EDITORIAL ORGANIZATION

EDITOR OF ORIGINAL EDITION AND INVENTOR OF THE SYSTEM

J. N. LARNED

Librarian, Buffalo Public Library (1877-1897)

President, American Library Association (1892-1894)

Author of "History of England for Schools," "A History of the United States for Secondary Schools," "Seventy Centuries," etc.

REVISION STAFF

EDITOR-IN-CHIEF

DONALD E. SMITH, A.B. (CORNELL), PH.D. (CALIFORNIA)

Professor of History, Geography and Economics

Formerly at University of California, Toledo University, etc.

Author of "Viceroy of New Spain in 18th Century," "Diary of the Portolá Expedition" (with F. J. Teggart), "The Geographic Factor in English History" (in "English Leadership", with J. N. Larned, W. H. Taft, et al.)

ASSOCIATE EDITORS

CHARLES SEYMOUR, B.A., M. A. (CAMBRIDGE, ENG.), PH.D. (YALE), LITT.D. (WESTERN RESERVE)

Professor of History at Yale University

Chief of Austro Hungarian division of American Commission to Negotiate Peace

Author of "Electoral Reform in England and Wales," "Diplomatic Background of the War," "How the World Votes" (with D. P. Frary), "What Really Happened at Paris" (with Col. E. M. House), "Woodrow Wilson and the World War," etc.

AUGUSTUS H. SHEARER, A.B., A.M., PH.D. (HARVARD)

Librarian, Grosvenor Library, Buffalo

Lecturer, University of Buffalo

Formerly Bibliographer, Newberry Library, Chicago, and Chairman, American Library Association Committee on Manual of Historical Literature

DANIEL C. KNOWLTON, A.B., PH.D. (CORNELL)

Head of History and Civics, The Lincoln School of Teachers College, New York

Member of Editorial Board of "The Historical Outlook"

Author of many books on teaching of history and (with S. B. Howe) of "Essentials in Modern European History," and (with Professors Hazen and Webster) of a series of wall-charts on ancient, medieval and modern history

ASSISTANT EDITORS

ALLEN L. CHURCHILL, A.B. (BOWDOIN)

On editorial staff of New International Encyclopædia and associate editor, New International Year Book

HENRI F. KLEIN (LONDON)

Formerly librarian "London Times," on editorial staff "London Standard" and contributing editor, "Encyclopedia Americana," etc.

HELENA (DOUGHTY) PETERSON, A.B. (VASSAR), A.M. (WISCONSIN)

Formerly high school teacher of history

JAMES R. ROBERTSON, A.B. (Beloit), A.M. (MICHIGAN), PH.D. (CALIFORNIA)

Professor of History and Political Science, Berea College, Kentucky

Formerly assistant curator, Bancroft Library of University of California

FRED C. WHITE, A.B., A.M. (ALFRED)

First assistant in History, Morris High School, New York City

NOTE: It will be understood that in building a work with the quoted words of the best authorities, it was a prerequisite that, in addition to other special qualifications, each member of the editorial organization should have specialized in the field of history and historical literature—the broadest interpretation being given to the term history. We give the full list of names, with selections from available data as to some, though all have taught, written or lectured on, or devoted years of study to, history, civics, government, economics, etc. etc. Each of the indexers had extended experience in library work also. See Publishers' Foreword and Editors' Preface.

THE PUBLISHERS.

PUBLISHERS' FOREWORD

With confident expectation of a well-nigh universal welcome and approval, we are pleased to introduce THE NEW LARNED HISTORY FOR READY REFERENCE, READING AND RESEARCH.

THE NEW LARNED HISTORY, as it will be familiarly called, is the culmination of long-cherished hopes and plans. For several years there has been an increasing demand from thousands of owners and users of the older Larned work, and others, for the *later* historical material—later, in respect to modern scholarship, as well as chronology—not found in our publication or any other. And, in consequence, soon after the outbreak of the World War, we determined to meet the need in the most adequate way. First of all, and as a proper service to former patrons, a painstaking expert examination of the existing work was made to determine the practicability of adding a third “recent-history,” supplemental volume. As the War continued, however, it became apparent that “recent history” was rapidly attaining such proportions that it would not be possible to present it in a single volume. Moreover, we were convinced that a mere supplemental volume, or volumes, bringing the work up to date chronologically, would only partially solve the problem. There would still be lacking the indispensable *new historical knowledge* needed to correct, amend, and supplement certain portions of the old Larned text. And, furthermore, we realized that a set with three supplemental volumes would involve four indexes to be consulted and would therefore not be in accord with the Larned ideal of “ready reference.”

Our conclusion therefore was that only through a complete revision and large extension of the old work, could we provide, for the benefit of old and new patrons, the following substantial additions and improvements:

1. Elimination of material which, though previously accepted as authoritative, had, as a result of modern research and interpretation, become obsolete, valueless and, in some cases, even harmful.
2. Addition of an important array of newly available and indispensable material of distinct value in portraying certain events and movements of history treated in the old work.
3. Inclusion of the most reliable records and descriptions of events and movements since 1910 — a period that may hereafter be considered the most important in all time.
4. Organization of, and welding together into one harmonious whole, all this world-history, by application of Larned's unique and unexcelled alphabetical-chronological system of arrangement, with interwoven index, references and cross-references, citations, bibliographies, etc. [For fuller explanation of system, see page xxi.]
5. Illumination of the text by authentic and artistic illustrations, charts, maps, etc.

THE NEW LARNED HISTORY was begun in August, 1916, and besides the above named important objects, it was decided to increase still further the usefulness and value of the work by

- (a) Broadening its scope, through an interpretation of History as embracing practically everything that has affected the life of mankind since time began.
- (b) Adding thousands of new entries, for the purpose of defining historical words and terms and of locating places and people, *historically* (not to provide substitutes for dictionaries, gazeteers, biographies).
- (c) Largely increasing the number of historical and other maps.
- (d) Providing frontispieces in color and numerous inserts in duotone, to illustrate scenes, things and persons of distinct historical importance and interest.

Further explanation of the reasons for, and scope of, the revision will be found in the Editors' preface.

To accomplish all these objects required historical, bibliographical, editorial and other knowledge and skill of a high order, and we sought the advice of some of the leading historical scholars and librarians before choosing our Editor-in-chief and his associates. We were confident that those selected possessed the necessary special qualifications and felt that we were fortunate in securing the advantages of the varied points of view of trained students and teachers of history in university, college and school, the experienced librarian, and the publicist. And, with the purpose of achieving results as nearly perfect as humanly possible, we devised an elaborate system of research, compilation, critical reading, and review by *each editor* of all manuscripts, with amplification, modification or change in accord with the final consensus of editorial opinion. These processes, and the indexing, cross-referencing, proof-reading and arranging of bibliographies were entrusted to individuals who were well qualified by education and experience and who also enjoyed our own special training. We are pleased to record on page v the names of these valued coadjutors.

The entire undertaking necessarily rested upon the cooperation of authors and publishers, for we could not quote from their copyrighted works without permission and did not purpose, without acquiescence, even to make extracts from books not so protected. The "golden rule" of observing all the rights of those concerned has been consistently obeyed; we have been allowed to draw from a "golden fountain" of historical literature and we value among our most prized possessions the hundreds of letters most generously and cordially granting us the desired permissions. These permissions are quite exceptional and we are confident the owners and users of THE NEW LARNED HISTORY will be fully appreciative and will join us in grateful acknowledgment of the great service thus rendered by our brother publishers and authors of the English-speaking world and elsewhere. More detailed acknowledgments will be found on page xiii.

Perhaps it is needless to say that our procedure in this respect has been in strict accord with the Larned practice, as stated in the preface to the original edition, written by Larned himself, from which we quote as follows:— "But the extensive borrowing which the work represents has not been done in an unlicensed way. I have felt warranted, by common custom, in using moderate extracts without permit. But for everything beyond these, in my selections from books now in print and on sale, whether under copyright or deprived of copyright, I have sought the consent of those, authors or publishers, or both, to whom the right of consent or denial appears to belong. . . . The authors of books have other rights beyond their rights of property, to which respect has been paid. No liberties have been taken with the text of their writings. . . . In the matter of different spellings, it has been more difficult to preserve for each writer his own. As a rule this is done, in names, and in the divergencies between English and American orthography; but, since much of the matter quoted has been taken from American editions of English books, and since both copyists and printers have worked under the habit of American spellings, the rule may not have governed with strict consistency throughout."

The dimensions of the new work considerably exceed those of its predecessor, which had 5600 pages. Roughly speaking, seventy percent of the old has been retained in the new work, which totals about 10,000 pages, approximating 12,000,000 words. Thus sixty percent of the new work comprises additional material supplied by the present editorial organization. The entire work is new mechanically. The plates are made from linotype composition. The format and type faces were specially designed to insure readability, attractive appearance and, withal, economy.

THE NEW LARNED HISTORY, to an even greater degree than the old work, offers to the casual reader the opportunity of discovering quickly and easily the established facts concerning any historical event or movement; to the scholar it constitutes a technical guide, providing him at once with the conclusions of the most eminent historians, and an indication as to where further information may be obtained. In addition to its encyclopedic and bibliographical uses the work serves as a compendium of the best historical literature, since the more important historical articles are not, as in the case of some historical dictionaries and encyclopedias, the work of so-called hack writers, but are composed of careful selections from the writings of the world's leading historians. They include some of the finest passages from Herodotus, Froissart, Machiavelli, Voltaire, Gibbon, Macaulay, Ranke, Treitschke, Stubbs, Rénan, Lavisse, Aulard, Ferrero, Breasted, Parkman, Rhodes, and a host of other famous writers. The student will thus find in the revised Larned work, not merely the most authoritative statement of facts, but also unlimited examples of the best historical writing.

Those of us who were privileged to plan the undertaking and to observe at close range the labors of the Editors and their assistants, can testify to the difficulties of the task. It demanded broad vision and the most delicate sense of proportion. The high degree of suc-

cess achieved by the earlier edition, while it supplied a stimulus, did not remove the necessity of gathering a vast collection of new material, some of it to describe the events of the past three decades, much to supplant material in the unrevised edition which might fairly be regarded as out of date. There was necessary the meticulous weighing of the merits of different accounts of the same subject; a close acquaintance with the sources and materials of history in all generations, and the scrupulous investigation of the most recent and most authoritative output of historical literature. Finally, it required a sense of imagination, unusually acute, which would enable the Editors to place themselves in the positions of people in various walks of life so as to visualize the sort of information these people were likely to seek. Only thus, indeed, could the work possibly justify itself and supply the incomparable Larned service to all who would apply to it for aid.

The extent to which those demands have been met and the success with which the accompanying difficulties have been overcome will be demonstrated in the actual experience of those who use the work, and theirs will be the final words of appreciation. As constant observers and critics, we confidently promise that THE NEW LARNED HISTORY will be for this generation what the "Old Larned" was for the past — than which there can be no higher praise.

The familiarity with *history*, *histories* and *historians*, resulting from use of these volumes, should prove a constant stimulus to the acquisition and reading of some of the older standard books and many of the worthy new books as they are published. In this connection our carefully prepared bibliographies and lists of books, selections from which have been made, will prove a valuable guide, especially when supplemented by our established "Editorial Service" which may be freely called upon at all times.

Finally, it is our earnest hope and expectation, as publishers for more than seventy years and as producers of the former editions and supplemental volumes of the Larned work, that the further knowledge and understanding of world-history made available in THE NEW LARNED HISTORY FOR READY REFERENCE, READING AND RESEARCH will constitute a genuine public service and contribute appreciably towards the raising of the standard of citizenship and government in our own country and elsewhere. For, as Burke said:

"In History a great volume is unrolled for our instruction, drawing the materials of future wisdom from the past errors and infirmities of mankind."

And, when mortals thus turn their errors into stepping stones leading to the Divine Way of Life, they will share what Cervantes evidently visioned when he wrote:

"History is like sacred writing because Truth is essential to it, and where Truth is, there God himself is."

C. A. NICHOLS PUBLISHING COMPANY
F. C. H. GIBBONS, *Managing Director.*

EDITORS' PREFACE

The problem of writing a history of the world which will be at once fully satisfactory to scholars and to the general reader has never been fully solved. Nevertheless, the initial publication of LARNED'S HISTORY FOR READY REFERENCE was undoubtedly the nearest approach to a solution. For nearly thirty years, that work has held a definitely marked position in the field of historical studies and has been the standard work of historical reference for both casual student and professional scholar. It was the purpose of the author to present a coherent narrative of the history of mankind which would be not merely authentic, instructive and interesting, but would also permit the reader to have actually before him, the words of the great masters of historical writing. Perhaps we can do no better than to state the aims of Larned, in his own words, quoted from the preface to the original edition:

"This work has two aims: to represent and exhibit the better Literature of History in the English language, and to give it an organized body — a system — adapted to the greatest convenience in any use, whether for reference, or for reading, for teacher, student, or casual inquirer. The entire contents of the work, with slight exceptions readily distinguished, have been carefully culled from some thousands of books,—embracing the whole range (in the English language) of standard historical writing, both general and special: the biography, the institutional and constitutional studies, the social investigations, the archaeological researches, the ecclesiastical and religious discussions, and all other important tributaries to the great and swelling main stream of historical knowledge. It has been culled as one might pick choice fruits, careful to choose the perfect and the ripe, where such are found, and careful to keep their flavor unimpaired. The flavor of the Literature of History, in its best examples, and the ripe quality of its latest and best thought, are faithfully preserved in what aims to be the garner of a fair selection from its fruits. History as written by those, on one hand, who have depicted its scenes most vividly, and by those, on the other hand, who have searched its facts, weighed its evidences, and pondered its meanings most critically and deeply, is given in their own words. If commoner narratives are sometimes quoted, their use enters but slightly into the construction of the work. The whole matter is presented under an arrangement which imparts distinctness to its topics, while showing them in their sequence and in all their large relations, both national and international. For every subject, a history more complete, I think, in the broad meaning of 'History,' is supplied by this mode than could possibly be produced on the plan of dry synopsis which is common to encyclopedic works. It holds the charm and interest of many styles of excellence in writing, and it is read in a clear light which shines directly from the pens that have made History luminous by their interpretations."

That Larned achieved his purpose has been abundantly attested by the most exacting critics of all shades of opinion, and of the most diverse points of view. However, as has been so truly said, "Each generation must write its own history," and the time came to acknowledge the need of thorough revision. During the past thirty years historical scholars have been active as never before, in both research and interpretation. Much that our fathers knew is now recognized to be not in accord with the historical record, or of doubtful value. New light has been thrown on the events of the past; conclusions which had to be couched in tentative form may now be stated definitely, while other conclusions must be revised. The whole horizon of historical knowledge has been widened, while the general progress of science has given new significance to what was formerly thought unimportant or irrelevant. History, whether it be a science or an art, or something of both, is never static; it must always be regarded in the light of the present, and the present is always changing.

Moreover, as the point of view of the generation has changed, the term "History" has broadened in its connotation. It is no longer merely what Professor Freeman called "past politics," but now embraces an infinite variety of subjects — literary, economic, social and scientific in character. A general work of historical reference must now include fully elaborated articles on such topics as education, chemistry, money and banking, philology and archaeology, which formerly would not have appeared to be within its scope. Finally, and if for no other reason, the need for revision would have been occasioned by the speed with which actual history has been made since the appearance of the former editions of the

Larned work. In a sense, every age is one of transition, but the one in which we have been living seems to have been fraught with events of the utmost importance as affecting the progress of human civilization. Historical scholarship cannot refuse to deal with this most difficult recent period, merely because of the difficulties arising from the lack of a proper historical perspective. The rapid development of applied science, the changing character of industrial organization, the internationalization of trade, the crises in international politics which culminated in the World War, and its aftermath; all these historical facts are of such weight and complexity that the student may justly demand an adequate guide to their comprehension.

Furthermore, it has been recognized that in the writing of history methods change. Even where sources of information were open to the older historians, they often, because obsessed by political and diplomatic history, disregarded what now appear to be facts of fundamental importance. This was already recognized by the generation to which Larned belonged, yet even he, in practice, encountered well-nigh insuperable obstacles in setting forth in orderly narrative the proper blending of these subjects with the social and economic facts of human existence. Larned recognized the need of a more adequate treatment of non-political history and met the difficulty by the creation of separate articles dealing with commerce, tariff-legislation, railroads and the like. In the present edition an even greater emphasis has been placed upon the facts of our industrial life. Such articles in the original work have been much enlarged, while many new articles, such as the industrial revolution, have been added. Likewise the former editions have been enriched by many new or fuller articles on subjects vital to the history of civilization such as architecture, sculpture, painting, costume, drama, science, literature and religion.

Popular interest in the best sense has also been aroused concerning many countries and parts of the earth which were regarded, only a quarter a century ago, as of interest only to specialists. The history of Latin America now subtends a much larger angle of the world's intellectual interest than in the nineteenth century. Questions relating to Africa and the Far East have taken on in recent years a new importance, while all phases of international relationships have come to occupy the foreground of our thought. All this has been taken into consideration in the preparation of the new work and constitutes, if not a departure from, at least a further development of the original Larned idea. The same is true of the two principal auxiliaries of history, namely, geography and political science or government to which extended treatment has been given.

The necessity of knowing the location of historic places has led to the introduction of what may be termed a gazetteer feature, by which cities and places mentioned in the regular narrative are entered in their proper alphabetical place and their location briefly indicated, with necessary cross-references. In order to afford a quick and easy way of visualizing these places, the changes in boundaries and many other facts, a large number of specially prepared historical maps has been provided. These maps, if bound together, would constitute a complete historical atlas, such as is now used in our principal universities and colleges. Also, the claims of geography are met by the use of actual geographical description where, as so often is the case, a knowledge of the terrain and of the physical environment is essential to the understanding of history.

The amplification of the material dealing with government or civics, in contradistinction to politics and political history, is likewise in response to a pressing need. Problems of municipal government and suffrage are not matters of mere abstract political theory, and they, and many cognate subjects, are treated as most important parts of the life of mankind. In order to understand better the broad political structure of a nation, the constitution of that nation is placed immediately with the article, and usually accompanied by explanations which will render it intelligible to the general reader.

More than a rearrangement or a simple expansion of material in the former editions, is the use of illustrations. Often a picture can convey to the mind more than pages of description. The hundreds of illustrations which are introduced into the new edition are intended primarily to be a part of the exposition of human development rather than ornamentation, and constitute, together with the maps and plans, a powerful visual help to the comprehension of the drama of human progress.

The two concluding volumes of the work are taken up principally with the history of the World War. It will of course be many years before all the evidence is in and the verdict of history rendered on all the extremely complex issues raised by this struggle. But in the meantime, we can know a great deal, and the most intense human interest must attach to that knowledge. The editors and publishers have spared no effort to bring together, after a most careful sifting and winnowing, a complete, authoritative, and impartial treatment of

EDITORS' PREFACE

the war, in all its phases, and with due regard to every point of view. The diplomacy, national policies, strategy and tactics, economics, international law, devastation and relief, and various other aspects of the great conflict of nations and interests, are set forth with informing simplicity and fidelity to truth.

It is a well-known fact that the orthodox historians do not like to deal with these most recent events, which they are tempted to call "present politics" or "history in the making." In the presence of this difficulty, the compilers of *THE NEW LARNED HISTORY* are forced to draw more heavily upon documents, or the primary material for history, than for the periods in the more remote past. So far as practicable the material used for the history of these later years is taken from official sources; that is from statements of fact that are made with official responsibility, in despatches, reports, diplomatic correspondence and other state papers published with governmental sanction. Important documents connected with greater events of the times, such as treaties, international agreements, new national constitutions and legislative acts are given generally in full from officially printed texts. The aim has thus been to prepare for students and inquirers a compilation of recent history as nearly authentic in its sources as can be gathered thus immediately after the events, and to organize it for "ready reference" in the form that has had approval in the older work.

The editors would be sadly remiss if they did not acknowledge their deep and constant obligations to the publishers and to the editorial office staff for their unwearied coöperation in carrying through the work to successful completion. Thanks are also due to the authorities of the New York Public Library and its Hamilton Grange branch for their kind coöperation in meeting our somewhat unusual demands upon their facilities; to the Russell Sage Foundation for the generous placing of its library resources at our service, and to the City Library Association of Springfield, Massachusetts, for help on bibliographical questions.

ACKNOWLEDGMENTS

In the Publishers' Foreword we have acknowledged in general terms the courtesy and liberality of authors and publishers, by whose permission we have used much of the matter quoted in this work. Following the example of the original editor, J. N. Larned, we wish now to make the acknowledgment more specific, by naming those persons and publishing houses whose coöperation has been so large a factor in maintaining the authority of the work, as well as its timeliness. Since many of the names in the original list are those of persons and firms no longer existent, we have thought it proper to retain that list with its original classifications, as a separate item, omitting only the few whose contributions have been deleted, because later discoveries, or later and more authentic information, have provided better material in replacement. The old list will be followed by a list of those authors and publishers who have contributed to the revision, and though some duplicate names will be found in both, the fact may be easily accounted for.

The two lists suggest two significant points of comparison, namely, the greater number of authors' names in the older list, and the noticeable increase in the American publishers' names in the present list. With regard to the first, we may say that most of the writers quoted in the revised portions of the old work and the additions thereto, have authorized their publishers to represent them. And we may add that, although in some cases conditions have been imposed, neither from authors nor publishers have we met with refusal. With regard to the second point, it may be said to be an indication of the growth in historical scholarship and in publishing enterprise in this country.

And, finally, with our acknowledgment, it is a very great pleasure to mention the helpful goodwill of representatives in America of English houses, which in not a few instances has strengthened the understanding and coöperation of such firms. The evidences of an Anglo-American community of interest, high purpose, and fraternal spirit, are also extremely gratifying.

THE ORIGINAL LIST

AUTHORS

Evelyn Abbott, M.A.; President Charles Kendall Adams; Prof. Herbert B. Adams; Prof. Joseph H. Allen; Sir William Anson, Bart.; Rev. Henry M. Baird; Mr. Hubert Howe Bancroft; Hon. S. G. W. Benjamin; Sir Walter Besant; Prof. Albert S. Bolles; John G. Bourinot, F.S.S.; Henry Bradley, M.A.; Rev. James Franck Bright, D.D.; Daniel G. Brinton, M.D.; Prof. William Hand Browne; Prof. George Bryce; Rt. Hon. James Bryce, M.P.; Prof. J. B. Bury; Mr. Lucien Carr; Gen. Henry B. Carrington; Mr. John D. Champlin, Jr.; Mr. Charles Carleton Coffin; Hon. Thomas M. Cooley; Prof. Henry Coppée; Rev. Sir George W. Cox, Bart.; Gen. Jacob Dolson Cox; Mrs. Cox (for "Three Decades of Federal Legislation," by the late Hon. Samuel S. Cox); Prof. Thomas F. Crane; Rt. Rev. Mandell Creighton, Bishop of Peterborough; Hon. J. L. M. Curry; Hon. George Ticknor Curtis; Prof. Robert K. Douglas; J. A. Doyle, M.A.; Mr. Samuel Adams Drake; Sir Mountstuart E. Grant-Duff; Hon. LIST OF MAPS IN VOLUME I

1. AFRICA, 1914, political See AFRICA
2. AFRICA, modern railroad lines See AFRICA
3. AFRICA, political (colored) See AFRICA

[EDITOR'S NOTE: This map of the Dark Continent now has more definite and accurately determined frontiers than that of Asia, and it is possible to show the actual political subdivisions as they now stand. It will be noted that Abyssinia and Liberia are the only remaining independent states, and that all the rest of the continent has passed under the sovereignty or political control of the various European powers. However, the World War brought about several interesting changes in the political map of the continent. Togoland and the Kamerun (Cameroon) were divided between France and England, the former country securing the greater part of both the former German colonies. German Southwest Africa was given to the Union of South Africa and German East Africa, renamed Tanganyika Territory, to Great Britain. Tanganyika Territory, however, is not exactly coterminous with the former German East Africa because a district in the northwestern part was entrusted to Belgium. All these transfers of territory were made under the new system of mandates under the League of Nations. The reader should also notice that the new name Kenya Territory is now officially applied to the former British East African protectorate. The recent railroad development in Africa and particularly the Cape to Cairo railway will be found on a special black and white map (see number 2 above).]

4. ALASKA, political (colored) See ALASKA
5. AMERICA, voyages of discovery, 1492-1611 (colored) See AMERICA

[EDITOR'S NOTE: A map drawn on the Mercator projection listing the voyages of discovery and exploration from 1492 to 1611. The voyage of Magellan is omitted because it was only of incidental importance to America proper. In most cases routes as laid down are, in the nature of the case, only of approximate accuracy. The historical importance of the map is twofold. In the first place it reveals the progress of geographical knowledge of the western hemisphere as successive voyages of exploration changed the preconceived notions of Europe regarding the New World. In the second place, since discovery and exploration were generally acknowledged to be a proper basis for a claim to possession of territory under international law, this map reveals in a general way how the early partition of America among the European powers was effected. Particular attention is called to the voyage of Cabral, the Portuguese navigator, whose accidental encountering of the eastern coast of South America on his voyage to India by way of the Cape of Good Hope, reinforced the Portuguese claim to the lands which were later known as Brazil.]

6. AMERICA, colonial grants (colored) See AMERICA
7. ANTARCTIC REGIONS (colored) See ANTARCTIC EXPLORATION

8. ARABIA (colored) See ARABIA

[EDITOR'S NOTE: No part of the world had its political geography changed more completely by the World War than Arabia. The independent Kingdom of Hejaz and the Zionist state in Palestine, under British mandate, no longer appear on the map as Turkish territory; while to the northeast the new Kingdom of Irak, with its capital at Bagdad, was organized by the British, acting as mandatory for Mesopotamia. The boundaries of Palestine and of Syria (under French mandate) were not entirely settled by the early part of 1922.]

9. ARCTIC REGIONS (colored) See ARCTIC EXPLORATION

10. ASIA, political (colored) See ASIA

[EDITOR'S NOTE: A map representing the political divisions of the continent in the beginning of the year 1922. Many of the frontiers which were disturbed by the World War were still purely conjectural. Those of Armenia, although decided by President Wilson when they were referred to him by the League of Nations, have never been put into effect because of unsettled conditions in Asia Minor. The same is true of the frontiers of Syria and Mesopotamia, where the new kingdom of Irak has just been estab-

LIST OF MAPS IN VOLUME I

lished. The latest information available regarding the boundaries of these regions will be found in the map of Arabia. Even less clear is the situation in the Far East where the status of Mongolia has yet to be decided, and the territorial extension of the new Far Eastern republic in eastern Siberia has fluctuated from month to month. The boundaries of the Chinese republic are, therefore, left as they were at the time of its establishment in 1912. No attempt has been made to show the expansion of Japanese influence in Manchuria and Inner Mongolia, because it lacks a definite territorial basis. The indefiniteness of our information regarding Persia also justifies the reproduction of the map of that country as it was in 1914, except that the Russian and British spheres of influence given on the older maps have now disappeared.]

- 11. EGYPTIAN, ASSYRIAN, BABYLONIAN AND MEDIAN POWERS (colored) . . . See ASSYRIA
- 12. ANCIENT ATHENS (colored) See ATHENS
- 13. AUSTRALIA AND NEW ZEALAND, political (colored) See AUSTRALIA
- 14. AUSTRIA, four development maps (colored) See AUSTRIA
- 15. DISTRIBUTION OF NATIONALITIES IN SOUTHEASTERN EUROPE (colored)

See BALKAN STATES

[EDITOR'S NOTE: This ethnographic map of Southeastern Europe reveals the tangle of races in the former Austro-Hungarian monarchy, and in the Balkan Peninsula, which goes far to explain the causes of the Balkan Wars of 1912-1913 and the beginning of the World War in 1914. The extraordinary complexity of the Macedonian problem, which more than anything else produced the Balkan Wars, is obvious from what the map reveals of the racial intermixture in that former Turkish province. It is also apparent how strong was the argument, based upon race, which induced the Peace Conference at Paris to fix the limits of the new Kingdom of the Serbs, Croats, and Slovenes, excluding Italy from the greater part of the eastern Adriatic littoral. The claim of Rumania upon Transylvania is shown by the common color.]

- 16. BALKAN STATES, political and physical (colored) See BALKAN STATES

[EDITOR'S NOTE: The boundaries of the Balkan States and Hungary were laid down by the treaties of St. Germain, Neuilly, Trianon, and Sèvres. These treaties superseded the settlements made at London and Bukarest, at the end of the Balkan Wars of 1912-1913, and represent an attempt to make political frontiers conform with racial and natural boundaries. The greatest difficulty was encountered in determining the territorial limits of Albania and the Turkish frontier in Thrace, which are admittedly of a provisional character. The partition of Macedonia among Bulgaria, Greece, and Serbia followed lines of nationality only approximately.]

EXPLANATORY NOTES ON THE ARRANGEMENT OF MATERIAL AND METHOD OF USING THE LARNED SYSTEM

Before beginning to examine or use the volumes, be sure to read through carefully the following notes. A few moments' attention will show that the unique combination of alphabetical and chronological arrangement, with thorough cross-reference, makes possible:

- (a) Instant accessibility of any specific topic;
- (b) Continuous reading of any nation's history;
- (c) Easy tracing of the inter-relations of history.

A. ALPHABETICAL ARRANGEMENT OF SUBJECT.—FILING RULES.—The primary arrangement is alphabetical, the index being embodied in the work encyclopedic fashion. (This is the only respect in which there is a resemblance to any encyclopedia.)

The latest library filing methods have been followed. For example: (a) Hyphenated words are considered as one word, thus, "ANTI-FEDERALISTS" follows "ANTIETAM"; but separated words are arranged by the first word, so that "NEW ZEALAND" precedes "NEWFOUNDLAND." (b) The rule of person, place and thing is observed, as (1) LONDON, Jack; (2) LONDON, a city; (3) LONDON, passenger steamer. (c) M' Mc or Mac are all arranged as if spelled Mac. (d) Proper names in order of rank, as follows: CHARLES, St.; CHARLES, pope; CHARLES, emperor; CHARLES, king; CHARLES, duke; CHARLES, John; CHARLES ALBERT; CHARLES OF BURGUNDY. For subject headings the American Library Association and Library of Congress practice has been the guide, with few exceptions. The texts, in full or in part, or summaries of national constitutions, will be found immediately following the national histories. For example, following the history of the United States of America, is "UNITED STATES OF AMERICA, Constitution of" under which heading is the text in full. Historical documents are usually placed with the history of the country or movement to which they belong and in their chronological places, but some of the outstanding documents are to be found under their own headings, such as "Berlin, Treaty of"; "Versailles, Treaty of". All of them are, of course, properly indexed.

B. CHRONOLOGICAL AND OTHER ARRANGEMENT UNDER SUBJECTS.—Under most of the subjects the topics are arranged in *chronological* order, so that one may read continuously the entire history of any nation or movement. Each topic has a suitable heading in bold-face type which catches the eye instantly. For example under AUSTRIA one of the topic-headings is as follows:

1848-1849.—Revolutionary risings.—Bombardment of Prague and Vienna.—Abdication of the Emperor Ferdinand.—Accession of Francis Joseph.—The Hungarian struggle for independence.

There are some necessary exceptions to the strict chronological arrangement of the topics, as some subjects require *alphabetical*, *topical* or *logical* arrangement and in certain cases a combination of some or even all of these. As examples:

ADRIATIC QUESTION has a *topical* arrangement of topic-headings, such as:

Friction between Italy and Jugo-Slavia.
Treaty of Rapallo, Nov. 12, 1920.
Problem of Italy's new frontiers.
Jugo-Slav contention.
Torre-Trumbitch agreement. — Congress at Rome (April 8-10, 1918).—Pact of Rome.

ÆGEAN CIVILIZATION has three *logical* main divisions indicated by center column heads:

EXCAVATIONS AND ANTIQUITIES
NEOLITHIC AGE
MINOAN AGE

Under each of these divisions are topic-headings chronologically arranged, such as

B. C. 3000-2200.—Early Minoan Age.
B. C. 2200-1600.—Middle Minoan age.
B. C. 1200-750.—Assimilation of Minoan culture by people of Hellas.

AFRICA also has *logical* main divisions:

GEOGRAPHIC DESCRIPTION
RACES OF AFRICA
ANCIENT AND MEDIEVAL CIVILIZATION
MODERN EUROPEAN OCCUPATION

EXPLANATORY NOTES

Topic-headings are in *logical* order under some of these division heads and in *chronological* sequence under others. For illustration, under the third division appear:

Development of Egyptian civilization.
Carthaginian empire.
Roman occupation.
Arab occupation.

Some topics require even further division, as for example under the same subject, **AFRICA**:

Division-heading: **MODERN EUROPEAN OCCUPATION**
Topic-heading: **Later 19th century.—Partitioning of Africa among European powers.**
Sub-topic-heading: **CONGO BASIN.**

HISTORY has several main divisions and these, as well as the topics under them, are arranged for the most part in *logical* order, but, owing to the difficulty of adhering to strict chronological order, the topic-headings are given *numerals*, as an aid to reference. Thus index entries arising from this subject will be found referring to such topics as:

1. Definitions
2. Philosophy of history
11. Development of chronology
16. Greek historians
32. Modern scientific historians
34. New orientation of history

WORLD WAR is a subject which comprises considerably over a thousand pages and requires special treatment. While it was possible to construct a chronological table of war events (q.v.), the descriptive matter could not be arranged in that order. This was due not only to the great length of the article but to its complexity. A scheme of *numerals* and *letters* was devised, full explanation of which will be found at the beginning of the article.

ARBITRATION AND CONCILIATION, **Industrial**, naturally falls into *alphabetical* main divisions by countries, with *chronological* topic-headings thereunder.

C. PAGE-HEADINGS.—To facilitate reference, the page-headings throughout the work indicate dates wherever possible and, in italics, the principal topics on the pages. For example, the page-heading:

AUSTRIA, 1798-1806

Austerlitz

AUSTRIA, 1806

D. RULE FOR REFERENCE.—Each specific topic treated under a larger subject appears in the general alphabetical index, where it is followed by explicit directions leading to the place where the treatment will be found. Thus to find the battle of Austerlitz, one does *not* turn to Austria and search through its fifty pages; he should turn alphabetically to Austerlitz, where he will find

AUSTERLITZ, Battle of. See **AUSTRIA: 1798-1806.**

Turning then, as directed, to **AUSTRIA**, the dated page-headings guide him quickly to 1798-1806, as above, under which the required topic is instantly found.

The simple rule for locating any desired topic will now be clear:

Turn alphabetically to the specific topic. Either the required treatment, or specific directions leading to it will be found.

E. GROUPING OF SUBJECTS.—Many events are of such a character that the reader's interest is served by listing them in groups, in addition to the indexing of each separate item. In such cases they are brought together under the class title, as, for instance: Abdications; Armistices; Assassinations; Battles (famous); Cities (abandoned or destroyed); Clubs; Coalitions and alliances; Codes; Congresses; Conspiracies; Constitutions; Councils of the church; Documents; Executions (notable); Genealogical tables; Impeachments; Laws; Leagues; Massacres; Parties and factions; Religions; Treaties; Wars.

F. GENEALOGICAL TABLES.—The lineage of each historic ruling family is to be found with the history of the country with which it was most closely connected. For list and index of these tables, see **GENEALOGICAL TABLES.**

G. NON-REPETITION.—INTER-RELATIONS OF HISTORY.—CROSS-REFERENCES.—There is practically no repetition in the work. A topic that is part of the history of two or more countries is treated fully once only, where it most properly belongs and in the connection which shows its antecedents and consequences best. It is then cross-referenced to every other point where it is of interest and multiple index entries made. Economics of this character bring into the compass of twelve volumes a body of history that would need twice the number, at least, for equal fullness on the monographic plan of encyclopedic works. An illustration will make clear the method and its unique exhibit of the *Inter-relations of History.*

A very complete and interesting account of the dispute between Great Britain and the United States in Jefferson's administration, over the impressment of American seamen, is given under the following subject and topic headings:

UNITED STATES OF AMERICA

1804-1809.—Difficulties with Great Britain.—Neutral rights.—The right of search.—Impressment.—Blockade by orders in council and the Berlin and Milan decrees. Embargo and non-intercourse.

1808.—The effect of the embargo.

EXPLANATORY NOTES

It is cross-referenced from France and England and also from Admiralty law, International law, Neutrality, etc., in the proper chronological places as follows:

ENGLAND

1804-1809.—Difficulties with the United States.—Neutral rights.—Right of search and impressment.—The American embargo. See U. S. A.: 1804-1809; and 1808.

FRANCE

1807-09.—The American embargo and non-intercourse laws. See U. S. A.: 1804-1809; and 1808.

ADMIRALTY LAW

1804-1809.—United States and England differ over impressment. See U. S. A.: 1804-1809.

INTERNATIONAL LAW

1804-09.—Right of blockade.—British impressment of United States seamen. See U. S. A.: 1804-1809.

NEUTRALITY

1804-1809.—Relations of United States and England. See U. S. A.: 1804-1809.

It is separately indexed as follows:

BERLIN DECREE. See FRANCE: 1806-1810 and U. S. A.: 1804-1809.

BLOCKADE, Paper. See U. S. A.: 1804-1809.
IMPRESSMENT OF AMERICAN SEAMEN BY BRITISH NAVY. See U. S. A.: 1804-1809; and 1812.

MILAN DECREE. See FRANCE: 1806-1810; also U. S. A.: 1804-1809.

NON-INTERCOURSE BILL, United States. See U. S. A.: 1804-1809; 1808-1810.

ORDERS IN COUNCIL: Blockade by British. See FRANCE: 1806-1810; and U. S. A.: 1804-1809.

RIGHT OF SEARCH. See U. S. A.: 1804-1809; and 1812.

SEARCH, Right of. See U. S. A.: 1804-1809; and 1812.

Cross-references are also inserted at the end of numberless subjects and topics, for the purpose of guiding the reader to further material related to the subject upon which he is reading.

Thus, under **AUSTRIA**, at the end of the text on topic:

1291-1349.—Loss and recovery of imperial crown
—See also **GERMANY**: 1314-1347.

Also, as an aid, wherever there is an allusion to a movement, or event, upon which information is available elsewhere in the work, a reference is inserted immediately after the allusion. Thus, under **AUSTRIA**:

1848-1849. — Revolutionary risings. — "News came of the flight of Louis Philippe from Paris [see FRANCE: 1841-1848; 1848]."

In this way, through the index entries, cross-references and references, the entire text is tied together in one harmonious whole and nothing is buried.

H. SPELLING AND ACCENTS.—The style or system of accentuation adopted for the work is, in general, that in everyday use in English language books and periodicals. The essential French, Italian and Spanish accents and the German *umlaut* are, of course, rigidly adhered to. In the transliteration of words and proper names taken from the Slavonic, Arabic, Turkish and other oriental languages, the style of the author quoted has been respected, though in editorial matter and headings a simpler and more representative phonetic rendering for English language readers has occasionally been found desirable. Webster's New International Dictionary (Merriam series) has been the authority for ordinary orthography. In the non-use of capitals the modern library practice has been our guide.

I. CITATION OF SOURCES.—BIBLIOGRAPHIES.—All quoted matter is in quotation marks, and the source is invariably cited in full. Abridgment by omissions is indicated by the usual omission marks, and occasional editorial interpolations are included in brackets. Abridgment by paraphrasing has been resorted to only when unavoidable and is shown by interruption of quotation marks. Bibliographies for topics, as

EXPLANATORY NOTES

well as for the larger subjects will be found in their proper connections. In addition, in the last volume of the work there is a carefully selected and classified bibliography, and a full list of books, from which selections have been made, giving names of publishers, full names of authors, and other useful information.

J. WHAT THE WORK IS NOT.—The work is first and last, *history*, not science nor biography (except, as in the words of Carlyle, "History is the essence of innumerable biographies"). Yet the person who has been a *maker of history*, so to speak, has his record as such given and his name and brief facts and cross-references are entered in alphabetical place.

K. FREE EDITORIAL SERVICE.—Our established editorial service is always available to the subscribers to "THE NEW LARNED HISTORY FOR READY REFERENCE, READING AND RESEARCH,"—which we believe more than ever merits the description given in the earlier editions by many an owner, viz., "the greatest saver of time and money and labor in the whole realm of books."

THE NEW LARNED HISTORY

FOR READY REFERENCE, READING AND RESEARCH

A

A, the initial letter of the English and almost all other alphabets. In the Runic Futhark alphabet it occupies fourth place, while in the Ethiopic the arrangement differs again, "aleph" being thirteenth. Since the English alphabet follows the Latin directly, which in turn is based on the Greek, the letter "a" agrees with the Greek letter "alpha." In the Semitic languages "aleph" is a consonant, although at times it loses completely its consonantal quality. This explains the adoption of the letter as a vowel by the Greeks, there being no corresponding sound in their language. The Phœnicians called the letter "aleph" seemingly because of the resemblance of the character to the head of an ox. Although nothing is known with any degree of certainty concerning the ultimate origin of this letter, in recent years, there has been strong advocacy of abandoning the assumption first propounded in 1850 by Vicomte Emanuel de Rougé, of immediate derivation of the Phœnician or North Semitic alphabet from Egyptian hieroglyphics, or from Babylonian cuneiform characters. On the other hand a marked tendency is in evidence to look for the solution of the problem to the later Cretan system of writing transferred to Syria as indicated by Sir Arthur Evans (*Scripta Minoa*, 1909) or to linear pottery marks abundantly found in many Mediterranean countries, as has been suggested by Flinders Petrie (*Formation of the alphabet*, 1912). Stucken (*Das Alphabet und die Mondstationen*, 1913) traces the origin of the Semitic alphabet to the signs of the lunar zodiac.—See also **ALPHABET**.

A POSTERIORI LANGUAGES. See **INTERNATIONAL LANGUAGE**: Early history.

A PRIORI LANGUAGES. See **INTERNATIONAL LANGUAGE**: Early history.

AA, a common name for small rivers in Europe. Of the forty or more of this name, two of the best known are in Russia; two others, the Westphalian Aa and the Münster Aa, are in Germany.

AACHEN. See **AIX-IA-CHAPELLE**.

AAHMES. See **AMASIS**.

AALAND ISLANDS. See **ALAND ISLANDS**.

AALI, Mehemet, Pasha (1815-1871), Turkish statesman. Five times grand vizier; in 1867 was appointed regent of Turkey, during the sultan's visit to Paris; strong advocate of a reform policy.

AALST. See **ALOST**.

AARAU, an important military center and capital of the Swiss canton of Aargau, situated on the right bank of the Aar, at the foot of the Jura. The cantonal library contains many works relating to Swiss history, also manuscripts from the suppressed Argovian monasteries. The ancient fortress of Aarau was taken by the Bernese in 1415. In 1798 it became for a short time the capital of the Helvetic Republic. Near by is the ruined castle of Hapsburg, the original home of the Hapsburg house.

AARAU, Peace of (1712). See **SWITZERLAND**: 1652-1789.

AARGAU, one of the most northerly Swiss cantons. Up to 1415 this region was the center of Hapsburg power, and there is still to be seen, near Brugg, the ruined castle of the Hapsburgs as well as the old convent of Königsfelden and remains of the ancient Roman settlement of Vindonissa. The canton contains many old castles and former monasteries; the suppression of the latter in 1847 was one of the chief causes of the Sonderbund War.

AARON, in biblical history, brother of Moses and his spokesman before Pharaoh. In company with Moses, leader of the Israelites during the Exodus. Founder of the Jewish priesthood, which became hereditary in his tribe.—See also **JEW**s: Children of Israel in Egypt.

AARSENS, Francis Van (1572-1641), Dutch diplomat and statesman. Protégé of Advocate Johan Van Oldenbarneveldt, who sent him as a diplomatic agent to the court of France, and later recalled him for giving offense to the French king; instrumental in condemning his aged benefactor to death; ranked by Richelieu among the three greatest politicians of his time.

AB, the fifth month of the Jewish ecclesiastical year, and the eleventh (in intercalary years the twelfth) of the Jewish civil year. It corresponds approximately to the period from July 15 to August 15. On the first day of Ab is kept a fast commemorating the death of Aaron; on the ninth, the Black Fast bewailing the destruction of the First Temple by Nebuchadnezzar (586 B.C.) and of the Second Temple by Titus (A.D. 70). The word was adopted by the Jews after the Babylonian captivity.

ABABDA, a nomad African tribe of Hamitic stock, extending along the southern border of Egypt from the Nile to the Red sea. In Roman times they were known as Gebadei, in the Middle Ages, as Beja. They are noted as caravan guides and trade carriers.

ABACAENUM, an ancient town of Sicily, lying west of Messana and north of Mt. Etna. It was one of the last Sicilian cities to give way to Greek influence.

ABACUS, in the Greek Doric order a square stone slab that covers the capital of a column. In the Roman order, the abacus is crowned by a molding; in the Archaic-Greek Ionic it is rectangular in form in view of the greater width of the capital. **ABACUS** is also the name of an instrument employed by ancient mathematicians for arithmetical calculations, and still used in China.

ABAE, a city of Phocis, Greece, famous in ancient times for its oracle of Apollo. (See **ORACLES**.) It was exceedingly rich in treasures until pillaged by the Persians. Restoration of the city and the temple was attempted by the Emperor

Hadrian. Traces of the polygonal walls of the acropolis have been preserved, including a gateway and part of the town walls, excavations of which were made in 1894 by the British School at Athens.

ABAFY (Abaffi), Michael (1632-1690), ruler in Hungary. See HUNGARY: 1660-1664.

ABAILARDUS. See ABELARD.

ABANCOURT, Charles Xavier Joseph de Franqueville d' (1758-1792), French statesman; Louis XVI's last minister of war. Contrary to orders of the Legislative Assembly, brought Swiss Guards to Paris for defense of Tuileries, August 10; arrested for treason; murdered while awaiting trial.—See also FRANCE: 1792 (June-August).

ABANTES, the most powerful tribe of ancient Eubœa, from whom in the Homeric age the island took its name Abantis.

ABATIS, a term in military parlance for a field fortification formed of trees laid in a row with sharpened limbs pointing toward the enemy; this obstacle is frequently used in connection with wire entanglements.

ABATTOIR, a French word often used instead of the English "slaughter-house," a place where animals are killed for food. Public control of such places has in recent years become a matter of great concern. In the United States, abattoirs are recognized by the law as in their nature nuisances and are regulated or prohibited by municipal ordinance. Though the meat industry is concentrated in a few cities, there are very few municipal slaughter-houses, a fact in sharp contrast with Continental Europe where they are very common, especially in Germany. In England legislation has, since 1388, been enacted for the regulation of abattoirs in cities.—See also LOUISIANA: 1894-1921.

ABBADIDES, a short-lived Mohammedan dynasty in Spain, c. 1023-1001, succeeding the Western caliphate. It was characterized by extravagance and corruption, and was finally overthrown by the Almoravides, its last monarch dying in prison. See SPAIN: 1031-1086.

ABBAS I (1813-1854), khedive of Egypt. Son of Tusun Pasha and grandson of Mehemet Ali, whom he succeeded in 1848. Was reactionary in policy. Murdered in 1854, and succeeded by his uncle, Sa'id Pasha. See EGYPT: 1840-1869.

Abbas II (Abbas Hilmi Pasha, 1874-), khedive of Egypt. Deposed by the British during the World War (December 17, 1914), at which time a British protectorate was proclaimed and Hussein Kemal Pasha, an uncle of the khedive, installed as sultan; this action was taken in consequence of the defection of Abbas to Turkey, which was at the time at war with England. See EGYPT: 1914; World War: 1914: IV. Turkey: h.

Abbas I (called the Great), shah of Persia, 1586-1628; greatly extended the dominions of Persia. See BAGDAD: 1303-1638; PERSIA: 1499-1887; TURKEY: 1623-1640.

Abbas II, shah of Persia, 1641-1668. Succeeded his father, Shah Safi I; regained Kandahar at the age of sixteen.

Abbas III, shah of Persia, 1732-1736. A child ruler, son of Tahmasp II; succeeded by the usurper Nadir Kuli.

ABBAS EFFENDI (1844-1921), the late leader of the Bahais; better known by the name of Abdu'l Bahá, which signifies "Servant of the

(divine) Glory." Abdu'l Bahá is styled "Center of the Covenant," and regarded by his followers as a divinely appointed teacher of spiritual truth.—See also BAHAIISM: Abdu'l Bahá.

ABBAS HILMI PASHA. See ABBAS II, khedive of Egypt.

ABBAS MIRZA (c.1783-1833), prince of Persia. He introduced reforms, especially in the army; was leader in two unsuccessful wars with Russia, but held his own in a war with Turkey.

ABBASIDS, the name usually given to the caliphs of Bagdad, constituting with the Omayyads, their predecessors, the two greatest dynasties of the Eastern caliphate. In opposition to the Omayyads who traced their descent from Omayya, the Abbasids based their claim to the office of caliph, according to Mohammedan custom, upon their descent from Abbas (566-652), the eldest uncle of Mohammed. See ABUL ABBAS; CALIPHATE: 715-750, 752-759, 750-1031, 763, 815-945, and 1262-1543; BAGDAD: 762-763 and 1258; JERUSALEM: 1144-1187.

Conquest by Arabs. See ARABIA: 1016.

ABBASIA, Agreement at (1921). See ITALY: 1920-1921.

ABBESS, a title given to the superior of a monastic establishment of twelve or more nuns. Her duties correspond very closely to those of an abbot (q.v.). See MONASTICISM: Women and monasticism; WOMEN'S RIGHTS: 300-1400, 1200-1600.

ABBEY, Edwin Austin (1852-1911), American mural painter. See PAINTING: American: 10th century.

ABBEY.—**Organization and activities**.—In its broader sense an abbey is a canonically erected monastery (or a religious organization under strictly prescribed rules of living), having not fewer than twelve religious monks or nuns, under the government of an abbot or abbess respectively; in its narrower sense the word is synonymous with the church of a monastery. It is to be carefully distinguished from the priory, a term applied to smaller monastic establishments some of which were founded independently, others as cells or offshoots from an abbey, remaining dependent on the parent house and having their priors chosen or removed by the abbot at will. Originally the term monastery designated, both in the East and in the West the dwelling of a solitary or hermit. In time, however, there grew up around the more famous of these solitaries settlements of enthusiastic disciples, necessitating an intricate and wide-spread system of organization. These establishments in turn developed into great centers of industry and culture assuming the characteristic features of the great abbeys of medieval times. "The abbeys, however . . . while containing great and wonderful buildings of cathedral-like proportion where worship to which the public was admitted was conducted with solemn and beautiful ritual, were never intended to serve, and never did serve the purpose of parish churches. These abbeys were not made for the people, but for the monks who found therein a home. They were generally built in remote places, far from centers of population, and there maintained an entirely independent existence. As time went on and their wealth and membership steadily increased, this wealth and this membership constituted potential elements of power that forcibly appealed to ambitious men. [Under this new impetus the abbeys became not only centers of wealth and art and luxury, but also of political power. During the period of their widest influence the greater abbeys were represented in the national councils, on a plane of political

equality with the great feudal lords. It was this combination of wealth and political influence which, arousing more and more the cupidity and the antagonism of secular rulers, ultimately resulted, during the sixteenth century, in the suppression of these great establishments and the confiscation of their estates.] In the very old days these abbeys were great and beautiful places that sheltered within their walls about all of culture and learning and peace that was to be found. . . . While the monks did not at first seek any part in controlling the life of the community, or indeed any share whatever therein, yet their position was of first importance to the people in that rude and early period. The very poor were in evidence in those days far more than they ever have been since, and on the long table of every monastic dining-room a basket always stood, receiving a large proportion of every kind of food as it was served, food that was afterwards disbursed as alms at the Abbey gates. No physicians practised then, and the monks alone knew what there was to know of the healing art, and always were their services freely given to both rich and poor. There were no libraries outside the monastery's rolls, but here was collected as incentive to study and to thought the literature of the time. There were no schools save those the monks maintained, and to them could come the children of the very poor, who, while they may not have learned much, yet were given an opportunity to find what learning meant, and some at least we know of who through these schools found opening a career of usefulness and distinction. There were no inns, but the traveler could always find a refuge at the monastery, where a great house was as much a part of the establishment as the chapel itself. Hundreds of monks found their homes in the great abbeys. . . . It was a wonderful organization that their necessities required and maintained. Everything needed for daily life was produced here. Thousands of acres of adjoining land were under constant cultivation, and to such of the brethren as had a taste in that direction was committed the task of overseeing the laborers on this great farm. From their vineyards came the wines that filled the cellars. On their pastures were the sheep from whose wool were woven their garments. Beef and pork came from the cattle and swine that every monastery owned. And fruits and flowers grew in the gardens and orchards the older or infirm brothers had in charge. . . . First of all the day's real business was the meeting of the chapter, over which the abbot presided and heard reports of the progress of all the work in hand. Here too was received the news from other [abbeys], for the custom was to send forth on a parchment roll what might be termed a circular letter. It gave the information current in the abbey whence it started, and was entrusted to a monk who thence started on the rounds of other monasteries, a journey that sometimes occupied a year. After being read aloud in chapter there was added to it the news of that establishment, and so it went its way. At Durham there is yet preserved one of these rolls which is nearly forty feet in length. And here in this public gathering the monks confessed their faults, or had tales told on them if they didn't, and thereupon were soundly whipped precisely like naughty boys at school. Then they went to the day's task—some to teach, some to labor at the loom or in the field, and some in the cloisters to illumine those rare rolls or volumes, each according to the gift God had given him. And so they filled their days. At dinner one read while the others ate, and after-

ward recreation, the telling of stories, perhaps the singing of songs, while some few walked along the sweet-smelling garden paths in the lingering northern twilight, for very beautiful friendships sometimes grew up among these unworldly men."—A. B. Osborne, *As it is in England*, pp. 178-189.—See also ABBOT; MONASTICISM; TRAPPISTS.

Medieval monastic libraries. See LIBRARIES: Medieval; Monastic libraries.

Abbeys in history.—An illustration of the importance of abbeys in the history of medieval Europe is to be found in the history of the Abbey of Saint-Denis, a few miles north of Paris. "St-Denis (Dionysius), the first Bishop of Paris, and his companions, martyred in 270, were buried here and the small chapel built over the spot became a famous place of pilgrimage during the fifth and sixth centuries. In 630 King Dagobert founded the abbey for Benedictine monks, replacing the original chapel by a large basilica, of which but little now remains. He and his successors enriched the new foundation with many gifts and privileges and, possessing as it did the shrine of St-Denis, it became one of the richest and most important abbeys in France. In 653 it was made exempt from episcopal jurisdiction. A new church was commenced in 750 by Charlemagne, at the consecration of which Christ, according to popular tradition, was supposed to have assisted in person. . . . The present church of St-Denis was commenced about 1140 and marks the beginning of the Gothic tendency in architecture and its transition from the Romanesque style. Further additions and alterations under succeeding abbots resulted in producing one of the finest Gothic buildings in France. . . . The abbey figures prominently in the history of France and its abbots were for several centuries amongst the chief seigneurs of the kingdom. The 'Oriflamme,' originally the banner of the abbey, became the standard of the kings of France and was suspended above the high altar, whence it was only removed when the king took the field in person. Its last appearance was at the battle of Agincourt in 1415. Joan of Arc hung up her arms in the church of St-Denis in 1429. Many kings and princes and other noble persons were buried there and three of the Roman pontiffs stayed in the abbey at different times: . . . After the Council of Trent the Abbey of St-Denis became the head of a congregation of ten monasteries, and in 1633 it was united, with its dependent houses, to the new Congregation of St-Maur, when its conventual buildings were entirely reconstructed. In 1601 Louis XVI suppressed the abbacy and united the monastery with its revenues to the royal house of noble ladies at St-Cyr, founded by Madame de Maintenon. The abbey was finally dissolved at the revolution, when much damage was done to the church and tombs. It was subsequently restored, under Napoleon III, by Viollet-le-Duc. The relics of St-Denis, which had been transferred to the parish church of the town in 1795, were brought back again to the abbey in 1810. It is now a 'national monument' and one of the show-places of Paris. Many of the chartularies and other manuscripts relating to its history are now either in the Archives Nationales or the Bibliothèque Nationale."—*Catholic encyclopedia*, v. 13, pp. 343-344.—See also BRITANNY: 992-1237.

Architectural features.—"The arrangement of all these [abbeys] shows a thorough uniformity in their important features. On all sides of a rectangular court, which, as a rule, is square, surrounded by arcades (the cloisters, *ambitus*), are grouped the church, and the places appointed for the residence of the monks, which are comprised

under the name of the *clausures*. It is the plan of the ancient *villa urbana*, which seems to have served as a pattern to the Benedictines. In the same way the out-houses exterior to the *clausures*, which are attached to them, follow the plan of the *villa rustica* among the Romans. Of the plan of a Benedictine abbey of the ninth century, the Abbey of St. Gall [in Switzerland], designed about 820, is an excellent example. The whole plan includes a space of from 300 to 430 feet square. The central point is the church, on the south side of which is the cloister, with the buildings belonging to the *clausure*; and to the east of the cloister, contiguous to it, is the dwelling-house of the monks, with the general dormitory, the bath and wash-house; to the south the *refectorium* (the dining-hall), with the church; and to the west the cellarage. The wing of the cloister next to the church serves as the *chapter-house*. Near the

round outhouses for the chickens and geese, the garden, and the burial-place. . . . Next to the Benedictines, the Cistercians, an order proceeding on the same discipline, have a great significance for the history of mediæval ecclesiastical architecture. The strictness of this order immediately brought with it a simplifying of church building. While generally the apse was omitted, and the choir terminated as a rectangle, minor chapels, as a rule, were attached to both sides of the transept. . . . Besides, the Cistercian Order forbade the introduction of bell-towers, and instead of these, even in the largest churches, they contented themselves with a small roof-turret in the middle of the transept. The towers of the church at Oliva, near Danzig, form an exception. Lastly, an extraordinary length of nave is common in Cistercian churches, the reason of which is so much more difficult to explain, as the cloister churches were

FOUNTAINS ABBEY, ENGLAND

eastern choir of the church is, on the north side, the writing-room, with the library above, and on the south side the justice-chamber. On the east side of the church lie, separated by two chapels, the infirmary and the school for the novices, each with its small cloister in the centre. To the north side of the infirmary stands the dwelling of the physician, with a special house for bleeding and purging. The dwelling of the abbot, the school-house, and the lodgings for illustrious strangers, with an out-house, are to be found on the north side of the church; corresponding to this last on the south-western side are the lodgings for pilgrims and the poor. Attached to these important parts thus spread out are, on the western and southern sides, the house for servants, and the stalls for sheep, pigs, goats, cows, oxen, and horses, besides the workhouse, the malt-kiln, the brewery, and the bakehouse attached to the kitchen of the monastery, the stamping-mill and the corn-mill, the house of the various labourers, and the great barn. Lastly, at the south-eastern corner, are the

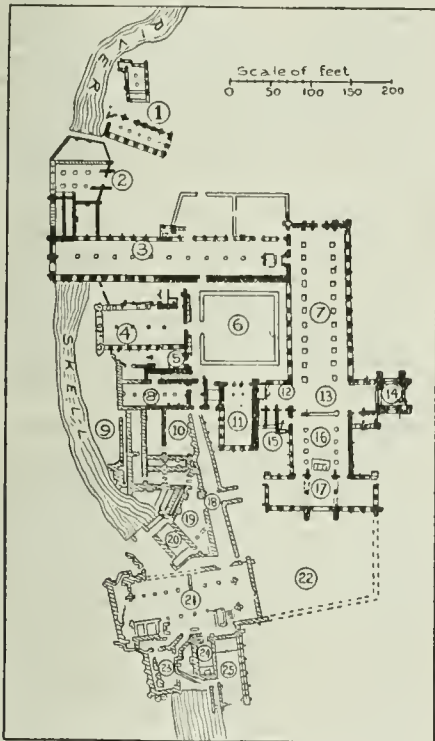

little attended by laity, and their use completely forbidden to women. The cloister arrangements of the Cistercians are in other things similar to those of the Benedictines. The cloister is here, as there, generally on the southern side, and seldom on the northern side of the church. With the Cistercians there was generally, on the side of the cloister lying opposite the church, a polygonal or round well-house, in which the beard and the hair of the crown of the head (the *tonsure*) were shaven off. The chapter-hall for the meetings of the convent is generally on the east side of the cloister, and is sometimes provided with an altar apse. Important monasterial arrangements of the Cistercians are still to be found at Ebrach, at Altenberg near Cologne, at Riddagshausen and Maulbronn in Würtemberg. In the last place, even the fortified walls, with their towers, as well as the other details of mediæval arrangements, are all preserved. From the large entrance-hall, we enter the church, the nave of which is separated from the presbyterium by the screen. On the north

side of the church lie the cloisters with the well-house, the refectory and the chapter-hall with its altar apse. From this, a corridor leads us to the house of the abbot. The space, at the north-eastern corner of the cloisters, seems to contain the discipline-chamber, to which adjoins the vaulted cellar space. On the west side of the cloister is another vaulted cellar and an older refectory, which, used alternately with the above-mentioned space, may have served as the winter refectory; for we find in many monasteries, as for example at Bebenhausen, special refectories for winter and summer. The monasteries of the Premonstratensians have much resemblance in arrangement and

themselves in the populous towns. For if the generality of the superior orders lived apart, with the view of devoting themselves to learned studies or artistic work, the popular orders undertook to work on the masses as curers of the soul by preaching and confession. They sought for a modest place in the towns, close to the walls or elsewhere, where they erected their monasterial arrangements, in fact, conformable to those of the older orders of monks. . . . Really differing from all these monasterial arrangements are the great establishments of the Carthusians, who arose about the fourteenth century in Germany. Their monasteries are distinguished by this: that they possess, by the side of the church, and of the cloister in connexion with it, a second far larger cloister, generally on the east side of the church, which includes the burial ground, and is surrounded by the single dwellings of the monks, which are separated from it by small gardens."—W. Lübke, *Ecclesiastical art in Germany*, pp. 103-108.—In consequence of the fact that the various buildings of an establishment were erected at different periods, the greater abbeys were seldom architecturally homogeneous; this multiplicity of styles affords, however, a pleasing variety which, added to the stately grandeur of nave and arch and tower, presents, even in their ruins, a picturesqueness which appeals alike to artist and historian.

There follows a list of the more important historic abbeys:

- Bangor, County Down, Ireland
- Bath, Somersetshire, England
- Battle, Sussex, England
- Beaulieu, Hampshire, England
- Bec, Normandy (q.v.)
- Bursfeld, near Göttingen, Hanover, Prussia
- Bury St. Edmund's, Suffolk Co., England (q.v.)
- Canterbury, Kent, England
- Cluny, Burgundy, France
- Dryburgh, Scottish border
- Einsiedeln, Canton of Schwyz, Switzerland
- Farfa, near Rome
- Fontenelle, Normandy
- Fountains, Yorkshire, England (q.v.)
- Furness, Lancashire, England (q.v.)
- Glastonbury, Somersetshire, England
- Hersfeld, Hesse-Nassau, Prussia
- Hirschau, near Stuttgart, Württemberg
- Holy Cross, County Tipperary, Ireland (q.v.)
- Holyrood, Edinburgh, Scotland
- Jumièges, Normandy
- Mellifont, County Louth, Ireland
- Melrose, Roxburghshire, Scotland
- Monte Cassino, near Rome
- New, near Dumfries, Scotland
- Peterborough, Northamptonshire, England
- Prémontré, Aisne, France
- Saint Albans, Hertfordshire, England
- Saint Denis, near Paris, France
- St. Gall, Canton of Gall, Switzerland
- Saint Mary, York, England
- Tavistock, Devonshire, England
- Tewkesbury, Gloucestershire, England
- Tintern, Monmouthshire, England
- Vendôme, France
- Waltham, Essex, England
- Wearmouth, Durham, England
- Westminster, London, England
- Whitby, Yorkshire, England. See BIBLE, ENGLISH: 7th-8th centuries.

execution to those of the Cistercians. The monasteries of the Madonna at Magdeburg and the Abbey Kappenberg in Westphalia, are examples of this kind, whose unassuming simplicity rivals the simplest arrangements of the Cistercians. If the Benedictines preferred to build in an open position at the back of a woody chain of mountains, and if the Cistercians sought separation from the world in the quiet woody glens, the Orders of Preachers and Mendicants, arising since the thirteenth century, of the Dominicans and Franciscans, or of the minor orders, established

ABBOT, George (1562-1633), English divine. Took a leading part in preparing the authorized version of the New Testament; assisted in arrang-

ing for the union of the churches of England and Scotland; for this he was rewarded by James I, who in 1610 made him Archbishop of Canterbury.

ABBOT, a title given to the superior of a monastic establishment of twelve or more monks. The term is derived from the Hebrew word *ab* meaning father, originally used as a title of honor and respect. Carried over from the East to the West the word came to imply also the exercise of authority and hence was used to designate the head of an abbey or monastery. This usage was definitely fixed by the rule of St. Benedict at the beginning of the sixth century. "The administration of the monastery was vested primarily in the hands of the abbot or father, in whose hands lay, theoretically, complete control over all the management of the house. The vow of obedience was made to him, and without his consent the individual monk could not properly perform any act of life. It was his duty to see that the monks observed the rule in all its details, and to punish infractions of it at his discretion. He was the responsible manager of the temporal property of the community, must see that its accounts were properly kept and must be in readiness at specified times to render an account of his stewardship to the community as a whole. He occupies in the feudal hierarchy the same rank held by the bishop; he is the responsible person for the performance of the feudal dues to the overlord and stands for the monastery in all its efforts to keep the feudal hold upon its vassal tenants. It was as important to the monastery as it was to the bishopric that its head should be chosen freely, without the use of any of the lower motives which were almost certain to affect the choice. The electors are the monks, but, since the abbot is regularly to be confirmed both by the secular head of the territory and by the bishop of the diocese, it is clear that these larger interests would have to be considered, and in the case of the more important monasteries we find the same difficulties in getting 'pure' elections that we have spoken of in connection with episcopal elections. The succession in a great monastery was often the occasion of violent conflicts between the complicated interests at stake."—E. Emerton, *Mediæval Europe*, pp. 572-573.

The following list of famous abbots and abbesses gives an idea of the variety of activity and influence possible to the office. The list is not, of course, exhaustive; it is merely a citation of a few typical cases.

Anselm of Canterbury (1033-1109).—A scholastic philosopher and able churchman, who, as abbot of Canterbury, made the monastery a famous seat of medieval learning. His writings "Cur Deus Homo" and "De Concordia Præscientiæ et Prædestinationis" made an epoch in Christian philosophy, and inaugurated the work of the schoolmen. His conflicts with William Rufus and Henry I of England made him, in his time, a powerful political force. See ENGLAND: 1087-1135.

Benedict of Nursia (c. 480-544), the founder of western monasticism. He first organized the scattered companies of the western monks into orders, and the humanity, moderation, and constructive social character of the "Rule of St. Benedict" which he devised for these monasteries turned the ascetic impulses that were hitherto somewhat sterile into a civilizing force of almost incalculable value in the development of Europe. For the importance of this rule in the history of western monasticism, see MONASTICISM: 6th century.

Bernard of Clairvaux (1090-1153), the first abbot of Clairvaux, and a leader in the reform of the monastic orders, and the chief center of the religious life of Europe, at the time when Christian fervor was reaching its height in the crusades and in the beginnings of Christian art. It was his preaching which fired all Europe to undertake the first expedition to the Holy Land and his ardent, childlike, and inspiring personality interpenetrates all the life of the twelfth century. He was constantly called to act as peace-maker in the quarrels of emperor and pope, and pope and anti-pope, and to represent the purest conscience of the church in the highest councils of his time. See CRUSADES: 1147-1149.

Bruno (1030-1101), founder of the Carthusian order which was a union of the hermit and the communal types of monasticism. Unlike most of the great abbots, who were also commanding figures in the intellectual and political life of their time, he is notable chiefly for the personal and creative influence within the strict bounds of the monastic life which made him a saint of the church and the subject of several notable works of religious art.

Hilda (614-680), foundress and abbess of Whitby, the famous double monastery which included among its members five future bishops as well as the poet Cædmon, and which was a powerful center of ecclesiastical and political influence. Statesmen and churchmen from all over Christian England came to Hilda for advice, and she stands out in the scanty records of the seventh century, as one of the most vigorous personalities of the age.

Hildegarde (1098-1179), a German abbess and mystic who from her convent near Bingen, carried on a voluminous and influential correspondence with the most notable figures of her time. Among her correspondents were Pope Anastasius and Pope Adrian IV, and the emperors Conrad III and Frederick I. Bernard of Clairvaux and the theologian Guibert of Gembloux were among those who sought her advice on theological questions. While it was her supposed gift of prophecy which made her most famous in her own time, her writings on natural science are now greatly respected by scholars as representing the highest point to which the scientific study of nature in medieval Europe had yet attained.

Lanfranc (d. 1089), first abbot of St. Stephens at Caen and later archbishop of Canterbury. Trained in legal studies, and a pioneer in the revival of Roman law, and in education, he became the political counsellor of William, the Conqueror, and did much to consolidate the power of the Normans in England, and at the same time to procure honorable conditions for the native English. As an abbot he elevated the clerical standards of discipline and education.

Sugier, Abbot of St. Denis (1081-1151), statesman and historian, and constant adviser of Louis VI and Louis VII of France. During the absence of Louis VII on the Second Crusade, he was appointed regent of the kingdom, and was so successful in keeping the turbulent vassals in order and improving the administration, that the king, on his return, bestowed upon him the title of "Father of the Country." As a statesman he strengthened the royal power, improved agriculture and commerce, and reformed the administration of justice. His chief literary works are historical accounts of his own stirring times. His work as an abbot had the same characteristics as his secular achievements, being a thoroughgoing and efficient administration and discipline of

the convent.—See also **ABBEY**: Organization and activities; **MONASTICISM**: 11th-13th centuries.

ABBREVIATION.—The representation of a word or phrase by the initial letter or letters or by some other standard shorter form. This practice was employed extensively by both ancient and medieval manuscript writers, with whom abbreviation was of considerable importance as a labor-saving and space-saving device. The saving of space was especially necessary as the material for writing (parchment, or, in Roman times, wax tablets) was extremely limited and very expensive.

Greek and Latin manuscripts, especially those which have been on technical subjects, made very great use of abbreviations, so that a certain Roman is said to have made a collection of 5000 abbreviations used in his time. A form of abbreviation was invented by Tiro, a slave of Cicero, who took down every word of his master's speech in specially devised shorthand symbols; these were known as Tironian notes, after the name of their inventor. In the earliest transcriptions of the Bible, no abbreviations were used, but from being employed in notes and marginal glosses, they soon began to appear in the texts. The universality of Latin as a language for scholars during the Middle Ages made the application of abbreviations a very simple matter, as the usage could become standardized without much difficulty or confusion. The reform in handwriting effected by the Carolingian schools in the Middle Ages did not discourage the use of abbreviations and contractions; on the contrary, it was under their influence that the fullest development was accomplished, letters from the middle as well as the end of words being omitted. All western Europe used common forms of contraction, with the exception of Spain, where slightly different meanings were attached to the various marks. In early English and Irish manuscripts certain arbitrary shorthand symbols were used to indicate common or special words. These were adaptations of the Tironian notes of Cicero's time. The use of abbreviations continued to increase until the thirteenth century, when the practice reached its height. From that time on three things caused its decline: first, the invention of the printing press, which obviated the necessity for the copying of manuscript by hand; second, the introduction of cheap paper for printing; and third, the widespread use of vernacular tongues, in which abbreviations were very much more difficult because of the peculiarities of grammar. In modern times some Latin abbreviations and contractions are still in use. Membership in certain orders or academies, university degrees, titles of address, or of office, and the names of certain very well-known organizations are indicated by abbreviations, usually consisting of the first letter or letters of each word in the phrase denoted. In addition practically every science has its own system of abbreviations and symbols known to students and specialists in its field. Although abbreviations are no longer generally employed in books or other printed matter, commercial letter writing has given rise to more or less complicated systems of shorthand which, with phonetics as a basis, are comprehensive of all languages, indicating sounds or groups of sounds by standard straight and curved symbols. In the United States the best known systems are the Pitman and the Gregg.

Abbreviations in Babylonian writing. See **EDUCATION**: Ancient; B. C. 35th-6th centuries: **Babylonia** and **Assyria**.

Roman System.—Use in the Middle Ages.—“The first mention of an abbreviated system is

in connection with the Roman poet Quintus Ennius, 200 B. C., who used a scheme of eleven hundred signs that he devised for the purpose of writing more swiftly than was possible by the ordinary alphabet. Doubtless some method of abbreviating words was used by the Hebrews, and also by the Persians, several hundred years before Christ, though there is no evidence that shorthand characters or other special symbols were employed. The first definite and indisputable evidence of the use of shorthand is recorded by Plutarch, who mentions that in the debate on the Catilinian conspiracy in the Roman Senate in 63 B. C. the famous oration of Cicero was reported in shorthand. The method of shorthand used was invented by Tiro, who was a freedman of Marcus Tullius Cicero. Like many of the slaves of that time, captives of other nations, he was highly educated, and on receiving his freedom from Cicero he adopted two thirds of his master's name and became Marcus Tullius Tiro. He then became Cicero's secretary and confidant. When one remembers that the shorthand-writers of those days were without paper, pen, pencil, or ink, and possessed only a crude method of shorthand-writing, it is almost incredible that they could report anything. The writing was done on tablets that were covered with a layer of wax. The edges of the wax tablets were raised in order to allow their being closed without injury to the writing. These tablets were fastened together at the corners by wire, thus forming a kind of book. As many as twenty tablets could be so fastened. When the book consisted of two tablets only it was called a *diploma*, and the official appointments conferring public office were in that form; hence our word ‘diploma.’ The instrument used for writing was a stylus, which was about the size of an ordinary pencil, the point being of ivory or steel, with the other end flattened for the purpose of smoothing the wax after a record had been made, in order that the tablet could be used again. It was with such instruments that Cæsar was stabbed to death. Tiro must have possessed unusual skill as a shorthand-writer, for Cicero, in writing to a friend when Tiro was absent, complained that his work was delayed because, while he could dictate to Tiro in ‘periods,’ he had to dictate to others in ‘syllables.’ Cicero himself was a shorthand-writer, but evidently not a skilful one, as he writes to Atticus, ‘You did not understand what I wrote you concerning the ten deputies, I suppose, because I wrote you in shorthand.’ In reporting the Roman Senate, it is said that Tiro stationed about forty shorthand-writers in different parts of the Curia, who wrote down on their tablets what they could. The transcripts were afterward pieced together into connected discourse. Even to-day, in the reporting in our own Congress, a somewhat similar method is used, except that the writers take notes in relays. It is stated that some of the Roman stenographers were trained to take down the first parts of sentences and others the closing words. The world is indebted to Tiro and his followers for the transmission to posterity of some of the finest bits of literature and some of the most effective orations of Roman civilization. By the grace of shorthand, we possess the opinions on the immortality of the soul of two of the famous men who lived before the Christian era. When we remember that in the days of Cicero and Cæsar the sayings of the famous intellectuals were passed on almost entirely by word of mouth, and were handed down in the same manner, the part that shorthand played in the preservation of thought was enormous. A knowledge of the Tironian

notes became a much-prized possession in Horace, Livy, Ovid, Martial, Pliny, Tacitus, and Suetonius. Julius Cæsar was a writer of shorthand, and the poet Ovid, in speaking of this, records, 'By these marks secrets were borne over land and sea.' . . . With the rise of the early Christian Church and the demand for a record of the exact words of the religious leaders of the day, the teaching and practice of the shorthand of Tiro received a new impetus. Pope Clement, in A.D. 196, divided Rome into seven districts and appointed a shorthand-writer for each. Cyprian, the famous bishop of Carthage, devoted much of his time to the elaboration of several thousand abbreviations to supplement the Tironian notes. These abbreviations were devoted for the main part to scriptural and proper names and to current phrases peculiar to the early Christians, thereby rendering the work 'much more useful to the faithful,' as he expressed it, but at the same time making the learning of shorthand much more difficult. . . . The famous preacher Origen (A.D. 185-253) has left on record the statement that he prepared his addresses in shorthand. He did not, however, permit the addresses to be reported until after he was sixty years of age, when he had acquired such skill as an orator that he could be certain that his orations were given in the form he wished. St. Augustine employed ten stenographers. Basil the Great (A.D. 329-379) wrote: 'Words have wings, therefore we use signs so that we can attain in writing the swiftness of speech.' . . . Pope Gregory the Great (A.D. 590-604), in the dedication to his famous 'Homilies,' mentions that he had revised them from the stenographic reports. St. Jerome had ten stenographers, four of whom took down his dictation, while six were transcribers who wrote out what the others had taken from dictation. . . . Bearing in mind the fact that the Tironian notes consisted of thousands of arbitrary signs for words and phrases, that the famous orator Seneca developed the Tironian notes by five thousand additional signs of his own invention, and that Bishop Cyprian added many thousands of abbreviations for scriptural terms, one may have some idea of the difficulties with which the students of shorthand in ancient times had to contend. Perhaps these long lists of arbitraries were responsible for the sad fate of Cassianus when teaching shorthand. Cassianus had been a bishop of Brescia, and when he was expelled from his see, he established an academy at Imola, in the Province of Bologna, in which he taught shorthand. It is recorded that his exasperated pupils suddenly surrounded him and stabbed him to death with their styli. . . . Then there is the sad case of the stenographer to a great ecclesiastic who, finding his stenographer dozing when he should have been transcribing his notes, dealt him such a vigorous blow on the ear that the stenographer died from the effects of it, and the churchman had to leave the city in order to avoid trial for manslaughter. With the crude form of shorthand that then prevailed, shorthand-writers had enough to worry about; but we find that the Emperor Severus, in the third century, decreed that a shorthand-writer who made a mistake in reporting a case should be banished and have the nerves of his fingers cut so that he could never write again. In 1903 archæologists discovered, one hundred miles south of Cairo, a great many ancient documents on papyrus. Among them was a contract with a shorthand-writer, dated A.D. 137, whereby a boy was to be taught shorthand for the sum of 120 drachmæ (about \$24.00); 40 drachmæ to be paid in advance, 40 drachmæ on satisfactory evidence of the progress of the boy in

the acquirement of the art, and a final 40 drachmæ when he had become a proficient writer. Remember that this was 137 years after the birth of Christ. Shorthand was so much in demand in those days that there may have been some profiteering among the teachers of it, because we find that in A.D. 301 the Emperor Diocletian issued an edict fixing tuition fees at seventy-five denares per month for each pupil, about a dollar and a half a month. Evidently the high cost of living did not vex teachers in those days. St. Augustine records the fact that the stenographers of Rome went on strike on one occasion and succeeded in securing their demands. . . . Peocopius, who was a stenographer to the Emperor Constantine II, became a count. He attempted to seize Julius's crown, but, vacillating at the critical moment, was betrayed by his generals and put to death. A teacher of oratory, Fabius Quintilian (A.D. 35-95), in publishing his 'Guide to the Art of Oratory,' complained that his lectures, published by others under his name, had injured him because they had been reported by 'greedy shorthand-writers who had taken them down, and circulated them.' It is stated that the early Christians bribed the judicial shorthand-writers to take down the sayings of the Christian on trial. These were preserved in the archives and read at the martyrs' anniversaries in order to encourage the faithful. With the decline and dissolution of the Roman Empire, shorthand, like all other arts, lost favor. It was no longer regarded as a great, fashionable art. The Emperor Justinian, in the sixth century, forbade his records being kept by the 'catches and short-cut riddles of signs.' Later, Frederick II ordered the destruction of all shorthand-characters as being 'necromantic and diabolical.' As the Holy Roman Empire then covered almost the entire known world, the edict of Frederick II rendered shorthand one of the lost arts. Then came the Dark Ages, and for nearly a thousand years the arts and sciences, among them shorthand, were banished from the world."—J. R. Gregg, *Julius Cæsar's stenographer* (*Century Magazine*, May, 1921).

Modern development.—"The first evidence of the revival of shorthand that we have in the Renaissance is in the fact that the orations of the reformer Savonarola (1452-1498) were reported in some form of abbreviated writing by Lorenzo di Jacopo Viola. There are many omissions or incomplete sentences in these reports, and in parenthesis there is this quaint explanation by the reporter, 'Here I was unable to proceed because of weeping.' Was the reporter merely camouflaging his own inability to keep pace with the fiery tongue of the orator? . . . The first system of shorthand published in modern times was that of Dr. Timothy Bright, whose system of 'characterie' was published in London in 1588. Dr. Bright, in the introduction to his book, said that he was inspired to devise his system through reading Plutarch's reference to the reporting of the Catilinian conspiracy. The full title of Dr. Bright's book was, 'Characterie. An Arte of Shorte, Swifte and Secrete Writing by Character.' The system was dedicated to Queen Elizabeth, and letters patent were issued to the author by the crown, dated July 13, 1588, giving him the exclusive right to the publication and use of shorthand. . . . 'Characterie' did not meet with favor, and it was superseded by brachygraphy, tachygraphy, stenography, and many other names. It is a curious thing that the first mention of the word 'shorthand,' by which the art is now generally known, is in an epitaph which is still to be seen in the

cloisters of Westminster Abbey. It is to William Laurence, who died December 28, 1661, and reads:

'Shorthand he wrot, his flowre in prime did fade,
And hasty death shorthand of him hath made.'

Dr. Bright was a man of rare attainments. He was a distinguished physician and an author of several books of importance. In 1586 one of his books was called 'A Treatise on Melancholy,' and it is believed that it suggested to Shakspeare many of the pranks of mad people as set forth in his plays, and especially, 'Hamlet.' Shakspeare was twenty-four years of age when Bright's book was published, and no doubt he was familiar with it, as it created a stir at the time; indeed, the word 'characterie' is used in two of his plays. Bright's 'Treatise on Melancholy' was published in 1586, and therefore long preceded 'Hamlet.' Recent investigators have found that several expressions in 'Hamlet,' which were heretofore believed to have been original with Shakspeare, are to be found in Bright's book; such as 'discourse of reason.' Bright's system was arbitrary and had not an alphabet that could be connected; it was simply a list of signs to be used for words. The first system with an alphabet was that of John Willis, published in 1602, and from that time on there was a steady stream of systems or modifications of systems. In the next century and a half more than two hundred systems were published. There was great interest in shorthand at this time. The people were eagerly desirous of preserving in permanent form the utterances of their beloved religious leaders. All textbooks of that time reflect this, because they are full of abbreviations for biblical phrases. John and Charles Wesley, the founders of the Methodist Church, were shorthand-writers. The Wesleys used the celebrated system of Dr. John Byrom. Dr. Philip Doddridge, in his famous theological college, insisted that all students preparing for the ministry should learn shorthand first in order that they might easily take down his lectures. In 1628 Bishop Earle denounced certain 'graceless' persons who did not scruple to report sermons in stenography and then palm them off later as their own. But shorthand was used for other purposes. The most famous diary ever published was that of Samuel Pepys, which was written in the Shelton system. In this diary Pepys gives a vivid account of the Great Plague and the Great Fire of London, with many intimate accounts of the court of King Charles II. Pepys was an expert shorthand-writer, because he mentions in his diary that in April, 1680, he attended the king, by command, at Newmarket, and there 'took down in shorthand from his own mouth the narrative of his escape from the battle of Worcester.' It is interesting to recall that Thomas Jefferson, in a letter to his friend Page, dated January 23, 1764, proposed that they should master Shelton's system, the one used by Pepys, so that they might have something which was unintelligible to any one else. He said, 'I will send you some of these days Shelton's Tachygraphical Alphabet and directions.' There is evidence that the art of shorthand was in use in this country within half a dozen years of the landing of the Pilgrims. In the library at Springfield, Massachusetts, there is preserved the shorthand note-books of Major John Pynchon, the son of the founder of Springfield, containing reports of the sermons of the first pastor of Springfield, the Rev. George Moxon. These sermons are dated from 1637 to 1639, seventeen years after the coming of the *Mayflower*. A majority of the

writers of shorthand in New England in the early colonial days were men of distinction. Roger Williams, the founder of Rhode Island, was a very accomplished shorthand-writer. An Indian Bible belonging to him in which are annotations in shorthand is still preserved in one of the historical societies. It is not, however, generally known that many years before coming to this country Roger Williams, at nineteen years of age, was employed by the famous lawyer Sir Edward Coke to report the proceedings of the Star Chamber in 1618. John Winthrop, Jr., the son of the first governor of Massachusetts, and who was himself afterward governor of Connecticut, was an accomplished shorthand-writer. When he arrived in Boston in 1631 he proceeded to superintend the settlement of the town of Ipswich, Massachusetts, while his wife Martha remained in Boston. They corresponded in shorthand, and many of these shorthand letters, which were written in 1633, are preserved by the Winthrop families under the date of that year. I mention this particularly because Martha Winthrop is the first American shorthand-writer of the gentler sex of whom we have record. As early as 1650 Sir Ralph Verney spoke of the 'multitudes of women practicing shorthand in church.' A discourse published in 1700 was described as 'taken down in characters from the pulpit by a young maiden.' In his autobiography Benjamin Franklin says: 'My uncle Benjamin had formed a shorthand of his own, which he taught me. He was very pious and a very great attender of the best preachers which he took down in shorthand, and he had many volumes of them. My father intended to devote me to the service of the Church. My uncle offered to give me his collection of sermons as a sort of stock in trade with which to start.' In 1837 Isaac Pitman published a system called 'Stenographic Sound-Hand,' which was revived in 1840 and published as 'Phonography.' So great was the interest displayed in the study of the art that enormous classes were organized, and in order to avail themselves of the teaching of Pitman, many of these met at six o'clock in the morning, and others continued their work until ten in the evening. . . . It was not until the invention of a simpler shorthand that there came the present growing interest in it as an art that should be mastered by everybody, whether they wish to make use of it professionally or otherwise."—*Ibid*.

Ciphers of Roger Bacon. See SCIENCE: Middle Ages and the Renaissance.

A B C ALLIANCE: Origin and nature of. See LATIN AMERICA: 1012-1015; 1018.

A B C CONFERENCE, a meeting held at Niagara, May-June, 1914, of representatives chosen by the A B C powers, Argentina, Brazil and Chile, which had as its object the peaceful settlement of the differences which had arisen between the United States and Mexico in 1914. "President Wilson had a very disagreeable situation to face when he assumed control of affairs at Washington. He refused to recognize Huerta whose authority was contested by insurrectionary chiefs in various parts of the country. It was claimed by the critics of the administration that the refusal to recognize Huerta was a direct violation of the well known American policy of recognizing *de facto* governments without undertaking to pass upon the rights involved. It is perfectly true that the United States has consistently followed the policy of recognizing *de facto* governments as soon as it is evident in each case that the new government rests on popular approval and is likely to be permanent. This doctrine of recognition is distinctively an

American doctrine. It was first laid down by Thomas Jefferson when he was Secretary of State as an offset to the European doctrine of divine right, and it was the natural outgrowth of that other Jeffersonian doctrine that all governments derive their just powers from the consent of the governed. Huerta could lay no claim to authority derived from a majority or anything like a majority of the Mexican people. He was a self-constituted dictator, whose authority rested solely on military force. President Wilson and Secretary Bryan were fully justified in refusing to recognize his usurpation of power, though they probably made a mistake in announcing that they would never recognize him and in demanding his elimination from the presidential contest. This announcement made him deaf to advice from Washington and utterly indifferent to the destruction of American life and property. The next step in the President's course with reference to Mexico was the occupation of Vera Cruz. On April 20, 1914, the President asked Congress for authority to employ the armed forces of the United States in demanding redress for the arbitrary arrest of American marines at Vera Cruz, and the next day Admiral Fletcher was ordered to seize the custom house at that port. This he did after a sharp fight with Huerta's troops in which nineteen Americans were killed and seventy wounded. The American chargé d'affaires, Nelson O'Shaughnessy, was at once handed his passports, and all diplomatic relations between the United States and Mexico were severed. A few days later the representatives of the so-called A B C powers, Argentina, Brazil, and Chile, tendered their good offices for a peaceful settlement of the conflict and President Wilson promptly accepted their mediation."—J. H. Latané, *United States and Latin America*, pp. 308-310.

Mediation agreement: Protocol.—The first formal session of the mediation conference was held at Niagara Falls on May 20, 1914. The United States was represented by Associate Justice Joseph R. Lamar and Frederick W. Lehmann, former Solicitor-General, Argentina, Brazil and Chile by their Plenipotentiaries, and Gen. Huerta by Augustin Rodriguez, Emilio Rabasa, and Luis Elguero. After five weeks of difficult labor during which the conference was several times on the brink of failure, the delegates issued a protocol which was signed on June 24 by all the mediators. It read as follows: "Article I.—The provisional government referred to in protocol No. 3 shall be constituted by agreement of the delegates representing the parties between which the internal struggle in Mexico is taking place. Article II.—(a) Upon the constitution of the provisional government in the City of Mexico, the Government of the United States of America will recognize it immediately, and thereupon diplomatic relations between the two countries will be restored. (b) The Government of the United States also will not in any form whatsoever claim a war indemnity or other international satisfaction. (c) The provisional government will proclaim an absolute amnesty to all foreigners for any and all political offenses committed during the period of Civil War in Mexico. (d) The provisional government will negotiate for the constitution of international commissions for the settlement of the claims of foreigners on account of damages sustained during the period of Civil War as a consequence of military acts or the acts of the national authorities. Article III.—The Three mediating Governments agree on their part to recognize the provisional government organized as provided in section I of this protocol."—*American year book*, 1914, p. 76.—Although this

protocol was not made operative in any particular, Huerta voluntarily resigned July 15th. "On August 20, General Venustiano Carranza, head of one of the revolutionary factions, assumed control of affairs at the capital, but his authority was disputed by General Francisco Villa, another insurrectionary chief. On Carranza's promise to respect the lives and property of American citizens the United States forces were withdrawn from Vera Cruz in November, 1914. In August, 1915, at the request of President Wilson the six ranking representatives of Latin America at Washington made an unsuccessful effort to reconcile the contending factions of Mexico. On their advice, however, President Wilson decided in October to recognize the government of Carranza, who now controlled three-fourths of the territory of Mexico."—*Ibid.*, p. 310.—See also U.S.A.: 1914 (April).

ABD-AL-BAHA IBN BAHÁ ALLAH. See **ABBAS EFFENDI**.

ABDALLAH, Mohammedan missionary in Africa, 11th century. See **ALMORAVIDES**.

ABDALLAH IBN ZOBÁIR (622-692), caliph of Mecca. See **CALIPHATE**: 715-750.

ABDALLEE, Ahmed (Ahmad Shah Durani), shah of Afghanistan, 1747-1773. See **INDIA**: 1747-1761.

ABD-AR-RAHMAN (I-V), a succession of members of the Ommayyad family, whose founder, Abd-ar-rahman I, escaped from the destruction of his house by the Abbasids, and ultimately founded in Spain the Ommayyad caliphate of Cordova. His reign began in 756, and his family continued to rule until 1031. See **CALIPHATE**: 756-1031.

ABD-EL-AZIZ IV (1880-), sultan of Morocco, 1900-1908. Proposed the conference at Algieras in 1906; regarded by his people as a weak ruler and in 1907-1908 was supplanted by his brother Mulai el Hafid. See **MOROCCO**: 1903, and 1907-1909.

ABD-EL-KADER (c.1807-1883), amir of Mascara. The great leader of the Algerian tribes against France, 1830-1847; yielded in 1847 and spent his last years in Damascus; celebrated throughout the Barbary States and highly esteemed by the French. See **BARBARY STATES**: 1830-1846.

ABD-EL-MUMIN EL KUMI (1130-1163), caliph and Commander of the Faithful. See **AL-MOHADES**; **AFRICA**: Ancient and medieval civilization: Arab occupation: Relations with Europe: Effects of Arab influence.

ABDERA, an ancient maritime town on the southern coast of Spain, bordering on the Mediterranean sea. The Carthaginians founded the town to be used as a trading station. It was subsequently taken over by the Romans. Abdera is the birthplace of the philosopher Democritus, of the historian Hecataeus and other distinguished men.

ABDERHALDEN'S ENZYME REACTION. See **MEDICAL SCIENCE**: Modern: 20th century: Experimental method.

ABDICATION, the renunciation, formally or otherwise, of an office, power or right. The term is used chiefly with reference to rulers. An absolute monarch may abdicate at will; in some constitutional monarchies the consent of the parliament is required. In England, action of both Houses of Parliament is necessary to validate an abdication. In the case of King James II it was decided by Parliament that the king's desertion of his official duties, followed by his flight from the realm, constituted an abdication of his royal position. History records a number of voluntary abdications, as well as numerous occasions on which

the ruler was compelled by insurrection to renounce his throne.

The following list of abdications, forced and voluntary, is by no means exhaustive, but includes those which have special interest or importance. Wholesale abdications, such as occurred in the minor German states immediately after the World War, may be found under the names of the separate states.

ABDUL AZIZ, sultan of Turkey, 1861-1876.
By imperial firman of 1866 he conceded to Ismail
Pasha and his descendants, the hereditary right to
the office of khedive of Egypt. Largely responsible
for the Bulgarian massacres of 1875. Popular dis-
content at his misgovernment led to his deposition,
May 30, 1876. He was found dead in his apart-
ments four days later. See TURKEY: 1861-1870.

Islamic teachings of. See WAHHABIS.

ABDUL BAHA. See ABBAS EFFENDI.

ABDUL HAMID I, sultan of Turkey, 1773-
1789. Involved in a series of unsuccessful wars
with Catherine II of Russia, as a result of which
Turkey lost the Crimea and adjacent territories.
See TURKEY: 1774 and 1776-1792.

Abdul Hamid II (1842-1918), sultan of Tur-
key, 1876-1909. Came to power in trying times,
suppressed the attempted Parliamentary reforms
of the Young Turks and inaugurated an ab-
solutist régime; responsible for the Armenian
outrages of 1895 and 1896. Political conflicts
caused by the success of the Young Turks enabled
Austria-Hungary formally to annex the occupied
provinces of Bosnia and Herzegovina (1908). De-
posed (1909) by the Young Turks.—See also TUR-
KEY: 1861-1876; 1877 to 1909.

Supporter of Pan-Islamic movement. See
PAN-ISLAMISM.

ABDUL MEJID, sultan of Turkey, 1839-1861.
In spite of sincere attempts at reform, his reign
was a failure because of the practical loss of Egypt
through his defeat by Mehemet Ali, and the ex-
haustion of Turkey in consequence of the Crimean
war.—See also TURKEY: 1839.

ABDULLAH, Mohammed, Somali mullah,
leader of the rebellion in 1902. See SOMALILAND.

ABDULLAH IBN SEYYID MOHAMMED
(c. 1846-1890), the khalifa, ruler of Egyptian Sudan.
See EGYPT: 1885-1890.

ABDUR RAHMAN (d. 666), Saracen general.
See CALIPHATE: 715-732.

ABDUR RAHMAN KHAN, amir of Afghanis-
tan, 1880-1901. See AFGHANISTAN: 1860-1881 and
1901-1906.

ABEKEN, Heinrich (1809-1872), chaplain to
the Prussian embassy at Rome in 1834. Was in
high favor with Bismarck, whose official dispatches
he was employed to write, and with King William,
whom he accompanied on several campaigns and
diplomatic missions during the Franco-German
War. Composed the famous Ems dispatch, which,
as edited by Bismarck, precipitated the Franco-
German War.—See also FRANCE: 1870 (June-July).

ABEL, Sir Frederick Augustus (1827-1902),
English chemist. Expert in the science of ex-
plosives; consulting chemist to the British war
department, 1854-1888; prepared gun-cotton in a
form which increased its usefulness; with James
Dewar invented cordite, the standard explosive of
the British army.—See also CHEMISTRY: Practical
application: Explosives: Gunpowder.

ABELARD, Peter (1079-1142), scholastic
philosopher, teacher and theologian. He was a
bold and original thinker with an irrepressible
thirst for knowledge, and his overthrow of realism
was the precursor of the Aristotelian ascendancy
in the Middle Ages. He created enemies among
the teachers who were lecturing in France by de-
feating them in debate, and by his remarkable

work "Yea and Nay" he introduced the fashion of discussing the tenets of Christianity. Cruelly persecuted both for his doctrines, and for his love for Héloïse, he fled from monastery to monastery. While on his way to Rome to suffer imprisonment by the church, he died at Cluny. The founding of the University of Paris was in great part due to his influence.—See also EDUCATION: Medieval: 9th-15th centuries: Scholasticism, Schoolmen; and 11th-12th centuries: Universities, their rise; also UNIVERSITIES AND COLLEGES: 1201-1070.

ABENAQUES. See ABNAKIS, ABENAQUES or TARANTEENS.

ABENCERRAGES, a powerful family in the Moorish kingdom of Granada. The name became famous in Spanish romance through feuds between the Abencerrages and their rivals, the Zegrís. Toward the close of Moorish rule the family is said to have been massacred in the Alhambra by King Abu Hassan. See SPAIN: 1238-1273 and 1476-1492.

ABENCERRAGES, Hall of. See ALHAMBRA.

ABENSBERG, a small town in lower Bavaria, Germany, on the Abens, eighteen miles southwest of Ratisbon. It gained prominence in the Austrian offensive of 1809. Here, on the 20th of April, 1809, Napoleon gained a signal victory over the Austrian army under the Archduke Charles and General Hiller. This opened the way to the victory of Eckmühl, and the retirement of the Austrians. See GERMANY: 1809 (January-June).

ABERCROMBIE, James (1706-1781), commander-in-chief of British and Colonial forces in America, 1757; his defeat following his attack on Ticonderoga led to his removal in 1759. See CANADA: 1758.

ABERCROMBIE, Lascelles (1881-), English poet. See ENGLISH LITERATURE: 1880-1920.

ABERCROMBY, Sir Ralph (1734-1801), distinguished soldier of Great Britain. Served in the Seven Years' War; fell in battle with the French near Alexandria.—See also FRANCE: 1801-1802.

ABERDARE, Henry Austin Bruce, 1st Baron of (1815-1895), English statesman; entered parliament, 1862; home secretary under Gladstone, 1869; responsible for Licensing Act of 1872; made lord president of the council and raised to the peerage 1873; political life closed with the defeat of the Liberal government in 1874. His last years were devoted to social and educational activities.

ABERDEEN, George Hamilton Gordon, 4th Earl of (1784-1860), English statesman and scholar. Signed the treaty of Teplitz at Vienna (1813) for Great Britain; represented his country at the Congress of Châtillon-sur-Seine (1814). Secretary of state for foreign affairs under Peel, 1841-1846; prime minister, 1852-1855. See ENGLAND: 1851-1852, and 1855.

ABERDEEN, a seaport and fourth largest city in Scotland, situated on a bay of the North Sea between the rivers Don and Dee; seat of the University of Aberdeen, which was formed by the incorporation (1860) of King's College (founded in 1494) and Marischal College (1503).

ABERDEEN AND TEMAIR, Ishbel Maria (Marjoribanks), Marchioness of (1857-), British social worker and writer. Founded the Onward and Upward Association to promote coöperation among women of different stations of life; the Irish Industries Association; the Canadian National Council of Women; and the Victorian Order of Nurses. President of the International Council of Women, 1893-1899; reelected in 1904.

ABERDEEN AND TEMAIR, John Campbell Gordon, 1st Marquess of (1847-), English Liberal. Lord-Lieutenant of Ireland, 1886; Governor-General of Canada, 1893-1898; upon the formation of the Liberal ministry under Sir Henry Campbell-Bannerman, again Lord-Lieutenant of Ireland, 1905-1915.

ABGEORDNETEN HAUS (Chamber of Deputies), Austria. See AUSTRIA: 1907.

ABHORRERS, the name given to those who were opposed to the signers of a petition in 1079 urging King Charles II to assemble parliament. During this controversy, it is said, the terms Whig and Tory were first applied to the two English factions. See also PETITIONERS AND ABHORRERS.

ABNAKIS, or Abenagues, or Taranteens.—"The Abnakis [Indians] were called Taranteens by the English, and Owenagungas by the New Yorkers. . . . We must admit that a large portion of the North American Indians were called Abnakis, if not by themselves, at least by others. This word Abnaki is found spelt Abenagues, Abenaki, Wapanachki, and Wäbenäkies by different writers of various nations, each adopting the manner of spelling according to the rules of pronunciation of their respective native languages. . . . The word generally received is spelled thus, Abnaki, but it should be 'Wanbanaghi,' designating the people of the Aurora Borealis, or in general, of the place where the sky commences to appear white at the breaking of the day. . . . It has been difficult for different writers to determine the number of nations or tribes comprehended under this word Abnaki. It being a general word, by itself designates the people of the east or northeast. . . . We find that the word Abnaki was applied in general, more or less, to all the Indians of the East, by persons who were not much acquainted with the aborigines of the country. On the contrary, the early writers and others well acquainted with the natives of New France and Acadia, and the Indians themselves, by Abnakis always pointed out a particular nation existing north-west and south of the Kennebec river, and they never designated any other people of the Atlantic shore, from Cape Hatteras to Newfoundland. . . . The Abnakis had five great villages, two amongst the French colonies, which must be the village of St. Joseph or Sillery, and that of St. Francis de Sales, both in Canada, three on the head waters, or along three rivers, between Acadia and New England. These three rivers are the Kennebec, the Androscoggin, and the Saco. . . . The nation of the Abnakis bear evident marks of having been an original people in their name, manners, and language. They show a kind of civilization which must be the effect of antiquity, and of a past flourishing age."—E. Vetromile, *Abnaki Indians* (*Maine Historical Soc. Coll.*, v. 6)—See also

ABOUKIR, a village in northern Egypt on the bay of Aboukir, thirteen miles northeast of Alexandria. In the bay was fought the battle of the Nile (1798) [see FRANCE: 1798-1799: August-August] in which the English under Lord Nelson defeated the French fleet under Brueys. Near the village a year later, Napoleon defeated the Turks. In 1801 the town was captured by the English under Sir Ralph Abercromby. See FRANCE: 1801-1802; WORLD WAR: 1914: IX. Naval operations: b.

ABOUKIR, British cruiser, sunk on September 22, 1914, together with the *Hogue* and the *Cressy*, by Otto von Weddigen, commander of a German submarine. See WORLD WAR: 1914: IX. Naval operations.

ABRAHAM, biblical and traditional patriarch, founder of the Hebrew nation. His name has become synonymous with absolute faith in God and implicit obedience to the divine will. In the Koran, he is represented as being from early childhood the solitary exponent of monotheism and violently persecuted by the polytheistic idolators on account of his fearless proclamation of the oneness of God. It is on the strength of the divine promise to Abraham that the Bible represents the Jews as a chosen people.—See also JEWS: Early Hebrew history; JEWS: Children of Israel in Egypt.

ABRAHAM, Plains of, that part of the high plateau of Quebec on which the memorable victory of Wolfe was won, September 13, 1759. The plain was so called "from Abraham Martin, a pilot known as Maitre Abraham, who had owned a piece of land here in the early times of the colony."—F. Parkman, *Montcalm and Wolfe*, v. 2, p. 289.—For an account of the battle which gave distinction to the Plains of Abraham, see CANADA: 1759 (July-September).

ABRAMS VERSUS UNITED STATES.—Supreme Court decisions. See SUPREME COURT: 1917-1921.

ABRANTES, Duke of. See JUNOT, ANDOCHE.

ABRANTES, a town of Portugal in Estremadura, on the Tagus. Captured on the 24th of November, 1807, by the French General Junot (Duc d'Abrantes), who made it the starting-point of his march on Lisbon and the conquest of Portugal.

ABRUZZI, Prince Luigi Amedeo, Duke of the (1873-), Arctic explorer. See ARCTIC EXPLORA-

TION: 1917-1918; Chronological record: 1899-1900, 1901; and MAP OF ARCTIC REGIONS.

ABSALON (1128-1201), Danish archbishop, statesman and soldier. In 1168 succeeded in forcing the Wends to accept the Christian religion and Danish sovereignty.

ABSAROKAS. See SIOUAN FAMILY.

ABSENCE, Ascertaining legality of death. See COMMON LAW: 1604.

ABSENTEE OWNERSHIP. See ABSENTEEISM.

ABSENTEE VOTING. See SUFFRAGE: Elections.

ABSENTEEISM.—"An absentee may be variously defined (1) as a landed proprietor who resides away from his estate, or (2) from his country; or more generally (3) any unproductive consumer who lives out of the country from which he derives his income. Examples of these species are (1) a seigneur under the *ancien régime* living in Paris at a distance from his estates; (2) an Irish landlord resident abroad; an Anglo-Indian ex-official resident in England and drawing a pension from India."—R. H. I. Palgrave, *Dictionary of political economy*.—"Those who live in another country contribute nothing, by their consumption, towards the support of the government of that country in which is situated the source of their revenue. If in this latter country there should be no land-tax, nor any considerable duty upon the transference either of moveable or immoveable property, as is the case in Ireland, such absentees may derive a great revenue from the protection of a government to the support of which they do not contribute a single shilling. This inequality is likely to be greatest in a country of which the government is in some respects subordinate and dependent upon that of some other. The people who possess the most extensive property in the dependent, will in this case generally choose to live in the governing country. Ireland is precisely in this situation, and we cannot therefore wonder that the proposal of a tax upon absentees should be so very popular in that country."—A. Smith, *Wealth of nations* (1776).—"Absenteeism is an old evil, and in very early times received attention from the government. . . . Some of the disadvantages to the community arising from the absence of the more wealthy and intelligent classes are apparent to every one. Unless the landlord is utterly poverty-stricken or very unenterprising, 'there is a great deal more going on' when he is in the country. . . . I am convinced that absenteeism is a great disadvantage to the country and the people. . . . It is too much to attribute to it all the evils that have been set down to its charge. It is, however, an important consideration that the people regard it as a grievance; and think the twenty-five or thirty millions of dollars paid every year to these landlords, who are rarely or never in Ireland, is a tax grievous to be borne."—D. B. King, *Irish question* (1882), pp. 5-11.

"The Irish system of landholding was exceedingly bad, for it contained many vicious features with scarcely any redeeming ones. . . . The ownership of the soil was vested, not in those who tilled it, but in those whose ancestors had profited from the confiscations in former years. These Irish landlords, mainly of English origin, regarded their estates merely as sources of revenue and cared little about the condition of the tenants, whom they greatly despised. Many of them were 'absentee landlords' living in England; their properties were managed by agents, who, in order to

please their employers, would raise the rents of the tenants on every possible pretext. Improvements on the farm had to be made by the peasant. If he drained a marsh, built a fence, or improved his cottage, his rent was immediately raised by the landlord; if he refused to pay it, he was promptly evicted and the improvements, as well as the farm, became the landlord's property without compensation to the tenant. From 1849 to 1882 no fewer than 363,000 peasant families were evicted from their homes. Often the fear of losing the money invested in the improvements compelled the peasant to suffer the greatest privations in order to satisfy the greed of the landlord. In this way the latter used as a means of coercion the very value created by the peasant. Owners refused to improve their properties, and the tenants were naturally slow to invest labor and money for the benefit of the former; hence the land was wretchedly cultivated. This system of 'rack-renting,' as it was called, became notorious the world over and excited the greatest sympathy for the Irish peasants."—J. S. Schapiro, *Modern and contemporary European history*, pp. 388-389. —See also AGRICULTURE; IRELAND: 1607-1611.

France was in somewhat the same position before the Revolution, which effected a great reform in land ownership. A French authority thus describes the situation: "Set aside in public matters, freed from taxation, the seignior remains isolated and a stranger among his vassals; his extinct authority with his unimpaired privileges form for him an existence apart. When he emerges from it, it is to forcibly add to the public misery. On this soil, ruined by the fisc [the crown rights to an estate], he takes a portion of its product, so much in sheaves of wheat and so many measures of wine. His pigeons and his game eat up the crops. People are obliged to grind in his mill, and to leave with him a sixteenth of the flour. . . . The spectacle becomes still more gloomy, on passing from the estates on which the seigniors reside to those on which they are non-residents. Noble or ennobled, lay and ecclesiastic, the latter are privileged among the privileged and form an aristocracy inside of an aristocracy. Almost all the powerful and accredited families belong to it whatever may be their origin and their date. Through their habitual or frequent residence near the court, through their alliances or mutual visits, through their habits and their luxuries, through the influence which they exercise and the enmities which they provoke, they form a group apart, and are those who possess the most extensive estates, the leading suzerainties, and the completest and most comprehensive jurisdictions. Of the court nobility and of the higher clergy, they number, perhaps, a thousand in each order, while their small number only brings out in higher relief the enormity of their advantages. . . . It is evident, that, with such revenues, coupled with the feudal rights, police, judiciary and administrative, which accompany them, an ecclesiastic or lay grand seignior is, in fact, a sort of prince in his district; that he bears too close a resemblance to the ancient sovereign to be entitled to live as an ordinary individual; that his private advantages impose on him a public character; that his rank, and his enormous profits, make it incumbent on him to perform proportionate services, and that, even under the sway of the intendant, he owes to his vassals, to his tenants, to his feudatories the support of his mediation, of his patronage and of his gains. This requires a home

residence, but, generally, he is an absentee. For a hundred and fifty years a kind of all-powerful attraction diverts the grandes from the provinces and impels them towards the capital; and the movement is irresistible for it is the effect of two forces, the greatest and most universal that influence mankind, one, a social position, and the other the national character. A tree is not to be severed from its roots with impunity. An aristocracy organized to rule becomes detached from the soil when it no longer rules; and it ceases to rule the moment when, through increasing and constant encroachments, almost the entire judiciary, the entire administration, the entire police, each detail of the local or general government, the power of initiating, of collaboration, of control regarding taxation, elections, roads, public works and charities, passes over into the hands of the intendant or of the sub-delegate, under the supreme direction of the comptroller-general or of the king's council. Clerks, gentry 'of the robe and the quill,' plebeians enjoying no consideration, perform the work; there is no way to prevent it. . . . 'The great proprietors,' says another contemporary, ['De l'état religieux,' by the abbé de Bonnefoi et Bernard, 1784] 'attracted to and kept in our cities by luxurious enjoyments know nothing of their estates,' save 'of their agents whom they harass for the support of a ruinous ostentation. How can ameliorations be looked for from those who even refuse to keep things up and make indispensable repairs?' A sure proof that their absence is the cause of the evil is found in the visible difference between the domain worked under an absent abbé-commendatory and a domain superintended by monks living on the spot. 'The intelligent traveller recognizes it' at first sight by the state of cultivation. 'If he finds fields well enclosed by ditches, carefully planted, and covered with rich crops, these fields, he says to himself, belong to the monks. Almost always, alongside of these fertile plains, is an area of ground badly tilled and almost barren, presenting a painful contrast; and yet the soil is the same, being two portions of the same domain; he sees that the latter is the portion of the abbé-commendatory.' 'The abbatial manse,' said Lefranc de Pompignan, 'frequently looks like the patrimony of a dissipator; the monastic manse is like a patrimony whereon nothing is neglected for its amelioration,' to such an extent that 'the two-thirds' which the abbé enjoys bring him less than the third reserved by his monks. The ruin or impoverishment of agriculture is, again, one of the effects of absenteeism; there was, perhaps, one-third of the soil in France, which, deserted as in Ireland, was as badly tilled, as little productive as in Ireland in the hands of the rich absentees, the English bishops, deans and nobles. Doing nothing for the soil how could they do anything for men? Now and then, undoubtedly, especially with farms that pay no rent, the steward writes a letter, alleging the misery of the farmer. There is no doubt, also, and especially for thirty years back, they desire to be humane; they descant among themselves about the rights of man; the sight of the pale face of a hungry peasant would give them pain. But they never see him; does it ever occur to them to fancy what it is like under the awkward and complimentary phrases of their agent? Moreover, do they know what hunger is? Who amongst them has had any rural experiences? And how could they picture to themselves the misery of this forlorn being? They are too remote from him to do that, too ignorant

of his mode of life. The portrait they conceive of him is imaginary; never was there a falsè representation of the peasant; accordingly the awakening is to be terrible. They view him as the amiable swain, gentle, humble and grateful, simple-hearted and right-minded, easily led, being conceived according to Rousseau and the idyls performed at this very epoch in all private drawing-rooms. Lacking a knowledge of him they overlook him; they read the steward's letter and immediately the whirl of high life again seizes them and, after a sigh bestowed on the distress of the poor, they make up their minds that their income for the year will be short. A disposition of this kind is not favorable to charity. Accordingly, complaints arise, not against the residents but against the absentees. . . . 'I have in my parish,' says a curate of Berry, 'six simple benefices of which the titularies are always absent, and they enjoy together an income of nine thousand livres; I sent them in writing the most urgent entreaties during the calamity of the past year; I received from one of them two louis only, and most of them did not even answer me.' Stronger is the reason for a conviction that in ordinary times they will make no remission of their dues. Moreover, these dues, the *censives* [quit-rent], the *lods et ventes* [lord's dues], tithes, and the like, are in the hands of a steward, and he is a good steward who returns a large amount of money. He has no right to be generous at his master's expense, and he is tempted to turn the subjects of his master to his own profit. In vain might the soft seigniorial hand be disposed to be easy or paternal; the hard hand of the proxy bears down on the peasants with all its weight, and the cautiousness of a chief gives place to the exactions of a clerk. How is it then when, instead of a clerk on the domain, a *fermier* [farmer] is found, an adjudicator who, for an annual sum purchases of the seignior the management and product of his dues? In the *election* of Mayenne, and certainly also in many others, the principal domains are rented in this way. Moreover there are a number of dues, like the tolls, the market-place tax, that on the flock apart, the monopoly of the oven and of the mill which can scarcely be managed otherwise; the seignior must necessarily employ an adjudicator who spares him the disputes and the trouble of collecting. In this case, so frequent, the pressure and the rapacity of the contractor, who is determined to gain or, at least, not to lose, falls on the peasantry: 'He is a ravenous wolf,' says Renaudon, 'let loose on the estate, who draws upon it to the last sou, who crushes the subjects, reduces them to beggary, forces the cultivators to desert, and renders odious the master who finds himself obliged to tolerate his exactions as to be able to profit by them.'—H. A. Taine, *Ancient régime* (tr. by J. Durand), pp. 40-52.

ABSOLUTE MUSIC, a term used to express the type of music that derives none of its interest from external things, therefore being in the greatest contrast to program music. It appeals directly to the emotions without reference to the intellect. The term arose about the middle of the nineteenth century when the new school of program music came into being. See **MUSIC**: Later 19th century; Brahms.

ABSOLUTISM, in the stricter sense, a form of government in which the sovereign wields supreme

power based directly upon force and unchecked by laws or political tradition; in the more usual sense, a term applied to the political system of any state which has not achieved representative government. With the exception of two brief periods, those of the Athenian democracy and the Roman republic, it was almost the only form known to the ancient world, and in Oriental countries has prevailed even down to recent years. In Western Europe, in consequence of the barbarian invasions, absolute monarchy gave way to feudalism, a system in which, though the king was recognized as the nominal sovereign, supreme power was in reality in the hands of the greater nobles. During the middle ages the greater part of Central and Western Europe was divided into a number of states, the most important rulers of which were called kings. Most of these kings possessed very little power and were constantly thwarted in what they regarded as the performance of their regal functions by a turbulent and intractable nobility. To be sure under the feudal system all their nobles owed and sometimes rendered various services to their over-lord or suzerain, but upon their own estates the nobles were practically supreme. During the fifteenth century a variety of forces combined to exalt the power of the kings and the bourgeoisie of the cities, at the expense of the nobility. By the end of the century powerful centralized monarchies had emerged in France, Spain and Portugal, while the Wars of the Roses in England paved the way for the domineering house of Tudor. (See **ENGLAND**: 1471-1485, 1485-1603.) In France and Spain this process of centralizing all political authority in the crown made those countries absolute monarchies in reality. (See **SPAIN**: Machinery of absolutism.)

Louis XIV of France converted the great nobles into courtiers and the lesser ones into officers of his military and diplomatic service. The rise to power and prosperity of the middle class was at the expense of the nobility, and despotic rulers like Philip II of Spain and John the Perfect of Portugal employed men not of the noble caste in important positions in the government.

'The period which preceded the French Revolution and the era of war, from the troubles of which modern Europe was to be born, may be characterized as that of the benevolent despots. The State was everything; the nation nothing. The ruler was supreme, but his supremacy rested on the assumption that he ruled his subjects for their good. This conception of the *Aufgeklärte Despotismus* [enlightened despotism] was developed to its highest degree by Frederick the Great of Prussia. 'I am but the first servant of the nation,' he wrote, a phrase which irresistibly recalls the definition of the position of Louis XVI. by the first leaders of the French Revolution. This attitude was defended by great thinkers like Diderot, and is the keynote to the internal policy of the monarchs of the latter half of the eighteenth century towards their people. The Empress Catherine of Russia, Gustavus III. of Sweden, Charles III. of Spain, the Archduke Leopold of Tuscany, and, above all, the Emperor Joseph II. defended their absolutism on the ground that they exercised their power for the good of their subjects. Never was more earnest zeal displayed in promoting the material well-being of all classes, never did monarchs labour so hard to justify their existence, or effect such important civil reforms, as on the eve of the French Revolution, which was to herald the overthrow of the doctrine of

absolute monarchy. The intrinsic weakness of the position of the benevolent despots was that they could not ensure the permanence of their reforms, or vivify the rotten fabric of the administrative edifices, which had grown up in the feudal monarchies. Great ministers, such as Tanucci and Aranda, could do much to help their masters to carry out their benevolent ideas, but they could not form or nominate their successors, or create a perfect body of unselfish administrators. When Frederick the Great's master hand was withdrawn, Prussia speedily exhibited a condition of administrative decay, and since this was the case in Prussia, which had been for more than forty years under the rule of the greatest and wisest of the benevolent despots, the falling-off was likely to be even more marked in other countries. The conception of benevolent despots ruling for their people's good was eventually superseded, as was certain to be the case, owing to the impossibility of their ensuring its permanence, by the modern idea of the people ruling themselves."—H. M. Stephens, *Revolutionary Europe*, pp. 4-5.

"The government of nearly every European country at the end of the eighteenth century was monarchical, and everywhere the monarch was absolute, except in England, which had established a parliamentary system. Feudalism on its political side had disappeared, and the once haughty noble was transformed into the fawning courtier. Only in Germany did political feudalism still maintain itself; there, the lord continued to govern and to judge as he had done in medieval times. The explanation given for absolute monarchy was known as 'divine right,' which asserted that the King's right to govern came from God, to whom alone he was responsible for his acts. Was a king good, just, and wise? Then the people were fortunate. Was he wicked, cruel, and stupid? Then they were unfortunate. In no case were they to revolt, for disobedience was not only a crime to be punished on earth, but likewise a sin to be punished in the hereafter. In case a bad king reigned, the people were to bear his rule patiently and meekly, and to pray to God to soften his heart. This doctrine of 'divine right' was insistently preached by the loyal followers of the monarch. Lutheran Prussia subscribed to it as heartily as Catholic Spain. In medieval times, the largest part of the taxes came from land. But the commercial expansion of the seventeenth and eighteenth centuries increased the scope of government, and taxes had to be increased correspondingly in order to pay the expenses of a rapidly developing bureaucracy. While the kings of the *ancien régime* still gathered around them the territorial lords who, in former days, had been their bitter opponents, they now looked more and more to the middle classes for the maintenance of the State. But their traditions and sympathies, however, remained with the landed aristocracy; and the latter were consequently exempt in large measure from the ever increasing burden of taxation, as is revealed by the legislation of the eighteenth century. . . . Many of the changes inaugurated by the French Revolution and by Napoleon could not be abolished without a violent wrench of the entire social system, and so were allowed to remain. The Holy Roman Empire was gone, feudalism was gone, and gone was the old authority of the Church. If absolute monarchy did return, it should do so without popular endorsement, for the doctrine of 'divine right' was now being preached to unwilling ears. The generation that had seen so many kings hurled

from their thrones during the Revolutionary and Napoleonic periods found it difficult to believe in a divine sanction of governments that could be so easily overturned. Absolute monarchy, feared for ages as all-powerful, had but to show its weakness to become ridiculous. Although Napoleon had preached 'divine right,' he did more to discredit the doctrine than even the French Revolution. For the first time, mankind saw in the bright light of the nineteenth century how kings were made and unmade by force of arms. And now that its moral authority was gone, absolutism could maintain itself only by resorting to brute force. Sullen obedience had succeeded loyal devotion among the masses of Europe."—J. S. Schapiro, *Modern and contemporary European history*, pp. 2-3, 24.—The nineteenth century marks the desperate efforts of the monarchs of Europe to reestablish the absolutism that had been shaken to its foundations by the French revolution. The inspiring genius of this reactionary policy was Metternick, the crafty Austrian chancellor, who dominated Europe from 1815 to 1848, and whose cynical doctrines continued in force despite the democratic outbreaks of 1848. (See AUSTRIA: 1815-1846; 1849-1859.) From the apotheosis of absolutism expressed in Louis XIV's "*L'état c'est moi*" ("*I am the state*") less than three centuries have sufficed to bring about its downfall in every civilized country of the Old World and the New. The overthrow of the shogunate and the establishment of parliamentary government in Japan in 1889 (See JAPAN: 1868-1894), the revolution of the Young Turks in 1908, the downfall of Nicholas II of Russia, and the overthrow of the militaristic power in Germany mark the final victory of popular government over the theory of absolutism and divine right of kings.—See also MONARCHY.

In Russia. See RUSSIA: 1916.

ABT, Franz (1819-1885), German composer of popular songs and conductor of the court orchestra at Brunswick, 1852-1882. Wrote over 3,000 songs, among them "When the swallows homeward fly."

ABU BAKR (fl. 11th century), Almoravide chief. See ALMORAVIDES.

ABU BEKR (573-634), first of the Mohammedan caliphs and successor of the prophet, 632-634. The name, Abu Bekr (meaning "Father of the Virgin"), was adopted in place of his original name, Abd-el-Ka'ba, after the marriage of his daughter to Mohammed. On his accession, he successfully put down the formidable opposition led by the imposter Mosailima; had the record of the sayings of the prophet preserved in written form and this furnished most of the material out of which the Koran was prepared. His zeal in the propagation of Mohammedan doctrines was largely responsible for the success and spread of the faith of Islam. See CALIPHATE, also 632-630; MOHAMMEDANISM.

ABU GHARAIB.—1918.—Region of British attack. See WORLD WAR: 1918: VI. Turkish theater: a, 5.

ABU HAMED, Sudan, captured by the British in 1897. See EGYPT: 1897-1898.

ABUKIR. See **ABOUKIR.**

ABU'L ABBAS (also called Abdullah), caliph, 750-754. His father was great-grandson of the uncle of the prophet; upon this relation the Abbassids based their claim to the caliphate.

ABUMIR. See **PYRAMID.**

ABUNA. See **ABYSSINIAN CHURCH.**

ABUNA (Salama) OF ABYSSINIA.—"Since the days of Frumentius [who introduced Christianity into Abyssinia in the fourth century] every orthodox Primate of Abyssinia has been consecrated by the Coptic patriarch of the Church of Alexandria, and has borne the title of 'Abuna'—or 'Abuna Salama'—'Father of Peace.'"—H. M. Hozier, *British expedition to Abyssinia*, p. 4.

ABURY. See **AVEBURY.**

ABYDENOS. See **HISTORY: 14.**

ABYDOS, an ancient city of Asia Minor, near the Hellespont, mentioned in the Iliad as one of the towns that were in alliance with the Trojans. Originally Thracian, as is supposed, it became a colony of Miletus, and passed at different times under Persian, Athenian, Lacedæmonian and Macedonian rule. Its site was at the narrowest point of the Hellespont—the scene of the ancient romantic story of Hero and Leander—nearly opposite to the town of Sestos. It was in the near neighborhood of Abydos that Xerxes built his bridge of boats (480 B. C.). The town is also famed for its stubborn resistance to Philip V of Macedon (200 B. C.). See **GREECE: B. C. 411-407;** and **MAP OF ANCIENT GREECE.**

ABYDOS, Egypt.—"There was a city in Egypt called by the Greeks Abydos. This is an example of popular etymology or rather popular transcription. Its Egyptian name was 'About,' which through resemblance of sound recalled the distant well-known Grecian city of Abydos on the Hellespont, made famous by the passage of the army of Xerxes, and led to calling the Egyptian city by that name. It played no part in the political world, but became famous chiefly as a place for the worship of Osiris; one could almost call it a Mecca of pilgrims. Osiris, the most human god of the Egyptian pantheon, had been cut into pieces by his rival, Set, or Typhon; but his son Horus had brought him back to life by reconstructing his body. His tomb, however, was at Abydos, though we do not know whether it contained the body of the god, or as Greek writers say, only his head. On account of the sanctity of the place, the Egyptians liked to be buried there, and very few localities contained cemeteries so rich, belonging to all epochs from the neolithic age down to the Roman Empire. Kings had there built temples most of which, excepting two, have been destroyed, though one in particular, built by Seti I, of the nineteenth dynasty, the father of Rameses II, has remained almost in its entirety. It was unearthed by Mariette. It is a large temple which was completed by Rameses. In the part built by Seti there are some of the most beautiful sculptures in Egypt, but from father to son the style changed completely, the work of Rameses being hastily done with the carelessness characterizing so many of his monuments. The temple of Seti is what is called a memnonium, that is, an edifice in connection with a tomb and in which they rendered services to the dead. Since it is dedicated to Osiris, it seemed probable that the tomb of this god might be in this vicinity. For several years [W. Flinders] Petrie had attracted attention to what he called the Osireion. He had discovered a passageway leading to a room ornamented with funeral paintings showing a scene of worship ren-

dered to Osiris. In this passageway was a side door before which Petrie was stopped and which he shows upon his map to be a passage leading to the temple of Seti, situated about eighty meters from this door. . . . Between the doorway with enormous lintels and the temple of Seti is a large edifice evidently built at the time of the pyramids, that is, belonging to the first dynasties. It is very much ruined, but it was constructed of massive materials, the largest that have been found in Egypt in like quantity. It is an edifice unique among those numerous temples and tombs that one finds in the valley of the Nile. . . . There is no longer any doubt, then, that we have discovered what Strabo calls the well or the fountain of Abydos. He spoke of it as being near the temple, at a great depth, and remarkable for some corridors whose ceilings were formed of enormous monolithic blocks. That is exactly what we have found."—E. Naville, *Excavations at Abydos (Smithsonian report, 1914, pp. 579-581).*

ABYDOS, Tablet of, one of the most valuable records of Egyptian history, found in the ruins of Abydos and now preserved in the British Museum. "It gives a list of kings whom Rameses II selected from among his ancestors to pay homage to. The tablet was much mutilated when found, but another copy more perfect has been unearthed by M. Mariette, which supplies nearly all the names lacking on the first."—F. Lenormant, *Manual of ancient history of the East, v. 1, bk. 3.*

ABYSSINIA (officially Ethiopia), an inland empire in northeast Africa, surrounded by the possessions of Britain, Italy and France. The area is about 350,000 square miles and the population in 1920 about 8,000,000. Both the character of the land itself and that of the people are reflected in the history of Abyssinia. The country consists of elevated plateaus and rugged mountain ranges, which as in the case of Switzerland are favorable to the development of a hardy race capable of maintaining its independence. As Miss Semple has pointed out, the stronger the natural location the more strongly marked is likely to be the national character. The Abyssinians, who furnish a rather unusual example of a civilized people wholly central in location, "have used the fortress character of their land to resist conquest, and have preferred independence to the commercial advantages to be gained only by affiliation with their peripheral neighbors. . . . [But] even the most pronounced land barriers have their passways and favored spots for short summer habitation, where the people from the opposite slopes meet and mingle for a season. Sandy wastes are hospitable at times. When the spring rains on the mountains of Abyssinia start a wave of moisture lapping over the edges of the Nubian desert, it is immediately followed by a tide of Arabs with their camels and herds, who make a wide zone of temporary occupation spread over the newly created grassland, but who retire in a few weeks before the desiccating heat of summer."—E. C. Semple, *Influences of geographic environment*, pp. 141, 215. —In consequence of such intermingling the people are of mixed Hamitic and Semitic origin with a negroid element. Though the people still call themselves Ethiopians, the name Abyssinians (derived from the Portuguese form of the Arabic *Habesh*, meaning mixture or composite race) is the one by which they are known outside their own country. A race of warriors and traders, they have long felt a marked national consciousness which in recent years has resulted in vigorous efforts to establish and maintain political inde-

pendence. See also AFRICA: Races of Africa: Modern people; and Map.

Embraced in ancient Ethiopia.—In ancient times Abyssinia, or at least the northern part of it was known as Ethiopia, of which the northernmost limit at one time reached nearly to Syene. Between Ethiopia and Egypt interchange of culture was facilitated by the fact that both countries were occasionally under the same ruler. Intercourse with the Jews, at first merely commercial, was extended after the visit of the Queen of Sheba to the court of Solomon. Their son Menelck is claimed as the ancestor of the kings of Abyssinia; and more intimate relations of language and traditions were secured by the settling of many Jews in Abyssinia during the captivity. Greek colonization, begun after the invasion of Ptolemy Euergetes (247-221 B. C.), succeeded in establishing the kingdom of Axum. This included nearly all of modern Abyssinia and was most vigorous between the first and the seventh centuries A. D.

B. C. 2nd century. In Axum. See ARABIA: The Sabaeans.

A. D. 4th century.—Converted to Christianity. —“Whatever may have been the effect produced in his native country by the conversion of Queen Candace’s treasurer, recorded in the Acts of the Apostles it would appear to have been transitory; and the Ethiopian or Abyssinian church owes its origin to an expedition made early in the fourth century by Meropius, a philosopher of Tyre, for the purpose of scientific inquiry. On his voyage homewards, he and his companions were attacked at a place where they had landed in search of water, and all were massacred except two youths, Ædesius and Frumentius, the relatives and pupils of Meropius. These were carried to the king of the country, who advanced Ædesius to be his cup-bearer, and Frumentius to be his secretary and treasurer. On the death of the king, who left a boy as his heir, the two strangers, at the request of the widowed queen, acted as regents of the kingdom until the prince came of age. Ædesius then returned to Tyre, where he became a presbyter. Frumentius, who, with the help of such Christian traders as visited the country, had already introduced the Christian doctrine and worship into Abyssinia, repaired to Alexandria, related his story to Athanasius, and . . . Athanasius . . . consecrated him to the bishoprick of Axum [the capital of the Abyssinian kingdom]. The church thus founded continues to this day subject to the see of Alexandria.”—J. C. Robertson, *History of the Christian church*, bk. 2, ch. 6.

6th to 16th centuries.—Wars in Arabia.—Struggle with the Mohammedans.—Isolation from the Christian world.—“The fate of the Christian church among the Homerites in Arabia Felix afforded an opportunity for the Abyssinians, under the reigns of the Emperors Justin and Justinian, to show their zeal in behalf of the cause of the Christians. The prince of that Arabian population, Dunaan, or Dsunovas, was a zealous adherent of Judaism; and, under pretext of avenging the oppressions which his fellow-believers were obliged to suffer in the Roman empire, he caused the Christian merchants who came from that quarter and visited Arabia for the purposes of trade, or passed through the country to Abyssinia, to be murdered. Elesbaan [or Caleb], the Christian king of Abyssinia, made this a cause for declaring war on the Arabian prince. He conquered Dsunovas, deprived him of the government, and set up a Christian, by the name of

Abraham, as king in his stead. But at the death of the latter, which happened soon after, Dsunovas again made himself master of the throne; and it was a natural consequence of what he had suffered, that he now became a fiercer and more cruel persecutor than he was before. . . . Upon this, Elesbaan interfered once more, under the reign of the Emperor Justinian, who stimulated him to the undertaking. He made a second expedition to Arabia Felix, and was again victorious. Dsunovas lost his life in the war; the Abyssinian prince put an end to the ancient, independent empire of the Homerites, and established a new government favourable to the Christians.”—J. A. W. Neander, *General history of the Christian religion and church, second period, sect. 1.*—“In the year 592, as nearly as can be calculated from the dates given by the native writers, the Persians, whose power seems to have kept pace with the decline of the Roman empire, sent a great force against the Abyssinians, possessed themselves once more of Arabia, acquired a naval superiority in the gulf, and secured the principal ports on either side of it. It is uncertain how long these conquerors retained their acquisition; but, in all probability their ascendancy gave way to the rising greatness of the Mahometan power; which soon afterwards overwhelmed all the nations contiguous to Arabia, spread to the remotest parts of the East, and even penetrated the African deserts from Egypt to the Congo. Meanwhile Abyssinia, though within two hundred miles of the walls of Mecca, remained unconquered and true to the Christian faith; presenting a mortifying and galling object to the more zealous followers of the Prophet. On this account, implacable and incessant wars ravaged her territories. . . . She lost her commerce, saw her consequence annihilated, her capital threatened, and the richest of her provinces laid waste. . . . There is reason to apprehend that she must shortly have sunk under the pressure of repeated invasions, had not the Portuguese arrived [in the 16th century] at a seasonable moment to aid her endeavours against the Moslem chiefs.”—M. Russell, *Nubia and Abyssinia*, ch. 3.—“When Nubia, which intervenes between Egypt and Abyssinia, ceased to be a Christian country, owing to the destruction of its church by the Mahometans, the Abyssinian church was cut off from communication with the rest of Christendom. . . . They [the Abyssinians] remain an almost unique specimen of a semi-barbarous Christian people. Their worship is strangely mixed with Jewish customs.”—H. F. Tozer, *Church and the eastern empire*, ch. 5.—See also ABYSSINIAN CHURCH.

15th to 19th centuries.—European attempts at intercourse.—Intrusion of the Gallas.—Intestine conflicts.—“About the middle of the 15th century, Abyssinia came in contact with Western Europe. An Abyssinian convent was endowed at Rome, and legates were sent from the Abyssinian convent at Jerusalem to the council of Florence. These adhered to the Greek schism. But from that time the Church of Rome made an impress upon Ethiopia. . . . Prince Henry of Portugal . . . next opened up communication with Europe. He hoped to open up a route from the West to the East coast of Africa [see PORTUGAL: 1415-1460], by which the East Indies might be reached without touching Mahometan territory. During his efforts to discover such a passage to India, and to destroy the revenues derived by the Moors from the spice trade, he sent an ambassador named Covillan to the Court of Shoa. Covillan was not suffered to return by Alexander, the then Negoos [or Negus,

or Nagash—the title of the Abyssinian sovereign]. He married nobly, and acquired rich possessions in the country. He kept up correspondence with Portugal, and urged Prince Henry to diligently continue his efforts to discover the Southern passage to the East. In 1498 the Portuguese effected the circuit of Africa. The Turks shortly afterwards extended their conquests towards India, where they were balked by the Portuguese, but they established a post and a toll at Zeyla, on the African coast. From here they hampered and threatened to destroy the trade of Abyssinia," and soon, in alliance with the Mahometan tribes of the coast, invaded the country. "They were defeated by the Negroos David, and at the same time the Turkish town of Zeyla was stormed and burned by a Portuguese fleet." Considerable intimacy of friendly relations was maintained for some time between the Abyssinians and the Portuguese, who assisted in defending them against the Turks. "In the middle of the 16th century . . . a migration of Gallas came from the South and swept up to and over the confines of Abyssinia. Men of lighter complexion and fairer skin than most Africans, they were Pagan in religion and savages in customs. Notwithstanding frequent efforts to dislodge them, they have firmly established themselves. A large colony has planted itself on the banks of the Upper Takkazie, the Jidda and the Bashilo. Since their establishment here they have for the most part embraced the creed of Mahomet. The province of Shoa is but an outlier of Christian Abyssinia, separated completely from co-religionist districts by these Galla bands. About the same time the Turks took a firm hold of Massowah and of the lowland by the coast, which had hitherto been ruled by the Abyssinian Bahar Nagash. Islamism and heathenism surrounded Abyssinia, where the lamp of Christianity faintly glimmered amidst dark superstition in the deep recesses of rugged valleys." In 1558 a Jesuit mission arrived in the country and established itself at Fremona. "For nearly a century Fremona existed, and its superiors were the trusted advisors of the Ethiopian throne. . . . But the same fate which fell upon the company of Jesus in more civilized lands, pursued it in the wilds of Africa. The Jesuit missionaries were universally popular with the Negroos, but the prejudice of the people refused to recognize the benefits which flowed from Fremona." Persecution befell the fathers, and two of them won the crown of martyrdom. The Negroos, Facilidas, "sent for a Coptic Abuna [ecclesiastical primate] from Alexandria, and concluded a treaty with the Turkish governors of Massowah and Souakin to prevent the passage of Europeans into his dominions. Some Capuchin preachers, who attempted to evade this treaty and enter Abyssinia, met with cruel deaths. Facilidas thus completed the work of the Turks and the Gallas, and shut Abyssinia out from European influence and civilization. . . . After the expulsion of the Jesuits, Abyssinia was torn by internal feuds and constantly harassed by the encroachments of and wars with the Gallas. Anarchy and confusion ruled supreme. Towns and villages were burnt down, and the inhabitants sold into slavery. . . . Towards the middle of the 18th century the Gallas appear to have increased considerably in power. In the intestine quarrels of Abyssinia their alliance was courted by each side, and in their country political refugees obtained a secure asylum." During the early years of the nineteenth century, campaigns in Egypt attracted English attention to the Red sea. "In 1804 Lord

Valentia, the Viceroy of India, sent his Secretary, Mr. Salt, into Abyssinia;" but Mr. Salt was unable to penetrate beyond Tigré. In 1810 he attempted a second mission and again failed. It was not until 1848 that English attempts to open diplomatic and commercial relations with Abyssinia became successful. "Mr. Plowden was appointed consular agent, and negotiated a treaty of commerce with Ras Ali, the ruling Galla chief."—J. J. Holland and H. M. Hozier, *Expedition to Abyssinia, Introduction.*

1854-1889.—Advent of King Theodore.—His English captives and the expedition which released them.—"Consul Plowden had been residing six years at Massowah when he heard that the Prince to whom he had been accredited, Ras Ali, had been defeated and dethroned by an adventurer, whose name, a few years before, had been unknown outside the boundaries of his native province. This was Lij Kâsa, better known by his adopted name of Theodore. He was born of an old family, in the mountainous region of Kwara, where the land begins to slope downwards towards the Blue Nile, and educated in a convent, where he learned to read, and acquired a considerable knowledge of the Scriptures. Kâsa's convent life was suddenly put an end to, when one of those marauding Galla bands, whose ravages are the curse of Abyssinia, attacked and plundered the monastery. From that time he himself took to the life of a freebooter. . . . Adventurers flocked to his standard; his power continually increased; and in 1854 he defeated Ras Ali in a pitched battle, and made himself master of central Abyssinia." In 1855 he overthrew the ruler of Tigré. "He now resolved to assume a title commensurate with the wide extent of his dominion. In the church of Derezye he had himself crowned by the Abuna as King of the Kings of Ethiopia, taking the name of Theodore, because an ancient tradition declared that a great monarch would some day arise in Abyssinia." Mr. Plowden now visited the new monarch, was impressed with admiration of his talents and character, and became his counsellor and friend. But in 1860 the English consul lost his life, while on a journey, and Theodore, embittered by several misfortunes, began to give rein to a savage temper. "The British Government, on hearing of the death of Plowden, immediately replaced him at Massowah by the appointment of Captain Cameron." The new Consul was well received, and was entrusted by the Abyssinian King with a letter addressed to the Queen of England, soliciting her friendship. The letter, duly despatched to its destination, was pigeon-holed in the Foreign Office at London, and no reply to it was ever made. Insulted and enraged by this treatment, and by other evidences of the indifference of the British Government to his overtures, King Theodore, in January, 1864, seized and imprisoned Consul Cameron with all his suite. About the same time he was still further offended by certain passages in a book on Abyssinia that had been published by a missionary named Stern. Stern and a fellow missionary, Rosenthal with the latter's wife, were lodged in prison, and subjected to flogging and torture. The first step taken by the British Government, when news of Consul Cameron's imprisonment reached England, was to send out a regular mission to Abyssinia, bearing a letter signed by the Queen, demanding the release of the captives. The mission, headed by a Syrian named Rassam, made its way to the King's presence in January, 1866. Theodore seemed to be placated by the Queen's

epistle and promised freedom to his prisoners. But soon his moody mind became filled with suspicions as to the genuineness of Rassam's credentials from the Queen, and as to the designs and intentions of all the foreigners who were in his power. He was drinking heavily at the time, and the result of his "drunken cogitations was a determination to detain the mission—at any rate until by their means he should have obtained a supply of skilled artisans and machinery from England." Mr. Rassam and his companions were accordingly put into confinement, as Captain Cameron had been. But they were allowed to send a messenger to England, making their situation known, and conveying the demand of King Theodore that a man be sent to him "who can make cannons and muskets." The demand was actually complied with. Six skilled artisans and a civil engineer were sent out, together with a quantity of machinery and other presents, in the hope that they would procure the release of the unfortunate captives at Magdala. Almost a year was wasted in these futile proceedings, and it was not until September, 1867, that an expedition consisting of 4,000 British and 8,000 native troops, under General Sir Robert Napier, was sent from India to bring the insensate barbarian to terms. It landed in Annesley Bay, and, overcoming enormous difficulties with regard to water, food-supplies and transportation, was ready, about the middle of January, 1868, to start upon its march to the fortress of Magdala, where Theodore's prisoners were confined. The distance was 400 miles, and several high ranges of mountains had to be passed to reach the interior table-land. The invading army met with no resistance until it reached the Valley of the Beshilo, when it was attacked (April 10) on the plain of Aroge or Arogi, by the whole force which Theodore was able to muster, numbering a few thousands, only, of poorly armed men. The battle was simply a rapid slaughtering of the barbaric assailants, and when they fled, leaving 700 or 800 dead and 1,500 wounded on the field, the Abyssinian King had no power of resistance left. He offered at once to make peace, surrendering all the captives in his hands; but Sir Robert Napier required an unconditional submission, with a view to displacing him from the throne, in accordance with the wish and expectation which he had found to be general in the country. Theodore refused these terms, and when (April 13) Magdala was bombarded and stormed by the British troops—slight resistance being made—he shot himself at the moment of their entrance to the place. The sovereignty he had successfully concentrated in himself for a time was again divided. Between April and June the English army was entirely withdrawn, and "Abyssinia was sealed up again from intercourse with the outer world."—*Cassell's illustrated history of England*, v. 9, ch. 28.—"The task of permanently uniting Abyssinia, in which Theodore failed, proved equally impracticable to John, who came to the front, in the first instance, as an ally of the British, and afterwards succeeded to the sovereignty. By his fall (10th March, 1880) in the unhappy war against the Dervishes [see EGYPT: 1885-1896] or Moslem zealots of the Soudan, the path was cleared for Menilek of Shoa, who enjoyed the support of Italy. The establishment of the Italians on the Red Sea littoral . . . promises a new era for Abyssinia."—T. Nöldeke, *Sketches from eastern history*, ch. 6.—See also AFRICA: Modern European occupation: 1884-1889; and ERITREA.

1895-1896.—War with Italy. See ITALY: 1870-1901, 1895-1896.

1896-1897.—Convention between Italy and Abyssinia.—Treaty with Great Britain.—By the convention of Adis Ababa of October 26, 1896, between Italy and King Menelek, the independence of Abyssinia was recognized. This was followed, in May, 1897, by another treaty between Menelek and the British government, giving to British subjects the privileges of the most favored nations in trade, and opening the port of Zaila to Abyssinian importations. The treaty also defined the boundary of the British Somali Protectorate, and pledged Abyssinia's hostility to the Mahdists.

1902.—The French in favor.—Their railway building and plans.—Treaty with Great Britain.—"Through Abyssinia the French hope to establish a line of trade across Africa from east to west in opposition to our Cape to Cairo railway from north to south. In this they have already achieved some success. They have settled themselves along the Gulf of Tadjoura, on the south of which they hold the magnificent Bay of Djibouti, while on the north their flag waves over the small port of Obok. But their real triumph in these regions has been the establishment of a lasting friendship with Abyssinia by judicious consignments of arms and ammunition—which were used against Italy in the war of 1896. Finally, they are now in the act of building a French railway from Djibouti to Addis Abeba, the capital of Abyssinia. This railway will completely cut out the British port of Zeila, for in the concession granted by Menelik it is stipulated that no company is to be permitted to construct a railroad on Abyssinian territory that shall enter into competition with that of M. Ilg and M. Chefneux."—G. F. H. Berkeley, *Abyssinian question and its history (Nineteenth Century, Jan., 1903)*.—A treaty between Great Britain and the Emperor Menelek, of the kingdom of Ethiopia (Abyssinia), signed on the 15th of May, 1902, defines the boundaries between the Soudan and Ethiopia, and contains the following important provisions:

"ARTICLE III. His Majesty the Emperor Menelek II., King of Kings of Ethiopia, engages himself towards the Government of his Britannic Majesty not to construct, or allow to be constructed, any work across the Blue Nile, Lake Tsana, or the Sobat, which would arrest the flow of their waters into the Nile, except in agreement with his Britannic Majesty's Government and the Government of the Soudan. ARTICLE IV. The Emperor Menelek engages himself to allow his Britannic Majesty's Government and the Government of the Soudan to select in the neighborhood of Itang, on the Baro River, a block of territory having a river frontage of not more than 2000 metres, in area not exceeding 400 hectares, which shall be leased to the Government of the Soudan, to be administered and occupied as a commercial station, so long as the Soudan is under the Anglo-Egyptian Government. It is agreed between the two high contracting parties that the territory so leased shall not be used for any political or military purpose. ARTICLE V. The Emperor Menelek grants his Britannic Majesty's Government and the Government of the Soudan the right to construct a railway through Abyssinian territory to connect the Soudan with Uganda. A route for the railway will be selected by mutual agreement between the two high contracting parties."

1906.—Agreement guaranteeing Abyssinia's integrity.—In December, 1906, Great Britain, France and Italy agreed by treaty to respect and

preserve the independence and territorial integrity of Abyssinia. The three Powers specifically undertook to secure no industrial concessions which would injure the other Powers and not to interfere in the internal affairs of the country. It was further agreed that no one of these Powers was to attempt independently to strengthen its position in the territories bordering Abyssinia, but they were to act together in promoting the construction of railways and telegraph lines, and the development of trade for their common benefit.

1907-1920.—Menelek's reforms.—Political institutions and government.—Internal development.—In 1907, Menelek issued a decree constituting a cabinet on the European model, and appointed ministers for the various departments. Politically Abyssinia has been and still is, a backward state with what may be called feudal institutions. The negus [king or emperor] has a sort of a Council of State to advise the crown and keep a watch over the governors and other administrative officials of the provinces and their

but small quantities. A wild coffee plant thrives in the forests and is the chief export. Cattle, sheep, goats and particularly mules are numerous. Manufacturing industry is, however, in a backward state, for Abyssinia has not yet made the most of her abundant resources in trees, rubber, iron and coal as well as numerous other mineral products. Means of transportation are also poor. Roads are mere tracks across sandy wastes and transportation is mainly by mules, pack-horses, donkeys and in some places, camels. There is, however, a railway from the port of Jibuti in French Somaliland to Diré Dawa in the south-eastern part of Abyssinia. Some time ago a company undertook to extend the line to Adis Ababa. This undertaking was completed in 1917 when the line reached the capital. In consequence of the rapid development of transportation, business methods are being modernized to some extent. At Adis Ababa is located the bank of Abyssinia with an authorized capital of \$2,500,000 and a paid up capital of \$625,000. The bank is controlled, how-

ABYSSINIAN COUNCILLORS IN CEREMONIAL ROBES

subdivisions. It was not till July, 1908, that a cabinet or Council of Ministers was actually organized, the various state departments being similar to those of civilized nations. The legal system of the country has its basis in the Code of Justinian but the relationship is scarcely recognizable. The Emperor is the fountain of justice and is the final court of appeal. In the same year (1907) Menelek also enjoined free compulsory education for all boys up to twelve; but the decree could not be very widely and effectively enforced; for in spite of the edict, education in the modern sense is still unpopular. In Adis Ababa there is a school under the direction of Coptic teachers; this, the only Abyssinian school in the country has over one hundred pupils, but attendance is still irregular. The lack of modern educational methods is due not so much to native hostility, as to the rivalry existing between various proselyting religions.

Although most of the land of Abyssinia would probably permit of an extensive agriculture, this industry is, nevertheless, backward, due perhaps to the absence of the idea of landed property. Cotton, sugar-cane, and date-palm are produced in

ever, from Cairo; there its governing body sits, and the governor of the National Bank of Egypt is its president. A new coinage has recently been put in circulation with the Menelek dollar as the standard coin. Outside the immediate radius of foreign influence, exchange is still very primitive, various articles, such as bars of salt, cartridges, etc., being used as barter. This in turn is but one indication of the primitive customs which prevail in many backward regions.

1913-1920.—Anarchy following the death of Menelek.—Revolution of 1916.—Reign of Empress Zauditu.—"Just at the time of his ambitious projects, Menelik had a stroke, and he gradually became paralyzed. Frequent to the point of becoming a joke were the newspaper reports, generally from Italy, during the period of 1907 to 1913, announcing the death of Menelik. Each time they were contradicted, and when he finally passed away in December, 1913, many newspapers refused to publish once more the familiar biography. Menelik's long illness was a great misfortune to Abyssinia, and it is still too soon to estimate the injury done, by the anarchy of the regency, to the Kingdom surrounded by land-

hungry neighbors. In 1900, Lidj Yeassu, Menelek's grandson, who was thirteen, and the husband of the seven-year-old Princess Romanie, granddaughter of the old Emperor Johannes, was chosen as the successor. He, by his own blood and that of his wife, would reconcile the rival factions of the Imperial family. Notwithstanding the heralded harmony, civil war broke out, and dragged on, with varying fortunes, for several years. Italy feared the breaking away from authority of the tribes on her Eritrean frontier, especially after the Tripolitan War began [1911], and there was some apprehension of raiding in the Sudan. The anarchy caused no particular difference in the Somaliland situation, because Great Britain already had her hands full there, and the responsibility for the Mullah could in no way be chargeable to Abyssinian unrest. The troubles in Abyssinia seem to have been confined to the rival court factions: for the country as a whole remained quiet throughout the years of Menelek's illness. However, there was apprehension in Adis Abeba just before the outbreak of the European War over the sudden and inexplicable strengthening of Italian forces in Eritrea.—H. A. Gibbons, *New map of Africa*, pp. 102-104.

"The recent [1916] *coup d'état* in Ethiopia, as Abyssinia is properly called, when the Powers acting on their Treaty of 1906 helped the Abyssinian nobles and the people to dethrone their young king and his Turko-Teuton clique, once more calls attention to the remarkable signs of vitality that Mohammedanism is showing in that historically Christian kingdom. It is not the first time that the great aggressive Asiatic religion has precipitated a revolution in Abyssinia; but the persistence with which it has survived oppression, as one strong Ethiopian ruler after another rose at the psychological hour to stamp it out, is merely indicative of the remarkable progress it has made throughout the Darkest Continent as far south as the Zambesi. . . . The late Emperor Menelek of Abyssinia died without an heir to the throne, but before his death he appointed as his successor Prince Lidj Jeassu, the son of one of his daughters. The young king had reigned three years when it became apparent that his father, a powerful chief, Negus Mikael, was a fanatical Moslem, and was coöperating with the Turko-Teuton emissaries in a Pan-Islamic movement. Not only was this conspiracy planning to deliver Abyssinia to Islam and secure its entrance into the war on the side of the Central Powers, but Abyssinia was being made a center for plots against the Islamic colonies of the French, Italians and British in the adjacent territories of Somaliland, Eritrea, British East Africa and the Sudan. The young ruler had become a Moslem, and was a pliant tool in the hands of the Central Powers and Turkey. The Allies accordingly took the part of the Christian Abyssinians. In the revolution that followed, 1916, Lidj Jeassu was deposed [Sept. 27], his Moslem father, Negus Mikael, was defeated by the Abyssinian army after a temporary success, and on February 11, the new Queen [Empress Waizeru Zauditu, another daughter of Menelek], was crowned at the capital Adis Abeba, a not unprecedented event—Abyssinia already having known one able queen in her history, while her rulers trace the royal lineage back to the Queen of Sheba and Solomon.

"But missionaries and travelers have unanimously testified to the great inroads that Mohammedanism has made in this historically Christian country. Whole tribes professing Islam may be

found today still retaining their Christian Ethiopian names. All northern Abyssinia will soon be unitedly Moslem, and the encroachments are continuing in various parts of the kingdom. The reasons for this growth are to be found in the lax and superstitious brand of Christianity of modern Ethiopia. A strong Christian ruler, in the spirit and mould of the late Menelek, may yet appear to save the country and its faith, which dates back to the fourth century when Athanasius of Alexandria was installed the first Bishop of Ethiopia. In Abyssinia the Powers have a sentimental interest, as an ancient outpost of Christianity in the Dark Continent, and its political integrity was guaranteed in the Treaty of 1906 with Menelek, by Great Britain, Italy and France, whose colonies are adjacent. Despite the fact that Menelek frequently thrashed the Italians when they encroached on his territory, yet he and the previous rulers of Ethiopia have cherished their bond of Christianity with Europe, and have favored western civilization. When the British stormed Magdala, the fortress of King Theodore, in 1868, to release British prisoners, and found the king a suicide, according to his wishes they took his eighteen-year-old heir to be educated in England. The boy was sent to Rugby school, but died shortly after. At Queen Victoria's request the body of the Ethiopian prince was buried in St. George's, the Chapel-Royal at Windsor. The Moslem evangelist has always been attracted to this historically Christian country of Abyssinia, not only because of its proximity to Mecca and the land that cradled the Founder and his Faith, but because of the early intimate associations between the Christian kingdom and Mohammed. In the sixth century the Abyssinians invaded Arabia, captured the rich province of Yemen, which alone gives to desert Arabia the paradoxical title of Arabia Felix, and for fifty years controlled the important land and sea routes East and West. It was the rise of Mohammed and his new faith in the seventh century that put an end to the power of Abyssinia, and which, from that time down to the sixteenth century, when the King asked aid of the Portuguese, effectually isolated this lone Christian country in the Dark Continent from the rest of the world. When Mohammed began his career, northern Arabia held Christian colonies due to the influence of Byzantium, and at the same time in the south, neighboring to Mecca, there were Syrian and Ethiopian Christians. . . . The Prophet, during the persecution of his new faith at the hands of the pagan Meccans, at the suggestion of an Abyssinian disciple found a haven for his followers in Abyssinia. Mohammed sent a delegation under his famous general, 'Amr ibn al-Ass, later conqueror of Egypt, to the Christian kingdom asking refuge and support, which the Ethiopian king readily gave. Unfortunately there are no Abyssinian records surviving to show how intimate this relationship was; but when Mohammed, at the height of his power, sent letters to the kings of the earth calling on them to accept his new creed, one was sent to Byzantium and another to Ethiopia. By the end of the twelfth century an Arab dynasty had won the coast lands, and with the fifteenth century began that long contest between Islam and Christianity which lasted to the recent revolution and dethronement of Menelek's grandson, and which has swept inwards to include the pagan tribes of the great Dark Continent. . . . While Moslems are now alarmed at the obvious signs of disintegration elsewhere, they must view

with satisfaction the comparatively robust condition of the Faith in Africa, where it is progressing with something of the old traditions that once prevailed when it swept into the fold in early times the pagan tribes of Arabia. The failure of the proclamation of the famous *jihād*, or holy war, in the Mohammedan world, and the secession of important Arab states like the Hejaz and Koweit whose chiefs and *imams* are renouncing allegiance to the Sultan of Turkey as Caliph, thus precipitating the all-important question of the Caliphate, have brought this historic Asiatic religion to a critical point in its great career. . . . Will Islam so change its fundamental traditionalism to suit the needs of its twentieth century adherents, and save itself from the disintegration with which political and economic conditions now threaten it? Since the Turkish Caliph has deliberately used the Faith as a catspaw for Germany, a *kafir*, or unbeliever nation, and since the purity of the Young Turk brand of Mohammedanism has long been suspect in the fanatical world of Islam, it is evident that the loyal supporters of Islam have at last realised that the future of the Faith is in jeopardy. But while there is a crying need for reorganization in enlightened communities like the Moslem worlds of India and Egypt, yet, true to its medieval energy, it has made enormous gains in Africa during these last few decades of apparent stagnation, extending from pseudo-Christian Abyssinia to the pagan tribes north of Zambesi. . . . It is not strange, therefore, that the Turko-Teuton régime seized upon the Moslem idea of *jihād* as a vehicle for galvanizing the warlike spirit of Islam. It failed for two reasons: *psychologically*, because they forgot to what degree economic conditions throughout the East have modified the old fanatical cohesions of Islam. In India and China, in the Dutch East and in French Africa, Moslems have come to recognize the advantages accruing under a stable and just rule of centralized European government. The annual pilgrimage to Mecca cannot have failed to impress the multitudes with the system of petty graft and tyranny, of over-taxation and economic stagnation, that has always characterized the greatest Islamic state, and the rule of their nominal Caliph, the Sultan of Turkey. Moslems were averse to losing these advantages for a shadowy substitute promised by a Pan-Islamic empire. The Turko-Teuton régime failed *dogmatically*, because every intelligent Moslem knows that the express purpose of a *jihād*, or holy war, in Islamic polity, is to free their co-religionists in duress. While Moslems had long been oppressed by the Turkish Caliph, their co-religionists under British, Dutch, French and Russian rule had made no appeal against the tyranny of their respective suzerains. Moreover, a *jihād* must be led by the Caliph; many schismatics in Arabia and Africa (the Senusseï were antagonistic until bribed by Enver Pasha), and the sultans of Morocco, have variously disputed the claim of the Turkish Sultan to the Caliphate. As a result the spectacle was furnished Islam of British, French, Belgian, and Russian Moslem troops fighting loyally under their respective flags. Finally, Islamic law expressly forbids the waging of a *jihād* against co-members of the Faith. It is this pragmatic and economic aspect of modern Islam that is now concerning its leaders and thinkers. The war with its racial confusion has merely accentuated the need for a widespread reform, at least so far as Asia is involved.—W. G. Tinckom-Fernandez, *Asia in Africa* (*Asia*, Nov., 1917).—See also AFRICA: Mod-

ern European occupation; 1914: Moslem occupation.

ABYSSINIAN CHURCH.—Christianity, according to the chronicle of Axum, was first introduced into Abyssinia by Frumentius in the fourth century. [See ABYSSINIA: 4th century.] The Abyssinians, refusing the decrees of the Council of Chalcedon (451), remained monophysites. Their close bond with the Coptic church of Egypt, which had been maintained from the beginning, was not affected by the Arab conquest. Further than this, little is known of their ecclesiastical history until that eastern bond was broken by the period of the Jesuit rule (about 1500 to 1633). In the sixteenth century, the Roman Catholic church attempted to establish sway over the Abyssinian church through the missionary work of Portugal, whose interest lay, not in religion, but in trade routes through the Red Sea to India. The rule of the western church was formally recognized by the king in 1604, but in 1633 the king was murdered, the Jesuits expelled, and allegiance once more given to Alexandria [see also ABYSSINIA; 6th-16th centuries]. The Abyssinian church agrees, in general, with the Coptic in matters of dogma. Though graven images are forbidden, saints and angels are held in great reverence. The clergy must marry once, but only once; and their power is greatly increased by the strict enforcement of confession and absolution. Pilgrimage to Jerusalem constitutes atonement for many sins "This ancient, strange and barbaric church has the true Semitic instinct of regarding God as Majesty rather than as Love This explains its monophysite tendency which almost completely swallows up Christ's humanity. . . . The church has now but one bishop, the Abuna, always sent from Alexandria or Cairo. [He is always a Copt, but his influence is controlled by the Echegeheh, a native ecclesiastical dignitary, who presides over the spirituality, numbering about 100,000 ecclesiastics.] The abbots also, as in the Roman church, have great authority. The cloisters are the principal seats of education which is chiefly scholastic and cultivates wonderful dialectical keenness. The parochial clergy often know little except how to repeat the liturgy [in Geez] now obsolete in language. The worship is a rude copy of that of the Greek church. Saints and above all the Virgin are plentifully invoked Transubstantiation, however, is unknown. Ordination is so carelessly performed that Rome has some hesitation in acknowledging it. Popular morals are very corrupt and barbarous and the priesthood is not a mirror of virtue although it enjoys very profound respect among the people."—B. E. Pastor, *Christianity in Abyssinia* (*Missionary Review of the World*, April, 1902).

ACADAMUS. See ACADEMY.

ACADEMIC FREEDOM.—"The question of freedom of instruction—*Lehrfreiheit*—is at bottom a question as to the relation of institutions of

education to other institutions with which they have to do. It is to be noted that educational establishments have for the most part been set up at first to serve other than purely educational purposes. The training which they have offered has been regarded as a means to some end beyond itself; and this ultimate end has been found embodied in some other institution, to which the school has been made tributary. Each of the great capital institutions of human society may be regarded as having an educational aspect. This is true of the family, of the Church, of civil government, of industrial societies. And it is a fact of no small significance that an appreciation of the need and value of education has commonly arisen in connection with one or another of these institutions. The ideas which they severally embody are the ideas which have been uppermost in the educational systems which they have severally fostered. . . . It has been commonly noted that public education in Europe during the Middle Age was carried on almost exclusively by the Church. Leaving out of account the system of apprenticeship fostered by the trade guilds and the training for the profession of arms which arose with chivalry, this is a fair statement of the case. The higher spiritual interests of the mediæval peoples were represented in the Church. She embraced, as Geffcken has remarked, 'many spheres of life which as yet were incapable of independent development: she united in her bosom those elements of spiritual culture which were destined to occupy in the future each a distinct and prominent position. Her schools were the sole avenues to knowledge.' It should be added that the schools found their place, as a matter of course, in the general administrative system of the Church, and were accordingly in the main under episcopal control. By the twelfth century, education had come into sufficient prominence to receive special recognition in the episcopal system. Under the bishop, the supervision of the schools was exercised sometimes by the chancellor, sometimes by the precentor, and sometimes by a dignitary designated for that particular service, and variously known as *magister scholarum*, *scholasticus*, or *scholaster*. It became the prerogative of this official to license teachers who sought to open schools within his jurisdiction. This may have been at first a mere means of preserving his monopoly of education. But in 1179 the Third Council of Lateran decreed that the license should issue to every qualified applicant, and that without the exaction of a fee. . . . While there appear occasional signs of real academic independence, the mediæval universities were in the main faithful subjects of the Church of Rome. And when they sided with the civil as against the ecclesiastical authorities, their course was so often marked with extreme servility that it can call forth but little whole-souled commendation. The first freshness of intellectual life which marked their beginnings soon gave way to a dreary and spiritless following of their own traditions. A deeper and more pervasive interest in education appeared with the Revival of Learning. . . . It is charged by Catholic writers that the main educational outcome of the Protestant movement was the control of education by the state. There is a large measure of truth in this charge. Yet it is not to be supposed that modern school systems came at once into being upon the claque of the states of northern Europe from the Catholic to the Protestant faith. The new organization grew out of the old. . . . The relations of church and state in Prussia during the nineteenth century have been full of

interest; and they have reacted powerfully upon the educational system. It was, in fact, a question relating to the schools which precipitated the *Kulturkampf* in the early seventies; and one of the most notable results of that struggle was the assumption by the state of the local supervision of the schools, which up to that time had been a recognized prerogative of the church authorities. . . . By the code of 1794, the teachers in the gymnasiums and higher schools were declared to be officers of the state. In the higher institutions, and particularly in the universities, the eighteenth century had seen the upgrowth of a demand that instructors should be free to teach what they conceived to be the truth, without interference from the authorities. Under Frederick William I, this freedom was ruthlessly invaded, on grounds that were fully as much ecclesiastical as political. Frederick the Great would hear nothing of such interference, at least so far as questions of religious controversy were concerned. Under succeeding reigns the universities were by no means secure from interference on political grounds. The ardent participation in political movements on the part of university professors and students during the first half of the present century brought the question of academic freedom sharply to the front. If the universities were to be freed from ecclesiastical supervision only to be brought under a kind of bondage to the government the real extent of their gain was problematical. When at last, in 1850, the long-sought-for written constitution was secured, it contained the liberal provision that 'Science and the teaching of science are free.' This was not the end of controversy; but it marked one of the great educational gains of the nineteenth century. . . . As Lutheran Prussia led the nations of Europe in the matter of state provision for public education, so Calvinistic Massachusetts was the leader of our American commonwealths. Under the quasi-theocracy of early colonial times, the people proceeded zealously in the establishment of educational institutions under public patronage and control. The General Court of the Colony appropriated moneys for the founding of a college. A little later, each town in the Colony having sufficient population was required by law to establish an elementary school; and with a somewhat larger population, a Latin school capable of preparing students for the university. The purpose of these provisions was to circumvent the devices of Satan and to prevent learning from being 'buried in the graves of our forefathers.' During the seventeenth century these provisions were rigorously enforced. The eighteenth saw considerable relaxation of this strenuousness. . . . But New England democracy survived the decay of its ecclesiastical sponsors. And the doctrine that public education of secondary as well as of elementary grade should be carried on under public control and with public support passed over to the modern state, when the theocracy which had nourished it was dead and gone."—E. E. Brown, *Academic freedom* (*Educational Review*, Mar., 1900), pp. 200-218.

"The ecclesiastical and educational history of England has been far different. . . . The episcopal control of English education was continued after the Tudor Reformation, and was expressly confirmed by the Canons of 1604. For a century and a half the Church of England claimed a monopoly of public education on the basis of these canons, and of the immemorial usage which they confirmed. The Act of Uniformity, of 1662, disallowed all orders save those conferred by bishops.

The same act required schoolmasters as well as clergymen to subscribe not only to a declaration of their assent to the prayer-book, but also to a pledge that they would seek to make no change in church or state. Under this act, some of the most learned men at both universities were driven from their posts; and instruction throughout England was made absolutely subservient to the Established Church. . . . The example of the Roman Empire had shown that education was a possible field for state agency. The long history of ecclesiastical control down to the time of the Reformation greatly obscured this fact. Many sincerely believed that schools could be managed and maintained only by the church. If men had not come to serious theological differences, the mediæval system would probably have continued to the present time. . . . Some of the most significant contributions to modern thought on the institutional relations of education were made by French writers of the latter half of the eighteenth century. When we remember the influence which France exercised over German thought at that period, we are ready to look for French elements even in the remarkable development of academic freedom in the Prussian universities under the leadership of Halle. The trend of French thought at the time takes two noteworthy directions. On the one hand, a vigorous group of writers called for education by the state for the purposes of the state. One of the most influential of these was La Chalotais. Protesting against a too exclusively ecclesiastical training, he declared, 'I dare claim for the nation an education which depends only on the state, because it belongs essentially to the state; because every state has an inalienable and indefeasible right to instruct its members; because, finally, the children of the state ought to be educated by the members of the state.' Voltaire called education a 'government undertaking.' . . . The contention of these writers seems to be, in substance, that education shall change its ecclesiastical master for a governmental master. The other direction is represented by Rousseau and his followers. Here appears the demand that early education shall be cut off from all connection with institutional life. It is to be universal, in that the ends which it seeks are to be such as will be of equal value to Christian, Jew, and pagan, and to those of any nation and any occupation in life. Here we have a universalism more abstract than any that the Renaissance produced. Children are to be brought up not even for participation in the ideal life of ancient Greece and Rome, nor for citizenship in a supramundane Kingdom of Heaven; but rather for ideal perfection as individuals. Education, according to this scheme, is not to change masters, but rather to free itself from masters altogether. It is to become free by cutting itself loose, in some quixotic manner, from all connection with any other institution whatsoever. . . . Freedom of instruction, in the proper sense of the words, implies instruction which puts the learner in possession of universal standards of excellence, or at least of standards as nearly universal as he can at any given stage of his development really make his own; but which also puts him in the way of employing these standards in the discharge of the duties of real life. Something like this seems to be implied in the demand that educational questions shall be determined solely on educational grounds; and in that demand is briefly summed up the whole question of academic freedom. It will be observed that in this discussion the case of the lower schools has been considered

along with that of the higher, as if the question of freedom of instruction affected them all alike. This has been done advisedly, in the belief that education is one concern from the lowest grades to the highest. A state which undertakes to determine the questions of higher education on purely educational grounds, while it determines questions relating to primary schools on narrowly governmental grounds, is preparing the different classes of its people to misunderstand one another. Such a condition can only promote a 'severance for the time between the thinking classes and the general bulk of the nation'—to use a happy expression of Mr. John Richard Green's. It can hardly continue permanently in any modern society. . . . The first half-century of our own Republic saw the beginnings of a remarkable movement toward public control of education in all of its grades. Particularly in secondary and higher instruction the change of sentiment within that period was highly significant. At the outset, institutions of learning were very generally controlled by self-perpetuating boards of trustees, acting under charters granted or confirmed by the several States. Not infrequently state aid was granted in considerable amounts to these institutions and no condition of state control was added to such grants. For a time such institutions increased rapidly in numbers. Finally there arose an insistent demand that institutions of learning be under public direction and control; a demand which found expression in the Dartmouth College case, in the establishment of the University of Virginia, and in the beginnings of the high-school movement. For the past three-quarters of a century, we have seen schools of secondary and higher education growing up under systems of public administration, alongside of other schools which, however public in other respects, are under one form or another of private control. . . . The demand for public control, as it appeared in the early part of this century, was in part a protest against ecclesiastical influence; but it was perhaps quite as much an expression of the purpose to make public schools directly responsible to the public to which they ministered. But, as we have seen, an increase of responsibility is an approach toward real freedom; it being impossible that an irresponsible institution, if such a thing exists, should be really free. . . . On the whole it seems fair to say that the movement toward public control in this country as in others is a step in the direction of academic freedom—of academic freedom which is one with academic responsibility. The importance of this movement to our national life can hardly be overestimated. But schools and universities under private control cannot be dispensed with. If such did not exist, the public welfare would demand their establishment; for times will inevitably appear in our national life when the immediate pressure of governmental control will unduly restrain our State institutions. Nor can we suppose that the schools of the churches, where these exist, will not have their call, now and again, to take up the theme and speak some free word of instruction which other institutions at the time fail to utter. John Stuart Mill was clearly justified in the contention that there should be no monopoly in education, whether of the government, of the clergy, or of philosophers. This question of academic freedom is intimately bound up with the question of freedom of the press, of the sciences, of the arts. In our university organization of the future, these several interests may be found more and more incorporated in the system of educational administration. Here we find some

of the highest concerns of the state which cannot be compressed into mere governments in a kind of independence which makes possible the best sort of co-operation. . . . After all is said and done, academic freedom cannot be expressed in formulas nor secured by mere systems of administration. It belongs to men who deserve it for pre-eminent worth and command it by the courage of well-reasoned conviction. No sort of freedom is worth having which can be marked out by fixed lines or maintained by inferior men without a struggle. It is a part of the mission of educational institutions to take their place and play their part in the conflicts which are necessary to the life of the peoples; and when their part assumes the form of a struggle for the right to teach the truth as they find it, the conflict itself may prove their best means of persuading men that truth is worth fighting for."—E. E. Brown, *Academic freedom* (*Educational Review*, Mar., 1900, pp. 219-231).

"The term 'academic freedom' has traditionally had two applications—to the freedom of the teacher and to that of the student. It need scarcely be pointed out that the freedom which is the subject of this report is that of the teacher. Academic freedom in this sense comprises three elements: freedom of inquiry and research; freedom of teaching within the university or college; and freedom of extra-mural utterance and action. The first of these is almost everywhere so safeguarded that the dangers of its infringement are slight. It may therefore be disregarded in this report. The second and third phases of academic freedom are closely related, and are often not distinguished. The third, however, has an importance of its own, since of late it has perhaps more frequently been the occasion of difficulties and controversies than has the question of freedom of intra-academic teaching. All five of the cases which have recently been investigated by committees of this Association have involved, at least as one factor, the right of university teachers to express their opinions freely outside the university or to engage in political activities in their capacity as citizens. . . . The simplest case is that of a proprietary school or college designed for the propagation of specific doctrines prescribed by those who have furnished its endowment. It is evident that in such cases the trustees are bound by the deed of gift, and, whatever be their own views, are obligated to carry out the terms of the trust. . . . Their purpose is not to advance knowledge by the unrestricted research and unfettered discussion of impartial investigators, but rather to subsidize the promotion of the opinions held by the persons, usually not of the scholar's calling, who provide the funds for their maintenance. Leaving aside, then, the small number of institutions of the proprietary type, what is the nature of the trust reposed in the governing boards of the ordinary institutions of learning? . . . They cannot be permitted to assume the proprietary attitude and privilege, if they are appealing to the general public for support. Trustees of such universities or colleges have no moral right to bind the reason or the conscience of any professor. All claim to such right is waived by the appeal to the general public for contributions and for moral support in the maintenance, not of a propaganda, but of a non-partisan institution of learning. . . . The function [of professors] is to deal at first hand, after prolonged and specialized technical training, with the sources of knowledge; and to impart the results of their own and of their fellow-specialists' investigations and reflection, both to students and to the

general public, without fear or favor. The proper discharge of this function requires (among other things) that the university teacher shall be exempt from any pecuniary motive or inducement to hold, or to express, any conclusion which is not the genuine and uncolored product of his own study or that of fellow-specialists. . . .

"The importance of academic freedom is most clearly perceived in the light of the purposes for which universities exist. These are three in number: (A) To promote inquiry and advance the sum of human knowledge. (B) To provide general instruction to the students. (C) To develop experts for various branches of the public service. Let us consider each of these. In the earlier stages of a nation's intellectual development, the chief concern of educational institutions is to train the growing generation and to diffuse the already accepted knowledge. It is only slowly that there comes to be provided in the highest institutions of learning the opportunity for the gradual wresting from nature of her intimate secrets. The modern university is becoming more and more the home of scientific research. There are three fields of human inquiry in which the race is only at the beginning: natural science, social science, and philosophy and religion, dealing with the relations of man to outer nature, to his fellow men, and to the ultimate realities and values. The second function—which for a long time was the only function—of the American college or university is to provide instruction for students. It is scarcely open to question that freedom of utterance is as important to the teacher as it is to the investigator. No man can be a successful teacher unless he enjoys the respect of his students, and their confidence in his intellectual integrity. It is clear, however, that this confidence will be impaired if there is suspicion on the part of the student that the teacher is not expressing himself fully or frankly, or that college and university teachers in general are a repressed and intimidated class who dare not speak with that candor and courage which youth always demands in those whom it is to esteem. . . . The third function of the modern university is to develop experts for the use of the community. If there is one thing that distinguishes the more recent developments of democracy, it is the recognition by legislators of the inherent complexities of economic, social, and political life, and the difficulty of solving problems of technical adjustment without technical knowledge. . . . It is obvious that here again the scholar must be absolutely free not only to pursue his investigations but to declare the results of his researches, no matter where they may lead him or to what extent they may come into conflict with accepted opinion. To be of use to the legislator or the administrator, he must enjoy their complete confidence in the disinterestedness of his conclusions. It is clear, then, that the university cannot perform its threefold function without accepting and enforcing to the fullest extent the principle of academic freedom. The responsibility of the university as a whole is to the community at large, and any restriction upon the freedom of the instructor is bound to react injuriously upon the efficiency and the *morale* of the institution, and therefore ultimately upon the interests of the community.

"The special dangers to freedom of teaching in the domain of the social sciences are evidently two. The one which is the more likely to affect the privately endowed colleges and universities is the danger of restrictions upon the expression of opinions which point towards extensive social in-

novations, or call in question the moral legitimacy or social expediency of economic conditions or commercial practices in which large vested interests are involved. In the political, social, and economic field almost every question, no matter how large and general it at first appears, is more or less affected with private or class interests; and, as the governing body of a university is naturally made up of men who through their standing and ability are personally interested in great private enterprises, the points of possible conflict are numberless. When to this is added the consideration that benefactors, as well as most of the parents who send their children to privately endowed institutions, themselves belong to the more prosperous and therefore usually to the more conservative classes, it is apparent that, so long as effectual safeguards for academic freedom are not established, there is a real danger that pressure from vested interests may, sometimes deliberately and sometimes unconsciously, sometimes openly and sometimes subtly and in obscure ways, be brought to bear upon academic authorities. On the other hand, in our state universities the danger may be the reverse. Where the university is dependent for funds upon legislative favor, it has sometimes happened that the conduct of the institution has been affected by political considerations; and where there is a definite governmental policy or a strong public feeling on economic, social, or political questions, the menace to academic freedom may consist in the repression of opinions that in the particular political situation are deemed ultra-conservative rather than ultra-radical. The essential point, however, is not so much that the opinion is of one or another shade, as that it differs from the views entertained by the authorities. The question resolves itself into one of departure from accepted standards; whether the departure is in the one direction or the other is immaterial. This brings us to the most serious difficulty of this problem; namely, the dangers connected with the existence in a democracy of an overwhelming and concentrated public opinion. The tendency of modern democracy is for men to think alike, feel alike, and to speak alike. . . . In a democracy there is political freedom, but there is likely to be a tyranny of political opinion. An inviolable refuge from such tyranny should be found in the university. . . . It is, in short, not the absolute freedom of utterance of the individual scholar, but the absolute freedom of thought, of inquiry, of discussion and of teaching, of the academic profession, that is asserted by this declaration of principles."—American Association of University Professors, *General report of the committee on academic freedom and academic tenure* (*American Political Science Review*, May, 1916).

Opinion of President Barrows of the University of California.—"Finally, we come to that special freedom to which the term 'academic freedom' is sometimes confined—freedom of teaching and of thought and utterance associated with it. This is undoubtedly the most crucial point of our inquiry. Is a professor in a university, and above all in a state university, to be permitted to express himself without restraint? I am not sure that I represent the unanimous academic view, but as a practical answer I would say, 'yes, once a man is called to be a professor.' The earlier grades of academic advancement are necessarily probationary, but once the professorial status is conferred the scholar can not thereafter successfully be laid under restraint. . . . I appreciate that there are times which are exceptional; when men neither in

a university nor in civil society generally may use their privilege of speech and criticism. War is such a season. . . . War is a highly abnormal experience in which thousands and millions of men, at utmost danger to their lives, forego *all* freedom, surrender *all* liberty to the necessary requirements of military discipline. And this being the situation of the men who fight, some measure of restraint is justifiable over the entire nation, that the army may suffer no increased hazard. And there may also be other crises in a state so acute, so disturbing, so painful to large numbers, as to necessitate a temporary suppression of free utterance, but normally the rule of academic freedom holds. The university is not an open forum. Its platforms are not free to the uninstructed or to those without repute. It is not a place where any sort of doctrine may be expounded by any sort of person. There is a public attitude that sometimes questions the right, particularly of a state university, to exclude any from public utterance in university halls. But just as the permanent members of a university are selected with great care and for reasons of confidence in their knowledge, so those who are invited to speak incidentally or occasionally must be judged with comparable considerations."—D. P. Barrows, *Academic freedom* (*School and Society*, Apr. 17, 1920).

Opinion of President Lowell of Harvard University.—"The teaching by the professor in his class-room on the subjects within the scope of his chair ought to be absolutely free. He must teach the truth as he has found it and sees it. This is the primary condition of academic freedom, and any violation of it endangers intellectual progress. In order to make it secure it is essential that the teaching in the class-room should be confidential. This does not mean that it is secret, but that what is said there should not be published. If the remarks of the instructor were repeated by the pupils in the public press, he would be subjected to constant criticism by people, not familiar with the subject, who misunderstood his teaching; and, what is more important, he would certainly be misquoted, because his remarks would be reported by the student without their context or the qualifications that give them their accuracy. Moreover, if the rule that remarks in the class-room shall not be reported for publication elsewhere is to be maintained, the professor himself must not report them. . . . That does not mean a denial of the right to publish them in a book, or their substance in a learned periodical. On the contrary the object of institutions of learning is not only the acquisition but also the diffusion of knowledge. . . . In troublous times much more serious difficulty, and much more confusion of thought, arises from the other half of our subject, the right of a professor to express his views without restraint on matters lying outside the sphere of his professorship. . . . The fact that a man fills a chair of astronomy, for example, confers on him no special knowledge of, and no peculiar right to speak upon, the protective tariff. His right to speak about a subject on which he is not an authority is simply the right of any other man, and the question is simply whether the university or college by employing him as a professor acquires a right to restrict his freedom as a citizen. . . . On their [the students'] side they have a right not to be compelled to listen to remarks offensive or injurious to them on subjects of which the instructor is not a master,—a right which the teacher is bound to respect. . . . The gravest questions, and the strongest feelings, arise from action by a professor beyond his chosen field

and outside his class-room. Here he speaks only as a citizen. By appointment to a professorship he acquires no rights that he did not possess before; but there is a real difference of opinion to-day on the question whether he loses any rights that he would otherwise enjoy. . . . In the first place, to impose upon the teacher in a university restrictions to which the members of other professions, lawyers, physicians, engineers, and so forth, are not subjected, would produce a sense of irritation and humiliation. In accepting a chair under such conditions a man would surrender a part of his liberty; what he might say would be submitted to the censorship of a board of trustees, and he would cease to be a free citizen. . . . Such a policy would tend seriously to discourage some of the best men from taking up the scholar's life. . . . If a university or college censors what its professors may say, if it restrains them from uttering something that it does not approve, it thereby assumes responsibility for that which it permits them to say. This is logical and inevitable, but it is a responsibility which an institution of learning would be very unwise in assuming. . . . Surely abuse of speech, abuse of authority and arbitrary restraint and friction would be reduced if men kept in mind the distinction between the privilege of academic freedom and the common right of personal liberty as a citizen, between what may properly be said in the class-room and what in public. But it must not be forgotten that all liberty and every privilege implies responsibilities. Professors should speak in public soberly and seriously, not for notoriety or self advertisement, under a deep sense of responsibility for the good name of the institution and the dignity of their profession. They should take care that they are understood to speak personally, not officially. When they so speak, and governing boards respect their freedom to express their sincere opinions as other citizens may do, there will be little danger that liberty of speech will be either misused or curtailed."—A. L. Lowell, *Annual report to the board of overseers, 1916-1917* (*Excerpts as quoted in Harvard Graduates' Magazine, Mar., 1918*).

Opinion of President Hadley of Yale University.—"The problem of the liberty of teaching connects itself with other problems of civil liberty; and all these problems together reach back into past history, and can be properly analyzed only by historical study. Only by placing them all in their proper relations to one another can we understand either the reasons or the limitations of our system of academic freedom as it exists at the present day. To the modern observer liberty in its various manifestations is neither an abstract right to be assumed, as Rousseau would have assumed it, nor a pernicious phantom to be condemned and exorcised, as Carlyle or Ruskin would have condemned it, but an essential element in orderly progress; not without its dangers and not without its limitations, yet justified on the whole because the necessary combination of progress and order can be better secured by a high degree of individual liberty than in any other fashion. . . ."—A. T. Hadley, *Academic freedom in theory and in practice* (*Atlantic Monthly, Feb., 1903, pp. 152-153*).

Opinion of President Butler of Columbia University.—"You will enter here into an atmosphere of complete intellectual freedom. Each member of this university, teacher and taught alike, is under two limitations, and only two, in matters of speech and of conduct. The first of these is the limitation put upon us all by the laws of the land, which are enforced by the properly constituted

authorities. The second is the limitation in speech and in conduct which an American gentleman puts upon himself. . . . The gravest, and indeed the only, university offence that one can commit is to be guilty of conduct unbecoming a gentleman."—N. M. Butler, *from address quoted in New York Sun, Oct. 22, 1917*.

ACADEMIE DES SCIENCES. See ACADEMY OF SCIENCES.

ACADEMIE FRANÇAISE. See ACADEMY, FRENCH.

ACADEMIES, International Union of. See INTERNATIONAL UNION OF ACADEMIES.

ACADEMY, takes its name from the "Academia" on the Cephissus, a sacred precinct of Athens, which spot probably belonged to Acadamus, a hero of Atticus. In time it became a public park; later, a gymnasium was built here where Plato held his first lectures in philosophy. The masters of the great schools of philosophy at Athens "chose for their lectures and discussions the public buildings which were called gymnasia, of which there were several in different quarters of the city. They could only use them by the sufferance of the State, which had built them chiefly for bodily exercises and athletic feats. . . . Before long several of the schools drew themselves apart in special buildings, and even took their most familiar names, such as the Lyceum and the Academy, from the gymnasia in which they made themselves at home. Gradually we find the traces of some material provisions, which helped to define and to perpetuate the different sects. Plato had a little garden, close by the sacred Eleusinian Way, in the shady groves of the Academy. . . . Aristotle, as we know, in later life had taught in the Lyceum, in the rich grounds near the Ilissus."—W. W. Capes, *University life in ancient Athens, pp. 31-33*.—Academy in its modern sense, is a corporation or society organized to encourage the disinterested pursuit of art or science, or both. It is now used to refer to learned organizations of all kinds. It is usually endowed by the state or otherwise publicly recognized. A list of the more important academies, with the date of founding is appended: Académie française (1629-1635); Académie des inscriptions et belles-lettres or "Petite académie" (1663); Académie des sciences (1666); Académie des beaux arts (Berne, 1677); Akademie der Wissenschaften zu Berlin (formerly Societas Regia Scientiarum, 1700); Académie Impériale des sciences de Saint-Petersbourg (Imperatorskaya Akademiya nauk, 1725); Royal Academy of Arts (London, 1768); American Academy of Arts and Sciences (1780); National Academy of Design (New York, 1826); National Academy of Sciences (U. S. A., 1863); American Academy in Rome (1865); British Academy (1902). Separate articles on the more important academies will be found under their own headings.—See also EDUCATION: Ancient: B. C. 7th-A. D. 3rd centuries: Greece, Socrates and the philosophical schools; GYMNASIA: Greek.

ACADEMY, American. See AMERICAN ACADEMY IN ROME.

ACADEMY, French.—Founded by Cardinal Richelieu, in 1635, for the refining of the language and the literary taste of France. [See also FRENCH LITERATURE: 1608-1715.] Its forty members are styled "les Quarante Immortels" (the Forty Immortals). Election to a seat among them is a high object of ambition among French writers. The seats are numbered from one to forty, and the records of members are kept under the numbers of their respective chairs.—"The literary movement of the Renaissance ended in Europe about the mid-

dle of the seventeenth century. There appeared no more great writers in Spain, nor in Italy, nor in Germany. France, only, was for a century the country of learning. The writers of that period had a totally different conception of the art of writing from those of the time of the Renaissance. They neither wrote for the learned nor for the common people; they wrote for society; for those whom they called well-bred people, and it was the well-bred company gathered in the salons which decided upon the value of the works. The salons were set up in France during the reign of Louis XIII.; manners and language had been rude at first; the nobles brought with them the customs of the soldier; little by little the ladies brought about a change in the general tone, and introduced the custom of speaking politely, and in choice terms. The Marquise de Rambouillet (q. v.) set the example, by holding in her own mansion regular reunions where questions of literature and morals were discussed. The employment of trivial expressions was forbidden; the ladies called themselves 'Précieuses.' They sought to purify the language, and were aided in their work by the grammarians, and by the Academy. The French language at that time was composed of many words and turns of phrase, which had their origin in the French of the Middle Ages; others had been drawn from the Greek or Latin by the men of the Renaissance. The grammarians and the 'Précieuses' proscribed a great many expressions on account of their coarseness, or their provincialism and many new words taken from the Latin, because they were too pedantic. They endeavored to 'follow good usage,' that is, to employ only such words as were used in the best circles in Paris. 'It is far better,' said Vaugelas, 'to consult the women, and those who have not studied, than to counsel with those who are learned in Greek and Latin.' The French language thus purified, became the language of the court, and of the salon, which every one must speak if one wished to be considered educated, and well-bred. 'One word amiss is sufficient to make one scorned in society.' 'To speak well is one of the forms required by good breeding.' In order to fix rules for the language, Richelieu founded the French Academy; to edit a dictionary of the French language is its especial charge. 'This small band called good society is the flower of the human race,' said Voltaire. 'It is for them that the greatest men have labored.' 'It is the taste of the court that should be studied,' said Molière. 'There is no place where decisions can be more just.' This taste which was imposed on all writers, is called the classic taste. It consists in expressing only ideas that can be easily understood, and expressing them in terms clear, precise, and elegant, setting them forth in perfect order, taking care to employ no popular expression, neither a term of science, trade, or of the household; in one word, sparing the reader everything which may demand an effort of the mind, or which may shock the proprieties. Literature became the art of making fine discourses; it was oratorical rather than poetic. Its dominant quality was perfection."—C. Seignobos, *History of medieval and of modern civilization*, pp. 424-426.—During the revolutionary period the Academy was suspected of monarchical sentiments and accused of constituting an intellectual aristocracy. It was accordingly suppressed August 8, 1793, by a decree of the Convention and incorporated, in 1795, into the Institut National, under the name of "La classe de la langue et littérature françaises." The Restoration replaced the Academy to its original status. The first edition of its *dictionnaire* was

issued in 1694; the sixth edition appeared in 1835, since augmented by supplements and revised. The selection of members for the Academy has long been a matter of bitter controversy. While a goodly number of great names in French history and literature appear on its roll, it is true that many others, equally great, are conspicuous by their absence. Among the more prominent of the latter category may be mentioned Diderot, Rollin, Rousseau, Beaumarchais, Helvétius, Condillac, Benjamin Constant, J. de Maistre, Prudhon, Béranger, Conte, Balzac, Gautier, Stendhal, Flaubert, Daudet, Zola, Flaubert, de Maupassant, etc. None of these became an "immortal." The following are some of the celebrated Frenchmen who held seats in the Academy: Racine (1672); Séguier (1635); Boileau-Despréaux (1684); Voltaire (1746); Corneille (1647); Bougainville (1754); D'Alembert (1754); Cardinal Dubois (1722); Cardinal de Rohan (1704); Bossuet (1671); Montesquieu (1728); Nicolas Bourdon, first occupant of seat No. 1 (1637); Scribe (1834); O. Feuillet (1861); Buffon (1753); Guizot (1836); Hugo (1841); Sainte Beuve (1844); Ampère (1847); De Tocqueville (1841); Lacordaire (père, 1859); Ph. de Ségur (1830); A. Thiers (1833); Merimée (1844); Chateaubriand (1811); Lamartine (1829); Condorcet (1782); Jules Favre (1867); Tissot (1833); A. de Vigny (1845); A. de Musset (1852); Montalembert (1851); Laplace (1810); Cuvier (1818) and Royer-Collard (1827).

1919.—Calling of International conference for union. See under INTERNATIONAL UNION OF ACADEMIES.

The membership of the Academy in 1920 in the order of election with the name of the predecessor in each case, was as follows:

Comte d'Haussonville, Gabriel Paul Othenin de Cléron (Caro)
de Freycinet, Claude Louis de Saulces (Augier, Emile)
Loti-Viaud, Pierre Louis Marie Julien (Feuillet, Octave)
Lavisse, Ernest (de la Gravière, Jurien)
Bourget, Paul (du Camp, Max)
France, Anatole Jacques Thibault (de Lesseps)
Hanotaux, Gabriel (Challemel-Lacour)
Lavedan, Henri (Meilhac, Henry)
Deschanel, Paul Eugène Louis (Hervé, Florimond Rongé)
Masson, Louis Claude Frédéric (Paris)
Bazin, René François Nicolas (Legouve)
Ribot, Alexandre (duc d'Audiffret-Pasquier)
Barrès, Maurice (de Heredia, J. M.)
Donnay, Maurice (Sorel, Albert)
Richepin, Jean (Theuriet, André)
Poincaré, Raymond (Gebhart)
Brieux, Eugène (Halévy)
Aicard, Jean (Coppée, François)
Prévost, Marcel (Sardou, Victorien)
Doumic, René (Boissier)
Mgr. Duchesne, Louis Marie Olivier (Card. Mathieu)
Vte. de Régnier, Henri (Comte de Vogüé)
Baron Cochlin, Henry Denys Benoit Marie (Vandal)
Général Lyantey, Herbert (Houssaye, Henri)
Boutroux, Etienne Emile Marie (Général Langlois)
Capus, Alfred Vincent Marie (Poincaré, H.)
de la Gorce, Pierre (Thureau-Dangin)
Bergson, Henri Louis (Olivier, Emile)
Maréchal Joffre, Joseph Jacques Césaire (Claretie, Jules)
Barthou, Louis (Roujon, Henri)

Mgr. Baudrillart, Henri Marie Alfred (Comte de Mun, Albert)

Boylesve, René (Mézières)

de Curel, François (Hervieu, Paul)

Cambon, Jules (Charmes, Francis)

Clémenceau, Georges (Faguet, Emile)

Maréchal Foch, Ferdinand (Marquis de Vogüé)

Bordeaux, Henry (Lemaître, Jules)

de Flers, Robert (Marquis de Ségur)

Bedier, Joseph (Rostand, Edmond)

Chevillon, André (Lamy, Etienne)

The above list was furnished by courtesy of the French government, in December, 1920.

ACADEMY OF SCIENCES (l'Académie des sciences), an institution founded at Paris in 1666 by Colbert and approved by Louis XIV in 1699; suppressed by the National Convention during the French Revolution and in 1816 reconstituted as a branch of the Institut de France (founded 1795). At first it served as an experimental laboratory and observatory; its purpose is to promote scientific research. It numbers sixty-eight members, ten honorary academicians, eight foreign associates, and one hundred corresponding members.

ACADIA. See CANADA: 1603-1605, 1610-1613, 1692-1697.

Origin of the name. See NOVA SCOTIA: 1604.

Capture of. See U. S. A.: 1690.

Given to Great Britain at Treaty of Utrecht.

See NEWFOUNDLAND, DOMINION OF: 1713.

In Nova Scotia. See NOVA SCOTIA: 1713-1730.

Boundary dispute with England. See NOVA SCOTIA: 1749-1755.

Exile of inhabitants. See NOVA SCOTIA: 1755.

ACANTHUS, a plant found in great abundance in ancient Greece. Because of its attractive form it was reproduced on metals and subsequently carved in stone, particularly by the Greeks. The succeeding styles of architecture employed the design especially in the Corinthian capital.

ACAPULCO, a seaport of Mexico, on the Pacific, in the state of Guerrero, with a very fine landlocked harbor, the chief port of call for steamships plying between San Francisco and South American ports. In the eighteenth century it was the port used for the Philippine trade.—See also MEXICO: 1810-1819.

ACARNANIA, a land in the western part of Greece, south of Epirus (see GREECE: Map of ancient Greece), whose people first emerged from obscurity at the beginning of the Peloponnesian War (431-404 B. C.). The Acarnanians formed "a link of transition" between the ancient Greeks and their barbarous or non-Hellenic neighbours in the Epirus and beyond. "They occupied the territory between the river Achelôús, the Ionian sea and the Ambrakian gulf; they were Greeks and admitted as such to contend at the Pan-Hellenic games, yet they were also closely connected with the Amphilochoi and Agræi, who were not Greeks. In manners, sentiments and intelligence, they were half-Hellenic and half-Epirotic,—like the Ætoliens and the Ozolian Lokrians. Even down to the time of Thucydides, these nations were subdivided into numerous petty communities, lived in unfortified villages, were frequently in the habit of plundering each other, and never permitted themselves to be unarmed. . . . Notwithstanding this state of disunion and insecurity, however, the Akarnanians maintained a loose political league among themselves. . . . The Akarnanians appear to have produced many prophets. They traced up their mythical ancestry, as well as that of their neighbours the Amphilochoians, to the most renowned prophetic family among the Grecian heroes,—Amphiaras, with his

sons Alkmæôn and Ampiloehus: Akarnan, the eponymous hero of the nation, and other eponymous heroes of the separate towns, were supposed to be the sons of Alkmæôn. They are spoken of, together with the Ætoliens, as mere rude shepherds, by the lyric poet Alkman, and so they seem to have continued with little alteration until the beginning of the Peloponnesian war, when we hear of them, for the first time, as allies of Athens and as bitter enemies of the Corinthian colonies on their coast. The contact of those colonies, however, and the large spread of Akarnanian accessible coast, could not fail to produce some effect in socializing and improving the people. And it is probable that this effect would have been more sensibly felt, had not the Akarnanians been kept back by the fatal neighbourhood of the Ætoliens, with whom they were in perpetual feud,—a people the most unprincipled and unimprovable of all who bore the Hellenic name, and whose habitual faithlessness stood in marked contrast with the rectitude and steadfastness of the Akarnanian character."—G. Grote, *History of Greece*, pt. 2, ch. 24.

ACARNANIAN LEAGUE.—"Of the Akarnanian League, formed by one of the least important, but at the same time one of the most estimable peoples in Greece . . . our knowledge is only fragmentary. The boundaries of Akarnania fluctuated, but we always find the people spoken of as a political whole. . . . Thucydides speaks, by implication at least, of the Akarnanian League as an institution of old standing in his time. The Akarnanians had, in early times, occupied the hill of Olpai as a place for judicial proceedings common to the whole nation. Thus the supreme court of the Akarnanian Union held its sittings, not in a town, but in a mountain fortress. But in Thucydides' own time Stratos had attained its position as the greatest city of Akarnania, and probably the federal assemblies were already held there. . . . Of the constitution of the League we know but little. Ambassadors were sent by the federal body, and probably, just as in the Achaian League, it would have been held to be a breach of the federal tie if any single city had entered on diplomatic intercourse with other powers. As in Achaia, too, there stood at the head of the League a General with high authority. . . . The existence of coins bearing the name of the whole Akarnanian nation shows that there was unity enough to admit of a federal coinage, though coins of particular cities also occur."—E. A. Freeman, *History of federal government*, ch. 4, sect. 1.—See also ATHENS: B. C. 336-332.

ACAWOIOS. See CARIBS: Their kindred.

ACCOLADE.—"The concluding sign of being dubbed or adopted into the order of knighthood was a slight blow given by the lord to the cavalier, and called the accolade, from the part of the body, the neck, whereon it was struck. . . . Many writers have imagined that the accolade was the last blow which the soldier might receive with impunity: but this interpretation is not correct, for the squire was as jealous of his honour as the knight. The origin of the accolade it is impossible to trace, but it was clearly considered symbolical of the religious and moral duties of knighthood, and was the only ceremony used when knights were made in places (the field of battle, for instance), where time and circumstances did not allow of many ceremonies."—C. Mills, *History of chivalry*, v. 1, p. 53, and foot-note.

ACCRETION, Title of. See RIPARIAN RIGHTS.

ACE OF DIAMONDS, U. S. A. Division.—In Meuse-Argonne. See WORLD WAR: 1918: II. Western front, v. 7.

ACES, a term applied in the World War to aviators who had brought down in combat, five or more enemy aircraft under conditions enabling official recognition and sanction of the accomplishment to be made. The following list contains only the leading aces of the belligerent nations.

Nation	Pilot	No. of Aircraft Destroyed
French	Lieutenant René Fonck	59
"	Captain Georges Guynemer	53
"	Lieutenant Charles Nungesser	38
"	Lieutenant Georges Madon	38
British	Major Raymond Colleschau	77
"	Captain William A. Bishop	72
"	Major E. Mannock	71
"	Captain J. McCudden	58
"	Captain Donald E. McLaren	48
"	Captain Philip F. Fullard	48
"	Captain R. A. Little	47
"	Captain G. E. H. McElroy	46
"	Captain Albert Ball	43
"	Captain H. W. Wallat	43
"	Captain L. Jones	40
"	Captain A. W. B. Proctor	39
"	Major Roderic S. Dallas	39
"	Captain W. G. Claxton	37
"	Captain F. R. McCall	34
"	Captain Frank G. Quigley	34
"	Major Albert D. Carter	31
"	Captain Cedric E. Howell	30
"	Captain A. E. McKeever	30
Italian	Major Baracca	36
"	Lieutenant Florio Barachini	31
Belgian	Lieutenant Coppes	30
German	Captain von Richthofen	80
"	Lieutenant Udet	69
"	Lieutenant Lowenhardt	53
"	Lieutenant von Crefeld	49
"	Captain Boelke	40
"	Lieutenant Gontermann	39
"	Captain Berthold	39
"	Lieutenant Max Müller	38
"	Lieutenant Bongartz	36

German	Lieutenant Max Buckler	34
"	Lieutenant Menckhoff	34
"	Lieutenant Loerzer	33
"	Lieutenant Carl Wolff	33
"	Lieutenant Klein	33
"	Lieutenant Roenneke	32
"	Lieutenant Bolle	31
"	Lieutenant Kroll	31
"	Corporal Rumej	30
"	Lieutenant Schleich	30
"	Lieutenant Schaeffer	30
"	Lieutenant Almenroeder	30

The American aces who brought down at least ten enemy aircraft are:

Captain E. V. Rickenbacker	25
Lieutenant Frank Luke	18
Major Raoul Lufberry	17
Lieutenant G. Vaughn	13
Lieutenant F. Kindley	12
Lieutenant D. Putnam	12
Lieutenant E. Springs	11
Lieutenant Reed Landis	10
Lieutenant J. M. Schwaab	10

ACHÆA.—"Crossing the river Larissus, and pursuing the northern coast of Peloponnesus south of the Corinthian Gulf, the traveller would pass into Achaia—a name which designated the narrow strip of level land, and the projecting spurs and declivities between that gulf and the northernmost mountains of the peninsula. . . . Achæan cities—twelve in number at least, if not more—divided this long strip of land amongst them, from the mouth of the Larissus and the northwestern Cape Araxus on one side, to the western boundary of the Sikyon territory on the other. According to the accounts of the ancient legends and the belief of Herodotus, this territory had been once occupied by Ionian inhabitants, whom the Achæans had expelled."—G. Grote, *History of Greece*, v. 2, pt. 2, ch. 4.—After the Roman conquest (see ROME: B. C. 197-146) and the suppression of the Achæan League, the name Achæa was given to the Roman province then organized, which embraced all Greece south of Macedonia and Epirus.—See GREECE: B. C. 280-146.—"In the Homeric poems, where . . . the 'Hellenes' only appear in one district of Southern Thessaly, the name Achæans is employed by preference as a general appellation for the whole race. But the Achæans we may term, without hesitation, a Pelasgian people, in so far, that is, as we use this name merely as the opposite of the term 'Hellenes,' which prevailed at a later time, although it is true that the Hellenes themselves were nothing more than a particular branch of the Pelasgian stock. . . . [The name of the] Achæans, after it had dropped its earlier and more universal application, was preserved as the special name of a population dwelling in the north of the Peloponnesus and the south of Thessaly."—G. F. Schömann, *Antiquities of Greece: The State, Introd.*—Legend has it that the Achæans were descended from Achæus, son of [I]uthus, who was the son of Hellen. According to Homer and later traditions they came to Greece about 1300 B. C. and soon acquired control of all Greece. "The ancients regarded them [the Achæans] as a branch of the Æolians, with whom they afterwards reunited into one national body, i. e., not as an originally distinct nationality or independent branch of the Greek people. Accordingly, we hear neither of an Achæan language nor of Achæan art. A manifest and decided influence of the maritime Greeks, wherever the Achæans ap-

pear, is common to the latter with the Æolians. Achæans are everywhere settled on the coast, and are always regarded as particularly near relations of the Ionians. The Achæans appear scattered about in localities on the coast of the Ægean so remote from one another, that it is impossible to consider all bearing this name as fragments of a people originally united in one social community; nor do they in fact anywhere appear, properly speaking, as a popular body, as the main stock of the population, but rather as eminent families, from which spring heroes; hence the use of the expression 'Sons of the Achæans' to indicate noble descent."—E. Curtius, *History of Greece*, bk. 1, ch. 3.—See also GREECE: Indo-European migrations.

ALSO IN: M. Duncker, *History of Greece*, bk. 1, ch. 2 and bk. 2, ch. 2.

1205-1387.—Medieval principality.—Among the conquests of the French and Lombard Crusaders in Greece, after the taking of Constantinople, was that of a major part of the Peloponnesus—then beginning to be called the Morea—by William de Champlitte, a French knight, assisted by Geoffrey de Villehardouin, the younger—nephew and namesake of the Marshal of Champagne, who was chronicler of the conquest of the Empire of the East. William de Champlitte was invested with this Principality of Achæa (or Morea). Geoffrey Villehardouin represented him in the government, as his "bailly," for a time, and finally succeeded in supplanting him. (See also ATHENS: 1205-1308). Half a century later the Greeks, who had recovered Constantinople, reduced the territory of the Principality of Achæa to about half the peninsula, and a destructive war was waged between the two races. Subsequently the Principality became a fief of the crown of Naples and Sicily, and underwent many changes of possession until the title was in confusion and dispute between the houses of Anjou, Aragon and Savoy. Before it was engulfed finally in the Empire of the Turks, it was ruined by their piracies and ravages.—G. Finlay, *History of Greece from its conquest by the Crusaders*, ch. 8.

ACHÆAN CITIES, League of.—This, which should not be confused with the Achæan League of the Peloponnesus, was a league of early Greek colonists in Italy. They arrived in the eighth century B. C. and built their fortified towns or "cities" of which the most powerful were Sybaris, Croton and Tarentum. The former inhabitants, living side by side with the colonists, adopted the superior culture of the Greeks and the whole of central Italy became known as Magna Græcia. "Of the Greek settlements, that which retained most thoroughly its distinctive character and was least affected by influences from without, was the settlement which gave birth to the League of the Achæan cities, composed of the towns of Siris, Pandosia, Metabus or Metapontum, Sybaris with its offsets Posidonia and Laus, Crotona, Caulonia, Temesa, Terina and Pyxus. . . . The language of Polybius regarding the Achæan symmarchy [alliance] in the Peloponnesus may be applied also to these Italian Achæans; 'not only did they live in federal and friendly communion, but they made use of the same laws, and the same weights, measures and coins, as well as of the same magistrates, councillors and judges.'"—T. Mommsen, *History of Rome*, bk. 1, ch. 10.

ACHÆAN FEDERATION. See FEDERAL GOVERNMENT: Greek federations.

ACHÆAN LEAGUE, in early times a confederation of twelve Achæan cities formed as a protection against the raids of pirates to which, because of their isolated position on the narrow

strips of plain, they were constantly exposed. Of the functions of this early league we have no definite record other than the worship of Zeus Amarios and an occasional arbitration between Greek belligerents. "Under the Macedonian supremacy the league was dissolved; but about the year 280 [B. C.], four cities, Dyme, Patrae, Pharae, and Tritaea, shook off the foreign yoke, and united in a new league. Other city-states were gradually added till 249 [B. C.], when the accession of Sicyon under the leadership of Aratus made the union a power to be reckoned with in international affairs. From that time Aratus was the inspiring genius of the federation. Under his direction it adopted a vigorous policy of freeing all Peloponnesus from the despots and from Macedonian control, and of annexing the individual states by negotiation or force."—(*Polybius* ii. 37 sq.) G. W. Botsford and E. G. Sihler, *Hellenic civilization*, pp. 613-614.—"The object of the union was the maintenance of peace within its borders and protection from foreign enemies. The federal power was limited strictly to this object. It alone made war, peace, and alliances, and managed all diplomatic matters. The army and navy though furnished by the states according to their means, were solely at the command of the federal power. It coined all money, excepting small change, and enforced a uniform system of weights and measures. Aside from these necessary restrictions, the states were sovereign and self-governing. The only requirement was that they should be republics and should remain permanently in the union. They enjoyed full rights of trade and intermarriage with one another; and any state was free to admit to its citizenship the inhabitants of any other. All stood on an absolute political equality. To prevent any one of them from gaining the leadership, it was decided that the cities should serve in turn as the place for holding the federal assembly."—G. W. Botsford, *History of the ancient world*, p. 301.—The central government of the Achæan League, as of the affiliated cities, was based on democratic principles. An assembly of all the members over thirty years of age constituted the chief legislative assembly, which met twice a year to decide the league's future policies and to elect its magistrates. "Nowhere could be found a more unalloyed and deliberately established system of equality and absolute freedom,—in a word, of democracy,—than among the Achæans. This constitution found many of the Peloponnesians ready enough to adopt it of their own accord; many were brought to share it by persuasion and argument: some though acting upon compulsion at first, were quickly brought to acquiesce in its benefits; for none of the original members had any special privilege reserved for them, but equal rights were given to all comers: the object aimed at was therefore quickly attained by the two most unflinching expedients of equality and fraternity. This then must be looked upon as the source and original cause of Peloponnesian unity and consequent prosperity."—G. W. Botsford and E. G. Sihler, *Hellenic civilization*, p. 615.—During the life of the league, however, federal wars were directed against Macedonia (280 B. C.), Ætolia (230-220 B. C.), Sparta (207 B. C., 201 B. C.), and Antiochus (100 B. C.). In 150 B. C. a controversy arose between the Achæan League and Rome. An attack on Sparta by the federal troops provoked war with Rome which soon ended the influence of the league. See MEGALOPOLIS: B. C. 222, 104-183.—See also GREECE: B. C. 280-146.

ACHÆANS. See ACHÆA.

ACHÆMENES. See **ACHÆMENIDS.**

ACHÆMENIDS, the dynastic name (in Greek form) of the kings of the Persian Empire founded by Cyrus, derived from an ancestor, Achæmenes (see **ATHENS:** B.C. 460-455) probably a chief of the Persian tribe of Pasargadaæ. "In the inscription of Behistun, King Darius says: 'From old time we were kings; eight of my family have been kings, I am the ninth; from very ancient times we have been kings.' He enumerates his ancestors: 'My father was Vistacpa, the father of Vistacpa was Arsama; the father of Arsama was Ariyarnna, the father of Ariyarnna was Khaispis, the father of Khaispis was Hakhamanis; hence we are called Hakhamanisiya (Achæmenids).' In these words Darius gives the tree of his own family up to Khaispis; this was the younger branch of the Achæmenids. Teispes, the son of Achæmenes, had two sons; the elder was Cambyses (Kambujiya), the younger Ariamnes; the son of Cambyses was Cyrus (Kurus), the son of Cyrus was Cambyses II. Hence Darius could indeed maintain that eight princes of his family had preceded him; but it was not correct to maintain that they had been kings before him and that he was the ninth king."—M. Duncker, *History of antiquity*, v. 5, bk. 8, ch. 3.

ALSO IN: G. Rawlinson, *Family of the Achæmenids*, app. to bk. 7 of *Herodotus*.

ACHÆUS (484-448 B.C.), a Greek tragic dramatist and poet of Eretria; contemporary of Sophocles and Euripides; author of forty-four dramas, of which only fragments remain.

ACHAIA. See **ΑΧΙΕΑ.**

ACHARNÆ, the principal deme of Attica, directly north of Athens at the foot of Mount Parnes.

ACHELOUS, (mod. Aspropotamo), the largest river in Greece, rises in Epirus and empties into the Ionian sea. This river, which formed the boundary between ancient Acarnania and Ætolia in western Hellas, "by overflowing its delta region, constantly obliterated the boundaries agreed upon by the two neighbors, and thereby gave rise to disputes that were only settled by force of arms."—E. C. Semple, *Influences of geographic environment*, p. 363.—It was doubtless as a personification of this river that the name Achelous appears in mythology as the river-god over whom Hercules won a great victory.

ACHESON, Edward Goodrich (1856-), American inventor; became Edison's assistant in 1880; invented widely used carborundum; discovered artificial graphite which far surpasses the natural; found a process for finely subdividing graphite; responsible for the development of the modern electric furnace, perfecting a more durable graphitized anode to replace the carbon electrodes; invented siloxicon, a compound of carbon, silicon, and oxygen, to meet the requirement for a highly refractory material; was awarded in 1910 the Perkin Medal of the Society of Chemical Industry, for the most valuable work in applied chemistry.

ACHEULIAN INDUSTRY AND IMPLEMENTS. See **EUROPE:** Stone Age, Divisions.

ACHEULIAN MAN. See **EUROPE:** Prehistoric period.

ACHI BABA, a hill 700 feet high, near the southwestern end of the Gallipoli peninsula; the main position of the Turkish defense in the fighting of 1915.

ACHIET-LE-PETIT, France.—Taken by the British (1918). See **WORLD WAR:** 1918: II. Western front, k, 1.

ACHILL ISLAND, a large island off the west

coast of Ireland. Its jagged cliffs and bogs, incapable of cultivation, leave only fishing and an exceedingly scant and difficult farming of oats as a means of livelihood. Its people have remained distinctly Gaelic in language and custom. There are antiquarian remains near Slievemore.

ACHILLES, one of the most famous legendary heroes of ancient Greece, and one of the most prominent leaders in the Trojan War. "The Black sea and the Propontis were the special domain of the sea-god Achilles, whose fame grew greater by his association as a hero with the legend of Troy. He was worshipped along the coasts as 'lord of the Pontus'; and in Leuce, the 'shining island' near the Danube's mouth, the lonely island where no man dwelled, he had a temple, and the birds of the sea were said to be its warders."—J. B. Bury, *History of Greece*, p. 92.

ACHILLINI, Alessandro (1463-1512). See **SCIENCE:** Middle Ages and the Renaissance: 16th century.

ACHIN (Dutch Atjeh), a region formerly an independent sultanate, now a Dutch administrative district in the northwestern extremity of Sumatra. The city of Kotaraja, the old Achinese capital, was once the center of considerable wealth and power and had diplomatic relations with European powers. It was visited by Marco Polo at the end of the thirteenth century and by the Portuguese in 1506. In the first half of the seventeenth century, the sultan of Achin had an extensive empire, including portions of the Malay peninsula. A century later it was but a petty state protected by the British until 1871. Since that time it has been a party to bitter and intermittent wars with the Dutch, and even now (1920) there are portions of the interior not entirely subdued.

Hostilities with the Dutch. See **NETHERLANDS:** 1904.

ACHMET. See **AHMED.**

ACHRADINA, a part of the ancient city of Syracuse, Sicily, known as the "outer city," occupying the peninsula north of Ortygia, the island, which was the "inner city."

ACHRIDA, Kingdom of.—After the death of John Zimisce who had reunited Bulgaria to the Byzantine Empire, the Bulgarians were roused to a struggle for the recovery of their independence, under the lead of four brothers of a noble family, all of whom soon perished save one, named Samuel. Samuel proved to be so vigorous and able a soldier and had so much success that he assumed presently the title of king. His authority was established over the greater part of Bulgaria, and extended into Macedonia, Epirus and Illyria. He established his capital at Achrida (modern Ochrida, in Albania), which gave its name to his kingdom. The suppression of this new Bulgarian monarchy occupied the Byzantine Emperor, Basil II., in wars from 981 until 1018, when its last strongholds, including the city of Achrida, were surrendered to him.—G. Finlay, *History of the Byzantine Empire from 716 to 1057*, bk. 2, ch. 2, sect. 2.

ACILIUS GLABRIO. See **GLABRIO.**

ACKERMAN, Francis (1335-1387), Flemish diplomat and soldier. Took a prominent part in the struggle between the burghers of Ghent and Louis II, count of Flanders; helped to sign the peace treaty between the city of Ghent and Philip the Bold, duke of Burgundy.

ACKERMAN, or Akkerman, Convention of (1826). See **TURKEY:** 1826-1829.

ACOLHUAS. See **MEXICO:** Aboriginal peoples.

ACOLYTH. See **VARANGIANS or WARINGS.**

ACOMA, an Indian pueblo in New Mexico, not

far from Albuquerque. It was visited by Coronado's expedition (1540), by Espejo (1583) and Juan de Oñate (1598). Because of the fidelity with which it has preserved its ancient customs, it has become in recent years one of the chief centers of interest to students of Indian antiquities.

ACRA, Mount of. See JERUSALEM: A. D. 33; see also CHRISTIANITY: Map of Jerusalem.

ACRABA, Battle of (633). See YEMAMA, BATTLE OF.

ACRABATENE, Battle of (B. C. 164). A sanguinary defeat of the Idumeans or Edomites by the Jews under Judas Maccabeus.—Josephus, *Antiquities of the Jews*, bk. 12, ch. 8.

ACRAGAS. See AGRIGENTUM.

ACRE, a city and seaport of Syria, known in antiquity as Ptolemais and in the days of the Crusades as St. Jean d'Acre. Though once regarded as the key to Palestine, it has been supplanted by Haifa to the south. In consequence of its strategic position it has been the scene of many famous sieges. See CRUSADES: Map (after 1204).

1104-1110.—Conquest, pillage and massacre by the Crusaders and Genoese. See CRUSADES: 1104-1111.

1187.—Taken from the Christians by Saladin. See JERUSALEM: 1144-1187.

1189-1191.—Great siege and reconquest by the Crusaders. See CRUSADES: 1188-1192, also Military aspect.

1256-1258.—Quarrels and battles between the Genoese and Venetians. See VENICE: 1256-1258.

1291.—Final triumph of the Moslems. See CRUSADES: Military aspect; JERUSALEM: 1201.

1517.—Taken by Selim I. Captured in his Syrian campaign, it fell rapidly into decay.

18th century.—Restored to importance by Sheik Daher.—"Acre . . . had, by the middle of the 18th century, been almost entirely forsaken, when Sheik Daher, the Arab rebel, restored its commerce and navigation. This able prince, whose sway comprehended the whole of ancient Galilee, was succeeded by the infamous tyrant, Djezzar-Pasha, who fortified Acre, and adorned it with a mosque, enriched with columns of antique marble, collected from all the neighbouring cities."—M. Malte-Brun, *System of universal geography*, v. 1, bk. 28.

1799.—Unsuccessful siege by Napoleon. See FRANCE: 1708-1700 (August-August).

1832.—Siege and capture by Mehemet Ali.—Recovery for the sultan by the western powers. See TURKEY: 1831-1840.

1918.—Capture by British. See WORLD WAR: 1918: VI Turkish theater: c, 13 and c, 19.

ACRÉ DISPUTES.—Claims on the region by Brazil, Peru, and Bolivia.—A considerable territory of much richness in the southwestern part of the Amazon valley, around the upper waters of the Madeira, the Aquiry, and the Purús tributaries, was long in dispute between Brazil, Bolivia, and Peru, and became a cause of serious quarrel between the two first named in 1903. (See LATIN-AMERICA: Map of South America.) The then Brazilian president, Rodriguez Alves, in his first annual message, May, 1903, stated the situation from the Brazilian standpoint as follows:

"Our former relations of such cordial friendship with Bolivia have suffered a not insignificant strain since the time when the Government of that sister Republic, unable to maintain its authority in the Acre region, inhabited exclusively, as you know, by Brazilians who, many years previously, had established themselves there in good faith, saw fit to deliver it over to a foreign syndicate upon whom it conferred powers almost sovereign.

That concession, as dangerous for the neighboring nations as for Bolivia itself, encountered general disapproval in South America. As the most immediately interested, Brazil, already in the time of my illustrious predecessor, protested against the contract to which I refer, and entered upon the policy of reprisals, prohibiting the free transit by the Amazon of merchandise between Bolivia and abroad. Neither that protest nor the counsels of friendship produced at that time the desired effect in La Paz, and, far from rescinding the contract or making the hoped-for modifications therein, the Bolivian Government concluded an especial arrangement for the purpose of hurrying . . . the syndicate into the . . . territory.

"When I assumed the government that was the situation, and in addition the inhabitants of the Acre, who had again proclaimed their independence, were masters of the whole country, excepting Puerto Acre, of which they did not get possession until the end of January. Although since January negotiations have been initiated by us for the purpose of removing amicably the cause of the disorders and complications which have had their seat of action in the Acre ever since the time when for the first time the Bolivian authorities penetrated thither, in 1890, yet the Government of La Paz has nevertheless thought proper that its President and his minister of war should march against that territory at the head of armed forces with the end in view of crushing its inhabitants and then establishing the agents of the syndicate."

The Brazilian president proceeded then to relate that he had notified the Bolivian government of the intention of Brazil to "defend as its boundary the parallel of 10° 20' south," which it held to be the line indicated by the letter and the spirit of a treaty concluded in 1867; and that Bolivia had then agreed to a settlement of the dispute through diplomatic channels. "Upon the Bolivian Government agreeing to this," he continued, "we promptly reestablished freedom of transit for its foreign commerce by Brazilian waters. Shortly after this the syndicate, by reason of the indemnity which we paid it, renounced the concession which had been made it, eliminating thus this disturbing element."

In conclusion of the subject, President Alves reported: "To the Peruvian Government we have announced, very willingly, since January, that we will examine, with attention, the claims which in due time they may be pleased to make upon the subject of the territories now in dispute between Brazil and Bolivia."

The result of the ensuing negotiations between Brazil and Bolivia was a treaty signed in the following November and duly ratified, the terms of which were summarized as follows in a despatch from the American Legation at La Paz, December 26: "Three months after exchange of ratifications Brazil is to pay an indemnity of £1,000,000 and in March, 1905, £1,000,000. A small strip of territory, north Marso, Brazilerio, embracing Babia Negra and a port opposite Coimbra, on Paraguay River, are conceded, and all responsibilities respecting Peruvian contentions are assumed. The disputed Acre territory is conceded by Bolivia. A railroad for the common use of both countries is to be built from San Antonio, on Madeira River, to Cuajar Ameren, on Mamoré River, within four years after ratification. Free navigation on the Amazon and its Bolivian affluents is conceded. A mixed commission, with umpire chosen from the diplomatic representation to Brazil, will treat all individual Acre claims."

Subsequently it was determined in Bolivia that

the entire indemnity received from Brazil should be expended on railroads, with an additional sum of £3,500,000, to be raised by loan.

For the settlement of the remaining question of rights in the Acre territory, between Bolivia and Peru, a treaty of arbitration, negotiated in December, 1902, but ratified with modifications by the Bolivian Congress in October, 1903, provided that "the high contracting parties submit to the judgment and decision of the Government of the Argentine Republic, as arbitrator and judge of rights, the question of limits now pending between both republics, so as to obtain a definite and unappealable sentence, in virtue of which all the territory which in 1810 belonged to the jurisdiction or district of the Ancient Audience of Charcas, within the limits of the viceroyalty of Buenos Ayres, by acts of the ancient sovereign, may belong to the Republic of Bolivia; and all the territory which at the same date and by acts of equal origin belonged to the viceroyalty of Peru may belong to the Republic of Peru."

1909.—Final partition.—The case was pending until July, 1909, when judgment favorable to the claims of Peru was pronounced by the President of the Argentine Republic, Señor Figueroa Alcorta. According to the award, as announced officially from Peru, the line was drawn to "follow the rivers Heath and Madre de Dios up to the mouth of the Toromonas and from there a straight line as far as the intersection of the river Tehuamanu with meridian 69. It will then run northwards along this meridian until it meets the territorial sovereignty of another nation"

The Bolivians were enraged by the decision against them, and riotous attacks were made on the Argentine Legation at La Paz, the Bolivian capital, and on Argentine consulates elsewhere. Worse than this in offensiveness was a published declaration by President Montes of Bolivia that the arbitration award respecting the frontiers of Bolivia and Peru had been given by Argentina without regard to Bolivia's petition that an actual inspection of the territory should be made in case the documents and titles submitted were unsatisfactory. "Had this been done," said the president of Bolivia, "the arbitrator would have been convinced of the respective possessions of the two countries. It is inexplicable how the arbitrator, after examining the titles and documents, could give such a decision. He passed over the elementary principles of international rights in awarding to Peru territory which had never been questioned as belonging to Bolivia. As a consequence Bolivia rejects the award."

The insulted government of Argentina demanded explanations; diplomatic relations between the two countries were broken off, and war seemed imminent. Fortunately the term of President Montes was near its close, and a man of evidently cooler temper, Elidoro Villazón, succeeded him in the presidency on August 12. The new President, in his message to Congress next day, while characterizing the award as unjust, said: "We must proceed circumspectly, and be guided by international rights and the customs of civilized nations in similar cases. I consider it right to avail ourselves of the means offered by diplomacy to obtain a rectification of the new frontier line given by arbitration, thus saving the compromised possessions of Bolivia."

With this better spirit entering into the controversy, Bolivia was soon able to arrange with Peru for a concession from the latter which made her people willing to recognize the award. This agreement was effected on the 11th of September,

and its terms, as made known in a despatch from Rio de Janeiro, were as follows: "Peru surrenders to Bolivia a very small extent of territory lying between the Madre de Dios River and the Acre, traversed by the rivers Tahuamanu and Buyamaro, which together form the river Orton, an affluent of the Beni River. This territory, with an area of about 6,500 square kilometres, was discovered and colonized by Bolivians, who to-day are in possession of numerous prosperous industries there. Peru gets possession of all the upper course of the Madre de Dios, from its head waters to its confluence with the river Heath. Such a slight modification as the foregoing from the decision reached by the arbitrator in no way disturbs the Argentine Republic."

As between Peru and Brazil the boundary question was settled by a treaty signed at Rio de Janeiro on the 8th of September, three days before the Bolivian pacification.

This probably closes a territorial dispute which has troubled four countries in South America for many years, and brought quarrelling couples to the verge of war a number of times.

ACROCERAUNIAN PROMONTORY. See CORCYRA.

ACRÓPOLIS, literally "the upper city" (or the highest part of the city), a term applied to the citadel or fortified part of an ancient Greek city. For purposes of defence the earliest settlements were usually made upon some lofty hill or other natural stronghold, further protected by fortification. As the town increased in size and more extensive walls were built, the acropolis, gradually losing its military character, was given over to temples, theatres and other public buildings dedicated to the protecting deity of the city. Among the more noteworthy of such acropolises were those at Athens and Corinth, Troy, Mycenae and Tiryns, Thebes, Argos, Messene (q. v.).

ACROPOLIS OF ATHENS, a precipitous and lofty flat-topped hill near the center of the city of Athens, forming a natural stronghold which became the seat of the earliest settlement. It measures about 1,000 feet long by 500 feet wide and reaches its maximum elevation of 512 feet on the northeast side. "In the early days, when the Acropolis was essentially a fortified castle, the bastion on which the temple of Athena Victory was afterwards built was an effective outwork against approaching enemies, who, as at Tiryns and other primitive citadels, could be attacked from above on their unshielded right side. The wall of the bastion has been repeatedly rebuilt, but the evidence is too scanty to permit as yet a final interpretation of its history, and opinions are still diverse."—C. H. Weller, *Athens and its monuments*, pp. 240-241.—Long before the Persian wars, the city having outgrown these narrow confines, the acropolis had been consecrated to the patron goddess Athena, for whose worship magnificent shrines were erected. "The private dwellings of the Athenians and even their state offices were small and inexpensive. Religion alone inspired them to build beautifully and grandly. When the Persians entered Athens, they burned the temples and other buildings, leaving the Acropolis strewn with heaps of ruins. For a time after their return the citizens had neither the leisure nor the means of restoring these shrines. Cimon, however, completing a work begun by Themistocles, levelled the surface of the Acropolis to fit it better for buildings. This end was accomplished by erecting a high wall along the southern edge, a lower one along the northern, and filling up the space thus made with earth and rubbish. The

present steep appearance of the hill is due chiefly to this work. But it was left to Pericles to build the temple on the ground thus prepared. For this purpose Pericles used some of the funds from the imperial treasury. Revenues from other sources were likewise used; and as the state owned the marble quarries on Mount Pentelicus, the chief cost was for the labor."—G. W. Botsford, *History of the ancient world*, p. 207.—In accordance with this plan there were erected, during the administration of Pericles and under the able direction of Phidias, Mnesicles, Ictinus, Callicrates and other artists, those magnificent buildings, the ruins of which are still the marvel of the world.

"Nothing in ancient Greece or Italy could be compared with the Acropolis of Athens, in its combination of beauty and grandeur, surrounded as it was by temples and theatres among its rocks, and encircled by a city abounding with monuments, some of which rivalled those of the Acropolis. Its platform formed one great sanctuary, partitioned only by the boundaries of the . . . sacred portions. We cannot, therefore, admit the suggestion of Chandler, that, in addition to the temples and other monuments on the summit, there were houses divided into regular streets. This would not have been consonant either with the customs or the good taste of the Athenians. When the people of Attica crowded into Athens at the beginning of the Peloponnesian war, and religious prejudices gave way, in every possible case, to the necessities of the occasion, even then the Acropolis remained uninhabited."

Since the only access from the lower city to the summit of the Acropolis was by way of a chariot road running zig-zag up the slope at the western end, and since the total breadth of the hill at this point was only 168 feet, it seemed advisable "to fill up the space with a single building which should serve the purpose of a gateway to the citadel, as well as of a suitable entrance to that glorious display of architecture and sculpture which was within the inclosure. This work [the Propylæa], the greatest production of civil architecture in Athens, which rivalled the Parthenon in felicity of execution, surpassed it in boldness and originality of design. . . . It may be defined as a wall pierced with five doors, before which on both sides were Doric hexastyle porticoes."—W. M. Leake, *Topography of Athens*, sect. 8.—"On entering through the gates of the Propylæa a scene of unparalleled grandeur and beauty burst upon the eye. No trace of human dwellings anywhere appeared, but on all sides temples of more or less elevation, of Pentelic marble, beautiful in design and exquisitely delicate in execution, sparkled like piles of alabaster in the sun. On the left stood the Erechtheion, or fane of Athena Polias; to the right, that matchless edifice known as the Hecatompedon of old, but to later ages as the Parthenon. Other buildings, all holy to the eye of an Athenian, lay grouped around these master structures, and, in the open spaces between, in whatever direction the spectator might look, appeared statues, some remarkable for their dimensions, others for their beauty, and all for the legendary sanctity which surrounded them. No city of the ancient or modern world ever rivalled Athens in the riches of art. Our best filled museums, though teeming with her spoils, are poor collections of fragments compared with that assemblage of gods and heroes which peopled the Acropolis, the genuine Olympus of the arts."—J. A. St. John, *The Hellenes*, bk. 1, ch. 4.—"Unlike the famous structures of the Ancient East, it was not the immense size of the Parthenon, but its beautiful propor-

tions, exquisite adornment and ideal sculptures that make it memorable. It was 100 feet wide, 226 feet long, and 65 feet high, built of marble and painted in harmonious colors. A row of 46 Doric columns surrounded it, and every available space above the columns within and without was carved in relief with scenes representing glorious events in the religious history of Athens. A wonderfully sculptured frieze, extending for more than 500 feet around the inner temple, depicted with a variety and energy never surpassed scenes in the Panathenæa, the festival in honor of the patron goddess Athena. In the temple stood a statue of the deity, the masterpiece of Phidias, made of ivory and gold, 38 feet in height, including the pedestal. Though this statue has long since disappeared and the temple itself is but a ruin, the remains of it illustrate supremely the chief features of Greek architecture, 'simplicity, harmony, refinement, the union of strength and beauty.'"—G. S. Goodspeed, *History of the ancient world*, pp. 148-149.—See also ATHENS: 461-431, and Map of ancient Athens; PARTHENON.

ACS, Battle of (1849). See AUSTRIA: 1848-1849.

ACT OF ABJURATION, MEDIATION, SECURITY, etc. See ABJURATION, ACT OF, etc.

ACT OF GOD, a legal term denoting the operation of uncontrollable natural forces, really confined to unforeseeable disasters. Prof. James H. Robinson derives the phrase from the usage of the Middle Ages, when the general abysmal ignorance attributed any unusual or startling occurrence to the intervention of either God or the devil, leading at that time to the worship of what Harnack has called "a God of Arbitrariness."

ACT OF UNION (1535). See WALES: 1535-1921.

ACT RESCISSORY. See SCOTLAND: 1600-1666.

ACTA DIURNA, a Roman daily chronicle, said to have been originated by Julius Cæsar (59 B. C.) who designed it to disclose the acts of the various public officers. It served the purpose, in a limited sense, of the modern newspaper. The acts were published on white boards so that anybody might read them.

ACTA SENATUS (Commentarii senatus), the record of the proceedings and decisions of the Roman Senate. Cæsar was the first consul to issue officially and publicly the proceedings of the Senate.

ADAIS—These Indians were a "tribe who, according to Dr. Sibley, lived about the year 1800 near the old Spanish fort or mission of Adaize, 'about 40 miles from Natchitoches, below the Yat-tassees, on a lake called Lac Maedon, which communicates with the division of Red River that passes by Bayou Pierre' [Lewis and Clarke]. A vocabulary of about 250 words is all that remains to us of their language, which according to the collector, Dr. Sibley, 'differs from all others, and is so difficult to speak or understand that no nation can speak ten words of it. . . . A recent comparison of this vocabulary by Mr. Gatschet, with several Caddoan dialects, has led to the discovery that a considerable percentage of the Adai words have a more or less remote affinity with Caddoan, and he regards it as a Caddoan dialect.'—J. W. Powell, *Seventh annual report, Bureau of ethnology*, pp. 45-46.

ADAIZE. See TEXAS: Aboriginal inhabitants.

ADALBERO, or Adalberon, archbishop of Reims (d. 988). Made Reims a center of intellectual culture; was an important influence in substituting the Capetian line for the Carolingian; chancellor of France under Lothair and Louis V; lord high chancellor under Hugh Capet.

ADALBERON, or Ascelin, bishop of Laon in 977, not to be confounded with his namesake, Adalbero of Rheims. Was imprisoned in 988 by Charles, duke of Lorraine, who captured the city of Laon; soon escaped and received the protection of Hugh Capet, king of France; succeeded in winning the confidence of Charles of Lorraine, and was restored to his see; betrayed Charles and the city of Laon into the hands of his former benefactor; died 1030 or 1031.

ADALBERT, or Adelbert (c. 1000-1072), archbishop of Hamburg-Bremen, his province including Scandinavia and most of Northern Germany. As a friend of the German king, Henry III, and of the emperor of the Holy Roman Empire, took a leading part in religious and civil government; is said to have refused the papal throne in 1046; was one of the most powerful and famous ecclesiastics of his day.

ADALBERT (originally Voytech), (955-997), known as the "Apostle to the Prussians"; in 983 chosen bishop of Prague. Devoted himself to missionary work, chiefly in North Germany and Poland.

ADALIA, a seaport of Asia Minor on the Gulf

of Adalia, is built on a hill around the harbor so that the streets appear to rise behind each other like an amphitheater; population about 30,000, mostly Mohammedans and Greeks; now heard of most often in connection with recent Italian immigration and the claims of Italy to the country around Adalia Bay as her portion of the Ottoman inheritance.

ADALIA RAILWAY. See ITALY: 1920.

ADALING. See ADEL.

ADALOALDUS, King of the Lombards, 616-626.

ADAM, Adolphe Charles (1803-1856), French operatic composer, follower of Auber in the *opéra comique*. See Music: 19th century: Opera before Wagner.

ADAMAWA. See CAMEROONS.

ADAMNAN, or Adomnan (c. 624-704), Irish saint and historian. Elected abbot of Iona, 679; tried unsuccessfully to enforce the adoption of the tonsure and a change in the date of the celebration of Easter.

ADAMS, Charles Francis (1807-1886), American diplomat and statesman. *Son of John Quincy Adams; edited the "Letters of Abigail and John Adams" and the "Works of John Adams"; member of Congress, 1859-1861; minister to England, 1861-1868; prominent leader in the Liberal Republican party in 1872; arbitrator for the United States on the Geneva Tribunal, 1871-1872.—See also U. S. A.: 1848: Free soil convention at Buffalo.

ADAMS, Ephraim Douglass (1865-), American educator and professor of history. See HISTORY: 33.

ADAMS, George Burton (1851-), American historian. Professor of history at Yale; president of American Historical Association, 1907-1908; member of board of editors, *American Historical Review* 1895-1913; author of many works on medieval and modern history.

ADAMS, Henry (1838-1918), American historian. Third son of C. F. Adams (q. v.); chief work, "History of the United States from 1801 to 1817," a standard authority on the administrations of Jefferson and Madison. See HISTORY: 32.

ADAMS, Henry Carter (1851-1921), American economist. Statistician to the Interstate Commerce Commission, 1887-1911; professor of political economy and finance at University of Michigan, 1887; in 1913 became advisor to Chinese commission to standardize railway records.

ADAMS, John (1735-1826), second president of the United States. Pungent writer against the Stamp Act; active delegate in the First Continental Congress and the Provincial Congress of Massachusetts; member of the Committee of Five which drew up the Declaration of Independence (see U. S. A.: 1776, January-June: King George's measures; June: Resolutions for independence; July); served on missions to France and at the Hague (see U. S. A.: 1776-1778); first minister of the United States to Great Britain; prominent Federalist; first vice-president of the United States, 1789-1797 (see U. S. A.: 1780); president, 1797-1801.

ADAMS ACT (1906). See EDUCATION, AGRICULTURAL: United States; Experiment stations acts.

ADAMSON LAW.—"The outbreak of the World War and the consequent increase in the volume of the foreign trade of the United States led to very great confusion and congestion in the

railway system. When, in February of 1916, 400,000 railroad trainmen demanded an eight-hour day for the freight service, without reduction of the existing ten-hour day wage, and time and a half pay for overtime, the whole industrial and commercial situation became threatening. In June the managers met the officers of the Four Brotherhoods of trainmen (Locomotive Engineers, Locomotive Firemen, Railway Conductors and Railway Trainmen) in a conference. The managers refused the men's demand, but offered to submit it to arbitration along with certain grievances of the railroads. . . . In June no agreement could be reached. The meeting broke up and the brotherhood chieftains took a strike vote. They found themselves authorized by over 95 per cent. of their constituents to call a strike unless the railroads gave in. With this power the brotherhood leaders met the railroad managers in a second series of conferences in August. Now for the first time the country realized the seriousness of the situation. All eyes were on the conferees in New York. Again they found themselves in deadlock. Then, as provided in the Newlands Act, one of the parties to the controversy, the railroads, invoked the Federal Board of Mediation and Conciliation, which found it impossible to mediate and suggested arbitration. The men refused, even if the roads were to agree to limit the arbitration proceedings to a consideration of the men's demands alone; that is, even if the roads agreed to withdraw their complaints. . . . At this point President Wilson stepped in. On August fifteenth, after seeing both men and managers, he made his proposition that the railroads grant the request of the men for ten hours' pay for the first eight hours of work and that the men agree to arbitrate the question of getting more than pro rata for overtime. That is, he asked that the men be given their main demand, and that their minor demand alone be investigated. The committee of railroad managers could not see their way clear to the assumption of this extra wage roll, without investigation. Nothing was more certain than that the burden would eventually have to be shifted to the public, in the form of higher rates, if the financial standing of the railroads was to be maintained. . . . It is fair to present the President's viewpoint. In describing these negotiations, he said to Congress on August twenty-ninth: 'The railway managers based their decision to reject my counsel in this matter on their conviction that they must at any cost to themselves or to the country stand firm for the principle of arbitration which the men had rejected. I based my counsel upon the indisputable fact that there was no means of obtaining arbitration. The law supplied none. Earnest efforts at mediation had failed to influence the men in the least. To stand firm for the principle of arbitration and yet not get arbitration seemed to me futile.' While negotiations were still proceeding, on Monday, August twenty-eighth, the six hundred and forty brotherhood chairmen left Washington. The President called on the steering committee of the Senate to plan legislation that would satisfy the men and avert the pending calamity. It transpired that when the brotherhood chairmen left Washington, they carried sealed orders in their hands for a strike, to become effective at 7 a. m., September fourth. . . . At 2 p. m. on Tuesday the President addressed Congress in joint session. He told of the tragical consequences which the strike would entail for the whole country. He told of his proposed settlement: the temporary granting of an eight-hour pay-day; a commission to investigate the cost to the railroads; the per-

manent adjustment of all matters in dispute in accord with the commission's report. 'It seemed to me,' he said, 'in considering the subject matter of the controversy, that the whole spirit of the time and the preponderant evidence of recent economic experience spoke for the eight-hour day.' He forecasted the success of the strike, should it start. He said that the railroad representatives had rejected his counsel: 'In the face of what I cannot but regard as the practical certainty that they will be ultimately obliged to accept the eight-hour day by the concerted action of organized labor, backed by the favorable judgment of society, the representatives of the railway management have felt justified in declining a peaceful settlement.'

"Finally, in order to prevent the strike and, above all to prevent such a situation from ever arising again, the President recommended these measures: (1) An enlargement of the Interstate Commerce Commission to deal with the burden of their duties. (This recommendation had nothing to do with the strike.) (2) Legislation making the eight-hour day the basis for work and wages on trains. (3) Authorization for the President to appoint a commission to investigate the effect of the wage increases. (4) Explicit approval given by Congress to the Interstate Commerce Commission with regard to granting a rate increase, if necessary, to offset the higher wages. (5) Amendment to the Newlands Act providing that the parties to such a controversy as this in the future shall be compelled to submit their causes to investigation, and, pending the completion of the investigation, they shall be forbidden to strike or lockout. (6) That the President be given authority, in case of military necessity, to take control of trains and operate them. (This was to meet the peril to our expeditionary force on the Mexican border, in case a strike occurred.) . . . These Senate hearings had been held with regard to the drafts of three separate bills, prepared by the Attorney-General, acting for the President. They carried all the President's recommendations for legislation. This was on Wednesday. On Thursday both Senate and House committees were busy perfecting bills which they believed would satisfy the views of the labor leaders, as expressed in the Senate hearings and in frequent conferences at the Capitol, and would induce them to call off the strike. . . . The House leaders, having framed a bill to suit their labor constituents on Friday night, thoughtfully let the Congressmen disperse so that on Saturday the Senate could not possibly do anything but pass the House bill if the Monday morning strike was to be averted. Republican Senators did protest, but at six o'clock the Senate passed the House bill by a partisan vote, forty-three to twenty-eight. La Follette of the Republicans voted for the bill, Hardwick of Georgia and Clarke of Arkansas voted against it. Twenty-four Senators did not vote. In the House one hundred and sixty-eight Democrats had been for the bill, two against it; seventy Republicans had been for it, fifty-four against; one hundred and forty-one Representatives did not vote on the measure."—E. J. Clapp, *Adamson law* (*Yale Review*, Jan., 1917, pp. 261-267).

Events preceding the law. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1888-1921.

Analysis.—"In the first place, although 'eight hours shall in contracts for labor and service, be deemed a day's work and the measure or standard of a day's work for the purpose of reckoning the compensation for services of all employees . . . actually engaged in any capacity in the operation

of trains,' this statute assuredly sets no limits to the length of the working day. It bears not the slightest resemblance to the Federal Hours of Service Law, which positively fixes a maximum of sixteen hours as a trainman's daily stint. Every member of the Brotherhoods understands this perfectly. President Garretson, of the Order of Railway Conductors, outlined the reason at the Senate Committee hearings: 'The charge . . . that it was impossible to put in a true eight-hour day on a railway is correct. It cannot be done. The trainman cannot stop, because eight hours may find him in a semi-desert country, or find him fifty miles from his home; therefore he is compelled to go on and work; but he demands a higher rate of speed.' The so-called Eight-Hour Law, then, is a statute fixing wages, with only an incidental bearing upon hours, as will soon appear. The new statute is in effect a minimum wage law for men engaged in a quasi-public employment. . . . But this new statute of ours not only fixes wages, it positively increases them by a substantial amount. In effect the new law orders ten hours' pay—that being roughly the former standard day—for eight hours' work, with the remaining two hours at the same rate."—W. Z. Ripley, *Railroad eight-hour law* (*American Review of Reviews*, Oct. 1916, pp. 389-390).

Question of constitutionality.—"The railroads immediately instituted proceedings in the courts to test the constitutionality of this Act. As a result of this action the Brotherhoods again threatened to strike without awaiting the decision of the courts if a settlement were not at once effected. The President thereupon appointed a committee representing the Council of National Defense to attempt the settlement of the controversy. On March 19, 1917, the committee made an award which was in harmony with the eight-hour law but defined somewhat more specifically the application of the eight-hour basis to existing schedules and practices. This award provided for a Commission of Eight, the railroads and Brotherhoods each being represented by four commissioners, to decide disputes arising under the award. The award was accepted by both parties. On the same day, March 19, 1917, the Supreme Court of the United States rendered its decision sustaining the constitutionality of the Adamson Act [by a vote of five to four] (*Wilson vs. New et al.*, 243 U. S. 332)."—W. F. Willoughby, *Government organization in war time and after*, pp. 183-184.—See also SUPREME COURT: 1917.

Economic considerations.—"With the establishment of federal control and the operation of the railways as a consolidated system, numerous economies became possible through the elimination of expense due to competition of the different companies with each other. Great publicity was given to these savings, effected by the Administration. Notwithstanding these economies, the large increase in rates and the record breaking volume of traffic, the net earnings of the railways have fallen far below the amount necessary to pay the standard return to the companies. The deficit for the two years will probably exceed half a billion dollars, and in addition, the physical condition of the railways has deteriorated materially. . . . The chief reason why railway net earnings have fallen off is the great increase in railway wages. The public believes that the railway employe is a profiteer, who is receiving higher wages than are warranted and has been unduly favored by the federal Administration in its grant of increased wages and better working conditions. . . . In 1916 and 1917 the railway employes were hard hit by the in-

crease in the cost of living and . . . the increase of wages which the federal Administration granted them in 1918 and 1919 was not sufficient to offset the increase in the cost of goods. Had the railways continued under private control, instead of being taken over by the government, wages would have had to be increased just the same. In fact, the increases in wages to railway employes have been less than the increases to factory workers. But those who indict the federal Railway Administration declare that its yielding to the railway employes on the eight hour day and on other matters where conditions of working are concerned, has also been responsible for a great increase in railway expenses. There is a certain measure of truth in this charge. The eight hour day, it is fair to recall, however, was established in train service by the Adamson law fifteen months before the government took over the railways. Its general extension to all classes of railway employes was sooner or later inevitable. A number of other concessions were made to the railway employes, for some of which, very likely, the Administration may properly be criticised. In dealing with the general question before us, however, we must look at the broad, general results in order to reach sound conclusions, and not at minor details. It is possible to determine from unimpeachable statistics whether there has been actually a great falling off in the amount of work done by the average railway employe. If the eight hour law and the other concessions in working conditions have really greatly reduced the amount of work done per employe, then there would have to be a large increase in the number of employes. Indeed a large increase would be looked for anyway, for there has been a great increase in the volume of traffic handled. The ton miles of freight traffic were 25 per cent. greater in 1918 than in 1913 (409 billion in 1918, and 301 billion in 1913). But actually the number of employes in 1918, the first year of federal control, was only 3 per cent. greater than in 1913, nothing like as large an increase as the growth in traffic would call for. Of course, in 1918 there was a great scarcity of labor. The railways got along with as few employes as possible, and did as little as possible in the way of maintenance, repairs and improvements. In the first six months of 1919, however, when plenty of men were obtainable, the number of employes was not much increased. Surely the above figures are a complete answer to the common belief that the federal Administration has granted higher wages or better working conditions to employes than justice demands."—C. W. Baker, *Government control and operation of industry in Great Britain and the United States during the World War*, pp. 49-54.—See also U. S. A.: 1916 (Aug.-Sept.).

ADANA, a city of Asiatic Turkey. Population, 60,000, mainly Armenian. Here the "Adana massacres" took place in 1909. See **TURKEY**: 1909; also **ARABIA**: Map; and **TURKEY**: Map of Asia Minor.

ADDYSTON PIPE CASE (*Addyston Pipe and Steel Co. vs. United States*, 175 U. S. 211) decided in 1899, is an important case construing the extent of the regulative powers given to the Federal Government under the commerce clause of the Constitution, and defining the scope of the Sherman Anti-Trust Law of 1890. In earlier cases it had been held that the manufacture of commodities intended for export and, in fact, thus exported, is to be distinguished from the interstate transportation of those goods, that "commerce succeeds to manufacture and is not a part of it," and that the federal jurisdiction begins only when transportation has begun. In the Sugar Trust Case (*United States vs. E. C. Knight Co.*, 156 U. S. 1), decided in 1895, the Supreme Court had, for this reason, held that the act of 1890 did not, and constitutionally could not, relate to the acquisition by one company of the stock of a number of other companies with a view to, and the result of, establishing a substantial monopoly of the business of refining sugar in the United States. The fact that the product was, for the most part, a subject of commerce among the states, was declared immaterial. The importance of the Addyston Pipe Case was that the court showed a willingness to give a more liberal interpretation to the federal commercial power and to the act of 1890, and to bring within the constitutional scope of the latter a combination or agreement between manufacturers or dealers if it should appear that in any way the agreement, in purpose or effect, controlled the normal course of interstate commerce. In this case an agreement was held illegal under which six companies, engaged in the manufacture or sale of iron pipe throughout the United States, had allotted among themselves the territory within which each should have the exclusive right to sell.

ADEL, ancient name by which the northern and central districts of Somaliland were known.

ADEL (Athel or Æthel), **ADALING**.—"The homestead of the original settler, his house, farm-buildings and enclosure, 'the toft and croft,' with the share of arable and appurtenant common rights, bore among the northern nations [early Teutonic] the name of Odal, or Edhel; the primitive mother village was an Athelby, or Athelham; the owner was an Athelbonde; the same word Adel or Athel signified also nobility of descent, and an Adaling was a nobleman."—W. Stubbs, *Constitutional history of England*, ch. 3, sect. 24.—See also **ÆTHEL**, **ÆTHELINGS**; **FOLCLAND**.

ADELAIDE, Marie (1894-), former grand

duchess of Luxemburg, abdicated (see LUXEMBURG: 1919-1921) in favor of her sister, Charlotte, January 9, 1919. In 1914, the grand duchess protested in vain against the German occupation of Luxemburg.

ADELAIDE, or Adelheid (931-999), empress, daughter of Rudolph II of Burgundy; wife of Lothair of Italy. "Upon Lothair's death in 950, she was imprisoned by Berengar who wanted her to marry his son. She escaped and sent a piteous appeal to Otto of Germany, who had already defended her father's house in Burgundy. The pope Agapitus alarmed for the safety of the papal lands on the Adriatic . . . joined in the appeal."—E. Emerton, *Medieval Europe*, pp. 126-128.—Otto marched into Italy and camped at Pavia. Here he summoned Adelaide, who had found refuge with the bishop Reggio, and offered his hand in marriage. Adelaide accepted. It is believed to be due to this marriage that the son of Otto I revolted against him in 963, the crushing of which revolt established Adelaide's power. She ruled Germany from the death of Otto I in 973 until 996, when Otto III was declared of age. For her devotion to the church and the establishment of the Benedictine cloister at Selz in Alsace, she was proclaimed a saint.—See also GERMANY: 936-976.

ADELANTADO, a medieval Spanish official. "The king of Castile, in addition to being recognized by most of the nobles as their overlord, had his own domains in which he exercised the same kind of proprietary sovereignty as the nobles on their estates. The outlying royal territories, as they increased in size and number, and as the sovereigns became more sure of their heritage, were divided for administrative purposes into royal districts with a count, appointed by the king, as administrative head of each. These counts were the first officials with administrative, judicial and military functions to represent the king at the head of frontier districts and provinces. Their duties were chiefly military, and these counts were frequently obliged to go beyond their own frontiers in the interest of the extension of the royal power. The great drawback, however, from the viewpoint of the king, consisted of the fact that the only class from which these officials could be enlisted was the noble class. In fact, they showed themselves to be more faithful to the aristocratic element than to the royal interests, and for this reason the counts were replaced by royal officials called *adelantados*, who were more completely dependent on the royal power than their predecessors had been. Antequera fails to give the date for the inauguration of this reform, but since the Council of Leon of 1020 defined the jurisdiction of the frontier counts, we know that the *adelantados* were substituted for these officials at some subsequent date.

"The earliest regulations which apply to these officials were the 'Laws of the *Adelantados Mayores*' of 1255 and 1274. The frontier *adelantado* has been noticed already. The provincial *adelantado* was mentioned in the law referred to as having been in charge of the larger and nearer provinces of Castile, Leon, Navarre, and Galicia. He was at the same time provincial governor, judge, and captain-general. Possibly the most far-reaching and characteristic feature of this office was the requirement that the *adelantado* should be accompanied on his tours of inspection by *letrados* or *asesores*—men of legal training, who should advise him in all questions of law, and assume re-

sponsibility for all his official acts of an administrative or judicial character. The *adelantados* were not trained lawyers or administrators, but soldiers—the predecessors of the colonial captains-general. They were empowered, however, to render legal opinions and dispense justice on the advice of, and by the assistance of the *letrados*. The *asesor* or *teniente letrado* played an important role subsequently in the administration of justice in the colonies. . . . The third type of *adelantado* specified in the ordinance of 1274 was the *adelantado mayor*. This magistrate, in contradistinction to the provincial *adelantado*, was a lawyer, and his activities were confined exclusively to the exercise of judicial functions. He was not accompanied, therefore, by an *asesor*. He was a peregrinating magistrate, holding court in different parts of the kingdom. Finally, he was frequently designated for special service as *adelantado mayor* from a higher tribunal of which he was a magistrate, and this tribunal was called the curia, or *corte del rey*, which was the forerunner of the royal *audiencia*. . . . This magistrate was in reality a judge of the first royal *audiencia* of Castile, and his designation to try cases in the provinces was identical in character with the subsequent designation of magistrates of colonial *audiencias* to try cases and conduct special investigations."—C. H. Cunningham, *Institutional background of Spanish-American history (Hispanic American Historical Review, Feb., 1918, pp. 26-30)*.—See also AUDIENCIAS.

ADELHEID, empress. See ADELAIDE or ADELHEIO.

ADEN is a rocky barren peninsula in south-western Arabia on the Indian ocean about 100 miles east of the straits of Bab-el-Mandeb. It is one of the important fortified coaling stations on the great highway from western Europe to India and the East. A brief Portuguese occupation at the beginning of the sixteenth century was followed by Turkish seizure in 1535. In the seventeenth century Aden came under the rule of the Sultan of Sana and native chiefs, which lasted until 1839, when it was captured by the British in punishment for native maltreatment of a shipwrecked British crew. The island of Sokotra off the coast of Africa is under British protection, and the Kuria Muria islands off the coast of Arabia are attached to Aden.—See also ARABIA: Political divisions; BRITISH EMPIRE: Extent.

ADERBEISAN, or Azerbaïjan, north-western province of Persia, anciently called atropatene. See ATROPATENE.

ADHÉMAR, Adémar, Aimar, Aelarz de Monteil (d. 1008), bishop of Puy en Velay; one of the leaders of the first crusade, which he accompanied as papal legate; caused the Siege of Antioch to be raised. See CRUSADES: 1006-1009.

ADHERBAL (fl. 112 B.C.), king of Numidia. See NUMIDIA: B. C. 118-104.

ADIABENE, a name which came to be applied anciently to the tract of country east of the middle Tigris, embracing what was originally the proper territory of Assyria, together with Arbelitis. Under the Parthian monarchy formed a tributary kingdom, much disputed between Parthia and Armenia. It was seized several times by the Romans, but never permanently held.—G. Rawlinson, *Sixth great oriental monarchy*, p. 140.

ADIRONDACKS.—"This is a term bestowed by the Iroquois, in derision, on the tribes who

appear, at an early day, to have descended the Utawas river, and occupied the left banks of the St. Lawrence, above the present site of Quebec, about the close of the 15th century. It is said to signify men who eat trees, in allusion to their using the bark of certain trees for food, when reduced to straits, in their war excursions. The French, who entered the St. Lawrence from the gulf, called the same people Algonquins—a generic appellation, which has been long employed and come into universal use, among historians and philologists. According to early accounts, the Adirondacks had preceded the Iroquois in arts and attainments.”—H. R. Schoolcraft, *Notes on the Iroquois*, ch. 5.—See also below: IROQUOIS CONFEDERACY: Their Conquests, &c.

ADITES.—“The Cushites, the first inhabitants of Arabia, are known in the national traditions by the name of Adites, from their progenitor, who is called Ad, the grandson of Ham.”—F. Lenormant, *Manual of ancient history*, bk. 7, ch. 2.—See **ARABIA:** Ancient succession and fusion of races.

ADJUTATORS, or Agitators. See **ENGLAND:** 1647 (April-August).

ADLERCREUTZ, Karl Johan, Count (1757-1815), Swedish general; defeated in Finland in 1808 by the Russians; assisted in the overthrow of Gustavus IV.

ADMINISTRATIVE LAW.—**Definition.**—**General survey.**—**Origin.**—**Character of tribunals.**—Administrative law is the portion of the law dealing with the enforcement of the social will as expressed by its authorized representatives in the established legislative bodies. Administrative law includes the organization of the executive powers of the State and of its general and local subdivisions, together with the respective functions of the administrative officers, the limitations of their powers and the remedies afforded in case of abuse of power or dereliction of duty. In the United States this branch of law would embrace all provisions relating to both elective and appointive officers, federal, state, county, municipal or other. It would also cover such matters as the law of municipal corporations, the abatement of nuisances, taxation and other revenue matters, such extraordinary legal remedies as the writ of prohibition, mandamus, injunction, habeas corpus, quo warranto and certiorari, and such equitable remedies as may be applied to executive officials.

“On the continent of Europe, particularly in France and Prussia, a special class of tribunals, separate and distinct from the ordinary courts of justice and constituted on different principles, has been provided, for the determination of administrative controversies, that is, disputes between private individuals and the public authorities as well as disputes among administrative officials themselves. In general, where such a system prevails, so-called administrative controversies are not allowed to be determined by the regular judicial courts. The idea originated in France at the time of the Revolution, and may be said to have resulted from the extreme conception of the doctrine of the separation of powers, then held by the French. Montesquieu’s famous theory concerning the necessity of intrusting the legislative, executive, and judicial powers to separate and distinct organs was embodied in extreme form in the ‘declaration of rights of man and the citizen’ of 1791 by the Constituent Assembly, which asserted that if the judiciary were permitted to meddle with administrative officials in the discharge of their duties the constitution would be violated and the operations

of the government hindered. The administrative authorities were therefore made completely independent of judicial control, and the judges were interdicted under pain of forfeiting their offices from interfering in any manner with the acts of the administration. This principle was in turn introduced into other continental states, particularly into Prussia and Italy, and has been retained by them to the present day.

“The chief advantage claimed for the system is that the subjection of the public authorities to the continual control and interference of the judicial courts is detrimental to prompt and efficient administration. Administrative controversies are somewhat peculiar in their nature and involve questions which for proper consideration require a special and technical knowledge not ordinarily possessed by judges whose training and experience have been confined to the field of private law, and whose education has been academic rather than practical. Such judges are likely to have exaggerated notions of the rights of private individuals, as against those of the public; they are inclined to a natural timidity in deciding issues between individuals and the government adversely to the claims of the individual; and with their disposition to adhere strictly to legal rules and traditions they sometimes unnecessarily hamper and obstruct the legitimate operations of the government.

“The history of administration in the United States and England abounds in illustrations of the truth of these observations. Only men who have been trained in the study of administrative law and who have had practical experience in the actual work of public administration, it is said, are capable of deciding wisely controversies involving a technical knowledge of an administrative question. Judges without such special knowledge or experience are apt to apply to the interpretation of controversies between private individuals and the public authorities the pure principles of private law, rather than those of the public law. This sometimes leads to results that are wholly inconsistent with sound public policy and efficient administration, for the rules of law governing the organization and functions of the administration are quite different from those governing the relations of private individuals, since the purpose of the former is the public welfare rather than private interests. When the government is a party to a dispute it cannot be treated like a private litigant without seriously injuring at times its efficiency and impeding its operations. The law of contract and tort, for example, which plays so important a part in the regulation of the conduct of private individuals, occupies a very unimportant place in the law governing the relations of the public authorities. The administration of two such widely different bodies of rules requires, therefore, different habits of mind, traditions, and training. It is also to be remarked that the individual under the continental system can often obtain redress where he could not do so in America or England, as for example, in a case of neglect or abuse of power by an official, who would not in America or England be liable in damages. . . .

“Where there are two sets of tribunals and two separate bodies of law, disputes must sometimes arise as to which domain a particular controversy belongs and which tribunal should have jurisdiction of it. For the determination of such disputes of jurisdiction the French law provides for a tribunal of conflicts, while in Germany there is usually a similar tribunal known as a competence-conflict court. In both countries these courts are composed of a certain number of regular judges

and of persons in the administrative service. In the German imperial system, however, all conflicts of jurisdiction between the imperial administrative courts and the judicial courts are settled by the latter, there being no special conflict courts. In both countries the power of raising the question of a conflict of jurisdiction belongs to the administration only, the theory being that it alone can be interested. When the administration notifies the judicial court that in taking jurisdiction over a particular controversy, it is encroaching upon the sphere of the administration, the court suspends further proceedings, and the question of competence is referred to the tribunal of conflicts for determination. If the decision is in favor of the claim set up by the administration, the case is removed to the administrative courts for final decision, otherwise it is decided by the judicial court.

"In England and America, and in countries generally where English legal institutions have been introduced, the doctrine of administrative jurisdiction, as it is known and practiced on the continent of Europe, is little known. There administrative law is not a separate branch of jurisprudence, and specially constituted administrative courts with jurisdiction over controversies between private individuals and public officials do not exist, at least not in the form in which they are found on the continent. Disputes between the public authorities and private citizens, like differences between private individuals themselves, are decided by the regular judicial courts and according to the ordinary law of the land. Nevertheless, both in England and America, there are numerous boards, commissions, and authorities which possess what may not improperly be described as administrative jurisdiction. They are, in fact, often referred to as administrative tribunals; they possess the power of adjudication and determination in many cases, and not infrequently their decisions are conclusive, and hence not subject to review by the courts. Although they are not a part of the judicial system, their procedure when hearing and determining controversies is often characterized by the formalism of the courts of justice. A regular system of appeal is often allowed from one to another, and in some cases their decisions are published and cited as precedents. In England examples of authorities which exercise a limited administrative jurisdiction are the Railway Commission, the Local Government Board, the Board of Trade, the Board of Education, and the Board of Agriculture. In the United States similar bodies are the Interstate Commerce Commission, whose powers have been described as 'quasi administrative, quasi judicial'; the Pension Office, the Patent Office, the Land Office, the Bureau of Immigration, the office of Comptroller of the Treasury, the General Board of Customs Appraisers, the United States Customs Court, and the Court of Claims. In the state governments there are almost countless boards and commissions which possess similar powers. Among these may be mentioned railroad commissions, boards of health, departments of education, pure food commissions, etc. There is, in fact, scarcely any department of the administrative service in which controversies involving both public and private rights do not frequently arise, which can be more wisely determined by the administration itself than by a court of justice. This fact has been recently recognized by the Congress of the United States in the act creating a customs court vested with power to determine controversies between the government and importers, regarding the value and classification of imported articles upon which a customs tariff is imposed. Whatever, therefore,

may be said against the European system of administrative justice and of administrative law, with its somewhat exaggerated emphasis upon the rights of the government in contradistinction to those of private individuals, the fact remains that it exists in England and America, though in less developed form; and the rôle which it is destined to play in the future is bound to increase with the multiplication of governmental functions and the increasing complexity of the governmental organization."—J. W. Garner, *Introduction to political science*, pp. 585-594.—See also CABINET; COMMISSION GOVERNMENT; CONGRESS; MUNICIPAL GOVERNMENT; REPRESENTATIVE GOVERNMENT; SUPREME COURT.

Administrative law in France.—"The territorial unity of the French state was attained many years ago. The great vassals who under a weak monarchy might have developed into independent princes, and whose domains might then have formed separate commonwealths, were suppressed by the kings and their lands became provinces of the kingdom of France. Most matters of administration, which during the feudal régime had been attended to by vassals, became a part of the royal administration and were attended to by the royal officers who were subject to a strong central control. These were the intendants, who date from the time of Richelieu and Louis XIII, and whose work was performed in the provinces or generalities as they were sometimes called, and the council of the king at the centre which directed all their actions and heard appeals, taken by individuals aggrieved, from their decisions. The great centralization of government under the absolute monarchy left little room for any important local authorities; though we do find even in the times of the most extreme centralization that there were in certain of the provinces, called *pays d'états* and occupying a privileged position, local assemblies having more or less control over the actions of the intendants; and also that in some of the largest of the cities the people had more or less well-defined rights to elect their municipal officers, rights, however, of which the king was endeavoring in the interest of centralized government to deprive them. The attempt made by the government of Louis XVI just before the revolution to introduce into all parts of the kingdom provincial assemblies modelled on the assemblies of the *pays d'états* failed; and when the revolution came in 1789 it found a most highly centralized system of administration—a system which hardly recognized the local districts as anything more than administrative circumscriptions, possessing few if any corporate powers. In these districts most matters of administration were attended to by officers either appointed and removed by the king in his pleasure, or else subject to a strict central control. The system which the revolution received as a legacy from the absolute monarchy it made few radical changes in. . . . The aim of the revolution was social and political rather than administrative reform. The revolution destroyed the social system on which the absolute monarchy rested and introduced the political principle that the people should have a larger influence in the management of the government, but it did little more in the way of permanent administrative reform than to make the system more symmetrical than it had been before. The reason why no greater change was made in the general character of the administrative system was that the revolution really aimed at the same end that had been before the eyes of the absolute monarchy. This end was the crushing out of feudalism, the taking away from the privileged classes those semi-political and social privileges and

exemptions which had been the cause of so many of the miseries of the absolute monarchy, but for which the absolute monarchy was responsible only in so far as it had allowed them to continue to exist, after the duties which had been originally associated with them had been assumed by the Crown, and after the expenses which their performance necessitated had been imposed upon the tax-payers. The cause of the dissatisfaction of the people with the absolute monarchy is to be found not so much in the character of the government which it gave the people as in the fact that its progress in the desired direction of abolition of feudal privileges seemed almost to have ceased. Therefore we find that the chief reforms of the revolution were social and, to a degree, political but not administrative. The celebrated night of the fourth of August, 1789, saw the abolition at one time of about all that was left of the feudal régime, while the exemption of the privileged classes from taxation was done away with by the new and proportional system of taxation formulated and enacted by the revolutionary leaders in the constituent assembly. After the constituent assembly had thus cleared away the débris of the feudal system it would have been suicidal for it to establish any system of administration in which large rights of local government were given to the people of the localities. For the people, as a whole, were so utterly incapacitated for political work, through long administrative and governmental tutelage, that it is improbable that they could have succeeded in governing themselves well. At first it is true there was a slight attempt in the direction of decentralization, but this, as might have been expected, was unsuccessful and led to disorganization and inefficient government, as indeed, did all attempts at reorganization until the government of the directory when Napoleon came into power. . . . Napoleon is to France what the Norman kings are to England. He moulded the form of her local institutions. The laws and decrees which were passed during the period of his control of the government have, it is true, received during this century most important modifications, but the main principles of the present system of local administration are even now to be found in them. Napoleon was satisfied that the social principles of the revolution could be adhered to only through the establishment of a most centralized system of administration and government, by means of which the impulse to action should come from the centre and which should be controlled by those who were in sympathy with the new order of things. Since Napoleon's time, however, there has been great progress in the direction of decentralization. This began with the government of the restoration and reached its climax in the communes act of 1884; and has consisted in the recognition of the possession by the localities, or at least the most important of the localities, of juristic personality and that there belongs to them a sphere of action of their own in which the central administration is to interfere but little.

"But notwithstanding the decentralization which has been going on, the French system of administration retains even at the present time quite enough of the old Napoleonic principles to make it, as compared with our own, a system which from the administrative point of view is quite centralized. . . .

"Below the department district and canton we find the *commune* as the lowest administrative unit. The commune is either rural or urban, but the French law makes no formal distinction in organization between the two, both being governed

by the same law, *viz.*, the law of April 5, 1884. While the department is an artificial creation of the revolutionary period, the commune is a natural growth. Before the revolution we find that there were, as a result of social and political conditions, two kinds of local communities in France, *viz.*, the urban communes and the rural communes. In the former were an officer, called by different names but performing for the most part executive functions, and a deliberative council. In the rural communes, and even in some of the cities, a general meeting of the inhabitants was often found together with a series of executive officers. A decree of 1702 established in each of these rural communes an officer called a syndic, who was to act to a large extent under the supervision of the intendant of the generality or province in which the commune was situated. The acts of all these authorities were subject, just before the revolution, to very strict central control, which was one of the results of the administrative centralization of the absolute monarchy. In 1789 the constituent assembly decided to efface all distinction in administrative organization between the rural and the urban districts, and provided for the formation of about 44,000 communes. Different experiments at organization were made in the period between 1790 and the year VIII or 1800 when the Napoleonic legislation was adopted. By this legislation there were placed in each commune a mayor and a municipal council, the former attending to executive business, both that relating to the commune, which was a municipal corporation, and that affecting the state as a whole, and the latter attending simply to local business. By this Napoleonic legislation, both the mayor and the members of the municipal council were appointed and could be removed by the central administration, while the decisions of the municipal council, even though they affected simply the local affairs of the commune, were in all cases subject to the approval of the central administration. Since the overthrow of the empire there has been an almost continuous tendency to decentralize this extremely centralized system. In 1831 the municipal council became elective, and by a gradual process the mayor has become elected by the municipal council in all the communes of France. But up to about 1884 no actual power of decision was given to the municipal council, whose resolutions were in most cases subject to central administrative approval. The law of April 5, 1884, has made a most radical change in this respect by providing that the decisions of the municipal council are absolutely final except in those cases in which the law has specially provided for central administrative approval. . . . In each commune at the present time are to be found a mayor and several deputies who are to assist him in the performance of his duties, all elected by the municipal council. In both cases the choice of the council is limited to its members. They serve for the term of the council, but may be suspended by the prefect of the department for one month, by the minister of the interior for three months, and may be removed by the President of the republic. Removal makes the person removed ineligible for the period of one year. Further, the prefect has quite a large control over the mayor in that the law provides that if the mayor refuses to do an act which he is obliged by law to do, the prefect may step in and, after demand made by the mayor, proceed to do the act himself or may have the act done by a special appointee: The mayor and his deputies are unsalaried and are not professional officers like the prefect. Their official expenses are to be paid, however. Like the prefect, the mayor

is at the same time the agent of the central administration in the commune and is the representative and the executive of the communal municipal corporation. As an officer of the central administration he is in most cases under the supervision of the prefect. Among his duties as such central officer may be mentioned his duty to keep a register of vital statistics. As the French law expresses it, he is an officer of the *état civil*. As such he also solemnizes all marriages. He is also an officer of what is known as the judicial police and, as such, has the power to file informations in purely petty offences and may act as public prosecutor in the smaller places. He has to publish and execute all the laws and decrees within the commune, makes up the election lists, the census tables for the recruiting of the army, publishes the assessment rolls, *etc.*, *etc.* Finally the mayor has a large power of local police. He has quite a large power of ordinance, a power which, like the similar power of the prefect, is always based upon some express provision of law. The power of ordinance granted by the statutes is, however, quite a general one. He has the right to issue such ordinances as may be necessary to maintain good order, public security and health. He has also a large power of issuing orders of individual and not general application, as, *e. g.*, to fix the building line for particular edifices, to grant building permits, to remove nuisances, and so on. All such ordinances and orders are sanctioned by the penal code, which punishes the violation of all legal ordinances and orders by a fine. An instance of the control which the prefect has over the acts of the mayor when the latter is acting as an officer of the general state administration, is to be found in the case of these ordinances and orders which may be repealed by the prefect within a month after their issue.

"As the executive officer of the communal municipal corporation the mayor has the appointment of most of the communal officers, the only important exceptions being found in the case of the local constabulary who are, to a large extent, central officers and under central control, the teachers, the forest guards, and the communal treasurer. Further the mayor is to attend to the detailed administration of all local property and is to supervise the different administrative services which are attended to by the commune. Thus in the financial administration of the commune the mayor draws up the budget of receipts and expenses of the commune, orders all expenses to be paid, has the detailed management of the revenue and property of the commune, executes its contracts and supervises its accounts and its public institutions. But in all these matters it must be remembered that the mayor is simply to execute the decisions of the municipal council, which has the final determination of all matters of communal interest.

"The *municipal council* is elected by universal manhood suffrage. Electors must have resided for six months within the commune or have paid direct taxes there. Electors must be registered in order to be able to vote. The rules in regard to eligibility are similar to those in force for the general council of the department. The term of office is four years. The council has four ordinary sessions each year, but extraordinary sessions may be called at any time. The meetings of the council are generally public. The mayor presides at all meetings of the council except when his accounts are being examined. As a rule a majority of the members constitutes a quorum. Finally the council may be suspended for a month by the prefect; and may be dissolved by the President of the republic.

"The duties of the municipal council relate al-

most exclusively to the local affairs of the commune, their general duties being so few in number and so unimportant in character as not to deserve special notice. In the legal provisions governing the powers of the municipal council we find a good example of the continental method of regulating the participation of the localities in the work of administration. The law of 1884 (the municipal code of the present time) simply says that the municipal council shall govern by its decisions the affairs of the commune. In order, however, to prevent the municipal council from being extravagant or acting unwisely, article 68 of the law provides that in certain enumerated cases the approval of some central authority, as a general rule the prefect, shall be necessary, before the resolutions of the council are of force. In general this approval of the central administration is necessary for the sale or long lease of communal property, for the undertaking of expensive public works, for the change of use of buildings used for general administrative purposes, for the regulation, laying out or closing of streets, for the levy of taxes above certain limits, and for the borrowing of money beyond a certain amount, and the imposition of *octroi* taxes, *i. e.*, indirect taxes on objects consumed within the cities. Finally, the budget of the commune must be submitted to the central administration, which must approve it before it can be executed. The purpose of submitting the budget to the central administration, is to afford it an opportunity to see if the municipal council has made appropriation for the obligatory expenses made necessary by law, and to prevent the council from being extravagant. If the budget does not provide for obligatory expenses, levies taxes or borrows money beyond certain limits, or provides for the payment of the current expenses of the commune from loans or extraordinary revenue, the central administration may make changes in the budget so as to make it conform to the provisions of law or to what the central administration regards as proper. Otherwise the central administration may make no alterations in the budget as voted by the council. Finally, in order to prevent the municipal council from overstepping the bounds of its competence as an authority for the purposes of purely local administration and from assuming functions of a central character, it is provided that the central administration may declare any act of the municipal council outside of its jurisdiction to be void. In such case the municipal council or any one interested has the right to appeal from the decision, declaring the act of the municipal council void, to the administrative courts, which thus have the power of determining finally the question of local jurisdiction."—F. J. Goodnow, *Comparative administrative law*, v. 1. pp. 268-272, 285-292.

Prussian administrative law.—"The present form of local government in Prussia was fixed in 1807. The Prussia of the time previous to 1807 was feudal rather than modern. The collapse of feudal Prussia at the time of the French invasion in 1806 was so sudden and so complete as to prove beyond peradventure that the magnificent fabric reared with so much pains by the great Prussian kings of the eighteenth century rested on most insecure foundations. The administrative system which had come down from the time of Frederick William I was bureaucratic to the last degree. The result of such a system was that the people participated hardly at all in the administration or even in the government, and naturally not only had lost all political capacity, but also had come to regard the government either with indifference or with

absolute hatred. The social conditions of the Prussian people also had been such as to favor one class at the expense of the others and at the same time to impoverish the country as a whole. The distinctions of class had been so fixed as almost to divide the people into castes, and artificial barriers placed about the freedom of trade and labor in the interest of the richer classes had prevented all classes alike from making the best use of their opportunities. . . . After the fall of Prussia, Baron Stein was made head of the administration and during the one year of service, from which he was finally driven by the influence of Napoleon, was the director of the policy of Prussia and may well be regarded as the founder of the Prussia of to-day. Recognizing the defects of the Prussian system, he formulated and published his plan of government; and although unable during his short term of service to secure the adoption of this plan, he left to his successors a model of administrative reform in his great municipal corporations act of 1808. Besides this, Stein was able to abolish serfdom, to make it possible for those not of noble blood to acquire and hold land, and to introduce important reforms in the general administrative system. Stein's concrete model of an administrative system was to be found in the English system as then existing. But his idea of granting to the nobility large local powers, to be exercised under central control so as to prevent the abuse of the powers granted, was not adopted. The failure of Stein's plans brought Hardenberg to the front in 1810. Hardenberg's ideas were quite different from those of Stein. Hardenberg felt that before many privileges of local self-government could be granted to the people, the poorer classes in the community must be released from their economic dependence upon the richer classes. He had the experience of the French before him and believed that the first thing to do was to establish a strongly centralized administration like the French, which should be directed by men of liberal ideas. Hardenberg was not, however, able to overthrow what Stein had already established. As a part of his reform Stein had divided the country into government districts . . . at the head of each of which was placed a board called the 'government' . . . which attended to almost all central administrative matters that in the nature of things could be attended to in the localities. Purely local matters, *i. e.*, matters recognized as belonging to the sphere of local autonomy, which were quite unimportant, were left in the charge of the cities and the rural communities, which were to act under the supervision of these 'governments.' Hardenberg suffered this organization to remain, but, in order to increase his influence over it, he put every two or three districts under a provincial governor who was to represent the central government in the province. Below the district Stein had retained a historic Prussian division, to wit the 'circle,' at the head of which was the landrath, who was now made the subordinate of the 'government.' All of these authorities—the governor, the 'government,' and the landrath—were placed under the direction of the chancellor, which last position Hardenberg had created for himself. Most of the officers in this organization were salaried and professional in character. The system was therefore, as before, a centralized bureaucracy. But it was better organized than before, and it was directed by a man of advanced liberal ideas, and who made use of the vast power he possessed to further the interests of the state as a whole. With this wonderfully efficient instrument great progress was made in carrying out the social and economic reforms begun

by Stein. . . . But before the reform could be completed Hardenberg died (in 1822) and a reaction immediately set in. The great landholders, whose privileges had been seriously diminished by what had been accomplished, came forward and managed to persuade the king to grant them certain powers in the domain of purely local government. Local legislatures were formed in which the landholders had almost complete control; and the attempt was made later to form out of delegates from these local legislatures a national parliament. This attempt was frustrated by the revolution of 1848, which was largely a protest by the commercial and industrial classes against the monopoly of governing which the landholders were beginning to claim. The result of the revolution was the formation of a constitution in which the suffrage was made to depend not upon the ownership of land but upon the ownership of any kind of property. At first the legislature which was formed on this basis contained a liberal majority which set to work to curtail the powers of the landowners. This led to another reaction, *viz.*, the conservative reaction of 1850-60, during which the entire power of the administration was prostituted in the interest of the Conservative party and the landholders. This preying of one class upon another, which is so characteristic of the internal history of Prussia from 1822 and 1860, was largely the result of the weakness of the monarchy during that period and of the introduction of the principle of the parliamentary responsibility of the ministry into a country in which the people had not as yet learned how to govern themselves. It was only natural therefore that, when the monarchy became stronger by the accession of the late King William I, who repudiated the principle of the parliamentary responsibility of his ministers, this class tyranny should cease. The great constitutional conflict in Prussia which followed his accession to the throne (1860-4) showed the Prussian people that they had found their master, and that the Crown in a monarchical country is the natural arbiter between conflicting social classes and should protect the weak against the aggressions of the strong. . . . It was seen that important changes must be made in the system of local government in order to accustom the people to exercise their powers with moderation and with a regard for the interests of the minority. The necessary concrete measures were sketched by Dr. Gneist of the University of Berlin, and one of the greatest of modern public lawyers, in his little book entitled *Die Kreisordnung*. In this work Dr. Gneist referred, as had Stein before him, to the English system of local administration which they both knew so well and admired so much. After a long discussion the plans advocated by Gneist were for the most part incorporated into the law of Dec. 13, 1872, commonly known as the *Kreisordnung*. The adoption of these plans was largely due to Prince Bismarck, who believed strongly in local autonomy and self-administration, and who supported the ideas advocated by Gneist in the face of the opposition of the general public and of that of his colleagues in the ministry and the greater part of the government officials who were loth to give up any of the powers which they possessed in the organization founded by Hardenberg. In addition to the *Kreisordnung* several other laws were passed in the course of the next ten years, all either carrying the reform further, or modifying details which experience had shown to be faulty. The definite ends which this reform has had in view are: First. The extension of the sphere of local autonomy. Second. The introduction of a judicial control over the actions of ad-

ministrative officers in the hope of preventing a recurrence of the prostitution of the powers of the administration in the interest of party or social faction. Third. The introduction of a non-professional or lay element into the administration of central as well as of local matters in the hope of increasing the political capacity of the people. . . .

"In accordance with continental ideas as to the territorial distribution of administrative functions two spheres of administrative action are recognized by the law: the one, central; the other, local. For the purposes of the central administration which needs attention in the localities, the country is divided into administrative circumscriptions called provinces, government districts, circles, *etc.*, in which are officers under the control of the heads of the various executive departments at Berlin. For the purposes of local government certain municipal or public corporations have grown up which have their own officers and their own property separate and apart from that of the central government. At the time of the reform in many instances the boundaries of the administrative circumscriptions for the purposes of central administration were not identical with those of the various public corporations, *e. g.*, the boundaries of the administrative provinces were not the same as those of the public corporations bearing the same name. In most cases, further, the authorities for the purposes of central administration were not the same as those of the public corporations. The reform of 1872 has endeavored to simplify matters. It has in the first place adopted the old divisions, *viz.*, the provinces, districts, and circles, but it has added a new division, *viz.*, the justice of the peace division (*Amtsbezirk*); in the second place it has in almost all instances insisted upon the coincidence of the boundaries of the corresponding areas. Thus at the present time in almost all cases the area of the administrative province is the same as that of the provincial corporation. In the third place the central and local authorities within the same area have in most cases been consolidated. In the province, however, the attempts at such consolidation were unsuccessful. . . . As in the French, so in the Prussian system of local government, the interference of the central legislature in local affairs is infinitesimal if it exists at all. Enough of the old feudal ideas of local autonomy have remained to permit of the development of the principle that there is a sphere of administrative action which must be left almost entirely to the localities; that within this sphere the legislature should not interfere at all; that any central interference or control that may be required over this local administration should come from the administration and in the main from the lay authorities of the administration, and should be confined simply to preventing the localities from incurring too great financial burdens. Therefore the law does not, as in the United States and as it does to a certain extent in England, enumerate the powers and duties of the localities, but says simply that the local affairs of particular districts shall be governed by the decisions of local authorities in the nature of local legislatures, and that in those cases only in which the law has expressly given it the power, may the central administration step in to protect the localities from their own unwise action. This system is one of general grants of local power with the necessity in certain cases of central administrative—not legislative—approval or control. The benefits of such a system cannot be overestimated. Through its adoption all the evils of local and special legislation are avoided. In place of an irresponsible legislative control, which in the

United States has shown itself so incapable of preventing the extravagance of localities that in many cases the power of the legislature to permit local action has been curtailed by the constitutions, is to be found a control exercised by responsible authorities—authorities which have a certain permanence and are well able to judge whether a given action will be really hurtful to a locality or not. At the same time the greater freedom from central interference guaranteed to the localities by this system is well calculated to encourage the growth of local pride and responsibility."—F. J. Goodnow, *Comparative administrative law*, v. 1, pp. 295-302, 336-337.

Administrative law in England.—"The English administrative jurisdiction, whose main principles have been adopted in the United States, is simply an outgrowth of the original system of administrative control. The Norman political system made no distinction between governmental authorities. All powers of government were consolidated in the hands of the Crown. First to be differentiated was the legislative authority, the Parliament. But for a long time after the differentiation of Parliament there was almost no legal distinction between the position of the officers for the administration of justice and that of the officers for the administration of government. Indeed most important officers discharged functions in both branches and all alike were regarded as merely the servants of the Crown. Some, it is true, were engaged mainly in the application of the private law, others were engaged mainly in the application of the public and administrative law. But all were officers of the Crown, which directly or indirectly could remove them all from office and could dictate to them what should be the decision of the cases which were brought before them. To the officers of one of the courts, *viz.*, the court of king's bench, which was regarded as occupying a superior position because the Crown by a fiction of the law was supposed always to be present in it, was given a supervisory power over all other authorities. If anyone was aggrieved by an act of a subordinate officer of the Crown he had the right to appeal to the Crown, who was the fountain of justice, and such an appeal went to the court of king's bench. At first it seems to have gone to the *Curia Regis* or King's Council before the development of the court of king's bench. Indeed, after the development of the king's bench, when with the usual habits of judges the members of this court became very technical in their application of the law, appeals went in many cases directly to the Crown and were attended to generally by the chancellor or the council. For the King at the time of the formation of the court of king's bench especially reserved to himself the decision of particularly difficult cases. From these reserved judicial powers grew up the court of chancery as well as other courts. In answer to such appeals the court of king's bench issued in the name of the Crown certain writs directed to the officer whose decision was complained of, and so formed as to afford the desired relief. Though these writs were originally issued from the office of the chancellor, the court soon obtained the right to issue them directly. These writs were named from the most prominent words in them—words which largely expressed the purpose of the writ. Thus, if anyone appealed to the Crown to force a recalcitrant officer to do something which the law of the land commanded the officer to do, the writ which was issued in answer to the appeal was called the writ of *mandamus*. But at the same time that the court of king's bench was developing

these special remedies, which became known as extraordinary legal remedies or prerogative writs, the chancellor, the keeper of the King's conscience, was, through the exercise of the reserved judicial powers of the King, also developing a series of special remedies called equitable remedies, the most important of which, from the point of view of administrative law, was the bill of injunction. Originally, however, the injunction does not seem to have been made use of commonly against officers. While most of the writs issued by the royal courts were issued to litigants upon proper demand *de cursu*, and were known as writs *ex debito justitiæ*, the writs by means of which the court of King's bench exercised its supervisory powers over the other authorities do not seem to have become, in early times at any rate, writs of right, writs *ex debito justitiæ*, but were issued only in extraordinary cases when some gross injustice was done. They were known, therefore, as 'prerogative writs.' The same was practically true of the equitable remedies, and particularly of the bill of injunction. Further on the return to these writs, generally only questions of law were considered. They were made use of simply to keep the lower authorities within the bounds of the law, and could not be used, after the practice in regard to them became crystallized, to review any question of fact or expediency. It therefore became necessary to develop some further remedy, unless the lower authorities were to be permitted to decide such questions free from all control. Such a method was found in the power which was granted to the individual to appeal to the Privy Council. Such appeals the council might hear as a result of the fact that the King granted to a division of it, *viz.*, the star chamber, a portion of his reserved judicial powers. This body acted as the administrative superior of the royal authorities in the localities, and on appeal to it questions of fact and expediency, as well as of law, could be considered. Formed in the time of Henry VII to control the nobility, who had grown turbulent during the wars of the Roses, it served at first to protect the weaker classes of the community against the arbitrariness of the administrative authorities, which were largely chosen from the nobility; but it was later, *viz.*, under the Stuarts, used in such a way that it was abolished on the occasion of the revolution in 1640. In order to offer an appeal similar to the one which disappeared on the occasion of its abolition, it was provided in a series of statutes that the court of quarter sessions of the justices of the peace, which had been theretofore mainly an administrative authority for the purpose of county administration, could hear and decide appeals from those decisions of the justices of the peace, acting singly or in petty and special sessions, which affected property and the right of personal liberty. There was thus formed for the decision of questions of fact and expediency, as well as of law, an administrative court in each county, which came finally to have a very wide power of control over the acts of subordinate administrative officers. Its members further would certainly have special knowledge of the law they had to apply and of the conditions of administrative action, since they were engaged in other capacities as administrative officers. Further the commission of the justices of the peace enjoined upon them in difficult cases to take the advice of the royal courts. This came finally to be done by 'stating a case' which was agreed upon by the justices and the parties before them, and which was then submitted to the royal courts, and finally decided by them. In consequence of these facts, one of the writs which were originally issued

by the court of king's bench, *viz.*, the *certiorari*, lost much of its earlier importance in England; and we find that statute after statute was passed which prohibited its use as a means of appealing from the acts of administrative officers. But up to the coming to the throne of the Orange-Stuarts in 1689, all officers, whether judges or administrative officers, held their office at the will of the Crown. There was no judicial tenure as there was at the time in both France and Germany. In this fact, and in the existence in the Crown of reserved judicial powers, are probably to be found the reasons why the Crown permitted such a control over the administration to be given to the courts. For the Crown could exercise at any time a strong personal influence over the judges of the courts; and if it was found that the administration of the law was becoming so technical as to hamper the action of the administration, the Crown could at any time exercise its reserved powers and transfer any matter to a newly created and more pliable authority. In 1701, however, all this was changed. The act of settlement made the judges independent of the royal power, and the whole tendency of English development was to make the justices of the peace actually, though not legally independent of the Crown. An attempt by Lord Somers during the reign of William III to coerce, through the power of dismissal from office, numerous justices of the peace raised such a storm of opposition that no later ministry has dared to make use of such a power. At the same time that the tenure of the judges and the justices became independent of the Crown their administrative jurisdiction remained essentially the same, with the result that the control which might before have been regarded as merely a part of the administrative control became absolutely judicial in character, *i. e.*, was exercised by authorities independent of the administration which was to be controlled.

"Such was the condition of the English administrative jurisdiction at the time the American colonies were founded. At first, indeed, the American judges, like the English judges of the same period, were both in tenure and action under the control of the executive which they were to control, but soon their tenure was assured both against the executive and the legislature, so that from a very early time the higher courts exercised a really judicial control over the actions of the administration. The justices of the peace did not, however, at first become independent of the administration in tenure. And this was probably the reason why our courts of quarter sessions were not able to develop any very large administrative jurisdiction. The appointment early in our history of other officers for purely administrative purposes relegated the justices to the position of inferior judicial officers who have a police jurisdiction and a minor civil private law jurisdiction. They were left very few administrative duties to perform. Notwithstanding the fact that the justices of the peace in the United States later on obtained a tenure independent of the administration, in that they became generally elected by the people for a fixed term of office, they never got anything like the same administrative jurisdiction that was given to their English brothers. It is true that in special instances we find appeals from the decisions of administrative officers allowed to the courts of the justices or their successors, the county courts. Especially is this true in some of the southern commonwealths and in Pennsylvania. But it may safely be said that there has never been, and is not now in the United States any at all important administrative jurisdiction except such as is to be

found in the writs which the higher courts, as a result of their being the heirs of the English court of king's bench, have the right to issue. We have lost an important part of the English administrative jurisdiction—particularly important because by its means a host of questions of fact and of expediency could be reviewed on appeal. With us such questions are decided finally by the administration, with the result that a most precious means of protecting individual rights has been lost.”—F. J. Goodnow, *Comparative administrative law*, v. 2, pp. 192-199.

ADMIRAL.—Origin of name.—Duties. See NAVAL LAW: Origin.

ADMIRALTY.—Constitution of the British Admiralty.—“The Navy, as every one knows, is ruled by the Admiralty, and the Admiralty is one of the oldest organs of administration in this country [England]. It is also quite unique in its constitution and characteristics. . . . The Admiralty, indeed, has no fixed constitution. There are certain documents which seem to define its duties, functions, and responsibilities, but the inner spirit of its working is not to be found in them. That is embodied in a whole mass of usages, precedents, prescriptions, and informal understandings, many of which have come down from time immemorial, none of which possesses the fixity of a constitutional text, while all are endowed with a flexibility which enables them to conform without stress or friction to circumstances as they arise in any emergency. Sir James Graham, a former First Lord of the Admiralty who had closely studied its constitution and who himself took a leading part in one of its most memorable reorganizations, declared in 1861 to a Committee of the House of Commons, ‘The more I have investigated the matter the more I am satisfied that, like the common law in aid of the Statute Law, the power exercised by the Board of Admiralty and the different members of it rests more upon usage than upon the Patents, uninterrupted usage from a very early period.’ Mention is here made of ‘the Patents.’ Each successive Board of Admiralty derives its formal authority from a Patent issued by the Crown, a new Patent being required whenever any change is made in the *personnel* of the Board. But these successive Patents are, and have been for more than two centuries, issued in substantially the same form. The Patent issued by Queen Anne vesting in Commissioners—now officially known as ‘My Lords Commissioners of the Admiralty’—all the powers previously exercised by her husband, Prince George of Denmark, as Lord High Admiral, is, save for certain small alterations, omissions, and additions, textually identical with that issued to the present Board of Admiralty by King George V. From it is nominally derived all the authority exercised by the Board of Admiralty over the whole naval service and over the civil departments subject to its control, though in reality much of that authority is of much earlier origin and date. The Patent of Queen Anne is only one of a long series, though it derives its special importance, on the one hand, from the fact that it marks a break in that series, and on the other from the fact that it has survived to our own days. The essential thing to bear in mind is that the Board of Admiralty as we know it is a body of Commissioners appointed by the Crown to execute the office of Lord High Admiral. Now the office of Lord High Admiral goes back to the beginning of the fifteenth century, its incumbent receiving a Patent of office just as the Board of Admiralty receives a similar Patent to-day. The powers conferred on successive Lords High Admiral varied from time to time and were

gradually enlarged. As early as the reign of Henry VI. the Patent had received a form and scope not greatly differing from those of the Patent issued by Queen Anne and her successors. We need not, however, trace the office of Lord High Admiral through its expansion in the time of Henry VIII into an Office of Admiralty on the one hand and a Navy Board on the other, or through its vicissitudes in Stuart and Commonwealth times down to its final abeyance on the death of Prince George of Denmark. It was, it is true, revived for a short period early in the last century in favour of the Duke of Clarence, afterwards King William IV, but the revival proved so disastrous to the welfare and good government of the Navy that it soon came to an end, and for all practical purposes it may be said that the office of Lord High Admiral has been in commission since Prince George of Denmark died in 1709. But its spirit survives not merely in the Patent of Queen Anne but in an earlier declaratory Act passed in 1690 under William and Mary to define the powers of a Board of Admiralty appointed at a time when the office of Lord High Admiral was in temporary abeyance. That Statute recited that ‘all and singular authorities, jurisdictions and powers which, by Act of Parliament or otherwise, had been lawfully vested in the Lord High Admiral of England, had always appertained and should appertain to the Commissioners for executing the office for the time being ‘to all intents and purposes as if the said Commissioners were Lord High Admiral of England.’ Whatever, therefore, the Lord High Admiral, in the height and plenitude of his power, might lawfully do, that the Board of Admiralty may also lawfully do. Its power and authority extend far beyond the Patent and the Statute of William and Mary because both those instruments confirm the powers of the Lord High Admiral without attempting to define them.”—C. Beresford, *Book of the Navy*, pp. 120-132.

“We have dwelt upon this peculiar history because it affords an instructive insight into those inestimable qualities of flexibility of administration and ready adaptability to circumstances which have made the Admiralty what it is. We have seen that both an Office of Admiralty—constituted as it were the Staff of the Lord High Admiral—and a Navy Board existed as early as the reign of Henry VIII. The latter administered the civil departments connected with the Navy in greater or less subordination to the former, which in its turn performed many of the directive and executive duties pertaining to the Lord High Admiral himself. This was no very logical distribution of the administrative work to be done, and those who are familiar with the history of naval administration in the eighteenth century are well aware that there was constant friction between the Navy Board and the Admiralty and that the former became in the course of time a very hotbed of inefficiency and even corruption—vices, however, from which the Admiralty itself was not entirely free. Still, the system survived through the great wars of the eighteenth and early nineteenth centuries and provided a Navy which, thanks mainly to the zeal and devotion of the officers who served in it, was generally equal to the work it had to do. It was abolished in 1832, when Sir James Graham in a series of far-reaching reforms put an end to what was regarded as a mischievous dual control. The Navy Board, always subordinate to the Admiralty, was then finally incorporated with the latter. . . . We must pass over the various forms which the Board of Admiralty has assumed since the Patent of Queen Anne finally settled such writ-

ten constitution as it has, and come at once to its structure and organization at the present day. The pivot and centre of the whole is the First Lord of the Admiralty. In the eighteenth century it was not uncommon for a naval officer of high rank and repute, such as Anson, Hawke, St. Vincent, Barham, and others, to hold the office of First Lord. But in more modern times the First Lord of the Admiralty has always been a civilian, and a politician with a seat in the Cabinet. The professional element so necessary to the government and control of a great fighting service is to be found in the naval members of the Board—Sea Lords as they are officially designated—and not in the statesman who presides over them. The powers, functions, and responsibilities of the First Lord have never been very precisely determined. He is not a Lord High Admiral, since he is only the chief of a body of Commissioners for executing the office of that functionary, and the powers conferred by the Patent are conferred not on any individual but on 'any two or more of you.' Nor can he as a Minister representing his Department in the Cabinet and in Parliament act wholly independently of his colleagues on the Board. Theoretically he could, perhaps, and there may in past times have been a few exceptional cases in which a First Lord has so acted. But in these days a First Lord who took important decisions in opposition to the judgment of his professional colleagues would very soon find his position untenable. As a rule, then, the First Lord is the intermediary between the Cabinet and the Board, and the representative of his Department in Parliament, deriving immense authority and influence from the fact that—under the Cabinet which can always overrule him—he is directly responsible to Parliament and the country for the efficiency and sufficiency of the Fleet, the other members of the Board being in like manner directly responsible to him. . . . The Board of Admiralty as now constituted consists of the First Lord, who presides over it, of the First, Second, Third, and Fourth Sea Lords, of the Civil Lord, of the additional Civil Lord—who holds an office which formerly existed for a short time and was revived for special purposes by Mr. Churchill in January, 1912—of the Parliamentary Secretary, and of the Permanent Secretary. The whole of the business of the Admiralty is distributed among these several members of the Board according to a standing scheme known as the 'Distribution of Business.' This scheme is modified from time to time and revised according to circumstances, but as it stands for the time being it clearly defines the sphere of administration for which each member of the Board is responsible. Thus, according to the scheme at present in force, the First Lord is responsible for the 'general direction of all business'—a comprehensive range of responsibility which of itself invests the First Lord with a large measure of authority over each and all of his colleagues. The First Sea Lord is responsible for 'organization for war and distribution of the Fleet' and for all executive and administrative questions relating thereto. In particular he is charged with the supervision of the War Staff, about which we shall have more to say hereafter. The Second Sea Lord is responsible for all questions relating to 'Personnel' and the Third Sea Lord for all questions relating to 'Materiel.' The Fourth Sea Lord is responsible for all questions relating to 'Stores and Transport.' The Civil Lord is responsible for all questions relating to 'Works, Buildings, and Greenwich Hospital,' and the Additional Civil Lord for all questions relating to 'Contracts and Dockyard Business.' The Parliamentary Sec-

retary is at the head of the department of 'Finance' and the Permanent Secretary superintends all 'Admiralty Business.' He controls the internal administration of the Department, and all communications from 'My Lords Commissioners of the Admiralty' pass through his office and are signed by him. . . . Thus all the master threads of a vast network of administration, affecting every branch of naval policy, naval preparation, naval construction, and naval finance, pass in due order into the Board Room, thence, after due deliberation and decision, to issue in the form of executive orders and directions. This is the paramount function of the Board, a function which immemorial usage and that flexibility of adaptation which is native to the sea service enable it to discharge with rare efficiency and, on occasion, with unexampled celerity and dispatch, all Statutes, Patents, and Orders in Council notwithstanding. As Lord George Hamilton, a former First Lord of great experience, told a Royal Commission in 1887, 'It has this advantage, that you have all departments represented round a table, and that if it is necessary to take quick action, you can do in a few minutes that which it would take hours under any other system to do.' Lastly, there is one vital organ of naval administration which has already been mentioned above, but which will well repay some further consideration. This is the War Staff. In its present form the War Staff is a newly-constituted department—the country owes it to the initiative of the present First Lord—though its constituent elements, imperfectly articulated and co-ordinated, have existed at the Admiralty for many years past. A Foreign Intelligence Branch was first established in 1883. This developed in a few years into the Naval Intelligence Department, its development in that direction having been greatly advanced by that gallant and zealous officer Admiral Lord Charles Beresford, who as Fourth Sea Lord of the Admiralty from 1886 to 1888 strenuously insisted on its vital importance, and is believed to have resigned in the latter year because he could not overcome the apathy of his colleagues on the subject. The Naval Intelligence Department has now in its turn been absorbed into a fully constituted War Staff, of which the best description is to be found in the following extracts from a Memorandum drawn up by the present First Lord [Winston S. Churchill] and issued by the Admiralty on January 1, 1912:—

" . . . Naval war is at once more simple and more intense than war on land. The executive action and control of fleet and squadron commanders is direct and personal in a far stronger degree than that of generals in the field, especially under modern conditions. The art of handling a great fleet on important occasions with deft and sure judgment is the supreme gift of the admiral, and practical seamanship must never be displaced from its position as the first qualification of every sailor. The formation of a War Staff does not mean the setting up of new standards of professional merit of the opening of a road of advancement to a different class of officers. The War Staff is to be the means of preparing and training those officers who arrive, or are likely to arrive by the excellence of their sea service, at stations of high responsibility for dealing with the more extended problems which await them there. It is to be the means of sifting, developing, and applying the results of history and experience, and of preserving them as a general stock of reasoned opinion available as an aid and as a guide for all who are called upon to determine, in peace or war, the naval policy of the country. . . .

"It should not be supposed that these functions find no place in Admiralty organization at the present time. On the contrary, during the course of years, all or nearly all the elements of a War Staff at the Admiralty have been successively evolved in the practical working of every-day affairs, and have been developing since the organization of the Foreign Intelligence Branch in 1883. The time has now come to combine these elements into an harmonious and effective organization, to invest that new body with a significance and influence it has not hitherto possessed, and to place it in its proper relation to existing power.

"Since, however, under the distribution of Admiralty business on the Board, the First Sea Lord occupies for certain purposes, especially the daily distribution of the Fleet, on which the safety of the country depends, the position of a Commander-in-Chief of the Navy, with the First Lord immediately over him, as the delegate of the Crown in exercising supreme executive power, it follows that the War Staff must work at all times directly under the First Sea Lord. His position is different in important respects from that of the senior member of the Army Council as constituted. The First Sea Lord is an executive officer in active control of daily Fleet movements, who requires, like a General in the field, to have at his disposal a Chief of the Staff, but who is not the Chief of the Staff himself.

"A proper staff, whether naval or military, should comprise three main branches—namely, a branch to acquire the information on which action may be taken; a branch to deliberate on the facts so obtained in relation to the policy of the State, and to report thereupon; and, thirdly, a branch to enable the final decision of superior authority to be put into actual effect. The War Staff at the Admiralty will, in pursuance of this principle, be organized from the existing elements in three divisions—the Intelligence Division, the Operations Division, and the Mobilization Division. These may be shortly described as dealing with war information, war plans, and war arrangements respectively. The divisions will be equal in status, and each will be under a director, who will usually be a Captain of standing. The three divisions will be combined together under a Chief of the Staff.

"The Chief of the Staff will be a Flag Officer. He will be primarily responsible to the First Sea Lord, and will work under him as his principal assistant and agent. He will not, however, be the sole channel of communication between the First Sea Lord and the Staff; and the First Lord and the First Sea Lord will, whenever convenient, consult the Directors of the various Divisions or other officers if necessary. . . . The Chief of the War Staff will guide and co-ordinate the work of the Staff in all its branches. He will, when desired, accompany the First Lord and the First Sea Lord to the Committee of Imperial Defence. . . .

"The functions of the War Staff will be advisory. The Chief of the Staff, when decision has been taken upon any proposal, will be jointly responsible with the Secretary for the precise form in which the necessary orders to the Fleet are issued, but the Staff will possess no executive authority. It will discharge no administrative duties. Its responsibilities will end with the tendering of advice and with the accuracy of the facts on which that advice is based.

"Decision as to accepting or rejecting the advice of the Staff wholly or in part rests with the First Sea Lord, who, in the name of the Board of Admiralty, discharges the duties assigned to him

by the Minister. In the absence of the First Sea Lord for any cause the Second Sea Lord would act for him. . . .

"The selection and training of the officers to compose a Staff of the nature described as important hitherto no special qualifications have been regarded as essential for the officers employed in the Intelligence and Mobilization Departments, because the ordinary sea training of naval officers was supposed to supply all that was required. This training, however, although admirable on its practical side, affords no instruction in the broader questions of strategy and policy, which become increasingly important year by year. A change in this respect is therefore considered advisable, and a special course of training at the War College will form an essential part of the new arrangements. The President of the College will be entrusted with this important duty, and in order that it may be carried out to the best effect, he will at all times be in close touch and association with the Chief of the Staff. In course of time the appointment will be held by a Flag Officer who has been a Staff Officer himself. Candidates for the Staff will be selected from volunteers among lieutenants of suitable seniority as well as officers of other branches throughout the Service irrespective of their previous qualifications as specialist officers or otherwise, and those who pass the necessary examinations at the end of or during the War College course will be eligible to receive appointments either at the Admiralty or on the Staff of Flag Officers afloat as they fall vacant. In all cases, however, regular periods of sea-going executive duty will alternate with the other duties of Staff Officers of all ranks, in order that they may be kept up to the necessary standard as practical sea officers. All appointments on sea-going staffs will in the course of time be filled by these officers, and form the proper avenue to eventual employment in the highest Staff positions at the Admiralty. . . ."—*Ibid.*, 133-137, 139-144.

1912-1920.—**Reorganizations.**—There have been two important reorganizations of the Admiralty in recent years, the first being part of Winston Churchill's naval schemes, the second made necessary by the increased responsibilities of the World War. In 1912, the various members of the board of Admiralty were made responsible for special functions:—the First Lord, general direction of business; First Sea Lord, organization for war and distribution of the fleet; Second Sea Lord, personnel; Third Sea Lord, stores and transport; Civil Lord, works, buildings, and hospital; Additional Civil Lord, contracts and dockyard business; Parliamentary Secretary, finance; Permanent Secretary, admiralty business. The reorganization of 1917 took place on May 14, the principal feature being that a Naval Staff was embodied in the Board. At present [1921] the duties of the Admiralty are divided into the two departments of operations and maintenance. The first division has as its functions naval policy and the general direction of operations, war operations in home waters and elsewhere, trade protection and anti-submarine operations. The officers in charge are the First Sea Lord and Chief of the Naval Staff, and the Deputy and Assistant Chiefs of the Naval Staff. The maintenance division is in charge of the Second, Third, and Fourth Sea Lords, and the Civil Lord, and is concerned with personnel, finance, supplies and transport.

ADMIRALTY ISLANDS, a small group of tropical islands, off the northeastern coast of New Guinea, forming a part of the Bismarck Archipelago. Became a German protectorate in 1884. The

principal island is Taui, or Manus. On September 12, 1914, they were occupied by an Australian force and were awarded to Australia as mandatory in 1919.—See also BISMARCK ARCHIPELAGO; MELANESIA.

ADMIRALTY LAW, the system of law and procedure referring to maritime transactions. The term originated in England from the fact that this branch of law was originally administered by the Lord High Admiral. At present, the Court of Admiralty in that country forms a separate part of the High Court of Justice, being grouped with the Probate and Divorce Courts in a special division. Its jurisdiction includes actions to recover possession of a ship, to recover damages for injuries to shipping, to recover seamen's wages, for necessities furnished to a ship, for bottomry [a loan on the ship], respondentia [a loan on the goods in the ship] and mortgage, for pilotage and towage, for salvage, for restoration of goods taken by pirates, for assaults and batteries on the high seas and all actions of similar scope. In the United States, the federal judiciary possesses exclusive jurisdiction in all maritime cases. This includes all cases arising on the high seas or Great Lakes, and most of those on navigable rivers and canals within the territory of the United States. In this country there is no special Admiralty Court. Admiralty cases are heard in the first instance in the United States District Courts, from which they may be appealed to the Circuit Court of Appeals and finally to the United States Supreme Court.—See also NAVAL LAW; Court of Admiralty.

1183.—Law as to shipwrecks.—"The Emperor Constantine, or Antonine (for there is some doubt as to which it was), had the honour of being the first to renounce the claim to shipwrecked property in favor of the rightful owner. But the inhuman customs on this subject were too deeply rooted to be eradicated by the wisdom and vigilance of the Roman law givers. The legislation in favor of the unfortunate was disregarded by succeeding emperors, and when the empire itself was overturned by the northern barbarians, the laws of humanity were swept away in the tempest, and the continual depredations of the Saxons and Normans induced the inhabitants of the western coasts of Europe to treat all navigators who were thrown by the perils of the sea upon their shores as pirates, and to punish them as such, without inquiry or discrimination. The Emperor Andronicus Comnenus, who reigned at Constantinople in 1183, made great efforts to repress this inhuman practice. His edict was worthy of the highest praise, but it ceased to be put in execution after his death. . . . Valin says, it was reserved to the ordinances of Lewis XIV. to put the finishing stroke towards the extinction of this species of piracy, by declaring that shipwrecked persons and property were placed under the special protection and safe guard of the crown, and the punishment of death without hope of pardon, was pronounced against the guilty."—J. Kent, *International law*, p. 31.

1537.—Jurisdiction.—The act of 28 Henry VIII, c. 15, granted jurisdiction to the lord high admiral of England.

1575.—Jurisdiction.—"The request of the Judge of the Admiralty, to the Lord Chief Justice of her Majesty's bench and his colleagues, and the Judges' Agreement 7th May 1575."—by which the long controversy between these courts as to their relative jurisdiction was terminated, will be found in full in E. C. Benedict, *American Admiralty*, 4th ed., p. 30.

1664.—Tide-mark.—The space between high and low water mark is to be taken as part of the

sea, when the tide is in.—E. C. Benedict, *American Admiralty*, 4th ed., p. 33.

1789.—United States Judiciary Act.—The Act of 1789 declared admiralty jurisdiction to extend to all cases "where the seizures are made on waters which are navigable from the sea by vessels of ten or more tons burthen."—*Judiciary Act, U. S. statutes at large*, v. 1, p. 76.—See also SUPREME COURT: 1789-1835.

1798.—Lord Stowell and admiralty law.—"Lord Mansfield, at a very early period of his judicial life, introduced to the notice of the English bar the Rhodian laws, the Consolato del Mare, the laws of Oléron, the treatises of Roccus, the laws of Wisbuy, and, above all, the marine ordinances of Louis XIV, and the commentary of Valin. These authorities were cited by him in *Luke v. Lyde* (2 Burr. 882), and from that time a new direction was given to English studies, and new vigor, and more liberal and enlarged views, communicated to forensic investigations."—J. Kent, *Commentaries*, pt. 5, lecture 42.—The old maritime codes brought before the English bar at this time were among the most important in the development of maritime law. The Rhodian laws dating back possibly to the third century stated that "if cargo is thrown overboard to lighten a ship all must contribute to make good the loss incurred for the benefit of all." The laws of Oléron, compiled in the twelfth century by order of Eleanor of Aquitaine were made up of the judgments of the court of Oléron, an important shipping center, and of the usages of the sea having force among the mariners of that island. The Consolato del Mare, compiled in the fourteenth century by the Catalans of Barcelona, was made up of the settled uses of trade and navigation of the maritime provinces of the Mediterranean. The laws of Wisby were the mercantile customs and regulations from Wisby, Sweden, compiled in the last years of the thirteenth century, and in force throughout the Baltic sea. They were the basis of the maritime regulations of the Hanseatic League. In 1681, Louis XIV had collected and systematised the whole law of shipping, navigation, marine insurance, bottomry, etc.—"Since the year 1708, the decisions of Sir William Scott (now Lord Stowell) on the admiralty side of Westminster Hall, have been read and admired in every region of the republic of letters, as models of the most cultivated and the most enlightened human reason. . . . The doctrines are there reasoned out at large, and practically applied. The arguments at the bar, and the opinions from the bench, are intermingled with the greatest reflections, . . . the soundest policy, and a thorough acquaintance with all the various topics which concern the great social interests of mankind."—*Ibid.*

1803-1809—Impressment of American seamen by British navy. See U. S. A.: 1803; Report on British impressment; 1804-1809.

1841-1842.—Jurisdiction.—The act 3 and 4 Vic., c. 65, restored to the English Admiralty some jurisdiction of which it had been deprived by the Common Law Courts.—E. C. Benedict, *American Admiralty*, p. 56.

1845.—Extension of admiralty jurisdiction.—"It took the Supreme Court of the United States more than fifty years to reject the antiquated doctrine of the English courts, that admiralty jurisdiction was confined to salt water, or water where the tide ebbed and flowed. Congress in 1845 passed an act extending the admiralty jurisdiction of the Federal courts to certain cases upon the great lakes, and the navigable waters connecting the same. The constitutionality of this act was

seriously questioned, and it was not till 1851 that the Supreme Court, by a divided court, in the case of the *Genesee Chief*, which collided with another vessel on Lake Ontario, sustained the constitutionality of the act, and repudiated the absurd doctrine that tides had anything to do with the admiralty jurisdiction conferred by the constitution upon Federal courts."—L. Trumbull, *Precedent versus justice* (*American Law Review*, v. 27, p. 324).

ALSO IN: *Act of 1845*, 5 U. S. Statutes at large, 726.

1873.—Division of loss in case of collision settled by Judicature Act.—"The rule that where both ships are at fault for a collision each shall recover half his loss from the other, contradicts the old rule of the common law that a plaintiff who is guilty of contributory negligence can recover nothing. This conflict between the common law and the law of the Admiralty was put an end to in 1873 by the Judicature Act of that year, which (s. 25, subs. 9) provides that 'if both ships shall be found to have been in fault' the Admiralty rule shall prevail. . . . There can be no doubt that in some instances it works positive injustice; as where it prevents the innocent cargo-owner from recovering more than half his loss from one of the two wrong-doing shipowners. And recent cases show that it works in an arbitrary and uncertain manner when combined with the enactments limiting the shipowner's liability for damage done by his ship. The fact, however, remains, that it has been in operation with the approval of the shipping community for at least two centuries, and probably for a much longer period; and an attempt to abolish it at the time of the passing of the Judicature Acts met with no success. The true reason of its very general acceptance is probably this—that it gives effect to the principle of distributing losses at sea, which is widely prevalent in maritime affairs. Insurance, limitation of shipowner's liability, and general average contribution are all connected, more or less directly, with this principle."—R. G. Marsden, *Two points of admiralty law* (*Law Quarterly Review*, v. 2, pp. 357-362).

An enumeration of the various maritime codes with their dates may be found in E. C. Benedict, *American admiralty*, pp. 88-90, 4th ed.—G. B. Davis, *Outlines of international law*, pp. 5-6.

1917-1921.—Effect of Supreme Court decisions. See SUPREME COURT: 1917-1921.

1920.—American principle in admiralty procedure.—Federal jurisdiction.—Federal and state regulations.—"The wisdom of our ancestors, in laying the foundations of the Republic, is in nothing more evident than in our organic regulations in relation to commerce. For all commercial purposes we must be one people; no different rules must be applied in our maritime commerce in the ports of different states; perfect freedom and equality of trade and navigation among ourselves is constitutionally secure. If it had not been so, long before this time we should have been divided, weak and antagonistic sections, the fragments of our original Union. How easy it is to perceive that our harmony might be interrupted, and our strength impaired, if each state might adopt and enforce, on its half of a river, its section of a lake, its short stretch of coast, in its own ports and harbors and local waters, to which all states have a common right of use, a system of commercial and maritime law, repealing, or conflicting with that great system of commercial law which is known as the Admiralty and Maritime Law, and which alone can secure those equal state rights which it was one great object of the Constitution to protect."—E. C. Benedict, *American admiralty*, 4th ed., p. 112.

The Constitution of the United States provides (Art. 3, Sect. 2) that the judicial power of the United States should extend to all cases of admiralty and maritime jurisdiction. Art. 1, Section 8 gives Congress power to make all laws necessary to carry into execution the powers vested in the Federal government.

The Federal Constitution adopted and established, as part of the laws of the United States, approved rules of the general maritime law, and empowered Congress to legislate in respect of them and other matters within the admiralty and maritime jurisdiction. Moreover, it took from the states all power, by legislation or judicial decision, to contravene the essential purposes of, or to work material injury to, characteristic features of such law, or to interfere with its proper harmony and uniformity in its international and interstate relations. (*Knickerbocker Ice Co. vs. Stewart*, 1920), 253 U. S. 149).

ADOLPH OF NASSAU (1255-1298), German king, son of Walram, count of Nassau, chosen king to succeed Rudolph I, on May 5, 1292, being crowned at Aix-la-Chapelle on July 1. To strengthen his position in 1294 he allied himself with Edward I of England, against France, but failed to aid him. Was deposed in 1298 as a result of the conspiracy against him by Albert I of Austria and Wenceslaus II of Bohemia, Albert succeeding him. See AUSTRIA: 1291-1349.

ADOLPHUS FREDERICK (1710-1771), king of Sweden. After being bishop of Lübeck, was in 1743 chosen as heir to the Swedish throne; became king in 1751 and reigned until 1771. Due to the wrangling in the Riksdag which was composed of the two political cliques, the Caps and the Hats, his position was without real power. See SWEDEN: 1720-1792.

ADONIJAH, son of David; attempted to gain throne from Solomon. See JEWS: Kingdoms of Israel and Judah.

ADOPTION, Roman. See ROMAN FAMILY.

ADOPTIONISM, a doctrine, condemned as heretical in the eighth century, which taught that "Christ, as to his human nature, was not truly the Son of God, but only His son by adoption." The dogma is also known as the Felician heresy, from a Spanish bishop, Felix, who was prominent among its supporters. Charlemagne took active measures to suppress the heresy.—J. I. Mombert, *History of Charles the Great*, bk. 2, ch. 12.

ADOR, Gustave, (1845-), president of Switzerland during 1919 and during the World War was president of International Committee of the Red Cross. See SWITZERLAND: Swiss Red Cross and the World War.

ADORNI FACTION: Genoa. See GENOA: 1458-1464.

ADOWA, Battle of. See ITALY: 1895-1896.

ADRAR, an oasis in the western part of the Sahara, on the caravan route of Morocco; by the agreement of 1892 a part of French Sahara.

ADRENALINE, Isolation and development of. See CHEMISTRY: Practical application: Drugs.

ADRIA, a town and episcopal see in the province of Rovigo, Italy, the ancient Atria (the form Hadria is less correct). About 30 miles southwest of Venice; was originally an island, and in the time of the Romans, a naval station and flourishing port but is now far inland; has numerous antiquities, having been successively an Illyrian, a

Greek, and a Roman town; population (1920) about 17,000.

ADRIAN, or **Hadrian** (Lat. *Hadrianus*), the name of six popes.

Adrian I, pope from 772 to 795; found it necessary to call upon Charlemagne to drive out Desiderius, King of the Lombards, from the territory bestowed on the popes by King Pepin. Adrian was faithful to the Frankish alliance throughout his reign. Charlemagne wrote the epitaph upon Adrian's death which may be seen to this day on the door of the Vatican basilica.

Adrian II, pope from 867-872, assuming his duties at an advanced age. He spent his last years in a vain effort to mediate between the quarrels of the Frankish princes. Adrian II was forced to submit to Emperor Louis II in numerous temporal disputes.

Adrian III, pope, succeeding Marinus I in 884. Died the following year while journeying to Worms.

Adrian IV (**Nicholas Breakspear**), pope from 1154 to 1159, the only Englishman who has occupied the papal chair; born at Langley in Hertfordshire before 1100; served as legate in Scandinavia from 1152 to 1154; placed Rome under the interdict because of the murder of one of the cardinals. Adrian IV bestowed the sovereignty of Ireland on Henry II of England. In 1155 he used drastic measures in putting down the democratic aspirations of the Roman people under Arnold of Brescia whom he succeeded in having executed. He virtually began the bitter struggle between the papal power and the House of Hohenstaufen and died just as he was about to march at the head of the Italian forces against Emperor Frederick I.

Adrian V (**Ottobuono de Fieschi**), became pope July 11, 1276, succeeding pope Innocent IV; lived but five weeks following his election to the papal chair, dying at Viterbo on August 18.

Adrian VI (**Adrian Dedel**, 1450-1523), pope, 1522-1523; appointed tutor by the Emperor Maximilian to his seven-year-old grandson, Charles, who later became Charles V. Adrian's former pupil made him regent of Spain in 1520, under which regency a serious revolt broke out. As pope, Adrian sought to correct many ecclesiastical abuses. Because of his brief occupancy of the papal throne, however, his efforts as reformer were hardly effective.—See also **PAPACY**: 1522-1525; **SPAIN**: 1518-1522.

ADRIANOPLE (**Hadrianople**), a city in Thrace founded by the Emperor Hadrian and designated by his name. It was the scene of Constantine's victory over Licinius in 323 (see **ROME**: 305-323), and of the defeat and death of Valens in battle with the Goths (see **GOTHS**: Visigoths: 379-382; **ROME**: 363-370). In 1361 it became for some years the capital of the Turks in Europe. It was occupied by the Russians in 1829, and again in 1878, and gave its name to the treaty negotiated in 1829 between Russia and the Porte. In the first Balkan War it was captured and annexed by Bulgaria; in the second, Bulgaria being at war with Greece, Serbia, Montenegro and Rumania, the Turks were able to recapture their ancient capital (1913). (See **BALKAN STATES**: 1878; 1912-1913; **TURKEY**: 1912-1913.) As a result of the World War, it is now included in the possessions of Greece.—See also **BALKAN STATES**: Map.

ADRIANOPLE, **Treaty of**, the treaty establishing Greek independence. "The uprising of the Greeks [1821] awakened general enthusiasm throughout Europe, and many ardent lovers of ancient Hellas, among them the English poet Byron, volunteered to help in the Greek struggle

for independence. In spite of many valorous deeds, the Greeks would have succumbed to the superior forces of Turkey had not Russia, England, and France intervened in their behalf. The Powers were induced to champion the cause of Greece chiefly through the influence of thousands of their citizens in whom the memory of the ancient land of philosophy, literature, and art had roused an intense desire to see it freed from Turkish misrule. In 1827 the representatives of the Powers met in London and demanded an armistice of the Sultan; but before final arrangements for this were made, a Turkish squadron was destroyed by the fleets of the Allies at the Battle of Navarino. The Sultan was furious, and he determined to resist the demands of the Powers at all costs. England now withdrew from the alliance because she feared that a war might lead to the destruction of Turkey, a consummation which she by no means desired. Tsar Nicholas I decided to wage war on his own account. Russian armies defeated the Turks in several battles and began marching toward Constantinople. At the same time French armies drove the Turks out of Morea, or southern Greece. These reverses compelled the Sultan to sue for peace, and he signed the Treaty of Adrianople (1829) granting complete independence to Greece. In 1833 the latter was organized as a constitutional monarchy with a Bavarian prince, Otto, as her first king.—J. S. Schapiro, *Modern and contemporary European history*, p. 628.—"By the settlement, Turkey virtually acknowledged the independence of Greece; granted practical autonomy to Serbia and to the principalities of Moldavia and Wallachia (modern Rumania); surrendered claims on Georgia and other provinces of the Caucasus to Russia; and recognized the exclusive jurisdiction of Russian consuls over Russian traders in Turkey."—C. J. Hayes, *Political and social history of modern Europe*, v. 2, pp. 49-50.—See also **SERBIA**: 1804-1817; **TURKEY**: 1826-1829.

ADRIATIC, **Wedding of**. See **VENICE**: 1177; 14th century.

ADRIATIC QUESTION.—Friction between Italy and Jugo-Slavia.—**Treaty of Rapallo**, Nov. 12, 1920.—"We do not think we are wrong," wrote the *Weser Zeitung*, in December, 1916, 'in regarding the Adriatic question as the surest source of future discord within the ranks of the present Allies.' The grave events of which Fiume and Ljubljana (Laibach) have lately been the scene, and which are the direct and natural result of the unsound principles underlying the Austro-Hungarian armistice, are giving point to the enemy's comment, and convince us of the need for plain speech, before the growing breach between the Italians and Jugoslavs becomes irreparable. . . . The relations between Italy and the Jugoslavs are one of the pivotal problems of the war and its settlement, both as regards the fulfilment of the public pledges towards 'the small nations,' and also as regards territories once known as the Habsburg Monarchy."—R. W. Seton-Watson, *Europe in the melting pot*, p. 297.—"The areas involved in the dispute are not large compared with other regions which have been re-assigned [by the treaty of Versailles] nor are they particularly fertile or wealthy. They are, however, so situated as to be of considerable importance strategically and economically and the question of their control and of the allegiance of their inhabitants has become a matter of national honor and prestige. Questions of this type are especially delicate. Concretely the clash is over the political future of the eastern part of the Istrian Peninsula, the town and district of Fiume, northern Dalmatia,

and a number of the islands of the eastern Adriatic. Closely linked with these is the future of part of Albania. With the exception of the city of Fiume, which enjoyed a degree of local self-government under the Hungarian crown, the disputed areas formed part of the former Austrian Empire. The population is predominantly South Slav, but in the towns, and notably in Fiume and Zara, there is an important Italian element. By the terms of the treaty signed by Austria, and that presented to Hungary, the principal Allied and Associated Powers are to dispose of these territories. Italy has therefore the advantage of being both a judge and claimant."—A. P. Scott, *Introduction to the peace treaties*, p. 270.—By the treaty of Rapallo, November 12, 1920, between Jugo-Slavia and Italy, the city of Zara was assigned to Italy, the remainder of Dalmatia being given to Jugo-Slavia. To the north Italy received a favorable frontier. Fiume was to be independent. All concerned seemed fairly satisfied with this compromise, with the exception of D'Annunzio, the master of Fiume, who at the end of 1920 still maintained his defiant attitude there, but he finally relinquished control and left the city. The civil authorities then adhered to the treaty, made peace with Italy and prepared to govern Fiume as an independent state.

Problem of Italy's new frontiers.—"The story of Fiume is closely linked with the whole problem of Italy's new frontiers. Both in the Trentino on the north and in the region of the Isonzo on the east Italy suffered before the war from frontiers which were geographically unsound, and which invited invasion by a dangerous neighbor. The boundary ran either close to the southern margin of the Alps, or actually down on the piedmont plain south of them, leaving almost the whole of the formidable mountain mass in Austria as a well-nigh impregnable defense against Italy, while Italy remained virtually defenseless against possible Austrian aggression. . . . If we are to appreciate the Italian point of view, we must try to put ourselves in the position of a people who find the gateways into their country held by an hereditary enemy, who have often suffered from invasions through those gateways in the past, and who know that they are held by the enemy for the deliberate purpose of making any possible future invasion easy. Add to this the further fact that Austria's strategic designs against Italy involved the enslavement of hundreds of thousands of Italians, both in the north and in the east, and it is not difficult to understand that the battle-cry of 'Trent and Trieste!' should awaken the fighting spirit of every patriotic Italian. Whatever the objectives of the then-existing government of Italy, it would seem clear that the great mass of the people, who knew nothing of the terms of the secret Treaty of London, entered the war not to subject large areas of Germanic and Slavonic territory to their rule, nor even to gain the port of Fiume, with its remote islet of Italian population; rather, they entered the war in a fervor of exalted patriotism, to complete the great work of unification of Italy by freeing truly Italian territory from a foreign yoke, and to drive the enemy from the very threshold of their homes back into his own domain. Since certain aspects of the Trentino or Tyrol problem are inseparable from the story of Fiume, let us pass in brief review the salient features of that problem. The Italian Government demanded the whole Trentino, to the line of the Brenner Pass, and in the secret Treaty of London the Allies promised it as part of the compensation to be given Italy for her aid against the Central Powers. At the Peace

Conference Italy increased her demands, claiming in addition to what the treaty allowed her several important areas on the northern slopes of the watershed having considerable strategic importance. As the Italian claims would certainly be supported by racial, historical, geographic, and strategic arguments, it was necessary for the American specialists to examine fully into every aspect of the problem. It is true that in the drainage basin of the Adige River, forming most of the Trentino, the majority of the population is Italian. But it is equally true that even the Italian authorities on the distribution of races in the Trentino admit that the Italian majority is largely confined to the south, while the northern parts of the basin are overwhelmingly German and have been so for centuries. It was found possible to draw in the Trentino one of the cleanest-cut ethnographic frontiers in the world, leaving few Germans to the south and few Italians to the north of it. A careful study of the theory that the watershed crossing the Brenner Pass was the only natural northern frontier for Italy, and that the drainage basin of the Adige River constituted an indivisible geographic unit, did not substantiate that view. In the Alps, as is so often the case in glaciated mountains, the drainage divide is in places determined by some insignificant topographic detail, such as a small moraine or a tiny alluvial fan in the bottom of a great valley. The Adige watershed, instead of following along Alpine ridges, actually descends into and cuts squarely across the floor of the Pusterthal, thus dividing in an accidental and abnormal manner one of the most striking geographic units in the Alps. The true boundary between geographic units, the real topographic barrier separating German and Italian lands in that part of the Alps east of the Brenner Pass, lies not on the watershed, but some distance south of it. Italy's historical claim to a frontier on the Brenner Pass seemed equally weak. The former extent of the Roman Empire over the coveted area could not seriously be regarded as a basis of territorial awards in the twentieth century. The argument that Napoleon's annexation of the upper Adige to the kingdom of Italy showed the military and political necessity of granting Italy a frontier on the Brenner, fell to the ground in view of the fact that the 'Upper Adige' of Napoleon's time stopped far short of the Brenner and included little beyond the lands which to-day are unquestionably Italian. If Napoleon's action proved anything, it proved that that military genius did not regard a frontier on the Brenner as vital to Italy. Yet the strategic arguments in favor of Italy's claim to the whole of the Trentino were the strongest which could be advanced. The long, narrow form of the Italian peninsula, by rendering peculiarly difficult the mobilization of Italy's man-power, makes the need of a strong frontier on the north especially urgent. Fifty per cent of the defenders of the frontier must come from south of the constriction of the peninsula near the latitude of Bologna, and must journey to and through that constriction on four main railway lines, of which three traverse the Apennines mountain barrier and two can be destroyed from the sea. Hence, Italy might with some show of reason demand a strategic frontier so strong that in case of attack a fraction of her man-power could defend it successfully against superior enemy forces until the whole could be mobilized.

"The geographic character of Italy's northern frontier compels her to maintain two campaigns against a Teutonic or a combined Teutonic-Slavonic aggression. Italy's northern plain is vul-

nerable from the north and from the east. The armies defending the eastern frontier depend upon supply lines which traverse the Venetian plain for 150 miles in sight of an enemy advancing over the northern mountains. Hence the eastern armies must always fight under the menace of a disaster which is inevitable if the enemy on the north succeeds in reaching the plain and cutting their communications. In the present war Cadorna's eastern operations came to an abrupt halt in May, 1916, when he was compelled to transfer large forces westward to check the dangerous Austrian advance across the Asiago plateau almost to the edge of the plains. Irretrievable disaster to the eastern armies was narrowly averted. The magnitude of the Caporetto disaster, consequent upon the Teutonic armies' breaking through to the plains near the extreme eastern end of the northern frontier, enables one to picture the far more serious consequences which must ensue if ever the northern mountain barrier is breached farther west, and the communications of the eastern armies destroyed 150 miles in their rear. Since Italy's military forces will not admit of two offensive campaigns against so powerful an enemy, at least one of these campaigns must be defensive. Topographic conditions dictate that the defensive campaign should be the northern one, for a successful offensive across the main Alpine barrier, supported by but one through railway line, has less chance of success than an offensive in the east, where the terrain is less difficult, railways are more numerous, and support by sea is possible. Hence we conclude that Italy's northern frontier should be strategically so strong as to render a defensive campaign in the north comparatively simple and assured of success, leaving the bulk of her forces free to defend the eastern gateways. It so happens that the Central Alps provide a series of natural trenches and mountain barriers together constituting one of the strongest defensive terrains in the world. But the Austrian province of the Trentino drove a wedge clear through the system, rendering the defense of Italian territory extremely difficult, and assuring tremendous advantage to a possible Teutonic invasion. In the opinion of the American specialists, to push the frontier northward only so far as the ethnographic frontier would still leave Austria, or Germany and Austria combined in case of their future union, in possession of very great strategic advantages over their Latin neighbor, advantages which might invite aggression. To push the boundary farther north, to the natural topographic barrier referred to above, would give reasonable protection to Italy by making invasion from the north so difficult as to be highly improbable, and would add the minimum German population to Italy compatible with securing a good geographic and defensive frontier for the southern Kingdom. To push the frontier clear to the Brenner and eastward into the Pusterthal, as Italy asked, would be to carry it far into purely Germanic territory, to enlarge the German irredenta to dangerous proportions, and to split the geographic and economic unit of the Pusterthal. In favor of the latter proposal it could, however, be urged that the territory to the Brenner had secretly been promised to Italy by England and France in order to secure Italy's entry into the war on the Allied side, that a frontier well advanced into Germanic territory would still more effectively protect Italian territory, and that generous treatment of Italy's demands on the northern frontier, where the mountainous terrain was not in any sense vital to the development of neighboring lands, might make Italy more willing to reduce her demands on the

east where she claimed areas the annexation of which would render impossible the free economic development of her neighbors.

"The Conference decided in favor of the most generous fulfilment of Italian ambitions on the north, and gave her not only all the territory to the watershed frontier promised by the Treaty of London, but in addition the Sexten valley district lying beyond the watershed and conferring important strategic advantages on its possessor. With Italy's frontier established in an impregnable position on the north, and all danger of invasion from that direction eliminated, we may now consider the eastern frontier in its proper relation to Italy's frontier problem as a whole. On the east the Italian Government had demanded as one of the conditions of Italy's entrance into the war, and in the Treaty of London England and France had promised to give, not only the Italian-inhabited areas around Goritzia and Trieste, but vast areas of almost pure Slavonic country about the head of the Adriatic and on the eastern shores of that sea, as well as a large proportion of the Slav-populated islands fringing the eastern coast. The American Government not only consistently refused to recognize the Treaty of London, a document held to be, both in the manner of its execution and in its precise terms, fundamentally in opposition to the very principles for which America was fighting, but early recognized the right of the Jugo-Slavs to rule themselves. President Wilson took certain other steps more or less incompatible with the fulfilment of the terms of the treaty, such as securing the consent of the Allied Powers to make peace on terms which provided for the determination of Italy's new frontiers 'along clearly recognizable lines of nationality.' Throughout the negotiations the American Government held to the view that the Treaty of London was obsolete in view of the disappearance of Austria-Hungary as a great Power (at whose expense the treaty was to have been executed), the agreement of the Allies to erect a new Jugo-Slav nation associated with them and Italy, the entry into the war of new nations not parties to the treaty, and the agreement of the Allies, Italy included, to make peace on a new basis of right and justice. . . . Such was the background of the thorny problem of Fiume and the Adriatic when it came before the Peace Conference. Instead of reducing their territorial demands to accord with the provisions of the Pact of Rome and the Fourteen Points, the Italian representatives believed themselves justified in increasing them even beyond the limits of the Treaty of London. While insisting upon the execution of the Treaty of London in respect to the territories which it assigned to Italy, the Italian representatives asked that it be revised where favorable to the Jugo-Slavs, in order that Fiume, definitely assigned to Croatia by the treaty, should be given to Italy. Other territories of much strategic or economic value, lying beyond the Treaty of London line, were also included in the Italian demands."—E. M. House and C. Scymour, *What really happened at Paris*, pp. 112-121.—See also LONDON, TREATY OR PACT OF.

Jugo-Slav contention.—"It is generally admitted that no frontier question before the Conference is so complex as that provided by the Adriatic, and yet, shorn of a multitude of secondary considerations which have been deliberately introduced, there is none in which it is easier to establish the facts. To take, for instance, the question of the nationality of the inhabitants of Fiume, Dalmatia, etc. The facts in this matter are by no means difficult to ascertain. It has been suggested that

the Yougo Slav majority on the Adriatic coast was deliberately created for political purposes by the Habsburg authorities. The fallacy of this argument is shown by the existence of no less than 60,000 Slavs who inhabited the district of the Udine, and who were there before there was a political, or even a national, Italy. Nor can it be allowed that Austria invented the Slav names of the cities, villages, rivers, and mountains of the Eastern Adriatic. Trieste, for instance, is built on purely Slovene territory. . . . Even the sons of Italian immigrants adopted Slav nicknames. We find the Magyar historian Fest stating that 'they (the Italian immigrants) are being Slavized by the local Slav influence.' In the fifteenth century the tradesmen of Fiume labelled their occupations with Slav words; thus, for instance, a bootmaker would be called *postolar*. The judges and priests of the same era were exclusively Slav. . . . As a matter of fact, the history of the period 1302-1600 indicates the name of one hundred and seven local judges, all of whom, with the exception of twelve, were Slavs. We are further indebted to Kobler (*Memorie*, pp. 149-252) for a list of the judges of Fiume from 1651-1776, and among them the Italian and German names are merely sporadic. When we examine the lists of the Church dignitaries, we find that from 1371-1780 twenty-one Archdeacons out of twenty-five were Slavs. From 1371-1626 there appear the names of forty Slav and only four Italian canons. So far as the dialect of the city is concerned, Professor N. G. Bartoli, of the University of Torino, has confirmed that this is of very recent origin. From Monfalcone to Albania, the Slav element has been autochthonous since the seventh century. It is true that in the coast towns it came under the influence of the stronger Latin culture, and began to use the Italian tongue in commercial intercourse with its neighbours. Yet ever since the decay of the Roman Empire, Dalmatia has maintained its devotion to the Slavonic idea, concerning which Mazzini and Tommaseo have written epic pages. This idea manifested itself in the national folk-lore and in the great works of the Slav poets, scholars, and artists of Dalmatia. And it is a significant fact that whilst at the courts of Italian princes and at the university of Florence the Serbo-Croatian language was placed next to Greek and Latin, Venice, the mistress of Dalmatia, did not bequeath to the country a single national school or printing press. . . . It is fundamentally wrong to judge the national character of the Eastern Adriatic by marble monuments and a study of history which does not take into consideration the national spirit. The Italian, defeated in argument, will urge that in this dispute numbers alone cannot decide. Yet, for the sake of argument, even that theory may be admitted, for the Yougo Slavs are ready at any moment to discuss the relative cultural progress of their peasantry in the occupied territory with any Italian groups save the *Calabrese*, Sicilians, etc. Yougo Slavs have urged since the beginning of this war that their problem should be discussed by the great Western democracies; but it is to be feared that the discussion has degenerated into propaganda of a more or less sensational order. The real point has been lost sight of. It is not merely the question of Fiume, nor a certain area of Dalmatia, nor the Slovenian territory on the Isonzo which are at issue. These are all parts of the same problem—the accomplished fact of Yougo Slav unification and the attitude which should be adopted towards it by the Italian nation. The Yougo Slavs, as the children of the twentieth century and as collaborators in the Great War, ask

that their problem should be solved on the basis of nationality, and not by *force majeure*. They, as a cultured people, do not relish being compared with the negroes of Middle Africa."—J. Vedlowski, *Thoughts on the Adriatic dispute* (*Balkan Review*, June, 1919, pp. 375-378).

Treaty of London, April 26, 1915.—"The root of the whole evil lies in the secret treaty concluded on April 26, 1915, by Great Britain, France, and Russia with Italy. The main lines of this iniquitous arrangement had already leaked out soon after its conclusion, but it was not until the Bolsheviks obtained control in Petrograd that the actual text of the treaty became known. . . . The territorial concessions thus secured by Italy include, not merely Southern Tirol to the Brenner, Gorizia, Trieste, the line of the Julian Alps to near Fiume, and the whole of Istria (with the islands of Lussin and Cherso), but also the whole of Northern Dalmatia, including Zara, Sebenico and their hinterland, and even the southern islands of Lissa, Lesina, Curzola, and Meleda. This involves the annexation of nearly three-quarters of a million Slovenes and Croats, living in compact masses and with a keenly developed national consciousness. . . . The Italian Government insisted, as a preliminary to negotiations, that the whole transaction should be concealed from the knowledge of the Serbian Government. . . . Meanwhile, quite apart from all moral considerations, the terms of the treaty are entirely meaningless, save on the assumption that Austria-Hungary is to survive as a Great Power. . . . The effect of the treaty, when hints as to its contents trickled through to Austria, was exactly that which all competent observers had prophesied at the time. Italy, who by unreservedly entering the war upon the basis of the Mazzinian principle of liberation, could have rallied all the subject-races of Austria-Hungary to her standard, saw herself regarded by them with alarm and suspicion, which Viennese and Magyar intrigue did everything to inflame. The false policy of Sonnino and his group galvanized Austria-Hungary into fresh life, and has cost the lives of many thousands on both sides of the black-and-yellow frontier. Nothing can better illustrate the unnatural situation thus produced than the fact that while Austria-Hungary was employing every measure of repression and persecution against the Jugoslavs at home, and while thousands of their volunteers were fighting heroically in the ranks of the Serbian Army in Macedonia and the Dobrudja, other Slav regiments stubbornly defended the Carso against Italy in the belief that they were saving their national territory from foreign imperialistic designs. The absurdity of denouncing as Austrophile this action of a race of Austrophobes is at last becoming clear even to the most wilfully blind: for the Serbs of the kingdom are absolutely solid with their kinsmen of Croatia and Slovenia in resisting Italian aggression. . . . From 1915-1917 Italy reaped the fruit of her shortsighted policy, but nothing occurred to shake the attachment of the leading Entente statesmen to the old diplomatic methods. But the situation was completely transformed by the Russian Revolution and the entry of America into the war. For, on the one hand, the young Russian Democracy, as yet free from Bolshevik infection, repudiated the secret methods of Tsardom and inscribed the watchword of Self-Determination upon its banners; while, on the other hand, America was entirely free from any European engagements and had not the slightest intention of entangling herself in diplomatic commitments savoring of the Congresses of Vienna and Berlin."—R. W. Seton-Watson, *Europe in the*

melting pot, p. 299.—See also AFRICA: Modern European occupation: 1918-1920.

Torre-Trumbitch agreement.—Congress at Rome (April 8-10, 1918).—Pact of Rome.—“In such circumstances it became more and more obvious that, unless professions and practice could be squared, eventual disaster was inevitable. As official circles in the three Western countries showed a complete inability to grasp this situation or to find a new and sounder basis of policy, a number of private individuals in Italy, France, and Britain set themselves to create a favourable atmosphere in the press and public opinion for the new ideas. In particular an attempt was made to bring together the more progressive political leaders of Italy and the exiled Yugoslav representatives—it being recognised that an understanding between Italians and Yugoslavs was an essential condition to a sound collective Entente policy towards Austria, and therefore towards the whole problem of racial and political reconstruction in Southern Europe. After a number of preliminary meetings and discussions, an agreement was reached last March, between Signor Torre, representing a large proportion of Italian senators and deputies, and Dr. Trumbic, the President of the Yugoslav Committee and co-signatory with Mr. Pasic of the Declaration of Corfu of July, 1917. The Torre-Trumbic agreement formed the basis of the Congress of Oppressed Austrian Nationalities which met in April [1918] in the Roman capital, and inaugurated a political campaign which contributed so materially towards sapping the final resistance of the Dual Monarchy. The public endorsement of the agreement by the Italian Premier, Signor Orlando, was generally regarded as an acceptance of the principle of revision of the London Convention. . . . The inclusion in the Austro-Hungarian armistice of the territorial line conceded to Italy by the London Convention—a step which has absolutely no military significance in view of the break-up of Austria-Hungary into distinct national units—has not unnaturally been regarded in all Slav circles as the affirmation of Italy’s extreme territorial claim. The fact that the Italians have not even rested content with the line assigned to them by the Armistice, but have pushed forward into territory to which they have no conceivable claim, has greatly increased the danger of the situation and has led the Zagreb Government to lodge a formal appeal with the Entente, demanding that Italian troops shall be replaced by British, French, and American troops on Yugoslav territory, lest Italy should attempt by occupation to create some kind of title of possession. . . . Meanwhile, the Pact of Rome remains the charter of all who still uphold the cause of Italo-Yugoslav friendship; and it is safe to assert that it will also remain one of the historic documents of the war. Its text runs as follows: The representatives of the nationalities subjected, in whole or in part, to the rule of Austria-Hungary—the Italians, Poles, Roumanians, Czechs, and Yugoslavs—join in affirming their principles of common action as follows: (1) Each of these peoples proclaims its right to constitute its own nationality and State unity or to complete it and to attain full political and economic independence; (2) Each of these peoples recognises in the Austro-Hungarian Monarchy the instrument of German domination and the fundamental obstacle to the realization of its aspirations and rights; (3) The assembly recognises the necessity of a common struggle against the common oppressors, in order that each people may attain complete liberation and national unity within a free State unit. The representatives of

the Italian people and of the Yugoslav people in particular agree as follows: (1) In the relations between the Italian nation and the nation of the Serbs, Croats, and Slovenes—known also under the name of the Yugoslav nation—the representatives of the two peoples recognise that the unity and independence of the Yugoslav nation is a vital interest of Italy, just as the completion of Italian national unity is a vital interest of the Yugoslav nation. And therefore the representatives of the two peoples pledge themselves to employ every effort in order that, during the war and at the moment of the peace, these decisions of the two nations may be completely attained; (2) They declare that the liberation of the Adriatic Sea and its defense against every present and future enemy is a vital interest of the two peoples; (3) They pledge themselves also, in the interest of good and sincere relations between the two peoples in the future, to solve amicably the various territorial controversies on the basis of the principles of nationality and of the right of peoples to decide their own fate, and in such a way as not to injure the vital interests of the two nations, such as shall be defined at the moment of peace; (4) To such racial groups of one people as it may be found necessary to include within the frontiers of the other, there shall be recognised and guaranteed the right to their language, culture, and moral and economic interests.”—R. W. Seton-Watson, *Europe in the melting pot*, p. 303.

Summary of arguments of both sides.—“The great mass of arguments, maps, statistics, and rhetoric emanating from the rival camps may be roughly grouped as geographic, including strategic considerations and economic outlet to the sea; historical, cultural, and nationalistic; and political, diplomatic, and practical. Perhaps the best way to secure some idea of the opposing points of view is through a summary of the claims and counter-claims, arguments and refutations, under these general headings. The Italians assert that the ‘natural’ frontier of Italy follows the watershed of the Alps around the north-east curve of the Adriatic and down the mountain crests into Dalmatia and Albania. They are invincibly persuaded that Nature intended the Adriatic to be an Italian lake. Their military and naval experts point out that the eastern coast of Italy possesses very few good harbors or naval bases, while the opposite coast of the Adriatic contains many. In order to end forever the possibility of a hostile navy in the Adriatic, Italy must control all points of strategic value on the farther shore. Otherwise one of the principal objects of the war would be lost. From the military point of view the defensible mountain barrier of Dalmatia is a necessary precaution against a possible Balkan Confederation or a revived Pan-Slavism. The South Slavs and their sympathizers reply that they have no navy, that they could not possibly afford to build one, that they are willing to agree to disarmament under the League of Nations, to demilitarization of the eastern coast, and to the possession by Italy of a number of islands. They point out that from the military point of view the defense of a narrow strip of difficult country, with poor communications and across a body of water, would call for a large army, and would in an emergency prove a weakness rather than a source of strength, particularly if it were purchased at the cost of the friendship of the South Slavs. The Italians have had some hopes of using the Dalmatian base for commercial penetration of the Balkans. Again the South Slavs warn of the bad psychology of making enemies of potential customers. But vigorously

and affirmatively the South Slavs claim the entire coast north of Albania as necessary to that 'free and secure access to the sea' which is guaranteed them by the eleventh of the Fourteen Points. To the Italian assertion that ample seacoast is left to them without northern Dalmatia and Fiume they retort that the closeness of the mountains to the sea makes it impossible to make extensive use of any port but Fiume except at prohibitive cost for construction and hauling. Only at Fiume is there a standard-gauge railroad to the interior, and nowhere else is it practicable to build one. The Italians keep insisting that something 'just as good' might be improvised elsewhere, but neutral geographers seem to agree with the Jugo-Slavs. It is admitted that Fiume is the natural outlet for the great hinterland of Hungary, for much of the South Slav territory, and in part for Czecho-Slovakia and Rumania. The Italians insist that under their control it would continue to be available for this purpose. Some critics, however, express the suspicion that in practice Trieste would be favored. When the Italians point out that only a relatively small part of South Slav commerce used to go through Fiume the obvious answer is that, the new situation would be entirely different from that of the Magyar régime.

"Historically neither state has claims of any particular force. The Italians go back to the days of the Roman Empire, and the time when the Republic of Venice held a part of Dalmatia. They point to the Roman ruins; they speak feelingly of the impress of Italian culture on the whole eastern shore of the Adriatic. More stress is laid upon nationalistic arguments, and much emotion has been roused in favor of redeeming the Italian-speaking communities at Fiume, Zara, and other scattered centers. The South Slavs are equally vigorous in their nationalistic claims. They deny that the culture of the region is predominantly Italian. The language statistics show that about 97 per cent. of Dalmatia is Slavic. Even granting the most extreme Italian corrections of the Austrian census, not over 10 per cent. of the population is Italian. To the argument that this minority is the educated, progressive, civilized, capable, and hence politically dominant element, the South Slavs indignantly reply that the principle of self-determination precludes the surrender of overwhelming majorities to any alien rule. They offer the most solemn guarantees that the Italian minority will be protected in its linguistic, religious, educational, and cultural rights; but an arrangement which would sacrifice nine or ten Slavs for the sake of 'redeeming' one Italian they denounce as a travesty, not a vindication, of the principle of nationalism.

"From the practical point of view, both sides speak of the sacrifices made during the war, and the right to demand compensation. Officially they point out the advantages of concessions for the sake of future friendship; unofficially they accuse each other of imperialism. The Italians keep referring to the Treaty of London; the Slavs retort that they have never been officially informed that such a treaty exists; that they never agreed to it; and that in any case it has been rendered inoperative by the acceptance of the Fourteen Points. As a matter of fact the terms of the Treaty by which Italy was promised Istria and Dalmatia soon became known to the South Slavs both in Serbia and Austria-Hungary. The Serbians regarded themselves as rather badly treated, and the Austro-Hungarian authorities used the news to stimulate their Croatian and Slovene recruits to hatred of Italy. On December 9, 1919, an agreement was reached between the English, French, and Ameri-

can representatives in Paris on the general principles which should determine the Adriatic settlement. President Wilson had long before indicated the boundary line in Istria which seemed to him satisfactory. In general the South Slavs were willing to accept it, but the Italians did not regard it as strategically adequate. The creation of a separate buffer state of Fiume was now proposed. Dalmatia was to go to the South Slavs. In their conferences at London early in 1920 the Italian, French, and British premiers drew up a somewhat different settlement, and attempted to force the South Slav Kingdom to accept it on penalty of having the Treaty of London put in force. President Wilson with unexpected vigor denounced this proposal, and insisted that the principles of December 9 should not be modified. The compensation of the South Slavs at the expense of Albania, which was part of the suggested settlement, he refused to countenance for a moment. All concerned then urged Italians and South Slavs to attempt to reach a settlement [which they did] by direct negotiation."—A. P. Scott, *Introduction to the peace treaties*, pp. 271-275.—See also AUSTRIA: 1917: Division into separate nationalities; BALKAN STATES: Map showing distribution of nationalities; ITALY: 1918-1919; FIUME: Attitude of President Wilson, also 1919-1921.

ADUATUCI. See BELGÆ.

ADULLAM, a Canaanite city of Judea, the exact location of which is uncertain. Although David was said to have twice taken refuge in the "Cave" of Adullam, this is a scribal error, and his retreat was really the stronghold of the city. When he had been cast out by the Philistines, among whom he sought refuge from the enmity of Saul, "his first retreat was the Cave of Adullam, probably the large cavern not far from Bethlehem, now called Khureitun. From its vicinity to Bethlehem, he was joined there by his whole family, now feeling themselves insecure from Saul's fury. . . . Besides these were outlaws from every part, including doubtless some of the original Canaanites—of whom the name of one at least has been preserved, Ahimelech the Hittite. In the vast columnar halls and arched chambers of this subterranean palace, all who had any grudge against the existing system gathered round the hero of the coming age."—Dean Stanley, *Lectures on the history of the Jewish church*, lect. 22.—In modern American and British politics the expression "Cave of Adullam" has been frequently used to denote any body of seceders or political irreconcilables. Abraham Lincoln in 1864 and John Bright in 1866 used the term.

ADULLAMITES. See ENGLAND: 1865-1868; LIBERAL PARTY: 1866-1900.

ADVENTISTS.—"This is the general name of a family of denominations whose leading tenet is a belief in the proximate and personal second coming of Christ. The movement began in Massachusetts in 1831, under the leadership of William Miller, who previously had been a member of the Baptist Church. As a result of much study of the

prophecies, Miller became convinced that the second coming of Christ was near at hand, and began to lecture on the subject. In 1833 he published a pamphlet entitled 'Evidences from Scripture and History of the Second Coming of Christ about the year 1843 and of His Personal Reign of One Thousand Years.' Miller made many converts to his views, and the doctrine announced in his pamphlet was widely proclaimed. Upon the failure of his prophecy for the year 1843, he fixed 1844—to be exact, October 22 of that year—as the date of the second advent. When this prophecy failed, his followers became divided. It is estimated that at the time of Miller's death (1840) they numbered 50,000. As a result of various divisions, there are now six bodies of Adventists, who, as a rule, simply await the second coming of Christ without attempting to fix a date for it. All hold, however, that it is near at hand, and they generally look for the personal reign of Christ on earth. All agree also in practicing immersion as the mode of baptism."—M. Phelan, *Handbook of all denominations*, p. 9.

ADVOCATUS (Vogt), a layman of high standing who "represented the abbey in its dealing with the outside world. . . . The advocate of a large monastery, especially if, as was often the case, he held the advocacy of several houses at once, tried naturally to make his office hereditary. . . . The advocacy of the Frauenmünster at Zürich by the Hapsburg family was the entering wedge for their claims over the Forest Cantons which finally resulted in the formation of the Swiss Confederation."—E. Emerton, *Medieval Europe*, p. 574.

ÆDHILING. See **ÆTHEL**; **ÆTHELING**.

ÆDILE, the name of a certain class of magistrates in ancient Rome. According to Cicero the ædiles were supposed to take care of the city's various departments, to have jurisdiction over provisions and correctness of weights and measures and to superintend and organize the public games. The office was created in the year 404 B. C. The name is probably derived from *ædis*, meaning temple, since one of the chief duties of the ædiles was

to take care of the temple of Ceres. Their persons were inviolable. See **CIVIL LAW**: B. C. 471; **ROME**: B. C. 494-492; 133.

ÆDILES PLEBIS. See **SUFFRAGE**, **MANHOOD**: B. C. 3d century.

ÆDUI.—"The two most powerful nations in Gallia were the Ædui [or Hædui] and the Arverni. The Ædui occupied that part which lies between the upper valley of the Loire and the Saone, which river was part of the boundary between them and the Sequani. The Loire separated the Ædui from the Bituriges, whose chief town was Avaricum on the site of Bourges. At this time [121 B. C.] the Arverni, the rivals of the Ædui, were seeking the supremacy in Gallia. The Arverni occupied the mountainous country of Auvergne in the centre of France and the fertile valley of the Elaver (Allier) nearly as far as the junction of the Allier and the Loire. . . . They were on friendly terms with the Allobroges, a powerful nation east of the Rhone, who occupied the country between the Rhone and the Isara (Isère). . . . In order to break the formidable combination of the Arverni and the Allobroges, the Romans made use of the Ædui, who were the enemies both of the Allobroges and the Arverni. . . . A treaty was made either at this time or somewhat earlier between the Ædui and the Roman senate, who conferred on their new Gallic friends the honourable title of brothers and kinsmen. This fraternizing was a piece of political cant which the Romans practiced when it was useful."—G. Long, *Decline of the Roman republic*, v. 1, ch. 21.—Later the Sequani, neighbors with whom the Ædui were continually at odds, invaded them. The Ædui appealed to the Roman senate for help; but it was not forthcoming until Cæsar's arrival in Gaul (58 B. C.), when he restored their independence.—See also **GAUL**: Cæsar's description.

ÆGEGALEA, **ÆGEGALEANS**.—The original name of the northern coast of Peloponnesus, and its inhabitants. See **GREECE**: Migrations.

ÆGEAN, that part of the Mediterranean sea lying between Greece and Asia Minor, connected by the Dardanelles with the Sea of Marmora and the Black sea. It washes the shores of a large number of islands known as the Grecian archipelago. Before the World War groups of these islands, including the Cyclades, the Northern Sporades, Euboea and a few others belonged to Greece, the Dodecanese to Italy, and most of the others to Turkey. After the war all of the islands belonging to Turkey, except Imbros, Tenedos, and Castelorizo, and all the Dodecanese except Rhodes, were ceded to Greece. The rocky elevations of these islands, many of which are of volcanic formation, though they lend a most picturesque appearance to the Ægean, nevertheless render navigation by large modern vessels especially hazardous. Some of the larger islands contain well watered and fertile valleys in which are raised the usual products of Mediterranean lands. The inhabitants are of the vigorous Greek type.

ÆGEAN CIVILIZATION

The ancient culture of the eastern Mediterranean basin, covering the period up to 1200 B. C., and including Greece, the islands of the Ægean sea, Crete and parts of North Africa, has been variously designated Mycænæan, Minoan, and Ægean. The term Mycænæan, however, has in recent years been to a great extent displaced by the other two. "Whether the word Minoan was the best one to substitute is of course another matter. It is argued by some German archæologists, such as Dr. Dörpfeld and Professor Reisch, that it is absurd to describe periods that stretch over thousands of years by a name that was presumably given to one particular historical personage. For the plea which they put in for the time-honoured word Mycænæan, consecrated by Schliemann's epoch-making discoveries, we have much sympathy, and there is no doubt that the ambiguity that now involves the term Mycænæan, used sometimes in its old generic and sometimes in its new specific sense, will, for a long time to come, lead to confusion. On the other hand the argument that the term is inapplicable to the early periods that are almost unrepresented at or near Mycænæ is unanswerable. . . . 'Ægean,' on the other hand, which Professor Reisch supports, will possibly prove ultimately the best generic word for the civilization as a whole, while Mycænæan and Minoan will fit into it, as representing certain stages of its development in different localities. . . ."—R. M. Burrows, *Discoveries in Crete*, pp. 41-42.

"Till recently historians have begun their account of Greek affairs with the eighth century B. C., some of them precisely with the year 776; and for the first century and a half they have given hardly more than a few bare dates. But all this has been changed by explorations in the Ægean area. The pioneer in the work was Heinrich Schliemann. In his boyhood he learned the stories told by the Hellenic poet Homer of the deeds of mighty heroes during the Trojan war; and thinking them real history, he believed the ancient city of Troy might be found buried beneath the earth. To achieve this task became the inspiration of his life. After amassing a fortune in business, in 1870 he began digging on the hilltop where, from Homer's description, he concluded Troy must have stood. This hill is in northwestern Asia Minor, not far from the sea. The result more than justified his hopes. On this spot he and his successor in the work unearthed the ruins of nine settlements, built above one another and belonging to different ages. It is calculated that the lowest settlement, a rude village, was inhabited about 3500 B. C., and that the sixth, which shows a highly developed civilization, flourished 1500-1000. Afterward Schliemann excavated Tiryns and Mycænæ in Argolis, Greece. They were contemporary with the sixth city at Troy. Mycænæ showed such signs of wealth and culture that he believed it to have been the centre of the civilization which flourished at that time on the shores of Greece and in Troy. Hence he called the civilization Mycænæan."—G. W. Botsford, *History of ancient world*, p. 68.

EXCAVATIONS AND ANTIQUITIES

Mycænæan area: Researches at Troy, Mycænæ, Tiryns and Vaphio.—"In 1882 Schliemann went to Troy again, and resumed his excavations in company with a German architect, Dr. Dörpfeld, whose help was of the greatest value. Schlie-

mann himself was no architect, and was not even a scientifically-trained observer. . . . he was often too downright in his methods, and might at times be accused of vandalism in the pursuit of his end—the discovery of the Heroic civilization of Greece. He cut through everything ruthlessly. . . . Dörpfeld was a guarantee of more scientific methods, necessary in a site like Troy, with its superimposed strata of different ages of settlement, very different from the simple grave-clearing at Mycænæ. The result of the renewed work was eventually the discovery of the 'Mycænæan' city of Troy."—H. R. Hall, *Ægean archæology*, p. 8.—"Dr. Dörpfeld finished in 1894 the exploration which he had begun in 1893 on the site of the excavations of Schliemann at Hissarlik (Troia). It appears to be established that Schliemann, carried away by his zeal, had overlooked the very end which he wished to attain, and that the burnt city, which he thought to be the real Troia, is a more ancient foundation going back beyond the year 2000 B. C. M. Dörpfeld discerned, in one of the layers of ruins (discovered but disregarded by Schliemann), a city which must be the Ilios of Priam contemporaneous with the Mykenai of Agamemnon; he removed the surrounding walls, the towers, and some of the houses that filled it. It is to be understood that this little acropolis, analogous to that of Tiryns, is not the whole of the city but simply its citadel, which Homer called 'Pergamos.' It was surrounded, lower down, by a city reserved for the habitation of the common people, some traces of which also have been found."—*American Journal of Archaeology*, 1896.—"There was no doubt as to the position of Mycænæ, as there had been about that of Troy. The Lion Gate was there, marking the ancient site which since 456 B. C. had been desolate. Schliemann passed through and struck spade into the earth beyond it in the year 1878 A. D. Immediately beyond the gate was a circular space enclosed by weather-worn and lichen-covered stone slabs. Within this stone circle Schliemann dug and discovered what he hoped to find: the graves of the heroes of Mycænæ mentioned by Pausanias. . . . Pausanias says there were six graves. Schliemann found five, and then stopped. After he left, a sixth was found. . . . Outside the grave-precinct was found amid house-ruins a stone chamber possibly a cellar, into which had been placed a remarkable treasure of gold, consisting of solid drinking-cups, and some fine signet-rings which are famous on account of the curious religious scenes engraved upon them. . . . Looking out over the ravine are the two great 'beehive tombs' or tholoi, known as the 'Treasuries of Atreus and Klytæimnestra.' . . . Atreus's Treasury has indeed lost the two great pilasters of grey-green stone that seemed to support the heavy architrave of its entrance-door. . . . The interior, though but 50 feet in height, is more impressive than anything Egypt has to show. . . . The great explorer interrupted his Trojan work in 1884 to go to Tiryns.

"The result of the excavations of 1884 and 1885 was the discovery of the ground plan of a palace within the walls, placed on the top of the long rock, sixty feet above the plain. Its entrance gate, with doorposts and threshold of breccia is as huge as are the casemates. The plan of the palace itself shews that it was a building of later date than the wall-framework, and quite lately renewed excavations have brought to light the remains of a much

earlier palace. At Tiryns Schliemann found the famous kyanos-frieze, the remains of a carved alabaster slab-decoration inlaid with hard blue glass, which at once was identified as the Homeric *kyanos*. Here, too, were found fragments of wall-painting which gave a foretaste of what was to come at Knossos. . . . In 1880 our knowledge of prehistoric Greek art took a great step in advance when the 'beehive tomb' at Vaphio in Laconia was excavated by Mr. Tsountas for the Greek Archaeological Society, and the famous 'Vaphio Cups' were found. . . . Later finds in Crete have shown us that they could make better things than the Vaphio Cups; but in 1880 these two little golden vases with their *repoussé* designs of men capturing bulls were regarded as extraordinary. It is not too much to say that the Vaphio Cups recalled the flagging attention of the world of artists and archaeologists to the work of excavation in Greece. Big discoveries were now looked

1300 B. C.) is certain from the distinctive Mycenaean pottery that was found in it: Schliemann, however, with his rough-and-ready methods, had not identified it. This distinction was reserved for Dörpfeld, and was the result of his more scientific operations. The discovery was announced in 1893. . . . Schliemann intended to follow up his work, but difficulties ensued with the Turkish authorities in the island with regard to the acquisition of the site, and death carried him off before he could get to work. We may—with all respect to Schliemann's memory be it said—be not altogether sorry that his somewhat summary methods were not allowed by fate to be exercised on Knossos, and that it was written that not he, but the Englishman Evans, was to excavate the palace of Minos and the Italian Halbherr to disinter the companion palace at Phaistos. Both were, when they began their work trained scholars and archaeologists, and the excavation of these two

THE THRONE-ROOM AT CNOSSUS
Showing throne and fresco of heraldic guardian lion

for. They did not come at once, but when they did the promise of the Vaphio Cups was more than fulfilled. In 1800 and 1801 the 'beehive tombs' at Thorikos in Attica and at Kampos in Messenia were excavated by Tsountas, and in the last-named was found the well-known leaden statuette of a man making an offering which has figured in so many books as a good illustration of Mycenaean male costume.

"The next important event after the discovery of the Vaphio Cups was the identification of the Sixth Trojan City as Mycenaean, or affected by Mycenaean influence. . . . It is the Sixth City, however, which succeeded the second after its total destruction by burning (after an interval filled by three small village settlements in succession) that is undoubtedly the Troy of legend, round which gathered the traditions of the great siege. It was the only important settlement after the Second City, the succeeding settlements being unimportant and unjustified. Its date (circa 1400-

splendid monuments of the older civilization of Greece could not have fallen into more capable hands than theirs."—H. R. Hall, *Ægean archaeology*, pp. 9-27.

Cretan area.—Results of extraordinary importance have been already obtained from explorations in Crete, carried on during 1890 and 1900 by the British School at Athens, under the direction of Mr. D. G. Hogarth, and by Mr. Arthur J. Evans, of the Ashmolean Museum, working with the aid of a small Cretan Exploration Fund, raised in England. The excavations of both parties were carried on at Knossos, but the latter was the most fortunate, having opened the site of a prehistoric palace which is yielding remarkable revelations of the legendary age in Crete. In a communication to the London *Times* of October 31, 1900, Mr. Evans gave the following account of the results so far as then obtained:

"The discoveries made at Knossos throw into the shade all the other exploratory campaigns of

last season in the Eastern Mediterranean, by whatever nationality conducted. It is not too much to say that the materials already gathered have revolutionized our knowledge of prehistoric Greece, and that to find even an approach to the results obtained we must go back to Schliemann's great discovery of the Royal tombs at Mycenæ. The prehistoric site, of which some two acres have now been uncovered at Knossos, proves to contain a palace beside which those of Tiryns and Mycenæ sink into insignificance. By an un-hoped-for piece of good fortune the site, though in the immediate neighbourhood of the greatest civic centres of the island in ancient, mediæval, and modern times, had remained practically untouched for over 3,000 years. At but a very slight depth below the surface of the ground the spade has uncovered great courts and corridors, propylæa, a long succession of magazines containing gigantic store jars that might have hidden the Forty Thieves, and a multiplicity of chambers, pre-eminent among which is the actual throne-room and council-chamber of Homeric kings. The throne itself, on which (if so much faith be permitted to us) Minos may have declared the law, is carved out of alabaster, once brilliant with coloured designs and relieved with curious tracery and crocketed arcading which is wholly unique in ancient art and exhibits a strange anticipation of 13th century Gothic. In the throne-room, the western entrance gallery, and elsewhere, partly still adhering to the walls, partly in detached pieces on the floors, was a series of fresco paintings, excelling any known examples of the art in Mycenaean Greece. A beautiful life-size painting of a youth, with a European and almost classically Greek profile, gives us the first real knowledge of the race who produced this mysterious early civilization. Other frescoes introduce us to a lively and hitherto unknown miniature style, representing, among other subjects, groups of women engaged in animated conversation in the courts and on the balconies of the Palace. The monuments of the sculptor's art are equally striking. It may be sufficient to mention here a marble fountain in the shape of a lioness's head with enamelled eyes, fragments of a frieze with beautifully cut rosettes, superior in its kind to anything known from Mycenæ; an alabaster vase naturalistically copied from a Triton shell; a porphyry lamp with graceful foliation supported on an Egyptianising lotus column. The head and parts of the body of a magnificent painted relief of a bull in gesso duro are unsurpassed for vitality and strength.

"It is impossible here to refer more than incidentally to the new evidence of intercourse between Crete and Egypt at a very remote period supplied by the Palace finds of Knossos. It may be mentioned, however, as showing the extreme antiquity of the earlier elements of the building that in the great Eastern Court was found an Egyptian seated figure of diorite, broken above, which can be approximately dated about 2000 B. C. Below this again extends a vast Stone Age settlement which forms a deposit in some places 24 ft. in thickness.

"Neither is it possible here to dwell on the new indications supplied by some of the discoveries in the 'House of Minos' as to the cult and religious beliefs of its occupants. It must be sufficient to observe that one of the miniature frescoes found represents the façade of a Mycenaean shrine and that the Palace itself seems to have been a sanctuary of the Cretan God of the Double Axe, as well as a dwelling place of prehistoric kings.

There can be little remaining doubt that this huge building with its maze of corridors and tortuous passages, its medley of small chambers, its long succession of magazines with their blind endings, was in fact the Labyrinth of later tradition which supplied a local habitation for the Minotaur of grisly fame. The great figures of bulls in fresco and relief that adorned the walls, the harem scenes of some of the frescoes, the corner stones and pillars marked with the labrys or double axe—the emblem of the Cretan Zeus, explaining the derivation of the name 'Labyrinth' itself—are so many details which all conspire to bear out this identification. In the Palace-shrine of Knossos there stands at last revealed to us the spacious structure which the skill of Daedalus is said to have imitated from the great Egyptian building on the shore of Lake Moeris, and with it some part at least of his fabled masterpieces still clinging to the walls."—Up to 1906 Sir Arthur Evans attracted the attention of archæologists to his excavations at Cnossus, where he recovered numerous valuable specimens of ancient art, which were deposited in the museum at Candia. Particular interest attaches to the architecture of the palace, disclosing among its wonders a remarkable grand staircase with decorated walls, and a series of sunken rooms which presumably were baths. Much, no doubt, still remains to be brought to light in this region; various circumstances have combined since 1906 to arrest the progress of the work. In the early 'sixties of last century the site of Phaestus, or Phaistos, was discovered by a British naval officer. A famous city in the legendary history of ancient Crete, Phaestus boasted a palace outranking even that of Cnossus. This building, together with a similar one on a lesser scale of magnificence and situated to the east of it, was uncovered by Italians. Among the treasures recovered were some fine specimens of gilt stone cups, imitations of the Vaphio, of c. 1600 B. C. A pottery sarcophagus, representing scenes from funeral ceremonials, was discovered in 1908. At Phaestus the British school discovered several inscriptions dating from the sixth century B. C. The characters seem to be Greek but the language it is impossible to read. Scholars believe that it is related to the non-Aryan tongues which were spoken in its near neighborhood. Its chief interest to us lies in the fact that it is undoubtedly the speech of the Bronze Age Cretans with their pictographs and hieroglyphics. To the east at Palaikastro the work of the British school was crowned with complete success. Here they discovered a complete town with shaft graves and cups corresponding in style and age to those at Mycenæ. Nearby Professor Myres discovered some interesting pottery showing the dress and costumes of the Minoan of the Middle Ages. A little further south Mr. Hogarth excavated a site of the best period with many fine vases and clay impressions of seals, which emphasized the bizarre side of Cretan art.—See also GREECE: Ægean or Minoan civilization.

Upon the advice of Dr. Evans, two Americans, Miss Harriet Boyd and Mr. R. B. Seager, discovered in 1903 a complete little town of the Bronze age called Gournia. This town like Pompeii now stands with its streets and houses opened to the sky. Its surprisingly narrow streets, the rough-walled chambers of its houses and its more prosperous market places give us a good idea of how the ordinary people of the Bronze age lived. Nearby at Pseira Mr. Seager found some objects of art which compared favorably in workmanship and beauty with the best products of the

Japanese. On the small island nearby, Mochlos, Mr. Seager discovered several tombs in which were found furniture of thin gold and beautiful little vases of stone. These objects are contemporary with the second city of Troy.—Brilliant as are the illustrations thus recovered of the high civilization of Crete and of the substantial truth of early tradition, they are almost thrown into the shade by a discovery which carries back the existence of written documents in the Hellenic lands some seven centuries beyond the first known monuments of the historic Greek writing. In the chambers and magazines of the Palace [of Cnosus] there came to light a series of deposits of clay tablets, in form somewhat analogous to the Babylonian, but inscribed with characters in two distinct types of indigenous prehistoric script—one hieroglyphic or quasi-pictorial, the other linear. The existence of a hieroglyphic script in the island had been already the theme of some earlier researches by the explorer of the Palace, based on the more limited material supplied by groups of signs on a class of Cretan seal-stones, and the ample corroboration of the conclusions arrived at was, therefore, the more satisfactory. These Cretan hieroglyphics will be found to have a special importance in their bearing on the origin of the Phœnician alphabet.

"But the great bulk of the tablets belonged to the linear class, exhibiting an elegant and much more highly-developed form of script, with letters of an upright and singularly European aspect. The inscriptions, over 1,000 of which were collected, were originally contained in coffers of clay, wood, and gypsum, which had been in turn secured by clay seals impressed with finely-engraved signets and counter-marked and counter-signed by controlling officials in the same script while the clay was still wet. The clay documents themselves are, beyond doubt, the Palace archives. Many relate to accounts concerning the Royal Arsenal, stores, and treasures. Others, perhaps, like the contemporary cuneiform tablets, refer to contracts or correspondence. The problems attaching to the decipherment of these clay records are of enthralling interest, and we have here looked up for us materials which may some day enlarge the bounds of history."—*London Times*, Oct. 31, 1900.

In an earlier communication to *The Times* (September 15), Mr. Evans had explained more distinctly the importance of the clay tablets found at Cnosus, as throwing light on the origin of the alphabet: "In my excavation of the prehistoric Palace at Knossos," he wrote, "I came upon a series of deposits of clay tablets, representing the Royal archives, the inscriptions on which belong to two distinct systems of writing—one hieroglyphic and quasi-pictorial; the other for the most part linear and much more highly developed. Of these the hieroglyphic class especially presents a series of forms answering to what, according to the names of the Phœnician letters, we must suppose to have been the original pictorial designs from which these, too, were derived. A series of conjectural reconstructions of the originals of the Phœnician letters on this line were in fact drawn out by my father, Sir John Evans, for a lecture on the origin of the alphabet given at the Royal Institution in 1872, and it may be said that two-thirds of these resemble almost line for line actual forms of Cretan hieroglyphics. The oxhead (Aleph), the house (Beth), the window (He), the peg (Vau), the fence (Cheth), the hand (Yod) seen sideways, and the open palm (Kaph), the fish (Nun), the post or trunk (Samekh), the eye

(Ain), the month (Pe), the teeth (Shin), the cross-sign (Tau), not to speak of several other probable examples, are all literally reproduced. The analogy thus supplied is indeed overwhelming. It is impossible to believe that, while on one side of the East Mediterranean basin these alphabetic prototypes were naturally evolving themselves, the people of the opposite shore were arriving at the same result by a complicated process of selection and transformation of a series of hieratic Egyptian signs derived from quite different objects. The analogy with the Cretan hieroglyphic forms certainly weighs strongly in favour of the simple and natural explanation of the origin of the Phœnician letters which was held from the time of Gesenius onwards, and was only disturbed by the extremely ingenious, though over-elaborate, theory of De Rouge."

At the annual meeting of the subscribers to the British School at Athens, held in London, October 30, 1900, Mr Hogarth, the Director, spoke with great enthusiasm of the significance of the Cretan discoveries already made, and of the promise of enlarged knowledge which they gave. He said: "The discovery made 25 years ago [by Schliemann] that no barbarians, but possessors of a very high and individual culture, preceded the Hellenic period in Greece—a culture which could not but have affected the Hellenic—had been developed in various ways since. It had been established that this culture had had a very long existence and development; it covered completely a large geographical area; it developed various local characteristics in art production which seemed to be gathered again into one by the typical art of Mycenæ. But the most important historical points remained obscure. Where was the original home of this new civilization; what family did the race or races belong to; of what speech were they and what religions; what was the history of their societies and art during their dominance, and what became of them after? Neither mainland Greece nor the Aegean islands answered these. But there were two unknown quantities, Crete and Asia Minor, with Rhodes. One of these we have now attacked. Crete by its great size and natural wealth, its position, and its mythologic fame was bound to inform us of much. It is too early to say that the questions will all be answered by Crete, but already we have much light. The discovery of written documents and of shrines has told us more than any other evidence of the origin and family. The Knossos frescoes show us the racial type; the Dictæan Cave, and Knossos houses illuminate the religion. New arts have been discovered, and the relation to Egypt and Asia are already far better understood. It remains now to find the early tombs, and clear the lower stratum of the Palace ruins at Knossos, to know more of the earliest Cretan race, to explore the east or 'Eteocretan' end of the island, to obtain light on the language and relations to Egypt and Asia, and to investigate the 'Geometric' period, which is the transition to the Hellenic."

Commenting in another place on the discoveries in Crete, Mr. Hogarth has pointed out their effect in modifying the ideas heretofore entertained of the importance of Phœnician influence in the rise of European civilization. "For many years now," he writes, "we have had before our eyes two standing protests against the traditional claim of Phœnicia to originate European civilization, and those protests come from two regions which Phœnician influence, travelling west, ought first to have affected, namely, Cyprus and Asia Minor. In both these regions exist remains of early systems

of writing which are clearly not of Phœnician descent. Both the Cypriote syllabic script and the 'Hittite' symbols must have been firmly rooted in their homes before ever the convenient alphabet of Sidon and Tyre was known there. And now, since Mr. Evans has demonstrated the existence of two non-Phœnician systems of writing in Crete also, the use of one of which has been proved to extend to the Cyclades and the mainland of Greece, it has become evident that we have to deal in south-eastern Europe, as well as in Cyprus or Asia Minor, with a non-Phœnician influence of civilization which, since it could originate that greatest of achievements, a local script, was quite powerful enough to account by itself also for the local art. Those who continue to advocate the Phœnician claim do not seem sufficiently to realize that nowadays they have to take account neither only of the Homeric age nor only of even half a millennium before Homer, but of an almost geologic antiquity. Far into the third millennium B. C. at the very least, and more probably much earlier still, there was a civilization in the Aegean and on the Greek mainland which, while it contracted many debts to the East and to Egypt, was able to assimilate all that it borrowed, and to re-issue it in an individual form, expressed in products which are not of the same character with those of any Eastern civilization that we know."—D. G. Hogarth, *Authority and archaeology sacred and profane*, pt. 2, pp. 237-238.—"During the past season, Evans, discoverer of the now famous early Cretan systems of writing, Halbherr and other Italians, as well as the French, have been proving what was already foreshadowed, that in Crete we find in its purest form and in all its historic and racial phases that Mediterranean civilization,—Pelagic and Achæan,—that culminated in Tiryns and Mykenæe. We now see that Homer sings of the closing years of a culture that dates back of the 'Trojan War' at least for fifteen hundred years. Crete is found to be covered with ruined Pelagic cities, surrounded by gigantic polygonal walls, crowned by acropoli, adorned with royal palaces, defended by forts, connected by artificial highways, and with necropoli of vaulted tombs like those discovered by Schliemann at Mykenæe. Already the royal palaces and libraries are being unearthed at Cnossos and 'Goulâs' with sculptures and decoration of the most novel description and early date. A literature in an unknown tongue and in undeciphered scripts is being found, to puzzle scholars as much perhaps as the Hittite and Etruscan languages. Some day these 'Pelagic' documents will disclose the secrets of a neglected civilization and fill up the gap between early Eastern and Hellenic cultures."—A. L. Frothingham, Jr., *Archæological progress* (*International Monthly*, Dec., 1900).—See also CRETE: Effect of position and physical features upon Cretan civilization.

Northern Greece and the islands.—It seems strange that the Germans did not follow out the work of Schliemann at Troy and Mycenæ; on the other hand they have made brilliant finds at Olympia. Semi-elliptical stone houses of primitive type and shaft graves of the Mycænæan type together with fine vases in imitation of the Cretan originals were discovered. It is possible that these vases were actually imported from Crete. The wall paintings found here present an interesting modification of Cretan art.

"Finally, we come to the latest and in some ways the most startling of all the discoveries. This is the fact, established by excavations in Bœotia, Phokis, and Thessaly, that down to the latest

period of the Ægean Bronze Age, North Greece still remained in the Chalcolithic period. Excavations by M. Tsountas at Sesklo and Dimini in Thessaly, and by M. Sotiriadis at Chaironeia in Bœotia, had revealed a Stone Age culture with remarkable painted handmade pottery, resembling that from the neolithic sites of Southern Russia. The date of this was naturally assumed to be altogether earlier than the Bronze Age in Greece, and was equated with that of the neolithic strata of Troy and Crete. But it is always unsafe to assume absolute contemporaneity of Stone Age with Stone Age and Bronze Age with Bronze Age, even in the same quarter of the world, especially when, as in this case, the neolithic products of the one country in no way resemble those of the other. Cyprus never seems to have had a Stone Age at all, properly speaking, but we cannot suppose that the island was uninhabited when Crete was using stone weapons and tools. In fact it is a mistake to suppose an universal Age of Stone all over one portion of the earth's surface coming to an end everywhere at the same time, and succeeded by a Copper and then a Bronze Age which equally came to their conclusions everywhere at the same time. Troy seems never to have had a Copper Age at all, but passed straight from the Stone period to that of Bronze; Cyprus and the Cyclades had a Copper Age; Egypt only reached the true Bronze Age—after long centuries of simple copper-using (though she knew both bronze and iron and occasionally used them)—not very long before she began commonly to use iron, and that was not long before iron began to be used even in Greece. The works of man's hands do not develop evenly everywhere, and an invention of the highest moment may be disregarded by one people for hundreds of years after it has been adopted by a neighbour. So it seems to have been in Greece. The adoption of metal in the Ægean lands and in Southern Greece, which brought about the whole magnificent development of Ægean civilization, was not imitated in the north, and the men of Thessaly continued to use their stone weapons and their peculiar native pottery until the Bronze Age culture of the South had reached its decadence, and the time for the introduction of iron from the North had almost arrived."—H. R. Hall, *Ægean archaeology*, pp. 40-41.

To the imagination and energy of Schliemann who was a pioneer in this field the world owes a real debt of gratitude. It is only fair to state, however, that his work paled into insignificance before the discoveries of Sir Arthur Evans. His patience, his energy and self-sacrifice, shown in particular at Cnossus, have resulted in discoveries which revolutionized our knowledge of early Greece. Moreover, his explorations opened to archæologists a vast new field for future endeavor. The cost of this work and the extent of the field have made it impossible for individuals to undertake this work at their own expense. Fortunately private munificence has made it possible for national societies to follow up this work. Scientists of each country have decided upon their own territory, and while there has been a keen sense of rivalry there have also been encouraging instances of coöperation.

NEOLITHIC AGE

B. C. 12000-3000.—*Evolution of pottery.*—Polished stone implements.—*Dress.*—"The first nine epochs designated as Minoan immediately succeed the Neolithic Age. Its deposit reaches to a depth of 17 feet below the surface of the soil, while below it the Neolithic remains are found, at one testing-point to a farther depth of nearly 21 feet, at another to one of 26 feet. Mr. Evans seeks to fix its date by certain connections that its remains show with those of early Egypt. If we thus allow about 3 feet of deposit for every millennium, we get a great age for the Neolithic strata that are below. Progress moves slowly in the dim early periods, and we need not shrink from the dates of 10,000 or 12,000 B.C. which are thus given to the first settlement of man upon the hill at Knossos. The black hand-burnished ware, or 'Bucchero' that it had inherited from Neolithic times is not what is most characteristic of Early Minoan. . . . It was the achievement of the Early Minoan Age to produce, by painting on the flat, the geometric effects that hitherto had been produced by the white filling, and it is possible that the very pigment used was the same white gypsum treated differently. The invention once made, there were rapid developments. A lustrous black glaze was spread as a slip over the surface, so that the lustreless white patterns over it gave the effect of the best old incrustated ware; and the black glaze, once discovered, was seen itself to have possibilities as decoration, and was in other vases laid on in black bands on the natural light buff of the clay."—R. M. Burrows, *Discoveries in Crete*, pp. 44-48.

"Except in the case of Egypt pottery is our only guide in the study of neolithic civilisation. The objects of wood and leather and the clothing have all disappeared in the destruction caused by damp and weather and the lapse of time. Only the implements of bone and stone and the terra cotta vases have remained. The walls are very rare and without mortar, and even bricks are late in appearing. Modeling and design had their first expression in pottery, and by means of this we can follow the progress of the people in their first steps towards civilisation. A plastic material like clay is not alone sufficient for pottery, for it loses moisture in drying and contracts. It is necessary to add something to the clay to prevent the vase from breaking after it is made. The firing of pottery presents another difficulty, for if the clay is very greasy and tenacious, it does not keep its shape, but cracks in the furnace. Some substance had to be mixed with the earth to render it porous, so that the vapour from the water could escape easily. The potters of the neolithic age had discovered that by adding powdered carbon to the clay this effect was obtained. Henceforward black pottery was not a caprice of fashion but a technical necessity. . . . After having learnt to polish the surface of the vases by burnishing with the bone or smooth stone spatula, the potters observed that when these black vases were placed in the flame or upon hot coals they became red in the parts where the fire was hottest; to avoid producing these red, yellow, or drab marks, which were the effect of firing by an open fire, they discovered how to bake fine pottery so that it was bright and black as ebony.

"In the neolithic soil of Phaestos were found the three stone axes. They are oval-shaped flints, sharpened on one side to give a cutting edge, and with the other end left rough where it would be fixed on the handle. . . . Among the ruins of the

primitive palace of Phaestos we had proof of the skill of the Cretans of the neolithic age in working stone, and in piercing the axes in order to fasten them to the handle, besides making double axes. In a niche we found some pieces of polished stone, fragments of broken axes; and amongst these a round piece of very hard green stone, about the size of a common cork. To make a hole in an axe they used a cane and some sand and water. The cane was spun round quickly and the stone was pierced by it with the help of the sand, and a circular hole was made. When half through, the stone was turned and the drilling recommenced on the opposite side. . . . When the first palace of Phaestos was built, the age of bronze was reached, the age of copper was past, and probably no flint weapons had been made for centuries. The sight of these useless fragments collected in a niche of the early palace convinced me that the tradition of the neolithic age was not spent and that the cult of the ancestor was still alive. One of the most important things (in my opinion) which came to light in my excavations beneath the foundations of the palaces of Phaestos was the discovery that even in the neolithic age the Cretans had learnt the art of giving colour to their pottery by a decoration of red and brown lines. From the pile dwellings beyond the Alps, in Sicily and the Balkan Peninsula, from Greece to Troy, from France to Spain, female figures, decorated in the same manner, represent the first traces of female costume in the stone age. The linen in which the neolithic bodies in Egypt are wrapped is so fine as to allow us to believe that semi-transparent robes may have been made at that period, as was the case under the early dynasties. The neolithic linen of Egypt is like canvas, so far apart are the threads of the web, and it was woven in so thin a texture that with the embroideries it might have a similar effect to this figure. The woman who is pouring out the liquid has a sort of white skirt made from the skin of an animal, as have also the men who bear offerings. The torso is not bare but covered by a bodice with sleeves which end above the elbow. Broad blue bands pass round the neck and down the sleeve; the girdle, too, is formed by a strip of blue, and a band of the same colour probably crosses on the breast, for another priestess, turned to the right, has the same kind of sash. The next figure, a woman with two pails hung from her shoulders, wears a long blue dress with the lower edge adorned by flounces. The neck and sleeves are edged by a band of three colours, and this woman also has a red sash edged with two black lines passing obliquely across the chest. We know that from the time of the first dynasties in Egypt the priests wore panther's skins at the religious functions, and here, too, the priestesses also wear a skin tight to the waist, with an appendage like a tail."—A. Mosso, *Dawn of Mediterranean civilisation*, pp. 79-105.—See also EUROPE: Prehistoric period.

MINOAN AGE

B. C. 3000-1200.—*Chronology.*—"The 'Minoan Age,' as defined by Sir Arthur Evans, includes the whole of the bronze age. It is classified in three principal periods, early, middle, and late; and each of these similarly into three sub-divisions, forming a ninefold series in which each phase is sufficiently distinguished by changing styles of pottery and other manufactures, sufficiently reflected in the analogous products of Melos, Thera, and other sites, to provide a standard series for

the whole Aegean area. Objects of foreign, and particularly of Egyptian make, and of known date, are found at sufficiently numerous points in this series, to permit us to regard the Early-Minoan period as contemporary with Dynasties I-VI in Egypt; the many-coloured pottery of the Middle-Minoan is found on Egyptian sites accurately dated to Dynasty XII; and at Cnossus the deposits classed as Middle-Minoan-3 yield an Egyptian statuette of Dynasty XIII and an inscription of the Shepherd-King Khyan, between 1900 and 1600. The Late-Minoan period is more precisely dated still. Its first two phases, 'L. M. 1 and 2' are contemporary with Dynasty XVIII, and datable to 1600-1400; they serve in turn to date the royal tombs at Mycenae, and the Vaphio tomb in Laconia with its magnificent embossed gold-cups." There was sudden destruction of the Cnossian Palace, to which last phase belong the third city at Phylakopi, the later graves at Mycenae and Ialysus, the 'Sixth City' at Troy, and the large Minoan settlements in Cyprus and Sicily. "Rather later than these, but still within the Late-Minoan period, comes the attempt . . . to occupy Thessaly; and the first contact with the west coast of Asia Minor.

"Then, with the cessation of intercourse with Egypt, Palestine, and Cyprus, and the simultaneous, though gradual, introduction of iron, first for tools, then for weapons—it had been known as a 'precious metal' in the Ægean since 'L. M. 3' or even 'L. M. 2'; of a new sort of costume which required safety-pins (fibulæ); of a new type of decorative art, non-representative, with a limited stock of stiff geometrical designs based on basketwork and incised ornament; and of the practice of cremation—wholly new in the Ægean, but long familiar in the forest-clad north, begins a new period, the Early Iron Age, with a new distribution of settlements, and centers of power and industry, and almost total extinction of the Late-Minoan culture, which was still relatively high, though already far gone in decadence, by the eleventh century."—J. L. Myres, *Dawn of history*, pp. 173-175.

B. C. 3000-2200.—Early Minoan age.—At the opening of this period potters discovered a black glaze for coating the wares on which they painted white or red bands or sometimes stripes. Naturally as time went on, the shapes of these vases became more regular. From this fact we must conclude the invention of the potters' wheel. Vase decoration, too, became more varied when potters began to depict the human body. At first this work was done in the geometric style—that is, with straight lines alone. We must remember that at this time the chief centre of culture was Melos rather than Crete. Undoubtedly this was due to the fact that here were available large quantities of hard stone from which could be fashioned all manner of sharp or pointed instruments such as knives and razors, as well as weapons. These wares were exported to the nearby Cyclades, to Troy and to the mainland of Greece. Unfortunately, we know little of the life and customs of these early people. They usually lived in rectangular stone houses with one or more rooms according to the wealth of the owner. Many of the chieftains built palaces of which the ones at Troy and Tiryns are best known. Rough walls of Cyclopean masonry were constructed about these palaces to prevent raids from neighbouring chieftains or even from foreign invaders. It is interesting to note that due to their geographic isolation the palaces of Crete remained unprotected. The most important families built sub-

terranean dome-shaped tombs modelled after those in which they lived. Here they placed articles of daily use for the disembodied spirit.—R. M. Burrows, *Discoveries in Crete*, ch. 3.—A. Mosso, *Dawn of Mediterranean civilisation*, ch. 6.—C. Tsountas and I. Manatt, *Mycenæan age*, pp. 44-55.—"The great innovation of the age was the introduction of copper most probably from Egypt and Cyprus. Silver and gold became known in the same period. For a long time, however, stone maintained its place in the useful arts. Equally important was the adoption of the system of picture writing, pictographs. They are found in Crete on seals of ivory, stone, and other material, in the form of cylinders, buttons, and prisms. Their near resemblance to Egyptian types proves a close intercourse between these two countries."—G. W. Botsford, *Hellenic history*, ch. 2.

B. C. 2200-1600.—Middle Minoan Age.—"During this period the chief seats of culture were Cnossus and Phaestus in central Crete, where we find Minoan civilization at its most brilliant height. By this time pottery had become really a fine art of which the specimens of the Kamares type are the most beautiful. In the egg-shell thinness of their walls they may be compared with the best Haviland china of today. At first artists paid little attention to a realistic representation of nature but aimed to create a brilliant harmony of colors. Gradually, however, the color scheme became more simple and artists attempted to depict natural objects as they really existed. This was also a period of the great Palace of Cnossus. By the end of this age pictographs gave way to linear writing in pen and ink."—A. Evans, *Scripta Minoa*, i. 19f.—C. H. and H. Hawes, *Crete, the forerunner of Greece*, pp. 136-139.—"Hieroglyphic writing is at its best, and the first kind of linear signs, Class A, though apparently only just come into fashion, had made rapid progress. They could indeed be used so flexibly that we find inside two cups of the period an inscription written in ink, in a cursive hand. If we are to judge too from the fact that the lines of the letters show a tendency to divide, it was written with a reed pen. What the medium was on which such pen and ink were ordinarily used, we cannot tell; imported papyrus, or palm-leaves, perhaps, or even parchment. The invention, we may be sure, once made, was not confined to the inside of pottery. The king who built the stately Tomb to rest in at Isopata, between the harbour and the town, on the hill that overlooked the sea, may have had his deeds recorded, not on clay tablets, but on something more worthy of a literature."—R. M. Burrows, *Discoveries in Crete*, pp. 64-65.

B. C. 1600-1200.—Late Minoan or Mycenaean age.—"Before the end of the Middle Minoan Age, the inventive spirit of Crete had achieved its utmost and had begun to stagnate, no longer creating new forms but satisfying itself with stereotyped conventions. For a time, however, we find a political advance. Power, concentrating in Cnossus involved the downfall of country towns. The palace attained the acme of its grandeur (about 1500). To this period belong most of the frescoes still preserved as well as a remarkably realistic style of reliefs. In vase ornamentation the characteristic development was the 'palace' style, which sacrificed the natural to a desire for decorative unity. The age attained great skill in bronze work and in inlaying metals. In writing, linear script superseded the pictographs, and a new and improved linear style usurped the place of the old. Before this age has far advanced the interest shifts, from Crete to Troy, and still more

to the Greek Continent, where Archomenus, Tiryns, and Mycenæ were entering upon an era of artistic and political splendor."—G. W. Botsford, *Hellenic history*, ch. 2.—"The language of the script is not yet deciphered, but from the form of the written documents, which Arthur Evans has found in very large numbers in the palace archives of Cnossus, and other explorers in smaller quantity at Phæstos and Agia Triadha, it is possible to learn something of Minoan government and organization. Most of the tablets are inventories of treasure and stores, and receipts for chariots, armour, metal vessels, ingots of copper such as have been found in store at Agia Triadha, and singly in Cyprus and Sardinia; and smaller quantities of unworked gold by weight. Other tablets contain lists of persons, male and female; perhaps tribute paid in slaves, or in person, as in the Greek legend of the Minotaur. Clearly we have to do with the details of a vast and exact administration, far more extensive than Cnossus itself would justify; and the comparative insignificance of other Cretan towns during the great 'Palace Period' (Late-Minoan 2'), the temporary extinction of some of them, and the traces of a system of highly engineered roads and forts over the mountain passes, confirm the impression that the later Greeks were right in the main, in regarding Minos of Cnossus as a monarch who ruled the seas and terrorized the land, absolute and ruthless, if only because inflexibly just."—J. L. Myres, *Dawn of history*, pp. 183-184.—"Minoan religion cannot be fully studied until the Cretan writing is deciphered. It is evident, however, from the artistic remains that the chief figure in the cult of the island was a goddess. She is represented in many ways, from Neolithic nude figures in the form of an excessively fat woman (many primitive races have regarded obesity as an element of feminine beauty) to the goddess with a flounced skirt, tight-fitting waist, and bare breast, of the Late Minoan period, who holds serpents in her hands. The serpents apparently typify her connection with the earth. Doves and lions were often associated with her. She was, then, goddess of the air and of wild animals. The bull was sacred to her. He was most often offered in sacrifice, his horns adorned her altars and temples, and ritual vessels were made in his form. The goddess was served by priestesses and worshiped at times in wild dances. As in other countries that worshiped goddesses, she was thought to have a son. Later Greek myths traced the birth of Zeus to the Dictean cave in Crete, or to Mount Ida, where Rhea, his mother, secretly brought him forth. . . . The son was thus identified in later time with the Greek Zeus. Cyprus shared in the Ægean civilization, but Semitic colonies were also established there, and the Ægean goddess was blended with the Semitic. When Minoan civilization was dominant in Greece in the Mycenaean age, the cult of the goddess was firmly established in many parts of the land. She became Rhea, mother of Zeus, Poseidon, and other deities. She became Hera, goddess of Argos, Athena in Attica, and Artemis in Attica and Arcada. At Corinth, where formative influences may have come from Cyprus, she became Aphrodite."—G. A. Barton, *Religions of the world*, pp. 247-248.—"The dwellings of the dead passed through many changes of fashion during the Minoan Age, and it has been reasonably argued from this that we may be dealing with more than one set of beliefs, perhaps held and put in practice by peoples of different origin. All Ægean rituals, however, agree in this, that the dead are buried,

not burned, and that they are provided with copious equipment for their other life. The luxury of the rich late graves, and even of some of the earlier, is comparable with that of Egypt itself. The earliest tombs are 'contracted burials,' in cist-graves like those of pre-dynastic Egypt, and of most other parts of the Mediterranean world, as well as of the western regions which have been reached by Mediterranean man. As in Egypt, also, some localities, in early periods, practised secondary burial; the body was interred provisionally until it was well decayed, and then the bones were transferred to the common chanel-house, as in a modern Greek churchyard. Later, families of distinction practised coffin-burial in larger and larger chambers, constructed underground or in hillsides, and (on the mainland) with domed masonry linings. The coffins are often of clay, richly painted, or frescoed as at Agia Triadha with funerary scenes. In the latest phases, such chambers on a smaller scale, with flat roofs, became common and superseded the old 'cist-graves'; but the royal tombs at Mycenæ still preserve, on a glorified plan, and with bodies at full length, the form of the primitive 'cist-grave.' Among other originalities, Minoan dress and armour deserve brief mention, if only for their contrast with that of the Ægean in Hellenic times. The men's dress was of the simplest; long hair-plaits without other head-dress, strong top-boots (as in modern Crete) for scrubland walking, and a loin-cloth or kilt, plain or fringed, and upheld by a wasp-waisted belt; elders and officials indulged in ample cloaks, and quilted sleeveless capes, like a crinoline hung from the shoulders. Women wore shaped and flounced skirts, richly embroidered, with 'zouave' jackets, low in front, puff-sleeved, with a standing collar or a peak behind the neck; they were tight-laced, and the skirts were belted like the men's. Gay curls and shady hats with ribbons and rosettes completed the costume, which resembles more than anything the peasant-girls' full dress in a Swiss valley, and may be 'alpine' too. Armour was simple; for attack, a long spear, and dagger-like sword with two straight hollow-ground edges; on the head a conical helmet of leather, strengthened with metal plates or boar's tusks in rows; and for other protection, the ordinary high boots, and a flexible shield of leather, oblong or oval, with metal rim, but no handle or central boss. It was slung over the left shoulder by a strap, and became distorted by its own weight to a quaint 8-shape; however, it wholly enveloped the wearer from ankles to chin, and could be bent so as to enclose him on each side. The horse was in use, and was brought from oversea; it was driven, not ridden, apparently; and light chariots were used both for hunting and in war."—J. L. Myres, *Dawn of history*, pp. 186-188.

B. C. 1600-1200.—Laborers and artisans of the Minoan Age.—"Many laborers busied themselves with tilling the soil and with rearing cattle, sheep, goats, and swine. They ground their barley or wheat in querns or crushed it in stone mortars still preserved. Among their fruits were the fig and the olive, whose oil entered into the preparation of food. Trades were specialized as in the Orient. Among the craftsmen were potters, brickmakers, and carpenters, whose bronze saws, axes, files, and other tools resemble in pattern those of today. Naturally in an age of bronze the workers in that metal filled a large place. Stone, while still serving the lesser arts, had become the essential architecture, and throughout all history wood has furnished a convenient ma-

ARCHEOLOGICAL FINDINGS FROM EGEAN AREA

- 1, The golden Vaphio cups (Laconia).
- 2, Inlaid daggers (Mycenae, 1600-1100 B.C.).
- 3, Models of house façades (Crete, 1500-1350 B.C.).
- 4, Statuette of a snake goddess (Cnossus, 1800-1500 B.C.).
- 5, Fresco of flying fish (Phylakopi, Melos, 1600-1500 B.C.).

terial for building and for a great variety of furniture. Among the most remarkable of skilled industries was the cutting and engraving of precious stones, which included practically all known to the moderns excepting the diamond. On these gems the engraver skillfully wrought varied scenes from nature and human life. The highest development of art is found in the work of the goldsmith—an achievement of the painstaking experience of centuries. This metal was more common than silver. Among his products were beads adorned with scenes in intaglio and rings with similarly decorated bezels used as seals. He could inlay gold, as well as ivory and other material, on bodies of different substance, so as to produce a polychrome effect. He wrought bracelets, diverse artistic patterns repoussé on thin plate and graceful drinking cups. Famed for beauty are the two gold cups from a beehive tomb at Vaphio, Laconia. The scenes which adorn them are bold, spiritual, and lifelike.”—G. W. Botsford, *Hellenic history*, ch. 2.

Natural conditions had favored the growth of just such a Minoan world: “easy livelihood from small secluded corn-lands, and abundant culture of fruit-bearing trees; supplemented by upland pasturage, and the harvest of the sea. Easy intercourse with many similar lands, or coast plains of the same land, identical in natural economy, almost infinitely various in mineral resources and in artistic and industrial dialect. Intercourse less easy, but within the power of moderate seamanship in the sailing season, with a venerable centre of art and luxury, like Egypt. Above all, a landscape of exceptional beauty, of brilliant atmosphere; grandly contrasted profile of ridge and promontory; infinitely various form and colouring of spring flowers and sponge-diver’s trophies, seaweed, shells, and sea-anemones. It is not surprising, then, that it is here that man first achieved an artistic style which was naturalist and idealist in one; acutely observant of the form and habit of living things, sensitive to the qualities and potentialities of raw material, wonderfully skilled in the art of the potter, painter, gem-engraver, and goldsmith; and above all, able to draw inspiration from other styles and methods, without losing the sureness of its own touch, or the power to impress its own strong character on its works of art.”—J. L. Myres, *Dawn of history*, pp. 180-181.

B. C. 1600-1200.—Minoan architecture.—Private Dwellings.—The Palace.—“Private dwellings of the wealthy were surprisingly modern. They were built on no fixed plan, but followed the necessity of the site and the taste of the owner. Some were three or four stories high and comprised a multitude of rooms. The owners furnished them comfortably and developed cooking to a high degree of perfection.”—G. W. Botsford, *Hellenic history*, ch. 2.—“Private houses were constructed of mixed timber and stone with stuccoed fronts, many windows, and flat roofs. They crowded one another along narrow tortuous alleys on uneven ground, more stair than street; and the general effect of a Minoan town must have been very like what is still to be seen in the Cretan villages. The palace architecture gives the impression of great luxury based on abundant wealth of oil and other produce; supplemented by skill in applied science, mechanical, hydraulic, sanitary, which is unparalleled till modern times. On to a central court, entered by an elaborate gateway, opened halls of reception, with deep porticoes and antechambers. Others, more secluded, opened on to terraces and bastioned platforms

down the slope. Between and behind these principal suites, winding corridors gave access to magazines and smaller living rooms. Staircases led to upper stories, with two or even three floors in some places. Practical convenience laid greater stress on inner planning, and room-decoration by fresco and fine stone panelling, than on external design. Only the plinths of a few original walls, facing on to the great courts, show any promise of a fine façade; and there was in any case so much rebuilding and patchwork addition, that the general effect must have been that of a crowded village rather than a single residence.”—J. L. Myres, *Dawn of history*, pp. 184-185.—“Naturally the palace was incomparably larger and more magnificent than the richest private dwellings. The residence of the King at Cnossus occupied more than five acres and stood at least four stories high. Its irregularity of plan may be due to additions and modifications by successive rulers. It comprised an immense central court, smaller courts, long corridors, a theatral space, audience rooms, sanctuaries, an industrial quarter, and ‘a system of drainage not equalled in Europe between that day and the nineteenth century.’ We may notice more particularly the room in which the throne of gypsum stands against the wall and is flanked on both sides with long benches of the same material. Here in the midst of his noble councillors sat the king on the ‘oldest throne in Europe,’ presumably to receive embassies and to transact business with his subjects. The industrial quarter swarmed with artists and artisans whose labors extended over a wide range of activities from the preparation and storage of wine and olive oil in huge earthenware jars to the finest gold work and elaborate mural frescoes. One chamber, fitted up with benches and ‘a seat for the master,’ is thought to be a school room, in which the young learned to mould clay into little tablets and to inscribe them with linear writing. Elsewhere were the archives in which those tablets were stored by the thousands. Although the script has not yet been deciphered, the inscriptions thus far discovered seem to be accounts of stores and of receipts and dues. A larger tablet, a case shrine has the appearance of a list of rings. If the Cretans possessed a literature of songs, epics and chronicles, as is not unlikely, it must have been written on perishable material, for nothing of the kind has been discovered.”—G. W. Botsford, *Hellenic hist.*, ch. 2.

B. C. 1400-1200.—Decline and fall of Minoan culture.—“In the main, the Ægean was at peace in the Minoan Age, a striking contrast with the wear-and-tear of the Hellespontine bridge, as successive ‘cities’ reveal it at Troy. In the south, on the contrary, it is difficult to trace any non-Ægean enemy either in Crete or even in the islands, down to the fall of Cnossus; and it remains obscure whether this last catastrophe was not due to internal discord; the circumference, as has been recently suggested, turning against the centre, and terminating its tyranny. Cretan tradition told also, later, how a lord of Cnossus went on a Sicilian expedition, with all his force, and never came back. But at this point in the story, Egyptian records come to our aid where Cretan archives are still dumb. They know of a change in the name and behaviour of the ‘people from over-sea’; and they give a clue to the decline and fall of the Cretan culture.”—J. L. Myres, *Dawn of history*, pp. 188-180.—See also GREECE: Ægean or Minoan civilization.

“These conditions were suddenly brought to an end by the destruction of the palace. The black-

ened walls, the charred ends of beams, the almost complete absence of gold and bronze seem to proclaim the sack and burning of the city. As the same thing happened at Phaestus and Hagia Triada no long time afterward we conclude that the catastrophe was this time due to no accident or dynastic revolution or uprising of the masses. We can explain the event best by supposing it to have been the work of raiders, who swept over the wealthy cities of the island in their career of plunder, whose object was not colonization but booty. This event occurred about 1400 B. C. It came as a premonition of an upheaval of Ægean populations whose waves of migration were to reach the shores of Syria and Egypt." Among them were peoples whose names sound like Sardinians, Sicilians, Achæans, Lycians and Tyrsenians (Etruscans). "Although we may not with certainty identify all these peoples, we may be sure there were among them Ægean and European tribes."—G. W. Botsford, *Hellenic history*, ch. 2.

B. C. 1200-750.—Assimilation of Minoan culture by the peoples of Hellas.—"It was reserved for British archæologists, Messrs. Wace, Droop, and Thompson, to prove by their excavations of the *mâgoulas* or village-mounds of Thessaly and Phokis that it was not till the 'Mycenæan' period that the Ægean culture, with its bronze, reached Northern Greece, and that before then there had existed no proper Bronze Age in the North. The remarkable remains of the northern stone-using culture are, then, not all contemporary with the Stone Age in the South; only the earliest of them are. The Cretan Stone Age never developed very highly; it was early supplanted by the introduction of copper from Cyprus. But the Northerners, without metal, developed their primitive culture more highly, especially in the ceramic art, and almost reached the height which was attained by the stone-users of South Russia, whose culture seems to have died out before metal could reach it." It was, however, impossible that the Northerners should be entirely without knowledge of the great civilization and art almost at their doors; "Ægean pottery must have reached them before the general civilization of the Ægean imposed itself upon them in the 'Mycenæan' or Late Bronze Age. And that it did and left traces upon their pottery even in the earlier Bronze Age we see not only from M. Sotiriadis's find, but from traces of spirals, the most characteristic form of Ægean decorations, in the Neolithic decoration scheme, which was severely geometrical, thus differing *in toto* from that of the South. . . . But this would not account for the finds in Phokis and Bœotia, and the Ægeans were from the beginning seafarers who could easily reach the Pagasæan Gulf. The facts are very difficult of explanation. A large number of sites of this Northern neolithic culture and its succeeding Chalcolithic development, which lasted down to the time of the Third Late Minoan period of the South, have been excavated from Chaironeia, Schiste, and Drakhmani in Phokis through Lianokladhi in the Spercheios Valley to Rakhmani in Northern and Tsani Magoula in West-central Thessaly. Besides those mentioned, the chief sites are Dimini, Sesklo, Zerelia, and Tsangli, all in Thessaly."—H. R. Hall, *Ægean archæology*, pp. 41-42.

The period beginning about 1200 B. C., when the Minoan decorative style has yielded to the geometric, and extending to about the middle of the eighth century, when written documents begin, "resembles the European Middle Ages in that both followed the inroads of barbarians and that

both were marked by a vast decline and an incipient recovery of culture. . . . In this period the colonial movement from the Greek peninsula eastward to the Anatolian coast, begun in the preceding age, was completed. The chief feature, however, was the blending of the northern invaders with the native Minoans, and through it the formation of the Hellenic race and Hellenic culture. We discover the process of assimilation at various stages. In Crete were communities of diverse speech existing side by side; in Ionia the mingling of peoples was under way, whereas in Attica and in Laconia we come upon the completed blend. Within the Ægean area the Minoan civilization had been most intense from Crete and Laconia northward to Attica and the Cyclades, in other words the region which in the Middle Age came to be occupied by the Dorians and the Ionians. A map of Hellas in the Middle Age accordingly will show this area fundamentally Minoan, though necessarily modified by external and internal forces. . . . For example, there prevailed throughout the area a nearly uniform social structure, in which the great lord commanded the labor of a multitude of serfs, whose rights and duties were clearly defined by customary law. The *mnoitæ* of Crete, the Laconian helots, the *hectemori* of Attica, and the *gergithæ* of Ionia seem to be remnants of Minoan serfdom. In Ionia, too, as in Crete and Laconia, the citizens ate at public tables. The leadership in the fine arts at first belonged to Crete but soon passed to Ionia. The Phœnicians were also heirs of Minoan culture. Their chief contribution to civilization was neither in art nor in navigation, but in the transmission of writing from the Minoans to the Hellenes of the Middle Age. In the view now most probable the Minoan linear script through wearing and selection gradually grew simpler, the Cypriote syllabary being a stage in the process. A further simplification took place in northern Syria when the number of characters was reduced to twenty-two. This system the Ionians adopted and by further changes made phonetic. . . . Perhaps no external feature of life so characterizes the classical Greeks as their loose, graceful dress. From this point of view their ancestors of the Middle Age seem foreign. Among the laborers the Minoan waist-cloth continued far down into historical times. An innovation, however, was the *chiton*, probably of Oriental origin. Its tightness is reminiscent of Minoan conditions. Woman's dress was more conservative. Doubtless the grand lady, like Artemis Orthia of Sparta, wore a low-cut waist with shoulder straps, a belt, and a tight skirt of strongly Minoan aspect. The introduction of the fibula, however, was bringing about a revolution in dress. This method of fastening was used in the *peplos*, which gradually prevailed over other styles and became the Doric gown of the historical age. Garments of both sexes were elaborately adorned with inwoven or embroidered patterns of the prevailing geometric style. The hair of women and men alike grew long, and hung down in several heavy strands on both sides of the face, and was held in order by a band encircling the head. Although these styles of dress began to appear early in the Mycenæan Age (about 1500 B. C.), it was not till the Middle Age that they displaced the Minoan patterns. One of the most important constructive elements in the new civilization which gradually emerged from the decadence of the old was the rise of an iron industry. The controversy over the place of its origin is now definitely settled by documentary evidence in favor of the Hittite country in eastern

Asia Minor (*Mitteilungen der Vorderasiatischen Gesellschaft*, XVIII, 61, n. 1). This industry, including the process of hardening to steel, must have flourished as early as the fourteenth century. In the thirteenth it made its way to Crete, whence it passed more slowly over the disturbed Ægean region to Laconia, Attica, Thessaly, and their colonies. While the metal was still scarce in Laconia, it began to be used as money. It is unnecessary here to dilate on the increased efficiency brought by the use of iron and steel to every walk of life. No human activity felt the impetus more keenly than warfare, which at the same time was affected by new economic and political causes. The clumsy chariot was consigned to the archaeological junk-heap and horse-back riding was substituted for it. Meanwhile the extension of prosperity, involving military and political aspirations, to a wider circle of the population brought into existence a body of troops which we may describe as heavy-armed, though their shields were lighter than the Minoan. It was mainly the introduction of steel swords and lance-points that compelled the strengthening of the defensive armor. The round or oval targe, reinforced by a central boss, became the normal shield. . . . In religion, too, great changes took place. Among the Minoans the burial of the unburned body, involving a worship of the dead, prevailed with but the slightest trace of cremation. The custom of burning the dead, now introduced by the Northerners, doubtless weakened the belief in the power of ghosts and in the need of ancestor worship. Gradually, however, inhumation reasserted itself; and henceforth the two forms existed side by side, yet with inhumation more common than burning. It is a curious fact that within this sphere of thought and usage historical Greece preserved more than half of its Minoan heritage. The work of analyzing the greater gods of Hellas into their Minoan and Indo-European elements has scarcely begun, and yet enough has been done to warrant the assumption that in all probability no single historical deity of Greece is in character and attributes wholly Indo-European or wholly Minoan. . . . Identifying their own sky-deity Zeus with the god of the double axe, they converted the shrines and sacred domains of the Carian deity to their own service. No less than six altars to Zeus Labraundios accordingly have been found in Miletus. In like manner their Artemis usurped the property and various attributes of the Anatolian Great Mother. The character and functions of Apollo, especially his healings, purifications, and oracles, seem to be in considerable part Minoan. These are but suggestions of a vast and intricate amalgamation which cannot as yet be analyzed in detail. The prevailing tendency to-day is to assign to the invading people the sunnier aspects of religion, while leaving to the natives the gloomy features, including magic, the worship of ghosts, the doctrine of sin, and its purification by washing in blood. This contrast seems justified but should not be pushed to extremes. The great deities were mainly goddesses as in the Minoan past; and correspondingly women occupied a high place in society. . . . This is but a hasty view of the Ionian-Dorian civilization during the Middle Age. With due appreciation of the danger of attributing too much to the brilliant Cretans the present writer cannot escape the conviction that the life of this area in the period under consideration was more Minoan than Indo-European."—G. W. Botsford, *Construction of a chapter on the Greek Middle Age* (*American Historical Review*, Jan., 1918, pp. 351-

353).—It is safe to conclude that "Mycenæan" culture had dominated all the southern Ægean in the later bronze age, and most of mainland Greece, as far north as South Thessaly, and as far west as Cephallenia; that it was probably of indigenous growth; that its intercourse with Egypt was extensive; and that, whatever its origin or precise date, it was wholly prior to that of historic Greece, and separated from it by a violent catastrophe, in which cities were sacked and deserted, palaces and tombs looted, and the whole distribution not only of political power, but of economic vigour, was fundamentally changed, in a 'dark age' of tumult and barbarism."—J. L. Myres, *Dawn of history*, p. 168.—See also EUROPE: Historic period: Greek civilization: Cretan and Ægean.

1912.—Temporary Italian occupation and final evacuation. See TURKEY: 1911-1912.

ÆGIDIUS, king of the Franks (457-464). See GAUL: 457-486.

ÆGIKOREIS. See PHYLÆ: Phratiæ: Gentes.

ÆGINA, a small rocky island in the Saronic gulf, between Attica and Argolis. First colonized by Achæans it was afterwards occupied by Dorians (see GREECE: Migrations) and was unfriendly to Athens. During the sixth century B. C. it rose to great power and commercial importance, and became for a time the most brilliant center of Greek art. At the period of the Persian war, Ægina was "the first maritime power in Greece." But the Æginetans were at that time engaged in war with Athens, as the allies of Thebes, and rather than forego their enmity, they offered submission to the Persian king. The Athenians thereupon appealed to Sparta, as the head of Greece, to interfere, and the Æginetans were compelled to give hostages to Athens for their fidelity to the Hellenic cause. (See GREECE: B. C. 492-491.) They purged themselves to a great extent of their intended treason by the extraordinary valor with which they fought at Salamis.—C. Thirlwall, *History of Greece*, v. 1, ch. 14.—See also ATHENS: B. C. 490-485.

B. C. 458-456.—Alliance with Corinth in war with Athens and Megara.—Defeat and subjugation. See ATHENS: B. C. 457-456; GREECE, B. C. 458-456.

B. C. 431.—Expulsion of the Æginetans from

their island by the Athenians.—Their settlement at Thyrea.

B. C. 210.—Desolation by the Romans.—The first appearance of the Romans in Greece, when they entered the country as the allies of the Ætolians, was signalized by the barbarous destruction of Ægina. The city having been taken, B. C. 210, its entire population was reduced to slavery by the Romans and the land and buildings of the city were sold to Attalus, king of Pergamus.—E. A. Freeman, *History of federal government*, ch. 8, sect. 2.

ÆGIRA, a town of Achæa, Greece, near the Corinthian Gulf.

ÆGITIUM, Battle of (B. C. 426).—A reverse experienced by the Athenian General, Demosthenes, in his invasion of Ætolia, during the Peloponnesian War.—Thucydides, *History*, bk. 3, sect. 97.

ÆGON, ruling house of Argos. See GREECE: B. C. 8th Century.

ÆGOSPOTAMI (goat streams), a small creek in the Thracian Chersonesus (modern Gallipoli), flowing into the Hellespont or Dardanelles, where the Spartans destroyed the last remaining naval force of Athens, thus leading to the end of the Peloponnesian War (405 B. C.). See GREECE: B. C. 405.

ÆHRENTHAL, Alois von, Count Lexa (1854-1912), Austro-Hungarian statesman; appointed minister to Rumania, 1888; ambassador to Russia, 1889; premier and minister of foreign affairs, 1906; brought about the annexation of Bosnia and Herzegovina, 1908.—See also WORLD WAR: Diplomatic background: 8.

Opinion on Friedjung forgeries. See AUSTRIA-HUNGARY: 1908-1909.

Plans in Novi Bazar. See NOVI BAZAR.

A. E. I. O. U.—"The famous device of Austria, A. E. I. O. U., was first used by Frederic III [1440-1493], who adopted it on his plate, books, and buildings. These initials stand for 'Austriæ Est Imperare Orbi Universo'; of, in German, 'Alles Erdreich 1st Österreich Unterthan': a bold assumption for a man who was not safe in an inch of his dominions."—H. Hallam, *Middle Ages*, v. 2, p. 89, foot-note.—See also AUSTRIA: 1477-1495.

ÆLFRED. See ALFRED.

ÆLFRIC (c. 950-1021), writer in early English prose. See ENGLISH LITERATURE: 6th-11th centuries.

ÆLIA CAPITOLINA, the new name given to Jerusalem by Hadrian. See JEWS: 130-134.

ÆLIAN AND FUFIAN LAWS.—"The Ælian and Fufian laws (leges Ælia and Fufia) the age of which unfortunately we cannot accurately determine . . . enacted that a popular assembly [at Rome] might be dissolved, or, in other words, the acceptance of any proposed law prevented, if a magistrate announced to the president of the assembly that it was his intention to choose the same time for watching the heavens. Such an announcement (obnuntiatio) was held to be a sufficient cause for interrupting an assembly."—W. Ihne, *History of Rome*, bk. 6, ch. 16.

ÆLIUS, Pons, a Roman bridge and military station on the Tyne, where Newcastle is now situated.

ÆLLE, leader of the South Saxons. See ELLA.

ÆMILIA, or Fulvia, secular basilica in Rome, built in 167 B. C. and later rebuilt by Paulus Æmilius in 50 B. C. It is remarkable for its monolithic columns of pavonazetto marble.

ÆMILIAN WAY.—"M. Æmilius Lepidus, Consul for the year 180 B. C. . . constructed the great road which bore his name. The Æmilian

Way led from Ariminum through the new colony of Bononia to Placentia, being a continuation of the Flaminian Way, or great north road, made by C. Flaminius in 220 B. C. from Rome to Ariminum. At the same epoch, Flaminius the son, being the colleague of Lepidus, made a branch road from Bononia across the Appenines to Arretium."—H. G. Liddell, *History of Rome*, bk. 5, ch. 41.

ÆMILIANUS, Roman emperor, A. D. 253. See ROME: 192-284.

ÆMILIANUS, P. Cornelius Scipio, Roman consul. See ROME: B. C. 149-146.

ÆMILIUS GENS.—One of the most famous ancient patrician houses at Rome. The first member to obtain the consulship was L. Æmilius Mamerus in 484 B. C.; family names are Barhula, Buca, Lepidus, Mamerus, Papus, Paulus, Regillus, and Scaurus.

ÆMILIUS PAULUS, Roman consul (217-216 B. C.); defeated at Cannæ by Hannibal. See ROME: B. C. 218-202; Punic Wars: Second.

ÆNEAS.—"When the Greeks had taken Troy by means of the wooden horse and were slaying the inhabitants, Æneas escaped by sea together with many followers. And though angry Juno threatened him with storms and beset his path with trials and dangers, his goddess mother, Venus, guided him safely through every peril, and brought him after many wanderings to a haven on the west coast of Italy. There he landed and began to build a city. Trojans and natives lived together in peace, all taking the name of Latins. A son of Æneas founded Alba Longa."—G. W. Botsford, *History of the ancient world*, p. 324.—Roman myth further tells us that Æneas was the ancestor of Romulus, the founder of Rome.

ÆOLIANS.—"The collective stock of Greek nationalities falls, according to the view of those ancient writers who laboured most to obtain an exact knowledge of ethnographic relationships, into three main divisions, Æolians, Dorians and Ionians. . . . All the other inhabitants of Greece [not Dorians and Ionians] and of the islands included in it, are comprised under the common name of Æolians—a name unknown as yet to Homer, and which was incontestably applied to a great diversity of peoples, among which it is certain that no such homogeneity of race is to be assumed as existed among the Ionians and Dorians. Among the two latter races, though even these were scarcely in any quarter completely unmixed, there was incontestably to be found a single original stock, to which others had merely been attached, and as it were engrafted, whereas, among the peoples assigned to the Æolians, no such original stock is recognizable, but on the contrary, as great a difference is found between the several members of this race as between Dorians and Ionians, and of the so-called Æolians, some stood nearer to the former, others to the latter. . . . A thorough and careful investigation might well lead to the conclusion that the Greek people was divided not into three, but into two main races, one of which we may call Ionian, the other Dorian, while of the so-called Æolians some, and probably the greater number, belonged to the former, the rest to the latter."—G. F. Schöman, *Antiquity of Greece: The state*, pt. 1, ch. 2.—In Greek mythology, Æolus, the fancied progenitor of the Æolians, appears as one of the three sons of Hellen. "Æolus is represented as having reigned in Thessaly: his seven sons were Kretheus, Sisyphus, Athamas, Salomoneus, Deion, Magnes and Perieres; his five daughters, Canace, Alcycone, Peisidike, Calyce and Permede. The fables

of this race seem to be distinguished by a constant introduction of the God Poseidon, as well as by an unusual prevalence of baughty and presumptuous attributes among the Æolid heroes, leading them to affront the gods by pretences of equality, and sometimes even by defiance."—G. Grote, *History of Greece*, pt. 1, ch. 6.—See also ACHAEA; ÆOLIS; ASIA MINOR: Greek colonies; THESSALY, DORIANS AND IONIANS.

ÆOLIS (Æolia), an ancient district of Western Asia Minor, extending along the Ægean coast from the river Hermus to the promontory of Lectum; settled by the so-called Æolian Greeks, who before 1000 B. C. had founded Cyme and several other cities both on the mainland and on the island of Mytilene.—See also ÆOLIANS.

ÆOLOPELE, device showing power of steam. See STEAM AND GAS ENGINES: Development up to Watt's time.

ÆOLUS. See ÆOLIANS.

ÆQUI (Æquians), an ancient tribe of Italy who occupied the territory called Latium, a section east of Rome; frequently fought with Rome but were not subdued until the fifth century B. C. See ROME: B. C. 458; 390-347.

ÆQUINOCTIA, the name given by E. C. Abendanon to an old Paleozoic continent, now sunk below the sea. From observations, he draws the following conclusions regarding this ancient continent: "The gneiss, the mica schists, the phyllites, and the real 'old' schists, must be Archean and pre-Cambrian rocks. They once built up an old Paleozoic continent, which extended at least over an area of 45° in latitude, between the tropics, from the southeast of Asia to the east of Australia. Its development from the southwest to northeast is unknown, owing to the presence of the Indian and Pacific oceans, but at all events this continent must have included most of Sumatra and the Philippine Islands, as in those countries also there has not yet been found any fossil of the Old Paleozoic. To the west, it may have stretched out as far as Madagascar. In the central part, north and south of the equator, mountain ranges of an almost east-west direction must have played an important part in this very old continent."—E. C. Abendanon, *Æquinoctia (Journal of Geology, Oct., 1910, pp. 562-578)*.

ÆRARII, Ærarians, a class of Roman citizens who were subjected to a poll-tax by the censor, usually placed upon inhabitants of conquered towns. Full Roman citizens were sometimes punished for certain dishonorable acts in private life by being placed among this class. See CENSORS: Roman.

ÆRARIUM, the name given by the ancient Romans to the public treasury containing the accounts and moneys of the state, the standards of the legions, engraved public laws and other official registers and papers. The aerarium was virtually under the administration of the Roman emperors although the latter had separate exchequers, called *fuscus*. In time the emperors were privileged with an *aerarium privatum*, apart from the *fuscus*, another allotment which they could use either for their personal purposes or to the interest of the empire.—See also FISCUS.

AERSCHOT, or Aarschot, a town of Belgium, province of Brabant. Scene of the first acts of terrorism by the Germans in their invasion of Belgium, August, 1914. See BELGIUM: 1914; WORLD WAR: 1914: I. Western front: c, 1 and e; also 1916: X. German rule in northern France and Belgium: b, 3; also Miscellaneous auxiliary services: X. Alleged atrocities and violations of international law: a, 7.

ÆSCHINES (389-314 B. C.), celebrated Athenian statesman and orator. Sent as a member of the embassy to Philip of Macedon, 347 B. C. From that time he actively favored Philip and became the leader of the peace party at Athens as against Demosthenes. In 330 B. C. Æschines unsuccessfully attacked Ctesiphon's efforts to reward Demosthenes with a golden crown for his services to the state. As a result of this defeat he went into voluntary exile at Rhodes. Æschines' most famous contributions to oratory, the three speeches referred to as "The Three Graces," rank close to those of Demosthenes.—See also ATHENS: 336-322 B. C.

ÆSCHINES (5th century B. C.), an Athenian philosopher and friend of Socrates; held in contempt by Plato and Aristotle. He was one of the most gifted orators of his time. His work is considered as the standard of the pure Attic style.

ÆSCHYLUS (525-456 B. C.), first of the three great Greek tragedians. Fought at Marathon and Salamis. His ninety plays, grouped in threes, extend over a period of forty years, during which time he won the first prize thirteen times. His plays, of which seven are extant, show the characters gradually displacing the chorus as protagonist.—See also DRAMA: Origin: Greek tragedy: Rise and development

ÆSCLEPIADAE. See MEDICAL SCIENCE: Ancient Greece.

ÆSCULAPIUS, Greek god of medicine. See MEDICAL SCIENCE: Ancient Greece.

ÆSOPUS INDIANS. See ALCONQUIAN FAMILY.

ÆSTHETICS: Croce. See ART: Croce's Aesthetic.

ÆSTII, or **Æstyī**.—"At this point [beyond the Suiones] the Suevic Sea [the Baltic], on its eastern shore, washes the tribes of the Æstii, whose rites and fashions and styles of dress are those of the Suevi, while their language is more like the British. They worship the mother of the gods and wear as a religious symbol the device of a wild boar. . . . They often use clubs, iron weapons but seldom. They are more patient in cultivating corn and other produce than might be expected from the general indolence of the Germans. But they also search the deep and are the only people who gather amber, which they call glesum."—"The Æstii occupied that part of Prussia which is to the north-east of the Vistula. . . . The name still survives in the form Estonia."—Tacitus, *Germany*, tr. by Church and Brodribb, with note.

ÆSYMNETÆ.—Among the Greeks, an expedient "which seems to have been tried not unfrequently in early times, for preserving or restoring tranquillity, was to invest an individual with absolute power, under a peculiar title, which soon became obsolete; that of æsymnetæ. At Cuma, indeed, and in other cities, this was the title of an ordinary magistracy, probably of that which succeeded the hereditary monarchy; but when applied to an extraordinary office, it was equivalent to the title of protector or dictator."—C. Thirlwall, *History of Greece*, ch. 10.

ÆTHEL, **ÆTHELINGS**.—Ætheling, an Anglo-Saxon word compounded of "æthele" or "ethel," meaning "noble," and "ing," belonging; akin to the modern German words "adel," "nobility" and "adelig," "noble," was used to denote members of a royal family. "The sons and brothers of the king [of the English] were distinguished by the title of Æthelings. The word Ætheling, like eorl, originally denoted noble birth simply; but as the royal house of Wessex rose to pre-eminence and the other royal houses and the nobles generally were thereby reduced to a relatively lower grade, it became restricted to the near kindred of the national king."—T. P. Taswell-Langmead, *Eng. Const. Hist.*, p. 20.—"It has been sometimes held that the only nobility of blood recognized in England before the Norman Conquest was that of the king's kin. The statement may be regarded as deficient in authority, and as the result of a too hasty generalization from the fact that only the sons and brothers of the kings bear the name of ætheling. On the other hand must be alleged the existence of a noble (edhiling) class among the continental Saxons who had no kings at all. . . . The laws of Ethelbert prove the existence of a class bearing the name of eorl of which no other interpretation can be given. That these, eorls and æthel, were the descendants of the primitive nobles of the first settlement, who, on the institution of royalty, sank one step in dignity from the ancient state of rude independence, in which they had elected their own chiefs and ruled their own dependents, may be very reasonably conjectured. . . . The ancient name of eorl, like that of ætheling, changed its application, and, under the influence, perhaps, of Danish association, was given like that of jarl to the official ealdorman. Henceforth the thegn takes the place of the æthel, and the class of thegns probably embraces all the remaining families of noble blood. The change may have been very

gradual; the 'north people's law' of the tenth or early eleventh century still distinguishes the eorl and ætheling with a wergild nearly double that of the ealdorman and seven times that of the thegn; but the north people's law was penetrated with Danish influence, and the eorl probably represents the jarl rather than the ealdorman, the great eorl of the fourth part of England as it was divided by Canute. . . . The word eorl is said to be the same as the Norse jarl and another form of ealdor (?); whilst the eorl answers to the Norse Karl; the original meaning of the two being old man and young man."—W. Stubbs, *Constitutional History of England*, ch. 6, sect. 64, and note.

ÆTHELBALD, one of the most powerful kings of Mercia, controlling all of Britain up to the Humber; invaded Wessex in 733 and Northumbria in 740; slain by his guards in 757 at Seckington, Warwickshire.

ÆTHELBALD, king of Wessex; defeated the Danes (851) with the help of his father, Æthelwulf. Æthelbald married his father's widow in 858 and ruled until his death in 860.

ÆTHELBERHT OF KENT, Saint (552(?)–616), king of Kent, 560 to 616. Established his supremacy over all the English south of the Humber in 593, after the death of Ceowlin, king of the West Saxons; married the daughter of Charibert, king of the Franks, agreeing to permit her to practice her own (Christian) religion; was himself converted by St. Augustine in 597 and founded the bishopric of Rochester and erected the church of St. Paul in London; is author of first written Saxon laws.

ÆTHELBERHT, king of the West Saxons; younger brother of Æthelbald, king of Wessex whom he succeeded upon the latter's death in 860. The Danes made two attacks upon his kingdom; in one of these (860) destroyed Winchester. Died in 865.—See also ENGLAND: 855–880.

ÆTHELFLED, daughter of King Alfred. See EDUCATION: Medieval: 871–900: England: King Alfred.

ÆTHELFRITH, king of Northumberland, 593–617.

ÆTHELRED, king of Mercia from 675 to 704. From 704 till his death in 716 he was abbot of Bardney.

ÆTHELRED, king of Wessex, A. D. 866–871.

ÆTHELRED II (968–1016), surnamed "The Unready"; in 991 instituted the payment of "danegeld" as a price of peace with the Danes; ordered a general massacre of the Danes in 1002 which caused more ravages of England by the Danes under King Sweyn, who marched upon London and deposed Æthelred whom the people deserted; was restored to the throne in 1014.—See also ENGLAND: 970–1016.

ÆTHELSTAN (c. 894–940) succeeded his father, King Edward the Elder, as king of the Saxons (924). Thirteen years later he had established himself as sovereign over the whole of England and Scotland.

ÆTHELSWISTHA, son of King Alfred. See EDUCATION: Medieval: 871–900: England: King Alfred.

ÆTHELWEARD, Anglo-Saxon historian; author of a Latin Chronicle extending to 975; in 991 was associated with Archbishop Sigeric in the conclusion of a peace with the Danes.

ÆTHELWERD, son of King Alfred. See EDUCATION: Medieval: 871–900: England: King Alfred.

ÆTHELWULF, king of Wessex, 830–858. Viking invasions. See SCANDINAVIAN STATES: 8th–9th centuries.

ÆTIUS (d. 454), Roman general under Valentinian III; won many notable victories in twenty years of warfare in Gaul, thereby delaying the collapse of the Roman empire; won a great victory over Attila and the Huns at Châlons-sur-Marne (September 20, 451). Ætius, in 454, formally asked Valentinian to give his daughter in marriage to his son Gaudentius. Suspecting designs upon his power, the emperor assassinated his general.—See also **BARBARIAN INVASIONS**: 423-455; **HUNS**: 451.

ÆTIUS, founder of an extreme sect of Arians; surnamed "the Atheist"; banished from Alexandria in 356 by Constantius for preaching Arianism; was a favorite with the emperor Julian who recalled him and presented him with an estate; died at Constantinople in 367.

ÆTNA INSURANCE COMPANY. See **INSURANCE**: Fire insurance: Development in United States.

ÆTOLIA, a district of central Greece, directly south of Thessaly and Epirus, bordering on the gulfs of Calydon and Corinth. In ancient times the inhabitants of this district were known as a backward and barbarous people. As late as the fifth century they were still bands or tribes under the leadership of plunderers who styled themselves "kings." The rise of Ætolia as a distinct power may be ascribed to the formation of the Ætolian League, which was originally intended to meet any invasion by the Macedonian regents, Antipater and Craterus. The confederacy, the members of which were the districts of Ætolia, Elis, Locris, Phocis, Bœotia, Cetræa and Phthiotis, continued to extend its influence to the northern sections of central Greece (290 B. C.). The Ætolian League reached the zenith of its power between the years 245-240 B. C., when the naval power of the Ætolians extended to the Ægæan islands and to the Hellespont. At this time all central Greece was under the control of the league. An inscription recently unearthed, indicates the extent of the Ætolian League's influence upon the other states of central Greece. "This inscription, discovered at Avaritza in Southern Thessaly, on the site of the ancient Melitea, records a decision of arbitrators appointed by the Ætolian League in a dispute between the city-state of Melitea and the neighboring settlement of Perea. The two were, at the time, politically united into one community, but the Pereans evidently were dissatisfied and desired the right of seceding if they should choose to do so. This the decision granted to them, and it also provided for the subsequent relations between the two communities, besides defining the boundary line, in the event of a separation. The inscription not only shows the preponderant influence of the Ætolian League in disputes between its member states, but also gives an interesting hint regarding the basis of representation in the federal council. The date is the last quarter of the third century B. C., when the power of the League extended into Southern Thessaly."—G. W. Botsford, and E. G. Sihler, *Hellenic civilization*, p. 622.—Towards the close of the third century B. C. the Ætolians became greatly alarmed at the growing power of the Macedonians and in order to check the inroads of the Macedonian king, Demetrius (230-229 B. C.), they joined forces with their former rivals, the Achæans. But this did not save their rapidly waning power, for in 228 their Arcadian possessions were abandoned to Sparta and in 224 B. C. Bœotia and Phocis were lost to Antigonos Doson, son of Demetrius. New enemies began to arise in all directions. The Illyrian pirates, who far sur-

passed the Ætolians in unscrupulous barbarity, raided numerous towns. Subsequent raids into Achæan territory by Ætolian chiefs brought about a coalition between Achæa and Philip V of Macedon. The combined forces attacked the Ætolians, drove them out of the Peloponnesus, marched into Ætolia and there sacked the capital, Thermon. Peace was finally purchased in 217 B. C. with the loss of Acarnania. Thereupon the Ætolians concluded an arrangement with Rome which helped to support its rapidly declining influence. The combined forces of Rome and the Ætolians inflicted severe punishment upon the Macedonian troops under Philip V at the battle of Cynocephalæ (197 B. C.). Central Greece was again restored to the Ætolian League. The withholding of the League's former Thessalian possessions by the Romans, however, excited the Ætolians to such resentment that they concluded a compact with Antiochus III of Syria and war with Rome followed. But in 191 B. C. the Ætolians gave very poor support to Antiochus. Their failure to defend Thermopylæ forced him to leave Greece. Alone on the field against the greatest power in the Mediterranean, the Ætolians vainly pleaded for some compromise. Their surrender in 189 practically brought the league to an end. The Ætolian League's constitution, which the Achæan league used as a model for their own, provided for the yearly convocation of a general assembly, which elected officials and usually shaped the league's policies. Although these general assemblies were open to all freemen they were usually controlled by Ætolian chiefs. The *strategus* (general) who had complete control in the field, presided over the assembly. Outlying dependencies, which were usually considered as protectorates, were rarely represented in the general law making body. Although the Ætolian troops were reputed to be ruthless and lawless, the responsibility for which rested with their generals and chiefs who enjoyed unlimited powers, Ætolia and the league contributed invaluable aid to the defence of Greece against foreign aggression. In 1205 Ætolia became part of the old Greek Empire. In the fifteenth century it fell under the control of Scanderbeg, and was in turn under the Venetians and the Turks.—See also **GAUL**: B. C. 280-270.

AFGHANA, founder of the Afghan race. See **AFGHANISTAN**: The name.

AFGHANISTAN.—The Name.—The People.—"The name Afghanistan was invented in the sixteenth century and seventeenth century, as a convenient term by the Moghul government of India, and since then it has become current in the mouths of foreigners. The Afghans speak of their country as Wilayat and less commonly as Khurassan [Khorasan], although Afghanistan covers less than a third of that ancient Division of Asia."—G. P. Tate, *Kingdom of Afghanistan*.—Although a nation of anti-Semites, the Afghans take great pride in their supposed Hebrew lineage. They call themselves Beni-Israel (Children of Israel), and claim descent from King Saul, through Afghana, son of Jeremiah, son of Saul, from whose country they were forced to migrate by Nebuchadnezzar. This claim is not substantiated by obtainable historical

Jata, but the unmistakable Hebrew cast of the Afghan countenance, as well as the opinions of Europeans resident in Afghanistan, put it within the range of possibility. Nine years after Mohammed's announcement of his mission, the "descendants of Afghana" heard of the new prophet and sent to Medina a deputation headed by Kais, to make inquiry. These, won over to the new belief, on their return converted their countrymen, and from Kais and his three sons the whole body of genuine Afghans claim descent.

Geographic description.—"Between the Russian Dominions in Asia and the Indian Empire of Great Britain, Afghanistan is placed, like a nut between the levers of a cracker. The rivalry between the great powers which are the neighbors of Afghanistan has led to the careful demarcation of the boundaries of that State with the exception of a short and unimportant length on the west and east. The generally accepted area of 243,000 sq. miles, therefore, may be regarded as correct. While, however, a fairly accurate general knowledge exists with regard to the geography of Afghanistan, very little is known as to the number of inhabitants the country supports. From observations made in Seistan, in 1904, there is reason to believe that an average density of 50 souls to a square mile, is not an excessive estimate or (say) 12,000,000 souls for the population of the country. The richer lands in the wider valley drained by the principal rivers of the country carry the densest population. In the more elevated and poorer districts, there are fewer inhabitants, and they are to a certain extent migratory. Those who are able to avoid the rigorous winter, descend to the lower levels on the approach of that season. Above these districts again, are others to which shepherds resort in the spring, and in which during the summer, a considerable population is to be found. These tracts are vacated as winter draws on. The flocks are driven down to warmer districts, where fodder is procurable and in which during the early spring (the lambing season) the climate is not too severe for the young stock. . . . The great range of the Hindu-Kush divides Afghanistan into two unequal parts, about a third part lying to the north of the watershed. The country generally consists of narrow valleys sheltered by giant spurs, and ridges of inferior elevation, which descend from the parent range. The Heri-Rud, the River of Herat, drains the western end of this trough. Within the present limits of Afghanistan, permanent snow covers only the loftier summits of the range or collects at the head of the most elevated valleys, which descend on either side, but the heavy snowfall of winter, on the whole range, and rain which falls at certain seasons replenish the rivers which rise high up on the slopes of the mountains. The southern ridge of the Hindu-Kush is pierced by the beds of the principal rivers of Afghanistan, and the northern ridge is broken by torrential streams which descend toward the Oxus; but only the more important of these actually join that river. The beds of these streams and rivers are followed by the routes which cross the lofty saddles of the range, and the lowest of these passes is the Khawak, considerably over 11,000 feet above sea-level. The two ridges culminate in the vicinity of the mass of Tirish Mir, close to the eastern boundary of Afghanistan, the highest peak of which attains to an altitude of 25,426 feet above the sea. . . . There is no part of Afghanistan where snow never falls. The rainfall is very small, and except on irrigated lands there is an absence of moisture and the climate of the country is very

unfavorable to human existence. About 43,000 square miles of unproductive desert exists in the extreme southern portion of Afghanistan. . . . Ten per cent. of the whole area of Afghanistan may perhaps represent the area which might be cultivated. . . . The mineral resources of the country are as yet unexplored, and as it is a task which can be successfully carried out only by foreign experts, progress in this [direction] must be slow."

—G. P. Tate, *Kingdom of Afghanistan*, pp. 1-11.

B. C. 330—A. D. 1747.—Under foreign rulers.—The territory now embraced in Afghanistan has frequently changed hands. It was a part of Alexander's empire, of the Bagdad Caliphate, of the empire of the Samanids, of the territories of the Ghaznevid dynasty, of the Mongol Empire, the empire of Timur, and of the Mogul Empire. The invasion of Persia in 1722 by the Afghan chieftain Mahmud resulted a few years later in an expedition under Nadir Kuli, who drove the Afghans out of Persia and made the last great conquest of Afghanistan. Nadir Shah was assassinated in 1747, and was succeeded by Ahmed Shah, one of his own officers, who established the Durani dynasty in Afghanistan and the independent status of the country. Ahmed made considerable conquests in India, but none of a permanent nature.

1803-1838.—Shah Shuja and Dost Mohammed. —English interference.—"Shah Soojah-ool Moolk, a grandson of the illustrious Ahmed Shah, reigned in Afghanistan from 1803 till 1800. His youth had been full of trouble and vicissitude. He had been a wanderer, on the verge of starvation, a pedler, and a bandit, who raised money by plundering caravans. His courage was lightly reputed, and it was as a mere creature of circumstance that he reached the throne. His reign was perturbed, and in 1809 he was a fugitive and an exile. Runjeet Singh, the Sikh ruler of the Punjab, defrauded him of the famous Koh-i-noor, which is now the most precious of the crown jewels of England, and plundered and imprisoned the fallen man. Shah Soojah at length escaped from Lahore. After further misfortunes he at length reached the British frontier station of Loodianah, and in 1816 became a pensioner of the East India Company. After the downfall of Shah Soojah, Afghanistan for many years was a prey to anarchy. At length in 1826, Dost Mahomed succeeded in making himself supreme at Cabul, and this masterful man thenceforward held sway until his death in 1863, uninterruptedly save during the three years of the British occupation. Dost Mahomed was neither kith nor kin to the legitimate dynasty which he displaced. His father Poyndah Khan was an able statesman and gallant soldier. He left twenty-one sons, of whom Futteh Khan was the eldest, and Dost Mahomed one of the youngest. . . . Throughout his long reign Dost Mahomed was a strong and wise ruler. His youth had been neglected and dissolute. His education was defective, and he had been addicted to wine.

Once seated on the throne, the reformation of our Henry V. was not more thorough than was that of Dost Mahomed. He taught himself to read and write, studied the Koran, became scrupulously abstemious, assiduous in affairs, no longer truculent, but courteous. . . . There was a fine rugged honesty in his nature, and a streak of genuine chivalry; notwithstanding what he suffered at our hands, he had a real regard for the English, and his loyalty to us was broken only by his armed support of the Sikhs in the second Punjaub war. The fallen Shah Soojah, from his asylum in Loodianah, was continually intriguing for his restoration. His schemes were long inoperative, and it was not until 1832 that certain arrangements were entered into between him and the Maharaja Runjeet Singh. To an application on Shah Soojah's part for countenance and pecuniary aid, the Anglo-Indian Government replied that to afford him assistance would be inconsistent with the policy of neutrality which the Government had imposed on itself; but it unwisely contributed financially toward his undertaking by granting him four months' pension in advance. Sixteen thousand rupees formed a scant war fund with which to attempt the recovery of a throne, but the Shah started on his errand in February, 1833. After a successful contest with the Ameers of Scinde, he marched on Candahar, and besieged that fortress. Candahar was in extremity when Dost Mahomed, hurrying from Cabul, relieved it, and joining forces with its defenders, he defeated and routed Shah Soojah, who fled precipitately, leaving behind him his artillery and camp equipage. During the Dost's absence in the south, Runjeet Singh's troops crossed the Attock, occupied the Afghan province of Peshawur, and drove the Afghans into the Khyber Pass. No subsequent efforts on Dost Mahomed's part availed to expel the Sikhs from Peshawur, and suspicious of British connivance with Runjeet Singh's successful aggression, he took into consideration the policy of fortifying himself by a counter alliance with Persia. As for Shah Soojah, he had crept back to his refuge at Loodianah. Lord Auckland succeeded Lord William Bentinck as Governor-General of India in March, 1836. In reply to Dost Mahomed's letter of congratulation, his lordship wrote: 'You are aware that it is not the practice of the British Government to interfere with the affairs of other independent States;' an abstention which Lord Auckland was soon to violate. He had brought from England the feeling of disquietude in regard to the designs of Persia and Russia which the communications of our envoy in Persia had fostered in the Home Government, but it would appear that he was wholly undecided what line of action to pursue. 'Swayed,' says Durand, 'by the vague apprehensions of a remote danger entertained by others rather than himself,' he despatched to Afghanistan Captain Burnes on a nominally commercial mission, which, in fact, was one of political discovery, but without definite instructions. Burnes, an able but rash and ambitious man, reached Cabul in September, 1837, two months before the Persian army began the siege of Herat. . . . The Dost made no concealment to Burnes of his approaches to Persia and Russia, in despair of British good offices, and being hungry for assistance from any source to meet the encroachments of the Sikhs, he professed himself ready to abandon his negotiations with the western powers if he were given reason to expect countenance and assistance at the hands of the Anglo-Indian Government. . . . The situation of Burnes in relation to the Dost was presently com-

pllicated by the arrival at Cabul of a Russian officer claiming to be an envoy from the Czar, whose credentials, however, were regarded as dubious, and who, if that circumstance has the least weight, was on his return to Russia utterly repudiated by Count Nesselrode. The Dost took small account of this emissary, continuing to assure Burnes that he cared for no connection except with the English, and Burnes professed to his Government his fullest confidence in the sincerity of those declarations. But the tone of Lord Auckland's reply, addressed to the Dost, was so dictatorial and supercilious as to indicate the writer's intention that it should give offence. It had that effect, and Burnes' mission at once became hopeless. . . . The Russian envoy, who was profuse in his promises of everything which the Dost was most anxious to obtain, was received into favour and treated with distinction, and on his return journey he effected a treaty with the Candahar chiefs which was presently ratified by the Russian minister at the Persian Court. Burnes, fallen into discredit at Cabul, quitted that place in August 1838. He had not been discreet, but it was not his indiscretion that brought about the failure of his mission. A nefarious transaction, which Kaye denounces with the passion of a just indignation, connects itself with Burnes' negotiations with the Dost; his official correspondence was unscrupulously mutilated and garbled in the published Blue Book with deliberate purpose to deceive the British public. Burnes had failed because, since he had quitted India for Cabul, Lord Auckland's policy had gradually altered. Lord Auckland had landed in India in the character of a man of peace. That, so late as April 1837, he had no design of obstructing the existing situation in Afghanistan is proved by his written statement of that date, that 'the British Government had resolved decidedly to discourage the prosecution by the ex-king Shah Soojah-ool-Moolk, so long as he may remain under our protection, of further schemes of hostility against the chiefs now in power in Cabul and Candahar.' Yet, in the following June, he concluded a treaty which sent Shah Soojah to Cabul, escorted by British bayonets. Of this inconsistency no explanation presents itself. It was a far cry from our frontier on the Sulej, to Herat in the confines of Central Asia—a distance of more than 1,200 miles, over some of the most arduous marching ground in the known world. . . . Lord William Bentinck, Lord Auckland's predecessor, denounced the project as an act of incredible folly. Marquis Wellesley regarded 'this wild expedition into a distant region of rocks and deserts, of sands and ice and snow,' as an act of infatuation. The Duke of Wellington pronounced with prophetic sagacity, that the consequence of once crossing the Indus to settle a government in Afghanistan would be a perennial march into that country."—A. Forbes, *Afghan wars*, ch. 1.

1838-1842.—English invasion, and restoration of Shuja Dowlah.—Revolt at Cabul.—Horrors of the British retreat.—Destruction of the entire army, save one man, only.—Sale's defence of Jellalabad.—"To approach Afghanistan it was necessary to secure the friendship of the Sikhs, who were, indeed, ready enough to join against their old enemies; and a threefold treaty was con-

tracted between Runjeet Singh, the English, and Shah Soojah for the restoration of the banished house. The expedition—which according to the original intention was to have been carried out chiefly by means of troops in the pay of Shah Soojah and the Sikhs—rapidly grew into an English invasion of Afghanistan. A considerable force was gathered on the Sikh frontier from Bengal; a second army, under General Keane, was to come up from Kurrachee through Sindh. Both of these armies, and the troops of Shah Soojah, were to enter the highlands of Afghanistan by the Bolan Pass. As the Sikhs would not willingly allow the free passage of our troops through their country, an additional burden was laid upon the armies,—the independent Ameers of Sindh had to be coerced. At length, with much trouble from the difficulties of the country and the loss of the commissariat animals, the forces were all collected under the command of Keane beyond the passes. The want of food permitted of no delay; the army pushed on to Candahar. Sbah Soojah was declared Monarch of the southern Principality. Thence the troops moved rapidly onwards towards the more important and difficult conquest of Cabul. Ghuznee, a fortress of great strength, lay in the way. In their hasty movements the English had left their battering train behind, but the gates of the fortress were blown in with gunpowder, and by a brilliant feat of arms the fortress was stormed. Nor did the English army encounter any important resistance subsequently. Dost Mohamed found his followers deserting him, and withdrew northwards into the mountains of the Hindoo Koosh. With all the splendour that could be collected, Shah Soojah was brought back to his throne in the Bala Hissar, the fortress Palace of Cabul. . . . For the moment the policy seemed thoroughly successful. The English Ministry could feel that a fresh check had been placed upon its Russian rival, and no one dreamt of the terrible retribution that was in store for the unjust violence done to the feelings of a people. . . . Dost Mohamed thought it prudent to surrender himself to the English envoy, Sir William Macnaghten, and to withdraw with his family to the English provinces of Hindostan [November, 1840]. He was there well received and treated with liberality; for, as both the Governor-General and his chief adviser Macnaghten felt, he had not in fact in any way offended us, but had fallen a victim to our policy. It was in the full belief that their policy in India had been crowned with permanent success that the Whig Ministers withdrew from office, leaving their successors to encounter the terrible results to which it led. For while the English officials were blindly congratulating themselves upon the happy completion of their enterprise, to an observant eye signs of approaching difficulty were on all sides visible. . . . The removal of the strong rule of the Barrukzyes opened a door for undefined hopes to many of the other families and tribes. The whole country was full of intrigues and of diplomatic bargaining, carried on by the English political agents with the various chiefs and leaders. But they soon found that the hopes excited by these negotiations were illusory. The allowances for which they had bargained were reduced, for the English envoy began to be disquieted at the vast expenses of the Government. They did not find that they derived any advantages from the establishment of the new puppet King, Soojah Dowlah; and every Mahomedan, even the very king himself, felt disgraced at the predominance of the English infidels. But as no actual insurrection broke out, Macnaghten, a man

of sanguine temperament and anxious to believe what he wished, in spite of unmistakable warnings as to the real feeling of the people, clung with almost angry vehemence to the persuasion that all was going well, and that the new King had a real hold upon the people's affection. So completely had he deceived himself on this point, that he had decided to send back a portion of the English army, under General Sale, into Hindostan. He even intended to accompany it himself to enjoy the peaceful post of Governor of Bombay, with which his successful policy had been rewarded. His place was to be taken by Sir Alexander Burnes, whose view of the troubled condition of the country underlying the comparative calm of the surface was much truer than that of Macnaghten, but who, perhaps from that very fact, was far less popular among the chiefs. The army which was to remain at Candahar was under the command of General Nott, an able and decided if somewhat irascible man. But General Elphinstone, the commander of the troops at Cabul, was of quite a different stamp. He was much respected and liked for his honourable character and social qualities, but was advanced in years, a confirmed invalid, and wholly wanting in the vigour and decision which his critical position was likely to require. The fool's paradise with which the English Envoy had surrounded himself was rudely destroyed. He had persuaded himself that the frequently recurring disturbances, and especially the insurrection of the Ghilzyes between Cabul and Jellalabad, were mere local outbreaks. But in fact a great conspiracy was on foot in which the chiefs of nearly every important tribe in the country were implicated. On the evening of the 1st of November [1841] a meeting of the chiefs was held, and it was decided that an immediate attack should be made on the house of Sir Alexander Burnes. The following morning an angry crowd of assailants stormed the houses of Sir Alexander Burnes and Captain Johnson, murdering the inmates, and rifling the treasure-chests belonging to Soojah Dowlah's army. Soon the whole city was in wild insurrection. The evidence is nearly irresistible that a little decision and rapidity of action on the part of the military would have at once crushed the outbreak. But although the attack on Burnes's house was known, no troops were sent to his assistance. Indeed, that unbroken course of folly and mismanagement which marked the conduct of our military affairs throughout this crisis had already begun. Instead of occupying the fortress of the Bala Hissar, where the army would have been in comparative security, Elphinstone had placed his troops in cantonments far too extensive to be properly defended, surrounded by an entrenchment of the most insignificant character, commanded on almost all sides by higher ground. To complete the unfitness of the position, the commissariat supplies were not stored within the cantonments, but were placed in an isolated fort at some little distance. All ill-sustained and futile assault was made upon the town on the 3d of November, but from that time onwards the British troops lay with incomprehensible supineness awaiting their fate in their defenceless position. The commissariat fort soon fell into the hands of the enemy and rendered their situation still more deplorable. Some flashes of bravery now and then lighted up the sombre scene of helpless misfortune, and served to show that destruction might even yet have been averted by a little firmness. . . . But the commander had already begun to despair, and before many days had passed he was thinking of making terms with

the enemy. Macnaghten had no course open to him under such circumstances but to adopt the suggestion of the general, and attempt as well as he could by bribes, cajolery, and intrigue, to divide the chiefs and secure a safe retreat for the English. Akbar Khan, the son of Dost Mohamed, though not present at the beginning of the insurrection, had arrived from the northern mountains, and at once asserted a predominant influence in the insurgent councils. With him and with the other insurgent chiefs Macnaghten entered into an arrangement by which he promised to withdraw the English entirely from the country if a safe passage were secured for the army through the passes. . . . The horrors of the retreat form one of the darkest passages in English military history. In bitter cold and snow, which took all life out of the wretched Sepoys, without proper clothing or shelter, and hampered by a disorderly mass of thousands of camp-followers, the army entered the terrible defiles which lie between Cabul and Jellalabad. Whether Akbar Khan could, had he wished it, have restrained his fanatical followers is uncertain. As a fact the retiring crowd—it can

reached Jellalabad to tell the tale. Literally one man, Dr. Brydon, came to Jellalabad [January 13] out of a moving host which had numbered in all some 16,000 when it set out on its march. The curious eye will search through history or fiction in vain for any picture more thrilling with the suggestions of an awful catastrophe than that of this solitary survivor, faint and reeling on his jaded horse, as he appeared under the walls of Jellalabad, to bear the tidings of our Thermopylae of pain and shame. This is the crisis of the story. With this at least the worst of the pain and shame were destined to end. The rest is all, so far as we are concerned, reaction and recovery. Our successes are common enough; we may tell their tale briefly in this instance. The garrison at Jellalabad had received before Dr. Brydon's arrival an intimation that they were to go out and march toward India in accordance with the terms of the treaty extorted from Elphinstone at Cabul. They very properly declined to be bound by a treaty which, as General Sale rightly conjectured, had been 'forced from our envoy and military commander with the knives at their throats.' General

JAMRUD FORT AT ENTRANCE OF FAMOUS KHYBER PASS

scarcely be called an army—was a mere unresisting prey to the assaults of the mountaineers. Constant communication was kept up with Akbar; on the third day all the ladies and children with the married men were placed in his hands, and finally even the two generals gave themselves up as hostages, always in the hope that the remnant of the army might be allowed to escape.”—J. F. Bright, *History of England*, v. 4, pp. 61-66.—“Then the march of the army, without a general, went on again. Soon it became the story of a general without an army; before very long there was neither general nor army. It is idle to lengthen a tale of mere horrors. The straggling remnant of an army entered the Jugdulluk Pass—a dark, steep, narrow, ascending path between crags. The miserable toilers found that the fanatical, implacable tribes had barricaded the pass. All was over. The army of Cabul was finally extinguished in that barricaded pass. It was a trap; the British were taken in it. A few mere fugitives escaped from the scene of actual slaughter, and were on the road to Jellalabad, where Sale and his little army were holding their own. When they were within sixteen miles of Jellalabad the number was reduced to six. Of these six five were killed by straggling marauders on the way. One man alone

Sale's determination was clear and simple. 'I propose to hold this place on the part of Government until I receive its order to the contrary.' This resolve of Sale's was really the turning point of the history. Sale held Jellalabad; Nott was at Candahar. Akbar Khan besieged Jellalabad. Nature seemed to have declared herself emphatically on his side, for a succession of earthquake shocks shattered the walls of the place, and produced more terrible destruction than the most formidable guns of modern warfare could have done. But the garrison held out fearlessly; they restored the parapets, re-established every battery, retrenched the whole of the gates and built up all the breaches. They resisted every attempt of Akbar Khan to advance upon their works, and at length, when it became certain that General Pollock was forcing the Khyber Pass to come to their relief, they determined to attack Akbar Khan's army; they issued boldly out of their forts, forced a battle on the Afghan chief, and completely defeated him. Before Pollock, having gallantly fought his way through the Khyber Pass, had reached Jellalabad [April 16] the beleaguering army had been entirely defeated and dispersed. . . . Meanwhile the unfortunate Shah Soojah, whom we had restored with so much pomp

of announcement to the throne of his ancestors, was dead. He was assassinated in Cabul, soon after the departure of the British, . . . and his body, stripped of its royal robes and its many jewels, was flung into a ditch."—J. McCarthy, *History of our own times*, v. 1, ch. 11.

1842-1869.—British return to Cabul.—Restoration of Dost Mahommed.—It was not till September that General Pollock "could obtain permission from the Governor-General, Lord Ellenborough, to advance against Cabul, though both he and Nott were burning to do so. When Pollock did advance, he found the enemy posted at Jugdulluck, the scene of the massacre. 'Here,' says one writer, 'the skeletons lay so thick that they had to be cleared away to allow the guns to pass. The savage grandeur of the scene rendered it a fitting place for the deed of blood which had been enacted under its horrid shade, never yet pierced in some places by sunlight. The road was strewn for two miles with mouldering skeletons like a charnel house.' Now the enemy found they had to deal with other men, under other leaders, for, putting their whole energy into the work, the British troops scaled the heights and steep ascents, and defeated the enemy in their strongholds on all sides. After one more severe fight with Akbar Khan, and all the force he could collect, the enemy were beaten, and driven from their mountains, and the force marched quietly into Cabul. Nott, on his side, started from Candahar on the 7th of August, and, after fighting several small battles with the enemy, he captured Ghuzni, where Palmer and his garrison had been destroyed. From Ghuzni General Nott brought away, by command of Lord Ellenborough, the gates of Somnauth [said to have been taken from the Hindu temple of Somnauth by Mahmoud of Ghazni, the first Mohammedan invader of India, in 1024], which formed the subject of the celebrated 'Proclamation of the Gates,' as it was called. . . . These celebrated gates, which are believed to be imitations of the original gates, are now lying neglected and worm-eaten, in the back part of a small museum at Agra. But to return, General Nott, having captured Ghuzni and defeated Sultan Jan, pushed on to Cabul, where he arrived on the 17th of September, and met Pollock. The English prisoners (amongst whom were Brigadier Shelton and Lady Sale), who had been captured at the time of the massacre, were brought, or found their own way, to General Pollock's camp. General Elphinstone had died during his captivity. It was not now considered necessary to take any further steps; the bazaar in Cabul was destroyed, and on the 12th of October Pollock and Nott turned their faces southwards, and began their march into India by the Khyber route. The Afghans in captivity were sent back, and the Governor-General received the troops at Ferozepoor. Thus ended the Afghan war of 1838-42. . . . The war being over, we withdrew our forces into India, leaving the son of Shah Soojah, Fathi Jung, who had escaped from Cabul when his father was murdered, as king of the country, a position that he was unable to maintain long, being very shortly afterwards assassinated. In 1842 Dost Mahomed, the ruler whom we had deposed, and who had been living at our expense in India, returned to Cabul and resumed his former position as king of the country, still bearing ill-

will towards us, which he showed on several occasions, notably during the Sikh war, when he sent a body of his horsemen to fight for the Sikhs, and he himself marched an army through the Khyber to Peshawur to assist our enemies. However, the occupation of the Punjab forced upon Dost Mahomed the necessity of being on friendly terms with his powerful neighbour; he therefore concluded a friendly treaty with us in 1854, hoping thereby that our power would be used to prevent the intrigues of Persia against his kingdom. This hope was shortly after realized, for in 1856 we declared war against Persia, an event which was greatly to the advantage of Dost Mahomed, as it prevented Persian encroachments upon his territory. This war lasted but a short time, for early in 1857 an agreement was signed between England and Persia, by which the latter renounced all claims over Herat and Afghanistan. Herat, however, still remained independent of Afghanistan, until 1863, when Dost Mahomed attacked and took the town, thus uniting the whole kingdom, including Candahar and Afghan Turkestan, under his rule. This was almost the last act of the Ameer's life, for a few days after taking Herat he died. By his will he directed that Shere Ali, one of his sons, should succeed him as Ameer of Afghanistan. The new Ameer immediately wrote to the Governor-General of India, Lord Elgin, in a friendly tone, asking that his succession might be acknowledged. Lord Elgin, however, as the commencement of the Liberal policy of 'masterly inactivity' neglected to answer the letter, a neglect which cannot but be deeply regretted, as Shere Ali was at all events the de facto ruler of the country, and even had he been beaten by any other rival for the throne, it would have been time enough to acknowledge that rival as soon as he was really ruler of the country. When six months later a cold acknowledgement of the letter was given by Sir William Denison, and when a request that the Ameer made for 6,000 muskets had been refused by Lord Lawrence, the Ameer concluded that the disposition of England towards him was not that of a friend; particularly as, when later on, two of his brothers revolted against him, each of them was told by the Government that he would be acknowledged for that part of the country which he brought under his power. However, after various changes in fortune, in 1869 Shere Ali finally defeated his two brothers Afzool and Azim, together with Afzool's son, Abdurrahman."—P. F. Walker, *Afghanistan*, pp. 45-51.

1869-1881.—Second war with the English and its causes.—The period of disturbance in Afghanistan, during the struggle of Shere Ali with his brothers, coincided with the vice royalty of Lord Lawrence in India. The policy of Lord Lawrence, "sometimes slightly spoken of as masterly inactivity, consisted in holding entirely aloof from the dynastic quarrels of the Afghans . . . and in attempting to cultivate the friendship of the Ameer by gifts of money and arms, while carefully avoiding topics of offence. . . . Lord Lawrence was himself unable to meet the Ameer, but his successor, Lord Mayo, had an interview with him at Umballah in 1860. . . . Lord Mayo adhered to the policy of his predecessor. He refused to enter into any close alliance, he refused to pledge himself to support any dynasty. But on the other hand he promised that he would not press for the admission of any English officers as Residents

in Afghanistan. The return expected by England for this attitude of friendly non-interference was that every other foreign state, and especially Russia, should be forbidden to mix either directly or indirectly with the affairs of the country in which our interests were so closely involved. . . . But a different view was held by another school of Indian politicians, and was supported by men of such eminence as Sir Bartle Frere and Sir Henry Rawlinson. Their view was known as the Sindh Policy as contrasted with that of the Punjab. It appeared to them desirable that English agents should be established at Quetta, Candabar, and Herat, if not at Cabul itself, to keep the Indian Government completely informed of the affairs of Afghanistan and to maintain English influence in the country. In 1874, upon the accession of the Conservative Ministry, Sir Bartle Frere produced a memorandum in which this policy was ably maintained. . . . A Viceroy whose views were more in accordance with those of the Government, and who was likely to be a more ready instrument in [its] hands, was found in Lord Lytton, who went to India intrusted with the duty of giving effect to the new policy. He was instructed . . . to continue payments of money, to recognise the permanence of the existing dynasty, and to give a pledge of material support in case of unprovoked foreign aggression, but to insist on the acceptance of an English Resident at certain places in Afghanistan in exchange for these advantages. . . . Lord Lawrence and those who thought with him in England prophesied from the first the disastrous results which would arise from the alienation of the Afghans. . . . The suggestion of Lord Lytton that an English Commission should go to Cabul to discuss matters of common interest to the two Governments, was calculated . . . to excite feelings already somewhat unfriendly to England. He [Shere Ali] rejected the mission, and formulated his grievances. . . . Lord Lytton waived for a time the despatch of the mission, and consented to a meeting between the Minister of the Ameer and Sir Lewis Pelly at Peshawur. . . . The English Commissioner was instructed to declare that the one indispensable condition of the Treaty was the admission of an English representative within the limits of Afghanistan. The almost piteous request on the part of the Afghans for the relaxation of this demand proved unavailing, and the sudden death of the Ameer's envoy formed a good excuse for breaking off the negotiation. Lord Lytton treated the Ameer as incorrigible, gave him to understand that the English would proceed to secure their frontier without further reference to him, and withdrew his native agent from Cabul. While the relations between the two countries were in this uncomfortable condition, information reached India that a Russian mission had been received at Cabul. It was just at this time that the action of the Home Government seemed to be tending rapidly towards a war with Russia. . . . As the despatch of a mission from Russia was contrary to the engagements of that country, and its reception under existing circumstances were an unfriendly aspect, Lord Lytton saw his way with some plausible justification to demand the reception at Cabul of an English embassy. He notified his intention to the Ameer, but without waiting for an answer selected Sir Neville Chamberlain as his envoy, and sent him forward with an escort of more than 1,000 men, too large, as it was observed, for peace, too small for war. As a matter of course the mission was not admitted. . . . An outcry was raised both in England and in India. . . . Troops were hastily

collected upon the Indian frontier; and a curious light was thrown on what had been done by the assertion of the Premier at the Guildhall banquet that the object in view was the formation of a 'scientific frontier;' in other words, throwing aside all former pretences, he declared that the policy of England was to make use of the opportunity offered for direct territorial aggression. . . . As had been foreseen by all parties from the first, the English armies were entirely successful in their first advance [November, 1878]. . . . By the close of December Jellalabad was in the hands of Browne, the Shutargardan Pass had been surmounted by Roberts, and in January Stewart established himself in Candahar. When the resistance of his army proved ineffectual, Shere Ali had taken to flight, only to die. His refractory son Yakoob Khan was drawn from his prison and assumed the reins of government as regent. . . . Yakoob readily granted the English demands, consenting to place his foreign relations under British control, and to accept British agencies. With considerably more reluctance, he allowed what was required for the rectification of the frontier to pass into English hands. He received in exchange a promise of support by the British Government, and an annual subsidy of £60,000. On the conclusion of the treaty the troops in the Jellalabad Valley withdrew within the new frontier, and Yakoob Khan was left to establish his authority as best he could at Cabul, whither in July Cavagnari with an escort of twenty-six troopers and eighty infantry betook himself. Then was enacted again the sad story which precluded the first Afghan war. All the parts and scenes in the drama repeated themselves with curious uniformity—the English Resident with his little garrison trusting blindly to his capacity for influencing the Afghan mind, the puppet king, without the power to make himself respected, irritated by the constant presence of the Resident, the chiefs mutually distrustful and at one in nothing save their hatred of English interference, the people seething with anger against the infidel foreigner, a wild outbreak which the Ameer, even had he wished it, could not control, an attack upon the Residency and the complete destruction [Sept., 1879] after a gallant but futile resistance of the Resident and his entire escort. Fortunately the extreme disaster of the previous war was avoided. The English troops which were withdrawn from the country were still within reach. . . . About the 24th of September, three weeks after the outbreak, the Cabul field force under General Roberts was able to move. On the 5th of October it forced its way into the Logar Valley at Charassiab, and on the 12th General Roberts was able to make his formal entry into the city of Cabul. . . . The Ameer was deposed, martial law was established, the disarmament of the people required under pain of death, and the country scoured to bring in for punishment those chiefly implicated in the late outbreak. While thus engaged in carrying out his work of retribution, the wave of insurrection closed behind the English general, communication through the Kuram Valley was cut off, and he was left to pass the winter with an army of some 8,000 men connected with India only by the Kybur Pass. . . . A new and formidable personage . . . now made his appearance on the scene. This was Abdurahman, the nephew and rival of the late Shere Ali, who upon the defeat of his pretensions had sought refuge in Turkestan, and was supposed to be supported by the friendship of Russia. The expected attack did not take place, constant reinforcements had raised the Cabul army to 20,000, and ren-

dered it too strong to be assailed. . . . It was thought desirable to break up Afghanistan into a northern and southern province. . . . The policy thus declared was carried out. A certain Shere Ali, a cousin of the late Ameer of the same name, was appointed Wali or Governor of Candahar. In the north signs were visible that the only possible successor to the throne of Cabul would be Abdurahman. . . . The Bengal army under General Stewart was to march northwards, and, suppressing on the way the Ghuznee insurgents, was to join the Cabul army in a sort of triumphant return to Peshawur. The first part of the programme was carried out. . . . The second part of the plan was fated to be interrupted by a serious disaster which rendered it for a while uncertain whether the withdrawal of the troops from Afghanistan was possible. . . . Ayooob had always expressed his disapproval of his brother's friendship for the English, and had constantly refused to accept their overtures. Though little was known about him, rumours were afloat that he intended to advance upon Ghuznee, and join the insurgents there. At length about the middle of June [1880] his army started. . . . But before the end of June Farah had been reached and it seemed plain that Candahar would be assaulted. . . . General Burrows found it necessary to fall back to a ridge some forty-five miles from Candahar called Kushy-Nakhud. There is a pass called Maiwand to the north of the highroad to Candahar, by which an army avoiding the position on the ridge might advance upon the city. On the 27th of July the Afghan troops were seen moving in the direction of this pass. In his attempt to stop them with his small force, numbering about 2,500 men, General Burrows was disastrously defeated. With difficulty and with the loss of seven guns, about half the English troops returned to Candahar. General Primrose, who was in command, had no choice but to strengthen the place, submit to an investment, and wait till he should be rescued. . . . The troops at Cabul were on the point of withdrawing when the news of the disaster reached them." General Roberts at once pushed forward to the beleaguered city, and dispersed the army of the Amir. Candahar was then held by the British until the fall of 1881, when they withdrew, Abdurahman having apparently established himself in power, and the country being in a quieted state.—J. F. Bright, *History of England, period 4*, pp. 534-544.

1893-1895.—Relinquishment of claims over Swat, Bajour and Chitral. See INDIA: 1895 (March-September).

1895.—Anglo-Russian agreement.—Determination of the northern frontier.—The joint Anglo-Russian commission for fixing the northern frontier of Afghanistan, from Zulfikar on the Heri-Rud to the Pamirs, finished its work in July, 1895. This was consequent upon an agreement between the governments of Great Britain and Russia which had been reduced to writing on the previous 11th of March. In part, that agreement was as follows: "Her Britannic Majesty's Government and the Government of His Majesty the Emperor of Russia engage to abstain from exercising any political influence or control, the former to the north, the latter to the south, of the above line of demarcation. Her Britannic Majesty's Government engage that the territory lying within the British sphere of influence between the Hindu Kush and the line running from the east end of Lake Victoria to the Chinese frontier shall

form part of the territory of the Ameer of Afghanistan, that it shall not be annexed to Great Britain, and that no military posts or forts shall be established in it. The execution of this Agreement is contingent upon the evacuation by the Ameer of Afghanistan of all the territories now occupied by His Highness on the right bank of the Panjah, and on the evacuation by the Ameer of Bokhara of the portion of Darwaz which lies to the south of the Oxus, in regard to which Her Britannic Majesty's Government and the Government of His Majesty the Emperor of Russia have agreed to use their influence respectively with the two Ameers."—*Great Britain, Papers by command: Treaty series, no. 8, 1895*.—See also INDIA: 1895 (March-September).

1896.—Conquest of Kafiristan.—By the agreement of 1893, between the Amir of Afghanistan and the government of India, the mountain district of Kafiristan was conceded to the former, and he presently set to work to subjugate its warlike people, who had never acknowledged his yoke. By the end of 1896 the conquest of these Asiatic Kafirs was believed to be complete.

1901-1906.—Death of Abdurahman.—Succession of his son, Habibullah.—Signs of a progressive spirit in the new Amir.—The late Amir, Abdurahman, died in October, 1901, and was succeeded by his eldest son, Habibullah. Early in the third year of his reign the new Amir began to show signs of a wish to have his country move a little on the lines of European progress, in the march which so many of his Asiatic neighbors were joining. His undertakings were disturbed for a time by trouble with his half-brother, Omar Jan, and with the latter's mother, the Bibi Halima or Queen of the Harem; but he brought the trouble to an end which does not seem to have been tragical, and that, in itself, is a notable mark in his favor. The Russo-Japanese War interested him immensely, and he established a daily post between Khyber and Cabul to bring speedy news of events. He then read the reports in public, with expositions, to make the listening people understand the bearing of what was happening on their own interests, and the lessons they should learn from what the Japanese were doing. He is said to have done much in the way of improving agriculture and horse-breeding in Afghanistan; he had a desire to establish a Chiefs' college, with the English language as the basis of instruction, but he met with strong opposition in this undertaking, and he introduced electric lighting, with probably other luxuries of modern science, in Kabul. Such things in Afghanistan mark a highly progressive man. His political intelligence was proved by the cordiality of his relations with the British Indian Government. An interesting account of conditions in the Amir's country in 1904 was given by D. C. Boulger, in the *Fortnightly Review* of December, that year, under the title of "The Awakening of Afghanistan."

1905.—The Amir becomes king.—In a new treaty between the Government of Great Britain and the Amir of Afghanistan, the latter was recognized as king.

1907.—Convention between Great Britain and Russia relative to Afghanistan. See ANGLO-RUSSIAN AGREEMENT OF 1907.

1907.—Effect of Russian and British agreement on Afghan trade.—"Russian goods enter Afghanistan chiefly through Herat, near to Kushkinski Post in Russian Turkestan, the terminus of the Nurghab Valley Railway, which connects with the Trans-Siberian Railway into European Russia. The treaty signed between Russia and Great

Britain in 1907 concerning Persia, Afghanistan, and Tibet, states that the British Government engages to exercise its influence in Afghanistan only in a pacific sense, and will not encourage Afghanistan to take any measures threatening Russia, while the Russian Government on its part recognizes that Afghanistan is outside the sphere of Russian influence, and that all political relations with this country shall be conducted through the intermediary of His Britannic Majesty's Government. Further, it engages not to send any agents into Afghanistan, though Russian and Afghan authorities may establish direct relations for the settlement of local questions of a non-political character. The British Government engages not to interfere in the internal administration of the country, provided that the Ameer fulfills the treaty engagements already contracted by him toward the British Government. Both countries affirmed their adherence to the principle of equality of commercial opportunity in Afghanistan. For whatever diplomatic intercourse is required between Afghanistan and British India the Indian Government has political agents at Kabul and Kandahar, who, in accordance with treaty regulations, must always be Mohammedans, while the Afghan Government, on its part, maintains an agent at the capital of India. Interesting evidence as to the awakening of the closed country of Afghanistan to modern progressive ideals of civilization is to be found in important construction works now being carried out under circumstances of great difficulty, especially those connected with costly and difficult transport of needed machinery and other material. The most interesting development of this sort is a project now under way for transmitting 44,000 volts of electrical energy from a waterfall about 120 feet high to Kabul, the capital, situated about 40 miles away. . . . This hydroelectric scheme will cost between \$500,000 and \$600,000 when completed, about \$300,000 being for machinery and materials. The water power will be used for distributing cheap electrical energy to the gun factory, shoe factory, projected woolen mill, and other industries at Kabul, under control of the Government of the Ameer; also for electric lighting of the royal palace, other residences, Government offices and street lighting. The machinery and material, including switches, generators, steel towers, and copper-covered steel wires, are being imported chiefly from the United States. The development should particularly benefit the industries of Kabul, which have been handicapped by the excessive cost of fuel. There are no coal mines in the country, and wood is scarce; for factories at Kabul wood has to be carried many miles on backs of camels. . . . The difficulty of transporting the machinery and ironwork through Khyber Pass and over almost impassable roads to Kabul is delaying the project, which may require several years to complete. The attempt to use motor lorries imported for this purpose failed, owing to the bad condition of the road to Kabul, and it is only by use of elephants that the heavy and bulky articles required can reach Kabul."—H. D. Baker, *British India*, pp. 543-544.

1915-1916.—Maintenance of neutrality during the war.—"The Amir of Afghanistan maintained his neutrality in the great war, and the principality did not become involved in the troubles of Persia. At the end of 1916 information was published concerning a German mission sent to Afghanistan in the previous year. It appears that the Emperor William had sent a German officer, Lieutenant von Hentig, accompanied by certain

Indian revolutionaries who had resided in Berlin, on a mission to the Amir, with the object of inducing him to attack India. The members of the mission had succeeded in making their way through Persia, by breaking up into small parties, and they had remained in Afghanistan nearly a year. Nevertheless, the Amir had refused the Turko-German proposals, and after the mission left Afghanistan in May, 1916, some of the members were captured by the Russians and British as they were trying to get back to Turkey.

"On November 29 an interesting statement was made by Mr. Chamberlain on the failure of a German mission to Afghanistan. The mission, he said, consisted of two Indian anarchists, a party of German officers and some Turks. The principal German Officer was the bearer of a letter from the German Chancellor to the Amir, in which the latter was invited to advise how best India might be liberated from British tyranny. The party were arrested on their arrival in Afghanistan and eventually conducted to Kabul where the Amir and his people quickly appraised them at their true value. At the outbreak of the war the Amir had given the Viceroy the most solemn assurances of his intention to preserve neutrality, and Mr. Chamberlain acknowledged with great satisfaction the loyalty he had shown to his pledged word."—*Annual Register*, 1916, pp. 299, 302.

1919.—Assassination of the Amir.—Accession of his son.—Attack on India.—On February 20, 1919, Habibullah Khan, Amir of Afghanistan, otherwise known as Siraj-ul-Millat-Wad-din, was assassinated in his camp in the Jelallabad district. As soon as this became known, Nasrullah Khan, brother of Habibullah, had himself proclaimed Amir, after forcing the submission of the late monarch's two older sons. His reign was exceedingly brief, however, for Amanullah Khan (born 1892), third son of Habibullah, who had managed to get control of the treasury and of the military supplies immediately after his father's assassination, won over to his cause the nobles and the soldiers, and thus simply secured the throne for himself. For complicity in the death of Habibullah, Nasrullah was condemned to life imprisonment, the actual murderer, Colonel Shah Ali Raza being put to death, while a third person said to be implicated shared the fate of Nasrullah. The new Amir found his position very insecure and sought to gain popularity at home by embarking on a war of aggression upon India. Hostilities broke out early in May and ended with a treaty of peace signed at Rawalpindi on August 8. By this war all former treaties between Afghanistan and Great Britain were cancelled and the subsidy paid to former amirs was declared forfeited, but the internal and external independence of Afghanistan was formally recognized by Great Britain.

1920 (April-July).—Discussions were held at Mussoorie, India, between British and Afghan delegates with a view to a permanent treaty of friendship.

1921.—Alliance with Russia.—Shortly after the accession of Amanullah an Afghan mission was sent to Moscow to establish relations with Soviet Russia. The negotiations developed into a treaty of Alliance concluded Feb. 28, 1921. A few days later a solemn reception was held at the Afghan embassy in Moscow to celebrate the anniversary of Afghan independence. Two representatives of the People's Commissariat for Foreign Affairs were present, also a delegation of the Turkish National

Assembly and members of the regular Turkish Delegation, representatives of the Persian embassy, the Khiva and Bokhara missions, and representatives of Esthonia, Latvia, Finland, etc.

AFRANIUS, Lucius, Roman general. Lived

about the period of the third Mithridatic War (74-61 B.C.). Consul in 60 B.C.; governor of Cisalpine Gaul in 59 B.C. Assisted Pompey against Cæsar, sustaining a severe defeat at Ilerda (49 B.C.).

AFRICA

The name Africa was originally applied by the Romans to part of the southern shore of the Mediterranean in the vicinity of Carthage, but later extended to include the entire continental mass extending southwest from Eurasia; the second largest of the world's great land divisions, by far the greater part of which lies within the tropics. See LIBYANS.

GEOGRAPHIC DESCRIPTION

General features.—"The comparative uniformity of the Continent of Africa, and the fact of its having been so repellent to the intervention of white races reared in temperate latitudes, can to a large extent be accounted for by comparing the lie of Africa with that of the other continents. It lies almost evenly balanced on each side of the equator, between about 40° north and 40° south. The equinoctial line which passes through its centre does not touch the Euro-Asiatic continent. . . . While the climate of the southern shores of Europe is very similar to that of the Mediterranean coast of Africa, and while the southern peninsulas of Asia are purely tropical, every variety of climate is found between that and the ice-bound shores of Siberia. In the other hemisphere, while the feet of the North American continent are laved by the warm waters of the Gulf Stream, its head is almost within hail of the North Pole. . . . Africa, then, is the tropical continent *par excellence*. Of its total area some two-thirds, almost 8,000,000 square miles, lie between the tropics, and have the sun vertical twice a year, while the rest of the Continent is more or less subtropical; so that, so far as climate goes, the popular conception is not far wrong. Even of America only about one-third of the land is within the tropics. . . . But there are other geographical factors to be taken into account, which modify the general effects of latitude, partly mitigating, partly intensifying them. We have seen how Africa lies compared with the situation of other continents. What about its relation to the great water-mass of the globe? We find its southern shores looking out upon the Antarctic, a long way off; from its western shores the broad Atlantic bears away without obstruction, and nothing intervenes between its eastern coast and the genial influence of the Indian Ocean. The northern and north-eastern coasts of the Continent are much less fortunately situated, only the narrow waters of the Mediterranean and the Red Sea separate Africa from the vast land-mass of Europe and Asia."—J. S. Keltie, *Partition of Africa*, p. 460.

Coastline.—"Though Africa is more than three times the size of Europe, and although it is practically an island while Europe has an extensive land frontier, the coast-line of Africa measures only about 15,000 miles in length, while that of Europe is 19,000 miles. A glance at a map of the world will show how this marked difference arises. There is not a single indentation on the coast of Africa worthy of the name; the coast-line all round looks like a barrier to keep back the beneficent advances of the ocean. . . . There is not-

ing in the whole round of the African coast to compare on the one hand with the great sea-arms and magnificent natural harbours that mark the west coast of Europe, nor with the richly broken Atlantic coast of North America on the other. There is only one estuary of real magnitude on the whole continent, that of the Congo; hence partly the great hopes entertained of the future of that river. Such second-rate harbours as those of Delagoa Bay and Mombasa are reckoned valuable possessions in Africa, for which nations struggle. This monotonous outline of the African coast acts disadvantageously in two ways from the point of view of European enterprise. In the first place, the lack of deep oceanic indentations deprives the great bulk of the Continent of the beneficent influences which contiguity to the sea brings with it; and in the second place, it deprives the enterprising navigator and trader of ready highways to the interior. Thus the mere character of the contour of the coast has contributed to retard the development of the Continent. At the same time, let us recall the fact that the spread of railways over the Continent would tend greatly to counteract the commercial disadvantages arising from the lack of deep arms of the sea, navigable rivers, and natural harbours. Railways are the great levellers, shattering old geographical traditions, and tending to place all continents on an equal footing, so far as communications are concerned."—*Ibid.*, pp. 463-464.

Mountains and plateaus.—"Passing from the contour of the coast-line to the configuration of the surface of the Continent, we find here again certain characteristics which distinguish Africa from all the other continents, except perhaps Australia, which might have been as far behind in civilisation as Africa had its latitude been different. The surface of Africa is nearly as monotonous as its outline. There is only one mountain range worthy of the name, that of the Atlas, which extends along the northern rim of the Continent from Tunis to the Atlantic coast of Morocco. . . . But when all is put together the really mountainous regions of Africa amount to little compared with the great size of the Continent. We have nothing in Africa that can compare in comparative mass and extent with the Alps, the Pyrenees, the Apennines, the Carpathians, the Scandinavian ranges, in Europe, not to mention the Himalayas, the stupendous ranges of Central Asia. . . . This lack of great mountain ranges upon the African Continent must be regarded as another serious drawback to its economical development, since it markedly affects its rainfall and the distribution of its water supply. . . . In a general way the composition of the soil of Africa is favourable enough to the varied requirements of humanity; its great want is water.

"It is a striking fact that, notwithstanding the paucity of great mountain ranges in Africa as compared with Europe and Asia, the general mean elevation of the former is greater than in either of the latter. . . . This reveals to us the great characteristic feature of the surface of Africa, that of a high plateau, descending almost everywhere

in terraces to the coast. . . . All round the coast is seen a strip varying in breadth, but generally comparatively narrow, of not more than 500 feet in height. But the great bulk of the Continent is a plateau of from 500 to 2000 feet, much nearer to the latter than the former. . . . In Africa, in short, the relief of the land, instead of being concentrated in one or two enormous mountain ranges, has been spread over the Continent with wonderful equality. The practical importance of the plateau character of the surface of Africa will be apparent when the influence of latitude in modifying temperature is kept in view. . . . The mean annual isotherm of 80° is in the north almost coincident with the Tropic of Cancer, and on the south enters at the Guinea Coast, but sweeps so abruptly south as to include the bulk of Africa south of the equator. These are enormous average temperatures to embrace a continent; no other land-mass has anything like them. . . . More trying even than this, according to many reliable authorities, is the excessive variation of temperature between day and night. The difference between summer and winter temperature in some parts of Africa is very great. . . . Such a difference can be provided for. But when there is a sudden lowering of the temperature at sundown in a tropical or subtropical moisture-laden atmosphere it is apt to tell severely on the European constitution. . . . These are a few of the advantages and disadvantages of the plateau character of Tropical Africa, so far as concerns the influence of the climate on the European constitution. It entails, however, still another obstacle to free commercial enterprise. The plateau, which prevails almost everywhere, slopes down in terraces more or less rapidly to the coast, and down these terraces the rivers from the interior must make their way with the result that we find the courses of the Nile, the Niger, the Congo, the Zambezi, more or less interrupted by cataracts. These are a serious obstacle to navigation. Forunately on the Niger the break occurs far up the river, leaving a long, clear waterway; but on the Congo we meet with some 200 miles of unnavigable cataracts, beginning at about 150 miles from the sea, and so cutting off from direct access the 1000 miles of splendid waterway above, which leads into the heart of Africa. Had it not been for this we cannot doubt that the Congo would have been traced from below long before Stanley's brilliant achievement from above. At the same time, as has already been pointed out, these geographical disadvantages can be almost nullified by the construction of railways. No doubt both in Europe and America river-navigation is of importance but it is insignificant compared with the importance of railway communication. In fact, the judicious introduction of railways would greatly enhance the value of the African waterway."—J. S. Keltie, *Partition of Africa*, pp. 464-468.

Climate.—"Prevailing winds have much to do with temperature, and still more perhaps with rainfall; and it is to be feared that here we touch upon one of the weakest of Africa's many weak points. On the east coast the prevailing winds are towards the Continent, bringing with them a fair supply of moisture, while farther south the cold Benguela current will tend to diminish the supply. The north-east trades just skirt the Sahara coast, and do it little good, while the winds that cross the Mediterranean and Red Sea have already parted with most of their moisture to the Euro-Asiatic land-mass, and what little remains is levied by the coast-lands. . . . Thus,

then, except in the centre of the Continent, in Tropical Africa the rainfall is almost everywhere inadequate for industrial operations; so that where Europeans might settle, so far as temperature goes, the water-supply is defective. Even, however, in the central belt, especially in East Africa, there are considerable areas of desert met with, where the water-supply is almost nil. . . . It is not surprising, then, to find that the rivers of Africa, with one exception, draw their supplies from the centre of the Continent. . . . But as a general rule, outside the tropical area, permanently flowing water is rare. . . . Between the north of the central belt and the Mediterranean coast, and also over most of the northeast horn of Africa, is found an area either absolutely desert, or the next stage to it—poor steppe, scrub, or other land of a like nature. This area covers something like 4,000,000 square miles—one-third of the Continent. Of this about one-half is pure desert, the veritable sandy Sahara. . . . On the other side of Africa we find a strip of true desert along the west coast from the Coanza to the Orange River. This spreads out on the south of the Zambezi. Over about two-thirds of South Africa, and extending well to the south of the Orange River, we have the scrub or steppe characteristics known in the Cape region as the Karroo."—J. S. Keltie, *Partition of Africa*, pp. 475-476.

RACES OF AFRICA

Prehistoric peoples.—"There is no exact data on the origin of the people of North Africa. The men of the Stone Age have left numerous traces in the country, and one finds everywhere, in caves, a few arms and implements of flint. Many stone implements and arms of various paleolithic types, as well as neolithic hatchets have been found in North Africa, in Algeria (at Tlemcen), in south Algeria (at El-Golea), up to Timbuctu. Finally there is in Tunis (at Gafsa) and in general west of the Gulf of Gabés a series of paleolithic implements resembling very closely those of Europe. The country bordering on the oasis of Gafsa, at one time wooded, is now completely denuded and unfertile, and the desert plain and mountains reveal the ancient flints level with the ground. To the east of the oasis considerable heaps of debris and stone chips can be seen at intervals. These first inhabitants belong without doubt to a race which came from the south, after having been expelled from the desert. On the other hand, everything conduces to the belief that at that ancient time, North Africa was connected to Europe by two large Iberian and Italian isthmuses or peninsulas, and it is possible that all the banks of the Mediterranean were inhabited by the same race.

"Two human groups," says Tissot, "have, then, at the most remote period, peopled the Atlantic *massif*; one coming up from the Sahara toward the north, the other descending from southern Europe towards the south. Such seems to us to be the first groundwork of the Berber race, and since that time we distinguish by this the two ethnic elements of which trace is found in the traditions of the following ages, and also as found in African anthropology, a brown European race, and a brown Saharan race, fundamentally distinct from the black race." To this foundation the blond men were afterward added, who came originally from the north of Europe, as well as Iberians. The date of the invasion of the fair-headed men is uncertain. We can only say that it is previous to the 10th Egyptian dynasty. Be-

fore the 19th dynasty, in fact, the inhabitants of the west were represented on the Egyptian monuments only by brown men, and after that time, blond men are figured among them. It is certain that the blond race was of considerable importance in all the Barbary coast. Even today one discovers numerous types of blonds in Tunis and in Algeria; in Morocco, about one-third of the population is blond; the tribes which inhabit the high regions of the Atlas are exclusively blond. The Iberians penetrated into Africa at about the same time. Tissot puts the invasion of the Iberians after the European immigration, while remarking at the same time that in this matter it is impossible to be certain, and that the question is connected with that of the origin of the Iberians. It is to them, according to the same author, that we must attribute the state of civilisation as advanced as Egyptian documents establish, in the north of Libya, at a time previous to the first known oriental invasions.

"The principal thing to remember is that the inhabitants of the north side of the Atlas alone seem to have been intermingled with new arrivals: one can see them modify themselves little by little at their contact, while the inhabitants of the southern side of the high plateaux remain unchanged and just as one finds them today. Among the people of the first race, one must range, in going from west to east, the Moors, the Numidians, and the Libyans. The people of the second race have received the name of Gaetulians and gave rise to the Zénète and Sanhadja Berbers, as well as to various Tuareg tribes. Finally, the influence of peoples inhabiting eastern Egypt and Africa on the population of Barbary was without doubt considerable, although not well defined. The Nefzaoua—inhabiting the oasis of Djerid—have saved in their traditions the memory of the Kouschite invasion, and the history of Egypt, at that time, is intimately connected with that of Barbary. Traces have been found in Egyptian documents, of numerous expeditions when cutlasses of bronze were taken from the Libyans, as well as money, gold, silver, bows, javelins and chariots.

"One may conclude, that since the 14th century before Christ the Libyans had a civilisation and industry. They already had hereditary kings and had concluded alliances with the people of the islands and with the Tyrians in particular. At the other extremity of North Africa the Mauretians appear to have arrived, at the same time, at a certain degree of civilisation. We have no exact data on the first inhabitants of North Africa. . . . Herodotus, who has left us the first historic data on North Africa, speaks only of the inhabitants of the eastern part. The Latin and Greek historians have left us some references to these people. The Libyans are represented as vigorous men and long-lived. They had white skin, blue eyes, blond or chestnut hair and beard, which were carefully curled in the manner still used by the Amazigh of the Rif. The headdress of the chiefs was surmounted by two ostrich plumes. The costume of the Libyans consisted of a piece of cloth or of cotton girding the loins and of a dress of wool open the whole length, the upper ends of which were simply knotted on the left shoulder. They carried on their heads a sort of round cap with a neckerchief, like those still worn by women of certain Tripolitan tribes today."—Tr. from V. Piquet, *Les civilisations de l'Afrique du nord*, pp. 1-6.—See also HAMITES: Hamitic languages; UGANDA.

"They lived in huts formed of stakes holding

up woven rushes or stems of the asphodel. 'The chiefs of the Libyans,' said Diodorus of Sicily, 'had no cities, but only, in the neighborhood of the springs, towers in which they concealed their riches.' Polybius represents them as leading a most miserable existence across their woods and plains. Those of the fertile regions lived on agriculture and obeyed their kings; the others lived on brigandage and established themselves nowhere. Their arms were sometimes a shield with two sides, an axe, bows and arrows, sometimes a round shield, three javelins and stones kept in a leather bag. All these peoples sacrificed victims to the sun or to the moon. They also worshipped the old sovereigns, the guardian angels of the cities. Each people had in addition, its particular god; it was Sinifere or Mastiman, Ifri or Ifru, god of the caves, or Gurzil to whom human sacrifices were made. Certain peoples offer interesting peculiarities. The Mauretians were the most advanced. They dressed their hair with care and carried jewels; they fought on horseback with a long lance and swords, the infantry carrying shields of elephant skin.

"The Nasamonians married several women, who were not, however, held to fidelity. This people honored the memory of the men who were distinguished by their justice and their valor. The Nasamonians knew no other divinities than the souls of the dead, swore by them and consulted them like oracles. To that purpose they slept on the tombs of their ancestors and regulated their conduct according to the dreams that were sent them. Certain Barbary tribes of the Sahara have kept this custom. They sheltered themselves among the rocks, and the first caves of the country of the Matmata were excavated by them. Like the Nasamonians the Garamantes went about almost nude, protected only by a shield of skin and by long javelins. The Anceans distinguished themselves by the arrangement of their hair, of which one still finds examples among the Amazigh of the Rif. Their women wore, besides their tunic, an undergarment of goatskin, decorated with a fringe. To the east of Cyrene, finally, the tribes took the Egyptian customs. The Gaetulians, who lived on the south side of the high plateaux, remained sheltered from contact with the people who invaded the neighboring regions at different times. The origin of their name—from which might be derived the name of certain Berber tribes, the Guezzoula, for example—is not known. Grouped in families, they wandered without covering, in the train of their troops, wearing nothing but a floating tunic and a cloak of skins attached by a clasp.

"The question of the sepulchres of these people is particularly interesting, and has given rise to numerous works. One meets with tumuli, or *redjem*, masses of stones, covering in general a rudimentary sarcophagus formed of large slabs of marble; dolmens, resembling those of other Mediterranean regions and forming a funeral chamber of variable size; and finally, some round tombs which are called *chouchets*. The tumuli are particularly numerous in Oran and in the Hodna, the dolmens on the contrary, in the east (ancient Numidia); they are unknown in the Sahara. Nevertheless, one can conclude nothing from the presence of these monuments as to the origin of the populations, one cannot even date them. It is certain only that some of them are relatively recent, and that their structure was maintained in Africa longer than the others."—Tr. from V. Piquet, *Les civilisations de l'Afrique du nord*, pp. 1-6.—"The ancient world had really

very little knowledge of the Dark Continent. These facts about Africa they did know, however; they had an almost correct idea of the bulk of Africa, they knew lower and middle Egypt, the Mediterranean and Atlantic shores, Cyrenaica to Cape Jubi, and the shores of the Indian ocean to Mozambique. But beyond some military penetration of the desert and the marshes of the Nile, they were never in direct touch with the black races properly speaking. However, the Sahara offers only a slight obstacle to relations between the peoples who live on its borders. The entire Sudan was thus open to the penetration, although indirect, of the inventions and ideas inherited by the Ethiopians through their contacts with the Egyptians."—Tr. from O. Meynier, *L'Afrique noire*, p. 69.—See also MYTHOLOGY: African mythology.

Modern peoples.—"Africa contains infinitely diversified populations which could not be assimilated, less because of different origin than because of dissimilarity of social life and customs. Interbreeding is not rare, however, and one can even foresee in the distant future the formation of a purely African race, having well defined characteristics, some of which one can almost predict even now. But for the present it is still easy to distinguish them from one another and to make a very clear classification. According to a division generally admitted (and one which does not include the inhabitants of the lower valley of the Nile, descendants of the ancient Egyptians), the people of Africa may be divided into six great classes: (1) The Berbers, (2) Arabs, (3) Fulas, (4) Negroes, properly speaking, (5) Hottentots and Bushmen, and (6) Europeans.

"Scientific research up to our day has not been able to establish exactly whether the Berbers were aboriginal inhabitants or whether the source of their migration might not be referred to one of those historic movements which, like the exodus of the famous Hyksos (18th century B. C.) would have led them from the centre of Asia to the north of Africa, passing through Egypt. The *Berbers* inhabit the largest part of the regions bordering on the Mediterranean west of Egypt. In the desert they form the principal element of a rather thin but very virile population. Finally they meet and combine with the black element on the southern border of the Sahara, from Abyssinia to Senegal. Individuals of pure Berber types are quite exceptional. In the north of the continent they were subjected to the influence of all the invasions that succeeded one another in that region. Phoenicians, Greeks, Romans, and Vandals have left on the Berbers visible traces of their blood. But the deepest influence has been exercised by the Arabs, who gave a great part of their religion, their art, and in many cases, their language itself to the Berbers. The Moorish tribes of the desert, above all the Tuaregs, seem, as far as one can tell, to have better preserved their individuality. The very constitution of a nomad tribe, the spirit of independence which animates it seem, in fact, to have enabled the Berbers to protect themselves from foreign influences more easily than the non-migratory organizations of the north. However, the Arabs were still able to establish their influence, to give their language as well as their religion to most of the Moorish tribes of the west. In the south of the Sahara, frequent inter-breeding with the black race occurred. Without counting the . . . rather more mongrel types, combinations of Moors, Tuaregs and negroes, there are peoples either black or red, who by their type, sometimes even

by their name (Berberi, Berabras, etc.), have very probably a Berber origin.

"There is much more knowledge on the origin of the *Arabs* than on that of the Berbers. History and tradition show the Arabs, even before the Hegira, crossing the same waters their sailing vessels travel over in our day, and coming to establish flourishing sultanates on the coast of Zanzibar and of Mozambique. After the death of Mohammed, the Arabs, fired with the enthusiasm of their faith, made a definite invasion of Africa. At two different resumptions of the attack their warlike tribes, issuing from Egypt, where one of their most powerful empires was established, spilled upon the African shores of the Mediterranean. . . . The number of the conquerors was relatively small, nevertheless the influence that they exercised upon the original inhabitants was considerable. The Berbers borrowed their civilization, their art, their religion. Many of them even renounced their own language for that of their conquerors, and even today it is difficult to distinguish between pure Arabs and Arabic Berbers, as Moslems everywhere have a strong tendency to claim direct descent from the prophet or his family. The Arabs have found, in the valley of the Nile, another route for their migrations. Some of their tribes ascended to the sources of the Nile planting their colonies on its banks; meeting near the great lakes the tribes from the littoral of the Indian Ocean. Others finally penetrated the west, following the course of the Bahr-el-Ghazal toward the Ouadai and the Bagirmi. These last were crossed like the Berbers with the original black population and of this mixture of blood resulted the Chuas, who are found in great numbers in Central Africa, showing by more delicate features and slightly corrupted language their semitic origin.

"Of all the races of Africa, the Fulas have the most uncertain and most controverted derivation. The physical type, characterized by graceful structure and fine features, yellow or red skin, a language altogether different and admirably homogeneous wherever spoken—all these attracted the attention of scholars. . . . [There are several explanations of their origin, but none of them is verifiable.] The *Fulas* are found in all Sudan from [the] Senegal to the Ouadai. They are, in general, shepherds with little settlements here and there. One finds some of them interested in letters, some even scholars. They have produced, particularly in the last century, a whole line of distinguished statesmen and warriors. A remarkable faculty for adapting themselves as easily as possible to whatever conditions of climate, food, and surroundings their travels and wars might expose them to, has made the Fulas an object of wonder. They frequently allied themselves with the original black population; the results of these crosses have been new races which have all played an important part in the history of Africa, and which have preserved, for the most part, the language and pastoral habits of the mother race.

"Considerations mainly of a philological nature have induced geographers to refer back the whole of the black population to a single type, which would be the *Bantu* race. Unquestionably the pure negroes of the Sudan, those of the equatorial regions, and of eastern and southern Africa, present among themselves some remarkable likenesses in the matter of physique, and even of character, institutions, customs and language. . . . But the black race has not everywhere remained pure. In particular on the southern border of the desert [Sahara], Berbers, Arabs and Fulas are crossed

with them. Because of a great power of absorption due to superior numbers, the negro has seemed sometimes to efface the principal traits of the other elements of the crossing. In reality, the superior races have left their mark. Not only has the physical type been modified, but their qualities of intelligence and of character have been influenced by these accumulated inheritances. . . . The primitive negro race lives, however, in many places. The equatorial forests conceal in their depths some miserable beings who, without material or moral needs, live in a state of complete brutality. But even numerically they form the exception and French Senegalese aborigines speak of them contemptuously as 'savages.' The negroes are uniformly settled and mostly agricultural. Therefore they are only met with in the desert oases. Outside of the desert, in the neighborhood of Tangiers, especially, they are found up to the present only in a state of slavery. When the Europeans, after having rounded the coast of Africa, came to establish colonies in Southern Africa, they found there, settled alongside of the blacks, Kafirs and Zulus, populations of a lighter color, yellow or brown, of gentle and peaceable customs, cultivating the land and raising flocks. They were the *Hottentots*. Departing soon to explore new lands or fleeing in their ox-wagons before the attacks of the English, the descendants of the Dutch and French colonists, the Boers, advanced further north where they met tribes of hunters, *Bushmen*, living in the great plateaus of the north and the extended deserts of Kalahari, on the uncertain products of the chase—antelopes, giraffes and ostriches. Today it is believed that the *Hottentots* and *Bushmen* belong to a common family, and a Malay-Polynesian origin is attributed to them. To speak truly, this hypothesis rests on very weak proofs, and the fact, reported by Prévile, that the *Hottentots* claim to have descended from individuals who had come from the East by the sea, in 'great baskets,' constitutes but a feeble argument in its favor.—Tr. from O. Meynier, *L'Afrique noire*, pp. 39-48.—Extensive *European settlements* are in the main confined to Algeria and South Africa, with beginnings in British East Africa. In most parts of the continent, officials and traders form practically the only European element.—See also *ABYSSINIA*.

ANCIENT AND MEDIEVAL CIVILIZATION

Development of Egyptian civilization.—"In Africa, in the valley of the Nile, was born and developed the most ancient civilization of the western world. The Egyptians, who may have been of African origin, were established at first in the delta of the river, but moved later towards its source, obeying the law imposed by nature on all the masters of the lower valley of the Nile. Under the Memphite emperors, Egyptian power grew constantly and the city of Elephantine, on the island of the same name, became the headquarters of trade with the Sudan. The Nubian tribes acknowledged the sovereignty of Pharaoh: visited by official missions in the time of Papi I, they were colonized, and later under the first Theban kings assimilated by the rest of Egypt. The rapids of Wadi Halfa formed henceforth the frontier of the empire. Commercial expeditions attacked Barbary and under the eighteenth Theban dynasty, Ethiopia was conquered to Egyptian customs. In the fourteenth century B. C., Egypt extended her dominion south of the conjunction of the White Nile and the Blue Nile, and over

the whole coast of the Red Sea. The great queen Hatsheput even sent a commercial expedition to obtain incense in the fabulous country of Pouanit (probably the coast of Somaliland). Egyptian dominion was not to progress any further. The old empire exhausted itself in opposing attacks from Asia. Egypt was conquered first by the Assyrians, then by the Persians. She sent fewer vessels to the islands of the Ægean Sea, but received at her ports those of the Phoenicians and the Greeks. The Greeks established themselves in the cities of the Delta. Certain of the cities, Miletus in particular, founded sizable colonies there. In the seventh century B. C. Greek infantry fought on the side of Psammetichus I for the liberty of Egypt, and from that time on the merchants from the North exercised a considerable growing influence on the ancient empire of the Pharaohs without ever being either loved or understood. They respected, however, the glory of her past, attested by her magnificent monuments, and the mysterious science of her priests. Alexander never took the trouble to conquer Egypt and make her adore him. As the situations of Thebes, Sais, and Memphis did not satisfy actual commercial needs, he established, opposite the Island of Pharos, at the town of Rakottis, a city to which he gave his name (332 B. C.). At the death of the conqueror, Egypt, with Lybia and Arabia, was willed to Ptolemy Soter. This was a period of remarkable prosperity. 'Alexander was the centre of the world's commerce and Egyptian vessels went from the coasts of India and of Ethiopia to Italy and Spain and into the sea.'—Tr. from R. Ronze, *La question d'Afrique*.—See also *CARTHAGE*; *EGYPT*; *LIBYANS*; *NUMIDIANS*.

Carthaginian empire.—Since about 813 B. C. another empire had grown up on the coast of Africa. The great Phœnician colony of Carthage had established its authority over a great territory, occupying part of Tunis and Tripoli. And, in her turn, she had established her colonies on the edge of the Mediterranean. Overcoming the distance which separated her from the Atlantic, she had sent her vessels to trade with the Canaries and the coast of Morocco. The prosperity of African Carthage, her maritime triumph and her conquests which led her to the gates of Rome caused her downfall. There was no room in the ancient world for two powerful cities.—Tr. from R. Ronze, *La question d'Afrique*.—See also *CARTHAGE*.

Carthage after Justinian's conquest. See *CARTHAGE*: 534-558.

Roman occupation.—"The feeling in Rome that Carthage had to be destroyed led in 146 B. C. to the capture and destruction of the great Punic city by Scipio. The Carthaginian territory was reduced to a Roman province. . . . Beyond that, extended the territories of Mauretania and Numidia, which Scipio was careful to separate from the province directly under the supervision of Rome. After the battle of Thapsus (46 B. C.), Cæsar extended the limits of Roman Africa by including Numidia. . . . In the year 30 B. C. at the death of Cleopatra, the race of Lagides being extinct, Egypt was reduced to the position of a province. [See also *EGYPT*: 30 B. C.]. Finally Mauretania, given by Augustus to Juba II, was retaken in 40 A. D. by Caligula from the son of that prince and incorporated in the Empire. Latin civilisation penetrated largely into the Roman provinces of Africa: Egypt, Cyrenaica, Numidia and Mauretania, that is to say in all of northern Africa save in Morocco, where it was halted by the desert of Malva. The Arabs themselves were

struck by the size and the number of the ruins, and they said when showing them to those they called the *Roumis* (from Rome, properly Roman-Arab name for Christian) 'Your ancestors believed then that they would never die!' The rôle that Roman Africa played in the Empire was great. She was not only Italy's granary, but she also furnished the Empire with raw army recruits as well as with the emperors: Septimus-Severus, Albinus, and Macrinus. From Hadrumetum came the great jurist Salvus Julianus who under Hadrian revised the law of the provinces; and the church of Africa can pride itself on the great names of Tertullian, Minutius Felix, Saint Cyprian, Arnobius, Finnianus, Lactantius and Saint Augustine. 'The Roman Empire fell in 429 under the attack of the Vandals. During a century from 429 to 529, the barbarian vandal submerged Africa. Reconquered by Belisarius and the patriarch Solomon, 'from Tripolitania to the confines of Cæsarian Mauretania, from the sea to the region of the lakes of Algeria and from Tunis to the mountains of Aures and the plateaux of Hodna, the ancient province of Africa recognised (in 539) the dominion of the very pious emperor Justinian.'—Tr. from R. Ronze, *La question d'Afrique*.—See also CARTHAGE: Founding of.

'Inscriptions innumerable bear ample testimony to the condition of the African population at this period, and monumental remains, which still greet the traveller in some of the less trodden parts of this fair land, bear ample evidence of the presence of large communities enjoying the full benefits of civilised life. If we turn to inscriptions relating to municipal life, we find that obedience to ruling authority and loyalty to the Emperor are seldom wanting. The discipline which was maintained in Rome till the fall of the Western Empire was equally potent in the provinces. We find the same degrees of magistracy, the same laws so adjusted as not to press too heavily on the old-world traditions of native races, the same gods and ranks of priesthood, and the same public-minded spirit which prompted Roman citizens in all parts of the Empire to ennoble the country of their adoption by works of munificence or general utility. . . .

'Allusion has been made to Carthage and Cirta as the great centres of scholarship, proving as attractive to students in literature and philosophy as the university towns of our own day in Great Britain or other European countries. A long roll of names, mostly bearing the stamp of Italian origin, has been transmitted to us by various contemporary writers. Some of these distinguished African scholars were descendants of settlers in the early days of colonisation, and may fairly lay claim to be classed as Africans; while others were of a rambling order, passing from Athens or Corinth, Alexandria or Rome, to take part in some educational movement, or to exhibit their skill in some school of rhetoric or philosophy. The intimate commercial relations between Carthaginians and Greeks, prior to the Roman occupation, tended to the spread of Hellenism in the coast towns of North Africa; while the establishment of Greek merchants in the chief cities of Numidia gave an impetus to the general use of Greek among the better educated classes. . . . At a still later period, under the Antonines, Greek was the accepted language of the coast towns. Latin had made little progress, and the Punic tongue largely prevailed among the peasantry and labouring classes. . . .

'The stamp of originality impressed upon so many literary creations in North Africa is conspicuous by its absence in all that relates to the

artistic products of the country. . . . The reason for this absence of artistic proclivities is not far to seek. The fine arts never flourished at Carthage, and certainly every exploration, either on the site of the city itself or the numerous *emporium* on the coast, favours this statement. As a tributary of Egypt for a long period the Carthaginians, in spite of their wealth and power, were satisfied with borrowing from their master the skilled products of a neighbouring country. And in later years, when Carthage had to contend with Greeks in the fair island of Sicily, resplendent with temples and palaces, embellished with sculpture of the best period of Greek art, and rich in works of jewellery and specimens of the plastic art, Hellenism exercised an irresistible attraction, testified in a measure by Carthaginian coins which have been transmitted to us almost as perfect as on the day when they were minted. These two consecutive influences, Egyptian and Greek, have left their mark on the numerous remains which may still be studied in the galleries of the Louvre or in the museum on Carthage hill, where decorative forms associated with Egyptian and Hellenic art may be seen side by side. . . .

'The difficulties which beset the Romans in their career of conquest, at the close of the second Punic war, arose in a great measure from the general configuration of the country, which seemed fatal also to the native races in their attempts to expel the invader. The three zones of the country, separated by high mountains, never impassable, but presenting natural difficulties in the transport of large bodies of disciplined troops, may be said to represent three distinct regions. On the north was the broad stretch of sea—the *Mare saevum* which, for so many generations, proved an insuperable barrier to Roman advancement, and on the south the sea of sand—the mysterious desert stretching across the equator, and unfit for habitation by European races. To these peculiar features of North Africa may be attributed the partial success which attended the rising of frontier and desert tribes at all periods of the Roman occupation, fully sufficient to account for difficulties experienced by the Roman legions in suppressing a long series of tribal revolts. Till the time of Trajan, colonisation by the Latin race was confined mostly to the towns already peopled by Carthaginians or the descendants of old Phœnician traders. The accession of this princely ruler marks a starting-point in the history of Roman Africa. Under the twelve Cæsars progress had been checked by the almost insuperable difficulties attending the invasion of an unknown country, peopled by races whose habits of life and methods of warfare had nothing in common with the more advanced civilisation of the people of Italy, and the islands under Roman domination. Trajan seems to have been born at the right time. His noble bearing and distinguished generalship, coupled with administrative abilities of a high order, roused the enthusiasm of his subjects to a degree unknown since the days of Augustus. The African provinces reaped a full share of benefits from the career of such a ruler. Colonisation was attended with marked success. Cities and towns sprang up at the Emperor's bidding. Native tribesmen found themselves unmolested, their forms of religion and habits of life undisturbed, and encouragement given to a free interchange of commercial products. Under the Antonines the good work still progressing, was checked for a time under the strong hand of Septimius Severus.

'It is difficult to ascertain from the latest Latin

authors, or from Byzantine and Arab writers, whether the boundaries of Roman administration were definitely fixed, and whether the subjugation of the country was ever regarded as complete. Fortunately, archaeology comes to our aid. . . . The remains of a clearly defined line of fortresses and military posts stretching across the mountain ranges of the Tell, and along the desert frontier from Cyrene to the confines of Western Mauretania, bear ample testimony to the nature of the defensive measures adopted by the Romans against invasion from the west and south, and to a feeling of insecurity in the presence of native races so little desirous of cultivating more civilised ways of life. Till the close of the Empire these frontier strongholds were mostly occupied by veterans, whose services to the State in times of raid or insurrection are recorded in several inscriptions still extant. From the time of their first encounter with the Berbers of the hill country or the rude warriors from the desert, the Romans must have recognised the almost insuperable difficulties in waging irregular warfare with unorganised tribes, having no seat of government and no settled habitations—here to-day and gone to-morrow, the hillsman secure in some inaccessible mountain retreat, the man of the desert lost to sight in a whirlwind of sand as he scampered across his trackless domain. This sense of insecurity seems to have been never absent from the Roman mind, and was particularly apparent at a late period of the Empire, when Diocletian attached the province of Muritania Tingitana to the diocese of Spain, as a means of checking the piratical raids of Moorish corsairs on both shores of the Mediterranean. It was also indicated by the unusual authority given to the commander of the legion in Africa, who, from the time of Caligula, received his orders direct from the Emperor, and exercised more power than the governor of the province. Exceptional circumstances demanded exceptional forms of government, and the defensive measures found necessary for the protection of large communities enjoying all the privileges of civilised life redound to the credit of the Roman world; yet, looking back at the six centuries of work accomplished by the Romans in their attempt to make North Africa a prolongation of Italy, one is forced to admit that the subjugation of the country was never complete, and that the native races were never conquered.

"The climatic condition and the general aspect of the country in the early days of Roman occupation were much as they are in our own time, except, perhaps, on the southern frontiers overlooking the great desert. But with the development of Roman civilisation a new order of things changed the face of the land. Recognising the value of natural resources, and bending the elements to his indomitable will in the service of mankind, the Roman colonist controlled the water-courses, constructed gigantic reservoirs to meet the necessities of a thirsty soil, encouraged forestry, and converted a region of desolation into a garden of cultivation. And this is amply borne out in the statements of Arab authors of the seventh century, who are profuse in their praise of the fair land which had fallen into their hands. From Carthage to Tangier, stretching a thousand miles from east to west, the whole country was clothed with timber, and in many parts of the south, olive woods were so dense that you could travel from village to village under a roof of foliage. It may be asserted, with an equal show of truth, that the condition of North Africa as a colony in the present day, and in full recognition

of the enlightened policy of the French, as masters of the larger portion, bears a strong resemblance to that which prevailed under the broad but sterner rule of the Roman Emperors. We hear of the same occasional disturbances on the frontiers, the same forced submission of the hill tribes, the same difficulties in guarding the outposts from the dangers of tribal revolt, and the same racial antagonism to the methods and habits of civilisation. The Libyan gave place to the Phœnician as a commercial necessity, and surrendered the command of the coast without appeal to arms or the sacrifice of human life. The Carthaginian, in his turn, converted the factories and storehouses of his ancestors into temples and palaces, and a country of traders became the most formidable nation of the old world."—A. Graham, *Roman Africa*, pp. 297-307.

Arab occupation.—Relations with Europe.—Effects of Arab influence.—"During the great offensive movement of Islam at the beginning of the 7th century, the Arabs penetrated into Egypt (638); and she succumbed in 641. A first assault upon the Byzantine province permitted the Musulman cavalry to ravage Byzacene after having conquered and killed the patriarch Gregory, who had himself proclaimed emperor of Carthage before he fled from the invaders. About 665, the conquest was repeated. A great battle before Tialet gave the Arabs the chance to break the resistance of the Berbers, and to penetrate to the Atlantic. Carthage, taken for the first time in 695; delivered in 697 by the patriarch John, was lost forever in 698. In 709 Count Julian handed over Septem Fratres (Ceuta), the last Byzantine citadel, to the Arabs. [See also CALIPHATE; 647-709.] The Arabs did not stop at the sea. Under . . . Barbar Tarik, lieutenant to . . . Mussa-ben-Nodeir, they crossed over near the place where Gibraltar stands (Djebel Tarik) and conquered Spain. In 718 they crossed the Pyrenees and penetrated into Gaul. The victory of Charles Martel at Poitiers (732) stopped their progress. They returned over the Pyrenees, but kept Spain. Separated from Europe, Mohammedan Spain went on receiving African rulers at different intervals during four centuries. While the Christian redemption (reconquista) was being carried out, the great sovereigns of Morocco were often called to the aid of the Spanish Mohammedans attacked by the infidels. Youssef-ben-Tachfin, founder of the dynasty of the Almohades, defeated Alphonse VI, king of Castille and Leon at Zalzarca in 1086 and subdued Spain. Abd-el-Moumen (1130-1163) reigned over southern Spain and over all of North Africa from Tangiers to Barka. He drove from Africa those Sicilian Normans who under the leadership of Roger II, had from 1143 to 1148 conquered all the country which extends from Tripoli to the neighborhood of Tunis and from the sea to Kairwan (1160). His grandson, Yacoub-el-Mansour (1184-1198) took Madrid. But in the 13th century, the decadence began. The Almohad Empire fell and from its ruins the three kingdoms of Fez, of Tlemcen and of Tunis, were born. The African offensive on Europe was stopped, and during nearly a century, friendly relations were established between the commercial towns of southern France, Spain, Italy, and Northern Africa. Even in the time of the Almohades, Marseilles, Pisa, and Genoa had signed treaties of commerce by which, by paying certain customs duties (about 10%), the Christians could unload their merchandise in certain ports where a strip of land outside the walls was conceded to them, a strip known to them as the factory on which they

could build their warehouses and a chapel near which they buried their dead. From the 12th to the 14th centuries, Venice, Florence, Majorca and Barcelona came to the same arrangements with the three old commercial cities. At the foot of the eastern Mediterranean, Alexandria in Egypt was then, as in ancient times, a great port, a link between the East and the West. Whatever horror may have been inspired by the Sultan of Egypt, the Christians lived in peace with him ever since they had felt the power of his arms in the Holy Land, and since Louis IX, after the disastrous defeat of Mansural (February, 1250) had had to pay him ransom. . . . The other powers continued their peaceful commerce with Africa. But they were not slow to realize the effect of the decadence of the empires of Northern Africa. As the kings were in no position to police the seas, the Barbary pirates began their fruitful operations, and soon they were dreaded by all sailors. Captive Christians could be found in great numbers in all the cities. . . . The coasts of North Africa had then not ceased to be frequented by Europeans in the Middle Ages. Intercourse between Mohammedan rulers of Africa and European kings had been frequent, often warlike, but now and then friendly. But although North Africa was rather well known, as maps would testify, on the other hand Europe was ignorant of almost all of dark Africa at least until the end of the 13th century."—*Ibid.*, pp. 307-308.—"Let us recapitulate . . . the exposition . . . of the Arabian attempts at colonization in black Africa. We have seen, on one hand, real colonies, in the modern sense of the word, founded by organized states, Morocco or Arabia, for the well determined purpose of exploiting the gold of the Niger, or the ivory of eastern Africa. For a certain time, these colonies enjoyed a certain prosperity. As long as the relations with the central government limited the authority of the governors and the first colonists were fortified by the arrival of new blood, the enterprise was, although with difficulty, kept up. But, as soon as the colonies gained their independence through the decadence of the mother country, when the merchants and soldiers who were the support of the administration no longer felt any check upon their cupidity or their thirst for blood, the whole edifice of civilization was upset. Social disorganization followed political anarchy. The civilization of the day before preceded a return to barbarism. The dominant race itself had been slowly but surely absorbed by the greater virility and numbers of the aborigines; who also, in spite of the general work of destruction resulting from these crises, were unable to return to their former depths of barbarity. Elsewhere, Arab tribes, or at least tribes that had been arabized (Ouled-Sliman), nomads of the western Sahara, Arabs of the valley of the Nile, had tried to establish their authority over the settled people who were their neighbors. But, lacking any strong base of operations, and induced by their spirit of independence to oppose any degree of centralization, their work, based on force, could lead only to destruction and anarchy. Before centralized states (Bornu, Bagirmi, Ouadai) they were helpless. At times they have been subjugated, reduced to vassalage; finally in all probability they were absorbed by the Sudanese. . . . But, before states in the process of formation, or even of decomposition, these tribes could exercise all the resources of their warlike and destructive spirit. The Kanem, cradle of ancient societies, had been ruined. The rich countries of the Senegal were sacked by their Moorish invaders. Sometimes we

see that direct contacts of the Arab race with the Sudanese were followed with disastrous effects. It would be unjust, however, to generalize beyond measure and to say that the arrival of the Arabs was an evil for Africa. Besides the benefits which their civilization had brought, the traces of Semitic blood which were introduced by them (as well as by the Berber strain) into the Sudan, will give to the future populations of Africa distinctive traits characteristic of a higher civilization."—Tr. from O. Meynier, *L'Afrique noire*, pp. 126-128.—"The achievements of the Romans are a landmark in the history of mankind, and can never be ignored. Then came the destructive Vandals [see also VANDALS: 429-439; 431-533], followed by the hybrid Byzantines, and with their final expulsion by Arabs the history of antiquity may be said to have come to a close. Today is but the yesterday of sixteen hundred years ago. 'The Arab has replaced the Phoenician,' (as M. Paul Monceaux has observed), 'and the Frenchman has replaced the Roman. But that is all.' The primitive races—the ancient Berbers of the Desert or the mountain ranges, are still in possession, preserving their old traditions of tribal and social life, and speaking almost the same tongue as their ancestors did some three thousand years ago. The Numidian, the Moor, and the Getulian are there also, cultivating their olives in the land of their forefathers, tending their sheep on the broad plains of the Metidja or Chelif, or moving silently from place to place, like true sons of the Desert."—A. Graham, *Roman Africa*, p. 308.

MODERN EUROPEAN OCCUPATION

Beginnings of European exploration.—"The Genoese were the first to set out on the discovery of the oceanic coasts of Africa. At about the end of the 13th century, they knew the Canary Islands. In 1292, one of the galleys of the expedition of the brothers Vivaldi reached the mouth of a river which their maps call Gohou and which seems to have been the Senegal. In the middle of the 14th century they knew Madeira and the coast opposite, of which the Medician map of 1351 gives an almost correct drawing. About 1365 the first Frenchmen, Normans, were established in Africa; traders from Dieppe and Rouen having associated themselves in 1364 for commerce on the coast of western Africa built some warehouses at the outlet of the Senegal, in Gambia, on the coasts of Sierra-Leone and of Malaguette. In 1402, the Norman Jean de Bethencourt arrived at the Canaries from La Rochelle with 53 companions and took possession of the islands in the name of the queen of Castile. So vigorous was this commercial movement between France and western Africa that it was not halted despite the wars in which France was engaging and the invasion of Normandy by the English. However the Normans pushed their expeditions no further, and it is to the Portuguese that the honor of discovering the coasts of Africa is due."—Tr. from R. Ronze, *La question d'Afrique*.—See also CALIPHATE: 640-646, 647-700, 008-1171; BARBARY STATES: 1543-1560.

Chronology of European exploration, missionary settlement, colonization and occupation.

1415.—Conquest of Ceutá by the Portuguese.

1434-1461.—Portuguese explorations down the western coast, from cape Bojador to cape Mesurado, in Liberia, under the direction of Prince Henry, called the Navigator.

1442.—First African slaves brought into Europe by one of the ships of Prince Henry.

1463-1498.—Portuguese explorations by Prince

Henry, the Navigator. See PORTUGAL: 1463-1498.

1471-1482.—Portuguese explorations carried beyond the Guinea Coast, and to the Gold Coast, where the first settlement was established.

1482.—Discovery of the mouth of the Zaire or Congo by the Portuguese explorer, Diogo Cam.

1485-1596.—Establishment of Roman Catholic missions on the western coast.

1486.—Unconscious rounding of the Cape of Good Hope by Bartholomew Diaz.

1490-1527.—Visit to Abyssinia of Pero Covilham, the Portuguese explorer.

1497.—Voyage of Vasco da Gama round the Cape of Good Hope to India.

1505-1508.—Portuguese settlements and fortified stations established on the eastern coast.

1506.—Discovery of Madagascar by the Portuguese.

1552-1553.—Beginning of English voyages to the Guinea and Gold Coasts.

1560.—French trading to the Senegal and Gambia begun.

1562.—First slave-trading voyage of Sir John Hawkins to the Guinea Coast.

1578.—Founding of St. Paul de Loando, Portuguese capital on the west coast.

1582 (about).—Founding of the French post, St. Louis, at the mouth of the Senegal.

1595.—Opening of trade on the western coast by the Dutch.

17th century.—Settlements in West Africa by British. See BRITISH EMPIRE: Expansion; 17th century: Africa: West Africa.

1618-1621.—Exploration of the river Gambia for the Royal Niger company of England.

1644.—Fort Dauphin founded by the French in the island of Madagascar.

1652.—Dutch settlement at the Cape of Good Hope.

1672.—Africa company chartered. See BRITISH EMPIRE: Expansion; 17th century: Africa: West Africa: 1672.

1694-1724.—Exploration of the river Senegal for the Royal Senegal company.

18th century: British acquire Sierra Leone. See BRITISH EMPIRE: Expansion; 18th century: Africa: West Africa.

1723.—Exploration of the Gambia for the English Royal African company.

1736.—Moravian mission on the Gold Coast.

1737.—Beginning of missionary work. See MISSIONS, Christian: Near East. Moravian mission planted by George Schmidt among the Hottentots.

1754.—Substantial beginning of the domination in Madagascar of the Hovas.

1761-1762.—Dutch expedition from Cape Colony beyond the Orange river.

1768-1773.—Journey of James Bruce to the fountains of the Blue Nile in Abyssinia.

1774.—Founding of a French colony in Madagascar by Count Benyowsky.

1781-1785.—Travels of M. le Vaillant among the Hottentots and Kaffirs.

1787.—Founding of the English settlement for freed slaves at Sierra Leone.

1788.—Formation of the African association in England, for systematic exploration.

1795.—The Cape Colony taken from the Dutch by the English.

1795-1797.—The first exploring journey of Mungo Park, in the service of the African association, from the Gambia.

1798.—Mission of Dr. John Vanderkemp to the Kaffirs, for the London Missionary society.

1798.—Journey of the Portuguese Dr. Lacerda

from the Lower Zambezi to the kingdom of Cazembe, on lake Moero.

1802-1806.—Restoration of Cape Colony to the Dutch and its reconquest by the English.

1802-1811.—Journey of the Pombeiros (Negroes) across the continent from Angola to Tete.

1804.—Founding of the Church of England mission in Sierra Leone.

1805.—Second expedition of Mungo Park from the Gambia to the Niger, from which he never returned.

1805.—Travels of Dr. Lichtenstein in Bechuanaland.

1808.—Beginning of missionary efforts in colonizing Liberia. See LIBERIA: Early history.

1810.—Missions in Great Namaqualand and Damaraland begun by the London Missionary society.

1812.—Exploration of the Orange river and the Limpopo by Campbell, the missionary.

1812-1815.—Journey of Burckhardt under the auspices of the African association, up the Nile, through Nubia, to Berbera, Shendi, and Suakin; thence through Jidda to Mecca, in the character of a Mussulman.

1816-1818.—Fatal and fruitless attempts to explore the lower course of the Niger

1818.—Mission in Madagascar undertaken by the London Missionary society.

1818.—Beginning, on the Orange river, of the missionary labors of Robert Moffat in South Africa.

1818.—Exploration of the sources of the Gambia by Gaspard Mollien, from Fort St. Louis, at the mouth of the Senegal.

1818-1820.—Exploration of Fezzan to its southern limit, from Tripoli, by Captain Lyon.

1820.—First Wesleyan mission founded in Kaffirland

1820.—Treaty abolishing the slave-trade in Madagascar.

1821.—Mission-work in Kaffraria undertaken by the Glasgow Missionary society.

1822.—Founding of the republic of Liberia. See SLAVERY, NEGRO: 1816-1847

1822.—Official journey of Lieutenant Laing from Sierra Leone in the "Timanee, Kooranko and Soolima" countries.

1822-1825.—Expedition of Captain Clapperton, Dr. Oudney, and Colonel Denham, from Tripoli to lake Chad and beyond.

1825-1826.—Expedition of Major Laing, in the service of the British Government, from Tripoli, through the desert, to Timbuktu, which he reached, and where he remained for a month. Two days after leaving the city he was murdered.

1825-1827.—Expedition of Captain Clapperton from the bight of Benin to Sokoto.

1827.—Moravian mission settled in the Tamboukie territory, South Africa.

1827.—Journey of Linant de Bellefonds, for the African Association, up the White Nile to 13° 6' north latitude.

1827-1828.—Journey of Caillé from a point on the west coast, between Sierra Leone and the Gambia, to Jenné and Timbuktu; thence to Fez and Tangier.

1828.—Undertakings of the Basle Missionary society on the Gold Coast.

1830-1831.—Exploration of the Niger to the sea by Richard and John Lander, solving the question as to its mouth.

1830-1846.—French conquest and subjugation of Algiers.

1831.—Portuguese mission of Major Monteiro

and Captain Gamitto to the court of Muata Cazembe.

1831.—Absorption of the African association by the Royal Geographical society of London.

1832-1834.—First commercial exploration of the lower Niger, from its mouth, by Macgregor Laird, with two steamers.

1833.—Mission in Basutoland established by the Evangelical Missionary society of Paris.

1834.—Beginning of missionary labors under the American Board of Missions in South Africa.

1834.—Mission founded at cape Palmas on the western coast, by the American Board of Foreign Missions.

1834.—The great trek of the Dutch Boers from Cape Colony and their founding of the republic of Natal.

1835.—Mission among the Zulus established by the American Board of Foreign Missions.

1835.—Founding of Senussia sect. See *SENUSSIA*.

DR. DAVID LIVINGSTONE

1835-1849.—Persecution of Christians in Madagascar.

1836-1837.—Explorations of Captain Sir James E. Alexander in the countries of the Great Namaquas, the Bushmen and the Hill Damaras.

1839-1841.—Egyptian expeditions sent by Mehemet Ali up the White Nile to latitude $6^{\circ} 35'$ N.; accompanied and narrated in part by Ferdinand Werne.

1839-1843.—Missionary residence of Dr. Krapf in the kingdom of Shoa, in the Ethiopian highlands.

1840.—Arrival of Dr. Livingstone in South Africa as a missionary.

1841.—Expedition of Captains Trotter and Allen, sent by the British government to treat with tribes on the Niger for the opening of commerce and the suppression of the slave trade.

1842.—Travels of Dr. Charles Johnston in southern Abyssinia.

1842.—Gaboon mission, on the western coast near the equator, founded by the American Board of Foreign Missions.

1842.—The Rhenish mission established by German missionaries at Bethany in Namaqualand.

1842.—Wesleyan and Norwegian missions opened in Natal.

1842-1862.—French occupation of territory on the Gaboon and the Ogowé.

1843.—British annexation of Natal, and migration of the Boers to found the Orange Free State.

1843.—Exploration of the Senegal and the Faleme by Huard-Bessinières and Raffeneil.

1843-1845.—Travels and residence of Mr. Parkyn in Abyssinia.

1843-1848.—Hunting journeys of Gordon Cumming in South Africa.

1844.—Mission founded by Dr. Krapf at Mombasa, on the Zanzibar coast.

1845.—Duncan's journey for the Royal Geographical society from Whydah, via Abome, to Adofudia.

1845.—Mission to the Cameroons established by the Baptist Missionary society of England.

1846.—Unsuccessful attempt of Raffeneil to cross Africa from Senegal to the Nile, through the Sudan.

1846.—Mission of Samuel Crowther (afterwards Bishop of the Niger), a native and a liberated slave, to the Yoruba country.

1846.—Mission on Old Calabar river founded by the United Presbyterian Church in Jamaica.

1847-1849.—Interior explorations of the German missionaries Dr. Krapf and Mr. Rebmann, from Mombasa on the Zanzibar coast.

1848.—Founding of the Transvaal republic by the Boers

1849.—Missionary journey of David Livingstone northward from the country of the Bechuanas, and his discovery of Lake Ngami.

1849-1851.—Journey of László Magyar from Benguela to the kingdoms of Bihe and Molua on the interior table-land, and across the upper end of the Zambezi Valley

1850.—Sale of Danish forts at Kwitta, Addah, and Fingo, on the western coast, to Great Britain.

1850-1851.—Travels of Andersson and Galton from Walfish bay to Ovampoland and lake Ngami

1850-1855.—Travels of Dr. Barth from Tripoli to lake Chad, Sokoto and the Upper Niger to Timbuktú, where he was detained for nine months

1851.—Discovery of the Zambezi by Dr. Livingstone.

1852-1863.—Hunting and trading journeys of Mr. Chapman in South Africa, between Natal and Walfish bay and to lake Ngami and the Zambezi.

1853.—Founding of the diocese of Natal by the English Church and appointment of Dr. Colenso to be its bishop.

1853-1856.—Journey of Dr. Livingstone from Linyante, the Makololo capital, up the Zambezi and across to the western coast, at St. Paul de Loando, thence returning entirely across the continent, down the Zambezi to Quillimane at its mouth, discovering the Victoria falls on his way.

1853-1858.—Ivory-seeking expeditions of John Petherick, up the Bahr-el-Ghazal.

1853-1859.—Roman Catholic mission established at Gondokoro, on the Upper Nile.

1854.—Exploration of the Somali country—the "eastern horn of Africa"—by Captains Burton and Speke.

1855.—Beginning of attempts by the French gov-

error of Senegal, General Faidherbe, to carry the flag of France into the western Sudan.

1856-1859.—Journeys of Du Chaillu in the western equatorial regions, on the Gaboon and the Ogobai.

1857-1858.—Expedition of Captains Burton and Speke, from Zanzibar, through Uzaramo, Usagara, Ugogo, and Unyamwezi, to Ujiji, on lake Tanganyika—making the first European discovery of the lake; returning to Kazé, and thence continued by Speke alone, during Burton's illness, to the discovery of lake Victoria Nyanza.

1858.—Journey of Andersson from Walish bay to the Okavango river.

1858.—English mission station founded at Victoria on the Cameroons coast.

1858-1863.—Expedition of Dr. Livingstone, in the service of the British government, exploring the Shiré and the Rovuma, and discovering and exploring lake Nyasa—said, however, to have been known previously to the Portuguese.

1860-1861.—Journey of Baron von Decken from Mombasa on the Zanzibar coast, to Mt. Kilimanjaro.

1860-1862.—Return of Speke, with Captain Grant, from Zanzibar to lake Victoria Nyanza, visiting Karagwe, and Uganda, and reaching the outlet of the Nile; thence through Unyoro to Gondokoro, and homeward by the Nile.

1861.—Establishment of the Universities mission by Bishop Mackenzie on the Upper Shiré.

1861-1862.—English acquisition of the town and kingdom of Lagos on the bight of Benin by cession from the native ruler.

1861-1862.—Sir Samuel Baker's exploration of the Abyssinian tributaries of the Nile.

1861-1862.—Journey of Captain Burton from Lagos, on the western coast, to Abeokuta, the capital of the Akus, in Yoruba, and to the Cameroons mountains.

1861-1862.—Journey of Mr. Baines from Walish bay to lake Ngami and Victoria falls.

1862.—Resumption of the Christian mission in Madagascar, long suppressed.

1862-1867.—Travels of Dr. Rohlfs in Morocco, Algeria and Tunis, and exploring journey from the gulf of the Syrtes to the gulf of Guinea.

1863.—Travels of Winwood Reade on the western coast.

1863.—Incorporation of a large part of Kaffraria with Cape Colony.

1863.—Second visit of Du Chaillu to the western equatorial region and journey to Ashangoland.

1863-1864.—Official mission of Captain Burton to the king of Dahomey.

1863-1864.—Exploration of the Bahr-el-Ghazal from Khartoum by the wealthy Dutch heiress, Miss Tinné, and her party.

1863-1865.—Expedition by Sir Samuel Baker and his wife up the White Nile from Khartoum, resulting in the discovery of lake Albert Nyanza, as one of its sources.

1864.—Mission of Lieutenant Mage and Dr. Quintin, sent by General Faidherbe from Senegal to the king of Segou, in the Sudan.

1866.—Founding of a Norwegian mission in Madagascar.

1866-1873.—Last journey of Dr. Livingstone, from the Rovuma river, on the eastern coast, to lake Nyassa; thence to lake Tanganyika, lake Mweru, lake Bangweolo, and the Lualaba river, which he suspected of flowing into the Albert Nyanza, and being the ultimate fountain head of the Nile. In November, 1871, Livingstone was found at Ujiji, on lake Tanganyika, by Henry

M. Stanley, leader of an expedition sent in search of him. Declining to quit the country with Stanley, and pursuing his exploration of the Lualaba, Livingstone died May 1, 1873, on lake Bangweolo.

1867.—Mission founded in Madagascar by the Society of Friends.

1867-1868.—British expedition to Abyssinia for the rescue of captives; overthrow and death of King Theodore.

1868.—British annexation of Basutoland in South Africa.

1869.—Christianity established as the state religion in Madagascar.

1869.—Fatal expedition of Miss Tinné from Tripoli into the desert, where she was murdered by her own escort.

1869-1871.—Explorations of Dr. Schweinfurth between the Bahr-el-Ghazal and the Upper Congo, discovering the Welle river.

1869-1873.—Expedition of Dr. Nachtigal from Tripoli through Kuka, Tibesti, Borku, Wadai, Darfur, and Kordofan, to the Nile.

SIR HENRY M. STANLEY

1870-1873.—Official expedition of Sir Samuel Baker, in the service of the khedive of Egypt, Ismail Pasha, to annex Gondokoro, then named Ismailia, and to suppress the slave-trade in the Egyptian Sudan, or Equatoria.

1871.—Transfer of the rights of Holland on the Gold Coast to Great Britain.

1871.—Annexation of Griqualand West to Cape Colony.

1871.—Scientific tour of Sir Joseph D. Hooker and Mr. Ball in Morocco and the Great Atlas.

1871.—Missionary journey of Mr. Charles New in the Masai country and ascent of Mt. Kilimanjaro.

1871-1880.—Hunting journeys of Mr. Selous in South Africa, beyond the Zambezi.

1872-1875.—Travels of the naturalist, Reinhold Buchholz, on the Guinea coast.

1872-1879.—Travels of Dr. Holub between the South African diamond fields and the Zambezi.

1873-1875.—Expedition of Captain V. L. Cameron, from Zanzibar to lake Tanganyika, and

exploration of the lake; thence to Nyangwe on the Lualaba, and thence across the continent, through Ulundi, to the Portuguese settlement at Benguela, on the Atlantic coast.

1873-1875.—Travels of the naturalist, Frank Oates, from Cape Colony to the Victoria falls.

1873-1876.—Explorations of Güssfeldt, Falkenstein and Pechuel-Loesche, under the auspices of the German African association, from the Loango coast, north of the Congo.

1874.—British expedition against the Ashantees, destroying their principal town Kumasi.

1874.—Mission of Colonel Chaillé-Long from General Gordon, at Gondokoro, on the Nile, to M'tesé, king of Uganda, discovering lake Ibrahim on his return, and completing the work of Speke and Baker, in the continuous tracing of the course of the Nile from the Victoria Nyanza.

1874-1875.—Expedition of Colonel C. Chaillé-Long to lake Victoria Nyanza and the Makraka Niam-Niam country, in the Egyptian service.

1874-1876.—First administration of General Gordon, commissioned by the khedive as governor of Equatoria.

1874-1876.—Occupation and exploration of Darfur and Kordofan by the Egyptians, under Colonels Purdy, Mason, Prout and Colston.

1874-1877.—Expedition of Henry M. Stanley, fitted out by the proprietors of the *New York Herald* and the London *Daily Telegraph*, which crossed the continent from Zanzibar to the mouth of the Congo river; making a prolonged stay in the empire of Uganda and acquiring much knowledge of it; circumnavigating lakes Victoria and Tanganyika, and exploring the then mysterious great Congo river throughout its length.

1874-1877.—Explorations of Dr. Junker in Upper Nubia and in the basin of the Bahr-el-Ghazal.

1875.—Expedition of Dr. Pogge, for the German African association, from the west coast, south of the Congo, in the Congo basin, penetrating to Kawende, beyond the Ruru or Lulua river, capital of the Muata Yanvo, who rules a kingdom as large as Germany.

1875.—Expedition of Colonel Chaillé-Long into the country of the Makraka Niam-Niams.

1875.—Founding by Scottish subscribers of the mission station called Livingstonia, at cape Maclear, on the southern shores of lake Nyasa; headquarters of the mission removed in 1881 to Bandawe, on the same lake.

1875.—Mission founded at Blantyre, in the highlands above the Shiré, by the Established Church of Scotland.

1875-1876.—Seizure of Berbera and the region of the Juba river, on the Somali coast, by Colonel Chaillé-Long, for the khedive of Egypt, and their speedy evacuation, on the remonstrance of England.

1876.—Conference at Brussels and formation of the International African association, under the presidency of the king of the Belgians, for the exploration and civilization of Africa.

1876.—Voyage of Romolo Gessi around lake Albert Nyanza.

1876.—Mission in Uganda established by the Church Missionary society of England.

1876-1878.—Scientific explorations of Dr. Schweinfurth in the Arabian desert between the Nile and the Red sea.

1876-1880.—Explorations and French annexations by Savorgnan de Brazza between the Ogowé and the Congo

1876-1890.—Congo region explored. See BELGIAN CONGO: 1876-1890.

1877.—The Livingstone Inland mission, for

Christian work in the Congo Valley, established by the East London Institute for Home and Foreign Missions.

1877-1879.—Second administration of General Gordon, as governor-general of the Sudan, Darfur and the equatorial provinces.

1877-1879.—War of the British in South Africa with the Zulus, and practical subjugation of that nation.

1877-1879.—Journey of Serpa Pinto across the continent from Benguela via the Zambezi.

1877-1880.—Explorations of the Portuguese officers, Capello and Ivens, in western and central Africa, from Benguela to the territory of Yacca, for the survey of the river Cuango in its relations to the hydrographic basins of the Congo and the Zambezi.

1878.—Founding in Glasgow of the African Lakes company, or "The Livingstone Central Africa company," for trade on lakes Nyasa and Tanganyika; by which company the "Stevenson road" was subsequently built between the two lakes above named.

1878.—Walfish bay and fifteen miles around it (on the western coast, in Namaqualand) declared British territory.

1878.—Journey of Paul Soleillet from Saint Louis to Segu.

1878-1880.—Royal Geographical society's East Central African expedition, under Joseph Thomson, to the Central African lakes, Tanganyika, Nyasa and Leopold, from Zanzibar.

1879.—Establishment, by the Belgian International society, of a station at Karema, on the eastern shore of lake Tanganyika.

1879.—Formation of the International Congo association and the engagement of Mr. Stanley in its service.

1879.—Missionary expeditions to the Upper Congo region by the Livingstone Inland mission and the Baptist Missionary society.

1879.—Journey of Mr. Stewart, of the Livingstonia mission, on lake Nyasa, from that lake to lake Tanganyika.

1879.—Discovery of the sources of the Niger, in the hills about 200 miles east of Freetown, the capital of Sierra Leone, by the French explorers, Zweifel and Moustier.

1879-1880.—Journey of Dr. Oskar Lenz, under the auspices of the German African society, from Morocco to Timbuktú, and thence to the Atlantic coast in Senegambia. The fact that the Sahara is generally above the sea-level, and cannot therefore be flooded, was determined by Dr. Lenz.

1879-1881.—Expedition of Dr. Buchner from Loanda to Kawende and the kingdom of the Muata Yanvo, where six months were spent in vain efforts to procure permission to proceed further into the interior.

1880.—Mission established by the American Board of Foreign Missions in "the region of Bihé and the Kwanza," or Quanza, south of the Congo.

1880-1881.—War of the British with the Boers of the Transvaal.

1880-1881.—Official mission of the German explorer, Gerhard Rohlfs, accompanied by Dr. Stecker, to Abyssinia.

1880-1884.—Campaigns in Upper Senegal, extending French supremacy to the Niger

1880-1884.—German East African expedition to explore, in the Congo basin, the region between the Lualaba and the Luapula.

1880-1886.—Explorations of Dr. Junker in the country of the Niam-Niam, and his journey from the equatorial province, through Unyoro and Uganda, to Zanzibar.

1880-1889.—Journey of Captain Casati, as correspondent of the Italian geographical review, "L'Esploratore," from Suakin, on the Red sea, into the district of the Mangbettu, west of lake Albert, and the country of the Niam-Niam; in which travels he was arrested by the revolt of the Mahdi and forced to remain with Emin Pasha until rescued with the latter by Stanley, in 1889.

1881.—French protectorate over Tunis.

1881.—Portuguese expedition of Captain Andrada from Senna on the Zambezi river to the old gold mines of Manica.

1881.—Journey of F. L. and W. D. James from Suakin, on the Red sea, through the Basé country, in the Egyptian Sudan.

1881.—Fouling of a mission on the Congo, at Stanley Pool, by the Baptist Missionary society of England.

1881-1884.—Expedition of Dr. Pogge and Lieutenant Wissmann to Nyangwe on the Lualaba, from which point Lieutenant Wissmann pursued the journey to Zanzibar crossing the continent.

1881-1885.—Revolt of the Mahdi in the Sudan; the mission of General Gordon; the unsuccessful expedition from England to rescue him; the fall of the city and his death.

1881-1887.—French protectorate established on the Upper Niger and Upper Senegal.

1882.—Italian occupation of Abyssinian territory on the bay of Assab.

1882-1883.—German scientific expedition, under Dr. Böhm and Herr Reichard, to lakes Tanganyika and Mweru.

1882-1883.—Journey of Mr. H. H. Johnston on the Congo.

1883.—Delagoa bay arbitration. See DELAGOA BAY ARBITRATION.

1883.—German acquisition of territory on Angra Pequena bay, in Great Namaqualand.

1883.—Exploration of Masailand by Dr. Fischer, under the auspices of the Hamburg Geographical society.

1883.—Explorations of Lieutenant Giraud in East Central Africa, descending for some distance the Luapula.

1883.—Scientific investigation of the basins of lakes Nyasa and Tanganyika, by Mr. Henry Drummond, for the African Lakes company.

1883.—Journey of M. Révoil in the south Somali country to the Upper Juba.

1883-1884.—Explorations of Mr. Joseph Thomson from Mombasa, through Masailand, to the northeast corner of the Victoria Nyanza, under the auspices of the Royal Geographical society.

1883-1885.—War of the French with the Hovas of Madagascar, resulting in the establishment of a French protectorate over the island.

1883-1885.—Exploration of Lieutenant Giraud in the lake region.

1883-1886.—Austrian expedition, under Dr. Holub, from Cape Colony, through the Boer states, Bechuanaland and Matabeleland to the Zambezi, and beyond.

1884.—Annexation by Germany of the whole western coast (except Walfish bay) between the Portuguese possessions and those of the British in South Africa.

1884.—German occupation of territory on the Cameroon River, under treaties with the native chiefs. English treaties securing contiguous territory to and including the delta of the Niger. See CAMEROONS: Occupation by Germany.

1884.—German protectorate over Togoland on the Gold Coast declared. See TOGOLAND.

1884.—Expedition of Dr. Peters, representing the Society of German Colonization, to the coast re-

gion of Zanzibar, and his negotiation of treaties with ten native chiefs, ceding the sovereignty of their dominions. See TANGANYIKA TERRITORY: German colonization.

1884.—Crown colony of British Bechuanaland acquired from the South African republic.

1884.—Portuguese government expedition, under Major Carvalho, from Loanda to the Central African potentate called the Muata Yanvo.

1884.—Exploration of the Benué and the Adamawa, by Herr Flegel.

1884.—Scientific expedition of Mr. H. H. Johnston to Mt. Kilimanjaro.

1884.—Discovery of the M'bangi or Ubanghi River (afterwards identified with the Welle), by Captain Hansens and Lieutenant Van Gèle.

1884.—Exploration of Reichard in the southeastern part of the Congo State.

1884-1885.—The Berlin Conference of Powers, held to determine the limits of territory conceded to the International Congo association, to establish freedom of trade within that territory, and to formulate rules for regulating in future the acquisition of African territory. See BERLIN ACT.

1884-1885.—Journey of Mr. Walter M. Kerr from Cape Colony, across the Zambezi, to Lake Nyasa, and down the Shiré river to the coast.

1884-1885.—Travels of Mr. F. L. James and party in the Somali country.

1884-1887.—Exploration by Dr. Schinz of the newly acquired German territories in Africa.

1884-1893.—England, France and Germany on the Niger coast. Settlement of the boundary of Sudan and Sahara sphere. See NIGERIA, PROTECTORATE OF: 1882-1899.

1885.—Transfer of the rights of the Society of German Colonization to the German East Africa company, and extension of imperial protection to the territories claimed by the company. German acquisition of Witu, north of Zanzibar.

1885.—Agreement between Germany and France, defining their respective spheres of influence on the bight of Biafra, on the slave coast and in Senegambia.

1885.—Transformation of the Congo association into the independent state of the Congo, with King Leopold of Belgium as its sovereign.

1885.—British protectorate extended to the Zambezi, over the country west of the Portuguese province of Sofala, to the 20th degree of east longitude.

1885.—British protectorate extended over the remainder of Bechuanaland.

1885.—Italian occupation of Massawa, on the Red sea.

1885.—Mission of Mr. Joseph Thomson, for the National African company, up the Niger, to Sokoto and Gando, securing treaties with the sultans under which the company acquired paramount rights.

1885-1888.—Mission of M. Borelli to the kingdom of Shoa (southern Ethiopia) and south of it.

1885-1889.—When, after the fall of Khartum and the death of General Gordon, in 1885, the Sudan was abandoned to the Mahdi and the fanatical Mohammedans of the interior, Dr. Eduard Schnitzer, better known as Emin Pasha, who had been in command, under Gordon, of the province of the equator, extending up to lake Albert, was cut off for six years from communication with the civilized world. In 1887 an expedition to rescue him and his command was sent out under Henry M. Stanley. It entered the continent from the west, made its way up the Congo and the Aruwimi to Yambuya; thence through the unexplored region to lake Albert Nyanza and into communication

with Emin Pasha; then returning to Yambuya for the rearguard which had been left there; again traversing the savage land to lake Albert, and passing from there, with Emin and his companions, by way of lake Albert Edward Nyanza (then ascertained to be the ultimate reservoir of the Nile system) around the southern extremity of the Victoria Nyanza, to Zanzibar, which was reached at the end of 1889.

1886.—Settlement between Great Britain and Germany of the coast territory to be left under the sovereignty of the sultan of Zanzibar, and of the "spheres of influence" to be appropriated respectively by themselves, between the lakes and the eastern coast, north of the Portuguese possessions.

1886.—Agreement between France and Portugal defining limits of territory in Senegambia and at the mouth of the Congo.

1886.—Transformation of the National African company into the British Royal Niger company, with a charter giving powers of administration over a large domain on the river Niger.

1886.—Mission station founded by Mr. Arnot at Bunkeya, in the southeastern part of the Congo State.

1886-1887.—Journey of Lieutenant Wissmann across the continent, from Luluaburg, a station of the Congo association, in the dominion of Muata Yanvo, to Nyangwe, on the Lualaba, and thence to Zanzibar.

1886-1889.—Expeditions of Dr. Zintgraff in the Cameroons interior and to the Benué, for the bringing of the country under German influence.

1887.—Annexation of Zululand, partly to the Transvaal, or South African republic, and the remainder to the British possessions.

1887.—French gunboats launched on the Upper Niger, making a reconnoissance nearly to Timbuktu.

1887.—Identity of the Welle river with the M'bangi or Ubanghi established by Captain Van Gèle and Lieutenant Liénart.

1887.—First ascent of Kilimanjaro by Dr. Hans Meyer.

1887-1889.—Exploration by Captain Binger of the region between the great bend of the Niger and the countries of the Gold Coast.

1887-1890.—Expedition of Count Teleki through Masailand, having for its most important result the discovery of the Basso-Narok, or Black lake, to which the discoverer gave the name of lake Rudolf, and lake Stefanie.

1888.—Chartering of the Imperial British East Africa company, under concessions granted by the sultan of Zanzibar and by native chiefs, with powers of administration over a region defined ultimately as extending from the river Umba northward to the river Juba, and inland to and across lake Victoria near its middle to the eastern boundary of the Congo Free State.

1888.—British supremacy over Matabeleland secured by treaty with its King Lobengula.

1888.—British protectorate extended over Amantongaland.

1888.—Ascent of Mt. Kilimanjaro by Mr. Ehlers and Dr. Abbott; also by Dr. Hans Meyer.

1888.—Travels of Joseph Thomson in the Atlas and southern Morocco.

1889.—Royal charter granted to the British South Africa company, with rights and powers in the region called Zambezia north of British Bechuanaland and the South African republic, and between the Portuguese territory on the east and the German territory on the west.

1889.—Will of King Leopold, making Belgium

heir to the sovereign rights of the Congo Free State.

1889.—Protectorate of Italy over Abyssinia acknowledged by the Negus.

1889.—Portuguese Roman Catholic mission established on the south shore of lake Nyasa. Portuguese exploration under Serpa Pinto in the lake Nyasa region, with designs of occupancy frustrated by the British.

1889.—Journey of M. Crampel from the Ogowé to the Likuala tributary of the Congo, and return directly westward to the coast.

1889.—Di. Wolf's exploration of the southeast Niger basin, where he met his death.

1889.—Major Macdonald's exploration of the Benué, sometimes called the Tchadda (a branch of the Niger), and of its tributary the Kebbi.

1889.—Journey of Mr. H. H. Johnston north of lake Nyasa and to lake Leopold.

1889.—Journey of Mr. Sharpe through the country lying between the Shiré and Loangwa rivers.

1889.—Mr. Pigott's journey to the Upper Tana, in the service of the Imperial British East Africa company.

1889-1890.—British protectorate declared over Nyasaland and the Shiré highlands.

1889-1890.—Italian protectorate established over territory on the eastern (oceanic) Somali coast, from the gulf of Aden to the Juba river.

1889-1890.—Imperial British East Africa company's expedition, under Jackson and Gedge, for the exploring of a new road to the Victoria Nyanza and Uganda.

1889-1890.—Captain Lugard's exploration of the river Sabaki for the Imperial British East Africa company.

1889-1890.—Journey of Lieutenant Morgen from the Cameroons, on the western coast to the Benué.

1889-1890.—French explorations in Madagascar by Dr. Catat and MM. Maistre and Foucart.

1890.—Anglo-German convention, defining boundaries of the territories and "spheres of influence" respectively claimed by the two powers; Germany withdrawing from Witu, and from all the eastern mainland coast north of the river Tana, and conceding a British protectorate over Zanzibar, in exchange for the island of Heligoland in the North sea.

1890.—French "sphere of influence" extending over the Sahara and the Sudan, from Algeria to lake Chad and to Say on the Niger, recognized by Great Britain.

1890.—Exploration of the river Sangha, an important northern tributary of the Congo, by M. Cholet.

1890.—Exploring journey of M. Hodister, agent of the Upper Congo company, up the Lomani river and across country to the Lualaba, at Nyangwe.

1890.—Journey of Mr. Garrett in the interior of Sierra Leone to the upper waters of the Niger.

1890.—Journey of Dr. Fleck from the western coast across the Kalihari to lake Ngami.

1890-1891.—Italian possessions in the Red sea united in the colony of Eritrea.

1890-1891.—Mission of Captain Lugard to Uganda and signature of a treaty by its king acknowledging the supremacy of the British East Africa company.

1890-1891.—Exploration by M. Paul Crampel of the central region between the French territories on the Congo and Lake Chad, ending in the murder of M. Crampel and several of his companions.

1890-1891.—Journey of Mr. Sharpe from Mandala, in the Shiré highlands, to Garenganze, the empire founded by an African adventurer, Msidi,

in the Katanga copper country, between lake Mweru and the Luapula river on the east, and the Lualaba on the west.

1890-1891.—Journey of Lieutenant Mizon from the Niger to the Congo.

1890-1891.—Journey of Captain Becker from Yambuya, on the Aruwimi, north-northwest to the Welle.

1890-1892.—Italian explorations in the Somali countries by Signor Robecchi, Lieutenant Baudi di Vesme, Prince Ruspoli, and Captains Bottego and Grisoni.

1890-1893.—Expedition of Dr. Stuhlmann, with Emin Pasha, from Bagamoyo, via the Victoria Nyanza and the Albert Edward, to the plateau west of the Albert Nyanza. From this point Dr. Stuhlmann returned, while Emin pursued his way, intending, it is said, to reach Kibonge, on the right bank of the Congo, south of Stanley falls. He was murdered at Kinena, 150 miles northeast of Kibonge, by the order of an Arab chief.

1891.—Extension of the British protectorate of Lagos over the neighboring districts of Addo, Igbessa, and Ilaro, which form the western boundary of Yoruba.

1891.—Treaty between Great Britain and Portugal defining their possessions; conceding to the former an interior extension of her South African dominion up to the southern boundary of the Congo Free State, and securing to the latter defined territories on the Lower Zambezi, the Lower Shire, and the Nyasa, as well as the large block of her possessions on the western coast.

1891.—Convention between Portugal and the Congo Free State for the division of the disputed district of Lunda.

1891.—Convention of the Congo Free State with the Katanga company, an international syndicate, giving the company preferential rights over reputed mines in Katanga and Urua, with a third of the public domain, provided it established an effective occupation within three years.

1891.—French annexation of the Gold Coast between Liberia and the Grand Bassam.

1891.—Opening of the Royal Trans-African railway, in West Africa, from Loanda to Ambaca, 140 miles.

1891.—Survey of a railway route from the eastern coast to Victoria lake by the Imperial British East Africa company.

1891.—Exploration of the Juba river, in the Somali country, by Commander Dundas.

1891.—Exploration by Captain Dundas, from the eastern coast, up the river Tana to Mount Kenia

1891.—Mr. Bent's exploration of the ruined cities of Mashonaland.

1891.—Journey of M. Maistre from the Congo to the Shari.

1891.—Journeys of Captain Gallwey in the Benin country, West Africa.

1891.—Mission established by the Berlin Missionary Society in the Konde country, at the northern end of Lake Nyasa.

1891-1892.—Incorporation of the African Lakes company with the British South Africa company. Organization of the administration of northern Zambezia and Nyasaland.

1891-1892.—Expedition of the Katanga company, under Captain Stairs, from Bagamoyo to lake Tankanyika, thence through the country at the head of the most southern affluents of the Congo, the Lualaba and the Luapula.

1891-1892.—Belgian expeditions under Captain Bia and others to explore the southeastern portion of the Congo basin, on behalf of the Katanga company, resulting in the determination of the

fact that the Lukuga river is an outlet of Lake Tanganyika.

1891-1892.—Journey of Dr. James Johnston across the continent, from Benguela to the mouth of the Zambezi, through Bihe, Ganguela, Barotse, the Kalihari desert, Mashonaland, Manica, Gorongozo, Nyasa, and the Shiré highlands.

1891-1892.—Expedition of Mr. Joseph Thomson, for the British South Africa company, from Kilimane or Quillimane on the eastern coast to lake Bangweolo.

1891-1892.—Journey of Captain Monteil from the Niger to lake Chad and to Tripoli.

1891-1892.—Exploration by Lieutenant Chaltin of the river Lulu, and the country between the Aruwimi and the Welle Makua rivers, in the Congo State.

1891-1893.—Journey of Dr. Oscar Baumann from Tanga, on the eastern coast; passing to the south of Kilimanjaro, discovering two lakes between that mountain and the Victoria Nyanza.

1891-1894.—Expedition under the command of Captain Van Kerckhoven and M. de la Kéthulle de Ryhove, fitted out by the Congo Free State, for the subjugation of the Arabs, the suppression of the slave trade, and the exploration of the country, throughout the region of the Welle or Ubanghi Welle and to the Nile.

1892.—Decision of the Imperial British East Africa company to withdraw from Uganda.

1892.—Practical conquest of Dahomey by the French.

1892.—Journey of M. Méry in the Sahara to the south of Wargla, resulting in a report favorable to the construction of a railway to tap the Central Sudan.

1892.—French expedition under Captain Binger to explore the southern Sudan, and to act conjointly with British officials in determining the boundary between French and English possessions.

1892.—Journey of Mr. Sharpe from the Shiré river to lake Mweru and the Upper Luapula.

1892-1893.—Construction of a line of telegraph, by the British South African company, from Cape Colony, through Mashonaland, to Fort Salisbury, with projected extension across the Zambezi and by the side of lakes Nyasa and Tanganyika to Uganda,—and ultimately down the valley of the Nile.

1892-1893.—French scientific mission, under M. Dècle, from Cape Town to the sources of the Nile.

1892-1893.—Italian explorations, under Captain Bottego and Prince Ruspoli, in the upper basin of the river Juba.

1893.—Brussels antislavery conference, ratified in its action by the Powers.

1893.—Official mission of Sir Gerald Porter to Uganda, sent by the British government to report as to the expediency of the withdrawal of British authority from that country.

1893.—Scientific expedition of Mr. Scott-Elliott to Uganda.

1893.—Scientific expedition of Dr. Gregory, of the British Museum, from Mombasa, on the eastern coast, through Masailand to Mt. Kenia.

1893.—Journey of Mr. Bent to Aksum, in Abyssinia, the ancient capital and sacred city of the Ethiopians.

1893-1894.—German scientific survey of Mt. Kilimanjaro, under Drs. Lent and Volkens.

1893-1894.—Expedition of Mr. Astor Chanler and Lieutenant von Hölnel from Witu, on the eastern coast, to the Jombini range and among the Rendile

1893-1894.—Explorations of Baron von Uechtritz and Dr. Passarge on the Benué.

1893-1894.—Journey of Baron von Schele from the eastern coast to lake Nyasa, and thence by a direct route to Kihsa.

1893-1894.—Journey of Count von Götzen across the continent, from Dar-es-Salaam, on the eastern coast, to the Lower Congo.

1894.—Treaty between Great Britain and the Congo Free State, securing to the former a strip of land on the west side of the Nile between the Albert Nyanza and 10° north latitude, and to the latter the large Bahr-el-Ghazal region, westward. This convention gave offense to France, and that country immediately exacted from the Congo Free State a treaty stipulating that the latter shall not occupy or exercise political influence in a region which covers most of the territory assigned to it by the treaty with Great Britain.

1894.—Franco-German treaty, determining the boundary line of the Cameroons, or Kamerun.

1894.—Treaty concluded by Captain Lugard, November 10, at Nikki, in Borgu, confirming the rights claimed by the Royal Niger company over Borgu, and placing that country under British protection.

1894.—Agreement between the British South Africa company and the government of Great Britain, signed November 24, 1894, transferring to the direct administration of the company the protectorate of Nyasaland, thereby extending its domain to the south end of lake Tanganyika.

1894.—Renewed war of France with the Hôvas of Madagascar.

1894.—Expedition of Dr. Donaldson Smith from the Somali coast, stopped and turned back by the Abyssinians, in December.

1894.—Completed conquest of Dahomey by the French; capture of the deposed king, January 25, and his deportation to exile in Martinique. Decree of the French government, June 22, directing the administrative organization of the "colony of Dahomey and dependencies."

1894.—Occupation of Timbuktu by a French force.

1894.—Journey of Count von Götzen across the continent, from the eastern coast, through Ruanda and the great forest to and along the Lowa, an eastern tributary of the Congo.

1894.—Exploration of the Upper Congo and the Lukuga by Mr. R. Dorsey Mohun, American agent on the Congo, and Dr. Hinde.

1894.—Scientific expedition of Mr. Coryndon from the Cape to the Zambezi and lake Tanganyika.

1894-1895.—War of the Italians in their colony of Eritrea with both the Abyssinians and the Mahdists. Italian occupation of Kassala. See ITALY: 1895-1896.

1895.—Franco-British agreement, signed January 21, 1895, respecting the "hinterland" of Sierra Leone, which secures to France the Upper Niger basin.

1895.—Convention between Belgium and France signed February 5, recognizing a right of preëmption on the part of the latter, with regard to the Congo State, in case Belgium should at any time renounce the sovereignty which King Leopold transferred to it.

1895.—Several Bechuana chiefs visited England to urge that their country should not be absorbed by Cape Colony or the British South Africa company. An agreement was made with them which reserved certain territories to each, but yielded the remainder to the administration of the British South Africa company.

1895.—The territories previously administered by the Imperial British East Africa company (except-

ing the Uganda protectorate, which had been transferred in 1894) were finally transferred to the British government on July 1. At the same time, the dominion of the sultan of Zanzibar on the mainland came under the administrative control of the British consul-general at Zanzibar.

1895.—Proceedings for the annexation of British Bechuanaland to Cape Colony were adopted by the Cape parliament in August.

1895.—In June, M. Chaudie was appointed governor-general of French West Africa, his jurisdiction extending over Senegal, the Sudan possessions of France, French Guinea, Dahomey, and other French possessions in the gulf of Benin.

1895.—A resolution making overtures for a federal union with the Transvaal was passed by the Volksraad of the Orange Free State in June.

1895.—By a proclamation in February, the Transvaal government assumed the administration of Swaziland and installed King Buna as paramount chief.

1895.—A strip of territory west of Amatongaland, along the Pondoland river to the Maputa was formally added to Zululand in May, the South African republic protesting.

1895-1896.—The Portuguese were involved in war with Gungunhana, king of Gazaland, which lasted from September, 1895, until the following spring, when Gungunhana was captured and carried a prisoner, with his wives and son, to Lisbon.

1895-1897.—Creation of British East Africa. See BRITISH EAST AFRICA: 1895-1897.

1896.—British protectorate over Sierra Leone; hut tax; insurrection of natives. See SIERRA LEONE: 1896.

1896.—On the sudden death (supposed to be from poison) of the sultan of Zanzibar, August 25, his cousin, Said Khalid, seized the palace and proclaimed himself sultan. Zanzibar being an acknowledged protectorate of Great Britain, the usurper was summoned by the British consul to surrender. He refused, and the palace was bombarded by war vessels in the harbor, with such effect that the palace was speedily destroyed and about 500 of its inmates killed. Khalid fled to the German consul, who protected him and had him conveyed to German territory. A new sultan, Said Hamud-bin-Mahomed, was at once proclaimed.

1897.—The Congo troops of an expedition led by Baron Dhanis mutinied and murdered a number of Belgian officers. Subsequently they were attacked in the neighborhood of lake Albert Edward Nyanza and mostly destroyed.

1897.—By a convention concluded in July between Germany and France, the boundary between German possessions in Togoland and those of France in Dahomey and the Sudan was defined.

1897.—In January and February, the forces of the Royal Niger company successfully invaded the strong Fula states of Nupé and Ilorin, from which slave raiding in the territory under British protection was carried on. Bida, the Nupé capital, was entered on January 27, after a battle in which 800 Hausa troops, led by European officers, and using heavy artillery, drove from the field an army of cavalry and foot estimated at 30,000 in number. The emir of Nupé was deposed, another set up in his place, and a treaty signed which established British rule. The emir of Ilorin submitted after his town had been bombarded, and bowed himself to British authority in his government. At the same time, a treaty settled the Lagos frontier. Later in the year, the stronghold at Kiffi of another slave-raider, Arku, was stormed and burned.

1897.—Under pressure from the British government, the sultan of Zanzibar issued a decree, on April 6, 1897, terminating the legal status of slavery, with compensation to be awarded on proof of consequent loss.

1897.—By act of the Natal parliament in December, 1897, Zululand (with Amatongaland already joined to it) was annexed to Natal Colony, and Dinizulu, son of the last Zulu king, was brought from captivity in St. Helena and reinstated.

1899-1902.—Boer War.

1901.—British control over Somaliland. See BRITISH EAST AFRICA: 1900-1901.

1904.—Anglo-French agreement concerning Egypt and Morocco.

1905.—Railroads. See CAPE TO CAIRO RAILWAY.

1906.—Algeciras conference.

1909.—Establishment of the Union of South Africa. See SOUTH AFRICA, UNION OF.

1911.—Franco-German agreement concerning Morocco.

1911.—Acquisition of part of French Congo. See GERMANY: 1911: Acquisition of part of French Congo.

1911.—Italian occupation of Tripoli. See ITALY: 1911.

1913.—German colonies.—Anglo-German agreements. See WORLD WAR: Diplomatic background: 71, xii.

1918.—Campaigns in East Africa during World War. See WORLD WAR: 1918: VII. East African theater: a.

Early 19th century: European possessions in Africa.—In the year 1815 "the eleven and one-half million square miles of Africa formed no part of the great world settlement after the Napoleonic wars. The European State had scarcely penetrated anywhere into the Continent. On the whole northern coast Europe had no footing at all, for Turkey is not a part of Europe. The whole of the west coast was 'independent' except for the following minute European claims or encroachments: 1, France possessed the Senegal coast from Cape Blanco to the Gambia, but had nowhere penetrated inland except for a short distance along the Senegal River; 2, Britain had possession of small patches of territory on the Gambia, and the Gold Coast and in Sierra Leone; 3, Portugal claimed territory stretching from what is now the southern boundary of French Congo down to Cape Frio, but she actually occupied only a few places on the coast in what is now Angola. She also possessed the Cape Verde Islands and a small extent of territory in Portuguese Guinea; 4, Spain held Fernando Po, and Denmark and Holland a few stations on the coast.

"In the whole of the rest of Africa there were only two places where the European State had set foot. In the south Britain occupied 120,000 square miles of territory in her Cape Colony, and on the east coast Portugal had an undefined claim to a strip of the coast between Lourenço Marques and Cape Delgado. Thus in 1815 Europe's claims to African territory amounted to considerably less than 500,000 square miles. . . . But we must return to the period 1815-80. The increase in the

territory dominated by the European State was due entirely to the French conquest of Algeria in the north, and to the extension of the British colony in the south. There was no change upon the western and eastern coasts of Africa."—L. Woolf, *Empire and commerce in Africa*, pp. 55-59.

Later 19th century: Partitioning of Africa among European powers.—"For centuries, colonisation in Africa was confined to the coast. Though the Portuguese traversed the continent from Angola and Mozambique, their occupation of the interior was never effective, and even on the coast their claims were ill-defined. Africa possessed few attractions. It had been drawn into the life of Europe only because it offered harbours on the route to India, a source of supply for the rough labour needed in tropical colonies, and a scanty trade in such commodities as palm-oil and gold-dust. During the middle years of the nineteenth century, France was active and ambitious in Africa. She established her power in Algeria, and, extending her influence also along the Senegal to the source of the Niger, planned the union of these dependencies in a great West African empire. In South Africa England had strong colonies; but, with a dominion vaster than public sentiment approved, she refused to extend her dominion northwards where Dutch exiles were planting new States. In her West African settlements she took little interest. . . . Gambia, Sierra Leone, the Gold Coast, and Lagos, which was acquired in 1861, formed the group; from all of which, save Sierra Leone, England trusted ultimately to withdraw. But destiny was too strong for her. First the Danes (1850), and then the Dutch (1871), handed over their forts, and thus left her for the time the only Power established on the historic Guinea coast. As the trade in tropical commodities increased, the English developed commercial interests on the Niger mouth, in the Cameroons, and in Zanzibar, which interests German merchants came to share. [See also BRITISH EMPIRE: Expansion: 19th century: Africa.]

"Meanwhile, a generation of great explorers was opening the way for the rapid occupation of Africa. When Livingstone died in 1873, the chief problems of African geography were near to their solution. Stanley, De Brazza, Thomson, and other bold travellers, completed the work. The courses of the Niger, the Nile, and the Congo were made known, and the commercial value of the interior regions of a neglected continent was revealed. Signs of a new period dawning followed each other quickly. The English changed their policy in South Africa; the French increased their activity in West Africa. In 1879, King Leopold of Belgium formed the Brussels International Association for the exploration of Central Africa. This body divided itself into national committees, of which the Belgian concentrated itself on the Congo and prepared the way for the Congo State. In 1882 England commenced that fateful intervention in Egypt which led on to a protectorate, to the conquest of the Egyptian Sudan, and the control of the upper waters of the Nile. Most significant of all was the entrance of Germany into the colonial field. . . . In 1878 the German African Society, and in 1882 the German Colonial Society, were formed. The arguments of merchants with substantial interests in Africa, the commercial needs of a great empire, the course of events in Africa, at last convinced Bismarck that the time had come for action. In Damara-land and Namaqualand German missionaries had taught, and German merchants traded, for forty

years; and, since Great Britain hesitated to undertake the responsibilities of government outside of Walfisch Bay, a German protectorate was in 1884 proclaimed over the remainder of the coast. Togoland and the Cameroons also were immediately afterwards annexed; and Great Britain, thus anticipated in several quarters, now hastened to extend her sovereignty over the mouths of the Niger and the Oil rivers. It was in these circumstances that in 1884 an international Conference assembled at Berlin to consider certain African questions. The main interest was concentrated on the Congo. The State which King Leopold had created received recognition, and the Congo basin was declared open to the trade and navigation of all nations. All the Powers concerned bound themselves to suppress the slave trade. They declared occupation of territory to be valid only when effective, and they defined a 'sphere of influence' as an area within which some one Power possessed a priority of claim. This preliminary agreement facilitated very much the peaceful settlement of the subsequent territorial controversies.

"Africa is not divided into very clearly marked geographical areas, but the problems of partition have had certain definite centres and are capable of being grouped. West Africa, the western Sudan, and the Niger basin formed one sphere of operations; the Congo Basin another; the upper Nile and the region of the great lakes a third; Africa south of the Congo and the lakes a fourth. Outside of these there remain Morocco, the Mediterranean littoral, Abyssinia, Somaliland, and the surrounding islands."—*Cambridge modern history*, v. 12, pp. 257-259.—See also SLAVERY; Negro; SOUTH AFRICA, UNION OF; SUDAN.

WEST AFRICA, WESTERN SUDAN AND NIGER BASIN.—"In West Africa, the French, extending along the Senegal to the upper waters of the Niger, broke the power of the independent native states, once part of a great Moslem empire in Central Africa which barred the way, and in 1881 established a protectorate over the left bank of the upper Niger. They occupied points on the coast between the existing settlements of the English and Portuguese, which they linked up with their acquisitions in the interior. They overthrew the kingdom of Dahomey in 1892-4, and in 1893 entered Timbuktu. Thus, by their earlier and superior energy, they secured the upper Niger and much of the country within its great bend; while closing the door on the expansion of the English and Portuguese settlements, whose natural hinterland this would have been. On the lower Niger the course of events was different. The English merchants established there united in 1879 to form a single company, which, after a severe struggle, defeated and bought out a rival French institution. By Treaties with the Sultans of Sokoto and Gando (1885), it secured access to the Benue and Lake Chad, which the Germans, operating from the Cameroons, were preparing to close. In 1886 it received a charter of incorporation as the Royal Niger Company, and undertook the task of penetrating and administering an immense country. A triple contest had now begun for the trade of the central Sudan. The French from the west, the English up the Niger and Benue, the Germans from the Cameroons, all pressed towards Lake Chad, where they met, and, by a series of agreements between 1886 and 1906, divided their spheres of influence. England left to Germany the area between the Cameroons and British East Africa, which Germany divided with France, resigning to her the territory east of the Shari and making her England's neighbour in Darfur and

Bahr-el-Gazal. France thus gained the opportunity of extending her North African empire to the Nile and the Congo; but, while she linked up the French Congo with her other possessions, her advance to the Nile was frustrated by the simultaneous approach of the English southwards from Egypt.

"Thus has North-western Africa been divided up [1919]. In the northern corner lies the untamed empire of Morocco whose trade and seaports have proved a dangerous cause of dispute amongst the Powers. Then Spain holds Tiris, and the English the river Gambia, though its trade is now largely in French hands; while, between Cape Roxo and the river Cajet, Portugal retains a last foothold on the coast which her navigators first explored. Save for these two places, the French hold all the coast from Cape Blanco to the English colony of Sierra Leone, now an important commercial emporium through which much trade with the interior passes. Liberia, a Negro republic, adjoins it, while on the historic Ivory Coast the French again are established. The Gold Coast retains its ancient name, though it has added a considerable hinterland. It still yields gold with other more valuable products, but suffers from want of means of communication. In Togoland, as in the Cameroons, the Germans have made considerable progress. To the east lies the territory subjugated by the French in 1892-4, and east of that the colony of Lagos, now included in Nigeria. In 1900, the Royal Niger Company, after conquering the Sultan of Nupè in 1897, surrendered its political privileges to the Crown; and the vast areas which it had governed, together with Lagos and the Oil rivers, were formed into the two protectorates of Northern and Southern Nigeria. Shortlived as it was, it takes a place amongst the great commercial companies which have extended and upheld imperial as well as trading interests in distant and difficult lands, in the face of severe rivalries and great financial difficulties. Enveloping Nigeria and the Cameroons as well as the older and smaller settlements, and stretching from the Mediterranean in the north and the Atlantic in the west to Darfur and the Congo east and south, sweeps the great dominion of the French, to whom has fallen the interior, immense in area though often of little value. In 1902, it was divided into five administrative territories, with a Governor-General resident at Dakar."—*Cambridge modern history*, v. 12.

UPPER NILE AND REGION OF THE GREAT LAKES.—"Between the Portuguese settlement of Mozambique in the south and Somaliland in the north, the Sultan of Zanzibar ruled, having control of the coast and vague claims over the interior. The commerce of his kingdom was largely in the hands of English and Indian merchants, and its administration was in 1878, and again in 1881, offered to the British Government. In the partition of Africa, his territories have been divided between England and Germany. Though England and France had agreed in 1862 to recognise the independence of Zanzibar, German emissaries in 1884, taking advantage of the weakness of the Sultan's position in the interior, negotiated treaties with some of the inland tribes, and, in 1885, a German East Africa Company was formed to develop the territory thus acquired. About the same time a British East Africa Company was formed, and the two associations were soon in competition. An Anglo-German agreement in 1886 made the first delimitation of their respective spheres, and confined the Sultan's territory to a narrow strip of coast . . . on parts of which both

Powers speedily obtained leases, lasting for two years (1888-9).” The result was the supersession of the company by the Imperial German Government and the purchase from the sultan of the leased territory (1890). “The claims which the Germans had acquired on various parts of the coast and in the interior placed them in a position to circumvent the English on the north and west, and to gain access to the upper Nile.” By an important agreement in 1890, which settled many difficulties, their sphere was more expressly delimited. They surrendered their claims on the coast between Witu and the river Jub. The northern boundary of their territory was carried from the Victoria Nyanza to the Congo State, excluding them from the upper Nile; and a line was drawn on the south from Lake Nyasa to Lake Tanganyika dividing their possessions from British Central Africa. The British Government declared a protectorate over the islands of Pemba and Zanzibar, and the dominions of the Sultan were thus finally partitioned. While Germany thus withdrew from the contest for the upper Nile, France and the Congo State remained as rivals of Great Britain. In 1890, the British East Africa Company, which had received a charter in 1888, asserted its authority in Uganda—a country divided at the time by fierce feuds of a mixed religious and political character. The resources of the Company proved unequal to the task, and two years later it withdrew; but its action resulted in the proclamation of a British protectorate in 1894. In the following year, the Company, which had remained in control of the coast, sold its assets to the State, and the British East Africa Protectorate was formed. To this Company the British owe their position in East Africa, for, though it never prospered, it carried British influence into the interior, and, when it failed, stronger hands took up its work. England thus secured her position on the upper Nile, and, by leasing the Lado enclave to King Leopold, enabled him also to attain an end which he had sought since 1884. But the arrangement which had been made by the two Powers in 1894—that King Leopold should have the Bahr-el-Gazal basin and Great Britain a strip of territory between the Albert Nyanza and Tanganyika, linking up her East and Central African possessions—was rescinded, in consequence of the opposition of France and Germany. The attempt of the French to reach the Nile at Fashoda was foiled by the English conquest of the Sudan (1898). Experience has shown that East Africa is of more commercial value than Uganda, and, owing to its altitude, capable in part of European settlement. In 1895, the construction of a railway was begun from Mombasa to the Victoria Nyanza, which it reached in 1902. The possession of Uganda is of great political importance, since it both secures the command of the upper Nile and offers to the spread of Islamic movements the barrier of a Christian native State.”—*Cambridge modern history*, v. 12.

CONGO BASIN.—“In the Congo basin, an international . . . undertaking issued in the formation of an independent State, which, in the process of time, has become a Belgian dependency. The labours of English and American explorers prepared the way for its foundation; but the State itself was organised by King Leopold, whose position as its sovereign was recognised by the Berlin Conference and the Great Powers. By successful war and more successful diplomacy, he enlarged its territories and raised its status. . . . The Congo State was in 1908 transferred to Belgium, and its

rulers have thus become responsible to the public opinion of a nation.”—*Cambridge modern history*, v. 12.

SOUTHERN AFRICA.—“Africa south of the Congo State and the great lakes has been divided between the Portuguese operating from their historic settlements, the English advancing northwards from Cape Colony, and the Germans. The ambition which the Portuguese cherished to unite Angola and Mozambique in a transcontinental dominion was frustrated by the activity of the English in Central Africa. Since 1878, English missionaries and traders had established interests in the region between Lakes Nyassa, Tanganyika, and Bangweolo. This region the Portuguese endeavored to secure, and an important expedition was dispatched under Major Serpa Pinto to extend their claims in the Zambesi basin (1889). In 1891, an Anglo-Portuguese agreement divided the disputed territory. Mashonaland was secured to the British South Africa Company, and a British protectorate was formed in Central Africa, a large part of which was in 1894 added to the Company's sphere of operations. The share which Portugal has thus obtained in the partition of Africa, though not commensurate with her historical place in its occupation, has been more than commensurate with her capacity to develop its resources. . . . The Anglo-German agreements of 1885 and 1890, and a German-Portuguese agreement in 1886, fixed its boundaries, bringing it at one point to the Zambesi. But the colony has proved expensive and disappointing. Namaqualand is dry and barren, though Damaraland is capable of development and, possibly, of European settlement. In 1904 a serious revolt of the Hottentots and Hereros arrested their progress, and has only recently been suppressed.”—*Cambridge modern history*, v. 12.

EASTERN AREA.—“In the eastern horn of Africa Italy marked out for herself a sphere of expansion. Occupying first the bay of Assab in 1870, she secured her hold in 1882, and extended her influence along the Red Sea coast to Obok, where the French had established themselves in 1862. The dependency of Eretrea thus created proved expensive; but the Italians intended to use it as a base from which to penetrate Abyssinia. That mountain kingdom lay aloof and independent. In 1868 it had been involved in war with England. When the proud warrior king, Theodore, offended by the action of the British Government, threw the British consul and other European residents into prison, Abyssinia was invaded and Magdala stormed; but no lasting intervention followed. Italy was less happy. Near Adowah, in 1896, her forces suffered a disastrous defeat and her intention was foiled. Meanwhile, on the other side of the horn she established a protectorate over a large part of Somaliland, where she found a rival in Great Britain, with whom the country was divided. The prosperity of British Somaliland was disturbed by a destructive war, which broke out in 1903.”—*Cambridge modern history*, v. 12.—For European occupation of the Mediterranean area, see MOROCCO; ALGERIA; TUNIS; LIBYA; EGYPT.

1884-1899.—Agreements among European powers on the partitioning of the interior.—“The partition of Africa may be said to date from the Berlin Conference of 1884-85. Prior to that Conference the question of inland boundaries was scarcely considered. . . . The founding of the Congo Independent State was probably the most important result of the Conference. . . . Two months after the Conference had concluded its

labours, Great Britain and Germany had a serious dispute in regard to their respective spheres of influence on the Gulf of Guinea. . . . The compromise . . . arrived at placed the Mission Station of Victoria within the German sphere of influence." The frontier between the two spheres of influence on the Bight of Biafra was subsequently defined by a line drawn, in 1886, from the coast to Yola, on the Benué. The Royal Niger Company, constituted by a royal charter, "was given administrative powers over territories covered by its treaties. The regions thereby placed under British protection . . . apart from the Oil Rivers District, which is directly administered by the Crown, embrace the coastal lands between Lagos and the northern frontier of Camarons, the Lower Niger (including territories of Sokoto, Gandu and Borgo), and the Benué from Yola to its confluence." By a protocol signed December 24, 1885, Germany and France "defined their respective spheres of influence and action on the Bight of Biafra, and also on the Slave Coast and in Senegambia." This "fixed the inland extension of the German sphere of influence (Camarons) at 15° E. longitude, Greenwich. . . . At present it allows the French Congo territories to expand along the western bank of the M'bangi . . . provided no other tributary of the M'bangi-Congo is found to the west, in which case, according to the Berlin Treaty of 1884-85, the conventional basin of the Congo would gain an extension." On May 12, 1886, France and Portugal signed a convention by which France "secured the exclusive control of both banks of the Casamanza (in Senegambia), and the Portuguese frontier in the south was advanced approximately to the southern limit of the basin of the Casini. On the Congo, Portugal retained the Massabi district, to which France had laid claim, but both banks of the Loango were left to France." In 1884 three representatives of the Society for German Colonization—Dr. Peters, Dr. Jühlke, and Count Pfeil—quietly concluded treaties with the chiefs of Useguba, Ukami, Nguru, and Usagara, by which those territories were conveyed to the society in question. "Dr. Peters . . . armed with his treaties, returned to Berlin in February, 1885. On the 27th February, the day following the signature of the General Act of the Berlin Conference [See BERLIN ACT], an Imperial Schutzbrief, or Charter of Protection, secured to the Society for German Colonization the territories . . . acquired for them through Dr. Peters' treaties: in other words, a German Protectorate was proclaimed. When it became known that Germany had seized upon the Zanzibar mainland, the indignation in colonial circles knew no bounds. . . . Prior to 1884, the continental lands facing Zanzibar were almost exclusively under British influence. The principal traders were British subjects, and the Sultan's Government was administered under the advice of the British Resident. The entire region between the Coast and the Lakes was regarded as being under the nominal suzerainty of the Sultan. . . . Still, Great Britain had no territorial claims on the dominions of the Sultan." The sultan formally protested and Great Britain championed his cause; but to no effect. In the end the sultan of Zanzibar yielded the German protectorate over the four inland provinces and over Witu, and the British and German Governments arranged questions between them, provisionally, by the Anglo-German Convention of 1886, which was afterwards superseded by the more definite Convention of July 1890, which will be spoken of below. In April 1887, the rights of the Society for Ger-

man Colonization were transferred to the German East Africa Association, with Dr. Peters at its head. The British East Africa Company took over concessions that had been granted by the sultan of Zanzibar to Sir William Mackinnon, and received a royal charter in September 1888. In South-west Africa, "an enterprising Bremen merchant, Herr Lüderitz, and subsequently the German Consul-General, Dr. Nachtigal, concluded a series of political and commercial treaties with native chiefs, whereby a claim was instituted over Angra Pequena, and over vast districts in the Interior between the Orange River and Cape Frio. . . . It was useless for the Cape colonists to protest. On the 13th October 1884 Germany formally notified to the Powers her Protectorate over South-West Africa. . . . On 3rd August 1885 the German Colonial Company for South-West Africa was founded, and . . . received the Imperial sanction for its incorporation. But in August 1885 a new Association was formed—the German West-Africa Company—and the administration of its territories was placed under an Imperial Commissioner. . . . The intrusion of Germany into South-West Africa acted as a check upon, no less than a spur to, the extension of British influence northwards to the Zambezi. Another obstacle to this extension arose from the Boer insurrection." The Transvaal, with increased independence had adopted the title of South African Republic. "Zulu-land, having lost its independence, was partitioned; a third of its territories, over which a republic had been proclaimed, was absorbed (October 1887) by the Transvaal; the remainder was added (14th May 1887) to the British possessions. Amatonga-land was in 1888 also taken under British protection. By a convention with the South African republic, Britain acquired in 1884 the Crown colony of Bechuana-land; and in the early part of 1885 a British Protectorate was proclaimed over the remaining portion of Bechuana-land." Furthermore, "a British Protectorate was instituted [1885] over the country bounded by the Zambezi in the north, the British possessions in the south, 'the Portuguese province of Sofala' in the east, and the 20th degree of east longitude in the west. It was at this juncture that Mr. Cecil Rhodes came forward, and, having obtained certain concessions from Lobengula, founded the British South Africa Company. . . . On the 29th October 1889, the British South Africa Company was granted a royal charter. It was declared in this charter that 'the principal field of the operations of the British South African Company shall be the region of South Africa lying immediately to the north of British Bechuanaland, and to the north and west of the South African Republic, and to the west of the Portuguese dominions.' No northern limit was given, and the other boundaries were vaguely defined. The position of Swaziland was definitely settled in 1890 by an arrangement between Great Britain and the South African republic, which provides for the continued independence of Swaziland and a joint control over the white settlers. A British Protectorate was proclaimed over Nyasa-land and the Shiré Highlands in 1880-90. To return now to the proceedings of other Powers in Africa: "Italy took formal possession, in July 1882, of the bay and territory of Assab. The Italian coast-line on the Red Sea was extended from Ras Kasar (18° 2' N. Lat.) to the southern boundary of Raheita, towards Obok. During 1889, shortly after the death of King Johannes, Kerén and Asmara were occupied by Italian troops. Menelik of Shoa, who succeeded to the throne of Abyssinia after subjugat-

ing all the Abyssinian provinces, except Tigré, dispatched an embassy to King Humbert, the result of which was that the new Negus acknowledged (29th September, 1889) the Protectorate of Italy over Abyssinia, and its sovereignty over the territories of Massawa, Keren and Asmara." By the protocols of March 24 and April 15, 1891, Italy and Great Britain define their respective spheres of influence in East Africa. "But since then Italy has practically withdrawn from her position. She has absolutely no hold over Abyssinia. . . . Italy has also succeeded in establishing herself on the Somál Coast." By treaties concluded in 1889, "the coastal lands between Cape Warsheikh (about 2° 30' N. lat.), and Cape Bedwin (8° 3' N. lat.)—a distance of 450 miles—were placed under Italian protection. Italy subsequently extended (1890) her Protectorate over the Somál Coast to the Jub river. . . . The British Protectorate on the Somál Coast facing Aden, now extends from the Italian frontier at Ras Hafún to Ras Jibute (43° 15' E. long.). . . . The activity of France in her Senegambian province, . . . during the last hundred years . . . has finally resulted in a considerable expansion of her territory. . . . The French have established a claim over the country intervening between our Gold Coast Colony and Liberia. A more precise delimitation of the frontier between Sierra Leone and Liberia resulted from the treaties signed at Monrovia on the 11th November 1887. In 1888 Portugal withdrew all rights over Dahomé. . . . Recently, a French sphere of influence has been instituted over the whole of the Saharan regions between Algeria and Senegambia. . . . Declarations were exchanged (5th August 1890) [between France and Great Britain] with the following results: France became a consenting party to the Anglo-German Convention of 1st July 1890. (2) Great Britain recognised a French sphere of influence over Madagascar. . . . And (3) Great Britain recognised the sphere of influence of France to the south of her Mediterranean possessions, up to a line from Say on the Niger to Barrua on Lake Tsad, drawn in such a manner as to comprise in the sphere of action of the British Niger Company all that fairly belongs to the kingdom of Sokoto." The Anglo-German convention of July, 1890, already referred to, established by its main provisions the following definitions of territory: "(1.) The Anglo-German frontier in East Africa, which, by the Convention of 1886, ended at a point on the eastern shore of the Victoria Nyanza was continued on the same latitude across the lake to the confines of the Congo Independent State; but, on the western side of the lake, this frontier was, if necessary, to be deflected to the south, in order to include Mount M'fumbiro within the British sphere. . . . Treaties in that district were made on behalf of the British East Africa Company by Mr. Stanley, on his return (May 1889) from the relief of Emin Pasha. . . . (2.) The southern boundary of the German sphere of influence in East Africa was recognised as that originally drawn to a point on the eastern shore of Lake Nyassa, whence it was continued by the eastern, northern, and western shores of the lake to the northern bank of the mouth of the River Songwé. From this point the Anglo-German frontier was continued to Lake Tanganika, in such a manner as to leave the Stevenson Road within the British sphere. (3.) The Northern frontier of British East Africa was defined by the Jub River and the conterminous boundary of the Italian sphere of influence in Galla-land and Abyssinia up to the confines of Egypt; in the west, by the Congo State and the

Congo-Nile watershed. (4.) Germany withdrew, in favor of Britain, her Protectorate over Vitu and her claims to all territories on the mainland to the north of the River Tana, as also over the islands of Patta and Manda. (5.) In South-West Africa, the Anglo-German frontier, originally fixed up to 22 south latitude, was confirmed; but from this point the boundary-line was drawn in such a manner eastward and northward as to give Germany free access to the Zambezi by the Chobe River. (6.) The Anglo-German frontier between Togo and Gold Coast Colony was fixed, and that between the Camarons and the British Niger Territories was provisionally adjusted. (7.) The Free-trade zone, defined by the Act of Berlin (1885) was recognised as applicable to the present arrangement between Britain and Germany. (8.) A British Protectorate was recognised over the dominions of the Sultan of Zanzibar within the British coastal zone and over the islands of Zanzibar and Pemba. Britain, however, undertook to use her influence to secure (what have since been acquired) corresponding advantages for Germany within the German coastal zone and over the island of Mafia. Finally (9.), the island of Heligoland, in the North Sea, was ceded by Britain to Germany." By a treaty concluded in June, 1891, between Great Britain and Portugal, "Great Britain acquired a broad central sphere of influence for the expansion of her possessions in South Africa northward to and beyond the Zambezi, along a path which provides for the uninterrupted passage of British goods and British enterprise, up to the confines of the Congo Independent State and German East Africa. . . . Portugal, on the East Coast secured the Lower Zambezi from Zumbo, and the Lower Shiré from the Ruo Confluence, the entire Hinterland of Mosambique up to Lake Nyasa and the Hinterland of Sofala to the confines of the South African Republic and the Matabele kingdom. On the West Coast, Portugal received the entire Hinterland behind her provinces in Lower Guinea, up to the confines of the Congo Independent State, and the upper course of the Zambezi. . . . On May 25th 1891 a Convention was signed at Lisbon, which has put an end to the dispute between Portugal and the Congo Independent State as to the possession of Lunda. Roughly speaking, the country was equally divided between the disputants. . . . Lord Salisbury, in his negotiations with Germany and Portugal, very wisely upheld the principle of free-trade which was laid down by the Act of Berlin, 1885, in regard to the free transit of goods through territories in which two or more powers are indirectly interested. Thus, by the Anglo-German compact, the contracting powers reserved for their respective subjects a 'right of way,' so to speak, along the main channels or routes of communication. Through the application of the same principle in the recent Anglo-Portuguese Convention, Portugal obtains not only a 'right of way' across the British Zambesi zone, but also the privilege of constructing railways and telegraphs. She thereby secures free and uninterrupted connection between her possessions on the East Coast and those on the West Coast. A similar concession is made to Britain in the Zambesi basin, within the Portuguese sphere. Finally, the Zambesi itself has been declared free to the flags of all nations. Britain has stipulated for the right of preëmption in the event of Portugal wishing to dispose of territories south of the Zambesi."—A. S. White, *Development of Africa*, 2d. ed.—See also DELAGOA BAY ARBITRATION.

1890-1906.—Agreements among European powers on the regulation of the slave trade and the liquor traffic.—On July 2, 1890, a convention relative to the African slave trade was framed at a conference of the representatives of European, American, African, and Asiatic states, at Brussels. The treaty, known as the General Act of Brussels, was signed July 2, 1890, but did not come into force until April 2, 1894. The text of it may be found in (U. S.) House Doc. No. 276, 56th Congress, 3d Sess. It put an end to the slave trade (See SLAVERY: 1860-1893) and either forbade entirely or greatly restricted traffic in arms or liquors in specified regions. Without interfering with European settlements in the North and South, the Act was designed to protect the native races. In June, 1890, representatives of the governments of Great Britain, Germany, Belgium, Spain, the Congo State, France, Italy, the Netherlands, Portugal, Russia, Sweden and Norway, and Turkey, assembled at Brussels, with due authorization, and there concluded an international convention respecting the liquor traffic in Africa. Subsequently the governments of Austria-Hungary, the United States of America, Liberia and Persia, gave their adhesion to the convention, and ratifications were deposited at Brussels in June, 1900. The convention was, in a measure, supplemental to the General Act of Brussels. It provided: "Article I. From the coming into force of the present Convention, the import duty on spirituous liquors, as that duty is regulated by the General Act of Brussels, shall be raised throughout the zone where there does not exist the system of total prohibition provided by Article XCI. of the said General Act, to the rate of 70 fr. the hectolitre at 50 degrees centigrade, for a period of six years. It may, exceptionally, be at the rate of 60 fr. only the hectolitre at 50 degrees centigrade in the Colony of Togo and in that of Dahomey. The import duty shall be augmented proportionally for each degree above 50 degrees centigrade; it may be diminished proportionally for each degree below 50 degrees centigrade. At the end of the above-mentioned period of six years, the import duty shall be submitted to revision, taking as a basis the results produced by the preceding rate. The Powers retain the right of maintaining and increasing the duty beyond the minimum fixed by the present Article in the regions where they now possess that right. Article II. In accordance with Article XCIII. of the General Act of Brussels, distilled drinks made in the regions mentioned in Article XCII. of the said General Act, and intended for consumption, shall pay an excise duty. This excise duty, the collection of which the Powers undertake to insure as far as possible, shall not be lower than the minimum import duty fixed by Article I. of the present Convention. Article III. It is understood that the Powers who signed the General Act of Brussels, or who have acceded to it, and who are not represented at the present Conference, preserve the right of acceding to the present Convention."—*Great Britain, Parliamentary publications (Papers by command: Treaty series, no. 13, 1900).*—A later conference at Brussels in 1906 again increased the duties on liquors, and as we shall see below, the World War settlements secured still greater protection for the African native.

1890-1914.—Extension of existing European possessions.—"The period 1890-1914 again shows a change in the nature of Europe's penetration into Africa. On the east and west coasts the claims of posterity had been fully pegged out by the different States. The increase in territory ap-

propriated was therefore caused by extension of existing possessions on the coast into the hinterlands. In fact in these regions the States were occupied not in acquiring new possessions, but in rounding off their previous conquests, and in converting spheres of interest into full colonial dominion. And, since in tropical Africa there was nothing left for Europe to do but attempt to digest what she had swallowed, those who still had cravings for 'expansion' and for economic imperialism had to turn once more to the only remaining places where it was possible to expand, the north and the south. Consequently the history of our last period, 1890-1914, reverts to that of our first, 1815-80, the penetration of France into the north by the acquisition of Tunis and Morocco, and the penetration of the south by Britain through the conquest or absorption of Rhodesia, the Transvaal, and the Orange Free State."—L. Woolf, *Empire and commerce in Africa* (1915), pp. 58-59.

1914.—Distribution of European sovereignty in Africa.—"The following European Powers possessed sovereign rights in Africa before the war:—Britain, France, Germany, Belgium, Portugal, Italy, and Spain. In addition, and as the result of the Boer War, the various British Colonies in South Africa had been welded together and formed, with the newly-annexed Boer Republics, a self-governing British Dominion, a State in Africa controlled by, and in part composed of, men of European blood, but African-born, known as *The Union of South Africa*, and stretching from Capetown to the Zambesi. The only part of Africa enjoying its own native government was Abyssinia. For although a certain area 'on the Kru Coast, together with its hinterland, known as Liberia, supposedly constitutes a 'government' . . . and is recognised as an Independent State, its 'government' consists of a few thousand descendants of repatriated American blacks, who enjoy no authority outside the confines of their settlements on the coast line. Egypt was virtually, although not then nominally, a British dependency. I give below the African dependencies of the various European governments with their area and population, . . . as they existed at the outbreak of the war.

BRITISH AFRICA

(A: Controlled by the Colonial Office)

	Area in Square Miles	Population
Nigeria	336,080	17,100,000
British East Africa	246,822	4,038,000
Uganda	121,437	2,803,494
Sierra Leone	31,000	1,400,000
Nyasaland	30,801	1,000,000
Gold Coast	24,335	853,766
Ashanti	24,800	287,814
Northern Territories	31,100	361,806
Basutoland	11,716	405,913
Somaliland	68,000	310,000
Gambia	4,500	146,100
Bechuanaland	275,000	125,350
Swaziland	6,536	99,959

(B: Controlled by the British South Africa Company)

	Area in Square Miles	Population
Rhodesia	438,575	1,772,511

(C: Self-governing Dominion)

Area in Square Miles Population

The Union of South Africa comprising the provinces of the Cape, Natal, Transvaal, and Orange Free State.....

473,100 5,973,394

To this list must now be added as definitely British:—

Area in Square Miles Population

Egypt 400,000 11,287,300
The Sudan 984,520 3,000,000

“The total of British Africa covers, therefore (exclusive of German African territory conquered since the war) an area of 3,517,322 square miles with an estimated population of 51,055,407. Of this total population about 1½ millions are Europeans or half-breeds; and of the 1½ millions, more than 1¼ millions reside in the territories of The South African Union. This leaves 250,000

Europeans for the remainder of the gigantic area affected, and Egypt accounts for more than half of these. It will be well to bear this fact carefully in mind when, later on, we pass to a consideration of the African problem in its fundamental aspects.

FRENCH AFRICA

Area in Square Miles Population

Algeria 343,500 5,563,828
Tunis 50,000 1,780,527
West Africa 1,478,000 10,465,072
French Congo 660,280 9,000,000
Saharan region 1,544,000 800,000
Somali Coast 5,700 208,000
Madagascar 228,000 3,104,881
Morocco 210,000 5,000,000

“The total of French Africa embraced, therefore, before the war an area of 4,537,570 square miles with an estimated population of 35,022,308. Algeria is looked upon as an extension of France. The total European population—chiefly French,

Italian and Spanish—in 1911 was 752,043. The census of 1911 showed a European and mixed European population in Tunis 126,265, of whom 46,044 were French (exclusive of the army of occupation); in Madagascar 12,000, of whom some 10,000 were French; in West Africa 7,104, of whom 6,377 were French. Before the war there were a considerable number of French troops and French colored troops in Morocco, and a few hundred French and other European residents. In 1914 the European population of French Africa, apart from the white troops in Algeria, Morocco, and Tunis, was slightly in excess of a million.

GERMAN AFRICA

"When the war broke out Germany possessed three considerable dependencies in Africa, and one small dependency. These were:

	Area in Square Miles	Population
Kamerun (the Cameroons)	281,950	3,720,000
German East Africa	384,000	7,651,106
German South-West Africa	322,450	94,386
Togo	33,700	1,031,078

"A total of 1,022,100 square miles with a population of 12,407,470.

The European population, mostly German, numbered under 20,000.

BELGIAN AFRICA

"In October, 1908, Belgium annexed the Congo Free State founded, under Treaty stipulations, by King Leopold II in 1884-5, and thereby became an African Power. The area of the Belgian Congo is just under one million square miles with a native population enormously reduced from the Stanleyan period. In 1908 the British Consular staff, basing its calculations on the taxable returns, estimated the population at some eight millions. There were 4,000 Europeans in the territory, a little over one-half of this number being Belgians.

PORTUGUESE AFRICA

	Area in Square Miles	Population
Angola (and Kabinda)	480,000	5,000,000
Portuguese East Africa	300,000	3,200,000
Portuguese Guinea	13,940	820,000
The Cocoa Islands (San Thomé and Príncipe)	442	45,000

ITALIAN AFRICA

	Area in Square Miles	Population
Tripoli	406,000	523,176
Italian Somaliland	139,430	400,000
Eritrea	45,800	450,000

SPANISH AFRICA

	Area in Square Miles	Population
Rio de Oro	73,000	12,000
Spanish Guinea	12,000	200,000
Various enclaves north of the Congo and the Island of Fernando Po	814	23,844

A narrow strip of territory on the Mediterranean coastline of Morocco and a small 'Enclave' on the Atlantic coast-line of Morocco."—E. D. Morel, *Africa and the peace of Europe*, pp. 11-15.

SUMMARY OF EUROPEAN OCCUPATION.—"Such, in brief outline, is the process by which Africa has been conquered and partitioned. Africa has been an easy prey because of its divisions, its military weakness, and its low civilisations. Though no one of the incoming Powers has established its position without a struggle, only in Morocco and Abyssinia has the native opposition proved really formidable. More serious difficulties have been encountered in the settlement of rival claims. England and Portugal came to the brink of war over Central Africa in 1891, as did England and France over the Sudan in 1898, and France and Germany over Morocco in 1904. The wide field of enterprise which has given scope to the ambitions of every colonising Power, a spirit of reasonableness, and the definite principles previously agreed upon for the decision of doubtful questions, have made it possible hitherto to reach a peaceful settlement of all disputes. The political divisions have not been formed according to geographical divisions—no one of the great river basins belongs exclusively to a single Power—but exhibit a strange diversity, being, in each sphere, a resultant of the forces which historic position and, later, energy and foresight, gave to the competing Powers. England owes much to the happy possession of points of access to the interior from south and north, much also to the energy of private persons acting singly or through Companies, and to the far-reaching conceptions of a few great leaders; as usual, she owes least of any Power to the direct intervention of Government. France, too, has expanded her rule from historic settlements, and owes her great dominion to the imagination which outlined, and the steadfastness which pursued, a vast ambition. The pertinacity with which the Germans discovered weak points in existing claims, the swiftness of their action, their unyielding diplomacy, . . . enabled them, while starting without advantages, to secure extensive possessions. [See also GERMANY: 1006-1007.] Belgium owes her share to the activity of her late sovereign, who by benevolent profession rescued a mighty domain from the international scramble to transform it into an estate for private gain. The Portuguese hold, much diminished, the heritage bequeathed them from a distant past. . . . The work of conquest and political organization is too recent for us to estimate its effects on the peoples of Africa, and that of economic organization is but beginning. One general end the Powers have had in view—the suppression of the slave trade at its sources—now practically achieved after a century of effort. Domestic slavery—an ancient African institution—is a different problem, but it has been discouraged in lands under direct British government. Tribal life continues and is deliberately preserved. The transformation of the native economy has not been attempted. Whether desirable or not, it is beyond the strength of any Government yet established in tropical Africa. Economic development in most cases proceeds but slowly. Governments are poor, for their subjects are poor; and the problem of adapting taxation to the organization of primitive peoples, though varying in difficulty, has nowhere been found easy. The immense task of associating the native in the development of the country on European lines requires so considerable a change in his ideas and life that it may take a long time to carry out, save where it is attempted by methods of

compulsion which public opinion more and more decisively condemns. Yet, without the aid of the native, the value of these tropical regions to their European conquerors is much diminished. In Europe, the occupation of Africa has increased wealth and trade, and cheapened some of the comforts of life; what it will mean for Africa cannot yet be judged."—E. A. Beniars, *European colonies (Cambridge modern history, pp. 657-666)*.

1914-1920.—Obstacles to European occupation.—There are many obstacles to the white race from Europe overrunning and colonizing the continent of Africa as it has overrun and colonized the two Americas and Australasia. One is the insalubrity of the well-watered regions and the uninhabitability of the desert tracts, that is, the climatic conditions. Another is the opposition of strong indigenous races influenced by successful Moslem occupation and proselytizing. A third obstacle is the lack of adequate railway communication, although, as we shall see, efforts have been made to build many new lines. Another obstacle is the labor problem, and still another is a body of adverse public opinion at home, based largely on the fact that many of the colonies are not self-supporting, but a source of expense.

(1) CLIMATIC CONDITIONS AND TOPOGRAPHICAL FEATURES.—"Deserts, to be made habitable and cultivable, only need irrigation, and apparently there is a subterranean water supply underlying most African deserts which can be tapped by artesian wells. The extreme unhealthiness of the well-watered parts of Africa is due not so much to climate as to the presence of malaria in the systems of the Negro inhabitants. This malaria is conveyed from the black man to the white man by certain gnats of the genus *Anopheles*—possibly by other agencies. But the draining of marshes and the sterilisation of pools, together with other measures, may gradually bring about the extinction of the mosquito; while, on the other hand, it seems as though the drug (*Cassia Beareana*) obtained from the roots of a cassia hush may act as a complete cure for malarial fever. . . .

"For practical purposes the only areas south of the Sahara Desert which at the present time are favourable to white colonisation are the following. In West Africa there can be no white colonisation under existing conditions; the white man can only remain there for a portion of his working life as an educator and administrator. . . . In North-East Africa, Abyssinia and Eritrea will suggest themselves as white man's countries—presenting, that is to say, some of the conditions favourable to European colonisation. The actual coast of Eritrea is extremely hot, almost the hottest country in the world, but it is not necessarily very unhealthy. The heat, however, apart from the existence of a fairly abundant native population, almost precludes the idea of a European settlement. But on the mountains of the hinterland which are still within Italian territory there are said to be a few small areas suited at any rate to settlement by Italians, who, by-the-by, seem to be getting on very well with the natives in that part of Africa. But a European colonisation of Abyssinia, possible as it might be climatically, is out of the question in view of the relatively abundant and warlike population indigenous to the Ethiopian Empire. . . .

"Then comes Central Africa, which may be taken to range from the northern limits of the Congo basin and the Great Lakes on the north to the Cunene River and the Zambesi on the south. British East Africa and Uganda offer probably the largest continuous area of white man's country

in the central section of the continent. The Ankole country in the southwest of the Uganda Protectorate and the highlands north of Tanganyika, together with the slopes of the Ruwenzori range, offer small tracts of land thoroughly suited to occupation by a white race so far as climate and fertility are concerned; but these countries have already been occupied, to a great extent, by some of the earliest forerunners of the Caucasian (the Bahima), as well as by sturdy Negro tribes who have become inured to the cold. To the northeast of the Victoria Nyanza, however, there is an area which has as its outposts the southwest coast of Lake Rudolf, the great mountains of Debasien and Elgon, and the snow-clad extinct volcanoes of Kenia and Kilimanjaro. This land of plateaux and rift valleys is not far short of 70,000 square miles in extent, and so far as climate and other physical conditions are concerned is as well suited for occupation by British settlers as Queensland or New South Wales. But nearly 50,000 square miles of this East African territory is more or less in the occupation of sturdy Negro or Negroid races whom it would be neither just nor easy to expel. . . .

"The only portion of German East Africa which is at all suited to European settlement lies along the edge of the Nyasa-Tanganyika Plateau. Here is a district of a little more than a thousand square miles which is not only elevated and healthy, but very sparsely populated by Negroes. A few patches in the Katanga district and the extreme southern part of the Congo Free State offer similar conditions.

"In British Central Africa we have perhaps 6,000 square miles of elevated, sparsely populated, fertile country to the northwest of Lake Nyasa and along the road to Tanganyika. There is also land of this description in the North-East Rhodesian province of British Central Africa, in Manikaland, and along the water-parting between the Congo and the Zambesi systems. Then in the southernmost prolongation of British Central Africa are the celebrated Shiré Highlands, which, together with a few outlying mountain districts to the southwest of Lake Nyasa, may offer a total area of about 5,000 square miles suitable to European colonisation. A small portion of the Moçambique province, in the interior of the Angoche coast, might answer to the same description. Then again, far away to the west, under the same latitudes, we have, at the back of Mossamedes and Benguela, other patches of white man's country in the mountains of Bailundo and Shella.

"In South Africa, beyond the latitudes of the Zambesi, we come to lands which are increasingly suited to the white man's occupation the further we proceed south. Nearly all German South-West Africa is arid desert, but inland there are plateaux and mountains which sometimes exceed 8,000 feet in altitude, and which have a sufficient rainfall to make European agriculture possible. . . . About two-thirds of the Transvaal, a third of Rhodesia, a small portion of southern Bechuanaland, two-thirds of the Orange River Colony, four-fifths of Cape Colony, and a third of Natal sum up the areas attributed to the white man in South Africa. The remainder of this part of the continent must be considered mainly as a reserve for the black man, and to a much smaller degree (in South-East Africa) as a field for Asiatic colonisation, preferentially on the part of British Indians.

"Counting the white-skinned Berbers and Arabs of North Africa, and the more or less pure-blooded, light-skinned Egyptians, as white men,

and the land they occupy as part of the white man's share of the Dark Continent, we may then by a rough calculation arrive (by adding to white North Africa the other areas enumerated in the rest of the continent) at the following estimate: that about 970,000 square miles of the whole African continent may be attributed to the white man as his legitimate share. If, however, we are merely to consider the territory that lies open to European colonisation, then we must considerably reduce our North African estimate."—H. H. Johnston, *White man's place in Africa (Nineteenth Century, June, 1904)*.

"What is Europe going to do with Africa? It seems to me there are three courses to be pursued, corresponding with the three classes of territory into which Africa falls when considered geographically. There is, to begin with, that much restricted . . . area, lying outside the tropics (or in very rare cases, at great altitudes inside the tropics), where the climate is healthy and Europeans can not only support existence under much the same conditions as in their own lands and freely rear children to form in time a native European race, but where at the same time there is no dense native population to dispute by force or by an appeal to common fairness the possession of the soil. Such lands as these are of relatively small extent compared to the mass of Africa. They are confined to the districts south of the Zambezi (with the exception of the neighborhood of the Zambezi and the eastern coast-belt); a few square miles on the mountain plateaux of North and South Nyasaland; the northern half of Tunisia, a few districts of North-east and North-west Algeria and the Cyrenaica (northern projection of Barka); perhaps also the northernmost portion of Morocco. The second category consists of countries like much of Morocco, Algeria, Tunis, and Tripoli; Barka, Egypt, Abyssinia and parts of Somaliland; where climatic conditions and soil are not wholly opposed to the healthful settlement of Europeans, but where the competition or numerical strength or martial spirit of the natives already in possession are factors opposed to the substitution of a large European population for the present owners of the soil. The third category consists of all that is left of Africa, mainly tropical, where the climatic conditions make it impossible for Europeans to cultivate the soil with their own hands, to settle for many years, or to bring up healthy families. Countries lying under the first category I should characterize as being suitable for European colonies, a conclusion somewhat belated, since they have nearly all become such. The second description of territory I should qualify as 'tributary states,' countries where good and settled government cannot be maintained by the natives without the control of a European power, the European power retaining in return for the expense and trouble of such control the gratification of performing a good and interesting work, and a field of employment for a few of her choicer sons and daughters. The third category consists of 'plantation colonies'—vast territories to be governed as India is governed, despotically but wisely, and with the first aim of securing good government and a reasonable degree of civilization to a large population of races inferior to the European." Here, however, the Europeans may come in small numbers with their capital, their energy, and their knowledge to develop a most lucrative commerce, and obtain products necessary to the use of their advanced civilization.—H. H. Johnston, *Colonization of Africa*, pp. 278-279.

(2) MOSLEM OCCUPATION.—Another great obsta-

cle in the way of European colonization is the opposition offered to Christian nations by the rapid spread of the Moslem faith.

"The reasons for the great strides that Mohammedanism has made among the primitive, pagan tribes of Africa are not far to seek. Before an aggressive, coördinating faith like Islam, the inferior civilization of the negro kingdoms and states in the interior practising polytheism and fetichism, continually at war with each other and thus in a perpetual state of trade stagnation, must inevitably give way." Through the ubiquitous Arab traders, all of whom are potential missionaries, the new, simple, quasi-political doctrine is peculiarly attractive. "And it has progressed in the same ratio as European nations have penetrated to the interior, and pushed their hinterlands against the savage negro societies, leaving them exposed to the fierce light of civilization. Thus, in Islam, these kingdoms and principalities of backward races are finding a ready and effective method of centralization and government. Pagan tribes like the Gallas and Shoans of Ethiopia, under centuries of fierce and perpetual persecution from their Abyssinian rulers, successfully resisted Christianity; yet they have easily fallen under the sway of Islam. Even so in the interior of Africa and along the coast, wherever Christian missionaries have . . . [come in] contact with them, the savage tribes have proved impervious to all Christian advances, but have readily turned to Islam, in spite of the fact that for centuries they were cruelly exploited by the Moslem Arab slave-dealers, before the European nations stamped out the trade. The virtue of such wholesale conversions lies in the ease with which Islam, like Hinduism in India, has adopted the customs and traditions of its rude adherents. The community life of these savages is allowed to continue. Rigid though Islam is on the subject of liquor, yet many of these tribes still retain their native habits of intemperance; likewise it must be said that those tribes on the coast that have suffered from the early European drink traffic, being of a higher order of intelligence and orthodoxy, have renounced liquor with their conversion to Islam. The cannibalism of British Ashantee, of French Dahomey, the fetichism and idolatry of the rest of Africa, have passed away in the wake of Islam, degenerating though the new influences may be in the eyes of the orthodox Islamic pundits of Al-Azhar in Cairo. Too much, however, cannot be made of the reforming influence of Islam among the savage Africans. . . . The Asiatic, and likewise the African, finds himself forlorn and isolated in Christianity, and no amount of official protection can save him from the social and economic tyranny to which all such converts are subjected. In Africa, the pagan negro races find themselves welcome in Islam with all their native customs. They are allowed to practise their polygamy, and their family or home unit is emphasized—a factor of prime importance in Asiatic psychology from China to Turkey. On the other hand, too much must not be made of the fact that Islam encourages lust and easy divorce. Accurate observers report that this offers no particular attraction to savage converts, especially when such vices have long been endemic among African, and some Asiatic tribes. Not the least picturesque feature of the conversions to Islam in Asia and Africa is the important part played by women, particularly when we consider that the Prophet degraded women and barred them from the rewards of a future [life]. In an unconscious way, Islam has spread through their efforts. Among the raiding

nations of Asia, like the Mongols, and in India, under the early dynasties and later under the Mughals, the propagation of Islam went apace. When a raid was made into Moslem territory the women were carried off and helped to convert the pagan tribe, or when a mercenary Moslem army lent aid to a foreign kingdom, as in the case of China, and was invited to settle, the Mohammedans took to wife the women of the country, and thus formed another outpost of Islam.

"In India the Mughal consorts founded *mad-rasahs* or endowed schools, which, together with libraries, were attached to their tombs and mosques. In the course of the many ruthless invasions that have swept India, when devastation was invariably practised, these semi-religious foundations have alone survived as examples of their culture, and they must have exerted an enormous influence from decade to decade. In Africa the fanatical Scusseï sect opened schools for girls in the region north of Lake Chad. This form of feminine proselytism has also been most active in Africa, especially on the east coast. In the Sudan, Islam has spread through the Egyptian army—every *fellah* recruit being circumcised at enlistment and given a rudimentary education. On the expiration of his term of service, he goes back to his pagan village to be an ardent proselytiser through his wife. In German East Africa the negroes recruited from railway and plantation work form temporary unions with the Moslem women, and since these women insist upon the Moslem rite of circumcision, the men are thus converted to Islam, and eventually take the new creed back to their villages. Perhaps the strongest reason for the success and appeal of Islam throughout the Orient and Africa is the . . . institution of concubinage and marriage. A Moslem will cherish a son by his negro wife or slave, while he readily offers his daughter in marriage to a Moslem negro. Many a sultan and pasha, many an *imam* and saint, has not considered it a disgrace to acknowledge the negro blood in his veins. Thus, in Africa, the lack of any social discrimination or ostracism, together with a compensating social rise, makes admission into the Islamic brotherhood attractive.

"Another appeal lies in the chance the religion gives warlike tribes to continue in the profession of arms, since the Faith countenances conversion through conquest. Wherever such races in Asia or Africa have been prevented by twentieth century laws and order, by the press of western influence or domination, from indulging in their hereditary pursuit (excepting a few military Hindu tribes like the Sikhs, Gurkhas and Rajputs in India) they will be found to flourish under the semi-military caste of Islam. It is not strange, therefore, that the Turko-Teuton régime seized upon the Moslem idea of *jihad* as a vehicle for galvanizing the warlike spirit of Islam. . . .

"In Africa, as I have endeavored to show, Islam is rapidly expanding in its pristine eighth-century character, appealing to the dark world of witchcraft and cannibalism that has for centuries made the African a problem to civilization. Writing in 1887 Bosworth Smith said: 'It is hardly too much to say that half of the whole of Africa is already dominated by Islam, while, of the remaining half, a quarter is leavened and another threatened by it.' In this great Asiatic religion the African negro is finding a facile medium of communication and expression; and the future of Africa's destiny would seem to lie with Islam."—W. G. Tinckom-Fernandez, *Asia in Africa* (*Asia*, Nov., 1917).—See also WAHHABIS.

(3) LACK OF RAILWAY AND INDUSTRIAL DEVELOPMENT IN AFRICA.—NEGOTIATIONS FOR THE CAPE-TO-CAIRO RAILWAY.—A third obstacle to European colonization lies in the lack of adequate railway facilities. "Africa is a big continent—about as large as the United States of America, Mexico, Australia, and the Continent of Europe put together—and as late as 1876 the whole of this vast area possessed less than 400 miles of railway. It has been the last of the great areas of this world to become civilized, and as Livingstone—greatest and best and wisest of all explorers—predicted, Africa's salvation is coming through its industrial development. When I first sailed for Africa in 1881 the railway had only been extended to Beaufort West, 300 miles north of Cape Town, where I took the coach to Kimberley. In 1885 the railway reached Kimberley. The main line was next pushed north to the Rand—the greatest goldfield in the world—and the shorter 'economic' lines were built to connect with Delagoa Bay and Natal. The Rand was discovered by the British, and the people of this country put millions into its development. It was not long, however, before financiers of German extraction became to a large extent masters of the Rand, as they had become of Kimberley.

"Rhodesia was the next big mineral development, and therefore the next of Africa's milestones on the road to civilization. At that date, 1890, the terminus of the main line was at Vryburg, and it reached Bulawayo in 1897. Rhodes wanted me to report on the mineral prospects of Rhodesia. I started in March, 1891, and reported to Rhodes that the minerals were there all right, but that he must have a shorter *economic* railway from Beira to make them pay. That line was completed to Bulawayo in 1902. Rhodes had a desperate struggle with the finance of the Rhodesian railways. He had asked the British Government to guarantee the interest, and . . . that Government refused. . . . Rhodes's friend Pauling, the famous railway contractor, and the Messrs. Erlanger, bankers of this city, came to the rescue—they, too, greatly aided the development of the British Empire, for they raised about £10,000,000 sterling to finance African railways. . . . The next great mineral milestone stands 1,000 miles further north, in the very heart of Africa, namely, Katanga. In 1895 Rhodes was anxious to find mineral wealth in Northern Rhodesia, and I sent up one or two of my best men with instructions to examine an area several hundred miles south of Katanga, where gold had been reported to exist. As my men found nothing of value, I stopped operations there and did nothing further until 1898, when, once again at Rhodes's request, I agreed to make another effort, as Rhodes was most anxious to find minerals that would help his railway forward. But as my services at that time were exclusively bound to the Zambesia Exploring Company, Rhodes granted certain rights in which that company should have a large interest. This grant included the right to locate a 2,000 square mile mineral area anywhere in Northern Rhodesia, together with a township and pier at the bottom end of Lake Tanganyika which was intended to be the terminus in Chartered Territory of the Cape-to-Cairo Railway. I organized a prospecting expedition, and appointed the late Mr. George Grey (Viscount Grey's brother) as leader, with instructions to search for minerals as close up to the Congo State frontier as possible. He and his party discovered the Kansanshi copper mine in Rhodesia, 12 miles south of the Belgian Congo frontier.

"Meantime, I approached King Leopold, and succeeded in making an agreement with him which gave the Tanganyika Company the sole prospecting rights for minerals over 60,000 square miles of the Katanga district of the Congo State, adjoining Northern Rhodesia. The King did not believe I should prove mineral wealth to exist in his country, as Professor Cornet, the well-known Belgian geologist, had been sent out by him to examine certain old native workings which had been the subject of comment by Livingstone, Cameron, Stanley, and others. The report by Professor Cornet (which had never been published) had been so unfavourable that the Belgians made no further effort for eight years. George Grey and his staff, in a very short time located these mines, probably the greatest in all the world, extending over about 250 miles of country—in short, a copper Rand—and many other deposits, including gold, tin, and diamonds. Katanga is now giving tangible proof of its mineral resources. The smelting works there have already yielded a total value of over £6,000,000 sterling, although they only started to produce on a small scale in 1912. They are at the present moment producing at the rate of 30,000 tons of copper per annum, of a value of about £4,000,000, and this output will go on increasing steadily year by year. The railway developments which have also resulted from the opening up of this latest mineral zone will, when completed, be probably the greatest in all Africa. Railways are now coming from the north, south, east, and west towards this great mineral and future industrial centre. Thus are minerals once again proving themselves veritable milestones in the progress of African civilization.

"At the date when these discoveries were made, it was Rhodes's intention to take his Cape-to-Cairo Railway to the southern end of Lake Tanganyika, and to utilize the 400-mile waterway as part of the route towards the north. But Germany thwarted his scheme by refusing to recognize the cession of the strip of Congo territory between Lake Tanganyika and Kivu, granted by King Leopold to England to enable Rhodes to carry forward this railway. The reason we all now know. Germany had already fixed her eyes on the Congo. Rhodes would have liked to run his line through the Congo State, and he tried to negotiate this with King Leopold, but had failed, and he suggested I should approach the King with a view to securing the right to build the Cape-to-Cairo Railway through the Congo State to the Nile. . . . The scheme fell through. I saw I was stone-walled, and I therefore studied the map of Africa to find an alternative route. I saw that the shortest route to the sea was along the same great divide between the Congo and Zambesi Rivers, as that on which we had discovered the minerals. It led from Katanga in an almost straight line westward to the old Portuguese town of Benguella. I saw instinctively that the economic route from Katanga to the coast lay along the old slave-road, and moreover that this route, with Lobito Bay as its terminus, was nearer by about 3,000 miles to England. I pointed this out to King Leopold, and, having got his approval and promise of cooperation, I went to Lisbon and without the knowledge of the British Government secured from the Portuguese Government the right to construct the Benguella Railway. But Germany had already grasped the value of this route; had already seen the future agricultural and trade prospects of Angola, and realized the magnificent advantages of the natural harbour of

Lobito Bay, how valuable it would be as the Western port to her Central African Empire. Four years before Portugal granted me the Benguella Railway Concession Germany had induced the British Government to enter into a secret agreement, under which our Government had pledged itself not to interfere with Germany's political efforts in Angola—the very country in which I had secured the right to build a trunk railway."

"Mr. Williams' continued efforts to secure British backing for the completion of the Cape-to-Cairo railway were also futile. He went to London to ask Mr. Joseph Chamberlain about obtaining the support of the Government, but Mr. Chamberlain's interest in the project was not of a material nature and the Government was unwilling to guarantee the interest on a loan to the railway. "I again met King Leopold, and we resolved upon a great cooperative railway scheme, comprising over 3,000 miles of railway. We agreed to build the Katanga Railway jointly, in order to link up the Rhodesian Railway with the navigable Congo River at Bukama. The King undertook to construct a railway from Leopoldville to Bukama; also the section that would connect the Benguella Railway with the Katanga Railway and the copper belt, and the earnings of all these railways were to be 'pooled.'

"The last link in this international chain of railways proved the most difficult of all to provide for, although it was only 132 miles in length and lay in British territory. It was the little bit between Broken Hill in Rhodesia and the Congo frontier. There the railway stood literally dying for want of traffic, unwilling to extend itself to serve British or Belgium interests. I saw that if it was to be done, I must do it myself, and I wrote to Dr. Jameson telling him I would arrange the finance for the Rhodesian section on certain conditions, with which I need not trouble you. Suffice it to say, that with the assistance of Mr. George Pauling, the great African railway contractor, and the Messrs. Erlanger, bankers of this city, I surmounted the difficulty. The Cape-to-Cairo Railway was arranged for at last."—R. Williams, *Railway developments in Central Africa* (*The Times* [London] May 11, 1917).—See also RAILROADS: 1895.

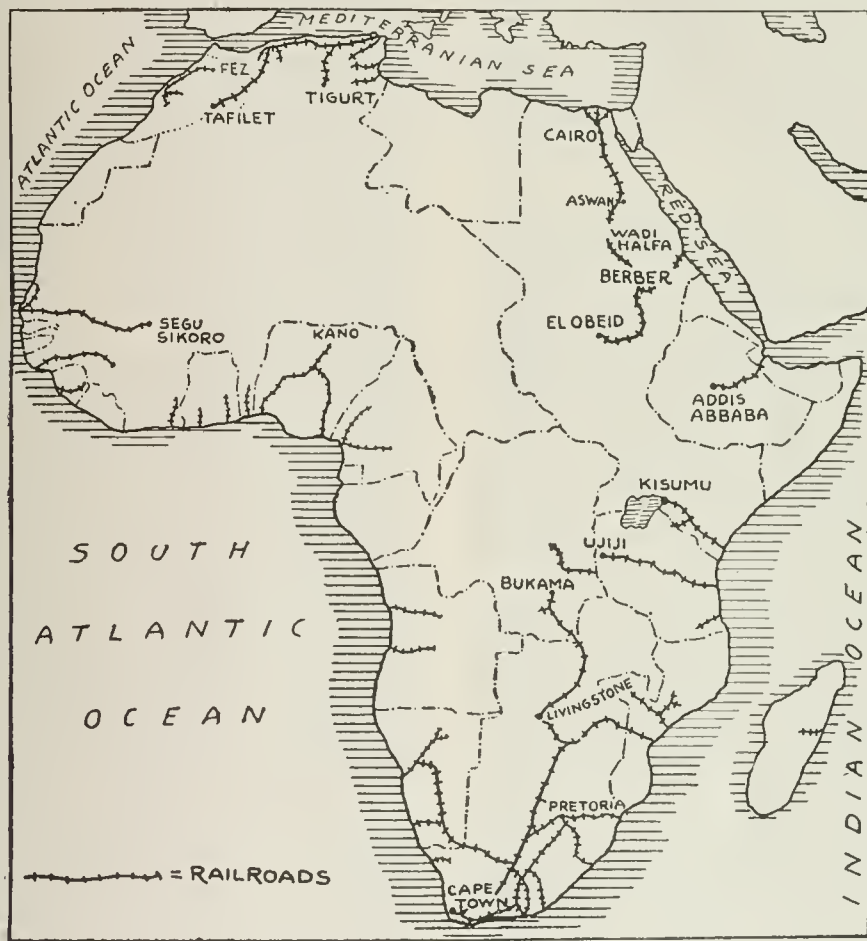

"Railroad development in Africa has been rapid in the past few years and seems but the beginning of a great system which must contribute to the rapid development, civilization, and enlightenment of the Dark Continent. Already [in 1890] railroads run northwardly from Cape Colony about 1,400 miles, and southwardly from Cairo about 1,100 miles, thus making 2,500 miles of the 'Cape-to-Cairo' railroad complete, while the intermediate distance is about 3,000 miles. . . . A line has already been constructed from Natal on the southeast coast; another from Lourenço Marquez in Portuguese territory and the gold and diamond fields; another from Beira, also in Portuguese territory, but considerably farther north, and destined to extend to Salisbury in Rhodesia; . . . still another is projected from Zanzibar to Lake Victoria Nyanza, to connect, probably, at Tabora, with the transcontinental line; another line is under actual construction westward from Pangani just north of Zanzibar, both of these being in German East Africa; another line is being constructed northwestwardly from Mombasa, in British territory, toward Lake Victoria Nyanza, and is completed more than half the distance, while at the entrance to the Red Sea a road is projected westwardly into Abyssinia, and is expected to

Maps prepared specially for the NEW LARNED
under direction of the editors and publishers.

pass farther toward the west and connect with the main line. At Suakim, fronting on the Red Sea, a road is projected to Berber, the present terminus of the line running southwardly from Cairo. On the west of Africa lines have begun to penetrate inward, a short line in the French Sudan running from the head of navigation on the Senegal eastwardly toward the head of navigation on the Niger, with the ultimate purpose of connecting navigation on these two streams. In the Kongo Free State a railway connects the Upper Kongo with the Lower Kongo around Livingstone Falls; in Portuguese Angola a road extends eastwardly

these branches connecting it with either coast. Another magnificent railway project, which was some years ago suggested by M. Leroy Beaulieu, has been recently revived, being no less than an east and west transcontinental line through the Sudan region, connecting the Senegal and Niger countries on the west with the Nile Valley and Red Sea on the east and penetrating a densely populated and extremely productive region of which less is now known, perhaps, than of any other part of Africa. At the north numerous lines skirt the Mediterranean coast, especially in the French territory of Algeria and in Tunis, where the

MODERN RAILROAD LINES IN AFRICA

from Loanda, the capital, a considerable distance, and others are projected from Benguela and Mosamedes with the ultimate purpose of connecting with the 'Cape-to-Cairo' road and joining with the lines from Portuguese East Africa, which also touch that road, thus making a transcontinental line from east to west, with Portuguese territory at either terminus. Farther south on the western coast the Germans have projected a road from Walfisch Bay to Windhoek, the capital of German Southwest Africa, and this will probably be extended eastwardly until it connects with the great transcontinental line from 'Cape-to-Cairo,' which is to form the great nerve center of the system, to be contributed to and supported by

length of railway is, in round numbers, 2,250 miles while the Egyptian railroads are, including those now under construction, about 1,500 miles in length. Those of Cape Colony and Natal are nearly 3,000 miles, and those of Portuguese East Africa and the South African Republic another thousand. Taking into consideration all of the roads now constructed, or under actual construction, their total length reaches nearly 10,000 miles, while there seems every reason to believe that the great through system connecting the rapidly developing mining regions of South Africa with the north of the continent and with Europe will soon be pushed to completion. A large proportion of the railways thus far constructed are owned by the

several colonies or States which they traverse, about 2,000 miles of the Cape Colony system belonging to the Government, while nearly all that of Egypt is owned and operated by the State."—U. S. Bureau of Statistics, *Monthly summary, August, 1899*.—See also CAPE-TO-CAIRO RAILWAY.

No transcontinental line has as yet (1921) been completed, but in the years preceding the World War much of the above mentioned mileage was constructed. The Cape was connected with the navigable Congo at Bukama. When finances permit, it is intended to construct the main line northward through Tanganyika Territory (formerly German East Africa) to connect with the Egyptian system, thus realizing the plan of Cecil Rhodes. From Dakar at Cape Verde, connection was made with the upper Niger. On the east the road from Jibuti, French Somaliland, was extended to the Abyssinian capital. Algerian lines were carried farther. No early day, however, can be set for the completion of a through East and West road, a trans-Sahara route or even a Cape-to-Cairo Railway.

(4) LABOR PROBLEMS.—A fourth obstacle to European colonization and the most difficult "problem of trade facing the administration in Africa is that of labour. The question is complicated by the absence of certain factors which minimise the difficulty of the labour problem in the West. Machinery has not been extensively introduced. This is largely due to the absence of railways, a fact which also influences the problem when the difficulty of transporting native labour has to be considered. White labour, whether skilled or unskilled, can be obtained only in very small quantities. The vast mining concerns of South Africa, the great rubber and cocoa plantations of West Africa, the growing cotton industry of Uganda, together with the palm-oil trade which spreads right across the continent, are dependent upon native labour, or, failing that, upon some substitute which will be equally cheap. The problem of the industrial companies of Africa is to obtain cheap labour. White labour is too highly paid to make possible any large demand for white labourers in those classes of work where muscle rather than brain is required. Cheap labour may be bad labour, but white labour is often impossible where a considerable margin of profit is essential. In course of time it may be possible to secure better labour by the payment of higher wages. But the wages offered can never be so high as those demanded by white men in tropical and subtropical countries. Therefore the bulk of the labour demand will continue to be supplied by natives. The increase in wages will be met by better production. Therein lies another difficulty which should only be transient. The native, at present, is only capable of performing work of a certain low standard. Higher wages will not immediately, and *ipso facto*, coax from him better work. He is incapable of it until education, civilisation and Christianity have removed certain deficiencies from his character. At the present time the African native is too unstable, too apt to abandon his work under slight provocation, too thriftless in the use to which he puts his money, and consequently thriftless of his efficiency as a worker, to make it desirable, or even profitable, to pay him higher wages. These deficiencies sometimes arise from the conditions of his work, and from the treatment meted out to him by overseers and paymasters, though more frequently they are due to weaknesses inherent in the native character. But—it is a fact to be emphasised—the development of the natives, in many individual

cases, proves that he is capable of overcoming these faults, and promises a time when he will justifiably demand a higher wage, and when the increased return made by his work will enable the employer to meet the demand. The labour problem in Africa is most acute on the Rand. It is said that the white man cannot work on the deep levels in the subtropical climate of South Africa. But Cornish miners are able to work on the deep levels of the Comstock mine in Nevada. . . . The real objection lies in the fact that the white man is ashamed to work in the presence of black men. He becomes an autocrat of the worst type. He shirks work because physical exertion 'looks bad.' But apart from these considerations, two insurmountable difficulties lie in the way of employing white labour for unskilled work in the mines: the white population is small; it is not possible to pay wages sufficiently high to attract men in large numbers from the West. The problem has not been completely solved by resorting to black labour. Fresh difficulties have been created, while some of those attached to the supply of white labour have not been overcome. Black labour in South Africa is not sufficient to meet the requirements of the mines. It has been estimated that only fifty per cent. of the demand can be supplied by the native races which dwell south of the Zambesi, in spite of large sums of money spent in recruiting.

"While the native races of South Africa have long since abandoned those warlike and migratory habits which made concentration upon settled labour an impossibility, they have not yet become wearied by the habits of an agricultural and pastoral life, nor have their numbers increased sufficiently to necessitate a periodical movement towards the centres of urban industry, such as takes place in the older agricultural communities of the West. Provided they can obtain a satisfactory settlement on the land, together with the ownership of a certain number of cattle, they have little spontaneous inducement to send them to the mines. The wants of the native are few. They are easily satisfied by a slight cultivation of the soil, and by the cattle which he allows to roam at random over the veldt. Moreover, these wants are supplied by a very limited amount of personal activity. His occupations on the . . . veldt afford him an easy means of livelihood at the cost of a small amount of labour. It is a simple, though not an idle life, suited to his somewhat indolent and unenterprising habits. The South African native is now a home-loving creature. His social instincts are largely developed. Like the Jew, his great ambition is to found a family. Until the time arrives when, by the process of 'labola,' he is able to make an arrangement with the father of his selected wife, he is content to remain in close touch with his own father's kraal. Since the cessation of intertribal wars, the native has swung over to an opposite extreme so far as his migratory habits are concerned. He fears long journeys, especially when the goal will bring him into a sphere of activity unknown to his past and present experience. Moreover, when the allurements of the labour agent, supported by his own desire to hasten the day when he may be able to take to himself a wife, have at last brought him to the mines, he does not often remain at work for any length of time. From three to six months is the average period during which the native stays on the Rand, with the result that the whole labour *personnel* of the mines changes every two years. His temperament is too uncertain, his moods too changeable, he is too prone to take

offence under slight provocation, to make possible a sojourn at the mines which would be more profitable to production. To these causes, which belong to the native himself, and which can only be removed by the processes of civilisation, others have to be added. They are created by the administration of labour, and are, therefore, a matter for the attention of the white man. The treatment offered to the natives in the mines is not always equitable. It is sometimes even harsh. The white overseers are often impatient of attempting to understand the native mind and the difficulties which new work under strange conditions presents. . . . Labour agents and paymasters have not always fulfilled the promises made to the native recruit. Pay has been held back or diminished by the compulsory purchase of goods, sold by interested persons on or near the mine compounds. The accommodation offered has sometimes afforded a poor substitute for the kraals on the open veldt. Overcrowded quarters, insanitary conditions, surrounded by moral temptations, have impaired his physical fitness, so that the arduous labour of the mines has become in itself a cause of discontent. At the end of his contract the native labourer often finds himself at a loss to know how to return to his kraal. Little advice is forthcoming from railway officials. If any of the proceeds of his labour remain to him, he is tempted to dispose of them in an unworthy manner, and at once becomes a member of the community of low-class blacks and whites who surround the mining towns, or attempts to reach his own country by vagrant methods. Perhaps the chief influences which make the native a bad labourer are not due to the native himself, or to his upbringing. They are due to the aforementioned causes, or to others of a similar nature. That is to say, they are the concern of the white man and his organisation. . . . Men of varied experience in different parts of Africa have testified to the efficiency and assiduity of the native labourer when adequate supervision and fair treatment are meted out to him. The whole procedure, from the action of the labour agent to the attitude of the repatriation officials, needs to be revised. The recruiting of native labour should be transferred from the control of monopolist labour associations, which are connected with the mining syndicates, to the native affairs department, every care being taken that it does not come within the duties of any revenue official. The native should be transported to the mines without being subjected to annoyance from railway or mining officials, and, if necessary, his ticket should be advanced and debited to the first instalment of his wages. Such a system has been introduced into the organisation of contract labour in Portuguese West Africa.

"Under the Portuguese regulations of January 20, 1903, powers were conferred upon a central committee for labour and emigration to appoint and control labour agents, or their substitutes, for the purpose of recruiting native labour. Funds were to be supplied to the agents by applicants for labour, and these payments were to be chargeable upon the wages of the natives. The agents were to co-operate with native chieftains in securing labourers. The native recruits were to be conveyed to the centres of industry by the principal railroads in the colony. They were to be accompanied by the recruiting agents, who were to supply them with proper food during the journey, whether by road or rail. During halts on the journey the natives were to be lodged by the agents in suitable depôts where the sanitary con-

ditions were free from objection. When the labourer had reached the centre of industry, he would be handed over to the master to whom he had been assigned, and who was responsible for the regular payment of his wages in coin. The native labourers were to be suitably housed by the masters in accommodations which resembled as nearly as possible the native huts. Proper food and clothing, with adequate medical treatment, was also to be supplied by the masters. The regulations insisted that every master employing over fifty labourers should maintain a separate infirmary for members of either sex. On plantations where one thousand or more labourers were employed, the doctors were required to pay a visit every day; where the number employed was less than a thousand, but not less than six hundred, the doctor must visit twice a week; in all other cases once a week. The doctors were to be men qualified at Lisbon, Oporto, or Coimbra. Similar regulations for the care of women and children, especially in maternity cases, were drawn up. At the close of the period of contract, the labourers were to be returned to their own villages by the repatriation agents at the expense of the masters. But they were free to engage for a further contract. On the return journey similar care was to be taken with regard to accommodation and food. The royal regulations of January 20, 1903, were revised by the Provisional Republican Government on May 13, 1911. In principle they remained the same. The whole scheme received the congratulation of the British Foreign Office and colonial officials. But later on heavy criticism was directed against the Portuguese Government to the effect that the regulations were not loyally carried out in West Africa, and in particular [that] the option given to the native to re-engage was abused by methods which made re-engagement almost compulsory. The important lesson to be drawn from the Portuguese regulations is the method employed in attempting to secure that the recruiting, payment, accommodation, and repatriation of native labour should be conducted by responsible authority. The history of the Congo, and of the more recent Putumayo atrocities in South America, apart from the past record of some British trading concerns in West Africa, prove that trading companies are not capable of restraining commercial enterprise in the interest of the native, even where moral and physical claims are clearly manifest. But where these matters are placed in the hands of an authority which has no commercial or even administrative interest, some of the difficulties which make native labour on the Rand, and elsewhere, so wasteful and inefficient will be removed. Recommendations similar to the regulations of the Portuguese Government, but only general in character, were made by the South African Commission of 1903-5, and also by the Natal Commission of 1906-7. The practicability of reforms of this nature is made apparent by the fact that for some considerable time the housing, sanitation, and medical treatment of the native labourers at Cape Town, Kimberley, and Johannesburg have been organised along these lines. The Commission of 1903-5 drew attention to the conditions in these towns. But there is need for extension and room for improvement."—A. J. MacDonald, *Trade politics and Christianity in Africa and the East* pp. 11-20.

(5) GROWTH OF ADVERSE OPINION.—Another obstacle to European colonisation is the rapid growth in recent years of a markedly adverse public opinion. Owing to the fact that many of the African

colonies at present cost more to administer than their trade is worth, there is in each European country owning them a considerable group indifferent or opposed to colonial undertakings. "Not all the expectations of the enthusiastic advocates of expansion were realized. The colonial trade of Germany was insignificant, though the expense of maintaining the colonies was very great. France has been more successful; but she, too, has had to make up annually a large colonial deficit. England has more to justify her imperialism than any other country, for she has a large and growing colonial trade; but her important customers are Germany, France, and the United States, and not Canada, Australia, or South Africa. The colonies have not proved successful in drawing off the surplus population of the mother countries. Because they were not attractive to white settlement, very few Germans went to the German colonies. But many went to the British possessions and to the United States. French colonies, although near the mother country, contain few Frenchmen besides military and civil officials. The migration of Italians to Libya has hardly justified Italy's 'war for a desert.' Even Great Britain, with a large surplus population and colonies in every climate, has failed to people the Empire with her children. During 1870-1905, a generation which saw the high tide of imperialism, six and a half million emigrated from the United Kingdom; of these, only two million settled in the colonies, whereas four million went to America and half a million to other places. So reluctant are the English masses to go to the colonies that societies have been organized to encourage them to emigrate there."—J. S. Schapiro, *Modern and contemporary European history*, p. 682.

1914-1916.—Part played by German colonies, Southwest Africa, and East Africa in the World War. See *WORLD WAR*: 1914: VI. Africa; 1915: VIII. Africa; 1916: VII. African theatre: a.

1918-1920.—Effects of the World War upon European occupation.—While it is as yet too early to be certain of the results of the World War on Africa, this much may be confidently asserted. (1) A firmer hold upon their African possessions has been secured by Great Britain, France and Italy. (2) Africa seems destined to be for a long time to come less and less a field for European rivalry and conflict. (3) Under the new mandatary system there is a recognition before the world of a stewardship of the Great Powers for their African territories. (4) The excellent service of the Negro as a worker behind the lines and as a soldier on the battlefields of France has not only been accorded grateful recognition but has doubtless deepened the black man's self-respect and consciousness of his rights as a human being. One of the manifestations of this new attitude on the part of both white and black races is to be seen in the recent (1910) Convention of the Powers regarding the liquor traffic in Africa. The British government has made public (Treaty series 1010, No. 10) a parliamentary paper disclosing that on September 10, 1910, the United States and Associated Powers entered into a convention intended to safeguard African races from alcohol and displacing for that purpose the Brussels Convention. This convention supercedes, recodifies and amplifies "former international conventions" dealing with the same subject. Thus come to an end the old liquor clauses of the Brussels General Act (1800) which with their general revisions at periodical conferences of the Powers (1800-1906) have regulated the

Central African spirit traffic. The area of the present convention is almost identical with that of the Brussels Act, though political areas are substituted for arbitrary geographical boundaries. Thus Algiers, Tunis, Morocco, Libya, Egypt and the Union of South Africa are excepted from the agreement, and the islands lying within 100 nautical miles of the coast are included in it. The objects of the convention as set forth in the preamble are to prohibit "the importation, distribution, sale and possession of trade spirits, absinthe," and of other "distilled beverages" containing essential oils or chemical products which are recognized as injurious to the health. Other forms of spirits are to be subjected to a minimum duty of 800 francs per hectolitre of pure alcohol, which amounts to about 36 francs per gallon of pure alcohol. By a further provision it is understood that the existing areas of prohibition of all spirits for the natives of these areas will be maintained. This is the only mention of any race distinction except in the preamble already quoted, reliance being placed upon the exclusion of all cheap and specially noxious distilled liquors. Exceptions are allowed for distillation for scientific or pharmaceutical purposes, or of industrial alcohol, but otherwise distillation is not allowed. Italy is the only one of the signatory powers which has claimed any concession on certain of the conditions of the convention. There is to be a Central International Office, in connection with the League of Nations, for recording the statistics and regulations put in force by each of the contracting parties and the adhesion to the convention of the other states exercising authority over the territories of the African continent will be sought. The convention is to come into force "for each signatory power from the date of the deposit of its ratifications," which ratifications will be deposited in the archives of the French government. Signatories:—The United States of America, Belgium, Great Britain, Canada, Australia, South Africa, France, Italy, Japan, Portugal.

TERRITORIAL ACQUISITIONS OF FRANCE AND GREAT BRITAIN.—Under the mandate provisions of the Treaty of Versailles, in effect January 10, 1920, German Southwest Africa and German East Africa became practically British possessions. A district in the extreme northwest of the latter colony was assigned to the Belgian Congo. Cameroon and Togo, the other two former German colonies in Africa, were divided between Great Britain and France. The latter country received the entire coast and rather more than half of Togo and about nine-tenths of Cameroon, incidentally regaining the large districts which France had ceded to Germany in 1911 as a result of the Agadir crisis in Morocco. A strip of varying width along the northwest boundary of Cameroon was given to Great Britain and added to the British colony of Nigeria. This strip includes the great Cameroon Mountain near the sea, and adds to the Bornu district near Lake Chad the part of that ancient sultanate formerly held by Germany. The port of Duala and the main routes to the interior are in the hands of the French.

ITALY'S TERRITORIAL ACQUISITIONS.—In accordance with provisions included in the Treaty of London, which was followed by Italy's entrance into the World War, negotiations were begun early in 1920 to carry out the promises made Italy by Great Britain and France in 1915, by adding generously to Italy's possessions in Africa. The provision in question, article XIII, stipulated that, in the event that France and England should increase their colonial possessions in Africa as a result of the

World War, Italy too must be compensated in an equitable manner, particularly in the extension of the frontiers of her colonies of Eritrea, Italian Somaliland and Tripoli (Libia Italiana).

France offered to cede the territory lying east of the line running north and south between the oases Ghadames and Ghat. This offer the Italian government was ready to accept but is still making efforts to have the Tibesti and Borku oases, south of the Libyan desert, included in the grant. The British government offered to cede Italy the Egyptian oasis of Jarabub. This has been practically accepted by the Italian government. Great Britain also offered to cede to Italian Somaliland extensive territory along the Juba river. This would give Italy the port of Kismayu, which has a better harbor than any port along the 1,200 mile coast line of Somaliland. Mindful of the value of this accession Italy accepted Great Britain's offer, which greatly increases the value of Italian Somaliland. The border with British Somaliland at the north has also been rectified in Italy's favor. Italy further sought to obtain part of the Anglo-Egyptian Sudan bordering on her colony of Eritrea. The concessions secured by Italy assure her of better facilities for developing her large colonies in Africa.

AFRICA UNDER THE LEAGUE OF NATIONS.—"In addition to these territories which are to be emancipated under the protection of stronger states, there are the former colonies of Germany, some of which are to be administered by a mandatory under a separate form of government and others to be administered as integral portions of the territory of the mandatory. In both cases provision is made in the covenant and in the body of the treaty that the administration shall be conducted under conditions approved by the league, by which equal opportunity for trade will be allowed to all members of the league, and certain abuses, such as the trade in slaves, arms, and liquor, will be prohibited; and the requirement is laid down that the mandatory shall render to the council of the league an annual report in reference to the territory committed to its charge. The value of these provisions, if it is not too much to assume their observance, lies not only in the fact that they attempt to protect the backward peoples of Africa against possible exploitation, but that they introduce a new principle of international responsibility into the relations of nations, in that they recognize that the development of such peoples forms 'a sacred trust of civilization.' If the league can secure the fulfillment of the promises thus made, a strong impetus will be given to the further development of international administrative law. At the present moment the functions of the permanent mandates commission, which is to receive the reports of the several mandataries, have been outlined and the personnel of the commission is about to be appointed."—*American Political Science Review*, Aug., 1920, p. 487.

AFRICAN SQUADRON.—Although the Congress (United States) in 1808 passed an act prohibiting the importation of slaves, a good many were smuggled in. The rather unsuccessful attempt to suppress this illicit trade is shown in the following articles of the Webster-Ashburton Treaty, 1842:

"ART. VIII.—The parties [United States and Great Britain] mutually stipulate that each shall prepare, equip, and maintain in service on the coast of Africa a sufficient and adequate squadron or naval force of vessels of suitable numbers and descriptions, to carry in all not less than eighty guns, to enforce, separately and respectively, the laws, rights, and obligations of each of the two countries for the suppression of the slave-trade, the said squadrons to be independent of each other, but the two Governments stipulating, nevertheless, to give such orders to the officers commanding their respective forces as shall enable them most effectually to act in concert and co-operation, upon mutual consultation, as exigencies may arise, for the attainment of the true object of this article, copies of all such orders to be communicated by each Government to the other, respectively.

"ART. IX.—Whereas, notwithstanding all efforts which may be made on the coast of Africa for suppressing the slave-trade, the facilities for carrying on that traffic and avoiding the vigilance of cruisers, by the fraudulent use of flags and other means, are so great, and the temptations for pursuing it, while a market can be found for slaves, so strong, that the desired result may be long delayed unless all markets be shut against the purchase of African negroes, the parties to this treaty agree that they will unite in all becoming representations and remonstrances with any and all Powers within whose dominions such markets are allowed to exist, and that they will urge upon all such Powers the propriety and duty of closing such markets effectually, at once and forever."—W. Macdonald, *Select documents illustrative of history of United States*, pp. 341-342.

"By the cruising convention clause [of the Webster-Ashburton Treaty], which the President himself bore a conspicuous part in arranging, the delicate point of 'right of search' was avoided; for instead of trusting Great Britain as the police of other nations for suppressing the African slave-trade, each nation bound itself to do its full duty by keeping up a sufficient squadron on the African coast. It so happened that Great Britain, by softening the old phrase 'right of search' into 'right of visitation,' had been inducing other nations to guarantee this police inspection of suspected slave vessels. In December, 1841, ambassadors of the five great European powers arranged in London a quintuple league of this character. But France, hesitating to confirm such an arrangement, rejected that league when the Ashburton treaty was promulgated, and hastened to negotiate in its place a cruising convention similar to ours on the slave-trade suppression; nor was the right of search, against which America had fought in the war of 1812, ever again invoked, even as a mutual principle, until by 1862 the United States had grown as sincere as Great Britain herself in wishing to crush out the last remnant of the African traffic. This cruising convention, however, left the abstract question of search untouched, and in that light Sir Robert Peel de-

fended himself in Parliament."—Schouler, *History of the United States*, v. iv, pp. 401-402.

AFRIDIS, a powerful warlike Afghan or Pathan tribe inhabiting the mountains of the Peshawar border of the north-west frontier of India; are said to have Israelite blood in their veins, and a Semitic cast of features.

AFRIKANDER BUND. See **SOUTH AFRICA**, **UNION OF**: 1877-1879; 1881-1888; 1898; 1898 (March-October).

AFRIKANDER CONGRESS. See **SOUTH AFRICA**, **UNION OF**: 1900 (December).

AFZELIUS, Adam (1750-1837), Swedish botanist. He founded the Linnæan Institute at Upsala, 1802, and subsequently wrote the standard biography of Linnaeus, 1823.

AGA, or **Agha**, a word supposedly of Tartar origin, meaning lord or excellency, applied in Turkey to military commanders and other high officials; also used as a general term of respect in addressing persons of the wealthy leisure class.

AGA KHAN I, His Highness the (1800-1881), the title accorded to Hasan Ali Shah by the British government. Was governor of Kerman for Persia until, incurring the displeasure of the ruler, he fled to Bombay; assisted his protectors in dealing with the natives over whom he held religious sway as leader of the Ismailiah sect of Moham-medans.

AGA KHAN III, Aga Sultan Mohammed Shah (1877-). In 1885, succeeded his father, Aga Khan II, to the leadership of the Ismailiah Mohammedans. In World War he brought his support to the side of the Allies. See **ARABIA**: 1016.

AGADE. See **AKKAO**.

AGADIR, a small seaport on the south-western coast of Morocco, formerly of some commercial importance. Acquired international fame in 1011 when the German gunboat *Panther* entered the harbor to maintain imperial economic interests. This event, known as the "Agadir incident" precipitated the second and most acute Moroccan crisis.—See also **FRANCE**: 1010-1014; **ITALY**: 1011.

AGAGIA, Egypt: defeat of Senussi (1016). See **WORLD WAR**: 1016: VI. Turkish theater: b, 1.

AGAMEMNON, a Greek hero of the Homeric age; son of Atreus and brother of Menelaus. Ruled at Mycenae; leader of the Greeks in the Trojan War.

AGAMEMNON, British warship at the Dardanelles. See **WORLD WAR**: 1015: VI. Turkey: a, 1.

AGANA, a fortified town, on the western side of the American island of Guam, formerly the Spanish capital of the Ladrone Islands. It has several schools, convents, and government buildings. See **GUAM**: 1000-1021; **U. S. A**: 1808 (June).

AGAPETUS I, pope 535-536; collaborated with Cassiodorus in founding a library of ecclesiastical authors at Rome; in 536 was sent by King Theodahad on an embassy to Constantinople and there deposed Anthimus from the patriarchal see of Constantinople. He died there.

Agapetus II, pope 046-055, a Roman by birth; established political rule over the churches of the Empire; also invoked aid of Otto I against Berenger II, king of Italy, who proved troublesome to the pontifical state.

AGAS. Outer and inner. See **SUBLIME PORTE**.

AGASSIZ, Alexander Emanuel (1835-1910), American scientist. Only son of Louis Agassiz; specialized in marine ichthyology; acquired a fortune in mining, especially from the famous Cal-

umet and Hecla copper mine, Michigan; gave large sums and much time to biological research.

AGASSIZ, Jean Louis Rodolphe (1807-1873), American scientist. Born in Switzerland, coming to America in 1846; Harvard professor and an enthusiastic and effective teacher; made extensive researches in ichthyology and palaeontology; enjoyed a world-wide reputation as a biologist, writer and lecturer.

AGATHO, pope 678-781, one of the most courageous pontiffs who ever occupied the papal chair; compelled St. Wilfrid to restore the bishopric at York (679) and established a precedent by refusing to pay tribute on election to the emperor at Constantinople.

AGATHOCLES (361-280 B. C.), the son of a potter who became tyrant of Syracuse. After putting thousands of his enemies to death Agathocles succeeded in taking Syracuse, which he subsequently lost. He ruled over Sicily towards the close of his life. See **SYRACUSE**: B. C. 317-280.

AGATHYRSI, a people of Thracian origin who once occupied the plain of Moris in the region of Transylvania; had luxurious habits, tattooed their bodies, had wives in common, and like Gallic Druids, recited their laws in sing-song to prevent their being forgotten; were later driven further north and were unknown to the Romans in their original home.

AGBATANA. See **ECBATANA**.

AGE OF STONE, **AGE OF BRONZE**, etc. See **ÆGEAN CIVILIZATION**; **AFRICA**: Races of Africa: Prehistoric peoples; **EUROPE**: Prehistoric period; **STONE AGE**.

AGED, Care of. See **CHARITIES**.

AGELA.—The youths and young men of ancient Crete were publicly trained and disciplined in divisions or companies, each of which was called an Agela, and its leader or director the Agelatas.

AGELATAS. See **AGELA**.

AGEMA, the royal escort of Alexander the Great.

AGENAIS, or **Agenois**, a former province of France in what is now the department of Lot-et-Garonne. The district was purchased in 1038 by the dukes of Aquitaine. Thus, with the marriage of Eleanor of Aquitaine to Henry Plantagenet (1152) the province was brought under English control. Subsequently, it was returned to French rule (1271) with the marriage of Richard Cœur-de-Lion's sister to Raymond VI, count of Toulouse, but restored once more to England in 1270. During the wars between the French and English (fourteenth-fifteenth centuries), the province again passed through a number of similar changes. With the retreat of the English in 1453 Agenais finally found itself peaceably possessed by the French.

AGENDICUM, or **Agedincum**. See **SENONES**.

AGER PUBLICUS.—"Rome was always making fresh acquisitions of territory in her early history. . . . Large tracts of country became Roman land, the property of the Roman state, or public domain (*ager publicus*), as the Romans called it. The condition of this land, the use to which it was applied, and the disputes which it caused between the two orders at Rome, are among the most curious and perplexing questions in Roman history. . . . That part of newly-acquired territory which was neither sold nor given remained public property, and it was occupied, according to the Roman term, by private persons, in whose hands it was a *Possessio*. Hyginus and Siculus Flaccus represent this occupation as being made without any order. Every Roman took what he could, and more than he could use profit-

ably. . . . We should be more inclined to believe that this public land was occupied under some regulations, in order to prevent disputes; but if such regulations existed we know nothing about them. There was no survey made of the public land which was from time to time acquired, but there were certainly general boundaries fixed for the purpose of determining what had become public property. The lands which were sold and given were of necessity surveyed and fixed by boundaries. . . . There is no direct evidence that any payments to the state were originally made by the Possessors. It is certain, however, that at some early time such payments were made, or, at least, were due to the state."—G. Long, *Decline of the Roman republic*, ch. 11.—See also **AGRARIAN LAWS**; **LAND TITLES**: Roman titles; **ROME**: Republic: B. C. 133-121.

AGER ROMANUS. See **LAND TITLES**: Roman colonial titles.

AGESILAUS II, king of Sparta, 401-361 B. C.; helped the Asiatic Greeks when attacked by the Persians (306 B. C.), defeating the Satraps, Tissaphernes and Pharnabazus. When recalled to Greece to defend Sparta against the combined forces of Athens, Thebes, Corinth and Argos, Agesilaus defeated the allied armies indecisively at the battle of Coronca, Boeotia (304). Various small expeditions followed. Agesilaus spent the last two years of his life in Egypt trying to raise sufficient money to bring Sparta to her former supremacy and died on his way home (361) at the age of 84.—See also **GREECE**: B. C. 4th century, 390-387.

AGGER. See **CASTRA**.

AGHA MOHAMMED KHAN, Shah of Persia, 1795-1797.

AGHLABITE DYNASTY. See **CALIPHATE**: 715-750; **SICILY**: 827-878.

AGHRIM, or Aughrim, Battle of (1601). See **IRELAND**: 1680-1601.

AGHYL BAIR.—Attacked by British (1015). See **WORLD WAR**: 1015: VI. Turkey: a, 4, xxvii.

AGHYL DERE.—Attacked by British (1015). See **WORLD WAR**: 1015: VI. Turkey: a, 4, xxvi.

AGILULPHUS, King of the Lombards, 590-616.

AGINCOURT (Azincourt), a village of northern France in the department of Pas de Calais, twenty-nine miles southeast of Boulogne; made famous by the victory of Henry V of England over the French under Constable d'Albret, October 25, 1415. See **FRANCE**: 1415.

AGIS I, king of Sparta about 1032 B. C. Tradition says the maritime city of Helos fell under his attack.

Agis II, king of the Spartans about 427 B. C.; led his forces to victory at Mantinea (418 B. C.) and helped to blockade Athens (405 B. C.).

Agis III, king of Sparta, 338-331 B. C.; revolted against Macedonia (333 B. C.) with the aid of the Persians but failed; slain in the deciding battle (331 B. C.).

Agis IV, succeeded his father, Endamidas II, as king of Sparta at the age of twenty. A noteworthy figure in Spartan history who tried to stay the ruin of the state.

AGITATORS, Council of, the name given to a body of representatives elected in 1647 by regiments of the English Parliamentary army. They prevented the disbanding of the army in April and again in June, 1647. A council composed of officers and agitators refused the offers of Parliament and demanded a march on London. See **ENGLAND**: 1647 (April-August).

AGLIPAY, Gregorio (1860-), Roman

Catholic archbishop; seceded 1902; founded the sect of the Independent Catholics. See **PHILIPPINE ISLANDS**: 1902.

AGNADELLO, Battle of (1500). See **VENICE**: 1508-1500.

AGNATI. See **GENS**: Gentes: Gentiles.

AGNES, Saint, the patron saint of young girls. Martyred in Rome by order of Diocletian at the age of thirteen. Her feast day is January 21, and her symbol the lamb.

AGNES OF MERAN (d. 1201), queen of France, daughter of Bérthold IV, duke of Meran, Tyrol. In 1196 became second wife of Philip II, after his repudiation of his first queen. Papal opposition, culminating in an interdict, forced a separation in 1200.

AGNES OF POITIERS (1025?-1077), empress of Germany, daughter of William V of Aquitaine. In 1043 became second wife of Henry III of Germany. Regent for her son, Henry IV, 1056-1062; her weak rule was finally overthrown by powerful nobles and she fled to Italy.

AGNIERS.—Among several names which the Mohawks (see **IROQUOIS**) bore in early colonial history was that of the Agniers.—F. Parkman, *Conspiracy of Pontiac*, v. 1, p. 9, foot-note.

AGNOSTICISM, the doctrine that there is no certain knowledge as to the existence of God, a future life or the essential nature of things. Contrary to Atheism (q.v.), Agnosticism makes no denials, and affirms nothing but present ignorance with reference to ultimate realities. It does not even assert that knowledge may not at some future time become possible. The term was coined in 1869 by Professor Huxley; but the doctrine is extremely old, being essentially contained in the teaching of Protagoras, Pyrrho and the entire skeptical school of Greek philosophers. (See **CHRISTIANITY**: 100-300: Church in Alexandria. The majority of modern Freethinkers may properly be classed as Agnostics, rather than Atheists. The late Col. Robert G. Ingersoll was perhaps the most notable among the aggressive champions of Agnosticism, although Charles Darwin, Herbert Spencer, Thomas Huxley, and other prominent scientists and men of letters in England and America may be cited as adherents of this doctrine. Agnosticism was, therefore, historically in vogue in the latter decades of the nineteenth century, when it denoted (a) a form of the philosophic revolt against the prevalent mid-Victorian theology, and (b) more broadly a form of philosophic doubt in the minds particularly of "Darwinian" scientists and the "sensationalist" school of thinkers as to accepting the reality of many current forms of human knowledge in general. In fact they denied the validity of any transcendental or extra-empirical tenets. The term "agnostic," invented by Huxley, is unfortunately correlative to the term "Gnostics" of early Christian history. Agnostics were engaged in combating latter-day church-men and others in their bigoted opposition to the tenets of modern "Darwinian" science and pushed them hard from many prevalent "Christian" notions. But unfortunately for agnosticism intellectual people—whether churchmen or not—cannot rest in suspension of judgment, still less be content with assertions of unknowableness. Not merely idealists, but pragmatists and neo-realists "carry on" and agnosticism is simply outgrown. "What Strabo said nineteen centuries ago still holds true. 'It is impossible,' said the old Greek, 'to conduct women and the gross multitude, and to render them holy, pious, and upright by the precepts of reason and philosophy; superstition or the fear of the gods

must be called in aid, the influence of which is founded on fiction or prodigies. For the thunder of Jupiter, the ægis of Minerva, the trident of Neptune, the torches and snakes of the Furies, the spears of the gods adorned with ivy, and the whole ancient theology are all fables which the legislators who formed the political constitution of states employ as bugbears to over-awe the credulous and simple."—J. Burroughs, *Light of day*, pp. 106-107.—"The name Agnostic, originally coined by Professor Huxley about 1860, has gained general acceptance." It is sometimes used to indicate the philosophical theory which Mr. Herbert Spencer, as he tells us, developed from the doctrine of Hamilton and Mansel. Upon that theory I express no opinion. I take the word in a vaguer sense, and am glad to believe that its use indicates an advance in the courtesies of controversy. The old theological phrase for an intellectual opponent was Atheist—a name which still retains a certain flavour as of the stake in this world and hell-fire in the next, and which, moreover, implies an inaccuracy of some importance. Dogmatic Atheism—the doctrine that there is no God, whatever may be meant by God—is, to say the least, a rare phase of opinion. The word Agnosticism, on the other hand, seems to imply a fairly accurate appreciation of a form of creed already common and daily spreading. The Agnostic is one who asserts—what no one denies—that there are limits to the sphere of human intelligence. He asserts, further, what many theologians have expressly maintained, that those limits are such as to exclude at least what Lewes called 'metempirical' knowledge. But he goes further, and asserts, in opposition to theologians, that theology lies within this forbidden sphere. This last assertion raises the important issue; and, though I have no pretension to invent an opposition nick-name, I may venture, for the purposes of this article, to describe the rival school as Gnostics. The Gnostic holds that our reason can, in some sense, transcend the narrow limits of experience. He holds that we can attain truths not capable of verification, and not needing verification, by actual experiment or observation. He holds, further, that a knowledge of those truths is essential to the highest interests of mankind, and enables us in some sort of way to solve the dark riddle of the universe. A complete solution, as everyone admits, is beyond our power. But some answer may be given to the doubts which harass and perplex us when we try to frame any adequate conception of the vast order of which we form an insignificant portion. We cannot say why this or that arrangement is what it is; we can say, though obscurely, that some answer exists, and would be satisfactory, if we could only find it. Overpowered, as every honest and serious thinker is at times overpowered, by the sight of pain, folly, and helplessness, by the jarring discords which run through the vast harmony of the universe, we are yet enabled to hear at times a whisper that all is well, to trust to it as coming from the most authentic source, and to know that only the temporary bars of sense prevent us from recognising with certainty that the harmony beneath the discords is a reality and not a dream. This knowledge is embodied in the central dogma of theology. God is the name of the harmony; and God is knowable. Who would not be happy in accepting this belief, if he could accept it honestly? Who would not be glad if he could sav with confidence, the evil is transitory, the good eternal; our doubts are due to limitations destined to be abolished, and the world is really an embodiment

of love and wisdom, however dark it may appear to our faculties? And yet, if the so-called knowledge be illusory, are we not bound by the most sacred obligations to recognise the facts? Our brief path is dark enough on any hypothesis. We cannot afford to turn aside after every *ignis fatuus* without asking whether it leads to sounder footing or to hopeless quagmires. Dreams may be pleasanter for the moment than realities; but happiness must be won by adapting our lives to the realities. And who, that has felt the burden of existence, and suffered under well-meant efforts at consolation, will deny that such consolations are the bitterest of mockeries? Pain is not an evil; death is not a separation; sickness is but a blessing in disguise. Have the gloomiest speculations of avowed pessimists ever tortured sufferers like those kindly plattitudes? Is there a more cutting piece of satire in the language than the reference in our funeral service to the 'sure and certain hope of a blessed resurrection'? To dispel genuine hopes might be painful, however salutary. To suppress these spasmodic efforts to fly in the face of facts would be some comfort, even in the distress which they are meant to alleviate. Besides the important question whether the Gnostic can prove his dogmas, there is, therefore, the further question whether the dogmas, if granted, have any meaning. Do they answer our doubts, or mock us with the appearance of an answer? The Gnostics rejoice in their knowledge. Have they anything to tell us? They rebuke what they call the 'pride of reason' in the name of a still more exalted pride. The scientific reasoner is arrogant because he sets limits to the faculty in which he trusts, and denies the existence of any other faculty. They are humble because they dare to tread in the regions which he declares to be inaccessible. But without bandying such accusations, or asking which pride is the greatest, the Gnostics are at least bound to show some ostensible justification for their complacency. Have they discovered a firm resting-place from which they are entitled to look down in compassion or contempt upon those who hold it to be a mere edifice of moonshine? If they have diminished by a scruple the weight of one passing doubt, we should be grateful: perhaps we should be converts. If not, why condemn Agnosticism? I have said that our knowledge is in any case limited. I may add that, on any showing, there is a danger in failing to recognise the limits of possible knowledge. The word Gnostic has some awkward associations. It once described certain heretics who got into trouble from fancying that men could frame theories of the Divine mode of existence. The sects have been dead for many centuries. Their fundamental assumptions can hardly be quite extinct. . . ."—L. Stephen, *An agnostic's apology and other essays*, pp. 1-5.—"The great uncertainty I found in metaphysical reasonings," writes Benjamin Franklin, referring to his youthful speculations, 'disgusted me, and I quitted that kind of reading and study for others more satisfactory.' Are we to conclude from this that the future statesman, once having ceased applying himself to metaphysics, was thenceforth emancipated from the intellectual attitude which had previously accounted for the practice? Apparently yes, but in reality no; for to the end of his long life—albeit he was not primarily a metaphysicist—Franklin remained, in spite of himself, indelibly stamped with a metaphysical cast of mind. The mental experience of the celebrated American philosopher, far from being unique or even markedly out of the ordinary, might be paralleled in the lives of

countless other thinkers, both professional and amateur. Whether or not the phenomenon be traceable to temperamental factors of a basic and ineradicable nature, it cannot be denied that certain persons, once blessed or cursed—let the reader take his choice—with the desire to probe the cosmos to its very bottom, persist therein even after they have become convinced of the utter futility of such investigation. Like Tantalus of the myth, they must needs make the effort to drink time and time again, though time and time again they fail to quench their thirst. Can it be that they are, after all, never quite convinced that the quest of ultimate truth is a barren one? Can it be that in an ever-recurring doubt must be sought the reason for the constant renewal of a search which the mind repeatedly renounces as hopeless? It is not the search for deity with which I am here concerned: I assume that the majority of us are agreed in rejecting such doctrines as posit or profess to demonstrate the existence of a personal God, and in maintaining a definitely Agnostic attitude with regard to other more or less attenuated phases of Theism. What I have reference to is the fact that many thinking men and women, including not a few whose Negativism and Agnosticism in the realm of theology are unequivocal, seem to find it possible to take a positive mental stand as respects the field of general metaphysics—to give assent, that is, to what sometimes is aptly designated as a 'philosophical creed.' Yet there can be no more justification, intellectually speaking, for assuming a positive position in the one case than in the other, since in both spheres the natural limitations of the human mind are equally pronounced. . . . And what Sir Leslie Stephen, in *An Agnostic's Apology*, asserts of natural theology is applicable to the entire field of metaphysics—namely, that 'there is not a single proof . . . of which the negative has not been maintained as vigorously as the affirmative.'—A. Kadeson, *Through agnostic spectacles*, pp. 16-19.—"Science deals entirely with phenomena, and has nothing to say as to the nature of the ultimate reality which may lie behind phenomena. There are four possible attitudes to this ultimate reality. There is the attitude of the metaphysician and theologian, who are convinced not only that it exists but that it can be at least partly known. There is the attitude of the man who denies that it exists; but he must be also a metaphysician, for its existence can only be disproved by metaphysical arguments. Then there are those who assert that it exists but deny that we can know anything about it. And finally there are those who say that we cannot know whether it exists or not. These last are 'agnostics' in the strict sense of the term, men who *profess not to know*. The third class go beyond phenomena in so far as they assert that there is an ultimate though unknowable reality beneath phenomena. But agnostic is commonly used in a wide sense so as to include the third as well as the fourth class—those who assume an unknowable, as well as those who do not know whether there is an unknowable or not. Comte and Spencer, for instance, who believed in an unknowable, are counted as agnostics."—J. B. Bury, *History of the freedom of thought*, pp. 213-214.

AGODE. See **BABYLONIA**: Early Chaldean monarchy.

AGOGÉ, the public discipline enforced in ancient Sparta; the ordinances attributed to Lycurgus, for the training of the young and for the regulating of the lives of citizens.—G. Schömann, *Antiquity of Greece: the State*, pt. 3, ch. 1.

AGOMAH.—Burned by the British (1916). See **WORLD WAR**: 1916: V. Balkan theater: b, 2, ii.

AGONCILLA, F., foreign agent and high commissioner of Philippines. Suggested negotiations with United States, but his proposition was refused. See **U. S. A.**: 1897 (November).

AGORA.—The market-place of an ancient Greek city was, also, the center of its political life. "Like the gymnasium, and even earlier than this, it grew into architectural splendor with the increasing culture of the Greeks. In maritime cities it generally lay near the sea; in inland places at the foot of the hill which carried the old feudal castle. Being the oldest part of the city, it naturally became the focus not only of commercial, but also of religious and political life. Here even in Homer's time the citizens assembled in consultation, for which purpose it was supplied with seats; here were the oldest sanctuaries; here were celebrated the first festive games; here centred the roads on which the intercommunication, both religious and commercial, with neighbouring cities and states was carried on; from here started the processions which continually passed between holy places of kindred origin, though locally separated. Although originally all public transactions were carried on in these market-places, special local arrangements for contracting public business soon became necessary in large cities. At Athens, for instance, the gently rising ground of the Philopappos hill, called Pnyx, touching the Agora, was used for political consultations, while most likely, about the time of the Pisistratides, the market of Kerameikos, the oldest seat of Attic industry (lying between the foot of the Akropolis, the Areopagos and the hill of Theseus), became the agora proper, i. e., the centre of Athenian commerce. . . . The description by Vitruvius of an agora evidently refers to the splendid structures of post-Alexandrine times. According to him it was quadrangular in size [? shape] and surrounded by wide double colonades. The numerous columns carried architraves of common stone or of marble, and on the roofs of the porticoes were galleries for walking purposes. This, of course, does not apply to all market-places, even of later date; but, upon the whole, the remaining specimens agree with the description of Vitruvius."—E. Guhl and W. Koner, *Life of the Greeks and Romans*, pt. 1, sect. 26.—In the Homeric time, the general assembly of freemen was called the Agora.—G. Grote, *History of Greece*, pt. 1, ch. 20.—See also **ATHENS**: B. C. 461-431: General aspect of Periclean Athens.

AGORANOMI, magistrates in the Greek republics, similar to the aediles in Rome. They maintained order in the markets, settled disputes, collected harbor dues, and inspected goods offered for sale.

AGRA, an ancient city of northern India, capital of a district and of a division of the same name in the United Provinces; principally famous for the Taj Mahal, the supremely beautiful mausoleum built in 1632 by the Mogul emperor Shah Jahan, for the remains of his favorite wife; also noted for the Pearl Mosque and other fine specimens of architecture; at one time capital of the Mogul empire; under British rule since 1803, and today a prosperous railroad, manufacturing and commercial center.—See also **INDIA**: 1798-1805, and **Map**.

AGRAM, in Slavic, Zágráb, capital of Croatia and Slavonia, an old but thoroughly modernized town, with handsome public buildings, churches, and monuments, higher colleges and academies.

AGRAM TRIALS. See **AUSTRIA-HUNGARY**: 1908-1909.

AGRARIAN LAWS (of ancient Rome) (Lat. *ager, land*), laws which dealt with the disposition of the public land, since it was unconstitutional to gratuitously dispose of the state's property without the consent of the people. Such land was the property of the Roman state by virtue of the conquests, and was used by the Republic as a means of defraying in part the expenses of administration, either through a direct sale, or through the leasing of it to private citizens. Often another object was achieved by means of this property—the satisfaction of the poorer citizens. In such cases, contrary to instances when property was leased out, the state henceforth ceased to have any right in the land. The state availed itself of still another method of disposing of its surplus properties, that is through a gratuitous assignment to an organization a colony, or a settlement. In such cases the ownership passed entirely into the hands of the assignee. In 232 B. C., C. Flaminius enacted a law by means of which tracts of land held by large landowners were redistributed in smaller allotments to the poorer people. Still a third method for providing land for unpropertied people was attempted. In 63 B. C. Servilius Rullus tried to have a law enacted which would have allowed the sale of foreign lands gained through conquests and the purchase of land in Italy with that money, and finally the allotment of this land to the citizens. Cicero's opposition to the bill caused its withdrawal.—“Great mistakes formerly prevailed on the nature of the Roman laws familiarly termed Agrarian. It was supposed that by these laws all land was declared common property, and that at certain intervals of time the state resumed possession and made a fresh distribution to all citizens, rich and poor. It is needless to make any remarks on the nature and consequences of such a law; sufficient it will be to say, what is now known to all, that at Rome such laws never existed, never were thought of. The lands which were to be distributed by Agrarian laws were not private property, but the property of the state. They were, originally, those public lands which had been the domain of the kings, and which were increased whenever any city or people was conquered by the Romans; because it was an Italian practice to confiscate the lands of the conquered, in whole or in part.”—H. G. Liddell. *History of Rome*, bk. 2, ch. 8.—See also **ROME**: Republic; B. AGRI DECUMATES.—“Between the Rhine and the Upper Danube there intervenes a triangular tract of land, the apex of which touches the confines of Switzerland at Basel; thus separating, as with an enormous wedge, the provinces of Gaul and Vindelicia, and presenting at its base no natural line of defence from one river to the other. This tract was, however, occupied, for the most part, by forests, and if it broke the line of the

Roman defences, it might at least be considered impenetrable to an enemy. Abandoned by the warlike and predatory tribes of Germany, it was seized by wandering immigrants from Gaul, many of them Roman adventurers, before whom the original inhabitants, the Marcomanni, or men of the frontier, seem to have retreated eastward beyond the Hercynian forest. The intruders claimed or solicited Roman protection, and offered in return a tribute from the produce of the soil, whence the district itself came to be known by the title of the *Agri Decumates*, or *Tithed Land*. It was not, however, officially connected with any province of the Empire, nor was any attempt made to provide for its permanent security, till a period much later than that on which we are now engaged [the period of Augustus].”—C. Merivale, *History of the Romans under the empire*, ch. 36.—“Wurttemberg, Baden and Hohenzollern coincide with the *Agri Decumates of the Roman writers*.”—R. G. Latham, *Ethnology of Europe*, ch. 8.

AGRICULTURAL SOCIETIES, associations for the promotion of agricultural science and knowledge, composed of farmers and other interested persons. Agricultural associations were first formed in the middle of the eighteenth century, some of the most important now in existence dating from that time. In recent years the tendency has been to form agricultural associations not only for purposes of education and research, but also in order to assist the farmer directly through co-operation.

A list of the most important agricultural societies is appended:

1. Denmark:
Royal Danish Agricultural Society.
2. France:
Society of Agriculturists of France.
National Society of Agriculture.
3. Germany:
German Agricultural Society.
4. United Kingdom:
Bath and West of England Society (1774).
Highland and Agricultural Society of Scotland (1784).
Royal Agricultural Society of England (1838)

- Agricultural Organization Society, England and Wales—cooperative (1901).
- Royal Dublin Society (1749).
5. United States:
Farmers' Alliance.
Patrons of Husbandry (the Grange).
Farmers' Educational and Coöperative Union.

AGRICULTURAL SYSTEM: Relation to slavery. See **AGRICULTURE**: Ancient period: Development of the servile system among the Romans; **SLAVERY**: United States.

AGRICULTURE

"So bountiful has been the earth and so securely have we drawn from it our substance, that we have taken it all for granted as if it were only a gift, and with little care or conscious thought of the consequences of our use of it; nor have we very much considered the essential relation that we bear to it as living parts in the vast creation. We may distinguish three stages in our relation to the planet,—the collecting stage, the mining stage, and the producing stage. These overlap and perhaps are nowhere distinct, and yet it serves a purpose to contrast them. At first man sweeps the earth to see what he may gather,—game, wood, fruits, fish, fur, feathers, shells on the shore. A certain social and moral life arises out of this relation, seen well in the woodsmen and the fishers—in whom it best persists to the present day—strong, dogmatic, superstitious folk. Then man begins to go beneath the surface to see what he can find,—iron and precious stones, the gold of Ophir, coal, and many curious treasures. This develops the exploiting faculties, and leads men into the uttermost parts. In both these stages the elements of waste and disregard have been heavy. Finally, we begin to enter the productive stage, whereby we secure supplies by controlling the conditions under which they grow, wasting little, harming not. Farming has been very much a mining process, the utilizing of fertility easily at hand and the moving-on to lands unspoiled of quick potash and nitrogen. Now it begins to be really productive and constructive, with a range of responsible and permanent morals. . . . Necessarily, the proportion of farmers will decrease. Not so many are needed, relatively, to produce the requisite supplies from the earth. Agriculture makes a great contribution to human progress by releasing men for the manufactures and the trades. In proportion as the ratio of farmers decreases it is important that we provide them the best of opportunities and encouragement: they must be better and better men. And if we are to secure our moral connection with the planet to a large extent through them, we can see that they bear a relation to society in general that we have overlooked. . . . If the older stages were strongly expressed in the character of the people, so will this new stage be expressed; and so it is that we are escaping the primitive and should be coming into a new character. We shall find our rootage in the soil."—L. H. Bailey, *Holy earth*, pp. 22-24.—See also **EUROPE**: Stone Age.

"The history of our Domestic Animals and Cultivated Plants is a subject of absorbing interest to the educated man, and (if he knew it) to the uneducated man too. It forms no small part of the history of Man himself and his slow advance to civilization. . . . And who can state the sum of

our obligations to the sheep, the pig, the camel, the dog, and even poor mousing Puss? Or why should Chanticleer and his family, with other bipeds of the poultry-yard, be forgotten? And much the same may be said of Cultivated Plants—the grains, the potherbs, garden-flowers, fruit-trees, timber, and even ornamental trees. Now the history of the Plants and Animals of Europe—of their reclamation from a wild state to the service of man, and their distribution in their present *locale*—is susceptible of two or three different methods of investigation, which sometimes clash, and lead to opposite conclusions. It is certain that *some* of them are not natives of the countries where we find them; that they have been imported from abroad. But which of them? whence, and along what route? how early, and by whom? Our answers to these questions will be different, accordingly as we lean chiefly on Natural Science, or on Ancient History, Literature, and even Language. . . . That the animal and vegetable worlds—that is to say, the whole physiognomy of life, labour, and landscape in a country—may, in the course of centuries, be changed under the hand of Man is an experimental fact that, especially since the discovery of America, cannot be contradicted. During the last three centuries—in a purely historical period, since the invention of printing, and in full view of the civilized world—the native animals and plants in newly discovered islands and in the colonized countries of the Western Hemisphere have been supplanted by those of Europe, or by a flora and fauna collected from all parts of the globe."—V. Hehn, *Cultivated plants and domestic animals*, pp. vii-viii, 17.

ANCIENT PERIOD

Beginnings of plant cultivation.—"In the progress of civilization the beginnings are usually feeble, obscure, and limited. There are reasons why this should be the case with the first attempts at agriculture and horticulture. Between the custom of gathering wild fruits, grain, and roots and that of the regular cultivation of the plants which produce them there are several steps. . . . Certain trees may exist near a dwelling without our knowing whether they were planted, or whether the hut was built beside them in order to profit by them. War and the chase often interrupt attempts at cultivation. Rivalry and mistrust cause the imitation of one tribe by another to make but slow progress. If some great personage command the cultivation of a plant, and institute some ceremony to show its utility, it is probably because obscure and unknown men have previously spoken of it, and that successful experiments have already

been made. A longer or shorter succession of local and short-lived experiments must have occurred before such a display, which is calculated to impress an already numerous public. It is easy to understand that there must have been determining causes to excite these attempts, to renew them, to make them successful. The first cause is that such or such a plant, offering some of those advantages which all men seek, must be within reach. The lowest savages know the plants of their country; but the example of the Australians and Patagonians shows that if they do not consider them productive and easy to rear, they do not entertain the idea of cultivating them. Other conditions are sufficiently evident: a not too rigorous climate; in hot countries, the moderate duration of drought; some degree of security and settlement; lastly, a pressing necessity, due to insufficient resources in fishing, hunting, or in the production of indigenous and nutritious plants, such as the chestnut, the datepalm, the banana, or the bread fruit tree. When men can live without work it is what they like best. Besides, the element of hazard in hunting and fishing attracts primitive, and sometimes civilized, man more than the rude and regular labor of cultivation. . . . The various causes which favor or obstruct the beginnings of agriculture explain why certain regions have been for thousands of years peopled by husbandmen, while others are still inhabited by nomadic tribes. It is clear that, owing to their well-known qualities and to the favorable conditions of climate, it was at an early period found easy to cultivate rice and several leguminous plants in Southern Asia, barley and wheat in Mesopotamia and in Egypt, several species of *Panicum* [millet and other grains] in Africa, maize, the potato, the sweet potato, and manioc in America. Centers were thus formed whence the most useful species were diffused. In the north of Asia, of Europe, and of America the climate is unfavorable and the indigenous plants are unproductive; but as hunting and fishing offered their resources, agriculture must have been introduced there late, and it was possible to dispense with the good species of the south without great suffering. It was different in Australia, Patagonia, and even in the south of Africa. They were out of reach of the plants of the temperate region in our hemisphere, and the indigenous species were very poor. It is not merely the want of intelligence or security that has prevented the inhabitants from cultivating them. Europeans established in these countries for a hundred years have cultivated only a single species, and that an insignificant green vegetable.

"The ancient Egyptians and the Phœnicians propagated many plants in the region of the Mediterranean, and the Aryan nations, whose migrations toward Europe began about 2500, or at latest 2000 B. C., carried with them several species already cultivated in Western Asia. Some plants were probably cultivated in Europe and in the north of Africa prior to the Aryan migration. This is shown by names in languages more ancient than the Aryan tongues; for instance, Finn, Basque, Berber, and the speech of the Guanches of the Canary Isles. However, the remains, called kitchen middens, of ancient Danish dwellings have hitherto furnished no proof of cultivation or any indication of the possession of metal. This absence of metals does not in these northern countries argue a greater antiquity than the age of Pericles, or even the palmy days of the Roman republic. Later, when bronze was known in Sweden—a region far removed from the then civilized countries—agriculture had at length been intro-

duced. Among the remains of that epoch was found a carving of a cart drawn by two oxen and driven by a man. The ancient inhabitants of Eastern Switzerland, at a time when they possessed instruments of polished stone and no metals, cultivated several plants, some of which were of Asiatic origin. The remains of the Lake-dwellers of Austria prove likewise a completely primitive agriculture: no cereals have been found at Laibach and only a single grain of wheat at the Mondsee. The backward condition of agriculture in this eastern part of Europe is contrary to the hypothesis, based on a few words used by ancient historians, that the Aryans sojourned first in the region of the Danube. In spite of this example, agriculture appears in general to have been more ancient in the temperate parts of Europe than we should be inclined to believe from the Greeks, who were disposed to attribute the origin of all progress to their own nation.

"In America agriculture is perhaps not quite so ancient as in Asia and Egypt, if we are to judge from the civilization of Mexico and Peru, which does not date even from the first centuries of the Christian era. [See PERU: Empire of the Incas: 1200-1527.] However, the widespread cultivation of certain plants, such as maize, tobacco, and the sweet potato, argues a considerable antiquity, perhaps two thousand years or thereabouts. History is at fault in this matter and we can only hope to be enlightened by the discoveries of archæology and geology. Men have not discovered and cultivated within the last two thousand years a single species which can rival maize, rice, the sweet potato, the potato, the breadfruit, the date, cereals, millets, sorghums, the banana, soy. These date from three, four, or five thousand years, perhaps even in some cases six thousand years. The species first cultivated during the Græco-Roman civilization and later . . . nearly all answer to more varied or more refined needs. A great dispersion of the ancient species from one country to another took place, and at the same time a selection of the best varieties developed in each species. . . . The peoples of Southern and Western Asia innovated in a certain degree by cultivating the buckwheats, several cucurbitaceæ [cucumbers, melons, etc.], a few alliums [garlic, chives, leek], etc. In Europe, the Romans and several peoples in the Middle Ages introduced the cultivation of a few vegetables and fruits, and that of several fodders. In Africa, a few species were then first cultivated separately. After the voyages of Vasco da Gama and of Columbus a rapid diffusion took place of the species already cultivated in either hemisphere. These transports continued during three centuries without any introduction of new species into cultivation. We must come to the middle of the present [19] century to find new cultures of any value from the utilitarian point of view, such as the *Eucalyptus globulus* of Australia and the *Cinchonas* of South America."—A. P. De Candolle, *Beginnings of plant cultivation* (E. G. Nourse, *Agricultural economics*, pp. 23-27).

Tree and vine culture.—"Wherever the cultivation of the three . . . plants—the vine, the fig, and the olive—was prosecuted on a large scale, there the face of the country and the habits and manners of the people were of necessity changed. Tree-culture was one step more on the path to settled habitations; with and by it men first became permanently domiciled. The transition from a nomadic to a settled life has nowhere been sudden; it was always accomplished in many intermediate stages, at each one of which the shepherd

hastily sows a piece of ground, from which he as hastily gathers the ensuing harvest; next spring he chooses another and fresh piece, which is no sooner stripped of its spoils than he neglects it in turn. When a tribe has settled on some especially fertile spot, building fragile huts, there too the soil is exhausted in a few years; the tribe breaks up its quarters, loads its animals and wagons with its movable goods, and goes on to new ground. Even when such a settlement has become more permanent, the idea of individual right to the ground is not yet realized. The cultivated land, of which there is an abundance in comparison to the scanty population, is common property like the pastures, and is divided anew among the people every year. Such was the condition of the Germans in the time of Tacitus, and this is the plain meaning of that historian's words, which have been carefully explained in a contrary and more welcome sense by patriotic commentators. The communistic, half-nomadic form of civilization, which was closely connected with ancient patriarchal life, still prevails in many parts of Russia, among the Tartars, Bedouins, and other races. During this first stage of agriculture, cattle-breeding is still the principal occupation, milk and flesh are the staple food, roving and plunder the ruling passion. The huts or houses are lightly built of wood, and easily take fire; the plough is nothing but a pointed branch guided by slaves taken in war, and only slightly scratches the ground; the foresight of the community is very short, extending only from spring to autumn. The sowing of seed in winter is a considerable advance, but the decisive step is taken when the Culture of Trees commences. Then only arises the feeling of a settled home and the idea of property. For a tree requires nursing and watering for many years before it will bear fruit, after which it yields a harvest every year, while the covenant with the annual 'grass' which Demeter taught men to sow is at an end the moment the grain is gathered. A hedge, the sign of complete possession, is raised to protect the vineyard or the orchard; for the mere husbandman a boundary stone had been sufficient. The sown field must wait for dew and rain, but the tree-planter teaches the mountain rivulet to wind round his orchards, and in so doing gets involved in questions of law and property with his neighbours—questions that can only be solved by a fixed political organization. One of the oldest political documents with which we are acquainted, the treaty sworn to by the Delphic Amphictyons, contains a decree that 'running water shall not be cut off from any of the allied cities either in peace or in war.'—V. Hehn, *Cultivated plants and domestic animals*.

Domestic animals.—"In the East and around the Mediterranean, wherever the summers are rainless, vegetation was threatened with destruction by drought during the three or four hot months of every year. In these countries, therefore, from the earliest times, the art of irrigation, the banking and diverting of streams, their horizontal distribution, the digging of canals, the making of dams and bores, of water-wheels and wells, were practised. So necessary was all this labour under the sunny skies, that it was continued from generation to generation until it became a second nature and innate skill. And as the art of irrigation was originally a sign of awakening reason, it also became a powerful stimulant to further mental development. It bound man to man, not by the stupid natural gregariousness common to beasts, but by free reciprocity, the first germ of all communities and states. . . . When the great Aryan

Migration brought the first inhabitants of a higher race, that we are historically acquainted with, into the two peninsulas which afterwards became the scene of classic culture, those lands (we may imagine) were covered with thick, impenetrable forests of dark firs and evergreen ilexes, or deciduous oaks . . . interspersed in the river valleys with more open stretches of meadow land, grazed by the herds of the newcomers, and with many a naked or grass-grown precipice, climbed by the nibbling sheep, from whose summits here and there could be seen the waste, unfruitful sea. The swine found plenteous nourishment in the abundant acorns, the dog guarded the flocks, wild honey-combs furnished wax and honey, wild apple, pear, and sloe trees afforded a hard, sour fruit; at the stag and boar, wild ox and ravening wolf the arrow sped from the bow, or the sharp, stone-tipped spear was hurled. Game and domestic animals furnished all that was needed: skins for clothing, horns for drinking vessels, sinews and entrails for bow-strings, bones for tools and their handles. Raw hides were the principal material, and needles of bone or horn served to stitch them together. The osier boat was covered with hide, and the leathern coat was sewed together with the sinews of bulls. . . . From the bark of trees, especially of the lime tree, and from the fibres of the stalks of many plants, principally of the nettle kind, the women plaited (plaiting is a very ancient art, the forerunner of weaving, which it nearly resembles) mats and web-like stuffs, hunting and fishing nets. Milk and flesh were the staple food, and salt a favourite condiment, but difficult to procure, and sought for on the seashore and in the ashes of plants. The farther south the easier it became to winter the cattle, which up in the north found but scanty nourishment beneath the snow, and in severe seasons must have perished wholesale; for the sheltering of cattle and the storing of dried grass against the winter are inventions of later origin, that followed in the wake of a somewhat advanced husbandry. The domestic animals were of poor breed. The pig, for example, was the small so-called peat-pig (torf-swine), far inferior to the animal now improved by cultivation and commerce. In winter the human dwelling-place was a hole in the ground, artificially dug, and roofed over with turf or dung; in summer it was the waggon itself, or, in the woods, a light tent-like hut, made of branches and wicker work. . . . The noble horse, the darling and companion of the hero, the delight of poets (witness the splendid descriptions in the Book of Job and in Homer's Iliad)—that glossy, proud, aristocratic, quivering, nervous animal, with its rhythmic action—has his home nevertheless in one of the wildest and most inhospitable regions of the world—the steppes and pasturelands of Central Asia, the realm of storms. There, we are assured, the wild horse still roams under the name of Tarpan, which tarpan cannot always be distinguished from the only half-wild *Musin*, or fugitive from tame or half-tame herds. It grazes in troops, under a wary leader, always moving against the wind, nostrils and ears alert to every danger, and not seldom struck by a wild panic which drives it full speed across the immeasurable plain. During the terrible winter of the steppes, it scrapes the snow away with its hoofs, and scantily feeds on the dead grasses and leaves which it finds beneath. It has a thick, flowing mane and bushy tail, and when the winter cold commences, the hair all over its body grows into a kind of thin fur. And in this very region lived the first equestrian races of whom we have

any knowledge—in the east the Mongols, in the west the Turks; taking those names in their widest sense. . . . That the horse in its original wildness also roamed westward of Turkestan, over the steppes of the present South-eastern and Southern Russia, and to the foot of the Carpathians, seems likely enough; not so likely that even the forest region of Central Europe once abounded in troops of that animal. And yet much historical testimony seems to put the fact beyond a doubt. Varro speaks of *Spanish* wild horses; and Strabo writes, 'In Iberia there are many deer and wild horses.' Wild horses as well as wild bulls lived among the Alps, as we learn again from Strabo; and Pliny tells us, not only in the Alps but in the north generally. Nor are the Middle Ages wanting in proofs of the existence of wild horses in Germany and the countries east of Germany. At the time of Venantius Fortunatus the *onager*—under which name may be understood the wild horse—was hunted in the Ardennes, as well as bears, stags, and wild boars. In Italy wild horses were seen for the first time during the rule of the Longobards, under King Agilulf. . . . If wild horses were thus found in the cultivated west and south of Germany, they must have existed still longer in the wild country on the Baltic, in Poland and Russia. In fact, we find innumerable proofs of this down to modern times. At the time of Bishop Otto of Bamberg, in the first half of the twelfth century, Pomerania was rich in all kinds of game, including wild oxen and horses. At the same period wild horses are mentioned as extant in Silesia, whence Duke Sobeslaus in 1132 'carried away many captives, and herds of wild mares not a few.' It is known, and is confirmed by many literary allusions, that till the time of the Reformation, and even later, the woods of Prussia were inhabited by wild horses. . . . Turning from the European chase to the steppes of Asia, the true home of the wild horse, we meet with the important fact, that the farther a country lies from this point of departure, the later is the appearance of the horse and its historical mention in that country, and the more clearly are the modes of breeding the animal seen to be derived from neighbouring nations to the east and north-east of it. In Egypt, to begin with the remotest member, no figure of a horse or of a war-chariot has ever been found under the so-called 'old kingdom.' It is only when the period of the Shepherd Kings is over, and the eighteenth dynasty with its campaigns has commenced (about 1800 B. C.), that we find both pictorial representations and the first mention in the papyri (so far as they have been deciphered) of the horse and of war-chariots equipped in Asiatic fashion. . . . As to the time when the horse became known to the Semites of Western Asia, we are limited to the evidence of the Old Testament—the Pentateuch, the Book of Joshua, etc.; but when were these books written? There is not a piece in this collection that does not consist of different parts, or that has not passed through the hands of successive revisers. . . . Descriptions of the horse are not wanting in the so-called books of Moses, nor in the historical books. . . . But in these descriptions the horse is never mentioned as a domesticated animal; it has no share in the wanderings and battles of the Children of Israel; it is the warlike servant of their neighbours and enemies, prancing and stamping before the war-chariot or beneath the rider. As a war horse, and as such only, it is also celebrated in the fine description in the Book of Job. In the household its place is taken by the ass. 'Thou shalt not covet,' says

the Decalogue, the commands of which were derived from a relatively very ancient period, 'thy neighbour's wife, . . . nor his ox, nor his ass, nor anything that is his.' The horse, the chief object of rapine among mounted nomads, is here, very significantly, never mentioned. . . . We are told later that King Josiah abolished, among other heathen abominations, the horses and chariots that were sacred to the sun—this was a feature of the Iranian worship of the sun introduced from Media. . . . Nowhere in the Old Testament do we find horses accompanying the shepherds of the Arabian desert; those people travel only with camels and asses, and the mode of warfare in the despotic kingdoms from the Tigris to the Nile is unknown to them. Quite in agreement with the above is the fact that the Arabs in the army of Xerxes rode only on camels. Herodotus writes, 'The Arabs were all mounted on camels, which yielded not to horses in swiftness.' And Strabo informs us that in Arabia Felix there were neither horses nor mules: 'There is a superfluity of domestic animals and herds, with the exception of horses, mules, and swine.'"—V. Hehn, *Cultivated plants and domestic animals*, pp. 26, 30-32, 35, 37-38, 40-42.

"If we take all the above data together, we find that nowhere in Europe, neither among the classic nations of the south, nor the North-European nations from the Celts in the west to the Slavs in the east, is the high antiquity of the horse and of its subjugation to man betrayed by any clear traces or undoubted evidence. Many facts, indeed, seem positively to exclude any acquaintance with the animal in early times; for instance, the fact of the Homeric Greeks not riding, as they must have done had they possessed the animal from the first, but only driving, as they had seen the Asiatics do. We have therefore no ground for imagining the Indo-Germans (Aryans) in their earliest migrations as a *horse-riding people*, galloping over Europe with loose rein, and catching men and animals with horse-hair lasso. But if the horse did not then accompany them on their great march through the world, it must have been the Iranian branch, which remained near the original point of departure, that learnt the art of riding later; and from whom did they learn it if not from the Turks, who dwelt next behind them, and in course of time drew nearer and nearer? Contemporaneous with the adoption of the novel culture, because closely connected with it, were the introduction of the *Ass*, the breeding of *Mules*, and the propagation of the *Goat*. The patient, hardworking, and intelligent Ass, which obediently fulfilled many domestic duties—driving the mill and the draw-well; carrying baskets full of earth to the hills; and accompanying its master to market and feast, loaded with the produce of the soil—had no need of fat meadows, shady trees, and ample space like the ox; it was content with what came first, the way-side herb, the refuse of the table, with straw, twigs, thistles, and brambles. That the ass came to Greece from Semitic Asia Minor and Syria—though its original home may have been Africa, where its relations still live—is taught us by the history of language, and confirmed by the oldest known conditions of nations and culture. In the epic time, when cattle-breeding and agriculture were the chief occupations, the ass had not yet become a common domestic animal; it is only mentioned *once* in the *Iliad*, and that only in a simile invented and inserted by a poet who was prejudiced against the Solamianians and Athenians; the simile is paradoxical and awkwardly paired with the one preceding. In the

Odyssey, the second part of which afforded plenty of opportunity for noticing such an animal, the ass is never named at all; nor is it spoken of by Hesiod. As the Latin word *asinus* has an archaic form which seems to reach back to a period preceding the Greek colonization, the animal must have come into Italy overland through the Illyrian tribes; or must we suppose that the people of Cumæ, when they founded their first city on the present Isle of Ischia, still said *asnos*? Later on, in Italy the ass, besides being valued for the domestic duties he performed, was of great use in facilitating import and export in the mountainous parts of the peninsula. Oil and wine and even corn were carried on donkey-back from the interior to the sea; Varro tells us that merchants kept herds of asses expressly for that purpose. The ass, and with it its name, accompanied the progress of the culture of the vine and olive to the north, not crossing the limits of that culture. In proportion as the ure-ox, the bison, and the elk died out, the long-eared foreign beast became domesticated in Gaul, receiving various names, and living in the customs, jokes, proverbs, and fables of the people. Germany, however, proved too cold for the animal. The Mule, already frequently mentioned by Homer, came from Pontic Asia Minor, or, as Homer expressly says, from the Henetians, a Paphlagonian people.

"The *Mulus*, or mule, was brought to Italy, as the name proves, from Greece. The Latin name was afterwards used by all the nations which adopted the animal. In Varro's time, just as now, cars were drawn along the high-roads by mules, which were not only strong, but pleased the eye by their handsome appearance. The Greeks were equally delighted with the animal, and Nausicaa's car is drawn to the sea-shore and back by mules. The Goat was used as a domestic animal in the mountainous districts of the south, where cultivation more resembled that of gardens than of fields. It feeds on the spicy herbs that grow on sun-heated cliffs, is content with tough shrubs, and yields aromatic milk. Stony Attica, which was rich in figs and olives, also nourished innumerable goats; and one of the four old Attic phylæ was named after the goat. Even if the animal came into Europe with the first Aryan immigrants, and accordingly the Hellenes and Italians had not to make its acquaintance after reaching their new home, yet it was only there, and under the Semitic mode of cultivation there adopted, that it found its proper place and true use. It is obvious, too, that the keeping of *Bees* could only have been adopted after the rise of tree-culture. The man who planted his own olives, for the fruit of which he had to wait for years, could easily keep beehives within his enclosed ground, nursing the bees through the winter, increasing their number by colonies derived from the parent-stock, and in due season receiving the reward of his exertions in the shape of honey and wax. Aristæus, the inventor of oil, also invented apiculture, and Autuchos, *i. e.*, the self-possessing, is named as his brother. Homer knows nothing of beehives; the simile of the Achæans gathering together 'like bees flying out of a cleft in the rock,' is derived from the swarming of *wild* bees. We first meet with an artificial beehive in a not very old passage in Hesiod's Theogony; in it the working-bees are distinguished from the drones, which latter are compared to *women*! In those days the shepherd robbed the wild honeycombs which he found in the forest, and if the spoil was abundant he made *mead* of the honey; the husbandman fermented his flour

into a kind of raw *beer*; the vintner often mixed the honey from his hives with his wine, which he then called *mulsum*, and believed that the enjoyment of this beverage would lengthen his days. . . . The domestic *fowl* made its appearance in Western Asia and in Europe much later than one would imagine. The civilized Semitic races cannot have been acquainted with the fowl, for it is nowhere mentioned in the Old Testament. It is never seen on Egyptian monuments otherwise so full of the details of ancient housekeeping on the Nile. There we see flocks of tame *geese* being driven home from the pasture, we see them and their eggs being carefully counted, but nowhere cocks and hens; and when Aristotle and Diodorus say that eggs were artificially hatched in Egypt by burying them in dung, they must mean the eggs of geese and ducks, or refer to a period later than the Persian conquest, which Diodorus seems to hint, for he commences his account of the *hatching ovens* with the words: 'The Egyptians inherited many customs relating to the breeding and rearing of animals from their fore-fathers, but other things they have invented, among which the most wonderful is the artificial hatching of eggs.' The domestic fowl is aboriginal in India, where its supposed parent species, the *Bankiva* fowl, still exists from Further India and the Indian islands to Cashmere. The domestic fowl first migrated to the West with the Medo-Persian invaders. In a work on the Temple of the Samian Hera, Herodotus says that as the cock spread from Persis, so the sacred peacock spread from the Temple of Hera to the surrounding districts. In the religion of Zoroaster the dog and the cock were sacred animals; the first as the faithful guardian of house and flocks, the second as the herald of dawn and the symbol of light and the sun. . . . Soon after the appearance of cocks and hens in Greece, whole families of these fowls must have been transported to Sicily and South Italy, and there, as in Greece, spread from house to house. That the Sybarites would suffer no cocks near them for fear of being disturbed in their sleep is one of those late-invented anecdotes by which people proved their wit. Sybaris was destroyed in 510 B. C., when the cock was unknown in Italy, or only just introduced. The figure of a cock may be seen on coins of Himera in Sicily, and sometimes the figure of a hen on the reverse side, perhaps as an attribute of Asklepios, the genius of the healing springs of the place. The oldest representations of the cock on coins and vases in Greece, Sicily, and Italy, never go beyond the date we have given, namely, the second half of the sixth century B. C. The Romans, to whom the bird was brought either directly or indirectly from one of these Greek towns, made use of it with truly Roman religious craft as a means of prophecy in war. . . . There is no direct historical testimony as to the manner in which domestic fowls were introduced into Central and Southern Europe. They may have come straight from Asia to the kindred nations of the South Russian steppes and the eastern slopes of the Carpathian mountains, whose religion agreed with that of the other Iranian races, and some of whom already practised agriculture in the time of Herodotus; or by way of the Greek colonies on the Black Sea, the influence of which, as is well known, spread far and wide; or from Thrace to the tribes on the Danube; or from Italy by way of the ancient commercial roads across the Alps; or through Massilia to the regions of the Rhone and Rhine; or, finally, by several of these ways at once. The more a people of

nomadic habits accustomed themselves to a settled mode of life, the more easily would the domestic fowl find shelter and acceptance among them. In the middle of the first century B. C. Cæsar found fowls among the Britons, though perhaps only among those who tilled the ground near the south coast and had adopted the culture of the Gauls. . . . While the number of mammalia that man has tamed and made companions of has only slightly increased in historical times, the farms and settlements of men have become enriched, at a comparatively late period, with various tame birds, among which the domestic fowl is the most important. Bird and cattle-breeding are to a certain extent opposed to one another. It is not where wide plains fertilized by copious droppings stretch in immeasurable corn-fields and green meadows, and are bordered by thick forests, but in the sunny districts of more restricted horticulture, where farm stands close to farm, and hedge succeeds to hedge—it is here that the winged tribe peck and flutter about the human habitation, forming a not-to-be-undervalued source of sustenance and income in the system of the household. Thus in Europe the Romance nations are, in accordance with their habit and tradition, the bird-breeding, bird-eating peoples: the Germans, on the contrary, feed principally on the flesh and milk of their cattle. France, at a moderate calculation, possesses above a hundred million fowls, and exports to England yearly above four hundred million eggs. In southern countries the only meat that the traveller tastes, often for months together, and that the native peasant regales himself with on feast-days, is a fowl roasted or boiled with polenta. The taming of the *Goose* and the *Duck* is far more ancient than that of the birds hitherto mentioned; and, what is more, they were not introduced from Asia, but have been reclaimed from the wild native species. . . . By the Greeks the goose was considered a graceful bird, admired for its beauty, and an elegant present for favoured friends. In the *Odyssey*, Penelope has a little flock of twenty geese, in which she takes much pleasure, as we learn from the beautiful passage in which she relates her dream to her disguised husband. Here the geese appear as domestic animals, kept more for the pleasure the sight of them affords than for any profit they might bring. So, in the *Edda*, Gudrun keeps geese, which scream when their mistress laments over the corpse of Sigurd. At the same time, the Greeks valued geese as careful guardians of the house; on the grave of a good housewife was placed the figure of a goose as a tender tribute to her quality of—vigilance! Among the Romans perfectly white geese were carefully selected and used for breeding, so that in course of time a white and tamer species was produced, which differed considerably from the grey wild goose and its direct descendants. In ancient as in modern Italy the goose was not so commonly found on small farms as in the North, partly because the necessary water was scarce, and partly because of the damage she caused to the young vegetation. But numerous flocks of this bird cackled in the huge goose-pens of breeders and proprietors of villas; there the enormous liver that made the mouth of the gourmand water was produced by forced fattening—an artificial disease which was poor thanks for their saving of the Capitol. The use of goose feathers for stuffing beds or cushions was foreign to early antiquity; the later Romans first learned the practice from the Celts and Germans. . . .

"It was also in consequence of the Migration of

Nations that the *Bos* family—that first friend of man when emerging out of barbarism—was enriched by the addition of a kinsman from the South, endowed with tremendous pulling power, the black and scowling *Buffalo*. He now lives in the moist, hot malaria plains of Italy, enjoying their slime, and defying their venomous vapours; the maremmas of Tuscany, the bottomlands about the Tiber's mouth, the Pontine marshes, the swamps of Pæstum, the Basilicata; also in the *landes* of Gascony, in many parts of Hungary, etc. The Pontine buffaloes wallow like immense swine in the high reeds of the swamps, standing still at the sound of a carriage on the high road, and stupidly staring at the traveller; or, when teased by gad-flies, hiding up to the muzzle in the water. The buffalo is employed, like the ox, in dragging the heavy plough, or the loaded harvest waggon; its milk is made into highly valued cheese (called in Naples *muzzarello*), and, after death, its thick, heavy skin forms the strongest leather. . . . While progressive culture has almost exterminated those savage, obstinate, and kingly inhabitants of the European forests, the ure-ox and the bison, the buffalo was brought by immigrating nations from the borders of India to the southern coasts of Italy. Aristotle describes a wild ox living in Arachosia, near modern Kabool, which can be no other than our present buffalo. During the succeeding centuries that animal must have migrated farther west. It was first seen in Italy about the year 600 A. D., in the reign of the Longobardian king, Agilulf—Paul. Diac. 4, 11: 'Then for the first time wild horses and buffaloes were brought to Italy, and regarded as wonders by the Italian people.' We must be grateful to the Longobardian monk for this report, for how seldom do the historians, who have enough to do with questions of war and government, throw us a crumb of what relates to culture; but we should have liked something still more exact."—V. Hehn, *Cultivated plants and domestic animals*, pp. 59, et seq.

Pastoral life of the Homeric period.—The early Greeks, "as they come before us in the Homeric poems, are rather a pastoral than an agricultural race. It is in their herds of cattle, sheep, and swine, rather than in the produce of their lands, that the wealth of the heroic kings consisted. It was cattle which furnished them with a measure of value; and cattle, together with slaves, were the most valuable spoil which they secured in their military and piratical expeditions. Thucydides traces the same lines as Homer. In early times, he tells us, the insecurity of property was too great to allow of the planting of trees, which would of course lie at the mercy of an invading enemy. And although men tilled the ground, the harvest would very often fall to the foe, whereas cattle could on an alarm be driven to a place of safety."—P. Gardner and F. B. Jones, *Agricultural development of ancient nations* (E. G. Nourse, *Agricultural economics*, pp. 29-30).—"Cattle raising seems to have been more important in the Homeric age than afterwards, when the needs of the population could not be satisfied by the home growth, and importation of foreign cattle from the Black Sea and from Africa was necessary. The small number of herds of cattle was probably due to the fact that in Greek antiquity very little cow's milk was drunk, but chiefly goat's milk. Sheep-rearing, however, was very general, and brought to great perfection, since they not only used the flesh and milk of the sheep for food, but in particular required their skin and wool for clothing. . . . Excellent quali-

ties [of sheep's wool] were produced by Hellas proper, as well as by the Greek colonies in Asia Minor and Lower Italy, and a great deal of it was exported to foreign countries. . . . The goat's hair was woven into stuff, not in Greece itself, but probably in Northern Africa and Cilicia, where a kind of coarse cloth was manufactured of it, which, however, was not often used for clothing. The facility of goat-rearing, which required no special care, and could be carried on even on rocky ground, where but little grass grew, enabled it to become very extensive, and we find it, in fact, throughout almost the whole of Greece in ancient times. The labor of slaves being very cheap and ineffective, shepherds and goatherds were very numerous in proportion to the number of animals they tended,—at least one to every hundred, more often one to fifty. Swine-rearing, on the other hand, played a very small part, for it was not sufficiently remunerative. Although the flesh was used for food, yet in the historic period it was not so popular a dish as in the age of Homer, and they did not understand how to draw a profit in other ways from swine. "In its technical aspects, ancient agriculture remained in much the same state throughout the whole of antiquity as it occupied in the heroic age, and probably this was the common inheritance of the Indo-Germanic race. In Homer, we find the custom, which always prevailed afterwards, of alternating only between harvest and fallow; even the succeeding ages seem to have known nothing of the rotation of crops. The implements used for necessary farming occupations were of the simplest kind, in particular the primitive plough, which was not sufficient to tear up the earth, so that they had to use the mattock in addition; they had no harrow or scythe, in place of which they used the sickle, and their threshing arrangements were most unsatisfactory, since they simply drove oxen, horses, or mules over the threshing floor, and beat out the ears with their hoofs, by which means a great part of the harvest was lost. It was only the large number of labourers at the disposal of the farmers (in consequence of the numerous slaves, to which at times, when there was a press of work, they added hired labourers), and the great care taken in manuring and improving the ground, etc., that enabled them to earn a living at all. Great wealth was never attained in ancient Greece by agriculture, certainly not by growing corn; vines and olives supplied better profits, though here too the instruments used were of the simplest, but the ground was especially favourable to their cultivation. Oil in particular, could be supplied by Greece to foreign countries, but corn did not grow in a quantity sufficient to provide their own population, and consequently they had to import a great deal from foreign countries, especially from the Black Sea, and afterwards too from Egypt."—A. E. Zimmern, *Home life of the ancient Greeks*, pp. 403-407.—"It is probable that the downfall of the Achæan race was followed by a time of greater simplicity, when the aristocracy of the Greek tribes lived on their estates in the midst of slaves and retainers, as did the wealthy inhabitants of Elis even in the time of the Achæan League. But Greek civic life began to develop with irresistible attraction. The rich thronged into cities, and left the work of their farms to bailiffs and slaves. There were in particular two states wherein the country life fell into the background—Athens and Sparta. But even at Athens, although the witty and luxurious citizens ridiculed the yeoman as a lout, they could

not deny his solid virtues. As a whole, Greece is a country by no means favorable to agriculture. The country is mostly rocky, barren, and uneven, especially unsuited for large farms. The system of farming was that adapted to peasant proprietors or yeomen. There can be no doubt that agriculture in Attica suffered more and more as time went on, though to a less degree than that of Italy in imperial times, from the competition of richer soils. Great cargoes of corn from Egypt and Sicily and the Black Sea constantly arrived in the Piræus, and the people of Athens learned the fatal lesson that it was easier to buy agricultural produce with money wrung from the allies or extracted from the mines of Laurium than to grow it on the rugged soil around Athens."—P. Gardner and F. B. Jevons, *Agricultural development of ancient nations* (E. G. Nourse, *Agricultural economics*, pp. 29-31).

Development of the servile system among the Romans.—The spread of slavery among ancient peoples was accompanied by a corresponding change in agrarian organization. In the early days of the Roman Republic, "the farm was the only place where slaves were employed. The fact that most of the Romans were farmers and that they and their free laborers were constantly called from the fields to fight the battles of their country led to a gradual increase in the number of slaves, until they were far more numerous than the free laborers who worked for hire. . . . In the last century of the Republic all manual labor, almost all trades, and certain of what we now call professions were in the hands of slaves. . . . The small farms were gradually absorbed in the vast estates of the rich, the sturdy yeomanry of Rome disappeared, and by the time of Augustus the freeborn citizens of Italy who were not soldiers were either slave holders themselves or the idle proletariat of the cities. . . . The slaves that were employed upon the vast estates were known as *familia rustica*; that very name implies that the estate was no longer the only home of the master. He had become a landlord, living in the capital and visiting his lands only occasionally for pleasure or for business. The estates may, therefore, be divided into two classes: country seats for pleasure and farms or ranches for profit. The former were selected with great care, the purchaser having regard to their proximity to the city or other resorts of fashion, their healthfulness, and the natural beauty of their scenery. They were maintained upon the most extravagant scale. There were villas and pleasure grounds, parks, game preserves, fish ponds and artificial lakes, everything that ministered to open air luxury. Great numbers of slaves were required to keep these places in order, and many of them were slaves of the highest class; landscape gardeners, experts in the culture of fruits and flowers, experts even in the breeding and keeping of the birds, game, and fish, of which the Romans were inordinately fond. These had under them assistants and laborers of every sort, and all were subject to the authority of a superintendent or steward (*vilicus*), who had been put in charge of the estate by the master. But the name *familia rustica* is more characteristically used of the drudges upon the farms, because the slaves employed upon the country seats were more directly in the personal service of the master and can hardly be said to have been kept for profit. The raising of grain for the market had long ceased to be profitable, but various industries had taken its place upon the farms. Wine and oil had become the most important products of the soil, and vineyards

and olive orchards were found wherever climate and other conditions were favorable. Cattle and swine were raised in countless numbers, the former more for draft purposes and the products of the dairy than for beef. Sheep were kept for the wool, and woolen garments were worn by the rich and poor alike. Cheese was made in large quantities, all the larger because butter was unknown. The keeping of bees was an important industry, because honey served, so far as it could, the purposes for which sugar is used in modern times. Besides these things that we are even now accustomed to associate with farming, there were others that are now looked upon as distinct and separate businesses. Of these the most important, perhaps, as it was undoubtedly the most laborious, was the quarrying of stone; another was the cutting of timber and working it up into rough lumber, and finally the preparing of sand for the use of the builder. This last was of much greater importance relatively than now, on account of the extensive use of concrete at Rome. In some of these tasks intelligence and skill were required as they are to-day, but in many of them the most necessary qualifications were strength and endurance, as the slaves took the place of much of the machinery of modern times. This was especially true of the men employed in the quarries, who were usually of the rudest and most ungovernable class, and were worked in chains by day and housed in dungeons by night, as convicts have been housed and worked in much later times. The management of such an estate was also intrusted to a *vilicus*, who was proverbially a hard taskmaster, simply because his hopes of freedom depended upon the amount of profits he could turn into his master's coffers at the end of the year. His task was no easy one. Besides planning for and overseeing the gangs of slaves already mentioned, he had under his charge another body of slaves only less numerous, employed in providing for the wants of the others. Everything necessary for the farm was produced or manufactured on the farm. Enough grain was raised for food, and this grain was ground in the farm mills and baked in the farm ovens by millers and bakers who were slaves on the farm. The task of turning the mill was usually given to a horse or mule, but slaves were often made to do the grinding as a punishment. Wool was carded, spun, and woven into cloth, and this cloth was made into clothes by the female slaves under the eye of the steward's consort, the *vilica*. Buildings were erected, and the tools and implements necessary for the work of the farm were made and repaired. These things required a number of carpenters, smiths, and masons, though they were not necessarily workmen of the highest class. It was the touchstone of a good *vilicus* to keep his men always busy, and it is to be understood that the slaves were alternately plowmen and reapers, vinedressers and treaders of the grapes, perhaps even quarrymen and lumbermen, according to the season of the year and the place of their toiling."—H. W. Johnston, *Private life of the Romans*, pp. 87, 95-98.

"Meanwhile out in the country we can perceive the farm, with its hedges of quick-set, its stone walls, or its bank and ditch. The rather primitive plough—though not always so primitive as it was a generation or so ago in Italy—is being drawn by oxen, while, for the rest, there are in use nearly all the implements which were employed before the quite modern invention of machinery. It may be remarked at this point that the rotation of crops was well understood and regularly practised. Then there are the pasture-

lands, on the plains in the winter, but in summer on the hills, to which the herdsmen drive their cattle along certain drove-roads till they reach the unfenced domains belonging to the state. . . . It is probable, doubtless, that the greater proportion of the slave body were employed as domestic servants. But many others tilled the lands of the larger proprietors. Others laboured under the contractors who constructed the public works. Others were used as assistants in shops and factories. It is obvious that such competition reduced the field of free labour, when it did not close it entirely, and the free labour must have been unduly cheapened. But to suppose that all the Roman work, whether in town or country, was done by slaves is to be grossly in the wrong. Romans were to be found acting as ploughmen and herdsmen, workers in vineyards, carpenters, masons, potters, shoemakers, tanners, bakers, butchers, fullers, metalworkers, glass-workers, clothiers, greengrocers, shopkeepers of all kinds. There were Roman porters, carters, and wharf-labourers, as well as Roman confectioners and sausage-sellers. To these private occupations must be added many positions in the lower public or civil service. There was, for example, abundant call for attendants of the magistrates, criers, messengers, and clerks. Unfortunately our information concerning all this class is very inadequate. The Roman writers—historians, philosophers, rhetoricians, and poets—have extremely little to say about the humble persons who apparently did nothing to make history or thought."—T. G. Tucker, *Life in the Roman world of Nero and St. Paul*, pp. 246-247, 252-253.

Discouragement of agriculture in Europe after the fall of the Roman empire.—"The state of Europe during and after the period of the barbarian invasions was not conducive to the best cultivation of either urban or rural lands. The confusion was not so great, however, as to blind the invading chieftains to the value of the territory under their dominion, and it was not long before all the land occupied by these people was gathered together under the proprietorship of a small number of the barbarian leaders. The huge estates so created escaped division, first, by the establishment of the law of primogeniture, and second, by the introduction of entails. From these great proprietors nothing could be expected in the way of improved methods of agriculture. Primarily fighting men, these landowners at first had no time, and later no taste for devotion to agricultural pursuits, a profession that requires great care, a certain amount of frugality, and an exact consideration of small advantages to be gained from plodding work. If little improvement was to be expected from such great proprietors, still less was to be hoped for from those who occupied the land under them. In the ancient state of Europe, the occupiers of land were all tenants at will. They were all, or almost all, slaves, but their slavery was of a milder kind than that known among the ancient Greeks and Romans, or even in our West Indian colonies. They were supposed to belong more directly to the land than to their master. . . . Whatever cultivation and improvement could be carried on by means of such slaves was properly carried on by their master. It was at his expense. The seed, the cattle, and the instruments of husbandry were all his. It was for his benefit. Such slaves could acquire nothing but their daily maintenance. It was properly the proprietor himself, therefore, that occupied his own lands and cultivated them by his own bondmen.

"The experience of all ages and nations, I believe, demonstrates that the work done by slaves, though it appears to cost only their maintenance, is in the end the dearest of any. . . . Under all these discouragements, little improvement could be expected from the occupiers of land. The ancient policy of Europe was, over and above all this, unfavourable to the improvement and cultivation of land, whether carried on by the proprietor or by the farmer; first, by the general prohibition of the exportation of corn, without a special license, which seems to have been a very universal regulation; and, secondly, by the restraints that were laid upon the inland commerce, not only of corn, but of almost every other part of the produce of the farm, by the absurd laws against engrossers, forestallers, and regraters, and by the privileges of fairs and markets."—T. N. Carver, *Middle Ages* (E. G. Nourse, *Agricultural economics*, pp. 36-38).

BIBLIOGRAPHY: Of contemporary works on ancient agriculture, Hesiod, *Works and days*, will serve for Greek rural life; while Cato, *De re rustica*, and Varro, *Rerum rusticarum*, are the standard works on Roman agriculture. However, a great many distinguished men of letters in Rome took up farming as a hobby, with the result that whole volumes, as well as many less direct and comprehensive discussions of farming are to be found among the works of such men as Pliny, Vergil and Cicero. Some recent treatments of the subject are contained in Glover's *From Pericles to Philip*, ch. 9-11, Charles Daubeny, *Lectures on Roman husbandry*, and in Vladimir G. Simkhovitch's *Rome's fall reconsidered* (*Political Science Quarterly*, June, 1916). Ancient and primitive agriculture in other parts of the world is handled—for China and Japan, by Franklin H. King, *Farmers of forty centuries* (Madison, Wis., 1911); in Peru, by O. F. Cook, *Staircase farms of the ancients* (*National Geographic Magazine*, May, 1916); in the tropics, by J. C. Willis, *Agriculture in the tropics*, ch. viii; and in France, by Albert Babeau, *La vie rurale dans l'ancienne France*. Other material on primitive agriculture may be found in the *Scientific American* for March 16, 1918: *Masterpieces of primitive engineering*; Max Ringelmann, *Essai sur l'histoire du génie rural* (*Annales de l'Institut Nationale Agronomique*, deuxième série, v. ii-ix), and *Le travail dans l'antiquité*, by René Mênard and Claude Sauva-geot.

MEDIEVAL PERIOD

Manorial system.—"The history of agrarian organisation in western Europe since the opening of the Christian era falls into three great stages, which may be designated the servile, the manorial, and the contractual. Exact chronological delimitation is impossible, for even within the bounds of a single country these stages overlap by very wide margins. Speaking broadly, however, the servile stage comprises the era of the Roman Empire and is marked by a rural economy involving ownership of the soil by great proprietors and cultivation mainly by slaves; the manorial stage includes large portions of the Middle Ages and is distinguished by a quasi-feudal type of agrarian organisation, involving ownership by feudal lords and cultivation by persons neither slave nor free but of status varying widely between the two conditions [See also SLAVERY: 600-900]; and the contractual stage comprises the modern era, characterised in a degree by the increased number of proprietors but mainly by the full establishment

of agrarian relationships upon the basis of voluntary contract. [See also FEUDALISM.] [The first of these three stages, the servile, has already been described in the preceding section.] The methods of agriculture and the conditions of the agricultural population in all western countries at the present day have been determined fundamentally by the changes involved in the transition from the second to the third of these stages, i. e., by the break-up of the manorial system. . . . The manor, which was the economic unit and the social cell of the Middle Ages, was an estate owned by a lord and occupied by a community of dependent cultivators. The proprietorship of the lord was acquired by feudal grant, by purchase, by usurpation, by commendation, or in some other way; while the tenants were the descendants of owners or occupiers of lands drawn under the lord's control, of persons who had become permanently indebted to the lord, or of settlers who had sought the lord's favour and protection. Throughout the Middle Ages practically all lands belonged to some manor, and until after commerce, industry, and town life had acquired fresh importance in the 12th and 13th centuries, almost the whole of the population was manorial. [See MANORS.] Speaking broadly, the cardinal features of the manor were everywhere and at all times the same. The inhabitants dwelt, not apart in isolated farm-houses, but in a 'nucleated' village, consisting of hais grouped about the parish church and the manor-house of the proprietor. Attached to the manor-house, which might be occupied by the proprietor himself or by a steward, was usually a courtyard, surrounded by buildings for brewing, cooking, and general farm purposes; and at some distance, situated if possible on a stream, was a mill. The houses of the tenants were likely to be thatch-roofed, one-roomed, cheerless, and closely adjoined by stables and granaries. From the village stretched in all directions the open fields, the cultivated portions lying nearest, with the meadows and waste-land beyond. The most characteristic feature of agriculture in the Middle Ages, and one which persisted in some regions until the nineteenth century, was the open-field system. Not only were the holdings of different persons on the manor not fenced off one from another; there were no durable enclosures at all. Growing crops were protected by rudely constructed barriers, as were the meadows during the weeks while the hay was maturing. But after harvest the hedges were removed, the cattle were turned in to graze, and the arable land was treated as common waste or pasture. In the lack of scientific schemes of crop rotation and of fertilisation it was not feasible to cultivate a piece of ground uninterruptedly year after year. Hence there had been devised, very early, the 'two-field' and the 'three-field' systems. Under the two-field system the arable land of the manor was divided into two large tracts, each to be cultivated in alternate years. Under the three-field system the arable land was divided into three parts, two being cultivated and one lying fallow every year. Of the cultivated fields under the latter arrangement, one was planted ordinarily with wheat, rye, or other crops sowed in the fall and harvested the next summer and the other with oats, barley, peas, or other crops planted in the spring and harvested in the fall. By rotating the three fields, each was given an opportunity every third year to recuperate. Although not so widely prevalent as at one time was supposed, the three-field system was probably the more common. A further important feature of the open-field system was the division of the

cultivated plots into strips for assignment to the tenants. To every land-holding inhabitant of the manor was assigned a number of the strips, not contiguous, but lying in different fields, and frequently in different parts of the same field. . . . The origins of this practice are obscure, and several conflicting theories respecting them have been advanced. There is no need to assume that they were everywhere the same. The basis of the strip system seems very generally to have been, however, the desire to ensure equity of allotment. Fields were likely not to be uniform in fertility and ease

tem was universal. An arable field was thus made up of any number of blocks of strips set at right angles or inclined one to another, presenting the checkered and variegated appearance of a patchwork quilt. On every manor were meadows sufficient to produce the supply of hay required for the sustenance of the live-stock through the winter months. Sometimes these lay in a block; sometimes they comprised two or more tracts interspersed with the cultivated fields."—F. A. Ogg, *Economic development of modern Europe*, pp. 18-22.—See also FERTILISERS: Origin.

TYPES OF EARLY AGRICULTURAL IMPLEMENTS

of cultivation, and their minute division into strips was calculated to prevent the more desirable areas from being monopolised by favoured or fortunate persons. In large portions of England the strips were arranged to be forty rods, or a furlong (i. e., a 'furrow-long,' or the normal length of a furrow), in length and four rods in width, giving an area of one acre. Strips two rods wide contained a half-acre and one rod wide a 'rood,' or quarter-acre. The strips were separated by narrow belts of unploughed turf, or simply by little ridges, which might be marked also with stones. The ridged surface of the fields in many districts to-day bears testimony to the employment of these primitive division lines, or 'balks.' On the continent arrangements varied in detail, but the strip sys-

"While the manorial type of rural organization as a method of land tenure was undoubtedly a great advance upon the servile system, farm implements and methods of tillage on the other hand showed but little improvement upon those in use in the days of the Roman Empire. Ploughing was still done by oxen, usually three times a year, in the autumn, in April and in midsummer; the furrows were a foot apart and the plough went no more than two inches deep. Seed was still scattered by hand, grain harvested by sickle and threshed by flail or oxen. Crops were consequently not only uncertain and uneven, but pitifully small. "The amount of wheat, rye, beans, and peas usually sown to the acre was only two bushels; and of oats and, strangely enough, of

barley, four bushels. The yield of wheat rarely exceeded fivefold, or ten bushels to the acre; that of leguminous crops ranged from three to sixfold, or from six to twelve bushels to the acre; that of oats and barley varied from three to fourfold, or from twelve to sixteen bushels to the acre. Considerable care was exercised in the choice and change of the seed-corn, which was often one of the produce-rents of the tenants. Wheat rarely followed a spring grain crop. The most important crops of the farm were the corn, crops of wheat, rye, and barley, which were raised for human food and drink. For such ready money as he needed, the lord looked mainly to the produce of his live stock. For their consumption were grown the remaining crops—the hay, beans, peas, and oats; though oats were not only used for human food, but in some districts were brewed into inferior beer. Horse-farms appear in some estate accounts; but they probably supplied the 'great horse' used for military purposes. As a rule, oxen were preferred to horses for farm work. Though horses worked more quickly when the ploughman allowed them to do so, they pulled less steadily, and sudden strains severely tested the primitive ploughgear. On hard ground they did less work, and only when the land was stony had they any advantage. Economical reasons further explain the preference for oxen. . . . The winter-keep of horses was about four times that of oxen. In addition to this, the more delicate construction of horses required careful attendance and greater expense than did the stolid and less susceptible oxen. Then again the ox, when no longer available for work, made excellent food, while the horse at that time was only worth his hide. Lack of feeding stuff for live stock made fresh butchers' meat a rarity, as the common pasturage ground supplied no more food for the cattle than was sufficient to keep the animals alive, never enough to fatten them. . . . The dairy produce was a greater source of money revenue, though the home consumption of cheese must have been very large. But the management was necessarily controlled, like the management of the stock, by the winter scarcity. The yield of a cow during the twenty-four weeks from the middle of April to Michaelmas was estimated at four-fifths of her total annual yield. Sheep were the sheet anchor of farming. But it was not for their mutton, or their milk, or even for their skins, that they were chiefly valued. Already the mediæval agriculturist took his seat on the wool-sack. As a marketable commodity, both at home and abroad, English long wool always commanded a price. It was less perishable than corn, and more easily transported even on the worst of roads. From Martinmas to Easter sheep were kept in houses, or in movable folds of wooden hurdles, thatched at the sides and tops. During these months they were fed on coarse hay or peas-haulm, mixed with wheat or oat straw. For the rest of the year they browsed on the land for fallows, in woodland pastures, or on the sheep-commons. Diseases made sheep-farming, in spite of its profits, a risky venture. Swine were the almost universal live stock of rich and poor. As consumers of refuse and scavengers of the village, they would, on sanitary grounds, have repaid their keepers. But mediæval pigs profited their owners much, and cost them little. A pig was more profitable than a cow. For the greater part of the year pigs were expected to pick up their own living. When the wastes and woodlands of a manor were extensive, they were, except during three months of the year, self-supporting.

They developed the qualities necessary for taking care of themselves. The ordinary pigs of the Middle Ages were long, flat-sided, coarse-boned, lop-eared, omniverous animals, whose agility was more valuable than their early maturity. . . . [The keeping of poultry, too, was at the time universal, so much so that, when sold, they were almost absurdly cheap. The keeping of fowls, ducks, and geese must, however, have materially helped the peasant in eking out his food supply, or in paying that portion of his rent which was paid in kind.] On the outskirts of the arable fields nearest to the village lay one or more 'hams' or stinted pastures, in which a regulated number of live stock might graze, and which therefore supplied superior feed. Besides the open arable fields, the meadows, and the stinted hams, there were the common pastures, fringed by the untilled wastes which were left in their native wildness. These wastes provided fern and heather for litter, bedding, or thatching; small wood for hurdles; tree-lopings for winter browse of live stock; furze and turves for fuel; large timber for fencing, implements, and building; mast, acorns, and other food for the swine. Most of these smaller rights were made the subject of fixed annual payments to the manorial lord; but the right of cutting fuel was generally attached to the occupation, not only of arable land, but of cottages. The most important part of these lands were the common pastures, which were often the only grass that farmers could command for their live stock. They therefore formed an integral and essential part of the village farm. No rights were exercised upon them by the general public. On the contrary, the commons were most jealously guarded by the privileged commoners against the intrusion or encroachments of strangers."—R. E. Prothero, *Manorial husbandry* (E. G. Nourse, *Agricultural economics*, pp. 38-43).

The mediæval manor was thus from one point of view "a compactly organized, economically self-sufficing, and socially independent unit. Defects, however, are obvious. The acquisition of land by small proprietors was rendered difficult. The dealings of the lord, or of his steward or bailiff, with the tenants were likely to be arbitrary and harsh. The scattered character of the holdings involved waste of the cultivator's time and effort. The lack of permanent fences tempted to trespassing and produced much quarrelling. The rotation of crops, the time of ploughing and sowing, the use of meadow and pasture, the erection and removal of hedges, and the maintenance of roads and paths were determined entirely by the community, on the basis usually of rigid custom, and the individual enjoyed little or no freedom or initiative. Experimentation was almost impossible. In consequence, largely, of the restraints which have been mentioned, agriculture continued throughout the Middle Ages to be extremely crude. It is doubtful, indeed, whether prior to the eighteenth century the soil was cultivated again in any considerable portions of Europe with either the science or the practical skill which were common in rural husbandry in the best days of the Roman Empire."—F. A. Ogg, *Economic development of modern Europe*, pp. 24-25.

14th-17th centuries.—Displacement of serfdom by free tenantry.—Growth of enclosures for pasturage.—Beginnings of the contractual system.—By the middle of the thirteenth century in England, a remarkable change had begun to affect the condition of the serfs or villeins under the manorial system, a change not effected on the Continent till three centuries later, "by which the

villains became free tenants, subject to a fixed money rent for their holdings. This rent was rapidly becoming a payment in money and not in labour, for the lords of the manors were frequently in want of cash, and were ready to sell many of their privileges. The change was at first gradual, but by the time of the Great Plague (1348) [see also ENGLAND: 1348-1349: Black Death], money rents were becoming the rule rather than the exception, and though labour rents were not at all obsolete, it was the ill-advised attempt to insist upon them unduly that was the prime cause of Wat Tyler's insurrection (1381). [See also ENGLAND: 1381: Wat Tyler's Insurrection.] Before the Plague, in fact, villeinage in the old sense was becoming almost extinct, and the peasants, both great and small, had achieved a large measure of freedom. The richer villains had developed into small farmers, while the poorer villeins, and especially the cottars, had formed a separate class of agricultural labourers, not indeed entirely without land, but depending for their livelihood upon being paid for helping to cultivate the land of others. . . . At the end of the thirteenth century we can trace three classes of tenants—(1) Those who had entirely commuted their services for a fixed money rent; (2) those who gave services or paid money according as their lord preferred; and (3) those who still paid entirely, or almost entirely, in services. Throughout the whole of this period the vast majority of the population were continuously engaged in agricultural pursuits, and this was rendered necessary owing to the very low rate of production consequent upon the primitive methods of agriculture. [In England the displacement of serfdom by free tenantry bore a very close relation to the great increase of sheep-farming which took place after the Great Plague (1348)]. This from two causes. The rapid increase of woolen manufacturers, promoted by Edward III, rendered wool-growing more profitable, while at the same time the scarcity of labour, occasioned by the ravages of the Black Death and the consequent higher wages demanded, naturally attracted the farmer to an industry which was at once very profitable, and required but little paid labour. So, after the Plague, we find a tendency among large agriculturists to turn ploughed fields into permanent pasture . . . , instead of turning portions of the 'waste' into arable land. Consequently from the beginning of the fifteenth century we notice that the agricultural population decreases in proportion as sheep-farming increases. . . . One consequence of this more extensive sheep-farming was the great increase in enclosures made by the landlords in the sixteenth century. So great were those encroachments and enclosures in north-east England, that they led, in 1549, to a rebellion against the enclosing system, headed by Ket; but though more marked perhaps in Henry VIII's reign, the practice of sheep-farming had been growing steadily in the previous century. . . . In fact, it is very clear that at this time a great change was passing over English agriculture, and the old agricultural system was becoming seriously disorganised."—H. De B. Gibbins, *Industry in England*, pp. 111-119.—The second great stage in western European agriculture, the medieval manorial system, was fast giving way before the encroachments of its successor, the modern contractual type of agrarian organization. "During the changes that had been taking place the villein had finally disappeared. He was now in many cases a copyholder, and like his neighbour, the yeoman, held his own estate of from 20 to 150 acres, and in the smaller farms

worked it mainly by the help of his family. The yeomanry, who formed something like one-sixth of the population, found in the seventeenth century their golden age. Their estates varied considerably in size and importance; the best of them were scarcely inferior in status to the country gentry. To be counted a yeoman, a man had to possess an income of at least forty shillings a year derived from his own freehold land. An act of Parliament of 1430 had made this the qualification for the parliamentary vote in the county areas, and the yeomen were proud of this privilege and showed their independence in the exercise of it. The tenant farmers were also prosperous and occupied a good position, though their social status was inferior to that of the yeomanry. As for the labourers, if they were poorly paid they were in most cases well fed, and, as we have already pointed out, they still had domestic industries and small holdings of land to help them. Unmarried servants of both sexes lived in the houses of the farms on which they worked, and shared in the food of the household. Married labourers supplemented their wages by domestic industries, and could obtain a portion of their food from the little plots of five or six acres attached to many cottages, and from the possession of a cow which they could graze upon the common lands. Their wives and children shared in this work and also in agricultural work generally. One of the worst hindrances of the labourer was the Act of Settlement of 1662. This prevented his movement from one district to another in search of higher wages and better employment, and might mean his having to journey a considerable distance to his work owing to the action of landlords who kept out the undesirable poor by forbidding the erection of cottages upon their estates."—F. W. Tiekner, *Social and industrial history of England*, pp. 336-330.

During this period from the fourteenth century to the seventeenth, as we have seen, there had begun in England a gradual disintegration of the manorial system which was destined to be completed only through the tremendous forces of the agricultural revolution of the later eighteenth century. In the meantime, however, two opposing tendencies were noticeable: on the one hand the displacement of serfdom by free tenantry with its accompanying development of small holdings and a self-sufficing yeomanry; on the other the transformation of arable manor land and commons into sheep-farms for the production of raw wool for continental markets. The growth of enclosures for pasturage reached its climax, however, during the sixteenth century, while the number of small holdings continued to increase during the seventeenth and early eighteenth centuries, when new methods and new forces introduced the modern period of agricultural development.

MODERN PERIOD

General survey. — Agricultural progress in modern times has been profoundly affected by the great revolutions which have occurred in the last two hundred years, particularly those in science, mechanical devices, and transportation. Although, unlike the European and American countries, Asia has maintained the use of rude implements, her agriculture has not been untouched by the deep-rooted changes of modern times. During the seventeenth and eighteenth centuries economic forces were at work both in England and on the Continent which were destined to change the entire system of agrarian organization as it had existed

during the Middle Ages. It was in England that these forces first became apparent, and there, too, that the resulting changes were soonest effected; but the movement spread rapidly during the early nineteenth century to France, Prussia and other continental nations, and while it presented in each country slightly differing phases due to local economic and social conditions, the directing forces and the changes wrought, with some noteworthy exceptions, parallel very closely those to be observed in England.

"A principle woven deeply into the American national system at its beginning is that of full and free industrial opportunity. For an American, therefore, it is difficult to conceive how completely the agriculture, the manufactures, and the trade of France, Germany, and other continental European countries were shackled but four or five generations ago by status, by custom, and by contractual arrangements. The guild, the manor, the state, and even the Church, imposed each its peculiar restrictions, and the industrial status and prospect of the individual were determined quite as largely by agencies beyond his power to control as by his own habits of enterprise and thrift. It is only within decades comparatively recent that the mass of men in Europe have acquired substantial freedom of industrial initiative and achievement. If the key-note of the economic history of the United States since 1789 has been expansion, that of the economic development of continental Europe during the same period has been liberation. Speaking broadly, one may say that the first great advance in the direction of liberation was accomplished by the Revolution in France in 1789-1794 [see FOOD REGULATION: 1793-1794]; that a second was realized under Napoleon, though accompanied by a certain amount of retrogression; that the period 1815-1845 witnessed small progress, except on the side of industrial technique; but that after 1845-1850 the triumph of the liberalizing principle was rapid and thoroughgoing. The transformations by means of which liberation has been wrought took place within all of the three principal fields of economic activity,—agriculture, manufacturing, and trade; and in any attempt to measure the progress of the average man during the period in hand the nature and extent of the changes in these three fields must continually be taken into account.

"Since 1789 the acreage of land cultivated in most continental countries has been enormously extended and new appliances and methods have been introduced, with the result of an increase that is remarkable in the yield both of foodstuffs and of materials for manufacture. Even more important, however, has been the sweeping readjustment of the position occupied by the tillers of the soil themselves. Emancipated from oppressive dues and services to landlord and state, and enabled to acquire land of their own, the rural inhabitants of almost every continental country have been brought up to a status vastly superior to that which their ancestors occupied a century and a half ago. The first nation within which the agricultural liberation took place was France. As has been indicated, one of the earliest decisive achievements of the Revolution in France was the abolition of all survivals of feudalism and serfdom; and this reform was accompanied by the conversion of numerous tenants, dependent cultivators, and ordinary laborers into independent, self-sustaining landholders. It used to be supposed that the multiplicity of little proprietorships which lends distinction to France to-day was wholly a

consequence of the Revolution. Research has shown that this is not true—that, in fact, the breaking up of the agricultural lands of France into petty holdings was already under way long before 1789. Some students of the subject have gone so far as to maintain, indeed, that the number of landed proprietorships in France was scarcely smaller prior to 1789 than it is to-day. There can be no question, however, that during the Revolution the growth of little holdings was greatly accelerated, notably through the sale of estates confiscated from the crown, the nobility, and the Church; nor that the general effect of the Revolution was to enhance the agricultural prosperity of France. . . . Throughout modern times France has been preëminently an agricultural country, and to this day the nation's enormous wealth is derived principally from the products of the soil rather than from manufactures and trade. Nearly one-half of the population of the republic to-day is employed upon the land, whereas in England and Wales the proportion is but one-tenth. No business has come to be better understood than husbandry, and the nation not only is entirely self-supporting in the matter of foodstuffs, such as cereals, meat, and dairy produce, but exports these articles heavily to other portions of the world. The great mass of cultivators are proprietors of little estates ranging in area from five to fifty acres. Three million proprietors occupy holdings of less than twenty-five acres apiece. Of waste land very little remains.

"In considerable portions of Germany agricultural advance in the earlier nineteenth century followed a course roughly analogous to that observed in France, although the remarkable expansion in Germany since 1871 of industry and of trade has brought that nation into an economic position fundamentally unlike that which France now occupies. At the beginning of the [last] century Germany was even more purely agricultural than was France. In 1804, 73 per cent of the population of Prussia was rural, and throughout Germany as a whole the proportion of the population engaged in agriculture was not less than 80 per cent. The natural resources of the country were then, as they are now, less favorable for agriculture than those of France, and agricultural methods were very poorly developed, with the consequence that the product was inferior and agricultural wealth meagre. Advance in technique, even past the middle of the nineteenth century, was distinctly slower than in France, but the changes wrought in the status of the agricultural laborer were in no small measure the same. The Napoleonic era became in Prussia a period of economic transformation, involving the abolition of serfdom. Throughout other portions of Germany serfdom had all but disappeared prior to the close of the eighteenth century, the serfs having obtained their freedom in some instances by purchase, but more frequently through the simple evaporation by imperceptible degrees of the traditional seigniorial rights. The non-existence of serfdom was recognized in all of the states, by 1820. In Germany, as in France, the beginnings of petty peasant holdings antedate the nineteenth century, but by the rise of the agricultural population from dependency to freedom the tendency toward the multiplication of these holdings was greatly accentuated. Just as in France, however, the small-holding idea did not work out everywhere alike, so that the holdings of the northwest became, on the average, considerably larger than those of the south, so in Germany the principle was very variously applied, and, in truth, in some

important portion of the country was not applied at all. In the northeast, beyond the Elbe, the same thing happened that happened in the England of the eighteenth century, namely, the concentration of land in estates even larger than those which had prevailed in earlier days. But in both the northwest and southwest the number of holdings was increased and their average size decreased, the principal difference being that in the north the holdings were as a rule larger than in the south. In the northeast, especially in Mecklenburg and Silesia, such small holders as there were fell pretty generally, by 1850, to the status of landless agricultural laborers, and their holdings were absorbed in the large estates, the consequence being that sharp differentiation of landlords and rural wage-earners which to the present day has comprised one of the principal problems of the east Prussian provinces. Agricultural development in Germany during the course of the nineteenth century was notably inferior to that which took place in France, and the state of German agriculture to-day is by no means wholly satisfactory. Between 1816 and 1887 the acreage under tillage was increased from 23,000,000 to 44,000,000, and in the same period the production of grain was more than doubled. The three decades from 1840 to 1870 were, on the whole, an era of rural prosperity, marked by an increased price of products and a decreased cost of production, arising principally from the introduction of agricultural machinery and of scientific methods of cultivation. About 1874-75, however, there set in, as at the same time in England, a pronounced agricultural depression, from which there has never as yet been any considerable recovery. The fundamental cause of depression, as also largely in England, was the decline in the price of agricultural products arising from the competition of American grains and meats. Despite tariffs designed to counteract competition, the price of wheat and of rye fell between 1876 and 1898 by 14 per cent and that of barley by 11. Other contributing causes, however, have been the scarcity and irregularity of labor, the necessity of paying increased wages, the heavy mortgages which to-day encumber half of the agricultural land of the country, and the unbusinesslike methods which long operated to impede the conduct of agricultural operations. Through the spread of education among the agrarian classes and the establishment of coöperative societies, the state of agriculture is tending somewhat to be improved, but it is still by no means favorable. In 1900 only 47.6 per cent of the area of the country was under cultivation, as compared with upwards of 80 per cent in France. In respect to foodstuffs the nation is not self-sufficing, and there is every reason to suppose that its dependence upon supplies obtained from the outlying world will tend steadily to be increased. Since 1900 the importation of cereals alone has averaged from 4,500,000 to 6,000,000 tons a year."—F. A. Ogg, *Social progress in contemporary Europe*, pp. 98-106.

of root crops and improved methods of farming.

—Growth of the domestic system of industry.—Its effects upon agrarian organization.—During the seventeenth century in England "several improvements were made under the influence of foreign refugees. . . . The inhabitants of the Low Countries . . . now introduced into England the cultivation of winter roots. . . . The introduction of hops also was of great importance. . . . As the use of winter roots had been the special feature of the seventeenth century, so the feature of the eighteenth was the extension of artificial pasture and the increased use of clover, sainfoin, and rye-grass; not of course, that these had been hitherto unknown, but now their seeds were regularly bought and used by any farmer who knew his business. At first, like all other processes of agriculture, the development was very slow and gradual, but it went on steadily nevertheless."—H. De B. Gibbins, *Industry in England*, pp. 206-270.—"Many new crops were introduced from Holland, where the advantages of turnips and such artificial grasses as clover, sainfoin, and lucerne were well known. Potatoes, too, began to be an important field crop after the middle of the seventeenth century, though they had not become a common food but remained rather a delicacy even at its close. . . . Attention was also paid to the implements employed, and the older crude and clumsy tools began to be replaced by better ones. The plough was improved, and drills for sowing began to be employed. The Dutch also taught the importance of the use of the spade. . . . Improvements were also effected in the use of manures. Liming and marling were renewed, and new forms of manuring were adopted. The use of sand, seaweed, oyster shells, and fish as manures was now known, and these were employed wherever the situation of the land made their use possible. The newly formed Royal Society paid much attention to the question of agriculture, and made many useful and profitable suggestions. But the greatest difficulty in the way of improvement was the innate conservatism of the farmers, who objected to new crops and new methods and tried to retain the customs of their forefathers. Where the land was still open-field progress was well-nigh impossible; in the enclosed farms there were enlightened agriculturists who were leading the way along better lines."—F. W. Tickner, *Social and industrial history of England*, pp. 337-338.—"The pioneers of this improved agriculture came from Norfolk, among the first being Lord Townshend and Mr. Coke, the descendant of the great Chief Justice. The former introduced into Norfolk the growth of turnips and artificial grasses, and was laughed at by his contemporaries as Turnip Townshend; the latter was the practical exponent of Arthur Young's theories as to the advantages to be derived from large farms and capitalist farmers. With improvements in cultivation, and the increase both of assiduity and skill, came a corresponding improvement in the live stock. The general adoption of root crops in place of bare fallows, and the extended cultivation of artificial grasses, supplied the farmer with a great increase of winter feed, the quality and nutritive powers of which were greatly improved. Hence with abundance of fodder came abundance of stock, while at the same time great improvements took place in breeding. This was mainly due to Bakewell (1760-1785), who has been aptly described as 'the founder of the graziers' art.' He was the first scientific breeder of sheep and cattle, and the methods which he adopted with his Leicester sheep and longhorns applied through-

out the country by other breeders to their own animals.' The growth of population also caused a new impetus to be given to the careful rearing and breeding of cattle for the sake of food, while the sheep especially became even more useful than before, since, in addition to the value of its fleece, its carcase now was more in demand than ever for meat. In various ways, therefore, the improvements in agriculture mark a very important advance, and the close of the eighteenth century witnessed changes in the field as great in their way as those in the factory."—H. De B. Gibbins, *Industry in England*, pp. 429-430.

"In order to understand the nature and extent of the changes wrought by the agricultural-industrial revolution [of the late eighteenth and early nineteenth centuries] it is necessary to bear in mind certain facts regarding the economic situation in England before the transformation came about. In the first place, England was still predominantly an agricultural country. Not until 1792 did the production of British grain fall below the volume of home consumption, so that it began to be necessary for the nation to rely regularly in some degree upon imported foodstuffs. Long past the middle of the eighteenth century the tilling of the soil was the standard occupation of the laboring masses. Cities were few and small, and city life played a minor part in the economy of the nation. In the second place, it is to be noted that the conditions of land tenure were still largely mediæval. In portions of the country where the manorial system had never been established, land was possessed outright by individual proprietors, but in more than half of the kingdom at the close of the eighteenth century the forms of tenure were governed by survivals of the manorial régime. . . . It was the proprietor who owned the land; the tenants were owners only of certain 'rights' and 'interests' which the proprietor vested in them. On the manors generally the ancient methods of administration . . . still prevailed. The third point of importance is the inseparable association in the eighteenth century of the cultivation of land and the domestic system of industry. The ordinary rural family derived its support at the same time from agriculture and manufacture. The industrial output of England in the earlier eighteenth century was large, but it was the output, not of factories, but of the numerous and widely scattered 'little industries' of the kingdom. And these little industries were, in the main, not urban, but rural. . . . In days when the processes of manufacture involved simple handicraft, not the use of complicated and costly machines, this was perfectly practicable. One of the most widespread forms of domestic industry was the making of woollen cloth. In the manufacture of this commodity virtually every process involved could be, and was, carried on under the roof of the humblest cottager. . . . Woollen fabrics commanded a ready sale, usually at a good price, and the petty agriculturist who would have found it difficult enough to support his family solely from the product of his bits of ground had in the woollen and other industries a welcome opportunity to supplement his scant means of livelihood. . . . In his 'Tour through Great Britain,' written at the end of the first quarter of the eighteenth century, Daniel Defoe affords an interesting glimpse of domestic manufacturing as he found it in the region of Halifax, in Yorkshire. 'The land,' he says, 'was divided into small enclosures from two acres to six or seven each, seldom more, every three or four pieces of land having a house belonging to

them; hardly a house standing out of speaking distance with another. At every considerable house there was a manufactory. Every clothier keeps one horse at least to carry his manufactures to the market; and every one generally keeps a cow or two, or more, for his family. By this means the small pieces of enclosed land about each house are occupied for they scarce sow corn enough to feed their poultry. The houses are full of lusty fellows, some at [the] dye-vat, some at the looms, others dressing the cloths, the women and children carding or spinning; being all employed, from the youngest to the oldest.'

"It is but fair to observe that the conditions of domestic manufacture varied widely in different regions. . . . Even where the measure of industrial independence was largest, the domestic system operated unquestionably in the eighteenth century to the deterioration at some points of the working population. Competition grew keener; wages fell; child labor became more common; workmen were led to dispose of their lands because they had ceased to be able to find time to cultivate them."—F. A. Ogg, *Social progress in contemporary Europe*, pp. 63-67.

British Isles: Late 18th to early 19th centuries.—Agricultural revolution.—"During the later eighteenth century and the earlier nineteenth England underwent a social and economic readjustment . . . essentially industrial and social. For present purposes . . . [these changes] may be grouped with convenience under two heads: (1) the transformation of agriculture, and (2) the revolution in industry. . . . Properly considered, the industrial revolution was the transformation which came about in the process and conditions of manufacture in consequence of the invention of machinery, especially machinery which involved the application of steam-power. . . . The 'agricultural revolution' meant different things in different parts of Europe. . . . What it meant in England was, in brief, the concentration of the ownership and control of land in the hands of a decreasing body of proprietors, the enclosure of the common lands upon the use of which the cottager class had been largely dependent, the reduction of many men to the status of wage-earning agricultural laborers, and the driving of many from agricultural employment altogether. It began toward the close of the eighteenth century and had run its course practically by 1845."—F. A. Ogg, *Social Progress in contemporary Europe*, pp. 62-63.—See also INDUSTRIAL REVOLUTION: FRANCE; INDUSTRIAL REVOLUTION: GERMANY; INDUSTRIAL REVOLUTION: UNITED STATES.

"The formative period of the factory system was the period also in England of the beginnings of the revolutionizing of agriculture. Of the two things each served in part both as cause and as effect. The rise of the factory was facilitated by the dislodgement of large numbers of people who had been accustomed to live by agriculture and domestic manufacturing conjointly. Conversely, the alteration of agricultural economy was stimulated by the drawing off to the towns of the surplus rural population and by the greatly increased demand for foodstuffs for the support of the industrial and trading classes. . . . The revolution in agriculture worked itself out in a variety of directions, but the principal elements in it were (1) a marked improvement in the technique of husbandry; (2) a greatly increased application of capital to agricultural operations; (3) the concentration of land in great estates owned by a small body of aristocratic proprietors and operated under the immediate direction of capitalistic entre-

preneurs known technically as 'farmers'; and (4) the virtual disappearance of the cottager class by which formerly the tilling of the soil had been carried on in connection with domestic industry. The stimulus came originally from the steady rise after 1760 in the price of agricultural produce, occasioned by the increase of population and of wealth derived from manufactures and commerce. With the growth, especially after 1775, of the factory system great industrial centres appeared, whence came ever increasing demand for food, and it was in no small measure to meet this demand that farms, instead of continuing small self-sufficing holdings, were enlarged and converted into manufactories of grain and meat. Within the domain of agriculture, as in that of industry, science and skill were brought to bear, to the end that the product might be greater and the cost of production less. Rational schemes of cropping replaced antiquated ones, the art of cattle-breeding was given fresh attention, and agricultural machinery, which called for considerable initial outlays, was widely introduced. The husbandry of the new type involved the employment of capital and the carrying on of farming operations upon a large scale. The average English husbandman of the eighteenth century, however, possessed no capital and had very little land. With the capitalistic agriculturists of the later decades he found it more and more difficult to compete, and the consequence was that gradually but inevitably he was forced into an entirely novel economic position. Through the revival of enclosures he lost his rights in the common lands of his parish; the land which he had owned or held individually he was compelled to sell or otherwise alienate; while he himself either went off to become a workman in a factory town or sank to the status of a wage-earning agricultural laborer.

"Gradually from the readjustment emerged the three great classes of men concerned in the English agriculture of later times, and of to-day: (1) the landed proprietors, who let out their land in large quantities to farmers in return for as considerable a rental as they can obtain; (2) the farmers, who, possessing no proprietary interest in the soil and no direct community of interest with either landlords or laborers, carry on agricultural operations upon these rented lands as capitalistic, profit-making enterprises; (3) the agricultural laborers who neither own land nor manage it, but simply work under orders for weekly wages, as do the operatives in the factories. It is in consequence of this great transformation that it has been brought about that among western European nations to-day it is Great Britain which has the largest average holding, the smallest proportion of cultivators who own their holdings, and the smallest acreage owned by its cultivators. In 1876 there was published in England a body of land statistics commonly designated the New Domesday Book. By this return it was shown that the aggregate number of landowners in England (outside London) was 966,175, of which number only 262,886 possessed more than one acre. At the same time France, with a population only a third larger, had some 5,600,000 landed proprietors, and Belgium, with a population of but 7,000,000, had as many as 1,000,000. From the return it further appeared that 28 English dukes held estates aggregating nearly 4,000,000 acres; 33 marquises 1,500,000 acres; 194 earls, 5,862,000 acres; and 270 viscounts and barons, 3,785,000 acres. Nearly one-half of the enclosed land of England and Wales was owned by 2250 persons; while at the same time nine-tenths of Scotland was owned by

1700, and two-thirds of Ireland by 1942. The divorce of the agricultural laborer from proprietary interest in the soil, which was the outcome of the capitalistic, concentrating transformation of agriculture between 1775 and 1850, is above all other things the distinctive feature of British agricultural economy in the last two generations.

"By the break-up of the domestic system of industry, occasioned by the development of large-scale manufacturing and of factory methods, the position of the small-farming population must in any case have been altered profoundly for the worse. The process was vastly accelerated, however, by the widespread revival in the later eighteenth and earlier nineteenth centuries of the enclosure of common lands. To 'enclose' a parish meant to redistribute its open fields, its wasteland, and its meadows among all those who possessed land rights within the parish in such manner that each of these persons should obtain one continuous and enclosed holding which would be equivalent to his former scattered holdings in the open fields plus the rights in meadow and waste appurtenant to these holdings. The processes by which enclosure was effected were various. Where it was possible to secure the unanimous consent of the holders of rights and interests of all kinds within the parish, the change might be carried through by the authorities of the parish themselves. Unanimous consent, however, was not likely to be obtained and in practice the process was pretty certain to involve two stages—first, the procuring of the assent of the possessors of four-fifths of the aggregate value of the land involved and, second, the passage of a special act by Parliament authorizing the enclosure and compelling the dissenting minority to acquiesce. As a rule enclosure measures, in which were stipulated the necessary arrangements for surveys, compensation, and redistribution, were actually drawn by the large landholders and other persons of influence in the parishes concerned. In 1801 a statute was enacted to make easier the passage of private bills for enclosure. An act of 1836 went further and made it possible, with the consent of two-thirds of the persons interested to enclose certain kinds of common lands without specific authorization of Parliament. And a general enclosure act of 1845 created a board of Enclosure Commissioners authorized to decide upon the expediency of projected enclosures and to carry them into execution if approved.

"The number of enclosure acts passed by Parliament between 1700 and 1850 and the approximate area of the lands enclosed were as follows:

	No. of Enclosure Acts	Acres Enclosed
1700-50	244	337,877
1760-60	385	704,550
1770-70	660	1,207,800
1780-80	246	450,180
1790-90	460	858,270
1800-00	847	1,550,010
1810-10	853	1,500,000
1820-20	205	375,150
1830-30	136	248,880
1840-49	66	394,747

"During the period 1760-1830 enclosures were especially numerous, and after 1850 little open land remained. The lands enclosed, unlike those enclosed in the fourteenth, fifteenth, and sixteenth centuries, were intended for cultivation, and care was taken, as a rule, furthermore, that every possessor be compensated, either in land or in money, for all of the common rights of which he

was deprived. None the less, the effects of enclosure upon the average small holder were likely to be disadvantageous. Heretofore the tenant had been accustomed to utilize his own allotments of land entirely for the growing of crops. His cow, his donkey, his flock of geese, found such sustenance as they could on the common lands of the parish. Now the common lands disappeared and the cottager must not only grow foodstuffs for his family upon his bit of ground, but must also provide upon it pasturage and meadow for his live stock. To share in the use of an open common might be, and generally was, more desirable than to occupy exclusively a petty enclosed holding. Not infrequently the compensation which the individual cottager obtained for the common rights which he yielded, took the form of money. Such sums, however, were easily expended, and the cottager was apt to find himself without anything to show for the valuable rights which once he had possessed. To his difficulties was added the fact that the application of capital to agriculture on the part of the large landholders, and the introduction of methods of cultivation which were for him impracticable, placed him at a distinct disadvantage in the growing of marketable produce."—F. A. Ogg, *Social progress in contemporary Europe*, pp. 62-63, 70-78.

"That the changes induced by the new system have been beneficial to agriculture no one will attempt to deny, just as no one can dispute the benefits conferred upon industry by the use of machinery; but, at the same time, one cannot be blind to the fact that these great industrial changes, both in manufactures and agriculture, brought a great amount of misery with them, both to the smaller employers and the mass of the employed. The change in agriculture brought with it a new agricultural and social crisis more severe than that of the Tudor period. The [eighteenth] century closed with the miseries that resulted from enclosures, consolidation of holdings, and the reduction of thousands of small farmers to the ranks of wage-dependent labourers. The result of the crisis was to consolidate large estates, extinguish the yeomanry and peasant proprietary, to turn the small farmers into hired labourers, and to sever the connection of the labourer from the soil. In a comparatively short time the face of rural England was completely changed; the common fields, those quaint relics of primitive times, were almost entirely swept away, and the large enclosed fields of to-day, with their neat hedges and clearly-marked limits, had taken their places. The improvements in agriculture, the enclosures, the consolidation of small into large farms, and the appearance of the capitalist farmer are, then, the chief signs of the Agricultural Revolution. They form an almost exact parallel to the inventions of machinery, the bringing together of workers in factories, the consolidation of small by-occupations into larger and more definite trades, and the appearance of the capitalist millowner in the realm of manufacturing industry."—H. De B. Gibbins, *Industry in England*, pp. 431-432.—See also ABSENTEEISM.

British Isles: 1815-1875.—Prosperity.—"In the history of agriculture in the British Isles during the past hundred years there are to be distinguished two general stages. The first, extending from the close of the Napoleonic wars to about 1875, was a period of intermittent, but on the whole substantial, prosperity. The second, extending from 1875 or 1880 to the present day, has been an epoch of almost unrelieved depression. The principal facts concerning the first of these periods

can be stated briefly. At the outset it is to be borne in mind that there went on steadily, from beginning to end, and without longer occasioning much comment, the extension of the large farm system which had set in during the preceding century. The enclosing of waste and other common land continued, the number of enclosure acts passed between 1815 and 1845 being 244 and the area enclosed being 199,300 acres; and wherever small farms were given up they were practically certain to be added to larger holdings. Consolidation proceeded with equal rapidity in arable and grazing districts. The first half of the period, furthermore, witnessed the almost total disappearance of the yeomanry. The greater part of this once important element in the country's population had vanished prior to 1815. Between that date and the middle of the century the remainder largely succumbed, and to-day the class is represented by only scant survivors in Westmoreland, Somersetshire, and a few other remoter counties. In legislation of 1819 and 1832 attempt was made to offset the tendencies of the time by provisions under which local authorities should acquire land and allot it to poor and industrious persons; but the effect was negligible. Whereas in 1811 the agricultural population comprised thirty-four per cent. of the whole, in 1821 it comprised but thirty-two per cent.; in 1831, twenty-eight per cent.; in 1841, twenty-two per cent.; in 1851, sixteen per cent.; and in 1861, ten per cent. The social distress occasioned by this continued readjustment was at times scarcely less severe than in earlier decades. To such elements as were in a position to profit from the new conditions, however, the period brought a large measure of prosperity. Primarily these were, of course, the greater landowners. In the first place, the prices of agricultural products, while subject to much fluctuation, continued as a rule to be high. Prior to 1846 they were supported, or were supposed to be, by the Corn Laws; although, contrary to all expectation, the repeal of those measures was followed by no serious fall in the price of wheat and other grains during a period of thirty years. Until the last quarter of the century, the British producers held their own against the vast grain-yielding areas of Russia, America, Egypt, and India, and it was only when, through the improvement and extension of steamship and railway lines, the transportation of bulky commodities to great distances had been made convenient, speedy, and cheap that the force of foreign competition became sufficient to involve the British corn-growers in disaster. Until that time production did not decline, and home-grown grain was only supplemented, not displaced, by the imported commodity. Between 1853 and 1873 the seasons, with only two or three exceptions, were favourable, and it is commonly regarded that for the agricultural interests these decades were the most prosperous of the century. Throughout the whole of the second and the third quarters of the century, moreover, agricultural technique was undergoing steady improvement. The studied application of science to agriculture really began in the nineteenth century, when the chemical composition of soils was first determined carefully, and the means of its restoration made a matter of common knowledge and use. Nitrate of soda and guano were employed from about 1835 on; and superphosphate of lime, first recommended by the German chemist Liebig, was introduced into England by Sir J. B. Lawes, who obtained this by dissolving bone-dust in sulphuric acid. The gradual introduction of phosphates and ammoniacal manures,

the increased attention paid to the cultivation of artificial grasses and the selection of seeds, the use of superior machines for agricultural purposes—the sub-soil plough, Meikle's threshing-machine, drilling and reaping machines—all these operated to increase the prosperity of the agricultural classes. "The list of field crops was extended by the addition of Italian rye-grass, winter beans, Belgian carrots, and alsike clover. Stock-breeding was given increased attention, and the better breeds were disseminated more widely through the country. An interest in agricultural science was promoted by the establishment of the Royal Agricultural Society in 1838 and of the Royal Agricultural College at Cirencester and the Agricultural Chemistry Association in 1842. In 1864 the government began the systematic collection and publication of agricultural statistics. Finally may be mentioned the fact that, whereas throughout most of the period arable farming strongly predominated, after about 1865 there was a notable extension of pasture-farming, so that the two were carried on more generally together, and with increased profit."—F. A. Ogg, *Economic development of modern Europe*, pp. 159-161.—See also TARIFF: 1815-1828.

British Isles: 1875-1900.—Decline.—"As a great department of economic activity, agriculture had long since been eclipsed, in point of numbers and of value of output, by manufacturing. Under conditions thus fundamentally altered, however, the agriculture of the middle portion of the nineteenth century was prosperous, and its well-being was prolonged almost unimpaired until the immediate eve of the great era of depression. . . . In 1876 and 1877 poor harvests, cattle-plague, and sheep-rot involved the agricultural classes in dire disaster. In 1882 a government commission testified mournfully to the 'great extent and intensity of the distress which has fallen upon the agricultural community.' And as time went on it began to appear that, far from being merely ephemeral, the adverse conditions which had arisen were permanent and perhaps largely irremediable. In point of fact, the depression which had thus settled upon the agrarian portion of the country has continued with only a modicum of relief to the present day. The statistics of the decline of agricultural prosperity are easier to ascertain than are the causes involved; and the causes are less difficult to determine than are the remedies. The first matter to be observed is the sharp reduction since 1875 of the amount of land under cultivation and the considerable increase of the amount utilized for grazing. . . . The total area devoted to wheat fell from about 3,700,000 acres in 1870 to 3,100,000 acres in 1880; 2,500,000 in 1890, and 1,700,000 in 1900. In 1911 it was about 1,000,000 acres. The decline in acreage has been heaviest in the case of wheat; but it has appeared in some measure in all corn crops grown in the United Kingdom except oats. Taking corn crops as a whole, the area cultivated was diminished by three million acres, or almost forty per cent., in the three decades 1876-1906. [During the Great War there was a marked increase. The acreage of wheat was 2,221,000 in 1910.] From these facts it follows that there has been a large falling off in the output of agricultural product. The production of wheat in the United Kingdom, which in the years 1841-1845 was sufficient for 24,000,000 persons, or almost ninety per cent. of the population, has declined until home-grown wheat in 1906 fed but 4,500,000 persons, or 10.6 per cent. of the population. The area under grass increased by almost one-third in 1876-1906; yet the quantity of meat

produced from home-fed stock was increased by only five per cent. From this situation it arises that the British people have become dependent in a fairly astounding degree upon foodstuffs imported from abroad. In 1875 the value of imported food supplies of all kinds was £124,000,000; in 1905 it was £205,000,000. On their face these figures, however, convey no adequate impression of the magnitude of the change. . . . This factor taken into consideration, it appears that the volume of food imports was increased during the period by 130 per cent., or almost four times the increase in population."—*Ibid.*, pp. 161-162.

British Isles: 20th century.—Development.—"Speaking generally the British Isles are intensively cultivated, the amount of land available being small and the agricultural population highly skilled in their industry. At the same time the proximity of valuable industries with a high rate of wages has drawn the agricultural population off all land that does not yield a high return to the cultivator, and in consequence there are in the British Isles many comparatively large areas which can hardly be said to be farmed at all, though they pay a trifling return per acre on an inconsiderable expenditure for labour. The density of the agricultural population in England averages about 125 per square mile, in Ireland about 100, both very high figures as compared with America and other new countries, but far below those which prevail in India, China, and Japan. They are also exceeded on the continent of Europe in Belgium, Holland, and Denmark, though not to any marked degree. The average yield per acre is only exceeded in Belgium, Holland, and Denmark. . . .

"The most characteristic feature of the agriculture of Great Britain is [that] the greater part of the land is farmed by comparatively large tenant farmers holding from 200 to 500 acres of land and possessed of both a considerable amount of capital and a high standard of cultivation. On less than 12 per cent. of the land are the occupiers owners, and the occupier-owners have steadily decreased of late years. . . . The British system of land tenure with its comparatively large holdings is in the main the outcome of the enclosures of the old common fields which took place most markedly towards the end of the eighteenth century. In a few districts the land has not been enclosed but is still held in narrow strips of one-acre and half-acre pieces. . . . In the British system of tenant farming the owner not only provides the land and buildings but is also responsible for all the permanent improvements upon the farm, and continues to supply material for gates, fences, drains, and repairs to the fabric. He thus becomes a very considerable partner in the farming enterprise, and it has been shown that on many of the large estates the rent does not represent a commercial interest on the capital that has been expended on the land during the last century, without allowing any value to the land itself. The development of British farming and the comparatively advanced stage it has reached have been due to the manner in which the tenant's capital has thus been free for the purposes of his business; he has been tempted to embark his capital freely by possessing a practical security of tenure and yet no obligation to remain if the business became unprofitable. The majority of the farms in Great Britain are held on yearly tenure, long leases being very uncommon. The effectiveness of the system may be judged not only from the comparatively high yields per acre but also from the improvement

that has been effected in the breeds of live stock, chiefly by tenant farmers. The conscious formation of specific breeds of live stock began in England in the latter part of the eighteenth century, and in no other country has attained to such a degree of perfection. As a consequence the newer countries which have been so largely opened up during the nineteenth century have been peopled almost exclusively with British breeds of live stock. The great cattle ranches of America, Argentina, and Australia are exclusively occupied by British stock, chiefly Shorthorns and Herefords, and certain British races of sheep have an equally wide distribution; in fact the only continental races that have been developed out of their own districts are the Holstein-Friesian dairy cattle and the Merino sheep. At the present time Great Britain is still resorted to by the breeders of all countries for sires whereby to improve their country stock and a valuable export trade in pedigree animals is carried on. One of the most marked features of English farming is the number of sheep that are carried . . . and though the British numbers are exceeded in Australia, . . . Argentina . . . and the United States . . . the density of the sheep in Great Britain is far greater than in any other country. In England also the sheep are almost as abundant on arable land as on the grass, because of the practice prevailing on all the lighter soils of consuming turnips and other green crops by sheep folded on the arable land. . . . It is difficult to trace any general causes at work in the distribution of large or small holdings. Poor land that is still fit for arable farming is generally divided into extensive farms, as for example, the land lying on the chalk, where the holdings are very often of 800 acres and upwards. On the other hand, the poorest land in the country is often cut up into comparatively small farms because it has never been sufficiently tempting to the large capitalist farmer. . . . Light soils in the neighbourhood of good markets are generally occupied by small holders engaged in market-gardening, milk production and other intensive forms of agriculture demanding a good deal of labour. . . . In Ireland, in Wales, and in Scotland away from the rich arable land in the eastern straths, we find the land divided into small grazing farms occupied by comparatively poor men employing little or no additional labour and content to work for a small pecuniary return. Finally, on the extreme western seaboard of Scotland and Ireland where both the land and the climate are unfavourable to agriculture we have a population of crofters tilling very small areas for a bare subsistence, far below the usual economic level prevailing in the British Isles. [For statistics of production see ENGLAND: 1901.]

"The cultivated land in Scotland is confined to the fringe of lowlands on the eastern coast, the broad river valleys and straths and the western seaboard of the lowland counties below the elevation of 600 feet or so. Of the cultivated land the greater proportion is under arable cultivation, but a large proportion of this is occupied by temporary grass which is left down for two or three years before coming into crop again. . . . Scottish farming generally is distinguished by a very high level of skill, culminating in the Lothians, where the most highly developed arable farming in the world may be seen. The statistics of production bear evidence of the general excellence of Scottish agriculture. [See SCOTLAND: 1750-1921.] . . . The holdings in Wales are . . . small, and because of the elevated . . . country and the high rainfall only a small proportion of the land is un-

der arable cultivation, except on some of the alluvial soils in the valleys and in Anglesey. The uplands are chiefly occupied by sheep, of which two races may be distinguished—the true mountain sheep and the forest sheep, which more properly belong to the march countries, Radnor and Montgomery. From the latter stock one or two distinct breeds have been segregated; indeed the widely distributed Shropshire breed has originated from it through a certain infusion of South Down blood. . . . Speaking generally Welsh farms are small and the land not rich, but even in the favourable districts, as in the island of Anglesey, the agriculture is backward and undeveloped.

"In many respects it is difficult to compare the farming of Ireland with that of the rest of Great Britain, so entirely different has been the system of land tenure. In Ireland the landlord has never carried out the improvements, but merely allowed his tenants the use of the land. [See also ABSENTEEISM.] The absence of any competing industries, to draw the sons of the farmers off the land, also resulted in continued subdivision, until the average size of the holding has become very small—28 acres, as compared with 63 acres in Great Britain. Having to such an extent made their farms, the tenants acquired, first by custom and then by law, a tenant-right in their improvements, which within the last few years has developed into a system of State-aided purchase, which will eventually make the tenants owners of their own farms. Owing to the comparatively high rainfall, the indifferent drainage of the river valleys in the central plain, and the equable temperature, Ireland as a whole is a country more suited to the growth of grass than to corn, and over a large part of the country very little arable farming is to be found. By temperament also the Irishman seems to be rather a grazer than a farmer. . . . With this restriction of arable farming to the better lands, and the equable climate and rainfall, the yields per acre of corn and especially of roots in Ireland are comparatively high. The area under tillage, however, is only just beginning to show signs of increase, though it is difficult to see how holdings of the Irish size can be economically profitable, except under intensive arable cultivation. The most strongly-marked farming district in Ireland lies in the eastern side of Ulster and comprises County Down and other counties abutting on Lough Neagh. These are arable counties, except where the elevation is too great or the land too boggy; the land is mostly divided into small farms, not exceeding 50 acres, occupied by men of Scottish origin. Very fine farming is to be found in Ulster; particularly the crops of potatoes and roots are often very large. Little wheat is grown, but on the coast of County Down, especially in the Ards peninsula, barley becomes an important crop; everywhere else oats form the chief and almost only cereal. Flax-growing forms an important feature in the Ulster farming; except on a small recently revived area in Cork, flax is now confined to Ulster, where the acreage undergoes rapid fluctuations from year to year according to the demand for fibre. Another characteristic crop of the district is grass seed. Cattle are extensively bred, there being a number of pedigree Shorthorn herds in the neighbourhood of Lough Neagh; but sheep are unimportant. This district has an export trade in oats, potatoes, and hay with Glasgow and Liverpool. Going southward the arable land does not extend much past Dundalk, but in the South of Louth, Meath, and northern Kildare passes into a great area of rich grassland—a thinly populated

country given over to the summer grazing of bullocks and commanding for that purpose exceptional rents up to £3 an acre or more. These famous Meath grazings are largely let on terms of eleven months only, so as to prevent the occupier acquiring any tenant-right by a continuous tenancy. Below the central grazing district will be found a few areas of arable farming in south Kildare, Queen's County, Tipperary, and Kilkenny; similar areas occur in Wexford and again in Cork, though the farming in the centre and south of Ireland rarely reaches the general high pitch of Ulster. The Shannon counties, and particularly Limerick, form the great dairying district of Ireland, and here also are raised the store cattle

which cross the Channel in such large numbers to be fattened by the English graziers. Lastly, on the western seaboard in Clare, Galway, Mayo, and Donegal come the congested districts, where an impoverished population wring a bare sustenance out of entirely inadequate patches of land that have been reclaimed from the mountain and bog.—A. France: Development since the Revolution.—Small holdings.—“The continental country in which the liberation of agriculture first took place upon a considerable scale was France. There, as

elsewhere, the development presents three principal phases: (1) the emancipation of the rural labourer in respect to his person; (2) the release of agricultural technique from the fetters imposed by law and custom; and (3) the liberation of the land, similarly, from ancient legal and customary fetters, and the opening of it to the possession of large numbers of people. One of the capital achievements of the Revolution was the abolition of all survivals of feudalism and serfdom. The number of serfs remaining to be set free in 1789 was not large. None the less, the liberation of such as there were, together with the cancellation of an intricate mass of surviving feudal and manorial obligations, was a step necessary to be taken before the French agricultural classes could be put in the way of the largest prosperity. By it the French people were guaranteed for the first time a universal status of personal legal freedom. The liberation of technique, involving especially the abandonment of the three-field system and the introduction of machinery and of new methods of cultivation, came gradually and did not reach full fruition before the second half of the nineteenth century. In some of its aspects, at least, it was promoted, as well as accompanied, by a development which must be considered much the most important of all, i. e., the conversion of tenants, dependent cultivators, and ordinary labourers into independent, self-sustaining landholders; and attention must first be directed in some detail to this fundamental matter. Formerly it was supposed that the multiplicity of small proprietorships which is the distinguishing feature of rural France to-day was wholly a consequence of the Revolution. Research has shown that this is not true—that, on the contrary, the breaking up of the agricultural lands of France into little holdings was already under way long before 1789. . . . Throughout the seventeenth and eighteenth centuries impoverished seigneurs in increasing numbers had been obliged to sell land to their tenants; while the number of small holdings had been increased steadily by the redemption of waste land and by the enclosure and division of common land. No reliable statistics of French landholding prior to 1789 exist. Arthur Young, however, says that in 1787 a third of the land was tilled by peasant owners; and it has been estimated that at the outbreak of the Revolution the total number of proprietors was about three millions, of whom three-fifths would be classified to-day as small proprietors. . . . After full allowance has been made for the growth of small holdings before the Revolution, the fact remains that the development was much accelerated by the Revolution itself. In the first place, the improvement of the conditions of landholding, through the suppression of manorial obligations, stimulated the desire of larger numbers of men to become proprietors. In the second place, the Revolution emphasised the principle—and Napoleon sought to enforce it in the Code—of egalitarian inheritance, in accordance with which the bulk of a testator's property was required to be divided equally among all of his children, without distinction of age or sex. . . . More important than these influences, however, was the extensive sale of lands confiscated from the crown, from the *émigrés*, and from the Church. Through the years 1790-1795 large areas were placed upon the market. Prices were low, payment was spread over a period of twelve or more years, a clear title was given, and no complicating obligations were imposed. The law of May 14, 1790, specifically enjoined that the lands should be sold in small portions, the large estates

being broken up for the purpose, to the end that the number of 'happy proprietors' might be increased. Until 1793, when the practice was prohibited, peasants frequently combined to purchase large tracts which they forthwith divided among themselves."—F. A. Ogg, *Economic development of modern Europe*, pp. 188-190.

France: Land tenure in recent times.—"From the Revolution to the present day France has remained a land of numerous and small holdings. The law of partible inheritance has been, however, the theme of heated controversy. . . . Statistics prepared in 1862 showed that in that year 56.29 per cent. of all holdings in the country had an area of five hectares (a little less than twelve and one-half acres) or less; 30.47 per cent., an area of between five and twenty hectares; 8.47 per cent., an area of between twenty and forty hectares; and only 4.77 per cent., an area of more than forty hectares. . . .

"At the present day there are somewhat more than three million proprietors whose holdings are under ten hectares in extent, and these holdings aggregate upwards of twenty per cent. of the total arable area of the country. The remainder is owned by some 750,000 proprietors—half of it by 150,000 whose holdings exceed one hundred and sixty hectares, the other half by 600,000 whose holdings fall between ten and one hundred and sixty hectares. About eighty per cent. of all holdings to-day are cultivated by their owners. Of the remainder, thirteen per cent. are leased and seven per cent. are worked under the system known as *metayage*, involving the division of the produce, on some designated percentage basis, between proprietor and cultivator. The number of small holders continues to increase. . . . The French peasant still displays a deep attachment for the soil. The ground is not so rich or well-favoured that hard work is not required for its tillage, but it repays the husbandmen's effort to his reasonable satisfaction."—F. A. Ogg, *Economic development of modern Europe*, pp. 190-194.

France: Century of agricultural development.—"While Great Britain was becoming distinctly an industrial and commercial nation and Germany, at a later period, was tending strongly in the same direction, France remained a predominantly agricultural country. And such she still is. . . . Throughout the past hundred years agricultural progress has been more steady and substantial than in any [other] country of Europe, with the possible exception of Belgium and Denmark. In the Napoleonic period Flemish and English systems of crop rotation were introduced and the cultivation of many products—dyes, chicory, flax, hemp, and beet-root—was begun or extended; although it must be added that after the restoration of normal trade relations in 1814-15 some of the newer forms of cultivation (*e. g.*, that of beet-root) which had been undertaken as a means of providing substitutes for commodities cut off by the war languished. The period 1815-47 was, in general, a time of rapid agricultural advance and of great rural prosperity. The country was at peace externally, and the people, although at times agitated by political questions, were in the main profitably employed and contented. After 1848 advance was somewhat retarded. The political unsettlement incident to the overthrow of the Orleanist monarchy and the establishment of the Second Empire, the Crimean War and the war with Austria in 1850, outbreaks of the cholera, and the poor harvests of 1853 and 1855 operated, along with other circumstances, to withdraw men from the land and to jeopardize

agriculture interests. At no time during the second half of the century did these interests quite regain their former prosperity. After 1860, however, the reclamation of waste land set in upon a large scale, and likewise the introduction of agricultural machinery. . . . Scientific methods of rotation, soil-preparation, and fertilization were introduced, and between 1818 and 1889 the average yield of wheat per acre was raised from eleven to seventeen and one-half bushels, and between 1825 and 1875 that of barley was increased by eight bushels, and that of oats by ten bushels. . . . In the matter of foodstuffs France today is practically self-supporting, and her exports of agricultural products are extensive. A main characteristic of the agriculture of the country is the diversity of its products. Wheat and wine are the staples, but there is a heavy output of rye, barley, buckwheat, oats, maize, fruits and dairy produce. Almost one-third of the cultivated land is devoted to cereals. . . . Of a total of 195,000 square miles of arable land, 171,000 square miles, or eighty-eight per cent., are steadily under cultivation."—F. A. Ogg, *Economic development of modern Europe*, pp. 188-194.

"The agricultural interests in France receive the assistance of the government mainly through the imposition of duties on imported agricultural commodities, a policy which reached its culmination in the decade 1881-1890 and has been enforced to this day by successive tariff legislation. The Ministry of Agriculture maintained by the state is a thoroughly modern and well-equipped institution, with an advisory council of politicians and agricultural experts, and a body of inspectors who travel over the country and indicate directions for state assistance to the farmer. One of the most important respects in which agriculture has been liberated by the state is the freedom of association, which was not granted in France until 1884. Before that time, agricultural societies were mainly of a scientific nature, although quite among the best of their kind in Europe. The great need for and impulse toward association is shown by the rapid growth of agricultural societies, of which there were 648 in 1890, with 234,234 members, and 6,178 in 1913, with 976,157 members. Membership is limited by region and by class, but there are small unions of the various local societies as well as the *Union Centrale des Syndicats Agricoles*, an association of about 2500 of the local societies. The purpose of these organizations is to promote the interests of the agricultural class through governmental interposition, through instruction of the farmer in the betterment of his own situation, and through securing the benefits of coöperation."—*Ibid.*—See also AGRICULTURE: Modern period: General survey; COÖPERATION: France.

United States: Beginnings of American agriculture.—"The agricultural as well as the political history of the United States is divided into two eras. The first is the colonial era, lasting from 1607 to 1776. The second is the era of national development, lasting from 1776 to the present time. This era of national development, however, is divisible into four distinct periods: first, from 1776 to 1833; second, from 1833 to 1864; third, from 1864 to 1888; fourth, from 1888 to the present time. The first era, being contemporaneous with the colonial era of our political history, may be called the era of establishment. It was the time during which the colonists transplanted European methods of agriculture to American soil and readapted them to the new conditions. This readaptation consisted in learning how to live a wilderness life, and to clear wild land of trees, stumps, and stones. It consisted also in learning by experiment what crops were adapted to the soil and climate, and what methods of cultivation were best calculated to insure satisfactory returns. The first European settlers in America . . . learned many of their first and, as it proved, most valuable lessons directly from the Indians. . . . They taught our ancestors how to grow two crops which were destined to play a large part in our national economy. These crops were tobacco and Indian corn, or maize. The former was the most important money crop in the southern colonies during the entire colonial period, and remained in the lead until 1801, when it was outstripped by cotton. During our entire history corn has been the leading agricultural product of the country as a whole, and still retains that position with no other crop even a close second. The history of land tenure in colonial times was one that was natural to the circumstances of a new country, sparsely settled under conditions of great hardship. In the first place, all titles were derived ultimately from the British Crown, which made grants to various companies, which in turn made grants to individuals. This was true of Virginia, after a period of unsuccessful communal ownership, but in New England the system was somewhat different. There grants were made to groups of individuals for the purpose of establishing a settlement or town. The middle colonies had several forms of land tenure—New York under the Dutch having the semi-feudal patroon system, while Pennsylvania, New Jersey and Delaware were under the proprietary system, upon which their government was based. It was not many years after settlement that speculation, which has been a characteristic of American expansion westward almost up to our own time, became a common practice. In colonial times it took this form:—that an individual or a group of persons would obtain a grant for a large tract of land, organize settlers on part of it, and hold the remainder of the tract until a high price could be demanded for it. While the early colonists learned their first lessons in successful agriculture from the Indians, and began growing corn or tobacco after the manner of their teachers, they were naturally unwilling to follow the Indian type of agriculture exclusively. Accordingly a great many experiments were tried. In Virginia espec-

ally these experiments were numerous. An attempt was made to develop the silk industry because mulberry trees were found growing wild, and to develop grape culture and wine making because wild grapes were found; and attempts were also made to grow the fig, the olive, and other semi-tropical fruits. . . . But after all their experimenting the Southern colonists fell back upon corn and tobacco as their leading field crops, though European grains, vegetables, and fruits were also introduced. Indigo and rice also became important crops in South Carolina and Georgia. In the middle colonies wheat became the staple crop, though corn was always grown, and European fruits and vegetables were cultivated in considerable quantities. There grew up a considerable export trade in wheat to the West Indies. In New England there were no great staple crops produced for export. Farming was of a more general sort, and products were grown mainly for the local markets.

"One of the most interesting phases of our colonial agricultural history is the live stock industry. All the domestic animals and fowls now grown in the United States, except the turkey, were first brought from Europe. Everywhere the hog flourished, running half wild in the woods, living upon mast and roots, and multiplying rapidly in spite of the depredations of wolves, bears and marauding Indians. Early in our colonial era Virginia hams and bacon acquired high reputation. Goats flourished also, being better able than sheep to protect themselves against wolves. Later, however, as the country became more settled, sheep displaced goats as a form of live stock. Sheep were grown in all the colonies where conditions were sufficiently settled to furnish protection from wolves. Cattle were naturally better fitted than sheep to defend themselves against the savage denizens of the woods, and have been bred in considerable numbers on the frontier ever since the earliest settlement. In Virginia and the Carolinas a flourishing cattle business, resembling modern cattle ranching, grew up. . . . The first [European animals] to reach the New World were brought by Columbus to the West Indies on his second voyage in 1493. Horses, cattle, hogs, goats, sheep, asses, chickens, ducks, and geese were known to have been brought at that time. During the colonial period there was considerable trade between our own colonies and the West Indies, and it is not improbable that specimens of all these Spanish varieties may have found their way to our shore. This is known to have been the case with horses, cattle, hogs, and sheep. Dutch cattle were brought to New York and Danish cattle to New Hampshire. In general, however, our farm animals came from the British Isles."—T. N. Carver, *Principles of rural economics*, pp. 63-72.

United States: 1776-1833.—National development.—Public land policy.—Cotton industry.—Westward migration.—Live stock.—"The War of Independence marks an era in our agricultural as well as in our political history. Shortly after this event a series of epoch-making changes began in agriculture. In the first place, the frontier moved rapidly westward into the great interior valley. The life of the pioneers on our frontier, wherever that frontier may happen to have been, has always retained certain of the essential features which it possessed in the colonial era. The next great epoch-making event was the establishment of the public-land policy of the federal government. At the close of the Revolution the land was all regarded as the property of the various states. By a series of acts the greater

part of the unoccupied or unsold lands were ceded to the central government, which then began to devise plans for their sale to private individuals. No other policy than that of turning the public domain as rapidly as possible into private property for individual farmers ever seems to have been seriously considered. At first the policy was to sell the lands for the benefit of the national Treasury and the extinction of the national debt. By a series of changes the financial motive was abandoned altogether, and a policy was adopted which aimed to put the land in the hands of actual settlers without any direct profit to the national Treasury whatever. . . .

"The next epochal change in the agricultural history of this period was the rise of cotton to the first place among Southern products. During the colonial era, and down to 1803, tobacco held first place, but at this date cotton began to outstrip it and soon left it far behind. This rise of cotton to a position of predominance came about as a result of several factors working together. During the latter half of the eighteenth century there had been a remarkable series of inventions, mainly in England, for the manufacture of cloth. These had greatly increased the demand for cotton on the markets of the world. In 1786 the long-staple or sea-island cotton was introduced and proved to be well adapted to the low lands of South Carolina and Georgia. But more important than all other factors was the invention of the saw gin in 1793. This was the first successful device for separating the seed from the short-staple or upland cotton. This is the kind of cotton from which the great bulk of the cotton fabrics of the world are manufactured, and the saw gin made its production profitable in this country where labor was scarce and land abundant. One of the unpleasant results of this rise of the cotton industry, however, was to give slavery a new lease of life. . . . The almost complete exclusion of white labor from cotton growing was by far the most important effect of slavery upon American agriculture. Three other effects are commonly attributed to it. First, it is held responsible for the process of 'land killing,' by which is meant the practice of growing a few crops from a piece of land until its original virgin fertility was partially exhausted and then abandoning it for a new and unexhausted tract. It is doubtful, however, whether this practice was due more to slavery than to the presence of indefinite supplies of new land. . . . Second, slavery tended to concentrate cotton growing in large plantations worked by gangs of slaves under supervision. . . . Third, the tools and implements used in Southern agriculture remained crude and heavy long after improvements had been introduced in the North. Tobacco, live stock, and general farming continued in the northern belt of slave states, that is, in Maryland, Virginia, North Carolina, Kentucky, Tennessee, and Missouri; but through the institution of slavery these found their interests to be with the cotton states to the south of them rather than with the free states of the North. The cotton states furnished a market for slaves and also for the horses, mules, cattle, hogs, hay, and grain produced by these border states. . . . [See MARYLAND: 1660-1776.]

"The opening up of the Northwest Territory under the ordinances of 1785 and 1787 stimulated a rapid migration westward to this new territory. Inasmuch as the government at this period sold land to speculators as well as to settlers, this westward migration was made up of very diverse elements, though then, as well as later, the home

seeker predominated. The land sought during this early period all lay in the continuous stretch of forest which extended westward from the coast to the present state of Indiana. Therefore the pioneering of this period differed, in some respects, from that which we have known later in the prairie states, though resembling that of the colonial period on the Atlantic seaboard. After locating his land and building a shelter, the first task of the settler was to clear his land of timber. The work of destroying the forest was prosecuted with such vigor and ingenuity as have probably never been equaled in the history of the world.

"There were few changes in agricultural implements until after 1833. The plow and harrow were almost the only tools not driven by human muscle. The wooden plow with an iron share was still in use, though sometimes the wooden moldboard was protected by strips of iron. In 1798 Thomas Jefferson wrote a treatise on the proper form of a moldboard of a plow. A year earlier Charles Newbold of New Jersey had invented a cast-iron plow having the share, moldboard, and land side all in one piece. It did not come into general use at once because some one invented the absurd doctrine, which farmers seem to have believed, that the cast-iron plow poisoned the land so that crops would not grow. Jethro Wood of New York, a correspondent of Jefferson, took out patents for cast-iron plows in 1814 and 1819. He had designed a moldboard resembling somewhat those now in use. Though there were few significant inventions of agricultural implements during the period from 1776 to 1833, there was the beginning of an interest in agricultural improvement which promised well for the future. Agricultural societies were founded in South Carolina in 1784, in Pennsylvania in 1785, in New York in 1791, in Massachusetts in 1792. In 1810 an exhibition of agricultural products was held in Georgetown, D. C., and another in Pittsfield, Massachusetts. In 1816 a somewhat larger exhibition was held in Brighton, Massachusetts. These were the forerunners of the agricultural fairs which have since had such a large development. During this period there were new importations of improved live stock, particularly Shorthorn and Hereford cattle, Kentucky, Massachusetts, and New York taking the lead. . . . One of the most interesting chapters in the history of American husbandry relates to the general introduction of the Merino sheep. The first animals of this breed were imported in 1773, but the industry was not yet in a flourishing condition. With the restrictions upon trade growing out of the Napoleonic disturbances in Europe, there grew up a necessity for a domestic supply of wool. At the same time the Peninsular War created such conditions in Spain that the herds of Merinos, which up to that time had been guarded as a quasi-national monopoly, were broken up and offered for sale. Enterprising American farmers began buying them, and by 1800 there were said to be 5000 in the country. The price of Merino wool soared, and the prices of sheep soared still higher. There grew up a speculative craze in Merinos, and some fabulous prices were paid. Hogs have always been an important agricultural product in the United States. The earliest settlers in all the colonies had found hogs very adaptable, multiply rapidly and flourishing on the food found in the forest. . . . During the period we are now studying, Ohio, Indiana, Kentucky, and Tennessee were the principal hog-growing states, and Cincinnati, the center of this region, soon became famous as the center of a large pork-packing in-

dustry, a position which she held until surpassed by Chicago many years later. In 1805 fat cattle began to be driven across the Alleghenies to the eastern seaport cities, but a good part of the produce of the Ohio valley found its way southward, first to New Orleans and later to supply the cotton states. In 1825 the Erie Canal, connecting the Great Lakes with the Atlantic, was opened. This marked the beginning of a new outlet for the products of the great interior, especially the northern belt of that interior. Wheat became the leading export from the Northwest, but corn, beef, and pork remained the leading products of the Ohio River region."—T. N. Carver, *Principles of rural economics*, pp. 74-84.

United States: 1833-1860.—Transformation.—Cattle raising.—"Beginning with 1833, there occurred on American soil during the next thirty years one of the most remarkable agricultural transformations ever known in the history of the world. In 1833 practically all the work of the farm except plowing and harrowing was done by hand. Though there had been minor improvements in hand tools, and considerable improvement in livestock and crops, particularly in Europe, yet it is safe to say that so far as the general character of the work actually performed by the farmer was concerned, there had been practically no change for 4000 years. Small grain was still sown broadcast, and reaped either with a cradle or the still more primitive sickle. The cradle, however, was a relatively new invention, being a modification of the scythe, which had been used for centuries in mowing grass. The addition of the frame and 'fingers' to the old-fashioned scythe, together with a few changes in the handle to restore the balance, made it into a so-called cradle and adapted it to the reaping of grain. But the sickle or reaping hook had been in use for thousands of years. . . . It is still in use in oriental countries and in some parts of Europe. Grain was still threshed with a flail in 1833, or trodden out by horses and oxen, as it had been in ancient Egypt or Babylonia. Hay was mown with a scythe and raked and pitched by hand. Corn was planted and covered by hand and cultivated with a hoe. By 1806 every one of these operations was done by machinery driven by horse power, except in the more backward sections of the country. The increased use of farm machinery also helped the horse to displace the ox as a draft animal, the former being much better suited than the latter to the drawing of these improved implements. . . . The transformation which took place in the agriculture of the North was due to several causes, any one of which might be called epoch making. The first was the railroad. At the beginning of this period there were none. By 1860 there were 30,000 miles in operation and they had penetrated every state east of the Missouri River. While the markets of the world were brought nearer to the Western farms by the building of the railroads, the markets themselves were growing larger. The building of the factory towns of New England called for larger supplies of food. In 1846 the English Corn Laws were repealed, though the repeal did not go into effect until 1849, when American foodstuffs began to be admitted to that country free of duty. The great Irish potato famine began in 1846. The continent of Europe was disturbed by the revolutions of 1848 and by the Crimean War of 1854. . . . Another set of causes was at work in the form of a more liberal land policy. . . . Another factor of great importance was the development of prairie farming. At the beginning of this period the van-

guard of the westward-moving army of settlers was just emerging from the great primeval forest, which covered the entire eastern third of the continent, and was beginning to settle in the great natural meadows of the upper Mississippi Valley. In this new region the settler was saved the enormous task of clearing his land of timber. . . . But the most important factor of all was the series of inventions of agricultural machinery by means of which horse power was substituted for human muscles as a motor force. In 1831 William Manning of New Jersey was granted a patent for a mowing machine. In 1833 and 1834 Obed Hussey of Baltimore and Cyrus McCormick were each granted patents for reaping machines. After 1840, when these machines had been improved and their practicability demonstrated, they began to come into general use. About the same time the threshing machine began to be widely used, and very soon displaced the old primitive methods. It was not, however, until about 1850 that the 'thresher' and the 'separator,' that is, the machine for beating out the grain and the machine for separating it

only those sections suitable for dairying, stock raising, and market gardening continued to prosper. The competition of the Eastern farmer with the farmer of the Western prairies might have been foreseen to be a helpless one. . . . Sometimes it was not even necessary to plow the prairie land before the crop could be raised. Furrows were plowed across the sod and the corn was planted in the bottom of these and covered with a hoe. The soil was so very rich and there were so few pests that a fair crop could be grown the first year with practically no cultivation. Another method of growing the first crop, however, was to plow the land and plant the corn in the up-turned sod by means of an ax or mattock. . . . It was the smoothness of this prairie land as much as anything else which led to the rapid development of farm machinery during this period when the prairie states were being settled. When these states began to be cultivated by means of effective modern machinery, and when the railroads began to transport the products of these states to the eastern seaboard, it became impossible for the

COMBINED REAPER AND THRESHER, DRAWN BY A TRACTOR

from the straw and chaff, were combined. These machines were usually run by horse power, though a steam thresher was beginning to be used before 1864. John Deere made his first steel plow from an old saw blade in 1837. Scarcely less important than the mower, the reaper, and the thresher were the corn planter and the two-horse cultivator, which came into use during this period. [See also INVENTIONS: 19th century: Reapers.] . . . Every part of the work of growing corn, except that of husking the crop, was done by horse power before 1864, except in certain sections where corn is a minor crop. In view of the fact that corn is and always has been our principal crop, it is doubtful whether the grain-harvesting machinery effected a greater saving of labor than did these improvements in the implements for corn production, by means of which horse power was substituted for man power. . . . It was during this period also, and as a result of the changes already described, that the agricultural decline in New England began. As early as 1840 the abandonment of the hill farms began to attract attention. General farming on these rocky hills in competition with the prairie farms and machine cultivation of the West was no longer possible, and

farmer on the hilly lands of the Appalachian slopes to hold his own in competition with them."—T. N. Carver, *Principles of rural economics*, pp. 84-90.

"During the period now under discussion the cattle industry in the Far West underwent a most interesting and spectacular development. Cattle ranching has always been associated with our frontier life, particularly in Virginia and the Carolinas. After the acquisition of Texas the American cattleman who had already penetrated that Territory took over the ranching business and reorganized it. The descendants of the Spanish cattle brought over by Cortes and his followers had multiplied rapidly in the mild climate of Mexico, which then included Texas, where they had run wild for more than two hundred years. . . . Under American dominion, however, American cattlemen made various attempts to open up a market for Texas beef. As early as 1857 a few Texas cattle were driven to the cornfields of Illinois, but they did not become popular. During the Civil War the outlet for Texas cattle was cut off and yet the cattle continued to multiply. Consequently the ranges were ready to swarm in the late sixties. The quality of the grass in the northern plains is somewhat better than that in the Texas ranges, and it was dis-

covered that the Texas cattle gained in weight more rapidly in the north than on their native ground. . . . From 1870 to the close of the period we are now considering, the great cattle trail was pretty well marked as the route over which vast numbers of cattle drifted north from the great breeding grounds of Texas. The migrating cattle were mainly young steers, besides some heifers taken north for the stocking of the northern ranges. Inasmuch as cattle seemed to multiply more rapidly in Texas, because apparently cows were more prolific in the milder climate of that state, and inasmuch as young cattle grew more rapidly after being moved north, a territorial division of labor grew up. The ranches of the south supplied the young and immature cattle, and those of the north matured them and prepared them for beef. . . . After 1885 the importance of the great cattle trail began to decline. The westward advance of the line of settlements tended to cut off this line of march, but the chief factor of the decline was the competition of the railroads, which were built into the heart of the cattle country and which trans-

row and planting the corn in the bottom by means of an automatic seeder. . . . This method of planting . . . has certain advantages, chief of which is that the deeper planting of the seed enables the crop to withstand drouth somewhat more successfully than does the shallower planting practiced farther east. Though the expansion of agriculture during the period immediately preceding the Civil War had been marvelously rapid, it was even more rapid during the period immediately following. The Civil War scarcely imposed even a temporary check upon the development of agriculture in the North, though it completely disorganized the cotton industry of the South and involved it in temporary ruin. [See also NORTH CAROLINA: 1870-1892.] During the preceding period agriculture had . . . passed into the commercial stage, where farmers were living upon the profits of farming rather than on the products of the farm itself, and it was now ready to respond to the new opportunities . . . created by the railroads, the inventions of farm machinery, the opening of the prairie states, and the development of the

WALLIS TRACTOR PULLING CASE DISC PLOW AND HARROW

ported the cattle more quickly and almost as cheaply as they could be driven overland."—T. N. Carver, *Principles of rural economics*, pp. 101-104.

United States: 1860-1888.—Expansion after the Civil War.—"The invention of the twine binder, by increasing the amount which a farmer could harvest, increased . . . the quantity which he could profitably grow. In other words, it was the twine binder more than any other single machine or implement that enabled the country to increase its production of grain, especially wheat, during this period. . . . Among the improved articles of machinery used in growing corn was the 'check rower.' This device attached to a corn planter enabled one man to do work which had formerly required two. It automatically drops the seed in rows running across the field at right angles to the direction in which the planter is being driven, thus planting the rows in two directions and permitting of cross cultivation. In the somewhat drier regions west of the Missouri corn came to be planted by means of the 'lister,'—a double-moldboard plow, throwing a deep fur-

row and planting the corn in the bottom by means of an automatic seeder. . . . This method of planting . . . has certain advantages, chief of which is that the deeper planting of the seed enables the crop to withstand drouth somewhat more successfully than does the shallower planting practiced farther east. Though the expansion of agriculture during the period immediately preceding the Civil War had been marvelously rapid, it was even more rapid during the period immediately following. The Civil War scarcely imposed even a temporary check upon the development of agriculture in the North, though it completely disorganized the cotton industry of the South and involved it in temporary ruin. [See also NORTH CAROLINA: 1870-1892.] During the preceding period agriculture had . . . passed into the commercial stage, where farmers were living upon the profits of farming rather than on the products of the farm itself, and it was now ready to respond to the new opportunities . . . created by the railroads, the inventions of farm machinery, the opening of the prairie states, and the development of the

county fairs. There followed, therefore, such an expansion of agricultural enterprise as the world had never seen before, so far as we have any record, and such as it may never see again. The chief factors in stimulating this remarkable expansion were the Homestead Laws of 1862 and 1864, the disbanding of the armies, the invention of the twine binder, the roller process of manufacturing flour, the building of the transcontinental railroads, the permeation of every nook and corner of the Mississippi Valley by the so-called 'granger roads,' and the development of the immense cattle ranches of the Far West. [See U. S. A : 1866-1877.] While this tremendous expansion was going on in the North and West the cotton industry was undergoing a complete transformation in the South and getting ready for the expansion . . . to come later. This transformation . . . was made necessary by the abolition of slavery. During the next decade, however, that is, from 1870 to 1880, over 207,000 square miles, a territory equal in extent to Great Britain and France combined, were added to the cultivated area of the United States. This increase in the cultivated area was due partly to

the increased effectiveness of labor when it was equipped with the improved machinery which had come into use, partly to the westward migration of our native population, and partly to the enormous immigration of that decade. . . .

"The following figures from the United States census will show the increase in the principal grain crops since the census of 1840.

	CORN (bushels)	WHEAT (bushels)	OATS (bushels)
1839	377,531,875	84,823,272	123,071,341
1849	592,071,104	100,485,944	146,584,179
1859	838,792,742	173,104,924	172,643,185
1869	760,944,549	287,745,626	282,107,157
1879	1,754,591,676	459,483,137	407,858,999
1889	2,122,327,547	468,373,968	809,250,666
1899	2,666,440,279	658,534,252	943,389,375
1910*	2,900,000,000	918,000,000	1,220,000,000

* In round numbers. [Last figures obtained.—Ed.]

heaviest work, such as breaking the sod, the latter seem to have been preferred. Since this time oxen have continued to be used in small numbers and in backward sections, but this date may be fixed upon as the turning point in the transition from the ox to the horse as the typical draft animal. . . . Among the more important inventions of agricultural machinery during this period the twine binder stands preëminent."—T. N. Carver, *Principles of rural economics*, pp. 92-95. See also *BLACK BELT*; U. S. A.: 1919.

United States: 1880-1916.—New problems.—"Thirty years ago this country was in . . . a period of agricultural depression; those were 'hard times' for farmers. . . . Railroads were being built into the West; population was advancing rapidly upon the new, rich soil; crops increased faster than the demand for the products; prices were low and falling lower. Before the year 1900, a new era of prosperity for farmers began, which we still enjoy. The supply of land ready for cultivation approached exhaustion, and immigration poured

IRRIGATION TRENCHES IN SOUTHERN CALIFORNIA

"One result of this enormous increase in our agricultural productivity was the increase in the exportation of breadstuffs. This did not begin on a large scale until after 1860, but after that date it increased by leaps and bounds until within twenty years, that is, by 1880, this country had become the world's greatest exporter of wheat. Only a small fraction of the corn crop has ever been exported in the form of corn, a greater part being fed to live stock; our exports of corn, therefore, have been mostly in the form of animals and animal products. . . . Before this period [1860-1888] both horses and oxen were used, but for much of the

in from foreign countries; hence population caught up with the production of foods, causing the prices of agricultural products to advance. . . . In the decade 1900-1910, the population of cities increased three times as fast as rural population. The effect of these new conditions is also seen in the increased value of farm land, which more than doubled the same years. In 1900 the average value of a farm was \$3,563. In 1910 this value had increased to \$6,444. These figures include not only the land itself, but also the buildings, machinery, improvements, and stock. Mr. James Wilson, who was Secretary of Agriculture

from 1897-1913, called attention to the remarkable agricultural advance of the country during that time. When Mr. Wilson took office, the farm products of each year were worth \$4,000,000,000. When he retired they were worth more than double that amount, \$9,500,000,000 being the figure for 1912. Only a part of this increase is accounted for by larger crops, since there has also been a great increase in the prices of farm products. Besides increased crops and greater values, many other changes have come about in our agriculture. . . . One of the greatest of these is seen in the increased use of mixed farming. . . . Where once were seen wheat fields, embracing thousands of acres, there now are seen much smaller fields producing a variety of grains; and these are interspersed with orchards, pastures, and crops of clover and alfalfa. [See SOUTH DAKOTA: 1913.] Where once a crop failure meant ruin, we now find the farmers secure from such disaster, because their capital is invested in a dozen crops instead of one. The growth of stock and dairy interests is adding still greater security to intelligent farming. For those who wish to continue the old methods of extensive farming, with single crops and speculation in land values, the door to western Canada is wide open, and thousands of farmers from the Middle States have gone there. . . . Fruit growing (see also CALIFORNIA: 1900) is a phase of agriculture that deserves treatment by itself. The spread of this industry has been made possible, not only by scientific discoveries, but also by improvements in transportation and by the use of refrigeration. Refrigeration in the shipment of perishable crops was first tried about the year 1866, the fruit being packed with ice in chests. Soon afterwards the idea of refrigerator cars was worked out, and by 1872 this method had proved successful. Refrigeration made possible the rapid development of truck farming—one of the remarkable features of recent agriculture. Truck farming on a large scale had its beginnings in the decade between 1840 and 1850, in the region about Norfolk, Virginia. . . . At present, many special districts in the South have been developed, where particular crops are raised, such as watermelons in Georgia, and sweet potatoes in eastern Maryland. In addition, all the common vegetables and small fruits are produced in immense quantities throughout the year for Northern markets. Consequently, dwellers in cities and the larger towns may enjoy fresh fruits and vegetables all through the winter months. This means much for the general health of the people.

"With the changes in this great era of prosperity there have come many problems. . . . One of these is the question of tenantry. To-day, more than one-third of our six million farmers rent their farms instead of owning them. In 1880, but one-fourth were tenants; so the number of tenants is increasing faster than the number of farmers. One reason for this condition is found in the great rise of land values within recent years. A laborer now must have considerable capital before he can buy a farm; so he is often obliged to become a tenant, if he would be a farmer at all. In the Middle West, a great many farmers whose lands have become valuable move to town and live upon the income received from renting their farms. Besides, the increase in land values has caused many city dwellers to purchase farms, hoping to sell later at a profit; in the meantime they rent their farms to tenants. . . . A more serious problem faces the American farmer to-day—that of the scarcity of labor. This

is one reason why many farmers have preferred to rent their farms, and why others have sold out and moved to town. It is not a new problem, for back in colonial times it was impossible to keep farm hands; they went off to get land for themselves, and only those who were in compulsory service (indentured servants and slaves) could be held for any considerable time. But in recent years the problem has become more acute. The growth of cities has emphasized the differences between rural and urban life. The farm has come to seem relatively less attractive; the growth of manufactures has enticed laborers from the farms by offers of higher wages. These are not necessarily bad signs, for they may represent the striving of individuals for a higher standard of living. The conclusion follows that, in order to obtain a supply of the best farm laborers, farmers must offer inducements that equal those of city life. In recent years farm wages have risen; but this is not a complete remedy. Social life on the farm must be made more attractive if the laborers are to be held. The increased use of machinery and the keeping of fine stock call for a type of skilled laborers for farm work. This demand will best be met when homes are provided on farms where married men may live comfortably as hired workers. This is the condition under which workmen prove to be most satisfactory in city employments—why not on the farm?"—A. H. Sanford, *Story of agriculture in the United States*, pp. 378-383.

United States: 1886-1910.—Dry farming in the West.—The Campbell system.—For twenty consecutive years, in scores of places from the James river to the Arkansas, H. W. Campbell, of Lincoln, Nebraska, the pioneer "dry farmer" of arid America, "has been uniformly successful in producing without irrigation the same results that are expected with irrigation, with comparatively little additional expense, but not without a great deal more watchfulness and labor. What Western people have become accustomed to calling the 'Campbell system of dry farming' consists simply in the exercise of intelligence, care, patience, and tireless industry. It differs in details from the 'good-farming' methods practised and taught at the various agricultural experiment stations; but the underlying principles are the same.

"These principles are two in number. First to keep the surface of the land under cultivation loose and finely pulverized. This forms a soil mulch that permits the rains and melting snows to percolate readily through to the compacted soil beneath; and that at the same time prevents the moisture stored in the ground from being brought to the surface by capillary attraction, to be absorbed by the hot, dry air. The second is to keep the sub-soil finely pulverized firmly compacted, increasing its water-holding capacity and its capillary attraction and placing it in the best possible physical condition for the germination of seed and the development of plant roots. The 'dry farmer' thus stores water not in dams and artificial reservoirs, but right where it can be reached by the roots of growing crops.

"Through these principles, a rainfall of twelve inches can be conserved so effectively that it will produce better results than are usually expected of an annual precipitation of twenty-four inches in humid America. The discoverer and demonstrator of these principles deserves to rank among the greatest of national benefactors."—John L. Cowan, *Dry farming, the hope of the West (Century Magazine, July, 1906)*.—"Just as the sheepmen, by determination and plodding methods,

have all but driven the cattlemen from the range—those that remain are dying hard—another industry is slowly arising, which appears destined, within ten years, to put an end to the sheepman as he conducts his business to-day. This menace to the free and open range is the dry farmer. Within the past two years thousands of soil tillers have settled upon the prairies of Wyoming and Montana. Agriculturalists are beginning to learn that farm produce will grow, luxuriantly, profitably, in these high areas where the annual [rain] precipitation is fifteen inches and less, if a man knows how to cultivate. The state of Wyoming has taken official cognizance of dry farming, and is doing all that can be done to encourage it. An expert, Dr. V. T. Cooke, of Oregon, has been employed at a salary of \$2,000 a year to show farmers how to succeed without irrigation. The office of state dry farmer was created two years ago, at which time an appropriation barely sufficient to pay Dr. Cooke was grudgingly made. The legislature of 1900, convinced and enlightened by the success of the several experimental farms, made an appropriation of \$10,000 to carry on this work. The State Agricultural College of Wyoming also is doing a great deal along this lead, issuing bulletins of information to farmers, encouraging the movement in every way. It is well known that increased cultivation will be followed by increased rainfall. This has been demonstrated in the great wheat belt of Kansas, once almost as arid as the plateaus of the West. But there is no quarrel between the farmer and the sheepman. Homesteading the range means smaller flocks, the sheepmen admit, and [will put] an end to promiscuous grazing. It will necessitate, however, the feeding of flocks in winter, at once disposing of the farmer's output and saving the percentage of loss now suffered through starvation. Dr. Cooke, Wyoming's expert at dry farming, speaking of the industry, said: 'Dry farming is already established in the semi-arid West. Some parts of California, with an annual precipitation of ten inches, have been dry farming for over forty years, eastern Oregon and eastern Washington for over twenty-five years, with an annual precipitation as low as eight inches, and Utah, Idaho, and Montana have been dry farming for years. Colorado, Wyoming, and western Nebraska have also been dry farming for several years, but only in the last two or three years has it been brought intelligently to the front. Many early settlers failed—and will continue to do so—principally through ignorance of how to do their work properly, through misinformation, and through having too good an opinion of what they know. A man must be ready to take the advice of those that know in this business. The effect of dry farming in Wyoming to the stockmen will be that instead of losing vast numbers of sheep and cattle during the winter and early spring through neglect of providing feed for them, they will be able to buy feed from the farmer and save the stock from starvation. The ranges have been overstocked. The government has made stockmen take their fences from immense areas of public land, thereby preventing them from holding pastures for the winter. The average stockman never has pretended to feed his stock at all, so, the range being overstocked, with no fenced winter pastures, it is easy to understand that the dry farmer is really a necessity, a benefit, rather than an ill, as some of the stockmen believed at first.' Dr. Cooke says that most of the grains, except corn, will grow in Wyoming under the dry method, and that the secret of dry farming is 'the use of

brains and muscle, deep plowing, cultivation at the proper time, the use of labor-saving machinery and seeds that are adapted to the climate.' So a few more years will see this last romantic phase of Western range life pass away. The sheepherder will go as the cowboy has gone, the flockmaster will turn his attention to the soil, and where immense flocks now roam in the ownership of one man scores of smaller bands will feed in comfort upon the new farms of the semi-arid West. With the old order of romance and picturesqueness will vanish the hardship and cruelty to flocks and herders alike; and the West, under the coming conditions, will yield more and better sheep than in the past."—G. W. Ogden, *Dry farming in Wyoming (Everybody's, Sept., 1910)*.

United States; Effects of the World War.
—War gardens.—Relation of agriculture to cost of living.—Farmers' associations.—County agents.—"In nearly all important respects with regard to foodstuffs America has been not only substantially self-sufficing but a country of surplus. This has been true for many years, both before and during the war. Incidentally we were dependent upon our neighbors for certain commercial fertilizers, and the difficulties attendant upon getting along without them or getting them elsewhere are very great. However, America has been and is a land of surplus food. While this is true beyond all controversy, it is just as true and no doubt a good deal more astonishing to notice that the amount of the surplus has for some years been steadily on the decline. The occasion for this lessening surplus is not mysterious. Of course if all the land in use were to be used to its fullest extent by the entire population, that is, if the country produced the minimum amount of other goods and utilities, devoting itself exclusively or mainly to agriculture, there would be an enormous surplus of food products. But since the normal course is to produce that which society wants most rather than that for which it will pay relatively little, we have no cause for complaint on account of the failure to make the land produce to its physical and biological maximum. Farmers, both consciously and unconsciously, limit their efforts in accordance with economic returns, instead of in accordance with the limits set by the laws of physics and biology. . . . In 1880 the population of the country was 70.5 per cent rural. In 1910 it was 53.7 per cent rural. Thus the proportion of producers to eaters has been undergoing a rapid change. Actually on farms the proportion is by no means 53.7 per cent, since in this classification there were included in rural population all villages and towns of less than 2,500 inhabitants. The farm population therefore was in 1910, as nearly as can well be estimated, about one-third of the entire population of the country. This is a rapidly decreasing proportion, yet it is still in marked contrast to the very small proportion of the population of England and Wales engaged in agriculture, where there are but 8 per cent so reported. On the other hand it coincides rather closely with the German situation where 20,000,000 people out of 70,000,000 are getting their living by, or immediately out of, agriculture. . . .

"In normal times Great Britain, France and Italy import about 313,000,000 bushels of wheat. This supply comes largely, but by no means exclusively, from the United States and Canada. Under the conditions existing since the beginning of the war in 1914 the supply has come more and more from these two sources. Ordinarily the United States and Canada furnish for export about two-thirds as much wheat as the three European

Allies import. Under war conditions the production of wheat by the Allies has been greatly reduced, notwithstanding the slight increase in Great Britain. On account of bad weather the supply of American wheat has been hardly above the amount required at home for normal consumption during the two years 1916 and 1917. The United States wheat crop of 1914 was the heaviest ever known and constituted almost one-fourth of the world's crop. Following as it did rather heavy crops for the two years preceding, the amount of wheat on hand at the outbreak of the war was by far greater than normal. . . . [See FOOD REGULATION: 1885-1914.]

"From the standpoint of world production the United States occupies the predominating position with respect to corn, producing from two-thirds to three-fourths of the world supply. In 1914 the world production was, according to the reports, 3,878,000,000 bushels, of which the United States produced 2,673,000 bushels or 69 per cent. The production of oats in the United States, in terms of bushels, ranks next to corn. In value oats rank normally below wheat. The acreage of oats has increased more, relatively, during the past forty years than have the acreages of either corn or wheat. In 1914 the world crop was 4,035,000,000 bushels, of which the United States produced 1,141,000,000 bushels, or 28 per cent. The importance of the oat crop is largely indirect so far as food is concerned since no considerable part is eaten. However, as a war commodity oats play an important rôle as feed for horses. . . . None of the other cereals enter greatly either directly or indirectly, into the food supply of the United States. As a barley producing nation the United States ranks second only to Russia, but even so the production in this country is normally under 200,000,000 bushels per year, or only about a quarter that of wheat, and not a tenth that of corn. Barley does not enter greatly into the food of the people of the United States nor of the European Allies. One of the most important food crops other than the cereals is the potato. The normal potato crop of the country ranges from 300,000,000 to 400,000,000 bushels, it being a crop which varies widely according to weather condition. To this may be added the sweet potato crop of 60,000,000 to 75,000,000 bushels. . . . Compared with that of other countries the potato crop of the United States is not large. The world crop is over 5,000,000,000 bushels, of which the United States produces but about 7 per cent. . . . No doubt the most important crop other than the cereals is sugar. The United States, including island possessions, produces from two to two and a half million tons, or four to five billion pounds, annually. This is about half of the amount consumed, the additional amount coming mainly from Cuba. . . . With the European supply mainly cut off the Allies are obliged to get their sugar in large part from Cuba, which is also the source of the American importations. In this roundabout manner the supply of sugar for American use is seriously reduced. . . . The production of beet sugar was begun in earnest about 1800. In 1906 the beet sugar production exceeded the cane sugar production. [See also LOUISIANA: 1914-1916.] . . . The cotton crop is sometimes second and sometimes third in value of all crops, it being exceeded uniformly by corn and part of the time by hay. Cotton is the most important commercial crop of the country, outranking corn in this respect because of the fact that substantially all cotton is sold as such by the producer, while corn has many uses, and is turned into other products

without leaving the farm. Three-fifths of the world's supply of cotton is grown in the United States. The yield ranges from 10,000,000 to 16,000,000 bales per year varying greatly with weather conditions. . . . While there is almost without fail a reduction in the cotton acreage following an unusually heavy yield with its attendant lower price it so happened that for the two years preceding the war the acreage and yield were both above normal, with the result that an unprecedented supply of cotton was on hand when hostilities began in Europe in 1914. . . . An idea of the growth of the cotton industry may be had from the fact that the acreage increased from 13,000,000 in 1880 to 37,000,000 in 1913. And the importance of the supply on hand in 1914 may be gathered from the figures showing an average yield from 1906 to 1909 of 11,000,000 bales per year, while from 1910 to 1914 this average was 14,000,000 bales."—B. H. Hibbard, *Effects of the war upon agriculture* (Department of Agriculture Yearbook, pp. 3-12).

It has been conservatively estimated that the gardens throughout the country trebled in area in 1917 when a concerted effort was made to increase the food supply in the United States. In practically every city, suburb and village home gardens were enlarged. Many thousands of acres of idle land, which heretofore had been wastefully neglected, were utilized during the World War, by individuals, municipalities and corporations, in the production of such staples as corn, potatoes, cabbage, turnips, onions, etc., as well as other perishable vegetables. Factors which gave invaluable aid to the spirit of utilizing gardens for food production were the extension services of the United States Department of Agriculture, as well as of the various State departments, the agricultural and the general press. All these agencies actively cooperated in furnishing assistance and information dealing both with the culture and conservation of vegetables. Where no garden space was available, the practice in the homes was to can and dry large quantities of vegetables. Although the season was unfavorable for successful cultivation in many localities, especially in cases of amateur gardening, the net result was an important addition to the country's supply of fresh, dried and canned vegetables, which brought about the release of a considerable amount of food to the soldiers and sailors of our army and navy and those of our allies.

"It is customary to attribute the high cost of living to lessened production due to a supposed decline of agriculture, and to advise, therefore, that more persons engage in farming for the purpose of increasing the product. This position is met by an editorial of the *New York Tribune*, which holds that intermediary trading combinations are responsible: 'It is true that the raising of cattle for the market has almost ceased in the East and that agriculture generally has not kept pace with the demand for food products. Yet it is hard to believe that agriculture in any part of the Union would steadily decline in the face of an enormous appreciation of the cost to the consumer of all farm products, were there not some powerful disturbing factor operating to deny the farmer the benefits of that appreciation. If the Eastern farmer could have reaped a legitimate share of the increase in the price of farm produce which has taken place in the last twenty years, he would certainly be in a position to command all the labor he needs and to develop resources now neglected because it does not pay to develop them. Yet economic law has not operated to stimulate agri-

culture, because the returns from steadily mounting prices have not really reached the producer. Thirty years ago the fattening of steers for the local markets was common in the East. But when the vast Western ranges were opened, and the great packing houses were established, the cheapness of range beef, refrigerated and delivered in Eastern cities, was used as a weapon to kill off the cattle industry of the East. When the Eastern cattleman was driven out of business, the price of beef rose, but virtually all the increase has gone to the packing combinations, which fix their own price to the Western range man and their own price to the consumer and artificially control the supply so as to discourage increased production in the West and to prevent a revival of production in the East. The country is growing in population at the rate of twenty to twenty-five per cent each decade. But Secretary Wilson has shown that the supply of food animals is not being maintained in proportion to population. In the last decade cattle have remained about stationary in numbers, swine are actually decreasing, and, while more sheep are available, the supply has diminished relatively to population."—L. H. Bailey, *Country-life movement in the United States*, pp. 153-155.—See also CONSERVATION OF NATURAL RESOURCES: United States.

Two associations of farmers have recently been formed and are at work in the United States to improve the conditions of farming and of farmers. One, the American Farm Bureau Federation, had been encouraging coöperative action on the part of farmers in order to lessen the profits of middlemen; while the other, the National Board of Farmers' Organizations was formed during the war to unify the agricultural interests and bring their cause before the people. Its activities continued after the war, and recently it announced the intention of building a "temple of agriculture" at Washington to act as headquarters for the organized farmers of the United States. Another agency for improving agricultural conditions has been employed in some of the States, notably in New York, namely, the farm county agents. On July 1, 1918, there were over 6,200 farm county agents employed in this country. Farmers are coming to demand a larger share in the administration of the government, claiming that theirs is the largest single industry in America and represents the largest investment. The presidential candidates of both great parties in 1920 acknowledged the justice of these claims and pledged to the farmers more representation on government boards. (See U. S. A.: 1920: Democratic platform, Republican platform). The junior agricultural movement in the country schools has developed rapidly in recent years, and the accomplishments of children in the schools along these lines form a prominent feature of the exhibits at country fairs. (See U. S. BOYS WORKING RESERVE.) The bitterest feelings have been engendered in the rural districts by the attempt to prolong the daylight saving laws and the farmers were mainly instrumental in effecting their repeal.—See also AGRICULTURAL EDUCATION; AGRICULTURAL SOCIETIES; CALIFORNIA: 1917 (Breed bill); DAYLIGHT SAVING MOVEMENT: 1919; FOOD REGULATION: 1920.

United States: Rural policy.—Information.—"A policy may be simply that which actually happens through a series of years, but a policy for the New Day, a real policy, implies adequate knowledge, definite plans, correlation of effort. So in our governmental affairs, whatever is done or advocated by departments, boards or bureaus, should

be the result of a well-founded and well-rounded policy. Probably there is in these agencies no lack of definite knowledge, and it should be easy for them to make plans. But it is more difficult to secure their coöperation. Within the state, for example, how may we adjust the administrative functions of a department of agriculture and the educational functions of a college of agriculture? We find in Washington half a dozen or more bureaus or boards dealing with matters of agricultural education. If these cannot be consolidated, at least they ought to be forced to coöperate intimately and freely and unreservedly. Perhaps an agricultural development committee in each state and in Washington might be a means of grace in this connection. The British Agricultural Development Committee is virtually an advisory committee to Parliament. It has no direct authority, but its recommendations as to appropriations and as to the work of the different governmental agencies, both national and local, carry far in Parliament. [See FOOD REGULATION: 1914-1918: Legislative enactments in Great Britain.] Some such group authorized by law, and composed of representatives of the public agencies involved, with additional members appointed by the President and in the state by governors, might be able to secure the necessary coöperation of governmental agencies. It is not too strong a statement to say that we are on the verge of chaos with reference to the interrelationships of public boards, departments and bureaus. It is a serious situation and there is only one way out. There must be coöperation, if not voluntary, then compulsory.

"Whatever our conclusions as to the place of the government dealing with agricultural matters, there is clearly one task that it can perform better than any other agency and which is evidently its duty. That is the task of discovering and disseminating information. This function embraces the necessity for accurate investigations, for wise and clear interpretation of these investigations, for well planned and numerous demonstrations of the applicability of the principles worked out as the result of investigation, and for widespread publicity that will reach the masses of farmers with understandable expert advice. Government, both state and national, should gather and distribute the fullest possible information on all of the different aspects of the rural problem. Its duty does not stop with information about production, but includes the field of distribution of farm products and the welfare or country life phase of the farmers' interests. This information should not only be made available to all the farmers, but they must be all but compelled to listen if they are unresponsive."—K. L. Butterfield, *Farmer and the new day*, pp. 193-195.—See also AGRICULTURE, DEPARTMENT OF (UNITED STATES).

United States: Railroad problem.—The progress of agriculture and the welfare of the farmer have been continuously bound up with the railroad question, and many states have seriously undertaken to bring closer coöperation between agricultural interests and the railroads.—See also MINNESOTA: 1916; NORTH DAKOTA: 1880-1916; 1892-1896.

AGRICULTURE, Biology as applied to. See **BIOLOGY**: Applications.

AGRICULTURE, Department of (United States), had its origin in one of the early duties of the Patent Bureau, that of the distribution of seeds and plants to farmers. In 1862 a bureau of agriculture was created and in 1889 it was raised to the dignity of an executive department, with a secretary having a seat in the cabinet. The weather bureau has charge of weather forecasts, including warnings of storms, cold waves, frosts and floods; it also reports temperature and rainfall conditions for agricultural staples. The bureau of animal industry conducts the inspection of animals slaughtered for food. The bureau of plant industry takes charge of the scientific investigation of plant life and the distribution, through members of Congress, of flower and garden seeds. The bureau of statistics prepares crop reports. The bureau of chemistry takes charge of the enforcement of the Pure Food and Drug Act. The forest service has charge of the national forest reserves and cooperates with state governments and private owners of forests. The bureau of entomology investigates injurious insects affecting crops, fruits and forests. The bureau of biological survey enforces federal laws for the protection of birds and game, has charge of the bison range and the protection of migratory birds. The bureau of soils, the division of publications, the office of experiment stations and the office of public roads have duties such as their titles suggest.

The work of the department as a whole "is covered in three general classes: (1) Research work, which includes the scientific study of the fundamental problems of agriculture. (2) Educational or extension work, which aims to make available to the rural population the results of the department's experiments and discoveries. (3) Regulatory work which includes the enforcement of statutes relating to meat inspection, animal and plant quarantine, foods and drugs, game and migratory birds, seed adulteration, insecticides and fungicides, the manufacture of vaccines and viruses, and the administration of the national forests. There stands to the credit of the Department of Agriculture the eradication of the cattle tick from 204,000 square miles of territory in ten years, the suppression of the foot-and-mouth disease in all the country from Massachusetts to Montana, the saving of the citrus industry of California, and a score of other invaluable services protecting the orchards and fields and forests from destruction by insect and fungus pests. In addition, new farm products to the value of \$270,000,000 have been promoted by the introduction and development of new crops, and one-third of the total area of the United States has been covered by the soil surveys conducted by this Department."—J. C. Hemphill, *A great farmer*, David Franklin Houston (*North American*

Review, June, 1917).—"The federal and state governments at present do little directly to aid in preserving and improving the fertility of the soil; but the experiments in advanced methods of cultivation carried on by the Department of Agriculture, the Experiment Stations, and state agricultural colleges, are doing much to show the farmers how to make the best use of their land and at the same time to conserve it for the use of posterity. Science will become the servant of agriculture as well as of industry."—C. A. Beard, *American government and politics*, p. 408.—See also **FOOD REGULATION**: 1917-1918: Food control in the United States.

AGRICULTURE, International Institute of. —The idea of an international organization for systematizing the agricultural production of the world and regulating the markets of food products, by constant and authentic knowledge of crops and conditions, was conceived some years ago by Mr. David Lubin, of California. It was first expressed by him publicly at Budapest in 1896, but was the growth of thirteen years of thought preceding that date. As the result of Mr. Lubin's efforts to interest governments and peoples in the project, King Victor Emmanuel III, of Italy, became its hearty patron in 1903, and took the initial step toward effecting an organization as wide as the civilized world, by inviting all nations to take part in a convention of delegates for the purpose, at Rome, in May, 1905. The invitation, as addressed to the Government of the United States by the Italian ambassador at Washington, on February 26, 1905, was in these words: "By order of my government, I have the honor to inform your excellency that His Majesty the King, my august sovereign, has taken the initiative in the formation of an international institute of agriculture to be composed of representatives of the great agricultural societies of the various countries and of delegates from the several governments. This institute, being devoid of any political intent, should tend to bring about a community of interests among agriculturists and to protect these interests in the markets of the world. It will study agricultural conditions in the different countries, periodically indicating the supply and the quality of products with accuracy and care, so as to proportion production to demand, increase and distribute the various crops according to the rate of consumption, render the commerce of agricultural products less costly and more expeditious, and suitably determine the prices thereof. Acting in unison with the various national bureaus already existing, it will furnish accurate information on conditions regarding agricultural labor in various localities, and will regulate and direct the currents of emigration. It will favor the institution of agricultural exchanges and labor bureaus. It will protect both producers and consumers against the excesses of transportation and forestalling syndicates, keeping a watch on middlemen, pointing out their abuses, and acquainting the public with the true conditions of the market. It will foster agreements for common defense against the diseases of plants and live stock, against which individual defense is less effectual. It will help to develop rural cooperation, agricultural insurance, and agrarian credit. It will study and propose measures of general interest, preparing international agreements for the benefit of agriculture and the agricultural classes. Carrying out the intention of His Majesty, the Italian Government appeals to all friendly nations, each of which ought to have its own representatives in the institute, appointed to act as the exponents of their

respective governments, as organs of mutual relations, and as mediums of reciprocal influence and information. It accordingly now invites them to participate through their delegates in the first convention, which is to be held at Rome next May for the purpose of preparing rules for the new institute. The king's government trusts that the United States will be willing to cooperate in the enterprise, the first inspiration of which is due an American citizen, and that, accepting the invitation to the conference at Rome, it will send thither a delegation commensurate with its importance as the foremost agricultural nation in the world."

1905.—Conference at Rome.—Gratifying responses to the invitation were made by most, if not all, of the governments addressed, and a royal proclamation was issued calling an international conference at Rome to which thirty-eight powers responded. It concluded its sessions on June 7, 1905, by adopting a final act embodying the resolutions upon which they had agreed. The text of the act follows:

"ARTICLE 1. There is hereby created a permanent international institute of agriculture, having its seat at Rome.

"ARTICLE 2. The international institute of agriculture is to be a government institution, in which each adhering power shall be represented by delegates of its choice. The institute shall be composed of a general assembly and a permanent committee, the composition and duties of which are defined in the ensuing articles.

"ARTICLE 3. The general assembly of the institute shall be composed of the representatives of the adhering governments. Each nation, whatever be the number of its delegates shall be entitled to a number of votes in the assembly which shall be determined according to the group to which it belongs, and to which reference will be made in article 10.

"ARTICLE 4. The general assembly shall elect for each session from among its members a president and two vice-presidents. The sessions shall take place on dates fixed by the last general assembly and according to a programme proposed by the permanent committee and adopted by the adhering governments.

"ARTICLE 5. The general assembly shall exercise supreme control over the international institute of agriculture. It shall approve the projects prepared by the permanent committee regarding the organization and internal workings of the institute. It shall fix the total amount of expenditures and audit and approve the accounts. It shall submit to the approval of the adhering governments modifications of any nature involving an increase in expenditure or an enlargement of the functions of the institute. It shall set the date for holding the sessions. It shall prepare its regulations. The presence at the general assemblies of delegates representing two-thirds of the adhering nations shall be required in order to render the deliberations valid.

"ARTICLE 6. The executive power of the institute is intrusted to the permanent committee, which, under the direction and control of the general assembly, shall carry out the decisions of the latter and prepare propositions to submit to it.

"ARTICLE 7. The permanent committee shall be composed of members designated by the respective governments. Each adhering nation shall be represented in the permanent committee by one member. However, the representation of one nation may be intrusted to a delegate of another adher-

ing nation, provided that the actual number of members shall not be less than fifteen. The conditions of voting in the permanent committee shall be the same as those indicated in article 3 for the general assemblies.

"ARTICLE 8. The permanent committee shall elect from among its members for a period of three years a president and a vice-president, who may be reelected. It shall prepare its internal regulations, vote the budget of the institute within the limits of the funds placed at its disposal by the general assembly, and appoint and remove the officials and employees of its office. The general secretary of the permanent committee shall act as secretary of the assembly.

"ARTICLE 9. The institute, confining its operations within an international sphere, shall—

"(a) Collect, study, and publish as promptly as possible statistical, technical, or economic information concerning farming, both vegetable and animal products, the commerce in agricultural products, and the prices prevailing in the various markets;

"(b) Communicate to parties interested, also as promptly as possible, all the information just referred to;

"(c) Indicate the wages paid for farm work;

"(d) Make known the new diseases of vegetables which may appear in any part of the world, showing the territories infected, the progress of the disease, and, if possible, the remedies which are effective in combating them;

"(e) Study questions concerning agricultural cooperation, insurance, and credit in all their aspects; collect and publish information which might be useful in the various countries in the organization of works connected with agricultural cooperation, insurance, and credit;

"(f) Submit to the approval of the governments, if there is occasion for it, measures for the protection of the common interests of farmers and for the improvement of their condition, after having utilized all the necessary sources of information, such as the wishes expressed by international or other agricultural congresses or congresses of sciences applied to agriculture, agricultural societies, academies, learned bodies, etc.

"All questions concerning the economic interests, the legislation, and the administration of a particular nation shall be excluded from the consideration of the institute.

"ARTICLE 10. The nations adhering to the institute shall be classed in five groups, according to the place which each of them thinks it ought to occupy. The number of votes which each nation shall have and the number of units of assessment shall be established according to the following gradations:

Groups of nations	Numbers of votes	Units of assessment
I.....	5	16
II.....	4	8
III.....	3	4
IV.....	2	2
V.....	1	1

"In any event the contribution due per unit of assessment shall never exceed a maximum of 2,500 francs. As a temporary provision the assessment for the first two years shall not exceed 1,500 francs per unit. Colonies may, at the request of the nations to which they belong, be admitted to form part of the institute on the same conditions as the independent nations.

"ARTICLE 11. The present convention shall be ratified and the ratifications shall be exchanged as soon as possible by depositing them with the Italian Government."

On March 27, 1906, the Italian ambassador at Washington was able to announce that "the States which were represented at the conference of last year at Rome . . . have now all sanctioned by the signature of their plenipotentiaries, the Convention drafted at that Conference." As appears from a copy transmitted, the convention had been signed by the plenipotentiaries of forty nations, including twelve American republics besides the United States. At the second general meeting of the institute at Rome, Dec. 12, 1909, at which more than one hundred foreign delegates were present, Victor Emmanuel III of Italy bestowed upon it a yearly allowance of 300,000 lire. This generous grant was used in the construction of a palace, which the institute now occupies. The organization carried on its work throughout the duration of the World War, supplying the data upon which all food commissions based their plans for conservation. Today (1921) fifty-eight nations are members of the institute and until his recent death David Lubin had a goodly share in its fine work. Upon learning that Belgium, Germany and Italy were far better organized for farm credit than the United States, he urged the United States to appoint a commission to study cooperation in rural credit and finance. This they did, and partly as a result of the work of this commission we have the establishment of the Federal Farm Loan banks in 1916.

AGRIGENTUM (Acragas), one of the youngest of the Greek colonies in Sicily, founded about 582 B. C. by the older colony of Gela, became in the fifth century B. C. one of the largest and most splendid cities of the age, as is testified by its ruins. It was the scene of the notorious tyranny of Phalaris, as well as that of Theron. Agrigentum was destroyed by the Carthaginians, 405 B. C., and rebuilt by Timoleon, but never recovered its former importance and grandeur.—E. Curtius, *History of Greece*, bk. 4, ch. 3. See SICILY: B. C. 409-405.—It was the scene of a great defeat of the Carthaginians by the Romans, in 262 B. C. See PUNIC WARS: First.

AGRIPPA, Baths of. Among the principal Roman baths said to have been built 21 B. C. immediately behind the Pantheon. See BATHS.

AGRIPPA, Herod, I. (c. B. C. 10-A. D. 44), king of Judea, the grandson of Herod the Great; was a great favorite with Gaius (Caligula) who gave him jurisdiction over Batanæa and Trachonitis, later adding the tetrarchy of Herod Antipas (A. D. 30), whose banishment he procured.—See also JEWS: B. C. 40-A. D. 44; CHRISTIANITY: A. D. 33-70.

AGRIPPA, Herod, II (A. D. 27-100), the last of the descendants of Herod the Great; king of Judea, following his father Agrippa I; deprived of the tetrarchy of Chalcis by Claudius in A. D. 53.—See also JEWS: B. C. 40-A. D. 44.

AGRIPPA, Marcus Vipsanius (63-12 B. C.), Roman general and statesman; advisor to the emperor Augustus who succeeded Julius Cæsar (44 B. C.); carried on successful expeditions against the Aquitanians and the Germans 38 B. C.; was made consul in 37 B. C.; defeated Pompeius at Mylæ, 36 B. C., and was responsible for the victory at Actium (31 B. C.).

AGRIPPINA, the "younger" (A. D. 16-59), daughter of Agrippina the elder and sister of Gaius (Caligula). She was the mother of Nero whom she placed upon the throne through intrigue. Nero

bad her put to death.—See also ROME: A. D. 47-54; and A. D. 54-64.

AGUESSEAU, Henri Francois d' (1668-1751), illustrious chancellor of France; at twenty-one was appointed advocate-general to the Parliament of Paris and procurator-general in 1700.

AGUILA, Don Juan de: Commander of Spanish fleet sent to aid Ulster. See ULSTER: 1585-1608.

AGUILAR Y CORREA, Antonio, Marqués de la Vega de Armijo (1824-1909), Spanish statesman. Associated with the Union Liberal party, 1855-1866; in 1873 became ambassador to France; played a prominent part in frustrating the plans of the Carlists. Held many ministerial positions in Spain, among others, minister of state.

AGUINALDO, Emilio (1870-), a Filipino mestizo of Chinese and Tagalog parentage, and the leader first of the revolt against Spain, and then of the insurrection against the United States. He was educated at the College of San Juan de Letrán and at the University of St. Thomas in Manila. He became mayor of Cavité Vieja. While still a very young man, he became interested in the liberal movement in the Philippines. When the insurrection of 1896 was suppressed, he was the chief of the revolutionary leaders exiled by Spain to Hongkong. (See PHILIPPINE ISLANDS: 1896-1898). With Hongkong as a center, Aguinaldo contrived to continue his machinations against Spain until they culminated in the insurrections of 1898, when he returned to Manila to aid the United States against Spain. (See U. S. A.: 1898 (April-May): Philippines). Aguinaldo arrived in Manila May 10, 1898, and proceeded to organize the insurgent forces. Although Aguinaldo's first attitude towards the United States in the Philippines was one of welcome and cooperation, he gradually became antagonistic toward the American army, and with him also many of the more notable Filipinos. (See U. S. A.: 1898 (July-August): Philippines). When the manifesto establishing a protectorate over the Philippines was issued, Aguinaldo, who had proclaimed himself president of the Philippine Republic (see U. S. A.: 1898 (July-September)), met it with a counter-proclamation asserting the independence of the islands, saying, "The United States did not take me out of Hongkong to make war for their own benefit." (See PHILIPPINE ISLANDS: 1898-1899: December-January). This manifesto he followed with an armed insurrection against the United States forces. After three years' fighting Aguinaldo was forced to flee to the mountains of Luzon. (See PHILIPPINE ISLANDS: 1899: Armed opposition to establishment of American government.) He was finally captured in 1901 by Brigadier-General Funston at Palawan, Luzon, and capitulated with some grace by issuing an address to his countrymen asking them to acknowledge the sovereignty of the United States. (See PHILIPPINE ISLANDS: 1901: Establishment of civil government). He retired from public life.

A. H. (Anno hejiræ). See CHRONOLOGY: Era of the hejira.

AHENOBARBUS ("brazen-bearded"), a plebeian family of Rome, the name being derived from the peculiar fact that most of the members of the family had red hair or beards. Some of the members of this family were: Gnaeus Domitius Ahenobarbus, tribune (104 B. C.), Lucius Domitius Ahenobarbus, consul in 54 B. C., and Gnaeus Domitius Ahenobarbus, son of the above, consul in the year 32 B. C. and supporter of Octavius against Antony.

AHMAD SHAH (1724-1773), the founder of the Durani dynasty in Afghanistan; led a revolt of

the Afghanistan tribes in 1747 and was crowned sovereign in October of that year. He was the possessor of the famous Koh-i-noor diamond; gained control of the Punjab in 1751, subdued Kashmir the following year and pillaged Delhi in 1756. Ahmad inflicted a serious defeat upon the Mahrattas who essayed to take possession of the Punjab (1758), which he later lost to the Sikhs.—See also INDIA: 1747-1761; AFGHANISTAN: 330-1747.

AHMADIYA.—"A sect which claims to have 500,000 members in various parts of India is the Ahmadiya. It was founded in 1889 by Mirza Ghulam Ahmad, who was born at Quadian near Batala about fifty years earlier. He claimed to be the promised Mahdi of the Moslems, the Messiah of the Christians, and the Avatar of the Hindus; and taught that Mohammed revealed the same great truths as are contained in other religions and embodied them in the Koran. Mr. O'Malley writes of the cult in the *Census Report*:

"One significant feature of the cult is its opposition to Christianity. According to Mussalman belief, when the end of the world approaches, *Dajjal* (Anti-Christ) will rule, and the powers of evil will reign till Christ reappears, and, with the help of Mahdi, overthrows *Dajjal* and converts the whole world to Islam. The Ahmadiya rejects this doctrine and identifies *Dajjal* with the teachings of the Christian Church, such as the atonement and the divinity of Jesus Christ. In fact, he holds that the prophecy of the advent of *Dajjal* has been fulfilled by the spread of Christian missionaries."—S. M. Zwemer, *Disintegration of Islam*, p. 101.

AHMAR, Mahomet Ibn-Al (Mohammed I, of Granada): Founder of the Alhambra. See SPAIN: 1238-1273.

AHMED I (1589-1617), Turkish sultan.

AHMED II (1643-1695), Turkish sultan.

AHMED III (1637-1736), Turkish sultan, Sheltered Charles XII of Sweden, after the battle of Poltava. Fought a successful war with Russia, but was defeated in other contests. Deposed by the Janissaries, and died in prison.

Struggle with Hungarians. See HUNGARY: 1699-1718.

AHMED (Al Mostanser Billah), last caliph of Bagdad. See BAGDAD: 1258.

AHMED ARABI (Arabi Pasha) (c. 1839-), Egyptian revolutionary leader. See EGYPT: 1875-1882.

AHMED MIRZA (1898-), shah of Persia, succeeding his deposed father in 1909, in the midst of unsettled conditions. See PERSIA: 1908-1909.

AHMED VEFIK, Pasha (1819-1891), Turkish statesman and man of letters. Furthered the spread of French culture by translations; editor of the first official annual of his country; ambassador to Persia, 1851-1855; president of the Turkish parliament in 1877; prime minister in 1878 and 1882. As vali of Brusa (1878-1882) inaugurated many internal reforms.

AHMEDABAD, British India, scene of a rebellion in 1918. See INDIA: 1919.

AHMEDNAGAR, or Ahmadnagar, city and district of British India in the central division of Bombay. The city, founded 1494, was the seat of a monarchy until 1636; in 1803 captured by the British (see INDIA: 1798-1805), who obtained possession of it by the Treaty of Poona, 1817.

AHTENA INDIANS. See INDIANS, AMERICAN: Mackenzie Area.

AHURAMAZDA, Zoroastrian deity. See ZOROASTRIANS: Magians: Parsees.

AHVAZ, Persia.—1914.—Held by Turks. See WORLD WAR: 1914: IV. Turkey: i.

1915.—Turks driven from it. See WORLD WAR: 1915: VI. Turkey: c, 1.

AIBAK, ruler in India. See INDIA: 977-1290.

AIDAN, or Aedan (d. 651), first bishop of Lindisfarne (about 634); helped in the restoration of Christianity in Northumbria. See CHRISTIANITY: 597-800: LINDISFARNE: 635-664.

AIDIN, a town in the former Turkish vilayet of the same name, situated near the river Mendere, about seventy miles southeast of Smyrna, the capital. It is near the ruins of ancient Tralles and contains numerous fine bazaars, Greek religious edifices and several Turkish mosques. In 1899 the town was greatly damaged by an earthquake. After the World War the greater part of the vilayet, including the city of Smyrna, was placed under the mandate of Greece.

AIGINA. See ÆGINA.

AIGUILLON, Emmanuel Armand de Wignerod du Plessis de Richelieu, Duc d' (1720-1782), French statesman and nephew of the Maréchal de Richelieu; took part in the campaign against Italy and in the War of the Austrian Succession; appointed governor of Brittany, 1753.

AIGUILLON, Siege of, a notable siege in the Hundred Years' War, 1346. An English garrison under the famous knight, Sir Walter Manny, held the great fortress of Aiguillon, near the confluence of the Garonne and the Lot, against a formidable French army.—J. Froissart, *Chronicles*, v. 1, bk. 1, ch. 120.

AILETTE, a river in France, flowing into the Oise; south of St. Gobain forest and north of the Chemin des Dames; was the scene of severe fighting in the World War, especially in 1917 and 1918.—See also WORLD WAR: 1917: II. Western front: b, 2, i; 1918: II. Western front: g, 1, g, 6.

AILLES, taken by the French (1917). See WORLD WAR: 1917: II. Western front: f, 3.

AIN KOHLEH, Palestine.—1917.—British objective. See WORLD WAR: 1917: VI. Turkish theater: c, 2, iii.

AINCREVILLE, French town, north-west of Verdun, taken by the Allies in 1918. See WORLD WAR: 1918: II. Western front: x, 4.

AINOS, aborigines of Japan. See JAPAN: Inhabitants and their origins.

AINTAB, Syrian town in the vilayet of Aleppo with a large population of Armenians and Greek Christians. It is the site of the Central Turkey College, founded by the American Board of Foreign Missions, and in March, 1909, was included in the Adana massacres, during which 15,000 Armenians were killed in three days.—See also TURKEY: 1909.

Siege of Aintab.—French forced to evacuate (1920). See SYRIA: 1908-1921.

AIRE AND CALDER NAVIGATION CANAL. See CANALS: Principal European canals: British Isles.

AIREY, Richard Airey, Baron (1803-1881), British general. Served in the Crimea; governor of Gibraltar, 1865-1870; presided over the celebrated Airey commission on army reforms.

AIRPLANE. See AVIATION: Development of airplanes and air service: 1809-1874; 1889-1900; 1910-1920.

AIRSHIPS: Invention. See AVIATION: Development of balloons and dirigibles: 1884-1897.

AIRY, Sir George Biddell (1801-1802), English astronomer. Conducted the astronomical observations preliminary to the boundary survey between the United States and Canada, and invented a device to correct the compass variations on war ships. See ASTRONOMY.

AISLABIE, John (1670-1742), English politician. In 1718 became chancellor of the exchequer; supported the proposal of the South Sea Company to pay the national debt, and on the collapse of that company was expelled from the House.

AISNE, a French river flowing through Soissons, tributary to the Oise. The Germans occupied strong positions north of the Aisne after their retreat from the Marne, September 12-28, 1914. The Allied forces succeeded in partially dislodging the Germans from these positions and some of the most bitter fighting of 1917 and 1918 took place in this vicinity. The valley of the Aisne with its chief affluents, the Aire and the Vesle, constitutes one of the natural highways from the Belgian frontier to the neighborhood of Paris.

AISNE, Department of: 1600.—Cession to France. See FRANCE: 1599-1610.

Devastation by the Germans. See WORLD WAR: Miscellaneous auxiliary services: XI. Devastation: c.

AISTULF, king of the Lombards, 749-756. In 751 seized Ravenna and soon after threatened

Rome. The pope secured the aid of Pepin, who defeated Aistulf at Pavia and forced him to return the Exarchate of Ravenna to the papacy. See ITALY: 568-800; LOMBARDS: 754-774.

AITKEN, Major-General John James (b. 1878), Campaign against Tanga. See WORLD WAR: 1914: VI. Africa: c, 1.

AIX, a city in the department of Bouches-du-Rhône, France, known to the Romans as Aquæ Sextiæ. It was founded as a military colony in 123 B. C. In the year 102 B. C. not far from the city Marius defeated the Teutones and their allies. It was later the capital of Provence and a literary center. Before the French Revolution it was the seat of one of the chief provincial *parlements*.

AIX, a small island off the western coast of France between the mouth of the Charente and the Island of Oléron. The roadstead near the island affords the best anchorage between the mouths of the rivers Loire and Gironde. It was here in 1815 that Napoleon went aboard the "Bellerophon," which took him to England, whence he was sent to St. Helena.

AIX-LA-CHAPELLE: The Capital of Charlemagne.—The favorite residence and one of the two capitals of Charlemagne was the city which the Germans call Aachen and the French have named Aix-la-Chapelle. "He ravished the ruins of the ancient world to restore the monumental arts. A new Rome arose in the depths of the forests of Austrasia—palaces, gates, bridges, baths, galleries, theatres, churches,—for the erection of which the mosaics and marbles of Italy were laid under tribute, and workmen summoned from all parts of Europe. It was there that an extensive library was gathered, there that the school of the palace was made permanent, there that foreign envoys were pompously welcomed, there that the monarch perfected his plans for the introduction of Roman letters and the improvement of music."—P. Godwin, *History of France: Ancient Gaul, bk. 4, ch. 17.*

Cathedral of Aix-la-Chapelle.—A famous cathedral founded by Charlemagne, the plan of which bears resemblance to San Vitale and similar Italian buildings. It consists of a polygonal structure built in 796 and a fourteenth century pointed choir.

Treaty of 803. See VENICE: 697-810.

Modern city.—The city lies forty-four miles west of Cologne on the great railway trunk line Berlin—Brussels—Paris. Previous to 1914 Aix-la-Chapelle (Aachen) was made a place of great military importance by means of a network of strategic railways. With the outbreak of the World War it became with Metz the principal detrainning station for the German armies and therefore the principal gateway through which they poured for the invasion of Belgium and northern France.—See also GERMANY: Map.

Congresses of Aix-la-Chapelle.—Three congresses have been held by the European powers at Aix-la-Chapelle, a city in Prussia, the first in 1668, the second in 1748 and the third in 1818.

(1) THE TREATY OF AIX-LA-CHAPELLE, May 2, 1668, put an end to the War of Revoltion and closed the Treaty of St. Germain which was signed April 15 of that year by representatives of France and the nations in the Triple Alliance. France gained materially by the provisions of the treaty, being permitted to hold all the territory she conquered in Flanders during the campaign of 1667.—See also NETHERLANDS: 1668.

(2) THE CONGRESS AND TREATY WHICH ENDED

THE WAR OF THE AUSTRIAN SUCCESSION (1748).—The War of the Austrian Succession, which raged in Europe, on the ocean, and in India and America, from 1740 to 1748 (see AUSTRIA: 1718-1738, 1740-1741, and after), was brought to an end in the latter year by a congress of all the belligerents which met at Aix-la-Chapelle, in April, and which concluded its labors on October 18 following. "The influence of England and Holland . . . forced the peace upon Austria and Sardinia, though both were bitterly aggrieved by its conditions. France agreed to restore every conquest she had made during the war, to abandon the cause of the Stuarts, and expel the Pretender from her soil; to demolish, in accordance with earlier treaties, the fortifications of Dunkirk on the side of the sea, while retaining those on the side of the land, and to retire from the conquest without acquiring any fresh territory or any pecuniary compensation. England in like manner restored the few conquests she had made [see ENGLAND: 1754-1755], and submitted to the somewhat humiliating condition of sending hostages to Paris as a security for the restoration of Cape Breton. . . . The disputed boundary between Canada and Nova Scotia, which had been a source of constant difficulty with France, was left altogether undefined. [See also NEW ENGLAND: 1745-1748.] The Assiento treaty for trade with the Spanish colonies was confirmed for the four years it had still to run; but no real compensation was obtained for a war expenditure which is said to have exceeded sixty-four millions, and which had raised the funded and unfunded debt to more than seventy-eight millions. Of the other Powers, Holland, Genoa, and the little state of Modena retained their territory as before the war, and Genoa remained mistress of the Duchy of Finale, which had been ceded to the king of Sardinia by the Treaty of Worms, and which it had been a main object of his later policy to secure. Austria obtained a recognition of the election of the Emperor, a general guarantee of the Pragmatic Sanction, and the restoration of everything she had lost in the Netherlands, but she gained no additional territory. She was compelled to confirm the cession of Silesia and Glatz to Prussia, to abandon her Italian conquests, and even to cede a considerable part of her former Italian dominions. To the bitter indignation of Maria Theresa, the Duchies of Parma, Placentia and Guastella passed to Don Philip of Spain, to revert, however, to their former possessors if Don Philip mounted the Spanish throne, or died without male issue. The King of Sardinia also obtained from Austria the territorial cessions enumerated in the Treaty of Worms [see ITALY: 1743; also 1740-1752], with the important exceptions of Placentia, which passed to Don Philip, and of Finale, which remained with the Genoese. For the loss of these he obtained no compensation. Frederick [the Great, of Prussia] obtained a general guarantee for the possession of his newly acquired territory, and a long list of old treaties was formally confirmed. Thus small were the changes effected in Europe by so much bloodshed and treachery, by nearly nine years of wasteful and desolating war. The design of the dismemberment of Austria had failed, but no vexed questions had been set at rest. . . . Of all the ambitious projects that had been conceived during the war, that of Frederick alone was substantially realized."—W. E. H. Lecky, *England in the 18th century*, ch. 3.—"Thus ended the War of the Austrian succession. In its origin and its motives one of the most wicked of all the many conflicts which ambition and perfidy have provoked in Europe, it excites a pecu-

liarily mournful interest by the gross inequality in the rewards and penalties which fortune assigned to the leading actors. Prussia, Spain and Sardinia were all endowed out of the estates of the house of Hapsburg. But the electoral house of Bavaria, the most sincere and the most deserving of all the claimants to that vast inheritance, not only received no increase of territory, but even nearly lost its own patrimonial possessions. . . . The most trying problem is still that offered by the misfortunes of the Queen of Hungary [Maria Theresa]. . . . The verdict of history, as expressed by the public opinion, and by the vast majority of writers, in every country except Prussia, upholds the justice of the queen's cause and condemns the coalition that was formed against her."—H. Tuttle, *History of Prussia, 1745-1756*, ch. 2.

(3) CONFERENCE OF AIX-LA-CHAPELLE (1818).—The negotiations carried on in 1818 at Aix-la-Chapelle and the subsequent treaty had to deal with problems so akin to those confronting the delegates to the Versailles Conference in 1919 that it has been thought best to treat them quite fully. "The great problem that confronted the statesmen of the Restoration was how to prevent the order established by the Congress of Vienna from being destroyed by revolutionary outbreaks. France, especially, as the home of revolution, needed careful watching. A coalition of great powers known as the Quadruple Alliance, composed of Russia, Austria, Prussia, and England, was organized, in 1815, for the purpose of preserving the 'tranquillity of Europe.' It was to meet every year to hold a sort of political inquest on the state of Europe, to suppress rebellions, and to advise on the best means of preventing the spread of democratic ideas. The moving spirit of this league to enforce autocracy was the Austrian Prince Metternich who was firmly convinced that the only way to fight revolutionary movements which, owing to the French Revolution, had become international, was by a compact of the despots pledged to support one another in case of an uprising. If revolution was to be international, so would be repression. Because of this Metternich developed his theory of 'intervention'; namely, that Europe was a social and political unit with a uniform system of government and society; hence an attack on any part of it would be fatal to the whole unless defended by the whole. International congresses were held at Aix-la-Chapelle in 1818, at Troppau in 1820, and at Laibach in 1821, where the principle of 'intervention' was adopted by the Powers."—J. S. Schapiro, *Modern and contemporary European history*, pp. 20-21.

"The Conference of Aix-la-Chapelle, of which the first session was held on September 30th, was attended by the Emperor Alexander of Russia, the Emperor Francis of Austria, and King Frederick William of Prussia in person, while Great Britain was represented by Wellington and Castlereagh. The ministers of the other Powers were Capo d'Istria and Nesselrode for Russia. Richelieu, though not admitted to the conferences, was present on behalf of France. The first question discussed was that of the withdrawal of the Allied army of occupation, and on this there was complete unanimity. At the second session, on October 1st, the four Powers signed a protocol agreeing to the principle of the evacuation of France at the end of the third year, or earlier if possible, subject to satisfactory arrangements being made for the payment of the instalments of the indemnity still due, which amounted to 265,000,000 francs. In regard to this latter, Wellington had been empowered to make an arrangement with the

financial houses of Hope, of Amsterdam, and Baring, by which these agreed to take over the debt on certain terms, thus converting it into an ordinary public obligation, which, to use the language of a draft memorandum laid before the Cabinet, could not be repudiated by the French Government without an act of violent bankruptcy. The details of the negotiation outstanding on September 30th were soon settled, and on October 9th a treaty was signed by which the Allies agreed to withdraw their troops from French soil by November 30th. . . . In coming to this decision there was complete harmony among the Powers; there was, however, no such harmony on the question of what further consequences were to follow on it. The Duc de Richelieu argued that the same reasoning which had induced the Powers to put an end to the armed occupation should lead them, as a logical consequence, to admit France to the Alliance on equal terms. This was, however, far from representing the mind of the Allies, whose policy of evacuation had not been inspired by any confidence in the improved temper of the French people. The autocratic Powers especially were seriously alarmed by what they considered the weak attitude of the French Government towards the Liberal Revival, to which recent elections had borne disquieting evidence. . . . On the question of admitting France to the Alliance on the basis of the Treaty of Chaumont the British Cabinet was at one with the other Allies, for Castlereagh and his colleagues had a strong sense of the precarious tenure of the restored monarchy in France, and believed that the maintenance of the Quadruple Alliance was essential to the peace of Europe; they realized, too, the paradox involved in making France a party to a treaty which was primarily directed against herself. On the other hand, were she to be altogether excluded, she would inevitably become the nucleus of a separate alliance, and everything that had been gained by the European Concert would be placed in jeopardy. . . . The problem of the future relation of France to the Alliance thus opened up at Aix-la-Chapelle the whole broader question of the future form of the 'Confederation of Europe.' As to this, much of course depended upon the attitude of the Emperor Alexander. His first care on arriving at Aix had been to place beyond doubt his own absolute loyalty to the European Alliance. In an interview with Metternich on September 20th he indignantly repudiated the truth of the rumours that he had been meditating a breach with the Alliance and a separate understanding with France. . . . In subsequent interviews with Wellington and Castlereagh he used the same language, insisting that his army was the army of Europe, and that he could not admit that it would be otherwise employed than with Europe, to repress any attempt that might be made to shake the system of which his empire formed only a part. . . . Meanwhile, Castlereagh had laid before the Powers the proposal of the British Government . . . which Metternich at once approved, while Hardenberg and Bernstorff gave it a friendly but more reserved reception. This formed the basis of the negotiations that followed, and in a couple of days Castlereagh reported home that the probable result of the Conference would be (1) to adhere strictly to the treaties, especially those of Chaumont and Paris, which constituted the Quadruple Alliance; (2) not to admit France to them, not to replace them by a Quintuple Alliance; (3) to invite France to join in the deliberations of the Powers under Article VI of the Treaty of Alliance of November 20th, which, as this article is the

only one that survived the war or that would be operative so long as France kept quiet, would in effect place her in a line with the other Powers so long as the state of peace subsisted; (4) in order to calm the alarm of the other Powers, to issue a declaration to the effect that, by these regular assemblies the Powers had no intention of arrogating to themselves any supremacy, or of interfering in the politics of other states in any way not warranted by the law of nations. . . . These proposals, however, did not go far enough for the Emperor Alexander. On the one hand, he was eager to publish to all the world the renewal of the disciplinary Alliance of Chaumont, which the others were anxious to keep effective, but in the background. On the other hand, he was bent on using this opportunity of realizing his political ideal of a confederated Europe. The outcome of this religious fervour was the presentation to the other Allies on October 8th of a confidential memorandum of the Russian cabinet drafted by Pozzo di Borgo, stating the Tsar's views on the measures to be adopted in order to preserve Europe from a return of revolutions and of the principle that might be right. Europe, it is said, had been restored in 1815 and served till now by the Alliance of the great states, unalterable in principle, but extending its sphere according to circumstances, and becoming thus the Alliance of all the states. The results thus far achieved had been due, less to the uncertain combinations of men than to that Supreme Intelligence to which the sovereigns had done homage by the act of September 26, 1815. The woes of humanity had been caused by egoism and partial combinations in politics, and the proof of this was the good derived from the empire of Christian morality and of the Rights of Man which had given Europe peace. The system of Europe was a general association, which had for *foundation* the Treaties of Vienna and Paris, for *conservative principle* the fraternal union of the Allied Powers, for *aim* the guaranteed best interests of the great European family; and it was the work not of any man but of Providence. Its moral support lay in the Quadruple Alliance and the Holy Alliance, its material support in the armed occupation of France. . . . The Emperor then proposed: (1) That the Quadruple Alliance should be preserved as against danger from France; (2) that a general Alliance should be formed, consisting of all the signatories of the Treaties of Vienna, having as its object the guarantee of the state of territorial possession and of sovereignty *ab antiquo*. The first of these objects was to be established by a protocol defining the *casus fœderis* and the military measures to be taken should this arise, and arranging for future meetings. The second was to be accomplished by a declaration of the Great Powers announcing to Europe the results of their deliberations at Aix, to which declaration, since the Quadruple Alliance was not a partial combination but the basis of the General Alliance, all the states which had signed the acts of 1815 should be invited to subscribe. The Quadruple Alliance, the memorandum explained, was held together as yet only by the sentiment of the parties to it; but if it formed part of a wide European association no Power could break away from it without being at once isolated. The Quadruple and General Alliance would be proclaimed as a single and indivisible system by the signatures of the Powers to the declaration. Such a system would guarantee the security of Governments by putting the rights of nations under a guarantee analogous to that which protects individuals. The Governments, for their

parts, being relieved from fear of revolutions could offer to their peoples Constitutions of a similar type . . . so that the liberties of peoples, wisely regulated, would arise without effort from this state of affairs once recognized and publicly avowed. . . .

"So far as the European Concert was concerned, then, the outcome of the Conference of Aix-la-Chapelle was a compromise, embodied in two instruments signed on November 15th. The first, in the form of a secret protocol, renewed the Quadruple Alliance for the purpose of watching over France in case of fresh revolutionary outbreaks menacing the peace of Europe; this was communicated in confidence to Richelieu. The second, to which France was invited to adhere, was a declaration, which ran as follows: 'The Convention of October 9, 1818, which definitely regulated the execution of the engagements agreed to in the Treaty of Peace of November 20, 1815, is considered by the sovereigns who concurred therein as the accomplishment of the work of peace, and as the completion of the political system destined to secure its solidity. The intimate union established among the monarchs, who are joint-parties to this system, by their own principles, no less than by the interests of their people, offers to Europe the most sacred pledge of its future tranquillity. The object of the union is as simple as it is great and salutary. It does not tend to any new political combinations—to any change in the relations sanctioned by existing treaties; calm and consistent in its proceedings, it has no other object than the maintenance of peace, and the guarantee of those transactions on which the peace was founded and consolidated. The sovereigns, in forming this august union, have regarded as its fundamental basis their invariable resolution never to depart, either among themselves or in their relations with other states, from the strictest observation of the principles of the rights of nations: principles, which, in their application to a state of permanent peace, can alone effectually guarantee the independence of each Government, and the stability of the general association. Faithful to these principles, the sovereigns will maintain them equally in those meetings at which they may be personally present, or in those which shall take place among their ministers; whether they be for the purpose of discussing in common their own interests, or whether they shall relate to questions in which other Governments shall formally claim their interference. The same spirit which will direct their councils and reign in their diplomatic communications will preside also at these meetings; and the repose of the world will be constantly their motive and their end. It is with these sentiments that the sovereigns have consummated the work to which they were called. They will not cease to labour for its confirmation and perfection. They solemnly acknowledge that their duties towards God and the people whom they govern make it peremptory on them to give to the world, as far as it is in their power, an example of justice, of concord, and of moderation; happy in the power of consecrating, from henceforth, all their efforts to protect the arts of peace, to increase the internal prosperity of their states, and to awaken those sentiments of religion and morality whose influence has been but too much enfeebled by the misfortunes of the times.' . . . These debates, however, by no means occupied the whole time of the Conference. It had been decided to use the occasion of its meeting to settle if possible a number of questions of common interest, of which the most important were defined in the

memorandum of the British Cabinet already quoted. These were: (1) The effective suppression of the Slave Trade, which had been abolished in principle at Vienna; (2) the suppression of the Barbary pirates; (3) the refusal of the King of Sweden to carry out the provisions of the Treaty of Kiel; and (4)—the most fateful of all—the proposed general mediation between Spain and her revolted American colonies.

"It is clear that at this period the Alliance was looked upon even by British statesmen as something more than a mere union of the Great Powers for preserving peace on the basis of the treaties; and in effect, during its short session the Conference acted, not only as a European representative body, but as a sort of European Supreme Court, which heard appeals and received petitions of all kinds from sovereigns and their subjects alike. The German mediatized princes invoked the aid of the Powers against the tyranny of their new overlords, and received satisfaction. The Elector of Hesse begged to be allowed to exchange his now meaningless title for that of king; a request which was refused because it was judged inexpedient to make the royal style too common. The mother of Napoleon, in a pathetic letter, petitioned for the release of her son, pleading that he was now too ill ever again to be a menace to Europe, a petition refused on the ostensible ground that there was proof that the letter was a political move and had been concocted under Napoleon's own direction. The people of Monaco presented a list of grievances against their prince. Questions as various as the settlement of the ranks of diplomatic agents, the rival claims of Bavaria and the Hochberg line to the succession in Baden, a quarrel between the Duke of Oldenburg and Count Bentinck about the lordship of Knipphaussen, the situation of the Jews in Austria and Prussia, were brought under discussion, settled or postponed. In general, on these minor matters it was possible to come to an agreement. It is, however, significant that on the greater issues discussed there was no such edifying harmony. The Powers had already agreed in principle to the suppression of the Slave Trade; jealousy of British sea-power prevented their accepting that mutual 'right of search' by which alone it could have been suppressed. The Barbary pirates were the scourge of the whole continental sea-board; they held up trading vessels at the mouth of the Elbe, and in the Mediterranean no vessel was safe that did not sail under the British or the Ottoman flag; yet it was found impossible to concert measures against them because of British jealousy of Russian intervention in the Mediterranean. The struggle between Spain and her colonies was regarded as a serious menace to the peace of Europe; the Powers were agreed as to the principle of mediation, but could not agree as to its form. They did agree in calling the King of Sweden to order. He obeyed, but at the same time protested against the 'dictatorship' arrogated to themselves by the Great Powers, a protest reinforced by an indignant letter from the King of Württemberg. . . . Of the more important questions thus discussed and left unsettled at Aix-la-Chapelle, the most interesting, from our present point of view, was that of the Spanish colonies, the debates on which opened up the whole question of the relations of the Old World and the New, and even foreshadowed the idea of that world-alliance which has been imperfectly realized in the Hague Conventions."—W. AKKAD.—“The beginnings of the history of Babylonia are shrouded in darkness and uncertainty. Projecting ourselves back to a period about 5000 B. C., we find two distinct races occupying the land, Semitic and Sumerian. The Semites occupied the northern part of the land, called Akkad; and the other people the southern, called Sumer. Scholars agree that neither people is indigenous to the land. Both, it seems, came from mountainous districts, as is determined by many elements in the culture of each. While a number of theories have been advanced, it is highly probable that the Semites, or Akkadians, came down the Euphrates from the west. Which of these two peoples, the Akkadians or the Sumerians, first entered the valley, is not known.”—A. T. Clay, *Art of the Akkadians* (*Art and Archaeology*, Feb., 1917).—“The earlier Semitic kings of Agade or Akkad expressed the extent of their empire by claiming to rule ‘the four quarters (of the world),’ while the still earlier king Lugal-zaggisi, in virtue of his authority in Sumer, adopted the title ‘King of the Land.’ In the time of the early city-states, before the period of Eannatum, no general title for the whole of Sumer or of Akkad is met with in the inscriptions that have been recovered. Each city with its surrounding territory formed a compact state in itself, and fought with its neighbours for local power and precedence. At this time the names of the cities occur by themselves in the titles of their rulers, and it was only after several of them had been welded into a single state that the need was felt for a more general name or designation. Thus, to speak of Akkad, and even perhaps of Sumer, in the earliest period, is to be guilty of an anachronism, but it is a pardonable one.”—L. W. King, *History of Sumer and Akkad*, pp. 14-15.—“... About 2500 B. C. it is

calculated, King Sargon of Akkad carried his arms beyond the limits of Shinar east and west and north and south. . . . He had conquered almost the whole world known to the men of Shinar; beyond there was only barbarian darkness—except, of course, in the Nile Valley, whose kings, about the same time as the conquests of Sargon, were annexing Palestine and Phœnicia, and must have had diplomatic relations with the King of Akkad. Sargon was now ‘lord of the four quarters of the earth,’ for the men of Shinar did not think of the barbarian darkness beyond the range of their knowledge as worth reckoning. This world that Sargon conquered in the middle of the third millennium before Christ is to-day a field for the operations of armies come in part from the land of India, far beyond the hills of Elam on the east.”—E. 1702-1711.—French occupation and first settlement.—Founding of Mobile.—See LOUISIANA: 1698-1712.

1712-1810.—Early settlement by Americans.—“In the early days territorial Alabama was made up of four districts, based on the river systems to which they belonged. The oldest of these settlements was of course that at Mobile, which was founded by the French and later developed by the English and Spaniards. These settlers came by water. Later Americans appeared and settled above and around Mobile in what is now Baldwin, Mobile and Washington Counties, even before all this had become American territory. In 1702, after Mobile itself, the most populous of these settlements was that upon the Tensas River. It was composed both of Whigs and Loyalists, the latter having been driven from Georgia and the Carolinas. This settlement was reached overland from Georgia, the creeks and rivers being passed on rafts, and household and other utensils being carried on pack horses. Next after Mobile came the American settlements on the Tombigbee River in the vicinity of old St. Stephens. This section contained the oldest American settlement in the state, and included a settlement of Georgians on the Alabama, a few miles above its confluence with the Tombigbee. This was made in 1777 and is believed to be one of the earliest settlements within the present limits of the state. The settlers had come overland through the Creek country

from Georgia. . . . From the time that the claims of Georgia to the Mississippi territory were extinguished (1804), immigrants began to flock into what is now Alabama. One party left North Carolina, scaled the Blue Ridge with their wagons, and descended into the valley of the Tennessee. At Knoxville they built flatboats and floated down the river to the Muscle Shoals, where they disembarked their goods, placed them on pack horses, which had been brought overland from Knoxville, and from the Muscle Shoals as a new basis, departed overland for the English settlements on the Tombigbee, about St. Stephens, in southern Alabama, thus traversing in a journey of 120 days from North Carolina nearly the whole length of the state from north to south.

"The northern section of Alabama, the Tennessee valley region, was settled mainly from Tennessee, as early as 1787, and in the earlier period filled up more rapidly than some of the other sections. These immigrants came overland from the Cumberland settlements or floated down the river in flatboats from the settlements farther east. The fourth district was that along the Alabama River, with centers near Claiborne, in Monroe county, and along the Alabama River from the confluence of the Coosa and the Tallapoosa rivers down to and including the present city of Montgomery. This section was settled mainly by Georgians and Carolinians, who came in over the government road. From these four centers population grew and extended to the intervening sections."—S. B. Weeks, *United States Bureau of Education (Bulletin 12, 1915, pp. 11-12)*.

1813-1814.—Creek War. See U. S. A.: 1813-1814 (August—April).

1817.—Detached from Mississippi and made territory of Alabama. See MISSISSIPPI: 1817.

1817-1819.—Organized as a territory.—Constituted a state, and admitted to the Union.—"By an act of Congress dated March 1, 1817, Mississippi Territory was divided. Another act, bearing the date March 3, thereafter, organized the eastern portion into a Territory, to be known as Alabama, and with the boundaries as they now exist. . . . By an act approved March 2, 1819, congress authorized the inhabitants of the Territory of Alabama to form a state constitution, 'and that said Territory, when formed into a State, shall be admitted into the Union upon the same footing as the original States.' . . . The joint resolution of congress admitting Alabama into the Union was approved by President Monroe, December 14, 1819."—W. Brewer, *Alabama, ch. 5*.

1830-1833.—Alabama's first railroads.—The Tuscumbia Railway Company, incorporated Jan. 26, 1830, completed a track of two and one-eighth miles and celebrated the event by the firing of cannon, and the giving of a dinner and ball on June 12, 1832. This was the first railway track laid west of the Alleghany mountains. By the 4th of July, 1833, the Tuscumbia, Courtland and

Decatur Railroad Company (inc. 1832) had constructed eight and seven-tenths miles of road from Tuscumbia toward Decatur. Among the promoters of these railroad enterprises were the leading citizens and business men of the Tennessee valley. The General Assembly was now called on at each session to incorporate one or more railroad companies.

1835-1838.—Removal of the Indians.—"And now came the end of the Indian question in Alabama. All but a few of the Creeks departed for their new lands in the west. The stronger race had driven out the weaker; but none of us who now possess the ancient home of the Muscogees can fail to respect the courage with which they battled against their fate. Only the Cherokees remained, and the final treaty for their removal was already concluded. It was dated December 29, 1835, and its provisions resembled those of the final treaty with the Creeks. New homes in the west and a large sum of money were given to the Cherokees, and in return they gave up all their lands east of the Mississippi. But among them also, as among the Creeks, there was a strong party that opposed the treaty, and threatened to make trouble. However, a large force of volunteers was assembled, including some fifteen hundred Alabamians, and the Cherokees were removed in 1838 without an outbreak. There were left in Alabama only a few scattered families of Indians, who for many years used to peddle bows and arrows and blow-guns to the children of their conquerors."—W. G. Brown, *History of Alabama, p. 170*.

1848.—Alabama platform.—Before 1832 the Democratic party ruled the state of Alabama without a rival for its power. However, about that time the question of nullification caused a split in the ranks, some adhering to the Jacksonian principle, and others to the State's Rights, Calhoun, principle. William L. Yancey, leader of the State's Rights men, the minority party, nevertheless was active and able enough to impose upon the whole Democratic party in the state the most radical views of his faction, which he embodied in a series of resolutions proposed to the Democratic state convention of 1848.

"The resolutions, in principle, were the same the committee had reported, except that they included in their condemnation of unconstitutional political propositions, the new doctrine of squatter sovereignty; and, in this, they were in advance of the Democratic party. They became the historic Alabama Platform bearing no less important relation to the great events of 1861, in the United States, than the resolutions of Patrick Henry bore to the crisis of 1776.

"Whereas, Opinions have been expressed by eminent members of the Democratic party and by a convention of the party assembled in New York to appoint delegates to the Baltimore Convention, that the municipal laws of the Mexican territory, ceded to the United States, should not be changed and that slavery could not be re-established except by authority of the United States or of the Territorial government, therefore, to the end that no doubt should be allowed to exist upon a subject so important and at the same time so exciting. Be it . . . :

"Resolved, That the treaty of cession should contain a clause securing an entry into those Territories to all citizens of the United States together with their property of every description and that the same should remain protected by the United States while the Territories are under its authority. . . .

"11. Resolved, That the opinion advanced or maintained by some that the people of a Territory acquired by the common toil, suffering, blood and treasure of the people of all the States, can, in other event than the forming of a State Constitution preparatory to admittance as a State into the Union, lawfully or constitutionally prevent any citizen of any such States from removing to or settling in such Territory with his property, be it slave property or other, is a restriction as indefensible in principle as if such restriction were imposed by Congress.

"12. Resolved, That the Democratic party is, and should be, co-extensive with the Union; and that while we disclaim all intention to interfere in the local divisions and controversies in any of our sister States, we deem it a solemn duty, which we owe to the Constitution, to ourselves and to that party, to declare our unalterable determination, neither to recognize as Democrats or to hold fellowship or communion with those who attempt to denationalize the South and its institutions, calculated to array one section in feeling and sentiment against the other; and we hold the same to be alike treason to party faith and to the perpetuity of the Union of these States.

"13. Resolved, That this convention pledge itself to the country, and the members pledge themselves to each other under no political necessity whatever to support for the offices of President and vice-President of the United States, any persons who shall not be openly and unequivocally opposed to either of the forms of excluding slavery from the Territories of the United States, mentioned in these resolutions, as being alike in violation of the Constitution and of the just and equal rights of the citizens of the slaveholding States.

"14. Resolved, That these resolutions be considered as instructions to our delegates to the Baltimore Convention to guide them in their votes in that body; and that they vote for no men for President and vice-President who will not unequivocally avow themselves to be opposed to either of the forms of restricting slavery which are described in these resolutions."

"The Alabama Legislature endorsed the Alabama Platform by special resolutions; the Legislature of Georgia endorsed it. The press of the party throughout the South repeated the praises of Yancey, confessing him to be the leader of the first organized effort to resist revolution."—J. C. DuBose, *Life and times of William L. Yancey*.—See also U. S. A.: 1850 (June).

1860.—Occupation of Fort Mobile. See U. S. A.: 1860 (December-February).

1861.—Attitude of North Alabama toward secession.—Proposed state of 'Nickajack.'—"To the convention of 1861 forty-four members from north Alabama were elected as coöperationists, that is, in favor of a union of the southern states, within the old Union, for the purpose of securing their rights under the Constitution or of securing safe secession. They professed to be afraid of separate state secession as likely to lead to disintegration and war. Thirty-one of these coöperationists voted against the ordinance of secession, and twenty-four of them (mostly members from the northern hill counties) refused to sign the ordinance, though all expressed the intention to submit to the will of the majority, and to give the state their heartiest support. When war came all espoused the Confederate cause. The coöperationist party as a whole supported the Confederacy faithfully, though nearly always in a more or less disapproving spirit toward the administration, both state and Confederate. North

Alabama differed from other portions of the state in many ways. There was no railroad connecting the country north of the mountains with the southern part of the state, and from the northern counties it was a journey of several days to reach the towns in central and south Alabama. Hence there was little intercourse between the people of the two sections, though the seat of government was in the central part of the state; even to-day the intimacy is not close. For years it had been a favorite scheme of Alabama statesmen to build railroads and highways to connect more closely the two sections. Geographically, this northern section of the state belonged to Tennessee. The people were felt to be slightly different in character and sympathies from those of central and south Alabama, and whatever one section favored in public matters was usually opposed by the other. Even in the northern section the population was more or less divided. The people of the valley more closely resembled the west Tennesseans, the great majority of them being planters, having little in common with the small farmers of the hill and mountain country, who were like the east Tennesseans. Of the latter the extreme element was the class commonly known as 'mountain whites' or 'sand-mountain' people. These were the people who gave so much trouble during the war, as 'Tories' and from whom the loyal southerners of north Alabama suffered greatly when the country was stripped of its men for the armies. Yet it can hardly be said that they exercised much influence on politics before the war. Their only representative in the convention of 1861 was Charles Christopher Sheets, who did not speak on the floor of the convention during the entire session. On the part of all in the northern counties there was a strong desire for delay in secession, and they were angered at the action of the convention in not submitting the ordinance to a popular vote for ratification or rejection. Many thought the course taken indicated a suspicion of them or fear of their action, and this they resented. Their leaders in the convention expressed the belief that the ordinance would have easily obtained a majority if submitted to the popular vote. Much of the opposition to the ordinance of secession was due to the vague sectional dislike between the two parts of the state. It was felt that the ordinance was a south Alabama measure, and this was sufficient reason for opposition by the northern section. Throughout the entire session a local sectional spirit dictated a course of obstruction. In January and February of 1861 there was some talk among the discontented people of seceding from secession, of withdrawing the northern counties of Alabama and uniting with the counties of east Tennessee to form a new state, which should be called Nickajack, an Indian name common in East Tennessee. Geographically this proceeding would have been correct, since these two parts of the country are closely connected, the people were alike in character and sentiment, and the means of intercourse were better. The people of the valley and many others, however, had no sympathy with this scheme. Lacking the support of the politicians and no leaders appearing, the plan was abandoned after the proclamation of Lincoln, April 10, 1861. Had the war been deferred a few months, it is almost certain that the discontented element of the population would have taken positive steps to embarrass the administration; many believed that reconstruction would take place. Only after four years of war was there after this any appreciable number of the people willing to listen again to

such a proposition."—W. L. Fleming, *Civil war and reconstruction in Alabama*, pp. 109-111.

1865.—Losses from the Civil War.—"The number of soldiers furnished by Alabama to the Confederate service will never be known. The estimates range from 60,000, the number given by Col. M. V. Morre, in the Louisville *Evening Post* of May 30th, 1900, to 122,000 claimed by Governor Parsons in his proclamation of July, 1865. Likewise the number of Alabama soldiers who lost their lives on the battlefield and from wounds, or from disease directly traceable to exposure in the army during the Confederate war will never be known. We only know that Alabama soldiers were buried in every battle-field of importance east of the Mississippi, near every large hospital through the same extent of country, in all cemeteries of the war prisons of the North, and in every graveyard in this State. . . . The property losses of the people of Alabama during the war were tremendous. We can form no just conception of them, except by comparing some items of the census of 1860 with those of 1870. . . . Nearly all the manufacturing industries of Alabama were burnt by the Federals. Most of the engines, cars, steam-boats, warehouses and depots were destroyed, a number of railroad bridges and trestles were burnt and most of the rails, which were made of iron, were worn out, so that the transportation property of the State was worth many millions of dollars less in 1865 than in 1860. Another heavy loss, which cannot be estimated, was the complete destruction of State and Confederate scrip and bonds, and railroad bonds and stocks, and all banking capital and securities. The merchandise in the stores, usually amounting to many millions of dollars, was all gone at the close of the war. Town property had depreciated in value. In the Tennessee valley hundreds of thousands of dollars' worth of private residences and public buildings were burnt, and the people stripped of nearly everything that they could not carry off or hide successfully. The property losses of the people of Alabama could not have been less than \$300,000,000, besides the loss of 435,000 slaves, which were worth \$500 each in gold or a total of \$217,000,000, making the total property losses not less than \$500,000,000 in Alabama."—L. D. Miller, *History of Alabama*, p. 233.—See also U. S. A.: 1865: Civil War losses.

1865 (December).—Ratification of 13th amendment.—On December 2, 1865, the thirteenth amendment to the Constitution of the United States was ratified.

1866.—Rejection of 14th amendment.—"In the fall of 1866 the proposed Fourteenth Amendment

was submitted to the legislature. There was no longer any belief that further yielding would do any good; the more the people gave the more was asked. State Senator E. A. Powell wrote to John W. Forney that the people would do nothing about the Fourteenth Amendment because they were convinced that any action would be useless. Condition after condition had been imposed and had been absolved; slavery had been abolished, secession acknowledged a failure, and the war debt repudiated by the convention; the legislature had ratified the Thirteenth Amendment, had secured the negro in all the rights of property and person; and after all the state was no nearer to restoration. This was the view of nearly all the newspapers of the state, and in this they represented popular opinion. They were intensely irritated by the fact that, although they had made so many concessions, still they were excluded from representation in Congress, and were heavily and unjustly taxed. Moreover, they were opposed to the amendment because it branded their best men as traitors. One newspaper, alone, advocated adoption of the amendment as the least of evils. . . . By most persons the question of negro political rights was considered to belong to the state and was not a matter for the Federal government to regulate. 'Loyalists' as well as 'rebels' were afraid to leave negro affairs to the regulation of Congress. In his annual message to the legislature, in November 1866, Governor Patton advised the legislature not to ratify the Fourteenth Amendment, on the ground that it could do no good and might do harm. It involved the creation of a penalty after the act. On this point, he said that it was an *ex post facto* law, and contrary to the whole spirit of modern civilization; that such a mode of dealing with citizens charged with offences against government belonged only to despotic tyrants; that it might accomplish revengeful purposes, but that was not the proper mode of administering justice, that adoption would vacate nearly all offices in most of the unrepresented states—governors, judges, legislators, sheriffs, justices of peace, constables—and the state governments would be completely broken up and reduced to utter and hopeless anarchy; that the disabilities imposed by the test oath were seriously detrimental to the interests of the government; that ratification of the Amendment could not accomplish any good to the country and might bring upon it irretrievable disaster. Under the circumstances, the legislature refused to consider the Amendment. But the governor during the next few weeks was induced by various considerations to recommend the ratification, and on December 7, 1866, he sent a special message stating that there was a purpose on the part of those who controlled the national legislation to enforce their own terms of restoration at all hazards; and that their measures would immeasurably augment the distress already existing and inaugurate endless confusion. The cardinal principle of restoration seemed to be, he said, favorable action on the Fourteenth Amendment. Upon principle he was opposed to it. Yet necessity must rule. So now he recommended reconsideration. If they should ratify and restoration should follow, they might trust to time and their representatives to mitigate its harshness. If they should ratify and admission should be delayed, it would serve as a warning to other states and thus prevent the necessary number for ratification." W. L. Fleming, *Civil war and reconstruction in Alabama*, p. 304.—See also SUFFRAGE, MANHOOD: U. S. A.: 1864-1921.—In spite of the governor's urgent recommendation, the legislature refused to

ratify the amendment, and Alabama, together with nine other southern states, prevented the fourteenth amendment from becoming a Federal law. As a result, Alabama was put under military government by the Reconstruction Act of 1867 and the state came under the sway of the negro and the "carpet-bagger."

1867 (November).—Meeting of the constitutional convention.—In the fall of 1867 a constitution was framed for Alabama in accordance with the principles of the Reconstruction Act and the fourteenth amendment.

1868 (February).—Constitution ratified.—When the constitution received a bare majority of the vote cast, but not a majority of the registered vote, Congress declared the constitution in effect by hurriedly changing the law which necessitated a state constitution receiving a majority of the registered vote.

1868 (June).—Ratification of 14th amendment.—Readmission to the union.—In the spring of 1868 the fourteenth amendment was adopted and Alabama was admitted to the union, June 25, 1868.

1868 (July 14).—Cessation of military rule.—Military rule ceased on this date and Alabama took up her own administration.

1870 (November 16).—Ratification of 15th amendment.

1874.—Whites regain control of the government.—By 1874, the State had become bankrupt; its credit was gone; city and county indebtedness had grown, with few betterments to show for the expenditures; and 'more intolerable were the turmoil and strife between whites and blacks kept alive' for political hold on the Negro vote. Every office was to be filled at a general election in November. As early as April 29th the Democratic and Conservative convention was organized in Montgomery. George Houston, the old 'Bald Eagle of the Mountains' from north Alabama, was chosen by acclamation for Governor. Houston, many years a member of Congress, and personally opposed to secession, had taken no part in the war. He was neither a full-fledged Confederate nor an offensive Unionist. Of the more important planks in the platform, the first averred 'that the radical and dominant faction of the Republican Party in this state persistently and by fraudulent representations have inflamed the passions and prejudices of the Negroes as a race against the white people, and have thereby made it necessary for the white people to unite and act together in self-defense and for the preservation of white civilization.' The third plank denounced the so-called 'Civil Rights Bill' then pending in Congress, and the fifth plank advocated economy. The Republicans renominated David P. Lewis for Governor, and in section 5 of their platform declared: 'We only ask equal advantages in matters of public and common right. This we consider to be all that is embraced in the Civil Rights Bill, and in order that we may be understood, and no false charges made against us, we hereby declare that the Republican Party does not desire mixed schools or mixed accommodations—we want no social equality enforced by law.' . . . On October 19th the Committee issued an appeal to the voters urging them to close their 'several places of business on the third day of November,' and to dedicate 'their individual and collective exertion to the redemption of Alabama.' . . . As the end of the canvass approached the forces making for good government were in line as never before in the history of the state. Every precaution was taken to have the polls guarded on Nov. 3. Every highway leading into the state was watched to

prevent the importation of voters. Railroad companies for days before the election reported every negro that came in and the station where he debarked. Victory was so important to our future that thousands were prepared to leave the state and seek homes where the Negro did not control, in case the election went against us—as many thousands had already done since March, 1868. . . . At the election there was rioting in Mobile, at Belmont, and at Gainesville, and one Negro was killed at each of these places. At Eufaula occurred the most serious riot of the Reconstruction period. Both whites and blacks were armed. While the whites were trying to protect from a mob a colored Democrat who was offering to vote a Negro fired a shot. Four Negroes were killed and sixty wounded. Ten whites were wounded. The whole Democratic State ticket was elected by majorities ranging more than 10,000 and the Supreme Court and both Houses of the Legislature were ours. Alabama was redeemed."—H. A. Herbert, *How we redeemed Alabama* (Century, v. 85, pp. 859-862).

1875 (September-October).—Constitutional convention.—The convention was held from September 6 to October 2. A new constitution was adopted, omitting the guaranty of the "carpet-baggers'" constitution that no one should be denied suffrage on account of race, color, or previous condition of servitude. It also forbade the state to engage in internal improvements.

1883 (February).—Establishment of a railroad commission.—A railroad commission was established in Alabama February 26, 1883.

1886-1887.—Farmers' Alliance.—The Farmers' Alliance of Alabama was incorporated by the session of the legislature of 1886-1887, and was then a strictly non-partisan agricultural organization. It was the forerunner of the Populist party, which was destined to play an important part in the politics of Alabama.

1886-1907.—Child labor legislation.—"Alabama began agitation against the child labor system in 1886. On page ninety of the Acts of the Legislature, 1886-7, will be found the law passed in this state against the employment of children and women in factories and manufacturing establishments, except as therein provided. The act was crude and carried no provisions for enforcement. It showed, however, that the public mind of the state had been aroused to the necessity of protecting those in need of protection. The act of 1886 remained on the statute books until the session of the legislature in 1894-5, when it was repealed through the efforts of a lobby sent to Montgomery by the cotton mills, headed by a superintendent of one of the New England mills which had lately been established in the state. There was no more child labor legislation until 1903, when mainly through the earnest and zealous work of Edgar Gardner Murphy, the second child labor law for Alabama was enacted. The law of 1903 was by no means satisfactory to those who had been contending for an effective child labor law. The provisions of this law made the age limit twelve years, but orphans and children of dependent families were exempt. No child under ten years of age was permitted to work under any circumstances. No child under thirteen years of age could be employed at night work, and none under twelve was allowed to work more than thirty-six hours per week. In 1907 a more acceptable law was enacted. The age limit was placed at twelve, without exception, and night work was permitted only by children of sixteen years of age and over. Provision was also

made for inspection, the state inspector of prisons and almshouses being empowered to inspect cotton mills and factories. There was general disappointment over the practical failure of the inspection feature of the law of 1907. Governor O'Neal has recommended in a message to the legislature raising the age limit of children working in cotton mills to fourteen years. He has also pointed out a defect in our present law which has greatly weakened the statute, namely the provision that the employer must 'knowingly violate' the law before any punishment can be imposed for its violation.—Dr. B. J. Baldwin (*Annals of the American Academy of Political and Social Science, July, 1911, pp. 111-113*).—A law was passed by the Alabama legislature which went into effect Sept. 1, 1915, providing that no children under thirteen should be permitted to work and a year afterward no children under fourteen.

1897-1898.—Period of great industrial depression.—During this period the price of cotton dropped to 4½ cents per pound.

1898.—Part played in Spanish-American War.—Like every other state, Alabama responded loyally to the call for troops in the war with Spain. Members of the national guard and many other citizens joined the colors, and Alabama had her due representation in the regular army and navy. After the Civil War General Joseph Wheeler of the Confederate army settled in Alabama, where he lived as farmer, merchant and lawyer. He was in 1882 elected to Congress, in which he served continuously for eighteen years. In 1898, President McKinley appointed him a major-general of volunteers, and he served with distinction in the Santiago campaign. In the navy, the most conspicuous enterprise of daring was led by a native of Alabama, Richmond Pearson Hobson. With seven men he attempted to block the channel of Santiago harbor and "bottle up" the fleet of Admiral Cervera. He took the collier *Merrimac* into the narrow passage and sunk her, but the ship did not completely obstruct the channel. Although under heavy fire, the men escaped injury, and were taken prisoners. Hobson afterwards represented his state in Congress.

1899.—Dispensary laws.—Acts applying the South Carolina "dispensary" system of regulation for the liquor traffic (see SOUTH CAROLINA: 1892-1899) to seventeen counties, but not to the state at large, were passed by the legislature.

1901.—Alabama's new constitution.—"The new Constitution in Alabama was adopted by a reported majority of nearly thirty thousand. The important provisions of the new Constitution are as follows: (1) Disfranchisement for crime or for failure to pay a voluntary poll tax of \$1.50 a year eight months before the election. This applies to whites and blacks alike. (2) Disfranchisement for illiteracy, unless the illiterate has been a soldier or is descended from a soldier, or is thought by the registrars of election to be of good character and to understand the duties of citizenship. The enfranchised illiterate must be enrolled as a voter before 1903. After that date the illiteracy disqualification applies to new voters of both races alike. (3) But after January 1, 1903, every male of age, white or black, literate or illiterate, may register and vote on his proving ownership, in his own or his wife's right, of property of taxable value of \$300. (4) Four-year terms for Governor and Legislature, the legislative session to last only fifty days. (5) A State tax of three mills for school purposes, with permission to localities to levy an additional tax of one mill. The State tax, together with the poll taxes and other

funds, insures a school revenue of \$1,100,000 a year, or one-fifth more than the revenue last year."—*Outlook, Nov. 23, 1901, p. 571.*

"In Alabama—where a little more than 14 per cent of the adult male whites of American parentage are reported as illiterate, while 59.5 per cent of the male negroes of voting age are illiterate,—it is declared that the new constitution was adopted by popular vote on November 11, and under the operation of the clauses relating to the franchise this entire mass of negro illiteracy will be at once excluded from the voting privilege. Most of the white illiterates will probably be able, under exceptional clauses, to place their names on the registration books. But after a limited period the system will work with practical equality, and every man of whatever race who knows enough to be morally entitled to exercise political privileges will be allowed to register and vote. These Southern franchise systems,—viewed broadly in their main features rather than narrowly in their minor details,—bid fair to be of advantage to both races. They supply the most powerful incentive to education and personal improvement. They create at once a bold and sweeping division between the enfranchised and the disenfranchised, but they do not erect an arbitrary or difficult barrier. An object-lesson in the disadvantages of illiteracy will be constantly before the eyes of the rising generation of both races. The children of native-born Americans will be impelled to follow the example of the American-born children of foreign parents and acquire the rudiments of an ordinary education."—*American Review of Reviews, Dec., 1901, p. 650.*—See also SUFFRAGE: Manhood: United States: 1864-1921.

ALSO IN: A. E. McKinley, *Constitution of Alabama (Political Science Quarterly, Sept., 1903).*

1903.—Law against boycott. See BOYCOTT: Recent judicial decisions.

1909.—Sixteenth Federal amendment ratified.—The income tax amendment to the Federal constitution was ratified August 17, 1909.

1911.—Case of Alonzo Bailey in United States Supreme Court.—This decision grew out of the case of a Negro, Alonzo Bailey, who had been hired as a plantation hand. His wage was set at \$12 a month and he was paid in advance \$15. Before the month was over he left and according to the existing law was considered guilty of fraudulent intention, in not returning the money advanced. He was obliged to prove his innocence which was not easy to do, since he could not testify as to his intentions. He could therefore according to the state law be convicted and forced to work without remuneration. The decision was rendered by Justice Hughes who held that the state law was contrary to the constitution.

1911.—Arbitration board created. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1912.—Internal improvements.—By the chartering of the Interstate Power Company a large plan of internal improvements was begun, to cost in the neighborhood of \$50,000,000 before completed. A dam and lock on the Coosa river was the first piece of construction and by this electric power was created for Birmingham, Montgomery, Anniston, Gadsden and Huntsville.

1916.—Educational revival.—**Constitution amended.**—"Alabama, as she herself fully admits, is down close to the bottom on the list of States made up according to literacy tests. Until recently Alabama raised most of her school funds by the State tax of three mills on the dollar. This gave her about \$1,813,000 to spend on her public

schools each year. The Legislature sometimes supplemented this fund by special appropriations averaging about \$283,000 yearly. In addition, some of the counties voted a one-mill local tax for their respective schools, one mill being the limit established by the State Constitution to which any county could tax itself for public education. As a result of this constitutional limitation Alabama has had no free school system to speak of except in the cities. The rural districts, the sources of production and wealth, have been miserably provided with schools. The little one-teacher school has been open seventy-five or eighty, or possibly a hundred, days in the year. Ten per cent of the children were, according to recent statistics, illiterate. The total number of illiterates in the State, was 360,000. Of these 93,000 were white, many of them men and women of middle age. This was the situation that Mr. William F. Feagin, State Superintendent of Education, determined to alter, if possible, during the recent Presidential campaign. His idea was to carry an amendment to the State Constitution that would give each county and also each school district the right to tax itself for long-term consolidated schools. By a preliminary campaign he succeeded in having placed on the ballots a constitutional amendment enabling each county to tax itself three mills on the dollar for its own schools, and in addition enabling each district to tax itself three mills—a tax right of six mills in all. . . . Even those who supported Mr. Feagin's plan supposed that the people were in no mood to consider additional taxation, and, generally speaking, they are always against constitutional amendments. But, nothing daunted, Superintendent Feagin plunged in to organize the entire State, county by county. The people of Alabama were waked up. They were expecting an uneventful election, with the usual Democratic majority for the President and Congressmen. But they found themselves in the midst of a regular old-time enthusiastic campaign, and for education per se. . . . When the votes were counted it was found that the amendment had been carried by more than 20,000 majority. The campaign and amendment have given public education an impetus in Alabama which will be very far-reaching in its effects."—L. McClurg, *Educational revival in Alabama* (*Outlook*, Feb. 28, 1917).

1917-1918.—Part played in the World War.—The state furnished in all 67,000 soldiers, and established two National Guard camps; Camp McClelland at Anniston and Camp Sheridan at Montgomery.

1919.—Industrial development resulting from the World War.—The effect of the war was to stimulate the industrial development of the state. The United States Steel Corporation, through the Tennessee Iron and Railroad Company initiated important enterprises. Plate mills were opened at Birmingham and a ship-building plant was established at Mobile. The federal government also opened a nitrogen plant at Sheffield to extract nitrogen from the air.

1919 (January).—Eighteenth Federal amendment ratified.—The prohibition amendment to the federal constitution was ratified on January 14, 1919.

1919 (September 2).—Nineteenth amendment defeated (woman suffrage).

ALABAMA (Confederate cruiser). See ALABAMA CLAIMS: 1862-1864.

ALABAMA CLAIMS: 1861-1862.—Origin.—Earlier confederate cruisers.—Precursors of the Alabama.—The commissioning of privateers, and

of more officially commanded cruisers, in the American Civil War, by the government of the Southern Confederacy, was begun early in the progress of the movement of rebellion, pursuant to a proclamation issued by Jefferson Davis on April 17, 1861. "Before the close of July, 1861, more than 20 of those deprecators were afloat, and had captured millions of property belonging to American citizens. The most formidable and notorious of the sea-going ships of this character, were the Nashville, Captain R. B. Pegram, a Virginian, who had abandoned his flag, and the Sumter [a regularly commissioned war vessel], Captain Raphael Semmes. The former was a side-wheel steamer, carried a crew of eighty men, and was armed with two long 12-pounder rifled cannon. Her career was short, but quite successful. She was finally destroyed by the Montauk, Captain Worden, in the Ogeechee River. The career of the Sumter, which had been a New Orleans and Havana packet steamer named Marquis de Habana, was also short, but much more active and destructive. She had a crew of sixty-five men and twenty-five marines, and was heavily armed. She ran the blockade at the mouth of the Mississippi River on the 30th of June, and was pursued some distance by the Brooklyn. She ran among the West India islands and on the Spanish Main, and soon made prizes of many vessels bearing the American flag. She was everywhere received in British Colonial ports with great favor, and was afforded every facility for her piratical operations. She became the terror of the American merchant service, and everywhere eluded National vessels of war sent out in pursuit of her. At length she crossed the ocean, and at the close of 1861 was compelled to seek shelter under British guns at Gibraltar, where she was watched by the Tuscarora. Early in the year 1862 she was sold, and thus ended her piratical career. Encouraged by the practical friendship of the British evinced for these corsairs, and the substantial aid they were receiving from British subjects in various ways, especially through blockade-runners, the conspirators determined to procure from those friends some powerful piratical craft, and made arrangements for the purchase and construction of vessels for that purpose. Mr. Laird, a ship-builder at Liverpool and member of the British Parliament, was the largest contractor in the business, and, in defiance of every obstacle, succeeded in getting pirate ships to sea. The first of these ships that went to sea was the Oreto, ostensibly built for a house in Palermo, Sicily. Mr. Adams, the American minister in London, was so well satisfied from information received that she was designed for the Confederates, that he called the attention of the British government to the matter as early as the 18th of February, 1862. But nothing effective was done, and she was completed and allowed to depart from British waters. She went first to Nassau, and on the 4th of September suddenly appeared off Mobile harbor, flying the British flag and pennants. The blockading squadron there was in charge of Commander George H. Preble, who had been specially instructed not to give offense to foreign nations while enforcing the blockade. He believed the Oreto to be a British vessel, and while deliberating a few minutes as to what he should do, she passed out of range of his guns, and entered the harbor with a rich freight. For his seeming remissness Commander Preble was summarily dismissed from the service without a hearing—an act which subsequent events seemed to show was cruel injustice. Late in December, the Oreto escaped from Mobile, fully armed for a

piratical cruise, under the command of John Newland Maffit. . . . The name of the Oreto was changed to that of Florida."—B. J. Lossing, *Pictorial field book of the Civil War*, v. 2, ch. 21.

ALSO IN: J. Davis, *Rise and fall of the confederate government*, v. 2, ch. 30-31.

1862-1864.—The Alabama, her career and her fate.—"The Alabama [the second cruiser built in England for the Confederates] . . . is thus described by Semmes, her commander: 'She was of about 900 tons burthen, 230 feet in length, 32 feet in breadth, 20 feet in depth, and drew, when provisioned and coaled for cruise, 15 feet of water. She was barkentine-rigged, with long lower masts, which enabled her to carry large fore and aft sails, as jibs and try-sails. . . . Her engine was of 300 horse-power, and she had attached an apparatus for condensing from the vapor of sea-water all the fresh water that her crew might require. . . . Her armament consisted of eight guns.' . . . The Alabama was built and, from the outset, was 'intended for a Confederate vessel of war.' The contract for her construction was 'signed by Captain Bullock on the one part and Messrs. Laird on the other.' . . . On the 15th of May [1862] she was launched under the name of the 200. Her officers were in England awaiting her completion, and were paid their salaries 'monthly, about the first of the month, at Fraser, Trenholm & Co.'s office in Liverpool.' The purpose for which this vessel was being constructed was notorious in Liverpool. Before she was launched she became an object of suspicion with the Consul of the United States at that port, and she was the subject of constant correspondence on his part with his Government and with Mr. Adams. . . . Early in the history of this cruiser the point was taken by the British authorities—a point maintained throughout the struggle—that they would originate nothing themselves for the maintenance and performance of their international duties, and that they would listen to no representations from the officials of the United States which did not furnish technical evidence for a criminal prosecution under the Foreign Enlistment Act. . . . At last Mr. Dudley [the Consul of the United States at Liverpool] succeeded in finding the desired proof. On the 21st day of July, he laid it in the form of affidavits before the Collector at Liverpool in compliance with the intimations which Mr. Adams had received from Earl Russell. These affidavits were on the same day transmitted by the Collector to the Board of Customs at London, with a request for instructions by telegraph, as the ship appeared to be ready for sea and might leave any hour. . . . It . . . appears that notwithstanding this official information from the Collector, the papers were not considered by the law advisers until the 28th, and that the case appeared to them to be so clear that they gave their advice upon it that evening. Under these circumstances, the delay of eight days after the 21st in the order for the detention of the vessel was, in the opinion of the United States, gross negligence on the part of Her Majesty's Government. On the 20th the Secretary of the Commission of the Customs received a telegram from Liverpool saying that 'the vessel 200 came out of dock last night, and left the port this morning.' . . . After leaving the dock she 'proceeded slowly down the Mersey.' Both the Lairds were on board, and also Bullock. . . . The 200 slowly steamed on to Moelfra Bay, on the coast of Anglesey, where she remained 'all that night, all the next day, and the next night.' No effort was made to seize her. . . . When the Alabama left Moelfra Bay her crew numbered about

90 men. She ran part way down the Irish Channel, then round the north coast of Ireland, only stopping near the Giant's Causeway. She then made for Terceira, one of the Azores, which she reached on the 10th of August. On 18th of August, while she was at Terceira, a sail was observed making for the anchorage. It proved to be the 'Agrippina of London, Captain McQueen, having on board six guns, with ammunition, coals, stores, etc., for the Alabama.' Preparations were immediately made to transfer this important cargo. On the afternoon of the 20th, while employed discharging the bark, the screw-steamer Bahama, Captain Tessier (the same that had taken the armament to the Florida, whose insurgent ownership and character were well known in Liverpool), arrived, 'having on board Commander Raphael Semmes and officers of the Confederate States steamer Sumter.' There were also taken from this steamer two 32-pounders and some stores, which occupied all the remainder of that day and a part of the next. The 22d and 23d of August were taken up in transferring coal from the Agrippina to the Alabama. It was not until Sunday (the 24th) that the insurgents' flag was hoisted. Bullock and those who were not going in the 200 went back to the Bahama, and the Alabama, now first known under that name, went off with '26 officers and 85 men.'—*Case of the United States before the tribunal of arbitration at Geneva (42d Congress, 2d Session, Senate Executive Document, No. 31, 146-171)*.—The Alabama "arrived at Porto Praya on the 10th August. Shortly thereafter Capt. Raphael Semmes assumed command. Hoisting the Confederate flag, she cruised and captured several vessels in the vicinity of Flores. Cruising to the westward, and making several captures, she approached within 200 miles of New York; thence going southward, arrived, on the 18th November, at Port Royal, Martinique. On the night of the 19th she escaped from the harbour and the Federal steamer San Jacinto, and on the 20th November was at Blanquilla. On the 7th December she captured the steamer Ariel in the passage between Cuba and St. Domingo. On January 11, 1863, she sunk the Federal gunboat Hatteras off Galveston, and on the 30th arrived at Jamaica. Cruising to the eastward, and making many captures, she arrived on the 10th April, at Fernando de Noronha, and on the 11th May at Bahia, where, on the 13th, she was joined by the Confederate steamer Georgia. Cruising near the line, thence southward towards the Cape of Good Hope, numerous captures were made. On the 29th July she anchored in Saldanha Bay, South Africa, and near there on the 5th August, was joined by the Confederate bark Tuscaloosa, Commander Low. In September, 1863, she was at St. Simon's Bay, and in October was in the Straits of Sunda, and up to January 20, 1864, cruised in the Bay of Bengal and vicinity, visiting Singapore, and making a number of very valuable captures, including the Highlander, Sonora, etc. From this point she cruised on her homeward track via Cape of Good Hope, capturing the bark Tycoon and ship Rockingham, and arrived at Cherbourg, France, in June, 1864, where she repaired. A Federal steamer, the Kearsarge, was lying off the harbour. Capt. Semmes might easily have evaded this enemy; the business of his vessel was that of a privateer; and her value to the Confederacy was out of all comparison with a single vessel of the enemy. . . . But Capt. Semmes had been twitted with the name of 'pirate;' and he was easily persuaded to attempt an éclat for the Southern Confederacy by a naval fight within sight of the French coast,

which contest, it was calculated, would prove the Alabama a legitimate war vessel, and give such an exhibition of Confederate belligerency as possibly to revive the question of 'recognition' in Paris and London. These were the secret motives of the gratuitous fight with which Capt. Semmes obliged the enemy off the port of Cherbourg. The Alabama carried one 7-inch Blakely rifled gun, one 8-inch smooth-bore pivot gun, and six 32-pounders, smooth-bore, in broadside; the Kearsarge carried four broadside 32-pounders, two 11-inch and one 28-pound rifle. The two vessels were thus about equal in match and armament; and their tonnage was about the same."—E. A. Pollard, *Lost cause*, p. 549.—Captain Winslow, commanding the United States Steamer Kearsarge, in a report to the Secretary of the Navy written on the afternoon of the day of his battle with the Alabama, June 10, 1864, said: "I have the honor to inform the department that the day subsequent to the arrival of the Kearsarge off this port, on the 24th [14] instant, I received a note from Captain Semmes, begging that the Kearsarge would not depart, as he intended to fight her, and would delay her but a day or two. According to this notice, the Alabama left the port of Cherbourg this morning at about half past nine o'clock. At twenty minutes past ten A. M., we discovered her steering towards us. Fearing the question of jurisdiction might arise, we steamed to sea until a distance of six or seven miles was attained from the Cherbourg break-water, when we rounded to and commenced steaming for the Alabama. As we approached her, within about 1,200 yards, she opened fire, we receiving two or three broadsides before a shot was returned. The action continued, the respective steamers making a circle round and round at a distance of about 900 yards from each other. At the expiration of an hour the Alabama struck, going down in about twenty minutes afterward, carrying many persons with her." In a report two days later, Captain Winslow gave the following particulars: "Toward the close of the action between the Alabama and this vessel, all available sail was made on the former for the purpose of again reaching Cherbourg. When the object was apparent, the Kearsarge was steered across the bow of the Alabama for a raking fire; but before reaching this point the Alabama struck. Uncertain whether Captain Semmes was not using some ruse, the Kearsarge was stopped. It was seen, shortly afterward, that the Alabama was lowering her boats, and an officer came alongside in one of them to say that they had surrendered, and were fast sinking, and begging that boats would be despatched immediately for saving life. The two boats not disabled were at once lowered, and as it was apparent the Alabama was settling, this officer was permitted to leave in his boat to afford assistance. An English yacht, the Deerhound, had approached near the Kearsarge at this time, whom I hailed and begged the commander to run down to the Alabama, as she was fast sinking, and we had but two boats, and assist in picking up the men. He answered affirmatively, and steamed toward the Alabama, but the latter sank almost immediately. The Deerhound, however, sent her boats and was actively engaged, and assisted several others which had come from shore. These boats were busy in bringing the wounded and others to the Kearsarge; whom we were trying to make as comfortable as possible, when it was reported to me that the Deerhound was moving off. I could not believe that the commander of that vessel could be guilty of so disgraceful an act as taking our prisoners off, and therefore took no means to

prevent it, but continued to keep our boats at work rescuing the men in the water. I am sorry to say that I was mistaken. The Deerhound made off with Captain Semmes and others, and also the very officer who had come on board to surrender."—In a still later report Captain Winslow gave the following facts: "The fire of the Alabama, although it is stated she discharged 370 or more shell and shot, was not of serious damage to the Kearsarge. Some 13 or 14 of these had taken effect in and about the hull, and 16 or 17 about the masts and rigging. The casualties were small, only three persons having been wounded. . . . The fire of the Kearsarge, although only 173 projectiles had been discharged, according to the prisoners' accounts, was terrific. One shot alone had killed and wounded 18 men, and disabled a gun. Another had entered the coal-bunkers, exploding, and completely blocking up the engine room; and Captain Semmes states that shot and shell had taken effect in the sides of his vessel, tearing large holes by explosion, and his men were everywhere knocked down."—*Rebellion record*, v. 9, pp. 221-225.

Semmes, *Memoirs of service afloat, ch. 20-55*.—J. D. Bullock, *Secret service of the confederate states in Europe, v. 1, ch. 5*.

1862-1865.—Other Confederate cruisers.—"A score of other Confederate cruisers roamed the seas, to prey upon United States commerce, but none of them became quite so famous as the Sumter and the Alabama. They included the Shenandoah, which made 38 captures, the Florida, which made 36, the Tallahassee, which made 27, the Tacony, which made 15, and the Georgia, which made 10. The Florida was captured in the harbor of Bahia, Brazil, in October, 1864, by a United States man-of-war [the Wachusett, Commander Collins], in violation of the neutrality of the port. For this the United States Government apologized to Brazil and ordered the restoration of the Florida to the harbor where she was captured. But in Hampton Roads she met with an accident and sank. It was generally believed that the apparent accident was contrived with the connivance, if not by direct order, of the Government. Most of these cruisers were built in British shipyards."—R. Johnson, *History of the war of secession, ch. 24*.—The last of the destroyers of American commerce, the Shenandoah, was a British merchant ship—the Sea King—built for the Bombay trade, but purchased by the Confederate agent, Captain Bullock, armed with six guns, and commissioned (October, 1865) under her new name. In June, 1865, the Shenandoah, after a voyage to Australia, in the course of which she destroyed a dozen merchant ships, made her appearance in the Northern sea, near Behring Strait, where she fell in with the New Bedford whaling fleet. "In the course of one week, from the 21st to the 28th, twenty-five whalers were captured, of which four were ransomed, and the remaining 21 were burned. The loss on these 21 whalers was estimated at upwards of \$3,000,000, and considering that it occurred . . . two months after the Confederacy had virtually passed out of existence, it may be characterized as the most useless act of hostility that occurred during the whole war." The captain of the Shenandoah destroyed fifteen vessels even after he had news of the fall of Richmond. In August he surrendered his vessel to the British government, which delivered her to the United States.—

J. R. Soley, *Confederate cruisers (Battles and leaders, v. 4)*. For statistics of the total losses inflicted by the eleven Confederate cruisers for which Great Britain was held responsible, see U. S. A.: 1865 (May).

1862-1869.—Definition of the indemnity claims of the United States against Great Britain.—First stages of the negotiation.—Rejected Johnson-Clarendon treaty.—“A review of the history of the negotiations between the two Governments prior to the correspondence between Sir Edward Thornton and Mr. Fish, will show . . . what was intended by these words, ‘generically known as the Alabama Claims,’ used on each side in that correspondence. The correspondence between the two Governments was opened by Mr. Adams on the 20th of November, 1862 (less than four months after the escape of the Alabama), in a note to Earl Russell, written under instructions from the Government of the United States. In this note Mr. Adams submitted evidence of the acts of the Alabama, and stated: ‘I have the honor to inform Your Lordship of the directions which I have received from my Government to solicit redress for the national and private injuries thus sustained.’ . . . Lord Russell met this notice on the 19th of December, 1862, by a denial of any liability for any injuries growing out of the acts of the Alabama. . . . As new losses from time to time were suffered by individuals during the war, they were brought to the notice of Her Majesty’s Government, and were lodged with the national and individual claims already preferred; but argumentative discussion on the issues involved was by common consent deferred. . . . The fact that the first claim preferred grew out of the acts of the Alabama explains how it was that all the claims growing out of the acts of all the vessels came to be ‘generically known as the Alabama claims.’ On the 7th of April, 1865, the war being virtually over, Mr. Adams renewed the discussion. He transmitted to Earl Russell an official report showing the number and tonnage of American vessels transferred to the British flag during the war. He said: ‘The United States commerce is rapidly vanishing from the face of the ocean, and that of Great Britain is multiplying in nearly the same ratio.’ ‘This process is going on by reason of the action of British subjects in coöperation with emissaries of the insurgents, who have supplied from the ports of Her Majesty’s Kingdom all the materials, such as vessels, armament, supplies, and men, indispensable to the effective prosecution of this result on the ocean.’ . . . He stated that he ‘was under the painful necessity of announcing that his Government cannot avoid entailing upon the Government of Great Britain the responsibility for this damage.’ Lord Russell . . . said in reply, ‘I can never admit that the duties of Great Britain toward the United States are to be measured by the losses which the trade and commerce of the United States have sustained. . . . Referring to the offer of arbitration, made on the 26th day of October, 1863, Lord Russell, in the same note, said: ‘Her Majesty’s Government must decline either to make reparation and compensation for the captures made by the Alabama, or to refer the question to any foreign State.’ This terminated the first stage of the negotiations between the two Governments. . . . In the summer of 1866 a change of Ministry took place in England, and Lord Stanley became Secretary of State for Foreign Affairs in the place of Lord Clarendon. He took an early opportunity to give an intimation in the House of Commons that, should the rejected claims be revived, the new Cabinet was not pre-

pared to say what answer might be given them; in other words, that, should an opportunity be offered, Lord Russell’s refusal might possibly be reconsidered. Mr. Seward met these overtures by instructing Mr. Adams, on the 27th of August, 1866, ‘to call Lord Stanley’s attention in a respectful but earnest manner,’ to ‘a summary of claims of citizens of the United States, for damages which were suffered by them during the period of the civil war,’ and to say that the Government of the United States, while it thus insists upon these particular claims, is neither desirous nor willing to assume an attitude unkind and unconciliatory toward Great Britain. . . . Lord Stanley met this overture by a communication to Sir Frederick Bruce, in which he denied the liability of Great Britain, and assented to a reference, ‘provided that a fitting Arbitrator can be found, and that an agreement can be come to as to the points to which the arbitration shall apply.’ . . . The first result of these negotiations, a convention known as the Stanley-Johnson convention was signed at London on the 10th of November, 1868. It proved to be unacceptable to the Government of the United States. Negotiations were at once resumed, and resulted on the 14th of January, 1869, in the Treaty known as the Johnson-Clarendon convention [having been negotiated by Mr. Reverdy Johnson, who had succeeded Mr. Adams as United States Minister to Great Britain]. This latter convention provided for the organization of a mixed commission with jurisdiction over “all claims on the part of citizens of the United States upon the Government of Her Britannic Majesty, including the so-called Alabama claims, and all claims on the part of subjects of Her Britannic Majesty upon the Government of the United States which may have been presented to either government for its interposition with the other since the 26th July, 1853, and which yet remain unsettled.”

—*Argument of the United States delivered to the tribunal of arbitration at Geneva, June 15, 1872, Division 13, sect. 2.*

“It came up there [in the Senate] April 13, when Andrew Johnson was no longer president, and was defeated by a vote of 54 to 1. Sumner alone spoke against it. As chairman of the senate’s foreign committee he felt it his duty to sum up the case for the United States, and his speech was printed for the information of the people. Through his bold handling, our case against England became far-reaching. He demanded satisfaction, first for all the losses of Americans through England’s recognition of belligerency for the Confederacy, secondly for losses due to the activity of the *Alabama* and other ships which England’s negligence suffered to take the sea, and thirdly for the expenses of prolonging the war through the hope of the South that England would assist her. From the first class, he said, the losses amounted to \$100,000,000, from the second to \$15,000,000, and from the third the inference was—although he would name no figure—a loss of \$2,000,000,000. Mr. Rhodes pronounces Sumner’s claim ‘outrageous.’ It is evident that Sumner himself did not expect England to pay the amounts specified, but stated them in this way so that England and the world might realize the vast wrong done us. But it was an unwise utterance. It raised too high the expectation of the American people, and if it were insisted upon by the government, it made impossible further negotiation by England. John Bright, one of our best friends in England, said that either Sumner was a fool or thought the English people were fools. No immediate action, however, followed the speech, and after a time the passions it

raised were cooled by sober thought. It was for the skillful hand of Hamilton Fish, Grant's secretary of state, to reopen the question in a more reasonable spirit and carry it to successful solution."—J. S. Bassett, *Short history of the United States*, p. 671.

1869-1871.—Renewed negotiations.—Appointment and meeting of the joint high commission.—The action of the Senate in rejecting the Johnson-Clarendon treaty was taken in April, 1860, a few weeks after President Grant entered upon his office. At this time "the condition of Europe was such as to induce the British Ministers to take into consideration the foreign relations of Great Britain; and, as Lord Granville, the British Minister of Foreign Affairs, has himself stated in the House of Lords, they saw cause to look with solicitude on the uneasy relations of the British Government with the United States, and the inconvenience thereof in case of possible complications in Europe. Thus impelled, the Government dispatched to Washington a gentleman who enjoyed the confidence of both Cabinets, Sir John Rose, to ascertain whether overtures for reopening negotiations would be received by the President in spirit and terms acceptable to Great Britain. . . . Sir John Rose found the United States disposed to meet with perfect correspondence of good-will the advances of the British Government. Accordingly, on the 26th of January, 1871, the British Government, through Sir Edward Thornton, finally proposed to the American Government the appointment of a joint High Commission to hold its sessions at Washington, and there devise means to settle the various pending questions between the two Governments affecting the British possessions in North America. To this overture Mr. Fish replied that the President would with pleasure appoint, as invited, Commissioners on the part of the United States, provided the deliberations of the Commissioners should be extended to other differences,—that is to say, to include the differences growing out of incidents of the late Civil War. . . . The British Government promptly accepted this proposal for enlarging the sphere of the negotiation." The joint high commission was speedily constituted, as proposed, by appointment of the two governments, and the promptitude of proceeding was such that the British commissioners landed at New York in twenty-seven days after Sir Edward Thornton's suggestion of January 26 was made. They sailed without waiting for their commissions, which were forwarded to them by special messenger. The high commission was made up as follows: "On the part of the United States were five persons,—Hamilton Fish, Robert C. Schenck, Samuel Nelson, Ebenezer Rockwood Hoar, and George H. Williams,—eminently fit representatives of the diplomacy, the bench, the bar, and the legislature of the United States; on the part of Great Britain, Earl De Grey and Ripon, President of the Queen's Council; Sir Stafford Northcote, Ex-Minister and actual Member of the House of Commons; Sir Edward Thornton, the universally respected British Minister at Washington; Sir John [A.] Macdonald, the able and eloquent Premier of the Canadian Dominion; and, in revival of the good old time, when learning was equal to any other title of public honor, the Universities in the person of Professor Montague Bernard. . . . In the face of many difficulties, the Commissioners, on the 8th of May, 1871, completed a treaty [known as the Treaty of Washington], which received the prompt approval of their respective Governments."—C. Cushing, *Treaty of Washington*, pp. 18-20 and 11-13.

1871.—Treaty of Washington.—The treaty signed at Washington on May 8, 1871, and the ratifications of which were exchanged at London on June 17 following set forth its principal agreement in the first two articles as follows: "Whereas differences have arisen between the Government of the United States and the Government of Her Britannic Majesty, and still exist, growing out of the acts committed by the several vessels which have given rise to the claims generically known as the 'Alabama Claims;' and whereas Her Britannic Majesty has authorized Her High Commissioners and Plenipotentiaries to express in a friendly spirit, the regret felt by Her Majesty's Government for the escape, under whatever circumstances, of the Alabama and other vessels from British ports, and for the depredations committed by those vessels: Now, in order to remove and adjust all complaints and claims on the part of the United States and to provide for the speedy settlement of such claims which are not admitted by Her Britannic Majesty's Government, the high contracting parties agree that all the said claims, growing out of acts committed by the aforesaid vessels, and generically known as the 'Alabama Claims,' shall be referred to a tribunal of arbitration to be composed of five Arbitrators, to be appointed in the following manner, that is to say: One shall be named by the President of the United States; one shall be named by Her Britannic Majesty; His Majesty the King of Italy shall be requested to name one; the President of the Swiss Confederation shall be requested to name one; and His Majesty the Emperor of Brazil shall be requested to name one. . . . The Arbitrators shall meet at Geneva, in Switzerland, at the earliest convenient day after they shall have been named, and shall proceed impartially and carefully to examine and decide all questions that shall be laid before them on the part of the Governments of the United States and Her Britannic Majesty respectively. All questions considered by the tribunal, including the final award, shall be decided by a majority of all the Arbitrators. Each of the high contracting parties shall also name one person to attend the tribunal as its Agent to represent it generally in all matters connected with the arbitration." Articles 3, 4 and 5 of the treaty specify the mode in which each party shall submit its case. Article 6 declares that, "In deciding the matters submitted to the Arbitrators, they shall be governed by the following three rules, which are agreed upon by the high contracting parties as rules to be taken as applicable to the case, and by such principles of international law not inconsistent therewith as the Arbitrators shall determine to have been applicable to the case: A neutral Government is bound—First, to use due diligence to prevent the fitting out, arming, or equipping, within its jurisdiction, of any vessel which it has reasonable ground to believe is intended to cruise or to carry on war against a Power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted, in whole or in part, within such jurisdiction, to warlike use. Secondly, not to permit or suffer either beligerent to make use of its ports or waters as the base of naval operations against the other, or for the purpose of the renewal or augmentation of military supplies or arms, or the recruitment of men. Thirdly, to exercise due diligence in its own

ports and waters, and, as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties. Her Britannic Majesty has commanded her High Commissioners and Plenipotentiaries to declare that Her Majesty's Government cannot assent to the foregoing rules as a statement of principles of international law which were in force at the time when the claims mentioned in Article 1 arose, but that Her Majesty's Government, in order to evince its desire of strengthening the friendly relations between the two countries and of making satisfactory provision for the future, agrees that in deciding the questions between the two countries arising out of those claims, the Arbitrators should assume that Her Majesty's Government had undertaken to act upon the principles set forth in these rules. And the high contracting parties agree to observe these rules as between themselves in future, and to bring them to the knowledge of other maritime powers, and to invite them to accede to them." Article 7 to 17, inclusive, relate to the procedure of the tribunal of arbitration, and provide for the determination of claims, by assessors and commissioners, in case the arbitrators should find any liability on the part of Great Britain and should not award a sum in gross to be paid in settlement thereof. Articles 18 to 25 relate to the Fisheries. By article 18 it is agreed that in addition to the liberty secured to American fishermen by the convention of 1818, "of taking, curing and drying fish on certain coasts of the British North American colonies therein defined, the inhabitants of the United States shall have, in common with the subjects of Her Britannic Majesty, the liberty for [a period of ten years, and two years further after notice given by either party of its wish to terminate the arrangement] . . . to take fish of every kind, except shell fish, on the sea-coasts and shores, and in the bays, harbours and creeks, of the provinces of Quebec, Nova Scotia and New Brunswick, and the colony of Prince Edward's Island, and of the several islands thereunto adjacent, without being restricted to any distance from the shore, with permission to land upon the said coasts and shores and islands, and also upon the Magdalen Islands, for the purpose of drying their nets and curing their fish; provided that, in so doing, they do not interfere with the rights of private property, or with British fishermen, in the peaceable use of any part of the said coasts in their occupancy for the same purpose. It is understood that the above-mentioned liberty applies solely to the sea-fishery, and that the salmon and shad fisheries, and all other fisheries in rivers and the mouths of rivers, are hereby reserved exclusively for British fishermen." Article 19 secures to British subjects the corresponding rights of fishing, &c., on the eastern sea-coasts and shores of the United States north of the 39th parallel of north latitude. Article 20 reserves from these stipulations the places that were reserved from the common right of fishing under the first article of the treaty of June 5, 1854. Article 21 provides for the reciprocal admission of fish and fish oil into each country from the other, free of duty (excepting fish of the inland lakes and fish preserved in oil). Article 22 provides that, "Inasmuch as it is asserted by the Government of Her Britannic Majesty that the privileges accorded to the citizens of the United States under Article XVIII of this treaty are of greater value than those accorded by Articles XIX and XXI of this treaty to the subjects of Her Britannic Majesty, and this assertion is not admitted by the Government of the United States, it is further agreed that Commissioners shall be ap-

pointed to determine . . . the amount of any compensation which in their opinion, ought to be paid by the Government of the United States to the Government of Her Britannic Majesty." Article 23 provides for the appointment of such commissioners, one by the president of the United States, one by her Britannic majesty, and the third by the president and her majesty conjointly; or, failing of agreement within three months, the third commissioner to be named by the Austrian Minister at London. The commissioners to meet at Halifax, and their procedure to be as prescribed and regulated by articles 24 and 25. Articles 26 to 31 define certain reciprocal privileges accorded by each government to the subjects of the other, including the navigation of the St. Lawrence, Yukon, Porcupine and Stikine rivers, lake Michigan, and the Welland, St. Lawrence and St. Clair Flats canals; and the transportation of goods in bond through the territory of one country into the other without payment of duties. Article 32 extends the provisions of articles 18 to 25 of the treaty to Newfoundland if all parties concerned enact the necessary laws, but not otherwise. Article 33 limits the duration of articles 18 to 25 and article 30, to ten years from the date of their going into effect, and "further until the expiration of two years after either of the two high contracting parties shall have given notice to the other of its wish to terminate the same." The remaining articles of the treaty provide for submitting to the arbitration of the German Emperor the northwestern water-boundary question (in the channel between Vancouver Island and the continent)—to complete the settlement of northwestern boundary disputes.—*Treaties and conventions between the United States and other Powers (ed. of 1889), pp. 478-403.*

ALSO IN: C. Cushing, *Treaty of Washington, app. 1871-1872.*—Tribunal of arbitration at Geneva, and its award.—Summary of the controversy.—"The appointment of Arbitrators took place in due course, and with the ready good-will of the three neutral governments. The United States appointed Mr. Charles Francis Adams; Great Britain appointed Sir Alexander Cockburn; the King of Italy named Count Frederic Sclopis; the President of the Swiss Confederation, Mr. Jacob Stampfli; and the Emperor of Brazil, the Baron d'Itajubá. Mr. J. C. Bancroft Davis was appointed Agent of the United States, and Lord Tenterden of Great Britain. The Tribunal was organized for the reception of the case of each party, and held its first conference [at Geneva, Switzerland] on the 15th of December, 1871," Count Sclopis being chosen to preside. "The printed Case of the United States, with accompanying documents, was filed by Mr. Bancroft Davis, and the printed Case of Great Britain, with documents, by Lord Tenterden. The Tribunal made regulation for the filing of the respective Counter-Cases on or before the 15th day of April next ensuing, as required by the Treaty; and for the convening of a special meeting of the Tribunal, if occasion should require; and then, at a second meeting, on the next day, they adjourned until the 15th of June next ensuing, subject to a prior call by the Secretary, if there should be occasion." The sessions of the tribunal were resumed on June 15, 1872, according to the adjournment, and were continued until September 14 following, when the decision and award were announced, and were signed by all the arbitrators except the British representative, Sir Alexander Cockburn, who dissented. It was found by the tribunal that the British government had "failed to use due diligence in the performance of its

neutral obligations" with respect to the cruisers Alabama and Florida, and the several tenders of those vessels; and also with respect to the Shenandoah after her departure from Melbourne, Feb. 18, 1865, but not before that date. With respect to the Georgia, the Sumter, the Nashville, the Tallahassee and the Chickamauga, it was the finding of the tribunal that Great Britain had not failed to perform the duties of a neutral power. So far as relates to the vessels called the Sallie, the Jefferson Davis, the Music, the Boston, and the V. H. Joy, it was the decision of the tribunal that they ought to be excluded from consideration for want of evidence. "So far as relates to the particulars of the indemnity claimed by the United States, the costs of pursuit of Confederate cruisers" are declared to be "not, in the judgment of the Tribunal, properly distinguishable from the general expenses of the war carried on by the United States," and "there is no ground for awarding to the United States any sum by way of indemnity under this head." A similar decision put aside the whole consideration of claims for "prospective earnings." Finally, the award was rendered in the following language: "Whereas, in order to arrive at an equitable compensation for the damages which have been sustained, it is necessary to set aside all double claims for the same losses, and all claims for 'gross freights' so far as they exceed 'net freights;' and whereas it is just and reasonable to allow interest at a reasonable rate; and whereas, in accordance with the spirit and letter of the Treaty of Washington, it is preferable to adopt the form of adjudication of a sum in gross, rather than to refer the subject of compensation for further discussion and deliberation to a Board of Assessors, as provided by Article X of the said Treaty: The Tribunal, making use of the authority conferred upon it by Article VII of the said Treaty, by a majority of four voices to one, awards to the United States the sum of fifteen millions five hundred thousand Dollars in gold as the indemnity to be paid by Great Britain to the United States for the satisfaction of all the claims referred to the consideration of the Tribunal, conformably to the provisions contained in Article VII of the aforesaid Treaty." It should be stated that the so-called "indirect claims" of the United States, for consequential losses and damages, growing out of the encouragement of the southern Rebellion, the prolongation of the war, &c., were dropped from consideration at the outset of the session of the tribunal, in June, the arbitrators agreeing then in a statement of opinion to the effect that "these claims do not constitute, upon the principles of international law applicable to such cases, good foundation for an award of compensation or computation of damages between nations." This declaration was accepted by the United States as decisive of the question, and the hearing proceeded accordingly.—C. Cushing, *Treaty of Washington*.

An excellent summary of the Alabama controversy by Prof. W. A. Dunning makes clear the general background of public opinion in the United States and Great Britain. After an account of the diplomatic preliminaries of the Treaty of Washington, Prof. Dunning says:—"As to the Alabama claims, the agreement embodied in the treaty signified great concessions on both sides in the interest of an amicable settlement. Great Britain expressed regret 'for the escape, under whatever circumstances, of the Alabama and other vessels from British ports, and for the depredations committed by those vessels.' In addition to this soothing admission that something disagreeable had

happened to the United States, the British Government consented to arbitration in the fullest sense in reference to all the claims. [Sec ARBITRATION, INTERNATIONAL: Modern Period: 1871-1872.] Three rules were laid down as to the duties of a neutral government, and the arbitral tribunal was enjoined to base its judgment on these rules, though the British Government recognized them, not as a statement of principles of international law in force in 1861-65, but as principles that ought in the future to be adopted by maritime powers, and that Great Britain had, in fact, sought to live up to during the American War. The three rules defined the duty of a neutral government, in respect to the fitting out and supplying of war-ships, in such terms as to make it morally certain that judgment would be adverse to Great Britain on the case of the Alabama, if not as to other of the Confederate cruisers. The British Government, in short, not only assumed a somewhat apologetic attitude at the outset, but also submitted to be judged by principles that were not obligatory as rules of international conduct at the time of the acts concerned, and that insured an unfavorable decision. A proud and powerful nation does not put itself in such a position without potent motives. One such was obvious and un concealed: the general adoption of rigorous rules of neutral duty would be very advantageous to Great Britain whenever she should become a belligerent. More influential than this selfish interest, however, was the desire, in no small measure purely sentimental, to be on friendly terms with the United States. The American democracy had proved in the severest of tests its fitness to survive, and the homage of a people and a generation in whom Darwinism was taking deep root was generously bestowed on the people who so opportunely illustrated the dogma of science. Not all the concession in the Treaty of Washington was on the part of the British. One point that had been strenuously insisted on as the original grievance of them all by Secretary Seward and Mr. Sumner was allowed by Secretary Fish to recede quietly into the background. This was the premature recognition of the Confederacy as a belligerent. Fish took the position that this action of the British Government was evidence of an unfriendly spirit, but could in no sense be the ground of a claim for compensation. This admission was regarded as having a bearing on the general question of the national or indirect claims. These were not the subject of any reference or allusion in the treaty, and it was understood by the British negotiators that the American Government had definitely abandoned them, as it was known to have ignored the demand of Sumner that a withdrawal of the British flag from the Western Hemisphere should be a preliminary condition to any settlement whatever. As a matter of fact, the Americans had no desire to urge the extravagant claims that Sumner had made so conspicuous. The British commissioners, on their side, were without authority to consider them. Yet because popular feeling was so sensitive about them on both sides of the water the negotiators avoided all reference to them, and by this very excess of caution left room for a dangerous misunderstanding. The tribunal of arbitration met and organized at Geneva, Switzerland, in the middle of December, 1871. It consisted of five arbitrators, appointed respectively by the governments of the United States, Great Britain, Italy, Switzerland, and Brazil. The cases of the two contending governments were at once presented in printed form. That of the United States was found to include,

in addition to the claims for losses due to the destruction of vessels by the cruisers and to the pursuit of the cruisers, claims also for the loss involved in the transfer of the merchant marine to the British flag, the increased cost of insurance, and the prolongation of the war. That is, the indirect or national claims were laid before the tribunal along with the rest. Protests arose at once from every organ of opinion in Great Britain. To admit responsibility for that kind and degree of loss would mean, it was declared, national humiliation and financial ruin. The government and the negotiators contended that the wording of the treaty excluded the indirect claims from submission to the tribunal, and that such exclusion had been agreed to in conference by the American negotiators. The latter denied any such agreement or interpretation. Great Britain stood firm in her contention, however, and her agent was directed to withdraw from the arbitration in case consideration of the indirect claims should be persisted in. After many months of tension and of deep distress among the friends of peace and amity, a way out of the impasse was found that was acceptable to both parties. The tribunal itself declared that it did not consider itself authorized, under international law, to award money compensation for such losses as those involved in the indirect claims. The American agent thereupon refrained from demands upon the arbiters for further attention to these claims. This happy outcome of the dispute was quite as pleasing to the American as to the British Government. Fish and his coadjutors had no expectation or desire that Great Britain should be mulcted in consequential damages. Sumner's speech had created a surprisingly strong sentiment in support of such mulcting, and it was problematical whether the administration could afford, in the year of a presidential election, to run counter to this sentiment. Animosity toward the Southerners was at this time a strong factor in the politics of the Republican party, and it fell in well with this feeling to disparage the South by contending that the remarkable prolongation of its resistance to the North was due solely to the aid it received from Great Britain. The rejection of the indirect claims by the tribunal of arbitration itself relieved the administration of all responsibility for abandoning them, and, passed without noteworthy effect on American public opinion. The judgment of the tribunal needs but casual mention. In respect to three of the Confederate cruisers, the *Alabama*, the *Florida*, and the *Shenandoah*, Great Britain was found to have contravened the three rules of neutral conduct laid down by the treaty, and the damages due to the United States on account of the dereliction were assessed at \$15,500,000. Sir Alexander Cockburn, the British arbitrator, dissented from the judgment of the tribunal on all but a single point, namely, that due diligence had not been used in ascertaining the character of the *Alabama* and preventing her departure from Liverpool. The dissenting opinions of the Englishman were embodied in a very lengthy document, in which he expressed with unjudicial candor his contempt for the intelligence of his fellow arbitrators and for the methods and attainments of those who conducted the American case. Cockburn's caustic criticism found some reflection in the Tory press, and there appeared more or less of the once familiar diatribe against the Yankees. In general, however, the judgment was acquiesced in by British public opinion with good grace. Even Cockburn ended his offensive opinion with an expression of the hope and desire that the arbitration would prove

a potent influence in maintaining amity between the two kindred peoples. In the United States the announcement of the actual award attracted little attention or comment. It came in the midst of a heated electoral campaign, and was little available for partisan purposes. The Treaty of Washington had afforded to the Americans their most substantial victory a year earlier, when Great Britain expressed her regret and agreed to arbitration. The carrying out of the treaty was followed with the somewhat languid interest of him who gathers up the trophies after the victory is won.—W. A. Dunning, *British empire and the United States*, pp. 251-257.

ALAMANNI. See ALEMANNI.

ALAMO, a Franciscan mission situated in San Antonio, Texas, so called from the grove of cottonwood in which it stands; built about 1722; used occasionally after 1703 as a fort. Bought by the state in 1883 and maintained as a public monument. For the massacre of the Alamo (1836), see TEXAS: 1835-1836.

ALAMOOT, or Alamout, Castle of.—The stronghold of the "Old Man of the Mountain," or sheikh of the terrible order of the Assassins, in northern Persia. Its name signifies "the eagle's nest," or "the vulture's nest." See ASSASSINS.

ALAND ISLANDS, an archipelago of about 300 islands situated in the Baltic sea, at the entrance to the Gulf of Bothnia. The western part of the Baltic, which extends from the Högsten lighthouse to that of the Lagskar and separates the Aland Islands from Sweden, is called the Aland sea. The sea to the eastward, separating Aland from the coast of Finland, is full of small islands and islets, eighty of which are inhabited. The rest are rocky islets, reefs and skerries. The largest island is that which gives its name to the group, Aland proper; its length is twenty-three miles and its greatest width twenty miles. The total area of the islands is about 550 square miles and the population numbers nearly 27,000, mostly of Swedish blood. The only town on the islands, which are sparsely populated, is Mariehamn, situated on the south coast of Aland.

12th century to World War.—In the 12th century the islands were occupied by Eric, the Saint; by the peace of Nöteborg (1323) they were incorporated together with Finland in Sweden, after they had been a duchy since 1284. In the Union of Calmar, 1307-1523, the Danes had control, but in 1634 the islands were made part of the government of Finland by the Swedish constitution. Peter the Great conquered the islands in 1714, but restored them to Sweden in 1721. Part of Finland fell under Russian rule in 1743; after the war between Russia and Sweden (1808), both Finland and the islands were ceded to Russia by the treaty of Frederikshamm. By the treaty of Paris, in 1856, Russia was prohibited from erecting fortifications on the islands, despite which some

defense works were constructed, while in 1906 a Russian garrison was installed there. In the following year Russia requested France and Great Britain to cancel the convention of 1856; about the same time a secret treaty was concluded between Germany and Russia, by which the latter was promised a free hand with regard to the islands. This agreement was first published to the world by Leon Trotsky, Bolshevik foreign minister, in December, 1917. In the Baltic Treaty, concluded in 1908 between Russia, Germany, Sweden and Denmark, no specific mention was made of the Alands, but the memorandum appended, taken in conjunction with the secret German treaty, appears to indicate no renunciation of Russia's intention to fortify the Alands. Early in 1908 a protest was made in the Swedish parliament; the matter was taken up in the British press and Sir Edward Grey, British foreign secretary, replying to a question, declared that Great Britain was opposed to the Russian demand. Nevertheless, when the World War broke out, the Russians lost no time in fortifying the islands, and in January, 1915, they assured Sweden that the fortifications were only temporary. This assurance was repeated in writing in 1916 and confirmed by British and French ministers. Great excitement was aroused in Sweden, and military measures were openly advocated. The ebullition, however, died down in the greater turmoil of the war.

1917-1919.—The Russian revolution introduced a new period in the history of Finland, and the question of the Aland islands, no longer one merely of fortifications, became acute. On August 20, 1917, a communal assembly was held in the islands to consider the question of reunion with Sweden. A delegation was sent to Sweden to urge the execution of that project, and during December 25-29 a plebiscite was held in the islands, at which 95 per cent. of the adult male and female population voted for reunion. A petition to that effect was sent to Stockholm and favorably received by the king. Meanwhile, Sweden had addressed a note to Germany, Austria-Hungary and Turkey requesting that the Aland question should be considered at Brest-Litovsk "in order to safeguard vital interests of Sweden in those islands." The Swedish government was urged by the country to occupy the islands, but the Bolsheviks forestalled them by landing 2,000 troops, together with a number of "Red Guards" from Finland. Outrages were committed on the inhabitants, who appealed to Sweden for aid. A Swedish military expedition arrived to protect their co-nationals, forced the Russians and "Reds" to retire, but were forced to evacuate their position by German troops, which occupied the islands on March 6, 1918. The German force remained till October, 1918. By Article VI of the Brest-Litovsk Treaty (March 3, 1918), Russia was obligated to evacuate the islands and remove the fortifications as soon as possible. On December 31, 1918, it was announced that an agreement had been signed between Sweden, Finland and Germany with regard to the postponed demolition of the Aland fortifications, and that the agreement was to be ratified at once. On March 24, 1919, a dispatch from Sweden announced that the new Aland expedition would leave Stockholm on March 31 to commence the destruction of the fortifications. Finland, the other claimant, had meanwhile not been idle. In March, 1918, the Finnish government had issued a decree declaring their intention of forming the islands into a separate province under a civil and military governor. Then came the islanders' appeal and the Swedish and German occupations al-

ready referred to. In February, 1919, a deputation of five Alanders proceeded to Paris to lay their case before the Powers. On March 18, the Swedish government suggested that the Peace Conference should consider the Aland question.—Based on *Handbook No. 48*, prepared under the direction of the *Historical Section of the British Foreign Office, 1920*.—"In regard to the disputed question of the Aland Islands which had been agitating both Finland and Sweden ever since the Russian Revolution, the Paris Peace Conference decided that the islands should be neutralized under the guarantee of the League of Nations."—*Annual Register, 1919, p. 226*.

1920.—**Finno-Swedish quarrel.**—**Intervention of the League of Nations.**—The dispute between Finland and Sweden over the disposition of the Aland Islands reached an acute stage. Sweden withdrew her minister from the Finnish capital and a conflict loomed on the horizon. The British government brought the matter to the attention of the secretariat of the League; the latter promptly intervened and induced the disputants to debate the case under the supervision of the League Council itself.—*Annual Register, 1920, pp. 153-154*.—See also FINLAND: 1920.

1920.—**Problem submitted to arbitration of jurists.**—"The Swedes claimed that the Alanders' right of self-determination was an international question. The Finns claimed that the problem was one within the domestic jurisdiction of Finland. The Council of the League of Nations decided to submit this preliminary contention to a small committee of international jurists. The following three were chosen: Herr Huber (Swiss), M. Larnaude (French), and Mynherr Steruycken (Dutch). This Commission decided the initial question in favor of the Swedes and Alanders, and reported that the question was essentially an international one. This, however, was only the preliminary point, and although representatives of the League of Nations proceeded to the Alands in the autumn, the Council of the League had reached no decision up to the end of the year."—*Annual Register, 1920, p. 267*.

1921.—**Final report of commission.**—**Islands awarded to Finland.**—**League of Nations decision.**—"Great excitement was manifested in all the Swedish press over the announcement from Geneva, on May 10, that the commission appointed to examine the question whether the Aland Islands in the Baltic should belong to Sweden or Finland had found for the latter country. Keen disappointment and indignation greeted the report everywhere, with expression of the hope that the League would refuse to adopt the recommendation. Should it sanction the report, according to *Tidningen* (Stockholm), it would deal the deathblow to Sweden's confidence in the will of the League and its power to uphold justice in the world. The Swedish government was said not to consider the commission's report as of decisive importance in the ultimate solution of the Aland question, and would energetically urge the League Council to let the Alanders decide their nationality by a plebiscite. In the course of its 36,000-word report, the commission stated that the Aland Islands form a part of the self-governing State of Finland, and that, though a plebiscite there would undoubtedly favor Sweden, it is questionable whether any one had the right to take them away from Finland. The desire of the Alanders to join Sweden was found to be mainly due to their anxiety to maintain their Swedish language and culture. As Finland is ready to grant satisfactory guarantees to the Alanders, the commission urged that it would

be unjust to deprive Finland of the islands. Furthermore, the Aland population is too small to stand alone, and the islands are in other ways hardly capable of surviving as an independent State. Therefore, the commission recommends that the Alands remain under Finland, but that Finland grant certain linguistic, cultural and trade guarantees to the Swedish population of the archipelago. . . . The commission recommends that the Alanders should have the right to present to the Finnish government a list of three candidates for Governor of the islands, and that the Governor be chosen from this list. The report ends the procedure begun in July, 1920, when Swedo-Finnish relations over the Aland question became acute, and Earl Curzon referred the question to the League of Nations."—*New York Times Current History*, June, 1921, pp. 543-544.—It may be added that this report was based on investigations conducted by Mr. A. Elkus, former United States Ambassador to Constantinople; M. Calonder, former President of the Swiss Confederation, and Baron Beyens, former Belgian Minister to Germany. On June 24, 1921, the Council of the League of Nations finally decided that the Alands should definitely be placed under the rule of Finland, but neutralized in regard to military affairs, while the guarantees recommended by the commission (see above, 1921), were also adopted.

ALANS, or Alani.—"The Alani are first mentioned by Dionysius the geographer (B. C. 30-10) who joins them with the Daci and the Tauri, and again places them between the latter and the Agathyrsi. A similar position (in the south of Russia in Europe, the modern Ukraine) is assigned to them by Pliny and Josephus. Seneca places them further west upon the Ister. Ptolemy has two bodies of Alani, one in the position above described, the other in Scythia within the Imaus, north and partly east of the Caspian. It must have been from these last, the successors, and, according to some, the descendants of the ancient Massagetæ, that the Alani came who attacked Pacorus and Tiridates [in Media and Armenia, A. D. 75]. . . . The result seems to have been that the invaders, after ravaging and harrying Media and Armenia at their pleasure, carried off a vast number of prisoners and an enormous booty into their own country."—G. Rawlinson, *Sixth great oriental monarchy*, ch. 17.—E. H. Bunbury, *History of ancient geography*, ch. 6, note H.—"The first of this [the Tartar] race known to the Romans were the Alani. In the fourth century they pitched their tents in the country between the Volga and the Tanais.—J. C. L. Sismondi, *Fall of the Roman empire*, ch. 3. ALARCON, Hernando de (fl. 16th century), a Spanish navigator sent in 1540 to assist Coronado

in New Mexico. Entered the gulf of California, explored, and made an excellent map of that territory; dispelled the popular belief that California was an island; explored Colorado river to point above Fort Yuma.

ALARCOS, Battle of (1195). See ALMOHADES.

ALARIC I (Gothic, Ala-reiks, "all ruler") (370-410), renowned chieftain of the Visigoths. In 395 he was chosen by the Visigoths to be their leader. "The very year of the death of Theodosius (A. D. 395), the Visigoths rose under Alaric, their chieftain, and marched into Greece. [See ATHENS: 395.] Seven years later they attacked Italy. Stilicho, the general of Honorius, successfully resisted them, until, out of jealousy and fear, he was murdered by his royal master. Then Alaric was able to overrun Italy and even to capture Rome (A. D. 410). It was . . . in this crisis that the Roman legions departed from Britain, leaving it exposed to the attacks of the Piets and Scots."—G. Goodspeed, *History of the Ancient World*, pp. 427-428.—"For the first time in 800 years, foreign soldiers were marched into the Forum and encamped in the streets of Rome. For three days and nights Alaric gave up the city to plunder. Then he gathered his forces together and started for southern Italy."—A. M. Wolfson, *Ancient civilization*, p. 106.

While preparing to invade Sicily and Africa, Alaric died and was buried with a vast treasure in the bed of the river Busento. The Visigoths then left Italy and moved into Spain, where they established a kingdom (412) which lasted for three hundred years.—See also BARBARIAN INVASIONS: 395-408, 408-410; GOTHs: 395, 400-403; ROME: 394-395, 408-410; EUROPE: Ethnology; Migrations: Map showing barbaric migrations.

ALARODIANS, IBERIANS, COLCHIANS.

—"The Alarodians of Heroditus, joined with the Sapeires . . . are almost certainly the inhabitants of Armenia, whose Semitic name was Urarda, or Ararat. 'Ararud,' indeed, is a mere variant form of 'Ararud,' the l and r being undistinguishable in the old Persian, and 'Ararud' serves determinately to connect the Ararat of Scripture with the Urarda, or Urartha of the Inscriptions. . . . The name of Ararat is constantly used in Scripture, but always to denote a country rather than a particular mountain. . . . The connexion . . . of Urarda with the Babylonian tribe of Akkad is proved by the application in the inscriptions of the ethnic title of Burbur (?) to the Armenian king . . . ; but there is nothing to prove whether the Burbur or Akkad of Babylonia descended in a very remote age from the mountains to colonize the plains, or whether the Urardians were refugees of a later period driven northward by the growing power of the Semites. The former supposition, however, is most in conformity with Scripture, and incidentally with the tenor of the inscriptions."—H. C. Rawlinson, *History of Herodotus*, bk. 7, app. 3.—"The broad and rich valley of the Kur, which corresponds closely with the modern Russian province of Georgia, was [anciently] in the possession of a people called by Herodotus Sapeires or Sapeires, whom we may identify with the Iberians of later writers. Adjoining upon them towards the south, probably in the country about Erivan, and so in the neighbourhood of Ararat, were the Alarodians, whose name must be connected with that of the great mountain. On the other side of the Sapeirian country, in the tracts now known as Mingrelia and Imeritia, regions of a wonderful beauty and fer-

tility, were the Colchians,—dependents, but not exactly subjects, of Persia.”—G. Rawlinson, *Five great monarchies: Persia*, ch. 1.

ALARUD. See ALARODIANS; IBERIANS; COLCHILIANS.

ALASHEHR. See PHILADELPHIA, ASIA MINOR. Battle of (1920). See GREECE: 1920.

ALASKA, a territory of the United States, situated at the extreme northwestern extremity of North America. Until 1867 it was known as Russian America. The name Alaska was given by William H. Seward, and is derived from the Aleut word *alak' shak* or *al-ay' ek-sa*, meaning “a great country.” The range of climate is great with wider extremes than from Maine to Florida. Only the northern third of the territory has a really Arctic climate, and the warm waters and winds of the Pacific make the southern seaboard comparatively temperate. Alaska has an area of 590,884 square miles. Not all of this is well-known—the density of population is a little more than 1 person per 10 square miles—but the general characteristics are a matter of common knowledge and the resources have been roughly estimated.

TYPES OF TOTEM POLES, ALASKA

Exploration has been going on from its acquisition right up to the present, so continually, that a statement of the most recent knowledge is soon superseded by later discoveries.

Natives.—The natives of the interior include two races, the Indian and the Esquimo. The valley of the Yukon is inhabited by the Indians, down to three or four hundred miles of its mouth, while its lower valley, as well as those of the Kuskokwim and the rivers that drain into the Arctic Ocean west and north are occupied by the Esquimos. (See also INDIANS, AMERICAN: Cultural areas in North America: Eskimo area.) “The Indians of the interior of Alaska are a gentle, . . . kindly . . . tractable people. They have old traditions of bloody tribal warfare that have grown in ferocity, one supposes, with the lapse of time,

for it is . . . difficult for one who knows them to believe that so mild a race could ever have been pugnacious or bloodthirsty. . . . It is true that . . . murders . . . have been committed—murders of white men . . . ; but in the sixty years from the Nulato massacre of 1851, over the whole vast interior, these crimes can be counted on the fingers of one hand. They are not a revengeful people. . . . The Indian is . . . in most cases eager to learn and eager that his children may learn. . . . The government has undertaken the education of the Indian, and has set up a bureau charged with the establishment and conduct of native schools. There are five such schools on the Yukon between Eagle and Tanana, including these two points, amongst Indians all of whom belong to the Episcopal Church, and five more between Tanana and Anvik, amongst natives divided in allegiance between the Episcopal and the Roman Catholic Churches. When, somewhat late in the day, the government set its hand to the education of the natives, mission schools had been conducted for many years at the five stations of the Episcopal Church above Tanana and at the various mission stations below that point. . . . That the Indian race of interior Alaska is threatened with extinction, there is unhappily little room to doubt. . . . At most places where vital statistics are kept the death-rate exceeds the birth-rate, though it is sometimes very difficult to secure accurate statistics. . . . Certain diseases that have played havoc in the past are not much feared now. . . . In the last few years there have been no serious epidemics; but epidemic disease does not constitute the chief danger that threatens the native. That chief danger looms from two things; tuberculosis and whiskey. Whether tuberculosis is a disease indigenous to these parts, or whether it was introduced with the white man, has been disputed and would be difficult of determination. Probably it was always present amongst the natives; the old ones declare that it was; but the changed conditions of their lives have certainly . . . aggravated it. They lived much more in the open when they had no tree-felling tool but a stone-axe and did not build cabins. Perhaps as great a cause of the spread of tuberculosis is the change in clothing. The original native was clad in skins, which are the warmest clothing in the world. The Indian usually sells all his furs and then . . . buys manufactured clothing from the trader at a fancy price. That clothing is almost always cotton and shoddy. . . . But far . . . beyond any other cause of the native decline stands the curse of the country, whiskey. Recognising by its long Indian experience the consequences of . . . liquor-drinking habits amongst the natives, the government has forbidden under penalty the giving or selling of any intoxicants to them. A few years ago a new law [was] passed making such giving or selling a felony. The Indian is the only settled inhabitant of interior Alaska to-day; for the prospectors and miners, who constitute the bulk of the white population, are not often very long in one place. Many of them might rightly be classed as permanent, but very few as settled inhabitants. It is the commonest thing to meet men a thousand miles away from the place where one met them last. It is unquestionable that the best natives in the country are those that have had the least intimacy with the white man, and it follows that the most hopeful and promising mission stations are those far up the tributary streams, away from mining camps and off the routes of travel, difficult of access, winter or summer, never seen by tourists at all; seen only by those who seek them with

cost and trouble. At such stations the improvement of the Indian is manifest and the population increases."—H. Stuck, *Ten thousand miles with a dog sled*, pp. 349-368.—See also ATHAPASCAN FAMILY: Chippewyans; Tinneh; Sarcees; ESKIMAUAN FAMILY.

1741-1787.—Early Russian exploration in Alaska.—Attitude of Peter the Great towards the new-found territory.—Catherine II refuses to colonize Alaska.—Establishment of Russian supremacy through private enterprise.—"Unlike other European powers Russia came into possession of territory in America by accident and not by design. Bering was sent to determine the relation between the old and the new worlds. Peter the Great had in mind scientific discovery and not the acquisition of new lands. When it was reported that Bering had located the northwest coast of America, the government took no steps to hold it. Who cared for a distant land inhabited by savages? Until the time of Cook the exact geographic situation of the islands and their relation to the mainland were matters of speculation. The statesmen in St. Petersburg had their faces turned towards the Near East and not the Far East. Had it not been for fur-traders, who, regardless of the neglect of the government, exploited one island after another, the term Russian-America would not have appeared on the maps. Catherine had not been on the throne very long before the newly discovered islands were called to her attention in various ways. The profitable trade attracted many adventurers, and the wealthier traders came to the capital to ask for special privileges, and to bring charges against their competitors. To gain their point they painted in bright colors the new possessions, the limitless territory for expansion,—the great future empire. In addition to these Russian promoters there were others of foreign countries who offered to lead expeditions of discovery and to extend Russia's commerce and empire in the Indies and America. It should be remembered that this was the last part of the eighteenth century, when the atmosphere of Europe was full of such projects, the voyages of Cook and La Pérouse being evidence enough on that point. Here was a serious and thoughtful problem for Catherine to decide. Catherine understood that in order to hold dominions out in the ocean and far from the metropolis a nation must have an over-flowing population, a strong navy, and a merchant marine. Russia had none of these. In order then to understand Russia's problem in Alaska, one should constantly keep in mind these factors—the need of population and of a navy. After thinking the subject over the Empress decided on a line of action. In a letter to her minister, Panin, written in 1769, in answer to various projects of foreign adventurers, she said: 'It is for traders to traffic where they please. I will furnish neither men, nor ships, nor money, and I renounce forever all lands and possessions in the East Indies and in America.' That was a clear statement of policy and could not be misunderstood. . . . In 1787, two Siberian merchant adventurers laid before the Empress a petition in which they undertook, in exchange for special commercial privileges in Alaska, to colonize that land and to extend the limits of the Russian Empire in America. Catherine drew up a paper in reply covering the questions of colonization and expansion in the North Pacific. In the

first place she declared that the proposition was an impracticable one because the population for the proposed colonies would have to be drawn from Siberia, and that country had none to spare; one hundred people in Siberia, were equal to a thousand in Europe. . . . Russia would not benefit from expansion in the Pacific; to claim a territory and trade in a colony was one thing, to hold and govern it was another."—F. A. Golder in *Pacific ocean in history*, pp. 269-273.—In spite of the lack of encouragement on the part of the government, numerous voyages were made to Alaska by private adventurers and considerable wealth was accumulated by them. In 1767 "the merchants Polonissouf and Popof also sent out a ship, the *Joann Predtecha*, which returned after an absence of five years with 60 sea-otters, 6,300 fur-seals, and 1,280 blue foxes. This ends the list of private enterprises prior to the resumption of exploration by the imperial government. . . . The gradual establishment of Russian supremacy in north-westernmost America upon a permanent basis had not escaped the attention of Spanish statesmen. . . . Alarmed by tidings of numerous and important discoveries along the extension of her own South Sea coast line, Spain ordered an expedition for exploring and seizing the coast to the northward of California in 1773."—H. H. Bancroft, *History of Alaska* (Works of H. H. Bancroft, v. 33), pp. 156, 194.—In 1786 French and English ships were cruising the coasts of Alaska and reporting on the fur-trade.

1787-1867.—Formation of United American Company.—Name changed to Russian American Company and first charter granted, 1799.—Second charter, 1821.—Company in the favor of the imperial government.—Third charter, 1841. Refusal to grant fourth charter.—Growth of friendly relations between Russia and United States and desire of Russia to sell Alaska.—In 1787 "the idea of a subsidized monopoly of trade and industry, to embrace all Russian discoveries and colonies on the shores of the north Pacific, first arose in the fertile brain of Grigor Shelikof. . . . In pursuance of this report an imperial oukaz was issued September 28, 1788, granting the company exclusive control over the region actually occupied by them. . . . It was at first feared that the decease of Catherine II. would be a death-blow to the ambitious schemes of the Shelikof party, for it was known that her successor, Paul I., was opposed to them. But . . . on the 11th of August, 1799, the act of consolidation of the United American Company was confirmed by imperial oukaz, and the association then received the name of the Russian American Company. 'By the same oukaz,' continues the report, 'the company was granted full privileges, for a period of twenty years, on the coast of northwestern America. . . . [The chief manager of the company under this charter was Baranof.] Baranof's complaints of foreign encroachment appear to have been well grounded. . . . 'The Americans,' writes the chief manager, 'have been acquainted with these tribes for two or three years, and have sent from six to eight ships each year. . . . At the end of the twenty years for which the exclusive privileges of the Russian American Company were granted, we find this powerful monopoly firmly established in the favor of the imperial government, many nobles of high rank and several members of the royal family being among the shareholders. The company already occupied nearly all that portion of the American continent and the adjacent islands south of the Yukon River now comprised in the territory of Alaska. . . . While the company's

business was thus progressing satisfactorily, a cloud arose in the diplomatic horizon, which at one time threatened the very existence of the colonies. [In 1821 the Tsar of Russia issued a ukase forbidding the vessels of any other nation to approach within 100 miles of the coast of Alaska above the fifty-first parallel.] As soon as the arbitrary measure of Russia became known to English and American northwest traders, protestations and complaints were forwarded to their respective governments. The matter was discussed with some heat in the United States congress, causing voluminous diplomatic correspondence. [This attitude of Russia towards her colonial territories was backed by the Holy Alliance whose pledge to restore the power and possession of all the 'legitimate thrones' was causing diplomatic complications.] In the meantime some traffic was carried on under protest, and the matter was finally settled by the Anglo-Russian and Russo-American treaties of 1824 and 1825. . . . [From 1820 to 1825 the Russian government prohibited foreign trade to such an extent that the company was on the brink of financial ruin. Foreign intercourse was necessary to supply the needs of the colony and develop its resources.] The expense of supporting the colonies, apart from the sums required for the home office, taxes, and other items, increased from about 676,000 roubles, scrip, in 1821, to over 1,210,000 roubles in 1841, and amounted for the whole period to nearly 18,000,000 roubles. . . . At the request of the directors, and after a careful investigation into the condition of the colonies, the imperial council at St. Petersburg decided, on the 5th of March, 1841, to renew the charter of the Russian American Company for a further period of twenty years.—*Ibid.* pp. 305-566.—“From 1820 to 1860 Alaska became more and more a burden on the Empire. The fur-bearing animals were being killed off, the natives were dying out, and it was difficult to persuade Russians to engage for service in Alaska when Siberia and the Amur offered so many better opportunities. The men who did come were in large part worthless. New international problems were coming up. The Crimean War demonstrated that Russia was not in a position to defend the colonies from an enemy unless she possessed a navy. If some agreement had not been reached as to the neutralization of Alaska, England would have captured it without any difficulty in 1854. There was also the financial question. The government stood back of the company and had to protect its credit by advancing loans to pay its bills. These were some of the considerations the Russian statesmen had to take into account when a request was made for a fourth charter. Before this was granted a committee was ordered to Alaska to make a report, which report did not promise much for the future of the territory. [In the meantime exposure of abuses in the company's affairs caused the government to refuse to renew the charter except on such terms as the company was unwilling to accept and in 1862 an officer of the imperial government was sent to take charge of the company's affairs.] The government realized that the only sensible thing to do with its American possession was to get rid of it. Even before 1860 it was proposed to sell it to the United States, but the war interfered. As soon as peace was declared the proposition was taken up again and successfully carried through. In a letter to the minister of finance written by Stoeckl, the Russian minister in Washington, a number of reasons are given why the sale was necessary. 1, With the exception of England every European nation, that at one time or other had

acquired colonies in America, has lost them. England still retains Canada but it is only a matter of years before that territory will become independent. If all these nations could not hold their colonies, it is not likely that Russia will be able to keep Alaska indefinitely. 2, In case of war Russia is in no position to defend her American territory. To be obliged to protect the large stretch of American coast would be a source of weakness. 3, The ports of Alaska are closed to American shipping. If the government of the United States should retaliate by closing the Pacific coast markets to Russian vessels the Alaskan trade would be badly affected. Should Alaska be thrown open to the Yankees they would soon exhaust it. If they close their ports to us we are lost; if we open ours to them we are equally lost. 4, The American people believe that it is their 'manifest destiny' to expand on the Pacific coast. . . . By handing the territory to the United States we bind that nation in friendship to us. Russia, too, has her manifest destiny, but it is on the other side of the Pacific, along the Amur. Our men and resources are needed there and should not be wasted in America. 5, From the very beginning Alaska has brought nothing but embarrassment, diplomatic complications, financial sacrifices and loss in men. If Russia should keep it there would be more trouble and additional sacrifices. Is Alaska worth the price? Looking at the matter from the point of view of the good of Russia we must answer in the negative.”—F. A. Golder, *Pacific ocean in history*, pp. 260-273.—“As early as 1861, the executive governments of the two countries came to an understanding to act in concert with a view to the establishment of a connection between San Francisco and St. Petersburg, by an interoceanic telegraph line across Behring's Straits. At a subsequent day Congress sanctioned and gave its co-operation to that policy. On the 26th of December, 1864, the Secretary of State, by direction of the President, invited the Emperor of Russia to send his principal advisor, the Grand Duke Constantine, upon a visit to the United States, intimating an opinion that such a visit would be beneficial to the United States, and by no means unprofitable to Russia, and giving the assurance that the Grand Duke, coming as a national guest, would receive a cordial and most demonstrative welcome by the government and people of the United States. The condition of domestic affairs in Russia [at that time] prevented the acceptance of this invitation. . . . The memorial of the legislature of Washington Territory to the President, received in February, 1866, was made an occasion, in general terms, for communicating to Mr. de Stoeckl the importance of some early and comprehensive arrangement between the two countries, to prevent the growth of difficulties arising out of the fisheries in the Russian possessions. In the spring of 1866, Mr. Fox, late Assistant Secretary of the Navy, was made the bearer of the expressions of national sympathy with the Emperor, arising out of the attempt at his assassination. He was especially charged to express the most friendly feelings towards the government and people of Russia. In the month of October, 1866, Mr. de Stoeckl, who had long been the Russian minister here, and enjoyed in a high degree the confidence of the government of the United States, went home on a leave of absence, promising his best exertions to facilitate the establishment of good relations upon a permanent basis. He returned to Washington early in the month of March last. The treaty for the cession of Russian American to the United States was

concluded and signed on the 30th day of March [1867].”—*Papers relating to the cession and transfer of Alaska to the United States in 1867*, p. 324.

1867.—Purchase by the United States.—In March, 1867, definite negotiations on the subject were opened by the Russian minister at Washington, and on the 23d of that month he received from Secretary Seward an offer, subject to the president's approval, of \$7,200,000, on condition that the cession be "free and unincumbered by any reservations, privileges, franchises, grants, or possessions by any associated companies, whether corporate or incorporate, Russian, or any other. Two days later an answer was returned, stating that the minister believed himself authorized to accept these terms. On the 20th final instructions were received by cable from St. Petersburg. On the same day a note was addressed by the minister to the secretary of state, informing him that the tsar consented to the cession of Russian America for the stipulated sum of \$7,200,000 in gold. At four o'clock the next morning the treaty was signed by the two parties without further phrase or negotiation. In May the treaty was ratified, and on June 20, 1867, the usual proclamation was issued by the president of the United States." On October 18, 1867, the formal transfer of the territory was made, at Sitka, General Rousseau taking possession in the name of the Government of the United States.—H. H. Bancroft, *History of the Pacific states*, v. 28, ch. 28.

1867-1883.—Lack of government in Alaska.—**Geodetic surveys.—Obstacles in the establishment of civil government.**—The only government in Alaska between 1867 and 1877 was that of more or less formal military authority. During these years considerable work was done in charting the coast, locating new harbors and exploring the sources of the Yukon. From 1877 to 1884, Alaska was almost entirely without government, both as to laws and officers. "The main obstacle in the establishment of some form of civil government for Alaska appears to have been the difficulty in reconciling the conflicting claims of the several sections, separated as they are by a vast extent of territory, and having few interests in common. . . . In 1883 Alaska was but a customs district, with a collector and a few deputies. For laws, the territory had the regulations made by the secretary of the treasury; and for protection, the presence of a single war-vessel, the crew of which was sometimes employed as a police force among the settlements of the Alexander Archipelago."—H. H. Bancroft, *History of Alaska*, (Works of H. H. Bancroft, v. 33) p. 627.

1884-1912.—Civil government.—First establishment and development.—Defects.—Civil government was first established in Alaska in May, 1884. Better provision was made by an act which passed Congress after much debate and was approved by the President on June 6, 1900. It constituted Alaska a civil and judicial district, with a governor invested with the duties and powers that pertain to the governor of a territory, and a district court of general jurisdiction, civil and criminal, and in equity and admiralty, the court being in three divisions, each with a district judge. The act also provided a civil code for the district. The Civil Government Act of 1912, approved by President Taft on August 24, altered the status of Alaska to that of an organized territory, with a capital at Juneau. (Previously for many years the government headquarters were at Sitka.) A

legislature, consisting of a senate and a house of representatives was created. Constitutional limits set to the powers of the legislature preclude the authority to grant divorces, special privileges and private charters; its fiscal policy is prescribed in regard to taxation, while its borrowing powers are limited to administrative expenditure. "The development of Alaska is held up by the laws governing it. Alaska's government is a motley affair. Franklin K. Lane, Secretary of the Interior [died May, 1921], who understands the situation admirably, calls it a patchwork. Many of the laws that govern it are passed by Congress. There is a territorial government, but here again Congress holds the controlling power, for there are many federal restrictions and all laws passed by the home legislature must be transmitted to Congress and if disapproved by the legislative body at Washington they are void. To be sure, Alaska has a delegate at the national capital, but he has no vote. . . . Thus, in its practical working out, Alaska is largely governed from Washington. . . .

This distant lawmaking, inefficient as it is, is not all of the maladministration of Alaskan affairs. Many departments and bureaus have the carrying out of the laws passed. This results in almost inextricable confusion. There is a government for certain public lands and forests, another for other lands and forests. There is one procedure for making homesteads, mineral and other land entries within the national forests; another procedure for making such entries in land outside the forest reserves. Certain islands along the southern coast of Alaska may be leased for fox farming by the Department of Commerce; adjoining unreserved islands may not be leased, but may be acquired under the general land laws from the Department of the Interior. Still other islands are reserved for special purposes under the control of the Department of Agriculture. Vast areas in the forest reserves are entirely untimbered, but are held under the regulations of the Forest Service, while timbered lands in other sections are unprotected. Some of the timbered islands off the coast are included within the forest reserves. Other islands equally well timbered are not. Homesteads within the forest reserves are surveyed by the Forest Service without cost to the entryman. Homesteaders on unsurveyed lands outside the Forest Reserves must pay for their own surveys. It has happened that three separate investigations of mineral claims have been made by field officers of the Forest Service Land Office and Geological Survey. Roads and trails within the Forest Reserves are built by the Forest Service Roads and trails outside these reserves are built by a commission of army officers. Still a third department having charge of road building has now been established by the Territorial Legislature. . . . Nor is this interlocking and overlapping of many governmental bureaus the only cause of confusion. In the individual department there is much distraction. The Land Office, one of the most vital to the fullest development of Alaska, is a fair sample. The administration of laws here is not plain and simple. They need many constructions to arrive at their meaning. And the regulations and reservation orders are many, ambiguous, and not known to the settler. . . . The legislative power of the Territory itself is vested in a Territorial Legislature consisting of a Senate and a House of Representatives. The Senate consists of eight members, two from each of the four judicial divisions into which Alaska is now divided. The House of Representatives consists of sixteen members, four from each of the four ju-

dicial divisions. The term of each member of the Senate is four years, one member from each judicial division being elected every two years. The term of each member of the House of Representatives is two years. The legislature convenes bi-annually at Juneau on the first Monday of March in odd years, and the length of the session is limited to sixty days, but the governor is empowered to call an extra session. The executive power is vested in the governor, who is appointed by the President for a term of four years by and with the advice of the United States Senate."—A. R. Burr, *Alaska*, pp. 401-412.

1884-1922.—Governors of Alaska.—"After the purchase of the territory of Alaska in 1867, Lovell H. Rousseau was appointed a special commissioner to formally take possession of the region, but aside from that, Alaska practically remained without civil government until May 17, 1884, when, by act of congress, it was created a 'civil and judicial district,' with executive officers appointed by the president for four years, but without representative institutions [until 1912].—J. H. Kinkead, ex-governor of Nevada, was appointed first governor by Pres. Arthur in 1884, but he resigned the following year upon the inauguration of Pres. Cleveland, and Mr. [Alfred P.] Swineford succeeded to the office [May 6, 1885] and served for four years. He was deeply interested in the development of the territory and repeatedly urged its organization. . . . On Apr. 20, 1880, . . . [Lyman E. Knapp] was appointed governor of Alaska, serving until Aug. 20, 1893. During his administration the development of the material industries, mines, fisheries and other resources of the territory marked an important era. The organization of the Indian police, the local militia, a territorial historical society and library, improvement in the public buildings and methods of conducting the public business, the more rapid progress in civilization by the natives, and improvements in the laws concerning town sites and pre-emption of lands occupied his attention. Nearly the whole of the seal fisheries controversy occurred during his administration and he was called upon to aid in the investigations made by both American and English Government vessels. [See U. S. A.: 1880-1892.] He earnestly labored for better mail service in the territory and succeeded in securing an extension of more than sixteen hundred miles of the established mail routes. He published many reports, official and unofficial, on Alaska and discussions of important public questions, among them 'The Legal and Political Status of the Natives of Alaska,' in the 'American Law Register,' May, 1891. [See TERRITORIES AND DEPENDENCIES OF THE UNITED STATES.] . . . [In 1893 James Sheakley became fourth governor of Alaska] . . . In 1887 Pres. Cleveland appointed him as one of the U. S. commissioners of Alaska, while the educational department made him superintendent of schools for southeast Alaska. Upon the expiration of his term as U. S. commissioner in 1892, he resigned the superintendency of the schools. . . . He was appointed governor of Alaska by Pres. Cleveland, June 28, 1893, entered upon his official duties Aug. 29, and served in that position four years. Gov. Sheakley gave every encouragement to the cause of education, assisted the missionaries of all denominations, and did what he could to protect, improve, and civilize the native Indians. The rich placer mines of British Columbia were discovered, and the great rush to the Klondike mining region began during his administration. In the fall of 1897 the San Francisco chamber of commerce sent him East, for the purpose of giving the public correct

information in regard to the Klondike mines. . . . [In 1897 John G. Brady was appointed fifth governor of Alaska]. In 1878 Mr. Brady went to Alaska as a missionary, with Dr. Sheldon Jackson, and later became manager of the Sitka Trading Co. On June 16, 1897, he was appointed to succeed James Sheakley as governor of Alaska. Under his administration there has been marked progress in the development of its resources, the expansion of trade and increase of population. On July 1, 1890, a new code of criminal procedure went into effect, and it has been of the greatest advantage to the territory. A territorial convention met in Juneau in October the same year, and submitted a memorial to congress petitioning for various reforms and for a delegate to that body. Gov. Brady in his annual reports has supported many of the measures asked for in the petition and has especially urged the extension of the land laws, the adoption of a code of civil procedure and the necessity for roads, telegraphs, and the erection of lighthouses upon dangerous points of the coast. His administration was so successful that on June 6, 1900, he was reappointed governor, his second term expiring in 1904."—*National cyclo-pedia of American biography*, pp. 355-356.—Governor Brady was again reappointed in 1904 and served until 1906. The governors of Alaska who have served since then are as follows: Wilfred B. Hogatt, 1906-1910; Walter E. Clark, 1910-1914; John F. Strong, 1914-1918; Thomas Riggs, Jr., 1918-1922. Scott Bone has been appointed to begin his term in 1922.

1897.—Gold discoveries in the Klondike region. See KLONDIKE GOLD FIELDS.

1898-1899.—Discovery of the Cape Nome gold mining region.—The Cape Nome mining region lies on the western coast of Alaska, just beyond the military reservation of St. Michael and about 120 miles south of the Arctic Circle. It can be reached by an ocean voyage of ten or twelve days from Seattle. It had long been known that gold existed in the general vicinity of Cape Nome, and during the years 1894-1898 a few adventurous miners had done more or less prospecting and claim staking throughout the district lying between the Norton and Kotzebue sounds. During the winter of 1898-1899, a large number of miners entered the Kotzebue country, while others spent the season in the vicinity of Golofnin bay. On Oct. 15, 1898, a party of seven men reached Snake river in a schooner. "Between that date and the 18th a miners' meeting was held, the boundaries of a district 25 miles square were established, local mining regulations were formulated, and Dr. Kittleson was elected recorder for a term of two years. After organizing, the district natives were hired to do the necessary packing, and a camp was established on Anvil Creek. The prospecting outfits were quickly brought into service. In one afternoon \$76 was panned out on Snow Creek. Encouraged by this showing lumber was carried up from the schooner and two rockers were constructed. . . . In four or five days over \$1,800 was cleaned up with these two rockers. . . . The weather turned cold and the water was frozen up. As it was impossible to do any more work with the rockers the party broke camp on the 3d of November and returned in the schooner, which they found frozen solid in 2 feet of ice. They then made their way in a small boat to an Indian village, near Cape Nome, where they obtained dogs and sleds, and a little farther on they were met by reindeer from the Swedish Mission, with which they returned to Golofnin Bay.

"The lucky miners had agreed among themselves

that their discovery should be held secret, but the news was too good to keep, and soon leaked out. A general stampede commenced at once and continued all winter. Every available dog and reindeer was pressed into the service, and they were soon racing with each other for the valuable claims which had been left unstaked in the vicinity of Anvil Creek. As soon as that creek had been all taken up the stampede extended to the neighboring streams and gulches, and Glacier and Dexter creeks, as well as many others which have not proved equally valuable, were quickly staked and recorded. By the 25th of December a large party armed with numerous powers of attorney had entered the district, and as the local regulations allowed every man to stake on each creek one claim of the full legal dimensions (660 by 1,320 feet), it was not long until the whole district had been thoroughly covered, and nearly every stream had been staked with claims, which in some cases were 'jumped' and the right of possession disputed.

"The news of a rich strike at Nome worked its way up the Yukon River during the winter, and as soon as the ice broke in June a large crowd came down from Rampart City, followed by a larger crowd from Dawson. . . . Those to whom enough faith had been given to go over to Cape Nome were disgusted and angered to find that pretty much the whole district was already staked, and that the claims taken were two or three times as large as those commonly allowed on the upper river. Another grievance was the great abuse of the power of attorney, by means of which an immense number of claims had been taken up, so that in many cases (according to common report) single individuals held or controlled from 50 to 100 claims apiece. . . .

"A miners' meeting was called by the newcomers to remedy their grievances. Resolutions were prepared, in which it was represented that the district had been illegally organized by men who were not citizens of the United States and who had not conformed with the law in properly defining the boundaries of the district with reference to natural objects, in enacting suitable and sufficient mining regulations, and in complying with any of the details of organization required by law. It was intended by the promoters of this meeting to reorganize the district in such a way as would enable them to share the benefits of the discovery of a new gold field with the men who had entered it the previous winter, and, as they expressed it, 'gobbled up the whole country.' It is, of course, impossible to say what would have been the result if their attempt had not been interfered with. . . . On the 28th of June Lieutenant Spaulding and a detachment of 10 men from the Third Artillery had been ordered to the vicinity of Snake River, and on the 7th of July their numbers were increased by the addition of 15 more. As soon as it was proposed to throw open for restaking a large amount of land already staked and recorded an appeal was made to the United States troops to prevent this action by prohibiting the intended meeting, which was called to assemble July 10. It was represented to them that if the newcomers should attempt, under the quasi-legal guise of a miners' meeting, to take forcible possession of lands already claimed by others, the inevitable consequence would be a reign of disorder and violence, with the possibility of considerable bloodshed. On the strength of this representation and appeal the army officers decided to prevent the adoption of the proposed resolutions. The miners were allowed to call their meeting to order, but as soon as the resolutions

were read Lieutenant Spaulding requested that they be withdrawn. He allowed two minutes for compliance with his request, the alternative being that he would clear the hall. The resolutions were not withdrawn, the troops were ordered to fix bayonets, and the hall was cleared quietly, without a conflict. Such meetings as were subsequently attempted were quickly broken up by virtue of the same authority. The light in which this action is regarded by the people at Nome depends, of course, upon the way in which their personal interests were affected. . . .

"The great discontent which actually did exist at this time found sudden and unexpected relief in the discovery of the beach diggings. It had long been known that there was more or less gold on the seashore, and before the middle of July it was discovered that good wages could be taken out of the sand with a rocker. Even those who were on the ground could hardly believe the story at first, but its truth was quickly and easily demonstrated. Before the month was over a great army of the unemployed was engaged in throwing up irregular intrenchments along the edge of the sea, and those who had just been driven nearly to the point of desperation by the exhaustion of all their resources were soon contentedly rocking out from \$10 to \$50 each per day and even more than that. This discovery came like a godsend to many destitute men, and was a most fortunate development in the history of the camp.

"Meantime the men who were in possession of claims on Anvil and Snow creeks were beginning to sluice their ground and getting good returns for their work, while others were actively making preparations to take out the gold which they knew they had discovered. More sluice boxes were constructed and put into operation as rapidly as possible. A town site was laid off at the mouth of Snake River, and on the 4th of July a post-office was established. The town which has sprung so suddenly into existence is called 'Nome' by the Post-Office Department, but at a miners' meeting held February 28, it was decided to call it 'Anvil City,' and this is generally done by the residents of the district, as well as in all official records. At a meeting held in September, however, the name was again changed to 'Nome.'"—*United States, 56th Cong., 1st sess., Senate Doc. No. 357, pp. 1-4.*

1900.—Explorations in the north. See ARCTIC EXPLORATION: 1000.

1903.—Settlement of boundary question with Canada. See ALASKA BOUNDARY QUESTION.

1904-1911.—Coal-land controversy.—Cunningham claims.—Ballinger vs. Pinchot.—The development of the coal deposits in Alaska has been retarded by the lack of transportation facilities and the controversies over the administration of the coal lands. The two issues at stake in the coal land controversy, which aroused considerable discussion from 1904 to 1911, were the fate of the principle of conservation and the rapid economic development of Alaska. Some of the claims entered previous to 1906, when the Alaska coal fields were withdrawn from entry by executive order, were charged with fraud because monopoly interests (especially the Alaska, or Morgan-Guggenheim syndicate) were supposed to be getting control of the coal lands. The investigation of the notable Cunningham group of claims dragged on in the Department of the Interior for several years and eventually gained publicity, resulting in a heated dispute between Chief Forester Pinchot and Secretary of the Interior Ballinger. Pinchot was removed by President Taft for insubordination

and Ballinger, accused of collusion, although upheld by a congressional investigating committee, resigned in 1911. Soon after, the Cunningham claims were cancelled, this acting as a precedent for the rejection of most of the remaining claims. The opening up of 12,800 acres of coal land withdrawn from the Chugach National Forest in October of 1910 raised again the fear of monopoly by the "Morgan-Guggenheim Syndicate," through its control of terminal facilities. President Taft and Secretary of the Interior Fisher defended this executive order by stating that the territory opened was guarded from monopoly by the reservation of 80-rod strips between the better claims.—See also CONSERVATION: 1010; 1010-1012.

1906.—Election of a delegate to Congress.—An act to authorize the election of a delegate to Congress from the territory of Alaska was approved by the President May 7, 1906.

1911.—First territorial legislature and its work.—"The more important legislation is summarized as follows: An act revising and making additions to the territorial licenses and taxes, and an act creating a territorial treasury and providing for the appointment of a treasurer; an act making important and comprehensive amendments to the general mining law as applied to Alaska; an employers' liability act; a poll-tax law, the poll taxes to be applied exclusively to the construction of wagon-roads; arbitration of labor disputes; a miners' labor-lien law; two acts limiting hours of labor, the first prescribing eight hours in all metalliferous lode mines, and the other placing the same limit on all labor in connection with public works for the territory; regulating banks and banking, and providing for examination; enabling municipal corporations to extend their boundaries; quarantine law and a simple sanitary code; compulsory registration of births, marriages and deaths; compulsory school attendance; providing for incorporated towns of the second class; extending the elective franchise to women. The first two named are the most important of all, because of their fundamental nature, but I would not be understood as implying that the measure which I have mentioned last is, in my opinion, of least importance. In respect to the general tax and license measure, the difficulty was encountered at the beginning of its consideration, of raising revenues in a territory whose population is small and whose developed resources are already taxed under federal laws. The new revenue law is somewhat unequal as to the various taxes imposed, but it is not a vicious or very burdensome measure. It is roughly estimated that it will yield about \$240,000, per annum. The appropriations authorized by the legislature amount to about \$60,000 per annum for the next two years."—*Alaska's first legislature (American Review of Reviews, v. 48, pp. 402-403)*.

1912.—Eruption of Mount Katmai.—"This volcanic ridge, a great fissure or vent it is supposed to be, extends on down the Alaska Peninsula where its most famous peak is Mt. Katmai. The eruption of this mountain in June, 1912, was the most tremendous volcanic explosion ever recorded. . . . The explosions and the shocks threw men and horses to the ground four hundred miles away. It was felt to the shore of the Arctic Ocean. The ash fell nine hundred miles away, and according to scientists the fine dust went into the higher regions of the atmosphere over the whole world and affected the weather for the summer, being the cause of the cold, wet season of that year. . . . Professor Robert F. Griggs, who was the leader of the expedition sent by the National Geographic

Society to Katmai after the disaster, computes that the ashes that fell, buried an area as large as the State of Connecticut to a depth varying from ten inches to more than ten feet. . . . Fortunately, the disaster did not occur in a settled district. Kodiak was the chief sufferer and its green beauty became a gray desert. Though one hundred miles away, the island was buried under ash. The roofs of the houses were broken in by the ashes that settled on them. The land was a land of darkness and stifling fumes and all the water was poisoned. A vessel that happened to be in the harbor of Kodiak took the people on board and supplied their needs as best it could until a weird, gray dawn at last broke and they returned to their homes and began the task of rehabilitation. Many of the cattle on the island perished for there was neither food nor drink. The government experimental station shipped its herd to the States until vegetation again appeared. But the greatest desolation was wrought on the Alaska Peninsula in the immediate vicinity of the mountain. The little village of Katmai though five times as far away as Pompeii from Vesuvius or St. Pierre from Mt. Pelée was a barren waste. The roofs were sunken in on the houses and the buildings were filled with pumice. The church stood in a sea of liquid mud. Trees were dead. Pumice was everywhere. To add to the destruction, if this were possible, a lake that had been formed by rubbish that had gathered across a stream and dammed it, broke and a flood swept down bringing boulders and trees and leaving a great plain of sticky mud. For several years after the explosion columns of steam a mile high and a thousand feet in diameter poured from other volcanoes of the group. New volcanoes came into existence at the time. Katmai itself really blew its head off and is to-day but a stub of what it was before the explosion. The force of the explosion right at the peak was so great that rocks were literally blown to pieces and the lava was so charged with gas it became steam."—A. R. Burr, *Alaska, pp. 176-178*.

1914.—Coal lands opened up by Congress under limitations.—Law passed to build a Federal railroad in Alaska.—By a law passed in 1914, the Secretary of the Interior was permitted to lease coal lands in blocks of forty acres or multiples to 2,560 acres. A royalty was fixed of not less than two cents a ton. In the same year a bill was passed authorizing a bond issue of \$35,000,000 for the purpose of building a Federal railroad in Alaska. The bill was vigorously opposed by the Guggenheim interests. "The government aims, Secretary Lane says, will be not merely to construct a railroad from the sea to the interior, but to select a route that will develop both the agricultural and mineral resources of the country 'so that we may have a road that will tap large coal fields and have other freight to carry.'"—*Independent, March 23, 1914*.

1915-1918.—Important legislation.—In 1915 a workmen's compensation law was adopted which surpassed that of other sections in its liberality. The following year the Mount McKinley district was set aside as a national park. The year 1917 was marked by two laws of note: an eight hour day law and a land law. In accordance with this latter law, homeseekers are allowed to secure titles though they are not residents on the land. In 1918 the prohibition law was passed.

1918.—Part played in the World War.—The territory furnished over 3,000 men for the service, and outranked all sections in purchase of war stamps. It was also a liberal subscriber to bonds.

Maps prepared specially for the NEW LARNED
under direction of the editors and publishers.

1919-1920.—Phases of economic development.—Problem of transportation.—Common carriers.—Roads.—Construction of the Federal railroad.—Mining handicapped.—Fisheries menaced.—Growth of agriculture and forest products.—“The great outstanding problem of Alaska is that of transportation. The public of coastal Alaska is served by three regular passenger and freight steamship lines—two American and one Canadian—representing about 25 per cent of the tonnage operating in the Territory. The Yukon River system is served by one line of river steamers of the White Pass & Yukon Route presumably controlled by British capital. The Kushokwim River is served by a small, combination freight and passenger ship sailing from San Francisco to Bethel, while the inhabitants of the valley itself are dependent upon one small American river steamer. There are a few semicommon carriers operating locally with indifferent success. The Copper River & Northwestern Railroad runs from Cordova to Kennecott, a distance of 106 miles, and is primarily an ore-carrying road, but performs the function of a common carrier. The railroad of the White Pass & Yukon Route extends from Skagway in Alaska to Whitehorse in Yukon Territory, a distance of 110 miles, 23 of which are in Alaska. The Yakutat & Southern Railroad, from Yakutat to the Seetuck River, carries little besides fish. The Government railroad from Seward to Fairbanks is still under construction. . . . [Its progress was handicapped during the World War for lack of labor and inadequacy in appropriations.] This, then, in brief practically covers the common-carrier systems to and within Alaska. . . . The Alaska Road Commission, constituted by act of Congress approved January 27, 1905, is composed of three officers of the Army, reporting to the War Department through the Chief of Engineers. . . . Approximately 5,000 miles of wagon road, sled road, and trail have been constructed and maintained by this board since 1905. Of the roads constructed about 400 miles have a gravel surface and are suitable for light automobile traffic. . . . In addition to roads constructed and maintained directly through Federal appropriation or authorization the legislature, at its last session, appropriated \$375,000 for roads and trails. . . . Not a great deal was accomplished in actual new construction of the Government railroad in Alaska during the first few months of the fiscal year 1920 because of the lack of appropriation and the uncertainty surrounding it. The original authorization of \$35,000,000 was almost exhausted and data was being assembled for presentation to Congress asking for an additional authorization of \$17,000,000. This was presented in July, 1910, and after extended hearings Congress granted the additional authorization in an act which was approved by the President on October 18, 1910 (Public No. 50). Of course, during these months the road was operated and maintained as well as possible under the circumstances, and some construction work done.”—*Report of the governor of Alaska to the Secretary of the Interior, 1920, pp. 11-15.*

One of the most important industries of Alaska is mining: gold, silver, copper and coal are found in large quantities. “It is true that mining has never before been so handicapped as at present, that operating costs are practically prohibitive in places, and that transportation could hardly be worse. . . . The winning of some \$20,000 worth of gold from placer mines near Juneau in 1880 marked the beginning of the great mining industry of Alaska, the value of whose total product up to

the close of 1919 is \$438,161,000. Alaska's developed mineral deposits are chiefly gold and copper. Hence, her mining industry in 1919 was subject to the same depression that affected gold and copper mining throughout the world. This fact explains in large measure why the value of Alaska's mineral output in 1919 is only about \$19,620,000, while that of 1918 was \$28,254,000. . . . The outlook of gold mining in Alaska under present economic conditions is not hopeful, yet the continued success of certain larger ventures, like dredging, shows that it is by no means hopeless. Such operations and the mining of bonanza deposits will continue. Alaska still contains large reserves of gold-bearing gravels that can be mined profitably when transportation conditions are improved. No one can foretell whether any more bonanza camps will be found, and therefore the only certain future lies in the development of deposits of lower grade. Therefore the most important event of the year for the future of mining in Alaska was the continuation of the work on the Government railroad and the assurance by congressional action of the money needed to complete the line. It is now certain that in three years there will be a standard-gauge railway connecting tidewater on the Pacific with Fairbanks and navigable waters on the Yukon. To give its full benefit to the mining industry, however, the Alaska Railroad must be connected with mining centers by good wagon roads.”—*Ibid., pp. 10-24.*—The production of coal, which reached a value of \$411,850 in 1918, was largely the work of the Alaskan Engineering Commission, which was responsible for 84 per cent of the total output. The copper production has been increasing regularly until it reached 88,703,400 pounds, worth \$24,240,508 in 1917. A decrease in production the following year was due to the shortage of labor and ships.

Fishing came to the fore in Alaska life in the 'eighties of the last century, when pelagic sealing had already made serious inroads into the seal-herds of the surrounding seas. The catching and canning of salmon, at first undertaken as a rather puny substitute for seal catching, has in recent years become the most important industry of Alaska, being in 1918 three and a half times greater than that of copper, which is next in rank. “Alaska's at present most important industry is seriously menaced. There must be speedy action of sorts taken by the Government or the salmon-fishing industry, normally furnishing trade to the United States in the sum of approximately \$50,000,000 annually, will be slowly wiped out. . . . In 1910 the salmon pack was only about two-thirds that of 1918, but a partial report of the canneries to the Territorial treasurer shows the profits of those reporting to have been considerably over \$2,000,000. Present indications are that the pack for 1920 will be less than that of 1919. . . . Due to overfishing both in and outside of salmon streams in 1918, 1919, and 1920, the cyclic return of salmon spawned in those years is becoming, and will become, less and less. As the runs decrease, newly devised and increased numbers of floating and fixed gear further decrease the escapement of spawning fish. . . . The take of seal and fox skins from the Pribilof Islands for 1917 and 1918 will net the Government \$6,400,000. In this large amount the Territory participates in not the slightest measure. Under careful governmental supervision the herd, at one time on the verge of annihilation, has increased to about 525,000 animals, which inhabit the waters of Alaska during the summer season.”—*Ibid., pp. 48-51.* See FISH-ERIES; BERING SEA QUESTION.

The agricultural value of Alaska has only recently been shown—certain grasses, grains, livestock and vegetables being suitable to the climate. Alaska is expected to have as much arable land as Finland, a country which exports agricultural products and also supports a population of 2,500,000. To further agricultural progress, government experiment stations have been established (see EDUCATION, AGRICULTURAL: United States), and an agricultural college has been founded at Fairbanks. Recently two industries related to agriculture have been developed. The breeding of reindeer as a native industry has increased considerably, the reindeer numbering, in 1910, over 125,000 head, of which only about 28 per cent are not owned by the Indians. Within the last year (1920) preparations have been made for the opening up of vast national forests for the manufacture of wood pulp. Alaska's resources in this direction are stated by Chief Forester W. B. Greeley who says that Alaska contains 100,000,000 cords of pulpwood. She has the resources to produce 1,500,000 tons of paper yearly. With reasonable care, under the methods followed by the Forest Service, this output can be kept up perpetually.

1920.—Education.—“The public schools of Alaska are under the direction of the Territorial board of education with the commissioner of education, Juneau, Alaska, as executive head. They are maintained for white children and for children of mixed blood leading a civilized life, and are administered under both Federal and Territorial laws. . . . There are 163 teachers in the schools of Alaska. . . . Schools in the following towns offer four years of high school work: Anchorage, Douglas, Fairbanks, Juneau, Ketchikan, Nome, and Valdez. . . . Alaska high schools are in general accredited at the leading State universities. . . .”—*Report of the governor of Alaska to the Secretary of the Interior, 1920, pp. 11-15, pp. 64-65.*—See also EDUCATION: Alaska.

1920.—Population.—Increase.—Effects of the World War.—“The white population of Alaska, 39,000 in 1910, increased by 1915 to about 50,000. From 1915 to 1918, owing to war conditions, the population declined, but in 1919 the tide set northward again and there was a slight increase, which will probably continue in 1920. The present white population of the Territory is estimated to be 36,000, in addition to about 25,000 natives, some of whom are civilized. The industrial population of the Territory exceeds 40,000. The loss in population during the period of the war was due to (1) men entering the military service, estimated to number 3,000, (2) high wages in the States, (3) the decrease in number of men employed in mining. In 1915 about 9,600 men were employed in the Alaska mining industry as compared with about 4,500 in 1919.”—*Ibid., p. 104.*

ALASKA BOUNDARY QUESTION.—1867-1903.—Basis of dispute.—Failure of Anglo-American joint commission to settle question in 1898.—*Modus vivendi.*—Hay-Herbert Convention, 1903.—“When Alaska was acquired from Russia by purchase in 1867, the boundary-line separating that territory from the British possessions had never been marked or even accurately surveyed, though the treaty between Great Britain and Russia, on which the controversy turned, had been made as far back as 1825. The language of this treaty seemed to exclude Great Britain altogether from the coast north of 54 degrees and 40 minutes. . . . But owing mainly to the expenses of a survey in that deserted region the matter was indefinitely deferred by both governments. There had never been any difference of opinion expressed

as to the general interpretation to be given to the treaty, and the question of marking the boundary was regarded merely as a surveying problem to be settled by commissioners appointed in the usual way and with the usual powers. The discovery of gold in the Klondike district, on the upper tributaries of the Yukon, in Canadian territory, in 1897, put a very different aspect on the matter. The shortest and quickest route to the gold-bearing region was by the trails leading up from Dyea and Skagway on the headwaters of Lynn Canal—Skagway being about 1115 miles from Seattle and less than 600 miles from Dawson. The Yukon, or all-water route, was much easier but slower—the distance from Seattle to St. Michael by ocean steamer being 2700 miles and from that point to Dawson by river steamer 1300 miles. Dyea and Skagway soon became important places, and the population rapidly increased. The Canadians now laid claim to these ports on Lynn Canal, and pushed their outposts down in that direction. Serious difficulties threatened from the conflict of authority over the collection of customs. The general question of the boundary was, therefore, referred to the Anglo-American joint high commission, which met at Quebec in the summer of 1868 for the purpose of adjusting matters relating to commercial reciprocity and fisheries. The commission not only failed to reach an agreement on this question, but it developed here for the first time that the Canadians had set up an entirely new theory as to the interpretation to be given to the treaty of 1825, so as greatly to narrow the American coast strip and throw the boundary line across the heads of inlets and channels in such a way as to give the Canadians access to several deep-water harbors. . . . The United States commissioners naturally did not feel authorized to trade off American territory in this way. When this interpretation was set up, it became at once evident that the permanent adjustment of the boundary was a matter that would require long diplomatic negotiation. Meanwhile there was a steady movement of men and supplies to the Klondike by way of Dyea and Skagway; and the situation of the headwaters of Lynn Canal, where both United States and Canadian officials claimed jurisdiction, was growing serious. Under these circumstances the United States agreed upon a *modus vivendi* with Great Britain, fixing a provisional line at certain points, and accordingly notes were exchanged October 20, 1899; the line thus established gave the Canadians temporary possession of several points which had always been regarded as within American jurisdiction. The main question was left for future adjustment, it being specifically provided that this provisional line was fixed ‘without prejudice to the claims of either party in the permanent adjustment of the international boundary.’ Finally, on January 24, 1903, Mr. Hay signed a convention with Sir Michael Herbert, agreeing to submit the question to a limited sort of arbitration; the tribunal was to consist of three Americans and three British members. . . . As the tribunal was finally constituted, no decision could be reached unless at least one commissioner failed to sustain the contention of his own government and upheld that of the other. The American members were Elihu Root, at that time secretary of war; Senator Henry Cabot Lodge, of Massachusetts; and ex-Senator George Turner of Washington. The British members were Lord Alverstone, lord chief justice of England; Sir Louis Amable Jette, lieutenant-governor of the province of Quebec; and Allen B. Aylesworth, of Toronto. . . . It was evident from the first that the trial was really before

Lord Alverstone, the chief justice of England; in case he sustained the American contention, there would be an end of the controversy; in case he sustained the Canadian view, there would be an even division, and matters would stand as they stood before the trial began, except that a great deal more feeling would have been engendered, and the United States might have had to make good its claim by force. . . . After a good deal of diplomatic sparring over points connected with the presentation of the cases, the members of the tribunal met in London September 3, 1903."—J. H. Latané, *America as a world power*, pp. 192-203.

1903.—Disputed treaty clauses.—Contentions of both sides.—Decision and award of arbitrators, Oct. 20, 1903.—As stated above the controversy arose over the ambiguous language of the Anglo-Russian treaty of 1825, Articles III and IV of which had been incorporated in the treaty of cession of the territory to the United States in 1867. These articles read as follows: "III. The line of demarcation between the possessions of the High Contracting Parties upon the Coasts of the Continent and the Islands of America to the North-West, shall be drawn in the following manner: Commencing from the southernmost point of the Island called Prince of Wales Island, which point lies in the parallel of 54 degrees 40 minutes, North Latitude, and between the 131st and 133d Degree of West Longitude (Meridian of Greenwich), the said line shall ascend to the North along the Channel called Portland Channel, as far as the Point of the Continent where it strikes the 56th Degree of North Latitude; from this last mentioned Point the line of demarcation shall follow the summit of the mountains situated parallel to the coast, as far as the point of intersection of the 141st Degree of West Longitude (of the same meridian), and, finally, from the said point of intersection, the said Meridian Line of the 141st Degree, in its prolongation as far as the Frozen Ocean, shall form the limit between the Russian and British Possessions on the Continent of America to the North-West.

"IV. With reference to the line of demarcation laid down in the preceding Article, it is understood: 1st. That the Island called Prince of Wales Island shall belong wholly to Russia. 2d. That wherever the summit of the mountains which extend in a direction parallel to the Coast, from the 56th Degree of North Latitude to the point of intersection of the 141st Degree of West Longitude, shall prove to be at the distance of more than ten marine leagues from the Ocean, the limit between the British Possessions and the line of Coast which is to belong to Russia, as above mentioned, shall be formed by a line parallel to the windings of the Coast, and which shall never exceed the distance of ten marine leagues therefrom.

"This language was indefinite in several particulars. In the first part of the boundary described—that is, from the southernmost point of Prince of Wales Island along Portland Channel to the 56th degree, there was room for doubt as to the side of the line on which the islands at the mouth of Portland Channel should fall; and there was the further difficulty that Portland Channel does not extend as far north as the 56th degree. In the second part of the line described—that is, from the 56th degree of north latitude to the 141st degree of west longitude (Mount St. Elias approximately)—there is no dominant range of mountains parallel to the coast corresponding to the language of the treaty, though such a range was prominently marked on the maps of Vancouver of 1798, and on the maps of other cartographers

prior to 1825. In 1893 a joint international survey of the coast between Portland Channel and Lynn Channel was undertaken by the United States and Great Britain, and in their report the American commissioners testified 'that throughout the lisière the mountains are composed of numerous isolated peaks and short ridges running in different directions, and that within ten leagues of tidewater there is no defined and continuous range such as appears upon the early maps and charts following the sinuosities of the coast.' As to the third section of the line—that is, from Mount St. Elias to the Arctic Ocean—there has never been any dispute. A number of specific questions were submitted to the tribunal for decision. The most important of these was number five: 'Was it the intention and meaning of said convention of 1825 that there should remain in the exclusive possession of Russia a continuous fringe or strip of coast on the mainland, not exceeding ten marine leagues in width, separating the British possessions from the bays, ports, inlets, havens, and waters of the ocean?' If this question should be answered in the negative, the tribunal was to tell how the lisière was to be measured, whether from the line of the general direction of the mainland coast, or from the line separating the territorial waters from the waters of the ocean or from the heads of inlets and bays. The English contention was that the line should follow certain peaks along the coast and run parallel with the general direction of the mainland coast, cutting through inlets, bays, and headlands. This interpretation ignored the meaning of the word sinuosities, and failed to construe the plain intent of the negotiators. The United States claimed: (1) that the treaty of 1825 confirmed in full sovereignty to Russia a strip of territory along the continental shore from the head of Portland Canal to Mount St. Elias, ten marine leagues in width measured from the heads of all gulfs, bays, inlets, and arms of the sea—that is, from tidewater—unless within that distance from tidewater there was a range of mountains lying parallel to the sinuosities of the coast, in which case the summit of such range was to form the boundary; (2) that the acts of Great Britain subsequent to this treaty, and the universal interpretation given it by governments, geographers, cartographers, and historians, agreed with and confirmed the intention and meaning as above stated; (3) that the United States purchased Alaska, entered into possession of and occupied the lisière above described, and exercised sovereign rights therein, and remained in possession for thirty years without any notice from Great Britain that she claimed any portion of the territory ceded by Russia; (4) that there being no continuous range of mountains between Portland Channel and Mount St. Elias parallel with the sinuosities of the coast, the width of the lisière above described was limited by the agreed distance of ten marine leagues from tidewater. In support of its claims the United States showed from the records of the negotiations leading up to the treaty of 1825 that Sir Charles Bagot, the English negotiator, made effort after effort to secure an outlet to deep water through the lisière, and was finally forced to yield the point. The most interesting feature of the case was the overwhelming array of maps presented by the United States, including British and Canadian, showing the boundary line claimed by Russia and the United States. It was also shown that both the Canadian and British authorities had, by repeated acts, recognized our title to the strip in dispute. The decision of the tribunal was rendered October 20, 1903. On all the

important points the vote stood four to two, Lord Alverstone, Root, Lodge, and Turner concurring in the decision; and the two Canadian members dissenting. The decision sustained in the main the American claim, holding that it was the intention of the treaty of 1825 to shut England out from access to tidewater through the *lisière*. Wales and Pearce islands, at the entrance of Portland Channel, were awarded to England, and the line from the head of Portland Channel to Mount St. Elias was slightly drawn in, though it ran well around the heads of all inlets. The tribunal designated certain mountain peaks as the mountains referred to as parallel to the coast, except between the Stikine and Taku rivers. From the greater part of the distance between these rivers the tribunal declared that 'in the absence of further survey the evidence is not sufficient to enable the Tribunal to say which are mountains parallel to the coast within the meaning of the treaty.' The commissioners appointed later to complete this part of the boundary agreed on what is practically a straight line, and this was accepted by both governments as final. The decision was, of course, a disappointment to the Canadians, but it did not justify the charge that Lord Alverstone had sacrificed their interests in order to further the British policy of friendly relations with the United States."—J. H. Latané, *America as a world power*, pp. 193-203.—See also ARBITRATION, INTERNATIONAL: 1903; U. S. A.: 1892: Settlement of Alaskan boundary.

1906-1914.—Convention to provide for final establishment of the boundary line.—Surveys.—Boundary line completed.—Final proceedings for establishing the boundary line of Alaska were provided for in a convention between the United States and Great Britain, signed April 21, 1906. The need and object of the convention were set forth in its preamble as follows:

"WHEREAS by a treaty between the United States of America and His Majesty the Emperor of all the Russias, for the cession of the Russian possessions in North America to the United States, concluded March 30, 1867, the most northerly part of the boundary line between the said Russian possessions and those of His Britannic Majesty, as established by the prior convention between Russia and Great Britain, of February 28-16, 1825, is defined as following the 141st degree of longitude west from Greenwich, beginning at the point of intersection of the said 141st degree of west longitude with a certain line drawn parallel with the coast, and thence continuing from the said point of intersection, upon the said meridian of the 141st degree in its prolongation as far as the Frozen Ocean,

"And whereas, the location of said meridian of the 141st degree of west longitude between the terminal points thereof defined in said treaty is dependent upon the scientific ascertainment of convenient points along the said meridian and the survey of the country intermediate between such points, involving no question of interpretation of the aforesaid treaties but merely the determination of such points and their connecting lines by the ordinary processes of observation and survey conducted by competent astronomers, engineers and surveyors:

"And whereas such determination has not hitherto been made by a joint survey as is requisite in order to give complete effect to said treaties."

To make such determination it was agreed that each Government should "appoint one Commissioner, with whom may be associated such surveyors, astronomers and other assistants as each Government may elect." The work of surveying

continued year by year, and at its completion, in 1914, a well-defined boundary line lay between Alaska and Canada.—See also ALASKA: Map.

ALBA, Celtic form for Caledonia. See SCOTLAND: The name.

ALBA.—Alban Mount.—"Cantons . . . having their rendezvous in some stronghold, and including a certain number of clanships, form the primitive political unities with which Italian history begins. At what period, and to what extent, such cantons were formed in Latium, cannot be determined with precision; nor is it a matter of special historical interest. The isolated Alban range, that natural stronghold of Latium, which offered to settlers the most wholesome air, the freshest springs, and the most secure position, would doubtless be first occupied by the new comers. Here accordingly, along the narrow plateau above Palazzuola, between the Alban lake (Lago di Castello) and the Alban mount (Monte Cavo) extended the town of Alba, which was universally regarded as the primitive seat of the Latin stock, and the mother-city of Rome, as well as of all the other Old Latin communities. Here, too, on the slopes lay the very ancient Latin canton-centres of Lanuvium, Aricia, and Tusculum. . . . All these cantons were in primitive times politically sovereign, and each of them was governed by its prince with the co-operation of the council of elders and the assembly of warriors. Nevertheless the feeling of fellowship based on community of descent and of language not only pervaded the whole of them, but manifested itself in an important religious and political institution—the perpetual league of the collective Latin cantons. The presidency belonged originally, according to the universal Italian as well as Hellenic usage, to that canton within whose bounds lay the meeting-place of the league; in this case it was the canton of Alba. . . . The communities entitled to participate in the league were in the beginning thirty. . . . The rendezvous of this union was, like the Pambœotia and the Panionia among the similar confederacies of the Greeks, the 'Latin festival' (*feriæ Latinæ*) at which, on the Mount of Alba, upon a day annually appointed by the chief magistrate for the purpose, an ox was offered in sacrifice by the assembled Latin stock

to the 'Latin god' (Jupiter Latiaris)."—T. Mommsen, *History of Rome*, bk. 1, ch. 3.

ALBAN, Kingdom of. See ALBION; SCOTLAND: 8th-9th centuries.

ALBANIA, the name given in ancient geography to a portion of the eastern Caucasus and a region west of the Caspian sea. The inhabitants, known as Albani, were spread over an extensive region to the northwest and up in the Caucasus mountains. They were described by Strabo as a people of fine physique and excellent character, but in a primitive stage of culture. Although they were a nomad people their form of government was a monarchy. In the wars between the Romans and Mithradates (King of Pontus) they came to the attention of Pompey, who subjected them to a formal recognition of Roman authority. At the time of the barbarian invasion in the second century A. D., Albania was invaded by the Alani. These were afterwards driven into Armenia by the Khazars. Still later the country was conquered by Persia under its Sassanid rulers. The successive invasions of the Huns, Mongols, and other barbarians effaced Albania from the map. This Albania must not be confused with the modern state of that name on the Adriatic coast of the Balkan Peninsula. (q. v.)

ALBANIA.—Name and people.—Lack of political organization.—Population.—Religion.—Language.—In a modern geographical sense Albania is a name applied to a region on the western shores of the Adriatic north of Greece, west of Macedonia and south of Serbia. It constituted part of what the Romans called Illyria, but has no easily defined natural boundaries. The entire region is extremely rough and mountainous, being traversed from northwest to southwest by a number of parallel mountain chains. Although the climate is salubrious and bracing and much of the soil fertile, the country as a whole has no industrial development and appears to have always been extremely poor. The people are famed for their mixed primitive virtues of honesty, lawlessness and courage, but do not seem to lend themselves to high political organization. "The Albanian people . . . are [1015] not a unit in race, language, religion or any other vital interest. They have refused to accept the political unity of the state, and have not progressed in thought beyond the stage of clan-organization. But they are a unit in not being related to any one else in the peninsula. When the invading swarms of Slavs, Bulgars and the like swept over the Peninsula, they swept the earlier inhabitants before them and in the almost inaccessible mountain fastnesses of the extreme south-west those who refused to be conquered or absorbed found a refuge. So in the Pyrenees and the Caucasus we find remnants of earlier races which the immigrant hosts have crowded out of their path and left as a glacier leaves its terminal or lateral moraines."—H. H. Powers, *Things men fought for*.—"The Albanian population may be reckoned at about two and a half million souls, the large majority of whom inhabit the southwestern portion of the Balkan Peninsula. The Albanians belong to three religions: the Roman Catholic Church, the Greek Orthodox Church, and to Islam. The Mohammedans exceed in number both the Catholics and Orthodox put together. The members of these three faiths all live together, but the Catholics are more

numerous in the north and the Orthodox in the south. The Mohammedans are found everywhere, but form compact masses in the center of the country. . . . The language is one and the same. It is, moreover, one of the oldest languages in Europe, and our people have clung to it tenaciously in the face of much enemy opposition."—M. B. Konitza, *Albanian question (International Conciliation, May, 1919)*.—See also BALKAN STATES: Races existing; and Maps; EUROPE: Modern: Political map of Europe.

Early history.—Rule of Pyrrhus.—Entrance of Christianity.—Under the Roman empire.—Invasion of Slavs.—"We first hear of our ancestors from classical authors who describe and give the names of many of the independent clans who inhabited the Balkan Peninsula when its history dawned. All authorities agree that they are not Greek. The Greeks, in fact, designated them 'barbarians.' The main groups formed by these clans were known as Macedonia, Illyria, and Epirus. The inhabitants of all three, so Strabo informs us, spoke the same tongue and had similar customs. The very name of Macedonia, formerly known as 'Emathia,' derives in all probability from the Albanian word E Madhia (the great). As for Illyria, 'Iria' in Albanian means 'freedom,' and we Albanians' interpret it as 'land of the free.' [Throughout their history the Albanians obstinately resisted subjugation from invading foes and were in the main successful. They were under the rule of Pyrrhus, however, from 296-272 B. C.] Christianity arrived early in Illyria. 'Round about Illyria,' says St. Paul, 'have I fully preached the Gospel of Christ.' The Albanians claim him as the first missionary among them. Illyria formed part of the Patriarchate of Rome at an early date, and a large number of the North Albanians (Ghegs) are faithful to Rome to this day. Scutari and Antivari have been bishoprics since the fourth century. The Roman Empire in the East was repeatedly invaded by hordes of barbarians from beyond the Danube. [Fourth and fifth centuries.] The Avars devastated wide tracts, and after them came the Slavs [640]. These, the ancestors of the Serbs, Montenegrins, and Bosniaks, swarmed in in overpowering numbers. They settled first in some districts depopulated by the Avars, and by the seventh century were widely spread in the Peninsula. They were a tribal and a pastoral people, and, taking possession of the rich plains for their flocks, they drove Roman civilization to the coast of the Adriatic, where it has never completely died out. [From 640-1360 with some interruptions the Albanians were under Serbian rule.] Of the native Illyrian population, that of the north disappeared. But southward the Illyrians defended themselves in the mountains of modern Albania, and there they preserved their language and customs uninterrupted, up to the present day, against all comers."—*Ibid.*

Medieval period.—Bulgarian kingdom in Albania.—Byzantine, Norman and Sicilian conquests.—Rise of the Serbian kingdom of Rasha.—Reign of Stefan Dushan.—"From the settlement of the Servian Slavonians within the bounds of the empire [during the reign of Heraclius, first half of the seventh century], we may . . . venture to date the earliest encroachments of the Illyrian or Albanian race on the Hellenic population. The Albanians or Arnauts, who are now called by themselves Skiptars, are supposed to be remains of the great Thracian race which, under various names, and more particularly as Paionians, Epirots and Macedonians, take an important part in early Grecian history. No distinct trace

of the period at which they began to be co-proprietors of Greece with the Hellenic race can be found in history. . . . It seems very difficult to trace back the history of the Greek nation without suspecting that the germs of their modern condition, like those of their neighbours, are to be sought in the singular events which occurred in the reign of Heraclius."—G. Finlay, *Greece under the Romans*, ch. 4, sect. 6.—"The most unchanged people in the [Balkan] peninsula must be the Albanians, called by themselves *Skipetar*, the representatives of the old Illyrians. . . . Before the end of the twelfth century the other primitive nations of the peninsula . . . began to show themselves more distinctly alongside of the Greeks. We now first hear of *Albanians* and *Vlachs* by those names."—E. A. Freeman, *Historical geog-*

united Bulgar force. In the twelfth century they united under the rule of the remarkable line of Nemanya princes, and established the Kingdom of Rashia and extended it rapidly. Rashia, in Albanian, means plain. It is possible, therefore, that Rashia was the original Illyrian name of the plains of Kosovo. The Serbs were, in fact, known by the name of Rashians even into the eighteenth century. Each of the Nemanya kings extended his realm by conquest. They spread over North Albania and seized Scutari. Scutari, the capital of North Albania, is one of the oldest capitals in Europe. It is first mentioned under its native name of Scodra in 604 B. C. And as Shkodra it is known still to all Albanians. The name of Scutari was given to it by the Venetians in the thirteenth century. That the Albanians were,

GROUP OF MODERN ALBANIANS

In the ancient Mohammedan dress still worn

raphy of Europe.—In 861 the Bulgars conquered the southern portion of Albania and gradually extended their sway northward. This Bulgarian kingdom was brought to a close by the victory of Basil II in 1014. Albania continued under Byzantine rule until 1204, but not without numerous revolts. In 1081 the Normans seized Durazzo, returning to Italy in 1100. In 1180 the Serbians established an independent kingdom in upper Albania. From 1204 to 1318 Epirus was held by Comnenus, a member of the imperial family at Constantinople who was forced to flee when the capitol was taken by the Crusaders, but Durazzo was under Sicilian kings of the house of Anjou (1271-1368). In the meantime the Serbian kingdom in the north was rising in importance. "Not till the fall of the . . . Bulgar Empire did the Serbs play an important part in Balkan affairs. A tribal people, they had been weak before the

when conquered by the Serbs, Roman Catholic, is evident from contemporary accounts. In 1321 they appealed to Charles of Anjou and to Filippo of Taranto to force the Serb King Milutin to respect their religious rights. [In 1331 the greatest of the Nemanya kings, Stefan Dushan ascended the throne. His rule lasted until 1358. He included all of Albania in his kingdom and ruled under the title "Imperator Romaniae, Slavoniae et Albaniae."] In 1332 the French friar, Pèrè Brochard, describes the land and people. 'It is inhabited,' he says, 'by two peoples, the Albanians and the Latins, who both belong to the Church of Rome. The Albanians have a language quite other than Latin. . . . They have four Bishops under the Archbishop of Antivari. . . . Both these peoples are oppressed under the very hard servitude of the most hateful and abominable lordship of the Slavs.' That the friar did not exag-

gerate is shown by the extremely severe laws enacted against the [Roman] Catholics by the great Czar Stefan Dushan in 1349 in his celebrated canon. Here we find that those of the Latin heresy who refuse to be converted are punishable by death, as are also Latin priests who attempt to convert anyone to the Latin faith."—M. B. Konitz, *Albanian question (International Conciliation, May, 1919)*.

1358-1443.—Growth of native rule after the fall of the Serbian kingdom.—Despotat of Epirus under the house of Thopia.—Venetian, Greek and Turkish invasions.—"On the break-up of that power [the Serbian] came a time of utter confusion and endless shiftings, which has, however, one marked feature. The Albanian race now comes fully to the front. Albanian settlers press into all the southern lands, and Albanian principalities stand forth on a level with those held by Greek and Latin lords. The chief Albanian power which arose within the bounds of the despotat [of Epirus] was the house of *Thopia* in northern Epeiros. They called themselves *Kings of Albania*; they won Durazzo from the Angevins, and their power lasted [1359-1392] till that duchy passed to Venice. . . . In Epeiros the Servian and Albanian despots had both to yield to Italian princes. . . . Early in the fifteenth century the Turk won all Albania, except the Venetian posts. [The Turkish advance began with the capture of Iannina in 1431.] Seventeen years later came a revolt and a successful defence of the country, whose later stages are ennobled by the name of George Kastriota of Croja, the famous Scanderbeg."—E. A. Freeman, *Historical geography of Europe*, pp. 423-425.—During this period of native rule from the middle of the fourteenth century to the early fifteenth, part of upper Albania was ruled by the Balsha dynasty (1366-1421) and a southern section by the Musaki (1368-1476). Towards the close of the century Albanian principalities fell by degrees under Venetians and Greeks.

1443-1467.—Scanderbeg's war with the Turks.—"John Castriot, Lord of Emalthia (the modern district of Moghlene) [in Epirus or Albania] had submitted, like the other petty despots of those regions, to Amurath early in his reign, and had placed his four sons in the Sultan's hands as hostages for his fidelity. Three of them died young. The fourth, whose name was George, pleased the Sultan by his beauty, strength and intelligence. Amurath caused him to be brought up in the Mahometan creed; and, when he was only eighteen, conferred on him the government of one of the Sanjaks of the empire. The young Albanian proved his courage and skill in many exploits under Amurath's eye, and received from him the name of Iskanderbeg, the lord Alexander. When John Castriot died, Amurath took possession of his principalities and kept the son constantly employed in distant wars. Scanderbeg brooded over this injury; and when the Turkish armies were routed by Hunyades in the campaign of 1443, Scanderbeg determined to escape from their side and assume forcible possession of his patrimony. He suddenly entered the tent of the Sultan's chief secretary, and forced that functionary, with the poniard at his throat, to write and seal a formal order to the Turkish commander of the strong city of Croia, in Albania, to deliver that place and the adjacent territory to Scanderbeg, as the Sultan's viceroy. He then stabbed the secretary and hastened to Croia, where his strategem gained him instant admittance and submission. He now publicly abjured the Mahometan

faith, and declared his intention of defending the creed of his forefathers, and restoring the independence of his native land. The Christian population flocked readily to his banner and the Turks were massacred without mercy. For nearly twenty-five years Scanderbeg contended against all the power of the Ottomans, though directed by the skill of Amurath and his successor Mahomet, the conqueror of Constantinople."—E. S. Creasy, *History of the Ottoman Turks*, ch. 4.—"Scanderbeg died a fugitive at Lissus on the Venetian territory [1467]. His sepulchre was soon violated by the Turkish conquerors; but the janizaries, who wore his bones enchased in a bracelet, declared by this superstitious amulet their involuntary reverence for his valour. . . . His infant son was saved from the national shipwreck; the Castriots were invested with a Neapolitan dukedom, and their blood continues to flow in the noblest families of the realm."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 67.

1478-1880.—Albania under Turkish rule.—Struggles for independence.—Effect of the Treaty of Berlin.—Struggle for education.—Between 1478 to 1502 the most important Venetian strongholds in Albania were captured by the Turks, including Scutari and Durazzo (see GREECE: 1454-1479) and by 1571 the Turks were masters of Albania. The Christians either emigrated or fled to the mountains, but the Turks were never able fully to convert Albania to Islam and the country was torn by endless strife between the mountainers and the Turks, the Christians and the Mohammedan converts. When the Turkish power began to wane towards the end of the 17th century, anarchy and confusion were abundant (See TURKEY: 1684-1696). "There was nothing for it but to accept Turkish rule. From the beginning the Albanians had contrived to retail local autonomy. In the seventeenth century many began to go over to Islam. But, as above stated, unlike the other Balkan peoples, when Mohammedanized they retained their strong sense of nationality. No sooner did the Moslem Albanian chiefs rise to power than they began to work for independence. The Albanians, both Moslem and Christian, descended from the mountains and began a struggle to retake the plains from which their forefathers had been driven by the conquering Serbs. Bit by bit they regained territory and settled upon it. Attacked by the Albanians on the one side, and oppressed on the other by the Turkish government, and oppressed also by the Greek Church—which strove ever to replace the Serb and Bulgar churches by Greek ones throughout Turkey in Europe—the Serbs of Kosovo, led by the Patriarch of Ipek, decided to emigrate and moved in vast masses into Austria, where they were given land in the Banat by the Emperor. The Albanians speedily resettled the vacated lands, occupying the whole of the Kosovo district as far as Mitrovitza and northeast as far as Nish and Uskub. Eastward they spread as far as Monastir, and the greater part of the Moslem villages of Macedonia are Albanian. In truth, they thus retook a great part of their ancient Illyria and Macedonia. Christian and Moslem united to preserve and maintain their customs, rights, and language, and brooked but little Turkish interference. [In the latter half of the eighteenth century, Moslem chieftans set up independent principalities, but failed to maintain their sovereignty against the Porte except for short periods. The last of these, the dynasty of Scutari, came to an

end in 1831 with the surrender of its head to the Grand Vizier Reshid Pasha.] The beginning of the nineteenth century was a time of great stress and struggle in the Balkan Peninsula. Repeated attacks by the Russians and Austrians, who each pretended they were animated by a desire to free the Christians from Turkish rule, and were in truth aiming only at territorial gains, had greatly weakened Turkish power and roused, too, the hopes of the subject peoples. Serbia rose first and, with the aid of both Austria and Russia, attained autonomy. Greece rose shortly afterward and, also with European help, obtained her freedom.

"The Greeks were greatly helped, too, by the Albanians of the south, of whose valor Lord Byron tells. In return for this help they hoped that Greece would aid them, too, when their time came. . . . Far from aiding Albania to gain freedom, Greece has had but one object, and that is to obtain more and more of Albanian territory. . . . In 1880 an International Commission, called the Eastern Roumelian Commission, was appointed to regulate the affairs of Turkey. Great Britain was ably represented by Lord Edmund Fitzmaurice, who recognized the important fact that if peace were to be permanent in the Balkan the rights of each nationality must be considered. Convinced, after careful examination, that the Albanians had been treated with great injustice, he made strong representations on the subject, and recommended the immediate formation of a large and autonomous Albania, which should become independent on the break-up of the Turkish Empire in Europe. Having caused inquiries to be made about the population of the various vilayets, he recommended that the state of Albania should consist of the whole of the vilayets of Scutari and Janina, the larger part of the vilayet of Kosovo, and a large part of the vilayet of Monastir. In this scheme he was strongly supported by [the British] Ambassador at Constantinople, Lord Goschen. The formation, however, of an independent Albania did not suit the ambitious plans either of Austria or of Russia. And, unfortunately for Europe, nothing was done save to recommend certain reforms to the Turks. [See BALKAN STATES: 1878.] The Albanian question remained and remains unsolved. . . . Though by means of the Albanian League a certain amount of Albanian territory was saved, yet the Treaty of Berlin resulted disastrously for Albania."—M. B. Konitz, *Albanian question (International Conciliation, May, 1919)*.—The Albanian League was formed to resist the concessions granted by the Treaty of Berlin (July 13, 1878) to Austria-Hungary, Servia and Montenegro, but in spite of the efforts of the league, the independence of Montenegro and Servia were guaranteed with portions of Albanian territory.—"Albania's struggle to obtain national education in the face of difficulties merits a chapter in the history of education. . . . Books and papers printed in London, Brussels, and Bucharest were smuggled into the country at great risk and eagerly studied, in spite of the fact that anyone found in possession of such works was liable to even fifteen years' imprisonment. Many people, both Moslem and Christian, studied their own language from the Gospels and the Book of Genesis which were published in Albanian by the British and Foreign Bible Society and circulated with great difficulty. Schoolmasters found guilty of teaching Albanian were severely punished—in some cases the extreme sentence of fifteen years being inflicted. But the Albanians did not relax their efforts. In South Albania the Americans, to whom Albania is deeply

indebted, opened a Girls' School at Koritza which was protected by the great Republic. This was a center of national enthusiasm. The girls taught their brothers to write their mother tongue. In the north education was better provided for. Both Italy and Austria, being anxious to obtain influence there, opened schools for boys, girls, and infants in Scutari and Durazzo. And the Abbott of the Mirdites started a school in his mountains."—*Ibid.*

1908-1914.—Young Turk revolution.—Balkan wars.—Temporary monarchy under Prince William of Wied.—Independence granted by the powers under an International Council of Control.—Revolt of Essad Pasha.—"Such was the situation of Albania when the Young Turk revolution took place in 1908. To this the Albanians at first lent their hearty support, believing that it meant equal opportunities for all races. They were soon undeceived. The Young Turks began a policy of forcible Ottomanization and the Albanians rose against it. [See also TURKEY: 1908.] This most useful and loyal corner of the sultan's dominions was turned into a country of perennial revolutions, which started soon after the inauguration of the constitutional régime. In the winter of 1911-1912, when the group of Albanian deputies in the Ottoman Parliament saw their demands for reforms rejected by the cabinet, and even the right of discussion of their complaints refused on the floor of Parliament, the Albanians north and south, Roman Catholics and Moslems, united in resistance to the Turkish authorities that extended to Uskub and Monastir. After the spring elections of 1912, the resistance became a formidable revolt. (See also TURKEY: 1910-1911.) For the Young Turks had rashly maneuvered the balloting with more than Tammany skill. The Albanians were left without representatives in Parliament. Former deputies, such as Ismail Kemal Bey, and chiefs such as Isa Boletinat, Idris Sefer, and Ali Riza joined in a determination to demand autonomy by force of arms. When, in July, the cabinet decided to move an army against the Albanians, there were wholesale desertions from the garrison at Monastir, and of Albanian officers from all parts of European Turkey. Mahmud Shevket Pasha was compelled to resign the ministry of war, and was followed by Said Pasha and the whole cabinet. The Albanians demanded as a *sine qua non* the dissolution of Parliament. The Mukhtar cabinet agreed to the dissolution, and accepted almost all the demands of the rebels in a conference at Pristina."—M. B. Konitz, *Albanian question (International Conciliation, May, 1919)*.

The situation was still further complicated by a split in the Albanian provisional government, Essad Pasha, minister of the interior and lately defender of Scutari, having refused to recognize Avlona as the seat of government, and having started a government of his own at Durazzo, apparently with the object of having himself elected Prince of Albania, as he possessed great influence in that part of the country where his extensive estates were situated. Meanwhile Servia marched her troops into Albania as a counter-attack to the Albanian raid, but she withdrew them a week after in response to a peremptory summons to do so from the Austro-Hungarian government. On November 23, 1913, Prince William of Wied, nephew of the queen of Rumania, an officer in the Prussian army, regarded as a well-informed and capable soldier, was selected by the powers as the future sovereign of Albania. (See SERBIA: 1909-1913.)

"The principle of the erection of Albania into an independent State was, of course, adopted by what used to be known as the Concert of Europe some years before the decision to liberate the small peoples who had long lived under the alien domination became the most widely advertised object of the Associated Powers in the present [world] war. When, after the first Balkan War, the Powers attempted to elaborate a settlement of the Balkan question, they decided that the moment had arrived to grant Albania its independence, and, following a series of difficult and long-drawn-out negotiations, the representatives of the six great European States, united under the presidency of Sir Edward Grey, created an independent, autonomous, and hereditary principality of Albania. The reasons which motivated that decision still exist, and have been strengthened rather than weakened by the international changes which have taken place in the meantime. But Albania had been so neglected by Turkey that she could not reasonably be expected to work out her own salvation single-handed, and, in order to assist her organization, the Powers accorded her assistance in the form of an International Council of Control. From its very inauguration this Council produced excellent results; the statute elaborated by it was admirably suited to a country such as mine, and it is in many ways unfortunate that the world war put an end to its mandate."—Essad Pasha, *My policy for Albania* (*Balkan Review*, London, June, 1919, pp. 329-330).

"Prince William of Wied . . . arrived at Durazzo, which he constituted his capital, on March 7, 1914. The fact that his régime was a total failure is due in part to the international conditions then prevailing and in part to the rôle he personally played. On the international side trouble arose from the fact that Albania had been constituted largely in order to relieve European tension and some of the ever-recurring difficulties between the Great Powers. [See BALKAN STATES: 1912-1913.] Moreover, whilst Europe had nominally fixed the northern and southern frontiers, she took no effective measures to hand over to the prince territory which was his. In the south, the Greeks remained in possession of large areas of Albania until the end of March, 1914. Most, if not all, of these districts were then officially evacuated. But, instead of the Greek regular army, there came the Epirote insurgents and the Epirote independent government, who, secretly supported from Athens, maintained a reign of terror in an area actually allotted to Albania. Thus throughout the stay of the 'Mpret,' as the Albanians called their ruler, the European concert, if concert it can be called, ignored the necessity for taking the measures essential for the protection of the country and looked on passively whilst the Greeks infringed the frontiers already delimited in the south and whilst the insurgents threatened and practically besieged Durazzo in a manner which finally confined the powers of the prince almost to the very precincts of his palace. Thus enormous difficulties must have beset any ruler of Albania. His Royal Highness, whose shortcomings were apparent from the first, made little endeavor to overcome them. To say nothing of his attitude towards the southern frontier question, concerning which he should have made some stipulation with the Great Powers before he ever entered upon his new task, the prince made at least two fundamental mistakes. By arriving at Durazzo, instead of entering his new country by way of Skutari, which was still in the hands of the international forces which occupied it in the first Balkan

War, and which was therefore more or less neutral country, the new ruler seemed to show his partiality towards Essad Pasha and thus offended all the enemies of a man, who, if then powerful in the center of the country, was certainly not beloved beyond the confines of his own particular district. [Essad Pasha soon led a rebellion against him and had himself proclaimed president.] Subsequently, instead of trying to take the people into his confidence before it was too late, and of endeavoring to travel among them, the prince appeared to think that he could maintain his authority by encouraging one section of the community to support him against the other and that he could succeed in Albania without any display of courage. Thus on May 24, a few days after the banishment of Essad Pasha, at a time when Durazzo was threatened by the insurgents, the prince and his family took refuge on an Italian warship—an act which was enough to seal his fate in a country where cowardice is not one of the faults of the people. [Before Albania had time even to organize gendarmerie, the Greeks attacked and occupied a large part of south Albania, and the commission looked on and did nothing.] As time wore on things went from bad to worse until the outbreak of the war, immediately before which the international contingent vacated Skutari and immediately after which [Sept. 3] the prince and the International Commission of Control left Durazzo."—H. C. Woods, *Albania and the Albanians* (*Geographical Review*, April, 1918, pp. 257-273).—During the early months of the war Essad Pasha made an effort to have his title of president confirmed by the Powers. As soon as Italy entered the war he went to Rome to persuade General Porro to attack Austria-Hungary by way of the Balkans, but he was unsuccessful in both undertakings.—See also WORLD WAR: 1914: III. Balkans: e.

1915.—Agreement of Allies and Italy over Albania, by Treaty of London. See LONDON, TREATY OR PACT OF.

1915-1917.—Effect of Serbian debacle.—Italian advance.—Independence proclaimed, July 3, 1917.—"The Montenegrins, though ostensibly engaged in opposing Austria, poured their troops into defenseless Scutari and remained there. No protest was made by the Powers for this unprovoked violation of the decision made by them in 1913 when they unanimously declared Scutari to be Albanian territory. The Serbs also entered Albania for a short time, but withdrew again. Then came the debacle of the Serbs and their flight across the Albanian mountains into Scutari. This was fatal for Albania. The Austrian and Bulgarian forces poured into Albania in pursuit of them. All members of the Entente departed, and Albania was left to her fate. The Bulgars withdrew, but three-quarters of Albanian territory have been militarily occupied by Austria until the last few weeks. Meanwhile, Italy had advanced in the south and occupied Tepelen and Argyrokastro. The Greek troops of King Constantine had poured into South Albania and were using Koritza as a center through which Austrian and German couriers could pass to or from Athens. They exported the foodstuffs, and the Albanian population was reduced to great straits. The French reached Koritza in December, 1916, evicting Greek troops; and at the request of the inhabitants of the whole district hoisted the Albanian flag at Koritza and proclaimed it an Albanian Republic. The Italians extended their occupation, and on July 3, 1917, General Ferrero at Argyrokastro proclaimed the independence of the whole of Albania under the

protection of Italy. We must now consider the question of Italy with regard to Albania. [See also ITALY: 1912-1914.] Albania's independence was proclaimed in 1912. But before she had time to organize or establish herself she was at once caught up by the whirlwind of opposing interests—those of Italy and Austria. [See WORLD WAR: Diplomatic background: 71, iv.] Not only did the two currents paralyze Albania, but they encouraged the neighbor states to make existence impossible to her. Today [1919] the situation is altogether changed. Austria has broken up completely, and on the frontier Albania will see arising in her place a large Slav State which is frankly hostile to her. To guard against possible danger, Albania must seek a support, and this time she will have no difficulty of choice. But if Albania needs the support of Italy, Italy, too, needs the support of Albania. For to Italy this state is of vital importance."—M. B. Konitz, *Albanian question (International Conciliation, May, 1919)*.—"I am often asked if Albania can ever become a self-supporting state. History, I am convinced, will reply to that question in the affirmative. Few countries have been subjected to so many changes and to so many dominations. But just as from ancient times she has been condemned to alien rule, so from ancient times she has fought for her independence. She has never been subjected. Even though a great part of the population adhered to the Moslem faith, and though the land remained under the nominal sovereignty of the Ottomans for centuries, she never submitted to Turkish rule, and her people rejected all attempts to 'Ottomanize' them. Even the Turks admitted this fact. When, in 1913, the Great Powers proposed that the Porte should maintain its sovereignty over Albania, Mahmud Shevket Pasha, the Grand Vizier, categorically declined the proposition, recalling to the London Conference that five hundred years of such sovereignty had merely involved his country in frequent, expensive, and disastrous campaigns. Albania has passed through a variety of crises without the character of her people having been subjected to the slightest alteration—a fact due to her social organization and the oral transmission of her laws and customs from generation to generation from the early days of history. The code which governs the conduct of the people and the administration of justice is that of the 'Law of Lek Dukaghin,' in whom some of us recognize the personality of the Duke Jean D'Anjou. Despite all the political changes that have taken place, the language has remained as it was in early days, and its persistence is all the more remarkable in that this is exclusively the result of the will of the people, for neither alphabet nor grammar have existed to perpetuate any particular system. There is not only every reason to believe that Albania can be formed into a self-supporting State, but it is obvious, even from the facts I have cited above, that any decision to throw the country back under foreign domination will conflict with the aspirations of the people, possibly with unhappy results for the peace of the Balkan Peninsula."—Essad Pasha, *My policy for Albania (Balkan Review, London, June, 1919, pp. 329-331)*.—See also WORLD WAR: 1916: IV. Austro-Italian front: d; V. Balkan theater: a.

1918.—Campaign of Italians and French. See WORLD WAR: 1918: V. Balkan theater: a.

1919.—Italy's strategic claims.—Albanian problem at the Peace Conference.—"The position

of Albania at the Peace Conference has been seriously compromised by the attempt of certain Albanians, who do not represent the people and whose only claim to notoriety would seem to consist in their former relations with the States with whom Britain, France, and America are now at war, to put themselves forward as the spokesmen of our people."—Essad Pasha, *My policy for Albania (Balkan Review, London, June, 1919, p. 331)*.—"Much of the business which occupied the attention of the (Peace) Council was formal in character. The smaller states, excluded from its deliberations, demanded at least the opportunity to present to it their claims, and many hearings were granted to their representatives. . . . Every one recognized the extravagance and unreality of many of the nationalist demands. . . . [By the Italian representatives] control over all Albania, instead of the portion tentatively assigned to Italy by the Treaty of London, was asked. The Italian representatives felt that Italy was entitled to increased compensation partly because the war had lasted longer than anticipated, and partly because the collapse of Russia had thrown a heavier burden upon Italy than was foreseen when the Treaty of London was negotiated. . . . It could not be forgotten that one of the potent causes of unrest in the Balkans had long been the mistaken policy of blocking Serbia's efforts to obtain 'free and secure access to the sea.' The possible political consequence of sanctioning Italy's desire to obtain a solid foothold in the Balkans through control of Albania and the annexation of Slavonic territories, against the bitter protests of both peoples concerned, appeared most grave. The people who were rejoicing over the elimination of Austrian interference in Balkan affairs were evidently equally hostile to anything which might savor of Italian interference. Under these conditions it was believed that to grant Italy's claims to the eastern islands and main-land must be to sow the seeds of a new Balkan conflict. When examined from the standpoint of strategic geography the three main areas along the eastern Adriatic coast claimed by Italy were seen to possess tremendous military value. It was the manifest duty of the American specialists, without in the least degree questioning the motives actuating the Italian claims, to study the inevitable consequences which must necessarily follow upon granting them. [See BALKAN STATES: 1021: Albania.] It seemed obvious that the Fiume region and adjacent territory at the head of the Adriatic, by dominating the great northwestern gateway into the Balkans . . . and Albania with Valona, by commanding the most important southern routes into the Balkans and blocking access to and egress from the Adriatic Sea, did in effect constitute three extremely strong and admirably strong military bridge-heads, assuring to Italy the possibility of moving across the Adriatic and advancing them into the Balkans, should occasion require. . . . Every direct access to the sea possessed by the Jugo-Slav lands would be blocked, and the power of resistance to an Italian advance enormously curtailed."—E. M. House and C. Seymour, *What really happened at Paris, pp. 127-130*.

"In Albania Italy had always maintained a lively interest, more particularly because of the magnificent harbour of Valona, situated on the eastern shore of the Strait of Otranto, and less than fifty miles from the Italian coast. The first object of her policy was to prevent the port from falling directly or indirectly into the hands of Austria, while the latter was equally concerned to prevent Italy from acquiring a position which would en-

able her to bottle up the Adriatic. The two allies intrigued actively against each other with the Albanian tribes, planting rival schools in the country and seeking to extend their influence over the clan chiefs. The result was a stalemate which was recognized in the mutual self-denying ordinance of 1906, by which the two Powers agreed to abstain from any attempt to obtain political dominion over the coveted territory. For the rest this agreement was never whole-hearted, and merely registered the fact that the two States, unable to bring their plans to fruition at the moment, were willing to hang the matter up till a more propitious moment for one or the other. Under pretext that the Turks had failed to fulfill the provisions of the Treaty of Lausanne, Italy had maintained her occupation of the Twelve Islands (the Dodecanese), but it was during the negotiations in London in the winter of 1912 that Italy first showed her hand openly in the matter of the Western Balkans. . . . [The Italian press] loudly proclaimed the necessity for a big Albania which should include Prizren and Pec in the north, as well as Debar (Dibra) and other territories in the centre, and Northern Epirus in the south; the two allies, in short, while jealous of each other, had no mind to tolerate the presence of a third competitor in the Adriatic."—A. H. E. Taylor, *Italy and the Balkans*, pp. 344-345.—See also ITALY: 1914: Military coup in Albania.—"The Albanians number 1,000,000 people. Like the states about them, they have slowly gained political self-consciousness. Their homeland is a broken country, and a large part of the population leads a pastoral life. Its coastal towns and lowland cities are intimately tied up with the commercial systems of its neighbors, and its mountain population retains the primitive organization of the clan. Under these circumstances it is obvious that the Albanians should not have had a strong national programme or the means to advance it. . . . Had the terms of the secret Treaty of London of 1915 been carried out, Albania would have been divided. The central portion would have been an autonomous Mohammedan state under Italian protection; the northern part would have been under the protection of Jugo-Slavia, and the southern part was to have been divided between Greece and Italy. Koritsa would have become a Greek city, Valona an Italian stronghold and point of penetration; Scutari and the Drin valley would have become an outlet for Jugo-Slavia's trade—and all of these points would have become places for military and political conflict, for the Albanians; though having no unity of sentiment regarding a national programme, are united in the belief that they can manage their affairs better than the people about them. The Italians have been driven from Valona by the efforts of the Albanians themselves, and Albanian independence has been recognized by the Council of the League of Nations."—E. M. House and C. Seymour, *What really happened at Paris*, pp. 174-175.

1920.—Admitted to the League of Nations. See LEAGUE OF NATIONS: First meeting of the assembly.

1920 (June).—Murder of Essad Pasha.—On June 13, 1920, Essad Pasha was shot dead in the city of Paris by an Albanian student named Aveni Rustem.

ALBANIA, Latin form for Caledonia. See SCOTLAND: The name.

ALBANO, Elias Fernandez (d. 1910), vice-president of Chile. See CHILE: 1910.

ALBANY, N. Y.—The capital, since 1797, of New York state, claims to be the oldest permanently settled town of the original thirteen colonies. As far back as 1540 a French trading post stood near its present site, though its continuous history begins with its first settlement by some Dutch families about 1623. In 1614, the year after the first Dutch traders had established their operations on Manhattan island, they built a trading house, which they called Fort Nassau, on Castle island, in the Hudson river, a little below where the city now stands. Three years later this small fort was washed away by a flood and the island abandoned. In 1623 Fort Orange, a more important fortification was erected on the site afterwards covered by the business part of Albany, when the settlement took place. "As soon as the colonists had built themselves 'some huts of bark' around the fort, the Mahikanders or River Indians [Mohegans], the Mohawks, the Oneidas, the Onondagas, the Cayugas, and the Senecas, with the Mahawawa or Ottawa Indians, 'came and made covenants of friendship . . . and desired that they might come and have a constant free trade with them, which was concluded upon.'"—J. R. Brodhead, *History of the state of New York*, v. 1, pp. 55, 151.

1630.—Embraced in the land purchase of the Patroon Kiliaen Van Rensselaer. (See NEW YORK: 1621-1646.) The original name was the *Fuyck*, or "hoop-net;" afterwards it was known as Beverwyck.

1664.—Occupied and named *Albany* by the English, in honor of the duke of York and Albany (James II). See NEW YORK: 1664.

1673.—Again occupied for a short time by the Dutch. See NEW YORK: 1673.

1686.—City charter received from Governor Dongan.

1777.—Encounters during revolution. See U. S. A., 1777 (July-October).

1866.—International Convention of Y. M. C. A.—International committee. See YOUNG MEN'S CHRISTIAN ASSOCIATION: 1865-1870.

ALBANY CONGRESS. See ALBANY PLAN OF UNION.

ALBANY PLAN OF UNION 1754.—For the purpose of securing a better treaty with the Six Nations, commissioners from the colonies of New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania and Maryland met at Albany in the Iroquois country. The meeting was suggested by the Lords of Trade. Councils were held with the Iroquois chieftains and Indian affairs were discussed.

The convention drew up a general plan of union which seems to have been mainly the work of Franklin. This plan proposed an act of Parliament creating "one general government" in America.

The sovereign of England was to appoint and pay a president-general. The assemblies of the colonies were to choose delegations to a colonial grand council, the number being in proportion to taxes paid, provided that no colony could have less than two nor more than seven. All acts of the council needed the assent of the governor-general. Together they could control Indian affairs, regulate Indian trade, raise troops and levy taxes. Laws were to be submitted to the king and council and if not disapproved within three years were to remain in force. Neither the colonies nor the English government adopted the plan.—See also U. S. A.: 1754.

ALBANY REGENCY.—A group of clever politicians of New York state who manipulated the Democratic party machinery of that state from about 1820 to the middle of the nineteenth century. Martin Van Buren, Silas Wright, William L. Marcy and John A. Dix were among its leaders. They maintained a strict party discipline by a strict system of rewards to the faithful, usually in the form of patronage, and by making offenders of the ring conscious of their displeasure. It derived its name from its position at the state capital. The steadfast support of one another as politicians, and friends, caused General Jackson to say, "I am no politician, but if I were one, I would be a New York politician."—See also NEW YORK: 1823.

ALBEMARLE, Confederate ram. See U. S. A.: 1864 (April-May; North Carolina); 1864 (October; North Carolina).

ALBEMARLE, Earls and dukes of.—The name Albemarle, now the title held by the English family of Keppel, is derived from the French *Aumale* (Latin, *Alba Marla*). Albemarle was "a town and territory in the dukedom of Normandy" granted by William III to Arnold Joost van Keppel in 1690-1697. He was the first earl of Albemarle and was born in 1670; he served with the English and Dutch troops, was a major-general in 1697, and governor of Bois-le-Duc. He commanded at the siege of Aire in 1710, led Marlborough's second line in 1711, and was general of the Dutch forces in 1712. He died on May 30, 1718, leaving a son William Anne, who succeeded him as the second earl of Albemarle. Of the later earls, George Thomas Keppel (1790-1801), the sixth earl, is worthy of mention. He entered the army in 1815 and rose to the rank of general. He travelled extensively and published several accounts of his journeys. From 1832-1835 he was a member of Parliament for East Norfolk. In 1660 Charles II bestowed the title of Duke of Albemarle on the famous General George Monk; this dukedom became extinct in 1688 on the death of Christopher, the Second duke. The earldom of Albemarle survives.

ALBEMARLE, N. C.—1667-1669.—Settlement under Stephens. See NORTH CAROLINA: 1663-1670.

ALBERCA COURT. See ALHAMBRA.

ALBERIC I (d. 925), a Lombard adventurer, who, joining forces with Berengar, became margrave of Camerino and later duke of Spoleto. Through marriage with Marozia he became the

most powerful noble in Rome. In 916 he assisted Pope John X in expelling the Saracens from Italy.

Alberic II (d. 954), son of Alberic I and Marozia. Rebelling against the authority of his mother, in 933 he overthrew her alien husband (second), Hugh, temporal ruler of Rome, and imprisoned Pope John XI, her son; for this, he was made "prince and senator of all the Romans;" ruled Rome wisely and moderately until his death.—See also ROME: 903-964.

ALBERONI, Giulio, Cardinal (1664-1752), Spanish-Italian statesman. Consular agent for Parma to the court of Philip V of Spain. Prime minister of Spain in 1715 and cardinal in 1717; banished from Spain in 1719. In 1724 he was proposed for the papal chair, receiving ten votes. Founded the Collegio Alberoni, a school for training poor boys for the priesthood. For details of his Spanish Ministry see SPAIN: 1713-1725; ITALY: 1715-1735.

ALBERT I (1875-), king of the Belgians. Succeeded his uncle, Leopold II, in 1909; upheld the neutrality of Belgium in August, 1914, so delaying the Germans' advance as to defeat their plan for the quick capture of Paris; remained at the head of his little army to see final triumph and a restored Belgium.—See also BELGIUM: 1909 (December); BELGIUM: 1914; World War; WORLD WAR: 1918: II. Western front: b; XI. End of the war: d; and d, 1; 1919: Visit of royal family to United States.

Albert I, German king, 1298-1308. As duke of Austria contended for the German throne with Adolph of Nassau, who was defeated and slain by Albert's army in 1298; at first antagonized and later cultivated Philip IV of France; recognized by Pope Boniface in 1303; tried unsuccessfully to extend his sway over Holland and Thuringia.—See also AUSTRIA: 1291-1349; GERMANY: 1273-1308.

Albert II (1307-1439), German king, 1438-1439. As duke of Austria (with the title of Albert V) was successively chosen king of Hungary, king of Bohemia and German king; fought the disaffected Bohemians, also the Turks; showed ability in his short reign.—See also AUSTRIA: 1438-1493. HUNGARY: 1301-1342.

Albert, Hungarian king. See ALBERT II, German king (1397-1439).

Albert II, king of Sweden, 1363-1380. Son of Albert I of Mecklenburg; held his throne with some difficulty and in 1380 was defeated and imprisoned by Queen Margaret of Denmark and Norway, widow of King Haakon; released in 1395 he renounced the throne and returned to rule over Mecklenburg until his death in 1412.

Albert (1819-1801), prince consort of England. A member of the house of Saxe-Coburg-Gotha and first cousin of Queen Victoria of England, whom he married in 1840; by tact and ability in affairs overcame early prejudice against him; he was cut off in the prime of life by a sudden illness, to the overwhelming grief of the queen and the mourning of the nation, which has since remembered him as Albert the Good.—See also ENGLAND: 1840: Queen's marriage.

Albert, (1848-), prince of Monaco. Conductor of oceanographic research around Spitsbergen. See SPITSBERGEN: 1906-1921.

Albert (1550-1621), archduke of Austria. He was sixth son of the emperor Maximilian II, and was brought up at the Spanish court; was made cardinal in 1577, archbishop of Toledo in 1584 and viceroy of Portugal in 1594; governor-general of the Netherlands; renounced his religious vows

in 1598 and married the Infanta Isabella; engaged in constant warfare in the unsuccessful attempt to subdue the rebellious Low Countries.—See also NETHERLANDS: 1588-1593 and 1594-1600.

Albert I, duke of Austria. See **ALBERT I**, German king, 1298-1308.

Albert V, duke of Austria. See **ALBERT II**, German king, 1397-1430.

Albert (1490-1568), first duke of Prussia and grand master of the Teutonic Order. Third son of Frederick of Hohenzollern; as grand master engaged in struggles and negotiations over East Prussia; followed the advice of Martin Luther to marry and make Prussia an hereditary duchy; invested with the duchy in 1525 by Sigismund I, king of Poland; founded the university of Königsberg.—See also **POLAND**: 1333-1572.

Albert, duke of Württemberg, commander of the fourth Germany army, directed against south-eastern Belgium at the opening of the World War. His army was the German center at the battle of the Marne. In October-November (1914) he opened the first drive to the Channel ports by an attack on Ypres and Dixmude (battle of the Yser), and in 1916 commanded the northern army group opposed to the Anglo-Belgian armies.

Albert III, elector of Brandenburg, 1470-1486. Third son of Frederick I of Hohenzollern; early began a stormy career as a German prince, ruling over Ansbach, but failing in several attempts at wider power; inherited Bayreuth from his brother John in 1464; six years later became elector of Brandenburg on the abdication of his other brother, Frederick II; acquired Pomerania and put down a revolt; one of the most energetic and ambitious rulers of the fifteenth century.—See also **BRANDENBURG**: 1417-1640.

Albert, the Bear (1100-1170), margrave of Brandenburg. See **BRANDENBURG**: 1142-1152.

Control of Lauenburg. See **SAXONY**: 1180-1553.

Albert, The Great. See **ALBERTUS MAGNUS**.

ALBERT, Marcellin, leader of the wine-growers revolt in France. See **FRANCE**: 1907 (May-July).

ALBERT, a town of France in the department of the Somme, eighteen miles northeast of Amiens, situated on a small stream, the Ancre. During the battle of the Somme it was the "jumping-off place" of the British attacks in the direction of Bapaume. Was captured by the Germans in March of 1918 and recovered by the British in August of that same year.—See **WORLD WAR**: 1918: II Western front: a, 1; c, 26; i, k, 1.

ALBERT EDWARD, Prince of Wales. See **EDWARD VII**.

ALBERTA, since 1905 a province of the Dominion of Canada, east of British Columbia and north of western Montana. In 1867, when the British North American Act was passed, Alberta was a part of the Northwest Territories. The province is governed by a uni-cameral legislature, the legislative assembly and a cabinet known as the executive council. The nominal head of the executive department is a lieutenant-governor, appointed by the Canadian government. Woman suffrage exists. Area 406,525 square miles. Edmonton is the capital and Calgary the chief city.—See also **CANADA**: 1905, also 1914-1918: War-time prohibition; and Map of Dominion of Canada and

Newfoundland; **NORTHWEST TERRITORY**; **TELEGRAPHS AND TELEPHONES**: 1916; **U. S. A.**: Economic map.

ALBERTINE LINE OF HOUSE OF SAXONY. See **SAXONY**: 1180-1553.

ALBERTUS MAGNUS (1193- or 1206-1280), Count of Bollstädt, German scholastic philosopher. Distinguished for his wide learning and his interest in the spread of knowledge, particularly the doctrines of Aristotle. Lectured at Paris, where he had as pupil Thomas Aquinas. Endeavored to reconcile philosophy and theology, using Aristotelian principles. Preached the eighth Crusade in Austria. Member of the Dominican order, and one of its ardent defenders. He was the most learned man of his time, and his writings dealt with philosophy and the Aristotelian sciences.—See also **UNIVERSITIES AND COLLEGES**: 1348-1826.

ALBI, capital of the department of Tarn, France; gives its name to the Albigenes (q. v.). Site of the cathedral of St. Cécile, a fortress-church in unornamented Gothic style with slit-like windows. From the twelfth century, authority was usurped by the bishops of Albi until, after the Albigensian War, the land passed to the crown of France.—See also **ALBIGENSES**.

ALBICI.—A Gallic tribe which occupied the hills above Massilia (Marseilles) and who are described as a savage people even in the time of Cæsar, when they helped the Massiliots to defend their city against him.—G. Long, *Decline of the Roman republic*, v. 5, ch. 4.

ALBIGENSES.—"The Albigensians, so called from the town of Albi in Languedoc, were a branch of a widely spread group of persons who could not be satisfied with the Christian theory of the universe and its government. While they differed very widely in details, all members of the group agreed in their fundamental notion that the only reasonable explanation of the existence of evil in the world was to give up, once for all, the idea of a single administration of the universe. If there were only one God and that an all-powerful one, why had he not done his work better? Why had he, the all-good, allowed so much evil to get into the world? Why had he, the all-wise, apparently made so many mistakes in his management of things? The ready answer to all this was, that there was not one God but two, one good, wise, perfect, absolute; the other evil, capable of errors, imperfect, limited. Such reasoning has satisfied vast masses of men. For instance, it forms the basis of the great Persian religion, which has been for centuries the religious inspiration of a race allied to our own by community of descent. When, however, men came to apply it to Christianity, and especially to Christianity as the outcome of Judaism, they found themselves involved in many difficulties. One of the first consequences of the dualistic theory was that the God of the Jews, as described in their writings, could never have been the good God, but must have been the lesser power, used by the greater as a convenient, though unconscious, agent in the creation of the world. The dualists therefore rejected the Old Testament as authority. Another consequence was the drawing of a sharp line between the spiritual and the material. Whatever was material belonged in the domain of the lower deity and was essentially base in its character. Man, therefore, in so far as he was a material being, was evil and his body was in a condition of hopeless conflict with his soul. The only way for the race of man to be redeemed was through a gradual process of spiritualization. . . . Then again the idea that the great God could have

come down to earth and actually have become a man was beyond all conception to the dualist. The thing we call Christ was only an emanation from the deity and was not at all a man, excepting in the mere form. His life on earth was only a vision, intended to impress men with the truth of his teaching, but not essentially the life of a man. Hence followed naturally the rejection of the doctrine of the Eucharist."—E. Emerton, *Mediaeval Europe*, pp. 335-336.—"Nothing is more curious in in Christian history than the vitality of the Manichean opinions. That wild, half poetic, half rationalistic theory of Christianity. . . . appears almost suddenly in the 12th century, in living, almost irresistible power, first in its intermediate settlement in Bulgaria, and on the borders of the Greek Empire, then in Italy, in France, in Germany, in the remoter West, at the foot of the Pyrenees. . . . The chief seat of these opinions was the south of France. Innocent III., on his accession, found not only these daring insurgents scattered in the cities of Italy, even, as it were, at his own gates (among his first acts was to subdue the Paterines of Viterbo), he found a whole province, a realm, in some respects the richest and noblest of his spiritual domain, absolutely severed from his Empire, in almost universal revolt from Latin Christianity."—H. H. Milman, *Latin Christianity*, bk. 9, ch. 8.—"Of the sectaries who shared the errors of Gnosticism and Manichæism and opposed the Catholic Church and her hierarchy, the Albigenses were the most thorough and radical. Their errors were, indeed, partly Gnostic and partly Manichæan, but the latter was the more prominent and fully developed. . . . They are called Cathari and Patarini in the acts of the Council of Tours (1163), and in those of the third Lateran, Publiciani (i. e., Paulicians). Like the Cathari, they also held that the evil spirit created all visible things."—J. Alzog, *Manual of universal church history*, period 2, epoch 2, pt. 1, ch. 3, sect. 236.

"It is not without significance that these ideas found their readiest acceptance in a population that was, probably, as keenly intelligent as any in Europe. The citizens of the great industrial towns of southern France caught at the teachings of the dualistic missionaries. . . . They did not proceed to any violence, but simply withdrew themselves from the association of the dominant religion. Their secular rulers, especially the count Raymond VI of Toulouse, finding nothing offensive to the public welfare in their doctrines, let them alone or even directly protected them from attack. Under these conditions they increased so rapidly that practically whole communities became converted, and the machinery of the church found itself for the moment incapable of dealing with so obstinate a resistance. . . . In addition to this all-sufficient religious motive for persecution there were not wanting others of a more practical sort. There was, first, the antagonism of North and South, an opposition which, in spite of all efforts on the part of the French government, was still far from being overcome. The chief feudal prince in the South was Raymond of Toulouse, one of the leading feudatories of the crown. If he could be brought down by a combination of the crown with the papacy, the game was worth the candle. If his lands could be brought into the hands of more pliant subjects, it would be so much gain in the great effort of Philip Augustus to make himself king indeed of all France. The tempting bait of the rich lands of Languedoc was enough to secure abundant fighting material and the dangers of this domestic crusade

were as nothing compared with those of an expedition to the East. The crusading ardor was at this moment decidedly on the wane. The result of the fourth Crusade had been far from encouraging to the purely religious interests concerned. It had ended in the capture of the friendly and Christian Constantinople by the crusading army under the lead of the clever traders of Venice and in much negotiation, with mutual goodwill, between the heathen and the Christian leaders.

"The outlook in southern France seemed to offer to the ambition of Innocent III the compensation he needed. There is probably no doubt whatever as to the personal integrity of his purposes. . . . Certainly it cannot be said that Innocent resorted to the sword until he had exhausted all the resources of peaceful endeavor. Almost immediately upon his accession he had sent two legates into the infected districts and had called upon the local clergy to assist them in converting or in punishing the heretics. The response was not encouraging. It became evident that the . . . principle of toleration had made great progress in the land. The local clergy knew too intimately the quality of the persons they were called upon to discipline and it was clear that a foreign agent would be needed. This point is characteristic of the whole history of the persecution. Nowhere in Europe, probably, was there a population more loyal to itself. A series of foreign, i. e., French monastic clergymen, Arnold of Citeaux and Peter of Castelnau the most prominent, headed the work of peaceful exhortation. The inhabitants made no resistance, were in fact more than willing to set their own champions against the strongest debaters of the Roman church; but this process did not succeed. The more the method of argument was tried, the more the heresy grew. . . . For nearly ten years the campaign of ideas went on; then a crisis came at the murder of Castelnau, possibly with the connivance of Count Raymond.

"From that time on there was no hesitation on the part of the pope. All previous efforts to rouse the crusading temper had failed. Philip Augustus, the overlord of the land, had his hands full in the north and the great barons of France were not yet ready to act. The murder of the papal legate seemed to break all restraints. Innocent renewed his summons to all the faithful in Europe. . . . The response this time was unexpectedly gratifying. Philip of France took no action himself, fearing possibly lest the appearance of wanting the southern lands for the crown might alienate the loyalty of his nearer neighbors; but he placed no obstacles in the way of his barons. Recruits of every description poured in from all over Europe, individuals and groups drawn together by the curious combination of motives usual in all the crusading armies."—E. Emerton, *Mediaeval Europe*, pp. 337-340.—See also CATHARI; PAULICIANS.

1209.—First Crusade.—Pope "Innocent III., in organizing the persecution of the Catharists [or Catharists], the Patarins, and the Pauvres de Lyons, exercised a spirit, and displayed a genius similar to those which had already elevated him to almost universal dominion; which had enabled him to dictate at once to Italy and to Germany; to control the kings of France, of Spain, and of England; to overthrow the Greek Empire, and to substitute in its stead a Latin dynasty at Constantinople. In the zeal of the Cistercian Order, and of their Abbot, Arnaud Amalric; in the fiery and unwearied preaching of the first Inquisitor, the Spanish Missionary, Dominic; in the remorseless

activity of Foulquet, Bishop of Toulouse; and above all, in the strong and un pitying arm of Simon de Montfort, Earl of Leicester, Innocent found ready instruments for his purpose. Thus aided, he excommunicated Raymond of Toulouse [1207], as Chief of the Heretics, and he promised remission of sins, and all the privileges which had hitherto been exclusively conferred on adventurers in Palestine, to the champions who should enroll themselves as Crusaders in the far more easy enterprise of a Holy War against the Albigenses. In the first invasion of his territories [1209], Raymond VI. gave way before the terrors excited by the 300,000 fanatics who precipitated themselves on Languedoc; and loudly declaring his personal freedom from heresy, he surrendered his chief castles, underwent a humiliating penance, and took the cross against his own subjects. The brave resistance of his nephew Raymond Roger, Viscount of Beziers, deserved but did not obtain success. When the crusaders surrounded his capital, which was occupied by a mixed population of the two Religions, a question was raised how, in the approaching sack, the Catholics should be distinguished from the Heretics. 'Kill them all,' was the ferocious reply of Amalric; 'the Lord will easily know His own.' In compliance with this advice, not one human being within the walls was permitted to survive; and the tale of slaughter has been variously estimated, by those who have perhaps exaggerated the numbers, at 60,000, but even in the extenuating despatch, which the Abbot himself addressed to the Pope, at not fewer than 15,000. Raymond Roger was not included in this fearful massacre, and he repulsed two attacks upon Carcassonne, before a treacherous breach of faith placed him at the disposal of de Montfort, by whom he was poisoned after a short imprisonment. The removal of that young and gallant Prince was indeed most important to the ulterior project of his captor, who aimed at permanent establishment in the South. The family of de Montfort had ranked among the nobles of France for more than two centuries; and it is traced by some writers through an illegitimate channel even to the throne: but the possessions of Simon himself were scanty; necessity had compelled him to sell the County of Evreux to Philippe Auguste; and the English Earldom of Leicester which he inherited maternally, and the Lordship of a Castle about ten leagues distant from Paris, formed the whole of his revenues."—E. Smedley, *History of France*, ch. 4.—See also CHRISTIANITY: 11th-16th centuries.

ALSO IN J. C. L. de Sismondi, *History of the crusades against the Albigenses*, ch. 1.—H. H. Milman, *History of Latin Christianity*, bk. 9, ch. 8.—J. Alzog, *Manual of universal church history*, period 2, epoch 2, pt. 1, ch. 3.

1210-1213.—Second Crusade.—"The conquest of the Viscounty of Beziers had rather inflamed than satiated the cupidity of De Montfort and the fanaticism of Amalric [legate of the Pope] and of the monks of Citeaux. Raymond, Count of Toulouse, still possessed the fairest part of Languedoc, and was still suspected or accused of affording shelter, if not countenance, to his heretical subjects. . . . The unhappy Raymond was . . . again excommunicated from the Christian Church, and his dominions offered as a reward to the champions who should execute her sentence against him. To earn that reward De Montfort, at the head of a new host of Crusaders, attracted by the promise of earthly spoils and of heavenly blessedness, once more marched through the devoted land [1210], and with him advanced Amalric. At each successive conquest, slaughter, rapine, and woes such as

may not be described tracked and polluted their steps. Heretics, or those suspected of heresy, wherever they were found, were compelled by the legate to ascend vast piles of burning fagots. . . . At length the Crusaders reached and laid siege to the city of Toulouse. . . . Throwing himself into the place, Raymond . . . succeeded in repulsing De Montfort and Amalric. It was, however, but a temporary respite, and the prelude to a fearful destruction. From beyond the Pyrenees, at the head of 1,000 knights, Pedro of Arragon had marched to the rescue of Raymond, his kinsman, and of the counts of Foix and of Comminges, and of the Viscount of Béarn, his vassals; and their united forces came into communication with each other at Muret, a little town which is about three leagues distant from Toulouse. There, also, on the 12th of September [1213], at the head of the champions of the Cross, and attended by seven bishops, appeared Simon de Montfort in full military array. The battle which followed was fierce, short and decisive. . . . Don Pedro was numbered with the slain. His army, deprived of his command, broke and dispersed, and the whole of the infantry of Raymond and his allies were either put to the sword, or swept away by the current of the Garonne. Toulouse immediately surrendered, and the whole of the dominions of Raymond submitted to the conquerors. At a council subsequently held at Montpellier, composed of five archbishops and twenty-eight bishops, De Montfort was unanimously acknowledged as prince of the fief and city of Toulouse, and of the other counties conquered by the Crusaders under his command."—Sir J. Stephen, *Lectures on the history of France*, lect. 7.—See also ARAGON.

ALSO IN: J. C. L. de Sismondi, *History of crusades against the Albigenses*, ch. 2.

1217-1229.—Renewed Crusades.—Dissolution of the county of Toulouse.—Pacification of Languedoc.—"The cruel spirit of De Montfort would not allow him to rest quiet in his new Empire. Violence and persecution marked his rule; he sought to destroy the Provençal population by the sword or the stake, nor could he bring himself to tolerate the liberties of the citizens of Toulouse. In 1217 the Toulousans again revolted, and war once more broke out betwixt Count Raymond and Simon de Montfort. The latter formed the siege of the capital, and was engaged in repelling a sally, when a stone from one of the walls struck him and put an end to his existence. . . . Amaury de Montfort, son of Simon, offered to cede to the king all his rights in Languedoc, which he was unable to defend against the old house of Toulouse. Philip [Augustus] hesitated to accept the important cession, and left the rival houses to the continuance of a struggle carried feebly on by either side." King Philip died in 1223 and was succeeded by a son; Louis VIII, who had none of his father's reluctance to join in the grasping persecution of the unfortunate people of the south. Amaury de Montfort had been fairly driven out of old Simon de Montfort's conquests, and he now sold them to King Louis for the office of constable of France. "A new crusade was preached against the Albigenses; and Louis marched towards Languedoc at the head of a formidable army in the spring of the year 1226. The town of Avignon had proffered to the crusaders the facilities of crossing the Rhone under her walls, but refused entry within them to such a host. Louis having arrived at Avignon, insisted on passing through the town: the Avignonais shut their gates, and defied the monarch, who instantly formed the siege. One of the rich municipalities of the south was almost

a match for the king of France. He was kept three months under its walls; his army a prey to famine, to disease and to the assaults of a brave garrison. The crusaders lost 20,000 men. The people of Avignon at length submitted, but on no dishonourable terms. This was the only resistance that Louis experienced in Languedoc. . . . All submitted. Louis retired from his facile conquest; he himself, and the chiefs of his army stricken by an epidemic which had prevailed in the conquered regions. The monarch's feeble frame could not resist it; he expired at Montpensier, in Auvergne, in November, 1226." Louis VIII was succeeded by his young son, Louis IX (St. Louis), then a boy, under the regency of his energetic and capable mother, Blanche of Castile. "The termination of the war with the Albigenses, and the pacification, or it might be called the acquisition, of Languedoc, was the chief act of Queen Blanche's regency. Louis VIII had overrun the country without resistance in his last campaign; still, at his departure, Raymond VI. again appeared, collected soldiers and continued to struggle against the royal lieutenant. For upward of two years he maintained himself; the attention of Blanche being occupied by the league of the barons against her. The successes of Raymond VII., accompanied by cruelties, awakened the vindictive zeal of the pope. Languedoc was threatened with another crusade; Raymond was willing to treat, and make considerable cessions, in order to avoid such extremities. In April, 1220, a treaty was signed: in it the rights of De Montfort were passed over. About two-thirds of the domains of the count of Toulouse were ceded to the king of France; the remainder was to fall, after Raymond's death, to his daughter Jeanne, who by the same treaty was to marry one of the royal princes: heirs failing them, it was to revert to the crown [which it did in 1271]. On these terms, with the humiliating addition of a public penance, Raymond VII. once more was allowed peaceable possession of Toulouse, and of the part of his domains reserved to him. Alphonse, brother of Louis IX., married Jeanne of Toulouse soon after, and took the title of count of Pointiers; that province being ceded to him in apanage. Robert, an other brother, was made count of Artois at the same time. Louis himself married Margaret, the eldest daughter of Raymond Berenger, count of Provence."—E. E. Crowe, *History of France*, v. 1, ch. 2-3.

Results of the Crusades.—"The struggle ended in a vast increase of the power of the French crown, at the expense alike of the house of Toulouse and of the house of Aragon. The dominions of the count of Toulouse were divided. A number of fiefs, Beziers, Narbonne, Nimes, Albi, and some other districts were at once annexed to the crown. The capital itself and its county passed to the crown fifty years later. . . . The name of Toulouse, except as the name of the city itself, now passed away, and the new acquisitions of France came in the end to be known by the name of the tongue which was common to them with Aquitaine and Imperial Burgundy [Provence]. Under the name of Languedoc they became one of the greatest and most valuable provinces of the French kingdom."—E. A. Freeman, *Historical geography of Europe*, ch. 6.—"So far as the apparent purpose of the crusade, the purifying of the land from heretical thought was concerned, the papacy might well congratulate itself. It had distinctly established the principle that, if political allies could be found, divergence from its system might successfully be met with the sword. Its

most important result was the permanent establishment of the Holy Tribunal of the Inquisition. The proceedings against the heretics of Toulouse had shown how utterly useless it was to entrust the pursuit of heresy to the local episcopal authority. Not only was the episcopate very largely contaminated by wordliness in every form; it was bound up with local interests in too many ways to make it a safe instrument of persecution. The next recourse had been to papal legates, specially created for this purpose, but this had only been able to call forth a lukewarm assistance from the existing local authorities. The only effective method was to create a new tribunal which should be composed of men who had no other interests. Such men were provided by the new mendicant orders and within a few years after the death of Innocent, we find the formal recognition by the papacy of the Dominicans as the regular organ for the searching out of heresy and its trial. From about 1230 on, it is fair to speak of the Inquisition as permanently established. . . . The political result of the crusade was the definite breaking-up of the overgrown power of the counts of Toulouse. . . . In this way the French monarchy gained the south of France, and perhaps its success there would have been long postponed if the religious troubles had not offered it this entering wedge."—E. Emerton, *Mediaeval Europe*, pp. 341-342.—"The Church of the Albigenses had been drowned in blood. These supposed heretics had been swept away from the soil of France. The rest of the Languedocian people had been overwhelmed with calamity, slaughter, and devastation. The estimates transmitted to us of the numbers of the invaders and of the slain are such as almost surpass belief. We can neither verify nor correct them; but we certainly know that, during a long succession of years, Languedoc had been invaded by armies more numerous than had ever before been brought together in European warfare since the fall of the Roman empire. [We know that these hosts were composed of men inflamed by bigotry and unrestrained by discipline; that they had neither military pay nor magazines; that they provided for all their wants by the sword, living at the expense of the country, and seizing at their pleasure both the harvests of the peasants and the merchandise of the citizens.] More than three-fourths of the landed proprietors had been despoiled of their fiefs and castles. In hundreds of villages, every inhabitant had been massacred. . . . Since the sack of Rome by the Vandals, the European world had never mourned over a national disaster so wide in its extent or so fearful in its character."—J. Stephen, *Lectures on the history of France*, lect. 7.

Albigenses in Bosnia. See BOSNIA: 12th century.

ALBIGEOIS. See ALBIGENSES.

ALBINUS, Clodius (d. 107 A. D.), Roman commander. Governor of Gaul and Britain; in 104 was made Cæsar by Septimius Severus.

ALBION, ancient name for the island of Great Britain; generally confined to England. "The most ancient name known to have been given to this island [Britain] is that of Albion. . . . There is, however, another allusion to Britain which seems to carry us much further back, though it has usually been ill understood. It occurs in the story of the labours of Hercules, who, after securing the cows of Geryon, comes from Spain to Liguria, where he is attacked by two giants, whom he kills before making his way to Italy. Now, according to Pomponius Mela, the names of the giants were Albiona and Bergyon, which one may, without

much hesitation, restore to the forms of Albion and Iberion, representing, undoubtedly, Britain and Ireland, the position of which in the sea is most appropriately symbolized by the story making them sons of Neptune or the sea-god. . . . Even in the time of Pliny, Albion, as the name of the island, had fallen out of use with Latin authors; but not so with the Greeks, or with the Celts themselves, at any rate those of the Goidelic branch; for they are probably right who suppose that we have put the same word in the Irish and Scotch Gaelic Alba, genitive Alban, the kingdom of Alban or Scotland beyond the Forth. Albion would be a form of the name according to the Brythonic pronunciation of it. . . . It would thus appear that the name Albion is one that has retreated to a corner of the island, to the whole of which it once applied."—J. Rhys, *Celtic Britain*, ch. 6.—See also BRITANNIA; SCOTLAND: 8th-9th centuries.

ALSO IN: E. Guest, *Origines Celticae*, ch. 1.

ALBIS, the ancient name of the river Elbe.

ALBIZZI, Rinaldo de (d. 1452), Florentine statesman who opposed Medici. See FLORENCE: 1433-1464.

ALBOIN (d. c. 573), king of the Lombards, son of Audoin, whom he succeeded. He destroyed the kingdom of the Gepidae and married Rosamund, daughter of the slain king Cummund. In 568 he invaded and conquered a large portion of Italy. At the instigation of his queen he was assassinated by his chamberlain Peredeo, in revenge for having forced her to drink wine from a cup formed from her father's skull.—See also LOMBARDS: 568-573.

ALBORNOZ, Gil Alvarez de (c. 1310-1367), Spanish cardinal. Fought in the battles of Tarifa (1340) and Algeciras (1344), sent to Italy as papal legate and paved the way for the return of Urban V to Rome; founder of the college of St. Clement at Bologna and author of a work on the constitution of the Roman church.—See also PAPACY: 1352-1378.

ALBRET, Lordship of, in the Landes, France, gave its name to a powerful feudal family, whose members distinguished themselves in local wars; during the fourteenth century supported first the English cause and later the French. By the accession of Henry IV whose mother was Jeanne d'Albret the dukedom came under the crown; in 1651, was granted to the family of La Tour d'Auvergne. Jean d'Albret, belonging to a younger branch, was employed by Francis I in his intrigues to become emperor.—See also NAVARRE: 1528-1563.

ALBRIGHT, Jacob (1759-1808), founder of the Evangelical Association (q.v.).

ALBRIGHT ART GALLERY.—"Incorporated 1862. Occupies magnificent gallery of white marble in Delaware Park [Buffalo, N. Y.] built and endowed by John J. Albright in 1905. Collections comprise 286 modern oil paintings by American, English, Scottish, German, French, Dutch, Austrian, Italian, Spanish and Scandinavian artists; 796 engravings, including a historical collection of the masters of engraving and an almost complete collection of the works of Sir Seymour Haden; Arundel prints, cartoons, drawings, sculptures and casts and various art objects—a total of over 1,300 exhibits. Maintains an art school attended by some 300 students and publishes a quarterly art magazine, 'Academy Notes.' The commission for two caryatid-porticos in white marble, for the north and south wings of the art building, was given to Augustus St. Gaudens, and

the eight beautiful statues were his last work."—*Year's art*, 1920, p. 238.

ALBU, Celtic form for Caledonia. See SCOTLAND: The name.

ALBUERA, or Albuhera, La, a small village in Spain in the province of Badajoz, celebrated for the victory of the British, Portuguese and Spaniards over the French in the Peninsular War, May, 1811.

ALBUM (Latin, *albus*, white), a board chalked or painted white, on which decrees, edicts, and other public notices were inscribed in black, in ancient Rome. In medieval and modern times album denotes a book of blank pages in which verses, autographs, sketches and the like are collected. In law, the word is the English equivalent of "maillles blanches," for rent paid in silver ("white") money.

ALBUMAZAR (805-885), Arabian astrologer. Author of over fifty works which contained some serious errors, but several of which were nevertheless translated into Latin.

ALBUQUERQUE, Afonso d', surnamed "the Great" and "the Portuguese Mars" (1453-1515), was a celebrated Portuguese navigator and conqueror, being the founder of the Portuguese empire in the east; made his first expedition to India in 1503; conquered Goa, the whole of Malabar, Ceylon, the Sunda Islands, the peninsula of Malacca and the island of Ormuz.—See also COMMERCE: Era of geographic expansion: 15th-17th centuries; Leadership of the Portuguese.

ALBUQUERQUE, the largest city of New Mexico and the capital of Bernalillo county; situated on the Rio Grande, 60 miles southwest of Sante Fé. Due to its climate, which is especially adapted for the treatment of tuberculosis, it has become a famous health resort. It was founded in 1706, and named in honor of the duke of Albuquerque, viceroy from Spain 1702-1710. During the Civil War it was occupied by Confederate troops under General Henry Hopkins Sibley. The modern city really dates from the completion of the first railway to Albuquerque in 1880.

ALCALÁ DE HENARES, a town of Spain, in New Castile, the birthplace of Cervantes, 1547; its once famous university founded by Cardinal Jiménez in 1510 was removed to Madrid in 1836. The city is supposed to be on the site of the Roman *Complutum*, hence the name *Complutensian Polyglot* which was given to the famous edition of the Bible prepared here between 1514 and 1517.

ALCALA UNIVERSITY.—1510.—Founded by Ximenes.—Constitution. See UNIVERSITIES AND COLLEGES: 1240-1510.

ALCALDE, ALGUAZIL, CORREGIDOR.—"The word *alcalde* is from the Arabic 'al *cadi*, the judge or governor. . . . *Alcalde mayor* signifies a judge, learned in the law, who exercises [in Spain] ordinary jurisdiction, civil and criminal, in a town or district." In the Spanish colonies the *alcalde mayor* was the chief judge. "Irving (Columbus, ii. 331) writes erroneously *alguazil mayor*, evidently confounding the two offices. . . . An *alguacil mayor*, was a chief constable or high sheriff." "Corregidor, a magistrate having civil and criminal jurisdiction in the first instance ('*nisi prius*') and gubernatorial inspection in the political and economical government in all the towns of the district assigned to him."—H. H. Bancroft, *History of the Pacific states*, v. 1, pp. 207 and 250, footnotes.—See also AUDIENCIAS; HOLY BROTHERHOOD or HERMANDAD.

ALCÁNTARA, town of western Spain on the Tagus, seven miles from the Portuguese frontier. The town was famous as the stronghold of the

knightly order of Alcántara; and also for the bridge over the Tagus built by Trajan in A. D. 105 and still in a fine state of preservation. From Arabic, al Kantara, "the bridge." For the battle of Alcántara (1580). See PORTUGAL: 1579-1580.

ALCANTARA, Knights of. See ALCÁNTARA, ORDER OF.

ALCÁNTARA, Order of.—"Towards the close of Alfonso's reign [Alfonso VIII of Castile and Leon, who called himself 'the Emperor,' 1126-1157], may be assigned the origin of the military order of Alcántara. Two cavaliers of Salamanca, don Suero and don Gomez, left that city with the design of choosing and fortifying some strong natural frontier, whence they could not only arrest the continual incursions of the Moors, but make hostile irruptions themselves into the territories of the misbelievers. Proceeding along the banks of the Coales, they fell in with a hermit, Amando by name, who encouraged them in their patriotic design and recommended the neighbouring hermitage of St. Julian as an excellent site for a fortress. Having examined and approved the situation, they applied to the bishop of Salamanca for permission to occupy the place: that permission was readily granted: with his assistance, and that of the hermit Amando, the two cavaliers erected a castle around the hermitage. They were now joined by other nobles and by more adventurers, all eager to acquire fame and wealth in this life, glory in the next. Hence the foundation of an order which, under the name, first, of St. Julian, and subsequently of Alcántara, rendered good service alike to king and church."—S. A. Dunham, *History of Spain and Portugal*, bk. 3, sect. 2, ch. 1, div. 2.

ALCÁZAR, or "The Three Kings," Battle of (1578 or 1579). See MOROCCO: 647-1860; PORTUGAL: 1579-1580.

ALCEDO, United States patrol boat sunk by a German submarine during the World War. See WORLD WAR: 1917: IX. Naval operations: c, 4.

ALCESTER, Frederick Beauchamp Paget Seymour, Baron (1821-1895), British admiral. Commanded the naval brigade in New Zealand during the Maori War; commanded the squadron sent to Albania in 1880 to compel the Porte to cede Dulcigno to Montenegro; commander of the British fleet at the bombardment of Alexandria, 1882.

ALCHEMY.—"The term 'alchemy,' or, as it was spelt until the nineteenth century, alchymy, derived from the Arabic, is said to have come originally from a Greek word (chyma) signifying things melted and poured out. It is more probably derived from *Khem*, 'the land of Egypt,' which was so named from the dark colour of its soil, composed of crumbling syenite. Alchemy, according to this derivation, is the 'art of the black country,' the *Black Art*. In Egypt it was carried to a high degree of development, and consequently this theory of the origin of the name receives support from the philological character of the derivatives—*al*, the Arabic definite article, and *Khem*, dark—because the term first came into use when the Arabian Mohammedans dominated Egypt, learned the secrets of the temple laboratories, and spread throughout the civilized parts of Western Europe the knowledge they had thus acquired. The application of the term has frequently, but wrongfully, been restricted to the pretended arts of making gold and silver, and the more profitable arts of adulterating and of imitating gold. It had, however, a wider application, and ought to be regarded as including all the arts known in ancient times, which dealt with things now compre-

hended in the science of chemistry."—J. C. Brown, *History of chemistry*, p. 2.—See also CHEMISTRY.

Practiced by Arabs. See SCIENCE: Ancient: Arabian Science.

ALCHUINE. See ALCUIN.

ALCIBIADES (c. 450-404 B. C.), Athenian politician and general. Commander of the Athenians in the enterprise against Syracuse. To escape trial for mutilation of statues, fled to Sparta where he arranged an alliance with Persia and an Ionian revolt against Athens; later assisted the Athenians by defeating the Lacedæmonians and returned to his native city in triumph.—See also ATHENS: B. C. 413-411; GREECE: B. C. 421-418; 419-416; 413-412; 411-407; SYRACUSE: B. C. 415-413.

ALCLYDE.—Rhydderch, a Cumbrian prince of the sixth century who was the victor in a civil conflict, "fixed his headquarters on a rock in the Clyde, called in the Welsh Alclud [previously a Roman town known as Theodosia], whence it was known to the English for a time as Alclyde; but the Goidels called it Dunbretan, or the fortress of the Brythons, which has prevailed in the slightly modified form of Dumbarton. . . . Alclyde was more than once destroyed by the Northmen."—J. Rhys, *Celtic Britain*, ch. 4.—See also CUMBRIA.

ALCMAEONIDAE, a distinguished family in Athens. The family was banished about 506 B. C. for the slaying of Cylon by Archon Megacles; returned in 510 through the aid of Sparta. To this family belonged Clisthenes, Pericles and Alcibiades.—See also ATHENS: B. C. 612-505; GREECE: B. C. 8th-5th centuries.

ALCOCK, Captain Sir John William, member of the Royal Air Force, decorated in 1919 for first crossing the Atlantic in an airplane, from Newfoundland to Clifden, Ireland. [See AVIATION: Important flights since 1900: 1919 (June).] Alcock was created knight in 1919. He died Dec. 18 of the same year.

ALCOCK, Sir Rutherford (1809-1897), English diplomat. Consul to China, 1844-1846; consul-general in Japan, 1846-1865, where he stayed through the period of feudal anarchy. Served as minister plenipotentiary to Peking until 1871. Brought the art of Japan to the world's notice.

ALCOHOL PROBLEM. See LIQUOR PROBLEM.

ALCOLEA, Battle of (1868). See SPAIN: 1868-1873.

ALCORTA, José Figueroa, President of Argentine republic, 1906-1910. See ACRÉ DISPUTES.

ALCUIN, or Albinus Flaccus (735-804), celebrated English prelate and scholar at the time of Charlemagne; active in ecclesiastical and literary movements on the Continent; writer of many learned treatises on grammar, rhetoric, theology and philosophy; at Troyes from 781 to 790; his school conducted for Charlemagne and his entourage, was instrumental in introducing Latin culture (see SCHOOL OF THE PALACE, CHARLEMAGNE'S); spent last years as abbot at Tours; a facile writer of prose and verse, and the leading intellectual figure of the Carolingian Renaissance.—See also ANNALS: French, German, Italian and Spanish annals; CHRISTIANITY: 507-800: English church; EDUCATION: Medieval: 724-814: Charlemagne and Alcuin.

ALDBOROUGH, England, called by the Romans Isurium Brigantum. See ISURIUM.

ALDEN, Ichabod (1739-1778), American officer. See U. S. A.: 1778 (June-November).

ALDEN, John (1500-1687), one of the Pilgrim Fathers, who emigrated to America in the Mayflower in 1620. One of the first settlers of Duxbury. Of great assistance in the government of

the colony, and the last male survivor of the original group. The romance of his marriage to Priscilla Mullens was the theme of Longfellow's poem "The Courtship of Miles Standish."

ALDERNEY ISLAND. See CHANNEL ISLANDS.

ALDERSHOT COMMAND, the body of troops stationed at the great military camp established in 1855 at Aldershot, Hampshire, England. The permanent force is made up of troops available for service with the first army corps.

ALDERSON, Sir Edwin Alfred Herrey (1859-), British Lieutenant-general. See WORLD WAR: 1915: II. Western front: c, 11.

ALDIE, Battle of. See U. S. A.: 1863 (June-July: Pennsylvania).

ALDINE PRESS. See PRINTING AND THE PRESS: 1469-1515.

ALDOBRANDINI, Florentine family. See ROME: 1600-1656.

ALDRED, or Ealdred (d. 1069), English archbishop. In 1046 led an unsuccessful expedition against the Welsh, supported the cause of Edgar the Ætheling, but later submitted to William the Conqueror, and crowned the Norman king.

ALDRICH, Nelson Wilmarth (1841-1915), Republican member of the United States Senate from Rhode Island for thirty years; previously in the House of Representatives, 1878-1880. He evidenced an unusual skill in parliamentary organization as leader of the conservative faction in the Senate; chiefly responsible for the Payne-Aldrich tariff act, which was received with keen disappointment by tariff reformers; responsible for the enactment of the Aldrich-Vreeland currency law (q. v.) As chairman of the National Monetary Commission, he recommended revision of the banking laws, which furnished the basis for the Federal Reserve act of 1913. See TARIFF: 1909; U. S. A.: 1910 (March-June).

ALDRICH-VREELAND ACT (1908), American monetary act. "The Aldrich-Vreeland act, 1908, undertook to supply the need [of a more elastic currency] by allowing banks to issue additional notes on depositing approved state, country, or municipal bonds and by forming associations with joint responsibility to issue notes secured by commercial paper. . . . In the Aldrich-Vreeland act was a provision for a monetary commission, Senator Aldrich becoming chairman."—J. S. Bassett, *Short history of the United States*, p. 850. See MONEY AND BANKING: Modern period: 1912-1913: Federal reserve system.

ALDRINGER, Johann, Count von (1588-1634), general in the imperial German army during the Thirty Years' War. Served under Wallenstein and Tilly, on the death of the latter (1632) succeeding to his command; fought against the Swedes on the Danube.

ALEANDRO, Cirolamo (Hieronymus Alexander, 1480-1542), Italian ecclesiastic (cardinal) and scholar; author of a "Lexicon græco-latinum" (1512), etc.; was several times papal legate to Germany, and an ardent opponent of the Reformation.

ALEICHEM, Sholem (1859-1916), pseud. of Solomon J. Rabinowitz, Jewish author. See JEWS: LANGUAGE AND LITERATURE.

ALEMAN, Louis (c. 1390-1450), French cardinal; member of the council of Basel where he maintained the supremacy of a council over the pope. In 1440 proclaimed the deposition of Pope Eugenius IV, elevating the antipope Felix V.

ALEMANNI, or Alamanni. — 213. — Origin and first appearance.—"Under Antoninus, the Son of Severus, a new and more severe war once more (213) broke out in Raetia. This also was

waged against the Chatti; but by their side a second people is named, which we here meet for the first time—the Alamanni. Whence they came, we know not. According to a Roman writing a little later, they were a conflux of mixed elements; the appellation also seems to point to a league of communities, as well as the fact that, afterwards, the different tribes comprehended under this name stand forth—more than is the case among the other great Germanic peoples—in their separate character, and the Juthungi, the Lentienses, and other Alamanni peoples not seldom act independently. But that it is not the Germans of this region who here emerge, allied under the new name and strengthened by the alliance, is shown as well by the naming of the Alamanni along side of the Chatti, as by the mention of the unwonted skillfulness of the Alamanni in equestrian combat. On the contrary, it was certainly, in the main, hordes coming on from the East that lent new strength to the almost extinguished German resistance on the Rhine; it is not improbable that the powerful Semnones, in earlier times dwelling on the middle Elbe, of whom there is no further mention after the end of the second century, furnished a strong contingent to the Alamanni."—T. Mommsen, *History of Rome*, bk. 8, ch. 4.—"The standard quotation respecting the derivation of the name from 'al'='all' and 'm-n'='man,' so that the word (somewhat exceptionally) denotes 'men of all sorts,' is from Agathias, who quotes Asinius Quadratus. . . . Notwithstanding this, I think it is an open question, whether the name may not have been applied by the truer and more unequivocal Germans of Suabia and Franconia, to certain less definitely Germanic allies from Wurtemberg and Baden,—parts of the Decumates Agri—parts which may have supplied a Gallic, a Gallo-Roman, or even a Slavonic element to the confederacy; in which case, a name, so German as to have given the present French and Italian name for Germany, may, originally, have applied to a population other than Germanic. . . . The locality of the Alemanni was the parts about the Limes Romanus, a boundary which, in the time of Alexander Severus, Niebuhr thinks they first broke through. Hence they were the Marchmen of the frontier, whoever those Marchmen were. Other such Marchmen were the Suevoi; unless, indeed, we consider the two names as synonymous. Zeuss admits that, between the Suevoi of Suabia, and the Alemanni, no tangible difference can be found."—R. G. Lathan, *Germania of Tacitus; Epilegomena*, sect. 11.—See also GERMANY: 3d century.

ALSO IN: T. Smith, *Arminius*, pt. 2, ch. 1.

259.—Invasion of Gaul and Italy.—The Alemanni, "hovering on the frontiers of the Empire . . . increased the general disorder that ensued after the death of Decius. They inflicted severe wounds on the rich provinces of Gaul; they were the first who removed the veil that covered the feeble majesty of Italy. A numerous body of the Alemanni penetrated across the Danube and through the Rætian Alps into the plains of Lombardy, advanced as far as Ravenna and displayed the victorious banners of barbarians almost in sight of Rome [250]. The insult and the danger rekindled in the senate some sparks of their ancient virtue. Both the Emperors were engaged in far distant wars—Valerian in the East and Galienus on the Rhine." The senators, however, succeeded in confronting the audacious invaders with a force which checked their advance, and they "retired into Germany laden with spoil."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 10.

270.—**Invasion of Italy.**—Italy was invaded by the Alemanni, for the second time, in the reign of Aurelian, 270. They ravaged the provinces from the Danube to the Po, and were retreating, laden with spoils, when the vigorous Emperor intercepted them, on the banks of the former river. Half the host was permitted to cross the Danube; the other half was surprised and surrounded. But these last, unable to regain their own country, broke through the Roman lines at their rear and sped into Italy again, spreading havoc as they went. It was only after three great battles,—one near Placentia, in which the Romans were almost beaten, another on the Metaurus (where Hasdrubal was defeated), and a third near Pavia,—that the Germanic invaders were destroyed.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 11.—See also BARBARIAN INVASIONS: 3d century.

355-361.—**Repulse by Julian.** See GAUL: 355-361.

365-367.—**Invasion of Gaul.**—The Alemanni invaded Gaul in 365, committing widespread ravages and carrying away into the forests of Germany great spoil and many captives. The next winter they crossed the Rhine, again, in still greater numbers, defeated the Roman forces and captured the standards of the Herulian and Batavian auxiliaries. But Valentinian was now Emperor, and he adopted energetic measures. His lieutenant Jovinus overcame the invaders in a great battle fought near Châlons and drove them back to their own side of the river boundary. Two years later, the Emperor, himself, passed the Rhine and inflicted a memorable chastisement on the Alemanni. At the same time he strengthened the frontier defences, and, by diplomatic arts, fomented quarrels between the Alemanni and their neighbors, the Burgundians, which weakened both.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 25.

378.—**Defeat by Gratian.**—On learning that the young Emperor Gratian was preparing to lead the military force of Gaul and the West to the help of his uncle and colleague, Valens, against the Goths, the Alemanni swarmed across the Rhine into Gaul. Gratian instantly recalled the legions that were marching to Pannonia and encountered the German invaders in a great battle fought near Argentaria (modern Colmar) in the month of May, A. D. 378. The Alemanni were routed with such slaughter that no more than 5,000 out of 40,000 to 70,000, are said to have escaped. Gratian afterwards crossed the Rhine and humbled his troublesome neighbors in their own country.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 26.

496-504.—**Overthrow by the Franks.**—“In the year 496 the Salians [Salian Franks] began that career of conquest which they followed up with scarcely any intermission until the death of their warrior king. The Alemanni, extending themselves from their original seats on the right bank of the Rhine, between the Main and the Danube, had pushed forward into Germanica Prima, where they came into collision with the Frankish subjects of King Sigebert of Cologne. Clovis flew to the assistance of his kinsman and defeated the Alemanni in a great battle in the neighbourhood of Zülpich [called, commonly, the battle of Tolbiac]. He then established a considerable number of his Franks in the territory of the Alemanni, the traces of whose residence are found in the names of Franconia and Frankfort.”—W. C. Perry, *The Franks*, ch. 2.—“Clovis had been intending to cross the Rhine, but the hosts of the Alamanni came upon him, as it seems, unexpect-

edly and forced a battle on the left bank of the river. He seemed to be overmatched, and the horror of an impending defeat overshadowed the Frankish king. Then, in his despair, he bethought himself of the God of Clotilda [his queen, a Burgundian Christian princess, of the orthodox or Catholic faith]. Raising his eyes to heaven, he said: ‘Oh Jesus Christ, whom Clotilda declares to be the Son of the living God, who art said to give help to those who are in trouble and who trust in Thee, I humbly beseech Thy succor! I have called on my gods and they are far from my help. If Thou wilt deliver me from mine enemies, I will believe in Thee, and be baptised in Thy name.’ At this moment, a sudden change was seen in the fortunes of the Franks. The Alamanni began to waver, they turned, they fled. Their king, according to one account was slain; and the nation seems to have accepted Clovis as its over-lord.” The following Christmas day Clovis was baptised at Reims and 3,000 of his warriors followed the royal example. “In the early years of the new century, probably about 503 or 504, Clovis was again at war with his old enemies, the Alamanni. . . . Clovis moved his army into their territories and won a victory much more decisive, though less famous than that of 406. This time the angry king would make no such easy terms as he had done before. From their pleasant dwellings by the Main and the Neckar, from all the valley of the Middle Rhine, the terrified Alamanni were forced to flee. Their place was taken by Frankish settlers, from whom all this district received in the Middle Ages the name of the Duchy of Francia, or, at a rather later date, that of the Circle of Franconia. The Alamanni, with their wives and children, a broken and dispirited host, moved southward to the shores of the Lake of Constance and entered the old Roman province of Rætia. Here they were on what was held to be, in a sense, Italian ground; and the arm of Theodoric, as ruler of Italy, as successor to the Emperors of the West, was stretched forth to protect them. . . . Eastern Switzerland, Western Tyrol, Southern Baden and Württemberg and Southwestern Bavaria probably formed this new Alamannia, which will figure in later history as the ‘Ducatus Alamanniae,’ or the Circle of Swabia.”—T. Hodgkin, *Italy and her invaders*, bk. 4, ch. 9.—See also SUEVI: 460-500; FRANKS: 481-511; SWITZERLAND: Celtic inhabitants; 1st-3d centuries; EUROPE: Ethnology: Migrations: Map showing Barbaric migrations.

ALEMANNIA: Mediæval duchy. See GERMANY: 843-902.

ALENÇON, Counts and dukes of.—First line founded by Yves, lord of Belesme, who fortified the town of Alençon in tenth century. All his successors were involved in the wars of the kings of England, in Normandy. Mabile, countess of Alençon and heiress of this family, married Roger de Montgomery, and thus a second house of Alençon was started, which became extinct with the death of Robert IV. Established in a third house in the person of Charles of Valois, it was raised to a peerage in 1367 and into a dukedom in 1414. John, first duke of Alençon, was killed at Agincourt on October 25, 1415, after having killed the duke of York. The dukedom reverted back to the crown in 1524, was given to Catherine de

Medici in 1559, and as an appanage to her son Francis in 1566. Henry IV pawned it to the duke of Würtemberg, and, by grant of Louis XIII, it passed to Gaston, duke of Orleans.

ALEPPO (Haleb), a vilayet of the former Turkish empire including northern Syria and northwestern Mesopotamia. The city of the same name is the junction point of the Bagdad and Hejaz railways, and with the surrounding territory was captured by General Allenby in 1918.

Location. See ARABIA: Map; TURKEY: Map of Asia Minor.

637.—Surrender to Moslems. See CALIPHATE: 632-639.

638-969.—Taken by the Arab followers of Mohammed in 638, this city was recovered by the Byzantines in 909. See BYZANTINE EMPIRE: 963-1025.

1260.—Destruction by the Mongols.—The Mongols, under Khulagou, or Houlagou, brother of Mangu Khan, having overrun Mesopotamia and extinguished the caliphate at Bagdad, crossed the Euphrates in the spring of 1260 and advanced to Aleppo. The city was taken after a siege of seven days and given up for five days to pillage and slaughter. "When the carnage ceased, the streets were cumbered with corpses. . . . It is said that 100,000 women and children were sold as slaves. The walls of Aleppo were razed, its mosques destroyed, and its gardens ravaged." Damascus submitted and was spared. Khulagou was meditating, it is said, the conquest of Jerusalem, when news of the death of the Great Khan called him to the east.—H. H. Howorth, *History of the Mongols*, pp. 209-211.

1401.—Sack and massacre by Timur. See TIMUR.

16th-18th centuries.—Conquest by the Ottomans.—Revival of trade.—Under the strong rule of the Ottomans, who took possession of Aleppo in 1517, its trade with the East revived and increased. In the reign of James I one of the first provincial factories and consulates of the British Turkey Company was established there. It was long the eastern outpost of the company's operations, and was connected by private postal service with the western outpost of the East India Company in Bagdad. Aleppo's importance in trade was first diminished by the discovery of the Cape route to India; the opening of a land route through Egypt to the Red sea lessened it further; and the making of the Suez canal struck the final blow.

1916 (May).—Declared independent with French and English spheres of influence. See SYRIA: 1908-1021.

1918.—Captured and occupied by British. See WORLD WAR: 1918: VI. Turkish theater: c, 13 and 24.

ALERIA, Naval battle of (537 B. C.). See ROME: Ancient kingdom: B. C. 753-510.

ALESIA, ancient name for a hill in central France now Alise-Ste.-Reine, where in 52 B. C. Cæsar besieged Vercingetorix, forced him to surrender and completed the conquest of Gaul. Excavations of the siege works were made by Napoleon III. See GAUL: B. C. 58-51.

ALESSANDRI, Arturo, president of Chile, 1920. As the result of a disputed election in 1920, a court of honor was appointed, and after careful examination, Señor Alessandri was declared elected. The result was accepted by the people.—See also CHILE: 1920 (June).

ALESSANDRIA: Creation of the city (1168). See ITALY: 1174-1183.

ALEUTIAN ISLANDS, a chain of islands ex-

tending westward from the coast of Alaska into the Pacific ocean. See ALASKA: Map.

Inhabitants. See ESKIMAUAN FAMILY.

ALEXANDER I, pope (A. D. 1066-1115).

Alexander II, pope, 1061-1073 coadjutor of Hildebrand in suppressing simony; was threatened by the pretensions of the German anti-pope Honorarius II, who was soon deposed.

Alexander III, pope, 1150-1181; opposed Frederick Barbarossa who withheld recognition of him as pope until 1177. Held the third Lateran Synod; humbled Henry II of England in the Thomas Becket affair; confirmed the kingship of Alphonso I of Portugal; excommunicated William the Lion of Scotland and laid the interdict on that country.—See also ITALY: 1154-1162 to 1174-1183; PAPACY: 1122-1250; VENICE: 1177.

Alexander IV, pope, 1254-1261; opposed the Hohenstaufens under Conradin and Manfred; tried to unite the Greek and Latin churches; established the Inquisition in France; attempted to organize a Crusade against the Tatars. See VERONA: 1236-1259.

Alexander V, pope, 1409-1410; promoted the council of Pisa, which elected him to supersede the two rival claimants to the papal succession in order to effect a solution of the Great Schism; conferred investiture of the kingdom of Sicily on Louis II of Anjou.—See also PAPACY: 1377-1417.

Alexander VI, pope, 1492-1503, lived a purely secular life, using all his power to gain wealth and station for his children. Intervened in the Franco-Spanish quarrels over the possession of Naples; attempted the conquest of central Italy. Crushed the power of several of the great families of Italy; patron of Italian art.—See also PAPACY: 1471-1513; AMERICA: 1492; 1493; FLORENCE: 1490-1498.

Alexander VII, pope, 1655-1667, patron of literature and art; favored the Jesuits; carried on protracted controversies with France and Portugal.—See also PAPACY: 1644-1667; PORT ROYAL AND THE JANSENISTS: 1602-1700.

Alexander VIII, pope, 1689-1691, condemned the proclamation of the liberties of the Gallican church made in 1682; indulged in nepotism; condemned the Jesuit doctrine of philosophic sin.

Alexander, of Battenberg (1857-1893). Made prince of Bulgaria in 1879 through the influence of the Russian tsar. In 1881 assumed absolute power, but restored the constitution in 1883; assumed the government of the revolted East Rumeia in 1885, causing a war with Serbia which he closed successfully; was forced by Russian influence to abdicate in 1886.—See also BULGARIA: 1885-1886; 1870.

Alexander III, the Great (356-323 B. C.), king of Macedon. Was ambitious to establish a Panhellenic empire; subdued Greece, the greater part of Asia Minor, and Egypt, where he founded the city that bears his name. Completely routed the Persians under Darius, and extended his empire to India. Attempted to fuse Oriental and Greek civilizations.—See also ASIA: B. C. 334-A. D. 1498; ATHENS: B. C. 336-322; EGYPT: B. C. 332; 332-322; GAZA: B. C. 332; GORDIAN KNOT; GREECE: B. C. 336-335; INDIA: B. C. 327-312; MACEDONIA: B. C. 334-330; B. C. 330-323; PERSEPOLIS: B. C. 330; RHODES, ISLAND OF: B. C. 332; SAMARIA: Change of population by Alexander the Great; SYDON; TYRE: B. C. 332.

Alexander (1893-1920), king of Greece, second son of king Constantine, whom he succeeded on

his abdication, June, 1917. Died, October, 1920. See GREECE: 1916; 1920-1921; WORLD WAR: 1917; V: Balkan theatre: a, 1; a, 5; a, 7.

Alexander (1461-1506), king of Poland, 1501-1507. The parsimony of the Polish nobles, who controlled the mint, forced him to sue for peace with Russia, and assisted Prussia and Moldavia in their efforts to secure their freedom. See POLAND: 1333-1572.

Alexander I (Aleksander Pavlovich) (1777-1825), tsar of Russia, 1801-1825. Posed as a reformer, but did little; made war on Napoleon, but became his ally at Tilsit. Took Finland from the Swedes (1809). After Napoleon's downfall, formed the Holy Alliance; was patron of liberal government in Europe until 1818 when Metternich gained influence over him; refused aid to the Greeks, but later threatened war upon Turkey.—See also AUSTRIA: 1809-1814; HOLY ALLIANCE; RUSSIA: 1801; 1807-1820.

Alexander II (1818-1881), tsar of Russia. Came to the throne 1855. In 1861 emancipated the serfs, retaining the communal system; organized the army and navy; drew up a new judicial administration, a new penal code, a system of rural government. Made war on Turkey 1877 to protect Christians in the east, but lost much of his gain at the Congress of Berlin. Assassinated, March 13, 1881. See EUROPE: Modern period: Russia in the 19th century; RUSSIA: 1870-1881.

Alexander III (1845-1894), tsar of Russia. A firm believer in autocracy and an ardent Slavophile. Annulled his father's reforms in local government, centralizing the imperial administration. He was the father of the last Russian tsar, Nicholas II.—See also EUROPE: Modern period: Russia in the 19th century; RUSSIA: 1881-1894; 1894.

Alexander I (1078-1124) king of Scotland, son of Malcolm Canmore and Margaret, sister of Edgar the Ætheling; brother of Edgar whom he succeeded to the Scottish throne in 1107. He married Sibylla, daughter of Henry I of England. Gained the title of "the Fierce" by his ruthless suppression of an insurrection in his northern dominion.

Alexander II (1108-1240), king of Scotland, son of William the Lion, whom he succeeded in 1214; surnamed "the Peaceful." Led an army into England to support the English barons against John in their struggle for Magna Carta.

Alexander III (1241-1285), king of Scotland, son of Alexander II, whom he succeeded in 1249. Married Princess Margaret, eldest daughter of Henry III of England in 1251; defeated the Norwegians in their attempt at invasion in 1263.

Alexander (fl. 323 B. C.), Greek painter. See PAINTING: Greek.

ALEXANDER, The Great. See ALEXANDER UI (356-323 B. C.).

ALEXANDER, Sir James Edward (1803-1885), British soldier, traveler and author. Served in the war against Burma (1825); conducted an exploring expedition into Africa 1836-1837.

ALEXANDER, Joshua Willis (1852-), appointed secretary of commerce. See U. S. A.: 1910-1920.

ALEXANDER, Sir William (1567-1640) See AMERICA: Map of early colonial grants; NEW ENGLAND: 1621-1631; NOVA SCOTIA: 1621-1668.

ALEXANDER OF HALES (d. 1245), English theologian. Received a doctor's degree at Paris where he was a celebrated teacher. His work, the "Summa Theologiae," formulates a system of education and is the first philosophical contribution of the Franciscan order, which Alexander had entered in 1222.

ALEXANDER JANNAEUS (d. 76 B. C.), king of the Jews. See GAZA: B. C. 100.

ALEXANDER KARAGEORGEVICH, prince-regent of Serbia and successor of Peter I, as king of the United Kingdom of Jugo-Slavia (1888-); distinguished himself in the national struggle against Austria and Bulgaria, 1914-1918.

ALEXANDER NEVSKY, Saint (1220-1263), grand duke of Vladimir. Fought against Germans, Swedes and Lithuanians, who attacked Russia after the Tatar invasions, in 1262, to prevent a revolt, induced the Tatars to lighten the yearly tribute and abolish military service rendered by the Russians to the Tatars.

ALEXANDER OBRENOVICH (1876-1903), king of Serbia, 1889-1903; in 1893 overthrew the regency and took authority into his own hands. Restored the conservative constitution of 1869. To appease the people's anger at his marriage to a lady of the court, granted a bi-cameral legislature; was assassinated with his consort by revolutionists, June 11, 1903. See SERBIA: 1885-1903.

ALEXANDER SEVERUS (A. D. 209-235), Roman emperor. Defeated Artaxerxes, king of Persia; defended his borders from the German invaders; killed in an insurrection in the army; though a pagan, revered the teachings of Christianity. See ROME: 192-284.

ALEXANDER-SINCLAIR, Sir Edwyn Sinclair (1867-), Rear-admiral served in battle of Jutland. See WORLD WAR: 1916: IX. Naval operations: a.

ALEXANDERSON, Ernst Fredrik Werner (1878-). See ELECTRICAL DISCOVERY: Telegraphy and telephony; Alexanderson alternator.

ALEXANDRA FEODOROVNA, Princess Alix of Hesse (1872-1918), last empress of Russia through marriage to Tsar Nicholas II in 1894; was a grand-daughter of Queen Victoria; was made prisoner by the Soviet government, and put to death with her husband and children. See RUSSIA: 1916: Opposition of Duma to cabinet.

ALEXANDRETTA, or Iskanderun, a town of North Syria, the key to Beisan Pass; scene of the victory of Ibrahim Pasha in 1832 which opened Cilicia to his advance.

1920.—Recognized as of international interest by treaty of Sévres. See SÈVRES, TREATY OF: 1920: Contents of treaty: Part XI. Ports, waterways and railways.

1921.—French administration. See SÈVRES, Treaty of: 1921: Secret pact of France with Turkey.

ALEXANDRIA.—B. C. 332.—Founding of the city.—"When Alexander reached the Egyptian military station at the little town or village of Rhakotis, he saw with the quick eye of a great commander how to turn this petty settlement into a great city, and to make its roadstead, out of which ships could be blown by a change of wind, into a double harbour roomy enough to shelter the navies of the world. All that was needed was to join the island by a mole to the continent. The site was admirably secure and convenient, a narrow strip of land between the Mediterranean and the great inland Lake Mareotis. The whole northern side faced the two harbours, which were bounded east and west by the mole, and beyond by the long, narrow rocky island of Pharos, stretching parallel with the coast. On the south was the inland port of Lake Mareotis. The length of the city was more than three miles, the breadth more than three-quarters of a mile; the mole was above three-quarters of a mile long and six hundred feet broad; its breadth is now doubled, owing to the silting up of the sand. Modern Alexandria until lately only occupied the mole,

and was a great town in a corner of the space which Alexander, with large provision for the future, measured out. The form of the new city was ruled by that of the site, but the fancy of Alexander designed it in the shape of a Macedonian cloak or chlamys, such as a national hero wears on the coins of the kings of Macedon, his ancestors. The situation is excellent for commerce. Alexandria, with the best Egyptian harbour on the Mediterranean, and the inland port connected with the Nile streams and canals, was the natural emporium of the Indian trade. Port Said is superior now, because of its grand artificial port and the advantage for steamships of an unbroken sea-route."—R. S. Poole, *Cities of Egypt*, ch. 12.—See also MACEDONIA, &c.: B. C. 334-330; and EGYPT: B. C. 332.

B. C. 304.—Antigonos and Demetrius make war on Ptolemy.—Rhodes sends fleet to aid Egyptian king. See RHODES, ISLAND OF: B. C. 304.

B. C. 282-246.—Reign of Ptolemy Philadelphus.—Greatness and splendor of the city.—Commerce.—Libraries.—Museum.—Schools.—Ptolemy Philadelphus, son of Ptolemy Soter, succeeded to the throne of Egypt in 282 B. C. when his father retired from it in his favor, and reigned until 246 B. C. "Alexandria, founded by the great conqueror, increased and beautified by Ptolemy Soter, was now far the greatest city of Alexander's Empire. It was the first of those new foundations which are a marked feature in Hellenism; there were many others of great size and importance—above all, Antioch, then Seleucia on the Tigris, then Nicomedia, Nicaea, Apamea, which lasted; besides such as Lysimacheia, Antigoneia, and others, which early disappeared. . . . Alexandria was the model for all the rest. The intersection of two great principal thoroughfares, adorned with colonnades for the footways, formed the centre point, the omphalos of the city. The other streets were at right angles with these thoroughfares, so that the whole place was quite regular. Counting its old part, Rhakotis, which was still the habitation of native Egyptians, Alexandria had five quarters, one at least devoted to Jews who had originally settled there in great numbers. The mixed population there of Macedonians, Greeks, Jews, and Egyptians gave a peculiarly complex and variable character to the population. Let us not forget the vast number of strangers from all parts of the world whom trade and politics brought there. It was the great mart where the wealth of Europe and of Asia changed hands. Alexander had opened the sea-way by exploring the coasts of Media and Persia. Caravans from the head of the Persian Gulf, and ships on the Red Sea, brought all the wonders of Ceylon and China, as well as of Further India, to Alexandria. There, too, the wealth of Spain and Gaul, the produce of Italy and Macedonia, the amber of the Baltic and the salt fish of Pontus, the silver of Spain and the copper of Cyprus, the timber of Macedonia and Crete, the pottery and oil of Greece—a thousand imports from all the Mediterranean—came to be exchanged for the spices of Arabia, the splendid birds and embroideries of India and Ceylon, the gold and ivory of Africa, the antelopes, the apes, the leopards, the elephants of tropical climes. Hence the enormous wealth of the Lagidæ, for in addition to the marvellous fertility and great population—it is said to have been seven millions—of Egypt, they made all the profits of this enormous carrying trade. We gain a good idea of what the splendours of the capital were by the very full account preserved to us by Athenæus of the great feast which inaugu-

rated the reign of Philadelphus. . . . All this seems idle pomp, and the doing of an idle sybarite. Philadelphus was anything but that. . . . It was he who opened up the Egyptian trade with Italy, and made Puteoli the great port for ships from Alexandria, which it remained for centuries. It was he who explored Ethiopia and the southern parts of Africa, and brought back not only the curious fauna to his zoological gardens, but the first knowledge of the Troglodytes for men of science. The cultivation of science and of letters too was so remarkably one of his pursuits that the progress of the Alexandria of his day forms an epoch in the world's history, and we must separate his University and its professors from this summary, and devote to them a separate section. . . . The history of the organization of the University and its staff is covered with almost impenetrable mist. For the Museum and Library were in the strictest sense what we should now call an University, and one, too, of the Oxford type, where learned men were invited to take Fellowships, and spend their learned leisure close to observatories in science, and a great library of books. Like the mediæval universities, this endowment of research naturally turned into an engine for teaching, as all who desired knowledge flocked to such a centre, and persuaded the Fellow to become a Tutor. The model came from Athens. There the schools, beginning with the Academy of Plato, had a fixed property—a home with its surrounding garden, and in order to make this foundation sure, it was made a shrine where the Muses were worshipped, and where the head of the school, or a priest appointed, performed stated sacrifices. This, then, being held in trust by the successors of the donor, who bequeathed it to them, was a property which it would have been sacrilegious to invade, and so the title Museum arose for a school of learning. Demetrius the Phalerean, the friend and protector of Theophrastus, brought this idea with him to Alexandria, when his namesake drove him into exile and it was no doubt his advice to the first Ptolemy which originated the great foundation, though Philadelphus, who again exiled Demetrius, gets the credit of it. The pupil of Aristotle moreover impressed on the king the necessity of storing up in one central repository all that the world knew or could produce, in order to ascertain the laws of things from a proper analysis of detail. Hence was founded not only the great library, which in those days had a thousand times the value a great library has now, but also observatories, zoological gardens, collections of exotic plants, and of other new and strange things brought by exploring expeditions from the furthest regions of Arabia and Africa. This library and museum proved indeed a home for the Muses, and about it a most brilliant group of students in literature and science was formed. The successive librarians were Zenodotus, the grammarian or critic; Callimachus, to whose poems we shall presently return; Eratosthenes, the astronomer, who originated the process by which the size of the earth is determined to-day; Apollonius the Rhodian, disciple and enemy of Callimachus; Aristophanes of Byzantium, founder of a school of philological criticism; and Aristarchus of Samos, reputed to have been the greatest critic of ancient times. The study of the text of Homer was the chief labour of Zenodotus, Aristophanes, and Aristarchus, and it was Aristarchus who mainly fixed the form in which the Iliad and Odyssey remain to this day. . . . The vast collections of the library and museum actually determined the whole character of the literature of

Alexandria. One word sums it all up—erudition, whether in philosophy, in criticism, in science, even in poetry. Strange to say, they neglected not only oratory, for which there was no scope, but history, and this we may attribute to the fact that history before Alexander had no charms for Hellenism. Mythical lore, on the other hand, strange uses and curious words, were departments of research dear to them. In science they did great things, so did they in geography. . . . But were they original in nothing? Did they add nothing of their own to the splendid record of Greek literature? In the next generation came the art of criticism, which Aristarchus developed into a real science, and of that we may speak in its place; but even in this generation we may claim for them the credit of three original, or nearly original, developments in literature—the pastoral idyll, as we have it in Theocritus; the elegy, as we have it in the Roman imitators of Philetas and Callimachus; and the romance, or love story, the parent of our modern novels. All these had early prototypes in the folk songs of Sicily, in the love songs of Mimnermus and of Antimachus, in the tales of Miletus, but still the revival was fairly to be called original. Of these the pastoral idyll was far the most remarkable, and laid hold upon the world for ever.”—J. P. Mahaffy, *Story of Alexander's empire*, ch. 13-14.—“There were two Libraries of Alexandria under the Ptolemies, the larger one in the quarter called the Bruchium, and the smaller one, named ‘the daughter,’ in the Serapeum, which was situated in the quarter called Rhacotis. The former was totally destroyed in the conflagration of the Bruchium during Cæsar's Alexandrian War [see below: 48-47 B. C.]; but the latter, which was of great value, remained uninjured (see J. Matter, *Essai historique sur l'École d'Alexandrie*, v. 1, p. 133 seq., 237 seq.). It is not stated by any ancient writer where the collection of Pergamus was placed, which Antony gave to Cleopatra (Plutarch, Anton., c. 58); but it is most probable that it was deposited in the Bruchium, as that quarter of the city was now without a library, and the queen was anxious to repair the ravages occasioned by the civil war. If this supposition is correct, two Alexandrian libraries continued to exist after the time of Cæsar, and this is rendered still more probable by the fact that during the first three centuries of the Christian era the Bruchium was still the literary quarter of Alexandria. But a great change took place in the time of Aurelian. This Emperor, in suppressing the revolt of Firmus in Egypt, A.D. 273 [see below: 273] is said to have destroyed the Bruchium; and though this statement is hardly to be taken literally, the Bruchium ceased from this time to be included within the walls of Alexandria, and was regarded only as a suburb of the city. Whether the great library in the Bruchium with the museum and its other literary establishments, perished at this time, we do not know; but the Serapeum for the next century takes its place as the literary quarter of Alexandria, and becomes the chief library in the city. Hence later writers erroneously speak of the Serapeum as if it had been from the beginning the great Alexandrian library. . . . Gibbon seems to think that the whole of the Serapeum was destroyed [389, by order of the Emperor Theodosius—see below]; but this was not the case. It would appear that it was only the sanctuary of the god that was levelled with the ground, and that the library, the halls and other buildings in the consecrated ground remained standing long afterwards.”—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 28. Notes by

Dr. William Smith.—Concerning the reputed final destruction of the library by the Moslems, see below: A. D. 641-646.—See also EDUCATION: Ancient: Alexandria; EUROPE: Historic period: Spread of Hellenism; HELLENISM: Hellenism and Alexandria; INVENTIONS: Greek; LIBRARIES: Ancient Alexandria; PAINTING: Greek.

ALSO IN: O. Delepiere, *Historical difficulties and contested events*, ch. 3.—S. Sharpe, *History of Egypt*, ch. 7, 8 and 12.

“If we consider in its large features what the early Hellenistic period has done for us in literature, we may divide its action into the care and preservation of Hellenic masterpieces, and the production of works of its own. As regards the former, there can be no doubt that the creation of the great cosmopolitan library at Alexandria, and the great trade in books which came thence, were the greatest acts of protection ever done for the greatest literature the world has seen. And not only were all the masterpieces of the Golden Age sought out and catalogued, but the chief librarian made it his business to publish critical studies on the purity of the texts, and to see that the Alexandrian text represented the best and soundest tradition. . . . So there was collected at this wonderful library all that was rare and precious, ordered and catalogued by competent scholars. I go a step farther, and say that, though we have no explicit record telling us the fact, there must have been some regular permission to copy books in the library, and, multiplying them by slave hands, to disperse them by way of trade all over the Greek-speaking world.”—See also GREECE, LITERATURE OF: Development of philosophical literature.—“We have from Alexandria, Theocritus, and we have the love-novel. I will here add a word upon two more of these poets. . . . The first is Aratus, who was indeed a Hellenistic, but not an Alexandrian, poet, whose didactic work on the astronomy of use for navigation, and on the signs of the weather of use for farming, has survived to us complete. . . . We still possess the Argonautics of Apollonius the Rhodian—a pedant-poet of the same generation. In the midst of pages of tedious prolixity, which have forever damned the popularity of the work, occurs the great episode of the meeting and love at first sight of Medea and Jason. The treatment of this world-wide, but never world-worn, theme is so wholly fresh, so wholly un-Hellenic, that it requires no subtle criticism to see in it the broad light of the oriental love-novel which had first dawned in the East upon the companions of Alexander. It is no longer the physical, but the sentimental side of that passion which interests the poet and his readers. The actual marriage of the lovers is but an episode, in which the surrounding anxieties and the unhappy omens take the foremost place.”—J. P. Mahaffy, *Story of Alexander's empire*, p. 100.

B.C. 48-47.—Cæsar and Cleopatra.—Rising against the Romans.—Siege.—Destruction of the great library.—Roman victory.—From the battle field of Pharsalia Pompey fled to Alexandria in Egypt, and was treacherously murdered as he stepped on shore. Cæsar arrived a few days afterwards, in close pursuit, and shed tears, it is said, on being shown his rival's mangled head. He had brought scarcely more than 3,000 of his soldiers with him, and he found Egypt in a turbulent state of civil war. The throne was in dispute between children of the late king, Ptolemæus Auletes. Cleopatra, the elder daughter, and Ptolemæus, a son, were at war with one another, and Arsinoë, a younger daughter, was ready to put forward claims. Notwithstanding the insignificance of his

force, Cæsar did not hesitate to assume to occupy Alexandria and to adjudicate the dispute. But the fascinations of Cleopatra (then twenty years of age) soon made him her partisan, and her scarcely disguised lover. This aggravated the irritation which was caused in Alexandria by the presence of Cæsar's troops, and a furious rising of the city was provoked. He fortified himself in the great palace, which he had taken possession of, and which commanded the causeway to the island, Pharos, thereby commanding the port. Destroying a large part of the city in that neighborhood, he made his position exceedingly strong. At the same time he seized and burned the royal fleet, and thus caused a conflagration in which the greater of the two priceless libraries of Alexandria—the library of the Museum—was, much of it, consumed. [See above: B. C. 282-246.] By such measures Cæsar withstood, for several months, a siege conducted on the part of the Alexandrians with great determination and animosity. It was not until March, 47 B. C., that he was relieved from his dangerous situation, by the arrival of a faithful ally, in the person of Mithradates, of Pergamum, who led an army into Egypt, reduced Pelusium, and crossed the Nile at the head of the Delta. Ptolemæus advanced with his troops to meet this new invader and was followed and overtaken by Cæsar. In the battle which then occurred the Egyptian army was utterly routed and Ptolemæus perished in the Nile. Cleopatra was then married, after the Egyptian fashion, to a younger brother, and established on the throne, while Arsinoë was sent a prisoner to Rome.—A. Hirtius, *Alexandrian war*.

A. D. 100-312.—Early Christian church.—Its influence. See CHRISTIANITY: 33-100: Rise of the churches: Alexandria, also 100-312: Period of growth and struggle: Alexandria.

116.—Destruction of the Jews. See JEWS: 116.

215.—Massacre by Caracalla.—“Caracalla was the common enemy of mankind. He left the capital (and he never returned to it) about a year after the murder of Geta [213]. The rest of his reign [four years] was spent in the several provinces of the Empire, particularly those of the East, and every province was, by turns, the scene of his rapine and cruelty. . . . In the midst of peace, and upon the slightest provocation, he issued his commands at Alexandria, Egypt [215], for a general massacre. From a secure post in the temple of Serapis, he viewed and directed the slaughter of many thousand citizens, as well as strangers, without distinguishing either the number or the crime of the sufferers.”—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 6.

260-272.—Tumults of the third century.—“The people of Alexandria, a various mixture of nations, united the vanity and inconstancy of the Greeks with the superstition and obstinacy of the Egyptians. The most trifling occasion, a transient scarcity of flesh or lentils, the neglect of an accustomed salutation, a mistake of precedency in the public baths, or even a religious dispute, were at any time sufficient to kindle a sedition among that vast multitude, whose resentments were furious and implacable. After the captivity of Valerian [the Roman emperor, made prisoner by Sapor, king of Persia, 260] and the insolence of his son had relaxed the authority of the laws, the Alexandrians abandoned themselves to the ungoverned rage of their passions, and their unhappy country was the theatre of a civil war, which continued (with a few short and suspicious truces) above twelve years. All intercourse was cut off between the several quarters of the afflicted city, every

street was polluted with blood, every building of strength converted into a citadel; nor did the tumult subside till a considerable part of Alexandria was irretrievably ruined. The spacious and magnificent district of Bruchion, with its palaces and museum, the residence of the kings and philosophers of Egypt, is described, above a century afterwards, as already reduced to its present state of dreary solitude.”—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 10.

273.—Destruction of the Bruchium by Aurelian.—After subduing Palmyra and its queen Zenobia, 272, the emperor Aurelian was called into Egypt to put down a rebellion there, headed by one Firmus, a friend and ally of the Palmyrene queen. Firmus had great wealth, derived from trade, and from the paper-manufacture of Egypt, which was mostly in his hands. He was defeated and put to death. “To Aurelian’s war against Firmus, or to that of Probus a little before in Egypt, may be referred the destruction of Bruchium, a great quarter of Alexandria, which according to Ammianus Marcellinus, was ruined under Aurelian and remained deserted ever after.”—J. B. L. Crevier, *History of the Roman emperors*, bk. 27.

296.—Siege by Diocletian.—A general revolt of the African provinces of the Roman empire occurred 206. The barbarous tribes of Ethiopia and the desert were brought into alliance with the provincials of Egypt, Cyrenaica, Carthage and Mauretania, and the flame of war was universal. Both the emperors of the time, Diocletian and Maximian, were called to the African field. “Diocletian, on his side, opened the campaign in Egypt by the siege of Alexandria, cut off the aqueducts which conveyed the waters of the Nile into every quarter of that immense city, and, rendering his camp impregnable to the sallies of the besieged multitude, he pushed his reiterated attacks with caution and vigor. After a siege of eight months, Alexandria, wasted by the sword and by fire, implored the clemency of the conqueror, but it experienced the full extent of his severity. Many thousands of the citizens perished in a promiscuous slaughter, and there were few obnoxious persons in Egypt who escaped a sentence either of death or at least of exile. The fate of Busiris and of Coptos was still more melancholy than that of Alexandria; those proud cities . . . were utterly destroyed.”—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 13.

389.—Destruction of the Serapeum.—“After the edicts of Theodosius had severely prohibited the sacrifices of the pagans, they were still tolerated in the city and temple of Serapis. . . . The archiepiscopal throne of Alexandria was filled by Theophilus, the perpetual enemy of peace and virtue; a bold, bad man, whose hands were alternately polluted with gold and with blood! His pious indignation was excited by the honours of Serapis. . . . The votaries of Serapis, whose strength and numbers were much inferior to those of their antagonists, rose in arms [389] at the instigation of the philosopher Olympius, who exhorted them to die in the defence of the altars of the gods. These pagan fanatics fortified themselves in the temple, or rather fortress, of Serapis; repelled the besiegers by daring sallies and a resolute defence; and, by the inhuman cruelties which they exercised on their Christian prisoners, obtained the last consolation of despair. The efforts of the prudent magistrate were usefully exerted for the establishment of a truce till the answer of Theodosius should determine the fate of Serapis.” The judgment of the emperor condemned the great

temple to destruction and it was reduced to a heap of ruins. "The valuable library of Alexandria was pillaged or destroyed; and, near twenty years afterwards, the appearance of the empty shelves excited the regret and indignation of every spectator whose mind was not totally darkened by religious prejudice."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 28.—Gibbon's statement as to the destruction of the great library in the Serapeum is called in question by his learned annotator, Dr. Smith. See above, B. C. 282-246.

413-415.—Patriarch Cyril and his mobs.—"His voice [that of Cyril, patriarch of Alexandria, 412-444] inflamed or appeased the passions of the multitude: his commands were blindly obeyed by his numerous and fanatic parabolani, familiarized in their daily office with scenes of death; and the præfects of Egypt were awed or provoked by the temporal power of these Christian pontiffs. Ardent in the prosecution of heresy, Cyril auspiciously opened his reign by oppressing the Novations, the most innocent and harmless of the sectaries. . . . The toleration, and even the privileges of the Jews, who had multiplied to the number of 40,000, were secured by the laws of the Cæsars and Ptolemies, and a long prescription of 700 years since the foundation of Alexandria. Without any legal sentence, without any royal mandate, the patriarch, at the dawn of day, led a seditious multitude to the attack of the synagogues. Unarmed and unprepared, the Jews were incapable of resistance: their houses of prayer were levelled with the ground, and the episcopal warrior, after rewarding his troops with the plunder of their goods, expelled from the city the remnant of the misbelieving nation. Perhaps he might plead the insolence of their prosperity, and their deadly hatred of the Christians, whose blood they had recently shed in a malicious or accidental tumult. Such crimes would have deserved the animadversions of the magistrate; but in this promiscuous outrage the innocent were confounded with the guilty."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 47.—"Before long the adherents of the archbishop were guilty of a more atrocious and unprovoked crime, of the guilt of which a deep suspicion attached to Cyril. All Alexandria respected, honoured, took pride in the celebrated Hypatia. She was a woman of extraordinary learning; in her was centred the lingering knowledge of that Alexandrian Platonism cultivated by Plotinus and his school. Her beauty was equal to her learning; her modesty commended both. . . . Hypatia lived in great intimacy with the præfect Orestes; the only charge whispered against her was that she encouraged him in his hostility to the patriarch. . . . Some of Cyril's ferocious partisans seized this woman, dragged her from her chariot, and with the most revolting indecency tore her clothes off and then rent her limb from limb."—H. H. Milman, *History of Latin Christianity*, bk. 2, ch. 3.

Also in: C. Kingsley, *Hypatia*.

641-646.—Moslem conquest.—The precise date of events in the Moslem conquest of Egypt, by Amru, lieutenant of the Caliph Omar, is uncertain. Sir William Muir fixes the first surrender of Alexandria to Amru in 641. After that it was reoccupied by the Byzantines either once or twice, on occasions of neglect by the Arabs, as they pursued their conquests elsewhere. The probability seems to be that this occurred only once, in 646. It seems also probable, as remarked by Sir William Muir, that the two sieges on the taking and retaking of the city—641 and 646—have been much

confused in the scanty accounts which have come down to us. On the first occasion Alexandria would appear to have been generously treated; while, on the second, it suffered pillage and its fortifications were destroyed. How far there is truth in the commonly accepted story of the deliberate burning of the great Alexandrian library—or so much of it as had escaped destruction at the hands of Roman generals and Christian patriarchs—is a question still in dispute. Gibbon discredited the story, and Sir William Muir, the latest of students in Mohammedan history, declines even the mention of it in his narrative of the conquest of Egypt. But other historians of repute maintain the probable accuracy of the tale told by Abulpharagus—that Caliph Omar ordered the destruction of the library, on the ground that, if the books in it agreed with the Koran they were useless, if they disagreed with it they were pernicious. See CALIPHATE: 640-646.

1861 (July).—Alexandria government.—After the secession of Virginia in 1861, unionist delegates meeting at Wheeling set up on July 1 a "reorganized state government" which was recognized by Congress. Its governor was Francis H. Pierpont. After the admission of West Virginia as a separate state (June 20, 1863), the capital of the unionist government of Virginia was transferred to Alexandria, where Governor Pierpont asserted jurisdiction over all the counties of Virginia lying within the federal lines. This "Alexandria government" continued until the close of the war in 1865 when a new state government was set up at Richmond.

ALEXANDRINE SCHOOL. See ECLECTICISM.

ALEXANDROPOL, a Russian town and fortified camp in Transcaucasia, the scene of the defeat of the Turks by the Russians in 1853. In 1910, an important center for American relief work in the Near East.

ALEXEIEV, Eugene Ivanovitch, Count (1845-), Russian admiral and the tsar's viceroy in the Far East. Regarded as responsible for precipitating the Russo-Japanese War (1904) through his aggressive policy in seeking valuable concessions in Korea; established his headquarters at Port Arthur when the Japanese suddenly attacked, opening hostilities without a declaration of war.

ALEXEIEV, M. V. (1843-), Russian general. Commander of the 3d Army in Manchuria, Russo-Japanese War, and chief of headquarters staff; commander of one of the Russian armies in the World War; chief of staff under the tsar when the latter took personal command in September, 1915; with other generals secured the abdication of the tsar at Pskov, March 15, 1917; commander-in-chief under Kerensky's provisional government; succeeded by Brusilov in June, 1917, Kerensky at the time, as minister of war, endeavoring to rally the troops for what proved to be a short-lived offensive.—See also **RUSSIA:** 1018-1020; **WORLD WAR:** 1916; **III, Eastern front:** a.

ALEXIS, tsar of Russia. See **ALEXIUS MIKHAILOVITCH.**

ALEXIUS I, Comnenus (1048-1118), son of John Comnenus, brother of the emperor Isaac Comnenus. In 1081 with the aid of soldiery, supplanted the old and feeble emperor Nicephorus Botaniates, who retired to a monastery. Was Byzantine emperor from 1081 to 1118, and during that time successfully defended his empire against the Petchengs, the Turks and the Normans. The first Crusade also occurred during his reign; he used the Crusaders as his instruments to reconquer the islands and coasts of Asia Minor from the Turks.—See also **BYZANTINE EMPIRE:** 1081-1085; **CRUSADES:** 1096-1099; **VENICE:** 1099-1101.

Alexius II, Comnenus (1167-1183), Byzantine emperor from 1180 to 1183, having succeeded his father Manuel I. Was strangled by his uncle, Andronicus.

Alexius III, Angelus (d. 1210), brother of Isaac II, Byzantine emperor, whose throne he usurped in 1195; was emperor until 1203, when an army of Crusaders besieged and captured Constantinople, deposed him, and reinstated Isaac II. Alexius died a few years later in exile.—See also **BYZANTINE EMPIRE:** 1203-1204.

Alexius IV, Angelus (d. 1204), Byzantine emperor 1203-1204, son of Isaac II, Angelus. Was associated with his father in the government; put to death by Alexius V after a reign of six months.

Alexius V, (d. 1204), surnamed **Ducas Murtzuphlus**, became Byzantine emperor in 1204 after the death of Alexius IV by usurping the throne, but was driven from Constantinople by the Crusaders, who had resolved to partition the empire. He fled to Morea where he was seized, tried for the murder of Alexius IV, and executed.

ALEXIUS COMNENUS (1180-1222), a grandson of Andronicus I. In 1204, while the Crusaders were besieging Constantinople, he captured Trebizond, and some other cities on the Black sea. He took the title of Grand Comnenus, and became governor or duke of Trebizond. His family ruled there for two and a half centuries, his grandson having assumed the title of emperor.—See also **TREBIZOND:** 1204-1461.

ALEXIUS MIKHAILOVITCH (1620-1676), second Russian tsar of the Romanoff line; son of Michael Romanoff, whom he succeeded in 1645. Early part of his reign was stormy, due to his youthfulness, but in ten years he quelled all insurrections; waged war on Poland from 1654 to 1667, acquiring possession of Smolensk and eastern Ukraine. In a war with Sweden from 1655 to 1658 he conquered a part of Livonia and Ingermanland, but by the treaty of Kardis of June 21, 1661, he had to relinquish this territory. He also extended his conquests to eastern Siberia, codified the laws of the various provinces of Russia, and began to introduce European civilization, thus paving the way for his son, Peter the Great.—See also **RUSSIA:** 1645-1675.

ALEXIUS PETROVITCH (1690-1718), eldest son of Peter the Great; entered a monastery rather than acquiesce in Peter's reforms and innovations; was disinherited in 1718 and condemned to death after an investigation followed by the discovery of a conspiracy to undo the reforms of Peter. Soon afterward he was pardoned, but the terror and agitation of the trial, and the torture to which he had been subjected, led to his death in 1718. To avoid scandal, Peter published the proceedings of the trial.

ALGAU, Battle of (1525). See GERMANY: 1524-1525.

ALGEBRA is a branch of mathematics which treats of the relation of quantities by means of letters and symbols. The word is of Arabic origin. First mention of algebra is found in a work called *ilm al-jabr wa'l-muqabala*, by Mohammed ben Musa al-Khwarizmi, who lived in the ninth century. It is interesting to note that a celebrated Moorish savant by the name of Geber, living in the eleventh century, was at one time believed to have been the founder of algebra. Proof, however, exists that the subject was treated as early as 1700 B. C. by Ahmes, an Egyptian. The invention of algebra was at one time attributed to the Greeks; but this theory has been discarded since Eisenlohr's decipherment of the "Rhind papyrus," inasmuch as distinct signs of an algebraic analysis are in evidence in this work. Egyptian algebra was probably of an elementary type, as Greek geometers ignore the subject. The earliest work on algebra, which exists only in translation, is by Diophantus (about 350 A. D.), an Alexandrian mathematician, who probably followed earlier investigators. It was the Hindus, however, who extended the scope of algebra. They evolved a method of solving determinate equations, and made even greater progress in their treatment of indeterminate equations of the first and second degrees. Aryabhata is the mathematician who is generally recognized as the man responsible for this extended study of the subject. Hankel credits the Brahmans with being the real inventors of algebra. With regard to the Arabs in the west, Cordova, the capital of the Moorish empire in Spain, like Bagdad in the east, became a center of learning, particularly along mathematical lines. The most famous Spanish mathematician is Al Madshritti (1007), who contributed an excellent dissertation on amicable numbers. Following the decline of the Moorish empire, the Arabs in the west failed to produce another mathematician comparable with the brilliant minds of the seventh to the eleventh centuries. Leonardo of Pisa, an Italian merchant, in 1202, published a work called "Liber abaci," thus bringing algebra into Christendom. Contemporaneously with this (Pisa's) historic achievement the popularity of algebra spread to Germany, France, and England. The writings of the German mathematicians, Michael Stifel and Johann Scheu-

belius (Scheybl, 1494-1570), are marked by the fact that they introduced into the field of algebra a more complete symbolism for quantities and operations. It was in consequence of their work that the sign (+) for addition or a positive quantity, the sign (−) for subtraction or the minus quantity, and (√) for denoting the square root, were adopted and are still in use to-day. In 1552 Robert Recorde published the first treatise on algebra in English. He it was who introduced the sign (=) for equality. Early in the seventeenth century many new terms and symbols were introduced through the works of Franciscus Vieta, republished at Leiden in 1646. He also vastly improved the methods for solving equations and devised a new means for determining approximate values of the roots of equations. In 1673 René Descartes, the famous French philosopher, rendered invaluable service to algebra by developing the modern theory of analytical geometry and by demonstrating the relationship between algebra and geometry. The seventeenth century also brought forward the epoch-making discoveries of Kepler and Bonaventura Cavalieri, upon the foundation of which both Newton and Leibnitz brought to light the infinitesimal calculus. Early in the nineteenth century, Benjamin and Charles S. Pierce, father and son respectively, devised systems of pure symbolic algebra.

ALGECIRAS, a seaport in southern Spain, four miles west of Gibraltar. It was perhaps the *Portus Albus* of the Romans and was probably refounded in 1713 by the Moors; taken by Alfonso XI in 1344 after a long siege and destroyed; rebuilt by King Charles III in 1760; in 1801 the scene of a naval encounter between the English and Franco-Spanish fleets. In 1906 the important international conference on Morocco (q.v.) was held here. See FRANCE: 1904-1906; ITALY: 1906; Part of Italy at Algeciras conference; TANGIER: 1906; U. S. A.: 1905-1906.

1907.—**Demonstration against French occupation**. See Morocco: 1907-1909.

ALGER, Russell Alexander (1836-1907), American soldier and politician. Served in the Civil War; governor of Michigan, 1885-1897; secretary of war, 1897-1900 (See U. S. A.: 1897, March; 1898, July-August: Army administration), appointed United States senator, 1902, and elected to that office, 1903.

ALGERIA, a Mediterranean country forming part of French Africa. It is bounded on the east by Tunis, on the west by Morocco, and on the south by the Sahara, all now under French control. (See AFRICA: Map). After the Turkish conquest, the name Algeria was applied to a territory which in ancient times was occupied in the east by the Numidians, and in the west by the Moors (or Mauri).

1830-1898.—French colonization.—Beginning of the French African empire.—"The establishment of the French Protectorate over Morocco in 1912 was the culmination of eighty years of effort in North Africa. . . . The French African empire started on the Mediterranean under Louis Philippe, was spread to West Africa under Napoleon III, and across the Sahara and through the Sudan to Central Africa under the Third Republic. Algeria was the nucleus on the Mediterranean, and Senegal on the Atlantic. It has been a curious combination of foresight and luck, the building of this empire, and, as in the case of every other African colony and every other Power, more the latter than the former. The late Europeanization of the Mediterranean is the great enigma of modern history. While remote regions of the globe were being transformed and brought under the ægis of European civilization, the Mediterranean remained under the shadow of Islam, a closed sea, whose waters washed nations in the embryo and vast coasts where anarchy had reigned for fifteen centuries since the disappearance of the Roman Empire. France went into Algeria in 1830, and inaugurated the modern era of the Middle Sea, not because of a conviction that the time had come to do away with the pirates of the Barbary Coast, but because of a trivial dispute between the Bey of Algiers and the French Consul over a question of grain! It was an auspicious moment, however. The sea power of the Ottoman Empire had been irrevocably destroyed three years before at the battle of Navarino. Mohammed Ali was severing in Egypt the essential link of the chain that bound Africa to Turkey. Christian civilization was being reëstablished in the Hellenic peninsula. Italy was at the threshold of the generation which was to bring national unity. . . . Fashoda was the awakening. This humiliation had to come. With aims definitely centered on definitely assured territories, the builders of the colonial empire were able to proceed to administrative organization along lines that would bring financial results. The money needed for economic development could then be solicited and obtained from Parliament and from private capital. . . . Napoleon's idea of an Arab empire was abandoned. The natives could not be assimilated. Algeria could not be held indefinitely as a vast military camp. A European element—for the most part French—must be introduced, given means of acquiring land, and encouraged to come and stay by the granting of privileges not enjoyed by the natives. The first step was the law of 1873 concerning native property. It resulted in the unjust and wholly indefensible eviction of thousands of proprietors from their lands. Then followed the suppression of the Moslem system of administering justice through *kadis*, which resulted in the oppression of the natives and the awakening of religious antagonism. The third step was the extension to Algeria of the new French municipal law. This put the government of communes into the hands of minor officials and white colonists, who became *legally* the masters of the destinies of the natives among whom they lived. All sorts of advantages were granted to colonists to bring them and to keep them in Algeria: partial exemption from military service, partial exemption from taxation, and a gift of lands of dispossessed natives. At the same time, the process of governing from Paris resulted in arrested economic development

and administrative confusion. The Governor of Algeria had no control over the military authorities. Administrations, depending upon ministries in Paris, were directed by considerations and governed by rules totally contrary to the interests of Algeria and unsuited to its different economic and political situation and its peculiar problems. There was no coordination of policy and effort between branches of the Government. Finances were managed from Paris, revenues collected by Paris, and credits voted in the general French budget. . . . Algeria did not prosper. The natives regarded the French, as they had every right to do, as gendarmes and merchants whose one thought was to exploit them and to treat them unjustly. They resented bitterly a régime which forced intruders upon them, gave the intruders exemption from military service and taxation, and imposed upon them [the natives] the burdens from which the intruders were free. The colonists felt that they had exchanged the orderly civil administration at home for a half-baked, improvised uncertain régime that was neither military nor civil, and under which they did not know exactly where they stood. They did not enjoy all the rights of French citizens, especially in the matter of voting upon how the money they paid in taxes and the revenue from the wealth they created should be spent. Essential reforms were enacted after Fashoda, reforms that have brought wealth and prosperity, and make the days of the nineteenth century seem like an ugly dream."—H. A. Gibbons, *New map of Africa*, pp. 130-133.—See also AFRICA: Modern European occupation: Later 19th century.

1896-1906.—Encroachments on the Moroccan boundary. See MOROCCO: 1895-1906.

1898-1912.—Economic and cultural development under the French.—Attitude of French inhabitants towards the natives.—"In 1898, three delegations, to be elected separately by French citizens, taxpayers other than citizens, and natives, were established to decide upon the expenditure of the tax-payers' money. This was the beginning of self-government. But it had no real importance until the law of December 24, 1900, separated Algerian from French finances, and established a distinct Algerian budget. The Algerian delegations, now masters of their finances, discussed and decided how their money should be spent. The result was magical. Immediately there was an extension of public works. Natives as well as colonists began to take an interest in *their* country. Let one illustration suffice. Before 1900, the forests of Algeria brought in only several hundred thousand francs, which represented fines collected from natives. To-day there are practically no fines. But forest products figure in the budget for more than five million francs. Since 1900, Algeria has become, after Great Britain, Germany, Belgium, and the United States, the best client of France. Eighty per cent. of her trade, which amounts to nearly \$250,000,000 per annum, is with the mother country. Railways have been extended [see AFRICA: Modern European occupation: Summary: Modern railroad and industrial development] so that Algeria, whose means of transportation were limited fifteen years ago, has now two thousand miles in exploitation. This has meant a rapid development of mineral wealth, and the possibility of using forest produce, especially cork. The great prosperity of Algeria, however, is in agriculture, where dry farming has brought under cultivation cereal-bearing areas that the natives never utilized. The most remarkable phenomenon in Algeria, from the standpoint of the colonists, is the way the soil takes to vines. Algerian wine

has become a factor in the French markets, and brings to its producers financial returns far beyond their dreams. Algeria is also looked upon as a most important source of mutton for French markets. Popular education was established in Algeria in 1892, and is more extended than anywhere else in Africa except in the South African Commonwealth. Since the inhabitants received the privilege of voting the budget, sums are allotted that would make possible primary education everywhere were it not for the unfortunate system of communal responsibility. There are still a hundred thousand boys in populated centers who have no school facilities, and little has been done to educate girls. But it is the will of the Government to give education to all, and the funds for that purpose are provided. In the matter of schools the French in Algeria have felt much more keenly their stewardship than the British in Egypt. The effort they are making in all their colonies is rivaled only by what the United States is doing in the Philippines. But education brings its problems, especially in old Moslem countries where the natives believe that they are superior to their rulers. In their attitude socially toward natives, the French are found by subject races to be far more pleasant to live with than the British. Especially among the upper classes life is happier and richer for French than for British subject races. . . . The Frenchman feels no racial antipathy for the natives and the native knows it. So the Frenchman has not as much to fear from Moslem education as the Englishman. His political interest does not suffer greatly by the spread of primary education. Higher education of native races is not a nightmare for him. He can conceive of the day when the native holds the franchise, full and free of French citizenship. What he asks is that the native learn to speak French and become impregnated with French ideals. His only fear is being too greatly outnumbered in the midst of a native population. Between 1901 and 1905, the territory of Algeria was greatly extended into the hinterland. By the decree of August 14, 1905, Southern Algeria was organized. It includes the oases on the northern edge of the Sahara. The extension of the railway to the desert and the pacification of the Sahara enabled the civil authorities to take over much sooner than was anticipated the administration of the Algerian hinterland. Not many years ago, a deputy declared in the Palais Bourbon that France would never hold Southern Algeria in any other way than by military posts, whose garrisons would be afraid to go out for a walk unless they were all together and all armed. Garrisons are few to-day, especially since they are needed more in France than in Algeria."—H. A. Gibbons, *New map of Africa*, pp. 133-140.

1919.—Fiscal reform.—"On January 1, 1919, an important fiscal reform went into effect. From that time on, native tax-payers in Northern Algeria were subjected to the same municipal and departmental charges as the European colonists, while they were freed from the whole of the special charges known as "impôts arabes." The new system of taxation includes (1) a land tax on property not devoted to building purposes, to be fixed generally at five per cent. of the taxable revenue of such property, and affecting Europeans in the same way as natives; (2) taxes on industrial and commercial profits, on profits of agriculture and development, on public and private salaries, and on the incomes in non-commercial professions; and (3) a comprehensive tax on income as a whole. Equality between Europeans and natives

in regard to taxation has by now been established in all French colonies in the north of Africa."—*Ibid.*, p. 141.

ALGONQUIAN (Algonkin) FAMILY.—

"About the period 1500-1600, those related tribes whom we now know by the name of Algonkins were at the height of their prosperity. They occupied the Atlantic coast from the Savannah river on the south to the strait of Belle Isle on the north. . . . The dialects of all these were related, and evidently at some distant day had been derived from the same primitive tongue. Which of them had preserved the ancient forms most closely, it may be premature to decide positively, but the tendency of modern studies has been to assign that place to the Cree—the northernmost of all. We cannot erect a genealogical tree of these dialects. . . . We may, however, group them in such a manner as roughly to indicate their relationship. This I do"—in the following list:—"Cree—Old Algonkin.—Montagnais.—Chipeway, Ottawa, Pottawatomie, Miami, Peoria, Pea, Piankishaw, Kaskaskia, Menominee, Sac, Fox, Kikapoo.—Sheshatapoosh, Senecoe, Micmac, Melissee, Etchemin, Abnaki.—Mohegan, Massachusetts, Shawnee, Minsi, Unami, Unalachtigo [the last three named forming, together, the nation of the Lenape or Delawares], Nanticoke, Powhatan, Pampticoke.—Blackfoot, Gros Ventre, Shenyenne. . . . All the Algonkin nations who dwelt north of the Potomac, on the east shore of Chesapeake Bay, and in the basins of the Delaware and Hudson rivers, claimed near kinship and an identical origin, and were at times united into a loose, defensive confederacy. By the western and southern tribes they were collectively known as Wapanachkik—"those of the eastern region"—which in the form Abnaki is now confined to the remnant of a tribe in Maine. . . . The members of the confederacy were the Mohegans (Mahicanni) of the Hudson, who occupied the valley of that river to the falls above the site of Albany, the various New Jersey tribes, the Delawares proper on the Delaware river and its branches, including the Minsi or Monseys, among the mountains, the Nanticokes, between Chesapeake Bay and the Atlantic, and the small tribe called Canai, Kanawhas or Ganawese, whose towns were on tributaries of the Potomac and Patuxent. . . . Linguistically, the Mohegans were more closely allied to the tribes of New England than to those of the Delaware Val-

ley. Evidently, most of the tribes of Massachusetts and Connecticut were comparatively recent offshoots of the parent stem on the Hudson, supposing the course of migration had been eastward. . . . The Nanticokes occupied the territory between Chesapeake Bay and the ocean, except its southern extremity, which appears to have been under the control of the Powhatan tribe of Virginia."—D. G. Brinton, *Lenape and their legends*, ch. 1-2.—"Mohegans, Munsees, Manhattans, Metoacs, and other affiliated tribes and bands of Algonquin lineage, inhabited the banks of the Hudson and the islands, bay and seaboard of New York, including Long Island, during the early periods of the rise of the Iroquois Confederacy. . . . The Mohegans finally retired over the Highlands east of them into the valley of the Housatonic. The Munsees and Nanticokes retired to the Delaware river and reunited with their kindred, the Lenapees, or modern Delawares. The Manhattans, and numerous other bands and sub-tribes, melted away under the influence of liquor and died in their tracks."—H. R. Schoolcraft, *Notes on the Iroquois*, ch. 5.—"On the basis of a difference in dialect, that portion of the Algonquin Indians which dwelt in New England has been classed in two divisions, one consisting of those who inhabited what is now the State of Maine, nearly up to its western border, the other consisting of the rest of the native population. The Maine Indians may have been some 15,000 in number, or somewhat less than a third of the native population of New England. That portion of them who dwelt furthest towards the east were known by the name of Etechemins. The Abenakis, including the Tarratines, hunted on both sides of the Penobscot, and westward as far as the Saco, if not quite to the Piscataqua. The tribes found in the rest of New England were designated by a greater variety of names. The home of the Penacook or Pawtucket Indians was in the southeast corner of what is now New Hampshire and the contiguous region of Massachusetts. Next dwelt the Massachusetts tribe, along the bay of that name. Then were found successively the Pokanokets, or Wampanoags, in the southeasterly region of Massachusetts, and by Buzzard's and Narragansett Bays; the Narragansetts, with a tributary race called Nyanatics in what is now the western part of the State of Rhode Island; the Pequots, between the Narragansetts and the river formerly called the Pequot River, now the Thames; and the Mohegans, spreading themselves beyond the River Connecticut. In the central region of Massachusetts were the Nipmucks, or Nipnets; and along Cape Cod were the Nausets, who appeared to have owed some fealty to the Pokanokets. The New England Indians exhibited an inferior type of humanity. . . . Though fleet and agile when excited to some occasional effort, they were found to be incapable of continuous labor. Heavy and phlegmatic, they scarcely wept or smiled."—J. G. Palfrey, *Compendious history of New England*, bk. 1, v. 1, ch. 3.—"The valley of the 'Cahohatatea,' or Mauritius River [i. e., the Hudson river, as now named] at the time Hudson first ascended its waters, was inhabited, chiefly, by two aboriginal races of Algonquin lineage, afterwards known among the English colonists by the generic names of Mohegans and Mincees. The Dutch generally called the Mohegans, Mahicans; and the Mincees, Sanhikans. These two tribes were subdivided into numerous minor bands, each of which had a distinctive name. The tribes on the east side of the river were generally Mohegans; those on the west side, Mincees. They were hereditary enemies. . . . Long Island, or 'Sewan-hacky,' was occupied by the savage tribe of Metowacks, which was sub-

divided into various clans. . . . Staten Island, on the opposite side of the bay, was inhabited by the Monatons. . . . Inland, to the west, lived the Raritans and the Hackinsacks; while the regions in the vicinity of the well-known 'Highlands,' south of Sandy Hook, were inhabited by a band or sub-tribe called the Nevesincks or Navisincks. . . . To the south and west, covering the centre of New Jersey, were the Aquamachukes and the Stankekans; while the valley of the Delaware, northward from the Schuylkill, was inhabited by various tribes of the Lenape race. . . . The island of the Manhattans" was occupied by the tribe which received that name [see MANHATTAN]. On the shores of the river, above, dwelt the Tappans, the Weckquaesgeeks, the Sint Sings, "whose chief village was named Ossin-Sing, or 'the Place of Stones,'" the Pachami, the Waorinacks, the Wappingers, and the Waronawankongs. "Further north, and occupying the present counties of Ulster and Greene, were the Minqua clans of Minnesincks, Nanticokes, Mincees, and Delawares. These clans had pressed onward from the upper valley of the Delaware. . . . They were generally known among the Dutch as the Esopus Indians."—J. R. Brodhead, *History of the state of New York*, v. 1, ch. 3.—"The area formerly occupied by the Algonquin family was more extensive than that of any other linguistic stock in North America, their territory reaching from Labrador to the Rocky Mountains, and from Churchill River of Hudson Bay as far south at least as Pamlico Sound of North Carolina. In the eastern part of this territory was an area occupied by Iroquoian tribes, surrounded on almost all sides by their Algonquin neighbors. On the south the Algonquin tribes were bordered by those of Iroquoian and Siouan (Catawba) stock, on the southwest and west by the Muskogean and Siouan tribes, and on the northwest by the Kitunahan and the great Athapascan families, while along the coast of Labrador and the eastern shore of Hudson Bay they came in contact with the Eskimo, who were gradually retreating before them to the north. In Newfoundland they encountered the Beothukan family, consisting of but a single tribe. A portion of the Shawnee at some early period had separated from the main body of the tribe in central Tennessee and pushed their way down to the Savannah River in South Carolina, where, known as Savannahs, they carried on destructive wars with the surrounding tribes until about the beginning of the 18th century they were finally driven out and joined the Delaware in the north. Soon afterwards the rest of the tribe was expelled by the Cherokee and Chicasa, who thenceforward claimed all the country stretching north to the Ohio River. The Cheyenne and Arapaho, two allied tribes of this stock, had become separated from their kindred on the north and had forced their way through hostile tribes across the Missouri to the Black Hills country of South Dakota, and more recently into Wyoming and Colorado, thus forming the advance guard of the Algonquin stock in that direction, having the Siouan tribes behind them and those of the Shoshonean family in front. [The following are the] principal tribes: Abnaki, Algonquin, Arapaho, Cheyenne, Conoy, Cree, Delaware, Fox, Illinois, Kickapoo, Mahican, Massachusetts, Menominee, Miami, Micmac, Mohegan, Montanais, Montauk, Munsee, Nanticoke, Narraganset, Nauset, Nipmuc, Ojibwa, Ottawa, Pamlico, Pennacook, Pequot, Piankishaw, Pottawotomi, Powhatan, Sac, Shawnee, Siksika, Wampanoag, Wappinger. The present number of the Algonquin stock is about 95,600, of whom about 60,000 are in Canada and the remainder in the United States."—J. W. Powell, *Seventh annual report (Bureau of Ethnology, pp.*

ALGUAZIL. See **ALCALDE**.

ALHAMA, Fall of (1476-1492). See **SPAIN**: 1470-1492.

ALHAMBRA, Granada, the most interesting example of the splendid citadel-palaces built by the Moorish conquerors. It was begun in 1248 by Mohammed-ben-Al-Hamar, enlarged in 1279 by his successor, and again in 1306, when its mosque was built. It "represents the best preserved as well as the most perfect example of the Moorish-Arabic genius. It was a fortress-palace, much of it built on the brink of the rock, the steep slopes of which were used to construct the lower stories of baths, offices, and guard-rooms. The exterior has no impressiveness, though the original grouping of walls and roofs must have been highly picturesque. Its halls, chambers, and remains of a mosque are clustered about two rectangular courts or patios, which are joined like the two parts of an 'L'—the 'Court of the Alberca' and the 'Court of the Lions.' From one of the ends of the Alberca Court projects the 'Hall of the Ambassadors'; from the other the 'Hall of the Tribunal,' while the long sides of the Court of Lions open respectively into the 'Hall of the Abencerrages' and the 'Hall of the Two Sisters.' The 'Court of the Lions' is so called from the fountain in its centre, an immense marble basin supported, upon twelve lions, which form a remarkable exception to the Muhammedan rule against representing the image of any living thing. Both these Courts are arcaded, the columns, set singly or in pairs, or groups, exhibiting, as do all the columns in the Alhambra, distinctive features in their capitals, which are separated by a high necking from the shaft. It is, however, in the interior of the halls that the decoration reaches its finest pitch and nowhere more than in the 'Hall of the Two Sisters,' which formed the culminating feature of the harem quarters. The name is supposed to have been derived from two slabs of marble in the pavement but may well have been suggested by the window, which occupies a bay and is divided by a small column and two arches into two lights. The walls, above a high wainscot of lusted tiles, are encrusted with flat moulded arabesques, representing a delicate lacelike tracery of leafy vines and tendrils, still tintured with the red, blue, and gold that formerly enriched them. The arabesques melt into the stalactite embellishments which completely cover the hollow of the dome; created, as it seems, by giant bees, whose cells hang down like grape-clusters in an endless profusion of exquisite intricacy. Time was when this unsurpassable delicacy of magnificence glowed with gold touched into a thousandfold diversity of tones, by the light of hanging lamps. As an

expression of the Arabic genius in the direction of subtlety, this represents finality. It embodies the culture of a race that in its learning as in its art had been devoted to the exaltation of details; and embodies also the latent instinct of a desert-wandering race whose eye had been little habituated to varieties of form, but saturated with colour and in the watches of the night had been long familiar with the mystery of vaulted sky, sown with star-clusters and hung with the jewelled lamps of planets. It was characteristic also of the Oriental fondness of abstraction that revels in subtleties and loves to merge itself in the contemplation of the infinite. It is the kind of decoration that being denied the reinforcement of nature was bound to evolve sterility."—C. H. Caffin, *How to study architecture, pp. 226-227*.—See also **ARCHITECTURE**: Mohammedan; **Spain**: 1238-1273.

ALIEN CONTRACT LABOR LAW (1885). See **LABOR LEGISLATION**: 1864-1920.

ALIEN ENEMIES, residents or sojourners in a country who are citizens or subjects of a hostile State. Their legal position is accurately indicated by the assurance addressed by the President to alien enemies in the United States, in his proclamation of April 6, 1917, that so long as they refrained from acts of hostility toward the United States and obeyed the laws they should "be undisturbed in the peaceful pursuit of their lives and occupations and be accorded the consideration due to all peaceful and law-abiding persons, except so far as restrictions may be necessary for their own protection and for the safety of the United States."

Restrictions in United States.—These were prescribed by the President in his proclamations of April 6 and November 16, 1917, by virtue of authority conferred upon him by paragraphs 4067-4070 of the Revised Statutes. By the earlier proclamation alien enemies were forbidden to have in their possession any firearms, ammunition, explosives, wireless apparatus or parts thereof; or to approach within one-half mile of any fort, camp,

© E. M. Newman

COURT OF THE LIONS IN THE ALHAMBRA, GRANADA, SPAIN

arsenal, aircraft station, navel vessel, navy yard, or munitions factory; or to write, print, or publish any attack upon the Government of the United States, Congress, or any person in the service of the United States, or upon any measure of the Government; or to abet any hostile acts against the United States, or to give its enemies information or aid and comfort. Alien enemies transgressing those restrictions were liable to summary arrest and to removal to any place designated by the President. Finally, no alien enemy could either leave or enter the United States except under restrictions to be prescribed by the President. The supplementary proclamation of November 16 forbade alien enemies to "enter or be found within" the District of Columbia or the Panama Canal Zone; or within 100 yards of any canal, wharf, pier, dry dock, warehouse, elevator, railroad terminal, etc.; or to be found on the waters within 3 miles of the shore line of the United States, or on any of the Great Lakes, except on public ferries; or to ascend in any airplane, balloon, etc. It also provided for the registration and issuance of registration cards to all alien enemies, with prohibition of change of abode or travel except on permission; and for monthly, weekly, or other periodical report to Federal, State, or local authorities as might be specified. Subsequent instructions to water-front operators provided for cooperation with United States troops in guarding docks, piers, warehouses, etc.—See also **WORLD WAR: 1917: VIII. United States and the war: e**; also **ALIEN PROPERTY CUSTODIAN; U. S. A.: 1917 (October): Trading with the Enemy Act.**

ALIEN IMMIGRATION LAWS: Canada. See **IMMIGRATION AND EMIGRATION: Canada: 1920.**

ALIEN LAND LAWS.—In many countries laws exist limiting or prohibiting the ownership of real estate by aliens. At common law it was not allowed, but in England and in most of the States in this country the disability has been removed since 1870. Various countries for obvious military reasons prohibit alien land ownership in frontier districts. Japan prohibits the owning of land by foreigners, but seeks for her nationals a continuance of the privilege of holding land in California. In view of the referendum of 1920, by which the people of California voted in favor of prohibiting alien land ownership, a controversy developed with Japan. There arose from this the question of the validity of state law if in seeming conflict with a national treaty.—See also **CALIFORNIA: 1900-1920.**

ALIEN PROPERTY CUSTODIAN, United States, an official created during the World War by the Trading with the Enemy Act, with power to require, at his discretion, any property held within the United States for, or on behalf of, an "enemy" or "ally of enemy," to be transferred to him, and to hold the same as trustee till the end of the war. The primary purpose of the measure was to prevent the property of the enemy from being used in the service of the enemy and to safeguard well-disposed enemy aliens from having their property thus abused. It also put it in the power of the government to requisition easily such property when it might require the same for the prosecution of the war, or even to confiscate it should Germany confiscate the property of Americans held in Germany. The provisions of the act applied to patents, debts, and ready money, and the latter was expected to be invested in Liberty Bonds. It

should be added that German subjects and the subjects of her allies, resident in the United States, did not, from the mere fact of their nationality, fall within the operation of the act.—See also **U. S. A.: 1917 (Oct.): Trading with the Enemy Act.**

ALLEGEWIS. See **ALLEGHANS.**

ALLEGHANS, or Allegewi, or Talligewi.—"The oldest tribe of the United States, of which there is a distinct tradition, were the Alleghans. The term is perpetuated in the principal chain of mountains traversing the country. This tribe, at an antique period, had the seat of their power in the Ohio Valley and its confluent streams, which were the sites of their numerous towns and villages. They appear originally to have borne the name of Alli, or Alleg, and hence the names of Talligewi and Allegewi. (Trans. Am. Phi. Soc., vol. 1.) By adding to the radical of this word the particle 'hany' or 'ghany,' meaning river, they described the principal scene of their residence—namely, the Alleghany, or River of the Alleghans, now called Ohio. The word Ohio is of Iroquois origin, and of a far later period; having been bestowed by them after their conquest of the country, in alliance with the Lenapees, or ancient Delawares. (Phi. Trans.) The term was applied to the entire river, from its confluence with the Mississippi, to its origin in the broad spurs of the Alleghanies, in New York and Pennsylvania. . . . There are evi-

dences of antique labors in the alluvial plains and valleys of the Scioto, Miami, and Muskingum, the Wabash, Kaskaskia, Cahokia, and Illinois, denoting that the ancient Alleghans, and their allies and confederates, cultivated the soil, and were semi-agriculturists. These evidences have been traced, at late periods, to the fertile table-lands of Indiana and Michigan. The tribes lived in fixed towns, cultivating extensive fields of the zea-maize; and also, as denoted by recent discoveries, . . . of some species of beans, vines, and esculents. They were, in truth, the mound builders."—H. R. Schoolcraft, *Information respecting the Indian tribes*, pt. 5, p. 133.—This conclusion, to which Mr. Schoolcraft had arrived, that the ancient Alleghans or Tallegwi were the mound builders of the Ohio valley is being sustained by later investigators, and seems to have become an accepted opinion among those of highest authority. The Alleghans, moreover, are being identified with the Cherokees of later times, in whom their race, once supposed to be extinct, has apparently survived; while the fact, long suspected, that the Cherokee language is of the Iroquois family is being proved by the latest studies. According to Indian tradition, the Alleghans were driven from their ancient seats, long ago, by a combination against them of the Lenape (Delawares) and the Mengwe (Iroquois). The route of their migrations is being traced by the character of the mounds which they built, and of the remains gathered from the mounds. "The general movement [of retreat before the Iroquois and Lenape] . . . must have been southward, . . . and the exit of the Ohio mound builders was, in all probability, up the Kanawah Valley on the same line that the Cherokees appear to have followed in reaching their historical locality. . . . If the hypothesis here advanced be correct, it is apparent that the Cherokees entered the immediate valley of the Mississippi from the northwest, striking it in the region of Iowa."—C. Thomas, *Problem of the Ohio mounds* (*Bureau of Ethnology*, 1889). See CHEROKEES; IROQUOIS CONFEDERACY; also AMERICA, PREHISTORIC.

ALLEGIANCE, the fidelity owed by every person to a ruler or to a state. Developing from feudal times, when it was a personal obligation to the subject's liege lord, it is in modern monarchies a duty owed nominally to the sovereign but really to the country which he personifies. In the United States of America, allegiance is due the state itself. It readily falls into three classes: (1) natural allegiance, due to birth within the country; (2) acquired allegiance, due to voluntary naturalization or to acquiescence in citizenship granted in connection with the transfer of territory from one country to another; (3) temporary limited allegiance, due from a foreigner to the country in which he is sojourning, and involving proper obedience to authority. This last obligation is terminated on departure from the country. Natural allegiance also applies to those born abroad under certain circumstances, and cases of ambiguity are settled by voluntary election of citizenship. For example, if an American citizen has a child born abroad, it is considered a natural born American. At the same time the child born in America of foreign parents may choose American allegiance and automatically assume American citizenship. The right of voluntary naturalization and transfer of allegiance has been generally recognized since about 1870 by most civilized nations,

although previously allegiance was regarded as inalienable. The former doctrine had led to the British claim of the right to impress seamen of alleged British birth; and to demands of continental countries that their nationals should not escape military duty by American naturalization. The late German empire asserted the right of dual citizenship and actually passed a law by which Germans could retain the rights and duties of German allegiance even after taking oath to support and defend another country.—See also BRITISH EMPIRE: Citizenship; NATURALIZATION; U. S. A.; 1812 and 1814.

ALLEGRI, Gregorio (1584-1652), Italian composer. Entered the Papal chapel in 1629. His works are chiefly motets, the most famous of which is the *Miserere* sung annually by the Pontifical choir on Wednesday and Friday of Holy Week. See MUSIC: 16th century.

ALLEMAGNE, the French name for Germany, derived from the confederation of the Alemanni. See ALSACE-LORRAINE: 1871.

ALLEMANT, France, taken by the French (1917). See WORLD WAR: 1917: II. Western front: f, 3.

ALLEN, Charles Herbert (1848-), American politician and banker. Appointed governor of Porto Rico. See PORTO RICO: 1900 (May), (November-December).

ALLEN, Ethan (1737-1789), American soldier. Upheld the rights of New Hampshire against New York state for jurisdiction over the "New Hampshire Grants," now Vermont. To protest against the disregard of this claim, he organized the Green Mountain Boys, and at the outbreak of the Revolution offered their services to the American cause. Captured Fort Ticonderoga in 1775. Accompanied the Montgomery expedition to Montreal and was made prisoner. His correspondence with Governor Haldimand of Canada laid him open to a charge of treason which was never substantiated.—See also VERMONT: 1749-1774, 1781; U. S. A.: 1775 (May), (August-December).

ALLEN, Grant (1848-1899). See ART: What is art.

ALLEN, Henry Justin (1868-), American editor and statesman; governor of Kansas, 1919-1921. An independent Republican. Broke a coal miners' strike by calling upon citizens to serve as volunteer miners. Sponsored some drastic legislation for compulsory arbitration of industrial disputes which he defended in debate with Samuel Gompers.—See also ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1920-1921.

ALLEN, Horatio (1802-1889), American engineer. Inventor of the swivelling truck for locomotives. See RAILROADS: 1830-1880.

ALLEN, Ira (1751-1814), brother of Ethan Allen, one of the founders of Vermont. See VERMONT: 1781.

ALLEN, James Lane (1849-), American novelist and short-story writer. Graduate of Kentucky University (1872), where he later taught languages. Since 1886 he has devoted himself to the writing of novels dealing almost wholly with the 'blue-grass region' and containing studies of nature and the pioneers.

ALLEN, Sir James (1855-), Prime Minister of New Zealand since 1912 and minister of finance and education from 1912 to 1915. For his action in the New Zealand coal strike see LABOR STRIKES AND BOYCOTTS: 1917.

ALLEN, William (1806-1870), American statesman. Member of Congress from Ohio, 1833-35; United States senator, 1837-49. Elected Democratic governor of Ohio, 1873. Favored green-

back paper money. Defeated for reelection by R. B. Hayes. Reputed author of the slogan "Fifty-four forty, or fight." Known in the senate as "Earthquake Allen," and "The Ohio Gong."

ALLENBY, Edmund Henry Hynman, Viscount (1861-), British field marshal; served in South Africa in various campaigns from 1884 to 1902, commanding cavalry in the Boer War and being cited and decorated; had important cavalry command at beginning of World War, being promoted to lieutenant-general; commander-in-chief Egyptian Expeditionary Force, 1917-1919; served throughout Palestine campaign and was made field-marshal and viscount; captured Jerusalem in 1917 and in the campaign of 1918 crushed Turkish resistance in Syria. In 1920, made High Commissioner for Egypt.—See also EGYPT: 1918-1919.

ALLISON, William Boyd (1820-1908), American legislator, served as Republican in House of Representatives (1863-1871); elected to Senate in 1873 and reelected in 1878, 1884, 1890, 1896 and 1902; assured the passage of the Silver Coinage Act of 1878, known as the Bland-Allison Act, by amending Bland's original bill and striking out the provision for "free and unlimited" silver coinage.

ALLIZE: French minister at Munich and Bavaria. See WORLD WAR: Diplomatic background: 12, and 4.

ALLMAN, George James (1812-1898), Scottish zoölogist; Regius professor of natural history in Edinburgh University, 1855; president of the Linnæan Society, 1874, and president of the British Association, 1870.

ALLOBROGES, Conquest of the.—The Allobroges having sheltered the chiefs of the Salyes, when the latter succumbed to the Romans, and having refused to deliver them up, the proconsul

Cn. Domitius marched his army toward their country, B. C. 121. The Allobroges advanced to meet him and were defeated at Vindalium, near the junction of the Sorgues with the Rhone, and not far from Avignon, having 20,000 men slain and 3,000 taken prisoners. The Arverni, who were the allies of the Allobroges, then took the field crossing the Cevennes mountains and the river Rhone with a vast host, to attack the small Roman army of 30,000 men, which had passed under the command of Q. Fabius Maximus Æmilianus. On the 8th of August, B. C. 121, the Gaulish horde encountered the legions of Rome, at a point near the junction of the Isere and the Rhone, and were routed with such enormous slaughter that 150,000 are said to have been slain or drowned. This battle settled the fate of the Allobroges, who surrendered to Rome without further struggle; but the Arverni were not pursued. The final conquest of that people was reserved for Cæsar.—G Long, *Decline of the Roman Republic*, v. 1, ch. 21.

ALLOTMENTS.—"From 1882 to 1890, [in England] a series of allotment Acts were passed to enable the local authorities to acquire lands to rent in small parcels. This was followed in 1892, by the Small Holdings Act, empowering County Councils to obtain lands and advance sums of money to those who desired to purchase holdings of fifty acres or under. But none of these measures proved effective; for in fifteen years not more than 850 acres were sold. A new Small Holdings and Allotments Act of 1907, authorizing the County Councils to take lands at the current price with or without the consent of the large owners, has proved more successful, and within three years nearly 100,000 acres were allotted to small cultivators. At present [1920], plans are under discussion to improve the housing conditions of the agricultural laborer, to raise his wages, to secure deserving tenants against eviction, and to increase still further the number of peasant proprietors."—A. L. Cross, *History of England and Greater Britain*, pp. 742-743.

ALLOUEZ, Claude Jean (1620-1689), one of the early French Jesuits to visit the Great Lakes. Founded the Mission of the Holy Ghost on Lake Superior in 1665, explored Green Bay and established missions among the Illinois Indians.—See also CANADA: 1634-1673; WISCONSIN: 1658-1669.

ALLPORT, Sir James Joseph (1811-1892), English railway manager. Was connected with the growth and development of railway lines from their beginning and rose to be manager of the great Midland system, one of the most important in England. Developed the third-class passenger service at a penny a mile.

ALLSTON, Washington (1779-1843), American historical painter and poet. "Elijah in the wilderness," "The Prophet Jeremiah" and "Saul and the Witch of Endor" are among his most noted works.

ALMANZA, or Almansa, Battle of. See SPAIN: 1707.

ALMA-TADEMA, Sir Laurence (Laurens) (1836-1912), Dutch-British painter. Many of his paintings were designed to reproduce the life of ancient Egypt, Greece and Rome. "The education of the children of Clovis," "An Egyptian at his

doorway," "The mummy," "Phidias and the Elgin marbles," and "The vintage festival" are among his most notable works.

ALMEIDA, Francisco de (c. 1450-1510), Portuguese warrior. Served against the Moors; established Portuguese fortresses in Cochin, Ceylon and Sumatra; destroyed the Egyptian fleet at Diu in 1508.—See also **COMMERCE**: Era of geographic expansion: 15th-17th centuries: Leadership of the Portuguese; **INDIA**: 1408-1580.

ALMENARA, Battle of (1710). See **SPAIN**: 1707-1710.

ALMERIC. See **AMALRIC**.

ALMOGAVARES, mercenary Spanish soldiers of the thirteenth and fourteenth centuries. They originally came from the Pyrenees, though they were later recruited from Navarre, Aragon, and Catalonia. They were frontier foot-soldiers, fighting with javelins, short stabbing swords, and shields. The culmination of their achievements was the foundation of the Aragonese duchy of Athens. The name died out in the sixteenth century.

ALMOHADES.—The empire of the Almoravides, in Morocco and Spain, which originated in a Moslem missionary movement, was overturned in the middle of the twelfth century by a movement of somewhat similar nature. The agitating cause of the revolution was a religious teacher named Mahomet ben Abdallah, who rose in the reign of Ali (successor to the great Almoravide prince, Joseph), who gained the odor of sanctity at Morocco and who took the title of Al Mehdi, or El Mahdi, the Leader, "giving himself out for the person whom many Mahometans expect under that title. As before, the sect grew into an army, and the army grew into an empire. The new dynasty were called Almohades from Al Mehdi, and by his appointment a certain Abdelmumen was elected Caliph and Commander of the Faithful. Under his vigorous guidance the new kingdom rapidly grew, till the Almohades obtained quite the upper hand in Africa, and in 1146 they too passed into Spain. [See **SPAIN**: 1146-1232.] Under Abdelmumen, Joseph and Jacob Almansor, the Almohades entirely supplanted the Almoravides, and became more formidable foes than they had been to the rising Christian powers. Jacob Almansor won in 1195 the terrible battle of Alarcos against Alfonso of Castile, and carried his conquests deep into that kingdom. His fame spread through the whole Moslem world. . . . With Jacob Almansor perished the glory of the Almohades. His successor, Mahomet, lost in 1211 [June 16] the great battle of Alcab or Tolosa against Alfonso, and that day may be said to have decided the fate of Mahometanism in Spain. The Almohade dynasty gradually declined. . . . The Almohades, like the Ommiads and the Almoravides, vanish from history amidst a scene of confusion the details of which it were hopeless to attempt to remember."—E. A. Freeman, *History and conquests of the Saracens*, lect. 5.—See also **AFRICA**: Ancient and mediæval civilization; Arab occupation.

Also in H. Coppée, *History of the conquest of Spain by the Arab-Moors*, bk. 8, ch. 4.

ALMONACID, Battle of (1800). See **SPAIN**: 1800 (August-November).

ALMORAVIDES.—During the confusions of the 11th century in the Moslem world, a missionary from Kairwan—one Abdallah—preaching the faith of Islam to a wild tribe in Western North Africa, created a religious movement which "naturally led to a political one."

"The tribe now called themselves Almoravides, or more properly Morabethah, which appears to

mean followers of the Marabout or religious teacher. Abdallah does not appear to have himself claimed more than a religious authority, but their princes Zachariah and Abu Bekr were completely guided by his counsels. After his death Abu Bekr founded in 1070 the city of Morocco. There he left as his lieutenant his cousin Joseph, who grew so powerful that Abu Bekr, by a wonderful exercise of moderation, abdicated in his favour, to avoid a probable civil war. This Joseph, when he had become lord of most part of Western Africa, was requested, or caused himself to be requested, to assume the title of Emir al Momenin, Commander of the Faithful. As a loyal subject of the Caliph of Bagdad, he shrank from such sacrilegious usurpation, but he did not scruple to style himself Emir Al Muslemin, Commander of the Moslems. . . . The Almoravide Joseph passed over into Spain, like another Tarik; he vanquished Alfonso [the Christian prince of the rising kingdom of Castile] at Zalacca [Oct. 23, 1086] and then converted the greater portion of Mahometan Spain into an appendage to his own kingdom of Morocco. The chief portion to escape was the kingdom of Zaragossa, the great out-post of the Saracens in northeastern Spain. . . . The great cities of Andalusia were all brought under a degrading submission to the Almoravides. Their dynasty however was not of long duration, and it fell in turn [1147] before one whose origin was strikingly similar to their own" [the Almohades q.v.].—E. A. Freeman, *History and conquests of the Saracens*, lect. 5.—See also **CRUSADES**: Map: A. D. 1097; **PORTUGAL**: Early history; **SPAIN**: 1146-1232.

Also in: H. Coppée, *History of the conquest of Spain by the Arab-Moors*, bk. 8, ch. 2 and 4.

ALMUTZ, Siege of (1758). See **GERMANY**: 1758.

ALNWICK CASTLE, a British merchant ship torpedoed March 19, 1917, by a German submarine without warning 320 miles from land; the crew was forced to take to six open boats, some of which were lost. After several days of severe suffering the survivors were rescued by the French steamer *Venezia*.

ALOD, ALODIAL.—"It may be questioned whether any etymological connexion exists between the words odal and alod, but their signification applied to land is the same; the alod is the hereditary estate derived from primitive occupation; for which the owner owes no service except the personal obligation to appear in the host and in the council. . . . The land held in full ownership might be either an ethel, an inherited or otherwise acquired portion of original allotment; or an estate created by legal process out of public land. Both these are included in the more common term alod; but the former looks for its evidence in the pedigree of its owner or in the witness of the community, while the latter can produce the charter or book by which it is created, and is called bocland. As the primitive allotments gradually lost their historical character, as the primitive modes of transfer became obsolete, and the use of written records took their place, the ethel is lost sight of in the bookland. All the land that is not so accounted for is folcland, or public land."—W. Stubbs, *Constitutional history of England*, ch. 3, sect. 24, and ch. 5, sect. 36.—"Alodial lands are commonly opposed to beneficiary or feudal; the former being strictly proprietary, while the latter depended upon a superior. In this sense the word is of continual recurrence in ancient histories, laws and instruments. It sometimes, however, bears the sense of inheritance. . . . Hence, in the charters

of the eleventh century, hereditary fiefs are frequently termed *alodia*."—H. Hallam, *View of the state of Europe during the Middle Ages, ch. 2, pt. 1, note*.—See also FOLCLANO.

ALOMPRA, Aloung P'Houra (1711-1760), founder of the last Burmese dynasty. Ousted the invading Peguans in 1753, and seized the Burmese throne; founded the city of Rangoon. In 1757 conquered Pegu, making himself one of the most powerful of eastern monarchs.—See also BURMA: Early history.

ALONZO, Severo, president of Bolivia, 1896-1899. See BOLIVIA: 1899.

Alost, a town in central Belgium, the old capital of East Flanders, thirty miles west of Louvain. Printing was introduced into Belgium in 1475 by Thierry Martens, a native of Alost. In 1914 the scene of military severities and violations of the laws of war by the Germans. See BELGIUM: 1667; WORLD WAR: Miscellaneous auxiliary services: X. Alleged atrocities and violation of international law: a, 11.

ALP, the name given by the Swiss inhabitants of the Alpine valleys to the summer pastures situated on the slopes of the mountains, below the snow line. These mountain pastures, found throughout the Alpine system, have been in use for more than a thousand years; references to their existence in the years 730, 868 and 990 have been noted. In the German-speaking mountain districts these alps are the centers of the pastoral life of the inhabitants. Statistics show that there are 4778 such pastures now in the country, 45% of which are owned jointly or exclusively by the communes, 54% by individuals, and the remaining 1% by the state or a few of the larger monasteries.

ALSO IN: J. Ball, *Hints and notes, practical and scientific, for travellers in the Alps (art. X and pp. lvii-lxv)*.

ALP ARSLAN, or Mohammed ben Da'ud (1029-1072), sultan of Khorasan, 1059-1072. Conquered Georgia and Armenia about 1064; in 1071 captured Aleppo and took prisoner the Byzantine emperor Romanus Diogenes; founder of the Seljuk empire of Rum. See TURKEY: 1063-1073.

ALPHABET.—Importance of the alphabet.—"To us nothing seems more natural or more easy than to express on paper the sounds of our spoken words by means of those twenty-six simple signs which we call the letters of the Alphabet. The phrase 'as easy as A. B. C.' has actually become a proverbial expression. And yet, if we set aside the still more wonderful invention of speech, the discovery of the Alphabet may fairly be accounted the most difficult as well as the most fruitful of all the past achievements of the human intellect. It has been at once the triumph, the instrument, and the register of the progress of our race. But, long before the Alphabet had been invented, men had contrived other systems of graphic representation by means of which words could be recorded. The discovery of some rude form of the art of writing was, we may believe, the first permanent step that was taken in the progress towards civilization. Till men could leave behind them a record of acquired knowledge the sum of their acquisitions must have remained almost stationary. Thus only could successive generations be enabled to profit by the labours of those who had gone before, and begin their onward progress from the most advanced point which their predecessors had attained. It is true that at a time when writing was unknown it would be possible for civilization to advance in certain defined directions.

There would, for example, be nothing to prevent a considerable development of artistic skill; the metallurgic, the ceramic, and the textile arts might flourish, and certain forms of poetry—lyric, epic, and dramatic—would not altogether be impossible. All this might easily be the case, but, on the other hand, law would be mainly custom, science could be little more than vague traditions, history would be uncertain legend, while religion must have consisted mainly of rhythmic adornings, and of formulas of magical incantation. The Vedic hymns, the Arval chants, the Rhapsodies of the Kalevala, the metrical maledictions of Accadian priests, the tale of Troy, the legend of Romulus, the traditional folk lore of the Maoris, may give us a measure of the extreme limits which are attainable by the religion, the literature, the history, and the science of unlettered nations. It is more than a mere epigram to affirm that unlettered races must of necessity be illiterate. But not only may a people have a literature without letters, but they may possess the Art of Writing without the knowledge of an Alphabet. Every system of non-alphabetic writing will, however, either be so limited in its power of expression as to be of small practical value, or, on the other hand, it will be so difficult and complicated as to be unsuited for general use. It is only by means of the potent simplicity of the alphabet that the art of writing can be brought within general reach. The familiar instances of Egypt, Assyria, and China are sufficient to prove that without the alphabet any complete system for the graphic representation of speech is an acquirement so arduous as to demand the labour of a lifetime. Under such conditions, science and religion necessarily tend to remain the exclusive property of a sacerdotal caste; any diffused and extended national culture becomes impossible, religion degenerates into magic, the chasm which separates the rulers and the ruled grows greater and more impassable, and the very art of writing, instead of being the most effective of all the means of progress, becomes one of the most powerful of the instruments by which the masses of mankind can be held enslaved. Hence it must be admitted that the really important factor in human progress is not so much the discovery of a method by which words can be recorded, as the invention of some facile graphic device, such as the alphabet, by means of which the art of writing can be so far simplified as to become attainable before the years of adolescence have been passed."—I. Taylor, *History of the alphabet*, pp. 1-3.

Earliest stages of development.—"The art of writing involves very complex factors. It can hardly be in doubt that man learned that art by slow and painful stages. The conception of such an analysis of speech-sounds as would make the idea of an alphabet possible must have come as the culminating achievement of a long series of efforts. The precise steps that marked this path of intellectual development can for the most part be known only by inference; yet it is probable that the main chapters of the story may be reproduced with essential accuracy. For the very first chapters of the story we must go back in imagination to the pre-historic period. Even barbaric man feels the need of self-expression, and strives to make his ideas manifest to other men by pictorial signs. The cave-dweller scratched pictures of men and animals on the surface of a reindeer horn or mammoth tusk as mementos of his prowess. The American Indian does essentially the same thing to-day, making pictures that crudely record his successes in war and the chase. The Northern

Indian had got no farther than this when the white man discovered America; but the Aztecs of the South-west and the Maya people of Yucatan had carried their picture-making to a much higher state of elaboration. They had developed systems

of pictographs or hieroglyphics that would doubtless in the course of generations have been elaborated into alphabetical systems, had not the Europeans cut off the civilization of which they were the highest exponents. What the Aztec and Maya

EXAMPLES OF EARLY ALPHABETS

were striving toward in the sixteenth century A. D., various Oriental nations had attained at least five or six thousand years earlier. In Egypt at the time of the pyramid-builders, and in Babylonia at the same epoch, the people had developed systems of writing that enabled them not merely to present a limited range of ideas pictorially, but to express in full elaboration and with finer shades of meaning all the ideas that pertain to highly cultured existence. The man of that time made records of military achievements, recorded the transactions of every-day business life, and gave expression to his moral and spiritual aspirations in a way strangely comparable to the manner of our own time. He had perfected highly elaborate systems of writing. Of the two ancient systems of writing just referred to as being in vogue at the so-called dawning of history, the more picturesque and suggestive was the hieroglyphic system of the Egyptians. This is a curiously conglomerate system of writing, made up in part of symbols reminiscent of the crudest stages of picture-writing, in part of symbols having the phonetic value of syllables, and in part of true alphabetical letters. In a word, the Egyptian writing represents in itself the elements of the various stages through which the art of writing has developed. We must conceive that new features were from time to time added to it, while the old features, curiously enough, were not given up. Here, for example, in the midst of unintelligible lines and pothooks, are various pictures that are instantly recognizable as representations of hawks, lions, ibises, and the like. It can hardly be questioned that when these pictures were first used calligraphically they were meant to represent the idea of a bird or animal. In other words, the first stage of picture-writing did not go beyond the mere representation of an eagle by the picture of an eagle. But this, obviously, would confine the presentation of ideas within very narrow limits. In due course some inventive genius conceived the thought of symbolizing a picture. To him the outline of an eagle might represent not merely an actual bird, but the thought of strength, of courage, or of swift progress. [See also AZTEC AND MAYA PICTURE WRITING.] Such a use of symbols obviously extends the range of utility of a nascent art of writing. Then in due course some wonderful psychologist—or perhaps the joint efforts of many generations of psychologists—made the astounding discovery that the human voice, which seems to flow on in an unbroken stream of endlessly varied modulations and intonations, may really be analyzed into a comparatively limited number of component sounds—into a few hundreds of syllables. That wonderful idea conceived, it was only a matter of time until it would occur to some other enterprising genius that by selecting an arbitrary symbol to represent each one of these elementary sounds it would be possible to make a written record of the words of human speech which could be reproduced—rephonated—by some one who had never heard the words and did not know in advance what this written record contained. This, of course, is what every child learns to do now in the primer class, but we may feel assured that such an idea never occurred to any human being until the peculiar forms of pictographic writing just referred to had been practised for many centuries. Yet, as we have said, some genius of prehistoric Egypt conceived the idea and put it into practical execution, and the hieroglyphic writing of which the Egyptians were in full possession at the very beginning of what we term the historical period made use of this phonetic system along with the ideographic system already

described.”—H. S. Williams, *History of the Alphabet* (*Harper's Magazine*, v. 108, pp. 534-535).

Deciphering the hieroglyphs.—“Of all the splendid achievements of archaeological research during the present century, there are none of more universal interest and importance than those which are revealing the origin and history of letters. . . . At the beginning of the present [19] century the great mass of testimony now laid open before us was an apparently impenetrable mystery. Egyptian hieroglyphics and cuneiform inscriptions yet remained, for the most part, but confusion of ornament and meaningless signs. Some little advance, it is true, had been reached during the latter part of the eighteenth century, as to the signification of certain hieroglyphic characters, but these were as yet but conjecture; a groping in the dark, with no means to verify, uncertain, unassured. [See also CUNEIFORM WRITING.] With the opening of the present century two events occurred which were to place in the hands of scholars the keys to these mysteries. The first in date of these discoveries, though not in results, was the finding of the Rosetta Stone in 1799. This was an outcome of the French scientific expedition to Egypt under the first Napoleon. At this date, a French artillery officer, named Bousard, while digging among some ruins at Fort St. Julian, near Rosetta, discovered a large stone, of black basalt, covered with inscriptions. This tablet, now known as ‘The Rosetta Stone,’ was of irregular shape, portions having been broken from the top and sides. The inscriptions were in three kinds of writing; the upper text in hieroglyphic characters, the second in a later form of Egyptian writing, called enchorial or demotic, and the third was in Greek. No one of these had been entirely preserved. Of the hieroglyphic text, a considerable portion was lacking; perhaps thirteen or fourteen lines at the beginning. From the demotic, the ends of about half the lines were lost, while the Greek text was nearly perfect, with the exception of a few words at the end. The immediate inferences were that these three inscriptions were but different forms of the same decree, and that in the Greek would be found some clew for the decipherment of the others. It was first presented to the French Institute at Cairo where it was destined not long to remain. The surrender of Alexandria to the British, in 1801, placed the Rosetta Stone, by the terms of the treaty, in the hands of the British commissioner. This gentleman, himself a zealous scholar and keenly alive to the importance of the treasure, at once dispatched it to England, where it was presented by George III to the British Museum. A fac-simile of the inscriptions was made in 1802, by the Society of Antiquaries, of London, and copies were soon distributed among the scholars of Europe. When the Greek inscription was read, it was found to be a decree by the priests of Memphis in honor of King Ptolemy Epiphanes, B. C. 198: That, in acknowledgment of many and great benefits conferred upon them by this king, they had ordered this decree should be engraved upon a tablet of hard stone in hieroglyphic, enchorial and Greek characters; the first, the writing sacred to the priests; the second, the language or script of the people, and the third that of the Greeks, their rulers. Also, that this decree, so engraved, should be set up in the temples of the first, second and third orders, near the image of the ever living King. It might be supposed that with this clew the work of decipherment would be readily accomplished. On the contrary, many of the most distinguished scholars of Europe tried, during the

twenty following years, without success. The chief obstacle in the way was the prevailing opinion that the pictorial forms of Egyptian hieroglyphs were mainly ideographic symbols of things. In consequence, the absurd conceptions read into these characters, led all who attempted the decipherment of these far away from the truth. It is true that Zoëga, a Danish archæologist, and Thomas Young, an English scholar, each independently, about 1787, had made the discovery that the hieroglyphs in the ovals represented royal names, and were perhaps alphabetic; but the signification of these characters were never fully comprehended by either of these great scholars. The claim made by the friends of Mr. Young as the first discoverer of the true methods of decipherment, rests upon the fact that he gave the true phonetic values to five of these characters in the spelling of the names of certain royal personages, and in 1819 published an article announcing this discovery. He seems, however, to have had so little confidence in this conception that he went no farther with it, and still later, in 1823, lost the prestige he might have gained, by the publication as his belief, that the Egyptians never made use of signs to express sound until the time of the Roman and Greek invasions of Egypt. The real work of decipherment was reserved for Champollion, who, born at Grenoble, in 1790, was but nine years old when the famous stone was discovered which later on was to yield to him the long lost language of the hieroglyphs. Among the characters on the Rosetta Stone, in the hieroglyphic text, were to be found certain pictorial forms enclosed in an oval. It had hitherto been suggested that these ovals contained characters signifying royal names. Were these symbolic signs, or how were they to be interpreted? Champollion concluded that some of these signs expressed sound and were alphabetic in character. Thus, if the signs in the cartouche supposed to signify Ptolemy, could be found to be identical, letter for letter, with the *Ptolemaios* of the Greek inscription, an important proof would be obtained. It so happened that on an obelisk found at Philæ there was a hieroglyphic inscription, which, according to a Greek text on the same shaft should be that of Cleopatra. If, then, the signs for P, t and l in *Ptolemaios* corresponded with the signs for p, t and l in *Cleopatra*, the identity of these alphabetic signs would be confirmed. The comparison fully justified his theory, and further confirmation was supplied by further comparisons, until he finally came into possession of hieroglyphic signs for all the consonants."—F. D. Jermain, *In the path of the alphabet*, pp. 9-14.

Theories of origin and development.—"At first sight the diversity of alphabets seems as little connected as the diversity of languages. But as the labours of the philologist have gradually traced the various relations of the better-known languages one to the other, so likewise the epigraphist has dealt with the varieties of the Greek and Roman alphabets which are the more familiar, while the archæologist has yet to trace and connect the alphabets of the less-known races, many of which were used for languages which are still unread. The more obvious questions of the origins and connections of the better-known alphabets of various countries seemed to have been fairly settled and put to rest a generation ago; the more remote alphabets and the more ancient signary had not then been brought to light to complicate the subject. The old traditional view of the derivation of the western alphabets from the Phœnician fitted well enough to most of the facts then known, and

was readily accepted in general. Further, De Rougé's theory of the derivation of the Phœnician from the Egyptian hieratic writing of the xith dynasty was plausible enough to content most enquirers, though only two out of twenty-two letters were satisfactorily accounted for. In 1883 Isaac Taylor could safely claim that he had 'summarised and criticised all previous discoveries and researches as to the origin and development of alphabets' by his general outline in his work on *The Alphabet*; in that book a sound general basis seemed to have been reached, and only minor questions needed further discussion and adjustment. Yet the voice of caution was heard even then. Dr. Peile, in 1885, when judicially reporting on Isaac Taylor's work, and while agreeing that 'his book deserves to be, and doubtless will be, the standard book in England on the history of the alphabet,' yet saw that other solutions might arise. He added: 'But no proof of the affiliation of the Phœnician alphabet can be complete without evidence from writing to fill up the long gap between the period of the Papyrus Prisse and that of the Baal Lebanon and Moabite inscriptions. In default of this it must always be possible that the Phœnician alphabet is descended from some utterly lost, non-Egyptian system of writing, traces of which may some day turn up as unexpectedly as the so-called Hittite hieroglyphs.' Within a generation later this possibility clearly appears to be the forecast of the real history."—W. M. Flinders Petrie, *Formation of the alphabet*, pp. 1-2.

"The investigation of the origin of our alphabet, always a subject of great interest, has been stimulated in recent years by the discovery of writing in Crete, and by the claim of Sir Arthur Evans that this Aegean writing was the source of the so-called Phœnician alphabet. In the midst of the present writer's work on the subject, in all too brief intervals snatched from other pressing duties, the trend of his own results has meantime received unexpected confirmation from the remarkable essay of Dr. Alan H. Gardiner revealing the existence of a hitherto unknown script of Egyptian origin in Sinai, which may have been a form of the Proto-Semitic script, posited by Praetorius as the probable ancestor of both the Phœnician and South Semitic alphabets. At the same time the thoughtful remarks of Schaefer, in a discussion of the reasons for the vowelless character of the Phœnician alphabet, have likewise lent further support to the author's conviction that the old and now widely rejected hypothesis of an Egyptian origin of the alphabet commonly called Phœnician must be carefully re-examined. One of the neglected aspects of the entire problem has been its connection with the related question of the physical process and material equipment of writing in the Near East. This subject has bearing, and important bearing, on the whole question of the influence of any given system of writing in the eastern Mediterranean. . . . An examination of the civilizations of the Near East shows clearly that (excluding monumental documents) there were two physical processes of writing in the eastern Mediterranean world. One, which grew up on the Nile, consisted in applying a colored fluid to a vegetable membrane; the other, which arose in the Tigris-Euphrates world, incised or impressed its signs on a yielding or plastic surface which later hardened. Both of these methods reached the classical world: in the wax tablet for the Greek or Roman gentleman's memoranda, and in the pen, ink, and paper (papyrus) which have descended to our own day. The early geographical line to

be drawn between these two methods of writing may be indicated in the shortest terms by saying that the practice of incision on a plastic surface was Asiatic; the process employing pen, ink, and vegetable paper was Egyptian. . . . If anyone has a lingering doubt about the Egyptian character of the writing equipment of these Aramean scribes in the Assyrian reliefs, such doubt will I am sure disappear on examination of a relief of the Aramean king of Samal, discovered at Senjirli by von Luschan. . . . The king is seated on his throne at the left, while before him stands his secretary, with an object under his left arm, which looks surprisingly like a book, but as this is impossible it may perhaps be a roll partly unrolled. In his left hand, however, he carries an unmistakable Egyptian writing outfit. . . . This Egyptian writing outfit, carried by the Aramean secretary of Samal, of course contained reed pens with a soft brush point like those we have found in Egypt. If this official were to begin taking down his lord's dictation, he would spread his papyrus paper on his left hand, as we have seen the Egyptian scribe doing, and after him the Aramean scribes on the Assyrian reliefs. The pen would make the same broad strokes produced by the Egyptian scribe, and to settle the matter once for all it is important to notice at this point that the Aramaic ostraca found at Samaria, perhaps reaching back into the ninth century B. C., clearly show that the soft-pointed Egyptian brush pen was employed in writing them. Finally we know exactly how these Aramean documents of Western Asia looked, since we have been able to hold in our hands the Elephantine papyri. The system of writing which employed pen, ink, and paper was the only one which possessed an alphabet, and which wrote that alphabet without vowels. It is evident that the pen-ink-and-paper method of writing came from Egypt into Asia and spread there at the very time when the alphabet also was appearing and coming into common use in the same region. It follows therefore that the Egyptian system of writing was in most intimate contact with the whole scribal situation in Western Asia, and it is highly unlikely that we can entirely dissociate the physical process and material equipment contributed by Egypt to Asia at this time from the alphabet which Asia likewise gained at the same time."—J. H. Breasted, *Physical processes of writing in the early Orient and their relation to the origin of the alphabet* (*American Journal of Semitic Languages*, July, 1916, pp. 230-248).—See also *ÆGEAN CIVILIZATION: Minoan age: B. C. 1200-750*.

"The vexed question of the origin of our alphabet has given rise to a long series of controversies and theories, but of recent years the matter appears to have been comfortably settled among philologists. A recent discovery of great importance has caused us, however, to reconsider our ideas and to push back farther into the mists of antiquity. It is, of course, a matter of common knowledge that our English alphabet is taken directly from that of the ancient Greeks, who in their turn received it from the Phœnicians. It is indeed true that not later than 1,000 years before the Christian era a perfect alphabet of twenty-two consonants, but without vowels, was used upon Phœnician soil, and it is clear that Greece adopted most of the letters of this script, although possibly in an earlier stage of development than that in which we first encounter it. Some of the Greek letters, however, seem to have a closer affinity with those of another Semitic alphabet, akin to Phœnician, but used in slightly varying forms in South Arabia and Abyssinia, and generally known

as *South Semitic*, the *North Semitic* being Phœnician proper. The mutual relations of the North and South alphabets seem to postulate a common parent which came into existence at least anterior to 1000 B. C., and which may be called *Original Semitic*. Opinions differ considerably as to the origin of this hypothetical script, and a cluster of divergent theories ascribe its origin respectively to Babylonian cuneiform, Egyptian hieratic, the lately discovered Cretan, and finally a number of marks and other symbols found on Egyptian pottery, but certainly not Egyptian in origin. All these derivations present difficulties, and a different solution of the problem has been presented by Dr. Alan H. Gardiner, who has studied the subject exhaustively and whose researches have already been propounded by Mr. T. E. Peet. Our data are the early forms of the letters, and their *names*, which can be shown with great probability to be as old as the letters themselves. The signs were originally chosen on the acrophonic principle; thus, in order to represent the sound B, a common object, whose name began with B—namely, BET, 'a house'—was chosen. The sign was hence called BET, which has survived in the Greek BETA. Can we see this process in its early stages? In the peninsula of Sinai, on a plateau called Serâbit-el-Khâdim, anciently frequented by the Egyptians for the purpose of turquoise-mining, stood a temple dedicated to the goddess Hathor, really called 'the Lady of the Turquoise.' In this temple the expedition sent by the Egypt Exploration Fund in 1905 discovered various monuments bearing inscriptions in an unknown script, and near the turquoise mines in the same district were found seven further inscriptions in the same writing. Careful copies were made of these documents, but it was not until 1914 that their true significance was realized, when Dr. Alan H. Gardiner, submitted them to a long and minute study. It soon became manifest to Dr. Gardiner that, though the language was not Egyptian, many of the characters were taken from Egyptian hieroglyphs, but this borrowing was confined merely to the forms of the sign and not to their Egyptian values. As Semites are known from other evidence to have accompanied the Egyptian expeditions to Sinai, Dr. Gardiner argued that the new script might well be Semitic, and he proceeded to fix the values of the signs on the acrophonic principle already alluded to. These signs being only thirty-two in number could scarcely be other than alphabetic. Having thus determined the values of fifteen signs, with their help a group of four signs which recurs in several of the texts was found to read BA'ALAT—the Semitic word for Lady, or Goddess—the evident equivalent of the Hathor of the purely Egyptian inscriptions of this site. Dr. Gardiner and other scholars have added new readings for other groups of signs, but none of these are quite as convincing as the instance just quoted. Here, then, in Sinai, we have at a date probably earlier than 1500 B. C. a Semitic people apparently in the very act of borrowing signs from the Egyptian hieroglyphic script, in order to form on the acrophonic principle a true alphabet which would suffice to write their own speech. For B they borrowed the Egyptian sign for 'house' because their own word BET began with the b-sound, and so on. From the very crude alphabet which these inscriptions reveal, it is possible to trace many of the letters of the Phœnician alphabet, and thus to show that they are conventionalized forms of objects selected originally from the Egyptian hieroglyphs on the acrophonic principle. If we have not here the actual origin of the Phœnician—and

hence of our own—alphabet, we have at least a striking example of the process to which both are due.”—W. R. Dawson, *Egyptian origin of the alphabet* (*Asiatic Review*, Jan., 1920, pp. 124-126).—See also ARABIA: The Sabaeans; RUNES; SEMITIC LITERATURE.

Origin of the English alphabet.—“The printed letters or sound-signs which compose our alphabet are about two thousand five hundred years old. ‘Roman type’ we call them, and rightly so, since from Italy they came. They vary only in slight degree from the founts of the famous printers of the fifteenth century, these being imitations of the beautiful ‘minuscule’ (so called as being of smaller size) manuscripts of four hundred years earlier. Minuscule letters are cursive (*i.e.* running) forms of the curved letters about an inch long called ‘uncials’ (from Latin *uncia*, ‘an inch,’ or from *uncus*, ‘crooked’), which were themselves derived from the Roman letters of the Augustan age. These Roman capitals, to which those in modern use among us correspond, are practically identical with the letters employed at Rome in the third century B. C.; such, for instance, as are seen in the well-known inscriptions on the tombs of the Scipios, now among the treasures of the Vatican. These, again, do not differ very materially from forms used in the earliest existing specimens of Latin writing, which may probably be referred to the end of the fifth century B. C. Thus it appears that our English alphabet is a member of that great Latin family of alphabets, whose geographical extension was originally conterminous, or nearly so, with the limits of the Western Empire, and afterwards with the ancient obedience to the Roman.”—E. Clodd, *Story of the alphabet*, pp. 34-35.

Slavonic alphabet.—Invented by Cyril and Methodius. See RUSSIAN LITERATURE: 9th-14th centuries.

Russian alphabet first used by Peter the Great. See RUSSIAN LITERATURE: 1680-1752.

ALPHEUS, the principal river of the Peloponnesus, the modern Morea. The Modern Ruphia, which rises near Asea, is for the most part a shallow, rapid stream. It flows into the Ionian Sea. For a short space the stream flows beneath the ground, hence, the fable that it passed underneath the sea and rose in Syracuse, Sicily.

ALPHONSO. See ALFONSO.

ALPINI: On Grappa front. See WORLD WAR: 1917: IV. Austro-Italian front: e, 5.

ALPS.—The name Alps has been given to the crescent-shaped mountain system of Europe, extending from Savona, Italy to Vienna, Austria. The system covers part of Italy, France, Switzerland, Bavaria and Austria. The length of the chain along the main line is 660 miles, and the area of the surface covered by the entire range is said to be 80,000 square miles. In the main the range is a continued chain of towering mountains, with sharp, abrupt peaks. Among the rivers which flow from the slopes of the Alps are the Rhine, Rhone, Danube and Po. The loftiest and most famous summits of the Alps are, Mount Blanc (15,782 ft.); Monte Rosa (15,215 ft.); Weisshorn (14,804 ft.); Breithorn (13,685 ft.) and Matterhorn (14,780 ft.). Aletsch is the name of the largest glacier in the Alps system, being thirteen miles long. The origin of the word Alps is uncertain, writers differing between a derivation from the Celtic root “alb” (height), and the Latin adjective “albus,” white. The word Alps should not be confused with Alp, which is the name given to the summer mountain pastures by the natives of the Alpine valleys. (See ALP.) Among the first men who did extensive exploration work in the ice

and snow regions were Horace Bénédicte de Saussure (1740-1799), and Placidus à Spescha (1752-1833), the Benedictine monk of Disentis. The first known English Alpine climber was Colonel Mark Beaufoy (1764-1827). The higher Alps are perpetually covered with snow, offering, with their picturesque glaciers, cascades and forests, scenery which is famous throughout the world for grandeur and magnificence. Several important mountain groups, although they might be considered independent ranges, are arranged in such a manner as to appear connected with the main system. It is therefore incorrect to suppose that the Alps form strictly a single range. It may be said, more accurately, that the main chain or group is flanked on either side by other important ranges, which, however, are not comparable with the main group, in point of height, grandeur or picturesqueness.

Concerning the early inhabitants of the Alps we know little more than what has come down to us from the Roman and Greek historians. Other than that a number of Alpine tribes were conquered by Augustus, we are in ignorance of the history of the Alpine dwellers previous to the early part of the eleventh century, when the Carolingian empire was finally dismembered. In 1349 Dauphiné became France’s prize, following a prolonged struggle for the Alpine region between the feudal lords of Savoy, Dauphiné and Provence. The county of Nice, which was formerly part of Provence, fell to the feudal house of Savoy in 1388, as did Piedmont and other lands on the Italian side of the Alps. France began to drive back the house of Savoy across the range, however, eventually forcing it to limit its power solely to Italy. (See also VENICE: 1508-1500.) In 1860 this rivalry came to an end when the rest of the county of Nice and Savoy were given over to France, making the latter a definite power in the Alpine region. This reversal of power is significant of the marked historical influence which the physical aspect of the Alpine ranges has exerted upon the Central European countries, particularly upon Italy.

As barriers.—Importance of passes.—It is to be noted that the Alps have had a great influence upon history. Passable only at a few points and there not readily, they have made it hard for the invader of Italy. Hannibal’s failure to crush Rome in 218 B.C. was undoubtedly due to the hardships suffered by his army in crossing the bleak Alpine passes. As a result of the World War, Italy’s northeastern frontier has been extended to the crest of the eastern Alps, making the country easier to defend on that side.

“The vast majority of these [passes] are naturally of no practical importance. Armies cannot use them: traffic over them is impossible. . . . At the utmost some of them may serve, as in the Pyrenees, for a smuggling trade, but even this disappears when the profits of smuggling cease to be great. There are, however, an appreciable number of gaps in the chain, by which there was never any difficulty for travellers on foot or with laden animals, over which in modern times good carriage roads have been made. These gaps occur at fairly long intervals, and in all parts of the Alps.”—H. B. George, *Relations of geography and history*, p. 202.—The natives of the Alpine regions were probably the first to use these passes, although the outside world first learned of their existence when they were crossed by the Romans during military expeditions. It is more than likely that the inhabitants themselves pointed out these convenient paths to the Romans. Cæsar makes no mention of the Alps beyond that he has crossed them; when some of the mountain tribes try to

block the passage of Roman merchants or armies, they become important enough to be conquered. It was not till after the Cimbri in 102 B. C. invaded Italy by the Brenner route that the Romans realized the value of Rhaetia (Tyrol) as a thoroughfare from Italy to Germany, and began its conquest in 36 B. C. We know for certain that the Romans availed themselves of the Mont Genève Pass, later used by Charles VIII in 1404 in his invasion of Italy; in the Central Alps the Romans used the Splügen and Septimer routes, as well as the Great St. Bernard, farther west, subsequently so advantageously made use of by Napoleon in his conquest of Italy. [See also COMMERCE: Ancient: 200-600.]

"The Alps long retarded Roman expansion into central Europe, just as they delayed and obstructed the southward advance of the northern barbarians. Only through the partial breaches in the wall

Provincia. . . Mountains folded into a succession of parallel ranges are greater obstructions than a single range like the Erz, Black Forest, and Vosges, or a narrow, compact system like the Western Alps, which can be crossed by a single pass. Owing to this simple structure the Western Alps were traversed by four established routes in the days of the Roman Empire. These were: I. The *Via Aurelia* between the Maritime Alps and the sea, where now runs the Cornice Road. II. The *Mons Matriona* (Mont Genève Pass, 6080 ft. or 1854 meters) between the headstream of the Dora Riparia and that of the Durance, which was the best highway for armies. III. The Little St. Bernard (7075 ft. or 2157 meters), from Aosta on the Dora Baltea over to the Isère and down to Lugdunum (Lyons). IV. The Great St. Bernard (8100 ft. or 2472 meters) route, which led northward from Aosta over the Pennine Alps to Octodurus at

ALPS

Road over the St. Gotthard Pass

known as passes did the Alps admit small, divided bodies of the invaders, like the Cimbri and Teutons, who arrived, therefore, with weakened power and at intervals, so that the Roman forces had time to gather their strength between successive attacks, and thus prolonged the life of the declining empire. So in the Middle Ages, the Alpine barrier facilitated the resistance of Italy to the German emperors, trying to enforce their claim upon this ancient seat of the Holy Roman Empire. The northern expansion of the Romans, rebuffed by the high double wall of the Central Alps, was bent to the westward over the Maritime, Cottine and Savoy Alps, where the barrier offered the shortest and easiest transmontane routes. Hence Germany received the elements of Mediterranean culture indirectly through Gaul, second-hand and late. The ancient Helvetians, moving southward from northern Switzerland into Gaul, took a route skirting the western base of the Alps by the gap at Geneva, and thus threatened Roman

the elbow of the upper Rhone, where Martigny now stands. Across the broad double rampart of the central Alps the Roman used chiefly the Brenner route, which by a low saddle unites the deep reëntrant valleys of the Adige and Inn rivers, and thus surmounts the barrier by a single pass. However, a short cut northward over the Chalk Alps by the Fern Pass made closer connection with Augusta Vindelicorum (Augsburg). The Romans seem to have been ignorant of the St. Gotthard, which, though high, is the summit of an unbroken ascent from Lake Maggiore up the valley of the Ticino on one side, and from Lake Lucerne up the Reuss on the other. . . . Mountains are seldom equally accessible from all sides. Rarely does the crest of a system divide it symmetrically. This means a steep, difficult approach to the summit from one direction, and a longer, more gradual, and hence easier ascent from the other. It means also in general a wide zone of habitation and food supply on the gentler slope, a better commissary

and transport base whence to make the final ascent, whether in conquest, trade or ethnic growth. Its boundary along the crest of the Alps from Mont Blanc to the Mediterranean brings over two-thirds of the upheaved area within the domain of France, and gives to that country great advantages of approach to the Alpine passes at the expense of Italy. With the exception of the ill-matched conflict between the civilized Romans and the barbarian Gauls, it is a matter of history that from the days of Hannibal to Napoleon III, the campaigns over the Alps from the north have succeeded, while those from the steep-rimmed Po Valley have miscarried. The Brenner route favored alike the Cimbri hordes in 102 B. C. and later the medieval German Emperors invading Italy from the upper Danube. The drop from the Brenner Pass to Munich is 2800 ft.; to Rovereto, an equally distant point on the Italian side, the road descends 3770 ft. . . . The strategic importance of pass peoples tends early to assume a political aspect. The mountain state learns to exploit this one advantage of its ill-favored geographical location. The cradle of the old Savoyard power in the late Middle Ages lay in the Alpine lands between Lake Geneva and the western tributaries of the Po River. This location controlling several great mountain routes between France and Italy gave the Savoyard princes their first importance. The autonomy of Switzerland can be traced not less to the citadel character of the country and the native independence of its people, than to their political exploitation of their strategic position."—E. C. Semple, *Influences of geographic environment*, pp. 4, 532-554.—See also BRENNER PASS.

The formation of the Swiss Confederation, between 1281 and 1815, marked a consolidation of the smaller and weaker cantons on the northern side of the Central Alpine chain. This unification of the smaller states, made possible by their strategic advantages, successfully achieved the desired result of maintaining a combined defense against foreign aggression. That the policy of the Swiss Federation has been exemplary has been borne out during the Great War when Switzerland insisted on maintaining strict neutral relations with all the warring nations unless an act of aggression were made against it. In consequence of this policy Switzerland was the only European country which held strictly to its neutrality although completely surrounded by neighbors warring against each other in a life-and-death struggle.

Roman period.—Hannibal's crossing of the Alps.—Medieval times.—"The position of the territories once occupied by the Etruscans, Tuscany and much of the Po basin, seems to imply that they [the Greeks] followed the Latins rather than preceded them, and traces of them are supposed to show that they came in from the north, through what are called the Rhaetian Alps. More confidently it can be affirmed that the Gallic tribes, who by the end of the fifth century B. C. had spread over the whole plain of the Po, came over the western Alps, though it is of course impossible to guess by what routes. They continued to form the bulk of the population north of the Apennines, even after Rome had in some sense conquered them in the interval between the first and second Punic wars, and were no small support to Hannibal, after he had crossed from the land of their kindred beyond the Alps into Cisalpine Gaul—the name of Italy was not yet extended to the plain of the Po.

"The most remarkable historical event connected with the passes of the Alps is certainly the passage of Hannibal; and much critical energy has been

expended in trying to determine his route, without further success than showing that he must certainly have crossed by some pass south of Mont Blanc. . . . Hannibal, coming from distant Carthage, had of course to rely upon guidance from the Gauls: he obviously knew before starting that the Alps were passable, but there is no indication that he had any knowledge either of the difficulties of the task, or that there was any choice of routes. . . . All that he knew himself was doubtless that his guides undertook to take him across into Cisalpine Gaul. The conduct of Scipio, the Roman general commanding against Hannibal, also tends to show that Roman knowledge of the Alpine passes was slight. Scipio, when he found that the Carthaginians had marched up the Rhone, took for granted that they were going to cross the Alps, and removed his army by sea to Italy, in order to meet the enemy in the plain of the Po. Scipio was not wanting in capacity, as this prompt action shows. It is no unfair conjecture that if he had possessed any definite knowledge of the Alpine valleys, he would have landed at Genoa, and posted himself at Turin, in order to encounter Hannibal before he could reach the open plains, where the famous African cavalry would have free scope. If, however, he knew that there were various routes, but had only confused and imperfect information about them, the course which he adopted, of waiting on the Ticino, was obviously right.

"The historical importance of Hannibal's feat is not however concerned with the determination of his exact route. It was a revelation to the world that an army, as distinguished from a mere horde—that an army with all its *impedimenta* could be conveyed across a great mountain range. Nor was it long before his example was followed. His brother Hasdrubal led an army into Italy ten years later, apparently by one of the passes from the Isere, with unexpected ease and speed. A century afterwards occurred another invasion of Italy, which illustrates the difficulty of defending a mountain frontier such as the Alps. The Romans were by that time effectively masters of the whole Po basin, as well as of Provence; geographical Italy was also now politically united under one government. They were aware that the hordes of barbarians, known to history as the Cimbri and Teutones, were on the move for Italy. These formidable enemies had either trampled over, or won to their side, the tribes beyond the Alps, both in the Rhone-land and in the modern Switzerland. They apparently formed a scheme, highly advanced for their stage of civilization, of entering Italy by two widely distant entrances, and joining forces on the Po. The Romans were informed of their purpose, and sent one consul to Provence, while the other waited on the Adige. Unfortunately our authorities are so brief that they give no hint as to the route by which the Cimbri entered Italy; all we know is that the consul Catulus failed to stop them, and that they moved westwards up the north bank of the Po to meet their kindred. Fortunately Marius had destroyed the Teutones in Provence, and was in time to join his colleague, and crush the Cimbri also, not far from the Ticino. One may conjecture that the St. Gotthard pass was unknown at the time, or the Cimbri, who were guided by their Helvetian allies, would not have gone so far to the eastwards as they did; though whether they crossed from the head of the Rhine, or made the still longer circuit by the Inn and Adige, we cannot even guess.

"As the Roman empire extended to its ultimate limits in Europe, the Alps became no longer a frontier. Naturally therefore centuries elapsed be-

fore they again figured in history. In the convulsions which followed the death of Nero, two candidates for the imperial throne successively entered north Italy, one from the west, the other from the east. Each in turn defeated the rival in possession on the Lombard plain, and as it happened on the same battlefield, but in neither case was there any defence of the mountain passes. In the break up of the Western empire, the Teuton tribes seem to have entered Italy as they pleased: the Alps might as well not have existed. Throughout the Middle Ages, the regions on both sides of the Alps were divided up into so many small states (if the word can be reasonably applied), all virtually independent, and all formally included in the Empire, that the mountains continued to be of little political importance. If the Emperor had to expect opposition on one route, he could take another; practically his communications with Italy lay chiefly over the Brenner and its variations. From western Europe the usual routes were, as has been said, the Great St. Bernard and the Mont Cenis; but nothing historically turned on this fact, travel over the Alps being substantially that of private persons, largely on business connected with the Church."—H. B. George, *Relations of geography and history*, pp. 211-212, 213-215.

Frontiers of Italy.—Peace Conference claims.—"Now if there is one country in Europe of which nature has made a geographic unity it is Italy. In all epochs, geographers have seen in the Alps the natural frontiers of that peninsula destined to be the first hearth of civilization in Europe. It can easily be understood, therefore, how Italy came [at the Peace Conference] to include among her war ambitions, the aim of gathering to herself the northern and eastern crests of the Alps, that is to say, the frontiers which Augustus had assigned to Italy, but which were held in 1914, by the Austrian Empire. By advancing to that line, and by annexing the Trentino and Istria, Italy would achieve, at one and the same time, both her geographical and her national unity. She would be, in Europe, the almost perfect model of the nation which, should a desire for war seize upon her, must face the greatest difficulties in attacking others, possessing, the while, the best facilities of defense in case she were attacked by others."—G. Ferrero, *National aspirations of Italy* (in *Le Figaro*, quoted in *The Living Age*, April 26, 1919).—See also ITALY: 1915: Treaty of London.

ALSACE-LORRAINE.—Its history as affected by its position.—The history of Lorraine up to modern times will be found under LORRAINE. The French geographer and historian Vidal de la Blache has characterized Alsace-Lorraine as "France of the east," a region between the Rhine, the Meuse, and the Ardennes. This territory has always been historically a frontier country lying at the junction of France, Belgium, Germany and Switzerland, and without such natural frontiers as might mark it off definitely from these neighboring countries. To be sure, Alsace is bounded on the east by the Rhine, but Lorraine has always had entirely artificial boundaries. The fate of Alsace-Lorraine has been complicated by the fact that it has been a meeting-place of two powerful aggressive peoples, the French and the German, and also because it lay on the cross-roads between the Rhine and the Danube valleys as well as the historic routes leading through the Alps from the Po valley and from the Rhone valley through the gap at Belfort. It may be said then, that this region has no geographic unity. Until very recent times Lorraine was closer to France than it was to Alsace, while Alsace itself is divided into a number of natural regions having little intricate indications. Although it was as late as 1648 when France secured possession of the greater part of Alsace [see also GERMANY: 1648] and not until more than one hundred years later that she acquired Lorraine, the process of assimilation was completed over a century ago. It was the French Revolution that made Alsace-Lorraine an integral part of the French nation. The development of communications, particularly canals and railroads, connected this territory with France and with the Rhine, so that by 1871 an economic unity with France was achieved.

Early history.—Romans, Gauls and Huns.—"But the Roman conquest was accomplished at last in Belgium and in the rest of Celtic land, and then was extended over the Rhine until the barbarian tribes were so interwoven with the Roman legions that it was hard to distinguish between them. Ruins of monuments planned by Romans and constructed by barbarian labour are scattered over Western Europe to tell the tale of who built, who saw, and who destroyed. In Alsace, the earliest ruins are not, however, these. There are still traces of preceding occupation. Parts of a great wall, the so-called *Heidenmauer*, are to be seen on the Odilienburg, showing how primitive people of the Vosges highlands tried to protect themselves against assault. Then there are many Druid remains, some near the sites of the Roman temples which are found in considerable numbers. Of Latin theatres, arches, aqueducts, such as blossomed in many parts of Gaul, there are no examples in Alsace. Fortifications and highways, however, remain to prove that the Romans did not neglect the Vosges region. Argentoratum, followed by Strasburg, was one of the Roman strongholds which has never ceased to be a fortified place. The splendid military roads show the best work of the Romans in this section of their domain. . . . Some of the most important ran from Besançon (to use modern terms) to Strasburg, on to Mayence, to Ell, Breisach, and on to the Rhine, from Brumath to Saverne and Metz, from Alsace into Lorraine through the valley of Schirmeck, from Alsace into Lorraine through the valley of the Villi, and in many other directions. If the Peutinger map be rightly dated, many of these highways were later than 200 A. D. But on it can be seen three highways leading out of Strasburg,—*Argentoratum*. The end of the Gallo-Roman

period came imperceptibly. Roman domination simply ceased to exist, and officials of northern races who had administered affairs in the name of Rome continued to hold sway without respect to trans-Alpine authority. German settlement, pre-eminently Frankish and Teutonic, in the Vosges tract westward of the Rhine was not the result of decisive conquest. It was merely gradual trans-Rhenish migration, not differing radically from the kind that had been inaugurated by Ariovistus and checked by Julius Cæsar, except that it was less aggressive and in smaller numbers. The Celtic inhabitants were neither entirely dispossessed nor enslaved by the German colonists, to whom, more over, they did not remain antagonistic. This must be taken into account in attempting to arrive at any conclusion as to the ultimate racial status of the Alsatian tract. Whether in the course of the centuries before 800 A. D. the predominant element remained as essentially Gallo-Frankish, with the characteristics of activity, enterprise, energy, independence, irony, and badinage ascribed to the people of the French realm, as it finally took shape, or whether an inherent Teutonic quality continued to differentiate the Alsatians from their French neighbours on the other side of the Vosges, remains a moot question. . . . As far as geographic nomenclature is concerned, it must be conceded that the dominant note in the formative period was Germanic. Strasburg, Breisach, Ebersheim, Rouffac, Seltz, Ell-Sass, itself, however spelled at different epochs, all tell one story, and they are not names that have changed radically during the last phase of political affiliation. . . . Many of those that passed over Alsatian soil did not trouble themselves, indeed, to leave any constructive trace of themselves, though they left trace enough of the damage they wrought. After the Burgundians came Attila, who destroyed Argentoratum—where Strasburg later came to replace the Roman city—and various other settlements. That was in the middle of the fifth century, not long before the invaders were repulsed at Châlons (451 A. D.) by Romans and Germans fighting as allies. Attila went on to Italy and gradually the Alsatians stole down to the plains from the highlands where, like other Gauls, they had taken refuge, and took up their life again amidst the ruins of the Roman civilization, which had indeed retreated, but which had left a permanent impress upon the land between the Rhine and mountains. There came a time when the Frankish sovereigns of Gaul recognized the individuality of the province so far as to create a duke of Alsace, and we hear of one Ettich or Attich as bearing that title before Christian times. Legends have clustered about his daughter Odilia, who brought bitter disappointment to her father at her birth, because she was not only a girl when he had desired a boy, but blind at that. The water of baptism finally gave her sight, and the Odilienberg, where she grew up, away from her father's unfriendly eyes, remains to bear witness to the miracle of her conversion to Christianity. The Bishop of Strasburg, too, comes upon the scene and Alsace thus becomes a duchy and has a bishopric, is Christian and provincial. . . . Had this title of duke not come into being there might never have been an *Alsace*, but the name persisted even though the unit was fractured."—R. Putnam, *Alsace and Lorraine*, pp. 15-21.

842-1477.—Strasburg Oath.—Treaty of Verdun.—Foundation of House of Hapsburg.—Treaty of St. Omer.—"The Treaty of Verdun, 843 A. D., between the three grandsons of Charles the Great (Charlemagne seems far more befitting

that sovereign) gave to Charles the Bald the nucleus of present-day France, to Louis the German, trans-Rhine territory as far as the River Elbe, while to Lothaire, eldest son and Emperor, fell a middle realm between the two familiar divisions of modern Europe. It was *Lotharii regnum*, a realm which bequeathed to posterity one legacy in the name *Lotharingia*, *Lothringen*, *Lorraine*, and another in the phantom of an ideal kingdom. One bequest was permanent, though applied to units of different area, the other intermittent in vitality. Modern Lorraine, Alsace, Burgundy, Provence, and Italy, excepting the States of the Church, were all comprised within Lothaire's heritage, in addition to the imperial title. [See also LORRAINE: 843-870.] But that allotment was of brief duration. Lothaire II. succeeded his father, indeed, but on his death, his uncles, Charles the Bald and Louis the German, took it upon themselves to make a fresh division of the Carolingian empire into only two parts as far as Europe north of the Alps was concerned. The son of Lothaire II. was permitted to retain the Italian provinces alone of the paternal 'Middle Kingdom,' while the remainder was parcelled out between his great-uncles, thus marking the confines of France, Germany, and Italy, or rather indicating those three geographical unities. Moreover, not only did modern European boundary lines cast their shadows before at the crisis of these territorial division but an interesting evidence of the linguistic scission between the subjects of the Frankish sovereigns remains as one result of these fraternal bargains. This is the document containing the oaths sworn at Strasburg, 842 A. D., as a prelude to the formal triangular convention at Verdun, the following year. The two younger brothers safe-guarded themselves against their senior by interchanging pledges of mutual support. The occasion was a formal and solemn function. The brothers were accompanied by their armies, who were taken into their confidence, each over-lord addressing his own soldiers in their own vernacular, explaining the reasons for enmity towards Lothaire, and then proceeding to give the formal oath each to the adherents of his brother, Louis the German speaking in the *lingua romana*, the speech of Romanized Gaul, and Charles, sovereign of the same realm, using the *lingua teudisca*, spoken across the Rhine. The phrases that were comprehensible to these ninth-century French and Germans look like a very queer jumble of words. Their interest lies in the fact that both vernaculars were probably comprehensible to the bystander in Strasburg, just as the two more polished languages have been in our day. It is probable that thus early the children of the borderland had their ears attuned to bi-lingual addresses. The words of Louis were: 'Pro Deo amur et pro christian poblo et nostro commun salvament, dist di in avant, in quant Deus savir et podir me dunat, si salvaraio cist meon fradre Karlo et in adiuha et in cadhuna cosa, si cum om per dreit son fradra salvar dist, in o quid il mi altresi fazet; et ab Ludher nul plaid numquam prindrai, qui meon vol cist meon fradre Karle in damno sit.'

"The form of Charles' oath was: 'In Godes minna ind in thes christianes folches ind unser bedhero gealtnissi, fon thesemo dage frammordes, so fram so mir Got gewizci indi madh furgibit, so haldih tesan minan bruoedher, sosó man mit rehtu sinan bruoedher scal, in thiú, thaz er mig sosoma duo; indi mit Ludheren in nonheiniu thing ne gegango the minan willon imo ce scadhen werhen.'

"[For the love of God, and for the sake as well of our peoples as of ourselves, I promise that from this day forth, as God shall grant me wisdom and strength, I will treat this my brother as one's brother ought to be treated, provided that he shall do the same by me. And with Lothair I will not willingly enter into any dealings which may injure this my brother.]—E. Emerton, *Medieval Europe*, p. 27.]

"The actual division between Louis and Charles of Lothaire's 'Middle Kingdom' did not take place until many years after the Treaty of Verdun. It was not until about 870 that Louis the German entered into the possession of his share, which included Alsace as well as other of the Lotharingian parcels. Then the Vosges Mountains, instead of the Rhine River, became the boundary between the Germanic and Frankish kingdoms. . . . Germany counted her own birthday as the day when the Treaty of Verdun was signed. A thousand years of existence was celebrated in 1843. Into that thousand-year nationality, Alsace did not enter either at the beginning or the end. On both days her fate was linked to another sovereignty. . . .

"Had the realm covered by the titular authority of Charles the Great remained intact, the Alsatian tract might have had a different history, for the great Carolingian made Colmar and Schlestadt his residence from time to time, and a mid-European capital might have grown into importance,—a capital looking east and west over a wide imperial domain. But after 870 A. D. the lot of Alsace as a border land on Germanized territory was practically decided, although confusing changes continued to make her ultimate political affiliations look very uncertain from time to time. [See also LORRAINE: 011-080.] The trail of hazardous fortune cannot be followed in detail. In the twelfth century her fealty was due to the great German King and Roman Emperor (1152), Frederick Barbarossa, while her immediate control was in the hands of various lesser authorities. A new power was springing into being at that period, destined to affect European life more than was possible for the sovereign, seldom seen by the people at large. That was the free city, waxing into prowess by means of valuable privileges bought from emperors who wished to obtain money for schemes of conquest or personal ambition, or bestowed by them voluntarily for the purpose of erecting burgher bulwarks against over-powerful nobles. In course of time, ten of these communes came into being in Alsace, while Strasburg besides being a city state continued to exert influence as a dominant episcopal see. Long before the two Pragmatic Sanctions of Frederick II (1220 and 1232) endowed bishops and nobles with supremacy in their own towns,—except when the Emperor was present in person,—this Alsatian bishopric had acquired territorial independence and a high degree of temporal power. Once, indeed, when the city attempted to use influence in an imperial election, it suffered seriously at the hands of the successful candidate whom it had opposed to no purpose, but as a rule it managed to hold its own against any interference from without. By the third quarter of the fifteenth century, the state of Alsatian administration was as follows: First, it must be noted that after the episode of Duke Ettich—Eticho, Attich—the dukedom does not seem to have been revived as such. Without examining too curiously how it all happened, we find in existence two landgraviates, dividing Alsace into two *gauen*, the Sundgau and the Nordgau, the latter, Lower Alsace, dependent on the see of

Strasburg, the former, Upper Alsace, in the hands of the cadet branch of the House of Habsburg. . . . Financial embarrassments led to a curious commercial transaction in regard to the lands to which the Habsburgs had title. Sigismund of Austria mortgaged his rights to Charles of Burgundy and the report made to the latter by Jean Poincot and Jean Pellot, June 13, 1471, gives a detailed account of the condition of Alsace. Here is the story of what happened and what led to such happening.

"The Habsburgs took the title by which they have so long been known from a castle built in the eleventh century by one bishop of Strasburg and his brother Radbod upon the Aar, in Swiss territory, not far from the border of Upper Alsace. Tradition has it that Radbod followed his hawk—*Habicht*—into an unknown region and was so much charmed with the beauty of the spot that he decided to build a castle there and, later, named the house *Habichtsburg* from the guide who had led him thither. The longer term contracted, naturally, by easy transition into Habsburg and has held its own to this day. Little by little, the family grew to be one of the foremost in the Empire, and in 1273 its reputation was enhanced by the elevation of Rudolph, Count of Habsburg, to the imperial dignity,—the first of many sons of the race to hold that office, although it did not become the assured perquisite of the Habsburgs until later. [See also AUSTRIA: 1246-1282.] It may be added that Radbod and his brother the bishop, Werner, who collaborated in the castle building on the heights of the Wulpelsberg, are alleged to be descendants of Duke Ettich of Alsace. Possibly the tradition originated to account for the partition of the two *gauen* or districts of Alsace between the see of Strasburg and the count of Habsburg. After three centuries of fortunes, more or less fair, we find Frederick III, Emperor, and his cousin the Archduke Sigismund, of the cadet branch, in possession of the Habsburg lands in Tyrol in various other places, besides being Landgrave of the Sundgau and holding other estates in Alsace. Sigismund did not have a compact principality to administer from his capital, Innsbruck, and perhaps that was the reason why he fell into serious difficulties in every direction. . . . There was a group of princes in Europe at this epoch (1460), Louis XI, of France, Charles of Burgundy, Frederick III, and his son Maximilian, who spent their lives in trying to overreach each other. Frederick could not help his cousin, so Sigismund applied to Louis XI, for assistance, but fear of the Swiss made the King refuse. Then the Archduke went down to the Netherlands with his petition and found Charles more amenable. The reason was plain. Charles was most desirous of uniting his Netherland group of duchies, countships, and seignories with his two Burgundies, and the territories offered to him by Sigismund lay so as to fill in part of the gap between. The Burgundian's hope of erecting a new edition of a 'Middle Kingdom' affected his policy in many respects and never more markedly than in this transaction with Sigismund. The bargain was made. Perhaps the fact that the applicant was pretty close to the Emperor, who alone could turn a duke into a real king, made Charles especially willing to oblige his needy visitor. At St. Omer on May 0th another of the long row of treaties was signed which, without the slightest concern for the will of the inhabitants, disposed of the political control of Alsatian soil. Charles agreed to pay Sigismund ten thousand florins immediately and forty thousand before September

24th in return for the cession of all Sigismund's seigniorial rights in the landgraviate of Alsace, the county of Ferrette, and in certain Rhine towns. If he found himself in possession of means to buy back his landgraviate, Sigismund was to be permitted so to do, provided that he could produce at Besançon *the whole sum at once*, that augmented by all the outlays made by the Burgundian upon the property. . . . No real gain came to Charles from the Treaty of St. Omer. The Austrian dukes had not been popular in Alsace, but their poverty had prevented them from being hard masters even where they retained the right to exert any local authority at all. . . . Before the death of Charles at Nancy in 1477, Sigismund had drawn back the Alsace estates to the Habsburgs. His friends rallied around him when they saw what Charles was about. Money was found for the Archduke, who was enabled to offer his creditor full redemption, with the required payment in one sum. Charles had refused to accept this and, as far as appears clearly, no money ever did return to the Burgundian treasury."—R. Putnam, *Alsace and Lorraine*, pp. 22-37.

1552-1774.—Medieval period.—Thirty Years' War.—Under Louis XIV, acquired by Louis XV.—"In the later Middle Ages Lorraine formed a duchy, within which lay a number of small and in some cases independent feudal states and the city of Metz, a free city of the Holy Roman Empire whose people spoke French. In 1552, on the petition of certain German Protestant princes, Metz was placed under the protection of the king of France, who took possession of the city and the surrounding territory subject to it. In 1613 the bishopric of Metz and its lands were taken over by the French king, the whole being combined with Toul and Verdun into the three provinces of the Three Bishoprics (Trois Evêchés), and the cession was confirmed by the Emperor in the treaty of Westphalia of 1648. [See also GERMANY: 1648.] Further acquisitions made in the seventeenth century, notably Sierck and Saarlouis, gave France a strategic line of communication through Lorraine to Alsace. The duchy of Lorraine, which had likewise been dependent on the Holy Roman Empire, was declared free by Emperor Charles V and was gradually drawn into the French sphere of influence. Relinquished by its Hapsburg duke in 1736, in 1738 by the treaty of Vienna it was handed over to a Polish duke, Stanislas Leszcynski, on condition that at his death it should pass to his son-in-law, Louis XV of France, by whom it was accordingly acquired in 1766. Certain small enclaves within Lorraine did not pass to France until the Revolution. Alsace, except the city of Mülhouse, was annexed to France in the course of the reign of Louis XIV. The Middle Ages had broken the country up into a great variety of feudal states and free cities; the Reformation divided it still further by religious dissensions. In the Thirty Years' War France intervened on the side of the Protestant princes of Germany; at its close France received considerable possessions in Alsace, in much the same way that Brandenburg (the future Prussia) then secured valuable additions in the north. The treaty of Westphalia (1648) assured to France

certain lands and certain governmental rights possessed by the Emperor in his imperial capacity and as head of the house of Hapsburg, but the provisions were, possibly with intention, left vague at certain points and became the occasion of protracted legal and historical disputes. By a combination of undoubted grants, more or less justified legal interpretations, and the direct seizure of the city of Strasburg, Louis XIV rounded out his possession of the whole of Alsace. [See also FRANCE: 1670-1681.] The sole exception, Mülhouse, allied with the Swiss Confederation, voluntarily offered itself to France in 1708."—C. H. Haskins and R. H. Lord, *Some problems of the Peace Conference*, pp. 77-79.

1789-1794.—French revolution period.—Origin of the Marseillaise.—The abolition of feudal privileges was one of the first steps of the Revolution, which reverberated in Alsace, where German princes held feudal privileges. These being directly threatened, the rulers appealed to the emperor. According to Maurice Leon, this attempt by a handful of German princes to force their feudal claims upon the country that first abolished them in Europe precipitated the war of monarchical Europe against revolutionary France and the consequent attempt to suppress republicanism in France. The Revolution, however, won the day; the people of Alsace and Lorraine sent delegates to the Assembly, while the princes held aloof. The stirring strains of the "Marseillaise" were first sung in Strassburg in 1792, and breathe defiance to the German invaders from Prussia.—See also MUSIC: Folk music and nationalism: France.

1871.—Cession to Germany.—"At the close of the Franco-Prussian war Germany required of France the cession of Alsace and Lorraine, with a boundary on the west which was defined by the treaty of Frankfurt in 1871. In the next forty years Alsace-Lorraine passed through various stages of government, from military dictatorship through a certain amount of territorial independence to the definite constitution imposed by the Reichstag in 1911. Those who had hoped for autonomy were disappointed in this instrument, which failed to elevate the Reichsland to the position of a federated state of the empire, although an anomalous provision was made for its representation in the Bundesrat. Legally Alsace-Lorraine was still a subject territory of the empire. . . . For more than half a century the problem of Alsace-Lorraine has been debated back and forth with arguments which have had no effect on the opposite sides of the controversy. . . . To the French Alsace and Lorraine had become and remained fundamentally French, having been assimilated gradually and without violence in the eighteenth century, French most of all by having entered fully into the spirit of the French Revolution and taken an active part therein. They begged to remain a part of France in 1871, as the unanimous protests of their representatives show, and they continued French at heart against the strongest pressure in the opposite direction. In

spite of differences of language, such as exist in other parts of France, Alsace and Lorraine were French in social structure, in political ideals, and in the sympathies of the population. Without these lost provinces France was a mutilated country, not fully France. Furthermore, the possession of Metz and the Vosges by a military power like Germany constituted a standing menace to a peaceful country like the French Republic; it also menaced the economic life of France and its defence by making possible, as in 1914, immediate seizure of the richest part of its iron supply. France was robbed of these provinces by force in 1871, and the wrong had to be righted, not only in the interest of France but for the sake of the inhabitants."—C. H. Haskins and R. H. Lord, *Some problems of the Peace Conference*, pp. 80-85.—"The French call their neighbour [Germany] Allemagne, after an unimportant Teuton people that settled in and about Alsace in the break-up of the Western empire. . . . Teutonic Alsace, Protestant and German-speaking, was conquered by France in the seventeenth century, the last stage of the conquest being marked by circumstances of exceptional treachery and wrong. Nevertheless it became thoroughly French in sentiment, and strongly resented being re-transferred to Germany in 1871. On which side is the principle of nationality to be invoked in the case of Alsace—for or against the present [1907] state of things? There is nothing but sentiment to draw it towards France, nothing except sentiment to alienate it from Germany."—H. B. George, *Relations of geography and history*, pp. 58, 65-66.—"The last great cession of territory in Europe [1871] deprived France of its piece of territory bordering on the Rhine, and restored to Germany a district German in race and language."—*Ibid.*, p. 30.—"The German conquest of 1870 made the political frontier correspond much more nearly to the division of races and languages, though entirely against the wish of the people, who had in the interval been incorporated in France. It is instructive to compare the fate of Lorraine with that of Savoy, that is to say with the composite state over which the dukes of Savoy ruled. Both were divided in language, and more or less in race: both were situated between two great and often hostile powers: both were to a certain extent, in the person of their princes, attracted towards France. Yet Lorraine was, so to speak, squeezed to death between France and Germany, while the house of Savoy throve on the vicissitudes of several centuries, and ultimately became sovereigns of united Italy. . . . But the main reason for the contrast between Lorraine and Savoy is geographical. It has been pointed out . . . how the Alps between Savoy and Piedmont helped the fortunes of those princes. Lorraine had no such backbone: it lay completely open to France, and Germany had no particular motive for defending it; for it can hardly be said that Metz, in French hands, constituted a menace to Germany, however the case may be now that it has reverted to German hands [in 1871]. The acquisition of Alsace by France marks the end of the period of religious wars, as the seizure of the three bishoprics marks the beginning. It was a piece of sheer undisguised conquest, without any excuse of nationality or of a personal convention between any Alsatian ruler and France. Richelieu simply took advantage of the distractions of Germany to lay hands on a German province . . . a province essentially German ever since the Allemanni invaded the Roman empire, and Protestant in addition. Louis XIV completed the robbery, and indeed improved

on the method. During a period of general peace he seized Strassburg and other places—which, though situated within Alsace, were politically independent of it—and the Empire was not strong enough to resent the outrage."—*Ibid.*, pp. 237-238.—See also FRANCE: 1871 (January-May).

1871-1879.—Organization of government as a German imperial province. See GERMANY: 1871-1879.

1879-1894.—Manteuffel era of German rule.—Administration of Hohenlohe as Statthalter.—Policy of Alsatian minister Puttkammer.—"The 'Manteuffel Era,' as this period of Alsatian history is called, lasted six years, from 1879 to 1885. If anyone could have succeeded in the rôle he had mapped out Manteuffel could have. Believing correctly that no government is successful for any length of time that does not have the people on its side, Manteuffel sought first to know those among whom he had come to rule. He traveled much through the country, trying to impart his ideas to local officials and notabilities, municipal councilors, clergymen, and teachers, to say the happy and healing word to everyone. He told the people of Alsace and Lorraine that he understood and respected their sentiments, that he did not ask for an enthusiastic adhesion to the new order of things, but only a reasoned submission to the ineluctable fact. He warned them, however, that he would proceed à outrance against anyone who should conspire with the foreigner. He announced that as the Doge of Venice had solemnly wedded the Adriatic, so he wished to woo Alsace-Lorraine and obtain her liberties for her. . . . In his personal capacity he won general esteem. Accessible to all, receiving freely even workmen who came to present their grievances, he exemplified the fine politeness of the Old Régime and was a more popular figure than his predecessor or than any of his successors were to be. . . . In his fundamental purpose Manteuffel could not succeed. Moreover, he did not have the support of his own officials whose conduct served more or less to nullify and insulate the Statthalter. All through his regency the bureaucrats of Alsace-Lorraine, big and little, carried on an incessant and perfidious campaign in the German press, seeking to undermine him. Harassed by the Germans who criticised his moderation and irritated by the Alsatians and Lorrainers whose passive resistance to the one thing that counted revealed the essential superficiality of the 'pacification,' moreover compelled from time to time in the discharge of his obligations to the authorities in Berlin to adopt harsh and unpopular measures, such as the suppression of certain newspapers. . . . Manteuffel stood insecurely upon treacherous sands. So strong was the opposition to his policy in Germany that he would have been recalled had it not been that the octogenarian Emperor, William I, did not like to dismiss old friends and advisers. . . . Manteuffel's programme, the only wise one, could only succeed if assured of length of years for its realization. And these were not to be vouchsafed the sagacious experiment. . . . Manteuffel's official days were numbered. But he was spared the crowning humiliation of recall because his earthly days were also numbered. He died on June 17, 1885, and the policy for which he stood died with him. . . . As the Manteuffel régime had not, in the brief space of six years, reconciled Alsace to Germany, as the process of comparatively mild Germanization had made no appreciable advance, the German government now resorted to methods with which it was more familiar, and in which it had a more robust faith. Coercion, pure and simple,

coercion thorough and undisguised, applied at every point considered dangerous and applied without hesitation and without interruption, was henceforth the programme of the government. To preside over the execution of this policy a new Statthalter, Prince Chlodwig von Hohenlohe-Schillingsfürst was appointed. . . . The period of greatest tension since 1871 now began and lasted for several years, indeed all through this regency, which ended only with the promotion of Hohenlohe to the chancellorship of the Empire in 1894. It was a period of danger, replete with incidents that set Germany, France, and Alsace-Lorraine on edge. . . . Meanwhile Hohenlohe had tried to use the war scare in Alsace to secure from the voters the election of candidates favorable to the project of the Chancellor. He told the Alsations that, if war came, their province would inevitably be the theater of hostilities and would be fearfully harried by the contending armies. The result of his intervention was quite unexpected. . . . Candidates patronized and supported by the Statthalter were decisively defeated. A solid delegation of fifteen '*protestataires*' was sent to the Reichstag. Of 314,000 registered voters, the 'protesters' received 247,000 votes, that is 82,000 more than had been cast for them in 1884. So stiff-necked a people needed emphatically to be tamed and tamed it should be. Bismarck went at the congenial task with determination, exceedingly irritated by the overwhelming condemnation of his policy in Alsace at the time it was so overwhelmingly approved throughout the Empire. Extraordinary, exceptional measures now rained upon the devoted heads of this independent people. The leading Alsatian minister, Hoffman, considered too mild for the work, was recalled and Puttkammer, a relative of Bismarck, was appointed in his place, and began at once a policy of punishment and repression. Puttkammer had declined even to accept his post, that of Secretary of State and President of the Ministry of Alsace-Lorraine, until Antoine, deputy from Metz . . . had been expelled from the Reichstag. Accordingly the Reichstag expelled him on March 31, 1887, an act entirely pleasing to those who did not care for parliamentary immunities. Against another deputy from Alsace, Lalancé of Mulhouse, a decree of expulsion was issued, then suspended, then replaced by judicial prosecution and finally by a mere administrative measure, which forced the unwelcome deputy to depart. A vigorous attack was made forthwith on various Alsatian organizations, art clubs, the medical society of Strasburg, botanical and zoölogical societies. Other organizations which refused to admit the German immigrants to their membership, such as gymnastic and choral and student clubs, were likewise dissolved by administrative decree. . . . A series of incidents also occurred, alarming and calculated to increase the irritation and tension of the times, such as the brutal arrest, on Alsatian soil, of Schnaebéle, a French railway official at Pagny-sur-Moselle, by his German colleague of Novéant who had summoned him hither for the transaction of routine business, an incident that for several days caused all Europe to hold its breath (April 20, 1887). . . . This policy of intimidation received its appropriate coronation in a measure, which, in the opinion of the German government would completely subdue the recalcitrants, a new and drastic regulation prescribing the use of passports, a measure put into force June 1, 1888. Henceforth certain categories of people were absolutely excluded from Alsace-Lorraine, for instance, anyone connected with the French army. Every

other person, not a German, who wished to enter Alsace-Lorraine, must get a passport viséed at the German embassy in Paris, and it was intended that this passport should be granted only in exceptional cases."—C. D. Hazen, *Alsace-Lorraine under German rule*, pp. 125-134.

1911.—Constitution.—"The people of Alsace-Lorraine had for forty years been in absolute subjection to other wills than their own. Though allowed a Delegation or Landesausschuss, before which routine legislative proposals were laid, yet that body was elected not directly by the people but indirectly and largely by and from district and municipal councils, so that, by reason of its complicated and carefully controlled composition as well as because of the humble character of its powers, it could only be servile. It could at any moment be overruled by outside powers, by the local executive, appointed from Berlin, or by Berlin itself. There was in this form of government no satisfaction given to the legitimate desire of the Alsations to manage their own affairs. . . . On March 15, 1910, the Chancellor of the Empire, Bethmann-Hollweg, announced in the Reichstag that the Emperor had agreed with the confederated governments to grant a more autonomous constitution to Alsace-Lorraine. This announcement was received with lively satisfaction. But the people of the Reichsland were soon to learn that the Greeks are not the only people to suspect when they come forward bearing gifts. When, on June 20, the members of the Landesausschuss expressed the desire that the Landesausschuss should be consulted beforehand as to the constitutional changes under consideration in Berlin they were informed by the Alsatian ministry that the Imperial Government did not recognize the right of the Landesausschuss to mix in questions which belonged exclusively to the Bundesrath and the Reichstag. Indeed, the speech of the Chancellor ought to have checked any undue optimism on the part of the Alsations. Stating that it was necessary to grant 'a greater political independence to Alsace,' the Chancellor proceeded to lecture both the Pan-Germanists—for their opposition to any concessions—and those whom he called the 'Pan-French,' for their particularistic and Francophile agitation. The cry 'Alsace for the Alsations' had, he said, a seductive sound, but he added that this could never be realized as long as the leaders of the movement affected not to recognize the fundamentally German character of the population and aimed at Gallicizing the country in the face of ethnography and history. . . . The cause of Alsace was thus really lost in advance. . . . The actual plan for reform was not laid before the Reichstag until December, 1910. Its discussion dragged from the start. When the Landesausschuss expressed opposition to certain features of the plan its session was abruptly closed, May 9, 1911, an action which naturally produced a bad impression upon the country. On May 26, 1911, the new Constitution of Alsace-Lorraine was voted by the Reichstag. Violently opposed by the Pan-Germanists and betrayed by those so-called liberal parties in the Reichstag whose supposed principles required that they support it, Alsatian autonomy came out practically by the same door wherein it went. Only one change of any importance was made. The Landesausschuss, or single-chambered body, was now to give way to a bicameral legislature which was henceforth to be the sole source of legislation for Alsace-Lorraine. The lower house was to be elected by secret and practically manhood suffrage, but this house was to be balanced by an upper house in which the

Government would always be assured of a majority. The control of the legislature over the budget, a vital test of its importance, was affirmed but was rendered illusory by the provision that if it should refuse to vote it, then the Government should be entirely free to levy taxes and incur expenses on the basis of the preceding budget, that is, to raise and spend as much money as ever. Moreover the legislature, in this respect like the other legislatures of Germany, would have no means of enforcing its wishes. The executive power remained concentrated, as before, in the hands of the Statthalter who would reside, it is true, in Strasburg, but whose inspiration and instructions would come, as hitherto, from Berlin. The local ministry was to be, as hitherto, responsible not to the elected chamber, but to the Statthalter alone, and the Statthalter was responsible only to the Emperor. As the Statthalter and the ministry were to appoint and control the bureaucracy, or civil service, Alsace would remain, as in the past, entirely subject to an oligarchy of foreign officials, the detested immigrants from Germany, and to the daily vexations and irritations of a despotic bureaucracy. Every individual in Alsace would be subjected as during the past forty years to the system of espionage which is one of the ubiquitous elements of modern German government. The Constitution of 1911 pretended to raise Alsace-Lorraine to the rank of a German state, to place it on a plane of equality with the other twenty-five members of the confederation. In practice it did nothing of the kind. It allowed her three votes in the Bundesrath. She would thus, like all the other states, be represented in both the Bundesrath and the Reichstag. But the three delegates from Alsace-Lorraine were to receive their instructions from the Statthalter, were to vote in the Bundesrath as he might direct. But the Statthalter was not an independent sovereign like the King of Saxony or the Duke of Mecklenburg, ruling by his own right; nor was he an elected republican head of the state. He was appointed by the Emperor, and was his representative, revocable at will and consequently not likely to do anything distasteful to him. The Constitution of 1911 increased greatly the power of the Emperor; it did not increase the power of the people. In theory Alsace-Lorraine was given statehood; in practice, she was to be as tightly bound as ever. . . . The Alsations were shown, in all this campaign of much talk about nothing, that nowhere in Germany did they have any friends in their desire for real self-government, not even in the Center and Socialist parties which decisively betrayed their allies in the Reichsland for the sake of the immediate political advantages which offered themselves. The latter cooperated with the Conservatives and the Pan-Germanists in granting this mockery of autonomy. The trail of Pan-Germanism was everywhere to be seen in the annexed provinces during the few remaining years of peace. It was indeed provided by Article 28 that any further modification of the new Constitution should be made by the Reichstag and the Bundesrath. The people themselves of the new 'state' would not be able to change their fundamental law in any particular. Their Constitution of 1911, like that of 1870, now superseded, was blighted in the same way. . . . At any moment the legislative organs of the German Empire were at liberty to withdraw it or to alter it. Alsace-Lorraine remained what she had always been in theory and in fact, an Imperial Territory, a Reichsland, the property of the collective states of the confederation.

. . . The period from 1911 to 1914 was the last act in the long and ignoble history of oppression which since 1870 has been the sign-manual of German rule. The situation became steadily more and more critical for the Alsations and Lorrainers.

"After 1911 a species of terrorism was organized in Alsace-Lorraine. Spies infested the country, denouncing every manifestation of opposition or criticism. Even local officials like the Statthalter, Wedel, or the chief secretary, Zorn von Bulach, a native Alsatian who had long ago gone over to the German official side, were reproached bitterly . . . with lukewarmness and indifference to the welfare of the Fatherland. . . . During the three years preceding . . . [the World War] the cloven hoof appeared repeatedly. The public opinion of the provinces was exacerbated and alarmed by a series of irritating episodes which showed the people the humiliation of their position, the fragility, indeed the non-existence, of any guarantee of their liberties. Hansi (J. J. Waltz), a native Alsatian, was thrown into prison . . . for having caricatured a Pan-German high school teacher, Herr Gneisse, and in 1914 he was . . . prosecuted for high treason in the federal court at Leipsic because of caricatures which in any self-governing country would pass current as the most ordinary satires upon the foibles and pretensions of the official class. Abbé Wetterlé, editor of a newspaper in Colmar, and formerly a member of the Reichstag, was condemned to fine and imprisonment for protesting against the insolence of the Pan-Germans. A merchant of Mülhouse was expelled from Alsace for having asked a hotel orchestra to play the *Marseillaise*. During these years, also, the authorities proceeded against numerous Alsatian societies and clubs in a way that could only create widespread irritation and resentment, against choral unions, gymnastic clubs, and societies founded for the purpose of caring for the graves of Alsations who died on Alsatian soil during the Franco-German war. In addition to military and political pressure, economic pressure was also used to further the programme of Germanization. Alsatian economic interests were repeatedly sacrificed in the interest of neighboring states like Baden or of the powerful Rhenish-Westphalian steel-and-iron-mongers. Alsatian manufacturers or merchants were the victims of despicable informers and all who were suspected of French sympathies were made to feel the full displeasure of the government. The great locomotive corporation of Graffenstaden, on which the life of that town absolutely depended, was informed that there would be no more government contracts, unless it dismissed a manager whom the Pan-Germanists considered Francophile. As the business would have been ruined without government orders, the corporation submitted. . . . The reaction of all these incidents, grave or petty as the case might be, was exactly what might have been expected. The Alsations and Lorrainers united as one man against this recrudescence of tyranny. Dropping their differences of opinion, ignoring party lines, they joined in indignant protest against a government which subjected them to continued maltreatment, which failed to assure them the most elementary rights of free men. The hollowness and the mockery of the boasted Constitution of 1911 were patent to all the world in the light of these events."—C. D. Hazen, *Alsace-Lorraine under German rule*, pp. 175-186.

1913.—Zabern (Saverne) affair.—"The Berlin government was harassed by the fear of treasonable arrangements between Alsace-Lorraine and

Paris. That this fear was well grounded was made more than probable by the fact that with the declaration of martial law in the 'Imperial Land' after the war tocsin sounded at the beginning of August, 1914, several prominent Alsatians, including Wetterlé fled across the border into France, and that others who were not so fortunate as to make their escape were arrested and found guilty of treasonable acts. As it was, however, the threats against the constitution and the various pin pricks which the government was able to inflict effectively destroyed any national patriotism which the granting of the constitution might have inspired. Popular irritation grew and showed itself in many ways, culminating in the incident at Zabern in December, 1913. In this busy Alsatian town of some ten thousand inhabitants a Prussian regiment of infantry was quartered. Soldiers on duty at the barracks and at liberty in the town had been subjected to insults, and in several cases to rough treatment on the part of rude fellows of the baser sort among the populace. Their officers, filled with the Prussian tradition of military supremacy, ordered the privates to make forcible resistance, employing at the same time the rugged language of the barracks, which being faithfully reported in the town, added still further to the excitement. A crisis was reached in an encounter between civilians and a squad of soldiers led by a young lieutenant, in which the latter fearing, as he claimed, that he would be assaulted by a civilian of the lower class, with the consequent irreparable loss of honor according to the peculiar Prussian military tradition, sabred a lame shoemaker. In the riot which resulted Colonel Reutter, in command at the barracks, took over the administration of public order, brusquely thrusting aside the civil officials and pacifying the city by the abrupt methods of the military. Instantly a shout of protest arose, not only from Alsace-Lorraine, but from all non-feudal circles in Germany as well. The rude supplanting of the civil power by the military was regarded as a recession to the most autocratic days of Prussian history, and in the Reichstag loud calls went up for an authoritative statement from the Kaiser. The Imperial Diet recorded a vote of censure upon the Chancellor for a speech in which the majesty of the law was not vindicated. The whole matter went to the Emperor as supreme military authority and the net result was the transferring of the regiment and the court-martialing of its officers. The latter were finally acquitted, and Colonel Reutter soon after was promoted by the Emperor. The feeling of the feudal classes was summed up in the words of the reactionary Police President of Berlin, Von Jagow: 'Alsace-Lorraine is the enemy's country.' Non-feudal Germany accepted a technical statement from the ministry confirming the supremacy of the constitution over the military power, with a further promise from the government that a certain old Prussian cabinet order of 1820 which might be interpreted to the contrary would be amended. Radical and Socialist were the more ready to still their attacks and hush the matter up, because the French journals, always ready to foment discord in the lost provinces, had seized upon the situation."—R. H. Fife, *German empire between two wars*, pp. 227-230.

1914-1918.—Part in the World War.—Alsace-Lorraine lay close to the scene of conflict, but was only occasionally the actual scene of severe fighting except during the first two months of the war. A little fringe of western Alsace was occupied uninterruptedly by the French throughout

the great struggle and was also the scene of occasional local fighting.—See also *WORLD WAR: 1914: I. Western front: h.*

1919.—Peace Conference decision.—"Alsace-Lorraine took little of the time of the peace conference. This would have seemed strange at any time during the war or the generation which preceded it, for Alsace-Lorraine was an open wound which, in President Wilson's phrase, 'had unsettled the peace of the world for nearly fifty years.' It was not a direct cause of the war, but it became a burning issue as soon as the war broke forth, and it remained one of the chief obstacles to any peace of compromise. But the problem of Alsace-Lorraine was settled by the Allied victory and evacuation required by the armistice, and these military acts were sealed by the enthusiastic reception of the French troops immediately thereafter. There was no way of reopening the question at the conference, for the Germans had accepted President Wilson's eighth point requiring that the wrong done to France should be righted, and by their enforced evacuation they were no longer in a position to delay or to interfere. Nevertheless at Versailles Germany put up a last fight for the retention of these territories, tied up as they were with Germany's imperial tradition, with her strategic position, and with her supply of iron ore. She demanded that there should be a popular vote. For this there was no legal ground, the language of President Wilson speaking only of the wrong done to France, and the armistice having assimilated Alsace-Lorraine to other occupied territories. . . . Since the signing of the treaty the secret propaganda of the German Heimdienst [Home Service] has been active in Alsace-Lorraine, keeping alive German feeling where it still exists and in particular fomenting a so-called Neutralist movement for the separation of this region as a neutralized state under the protection of the League of Nations. . . . With the major question of the return of the lost provinces to France settled in advance, the Paris conference had only to deal with matters of detail, such as naturally arise in a retrocession from one country to another. The draft of such clauses was submitted by the French and referred by the council of four to the special committee of three, Messrs. Tardieu, Headlam-Morley, and Haskins, which had already been at work on the Saar valley. . . . The clauses respecting citizenship are particularly complicated, and much depends upon the spirit of liberality with which these and the economic clauses are interpreted by the French administration"—E. M. House and C. Seymour, *What really happened at Paris, story of the Peace Conference*, pp. 46-48.

"The treaty therefore restored the provinces with the frontiers of 1871. Since Germany had refused to assume any share of the French debt in

1871, France now recovers the provinces free of obligations as to the German national debt. Similarly German state property including railroads is transferred without payment or credit on Germany's reparation account. Other articles fix the details as to customs, court proceedings, and the like. For five years products of Alsace-Lorraine are to enter Germany duty-free, up to the average amounts of 1911-1913. Germany also is to allow free export and re-import of yarns and textile products. The French government has the right to exclude German capital from public utilities and mines, and it also reserves the right to retain and liquidate the property of German citizens in Alsace-Lorraine. An annex provides for the restoration to French citizenship of the old Alsace-Lorrainers and their descendants, with some exceptions. Various others within a year may claim French nationality, though in individual cases the French may reject the claim. Germans born or domiciled in Alsace-Lorraine before the war must be naturalized, a period of three years from November 1, 1918, being required.—A. P. Scott, *Introduction to the peace treaties*, p. 16.—See also VERSAILLES, TREATY OF: Part III: Section V.

"France had not provoked the war in order to regain Alsace-Lorraine; but from the moment the war began, every Frenchman was determined that the old 'open wound' in the side of France must be healed. Although during the war there had been some talk among outside observers of a possible division of Alsace-Lorraine along the lines of the prevailing languages, and although President Wilson had not specified just how 'the wrong done to France in 1871' was to be righted, there was not the slightest doubt after the armistice that Alsace-Lorraine should be restored entire to France. The Germans admitted that in spite of their historic and nationalistic claims, they had, according to present conceptions of right, done an injustice in 1871, when they had not consulted the people of Alsace-Lorraine. In accordance with the new principle of self-determination, however, they demanded a plebiscite, which should decide whether the region wished to join France or Germany or become a free state. This proposal was summarily rejected. It was felt that restoration to France was necessary to redress the injustice of 1871. The will of the inhabitants had been shown by their protests at that time, and later. Practically, a fair plebiscite would have been difficult in view of the fact that many French sympathizers had left after 1871, that many Germans had come in since then, and that during the war the Germans had treated the territory as enemy country. The treaty therefore restored the provinces to France with the frontiers of 1871. . . . The restoration of Alsace-Lorraine is doubly significant. It has a moral and sentimental value, as marking the failure of that Prussian policy of blood and iron which seemed so triumphant in 1871. For France, the stronger frontier and the added population are additional safeguards. But still more important is the iron of Lorraine, the richest field in Europe. From it Germany drew nearly all her ore. With it Germany was able to forge her industrial and military machine. Without it Germany will be helpless for aggression, and dependent for her industrial development on the cultivation of friendly economic relations with France."

With the signing of the armistice, the transition period began. The French government by the decree of November 26, 1918, took over the administration of the country and French troops displaced the Germans. On March 22, 1919, M.

Alexandre Millerand was appointed first governor-general. The task of submitting civil officials and courts for the administration of French law and of organization of the educational system along French lines, has been substantially achieved. Serious difficulties were encountered due to French unfamiliarity with the country and the barrier of languages, for, in Alsace at least, the great majority of the people speak a German dialect. The currency question also offered certain peculiar difficulties of its own. The franc was made to take the place of the mark. Altogether there was much confusion and disappointment over these various difficulties in spite of the great popular acclaim with which the transfer of these last provinces from German to French sovereignty was received.

"For France the reacquisition of the lost provinces brings not only renewed strength but perplexing problems and responsibilities. Germany had signally failed to win the affection and loyalty of Alsace-Lorraine. On the other hand, the German connection had brought much prosperity to the provinces, and by no means all—perhaps not even a majority—of the people were in 1914 anxious to return to France. In 1918, however, the French were welcomed with a heartiness which even the Germans had to admit. The problem of the complete reincorporation of the provinces in France is not a simple one. Great caution will have to be exercised in applying the French laws as to the separation of church and state, and limiting clerical control of education. If Alsace-Lorraine should prove less prosperous than under German rule, or if the anti-clericalism of France should offend the strong Catholic sentiment of the people, grave dissatisfaction may yet arise. It is to be hoped that as little occasion as possible will be given for the growth of a new irredentism, and that the historic wrong of 1871 may have found its final solution."—A. P. Scott, *Introduction to the peace treaties*, pp. 115-118.—See also FRANCE: 1918 (November).

ALTAMIRA, caves in northern Spain wherein notable examples of prehistoric paintings were found. See PAINTING: Pre-classical.

ALTAMSH, or Altimsh (d. 1236), king of Delhi. See INDIA: 977-1290.

ALTAR, a raised place of earth, stone or other material, which forms the central point of worship in the sacred building or enclosure of any religion. In the older religions it was upon the altar that sacrifices were made, libations poured, or gifts deposited. In the liturgical Christian churches the sacrament is administered from the altar. In the Protestant churches, the altar has disappeared, or has been replaced by the simple communion table.

ALTDORFER, Albrecht (?1480-1538), German painter and engraver, called the "Giorgione of the North." His engravings on wood and copper rank next to those of Albrecht Dürer.

ALTEN, Sir Charles (1704-1840), Hanoverian and British soldier. Participated in the campaign in the Low Countries, 1703-1705, in the Hanoverian expedition 1805, was with Moore in the expedition to Spain, and commanded Wellington's third division at Waterloo.

ALTENBURG: Its origin and dukedom. See SAXONY: 1180-1553.

ALTENHEIM, Battle of (1675). See NETHERLANDS: 1674-1078.

ALTGELD, John Peter (1847-1902), governor of Illinois, 1893-1897; came to the United States from Germany at an early age. While governor he was severely criticized for his leniency in pardoning three anarchists, said to have been guilty of exploding a bomb in Chicago during a strike in 1886. He again showed that his sympathies were with the workers when he refused to call out the militia in 1894, during the Pullman strikes. President Cleveland sent federal troops over Altgeld's protest on the ground that his action was necessary to protect the federal mills. He supported William J. Bryan in the 1896 and 1900 presidential campaigns, in favor of "free silver," and was a strong advocate of prison reform.

AMAHUACO. See ANDESANS.

AMAL, the name of the leading family of the Ostrogoths, from which nearly all their kings, known as Amalings, were chosen.

AMALEKITES.—"The Amalekites were usually regarded as a branch of the Edomites or 'Red-skins.' Amalek, like Kenaz, the father of the Kenizzites or 'Hunters,' was the grandson of Esau (Gen. 36: 12, 16). He thus belonged to the group of nations,—Edomites, Ammonites, and Moabites,—who stood in a relation of close kinship to Israel. But they had preceded the Israelites in dispossessing the older inhabitants of the land, and establishing themselves in their place. The Edomites had partly destroyed, partly amalgamated the Horites of Mount Seir (Deut. 2:12); the Moabites had done the same to the Emlin, a people great and many, and tall as the Anakim' (Deut. 2:10), while the Ammonites had extirpated and succeeded to the Rephaim or 'Giants,' who in that part of the country were termed Zamzummin (Deut. 2:20; Gen. 14:5). Edom however stood in a closer relation to Israel than its two more northerly neighbours. . . . Separate from the Edomites or Amalekites were the Kenites or wandering 'smiths.' They formed an important Guild in an age when the art of metallurgy was confined to a few. In the time of Saul we hear of them as camping among the Amalekites (I. Sam. 15:6) . . . The Kenites . . . did not constitute a race, or even a tribe. They were, at most, a caste. But they had originally come,

like the Israelites or the Edomites, from those barren regions of Northern Arabia which were peopled by the Menti of the Egyptian inscriptions. Racially, therefore, we may regard them as allied to the descendants of Abraham. While the Kenites and Amalekites were thus Semitic in their origin, the Hivites or "Villagers" are specially associated with Amorites."—A. H. Sayce, *Races of the Old Testament*, ch. 6.—See also JEWS: Israel under the Judges, and Kingdoms of Israel and Judah; CHRISTIANITY: Map of Sinaitic peninsula.

AMALFI, a seaport town in Campania, south Italy. It is about twenty-two miles southeast of Naples, on the Gulf of Salerno. An interesting building is the old cathedral, with bronze doors cast in Constantinople in the 11th century. A hotel now makes use of an old Capuchin monastery, which dates from the beginning of the 13th century. "It was the singular fate of this city to have filled up the interval between two periods of civilization, in neither of which she was destined to be distinguished. Scarcely known before the end of the sixth century, Amalfi ran a brilliant career, as a free and trading republic which was checked by the arms of a conqueror in the middle of the twelfth. . . . There must be, I suspect, some exaggeration about the commerce and opulence of Amalfi, in the only age when she possessed any at all."—H. Hallam, *Europe during the Middle Ages*, ch. 9, pt. 1, with note.—"Amalfi and Atrani lie close together in two . . . ravines, the mountains almost arching over them, and the sea washing their very house-walls. . . . It is not easy to imagine the time when Amalfi and Atrani were one town, with docks and arsenals and harbourage for their associated fleets, and when these little communities were second in importance to no naval power of Christian Europe. The Byzantine Empire lost its hold on Italy during the eighth century; and after this time the history of Calabria is mainly concerned with the republic of Naples and Amalfi, their conflict with the Lombard dukes of Benevento, their opposition to the Saracens, and their final subjugation by the Norman conquerors of Sicily. Between the year 839 when Amalfi freed itself from the control of Naples and the yoke of Benevento, and the year 1131, when Roger of Hauteville incorporated the republic in his kingdom of the Two Sicilies, this city was the foremost naval and commercial port of Italy. The burghers of Amalfi elected their own doge; founded the Hospital of Jerusalem, whence sprang the knightly order of S. John; gave their name to the richest quarter in Palermo; and owned trading establishments or factories in all the chief cities of the Levant. Their gold coinage of 'tari' formed the standard of currency before the Florentines had stamped the lily and S. John upon the Tuscan florin. Their shipping regulations supplied Europe with a code of maritime laws. Their scholars, in the darkest depths of the dark ages, prized and conned a famous copy of the Pandects of Justinian, and their seamen deserved the fame of having first used, if they did not actually invent, the compass. . . . The republic had grown and flourished on the decay of the Greek Empire. When the hard-handed race of Hauteville absorbed the heritage of Greeks and Lombards and Saracens in Southern Italy these adventurers succeeded in annexing Amalfi. But it was not their interest to extinguish the state. On the contrary, they relied for assistance upon the navies and the armies of the little commonwealth. New powers had meanwhile arisen in the North

of Italy, who were jealous of rivalry upon the open seas; and when the Neapolitans resisted King Roger in 1135, they called Pisa to their aid, and sent her fleet to destroy Amalfi. The ships of Amalfi were on guard with Roger's navy in the Bay of Naples. The armed citizens were, under Roger's orders, at Aversa. Meanwhile the home of the republic lay defenceless on its mountain-girdled seaboard. The Pisans sailed into the harbour, sacked the city and carried off the famous Pandects of Justinian as a trophy. Two years later they returned, to complete the work of devastation. Amalfi never recovered from the injuries and the humiliation."—J. A. Symonds, *Sketches and studies in Italy*, pp. 2-4.

AMAZON RIVER: Its course.—Madeira-Mamore railway.—The Amazon is a river of South America, and is the longest and most extensive inland waterway in the world. Its length is variously estimated at between 3,000 and 4,000 miles; with more than 200 tributaries this great fluvial system drains an area of over 2,700,000 square miles. About 2,500 miles of its length courses through Brazil. Rising in the Peruvian Andes in two main arteries, the Marañon or Tinguiragua and the Ucayali, also known as the Apurimac, the stream becomes united at Tabatinga on the borders of Peru and Brazil, about 5° south and flows eastward as the Solimoens river to the Rio Negro confluence. From this point the Amazon proper, or lower course, winds through Brazil and empties itself into the Atlantic directly on the equator. From Tabatinga the two sections of the main stream, together with most of their ramifying branches, are comprised within Brazilian territory; the upper section, together with the upper valleys of some of the Solimoens affluents, belong entirely to Peru. Here rise and flow for hundreds of miles the Marañon, the Huallaga, and the Ucayali, that is, the three farthest head-streams of the whole system with which the Paute, Pastaza, Tigre and Napo from Ecuador converge above Tabatinga to form the Solimoens. It is apparently owing to its westernmost position, farthest from the Atlantic, that the Marañon is commonly regarded as the true upper source of the Amazon. Judging by length and volume, however, this distinction should be awarded to the Ucayali, which is the larger of the two at the confluence and has also a much longer course.

"From Pará to the Amazon proper much can be seen, but by far the greater interest lies in the passage through the narrows; that is, the latter part of this stretch, and it can be enjoyed only by daylight, when the sometimes threatening closeness to the banks permits those on the deck of the steamer to catch the details within or about the small thatched huts (barracas) of the natives; to watch the children at their games, which are much the same as games of children in other parts of the world; and to study the endless variety of the crowded, impenetrable vegetation of the forest. Here the trees appear to be higher and greener, the sparse clearings, whether made by nature or man, farther apart; but the huts are numerous, and the traveler can fancy a certain degree of neighborhood life among the simple people. One seldom sees a patch along the water's edge between any two huts, or settlements, but the water is always there, and it affords the only traveled highway for either sociability or commerce. The main river to the novelty-seeking tourist may be somewhat disappointing. He who has seen the Rhine, the Thames, the Danube, or the Hudson is apt to come away with the fixed opinion that the Amazon is rather monotonous. The only reason upon which such an opinion can be based is the fact that the four or five days on the river to Manaus present no striking views of constantly varying scenery, no great evidences of the struggles of nature when the earth was forming, and only here and there substantial traces of man's conquest of the land. The stream flows practically due east

from the Andes with only a few turns in its course, although the channel alters from season to season. The numerous islands are in general indistinguishable from the mainland; the entrance of any one of the many important tributaries creates little disturbance and seems not to increase at all the tremendous volume of water between the two banks. . . . Only three places really attract notice on the through voyage—Obidos, Santarem, and Itacoatiara a few miles below the mouth of the Madeira River. The two former are historical, being early settlements grown into cities since the time of the Province and the Empire; the latter was originally an Indian village and once had the name of Serpa which is yet heard on the lips of experienced river men. Pará is one of the oldest cities in Brazil, and offers for the tourist much that is interesting from any point of view. Manaus, on the contrary, is one of the newest cities in Brazil, and illustrates fairly well what Brazilians can do in civic foundation and improvement. . . . To those who are travelers with a different purpose, however, the Amazon Valley is a wonderland, the richest in opportunity of any of the world's hitherto unoccupied spaces. For the botanist, for instance, an unlimited field for investigation is still open, and the studies of Bates, Spruce, or others have merely hewn a slight path through this most luxuriant of nature's gardens. For the biologist and zoologist, the amount of the unknown is fascinating, and the needed researches into the natural history of this region will furnish activity for inquiring minds during the greater part of the present century. The ethnologist also must be fascinated by the chance here offered to discover man in an environment which, while leaving him essentially savage, has yet developed in him many of the better phases of human nature. In fact every student of whatever degree or inclination should know that here is a theater that calls him most ardently to action now, and in which there need be not one moment of dullness or monotony. . . . One of the seven wonders of the first part of the twentieth century . . . [is] the Madeira-Mamore Railway. . . . In a sentence, the Madeira-Mamore Railway is to Brazil and Bolivia what the Panama Canal is to Chile and Peru. . . . The Madeira-Mamore Railway is 363.4 kilometers long (202 miles). It extends in a direction almost due south, within the Brazilian State of Matto Grosso, between the terminals Porto Velho at the north, on the Madeira River, to Guajara-Mirim at the south, on the Mamore River. . . . The Madeira-Mamore Railway was built to avoid the rapids and falls of the Madeira River, and it is evident, when passing over the line, that the result was most satisfactorily obtained."—H. Hale, *Valley of the river Amazon.—Madeira-Mamore Railway Company (Pan American Union, Dec., 1912)*.—See also BRAZIL: Geographic description; LATIN AMERICA: Map of South America.

Discovery and naming.—The mouth of the great river of South America was discovered in 1500 by Pinzon, or Pinçon, who called it "Santa Maria de la Mar Dulc" (Saint Mary of the fresh-water sea). "This was the first name given to the river, except that older and better one of the Indians, 'Parana,' the Sea; afterwards it was Marañon and Rio das Amazonas, from the female warriors that were supposed to live near its banks. . . . After Pinçon's time, there were others who saw the fresh-water sea, but no one was hardy enough to venture into it. The honor of its real discovery was reserved for Francisco de Orellana; and he explored it, not from the east,

but from the west, in one of the most daring voyages that was ever recorded. It was accident rather than design that led him to it. After . . . Pizarro had conquered Peru, he sent his brother Gonzalo, with 340 Spanish soldiers, and 4,000 Indians, to explore the great forest east of Quito, 'where there were cinnamon trees.' The expedition started late in 1539, and it was two years before the starved and ragged survivors returned to Quito. In the course of their wanderings they had struck the river Coco; building here a brigantine, they followed down the current, a part of them in the vessel, a part on shore. After a while they met some Indians, who told them of a rich country ten days' journey beyond—a country of gold, and with plenty of provisions. Gonzalo placed Orellana in command of the brigantine, and ordered him, with 50 soldiers, to go on to this gold-land, and return with a load of provisions. Orellana arrived at the mouth of the Coco in three days, but found no provisions; 'and he considered that if he should return with this news to Pizarro, he would not reach him in a year, on account of the strong current, and that if he remained where he was, he would be of no use to the one or to the other. Not knowing how long Gonzalo Pizarro would take to reach the place, without consulting any one he set sail and prosecuted his voyage onward, intending to ignore Gonzalo, to reach Spain, and obtain that government for himself.' Down the Napo and the Amazons, for seven months, these Spaniards floated to the Atlantic. At times they suffered terribly from hunger: 'There was nothing to eat but the skins which formed their girdles, and the leather of their shoes, boiled with a few herbs.' When they did get food they were often obliged to fight hard for it; and again they were attacked by thousands of naked Indians, who came in canoes against the Spanish vessel. At some Indian villages, however, they were kindly received and well fed, so they could rest while building a new and stronger vessel. . . . On the 26th of August, 1541, Orellana and his men sailed out to the blue water 'without either pilot, compass, or anything useful for navigation; nor did they know what direction they should take.' Following the coast, they passed inside of the island of Trinidad, and so at length reached Cubagua in September. From the king of Spain Orellana received a grant of the land he had discovered; but he died while returning to it, and his company was dispersed. It was not a very reliable account of the river that was given by Orellana and his chronicler, Padre Carbajal. So Herrera tells their story of the warrior females, and very properly adds: 'Every reader may believe as much as he likes.'—H. H. Smith, *Brazil, the Amazons, and the coast*, ch. 1.—In chapter eighteen of this same work "The Amazon Myth" is discussed at length, with the reports and opinions of numerous travelers, both early and recent, concerning it. Mr. Southey had so much respect for the memory of Orellana that he made an effort to restore that bold but unprincipled discoverer's name to the great river. "He discarded Marañon, as having too much resemblance to Maranhon, and Amazon, as being founded upon fiction and at the same time inconvenient. Accordingly, in his map, and in all his references to the great river he denominates it Orellana. This decision of the poet-laureate of Great Britain has not proved authoritative in Brazil. O Amazonas is the universal appellation of the great river among those who float upon its waters and who live upon its banks. . . . Pará, the aboriginal name of this river, was more appropriate than any other. It signifies 'the father of

waters.' . . . The origin of the name and mystery concerning the female warriors, I think, has been solved within the last few years by the intrepid Mr. Wallace. . . . Mr. Wallace, I think, shows conclusively that Friar Gaspar [Carbajal] and his companions saw Indian male warriors who were attired in habiliments such as Europeans would attribute to women. . . . I am strongly of the opinion that the story of the Amazons has arisen from these feminine-looking warriors encountered by the early voyagers."—J. C. Fletcher and D. P. Kidder, *Brazil and the Brazilians*, ch. 27.

Tributaries.—River of Doubt.—Development of river system.—The more important of the many tributaries of the Amazon are: Tocantins, Xingu, Tapajos, Purus, Juruá, Japurá, Rio Negro and Madeira. One of the largest affluents of this great arm of the Amazon is the Rio Teodoro, which was named in honor of the discoverer, the late ex-president, Theodore Roosevelt, who led the Roosevelt-Rondon exploration expedition through the Brazilian wilderness in 1914. "On February 27, 1914, shortly after midday, we started down the River of Doubt (Rio Teodoro) into the unknown. We were quite uncertain whether after a week we should find ourselves in the Gy-Paraná, or after six weeks in the Madeira, or after three months we knew not where. . . . We put upon the map a river some fifteen hundred kilometres in length, of which the upper course was not merely utterly unknown to, but unguessed at by, anybody; while the lower course, although known for years to a few rubber-men, was utterly unknown to cartographers. It is the chief affluent of the Madeira, which is itself the chief affluent of the Amazon. The source of this river is between the 12th and 13th parallels of latitude south and the 50th and 60th degrees of longitude west from Greenwich . . . we finally entered the wonderful Amazon itself, the mighty river which contains one-tenth of all the running water of the globe. It was miles across, where we entered it; and indeed we could not tell whether the farther bank, which we saw, was that of the mainland or an island. . . . The mightiest river in the world is the Amazon. It runs from west to east, from the sunset to the sunrise, from the Andes to the Atlantic. The main stream flows almost along the equator, while the basin which contains its affluents extends many degrees north and south of the equator. This gigantic equatorial river basin is filled with an immense forest, the largest in the world, with which no other forests can be compared save those of western Africa and Malaysia."—T. Roosevelt, *Through the Brazilian wilderness*.

"So fertile is the soil of the Amazon that it is claimed that for every bushel of maize, rice, or beans planted over 800 bushels are harvested. . . . 'Amazonia' is an agricultural El Dorado, and it is an amazing incongruity that food should ever have been imported into the valley, where enough rice, for instance, could be raised to feed the entire world; yet until two or three years ago rice was imported, some of it from China."—J. F. Barry, *Great possibilities of Amazonia (Pan American Union, Mar., 1920)*.—The last ten years have brought great changes in the civilization and commercial life of the Amazon and "Amazonia." Probably the most important factors in the development of this fabulously wealthy river system are the construction of the railroad line from Porto

Velho to Guajará-Mirim, and the establishment of the Amazon Navigation Company in 1912. The importance of the latter undertaking, to the life and progress of the Brazilians, can hardly be over-estimated. The Amazon Navigation Company, which operates under a federal charter, covers fifteen routes and a total distance of 235,552 miles annually. The fleet consists of about 100 crafts, some of which have been taken from the old (English) Amazon Navigation Company. The steamers ply not only on the Amazon but also on all of its more important affluents, such as the Tapajos, the Javory, the Madeira, the Rio Negro, the Purus and the Juruá.

AMAZON RUBBER COMPANY: Putumayo rubber atrocities. See PERU: 1912-1913.

AMAZONS.—"The Amazons, daughters of Arès and Harmonia, are both early creations, and frequent reproductions, of the ancient epic. . . . A nation of courageous, hardy and indefatigable women, dwelling apart from men, permitting only a short temporary intercourse for the purpose of renovating their numbers, and burning out their right breast with a view of enabling themselves to draw the bow freely,—this was at once a general type stimulating to the fancy of the poet, and a theme eminently popular with his hearers. Nor was it at all repugnant to the faith of the latter—who had no recorded facts to guide them, and no other standard of credibility as to the past except such poetical narratives themselves—to conceive communities of Amazons as having actually existed in anterior time. Accordingly we find these warlike females constantly reappearing in the ancient poems, and universally accepted as past realities. In the Iliad, when Priam wishes to illustrate emphatically the most numerous host in which he ever found himself included, he tells us that it was assembled in Phrygia, on the banks of the Sangarius, for the purpose of resisting the formidable Amazons. When Bellerophon is to be employed on a deadly and perilous undertaking, by those who indirectly wish to procure his death, he is despatched against the Amazons. . . . The Argonautic heroes find the Amazons on the river Thermòdon in their expedition along the southern coast of the Euxine. To the same spot Hèrakles goes to attack them, in the performance of the ninth labour imposed upon him by Eurystheus, for the purpose of procuring the girdle of the Amazonian queen, Hippolyte; and we are told that they had not yet recovered from the losses sustained in this severe aggression when Thèseus also assaulted and defeated them, carrying off their queen Antiopè. This injury they avenged by invading Attica . . . and penetrated even into Athens itself: where the final battle, hard-fought and at one time doubtful, by which Thèseus crushed them, was fought—in the very heart of the city. Attic antiquaries confidently pointed out the exact position of the two contending armies. . . . No portion of the ante-historical epic appears to have been more deeply worked into the national mind of Greece than this invasion and defeat of the Amazons. . . . Their proper territory was asserted to be the town and plain of Themiskyra, near the Grecian colony of Amisus, on the river Thermòdon [northern Asia Minor], a region called after their name by Roman historians and geographers. . . . Some authors placed them in Libya or Ethiopia."—G. Grote, *History of Greece*, pt. 1, ch. 11.

AMA-ZULU. See ZULULAND.

AMBACTI.—"The Celtic aristocracy [of Gaul] . . . developed the system of retainers, that is, the privilege of the nobility to surround themselves with a number of hired mounted servants—the am-

bacti as they were called—and thereby to form a state within a state; and, resting on the support of these troops of their own, they defied the legal authorities and the common levy and practically broke up the commonwealth. . . . This remarkable word [ambacti] must have been in use as early as the sixth century of Rome among the Celts in the valley of the Po. . . . It is not merely Celtic, however, but also German, the root of our 'Amt,' as indeed the retainer-system itself is common to the Celts and the Germans. It would be of great historical importance to ascertain whether the word—and therefore the thing—came to the Celts from the Germans or to the Germans from the Celts. If, as is usually supposed, the word is originally German and primarily signified the servant standing in battle 'against the back' ('and' =against, 'bak' =back) of his master, this is not wholly irreconcilable with the singularly early occurrence of the word among the Celts. . . . It is . . . probable that the Celts, in Italy as in Gaul, employed Germans chiefly as those hired servants-at-arms. The 'Swiss guard' would therefore in that case be some thousands of years older than people suppose."—T. Mommsen, *History of Rome*, bk. 5, ch. 7, and *foot-note*.

AMBAN, the title of two imperial Chinese residents in Lhasa, Tibet, who supervised the management of all secular affairs of the country by the four ministers of state. See TIBET: 1902-1904: 1010-1014.

AMBARRI, a small tribe in Gaul which occupied anciently a district between the Saone, the Rhone and the Ain.

AMELIA CASE.—The *Amelia* had sailed from Hamburg to Calcutta and on the return voyage was captured by the French, who held her about ten days, when she was captured by the *Constitution*, commanded by Captain Silas Talbot, U. S. N. Talbot had brought suit in the New York district court that the *Amelia* be judged lawful prize, which the owners disputed, since Hamburg and the United States were not at war. Seaman appealed from the decision of the district court, and Talbot from that of the circuit court. The supreme court ordered the vessel to be sold and the costs to be paid from the proceeds of the sale; of the residue one-sixth was to go to the libellant, for commander and crew, the remainder to the owners of the vessel. This practically reaffirmed the decision of the circuit court. The decree was handed down in August, 1801. Jared Ingersoll was principal counsel for plaintiff, Alexander James Dallas for defendant.—J. A. Bayard, *Annual report of the American Historical Association*, 1913, p. 123.

AMELIUS (fl. 246-260), Greek philosopher. See NEOPLATONISM.

AMEL-MARDUK, or Amit-Marduk, king of Babylonia. See BABYLONIA: Decline of the Empire.

AMENDMENTS TO CONSTITUTIONS: United States.—To the Federal constitution.—The framers of the Constitution of the United States seem to have felt that the sovereignty of the states would be best protected by the legislatures of the several states. They provided that Congress may propose amendments by a two-thirds vote of each house, but that such amendments must be ratified by three-fourths of the several states either through their legislatures or by conventions. The states themselves may take the initiative in proposing amendments and Congress is required to call a convention for this purpose on application of the legislatures of two-thirds of the states. One part of the Constitution is virtually unamendable because of the provision "that no State, without its consent, shall be deprived of its equal suffrage in the Senate." Between 1780 and 1920, nineteen amendments were adopted. The first ten, however, were adopted at one time and comprise a Bill of Rights omitted from the original Constitution because the framers of the Constitution took these rights for granted. (See also U. S. A.: 1701.) The eleventh amendment prevents the Federal Government from being party in law suits brought by citizens of any state against the government of another state. The twelfth amendment changed

the manner of voting in the electoral college. The thirteenth, fourteenth and fifteenth amendments were adopted after the Civil War. The thirteenth gives the slaves their freedom, [see also U. S. A.: 1865 (January)] the fourteenth gives civil rights to the freedman and defines citizens as "all persons born or naturalized in the United States and subject to the jurisdiction thereof." It also forbids any state to abridge the privileges or immunities of citizens of the United States" or to "deprive any person of life, liberty, or property without due process of law." [See also SUFFRAGE, MANHOOD: United States: 1864-1921; U. S. A.: 1866 (June), 1866-1867 (October-March), 1901 (January).] The fifteenth amendment provides that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color, or previous conditions of servitude." [See also U. S. A.: 1868-1870: Process of reconstruction; also 1860-1870.] Amendment sixteen empowers Congress to levy and collect taxes on incomes. [See U. S. A.: 1909 (July).] The seventeenth amendment provides for the election of United States senators by vote of the people. [See also ARIZONA: 1912.] The eighteenth is as follows [Constitutional League of America, p. 31]:—"Section I.—After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited. Section II.—The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation. Section III.—This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission thereof to the States by the Congress." [See also LIQUOR PROBLEM: United States: 1913-1919.] The nineteenth amendment forbids any state to deny suffrage to a citizen because of sex. [See SUFFRAGE, WOMAN: United States: 1851-1920.] It will thus be seen that in this period of over a century and a quarter the Constitution has been amended at only eight different times. It requires a strong popular demand to get Congress to pass a proposed amendment. More than one-half of eighteen hundred propositions of this sort introduced into Congress in the first hundred years were "pigeon-holed" or killed in committees.—See also U. S. A.: Constitution.

Court decisions covering amendments to Federal constitution.—"In March, 1920, a United States District Court held that both the Amendment and the National Prohibition Act are valid; that there is nothing in the subject-matter of the Amendment incompetent or improper to form part of the Constitution; that there is no usurpation of powers properly belonging to the States alone; that since an amendment of the Constitution provides that future amendments shall be ratified by the Legislatures of the States, the objection urged as regards States which have a referendum law, namely, that the Amendment should have been submitted to referendum, is of no force; that Congress had a right to define (as it has defined, by the 'half of one per cent.' provision in the Volstead Law) what intoxicating liquor is; and that the contention that the plaintiff's property has been destroyed without compensation, contrary to the Constitution, has no basis, because Congress has the right to determine whether compensation shall be made when the property (as here) is not taken

for public use. The discussion by Judge Rellstab of the meaning of the clause 'concurrent power to enforce by appropriate legislation' is full and interesting. He rejects any dictionary definition of the word 'concurrent' which would restrict the action of Congress and the Legislatures to agreement upon 'every phase of the intended enforcing legislation,' and even adds that 'to impute to Congress and the ratifying States such an impracticable purpose . . . is unthinkable.' With equal positiveness he rejects the claim of the brewer-plaintiff that no enforcement act of Congress affecting such a business has legal force or effect unless the State agrees therein. This is further emphasized in this passage of the decision:

"That meaning which will carry out the intended purpose of Congress should be given to this word. The thing sought to be prohibited is the manufacture of and commerce in intoxicating liquors for beverage purposes, and the prohibition extends throughout the United States and all territory subject to its jurisdiction. Only the enforcement of this prohibition is subject to the legislative power, and this power is delegated to both Congress and the several States. If Congressional action to be effective is dependent upon each of the States joining with it in its enforcement legislation, an absolute failure to effect such legislation is not merely possible but decidedly probable."

"In another form the anti-nullifying force of this decision is expressed in the words: 'When Congress acts to enforce this Amendment, its commands extend throughout the Union.' This is certainly plain and direct doctrine. It is supported by a reference to a statement of Chief-Justice Marshall, of the United States Supreme Court, many years ago. Justice Marshall said:

"Should this collision [between an act of Congress and New York [legislation] exist, it will be immaterial whether those laws were passed in virtue of a concurrent power 'to regulate commerce with foreign nations and among the several States,' or in virtue of a power to regulate their domestic trade and police. In one case and the other, the acts of New York must yield to the law of Congress; and the decision sustaining the privilege they confer, against a right given by a law of the Union, must be erroneous. . . . The nullity of any act, inconsistent with the Constitution, is produced by the declaration, that the Constitution is the supreme law."

"Finally, Judge Rellstab holds: 'The prohibitory section of the Eighteenth Amendment is of national scope and operation, and its efficacy depends upon its being nationally enforced. Its enforcement section was nationally envisaged, as was the need of the co-operation of the several States to secure general observance. To carry out such a concept, Congress alone, of all the legislative bodies, must take the lead, and its leadership, when assumed, dominates.'"—*Outlook*, March 31, 1920.—See also SUPREME COURT: 1882-1808; 1014-1021.

The Supreme Court held, in the case of *Hollingsworth vs. Virginia* (3 Dallas 78) that the president had nothing to do with the proposing or adopting of amendments.

Amendment of state constitutions.—Referendum.—There is as yet no uniform practice with regard to consulting the people before calling a constitutional convention. In nearly thirty states the legislature may use its discretion as to the time of consulting the people. In several states, New York among the number, the people must be consulted at stated intervals on the question of holding a constitutional convention. Thomas Jefferson held that once in each generation a new constitu-

tion should be made and it is now a general rule to secure popular approval for the calling of a convention once in about twenty years. Some states like New York, Michigan and Missouri have in their constitutions complete provision for the election and assembly of constitutional conventions, but a few states leave these details entirely to legislative discretion. In the states that have the direct popular initiative the voters are independent of the legislatures in the matter of calling and organizing constitutional conventions. These states number more than a third of the total.

There is no uniform practice in the matter of securing the approval of the electorate after constitutions have been revised. New England, New York and Virginia led the way in the practice of securing popular approval to propose amendments and it is now general, though there has been in recent years some departure from this custom. For a discussion of these cases, consult W. F. Dodd, *Revision and amendment of state constitutions*, pp. 67-71—See also MINNESOTA: 1896.

Other methods of amending state constitutions.—"In the beginning there seems to have been no clear recognition of the necessity for a distinction between the revision and the amendment of state constitutions. In the original states the practice varied. Only three of the original state constitutions contained any special provisions for their amendment by legislative action. Delaware provided that certain parts of the constitution should not be subject to amendment at all, and that 'no other part should be altered except with the consent of five out of the seven members of the legislative assembly and seven out of the nine members of the legislative council.' South Carolina also established a distinction between the process of ordinary legislation and that of constitutional amendment by requiring an exceptional majority for the adoption of a measure of the latter character. Maryland made a sharper distinction between constitutional amendments and ordinary statutes by requiring that the former, having been adopted by the legislature, should be published at least three months before the election of the next legislature, and then readopted by the latter, in order to become effective. The Maryland plan of action by two successive legislatures was accepted by South Carolina in 1790 and by Delaware in 1792 and grafted upon their own original devices. This arrangement was generally considered at the time to give adequate popular control over the process of amendment, and was adopted in several other states; but the only state which still clings to-day to a process of amendment which makes no provision for a special popular vote upon each proposed amendment is Delaware. A somewhat more democratic practice was adopted in Alabama in 1810. This consisted in the provision that an amendment proposed by the legislature should be voted on directly by the people, instead of being merely published for their information, but the power to take final action was still vested in the next succeeding legislature. This plan was never widely copied, and exists to-day in only two states, South Carolina and Mississippi. A still more democratic practice was inaugurated in Connecticut in 1818. Instead of placing the popular vote between the two successive legislative actions the popular vote was placed after the second legislative action, thus giving to the electorate the final decision, and making its action definitive instead of merely advisory. The Connecticut plan was adopted in Maine in 1819 and simplified by the omission of the requirement that a second legislature endorse proposed amendments, thus enabling any legisla-

ture to submit its proposals directly to the people. The Connecticut and Maine plans have since been widely copied, and popular control over the process of amendment through legislative initiative has been almost completely established. The final stage in the evolution of the amending process has been the adoption of the direct popular initiative, thus dispensing altogether with legislative intervention. This stage was first entered upon in Oregon in 1902, and is now established in twelve states."—A. N. Holcombe, *State government in the United States*, pp. 98-99.—See also INITIATIVE AND REFERENDUM; SOUTH DAKOTA: 1889-1912.

The method of altering constitutions piecemeal by separate amendments seems to be yielding to the method of general overhauling by constitutional conventions. In none of the states is action by the governor necessary in amending the state constitution. The growing tendency to distrust the legislature and to make the state constitutions resemble a group of statutes has made it necessary to amend the fundamental law rather often. For further details of state constitutional amendments see various states as ARKANSAS: 1885-1908; CALIFORNIA: 1000-1009: Constitutional changes; IMMIGRATION AND EMIGRATION: United States: 1920-1921: Anti-Japanese law in California; INDIANA: 1918; NORTH CAROLINA: 1900.

Amenophis IV (died c. 1350 B. C.), one of the Pharaohs of the Eighteenth Dynasty in Egypt; endeavored to substitute exclusive worship of the sun for Egyptian polytheism and shifted his capital to the city of Tell-El-Amarna. After his reign of about 18 years, his reforms were soon abolished.—See also EGYPT: B. C. 1379.

AMERICA

Politico-geographical survey.—Arrival of the white man.—Influence of the discovery on European history.—Geography and climate: factors in settlement.—Natural resources.—Area.—"The history of America covers but a short period, and the political conditions have been peculiar. It furnishes very few instances, similar to those afforded in abundance by European history, of the influence of geography on the political destinies of nations. Though the whole of South America, except the European settlements in Guiana, is now partitioned among independent nations, they are all of one type; and their turbulent annals record no events of the slightest interest from the geographical point of view. The same holds good of the southern portion of North America: the descendants of the Spanish conquerors have mingled with the natives, and have formed states like their southern neighbors, with a similar veneer of modern civilization largely due to immigrants from Europe, and a similar substratum of comparative barbarism. The United States were saved by the triumph of the North in the war of secession from breaking up into separate nations, so that a single government rules the whole centre of the continent from ocean to ocean. Similarly the whole of America north of the United States is occupied by the single dominion of Canada, loyal to the British crown, but in other respects an independent nation. The frontier between the two is in most of its length absolutely conventional, but happily there have been only trifling wars upon it. The geography of North America to some extent accounts for the fact that two great nations now occupy the whole of it, north of the comparatively narrow portion which tapers down to the isthmus of Panama. The Rocky mountains, which form the watershed between the Atlantic and the Pacific, run close to the western side of the continent. East of them is one boundless plain, not of course altogether flat, but containing no chain of mountains long or high enough to form a definite barrier. Even the

Alleghanies are not hard to cross, and sink away into the plain at each end. Thus when the white men, having settled along the Atlantic coast, began to push their way westward, they encountered no geographical obstacles. The question as to which of the European peoples should dominate America was fought out before the great expansion began."—H. B. George, *Relations of geography and history*, pp. 294-295.

"Two great events happened within thirty years of each other, the discovery of the New World and the Reformation. These two events closely involved with two others, viz., the consolidation of the great European States and the closing of the East by the Turkish Conquest, caused the vast change which we know as the close of the Middle Ages and the opening of the modern period. But of the two leading events the one was of far more rapid operation than the other. The Reformation produced its effect at once and in the very front of the stage of history. . . . Meanwhile the occupation of the New World is going on in the background, and does not force itself upon the attention of the student who is contemplating Europe. The achievements of Cortez and Pizarro do not seem to have any reaction upon the European struggle. And perhaps it is not till near the end of the sixteenth century, when the raids of Francis Drake and his fellows upon the Spanish settlements in Central America mainly contributed to decide Spain to her great enterprise against England, perhaps it is not till the time of the Spanish Armada, that the New World begins in any perceptible degree to react upon the Old. But from this time forward European affairs begin to be controlled by two great causes at once, viz., the Reformation and the New World, and of these the Reformation acts with diminishing force, and the New World has more and more influence. . . . [In the eighteenth century] the religious question with all its grandeur has sunk to rest, and the colonial question, made up of worldly and material considerations, has taken its place. Now the New

World, considered as a boundless territory open to settlement, would act in two ways upon the nations of Europe. In the first place it would have a purely political effect, that is, it would act upon their governments. For so much debatable territory would be a standing cause of war. It is this action of the New World that we have been considering hitherto, while we have observed how mainly the wars of the eighteenth century, and particularly the great wars of England and France, were kindled by this cause. But the New World would also act upon the European communities themselves, modifying their occupations and ways of life, altering their industrial and economical character."—Sir J. Seeley, *Expansion of England*, pp. 78-80.

"For over one hundred years after the discovery of America the Spanish and the Portuguese were permitted to select the sites of their colonies and occupy as much of the land of the new continent as they desired, undisturbed by any interference of the English or French. Fortunately for the future of Anglo-Saxon supremacy in North America, the Portuguese directed their efforts to South America, Africa, and southeastern Asia. The Spaniards followed in a general way the tracks of Columbus and concentrated their efforts upon the West Indies, and Central and South America. The initial impulse which was given to exploration and settlement in this region was reinforced by the finding of precious metals in Mexico and Peru. For generations afterwards, the energies of Spain were concentrated here, leaving the northern part of the American continent to others. This was largely accident, although the winds and ocean currents had been the chief factors in taking Columbus over the course which he sailed and bringing him to the particular portion of the newly discovered lands which he actually reached.

"Similarly, the claims of the New World which were staked out by the English, French, and Dutch were determined in the first instance mainly by geographical considerations. The North Atlantic is relatively narrow between Newfoundland on the one side and Ireland and Brittany on the other. Knowledge that the Spaniards had already preempted the lands for the south also directed the later arrivals to the more northern portion of North America. All these influences combined to apportion in a rough way the newly discovered lands among the maritime powers. The new conditions of life which the English and French found awaiting them were arduous enough to discourage the timid and weed out the unfit, without absolutely discouraging immigration from Europe. The climate of our Atlantic seaboard is more rigorous than that of France and the British Isles but it is a white man's country and makes no impossible demands upon a European's powers of adaptation. South of Chesapeake Bay many districts suffered from malaria which, combined with the hot summers, put a premium upon negro slavery. On the northern end of the habitable area, in the St. Lawrence region, agriculture was made difficult by severe winters and a thin soil. Physiography and climate, therefore, discouraged the growth of a dense population in what is now lower Canada and hampered the growth of the French settlements there, despite the profits in the fur trade.

"The main outlines of the growth of the English colonies were also fixed fairly early by these same natural features. The climate, the configuration of the land, the presence or absence of natural harbors, the fertility of the soil, and the fauna and flora directed industry into this or that chan-

nel. The mountain wall of the Appalachians flanked by dense forest growths opposed a mighty barrier to westward migration, while the warlike aborigines assisted the mountains and forests in hemming in the English colonists close to the Atlantic shore-land."—D. E. Smith, in J. N. Larned, Ed., *English leadership*, pp. 210-212.

"The first Europeans in America were doomed to many a disappointment in the matter of climate. The effects of the Gulf Stream, which carries the heat of the Gulf of Mexico away from North America to warm the shores of western Europe, were at first not recognized by the newcomers. Their natural expectation was that in a given latitude the climate of America would approximate that of Europe. New England, from June to September, did appear in the same latitude. A New England winter, on the other hand, resembled that of Norway or Sweden, while Labrador, which was only as far north as England, had a climate which in Europe was known only within the Arctic Circle. . . . Low-lying shores, cut by numerous navigable streams, rendered the Atlantic coast of North America more easy of access than was the Pacific coast. The majority of these Atlantic rivers were short and swift, and possessed of water power well suited to the manufacturing which was to spring up in later centuries. The interior of the continent could not easily be penetrated along these streams, for the reason that some few miles inland they were usually broken in their course by rapids and falls, which were difficult of passage. Still farther inland they lost themselves in a mountain barrier, the Appalachians, which extended parallel to the seashore as far south as Georgia. The waters of the St. Lawrence cut this barrier in the north, but it was early found that this waterway, filled with rapids and frozen over for nearly half the year, was not all that could be desired as a key to the interior of the continent. Nor was the Mississippi a much more satisfactory route inland, since hidden shoals rendered its ascent so difficult that navigation of its waters could be easily accomplished only southward with the current. Confronted by these conditions, the European settlers quite naturally contented themselves at first with the coast. They did not explore the passes over the mountains to the west till almost a century after their first settlement, and they did not push through these barriers in any considerable numbers for another half century. . . . Fortunately the Europeans found the struggle for existence in America comparatively easy. The Atlantic Ocean, from Newfoundland to Cape Cod, contained an abundance of sea food, particularly the valuable codfish and mackerel, which were highly esteemed as early as the days of Columbus and have constituted the basis of a valuable industry down to the present time. On land the fertile soil responded quickly to the efforts of the husbandmen. As has been well said, raising their own food has seldom been a serious problem for the settlers in virgin America. Over and above its own needs, the country has usually been able to furnish a surplus for consumption abroad. Supplies of game, such as deer, elk, wild geese, and turkeys, abounded. The forests, extending as far west as the plains of the interior, furnished an abundance of lumber; and everywhere, in forests, streams, and plains, the beaver, otter, sable, badger, buffalo, deer, and other fur-bearing animals yielded rich returns to the fur trader. The vast mineral resources of gold, silver, copper, coal, iron, and petroleum, though not yielding up their treasure to the early settlers, have added immensely to the wealth of the country, as from time to time

the secret of their existence has been wrested from nature.

"The vastness of the new continent surprised the Europeans. Both North America, with 8,000,000 square miles, and South America, with 6,800,000 square miles, are larger than Europe, which totals only 3,700,000 square miles. Exclusive of the island possessions, the present area of the United States, 3,600,000 square miles, is almost as large as the whole of Europe."—E. D. Fite, *History of the United States*, pp. 26-28.

Aboriginal inhabitants. See INDIANS, AMERICAN; **MYTHOLOGY:** Primitive mythology; also under the names of the tribes, and under countries, e.g., MEXICO: Aboriginal inhabitants, etc.

the theme of many an essay on the wonders of ancient civilization. The research of the past years has put this subject in a proper light. First, the annals of the Columbian epoch have been carefully studied, and it is found that some of the mounds have been constructed in historical time, while early explorers and settlers found many actually used by tribes of North American Indians; so we know that many of them were builders of mounds. Again, hundreds and thousands of these mounds have been carefully examined, and the works of art found therein have been collected and assembled in museums. At the same time, the works of art of the Indian tribes, as they were produced before modification by European culture, have been assembled in the same museums, and

Oldest signs of human habitations in America

Prehistoric.—"Widely scattered throughout the United States, from sea to sea, artificial mounds are discovered, which may be enumerated by the thousands or hundreds of thousands. They vary greatly in size; some are so small that a half-dozen laborers with shovels might construct one of them in a day, while others cover acres and are scores of feet in height. These mounds were observed by the earliest explorers and pioneers of the country. They did not attract great attention, however, until the science of archaeology demanded their investigation. Then they were assumed to furnish evidence of a race of people older than the Indian tribes. Pseud-archæologists descanted on the Mound-builders that once inhabited the land, and they told of swarming populations who had reached a high condition of culture, erecting temples, practicing arts in the metals, and using hieroglyphs. So the Mound-builders formed

the two classes of collections have been carefully compared. All this has been done with the greatest painstaking, and the Mound-builder's arts and the Indian's arts are found to be substantially identical. No fragment of evidence remains to support the figment of theory that there was an ancient race of Mound-builders superior in culture to the North American Indians. . . . That some of these mounds were built and used in modern times is proved in another way. They often contain articles manifestly made by white men, such as glass beads and copper ornaments. . . . So it chanced that to-day unskilled archæologists are collecting many beautiful things in copper, stone, and shell which were made by white men and traded to the Indians. Now, some of these things are found in the mounds; and bird pipes, elephant pipes, hanner stones, copper spear heads and knives, and machine-made wampum are collected

in quantities and sold at high prices to wealthy amateurs. . . . The study of these mounds, historically and archaeologically, proves that they were used for a variety of purposes. Some were for sepulture, and such are the most common and widely scattered. Others were used as artificial hills on which to build communal houses. . . . Some of the very large mounds were sites of large communal houses in which entire tribes dwelt. There is still a third class . . . constructed as places for public assembly. . . . But to explain the mounds and their uses would expand this article into a book. It is enough to say that the Mound-builders were the Indian tribes discovered by white men. It may well be that some of the mounds were erected by tribes extinct when Columbus first saw these shores, but they were kindred in culture to the peoples that still existed. In the southwestern portion of the United States, conditions of aridity prevail. Forests are few and are found only at great heights. . . . The tribes lived in the plains and valleys below, while the highlands were their hunting grounds. The arid lands below were often naked of vegetation; and the ledges and cliffs that stand athwart the lands, and the canyon walls that inclose the streams, were everywhere quarries of loose rock, lying in blocks ready to the builder's hand. Hence these people learned to build their dwellings of stone; and they had large communal houses, even larger than the structures of wood made by the tribes of the east and north. Many of these stone pueblos are still occupied, but the ruins are scattered wide over a region of country embracing a little of California and Nevada, much of Utah, most of Colorado, the whole of New Mexico and Arizona, and far southward toward the Isthmus. . . . No ruin has been discovered where evidences of a higher culture are found than exists in modern times at Zúñi, Oraibi, or Laguna. The earliest may have been built thousands of years ago, but they were built by the ancestors of existing tribes and their congeners. A careful study of these ruins, made during the last twenty years, abundantly demonstrates that the pueblo culture began with rude structures of stone and brush, and gradually developed, until at the time of the exploration of the country by the Spaniards, beginning about 1540, it had reached its highest phase. Zúñi [in New Mexico] has been built since, and it is among the largest and best villages ever established within the territory of the United States without the aid of ideas derived from civilized men." With regard to the ruins of dwellings found sheltered in the craters of extinct volcanoes, or on the shelves of cliffs, or otherwise contrived, the conclusion to which all recent archaeological study tends is the same. "All the stone pueblo ruins, all the clay ruins, all the cliff dwellings, all the crater villages, all the cavate chambers, and all the tufa-block houses are fully accounted for without resort to hypothetical peoples inhabiting the country anterior to the Indian tribes. . . . Pre-Columbian culture was indigenous; it began at the lowest stage of savagery and developed to the highest, and was in many places passing into barbarism when the good queen sold her jewels."—J. W. Powell, *Prehistoric man in America* (*Forum*, Jan., 1800).—"The writer believes . . . that the majority of American archaeologists now sees no sufficient reason for supposing that any mysterious superior race has ever lived in any portion of our continent. They find no archaeological evidence proving that at the time of its discovery any tribe had reached a stage of culture that can properly be called civilization. Even if we accept the exaggerated statements of

the Spanish conquerors, the most intelligent and advanced peoples found here were only semi-barbarians, in the stage of transition from the stone to the bronze age, possessing no written language, or what can properly be styled an alphabet, and not yet having even learned the use of beasts of burden."—H. W. Haynes, *Prehistoric archaeology of North America* (*Narrative and Critical History of America*, v. 1, ch. 6).—"It may be premised . . . that the Spanish adventurers who thronged to the New World after its discovery found the same race of Red Indians in the West India Islands, in Central and South America, in Florida and in Mexico. In their mode of life and means of subsistence, in their weapons, arts, usages and customs, in their institutions, and in their mental and physical characteristics, they were the same people in different stages of advancement. . . . There was neither a political society, nor a state, nor any civilization in America when it was discovered; and, excluding the Eskimos, but one race of Indians, the Red Race."—L. H. Morgan, *Houses and house-life of the American aborigines* (*Contributions to North American Ethnology*, v. 4, ch. 10).—"We have in this country the conclusive evidence of the existence of man before the time of the glaciers, and from the primitive conditions of that time, he has lived here and developed, through stages which correspond in many particulars to the Homeric age of Greece."—F. W. Putnam, *Report Peabody Museum of Archaeology*, 1886.

"In recent years archeologists have uncovered a number of interesting ancient Indian villages in the southwestern part of the United States where the four states of Arizona, Utah, Colorado and New Mexico corner. It is a collection of remarkable ruins called Mummy Lake Village, so named from a mummy pit found there. It contains a strange three-story house 113 feet long and 110 feet wide; a large front court is inclosed with a stone wall. The house had more than 100 rooms. In one of these southwestern villages an ancient fire-place was found and a grinding mill with the grinding stones still in their original position. Aztec Spring City is another interesting place. It extends over 15 acres and the stone wall built into it is estimated to contain 2,000,000 cubic feet. It seems queer that the stones had to be carried from a distance. This village has been dug into considerably by grave robbers. At Goodman Point Village there was a large building in the center, apparently a community house, and similar structures around it. A community spring furnished water for the villagers. The National Geographic Society through the Yale University Expedition to Peru in 1915 resulted in making known to the world the marvelous civilization of the early Peruvian Indians. Megalithic or big stone people were probably the ancestors of the modern Quichuas, a tribe of the Incas whom the Spaniards conquered. It is clear that there were settled agricultural communities centuries before America was discovered by Columbus. These Aborigines had tillage agriculture, used fertilizer, and irrigated arid regions. They also built terraces with large stones carefully fitted together behind which soil, brought from a distance, was placed for the growing of crops. River courses were straightened and this valley land was reclaimed for agriculture. The Peruvian Indians placed more importance on the raising of crops than on the tombs of the dead. Their agricultural terraces show finer workmanship than their dwellings. Early Spanish historians tell us that they had special gardens for raising potatoes for the royal household. Among the crops of the ancient Peruvians were the sweet potato,

the potato, the tomato and Indian corn. When we think of the importance of the potato as an article of food today we can see that the real treasure of the Incas was not their gold but their agriculture. In the masonry of these Staircase Farms are some joints so delicate as to be invisible to the naked eye, indicating the finest craftsmanship."—O. F. Cook, *Staircase farms of the ancients* (*National Geographic Magazine*, May, 1916).

Theory of a land bridge from Africa.—Readers conversant with various theories of the origin of the American Indians and their culture will recognize immediately the significance of the hypothesis of a land bridge between America and Africa in pre-historic times. The idea is not new but it has been given a new interest because its defense has been taken up recently by M. Joleaud. The existence of such a land bridge extending in recent geologic times from the West Indies to Morocco, would explain most of the heretofore inexplicable similarities between Aztec and Inca civilization on the one hand, and Egyptian civilization on the other. This theory has also been sponsored recently by Professor Leo Wiener of Harvard, in a work entitled *Africa and the discovery of America*. Professor Wiener induces the aid of philology and archaeology to prove that African negroes, mainly from the neighborhood of the river Niger, crossed the Atlantic and settled in America long before the arrival of Columbus. He claims that many Indian words quoted by Columbus are in reality of African origin; and that the habit of smoking, and the cultivation of certain plants, were practiced by Africans before they were taken up by American Indians.

Theory of a cultural wave across Asia.—Another theory of the origin of ancient civilization in America was presented by Mr. G. Elliot Smith in *Science*, August 11, 1916. He holds that the distinguishing characteristics of American cultures, such as the mummifying of the dead, the use of irrigation canals and pyramidal structures, come from the ancient civilization of Egypt through a 'great cultural wave.' He believes that this cultural wave passed from the valley of the Nile by way of Assyria into India, Korea, Siberia, the Pacific islands and America. He thinks it started about 900 B. C. He says:—"In the whole range of ethnological discussion perhaps no theme has evoked livelier controversies and excited more widespread interest than the problems involved in the mysteries of the wonderful civilization that revealed itself to the astonished Spaniards on their first arrival in America. During the last century,

which can be regarded as covering the whole period of scientific investigation in anthropology, the opinions of those who have devoted attention to such inquiries have undergone the strangest fluctuations. If one delves into the anthropological journals of forty or fifty years ago they will be found to abound in careful studies on the part of many of the leading ethnologists of the time, demonstrating, apparently in a convincing and unquestionable manner, the spread of curious customs or beliefs from the Old World to the New. Then an element of doubt began to creep into the attitude of many ethnologists, which gradually stiffened until it set into the rigid dogma—there is no other term for it—that as the result of 'the similarity of the working of the human mind' similar needs and like circumstances will lead various isolated groups of men in a similar phase of culture independently one of the other to invent similar arts and crafts, and to evolve identical beliefs. The modern generation of ethnologists has thoughtlessly seized hold of this creed and used it as a soporific drug against the need for mental exertion. For when any cultural resemblance is discovered there is no incentive on the part of those whose faculties have been so lulled to sleep to seek for an explanation; all that is necessary is to murmur the incantation and bow the knee to a fetish certainly no less puerile and unsatisfying than that of an African negro. It does not seem to occur to most modern ethnologists that the whole teaching of history is fatal to the idea of inventions being made independently. Originality is one of the rarest manifestations of human faculty. . . . From Indonesia the whole eastern Asiatic littoral and all the neighboring islands were stirred by the new ideas; and civilizations bearing the distinctive marks of the culture-complex which I have traced from Egypt sprang up in Cochinchina, Korea, Japan and eventually in all the islands of the Pacific and the western coast of America. The proof of the reality of this great migration of culture is provided not merely by the identical geographical distribution of a very extensive series of curiously distinctive, and often utterly bizarre, customs and beliefs, the precise dates and circumstances of the origin of which are known in their parent countries; but the fact that these strange ingredients are compounded in a definite and highly complex manner to form an artificial cultural structure, which no theory of independent evolution can possibly explain, because chance played so large a part in building it up in its original home. For instance, it is quite conceivable (though I believe utterly opposed to the evidence at our disposal) that different people might, independently the one of the other, have invented the practises of mummification, building megalithic monuments, circumcision, tattooing and terraced irrigation; evolved the stories of the petrification of human beings, the strange adventures of the dead in the underworld, and the divine origin of kings; and adopted sun-worship. But why should the people of America and Egypt who built megalithic monuments build them in accordance with very definite plans compounded of Egyptian, Babylonian, Indian and East Asiatic models? And why should the same people who did so also have their wives' chins tattooed, their sons circumcised, their dead mummified? Or why should it be the same people who worshiped the sun and adopted the curiously artificial winged-sun-and-serpent symbolism, who practised terraced irrigation in precisely the same way, who made idols and held similar beliefs regarding them, who had identical stories of the wanderings of the dead

in the underworld? If any theory of evolution of customs and beliefs is adequate to explain the independent origin of each item in the extensive repertoire, either of the New Empire Egyptian or the Pre-Columbian American civilization (which I deny), it is utterly inconceivable that the fortuitous combination of hundreds of utterly incongruous and fantastic elements could possibly have happened twice. It is idle to deny the completeness of the demonstration which the existence of such a civilization in America supplies of the fact that it was derived from the late New Empire Egyptian civilization, modified by Ethiopian, Mediterranean, West Asiatic, Indian, Indonesian, East Asiatic and Polynesian influences. The complete overthrow of all the objections of a general nature to the recognition of the facts has already been explained. There is nothing to hinder one, therefore, from accepting the obvious significance of the evidence. Moreover, every link in this chain of connections is admitted by investigators of localized areas along the great migration route, even by those who most strenuously deny the more extensive migrations of culture. The connections of the New Empire Egypt with the Soudan and with Syria and its relations with Babylonia; the intercourse between the latter and India in the eighth and seventh centuries B. C.; the migrations of culture from India to Indonesia and to the farthest limits of Polynesia—all these are well authenticated and generally admitted. All that I claim, then, is that the influence of Egypt was handed on from place to place; that the links which all ethnologists recognize as genuine bonds of union can with equal certainty be joined up into a cultural chain uniting Egypt to America. In almost every one of the focal points along this great migration route the folk-lore of to-day has preserved legends of the culture-heroes who introduced some one or other of the elements of this peculiarly distinctive civilization. Those familiar with the literature of ethnology must be acquainted with hundreds of scraps of corroborative evidence testifying to the reality of the spread postulated. For I have mentioned only a small part of the extraordinary cargo of bizarre practises and beliefs with which these ancient mariners (carrying of course their characteristic ideas of naval construction and craftsmanship) set out from the African coast more than twenty-five centuries ago on the great expedition which eventually led their successors some centuries later to the New World. At every spot where they touched and tarried, whether on the coasts of Asia, the islands of the Pacific or on the continent of America, the new culture took root and flourished in its own distinctive manner, as it was subjected to the influence of the aborigines or to that of later comers of other ideas and traditions; and each place became a fresh focus from which the new knowledge continued to radiate for long ages after the primary inoculation. The first great cultural wave (or the series of waves of which it was composed) continued to flow for several centuries. It must have begun some time after B. C. 600, because the initial equipment of the great wanderers included practises which were not invented in Egypt until that time. The last of the series of ripples in the great wave set out from India just after the practise of cremation made its appearance there, for at the end of the series the custom of incinerating the dead made its appearance in Indonesia, Polynesia, Mexico and elsewhere. . . . I wish especially to appeal to that band of American ethnologists, whose devoted labors in rescuing the information concerning the

ethnography of their country have called forth the admiration of all anthropologists, seriously to reconsider the significance of the data they are amassing."

Objection was urged to this theory by Mr. Philip Ainsworth Means in *Science*, Oct. 13, 1916. He says: "This theory is important. But there are several serious objections to it: (1.) If Mr. Elliot Smith is right in thinking that the American aborigines in Mexico, Peru, etc., used pyramidal structures, numerous irrigation systems, and many customs closely resembling those of the ancient Egyptians because their culture was really an offshoot of the Egyptian culture, how can it be explained that in all pre-Columbian America there was no such thing as a wheeled vehicle? Chariots of various sorts were much used in ancient Egypt, as well as in the intervening areas, yet there is not a shred of evidence to prove that the Indians of America ever knew anything even remotely resembling them. Had the founders of American culture come from an area where wheeled vehicles were known, is it not inevitable that they would have made use of such vehicles during their long journey? Does it not seem that wheeled vehicles would be more useful to them than pyramids, and that therefore they would have been remembered first on the arrival of the wanderers in their new land? It is difficult to believe that the American aborigines were the cultural descendants of a wheel-using people, for wheels, being essentially useful, would inevitably have persisted as a feature of their material culture, had that been the case. (2.) In a like manner, one is puzzled by a lack of any ships or vessels of advanced type among the American Indians. Even in Mexico, Yucatan and Peru, where civilization was, in other respects, of a well-advanced type, there were no really complicated vessels before the coming of the Spaniards. On the coast of Ecuador there was found the most elaborate type of boat known to the Indian race. It consisted of a raft of light wood with a flimsy platform on which stood a rude shelter. A simple sail, sometimes even two, was used. Large canoes with sails were also used in Yucatan. Not one of these, however, is worthy to be compared with even the earliest and simplest ships used in Egypt. It is known, of course, that boat-building reached very early a high development in Babylonia, India and China, through all of which the 'cultural wave' is said to have passed. (3.) Finally, the date B. C. 600 is altogether too late for the beginning of the alleged migration of cultures. If this migration took place at all, it must have left Egypt much earlier than this, for we have the Tuxtla statuette (dated about B. C. 100) to prove that even before the commencement of our era the Maya calendar had already gone through its long preliminary stages and was already in existence in practically its final form. No doubt every one will admit that the period B. C. 600-100 is entirely too short for a 'great cultural wave' to roll from Egypt to America. The year B. C. 1500 is much more likely to be the date needed. In conclusion, the present writer admits that, despite the three objections here noted (and several others), there is a large amount of seemingly corroborative evidence that tends to support the views of Mr. Elliot Smith. It will, however, be a long time before American anthropologists will be forced to accept these views as final, and many tests, based on physical anthropology, history, archeology, etc., will have to be successfully applied before the Egyptian source of American civilization is finally proved."

In a rejoinder to Mr. Means, Mr. Smith writes in *Science*, March 9, 1917.—"It is significant that, when citing six memoirs relating to shipping, some of them quite irrelevant, Mr. Means should have omitted all reference to the writings of Paris, Pitt-Rivers, Assmann and Friederici, where he will find the evidence he imagines to be non-existent. But does the argument from ships really help his case? Where is the 'similarity of the working of the human mind' if the highly civilized people of Peru and Mexico hadn't sufficient of what Dr. Goldenweiser calls 'happy thoughts' to accomplish more in the way of ship-building? Is not this paucity of shipping merely a token of the remoteness of America from the home of its invention? The fact that the culture-bearers who first crossed the Pacific by the Polynesian route were searching for pearls and precious metals is surely a sufficient explanation of their desertion of the sea once they reached the American eldorado. Another of Mr. Means's difficulties I fail to understand. Why was eight centuries too brief a time for a ship to have made its way from the Red Sea to America? Before the introduction of steam-ships what was to prevent a vessel doing the journey as quickly in the eighth century B. C. as in the eighth, or perhaps even the eighteenth, A. D.? There are reasons, given in detail by Aymonier and others, for believing that western culture had already made its influence felt in Cambodia before the close of the seventh century B. C.; Indonesia and even Japan received the leaven at the same time; and it can hardly be in doubt that the ancient mariners did not limit their easterly wanderings to Indonesia, but pushed out into the Pacific, and soon afterwards crossed it to America. The remaining difficulty which is holding Mr. Means back is that the Pre-Columbian Americans did not use wheeled vehicles. Seeing that the whole of the migration, which I have described as extending from the Red Sea to America, consisted of a series of maritime expeditions, it is not altogether clear what Mr. Means is referring to when he asks: 'Is it not inevitable that they would have made use of such vehicles during their long journey?' At the time the great cultural movement took place it is quite likely that none of the wanderers had ever seen, or even perhaps heard of, a wheeled vehicle. Even if, on some rare occasion of state, in Egypt or one of the Asiatic monarchies, they had seen the king drive in a chariot, was that an adequate reason why these sailors, when, after many years of adventure, they at last reached the American coast, teeming with the spoils they coveted, should have remembered the chariot, and at once set to work to build carts and train llamas to draw them? Surely the utter improbability of this whittles down Mr. Means's difficulty to the vanishing point. Or alternatively, if there is any substance in the 'psychic unity' hypothesis, why didn't the Americans get a 'happy thought' and invent 'so simple and obvious a device' as a wheeled vehicle?"

10th-11th centuries.—Supposed discoveries by the Northmen.—"The fact that the Northmen knew of the existence of the Western Continent prior to the age of Columbus, was prominently brought before the people of this country in the year 1837, when the Royal Society of Northern Antiquaries at Copenhagen published their work on the Antiquities of North America, under the editorial supervision of the great Icelandic scholar, Professor Rafn. But we are not to suppose that the first general account of these voyages was then given, for it has always been known that the history of certain early voyages to America by the Northmen were preserved in the libraries of Den-

mark and Iceland. . . . Yet, owing to the fact that the Icelandic language, though simple in construction and easy of acquisition, was a tongue not understood by scholars, the subject has until recent years been suffered to lie in the background, and permitted, through a want of interest, to share in a measure the treatment meted out to vague and uncertain reports. . . . It now remains to give the reader some general account of the contents of the narratives which relate more or less to the discovery of the western continent. . . . The first extracts given are very brief. They are taken from the 'Landanama Book,' and relate to the report in general circulation, which indicated one Guinniborn as the discoverer of Greenland, an event which has been fixed at the year 876. . . . The next narrative relates to the rediscovery of Greenland by the outlaw, Eric the Red, in 983, who there passed three years in exile, and afterwards returned to Iceland. About the year 986, he brought out to Greenland a considerable colony of settlers, who fixed their abode at Brattahlid, in Ericsfiord. Then follow two versions of the voyage of Biarne Heriulfson, who, in the same year, 986, when sailing for Greenland, was driven away during a storm, and saw a new land at the southward, which he did not visit. Next is given three accounts of the voyage of Leif, son of Eric the Red, who in the year 1000 sailed from Brattahlid to find the land which Biarne saw. Two of these accounts are hardly more than notices of the voyage, but the third is of considerable length, and details the successes of Leif, who found and explored this new land, where he spent the winter, returning to Greenland the following spring [having named different regions which he visited Helluland, Markland and Vinland, the latter name indicative of the finding of grapes.] After this follows the voyage of Thorvald Ericson, brother of Leif, who sailed to Vinland from Greenland, which was the point of departure in all these voyages. This expedition was begun in 1002, and it cost him his life, as an arrow from one of the natives pierced his side, causing death. Thorstein, his brother, went to seek Vinland, with the intention of bringing home his body, but failed in the attempt. The most distinguished explorer was Thorfinn Karlsefne, the Hopeful, an Icelander whose genealogy runs back in the old Northern annals, through Danish, Swedish, and even Scotch and Irish ancestors, some of whom were of royal blood. In the year 1006 he went to Greenland, where he met Gudrid, widow of Thorstein, whom he married. Accompanied by his wife, who urged him to the undertaking, he sailed to Vinland in the spring of 1007, with three vessels and 160 men, where he remained three years. Here his son Snorre was born. He afterwards became the founder of a great family in Iceland, which gave the island several of its first bishops. Thorfinn finally left Vinland because he found it difficult to sustain himself against the attacks of the natives. The next to undertake a voyage was a wicked woman named Freydis, a sister to Leif Ericson, who went to Vinland in 1011, where she lived for a time with her two ships, in the same places occupied by Leif and Thorfinn. Before she returned, she caused the crew of one ship to be cruelly murdered, assisting in the butchery with her own hands. After this we have what are called the Minor Narratives, which are not essential."—B. F. De Costa, *Pre-Columbian discovery of America, general introduction*.—"By those who accept fully the claims made for the Northmen, as discoverers of the American continent in the voyages believed to be authentically narrated in

these sagas, the Helluland of Leif is commonly identified with Newfoundland, Markland with Nova Scotia, and Vinland with various parts of New England. Massachusetts bay, Cape Cod, Nantucket island, Martha's Vineyard, Buzzard's bay, Narragansett bay, Mount Hope bay, Long Island sound, and New York bay are among the localities supposed to be recognized in the Norse narratives, or marked by some traces of the presence of the Viking explorers. Prof. Gustav Storm, the most recent of the Scandinavian investigators of this subject, finds the Helluland of the sagas in Labrador or Northern Newfoundland, Markland in Newfoundland, and Vinland in Nova Scotia and Cape Breton island.—G. Storm, *Studies of the Vinland voyages*.—"The only discredit which has been thrown upon the story of the Vinland voyages, in the eyes either of scholars or of the general public, has arisen from the eager credulity with which ingenious antiquarians have now and then tried to prove more than facts will warrant. . . . Archaeological remains of the Northmen abound in Greenland, all the way from Immartinek to near Cape Farewell; the existence of one such relic on the North American continent has never yet been proved. Not a single vestige of the Northmen's presence here, at all worthy of credence, has ever been found. . . . The most convincing proof that the Northmen never founded a colony in America, south of Davis Strait, is furnished by the total absence of horses, cattle and other domestic animals from the soil of North America until they were brought hither by the Spanish, French and English settlers."—J. Fiske, *Discovery of America*, ch. 2.—"What Leif and Karlsefne knew they experienced," writes Prof. Justin Winsor, "and what the sagas tell us they underwent, must have just the difference between a crisp narrative of personal adventure and the oft-repeated and embellished story of a fireside narrator, since the traditions of the Norse voyages were not put in the shape of records till about two centuries had elapsed, and we have no earlier manuscript of such a record than one made nearly two hundred years later still. . . . A blending of history and myth prompts Horn to say that 'some of the sagas were doubtless originally based on facts, but the telling and retelling have changed them into pure myths.' The unsympathetic stranger sees this in stories that the patriotic Sandinavians are over-anxious to make appear as genuine chronicles. . . . The weight of probability is in favor of a Northman descent upon the coast of the American mainland at some point, or at several, somewhere to the south of Greenland; but the evidence is hardly that which attaches to well established historical records. . . . There is not a single item of all the evidence thus advanced from time to time which can be said to connect by archaeological traces the presence of the Northmen on the soil of North America south of Davis' Straits." Of other imagined pre-Columbian discoveries of American, by the Welsh, by the Arabs, by the Basques, &c., the possibilities and probabilities are critically discussed by Professor Winsor in the same connection.—J. Winsor, *Narrative and critical history of America*, v. 1, ch. 2, and *Critical notes to the same*.—See also below: 1494.

15th century.—Need of new trade routes.—"During this period the city republics of Italy were losing their prosperity, their wealth, their enterprise, and their vigor. This was due, as a matter of fact, to a variety of causes, internal and external, political and economic; but the sufferings in the wars with the Turks and the adverse conditions of the Levant trade on which their prosperity primarily rested were far the most important causes of their decline. Thus the demand of European markets for Eastern luxuries could no longer be met satisfactorily by the old methods; yet that demand was no less than it had been, and the characteristic products of the East were still sought for in all the market-places of Europe. Indeed, the demand was increasing. As Europe in the fifteenth century became more wealthy and more familiar with the products of the whole world, as the nobles learned to demand more luxuries, and a wealthy merchant class grew up which was able to gratify the same tastes as the nobles, the demand of the West upon the East became more insistent than ever. Therefore, the men, the nation, the government that could find a new way to the East might claim a trade of indefinite extent and extreme profit. This is the explanation of that eager search for new routes to the Indies which lay at the back of so many voyages of discovery of the fifteenth and sixteenth centuries. Southward along the coast of Africa, in the hope that that continent could be rounded to the southeast; northward along the coast of Europe in search of a northeast passage; westward relying on the sphericity of the earth, and hoping that the distance from the west coast of Europe to the east coast of Asia would prove not to be interminable; after America was reached, again northward and southward to round and pass beyond that barrier, and thus reach Asia—such was the progress of geographical exploration for a century and a half, during which men gradually became familiar with a great part of the earth's surface. A study of the history of trade-routes corroborates the fact disclosed by many other lines of study—that the discovery of America was no isolated phenomenon; it was simply one step in the development of the world's history. Changes in the eastern Mediterranean led men to turn their eyes in other directions looking for other sea routes to the East. When they had done so, along with much else that was new, America was disclosed to their vision. . . . but the diversion of commercial interest was only a part; the restless energies of the Latin races of southern Europe turned into a new channel; search for trade led to discovery, discovery to exploration, exploration to permanent settlement; and settlement to the creation of a new centre of commercial and political interest, and eventually to the rise of

a new nation."—E. P. Cheyney, *European background of American history*, 1300-1600, pp. 38-40.—See also COMMERCE: Era of geographic expansion: 15th-17th centuries: Spanish enterprise.

1484-1492.—Great project of Columbus, and the sources of its inspiration.—Seven years' suit at the Spanish court.—Departure from Palos.—"All attempts to diminish the glory of Columbus' achievement by proving a previous discovery whose results were known to him have signally failed. . . . Columbus originated no new theory respecting the earth's form or size, though a popular idea has always prevailed, notwithstanding the statements of the best writers to the contrary, that he is entitled to the glory of the theory as well as to that of the execution of the project. He was not in advance of his age, entertained no new theories, believed no more than did Prince Henry, his predecessor, or Toscanelli, his contemporary; nor was he the first to conceive the possibility of reaching the east by sailing west. He was however the first to act in accordance with existing beliefs. The Northmen in their voyages had entertained no ideas of a New World, or of an Asia to the West. To knowledge of theoretical geography, Columbus added the skill of a practical navigator, and the iron will to overcome obstacles. He sailed west, reached Asia as he believed, and proved old theories correct. There seem to be two undecided points in that matter, neither of which can ever be settled. First, did his experience in the Portuguese voyages, the perusal of some old author, or a hint from one of the few men acquainted with old traditions, first suggest to Columbus his project? . . . Second, to what extent did his voyage to the north [made in 1477, probably with an English merchantman from Bristol, in which voyage he is believed to have visited Iceland] influence his plan? There is no evidence, but a strong probability, that he heard in that voyage of the existence of land in the west. . . . Still, his visit to the north was in 1477, several years after the first formation of his plan, and any information gained at the time could only have been confirmatory rather than suggestive."—H. H. Bancroft, *History of the Pacific states*, v. 1, *summary appended to ch. 1*.—"Of the works of learned men, that which, according to Ferdinand Columbus, had most weight with his father, was the 'Cosmographia' of Cardinal Aliaco. Columbus was also confirmed in his views of the existence of a western passage to the Indies by Paulo Toscanelli, the Florentine philosopher, to whom much credit is due for the encouragement he afforded to the enterprise. That the notices, however, of western lands were not such as to have much weight with other men, is sufficiently proved by the difficulty which Columbus had in contending with adverse geographers and men of science in general, of whom he says he never was able to convince any one. After a new world had been discovered, many scattered indications were then found to have foreshown it. One thing which cannot be denied to Columbus is that he worked out his own idea himself. . . . He first applied himself to his countrymen, the Genoese, who would have nothing to say to his scheme. He then tried the Portuguese, who listened to what he had to say, but with bad faith sought to anticipate him by sending out a caravel with instructions founded upon his plan. . . . Columbus, disgusted at the treatment he had received from the Portuguese Court, quitted Lisbon, and, after visiting Genoa, as it appears, went to see what favour he could meet with in Spain, arriving at Palos in the year 1485." The story of the long suit of Columbus at the court of Ferdinand and Isabella;

of his discouragement and departure, with intent to go to France; of his recall by command of Queen Isabella; of the tedious hearings and negotiations that now took place; of the lofty demands adhered to by the contident Genoese, who required "to be made an admiral at once, to be appointed viceroy of the countries he should discover, and to have an eighth of the profits of the expedition;" of his second rebuff, his second departure for France, and second recall by Isabella, who finally put her heart into the enterprise and persuaded her more skeptical consort to assent to it—the story of those seven years of the struggle of Columbus to obtain means for his voyage is familiar to all readers. "The agreement between Columbus and their Catholic highnesses was signed at Santa Fé on the 17th of April, 1492; and Columbus went to Palos to make preparation for his voyage, bearing with him an order that the two vessels which that city furnished annually to the crown for three months should be placed at his disposal. . . . The Pinzons, rich men and skilful mariners of Palos, joined in the undertaking, subscribing an eighth of the expenses; and thus, by these united exertions, three vessels were manned with 90 mariners, and provisioned for a year. At length all the preparations were complete, and on a Friday (not inauspicious in this case), the 3d of August, 1492, after they had all confessed and received the sacrament, they set sail from the bar of Saltes, making for the Canary Islands."—Sir A. Helps, *Spanish conquest in America*, bk. 2, ch. 1.

1492.—First voyage of Columbus.—Discovery of the Bahamas, Cuba and Haiti.—The three vessels of Columbus were called the Santa Maria, the Pinta and the Niña. "All had forecables and high poops, but the 'Santa Maria' was the only one that was decked amidships, and she was called a 'nao' or ship. The other two were caravels, a class of small vessels built for speed. The 'Santa Maria,' as I gather from scattered notices in the letters of Columbus, was of 120 to 130 tons, like a modern coasting schooner, and she carried 70 men, much crowded. Her sails were a foresail and a foretop-sail, a sprit-sail, a main-sail with two bonnets, and maintop sail, a mizzen, and a boat's sail were occasionally hoisted on the poop. The 'Pinta' and 'Niña' only had square sails on the foremast and lateen sails on the main and mizzen. The former was 50 tons, the latter 40 tons, with crews of 20 men each. On Friday, the 3d of August, the three little vessels left the haven of Palos, and this memorable voyage was commenced. . . . The expedition proceeded to the Canary Islands, where the rig of the 'Pinta' was altered. Her lateen sails were not adapted for running before the wind, and she was therefore fitted with square sails, like the 'Santa Maria.' Repairs were completed, the vessels were filled up with wood and water at Gomera, and the expedition took its final departure from the island of Gomera, one of the Canaries, on September 6th, 1492. . . . Columbus had chosen his route most happily, and with that fortunate prevision which often waits upon genius. From Gomera, by a course a little south of west, he would run down the trades to the Bahama Islands. From the parallel of about 30° N. nearly to the equator there is a zone of perpetual winds—namely, the north-east trade winds—always moving in the same direction, as steadily as the current of a river, except where they are turned aside by local causes, so that the ships of Columbus were

steadily carried to their destination by a law of nature which, in due time, revealed itself to that close observer of her secrets. The constancy of the wind was one cause of alarm among the crews, for they began to murmur that the provisions would all be exhausted if they had to beat against these unceasing winds on the return voyage. The next event which excited alarm among the pilots was the discovery that the compasses had more than a point of easterly variation. . . . This was observed on the 17th of September, and about 300 miles westward of the meridian of the Azores, when the ships had been eleven days at sea. Soon afterwards the voyagers found themselves surrounded by masses of seaweed, in what is called the Sargasso Sea, and this again aroused their fears. They thought that the ships would get entangled in the beds of weed and

was on the poop and saw a light. . . . At two next morning, land was distinctly seen. . . . The island, called by the natives Guanahani, and by Columbus San Salvador, has now been ascertained to be Watling Island, one of the Bahamas, 14 miles long by 6 broad, with a brackish lake in the centre, $24^{\circ} 10' 30''$ north latitude. . . . The difference of latitude between Gomera and Watling Island is 235 miles. Course, $W. 5^{\circ} S.$; distance 3,114 miles; average distance made good daily, 85'; voyage 35 days. . . . After discovering several smaller islands the fleet came in sight of Cuba on the 27th of October, and explored part of the northern coast. Columbus believed it to be Cipango, the island placed on the chart of Toscanelli, between Europe and Asia. . . . Crossing the channel between Cuba and St. Domingo [or Hayti], they anchored in the harbour of St.

LANDING OF COLUMBUS
From the painting by Vanderlyn

become immovable, and that the beds marked the limit of navigation. The cause of this accumulation is well known now. If bits of cork are put into a basin of water, and a circular motion given to it, all the corks will be found crowding together towards the centre of the pool where there is the least motion. The Atlantic Ocean is just such a basin, the Gulf Stream is the whirl, and the Sargasso Sea is in the centre. There Columbus found it, and there it has remained to this day, moving up and down and changing its position according to seasons, storms and winds, but never altering its mean position. . . . As day after day passed, and there was no sign of land, the crews became turbulent and mutinous. Columbus encouraged them with hopes of reward, while he told them plainly that he had come to discover India, and that, with the help of God, he would persevere until he found it. At length, on the 11th of October, towards ten at night, Columbus

Nicholas Mole on December 4th. The natives came with presents and the country was enchanting. Columbus . . . named the island 'Española' [or Hispaniola]. But with all this peaceful beauty around him he was on the eve of disaster." The Santa Maria was drifted by a strong current upon a sand bank and hopelessly wrecked. "It was now necessary to leave a small colony on the island. . . . A fort was built and named 'La Navidad,' 30 men remaining behind supplied with stores and provisions," and on Friday, Jan. 4, 1493, Columbus began his homeward voyage. Weathering a dangerous gale, which lasted several days, his little vessels reached the Azores Feb. 17, and arrived at Palos March 15, bearing their marvelous news.—C. R. Markham, *Sea fathers*, ch. 2.—The same, *Life of Columbus*, ch. 5.—The statement above that the island of the Bahamas on which Columbus first landed, and which he called San Salvador, "has now been ascertained to be Wat-

ling Island" seems hardly justified. The question between Watling island, San Salvador or Cat island, Samana, or Attwood's Cay, Mariguana, the Grand Turk, and others is still in dispute. Professor Justin Winsor says "the weight of modern testimony seems to favor Watling's Island;" but at the same time he thinks it "probable that men will never quite agree which the Bahamas it was upon which these startled and exultant Europeans first stepped."—J. Winsor, *Christopher Columbus*, ch. 9.—The same, *Narrative and critical history of America*, v. 2, ch. 1, note B.—Professor John Fiske says: "All that can be positively asserted of Guanahani is that it was one of the Bahamas; there has been endless discussion as to which one, and the question is not easy to settle. Perhaps the theory of Captain Gustavus Fox, of the United States Navy, is on the whole best supported. Captain Fox maintains that the true Guanahani was the little Island now known as Samana or Attwood's Cay."—J. Fiske, *Discovery of America*, v. 1, ch. 5.

1492.—Discovery of the Virgin Islands. See VIRGIN ISLANDS: Discovery and settlement.

1493.—Papal grant of the New World to Spain.—Demarcation of maritime and colonial domains of Spain and Portugal.—"Spain was at this time connected with the Pope about a most momentous matter. The Genoese, Cristoforo Colombo, arrived at the Spanish court in March, 1493, with the astounding news of the discovery of a new continent. . . . Ferdinand and Isabella thought it wise to secure a title to all that might ensue from their new discovery. The Pope, as Vicar of Christ, was held to have authority to dispose of lands inhabited by the heathen; and by papal Bulls the discoveries of Portugal along the African coast had been secured. The Portuguese showed signs of urging claims to the New World, as being already conveyed to them by the papal grants previously issued in their favour. To remove all cause of dispute, the Spanish monarchs at once had recourse to Alexander VI., who issued two Bulls on May 4 and 5 [1493] to determine the respective rights of Spain and Portugal. In the first, the Pope granted to the Spanish monarchs and their heirs all lands discovered or hereafter to be discovered in the western ocean. In the second, he defined his grant to mean all lands that might be discovered west and south of an imaginary line, drawn from the North to the South Pole, at the distance of a hundred leagues westward of the Azores and Cape de Verd Islands. In the light of our present knowledge we are amazed at this simple means of disposing of a vast extent of the earth's surface." Under the Pope's stupendous patent, Spain was able to claim every part of the American Continent except the Brazilian coast.—M. Creighton, *History of the Papacy during the period of the Reformation*, bk. 5, v. 3, ch. 6.

"Perhaps there are, in the whole history of diplomacy, no documents which have aroused more passionate discussions and given occasion to more divergent commentaries, than the bulls of Alexander VI. relating to the colonial expansion of Spain. Promulgated at a critical moment in the evolution of Europe, a moment marked by the rise of the modern states and a decline of the papacy, they belong to a period of political and religious transition. If they have obtained so extraordinary a prominence, it is because of the mass of various and important events with which they were associated: the rapid enlargement of the geographical

horizon, colonial expansion, religious propaganda, the foundation of international law, the transformation of the relations between Church and State. They have been published in the great diplomatic collections, and the chief of them (*Inter caetera*, May 4) is found in the *Corpus* of the Catholic canon law. It is nowise surprising that they have been considered from very different points of view: they have been of interest alike to geographers and to historians, to theologians, statesmen, and jurists, and the opinions expressed regarding them have varied with the different epochs, quite as much as with the different minds of those expressing them. To relate the history of the discussions occasioned by these documents would be to set forth comprehensively all the transformations of modern and contemporary historiography. Even to-day, despite the searching investigations to which these bulls have been subjected, despite the publication of a number of sources already considerable, opinions are much divided, and several problems, enigmas even, are still to be solved, with respect to their scope and meaning. In the first place what was the rôle of Alexander VI. himself? Did he undertake a veritable partition of the world? And did he do this in the capacity of an arbiter, of a supreme judge, of a guardian of the peace, or otherwise? Was he protecting the interests of the two leading colonial powers, or only those of one of them? What was, at the beginning, the importance of the line of demarcation, and who was its author? What force did the Spanish sovereigns and the princes of the period ascribe to the bulls in question? The opinion which has long prevailed is that which regards Alexander VI. as an arbiter. This opinion was sustained especially by Hugo Grotius, and one of its principal upholders at the present time is L. Pastor. According to this author, the pope, at the time of the conflict which arose between Spain and Portugal with respect to the lands discovered by Columbus, was invited to act as mediator; he decided in a peaceful manner a series of very thorny boundary questions, and these decisions are to be regarded as one of the glories of the papacy. Another view, held by E. G. Bourne, S. E. Dawson, and H. H. Harrisse, is that Alexander VI. intervened in the conflict between Spain and Portugal, not as an arbiter, but as supreme judge of Christendom, or guardian of its peace. It is asserted that, at least in respect of certain dispositions appearing in the bulls, he took the initiative in order to prevent strife. Finally, an opinion completely differing from all the preceding has been expressed by E. Nys. He believes it possible to prove that the rôle of Alexander VI. was absolutely a nullity, his bulls containing neither an arbitral decision nor even an ascription of sovereignty. . . . At the moment when Columbus was undertaking the exploration of the Atlantic, the Spanish sovereigns had renounced for the benefit of Portugal all colonial expansion 'beyond or on this side of the Canaries over against Guinea.' Sixtus IV. (1481) had confirmed this treaty as well as the bulls granted to the Portuguese by Nicholas V. and Calixtus III. The same pope had assured to the Portuguese the discoveries which should be made in Guinea and beyond in the direction of these 'southern regions,' sanctioning thus the bulls of his predecessors, notably that which Nicholas V. (1454) issued in consequence of the Portuguese discoveries 'in the Ocean Sea toward the regions lying southward and eastward' Out in the Atlantic the maps of the period place the mysterious island Antilia or Island of the Seven Cities.

In 1475 and in 1486 the King of Portugal had granted it, together with neighboring islands and lands, to F. Telles and to Dulmo respectively. He considered the 'Ocean Sea' as his domain, imagining, as did all his contemporaries, that it lay chiefly in the equatorial zone. On the return from his first voyage Columbus, as is well known, landed in Portugal. King John II., declaring that he had operated in 'the seas and limits of his lordship of Guinea,' had the discoverer brought before him (about March 6, 1493) and Columbus declared to him that he was returning from 'Cypangu and Antilia,' islands which formed the approaches to India. Shortly after, Peter Martyr, the Italian humanist, chaplain of Isabella, spoke of the 'western Antipodes' discovered by Christopher Columbus in contrast to the 'southern Antipodes,' toward which the Portuguese navigators sailed. But it was believed that the chief transoceanic lands lay in the southern hemisphere, balancing thus the Eurasian continent. Zurita, chronicler of Aragon under Charles V. and Philip II., alludes to the fact that the ancients represented this southern world in the form of islands, large and small, separated by great distances. John II. went to Torres Vedras to pass Easter (April 7). Two days before, he sent to the court of Spain the *alcalde mayor* of that town, Ruy de Sande, to ascertain whether Columbus intended to pursue his discoveries to the south, or would confine his enterprises to the west. But this envoy did not arrive till after the departure from Barcelona (April 22) of the Spanish ambassador charged to announce to the King of Portugal the discovery, on behalf of the Spanish sovereigns, of the islands and continents situated in the direction of the Indies. Ferdinand and Isabella had not waited till this time to obtain from the sovereign pontiff a monopoly of the discoveries and the right of commercial exploitation in the Oceanic Sea and in the islands of the Indies. As early as March 30, they had addressed their congratulations to Columbus, 'Admiral of the Ocean Sea and viceroy and governor of the islands discovered in the Indies.' They no doubt hastened to address to their agents or permanent ambassadors at the court of Rome the instructions necessary to enable the latter to assert title as soon as possible, over against the claims which would without question be asserted by the King of Portugal. The reception which the Curia would give to this demand could not fail to be most favorable. The many bonds which attached Alexander VI. to Spain during the first years of his pontificate are well known, as also the care with which he strove then to maintain them in spite of all sorts of difficulties. Though he had not lived long in his native country he had remained a true Aragonese, and had constantly surrounded himself by compatriots and by other Spaniards in the course of his cardinalate. . . . An upholder of Spanish-Neapolitan policy during his cardinalate, Alexander VI. treated it with solicitude at the beginning of his pontificate, and was able to derive from his relations with the Spanish sovereigns valuable advantages for his family. As is well known, he sacrificed everything, both spiritual and temporal interests, to his children; in the first place to Juan, whose fortunes and influence depended entirely upon the prosperity and strength of Spain. The death of Pedro Luis, duke of Gandia, had caused that duchy in 1488 to pass to Juan, for whom the pope obtained the hand of Doña Maria Enriquez, fiancée of the deceased (August, 1493). Meanwhile, however, Alexander VI. allowed himself to be drawn away by Cardinal Ascanio, to

whom he owed the tiara, toward the Milano-Venetian alliance, hostile to the King of Naples and favorable to France. Ascanio Sforza, brother of Ludovico il Moro, after becoming vice-chancellor exercised for some time a considerable ascendancy over the pope, and so caused him to attach himself to that alliance, represented as intended to insure the peace of Italy (April 25). It was just at this time that the Spanish sovereigns requested the bull of donation of the islands recently discovered. To secure their pardon, so to speak, for his equivocal course, Alexander VI. took pains to give them satisfaction and at the same time to address to them a formal document attested by a notary (*instrumentum publicum*), by which he declared that he 'desired that even his allies should preserve entire and inviolable the bond which united him to these sovereigns, and this under all circumstances whatever.' He also informed Ferdinand and Isabella of the conditions of the alliance which he had concluded with Milan and Venice, and made his excuses for not having offered his mediation between Spain and France by declaring that he had supposed peace to have been concluded by the restoration of Perpignan and Roussillon to the first of these powers. Finally, he sent them, by the hand of the same nuncio, the correspondence exchanged between the Emperor and the King of France relating to a plan of peace. The pope visibly exerts himself to please the monarchs to whom he was soon about to grant the title of 'Catholic,' and informs them of his whole policy. The conclusion of the letter which Podocatharus addressed in his name to the nuncio in Spain contains this interesting recommendation: 'Moreover tell them distinctly with what care we lay ourselves out to satisfy them in all things and to furnish to all the world proofs of the paternal affection we have for them.' Evidently then Alexander VI. could refuse nothing to Ferdinand and Isabella; eager to give them evidences of his good-will he did not hesitate to comply entirely with their request relative to the discoveries made by Columbus, without examining whether their claim menaced the rights of other sovereigns or not. He was to continue in this attitude of favor until the time when he came under the influence of his son, Caesar, that is to say, after the death of Juan, duke of Gandia (1497). The question has often been discussed, whether Ferdinand and Isabella needed a papal grant in order to acquire the sovereignty of lands discovered by one of their agents. This question directly depends upon that of the nature of the papal power, and opinions relating to the latter vary according to place and time. By the terms of the bull itself, the pope disposed, in favor of the Spanish monarchs, of the temporal sovereignty (*dominium*) of lands discovered or to be discovered in a certain region. While the Catholic sovereigns clearly held at that time that they had in temporal matters no superior within their own dominions, including all lands of which they had made effective acquisition, the bulls in question were titles to future discoveries, and were designed to repeal bulls which previous popes had promulgated in favor of the kings of Portugal. Proof that Ferdinand and Isabella attached a great value to them is seen in their anxiety that the things which they desired should be incorporated in them, and also in the revisions to which, as we shall see, they subsequently caused them to be subjected. Before the end of May, negotiations had begun between John II. and the Spanish monarchs. They were conducted with peaceful intentions on both sides. In the course

Maps prepared specially for the **NEW LARNED**
 under direction of the editors and publishers.

of them, Ferdinand and Isabella obtained a fuller knowledge of the extent of the claims made by the Portuguese king, and of his intention to reserve to himself discoveries made toward the south and the Ocean Sea. Thereupon the dispositions made by the bull of May 3 became inadequate, for Columbus counted with certainty, as we have seen, upon making new expeditions, and first of all toward the south. He was urgent that this bull should be replaced by another, containing a new stipulation with respect to the maritime and colonial dominion of Spain. The Spanish monarchs desired to include in that dominion the whole Atlantic, as is proved by the confirmation of privileges which was granted to Columbus on May 28. 'This sea,' they say, 'belongs to us to the west of a line passing through the Azores and the Cape Verde Islands, and extending from north to south, from pole to pole.' It is manifest with what insistence they claim the Ocean Sea in both hemispheres. Columbus however suggested that the line should be set further to the west, a hundred leagues from the Portuguese islands in question. That fact is explicitly shown in a letter which the sovereigns addressed to him later (September 5) and which reports a rumor that had been spread of the existence of very rich lands between that line and the southern part of Africa, lands of which they feared that they might be deprived in virtue of the terms of the bull already amended. The text of the latter must have been drawn up during the month of June and sent then to the Spanish agents at the court of Rome. The determination of Columbus to operate in the south of the Ocean Sea as well as in the west gave rise to the repetition of the words 'toward the west and the south' which determined in so strange a fashion the position of the boundary in the ocean between the Spanish and the Portuguese dominions. It was, then, at the instance of Columbus that the line of demarcation was mentioned in the papal document. Was he himself the author of that line, and if so on what basis did he select it? It does not appear to have been suggested to him by his sovereigns. The instructions which they gave him at the beginning of September, 1493, and a little earlier, with a view to his second voyage, were merely that he should sail as far as possible from the Portuguese possessions. On the other hand, everything leads us to believe that both the papal chancery and the pope himself were entirely strangers to the establishment of this line. If they did not take the initiative in the case of any of the essential stipulations contained in the bulls in question, why should they have done so in precisely that one which concerns the delimitation of the two colonial domains, so advantageous to Spain? The supposition of Alexander von Humboldt attributing to Columbus the authorship of the line of demarcation appears accordingly very plausible, and in the present state of the sources, practically certain. Whether Columbus, in establishing the line, was guided by facts of physical geography observed in the course of his first voyage—changes in the stars, the aspect of the sea, the temperature, the variation of the compass and the like—drawing inferences from these as to the beginning of the Orient and the end of the Occident, may be doubted, but it is no longer possible to deny him an essential part in the planning of the famous line of demarcation. . . . We do not enter now into the history of those diplomatic negotiations between Spain and Portugal, which, beginning on August 18, 1493, resulted in the treaty of Tordesillas (June 7, 1494). Early in the course of those negotiations the Span-

ish sovereigns, in a letter of September 5, addressed to Columbus, asked his advice as to whether it was not necessary to modify the 'bull'—evidently that of May 4. His reply was no doubt affirmative. Such a modification might be brought about through a simple additional and amplifying bull. Columbus intended to pursue his discoveries to the very Orient itself, where the Portuguese hoped to arrive soon. He wished to plant the standard of Castile in the eastern as well as in the southern Indies and it was no doubt for this reason that he requested the papal ratification of the Spanish monopoly of conquests beyond the sea, by way of the west, in all regions not occupied by Christians, especially in the Orient and in the Indies. The bull, dated September 26, revoked, it will be recalled, all contrary dispositions in previous bulls granted to kings, princes, infantes, or religious or military orders (this stipulation is evidently directed at Portugal), even when granted for motives of piety, the spread of the gospel, or the ransom of captives. It also gave expression to the principle that the possession of territories, to be valid, must be effective; but its chief object was to secure to Spain access to the Orient, where it was customary to locate India properly so called. The position of India is however not clearly defined in the papal document; it names it at first in connection with the 'oriental regions,' and then after a mention of these regions. That the King of Portugal did not succeed in preventing so considerable an extension of the sphere of influence of Spain must probably be attributed to the fact that at this time he was making it the chief objective of his policy to procure that his natural son, Dom Jorge, should be recognized as his heir presumptive to the prejudice of his brother Manoel, and to obtain for him the hand of a Spanish infanta. The decision of the Spanish and Portuguese ambassadors that the line of demarcation should be set at a point 370 leagues west of the Cape Verde Islands differing considerably from that set forth in the bull of May 4, 1493, the contracting parties agreed to insert in the treaty of Tordesillas a clause stipulating that the papal confirmation should be sought; but that no papal *motu proprio* should dispense either one of the two parties from observing the convention. The maintenance of the treaties was thus guaranteed against the arbitrary action of the *plenitudo potestatis* of the sovereign pontiff. The confirmation of the treaty was not obtained under the pontificate of Alexander VI., nor until January 24, 1506. The other European states bordering on the Atlantic, contrary to what has generally been believed, made no account of the bulls issued in favor of the first two colonial powers. . . . The kings of France, like those of England, whose line of conduct with respect to the pope they had imitated, did not recognize the supreme jurisdiction of the Holy See even in ecclesiastical matters; naturally they were still less disposed to recognize it in temporal affairs. To sum up, then, the bull of demarcation, like the other bulls delivered to Spain in 1493, constituted at first a grant exclusively Spanish; it was in large part, if not wholly, shaped by the chancery of Ferdinand and Isabella; the line of demarcation itself, which played so important a part in subsequent transactions, had been suggested and probably first devised by Christopher Columbus. Moreover, the different bulls of that year were but successive increments of the favors granted to the Spanish sovereigns, Alexander VI. being at that time but an instrument in their hands. Friction with Portugal was increased

rather than diminished by the granting of these bulls. Far from recognizing the prior rights of that country in the Atlantic, the Holy See restricted them more and more, in the interest of Spain. The difficulties between the two powers were smoothed away by their own diplomatic means and Portugal distinctly repudiated the incidental arbitration of the pope or of any other authority. If later she relied upon the bull of demarcation, it was because new circumstances brought her into that attitude, for the force of a diplomatic document arises less from the conditions under which it has been shaped than from the events with which it is subsequently associated, and which usually modify its range of application."—H. Vander Linden, *Alexander VI and the demarcation of the maritime and colonial domains of Spain and Portugal, 1493-1494* (*American Historical Review, Oct., 1916, pp. 1-20*).

ALSO IN: E. G. Bourne, *Demarcation line of Pope Alexander VI* (*Yale Review, May, 1920*).—J. Fiske, *Discovery of America, v. 1, ch. 6*.—J. Gordon, *Bulls distributing America* (*American Society of Church History, v. 4*).

1493-1496.—Second voyage of Columbus.—Discovery of Jamaica and the Caribbees.—Subjugation of Hispaniola.—The departure of Columbus on his second voyage of discovery presented a brilliant contrast to his gloomy embarkation at Palos. On the 25th of September [1493], at the dawn of day, the bay of Cadiz was whitened by his fleet. There were three large ships of heavy burden and fourteen caravels. . . . Before sunrise the whole fleet was under way." Arrived at the Canaries on the 1st of October, Columbus purchased there calves, goats, sheep, hogs, and fowls, with which to stock the island of Hispaniola; also "seeds of oranges, lemons, bergamots, melons, and various orchard fruits, which were thus first introduced into the islands of the west from the Hesperides or Fortunate Islands of the Old World." It was not until the 13th of October that the fleet left the Canaries, and it arrived among the islands since called the Lesser Antilles or Caribbees, on the evening of Nov. 2. Sailing through this archipelago, discovering the larger island of Porto Rico on the way, Columbus reached the eastern extremity of Hispaniola or Haiti on the 22d of November, and arrived on the 27th at La Navidad, where he had left a garrison ten months before. He found nothing but ruin, silence and the marks of death, and learned, after much inquiry, that his unfortunate men, losing all discipline after his departure, had provoked the natives by rapacity and licentiousness until the latter rose against them and destroyed them. Abandoning the scene of this disaster, Columbus found an excellent harbor ten leagues east of Monte Christi and there he began the founding of a city which he named Isabella. "Isabella at the present day is quite overgrown with forests, in the midst of which are still to be seen, partly standing, the pillars of the church, some remains of the king's storehouses, and part of the residence of Columbus, all built of hewn stone." While the foundations of the new city were being laid, Columbus sent back part of his ships to Spain, and undertook an exploration of the interior of the island—the mountains of Cibao—where abundance of gold was promised. Some gold washings were found—far too scanty to satisfy the expectations of the Spaniards; and, as want and sickness soon made their appearance at Isabella, discontent was rife and mutiny afoot before the year had ended. In April, 1494, Columbus set sail with three caravels to

revisit the coast of Cuba, for a more extended exploration than he had attempted on the first discovery. "He supposed it to be a continent, and the extreme end of Asia, and if so, by following its shores in the proposed direction he must eventually arrive at Cathay and those other rich and commercial, though semi-barbarous countries, described by Mandeville and Marco Polo." Reports of gold led him southward from Cuba until he discovered the island which he called Santiago, but which has kept its native name, Jamaica, signifying the Island of Springs. Disappointed in the search for gold, he soon returned from Jamaica to Cuba and sailed along its southern coast to very near the western extremity, confirming himself and his followers in the belief that they skirted the shores of Asia and might follow them to the Red Sea, if their ships and stores were equal to so long a voyage. "Two or three days' further sail would have carried Columbus round the extremity of Cuba; would have dispelled his illusion, and might have given an entirely different course to his subsequent discoveries. In his present conviction he lived and died; believing to his last hour that Cuba was the extremity of the Asiatic continent." Returning eastward, he visited Jamaica again and purposed some further exploration of the Caribbee Islands, when his toils and anxieties overcome him. "He fell into a deep lethargy, resembling death itself. His crew, alarmed at this profound torpor, feared that death was really at hand. They abandoned, therefore, all further prosecution of the voyage; and spreading their sails to the east wind so prevalent in those seas, bore Columbus back, in a state of complete insensibility, to the harbor of Isabella," Sept. 4. Recovering consciousness, the admiral was rejoiced to find his brother Bartholomew, from whom he had been separated for years, and who had been sent out to him from Spain, in command of three ships. Otherwise there was little to give pleasure to Columbus when he returned to Isabella. His followers were again disorganized, again at war with the natives, whom they plundered and licentiously abused, and a mischief-making priest had gone back to Spain, along with certain intriguing officers, to make complaints and set enmities astir at the court. Involved in war, Columbus prosecuted it relentlessly, reduced the island to submission and the natives to servitude and misery by heavy exactions. In March, 1496, he returned to Spain, to defend himself against the machinations of his enemies, transferring the government of Hispaniola to his brother Bartholomew.—W. Irving, *Life and voyages of Columbus, bk. 6-8, v. 1-2*.

1494.—Treaty of Tordesillas.—Amended partition of the New World between Spain and Portugal.—"When speaking or writing of the conquest of America, it is generally believed that the only title upon which were based the conquests of Spain and Portugal was the famous Papal Bull of partition of the Ocean, of 1493. Few modern authors take into consideration that this Bull was amended, upon the petition of the King of Portugal, by the [Treaty of Tordesillas], signed by both powers in 1494, augmenting the portion assigned to the Portuguese in the partition made between them of the Continent of America. The arc of meridian fixed by this treaty as a dividing line, which gave rise, owing to the ignorance of the age, to so many diplomatic congresses and interminable controversies, may now be traced by any student of elementary mathematics. This

line . . . runs along the meridian of $47^{\circ} 32' 56''$ west of Greenwich. . . 'The name Brazil, or 'tierra del Brazil,' at that time [the middle of the 16th century] referred only to the part of the continent producing the dye wood so-called. Nearly two centuries later the Portuguese advanced toward the South, and the name Brazil then covered the new possessions they were acquiring."—L. L. Dominguez, *Introd. to "The conquest of the River Plate"* (*Hakluyt Society Publications, No. 81*).

1497.—Discovery of the North American continent by John Cabot.—'The achievement of Columbus, revealing the wonderful truth of which the germ may have existed in the imagination of every thoughtful mariner won [in England] the admiration which belonged to genius that seemed more divine than human; and 'there was great talk of it in all the court of Henry VII.' A feeling of disappointment remained, that a series of disasters had defeated the wish of the illustrious Genoese to make his voyage of essay under the flag of England. It was, therefore, not difficult for John Cabot, a denizen of Venice, residing at Bristol, to interest that politic king in plans for discovery. On the 5th of March, 1496, he obtained under the great seal a commission empowering himself and his three sons, or either of them, their heirs, or their deputies, to sail into the eastern, western, or northern sea with a fleet of five ships, at their own expense, in search of islands, provinces, or regions hitherto unseen by Christian people; to affix the banners of England on city, island, or continent; and, as vassals of the English crown, to possess and occupy the territories that might be found. It was further stipulated in this 'most ancient American State paper of England,' that the patentees should be strictly bound, on every return, to land at the port of Bristol, and to pay to the king one-fifth part of their gains; while the exclusive right of frequenting all the countries that might be found was reserved to them and to their assigns, without limit of time. Under this patent, which, at the first direction of English enterprise toward America, embodied the worst features of monopoly and commercial restriction, John Cabot, taking with him his son Sebastian, embarked in quest of new islands and a passage to Asia by the north-west. After sailing prosperously, as he reported, for 700 leagues, on the 24th day of June [1497] in the morning, almost fourteen months before Columbus on his third voyage came in sight of the main, and more than two years before Amerigo Vespucci sailed west of the Canaries, he discovered the western continent, probably in the latitude of about 56° degrees, among the dismal cliffs of Labrador. He ran along the coast for many leagues, it is said even for 300, and landed on what he considered to be the territory of the Grand Cham. But he encountered no human being, although there were marks that the region was inhabited. He planted on the land a large cross with the flag of England, and, from affection for the republic of Venice, he added the banner of St. Mark, which had never been borne so far before. On his homeward voyage he saw on his right hand two islands, which for want of provisions he could not stop to explore. After an absence of three months the great discoverer reentered Bristol harbor, where due honors awaited him. The king gave him money, and encouraged him to continue his career. The people called him the great admiral; he dressed in silk; and the English, and even Venetians who chanced to be at Bristol, ran after him with such zeal that he could enlist for a new voyage as many as he pleased. . . . On the third day of the month of

February next after his return, 'John Kaboto, Venecian,' accordingly obtained a power to take up ships for another voyage, at the rates fixed for those employed in the service of the king, and once more to set sail with as many companions as would go with him of their own will. With this license every trace of John Cabot disappears. He may have died before the summer; but no one knows certainly the time or the place of his end, and it has not even been ascertained in what country this finder of a continent first saw the light."—G. Bancroft, *History of the United States* (Author's last Revision), *pt. 1, ch. 1*.—In his critical work on the discovery of America, published in 1892, Mr. Henry Harrisse states his conclusions as to the Cabot voyages, and on the question whether the American discoveries were made by John Cabot or his son Sebastian, as follows: "1.—The discovery of the continent of North America and the first landing on its east coast were accomplished not by Sebastian Cabot, but by his father John, in 1497, under the auspices of King Henry VII. 2.—The first landfall was not Cape Breton Island, as is stated in the planisphere made by Sebastian Cabot in 1544, but eight or ten degrees further north, on the coast of Labrador; which was then ranged by John Cabot, probably as far as Cape Chudley. 3.—This fact was tacitly acknowledged by all pilots and cosmographers throughout the first half of the 16th century; and the knowledge of it originated with Sebastian Cabot himself, whatever may have been afterwards his contrary statements in that respect. 4.—The voyage of 1498, also accomplished under the British flag, was likewise carried out by John Cabot personally. The landfall on that occasion must be placed south of the first; and the exploration embraced the northeast coast of the present United States, as far as Florida. 5.—In the vicinity of the Floridian east coast, John Cabot, or one of his lieutenants, was detected by some Spanish vessel, in 1498 or 1499. 6.—The English continued in 1501, 1502, 1504, and afterwards, to send ships to Newfoundland, chiefly for the purpose of fisheries."—H. Harrisse, *Discovery of North America*, *pt. 1, bk. 8, ch. 5*.

1497-1498.—First voyage of Vespucci.—Misunderstandings and disputes concerning it.—Vindication of the Florentine navigator.—His exploration of 4,000 miles of continental coast.—'Our information concerning Americus Vespucci, from the early part of the year 1496 until after his return from the Portuguese to the Spanish service in the latter part of 1504, rests primarily upon his two famous letters: the one addressed to his old patron Lorenzo di Pier Francesco de' Medici (a cousin of Lorenzo the Magnificent) and written in March or April, 1503, giving an account of his third voyage; the other addressed to his old school-fellow Piero Soderini [then Gonfaloniere of Florence] and dated from Libson, September 4, 1504, giving a brief account of four voyages which he had made under various commanders in the capacity of astronomer or pilot. These letters . . . became speedily popular, and many editions were published, more especially in France, Germany, and Italy. . . . The letter to Soderini gives an account of four voyages in which

the writer took part, the first two in the service of Spain, the other two in the service of Portugal. The first expedition sailed from Cadiz, May 10, 1497, and returned October 15, 1498, after having explored a coast so long as to seem unquestionably that of a continent. This voyage, as we shall see, was concerned with parts of America not visited again until 1513 and 1517. It discovered nothing that was calculated to invest it with much importance in Spain, though it by no means passed without notice there, as has often been wrongly asserted. Outside of Spain it came to attract more attention, but in an unfortunate way, for a slight but very serious error in proof-reading or editing, in the most important of the Latin versions, caused it after a while to be practically identified with the second voyage, made two years later. This confusion eventually led to most outrageous imputations upon the good name of Americus, which it has been left for the present century to remove. The second voyage of Vespucci was that in which he accompanied Alonso de Ojeda and Juan de la Costa, from May 20, 1499, to June, 1500. They explored the northern coast of South America from some point on what we would now call the north coast of Brazil, as far as the Pearl Coast visited by Columbus in the preceding year; and they went beyond, as far as the Gulf of Maracaibo. Here the squadron seems to have become divided, Ojeda going over to Hispaniola in September, while Vespucci remained cruising till February. . . . It is certainly much to be regretted that in the narrative of his first expedition, Vespucci did not happen to mention the name of the chief commander. . . . However . . . he was writing not for us, but for his friend, and he told Soderini only what he thought would interest him. . . . Of the letter to Soderini the version which has played the most important part in history is the Latin one first published at the press of the little college at Saint-Dié in Lorraine, April 25 (vij Kl' Maij), 1507. . . . It was translated, not from an original text, but from an intermediate French version, which is lost. Of late years, however, we have detected, in an excessively rare Italian text, the original from which the famous Lorraine version was ultimately derived. . . . If now we compare this primitive text with the Latin of the Lorraine version of 1507, we observe that, in the latter, one proper name—the Indian name of a place visited by Americus on his first voyage—has been altered. In the original it is 'Lariab;' in the Latin it has become 'Parias.' This looks like an instance of injudicious editing on the part of the Latin translator, although, of course, it may be a case of careless proof-reading. Lariab is a queer-looking word. It is no wonder that a scholar in his study among the mountains of Lorraine could make nothing of it. If he had happened to be acquainted with the language of the Huastecas, who dwelt at that time about the river Panuco—fierce and dreaded enemies of their southern neighbours the Aztecs—he would have known that names of places in that region were apt to end in *ab*. . . . But as such facts were quite beyond our worthy translator's ken, we cannot much blame him if he felt that such a word as Lariab needed doctoring. Parias (Paria) was known to be the native name of a region on the western shores of the Atlantic, and so Lariab became Parais. As the distance from the one place to the other is more than two thousand miles, this little emendation shifted the scene of the first voyage beyond all recognition, and cast the whole subject into an outer darkness where there has been much groaning and gnash-

ing of teeth. Another curious circumstance came in to confirm this error. On his first voyage, shortly before arriving at Lariab, Vespucci saw an Indian town built over the water, 'like Venice.' He counted 44 large wooden houses, 'like barracks,' supported on huge tree-trunks and communicating with each other by bridges that could be drawn up in case of danger. This may well have been a village of communal houses of the Chontals on the coast of Tabasco; but such villages were afterwards seen on the Gulf of Maracaibo, and one of them was called Venezuela, or 'Little Venice,' a name since spread over a territory nearly twice as large as France. So the amphibious town described by Vespucci was incontinently moved to Maracaibo, as if there could be only one such place, as if that style of defensive building had not been common enough in many ages and in many parts of the earth, from ancient Switzerland to modern Siam. . . . Thus in spite of the latitudes and longitudes distinctly stated by Vespucci in his letter, did Lariab and the little wooden Venice get shifted from the Gulf of Mexico to the northern coast of South America. . . . We are told that he falsely pretended to have visited Paria and Maracaibo in 1497, in order to claim priority over Columbus in the discovery of 'the continent.' What continent? When Vespucci wrote that letter to Soderini, neither he nor anybody else suspected that what we now call America had been discovered. The only continent of which there could be any question, so far as supplanting Columbus was concerned, was Asia. But in 1504 Columbus was generally supposed to have discovered the continent of Asia, by his new route, in 1492. . . . It was M. Varnhagen who first turned inquiry on this subject in the right direction. . . . Having taken a correct start by simply following the words of Vespucci himself, from a primitive text, without reference to any preconceived theories or traditions, M. Varnhagen finds 'that Americus in his first voyage made land on the northern coast of Honduras; that he sailed around Yucatan, and found his aquatic village of communal houses, his little wooden Venice, on the shore of Tabasco.' Thence, after a fight with the natives in which a few tawny prisoners were captured and carried on board the caravels, Vespucci seems to have taken a straight course to the Huasteca country by Tampico, without touching at points in the region subject or tributary to the Aztec confederacy. This Tampico country was what Vespucci understood to be called Lariab. He again gives the latitude definitely and correctly as 23° N., and he mentions a few interesting circumstances. He saw the natives roasting a 'dreadfully ugly animal,' of which he gives what seems to be 'an excellent description of the iguana, the flesh of which is to this day an important article of food in tropical America. . . . After leaving this country of Lariab the ships kept still to the northwest for a short distance, and then followed the windings of the coast for 870 leagues. . . . After traversing the 870 leagues of crooked coast, the ships found themselves 'in the finest harbour in the world' [which M. Varnhagen supposed, at first, to have been in Chesapeake Bay, but afterwards reached conclusions pointing to the neighbourhood of Cape Cañaveral, on the Florida coast]. It was in June, 1498, thirteen months since they had started from Spain. . . . They spent seven-and-thirty days in this unrivalled harbour, preparing for the home voyage, and found the natives very hospitable. These red men courted the aid of the 'white strangers,' in an attack which they wished to

make upon a fierce race of cannibals, who inhabited certain islands some distance out to sea. The Spaniards agreed to the expedition, and sailed late in August, taking seven of the friendly Indians for guides. 'After a week's voyage they fell in with the islands, some peopled, others uninhabited, evidently the Bermudas, 600 miles from Cape Hatteras as the crow flies. The Spaniards landed on an island called Iti, and had a brisk fight,' resulting in the capture of more than 200 prisoners. Seven of these were given to the Indian guides, who paddled home with them. "We also [wrote Vespucci] set sail for Spain, with 222 prisoners, slaves; and arrived in the port of Cadiz on the 15th day of October, 1498, where we were well received and sold our slaves.' . . . The obscurity in which this voyage has so long been enveloped is due chiefly to the fact that it was not followed up till many years had elapsed, and the reason for this neglect impresses upon us forcibly the impossibility of understanding the history of the Discovery of America unless we hear in mind all the attendant circumstances. One might at first suppose that a voyage which revealed some 4,000 miles of the coast of North America would have attracted much attention in Spain and have become altogether too famous to be soon forgotten. Such an argument, however, loses sight of the fact that these early voyagers were not trying to 'discover America.' There was nothing to astonish them in the existence of 4,000 miles of coast line on this side of the Atlantic. To their minds it was simply the coast of Asia, about which they knew nothing except from Marco Polo, and the natural effect of such a voyage as this would be simply to throw discredit upon that traveller."—J. Fiske, *Discovery of America*, v. 2, ch. 7.

The arguments against this view are set forth by Mr. Clements R. Markham, in a paper read before the Royal Geographical Society, in 1892, as follows: "Vespucci was at Seville or San Lucar, as a provision merchant, from the middle of April, 1497, to the end of May, 1508, as is shown by the official records, examined by Muñoz, of expenses incurred in fitting out the ships for western expeditions. Moreover, no expedition for discovery was despatched by order of King Ferdinand in 1497; and there is no allusion to any such expedition in any contemporary record. The internal evidence against the truth of the story is even stronger. Vespucci says that he sailed W. S. W. for nearly 1000 leagues from Grand Canary. This would have taken him to the Gulf of Paria, which is rather more than 900 leagues W. S. W. from Grand Canary. . . . No actual navigator would have made such a blunder. He evidently quoted the dead reckoning from Ojeda's voyage, and invented the latitude at random. . . . His statement that he went N. W. for 870 leagues (2,610 miles) from a position in latitude 23° N. is still more preposterous. Such a course and distance would have taken him right across the continent to somewhere in British Columbia. The chief incidents in the voyage are those of the Ojeda voyage in 1499. There is the village built on piles called Little Venice. . . . There was the encounter with natives, in which one Spaniard was killed and 22 were wounded. These numbers are convincing evidence."—C. R. Markham, *Columbus (Royal Geographical Society Proceedings, Sept., 1892)*.

1498.—Second voyage of John Cabot, sometimes ascribed to his son Sebastian.—"Very soon after his return, John Cabot petitioned Henry

VII. for new letters patent, authorizing him to visit again the country which he had just discovered. The King granted his request on the 3rd of February, 1498. There is no ground whatever for the assertion, frequently repeated, that John Cabot did not command this second expedition, or that it was undertaken after his death. On the contrary, Pasqualigo and Soncino mention him by name exclusively as the party to whom Henry VII. intended to entrust the fleet. Besides, this time, John Cabot is the only grantee, and the new letters patent omit altogether the names of Sebastian and of his brothers. Moreover, John explained in person to Soncino his plans for the second voyage; and July 25, 1498, Puebla and Ayala announced officially to the Spanish Sovereigns that the vessels had actually sailed out 'con otro ginoves como Colon,' which description does not apply certainly to Sebastian, but to John Cabot, as we know from corroborative evidence already stated. The fact is that the name of Sebastian Cabot appears in connection with those voyages, for the first time, in Peter Martyr's account, printed twenty years after the event, and taken from Sebastian's own lips; which . . . is not a recommendation. In England, his name reveals itself as regards the discovery of the New World at a still later period, in John Stow's Chronicle, published in 1580. And, although both that historian and Hakluyt quote as their authority for the statement a manuscript copy of Robert Fabian's Chronicle, everything tends to show that the name of Sebastian Cabot is a sheer interpolation. . . . The expedition was composed of five vessels, fitted out at the expense of John Cabot, or of his friends: 'paying for them and every of them.' We have not the exact date when the fleet sailed. It was after April 1, 1498, as on that day Henry VII. loaned £30 to Thomas Bradley and Lancelot Thirkill, 'going to the New Isle.' On the other hand, Pedro de Ayala already states, July 25, 1498, that news had been received of the expedition, which was obliged to leave behind, in Ireland, one of the ships, owing to a severe storm. The vessels therefore set out (from Bristol?) in May or June. Puebla states that they were expected back in the month of September following: 'Dizen que seran venydos para el Septiembre;' yet the vessels had taken supplies for one year: 'fueron proveydos por hun año.' We possess no direct information concerning this voyage, nor do we know when Cabot returned to England. It is important to note, however, that the expeditions of 1497 and 1498 are the only ones which in the fifteenth century sailed to the New World under the British flag, and comprise, therefore, all the transatlantic discoveries made by Cabot before the year 1500. Our only data concerning the north-west coast, which the Venetian navigator may have visited in the course of his second voyage, are to be found in the map drawn by Juan de la Cosa in the year 1500. . . . In that celebrated chart, there is, in the proximity and west of Cuba, an unbroken coast line, delineated like a continent, and extending northward to the extremity of the map. On the northern portion of that seaboard La Cosa has placed a continuous line of British flags, commencing at the south with the inscription; 'Mar descubierta por ingleses;' and terminating at the north with 'Cape of England:—Cauo de ynglaterra.' Unfortunately, those cartographical data are not sufficiently precise to enable us to locate the landfalls with adequate exactness. Nor is the kind of projection adopted, without explicit degrees of latitude, of such a character as to aid us much in determining

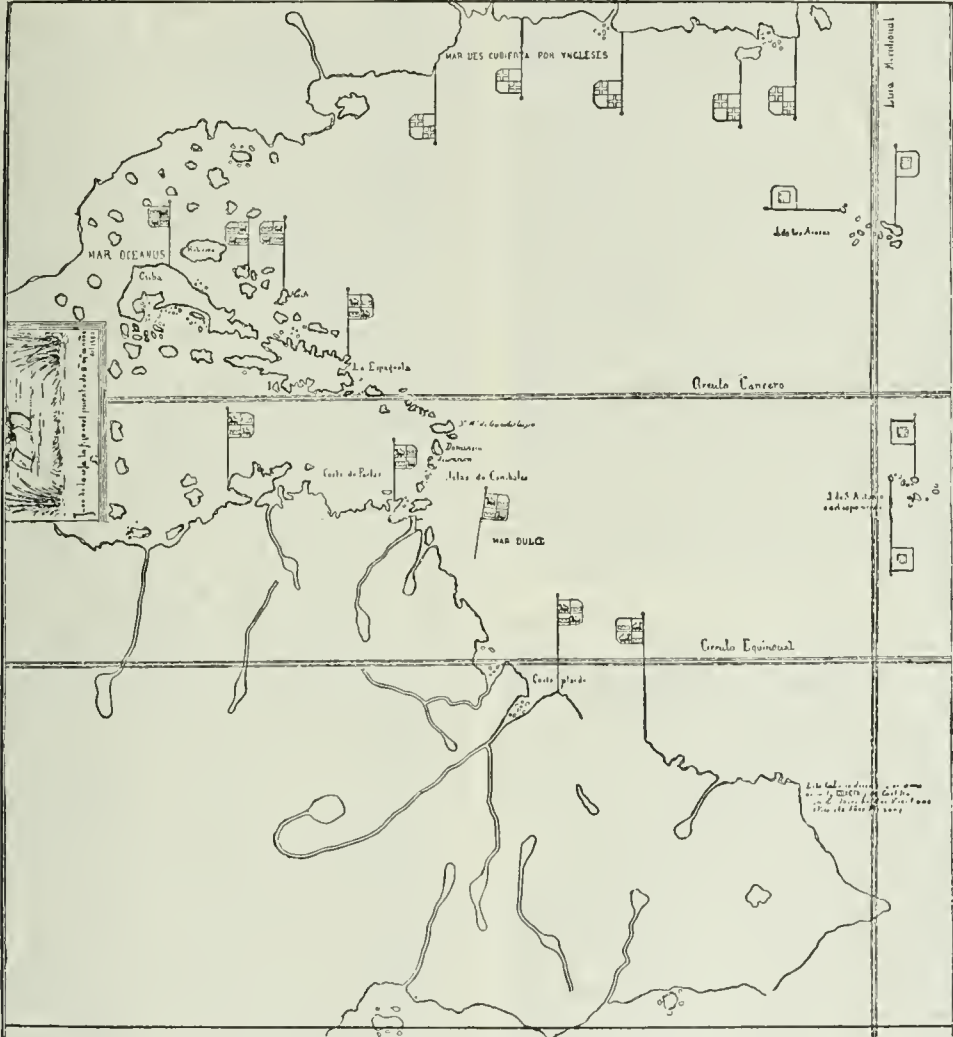

positions. We are compelled, therefore, to resort to inferences. . . . Taking the distance from the equator to the extreme north in La Cosa's map as a criterion for measuring distances, and comparing relatively the points named therein with points corresponding for the same latitude on modern planispheres, the last English flagstaff in the southern direction seems to indicate a vicinity south of the Carolinas. . . . This hypothetical estimate finds a sort of corollary in Sebastian Cabot's account, as reported by Peter Martyr. In describing his alleged north-western discoveries, Sebastian said that icebergs having compelled him to alter his course, he steered southwardly, and followed the coast until he reached about the latitude of Gibraltar. . . . Several years afterwards, Sebastian Cabot again mentioned the matter in his conversation with the Mantua gentleman; but this time he extended the exploration of the north-west coast five degrees further south, naming Florida as his terminus. . . . Twenty years after . . . Sebastian . . . declared, under oath before the Council of the Indies, December 31, 1535, that he did not know whether the mainland continued northward or not from Florida to the Bacallaos region."—H. Harrisse, *Discovery of America*, pt. 1, bk. 2.

1498-1505.—Third and fourth voyages of Columbus.—Discovery of Trinidad, the northern coast of South America, the shores of Central America and Panama.—When Columbus reached Spain, June, 1496, "Ferdinand and Isabella received him kindly, gave him new honors and promised him other outfits. Enthusiasm, however, had died out and delays took place. The reports of the returning ships did not correspond with the pictures of Marco Polo, and the new-found world was thought to be a very poor India after all. Most people were of this mind; though Columbus was not disheartened, and the public treasury was readily opened for a third voyage. Coronel sailed early in 1498 with two ships, and Columbus followed with six, embarking at San Lucas on the 30th of May. He now discovered Trinidad (July 31), which he named either from its three peaks, or from the Holy Trinity; struck the northern coast of South America, and skirted what was later known as the Pearl coast, going as far as the Island of Margarita. He wondered at the roaring fresh waters which the Oronoco pours into the Gulf of Pearls, as he called it, and he half believed that its exuberant tide came from the terrestrial paradise. He touched the southern coast of Hayti on the 30th of August. Here already his colonists had established a fortified post, and founded the town of Santo Domingo. His brother Bartholomew had ruled energetically during the Admiral's absence, but he had not prevented a revolt, which was headed by Roldan. Columbus on his arrival found the insurgents still defiant, but he was able after a while to reconcile them, and he even succeeded in attaching Roldan warmly to his interests. Columbus' absence from Spain, however, left his good name without sponsors; and to satisfy detractors, a new commissioner was sent over with enlarged powers, even with authority to supersede Columbus in general command, if necessary. This emissary was Francisco de Bobadilla, who arrived at Santo Domingo with two caravels on the 23d of August, 1500, finding Diego in command, his brother, the Admiral, being absent. An issue was at once made. Diego refused to accede to the commissioner's orders till Columbus returned to judge the case himself; so Bobadilla assumed charge of the crown property violently, took possession of the Admiral's house, and

when Columbus returned, he with his brother was arrested and put in irons. In this condition the prisoners were placed on shipboard, and sailed for Spain. The captain of the ship offered to remove the manacles: but Columbus would not permit it, being determined to land in Spain bound as he was; and so he did. The effect of his degradation was to his advantage; sovereigns and people were shocked at the sight; and Ferdinand and Isabella hastened to make amends by receiving him with renewed favor. It was soon apparent that everything reasonable would be granted him by the monarchs, and that he could have all he might wish short of receiving a new lease of power in the islands, which the sovereigns were determined to see pacified at least before Columbus should again assume government of them. The Admiral had not forgotten his vow to wrest the Holy Sepulchre from the Infidel; but the monarchs did not accede to his wish to undertake it. Disappointed in this, he proposed a new voyage; and getting the royal countenance for this scheme, he was supplied with four vessels of from fifty to seventy tons each. . . . He sailed from Cadiz, May 9, 1502, accompanied by his brother Bartholomew and his son Fernando. The vessels reached San Domingo June 29. Bobadilla, whose rule of a year and a half had been an unhappy one, had given place to Nicholas de Ovando; and the fleet which brought the new governor—with Maldonado, Las Casas and others—now lay in the harbor waiting to receive Bobadilla for the return voyage. Columbus had been instructed to avoid Hispaniola; but now that one of his vessels leaked, and he needed to make repairs, he sent a boat ashore, asking permission to enter the harbor. He was refused, though a storm was impending. He sheltered his vessels as best he could, and rode out the gale. The fleet which had on board Bobadilla and Roldan, with their ill-gotten gains, was wrecked, and these enemies of Columbus were drowned. The Admiral found a small harbor where he could make his repairs; and then, July 14, sailed westward to find, as he supposed, the richer portions of India. . . . A landing was made on the coast of Honduras, August 14. Three days later the explorers landed again fifteen leagues farther east, and took possession of the country for Spain. Still east they went; and, in gratitude for safety after a long storm, they named a cape which they rounded, Gracias à Dios—a name still preserved at the point where the coast of Honduras begins to trend southward. Columbus was now lying ill on his bed, placed on deck, and was half the time in reverie. Still the vessels coasted south," along and beyond the shores of Costa Rica; then turned with the bend of the coast to the northeast, until they reached Porto Bello, as we call it, where they found houses and orchards, and passed on "to the farthest spot of Bastidas' exploring, who had, in 1501, sailed westward along the northern coast of South America." There turning back, Columbus attempted to found a colony at Veragua, on the Costa Rica coast, where signs of gold were tempting. But the gold proved scanty, the natives hostile, and, the Admiral, withdrawing his colony, sailed away. "He abandoned one worm-eaten caravel at Porto Bello, and, reaching Jamaica, beached two others. A year of disappointment, grief, and want followed. Columbus clung to his wrecked vessels. His crew alternately mutinied at his side, and roved about the island. Ovando, at Hispaniola, heard of his straits, but only tardily and scantily relieved him. The discontented were finally humbled; and some ships, despatched by the Admiral's agent in Santo Domingo, at last

reached him and brought him and his companions to that place, where Ovando received him with ostentatious kindness, lodging him in his house till Columbus departed for Spain, Sept. 12, 1504." Arriving in Spain in November, disheartened, broken with disease, neglected, it was not until the following May that he had strength enough to go to the court at Segovia, and then only to be coldly received by King Ferdinand—Isabella being dead. "While still hope was deferred, the infirmi-

urers who accompanied Columbus on his second voyage (in 1493) was Alonzo de Ojeda. Ojeda quarrelled with the Admiral and returned to Spain in 1498. Soon afterwards, "he was provided by the Bishop Fonseca, Columbus' enemy, with a fragment of the map which the Admiral had sent to Ferdinand and Isabella, showing the discoveries which he had made in his last voyage. With this assistance Ojeda set sail for South America, accompanied by the pilot, Juan de la Cosa, who had

ties of age and a life of hardships brought Columbus to his end; and on Ascension Day, the 20th of May, 1506, he died, with his son Diego and a few devoted friends by his bedside."—J. Winsor, *Narrative and critical history of America*, v. 2, ch. 1.—See also VENEZUELA: 1499-1550.

1499-1500.—Voyages and discoveries of Ojeda and Pinzon.—Second voyage of Vespucci.—One of the most daring and resolute of the adven-

accompanied Columbus in his first great voyage in 1492, and of whom Columbus complained that, 'being a clever man, he went about saying that he knew more than he did,' and also by Amerigo Vespucci. They set sail on the 20th of May, 1499, with four vessels, and after a passage of 27 days came in sight of the continent, 200 leagues east of the Orinoco. At the end of June, they landed on the shores of Surinam, in six degrees of north latitude, and proceeding west saw the mouths of the Essequibo and Orinoco. Passing the Boca del Drago of Trinidad, they coasted westward till they

reached the *Capo de la Vela* in Granada. It was in this voyage that was discovered the Gulf to which Ojeda gave the name of Venezuela, or Little Venice, on account of the cabins built on piles over the water, a mode of life which brought to his mind the water-city of the Adriatic. From the American coast Ojeda went to the Caribbean Islands, and on the 5th of September reached Yaguimo, in Hispaniola, where he raised a revolt against the authority of Columbus. His plans, however, were frustrated by Roldan and Escobar, the delegates of Columbus, and he was compelled to withdraw from the island. On the 5th of February, 1500, he returned, carrying with him to Cadiz an extraordinary number of slaves, from which he realized an enormous sum of money. At the beginning of December, 1499, the same year in which Ojeda set sail on his last voyage, another companion of Columbus, in his first voyage, Vicente Yañez Pinzon, sailed from Palos, was the first to cross the line on the American side of the Atlantic, and on the 20th of January, 1500, discovered Cape St. Augustine, to which he gave the name of Cabo Santa Maria de la Consolacion, whence returning northward he followed the westerly trending coast, and so discovered the mouth of the Amazon, which he named Paricura. Without a month after his departure from Palos, he was followed from the same port and on the same route by Diego de Lepe, who was the first to discover, at the mouth of the Oronoco, by means of a closed vessel, which only opened when it reached the bottom of the water, that, at a depth of eight fathoms and a half, the two lowest fathoms were salt water, but all above was fresh. Lepe also made the observation that beyond Cape St. Augustine, which he doubled, as well as Pinzon, the coast of Brazil trended southwest.—R. H. Major, *Life of Prince Henry of Portugal*, ch. 10.

ALSO IN: W. Irving, *Life and voyages of Columbus*, v. 3, ch. 1-3.

1500.—Voyages of the Cortereals to the far north and of Bastidas to the Isthmus of Darien.—“The Portuguese did not overlook the north while making their important discoveries to the south. Two vessels, probably in the spring of 1500, were sent out under Gaspar Cortereal. No journal or chart of the voyage is now in existence, hence little is known of its object or results. Still more dim is a previous voyage ascribed by Cordeiro to João Vaz Cortereal, father of Gaspar. . . . Touching at the Azores, Gaspar Cortereal, possibly following Cabot's charts, struck the coast of Newfoundland north of Cape Race, and sailing north discovered a land which he called Terra Verde, perhaps Greenland, but was stopped by ice at a river which he named Rio Nevado, whose location is unknown. Cortereal returned to Lisbon before the end of 1500. . . . In October of this same year Rodrigo de Bastidas sailed from Cadiz with two vessels. Touching the shores of South America near Isla Verde, which lies between Guadalupe and the main land, he followed the coast westward to El Retrete, or perhaps Nombre de Dios, on the Isthmus of Darien, in about 9° 30' north latitude. Returning he was wrecked on Española toward the end of 1501, and reached Cadiz in September, 1502. This being the first authentic voyage by Europeans to the territory herein defined as the Pacific States, such incidents as are known will be given hereafter.”—H. H. Bancroft, *History of the Pacific states*, v. 1, p. 113.—“We have Las Casas's authority for saying that Bastidas was a humane man toward the Indians. Indeed, he afterwards lost his life by this humanity; for, when governor of Santa Martha, not consenting to

harass the Indians, he so alienated his men that a conspiracy was formed against him, and he was murdered in his bed. The renowned Vasco Nuñez [de Balboa] was in this expedition, and the knowledge he gained there had the greatest influence on the fortunes of his varied and eventful life.”—Sir A. Helps, *Spanish conquest of America*, bk. 5, ch. 1.—See also NEWFOUNDLAND: 1501-1578.

1500-1514.—Voyage of Cabral.—Third voyage of Vespucci.—Exploration of the Brazilian coast for the king of Portugal.—Curious evolution of the continental name “America.”—“Affairs now became curiously complicated. King Emanuel of Portugal intrusted to Pedro Alvarez de Cabral the command of a fleet for Hindustan, to follow up the work of Gama and established a Portuguese centre of trade on the Malabar coast. This fleet of 13 vessels, carrying about 1,200 men, sailed from Lisbon March 9, 1500. After passing the Cape Verde Islands, March 22, for some reason not clearly known, whether driven by stormy weather or seeking to avoid the calms that were apt to be troublesome on the Guinea coast, Cabral took a somewhat more westerly course than he realized, and on April 22, after a weary progress averaging less than 60 miles per day, he found himself on the coast of Brazil not far beyond the limit reached by Lepe. . . . Approaching it in such a way Cabral felt sure that this coast must fall to the east of the papal meridian. Accordingly on May day, at Porto Seguro in latitude 16° 30' S., he took formal possession of the country for Portugal, and sent Gaspar de Lemos in one of his ships back to Lisbon with the news. On May 22 Cabral weighed anchor and stood for the Cape of Good Hope. . . . Cabral called the land he had found Vera Cruz, a name which presently became Santa Cruz; but when Lemos arrived in Lisbon with the news he had with him some gorgeous parquets, and among the earliest names on old maps of the Brazilian coast we find ‘Land of Parquets’ and ‘Land of the Holy Cross.’ The land lay obviously so far to the east that Spain could not deny that at last there was something for Portugal out in the ‘ocean sea.’ Much interest was felt at Lisbon. King Emanuel began to prepare an expedition for exploring this new coast, and wished to secure the services of some eminent pilot and cosmographer familiar with the western waters. Overtures were made to Americus, a fact which proves that he had already won a high reputation. The overtures were accepted, for what reason we do not know, and soon after his return from the voyage with Ojeda, probably in the autumn of 1500, Americus passed from the service of Spain into that of Portugal. . . . On May 14, 1501, Vespucci, who was evidently principal pilot and guiding spirit in this voyage under unknown skies, set sail from Lisbon with three caravels. It is not quite clear who was chief captain, but M. Varnhagen has found reasons for believing that it was a certain Don Nuno Manuel. The first halt was made on the African coast at Cape Verde, the first week in June. . . . After 67 days of ‘the vilest weather ever seen by man’ they reached the coast of Brazil in latitude about 5° S., on the evening of the 16th of August, the festival-day of San Roque, whose name was accordingly given to the cape before which they dropped anchor. From this point they slowly followed the coast to the southward, stopping now and then to examine the country. . . . It was not until All Saints day, the first of November, that they

reached the bay in latitude 13° S., which is still known by the name which they gave it, Bahia de Todos Santos. On New Year's day, 1502, they arrived at the noble bay where 54 years later the chief city of Brazil was founded. They would seem to have mistaken it for the mouth of another huge river, like some that had already been seen in this strange world; for they called it Rio de Janeiro (River of January). Thence by February 15 they had passed Cape Santa Maria, when they left the coast and took a southeasterly course out into the ocean. Americus gives no satisfactory reason for this change of direction. . . . Perhaps he may have looked into the mouth of the river La Plata, which is a bay more than a hundred miles wide; and the sudden westward trend of the shore may have led him to suppose that he had reached the end of the continent. At any rate, he was now in longitude more than twenty degrees west of the meridian of Cape San Roque, and therefore unquestionably out of Portuguese waters. Clearly there was no use in going on and discovering lands which could belong only to Spain. This may account, I think, for the change of direction." The voyage southeastwardly was pursued until the little fleet had reached the icy and rocky coast of the island of South Georgia, in latitude 54° S. It was then decided to turn homeward. "Vespucius . . . headed straight N. N. E. through the huge ocean, for Sierra Leone, and the distance of more than 4,000 miles was made—with wonderful accuracy, though Vespucius says nothing about that—in 33 days. . . . Thence, after some further delay, to Lisbon, where they arrived on the 7th of September, 1502. Among all the voyages made during that eventful period there was none that as a feat of navigation surpassed this third of Vespucius, and there was none, except the first of Columbus, that outranked it in historical importance. For it was not only a voyage into the remotest stretches of the Sea of Darkness, but it was preëminently an incursion into the antipodal world of the Southern hemisphere. . . . A coast of continental extent, beginning so near the meridian of the Cape Verde Islands and running southwesterly to latitude 35° S. and perhaps beyond, did not fit into anybody's scheme of things. . . . It was land unknown to the ancients, and Vespucius was right in saying that he had beheld there things by the thousand which Pliuy had never mentioned. It was not strange that he should call it a 'New World,' and in meeting with this phrase, on this first occasion in which it appears in any document with reference to any part of what we now call America, the reader must be careful not to clothe it with the meaning which it wears in our modern eyes. In using the expression 'New World' Vespucius was not thinking of the Flor'da coast which he had visited on a former voyage, nor of the 'islands of India' discovered by Columbus, nor even of the Pearl Coast which he had followed after the Admiral in exploring. The expression occurs in his letter to Lorenzo de' Medici, written from Lisbon in March or April 1503, relating solely to this third voyage. The letter begins as follows: 'I have formerly written to you at sufficient length about my return from those new countries which in the ships and at the expense and command of the most gracious King of Portugal we have sought and found. It is proper to call them a new world.' Observe that it is only the new countries visited on this third voyage, the countries from Cape San Roque southward, that Vespucius thinks it proper to call a new world, and here is his reason for so calling them: 'Since among our ancestors there was no knowl-

edge of them, and to all who hear of the affair it is most novel. For it transcends the ideas of the ancients, since most of them say that beyond the equator to the south there is no continent, but only the sea which they call the Atlantic, and if any of them asserted the existence of a continent there, they found many reasons for refusing to consider it a habitable country. But this last voyage of mine has proved that this opinion of theirs was erroneous and in every way contrary to the facts.' . . . This expression 'Novus Mundus' [New World], thus occurring in a private letter, had a remarkable career. Early in June, 1503, about the time when Americus was starting on his fourth voyage, Lorenzo died. By the beginning of 1504, a Latin version of the letter [translated by Giovanni Giocondo] was printed and published, with the title 'Mundus Novus.' . . . The little four-leaved tract, 'Mundus Novus,' turned out to be the great literary success of the day. M. Harrisse has described at least eleven Latin editions probably published in the course of 1504, and by 1506 not less than eight editions of German versions had been issued. Intense curiosity was aroused by this announcement of the existence of a populous land beyond the equator and unknown (could such a thing be possible) to the ancients,—who did know something, at least, about the eastern parts of the Asiatic continent which Columbus was supposed to have reached. The "Novus Mundus," so named, began soon to be represented on maps and globes, generally as a great island or quasi-continent lying on and below the equator. "Europe, Asia and Africa were the three parts of the earth [previously known], and so this opposite region, hitherto unknown, but mentioned by Mela and indicated by Ptolemy, was the Fourth Part. We can now begin to understand the intense and wildly absorbing interest with which people read the brief story of the third voyage of Vespucius, and we can see that in the nature of that interest there was nothing calculated to bring it into comparison with the work of Columbus. The two navigators were not regarded as rivals in doing the same thing, but as men who had done two very different things; and to give credit to one was by no means equivalent to withholding credit from the other." In 1507, Martin Waldseemüller, professor of geography at Saint-Dié, published a small treatise entitled "Cosmographie Introductio," with that second of the two known letters of Vespucci—the one addressed to Soderini, of which an account is given above (1407-1408)—appended to it. "In this rare book occurs the first suggestion of the name America. After having treated of the division of the earth's inhabited surface into three parts—Europe, Asia, and Africa—Waldseemüller speaks of the discovery of a Fourth Part," and says: "Wherefore I do not see what is rightly to hinder us from calling it Amerige or America, i. e., the land of Americus, after its discoverer Americus, a man of sagacious mind, since both Europe and Asia have got their names from women.' . . . Such were the winged words but for which, as M. Harrisse reminds us, the western hemisphere might have come to be known as Atlantis, or Hesperides, or Santa Cruz, or New India, or perhaps Columbia. . . . In about a quarter of a century the first stage in the development of the naming of America had been completed. The stage consisted of five distinct steps: 1. Americus called the regions visited by him beyond the equator 'a new world' because they were unknown to the ancients; 2. Giocondo made this striking phrase 'Mundus Novus' into a title for his translation of the letter. . . . ; 3. the name Mundus Novus got

placed upon several maps as an equivalent for Terra Sanctæ Crucis, or what we call Brazil; 4. the suggestion was made that Mundus Novus was the Fourth Part of the earth, and might properly be named America after its discoverer; 5. the name America thus got placed upon several maps [the first, so far as known, being a map ascribed to Leonardo da Vinco and published about 1514, and the second a globe made in 1515 by Johann Schöner, at Nuremberg] as an equivalent for what we call Brazil, and sometimes came to stand alone as an equivalent for what we call South America, but still signified only a part of the dry land beyond the Atlantic to which Columbus had led the way. . . . This wider meaning [of South America] became all the more firmly established as its narrower meaning was usurped by the name Brazil. Three centuries before the time of Columbus the red dye-wood called brazil-wood was an article of commerce, under that same name, in Italy and Spain. It was one of the valuable things brought from the East, and when the Portuguese found the same dye-wood abundant in those tropical forests that had seemed so beautiful to Vespucci, the name Brazil soon became fastened upon the country and helped to set free the name America from its local associations." When in time, and by slow degrees, the great fact was learned, that all the lands found beyond the Atlantic by Columbus and his successors, formed part of one continental system, and were all to be embraced in the conception of a New World, the name which had become synonymous with New World was then naturally extended to the whole. The evolutionary process of the naming of the western hemisphere as a whole was thus made complete in 1541, by Mercator, who spread the name America in large letters upon a globe which he constructed that year, so that part of it appeared upon the northern and part upon the southern continent.—J. Fiske, *Discovery of America*, ch. 7, v. 2.

Complete bibliography of the Vespucci question and of the name America prepared by G. Fumagalli for G. Uzielli's new edition of A. M. Bandini, *Vita di Amerigo Vespucci* (1893). A good modern critical discussion of the Vespucci question is that by Hugues, in *Raccolta Columbiana*. A good resumé of the diffusion of the name America is L. Hugues, *La Vicende del Nome "America"* (1898). Also in H. Ludin, *Naming of America*, (*Americana*, v. 6, Dec., pp. 1174-1176).

1502.—Second voyage of Ojeda.—The first voyage of Alonzo de Ojeda, from which he returned to Spain in June 1500, was profitable to nothing but his reputation as a bold and enterprising explorer. By way of reward, he was given "a grant of land in Hispaniola, and likewise the government of Coquibacoa, which place he had discovered [and which he had called Venezuela]. He was authorized to fit out a number of ships at his own expense and to prosecute discoveries on the coast of Terra Firma. . . . With four vessels, Ojeda set sail for the Canaries, in 1502, and thence proceeded to the Gulf of Paria, from which locality he found his way to Coquibacoa. Not liking this poor country, he sailed on to the Bay of Honda, where he determined to found his settlement, which was, however, destined to be of short duration. Provisions very soon became scarce; and one of his partners, who had been sent to

procure supplies from Jamaica, failed to return until Ojeda's followers were almost in a state of mutiny. The result was that the whole colony set sail for Hispaniola, taking the governor with them in chains. All that Ojeda gained by his expedition was that he at length came off winner in a lawsuit, the costs of which, however, left him a ruined man."—R. G. Watson, *Spanish and Portuguese South America*, bk. 1, ch. 1.

1503-1504.—Fourth voyage of Vespucci.—First settlement in Brazil.—In June, 1503, "Amerigo sailed again from Lisbon, with six ships. The object of this voyage was to discover a certain island called Melcha, which was supposed to lie west of Calicut, and to be as famous a mart in the commerce of the Indian world as Cadiz was in Europe. They made the Cape de Verdes, and then, contrary to the judgment of Vespucci and of all the fleet, the Commander persisted in standing for Serra Leoa." The Commander's ship was lost, and Vespucci, with one vessel, only, reached the coast of the New World, finding a port which is thought to have been Bahia. Here "they waited above two months in vain expectation of being joined by the rest of the squadron. Having lost all hope of this they coasted on for 260 leagues to the Southward, and there took port again in 18° S. 35° W. of the meridian of Lisbon. Here they remained five months, upon good terms with the natives, with whom some of the party penetrated forty leagues into the interior; and here they erected a fort, in which they left 24 men who had been saved from the Commander's ship. They gave them 12 guns, besides other arms, and provisions for six months; then loaded with brazil [wood], sailed homeward and returned in safety. . . . The honour, therefore, of having formed the first settlement in this country is due to Amerigo Vespucci. It does not appear that any further attention was at this time paid to it. . . . But the cargo of brazil which Vespucci had brought home tempted private adventurers, who were content with peaceful gains, to trade thither for that valuable wood; and this trade became so well known, that in consequence the coast and the whole country obtained the name of Brazil, notwithstanding the holier appellation [Santa Cruz] which Cabral had given it."—R. Southey, *History of Brazil*, v. 1, ch. 1.

1509-1511.—Expeditions of Ojeda and Nicuesa to the Isthmus.—Settlement at Darien.—"For several years after his ruinous, though successful lawsuit, we lose all traces of Alonzo de Ojeda, excepting that we are told he made another voyage to Coquibacoa [Venezuela], in 1505. No record remains of this expedition, which seems to have been equally unprofitable with the preceding, for we find him, in 1508, in the island of Hispaniola as poor in purse, though as proud in spirit, as ever. . . . About this time the cupidity of King Ferdinand was greatly excited by the accounts by Columbus of the gold mines of Veragua, in which the admiral fancied he had discovered the Aurea Chersonesus of the ancients, whence King Solomon procured the gold used in building the temple of Jerusalem. Subsequent voyagers had corroborated the opinion of Columbus as to the general riches of the coast of Terra Firma; King Ferdinand resolved, therefore, to found regular colonies along that coast, and to place the whole under some capable commander." Ojeda was recommended for this post, but found a competitor in one of the gentlemen of the Spanish court, Diego de Nicuesa. "King Ferdinand avoided the dilemma by favoring both; not indeed by furnishing them with ships and money, but by granting patents and dignities, which cost nothing, and might bring rich returns. He

divided that part of the continent which lies along the Isthmus of Darien into two provinces, the boundary line running through the Gulf of Uraba. The eastern part, extending to Cape de la Vela, was called New Andalusia, and the government of it given to Ojeda. The other to the west [called Castilla del Oro], including Veragua, and reaching to Cape Gracias à Dios, was assigned to Nicuesa. The island of Jamaica was given to the two governors in common, as a place whence to draw supplies of provisions." Slender means for the equipment of Ojeda's expedition were supplied by the veteran pilot, Juan de la Cosa, who accompanied him as his lieutenant. Nicuesa was more amply provided. The rival armaments arrived at San Domingo about the same time (in 1509), and much quarreling between the two commanders ensued. Ojeda found a notary in San Domingo, Martin Fernandez de Enciso, who had money which he consented to invest in the interprise, and who promised to follow him with an additional ship-load of recruits and supplies. Under this arrangement Ojeda made ready to sail in advance of his competitor, embarking Nov. 10, 1509. Among those who sailed with him was Francisco Pizarro, the future conqueror of Peru. Ojeda, by his energy, gained time enough to nearly ruin his expedition before Nicuesa reached the scene; for, having landed at Cartagena, he made war upon the natives, pursued them recklessly into the interior of the country, with 70 men, and was overwhelmed by the desperate savages, escaping with only one companion from their poisoned arrows. His faithful friend, the pilot, Juan de la Cosa, was among the slain, and Ojeda himself, hiding in the forest, was nearly dead of hunger and exposure when found and rescued by a searching party from his ships. At this juncture the fleet of Nicuesa made its appearance. Jealousies were forgotten in a common rage against the natives and the two expeditions were joined in an attack on the Indian villages which spared nothing. Nicuesa then proceeded to Veragua, while Ojeda founded a town, which he called San Sebastian, at the east end of the Gulf of Uraba. Incessantly harassed by the natives, terrified by the effects of the poison which these used in their warfare, and threatened with starvation by the rapid exhaustion of its supplies, the settlement lost courage and hope. Enciso and his promised ship were waited for in vain. At length there came a vessel which certain piratical adventurers at Hispaniola had stolen, and which brought some welcome provisions, eagerly bought at an exorbitant price. Ojeda, half recovered from a poisoned wound, which he had treated heroically with red-hot plates of iron, engaged the pirates to convey him to Hispaniola, for the procuring of supplies. The voyage was a disastrous one, resulting in shipwreck on the coast of Cuba and a month of desperate wandering in the morasses of the island. Ojeda survived all these perils and sufferings, made his way to Jamaica, and from Jamaica to San Domingo, found that his partner Enciso had sailed for the colony long before, with abundant supplies, but could learn nothing more. Nor could he obtain for himself any means of returning to San Sebastian, or of dispatching relief to the place. Sick, penniless and disheartened, he went into a convent and died. Meantime the despairing colonists at San Sebastian waited until death had made them few enough to be all taken on board of the two little brigantines which were left to them; then they sailed away, Pizarro in command. One of the brigantines soon went down in a squall; the other made its way to the harbor of Cartagena, where it found the tardy

Enciso, searching for his colony. Enciso, under his commission, now took command, and insisted upon going to San Sebastian. There the old experiences were soon renewed, and even Enciso was ready to abandon the deadly place. The latter had brought with him a needy cavalier, Vasco Nuñez de Balboa—so needy that he smuggled himself on board Enciso's ship in a cask to escape his creditors. Vasco Nuñez who had coasted this region with Bastidas, in 1500, now advised a removal of the colony to Darien, on the opposite coast of the Gulf of Uraba. His advice, which was followed, proved good, and the hopes of the settlers were raised; but Enciso's modes of government proved irksome to them. Then Balboa called attention to the fact that, when they crossed the Gulf of Uraba, they passed out of the territory covered by the patent to Ojeda, under which Enciso was commissioned, and into that granted to Nicuesa. On this suggestion Enciso was promptly deposed and two alcaldes were elected, Balboa being one. While events in one corner of Nicuesa's domain were thus establishing a colony for that ambitious governor, he himself, at the other extremity of it, was faring badly. He had suffered hardships, separation from most of his command and long abandonment on a desolate coast; had rejoined his followers after great suffering, only to suffer yet more in their company, until less than one hundred remained of the 700 who sailed with him a few months before. The settlement at Veragua had been deserted, and another, named Nombre de Dios undertaken, with no improvement of circumstances. In this situation he was rejoiced, at last, by the arrival of one of his lieutenants, Rodrigo de Colmenares, who came with supplies. Colmenares brought tidings, moreover, of the prosperous colony at Darien, which he had discovered on his way, with an invitation to Nicuesa to come and assume the government of it. He accepted the invitation with delight; but, alas, the community at Darien had repented of it before he reached them, and they refused to receive him when he arrived. Permitted finally to land, he was seized by a treacherous party among the colonists—to whom Balboa is said to have opposed all the resistance in his power—was put on board of an old and crazy brigantine, with seventeen of his friends, and compelled to take an oath that he would sail straight to Spain. "The frail bark set sail on the first of March, 1511, and steered across the Caribbean Sea for the island of Hispaniola, but was never seen or heard of more."—W. Irving, *Life and voyages of Columbus and his companions*, v. 3.

1512.—Voyage of Ponce de Leon in quest of the fountain of youth, and his discovery of Florida.—"Whatever may have been the Southernmost point reached by Cabot in coasting America on his return, it is certain that he did not land in Florida, and that the honour of first exploring that country is due to Juan Ponce de Leon. This cavalier, who was governor of Puerto Rico, induced by the vague traditions circulated by the natives of the West Indies, that there was a country in the north possessing a fountain whose waters restored the aged to youth, made it an object of his ambition to be the first to discover this marvellous region. With this view, he resigned the governorship, and set sail with three

caravels on the 3d of March 1512. Steering N. $\frac{1}{4}$ N., he came upon a country covered with flowers and verdure; and as the day of his discovery happened to be Palm Sunday, called by the Spaniards 'Pasqua Florida,' he gave it the name of Florida from this circumstance. He landed on the 2d of April, and took possession of the country in the name of the king of Castile. The warlike people of the coast of Cautio (a name given by the Indians to all the country lying between Cape Cañaveral and the southern point of Florida) soon, however, compelled him to retreat, and he pursued his exploration of the coast as far as 30° 8' north latitude, and on the 8th of May doubled Cape Cañaveral. Then retracing his course to Puerto Rico, in the hope of finding the island of Bimini, which he believed to be the Land of Youth, and described by the Indians as opposite to Florida, he discovered the Bahamas, and some other islands, previously unknown. Bad weather compelling him to put into the isle of Guanima to repair damages, he despatched one of his caravels, under the orders of Juan Perez de Ortubia and of the pilot Anton de Alaminos, to gain information respecting the desired land, which he had as yet been totally unable to discover. He returned to Puerto Rico on the 21st of September; a few days afterwards, Ortubia arrived also with news of Bimini. He reported that he had explored the island,—which he described as large, well wooded, and watered by numerous streams,—but he had failed in discovering the fountain. Oviedo places Bimini at 40 leagues west of the island of Bahama. Thus all the advantages which Ponce de Leon promised himself from this voyage turned to the profit of geography: the title of 'Adelantado of Bimini and Florida,' which was conferred upon him, was purely honorary; but the route taken by him in order to return to Puerto Rico, showed the advantage of making the homeward voyage to Spain by the Bahama Channel."—W. B. Rye, *Introduction to "Discovery and conquest of Terra Florida, by a gentleman of Elvas"* (Hakluyt Society, 1851).

1513-1517.—Discovery of the Pacific by Balboa.—Pedrarias Davila on the isthmus.—With Enciso deposed from authority and Nicuesa sent adrift, Vasco Nuñez de Balboa seems to have easily held the lead in affairs at Darien, though not without much opposition; for faction and turbulence were rife. Enciso was permitted to carry his grievances and complaints to Spain, but Balboa's colleague, Zamudio, went with him, and another comrade proceeded to Hispaniola, both of them well-furnished with gold. For the quest of gold had succeeded at last. The Darien adventurers had found considerable quantities in the possession of the surrounding natives, and were gathering it with greedy hands. Balboa had the prudence to establish friendly relations with one of the most important of the neighboring caciques, whose comely daughter he wedded—according to the easy customs of the country—and whose ally he became in wars with the other caciques. By gift and tribute, therefore as well as by plunder, he harvested more gold than any before him had found since the ransacking of the new world began. But what they obtained seemed little compared with the treasures reported to them as existing beyond the near mountains and toward the south. One Indian youth, son of a friendly cacique, particularly excited their imaginations by the tale which he told of another great sea, not

far to the west, on the southward-stretching shores of which were countries that teemed with every kind of wealth. He told them, however, that they would need a thousand men to fight their way to this Sea. Balboa gave such credence to the story that he sent envoys to Spain to solicit forces from the king for a adequate expedition across the mountains. They sailed in October, 1512, but did not arrive in Spain until the following May. They found Balboa in much disfavor at the court. Enciso and the friends of the unfortunate Nicuesa had unitedly ruined him by their complaints, and the king had caused criminal proceedings against him to be commenced. Meantime, some inkling of these hostilities had reached Balboa, himself, conveyed by a vessel which bore to him, at the same time, a commission as captain-general from the authorities in Hispaniola. He now resolved to become the discoverer of the ocean which his Indian friends described, and of the rich lands bordering it, before his enemies could interfere with him, "Accordingly, early in September, 1513, he set out on his renowned expedition for finding 'the other sea,' accompanied by 100 men well armed, and by dogs, which were of more avail than men, and by Indian slaves to carry the burdens. He went by sea to the territory of his father-in-law, King Careta, by whom he was well received, and accompanied by whose Indians he moved on into Poncha's territory." Quieting the fears of this cacique, he passed his country without fighting. The next chief encountered, named Quarequa, attempted resistance, but was routed, with a great slaughter of his people, and Balboa pushed on. "On the 25th of September, 1513, he came near to the top of a mountain from whence the South Sea was visible. The distance from Poncha's chief town to this point was forty leagues, reckoned then six days' journey; but Vasco Nuñez and his men took twenty-five days to accomplish it, as they suffered much from the roughness of the ways and from the want of provisions. A little before Vasco Nuñez reached the height, Quarequa's Indians informed him of his near approach to the sea. It was a sight in beholding which, for the first time, any man would wish to be alone. Vasco Nuñez bade his men sit down while he ascended, and then, in solitude, looked down upon the vast Pacific—the first man of the Old World, so far as we know, who had done so. Falling on his knees, he gave thanks to God for the favour shown to him in his being permitted to discover the Sea of the South. Then with his hand he beckoned to his men to come up. When they had come, both he and they knelt down and poured forth their thanks to God. He then addressed them. . . . Having . . . addressed his men, Vasco Nuñez proceeded to take formal possession, on behalf of the kings of Castile, of the sea and of all that was in it; and in order to make memorials of the event, he cut down trees, formed crosses, and heaped up stones. He also inscribed the names of the monarchs of Castile upon great trees in the vicinity." Afterwards, when he had descended the western slope and found the shore, "he entered the sea up to his thighs, having his sword on, and with his shield in his hand; then he called the by-standers to witness how he touched with his person and took possession of this sea for the kings of Castile, and declared that he would defend the possession of it against all comers. After this, Vasco Nuñez made friends in the usual manner, first conquering and then negotiating with" the several chiefs or caciques whose territories came in his way. He explored the Gulf of San Miguel, finding much wealth of pearls in the region, and returned to Darien by a route

which crossed the isthmus considerably farther to the north, reaching his colony on the 29th of January, 1514, having been absent nearly five months. "His men at Darien received him with exultation, and he lost no time in sending his news, 'such signal and new news,' . . . to the King of Spain, accompanying it with rich presents. His letter, which gave a detailed account of his journey, and which, for its length, was compared by Peter Martyr to the celebrated letter that came to the senate from Tiberius, contained in every page thanks to God that he had escaped from such great dangers and labours. Both the letter and the presents were intrusted to a man named Arbolanche, who departed from Darien about the beginning of March, 1514. . . . Vasco Nuñez's messenger, Arbolanche, reached the court of Spain too late for his master's interests." The latter had already been superseded in the Governorship, and his successor was on the way to take his authority from him. The new governor was one Pedrarias De Avila, or Davila, as the name is sometimes written;—an envious and malignant old man, under whose rule on the isthmus the destructive energy of Spanish conquest rose to its meanest and most heartless and brainless development. Conspicuously exposed as he was to the jealousy and hatred of Pedrarias, Vasco Nuñez was probably doomed to ruin, in some form, from the first. At one time, in 1516, there seemed to be a promise for him of alliance with his all-powerful enemy, by a marriage with one of the governor's daughters, and he received the command of an expedition which again crossed the isthmus, carrying ships, and began the exploration of the Pacific. But circumstances soon arose which gave Pedrarias an opportunity to accuse the explorer of treasonable designs and to accomplish his arrest—Francisco Pizarro being the officer fitly charged with the execution of the governor's warrant. Brought in chains to Acla, Vasco Nuñez was summarily tried, found guilty and led forth to swift death, laying his head upon the block (1517). "Thus perished Vasco Nuñez de Balboa, in the forty-second year of his age, the man who, since the time of Columbus, had shown the most statesmanlike and warriorlike powers in that part of the world, but whose career only too much resembles that of Ojeda, Nicuesa, and the other unfortunate commanders who devastated those beautiful regions of the earth."—Sir A. Helps, *Spanish conquest in America*, bk. 6, v. 1.—"If I have applied strong terms of denunciation to Pedrarias Dávila, it is because he unquestionably deserves it. He is by far the worst man who came officially to the New World during its early government. In this all authorities agree. And all agree that Vasco Nuñez was not deserving of death."—H. H. Bancroft, *History of the Pacific states*, v. 1, ch. 8-12 (foot-note, p. 458).

1515.—Discovery of La Plata by Juan de Solis. See PARAGUAY: 1515-1557.

1517-1518.—Spaniards find Mexico.—"An hidalgo of Cuba, named Hernandez de Cordova, sailed with three vessels on an expedition to one of the neighbouring Bahama Islands, in quest of Indian slaves (Feb. 8, 1517). He encountered a succession of heavy gales which drove him far out of his course, and at the end of three weeks he found himself on a strange and unknown coast. On landing and asking the name of the country, he was answered by the natives 'Tectelan,' meaning 'I do not understand you,' but which the Span-

iards, misinterpreting into the name of the place, easily corrupted into Yucatan. Some writers give a different etymology. . . . Bernal Diaz says the word came from the vegetable 'yuca' and 'tale,' the name for a hillock in which it is planted. . . . M. Waldeck finds a much more plausible derivation in the Indian word 'Ouyouckatan,' 'listen to what they say.' . . . Cordova had landed on the north-eastern end of the peninsula, at Cape Catoche. He was astonished at the size and solid materials of the buildings constructed of stone and lime, so different from the frail tenements of reeds and rushes which formed the habitations of the islanders. He was struck also, with the higher cultivation of the soil, and with the delicate texture of the cotton garments and gold ornaments of the natives. Everything indicated a civilization far superior to anything he had before witnessed in the New World. He saw the evidence of a different race, moreover, in the warlike spirit of the people. . . . Wherever they landed they were met with the most deadly hostility. Cordova himself, in one of his skirmishes with the Indians, received more than a dozen wounds, and one only of his party escaped unhurt. At length, when he had coasted the peninsula as far as Compeachy, he returned to Cuba, which he reached after an absence of several months. . . . The reports he had brought back of the country, and, still more, the specimens of curiously wrought gold, convinced Velasquez [governor of Cuba] of the importance of this discovery, and he prepared with all despatch to avail himself of it. He accordingly fitted out a little squadron of four vessels for the newly discovered lands, and placed it under the command of his nephew, Juan de Grijalva, a man on whose probity, prudence, and attachment to himself he knew he could rely. The fleet left the port of St. Jago de Cuba, May 1, 1518. . . . Grijalva soon passed over to the continent and coasted the peninsula, touching at the same places as his predecessor. Everywhere he was struck, like him, with the evidences of a higher civilization, especially in the architecture; as he well might be, since this was the region of those extraordinary remains which have become recently the subject of so much speculation. He was astonished, also, at the sight of large stone crosses, evidently objects of worship, which he met with in various places. Reminded by these circumstances of his own country, he gave the peninsula the name New Spain, a name since appropriated to a much wider extent of territory. Wherever Grijalva landed, he experienced the same unfriendly reception as Cordova, though he suffered less, being better prepared to meet it." He succeeded, however, at last, in opening a friendly conference and traffic with one of the chiefs, on the Rio de Tabasco, and "had the satisfaction of receiving, for a few worthless toys and trinkets, a rich treasure of jewels, gold ornaments and vessels, of the most fantastic forms and workmanship. Grijalva now thought that in this successful traffic—successful beyond his most sanguine expectations—he had accomplished the chief object of his mission." He therefore dispatched Alvarado, one of his captains, to Velasquez, with the treasure acquired, and continued his voyage along the coast, as far as the province of Panuco, returning to Cuba at the end of about six months from his departure. "On reaching the Island, he was surprised to learn that another and more formidable armament had been fitted out to follow up his own discoveries, and to find orders at the same time from the governor, couched in no very courteous language, to repair at once to St. Jago. He was received by that personage, not merely with

coldness, but with reproaches, for having neglected so far an opportunity of establishing a colony in the country he had visited."—W. H. Prescott, *Conquest of Mexico*, bk. 2, ch. 1.

1519-1524.—Spanish conquest of Mexico. See MEXICO: 1519 (February-April); 1519-1520; 1520 (June-July); 1520-1521; 1521 (May-July); 1521 (July); 1521 (August); 1521-1524.

1519-1524.—Voyage of Magellan and Sebastian del Cano.—New World passed and the earth circumnavigated.—Congress at Badajoz.—Fernando Magellan, or Magalhaes, was "a disaffected Portuguese gentleman who had served his country for five years in the Indies under Albuquerque, and understood well the secrets of the Eastern trade. In 1517, conjointly with his geographical and astronomical friend, Ruy Falerio, another unrequited Portuguese, he offered his services to the Spanish court. At the same time these two friends proposed, not only to prove that the Moluccas were within the Spanish lines of demarcation, but to discover a passage thither different from that used by the Portuguese. Their schemes were listened to, adopted and carried out. The Straits of Magellan were discovered, the broad South Sea was crossed, the Ladrones and the Philippines were inspected, the Moluccas were passed through, the Cape of Good Hope was doubled on the homeward voyage, and the globe was circumnavigated, all in less than three years, from 1519 to 1522. Magellan lost his life, and only one of his five ships returned [under Sebastian del Cano] to tell the marvelous story. The magnitude of the enterprise was equalled only by the magnitude of the results. The globe for the first time began to assume its true character and size in the minds of men, and the minds of men began soon to grasp and utilize the results of this circumnavigation for the enlargement of trade and commerce, and for the benefit of geography, astronomy, mathematics, and the other sciences. This wonderful story, is it not told in a thousand books? . . . The Portuguese in India and the Spicers, as well as at home, now seeing the inevitable conflict approaching, were thoroughly aroused to the importance of maintaining their rights. They openly asserted them, and pronounced this trade with the Moluccas by the Spanish an encroachment on their prior discoveries and possession, as well as a violation of the Papal Compact of 1494, and prepared themselves energetically for defense and offense. On the other hand, the Spaniards as openly declared that Magellan's fleet carried the first Christians to the Moluccas and by friendly intercourse with the kings of those islands, reduced them to Christian subjection and brought back letters and tribute to Caesar. Hence these kings and their people came under the protection of Charles V. Besides this, the Spaniards claimed that the Moluccas were within the Spanish half, and were therefore doubly theirs. . . . Matters thus waxing hot, King John of Portugal begged Charles V. to delay dispatching his new fleet until the disputed points could be discussed and settled. Charles, who boasted that he had rather be right than rich, consented, and the ships were staid. These two Christian princes, who owned all the newly discovered and to be discovered parts of the whole world between them by deed of gift of the Pope, agreed to meet in Congress at Badajoz by their representatives, to discuss and settle all matters in dispute about the division of their patrimony,

and to define and stake out their lands and waters, both parties agreeing to abide by the decision of the Congress. Accordingly, in the early spring of 1524, up went to this little border town four-and-twenty wise men, or thereabouts, chosen by each prince. They comprised the first judges, lawyers, mathematicians, astronomers, cosmographers, navigators and pilots of the land, among whose names were many honored now as then—such as Fernando Columbus, Sebastian Cabot, Estevan Gomez, Diego Ribero, etc. . . . The debates and proceedings of this Congress, as reported by Peter Martyr, Oviedo, and Gomara, are very amusing, but no regular joint decision could be reached, the Portuguese declining to subscribe to the verdict of the Spaniards, inasmuch as it deprived them of the Moluccas. So each party published and proclaimed its own decision after the Congress broke up in confusion on the last day of May, 1524. It was, however, tacitly understood that the Moluccas fell to Spain, while Brazil, to the extent of two hundred leagues from Cape St. Augustine, fell to the Portuguese. . . . However, much good resulted from this first geographical Congress. The extent and breadth of the Pacific were appreciated, and the influence of the Congress was soon after seen in the greatly improved maps, globes, and charts."—H. Stevens, *Historical and geographical notes*, 1453-1530.—"For three months and twenty days he [Magellan] sailed on the Pacific and never saw inhabited land. He was compelled by famine to strip off the pieces of skin and leather wherewith his rigging was here and there bound, to soak them in the sea and then soften them with warm water, so as to make a wretched food; to eat the sweepings of the ship and other loathsome matter; to drink water gone putrid by keeping; and yet he resolutely held on his course, though his men were dying daily. . . . In the whole history of human undertakings there is nothing that exceeds, if indeed there is anything that equals, this voyage of Magellan's. That of Columbus dwindles away in comparison. It is a display of superhuman courage, superhuman perseverance."—J. W. Draper, *History of the intellectual development of Europe*, ch. 19.—"The voyage [of Magellan] . . . was doubtless the greatest feat of navigation that has ever been performed, and nothing can be imagined that would surpass it except a journey to some other planet. It has not the unique historic position of the first voyage of Columbus, which brought together two streams of human life that had been disjoined since the Glacial Period. But as an achievement in ocean navigation that voyage of Columbus sinks into insignificance by the side of it, and when the earth was a second time encompassed by the greatest English sailor of his age, the advance in knowledge, as well as the different route chosen, had much reduced the difficulty of the performance. When we consider the frailness of the ships, the immeasurable extent of the unknown, the mutinies that were prevented or quelled, and the hardships that were endured, we can have no hesitation in speaking of Magellan as the prince of navigators."—J. Fiske, *Discovery of America*, v. 2, ch. 7.

1519-1525.—Voyages of Garay and Ayllon.—Discovery of the mouth of the Mississippi.—Exploration of the Carolina coast.—In 1519, Francisco de Garay, governor of Jamaica, who had been one of the companions of Columbus on his second voyage, having heard of the richness and beauty of Yucatan, “at his own charge sent out four ships well equipped, and with good pilots, under the command of Alvarez Alonso de Pineda. His professed object was to search for some strait, west of Florida, which was not yet certainly known to form a part of the continent. The strait having been sought for in vain, his ships turned toward the west, attentively examining the ports, rivers, inhabitants, and everything else that seemed worthy of remark; and especially noticing the vast volume of water brought down by one very large stream. At last they came upon the track of Cortes near Vera Cruz. . . . The carefully drawn map of the pilots showed distinctly the Mississippi, which, in this earliest authentic trace of its outlet, bears the name of the Espiritu Santo. . . . But Garay thought not of the Mississippi and its valley: he coveted access to the wealth of Mexico; and, in 1523, lost fortune and life ingloriously in a dispute with Cortes for the government of the country on the river Panuco. A voyage for slaves brought the Spaniards in 1520 still farther to the north. A company of seven, of whom the most distinguished was Lucas Vasquez de Ayllon, fitted out two slave ships from St. Domingo, in quest of laborers for their plantations and mines. From the Bahama Islands they passed to the coast of South Carolina, which was called Chicora. The Combahee river received the name of Jordan; the name of St. Helena, whose day is the 18th of August, was given to a cape, but now belongs to the sound.” Luring a large number of the confiding natives on board their ships the adventurers treacherously set sail with them; but one of the vessels foundered at sea, and most of the captives on the other sickened and died. Vasquez de Ayllon was rewarded for his treacherous exploit by being authorized and appointed to make the conquest of Chicora. “For this bolder enterprise the undertaker wasted his fortune in preparations; in 1525 his largest ship was stranded in the river Jordan; many of his men were killed by the natives; and he himself escaped only to suffer from the consciousness of having done nothing worthy of honor. Yet it may be that ships, sailing under his authority, made the discovery of the Chesapeake and named it the bay of St. Mary; and perhaps even entered the bay of Delaware, which, in Spanish geography, was called St. Christopher’s.”—G Bancroft, *History of the United States*, pt. 1, ch. 2.

Also in: H. H. Bancroft, *History of the Pacific states*, v. 4, ch. 11, and v. 5, ch. 6-7.—W. G. Simms, *History of South Carolina*, bk. 1, ch. 1.

1523-1524.—Voyages of Verrazano.—First undertakings of France in the New World.—“It is constantly admitted in our history that our kings paid no attention to America before the year 1523. Then Francis I., wishing to excite the emulation of his subjects in regard to navigation and commerce, as he had already so successfully in regard to the sciences and fine arts, ordered John Verazani, who was in his service, to go and explore the New Lands, which began to be much talked of in France. . . . Verazani was accordingly sent, in 1523, with four ships to discover North America; but our historians have not spoken of his first expedition, and we should be in ignorance of it now, had not Ramusio preserved in his great collection a letter of Verazani himself ad-

dressed to Francis I. and dated Dieppe, July 8, 1524. In it he supposes the king already informed of the success and details of the voyage, so that he contents himself with stating that he sailed from Dieppe in four vessels, which he had safely brought back to that port. In January, 1524, he sailed with two ships, the Dauphine and the Normande, to cruise against the Spaniards. Towards the close of the same year, or early in the next, he again fitted out the Dauphine, on which, embarking with 50 men and provisions for eight months, he first sailed to the island of Madeira.”—Father Charlevoix, *History of New France* (translated by J. G. Shea), bk. 1.—“On the 17th of January, 1524, he [Verrazano] parted from the ‘Islas desiertas,’ a well-known little group of islands near Madeira, and sailed at first westward, running in 25 days 500 leagues, with a light and pleasant easterly breeze, along the northern border of the trade winds, in about 30° N. His track was consequently nearly like that of Columbus on his first voyage. On the 14th of February he met ‘with as violent a hurricane as any ship ever encountered.’ But he weathered it, and pursued his voyage to the west, ‘with a little deviation to the north,’ when, after having sailed 24 days and 400 leagues, he decied a new country which, as he supposed, had never before been seen either by modern or ancient navigators. The country was very low. From the above description it is evident that Verrazano came in sight of the east coast of the United States about the 10th of March, 1524. He places his land-fall in 34° N., which is the latitude of Cape Fear.” He first sailed southward, for about 50 leagues, he states, looking for a harbor and finding none. He then turned northward. “I infer that Verrazano saw little of the coast of South Carolina and nothing of that of Georgia, and that in these regions he can, at most, be called the discoverer only of the coast of North Carolina. . . . He rounded Cape Hatteras, and at a distance of about 50 leagues came to another shore, where he anchored and spent several days. . . . This was the second principal landing-place of Verrazano. If we reckon 50 leagues from Cape Hatteras, it would fall somewhere upon the east coast of Delaware, in latitude 38° N., where, by some authors, it is thought to have been. But if, as appears most likely, Verrazano reckoned his distance here, as he did in other cases, from his last anchoring, and not from Cape Hatteras, we must look for his second landing somewhere south of the entrance to Chesapeake Bay, and near the entrance to Albemarle Sound. And this better agrees with the ‘sail of 100 leagues’ which Verrazano says he made from his second to his third landing-place, in New York Bay. . . . He found at this third landing station an excellent berth, where he came to anchor, well-protected from the winds. . . . and from which he ascended the river in his boat into the interior. He found the shores very thickly settled, and as he passed up half a league further, he discovered a most beautiful lake . . . of three leagues in circumference. Here, more than 30 canoes came to him with a multitude of people, who seemed very friendly. . . . This description contains several accounts which make it still more clear that the Bay of New York was the scene of these occurrences.”—Verrazano’s anchorage having been at Gravesend Bay, the river which he entered being the Narrows, and the lake he found being the Inner Harbor. From New York Bay Verrazano sailed eastward, along the southern shore of Long Island, and following the New England coast,

touching at or describing points which are identified with Narragansett Bay and Newport, Block Island or Martha's Vineyard, and Portsmouth. His coasting voyage was pursued as far as 50° N., from which point he sailed homeward. "He entered the port of Dieppe early in July, 1524. His whole exploring expedition, from Madeira and back, had accordingly lasted but five and a half months."—J. G. Kohl, *History of the discovery of Maine (Maine Historical Society Collection, 2d Series, v. 1, ch. 8)*.

1524.—Verrazano's voyage along the Atlantic coast of North America.—Letter of Bernardo Carli to his father about Verrazano's voyage.—"So there being here news recently of the arrival of Captain Giovanni da Verrazano, our Florentine, at the port of Dieppe, in Normandy, with his ship, the *Dauphine*, with which he sailed from the Canary islands the end of last January, to go in search of new lands for this most serene crown of France in which he displayed very noble and great courage in undertaking such an unknown voyage with only one ship, which was a caraval of hardly — tons, with only fifty men, with the intention, if possible, of discovering Cathay [China], taking a course through other climates than those the Portuguese use in reaching it by the way of Calicut [Calcutta], but going towards the northwest and north, entirely believing that, although Ptolemy, Aristotle and other cosmographers affirm that no land is to be found towards such climates, he would find it there nevertheless. And so God has vouchsafed him as he distinctly describes in a letter of his to this S.M.; of which, in this, there is a copy. And for want of provisions, after many months spent in navigating, he asserts he was forced to return from that hemisphere into this, and having been seven months on the voyage, to show a very great and rapid passage, and to have achieved a wonderful and most extraordinary feat according to those who understand the seamanship of the world. Of which at the commencement of his said voyage there was an unfavorable opinion formed, and many thought there would be no more news either of him or of his vessel, but that he might be lost on that side of Norway, in consequence of the great ice which is in that northern ocean; but the Great God, as the Moor said, in order to give us every day proofs of his infinite power and show us how admirable is this worldly machine, has disclosed to him a breadth of land, as you will perceive, of such extent that according to good reasons, and the degrees of latitude and longitude, he alleges and shows it greater than Europe, Africa and a part of Asia; *ergo mundus novus* [Note.—Translation: "therefore a new world." Ed.]: and this exclusive of what the Spaniards have discovered in several years in the west. . . . What this our captain has brought he does not state in this letter, except a very young man taken from those countries; but it is supposed he has brought a sample of gold which they do not value in those parts, and of drugs and other aromatic liquors for the purpose of conferring here with several merchants after he shall have been in the presence of the Most Serene Majesty. And at this hour he ought to be there, and from choice to come here shortly, as he is much desired in order to converse with him; the more so that he will find here the Majesty, the King, our Lord, who is expected here in three or four days. And we hope that S.M. will entrust him again with half a dozen good vessels and that he will return to the voyage. And if our Francisco Carli be returned from Cairo,

advise him to go, at a venture, on the said voyage with him; and I believe they were acquainted at Cairo where he has been several years; and not only in Egypt and Syria, but almost through all the known world, and thence by reason of his merit is esteemed another Amerigo Vespucci; another Fernando Magellan and even more; and we hope that being provided with other good ships and vessels, well built and properly victualled, he may discover some profitable traffic and matter; and will, our Lord God granting him life, do honor to our country, in acquiring immortal fame and memory."

HISTORY OF THE DAUPHINE AND ITS VOYAGE.—Selections from a letter of the Navigator Giovanni da Verrazano to the King of France, Francis I. Patron and Director of the Exploration, about the Voyage which He Made along the Eastern Coast of the Present United States and during which He Entered the Harbor of the Present City of New York.)

FROM MADEIRA TO THE NEW WORLD.—TEMPEST ON THE OCEAN.—"From the deserted rock near to the island of Madeira of the Most Serene King of Portugal ^a (Note *a*—commencing 1524.) [Lettered notes are the annotations found in the manuscript. Ed.] with the said Dauphine, on the XVII of the month of January past, with fifty men, furnished with victuals, arms and other instruments of war and naval munitions for eight months, we departed, sailing westward by an east-south-east wind blowing with sweet and gentle lenity. In XXV days we sailed eight hundred leagues. The XXIII days of February ^a (Note *a*—perhaps 16 hours) we suffered a tempest as severe as ever a man who has navigated suffered. From which, with the divine aid and the goodness of the ship, adapted by its glorious name and fortunate destiny to support the violent waves of the sea, we were delivered. We pursued our navigation continuously toward the west, holding somewhat to the north. In XXV more days we sailed more than 400 leagues where there appeared to us a new land never before seen by anyone, ancient or modern."

LAND FIRST SEEN IN 34° NORTH LATITUDE.—"At first it appeared rather low; having approached to within a quarter of a league, we perceived it, by the great fires built on the shore of the sea, to be inhabited. We saw that it ran toward the south; following it, to find some port where we could anchor with the ship and investigate its nature, in the space of fifty leagues we did not find a port or any place where it was possible to stay with the ship. And having seen that it trended continually to the south^b, (Note *b*—in order not to meet with the Spaniards) we decided to turn about to coast it toward the north, where we found the same place. (Note—That is, to the place where he first came in sight of land—about 34 degrees north latitude.) We anchored by the coast, sending the small boat to land. We had seen many people who came to the shore of the sea and seeing us approach fled, sometimes halting, turning back, looking with great admiration. Reassuring them by various signs, some of them approached, showing great delight at seeing us, marvelling at our clothes, figures and whiteness, making to us various signs where we could land more conveniently with the small boat, offering to us of their foods."

FIRST LANDING AND THE FIRST INDIGENES.—"We were on land, and that which we were able to learn of their life and customs I will tell Your Majesty briefly: They go nude of everything except that . . . they wear some skins of little animals like

martens, a girdle of fine grass woven with various tails of other animals which hang around the body as far as the knees; the rest nude; the head likewise. Some wear certain garlands of feathers of birds. They are of dark color not much unlike the Ethiopians, and hair black and thick, and not very long, which they tie together back on the head in the shape of a little tail. As for the symmetry of the men, they are well proportioned, of medium stature, and rather exceed us. In the breast they are broad, their arms well built, the legs and other parts of the body well put together. There is nothing else, except that they incline somewhat to broadness in the face; but not all, for in more we saw the face clear-cut. The eyes black and large, the glance intent and quick. They are not of much strength, in craftiness acute, agile and the greatest runners. From what we were able to learn by experience, they resemble in the last two respects the Orientals, and mostly those of the farthest Sinarian regions. (Note—Ramusio's text has the 'regions of China.')

We were not able to learn with particularity of the life and customs of these people because of the shortness of the stay we made on land, on account there being few people and the ship anchored in the high sea." [Here follows a description of the country and the climate in the vicinity of the Carolinas.]

SAILOR AMONG THE INDIGENES.—"We left this place continually skirting the coast, which we found turned to the east. Seeing everywhere great fires on account of the multitude of the inhabitants, anchoring there off the shore because it did not contain any port, on account of the need of water we sent the little boat to land with XXV men. Because of the very large waves which the sea cast up on the shore on account of the strand being open, it was not possible without danger of losing the boat for any one to land. We saw many people on shore making us various signs of friendship, motioning us ashore; among whom I saw a magnificent deed, as Your Majesty will hear. Sending ashore by swimming one of our young sailors carrying to them some trinkets, such as little bells, mirrors, and other favors, and being approached within 4 fathoms of them, throwing the goods to them and wishing to turn back he was so tossed by the waves that almost half dead he was carried to the edge of the shore. Which having been seen, the people of the land ran immediately to him; taking him by the head, legs and arms, they carried him some distance away. Where, the youth, seeing himself carried in such way, stricken with terror, uttered very loud cries, which they did similarly in their language, showing him that he should not fear. After that, having placed him on the ground in the sun at the foot of a little hill, they performed great acts of admiration, regarding the whiteness of his flesh, examining him from head to foot. Taking off his shirt and hose, leaving him nude, they made a very large fire near him, placing him near the heat. Which having been seen, the sailors who had remained in the small boat, full of fear, as is their custom in every new case, thought that they wanted to roast him for food. His strength recovered, having remained with them awhile, he showed by signs that he desired to return to the ship; who, with the greatest kindness, holding him always close with various embraces, accompanied him as far as the sea, and in order to assure him more, extending themselves on a high hill, stood to watch him until he was in the boat. Which young man learned of this people that they are thus: of dark

color like the others, the flesh more lustrous, of medium stature, the face more clear-cut, much more delicate of body and other members, of much less strength and even of intelligence. He saw nothing else." [Here follows an annotation on the names which Verrazano gave to various places in this locality.]

THREE DAYS IN 'ARCADIA' (Note—Maryland or Delaware): A BOY STOLEN.—"Having departed thence, following always the shore which turned somewhat toward the north, we came in the space of fifty leagues to another land which appeared much more beautiful and full of the largest forests. Anchoring at which, XX men going about two leagues inland, we found the people through fear had fled to the woods. Seeking everywhere, we met with a very old woman and a damsel of from XVIII to XX years, who through fear had hidden themselves in the grass. The old one had two little girls whom she carried on the shoulders, and back on the neck a boy, all of eight years of age. The young woman had as many . . . but all girls. Having approached toward whom, they began to cry out, [and] the old woman to make signs to us that the men had fled to the woods. We gave them to eat of our viands, which she accepted with great gusto; the young woman refused everything and with anger threw it to the ground. We took the boy from the old woman to carry to France, and wishing to take the young woman, who was of much beauty and of tall stature, it was not however possible, on account of the very great cries which she uttered, for us to conduct her to the sea. And having to pass through some woods, being far from the ship, we decided to release her, carrying only the boy."

TEXTILE PLANTS AND THE GRAPES: THE OFFERING OF FIRE.—Here is given a description of the products found in the vicinity of Maryland and Delaware.] "Having remained in this place three days, anchored off the coast, we decided on account of the scarcity of ports to depart, always skirting the shore^a. (Note *a*—which we baptized Arcadia on account of the beauty of the trees.) In Arcadia we found a man who came to the shore to see what people we were; who stood hesitating and ready for flight. Watching us, he did not permit himself to be approached. He was handsome, nude, with hair fastened back in a knot, of olive color. We were about XX [in number] ashore and coaxing him he approached to within about two fathoms, showing a burning stick as if to offer us fire. And we made fire with powder and flint-and-steel and he trembled all over with terror and we fired a shot. He stopped as if astonished and prayed, worshipping like a monk, lifting his finger toward the sky, and pointing to the ship and the sea he appeared to bless us. [We sailed] toward the north and east, navigating by daylight and casting anchor at night^b. (Note *b*—we followed a coast very green with forests but without ports, and with some charming promontories and small rivers. We baptized the coast 'di Lorenna' on account of the Cardinal; the first promontory 'Lanzone,' the second 'Bonivetto,' the largest river 'Vandoma,' and a small mountain which stands by the sea 'di S. Polo' on account of the Count.)"

LAND OF ANGOULÊME, BAY SAINT MARGHERITA (New York), RIVER VENDÔME (Hudson), ISLAND OF QUEEN LOUISA* (Block Island?).—"At the end of a hundred leagues we found a very agreeable situation located within two small prominent hills, in the midst of which flowed to the sea a very great river, which was deep within the

mouth; and from the sea to the hills of that [place] with the rising of the tides, which we found eight feet, any laden ship might have passed. On account of being anchored off the coast in good shelter, we did not wish to adventure in without knowledge of the entrances. We were with the small boat, entering the said river to the land, which we found much populated. The people, almost like the others, clothed with the feathers of birds of various colors, came toward us joyfully, uttering very great exclamations of admiration, showing us where we could land with the boat more safely. We entered said river, within the land, about half a league, where we saw it made a very beautiful lake with a circuit of about three leagues; through which they [the Indians] went, going from one and another part to the number of XXX of their little barges, with innumerable people, who passed from one shore and the other in order to see us. In an instant, as is wont to happen in navigation, a gale of unfavorable wind blowing in from the sea, we were forced to return to the ship, leaving the said land with much regret because of its commodiousness and beauty, thinking it was not without some properties of value, all of its hills showing indications of minerals.^c (Note *a*—called Angólème from the principality which thou attainedst in lesser fortune, and the bay which that land makes Santa Margherita from the name of the sister who vanquishes the other matrons of modesty and art.) The anchor raised, sailing toward the east, as thus the land turned, having traveled LXXX leagues always in sight of it, we discovered an island triangular in form, distant ten leagues from the continent, in size like the island of Rhodes, full of hills, covered with trees, much populated [judging] by the continuous fires along all the surrounding shore which we saw they made. We baptized it in the name of your most illustrious mother^b (Note *b*—Aloysisia); not anchoring there on account of the unfavorableness of the weather.”

“REFUGIO,” THE VERY BEAUTIFUL PORT (Newport), AND ITS TWO KINGS.—“We came to another land, distant from the island XV leagues, where we found a very beautiful port, and before we entered it, we saw about XX barges of the people who came with various cries of wonder round about the ship. Not approaching nearer than fifty paces, they halted, looking at the edifice [that is, the ship], our figures and clothes; then altogether they uttered a loud shout, signifying that they were glad. Having reassured them somewhat, imitating their gestures, they came so near that we threw them some little bells and mirrors and many trinkets, having taken which, regarding them with laughter, they entered the ship confidently. There were among them two Kings, of as good stature and form as it would be possible to tell; the first of about XXXX years, the other a young man of XXIII years, the clothing of whom was thus: the older had on his nude body a skin of a stag, artificially adorned like a damask with various embroideries; the head bare, the hair turned back with various bands, at the neck a broad chain ornamented with many stones of diverse colors. The young man was almost in the same style. This is the most beautiful people and the most civilized in customs that we have found in this navigation. They excel us in size; they are of bronze color, some inclining more to whiteness, others to tawny color; the face sharply cut, the hair long and black, upon which they bestow the greatest study in adorning it; the eyes black and alert, the bearing kind and gentle, imitating much the ancient [manner]. Of the

other parts of the body I will not speak to Your Majesty, having all the proportions which belong to every well built man. Their women are of the same beauty and charm; very graceful; of comely mien and agreeable aspect; of habits and behavior as much according to womanly custom as pertains to human nature; they go nude with only one skin of the stag embroidered like the men, and some wear on the arms very rich skins of the lynx; the head bare, with various arrangements of braids, composed of their own hair, which hang on one side and the other on the breast. Some use other hair-arrangements like the women of Egypt and of Syria use, and these are they who are advanced in age and are joined in wedlock. They have in the ears various pendent trinkets as the orientals are accustomed to have, the men like the women, among which we saw many plates wrought from copper, by whom it is prized more than gold; which, on account of its color, they do not esteem; wherefore among all it is held by them more worthless; on the other hand rating blue and red above any other. That which they were given by us which they most valued were little bells, blue crystals and other trinkets to place in the ears and on the neck. They did not prize cloth of silk and of gold nor even of other kind, nor did they care to have them; likewise with metals like steel and iron; for many times showing them our arms they did not conceive admiration for them nor ask for them, only examining the workmanship. They did the same with the mirrors; suddenly looking at them, they refused them laughing. They are very liberal, so much so that all which they have they give away. We formed a great friendship with them, and one day, before we had entered with the ship in the port, remaining on account of the unfavorable weather conditions anchored a league at sea, they came in great numbers in their little barges to the ship, having painted and decked the face with various colors, showing to us it was evidence of good feeling, bringing to us of their food, signaling to us where for the safety of the ship we ought anchor in the port, continually accompanying us until we cast anchor there.”

FIFTEEN DAYS AMONG THE INDIGENES OF “REFUGIO.”—“In which we remained XV days, supplying ourselves with many necessities; where every day the people came to see us at the ship, bringing their women, of whom they are very careful; because, entering the ship themselves, remaining a long time, they made their women stay in the barges, and however many entreaties we made them, offering to give them various things, it was not possible that they would allow them to enter the ship. And one of the two Kings (Note—When Roger Williams went to this same country over a century later he found that they had two chief kings or sachems, Canonicus and Miantonomo) coming many times with the Queen and many attendants through their desire to see us, at first always stopped on a land distant from us two hundred paces, sending a boat to inform us of their coming, saying they wished to come to see the ship; doing this for a kind of safety. And when they had the response from us, they came quickly, and having stood awhile to look, hearing the noisy clamor of the sailor crowd, sent the Queen with her damsels in a very light barge to stay on a little island distant from us a quarter of a league; himself remaining a very long time, discoursing by signs and gestures of various fanciful ideas, examining all the equipments of the ship, asking especially their purpose, imitating

our manners, tasting our foods, then parted from us benignantly. And one time, our people remaining two or three days on a little island near the ship for various necessities as is the custom of sailors, he came with seven or eight of his attendants, watching our operations, asking many times if we wished to remain there for a long time, offering us his every help. Then, shooting with the bow, running, he performed with his attendants various games to give us pleasure. . . . [Here follows a description of the land and the products in the vicinity of Newport. This is followed by a description of the coasts of Cape Cod and those to the north of that cape. Then follows a description of the Indians living along those coasts.]

THE RETURN.—“We departed, skirting the coast between east and north. . . . [Here follows a description of a coast with many islands, probably the coast of Maine.] Navigating between east-south-east and north-north-east, in the space of CL leagues we came near the land which the Britons found in the past, which stands in fifty degrees, and having consumed all our naval stores and victuals, having discovered six hundred leagues and more of new land, furnishing ourselves with water and wood, we decided to turn toward France. . . .”

OBJECT OF THE VOYAGE.—“My intention was in this navigation to reach Cathay and the extreme east of Asia, not expecting to find such an obstacle of new land as I found; and if for some reason I expected to find it, I thought it to be not without some strait to penetrate to the Eastern Ocean. And this has been the opinion of all the ancients, believing certainly our Western Ocean to be one with the Eastern Ocean of India without interposition of land. This Aristotle affirms, arguing by many similitudes, which opinion is very contrary to the moderns and according to experience untrue. Because the land has been found by them unknown to the ancients, another world with respect to the one which was known to them, it manifestly shows itself to be larger than our Europe and Africa and almost Asia, if we estimate correctly its size; as briefly I will give Your Majesty a little account of it.”

NEW LANDS FORM A GREAT CONTINENT.—[Here are put some more mathematical calculations.] “On the other hand, we, in this navigation made by order of Your Majesty beyond 92 degrees, etc., from said meridian toward the west to the land we first found in 34 degrees^a, (Note *a*—land near Temistitan) navigated 300 leagues between east and north and almost 400 leagues to the east uninterruptedly along the shore of the land, attaining to 54 degrees, leaving the land that the Lusitanians^b (Note *b*—that is, Bacalaia, so called from a fish) found a long time ago, which they followed farther north as far as the Arctic circle leaving the end unknown. Therefore the northern latitude joined with the southern, that is, 54 degrees with 66 degrees, make 120 degrees, more latitude than Africa and Europe contain, because joining the extremity of Europe which the limits of Norway form [and] which stand in 71 degrees with the extremity of Africa, which is the Promontory of Good Hope in 35 degrees, makes only 106 degrees, and if the terrestrial area of said land corresponds in extent to the seashore, there is no doubt it exceeds Asia in size. . . . In such way we find the globe of the Earth much larger than the ancients have held and contrary to the Mathematicians who have considered that relatively to the water it [the land] was smaller, which we

have found by experience to be the reverse. And as for the corporeal area of space, we judge there cannot be less land than water, as I hope on a better occasion by further reasoning to make clear and proven to Your Majesty.”

NEW WORLD IS ISOLATED.—“All this land or New World which above I have described is connected together, not adjoining Asia nor Africa (which I know to a certainty); it may join Europe by Norway and Russia; which would be false according to the ancients, who declare almost all the north from the promontory of the Cimbri to have been navigated to the east, going around as far as the Caspian Sea itself they affirm. It would therefore remain included between two seas, between the Eastern and the Western, and that, accordingly (secondo), shuts off one from the other; because beyond 54 degrees from the equator toward the south it [the new land] extends toward the east for a long distance, and from the north passing 66 degrees it continues, turning toward the east, reaching as far as 70 degrees. I hope we shall have better assurance of this, with the aid of Your Majesty, whom God Almighty prosper in everlasting glory, that we may see the perfect end of this our cosmography, and that the sacred word of the evangelist may be accomplished: ‘Their sound has gone out into all the earth,’ etc.—In the ship Dauphine, VIII of July, M. D. XXVIII. Humble servant, JANUS VERRAZANUS.”

1524-1528.—Explorations of Pizarro and discovery of Peru.—“The South Sea having been discovered, and the inhabitants of Tierra Firma having been conquered and pacified, the Governor Pedrarias de Avila founded and settled the cities of Panama and of Nata, and the town of Nombre de Dios. At this time the Captain Francisco Pizarro, son of the Captain Gonzalo Pizarro, a knight of the city of Truxillo, was living in the city of Panama; possessing his house, his farm and his Indians, as one of the principal people of the land, which indeed he always was, having distinguished himself in the conquest and settling, and in the service of his Majesty. Being at rest and in repose, but full of zeal to continue his labours and to perform other more distinguished services for the royal crown, he sought permission from Pedrarias to discover that coast of the South Sea to the eastward. He spent a large part of his fortune on a good ship which he built, and on necessary supplies for the voyage, and he set out from the city of Panama on the 14th day of the month of November, in the year 1524. He had 112 Spaniards in his company, besides some Indian servants. He commenced a voyage in which they suffered many hardships, the season being winter and unpropitious.” From this unsuccessful voyage, during which many of his men died of hunger and disease, and in the course of which he found no country that tempted his cupidity or his ambition, Pizarro returned after some months to “the land of Panama, landing at an Indian village near the island of Pearls, called Chuchama. Thence he sent the ship to Panama,

for she had become unseaworthy by reason of the teredo; and all that had befallen was reported to Pedrarias, while the Captain remained behind to refresh himself and his companions. When the ship arrived at Panama it was found that, a few days before, the Captain Diego de Almagro had sailed in search of the Captain Pizarro, his companion, with another ship and 70 men." Almagro and his party followed the coast until they came to a great river, which they called San Juan [a few miles north of the port of Buenaventura, in New Granada]. . . . They there found signs of gold, but there being no traces of the Captain Pizarro, the Captain Almagro returned to Chuchama, where he found his comrade. They agreed that the Captain Almagro should go to Panama, repair the ships, collect more men to continue the enterprise, and defray the expenses, which amounted to more than 10,000 castellanos. At Panama much obstruction was caused by Pedrarias and others, who said that the voyage should not be persisted in, and that his Majesty would not be served by it. The Captain Almagro, with the authority given him by his comrade, was very constant in prosecuting the work he had commenced, and . . . Pedrarias was forced to allow him to engage men. He set out from Panama with 110 men; and went to the place where Pizarro waited with another 50 of the first 110 who sailed with him, and of the 70 who accompanied Almagro when he went in search. The other 130 were dead. The two captains, in their two ships, sailed with 160 men, and coasted along the land. When they thought they saw signs of habitations, they went on shore in three canoes they had with them, rowed by 60 men, and so they sought for provisions. They continued to sail in this way for three years, suffering great hardships from hunger and cold. The greater part of the crews died of hunger, insomuch that there were not 50 surviving, and during all those three years they discovered no good land. All was swamp and inundated country, without inhabitants. The good country they discovered was as far as the river San Juan, where the Captain Pizarro remained with the few survivors, sending a captain with the smaller ship to discover some good land further along the coast. He sent the other ship, with the Captain Diego de Almagro to Panama to get more men." At the end of 70 days, the exploring ship came back with good reports, and with specimens of gold, silver and cloths, found in a country further south. "As soon as the Captain Almagro arrived from Panama with a ship laden with men and horses, the two ships, with their commanders and all their people, set out from the river San Juan, to go to that newly-discovered land. But the navigation was difficult; they were detained so long that the provisions were exhausted, and the people were obliged to go on shore in search of supplies. The ships reached the bay of San Mateo, and some villages to which the Spaniards gave the name of Santiago. Next they came to the villages of Tacamez [Atacames, on the coast of modern Ecuador], on the sea coast further on. These villages were seen by the Christians to be large and well peopled: and when 90 Spaniards had advanced a league beyond the villages of Tacamez, more than 10,000 Indian warriors encountered them; but seeing that the Christians intended no evil, and did not wish to take their goods, but rather to treat them peacefully, with much love, the Indians desisted from war. In this land there were abundant supplies, and the people led well-ordered lives, the villages having their streets and squares.

One village had more than 3,000 houses, and others were smaller. It seemed to the captains and to the other Spaniards that nothing could be done in that land by reason of the smallness of their numbers, which rendered them unable to cope with the Indians. So they agreed to load the ships with the supplies to be found in the villages, and to return to an island called Gallo, where they would be safe until the ships arrived at Panama with the news of what had been discovered, and to apply to the Governor for more men, in order that the Captains might be able to continue their undertaking, and conquer the land. Captain Almagro went in the ships. Many persons had written to the Governor entreating him to order the crews to return to Panama, saying that it was impossible to endure more hardships than they had suffered during the last three years. The Governor ordered that all those who wished to go to Panama might do so, while those who desired to continue the discoveries were at liberty to remain. Sixteen men stayed with Pizarro, and all the rest went back in the ships to Panama. The Captain Pizarro was on that island for five months, when one of the ships returned, in which he continued the discoveries for a hundred leagues further down the coast. They found many villages and great riches; and they brought away more specimens of gold, silver, and cloths than had been found before, which were presented by the natives. The Captain returned because the time granted by the governor had expired, and the last day of the period had been reached when he entered the port of Panama. The two Captains were so ruined that they could no longer prosecute their undertaking. . . . The Captain Francisco Pizarro was only able to borrow a little more than 1,000 castellanos among his friends, with which sum he went to Castile, and gave an account to his Majesty of the great and signal services he had performed."—F. de Xeres (Secretary of Pizarro), *Account of the province of Cuzco*; tr. and ed. by C. R. Markham (*Hakluyt society*, 1872).

1528-1648.—America and European diplomacy, to Treaty of Münster.—"The history of the struggle of the European nations for participation in the profits of the American trade naturally falls into three periods. In the first, France was the most formidable opponent of the Spanish-Portuguese monopoly. Jean Anjo and his pilots led the attacking forces. This phase ended with the treaty concluded between France and Spain at Cateau-Cambrésis in 1550. In the second period England took the place of France as the principal antagonist. Hawkins and Drake were the most conspicuous foes of Spain. This epoch extended to the treaty concluded between England and Spain at London in 1604. In the third period commercial maritime supremacy passed from England to the United Provinces. The Dutch West India Co., organized within this epoch, played a rôle similar in many respects to that of the

French corsairs and English privateers; but in addition possessed great administrative powers. This period ended with the treaty concluded between the United Provinces and Spain at Münster in 1648. Jean Ango and his pilots, Hawkins and Drake, and the Dutch West India Co., each attacked the Spanish-Portuguese monopoly for the sake of pecuniary gain; each represented a syndicate of capitalists, and had government support; and the profits of each were derived partly from trade and partly from booty.

"Throughout the first period, to 1550, France and Portugal were at peace; while during a part of the same interval France and Spain were at war. As between France and Spain, Portugal posed as neutral. This, however, did not suffice to protect her vast colonial trade and territory, which she was unable to defend. Jean Ango, like the directors of the Dutch West India Co., 'dreamed of an empire in Brazil.' But when his pilots reached Brazilian waters they met the cruelest of receptions; and their sufferings caused them to undertake reprisals. The complaints arising from these reprisals, which Portugal, from 1510 onward, repeatedly made to France, proved unavailing and Portugal endeavored to frighten off the intruders. In 1526 the King of Portugal ordered his subjects under pain of death to run down all French vessels going to or returning from these distant territories. This and other instances of harshness on the part of Portugal and also of Spain toward interlopers were defended chiefly on the ground that the intruders were pirates, and that treaties provided that pirates should be put to death. On this pretext Charles V refused for a time to send back to France the companions of Fleury (the captor of Montezuma's treasure), although the treaty of Cambray had provided for the mutual return of all prisoners of war. For the same reason Philip II refused to deliver over the survivors of the Florida massacre, although the French ambassador protested that their enterprise was authorized by the Admiral of France. Under this name Hawkins, returning to England after a peaceful trading voyage, was denounced by the Spanish ambassador. Other instances might be cited. But whatever the excuse for Portugal's treatment of French corsairs, France could not tamely accept it. In 1528 Francis I affirmed the principle of freedom of trade 'as of all rights one of the most natural.' Following a practice then in use, he granted to Ango and to one of his associates letters of marque, giving them the right to reimburse themselves for the losses which they had suffered from the Portuguese. General letters of marque were also issued enjoining the French admirals to permit all their captains, wherever they should be, to run down the Portuguese, seize their persons, goods, or merchandise and bring them to France. In 1531 the King of Portugal complained that the French had captured 300 of his ships. Unable to defend himself by force, he employed gold, and by bribing the French admiral managed to have Ango's letters of marque revoked. In obtaining this revocation he was also helped by the intervention of the Emperor, Charles V, who in the matter of defending the oversea trade identified the interests of Portugal with his own. The reasons for this identification is not far to seek—the Portuguese Islands of Madeira and the Azores were situated on or near the routes of ocean commerce. The Spanish fleets returning from America put in at the Azores, hence Spain must always keep on the best terms with Portugal. Hence, also, the Emperor's displeasure when in 1536 Portugal concluded a treaty with France

which permitted the French to bring their prizes—i. e., Spanish ships—into all Portuguese havens and had the effect of making the harbors of the Azores and Madeira as well as of Portugal lurking places from which the French preyed upon the ocean shipping of Spain. In return Francis I forbade his subjects to sail to Brazil and Guinea; but when a few years later Portugal's bribery of the French admiral was discovered this prohibition was revoked. The activities of Ango's captains were directed not only against their Portuguese friends but also against their Spanish enemies. The sensational capture made by one of them of a part of Montezuma's treasure has already been referred to. In 1523 and 1525 the Cortes of Castile complained of the frequent and intolerable depredations committed by the French at sea, and their feeling appears to be reflected in the treaty of Madrid in 1526. The question of admitting the French to the American trade seems to have been discussed in the negotiations for the Franco-Spanish truce of 1538, as it certainly was in connection with the treaty of 1544. In 1544 the Emperor had been greatly disturbed by Cartier's plan to colonize in Canada. Despairing of keeping the French altogether away from the new world, Charles V was willing to come to terms with them. An article signed by the French commissioners in 1544 contained the following stipulation: That the King of France, his successors and subjects, would leave the Emperor and the King of Portugal at peace in all that concerned the East and West Indies and would not attempt any discoveries or other enterprises there. French subjects might, for purposes of trade only, go to both the East and the West Indies, but if they committed any acts of violence in going or returning they should be punished. This article was apparently acceptable to the Emperor and Prince Philip and to the president of the Council of the Indies. Other councilors believed that the permission to trade would lead to further trouble, because the French would not conduct it in accordance with regulations. The Council of the Indies urged that in this as in former treaties matters pertaining to the Indies should not be mentioned at all. If, however, the French were permitted to trade they should be held to the laws prohibiting the removal of gold and silver from territory subject to Castile, even in exchange for merchandise, and their homeward-bound ships should be obliged to touch at Cadiz or San Lucar. The King of Portugal also objected to the article, declaring that the French went in armed ships not only for the purpose of trading but in order to rob with more security. The article seems never to have been ratified. In the truce between France and Spain concluded in 1556 it was agreed that during the period of the truce the French should not sail to or trade in the Spanish Indies without license from the King of Spain. In a few months the truce was violated. The Venetian ambassador ascribed the rupture partly to the sending of French ships to the Indies 'to occupy some place and hinder the navigation.' The reference is to Villegagnon's colony in Brazil, which seemed a danger to Spain as well as to Portugal. In the negotiations for the treaty of Cateau-Cambrésis, in 1559, the right of the French to go to the Spanish Indies was discussed repeatedly and at length. [See also FRANCE: 1547-1550.] The Spanish commissioners urged that Villegagnon should be recalled. They based their claim to a monopoly of the western navigation on the bulls of Popes Alexander VI and Julius II, and on the fact that Spain alone had borne the labor and expense of discovery. The French depu-

ties argued that the sea was common. They would not consent to exclude Frenchmen from places discovered by them and not actually subject to the Kings of Portugal or Castile. On the other hand, they would agree that the French should keep away from lands actually possessed by the aforesaid sovereigns; or, as an alternative, that the Indies should not be mentioned, and if Frenchmen were found doing what they should not there, they might be chastised. King Philip did not approve of the former alternative. The Indies were therefore not mentioned in the treaty, but an oral agreement was made, the precise wording of which is not known. From accounts in Spanish and French documents it appears that it was to the effect that Spaniards and Frenchmen encountering one another west of the prime meridian might treat each other as enemies, without thereby giving ground for complaint of the violation of existing treaties. The location of the prime meridian remained a matter of dispute. In 1634 the King of France placed it at the island of Ferro, in the Canaries. Richelieu stated that Spain preferred to locate it farther west, in the Azores, because ships captured west of the prime meridian must be declared good prize. The rule that might would be the only right recognized between nations west of the prime meridian was the one permanent result of Spanish-French diplomacy regarding America up to 1559, or indeed up to 1648. In the treaty of Vervins, in 1598, no better arrangement could be agreed on. [See also FRANCE: 1593-1598.]

"During the wars of religion in France the maritime strength of that nation fell to its lowest ebb. Leadership in maritime affairs, and hence in the effort to force an entrance into the American trade, passed to England—the second great antagonist of the Portuguese-Spanish monopoly. In 1553 a joint-stock company was founded in London for the Guinea trade. This intrusion of the English into regions claimed by Portugal led to repeated complaints by the ambassador of Portugal, who was supported by the ambassador of Spain. Important negotiations relative to the commerce with Portuguese colonies were in progress in 1555, 1561, 1562, and from 1560 to 1576. The treaty signed in 1576 permitted the English to trade in Madeira and the Azores, but did not mention Barbary, Guinea, or Brazil. Between 1562 and 1568 Hawkins made three slave-trading voyages to the West Indies. Subsequently English privateers played havoc with Spanish shipping there, and in 1580 Drake returned from his voyage around the globe with treasure estimated at a million and a half sterling. The Spanish ambassador in London wrote that Drake was preparing for another voyage and that everybody wanted to have a share in the expedition. He therefore considered it in the King of Spain's interest that orders be given that no foreign ship should be spared in either the Spanish or the Portuguese Indies, but that every one should be sent to the bottom. War followed in a few years. Peace negotiations took place in 1588, 1600, and 1604. The negotiations of 1588 were insincere, at least on the part of Spain, in whose ports the Armada was preparing. But they have an interest as indicating England's attitude. Of her two main grievances against Spain, one was the restrictions imposed by Spain upon English trade to the newly discovered lands. The instructions issued to Elizabeth's commissioners also, in so far as they relate to the West Indies, are of interest. For they indicate that England based her claim to trade in the Indies upon the ancient treaties concluded between

Charles V and Henry VIII providing for reciprocal trade in all of her dominions. On this ground, in 1566, Cecil asserted a right to the Indian trade, and the claim seems to explain Philip II's reluctance to renew these treaties. The Spanish view was that the Indies were a new world, to which treaties between European powers did not apply unless the Indies were indubitably referring to them.

"Not until after the death of Elizabeth could peace be made. After the accession of King James negotiations were again undertaken. Concerning trade to the East and West Indies an arrangement was then effected, though no real agreement was reached. The instructions of the English commissioners in this matter were identical with those for the negotiations of 1600. They sanctioned only one concession, that Englishmen should be prohibited from going to any places in the Indies where the Spaniards were actually 'planted'—a principle embodied in the charter granted to the English East India Co. on December 31, 1600. It was rejected by the Spaniards, who insisted that the English should be excluded from every part of the Indies, either expressly or by clear implication; or else that the King of England should declare in writing that his subjects would trade in the Indies at their own peril. These demands the English refused. Cecil and Northampton alleged that an express prohibition to trade would wrong James's honor since Spain had not put it in the treaties made with France and other princes. After much debate it was resolved that intercourse should be permitted in those places 'in which there was commerce before the war, according to the observance and use of former treaties.' These words were differently interpreted by each party. Soon after the conclusion of the treaty Cecil wrote to the English Ambassador in France: 'If it be well observed how the (ninth) article is couched, you shall rather find it a pregnant affirmative for us than against us; for, sir, where it is written that we shall trade in all his dominions, that comprehends the Indies; if you will say, *secundum tractatus antiquos*, no treaty excluded it.' When the Venetian ambassador wished to hear from his majesty's own lips how he read the clause about the India navigation, and said, 'Sire, your subjects may trade with Spain and Flanders, but not with the Indies.' 'What for no?' said the king. 'Because,' I replied, 'the clause is read in that sense.' 'They are making a great error whoever they are who hold this view,' said His Majesty; 'the meaning is quite clear.' The Spaniards, on the other hand, resolutely affirmed that the terms of the peace excluded the English from the Indies. However, as was remarked in the instructions, Spain was not able to bar out the English by force, and the latter not only continued their trade in the East, but in spite of Spanish opposition proceeded to colonize Virginia under a charter which allotted to the grantees a portion of America 'not actually possessed by any Christian prince.' The memorable year of 1580, which saw Drake's return to England, witnessed also Spain's annexation of Portugal's vast empire and trade. The threat of Spain's sudden aggrandizement brought France and England together; and toward the close of the century the United Provinces joined the alliance against the common enemy. Several treaties provided for joint naval operations by England and the United Provinces against Spain. Early in the seventeenth century the Dutch outstripped Spain in the race for commercial supremacy. The Dutch East India Co., founded in 1602, undermined the power of the Portuguese in

the East; and in Guiana, Brazil, Guinea, Cuba, and Hispaniola, the Dutch were also prosecuting an active trade. In 1607 peace negotiations between Spain and the United Provinces began. The hope of expelling the Dutch from the forbidden regions was believed by many to be the principal motive that induced Spain to treat. Another reason was the project of a Dutch West India Co. 'that should with a strong fleet carry at once both war and merchandize into America.' During the protracted negotiations one of the main points of dispute was the India trade. Both sides regarded the question as vital. The States brought forward three alternative means of accommodation; peace, with free trade to those parts of the Indies not actually possessed by Spain; peace in Europe, and a truce in the Indies for a term of years with permission to trade during that period; trade to the Indies 'at their peril' after the example of the French and English. The Catholic deputies totally rejected the first and third propositions, but would submit the second to Spain if it were acceptably modified. They wished the States to declare expressly that they would abstain from going to the West Indies, and that in the East Indies they would not visit the places held by the Portuguese. The Dutch, who meanwhile had tried to frighten their opponents by showing a renewed interest in the West India Co., finally drafted what was deemed an acceptable article, but Spain insisted on their prompt withdrawal from both the East and West Indies as one of the two indispensable conditions for her recognition of their independence. Peace was unattainable, and negotiations were broken off. The French ambassador, however, persuaded the States to revive negotiations for a truce and to employ the French and English ambassadors as intermediaries. The principal point of difficulty was the India trade. The French ambassador labored for the end desired by the Dutch not because France wished to strengthen them unduly but because she was unwilling to restore Spain to her former power or to play into the hands of the English, who were believed to desire the trade for themselves. An article was finally agreed on which was a concession of the India trade veiled by circumlocutions. Traffic was permitted in Spain's European lands and in any other of her possessions where her allies were permitted to trade. Outside these limits (i. e., in the Indies) subjects of the States could not traffic without express permission from the King in places held by Spain, but in places not thus held they might trade upon permission of the natives without hindrance from the King or his officers. The agreement that Spain would not hinder the subjects of the States in their trade 'outside the limits' was also strengthened by a special and secret treaty in which the name Indies was again avoided. The name, however, appeared in an act signed by the French and English ambassadors, which certified that the archdukes' deputies had agreed that, just as the Dutch should not traffic in places held by the King of Spain in the Indies without his permission, so subjects of the King of Spain should not traffic in places held by the States in the Indies without their permission. In 1621 the truce of 1609 expired and Spain declared war on the United Netherlands. Between 1621 and 1625 the Dutch negotiated with Denmark, France, and England to secure their alliance against Spain. The States General earnestly desired that these nations should cooperate with the Dutch West India Co., chartered by the States in 1621 for the purpose of attacking Spain's American possessions and treasure fleets as well as for trade, but the Danes and

French preferred rather to share in the East India commerce. In 1621 the Dutch and Danish commissioners signed an agreement that in their journeys, trade, and navigation in the East and West Indies, Africa, and Terra Australis subjects of either party should befriend subjects of the other. The treaty between the Dutch and French merely stipulated that the question of traffic to the East and West Indies should be treated later by the French ambassador. The offensive alliance with England in 1625 enjoined attacks by both parties on Spain's dominions on both sides of the line and especially on the treasure fleets, and one of the results of this treaty was the opening of trade between the Dutch and the English colonists in North America. [See also *COMMERCE: Medieval: 8th-16th centuries.*] During the 20 years following 1621 there were repeated negotiations for peace between the United Provinces and Spain. The most important took place in 1632 and 1633. They failed chiefly because no agreement could be reached on colonial matters, particularly those in which the Dutch West India Co. was involved. Since this company had captured the port of Pernambuco, in Brazil, it looked forward to a rapid extension of its authority and trade in this region and to profits from raids undertaken thence against the Spanish treasure fleets, the West India Islands, and Central America. Having acquired a great fleet equipped for war, it opposed any peace or truce with Spain that should extend beyond the Line, unless, indeed, Spain would permit the Dutch to trade in both Indies. Since Spain refused these demands, negotiations ended fruitlessly.

"The negotiations at Münster from 1646 to 1648 were carried on under widely different circumstances from those of 1632, 1633, just mentioned. In 1646 peace was essential to the Spanish Government, exhausted by its efforts against domestic and foreign foes. Moreover, the chief obstacle to peace had been removed by her loss of Brazil and other Portuguese colonies. On the other hand, the Dutch East and West India companies would willingly have continued the war. The West India Co. considered that if the two companies should be united it would be more profitable to continue hostilities in both Indies and Africa than to conclude any peace or truce with Spain. In case of a peace or truce the company desired freedom to trade in all places within the limits of its charter where the King of Spain had no castles, jurisdiction, or territory, and it further sought the exclusion of Spaniards from trade in all places similarly held by the company unless like privileges were granted to the company in places under the dominion of Spain. These stipulations were practically those agreed to in the truce of 1609. Somewhat modified they were finally included in the treaty of Münster, a treaty in which for the first time Spain granted to another nation, as a permanent concession, in clear and explicit terms, and with mention of the Indies, the right to sail to, trade, and acquire territory in America. By treaties concluded in 1641 and 1642, Portugal, newly liberated from Spain, had legalized the trade which the Dutch and English had previously established with the African coast, and recognized Dutch possession of a part of Brazil. Thus, in the fifth decade of the seventeenth century, the two Iberian powers, then bitterly estranged from each other, were both compelled to concede to certain European nations the right to occupation and trade in those overseas lands from which, since the period of discovery, they had endeavored to exclude them. But, as old walls were breached, new ones were erected. The Dutch, English, and French, having acquired much

oversea territory and commerce, each tried to use them for the exclusive profit of their respective peoples, or even of certain of their own trading companies. Hence in 1648 the ideal of free ocean commerce and navigation, conceived long before by Grotius, remained unrealized."—F. G. Davenport, *American and European diplomacy to 1648* (Annual Report American Historical Association, 1915, pp. 153, 161).

1534-1535.—Exploration of the St. Lawrence to Montreal by Cartier.—"At last, ten years after [the voyages of Verrazano], Philip Chabot, Admiral of France, induced the king [Francis I.] to resume the project of founding a French colony in the New World whence the Spaniards daily drew such great wealth; and he presented to him a Captain of St. Malo, by name Jacques Cartier, whose merit he knew, and whom that prince accepted. Cartier having received his instructions, left St. Malo the 2d of April, 1534, with two ships of 60 tons and 122 men. He steered west, inclining slightly north, and had such fair winds that, on the 10th of May, he made Cape Bonavista, in Newfoundland, at 46° north. Cartier found the land there still covered with snow, and the shore fringed with ice, so that he could not or dared not stop. He ran down six degrees south-southeast, and entered a port to which he gave the name of St. Catharine. Thence he turned back north. . . . After making almost the circuit of Newfoundland, though without being able to satisfy himself that it was an island, he took a southerly course, crossed the gulf, approached the continent, and entered a very deep bay, where he suffered greatly from heat, whence he called it Chaleurs Bay. He was charmed with the beauty of the country, and well pleased with the Indians that he met and with whom he exchanged some goods for furs. . . . On leaving this bay, Cartier visited a good part of the coasts around the gulf, and took possession of the country in the name of the most Christian king, as Verazani had done in all the places where he landed. He set sail again on the 15th of August to return to France, and reached St. Malo safely on the 5th of September. . . . On the report which he made of his voyage, the court concluded that it would be useful to France to have a settlement in that part of America; but no one took this affair more to heart than the Vice-Admiral Charles de Mony, Sieur de la Mailleraye. This noble obtained a new commission for Cartier, more ample than the first, and gave him three ships well equipped. This fleet was ready about the middle of May, and Cartier . . . embarked on Wednesday the 10th. His three vessels were separated by violent storms, but found one another, near the close of July, in the gulf which was their appointed place of rendezvous. On the 1st of August bad weather drove him to take refuge in the port of St. Nicholas, at the mouth of the river on the north. Here Cartier planted a cross, with the arms of France, and remained until the 7th. This port is almost the only spot in Canada that has kept the name given by Cartier. . . . On the 10th the three vessels re-entered the gulf, and in honor of the saint whose feast is celebrated on that day, Cartier gave the gulf the name of St. Lawrence; or rather he gave it to a bay lying

between Anticosti Island and the north shore, whence it extended to the whole gulf of which this bay is part; and because the river, before that called River of Canada, empties into the same gulf, it insensibly acquired the name of St. Lawrence, which it still bears. . . . The three vessels . . . ascended the river, and on the 1st of September they entered the river Saguenay. Cartier merely reconnoitered the mouth of this river, and . . . hastened to seek a port where his vessels might winter in safety. Eight leagues above Isle aux Coudres he found another much larger and handsomer island, all covered with trees and vines. He called it Bacchus Island, but the name has been changed to Isle d'Orleans. The author of the relation to this voyage, printed under the name of Cartier, pretends that only here the country begins to be called Canada. But he is surely mistaken; for it is certain that from the earliest times the Indians gave this name to the whole country along the river on both sides, from its mouth to the Saguenay. From Bacchus Island, Cartier proceeded to a little river which is ten leagues off, and comes from the north; he called it Rivière de Ste Croix, because he entered it on the 14th of September (Feast of the Exaltation of the Holy Cross); but it is now commonly called Rivière de Jacques Cartier. The day after his arrival he received a visit from an Indian chief named Donnacona, whom the author of the relation of that voyage styles Lord of Canada. Cartier treated with this chief by names of two Indians whom he had taken to France the year before, and who knew a little French. They informed Donnacona that the strangers wished to go to Hochelaga, which seemed to trouble him. Hochelaga was a pretty large town, situated on an island now known under the name of Island of Montreal. Cartier had heard much of it, and was loth to return to France without seeing it. The reason why this voyage troubled Donnacona was that the people of Hochelaga were of a different nation from his, and that he wished to profit exclusively by the advantages which he hoped to derive from the stay of the French in his country.' Proceeding with one vessel to Lake St. Pierre, and thence in two boats, Cartier reached Hochelaga Oct. 2. 'The shape of the town was round, and three rows of palisades inclosed in it about 50 tunnel shaped cabins, each over 50 paces long and 14 or 15 wide. It was entered by a single gate, above which, as well as along the first palisade, ran a kind of gallery, reached by ladders, and well provided with pieces of rock and pebbles for the defence of the place. The inhabitants of the town spoke the Huron language. They received the French very well. . . . Cartier visited the mountain at the foot of which the town lay, and gave it the name of Mont Royal, which has become that of the whole Island [Montreal]. From it he discovered a great extent of country, the sight of which charmed him. . . . He left Hochelaga on the 5th of October, and on the 11th arrived at Sainte Croix.' Wintering at this place, where his crews suffered terribly from the cold and from scurvy, he returned to France the following spring. 'Some authors . . . pretend that Cartier, disgusted with Canada, dissuaded the king, his master, from further thoughts of it; and Champlain seems to have been of that opinion. But this does not agree with what Cartier himself says in his memoirs. . . . Cartier in vain extolled the country which he had discovered. His small returns, and the wretched condition to which his men had been reduced by cold and scurvy, persuaded most that it would never be of any use to France. Great stress was laid on the fact that he

nowhere saw any appearance of mines; and then, even more than now, a strange land which produced 'neither gold nor silver was reckoned as nothing.'—Father Charlevoix, *History of New France*, bk. 1.

1540-1541.—Coronado expedition.—"Its [De Soto's expedition] only parallel is the contemporary enterprise of Coronado, which did for the southwest what De Soto did for the eastern and central belt. If Cabeça de Vaca's reports of the riches of Florida spurred on De Soto and his followers in Spain they were not less exciting in Mexico. There the ground had been in a measure prepared by the fusing of an Indian folk tale of seven caves with the old geographical myth of the Seven Cities; and the whole was made vivid by the stories told by an Indian of a visit when a child to these seven towns, which he compared to the city of Mexico. It seemed advisable to Mendoza, the viceroy of New Spain, to explore the region, and he chose a Franciscan, Friar Marcos, of Nizza, or Nice, who had been in Peru with Pizarro, and in Mexico had had some missionary experience in the frontier, to make a reconnaissance. He was now instructed to make careful observations of the country, its products and people, and to report them in detail to Mendoza. The negro Stephen, who had come with De Vaca, was given to him to serve as a guide, and he was also attended by some Christianized Pima Indians. Friar Marcos left Culiacan in the western frontier of Sinaloa a few weeks before De Soto landed in Florida. Following the coast as far as the Yaqui, he then went nearly due north, veering later towards the east, until he came within sight of the Zuni villages in western New Mexico. The negro Stephen had gone on ahead with a retinue of Indians, and Friar Marcos now learned that he had been killed by the Indians of Cibola, the first of the seven cities (which are now usually identified with the Zuni pueblos). From a distant point of view, the pueblo seemed to the friar in that magnifying atmosphere as large as the city of Mexico. The magic of the association with the legend of the 'Seven Cities' reinforced the impression made by the narrative of the friar, some of whose exaggerated reports may have arisen from imperfectly understanding his informants; and elaborate preparations were at once made to invade the new land of wonder, and to repeat, if possible, the history of the conquest of Mexico. The enterprise was placed in the charge of Francisco de Coronado, the recently appointed gov-

ernor of New Galicia, the northern frontier province of New Spain, and a personal friend of Mendoza. The vigor and energy of Mendoza's government as well as the resources of New Spain at that early date are strikingly displayed in the preparations for what is perhaps the most elaborate single enterprise of exploration in North American history. The land force under Coronado numbered three hundred Spaniards and eight hundred Indians, and was accompanied by a large number of extra horses and droves of sheep and pigs. There was in addition a sea force of two ships under Hernando de Alarcon to coöperate with Coronado by following the coast of the Gulf of California and keeping in communication with the army and carrying some of its baggage. Alarcon discovered the mouth of the Colorado River, and August 26, 1540, started to explore it with boats. In the second of his two separate trips he apparently got as far as the lower end of the cañon, about two hundred miles up, as he estimated it. Coronado himself set out in February, 1540, marching up the west coast of Mexico. At Culiacan he left the main force and went ahead with about fifty horsemen, some foot-soldiers, and most of the Indian allies. Passing across the southwestern section of Arizona they verged to the eastward till they came to Cibola, which was captured. Here they were profoundly disappointed. However plausible Friar Marcos's comparison of the distant view of the pueblo with the city of Mexico may be made to seem in our time, there is no doubt that it completely misled the men of that day who knew Mexico. Coronado now sent back Melchior Diaz to order up the main force. Diaz did so, and then set out to explore the region at the head of the Gulf of California. He crossed the Colorado River and penetrated the country to the west. Another important side expedition during this summer was that of Pedro de Tovar to the province of Tusayan, northwest of Cibola, which led to the discovery of the Grand Cañon of the Colorado by De Gardenas. As they looked into its depths it seemed as 'if the water was six feet across, although the Indians said it was half a league wide.' They tried to get down to the stream, but in vain. 'Those who stayed above had estimated that some huge rocks on the sides of the cliffs seemed to be about as tall as a man, but those who went down swore that when they reached these rocks they were bigger than the great tower of Seville.' When the main army reached Cibola, Coronado moved with it to about the middle of New Mexico, where he went into winter quarters at Tiguex, on the Rio Grande. Here the burden of requisitions for supplies and individual acts of outrage against the Indians of Tiguex provoked them to an attack on the Spaniards, which was successfully repelled. The cruelty of the reprisals inflicted on the Indian prisoners exceeded anything done by De Soto, and constitutes a dark stain on the expedition. In the spring of 1541, Coronado set out to reach Quivira, a town of which an Indian prisoner had given a glowing description. It seems probable that the thirty-seven days' march took them northeasterly, but constantly verging to the right, across the plains until they reached the borders of the [former] Oklahoma Territory. A further advance with the main force now seemed inadvisable; but to verify, if possible, the stories about Quivira, Coronado went on early in June with thirty horsemen to the northeast. After a ride of about six weeks the goal was reached, and proved to be nothing more than a village of semi-nomadic Indians in the centre of the present state of Kansas. A few hundred miles to the southeast

De Soto at this same time was exploring Arkansas. An Indian woman who had run away from Coronado's army fell in with De Soto's nine days later. Fertile as was the soil of the western prairies, the region had nothing at that time adequate to reward settlement so far inland; and Coronado in the following spring returned to New Spain with all his force save two missionaries and a few others. The expedition, like De Soto's, failed of its immediate object, but it revealed the character of a large part of the southwest and of the trans-Mississippi plains; and the branch expeditions had proved that Lower California was a peninsula and not an island."—E. G. Bourne, *Spain in America*, pp. 168-172.—In regard to the literature of southwestern exploration, G. P. Winship, *Bibliography of the Coronado Expedition*, is a very valuable guide. It was appended to his edition of all the Coronado documents in English translation, including the original Spanish text, not previously printed, of Castaneda's narrative, published by the United States Bureau of Ethnology, *Fourteenth Annual Report* (1896). The translations have been revised in G. P. Winship's *Journey of Coronado* (1904).

1541-1603.—Cartier's last voyage.—Abortive attempts at French colonization in Canada.—"Jean François de la Roque, lord of Roberval, a gentleman of Picardy, was the most earnest and energetic of those who desired to colonize the lands discovered by Jacques Cartier. . . . The title and authority of lieutenant-general was conferred upon him; his rule to extend over Canada, Hochelaga, Saguenay, Newfoundland, Belle Isle, Carpon, Labrador, La Grand Baye, and Baccalaos, with the delegated rights and powers of the Crown. This patent was dated the 15th of January, 1540. Jacques Cartier was named second in command. . . . Jacques Cartier sailed on the 23d of May, 1541, having provisioned his fleet for two years." He remained on the St. Lawrence until the following June, seeking vainly for the fabled wealth of the land of Saguenay, finding the Indians strongly inclined to a treacherous hostility, and suffering severe hardships during the winter. Entirely discouraged and disgusted, he abandoned his undertaking early in the summer of 1542, and sailed for home. On the road of St. John's, Newfoundland, Cartier met his tardy chief, Roberval, just coming to join him; but no persuasion could induce the disappointed explorer to turn back. "To avoid the chance of an open rupture with Roberval, the lieutenant silently weighed anchor during the night, and made all sail for France. This inglorious withdrawal from the enterprise paralyzed Roberval's power, and deferred the permanent settlement of Canada for generations then unborn. Jacques Cartier died soon after his return to Europe." Roberval proceeded to Canada, built a fort at Ste Croix, four leagues west of Orleans, sent back two of his three ships to France, and remained through the winter with his colony, having a troubled time. There is no certain account of the ending of the enterprise, but it ended in failure. For half a century afterwards there was little attempt made by the French to colonize any part of New France, though the French fisheries

on the Newfoundland Bank and in the Gulf of St. Lawrence were steadily growing in activity and importance. "When, after fifty years of civil strife, the strong and wise sway of Henry IV. restored rest to troubled France, the spirit of discovery again arose. The Marquis de La Roche, a Breton gentleman, obtained from the king, in 1598, a patent granting the same powers that Roberval had possessed." But La Roche's undertaking proved more disastrous than Roberval's had been. Yet, there had been enough of successful fur-trading opened to stimulate enterprise, despite these misfortunes. "Private adventurers, unprotected by any special privilege, began to barter for the rich peltries of the Canadian hunters. A wealthy merchant of St. Malo, named Pontgravé, was the boldest and most successful of these traders; he made several voyages to Tadousac, at the mouth of the Saguenay, bringing back each time a rich cargo of rare and valuable furs." In 1600, Pontgravé effected a partnership with one Chauvin, a naval captain, who obtained a patent from the king giving him a monopoly of the trade; but Chauvin died in 1602 without having succeeded in establishing even a trading post at Tadousac. De Chatte, or De Chastes, governor of Dieppe, succeeded to the privileges of Chauvin, and founded a company of merchants at Rouen [1603] to undertake the development of the resources of Canada. It was under the auspices of this company that Samuel Champlain, the founder of New France, came upon the scene.—E. Warburton, *Conquest of Canada*, v. 1, ch. 2-3.—See also FRANCE: Colonial empire.

1562-1567.—Slave-trading voyages of Hawkins.—Beginnings of English enterprise in the New World.—"The history of English America begins with the three slave-trading voyages of John Hawkins, made in the years 1562, 1564, and 1567. Nothing that Englishmen had done in connection with America, previously to those voyages, had any result worth recording. England had known the New World nearly seventy years, for John Cabot reached it shortly after its discovery by Columbus; and, as the tidings of the discovery spread, many English adventurers had crossed the Atlantic to the American coast. But as years passed, and the excitement of novelty subsided, the English voyages to America had become fewer and fewer, and at length ceased altogether. It is easy to account for this. There was no opening for conquest or plunder, for the Tudors were at peace with the Spanish sovereigns: and there could be no territorial occupation, for the Papal title of Spain and Portugal to the whole of the new continent could not be disputed by Catholic England. No trade worth having existed with the natives: and Spain and Portugal kept the trade with their own settlers in their own hands. . . . As the plantations in America grew and multiplied, the demand for negroes rapidly increased. The Spaniards had no African settlements, but the Portuguese had many, and, with the aid of French and English adventurers, they procured from these settlements slaves enough to supply both themselves and the Spaniards. But the Brazilian plantations grew so fast, about the middle of the century, that they absorbed the entire supply, and the Spanish colonists knew not where to look for negroes. This penury of slaves in the Spanish

Indies became known to the English and French captains who frequented the Guinea coast; and John Hawkins, who had been engaged from boyhood in the trade with Spain and the Canaries, resolved in 1502 to take a cargo of negro slaves to Hispaniola. The little squadron with which he executed this project was the first English squadron which navigated the West Indian seas. This voyage opened those seas to the English. England had not yet broken with Spain, and the law excluding English vessels from trading with the Spanish colonists was not strictly enforced. The trade was profitable, and Hawkins found no difficulty in disposing of his cargo to great advantage. A meagre note . . . from the pen of Hakluyt contains all that is known of the first American voyage of Hawkins. In its details it must have closely resembled the second voyage. In the first voyage, however, Hawkins had no occasion to carry his wares further than three ports on the northern side of Hispaniola. These ports, far away from San Domingo, the capital, were already well known to the French smugglers. He did not venture into the Caribbean Sea; and having loaded his ships with their return cargo, he made the best of his way back. In his second voyage . . . he entered the Caribbean Sea, still keeping, however, at a safe distance from San Domingo, and sold his slaves on the mainland. This voyage was on a much larger scale. . . . Having sold his slaves in the continental ports [South American], and loaded his vessels with hides and other goods bought with the produce, Hawkins determined to strike out a new path and sail home with the Gulf-stream, which would carry him northwards past the shores of Florida. Sparke's narrative . . . proves that at every point in these expeditions the Englishman was following in the track of the French. He had French pilots and seamen on board, and there is little doubt that one at least of these had already been with Laudonnière in Florida. The French seamen guided him to Laudonnière's settlement, where his arrival was most opportune. They then pointed him the way by the coast of North America, then universally known in the mass as New France, to Newfoundland, and thence, with the prevailing westerly winds, to Europe. This was the pioneer voyage made by Englishmen along coasts afterwards famous in history through English colonization. . . . The extremely interesting narrative . . . given . . . from the pen of John Sparke, one of Hawkins' gentlemen companions . . . contains the first information concerning America and its natives which was published in England by an English eye-witness." Hawkins planned a third voyage in 1566, but the remonstrances of the Spanish king caused him to be stopped by the English court. He sent out his ships, however, and they came home in due time richly freighted,—from what source is not known. "In another year's time the aspect of things had changed." England was venturing into war with Spain, "and Hawkins was now able to execute his plans without restraint. He founded a permanent fortified factory on the Guinea coast, where negroes might be collected all the year round. Thence he sailed for the West Indies a third time. Young Francis Drake sailed with him in command of the 'Judith,' a small vessel of fifty tons" The voyage had a prosperous beginning and a disastrous ending. After disposing of most of their slaves, they were driven by storms to take refuge in the Mexican port of Vera Cruz, and there they were attacked by a Spanish fleet. Drake in the *Judith* and

Hawkins in another small vessel escaped. But the latter was overcrowded with men and obliged to put half of them ashore on the Mexican coast. The majority of those left on board, as well as a majority of Drake's crew, died on the voyage home, and it was a miserable remnant that landed in England, in January, 1569.—E. J. Payne, *Voyages of Elizabethan seamen to America*, ch. 1.

1572-1580.—Piratical adventures of Drake and his encompassing of the world.—"Francis Drake, the first of the English Buccaneers, was one of the twelve children of Edward Drake of Tavistock, in Devonshire, a staunch Protestant, who had fled his native place to avoid persecution, and had then become a ship's chaplain. Drake, like Columbus, had been a seaman by profession from boyhood; and . . . had served as a young man, in command of the *Judith*, under Hawkins. . . . Hawkins had confined himself to smuggling; Drake advanced from this to piracy. This practice was authorized by law in the middle ages for the purpose of recovering debts or damages from the subjects of another nation. The English, especially those of the west country, were the most formidable pirates in the world; and the whole nation was by this time roused against Spain, in consequence of the ruthless war waged against Protestantism in the Netherlands by Philip II. Drake had accounts of his own to settle with the Spaniards. Though Elizabeth had not declared for the revolted States, and pursued a shifting policy, her interests and theirs were identical; and it was with a view of cutting off those supplies of gold and silver from America which enabled Philip to bribe politicians and pay soldiers, in pursuit of his policy of aggression, that the famous voyage was authorized by English statesmen. Drake had recently made more than one successful voyage of plunder to the American coast." In July, 1572, he surprised the Spanish town of Nombre de Dios, which was the shipping port on the northern side of the Isthmus for the treasures of Peru. His men made their way into the royal treasure-house, where they laid hands on a heap of bar-silver, 70 feet long, 10 wide, and 10 high; but Drake himself had received a wound which compelled the pirates to retreat with no very large part of the splendid booty. In the winter of 1573, with the help of the runaway slaves on the Isthmus, known as Cimarrones, he crossed the Isthmus, looked on the Pacific ocean, approached within sight of the city of Panama, and waylaid a transportation party conveying gold to Nombre de Dios; but was disappointed of his prey by the excited conduct of some of his men. When he saw, on this occasion, the great ocean beyond the Isthmus, "Drake then and there resolved to be the pioneer of England in the Pacific; and on this resolution he solemnly besought the blessing of God. Nearly four years elapsed before it was executed; for it was not until November, 1577, that Drake embarked on his famous voyage, in the course of which he proposed to plunder Peru itself. The Peruvian ports were unfortified. The Spaniards knew them to be by nature absolutely secured from attack on the north; and they never dreamed that the English pirates would be daring enough to pass the terrible straits of Magellan and attack them from the south. Such was the plan of Drake; and it was executed with complete success." He sailed from Plymouth, Dec. 13, 1577, with a fleet of four vessels, and a pinnace, but lost one of the ships after he had entered the Pacific,

in a storm which drove him southward, and which made him the discoverer of Cape Horn. Another of his ships, separated from the squadron, returned home, and a third, while attempting to do the same, was lost in the river Plate. Drake, in his own vessel, the *Golden Hind*, proceeded to the Peruvian coasts, where he cruised until he had taken and plundered a score of Spanish ships. "Laden with a rich booty of Peruvian treasure he deemed it unsafe to return by the way that he came. He therefore resolved to strike across the Pacific and for this purpose made the latitude in which this voyage was usually performed by the Spanish government vessels which sailed annually from Acapulco to the Philippines. Drake thus reached the coast of California, where the Indians, delighted beyond measure by presents of clothing and trinkets, invited him to remain and rule over them. Drake took possession of the country in the name of the Queen, and refitted his vessel in preparation for the unknown perils of the Pacific. The place where he landed must have been either the great bay of San Francisco or the small bay of Bodega, which lies a few leagues further north. The great seaman had already coasted five degrees more to the northward before finding a suitable harbour. He believed himself to be the first European who had coasted these shores; but it is now well known that Spanish explorers had preceded him. Drake's circumnavigation of the globe was thus no deliberate feat of seamanship, but the necessary result of circumstances. The voyage made in more than one way a great epoch in English nautical history." Drake reached Plymouth on his return Sept. 26, 1580.—E. J. Payne, *Voyages of the Elizabethan seamen to America*, pp. 141-143.

1583.—Expedition of Sir Humphrey Gilbert.—Formal possession taken of Newfoundland.—In 1578, Sir Humphrey Gilbert, an English gentleman, of Devonshire, whose younger half-brother was the more famous Sir Walter Raleigh, obtained from Queen Elizabeth a charter empowering him, for the next six years, to discover "such remote heathen and barbarous lands, not actually possessed by any Christian prince or people," as he might be shrewd or fortunate enough to find, and to occupy the same as their proprietor. Gilbert's first expedition was attempted the next year, with Sir Walter Raleigh associated in it; but misfortunes drove back the adventurers to port, and Spanish intrigue prevented their sailing again. "In June, 1583, Gilbert sailed from Cawsand Bay with five vessels, with the general intention of discovering and colonizing the northern parts of America. It was the first colonizing expedition which left the shores of Great Britain; and the narrative of the expedition by Hayes, who commanded one of Gilbert's vessels, forms the first page in the history of English colonization. Gilbert did no more than go through the empty form of taking possession of the island of Newfoundland, to which the English
