hour. Curiously enough, this delivery represents more than a solid column of water of the diameter of the cups. The cups rise full of water, and there is in addition a large quantity carried on the outside. No fixing is needed beyond the casing at the well-head, and on this and the grounds of simplicity and ease in maintenance the "hydrohoist," as it is called, appeals particularly to agriculturists. It can be worked by hand on lifts as high as 150 feet. Power drive can easily be arranged, and the capacity can be increased by running two or more ropes alongside each other.

RHODESIAN SECTION.

Labour Problems in Rhodesia.

MINES AND RAILWAYS—REDUCTIONS FORESHADOWED.

It is natural that the Rhodesian Labour unions should be watching with the keenest interest the progress of the present crisis on the Rand, says the latest issue of the *Bulawayo Chronicle*.

It happens that in Rhodesia also, and for reasons similar to those in the Transvaal, a reduction of wages is imminent. Notice to this effect has been given in the case of the miners, to take effect from April 1. We understand that the actual amount of the proposed reduction will shortly be decided. As we have stated, they will be based on the recently issued official figures as to the reduction in the cost of living; but it is not to be expected that wages will be lowered to anything like the proportion represented by the fall in prices. This, it will be remembered, is stated by the recently issued supplementary report of the Cost of Living Committee as showing a fall of 13.18 per cent. within the past year, the average figures in December being 23 per cent. above pre-

a grave injustice to the Rhodesian miners, as to whom the individual members must admit the logic and justice of the argument that when wages are put up to meet the added cost of living, there may legitimately be some decrease when living costs fall, especially when such a thing is necessary to preserve employment. Owing to our smaller population, the unemployment problem has not got outside the bounds of treatment in this territory, but it would do so immediately if our general industries flagged, or if any local Labour troubles arose.

We have no official information regarding railway wages, but it is understood that in this service also there will have to be early proposals based on the same reduction in living costs, the increase of which was the basis of well-remembered wage increases that had to be largely passed on to the revenue-earning machinery in the shape of surcharges on freights and fares.

There are reports and indications of much activity in the Rhodesian Labour organisations, and we earnestly hope that these efforts are being directed to the avoidance in this territory of any such disputes as now afflict the Rand, whence, however, the news is that the mine-owners, replying to the unions, have expressed their readiness to negotiate, though not in the terms of the strike-leaders' ultimatum. It is understood that one or two emissaries from the Transvaal have arrived in Rhodesia during the past few days, and local Labour feeling expresses the hope that they have come to advise us to "keep out of the troubles down below."

The Lonely Mine, Matabeleland.

war prices, on the basis of a typical family budget. Nor is it likely that the proportionate reduction will be the same for all classes of pay, and it will certainly be found that the men at lower rates escape very lightly indeed.

So far as we can see, there will not be the slightest excuse for associating the necessary Rhodesian economies with the present dispute in the South, though the same need for cheaper production exists in the case of both branches of the mining industry. Any attempt to create such an association would not help the Rand trouble, and would be

In face of the recorded assurances of the Chamber of Mines that there is no intention to remove the colour bar, the men's leaders are incurring a grave responsibility to their fellow men in telling them that the colour bar is to be abolished and that they are fighting a just cause. What is actually happening? (a) No gold has been won along the Rand for a week, and the mines have thus obtained no revenue, no earnings to place against their accumulating bills. In the case of some properties, the week's idleness has plunged them into financial difficulties from which it is questionable whether they can recover. Their closure, further, will mean hardship for the men, women and children whose daily bread has hitherto been won in their stopes. (b) The loss in wages to mine employees alone—reckoning seven days at £35,000 per day up to Monday—amounted to £245,000. (c) The community itself has lost £600,000 directly in the expenditure of the mines for the same period (already mentioned). This sum was augmented to £1,000,000 on Thursday. (d) Some 65,000 natives who have completed their contracts and who are, therefore, free, are returning home. As the mines have been shut down by the S.A.I.F., and no work is offering the boys, the leaders of the industry have no alternative but to allow these natives to go. If they leave in huge numbers, as seems not unlikely, there will be a grave restriction of white employment. The action of the S.A.I.F., in other words, is likely to enhance unemployment.

Rhodesian Arsenic.

THE CHAMPION MINE.

The second annual general meeting of the shareholders of the Standard Arsenic (South Africa), Limited, was held in Bulawayo the other day.

The Chairman, Captain L. Ludlow, in moving the adoption of the report, stated: The report and accounts having been in the shareholders' hands for some time, I therefore, with your permission, take the same as read and proceed to deal briefly with the accounts and general affairs of the company.

Capital.—The authorised capital remains the same as last year, but since then negotiations for the issue of a further 15,325 shares have been concluded, and the issued capital now stands at £40,325 in £1 shares, all of which are fully paid.

Mining operations have been carried out continuously throughout the year with very satisfactory results, whilst the position in the mine has improved very greatly since the date of our last meeting, and we are now in the gratifying position of having sufficient ore in sight to provide enough white arsenic to last us for several years, in addition to which we have already mined and dumped on the surface 2,039 tons of ore from which our arsenic requirements can readily be obtained at short notice.

The question as to the future policy to be adopted in connection with the mine is having the serious consideration of the Board, and after a large proportion of the ore already in sight has been brought to the surface it may be decided to close down mining operations temporarily, thus reducing our expenditure to the lowest limit, but before any decision is arrived at in this connection several important factors have to be carefully weighed, and we shall, of course, be guided very largely by the recommendation of our engineers as to the policy which will be adopted.

The fact that our dip is manufactured in Rhodesia, from Rhodesian arsenic, should, we think, weigh with cattle owners when deciding as to which dip they should use, but in asking them for their support we can safely claim that Champion is as effective and reliable as any dip that can be offered them, and as nearly half-a-million head of stock in Rhodesia are dipped weekly with Champion Dip, there is little need to give further evidence as to the freedom from risk in using it.

Rhodesian Railway Finances.

GENERAL MANAGER'S FIGURES.
DEFICIT OF £35,000.

Working Expenditure Increased by £363,000.

In his "Bulletin No. 2," Colonel Birney (General Manager of Rhodesian Railways) gives the approximate figures for the financial year ended September 30, 1921, which may be taken as a rough estimate of the principal items of interest connected with the year's working for all sections, including the Vryburg-Bulawayo line and the Rhodesia Katanga junction railway. For the purpose of comparison the figures for the corresponding period in 1920 are also shown (in brackets).

Revenue in South Africa, £3,075,000 (£2,507,420); expenditure in South Africa, including provision for depreciation, £2,085,000 (£1,722,078); surplus earnings over expenditure in South Africa, £990,000 (£785,342); fixed charges payable out of surplus earnings, i.e., debenture interest, in-

terest on income debenture stock (1921 only), interest on 6 per cent. notes (1921 only), interest on loans, income and Corporation Tax, and sundry payments, £1,025,000 (£820,798); deficit, £35,000 (£35,456).

The increased revenue may be accounted for as under:—
(a) Surcharge on goods, minerals, etc., traffic: In 1921 the surcharge was in operation for two months at 25 per cent., and for 10 months at 33½ per cent., as against—1920 for six months only at 25 per cent. (b) Surcharge on coaching traffic: In 1921 the surcharge was in operation for two months at 10 per cent. and for 10 months at 16⅔ per cent., as against—In 1920 for six months only at 10 per cent. (c) Increased receipts, from additional tonnage of goods, mineral, etc., traffic hauled, and the increased number of passengers carried.

The increase in the working expenditure of £362,922 may be broadly set out under seven headings, viz.:—(a) Increase in the remuneration of the staff; (b) the introduction of shorter working hours; (c) increase in payments for overtime and for travelling and booking-off expenses; (d) additional leave to staff; (e) increased cost of material; (f) cost of working additional traffic; (g) increased contribution to Depreciation Fund. In 1921 there is a full year's cost of items (a), (b), (c) and (d), whilst the 1920 expenditure includes 7½ months only.

The increase of £204,202 in the fixed charges represents interest and income tax on the 6 per cent. notes issued on various dates during the year, interest on Beira Railway 6 per cent. income debenture stock (not earned and therefore not paid in 1920), and to increases in sundry payments during the year.

The figures for the financial year ended September 30, 1921, do not include a full year's interest and income tax on the 6 per cent. notes as the issue was made at varying dates throughout the year as the money was required.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material and Engineering Trades.

PROMINENT MERCHANTS' VIEWS ON STRIKE POSITION—IRON AND STEEL—TIMBER AND BUILDING MATERIALS—COAL INDUSTRY IN BRITAIN AND UNION—RHODESIAN MINERS' WAGE REDUCTION—BOARD OF TRADE RETURNS FOR DECEMBER MONTH AND FOR YEAR 1921—BANTJES CONSOLIDATED LIQUIDATION—METAL MARKET.

General.

The Industrial Conference, presided over by Mr. Justice Curlewis, has been sitting for some days, but up to Wednesday last no agreement had been reached regarding the coal trouble, which has been taken in hand first, but which seems to bristle with unexpected difficulties. A settlement of the coal dispute was confidently anticipated early in the week. As regards the gold mines strike, this has resulted in the utter dislocation of mining material business in particular and the whittling down of all other commercial activities in general. The losses caused by the strike up to the present amount, it is estimated, to approximately £1,000,000. What this means to the community—with no end of the dispute in view and the losses being added to by every day which passes without a settlement and resumption of work—is only too apparent. In addition to all this it is quite on the cards that by the time these notes appear—unless something crops up in the meantime of which at the moment there is no sign, the City's power works will have come to a stop through exhaustion of coal supplies, which were estimated to hold without accretion till yesterday only. If common-sense action is demanded in respect of the many vital issues surrounding the strike, surely it is absolutely imperative for the convenience of the community that it be exercised in the matter of continuing the running of such an important service as the power station, and it is inconceivable that the Federation will fail of its bounden duty in permitting the requisite supplies of coal to be furnished to allow of the proper and regular running of this service.

Apart from our admittedly low-grade propositions it is not sufficiently kept in view that even our richest mines contain huge quantities of low-grade ore which, if the cost of production is brought down to a reasonable level will provide employment for many years to come for numbers of miners. The extension of working the less rich portions of our richer mines would thus compensate for the inevitable falling out of some of the downright low-grade com-

panies which will be unable to carry on with a further decline in the price of gold, which, however, must inevitably happen.

In the meantime everything is hanging off and there is no life in anything, commercially or otherwise, at the moment. Everybody is tired of the present state of things—the miners just as much as the citizens. A well-known merchant, who has had many opportunities of speaking to numbers of the more respectable and reasonable workers, said there was no enthusiasm among them regarding the strike; that the spirit abroad is not too good; in fact, that there is a nasty feeling spreading among the heads on both sides; and that the men would be only too glad to get back to work. A settlement of the coal strike, he said, would undoubtedly ease matters in respect of smoothing over the more important issues raised by the gold miners' strike. Another prominent importer said it would take many months after settlement of the present dispute before anything like normal business could eventuate. There was, he said, a lot of work to be done—public and other work—which had all been waiting for a reduction of costs. There had during the past few months been a large number of tenders called for, which, however, had been shelved for that reason. Engineering people had told him that for every seven or eight tenders called for perhaps only one had been given out, the others being laid aside for lower production costs. He thought that lower working costs in every class of work would tend to the ultimate prosperity of the Union. Still another influential merchant in the course of a chat this week regarding the present position, said of course everything is absolutely at a standstill, and he thought that the length of time the mines had already been shut down would necessitate a very long period to get the industry into order again, and consequently the commercial community would feel it acutely for at least two months even if a settlement were brought about this week. It looked, he said, as if some of the mines would never start up again, which again would curtail the spending power of the remaining ones, as they would be absorbing the second-hand plant

and material available from the mines closed down. As regards the duration of the strike, it was of course impossible to judge from the resumé of the conference meetings issued daily, but he did not think the Chamber of Mines would withdraw their notices, or abate one jot of their main principle to secure a reduction of working costs and greater ratio of natives to whites. It depended, also, to a great extent, upon how far the Federation were prepared to accept some slight concessions, with which they could approach their unions; they might perhaps be looking for very little now with which to go to their people and thus with some small compromise save their face. He did not, he said, in conclusion, think there would be any sympathetic strike; nobody, he thought, outside the Rand wanted a strike to-day.

Timber is slightly harder on reports from the Baltic, but iron and steel are inclined to give way a little.

Iron and Steel.

There can, of course, be no question of business in this section while the strike lasts. Merchants are, as a matter of fact, hard put to it to fill up their time, and the perusal of their ledgers showing their losses during the past twelve months is no agreeable pastime.

Latest quotations.—Dunswart iron, 22s. per 100 lb. basis price; Union Steel Corp., Ltd., 22s.; imported iron and steel, flats, small, 33s. to 40s.; larger sizes, 30s. to 38s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 37s.; $\frac{3}{8}$ in. iron, 30s. to 32s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ iron, 31s.; steel, 37s.; $\frac{3}{4}$ in. round iron, 30s.; steel, 33s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 30s.; channel and joists, 35s. 6d.; shafting, $\frac{5}{8}$ in., $\frac{3}{4}$ in. and $\frac{7}{8}$ in., 9d. per lb.; 1 in., 8 $\frac{1}{2}$ d.; 1 $\frac{1}{2}$ in. to 2 in., 7d.; larger sizes, 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{8}$ in., 22s. to 23s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 45s. to 50s. per 100 lb.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 43s. to 48s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lb.; rivets, $\frac{1}{4}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lb.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d. per lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb.; $\frac{3}{8}$ in., 2s. 11d. per lb.; 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ to 1 $\frac{1}{2}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{1}{2}$ d.; 1 $\frac{1}{4}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 35s. to 47s. 6d.; shovels, 52s. 6d. to 57s. 6d.; wheelbarrows, 47s. 6d.; picks, 37s. 6d. to 67s. 6d.; pick handles, 35s.; hammer handles, 14 in., 17s. 6d.; 18 in., 9s. 6d.; 24 in., 13s. 6d.; 30 in., 18s. 6d.; 36 in., 35s.; barbed wire, "Shorthorn," 69 lb., 13 $\frac{1}{2}$ gauge, 21s. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bulb tee fencing standards, 14 lb., 28s. 6d. per dozen; 12 lb., 25s. per dozen; black baling wire, 14 gauge, 22s. per coil, 100 lb.; screening, 3s. to 9s. 6d. per sq. yard; cyanide, 1s. 7 $\frac{1}{2}$ d.; zinc shavings, 1s. per lb.; asbestos, white, $\frac{3}{8}$ in. to $\frac{1}{2}$ in., £35 per ton; $\frac{1}{2}$ in. to $\frac{3}{4}$ in., £50 per ton; $\frac{3}{4}$ in. to 1 $\frac{1}{4}$ in., £80 per ton; 1 $\frac{1}{4}$ in. to 2 in., £175 per ton; Blue, No. 3, £25 per ton; No. 2, £34 per ton; No. 1, £45 per ton; short, £20 per ton.

L.C. Steel Coke Tin Plates.—L.C. 11 x 20, 112s., 108 lb.; coke quality, 21s. per box. L.C. 28 x 20, 112s., 216 lb.; coke quality, 42s. per box.

Newcastle Iron and Steel Company, Ltd.

General Smuts, Mr. P. Dunean, Sir Thomas Watt, and others visited the above works recently, and the Premier was greatly impressed with all that he saw. The plant is

now completed, and the company hope shortly to have the necessary raw materials on the property, approximately 10,000 tons of iron ore, coke and lime.

Second-hand Machinery.

There is, of course, very little doing just now in second-hand plant, a few industrial inquiries, but not of any magnitude, mostly for spares, pulleys, etc. The mines are naturally the dealers' biggest customers for second-hand machinery, and the strike has minimised orders considerably, all the properties being shut down. One particular dealer had several large orders to complete, and was already on the verge of delivering several orders which he had received, when he was asked to hold them up for the present. Of course, he said, all stores and everybody are affected in a like manner until the strike is settled. This particular dealer was delivering goods up to Christmas and New Year's Eve to several companies that had tried to run low till the end of the year, but were compelled to purchase to keep going. Dealers anticipated big things this present year, but unfortunately the strike has put the stopper on everything.

Iron and Steel Trades in Britain.

The iron and steel trades in Britain continue quiet in spite of a certain amount of Continental business. Prices generally are maintained. The prospects are a little brighter for the Sheffield trades. A fair number of orders have been received, but the armament firms are seriously affected by the cessation of orders and many are reducing establishments. The cutlery and plate trades are still idle, as it is impossible to compete with German goods.

Oudtshoorn's New Steam Power Plant.

The new steam power plant installed in the Oudtshoorn municipal electric light undertaking, at a cost of £15,000, has undergone very successful tests. The plant was erected by the engineering firm of Messrs. Hubert Davies & Co., and is of 150 kilowatts capacity, and it is anticipated will be far more economical than the Diesel oil engines, which, notwithstanding an appreciable drop in oil and fuel, had been a heavy charge on the undertaking.

Agricultural Implements.

Business has not improved but rather the reverse during the past two or three months; money is still very tight, and farmers are finding it difficult to get any relaxation in their financial relations with the banks, in view of the general state of affairs and the low prices obtainable for their products. They are therefore compelled to await better times and lower prices for agricultural machinery.

Timber and Building Materials.

There is but little business doing just now, but prices are very firm here, with a tendency for timber to go higher on reports from the Baltic, where quotations are advancing. Prices.—3 x 9 deals, 1s. to 1s. 1 $\frac{1}{2}$ d.; scantlings, 11d.; beaver boards, 4 $\frac{1}{2}$ d. to 1 $\frac{1}{2}$ d.; floorings, 6 $\frac{1}{2}$ d. to 6 $\frac{3}{4}$ d.; ceilings, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; Oregon, 7s.; pitch pine, 8d.; Corrugated iron, 8 $\frac{3}{4}$ d. to 9 $\frac{3}{4}$ d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second at the coast; American oak, 1 in., 10d.; 1 $\frac{1}{2}$ in., 11d.; 2 in., 11 $\frac{1}{2}$ d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1 $\frac{1}{2}$ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per foot. Prices for bricks are: Mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Building Workers' Ballots.

The Building Workers' ballot which was taken at a meeting on Monday last, at which the attendance was over 400, showed a majority of four to one in favour of a sympathetic strike. The Durban Building Workers' decision

was a two-thirds majority, and the East London Union showed 45 for and 19 against a sympathetic strike. Generally, however, among other sections of workers in the Union the tendency seems to be hostile to supporting the Rand Federation's request for a sympathetic strike.

Second-hand Iron and Timber Yards.

Dealers are perforce marking time at the moment, but hopes are high of good business coming as soon as the strike has been satisfactorily settled. Second-hand iron is 6d. to 7d., 9d. to 10d. for timber. The different yards are very fully stocked at present, and their owners are only too anxious to work off some of the accumulated surplus.

Coal Industry in Britain.

The shipment of coal to India, the Far East and elsewhere is very brisk. It is thought probable that the pits will be kept in steady work for some time to come and others added to those now producing. Prices are steady without quotable change. With regard to India the latest inquiry is for 300,000 tons of Welsh Admiralty and Monmouthshire coals for shipment during this year on c.i.f. terms. This inquiry is from sources other than the Indian Government. From the latter tenders have been called for 250,000 tons for shipment during January and February. The Bombay and Baroda Railway, which has already given out contracts for 175,000 tons, is asking for a further 60,000. These inquiries represent prospective business for several months. Welsh coal has been shipped to India and the Far East in very large quantities owing to the Indian coalfields being unable to meet the local and export demands. The shipments during October and November totalled over 300,000 tons.

Union's Coal.

The course taken by the shipping companies gives one some idea of the loss of business which the Union is suffering through the present coal strike. At the first throat of a strike the Union-Castle seamers have taken all possible bunker coal supplies from Home ports, which policy has undoubtedly been followed by other lines. This loss of supply is a great loss to our collieries, leaving the Rand strike and stoppage of supplies out of the question.

Rhodesian Miners' Wage Reductions.

The Rhodesian Mine Owners' Association have advised the Rhodesian Section of the South African Mine Workers' Union that a reduction of wages will come into force on April 1. Wages amounting to 30s. per day will be reduced by 12 per cent., and others will be reduced in the same ratio. After April 1 all overtime will be reckoned at time and a quarter, except that of shiftmen maintaining continuity of shifts, which will remain straight time as at present.

Electrical Appliances.

Business remains very quiet as it has been for some few months; there is naturally, during the present labour unrest, not much doing in town apart from repairs and essential replacements. A large dealer reported the receipt of a few orders from Rhodesia, but few inquiries from other parts. He was sanguine, however, that as soon as normal had again been reached business would improve considerably, as there was to his certain knowledge a large amount of work hingeing on the resumption of building operations. Prices remain without quotable change; stocks on hand are full in all descriptions.

Shipbuilding in Britain.

The shipbuilding industry in Britain, though still below par, shows signs of a revival, and several vessels on which construction was suspended will now be completed. The marine engineering industries also show an improving tendency.

Board of Trade Returns.

The Board of Trade returns for December show imports at 85½ millions, against 89½ millions for November; exports at 68½ millions, against 72½ millions for the previous month.

The decrease is attributed, however, to the fall in prices and not the volume, which is slowly though steadily growing. The total imports for 1921 amounted to 1,086 millions, the exports to 703 millions, compared with 1,932 and 1,334 millions respectively in 1920.

Flooding of Mines.

The action of the Strike Committee at Benoni in pulling out the employees of the Kleinfontein power station has prevented necessary pumping from being carried on on the Modder East, with the result that the mine is now flooded. The water is already up to the 23rd level, and when it reaches the 22nd the electric hoists will be flooded out.

The water in the Village Deep is also steadily rising, but the danger here is not so imminent as in the case of the Modder East.

Bantjes Consolidated Mines, Ltd.

The Board have decided in view of the very small percentage of payability disclosed throughout the drive recently extended to 500 ft. west of the dyke, to call a meeting of shareholders to consider resolutions for placing the company in voluntary liquidation. It will be remembered that the mine was closed down at the end of 1918 and in the opinion of the Board any attempt to re-open the same for the purpose of working the small remaining ore reserve is not warranted. Great expectations were formed of the original Bantjes Company over thirty years ago, which, however, were never fulfilled.

South African Reserve Bank.

The statement of the above on January 14 showed ratio of cash reserves to liabilities to the public 74.3 per cent.

It is reported from Rome that negotiations are under weigh for the reconstitution of the Banca di Sconto with Italian and foreign capital. Mr. Otto Kahn, the well-known New York financier, and Messrs. Dreyfus, of Paris, are expected to participate in the new concern.

New Issues.

A new Commonwealth of Australia 6 per cent. loan of £5,000,000, redeemable from 1931 to 1941, at 97 is being underwritten, while an issue of £4,000,000 sterling of ordinary and 8 per cent. preference shares by the Anglo-Persian Oil Company will, it is understood, be underwritten this week.

Metal Market.

Latest quotations: Standard Copper, £65 12s. 6d. cash, £66 7s. 6d. forward; electrolytic copper, £73 cash, £74 forward; standard tin, £165 2s. 6d. cash, £166 17s. 6d. forward; foreign lead, £23 17s. 6d. cash, £23 15s. forward; quicksilver, £10 15s.; bar silver, 35½d.; bar gold, 97s. 6d. per oz.

SWAZILAND TIN.

The following are the results of the operations of this company for the month of December, 1921:—Concentrate recovered, 18 tons; estimated net profit for the month, including credit adjustments on previous shipments (taking tin at £160 per ton), £264.

THE STRIKE.

THE CONFERENCE CONTINUES—COAL MINERS REFUSE CONCILIATION—TOWN SHOPS AND ARBITRATION—THE TOWN COUNCIL'S DILEMMA—THE GOLD INDUSTRY—MR. BUCKLE STATES THE CASE FOR THE MINES—LABOUR LEADERS UNREASONABLE.

The Conference sat all day on Saturday and advanced the V.F.P. and town engineering shops disputes a slight stage further. The discussions were resumed on Monday morning, and the Conference will sit till 6 p.m. each day in order to expedite business. It was not expected that the adjourned discussion on the coal question will be resumed for some days. The unanimous decision of the colliery workers at Witbank not to return to work will not be followed by immediate action. The opinion of the colliery workers at Cornelia Colliery (Vereeniging) and other collieries in the Transvaal will next be ascertained, and then the S.A.I.P. Executive will deal with the whole matter before the debate on this subject is resumed in the Conference.

So far as Johannesburg is concerned, some little stir was caused early in the week by the prospect of 10,000 tons of coal from the Albion Colliery being available for municipal services. The Johannesburg Town Council, it may be recalled, did not immediately accept the tonnages of coal offered by the Grenfell and O'Neil Collieries last week, and the Grenfell Colliery then formally withdrew its offer.

Resolution of the Technical Societies.

At a special meeting of the Controlling Executive of the Associated Scientific and Technical Societies of South Africa, held in the Scientific and Technical Club, certain important resolutions on the strike position were passed. The meeting was attended by delegates of the following constituent societies: S.A. Institute of Engineers, S.A. Institute of Electrical Engineers, Chemical, Metallurgical

STRIKE PERSONALITIES.

Professor Lawn, one of the members of the Conference.

and Mining Society of South Africa, Geological Society of South Africa, Witwatersrand Branch of British Medical Association, Association of Transvaal Architects, S.A. Association for the Advancement of Science, S.A. Association of Assayers, S.A. Chemical Institute, S.A. Institute of Quantity Surveyors, S.A. Association of Draughtsmen—with a total membership of 2,380. Dr. A. J. Orenstein presided, and the following resolution was carried unanimously:—

Whereas owing to a strike of employees in collieries, gold mines, and certain other industries, certain public services, essential to the health and safety of citizens are threatened with stoppage, or have already been stopped, and

Whereas the essential services cannot be permitted to be affected by industrial strife, but should be subject to the same immunity as is granted life-saving and health services, even in theatres of war, be it resolved:

(a) That the Controlling Executive urges members of the constituent societies to use all the influence they can muster in their private and professional capacities to ensure the uninterrupted and adequate continuance of such services, especially those of water supply, light, gas and power, sewage disposal, and such services as protect mines and plants from destruction.

(b) That members of the constituent societies are recommended, if need be, to offer their services in such capacity as is within their capabilities, and in which their professional training would be most useful, to operate such essential services.

(c) That the Controlling Executive pledges itself to protect in every way members of societies who may volunteer to help in providing such services or/and in protecting the personnel and plants of such services.

(d) That the Controlling Executive confidently expects that the municipal and other authorities will on no account discontinue such essential services or curtail these to an extent involving any risk to the public health, or safety, or property, which, even though it might fall under the designation of "private property," is still always a national and communal asset.

Mr. F. S. Malan, Minister of Mines. The Government is closely and anxiously following the deliberations of the Conference.

(e) That the Controlling Executive, in pledging its full support to the Union Government and municipal authorities in the maintenance of essential services, confidently anticipates that the Union Government will provide adequate protection for the personnel and plant concerned with such services and deal drastically and instantaneously with any attempt to interfere with same.

(f) That a copy of these resolutions be forwarded by telegram to the Right Hon. the Prime Minister, and also be forwarded immediately to the Town Councils of Johannesburg, Benoni, Brakpan, Springs, Boksburg, Germiston, Krugersdorp, Roodepoort-Maraisburg, and Randfontein, as well as published in the daily Press.—(Signed) A. J. Orenstein (President), H. A. G. Jeffreys (Secretary).

Hope Disappointed.

Last week end the strike assumed a more hopeful aspect on account of what appeared to be a fair prospect of the strike of the coal miners being brought to a satisfactory stage by the submission of the dispute to a Conciliation Board. This hope was, however, quickly dashed to the ground, and the protracted labours of the Conference in connection with the collieries dispute were nullified by the decision of the Witbank employees. The workers' representatives informed the Conference that they could not state definitely what the result of the miners' decision was, as they had no official notification from Witbank. It was impossible to state what the official decision was until the results from Witbank and other districts had been received officially, and not through the Press. The employers' representatives questioned the advisability of continuing the discussion on the other questions after the offer of the coal owners had been turned down. It was pointed out that the conditions made regarding re-employment applied to all the other industries, and for this reason it would be as well to revert to the coal question, as such procedure would remove difficulties on the other points, and would clear the way for a more rapid handling of the disputes on the gold mines, including the status quo.

Sir Robert Kotzé. Government Mining Engineer.

Contention of Men's Delegates.

The workers' representatives urged very strongly that the coal question should be left in abeyance, and that the other problems before the Conference should be dealt with, in the hope of finding a solution. The Chamber's representatives urged that a definite date should be intimated by which the decision of the colliery employees should be officially communicated to the Conference. They pointed out that their proposals could not be kept open indefinitely. After considerable debate it was decided to proceed with the discussion of the town shops dispute, the workers, representatives promising to announce the decision of the colliery workers on the question of the Conciliation Board at the earliest possible date, while the employers intimated that, as no time could be stated when this result could be known, the coal owners reserved the right to withdraw their offer if and when they thought fit.

Terms of Reference.

After considerable discussion on the subject of the town engineering shops, an agreement was arrived at. The actual terms of the agreement were as follows:—Subject to confirmation by the Executives of the Engineers' and Founders' Association and the South African Industrial Federation, we agree:—(1) To refer to arbitration the question whether the contention of the Association is correct that no formal notice was necessary after the wages agreement arrived at between the Chamber of Mines and the Federation in August last,

also whether the notice of December 1 last is a breach of any agreement or understanding existing between the Federation and the Association. One arbitrator to be agreed upon, and two representatives from either side to be allowed to present their respective cases to the arbitrator. Should the men return to work before the award is given, they will return at the Chamber of Mines' reduced rate, provided that if the arbitrator decides in favour of the men, and adjustment in accordance with the arbitrator's award will be made retrospective. The arbitrator's award shall be binding on both parties. If the parties fail to appoint an arbitrator, the Chairman of this Conference shall appoint an arbitrator. The arbitrator to give his decision as early as possible, but not later than two weeks from the date of his appointment. (2) That immediately the men return to work, the parties meet in conference to discuss all other outstanding questions in accordance with the ordinary procedure. (3) The acceptance or rejection of this agreement to be notified to the Conference by the respective Executives during the course of this week.

N.B.—The Association does not withdraw any notice which has been given.

Tenth Day of the Conference.

Monday's sitting of the Conference was the 24th day of the coal strike, the 15th day of the gold strike, and the 10th

Sir Evelyn Wallers, a former President of the Chamber of Mines.

day of the Conference. It was then agreed that the town engineering dispute, as to whether three months' notice of reduction of wages should have been given or not, should go to arbitration. The Conference proceeded to the V.F.P. problem, Mr. Bernard Price declaring that the company had given no ultimatum and had nothing to withdraw.

Other Matters.

The Federation Essential Services Committee on Monday agreed to the purchase of the proffered 10,000 tons of coal by the Town Council if the latter so desired. At a meeting of the Town Council in committee in the afternoon it appeared that there was a difficulty about the ownership of this coal. The Council instructed the Town Buyer in consultation with the general manager of the Power Station to seek out and buy all coal approved of by the Federation. Meanwhile the town's position is practically unchanged. The Citizens' Protection League passed resolutions urging the Council to make immediate efforts to re-start the full essential services, failing which they would ask for Government control.

The total number of natives repatriated up to Tuesday night was nearly 28,000.

The Strike Conference having temporarily cleared the ground of the coal dispute, the reduction of wages in the town engineering shops and the demand of the V.F.P. employees for an increase in wages, reached the big issues

relating to the gold mines on Tuesday afternoon, the eleventh day of sitting.

Mr. Buckle, President of the Chamber of Mines, opened the discussion. In going over the points which had led up to the dispute, Mr. Buckle pointed out that the trouble in the gold mining industry had been primarily caused by the rise in the cost of production from an amount of about 17s. per ton to about 25s. 8d. per ton, or roughly speaking, an increase of approximately 50 per cent.

Mr. Buckle touched lightly on the exchange question, but did not go into details, which, he thought, would be of little value to the Conference. In reviewing the negotiations which had taken place between the Chamber of Mines and the Federation, Mr. Buckle referred to the granting of the £2 8s. per week increase over pre-war rates, and incidentally pointed out that at this particular period the price received for gold had reached its highest point, namely, about 130s. per ounce of fine gold.

Wages and Cost of Living.

Continuing, Mr. Buckle referred to the agreement arrived at during 1921, whereby a sliding scale was fixed in con-

had been held in December last, and then touched on the letter which had been addressed to the Federation on December 28, and which had been called an ultimatum.

Continuing, Mr. Buckle pointed out that the letter under discussion was simply a formal notice, and was required by the provisions of the law before any changed conditions could be introduced. Mr. Buckle further pointed out that the giving of notice was a very necessary precaution in order to avoid unnecessary delay.

Mr. Buckle then referred to the taking of a strike ballot on the so-called ultimatum and the meeting which took place the day before the strike took place. Mr. Buckle stated that the points in dispute had not been discussed at the meeting in question, but that, in effect, the representatives of the workers demanded the withdrawal of the ultimatum, or, failing such a withdrawal, strike action would be taken. Mr. Buckle claimed that the action of the representatives of the workers was not only that of submitting an ultimatum, but amounted to an open declaration of war. Mr. Buckle, in continuing, deprecated the drastic action taken so precipitately by the Federation in that the strike

Group of Miners on an East Rand Property.

formity with the rise or fall in the cost of living within certain limits, viz., between 21 and 57 per cent. increase over pre-war cost. The increase in the cost of living being now less than 21 per cent., the sliding scale came up for reconsideration in accordance with the agreement.

Mr. Buckle next dealt with the Conference which had been held between the Chamber and the Federation towards the end of last year, at which the Prime Minister had presided. He pointed out that when an alteration to the Mining Regulations had been agreed to, Sir Evelyn Wallers had then clearly indicated that while the amended regulations was a step in the right direction, it would be necessary to go much further if the industry was to carry on, and retain anything like its present activity.

The Strike Ballot.

The workers, Mr. Buckle continued, had not said very much on the changes which the Chamber had suggested, but asked that the proposals should be put forward in writing. Mr. Buckle then dealt with the Conferences which

had been called into force at least three weeks before the proposed change was to come into effect, and thus the opportunity of using the time available for amicable discussion was lost.

Mr. Buckle, in closing, said: "Well, sir, I have said that our notice was not an ultimatum, but there can be no dispute as to the fact that the action of the Federation was not only an ultimatum, but it was a plain declaration of war, and they, having even then still three weeks open to them to negotiating, we proposed no change whatever until February 1—being offered by us a full month for negotiations. Instead of availing themselves of that, they deliberately broke off the negotiations, stopped the whole of the industry, and, as I say, declared war

Repatriation of Natives.

Well, sir, that, of course, very greatly aggravated the position of the mines, and it is a continuation of those circumstances which aggravated them still further every day. Every day we have to send away natives, and are sending

them away, and the working of the industry depends largely on its having a full native labour force available, and the wastage has to be kept up by a constant supply pouring in. Of course, under present conditions we have not only had to stop recruiting to fill that wastage, but we are also having to get rid of the natives as fast as they are willing to go and they are time expired, and we are already seriously handicapped in restarting. Mr. George said the other day that two parties who might be quite willing to accept certain terms and conditions between themselves to settle a dispute while they were at peace, would not be likely to accept them after war had broken out.

Underground Contracts.

Mr. F. G. A. Roberts took up the case of the gold mining industry and went into the details regarding the proposed alteration of underground contracts and, incidentally, cited the Underground Contract Commission Report and also the report of the Economic Commission of 1914 in support of the proposals of the Chamber for the present reorganisation. Mr. Roberts explained the difference between the present system of contracts as against the proposed "no cost" contract, this chiefly consisting of, under the old style of paying a price per fathom out of which the contractor had

on the Witwatersrand, and it had evidently been found desirable to practically eliminate the contract system in Kimberley. Professor Lawn, in conclusion, pointed out that the contract system had been investigated by committees and commissions and had been condemned on every occasion.

Mr. Thompson's View.

Mr. Thompson (President, S.A.I.F.), in replying to the case put up by the Chamber, stated that the figures produced by Mr. Roberts left them stone cold, and they were so used to the figures produced by the Chamber being proved false that they had ceased to take any notice of arguments based on figures. As a case in point, Mr. Thompson cited the question of the 48 hour week for engine drivers.

In referring to the points raised by Mr. Anderson, Mr. Thompson stated that if the desire of the Chamber was to pay wages in accordance with ability, he might well start at once, and suggested immediately dispensing with the services of six of the Chamber's representatives and allow Mr. Buckle, the President, to conduct their case, as his salary alone was actually more than the salaries of the seven delegates who represented the workers. Mr. Thompson stated that he would leave the other points to be dealt with by Messrs. Lewis and Price.

Mine Boys Idle on the West Rand.

to pay the cost of labour and stores, whereas, in the "no cost" contract system a much lower price would be paid per fathom, but all labour and stores would be provided, also a guaranteed day's pay would be given and, probably, a bonus on saving in stores.

Mr. Anderson supplemented the technical aspect of the case as put forward by Mr. Roberts, and pointed out that a so-called contractor was not a contractor in the ordinary sense of the term in that he was not required to work out estimates as an ordinary contractor in other industries had to do, and, furthermore, he pointed out that by reason of the guaranteed day's pay the so-called contractor on a mine was not required to take the risk of loss which an ordinary contractor had to take.

Comparison with Kimberley.

Professor Lawn next took up the discussion, and further elucidated the contract system, comparing the present contract system on the gold mines with the system as it had been applied in England, and further drew comparisons with the system adopted in Kimberley. At one time Kimberley contracts had been somewhat similar to those now in existence

Government Figures.

The Chamber's representatives pointed out that the figures submitted by them were compiled from the official returns of the Government Mining Engineer.

Mr. Lewis, in continuing the debate, referred to the remarks from the other side about the Federation having declared war. In his opinion the Federation had simply taken up the challenge thrown down by the Chamber. Mr. Lewis stated that he did not think it was possible for any settlement to be arrived at by the present Conference on many of the points in dispute. He did not propose to go into detail on the question of the contract system, as such details would require to be dealt with at a later date by the Chamber and the unions concerned.

Other Views.

Mr. W. Price (miners' delegate) stated that he did not desire to discuss the contract system apart from the reorganisation of underground work.

This led to some discussion on the order of procedure which had been agreed to on the first day the Conference sat to discuss the various points in dispute.

Mr. Lewis stated that he considered the time spent by the Conference so far was, in his opinion, so much time wasted. Putting the position bluntly, he claimed that the arguments put forward by the other side would in no way convince him any more than he expected his own arguments

Police Quartered on a Rand Gold Mine.

to convince the other side. He had been of this opinion since the Conference commenced, and thought the status quo question should be dealt with.

Mr. Price stated that he agreed with the opinion expressed by Mr. Lewis, but also claimed that it was impossible to discuss the contract system without touching on the re-arrangement of underground work in view of the proposal to include timbering, etc., in the contract.

Mr. Gemmill suggested that the proper course would be to discuss any reorganisation of underground work which was bound up with the contract system, and similarly to discuss any reorganisation of underground work in conjunction with the status quo when the status quo was being discussed.

(Other portions of Mr. Buckle's speech are referred to in a leading article in this issue.)

Technical Societies' Club House, Johannesburg. The members have pledged themselves to assist in the maintenance of essential services during the strike.

Transvaal Silver Progress Report.

The latest report issued by the Transvaal Silvers is dated January 11. It deals with the quarter ended December 31, and gives the following interesting information.—

Dwarsfontein No. 145.

Shafts.—The No. 1 Shaft was sunk 10 feet to a total depth of 383 feet. Sinking has been suspended in the meantime at a depth of 62 feet below the third level. An ore pass has been constructed between the second and third levels, and a start has been made on cutting an ore bin of suitable capacity at the latter plane. **Development.**—The development footage sampled during the quarter totalled 1,620 feet, and gave the following results: Payable, 435 feet, having an average value of 10.6 per cent. lead and 10.7 oz. silver over 48 inches. Unpayable, 1,185 feet, having an average value of 2.1 per cent. lead and 2.1 oz. silver over 32 inches. Exploitation of the lode below the third level is being undertaken by means of a double winze sunk from this plane. Within the past few days this winze has reached the position of the fourth level and the lode has been intersected. Values are not yet available, but the appearance of the lode is distinctly encouraging.

Brakfontein No. 219.

The Brakfontein Shaft was sunk 112 feet, to a total depth of 21 feet below the second level. A cross-cut at this plane has intersected the upper portion of the central lode, which shows satisfactory values. In order to expedite development the Tangye compressor has been transferred from No. 1 Mine to this point, and two new loco. boilers have been erected. As soon as a sump for dealing with the water has been cut on the first level, development both at the first and second levels will be pushed ahead with all possible speed.

Machinery and Plant.

The sorting and crushing station has been in operation during the greater portion of the period under review, and is running smoothly. The concentration plant was completed towards the end of the quarter, and trial runs have been carried out. After making certain minor adjustments, the plant is now running satisfactorily on ore. Erection of the second smelting furnace is in hand. Ninety-one tons of lead bullion, produced from smelting hand-picked ore, has been shipped to Europe. The assay value of this bullion was 98.16 per cent. lead and 110.12 oz. silver per ton.

Mining Men and Matters.

Messrs. Llewellyn Edwards and Son (Llewellyn Edwards, senior, accountant and auditor; Llewellyn Edwards, junior, A.I.M.M.), of 74 Fox Street, Johannesburg, announce that they have commenced a mining, secretarial, insurance, and general agency business on their own account.

Glynn's Lydenburg—re Dividend, 31st January, 1922.

The following is a copy of a cablegram which has been despatched to the London office of this company for publication:—Net cash improvement for the half-year ending 31st January, 1922, is estimated to amount to approximately £1,400 after meeting capital expenditure on new circular shaft and development. In pursuance of its declared policy the Board of Directors has, therefore, decided to distribute no dividend per 31st January.

The V.F.P. and the Strike Conference.

DEADLOCK REACHED—NEW GRIEVANCES ADVANCED—CASE PUT IN WRITING BY BOTH SIDES.

The Strike Conference reached the questions between the V.F.P. and its employees and the Federation last week end.

Mr. Bernard Price opened the discussion on the V.F.P. Company's dispute, and elucidated the position of the company. Beginning with the conference held between the company and its employees early in 1919, Mr. Price described the various classes of workpeople employed by his company, and also described the system of shift work which obtained with the operating staff, namely, switchboard attendants, engine drivers and firemen.

Continuing, Mr. Price described how the rates of pay had been fixed for the semi-skilled workers in relation to the skilled mechanics.

On November 14, 1921, Mr. Price continued, a letter was addressed to the V.F.P. Company by the Federation, submitting demands for increased wages on behalf of certain employees. A schedule setting out basic rates for the various sections was attached to this letter.

The V.F.P. replied showing the impossibility of consenting to these demands.

After reading the voluminous correspondence in the case, Mr. Price replied in detail to the questions brought up by the Federation's representatives. In concluding the discussion, Mr. George stated that if an agreement was arrived at to hold a conference on the V.F.P. question a full statement of the points at issue between the V.F.P. and the A.E.U. would be forwarded. Mr. Price pointed out that several entirely new points had been raised by the representatives of the Federation in which no correspondence whatever had passed between his company and the Federation, and it was essential to have a written statement on every point which the union now urged should be referred to a conference with his company. It was ultimately agreed that a complete statement would be laid before the Conference, setting out the points which the unions considered should be the subject of consideration between the unions and the V.F.P.

The Men's Case in Writing.

When the Industrial Conference resumed on Saturday a letter was submitted, addressed to Mr. Price, General Manager of the Victoria Falls and Transvaal Power Company, from the South African Industrial Federation, reading as follows:—

"On behalf of the different unions affected in the present dispute concerning the reduction of wages, I am directed to inform you that the basis of a conference to the unions' demands should be: The applied reduction as affecting the whole of the workers throughout the company's power stations; discussion on the question of basic rates as put forward by the S.A. Engine Drivers and Firemen's Association; and, further, this not to preclude discussion regarding any previous agreements having been observed."

Mr. Price's Reply.

On Monday these written demands were discussed at great length, and inclosing the debate Mr. Price stated that he had explained the position fully at the beginning of the afternoon session, and he had nothing to withdraw. The Federation had chosen to put forward a very definite ultimatum, namely, the notice of strike, which would force the company to consider those conditions under which it would be justified in restarting its industry. He had pointed out that in regard to the application to his company's employees of the reduced rates of pay, the V.F.P. would adopt such rates as might be adopted as a result of this strike by the larger employer, the gold mining industry.

With regard to rent concessions, he must definitely refuse to reconsider that. The company was not in a position to grant any special privileges, and he could not agree to refer such a matter to a possible future conference. In connection with the switchboard attendants, which was apparently the only point included in the last phrase of the Federation's letter of January 21, setting out the conditions for settlement, there was nothing further to be said. He thought that the V.F.P. on the contrary had acted in a very generous spirit. He saw nothing whatever, therefore, which should be referred to a conference. He wished to make it clear that legitimate points which might arise in regard to conditions of service are, and always have been, matters for discussion, first of all between the shop stewards and the officials, and, if necessary, subsequently between the company and the Federation. He did not wish to alter the machinery which had been adopted to settle matters in the past, but there was nothing of a special nature that required any conference in the future.

The Last Word.

That attitude was maintained by Mr. Price on Tuesday, and before the Conference adjourned the morning. Mr. Thompson, in concluding on behalf of the workers, claimed that Mr. Price had not only put up the case on behalf of his company, but that he had usurped the position of arbitrator, and given a binding decision as well. Continuing, Mr. Thompson desired to know whether the power company would be prepared to submit the outstanding points in dispute to arbitration, both parties to be bound by the decision. If the power company were not prepared to agree to arbitration would Mr. Price indicate how he proposed to meet the present position.

In reply Mr. Price stated that he would put his reply in writing so that the Federation could submit it to their Executive and submit a written reply in due course.

There, for the moment, the matter rests, and the Conference has passed to the discussion of the gold mining dispute.

The war profiteer is a person who is generally, and very rightly, condemned, and particularly by the Labour leaders. These leaders would no doubt be astonished and indignant if Labour itself was accused of being the biggest profiteer in South Africa. But this in point of fact is absolutely true. Labour has put its cost up by 50 per cent. since the pre-war days, and it has given inferior service to that which it rendered in 1914. The prices of all commodities have recently fallen and are continuing to fall. The cost of living continues to decline. Most important of all, the price of gold is falling. But Labour still rides on a high horse of demands which cannot possibly be conceded.

African Railway Extensions.

SURVEY OF NEW MOZAMBIQUE LINE SANCTIONED—PAULINGS ACCEPT BIG LOBITO HARBOUR WORKS CONTRACT—WANKIE COAL AND S.W. ASPIRATIONS—PROGRESS OF THE TRANS-ZAMBESIA LINE—GRIQUALAND WEST RAILWAY DEVELOPMENTS.

The announcement in our last issue that negotiations were in progress to finance the continuance of the Lobito Bay-Katanga Railway aroused so much interest that something more may be said of other important railway developments. Apropos of Lobito, it may be mentioned that Paulings, the great railway and harbour contracting firm, have recently secured the contract for harbour works at Lobito Bay, and that the work will be taken in hand at once. Lobito, though of course a magnificent natural harbour, will have to have much money spent on it to complete its equipment.

New Mozambique.

Paulings have also recently secured the contract for the survey of a line from the Mozambique coast at a point behind the island of that name to Lake Nyasa, and the work will begin at once. The country behind Mozambique has long been known for its wonderful natural resources, and the new line is planned to tap this fertile hinterland. When Nyasa is joined up by rail with Luchenza, which is now being linked up with Beira and the Union railway system, the whole East Central African trade will be brought together.

Progress of the Trans-Zambesia Railway.

According to information given by Sir J. D. Rees at the recent meeting of the British Central Africa Company, progress in construction of the Trans-Zambesia Railway has been excellent. Latest advices show that earthworks have been completed to within two miles of the Zambesi, and platelaying completed to mile 142, at which point a temporary bridge over the Pungwe is completed. The opening of the line in the early part of next year will bring Blantyre (British Central Africa) within 24 hours of Beira. Arrangements are being made for carrying the sugar crop of Villa Fontes almost immediately by direct rail route to Beira. A railway is at present open from Chindio on the Zambesi to Blantyre, 174 miles north, and the new line will link up the southern bank of the Zambesi opposite Chindio with the South African railway system within 18 miles of Beira. Until the bridge over the Zambesi is completed, communication will be effected between the right and left banks of the river by a steam ferry. Another railway starting near Blantyre will shortly be commenced, which will run northwards to the southern end of the navigable Lake Nyasa, thus greatly facilitating the movement of merchandise into the Tanganyika territory. In these developments the British Central Africa Company has played a most important part.

Wankie and the S.W. Protectorate.

It is noteworthy that, according to a Luderitz-bucht correspondent, the people in the S.W. Protectorate are insisting upon linking up per rail with Wankie for the export coal trade. The proposal is favoured in influential quarters, and as the distance from Grootfontein in S.W. Africa to the Rhodesia coalfields is not prohibitive, the scheme may be realised one of these days.

Rand miners are, or have been, the most highly paid trades or craftsmen in the Union. Not only are Rand miners more highly paid than any other workers in the Union, but they are better paid, have easier duties to perform, and live or can live under more pleasant conditions than miners in any other part of the world. If all the proposals now put forward by the Chamber of Mines with a view to reducing working expenses, in order that certain low grade mines which employ thousands of white men and which distribute millions a year amongst the community, may continue to be worked, Rand miners would still be better off than miners in any other part of the world, and they would still be more highly paid than any other trades or craftsmen in South Africa. The Chamber of Mines believes in paying a good day's wage for a good day's work, and it has no intention of departing from this principle; but what it does object to and is opposing is

- The anomalies of the contract system;
- The employment of a limited number of redundant and unskilled men on skilled jobs; and
- The restriction of occupation policy of Trades Unionism, which has been carried to an absurd and impossible degree.

In wishing rather to effect these modifications than to be compelled permanently to close down several low grade mines which cannot bear the burden of expenditure imposed upon them, the Chamber of Mines has no intention whatsoever of removing the so-called "colour bar." Those who circulate the statement that the Chamber desires to destroy the colour bar are propagating a malicious falsehood, which is greatly assisting in the prolongation of this strike and is bringing ruin upon a large percentage of the community.

New Industry for Kimberley.

At the last meeting of the City Council in Committee, a letter was read from Mr. H. J. Hbbotson, of Johannesburg, in further reference to the proposed establishment of coal gas locally. He stated that his application was made under the terms of the Cape Local Authorities Gas Ordinance, 1912, subject only to cancellation of the clauses relating to illuminating power. It appeared to him that the only matter to settle was the maximum selling price of gas mentioned in Clause 29, Section 2, which matter he would prefer to leave in abeyance for a short time pending completion of his investigations in regard to estimated capital and working costs, and that the actual contract to be entered into between the Council and himself seemed to be a simple matter.

He added that he estimated the quantity of water required when the works had been in operation for, say, two years would be about 4,000 gallons per day, this being in addition to several hundred thousand gallons required for filling the gas holder or tank, which quantity could be taken at Council's convenience, also that about five acres of land would be required.

The City Engineer's memorandum suggested the ordinary retail charges for water, and that with regard to filling the tank it could be dealt with without difficulty during the cold or rainy weather, when water was in abundance; and that five acres of ground could be set apart for this industry.

Griqualand West Railways.

During the week, as the result of a deputation to the Prime Minister by an influential Kimberley deputation, it was announced that the Government had consented to the immediate construction of a line from Kimberley to Barkley West. Apropos of this a valued correspondent writes to us from Potmasburg as follows:—

With all this agitation going on in Kimberley, over the construction of a railway line from Kimberley to Borrel's Kopje and on to Kuruman, I think that a few words from one interested in farming, mining and trading in the locality affected, on the wider issues of the matter, will not be amiss.

For the sake of regularity I have tabulated the pro's and con's:—

1. The existing main line, between Fourteen Streams and Wellington is congested, and some time back it was very nearly decided to duplicate this section, and thus save eight hours between Capetown and Johannesburg.

2. There is a railway line from Capetown via Piquetberg and Clanwilliam, to closeup to Calvinia.

3. Quite a considerable amount of coal is now being sent from the Transvaal to South-West Africa, and a shorter route than the one via De Aar and Ujington, is being strenuously advocated in some quarters.

These three points summarise the situation as it is to-day.

4. Asbestos, it is acknowledged, is one of the coming industries of this country. The asbestos in these parts occurs in a belt of hills (known as the Asbestos Mountains), extending roughly from Prieska to a little north of Kuruman. No big capital has as yet become interested in this industry, owing to the lack of cheap power.

5. There are several diamond mines in and around Postmasburg, on the western edge of the asbestos belt. These also require cheap fuel.

6. Lastly, in and around Postmasburg there is the finest occurrence of iron ore as yet recorded in this country. It is valueless to-day, owing to lack of cheap power.

These three points summarise the possibilities of these parts.

A map showing Rhodesian Railways connection with the Union and proposed extensions and new railways. (See page 744).

7. One of the first principles in railway construction is to try and arrange your gradients to suit the bulk of your heavy traffic. Thus if a railway was to be constructed to these parts, for the purpose of developing them, bringing coal for power and maize for food, it would have to be built from some point north of where the Kaab Plateau forms a barrier to these parts.

At Pudimoe Junction the Transvaal system links up with the Rhodesian system, and at Pudimoe also we have the ideal site for commencing railway construction to these parts. One finds a gentle down grade from there, via Kuruman, Postmasburg, right down to Marydale. Then, to carry the scheme further, there are no insuperable difficulties to railway construction between Marydale, Kenhardt and right on to Calvinia, linking up with the Cape connection just beyond there. This is a big scheme of railway construction and at the present time beyond the means of the Government, but that is no reason why any railway construction, adopted, we will say from a policy of relieving unemployment, should not be controlled so as to have this big project in view.

What would such a line not mean to the country?

1. It would relieve the congestion on the main line, allowing of speeding up and a consequent saving in outlay on running staff.

2. It would provide a shorter and easier route for the coal traffic between the Transvaal and South-West Africa, giving a fresh stimulus to a South African industry and a bigger revenue to the railways.

3. It would beneficially open up a section of the country, which has mineral potentialities equal to that of the Witwatersrand, providing it with a means of obtaining cheap power, and also a means of exporting their products, considerably cheaper than the old ox or donkey wagon arrangement extant.

4. Truck loads of live stock are, in railway parlance, known as light loads. These and empties would be the chief make up for trains returning from here to the Transvaal.

For the sake of brevity I have left out several minor points, but to anyone with a personal knowledge of this locality, as yourself, or anyone sufficiently interested in the foregoing, a glance at the map, whilst perusing this, will assist in filling in what I have left out.

PROGRESS ON THE S.A. RAILWAYS.

New All-Steel Coaches.

The *S.A. Railways and Harbours Magazine* for this month has an illustrated article on the new all-steel suburban coaches for the S.A. Railways, a few of which were seen at Capetown a little time ago, but are not in use locally. These coaches are almost the same in appearance as the present type of corridor coaches, except, of course, for the metal.

The vehicles have patent pressed steel side pillars, patent detachable window frames, and Fox's pressed steel underframes. Each coach runs on two four-wheeled bogies having 5 ft. 1 in. wheel base and 2 ft. 10 in. diameter wheels, the distance between centres of bogies being 4½ ft. 6 in., with a total wheel base of 50 ft. 7 in. in all cases. The length over headstocks is 60 ft. 7 in., and that over the body corner pillars 60 ft. ½ in. The coaches have a maximum width of 9 ft. 9 5-16th in., and are 9 ft. 1 9-16th in. over side pillars. The height from rail to the top of roof is 11 ft. 11 3-16th in., and the maximum height over the roof ventilators is 12 ft. 6 in.

The coaches are equipped with Laycock's central couplers and enclosed vestibules, vacuum brakes, steam heating and Vicker's system of electric lighting; are constructed with a space between the outer and inner cases of the sides and roofs; this allows for a free circulation of air, the side cases being open at the bottom. Extractors are fitted to the outer roof connecting with the air space only, thus assisting in the circulation of air within the cases.

The seating capacity of the first-class coaches is 72 passengers. The second and third-class composite coaches accommodate 48 passengers in the third-class portion and 32 in the second-class portion. The first and second-class composite brake van conveys eight first-class and 24 second-class passengers, the rest of the coach being devoted to luggage space and a guard's compartment at the rear.

The M'Fongosi Silver Lead Mines.

A VISIT TO A LITTLE KNOWN ZULULAND VENTURE.

Mr. Jno. Hunter McLea writes:—When the country was in low water in the early seventies the discovery and opening up of the diamond mines set it on its feet again. Then followed the goldfields, which placed it in such a sound position, and the next advance will be that of the silver mines, which are still in their infancy, but which will soon develop into big business and place the country on a still more solid foundation.

I have lately been down to Zululand to see the M'Fongosi Silver-Lead Mines, which are situated in the N'Kandhla district, immediately north of the junction of the Amanzinyayo and M'Fongosi Rivers, the latter river flowing into the Tugela about 1½ miles south of the property. The distance to the Ngobevu crossing of the Tugela River, just below its junction with the Buffalo River, is about 14 miles, and from there to Greytown, by the Inadi wagon road, is about 41 miles, making the total distance from the property to Greytown, over a good road, about 55 miles. The journey is a very interesting one, as there is beautiful scenery, mountains and rivers, all along. The Government ought to put a punt at this crossing for the convenience of wagons and travellers during the rainy season.

A shorter route from the property to the Krantz Kop Railway terminus exists, via what is known as the "Devil's Staircase," making the distance to the railway about 20 to 25 miles. Part of this route would probably have to be overcome by means of an aerial tramway, crossing the Tugela River to the top of the staircase, which is about 1,500 feet high. It could be worked by water power.

The surface of the property may be said to be divided in the direction of its length, which is about 4,800 yards, into a series of six distinct hills, by two rivers and four dry dongas, the highest point being about 400 feet above the river level.

The formation throughout the property is very regular. Nature has scooped out the country into hills and valleys apparently with the express purpose of facilitating the opening of this lode.

A careful examination of the outcrops, together with the exploratory work already accomplished, shows the existence of a distinct well-defined mineral vein or lode running through the length of the property. This vein is parallel with the foliation of the schists which form its hanging and footwalls. In addition to the main lode a number of parallel quartz veins or reefs occur more or less continuously through the property, but so far these have not received attention.

In No. 3 Hill two shafts have been sunk on the side of the hill about 215 feet above river level, on an outcrop of the main lode, showing galena and silver. The one shaft is about 25 feet deep on the true dip of the vein. The other shaft starts about 3 feet from the mouth of the former and is sunk at an angle of about 40 degrees in the direction of the strike of the lode westwards for a depth of 63 feet on the incline. This shaft has exposed the lode about 4 feet wide, carrying galena and silver over a thickness of 4 to 8 inches on the hanging wall for about 40 feet, and the same on the footwall for about 20 feet.

At No. 6 Hill, on the west side and about 2,000 yards from the shafts in No. 3 Hill, the lode has again been opened up about 240 feet above river level by means of an inclined shaft following it down on its true dip at an angle of about 45 degrees to a depth of some 95 feet. The lode is seen to the best advantage at this shaft, varying over the full width of the shaft from 1 to 36 inches and averaging about 14 inches in thickness.

The assay certificates from the Government Laboratory shown to me are:—

Bag marked W shaft: Lead, 74.52 per cent.; silver, 22 oz. 10 dwt. per Imp. ton of lead.

Bag marked E shaft. Lead, 82.05 per cent.; silver, 27 oz. 9 dwt. per Imp. ton of lead.

It must be borne in mind that the history of lead mining throughout the world points to the fact that never does the ore occur perfectly regular and continuous throughout the length and depth of the lode, but in the form of shoots or bunches occurring at more or less intermediate intervals in it.

There is an abundant supply of water in the Amanzinyayo and Amanzinyama Rivers, both of which flow through the property. The former river flows over a series of waterfalls several hundreds of feet in height about a mile north of the western end of the property, and is capable of yielding more water power than is ever likely to be required.

The Qudeni forest overlooks the property immediately to the north on the slopes of a mountainous range 3,000 to 4,000 feet above it. The forest mainly consists of the indigenous hardwoods. Numerous wattle plantations exist along the route from the property to Greytown, which could also supply a useful mining timber.

The property is situated in a populous native district and the natives will probably prefer working near their kraals to going further afield.

An expert in a report on the property some years ago, when the prospecting work was stopped (which report I have seen) said the value of the ore in England dressed to 75 per cent. lead at the then current prices could be taken to be about £7 15s. per ton and the property would show a clear profit of 32s. per ton. What profit would it show now with lead at £24 per ton and silver at 3s. per ounce?

THE INDUSTRIAL DEADLOCK.

The great strike continues to drag on. It is having a paralysing influence on the Rand, and it is inevitable that the effects of a complete cessation of the gold output will be most detrimental to the finances and prosperity of the whole country. Each day it becomes more and more evident that the ill effects of the strike are spreading to places and industries far removed from the storm centre of commercial South Africa, but which have been riding with the rest of the country on the back of our major industry. The Somerset West works of the Cape Explosives Company, for instance, have for the time being ceased the manufacture of explosives because there is no demand for gelignite and gelatine. Farmers all over the country are beginning

to feel the withdrawal of orders for foodstuffs for the mines. The railway revenue is being seriously affected. It is impossible to compute the total loss to the whole community, but it cannot be far short of a million a week. The Share Market keeps wonderfully firm, and the price of gold remains steady at just under 98s. From an investor's point of view, special interest attaches to the dividends which in the ordinary course of events would be declared in June. It is obvious that every mine on the Rand is incurring enormous losses at the present time, and even if the strike were settled to-morrow many mines would have suffered so much from a financial point of view that they would, under the most favourable circumstances, be quite unable to recoup themselves for several months to come, and it is, therefore, certain that the half-yearly dividends will at the best of it be hundreds of thousands of pounds below the aggregate distribution in December.

The fact is that there has been no such tremendous and prolonged dislocation of the industry since the days of the Boer War. Not a few mines have suffered so severely that they will not be able to reopen. Up to Tuesday night over 28,000 natives had been repatriated, and it must be obvious that in consequence of this exodus the white worker's position has been affected to the extent of nearly 3,000 jobs on the basis of a ten to one ratio. It is becoming more and more clear that the longer the strike continues the more difficult will it be, even if all the proposals of the Chamber of Mines are accepted, to restart the industry on its former scale.

Mr. Buckle, President of the Chamber of Mines, stated the case for the employers very clearly on Tuesday, when, after eleven days of more or less futile debate, discussion of the largest issue of the dispute commenced. Mr. Buckle, in addressing the Chairman of the Conference, Mr. Justice Curlewis, said, *inter alia*:—Well, Sir, as I pointed out just now, war has been declared by the Federation, and that simple fact has made the position of the mines worse, and I doubt very much whether we could carry on to-day or shall be able to carry on to-morrow, simply on the terms which we originally proposed, if they were accepted. Not only is the position made worse with regard to the natives, but some of the mines are being flooded, and that, of course, is always a great cause of cost and of delay in re-starting. In some cases it may prove to be a final bar to re-starting. It may very well be that the prospects of the mines are not such as to warrant the additional expenditure necessary to clear them of flooding. It may be again that other mines we have—as is common knowledge are in any event pretty near their end—it may be that the additional expense involved in re-collecting the native labourers who have gone would be such that the amount remaining to be taken out of the mine will not be worth it. And, generally, it is a very difficult thing to say on what terms it will be worth while to re-open some mines. Well, I might mention one difficulty—an additional difficulty that has been created by the strike itself, and it is the one we have already discussed in connection with the coal mines, and that is the difficulty of re-employment. It is perfectly certain that none of the mines will be able to re-start on their old scale at once. It will be a greater or less time before they can work up to what they were having before. It is, I think, practically certain that some of the mines, even now, will not re-open, and if the strike goes on even a short time longer, more and more mines will find themselves in that position. In other words, like the coal mines, though for a different reason, we shall not be able to take back all the men who went on strike. And as you have seen, Sir, that in itself creates very serious difficulty in coming to an arrangement. And other points will emerge, I have no doubt, in the course of discussion, which will raise similar difficulties.

We quote Mr. Buckle's words exactly as reported, because they so clearly express the present position of the industry. To these remarks and to the evidence on the subject of underground contracts tendered by Mr. Roberts—evidence based on Government statistics—the President

of the South African Industrial Federation merely retorted that the figures left them "cold." If this is the attitude in which the men's representatives approach the dispute, we fail to see why the Conference should go on. The men's leaders continue to falsify the issue and to contend that the abolition of the *status quo* agreement means the removal of the colour bar. The Witbank colliers refuse to submit their case to a Conciliation Board. Apparently the V.F.P. dispute has come to a deadlock, and the only decision that has been reached by the Conference is that the interpretation of a point in the dispute over the engineering shops should be submitted to arbitration. The essential services of the town of Johannesburg have had to be very greatly curtailed, to the inconvenience of large numbers of the public, and the Municipal Council of the town seems at present to be dominated by a local Government of Soviet Nihilism. Under these circumstances, it seems almost hopeless to expect anything which is likely to lead to a settlement from the employees' side.

The daily Press is, of course, full of all manner of solutions of the strike settlement, and whilst it would appear that all the avenues leading to a satisfactory solution of the problem have been searched, at least by the Chamber's representatives, there are a good many people who think that the question of longer working hours has not received the consideration it should from both parties. But, as we have already said, so long as the men's reputed leaders are prepared to sit still and say that economic facts and figures leave them stone cold and are unwilling or unable to bring forward any concrete proposals which would assist in arriving at an understanding between both sides nothing much can be hoped for from the Conference. One is tempted to wonder whether the Federation leaders at the Conference are really representative of the men who are now discarding their livelihoods on an absolutely false issue, and whether better progress towards a settlement of the dispute would not be secured if the present representatives of Labour who earn their livings by disputes of this kind were supplanted by real working miners and engineers who had the voice of the Reef behind them and who are at present sacrificing all they possess on the false altar of direct action. But whether we are right or wrong in our estimate of the men's reputed spokesmen, we are quite certain of one thing, and that is this, that it is the men themselves who are going to suffer principally on account of this ill-timed strike. It is always the men who are the chief losers. The British colliers fought a hopeless struggle for more than two months last year, and then they had to cave in. They were beaten and broken and bankrupt. They lost because they were fighting the strongest opposition in the world, and that opposition was not the colliery proprietors, but economic facts. The men here are going to lose this struggle, too, for the very same reason. They think that they are fighting the Chamber of Mines, but in reality they are fighting a power in whose hands the Chamber of Mines is as mere clay. They are fighting the omnipotent forces marshalled together under the strongest commercial general in the world, and his name is economic facts. The colliers in Great Britain admitted this general's impregnability after they were beaten, and the men here will have to admit the same.

SOME EFFECTS OF THE STRIKE.

The latest statistics issued by the Government Department of Mines—those for November last—show that during that month 30,031 whites were employed on all the mines and metallurgical works of the Union, and that the grand total of mineral output for the country during that month was £4,173,401. Of these 30,031 white employees, there were at work on the Rand gold mines 20,565 men, and on the Transvaal coalfields 1,046 white men, or a total of 21,611 Europeans. The gold output of the Rand during the same period had a value of £3,464,836, and the output of the Transvaal collieries was worth at pit's mouth £172,856 or a grand total for gold and coal of £3,637,692. In other words, the Rand gold industry and the Transvaal coal

industry during November were employing more than two-thirds of all the mine employees of South Africa, and produced nearly nine-tenths of the total mineral output of the country. The total amount disbursed to white persons in the service of Witwatersrand gold mines (large mines) during the month was £829,215, including £37,725 as leave pay and £4,042 as bonus. These figures are issued by the Government Department of Mines, and they are worth thinking over. These industries are at a standstill to-day. No gold is being won, and the only coal being produced is being won by natives under staff supervision for essential services. The white employees of the Rand alone are losing in respect of salaries at the rate of ten millions per annum on account of the strike, which is being prolonged because the men's leaders refuse to recognise economic facts. When a business will not allow of the present wages bill, then wages must come down. The low grade mines have simply got to reduce their wages bill or close down altogether. Instead of endeavouring to settle the strike on a sound and safe and honest basis, the Federation of Trades is continuing to falsify the issue by stating that the Chamber of Mines seeks to break down the colour bar. The Chamber has not any such intention or desire. It has no ability to do so even if it desired to break down the colour bar. The Chamber only seeks to retrench a limited number of redundant men in certain specific occupations, in preference to some mines having to close down and throw a large number out of employment (perhaps as many as 10,000), and it has offered to safeguard the position by the establishment of a fixed ratio of the Europeans to natives. To say that this means the removal of the colour bar is a dangerous falsehood.

MINERS OR OVERSEERS?

The Labour representatives at the Conference appear to have tied themselves up in knots in an endeavour to define the true functions and status of the European "miner" in this country. According to the reports issued by the Press Committee at the Conference as published in *The Star* the claim was put forward by the workers' representatives that it was unfair to compare the South African white miner with the miner in other countries, as the native was the miner in South Africa, the so-called miner was really an overseer in South Africa and was only comparable to the official in other countries.

The Star quite reasonably employed the headline "Workers' representatives declare that white miner is really 'overseer,'" and to this grave exception was taken by Messrs. Thompson, Lewis and George at Wednesday's meeting.

Mr. Lewis, according to the Press report, claimed definitely that "the miner" here was the actual miner, an utterance of profound wisdom which was evidently meant to mean that the *European* miner on the Rand is the actual miner.

Mr. Thompson followed this up by asserting that to a certain extent the miners overseas perform work similar to what is performed by natives here, but with this great difference. The miner overseas is fully competent to perform the whole of the duties necessary in the production of the product, whereas the native miners of this country are to a very large extent without any knowledge of mining. Therefore the white miner here not only undertakes the responsibilities of an official in supervising large numbers of unskilled men, but has actually to perform himself the highly skilled and dangerous work such as all blasting operations, together with arranging all work so that the best results may be obtained, so as to conform to mining regulations.

We do not know what experience the Federation's spokesmen have had of mining and particularly of metalliferous mining in other parts of the world, but, it may be pointed out, that in Cornwall, in North America, and in Australia the white miner has to do all the hard manual labour (which is performed on the Rand by the natives) as well as the "highly skilled and dangerous work."

In those mining camps there is no essential kaffir to "pezulu lo cocopan" or to "tshya lo n achin"; the white man has to do that himself.

There are still some good white miners left on the Rand, but a good many of the European underground employees—call them miners or overseers or what you will—would not last more than one shift in a Cornish Tin or Copper Mine. We say this with some experience of actual working conditions in both countries.

Perhaps the Indian mines provide a closer parallel to the conditions obtaining on the Rand than elsewhere. In India, as in the Transvaal, there is a coloured subordinate labour force working under a white complement. And what are the conditions in the Indian mines? In the Carnichael shaft "A" section of the Champion Reef Gold Mines Kolar Gold Fields, Mysore, 1,509 coloured employees work 32 stopes and 13 developing places under the supervision of 7 white men. These white men are skilled workmen; they would never go down one of the Kolar Fields mines if they were not.

We commend these facts and figures to the Labour leaders at the Conference. Possibly they will assist them in arriving at some definite opinion and in giving a clear expression of what they really do mean.

Some of the remarks on the question of whether the Rand's white employees below surface are miners or overseers or both or neither have been expressed in such terms of illogical contradiction that they are only comparable with the indecisions of a chimera ruminating in a vacuum.

Notes & News.

Owing to printing difficulties this issue of the "Mining Journal" has to go to press considerably earlier than usual, and we are therefore unable to comment on the debate on the status quo agreement at the Conference on Wednesday afternoon.

* * *

Gold Refinery Idle.

The gold refinery at Germiston, which started operations a few months ago, is to-day, as a consequence of the strike, standing idle. The last consignment of gold went through the final process last week, and the works were completely cleaned up. As a result the hands, several of whom came out to this country not long ago on lengthy contracts, have had to be laid off.

* * *

Kleinfontein G.M. Co.

Latest reports from Kleinfontein Gold Mine go to show that flooding is steadily proceeding. On the lower levels the water has submerged the pumps. This mine, like other deep working mines, is supplied with pumps on various levels, the water being pumped from the lowest levels up a few levels higher and again still higher until by about seven or eight pumpings the water reaches the surface and runs off into the dam. The higher the water rises the more difficult it will be to eventually clear the lower workings.

* * *

The South African Mint.

The South African Mint will not be completed for several months. As long as there is an embargo on export gold coins will not be turned out. There is no object in manufacturing them under such circumstances. Furthermore, gold will have to come to its standard value. The Mint cannot and will not pay a higher price than £3 17s. 9d. per ounce for its gold to turn into sovereigns. Owing to the delay in the realisation of turning refined gold into sovereigns—sometimes it may be six weeks—the actual value of the gold may be set down as £3 17s. 10½d. to make up for the loss of interest. Silver coins, like gold coins, will not be minted until the face value of the coin at least equals the cost of the material.

A SUGGESTION TO BOTH SIDES.

Let there be another ballot, a secret ballot under Government supervision, of all men who are now on strike.

The question to be answered to be this:—

Are you in favour of returning to work, leaving your leaders (who may not be your present leaders) to negotiate with the Chamber of Mines and to secure for you the best terms they can?

Yes or No.

* * *

Dr. Molengraaff's Mission.

It is noteworthy that there has just arrived in South Africa a special expedition for the purpose of carrying out scientific work. The expedition consists of Professor Molengraaff, of the Delft High School, who is well known as a geologist in the Transvaal, Professor Charles Palache and Professor Reginald A. Daly, of Harvard University (U.S.A.), and Dr. Frederick Eugene Wright, of the Geophysical Laboratory of the Carnegie Institute at Washington. The expedition has been organised by the Harvard University and members of the Shaler Museum. Asked what the precise object of the expedition was, Professor Molengraaff said: "The object is to investigate the laccolite sheet of the Bushveld which is a unique geological feature in the world. It is not the only sheet, but it is the largest in size." Asked as to whether the Union Government was interesting itself in the expedition, Professor Molengraaff said they had not yet got into touch with the Government. The expedition will remain several months in this country, and should the members, during their geological investigations discover indications of economic value, they will, of course, report, but their mission is entirely scientific. It has been suggested to us that the presence of these distinguished scientists offers a unique opportunity to the Union Government to secure an independent and unbiassed opinion on the vexed question of the reef series of the Far East and South-East Rand, on which there has been so much controversy during the past few years. At a time when there is so much talk of a dwindling Rand it seems the duty of the Government to leave no avenue unexplored which may lead to the discovery of an extension of our gold mining industry. The distinguished visiting geologists might be asked by the Government to visit the area in question and consider the evidence immediately available and give an expression of opinion thereon. They might not require to spend much time over their report as there is a vast amount of evidence available in actual workings and boreholes. The bases of their inquiry might be the questions propounded by Mr. R. R. Mabson, who visited the Rand at the beginning of last year. These questions have been printed *in extenso* in our columns.

* * *

Gambling in Exchange.

We note with much interest a note on the "Evils of Exchange Gambling" in a recent issue of the *Chamber of Commerce Journal*, in the course of which the writer remarks that it is estimated that about 50,000,000,000 marks are held outside Germany by speculators in other European countries and in America. If this estimate is correct, it means that only about one-half of the notes issued by the Bank of Germany is required for currency purposes; the rest is held by speculators. Even at 1,000 marks to the £ this balance represents a sum of £50,000,000. The existence of such a huge amount is of great potential importance, for it means that this is available if a demand should arise for German marks as a result, say, of any modification favourable to Germany on the terms of reparation. As the amount is far in excess of the sum likely to be required for exchange purposes, the future of the mark will be influenced by operations on the part of holders of this currency, and if they decide to sell it is difficult to see how a further severe decline in the mark can be avoided.

Metal Report.

Metal report from H. A. Watson & Co., Ltd., dated 28th December, 1921:—

Standard Copper.—The Christmas holidays have intervened since the date of our last circular, but there is no change to report in the general situation. Prices have been just a little weaker latterly, but movements have been unimportant. After closing on 13 inst. at £66 12s. 6d. cash and £67 12s. 6d. three months, the market improved 2s. 6d.

in each position, closing on 16th inst. at £66 15s. cash and £67 15s. three months; these quotations stood until 22nd, when values fell 10s., closing at £66 5s. cash and £67 5s. three months, at which it remains to-day. Closing quotations for manufactured copper are as follow:—Strong sheets, £98 per ton; best select, £68 10s. to £70 10s. per ton; electrolytic, £74 to £75 per ton. Quotations for best select during the past fortnight were as follow:—December 13th, £68 10s.; December 16th, £69; December 20th, £69; December 23rd, £68 10s.; December 28th, £69 10s.

Standard Tin.—Prices advanced smartly from £170 cash and £171 15s. three months, the close on 13th inst. to £174 10s. cash and £176 10s. three months on the 15th inst. The higher level was not maintained and values reacted on 19th inst., when quotations were £2 lower, followed by further reductions on 20th to £171 10s. cash and £173 7s. 6d. three months. Liquidation and profit-taking, also the approach of the Christmas holidays, left a weaker market, and prices again closed lower on 23rd inst. at £173 cash and £173 three months. To-day's market is better, closing at £172 5s. cash and £174 5s. three months. Tin ores continue in good demand and find ready sale. Bolivian bars: Value nominally £152 to £162, according to quality.

Sulphate of Copper.—£27 per ton.

Spelter.—To-day's close is £27 7s. 6d. all positions.

Lead.—The closing prices are £24 8s. 9d. spot, £24 3s. 9d. forward.

Bismuth.—Remains at 7s. 6d. per lb.

Nickel.—Refined reduced at £180 per ton.

Quicksilver.—Prices unchanged at £10 7s. 6d. to £10 10s. per bottle.

Bar Silver.—Closes at 35½d. spot and 34½d. per oz. forward.

Manganese Ores.—Poor demand; value nominally 1s. 1½d. to 1s. 2d. per unit.

Antimony.—Prices unchanged, viz.:—English Regulus £34 to £39 per ton. Chinese £22 to £24 10s. Crude, nominal, £16 to £17.

Wolfram.—There is very little inquiry and the value is nominally about 11s. 6d. per unit for ore of 65 per cent. W.O₃.

Bank Rate.—Reduced to 5 per cent. on 3rd November.

New Mining Companies.

The following are the new mining companies registered in the Union of South Africa from 1st November, 1921, to 31st December, 1921:—Harrismith Townlands Development Syndicate, Ltd., Box 3987, Johannesburg; province, Orange Free State; mineral, oil. Durban Roodepoort Mynpacht, Ltd., Box 7594, Johannesburg; province, Transvaal; mineral, gold. Bethlehem Oils, Ltd., Box 4265, Johannesburg; province, Orange Free State; mineral, oil. Cleveland Mining Syndicate, Ltd., Box 3258, Johannesburg; province, Transvaal; mineral, gold. Platinum Explorations, Ltd., Box 2641, Johannesburg; province, Cape Province; mineral, platinum. Western Main Reef, Ltd., Box 6952, Johannesburg; province, Transvaal; mineral, gold. Afrikander Lease, Ltd., Box 121, Klerksdorp; province, Transvaal; mineral, gold. Kaapsche Hoop Chrysotile, Ltd., P.O. Kaapsche Hoop; province, Transvaal; mineral, chrysotile. Lancaster Central G.M. Co., Ltd., 24 Stock Exchange Buildings, Johannesburg; province, Transvaal; mineral, gold. Arton Copper Co., Ltd., Box 1083, Johannesburg; province, Transvaal; mineral, copper. Lucerne (Transvaal) Asbestos Mines, Ltd., Box 2001, Johannesburg; province, Transvaal; mineral, asbestos. International Coal Syndicate, Ltd., Box 413, Maritzburg, Natal; province, Natal; mineral, coal.

ENGINEERING SECTION.

Bridge Building in South Africa.

ACTIVITIES OF THE CLEVELAND CO.—HUGE STRUCTURE OVER THE VAAL AT VEREENIGING.

As was stated in this Journal some time ago the Cleveland Bridge and Engineering Co., Ltd., of Darlington, England, who were responsible for the steelwork of the Victoria Falls Bridge, have recently been successful, through their sole South African agents, Messrs. A. and S. Ash Bros., Cullinan Buildings, in securing contracts from the Public Works Department of South Africa for steelwork for no less than twenty South African bridges. The weight of the 15 spans required will be approximately 4,400 tons and the cost well over £200,000.

The contract was secured in open competition against the leading firms of Britain, France, Belgium, Canada and the United States. The result is one upon which the world-famous British firm is to be heartily congratulated, also their agents, Messrs. Ash Bros.

The largest bridge of the series is to be erected on the Vaal at Vereeniging, where five spans, each of 150 feet, will replace the present ferry. The material of the bridge is already on the spot and the frontispiece of this week's issue shows the bridge.

Following are details of the twenty bridges, sizes and quantities:—

	Width of		Tons.
	Spans.	Span.	
Vaal River Bridge, Vereeniging...	5	150	465
Knysna River Bridge	2	150	186
Moperi Spruit Bridge	1	150	93
Umhlatuzi River Bridge	3	150	279
Modder River Bridge	2	150	186
Umbogintwini River Bridge ...	2	150	186
*Tugela River Bridge	1	200	156
Unkomaas River Bridge	3	200	468
Umbogintwini River Bridge ...	2	200	312
Umhlatuzi River Bridge	2	200	312
Steelpoort River Bridge	1	200	156
Vet River Bridge	1	200	174
Valsch River Bridge	1	200	174
	(1)	179	
Umhloti River Bridge	(2)		215
	(2)	58ft. 8in.	
Zand River Bridge	2	125	162

IMPORTANT PATENT CASE.

"Natalite" Loses.

In the Transvaal Provincial Division of the Supreme Court, the presiding Judge, Sir Arthur Mason, read the considered judgment of Mr. Justice Gregorowski in the case

of Thomas Bertram Davies v. Natalite Motor Spirit Co., Ltd., and Natal Cane By-Products, Ltd. This dealt with an application for a patent in respect of a process for manufacturing motor spirit from a combination of alcohol with methyl oxide, which was claimed by the applicant to have a vapour tension sufficiently high for use in internal combustion engines designed for the use of petrol. The respondents opposed the grant of a patent on the ground that the applicant's process was not new or commercially useful. At the hearing, which lasted some twelve days, evidence of a highly technical nature was given by a large number of scientific witnesses called on both sides. In the course of his judgment, his Lordship said the applicant was the managing director of the Natal Distilleries, Ltd., in which he held 15,000 shares, and he was anxious to patent a motor fuel of which alcohol would be the predominant constituent, in order to get a commercial outlet for the alcohol produced by his company. In the ordinarily designed motor engine the vapour of alcohol was not sufficiently volatile, and the task set the applicant to the chemist, Mr. Adam, and his collaborator, Mr. Thornburn, was to mix and infuse some substance not already patented, which would increase the volatility, raise the ignition point, and make starting easy and immediate even if the engine were cold, and generally to improve the inflammability of the alcohol.

It appeared from the evidence as to the tests that the applicant's fuel affected the purpose of starting the engine when cold. The vast number of patents granted with small variations of the ingredients showed that the difficulty of solution of the problem had been great, and immense ingenuity and labour had been expended by various patentees in the endeavour to overcome the disadvantage of low volatility of alcohol used by itself as a fuel for internal combustion engines. The evidence showed that the applicant's fuel was new and was an improvement on existing patents. The application for a patent must therefore be granted, and the objectors must pay the costs of opposition, including proper qualifying fee of the applicant's witnesses.

A Monster Crank-Shaft.

Something approaching a record in large crank shafts was recently achieved in a British engineering works. This shaft was constructed for a large marine engine; it measures nearly forty-three feet long and weighs fifty tons. Much more notable than its size, however, was the accuracy with which it was finished. When the shaft was inspected the error in the total length was only eight one-thousandths of an inch, while the maximum error in all the bearings did not exceed twelve ten-thousandths of an inch. These figures were well within the limits of error allowed and constitute a remarkable achievement in complex work of these huge dimensions.

South African Railway Electrification.

SOME IMPORTANT ECONOMIES.

From a valuable paper read recently before the Natal Institute of Engineers, by Mr. H. Clark, B.Sc., on railway electrification, with special reference to South Africa, we take the following interesting extracts.

Whereas in Europe the railway developed in response to a demand already existing, in this country it has, to a large extent, preceded the demand and opened up the country through which it passed. It is well recognised that in the development of a country which possesses latent possibilities, nothing gives a greater impetus to progress than the provision of a cheap and efficient system of transport. It is doubtful whether any Government expenditure is so certain of ultimate returns as money intelligently invested in extending and improving its railway facilities. Indeed, the very prosperity of the country is, in no small measure, dependent upon the efficiency of operation and extent of its railway network.

Considering the South African Railways, the total mileage of track in the Union at the present time is about 10,100 miles, of which 9,600 miles are Government-owned and the balance private line. In Natal, of about 1,400 miles of line 1,360 are Government-owned. Nearly £100,000,000 is now invested in the railways.

Although at present the whole system is steam operated, it is understood that a large portion of the track is to be electrified shortly, and ultimately the whole 10,000 miles will undoubtedly be electrically worked.

Engineers have not always clearly defined ideas as to the advantages of the electrification of our railways, whilst the general public too often have grossly exaggerated ideas of the benefits to be obtained therefrom. In the first place, it must be borne in mind that many of the big electrification schemes have been carried through by private enterprise, although electrification has also been adopted on a number of State-owned railways. Since the private companies are run for profit, it is clear that the electric train must pay better than its steam rival, under certain conditions of traffic and line configuration.

It may be justly claimed that the electric train can be designed for continuous current, single phase, three phase or split phase, and built for any traffic conditions, and that it will then operate at least as satisfactorily under these conditions as the steam-hauled train. The question is, therefore, narrowed down to an almost purely financial one. For electricity to oust the steam locomotive from a position to which it has risen after 120 years of faithful service, it must prove itself to be capable of working more efficiently or of economically performing a service impossible without its aid.

Economy in Fuel and Haulage.

The first claim for electrification is fuel economy. The steam locomotive can deliver one horse-power hour for a consumption of about 4 lb. of coal used, whereas in a modern 50,000 kw. generating station, with a 50 per cent. load factor, about 1.5 lb. of coal would be consumed per horse-power hour. It may be mentioned that Mr. F. J. Aspidal, as general manager of the Liverpool to Stockport line, published figures which showed that when run by steam locomotives the fuel consumption was 100 lb. per train mile, but after electrification the fuel consumption at the generating station was reduced to 19 lb. per train mile. Also tests with 20 steam locomotives on the New York, New

Haven and Hartford Railway and with electric trains running under the same conditions showed that the coal burned at the generating station was half that burnt by the steam locomotive service. Moreover, in a recent article dealing with the United States railways, it is estimated that the electrification of the American railways would reduce the amount of coal used annually for railway purposes from 176,000,000 tons to 54,000,000 tons, thus saving 122,000,000 tons of coal per annum, to which would also be added any saving effected by developing the water power along the routes.

This claim alone will be sufficient to justify electrification in those countries possessing little coal, as in Italy, or where coal is expensive as in France.

The second big claim for electrification is that it increases the working capacity of the line. As a result of careful investigation, it is established that on most railways 10 to 14 per cent. of the total ton miles carried annually with steam working is represented by hauling locomotive coal in tenders and in wagons for supply of tenders. From this point of view alone an increased capacity of 10 to 14 per cent. is assured by electrification. Actually the weight of the tender of a locomotive in running order is from 45 to 60 per cent. of the weight of its locomotive, and in most cases represents weight useless for adhesive purposes. As will be considered further on, there are other factors which enable the electric locomotive to increase the capacity of the line enormously.

STANDARD BANK

OF SOUTH AFRICA,
LIMITED.

Agents and Correspondents
throughout the World.

Regenerative Control and Multiple Unit Working.

Thirdly, regenerative control is possible with the electric train. Instead of applying mechanical brakes to the wheels, the connections of the motors are so arranged that the motors generate electricity and deliver it back into the system. In this way wear and tear of brake shoes, wheels and rails is reduced and economy of energy is effected. On the Italian State Railways the energy returned to the line as the train descends the long gradients is said to be from 60 to 80 per cent. of the energy consumed by the same train on the up journey. Regeneration braking enables very heavy trains to be taken down steep gradients without danger, and on the Giovi-Genoa line, which has very long and heavy gradients, it was found that with electric traction the capacity of the line was trebled, and even then the total running costs were reduced by 25 per cent., due largely to the possibility of using electric braking.

Fourthly, for suburban working the multiple coach system may be employed, and a large proportion of the total weight of the train is then available for adhesion. For freight and main line traffic the tractive force characteristic of the electric locomotive is more suitable for hauling trains than that of the steam locomotive.

Multiple unit working permits of high starting acceleration, and enables the schedule speed upon suburban lines to be raised when stations are close together. The starting acceleration permissible with the steam locomotive is usually about one-third mile per hour per second, whilst with the multiple coach train it may be as high as three miles per hour per second. A schedule speed of nearly 20 miles per hour with stations 730 yards apart is maintained on the Liverpool overhead railway by adopting a starting acceleration of three miles per hour per second.

Fifthly, the capacity of termini is increased, especially where multiple unit coaches are employed upon electrification. Valuable land at termini may sometimes be recovered for building purposes.

Other Advantages.

Many other advantages may be mentioned. Running expenses are greatly reduced. No fireman is required. The cost of repairs is at least 50 per cent. less with the electric train than with the steam train, where the boiler needs constant care and repair. Philip Dawson gives the following particulars relating to the suburban steam locomotive on the British railways:—

- Locomotive under steam, but doing no work 48 p.c. of its life.
- Locomotive under steam pulling train ... 28 p.c. of its life.
- Locomotive under repair or cleaning, etc. 24 p.c. of its life.
- Mileage per annum 20,000 miles.
- Mileage between serious repairs (average) 40,000 miles.

(N.B.—The last report of the General Manager of the South African Railways contained the figure 26.3 for the percentage of locomotives out of commission in May, 1921.)

For the electric train Dawson claims an annual mileage of 50,000 on suburban service and a mileage of 250,000 between serious repairs. The Prussian Government estimated that for equal work with an equal number of reserves 30 per cent. less electric locomotives are required than would be necessary if steam locomotives were employed. It was found that there were always 22.5 per cent. of their steam locomotives in the repair shop, and that there were never more than 54 per cent. of their total steam engines in service at any time—some were being got under steam, others were having boilers cleaned or fire-tubes cleaned, etc.

With the electric locomotive there is no danger of grass fires due to sparks, and this results in a consequent saving of money paid as compensation. Bridges and terminal station interiors need painting less frequently if the corrosive action of the hot sulphurous gasses from the locomotive are eliminated. Costly isolated small generating stations can also be dispensed with.

The electrical engineer will naturally regard the subject from a somewhat broader point of view. He will see in electrification one step towards the universal application of electricity, whereby coal will be burnt economically, its by-products saved from destruction, and the smoke of cities banished.

Germiston Enterprise.

The first steps, of which has been described as the "biggest thing attempted in Germiston," were taken last week when the Council accepted the following resolution without discussion: "That the Council agrees to an option of ten acres in the new industrial township for a period of 12 months from the date of the submission of the draft contract to the Council." In submitting the resolution the Finance and Executive Committee stated that they had been in negotiation with Mr. H. J. Ibbotson, M.Inst.C.E., with a view to the establishment of a gas-producing plant in Germiston. The position is: (1) That the Council grant an option of ten acres in the new industrial township; (2) that a five years' contract be entered into which would provide, *inter alia*, the Council's right to expropriate the plant, mains, etc.; a maximum price to consumers for heating, cooking, and lighting purposes; and (3) protection in regard to any matter arising from the manufacture and distribution of gas.

The Week in the Sharemarket.

PRICES STEADY BUT BUSINESS STAGNANT—WAITING CONFERENCE RESULTS—DIAMOND AND OTHER STOCKS DEPRESSED.

In view of the unsatisfactory course taken by events, prices have remained surprisingly steady during the week. Indeed, some of the Far East Rand favourites have enjoyed support from London, which seems to ignore the possibility of a restriction or absence of dividends for the current half-year. Gedulds were something of a feature on Wednesday, though the whole market tended to become easier on the prospect of the Strike Conference breaking down. At the time of going to press everything pointed to a deadlock, the V.F.P. having declared its non-acceptance of the Federation's arbitration proposals and the Chamber having withdrawn its offer to the Collieries. It is hoped that matters may soon be brought to a head, as business is simply stagnant, and brokers declare they cannot remember any time when there was less doing—not excepting the dark days of the Great War. Diamonds were easier at the beginning of the week, but this department, it is expected, will be the first to recover. Tin and Colliery shares are lifeless, and generally it may be said that the market is anxiously awaiting what the end of the week and the end of this black and troubled month may bring forth.

Piggs Peak Development.

The report for year ended 31st March, 1921, states that no further mining operations have been carried on since last report. The future of the mine depends upon value of ore in lower levels, where prospects at time of closing down were encouraging. In the meantime it is necessary to extend period of debenture issue for another year, and also to postpone payment of interest due thereon for same period.

* * *

Bwana M'Kubwa.

The long-expected scheme for reconstruction of the Bwana M'Kubwa Copper Mining Co., Ltd., is now officially propounded and was duly approved at a recent special meeting. It is proposed to form a new company with a capital of £100,000 in 5s. shares. Holders of the 925,053 old 10s. shares in issue will be offered one new share, with a liability of 2s. 6d., for each old. Subscribers will be given two and four years' option on additional shares at par. Similar operations will be granted to the guarantors of the issue and also to the influential group which sent the well-known engineer, Mr. A. B. Emery, to report on the property. Mr. Emery is stated to have come to most satisfactory conclusions. The quantity of ore proved and reasonably to be expected down to the 450 ft. level is put at 3,000,000 tons, assaying 4 per cent. copper. It is assumed that an additional million tons will be developed for each further 150ft. opened up on the ore body below that level. The flotation process owned by Minerals Separation, Ltd., has been proved eminently suitable for concentrating the ore, and that company is one of the influential interests backing the present scheme.

The Lamplough Synthol Process.

DETAILED DESCRIPTION OF A NEW AND IMPORTANT SOLUTION OF AN OLD PROBLEM.

It has long been known to scientists and others that, subject to certain conditions of treatment, bituminous coal can be resolved into its nascent constituents, and, furthermore, it is more generally known that unless the conditions necessary are obtainable, a re-action sets in, and instead of obtaining what is sought for, the nascent constituents given up by the coal, resolve themselves into acids, and aromatic hydrocarbons, naphtha salts, anthracene, tar, and pitch, all useful products in their way, but not so commercially valuable as the petroleum products obtainable if this reaction can be avoided. Many attempts have been made to obtain the conditions necessary, but as the late Sir Boverton Redwood once observed, the prime difficulty was that chemists were not engineers, and engineers were not chemists, and therefore the harmony necessary between the two to find a solution of the problem, was non-existent. In the present case, the discoverer of a commercial solution of the difficulty happens to be a fully qualified and experienced engineer, with a profound knowledge of industrial chemistry, who, after several years careful experiment and considerable expenditure, has actually solved the problem that has perplexed our greatest scientists and chemists to date. In fact, in 1917, so satisfied was Sir Boverton Redwood (then in charge of the Oil Research Department of the Ministry of Munitions) with his investigation of the Lamplough process, that he strongly recommended the Government to use it for producing the whole of the oil necessary to run the British Navy, and supply the British Armies in the field with petrol spirit.

Before his recommendation could be put into practice came the Armistice, and the advice of Sir Boverton Redwood was not followed up by the Ministry, until last year, when the matter of treating coal for its nascent constituents by the Lamplough process came before the Ministry of Transport, who were, and are, very favourably impressed with the system, and although they cannot guarantee any financial assistance from the Ministry, are prepared to recommend, and use the system for their own requirements as soon as they can be supplied with plants.

In addition to Sir Boverton Redwood's investigations, the system has been thoroughly tested, reported upon and highly recommended by Messrs. Eastlake and Sutton, the well-known oil chemists and experts in such matters. The process is one of great importance to this and other countries, which at the present time are needing an impetus to their industrial progress, and consists of treating coal in such a manner that it is resolved into motor spirit, lubricating oil, gear grease, axle grease, sulphate of ammonia, and smokeless fuel. These results are obtained by an absolutely new and original method of treating the coal, never before attempted by experimenters.

Previous Failures.

There are processes in existence claiming perfect results, while, although backed by much money, and expert advice, have failed dismally to materialise, the chief reason being that they have not overcome the engineering side of the problem, and consequently are still floundering in the stagnant pools of re-actions, which have cursed every attempt to treat coal for its nascent compounds to date. The prime reasons for the many failures to obtain results is through not attacking the problem with a complete understanding of the nature of coal when under heat treatment. For example: Coal in its formation absorbs a large amount of heat, and since its formation has undergone a complete

change of state, needs gentle treatment and humouring to obtain its complete constituents in their nascent condition. Bituminous coal is pregnant with its valuable constituents, which, to be of great commercial value, must be born uncontaminated. To make coal give birth to the perfect fractions of its mother body, requires most careful and positive handling, otherwise the fractions as formed, become degraded, by what is known as the action of destructive distillation, and instead of paraffinoids, one gets reactionary compounds.

The Lamplough System Described.

By the foregoing it will be seen that to handle the prime substance, coal, in a satisfactory manner, is a task of almost super-human difficulty, this difficulty, by the Lamplough process, has been combated and met, by passing the coal through several preparatory zones and keeping it continuously on the move. The first action takes place in the absorption zone. Here the coal, which at this period is endothermic, gradually absorbs heat, and thereby is practically restored to life, and action. At this point the necessary degree of heat saturation is reached, which must be very carefully accomplished, otherwise the coal becomes violently exothermic, and destroys its unborn fractions. By the Lamplough system, a sudden action of this kind is prevented on reaching the exothermic stage, by the coal having by this time travelled into the zone of reduced temperature, where any abullition of excess heat is immediately re-absorbed by the surrounding medium, and by the time the coal has passed through this temperature zone the danger of any possible re-action is entirely averted and the coal commences to distill properly, and give birth to its first fractions, consisting of very light spirit and hydrogen. Having parted with its light fractions, the coal passes into the successive zones of higher temperature, and successively gives off its fractions in the order of their specific gravity, until the hottest zone is reached. From here, after giving up its final fractions, the coal passes into the cooling chamber, where it gives up its heat to the incoming medium, and is passed on to, and through the Briquetting plant, where it is formed into smokeless fuel briquettes, which, paradoxical as it may seem, are capable of giving off twice the radiant heat of the original coal before treatment. Consequently, although in giving up its hydrocarbon content of 20 gallons of oil to the ton of coal treated, plus a quantity of gas and water, and thereby reducing its original weight by 25 per cent., an equivalent in heating effect is obtained from burning the remaining 15-cwt equal to one and a half tons of the original coal from which the oil was extracted.

The net result is a gain of 50 per cent in the fuel value for heating purposes, no smoke or noxious fumes are evolved during combustion, and 20 gallons of oil. From the latter, by a special refining and transforming process (part of the Lamplough system) 3 to 5 gallons of first class motor spirit is obtained, and a similar amount of lubricating oil, the balance being fuel oil, gear and axle grease, and a bituminous pitch, the latter forming an excellent binder for the briquetting part of the process, consequently there is nothing wasted, every scrap of the coal being utilised and accounted for. The gas given off is used for power, lighting, and furnaces, after a preliminary treatment to extract the sulphate of ammonia, for which product there is always a good market, it being always in great demand for fertilizing purposes.

Economic Considerations.

The cost of the plant to obtain these results is quite 50 per cent. less than the cost of any existing plant hitherto used for similar purposes, although the more expensive plants have never obtained anything like the results obtained by the improved and perfected system herein described.

Lubricants

"A grade for each type of service"

Production's Sly Enemy

FRICION—

the [unseen enemy of production in your plant.

IF FRICTION COULD SPEAK, it would confess, "I am robbing you of power, of production, of profit."

If your machines were human, they would tell you that friction is pain—and pain is the forerunner of trouble.

What will guard you against wasteful friction? Correct lubrication—and that only. The subject is well worth your most serious thought.

We are in a position to reduce the wear and tear on your machinery—to reduce power waste and so increase your useable power.

This increased power means increased production without added power cost. It means improved profit. It will protect your pocket-book from friction theft.

We can bring to bear on your plant the most complete fund of lubricating experience in existence. It embraces thorough engineering knowledge and wide practical experience.

The Week's Meetings.

WITBANK COLLIERY, LTD.

IMPORTANCE OF EXPORT TRADE.

Railage Development Needed.

At the annual general meeting of the Witbank Colliery, Ltd., which took place on Jan. 25th at the Corner House, Sir Harry Ross Skinner, who presided, dealt with the work of the company during the year 1921, and in the course of his speech gave some interesting particulars with regard to the export trade. He attributed the improvement in output and profit for the financial year as almost entirely due to the volume and satisfactory price of the export trade, especially in the earlier part of the year.

With the termination of the coal strike in Great Britain in June, 1921, the British coal owners instituted a vigorous campaign to recover their lost markets, which had chiefly fallen into the hands of the American shippers. Prices for Welsh coal were rapidly reduced from 40s. to 20s. f.o.b., whilst the low rates of freights ruling in England for Indian Ocean ports (upon which the Transvaal coal owners chiefly depend) enabled British shippers to land coal at these ports at prices at which the Transvaal could not compete, without revision of railage rates as well as pit mouth prices.

The adverse effect which the complete loss of this trade would have upon the future development of our coal resources and upon railway revenue made it imperative that Transvaal coal should not be driven from these markets. Accordingly representations were made to the Railway Administration and I am pleased to state that both the Honourable the Minister of Railways and the General Manager of Railways appreciated the altered conditions, with the result that the export railage rate to Delagoa Bay, which had been reduced in March last to 8s. 3d. per ton, was further brought down to 7s. per ton and finally to its present figure of 6s. 6d. per ton.

All-Round Sacrifices.

The coal owners supported the action of the Railway Administration and at great financial sacrifice, made drastic cuts in their prices, with the result that up to now shipments have been more or less maintained and a certain quantity of business has been booked for 1922 at the much reduced prices.

These cuts in the price for export coal, combined with the reductions that have been found necessary in the rates for the internal trade, more especially in the retail trade, have resulted in a gradual fall in the average pit mouth price realised, from 7s. per ton obtained in January, 1921, to 6s. per ton in November, 1921, whilst for January, 1922, a careful estimate disclosed a further expected fall to approximately 5s. 9d. per ton.

The maintenance of the export trade is of the greatest importance to the Transvaal collieries, as unless it can be kept up, the reduction in the tonnage output would be immediately reflected in a sharp rise in working costs, which would compel an increase in selling prices, of coal for internal consumption, thus adversely influencing the development of other industries. This would, in turn, reflect again on the coal industry, as well as on the general welfare of the country, and so close the "vicious circle" of restriction. Meanwhile, the infinitesimal margin which to-day exists between the average working cost per ton of the collieries as a whole and the average price realised would be converted into a loss, and several of the less favourably circumstanced collieries would have to close down.

It is to be regretted that the Railway Administration has not seen its way to grant a sufficient reduction in the rail-

age rate to Capetown for bunker coal, since the result is that, with the exception of a few steamers with very restricted bunker accommodation, the large number of boats on the Australian route, which used to bunker at Capetown, now take, at British and Australian ports, enough coal to complete the full voyage, and this trade has fallen from over 20,000 to a few hundred tons per month. South Africa not only loses the sale of coal, including railage, but the port loses a certain amount of general trade.

Colliery Workers' Wages.

As our employes have been on strike since January 1 and continue to be so, I, at the risk of being more lengthy than I would wish, think it advisable to explain the position to shareholders.

From August 1, 1920, the "extra cost of living allowances" which, up to that date, had varied according to a man's dependents, were further increased and consolidated into an allowance, applicable to all workers, irrespective of dependency, which brought the wage per day for workers who drew £1 per shift before the war up to 30s., and provided increases in proportion for lower-paid employes. This allowance was based upon the cost of living figures tabulated by the Director of Census, it being understood that, should these figures vary in the future, the allowances would be adjusted accordingly.

The fall in the cost of living during 1921 resulted in certain quarterly adjustments being made in the workers' wages on the gold mines, the first reduction taking effect from August 1, 1921. Representations were made to the representatives of the colliery workers in respect of a similar reduction in their wages, and conferences were held and correspondence was exchanged on the subject during October and November. Finally when it was realised that the workers' representatives could not agree to the proposed reduction, the collieries section of the Chamber was compelled to give the necessary month's notice, on November 25, 1921, that, from January 1, 1922, the allowance to the higher-paid workers would be reduced according to a scale based upon the cost of living figures from 10s. to 5s. per shift, with proportionate reductions to the lower-paid men.

Where the Colliers Gained.

It should be noted that, as the reduction was to come into force five months after it had been accepted by the workers on the gold mines, the colliery workers have enjoyed the higher rates of pay during that additional period, whilst, from January 1, 1922, the wage would be 25s. per shift as against 24s. 6d. per shift on the gold mines.

The employes refused to accept the proposed reductions and struck work on January 2, 1922, since which date the collieries, thanks to the loyal co-operation of their officials, have been able to maintain a steady output of coal sufficient for present though necessarily limited requirements.

Although the scale of reduction of the workers' wages is based upon the fall in the cost of living, the fall in prices of coal during the past few months, especially for export, has so reduced the margin between cost of production and revenue from sales for the collieries as a whole, that, even with the proposed reduction in wages, it is questionable whether some of the less favourably situated collieries will be able to continue operations.

Our industries are to-day faced with grave difficulties, largely brought about by economic conditions in other parts of the world and over which we have no control. In our efforts to overcome these difficulties, those who are entrusted with responsibility in the direction and management of mines and other works

should be able to count on the loyal support and willing effort of all those who gain their daily bread through the employment afforded, instead of being hindered by strike, dictated by a body of officials of various trade unions who have no responsibility in the running of the industries, and apparently a very short-sighted view as regards the real welfare of the workers.

The whole position has been exhaustively discussed at the conference between representatives of the South African Industrial Federation and representatives of the Chamber of Mines and allied bodies which has been sitting since the 14th inst.; a scheme of settlement of the dispute has been put to the workmen for their consideration, and one sincerely hopes that the men will consider these proposals in a reasonable spirit, and that a way out of the present impasse may be found.

How Progress is Made.

Progress in any country is indicated by an increasing number of successful enterprises, and the more we have in this country of healthy concerns like Witbank Colliery the better. Our company, in earning dividends for its shareholders, not only distributes great sums in payment of wages and stores, but also contributes very largely to the public revenues by direct taxation and railage charges on its products. The last item amounted to no less than £765,675 for the year under review, and the handling after leaving the mine of such a tonnage furnishes employment for many workers outside those directly employed on the mine.

Dr. E. T. Mellor in his recent address on "Recent additions to our knowledge of South African Coalfields," said with special reference to the Witbank district in which district Witbank Colliery is perhaps the most important producer:

"The position to-day is that we have practically unlimited quantities of coal of good quality and proved commercial value, which lie ready to hand, and which can be opened up and worked under conditions as favourable as those prevailing in any other country in the world.

"There are, however, two main obstacles to the proper development of an export trade—inadequate and uncertain means of transport to the coast, and still more inadequate and uncertain provision for the handling of the coal between rail and ship.

"With something like 1,000,000,000 tons practically awaiting removal as soon as a suitable outlet is found, one at least of the conditions necessary to provide our railways with an abundance of traffic for a great many years to come may be regarded as fully assured."

It is difficult to gainsay this opinion; and if railway facilities existed which would permit of the economical and rapid transport of coal to the coast, and those who were concerned in the maintenance of the export trade had a measure of control over the loading arrangements, it is not unlikely that all the former export trade would not only be recovered but exceeded, to the benefit not only of the collieries but of the community in general.

Your colliery has several most valuable assets. It is most favourably situated, lying as it does alongside the main line of railway on the Johannesburg-Pretoria-Delagoa Bay line.

It has wide seams of easily worked coal of excellent quality, and what is important, of a quality slightly better than most of its neighbours in the Mid-delburg district.

It has a most efficient management and staff, to whom the thanks of the shareholders are due; and after these present most difficult times are behind us I hope their services will be suitably recognised.

General.

"The Spanish fleet thou canst not see, because—
It is not yet in sight!"

The Strike Conference, except in so far as the temporary removal from the agenda is concerned of the coal question, the reduction of wages in the Town Engineering Shops, and the demands of the V.F.P. employees for an increase in wages, is no whit more advanced in the matter of the much more important issues relating to the gold mines than when it commenced its labours. No end of the main dispute is yet in sight, and unless the Conference, which appears to be at breaking point, breaks up of its own volition, very protracted negotiations appear to be ahead of us.

"Quip's" admirable "tortoise" cartoon which appeared in *The Star* last week, aptly hit off the position regarding the progress—or, rather, absence of progress—made at the Conference, the strike might collapse. He referred to the same cartoon to-day would but too truly depict the position as it now appears to the man in the street. In the meantime upwards of 30,000 natives from the various mines have been sent home, with the result that even if the strike were to be called off now there would be fewer jobs going for at least 3,000 miners. A mass meeting of ratepayers held in the Town Hall on Monday last protested vigorously against the attitude of the Tramway and Lighting Committee in refusing to accept the supplies of coal offered to the Town Council, which would at any rate have prevented the lamentable stopping of the tram service and much inconvenience to the public. Energetic, if belated, action seems now about to be taken in connection with the Albion Mine's offer to supply coal to the Council, and it is much to be hoped that the tram service will soon be in operation again. Commercially the protracted strike is having a disastrous effect; business has fallen off tremendously, in fact, one is not at all exaggerating in saying that for the past fortnight there has been a complete cessation of business operations in the mining material and wholesale houses; and the effects among the retailers have been of a no less devastating character. Speaking to a very prominent commercial man this week, he said the extent of the losses caused the community through the strike was simply incalculable, and that people were sick and disgusted with the whole business. The trend of feeling in commercial circles was that all this trouble could well have been avoided by timely action in taking the necessary steps to come to a proper settlement. Financially, the position was extremely grave, as, should the strike continue much longer—and unfortunately everything points to its doing so—many merchants would be faced with great financial difficulties. Merchants have, of course, to meet their bills falling due, and, in many cases, to keep people going who are indebted to them for large sums, which is a very awkward position, to say the least. To-day, he said, no man could say how long the strike was going to last; there were possibilities of a very long struggle, but, on the other hand, it might just happen that something would come along to end it quickly. It was very clear to him and others that every day that passed without a settlement was automatically laying off so many workers from their billets. He thought that the workers themselves were getting tired of the position, and it was just possible that through the action of the workers

themselves, and not through any efforts on the part of the Conference, the strike might collapse. He referred to the very satisfactory outputs of coal now being made at several of the collieries by mine officials without the aid of the so-called "collier," and thought that it was possible to do away with redundant labour on some similar plan in the gold mines also. A very serious feature in the present strike—leaving other huge losses out of the question—is the loss by the gold mining companies of the present premium on gold—12s. to 15s. per oz. on the thousands and thousands of ounces—now irretrievably lost. A prominent importer of mining material said he could only foresee a bitter struggle ahead, while both parties were so adamant in their demands, and in his opinion the Government should now step in and force a settlement to prevent the further ruination of business. On all sides emphasis was laid on the imperative necessity of wholesale houses resorting to retrenchment of staffs should the strike extend over the present month. This is a disagreeable necessity, but merchants cannot of course carry such big expenses without

making sales. At the moment merchants are not in touch with overseas markets, no indents are being placed, and everything is hung up waiting on the labour settlement. A leading mining material importer said the Press was at first too optimistic as to the duration of the strike; he was afraid it was going to continue for a long time. In the meantime, in the complete absence of business, he was giving his staff extended holiday leave. Another well-known merchant looked upon the position as very grave, but at the same time said that in view of the present cost of living standard the mining industry could not afford to pay the present high wages.

Iron and Steel Trade in America.

Production of steel ingots in November was at about 44 per cent. of capacity, or approximately the same rate as in October. The Steel Corporation's unfilled obligations decreased by only 36,286 tons during November, but shipments, at about 675,000 tons, were the heaviest since last March, so that the bookings were about 650,000 tons, probably the largest since September, 1920. Finished steel prices are practically stationary. Though there is open and active competition, mills show little disposition to cut prices. When the market broadens, probably early this year, some slight further sagging may occur. Sheets, formerly irregular, are now stiffly held at 3 cents for black and 4 cents for galvanised, with a light demand. Pig iron: Prices are unchanged. Bessamer, \$20; basic, \$19; foundry, \$20.50 f.o.b.

The Federal Iron and Steel Corporation has been organised in Spokane for the development of 1,500 acres of iron-bearing land near Tekoa. Plans include a 100-ton pig iron furnace to be erected at Pekoa.

The Anaconda Copper Mining Company will come close to monopolising the western wire trade, once it has brought to fruition its plans for the installation of a plant at East Falls for the insulation of wires.

Union's Grain Elevators.

The contractor for the construction of 36 grain elevators in the Union, Mr. A. W. Meukins, has left for South Africa with the remainder of the expert staff, comprising, chiefly, Canadians, but including several Englishmen, Australians, and two Americans. Interviewed by Reuter previous to his departure, Mr. Meukins emphasised that the material used for the elevators would be British or South African, and that out of an expenditure of £1,250,000 less than £30,000 would go to foreign countries for special requirements which it would not pay to construct in Britain. As previously stated, the order for the machinery for Durban and country elevators has been placed with Messrs. Spencer & Co., of Melksham; that for the machinery for the Capetown elevator with Messrs. Henry Simon, of Manchester; roofing material with Messrs. Briggs, of Dundee; waterproofing material with Messrs. Faldo, of London; and steelwork with the Furness Shipbuilding Co. Practically all the other items required, notably sandstone, cement, reinforcements, and ironwork will be obtained in the Union. As at present arranged, Mr. Meukins will commence the work within two months of his arrival on the Durban terminal and its feeders, with Bethlehem as the central station, covering the Free State east of the main line. He then proceeds to the Transvaal to construct the system covering the Eastern Transvaal, bounded by Standerton, Bethal and Oogies, with the central station at Germiston. It is hoped to commence the terminal at Capetown in September.

Steam Tractors in use by Railways proving very Economical.

The General Manager of Railways states that a number of new rubber-tyred tractors recently introduced in connection with the cartage work in Johannesburg are proving very successful. The load hauled by them averages 70 to 110 tons per day, compared with 24 tons hauled by motor lorries. The quantity of coal consumed in one day by 12 of the new tractors costs very little more than the daily petrol consumption of a single motor lorry capable of handling only 24 tons per day.

Pretoria Engineers Shut Down.

Owing to the absence of orders from the Reef, the firm of Messrs. Delfos, electrical engineers, Pretoria, has closed down.

Timber and Building Materials.

Business has slackened off considerably during the past fortnight. A lot of work is in the offing and will be vigorously tackled so soon as things have again reached normal.

Prices.—3 x 9 deals, 1s. to 1s. 1 $\frac{1}{2}$ d.; scantlings, 11d.; beaver boards, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; floorings, 6 $\frac{1}{2}$ d. to 6 $\frac{3}{4}$ d.; coilings, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; Oregon, 7s.; pitch pine, 8s.; corrugated iron, 8 $\frac{1}{2}$ d. to 9 $\frac{3}{4}$ d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second at the coast; American oak, 1 in., 10d.; 1 $\frac{1}{2}$ in., 11d.; 2 in., 11 $\frac{1}{2}$ d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1 $\frac{1}{2}$ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per foot. Prices for bricks are: Mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Builders are, it is understood, full up with orders, but are staying their hand for the present, with the result that things are very quiet.

Second-hand Iron and Timber.

Business in this section is exceedingly quiet pending settlement of the labour dispute. Timber is 8d. to 9d., iron 6d. to 7d.

World's Gold.

According to the latest statistics available at the end of 1921, it is stated that the Empire visible stock of gold totals £247,000,000, excluding amounts held privately by the United Kingdom banks. The national gold reserve of the United States, including the Treasury and the Federal Reserve Banks, totalled £789,000,000; France had £219,000,000, Japan £129,000,000, and Spain £100,000,000. The estimated British production in 1921, taken at 85s. per fine oz., was £46,500,000 of the world's production of £66,000,000. Of this amount £34,500,000 came from the Transvaal and £3,300,000 from Rhodesia and West Africa. The British proportion of gold is increasing, although the world production is decreasing.

American Notes—America and its Surplus Gold in respect of World Trade.

The world is still in a curious situation as to its money, says the *Engineering and Mining Journal*. American money is good, because it is gold and silver money. But we have the lion's share of the gold reserves of the world in our vaults. Prosperous as we still are, we see that the prosperity we demand depends upon the revived prosperity of the rest of the world. Through inflation—through vast issues of paper money produced with the superstitious idea that it would turn out to be good or half good—and the exhaustion of gold to pay nations like the United States which would accept, not paper, but gold alone, in settlement of trade balances, many of the European countries besides Russia—such as Poland, Germany, and Austria—find themselves without money. Our problem is to help them to get money again—gold or silver. We must loan them money if they are ever going to be able to re-enter business relations with us again. We have enough metal in our Treasury for that purpose, and the justification therefore no longer exists for the Governmental stimulation of gold production. We must now find some way of distributing our metallic reserve in part among the other members of our world in trade. But have we enough metal, after all, for the vastly increased trade demands and for the vast modern currencies which must be supported? Great as is the store of gold in the world, as compared with former times, it is relatively less when we consider the increased wealth which it represents and the trade it must accomplish. Our position is strengthened through increased reserves of gold and silver and the infiltration into the United States. This will go on for some years. Our gold and silver is at a fixed ratio of \$20.67 to \$1. The unstabilised price of silver in the outside world has fluctuated as widely, almost, as the exchanges. Therefore the silver money of the world, primarily intended as a medium of trade, has become an object of trade, has been melted down and sold outside the countries of issue, thus further stripping these unhappy nations of that money without which they cannot go on. All of these countries have plenty of goods to barter—it is money they need, and that money must be gold or silver.

Silver should be stabilised in Europe and Asia, and the existing stabilisation in the United States should be made permanent.

Industrial Wage Reductions.

In the eleven months from January 1 to November 30 the wage reductions in the principal industries in England have been:—

	No. of workpeople affected.	Aggregate net decrease per week.
Building and allied trades ...	445,000	£303,000
Mining and quarrying ...	1,291,000	2,550,000
Iron and steel smelting and manufacture ...	239,000	431,700
Engineering and shipbuilding ...	1,359,000	652,000
Other metal trades ...	360,000	200,000
Textile ...	1,004,000	594,800
Clothing ...	222,000	44,500
Transport (excluding tramways)..	906,000	383,000
Printing and allied trades ...	202,000	47,500
Furniture and wood-working ...	83,000	53,400
Chemical glass, brick and pottery	230,000	122,900
Food, drink and tobacco ...	195,000	47,400
Other miscellaneous trades ...	123,000	56,700
Public utility services ...	314,000	126,000
	6,973,000	5,563,000

To this aggregate of £5,563,000 per week has to be added the further reductions made in the mining, engineering, shipbuilding, iron and steel, and other industries in December. In most of the mining districts the amount of reduction was small, and South Wales and several other districts are now down to the minimum wage.

Union's Imports and Exports 11 Months ended November, 1921.

	1921.	1920.
Imports ...	£53,472,347	£96,913,441
Exports ...	£55,825,033	£77,485,500
Total ...	£109,297,380	£174,398,941

This is a decline in the trade of the Union of £65,101,561. The exports of raw gold totalled £31,098,000 for 1921, as compared with £32,529,612 for 1920; wool, £7,025,770 last year as against £15,424,488 in 1920; food and drink, £3,485,240 in 1920, as compared with £6,420,699 last year. Decreased entries of food and drink, iron and steel manufactures, wood and timber, cotton and woollen goods account for the decline in imports. Machinery, on the other hand, marked an increase, but the strike has put a stop to any active developments in that direction.

Railway Earnings for Week ended January 14.

These, according to an official statement, were £425,135, which represents a drop of £10,067 under the estimates, chiefly due to diminished coal traffic. The harbour earnings, £23,441, during the same period, show a slight advance on the estimates.

Railway Deficit.

The financial position is steadily becoming worse. Starting the year with a deficit of £2,598,884, losses have been increasing month by month and the probability is that the deficit will be nearly £4,000,000 when the railways start the financial year 1922-1923.

Electrical Goods.

A leading importer of electrical wares stated that business was very bad, and that it was almost a farce to keep open during the present crisis. Rhodesia was ordering a few goods, but otherwise there was nothing doing. Instead of, as normally, taking about £100 to £150 daily, his receipts to-day did not exceed £15 to £20.

Britain's Declining Cost of Living.

The cost of living fell 7 per cent. during December, at the end of which month it was at the lowest since March, 1918, viz., 92 per cent. above the pre-War rate.

FOR SALE.

**NEAR JOHANNESBURG GOLF CLUB.
FAIRWOOD, ORANGE GROVE EAST.**

Brick house, lounge 20x16, dining room 20x13, 4 bedrooms, steel ceilings, electric light, hot and cold water, 5 stands, tennis court, pine trees, few fruit trees; easy distance from town, 70 yds. from Johannesburg Golf Club Road. Suitable place near gate for garage.

Owner who is shortly leaving for Europe will accept reasonable cash offer.

Apply L. A. S. c o "Mining Journal"
178 Stock Exchange Building.

Cape Electricians' Strike.

A settlement has been arrived at in the strike of local employees in the electrical trade and the men have returned to work, the highest scale of pay being fixed at 2s. 11d. an hour.

Metal Market.

Latest London quotations: Standard copper, £65 cash, £65 15s. forward; electrolytic copper, £71 cash, £73 forward; standard tin, £158 17s. 6d. cash, £160 7s. 6d. forward; foreign lead, £23 cash, £22 17s. 6d. forward; quicksilver, £11 5s.; bar silver, 34 $\frac{3}{4}$ d.; and bar gold, 97s. 9d. per oz.

New York Metal Market.

Latest quotations: Copper, 13.75 cents; lead, 4.70 cents; zinc, 6 cents; tin, 33 cents; aluminium, 20 cents per lb. for 99 per cent. grade; antimony, Chinese and Japanese brands, 4.50 cents; quicksilver, \$49 per 75-lb. flask.

Copper is steadily rising in America. Last August saw the metal freely offered at 11.75 cents with but few buyers; mid-December it was selling at 14 cents, a rise of almost 20 per cent. At the beginning of 1921 almost one billion pounds of copper was available, a surplus which is now estimated at 600,000,000 lb. Export business in copper continues to be surprisingly good. Germany and Japan are the best purchasers. The copper situation is better than it has been at any time since the Armistice.

Letters to the Editor.

KNIGHT CENTRAL GOLD MINE.

To the Editor, *S.A. Mining and Engineering Journal*.

Dear Sir,—Wouldn't it be a good scheme to place Knight Central in liquidation at once? If the mine does re-open it will only be for a couple of months, and operations for these few months will only result in a loss. Cash in hand at present is sufficient to pay a first liquidation dividend of 3s. to 3s. 6d. per share, but this is being eaten away daily. Let's wind up at once and save as much from the wreck as possible.—Faithfully yours,

SHAREHOLDER.

SOLUTION OF THE STRIKE TROUBLE.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir,—There have been floods of oratory during the past few weeks, but oratory should be fined at present—it is a nuisance. We want to get back to an efficient mining industry, and in this process a large number of men will be displaced—for their own good. Consequently it is up to the Government or some other body, if the Government is quite incapable, to arrange to disperse these men and send them back to their dorps, and, if necessary, issue doles for a period to enable them to get work. It is quite unreasonable to ask that the mines and the railways should become relief organisations, and I think that if the leaders of the men could be told that the redundant workers would be assisted by the Government, the strike would be closed. There is no doubt we are in a mess, but by the exercise of good temper and everyone doing a bit to help the Government, a solution can be found to the present trouble. Naturally, the Government will have to put on a special tax to meet the payment of doles and cost of sending the men back, but this could be met by a special tax on the mines which would benefit by the increased efficiency of mining. It is quite clear that 2,000 or more men cannot roughly be told to "get out"; they should be assisted to find other avenues of employment. South Africa wants a lot of development yet, and the Government should be assisted to

find employment for all our youth, and redundant mine operatives, who will be disturbed by the new conditions which we are determined to get, viz., proper conditions of

EFFICIENCY.

[Our correspondent seems to overlook the fact that it is a question, or rather has been a question, of either 2,000 men being dispensed with or else of a very much larger number of men having to be retrenched in consequence of the closing down of a number of low-grade mines.]

German Wire Ropes for Export.

An export organisation of a somewhat novel kind is proposed by the Economic Association of German Wire Rope Works, of Düsseldorf, for the purpose of promoting the export trade and thereby enabling Germany to obtain foreign currency to pay her indemnity with. The scheme proposes in the first place that German works obtaining an order from abroad shall receive a commission of 5 per cent. on the order in the currency of the country for which it has been booked. In addition to this, the works in question is to be allowed to book one-fourth of the order without this quantity being deducted from its allocation in the Association, and, of course, also one-fourth of the amount of the invoice. The remaining three-quarters of the order are to be divided among the constituents in such a way that 75 per cent. of the three-quarters are distributed among all the constituents of the Association in proportion to the number of workmen employed by the various concerns at the end of 1919, while the balance of 25 per cent. is to be divided among all the works in equal shares irrespective of the size of the different plants. It is claimed that this scheme would render it possible for 70 per cent. of the amount of the bills of exchange obtained through foreign orders to be placed at the disposal of the Government, and mutual underselling of the various concerns abroad would be stopped. It is explained that the situation of the German wire rope industry has hitherto been of such a character, owing to the ruthless price undercutting in the markets abroad, that the obtaining of orders at rates in foreign currency has been prevented to a large extent, and as a rule export prices were consequently forced down to the level of inland prices. Under the pressure of the competition of German non-associated firms, the members of the Association, who until then had faithfully observed the rule to sell only in foreign currency for export, were compelled to drop their allegiance to the Association since last March, and to invoice their goods in marks. Under the proposed scheme, however, as almost all the makers of wire ropes have now joined the Association, it is calculated it will be possible to sell in foreign currency in every case and obtain substantially good prices abroad.

S.A.I.F. Finances.

In view of the ballot to be taken on the strike by Durban building trades, the circular issued last month by the S.A.I.F. to affiliated bodies is interesting, writes a Durban correspondent. It was a reminder to the unions that the executive could not meet their liabilities unless financial obligations were met. Attached to the circular was an approximate amount due to the Federation in respect of affiliation fees. According to the statement, accounts owing to sundry creditors amounted to £1,231 14s. 3d., plus £169 in respect of salaries for December. The principal items were: Johannesburg Trades Hall, rent, £537 17s.; A. Crawford, amount loaned, £210; and Durban District accounts, £117. Affiliation fees in arrear to December 31 totalled £1,936 2s. 6d., the principal amounts being: S.A.I.F. Industrial Union, £196 16s.; S.A. Mine Workers, Benoni, £190; S.A. Reduction Workers' Association, £170; S.A. Mine Workers', Boksburg, £80; Germiston, £80; Springs, £95; A.E.U.S.A. Council, £90; Durban A.S.W., £70; and S.A. Boilermakers, £75. By the way, when do these various unions and societies publish balance sheets and reports? We should particularly like to see them.

Crocodile River Gold Fields.

REPORTED DISCOVERIES—A NEW BANKET FIELD?—TOPOGRAPHY AND GEOLOGY OF THE AREA—
A RUSH OF FARMERS AND PROSPECTORS—IS IT BLACK REEF?

Considerable interest is now being evinced in the mineral prospects of the country traversed by the Crocodile River in the mid-western portion of the Transvaal. This area has for long been known to contain promising indications of mineral wealth, including iron ores and coal. Interest in this district has, however, just recently been greatly quickened by reported discoveries of gold. According to one informant, discoveries of rich auriferous ore have lately been made at two or three points in the vicinity of the Crocodile River, and prospectors and farmers are said to be trekking to the new fields in large numbers. One well-known prospector whom we interviewed on the subject stated that he had recently seen specimens of banket from this locality which were very similar in appearance to the conglomerate beds of the Witwatersrand. It is stated that on the farm Hagebomen No. 85, which is situated about 80 miles north of Rustenburg and a few miles from one of the large iron ore discoveries of the country, a conglomerate bed, probably of Black Reef age, is being opened up and that the indications are quite promising. Other authorities, however, contend that the "discovery" has been known of for many years, that it is ascribable to the Lydenburg age, and that it is unlikely to lead to anything of much importance.

Physicgraphy of the Area.

According to Dr. P. A. Wagner's recently published memoir on the Crocodile River iron deposits, the area illustrates in a striking manner the combined effects of complex

On the Bank of the Crocodile River, showing Outcrop of Iron Ore.

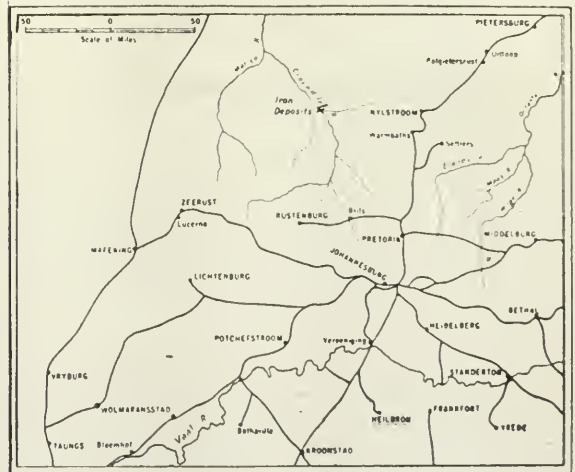

faulting and long continued denudation on a tract of country built up of a succession of highly resistant and comparatively easily eroded sedimentary rocks. It is, as stated, of a rugged nature, lofty ridges alternating with flat-bottomed valleys, which in turn are surmounted by minor ridges and hills. The dominant features in the landscape are three banded ironstone ranges, which in their highest portions attain elevations of from 1,500 to 2,200 feet above the level of the Crocodile River.

The northernmost of the ranges trends in a north-north-east direction from the northern portions of Mooivallei No. 144 and Donkerpoort No. 839 across Rosseauspoort No. 32, Rotterdam No. 237, and Cornwall No. 521; eventually dying out on the last-named farm beneath the Waterberg sandstones occupying the north-eastern part of the area. The range culminates on the farm Rosseauspoort in a great escarpment presenting a precipitous face to the north-west, in which it attains an altitude of 5,160 feet above sea-level. This is the most elevated part of the area.

Geology.

Geologically, the area is situated at the point where the north-western rim of the Bushveld basin has, as a result of thrusting from the south, overridden the south-western edge of the main Waterberg basin. It thus includes small portions of the margins of both basins, that of the former showing the Transvaal and Ventersdorp Systems resting on the older granite and dipping in a general south-easterly direction beneath the igneous complex of the Bushveld.

As in the country lying to the east, the contact between the two basins has been the scene of great earth movements caused by intense pressure acting from the south, and doubtless in great part due to the intrusion of the Bushveld laccolite. The greater part of the area is occupied by the Transvaal System. This forms a broad belt with a general north-east-south-west trend, which on the farms Mooivallei No. 144 and Donkerpoort No. 839 is split by faulting into two portions, one trending north-north-east and the other roughly east and west. The two belts gradually diverge, being separated in the north-eastern part of the area by an irregularly wedge-shaped tract of Waterberg sandstone representing a south-westerly projection from the main Waterberg area to the north-east. The Waterberg sandstone rests unconformably on the rocks of the belt trending north-north-east, while its boundary with the east and west belt is formed by a great thrust fault. Dipping beneath the Transvaal

Map of the Crocodile River Area.

System on the north-west is a belt of rocks partly of volcanic and partly of sedimentary origin belonging to the Ventersdorp System. These rest unconformably on the Old Granite. On the south-east the rocks of the Transvaal System are succeeded by norite and diabase belonging to the Igneous Complex of the Bushveld. These rocks have invaded the upper part of the Pretoria Series and extend as far as the Middle or Daspoort quartzite. The Magaliesberg quartzite is broken up into detached fragments completely surrounded by norite. In the south-eastern corner of the area normal

P.O. Box 3807.

ROCKWOOD PRESSED STEEL UNIONS

H. ALERS HANKEY - - - Sole Agent.

red Bushveld granite makes its appearance. South of the southern iron range, and north of it between the Crocodile River and the Bier Spruit, the underlying rocks are over wide stretches hidden from view by a considerable thickness of alluvium and superficial drift. In the valley of the Zand River, for example, one can walk for miles without seeing rock in place.

Awaiting Further Developments.

Until more definite information as to the nature and extent of the deposits is available, it would be unwise to attach too much importance to the statements which are now being circulated as to the finding of a new and rich gold field in this portion of the Transvaal.

It need hardly be said, however, that subsequent developments will be watched with very great interest, and especially so in view of the fact that the great gold mining industry of the Rand is now enveloped in a cloud of black industrial dispute.

Making Maps from the Air.

When photography from aeroplanes began to develop many people realised that it would prove of great assistance in surveying countries and making maps. All that seemed to be required was a series of photographs which could be pieced together to form an accurate picture of the country over which the aeroplane passed. The problem is not, however, quite so simple as it sounds. In order to get an accurate picture the camera should be strictly vertical at the moment the photograph is taken. It seldom happens, however, that an aeroplane is flying exactly horizontal; and for this and other reasons, very careful investigation of the problem became necessary before aeroplane photographs could be used for really scientific map making. This investigation was undertaken recently at the University of Cambridge, England. It was found advisable to select and train pilots specially for map photographs and also to carry out careful experiments in the measurement of the tilt of an aeroplane. As a result it was found possible to reduce the tilt to within a safe limit, so that there should be no material distortion of the photograph due to the camera being at an angle. The next part of the problem was to arrange the flights of the mapping aeroplane so as to cover the entire ground without gaps or excessive overlapping between the strips of photographs. Satisfactory progress has been made with this part of the problem, and it is also hoped to develop a system by which relief maps can be composed from photographs taken from the air.

* * *

Gas Engines.

Investigations for the more economic utilisation of coal and the substitution of other sources of power have led to some astonishing results in the use of all sorts of hitherto waste substances which, when dealt with by modern methods, have been found to have a high calorific value. This will prove of great value to South Africa, especially in districts far removed from the coal fields. Apart from the engines and plants to run on anthracite coal or charcoal, gas engines and plants for the utilisation of bituminous coal, loco, smokebox char, green wood, mealie cobs, sugarcane, refuse, spent wattle bark and practically any negotiable refuse not containing more than 50 per cent. moisture are now being manufactured. Also airless cold starting engines from 20 horse-power upwards to run on mineral oils, such as crude, residual, semi-refined and vegetable oil, such as monkey nut, cotton seed and palm oil, are being used in ever-increasing quantities. The Lonely Mine (Rhodesia) has decided to discard its steam engines and to instal three 444 horse-power horizontal multi-cylinder engines for running alternators in parallel and one 333 horse-power for direct coupling to an air compressor. The gas plants to be employed consist of four suction producers, cross-coupled and gasifying the local Rhodesian woods. Three of those engines and plants have been in commission for some months and are reported to be giving the utmost satisfaction. Many other gas plants have been installed in South Africa which are running on wood and products other than coal.

THE GREAT STRIKE.

FAILURE OF THE CONFERENCE—JUDGE CURLEWIS ATTEMPTS TO BRIDGE THE GULF—GENERAL SMUTS APPEALS TO BOTH PARTIES—COLOUR BAR NOT THE ISSUE—THE CHAMBER STATES ITS NEW TERMS—JOINT EXECUTIVES CLOAK THE DISPUTE WITH POLITICS.

The thirteenth sitting of the Strike Conference on Friday of last week proved its last.

The Federation had made its final proposals to the Chamber the previous evening, and when the Conference resumed its sittings on Friday morning, these were described as preposterous by the Chamber of Mines' representatives, and rejected.

Suggestions were then put forward by the Chairman, Judge Curlewis, with the object of bridging the gulf. But in the afternoon it was intimated that these also were unacceptable, and the conference broke up.

Both parties agreed that further meetings would serve no useful purpose.

When the morning session of the Conference opened, the Chairman, Judge Curlewis, read the letter from the Federation setting forth their final proposals for the ending of the disputes. These were:—

Mr. Buckle commented on the failure of the Federation to put forward constructive proposals, and added that they simply reiterated their direct negative to the Chamber's proposals, and it seemed to him that they had shown an extraordinary absence of sense of responsibility for the carrying on of the industry.

"I want to point out one other thing quite clearly," he added. "Our proposals were put forward last November when the price of gold was undoubtedly higher than it is now, and even if there had been no strike, the steady drop in the price of our product would by this time have compelled us to put forward other proposals. And, of course, this strike has enormously aggravated the situation, and I desire to make it perfectly clear that there can be no question at all of our withdrawing or modifying the pro-

Idle Mine Boys watching a Strikers' Commando on the March.

By courtesy of *The Star*.

Coal Section: Withdrawal of notices, and submission of disputes to arbitration.

Gold Section: Withdrawal of all notices, and no interference with the status quo agreement.

The Federation and unions are prepared to discuss with the employers all other questions in dispute in conference, in accordance with past procedure.

No settlement of the strike can take place until the outstanding disputes with other employers balloted on are settled.

Mr. H. O. Buckle, replying on behalf of the Chamber of Mines, said that the Chamber put forward proposals which, if considered, rightly or wrongly, would prolong the life of several mines, extend the quantity of ore they could work, and would in the long run increase employment. To these proposals the Federation returned a direct negative, and now, in its present terms, it reiterated that.

posals we have put forward. The only question is what increases have to be made to meet the present situation. Of course we entirely reject the Federation's terms."

The Last Effort.

The last effort to prevent the Conference breaking up with nothing done, was made by the Chairman, who at this stage reviewed the points made on either side, and put forward the following suggestions on his own part:—

(1) The statutory regulations laying down the colour bar to remain unaltered.

The status quo agreement to be withdrawn as regards low grade mines, a schedule to be drawn up of what are considered low grade mines. If necessary, a ratio of white to coloured can be fixed for such low grade mines, below which the withdrawal of the status quo agreement shall not be allowed to operate.

The strike to be called off; the men to return to work as soon as the condition of a mine justifies a resumption of operations, and the men to be allowed to resume work in proportion as operations are resumed.

(2) The contract system to be abolished, leaving it to a Conference or Reference Board between the Federation and the Chamber of Mines to decide as to what system of remuneration shall be substituted for the contract system.

(3) The reorganisation of underground work to be settled by a Conference or Reference Board between the Federation and the Chamber of Mines.

It was agreed that the Conference should adjourn until the afternoon, in order to give both sides an opportunity of considering the Judge's proposals.

The afternoon session proved to be the last of the ill-fated Conference.

The Chamber's Last Word.

On the Conference resuming,

Mr. Buckle said: We have considered the proposals before us from the Federation, and the only thing we can say about them is that they are preposterous and impossible. Their proposals that the high grade mines should turn themselves into an association for the relief of unemployment, really seem so far from practicable, that one cannot take it seriously. There is no earthly reason why a baker who has prospered in trade should proceed to take over the employes of a baker who has failed in trade when he does not in the least want them. And what the allusion to the money saved by the high grade mines is, we do not understand. No money has been saved, not that I know of at any rate, but of course that really does not affect the position.

Then the proposal that the ratio should be fixed in such a form as to make a gradual return to the population ratio—well, there really is no foundation for that at all. There is no conceivable reason why a particular industry should employ different races in proportion to the population of the country. The two things have no connection whatever. They must of course be employed in the ratio to what the particular industry demands, and the fact that the relations of white and black throughout the Union is such and such, has no relation whatever to the question of what the ratio should be on the mines.

The remainder of their items are simply reiterating their original oppositions.

What we have got to do clearly is to reconsider the position entirely in the way in which it has been aggravated, and is being aggravated every day.

We shall have to state shortly the terms on which we shall be able to resume the work of the mines, and those terms will have to go further than the ones we have put hitherto. We shall have to deal with other subjects, wages, etc., and then we shall have to consider these in the light of present circumstances, and not of a month or two ago, which are very different, and we shall have to endeavour to go into that and put forth a statement on the matter; but, sir, we entirely agree that under present circumstances, under the present state of affairs, any further discussion will be quite useless.

Mr. Thompson: After what Mr. Buckle has said, I can only state that I agree with Mr. Buckle when he says we have utterly failed.

We have utterly failed at this Conference to find any solution of the present difficulties.

I claim that the reason for that failure will be shown in the records of this Conference that it has been largely due to the continual hardening of the employers. Whenever they opened the Conference, we did show a spirit of compromise. Had the same spirit been shown by the employers, I feel that there was a possibility that we might

have found some solution, but instead of that they have consistently and religiously made the position harder and harder.

General Smuts' Letter.

The Prime Minister on Friday addressed a letter to the President of the S.A.L.F. and the Chamber of Mines, in the course of which he stated:—

Government's Anxiety.

Before the occurrences which led to the present strike, the Government had for some time been gravely anxious about the position of the low grade mines and the threatened extinction of a large portion of the mining industry.

In November last I met both sides to the present dispute at a conference called by the Government, and warned them of the urgent necessity, in view of the fall in the gold premium, for re-organising the mining industry in order to save the low grade mines. How urgent that necessity was appears clearly from the report of the Low Grade Mines Commission, which was signed, among others, by the present Secretary of the Federation of Trades, the present Assistant Secretary of the Mine Workers' Union, and the then Secretary of the Mine Workers' Union. That report pointed out that with gold at 105s. per oz. (as it then was) more than half the mining industry was low grade and in danger. This affected the employment of 11,656 whites and 88,000 natives, and an annual expenditure in wages and stores of nearly £13,000,000.

Fall in Price of Gold.

Since then the price of gold has fallen until to-day it is 97s. 6d. per ounce, and the urgency of special measures to save these mines from disaster has become most acute.

The Conference.

The only effect to-day of the use of the strike weapon has been the endangering of the lives of certain low grade mines, owing to the flooding and the heavy cost of native wages, the loss of over 30,000 natives who have voluntarily returned to their homes, the postponement of the date of re-employment of a number of men far beyond the actual ending of the strike, the closing of many of the public services of the Rand, stagnation and loss to the whole trading community and a great aftermath of unemployment and distress.

The gains are nil.

The Colour Bar.

The country has been flooded with a campaign of mis-statements about the colour bar and numbers of public spirited citizens have been worked up into a state of great anxiety to protect the colour bar which is established on the basis of statutory regulation and has never been either attacked or threatened in the present dispute. The colour bar is as old as the mining industry in the Transvaal and does not rest on the status quo agreement, which was a private agreement between the Chamber and the Federation concluded only three years ago.

The issue is not about the colour bar, but how to save the low grade mines—which means more than half the mining industry—from early extinction. The Chamber say that their proposals involve the retrenchment of less than 2,000 underground miners. The Low Grade Mines Commission's report says that unless special measures are taken to save those mines, many times that number of miners will become unemployed. With the decay in the gold industry white employment is in any case going to contract. We are therefore presented with a choice between evils.

Strikes and violence will not help or save us in the choice which depends on reasonableness and a spirit of compromise on both sides.

Need for Give and Take.

There has, unfortunately, been no evidence of such a spirit in the conference which has just proved abortive. But the Government would once more with all the force and earnestness at their command appeal to both sides to approach the dispute in a spirit of give-and-take.

No principle is at stake but only a question of minimising inevitable harm to the mining industry and to the community generally. At the least special and exceptional arrangements in the case of low grade mines will be necessary to prevent disaster, and those arrangements require calm and fair consideration.'

Chamber's Latest Statement.

At the beginning of the week the Chamber of Mines issued a statement in which it pointed out that the position of the gold mining industry had seriously altered for the worse during December. The present strike has now greatly aggravated even the December position. The heavy strike expenditure, the depletion of the native labour force, the flooding of mines, and the general impossibility of re-starting operations on anything like the normal scale, render it useless for many of the mines to re-open unless satisfactory and reasonably permanent conditions are assured. A patched-up compromise

Those two holidays alone, it is pointed out, cost the industry £80,000 per annum in wages, irrespective of the loss and disorganisation through the stoppage of work, and are a distinct handicap on the poorer mines.

Re-employment Question.

The Chamber's statement concludes:—It is, of course, understood that the Chamber can give no guarantee to the men on strike that they will be immediately employed at the conclusion of the strike, nor that every man taken on will be employed in his former capacity or working place, or even in the same mine. Through the effects of the strike on the scale of operations, there will unfortunately for a time be more men available than can be placed, and managements will naturally select the best men.

Underground men re-engaged (other than mechanics and engine-drivers) will be taken on for general mining work, and will be required to do whatever mining work is required of them by the management. A considerable number of men will necessarily be out of employment owing to the curtailment of operations through the strike, but the Chamber hopes that with the satisfactory and settled state of affairs which should follow the alterations now proposed, the industry will steadily recover, and many of these men would be reabsorbed.

A Strike Scene: Commando marching through Fordsburg.

of the present dispute offers no solution of the problem, and would only be productive of further trouble in a few months' time.

Basis for Restarting.

The Chamber now proposes, as a basis on which the industry can restart with a reasonable prospect of prosperity both for the bulk of the mines and for the community dependent upon them:—

(1) That the average ratio of Europeans to natives on the producing gold mines members of the Chamber be fixed for a period of two years at not less than one European to 10.5 natives, this figure to be calculated over each calendar year, the industry being under a definite obligation to the Government that the ratio be adhered to. Within the limits of this ratio, the industry shall be entitled to make such re-arrangements of its work as it thinks fit, including the right to dispense with employes whom it does not require, but subject always to the mining regulations and to existing agreements as to hours and basic wages.

(2) That, subject to the right to re-organise work provided under (1) above, men employed after the strike be taken on at December, 1921, daily rates of pay plus one-half of the cost of living addition to January 1, 1922, this reduced addition to continue until June 30, 1922, and then to disappear entirely.

(3) That May Day and Dingaan's Day be no longer paid holidays on the mines.

Avenues for Youths.

A temporary reduction in the scope of European employment in the gold mines is, unfortunately, unavoidable, if a very much greater permanent reduction is not to take place, but the situation is not of the industry's making; it is brought about by the pressure of economic circumstances, aggravated by the prolongation of the strike.

The industry is prepared to join with the other sections of the community in any reasonable attempt to mitigate the difficulties of that situation, and it is further prepared to increase substantially the number of apprentices on the mines (the number now employed is the maximum permitted by the unions), and so assist to an even greater extent than it does at present in equipping the youth of South Africa for the future.

Strikers' New Moves: Use of Political Machinery.

The following resolutions, which were adopted at the meeting of the Joint Executives in the Trades Hall on Saturday as recommendations to the Augmented Executive of the Federation, were confirmed by the latter body on Sunday:—

(1) That in the opinion of the Augmented Executive Committee of the S.A.I.F. and the Joint Executives of all unions concerned in the present disputes, the attitude of the Prime Minister indicates that the Government is backing the present attack by the employers on the white workers,

both in reducing their standard of living and curtailing their opportunity of employment. We therefore request the workers, and also all sympathisers, to take the necessary steps in conjunction with ourselves to defeat the present Government and substitute one calculated to protect the interests of the white race in South Africa. That with this end in view a conference be arranged at once with representatives of the opposition parties in Parliament to investigate what immediate steps can be taken to remedy the present situation, and that invitations be extended to all bodies which can and are desirous of assisting to come and offer their services for the foregoing objects.

(2) That all strike committees are instructed to take any necessary steps they may deem fit to stop all scabs continuing to work, and from now onwards they have full powers to do anything they desire to bring the present strike to a successful issue.

POSITION AT WITBANK.

There was little change in the position at Witbank on Wednesday. An aggregate meeting of strikers was held in the Cinema Hall behind closed doors. Pickets were placed upon the doors, and great care was taken that no one but strikers were present or could hear the proceedings. When Mr. Hobson opened the proceedings at 9.30 there must have been quite four hundred present. The meeting lasted until twelve. A resolution was passed affirming determination to stand firm and not to return to work until told to do so by the Strike Committee. A vote of confidence in the committee was also passed.

It is reported that some men were turned away from the Witbank and Station collieries on Wednesday morning, in the first instance because the mine being right in the town, the manager will only take a body of twenty or thirty, and in the second case the men were told to go and bring the rest in. There are only nine or ten employed at the Station Colliery.

On Tuesday meetings were held at Oogies and Tweefontein, at which the usual resolutions to stand firm were carried, but there is no denying that the men are anxious to get back to work and are said to be communicating with Johannesburg direct on the point.

Six more men went down on Wednesday morning, and no attempt was made to interfere with them. The police are always present when the men go down and come up again. The return of the miners is strongly resented by some of the mechanics.

At Oogies on Tuesday a resolution that a secret ballot should be taken was ruled out of order, as was also one that volunteers should be called to go and pull out the strike-breakers. It was, however, resolved that all should go to the aggregate meeting at Witbank, but very few came.

The engineers' and miners' executive on Tuesday night seriously debated the holding of a secret ballot, the result of which would be a foregone conclusion. It would be for a return to work.

AT VEREENIGING.

The employees of the steel works received notice of discharge on Tuesday. The employees of the V.F.P. generating station here also received their formal notices of dismissal on Wednesday morning. This action led to a demonstration by the strikers during the forenoon. A commando, some 500 strong, headed by two mounted men and a couple of dozen cyclists, marched to the V.F.P. power station and there detached a dozen of their number to interview the management.

Headed by Inspector Fall, of Heidelberg, who is in charge of the special police force on duty here, they proceeded to the offices of the company. Inspector Fall saw the manager

alone, leaving the delegates outside. After a few minutes he returned and intimated that the management had nothing to discuss and was not prepared to receive the strikers.

Upon this intimation being conveyed to them the strikers re-formed, marched in front of the station and informed these officials who were on duty that the demonstration was intended to impress upon them the desirability of ceasing "scabbing," and if they ignored it, then the responsibility for any trouble that might develop in the district would rest upon them, after the warning conveyed.

About twenty officials are engaged in running the electric generating plant.

At the Cornelia Colliery on the O.F.S. side of the Vaal River all is quiet. The coal workers on strike have received notice of dismissal. Only about seven officials are at work on the mine.

The Mines and their Employees.

The Government Department of Mines has just published its statistics for the month of December and it is now possible therefore to present certain figures the accuracy of which is vouched for by Government authority as to the output of the mines and the amounts of money paid to white employees last year.

The Witwatersrand Gold Mines during that period produced 7,930,663 fine ozs.

The actual numbers of white persons in the service of the Witwatersrand Gold Mines on the last full working day of each month, and the total amounts of money disbursed to white persons in the service of these mines during each month were as under:—

	Number of White Employees	Amount Disbursed to White Employees	Including Leave Pay as under
January	20,879	£878,060	39,957
February	20,774	772,514	36,645
March	20,889	901,512	36,193
April	20,892	891,494	48,825
May	20,887	890,254	44,036
June	20,938	883,696	44,001
July	20,942	876,738	43,253
August	20,928	876,224	49,602
September	20,912	852,069	41,581
October	20,958	817,253	40,342
November	19,411	829,215	37,725
December	20,764	847,309	44,608

A Fast Scooter.

During the War, small motor boats constructed by the British Navy were among the fastest vessels afloat and did extraordinarily good work in hunting submarines and in patrol work generally. Since the War progress has been made in the design and construction of these vessels. The latest, which has been turned out by a British shipyard for a foreign government, is 55 ft. long with a beam of 11 ft. and a draught of 3 ft. 3 in. For the sake of lightness and flexibility the vessel is built entirely of wood. It has two skins of mahogany with a layer of oiled canvas between them. A third skin at the fore portion of the boat forms a step of about 3½ inches in depth upon which the vessel rises as she gathers speed and by means of which she achieves a skimming action over the surface of the water. This remarkable vessel attained an average speed of nearly 48 miles an hour during her official trials and she carries two 18 inch torpedoes, two depth charges and four machine guns. Moreover, she is capable of standing very heavy weather.

The Strike and Its Effects.

ELEMENTARY TRUTHS—LOSS OF A MILLION A WEEK — CONDEMNATION BY THE PUBLIC — SOME BROADER ASPECTS OF THE STRIKE—LESSONS FROM ENGLAND—THE SUICIDAL POLICY OF ORGANISED LABOUR.

The truth about the present industrial *impasse* on the Rand is being so camouflaged by side issues and by the larger but really irrelevant subject of politics that the general public (which term includes the employees now on strike) must often feel mystified as to what the main issue really is.

In reality the whole problem of the Rand is a simple equation in elementary business. Concisely stated, it is merely this, that under present conditions a considerable number of mines are working at a loss, that in view of the declining price of the product of the mines numerous other companies which are at present earning a small profit are likely to record losses in the near future, that the mines in question are naturally the lower grade and poorer mines of this goldfield and are not, therefore, endowed with large capital resources which would enable them to hang on like a number of industrial Micawbers waiting for something to turn up, and that in consequence of these irrefutable facts the further existence of these properties is in jeopardy and the jobs of about 10,000 Europeans who are employed by the companies concerned are imperilled.

Keep the Issue Clear.

These are the plain facts of the case, and no amount of oratorical side-tracking or debate or confusion with political questions can alter them. It is equally irrefutable that since the management of the mines cannot alter the quantity of gold contained in these propositions or control the selling price of the product, the only way of saving these mines from ruin and the only method of making mining enterprises on the Rand attractive to capitalists in order that new properties may be opened up is by reducing the costs of production. No conferences or conciliation boards, no arbitrators or awards by disinterested parties, can alter these facts. *They are unalterable.*

The Two Ways.

The only aspect of the whole problem which admits of any argument lies in the direction of ascertaining the method by which this reduction of expenditure can most effectively be obtained at a minimum of hardship to the smallest number of people. The method pursued by the S.A.L.F. in endeavouring to refuse acceptance of the proposals made by the managements of the mines on behalf of the shareholders who own these mines, that is to say, by proclaiming a strike and by attempting to extend this strike until it involves all other industries and paralyses the Government and the whole community is the method calculated to do the *greatest amount of harm to the maximum number of people.*

The Verdict of the Public.

The causes and effects of the proposals made by the Chamber have been so much debated by both sides that little good purpose can here be served by repeating the arguments employed by both sides for and against these proposals. But it would seem that whatever may have been the opinion of the general public when this industrial bombshell was hurled into the Union nearly four weeks ago the verdict of the man in the street to-day is that the Unions were wrong in interpreting notices (which had to be legally given under the Industrial Disputes Act) of intention to withdraw from agreements entered into during the abnormal period of the War by the Chamber "without prejudice to negotiations" as ultimatums, and also that the true facts of the position in regard to the *status quo* were misunderstood.

The "Colour Bar" Misconception.

Public opinion (and it is public opinion that in the long run counts in these matters) is now of the view that the Unions acted unwisely in proclaiming a strike. And public opinion is now, too, veering round to the conviction that

the Mining Houses have *no* intention of breaking down the colour bar and *could not do so even if they desired such action and policy.*

These are fast becoming the convictions of the disinterested public, but they need to become the convictions of the men involved in this calamitous business, and particularly of the men's leaders, if this devastating strike is to be brought to a sound and sane conclusion before irreparable harm is done, not only to the mines, but to the country at large.

The Country Losing a Million a Week.

The direct loss to the community due to the present strike on the gold and coal mines and in power stations and engineering shops is estimated at about £700,000 per week. If we add to this the indirect losses such as are bound to result from loss of railway revenue, cost of defensive and precautionary measures, loss of revenue on income tax and super tax due to trade disturbance and on account of other items, it is probable that the country is losing not less than *a million pounds a week, or at the rate of fifty-two millions a year.*

More Disastrous than the British Coal Strike.

Taking the population of the United Kingdom at, say, 50 millions and the white population of the Union at a million and three-quarters, this means that the present strike is costing more than £30 per capita per annum for each European inhabitant of South Africa. This is more than the per capita loss occasioned by the British coal strike of last year. And we in South Africa have only one industry which has been keeping its head above water during recent months.

Lessons from Overseas.

What did the strike of colliers do for Great Britain? It nearly ruined every worker in the country. Organised labour must learn that in the Union, as in England, labour must cut its coat according to its cloth. It must face economic facts and realise that a mine which cannot produce a sovereign's worth of gold for less than twenty-five shillings *cannot carry on*, and it must realise, too, that in seeking to maintain a false and unjustly high rate of wages, a rate of wage immeasurably above the value of the labour given judged in terms of the selling price of the product raised, it is transgressing the fundamental laws of political economy. The action of the Federation in seeking to bolster up a fictitious and economically unsound rate of pay is damaging to the whole community. The effect of such a policy is simply this, that the other inhabitants of the country, and particularly the farmers, have to pay for that portion of the miner's wage which is above the economic limit. In other words, the rest of the country is giving to the miners an immense subsidy, a subsidy which it is beyond the limits of the community to maintain.

Some people contend that head offices' expenses and overhead charges are too high, and that it is in this direction that economies should be effected. These expenses amount to only about 6d. per ton, and if they were abolished altogether the position would not be materially altered. No, a wider field for economy than is offered by head office expenses must be sought, although it may be pointed out that salaries have been and are being reduced in the head office establishments. The mines have got to reduce expenses on and in the mines themselves. Therefore the Chamber has proposed to introduce certain economies which will mean the infliction of a minimum of hardship to the least number of men. The Chamber has no intention, desire or ability to remove the "colour bar." The Federation's method of settling the dispute by calling a general strike and by interfering with public services is doing a maximum of harm to the greatest number of people.

The Relation of Ventilation to Accidents.

(By W. H. Jones.)

A problem of extreme importance in the present day working of the Rand Mines is that of providing an adequate ventilating current for the whole of the underground workings of the mine. While the shafts and the main drives are beyond reproach in this respect and are amply and sufficiently supplied with large quantities of pure air, the same cannot be said of the parts of the mine where practically all the day's work is carried on and where at least 99 per cent. of the underground workers spend their eight hours working shift. While it is scarcely possible to point to any accident as being actually due to the effect of a vitiated atmosphere, there can be no question of doubt as to the contributory influence of such a condition towards increasing the accident rate. The necessity for providing artificial ventilation did not arise so long as the mines were limited in depth, provided there were two shafts each open to the workings and so connected one with the other, a certain quantity of air was always flowing into and around the working faces always excepting dead ends. It is true that the current of air had no definite direction of flow, and either shaft might be a downcast at times, but generally speaking the limitation of the quantity of air in the workings was not such as to militate against the efficiency of the workers. This also is not exactly true, since the development faces everywhere, were even then most inadequately ventilated and cases of gassing were much more frequent than at present, and even where actual gassing did not occur, the workers in such places suffered very acutely from inhaling impure and vitiated air during the shift.

Pari passu with the extension of the mine workings in depth the disadvantages of a natural ventilation supply of air become more and more pronounced, and culminated in several spasmodic attempts at controlling the direction of the air current while greatly increasing its volume. The installation of fans at the upcast shafts and the creation of subsidiary fans underground were carried out on a number of the deeper mines and the process has gone on until today no mine depends any longer on "natural ventilation," but relies on a large circulating air current produced and regulated by means of steam, air, and electrically driven fans. The mining regulations specify a minimum quantity of air which must be passed through the fan during the periods of work in the mine. It gives the number of cubic feet per minute for each person employed underground—and there it stops—and does not enforce this minimum air supply demand for any particular working face.

In practice it works out that, while some parts of the mine are more than adequately well ventilated, most parts are very much below the standard of supply aimed at. A word as to the proper system of mine ventilation. In all mines where the air current has been carefully thought out, the system of ascensional ventilation is in vogue. This depends for its proper working on the fact that a condition of unstable equilibrium is essential to move air in any direction vertically or horizontally. In other words the difference in weight which may exist between two columns of air contained in two shafts when properly connected will serve to set in motion a volume of air directly proportioned to the difference in density of the columns contained in the shafts. The co-efficient of expansion for air being .00203, the difference of volume or the ratio of the relative volumes

$$u = \frac{t}{1 + .00203 (t - 32)}$$

is expressed by the formula:

$$u, = \frac{t}{1 + .00203 (t - 32)}$$

where u, n, are the volumes t t, = temperatures of the air, 32°F. being minimum temperature of the air ° 212°F. the maximum. The difference in volume of two equal air columns depends on their relative temperatures and pressures. It follows then that if the air columns in the shafts

are altered by any means whatsoever, such as heat, water, a vacuum, in any case the result is to set the air in motion, and the greater the displacement the greater the air current. Since column for column, the longer air column will be the heavier, and since further the tendency of a current of air hotter than a second current is to rise more rapidly and displace the latter, every effort must be made to carry down to the lower parts of the workings the cold air column, since this will, by its greater weight, materially assist in the effort made by the fan to cause a vacuum by drawing towards it the heated air. This difference 212° - 32° = 180° being equal to 0.366 of its original volume:

$$\frac{0.366 + 1}{180} = \frac{1}{491.8} = .00203 \text{ the constant.}$$

A Simple System.

This then is the objective of any well-reasoned system of mine ventilation to make the work of the fan engine as light as possible by carrying down to the lowest workings the cold air which is therefore heavier, and which by sinking displaces the hot air and drives it always upwards.

It will be seen then that the system is extremely simple and easy to work, it is all the more amazing in view of this same simplicity to discover applications of artificial ventilation in some of the large mines of the Rand which aim at reversing the order of nature and try hard to make the heavier air column go up and not down. When one sees a fan engine of the exhaust type placed over the deeper shaft, one wonders what lazy notion of the laws of gases was in the mind of the authority of such a monument to ignorance. One will find also a wet shaft made an upcast; another attempt to reverse natural law. It is, however, when we come to examine the direction of the air currents in the underground workings that we see ignorance and stupidity personified. The bottom workings which ought to be coolest, are filled with warm, moist air, some of the working faces are well provided with ventilation, others have none at all. Split currents of air appear to wander anywhere and anyhow doing little or no effective work, and simply wasting as much power at the fan.

Old stopes are cool and breezy, working stopes are hot and nauseating from the evidence of foul gases which are not removed owing to a sluggish air current and so on. It means in effect, that the importance of proper mine ventilation has not been, and is not even to-day appreciated sufficiently by the responsible leaders of the industry. As against the strict regulations for the use of water—and very properly so—we have only a half-hearted attempt to enforce penalties for inadequate ventilation, the water supply is measured and tested by all in authority, but who concerns himself with ventilation? The dust sampler measures the air current at intervals, and takes more or less accurate records—if his anemometer is in order, the writer has not himself seen a single recording place properly fitted for exhaustive tests on any mine on these fields—he is usually much more concerned with the water supply and its use, and is therefore in good company in neglecting the equally important matter of abundance of air. It appears then that pending a proper lead being given in the direction of penalising ignorance by the Mines Department, we shall not see the Rand mines provided with the necessary air supply at all times and in all places which is essential to the efficient and safe working of the properties. One must perforce append here a word of praise for the De Beers system, which is scientifically conceived in purpose and practical in action. To those who complain about the impossibility of bringing the Rand mines up to date in this respect, a visit to the diamond mines would be a splendid object lesson. We are accus-

toned nowadays to measure all innovations in terms of their payability. A scheme either commends itself or not according as to whether it will reduce working costs or otherwise. While agreeing in the main with this attitude, and while remembering that with a falling gold premium, there is little room for grandiose schemes or a display of altruism. The health of the workers is nevertheless worth something to the owners, and if a good supply of pure air is going to improve health conditions in the mines, it is no longer a luxury, but it becomes at once a paying investment to everyone concerned.

We have all heard of the "box miner," and have each one expressed his opinion of such a person. We have also heard much about inefficient miners and mining of late years in particular. No one will attempt to defend such people when they are to blame, but in our zeal to cast stones we must be careful to rightly apportion the blame. If one imagines the possibility of being locked up in a room day after day with the windows and doors safely locked up with practically no fresh air, but rather the breathing by the inmates of the same air over and over again until not only the nostrils, but even the palate, strives to void the vile element, would it be a matter for surprise to learn that the workers, so handicapped, became lethargic and listless, that they were indifferently interested in their surroundings that they became pale and anaemic, in short that they were inefficient and careless?

Not for nothing have the Factory Laws made ventilation in factories a matter of great importance, and if necessary there, how much the greater is the need when in addition to all other obstacles to efficiency is added that of semi-darkness. The man becomes careless and blind to the dangers surrounding him, he hasn't that clear brain which is essential to the proper safe-guarding of himself and others. He is not on the *qui vive*, and consequently, he loses vigour and elasticity. Under such conditions, the worker is no longer efficient and even if no actual danger to life and limb ensues, he is not fitted to carry out his duties in such a manner as to give a fair days' work to his employers.

The Economic Aspect.

It may be argued that the whole matter is grossly exaggerated and fantastic, that the average conditions underground are not so pronounced, and that the average efficiency is greater than seems to be accepted by the writer, but when it is remembered that with the easiest-mined gold reef in the world and one very amendable to simple metallurgical treatment, the working costs are nearly at the peak of the world's records, and this while depending in a large degree on a broad low wage basis of unskilled labour, there is undoubtedly a very considerable margin of waste in efficiency which reacts on the mining costs. A healthy, intelligent and progressive worker will make for reduced

costs, the converse will pile up costs always. If the Rand miners were enabled to perform their work under the best possible conditions, as regards abundance of fresh air, it is not too much to assert that not only would there be reduced working costs due to greater application and consequent efficiency, but the big accident bill rendered yearly by the mines could and would be tremendously reduced. Give the man live air to breathe, not dead poison and he may reasonably be asked to respond to the call for greater effort. A twenty-five per cent. increase in efficiency would go far to counteract the loss of the gold premium. It must be remembered that this handicap of bad ventilation affects the official as well as the workman, and makes both of them inefficient. Plenty of fresh air would make for a speeding up all round to the lasting benefit of the industry as well as of the individual worker. No exact records are at hand which would afford data for measuring the influence of impure air in the development of Silicosis, that it has an ill effect on the lungs is certain, weakening their action and impeding their powers of recuperation, and thus rendering them less able to resist other injurious elements, but we may safely assume that the matter of ventilation is urgent in the interests alike of safety, health and low costs of mining, and therefore is a matter of very present urgency.

ANSWERS TO CORRESPONDENTS.

P T. Badcock, Greene's Chambers, Maritzburg.—We regret that we have misplaced Mr. Willfred T. Fry's address, but if he sees this in print he will doubtless reply to you direct.

The Wolhuter.

POINTS FROM ANNUAL REPORT.

The annual meeting of the Wolhuter Gold Mines, Ltd., will be held on March 23. From an advance copy of the annual report for 1921 we learn that the net profit for the year was £71,767. Mr. A. J. Brett, the consulting engineer, writes:—The following is a summary of the salient features of the work of the past three years: Tonnage milled, 1919 348,902, 1920 370,200, 1921 378,600; working costs per ton, 1919 22s. 1d., 1920 20s. 5d., 1921 23s. 6d.; revenue per ton at standard price of gold, 1919 24s. 8d., 1920 23s. 6d., 1921 21s. 1d.; working profit per ton at standard price of gold, 1919 2s. 7d., 1920 0s. 1d., 1921 2s. 5d. (loss); working profit at standard price of gold, 1919 £45,713, 1920 £2,339, 1921 £45,915 (loss); additional revenue from increased price of gold less realisation charges and exchange, 1919 £18,500, 1920 £132,997, 1921 £119,871; total working profit, 1919 £64,317, 1920 £135,336, 1921 £73,956; development footage, 1919 6,319, 1920 4,714 1921 3,642; ore reserve tonnage, 1919 653,894, 1920 661,904, 1921 399,100; average value of ore reserve (dwt. per ton), 1919 5.7, 1920 5.7, 1921 5.6; average strength of coloured labour force, 1919 2,187, 1920 2,325, 1921 2,501.

The working profit earned during the year under review was £61,380 lower than that of the preceding financial year, the result of an inevitable and anticipated decline in the grade of ore treated. A satisfactory supply of native labour permitted the milling of a larger tonnage while the rate of sorting was increased by nearly 2 per cent., which made the working costs 5d. per ton milled higher than they would have been had the same rate of sorting been kept to as in the previous year. However, even with the increased sorting it was not possible to avoid a decrease in the yield, and with gold at standard price it would have been impossible to operate the mine at a profit. There remains little further development to be done on the South Reef, Main Reef Leader, and Main Reef, and development operations during the year were confined, in the main, to the pyritic lode in the Western Section of the mine, on which body a small but comparatively high-grade area has been opened up. From the information at present available, however, it would appear that but little extension of this payable zone can be looked for. During the year an agreement was arrived at with the City Deep, Ltd., mutually advantageous to both companies, under which this company is enabled to mine its remaining portion of the boundary pillar between the two properties.

The ore in reserve at the end of the financial year was estimated to be as follows: Immediately available, 345,750 tons, value 5.5 dwt. per ton; temporarily unavailable, 53,850 tons, value 6.8 dwt. per ton; total, 399,600 tons, value 5.6 dwt. per ton. In addition to this total there are certain fully

developed and available areas containing in all 92,000 tons, which would fall within the limit of payability on a reasonable reduction in operating costs. In view of the depleted state of the ore reserves and the necessity, as time goes on, of relying to an increasing extent on reclamation sources for the supply of ore to the mill, a further decline in the yield seems probable during the coming year. Given uninterrupted working, however, it may be possible to effect some reduction in the cost of operating the mine, but the influence of the price of gold on the profits of a low-grade mine is so great that this will obviously be the dominant factor in the results to be achieved during the ensuing year.

The manager, Mr. W. C. Mossop, writes, *inter alia*:—Tonnage and working cost: The tonnage milled shows an increase of 8,400 tons compared with the previous year, the working cost being 1d. per ton higher. Throughout the year the supply of native labour has been satisfactory, the average number at work underground being 1,945, as against 1,775 during 1920. Mining: The proportion of ore mined from reclamation was 36 per cent. With regard to the coming year, I am of opinion, should the supply of native labour be maintained, and nothing of an untoward nature occur, the tonnage milled will compare favourably with that of the past year. It is, however, improbable that last year's rate of yield will be maintained. The development during the year has been practically confined to the pyritic lode and the opening up of small faulted blocks of ore at various points of the mine. The work done on the pyritic lode (west shaft section) has been very helpful. The payable tonnage developed on this body has, however, been confined to a moderately small area, and outside this area, where prospecting has been carried out at likely points, the results have been disappointing. Government Miners' Training School: During the year the pupils of this school were transferred to the City Deep mine, where better accommodation in the way of working faces could be afforded them. This withdrawal necessitated the employment of a few additional white men underground. Sand filling: During the year 41,290 tons of sand have been placed in the mine. Staff: In conclusion, I wish to express my thanks to the mine staff for the loyal service rendered to the company during the year.

The leaders of the Federation of Trades and their political supporters, not content with disseminating the falsehood that the Chamber of Mines is desirous of removing the "colour bar," are widening the front of their attack upon the industry by endeavouring to propagate the belief that the standard of living of employees of the Witwatersrand mines is poor and that the Chamber now seeks to still further lower this standard of living. Nothing could be further from the truth. According to the Government Mining Engineer's report the average wages of 19,719 white employees of Witwatersrand mines during 1920 were £478 per head, or nearly £40 per month for each employee of the industry. This compares with £308 per head for 18,655 white employees in 1914. The wages paid to white employees of the Rand amounted to £5,753,206 in 1914 and to £9,423,036 in 1920. These figures are in each instance for employees other than staff. In addition special payments to or on behalf of men on active service, 1914-1920 (both years inclusive), amounted to £902,986, exclusive of active service pay to staff men. In no other mining field in the world do employees draw such high wages and in no other mining field do European miners work under such easy conditions as in the mines of the Witwatersrand, and in no other mining field can employees live amidst such comfortable surroundings as they can on the Witwatersrand.

The Week in the Sharemarket.

A FIRM TONE—SPECIALITIES IMPROVE—DIAMONDS BETTER.

The feature of the week has been the surprisingly firm tone in face of many depressing factors. The strike outlook gets no brighter as the days go by, and the market is learning to take the news with stoic resignation. Professional buying at times during the week caused a flutter, but the public and the houses refuse to be tempted in to taking any active interest. The cable delays make business with London well nigh impossible, and help to try the patience of those who attempt to do anything. Nevertheless, a few specialities have shown unexpected improvements. New States were done at 24s. on Wednesday, and several sporadic signs of life have been visible in the market. Diamonds have on balance been slightly better, De Beers Deferred touching £10 5s., and the Preference £9 7s. 6d. Consolidated have touched 15s. 6d., Crowns 3s. 3d. each, and Frank Smiths 3s. 4d. In the debenture list, it may be noted that Cape Explosives were dealt in at £101½, Consolidated Diamonds at £112½, East Rand Proprietary at £80 and £85, and Randfontein Estates at £80 and £90. The immediate future of the market is, of course, bound up with the strike issue. Meanwhile, gold continues to fall in price, the cabled figure on Thursday being 46s. 6d. The week's fluctuations in share quotations are set out below.

Robins Rotary Grizzlies

For the coarse screening of coal, coke, ore and stone, Robins Patent Rotary Grizzlies are widely used instead of trommels, shakers, bar grizzlies, etc.

In their low power, space, and head-room requirements, amazingly high capacity per unit screening area, ease and low cost of upkeep, high comparative efficiency, and freedom from the vibration which is characteristic of other types of screens, they are markedly superior to other screening devices for this class of duty.

EDITORIAL.

THE UNION STEEL ENTERPRISE.

Unusual interest attached to the annual meeting of the Union Steel Corporation of South Africa last week. A full report of the Chairman's speech appears in another part of this issue, and will repay perusal by everyone interested in the industrial development of the country. Mr. Isaac Lewis presided, and in his speech dealt with the general conditions of the steel industry and the special conditions as they concerned the Union Steel Corporation. The main feature of the latter is that the gross manufacturing profit amounted to £146,381, being about £4,000 more than that for the previous year. The cash position of the company is a strong one, the year's profit added to the balance brought forward leaving a total credit to profit and loss account of £215,519. The financial policy of the directors seems, in the circumstances, eminently sound and reasonable. In order to meet trade demands, to strengthen the position to meet overseas competition, and to conserve their resources in face of "the present unstable economic conditions" throughout the country, the directors have decided, for

the present, not to declare any dividend, other than those on the preference and preferred ordinary shares. Very wisely, it seems to us, a substantial interest has been acquired in the Newcastle Iron and Steel, Ltd.—a promising enterprise with an assured future. In view of the set back to trade towards the close of last year, and the competition from overseas, the results won certainly reflect the greatest credit on all concerned. Unfortunately for the company, competition from overseas has become increasingly serious of late, and Continental-manufactured goods have begun to play a prominent part. This form of competition is artificially helped by the present industrial conditions in some European countries, by the depressed exchanges, and by the low sea freights which are quoted for some of those competing Continental products. We entirely agree with the Chairman that "this is an artificial combination of advantages in favour of foreign competitors which imposes a real hardship on our local manufactures, and which must result in checking the development of our own local industries at a time when their expansion is so much needed." Mr. Lewis made an eloquent appeal for some form of protection for the industry, and he quoted with approval the supporting views of the Prime Minister and of the President of the Transvaal Manufacturers' Association. In this connection he paid a graceful tribute to the Press for the interest and sympathy it has shown towards the efforts being made to establish local industries. Referring to the policy of his company, the Chairman expressed the Board's determination to keep the South African trade in the products it manufactures; to keep its works operating to the fullest extent possible and to keep its men employed "with a view to the fruition of the larger scheme we have in mind." The Chairman was able to announce that several large and important orders for reinforcing steel had been secured and that others were in sight. To meet competition and to prepare for improved trade conditions, the works of the company have been considerably enlarged. Regarding the vexed question of the treatment of native ores for the production of pig iron, the Chairman emphasised what the company had already done in this direction. Briefly, it has spent large sums in the location and examination of local ore bodies and raw materials, and in the experimental production of pig iron. Twice the company has brought to this country, at great expense, the best experts both on steel making and in the knowledge of the raw materials necessary for the purpose, and it was the first to take that action. The first report was most satisfactory, the second is in course of preparation and promises to confirm the first. In consultation with the experts the directors have prepared schemes for the establishment of the big industry, and have conducted important negotiations to raise the large capital necessary. The financial conditions, however, throughout the world have been unfavourable to obtaining this money at present. Summing up the records of the company, the Chairman, with justifiable pride, pointed out that it had produced over £1,500,000 of finished goods; employed over 180 white men earning good wages, the majority of whom are Afrianders who have been trained over a period of years in this skilled industry; had given employment to nearly 500 natives; had paid very large sums to the Government for the purchase of their scrap steel and in railage on this scrap and on finished products, and, moreover, had paid further during the past two years some £57,000 to the Government in taxes. "We have been acting, not merely talking," Mr. Lewis declared, and he certainly was able to substantiate the statement. The Chairman ended in a note of hope and cheerfulness. "I have the fullest confidence," he said, "not only in the future of the steel industry, but also in the early and successful expansion of the agricultural and manufacturing industries of the Union, and if wise counsels prevail in the present dispute, I am convinced that these will provide new and ever-increasing fields for the employment of labour." This, of course, is the spirit that makes for success, and the chairman and directors of this Vereiniging enterprise are to be congratulated on the splendid measure of success that has already rewarded their labours.

CONTINUATION OF THE STRIKE.

Since the break up of the Conference at the end of last week things have moved slowly on the Witwatersrand. In the Witbank coalfields a considerable number of colliers have returned to work, but in so far as the gold mines are concerned the position is just the same as it was a week ago except for the continued repatriation of the natives. The failure of the Conference to come to any real solution of the trouble was more or less of a foregone conclusion. But it was hardly expected that the suggestions of the chairman of the Conference, Mr. Justice Curlewis, would be so curtly dismissed by the Labour representatives. The breaking up of the Conference was immediately followed by a letter addressed to both disputant parties by the Prime Minister. In this letter General Smuts asked for a spirit of compromise and declared that the issue of the dispute was not the Colour Bar at all but the salvation of the low grade mines.

The augmented executive of the Federation has held several meetings during the past week and at these the questions of proclaiming a general strike, of the rights and privileges of the Press, of the necessity for Parliament assembling at the earliest possible opportunity to consider the position and, if necessary, to legislate thereon, were debated at length. In addition to such vital matters as these contentious problems irrelevant to the dispute, such as selective mining, have been discussed, and there has been a considerable ventilation of Bolshevik bunkum.

One or two of the Nationalist leaders have come to the fore as sudden found champions of Labour, and in some quarters a strong Nationalist-Labour coalition is spoken of.

There is, however, unfortunately, no apparent disposition on the part of the men's leaders to face the economic facts of the case and to see the dire necessity that existed for some radical reform which would secure substantial reductions in Rand working costs if the low grade mines were to be saved from closure. Three such mines are now being finally closed down and the future of several others, including the E.R.P.M., is highly problematical.

The Chamber of Mines has now made it quite clear that the proposals which it originally made and which the Federation replied to by means of a strike called on a false issue are not the terms upon which they are prepared to restart the industry. Thirty-six thousand natives have now been repatriated, and obviously on this account alone nearly four thousand Europeans have lost their jobs. Other causes have greatly tended to aggravate the condition of the industry, and it must therefore be clear that when the mines resume operations the field for white employment will be restricted for some time to come.

At the moment of writing the only new development in the situation is that a resolution has been passed by the Germiston Executive of the Strike Committee recommending that ways and means be found to see the Prime Minister and the Governor-General to request that an Arbitration Court be set up immediately to settle the present crisis.

The importance of this resolution lies in the fact that it is the first reply that has been made to the Prime Minister in respect to the statement he issued last week, in which he said the Government, if approached by either or both parties, was prepared to explore any avenue which might lead to a settlement of the dispute.

The Prime Minister was not long in replying to the Germiston resolution, and expressed his willingness to receive a deputation from Germiston on Thursday morning.

The following resolution from the Germiston Executive Strike Committee was signed by J. MacMillan, Secretary of the Executive Committee, and M. T. Crawford, General Secretary, and read:—"We, the Executive Strike Committee of Germiston, recommend that ways and means be found to approach the Prime Minister and the Governor-General with a request that an Arbitration Court be set up immediately to settle this present crisis, and that the court consist of five persons, the men's representatives to be Colonel Creswell and Advocate Lucas, and that Judge Curlewis be chairman of the court. To show to the public that it is our desire to settle this crisis, we, in the event of a court being set up, are prepared to recommend to the col-

liery section that they accept 50 per cent. of the Chamber's proposals, and that the other sections of the workers go back to work on the terms they came out on, and to await the decision of this court, whose finding shall be final."

The Strike Committee also issued the following communication:—"In reference to our recommendation of yesterday re an Arbitration Court, we further recommend that a convening or agenda committee be appointed to take all necessary steps to the furtherance of essentials necessary to such a court, and recommend that the following personnel be the nucleus of such a committee: R. Tennant (secretary, E.D.A.), A. Crisp (organiser, A.E.U.), A. Crawford (general secretary, S.A.I.F.), and one member of the Mine Workers' Union to be selected by the executive of the M.W.U. In respect of the above it will be seen that it is our intention to get a fresh personnel in action. In our opinion the present action, or lack of action, of the Augmented Executive of the S.A.I.F., is one that is going to lead to a stalemate and further disorganise the ranks of the workers."

We are glad to observe that the name of Mr. A. Crawford is included in this broader personnel of the strikes committees. Mr. Crawford is a man of wide experience and of moderate and sane views, and his presence in any Executive Commission of Conference would be of incalculable benefit to the men and also to the industry. But it is clear that no good can come of any further Conferences unless the men's representatives are first of all prepared to recognise the true economic facts concerning not only the Rand of a month ago, but the Rand of to-day. And, moreover, it must be frankly recognised that this is no political quarrel but a dispute on a business subject which can only be settled in a businesslike manner.

[Since writing this we have been informed that the interview with the Prime Minister has been postponed owing to the attitude of the Mine Workers Union in the Germiston District.]

THE TRUTH MADE MANIFEST!

"Long threatening comes at last," and the "closing down bogey" has, during the week, become a cold fact and very stern reality. In this, as in other directions, the coal industry led the way, and the directors of Breyten Colliery were the first regretfully to announce that the mine had closed to open no more. "Facts are chiefs that winna ding!"; and the Breyten object-lesson was not lost, let us hope, on the white colliery employees of the Transvaal. But Breyten Colliery was not long left alone, being soon joined by the New Goch and Roodepoort United Main Reef. The Luipaardsvlei Estate G.M. Co., Ltd.—despite the chairman's recent cheery speech at the annual meeting in London—was the next to find itself, in the vernacular, "up against it." After an anxious period of cabled correspondence between the London and the local boards, the company had to confess itself unable to "carry on," the sinews of industry having failed it. The mine will cease operations on February 28, and the officials are all under notice. The repatriation of the natives (numbering 2,000) began on Thursday, and the 150 white workers on the mine have been discharged. With nothing coming in, the company has been paying out £400 per day since the strike began—and the age of miracles is past! Krugersdorp will feel the blow first, but the rest of South Africa will feel it likewise—merely a little later. Then the case of the E.R.P.M. falls to be mentioned. Every newspaper reader, one might almost say every child on the Reef, knows the case of the E.R.P.M. The Low Grade Mines Commission gave the property the place of honour in its now historic report—a report which now appears about to be only too thoroughly vindicated, and a special Commission only the other day said "ditto." The E.R.P.M. has not yet actually and finally closed down—at least not up to the time of writing. But the mine is spending £70,000 per month, no gold is being won, and Sir Harry Ross Skinner has publicly declared, more in sorrow than in anger, that "the position of running the E.R.P.M. at a dead loss cannot continue indefinitely." That surely is simple enough and direct enough to give pause to the most eloquent strike leader, however "intoxicated with the verbosity of his own enthusiasm" he may be. In fact, that's all there's "to it."

THE MINES AND THE FARMER.

According to the statistics issued by the Government Department of Mines in respect of the year 1920, the purchases of Rand Gold Mines in that period included:

Beans, 6,216,000 lb.	£64,060
Rice, 879,098 lb.	21,106
Mealie Meal, Kafir Corn etc.	702,775
Malt and Cereals for Beer	57,390
Meat, 30,549,922 lb.	564,083
Sundry Food (including Bread)	205,148
Sundry Food (including Bread)	205,148
Vegetables 66,211	
Coffee, Sugar, Oil, Ghee, Molasses etc.	68,734
Fodder for stables (Bran, Chaff, Mealies, Forage, etc.) 41,797	
Timber (Mining Poles and Lagging) 526,052	
Total	£2,522,504

In addition to these there were the purchases of the European employees of the mines. In 1920 the Rand paid over eleven millions sterling to such employees and obviously a very large proportion of this must have been spent on food stuffs produced by South African farmers.

What is the position on the Rand to-day? The mills are silent, the miners are earning no wages and the mines are compelled to repatriate large numbers of natives for whom in normal times they purchase vast quantities of food. The strike was called on false issues, and is being carried on by the Federation on false issues. If a farmer cannot make his farm pay he either has to reduce expenditure or give the farm up. The position is exactly the same with the mines. The Chamber of Mines proposed to reduce the working costs. Any sensible farmer who found that his farm was not paying would have done exactly the same thing. But the whole issue of the dispute is now being camouflaged by a lot of political clap-trap and by sudden found champions of the Labour cause who are in reality Nationalist opportunists out to make Party capital from the present industrial misfortune.

The public generally, and particularly the farmers and the men on strike will be well advised to treat the doctrines of these political mountebanks with disdain, and to follow their counsels either with extreme caution or—best of all—not to follow them at all.

Explosives and Chemical Works.

FORTHCOMING PUBLICATION.

IMPORTANT NOTICE.

The "South African Mining and Engineering Journal" will publish in the near future a special illustrated supplement dealing with the explosives and chemical works of the Union. Several of the principal firms having factories of this nature in South Africa have expressed their approval of such a publication, which will be issued as a supplement to the ordinary weekly issue of the Journal. Special commissioners have been appointed to visit the various works, and the results of their investigations will be published in this supplement in the form of lengthy and illustrated articles. The supplement will also contain valuable data as to the quantities of explosives, fertilisers, chemicals, etc., produced in the Union, methods of manufacture and details as to markets and consumption.

Prospective advertisers and manufacturers of chemicals, etc., interested in this supplement are advised to communicate with this office at the earliest opportunity.

Notes & News.

The Busy Man's Page.

Owing to the delay in the delivery of the mail papers this week and the need for going to press early, the "Busy Man's Page" must be held over till our next issue.

* * *

The Heidelberg-Roodepoort Redivivus.

The old Heidelberg-Roodepoort G.M. dies hard. According to a correspondent of our esteemed contemporary, the *Heidelberg News*, Mr. A. G. Langley, a well-known resident of Greylingstad has been fossicking round the old mine "with most surprising results." He has been finding gold in all directions and drawing quite good revenue from washing the dust between the broken shale on the waste rock dump." Mr. Langley is also credited with having found iridium "in no inconsiderable quantities." A local syndicate has been formed to exploit these finds, and a Continental firm is said to be sending out a representative to verify their representations regarding the property with a view to purchase. The *Heidelberg News* contains a very interesting article on the subject.

* * *

An Object Lesson.

The disastrous policy of withdrawing the safety men from home collieries during the coal stoppage of last spring is in no small degree responsible for the high figure of unemployment among workers of the mining industry (says an exchange). This is exemplified in the case of Hucknall No. 2 colliery, which has only just re-opened since closing down on March 31 last. Serious damage to the shaft resulted from the total abandonment of the mine. The management spared no effort to expedite the repairs necessary for re-opening the property, but this has proved a long and difficult business. There has been considerable distress among the workers formerly employed. They have now been given the opportunity of signing on to re-start work.

* * *

What Chartered Shareholders May Receive.

The Chartered report is fully dealt with elsewhere in this issue. It will be seen that the capital of the Chartered Company is £9,000,000, and there is a debenture debt of £1,250,000. A distribution of cash assets would mean over 10s. per share for the shareholders, assuming that expenses will be moderate in amount. The company has been dividendless during the whole period of its existence. The £9,000,000 invested has not returned to the shareholders a single penny. Sometimes the shares have been as high as £9, and at others below 10s., though these fluctuations have to some extent been influenced by increases of capital. The company has secured Rhodesia for the Empire, and all the reward the shareholders have had is that which a patriotic effort, involving a loss of over £40,000,000 sterling, may bring.

AFRICAN VANADIUM.

An extraordinary general meeting of the African Vanadium and Lead Mines, Limited, will be held at 36, Permanent Buildings, Harrison Street, Johannesburg, on Wednesday, the 15th day of February, 1922, at 11 o'clock a.m., for the purpose of considering, and if deemed advisable of passing, the following resolution:—

"That the African Vanadium and Lead Mines, Limited, be wound up voluntarily."

Notice is also given that a further extraordinary general meeting of the company will be held on Friday, the 3rd day of March, 1922, at the same hour and at the same place, for the purpose of receiving a report of the above-mentioned meeting, and, if thought fit, of confirming as a special resolution as set out above.

“WITTON” Fractional Horse Power MOTORS

In standard sizes from $\frac{1}{50}$ to $\frac{1}{2}$ H.P. for D.C. & A.C. Circuits.

Suitable for all low power drives.

For Driving:—

Sewing Machines
Window Models
Exhaust Fans

Emery Wheels
Knife Polishers
Electric Pianos

Vacuum Cleaners
Drilling Equipments
Advertising Signs

Kinematograph
Machines
Boot Polishers, etc.

“Witton” Fractional Horse Power Motors combine highest efficiency and durability with a minimum of weight and size. High Class finish. Stove-enamelled jet black. Manufactured in standard sizes from $\frac{1}{50}$ to $\frac{1}{2}$ H.P. Entirely British made.

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

Quoted Prices and Intrinsic Merits.

The relationship of quoted prices to the intrinsic merits of the investment concerned could not have been better stated than it was by Mr. C. F. Rowsell, who, speaking recently at the annual meeting of the African and European Investment Co., Ltd., in London, said: "The question of your land brings forcibly before me a point which I think is almost one of the most striking facts of the present time, and that is the remarkable difference between the intrinsic value of the shares of public companies and the value placed upon them by the market at the present time. I do not think I can remember a time in the City when this difference was more marked. If one is acquainted with the histories of many companies, and in the case of the companies who publish, as we do, full details of their holdings, from evidence contained in the balance-sheets, it is possible to see that in many cases the market value of a share is far less than at which its cash assets could be realised, without regard to the value of its fixed and speculative assets." Mr. Rowsell went on to mention several cases in point—as, for example, that of Rhodesia Gold Mining and Investment Co., the shares of which stand in the market to-day at 7s.—8s., or less than the actual cash and immediately realisable assets which that company holds, whilst, in addition, it has a mine which is making satisfactory profits besides possessing other valuable assets. He mentioned a further case—that of Vereeniging Estates, Ltd., which is paying regular dividends, and has shown every year a greater appreciation of intrinsic value. These shares stand to-day at 13s.—14s., and Mr. Rowsell said it would be impossible to acquire assets of similar value to those owned by Vereeniging Estates at a figure which would represent £2 to £3 per share for the whole of the issued capital of that concern.

Railway Finance.

Returns published in the latest *Gazette* show that the railways and harbours deficit continues to mount up. The figures given are for the first eight months of the financial year, and carry the position down to the end of November. The ordinary working expenditure of the railways for that period amounts to £10,519,676. To this must be added £83,139 for renewals and £1,111,782 for depreciation, thus making the total working expenditure £11,711,598. The earnings of the railways for the period under review total £14,328,831. There is thus a balance of earnings over working expenditure of £2,614,233. To this sum must be added various items such as the profits on the book-stalls and on the catering and motor services, and interest on investments, which bring the net railway revenue total up to £2,842,462. Against this revenue must be set £2,571,678, interest on capital; £163,528, interest on superannuation and other funds; £1,080,296, abnormal cost of living allowance, and various smaller sums for other items, totalling in all

£3,876,022. There is thus a net railway deficit of £1,033,559 to be carried to the joint account, in which the harbours also show a deficit.

What Nationalisation Means.

In their annual review of financial conditions for 1921, Messrs. Joseph and Strauss write:—"The war and its aftermath have turned a strong sidelight on the inefficiency and wastefulness of bureaucratic control of public services everywhere, which in some cases resulted in deficits nothing short of disastrous. The American Government have wasted untold millions in mismanaging public services, and have practically bankrupted the railways. The deficit of the German railways for 1921 will reach 15,000,000,000 marks; the French telephone showed a loss of 200,000,000 francs in 1920; our own Budget is evidence of similar experience. Hence a universal cry for denationalisation even in Germany, which set the example for nationalisation. 'More business in Government and less Government in business' sums up to a nicety what is wanted and what President Harding emphasised. While the history of the past year (2,000,000 unemployed in this country and more than 5,000,000 in America)," conclude Messrs. Leopold Joseph and Strauss, "would not seem to afford much comfort and encouragement, there are fortunately some inspiring indications of a more hopeful outlook. There is a more reasonable disposition among the nations and between capital and labour to pull together."

Depreciated Currencies.

In a long and interesting review of the course of international financial conditions during the past year, and of the outlook for that just begun, Messrs. Leopold Joseph and Strauss reach the conclusion that in 1921, though the period was full of cares and anxieties, distinct progress in the direction of concerted action to shoulder the burdens and responsibilities attaching to the task of reconstructing and readjusting the economic structure of the world was made. This, despite serious losses which were suffered, as in every crisis. In reviewing the events of 1921 Messrs. Leopold Joseph and Strauss point out that "the necessity for economy by Governments and individuals—in the world is to recover from the waste and disorganisation—was not properly heeded, while all nations wanted to export, none to import. The stabilisation of currencies in the present state of chaos and confusion seems to be beyond the genius of mankind. Some European currencies have become so depreciated that they can hardly serve any more as means of exchange. In Russia the old rouble, formerly worth 2s., is now of such an infinitesimal value that the old denominations are entirely out of circulation, and only notes of 10,000 roubles and upwards are used for trade. Similar conditions, though not quite so bad, exist in Poland and Austria. In Germany, too, a situation has arisen which makes it difficult for her to use her own currency as a medium in trade. The value of the mark has not lost in purchasing power internally as much as in foreign markets, but naturally that difference will narrow down as and when the effect of imports of raw material, etc., bought at depreciated rates of exchange, upon the cost of living asserts itself. Hand in hand with the depreciation of the currency the issue of notes naturally increases, other means of payment not being available, so that the increase of the note issue and its depreciation must react upon one another in a vicious circle."

Mr. Herbert Freeland, who has been associated with the firm of Sturrock (S.A.) Ltd. since its inception, has retired from this Company in order to devote himself to mining work.

Letters to the Editor.

THE "PASSING" OF THE DIAMOND INDUSTRY.

To the Editor, *S.A. Mining and Engineering Journal.*

Sir,—On my previous visit to Kimberley a short time ago, everything seemed flourishing. The demand for diamonds was good and the price per carat appeared to be advancing almost daily. This was an ideal state of things as far as the prosperity of the city of Kimberley is concerned, for its welfare depends wholly and solely on a good demand for diamonds. To-day Kimberley has no future for there are no buyers of diamonds and no prospect of any.

This is the state of affairs which the late Mr. Francis Oats feared might come about. He foresaw that the world could only absorb a certain quantity of diamonds and that if sales were pushed to the utmost, sooner or later the point of saturation must be reached.

Probably the putting on the market of Russian jewels has somewhat hastened the day, but this state of affairs would have come about in any case had the diamond party of De Beers Company continued their policy of selling as many diamonds as possible. The portion of the community which purchases diamonds is only limited, and immediately the point of saturation was reached the demand would cease. It is not a question of the price per carat, whether the price be twenty pounds or twenty shillings makes no difference if there are no buyers. An all important point bearing on the future demand for diamonds is the fact that for some little time now it has not been considered good form for ladies, as distinguished from others, to wear jewellery. This applies to England, France and America. Most of us remember when gentlemen wore watch chains and rings, now no gentleman does so. The wearing of jewellery by the fair sex will also soon be taboo. After all the wearing of jewellery or ornaments is only a relic of a barbaric custom. The present mining debacle is the only case on record where the public alone have not been left to "nurse the baby." The rough diamond buying syndicate are possessors of diamonds which have cost them millions of pounds and which have no commercial value. The Syndicate has been badly hit; to use a sporting expression, they have got it in the neck. The public are the unfortunate holders of De Beers Company shares, and the case of elderly people who have invested their hard earned savings is particularly hard for they are dependent on the dividends from De Beers shares. Some have seen the writing on the wall and have left Kimberley, while others are preparing to leave at an early date. When I said at the commencement of this article that Kimberley has no future, I gave expression to the conclusions of some weeks of close observation.

Everyone is waiting for the improvement in trade that will furnish buyers of diamonds. The Directors of De Beers Company are hugging this delusion and are preparing for the direct treatment of the ground from the mines. They must realise on careful consideration that the old conditions will not recur. They should, therefore, at once set their house in order, reduce their large and expensive staffs and re-organise the Company. Every day's delay in so doing means a wasting of the Company's assets. Taking to-day's value of real estate at Kimberley at the figure of one hundred (100) it is doubtful if in six months time it will reach fifty. If the programme of the late Mr. Francis Oats had been followed up, the De Beers Company by this time would have proved the commercial importance of the copper occurrences of the North-West, and could have utilised their workshops for the manufacture of copper wire, tubes, sheets, etc., from the rough copper obtained from this source. It is not too late to remedy this failure to do the obvious. It is futile to appoint com-

mittees of industries the members of which do not possess the rudiments of any technical knowledge. Whether Kimberley possesses any special features to recommend it as a manufacturing centre is a matter to be determined by qualified experts. Left to itself, Kimberley will dwindle to a dorp. The Kimberleyite is a trader and has as much initiative as a sheep. The explosive works established by De Beers Company at Somerset West must be re-valued and probably re-organised, for the De Beers Company were the best customers of the explosive works. Mr. Warrington Smythe recently delivered a lecture at Cape Town in which he spoke of the manufacture of rich agricultural manures from coarse fish which exist in practically unlimited numbers off the West Coast.

Should this come about the million pounds raised in guaranteed debentures by De Beers Company for the purpose of manufacturing artificial manures from imported phosphates, may prove to be a heavy charge on the Company's resources. The Directors of the De Beers Consolidated Mines, Ltd., must surely by this time have realised the fact that the conditions that have gone will never return, they must cut down their staffs and overhead charges to the lowest, and ascertain at once in what way they can employ the resources of the Company to the best advantage of their shareholders. This is the only way to enable the Company to make any return and so relieve to some extent the sufferings of a large number of its shareholders. There will always be a certain industrial demand for diamonds for crowns of boring machines or drills, but this demand will be easily met by the production on a small scale of South-West Africa diamonds which are better suited for this class of work than mine stones. This letter might well have been headed "A Sermon in Stones."—Yours, etc.,

"ENGINEER."

[It must be understood that we do not endorse this correspondent's views.—Ed. S.A.M. & E.J.]

The issue of the "colour bar" continues to be misrepresented by the Federation and its political partisans throughout the country. Despite all the categorical assertions to the contrary made by the Chamber of Mines, it is still being published broadcast that the notice given by the Chamber of Mines to the Federation—a notice given without prejudice to negotiations—of its intention to withdraw from what is known as the "status quo" agreement, is merely a blind to cloak the motive underlying all the recent efforts of the Chamber to reduce working costs in the interests of the struggling low grade mines. That motive is said to be the removal of the "colour bar." It is in fact being freely represented by people who have axes to grind in the interests of Labour and Labour's political friends that there is a tremendous conspiracy afoot, a conspiracy which has as its objective the turning of South Africa into a black man's country, in which there shall be no room or hope or prospect for the white man. This of course is all absolute moonshine. The tragedy of it is that it is moonshine of a particularly dangerous character, since the propagation of this maliciously false doctrine is obviously tending to prolong the strike.

ENGINEERING SECTION.

Ingersoll Rand: Extending their Business.

In these hard times, we welcome signs of extensions and development of business, and it is therefore a pleasure to notice that the Ingersoll-Rand Company, whose mining and compressed air machinery is so well known on the Rand and throughout South Africa generally, are opening a Natal branch to take care of their business in that territory.

The Ingersoll-Rand Company has offices at 338a Smith Street, Durban, and that well-known Durban business man, Mr. H. P. MacNay, is manager of the branch. We wish the new office every success, and trust that it will prove of mutual benefit and a convenience to the Natal coal fields, sugar industries, and all other users of machinery in that progressive territory.

* * *

Motor Cars Made of Cotton.

It is predicted that motor cars will in future be made out of a material consisting mainly of highly pressed cotton, which replaces the steel, thus greatly reducing the weight and cost. Mr. Ford, at Detroit, is now working on a scheme to make motor cars from this new substance, which is a mixture of formaldehyde, glue and cotton, called "cottonoid." The material is described as tough and long wearing. Should the experiments prove successful, a revolution in the motor-car world is expected.

* * *

A Trade Inquiry.

The American Trade Commissioner, Mr. P. J. Stevenson, has received an inquiry from a large and important American manufacturer of stationary engines, including paraffin, petrol, gas, distillate and oil engines. This manufacturer also produces sawing outfits, log and tree saws, stump borers, pumping outfits and hoists.

Any firms interested in securing information and details should communicate with Mr. Stevenson at P.O. Box 6989, or 42, Standard Bank Chambers, Johannesburg.

A New Flexible Shaft.

For many small appliances such as dental drills, horse clippers and speedometers, it is necessary to use a flexible shaft between the driving mechanism and the tool or instrument. An interesting novelty in this type of appliance has been developed in Great Britain. It consists of a steel chain with alternate pin joints at right angles to each other, the whole mechanism being enclosed in a flexible metallized tube. This tube is filled with grease so as to lubricate all the joints thoroughly; and the arrangement is simple, flexible and highly efficient.

NEW PATENTS.

- Thaddeus Joy Armstrong.—Improvements in the construction of buildings.
- Harry Holmes Cuthbert. Improvements in or relating to the manufacture of decarbonising agents for internal combustion engines.
- Bullifants' South African Co., Ltd.—Improvements relating to unstable chemically or electrolytically produced solutions.
- Sigismund Rudolf James.—Improvements in wet hammer rock drills.
- William George Blake Brinton.—Spray for allaying dust after blasting in mines and the like.
- Maschinenbau Aktiengesellschaft (H. Flottmann & Co.).—Improvements in percussive rock drills.
- Ferdinand Dietzsch and Robert Pattison Farquhar Prain.—Improved preparatory treatment of ores or metallurgical products.
- Vickers Ltd. and Cecil Leslie Sumpter.—Improvements in or relating to oil well boring tools.
- Frederic Augustus Eustic.—Improvements in or relating to the art of making electrolytic iron.
- William Francis Makelin. Fixed gasket for hose-pipe spuds.
- The English Electric Co., Ltd.—A protective device for direct current electric motors.
- Stewart Roy Hlingworth.—Improvements in the coking of coal and apparatus therefor.
- Peter Burd Jagger.—Improvements in and relating to rope untwisting apparatus.
- William Josua v. d. Kloet and Willem Alexander Lodewyk Tuft.—Pivotal connection for iron structures.
- Jan Arend Schallies.—New process and machinery for burning plaster of paris.

Road Surfaces.

MERITS OF BITUMINOUS MATERIALS—LESSONS FROM BRITAIN AND INDIA.

With the growth of motor traction the importance of good roads to the development of the Union is, as we showed recently, to-day more than ever apparent. In this connection the following extracts from a long and valuable paper on road surfaces by Mr. Measham Lca, M.Inst.C.E., may be of interest.

The large increase in the number of motorcars and mechanically propelled vehicles now using the roads compels a consideration of the methods of road making to be adopted to meet the necessities of the present-day traffic.

An average taken of several of the larger cities in India, shows that the number of mechanically propelled vehicles in use in 1920 is four times the number of those in use in 1914 and twice the number of those in use in 1918, whilst the number of heavy motor lorries has shown an even larger percentage increase.

Beyond all question, motor traction must go on expanding to an amazing degree, and the very character of our roads must alter in consequence. Further, it has become self-evident that unimproved and improperly built highways constitute a positive barrier to the development of economic highway transport, and the ultimate solution of the road problem of to-day is to be found in the adaptation of the roads to the new traffic conditions rather than in restrictive regulation of traffic, or of vehicle construction.

The term "water-bound" macadam serves to distinguish the type of road surface which is formed by laying down a coating of road metal, rolling by a steam roller to consolidate it, spreading with binding, copiously watering and rolling until a compact surface is formed to the road.

Such a water-bound macadam road not only produces dust when used by motor vehicles, intolerable to all road users; but further the road surface is rapidly disintegrated under such traffic.

The object lesson which road engineers, all the world over, have learned is the futility and waste of money in endeavouring to maintain roads for mechanically propelled traffic by the former method of piling on macadam, to be shattered, pulverised, and subsequently removed in the form of mud and dust.

The Ministry of Transport in England have stated that: "The condition of road surface is a most urgent problem, upon that depend both the alleviation of the intolerable and injurious nuisance arising from mud and dust and also the mitigation of the burden of increasing cost of maintenance which is causing such widespread apprehension. Many miles of important roads in nearly every country are not constructed or surfaced so as to be suitable for motor traffic; and on the other hand the motor traffic, which on surfaces properly constructed and bound with water proof bituminous binding material probably causes less damage and wear than is caused by horse drawn traffic, is destroying and wearing existing water-bound surfaces in many districts to such an extent, that the cost of the frequent renewal which they require to keep them in fair condition imposes on the rate-payers quite a considerable burden. The most immediate and pressing need, therefore, at the present day is to encourage Road Authorities to strengthen and improve the crusts and surfaces of roads without delay, so as to secure satisfactory road surfaces for the requirements of modern traffic to alleviate the dust nuisance and to check the waste that is being incurred by continuing to maintain roads by the use of materials unsuited to the traffic requirements."

The experience in the City of Karachi, in Bombay, and other cities in India, coincides with this generally expressed opinion that the "water-bound" macadam road is not a satisfactory or even an economical road surface for motor traffic, and as the number of motor cars, mechanically-propelled wagons and motor buses increase on any given road, this defect will be more and more manifest.

Paved Roads.

As the intention of this paper is to lead up to a consideration of bituminous forms of construction, the reference to paved roads will be brief.

In most of the important cities and towns of Europe, the main thoroughfares in the central districts, where the density of traffic is great, are provided with paved surfaces, the following types of paving being adopted, viz.:

Granite sett paving on cement concrete foundations. Wood block paving on cement concrete foundations. Compressed asphalt on cement concrete foundations. The granite setts are dressed blocks of granite or other hard suitable stone from 4in. to 6in. deep, by, say, 4in. to 5in. wide and 9in. long. Additional care is now being taken to finely dress the setts so as to get close joints and smooth surfaces, reducing noise, and give a better tractive surface. The wood blocks now generally used are soft, 6in. to 9in. in thickness, and in some cases 12 hard wood blocks such as Jarrah and Karrah Wood, Red gum, etc., which have been tried have not been found to be so satisfactory as the soft deals creosoted, as the latter wear down evenly and do not result in the bumpy roads which the hard woods give after some years of life. The compressed asphalt is prepared from a mineral rock impregnated with asphalt found in a natural state, which is ground to powder and laid and consolidated whilst hot in a layer from 1½in. to 2in. in thickness on a prepared cement concrete foundation.

For each of the three types of paving referred to a cement concrete foundation over the whole surface of the road is necessary, varying from 6in. to 9in. in thickness and in some cases 12 in. in thickness according to the traffic requirements of the road. Nearly all the large towns in England have some of the principal thoroughfares paved with one or more of these methods. In London, for instance, the city area proper has compressed asphalt roads, the West End wood paving with some asphalt, whilst in the East End the roads carrying the dock traffic are, in many cases, paved with granite setts. The cost of granite sett paving, wood block paving or compressed asphalt, all on cement concrete foundations, at the present time, is approximately from Rs. 30 to Rs. 35 per square yard.

None of the cities of India have yet attempted to lay down road surfaces on any considerable scale involving costs even approaching the figures given above. The City of Calcutta laid one road with wood-paving, but it underwent an unfortunate experience during monsoon rainfall, and was removed last year and replaced with asphalt road surface. Wood paving was laid in Karachi many years ago, but had to be removed owing to the surface becoming very uneven. A small experimental area of wood paving was laid in Frere Road, Bombay, but the more recent experiment in this road is in the direction of laying granite setts on cement concrete foundations. The harder woods are liable to wear unevenly and are therefore unsuitable for road surfaces, and if wood paving is to be laid successfully in India it is incumbent on the Forest Department to put on the market, if possible, soft woods approximating to the Norway deals, and plants to creosote the wood blocks would be necessary.

Bituminous Materials.

The Ministry of Transport in England, in order to provide any satisfactory road surfaces for the requirements of modern traffic, have made available a sum of £10 millions sterling or 15 crores of rupees to be distributed this year

to cities and authorities maintaining roads, and they decided in dealing with applications for grants for the improvement of road surfaces to encourage the use of bituminous binding materials. They were advised by their Engineering Committee that it is essential in order to obtain strong and durable road surfaces which will stand modern traffic, that the old "water-bound" system of construction should be superseded by the use of some bituminous binding material in all important roads.

Summary.

Water-bound macadam road surfaces, even when made of the best materials available, are not capable of withstanding the wear and stress of any considerable volume of motor traffic, the road surface being more rapidly disintegrated under such traffic. The extent and character of the traffic now using the roads in Karachi and other cities demand that some forms of more permanent road surfaces should be provided and that the old water-bound system of construction should be superseded by the use of some bituminous binding material in all important roads.

A palliative may be adopted on roads of moderate traffic by spraying the surface with bituminous material such as tar, and residual oil, and this is the class of protection which can be most quickly and readily afforded, but for the roads where the volume and weight of the traffic is great, tar-painted roads are insufficient, and in such cases the road crusts and not merely the surface should be bound with bituminous materials in the form of tar macadam or the two-coat asphaltic road, both of which have been described.

An important factor making for economy in such bituminous roads, is that the bulk of the materials can be provided locally, the imported bituminous material only forming a comparatively small percentage of the materials required, whereas to provide paved surfaces the whole of the materials would require to be imported. The two-coat asphaltic road provides a road at a moderate cost to withstand heavy self-propelled traffic.

The construction of roads of a more permanent character will involve a large initial cost, but when their longer life and other factors in their favour are taken into account, it does not follow that over their life they are more costly than roads of low initial cost. A description of the various types of roads which have been, and are being, used leads to the conclusion that in the case of Karachi the two-coat asphaltic roads, tar macadam roads and tar-sprayed or oil-coated roads offer the best solution to the problem of how to prepare the roads to meet the motor and other traffic at present existing and which will undoubtedly grow. There are some special cases where reinforced concrete roads might be tried.

OIL FUEL IN SOUTH AFRICA.

The valuable and instructive paper read recently before the S.A. Institution of Engineers by Prof. Dobson, on oil fuel in South Africa, led to an extremely interesting discussion. To that discussion Mr. H. W. Miller (Past President of the Institution) contributed the following:—

He said he had watched the development of the coal mines with great interest, as he knew that cost was a very important factor in power production. In the Transvaal, up to the year 1914, the average cost of putting a ton of coal on to the trucks at the pit mouth was a fraction under five shillings a ton. On the top of this they had to allow a reasonable profit to the coal owners, and they still got a fuel which compared favourably with first-class coal mined in other parts of the world, even in its calorific value. Great events had taken place in the last seven years, and conditions had changed owing to the war. The conditions governing the coal mines had changed; the coal they used to get in England at from 8s. to 9s. a ton delivered at the works had risen in price in recent years to something like ten times that amount. The economic conditions were thus entirely altered. Oil had figured largely in these changes. He thought that power users really owed a great debt of gratitude

to Labour for the attitude it had taken up in the last few years, by which it materially increased the cost of the old-fashioned fuel, coal, and therefore gave the necessary stimulus to engineers to devise means of producing power in a more economical manner. If they considered the production of fuel in South Africa, they would see that the cost of coal had not advanced very materially. When they began with costs at 5s., now brought up to 7s., the cost to-day, they would see that, while the difference represented a large percentage on the original amount, it was not a big item. What hampered our coal industry in this country was the enormous freight charged by the railway. The charges had increased owing to the peculiar labour conditions, which had changed so materially in the last four or five years, but this had given engineers the necessary stimulus to turn their attention to other means of power production, and the internal combustion engine was therefore, he thought, coming into its own. He was sure that if Ackroyd were alive to-day he would be a proud man to have heard Professor Dobson's paper read, especially that section devoted to the semi-Diesel engine, which is largely the development of his researches, and which is simple in its design and economical in its use, as shown from the actual results quoted by Professor Dobson in his paper of the recent trial by Captain Riall Sankey. As he had mentioned, railway cost was a heavy item. To rail 100 lb. of material from Johannesburg to the borders of Rhodesia cost a sovereign, yet the same quantity of material could be sent round the world several times for the same amount. For this reason it was impossible for the coast towns to avail themselves of our coal resources inland, and power users there found they could import better fuel, oil fuel, and land it at their own doors at a more favourable price, especially when one considered the value per heat unit, which was, after all, its real value. It seemed to him that the only thing they could do, unless conditions might soon alter, now that the Government was faced with the necessity of reducing railway rates, was to consider the more scientific use of their coal fuel by extracting all that was contained in it, and, instead of burning it in a wasteful way, extract its constituent oils, tarry matters and other by-products for the manufacture of dyes and so forth, leaving the coke, a very valuable fuel in itself, and perhaps also making use of the gases as fuel. It was quite instructive to go through some of the steel works to-day and see the remarkable reduction in the quantity of coal used. All the power plant was operated from the furnace gases, and by the use of ingenious burners the boilers were fired with tarry residual matters, which proved excellent fuel. He thought that Professor Dobson had opened up an immense field for thought, and he was sure that many of the members of the Institution would be able to give further valuable information on that subject, so that all could see the benefits of the economic use of the more modern method of power production outlined in the paper.

The Chartered Company and its Shareholders.

ISSUE OF LENGTHY AND DETAILED REPORT—THE CAVE AWARD—IMPORTANT NEGOTIATIONS IN PROGRESS—THE FINANCIAL AND COMMERCIAL POSITION OF THE B.S.A. CO., LTD.

The mail brings a long and detailed report of the Chartered Company for the year ended March 31, 1920. The report, however, is not so belated as it seems, as it contains the full history of the momentous events in which the Company has been concerned down to date. The directors are under a bond of secrecy respecting discussions now passing between the Company and the Secretary of State for the Colonies. So confidential and important are these discussions that the directors have decided not to summon a meeting until full disclosure can be made "without breach of confidence and consistently with the shareholders' interests." Nothing, of course, could be more unprofitable than to talk over accounts nearly two years old with the consciousness that nothing that matters dare be mentioned. In point of fact the balance-sheet of March 31, 1920, could not safely be discussed, for it has been recast to conform so far as possible with the award of Lord Cave's Commission, while keeping in being, as a problematical asset, the net difference of £2,372,400 between the Company's claim and the amount awarded.

Besides being an exposition of the Company's views, the report is a historical document of value by virtue of the numerous appendices reproducing the Privy Council judgment on the ownership of unalienated lands, the reports of the Cave Commission and the Buxton Committee and sundry other illuminative reprints. The report proper plunges at once into a review of the Cave Commission award. This is described as "not wholly unsatisfactory," but only because the Crown had admitted liability for no more than £1,500,000. As Lord Cave and his colleague wisely eschewed reasons, the directors are "unable to conjecture the grounds on which, as against a claim of just over 7½ millions, the Company was, in effect, awarded something under 5 millions." In two respects the award was "profoundly disappointing." The flat statement of opinion that, "in the circumstances of this case, interest should not be allowed," was final, and the directors see that protest is useless. But, "advised by counsel of the highest eminence," they believe that interest must run on the amount of the award as from March 31, 1918. In the balance-sheet they credit the Company with such interest, calculated provisionally at 5 per cent., for two years, but put an equal sum into suspense on the debit side. The same counsel advise that the principal of the award, with accumulated interest, will be payable as soon as the Crown puts an end to the Company's administration of Southern Rhodesia. That matter is under correspondence with the Colonial Secretary.

The Company's Accounts.

The receipt of the report of the Cave Commission necessitates considerable alterations in the balance-sheet, which, for the year ended March 31, 1920, now appears in a new form. For the convenience of shareholders a copy of the balance-sheet as at March 31, 1918, is appended, and the figures in the balance-sheet as at March 31, 1920, should be compared with it, and not with the balance-sheet as at March 31, 1919, because while the 1919 balance-sheet was similar in form to the 1918 balance-sheet, it was upon the figures up to March 31, 1918, that the Cave Commission's award was based.

The administrative accounts of Southern Rhodesia show a deficit of £32,223 for the year ended March 31, 1920, as compared with a surplus of approximately £100,000 for the year ended March 31, 1919. This deficit has been added to the Company's claim against the Crown, and the Company will be entitled to repayment thereof in the manner determined by the Judicial Committee of the Privy Council. The net administrative expenditure on public works and buildings account in Southern Rhodesia during the year 1919-20 was £28,974. The deficit on administrative account in Northern Rhodesia for the year ended March 31, 1920, was £90,481,

as compared with a deficit of £47,071 for the previous year. The net administrative expenditure on public works and buildings account in Northern Rhodesia during the year ended March 31, 1920, amounted to £25,613.

Commercial Accounts.

The commercial accounts (that is those covering the Company's personal finances) for the year ended March 31, 1920, show an excess of revenue over expenditure of £166,898, as compared with £229,490 in the previous year. The difference is partly due to the fact that quit, lease and other rents in Southern Rhodesia, which in former years were included as revenue, have been excluded from commercial revenue account in the year ended March 31, 1920, and have been applied to the reduction of past administrative deficits. No dividend upon the Company's shareholding in the Rhodesia Railways Trust, Ltd., was received during the year ended March 31, 1920, whereas an amount of £51,607 was received during the previous year. The total advances received by the Company from His Majesty's Government up to March 31, 1920, to meet disbursements in connection with military operations in Africa against the Germans amounted to £1,915,000. A further advance of £25,000 on this account has been received since that date. The Company's resources in cash and first-class securities at 31st March, 1921, amounted to approximately £1,570,000. The corresponding figure at March 31, 1920, was £1,785,000. As the whole question of the future of Rhodesia is now, in view of the new Constitution, in the melting pot, comment had better be reserved until the result is known of the coming conference with the Premier of the Union.

**AVOID THE
FREQUENT
REPACKING
OF VALVES
IN UNHANDY
PLACES**

You can save yourself unnecessary trouble by packing the valves in out-of-the-way places with a packing that you know has the long-service quality.

You take no chances when you pack your Valves with

"PALMETTO"

Because it's made of materials having high tensile strength with such lubricant in each single strand as to cause it to retain its packing qualities.

Why not use "PALMETTO" Twine?

If you are in doubt about "Palmetto" let us send you a sample spool to test. At the same time we will send you a working sample of the braided—no charge; we wish to convince you.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material and Engineering Trades.

THE STRIKE: VIEWS OF COMMERCIAL MEN ON PRESENT IMPASSE—IRON AND STEEL—TIMBER AND BUILDING MATERIALS—ELECTRICAL GOODS—OILS AND COLOURS—COAL—BRITISH CREDIT AND INDUSTRIES—IMPERIAL WIRELESS CHAIN—RUBBER—PREDICTED MOTOR CAR REVOLUTION—OIL—METAL MARKET.

General.

Notwithstanding the efforts made by the Premier and the Chamber of Mines since the break up of the Strike Conference, to arrive at some *modus vivendi* for the settlement of the dispute, the position at the moment is one of stalemate. The opinion generally expressed in commercial circles is that the strikers are beaten and that they know that they are beaten, but the community is also of the opinion that unless strong and determined action is at once taken to bring things to a head, the present unfortunate state of affairs may continue for some time longer. One ray of hope is seen in the weakening of the coal strikers and their return to work in the Witbank district. All indications seem to point to the resumption of coal mining, to the extent the industry will at present permit of, at an early date. Unfortunately for the coal strikers the Breyten Colliery, which had for some time past been sailing very close to the wind, has been forced by economic causes to shut down, a factor which, together with others already adumbrated in our columns will tend to curtail the number of men it will be in the power of the Collieries to employ at the moment. Johannesburg has been very much impressed by the statements issued by the Chamber of Mines during the past week of the results attained by certain gold mining companies during last year with gold at an average price of 105s. per oz. compared with the present price of 97s. and a few pence and the normal price of about 85s. These figures, which are as startling as incontrovertible, may leave the Federation leaders "stone cold," but they give the ordinary man "furiously to think." When it is borne in mind that the average working cost for 1921 was 25s. 8d. per ton compared with 17s. 8d. in 1914, only those belonging to, or at any rate possessing the intelligence of, the stone age can fail to see the imperative necessity, and the immediate necessity, in the face of the steadily decreasing price of gold, of reducing working costs.

Merchants' views as to the present impasse are, as is to be expected, diverse, but the majority do not anticipate an early settlement. The opinion is that the men's leaders have been false to their trust and have offered no terms which could be accepted as a basis for negotiations. The strikers are, it is generally admitted, in a hopeless position, leaving them no other course to adopt than to break away from their unions and go back to work. If the strike were prolonged for yet another three months no other solution could be found. A leading commercial man reaffirmed his contention all along that if the men returned to work at the wages now offered by the industry, they would before the end of June, in view of the declining cost of living, be better off than at the higher rate. He thought the fact that some of the Collieries had now full complements and that colliers were steadily dribbling back to work was very significant as to what both coal and gold miners were thinking at the present time, and he looked for similar happenings here on the Rand in respect of the gold mines. Stern economic facts—not the Chamber of Mines—had beaten the men, and their leaders were deserving of all blame for calling the strike when the month's grace conceded by the Chamber of Mines would have enabled negotiations to be carried on without the present dislocation of business and inconvenience to the public. Another merchant said unless

common sense were going to be exercised on the part of the strikers and their leaders the trouble would apparently last some time longer, the consequences of which would, however, be bound to react on the men eventually. He thought that a new conference, with Mr. Crawford as the moving spirit, with the Government and the Chamber of Mines, would give a new index to the position. The strikers had got into deep waters and were making no headway at all. Mr. Crawford was inclined to act more sympathetically than the present leaders, and if a mandate were given him there seemed some possibility of an agreement being arrived at. He thought, reading between the lines of recent communications to the Press such office would not be unacceptable to him. A large importer of mining material said he thought the strike would end quickly because of economic pressure. The present upheaval had undoubtedly taught the country a good lesson—not to be too reliant upon the mining industry alone, but to adopt agricultural and other industrial measures. The mining industry is a perishing asset, and the problem will have to be faced one day as

SAMUEL OSBORN (South Africa) Ltd.
SHEFFIELD & JOHANNESBURG.

it had been in other countries) of replacing the present main industry by other permanent ones. The Rand commercial community could not possibly subsist, he said, if anything serious happened to the mining industry, either in the ordinary way or extraneously. He was confident, provided progressive measures were adopted, South Africa would eventually make good. Still another substantial merchant said it was impossible to say what the effects of the present upheaval would be. The present position was one of stalemate, and financially it was very serious indeed. Storekeepers along the Reef were heading towards bankruptcy, nor were the prospects in Johannesburg itself more reassuring.

To date nearly 40,000 natives have been repatriated, meaning less employment for some 4,000 whites at least. The Luipaardsvlei G.M. Co., Ltd., which has struggled valiantly for years past, is, it is stated, on the point of shutting down. This will mean unemployment for nearly 200 whites and 2,000 natives.

Iron and Steel.

One important mining material importer reported having done very fair business with outside districts during the week, but no other merchants whom we called upon had a similar tale to report but the reverse. Business on the whole had been stagnant, was the general report, with no prospect of trading until the strike was finally settled.

Latest nominal quotations.—Dunswart iron, 22s. per 100 lb. basis price; Union Steel Corporation, Ltd., 22s.; imported iron and steel, flats, small, 33s. to 40s.; larger sizes, 30s. to 38s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 37s.; $\frac{3}{8}$ in. iron, 30s. to 32s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ iron, 31s.; steel, 37s.; $\frac{3}{4}$ in. round iron, 30s.; steel, 33s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 30s.; channel and joists, 55s. 6d.; shafting, $\frac{3}{4}$ in. to 2 in., 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{4}$ in., 22s. to 23s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 45s. to 50s. per 100 lb.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 43s. to 48s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lb.; rivets, $\frac{1}{4}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lb.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d. per lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb.; $\frac{3}{8}$ in., 2s. 11d. per lb.; 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ to 1 $\frac{1}{2}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{1}{2}$ d.; $\frac{1}{4}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 30s. to 35s.; shovels, 52s. 6d. to 57s. 6d.; wheelbarrows, 47s. 6d.; picks, 37s. 6d. to 67s. 6d.; pick handles, 21s.; hammer handles, 14 in., 7s. 6d.; 18 in., 9s. 6d.; 24 in., 13s. 6d.; 30 in., 18s. 6d.; 36 in., 35s.; barbed wire, "Shorthorn," 69 lb., 13 $\frac{1}{2}$ gauge, 22s. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bull tee fencing standards, 14 lb., 27s. per dozen; 12 lb., 25s. per dozen; black baling wire, 14 gauge, 19s. per coil, 100 lb. Barbed wire is meeting with more ready sale; prices are fairly firm; 12-gauge barbed wire, 25s. retail. Screening, 3s. to 9s. 6d. per sq. yard cyanide, 1s. 7 $\frac{1}{2}$ d.; zinc shavings, 1s. per lb.; asbestos, white, $\frac{3}{4}$ in. to $\frac{1}{2}$ in., £35 per ton; $\frac{1}{2}$ in. to $\frac{3}{4}$ in., £50 per ton; $\frac{3}{4}$ in. to 1 $\frac{1}{4}$ in., £80 per ton; 1 $\frac{1}{4}$ in. to 2 in., £175 per ton; Blue, No. 3, £25 per ton; No. 2, £34 per ton; No. 1, £45 per ton; short, £20 per ton. Tin plates (L. C. Cokes), 20 in. x 14 in., per box f.o.b. Swansea, 19s. 3d. Galvanised sheets, 15 $\frac{1}{2}$ d. to 16d.

British Iron and Steel Production Costs.

The Controller and Auditor-General, Mr. J. de V. Roos, in his report on the statement of accounts of the Railways and Harbours for the financial year 1920-21, says, *inter alia*, that 98 engines had been supplied by an American corporation all of which had been found to be defective. The cost to the Union was £1,409,447, and the Auditor-General is clear that the compensation paid by the American corporation for these defects, £52,000, was below the legal liability which the Railways could have enforced.

Union American Locomotives.

Replying to a deputation from the National Federation of Iron and Steel Manufacturers, who urged reduction of freights, Sir Owen Phillips, President of the Chamber of Shipping, stated that freights had fallen very heavily and were now no more than barely living rates. He referred to the contract recently placed by the Rand Water Board with a Dusseldorf firm for materials in connection with the Vaal River scheme, the German company's price being £117,000 below the British tender, and that, therefore, even if the shipowner carried the goods free, the British price would still be unacceptable. He urged the iron and steel industry to work towards low production costs as well as excellence of quality.

British Iron and Steel Trades.

London cables that there is little change in the iron and steel trades. A fair amount of buying for forward delivery is passing. Foreign offers of iron and steel are falling off, current prices being more on the level of English quotations, at which, owing to their more reliable quality, the home products are generally preferred. Competition in regard to pig iron, steel billets and wire rods, which a short time since was very formidable, has now practically ceased. The pig iron section is quiet in expectation of reduced railway rates this month, which is restricting business, as consumers anticipate lower rates will bring reduced prices. The situation in Sheffield is not at all bright, there being nearly 50,000 unemployed, and the cancellation of battleship contracts is being specially felt. There has been some demand for tin plates and galvanised sheets for the Argentine and other parts of South America. German competition is seriously impeding disposals of enamelled hollowware. Screws, rivets, nuts, bolts and edge tools are suffering from the flooding of the market by Government surpluses.

American Iron and Steel Trades.

New York advises that the improvement in production and orders is quite pronounced, and all indications are that the principal consumers, the railways and the builders, will expand their demands very substantially during the coming months. Lowering of the price of steel plates has started negotiations which may result in the placing of very extensive tonnage.

It is reported from Berlin that a German metal trust has bought a number of old British warships as old iron for £500,000, with the object of supplying the German industry with raw material, especially high quality steel.

Australian Steel Industry.

The Australian Prime Minister, Mr. Hughes, has uttered a warning that unless a determined effort is made to meet the new conditions created by the fall of prices Australia would soon have to face an industrial crisis. Unless the price of Australian steel was reduced so as to compare with the American price, plus freight and tariff, further Australian shipbuilding would be impossible.

Timber and Building Materials.

Prices of timber remain practically unchanged with, however, a firmer tendency, especially in 3 x 9 deals, which, according to latest advices from the Baltic, are inclined to go higher. There has been a little activity in building—no large contracts, of course, but the building of small cottages by people assisted by the building societies.

Prices.—3 x 9 deals, 1s. to 1s. 1½d.; scantlings, 11d.; heavier boards, 4¼d. to 4½d.; floorings, 6¼d. to 6¾d.; ceilings, 4½d. to 4¾d.; Oregon, 7s.; pitch pine, 8s.; corrugated iron, 8¾d. to 9¾d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second at the coast; American oak, 1 in., 10d.; 1½ in., 11d.; 2 in., 11½d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1½ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mill; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per foot. Prices for bricks are: Mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

No new jobs are being started at present, only old ones are being continued.

Plastic Wood.

This is the name given to a material recently introduced by a British firm. It is made of very fine wood meal mixed with collodion. One of its most valuable applications is in the making of patterns for casting purposes. It can be built up into any form, and it sets quite hard, so that it can be cut like ordinary wood or turned in the lathe. It is waterproof and does not warp or deteriorate through damp. Nails can be driven firmly into it without cracking it.

Electric Goods.

There is, of course, very little business doing just now. Materials are coming in very slowly and, according to a leading importer, Germany is not sending stuff out so willingly as previously, as prices of raw materials are on the up-grade in that country as was predicted would be the case some months ago. Three manufacturers' representatives of the Central Powers here have all put up their quotations. My informant said that a serious feature in the electrical business was that, owing to the recurring labour troubles which had affected the Rand, numbers of really steady and experienced young mechanics had become disgusted with their prospects here and were migrating to the United States, where a more settled state of affairs seemed to prevail and a better future held out than was to be realised here.

Oils and Colours.

White lead in oil, 39s. per 50 lb. keg; English red lead, 10d. per lb., 9d. per lb. in 50 lb. kegs; dry white lead, 1s. 6d. per lb.; linseed oils, raw or boiled, small bottle, 1s. 6d. each; 7 lb. tins 7s. 6d. each, 4 imp. gall. 35s.; spirits of turpentine, small bottle, 2s. each, 12s. 6d. per '83 imp. gall.; turpentine substitute, 5s. 6d. per tin, each 5-6th imp. gall.; finest linseed oil putty, in 100 lb. drum bulk, 4½d. per lb.; English putty, in bladders, 6d. per lb.; colours ground in oil, 1s. 6d. to 4s. 6d. per lb.; dry colours, 6d. to 10s. 6d.; colours ground in water, 1s. to 2s. per lb.; in turpentine, 2s. 6d. to 10s.; motor colours ground in gold size, 2s. 6d. to 5s. 6d.; ready mixed paints, 1s. 6d. per lb., 70 lb. drums 75s.; roof paints, 16s. 6d. per 14 lb. tin, 75s. per 70 lb. drum; varnishes, 25s. to 47s. per imp. gall.; calcite cold water paint, 38s. per case of 8 7 lb. packets; pumice stone, 1s. 3d. per lb.; bees wax, 1s. 6d. per lb.; alum, 9d. per lb.; creosote, 4s. 6d. per 5-6th imp. gall. tin; gum arabic, 3s. 6d. per lb.; methylated spirits, 5s. 6d. per tin 5-6th imp. gall., bottles 1s. 3d.; resin, 8d. per lb.; caustic soda, 1s. 3d. per lb.; coal tar, 4s. 6d. per '83 imp. gall., per 4 imp. gall. 17s. 6d.; Stockholm tar, 9s. 6d. per '83 imp. gall. 47s. 6d. per 5 imp. gall.; common glue, 10d. per lb., good quality cake 1s. 3d., finest Russian 1s. 6d.; gold leaf, English plain, per book 3s. 9d., transferred per book 4s. 3d.; aluminium leaf, plain, 1s. 9d. per book, transferred 2s. per book.

Cheaper Petrol and Paraffin.

The Vacuum Oil Co. (S.A.), Ltd. notify that the price of petrol has been reduced by 1s. per case, and paraffin by 1s. 6d. per case.

Union Grain Elevators.

Messrs. W. H. Menkin and Benjamin have arrived in Capetown and proceeded to Durban in order to make a beginning on the construction of the 36 grain elevators.

Coal Options in Carolina District.

It is reported that options upon practically the whole of the coal rights lying in the triangle formed by the Delagoa Bay, Springs, Breyten and Machadodorp-Piet Retief railway lines have been given to American and English syndicates. The capital represented totals, it is stated, several millions.

There is at present such a demand for Welsh anthracite coal that orders can only be met with difficulty; on the other hand, the conditions in the Welsh steam coal market are the reverse of good.

Coal and Oil Finds in Germany.

Borings in Central Germany, near Esbeck-Schoeningen, have led to the discovery of a large lignite field, which it is expected will also yield a high-grade coal. Experts are of opinion that considerable seams have still to be found, especially in Bavaria and Southern Germany. Coal has further been discovered on the Harz Mountains, and a lignite seam has been found below the centre of Berlin.

Some fairly important oil discoveries have recently been made in Germany. Borings near Bruchsal, in Wurtemberg, have given satisfactory results, and in Bavaria some small oil fields have been discovered.

Synthetic Coal.

It is reported from Munich that a practising chemist in that city has discovered a new coal after experiments lasting over six years. A patent has been applied for. A demonstration before a number of professors and experts has, it is stated, convinced them that the discovery is a genuine and important one. The coal is said to have a heating power of 8,000 heat units. It produces gas at least equal to that obtained from the best gas coal, and the cost of its production is said to be about half the market price of ordinary coal at the present moment.

British Industries Fair.

The British Department of Overseas Trade is organising a British Industries Fair, at which British manufacturers will be able to show their goods to home and foreign buyers. The fair will be held in London and Birmingham concurrently, from February 27 to March 11. 48,000 invitations have been sent out to buyers in all parts of the world. Special attention is to be paid to buyers from abroad, including the provision of a special class of men able to introduce them to the firms most competent to meet their demands. Another branch of the official staff of the fair will explain the facilities afforded for foreign credit by the Trade Facilities Act. The Export Credit Department will negotiate general and specific credits.

Shipbuilding in 1921.

According to Lloyds' annual summary the total tonnage of merchandise launched in the United Kingdom during 1921 was 1,500,000 tons. 590,000 tons of this was for owners abroad, being a decrease of 517,000 tons compared with the record year of 1920.

The world output of ships was 4,340,000 tons, a decrease of 1,500,000 tons compared with 1920, but an increase of over 1,000,000 tons compared with the previous record in 1913. The tonnage under construction in the world amounts

to nearly 4,500,000 tons, being 2,700,000 tons lower than a year ago. The construction of many of these vessels has been suspended, and orders are still far below normal.

British Credit.

According to late cables a steady improvement has taken place recently in British credit resulting from reduced value of money. As a consequence of this $5\frac{1}{2}$ per cent. Treasury bonds are now being converted into 5 per cent. bonds at 99, which it is expected will place the Government in a satisfactory position regarding near debt maturities, seeing that some £250,000,000 in cash must have been subscribed for the $5\frac{1}{2}$ per cent. bonds. Outside that loans are 3 to 4 per cent. Discount rates have risen to about $3\frac{3}{4}$ per cent., but this is looked upon as temporary only, and the bank rate is still expected to be reduced later. The improvement in the New York rate of exchange has been of great assistance to general trade. There has been keen competition for new issues, all Colonial loans offered being subscribed quickly.

Imperial Wireless Chain.

The Wireless Telegraphy Commission appointed by the British Government in December, 1920, has reported recommending the erection of thermionic valve stations in England, Canada, Australia, South Africa, India, and Egypt and the erection of arc stations in East Africa, Singapore and Hong Kong. The average cost for oversea stations will not, it is estimated, exceed £150,000, while the cost of stations in England, Egypt, East Africa, Singapore and Hong Kong, for which presumably the Imperial Government will be responsible, should not exceed an aggregate of £853,000. The arc station in East Africa will probably draw its electrical power from the falls of the river Thika. The plans for South Africa assume that the stations will be on the Rand, near the bulk of the supply of electricity. The Wireless Commission's report is severely criticised by the *Manchester Guardian*, which says that the course of experiment and discovery in wireless has moved so swiftly that it is doubtful whether the plan recommended is worth proceeding with. The need of the British Empire, the *Guardian* says, is a wireless plant that will reach the ends of the earth cheaply, and such a plant will be perfected before long. That paper asks, not without reason, why, if we can speak comfortably to the Antipodes, instal a plant in East Africa merely to pass on messages. The *Guardian* thinks the present expensive programme should be modified in favour of a simpler and more courageous plan.

New Use for Rubber.

An absolutely new use for rubber has been discovered in connection with cold storage installations. This is india rubber expanded by gas into highly cellular form. It has been found that by packing the cold chamber with this material the amount of heat that comes in from outside is lower than in the case of cork or of any other substance

NICE HOUSES FOR SALE IN THE NORTHERN SUBURBS.

HOUGHTON.—The owner, who is leaving, has instructed us to offer for private sale at £3,300, his residence in Houghton Estate, containing lounge, 6 rooms (2 of which are of large dimensions), usual offices, hot water, etc. Substantially built garage, stable and boy's room. There are two freehold plots tastefully laid out with lawn, garden and fruit trees, etc., etc. The property is in good order throughout and possesses those attractive features which appeal to a discriminating purchaser.

MOUNTAIN VIEW.—Pretty residence on the hill side, of rondavel type, 5 rooms, etc., on full acre. Photographs at our office.—£2,200.

PARKVIEW.—Villa of lounge and 4 rooms and all modern conveniences, two minutes' from Zoo gates. £1,800. A larger house (7 rooms) in same vicinity £1,000.

YEOVILLE.—Double-storey residence of 7 rooms, sewer-d. hot water, £1,850.

R. A. PRIOR,

Registered Public Accountant and Member Real Estate Agents' Association, 105 Fox Street. Phone 3305.

previously employed. This cellular expanded rubber is prepared by vulcanising under gaseous pressure amounting to as much as 100 atmospheres.

Rubber sheets for paving London streets have proved satisfactory and are likely in the very near future to replace the present wood blocks and asphalt paving. The initial cost of the rubber sheets is, it is stated, double that of wood, but the sheets last six to ten times as long.

Seamen's Reduced Wages.

The shipowners' and employees' organisations, representing all ranks in the mercantile marine, have arrived at a complete settlement of the question of wage reductions. The wages of men on foreign going vessels will be reduced by £2 a month, viz., 30s., on March 4 and a further 10s. on April 1. The wages of the men employed on coasters will be reduced 10s. 6d. a week, with proportionate reductions for officers ranging from 25 per cent. to 10 per cent.

Unemployment in Britain.

It is announced that 250,000 fewer people were registered as wholly unemployed on January 17 as compared with six months ago, but the present total is nearly two millions, of whom 124,000 are employed on Government and municipal schemes of emergency work.

Revenual Effect of Stoppage of Trams.

The tramway traffic returns for the week ended January 21 have been considerably affected by the curtailment of the Thursday and Friday and complete stoppage of the Saturday services. The total receipts were £6,932, as against £10,105 during the same period last year.

Anglo-Persian Oil Company's Successful Issue.

The Anglo-Persian Oil Co., which invited subscriptions for £4,000,000 in ordinary and preferred shares, closed their lists almost as soon as they were opened, the applications totalling £57,000,000.

The Week's Meetings.

THE UNION STEEL CORPORATION.

INCREASED PRODUCTION.

SEVERE EFFECT OF STRIKE.

The tenth annual general meeting of shareholders of the Union Steel Corporation (of South Africa), Ltd., was held on Friday, January 27, 1922, in the board-room, Lewis and Marks Building, President Street, Johannesburg, at 12 o'clock noon.

Mr. Isaac Lewis (the chairman of the company) presided. Among those present were Messrs. George Falcke, C. B. Kingston, G. Roy Lewis (managing director), T. Marks, F. A. E. Wells, A. D. Viney, R. W. Townsend (representing African and European Investment Co., Ltd.), Alfred d'Altera Dowsley, H. J. Dowdall, L. First, G. Robson (manager), D. MacGregor Kay (secretary), representing 141,150 shares out of an issue of 231,607.

Chairman's Speech.

In moving the adoption of the report and accounts, Mr. Isaac Lewis said:—

Gentlemen: The report and accounts before you record the result of your Company's operations for the year ended September 30 last. I am pleased to say that the year with which our accounts deal was a record one, both in respect of tonnage production and value of the sales. The gross manufacturing profit of £146,381 15s. 5d. exceeded the figures of the previous year by about £4,000. After the usual writings off as detailed in the Profit and Loss Account, and after making liberal provision for depreciation on machinery, plant and buildings, dwelling houses, bad and doubtful debts and normal tax assessment to June last, there remains a net profit for the year of £82,069 18s. 1d., as compared with £85,652 19s. 9d. in the previous year. The decrease of £3,583 1s. 8d. in the net profit is chiefly accounted for by the increased reserve made for depreciation, by a larger provision for Government taxation, and by an increase in our general expenditure in South Africa, which has been caused by the larger volume of trade, and by the increase in our organisation. The year's profit added to the balance brought forward at September 30, 1920, leaves a total credit to Profit and Loss Account of £215,519 17s. 6d.

On referring to the Balance Sheet, you will see that from this amount there has been appropriated for the payment of excess profits duty and for the balance of Normal Tax to June 30, 1920, an amount of £50,415 16s. This is in addition to the provision in the Profit and Loss Account before you of £7,455 1s. 6d. for Normal Tax to June 30, 1921. A settlement of our liability for excess profits duty and normal tax to June 30, 1920, was only concluded after publication of our last year's accounts, and therefore the amount could not previously be brought into account. As you will see, the Government's share of our profits has been a substantial one.

During the year a sum of £37,477 7s. 2d. was appropriated and paid for dividends on the Eight per Cent. Cumulative Participating Preference Shares to

September 30, 1921, including the participating dividend on the Eight per Cent. Preference Shares and Seven per Cent. Preferred Ordinary Shares, in accordance with their respective rights and interests. To meet the demand of our trade, to strengthen our position to meet overseas competition, and to conserve our resources in view of the present unstable economic conditions throughout the country, the directors, after fullest consideration, have decided not to declare any further dividend for the present.

A sum of £71,182 3s. 6d. has been transferred from the Profit and Loss Account to Funds Appropriated for Capital Expenditure Account as at September 30, 1921, representing capitalised profits to that date expended upon the extension of our plant and buildings.

Additions During the Year.

On the assets side of the Balance Sheet, machinery, plant and buildings show an increase over last year's figures of £38,311 1s. 11d., represented by very considerable improvements and additions made during the year, including the new 25 ton furnace and the extension of our building in connection therewith, to the commencement of which work I referred in my remarks at our last annual meeting. There remains a net balance to credit of Profit and Loss Account of £53,411 10s. 10d., which is carried forward.

We have made provision of a further sum of £18,500 for depreciation of plant, machinery, buildings and dwelling houses, so that the total reserve for this purpose now stands at £72,951 14s. 9d. There is also an increase of £6,090 2s. 6d. for provision of dwelling houses, being the cost of additional accommodation provided during the year for our employees. Owing to the rapid industrial expansion at Vereeniging and to the increase of our own trade, there is still a shortage of houses, but steps are being taken to overcome this, and some of our employees are now building their own homes.

With regard to the item of Investments, you will see that we have acquired 25,000 shares of £1 each in the Newcastle Iron and Steel, Limited. After full consideration your Board were of opinion that it was sound business to assist the Newcastle Company by subscribing to its capital, so that we might be assured of an early supply of pig iron required either by reason of the extension of our own manufactures, or by any curtailment in the supply of scrap steel until such a time as our own blast furnaces may be erected and come into operation.

Other Purchases Made.

We have purchased 9,998 shares of £1 each in the business of Stewart, Sanders and Company, Limited, manufacturers of steel nuts and bolts, etc., as a condition of which they are erecting their factory in the vicinity of our own works at Vereeniging, and it is confidently hoped that as soon as the erection of the factory is completed, we shall do an increasingly important trade with them in our steel.

Stocks of scrap and manufactured goods show a small increase over last year's figures.

The ascertained bad debts have been written off and the item of £1,510 13s. in the Profit and Loss Account includes a provision of £1,000 against contingent bad and doubtful debts, which is considered ample. Your Corporation have been singularly fortunate in escaping any serious losses from bad debts, considering the total amount of sales effected.

Cash at bank and at call amounts to £32,214 12s. 7d., a decrease from last year accounted for by the purchase of shareholdings in the companies referred to and also to the capital expenditure on extension of our works.

I do not think there are any other items in the Accounts which call for special comment.

Gentlemen, we all know that in the early part of last year there were distinct signs of a set-back in trade and industry, and that local manufacturers were beginning to suffer from the effects of overseas competition, which has since become increasingly severe. In the light of such knowledge, I think we have reason to be very pleased with the year's work as disclosed in the accounts before you, and the result reflects great credit on the management and staff of the Corporation. Since the close of the year under review our trade, in common with that of many other industries, has fallen off, as both the mines and the railways, our two largest customers, have been buying practically from hand to mouth, but we have endeavoured to maintain our share of such business as has been available.

Continental Competition.

In some directions our trade has been adversely affected to an increasing extent by overseas competition, particularly by Continental manufactured goods, and especially in the coastal markets, where we have recently found it difficult to compete. A young industry such as ours, with neither tariffs nor bounties to protect it, is sufficiently handicapped by legitimate and normal competition from the more highly developed overseas producers. But the competition with which we are now faced is artificially helped by the present industrial conditions in some European countries which are favouring cheap production, by the depreciated exchanges and by the low sea freights which are quoted for some of these Continental products. This is an artificial combination of advantages in favour of foreign competitors which imposes a real hardship on our local manufactures and which must result in checking the development of our own industries at a time when their expansion is so much needed.

In one of his speeches on the subject, General Smuts, the Prime Minister, said:—

"Firm support must be given to those industries which have arisen and which are now exposed to heavy attacks from overseas industries which are better organised and more highly developed."

This speech was made some time ago, and showed the Prime Minister's prophetic vision and statesmanlike appreciation of what is needed. I think today not only those concerned in manufacturing industries, but the whole country are anxiously waiting to learn the results of the deliberations of the Advisory Board of Industries and the Tariff Board, and I may add that overseas capitalists who have been approached for their co-operation are also not unmindful of this aspect of the matter.

Local Support Needed.

In this connection I want to say that while we have every reason to be satisfied and even grateful for the support which has been accorded us by our customers, I cannot too strongly emphasise at this crisis in the industrial life of South Africa the vital need for consum-

ers in this country to place their orders with the local manufacturing concerns to the fullest extent of their power. The economic conditions of the country today demand that the loss of employment and trade caused by the closing down of some, and the rapidly shortening life of other, gold mines shall be compensated by the development of permanent industries. The Unemployment Commission, realising the seriousness of the position, emphasised in their report the necessity of this, so that surplus labour might be absorbed and an avenue of employment found for the youth of the country.

The difficulties are great, and success and permanence can only be attained by the hearty co-operation of labour, and by the sympathetic support of both the consumer and the merchant. As Mr. Skeels, the president, so pertinently pointed out at the last meeting of the Transvaal Manufacturers' Association, that:

"If they put nothing in the place of the mines, the output of which was diminishing year by year, it would not be long before the purchasing power of the community would be so decreased that there would be little left to distribute."

Many thanks are due to the Press for the interest and sympathy shown towards the efforts being made to establish local industries, and I hope it may not be thought that I am going outside my province if I express the hope that the Press will continue in an ever-widening degree to inform and educate the public and enlist their sympathy for local manufacturers, so that the industries already established may prosper and the capital for their further expansion be obtained.

We realise that the special conditions under which these industries worked during the war period no longer operate in their favour, and that we have now to face, unaided for the moment by any Government assistance in the way of protective tariffs or bounties, the artificial competition of the imported article to which I have referred. We on our part are sparing no effort to maintain and improve the quality of our products, and to satisfy customers both as to quality and price, and I feel justified in saying that our customers are generally well satisfied.

It is the determination of your Board, so far as lies in its power, to keep the South African trade in the products it manufactures; to keep its works operating to the fullest extent possible; and to keep its men employed with a view to the fruition of the larger scheme we have in mind.

Grain Elevators Contract.

I am sure you will be pleased to learn that we have successfully competed in London for the order for the whole of the reinforcing steel required for the erection of the 36 Government grain elevators in South Africa. We have further large orders in view which we hope to secure. To meet competition and to prepare for the improved trade conditions to which I confidently look forward, we have considerably enlarged our works.

The new 25 ton furnace should have been ready for work this month, but has been delayed by the strike. It is confidently expected that this new furnace will enable us to double our output of ingots and show a very substantial reduction in cost of production.

The Heroult Furnace, erected in 1919, the first of its kind to be installed in South Africa, continues to give excellent results, and the steel castings produced from this furnace have proved to be of the very best quality and have given entire satisfaction to our customers. Shoes and dies for the mines are being

produced from the steel from this furnace. We are taking steps to overcome any defects that may have been detected in some of our earlier deliveries, and are now supplying both cast and forged shoes which give a life bearing the most favourable comparison with the imported article with which we are competing.

We are about to commence the production of a much heavier rail than we have hitherto produced, and for which there is a large demand. The rolls for these rails are already ordered, and we hope to obtain delivery very shortly. This marks another step forward in the expansion of our industry to meet local needs. We have also in contemplation the rolling of very much heavier angles, rounds and flats, which will greatly add to the range of sections now being produced.

The foundry equipment has been further improved, and we are in a position to machine our castings and also to undertake forging of every description.

We continue to do a large trade in steel rails, rounds, angles, flats, squares, fencing standards, tube-mill bars, in mild and hard steel castings, etc., and in reinforcing rods to British standard specification.

Gold Medal Awarded.

Specimens of our products have been sent to the office of the High Commissioner for South Africa in London, for exhibition and should prove of great interest to English shareholders.

For the second time in succession we were successful in obtaining the gold medal for our exhibit at the Witwatersrand Agricultural Show last year.

Disappointment has been expressed in some quarters that greater progress has not been made in the development of the steel industry, particularly from native ores. I may therefore be pardoned if I repeat and supplement some of the information I gave you last year as to the scope and nature of our efforts to establish a large iron and steel industry in South Africa, because I do not think that the critics have attached sufficient importance to them or that it has been sufficiently recognised that practically the whole of the work has been carried out by private enterprise. I contend that the work done by the Union Steel Corporation has been the most important factor in bringing this steel industry into prominence and revealing its great possibilities.

With our friends we have spent very large sums in the location and examination of local ore bodies and raw materials, in the experimental production of pig iron. We have twice brought out to South Africa, at great expense, the best experts both on steel making and in the knowledge of the raw materials necessary for the purpose, and we were the first to take this action, which we did as soon after the close of the late war as conditions at home permitted. The first report was most satisfactory; the second is in course of preparation, and I have every hope that it will confirm the promise of the first one. In consultation with our experts we have prepared schemes for the establishment of the big industry and have conducted important negotiations in the endeavour to raise the large capital necessary, but the financial conditions throughout the world have been unfavourable to obtaining this money at present.

Produced over £1,500,000 Goods.

In addition this corporation produced over £1,500,000 of finished goods; they employ over 180 white men earning good wages, the majority of whom are Africans who have been trained over a period of years in this skilled industry; we give employment to nearly 500

natives; we have paid very large sums to the Government for the purchase of their scrap steel and in railage on this scrap and on our finished products, and, moreover, as you will have seen by the balance sheet, we have paid further during the past two years some £57,000 to the Government in taxes. We have been acting, not merely talking.

I have dwelt upon this aspect of the question, because of the great importance of the subject. Unhappily, I have to address you in the midst of a disastrous strike which is taking place and threatening the whole economic stability of the country. At a critical period of readjustment to post-war conditions, the strike is creating a serious obstacle to the conduct of the principal industries, retarding progress in every direction, and giving a most favourable opportunity for foreign competitors to reconquer the market for goods which were being produced in South Africa.

Your corporation has suffered very severely from the effects of the strike, coming, as it has, at a time when every effort is being devoted to fighting foreign competition.

It is well known that employees of your corporation have been liberally treated during the whole of the War period, and even at this moment we have no differences excepting with a very small minority of them. The unions, however, decided to call out all our men in sympathy with their fellow-workers on the mines, and so far as I can gather, for no other reason, as agreements between ourselves and the various unions in regard to a reduction of wages of our own employes had already been accepted, and were actually in force when the strike broke out.

Effect of Present Dispute.

We must all pray that those who are conducting the present negotiations in regard to the labour dispute may quickly find an avenue for a peaceful settlement, and an early return to work. The whole economic structure and welfare of this country is at present unfortunately so largely founded upon the profitable working of our mining industries, that any prolonged cessation of work there, such as we see to-day, and which follows upon the closing down of the diamond mines and some of the low grade gold mines must inevitably bring in its train further unemployment and privation and suffering to a majority of the population not directly involved in the present disputes.

Whatever settlement may be made as to the division of the product of labour, it cannot be too clearly recognised that it is only by high efficiency and greater production by each unit of labour that the industries can be successfully carried on and the material welfare of the worker permanently improved. This applies in a special degree to an industry like our own, which is still in its infancy and which has to fight its way against the more highly organised efforts of producers in Europe and America.

I have the fullest confidence not only in the future of the steel industry, but also in the early and successful expansion of the agricultural and manufacturing industries of the Union, and if wise counsels prevail in the present dispute, I am convinced that these will provide new and ever-increasing fields for the employment of labour.

I now move the adoption of the report and accounts as submitted.

Mr. Falcke seconded, and it was carried unanimously.

The retiring directors, Mr. L. Marks and Major Aubrey Butler, were re-elected, and the appointment of Mr. G. Roy Lewis on the directorate was confirmed. Messrs. Deloitte, Plender, Griffiths, Annan and Co. were re-appointed auditors.

BOTH PARTIES CONFER WITH THE GOVERNMENT—THE CHAMBER'S OFFER AND ITS SUBSEQUENT WITHDRAWAL—FEDERATION MERELY REITERATES ITS IMPOSSIBLE "DEMANDS"—THE REPUBLICAN FIASCO—S.A.I.F. AGAINST GENERAL STRIKE—NEARLY 40,000 NATIVES REPATRIATED—THE CASE OF THE ROBINSON MINE—KLEINFONTEIN POWER STATION RESTARTED—MEN ANXIOUS TO RETURN TO WORK—FIVE ARRESTS IN JOHANNESBURG—POSITION AT WITBANK.

During last week-end prospects of bridging the gulf between the two parties in the present dispute assumed a temporarily brighter aspect. The Federation of Trades made the first move by announcing that it intended approaching the Government in terms of the Prime Minister's letter of the previous week-end. The Chamber of Mines representatives also met General Smuts on Sunday and the Federation representatives again on Monday. The result of these interviews is contained in the following statement issued on Monday afternoon by the Prime Minister's office:

The Prime Minister and the Minister of Mines met the representatives of the South African Industrial Federation on Saturday morning. After discussion, the Prime Minister proposed the following terms of settlement:—

(1) That in view of the gravity of the situation and the necessity of avoiding further delay in the discussion of the terms of settlement, the men return to work immediately

An Idle Tailings Wheel on the Reef.

as operations can be resumed on the various mines, and that they do so on the best terms they can get, and if no other terms can be obtained, then on the terms contained in the Chamber's letter of last Saturday.

(2) That the terms on which the men return to work be subject to modification and readjustment in the final settlement, as hereafter explained.

(3) That the Government immediately appoint an impartial board to inquire into all the matters raised in the present dispute by both sides, and that their finding be reported to the Government as soon as possible.

(4) That on the receipt of such report the Government immediately lay it before Parliament for its consideration, and if the findings prove fair and workable the Government undertake to see that they are given effect to.

(5) That, if necessary, a ballot of the men be immediately taken on the above terms of settlement.

Discussion followed the proposals, as a result of which the Prime Minister met the representatives of the Chamber of Mines on Sunday morning, February 5, and discussed the position with them.

The Chamber's Proposals.

On Monday morning the Chamber submitted the following modifications of the letter of January 28:—

"That the termination of the status quo agreement shall take effect in respect of the low grade mines, namely, mines whose cost per fine ounce during the last three months of 1921 exceeded the standard value of gold, and that in respect of all other gold mines the termination shall be suspended until the Government and Parliament have considered the report of the Board. The Government Mining Engineer shall, in case of dispute, decide into which of the above categories any particular gold mine falls."

The conference between the Prime Minister and the Minister of Mines and the representatives of the Federation was resumed on Monday, and discussion ensued on the proposals of the Prime Minister in conjunction with the amended proposals of the Chamber of Mines above referred to.

Maintaining Essential Services During the Strike: An Underground Pumping Station on the Reef.

After a full discussion, the representatives of the Federation submitted the original proposals authorised by the Augmented Executive of the South African Industrial Federation as a basis for a settlement of the dispute by which the industries can be restarted, which are as follows:—

(a) Unconditional withdrawal of the notice re the status quo.

(b) The coal dispute to be submitted to arbitration

(c) The question in dispute in other industries to be submitted to arbitration.

(d) The question of contracts and the re-arrangement of underground work be a matter for discussion between representatives of the Unions and the Mine Managers' Association.

(e) The finding or award to be given not later than six weeks from first day of sitting

They are prepared to recommend that men return to work providing they return on the December, 1921, conditions, until a settlement is reached.

Turned Down by the S.A.I.F.

After further discussion the representatives of the Augmented Executive of the S.A.I.F. submitted their final proposals in regard to the suggested terms of settlement, subject to the approval of the Augmented Executive, which read as follows:—

(1) That in view of the gravity of the situation and the necessity of avoiding further delay in the discussion of the terms of settlement, the employers and the Federation agree to the resumption of operations in the industries concerned in the present dispute under pre-strike conditions.

(2) That the Government immediately appoint an impartial Board to inquire into all the matters raised in the present dispute by both sides (with the exception provided for in paragraph 4) and that their findings be reported to the Government as soon as possible.

(3) The terms on which operations are restarted to be subject to modification and readjustment in a final settlement, based on the findings of the Board appointed by the Government.

(4) The status quo agreement to remain in force, but should it be found necessary, the board might make recommendations as to any method alternative to the status quo agreement and the "colour bar" regulations for the more adequate protection of the position of the white workers in the industry.

(5) In view of the serious position that has been created by the present strike, and as a means of avoiding if possible any such like dispute arising in the future, we suggest that the Government establish a permanent Industrial Board to co-operate with Parliament for the purpose of advising on all matters concerning the industrial life and development of the resources of the country.

No agreement was arrived at. It was understood, however, by the Conference that if new light was thrown on the situation the Government and the parties concerned would consult again.

The Republican Fiasco.

Early last week the situation began to assume a distinct and dangerous political complexion, and during this week there have been one or two interesting developments in connection with this phase of the dispute.

On Sunday the following resolution was carried at a meeting of strikers in Johannesburg: "We ask the members of Parliament assembled in Pretoria to proclaim a South African Republic and immediately to form a Provisional Government." This was duly conveyed by a deputation on Monday.

Mr. M. Kentridge put the case to the meeting of Parliamentarians assembled in the Capital. Mr. Waterston seconded. The resolution was supported by messages from the Strike Committees in Springs, Brakpan and Benoni.

A special committee at the Pretoria gathering reported, *inter alia*, in response: "That such change of system can only be reached by obtaining a majority of the people in favour thereof, such majority to be reflected in Parliament."

Mr. Roos Favours Constitutional Methods.

Mr. Tielman Roos, speaking for the Nationalists, said if they fell in with the Johannesburg resolution they would belie the principles they had preached for years. The Party congresses had decided to achieve their object by constitutional means.

There was no concerted movement of the commandos on Monday, as had been expected. "Waterston's Army" at Brakpan paraded peacefully and in greatly diminished

numbers; while on the Central Rand the only "pulling-out" movement recorded affected four men on the City and Suburban, three of whom afterwards returned to work.

Reports from the East Rand indicated that no pulling-out of "scabs" was attempted. There was drilling by various commandoes, and a Brakpan meeting of strikers and other citizens endorsed the resolution passed at Sunday's meeting in Johannesburg.

Natives Still Leaving.

The number of time-expired mine labourers who had their passes endorsed for home brought the aggregate early in the week up to close on 40,000.

Endorsements for home have been few during the past two or three days, but the fact of the depletion of the available native labour force by nearly 40,000 is a very serious one, and means a tremendous diminution in the possibility of white employment after the strike.

Tuesday's Developments

An official warning was issued on Tuesday that the use of bodies of men such as commandos for "pulling out" purposes constitutes public violence; and the police have been instructed to take action in all such cases. The Augmented Executive of the S.A.I.F. has reaffirmed its approval of the commando system.

In view of the fact that the water conditions of the Modder East mine will render it impossible to save that mine unless active steps are taken within the next few days, the board of the New Kleinfontein Company have thought it necessary to make urgent representations to the Government, and it has now been decided that the New Kleinfontein power station should begin lighting the fires at 7 o'clock on Wednesday morning. It is hoped that power to pump the Modder East and New Kleinfontein mines will be available on Friday morning.

At a big gathering at Brakpan on Tuesday, Mr. Waterston deprecated that the republican resolution had been attributed to him, as he had not the brains for such an inspiration. It was proposed, he said, by a member of the Sons of England and a returned soldier at a meeting of East Rand delegates, and seconded by a Britisher.

The Brakpan commando kept a "truce of God" on Tuesday as a mark of respect to the memory of the late General De Wet.

A gathering of East Rand commandos took place at Boksburg on Tuesday for the purpose of considering a resolution recommending the S.A.I.F. Executive to declare a General Strike.

A deputation from "Roos's Parliament" waited on General Smuts yesterday to express their view of the seriousness of the industrial position.

FURTHER STRIKE DEVELOPMENTS.

Chamber of Mines Offer Withdrawn.

The following statement has been issued by the Chamber of Mines:—

"It will be remembered that the Chamber, with a view to facilitating a settlement of the present strike, offered to suspend the operation of the cancellation of the *status quo* agreement on all but the low-grade mines until Government and Parliament had an opportunity of considering the report of the proposed impartial Commission.

"The Chamber, in making this most important offer, was influenced not by any belief that the concession was required in equity, but solely by the urgent representations of the Prime Minister and by the desire to help the whole community, which is faced with ruin through the strike."

"The Federation representatives having rejected the Government's terms, together with the concession offered

by the Chamber, the Chamber desires to make it clear that the Chamber's offer, and its acceptance of the Government's terms, therefore automatically fall to the ground."

A prominent member of the mining industry said in the course of a statement to the *Daily Mail* on Wednesday:—

"What is exercising the men's minds very considerably is the obvious fact that the Chamber of Mines is not likely to leave its present terms open for long.

"It will be remembered that the Chamber proposed to take back men at December rates less one-half of the January cost of living allowance—very much better terms than if the Chamber had decided to pay only the minimum rates of pay provided for in the agreement, as, of course, it would be quite entitled to do. Indeed, if the Chamber decided on the latter course, it could hardly be called an unreasonable decision.

"Such an alteration would not mean much to the younger and less efficient employees who form the backbone of the present strike, but the older and more experienced men who have been promoted above minimum rates would be badly hit, and it behoves them to take this possibility into consideration very seriously."

wages to the strike funds—75 per cent. of the contribution to be utilised for the relief of distress and 25 per cent. to form a "fighting fund."

"The Council of Action": Five Arrests Effectuated.

The police moved quickly after their official announcement on Tuesday that they intended taking action in regard to certain phases of the strike. It was learned on Wednesday that five men had been arrested on charges of inciting to public violence. Their names are:—

- Ernest Shaw.
- Percy Fisher.
- Jack Wordingham.
- H. Spendiff.
- A. McDermid.

All these men are members of the S.A. Mine Workers' Union, and are amongst the number who were fined and suspended from office owing to their participation in the spreading of the Langlaagte strike in February last year.

After they had been debarred from office in their union, they identified themselves with what is known as the "Council of Action"; all the men being understood to hold very strongly to the "direct action" policy instead of more conciliatory methods of dealing with industrial disputes.

The Kleinfontein Power Station, where work has been resumed.

General Strike Vetoed.

The resolution in favour of a general strike which was carried at the Johannesburg Town Hall meeting during Wednesday morning came before the Augmented Executive of the Federation in the afternoon as a recommendation from the rank and file.

Such an extension of the strike has repeatedly been urged upon the central authority by local strike committees and other bodies, but the Executive has always taken a stand against action in this direction, on various grounds.

On Wednesday the whole question was gone into, and the resolution passed at the Town Hall was carefully considered. Finally the Executive declared its decision in the following official communication:—

"That the Executive are of opinion that no advantage would be gained by calling a general strike at the present juncture."

The Executive went further into the question of how best the assistance of other workers could be enlisted in behalf of the men on strike, and at length they agreed upon a scheme whereby all workers not affected by the strike should be recommended to contribute 10 per cent. of their weekly

The Case of the Robinson.

The effect of the strike on the prospects of the Robinson mine is shown in the following official announcement, issued on Wednesday:—

The board of directors regrets to announce that on the resumption of work on the mine after the present strike, the basis of operations will have to be reduced to approximately the tonnage which can be mined monthly from the ore of better grade remaining in the mine, viz., to a tonnage milled of about 12,000 tons per month. The effect will be to reduce the white and native labour force by approximately 250 whites and 2,000 natives.

Towards the end of last year the future of the company was most uncertain, owing to the continued fall in the price of gold. However, it was hoped that the mine would struggle on for a few months longer in 1922 on the recent output basis, but this is now not possible owing to a further fall in the price of gold and the heavy losses made due to the strike. Moreover, since the strike started, No. 2 shaft, the main hauling shaft of the mine, has been completely closed for a distance of about 60 feet by a fall of rock.

Apart from the low-grade Main Reef ore, there only remains in the mine about 63,000 tons of South Reef and Main Reef Leader, chiefly in the form of pillars. The consulting engineer therefore reports that the time has now arrived when the mine cannot be worked on a monthly milling basis of 38,000 to 40,000 tons, as the recovery, including the Main Reef ore, only averages slightly over 4 dwt. per ton, which at to-day's price of gold makes it impossible for the company to continue working the Main Reef without incurring losses.

Returning to Work: Incidents on the Mines.

On one of the big mines of the Rand a considerable number of the white workers approached the management with a request that they be allowed to return to work on the terms of the Chamber of Mines. A list of these names has been taken, and it is understood that the management intends to restart the mine at the earliest possible moment.

Other notable developments occurred on Wednesday which are regarded in many quarters as indicative of a growing desire on the part of mine employees to return to work—and the determination of the extremists to stop them.

On the City Deep a meeting called by a shaft steward with a view to discussing the possibility of returning to work was packed by the local strike committee and rendered nugatory, although a large number of the mine employees wished to attend.

On the Wit. Deep the surface employees proposed to take a ballot on Wednesday morning with a view to testing feeling with regard to resumption of work on the Chamber's terms.

A large body of Boksburg extremists intervened, however, and refused to permit the ballot to be taken.

"It begins to be clear," said an official on Wednesday, "that definite action by the Government towards providing protection and enabling those men who desire to do so, to resume work, is now called for."

Kleinfontein Power Station.

It had been anticipated that there might be some trouble in connection with the starting of the fires at the Kleinfontein power station, but the welcome smoke commenced to roll out of the stack shortly after 7 o'clock on Wednesday, and no one interfered.

Perhaps the presence of a strong force of armed police only a few hundred yards from the entrance gate had something to do with this passivity on behalf of the strikers. It was expected that power would be available on Friday. The Government is determined to protect power stations at all costs.

At Witbank.

At a public meeting at Witbank on Wednesday the following resolution was passed: "That in view of the gravity of the situation in regard to the industrial crisis and the ruin facing the country, we, the workers of the Witbank district, recommend the Augmented Executive of the S.A.I.F. to request the Government to appoint a tribunal of seven with Judge Curlewis as chairman, with full power to settle the following points: Colliery dispute, V.F.P., town shops, re-organisation of underground work and the contract system on the gold mines. The tribunal should be composed of two representatives from the employers, two from the workers, one from the Government, and one from the community. Further, the *status quo* remain in force until the tribunal investigates and reports on the same, such report to be submitted to Parliament to legislate accordingly. That if the Cabinet agree to this, we immediately return to work on terms to be agreed upon, such terms to be subject to readjustment or modification in accordance with any findings of the tribunal. That in view of riot and violence we appeal to the Government to act at once."

Union Minière Output.

At the meeting of the Union Minière held in Brussels in July last the chairman, after giving the figures of the copper output for the first half of the year, expressed the hope that production would still further improve, and that the total

for 1921 would be much higher than that for the preceding year. The particulars of the December return are now to hand, and the hope has been fulfilled, the quantity of copper produced being 2,980 tons, bringing the total for the twelve months up to 30,468 tons, which compares with 18,962 tons for 1920 and 23,028 tons for 1919. It will be remembered that the leaching works were expected to start in October, and that the programme of treatment when the whole of the additional works are in operation provides for "an important output of metal which may rise progressively to 100,000 tons of copper per year, independently of the production of our present plant."

Modder East and New Kleinfontein Mines.

The water conditions in these mines render it impossible to save them unless active steps are at once taken. The board of the New Kleinfontein Company have therefore made urgent representation to the Government and have already fired up the New Kleinfontein power station. It was hoped that power would be available yesterday to pump the Modder East and New Kleinfontein mines.

GLYNN'S LYDENBURG.

The following are the particulars of the output for the month of January, 1922:—Tons crushed, 4,030; yielding, fine oz., 1,539; estimated value of month's output, £7,169; estimated profit for month, £753. Note: The above figures are exclusive of expenditure for the month upon shaft sinking, special development and capital expenditure amounting to £2,615. The gold output for the month is valued at £4 13s. 6d. per fine oz., after allowing for exchange and realisation charges.

Robins Rotary Grizzlies

For the coarse screening of coal, coke, ore and stone, Robins Patent Rotary Grizzlies are widely used instead of trommels, shakers, bar grizzlies, etc.

In their low power, space, and head-room requirements, amazingly high capacity per unit screening area, ease and low cost of upkeep, high comparative efficiency, and freedom from the vibration which is characteristic of other types of screens, they are markedly superior to other screening devices for this class of duty.

Pressing Needs of the Gold Industry.

NECESSITY FOR REORGANISING RAND WORK—VIEWS OF HIGH GOVERNMENT OFFICIALS.

In a time like the present, when two sections of the community are involved in a great industrial dispute, one must naturally look to the Government for guidance, and also information. No doubt the ordinary public are sometimes mystified as to the whys and wherefores of the present *impasse*, and are unable to make up their minds as to who is right and who is wrong when one party makes a categorical assertion and the other party gives that assertion a point-blank denial.

It should therefore serve some useful purpose if reference is made to certain statements contained in the last report of the Department of Mines and Industries of the Union of South Africa—that is to say, in the annual report of the Secretary for Mines and Industries and the Government Mining Engineer for the calendar year ended 31st December, 1920, issued in August last. This report deals exhaustively, competently and impartially with all aspects of the mining industry in the country, and the statements contained therein can be challenged by either party to the present calamitous dispute.

It is here proposed to deal with certain views expressed therein by Government officials on some of the matters which have tended to bring about the great strike. The following are extracts from the reports of the officials whose names are stated at the commencement of each quotation.

Mr. H. Warrington Smyth, Secretary for Mines and Industries.

The salvation of the low-grade mines depends entirely upon two factors, viz., the price of gold and working costs, the danger being that a decline in the former will not have immediate effect in a corresponding reduction of the latter. Every effort will certainly be made to tide the poorer mines over that very critical intervening period, but, should it be prolonged, the question of reducing costs by an all-round efficiency will have to be faced seriously to enable those mines which, if closed down, could never be reopened, to carry on until the working costs can be brought into line with the general reduction in the cost of living.

Another Official's Views.

There can be no doubt that numbers of men were attracted to the mines during the past few years by the high wages easily gained without the necessity for any preliminary knowledge or training. Such men are not like old miners who have spent their lives at the one occupation, and are consequently unable to adapt themselves to any other calling. Many of them have been mining for so few months that it would be no hardship to send them back to their original occupations. It certainly seems unreasonable that because a man has once obtained an engagement in a mine he should expect to be clothed, housed, fed, and have his pockets kept filled with money for the rest of his life, irrespective of what he gives in return. Some of them seem to forget that there are two sides to every bargain, and since wages are standardised, and consequently must be paid in full, the employer must have the right to balance the account in some other way—such, for instance, as choosing his workmen. At some of the mines attempts appear to have been made to force the management to agree to an arrangement whereby any vacancy occurring shall be filled by an employe of the mine engaged in a lower class of work. For instance, if a stoper is required, the manager is not permitted to engage a stoper from outside, however good his record in that class of work may be. The vacancy must first be filled by someone working in the mine—say a trammer. If that trammer has had no experience of stoping before, it makes no difference; he must be given the opportunity. Consequently he is put into the stope to show what he can do. If he gets the

place into bad shape and proves himself incompetent, he may be removed, but must be replaced by the next in seniority, and so on. How anyone can expect efficiency under such conditions passes all comprehension.

Krugersdorp Inspectorate (Mr. M. Fergusson).

If all the white men employed in responsible positions in the mines were qualified miners, capable of using their knowledge and experience to the best advantage in obtaining the highest results from the gangs under their charge, there might be a lot to be said in favour of the existing conditions of labour, but where large staffs of highly-paid white men—many of whom are of no benefit to the company—have to be employed simply because the law or the unions demand it, many mines will be rendered unpayable which, if worked on a purely economical basis, would continue for many years to carry on operations at a profit to the shareholders and to the benefit of large staffs of employes. High wages do not necessarily mean high working costs, as was proved in America before the War. In that country wages in many industries were higher than in any other part of the world, and yet by reason of the great efficiency of the workmen and the systematisation of the work, America was able to send her products abroad and compete with all foreign markets. In this country the high wages exist, but it is to be feared that to a very large extent the other factors mentioned are lacking. As has been pointed out on previous occasions, the white workmen on these fields may be divided into two classes: (a) the skilled workman, and (b) the unskilled or partially skilled workman. Those included in the first class know what is expected of them, and know how to calculate the cost of their labour and the value of the product. Very little is ever heard of them. They perform their work in a thorough and conscientious manner and give satisfaction to themselves and their employers. Such men are naturally in great demand, and there is a tendency to secure their services by offering them substantial rewards for their labour in the form of big wages or highly remunerative contracts. Those included in class (b) are more difficult to deal with. They do not always understand the work, and in some cases do not attempt to learn it. Their whole object in coming to the mines is to obtain the highest wage possible without considering the value of the work which they give in return. Where these men are concerned it is frequently found that they are merely lookers-on whilst the more intelligent natives amongst their gangs are doing the skilled part of their work. They see men included in class (a) drawing big cheques and they agitate for increase in pay, because they consider they are entitled to as much as anybody else. Certain duties become irksome because they do not understand how to perform them, and consequently they are inclined to dictate to the managements what work they shall do. Such men are extremely difficult to control, and where they have a difference of opinion with one of the officials they endeavour to use the whole weight and influence of their Union to obtain their individual ends. This is made easier for them by the fact that it is not always that class (a) men can be found to take office in the Unions' services, their time being generally too valuable to spend in listening to the numerous complaints which they would be required to investigate. It is generally accepted that there are a number of men working on the mines to-day who are neither experienced nor industrious; consequently it is surprising to find that any attempt on the part of the employers to get rid of such incompetent persons is often strenuously opposed by the body of workmen.

Bcksburg Inspectorate (Colonel H. Bottomley).

There has been no sign of improvement in the atmosphere of unrest and antagonism amongst mine workers during the year under review. Boards of reference have

been frequent, and still more frequent have been the submission of grievances to the committees appointed to deal with such matters. The ceaseless agitation which has been apparent appears to be the natural characteristic of the Africander unskilled workers, who, as is well known, form the major portion of our underground men. Underground efficiency has never been on such a low mark as it is now, and the time appears to have arrived for drastic reorganisation in the methods of working and pay.

Mr. C. E. Hutton, Germiston Inspectorate.

The efficiency of the white miner has not, speaking collectively, improved. Despite the fact that managements have frequently expressed the opinion that there are many natives more competent than the semi-experienced white men, there has been no attempt to economise in white labour, which could be done in certain directions without contravening the Mines and Works Regulations. The reason, no doubt, why managements do not cut down to a legal minimum the number of white men, both surface and underground, can be put down to charity and fear of public opinion.

The inspectors of mines whose opinions are cited above are all qualified mining men with long experience of Rand conditions. As is well known, their views and requirements are often in conflict with the policy of the Chamber of Mines and with those of the mine managers, and therefore and because of the fact that they are Government officials, and accordingly impartial observers, the considered opinions expressed by them in the Government Blue Book, of which extracts are given above, should receive the close attention of every member of the community.

ANSWERS TO CORRESPONDENTS.

A. J. C., Bulawayo.—All the shares in the New State Areas have been taken up and paid for.

Improved Acetylene Cutter.

For rough work the ordinary acetylene blowpipe is quite satisfactory, but where it is desired to cut out a piece of metal with a sharp edge the blowpipe by itself is not suitable as it leaves a ragged edge where it cuts. The wide scope for an oxy-acetylene cutter which would give a fine edge has induced a British inventor to undertake research into the best form of blowpipe, which cuts almost as fine an edge as a saw. He has developed, in conjunction with this blowpipe, an ingenious machine which enables any shape to be reproduced; that is to say, once a pattern has been made, the machine will reproduce it as often as required by cutting metal sheets to precisely the same shape. The process is so rapid and so perfectly performed that the machine has attracted the greatest interest among railway companies, motor-car manufacturers, and others who have a large amount of reproduction work in sheet metal to perform.

UNION'S MINERAL OUTPUT: 1920 AND 1921 COMPARISONS.

The following diagram exhibits in graphic form the essential figures of output in last year and in 1920:—

"Synthetic" Gold.

THE THEORY OF TRANSMUTATION—A DISTORTED VERSION WITH NO FOUNDATION IN FACT.

(Percy G. Paris.)

The recent rumours of a German method of producing gold synthetically have already been widely commented upon by the British and French Press, generally in a derisive and sceptical manner. In spite of the extreme improbability of a practical solution (in our time) of a problem that has been the dream of chemists ever since the middle ages, the matter is particularly interesting in the light of recent knowledge of phenomena that seem to have some bearing on the subject. Though this knowledge has opened up a completely new field of research, which in the coming years will no doubt be productive of results, the wide gulf that exists between experimental conditions and practice, and the years it will take to bridge it, leave the commercial considerations a matter of purely remote interest. Nevertheless, as the centre of the world's gold production, the Rand will necessarily watch with close interest the gradual development of these theories, upon which the present claim of the so-called synthetic gold has, no doubt, been based.

In the first place, it should be stated that the term "synthetic" is a misnomer. Synthesis indicates the building up of a compound by a combination of the primary elements, disclosed by analysis; and is, therefore, the exact converse of "analysis." In the case of a complicated organic structure, such as indigo, camphor and rubber (all of which can be made synthetically) combination is made of various intermediate products, each of which contains certain of the essential elements that analysis of the natural product has indicated. Generally speaking, it is not possible to produce synthetically by simply taking the primary elements required, as these will most probably not combine with each other. Consequently this has to be done by indirect methods and in several steps or manufacturing stages to bring about the proper grouping of the necessary elements and the discarding of those not needed. There are comparatively few instances of direct syntheses in industrial chemistry; the simplest and the best known is, of course, the combination of nitrogen and hydrogen to form synthetic ammonia.

The case of gold is, however, quite different; it is itself a primary element, uncombined with any other except in so far as it can be converted to its own salts. Hence the term "synthetic gold" that has been the subject of so much discussion is quite misapplied; any process claiming to produce gold from some baser metal should more correctly be termed a transmutation.

The unity of matter and the transmutation of elements are theories that have existed since the middle ages; they were in fact the philosopher's stone of the early alchemists. Presupposing the correctness of their theory, they devoted all their energies to the production of gold from base metals; and were encouraged by the fact that minute traces of gold were actually found in certain ores after treatment, simply because these existed as impurities in the ores! It was only in quite recent years that the ancient theory of transmutation, that is the conversion of one element to another, has been proved to be feasible. The investigations into the phenomena of radio-activity have given us the first ray of light on this question, and though much ground has yet to be covered before a complete understanding of these phenomena can be attained, there exists already sufficient experimental proof that the transformation of the elements may not be so wide of the mark after all.

It may be interesting to recall that it was Becquerel, in 1896, who first noticed that uranium in uraninite (pitchblende) Uranium, uranium X, ionium, radium, radium emanation, of rays, but that these rays differed from those of light, in that they could not be reflected, refracted nor polarised. His discovery was confirmed and amplified by the researches of Mme. Currie, but she attributed the phenomena to the

existence of a new element, which she named polonium (after her native land) and which she definitely established some years later. The story of her discovery and isolation of radium itself is too well known to require repetition. Radium though widely diffused can only be isolated in very minute quantities, 10 tons of pitchblende being required for a bare half-ounce of radium salt; from the same quantity of pitchblende only about one-hundredth of an ounce of polonium is obtainable; this gives one some idea of the careful work her discoveries have involved.

Conversion of Copper to Lithium.

When propounding the theory of the electrons (a term applied to the minute subdivisions of the atom), Ramsay suggested the feasibility of a transmutation of the elements, and actually demonstrated this by converting copper to lithium under radio-active influence. He also showed that under similar conditions gases such as carbon dioxide and carbon monoxide were evolved from certain metals, zirconium, thorium, lead, etc.

Space does not permit of our following the individual researches of the foremost chemists and physicists during the past year; it suffices us to note the following determinations. Radium emanates certain rays, called alpha rays, which are themselves identical with the element helium; other radio-active materials, such as actinium, also emit helium, in fact presence of this gas is now taken as a general indication of the existence of radio-active material. Radium is itself derived from uranium, and is but one link in a cycle of changes from one element to another, brought about in the process of time. Thus we have the following cycle: Uranium, uranium X, ionium, radium, radium emanation, radium "A," "B," "C," "D" and radium "F," the last named being identical with the polonium discovered by Mme. Currie. Similar cycles have been determined from actinium and thorium. It is evident from our present knowledge that transmutation tends to take place from an element of higher atomic weight to one of lower. It is also significant that of all the elements we know of at present there are only two of higher atomic weight than radium (224), namely, uranium (236) and thorium (230); helium comes right at the other end of the scale with an atomic weight of only (4). This agrees very well with the electron theory of Ramsay, conversion from one element to the other being due to loss of electrons, hence loss in atomic weight, and the regrouping of the remaining electrons into a more stable formation. His experiments converting copper (63) to lithium (7) also bear out this loss in weight, though not necessarily the factor of stability. There is also some side-light on this question from other fields of research. There has always been some conjecture on the part of astronomers and physicists as to the source from which the heat of the sun is derived. Chemical reaction would not compensate for the heat lost by radiation, and there must, therefore, exist some other source of energy sufficient to maintain these conditions. Spectroscopic examination of the sun's rays have disclosed the predominant existence of both uranium and helium, from which we are led to deduce that the mass of the sun is still largely composed of unstable elements, and that these, by emission of electrons, are developing the heat necessary to compensate for that loss by radiation.

Mendeljew's Theory.

Carrying this hypothesis a step further, the present condition of the earth is believed to be such that it is composed of elements, formerly of unstable character, which have in the process of time and under the electron theory changed to stable formation; and that there still remains a certain amount of unstable matter, under which category would fall

materials of a radio-active nature. To show how these various aspects of the question seem to dovetail with each other, mention must be made of the periodic system of the elements, as enunciated by the famous Russian chemist Mendelejew in the middle of the last century. By listing all the elements that were then known, in ascending order of their atomic weights, he was able to arrange them in series of seven in such a way that those elements occupying similar position in different series resembled each other in certain respects. As he went higher up the scale of atomic weights he had to leave blank spaces in his tabulation, because elements which would belong to the spaces in question were not at that time known. So convinced was he of the periodicity of all elements, as indicated by those he already knew, that he not only predicted the discovery of several elements that have since been obtained, but was able to foretell correctly what their general properties would be. The bearing that the periodic system has on the hypothesis of the unity of matter and the transmutation of the elements lies in the clear manner in which it demonstrates the connection between their properties and atomic weights. The electron theory explains that this conversion and change in properties is due to loss and regrouping of electrons with resulting loss in atomic weight. Finally the study of radio-activity has demonstrated that inter-elemental conversions are actually taking place. Hence there is no reason to doubt that gold also is the result of conversion from some other element and that all the elements originate from some one primordial substance. On this assumption, therefore, and taking the case of gold, we would have to look to some element of higher atomic weight to find that from which the conversion is to be made. Referring to Mendelejew's table, gold is the lowest member of its series of seven, other members of the series in ascending order being mercury, thallium, lead, and bismuth. On the other hand, in the arrangement of the elements in groups, according to their position in the periodic series, and their similarity in valency and in properties, we find gold, silver, copper, sodium, and lithium falling in the same group, with gold heading the list in atomic weight. It is also noticeable that copper and lithium, which have already been referred to as providing an example of transmutation, both occur in this group.

On the basis of our present knowledge, it therefore seems feasible to expect that we may presently discover the parent element from which gold is derived. We are not yet sufficiently well acquainted with the laws governing transmutation to determine whether this "parent" element will, according to the periodic system, fall in the same group as gold, silver, copper, etc.; or whether it will occur in the same periodic series as gold, mercury, lead, etc.; but we do expect that its atomic weight will be higher than that of gold itself.

Even when that point shall have been reached, we shall still be very far away from any practical application of our knowledge. The time factor in radio-active transmutation, and the wide distribution of radio-active material in but small quantities, will keep this question in the domain of only theoretical interest for many years to come. This is no new conception and has been the subject for debate by learned societies all over the world. Even the foremost chemical journal in Germany was willing some years ago to publish and advertise a claim by a German scientist to produce gold by some such means.

In the present instance, we may safely conclude that the rumoured production of synthetic gold is a distorted version of the theory of transmutation and that it has no practical foundation in fact.

POWER ALCOHOL.

The Fuel Research Board (Department of Scientific and Industrial Research) have published their Second Memorandum on "Fuel for Motor Transport." The Inter-Departmental Committee on Alcohol for Power and

Traction Purposes, in their Report dated June 23, 1919, recommended that an organisation should be established by the Government to initiate and supervise experimental and practical development work, at home and overseas, on the production and utilisation of power alcohol, and to report from time to time for public information on all scientific, technical, and economic problems connected therewith. The Report was referred to the Committee of the Privy Council for Scientific and Industrial Research, and on the recommendation of their Advisory Council they decided, in the first instance, to appoint a suitable officer with the necessary assistance, under the Fuel Research Board, who would be charged with the duty of collecting accurate data from different parts of the Empire as to the possibility of producing alcohol in bulk from local vegetable materials, and of arranging for the continuance of any experiments and negotiations connected with utilisation which could usefully be undertaken. Accordingly Sir Frederick Nathan was appointed Power Alcohol Investigation Officer under the Fuel Research Board in December, 1919. An Interim Memorandum on Fuel for Motor Transport was issued by the Board in July, 1920.; The present Memorandum gives a brief general survey of the work of the Board in regard to Power Alcohol since that date.

The subjects dealt with in the Memorandum include, among others (1) production of alcohol in the British Dominions and Colonies; (2) synthetic production from calcium carbide and from the ethylene in coal gas from gas-works and cokeries. Considerable attention has been given during the last two years to the possibility of removing ethylene from coal gas and its subsequent conversion into power alcohol. A manufacturing-scale process has not yet been developed, however, and even should a successful one be worked out, it would still be a question whether it would be profitable to produce alcohol by such process at the expense of the calorific value of the coal gas. Some of the general conclusions arrived at in the Report are:—

(1) The prospect is remote of adding materially to the supplies of liquid fuel for internal combustion engines in this country by the manufacture of alcohol from home-grown materials.

(2) The production of alcohol within the Empire from materials containing sugar or starch is only likely to be possible commercially in the near future in some of the Dominions and Colonies, and then only on a sufficient scale to meet local requirements.

(3) It is unlikely that alcohol could be produced in excess of local needs and at a price, when freight to seaboard and to this country is included, at which it would find a market here.

(4) Synthetic production on a commercial scale in this country is unlikely; it might be possible, however, in Canada and Australia.

ENGINEERING JOURNAL.**

The Reconstruction of the Coronation Syndicate.

LONDON UNDERWRITERS GUARANTEE FRESH CAPITAL—OPTION OVER LUIPAARDSVLEI No. 10
TO BE EXERCISED—DETAILS OF THE SCHEME.

The Coronation Syndicate is to be reconstructed with the object of acquiring portion of the farm Luipaardsvlei No. 10, upon which, it will be remembered, important reef discoveries were recently made. The purchase price of the mineral contract of lease over portion of the farm is 1,000,000 new shares of 5s. each to be created. The agreement with the London underwriters provides, *inter alia*, that the company's issued capital of £520,000 in £1 shares all issued and fully paid up be reduced to £130,000 in 520,000 shares of 5s. each, by writing the sum of 15s. off each of such issued shares; that such reduced capital be increased to £180,000, by the creation of 1,400,000 new shares of 5s. each ranking *pari passu* with the above-mentioned 520,000 shares; that the option held by the company for the purchase of the mineral contract of lease over portion of the farm "Luipaardsvlei" No. 10, District Krugersdorp, be exercised; that 1,000,000 of the said new shares be issued as fully paid up in consideration of the said mineral contract, in terms of the option; that the remaining 400,000 new shares be offered for subscription at par to shareholders in the company *pro rata* to the holdings of such shareholders in the said reduced capital of £130,000; that all shares not

applied for by shareholders may be applied for by shareholders at par within a time fixed by the company, the allotment of such last-mentioned applications to be as the directors of the company may determine. Each of the shareholders who has been allotted any of the 400,000 shares shall have the right, exercisable at any time after the 1st February, 1924, and before the 28th February, 1924, to call for one further share of 5s. in the company, at the price of 7s. 6d. for every share allotted to him out of the said 400,000 shares; the underwriters will subscribe at par for all the 400,000 shares not applied for by shareholders; in consideration of his undertaking each underwriter is to be paid by the company a cash commission of 5 per cent. on the par value of the shares underwritten by him, payable at the expiration of three calendar months after the date of the offer of 400,000 shares to existing shareholders, and also receives the right, exercisable at any time after the 1st February, 1924, and before the 28th February, 1924, to call for one further share of 5s., at the price of 7s. 6d. for every share so underwritten by him. The main point is that the necessary new capital is underwritten and that the mineral lease is being acquired for a share consideration in the reconstructed company.

The Year with the Premier Diamond Mining Company, Limited.

BIG DROP IN REVENUE—RESTRICTED OPERATIONS—STRONG CASH POSITION.

The annual meeting of the Premier Company was held this month, and an advance copy of the report to be submitted to the shareholders for the year to October 31 last shows a working profit of £110,385. Diamonds on hand at the end of the year have been taken into stock at nominal value of 1s. After allowing for expenditure on equipment £20,030, the balance is £90,354, which is the amount available for distribution between the Government and the company. Revenue from diamonds was only £439,636, as against £2,098,482 for the previous year. Two dividends of 6s. 3d. each per share, less dividend tax, have been paid on the Preference issue.

The general manager in his report states that the total number of loads of 16 cubic feet hauled from the mine was 1,996,981, total production of diamonds 411,981 carats, average yield per load .211 carat, average cost per load mined and washed 3s. 5.230d., average cost per carat 16s. 3.347d., average cost per load on total loads hauled 3s. 4.347d.; last three items calculated on mine expenditure only—namely, £335,716. Mining and washing operations were restricted to two shifts of eight hours each per diem from 1st November, 1920, to 27th February, 1921, and thereafter to one shift per diem until 30th June, when all productive work was further curtailed to five shifts per week.

In view of the abnormal conditions which have obtained, comparisons with previous financial periods are rendered valueless, and it will, therefore, suffice to add that the quantity of blue ground washed and the recovery is less by 2,706,268 loads and 408,583 carats respectively than corresponding figures for preceding year. Mining has been confined practically to the working faces above the 410 feet level in the several sections of pipe area, and in this connection it

may be mentioned that the quantities of ground shown as having been drawn from the 360 and 410 feet levels include a considerable percentage of "blue" from levels nearer the surface of the mine which for various reasons were not entirely worked out before, especially in the vicinity of the rim rock, and this is a factor which has probably had a favourable bearing on the yield as reflected in the higher average recorded for period under review.

In comparison with the previous year the total working expenditure at the mine shows a decrease of £303,553, but the average cost per load mined and washed is 8.310d. higher, due to the restricted scale of operations and to the fact that certain standing charges could not be proportionately reduced. Further, the gratuities paid to the employees who were retrenched, amounting to £8,231, also added appreciatively to cost of operations.

In consequence of the reduction of operations, and the fact that the development of the mine generally was well ahead of requirements at the close of the preceding year, very little work has since been done beyond the development of additional working faces below the 360 feet level in the central section of the mine. The quantity of blue ground available above the lowest level so far developed—namely, 460 feet—is 39,000,000 loads, of which 25,000,000 loads are contained in the working faces above the 410 feet level. The average depth of the mine is 294 feet, an increase of 6 feet for the year. The pumping plant at Wilge River station continues to work smoothly and economically, and the total quantity of water pumped to the mine represents 370,000,000 gallons.

The curtailment of operations necessitated the repatriation of 3,146 natives whose services were no longer required. The recruiting agencies in the Cape Colony have been closed down entirely, and such representation only as is necessary to ensure a regular supply of natives for present requirements has been retained in other labour areas. The total number

Blasting at the Premier Diamond Mine.

of natives to the compound was 2,675, and the actual number in service at the close of the year was 1,228. Wages amounted to £97,955, equivalent to 3s. 5.473d. per native per day, including piecework and overtime, natives, as usual, providing their own food. The services of 354 white employees were dispensed with during the period under review,

and at 31st October last the total number of men employed, including 29 apprentices, was 266.

The Premier's History in Brief.

The following table gives the history of the Premier Mine in brief:—

MINING OPERATIONS SUSPENDED.

* After allowing for Sundry Revenue amounting to £28,893 8s. 3d.

S.A. Carbide.

An issue of £75,000 Eight per Cent. First Mortgage Debenture stock is offered to holders of Ordinary and Preference shares of the South African Carbide and By-Products Company at par. The stock will be secured by trust deed as a first specific charge on the present immovable property, and a first floating charge on the undertaking and other assets, including uncalled capital, and in addition the deed will bind the company to execute such First Mortgage bond and/or Notarial bond over the property in Natal as necessary to secure an effective first specific charge over all the present immovable property and assets and an effective floating charge over the remaining property, present and future, including its uncalled capital.

Otavi Mines Report.

The management committee, in their report for the period from April 1, 1914, to March 31, 1921, which was presented at the meeting held in Berlin on December 30, state, *inter alia*:—"Throughout the war we suffered severely through the greater part of our men being called to the colours. Work at the mine was confined to what was strictly necessary. The railway was surrendered to the military authorities. After the capitulation at Khorab on July 9, 1915, and the occupation of the Tsumeb Mine by the Union Authorities, the latter offered to allow work to be continued, provided the mine was operated to its full extent. This measure, however desirable in itself, unfortunately could not be guaranteed in the absence of any possibility of marketing the ores which would be extracted if the mine were in full working order. Only a few steamers were available for ore freights, and these at exorbitant rates. In addition, there was no possibility of treating direct with buyers, negotiations being necessarily conducted through the South African Government. There was consequently no profit on the shipments made. The working of the railway being taken out of our hands by the occupying forces, no further revenue accrued from this source. Considerable stores of materials, the company's property, were also

seized. We have notified our claims in this respect with the proper Government authority, but so far received no payment. We were only able, during the seven years under notice, to ship 87,614 tons of ore, or about the fourth part of what in former and normal years we should have shipped during the same period; and these shipments have nearly always been effected under the pressure of circumstances at abnormally high freights and smelting costs. We were thus compelled, in order to maintain our work, to obtain loans from South African banks, which reached the high total of about £300,000, against which we could, of course, set *inter alia* the value of the developed ores. Having regard to all the above we consider it, after all, a tolerable result that these seven years, notwithstanding the crushing conditions under which we had to work, notwithstanding the impossibility of making shipments at prices corresponding to the circumstances, and notwithstanding high rates of interest, have yielded a profit. This profit has been utilised to write down our undertaking. Contrasting with the uncertain position during the war and the subsequent period under review, we have to-day the satisfaction to be able to say that the company once more stands upon firm ground. By Proclamation, dated November 17, 1920, the Administrator of the South-West African Protectorate definitely acknowledged the following rights of the company: (1) The property in all mines actually being worked; (2) the freehold rights in the 1,000 square mile area, as well as in a zone of 10 kilometres broad on each side of the railway, within the freehold territory of the South-West Africa Co.; (3) the sole right to prospect for and win minerals (other than precious stones) in the 1,000 square mile area until November 17, 1921, which period has been subsequently extended to November 17, 1923. So far as our mining rights are concerned, they are substantially intact. The Government of the South-West African Protectorate has not recognised the railway lease which had still to run until 1940. We have not yet succeeded in obtaining from the authorities compensation for being deprived of the working of the railway, nor for the stores and materials which were also taken from us, although in no way the property of the German Government. Our claims in this respect are being urged.

The New Union Company Law.

PROVISIONS OF DRAFT BILL—A CONSOLIDATING BUT COMPLICATED MEASURE.

The draft Bill to consolidate and amend the laws in force in the several provinces of the Union relating to the incorporation, registration and winding up of companies is gazetted. The Bill contains no less than 224 clauses, and it has been modelled upon the 1908 Act of Great Britain and the Transvaal Act of 1909. In the introductory matter of the Bill it is provided that for the purposes of the registration of companies under this Act an office shall be established in Pretoria, called the Companies Registration Office, with a Registrar of Companies at the head and, if necessary, other officers and staff; that all registers kept in any public office under any of the Provincial companies laws shall be incorporated in, and form part of, the register of companies kept in the office established as above. All powers and functions vested in any officer in the public service in relation to the registration of companies and all powers and functions in relation to the administration of any of the Provincial companies laws, other than those vested in any Master of the Supreme Court, shall vest in the Registrar of Companies appointed under this section.

The Bill consists of eight chapters, the first dealing with constitution and incorporation. Clause 4 prohibits any company, association, syndicate or partnership consisting of more than 20 persons being formed for carrying on any business for acquisition or gain unless it is registered as a company under this Act, or is formed in pursuance of some other law or of letters patent or Royal Charter.

The Act goes minutely into every detail. For instance, a couple of columns are taken up in explaining what the memorandum of association of a company must state, what must be done in the case of its being required to alter the objects of the company, and what documents should be delivered to the Registrar; and if a company makes default as to the latter it shall be liable to a fine of £10 a day for every day during which it is in default. Clauses 12 to 20 deal with the articles of association and the various documents in connection therewith, which must be sent to the Registrar, and default in complying with the requirements entails a fine for each offence of £1.

Companies not for Profit.

With regard to associations not for profit, it is provided that if the Minister is satisfied that the limited company is to be formed for promoting commerce, art, science, religion, charity, or any other purpose not associated with race interests or political aims, the pursuit of which is calculated to be in the interests of the public, and intends to apply the profits in promoting its objects, then the Minister may direct the association to be registered with limited liability, without the addition of the word "Limited" to its name.

Chapter 2 deals with the distribution of share capital, and here again there is provision for supplying the Registrar with a large amount of information, and if there is default in compliance the penalty is a fine of £5 for each day. Failure to notify the Registrar of increase of its share capital or of increasing the number of members beyond the registered number entails the same penalty.

If a company reduces its capital it shall add to its name, until such date as the Court may fix, the words "and reduced." There are penalties provided.

Chapter 3 deals very fully with the management and administration of a company, and provides that if the name of the limited company is not affixed as directed in the Act it shall be liable to a fine of £5 for every day it is not affixed, while there is a fine for any director, manager, secretary or other officer of a limited company who uses, or authorises the use of, any seal which has not the name of the company upon it, or signs any financial documents or orders for goods without the name of the company appearing, and such person shall also be liable to the holders of the documents.

A Heavy Penalty.

Where a prospectus invites persons to subscribe for shares in or debentures of a company, every person who is a director of the company at the time of the issue of the prospectus, and every person who has authorised the naming of him and is named in the prospectus as a director or as having agreed to become a director either immediately or after an interval of time, and every promoter of the company, and every person who has authorised the issue of the prospectus shall be liable to pay compensation to all persons who subscribe for any shares or debentures on the faith of the prospectus for the loss or damage they may have sustained by reason of any untrue statement therein, or in any report or memorandum appearing on the face thereof, or by reference incorporated therein or issued therewith, unless it is proved that the person had reasonable ground for believing that it was true.

It is provided that a register of mortgages shall be kept at the company's registered offices under a penalty of £50.

The Minister of Justice may appoint one or more inspectors to investigate the affairs of any company, and to report thereon; in the case of a company having a share capital, on the application of members holding not less than one-tenth of the shares issued; if the company has not share capital, then on the application of not less than one-fifth of the members.

There is a penalty for carrying on business with less than the legal minimum number of members.

The procedure for arbitration and power to compromise is dealt with in clauses 103 and 104.

Master of Supreme Court.

There are four columns devoted to the various modes of winding up companies, and then come clauses dealing with the powers of the Master of the Supreme Court. Where the Court has made a winding-up order, the Master has to be supplied with a statement as to the affairs of the company, giving all particulars of assets, debts, liabilities, creditors, the securities held by them, and so on. Then the Master has to submit a report of the company's affairs to the Court.

This statement is to contain the particulars already furnished by the auditors and liquidator, and also state if the company has failed, the causes of the failure, and whether further inquiry is desirable. The Master may also, if he thinks fit, make further reports, stating whether any fraud has, in his opinion, been committed, and any other matters which in his opinion it is desirable to bring to the notice of the Court.

With regard to the clauses dealing with the Master, the Chamber of Commerce report states that the Master's office at the Cape is already overloaded with work, and it seems unnecessary to give the Master the additional work which this new draft Bill seeks to place upon him. If a liquidator's accounts have been audited by a fully-qualified accountant, why should the Master have to do the work all over again? Very few Masters of the Supreme Court would be qualified to make an effective investigation into a company's affairs and report thereon. To make an investigation of this nature one would require to have the training of an experienced accountant.

Practically the whole of the remainder of the Bill deals with the procedure in winding up and what has to be done in special cases, the removal of defunct companies from the register, and the position of foreign companies.

EDITORIAL.

BUSINESS BEFORE POLITICS.

Last week-end the strike position assumed a more eventful aspect than it had borne since the break up of the Conference. After the move on the part of the more moderate minded faction at Germiston had been frustrated by the extremists, the Federation announced that it had been considering the Prime Minister's offer contained in his letter addressed to both parties when the Conference broke up.

The Federation had apparently spent a great deal of time in considering General Smuts's desire to place the machinery of the Government at the disposal of the disputants with a view to searching all avenues which may possess the semblance of a path to solution.

In point of fact it is probable that the Federation leaders took this step because they sensed a weakening of some of its adherents. The deputation from the S.A.I.F. then waited on the Prime Minister and the Minister of Mines, and on Sunday morning the Chamber of Mines representatives met the Government in Pretoria and offered to suspend

the conditions of the status quo agreement in so far as the mines not classified as low grade are concerned pending a full Parliamentary enquiry. On the following day the Federation leaders again proceeded to Pretoria and after debating with General Smuts and Mr. Malan merely reiterated their original demands and turned down the new basis for negotiation offered by the Chamber. The Federation, it seems, despite all the assurances that it has given to the industry of its intention of bringing forward proposals which would greatly assist in solving our difficult industrial problems merely reiterates its original demands which clearly cannot possibly be conceded. And so long as the present leaders of the Federation are entrusted with the representation of organised labour one cannot feel particularly hopeful as to the likelihood of an early settlement.

Simultaneously with the short-lived progress and breakdown of these negotiations, the political aspect of the dispute which had been worked up to a fever pitch by agitators and party opportunists terminated in a fiasco; and on Tuesday unmistakable signs of a weakening interest in the commando movement were to be observed.

The most noteworthy of these was the amazing disclaimer of Mr. Waterston, who said that he was not responsible for the revolt motion but was only the mouthpiece of returned soldiers.

The chief incidents on Wednesday in Johannesburg were the arrest of five of the agitators and the holding of a meeting at the City Deep of employees of that company on the subject of returning to work. At this meeting opinion seems to have been somewhat sharply divided between British and Dutch employees.

These matters are in reality only side-shows of the dispute, and were it not for the elements of danger that lurk in such fiascos as Waterston's army and Tielman Roos's parliament they might be regarded as the star turns of a political pantomime. The most serious feature of these distractions is that they are tending to deflect public opinion from the real issues at stake.

The dispute is in reality an industrial one. Concisely put, the issue is simply this—Do the gold mines of the Rand belong to the shareholders of these mines or to the South African Industrial Federation?

The Chamber of Mines has very properly pointed out during the past week that the bulk of the shareholders in these mines are not millionaires. The majority of the shareholders are people who do not possess more than 100 shares. Why should these people be compelled to forego dividends just because trades unionism desires that the mining industry shall be compelled to continue working on an absolutely false and uneconomic basis, employing more white men than it has need of and paying more wages than it can afford to?

The facts of the case are quite clear. The Chamber of Mines has published broadcast facts and figures concerning the mines and the disabilities under which they work, which are irrefutable. These facts and figures have never been disproved by the Labour leaders; on the contrary, they have been confirmed by Government Commissions. There is nothing in the case which calls for arbitration, simply because there is no controversy upon which to arbitrate.

The Chamber of Mines has no more right to submit the present dispute to arbitration than the present Government has a right to decide by arbitration whether Smuts or Tielman Roos and Bob Waterston shall rule in Pretoria. If the Chamber agreed to arbitration in regard to the future management of the mines its members would be just as guilty of a serious breach of faith to the shareholders in the mines as the Government in seeking arbitration to decide which party rules South Africa would be guilty of breaking faith with the electorate of the public who put the Government into office.

There is a very real danger of the true industrial aspects of this dispute being lost sight of in a smoke screen which

is being created by political opportunists. But the real facts of the position remain unaltered and unalterable. Until the present leaders of the men are prepared to recognise these facts or else make way for men who will recognise them a speedy and satisfactory settlement of the trouble can hardly be looked for.

One cannot be surprised at the fact that the Chamber withdrew its offer on Wednesday. With gold back to less than 95s. per oz. and with the disastrous effects of the prolongation of the strike becoming more pronounced every day it is clear that this is not the time for concessions of any kind.

EXCESSIVE COSTS.

The Transvaal Chamber of Mines has recently published an interesting table exhibiting a few examples of the results of certain companies during 1921 with gold at an average price of 105s. and what the results would have been had gold been at its present price of 97s. 7d. and if gold had been at par, with working costs remaining the same. The figures for a dozen mines are:—

Mine.	Results for 1921. £	Results at 97/7. £	Results at par. £
Aurora West ... P.	5,886	L. 7,536	L. 27,579
New Goch ... P.	6,557	L. 11,009	L. 38,237
Roode. U.M.R. ... L.	14,309	L. 36,432	L. 67,803
West Rand Cons. P.	54,978	P. 10,847	L. 56,599
Robinson Deep ... P.	185,638	P. 106,889	L. 25,547
Crown Mines ... P.	672,030	P. 372,392	L. 16,093
Durban Deep ... P.	36,490	L. 12,434	L. 77,681
Rose Deep ... P.	124,907	P. 51,631	L. 43,931
Village Deep ... P.	112,746	P. 28,409	L. 82,889
Cons. Langlaagte.. P.	167,912	P. 112,688	P. 21,326
Langlaagte Estate P.	144,749	P. 89,360	L. 3,586
Randfontein ... P.	225,242	P. 59,557	L. 210,164

For 1921 the average working cost was 25s. 8d. per ton, while in 1914 it was 17s. 8d. per ton. The Chamber, in publishing this compilation, aptly remarks: "The above table must make every thinking man realise how imperative it is for the industry, with gold falling in price, to get the cost of production down." The latest price of gold is 94s. 9d. per oz.

Explosives and Chemical Works

IMPORTANT FORTHCOMING PUBLICATION.

The "S.A. Mining and Engineering Journal" has now in preparation a special illustrated supplement dealing with explosives and chemical works of the Union. Several of the principal firms having factories of this nature are giving their active support to the publication, which will be issued as a supplement to the ordinary weekly issue of the journal. Special commissioners are now visiting the various works, and the results of their investigations will be published in the supplement in the form of full, descriptive and illustrated articles. The supplement will also contain valuable data as to the quantities of explosives, fertilisers, chemicals, etc., produced in the Union, methods of manufacture and details as to markets and consumption. Prospective advertisers and manufacturers of chemicals, etc., interested in this supplement are advised to communicate with this office at the earliest opportunity.

Notes & News.

Mr. Bleloch's Proposals.

Mr. W. Bleloch has submitted certain proposals for settling the present difficulties on sound economic lines, and it is understood that the S.A.I.F. has given his memorandum consideration. Pressure on space prevents us from

dealing with the whole of Mr. Bleloch's suggestions, some of which appear to be of rather problematical value. But the memorandum constitutes an impartial and unbiassed effort to propound some thesis of which a portion is capable perhaps of being used as a basis of settlement. There are several admirable points in Mr. Bleloch's memorandum. There is, for example, a very profound and valuable bit of philosophy in the following: "To the leaders of the Federation I will say that, although it may sound paradoxical, it is usually true that the strike weapon is only of use before it is used."

And the following paragraph is eminently sensible:—
*It is impossible to lay down regulations for all mines alike, whether on the lines of a definite ratio of black to white or otherwise which will be suitable or workable for each individual mine if efficiency is to be attained. The native labour required for the work in each mine, whether the working places be shafts, winzes or raises, stopes or drives, or for any other work in or on the mines, are matters which should be left in the hands of the management and the men concerned to arrange for according as commonsense dictates and according to the requirements of each specific place or work. Always provided that the present works regulations are complied with—that is the "colour bar"—for skilled work affecting life and limb shall not be removed.

*Note.—It is quite impossible to lay down any ratio. On Meyer and Charlton, with 48' to 55 inch stope on 24 deg. dip, a man can comfortably run 40 boys, while on the Roodepoort United, with a narrow reef, steep dip 60 per cent. and faulted, it is harder work to run 20 boys.

Developments in the Klerksdorp District.

Renewed attention is being directed towards the possibilities of this district, says the *Klerksdorp Record*. The rejuvenation of some of the derelict mines has actually commenced. Following on the reopening of the Atrikander Mine noticed in our columns recently, the claim area of the New West Bonanza Gold Mine has been repegged. A strong syndicate is in process of formation to work the property, and pumping will be proceeded with at once in order to dewater the mine and to restart operations underground while the mill and cyanide plant is being re-erected. A considerable quantity of mining material is now on the ground, and it is further proposed to crush the rock in the mine dump, which has been sampled and goes upwards of 3 dwts. unsorted. The large tonnage of sand and slimes will also be retreated and will return a good yield when treated by modern methods of extraction. This district contains several derelict mines which would bear further investigation in order to revive the gold industry of the Western Transvaal, the old Wolf-skal, the Homestead, the Jooste and other properties are all open at present and would give good returns on a moderate capitalisation. A property of very considerable possibilities, the Riet Kuil, has also been taken up by certain people here, and will in due course be re-equipped on a modern basis. The Riet Kuil formerly belonged to Messrs. Neumann's, and a very large amount of money has been spent on the development of the mine. Several thousand tons of 7 dwt. ore are lying at grass awaiting treatment. Thousands of feet of development work has been done showing good average values, and there is no reason why this property should not become a steady gold producer on a 50-stamp milling basis. When it is remembered that the district is extremely healthy and within about eight miles of the Kimberley-Johannesburg main line, with a good motor road to the mining area, there ought to be a steadily increasing mining activity in process, and we shall be very pleased at any time to furnish information which will be helpful to those who may desire to participate in the growth of this new-old mining district.

South African Trade with America.

South African trade with the United States during December was practically the same as in November, according to cable advice from the Department of Commerce

to the American Trade Commissioner, Mr. P. J. Stevenson. American imports of South African products were again \$200,000, while American exports totalled \$1,600,000, which is slightly under the figure for the previous month. In the last half of 1921, the United States imported directly, South African raw materials to a value of \$1,768,000. It is probable that the indirect imports, largely through England, were vastly in excess of this figure. Exports from the United States were \$8,700,000, making the total commerce between the two countries during this period, \$10,468,000, as compared with \$57,763,107 in the first half of 1921, when American exports were \$46,925,067, and imports were \$10,838,040.

Conditions in the United States in December may be described as spotted. On the one hand, production has been increasing slightly, money is plentiful and interest rates are declining. On the other hand, the unfavourable factors include heavy commercial failures, and irregular prices. American oversea commerce in December continued to show an upward trend in imports, while exports were stationary.

* * *

The Seitz Diamonds.

In the report of the Union Auditor-General for 1920-21, the following appears under the head of "Mining Royalties":—"A sum of £235,040 12s. 10d., being tax in connection with a parcel of diamonds known as the 'Seitz diamonds.' The last shipment of diamonds from South-West Africa during the German occupation took place on July 27, 1914. Stones produced subsequent to that date were, on the advance of the Union troops to Luderitz, despatched to Windhoek on instructions from Governor Seitz for safe keeping by the Treasury. These stones were subsequently removed by the Germans and hidden in the Grootfontein district, but were afterwards handed over to the British Military Governor in terms of an agreement entered into with the said German Governor. The stones in question were sold after the cessation of hostilities in terms of an agreement with the London Diamond Syndicate. The proceeds were disposed of in accordance with the German laws. The sum of £248,000, the estimated amount of tax in connection with the Seitz diamonds, was actually credited to revenue. The difference will be deducted from the amount payable to revenue during the current year in respect of diamond tax, the amount of the final assessment being considerably greater than the amount credited upon provisional assessment. The amount of the assessment of the diamond tax for 1919 was £931,921. After the schedules of assessment had been scrutinised, the tax was finally assessed at £1,006,984. This amount will be paid over to revenue during the current year, less the sum assessed in respect of the Seitz diamonds."

Sir Henry Strakosch has left the Rand for England.

Mr. F. G. A. Roberts, Technical Adviser to the Transvaal Chamber of Mines, has left the Rand for a well-earned six months' holiday in Europe.

What man in possession of his senses would put money into a losing venture (with a very limited life under the best of conditions) like the E.R.P.M. when he can get 3½ or 4 per cent. in a Post Office Savings Bank with capital and interest guaranteed by the State? The mines of the Rand have simply to put their industrial houses in order and reduce costs to such a level that they can at least pay their way, or else they will have to close down. No conferences or arguments or arbitrators can alter these unassailable facts, and the labour leaders in wilfully distorting the issue and camouflaging the facts by a smoke screen of political clap-trap are doing the country and everybody in it an immeasurable amount of harm.

TRANSVAAL ALLUVIAL DIGGINGS IN 1921.

The complete monthly returns for the South-Western Transvaal alluvial diggings for last year were as follows:—

	Carats.	Value.
January	4,281½	£22,719
February	4,376½	20,272
March	5,178	26,227
April	6,734½	35,177
May	5,084½	29,972
June	5,353¾	27,444
July	5,919	38,640
August	5,687	41,990
September	6,427	49,411
October	6,141	40,048
November	5,399¾	35,684
December	5,257¼	33,418
Total for 1921	65,839¾	£401,002

The Producing Areas.

To the year's output there were 84 different contributing areas, and an analysis of the returns for the twelve months shows that the output of the principal individual diggings for the year was as under:—

	Carats.	Value.
Blesbokfontein	9,335½	£53,439
Kameelkuil	7,551¾	48,163

Building the British Trade Ship.

Active preparations are being made for the "Trade Ship" which is to be built to carry samples of British manufactures and other products on exhibition to all parts of the world. The builders of the ship are obtaining provisional tenders for the various parts and fittings. Not only will the ship itself be a demonstration of British engineering, but every part of it will constitute an exhibit. Care is being taken to select only those component parts which will represent the best in British production. Keen rivalry is expected in this connection. The vessel is expected to sail from London in the autumn of next year on a voyage which will occupy eighteen months.

A Steam-Petrol Engine.

An entirely novel type of engine is dealt with in "The Motor." This new engine, which may ultimately revolutionise all forms of mechanical transport, works on the principle that the waste heat of an internal-combustion engine is used to keep the exhaust of a steam engine continually in the form of steam, while the power of the engine re-compresses it so that it is used over and over again. The steam engine is coupled up to the driving wheels of the vehicle or whatever it is wished to drive, and instead of a boiler there is an internal-combustion unit, which serves two purposes—firstly of reheating the exhaust steam so that it does not condense back into water; and, secondly, of compressing it so that it can be used again in the steam engine,

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the Journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

Breyten Collieries.

An extraordinary general meeting of shareholders of the Breyten Collieries, Ltd., will be held in the Board Room, Consolidated Goldfields Buildings, Johannesburg, on Monday, 10th April, 1922, at 10 o'clock in the forenoon, to consider the advisability of, and, if thought fit, passing the following resolutions, as extraordinary resolutions, under the Companies' Act, 1909, of the Transvaal Province:—(1) That it has been proved to its satisfaction that the Company cannot, by reason of its liabilities, continue its business, and that it is advisable to wind up the same, and accordingly that the Company be wound up voluntarily; (2) a resolution appointing a liquidator or liquidators and giving them any special directions that may be deemed necessary in connection with the winding-up of the Company and fixing his or their remuneration. The share transfer books of the Company will be closed from 1st to 10th April, 1922, both days inclusive. All proxies to vote at the above-mentioned meeting may be lodged at the head office of the company at any time before the meeting, or may be delivered to the secretaries up to the time of the opening of the meeting.

Rhodesian Dividends for 1921: Total Mining Distributions to Date, £8,201,821.

For the year ended December 31 the mining companies of Rhodesia distributed the following dividends:—

Name of Company.	Rate declared or its equivalent subject to income tax. Per cent.	Amount absorbed.
Gaika Gold Mining Co., Ltd.	12½	£34,187
Globe and Phoenix Gold Mining Co., Ltd.	11½/7	228,571
Lonely Reef Gold Mining Co., Ltd.	30	81,302
Rezende Mines, Ltd.	40	48,000
Rhodesia Broken Hill Development Co., Ltd.	10	35,000
Shanva Mines, Ltd.	30	180,000
Wankie Colliery Co., Ltd.	10	56,733
Total		£663,793

The total cash dividends declared by Rhodesian mining companies to December 31, 1921, amounts to £8,201,821. This figure does not take into account dividends declared by Rhodesian development and miscellaneous companies in cash or scrip amounting to over £3,800,000, net dividends paid by local Rhodesian mining companies and syndicates, not distributions effected in the form of return of capital.

The total of £663,793 declared during the year ended December 31, 1921, is the third highest on record. During 1920 a total of £1,056,840 was declared, but this figure was swelled by the fortuitous inclusion in that year of certain dividends from profits made in the previous year.

The following dividends also have been declared by Rhodesian development and miscellaneous companies during the year ended December 31, 1921:—

Name of Company.	Rate declared or its equivalent subject to income tax. Per cent.	Amount absorbed.
Beechuanaland Exploration Co., Ltd.	8½	£25,074
Beechuanaland Trading Association Ltd.	2½	1,319
Charterland and General Exploration and Finance Co., Ltd.	15	24,572
Crescens (Matabele) Mines and Land Co., Ltd.	10	7,271
Exploring Land and Minerals Co., Ltd.	5	13,765
Gold Fields Rhodesian Development Co., Ltd.	10	125,711
Mashonaland Agency, Ltd.	4	8,257
New Bulawayo Syndicate, Ltd.	10½/7	4,896
Rhodesia Copper and General Exploration and Finance Co., Ltd.	12½	22,001
Rhodesia Land Bank, Ltd.	5½/7	10,000
Tobacco Co. of Rhodesia and South Africa, Ltd.	7½	5,000
Total		£247,866

S.A. Banking in 1921.

Deposits in the South African banks steadily declined from £102,331,940 at December 31, 1920, to £90,747,977 at September 30 last, and the restriction in business is also reflected in the returns from the bankers' clearing houses at the principal centres, which show material all-round reductions compared with the previous year. The proportion of advances to deposits, on the other hand, still remains at the high figure of approximately 83 per cent., and evidences the assistance given by the banks in financing the country through difficult times. The stability of exchange rates on London, which fluctuated during the year within the comparatively narrow margin of 2½ per cent., has been a satisfactory feature in view of prevailing conditions.

A Year's Imports and Exports.

Trade returns for the complete year are not yet available, but for the 11 months ended 30th November last the total imports of merchandise (excluding specie and articles for the South African Government) were valued at £48,635,403, as against £87,385,232 for the corresponding period of 1920. Lower prices are responsible for part of the decline in total value, but there has also been a material decrease in the tonnage of goods imported.

Exports (including re-exports) for the same period of 1921 were valued at £58,147,961, compared with £79,638,175 for the previous year, the decline being due mainly to the lower prices obtained for produce and to the falling off in the demand for diamonds. If allowance is made for Government imports and for specie it appears likely that the trade figures for the whole year will approximately balance, whereas in the previous year imports exceeded exports by about 21½ millions.

Harmony Proprietary.

According to the "Zoutpansberg Review," Mr. J. F. Stewart, the General Manager of the Harmony Proprietary Company, Ltd., is on a business visit to London, and on his return, in March or April, there is reason to believe that this Company's large and valuable estate will be developed on an extensive scale.

ELECTRIFICATION OF ITALIAN RAILWAYS.

It is announced from Rome that a report has been laid before the Senate relating to the authorisation given to the Railway Administration to raise a sum of 440 million lire for special works. At the present moment electric traction is employed on 559 kilom. of line with a length of rails aggregating 1045 kilom. The complete electric plant is about to be put into operation for the whole Ronco line, thus completing the electric equipment for the entire Turin-Rome line. The electrification of the direct lines Ronco-Arquata-Tortona, Tortona-Novì, Voghera-Bivio-Bornida and Genoa-Ovada-Alessandria has been begun. It is hoped to complete very shortly the electrification of the Rome-Tivoli and the Rome-Anzio-Nettuno lines, after which the works for the electrification of the direct Rome-Naples line will be pushed on. Thus at the beginning of 1923 another 500 kilom. of electrified lines may be completed with 1370 kilom. of rails.

But since the electrified lines would be useless without electric locomotives, and the construction of the latter takes from eighteen to twenty-one months, the Railway Administration has been obliged to give orders already, beginning with one for 111 locomotives, at a total estimated cost of 165 million lire. Some of these locomotives will be used to complete the equipment of the lines already in use, and the remainder will serve for those in course of electrification. The proportion of the 111 locomotives, however, destined for use on the lines to be electrified by the beginning of 1923 is considered insufficient by the Railway Administration by a decree law to raise 169 million lire for the acquisition of 120 additional electric locomotives.

There is one aspect of the present strike on the Rand which so far has received little notice. But it is a matter of very great importance, and therefore deserves considerable attention. If South Africa is to continue in its position as the leading gold producing country of the British Empire and of the world, large sums of money will have to be found during the next few years for the expansion of mining operations. Whatever the outcome of this strike may be, it is certain that several mines have but a limited life. Provided working costs can be reduced to a reasonable level and the efficiency of the labour force can be brought up to something approaching the level of efficiency in other mining fields, there should, however, be a long period of comparative prosperity before the Rand, because there are enormous tonnages of low grade ore in the so-called rich mines which cannot be exploited under the conditions which recently have obtained. And if ability to work these low grade tonnages at a profit is shown capital will be forthcoming for the development of new areas, and particularly those in which the Government and therefore the people of the Union have a big interest as leaseholders. But if working expenses are not reduced to a reasonable level and if Trades Unionism is going to continue a policy of harrassing the mines at every turn, it is certain that capitalists will fight shy of South Africa. They will turn to other fields where returns are more attractive and where there is less Labour obstruction and more freedom from political-industrial attempts at revolution which are fast reducing the stability of South Africa to the level of a Central American Republic.

Lubricants

"A grade for each type of service"

Production's Sly Enemy

FRICITION—

the unseen enemy of production in your plant.

IF FRICITION COULD SPEAK, it would confess, "I am robbing you of power, of production, of profit."

If your machines were human, they would tell you that friction is pain—and pain is the forerunner of trouble.

What will guard you against wasteful friction? Correct lubrication—and that only. The subject is well worth your most serious thought.

We are in a position to reduce the wear and tear on your machinery—to reduce power waste and so increase your useable power.

This increased power means increased production without added power cost. It means improved profit. It will protect your pocket-book from friction theft.

We can bring to bear on your plant the most complete fund of lubricating experience in existence. It embraces thorough engineering knowledge and wide practical experience.

We suggest you get in touch with our nearest branch

ENGINEERING SECTION.

Randfontein Central.

HOISTING EQUIPMENTS.

The hoists shown in the accompanying photo are installed at the north deep and south deep shafts, Randfontein Central Gold Mining Company, Limited, and are designed to raise a load of rock of five tons from a vertical depth of 5,000 feet, or a total load of 22½ tons at a maximum speed of 4,000 feet per minute.

These hoists are operated on the "Ward Leonard" system, each hoist having two direct current motors carried on extensions of the drum shaft. The normal rating of each motor is 2,500 h.p., with a maximum capacity of 5,000 h.p.; the combined effort, therefore, will be capable of a maximum output of 10,000 h.p. for each hoist.

The converter set supplying these hoists with power consists of one induction motor with a normal rating of 5,000 h.p., driving two generators with a normal rating of 4,000 K.W.

A novel feature of these hoists is that they are provided with a special dynamic braking arrangement, designed by the consulting mechanical engineer of the J.C.I. Group, which makes it practically impossible for the skip either to run away or to be too abruptly retarded. Such an accident, therefore, as occurred at the Meyer and Charlton some years ago would not occur under similar circumstances here.

The power for driving the hoists is supplied by the Randfontein Estates Power Station, the operating pressure being 2,000 volts on the alternating side and 600 volts on the D.C. side.

The electrical portions of the hoists were manufactured by the General Electric Company, U.S.A., and the mechanical portions by Messrs. Fullerton, Hodgart and Barclay, Paisley.

Political opportunists are seeking to make all the capital they can out of the present dispute, which is purely an industrial dispute and should in no way be confused with party politics. They are helping to propagate the falsehood that the Chamber of Mines seeks to remove the Colour Bar. This is an absolute lie and the dissemination of this malicious falsehood is helping to prolong the strike and to bring ruin to this country which depends so largely on the Gold Mines of the Witwatersrand. All that the Chamber of Mines has proposed to do is to introduce certain measures of reform calculated to reduce working costs with the object of saving several of the large low grade mines from closure and with a view to enabling the richer mines which have only a limited quantity of high grade ore to work their huge tonnages of low grade ore, thereby prolonging and expanding the life of the industry.

Randfontein's New Winders.

South Africa's First Giant Grain Elevator.

So much has been heard of the grain elevator contract of late that a few technical details regarding the Durban installation may be of interest.

The elevator is being constructed at Congella Wharf, Durban, under a contract amounting to £1,250,000. The site covers three acres, so that there will be ample room for future extensions or accessories as may be necessary. The work was started in March last, and is expected to occupy over four years. This great structure will be built on reclaimed ground and to do this effectually scientific engineering skill and experience is required. An enormous amount of draining is continually going on necessitating the laying down of a huge pumping plant capable of drawing away 20,000 gallons of sea water per day. In order to protect the foundations of the grain elevator from flooding, they have to be completely surrounded by sheet steel joists approximating in weight about 900 tons, and each 36ft. in length. Every one of these joists must be driven into the ground to a depth of 35ft. and this is accomplished with the aid of four immense steam pile-drivers, 60ft. high, and a steam hammer weighing approximately $4\frac{1}{2}$ tons. This hammer, holding the upper end of the steel joist in a powerful cramp, keeps up a continuous beating, averaging 120 beats per minute. In nine minutes this steam giant crushes into the earth a steel joist to the depth of 35ft., and it has been known to accomplish the feat in seven minutes. The force of each blow is $4\frac{1}{2}$ tons.

To reach the beds for the foundations, excavations must be made through a 4ft. surface of sand and 32ft. of clay. The foundation beds will be covered by two solid slabs of concrete each 4ft. thick. The beds will have to support 3,400 piles of reinforced concrete, composed of 36,000 steel rods, and squares to hold the mixture. Each pile is 36ft. long and 15ft. square, and weighs $3\frac{1}{2}$ tons.

NEW TYPE OF S.A.R. LOCOMOTIVE.

During the past two years, says the *S.A. Railway and Harbours Magazine*, five locomotives of a type totally new to this continent have arrived, and have been put in service on the South African Railways. They are of the Garratt articulated type, and are of three different designs. There are three of the 2ft. gauge; one is a light type for use on 45lb. standard gauge rails, and the last a heavy main line locomotive. Two of the narrow gauge engines have been working on the Stuart's Town line, and the third on the Aventura line; the branch line engine is on the Natal coast lines, and the large one on the Natal main line.

A "Garratt" locomotive is made up of three distinct units: two bogies, each carrying a pair of cylinders and a set of coupled wheels, and a boiler on a rigid plate frame. Tanks are carried on the bogies, and thus a "Garratt" engine appears unlike the usual locomotive, its most peculiar feature being the tanks, one in front of the smoke box and the other behind the cab.

Perhaps the most interesting feature of the "Garratt" locomotive, says the magazine, is the large boiler it is possible to apply. The designer is free to develop the firebox, not being encumbered by the limiting factors of frame clearance or coupled wheels, the presence of a bissel truck, and an easily accessible ashpan can be fitted. A large boiler barrel is possible, as the clearance between the boiler cradle frame can be arranged to suit. In the large locomotive the outside diameter of the middle ring is 6ft. 9in. diameter. The Belpaire firebox is very deep, thus giving large volume without the complication of a combustion chamber.

The large "Garratt" is an engine of great tractive power, and is larger by forty tons than any previously constructed locomotive of this type. Although, therefore, be-

The manufacture of these concrete mammoth piles proceeds at the rate of 41 per day, in detachable mould boxes.

Before anything is put into the mould boxes, each box is well white-washed, and allowed to dry thoroughly. The steel rods and squares are then placed inside, and the concrete mixture poured in. When the box is full the mixture is allowed to thoroughly harden, after which the sides of the moulding box are taken away and the pile is left to itself for some days. Then it is turned over, the bottom of the moulding box removed, the top of the pile covered with sand, and left to await the time when the pile will be driven into the earth.

Three Ransom mixers are used. The water necessary for mixing is carried through a net of piping 12,000ft. in all. Over 900 concrete piles are already finished, and in the pile yard are from 4,000 to 5,000 tons of stone and Umgeni sand. Sixty days are allowed to elapse from the time of pouring the mixed concrete into the moulding before a pile can be driven. Excavating through 4ft. of sand and 31ft. of hard clay is proceeding at the rate of 500 cubic yards per day. Thirty iron steam-hauled dumping wagons are being used. Fifteen white mechanics and white handymen are employed besides 450 boys. This labour will not suffice in the future, for the contractors intend working a night as well as a day shift, and for this purpose have erected a large electric plant carrying 15,000 candle power flood lights, ready for the increased staff that will be required when the concrete piling is ready. This mammoth grain elevator is designed for the storage of grain in bulk and direct loading into ships—a serious want that South Africa has experienced for a long time past. The capacity will be 48,000 tons of maize, and when the grain elevator is completed in its entirety Durban will have one of the largest in the world.

ing somewhat experimental, engine 1649 must, at any rate, be given credit for being the highest powered locomotive in the world designed for and working on 1 in 30 grades and 300 feet, radius curves at the customary speeds for such conditions.

This type of articulated locomotive, being primarily designed to enable a large boiler of straightforward design to be used on a narrow gauge railway, has doubtless many other attractive features; and while the development of the idea is only emerging from comparative infancy, it is perhaps not too optimistic to expect that the "Garratt" locomotive will command a big field in the future, and probably give another lease to the steam locomotive.

The Assistant General Manager, Durban, in his report for the quarter ended September 30, says that the "Garratt" engines in Natal continue to work satisfactorily.

Better Roads without Expense.

In districts where traffic has increased or has grown more serious by the change from horses to motors, road engineers are apt to be pessimistic about the heavy cost of bringing the road up to the higher standard necessary. In one British city, however, the road engineer has cleverly contrived to make the change without demanding any increase in the rates for road making and maintenance. The secret of his success lies in the skilful use of materials having a long life. He claims that a good water-bound road, eight yards wide, painted or sprayed with tar, can stand 400 to 600 tons of mixed traffic per day. For roads carrying 80 to 100 omnibuses tar macadam on a sound foundation is economically satisfactory; and on roads with 300 to 400 tons per day clinker-asphalte or a similar surface is sufficient. In one case a road was laid with clinker-asphalte four years ago and shows no signs of deterioration although the traffic amounts to 6,000 tons per day.

Big Engineering Contracts.

Three months ago there was much discussion in the press over the award of a large contract for the supply of steel pipes by the Rand Water Board to a German firm. The German tender was about £270,000 and the lowest tender of a British firm was £117,000 more in amount. Naturally, a good deal was said about the decadence of British engineering, and doleful prophecies were made about the decline of British trade. The difference in the amounts of the tenders was startling but, apparently, it was due to a strong attempt by Germany to gain a foothold in the South African market. The effort has not been sustained, and it is only fair to notice the less sensational events which have happened in connection with other and similar engineering contracts since that time. In every case British firms have been successful in the face of severe competition from all over the world. We recently announced that the Metropolitan Vickers Company had obtained the contract, to the amount of over three-quarters of a million sterling, for the supply of material, including seventy electric locomotives, needed in connection with the electrification of the Glencoe-Maritzburg section of the South African Railways. And this large contract is not singular. The Rand Water Board is constructing a large barrage across the Vaal River and has been calling for tenders for the supply of a considerable

amount of plant and material for this purpose. It had occasion a few days ago to consider the tenders for the supply of pipes similar to those for which the German firm obtained the contract three months ago. The positions are now reversed, the lowest British tender is considerably lower than the lowest German one, and the price per ton of steel of the German tender is about 20 per cent. higher than it was for the successful German contract obtained three months ago. The recent British price is only about three per cent. higher than that for the pipes then ordered from Germany. All the Rand Water Board's contracts, too, for such complicated plant as boilers, turbo-centrifugal pumps, and electric generating sets, have been awarded on an economic basis to British firms. The *Cape Times* says that the successful British tenderers have agreed to all the conditions laid down by the Board, the prices are firm, and the time for delivery is satisfactory.

The s.s. "Sandown Castle," the first oil-burning steamer of the Union-Castle Line, which has recently been delivered by the builders, sailed from Southampton on the 24th December for New York, where she will load for South African ports.

INDUSTRY AND SCIENCE.

Prof. R. B. Young presided over the quarterly session of the Advisory Board of Industry and Science, which was held at Capetown last week. There were also present Col. W. Arnott (president of the South African Agricultural Union), Mr. W. J. Laite, Prof. B. L. St. J. van der Riet, Sir Carruthers Beattie, Prof. G. H. Stanley, and Dr. J. D. P. Gilchrist, together with Dr. E. P. Nobbs (Director of Agriculture, Southern Rhodesia, representing the Rhodesian Government) and the following Government officials: Dr. H. J. van der Byl (scientific and technical adviser to the Government on industrial questions), Col. A. K. Harvey (officer in charge of the Industries Division), and the secretary (Mr. A. C. Marsh), Mr. Warington Smyth was prevented from attending owing to the labour troubles in Johannesburg. The proceedings were not open to the Press, but it is understood that among the matters discussed was the question of by-products obtainable from an electric power generating station (in view of the early electrification of railways), fisheries survey, the manufacture of alcohol for industrial purposes, soil erosion, and the

point as to whether anything can be done for Kimberley in the way of industrial development to relieve the depression caused by periodical slackness in the diamond trade and consequent unemployment in connection with the mines. During the proceedings a discussion on general matters took place between the Board of Industry and Science and the newly-formed Board of Trade and Industry (a Board to deal with Customs and railway tariffs). It might be mentioned that the Advisory Board of Industry and Science has been in existence since 1917. It was re-organised in October, 1920. Its purpose is to advise the Government on questions affecting the development of the resources of the country, particularly those things that concern the establishment of industries. In addition to that, it is permitted to initiate matters which, in its opinion, are of sufficient importance to warrant their introduction for development purposes. In view of its advisory capacity, all its deliberations are conducted in private; but an annual report is prepared, presented to Government, and published in the usual way. The account of the year's work is always rendered promptly. As a matter of fact, the report for 1921 has already been completed, and will be submitted to the Government in the course of a few days.

THE HYDROGEN, OXYGEN & PLANT CO., Ltd.

(REGISTERED IN ENGLAND),

WONDERFUL TIME-SAVERS**THE "VELOX" PATENT RAPID-ACTION SPANNER.**

The "VELOX" is
Made of Siemens-Martin Steel.

Easily and Quickly taken to pieces.
Adjustable with one movement.

Easily worked with one hand and will
Grip bolts placed in difficult positions.
No Gear Wheels, Screws, Springs
or Levers.

SIMPLE. STRONG.

Our Simple Secret is:—The moveable
jaw has a wedge-shaped foot and under
this is placed a second moveable
wedge. These two react on each other
and lock at any desired point.

THE "RAPID" PATENT QUICK-ACTION SCREW WRENCH.

Made of Best Siemens-Martin Steel.
The MOVEABLE JAW is fitted as a
BAYONET CATCH and can be
FREELY ADJUSTED without screw
and FIXED INSTANTLY.

**INGENIOUS and
SUBSTANTIAL.**

Indispensable for Good and Quick
work.

Instructions for Use:—The moveable
jaw is easily adjusted by simply
sliding up and down. The two jaws
are thus fitted to the nut and a half-
turn of the handle to the right suffices
to fix the wrench immovably. By
further turning to the right the
wrench can be adjusted to a nicety.

The Week in the Sharemarket.

PRICES KEEP FIRM—GEDULDS A FEATURE—DIAMONDS BETTER.

The local share market keeps remarkably firm, and as indications are not lacking that a large number of men on strike are anxious to return to work it is generally felt that prices are likely to improve despite the declining price of gold. Gedulds have been a strong feature throughout the week and diamond shares are also better. Business before High Change on Thursday was moderate in amount, but prices were firm. Springs Mines were bought at 36s. 9d. and 37s., Nourse Mines at 9s. 3d., Consolidated Diamonds at 15s. 6d., and £1,000 Debentures at £112 10s. On the Call there was considerable inquiry for several stocks and Gedulds were bought in some numbers at 48s. 9d., an advance of about 6d. Springs Mines were 1s. 6d. higher at 37s. buyers. Modder Easts were better at 5s. 10d. and 5s. 11d. sales. Anglo-Americans were 6d. up at 19s. 3d. sales. Brakpans about 1s. at 45s. 6d. sales. Randfonteins were 7½d. higher at 16s. 1½d. sales, etc. New Modders, City Deeps, Van Ryn Deeps, Modder Deeps and Modder B. were unchanged. Consolidated Diamonds were 7½d. higher at 15s. 7½d. sales. Frank Smiths and Crowns slightly harder, etc. Tin shares were inactive. Pretoria Cements were about 1s. higher at 41s. and 41s. 3d. sales; Transvaal Silvers higher at 21s. 6d. buyers, and Alkali firm but inactive. Union 5 per cent. Tax Free Loan was easier at £100 sales, and the 4½ per cent. Loan steady at £92 10s. sales.

GERMAN ELECTRICAL COMPANY'S PROFITS.

The annual report of the German General Electrical Company shows that at the beginning of its last business year, which closed at the end of June, the share capital was 200,000,000 marks. During the year the capital was increased to 850,000,000. The additional issues of shares consequently took place after the first big drop in the value of the mark, and before the second. Nevertheless, it pays a record dividend of 16 per cent. on 350,000,000 ordinary capital and 6 and 7 per cent. respectively on the two emissions, each of 250,000,000 preference shares. But that is not all. Before these dividends were allowed for, 100,000,000 were assigned as the first instalment of the new "works maintenance" reserve, 5,000,000 for benevolent funds, and 12,000,000 to "foundations." From the figures published it is not evident what further allocations were made for writing off and reserves. But even this does not finish the tale of the company's abounding prosperity. The directors ask for powers to issue a further 250,000,000 shares during the current year. That will bring the total capital up to 1,100,000,000 marks, or, with debentures, to 1,302,000,000. The Allgemeine Electricitaetsgesellschaft will thus be the first German company to pass the milliard mark with its capital. The *Vossische Zeitung*, which is well informed on commercial matters, assumes that it is the "development of the organisation abroad" which makes it necessary to increase the pecuniary resources contemplated for this year. A similar lesson is to be learnt from the report of the Mannesmann Tube Works. This company, which has a paid-up share capital of 89,750,000 marks, shows a net profit of 84,500,000 marks, places 108,000,000 to reserves, and increases its dividend from 20 to 30 per cent. Figures published show that during the first nine months of this year new companies were founded with a total capital of 2,300,000,000 marks. In the same period old concerns increased their capital by 11,067,000,000. During the whole of 1913 new flotations accounted for 217,000,000 marks, and increases of capital 418,000,000 marks.

On the London Metal Exchange on Wednesday bar gold closed at 91s. 9d. per oz. Standard copper, £61 12s. 6d. ash, £62 12s. 6d. forward; electrolytic copper, £67 cash, £69 forward; standard tin, £157 7s. 6d. cash, £159 2s. 6d. forward; foreign lead, £21 5s. cash, £21 2s. 6d. forward; quicksilver (middle), £11 7s. 6d.; bar silver, spot, 34½d.

The Pilgrims Rest Gold Fields.—II.

SOME FURTHER NOTES ON THE MINES OF THE DISTRICT.

Some weeks ago we printed notes by Mr. H. C. F. Bell on the Pilgrim's Rest goldfields. The following is the conclusion of his paper which was read recently before the C.M. & M. Society of S.A.

Vertical Reefs and Leaders.

These are numerous and uncertain in value. To go into details would require a separate paper. In the area round Mt. Anderson, and from the Waterfall River to Marieps Mountain, vertical quartz leaders abound. Some carry little or no gold, while others are exceptionally rich. One leader recently opened up gave 294 ozs. from 20 tons of ore crushed. Of vertical reefs there are three being worked, namely "The Rietfontein Reef," "The Sunlight Reef," and the reef being worked by the "Hepta Syndicate." On the farm Sabie Nook there are several vertical reefs, one of which is the Rietfontein Reef, and which carries some encouraging values. Vertical reefs several miles further north have been located, but insufficient work has been done on them to indicate their merits. They are probably the same series as on Sabie Nook.

In recent months considerable activity is being shown in the opening up and working of leaders with profitable results to the "small man."

The Black Reef Series.—One of the most interesting belts of country in the district is the long strip of Black Reef Series running along the edge of "The Berg," almost due north and south, and extending from south-east of Sabie to Marieps Mountain. From it a great amount of alluvial and "leader" gold has been won. Alluvial diggings in this belt start from the eastern portion of the farm Spitzkop No. 39, but in the neighbourhood of Spitzkop Mountain there are other alluvial workings which lie in the lower part of the dolomite series.

About two miles north of Sabie there is a busy little group of mines producing iron pyrite from the sandstone reef. This class of mining, which has been in vogue for the last few years only, is very attractive, owing to its simplicity and cleanliness. The Sandstone reef is very pyritic and hard. The ore is crushed to a coarse mesh and passed over concentrating tables. The concentrates, which vary in gold contents from 2 ozs. to 3 ozs., and in sulphur from 40 to 45 per cent., are railed to chemical and explosive works, chiefly for the manufacture of sulphuric acid.

Further north there are the Mac-Mac and Graskop diggings. Running through the Graskop diggings is the Mali-Dyke, and here is the "Mali-Dyke" gold mine. This mine is most interesting in that the reef is in immediate contact with the wall of the dyke, which is vertical. The reef splits in places and runs right into the dyke, and even in the dyke it carries payable gold. This dyke is not easy to trace, but what appears to be the Mali-Dyke outcrops at Waterfall, and there is reef in the same vicinity. Some serious prospecting here might open up a payable mine. When the dyke has once been unmistakably located in a second place, the problem of tracing it further afield will be much easier. Its probable line traverses the farms Lisbon, Berlyn, London, Ledouphine and Goedgeloof. It is possible that the main dyke which runs through the New Chum Mine is the Mali-Dyke.

Several miles further north the Sandstone reef has been found in several places carrying fairly good values, but very little work has been done towards proving the extent and value of this reef. One area in particular, where several good assays have been obtained, requires development, and may prove to be a profitable proposition. Water is a little troublesome, but could be overcome with hand-pumps.

The next important area is the one locally known as "Waterfall," situated on the farms Lisbon and Berlyn, where there have been extensive alluvial diggings and a fair amount of reef mining. The New Lisbon Berlyn Company did a lot of work here many years ago. A small mill is now in the course of erection, and alluvial digging is still being carried on in a quiet way. There are two reefs, called the "Robertson" and the "Pidgeon" reef. They are above the Sandstone reef and below the Glynn's Lydenburg reef.

Between this area and Belvedere is an area in which some very rich leaders have been found, one of the most noted of which was the "Tucker Leader," which, though very narrow, extended for 1,400ft. into the hill and produced many thousands of pounds' worth of gold.

Not very far from here is the "New Chum Syndicate" Mine. This has been working for several years. A main drive, 2,000ft. has been driven into a hill parallel to a large dyke. This drive intersected several small cross dykes and leaders, and of the latter the biggest, which is called "Big Ben," runs right through the dyke. The smaller leaders do not run through, but there are rich leaders on both sides of the dyke. For a long time prospectors have maintained that the leaders on the east side of the dykes do not carry gold, but this belief has been definitely disproved at the New Chum Mine.

At the Hepta Syndicate Mine, in this same area, nearly all the gold is in the form of nuggets, and some very fine specimens have been obtained. Most of the gold is found in a seam of dark-coloured clay, in contact with a vertical reef. Until recently it was believed that there was only one goldbearing horizon, but recent development has proved that there is payable gold at other horizons.

In this vicinity a goldbearing flat reef has also been found, but no work has been done on it. It is alleged that further north there are clay seams of possibly good value which have not been developed, and no serious prospecting has been done to find others.

Just below the junction of the Treur with the Blyde River, amidst beautiful scenery, are situated the "Bourke's Luck" and the "Deintje" Gold Mines. These two mines are, I believe, on the same reef called by some the "Bourke's Luck" reef, and by others the "Sherwell" reef. I think the former theory is correct, and that the Sherwell reef is lower down.

The Deintje mine is dealing with a pyritic ore containing a high percentage of copper, and the concentrates are being sent overseas for treatment. The "Bourke's Luck" mine has a large dyke running through it, and associated with this dyke are numerous leaders, which in places almost form a stock-work. These leaders have supplied practically all the ore for the mill. Some time ago the mine closed down, but has recently been re-started.

Several miles further north is a baby mine, where a little three-stamp mill is situated amongst the wild surroundings of Marieps Kop. Only vertical quartz leaders are being worked at present.

Comparatively little prospecting has been done in this area, but those who know it fairly well believe that it offers excellent opportunities for the "small man."

Corner House Mines in the last Quarter.

A DIGEST OF REPORTS—FIGURES FOR TWELVE SUBSIDIARIES—FALLING PRICE OF GOLD AFFECTS PROFITS—REFERENCES TO THE STRIKE.

Reports of the various subsidiaries of the Central Mining-Rand Mines Group have now been published, and from these we take the following extracts:—

City Deep.

Development work: Total footage, 7,807 ft.; total footage sampled, 3,450 ft. The payable reef disclosures were as follow: Main Reef Leader, 1,990 ft., width 21·7 in., assay value 20·5 dwt.; South Reef, 110 ft., width 24·6 in., assay value 12·5 dwt. Tons crushed, 259,600. Total profit, £170,178. The yield per ton was slightly lower than that of the preceding quarter, but the decrease in profit was mainly due to the decline in the price of gold. Development work was considerably increased. In addition to the development recorded above, the south shaft was sunk 400 ft., making its depth 4,470 ft., which is the horizon of the 17th level.

Consolidated Main Reef.

Development work: Total footage, 5,751 ft.; total footage sampled, 3,340 ft. The payable reef disclosures were as follow: Main Reef Leader, 2,145 ft.; width 7 in., assay value 61·5 dwt. Tons crushed, 149,800. Total profit, £37,618. The decrease in profit is mainly the result of the decline in the price of gold.

Crown Mines.

Development work: Total footage, 10,394 ft.; total footage sampled, 7,220 ft. The payable reef disclosures were as follow: Main Reef Leader, 2,700 ft., width 24 in., assay value 18·3 dwt.; South Reef, 1,840 ft., width 27 in., assay value 16·9 dwt. Tons crushed, 521,000. Total profit, £163,836. A reduction in the price received for gold of 11s. per fine oz., coupled with the decrease in production consequent on the strike of miners, caused a serious decline in profit, as compared with September quarter. The strike, which commenced at No. 5 shaft on the 9th November and extended to all producing sections on the 25th of that month, was due to the management refusing to discuss with the Mine Workers' Union the dismissal of an official of the company. The Chamber of Mines, in taking the matter in hand, approved of the action of the management, and eventually on the 5th December a settlement was arrived at, the terms being practically those laid down by the Chamber. Development was commenced in the southern section from No. 5a shaft, and No. 14a shaft was sunk 238 ft., to a total depth of 414 ft. below the 19th level. The dewatering and equipment of No. 12 shaft down to the 19th level was completed.

Durban Roodepoort Deep.

Development work: Total footage, 3,682 ft.; total footage sampled, 2,780 ft. The payable reef disclosures were as follow: Main Reef, 525 ft., width 33 in., assay

value 12·2 dwt.; South Reef, 1,740 ft., width 5 in., assay value 60·1 dwt. Tons crushed, 80,000. Total loss, £1,794. Owing to a fall in yield of 577 dwt. per ton milled, and a reduction in the average price of gold of about 11s. per fine oz., the total revenue for the quarter was £25,932 less than for September quarter. Although working expenditure was £4,510 lower, the above factors brought about a working loss for the quarter. The expenditure on capital account was made in connection with the Robey hoist, west incline. Development operations were well maintained with satisfactory reef disclosures. The price now ruling for gold makes it impossible to work the mine without incurring losses unless a material reduction in working expenditure can be effected.

East Rand Proprietary Mines.

Development work: Total footage, 6,832 ft.; total footage sampled, 5,365 ft. The payable reef disclosures were as follow: Main Reef, 465 ft., width 28 in., assay value 17·2 dwt.; Main Reef Leader, 2,095 ft., width 22 in., assay value 23·6 dwt. Tons crushed, 380,500. Tonnage mined and from surface dumps, 413,550 tons; total yield, 95,884 oz. fine; total yield per ton, 5·040 dwt. Working revenue, £473,202, or £1 4s. 10d. per ton milled; working costs, £466,491, or £1 4s. 6d. per ton milled; working profit, £6,711, or 4d. per ton milled; total profit, £4,802. Working costs show a substantial decrease as compared with the previous quarter, but the yield per ton has fallen, and with the severe decline in the price of gold profits have been reduced almost to vanishing point.

Ferreira Deep.

Development work: Total footage, 231 ft.; total footage sampled, 215 ft. The payable reef disclosures were as follow: South Reef, 4 ft., width 25 in., assay value 25·0 dwt. Tons crushed, 83,900. Total profit, £15,281. A fire was discovered on the 7th December in a stope above No. 1 incline shaft, which eventually caused the stoppage of all underground work, one European and five natives unfortunately losing their lives as the result of gassing. During operations in connection with the extinguishing of the fire a fall of rock occurred at the 7th level station, entombing five Europeans, and although heroic services were rendered by the employees and others in attempts to save the lives of those who had not been killed by the fall of rock, their untiring efforts proved of no avail. Work was restarted in the western portion of the mine on the 21st December, 1921. Results for the quarter were adversely affected by the fire and the serious accident above referred to, and by the decline in the price of gold.

Geldenhuis Deep.

Development work: Total footage, 2,377 ft.; total footage sampled, 1,545 ft. The payable reef disclosures were as follow: Main Reef, 320 ft., width 46 in., assay value 9·4 dwt.; Main Reef Leader, 105 ft., width 8 in., assay value 62·8 dwt.; South Reef, 445 ft., width 24 in., assay value 27·5 dwt. Tons crushed, 146,760. Total loss, £4,281. The working loss for the quarter is due almost entirely to the heavy fall in the price of gold. In view of the working loss and the grave situation confronting this company owing to the heavy fall in the price of gold, the directors again decided to declare no dividend for the half-year ended 31st December, 1921.

Knight Central.

Development work: Total footage, 184 ft.; total footage sampled, 140 ft. The payable reef disclosures were as follow: Main Reef, 20 ft., width 79 in., assay value 13·0 dwt.; South Reef, 95 ft., width 46 in., assay value 9·9 dwt. Tons crushed, 88,500. Total profit, £6,498. Capital

MICA

WANT quotation (with samples) for Dark Colour or Stained Mica selected to cut sizes $1\frac{1}{2} \times 6\frac{1}{2}$, $3\frac{1}{2} \times 6\frac{1}{2}$,

—also—

Clear Ruby Mica selected to cut size 5 x 8 and larger. I am also interested in purchasing $1\frac{1}{2}$ in. to be cut from first and second quality Ruby Mica.

JOHN BURMESTER,

68, SHORTMARKET STREET, CAPETOWN.

expenditure, £11. The tonnage milled during the quarter constitutes a record in the history of the company, while working costs per ton show a further decrease of 2s. per ton. The decrease in profit is chiefly due to the heavy fall in the price of gold.

Modderfontein East.

Development work: Total footage, 5,665 ft.; total footage sampled, 4,950 ft. The payable reef disclosures were as follow: No. 1 shaft, 1,055 ft., 38.0 per cent., width 31 in., assay value 13.3 dwt., 412 inch-dwt.; No. 2 shaft, 800 ft., 63.0 per cent., width 22 in., assay value 14.1 dwt., 310 inch-dwt.; No. 3 shaft, 645 ft., 71.3 per cent., width 20 in., assay value 19.7 dwt., 395 inch-dwt.; total and average, 2,500 ft., 50.5 per cent., width 25 in., assay value 15.0 dwt., 375 inch-dwt. Tons crushed, 75,800. Total profit, £13,596. The reduction in profit, compared with the preceding quarter, was mainly due to the heavy fall in the price of gold. The sources of ore supply were 80.4 per cent. from stoping, 14.6 per cent. from development faces, and 5.0 per cent. from surface development dumps. The net expenditure on capital account was less than in the preceding quarter, the total of £19,094 being made up as follows: Development, £13,020; underground equipment, £2,168; surface equipment, £3,906.

Nourse Mines.

Development work: Total footage, 4,179 ft.; total footage sampled, 2,440 ft. The payable reef disclosures were as follow: Main Reef, 100 ft., width 51 in., assay value 9.2 dwt.; Main Reef Leader, 1,490 ft., width 26 in., assay value 14.2 dwt.; South Reef, 440 ft., width 26 in., assay value 18.3 dwt. Tons crushed, 136,100. Total profit, £15,219. The working profit from current operations was £14,877 less than for the preceding quarter, principally owing to a reduction of approximately 11s. per fine oz. in the estimated price obtainable for gold. Owing to a full supply of native labour, it was possible to increase the tonnage output by 6,500 tons, and working costs were lower at 30s. 8d. per ton milled, a decrease of 1s. 7d. per ton. Development operations were well maintained, with reef disclosures fully up to the standard of the mine.

Rose Deep.

Development work: Total footage, 1,548 ft.; total footage sampled, 1,144 ft. The payable reef disclosures were as follow: Main Reef, 278 ft., width 39 in., assay value 12.8 dwt.; Main Reef Leader, 159 ft., width 33 in., assay value 7.6 dwt.; South Reef, 453 ft., width 36 in., assay value 9.4 dwt. Tons crushed, 165,300. Total profit, £23,830. All work on the property has ceased, with the exception of certain essential services (such as pumping, etc.), which are being carried out as far as possible by the company's officials. The results for the current quarter will therefore be seriously affected.

Village Deep.

Development work: Total footage, 6,297 ft.; total footage sampled, 3,150 ft. The payable reef disclosures were as follow: Main Reef Leader, 2,800 ft., width 25 in., assay value 15.5 dwt. Tons crushed, 152,400. Total profit, £17,111. The decrease in working profit was due to a slightly lower yield, and a reduction in the average value obtained for gold of about 11s. per oz.

The working revenue is arrived at by calculating the value of the gold produced at the following prices:—October, £5 1s. 9d. per fine oz., after deducting realisation charges; November, £5 0s. 9d. per fine oz., after deducting realisation charges; December, £4 13s. 9d. per fine oz., after deducting realisation charges.

The above-mentioned profits are subject to taxation. In the case of all the subsidiaries a brief paragraph refers to the strike. The stereotyped statement is as follows:—In consequence of certain alterations in conditions of employment proposed to be introduced on Witwatersrand gold mines by the Transvaal Chamber of Mines (of which this company is a member) as from the 1st February, 1922, a general strike of all European day's pay employees was called by the South African Industrial Federation on the 10th January, and is still in progress. All work on the property has ceased, with the exception of certain essential services (such as pumping, etc.), which are being carried out as far as possible by the company's officials. The results for the current quarter will therefore be seriously affected.

In respect of the Modder East and Village Deep it is stated that pumping operations are not proceeding.

QUARTERLY REPORTS.

The following are extracts from mining companies' directors' reports for the quarter ended 31st December, 1921:—

Consolidated Langlaagte Mines.

Crushed, 133,100 tons; total working revenue £195,416, or 29s. 4d. per ton crushed; total working costs £155,410, or 23s. 4d. per ton crushed; profit £40,006, or 6s. per ton crushed; sundry revenue, £1,392; total profit for quarter, £41,389. There was an increase of 2,800 tons in the quantity of ore crushed as compared with the preceding three months. The working costs were decreased by 4d. per ton, and the revenue was 3s. 10d. per ton lower, with the result that the working profit was £22,145 less than that for the previous quarter. The development footage sampled totalled 2,361 feet, and gave the following results:—Payable, 1,101 feet, having an average value of 31·73 dwts. over 12·12 inches of reef; unpayable, 1,260 feet, having an average value of 10·96 dwts. over 10·67 inches. The average number of natives at work underground during the quarter was 3,162, as compared with 2,914 for the previous quarter.

Government Gold Mining Areas.

Crushed, 421,500 tons; total working revenue £915,478, or 43s. 5d. per ton crushed; total working costs £449,445, or 21s. 4d. per ton crushed; profit £466,033, or 22s. 1d. per ton crushed; sundry revenue, £2,311; total profit for quarter £468,344. The quantity of ore crushed was 3,500 tons less than that for the previous quarter. The working costs were 2d. per ton higher, and the revenue 1s. per ton lower, with the result that the working profit was £27,354 less than for the preceding three months. The development footage sampled totalled 3,900 feet, and gave the following results:—Payable, 2,640 feet, having an average value of 11·4 dwts. over 64 inches of reef; unpayable, 1,260 feet, having an average value of 3·2 dwts. over 45 inches. The average number of natives at work underground during the quarter was 6,913 as compared with 6,597 for the previous quarter.

Langlaagte Estate.

Crushed, 133,600 tons; total working revenue £202,881, or 30s. 4d. per ton crushed; total working costs £164,774, or 24s. 8d. per ton crushed; profit £38,107, or 5s. 8d. per ton crushed; sundry revenue, £1,404; total profit for quarter, £39,511. The quantity of ore crushed during the quarter was 10,400 tons more than that for the preceding three months. The revenue showed a decrease of 3s. 8d. per ton, and the working costs were 1s. 3d. per ton lower, and the working profit was £11,694 less than that for the previous quarter. The development footage sampled totalled 2,186 feet, and gave the following results:—Payable, 1,256 feet, having an average value of 24·6 dwts. over 21 inches of reef; unpayable, 930 feet, having an average value of 6·1 dwts. over 20 inches. The average number of natives at work underground during the quarter was 3,092, as compared with 2,749 for the previous quarter.

New Primrose.

Crushed, 65,700 tons; total working revenue £72,406, or 22s. per ton crushed; total working costs £62,474, or 19s. per ton crushed; profit £9,932, or 3s. per ton crushed; sundry revenue, £864; total profit for quarter, £10,796. There was an increase of 200 tons in the quantity of ore crushed as compared with the preceding three months. The working costs were 6d. per ton lower, the revenue 2s. 5d. per ton lower, and the working profit at £9,932 was £6,192 less than that for the previous quarter. The average number of natives employed underground during the quarter was 1,431, as compared with 1,283 for the previous quarter.

New Unified Main Reef.

Crushed, 34,800 tons; total working revenue £38,781, or 22s. 3d. per ton crushed; total working costs £33,606, or 19s. 4d. per ton crushed; profit £5,175, or 2s. 11d. per ton crushed; sundry revenue £315; total profit for quarter, £5,490. There was an increase of 900 tons in the quantity of ore crushed as compared with the preceding three months. Working costs were 8d. per ton lower, but as the revenue showed a decrease of 2s. 2d. per ton, the working profit was £2,283 less than that for the previous quarter. The average number of natives at work underground was 667, as compared with 611 for the previous quarter.

Randfontein Central.

Crushed, 358,000 tons; total working revenue £521,496, or 29s. 2d. per ton crushed; total working costs £494,444, or 27s. 3d. per ton crushed; profit, £27,052, or 1s. 6d. per ton crushed; sundry revenue £3,778; total profit for quarter, £30,830. The expenditure on capital account amounted to £108,865, and debenture interest to £32,560. The ore crushed during the quarter was 34,500 tons less than for the preceding three months. The revenue was 3s. 1d. per ton lower, and working costs 1s. 2d. per ton higher, with the result that the working profit was reduced by £85,647, as compared with the previous quarter. The development footage sampled totalled 6,395 feet, and gave the following results:—Payable, 3,905 feet, having an average value of 23·5 dwts. over 17 inches of reef; unpayable, 2,490 feet, having an average value of 11·4 dwts. over 13 inches. The average number of natives employed underground during the quarter was 10,084, as compared with 10,494 for the previous quarter.

Van Ryn Deep.

Crushed, 162,800 tons; total working revenue £434,944, or 53s. 5d. per ton crushed; total working costs £204,548, or 25s. 1d. per ton crushed; profit £230,396, or 28s. 4d. per ton crushed; sundry revenue, £4,322; total profit for quarter £234,718. There was an increase of 11,800 tons in the ore crushed as compared with the previous quarter. The working costs were 2s. 4d. per ton lower, the revenue was 7s. 4d. per ton lower, and the working profit was £21,319 less compared with the preceding three months. The development footage sampled totalled 1,950 feet, and gave the following results:—Payable, 1,045 feet, having an average value of 31·1 dwts. over 25 inches of reef; unpayable, 905 feet, having an average value of 5·3 dwts. over 36 inches. The average number of natives at work underground during the quarter was 3,365, as compared with 3,132 for the previous quarter.

Witwatersrand Gold Mining.

Crushed, 128,400 tons; total working revenue £160,690, or 25s. per ton crushed; total working costs £139,212, or 21s. 8d. per ton crushed; profit £21,478, or 3s. 4d. per ton crushed; sundry revenue, £4,078; total profit for quarter, £25,556. There was an increase of 9,400 tons in the quantity of ore crushed as compared with the previous quarter. The revenue was 3s. 4d. per ton lower, the working costs 1s. per ton lower, and the working profit at £21,478 was £12,177 less than that for the preceding three months. The development footage sampled totalled 960 feet, and gave the following results:—Payable, 670 feet, having an average value of 13·6 dwts. over 32 inches of reef; unpayable, 290 feet, having an average value of 7·5 dwts. over 16 inches. The average number of natives at work underground during the quarter was 2,507, as compared with 2,242 for the previous quarter.

New State Areas.

Capital Expenditure.—The expenditure on capital account for the quarter amounted to £112,054, of which £72,586 was spent on development and the balance on ventilation, underground electric traction, air mains, and surface works. Development.—A total of 6,557 feet of development was accomplished, 3,918 feet being on reef. South Shaft.—1,820 feet were sampled, of which 1,460 feet

were payable, having an average value of 30.1 dwts. over 20 inches. 360 feet were unpayable, having an average value of 9.1 dwts. over 8 inches. North Shaft.—2,100 feet were sampled, of which 720 feet were payable, having an average value of 8.1 dwts. over 38 inches. 1,380 feet were unpayable, having an average value of 5.3 dwts. over 18 inches. 924 feet were driven in the connecting drive.

General Remarks.

The declared profits have been arrived at by adding together the published monthly figures. The value of the gold was taken as follows:—October, £5 3s. per fine ounce; November, £5 2s.; and December, £4 15s. 6d. These figures average 11s. 2d. per fine ounce less than those for the previous quarter.

No allowance has been made in the profit declarations as above for taxation.

Technical Books Received.

“The Analysis of Coal and its By-Products,” by S. Roy Illingworth, M.Sc (Lond.), A.R.C.Sc., F.I.C., assisted by Jenkyn Griffiths, F.C.S., Chemical Engineer, Assistant Editor of the “Colliery Guardian,” formerly of the South Wales School of Mines, and Coke and By-Products Section of the Welsh Navigation Steam Coal Co., Ltd.; with a foreword by Sir Robert Robertson, K.B.E., F.R.S., the Government Chemist.

This is a valuable text book on coal analysis and the determination of its many and complex by-products. The author prefaces the volume by stating:—“The efficient utilisation of our coal resources is a problem that becomes more pressing every day. Progress in the matter is largely in the hands of the chemist and chemical engineer, supported by a wider outlook on the part of the coal producer and the coal consumer. Our educational institutes are endeavouring to produce men specially trained in the technology of coal and fuel. The author, in the course of his professional activity in these matters, has come to the conclusion that there exists the need for a book which deals with the analytical work required in the training of fuel and colliery chemists. Empiricism has characterised certain phases of the commercial analysis of coal and its products, with the result that the agreement of analytical data between buyer and seller has been a contentious matter, and the sale of coal on specification has made no headway. Too many people prefer to rely on the name of a coal, without being in a position to define the particular product or to check delivery thereof. The author has therefore endeavoured to pass under review and criticise alternative methods of analysis, in the hope that the book will not only be of value in the training of students, but that it will help towards the standardisation of commercial practice.

“The author would welcome criticism. In this country we can no longer look upon coal as a product won from Nature solely by the sweat of the brow, and then handed over, to be burnt, to a man strong in the arms and back. Coal is a natural commodity that can be refined or manufactured into fuel; performance per unit of cost is the criterion of value. In the winning, the refining, the selection, and the evaluation of coal and its uses, sound analytical methods are essential. The author has endeavoured to collect together such methods in this book, and he will feel amply rewarded if these furnish a nucleus around which there is subsequently crystallised a more scientific control of the winning, sale, and use of coal and its products.”

In a foreword, Sir Robert Robertson, K.B.E., F.R.S., the Government Chemist, writes:—“Coal, our indigenous source of energy, and the one on which we must depend for many years for maintaining our position as an industrial nation, has in the past been wastefully used, with little or no regard either to the iniquity of squandering our national resources, which, after all, are limited, or to the loss due to neglecting to recover the valuable by-products that form a

basis for numerous important industries. A gradually awakening consciousness of the need for the better utilisation of the national wealth stored in our coal measures has led to this problem being attacked in the only way that is likely to conserve and make the fullest use of our supplies, namely, by the application of scientific methods of treatment. Little more than a beginning has been made, and a great deal remains to be done to combat the present wasteful methods of using coal, and to win from it substances of commercial value. Progress in this direction can come only from the application of scientific method, and there are few subjects to which the application of science will materially benefit the nation more than the technology of coal and its products. In the direction of the many industries which had to be started in this country during the war, while production on the largest scale was of the first importance, the necessity for economy, in process, in personnel, and in usage of material, became increasingly urgent, and such records as those of the Department of Explosives supply, now being edited by Mr. MacNab, show how this need was appreciated. The hope may be expressed that the large number of young scientific men who were brought for the first time in touch with such manufactures, have had brought home to them the vital importance of ordered method in the conduct of industrial processes, and that they may carry into peaceful industry the lessons learnt during the past few years. The need for chemical control in the manufacture of chemical products is a subject which had occupied the mind of the author of this book before the war, when in his publication he pressed for more research, more technical education, and more application of scientific method to national industries. His present activities are intimately associated with the application of scientific method to the control of the important industries of winning coal, and of using it as a fuel alone, or as a source of products vital for innumerable manufactures. His practical knowledge of these industries should therefore render valuable his collection and criticism of the analytical methods that are employed in the technical treatment of coal.”

The volume is published by the Colliery Guardian Co., Ltd., 30 & 31, Furnival Street, Holborn, London, E.C.4, at the price of 21s. net.

TRANSVAAL G.M. ESTATES.

The following are the particulars of the output for the month of January, 1922:—Central Mines: Tons crushed, 12,600; yielding, fine oz., 3,853. Elandsdrift Mine: Tons crushed, 1,700; yielding, fine oz., 993. Vaalhoek Mine: Tons crushed, 1,930; yielding, fine oz., 623. Estimated value of month's output, £25,053; estimated loss for month, £437. Note: The gold output for the month is valued at £4 13s. 6d. per fine ounce net, after allowing for exchange and realisation charges. Grade for month at Central Mines and Vaalhoek Mine was slightly better. Loss due to abnormal expenditure and increased prospecting expenditure consequent on improved native labour position.

RHODESIAN SECTION.

Rhodesian Mine Wage Reductions.

OFFICIAL FIGURES—CUT OF FROM 12 TO 6 PER CENT.—OVERTIME AT TIME AND QUARTER.

We have received for publication, from Mr. J. D. Morton, Secretary of the Rhodesia Mine Owners' Association, the following copy of a letter addressed to the Secretary of the Rhodesian Section of the South African Mine Workers' Union with regard to the proposed reductions in wages and overtime rates on mines in Rhodesia in view of the decreased cost of living and the necessity for a reduction of mine working costs, together with a copy of a notice which is being posted on the various mines, setting forth very full particulars in regard to the reductions in question: The Secretary, Rhodesian Section, South African Mine Workers' Union, Bulawayo.

Dear Sir,—With reference to my letter of the 29th ultimo I now send you herein copy of a Notice to be posted on the various mines connected with my Association setting forth full particulars of the reductions in wages and

As already advised you, it is intended that the reductions should take effect as from the 1st April, 1922.—
Yours faithfully,

J. D. MORTON,
Secretary, Rhodesian Mine Owners' Association.
Bulawayo, January 16.

The accompanying notice reads:—
RHODESIAN MINE OWNERS' ASSOCIATION

NOTICE TO MINE EMPLOYEES.

Particulars as to the Reduction of Wages and Overtime Rates already notified.

On and from 1st April, 1922, wages amounting to 30s. per day will be reduced by 12 per cent., and for lower or higher rates a percentage will be deducted which is in the same ratio to the wages as 12 per cent. is to 30s.

To facilitate calculation of the percentage in each case the formula will be $12 \div 30$ equal to the factor 0.4 which is to be multiplied by the rate of wages.

Examples calculated to the nearest 3d. upwards are as follows:—

Present rate.	Deduction.	New rate.
s. d.		s. d.
32 0	12.8 per cent.	28 0
31 0	12.4 ..	27 3
30 0	12.0 ..	26 6
29 0	11.6 ..	25 9
28 0	11.2 ..	25 0
27 0	10.8 ..	24 3
26 6	10.6 ..	23 9
25 0	10.0 ..	22 6
24 0	9.6 ..	21 9
23 0	9.2 ..	21 0
22 6	9.0 ..	20 6
22 0	8.8 ..	20 3
21 0	8.4 ..	19 3
20 0	8.0 ..	18 6
19 0	7.6 ..	17 6
18 6	7.4 ..	17 5
18 0	7.2 ..	16 9
17 6	7.0 ..	16 6
17 0	6.8 ..	16 0
16 0	6.4 ..	15 0
15 0	6.0 ..	14 3

Any further revisions of wages in future will take place at one month's notice in accordance with any alteration in the cost of living.

On and from 1st April, 1922, all overtime shall be time and a quarter, except in the case of shiftsmen maintaining continuity of shift, which shall remain straight time as at present.

Some of the Leaders of the Rhodesian Mining Industry and Members of the Government in Conference.

overtime rates as decided upon in view of the decreased cost of living and the necessity for a reduction in the working costs on the mines in Rhodesia.

The following reasons are given for this proposed re-adjustment of overtime rates, viz.:—

It has been frequently stated both by employers and employees that neither desire overtime if it can possibly be obviated. In ordinary industrial concerns carrying on work on day shift only, maintenance and repairs can be done by special men at night, but the case is different in mining, in which work has to be carried on continuously by successive shifts, and maintenance and repairs have to be carried out at once and executed promptly, as otherwise many employees would be thrown out of work. All mine workers know that in mining a certain percentage of overtime is therefore essential, and that it could not be done away with. It is, therefore, unfair to impose a special penal overtime rate on the industry.

It may be mentioned that at the International Labour Conference held in Washington in November, 1919, and at which over 40 countries were represented, it was agreed that the rate for overtime should be time and a quarter.

Rhodesia's Mineral Output.

OVER 60 MILLIONS STERLING.

Totals for 1921.

The summary of mineral production in Southern Rhodesia during December, 1921, is as follows:—

	Value.
Gold, 55,967.64 fine ounces	*£267,005
Silver, 13,369.77 fine ounces	1,433
Coal (raised), 50,457 tons (sales)	14,971
Do. (used for coke)	5,960
Copper (Blister), 270.28 tons	16,217
Chrome Ore, nil	nil
Asbestos, 754.69 tons	15,049
Arsenic, 41.84 tons	993
Tin, 1.12 tons	53
Mica, 1 ton 1,968 lb.	496
Diamonds, 5.5 carats	17
Total	£322,194

*Includes £30,952 gold premiums.

Comparative figures, 1920 and 1921, are:—Gold, 1920, 552,498.12 fine oz.; 1921, 585,524.99 fine oz. Silver, 1920, 158,981.96 fine oz.; 1921, 152,988.80 fine oz. Copper, 1920, 3,108.17 tons; 1921, 3,079.94 tons. Chrome Ore, 1920, 60,268.96 tons; 1921, 50,187.76 tons. Coal, 1920, 578,492 tons; 1921, 574,753 tons. Asbestos, 1920, 18,822.63 tons; 1921, 19,528.71 tons.

The following official table gives the grand total of the mineral output of Southern Rhodesia to date:—

Gold, 12,300,414 ounces	£51,501,615
Silver, 3,123,817 ounces	410,668
Lead, 7,072.17 tons	94,788
Copper, 24,769.43 tons	2,094,661
Chrome Ore, 727,296.77 tons	2,301,521
Tungsten Ores, 233.90 tons	26,946
Coal (raised), 5,563,998 tons (sales) ...	2,094,016
Antimony Ore, 79.11 tons	1,550
Asbestos, 76,349.27 tons	2,187,163
Arsenic, 173.24 tons	46,093
Ironstone, 29,604.42 tons	4,198
Tin, 16.92 tons	2,784
Barytes, 53.66 tons	88
Mica, 188 tons 321 lb.	47,243
Diamonds, 13,652.625 carats	63,295
Other Precious Stones, 72,977 carats ...	8,065

Grand Total of Mineral Production to date £60,884,604

Northern Rhodesia.

Total output and value from commencement to December 31st, 1921:—

Gold, 12,336.39 ounces	£53,546 15 0
Silver, 53,592.28 ounces	7,490 12 6
Lead, 67,316.43 tons	1,527,815 2 0
Copper Concentrates, 5,232.06 tons	220,959 2 8
Copper Finished, 7,154.26 tons	378,510 5 5
Bismuth, 6.24 tons	3,491 9 5
Zinc Ore, 13,175.85 tons	85,198 5 3
Mica, 1.18 tons	412 0 0
Vanadium Ore, 61.76 tons	2,401 1 3
	£2,279,824 13 6

Rhodesia and the Gold Premium.

Cabled advice has been received by the Rhodesia Chamber of Mines from the London office of the B.S.A. Company, dated 18th January, that Messrs. Rothschild and Sons distributed on that date the sum of 18s. 4d. per fine ounce profit on gold realised during the period ended 7th January (December quarter). The following are the premiums distributed to date:—July 25th to December 31st, 1919, 17s. per fine oz.; January 1st to March 31st, 1920, £1 9s. 8½d. per fine oz.; April 1st to June 30th, 1920, £1 0s. 9d. per fine oz.; July 1st to September 30th, 1920, £1 7s. 1d. per fine oz.; October 1st to December 31st, 1920, £1 13s. 5¼d. per fine oz.; January 1st to March 31st, 1921, £1 2s. 5d. per fine oz.; April 1st to June 30th, 1921, £1 0s. 11d. per fine oz.; July 1st to September 30th, 1921, £1 7s. 3¼d. per fine oz.; October 1st to December 31st, 1921, 18s. 4d. per fine oz.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material and Engineering Trades.

COMMUNITY'S DISGUST AT FEDERATION'S TACTICS—IRON AND STEEL—TIMBER AND BUILDING MATERIALS—UNION'S TIMBER RESOURCES—VIEWS ON PRESENT POSITION—BRITISH TRADE CONDITIONS—AMERICAN TARIFF BILL—REDUCED PARRAFIN AND PETROL PRICES—RAILWAY STRIKE IN BERLIN—EFFECTS OF RAND STRIKE ON COAST FACTORIES—TRADE WITH BELGIUM AND FRANCE—METAL MARKET.

General.

Whom the gods deride they sometimes make mad. Or when, as in this case, their intention has already been forestalled, metamorphose them into leaders (save the mark!) of a forlorn hope and clothe them with a little brief authority!

The week under review has been marked by events of a serious and, if the issues involved were not of such grave importance, of a childish, if not Gilbertian, character. Under the first category come the turning down by the Federation of the Chamber of Mines' very generous offer regarding redundant labour on the richer mines until such time as an impartial investigation could go thoroughly into the question, and the abortive result of the Conference between General Smuts and a delegation of the Federation on the general issues raised by the strike. It is perhaps unnecessary to make more than a passing reference to the ridiculous resolutions passed at the Town Hall meeting in respect of revolutionary measures and the reception the deputation met with at Pretoria at the hands of Mr. Tielman Roos and his fellow Nationalists when those resolutions were formally announced. Such a severe slap in the face is bound to make the misguided miners ponder deeply on the present state of affairs, and combined with the turn of the month, when financial obligations come more prominently to the fore, eventually cause him to come to the conclusion that "Codlin is his friend, not Short." While the commercial community on the whole does not see how the Chamber of Mines can farther go in the matter of concessions, in view of the present parlous state of the industry, a not unimportant minority are inclined to cry: "A plague on both your Houses" and to invoke the aid of Government and Parliament to stop the disastrous struggle, which has now dragged on for more than a month, to the incalculable loss of the mining industry and the commercial community of the Rand in particular, and to the whole of the Union in general.

A prominent commercial man said there was no alternative but for the workers to go back to their work, and he failed to understand the non-acceptance by the Federation of the Chamber's handsome offer to find employment for practically 50 per cent. of redundant labour on the richer mines—an offer which, under the circumstances, no other industry in the world would have made. It was essentially necessary that the men should resume work as speedily as possible, as their so-called leaders had done nothing and were not likely to do anything for them even if the strike should last as many months as it has weeks. The present ebullition of the Federation leaders he looked upon as so much camouflage and as a safety valve for the escape of hot air. The talk, he said, about 95 per cent. of the people of the Union being in favour of a Republic was absurd; it was altogether the other way about. Where was there a freer Government in the world than ours? People now earnestly wish for a settlement, because the effect on commerce is a very serious one indeed; some of the large houses are suffering from the present inaction very considerably. These, he said, to use an expressive phrase, could "live on their own fat" for some time, but there were of course limits to even this form of nutriment, but to many of the

smaller concerns the present cessation of business would probably spell ruin, and that in a very short time, unless the mines speedily resumed operations. It would, in any case, take the industry a long time to get back to normal again—more months than many people at the moment probably realise. The price of gold is still steadily declining, but that was, he said, in the circumstances, a secondary matter; the first essential was that the industry should get on its feet again. Asked as to how long, in his opinion, the present impasse might last, he thought that the coming week was fraught with big possibilities.

Another light in the commercial life of the Rand, who has opportunities beyond most of sounding the rank and file of the workers regarding labour conditions, said he had been impressed by the views expressed by a Cornish miner of many years' standing. This practical man, with over 30 years' experience on the Rand mines, said the root of the trouble was the incidence of the 75 per cent. to 80 per cent. of Afrianders who had replaced the experienced British and Australian miners in the mines. Those men, he said, were

not worth their salt, had no idea about the work, could not cut ground, and were absolutely useless there, and would not improve in a further five generations. They were all very well at sitting on the stoep "so long," drinking coffee and talking, but were of no practical account underground. This was the whole crux of the matter, he asserted. There were too many of these passengers down below, and the mines must get rid of them. They came in at 5s. to 7s. 6d. a day, but the Unions soon forced their wages up to skilled miners' scale. These men, he said, go down the mines day after day and have to ask instructions as to their work. It takes, in his opinion, five of these so-called miners to do what one of the old miners did. It was, he concluded, the Chamber of Mines' own fault; they begrudged the old experienced miners their wages and replaced them by these incompetent.

The retrenchment of staffs in commercial houses foreshadowed a fortnight ago has now in several instances been effected, and the pruning knife, it is generally expected, is likely to be more largely used should the strike be much longer protracted.

Iron and Steel.

Latest nominal quotations.—Dunswart iron, 22s. per 100 lb. basis price; Union Steel Corporation, Ltd., 22s.; imported iron and steel, flats, small, 33s. to 40s.; larger sizes, 30s. to 38s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 37s.; $\frac{3}{8}$ in. iron, 30s. to 32s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ iron, 31s.; steel, 37s.; $\frac{3}{4}$ in. round iron, 30s.; steel, 33s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 30s.; channel and joists, 35s. 6d.; shafting, $\frac{3}{4}$ in. to 2 in., 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{2}$ in., 22s. to 23s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 45s. to 50s. per 100 lb.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 43s. to 48s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lb.; rivets, $\frac{1}{4}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lb.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d. per lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb., $\frac{3}{8}$ in., 2s. 11d. per lb.; 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ to 1 $\frac{1}{8}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{1}{4}$ d.; 1 $\frac{1}{4}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 30s. to 35s.; shovels, 52s. 6d. to 57s. 6d.; wheelbarrows, 47s. 6d.; picks, 37s. 6d. to 67s. 6d.; pick handles, 21s.; hammer handles, 14 in.,

7s. 6d.; 18 in., 9s. 6d.; 24 in., 13s. 6d.; 30 in., 18s. 6d.; 36 in., 35s.; barbed wire, "Shorthorn," 69 lb., 13 $\frac{1}{2}$ gauge, 22s. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bulb tee fencing standards, 14 lb. 27s. per dozen; 12 lb., 25s. per dozen; black baling wire, 14 gauge, 19s. per coil, 100 lb. Barbed wire is fairly firm; 12-gauge barbed wire, 25s. retail. Screening, 3s. to 9s. 6d. per sq. yd.; cyanide, 1s. 7 $\frac{1}{2}$ d.; zinc shavings, 1s. per lb.; asbestos, white, $\frac{3}{4}$ in. to $\frac{1}{2}$ in., £35 per ton; $\frac{1}{2}$ in. to $\frac{3}{4}$ in., £50 per ton; $\frac{3}{4}$ in. to 1 $\frac{1}{4}$ in., £80 per ton; 1 $\frac{1}{4}$ in. to 2 in., £175 per ton; Blue, No. 3, £25 per ton; No. 2, £34 per ton; No. 1, £45 per ton; short, £20 per ton. Tin plates (L. C. Cokes), 20 in. x 14 in., per box f.o.b. Swansea, 19s. 3d. Galvanised sheets, 15 $\frac{3}{4}$ d. to 16d.

Second-hand Machinery.

As was to be expected, the advent of the strike has made a tremendous difference as regards sales of second-hand machinery. Several very big deals have been hung up on that account, one dealer in particular reckons he has lost at least £500 in commission alone through several orders which were practically closed having been cancelled on account of the strike. There is not much serviceable spares for batteries and other parts required by the mines to be had just now, as those mines which have closed down are practically exhausted of stocks which they had. It must be admitted that the mines have been most sparing of their orders of late, purchasing second-hand spares whenever required. This is, of course, a big contrast to what it used to be, when goods were ordered practically for months in advance; to-day the mines are purchasing from hand to mouth. Prices remain practically the same as they were a week or so ago. Steel plates are the same, anything from £12 to £16 second-hand. Boilers are scarce of the smaller loco sizes. Of the larger sized boilers there are still a number to be had. Many of them were scrapped when steel plates were selling at £50 per ton second-hand, so that there is a scarcity of this kind of power in the country. A prominent dealer said he thought at least 100 boilers were scrapped for steel plate alone when this was so scarce here during the War, hence the present shortage. Undoubtedly many a good boiler has thus been cut up, and until freights are lower and labour cheaper at Home, there will be very few new boilers coming into the country.

German Machinery for the Congo.

The Minister of the Colonies, says a message from Brussels, is now considering the question of inviting Germany to supply machinery for the Belgian Congo. He declares that for every hundred francs' worth of such goods at least a hundred and fifty should be reckoned for transport charges and the installation of machinery. Belgium will not permit the introduction of German workmen into the Colony.

Union Grain Elevators.

The approximate amount of the contract secured by Messrs. Spencer & Co., Ltd., the well-known Melksham engineers, for the whole of the plant of the terminal elevator at Durban, and also for the smaller collecting elevators, is £500,000. It is estimated that it will take 18 months to complete the order, which was obtained in face of American and Continental competition.

Timber and Building Materials.

There is very little indeed being done at present in the building trade; old jobs are in most cases being completed, but no new enterprises are being started, people waiting to see what is going to happen.

Prices.—3 x 9 deals, 1s. to 1s. 1 $\frac{1}{2}$ d.; scantlings, 11d.; beaver boards, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; floorings, 6 $\frac{1}{2}$ d. to 6 $\frac{3}{4}$ d.; ceilings, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; Oregon, 7s.; pitch pine, 8s.; corrugated iron, 8 $\frac{3}{4}$ d. to 9 $\frac{3}{4}$ d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second

at the coast; American oak, 1 in., 10d.; 1½ in., 11d.; 2 in., 11½d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1½ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelling, 1s. per foot. Prices for bricks are: Mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Second-hand Iron and Timber.

Business in the second-hand iron and timber yards is practically at a standstill pending settlement of the strike. Timber is 8d. to 9d., iron 6d. to 7d.

There is considerable building activity in Durban owing to the lower costs due to wage reductions and reduced prices of materials. The strike on the Rand is, however, holding up several important schemes.

Union's Timber Resources.

Mr. K. A. Carlson, the Transvaal Conservator of Forests, has written a very thoughtful and interesting article in the South African *Journal of Industries* about this country's timber resources. Civilisation, he says, is built up and maintained on wood, and though iron and steel are necessarily in the foreground wood remains the first essential, being cheaper, lighter to handle, more elastic and easily worked. Mr. Carlson emphasises that the world's sources of timber are drying up, and advocates the afforestation of South Africa on a really vast scale. America has lost five-sixths of her original forest area and must import 60 per cent. and more till the situation is relieved by the planting of some 260 million acres. Canada and Russia have a large percentage of forests incapable of producing timber, and in Sweden the present position is regarded as very grave, and steps are being taken to plant nearly 2 millions of commercial timber. Mr. Carlson, taking two acres per unit of consumption as the standard figure for the Union, and assuming that the population will have doubled itself in the next fifty years, says we should then require no less than 14 million acres of forest to sustain the needs of fully developed industries. As the present effective area of industrial timber does not much exceed 100,000 acres, the Union is faced with the titanic task of planting an average of nearly 200,000 acres every year for the next 50 years. While America is estimated to have 0.92 acre per capita, the Union is only possessed of 0.43 per unit. He says that most of the accessible private forests in the Union are being rapidly cut out and destroyed without replacement. Much of the work in Government plantations has been experimental, and 75 per cent. of the private plantations are under wattle, chiefly for the production of bark. The Forestry Department had done its best, but altogether insufficient provision had been made as regards afforestation in the Union. If the public only realised, he states, what an intimate bearing timber production has on our industrial advance, and what a valuable asset a great forestry scheme would ultimately prove, sufficient pressure would be brought to bear to carry out such an absolutely necessary scheme. Mr. Carlson concludes by saying that those countries which do not possess sufficient forests of their own will be compelled to retire from whatever position they may have attained in their competition for the world's trade.

Prominent Merchant's Views on Present Position.

In the course of a chat with an important merchant, he said that his personal opinion regarding the present position was that somewhere about the end of this month some of the mines would attempt to start up again—probably confined to the richer mines, such as the Government Areas, New Modderfontein, etc.—provided no definite settlement had been arrived at with regard to the strike. He thought the ultimate result of this trouble was going to be the complete

collapse of the Federation, and of course things were bound to be very bad. The starting up of the mines was going to be a very gradual process, and was going to reflect back on the whole of Johannesburg to a very serious extent for at least six to nine months. The spending power of the town, he said, is going to be permanently curtailed on account of the old low-grade mines never starting up again. So far, he said, only three mines had been officially notified as shut down, but certainly four or five more would eventually be added to the list, and of course when it comes to spending power the low-grade mines are just as good to the community as the richer propositions; the E.R.P.M.'s spending power would be much greater than that of the New Modder and it would be of more benefit to the community to keep such properties alive than the richer mines. He thought the result of this strike must mean the financial ruin of a large number of the smaller commercial firms; they will never, he thought, be able to get through this crisis, which is undoubtedly the worst ever experienced by Johannesburg. Of course, the effect of it will not be apparent to-day, but will be apparent, say, in anything from two to three months' time—that is when the real effect is going to be felt. Take the position of a short time ago, say in November and December last. The stocks of many of these people were getting fairly low, they re-ordered, and all this material will be arriving within the next month or six weeks. Having done no business for the past five weeks they will be unable to meet their bills, which is going to precipitate matters.

British Trade Conditions.

The reports from various manufacturing centres since the New Year opened have been rather more cheerful. The improvement so far is not very pronounced, but the receipt of a larger number of inquiries from export markets leads to the hope that many of these inquiries may lead to actual business. It now seems evident, however, that there is no likelihood of sufficient demand to justify the retention of the greater part of the extra plant installed to meet war requirements, and as this idle machinery involves its owners in overhead charges without producing any return, some extensive scrapping seems necessary in order to restore something like equilibrium between factory capacity and normal demand. Manufacturers have lost the fatuous optimism of the possibility of doing a much larger volume of trade after the War than before, and are at last alive to the fact that hard work and small profits are to be the order of the day for some time to come. The position in the iron and steel trade is still far from satisfactory. Here and there the outlook is perhaps a trifle brighter, but there are still a great many furnaces that have never been restarted since the coal strike of last spring. The recent reductions in railway rates were insufficient to stimulate trade, and the price of coke is still regarded as too high. Sheffield and other armament making districts are, of course, suffering severely from the present disarmament programme, and the lack of activity in engineering works all over the world is reflected in the paucity of orders. South African coal exporters will have to fight hard to retain any of their markets in the face of the keen competition from Wales. The report of the General Manager of the Sudan Government Railways for 1920 does not encourage the hope that South African coal will continue to find a market in that quarter. It is stated that although the large quantities of Natal coal imported for the railways enabled services to be satisfactorily maintained, the coal needed careful handling, and the General Manager recommends that in future Welsh coal should be purchased in preference, provided that it is available at a competitive price. Germany is sending orders to Britain for pig iron, indicating that the abnormal trade depression in the United Kingdom is ending. It is hoped that the holding of the British Industries Fair in London and Birmingham, from 27th February to March 10th, will mark a turn in the tide in regard to the trade of the country.

American Tariff Bill.

Great interest is being taken in the United States in the American Tariff Bill, says Mr. Stevenson, the American Consul here. He has received a cable that it may be several

months before the new tariff will be passed. It is quite probable, he said, that there will be great changes introduced into the Bill in respect of the American valuation system, but just what that form will be it is, of course, impossible as yet to tell. There is a tendency to make this tariff more flexible; the two fundamental things will be the world's comparative conditions and the value of the German mark in other countries—thus the tariff will be more on the bargaining basis. There is a very fair import trade between the Union and America, and this should be of interest to South Africa.

Paraffin and Petrol Prices: Further Reductions.

A notice in the *Gazette* fixes the maximum price of paraffin to the retailer at the coast ports at 15s. 3d. a case of large tins and 19s. 9d. small tins. At other places prices as above plus charges. Prices to the consumer: At the ports and less than 400 miles away 17s. 6d. per case and 22s. At places 400 miles from the nearest port and farther, 17s. 9d. per case or 8s. 11d. per tin or 22s. 3d. per case or 2s. 3d. per tin, plus charges. Bottle prices at the ports, 5d., elsewhere 6d.

The notice fixes the wholesale price of petrol (all brands) at the ports at 26s. per case; Shell brand, 29s. 9d.; Pegasus and Zenith at 29s. 6d. At other places prices as above plus charges. Retail prices: At the ports, 26s. per case (all brands) plus 15 per cent. on smaller quantities in bulk at the rate of 4s. per imperial gallon. Shell brand 4s. 7d. per tin; Pegasus and Zenith 3s. 7d. per tin. At other places 26s. per case plus 15 per cent., plus charges, or 4s. 8d. per imperial gallon. Shell brand 5s. 1d. per tin; Pegasus and Zenith 4s.

Strike of Railwaymen in Berlin.

The railwaymen at Frankfurt-on-Main have in consequence of a dispute over wages, ceased work, and the movement is extending to other places. Krupp's works at Magdeburg are closed owing to lack of coal. Gas and electric workers, builders and telegraphists in Berlin have also struck work, paralysing the activities of the capital. Berlin's essential services are held up and many factories have been obliged to reduce working hours, some indeed having closed down. Breslau and Frankfurt are isolated. In the south and south-west the situation is brighter. The Munich engine drivers refused to come out, while the Bavarian railways are almost normal as well as those in Wurtemberg and Baden. There appears to be no disposition to violence. The transport of foodstuffs and other necessities is being done by the use of the canals, while a staff of officials has been organised to drive and stoke the engines. The position appears to be becoming more serious, as the men in the railway repairing shops have joined their comrades. About a quarter of a million employees, it is estimated, are now out. In the meantime passenger and goods traffic in North Germany is at a standstill.

Effects of Rand Strike on Coast Factories.

All coast factories, says the *Cape Argus*, have been adversely affected by our labour dispute. Orders that were on hand have been cancelled, and no fresh orders are coming in. Hitherto the factories have been kept going on a normal scale, hoping for an early settlement, but stocks have accumulated to such an extent that operations must be curtailed. Short time has been inaugurated, and the retrenchment of operatives is imminent.

Trade Arrangement Between Union and Belgium & France.

A London cable says important arrangements have just been concluded by which a company has been formed at Antwerp, backed by a number of Belgian and French companies who control capital aggregating some £30,000,000 sterling, for the purpose of stimulating trade between South Africa and Belgium and Northern France. The new organisation comprises a number of leading Belgian and French manufacturers of iron and steel goods of all descriptions, railway rolling stock, mining requisites, etc. It is anticipated

that a wide outlet will be provided in the Allied countries for South African products—wool, hides, skins, mohair and wattle bark.

Reduced Wages on Scottish Railways.

The National Union of Railwaymen has accepted the award of the National Wages Board on the claim of the Scottish railway companies for a reduction of wages and the extension of working hours.

Electrical Goods.

Dealers report but very little business doing, and that things are going from bad to worse; with the exception of a few orders from the country of insignificant proportions, and the filling in of the usual replacement fittings and repairs, trading is practically stagnant.

Clyde Yards Busy.

The output of the Clyde shipyards for last month constituted a record, eight steamers, aggregating 52,000 tons, being launched. Nearly all of these steamers will use oil fuel.

Hydro-Electrical Material for New Zealand.

Mr. Massey, speaking in the House of Representatives, confirmed the report that the contract to supply hydro-electrical material had been given to a British firm, notwithstanding a tender lower by £13,000 had been received from an American company. Mr. Massey said, however, that this amount would have been reduced by the preference tariff to £7,000, and that the Cabinet had decided to take British machinery manufactured by British workmen.

Commonwealth's Telegraphic and Telephonic Services.

The Australian Commonwealth Government has decided to cease the manufacture of ammunition and expend the money thereby saved on the development of backward telephone service and the employment of returned soldiers. The Government contemplates asking Parliament to authorise a loan of £8,000,000 for speeding up telegraph and telephone construction work.

Commonwealth Line of Steamers.

Mr. Hughes, a Melbourne cable states, announced that, allowing for writing down of the whole capital cost of the line, the net gains for the past five years was £1,600,000. He said that with four additional steamers soon to be added the Commonwealth line would be able to give a regular and rapid service.

Dunlop Rubber Company.

The annual report of this company for the year ended August 31, 1921, disclosed the huge loss of £8,320,000. The loss is chiefly due to the enormous shrinkage of the market price of stocks of raw material, principally cotton and rubber. The company's reserve account now stands at £2,750,000.

The Moonta Copper Mine (Australia) is about to resume operations, the men having accepted reduced wages.

Big Hungarian Coal Strike.

A Prague cable announces that a strike has broken out on the coalfields in Czecho-Slovakia, 145,000 miners having ceased work.

Wireless.

The Belgian Government has decided to construct at Elisabethville a wireless telegraph station of great power, with a view to direct communication between Belgium and the Congo.

THE GREAT STRIKE.

RESTARTING THE INDUSTRY—RESPONDING TO THE PRIME MINISTER'S APPEAL— ATTITUDE OF THE MINE OFFICIALS—EVENTS OF THE WEEK ON THE REEF AND AT WITBANK.

On Saturday afternoon a further attempt was made to effect a settlement by the Prime Minister, who issued the following statement:—

The strike on the Rand gold mines has now lasted for more than a month. The Government did everything in their power to prevent it, and subsequently spared no effort to bring about a settlement.

They brought the parties together in a conference; when the conference failed they negotiated separately with the parties with a view to bringing about a settlement. These negotiations also failed, and for some days now the strike has mechanically dragged on, to the serious loss and suffering of all concerned.

It is clear that the continuance of this unhappy state of affairs cannot be tolerated any longer.

Unless work is immediately resumed the loss to the workers through eventual unemployment would be many times greater than the sacrifices they were originally called upon to make in order that the low-grade mines might be saved.

General Smuts, Prime Minister of the Union, who has issued another appeal for the resumption of work.

Under such circumstances victory itself becomes meaningless, and the only course open is to end the strike without delay. It would be vain to waste further time in trying to obtain satisfactory terms of settlement.

The final settlement must be left to Parliament after impartial inquiry. And in the meantime work must be resumed so as to preserve means of employment and livelihood to as many as possible.

“ Call the Strike Off.”

I do not think better terms for the immediate resumption of work can be received than those which I advised the Federation to accept last week. That is to say, the Chamber's letter of January 29, plus the concessions in regard to the temporary maintenance of the *status quo* agreement on the high-grade mines.

I would ask the Chamber not to withdraw that concession if a general resumption of work can be secured on this basis.

I appeal to the Federation to call off the strike on that basis, and to the workers to go to work and leave the final settlement to Parliament.

The Government have promised, and will immediately appoint, an impartial board to review the issues that have been raised, and to frame a settlement for the consideration of the Government and Parliament.

The board will go into the questions of European employment, of the operation of the *status quo* agreement, of the fixing of some ratio of European to native labour, and of the finances and economical working of the mines.

They will inquire impartially into the sacrifices to be made, not only by the men, but also by the mine owners, in order to save a large part of the mining industry from extinction.

If, in order to save the low-grade mines, it is necessary to work them under a less expensive and more elastic system, it is only fair that the matter of overhead charges and office expenses should be reviewed *pari passu* with the sacrifices which are demanded of the workers. And impartial machinery should be established which will settle what

Mr. J. K. Addie, Manager of the Witbank Colliery, one of the leading coal propositions of the Transvaal.

are and what are not low-grade mines in order that none should have the power arbitrarily to move a mine from one class to the other.

Parliamentary Inquiry.

All these matters require careful inquiry for the guidance of Parliament, and the findings of the Board can be awaited in full confidence that Parliament will do its best to give a square deal to both parties.

In the meantime it is essential, in the interests of all, that work be immediately resumed. Even so, I fear large numbers of men will not be able to find immediate re-employment on the mines.

Many mines have flooded badly, all have had their native labour complement seriously reduced, and for some time the numbers of white workers to be re-employed will necessarily be restricted.

The Government have already given earnest consideration to the aftermath of unemployment which is certain to follow

on this strike, and schemes are being worked out for employing some thousands on afforestation, irrigation, and other public works.

In concluding this most earnest appeal to the men to return to work without any further delay, I wish to add that the Government will use all its powers to protect those who listen to this appeal, and the police have instructions, as from next Monday (February 13) to give protection to all miners who return to their former employment.

And I call upon the mine owners to re-start the mines in all cases where sufficient numbers of men offer to return to their work.

(Signed) J. C. SMUTS.

February 11.

Mr. Thompson's Views.

"This is something for us to get down to," said Mr. Joe Thompson, Acting President of the Federation, when interviewed at Witbank at 10 o'clock on Saturday night in reference to General Smuts' statement.

"It goes further than the one made at the conference," he proceeded. "But it has to be gone into very carefully; so I think we should call the governing bodies of the unions to go thoroughly into it."

Mr. Thompson then made the following announcement:—
"Regarding the Prime Minister's statement just received, and in view of the possibility of an attempt being made to start up the gold mines and other industries before it has been definitely decided to do so by the Federation, which is the authority on behalf of the whole of the workers implicated in the present dispute, I hereby, on behalf of the Augmented Executive of the unions concerned, definitely instruct all workers not to return to work until the Prime Minister's statement has been considered by the above body and a decision arrived at."

THE FEDERATION REJECTS PROPOSALS.

Immediately upon hearing of the announcements of the Prime Minister and of the Chamber of Mines in regard to the re-opening of the mines this morning, Mr. Joe Thompson, acting president of the S.A.I.F., who was at Witbank on Saturday, called a special meeting of the Joint Executives of all affected Unions at the Trades Hall on Sunday. The following official report, signed by Mr. J. Thompson, acting president, was issued to the Press on Sunday night:—

The letter of the Prime Minister was full discussed, and attention was specially directed to the two concluding paragraphs of his appeal, which read as follows:—

"In concluding this most earnest appeal to the men to return to work without any further delay, I wish to add that the Government will use all its powers to protect those who listen to this appeal, and the police have instructions, as from next Monday (February 13) to give protection to all miners who return to their former employment.

"And I call upon the mine owners to re-start the mines in all cases where sufficient numbers of men offer to return to their work."

It was decided as a recommendation to the Augmented E.C. of the Federation "That we accept General Smuts' challenge to the workers as contained in the last two paragraphs of his appeal, and that we recommend all men on strike to stand fast and carry on the strike to a successful issue, viz., the withdrawal of all ultimatums on which the ballot was taken."

The above decision was afterwards endorsed by the Augmented Executive, and is therefore issued as an instruction to all workers not to return to work until a settlement has been arrived at.

Typical Mine Boys in a Rand Compound during the Strike.

It was further decided to hold three demonstrations during the week.

Meeting at Town Hall.

The strikers' meeting at the Town Hall on Sunday afternoon was the most remarkable of the series since the strike began. Long before three o'clock the hall was packed to

A Witbank Resolution.

At a big meeting of Witbank strikers the terms on which the colliery employes are prepared to return to work were laid down.

It was declared that colliery workers could not consider a return until the personnel of the Board suggested by General Smuts was known and accepted by the workers.

Mounted Police Guarding one of the Mines.

the doors and every inch of standing room was occupied. Many inflammatory speeches were made.

MONDAY'S DEVELOPMENTS.

RE-STARTING THE INDUSTRY.

In response to General Smuts' appeal, all the gold mines on the Reef prepared to re-start on Monday, and preparations were made to have natives available for the resumption of operations.

Thirteen men were arrested at the Robinson Deep during Monday morning, 14 at the Village Deep, and 12 at the E.R.P.M., Boksburg. Bail was fixed at £40 each in the case of the Village Deep and Robinson Deep men. The Boksburg men were released on £10 bail.

At the E.R.P.M.

The largest number of men who returned to work on Monday was on the E.R.P.M. group, where about 100 signed on.

Carrying on Essential Services: Underground Pumping.

All mines had an adequate armed police guard for the protection of those men who desired to return to work, while the strikers had pickets on almost every property.

Picketing, whether peaceful or otherwise, being contrary to the Riotous Assemblies and Criminal Law Amendment Act, the police made numerous arrests in the central area and at Boksburg.

Other mines, both in the central area and the East Rand, started in a partial way with the services of underground and surface officials and any of the strikers who returned.

On the Central Rand few underground men presented themselves for work.

In the Supreme Court, Pretoria, application was made for the release on bail of Messrs. Shaw, Fisher, Wordingham, Spendiff and McDermid, who are charged with inciting to public violence, but after argument the Court declined to interfere with the Magistrate's discretion.

It was announced on Monday that owing to heavy losses the Knight Central would close down for good unless it could be restarted on Wednesday.

In a Rand Compound: Generally speaking, the mine boys have behaved admirably during the strike.

None of the four municipal employes on the Augmented Executive of the S.A.I.F.—Messrs. Thompson, Tom Matthews, Buxton and Hicks—returned to work on Monday, as ordered by the Tramway and Lighting Committee.

TUESDAY'S DEVELOPMENTS.

The situation with regard to the gold mines was officially reported on Tuesday night to be one of "steady progress." Several mines were restarting on a limited scale, principally

A Stack Smoking Again on the Far East Rand.

with the aid of officials. It is expected that with the withdrawal of pickets from the near vicinity of the mines many more workers will sign on in the course of the next few days. The Angelo mine (one of the E.R.P.M. group) dropped 30

stamps on Tuesday. Three further arrests took place on Tuesday. Mr. W. H. Andrews, the well-known Socialist and editor of the "International," organ of the Communist Party, was arrested and charged with inciting to public violence, and was remanded till February 22, bail being refused. At Boksburg Mr. H. E. Morgan was arrested and charged under the section of the Riotous Assemblies Act, which deals with "blacklisting," but was released on £50 bail. Another Boksburg miner was arrested for picketing and remanded, bail being fixed at £30.

Underground Officials Attitude.

The Underground and Surface Officials' Association decided that as they responded to General Smuts's first appeal to keep the essential services going, they would continue that attitude, especially in view of the fact that they felt it would be to the interests of the mine workers themselves that the mines should be kept from being ruined, and as far as possible retained in a condition in which they could be worked at the earliest possible date when the strike is settled.

Position at Witbank.

Notices have been posted at the principal collieries in the district to the effect that only certain classes of labour are required to run the mines. There is an appreciable

European Miners on the East Rand in the Pre-Strike Days.

decrease in the number of artisans necessary, both underground and on the surface, according to the lists. It is also stated that up to Thursday, February 16, preference will be given to former employes seeking to resume work. Only

men who, in the discretion of the management, are considered suitable applicants, will be engaged. The terms of engagement are as laid down in the notices posted on November 29, subject to the engagement of men only as actually required. No holiday leave is to be carried forward.

Position on the Coal Fields.

The notices issued on the coalfields in regard to the re-employment of men makes it clear that a drastically diminished number of workers will be taken back when the present industrial trouble ends.

The Witbank Colliery now offers employment to only seven miners, and a total underground complement of 13 men; and it may be taken for granted that the curtailment of operations will be even greater on other properties. The surface mechanics are rather better off.

Altogether about 700 men came out on strike; and under the arrangements indicated in the final offer of re-employment, it is clear that only considerably less than half of them can go back. In fact, it is estimated that at the moment the offer is only open to about 100 men.

Since the strike started, it is well known that big orders have been lost by the colliery companies; while another important factor is that even while the men are on strike, the pits have somehow managed to produce a tonnage very closely approximating present requirements. A "rearrangement of underground work" has evidently been found possible, with very striking success.

An Important Meeting.

A meeting of the Executive Committee of the Engine Drivers' and Firemen's Union was held in the New Trades Hall on Tuesday evening, and was addressed by Mr. A. Crawford at considerable length.

The meeting was largely the outcome of the meeting of the Germiston Strike Committee some weeks ago, when an attempt was made to force the pace by arranging a deputation to meet General Smuts.

It may be remembered that the meeting between the Premier and the Germiston Committee did not take place, but a deputation from the Augmented Executive of the S.A.I.F. subsequently proceeded to Pretoria and held a conference with the Premier, which proved abortive after an agreement had nearly been reached.

A feeling is said to have arisen that the time has arrived for an entirely new set of men to take matters in hand on behalf of the Federation with a view to re-opening negotiations with the Government and the Chamber of Mines.

It is this movement within the movement that has been the cause of many references at strike meetings to the danger of swapping horses while crossing a stream and why votes of confidence in the Executive are so frequently proposed in order to test the feeling of the strikers.

The movement for more progress in the settlement of the strike either by the present Executive or by a new set of negotiators is expected to culminate in a demand by several of the unions for a ballot to test the feeling of all members of the Federation as to their confidence in the present Executive.

Wednesday's Developments.

Several mines resumed operations on Wednesday on a limited scale, and on others cleaning up went forward vigorously in view of an early restart of general mining operations.

A feeling of cheerfulness was apparent among the mine managements, who appear to be highly pleased with the work of the officials and the few strikers who have resumed work.

A huge demonstration was held in Johannesburg, some 10,000 miners and sympathisers assembling on the Union Ground, where resolutions in favour of continuing the strike were unanimously carried.

Mr. J. Thompson, Acting President of the S.A.I.F., said South Africa had now an opportunity of setting an example to humanity throughout the world as to what the conditions of life should be, and the conditions under which the production of wealth should be carried on.

Natal Collieries.

EMPLOYEES AGREE TO WAGE REDUCTIONS.

Employees of the Natal Coalfields have come to an agreement with the colliery owners regarding the scale of wages to replace the agreement which expired on January 31. A Conciliation Board sat on January 30, when representatives of the employees agreed to recommend the acceptance of rates of pay as from January 31 on the following basis:—

(1) That the standard rate of pay per shift for the months of February and March shall be 24s. 6d. instead of 28s. per shift.

(2) That the standard rate of pay per shift on and after April 1 and until otherwise arranged shall be on the basis of 2s. per shift below the rate operative in the Transvaal collieries as fixed by the colliery section of the Transvaal Chamber of Mines.

(3) That all rates of pay less than 28s. per shift be reduced pro rata to the reductions made in the 28s. per shift standard rate of pay.

(4) That reduced rates of pay shall apply, as has been the custom in the Natal collieries, to all employees whether members of the Natal Mine Workers' Association or not, including winding engine drivers, fitters and other mechanics, blacksmiths, carpenters and employees generally, whether working above ground or below ground.

These proposals were submitted to a meeting of the men a week ago, when it was decided to take a ballot upon them, and during the week a telegram was received from Hatting Spruit announcing that the majority of the men had balloted in favour of the acceptance of these proposals, which will presumably now come into force.

It may be explained that prior to December 31 the rate in the Transvaal mines stood at 2s. per shift above the Natal rate, and it is for this reason that that figure has been adopted in clause 2 of the agreement.

Up to the beginning of the week the strike had lasted 35 days. The price of gold has declined from 97s. 5d. to 95s. 1d., the lowest reached being 94s. 9d. The yield of gold in December last for the Rand was 664,935 fine ounces. The value of this total at 97s. 5d. when the strike began was £3,238,785, and on the 35th day at 95s. 1d. was £3,211,851 or a loss of £26,934 on the yield. As the premium is operating on a time mark, any failure to take advantage of the premium in operation cannot be recovered. The number of natives sent back to their homes during the 35 days was 42,000. In 1920 some 175,980 were paid £6,014,428 or about £35 per year. The loss of wages from 42,000 men would be £1,470,000 or £122,500 a month. On the first day of the strike the loss of wages to miners was estimated at £35,000 per day, and 35 days brings up the loss under this head to £1,225,000. The working costs for 31 days in December last in the Transvaal gold mines were £2,493,809; and the declared revenue £3,183,267. The loss to the general community was estimated at the beginning of the strike at £90,000 a day, which would amount to £3,150,000.

Lonely Reef Ore Reserves.

The Lonely Reef Gold Mining Company announces that the ore reserves at 31st December were 204,249 tons of an estimated value of 18.1 dwt. per ton. On the 30th September, the tonnage was computed at 202,033 and the average value at 18.79 dwt.

KATANGA'S NEW SCHEMES.

FINANCES BEING REORGANISED—PROCURING CAPITAL FOR FURTHER DEVELOPMENT—HYDRO-ELECTRIFICATION PROJECTS—THE NEW TREATMENT PLANTS—IMMENSE PRODUCTION FORESHADOWED.

In the whole history of mining there is no more romantic chapter than that which may be written of the development of the great copper fields of the Katanga region of the Congo—the copper Rand of the world as it has rather aptly been termed.

When, just after the Boer War, the promoters of Tanganyika Concessions declared that their prospectors, led by the late Mr. George Grey, had located in the Katanga region of the Belgian Congo one of the greatest mineral fields on earth, the world merely smiled. But the smile is with Mr. Robert Williams and his Belgian associates to-day. In the face of enormous difficulties the moving spirits of the Union Minière-Tanganyika group have doggedly persevered, and the position to-day is that one of the greatest copper belts known—perhaps the greatest copper belt on earth—has been opened up, equipped, linked up with ports by railways, and brought to a state of production on an immense scale.

Unrecorded History.

Not so many years ago a very prominent mining engineer inspected the Katanga copper discoveries, and made a voluminous report, which was of a decidedly pessimistic nature in regard to the production of copper from the Katanga Mines. This report came into the possession of the *South African Mining Journal*, and we sought permission

M. Jean Jadot,

President of the Union Minière du Haut Katanga.

to publish it. We were threatened with legal action if we allowed the report to appear in print, and the views of the very eminent engineer were therefore never published.

The optimistic opinions held by the Union Minière-Tanganyika directors have since been fully confirmed, and the eminent engineer's premises have been demonstrated to be unsound in regard to the metallurgy of the great Congo copper belt.

The work that already has been carried out in Katanga is colossal; the magnitude of the development projected is simply staggering.

The development of the great Katanga copper belt of the Southern Congo Free State has taken much time and toil

and has called for the expenditure of colossal sums of money. The operations of the Union Minière and its associate the Tanganyika Concessions have during the past few years been hampered by the War, the influenza epidemic, and more recently by labour troubles and a reorganisation of the administration. Despite all these hindrances, however, the ambitious scheme of development laid down by the Anglo-Belgian directors is proceeding apace, whilst at the same time the mines continue to produce large quantities of copper.

M. Jadot's Review.

As an indication of the magnitude of the ambitious projects which the Union Minière Committee now have in view, reference may be made to the speech of M. Jean Jadot, President of the Union Minière's Board, at the extraordinary general meeting of the Company held in Brussels the other day.

M. Jadot's address dealt with the raising of the ordinary share capital of the Company to 26,000,000 francs, and the authorised issue of 150,000,000 francs 6 per cent. preference shares, carrying 25 per cent. of profits after 1927.

M. Jadot dwelt on the satisfactory condition of the Company's huge assets and the convention with the Comité Spécial du Katanga, and he also referred at length to the treatment of copper ores and the employment of hydro-electric power.

The Chairman's speech showed that in spite of the low price of copper, the Company's operations are covering expenditure.

On the Katanga Copper Fields.

In the course of his speech M. Jadot remarked:—In his speech at the general meeting of July 11 last our President informed you that the negotiations which were being carried on had a double aim: to find at once the resources necessary to relieve our financial position which had been adversely affected by the existing industrial crisis, and to secure by a practical scheme the financial resources which are indispensable to carry out our plans for the treatment of our low-grade ores.

The views which were then expressed to you on this subject have received the concurrence of the Colonial Minister, as can be seen by the Explanatory Memorandum which accompanied the new Convention when it was submitted for the approval of the Colonial Council.

We would remind you that our original Convention of 1906 stipulated that at every increase of our share capital an equivalent number of dividend shares must be created and handed over without payment to the Comité Spécial du Katanga; that Convention also made it a condition of the extension of our concession after 1936 that the Company should increase its share capital by 30 per cent. and hand over to the Comité Spécial du Katanga an equivalent number of dividend shares, together with a sum in cash equal to the nominal value of the additional capital shares.

Already, in 1912, our communications and reports indicated to you the impossibility of finding, under the onerous conditions of our Convention, the resources necessary to deal

with our average or low-grade ores which constitute the great bulk of the copper deposits in Katanga.

In 1913 we informed you that negotiations were proceeding for the constitution of a subsidiary company for the treatment of our ores by the leaching process. Indeed, as far back as 1912, the excessive cost of the coke and coal we imported had led our engineers to endeavour to take advantage of the waterfalls which we had the right to work under our Convention, and we contemplated adopting the only known process which could utilise hydraulic power for the treatment of ores. After tests of electric smelting made in Europe, we hoped that the comparatively low cost of the power would enable us to treat our low-grade ores with economy.

The negotiations with the Colonial Minister and with the Comté Spécial du Katanga for the constitution of a subsidiary company resulted in an agreement in principle, and we were hoping to get this subsidiary company established during the year 1914, when the war broke out.

The Treatment of Copper Ores.

Between 1914 and 1918—that is, during the period of the War—copper metallurgy made serious progress, not only in the domain of smelting properly so-called, but also in connection with the application of electricity to the treatment of certain classes of ore which were not suitable for smelting. For instance, plants were erected in Chili and in the United States which utilised hydro-electric power, not for the smelting of ores but for an electro-chemical process (leaching), which has since given excellent results.

In 1914 we engaged a consulting engineer, whose duties consisted mainly of following up the progress made in the United States and of investigating the application of the new process to our ores, the characteristics of which were somewhat unusual.

At the same time we decided to erect a test plant, properly equipped for the investigation of mechanical concentration, as well as of various new methods of treatment. This plant, although of small capacity, was on an industrial scale, included, in addition to a very complete equipment for mechanical concentration, a reverberatory furnace, with which we produced in 1917 a certain quantity of refined copper, and also, since the discovery of coal at Sankishia, carried out some interesting smelting tests.

Further, as we have stated in several of our reports, the question of the agglomeration of our fine ores has continued to be the object of our investigations.

Lastly, we have erected an experimental plant for the process which appears the most suitable for the economic treatment of all our low-grade ores, whatever their texture and composition. This plant has just started work, and the first results obtained have been very satisfactory. They confirm that the most practical method for the treatment of the bulk of our ores is the leaching process. This method,

however, requires a vast plant for the captation of waterfalls and also for the leaching works proper.

Hydro-electric Power.

The detailed surveys of the N'Zilo and Lufira Falls which are now being made show that these falls are capable of producing a very considerable volume of power, which will amply cover all our power requirements during the whole period of our concessions. The Lufira Falls, which are the nearest to the region in which we have so far carried out our principal operations, constitute in themselves a most valuable asset, and will, in all probability, supply a substantially higher volume of power than that previously estimated; their utilisation for the treatment by leaching will enable us to produce a larger tonnage of copper than that anticipated, and the output from this source is now estimated at round about 50,000 tons per annum.

We intend to commence with the captation of the Lufira Falls and the erection of a leaching plant at the Panda to be worked by electric power derived from those falls. The execution of this project will require first of all a considerable tonnage of cement, and this, we hope, will be supplied by a works which a company now being formed propose to establish very shortly in Katanga.

We must, however, repeat that the large schemes contemplated will require a considerable expenditure. We hope, nevertheless, that by the time the work is begun, say, in about eighteen months from now, the economic conditions will have so far improved and become more settled as to reduce our further outlay to a reasonable figure.

Now that we are confronted with important decisions for the realisation of our programme for the treatment of our low-grade ores, we are, thanks to the numerous tests carried out over several years, in possession of results which enable us to state that we have solved the problem of treating the whole of our ores without distinction."

Leeuwpoort Tins, Ltd.

It is rumoured that this mine is going to be started shortly. It is stated that the company has in sight several million tons of ore equal to 1 per cent. of cassiterite, but at the present price of tin the yield is unpayable. The life of the mine is about 25 years.

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

WIT. DEEP FINANCES.

A Cable from London—Promotion of the Union Mining Finance and Investment, Ltd.—Alleged Transactions—Co-operation of Shareholders Invited.

The "control" of the Wit Deep Company was recently wrested from the Corner House, and for the last year or two the concern has been administered by an independent board. Those shareholders who expressed pleasure that the administration of the company had been changed can scarcely now feel pleased with the conduct of the company's business, as revealed by the following cable, which appeared in the local Press the other day:—

The *Financial Times* gives prominence to the "unprecedented position" of the affairs of the Witwatersrand Deep Company, and criticises the action of the majority of the board at Johannesburg in forming a union with the Mining and Finance Investment Company, to which the Wit. Deep Company subscribed £49,000. It draws attention to the action of the meeting of shareholders in London, at which a committee of three was appointed with the object of securing liquidation of the finance company and the restoration of any Wit. Deep funds paid to it by the chairman and committee.

In connection with this we have been approached by Messrs. Catesby Holland and Barker, and we publish hereunder the contents of a letter written by the solicitors of these two gentlemen to the Press. The letter states:—

Sir,—With reference to a cablegram dealing with Wit. Deep Finance, as solicitors for Messrs. Catesby Holland and Barker, we shall be glad if you will publish the following for the information of shareholders.

The facts are that a majority of the board, consisting of Messrs. A. E. O'Flaherty (chairman of the Wit. Deep, Ltd.), Gamble, Deeble, Ellis and McAllister, on November 22 last, carried resolutions promoting a company called the Union Mining, Finance and Investment, Ltd., having a capital of £50,000, divided into £1 shares, towards which, at such meeting, the Wit. Deep, Ltd., agreed to subscribe a sum of £49,000, and authorised Messrs. O'Flaherty and Deeble to sign the memorandum and articles of association accordingly. The sum of 2s. per share has been called up.

This transaction was carried through without previous consultation with, and during the absence of, the joint-managing director, Mr. F. Catesby Holland. The minority directors mentioned below had received no previous notice that any such scheme was to be placed upon the agenda, and despite the emphatic protests of Messrs. Rosenzweig, Barker and Pickard (alternate for Mr. Holland), the resolutions were carried and put into effect by the votes of the majority above named, who are now directors of the new company. In spite of repeated requests at the meeting for time to be allowed for consideration of so important a transaction, the proceedings were rushed through and the company became an accomplished fact.

Some of the Clauses.

It was subsequently ascertained by our clients that the following clauses appeared in the memorandum and articles of association of the Union Mining, Finance and Investment, Ltd.:—

(1) The company is a private and not a public company. Shareholders can ascertain for themselves the important legal distinctions involved.

(2) The objects of the company, as stated in the memorandum, are wide enough to enable the directors to do all things in heaven or on earth or in the waters under the earth, or elsewhere, if necessary.

(3) The directors of the company have power to appoint any three of their number as life directors.

(4) If life directors are appointed, the shareholders have no power, even in general meeting, to alter the memorandum or articles of association of the company without the written consent of two out of the three life directors.

(5) Directors are expressly given the power to vote upon contracts with the company in which they are personally interested for their own profit and benefit.

(6) Neither insolvency, nor even a voluntary or enforced permanent absence, incapacitates a director from continuing to hold office as such.

For the present we desire to say no more. Until the arrival in South Africa of a representative of the European interests, shareholders in the Wit. Deep, Ltd., may rest assured that the gentlemen on whose behalf we sign will maintain an attitude of vigilance, meanwhile inviting shareholders to co-operate with them and the committee formed in London for the purpose of dealing with the situation on its merits. Any communications may be addressed to the undersigned, at whose office a copy of the memorandum and articles of association of the Union Mining, Finance and Investment, Ltd., may be inspected.—Yours, etc..

ALEX. S. BENSON & SMITS,

Solicitors for Messrs. F. Catesby Holland and R. E. Barker.

In the light of the information which has reached us we consider that the circumstances of the formation of the Union Mining, Finance and Investment, Ltd., and of the finances of the Wit. Deep, Ltd., require most searching examination.

In connection with this matter it is only fair to point out that a representative of *The Star* called on Mr. A. Gamble on Wednesday morning and was informed that as far as Mr. Gamble was personally concerned, Messrs. Catesby Holland and Barker were quite at liberty to apply to the courts for an interdict with reference to the formation of "The Union Mining, Finance and Investment Co., Ltd." Last November, a paragraph appeared in the local Press taken over from the London Press in which it was stated that the probable course to be followed in the case of enemy shares would be that the companies concerned would register either investment trusts to hold their own particular block and to subscribe the necessary capital. Some time previous to this the matter of enemy shares had been discussed by the directors of the Wit. Deep. Mr. Gamble explained that a sub-committee had been formed, of which Mr. Catesby Holland was one, to go into the matter. This sub-committee subsequently reported in favour of the formation of a Trust company, the main object of which was to deal with such enemy shares.

In order to allow of freedom of action on at least a part of the directorate of the Wit. Deep, which consists of eight directors, it was agreed that the directorate of the new trust should be limited to five, and it was merely the fortune of war that the three gentlemen named were not elected to the directorate of the Union Mining, Finance and Investment Company.

Mr. Gamble stated that he was quite satisfied that if the three gentlemen named had also been on the directorate of the company, referring more particularly to Messrs. Catesby Holland and Rosenzweig, no objection would have been raised to the new venture. As it was, he deplored the fact that they should rush into print in the absence of the chairman of the Wit. Deep, Mr. A. E. O'Flaherty, and before the publication of the annual report of the Wit. Deep Company which would appear in the course of a week or two and would contain a full and satisfactory explanation of everything that might not be at present understood by the gentlemen in question or by the other shareholders of the company.

EDITORIAL.

THE BREAKING OF THE STRIKE.

At the time of going to press, the outlook for the resumption of work by the gold mining industry is considered to be very satisfactory. One mine is already dropping 100 stamps and is feeding the mill bins with broken ore from the mine. Various other propositions at several points along the Reef are crushing, and at most mines a certain number of men are drifting back to work.

The strike on the Transvaal collieries has now lasted for nearly seven weeks and that on the gold mines for nearly six weeks. The direct loss to the workers is already getting on for a million and a half in wages, and to date more than five million working hours have been lost. It is going to take the industries involved a very long time to regain the industrial positions which they had attained to before the South African Industrial Federation called the strikes on false issues.

People have yet to realise the cumulative effects of the strike on the community at large, and they have yet to appreciate the extraordinary ramifications of the business. Tremendous damage has already been done, and it can be asserted without fear of contradiction that the mines in answering the appeal of the Prime Minister to reopen have saved the country from well-nigh irretrievable disaster in

the nick of time. In this connection the decision of the officials to stand by the industry and to do their utmost to save the situation is worthy of the highest praise. The men on strike will realise this sooner or later, however much their leaders may declaim the officials' efforts at present.

Some of the British colliers condemned the blue jackets who kept the pumps running during the last great British coal strike. But many of the colliers who are now out of employment openly express the wish that all the blue-jackets of the British Navy had been at work to save the miners from their own folly.

It is difficult to gauge the situation accurately, but we believe that by the time our next issue is published we shall be able definitely to state that the backbone of the strike has been broken.

BRAVO! MINE OFFICIALS.

During the trying and critical period of the strike the officials of the mines have stood loyally by their employers, and their conduct and allegiance to the industry is deserving of the very highest praise. Members of the mines staffs employed both underground and at surface have shown a fine spirit of courage and of perseverance in the face of very trying conditions, and we think that shareholders in the mines should fully appreciate the fact that the services of these men have been of incalculable value. They have indeed proved themselves to be the backbone of the industrial army of the Witwatersrand, and when the present calamitous days are over their services should be recognised by all sections of the community. Had their loyalty to the mines been less whole-hearted permanent injury might have been done to the mines and therefore to the whole country, and although it is hardly to be expected that in the present heated atmosphere the men themselves will recognise this fact we feel sure that when more moderate counsels prevail the rank and file will realise that by maintaining essential services the staffs of the mines have rendered signal services to the employees of the industry as well as to that much-slandered organisation, the Chamber of Mines.

Not only have the mine staffs been threatened and intimidated; they have also had to withstand innuendoes from well-intentioned persons who, in seeking to find a way out of the present impasse, have hinted that one of the troubles of the industry is the high rate of pay of officials, and who have urged that in the reconstruction of the industry the officials should be paid salaries which bear some fair relation to the rate of pay made to miners. As a matter of fact one of the great grievances of the Reef has been that many untrained and little educated miners have been drawing wages very considerably in excess of the salaries paid to the mine officials, many of whom are qualified technical men with Schools of Mines' experience. Others are highly educated clerical officials, and it must often have come as gall and wormwood to their souls to have to make up cost sheets or to pay out cheques for amounts very greatly in excess of their salaries to men whose education has cost them nothing and whose only recommendation is that they belong to a trades union.

This journal has for long pleaded the cause of the mine official, and particularly that of the shift boss and the junior mine captain. We have consistently argued that there should be more adequate recognition of the value and services of this type of official, and that he should receive the full support of the management in the execution of his highly responsible and often difficult duties. We believe that after this strike is settled the services of the mine officials will receive such recognition. And we believe, too, that in seeking to modify the underground contract system the Chamber of Mines is endeavouring to remove one of the greatest anomalies on the Reef—an anomaly which has often caused a good deal of justifiable dissatisfaction among the staff employees who in this trying period have proved so faithful and worthy of the trust reposed in them.

RELIEF SCHEMES.

According to ministerial statements the Government has under consideration large afforestation and irrigation projects with a view to relieving the unemployment problem which has been rendered very much more acute in consequence of the strike. General Smuts made reference to this Government project in his appeal for the restarting of the industry. Colonel Reitz, Minister for Lands, stated at Port Elizabeth during the week that he had been travelling for ten days in connection with the Government relief scheme for unemployment.

"The Government realises," said the Minister, "that the unemployment problem will be much accentuated by the strike in the Transvaal, and steps are being taken to deal with the position at once. We have already ordered material for hundreds of buildings for workers on an afforestation scheme at Zoutpansberg." Colonel Reitz added that other similar projects were afoot for Natal, and probably at Knysna and George. Work on railways and harbours and irrigation development would also be utilised in the alleviation of unemployment.

We are heartily in accord with the Government relief schemes, provided that they are framed on a sound economic basis; that is to say, that they do not partake of the nature of doles which are only State premiums on laziness. The kind of relief work which this country requires is work which will be reproductive, and reproductive at an early date. Afforestation and irrigation are certainly admirable undertakings which will secure abiding assets for the country, but some considerable period of time must elapse before either of these methods produce very much in the way of revenue, and in so far as irrigation is concerned it may be pointed out that unless a rate of progress substantially more rapid than that attained in connection with the Hartebeestpoort scheme is made, the country will have to wait a considerable time before any financial return is derived.

To our way of thinking the Government would do well to pay particular heed to the question of roads. The unemployed want work. It is no use squandering the Union's slender financial resources on doles and on useless relief work. But employment for the growing army of the out-of-works upon a main trunk road system traversing the whole country from Table Bay to the Limpopo would be the commencement of a step which would ultimately give to the Union an asset of vast value. Such an undertaking would, with its feeder lines acting in consort with the railways, give a tremendous fillip to commerce, and we believe that it would speedily show tangible and large returns because of the benefits it would confer upon the farmers in the more rapid and economical marketing of their produce.

Construction and maintenance of this main trunk road would provide our collieries with an immense market for the inexhaustible quantities of tar which they could produce from low-grade and waste coals. We have frequently observed in the course of visits to the coal fields of the Union that a vast amount of low-grade and fine coal is being dumped as waste. According to the managements of these collieries, there is no sale for this coal. Frequently we have been told that the collieries would be only too glad if some one would take the waste coal away. They could have it for nothing.

When it is pointed out that this coal contains valuable by-products, and particularly tar, the invariable reply is: "And who is going to buy the tar? The market for tar in South Africa is exceedingly small. If we put up a tar plant we could not sell what we produced." The point is that an enterprising road policy would provide an ample market for innumerable tar plants. The main trunk road and its branches must be well metalled and a good surface maintained. Here, then, is an undertaking which would not only give useful employment to the out-of-works of the Union, but would also provide a profitable market for many

thousands of tons of coal which are to-day going to waste. And of the advantages of such a road system to the country at large there can be no question whatsoever.

In addition to the points mentioned above, it would have a great strategic value, and in the case of transportation trouble it might well prove the salvation of the Union. In England the great railway strike of 1919 was broken by the employment of mechanical transport on the excellent roads of the Island Kingdom. How much more important is it to the inland centres of the Union, situated at great distances from the coasts that there should be a valued coadjutor of the railways in normal times; an adjunct which could if need be take the place of the railways during any possible period of industrial unrest.

There is another direction in which the Government might well look for a profitable method of solving our unemployment problems. On the outlying sections of the Witwatersrand there are large auriferous areas, many of them with small gold content which on a reasonable basis of working expenditure might at an early date be able to supply several small batteries with ore which would yield a profit. And in this connection we would repeat what we said in our issue of a week or two ago on the subject of the special geological mission, which includes Dr. Molengraaf. This mission is now visiting South Africa, and its presence affords an unique opportunity to the Union Government to secure an independent and unbiassed opinion on the vexed question of the reef series of the Far East and South-East Rand, on which there has been so much controversy during the past few years. At a time when there is so much talk of a dwindling Rand it seems the duty of the Government to leave no avenue unexplored which may lead to the discovery of an extension of our gold mining industry, and thus afford a substantial field for the growing ranks of the unemployed, many of whom are men with some experience of mining.

The Labour leaders are so obsessed with the pathetically foolish idea of "winning" an industrial battle which can hold no victory for either side, and the general public are so staggered at the devastating effects of the stagnation resulting from the Federation's refusal to face the economic facts of the position, that the continued and serious decline in the price of gold is being overlooked. The selling value of the product of the mines of the Witwatersrand, upon which the prosperity of South Africa so largely depends, has fallen to 94s. 9d. per oz. It is, in fact, now only 10s. per oz. more than it was two and a half years ago when as a result of the chaotic conditions resulting from the War, the metal was sold in a free or open market, and the price broke away from the standard value to which it had for so long been tied. Since the strike was declared, the price of gold has fallen by three shillings per ounce. If this decline be applied to the returns of the mines for the month immediately preceding the strike period, that is to say, for the month of December, 1921, it will be more than ever brought home to one that the majority of the mines operating on the Witwatersrand could not possibly continue working on their former basis of costs.

Notes & News.

Orange River Oil Shales.

Much interest, says a message from Kimberley, is being evinced in the development of oil shales on the Orange River. Shale has, it is said, been struck at about 93 feet.

* * *

West End Diamonds.

During the quarter ended 31st December, 1921, very material progress has been made with erection of permanent plant. The various units are practically complete. We understand that washing operations will commence about the end of this month.

Port Natal's Coaling Business.

Contrary to general expectations the coaling business at Port Natal has not increased in volume as a result of the trouble elsewhere, but has shrunk to smaller proportions than usual during the last few weeks. The total sales for cargoes and bunkers were just under 16,500 tons last week, which is much below the port's usual weekly average. This week, however, is showing an improvement, as the total order in hand up to now aggregate 11,600 tons for bunkers.

* * *

British Export Coal Trade.

Writing on the present position of the British export coal trade, Sir D. M. Stevenson, Bart., of Glasgow—who was chairman of the Committee for the Supply of Coal to the Allies from its formation in 1916 until it was disbanded at the end of 1919—gives in the current issue of *The British Trade Review* a brief survey of the trade's vicissitudes in 1921 and concludes that it may not be long before British coal-exporters win back their former oversea markets. Sales of coal by America to the Continent have now practically ceased, the writer states, adding that whereas during 1913 British coal exports (excluding Germany, Russia, and Austria) amounted to nearly 60 million tons, they have been at the rate of fully 40 million tons in recent months on practically the same basis.

* * *

Pretoria Silver Lead Co.

It will be noticed from our advertising columns that this company has extended the options for three months to the 21st June. Work is proceeding satisfactorily on the property; the No. 2 shaft is now approaching 100 feet and no difficulty has been experienced in sinking. The lode at the point of intersection was tested by borehole, when it was found to be 10 feet thick and of excellent value. It will be noticed that the board is requesting shareholders to register their shares so as to consolidate the certificates.

* * *

A Big Industrial Law Suit.

A big claim for a refund brought by the Cape Explosives Works against Lever Bros. and the S.A. Oil and Fat Industries failed in the Supreme Court at Capetown on Tuesday. During the War the defendants agreed to supply plaintiffs with crude glycerine for conversion into dynamite glycerine at a fixed English price. In 1917 the defendants complained that prices did not leave them a sufficient margin of profit, but the whole position was suddenly altered by the news that the British Government had decided to raise the controlled price for both crude and dynamite glycerine by more than fifty per cent. Thereafter defendants supplied plaintiffs on the basis of the increased price. It was later discovered that when the British Government raised the issue price of glycerine it did not interfere with the requisition price, and the plaintiffs contended that they had overpaid the defendants to the extent of £27,000. Sir John Kotze and Mr. Justice Van Zyl, however, came to the conclusion that there had been no misrepresentation on the part of the defendants, and granted absolution from the instance with costs.

* * *

New Deep Water Diamonds.

The directors of the New Deep Water Diamonds, Ltd., and the Tributaries, Ltd., report that they have received a letter from the manager at the diggings stating that on the afternoon of February 7 he found a $5\frac{3}{4}$ carat diamond of a very fine quality, the value of which he estimates at £90. The directors add that the last two months of 1921 were spent in prospecting operations, in the course of which two small stones were found. In January no digging was possible owing to the abnormal rise in the river. Hauling commenced again on February 4, and the stone now found was discovered at a depth of six inches under the surface.

Explosives and Chemical Works

IMPORTANT FORTHCOMING PUBLICATION.

The "S.A. Mining and Engineering Journal" has now in preparation a special illustrated supplement dealing with explosives and chemical works of the Union. Several of the principal firms having factories of this nature are giving their active support to the publication, which will be issued as a supplement to the ordinary weekly issue of the journal. Special commissioners are now visiting the various works, and the results of their investigations will be published in the supplement in the form of full, descriptive and illustrated articles. The supplement will also contain valuable data as to the quantities of explosives, fertilisers, chemicals, etc., produced in the Union, methods of manufacture and details as to markets and consumption. Prospective advertisers and manufacturers of chemicals, etc., interested in this supplement are advised to communicate with this office at the earliest opportunity.

Case of the Messina Mine.

The gold and coal mines are not the only mining ventures in South Africa which have suffered, and suffered severely, by reason of increased costs, largely through inordinately high wages and trades union restrictions during the past year or two. Take, for instance, the case of the Messina Copper Mine. The position from the point of view of the company has been clearly stated in the columns of the local Press by the chairman, Colonel Grenfell. Adverse conditions have been such that to work at a profit has become impossible. High working costs have been the chief factor, and taxation has also helped materially to make the mine unremunerative. "The Messina Mine," remarked Colonel Grenfell, "can be run with a complement of fifty white men and eighteen hundred natives, and before it was closed the company was forced to employ one hundred and seventy white men at wages fifty per cent. above those prevailing in 1914." Apart from high wages, therefore, it is contended, the ratio of white to coloured labour must be altered. According to Colonel Grenfell, the company has ready for extraction on the Messina mines alone over 600,000 tons of ore containing 20,000 tons of metal, of an approximate value of £1,400,000, the production of which would certainly entail an expenditure of over £1,000,000 locally. For the electrification of the Natal railway thousands of tons of copper will be required, and South Africa's own metal will not be available.

Railway Electrification Contract.

In reference to the acceptance of the English Metropolitan Vickers Electrical Company's tender for the electrification of a section of the South African Railways, it is ascertained that though it is not intended to publish the terms of the contract at the present moment, probably not before the meeting of Parliament, it is possible to state that the statements made by "Bene van Rippir" appearing in the Bloemfontein *Friend* are quite without foundation. It is possible, further, to add that not only was the contract British, but it was the lowest submitted and considerably lower than either of those submitted by its German rivals. Incidentally it was for 70 engines and not 85, as erroneously stated in the letter referred to.

The men cannot possibly get improved terms by remaining on strike. In fact, the longer the strike continues, the less favourable must be the terms. Even if the Chamber, and the Government, and the public and Parliament wished the men to have better terms, they could not possibly be given. If they were, only the few rich mines could make ends meet.

Metal Market Report.

Messrs. H. A. Watson & Co., Ltd., report under date 23rd January, 1922:—

Standard Copper.—The improved outlook to which we were looking forward with the turn of the New Year has not yet shown itself, and prices for metals generally are lower. Lack of interest and absence of demand by consumers has caused a weakening tendency during the past fortnight. After closing on the 10th inst. at £65 10s. cash and £66 5s. three months the market only moved slightly, until the 18th inst., when the day's close was £64 10s. cash and £65 5s. three months. There was a sharp recovery on the 19th inst. to £65 7s. 6d. cash and £66 2s. 6d. three months, values again falling on the 20th to £65 cash and £65 15s. three months, at which they remain to-day. Closing quotations for manufactured copper are as follow: Strong sheets, £96 per ton; best select, £67 to £69 per ton; electrolytic, £71 to £73 per ton. Quotations for best select during the past fortnight were as follow: January 10th, £69; January 13th, £69; January 17th, £68; January 20th, £68.

Standard Tin.—The market looked like recovering some of its lost ground when values touched £167 5s. cash and £169 three months on 12th inst., but liquidations by tired holders, coupled with absence of real demand, brought a downward tendency and prices fell away, until on the 17th inst. the close was £163 10s. cash and £165 three months. A slight recovery on 18th-19th was followed by a drop to £162 15s. cash and £164 5s. three months on 20th inst. To-day's close records a further heavy fall following considerable sales in the East. Large quantities were thrown on the market and values dropped £4, closing at £158 15s. cash and £160 5s. three months. Tin ores: There is a fair inquiry for good clean ores.

Sulphate of Copper.—£27 to £28 per ton.

Spelter.—To-day's close is £26 to £26 7s. 6d.

Lead.—The closing prices are £23 spot and £22 17s. 6d. forward.

Bismuth.—Remains at 7s. 6d. per lb.

Nickel.—Remains at £180 per ton.

Quicksilver.—Price advanced to £11 per bottle.

Bar Silver.—Closes at 34½d. spot and 34½d. per oz. forward.

Manganese Ores.—Value nominally 1s. 1½d. per unit.

Antimony.—Prices unchanged, viz.:—English regulus, £34 to £39 per ton. Chinese £23 to £24 10s. Crude, nominal, £14 to £16.

Wolfram.—To-day's value is nominally about 11s. 6d. per unit for ore of 65 per cent. W.O.

Bank Rate.—Reduced to 5 per cent. on 3rd November.

PENROL FUEL.

The report of the directors of Penrol Motor Fuel, Ltd., for the year ended 31st December, 1921, to be presented to the shareholders at the first annual general meeting to be held on the 10th March, 1922, states, *inter alia*:—The original capital was £7,000, which was privately subscribed in cash. Thereafter the capital was increased to £32,500 to provide for vendor shares and 4,000 reserve shares. The present capital is £32,000, divided into 32,500 shares of £1 each. The "Penrol" patents in the (a) Union of South Africa, (b) Rhodesia, (c) Great Britain, and (d) the Commonwealth of Australia were purchased for the sum of £23,000, payable as to 21,500 shares of £1 each and £1,500 in cash. The patents were all duly transferred to the company and the purchase price paid. The Union and Rhodesian patents were sold to "Penrol (South Africa, Limited)" for 60,000 fully-paid £1 shares in that company. The Australian patent was sold to "Penrol (Australia, Limited)" for 1,000 shares of £5 each, of which 300 shares were paid to the promoters, leaving 700 shares as the net return for the sale of the patent. The subsidiary South African company has made arrangements to start the manufacture of Penrol almost immediately. The buildings and plant are approaching completion, and it is hoped that by the time this report reaches the shareholders Penrol will be actually on the market. A good deal of expense has to be incurred in placing the article on the market, but it is hoped that the result will prove to the eventual satisfaction of shareholders. The matter of distributing shares in "Penrol (South Africa, Limited)" remaining after payment of commission under agreement with Penrol Share Agency, when received, will have to be dealt with at the general meeting. The directors propose to hold the shares of the Australian company in the meantime. As manufacturing companies are formed this company will receive its quota of shares, when distribution to shareholders will be considered.

ANSWERS TO CORRESPONDENTS.

A.B., Durban.—(1) We do not regard these shares as a good investment at the price you mention. They are, in our opinion, a speculation with moderate prospects. (2) In the case of (a) yes, (b) probably not. (3) We cannot say without going into the matter in great detail. Perhaps reconstruction on the basis of four new shares for the old one will take place.

T. Holdsworth, Tinfields, Ndanga, Fort Victoria.—We regret that we possess no information concerning the mine you mention, but will endeavour to obtain particulars.

ENGINEERING SECTION.

“Broken Tools.”

SOME OF THE CAUSES OF SPLINTERING AND CRACKING OF HARDENED STEEL.

(Specially written for the “S.A.M. & E.J.” by J. A. Holden.)

If a tap breaks in the hole or a tool is found to be cracked after grinding there is some excuse for the ruffled feelings of the mechanic, but with whatever vehemence he may blame the hardener or the steel-maker, it is unlikely that a real understanding of the cause of the failure will result unless a thorough investigation is made. At one time considerable prominence was given to the injurious effects of impurities and the difficulties in the working up of steel were summarised in the phrases “sulphur makes it red short and phosphorus makes it cold short.” Even to-day these expressions are sometimes used with dogmatic conclusiveness. But methods other than chemical analysis have been developed and they have shown that failures occur which are in no way associated with the elements

because of the natural laws which govern the solidification of such liquids there is great difficulty in securing an absence of segregation, not only an absence of segregation of the impurities but also of one of the chief constituents—that is, carbon.

Taking as an analogy a solution of brine; the presence of the salt depresses the freezing point and when the solution is gradually cooled it deposits pure frozen water (*i.e.*, ice). Meanwhile the mother liquor gradually becomes more and more concentrated ice separating all the time until the temperature—22.4° C.—is reached and then the concentrated brine solution freezes without water or salt separating. This freezing of the pure crystals followed by

Fig. 1.—Massive Slag Inclusion. ×1000 diameters.

Fig. 2.—Fine Slag Line with Adhering Carbides. ×1000 diameters.

sulphur and phosphorus. Since the application of microscopical investigations, coupled with carefully controlled heat treatments, very valuable information has been obtained. It is perhaps unfortunate that the micro-constituents of iron and steel have been given rather complex names, but the subject itself is not by any means so complicated as we might suppose from the terms used.

Correctly made tool steels and special steels do not contain impurities except in very small quantities, and when such impurities are uniformly distributed throughout the metal they exert but a negligible influence. Such ideal conditions, however, cannot always be attained in practice, for liquid steel behaves in a precisely similar manner to other liquids made up of two or more components, and

the freezing of the impure water (*i.e.*, brine) is a more or less exaggerated example of what happens to liquid steel. In the case of liquid steel which of necessity (when cast into chill moulds) freezes with great rapidity there is but a limited period for the purer crystals to freeze in advance of the mother liquor; in very small ingots there is little or no chance for such phenomena to occur, but in large ingots it becomes a very disturbing factor.

The effect of such segregation may lead to very serious consequences, particularly if it occurs in bars which are hardened by quenching in either oil or water. For in badly segregated steel the carbon content may vary between the outer surfaces and the centre by as much as 40 per cent. The

writer actually came across some bars of supposed .80 per cent. carbon steel which varied from .50 per cent. to .90 per cent.; when quenching this steel for hardening, the difference in the carbon content in various parts of the bars set up such unequal strains that rupture followed. Here it may be added that by suitable preliminary heat treated such variation in carbon content can be considerably reduced, *i.e.*, the carbon in the more concentrated areas can be made to diffuse into the more diluted areas. It is occasionally found that a fractured piece of steel presents an appearance almost akin to torn timber; this is more com-

Fig. 3.—“ Ghost Lines ” in Tool Steel. $\times 100$.

Fig. 4.—Banded Structure in Chrome Steel. $\times 100$.

monly found in steel broken at right angles to the direction of rolling or forging—that is, in what are known as transverse tests. Although “woody” structures are troublesome in certain classes of work such as, for example, in gun steels (here it may be mentioned that transverse tests are methodically carried out in armament works); it is but a rare occurrence in tool steels. There are, however, formations of a similar character common to certain kinds of tool steels and these are known as “banded” structures and “ghosts” or “ghost lines.” They were given the latter name because the lines could be discerned by the unaided eye upon well polished surfaces.

When steel is made in large quantities it must necessarily contain slag inclusions, which may consist of a product of the refining reactions, or mechanical erosions (such as fluxed ladle brick). In the ingot mould the globules of slag have the property of acting as crystallisation centres; in hard tool steels the slag acts as a nuclei for cementite (the micro-name given to free carbides) and in the case of mild steel the slag attracts the ferrite (the micro-name given to the chief constituent of mild steels and which consists of practically pure iron).

Eventually these minute islands of slag become drawn out under the influence of either forging, pressing or rolling and with them of course the adhering ferrite or cementite. As tool steels only are being considered here the latter type of inclusion will be dealt with.

The resulting form of such inclusion with adhering free carbide (or to give it the usual micro term—cementite) is depicted in Figs. 1 and 2. Fig. 1 shows massive slag inclusions surrounded with cementite—in this case the slag

Fig. 5.—Sulphide Inclusion. $\times 1000$ Sulphur in the steel .039 per cent.

consists of ferrous silicate and the steel is acid Siemens open hearth of exceptional purity. Fig. 2 shows a fine slag line with adhering islands of carbide of iron and chromium.

When a tool contains a pronounced banded structure or it is full of “ghost lines,” such as in Figs. 3 and 4, it makes the material very prone to crack during hardening, particularly if water is used as the quenching medium. In steel balls and ball races it is one of the common causes of splintering and scoring, for under the combined stresses of load and speed the minute streak, if on the surface of either a ball or a race, becomes ultimately dislodged and scoring of the balls rapidly follows and the bearing fails.

As so much has been written about the sulphur content of steel, the writer shows a micro photograph (Fig. 5) of a streak of sulphide of manganese in a tool steel. Although the percentage of sulphur is in excess of the usual amount in good quality tool steel it may be mentioned that this material gave good results in practice.

(To be continued.)

NEW GRIQUALAND WEST RAILWAY.

It is understood that construction work in connection with the Kimberley-Barkly West-Borrellskop railway will be started next week, and will give relief to Kimberley unemployed. While dealing with railway matters, it may be mentioned that the Chamber of Commerce have asked for the railway line to be continued from Koffyfontein to Modder River, a distance of about 35 miles, which would bring Kimberley about 50 miles nearer the coast than at present.

Transport Marvels of the Congo.

A SHIP THAT LEAVES THE WATER.

The following interesting article recently appeared in the "South African Railways and Harbours Magazine":—

Belgium has just decided upon a wonderful new scheme of transport that will make the Congo continuously navigable for hundreds of miles where now the journey has to be done in stages, involving much delay and expense.

The mighty African river, one of the world's greatest waterways, is navigable from its mouth to Matadi, a distance of 110 miles, and then for the next two hundred miles there are cataracts and waterfalls that prevent any boat travelling on the river for any great distance.

Either the goods must be unloaded from one boat, carried round the cataract, and loaded up on another for the next stage, or the original boat, after being unloaded, must be dragged out of the river, drawn round the cataract on dry land, and then launched and loaded up again on the other side.

Conquering the Cataracts.

This, of course, is a serious hamper to commerce, and the delay is enormous as there are no fewer than 32 big cataracts and falls, besides many minor rapids. When

Saving Time and Trouble.

The vessel will proceed up the river as far as the cataracts in the ordinary way, each hull having its own engine and propeller and rudder. Then, when it gets to a cataract, it will run on to a mono-rail built on girder trestles in the river and running right over the cataract into the river on the other side.

This mono-rail will be racked with teeth, and between the twin hulls of the boat will be a series of powerful toothed wheels. The engines of the vessel, when the boat mounts the rail, will no longer work the propellers, but will be switched over to turn the toothed wheels. These will grip the racked rail and carry the boat up and over the cataract, and down into the river on the other side. In this way the delay and expense of unloading and reloading the goods at each cataract will be avoided.

Ship Becomes a Train.

It is a wonderful idea, yet very simple. Already it has proved successful in a series of elaborate tests carried out

HOW THE "PUKKA PUKS" WILL RIDE UP THE CATARACTS.

The natives of the Congo Bas'n call the stern wheel steamers that ply on the great river "Pukka Puks."

these are once passed the river is navigable for a thousand miles.

The Belgians have now solved the difficulty of navigating the Congo over the two hundred miles. They are conquering the cataracts, not by blowing up the rocks, which would involve an expenditure of many millions of pounds, but by a novel scheme never tried before.

The boats that will navigate the Congo will be built with twin hulls connected down their whole length with girder brackets. They will, in fact, be very much like the twin engines and carriages used on the famous Lartigan mono-railway at Ballybunion, in Ireland.

on canals near Antwerp, and the work of building the mono-rails over the cataracts on the Congo is to be begun at once.

What will really happen is that the ships will steam up the Congo for just over a hundred miles, and then suddenly change into railway trains. Again they will become ships, then change back into trains, and so on till the two hundred miles are passed.

If the scheme proves as successful as the tests in Belgium and the prospects on the Congo suggest, it will no doubt be extended to other rivers that have similar difficulties, such as the Nile, Amazon and Yukon.

All Cables, Wires and Flexibles sold by the British General Electric Co., Ltd., are made at the Pirelli-General Cable Works at Southampton, England.

Immediate Deliveries can be given from large stocks held in this country.

PIRELLI-GENERAL WIRES & CABLES

"PIRELLI-GENERAL" Cables form an integral part in the successful application of Electricity to Mining, Industrial and Commercial requirements.

"PIRELLI-GENERAL" Wires and Cables are manufactured by the most modern and up-to-date methods; they embody all that science and experience can devise for the production of the best possible cables at the lowest possible prices.

Organising a Blast-Furnace Plant.

THE BUNKER PLANT—CAR DUMPERS—BOILER HOUSE.

(By E. E. Buttner, D.Ch.)

The Bunker Plant.

The bunker plant of a recently erected Continental iron works is made of iron construction throughout and consists of two parabolic bunkers, side by side, divided at intervals by cross-partitions. It is covered by a roof carrying bracket supports for several lines of ropeway, some full and some empty. Underneath the bunkers, which have electrically operated slutes, are tracks for the electric charging trucks. At the end of the bunkers is a truck repair shop served by a traverser. On the further side of the bunkers from the furnaces is a crane shed in which railway borne coke can be filled directly into the furnace skips. Any surplus coke beyond the daily consumption is discharged into the bunkers as a reserve stock in the event of any unforeseen stoppage of the regular supply, a point that taught a great lesson at the Pretoria iron mines during railway congestions. This model plant is also provided with electric ore supply trucks fitted with turntables, and electric coke trucks equipped with cranes, and also without cranes. Under the horizontal section of each hoist is an auxiliary crab. The charging platform carries an emergency charging truck and a travelling gantry crane for charging, repairs and replacements at the furnace tops.

In the case of a recent American plant, stock from the ore yard is delivered to Hoover Mason ore and coke bins, consisting of 10 double stock pockets spaced 14 feet on centres and one central coke bin located directly above the furnace skips. The bins are of heavy type steel construction with double louvres and 5 foot drums on each side. Two double compartment scale cars are used, equipped with doors at the bottom made of manganese steel. The cars are operated with railway type motors with standard drum controller, and are furnished with standard indicating and recording apparatus.

Car Dumpers.

The raw material is received on cars by a movable car dumper electrically operated at one of the most economically constructed plants at Midland, America. The track on which the car dumper travels runs parallel to the ore bridge yard. The car dumper is arranged for handling all types of open top railway cars. Interference due to the overhang of the ore bridge is eliminated by discarding the usual housing, which embraces the entire machinery floor, and covering only the motors and adjacent machinery with a small housing. In order to provide for the possible use in future of longer cars than those used at present, the framework of this machine may also be modified to the extent of making the distance between end posts several feet greater than would usually be designed. To reduce the travel of the ore bridges to a minimum and to enable the car dumper to deposit the stock directly opposite the stock piles, the stock must be unloaded from the car dumper into a concrete receiving pit running parallel to the entire length of the runway, whence it is removed by travelling bridges to the respective stock piles. In charging the bins at the furnace the bridge is placed over the pile of desired stock, and the bucket deposits its load into an ore transfer side dump car which travels on an elevated steel trestle above the yard level, the tracks of which are an extension of those on the stock bins. A long track should extend the full length of the trestle to the coke bin at the coke oven plant. After

the coke is delivered to this bin from the coke ovens, it could be conveyed to the central coke bin at the furnace by means of a one side delivery coke car. This car also could be electrically operated and provided with railway type motors, and have a cab on each end for housing the operator and control equipment. The coke from the central bin enters the skip buckets through chutes which contain manganese screen plates. The coke breeze is collected below the screens on one side of the skip bridge by a receiving hopper, which also receives the breeze from the other side by means of a belt conveyor, crossing under the skip bridge. From this hopper, the breeze passes into a bucket which in turn deposits its contents into a skip tub, which can be elevated on an inclined runway by means of an electrically operated hoist, and the breeze dumped into a storage bin placed alongside and above one of the cinder car tracks. When enough breeze has collected, it is discharged into a car through chutes with gates controlled by hand levers operated on the ground level. The hoist control should be so arranged that one pressure of the button results in a complete cycle of operation, consisting of raising, dumping and lowering the tub, and the automatic filling of the bucket. This method saves a whole gang of labourers.

Boiler House.

Each boiler usually is equipped with superheaters giving 100 deg. F. superheat to the steam, with perforated brick chimneys to remove the flue gases from the boilers. Soot cleaners also make valuable accessories for boilers, as well as recording flue-gas temperature gauges and draft gauges. The flue gas is analysed by an automatic recording C.O. instrument. Recording steam pressure and temperature gauges should be installed on each head if the header is designed so that the coke oven plant may be operated with two or three boilers separate from the rest of the plant, so as not to receive the steam pressure fluctuation due to change of blast furnace and mill operations. All boilers are fitted with feed-water heaters and travelling grates. To utilise the exhaust heat from the gas engines, there are waste heat boilers.

We have only mentioned those factors in organising a blast furnace plant which make for the strictest economy, as is the case with the most recent plants constructed by firms whose total experience ranges through scores of years. If such establishments practice the utmost economy in production, it behoves all South African iron works to certainly take hints, as it is a case of the one competing against the other. So far from local steel works competing against each other, their combined efforts could barely hold the field against overseas combines nowadays.

MINES DEPT. EXAMS. CERTIFICATES AWARDED INSTITUTE.

THE "PASSING" OF THE DIAMOND INDUSTRY.

To the Editor, *S.A. Mining and Engineering Journal.*

Dear Sir,—In your issue of the 4th instant one perused an article under the above heading, to which I was pleased to note that you had added a footnote to the effect that you did not endorse the writer's views. Diamonds are admittedly a luxury, but in spite of this, if "Engineer" will condescend to pay Kimberley a visit again, just twelve months from date, he will again find all the mines there working and things there very much as he found them on the occasion of his first visit there.

If he will go along the River Diggings to-day he will find that diamonds are still being purchased, and at quite good figures, too; prices approximating to those ruling in 1916, not boom prices, of course. I wonder if "Engineer" has ever watched the faces of a group of people, people in no way interested in the diamond industry, round a sorting table? Watch the expression of tense expectancy on those faces, watch the involuntary movement of their hands when a stone is unearthed, then talk to us about the "passing" of the diamond industry.

Again, take up your station in a large jeweller's store, opposite the diamond trays, just before Christmas time. Watch the expressions on the faces of the fair sex, all grades, overhear their remarks. There is only one conclusion one can come to, and that is, that as long as there is a woman in the world to wear diamonds and a man to purchase them for her, just so long will the demand for diamonds exist.

The diamond industry has felt the effects of the world-wide slump, exactly the same as the wool or hide markets have. Wool has recovered a bit and so have diamonds for that matter. Even though poor old Kimberley is a one industry concern, her mines will be running before the end of this year, and prosperity will again be the order of the day there.—Yours truly,

W. B. COLLINS.

The Week in the Sharemarket.

A BETTER TONE—BUYING FOR INVESTMENT—DIAMONDS IMPROVE.

In some quarters it is anticipated that the market will fall on the definite settlement of the strike, but we are of opinion that the exception may prove the rule in this case in view of the fact that the recent buying of good shares has been chiefly for investment and not for speculation. A certain amount of speculation has, of course, been taking place, but the "profit-taking shares" thrown on the market from this source will probably be easily absorbed.

With the satisfactory settlement of the industrial trouble the whole position of the Union, both mining and commercial, will be on a sounder basis, and, although immediate financial difficulties have undoubtedly to be overcome, the eventual result will be beneficial by reason of the attraction of capital to this country, enabling the extension of present, and the opening up of future, concerns.

The market during the week has shown slight fluctuation. The general opinion is that the strike will collapse at an early date.

An easier tendency has been noticeable, due, perhaps to speculators realising shares bought for a turn the previous week in the hope that a sudden collapse of the strike would take place.

Modders fell from 66s. 6d. to 64s. 9d.; Areas from 77s. 6d. to 75s. 6d.; Modder Deeps from 38s. 3d. to 37s. 9d.; Gedulds from 48s. 3d. to 47s. 9d.; and other stocks more or less in proportion.

Diamonds continue to show small activity, the leader, Consolidated Diamonds, fluctuating between 15s. and 16s. West Ends showed a slight easing from 24s. to 22s. 6d.

Thursday Morning.—The market again shows a hardening tendency, particularly in diamonds. Consolidated Diamond Debentures, buyers, £110; sellers, £117 10s. This stock is considered to be worth considering at this price. West Ends have improved to 24s. buyers.

Mining Men and Matters.

OBITUARY.

Lieut-Colonel Gordon Sandilands.

We greatly regret to have to record the death of Lieut.-Colonel Gordon Sandilands. Colonel Sandilands had for long been associated with the social and mining life of the Witwatersrand. He was universally liked and respected, and the news of his death from heart seizure on Friday of last week came as a shock to a very wide circle of friends.

Lt.-Col. G. Sandilands came of a military stock. He was a grandson of Lieut.-General Phillip Sandilands, R.A., and third son of Major-General P. H. Sandilands, R.A. He was educated at Canterbury, and subsequently for some years in Germany. He was gazetted to the Royal Scots, his regiment then being stationed at Capetown. He took part in the Zulu Rebellion of 1888. He returned to England with his regiment and studied at the Staff College under Lieut.-General Sir Henry Hillyard, K.C.B. He was a contemporary of Field Marshal Earl Haig and a close friend of the late Sir Hamilton Goad Adams, a former Lieutenant-Governor of the Orange River Colony, and of Lord Allenby, at present High Commissioner in Egypt.

Colonel Sandilands took part in the Jameson Raid, and after the cessation of hostilities in the Anglo-Boer War he entered the mining and commercial life of the Rand, joining the Corner House. Subsequently he became associated with the Anglo-French Navigation Collieries and other companies, and ultimately joined the Sir Abe Bailey group, with which he was connected up to the time of his death.

He raised and was commanding officer of the Transvaal Scottish Volunteer Battalion, and during the late War, at General Botha's special request, he raised and commanded the 2nd Regiment of the Transvaal Scottish.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material and Engineering Trades.

GRADUAL RETURN OF MINERS AND RESUMPTION OF INDUSTRY PREDICTED—IRON AND STEEL—SCOTTISH IRON AND STEEL TRADE IN 1921—UNION'S GRAIN ELEVATORS—TIMBER AND BUILDING MATERIALS—GOLD INDUSTRY PAYS OUT 50 PER CENT. AS AGAINST 20 PER CENT. BY OTHER INDUSTRIES—BRITISH TRADE RETURNS FOR 1921—OILS AND OIL SHALES.—WIRELESS.

General.

Despite the rejection by the Federation of the Premier's appeal to restart the mining industry, not a shadow of doubt exists in the mind of the community that, freed of restraint of leaders and unions, the majority of the miners would gladly return to work. A secret ballot on this issue would, it is confidently felt, at once establish the truth of this oft-repeated assertion, but for reasons which are perfectly obvious to the man in the street, the Federation will have none of it. Discretion is, of course, a very laudable quality and cannot be too highly commended, except in such cases where the motives underlying such action, or rather inaction, are so transparently evident. It is generally conceded that the golden bridge offered by General Smuts was, under the circumstances, the best possible solution of the present impasse. Nor, in the opinion of those best qualified to judge, will such appeal ultimately fail of success. During the past week a number of miners have already returned to work, and with the help of mine officials, a tentative effort has been made towards restarting the industry. Whether the present dribble of returning miners will, as time passes, assume larger proportions and eventually be the means of stopping the disastrous struggle remains, of course, to be seen, but the consensus of opinion in the commercial community undoubtedly is that it will, and that, without any fuss or formal declarations on the part of the S.A.I.F. the industry will shortly be enabled to resume operations on a scale, which, though it is bound to fall short—unfortunately, on account of the aggravated economic factors which have intervened during the strike—very short of the level obtaining before the 10th January, will still hold out hopes of steady and increasing improvement. General Smuts has intimated the intention of the Government to provide employment for thousands of the workers thrown idle by inexorable economic laws, by the undertaking of large railway, irrigation and other public works, which should go far towards relieving a great part of the hardships caused by the steady decline in the price of our gold product and its automatic effect on the cost of production. A leading commercial man thought that the acceptance by the Natal colliery workers of a cut of 3s. 6d. in wages would be an object lesson to our miners, and he had no doubt whatever that the men would return to work in ever increasing numbers; in fact, he was sanguine that the coming week would see the break up of the present impossible position, and with it, of course, the disintegration of the Federation. The workers, he said, would fall back upon General Smuts' appeal and make that the basis of the final settlement. He thought that there was no doubt about there being a very rocky road ahead of us for some months, but that eventually we should emerge from our present difficulties and progress towards better and more stable conditions. The 10th of this month was the first time for many a long day that no output was declared by the industry. The price of gold during the five weeks and more that the strike has lasted has declined about 3s. per fine ounce, with the certainty of still further falls in the near future. What effect this will have on many of our gold mining propositions, in the absence of very drastic reductions in our production costs, it is unnecessary to dwell upon. Several acts of sabotage have been reported,

but the precautionary measures adopted by the police appear to be very effective, and although several strikers have been arrested, no serious trouble, as was at one time thought probable, has as yet occurred.

Prices generally all round, in the absence of all activity, are inclined to sag somewhat. Timber comes very firm in prices from oversea, but locally there is no appreciable change in quotations.

Iron and Steel.

A prominent importer of mining material says that during the whole time of the strike small quantities of bar iron and steel have been going out, of course not of any great magnitude, but still, under the present untoward conditions, of a rather surprising quantity. During the past week there have been rather more inquiries. Quite a number of tenders are being called for. The S.A.R. tenders for the supply of copper tubes and boiler and other steel for their yearly requirements, approximately about 222 tons, closed on the 16th inst. A large importer said one redeem-

ing feature of the position was the strength of the share market, showing confidence in financial quarters that things were after all not so bad as some people imagine. He personally thought that about the middle of the year things were going to be bad here; that a lot of men would be out of employment, and that the failure of some of the smaller firms might be expected, but that for those firms which succeeded in weathering the storm business would gradually improve.

Latest nominal quotations.—Dunswart iron, 22s. per 100 lb. basis price; Union Steel Corporation, Ltd., 22s.; imported iron and steel, flats, small, 33s. to 40s.; larger sizes, 30s. to 38s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 37s.; $\frac{3}{8}$ in. iron, 30s. to 32s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ iron, 31s.; steel, 37s.; $\frac{3}{4}$ in. round iron, 30s.; steel, 33s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 30s.; channel and joists, 35s. 6d.; shafting, $\frac{3}{8}$ in. to 2 in., 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{8}$ in., 22s. to 23s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 45s. to 50s. per 100 lb.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 43s. to 48s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lb.; rivets, $\frac{1}{4}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lb.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d. per lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb.; $\frac{3}{8}$ in., 2s. 11d. per lb.; 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ to 1 $\frac{1}{2}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{1}{2}$ d.; $\frac{1}{4}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 30s. to 35s.; shovels, 52s. 6d. to 57s. 6d.; wheelbarrows, 47s. 6d.; picks, 37s. 6d. to 67s. 6d.; pick handles, 21s.; hammer handles, 14 in., 7s. 6d.; 18 in., 9s. 6d.; 24 in., 13s. 6d.; 30 in., 18s. 6d.; 36 in., 35s.; barbed wire, "Shorthorn," 69 lb., 13 $\frac{1}{2}$ gauge, 22s. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bulb tee fencing standards, 14 lb. 27s. per dozen; 12 lb., 25s. per dozen; black baling wire, 14 gauge, 19s. per coil, 100 lb.; 12 gauge barbed wire, 25s. retail. Screening, 3s. to 9s. 6d. per sq. yd.; cyanide, 1s. 7 $\frac{1}{2}$ d.; zinc shavings, 1s. per lb.; asbestos, white, $\frac{3}{8}$ in. to $\frac{1}{2}$ in., £35 per ton; $\frac{1}{2}$ in. to $\frac{3}{4}$ in., £50 per ton; $\frac{3}{4}$ in. to 1 $\frac{1}{4}$ in., £80 per ton; 1 $\frac{1}{4}$ in. to 2 in., £175 per ton; Blue, No. 3, £25 per ton; No. 2, £34 per ton; No. 1, £45 per ton; short, £20 per ton. Tin plates (L. C. Cokes), 20 in. x 14 in., per box f.o.b. Swansea, 19s. 3d. Galvanised sheets, 15 $\frac{3}{4}$ d. to 16d.

Second-hand Machinery.

There has practically been nothing done since last week in second-hand machinery on account of the strike, but it is hoped that there may be better news next week. It will, it is generally admitted, take some time for the works of the different mines to be in operation, and when, as is expected, other mines close down, there will be a lot of spares to be had and batteries and other parts of machinery. There have been several inquiries for machinery for industrial concerns and also inquiries for small batteries for up country, and for working some of the dumps along the Main Reef. Small batteries are practically unobtainable. The second-hand dealers in machinery, like others, have had a rather bad time, and are hopefully looking forward to the restarting of the mines.

Projected Huge Iron and Steel Industry in South Africa.

Mr. Stanley R. Kay, mining and civil engineer and an iron and steel expert, has been investigating the possibilities of establishing an iron and steel industry in the Union on a

big scale. Mr. Kay, who has left for England, represents an influential group of ironmasters in England, and without going into details, has assured interested parties in the Union that the establishment of a huge industry will shortly take concrete form. Mr. Kay's researches and tests of ores available for the production of high-class iron and steel have been very successful, and huge reserves, capable of carrying on the industry for 50 or 60 years, have been proved, while other sources will, no doubt, be developed. The ore Mr. Kay has submitted to the test is, he says, entirely free from deleterious ingredients and carries a high percentage of metallic iron. The experience already gained by the Union Steel Corporation at Vereeniging in the production of steel goods for the market, has been remarkably successful, and foreshadows potential success for the establishment of the industry on a much larger scale. The difficulty in the past, says Mr. Kay, has been mainly the lack of sufficient capital to develop the industry, but in this instance that trouble will not arise. Given sympathetic treatment by the Government—and that is of the utmost importance—such an industry can be established with every prospect of success.

The Broken Hill Proprietary's steel works at Newcastle, Australia, which recently suspended operations, are now re-opening, says *The Times*, on a basis which will reduce the number of employees from 5,500 to 1,800. The reasons for the step are the rapidly increasing importations which the new tariff is ineffectual to restrict, and the increase in wages and decrease in hours of work through the decisions of the Arbitration Courts. The high cost of coke in Australia and the heavy local rates for transport are contributory causes.

Review of the Iron and Steel Trade of Scotland during 1921.

1921 has been one of the most depressing and unsatisfactory years within memory. Business in all directions has

been very flat, with the result that prices have been continually on the down grade. It has been a year of especial difficulty for manufacturers, and its close finds them accepting business in many cases at a loss. The Continent has been a formidable competitor during the past year, aided as they have been by the incidence of exchange. It has been a trying period, but it is thought that the worst is now over, and that with prices on a more competitive level, 1922 will see a gradual recovery.

Pig-iron.

The year opened with the pig-iron trade just recovering from the strike of the coal miners and the inroad of Continental pig-iron, making the sale of the local product more difficult week to week. Some of the ironworkers had not thought the inducement to start sufficiently bright, and many of the furnaces therefore were either closed or damped down awaiting better times. The further miners' strike which started on April 1 and lasted for three months naturally brought the pig-iron industry, along with the other iron and steel-producing plants, to a complete standstill. It was not until several weeks after the settlement that one or two of the iron masters ventured to blow in some of their furnaces once more.

By this time, however, the Continental grades of pig-iron had been firmly established, and, in spite of continued reductions on the part of local sellers, it was obvious that this competition could not be met. Reductions in wages and cheaper raw material have since enabled producers to name lower prices, but coal and railway rates will require to be further reduced before ironmasters are able to stem the inflow from Continental sources. The pig-iron industry is wholly dependent on the demand for finished iron and steel, and these branches of industry are at present very much depressed. While evidence is not wanting of slight improvement, with inquiries increasing, the volume of business is insufficient to keep more than half-a-dozen smelters going. At the beginning of 1921 No. 1 foundry pig-iron was about £15, while to-day it is £6.

Steel.

At the beginning of 1921 the Association prices were £25 10s. and £24 10s. respectively for ship-plates and angles, and these figures were 40s. and 20s. under the highest points reached in 1920. Business was dull to start with, and as work on hand was finished, makers found difficulty in getting specifications to keep the mills going. Reductions made in prices from time to time had not much effect in bringing forth or encouraging business, chiefly on account of the fact that trade in all lines was becoming increasingly slack, and very little material was required. In the shipyards, for instance, the wholesale cancellation and suspension of ships which took place at the end of 1920 had left most of the builders with large stocks of plates and sections on their hands, and these were naturally used up first before ordering new supplies. In addition to this, the Continental works were offering ship and boiler plates at very much lower figures. In all, the reductions made by the Association up to the date when prices were freed totalled £13 in the case of ship plates and £12 10s. in the case of sections, making the prices in October last £12 10s. and £12. Boiler plates were not reduced so quickly nor to the same extent as ship plates, this being due to some extent to the fact that boiler plates could not be made from British hematite, the latter remaining at a very high price owing to the high cost of coal and the recurring labour troubles.

For ship plates, on the other hand, makers could use the Continental basic pig-iron, which was very much cheaper. The total reductions in price of boiler plates amounted to £17 10s., making the price at the close of 1921 £14. Up to now the local Scottish works have not made such drastic cuts as the English makers. The present average home prices, which are about £10 for ship plates and £9 10s. for sections, are probably unprofitable for the market, and business is only taken to meet on-cost charges, keep machinery running, and give employment.

Manufactured Iron.

As in the case of steel, 1921 opened with iron prices on the down grade, the price of Crown iron for home delivery being £27 10s., or 50s. under the top figure for 1920. For the earlier part of the year the bar-iron works had about enough to keep them running, but makers later on began to feel the pinch, as for the little new business offering the Continental works were outbidding them all the time. During the coal strike April-June the works had to close down almost entirely for lack of fuel, the Continental makers meanwhile reaping the benefit. Since the settlement the works have only been running on a reduced scale. The price of Crown iron at the close of 1921 was £12 10s. for home delivery. The steel branch of this industry has had even a more trying time, as they have had severe Continental competition, and had it not been for the large importation of Continental semi-finished material, they would have been pretty well out of business. The present basis price of steel bars is about £10 5s. The Continental works are far from satisfactory in the matter of deliveries, and this is a favourable factor for the British works. It is hoped that the darkest hour has been passed, and that 1922 has better things in store.

Black Steel Sheets.

The sheetmakers have had rather a better year than the other branches of the trade. They were early affected by the falling off in export business, and at the beginning of the year their prices had already been reduced from the highest level by £9 10s. per ton to £29 basis. Frequent reductions were made in prices, and for export the makers cut to the very lowest. Later on in the year the export trade improved somewhat, as the Continental works had fairly well-filled order books. At the moment the prices of light British sheets are practically the same as the Continental prices, and the thinner gauges can be bought more

DAVIS - MADE

JOHN DAVIS & SON (DERBY), LIMITED.

THE DAVIS SELF-RECORDING STEEL TUBE MERCURY THERMOMETER OR PYROMETER

with Flexible Connecting Tube. Supplied in nickel-plated iron case, 9in. outside diameter, 8in. chart; arranged for 12 or 24 hours' record as required. For super-heated steam this instrument is provided with an iron protection tube 6in. long and screwed 3/4in. gas, but extra length can be provided at an additional cost. The tube is filled with mercury or iron filings, but can only be used in a position where it can be suspended vertically, not horizontally or inverted. To specify Davis Thermometers is to take no risks.

Sole Agents for South Africa:

BARTLE & CO. LTD.,

Loveday House, Box 2466, Phone 3551,
JOHANNESBURG.

And at KIMBERLEY and DURBAN.

HIGHEST GRADE

advantageously in Britain. The present basis price is £12 5s. for $\frac{1}{8}$ in., which shows a fall of £16 5s. on the year. Scrap.

1921 was an extremely poor one for the scrap trade. Prices have declined steadily, which, of course, is in keeping with the fall in selling prices for new products. Export business was practically non-existent for the greater part of the year, but during the last few months there has been some revival of trade with Far Eastern markets. Heavy malleable iron was selling at the early part of the year around £7 to £8, but to-day 60s. per ton is considered to be about proper value. Steel scrap is in just the same position, having fallen during the year from £6 to about 47s. 6d. per ton. Turnings and borings are now about 30s. per ton, as against £5 in January, 1921. All other scrap materials have been similarly affected, and buying has been on a very restricted scale. Looking forward to 1922, it must be said that although no material improvement has yet taken place, a more hopeful feeling prevails. It is thought probable that in the near future railway rates will be reduced, which will mean lower manufacturing costs. Coal is considered still at too high a figure, and the price will have to be considerably modified before manufacturers can regain a sound competitive position.

The Union's Grain Elevators.

The *Times* says the completion of the works should place South African maize growers in a most favourable position to compete with rivals in other countries by the time the 1924-5 harvest is ready for export.

The *Manchester Guardian* states that the consensus of opinion is that under the new system of the grain trade the Union will save fully £500,000 per annum, after making adequate provision for interest charges on capital expenditure, depreciation, and all working costs. "It is a foregone conclusion, says the *Guardian*, that the enterprise of the South African Government will be repaid manifold within a short time, and the maize exports especially will soon reflect altered conditions in transport." As regards the contracts for these elevators, the only orders given to firms other than British were to American houses for the supply of driers and automatic weighers and sacking weighers. All other work of this description is to be carried out by the firms of Messrs. Leyland and the Birmingham Rubber Co., which are supplying the conveyor and elevator belting. The total length of the various belts required in connection with the conveyor is, it is stated, 17 miles, the width varying from 12 to 30 inches. These belts form the actual bearing service for the conveyance of maize, and must be capable of sustaining a considerable tensile strain within the narrow limits of elongation.

Messrs. Ruston and Hensby, of Lincoln, are reported to have secured a contract for 38 heavy oil engines to be supplied to the South African Railways and Harbours Board for driving grain elevators and for electric lighting purposes in different parts of the country.

Germany's Trade with America.

A Washington message states that the annual report of the United States Department of Commerce for 1921 shows that the exports of steel by American and European countries during the year were as follows:—United States, 2,309,000 tons; Germany, 1,250,000 tons; Britain, 1,650,000 tons; France, 130,000 tons; Belgium, 90,000 tons.

Germany is not only competing with the United States in the world's markets, but is selling to the United States more iron and steel than any other country; thanks to low prices and prompt delivery.

Timber and Building Materials.

Business is practically at a standstill as regards the building operations, although a few odd jobs here and there are being proceeded with. The market for timber remains very firm at home. Corrugated iron is slightly weaker.

Prices.—3 x 9 deals, 1s. to 1s. 1½d.; scantlings, 11d.; beaver boards, 4½d. to 4¾d.; floorings, 6¾d. to 6¾d.; ceilings, 4¾d. to 4¾d.; Oregon, 7s.; pitch pine, 8s.; corrugated iron, 8½d. to 9½d. Furniture timber: Burmah teak, 18s. to 19s. 3d. per cube here for first quality, 16s. 6d. for second at the coast; American oak, 1 in., 10d.; 1½ in., 11d.; 2 in., 11½d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1½ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per foot. Prices for bricks are: Mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Second-hand Iron and Timber.

The second-hand iron and timber yards are still marking time awaiting a settlement of the strike. Timber remains at 8d. to 9d., iron at 6d. to 7d.

Production Statistics.

Outlays of other industries compared with gold industry—20 per cent. as against 50 per cent.:—Wages, White, 1916 £6,739,966, 1920 £13,922,258; other, 1916 £2,172,891, 1920 £5,196,832; materials, 1916 £22,315,587, 1920 £53,851,256; products, 1916 £40,434,882; 1920 £92,919,844. The total salaries and wages paid were £19,119,090 out of a gross output of £92,913,000, as compared with a total of £17,363,000 paid in salaries and wages out of a total output of £34,653,000. While industries paid out 20 per cent. of the output in wages and salaries, the gold mines paid out 50 per cent.

Rand Wages.

Apart from gold mines and quarrying, the Rand pays out in wages to all employees £7,523,000 a year, as compared with £3,517,121 by the Cape Peninsula and £2,168,701 by Durban. Of this total £6,148,036 is paid to whites and £1,374,972 to coloured. The following is the list of concerns on the Rand which contribute to paying out £7,523,000 a year:—Raw materials treated, £12,903; processes in stone, clay, etc., £307,819; woodworking, £193,151; metal works, £3,160,911; food and drink, £481,635; clothing, fabrics, etc., £308,354; books, printing, £482,554; vehicles, £241,447; furniture, £144,649; drugs, chemicals, £235,491; surgical, dental, etc., £6,605; jewellery, etc., £28,476; heat, light, power, £863,346; leather, £67,100; house building, £933,843; other industries, £54,724. The average wage paid to whites in the above industries in the Union is £244 per year, as

compared with £295 on the Rand; and the average wage to coloured is £46 in the Union and £44 on the Rand. The value of South African raw materials used in the Transvaal is £8,634,645, out of a total of £17,699,000, and the total output is £33,225,833.

British Trade Returns—Big Slump.

Startling figures showing the slump in British trade are disclosed in the full return by the Board of Trade of the accounts of the United Kingdom for December and for 1921. The following figures for exports reveal the position on a comparison of the last two years with 1913:—703 millions in 1921, 1,334½ millions in 1920, and 525¼ millions in 1913. The present value of money is, of course, lower than in 1913, but is higher than in 1920. Imports also seriously declined, as the following figures show:—1,086¼ millions in 1921; 1,932½ millions in 1920; 768¾ millions in 1913. The decreases of exports and imports last year, therefore, were:—Exports, £631,500,000; imports, £846,000,000. Towards this decrease grain and flour contributed £93,550,914, white dutiable food and drink added another £75,645,605. Under the head of raw materials and articles mainly unmanufactured, the largest decrease was in raw cotton and cotton waste, where the falling off was £183,348,972, while other big decreases were wool, raw and waste, and woollen rags, £49,693,984; and oil seeds, nuts, oils, fats, resins and gums, £43,961,492. The only increase is coal, which was up by £12,103,318. The exports decrease for the year show that by far the largest item was cotton, in connection with which there is a reduction of £222,710,360. Woollen and worsted yarns account for another £79,755,281, while iron and steel show a decrease of £65,134,908. The only substantial increase is in machinery, the amount being £11,198,127. The exports for December, as compared with that month in the previous year, are down by 37¼ millions, and the imports were down by over 57 millions.

Oils.

Turpentine is going at about 96s. a case, 8 imperial gallons; white lead at about 76s. 6d. per 100 lb.; linseed oil at about 7s. per imperial gall. A cable received early this week announced a rise of about 8d. a gallon in the latter at home, which will have the effect of hardening the price here slightly. Oil is to-day standing at the lowest figure it has reached for a long time.

Ship Yards and Shipbuilding.

The firm of Armstrong, Whitworth & Co., Ltd., are at the head of the list of British shipbuilders for merchant tonnage launched during 1921. Fourteen vessels, of an

aggregate tonnage of 98,390, were launched by the firm during the year.

More than half the shipyards of Britain were lying idle from March to December last year. Only 160,000 tons were laid down compared with 620,000 in the corresponding period of 1908, which was the worst pre-war year record. These facts notwithstanding, a proposal to abolish the war bonus forthwith in order to regain work for the yards was rejected unanimsly by the trade unions in conference with the shipbuilding employers. This living bonus amounts to 26s. 6d. a week. The Unions refuse to agree to the reduction, even by instalments, declaring that wages fell last year by 17s. 6d. per week.

Wireless.

The Marconi Company has made an offer to India similar to the one to South Africa for a direct wireless communication. Great Britain has, as a matter of fact, for the past month or so been in direct communication between London and India, and the results of the trial have been declared quite satisfactory.

Canada, Australia and India want direct wireless communication with Britain, and it is believed that if the South African Government took the same line as the Government of Australia, the British Government would drop the Imperial wireless chain scheme, especially in view of the heavy cost involved; but there can be no direct wireless communication between Britain and South Africa until the necessary licence is granted by the Imperial Government, and there are powerful influences at work to prevent this.

Cost of Living still Declining in Britain.

The official *Labour Gazette* says there was a reduction of seven points in the official cost of living index in December, 1921. On December 31 the figure was 92 per cent. above that of July, 1914, being the lowest recorded since March, 1918. It compares with 165 per cent. on January 1, 1921. A net reduction of about £6,000,000 occurred during the year in the weekly full-time wages of over 7,000,000 people in these industries, where the pay was governed by the cost of living figures. In 1920 the net advance was £4,800,000 for 7,700,000 workpeople.

Projected Railways Amalgamation.

According to the *Manchester Guardian*, the directors of the London and North-Western Railway, which has already amalgamated with the Lancashire and Yorkshire, are now negotiating for amalgamation with the Midland Railway, whose issued capital is 160 millions, the largest of any British railway.

THE TRANSVAAL CONSOLIDATED LAND & EXPLORATION CO., LTD,

(Incorporated in the Transvaal.)

NOTICE TO SHAREHOLDERS OF EXTRAORDINARY GENERAL MEETINGS.

NOTICE IS HEREBY GIVEN that an Extraordinary General Meeting of the Shareholders in the above-named Company will be held in the Board Room, Second Floor, The Corner House, corner of Commissioner and Simmonds Streets, Johannesburg, on Thursday, the 20th day of April, 1922, at Noon, for the purpose of considering, and if thought fit passing, with or without modifications, the following resolution, viz.:-

"That the Capital of the Company be reduced from £728,410 10s., divided into 971,214 shares of 15s. each, whereof all are issued as fully paid to £607,008 15s., divided into 971,214 shares of 12s. 6d. each fully paid, and that such reduction be effected by returning to the holders of the 971,214 shares the sum of 2s. 6d. per share in cash, and by reducing the nominal amount of all the said 971,214 shares from 15s. to 12s. 6d. each, and that the Chairman for the time being of the Company or of the confirmatory meeting be and he is hereby authorised to apply by petition to a competent Court for confirmation of the said reduction."

AND NOTICE is also hereby given that a further Extraordinary General Meeting of Shareholders in the said Company will be held at the same place on Friday, the 12th day of May, 1922, at Noon, for the purpose of receiving a report of the proceedings of the first-mentioned meeting and of confirming, if thought fit, the said resolution as a Special Resolution pursuant to the provisions of the Companies' Act, 1909, Transvaal.

The Share Transfer Books of the Company will be closed from 14th to 20th April, 1922, both days inclusive, and from 6th to 12th May, 1922, both days inclusive.

Holders of Share Warrants who desire to be present or represented at the Meetings must deposit their Share Warrants at the places and within the times following:-

- (a) At the Head Office of the Company, in Johannesburg, at least three days before the time appointed for the holding of each meeting.
- (b) At the London Office of the Company, No. 1 London Wall Buildings, London, E.C. 2, at least 30 days before the date appointed for the holding of each meeting.
- (c) At the Office of the Crédit Mobilier Français, 30 and 32 Rue Taibout, Paris, at least thirty days before the date appointed for the holding of each meeting. Only Share Warrants bearing French stamps can be deposited at the Crédit Mobilier Français.

And shall otherwise comply with the "Conditions as to the issue of Share Warrants" now in force.

Upon such deposit a Certificate, with Proxy Form, will be issued, under which such Share Warrant Holders may attend the meeting either in person or by proxy.

By Order of the Board,

H. J. SUMMERLEY, Secretary.

AT WORK ONCE MORE.

A scene on a Rand Reduction Plant. In response to the Prime Minister's request, the industry has resumed working and, despite the intimidation campaign of the strikers, a large number of stamps are dropping.

The Week's Strike Developments.

STRIKERS NEW TACTICS — VIOLENCE AND INTIMIDATION — ONE QUARTER OF THE NATIVE LABOUR FORCE GONE — POSITION AT VEREENIGING.

During last week-end the attitude of the strikers towards the men who were returning to work assumed a rather ugly complexion, and on Monday and Tuesday unmistakable signs of a tendency towards violence were to be observed, particularly in the central area, at Germiston, and in the neighbourhood of Benoni.

Disagreeable Incidents.

An incident, indicative of the dangerous mood of some of the strikers towards the so-called "scabs," took place on Monday afternoon in Victoria Avenue, Benoni. It seems that a man who is working at Modder B had loaded his household furniture on a trolley with the object of having it conveyed to the property, where he intended to reside. Knowing the risk that existed in the circumstances, he was afforded police protection, but the crowd which had collected began to swell to alarming proportions. A number of women and children stood in front of the horses, when a man stepped forward, and before the police realised his motive succeeded in throwing something inflammable on the furniture and setting it alight. Detectives Whittow and Foley, who were eye-witnesses of the incident, rushed forward and secured the man. They hurried him away, whilst the excited mob were kept at bay by the police. They were no sooner out of range when the Benoni commando intercepted them. The two detectives were captured, during which time they were roughly handled, so much so that Foley had

At Springs Mines in the Pre-Strike Days.

subsequently to be conveyed to hospital. Incidentally, the man who tried to destroy the furniture escaped. Foley and Whittow, in spite of their bruised and battered condition, were marched through the streets by the commando to the Workers' Hall. In the meantime police reinforcements were sent to Victoria Avenue, where the crowd was dispersed and the trolley, with its load of furniture, escorted to a place of safety. After the affair with the commando the police reinforcements cleared the street, and a mixed body of

mounted police went to the Workers' Hall, which was practically surrounded. A huge crowd collected, and there was intense excitement, but eventually Mr. Harry Day, chairman of the Benoni District Strike Committee, spoke to the police and apologised for the manner in which the two detectives were treated.

Three officials employed at the Van Ryn Deep were way-laid on Monday whilst on their way to the Benoni Hotel to lunch. They were assaulted, and one in particular is said to be in a serious condition.

On the Far East Rand—The "Cockpit" of Industrial South Africa.

Trouble at Fordsburg.

Fordsburg passed a feverish Monday night. The disorder originated in violent speeches, increased to an alarming extent when strong detachments of police swooped down and laid siege to the local "trades hall," and reached its climax on the Fordsburg commando, that had been hastily assembled, being reinforced by a mob from town; then thousands of lungs were strained in a vain endeavour to drive the police from the neighbourhood.

Fracas at Fordsburg.

A section of the strikers were not long in taking the hint of the Central Strike Committee issued on Monday evening. The Central Strike Committee wrote to the Tramway and Lighting Committee stating that it had come to the notice of the committee that police were escorting "scabs" to work and using the trams for the purpose. The Strike Committee informed the Tramway and Lighting Committee that it had passed a resolution stating "That all tram motormen and conductors are hereby requested to refuse such passengers, and that your association issue instructions to your members to carry this into effect." A copy of this resolution was forwarded to the Town Clerk, the Tramway and Lighting Committee, and to the Tramwaymen's Union. What might be called a sequel to this resolution was forthcoming on Tuesday morning, when the Fordsburg commando stopped two trams on the way to Crown Mines and pulled a man from each of them. It was subsequently ascertained that the Fordsburg commando at the beginning of its march to Germiston, stopped two tramcars travelling to the Crown Mines, and took a "seab" from each of them, despite the fact that both were attended by an escort of six policemen. Entering Germiston a notice-board was taken off a mine property and the words "We are two scabs" scribbled on them. This board the two men were forced to carry. In Germiston the Fordsburg commandos joined the others, and a demonstration was held in the vlei between Joubert and Victoria Streets. Speeches were being delivered when presently six mounted police

under Lieut. Whelan arrived and tried to rescue the two "seabs." The strikers charged them, hurled stones at them, and finally drove them from the ground. Lieut. Whelan was hit with a stone on the thigh. Sergt.-Major Hennings was struck on the temple and unseated. While he was on the ground in a semi-dazed condition he was surrounded by strikers. Trooper Lourens seeing his plight galloped into the mob, and with amazing swiftness lifted Hennings into his saddle, and rode off with him. Hennings was deprived of his revolver by the mob. He was removed to the Germiston Hospital. His condition is serious.

Men Returning to Work.

Despite these incidents, the "return to work" movement was steadily maintained on Monday. On one mine on the Far East Rand as many as 22 men came to sign on. On another property 18 put in an appearance, while in a third instance the mine increased its complement by 16.

The "return" at one of the Central Rand mines was ten, while the rest of the total of a hundred all told was made up of batches of five or six, there being hardly a mine which did not receive a few.

The mining industry looks upon this rate of return complacently, for the average is maintained steadily at a level of something like a hundred men a day. Thus the position from the point of view of the continuance of the industry becomes stronger every day, and (it is held) that of the strikers weaker by reason of this depletion of their ranks and the progressive contraction of the number of jobs which are available.

Where the strikers lost ground most notably, however, was at Vereeniging. The reports received from this centre during Monday morning were that the V.F.P. Company's power station had started the previous day with a full complement of about 30 men, including drivers, firemen, greasers, and other grades.

At the Cornelia Colliery there was also a rush back to work, and the company was reported as being in full operation, having taken on all the men it required, and even being in a position to pick and choose.

The position, as reported on Monday, on the Crown Mines is that they are managing to pull about 2,000 tons of rock daily. Everything was quiet. There has been no pulling-out on the property, but some men have been interfered with on the way to and from their work, and it is alleged that threats have been used to some miners' wives. Intimidation of this description is located chiefly round Brixton. The natives are working with a will on the Crown Mines.

On other properties of the Central area the situation on Monday was reported as being unchanged. The Robinson Deep reported a very good day's operations, and a satisfactory number of men returned.

Another Suggestion from the S.A.I.F.

Late on Monday night the special sub-committee of the Joint Executives prepared another utterly futile scheme for the settlement of the strike. The scheme asked for a Commission similar to the Sankey Commission in Great Britain and contained several preposterous demands upon the mining industries for the re-employment of strikers.

Returning Natives.

Quite a large number of travelling endorsements for mine natives were signed by the Native Department on Monday, the figure being 405. This brings the total of the mine exodus up to 44,246. Attention was called by an official of the Department to the fact that this figure means that the mines have now been deprived of one-fourth of their ordinary working native complement since the beginning of the strike. Even though the strike still continues, the mines have evidently employment for the boys left, for they are re-engaging any who do not wish to go home, and are also able to give employment to other boys who make application from outside sources.

Wednesday's Developments.

Colonel T. G. Truter issued a notification that "gatherings such as commandos or gatherings of smaller bodies of persons for unlawful purposes, such as interference with men who have returned or wish to return to work, or with their households, or attempts to damage any mine or other property, are unlawful assemblies under the common law." All law-abiding citizens are requested to assist the authorities by immediately giving information of any unlawful acts or contemplated acts by such gatherings.

The office of the Miners' Union, Ford-burg, was raided by the police at about 3 o'clock in the afternoon. A big crowd gathered outside, but no interference was offered the police, who, with the exception of two officers, seemed to be unarmed. No arrests were made.

The charges against four strikers of alleged picketing in Jeppe on Tuesday "to compel other persons to abstain from their work" were withdrawn in "E" Court, Johannesburg.

The total number of mines and works natives who had left the Rand labour districts from the period January 16 to February 21 was 44,622. The exodus is now lessening.

It was stated that four engine drivers on the Geduld Mine have returned to the ranks of the strikers, also one engine-driver from the New State Areas.

The engine-drivers and firemen who returned to work at the V.F.P. generating station at Vereeniging on Monday,

Police on Strike Duty on the Rand.

and ceased work again on Tuesday, did so, it is stated, on the ground of victimisation of those who had taken a prominent part in the strike movement.

Evidence was taken in "A" Court, Johannesburg, before Mr. J. C. Juta, against P. Fisher, alleged to have incited to violence in speeches at strikers' meetings. He was remanded till March 13 on £100 bail. Five other cases connected with the strike were remanded to the same date, in one instance bail being fixed at £100, and in the others £25 each. In a seventh case, that of Jeffery, the bail was made £50. Wm. Jolley and John McKerrell were remanded to Germiston.

On Thursday it was announced that the Sub-Committee of the Joint Executives of the unions concerned in the strike is now out of session for the time being, having completed its labours.

The Augmented Executive of the South African Industrial Federation will now be brought up to its full strength by the return of a number of its original members and will proceed to discuss the work of the Sub-Committee and the tentative solutions it has put forward for a settlement of the strike, after which it may be anticipated that an authoritative statement will be made as to whether or not these proposed solutions can be officially put forward on behalf of the Executive.

There is also other important business on hand to be transacted by the full Augmented Executive concerning the strike.

“The Crisis on the Rand Gold Fields.”

THE CASE FOR THE CHAMBER.

A VALUABLE BROCHURE—INCONTROVERTIBLE FACTS.

“The Crisis on the Rand Gold Fields” is the title to a brochure which has been issued by the Transvaal Chamber of Mines, which should be read by every person in South Africa. It has been printed in both official languages, and it sets forth in clear and lucid style what is termed “an outline of the case for the Chamber of Mines in its dispute with the South African Industrial Federation.” Within the 30 pages of this little book are set forth in moderate but convincing language all the essential facts and figures which are required for a proper understanding of the more recent history of the industry, the plight of the low grade mines, the dependence in large degree of the whole of the Union upon the gold mining industry, the remedies proposed by the Chamber, and the attitude of “blank negation” adopted by the S.A. Industrial Federation and the intimate concern of the whole community in the acceptance of the Chamber’s remedies. On its opening pages the pamphlet contains the following extracts from the report of the Low Grade Mines Commission:—

The Low Grade Mines Commission found—

That the Witwatersrand Gold Mines were the sole support of at least a quarter of a million whites and a million natives;

That in every part of South Africa there are people who are more or less directly dependent for their living on the spending power of the money put into circulation by the mines of the Rand;

That as regards the Government revenue, of the total Union General and Railway revenue of £27,700,000 in 1914, £12,000,000 was traceable to the mines of the Witwatersrand.

The brochure then goes on to state:—The Transvaal Chamber of Mines, observing that the facts and issues of the present industrial dispute on the goldfields of the Witwatersrand have been disguised by a multitude of misunderstandings and misrepresentations, believes that members of the Union Parliament will welcome a plain statement of the true facts and of the reasons for the Chamber’s action in connection with the strike. The Chamber does not, of course, claim to be unbiassed in the matter, but it does assert, with a full sense of responsibility, that every fact and figure contained in this brochure can be supported by overwhelming evidence, and it submits with confidence that the reasoning based thereon will, upon examination, be found to be sound.

We regret that the space at our disposal is not sufficient to enable us to print the contents of this illuminating pamphlet in full, but we give hereunder a few extracts from the publication, and additional excerpts will be found in other portions of this issue.

A Much Misunderstood and Misrepresented Agreement.

The Chamber’s statement of its attitude in regard to the *status quo* agreement is as follows:—The *status quo* agreement had no existence until September, 1918. It was one of the many fortuitous agreements forced upon all industries during the war—one of the makeshifts to enable production to be continued uninterruptedly. At the time it was made, certain work (for example, drill sharpening) was on some mines carried on by Europeans and on others by natives. The Mine Workers’ Union demanded that the natives employed on drill sharpening should be dismissed and their places taken by Europeans. The Chamber refused to agree to this, and it was arranged that, for the time, the jobs held by coloured employees should be continued to be so held, and *vice versa*. That is to say, if a coloured man was at September 1st, 1918, employed on a mine on drill sharpening or other work, the Unions could not claim that the work should be done by a white man, and conversely, if a white man was at that date employed on the adjoining mine on drill sharpening or other work, the mine could not claim that the work

should be done by a coloured man. Such was the whole of the *status quo* agreement. Obviously this was not an arrangement which could stand the test of time. There was nothing logical or permanent about it; it was the merest temporary makeshift. This arrangement has, however, been interpreted to mean that if, for example, two separate gangs of natives, each under the charge of a separate “boss boy,” were each also under the nominal supervision of a separate European, the industry was debarred from dismissing one of those Europeans and putting both gangs under the charge of the other European. In other words, although a number of Europeans on the mines became in the course of time superfluous and redundant, the industry was prevented from discharging those superfluous and redundant men by reason of the *status quo* agreement. In order, therefore, to have a free hand in getting rid of these unnecessary and useless employees, it was necessary to denounce the agreement. In doing so, the mines are merely claiming the right, which no one has ever dreamed of denying the farmer or the commercial man when revenue falls off, of retrenching employees and thus improving efficiency while economising expense and conserving the industry.

Attitude of the Federation.

The attitude of the South African Industrial Federation has throughout been one of blank negation. While refusing entirely to accept the Chamber’s proposals, they have no alternative to put forward. Since as long ago as May, 1921, they have been talking at large about producing their own schemes, but they have never laid before the Chamber any constructive proposal whatever. It is true, about two months ago, there appeared in the Press two schemes which purported to emanate from the Federation, but on examination these proved to be merely accounts of methods of working which were already being experimentally tried on certain mines. Those methods were devised by the managements, not by the unions, and were perfectly familiar to the Chamber.

Throughout December the Chamber was in correspondence and conference with the Federation without result; and all the time the price of gold was falling. Seeing that it was necessary to take early action in order to save certain mines, the Chamber at the end of December gave the month’s notice required by the Transvaal Industrial Disputes Prevention Act, 1909, that it proposed to put the indicated changes into effect on 1st February, 1922, at the same time expressly informing the Federation that this notice was without prejudice to the negotiations then going on. This was the so-called “ultimatum.”

Negotiations had then been going on for six weeks, and the Chamber’s notice allowed a further five weeks for discussion. The Federation, instead of availing themselves of this opportunity, put off the further conference (a date for which had actually been fixed), took a strike ballot, and, on January 9th, demanded the withdrawal of the notice under threat of a strike on the following morning. This the Chamber, of course, refused, but in order that the postponement of the conference (although caused by the Federation) might not prejudice the negotiations, the Chamber offered to extend the notice to a full month from the date of the meeting. The Federation rejected this offer, broke off negotiations, and called a strike.

Campaign of Calumny.

Since then the Federation has initiated and continued a campaign of calumny, principally centring around the assertion that the Chamber is attempting to abolish “the colour bar.” A more untrue statement it would be difficult to imagine. The colour bar is brought about by the mining regulations. Whatever may be said of the rights or wrongs of the colour bar, the industry is not attempting to alter it. But let Members of Parliament picture for themselves their

The Problem of the Low Grade Mines.

(By J. Everard Anderson, M.I.Min.E., Lydenburg.)

Much has been written about the low-grade mines of the Witwatersrand, but the steady fall in the price of gold renders their position daily more precarious. A large number of the people of the country, probably do not realise the urgent necessity of making a strenuous effort to keep the mines going, or what a serious matter for the country the closing down of some 25 mines would be. Every thinking man must know that it would be nothing short of a disaster, and that this disaster may happen almost at any time. Gold may drop to 85s. per fine ounce in a month's time, for anything anyone knows to the contrary, and if any workable scheme is to be evolved, now is the time to make the effort, not after the event has taken place.

The only solution is to reduce working costs—to talk of a subsidy is wasting time. Why should a gold mine, unable to produce its product below the market price, be subsidised

Year.	White Wages.	Native Wages.	Native Food	Stores	Total
1914	5/6	4/-	1/6	6/1	17/1
1920	9/2	4/10	1/6	10/2	25/8

The percentage of costs for 1920 is given below—

White wages	36%
Native wages	19%
Native Food	6%
Stores	39%
	<hr/>
	100%.

It will be noted that the heaviest item of cost and the one which shows the greatest increase is stores. Stores, including native food, constitutes 45 per cent. of the total cost, but it is reasonable to suppose that the year 1921 will

The S.A. Institute of Medical Research, Johannesburg, where men are examined for phthical complaints. In this article our correspondent claims that white men should not work in the gold mines.

from the public funds, any more than any other industry? The suggestion is unsound, and those mines which cannot produce gold at a profit, without a subsidy, will undoubtedly have to stop working.

While the State should not subsidise, it should be willing to help by every means in its power. This can best be done by a careful consideration of the railway rates, and the removal of all artificial barriers which militate against the chance of success of the low-grade mines. The following figures taken from the report of the Government Mining Engineer for the year 1920 may be of interest.

The average value of the gold recovered on the mines of the Witwatersrand for the year 1920, estimating the gold at £4.24773 per fine ounce, was £1 7s. 11d. per ton treated. The average working cost for the same year was £1 5s. 8d. per ton, thus showing an average profit of 2s. 3d. per ton. As is well known, had gold been at par, the majority of the mines would have been run at a substantial loss.

The distribution of the costs per ton treated on the Witwatersrand is roughly as follows—for the two years 1914 and 1920:—

show a marked decrease in the cost per ton of this item of expenditure.

White and native wages shown an increase of 3s. 8d. and 10d. per ton respectively, but the efficiency of both whites and natives shows a very marked decrease:—

Year	Tons per head per annum.	
	Whites.	Natives.
1914	1,302	164
1920	1,216	145

a decrease of 84 tons per head per annum for the whites and 19 tons per head per annum for the natives.

In the opinion of the writer this inefficiency is largely due to phthisis. The life of a white man underground on the Witwatersrand mines at the present time is probably from three to eight years, and, knowing this, there is little inducement for the day's pay man to become any more efficient than is absolutely necessary for the retention of his billet. The inefficient white miner cannot be expected to get efficient work out of the natives under his supervision, hence high mining costs.

The native, owing to the fact that, generally speaking, he is an intermittent worker, stands a far better chance of resisting phthisis than the white worker. The majority of natives work for six or twelve months, after which they return to their kraals for at least several months before again resuming underground work. The native can, as a rule, retire from active work before he is forty; by that time the "lobola" for his daughters is beginning to come in and his sons are earning money. The white man, on the other hand, has to work all his life, and when he is turned out of the mines with phthisis, he must still find work on the surface or on some of the outside mines. How difficult this is, many residents in the outlying districts, and many an unfortunate phthisis man who has tramped through the Middelburg coal fields, and the goldfields of Lydenburg and Barberton without success, can tell.

If it were only realised by the Government and people of this country, that it is a waste of our young manhood—the greatest asset any State can possess—to encourage them to work underground on the Witwatersrand mines, there would be no objection to the abolition of the colour bar, so far as the underground workings of the Witwatersrand mines were concerned.

But the white man at present working underground would require to be provided with some other occupation—one which he could follow for all his working life should he so desire. The resources of this great country of ours are almost untapped, and there are vast fields for the employment of our rising population, which only require to be started. To give only one instance: The Union of South Africa imports annually some £6,000,000 worth of cotton goods, on which a 25 per cent. *ad valorem* import duty is imposed. Cotton is being grown here successfully, we have

an ample supply of coal, and in many places waterfalls on fair-sized rivers which could be utilised for power, cheap land, and cheap unskilled labour, and yet there is not a cotton factory in the country. Instances such as this could be multiplied—but sufficient has been said to show that there are other and better outlets for our young manhood than the underground workings of the Witwatersrand mines.

If some scheme were adopted whereby the white men who would be gradually drafted out of the mines were placed in some other employment, it would greatly benefit, directly or indirectly, every man, woman and child in the Union of South Africa. The white men who were drafted out of the mines would exchange an unhealthy occupation which they inevitably would require to give up in a few years at most, for a healthy occupation which they could follow all the working days of their lives. The Government and the people generally would benefit by the working at a profit of a number of low-grade mines and the entry into the country of fresh capital for exploitation. The reduction of the white wages bill and the large saving of phthisis payments would so reduce working costs that a very low grade of ore would pay to work. There is another feature which must not be lost sight of, and that is that the intelligent native who follows mining would have an inducement to become efficient, and an opportunity of advancement.

In conclusion, if decentralisation were adopted, it would be much to the benefit of individual mines, and probably mean a considerable reduction in stores and administration charges, and freedom from industrial disputes.

Small Gold Mine Enterprise in the Transvaal.

OUTPUT AT THE RATE OF £100,000 PER ANNUM—FIGURES FOR DISTRICTS—SMALL MINE ENTERPRISE AND THE TRADES UNIONS.

Considerable activity in regard to the reworking of mines of the Witwatersrand which have passed out of the aegis of large limited liability companies is being displayed at various points on the Reef. Numerous old tailings dumps are also being retreated. Several syndicates, backed by fairly substantial sums of capital, are operating on these propositions. The development rock at the Ginsberg is, we understand, to be milled, and with this object in view a 10-stamp proposition is to be erected.

The Spes Bona is being taken over again by a syndicate, and the old Durban Roodepoort workings are being reopened by a syndicate in which influential Randites are interested. In the vicinity of Luipardsvlei a good deal of work is being done on old tailings dumps and waste rock dumps. Some of these rejected accumulations of the early days contain quantities of gold which can be made to yield a profit under the modern methods of treatment.

Government Returns.

It may here be of interest to state the amounts of gold recovered by what are classified as "Small Mines," "Alluvial Diggers," and "Old Tailings and Reduction Sites" in the Transvaal according to the returns of the Government Department of Mines for the month of December, 1921. The figures were as under:—

MINING DISTRICT AND PROVINCE.	SMALL MINES.		
	No. of Concerns Declaring Gold.	Fine Gold.	Value.
		3	£
Witwatersrand Area	1	149,580	636
Heidelberg	2	170,270	723
Klerksdorp	—	—	—
Ottoshoop	—	—	—
Pretoria	—	—	—
Barberton	2	185,585	788
Pilgrims Rest	14	859,808	3,652
Pietersburg	2	48,430	206
Transvaal	21	1,413,673	6,005

MINING DISTRICT AND PROVINCE.	ALLUVIAL DIGGERS.		OLD TAILINGS and REDUCTION SITES.	
	No. of Concerns Declaring Gold.	Value. £	No. of Concerns Declaring Gold.	Value. £
Witwatersrand Area	1	1	12	1,922
Heidelberg	—	—	1	13
Klerksdorp	—	—	1	66
Ottoshoop	—	—	—	—

Barberton	—	—	—	—
Pilgrims Rest	12	233	—	—
Pietersburg	1	23	—	—
Transvaal	14	257	14	2,001

It will be seen from this that the output of gold from what may be described as small mine concerns in the Transvaal has been at the rate of about £100,000 per annum.

The Trades Union Factor.

Expansion of small mine enterprise in the Transvaal would seem, however, in large degree to be dependent upon the attitude adopted towards such propositions by the labour unions. Numerous instances could be recorded of small mines which have been broken by the application of Trades Hall methods to their slender resources, and it is clearly evident that if small man mining in the Transvaal is to prosper it is not so much a remodelling of the Gold Law as freedom from the industrial tyranny of the trade unions, which is required.

Conditions in Rhodesia.

The gold mining industry of Rhodesia has been built up largely by means of the operation of small mines. On the Rhodesian mining fields there are no grotesque laws which compel a mine to employ so many white men, whether they are required or not. And anyone who has ever seen much of Rhodesian mining will not deny the fact that if Transvaal Labour methods and preposterous ideals had been applied on the gold fields of Matabeleland and Mashonaland instead of there being 138 mines declaring gold outputs as at present, not half a dozen properties would be working in the whole of the country.

WIT. DEEP FINANCE.

To the Editor, S.A. Mining and Engineering Journal.

Sir,—Referring to an explanation of the Wit. Deep finance by one of this company's directors, I ask what was the need for forming a separate finance company to buy the enemy-held shares, when the Wit. Deep Company itself is empowered to do so under the Enemy Trading Act; and why for buying and distributing these shares should each of the five directors in the newly-formed finance company be entitled to remuneration (which I understand is for life) of fees amounting from £250 to £400 per annum? I only trust that other companies in which I am an investor will not follow this example, and will consider the interests of the shareholders to a greater extent, or all confidence will be shaken.—Yours, etc.,

NEW LINES SUGGESTED—MINERAL AND AGRICULTURAL WEALTH.

(By a Correspondent.)

For some months past in the Kimberley papers a controversy *re* railway extension has been raging, every little backveld dorp in these parts agitating for a railway to be brought into their backyards. Why not take a broader view of the matter and look ahead a bit, and construct a line that will open up one of the healthiest and most magnificent parts of the Union, as well as one of the most highly mineralised? The two routes most agitation has been going on about are: (1) the Belmont to Douglas extension, a line (justly described as from "Nergens" to "Nowhere") that would never pay even officials' salaries, much less running costs. It would be an imbecile Government that would pass a vote for building this line in the present hard-up state of the country. The other is (2) the Kimberley-Borrel's Kop line with possible extension to Kuruman, for which little more can be said than the Belmont to Douglas line, as it also would end at "Nowhere" and be as great a white elephant as most of the Union's branch lines from a revenue point of view. Now, there remain two points from which revenue-producing lines could be built, cheaply, with little or no engineering difficulties, and which would open up a grand stock country, superior in many respects to the Karoo, and be a main trunk line, in fact a trans-continental line, enabling passengers and mails to reach the Rand at least three days earlier than by the Cape route. Besides that, these would open up the South-West Protectorate and place the settlers there in direct touch with the Rand market, instead of having to go that tedious long journey round *via* De Aar. In addition, they would open up that healthy,

does in a range over 40 miles long. It is almost pure hematite, free from titanic or phosphoric acid, running 80 to 90 per cent. and very easily smelted. Besides these, diamond mines producing the very finest quality stones, such as the West End mine and mines controlled by the Diamond Fields of Africa (D.F.A.), Ltd., Postmas, Makganyene, Bowden and Smuts, other minerals such as salt, gypsum, galena, nitrates, etc., exist in quantities, and only await railways to develop; gold also in a blanket formation, running strong through the so-called desert, that only requires prospecting to possibly create a second Rand. I've had samples assaying 4 dwts. In fact, here we have a country with vast possibilities, in both mining and pastoral wealth, lying idle for want of railways and direct communication to coast and coalfields. Continually one hears there is a dearth of good building stone in South Africa; here we have vast deposits of the most beautiful jasper and marble, that would pay handsomely to even export. I do not suppose that these particulars or this letter will have the slightest effect in securing either of these lines being built, dominated as we are by Cape coast politics. Capetown, Port Elizabeth, and East London clamouring for all the import and export traffic. But may the day come soon when our present parties, S.A.P., Nationalists, and Labour, are done away with, and the only two possible parties for the good of South Africa as a whole come into power, *viz.*, Inland v. Coast.

T. L. H. SHONE, Capt.,
Mineral and Gem Explorer.

Opening up a Diamond Mine near Postmasburg.

for man and beast, part of the Union known as the Kalahari Desert, quite a misnomer. The whole of that portion known as the game reserve could be cut up into farms, and it would become the finest ranching part of the Union. "Water?" I hear someone say; well, I have been over a large portion of it, and I am certain that water can be struck in most parts at depths of from 60 to 200 feet in practically unlimited quantities. Now, the first of these lines, and the one I favour most, would be from "Pudimoe Junction" to Kuruman, thence between the iron and asbestos ranges of hills. These run almost parallel with each other to Postmasburg, thence to link up with the present line at Upington. The other is from Fourteen Streams to Postmasburg, thence to Upington. Either of these lines would be trans-continental, but of the two I favour the Pudimoe route as the one that would open up the larger area of country, and do the most good, placing us in direct touch with the Transvaal coalfields and enabling us to work the vast asbestos and iron deposits in these parts at a profit. While here, I may state that we have the finest as well as the largest deposit of high-grade iron ore, I should say, in the world, extending as it

TRANSVAAL CONSOLIDATED LAND & EXPLORATION CO., LTD.

(Incorporated in the Transvaal.)

NOTICE TO SHAREHOLDERS

NOTICE IS HEREBY GIVEN that the Twenty-Seventh Ordinary General Meeting of Shareholders for the year ended 31st December, 1921, will be held in the Board Room, The Corner House, Johannesburg, on Friday, 12th May, 1922, at 12.15 p.m., for the following business:—

1. To receive and consider the Balance Sheet and Accounts for the year ended the 31st December, 1921, and the Reports of the Directors and Auditors.
2. To confirm the appointments of Mr. F. R. Phillips and Mr. W. H. A. Lawrence as Directors of the Company in place of Mr. F. H. Wallers and Mr. J. R. Leisk, C.M.G., respectively, resigned, and to elect Directors in place of those retiring in accordance with the provisions of the Company's Articles of Association.
3. To determine the remuneration of the Auditors for the past audit, and to appoint Auditors for the ensuing year.
4. To transact any other business which may be transacted at an Ordinary General Meeting, or which is brought under consideration by the Report of the Directors.

The Share Transfer Books of the Company will be closed from the 6th to 12th May, 1922, both days inclusive.

Holders of Share Warrants who desire to be present or represented at the Meeting must deposit their Share Warrants at the places and within the times following:—

- (a) At the Head Office of the Company, in Johannesburg, at least three days before the time appointed for the holding of the meeting.
- (b) At the London Office of the Company, No. 1 London Wall Buildings, London, E.C. 2, at least 30 days before the date appointed for the holding of the meeting.
- (c) At the Office of the *Crédit Mobilier Français*, 30 and 32 Rue Taitbout, Paris, at least thirty days before the date appointed for the holding of the meeting (only Share Warrants bearing French stamps can be deposited at the *Crédit Mobilier Français*).

And shall otherwise comply with the "Conditions as to the issue of Share Warrants" now in force.

Upon such deposit a Certificate, with Proxy Form, will be issued, under which such Share Warrant Holders may attend the meeting either in person or by proxy.

By Order of the Board,

H. J. STIMMERLEY, Secretary.

Head Office,
The Corner House, Johannesburg,
14th January, 1922.

Caving Systems of Mining.

(By J. Parke Channing, Vice-President, Miami Copper Co.)

The following important article on underground practice by a well-known American engineer appears in the January number of "Mining and Metallurgy":

The caving system of mining is that method of removing the ore from an underground body in which the top is first attacked and mined out and the capping, or roof, as the case may be, is allowed to fall in or "cave" and fill the space formerly occupied by the mined ore. It is applicable, generally, to large orebodies where the ore is relatively soft. We may say, within moderate limits, that when ore is removed the surrounding ground either caves in or remains open. For example, in mines like the Lake Superior amygdaloid copper mines, when the lode is removed there is left a void which remains open for many years; on the contrary, mining a Lake Superior soft hematite ore, however carefully it may be done, always produces a caving of the surrounding rocks. We may say, with propriety, therefore, that the caving system is applicable to that type of ore deposit in which the surrounding rock readily caves.

Another factor which governs the use of the caving system is the value of the ore itself. Admittedly, any form of caving will not extract 100 per cent. of the ore, and in the case of a very rich orebody it is often desirable to get out every pound of the ore with as little dilution as possible. Under these conditions, some other method of mining, such as that by square sets and filling, is indicated and should be followed. We may say, however, that, looking at it broadly, in the United States the caving system of mining is generally used for the removal of soft hematite and for the so-called "porphyry" coppers. In both cases this method is used where open-pit mining is not possible.

Three Caving Methods.

Caving systems of mining may be divided into three general classes; top slicing, sub-drift caving, and block caving. In top slicing, successive layers, usually about 10 ft. in thickness, are taken, beginning at the top of the ore and so on successively down. In sub-drift caving, the ore is taken in thicker slices; say, for example, from 14 ft. to 22 ft. thick, of which the lower 8 ft. is taken out with timber and the upper 6 to 14 ft. is pulled down and drawn on the retreat. The block caving system is one in which slices are anywhere from 35 to 100 ft. in thickness and in which the ore, after suitably breaking up, is drawn out through a multiplicity of chutes in a series of drifts driven at the bottom of the slice.

In attacking a new orebody whose outline has been sufficiently determined, in the two cases first mentioned, it is frequently the practice to establish a level near the top of the ore body, but below the deepest irregularity of the capping, and mine out the first slice by square sets. This is done with a two-fold purpose, not only to give enough reach to the capping so that it may break and settle down, but also to establish a flat surface from which the slicing or sub-drift caving below may proceed in a regular manner. Great care must be taken in this preliminary operation, so that a cave may not occur with a sudden rush of air, with its resultant damage. This method is not always used, but has been found desirable and necessary in several of the Lake Superior hematite mines.

Caving Introduced from Lancashire.

It is well to consider first the sub-drift caving system, as this was the first method introduced into the United States. In 1881 or 1882, George W. Wallace was in charge of the Cleveland Hematite mine near Ishpeming, Mich. The orebody was a soft hematite which was being mined with square sets. There came to the mine two miners from Dalton-

Furness, Lancashire, England, who were expert in what was known as the caving method and who explained it to Captain Wallace. He realised its good points and introduced it into the Cleveland Hematite, or old Nelson mine, as it was frequently called. I am not able to say whether the method used there was sub-drift caving or top slicing, but I am inclined to think that it was sub-drift caving. Captain Wallace wrote a description of the method about 1910, but it was never published and the manuscript was lost when he moved to the west.

The first time I saw the sub-drift caving system was at the Brotherton mine at Wakefield, Gogebic County, Mich., in 1886. John Pengilly was in charge of the mine, having been sent there by D. H. Bacon, who was at that time general manager of the Cleveland Iron Mining Co., and under whom Captain Wallace was mining captain at the Cleveland Hematite. The Brotherton hematite was a rather soft ore and the orebody was of somewhat irregular shape, varying in width from 20 to 40 ft. and dipping probably at an average angle of 45 degrees, though at times the irregular foot wall was steep and at other times nearly vertical. The main levels were about 60 ft. apart and each lift was mined out in four successive layers of 15 ft. each. Raises were put up 50 ft. apart along the strike, and these were connected with sub-drifts, leaving in each case a 6- to 7-ft. back. Therefore, when a level was opened, these successive layers of 15 ft. were opened, with drifts along their bottom.

Stoping or mining was started at the far end of the top lift, gradually drawing back toward the shaft crosscut, timber being used for the bottom 8 ft. and the top 7 ft. being drawn or caved as retreating continued toward the shaft. A description of this may be found in an article written by myself.¹

It is interesting to note that at about the same time Guy R. Johnson adopted a very similar system at the mines of the Longdale Iron Co. in Virginia.² Probably very soon after this a similar method was used in mining the orebodies in Lowmoor, Va., as described by W. S. Hungerford.³

I think the first time that we on Lake Superior realised that this work was being done in Virginia was when the late Guy R. Johnson, Sr., visited the Menominee Range in 1887-88, to examine the Chapin mine, and told us what he was doing. It shows how frequently the same problem is solved in a similar manner in different parts of the world. Since that time the sub-drift caving method has been in continuous use throughout the United States in various classes of mines and is to-day a good standard method. The thickness of the slice removed depends entirely on circumstances. If reduced to the mere height of the regular drifts, the method is the top-slice system, and when the thickness becomes 35 or 40 ft. or over, the method merges into the block caving system.

Factor of Success of Sub-drift Caving.

The success of the sub-drift system depends very largely on the building up of a "mat" of crushed timber between the ore and the broken capping or "gob." Even at the best this "mat" is never perfect and when the ore from above the timbers of the extraction drift and below the "mat" is drawn out, waste material invariably trickles down through it and dilutes the ore. At times rushes of the "gob" come and some of the ore is lost. In hematite mining, where very frequently the "gob" is a low-grade iron ore, the dilution does not amount to much, but often in the mining of "porphyry" ores, where the ore may run 2

per cent. in copper and the "gob" only 0.2 per cent., this dilution and loss is of importance. It is evident, however, that the thicker the slice in the sub-drift method, the less ore has to be breasted out or actually mined, and more ore is cheaply won by caving the upper part. Only the results of careful experiments and calculations can show the proper mean. There are many modifications of the sub-drift caving system and these are well described in the numerous articles in the *TRANSACTIONS* of the A.I.M.E.

In the top-slice system, haulage levels are put at any convenient distance apart, usually 100 ft. vertically. The haulage drifts themselves are sufficiently numerous and are so spaced that raises from them can reach the top of the orebody at points not more than 50 ft. apart from one another, the object being to avoid too much tramping to these raises in the slices. The usual thickness of one of these top slices is 10 ft., this being the distance from the bottom of the post to the top of the lagging, though sometimes the height may be only 8 ft. and at others it may be as high as 12 feet.

Advantages and Disadvantages of Top Slicing.

In taking out this top slice, various plans are used, dependent on the area of the orebody. Frequently a system similar to the long-wall retreating method of coal mining is used and a long face, the full width of one dimension of the orebody, is kept constantly open. The ore is removed in a drift along this face, perhaps two sets wide, then the further drift timber is blasted in and a new one driven back of the one left opened. This method, however, is often difficult to maintain, and a successful modification of it has been described by E. G. Dean.⁴ In this case the slice is divided into 250-ft. squares with a central supply raise to each square and the usual number of raises down which the ore is dumped.

In any method of this kind, hand-tramming is necessary, to transfer the ore from the place where it is broken to the raise; this is done either by direct shoveling, by wheel barrows, or by small cars of one-ton capacity. Endless belts and scrapers have been tried, but without success. Great care must be taken, in this method of mining, to insure ventilation, as open drifts are not as numerous as in the sub-drift method. Good ventilation can be maintained, however, by a careful system of plenum and suction drifts which are not interconnected.

An interesting modification of the top-slicing method is that of making the floor of the slice inclined. This obviates to a large extent the necessity for shoveling and hand-tramming. Its use in the Coronado mine in Arizona is described by W. G. Scott,⁵ but it is well to note that in the Coronado mine the orebody is relatively long and narrow and it is questionable whether this method can be successfully employed in a large orebody where it might be necessary to divide the slicing area into 250-ft. squares.

The advantage of the top-slicing system is that one has a practical control over the mining of the ore. It is in reality all breast stoped with, of course, an increase in cost as compared with the sub-drift system, but with the advantage that nearly all the ore is removed and the admixture of waste is reduced to a minimum. In case of any unexpected caving, in which a block of ore is temporarily lost, its position can be accurately determined and a large part of it may be taken out on the next slice, either by square-setting or by drawing. In this connection, it will be desirable for the student to read the paper on Methods of Iron Mining in Northern Minnesota, by F. W. Denton. On page 383 he refers to the Genoa mine, which, in the year 1897, mined about 300,000 tons by the top-slice method at a total cost of 41 cents a ton, including all underground and surface expenses, taxes, etc. This, I believe, is the record for underground mining on Lake Superior. I have not any unit costs on the Mesabi Range for that time, but I do know that the cost of timber and plank was extremely low because at that time the pine in the district was being cut and marketed.

It is interesting to note the comparison Mr. Denton gives between top slicing and sub-drift caving, where he says, "Ore by such a method (sub-drifting) is, of course, much more cheaply broken than that which is sliced or broken out, but it is a question of both gain and loss."

Crown Diamonds.

A BIG REVIVAL IN SHARE VALUES—IMPORTANT DEVELOPMENTS—TEST WASHINGS GIVE GOOD RESULTS.

A feature of this week's operations on the local share market has been very heavy buying of Crown Diamonds shares. This property, formerly known as the Lace Diamond Mine, has been a proposition of fluctuating fortunes, and it is a proposition of unhappy memories for a large number of people. The outlook for the concern is, however, now considered to be much more hopeful in view of developments just recently obtained in the mine.

In view of the revival of interest in the company's shares, the board have decided to publish the following statement, as drawn up by the Company's Consulting Engineer, Mr. C. B. Kingston. During the year 1921 attention has been concentrated upon exploratory work in the western end of the open mine, as the best returns have always been obtained here. A mass of mixed material, largely hardibank, has always presented an obstacle to mining in this section, but the blue ground has been worked out round it. An exploratory tunnel has been driven through this mass, at the 160 ft. level, and good ground has been found behind it and beneath it.

ground in this new area. These drives have now reached points vertically below the exploratory drives at the 160 ft. level. All three faces are still in blue ground, and are being pressed on to determine the extent of the new area. When the work has been carried further, test washings of the blue ground in the new area will be made. Until the new area has been clearly defined by the exploratory drives, and the value of the ground determined by test washings, it is impossible to gauge the value of this discovery. The blue ground in the new area is mixed with pebbles and small boulders, but on the whole is cleaner than the ground in the old mine at the same horizon. One small body of hardibank has been found in the new area, but the main drive has passed through this into blue ground. The prospects at present are encouraging, but the exploratory work and the test washings must be completed before any definite statement can be made about the real value of this new find. Plans have been prepared for remodelling and increasing the treatment plant to deal with 50,000 loads per month. The whole plant will be erected on a new site, so that a better method of handling the tailings may be adopted.

The Crown Diamond Company's Washing Plant.

Test Washings.

The following test results have been obtained from this ground:—1,090 loads=11.78 carats per 100 loads; 458 loads=16.7 carats per 100 loads; 541 loads=20.01 carats per 100 loads. A winze under the hardibank at an inclination of 5 degrees has been carried down a short distance in blue ground, while a drill hole bored near the mouth of the exploratory tunnel passed out of hardibank into blue ground at 34 feet. It is clear from this evidence that this mass of hardibank does not extend downwards, but that it lies on blue ground. The drill hole was carried down to 202 feet in blue ground, and then encountered basalt. Exploratory drives put in at the 440 ft. level in 1919 exposed basalt in the walls of the pipe and the drives were driven along the contact exposing the basalt in the western section. A large body of basalt was found in the exploratory drives at the 160 ft. level, which must have been thrown up from below, because there is only one sheet of this amygdaloidal basalt known to exist in the mine.

Blue Ground Encountered.

From this fact, coupled with the result of the diamond drilling, it appeared that blue ground might be found by driving west through the basalt at the 440 ft. level. A drive was started, and after passing through basalt for 113 feet, broke into blue ground. This drive has been extended, and two other drives have been carried, one right and one left, along the contact between the basalt and the blue

Explosives and Chemical Works

IMPORTANT FORTHCOMING PUBLICATION.

The "S.A. Mining and Engineering Journal" has now in preparation a special illustrated supplement dealing with explosives and chemical works of the Union. Several of the principal firms having factories of this nature are giving their active support to the publication, which will be issued as a supplement to the ordinary weekly issue of the journal. Special commissioners are now visiting the various works, and the results of their investigations will be published in the supplement in the form of full, descriptive and illustrated articles. The supplement will also contain valuable data as to the quantities of explosives, fertilisers, chemicals, etc., produced in the Union, methods of manufacture and details as to markets and consumption. Prospective advertisers and manufacturers of chemicals, etc., interested in this supplement are advised to communicate with this office at the earliest opportunity.

EDITORIAL.

"PRIDE OF LABOUR."

With the gradual breaking up of the strike movement the Rand will again be able to breathe a certain amount of healthy industrial air. One can only hope at any rate that after the settlement of this disastrous business there will be peace on the Reef and that the managements of the mines will be able to do the best they can towards establishing this low-grade mining field on a sure and safe basis. But this cannot be achieved unless the men themselves co-operate with the managements in a real endeavour to save an industry that has been waning for years from a further large contraction. No one with any vestige of authority has attempted to deny that there was most urgent need for a substantial reduction of working expenditure. Even the Labour leaders themselves have admitted this. But where Labour disagreed with the management of the mines was in regard to the methods to be adopted. It is difficult to conceive any ways and means by which working expenditure could be reduced except along the lines upon which the Chamber has taken tardy action.

It was clear that working expenditure was far too high and working efficiency was far too low. It was clear, too, that the selling price of the product of the mines was declining; indeed leading bankers and financial authorities

in Europe are anticipating a return to parity between British and American currencies (which implies the total elimination of the premium) much quicker than most people anticipate. There may be—there are almost sure to be—fluctuations of a more or less important nature in the incidence of the British exchange rate with America, and therefore in the price of gold. But the direction which the price of gold is taking is clearly indicated by the trade and financial sign posts overseas, and therefore it will be unsafe in any calculations as to Rand outputs and profits to base figures on more than standard price. This being so, it is very clearly the duty of the managements of the mines to bring about a change in the economics of this gold field, a change which will admit of all mines being run on a sound and stable basis, and the only basis upon which gold mining or any other industry can be run, is on the basis of earning profits commensurate with the capitals invested.

Whether all the reforms proposed by the Chamber will secure this or not remains to be seen. Personally speaking, we doubt whether such reforms will be adequate to compensate for a decline in the price of gold to normal unless the employees willingly co-operate with the managements in a supreme effort to bring working expenses down to a figure which will admit of six or even five pennyweight ore being worked at a profit. This can, we believe, be done by the employment of the best men and by a whole-hearted and willing attempt on the part of all the employees of the mines. The whole conception of organised labour on the Rand is wrong. In the words of one of the great political economists, labour on these fields has "become soulless, ceasing to minister to fulness of life." The old quality of "Pride of Labour," the pardonable conceit which a man took in his own craftsmanship and handiwork, has been smothered by a surfeit of trades unionism, antagonism towards employers, antagonism towards the Government, and antagonism towards the community at large, and by preposterous restrictions upon individual effort. If members of the trades unions would only take their own inspiring motto to heart—if they would only realise that "*Labor omnia vincit*" has a grandeur of truth when interpreted in its purist sense! If, instead of reading into those three words a conception of perpetual militancy towards the real co-partner of Labour, which is Capital, they would subscribe towards the practical demonstration of the truth of Labour's omnipotence in relation to the rock of golden content from which all of us on the Reef earn our daily bread, then indeed would there be a roseate prospect of a return of prosperity in which all would share.

THE FINANCIAL OUTLOOK.

Whilst everyone on the Rand, and to a considerable degree throughout South Africa is at present obsessed with settling the strike, to the exclusion of every other thought, the financial aspect of the situation and its effect on the monetary position of the country generally must not be overlooked.

In this connection the statements in the House of Assembly on Monday by the Minister of Finance and the Minister of Railways make anything but cheerful reading. On general revenue there will be a deficit of nearly £2,000,000, including the deficit for the financial year 1920-21 of £255,000, which was carried over. The actual deficit for 1921-22 is considerably over £1,000,000 in excess of the deficit for which Mr. Burton budgeted in March last year. In addition to the decrease in Customs there has been a substantial decline in revenue from excise, diamonds, native taxation, etc., to set against the increases from income tax and direct profits tax. During last year the financial position became steadily worse, and since the beginning of the year the mining strike has gravely accentuated the crisis. Mr. Burton estimates the shrinkage of revenue owing to the strike at the enormous figure of £750,000 a week. The railway position is also most serious, despite the admirable and untiring efforts of Sir William Hoy and his staff to tide over a period of exceptional

adversity. The last financial year closed on March 31, 1921, with an accumulated deficit of £2,598,000, the deficit on 1921-22 being estimated at £693,000, or a total shortfall of £3,291,000. In spite of the most rigid economies the total accumulated railway deficit at the end of next month will not fall very far short of £4,000,000. The actual deficit for 1921-22 is about one and a quarter millions, and but for the very considerable savings in maintenance, travelling expenses, and running expenses the loss on the current year would have been £1,859,000.

It is becoming painfully clear that rigid economy in Government services will have to be practised or else that large sums of money will have to be raised by further taxation, and where such money is to come from is indeed a poser. For private individuals as well as industrial concerns (and particularly the mines) of the country have all well-nigh reached the point of saturation as far as taxes go. In other words, they can carry no more.

THE PREMIER'S SPEECH.

The speech made by the Prime Minister in the House of Assembly on the strike is a plain, straightforward and courageous exposure of the Federation's mishandling of the labour position and of the pantomimic escapades of some of the political opportunists who have been coquetting with the Trades Hall officials. The speech shows clearly that the Labour leaders who have expected that Parliament would effect a settlement of the strike in a manner satisfactory to their futile cause have merely made another colossal blunder.

In the course of his speech the Prime Minister proceeded to deal with General Hertzog's motion in regard to the colour bar. He said that legislation was not necessary because they had the statutory position. In regard to the *status quo* agreement he was sure there were very few members who would like to see it the law of the land. He had been trying to think how the proposal of the hon. member could be carried out. The Select Committee would be appointed and would bring a report before the House, and they would say that such and such steps ought to be taken, and Parliament would then have to create a statutory body to settle the strike. They had to give compulsory powers of settlement to that body and say, "Go ahead and settle the strike." They were asked to create a dictatorial body and give them compulsory powers of arbitration.

The Prime Minister said he was sure General Hertzog did not know what he was proposing. If his plan were adopted Parliament would have to pass a law creating a statutory body armed with dictatorial powers to settle strikes. The law would be similar to that in Australia, where there was compulsory arbitration. A court had to be constituted, and it would adjudicate on a strike, and its decision would be the law of the land. "If," exclaimed the Premier, "I know one thing about the temper of the people of this country I say they will never submit to any such law or court.

"The only countries which have compulsory arbitration are Australia and New Zealand, and in those two countries the system is a ghastly failure. The accounts published show that it is one of those devices which is wrecking the whole industrial system of Australia. There is no country in the world where strikes are more rife and the industrial position is more unsound."

General Smuts maintained that the only way of dealing with the strike was the way adopted by the Government. The men were advised to go back to work, when the Government would appoint an impartial tribunal to investigate all the issues that had been raised by both sides in the dispute. That body would try to work out from the evidence before it permanent lines of a solution, and the report would be submitted to Parliament and dealt with in due course during the session.

The Premier explained that a judge would be chairman of the Commission, which would be composed of impartial gentlemen of the highest standard, with a representative of the employees and a representative of the employers. "If," said General Smuts, "they go into the matter of the ratio of coloured and European, finance, more economical working, and so forth, we shall have before us material on which Parliament can act and pass such legislation as it deems fit, but we are not going to trust any outside body with arbitrary powers to settle the strike."

The Premier wound up by declaring that the Government could agree to no other scheme than that he had just expounded. Anything else would be unsafe and dangerous, because the Government thought it was the only policy the country would agree to. They would abide by it, and that side of the House would vote against General Hertzog's motion and the amendments.

Pressure on space prevents us from quoting the Premier's speech in full, but the following telling paragraphs from his peroration are worthy of particular note.

Do not say anything against the coal miners. They are a good body of men, but they have made a ghastly mistake for which not only themselves but the whole country is going to pay very dearly. . . . Those men think they are on strike. They are not on strike: they are unemployed. . . . They have for the present destroyed this industry.

There are thousands of workers in the (gold) mines who look upon the industry not as their main industry in life, but as their enemy. When I look at the action they took with regard to essential services, it seems as if they were anxious to destroy the industry by which they were kept going. . . . The Government stepped in and kept the mines going. . . . If matters had been dependent on the action of the men, there would not have been a gold industry in South Africa to-day.

It is unnecessary for me in this House to point out to the members and to the country what the Witwatersrand means to South Africa as a whole. It not only supports the largest industrial population in South Africa, it is not only the largest centre of population in South Africa, but it is the market for all our producers in South Africa. Farmers and producers of whatever stuff is produced in South Africa look to Johannesburg as their main market, and if that community were to collapse, if half of the Witwatersrand were to decay and the mines were to stop, the result would be a terrific, a cataclysmic blow not only to the Witwatersrand but to the whole of South Africa.

The *status quo* agreement has been confused even to-day in this House with what is called the colour bar, and I want to make it perfectly clear that the *status quo* agreement is one thing and the colour bar another. The colour bar is a legal statutory bar, a line of colour, a line which is drawn in the Mining Regulations of the Transvaal. . . . There is no proposal to touch that colour bar at all.

I don't think the action of the men has been in the interests of the white position, whatever they may think. Rather is it clear to me that if the *status quo* agreement were to remain, a very much larger number of white men would be in danger.

We must not set up a false standard which this country cannot maintain. I am for the white standard, and I hope we shall have the white standard as an ideal and that this community will build itself up a white civilised basis and make this white community as strong as possible in South Africa; but, if an attempt is made to bolster this white basis on a false economic standard, the whole effort is bound to end in a ghastly failure.

Talk about the white standard! Come to our farmers to-day all over South Africa. The coal miners at Witbank would not accept 25s. a day. I should like to know how many farmers in this South Africa of ours make 25s. a day from one year to another?

Notes & News.

Orange River Oil Shales.

A Kimberley correspondent writes:—

The manager in charge of the shaft at Elandsdraai, Orange River, reports by wire that he has struck the oil shales at about 93 feet depth. The band of shale is 8 feet thick, and of an analysed value of not less than £3 per ton. The payability of these shales may, therefore, be accepted as an indisputable fact.

That a vast quantity of the shales exist may be gathered from the fact that the borings proved the presence in an area of 50 acres of 1,250,000 tons. The property embraces some 25,000 morgen in the direction in which the oil shale is known to extend.

The importance to the Union of such a discovery can hardly be over-estimated. It proves most conclusively the existence in the Cape Province of oil shales of a highly payable nature.

Considerable activity is now foreshadowed in the direction of prospecting for these shales by boring on adjoining farms, and there is little reason to doubt that satisfactory results will be obtained by systematic and careful work in the right direction.

* * *

Gem Tariffs in U.S.A.

The following note taken from the *Jewellers' Circular of America* should be of interest on account of its possible bearing on the South African diamond trade:—

Retail Jewellers' Association of Greater New York Asks Senate for Lower Gem Tariff.

Supplementing the appeal made by the American Jewellers' Protective Association for a revision of the gem traffic, Emil W. Kohn, as president of the Jewellers' Association of New York and vicinity, has written letters to Senator Boies Penrose, chairman of the Finance Committee of the Senate and to other members of the Committee, asking that the new tariff bill put the rate of duty on gems at 10 per cent. and admit uncut gems free.

President Kohn's letter to the various Senators reads as follows:—

December 30, 1921.

Hon. Boies Penrose, Chairman,
Committee on Finance,
United States Senate,
Washington, D.C.

Dear Sir,—As President of the Retail Jewellers' Association of Greater New York, I desire to urge you to use your great influence in bringing about a reduction in the duties on diamonds and other precious stones.

We desire the restoration of the former duties, namely, ten per cent. on cut diamonds, pearls and other precious stones, and the admission of rough (uncut) diamonds free of duty. We believe that this change will benefit our entire industry and result in increased revenue to the Government.

The present high rate of duty is an incentive to smuggling on the one hand, and incidentally an incentive to people of wealth to make their purchases abroad.

On the other hand, the admission of rough (uncut) diamonds, free of duty, will be a great encouragement to the further development of the cutting industry in this country, and furthermore a reduction of the present duty on cut diamonds, etc., from twenty to ten per cent., will check smuggling which is now carried on to a considerable extent.

Trusting that this matter will receive your favourable consideration,—Yours very truly,

EMIL W. KOHN, President.

Mining Men and Matters.

It is notified for general information that Arthur James Shaw, Responsible Clerk, has been appointed Acting Mining Commissioner for the Mining District of Boksburg, vice J. P. E. Douglas, with effect from the 1st February 1922

* * *

Mr. W. D. Robinson, manager of the Export Department of the Chicago Bridge and Iron Works and its subsidiary, the Horton Steel Works, Limited, is on a visit to the leading centres of South Africa, with a view to looking over the field and establishing local agencies. Mr. Robinson is on a tour round the world on behalf of his company, which are large manufacturers of steel tanks, towers, stacks, flumes, plate work and bridges, with three plants in America and Canada. Any firms interested in getting in touch with Mr. Robinson can do so through the office of the American Trade Commissioner in Johannesburg.

The farmers in Australia at first adopted towards wages disputes on the mines and in the town industries of that country very much the same attitude as that which farmers in South Africa have taken up in recent years in connection with the activities of labour unions here. It is probably correct to say that up to the present the agricultural community of South Africa has been, on the whole, rather inclined to side with organised labour because of a vague feeling that the men are struggling to prevent themselves being exploited by self-seeking foreign capitalists—a doctrine which labour leaders everywhere are constantly and insistently preaching. It was only after the government of the country had been handed over to the Labour Party that the farmers of Australia realised what a disastrous mistake they had made. There is a lesson in the recent history of Australia, which the farmers of South Africa would do well to study and ponder over.

ROBINS "PERFEX" BALANCED SCREENS.

Give favourable results on the fine screening of a variety of materials—Coal, Coke, Fertiliser, Sand and Gravel, Slag, Stone, etc.

They supplement the Robins Rotary Grizzly, and have its characteristics—low power consumption, freedom from vibration, high efficiency and capacity, small headroom.

Moreover, they have a positive screening action on damp or wet material, and cannot plug up.

In all these respects they are an improvement over revolving or shaking screens.

Chemistry, Geology, etc.

Chemistry of Platinum at High Temperatures and Pressures.—Economic Geology, Dec., 1921, p. 524.

Brakpan Mines.—Report for Quarter ended December.

The linear development amounted to 5,423 ft., of which 2,893 ft. were on reef, averaging 8.72 dwt. over a reef width of 36.01 in. Of the footage on reef, 1,190 ft., equivalent to 42 per cent. of the sections sampled, were payable, and averaged 16.94 dwt. over 35.91 in. In addition to the above footage, development work was continued from the circular shafts, details of which are given below. Total working costs, £226,648 4s. 7d. (per ton milled, 26s. 11.783d.). Working profit, £109,438 10s. 6d. The payable ore reserve as at December 31, 1921, was estimated at 2,423,230 tons, of an average assay value of 8.61 dwt. over an average stoping width of 68.13 in. When compared with the reserve as at 30th June, 1921, the estimate shows a decrease of 126,395 tons, the average value a decrease of 0.16 dwt., while the average stoping width is narrowed by 1.65 in. No. 3 circular shaft: During the quarter under review the main station crosscut was advanced 256 ft. A point in line with the main incline from No. 2 shaft was reached, and a commencement was made with the connecting incline, which was styled the main incline north. A total of 127 ft. was accomplished in this heading, all the work being off reef. At the end of the year the distance remaining to be traversed to effect the connection was about 330 feet. No. 4 circular shaft: The details of the quarter's development at this shaft, together with a summary of the work so far accomplished, are as follow:—

Working Place..	Total Footage.	Footage on Reef.	Footage Sampled.	Reef Width, inches.	Assay Value, Dwts.
East haulage	140	—	—	—	—
South haulage	231	—	—	—	—
West haulage	208	208	205	68.2	2.5
North haulage	127	31	25	48.2	7.7
Crosscuts	183	—	—	—	—
For quarter	889	239	230	66.07	2.95
Previously reported	1,377	147	140	33.79	2.91
Totals and averages	2,266	386	370	53.85	2.93

Of the footage sampled during the quarter, 40 feet, or 17 per cent. of the sections sampled, gave payable assays averaging 7.57 dwt. over 47.25 in. The capital expenditure during the quarter amounted to £29,232 19s. 5d. The estimated premium on gold recovered during the quarter

was calculated by taking the price of gold as follows:—October, 103s. 0d. per fine oz., £20,137 3s. 8d.; November, 102s. 0d. per fine oz., £19,848 0s. 10d.; December, 95s. 6d. per fine oz., £11,868 4s. 10d.; less estimated exchange premium on remittances, £3,773 0s. 1d.; total, £48,080 9s. 3d. The actual premium on gold for the three months ended 30th November, 1921, was £8,896 7s. 11d. short of the amount estimated. The directors' report for the quarter ended 30th September, 1921, notified shareholders that the Court had given judgment in favour of the company in its action to recover from the Union Custodian the amount due from the above bank, and that the Custodian had noted an appeal. The appeal was dismissed, whereupon the Custodian noted a further appeal to the Appellate Division. This appeal has not yet been heard.

West Springs.

No. 1 shaft: During the quarter good progress was made in the east haulage, which was advanced 624 ft., while the haulage from Springs Mines was driven 312 ft. The holing was effected on the 3rd of January of the current year, thus completing the connection with the No. 2 shaft of Springs Mines. The details of the quarter's development, together with a summary of the work so far accomplished by Springs Mines, Ltd., in your company's property under the working agreement, are as follows:—

Working Place.	Total Footage.	Footage on Reef.	Footage Sampled	Reef Width, Inches.	Assay Value, Dwts.
For quarter	1,154	255	255	24.35	7.04
Previously reported	4,162	2,782	2,760	27.20	7.88
Totals and averages	5,316	3,037	3,015	26.96	7.82

Of the footage sampled during the quarter, 65 ft., equivalent to 25.5 per cent., showed payable assays, averaging 18.85 dwt. over 26.15 in. Development from No. 1 shaft, West Springs:—

Working Place.	Total Footage.	Footage on Reef.	Footage Sampled.	Reef Width, Inches.	Assay Value, Dwts.
For quarter	2,761	1,668	1,625	22.4	4.4
Previously reported	1,808	283	260	25.75	5.73

Totals and averages 4,569 1,951 1,885 22.9 4.6
Of the footage sampled during the quarter, 115 ft., equivalent to 7.1 per cent., showed payable assays, averaging 8.5 dwt. over 37.3 in. During the period under review, a call of 2s. per share was made on all partly-paid shares, and advance payments were made in respect of 5,250 shares, making them fully paid up. At the 31st December the capital of the company was as follows:—452,419 shares fully paid up; 947,581 shares 16s. per share paid up.

Considerable activity is observable on the Klein Letaba Goldfields of the Northern Transvaal. The Golden Hill prospecting venture has been taken over by a Johannesburg company, and another proposition known as the Letaba Eclipse is starting on a fairly large scale in April.

The effects of the Rand strike are being felt not only in the Union itself, but even so far away as India, to which country, according to messages from New York, American bankers have arranged to ship 800,000 dollars worth of gold bars to Bombay.

Finance and Information for Investors.

AN EXAMINATION OF BALANCE SHEETS AND REPORTS—DATA FOR SHAREHOLDERS.

In response to the request of numerous readers we have commenced a new feature of the journal. In these pages we shall endeavour to compress reviews and criticisms of balance sheets, to examine Government, Municipal and other loans, to note dividend declarations, to analyse new prospectuses, and to examine the financial results and prospects of mining, commercial and banking companies concerned with trade, industry and finance in the Union and Rhodesia.

The Maintenance of Sterling.

Another valuable, and from the public point of view welcome, criticism and review of the present business position in Great Britain and the price of gold was given in London in mail week by Sir William Goschen. Presiding at the annual meeting of the National Provincial and Union Bank of England, Sir William Goschen had something to say on a matter with which, above all, he is familiar, for if anybody may be credited with understanding "Goschen's Law" of monetary movements and their causes and effects, he assuredly may. Since the beginning of 1921 the £, in relation to the U.S. dollar, has gone up, as he recalled, from \$353 to \$421½. It is a substantial and gratifying rise; not can it be questioned, to quote his words, that the rise is fully justified by our general position and the state of our currency." The figures he gave are really significant. At the end of 1920 the net total of fiduciary currency over and above the cover in gold coin and bullion was £348,126,000, or 68·7 per cent. of the £492,560,000 of notes in circulation. At the end of 1921 the net total of fiduciary currency over and above the gold coin and bullion cover was £293,084,000, or 65·1 per cent. of the £450,648,000 of circulating notes. The decrease of £55,042,000 in a year, and that year presenting the features of 1921, is really an important, and, what is more, a wholesome sign. Is it remarkable that the £ has gone up in relation to the dollar, when there is this evidence of the growing credit behind the £? And if there is that growing credit, advocates of devaluation of the £ are plainly left without a leg to stand upon. To devalue the £ by reducing the gold content of the sovereign, either in weight or fineness, or both, has appeared to some to be an easy way out, since, among other things, it means, to the extent of the devaluation, a final repudiation of national and public debt whether internal or external. Were the sovereign "devalued" down to, say, 15s., we should nationally do our creditors out of 5s. in the £; we should not pay what we have solemnly promised to pay. But this applies not only to public debts; it applies to every kind of private debt at home or abroad payable in sterling. The moment the effect on the country's credit is considered, the incidental loss is seen to be out of all ratio to the gain. The gain would be limited; the loss without limit, either in total or in time. Credit would sustain a crushing blow, and the place of this country in the world's business, more especially its place as the clearing-house of the world's finance, would be lost, and probably for ever. For that place has been gained by honour, and it can be held on no other terms. Compared with so shady a device as devaluation, the restoration of the £ to pre-war parity is ease and simplicity itself. On points like these there are times when words have to be plain, because the restoration of the £ to parity means both restoration of national earnings and the rise of those earnings in real value at the same time. In brief, the road of honour and the road of prosperity are one.

Bank of England Returns.

London, February 16.—The following is the weekly return of the Bank of England issued to-day, together with figures for last week and the corresponding week of last year:—Reserve of notes and coin, £25,460,000, £24,530,000, £18,946,000; coin and bullion, £128,760,000, £128,750,000, £128,306,000; public deposits, £14,910,000, £14,720,000, £15,563,000; other deposits, £137,460,000, £154,410,000, £114,042,000; other securities, £80,570,000, £80,430,000, £85,202,000; proportion of reserve to liabilities, 16½ per cent., 14½, 14½; private discount, 3 per cent., 3½, 6½; bank rate, 4½ per cent., 5, 7; deposit allowances, 2½ per cent., 5.

Industry's Tax Burden.

According to a London cable dated February 16, a reduction of the income tax by 2s. in the £, the abolition of the corporation profits tax and proportionate adjustments in super tax by private firms, and also the advisability of permitting posterity to bear its share of the nation's indebtedness, were the principal requests advanced by an influential deputation representing the principal industries which waited on the Chancellor of the Exchequer to-day. The deputation, which was headed by Colonel Armstrong, President of the Federation of British Industries, strongly impressed on the Chancellor the necessity to reduce taxation. Sir Robert Horné requested that his reply be treated confidentially, but he promised sympathetically to consider the arguments presented.

"Bantjes" Liquidation Value.

In reply to several inquirers, we give the following information:—

The issued capital of the company is £502,306 in shares of £1 each. In the last balance sheet the equipment stands in the books at £381,881 16s. 10d., and the company's cash assets stood at £100,332 6s. 5d., made up as to:—

Cash at Bankers and in hand	£1,399	3	4
Union of South Africa Treasury Bills	10,000	0	0
£50,000 English Treasury Bills	49,576	7	5
Deposits, fixed, on call and on loan			
bearing interest	39,356	15	8

The last quarterly report issued, *i.e.*, that for quarter ended June 30th, 1920, showed a profit from clean-up, etc., of £3,128, in addition there is a credit to capital expenditure for plant, etc., sold, totalling £2,162, and the report stated: "In view of the clean-up being practically completed, the Board has decided to discontinue the issue of quarterly reports. Particulars, however, of the footage driven and values obtained in the exploratory drive will be published quarterly in the Press for the information of the shareholders."

A circular dated January 16th stated: "In view of the very small percentage of payability disclosed throughout this drive, the consulting engineer, Mr. H. Stuart Martin, has recommended to the Board that the work should cease. Having given the matter full consideration, the directors are satisfied that there is no hope of discovering payable values. They are also of opinion that any attempt to re-open the mine (which was closed down at the end of 1918) for the purpose of working the small remaining ore reserve is not warranted, by the reason of the heavy expenditure involved in dewatering the mine and the general reconditioning of plant. Accordingly they have now decided to discontinue the drive referred to and to call meetings of shareholders to consider resolutions for placing the company in voluntary liquidation. The notices convening such meetings will be issued to shareholders at an early date. The company would appear to have liquid assets representing about 4s. per share.

The present value of the plant in a liquidation market is very hard to determine. In our judgment gravity stamp

Lubricants

"A grade for each type of service"

Production's Sly Enemy

FRICION—

the unseen enemy of production in your plant.

IF FRICTION COULD SPEAK, it would confess, "I am robbing you of power, of production, of profit."

If your machines were human, they would tell you that friction is pain—and pain is the forerunner of trouble.

What will guard you against wasteful friction? Correct lubrication—and that only. The subject is well worth your most serious thought.

We are in a position to reduce the wear and tear on your machinery—to reduce power waste and so increase your useable power.

This increased power means increased production without added power cost. It means improved profit. It will protect your pocket-book from friction theft.

We can bring to bear on your plant the most complete fund of lubricating experience in existence. It embraces thorough engineering knowledge and wide practical experience.

We suggest you get in touch with our nearest branch

SOLID-SOCKET SHOVELS AND SPADES.

ADVANTAGES OF THE SOLID-SOCKET.

GREATLY INCREASED STRENGTH which the Steel Tube or Socket naturally gives over two straps riveted on a wooden shaft.

The Strength of a Tube is proverbial. You get that strength in the solid-socket.

"FOX" Solid - Socket Shovels and Spades are made from **one piece of steel** without a weld. They **long outlast** other types.

CHEAPEST IN LAST COST.

SPECIFY "FOX."

installations have had their day on the Rand (New State Areas is to be equipped without stamps), and in view of the fact that numerous properties will probably be suspending operations in consequence of the strike or because of depletion of ore contents the realisable value of the Bantjes equipment may not perhaps exceed 3s. per share, or, say, not more than 7s. per share for investments and equipment. The value of the mining area is in our estimate negligible. This is only a rough and hasty calculation, but it may be of some value to those who are interested in the liquidation prospects of Bantjes.

There are 1½ million whites and 7 million natives in the Union, and the whole population exists in large degree upon the Rand, which produces about £40,000,000 per annum. Of this, 14s. in the £ remain in the country. Nearly

sixty per cent. of the general revenue of the country is derived from the Rand. This flow of economic life blood has dried up for seven weeks because 20,000 miners have been on strike. Three-quarters of these men wish to return to work. Some hundreds have already returned. The others are being prevented from returning by a few hundred extremists. Shall a few hundred extremists dictate to and ruin 1½ million Europeans and 7 million natives?

Your fortunes are wrapped up in the Rand. It doesn't matter whether you live at Capetown or Ceres, or in Durban or Tembuland. No matter whether you are a farmer, railwayman, storekeeper or clerk, the strike on the Rand is costing you money. And you are losing this money because the extremist leaders are deterring the men from going back to work.

The Union's Expenditure.

The following is an official abstract of the estimates of additional expenditure of the Union Government to be defrayed from revenue and loan funds during the year ending 31st March, 1922:—

VOTE.	Original Estimates, 1921-22.	Plus Grant from Vote No. 36.	Revised Estimates 1921-22.	Less Savings * not available to meet excess expenditure.	Additional amount to be voted

ENGINEERING SECTION.

"Broken Tools."

SOME OF THE CAUSES OF SPLINTERING AND CRACKING OF HARDENED STEEL.

(Specially written for the "S.A.M. & E.J.," by J. A. Holden.)

II.

There are banded formations which are in no way dependent upon the presence of slag inclusions; certain micro formations in high speed steel belong to this category.

The free carbides in such material may appear in the form of lines, particularly in material which has been forged considerably; more often commercial high speed steels are not forged excessively, and the carbide segregations take an irregular form, like a roughly shaped Z.

In a modern high speed steel the carbides are very complex, consisting of iron, chromium, tungsten, and sometimes molybdenum. If during hardening the free carbides are not diffused it is certain that the tools will give disappointing results. There are certain carbide segregations which cannot be broken up during hardening, and a number of trepanning tools made from this material yielded very poor service. In the case of fine edged tools and complex milling cutters, where it is impossible to harden from the very high temperature usually employed for high speed steel, because of the danger of destroying the teeth, it is important to avoid using steel containing certain structure for material of this kind would furnish defective tools fit only for the scrap pile.

At one time the hardening of steel was done without the aid of scientific instruments. In some dark corner of the forge the hardener would judge by the colour of the object when the correct hardening heat had been reached. Although the well trained eye of a highly skilled hardener may rarely be at fault, it is doubtful whether it is possible to run a large hardening shop without the aid of pyrometers. For it must be remembered that some steels (such as those containing chromium) are very susceptible to overheating, and in consequence very little latitude is allowable in the quenching temperature, and the operator who works with the eye alone cannot keep within the very narrow limits which are sometimes mandatory. Where by reason of initial expense or a limited amount of work a pyrometer cannot be installed a very efficient substitute can be used in the shape of either a "Seger" cone or a "Sentinel" cylinder. These are made from silicates or salts, and each one has a known and fixed melting temperature.

The exact temperature at which a piece of carbon steel may be hardened (by quenching) can be determined experimentally, or it may be obtained from what is known to metallurgists as the equilibrium diagram. A complete description of such diagrams will not be given here, but as the steel diagram is so useful to the hardener it will be briefly dealt with.

It will be necessary to describe a phenomenon of very great importance, and that is the spontaneous absorptions or evolutions of heat which occur during the heating or cooling of the steel. These are usually called critical points.

If we take a piece of mild steel and heat it very slowly, recording the heat of the specimen with a delicate pyrometer and taking the steel up to a temperature of 900°C, we find the following critical points (that is, points where a spontaneous absorption of heat occurs):—720°C, 760°C, and 870°C. Upon cooling from 900°C we find the following critical points (that is, points where a spontaneous evolution of heat occurs): 850°, 760°C, and 700°C. Thus a mild steel containing .10% of carbon has six critical points. Those obtained on heating are called the AC1, AC2, and AC3 points (where "C" is a contraction for the French word *chauffage*, meaning heating), those obtained on cooling are called the AR1, AR2, and AR3 points (where "R" is a contraction for the French word *refroidissement*, meaning cooling).

When a steel contains about .35% carbon the two critical points AR2 and AR3 (and also AC2 and AC3) merge into one. As a result the steel has but two AR points and two AC points. When the carbon in the steel exceeds .5% the metal has only one critical point on heating and one on cooling, and which are denoted as AC1, 2, and 3, and AR1, 2, 3.

(To be continued.)

Employees on the gold mines receive privileges in many respects far in advance of those given to employees in any other industry in the world. The working hours are 48 per week, over a six days week; overtime is paid for at time and a half; every employee receives paid annual leave, averaging three weeks per annum; Christmas Day and Good Friday are holidays; the companies have spent huge sums on recreation halls, swimming baths and other welfare measures for their employees; a large proportion of the employees are granted housing accommodation on the mines at very low rents, and so on.

Electrification of Natal Railways.

COLENZO TO BE AN IMPORTANT CENTRE.

Colenso has been chosen by the South African Railways management as the best site for the new electricity works which will generate the power for the electrification of the railway line, for which, as announced recently, the engines have already been ordered. For some time past surveys have been made with the view of finding a locality that will meet the requirements of the line under its new conditions.

Besides being about midway between the two termini of the electrified section—Glencoe and Maritzburg—Colenso has other advantages which helped the authorities in coming to a definite decision. We are not able to state at the present time what area the new works will occupy nor the probable amount of skilled labour to be employed there. But, considering that the electrification of the line, when it has been put into operation over the one section, is likely to be extended, it may be taken for granted that Colenso is bound to become a very important centre.

Two or three weeks ago mention was made of some of the principal advantages of electric locomotives over steam locomotives, as expressed in a lecture given in Durban by Mr. H. Clark, B.Sc., and particularly when applied to the gradients and curves of such a line as that in Natal. Railwaymen who are familiar with steam locomotives and know how often they require repair (if only in the shape of special treatment to the boilers) will be interested in a comparison drawn by Philip Dawson, from the data of suburban steam locomotives on the British railways: Mileage per annum, 20,000 miles; mileage between serious repairs (average), 40,000 miles. For the electric train Dawson claims an annual mileage of 50,000 on suburban services and a mileage of 250,000 between serious repairs.

The Prussian Government estimated that for equal work with an equal number of reserves 36 per cent. less electric locomotives are required than would be necessary if steam

locomotives were employed. It was found that these need always 22.5 per cent. of their steam locomotives in the repair shop, and that there were more than 54 per cent. of their steam engines in service at any time—some were being got under steam, others were being boilers cleaned or fire-tubes cleaned, etc.

The question of train resistance, as is familiar to those who know such sections as near Stryden, where the gradient is 1 in 36 and the curve radius 200 feet, or Eskdale, where the gradient is 1 in 40 and the curve radius 600 feet, and where laymen can appreciate the statement that whereas the maximum draw-bar pull of the S.A.R. 14th class locomotives is 35,000 lb., the electric locomotive has a pull of 96,000 lb.

A little consideration will show that extravagantly high wages to European workers in the municipal services, in mining, and in other industries on the Witwatersrand are harmful to the whole country, and are a potent cause of the parlous position of the South African farmers to-day. A wage standard has been set up on the Witwatersrand which the Railway Administration and employers of European labour elsewhere in South Africa have had to follow to a considerable extent, or otherwise face constant dissatisfaction and trouble amongst their men. The result is an unduly high level of wages generally, which means high railway rates, high rents, and high charges for all services by Europeans to the detriment of the farmer and other producers who cannot transfer to the consumer any additional burdens they may have to carry because the prices of most of their products are fixed in Europe and not in South Africa.

A Locomotive on the S.A.R.

WAKEFIELD'S HIGH-CLASS LUBRICANTS.

The Economy of Paying a Higher Price.

Were we to assert that we could get a good satisfactory engineering job at a low price or that a cheap machine is as good and will do equally good work and be as economical as a first class one.

What would you say or think?

**TRUE CHEAPNESS IS DECIDED BY THE
AMOUNT AND QUALITY OF THE WORK DONE.**

Why not be your own Judge?

Put WAKEFIELD'S LUBRICATING OIL to the test. If a gallon goes further, gives better working results and reduces danger of breakdown, your very pride in your work will decide the matter apart from all selling talk.

Combustion of S.A. Coals in Boiler Furnaces.

Abstract of a paper read by E. P. Reim, B.Sc., before the Chemical, Metallurgical and Mining Society of S.A.

Spontaneous Combustion.

From Mahler's researches we see that oxidation of coal takes place at ordinary atmospheric temperatures, and this would apply particularly to coals high in volatile matter. If the coal is not in a confined space the action will not be cumulative; if, however, the conduction away of the heat generated is restricted the temperature will increase, and the oxidation will become quicker, until finally the coal will ignite. Thus the grade of the coal is an important factor, for if it is large and irregularly shaped the exposed surfaces and the surfaces in contact are small, so the heat can be readily conducted away; but if there is much small coal and duff present, even if only the surfaces of the coal are covered, with duff, then heat conduction is hindered, and so the cumulative action is increased. When pyrites are present in a finely divided state, especially in the presence of moisture, oxidation of that takes place and so increases the effect. This action takes place even when coal is stored under the most favourable conditions, for samples of pyrites kept in a reasonably dry room for some months showed distinct signs of sulphating. The presence of occluded gas in coal must also have some effect in accelerating spontaneous combustion, as it contains free hydrocarbons and oxygen. From a paper read by Mr. James Lomax before the Institute of Mining Engineers I gather that certain coals, no matter in what size or condition, are liable to spontaneous combustion, and these are not always those with the highest percentages of volatile matter or pyrites.

The Choice of Coal for Steaming.

To a great extent the choice of a coal for steaming, and the design of the boiler furnace in which it is to be used, depend on one another. The higher the percentage of volatile matter in the coal the larger must be the combustion chamber. If this is too small the gases will not be completely burned when they reach the boiler tubes, the cooling from which will prevent their further combustion, and apart from the loss in furnace efficiency when this effect is excessive, it will lead to soot being formed around the boiler tubes and so necessitate frequent cleaning. A coal very high in volatile matter, say, above 35 degrees, will require for complete combustion a combustion chamber whose size will render it costly in erection and maintenance, and its

large external surface will mean a correspondingly large loss through radiation and conduction. A coal very low in volatile matter will burn with a very low intense flame, such as with anthracites, and this will mean excessive heating of the grate links with attendant high upkeep expenses. The speed of combustion also will be slower, and this will particularly be the case with the Natal anthracites, where the ash percentage is fairly high (12 per cent. to 15 per cent. against the Welsh anthracites containing 4 per cent. to 5 per cent. of ash, and often less). Thus the most suitable coals for steaming purposes are those coming between these two, namely, the semi-bituminous. Then there is the consideration of the resulting ash, which should break up readily to allow the combustion of the carbon to take place. In semi-bituminous coals one gets bands of both of these types, and one then has to form an idea of the suitability of the coal as regards the mechanical distribution of the constituents, by estimating the ratio in which these two types are present.

Another point to be considered in the choice of a coal is that of the ash, forming slag and so clinkering. With furnace temperatures under 1100 degrees C., the slag chiefly consists of the bisilicate of iron, which has a melting point of 1065 degrees C.; but at higher temperatures the slag includes more of the bisilicates of calcium and aluminium, whose melting points are about 1400 degrees C., but which when mixed with iron bisilicate will have lower melting points depending on the proportions in which they are present. With furnace temperature less than 1000 degrees C. due to local higher temperatures immediately around the coal, to fuse the coal pieces together and so form an open clinker.

The bi-silicates usually have the lowest melting points of the silicate slags, and so it is they that are usually formed. Their compositions are:— $2 \text{FeO} \cdot \text{SiO}_2$, $\text{CaO} \cdot \text{SiO}_2$ and $\text{Al}_2\text{O}_3 \cdot \text{SiO}_2$. The slag calculations for an ash will be as follows, the amount in which the actions are completed, depending on the furnace temperature:—

2FeS ₂ becoming 2 FeO requires for slag formation	SiO ₂	Silica.
2 (56 + 64) requires for slag formation...	28 + 32	
1 lb. of FeS ₂ requires for slag formation	60/240 =	.25 lb.
CaO, becoming CaO requires for slag formation	SiO ₂	
(10 + 12 + 18) requires for slag formation	28 + 32	
1 lb. of CaO, requires for slag formation	60/100 =	.6 lb.
Al ₂ O ₃ requires for slag formation	3 SiO ₂	
51 + 48 requires for slag formation	3 (28 + 32)	
1 lb. of Al ₂ O ₃ requires for slag formation	180/102 =	1.76 lb.

The Mile at pre-wear cost

The initial cost of the Michelin "Cablé" is higher than you paid in 1914 for a Michelin Tyre, but it more than repays you in extra mileage.

FIT

Michelin "Cablé" COVERS

the latest development in Cord tyres

Made in Clincher or Straight Side type.

— The Michelin Straight Side "Cablé" is the only S. S. tyre which makes it possible to do away with the "flap". —

The Michelin "CABLÉ" is available in the 155, 150, 135, 120, 105, 90 and $30 \times 3\frac{1}{2}$ beaded edge sections.

Also 6, 5, $4\frac{1}{2}$, 4 and $3\frac{1}{2}$ Straight Side sections.

The Week in the Sharemarket.

A GENERAL IMPROVEMENT FOLLOWED BY IRREGULARITY—DIAMONDS VERY ACTIVE.

The market has shown improvement during the week on the continued return of strikers to work. The numbers returning gradually increased until last Wednesday, when the position was slightly reversed owing to the unions declaring a policy of intimidation. This has called forth strong representations from the mining houses to Government, and it is generally anticipated that early steps will be taken to put a stop to this dastardly action.

Cables indicate an appreciable rise in the London market; practically all descriptions have become active, and in the general business Kafirs have been carried into more favour. The week's business has increased materially, all sections, the public, professionals, and London, taking a hand in the general improvement.

Gedulds are still favoured, rising from 49s. to 51s., receding again to 50s. 3d., while the London quotation on Wednesday last was 54s. 4½d. (cum Div. 2s.) buyers. Modders and Modder Deeps have been very firm, but show only slight fluctuation. Government Areas rose from 77s. to 79s. receding again to 77s. 6d. on the intimidation movement. Good business was done in Nourse Mines between 10s. and 11s. Diamonds continue firm, the feature of the week being Crown Diamonds rising from 4s. 9d. to 7s. 9d., and receding to 6s. 4d.; the improvement is due to new developments on the property, which, with the assistance of capital, may be turned to good account. West Ends and Thurons remain at about 24s. and 16s. respectively. Consolidated Diamonds continue active at about 16s. 6d.

Letters to the Editor.

THE POSITION ON THE WITWATERSRAND.

Some Candid Criticism from Overseas.

To the Editor, *S.A. Mining and Engineering Journal*.

Dear Sir,—For many months I have been quite undecided as to the wisdom of saying anything which would add to the difficulties of those who are connected with the gold and coal mining of South Africa. Even as I write I am not certain that I am doing the right thing, but the fight which everyone on this side thought inevitable has come about, and the cables in this morning's papers do not seem very encouraging. I do not suppose for a moment that anything I say will matter much either way, but I have thought for a long time that the views of an outside observer who knows something of the inside might be of value to those who have been living for a long time in the "fools' paradise" of the Rand, more particularly as I meet from time to time all classes of Anglo-South Africans and on occasion South Africans who are visiting this country. And in this connection I may state quite frankly that I am on occasion the recipient of confidences which never, I imagine, reach the ears of the controlling directors or the higher officials. These, I need hardly say, will be respected. To clear the ground, however, I may say that I am not a holder of any gold shares. Apart from sentiment, my one interest is a small holding in a coal mining company, which has always paid me well, though I have very considerable doubts about the future of South African coal as a general proposition.

Now I think it is clear, and is indeed generally recognised by those who stop to think, that there can be no development in South African mining unless there is a steady flow of capital to South Africa from the outside. There has been none for a very long time, nor will there be anything worth speaking about until to-day's conditions are radically amended. You, sir, have done your part in endeavouring to awake the community to the imminence of the threatened disaster, though I personally don't always agree with what you have said, but the point I want to make is that, so far as I know, yours has been the solitary voice which has reiterated from week to week the fact that the whole community was approaching an abyss. I think, however, that you have erred somewhat in throwing an undue proportion of the onus on the men. To my mind, the three parties interested are all equally to blame—the Government, the mines themselves, and the men. I am no Solomon, but in the observations which follow I am endeavouring to voice not my own sentiments, but those of the large circle of friends with whom I am in contact. I need hardly say that to a very large extent I share them, though, as I have indicated already, the whole affair is in reality no concern of mine. I personally cleared out of my gold holdings, which were of the best, some considerable time ago, simply because I personally had no confidence in the Government, the men's sense of decency, or in the controllers of the industry. I shall consider these in their order after I have disposed of one point. There has been a controversy in your columns and elsewhere as to whether Johannesburg is a dwindling town or community. I shall not go into the pros and cons of the proposition, but I would merely repeat what I have said earlier in this letter, that when capital ceases to flow from England—for all countries will follow suit, America included—then Johannesburg will commence to die. If this proposition is accepted, then Johannesburg has already one foot in the grave. This should be proclaimed from the housetops, for it concerns everyone—the men who draw the big salaries as well as those occupying more humble spheres. There is just as bare chance that the foot will be lifted, but most heroic measures will be required.

Now I come to the Government. For years they have been warned of the danger, and beyond a few spoken platitudes they have done absolutely nothing to help. True,

the powers of a Government are somewhat restricted in matters of this sort, and on the whole they are better out of things. Had they remained passive, one could say very little, but since 1910 in particular their policy has been one continual putting on of additional burdens until to-day the load cannot be borne. In the pre-Boer war days, the mine owners complained of the exactions of the Kruger regime, whose methods were crude but understandable. The more scientific methods of the last two Governments in particular have, I should say, at a guess, about trebled the Kruger exactions, and no one has any idea where they are going to end, for the mines were, and are still, considered fair game. A 10 per cent. profits tax was a very simple affair, and moreover, the money was easily collected. The same applied to the special war levy on a commodity, if you please, which had remained constant in value while wages and everything else had gone up. I need hardly recall the fact that concurrently farmers, profiteers and speculators generally were making fortunes. Then came the provincial taxation, phthisis exactions, increased railway rates, mealies at 30s. a bag, and not one helping hand to the industry which General Smuts to-day states is carrying the country. That, however, is not the worst. In Parliament the industry had no friends; certainly the Government never indicated in any way that it had a friendly disposition. Those who did really represent it were, if not actually hounded out, told that they were there representing special interests. What of the farmers and the wine growers! Were they the only disinterested parties? Assuredly not. I shall not weary my readers, but this I can say with every assurance, that the attitude of the Government during the last twelve years has been one to frighten away investors. Their one interest was picking the pockets of the mine shareholders. The days of Government leases are gone never to return. What would have done a good deal to attract capital was the existence of one or two New Modders comparatively untrammelled by exorbitant taxation. Mining is after all a speculation, and if there were no plums there would be no mining. A crowning act of folly was the taking of the mint to Pretoria.

And now I must say something about the mine owners, though the term is a misnomer. Much fresh blood will require to be imported. The Rand is not, after all, the last word either in mining or in administration. There are quite good ideas to be obtained from other sources in all that appertains to mining, but it is a rare thing to hear of the importation of an important official. Most of the men occupying the principal positions on the Rand to-day have grown up there. Certainly they have gained their big experience there. Their outlook on life is the Rand, and naturally the younger men, whether from the colleges or training schools, know nothing else. Let me say at once that the Rand is an excellent school, but all of us want from time to time fresh blood and fresh ideas.

I come to the men. That they are behaving and have behaved like fools, that they are shortsighted, that they have been and still are being badly advised is admitted. They must know that if there is no profit they must lose their jobs when there are no other jobs going. They must also know and realise that it is better to accept a general reduction than to be without a job, yet they ignore all that is going on in this big world of ours. In this country wages of miners have been cut in two, and the process is not yet finished. It can only be stayed by the men working harder and putting in longer hours, simply because British coal cannot be sold unless it is something like the price which coal from other countries fetch. I said at the beginning that I thought an undue proportion of the blame had been put on the shoulders of the men, and for this reason. During the past seven years the men have got practically all they asked for. True there was sometimes a bit of a rumpus, but I take it that the men always started out by asking more than they expected to get, and in the end they got what they really wanted. There has been an entire lack of firmness in dealing with them. They have become so accustomed to get what they demanded that in the present trouble they no doubt anticipated another success. What

I mean is that the controllers of the industry have brought up the men to believe that they had only to ask to get. That is why I think the men are not so much to blame. If there had been greater firmness earlier, there would have been less trouble to-day. As a sincere friend of the working man I tell him he is living in a fool's paradise. The cuts suggested in his wages to-day are small. They will be bigger before long, but even then he will be about the best paid in the world, and there is certainly no other mining field in the world where he is so well looked after, both by the Government and the owners.

The plain English of the whole matter is that costs on the gold mines must come down by at least 6s. per ton before confidence is restored, *i.e.*, before the investor will put money in the mines. I am not going to say how this will be done. No single method will suffice. All the talk of potential riches on the East Rand or anywhere else won't alter things in the very slightest. The first essential is reduction of costs. Improvements in mining and metallurgical practice will no doubt help in this direction, but only to a minor extent. Better work and more of it is the big individual factor—in brief, greater efficiency.

Then again, the investor distrusts the Government. Be it right or wrong, he has come to think that the attitude of the Government to the mines is that of a pocket picker. All this must be changed. The mining regulations, among other things, must be amended. Taxation, direct and indirect, must be reduced; the farming community must be made to bear a portion of the burden; and the colour bar must go. I waste no words on this latter point, for I look upon it as inevitable and a simple act of justice.

As for the groups, I shall say no more except that it is high time they backed up their own men—the managers and the shift bosses. At whatever cost discipline must be reintroduced and maintained. Between the head offices, the Chamber of Mines, the Labour leaders and Government regulations, mine managers have had a devil of a time. No wonder they lost heart and followed the line of least resistance. I shall also admit in all charity that the controllers must also have lost heart, for it certainly has looked to them that if they were lucky enough to make good profits, the Government or the men, or both, would promptly step in and demand their whack.

I shall leave the men where they are, and I predict that they are going to get the surprise of their lives. They are going to be badly beaten, both on the gold and the coal mines, for they cannot override the ordinary simple axioms of economics. Not very long ago I received a very interesting letter from an old friend who is in the midst of all that goes on. He says, "I can see no hope for the industry as long as we allow the trades unions to dictate the policy of the mines. Should a subordinate official show any interest in efficiency, he at once becomes an object for a violent attack from the combined forces of the workmen's organisations, and (I say it with shame) he very seldom receives any support from his manager or consulting engineer. Time after time our capable officials have been thrown over to appease the labour wolves, and the natural consequence is that our officials are learning wisdom and showing the pace. Most mine managers are sick at heart over the whole business and are prepared to make any concession for the sake of a quiet life. Should they stand for increased efficiency and lower working costs, they know that they cannot count upon the support of the head office, and so the policy of drift, drift, drift." This letter does not, of course, stand by itself. I have many communications all to the same effect. Poor shareholders!

One last point and I am finished. There was a time when the technical societies of the Rand were a kind of forum where pressing questions were discussed without fear or favour. Debating blows were given and exchanged all in the best part, but something resulted. To-day without exception they are silent. I wonder why. Has Johannesburg at last become a big Kimberley? It looks very like it. The only men who can alter the present state of affairs are

the consulting engineers—all decent fellows and all good at their jobs, but the smaller men with ideas will never bring them forward until they know they are not going to be frowned on or, it may be, sacked.

"OLD JOHANNESBURGER."

London, January 17th, 1922.

[We have deleted certain portions of this letter (which has been written by a former resident of the Rand who occupied high technical and administrative positions) because we think that they would only tend to create bad feeling during the present crisis.—Editor, S.A.M. & E.J.]

ARTIFICIAL COAL.

To the Editor, *S.A. Mining and Engineering Journal*.

Sir.—As a regular subscriber of your journal, I thought it of more than ordinary interest to you to learn about a certain invention which has recently been made in Germany by Mr. Ludwig Prukner. Mr. Prukner was able to produce on a commercial scale artificial coal. I am sorry that I have not got the time to translate the article for you, but I am giving you the rough outlines of this invention as described in the article. He says he uses two kinds of rock which are plentiful in Germany, and he mixes it with another mineral and a few other chemicals which are cheap and plentiful. The whole thing is kneaded together, and the mass is ready to be pressed in any desired shape or form. Heated from 15 to 20 minutes by 60 degrees and the artificial coal is ready. The caluclative value of this coal has proved to be 7,995, and 9.9 lb. when burnt left a residue of 200 grams. And the artificial coal is in burning nearly odourless. Mr. Prukner makes a special point in his description that this artificial coal is no way connected with ordinary coal. About the price, he says that it will be possible to produce 110 lb. of coal, including everything, even depreciation of machinery, at 25 marks. Taking the mark at the present rate of 860 to the £, it will work out at 8d. for the 110 lb. Hoping that this article will be of a general interest to your readers.

Yours faithfully,

JOHN BURMESTER.

SWAZILAND TIN.

The following are the results of the operations of this company for the month of January, 1922: Concentrate recovered, 20.5 tons; estimated net profit for the month, including credit adjustments on previous shipments (taking tin at £150 per ton), £125.

TRADE AND INDUSTRIES SECTION.

Week in the Mining Material and Engineering Trades.

STRIKE GRADUALLY PETERING OUT—IRON AND STEEL—TIMBER AND BUILDING MATERIALS—ELECTRICAL GOODS—RAILWAY DEFICIT—RAILWAY DEVELOPMENT SCHEMES—COAL—BASE METAL CRISIS IN AUSTRALIA—BOARD OF TRADE RETURNS FOR JANUARY, 1922—INVESTMENT BOOM IN GOVERNMENT SECURITIES—METAL MARKET.

General.

None are so blind as those who will not see. The writing is on the wall. The initials S.A.I.F., under which is understood the South African Industrial Federation, are now more generally interpreted to mean "Strike And Its Failure." Opinion in commercial circles is now pretty unanimous that the end of the present disastrous struggle is in sight, and while some go so far as to measure the inevitable collapse of the strike by days, the least sanguine do not anticipate a much longer life. That it should lie in the power of a handful of irresponsible individuals to hang up such important industries as our coal and gold mining industries and at the same time paralyse the commercial activities of the country for a period extending over six weeks is, in the opinion of the vast majority of the community, not more a matter of astonishment than disgust. It is true that there are classic precedents for such mensate folly in the recent coal strike in Britain and in others which have preceded or followed it in other parts of the world, but this only emphasises the conviction of every right-thinking man that even in the twentieth century the relations between capital and labour leave plenty of room for amendment. The impression made on the community last Tuesday by the publication of the Chamber of Mines' very full and convincing statement of its case was profound. Not so, however, the modified proposals of the Federation to end the struggle. Such proposals, had they been made before the strike, might at any rate have afforded some ground for negotiation, but the continued fall in the price of gold since the 10th of last month and the economic factors which have occurred since the present strike began have now ruled such "terms" completely out of court. Nor, of course, has the repatriation of over 44,000 natives—approximately one-quarter of the mines' complement of native labour—helped matters, but very much the reverse. Still the mere fact that the Federation has at last awakened from its policy of masterly inactivity in so far as constructive action is concerned undoubtedly shows that certain pressure has been brought to bear upon their councils by the rank and file of the strikers and proves also that a more conciliatory attitude is now in evidence than has heretofore been shown by that body. It should therefore not be beyond the wit of the powers that be to find a satisfactory solution of the difficulty under the altered circumstances.

As a leading commercial man said this week, the most serious difficulty to be faced by the miners on returning to work will be the absolute impossibility of the industry to employ them in such numbers as were working in pre-strike times—a consequence of the suicidal policy adopted by their so-called leaders. Eventually the majority of the workers will be absorbed, but in the meantime a lot of unemployment is bound to occur, which the Government schemes in contemplation will only partially or, at any rate, only gradually relieve. The check to the commercial life of the Rand, he said, would undoubtedly be felt for many months to come.

Prices are, generally speaking, much about the same, with, however, some lines still inclined to recede. As a matter of fact, prices, my informant said, are now approach-

ing that level at which, as soon as the labour trouble has been settled, much of the work which has been held up for lower costs during the past few months can and will be tackled. He thought that the present comparatively low costs of stores and materials would, combined with the approaching lower white wages level and greater efficiency of the workers, enable many of our lower-grade mines to be worked at a profit and encourage the further exploitation of low-grade propositions. In fact, he was of opinion that provided costs of production were once and for all settled upon a true and economic basis in relation to the value of the gold product, we should see a much greater proportion of white labour working here than ever before.

Iron and Steel.

Business this week has naturally been but a reflection of the strike weeks which have preceded it—little or nothing having been done. Merchants are now in general convinced that the end of the present disastrous labour struggle is in sight, but are convinced that it will be months before anything like stable conditions prevail, and no very big recovery in business is anticipated for many months.

British Output of Pig Iron and Steel in 1921.

The production of pig iron in Britain in December, 1921, amounted, according to *Engineering and Industrial Management*, to 275,000 tons, a figure slightly in excess of the production in November, when it was 271,800 tons. The furnaces in blast at the end of December numbered 77, compared with 85 at the end of November, 15 of the furnaces having gone out of blast during the month and 7 rebuilt. The production of pig iron for the year 1921 amounted to 2,611,400 tons, compared with 8,007,900 tons in 1920. This figure is lower than in any year since 1850, when the production of pig iron amounted to 2,219,000 tons. Of the production of pig iron in December, 92,400 tons were hematite, 81,500 tons were basic, 13,800 tons were forged, and 78,600 tons were foundry. The production of steel ingots and castings in December amounted to 381,000 tons, or 62,000 less than November. The total production of steel for the year amounted to 3,624,800 tons, compared with 9,056,800 in 1920.

Latest advices from Britain report that prices generally are maintained, with no material development in new business. In the pig iron trade consumers are looking for still lower prices and are disinclined to undertake large forward contracts.

Unmarked iron bars, 12 lb., No. 1 Cleveland, 95s.; No. 3, G.M.B., 90s. The agreement between the English and Scottish steel makers for a minimum home trade price has been restored. Galvanised sheets are being ordered by Australia in fair quantities.

Owing to the high cost of production, the Armstrong, Whitworth Co. announce the closing down of their steel works at Newcastle. Eight hundred men will be thrown out of employment.

Latest cables from America report that manufacturing conditions lack uniformity throughout the country. Financial circles predict rather pronounced irregularities during the early part of the year, with increasing stability later. The permanent tariff is not expected to be enacted before May 1. Iron and steel show a decrease, while textile mills are operating near capacity. The December export balance is below sixty million dollars, compared with 450 million dollars a year ago. The Steel Corporation shows a slight increase of unfilled tonnage for December. Plates are quoted 1.50 dollars base Pittsburg.

Latest nominal quotations.—Dunswart iron, 22s. per 100 lb. basis price; Union Steel Corporation, Ltd., 22s.; imported iron and steel, flats, small, 33s. to 40s.; larger sizes, 30s. to 38s.; $\frac{1}{4}$ in. and 5-16 in. rounds, iron and steel, 37s.; $\frac{3}{8}$ in. iron, 30s. to 32s.; $\frac{1}{2}$ in. and $\frac{5}{8}$ iron, 31s.; steel, 37s.; $\frac{3}{4}$ in. round iron, 30s.; steel, 33s.; $\frac{7}{8}$ in. and upwards, imported, round iron and steel, 30s.; channel and joists, 35s. 6d.; shafting, $\frac{3}{4}$ in. to 2 in., 6 $\frac{1}{2}$ d.; steel plates, 1-16 in. and $\frac{1}{8}$ in., 22s. to 23s.; 3-16 in. and upwards, 24s.; spring steel, 7 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. a lb.; bolts and nuts, hexagon, round, $\frac{3}{8}$ in., 9d. to 1s.; $\frac{1}{2}$ in., 45s. to 50s. per 100 lb.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 43s. to 48s.; hexagon nuts, $\frac{3}{8}$ in., 11d.; $\frac{1}{2}$ in., 10d.; $\frac{5}{8}$ in. and $\frac{3}{4}$ in., 9d. lb.; fish plates, bolts and nuts, $\frac{3}{8}$ in., 8d. lb.; $\frac{1}{2}$ in., 6d.; $\frac{5}{8}$ in., 5 $\frac{1}{2}$ d.; $\frac{3}{4}$ in., 5d.; dog spikes, 35s. per 100 lb.; rivets, $\frac{1}{4}$ in., 11d.; $\frac{3}{8}$ in., 9d.; $\frac{1}{2}$ in. and $\frac{5}{8}$ in., 45s. per 100 lb.; brass rods, round, $\frac{3}{8}$ in., 1s. 5d.; $\frac{1}{2}$ in., 1s. 4d.; $\frac{5}{8}$ in. and upwards, 1s. 3d.; brass rods, hexagon, 1d. lb. extra; copper rods, round, $\frac{3}{8}$ in., 2s. 4d.; $\frac{1}{2}$ in., 2s. 3d.; $\frac{5}{8}$ in. and upwards, 2s. 1d. lb.; tool steel, 3s. 6d. to 3s. 9d. lb.; brass sheets, 1s. 11d. to 2s. 1d. per lb.; copper tubes, solid drawn, $\frac{1}{4}$ in., 3s. 9d. per lb.; $\frac{3}{8}$ in., 2s. 11d. per lb.; 7-16 in., $\frac{1}{2}$ in. and 9-16 in., 2s. 9d. per lb.; $\frac{3}{4}$ to 1 $\frac{1}{8}$ in., 2s. 6d. per lb.; 1 $\frac{1}{2}$ in. to 2 in., 2s. 3d. per lb.; 2 $\frac{1}{2}$ in. to 3 in., 2s. 6d. per lb.; 3 $\frac{1}{2}$ in. to 4 $\frac{1}{2}$ in., 2s. 8d. per lb.; copper rods, $\frac{3}{8}$ in., 2s. 5d. per lb.; $\frac{1}{2}$ in., 2s. 4d. per lb.; $\frac{5}{8}$ in. to 2 $\frac{1}{2}$ in., 2s. 2d. per lb.; copper sheets, 2s. 2d. to 2s. 3d. per lb.; fire box copper, 2s. 5d. per lb.; phosphor tin, 3s. 3d.; ingot tin, 2s. 2d.; ingot lead, £28 per ton; drill steel, 6 $\frac{1}{2}$ d.; hollow, 9 $\frac{3}{4}$ d.; 1 $\frac{1}{2}$ in., 9d. to 10 $\frac{1}{2}$ d.; wire nails, 30s. to 35s.; shovels, 52s. 6d. to 57s. 6d.; wheelbarrows, 47s. 6d.; picks, 37s. 6d.

to 67s. 6d.; pick handles, 21s., hammer handles, 14 in., 7s. 6d.; 18 in., 9s. 6d.; 24 in., 13s. 6d.; 30 in., 18s. 6d.; 36 in., 35s.; barbed wire, "Shorthorn," 69 lb. 13 $\frac{1}{2}$ gauge, 22s. per coil; plain galvanised fencing wires, No. 8 gauge, 100 lb. coils, 27s. per coil; No. 10 gauge, 100 lb. coils, 29s. per coil; No. 12 gauge, 100 lb. coils, 32s. per coil; bulb tee fencing standards, 14 lb., 27s. per dozen; 12 lb., 25s. per dozen; black baling wire, 14 gauge, 19s. per coil, 100 lb.; 12 gauge barbed wire, 22s. per coil 96 lb.; plain wire, No. 8 galvanised, 20s. 6d. per coil 100 lb.; fencing standards, 12 lb., 20s. per dozen; asbestos, short blue crude, £25 per ton, London. Screening, 3s. to 9s. 6d. per sq. yd.; cyanide, 1s. 7 $\frac{1}{2}$ d.; zinc shavings, 1s. per lb.

Second-hand Machinery.

Since several mines are restarting there have this week been a few orders received but mostly for second-hand material, such as pumps, small engines and boilers. The market is still depressed and there is very little otherwise doing in second-hand material, excepting to outside districts and towns an occasional order for building material and pumps and spares. It is felt that immediately the mines return to normal there will be a lot of inquiries in the market. It is understood that most of the batteries and machinery have been overhauled and defective and worn parts taken out and replaced. As most of the mines are endeavouring to work as economically as possible it is only natural that they are buying second-hand goods to replace. Second-hand timber and iron are still sought for in many instances by the strikers who have devoted their time to building operations, so that its an ill wind that blows nobody any good!

Timber and Building Materials.

There is little to report this week in this connection. Building operations, although being carried out to a limited extent, have not of course assumed any magnitude, nor are likely to until the labour trouble has been definitely settled. As soon as normal conditions have again been reached, active and extensive operations are confidently anticipated, as the amount of work held over pending the settlement is on all hands said to be very large. In the meantime merchants are putting little or nothing into stock.

Prices.—3 x 9 deals, 1s. to 1s. 1 $\frac{1}{2}$ d.; scantlings, 11d., beaver boards, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d.; floorings, 6 $\frac{1}{2}$ d. to 6 $\frac{3}{4}$ d.; ceilings, 1 $\frac{1}{2}$ d. to 4 $\frac{1}{4}$ d.; Oregon, 5s. 6d. to 6s.; pitch pine, 6s. 6d. to 7s.; corrugated iron, 8 $\frac{1}{2}$ d. to 8 $\frac{1}{2}$ d. Furniture timber: Burmah teak, 17s. 6d. per cube here for first quality, 14s. 6d. for second at the coast; American oak, 1 in., 10 $\frac{1}{2}$ d.; 1 $\frac{1}{2}$ in., 11d.; 2 in., 11 $\frac{1}{2}$ d., at coast; and Japanese oak, 1 in., 1s. 1d.; 1 $\frac{1}{2}$ in., 2 in., 1s. 2d., at coast; West African mahogany, 1 in. to 4 in. thick, 26s. 9d. to 27s. 6d. per cube at coast; Rhodesian mahogany, 9s. per cubic foot at mills; Honduras mahogany, 30s. per cubic foot; American yellow pine, 1s. 9d. per foot of 1 x 12 here; American pine shelving, 1s. per ft. 3-ply wood, 3 m.m. up to 5 m.m., alder and birch, 4d. to 6 $\frac{1}{2}$ d. per sq. ft.; oak and teak, 3-ply, 11d. per sq. ft. Prices for bricks are: Mixed, 70s.; wire-cuts, £4 10s. to £5; and £5 for pressed per 1,000, at kilns; white lime, 7s.; unslaked, 10s. 6d. per 180 lb. bag; 8 lb. bag, 1s.; blue lime, 3s. 9d.; blue plaster lime, 4s. 9d.; cement, 11s. 6d. a bag; damp course and roofing, 36s., 54s. to 55s. for 1 to 3-ply.

Second-hand Iron and Timber.

Business in this section is practically stagnant, as it has been more or less during the period of the strike. The price of timber is 8d. to 9d., iron 6d. to 7d.

Roofing Tiles.

Owing to the heat generated by corrugated iron, attempts have been made in the Union to manufacture roofing tiles. Specimens of clay and sand from Uganda and of clay and diatomite from Kenya Colony have recently been under examination in London with a view to ascertaining their possibilities in the way of manufacturing roofing tiles. It

is stated that tiles of good quality can be made with a suitable mixture of the clays and sand from Uganda, whilst good tiles can also be made from mixtures of the washed clays with "grog," i.e., clay that has been burnt and finely ground. The clays from Kenya Colony are also found suitable for making roofing tiles. The results obtained with the infusorial earth or diatomite are of special interest, as this material, which apparently has not been employed previously for the purpose, furnishes tiles which are much lighter than ordinary roofing tiles. There are, it is stated, extensive deposits of infusorial earth in Kenya.

Electrical Goods.

A slight improvement falls to be noted this week in electrical wares, outside orders coming in more freely than for some time past. There are no alterations in prices to record locally, but, according to latest advices, the tendency is for British goods to come down and German wares to go up, owing to the raw material position on the Continent. British quotations are 10 per cent. to 15 per cent. lower, while German prices are 5 per cent. to 10 per cent. up. A large dealer in electrical appliances says contractors are to-day cutting prices very considerably. Some of these have been waiting for months for lower levels, but are now realising that prices will not go much lower, at any rate for some time, and are taking advantage of some of the men on strike, who are receiving their strike pay, and are paying them only half wages and undercutting things to such an extent that the larger firms are holding aloof from such business, which in many cases leaves no profit.

Railway Deficit.

Mr. Jagger, the Minister of Railways and Harbours, had the unpleasant task of announcing to the House on Monday last that the loss in working, up to December 31, was £1,106,000. He anticipated a further loss of £150,000 for January-March, making altogether an estimated loss of £1,250,000. The accumulated deficit was, he announced, £3,855,000.

Railway Development Schemes.

The *Cape Times* states that with a view to relieving the distress at Kimberley a railway from that town to Barkly West and Borrelskop along the Vaal River has been definitely promised by the Prime Minister. In addition, the Government has on its programme a railway from Belmont to Douglas, in order to open up the irrigation lands along the Orange River. Other probable lines are one from Oudtsboorn to Calitzdorp and Ladismith, and a line from Frankfort, in the Free State, to Balfour, in the Transvaal.

Union Coal.

Owing to continued competition from England, business for export has declined to 18s. 6d. per ton. The price of bunker coal is now 32s. 9d. as against 42s. 9d. for 1921. During the eleven months ended November 30 last exports amounted to 1,587,496 tons, valued at £1,777,635, as compared with 1,215,690 tons, valued at £1,337,840 during the corresponding period of 1920. Union sales and shipments for December at shown at 908,025 tons, valued at £351,599, and for the year ended December 31, 11,389,015 tons, valued at £4,989,028. Seventy-three collieries were producing in the Union during December, the total tonnage mined being 1,089,385 tons. 4,920 tons were converted into by-products, 2,020 tons of coke and 3,525 gallons of tar being produced.

Copper Mining Crisis in Australia.

A message from Adelaide (Australia) says that a crisis has arisen in the copper mining industry as a result of the employers' insistence on reducing wages. Although a section of the workers seceded from the unions in order to accept a reduction of 18 per cent. in wages, the necessary number of men is not obtainable to enable the continuance of mining operations.

The general position in Australia is in a very serious plight, and many of the principal base metal mines are closed because the miners decline to accept lower wages.

Board of Trade Returns for January, 1921.

Exports have increased by nearly £4,000,000 to £63,000,000 and are higher than for any month since March last. The principal increase both in volume and value are shown in iron and steel products, machinery, cotton and woollen yarns and apparel. The imports have declined by £9,000,000 to £76,500,000 and are much below any 1921 month.

Holland-South Africa Line.

This line's newest steamship, "Springfontein," is now about to make her homeward run to Europe after her maiden trip to South Africa. The ship is described as replete with every modern convenience for efficiency in handling cargo and for the comfort of passengers. She was built in Port Glasgow. Her net register is 5,494 tons, length 430 ft., breadth 56 ft., and depth 36 ft. She carries approximately 11,000 tons of cargo and steams up to 12 knots. For the homeward run the "Springfontein" has secured a full cargo of maize, bark and other Union products.

An Amsterdam message reports a rumour that important South German industrial groups are endeavouring to acquire financial influence in the Holland-South Africa line. It is stated that the leaders of German industry, in consequence of the loss of the German Colonies in South Africa, are doing their utmost to obtain a firm footing in the Union.

Big Investments in Government Securities.

The market in London for British and overseas Government stocks has been very active since the reduction of the Bank of England rate to 4½ per cent., and huge transactions have taken place at enhanced prices. One of the chief factors is the slackness of trade inducing people with capital to invest in high-class securities yielding more than is obtainable from the banks.

Railway Amalgamations.

The chairman of the Midland Railway Co. at the annual meeting confirmed the report that negotiations were proceeding for amalgamation with the London and North-Western Railway Co. and five other companies, with a capital of 527 millions.

Direct Sailings, Australia to Manchester.

The first direct sailings from Australia to Manchester are announced. In consequence of this development three New Zealand exporting firms have decided to open branches in Manchester for the disposal of produce.

Belgian Katanga Railway.

The Belgian Government has decided to push ahead with the construction of the final section of the route for the railway to connect Katanga and the Kasai River, thus permitting the exportation of Katanga copper *via* Matadi, in the Congo estuary.

Falling Cost of Living.

The cost of living in the United Kingdom declined during January four points to 88 per cent. above pre-War rate, due mainly to reduction in food prices. This figure has not been touched since January, 1918. According to a cablegram from the Minister of Labour the percentage increase in food prices in February, 1922, over pre-War prices is given as 79.

Johannesburg's Tramway Deficit.

Through the unfortunate suspension of the tramway service it is estimated that a deficit of £27,442 for the year ending June 30th will have to be made good by ratepayers.

Metal Market.

Latest London quotations: Standard copper, £58 cash and £59 forward; electrolytic copper, £64 10s. cash, £66 10s. forward; standard tin, £146 2s. 6d. forward; foreign lead, £19 17s. 6d. cash and £19 forward; quicksilver, £11 5s.; bar silver, 33½d.; and bar gold, 95s. 4d. per oz.
