name formerly applied to the continent in general . . . was now restricted. . . . Gilbert dallied here too long. When he set sail to cross the Gulf of St. Lawrence and take possession of Cape Breton and Nova Scotia the season was too far advanced; one of his largest ships went down with all on board, including the Hungarian scholar Parmenius, who had come out as the historian of the expedition; the stores were exhausted and the crews dispirited; and Gilbert resolved on sailing home, intending to return and prosecute his discoveries the next spring. On the home voyage the little vessel in which he was sailing foundered; and the pioneer of English colonization found a watery grave. . . . Gilbert was a man of courage, piety, and learning. He was, however, an indifferent seaman, and quite incompetent for the task of colonization to which he had set his hand. The misfortunes of his expedition induced Amadas and Barlow, who followed in his steps, to abandon the northward voyage and sail to the shores intended to be occupied by the easier but more circuitous route of the Canaries and the West Indies."—E. J. Payne, *Voyages of Elizabethan seamen to America*, pp. 173-174.—"On Monday, the 9th of September, in the afternoon, the frigate [the 'Squirrel'] was near cast away, oppressed by waves, yet at that time recovered; and giving forth signs of joy, the general, sitting abaft with a book in his hand, cried out to us in the 'Hind' (so oft as we did approach within hearing), 'We are as near to heaven by sea as by land,' reiterating the same speech, well beseeming a soldier resolute in Jesus Christ, as I can testify he was. On the same Monday night, about twelve o'clock, or not long after, the frigate being ahead of us in the 'Golden Hind,' suddenly her lights were out, whereof as it were in a moment we lost the sight, and withal our watch cried the General was cast away, which was too true; for in that moment the frigate was devoured and swallowed up by the sea. Yet still we looked out all that night and ever after, until we arrived upon the coast of England. . . . In great torment of weather and peril of drowning it pleased God to send safe home the 'Golden Hind,' which arrived in Falmouth on the 22d of September, being Sunday."—E. Haies, *A report of the voyage by Sir Humphrey Gilbert* (reprinted in Payne's *Voyages*).

1584-1586.—Raleigh's first colonizing attempts and failures.—"The task in which Gilbert had failed was to be undertaken by one better qualified to carry it out. If any Englishman in that age seemed to be marked out as the founder of a colonial empire, it was Raleigh. Like Gilbert, he had studied books; like Drake he could rule men. . . . The associations of his youth, and the training of his early manhood, fitted him to sympathize with the aims of his half-brother Gilbert, and there is little reason to doubt that Raleigh had a share in his undertaking and his failure. In 1584 he obtained a patent precisely similar to Gilbert's. His first step showed the thoughtful and well-planned system on which he began his task. Two ships were sent out, not with any idea of

settlement, but to examine and report upon the country. Their commanders were Arthur Barlow and Philip Amidas. To the former we owe the extant record of the voyage; the name of the latter would suggest that he was a foreigner. Whether by chance or design, they took a more southerly course than any of their predecessors. On the 2d of July the presence of shallow water, and a smell of sweet flowers, warned them that land was near. The promise thus given was amply fulfilled upon their approach. The sight before them was far different from that which had met the eyes of Hore and Gilbert. Instead of the bleak coast of Newfoundland, Barlow and Amidas looked upon a scene which might recall the softness of the Mediterranean. . . . Coasting along for about 120 miles, the voyagers reached an inlet and with some difficulty entered. They then solemnly took possession of the land in the Queen's name, and then delivered it over to Raleigh according to his patent. They soon discovered that the land upon which they had touched was an island about 20 miles long, and not above six broad, named, as they afterwards learnt, Roanoke. Beyond, separating them from the mainland, lay an enclosed sea, studded with more than a hundred fertile and well-wooded islets." The Indians proved friendly, and were described by Barlow as being "most gentle, loving and faithful, void of all guile and treason, and such as live after the manner of the golden age." "The report which the voyagers took home spoke as favourably of the land itself as of its inhabitants. . . . With them they brought two of the savages, named Wanchese and Manteo. A probable tradition tells us that the queen herself named the country Virginia, and that Raleigh's knighthood was the reward and acknowledgment of his success. On the strength of this report Raleigh at once made preparations for a settlement. A fleet of seven ships was provided for the conveyance of 108 settlers. The fleet was under the command of Sir Richard Grenville, who was to establish the settlement and leave it under the charge of Ralph Lane. . . . On the 9th of April [1585] the emigrants set sail." For some reason not well explained, the fleet made a circuit to the West Indies, and loitered for five weeks at the island of St. John's and at Hispaniola, reaching Virginia in the last days of June. Quarrels between the two commanders, Grenville and Lane, had already begun, and both seemed equally ready to provoke the enmity of the natives. In August, after exploring some sixty miles of the coast, Grenville returned to England, promising to come back the next spring with new colonists and stores. The settlement, thus left to the care of Lane, was established "at the north-east corner of the island of Roanoke, whence the settlers could command the strait. There, even now, choked by vines and underwood, and here and there broken by the crumbling remains of an earthen bastion, may be traced the outlines of the ditch which enclosed the camp, some forty yards square, the home of the first English settlers in the New World. Of the doings of the settlers during the winter nothing is recorded, but by the next spring their prospects looked gloomy. The Indians were no longer friends. . . . The settlers, unable to make fishing weirs, and without seed corn, were entirely dependent on the Indians for their daily food. Under these circumstances, one would have supposed that Lane would have best employed himself in guarding the settlement and improving its condition. He, however, thought otherwise, and applied himself to the task of exploring the neighbouring territory." But a wide

combination of hostile Indian tribes had been formed against the English, and their situation became from day to day more imperilled. At the beginning of June, 1586, Lane fought a bold battle with the savages and routed them; but no sign of Grenville appeared and the prospect looked hopeless. Just at this juncture, a great English fleet, sailing homewards from a piratical expedition to the Spanish Main, under the famous Captain Drake, came to anchor at Roanoke and offered succor to the disheartened colonists. With one voice they petitioned to be taken to England, and Drake received the whole party on board his ships. "The help of which the colonists had despaired was in reality close at hand. Scarcely had Drake's fleet left the coast when a ship well furnished by Raleigh with needful supplies, reached Virginia, and after searching for the departed settlers returned to England. About a fortnight later Grenville himself arrived with three ships. He spent some time in the country exploring, searching for the settlers, and at last, unwilling to lose possession of the country, landed fifteen men at Roanoke well supplied for two years, and then set sail for England, plundering the Azores, and doing much damage to the Spaniards."—J. A. Doyle, *English in America: Virginia, &c.*, ch. 4.—"It seems to be generally admitted that, when Lane and his company went back to England, they carried with them tobacco as one of the products of the country, which they presented to Raleigh, as the planter of the colony, and by him it was brought into use in England, and gradually in other European countries. The authorities are not entirely agreed upon this point. Josselyn says: 'Tobacco first brought into England by Sir John Hawkins, but first brought into use by Sir Walter Raleigh many years after.' Again he says: 'Now (say some) Tobacco was first brought into England by Mr. Ralph Lane, out of Virginia. Others will have Tobacco to be first brought into England from Peru, by Sir Francis Drake's Mariners.' Camden fixes its introduction into England by Ralph Lane and the men brought back with him in the ships of Drake. He says: 'And these men which were brought back were the first that I know of, which brought into England that Indian plant which they call Tobacco and Nicotia, and use it against crudities, being taught it by the Indians.' Certainly from that time it began to be in great request, and to be sold at a high rate. . . . Among the 108 men left in the colony with Ralph Lane in 1585 was Mr. Thomas Hariot, a man of a strongly mathematical and scientific turn, whose services in this connection were greatly valued. He remained there an entire year, and went back to England in 1586. He wrote out a full account of his observations in the New World."—I. N. Tarbox, *Sir Walter Raleigh and his colony in America* (Prince Society, 1884).

1587-1590.—Lost colony of Roanoke.—End of the Virginia undertakings of Raleigh.—“Raleigh, undismayed by losses, determined to plant an agricultural state; to send emigrants with their wives and families, who should make their homes in the New World; and, that life and property might be secured, in January, 1587, he granted a charter for the settlement, and a municipal government for the city of ‘Raleigh.’ John White was appointed its governor; and to him, with eleven assistants, the administration of the colony was intrusted. Transport ships were prepared at the expense of the proprietary; ‘Queen Elizabeth, the godmother of Virginia,’ declined contributing ‘to its education.’ Embarking in April, in July they arrived on the coast of North Carolina; they were saved from the dangers of Cape Fear; and, passing Cape Hatteras, they hastened to the isle of Roanoke, to search for the handful of men whom Grenville had left there as a garrison. They found the tenements deserted and overgrown with weeds; human bones lay scattered on the field where wild deer were reposing. The fort was in ruins. No vestige of surviving life appeared. The instructions of Raleigh had designated the place for the new settlement on the bay of Chesapeake. But Fernando, the naval officer, eager to renew a profitable traffic in the West Indies, refused his assistance in exploring the coast, and White was compelled to remain on Roanoke. . . . It was there that in July the foundations of the city of Raleigh were laid.” But the colony was doomed to disaster from the beginning, being quickly involved in warfare with the surrounding natives. “With the returning ship White embarked for England, under the excuse of interceding for re-enforcements and supplies. Yet, on the 18th of August, nine days previous to his departure, his daughter Eleanor Dare, the wife of one of the assistants, gave birth to a female child, the first offspring of English parents on the soil of the United States. The infant was named from the place of its birth. The colony, now composed of 89 men, 17 women, and two children, whose names are all preserved, might reasonably hope for the speedy return of the governor, as he left with them his daughter and his grandchild, Virginia Dare. The farther history of this plantation is involved in gloomy uncertainty. The inhabitants of ‘the city of Raleigh,’ the emigrants from England and the first-born of America, awaited death in the land of their adoption. For, when White reached England, he found its attention absorbed by the threats of an invasion from Spain. . . . Yet Raleigh, whose patriotism did not diminish his generosity, found means, in April 1588, to despatch White with supplies in two vessels. But the company, desiring a gainful voyage rather than a safe one, ran in chase of prizes, till one of them fell in with men of war from Rochelle, and, after a bloody fight, was boarded and rifled. Both ships were compelled to return to England. The delay was fatal: the English kingdom and the Protestant reformation were in danger; nor could the poor colonists of Roanoke be again remembered till after the discomfiture of the Invincible Armada. Even then Sir Walter Raleigh, who had already incurred a fruitless expense of £40,000, found his impaired fortune insufficient for further attempts at colonizing Virginia. He therefore used the privilege of his patent to endow a company of merchants and adventurers with large concessions. Among the men who thus obtained an assignment of the proprietary’s rights in Virginia is found the name of Richard Hakluyt; it connects the first efforts of England in North Carolina with the final coloniza-

tion of Virginia. The colonists at Roanoke had emigrated with a charter; the instrument of March, 1589, was not an assignment of Raleigh’s patent, but the extension of a grant, already held under its sanction by increasing the number to whom the rights of that charter belonged. More than another year elapsed before White could return to search for his colony and his daughter; and then the island of Roanoke was a desert. An inscription on the bark of a tree pointed to Croatan; but the season of the year and the dangers from storms were pleaded as an excuse for an immediate return. The conjecture has been hazarded that the deserted colony, neglected by their own countrymen, were hospitably adopted into the tribe [the Croatans] of Hatteras Indians. Raleigh long cherished the hope of discovering some vestiges of their existence, and sent at his own charge, and, it is said, at five several times, to search for his liege men. But imagination received no help in its attempts to trace the fate of the colony of Roanoke.”—G. Bancroft, *History of the United States*, pt. 1, v. 1, ch. 5.—“The Croatans of to-day claim descent from the lost colony. Their habits, disposition and mental characteristics show traces both of savage and civilized ancestors. Their language is the English of 300 years ago, and their names are in many cases the same as those borne by the original colonists. No other theory of their origin has been advanced.”—S. B. Weeks, *Lost colony of Roanoke (American Historical Association Papers, v. 5, pt. 4)*.—“The last expedition [of White, searching for his lost colony] was not despatched by Raleigh, but by his successors in the American patent. And our history is now to take leave of that illustrious man, with whose schemes and enterprises it ceases to have any further connexion. The ardour of his mind was not exhausted, but diverted by a multiplicity of new and not less arduous undertakings. . . . Desirous, at the same time, that a project which he had carried so far should not be entirely abandoned, and hoping that the spirit of commerce would preserve an intercourse with Virginia that might terminate in a colonial establishment, he consented to assign his patent to Sir Thomas Smith, and a company of merchants in London, who undertook to establish and maintain a traffic between England and Virginia. . . . It appeared very soon that Raleigh had transferred his patent to hands very different from his own. . . . Satisfied with a paltry traffic carried on by a few small vessels, they made no attempt to take possession of the country; and at the period of Elizabeth’s death, not a single Englishman was settled in America.”—J. Grahame, *History of the rise and progress of the United States of North America*, till 1688, ch. 1.

1602-1605.—Voyages of Gosnold, Pring, and Weymouth.—First Englishmen in New England.—Batholomew Gosnold was a West-of-England mariner who had served in the expeditions of Sir Walter Raleigh to the Virginia coast. Under his command, in the spring of 1602, “with the consent of Sir Walter Raleigh, and at the cost, among others, of Henry Wriothesley, Earl of Southampton, the accomplished patron of Shakespeare, a small vessel, called the Concord, was equipped for exploration in ‘the north part of Virginia,’ with a view to the establishment of a colony. At this time, in the last year of the Tudor

dynasty, and nineteen years after the fatal termination of Gilbert's enterprise, there was no European inhabitant of North America, except those of Spanish birth in Florida, and some twenty or thirty French, the miserable relics of two frustrated attempts to settle what they called New France. Gosnold sailed from Falmouth with a company of thirty-two persons, of whom eight were seamen, and twenty were to become planters. Taking a straight course across the Atlantic, instead of the indirect course by the Canaries and the West Indies which had been hitherto pursued in voyages to Virginia, at the end of seven weeks he saw land in Massachusetts Bay, probably near what is now Salem Harbor. Here a boat came off, of Basque build, manned by eight natives, of whom two or three were dressed in European clothes, indicating the presence of earlier foreign voyagers in these waters. Next he stood to the southward, and his crew took great quantities of codfish by a head land, called by him for that reason Cape Cod, the name which it retains. Gosnold, Brereton, and three others, went on shore, the first Englishmen who are known to have set foot upon the soil of Massachusetts. . . . Sounding his way cautiously along, first in a southerly, and then in a westerly direction, and probably passing to the south of Nantucket, Gosnold next landed on a small island, now called No Man's Land. To this he gave the name of Martha's Vineyard, since transferred to the larger island further north. . . . South of Buzzard's Bay, and separated on the south by the Vineyard Sound from Martha's Vineyard, is scattered the group denoted on modern maps as the Elizabeth Islands. The southwesternmost of these, now known by the Indian name of Cuttyhunk, was denominated by Gosnold Elizabeth Island. . . . Here Gosnold found a pond two miles in circumference, separated from the sea on one side by a beach thirty yards wide, and enclosing 'a rocky islet, containing near an acre of ground, full of wood and rubbish.' This islet was fixed upon for a settlement. In three weeks, while a part of the company were absent on a trading expedition to the mainland, the rest dug and stoned a cellar, prepared timber and built a house, which they fortified with palisades, and thatched with sedge. Proceeding to make an inventory of their provisions, they found that, after supplying the vessel, which was to take twelve men on the return voyage, there would be a sufficiency for only six weeks for the twenty men who would remain. A dispute arose upon the question whether the party to be left behind would receive a share in the proceeds of the cargo of cedar, sassafras, furs, and other commodities which had been collected. A small party, going out in quest of shell-fish, was attacked by some Indians. With men having already, it is likely, little stomach for such cheerless work, these circumstances easily led to the decision to abandon for the present the scheme of a settlement, and in the following month the adventurers sailed for England, and, after a voyage of five weeks, arrived at Exmouth. . . . The expedition of Gosnold was pregnant with consequences, though their development was slow. The accounts of the hitherto unknown country, which were circulated by his company on their return, excited an earnest interest." The next year (April, 1603), Martin Pring or Prynne was sent out, by several merchants of Bristol, with two small vessels, seeking cargoes of sassafras, which had acquired a high value on account of supposed medicinal virtues. Pring coasted from Maine to Martha's Vineyard, secured his desired cargoes, and

gave a good account of the country. Two years later (March, 1605), Lord Southampton and Lord Wardour sent a vessel commanded by George Weymouth to reconnoitre the same coast with an eye to settlements. Weymouth ascended either the Kennebec or the Penobscot river some 50 or 60 miles and kidnapped five natives. "Except for this, and for some addition to the knowledge of the local geography, the voyage was fruitless."—J. G. Palfrey, *Compendious history of New England*, v. 1, ch. 2.

1607-1608.—First voyages of Henry Hudson.—"The first recorded voyage made by Henry Hudson was undertaken . . . for the Muscovy or Russia Company [of England]. Departing from Gravesend the first of May, 1607, with the intention of sailing straight across the north pole, by the north of what is now called Greenland, Hudson found that this land stretched further to the eastward than he had anticipated, and that a wall of ice, along which he coasted, extended from Greenland to Spitzbergen. Forced to relinquish the hope of finding a passage in the latter vicinity, he once more attempted the entrance of Davis' Straits by the north of Greenland. This design was also frustrated and he apparently renewed the attempt in a lower latitude and nearer Greenland on his homeward voyage. In this cruise Hudson attained a higher degree of latitude than any previous navigator. . . . He reached England on his return on the 15th September of that year [1607]. . . . On the 22d of April, 1608, Henry Hudson commenced his second recorded voyage for the Muscovy or Russia Company, with the design of 'finding a passage to the East Indies by the north-east.' . . . On the 3d of June, 1608, Hudson had reached the most northern point of Norway, and on the 11th was in latitude 75° 24', between Spitzbergen and Noza Zembla." Failing to pass to the north-east beyond Nova Zembla, he returned to England in August.—J. M. Read, Jr., *Historical inquiry concerning Henry Hudson*, pp. 133-138.

1609.—Hudson's voyage of discovery for the Dutch.—"Henry Hudson comes into the historian's notice in 1607, and he disappears in the ice and mist of Hudson Bay in 1611. In this brief period he gained a 'farther north' than any other man for many a long year and made two memorable voyages which are commemorated in the names Hudson River and Hudson Bay. His antecedents are unknown, though conjectures have not been wanting; J. R. Read [*Historical inquiry concerning Henry Hudson*] gives many facts about sundry Hudsons who lived in the reigns of Elizabeth and James I; but the links connecting these persons with the navigator are still lacking. The sources

are given in the original and in translation in Asher's *Henry Hudson, the navigator* (*Hakluyt Society Publications*, 1860). H. C. Murphy, to whom students of New York history are largely indebted, printed the contract between the Dutch East India Company and Hudson in his *Henry Hudson in Holland*. For some inscrutable reason, he refused Asher a sight of the brochure, which was designed for private distribution, nor is there any certain information as to the reasons for his voyaging in the service of the Dutch East India Company. Unquestionably he was an Englishman, and as certainly he sailed, in 1609, in search of a new waterway to India and Cathay. His vessel was named the *Half-Moon*; she was a 'fly-boat,' or fast sailing vessel whose speed was secured by making her long in proportion to her beam; she carried eighteen or twenty men. The *Half-Moon's* crew was ill-assorted of Englishmen and

'On the morning of the five-and-twentieth,' so the chronicler of the expedition informs us, 'we manned our scute with four muskets and six men and took one of their shallops and brought it aboard. Then we manned our boat and scute with twelve men and muskets and two stone pieces or murderers, and drove the savages from their houses, and took the spoyle of them, as they would have done of us,'—which was quite likely after the unprovoked seizure of their boat. Once again, the *Half-Moon* steered to the south and, rounding Cape Cod, made the Virginia coast. After coasting southward for a time, Hudson turned to the north again and possibly entered Chesapeake Bay. [Asher's *Hudson*, 73, note.] He certainly sailed into Delaware Bay and, not liking the looks of the shoal water, soon ran out again, and, steering northward, anchored inside of Sandy Hook. On the 4th of August, 1609, a party went on

HENRY HUDSON AND SON CAST ADRIFT IN HUDSON BAY BY
MUTINOUS SAILORS, 1611

Dutchmen and was soon discouraged by ice and storms. Hudson, therefore, abandoned his northward course through Arctic seas and steered westward for America, to which he was drawn by the knowledge of Weymouth's voyage and of the discoveries of the Virginia explorers. [Murphy's *Hudson*, pp. 47, 63, and Asher's *Hudson*, p. 148. The former is in many ways to be preferred.] It is not unlikely that this following up of the English explorations was in the minds of Hudson and his Dutch employers before he sailed from the Texel. In her westward course across the Atlantic, the *Half-Moon* encountered gale after gale. In one of these her foremast was injured, but on she kept under such sail as she could carry. Off Newfoundland, Hudson sighted some French fishing vessels, and stopped long enough for his men to catch 'one hundred and eighteen great coddes.' On the 17th of July, in the heat and fog of a Maine summer, he anchored in the vicinity of Penobscot Bay. While lying at his moorings the natives came to the ship in two 'French shallops.'

shore,—tradition says on Coney Island, but the landing might have been at almost any other point. Carefully exploring the Narrows, Hudson navigated the *Half-Moon* into the upper bay, and then into the mouth of the river which now bears his name. The water was salt, and the tide ebbed and flowed with great force. Here, at last, seemed to be the long-looked-for passage to the Pacific Ocean. For eleven days, therefore, the *Half-Moon* drifted and sailed northwardly. The wonderful scenery of the Hudson—the Palisades, the Donderberg, West Point, and the Catskills—impressed the explorers. Above the site of the modern Albany the water became too shoal for the ship, but a boat party proceeded eight or nine leagues farther on. [Brodhead, in his *New York* (i, 31), identifies localities.] While the *Half-Moon* was at anchor in one of the northern reaches, Hudson invited a party of Indians into the cabin and 'gave them much wine and aquavitæ, that they were all merrie. In the ende one of them was drunke.' As a requital for this hos-

LANDING OF THE PILGRIMS

Leaving the "Mayflower," at Provincetown, Massachusetts, Nov. 21, 1620

(From the painting by Daly)

pitality, the Indians the next day presented Hudson with tobacco, wampum, and venison. These natives were Iroquois of the Mohawk tribe. A traditional account of a scene of revelry at the first coming of the whites was preserved among them until the American Revolution; it is generally regarded as descriptive of the coming of Hudson and his crew, but it may possibly refer to earlier French explorers. Two things, however, seem to be reasonably certain. The first is that the Iroquois appreciated the attentions of the early Dutch navigators and fur traders, who supplied them with fire water and firearms. [See *New York Historical Society's Collections, New Series*, 1, 71, and Asher's *Hudson*, 173.] The other assured fact is that these Indians had had slight intercourse with white men, or they would not have been so friendly. The natives of the lower Hudson showed their familiarity with the whites by attacking the *Half-Moon* at every good opportunity. The future careers of the *Half-Moon* and her gallant captain were not fortunate; putting into Dartmouth, England, Henry Hudson was forbidden to remain longer in the service of the Dutch, and in April, 1610, he sailed from the Thames on his last voyage in quest of the Northwest Passage. Fourteen months later he was set adrift in a shallop in Hudson Bay by a panic-stricken mutinous crew, and no trace of him has since been found. As to the *Half-Moon*, she gained a Holland port early in 1611, and four years later was wrecked on the shore of the island of Mauritius."—E. Channing, *History of the United States*, v. 1, pp. 439-442.

1614-1615.—Voyages of Capt. John Smith to North Virginia.—Naming of the country New England.—"From the time of Capt Smith's departure from Virginia [see VIRGINIA: 1607-1610], till the year 1614, there is a chasm in his biography. . . . In 1614, probably by his advice and at his suggestion, an expedition was fitted out by some London merchants, in the expense of which he also shared, for the purposes of trade and discovery in New England, or, as it was then called North Virginia. . . . In March, 1614, he set sail from London with two ships, one commanded by himself, and the other by Captain Thomas Hunt. They arrived, April 30th, at the island of Manhegin, on the coast of Maine, where they built seven boats. The purposes for which they were sent were to capture whales and to search for mines of gold or copper, which were said to be there, and, if these failed, to make up a cargo of fish and furs. Of mines, they found no indications, and they found whale-fishing a 'costly conclusion;' for, although they saw many, and chased them too, they succeeded in taking none. They thus lost the best part of the fishing season; but, after giving up their gigantic game, they diligently employed the months of July and August in taking and curing codfish, an humble, but more certain prey. While the crew were thus employed, Captain Smith, with eight men in a small boat, surveyed and examined the whole coast,

from Penobscot to Cape Cod, trafficking with the Indians for furs, and twice fighting with them, and taking such observations of the prominent points as enabled him to construct a map of the country. He then sailed for England, where he arrived in August, within six months after his departure. He left Captain Hunt behind him, with orders to dispose of his cargo of fish in Spain. Unfortunately, Hunt was a sordid and unprincipled miscreant, who resolved to make his countrymen odious to the Indians, and thus prevent the establishment of a permanent colony, which would diminish the large gains he and a few others derived by monopolizing a lucrative traffic. For this purpose, having decoyed 24 of the natives on board his ship, he carried them off and sold them as slaves in the port of Malaga. . . . Captain Smith, upon his return, presented his map of the country between Penobscot and Cape Cod to Prince Charles (afterwards Charles I.), with a request that he would substitute others, instead of the 'barbarous names' which had been given to particular places. Smith himself gave to the country the name of New England, as he expressly states, and not Prince Charles, as is commonly supposed. . . . The first port into which Captain Smith put on his return to England was Plymouth. There he related his adventures to some of his friends, 'who,' he says, 'as I supposed, were interested in the dead patent of this unregarded country.' The Plymouth Company of adventurers to North Virginia, by flattering hopes and large promises, induced him to engage his services to them." Accordingly in March, 1615, he sailed from Plymouth, with two vessels under his command, bearing sixteen settlers, besides their crew. A storm dismasted Smith's ship and drove her back to Plymouth. "His consort, commanded by Thomas Dermer, meanwhile proceeded on her voyage, and returned with a profitable cargo in August; but the object, which was to effect a permanent settlement, was frustrated. Captain Smith's vessel was probably found to be so much shattered as to render it inexpedient to repair her; for we find that he set sail a second time from Plymouth on the 24th of June, in a small bark of 60 tons, manned by 30 men, and carrying with him the same 16 settlers he had taken before. But an evil destiny seemed to hang over this enterprise, and to make the voyage a succession of disasters and disappointments." It ended in Smith's capture by a piratical French fleet and his detention for some months, until he made a daring escape in a small boat. "While he had been detained on board the French pirate, in order, as he says, 'to keep my perplexed thoughts from too much meditation of my miserable estate,' he employed himself in writing a narrative of his two voyages to New England, and an account of the country. This was published in a quarto form in June, 1616. . . . Captain Smith's work on New England was the first to recommend that country as a place of settlement."—G. S. Hillard, *Life and adventures of Captain John Smith*, ch. 14-15.

1629.—Carolina grant to Sir Robert Heath.—“Sir Robert Heath, attorney-general to Charles I., obtained a grant of the lands between the 38th [36th?] degree of north latitude to the river St. Matheo. His charter bears date of October 5, 1629. . . . The tenure is declared to be as ample as any bishop of Durham [Palatine], in the kingdom of England, ever held and enjoyed, or ought or could of right have held and enjoyed. Sir Robert, his heirs and assigns, are constituted the true and absolute lords and proprietors, and the country is erected into a province by the name of Carolina [or Carolana], and the islands are to be called the Carolina islands. Sir Robert conveyed his right some time after to the earl of Arundel. This nobleman, it is said, planted several parts of his acquisition, but his attempt to colonize was checked by the war with Scotland, and afterwards the civil war. Lord Maltravers, who soon after, on his father's death, became earl of Arundel and Sussex . . . made no attempt to avail himself of the grant. . . . Sir Robert Heath's grant of land, to the southward of Virginia, perhaps the most extensive possession ever owned by an individual, remained for a long time almost absolutely waste and uncultivated. This vast extent of territory occupied all the country between the 30th and 36th degrees of northern latitude, which embraces the present states of North and South Carolina, Georgia, [Alabama], Tennessee, Mississippi, and, with very little exceptions, the whole state of Louisiana, and the territory of East and West Florida, a considerable part of the state of Missouri, the Mexican provinces of Texas, Chiuhaha, &c. The grantee had taken possession of the country, soon after he had obtained his title, which he afterwards had conveyed to the earl of Arundel Henry Lord Maltravers appears to have obtained some aid from the province of Virginia in 1639, at the desire of Charles I., for the settlement of Carolana, and the country had since become the property of a Dr. Cox; yet, at this time, there were two points only in which incipient English settlements could be discerned; the one on the northern shore of Albemarle Sound and the streams that flow into it. The population of it was very thin, and the greatest portion of it was on the north-east bank of Chowan river. The settlers had come from that part of Virginia now known as the County of Nansemond. . . . They had been joined by a number of Quakers and other sectaries, whom the spirit of intolerance had driven from New England, and some emigrants from Bermudas . . . The other settlement of the English was at the mouth of Cape Fear river; . . . those who composed it had come thither from New England in 1659. Their attention was confined to rearing cattle. It cannot now be ascertained whether the assignees of Carolana ever surrendered the charter under which it was held, nor whether it was considered as having become vacated or obsolete by non-user, or by any other means.”—F. X. Martin, *History of North Carolina*, v. 1, ch. 5 and 7.

1639-1700.—Buccaneers and their piratical warfare with Spain.—“The 17th century gave birth to a class of rovers wholly distinct from any of their predecessors in the annals of the world, differing as widely in their plans, organization and exploits as in the principles that governed their actions . . . After the native inhabitants of Haiti had been exterminated, and the Spaniards had sailed farther west, a few adventurous men from Normandy settled on the shores of the island, for the purpose of hunting the wild bulls and hogs which roamed at will through the forests. The small island of Tortugas was their market; thither they repaired with their salted and smoked meat, their hides, &c., and disposed of them in exchange for powder, lead, and other necessities. The places where these semi-wild hunters prepared the slaughtered carcases were called ‘boucans,’ and they themselves became known as Buccaneers. Probably the world has never before or since witnessed such an extraordinary association as theirs. Unburdened by women-folk or children, these men lived in couples, reciprocally rendering each other services, and having entire community of property—a condition termed by them *matelotage*, from the word ‘*matelot*,’ by which they addressed one another. . . . A man on joining the fraternity completely merged his identity. Each member received a nickname, and no attempt was ever made to inquire into his antecedents. When one of their number married, he ceased to be a buccaneer, having forfeited his membership by so civilized a proceeding. He might continue to dwell on the coast, and to hunt cattle, but he was no longer a ‘*matelot*’—as a Benedick he had degenerated to a ‘*colonist*’ . . . Uncouth and lawless though the buccaneers were, the sinister signification now attaching to their name would never have been merited had it not been for the unreasoning jealousy of the Spaniards. The hunters were actually a source of profit to that nation, yet from an insane antipathy to strangers the dominant race resolved on exterminating the settlers. Attacked whilst dispersed in pursuance of their avocations, the latter fell easy victims; many of them were wantonly massacred, others dragged into slavery. . . . Breathing hatred and vengeance, ‘the brethren of the coast’ united their scattered forces, and a war of horrible reprisals commenced. Fresh troops arrived from Spain, whilst the ranks of the buccaneers were filled by adventurers of all nations, allured by love of plunder, and fired with indignation at the cruelties of the aggressors. . . . The Spaniards, utterly failing to oust their opponents, hit upon a new expedient, so short-sighted that it reflects but little credit on their statesman-

Maps prepared specially for the NEW LARNED under direction of the editors and publishers.

ship. This was the extermination of the horned cattle, by which the buccaneers derived their means of subsistence; a general slaughter took place, and the breed was almost extirpated. . . . The puffed up arrogance of the Spaniard was curbed by no prudential consideration; calling upon every saint in his calendar, and raining curses on the heretical buccaneers, he deprived them of their legitimate occupation, and created wilfully a set of desperate enemies, who harassed the colonial trade of an empire already betraying signs of feebleness with the pertinacity of wolves, and who only desisted when her commerce had been reduced to insignificance. . . . Devoured by an undying hatred of their assailants, the buccaneers developed into a new association—the freebooters.”—C. H. Eden, *West Indies*, ch. 3.—“The monarchs both of England and France, but especially the former, connived at and even encouraged the freebooters [a name which the pronunciation of French sailors transformed into ‘filibustiers,’ while that corruption became Anglicized in its turn and produced the word filibusters], whose services could be obtained in time of war, and whose actions could be disavowed in time of peace. Thus buccaneer, filibuster, and sea-rover, were for the most part at leisure to hunt wild cattle, and to pillage and massacre the Spaniards wherever they found an opportunity. When not on some marauding expedition, they followed the chase.” The piratical buccaneers were first organized under a leader in 1630, the islet of Tortuga being their favorite rendezvous. “So rapid was the growth of their settlements that in 1641 we find governors appointed, and at San Christobal a governor-general named De Poincey, in charge of the French filibusters in the Indies. During that year Tortuga was garrisoned by French troops, and the English were driven out, both from that islet and from Santo Domingo, securing harborage elsewhere in the islands. Nevertheless corsairs of both nations often made common cause. . . . In [1654] Tortuga was again recaptured by the Spaniards, but in 1660 fell once more into the hands of the French; and in their conquest of Jamaica in 1655 the British troops were reinforced by a large party of buccaneers.” The first of the more famous buccaneers (and apparently the most ferocious among them all, was a Frenchman called François L’Olonnois, who between 1600-1665 harried the coast of Central America with six ships and 700 men. At the same time another buccaneer named Mansvelt, was rising in fame, and with him, as second in command, a Welshman, Henry Morgan, who became the most notorious of all. In 1668, Morgan attacked and captured the strong town of Portobello, on the Isthmus, committing indescribable atrocities. In 1671 he crossed the Isthmus, defeated the Spaniards in battle and gained possession of the great and wealthy city of Panama—the largest and richest in the New World, containing at the time 30,000 inhabitants. The city was pillaged, fired and totally destroyed. The exploits of this ruffian and the stolen riches which he carried home to England soon afterward gained the honors of knighthood for him, from the worthy hands of Charles II. In 1680, the buccaneers under one Coxon again crossed the Isthmus, seized Panama, which had been considerably rebuilt, and captured there a Spanish fleet of four ships, in which they launched themselves upon the Pacific. From that time their plundering operations were chiefly directed against the Pacific coast. Towards the close of the seventeenth century, the war between England and France, and the Bourbon alliance of Spain with France, brought about the discouragement,

the decline and finally the extinction of the buccaneer organization.—H. H. Bancroft, *History of the Pacific states: Central America*, v. 2, ch. 26-30.—See also JAMAICA: 1655; 1655-1706.

1720-1744.—Relations of England with Spanish America.—“The imperial policy, the English Government’s plans and their execution are by no means of the same importance in the English colonies on the mainland, because these were self-sufficient and independent enough to work out their own development, and could easily confront imperial regulations by a passive resistance or by a

practical evasion. This method was more difficult in the West Indies; the islands had actually to be fed with Irish salt beef, Old English herrings, and New English corn. They were continually subject to inspection by the British fleet, by British military officers, and by governors who were not in general liable to the same pressure from their assemblies as were those on the continent. Speaking broadly, the continental colonies developed along their own lines, hampered but not checked permanently by restrictive commercial and political regulations. The West Indies grew up under the imperial shadow, and felt the influence of Burke's 'winged messengers of vengeance who carried (England's) bolts in their pounces to the remotest verge of the sea.' During our period the West Indies were important to England on every ground, popular, parliamentary, strategic, and commercial. It was in the West Indies that Drake and Hawkins had reaped a golden harvest, and the popular imagination still regarded the isles as the outposts from which assaults could be made on the treasure houses of the Incas. Pious Protestant adventurers could be trusted to destroy the popish inquisition at the same time that they deprived Spain of the gold of Eldorado. To the outbursts of the mob and of popular feeling neither of England's two real rulers in this period were ever indifferent. To parliamentary pressure Walpole and Newcastle were even more susceptible, and there were in the House of Commons not only members of the South Sea Company, but also West Indian landlords. The West Indian archipelago, unlike the American continent, was in large part settled and exploited by men who lived in England, and who employed agents or factors to manage their West Indian estates. Such men often found it convenient or commercially profitable to obtain seats in the Commons, and the young Gladstone was perhaps the last man who represented the West Indian slavery interest in that body. It was as literally true to say that the West Indies were represented in British Parliament as it was absurd to assert that the American colonies were. Commercial considerations were the most important of all; in the early eighteenth century England judged colonies by the value of their trade even more than by their provision of materials—raw and human—for the British Navy. From the trade test the West Indies emerged triumphantly. The English exports to the West Indies differed so amazingly from the imports that even contemporaries ceased to trust entirely to the balance of trade as a measure of value. By the import test the West Indian trade was about equal during this period to that from the northern colonies, and it brought more direct gains to English pockets. Unlike the continental colonies the West Indies could not rival English manufactures, for coffee, cocoa, indigo, cotton, fruits, and sugar were all tropical products. The West Indies were also the center and clearing house of that traffic in negroes, which was so dear to the hearts and pockets of the merchants of Liverpool, Bristol, and London. But more important than all this, they were the subterranean channel which might convey to England the whole measureless volume of Spanish trade, the silks and tea of the East, carried from Acapulco to Mexico and thence to Vera Cruz, the Peruvian gold piled high on the quays of Porto Bello, the galleons laden with jewels and plate which sailed from Cartagena and Havana. By the Asiento treaty England, and England alone of European powers, had the opportunity of tapping these boundless resources. This treaty gave England the sole contract for supplying negroes

to Spanish America and also permission to unlade in Spanish America the cargo of one large ship filled with English goods. Both these privileges could be used to open up the Spanish trade. The limited right of entry for English goods might well become an unlimited one under an easy-going Spanish governor. Even when he refused to wink at an illicit commerce, he was often quite unable to police the coast and suppress the smugglers. An enormous illicit trade with the Spanish islands and the mainland was thus promoted or permitted by the interest, the impotence, or the supineness of the Spanish governors themselves. Other countries were not so fortunate in their attempts to smuggle goods into Spanish America. Newcastle admitted to Keene (England's ambassador to Spain) that the 'Dutch trade in the West Indies in general is much more confined than ours, and that which they carry on to the Spanish colonies is altogether an illicit one.' As their trade was altogether illicit the poor Dutch could not complain of confiscated goods, but by the Asiento it was hard to draw the line between the avowed English trade and the smuggling. Keene and Villarias (the Spanish foreign minister) both declared that the French Government had almost entirely stopped French illicit practices in the West Indies. Even if we do not altogether accept this statement it seems safe to assume that the English illicit trade with Spanish America was far larger than the French or the Dutch. It is at least worthy of note that in 1762 the French trade to Spanish America was reckoned at £1,250,000 and the English at £1,090,000. This was 23 years after 1739, the year in which England's privileged monopoly practically ceased, and we must assume, therefore, that in the interval the destruction of English privilege enabled France to equalize matters. In January, 1738, Horatio Walpole, not the most delightful of historical gossips but his uncle, the most learned and informed of contemporary English diplomatists, wrote a famous secret memoir for the British Government. In it he reviewed the whole subject of the English relations with Spanish America, and his arguments formed the basis of all the diplomacy which led up to the war of 1739. He begins by surveying the treaties between Spain and England and admits that a beneficial construction of treaties had given a large amount of illicit trade to England until the end of the seventeenth century, 'which without doubt was by connivance and indulgence on the part of Spain, by treating us in a more favorable manner than any other country whatsoever.' Spain even extended their indulgence, with respect to navigation and trade, farther than we could pretend to claim by treaty.' When Spain ceased to be England's ally, beneficial constructions ceased also. But in 1713 came the peace of Utrecht (q.v.) and the Asiento, which increased the possibility of smuggling. From 1717 to 1719 and from 1726 to 1727 there was actual war between the two countries. From 1734 to 1737 there was, however, again greater freedom of intercourse, but from 1737 onward a greater Spanish severity than at any previous period in the eighteenth century. Walpole's general conclusion as to England issuing letters of reprisal on Spain in case of war is interesting. He avows that this is not a good plan, because the Spaniards have nothing worth taking even in the galleons; 'two-thirds or one-half at least of all these rich loadings belonged to the French.' Reprisal may, therefore, embroil against us those nations 'that have a chief property in the galleons.' On the other hand, England's rich and valuable West Indian

trade will be at the mercy of all pirates and interlopers, as well as privateers in case of reprisal. Accordingly he does not recommend action against Spain, but the conclusion of an agreement by which both nations should arrange to restrain by legislation illicit intercourse between their subjects in the West Indies. Hardwicke or Newcastle wrote a note on the margin of the memoir as follows: 'The trade to the Spanish West Indies, although illicit by treaties between sovereign and sovereign, is so very lucrative that the Parliament will never pass such a law, and the English merchant will run the hazard of carrying it on in spite of treaty.' This aristocratic Government was singularly deferential to the trader. Newcastle complains how he had to endure threats from deputations of merchants 'who used in times past to come cap in hand . . . now and the second word is . . . you shall hear of it in another place' (meaning the Commons), and the duke also approved of 'yielding to the times' (meaning not the newspaper but the London mob). It was quite clear that neither Newcastle nor Walpole could oppose the Commons or the capital too far, and in fact the main cause of the war of 1739 appears to have been an outcry of Parliament and people, stimulated by commercial influence. If we survey the facts, we shall, I believe, find that during 1738-39, the question of Spanish-American trade dominated and subordinated to itself the whole domestic and colonial policy of England. There was in 1739 a popular clamor about Jenkins and his ear [see ENGLAND 1739-1741], about outrages on Englishmen by Spanish governors, and about the torturing of Protestants by Jesuits. There was also a very strong commercial pressure on the Government to preserve the whole of the existing illicit trade with Spain and Spanish America. None the less it remains a striking fact that, at one point in the negotiations to preserve peace in 1738-39, Walpole and Newcastle were willing to suppress a large part of that illicit trade with Spain. They actually prepared and drafted articles for a treaty which would have suppressed the illicit trade of private adventurers to the Spanish Indies and mainland. They were not, however, prepared to suppress the illicit trade conducted by the South Sea Co. under the shadow of the Asiento. They were willing enough to put pressure on private adventurers and smugglers because these undercut the profits of the South Sea Co., but they absolutely refused to put any pressure on the company to force it to trade fairly. The reason I believe to be rather an interesting one. The English Government was financially and officially committed to the support of the South Sea Co., which was an English venture and which had an important parliamentary interest. Private individuals who smuggled on the Spanish Main were some of them perhaps English, more were West Indians, the majority were from the continental colonies, especially from New England. The continental colonies possessed very little interest in Parliament, the West Indian smugglers had less than the South Sea Co. Hence, if there was to be a suppression of illicit trade that of private individuals must suffer. In a sense this action was a sacrifice of colonial interests to purely English ones. In a way it is a more serious instance of such sacrifice than Walpole's sugar act of 1733. He never attempted to enforce the prohibitions of that act, but he did seriously contemplate this other suppression of illicit trade. Thus we see as far back as 1739, a growing difference of treatment and a possible cause of irritation arising between motherland and her continental colonies. When the wars

were over, the separation of commercial interests between the two was soon to be revealed, and to set one fighting against the other. But as yet the difference was hidden in ministerial portfolios. When war broke out in 1739 the New Englanders fitted out ships and spent money to aid the Old Englanders against the Spaniards, and side by side they shared the triumphs and treasure of Porto Bello and disease and defeat beneath the fever-haunted walls of Cartagena."—H. AMERICAN ACADEMY IN ROME, an institution for the cultivation of American talent in the field of art, founded in 1865 by a group of men among whom were Charles F. McKim, Augustus Saint-Gaudens, Francis D. Millet, J. Pierpont Morgan, and William K. Vanderbilt. "The Academy offers fellowships to men and women who have already had a preliminary education in the arts and have given evidence of being potential creators of art of the highest order. It holds out to the gifted youth throughout the Union exactly the same privileges which the French Academy offers to the geniuses of France. Fellows, or prize-holders, are given an opportunity of living in an artistic environment and meeting with great minds in their own and allied arts and letters. That the American Academy fills a long-felt want, and that the plan upon which it was founded is ideal, is attested by the fact that during the past quarter of a century it has produced, in the fine arts, such men as John Russell Pope, Harry Allen Jacobs, Paulanship, Herman A. MacNeil, George Breck and Eugene Savage. From its classical studies fellowships, it has furnished our universities and schools with nearly one hundred and fifty professors trained in the humanistic as opposed to the pedantic spirit."—G. René du Bois, *American Art (Arts and Decoration, Mar. 25, 1020.)*

AMERICAN AMBULANCE.—"During the first eight months of the World War the American Ambulance continually hoped to extend its work to an Ambulance Service definitely connected with the armies in the field, but not until April, 1915, were these hopes definitely realized. The history, however, of these first eight months is important; its mistakes showed the way to success; its expectations brought gifts of cars, induced volunteers to come from America, and laid the basis upon which the present service is founded. A gift of ten ambulances, whose bodies were made out of packing-boxes, enabled the American Ambulance, at the very outset of the war, to take part in the transportation service, and as more and more donations were made, small squads were formed in an attempt to enlarge the work. . . . In April, 1915, . . . the French authorities made a place for American Ambulance Sections at the front on trial. A squad of ten ambulances was sent to Vosges, and this group attracted the attention of their commanding officers, who asked that it be increased by ten cars so as to form it into an independent Sanitary Section. As soon as this was done, the unit took its place in conjunction with a French Section in an important Sector on the front in Alsace. With this initial success a new order of things began, and in the same month a second Section of twenty cars was formed and was stationed, again in conjunction with an existing French service, in the much-bombarded town of Pont-à-Mousson. In the meantime, two squads of five cars each had been working at Dunkirk. These were now reinforced by ten more and the whole Section was then moved to the French front in Belgium, with the result that at the end of the month of April, 1915, the Field Service of the American Ambulance had really come into existence. It comprised three Sections of twenty ambulances, a staff car, and a supply car. . . . The story of the next year is one of real achievement, in which the three Sections emerged from the test with a record of having fulfilled the highest expectations of proving their utility to France. . . . The ambulances were manned chiefly by American college men who agreed to serve not less than six months, and who brought to the work youth and intelligence, initiative and courage. . . . In November, 1915, at the request of General Headquarters, a fourth Section, made possible through the continued aid of generous friends in America, took its place in the field. . . . In February, 1916, Section 2 was summoned to the vicinity of Verdun at the moment of the great battle, and in March definite arrangements for a fifth Section was completed."—H. S. Harrison and S. Galatti, *Friends of France, pp. 1-4.*—By the end of the war, 47 companies had been organized with a personnel of 4,760 men. After bringing the men together and instructing them in first-aid, the Red Cross turned them over to the Army Medical Department and they were at once mustered into service. All of them were motor companies. Until 1916 the Army had made no provision for such motorized companies, and animal-drawn vehicles were used in all cases.

AMERICAN ASSOCIATION FOR LABOR LEGISLATION, an organization affiliated with the International Association for Labor Legisla-

tion; founded 1906; interests itself chiefly in labor problems and endeavors to influence legislation for the betterment of labor conditions throughout the country; has been a great influence in the enactment of federal and state workmen's compensation and insurance laws. The association publishes a quarterly, *American Labor Legislation Review*.—See also LABOR LEGISLATION: 1906-1921.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, the most important American scientific society; was organized in Boston in 1847. It was an outgrowth of the Association of American Geologists and Naturalists. The society is organized in sections, each of which holds its own convention at the time of the annual meeting of the association. These sections include: A, mathematics and astronomy; B, physics; C, chemistry; D, mechanical science and engineering; E, geology and geography; F, zoölogy; G, botany; H, anthropology and psychology; I, social and economic science; K, physiology and experimental medicine; L, education. Since 1901 the journal *Science* has been the semi-official organ of the association.

AMERICAN CIVIC ASSOCIATION.—"Organized effort for the systematic making of a beautiful America did not manifest itself until within comparatively recent years. Prior to 1904 there had been various short-lived state associations, a few interstate societies and two national organizations, working with the same general objects in view. But at St. Louis, in 1904, the year of the great exposition, a merger of the two national organizations brought forth the American Civic Association which, since that time, has carried on with increasing success and popular support the greatly needed work for a 'More Beautiful America'; and since that time it has been recognized as the one great national agency for the furtherance of that work. With its purpose as stated in its constitution clearly before it, it has constantly widened the circle of its usefulness until recently they were grouped under fifteen general departments, each department headed by an expert in his or her particular specialty. In classifying its varied activities, the Association announces that it aims 'to make American living conditions clean, healthful, attractive; to extend the making of public parks; to promote the opening of gardens and playgrounds for children and recreation centers for adults; to abate public nuisances—including objectionable signs, unnecessary poles and wires, unpleasant and wasteful smoking factory chimneys; to make the buildings and the surroundings of railway stations and factories attractive; to extend the practical influence of schools; to protect existing trees and to encourage intelligent tree planting; to preserve great scenic wonders (such as Niagara Falls and the White Mountains) from commercial spoliation. So vigorously has it pursued these activities that it has seen some of them develop to such proportions that they were ready to swing off from the parent circle into spheres of their own. Such was the case with the playground movement, which for years was fostered most energetically by the American Civic Association until it grew into an independent organization known as the National Playground Association, and which is now an agency of splendid achievements in its one specialized function."—B. Watrous, *American Civic Association*

(*American City, October, 1909*).—During 1913 a group of the association's members visited various European countries to study the civic progress there and to see what methods of efficient administration might be adapted to American needs. From Oct. 13-15, 1920 the American Civic Association held its sixteenth annual convention at Amherst.—See also CIVIC BEAUTY; CITY PLANNING; BILLBOARDS: Efforts of women.

AMERICAN COMMISSION FOR RELIEF IN BELGIUM. See BELGIUM: 1914.

AMERICAN COMMISSION IN SYRIA. See INTERNATIONAL RELIEF: Near East.

AMERICAN COMMISSION TO NEGOTIATE PEACE.—"The Paris Conference was opened in January [1919]. . . . The President of the United States, Dr. Woodrow Wilson, had arrived in Europe in the previous month; and the American representatives being present in Paris, no time was lost in making arrangements for the Conference. Dr. Wilson was accompanied by Mr. Robert Lansing (Secretary of State), and by Colonel E. M. House, Mr. Henry White, and General T. H. Bliss. The last-named delegate had previously been the American representative on the Supreme War Council at Versailles, and hence he was, of course, well-known in Paris."—*Annual Register for 1919*, p. 150.—The Commission was accompanied by a band of expert advisers. "As to personnel, the problem proved to be less difficult than at first it threatened to be. . . . Work of such detail could not be expected of statesmen and diplomats, nor would they have been competent for it. The need was for men expert in research. Consequently the staff was in the main recruited from strong universities and colleges but also from among former officials, lawyers, and business men. The studies that were made during the winter, spring and autumn of 1918 in the geography, history, economic resources, political organization and affiliations, and ethnic and cultural characteristics of the peoples and territories in Europe, Africa, Asia, and the islands of the Pacific, served as tests for the selection and elimination of workers; the men making these studies and reporting thereon were under constant observation, and as a result the best fitted among them emerged and were put in charge of various subdivisions of the work and assigned groups of assistants. As a consequence, by the fall of 1918 The Inquiry was thus organized:

"*Director*, Dr. S. E. Mezes, College of the City of New York.

"*Chief Territorial Specialist*, Dr. Isaiah Bowman, American Geographical Society. (Dr. Bowman was named executive officer in the summer of 1918, after Mr. Walter Lippmann resigned as secretary to undertake intelligence work for the army in France.)

"*Regional Specialists*:

For the northwestern frontiers—Dr. Charles H. Haskins, Harvard University.

For Poland and Russia—Dr. R. H. Lord, Harvard University.

For Austria-Hungary—Dr. Charles Seymour, Yale University.

For Italian boundaries—Dr. W. E. Lunt, Haverford College.

For the Balkans—Dr. Clive Day, Yale University.

For Western Asia—Dr. W. L. Westermann, University of Wisconsin.

For the Far East—Capt. S. K. Hornbeck, U. S. A.

For Colonial Problems—Mr. George L. Beer, formerly of Columbia University.

"*Economic Specialist*, Dr. A. A. Young, Cornell University

"*Librarian and Specialist in History*, Dr. James T. Shotwell, Columbia University.

"*Specialist in Boundary Geography*, Maj. Douglas Johnson, Columbia University.

"*Chief Cartographer*, Prof. Mark Jefferson, State Normal College, Ypsilanti, Michigan.

"Besides The Inquiry proper, and affiliated with

they would have on the spirits of the allied peoples, and the first division under Pershing was dispatched. At the same time steps were taken to raise a great army."—J. S. Bassett, *Our war with Germany*, pp. 189-190.—General Pershing reached Paris on June 13, 1917, and the first contingent of American troops arrived at the port of St. Nazaire, France, on June 25, 1917. "The first American artillery in France undertook a schedule of studies in an old French artillery post located near the Swiss frontier. This place is called Valdahon, and for scores of years had been one of the training places for French artillery. But during the third and fourth years of the war, nearly all of the French artillery being on the front, all subsequent drafts of French artillery received their training under actual war conditions. . . . It was after midnight that our men reached the front line. It was the morning of October 23, 1917, that American infantrymen and Bavarian regiments of *Landwehr* and *Landsturm* faced one another for the first time in front line position on the European front. . . . The first shot was fired at 6:5:10 [5 minutes and 10 seconds after 6 o'clock] A. M., October 23, 1917. The missile fired was a 75-mil-

MOVEMENT OF AMERICAN EXPEDITIONARY FORCES TO EUROPE

although distinct from it, were the experts in international law, Mr. David Hunter Miller and Major James Brown Scott. This body of men proceeded to Paris at the opening of December, 1918, except Mr. Miller, who had gone in October. In Paris they assisted the commissioners plenipotentiary with data and recommendations, and themselves served on commissions dealing with three types of problems: First, territorial; second, economic questions and reparation; third, international law and the League of Nations. . . . As it turned out, the staff of The Inquiry were concerned in Paris, as members of commissions, with delicate questions of policy, and it may be noted that the decisions which they had a part in negotiating were only in the rarest instances modified by the supreme council."—E. M. House and C. Seymour, *What really happened in Paris*, pp. 6-8.

AMERICAN EMBARGO CONFERENCE. See U. S. A.: 1014-1017.

AMERICAN EXPEDITIONARY FORCES.—"Interviews with members of the French and British missions that arrived in Washington in April [1917] convinced the president that we ought to send troops [to Europe] for the effect

limetre or 3-inch high-explosive shell. The target was a German battery of 150-millimetre or 6-inch guns located two kilometres back of the German first line trenches, and one kilometre in back of the boundary line between France and German-Lorraine. The position of that enemy battery on the map was in a field 100 metres west of the town which the French still call Xaurey, but which the Germans have called Scheuris since they took it from France in 1870. Near that spot . . . fell the first American shell fired in the Great War. . . . The first executive work of the American Expeditionary Forces overseas was performed in a second floor suite of the Crillon Hotel in the Place de la Concorde in Paris. This suite was the first temporary headquarters of the American commander."—F. Gibbons, *And they thought we wouldn't fight*, p. 96.—"The American Expeditionary Force . . . was composed of forty-two divisions, twenty-nine of which were combat units. In the last week of October, 1918, when these twenty-nine were in action, they held 101 miles of front, or twenty-three per cent. of the Allied line. They advanced in battle 485 miles, and captured 63,079 prisoners and 1,378 guns. The part taken by the American Expeditionary Force in the fighting on the Western Front [may be

summarized as follows:] . . . The First Division captured Cantigny, in the Amiens sector, on May 28th. The Second Division, with elements of the Third and Twenty-eighth, helped to stop the German advance in the neighbourhood of Château-Thierry. The Second Division (June 5th-11th) took Bouresches, Torcy, and Belleau Wood—a brilliant operation. Eighty-five thousand American troops cooperated in the repulse of Ludendorff's Fifth Offensive—the Forty-second Division fighting with Gouraud, in Champagne, east of Rheims, and the Third and Twenty-eighth fighting with de Mitry south of the Marne. Eight divisions—the First, Second, Third, Fourth, Twenty-sixth, Twenty-eighth, Thirty-second, and Forty-second were employed in Foch's attack against the Aisne-Marne salient, beginning July 18th. Elements of the Thirty-third Division took part in Haig's offensive against the Montdidier salient, beginning August 8th. They helped the Australians to storm Chipilly Ridge, on the north side of the Somme. The Twenty-seventh and Thirtieth divisions were used in conjunction with the Australians to break the Hindenburg Line about Le Catelet and in the subsequent advance toward Maubeuge. The Twenty-eighth, Thirty-second, and Seventy-seventh divisions participated in the first stages of General Mangin's Oise-Aisne offensive, beginning August 18th. The Twenty-seventh and Thirtieth divisions, before storming the Hindenburg Line, had helped to recapture Mount Kemmel. On October 31st two other American divisions—the Thirty-seventh and Ninety-first—were sent to Flanders from the Meuse. They took part in the last stages of the Ypres-Lys offensive, reaching the line of the Scheldt."—W. L. McPherson, *Short history of the great war*, pp. 385-386.—With the termination of hostilities (November 11, 1918), the American Expeditionary Forces took over the administration of the city of Coblenz. Out of a total mobilization of 4,272,521 fighting men, of which more than half comprised the A. E. F., the greater part of the remaining force awaiting orders to join the A. E. F., the total casualties were 274,659. This figure included the 67,813 dead, the 192,483 wounded and the 14,363 prisoners or missing.—See also TRENCH WARFARE: Defensive weapons; WORLD WAR: 1917: VIII. United States and the war: j.

AMERICAN FABIUS, a sobriquet bestowed upon George Washington for his tactics against the British forces. Like the old Roman Dictator, Fabius Cunctator (Delayer), he harassed the enemy, but avoided open battle. This policy was unpopular and nearly led to Washington's removal.—See also U. S. A.: 1783 (November-December).

AMERICAN FEDERATION OF LABOR: 1881-1886.—Organization.—Early relations with Knights of Labor.—"A call was issued conjointly by the 'Knights of Industry' and a society known as the 'Amalgamated Labor Union'—an offshoot of the Knights of Labor, composed of disaffected members of that order—for a convention to meet in Terre Haute, Ind., on August 2, 1881. . . . The Terre Haute convention had for its object the establishment of a new secret order to supplant the Knights of Labor, although on the face of the call, its object was stated to be to establish a national labor congress. There was a large representation of delegates present from St. Louis, Cleveland, Chicago, and other western cities, but the only eastern city represented was Pittsburgh. The trade union delegates represented the largest

constituency, but were less in number themselves than the delegates of the other societies. But, by the exercise of tact and diplomacy, the trades union men, who were at that time also members of the Knights of Labor, successfully opposed the project of adding another new organization to the list of societies already in existence, and, for the time being, the friends of the proposed secret organization were defeated. A call was published, however, for subsequent convention, to be held in Pittsburgh on November 15, 1881, and this gathering proved to be the most important of its kind that had thus far been held. . . . There were 107 delegates present at the Pittsburgh convention, representing 262,000 workingmen. A permanent organization was formed and named the Federation of Organized Trades and Labor Unions of the United States and Canada. A legislative committee, now known as the Executive Council, was appointed. . . . Knights of Labor assemblies and trades unions were equally represented, and it was thoroughly understood that the trade unionists should preserve their form of organization and the Knights of Labor should maintain theirs, and that the two should work hand in hand for the thorough amalgamation of the working people under one of these two heads. . . . [The convention of 1883] favored arbitration instead of strikes. The eight-hour rule was insisted upon and laws were demanded to limit the dividends of corporations and to introduce governmental telegraph systems. . . . The 1885 convention in Washington was principally directed to strengthening the national organization and preparing for the eight-hour movement. . . . The 1886 convention was originally called to meet in St. Louis in the latter part of the year, but the stirring events incident to the eight-hour strikes and the difficulties existing with the Knights of Labor led to the memorable conference of the officers of the trades unions on May 18, when defensive measures were outlined to protect the trades unions and to secure harmony with the Knights of Labor. A committee attended the special session of the Knights' General Assembly, at Cleveland, on May 26, and, after several days' waiting, marked by long and animated discussions . . . no definite assurances were obtained, and no action was taken. The trades union committee a second time met the Knights of Labor Executive Board on September 26, and secured promises that definite action would be taken at the Richmond General Assembly, which would lead to harmony between the two organizations. The trade unions objected to the admission to the Knights of Labor of members who had been suspended, expelled, or rejected for cause by their own organization; they opposed the formation of Knights of Labor assemblies in trades already thoroughly organized into trades unions, and complained of the use of Knights of Labor trade-marks or labels, in competition with their own labels, notably so in the case of the Cigar Makers' International Union. At the Richmond General Assembly, the trade union chiefs presented a mass of grievances, showing where their local unions had been tampered with by Knights of Labor organizations, where movements had been made to disrupt them, and where, in cases where such disruption could not be effected, antagonistic organizations were formed by the Knights. The General Assembly, however, instead of removing these alleged evils or giving satisfactory redress to the trade union element, administered to the Federation a slap in the face, as the latter understood it, by passing a resolution compelling the members of Cigar Makers' International Union connected with the Knights of Labor

to withdraw from the order. The call for the St. Louis convention of the Federation was then abrogated, and a circular was issued designating Columbus, Ohio, as the place of meeting on December 8. At the same time all organizations not already affiliated with the Federation, were urged to attend a trade union convention to be held in the same place on the following day. After four days' joint sessions of the bodies, the old Federation of trade and labor unions was dissolved, and the American Federation of Labor . . . was born. . . . Twenty-five national organizations were blended in it, with an aggregate membership of 376,469 workmen. A plan of permanent organization was adopted . . . and an executive council of five members and chief officers were elected. Resolutions were passed favoring the early adoption of the eight-hour rule, demanding of Congress the passage of a compulsory indenture law, and condemning the Pinkertons' Protective Patrol, and the Coal and Iron Police. After much deliberation, a constitution was agreed upon, in which the main objects of the great organization were stated to be 'the encouragement of formation of local unions, and the closer federation of such societies, through central trade and labor unions in every city, with the further combination of these bodies into state, territorial, and provincial organizations, to secure legislation in the interests of the working masses; the establishment of national and international trade unions, based upon a strict recognition of the autonomy of each trade, and the promotion and advancement of such bodies; and the aiding and encouragement of the labor press of America.'—*American Federation of Labor, History, encyclopedia, reference book, pp. 40-45.*—See also LABOR ORGANIZATION: 1825-1875; LABOR STRIKES AND BOYCOTTS: 1880-1900.

1881-1916.—Use of boycotts. See LABOR STRIKES AND BOYCOTTS: 1881-1916.

1884-1917.—Federation's eight-hour agitation.—While the federation's activities have covered a wide range of subjects, its agitation for an eight-hour day may be taken as typical. "The preliminary steps for a universal demand for eight hours were taken in the 1884 convention, and May 1, 1886, was selected as the date for its inauguration. Each local union was asked to vote on the question, those favoring it to be bound by the strike order, and those voting in opposition to pledge themselves to sustain the other pioneers in the movement. Arrangements were made for conferences with employers who were willing to talk over the change in hours. Among the trades that voted to make the campaign were the Cigarmakers, Furniture Workers, German Printers and Carpenters. The Cigarmakers and German Printers succeeded and the Furniture Workers compromised on nine hours. The Carpenters established eight hours in seven cities and compromised on nine in eighty-four. . . . May 1, 1890, was selected for another general strike for the eight-hour day. A remarkable campaign followed which spread to Europe . . . The Carpenters were selected to make the struggle. It was successful in 137 cities, benefiting 47,197 workmen. . . . In 1900 the agitation for the eight-hour day was still going on. It was then decided to secure the shorter work-day for at least one trade each year. . . . In 1905 the International Typographical Union began a general strike for eight hours, and it was successful. . . . [At] this time [1905] twenty-six trades were enjoying the eight-hour day in whole or part. . . . While maintaining that the eight-hour day for workers in private employment should be secured through trade union activity, the A. F. of L. per-

sistently demanded the shorter work-day for government employes. Such a law was enacted in 1886 [1868?], but never enforced. After the A. F. of L. was organized, it began an agitation for the enforcement of the act. This met with more or less success, but was wholly dependent on the viewpoint of the federal official having the power to order it obeyed. In 1892 Congress enacted an eight-hour law which went further than the 1868 act. The new measure extended the shorter work-day to employes of contractors for government work. But the same opposition was met to its being enforced. It also was soon found that this law did not cover all the workers for which it was intended, as federal officials decided it did not apply to subcontractors. Then another campaign was begun to extend the law. Finally, in 1912 an act was secured that covered contractors and subcontractors. . . . When war came in 1917 the principle of the maximum work-day had been indorsed by society and the United States Government. Owing to the emergencies created by the War, it was found that it would be impossible for the United States to supply our soldiers with munitions by working only eight hours. Congress then empowered the President to suspend the law when necessary, but provided that all overtime should be paid for at the rate of time and a half. This maintained the eight-hour principle while meeting an emergency."—*Ibid., pp. 10-12.*

1917-1919.—Federation of Labor and the World War.—American Alliance for Labor and Democracy.—War labor boards.—Support of striking miners.—"Not only through their local, state, national and international unions and their federated organization—the American Federation of Labor—did the organized workers of the United States support the government but they called into existence [in the summer of 1917] a separate organization in order to make their influence even more widely felt, particularly among the unorganized workers. This new organization was the American Alliance for Labor and Democracy. . . . The week of Lincoln's Birthday [1918] was observed as Loyalty Week by organized labor in order 'the more thoroughly and effectively to demonstrate our solidarity and our unity in behalf of our Republic.' All local branches of the Alliance, in cooperation with the local bodies of organized labor, held mass meetings and demonstrations and distributed patriotic literature among their fellow workers and citizens setting forth America's aims and ideals with the view of combating the insidious forces of pro-German and anti-American propaganda"—F. J. Warne, *Workers at war, pp. 38-40.*—"The importance of labor as one of the dominant factors in the prosecution of the war was recognized by the selection of Samuel Gompers, President of the American Federation of Labor, as one of the six members of the Advisory Commission of the Council [of National Defense]. In the apportionment of work among the members of the Commission the field of labor naturally fell to him. . . . As the war progressed, one agency after another had to be created by the Government for the handling of labor matters, and

as they got into working order, the work of the Committee on Labor of the Council of National Defense became, relatively at least, less important. At the outset, however, the whole work of determining fundamental policies and of taking action to secure their adoption fell upon this body. The Committee was formally constituted on February 13, 1917. The first step taken by Mr. Gompers was to secure a general agreement on the part of organized labor as to the attitude it would take towards the war and the problems engendered by it. In his capacity as President of the American Federation of Labor he first called a preliminary conference of representatives of organized labor on February 28, and a meeting of the Executive Committee of the Federation on March 9. This was followed by a general conference in Washington on March 9, 1917, of the executive officers of all the leading labor organizations of the United States. At this meeting, which was a very important gathering attended by more than 150 persons, there was adopted a formal declaration of principles setting forth the attitude of union labor towards the war. In this declaration organized labor pledged its unqualified support of the war and made known its demands. Among them were the demands that Government should take energetic steps to curb profiteering, and that labor should have adequate representation in all bodies created by the Government for the handling of industrial matters. This meeting of labor was followed by a general conference of representatives of labor, employers' organizations, and others prominent in the field of social reform at Washington on April 2, 1917, called by Mr. Gompers as Chairman of the Committee on Labor of the Council of National Defense. The persons invited to participate in this conference, numbering from 180 to 200 persons, effected a permanent organization as the full Committee on Labor of the Council of National Defense. It thereupon organized itself into numerous subcommittees to deal with specific phases of the labor problem and provided for the creation of an Executive Committee of 11 members who should act for the whole Committee. This Executive Committee on April 6, 1917, adopted a formal resolution, the most important provision of which was a recommendation that the Council of National Defense should issue a statement to employers and employees in all industrial establishments and transportation systems, advising that "neither employers nor employees shall endeavor to take advantage of the country's necessities to change existing standards."—W. F. Willoughby, *Government organization in war time and after*, pp. 207-210.—"For the purpose of formulating a national labor policy and for devising and providing a method of labor adjustment which would be acceptable to employers and employes at least for the war emergency period, the Wilson administration created on January 28, 1918, the War Labor Conference Board consisting of five representatives of employers, five representatives of employes, and two of the general public. . . . The five representatives of the employes were officials of national and international labor unions whose members were almost entirely engaged in war production. The members of the board were appointed by the Secretary of Labor upon nomination by the president of the National Industrial Conference Board, an organization of employers, and the president of the American Federation of Labor, the latter representing all the more important labor unions of the country with the exception of the four railway brotherhoods whose members were engaged in

the operation of trains. Each of the two groups thus selected chose one of the two representatives of the public. This board presented a formulation of industrial principles which represented the Administration's labor policy and which were to govern the relations between workers and employers in war industries for the duration of the war. These principles are [in part] as follows: There should be no strikes or lockouts during the war. The right of workers to organize in trade unions and to bargain collectively through chosen representatives is recognized and affirmed. [The analogous right of the employers was also recognized and affirmed.] . . . Employers should not discharge workers for membership in trade unions, nor for legitimate trade union activities. The workers, in the exercise of their right to organize, shall not use coercive measures of any kind to induce persons to join their organizations, nor to induce employers to bargain or deal therewith. In establishments where the union shop exists the same shall continue and the union standards as to wages, hours of labor, and other conditions of employment shall be maintained. . . . Established safeguards and regulations for the protection of the health and safety of workers shall not be relaxed. If it shall become necessary to employ women on work ordinarily performed by men, they must be allowed equal pay for equal work and must not be allotted tasks disproportionate to their strength. The basic eight hour day is recognized as applying in all cases in which existing law requires it. . . . The right of all workers, including common laborers, to a living wage is hereby declared."—F. J. Warne, *Workers at war*, pp. 84-87.—"Among the most important of these [agencies to control labor relations] is the National War Labor Board recommended by the War Labor Conference Board in its report of March 29 and created by Presidential Proclamation April 8, 1918. This board had jurisdiction over all matters of labor controversies between employers and employes in all fields of industrial or other activity affecting war production where there did not already exist by agreement or federal law a means of settlement. Even where such agencies were provided, jurisdiction was with the War Labor Board in case these agencies failed to secure adjustment. . . . The War Labor Board consisted of the same members selected in the same manner and by the same agencies as the War Labor Conference Board."—*Ibid.*, pp. 131-132.—"On November 9 [1919] a specially called meeting of the executive council of the American Federation of Labor, representing 114 national and international unions and an individual membership of more than four million workers engaged in all the occupations throughout the country, took up consideration in a most serious attitude of mind the coal miners' strike and the action of the Government in relation to it. . . . The attitude of organized labor as represented by this supreme advisory authority of the labor unions was expressed in an 'appeal to the public' containing among other things the following: . . . 'By all the facts in the case the miners' strike is justified. We indorse it. We are convinced of the justice of the miners' cause. We pledge the miners the full support of the American Federation of Labor and appeal to the workers and the citizenship of our country to give like endorsement and aid to the men engaged in this momentous struggle.'"—*Ibid.*, pp. 172-173.—See also LABOR PARTIES: 1868-1910.

1919.—Thirty-ninth Annual Convention.—"The 30th annual convention of the American Federation of Labor was held in Atlantic City, N. J., from

June 7 to June 24, 1919. . . . Almost all official recommendations were upheld by an overwhelming vote, the only evidence of any dissenting opinion being the nature of some of the 211 resolutions introduced but always defeated when of a radical nature. . . . 'The conflict for industrial democracy is just beginning,' declared Samuel Gompers, president of the American Federation of Labor, in his opening address to the convention. . . . Previous to Gompers' address, which was the key-note speech of the convention and sounded the new international relationship of labor through the League of Nations, a cablegram was read from President Wilson, lauding Gompers for having established in international circles as well as at home, the reputation of the American Federation of Labor for sane and helpful counsel.' . . . The afternoon of the first day was consumed with the reading of the report of the American Federation of Labor Delegation to the Peace Conference by James Duncan, first vice-president. . . . Miss Margaret Bonfield, fraternal delegate from the British Trades Union Congress, addressed the convention bringing the greetings of the organized wage earners of Great Britain. . . . One of the most noteworthy [speeches was] an address by Glenn E. Plumb, counsel of the four railroad brotherhoods, advocating the railroad workers' plan for government ownership and democratic control of the railroads. The executive council of the Federation was later instructed to take necessary steps toward realizing this project. . . . The one successful attack on the administration was the overturn of the committee on resolutions' recommendation 'that the principle of self-determination of small nations applies to Ireland' for the stronger amendment from the convention itself calling for recognition of the Irish republic and later providing in the indorsement of the League of Nations that this should not exclude Irish independence. The Irish nationalists in the convention backed by the radicals anxious to score over the administration and demonstrate the imperialist character of the peace settlement forced the issue and defeated the committee recommendation . . . by a vote of 181 to 150 and adopted the amendment asking recognition for Ireland by the Peace Conference. . . . This was the only revolt of the convention, the Irish being placated and assisting in the condemnation of the Russian Soviet republic soon thereafter. . . . John P. Frey, secretary of the resolutions committee, brought in a recommendation as a substitute [for three other resolutions] urging the Government to withdraw all troops from Russia but refusing the endorsement of the Soviet Government or any other Russian government until a constituent assembly has been held to establish 'a truly democratic form of government.' . . . Vigorous opposition . . . failed to change the result and the recommendation of the committee was adopted. . . . One of the favorable results of the convention was the support obtained by the Negro workers from the executive council and the convention, tending to break down the bars against admission of colored workers in the international unions. Nearly fifty of the international officials reported that they raised no barrier against the Negro, and the convention authorized the formation of federal locals of all colored workers refused membership in any international union. . . . The most dramatic incident of the convention was the solitary stand made against the League of Nations covenant and the labor charter contained in the peace treaty by Andrew Furuseth, the seamen's leader. . . . The entire executive council of the American Federation of Labor and its national

officials were re-elected. . . . Samuel Gompers was appointed to represent the Federation at the meeting of the Trades Union International Congress in Amsterdam on July 25."—C. Lane, 1919 *A. F. of L. convention (American Labor Year Book, 1919-1920, pp. 149-155)*.—See also LABOR PARTIES: 1918-1920; RAILROADS: 1919; Plumb plan.

1920.—Fortieth Annual Convention.—Statistics of the Federation.—Gompers and the national election.—"The American Federation of Labor met in annual convention for the fortieth time at Montreal, Canada, on June 7, 1920. . . . The most contentious issue fought out on the floor of the convention during its 12 days' session was the question of Government ownership of the railroads. The resolution in favor of Government ownership and democratic operation, which was passed by a vote of 20,058 to 8,348, is as follows:

"Resolved, That the Fortieth Annual Convention of the American Federation of Labor go on record as indorsing the movement to bring about a return of the systems of transportation to Government ownership and democratic operation; and be it further

"Resolved, That the executive Council be, and are hereby, instructed to use every effort to have the transportation act of 1920 repealed and legislation enacted providing for Government ownership and democratic operation of the railroad systems and the necessary inland waterways. . . .

"The convention indorsed the covenant of the League of Nations without reservations. 'It is not a perfect document and perfection is not claimed for it. It provides the best machinery yet devised for the prevention of war. It places human relations upon a new basis and endeavors to enthrone right and justice instead of strength and might as the arbiter of international destinies.' Other resolutions adopted by the convention may be summarized as follows: Compulsory military training and military training in schools were condemned as 'unnecessary, undesirable, and un-American.' Public officers were urged to make all possible effort to release political prisoners. The Kansas court of industrial relations was condemned and its abolition urged. Four resolutions on this subject were referred to the executive council of the Federation for action in bringing about the repeal of the law involved. Congress was enjoined to enact immediately the legislation necessary to establish the United States Employment Service as a permanent bureau in the Department of Labor. The creation of a Federal compensation insurance fund for maritime workers, under the administration of a Federal or State compensation commission, was urged to offset the recent decision of the United States Supreme Court denying longshoremen the benefits of State workmen's compensation laws. Reclassification of the civil service was advocated and the adoption of a wage scale commensurate with the 'skill, training, and responsibility involved in the work performed.' Enactment of legislation granting civil-service employees the right to a hearing and to an appeal from judgment in case of demotion or dismissal was also urged. The nonpartisan political campaign inaugurated by the Federation at its Atlantic City convention in 1910 to defeat candidates for office 'hostile to the trade-union movement' and 'elect candidates who can be relied upon to support measures favorable to labor,' was indorsed. A fund of \$20,545.42 was donated to the campaign committee by members of the Federation between February 24, 1920, and April 30, 1920. Repeal of the Lever law and of the espionage act and other wartime legislation was demanded. Legislation

against profiteering, in support of the Women's Bureau and of a Federal housing program was advocated, and the strengthening of the Department of Labor was urged. Continued organization of the steel industry and particular attention to organization of laundry workers and telephone operators were ordered. The Nolan minimum-wage bill (H. R. 5726), providing a minimum wage of \$3 a day for Federal employees, was approved. The secession movement of the 'outlaw' railway unions was condemned. The convention adopted a resolution in favor of the independence of Ireland and voted against recognition of the Soviet Government. Coöperation between labor unions and the farmers was advocated. A committee was appointed to report upon the question of health insurance to the 1921 convention of the Federation. On the question of Asiatic immigration, the convention concurred in the resolution proposed by the Building Trades Council of California urging upon Congress: 'First, cancellation of the "gentlemen's agreement;" second, exclusion of "picture brides" by action of our Government; third, absolute exclusion of Japanese, with other Asiatics, as immigrants; fourth, confirmation and legalization of the principle that Asiatics shall be forever barred from American citizenship; fifth, amendment of section 1 of Article XIV of the Federal Constitution, providing that no child born in the United States of Asiatic or Oriental parents shall be eligible to American citizenship unless both parents are eligible for such citizenship.' The employment of alien labor on the Panama Canal was protested. Fullest support was pledged to 'reestablish the rights of free speech, free press, and free assemblage,' wherever denied. A congressional investigation into conditions in the West Virginia coal fields was asked. Congress was urged to make adequate provision for World War veterans. Relief for the people of Austria, Serbia, Armenia, and neighboring countries was urged. . . .

"Membership in the American Federation of Labor has passed the four million mark. In 1000 it was over half a million, in 1902 over one million, in 1914 over two million, and in 1919 over three million. The paid-up and reported membership of affiliated unions for the year ending April 30, 1920, was 4,078,740. This number does not include the 207,065 members of the national organizations at present suspended from the Federation, nor does it include the membership of those railway brotherhoods partially affiliated. The membership of the Federation in 1920 represents an increase of 109.6 per cent over the membership in 1915, when it was 1,946,347 [having fallen slightly from 1914]. There are 36,741 local unions in the 110 national and international unions directly affiliated with the Federation in addition to the 1,286 local trade and federal labor unions, which are similarly affiliated. The strike benefits paid by the Federation to local trade and federal unions for the year ending April 30, 1920, totaled \$67,912.95. A total of \$3,213,406.30 in death benefits, \$937,219.25 in sick benefits, and \$65,026.42 in unemployed benefits, was paid during the same period by affiliated international organizations. These figures do not include the benefits paid by local unions, many of which provide death, sick, and out-of-work benefits, and therefore represent but a small proportion of the aggregate sum paid by trade unions for these purposes."—*Monthly Labor Review (United States Bureau of Labor Statistics, August, 1920, pp. 168-171)*.—In line with the federation's political policy of "rewarding its friends and punishing its enemies," Mr. Gompers during the presidential campaign urged organized labor to

vote for James Cox, the Democratic candidate; Cox received about seven million votes fewer than Harding.—See also RAILROADS: 1920: Esch-Cummins Act.

1921.—Forty-first Annual Convention.—The federation held its forty-first annual convention at Denver, Colo., June 13 to 25, 1921. One notable feature of the convention was the contesting of the election for the presidency. John L. Lewis, president of the United Mine Workers of America, was the opposition candidate, but Samuel Gompers was reelected by a vote of 25,022 to 12,324; not voting, 1,084. This was Mr. Gompers' fortieth election to the presidency of the federation. At one of the opening sessions, J. H. Thomas, British fraternal delegate to the convention, warned the federation against encouraging any American intervention in the Irish question. This question aroused much discussion at various sessions; Irish sympathizers gradually divided into those who favored a resolution calling for American recognition of Ireland as a republic and those who favored a resolution demanding a boycott of English-made goods. The resolution of the "recognition" was finally adopted. The convention defeated by a roll call vote of 21,742 to 14,530 a resolution proposing that the war-making power be taken from Congress and given to the people to be exercised through a referendum. The convention adopted a resolution favoring public ownership of the railroads, after a clause providing for government control of all basic industries had been stricken out. Definite action on the campaign for a six-hour day was postponed. A resolution offered by negro delegates asking the federation to take steps toward abolishing the Ku-Klux-Klan was opposed. The convention declined to interfere with the autonomy of international or national unions in regard to the membership of women or negroes. It endorsed the Sheppard-Towner bill (to aid in the establishment of maternity centers), called for federal control and development of natural resources, declared against universal military training and denounced the "growing abuse of injunctions in labor disputes."

AMERICAN HISTORICAL ASSOCIATION, founded at Saratoga in 1884. An American Historical Society had been founded in Washington in 1835 by Peter Force and others. It had had John Quincy Adams, Lewis Cass and Levi Woodbury as presidents and had published one volume of transactions. The call for the meeting at which the American Historical Association was organized was signed by John Eaton, President, and Frank B. Sanborn, Secretary of the Social Science Association, Charles Kendall Adams of Ann Arbor, Moses Coit Tyler of Ithaca and Herbert B. Adams. About forty responded to the call. A constitution was prepared by C. K. Adams, H. B. Adams, Clarence W. Bowen, Ephraim Emerton, M. C. Tyler

and William B. Weeden. The first paper was read by President Andrew D. White of Cornell "On studies in general history and the history of civilization." Mr. White was the first and George Bancroft the second president of the Association. On January 4, 1889, President Cleveland signed the act of incorporation of the Association in the District of Columbia, "for the promotion of historical studies, the collection and preservation of historical manuscripts, and for kindred purposes in the interest of American history and of history in America." This act requires the Association to have its principal office in Washington, and to report annually to the secretary of the Smithsonian Institution concerning its proceedings and the condition of historical study in America. The annual reports were to be published by the public printer. Prior to 1889 the publications were known as Papers of the American Historical Association. The connection with the government has brought some disadvantages, such as the barring from publication in the annual reports of some discussions on religious questions and the papers of the Church History section. The Association has a Historical Manuscripts Commission which has done much to preserve valuable historical manuscript material. Members of the Association were prominent in the founding of the American Historical Review in 1895. [The issue of October, 1920, contains the history of its first 25 years.] At the meeting in 1896 a Committee of Seven on the teaching of history in secondary schools was appointed at the instance of Professor Henry Morse Stephens. The report of this committee did much to improve the teaching of history in high schools and academics. Since 1898 the Association has aided the American Historical Review and distributed it to all the members. Standing committees on bibliography and publications and a Public Archives Commission have done good work. The Association awards prizes for historical essays. In 1904 a Committee of Eight was appointed to prepare a report on the study of history in elementary schools after the analogy of the Committee of Seven.

"The Committee on History and Education for citizenship in the Schools was constituted in 1918, first by the National Board for Historical Service and later by the Association, in order to consider those extensive modifications in the methods of historical teaching in the Schools which, it was then felt, must be brought about as a result of the Great War, in order that history might do its full part in training the minds of the young for proper service to a new era."—*American Historical Review*, April, 1921, p. 419.—During the World War the Association rendered valuable services for the Committee on Public Information and the National Board of Historical Service.

AMERICAN INDIANS. See INDIANS, AMERICAN; also under the names of various tribes.

AMERICAN INSTITUTE OF INTERNATIONAL AFFAIRS.—"Because these facts [increasing international relationships] are recognized, simultaneous efforts are being made [October, 1920] in several nations to build up institutes of international affairs. Such organizations have already been established in the United States, in Great Britain and in Japan. The American branch is now in the process of reorganization and of combination with the Council on Foreign Relations under the title of the American Institute of International Affairs. The undertaking, it is significant to note, arose out of the informal meetings which

were held by the experts of the American and British peace delegations at Paris. Lindsay Russell, Chairman of the Council on Foreign Relations, is actively aiding the reorganization. Concerning the activities of the new body, he said . . . 'What is being attempted is to establish a national centre of international thought. . . . The American Institute, of which Whitney Shepardson is secretary, has established a nucleus for an international library and outlined the publication of monographs on international topics which concern us as a nation. . . . The first work of the American Institute has been to co-operate with the British Institute in causing to be published a voluminous history of the Peace Conference [in five volumes, edited by H. W. V. Temperley]. This has been distributed to libraries. It is important to note that the American Institute of International Affairs is designed to be a source and centre of information, but not of propaganda. As such, the institute can formulate no policies. . . . The British were willing to undertake the first work, that of preparing the history of the treaty. The Americans, among them Thomas W. Lamont, provided a part of the funds for the work.'—W. L. Cheney, *Foramity of nations* (*New York Times*, October 31, 1920).

AMERICAN INSTITUTE OF INTERNATIONAL LAW, "organized at Washington in October, 1912, is a body which is likely to have great influence in promoting the peace and welfare of this hemisphere. The Institute is composed of five representatives from the national society of international law in each of the twenty-one American republics. At the suggestion of Secretary Lansing the Institute at a session held in the city of Washington, January 6, 1916, adopted a Declaration of the rights and duties of Nations, which was as follows: I. Every nation has the right to exist and to protect and to conserve its existence; but this right neither implies the right nor justifies the act of the state to protect itself or to conserve its existence by the commission of unlawful acts against innocent and unoffending states. II. Every nation has the right to independence in the sense that it has a right to the pursuit of happiness and is free to develop itself without interference or control from other states, provided that in so doing it does not interfere with or violate the rights of other states. III. Every nation is in law and before law the equal of every other nation belonging to the society of nations, and all nations have the right to claim and, according to the Declaration of Independence of the United States, 'to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them.' IV. Every nation has the right to territory within defined boundaries, and to exercise exclusive jurisdiction over its territory, and all persons whether native or foreign found therein. V. Every nation entitled to a right by the law of nations is entitled to have that right respected and protected by all other nations, for right and duty are correlative, and the right of one is the duty of all to observe. VI. International law is at one and the same time both national and international; national in the sense that it is the law of the land and applicable as such to the decision of all questions involving its principles; international in the sense that it is the law of the society of nations and applicable as such to all questions between and among the members of the society of nations involving its principles.' This Declaration has been criticized as being too altruistic for a world in which diplomacy has been occupied with selfish

aims."—J. H. Latané, *United States and Latin America*, pp. 304-306.—See also INTERNATIONAL LAW: 1856-1909.

AMERICAN LEAGUE OF ANTI-IMPERIALISTS.—Indianapolis declaration. See U.S.A.: 1900 (May-November).

AMERICAN LEGION, an organization of American veterans of the World War. "The purpose of the American Legion is . . . twofold: service to ex-service persons and service to the country. The organization is exerting . . . its influence and strength to the end that all ex-service men, especially the disabled and their dependents, and the dependents of the those who [were killed, should] receive that just and fair treatment which they have reason to expect from a patriotic and liberal country. In serving the country, the organization is endeavoring to keep alive that spirit of service which induced all to respond to the country's call in time of need. . . . The American Legion is not a military organization, nor does membership therein affect or increase liability for military or police service. It is absolutely non-political and is not to be used for the dissemination of partisan principles or for promoting the candidacy of any person seeking public office or preferment. The constitution of the American Legion provides for active membership only. There is no honorary membership in the Legion. The following are eligible to membership: 1, Men and women who served honorably in any branch of the army, navy, or marine corps for any length of time between April 6, 1917, and November 11, 1918. 2, Men and women who served in the naval, military, or air forces of any nation associated with the United States in the war, provided that at the time of their entry into this service they were American citizens and that they have resumed their American citizenship by the time they apply for membership in the Legion, and received upon discharge an Honorable Discharge or its equivalent."—*Facts about the American Legion (Publications of the American Legion)*.

Women's Auxiliary.—"The first National Convention, held at Minneapolis, provided for the formation of an Auxiliary Organization to be governed by the rules and regulations prescribed by the National Executive Committee, to be known as the Women's Auxiliary of the American Legion. Those eligible to this auxiliary are the mothers, wives, daughters and sisters of the members of the American Legion; the mothers, wives, daughters and sisters of all men and women who were in the military or naval service of the United States at some time between April 6, 1917, and November 11, 1918, and died in line of duty or after honorable discharge and prior to November 11, 1920. Mothers, wives, sisters and daughters by law have been ruled eligible to membership in this auxiliary organization, on the ground that any person related to any member of the Legion, either by birth or by law, under the above classification, is entitled to membership in this organization."—*Facts about the American Legion (Publications of the American Legion)*.

Organization.—"Each state constitutes a department of the American Legion and has direction of all posts within its area. Each department has a department commander, a department adju-

tant, and a department executive committee and such other officers as the department may determine. Post officers are determined by the various state constitutions. The organization is thoroughly democratic. From the Sergeant-at-Arms of the smallest post to the national commander, every Legion official in the organization is chosen by majority vote of the members or their duly elected representatives. Any fifteen ex-service persons eligible to membership can form a post on application to the Commander of the department in which the post is to be located. Any ex-service person desiring to enroll in the Legion who does not know of a post in his community should write the department commander. The National Convention is the law-making body, the administrative authority being vested in the National Executive Committee, between conventions. The National Convention elects the National commander, five National vice-commanders, and a National chaplain. The National commander appoints the National adjutant. The Executive Committee appoints the National treasurer and such officials and standing committees as may be necessary. The Executive Committee is composed of the National commander and Vice-commanders in office, and one representative and one alternate from each department, to be elected as such department shall determine. The American Legion is financed by membership dues, and from such other sources as may be approved by the National Executive Committee, as provided by the Constitution. The Minneapolis convention last year fixed the annual dues for the fiscal year 1920, at one dollar a member, this to cover the cost of maintaining headquarters and publishing the *American Legion Weekly*."—*Facts about the American Legion (Publications of the American Legion)*.

Policies.—"The American Legion assembled in convention at Minneapolis November 10, 11 and 12, 1919, went on record as follows:

"**Americanism.**—That relief to civilian population of countries now or lately our enemies be extended only through agencies incorporated by Congress. That all foreign language papers be required to furnish a true and correct translation, properly sworn, to the Postmaster-General of the United States. That proper punishment be meted out to all slackers and to those who aided and abetted slackers. That any attempt at this time to resume relationship with German activities be condemned, as well as the resumption of German operas, instruction of German in the schools and public performances of German and Austrian performers. That all American Indians who served in the war be given the full rights of citizenship, provided they did not attempt to evade full and complete performance of such services. That the Government's Thrift, Savings and Investment Campaign be heartily supported. That the immigration policy be revised along the lines of adaptability of alien races for American citizenship. That the so-called "Gentlemen's Agreement" with Japan be abrogated. That foreign-born Japanese be forever barred from American citizenship. That all other aliens advocating the overthrow of our Government by force and violence be tried and if possible convicted and deported. That a course in citizenship be made a part of the curriculum of every school in the country. That the Department of Justice be changed from a passive, evidence-collecting organization to a militant and active group of workers whose findings shall be forcefully acted upon. That all aliens who withdrew application for American citizenship because of America's participation in the war be deported. That

a list of names of all persons granted exemption from the selective service laws on the grounds of alienage be compiled and published for the Bureau of Naturalization. That all aliens in the United States be required to learn the American language and that all instruction in the elementary, public and private schools be in the American language. That the War Department recall all honorable discharges granted to conscientious objectors and that legislation be enacted providing for their prompt punishment. [See also AMERICANIZATION.]

"*Compensation.*—That the Sweet Bill, providing increased compensation for disabled men, payment of insurance in a lump sum, or installments, covering three years, be passed. That war risk insurance rates be revised to actual mortality costs. That the Government pay \$75.00 a month to all ex-service persons disabled by tuberculosis, and a special payment of \$50.00 a month to all other disabled men and women. That all disabled officers and enlisted personnel be placed on the same basis as to retirement for disability whether they served in the Regular Army, National Guard, National Army or Reserve Corps. That all ex-service persons suffering from the recurrence of disease, or other disability, resulting from service, become automatically eligible to all provisions of the War Risk or Vocational Rehabilitation Act. That all unproductive lands be reclaimed by direct Government operation for settlement by service men and women. That Government credit be extended for settlement of rural communities by service men and women. That no child born to parents ineligible to citizenship be granted citizenship in this country. That every public and private school be required to devote at least ten minutes of each day to patriotic exercises and that the American flag be raised over each school during the day, weather permitting. That all aliens tried, convicted or interned as enemies of our Government be deported. That the Government lend money to service men and women for the purchase and development of farms, or for the purchase of city homes. That the obligation which the Government owes to all service men and women to relieve the financial disadvantages incidental to their military service be left to Congress to discharge.

"*Employment.*—That preference be given to ex-service men in all civil service appointments and to the widows of those who laid down their lives in service, absolute preference being given to those physically disabled. That only ex-service men be employed in the quartermasters' depots and navy commissary stores.

"*Memorial.*—That the National Executive Committee select a site for a memorial in France and organize a movement to raise a popular subscription fund for the erection of such a memorial. That the American Legion co-operate with the G. A. R. and Confederate Veterans in their memorial services. That the bodies of the American dead be not returned from France except where the parents or next of kin desire that the Government return them. That arrangements be made with the people of France to maintain as permanent memorials of America's unselfish service to humanity, the graves of those who made the supreme sacrifice.

"*Miscellaneous.*—That the achievements of the Boy Scouts be commended and the work of the organization aided by various Posts. [See Boy Scouts: Coöperation with American Legion.] That nurses should have absolute rank, with opportunity of promotion. That the Articles of War and Court Martial laws be revised. That a program of social and community service be outlined. That

the efficiency of the Finance Office be improved." —*Facts about the American Legion (Publications of the American Legion).*—At the Minneapolis convention a committee of military policy was appointed. The Legion favors military training in high schools and colleges, universal military training with safeguards for civilian control and protection against a military caste. It favors measures to eradicate illiteracy and believes that "the only agitator that eventually need be feared is injustice." The Legion stands unreservedly for law and order. Persons who were not in active service during the war are not eligible to membership. Membership in the Students' army training corps is not sufficient for eligibility to membership in the Legion. Members of the Red Cross, Y. M. C. A. and similar welfare organizations are not eligible. Members of exemption boards and the public health service board are not eligible.

Chronology.—"February 15, 1919, Paris.—Idea of a war veteran's organization crystallized at meeting of twenty members of the A. E. F.

"March 15-17, 1919, Paris.—A. E. F. Caucus, representatives of all divisions and S. O. S. sections, temporary constitution adopted and plans formulated to organize in the United States. Executive Committee of one hundred elected. Name chosen.

"April 7, 1919, Paris.—Executive Committee organized and appointed committee of fifteen to work in the United States, and also arranged for exploitation of work in France.

"May 8-9-10, 1919, St. Louis.—Caucus of delegates representing troops at home, temporary constitution adopted, general policies formulated and plans perfected for organizing the Legion preparatory to first national convention on November 10, 11, 12, 1919.

"May 23, 1919, New York.—Amalgamation of Paris and St. Louis Executive Committee into Joint National Executive Committee responsible for organization of the American Legion on temporary basis preparatory to national convention.

"June 9, 1919, New York.—Formal amalgamation of Paris and St. Louis sub-committees effected at meeting of Joint Executive Committee of thirty-four.

"September 16, 1919.—Congressional Charter granted, incorporating the American Legion.

"November 10-11-12, 1919, Minneapolis.—First national convention of the American Legion, permanent organization effected, permanent constitution adopted, policies projected. Franklin D'Olier elected National Commander.

"November 24, 1919, Indianapolis.—Permanent National Headquarters established at Indianapolis pursuant to mandate of National Convention.

"December 12, 1919.—Conference in Washington on Sweet Bill.

"December 19-20, 1919, Indianapolis.—First meeting National Executive Committee.

"January 19, 1920, Indianapolis.—First meeting of National Americanism Commission.

"February 9, 1920, Indianapolis.—Meeting Military Policy Committee.

"February 22, 1920.—Legionnaires throughout country as part of Washington's birthday ceremony, bestowed French certificates on next of kin of those who died in the war.

"March 22-23-24, 1920, Washington.—Special conference of Executive Committee and Department representatives to discuss adjusted compensation, and four-fold plan was adopted.

"April 22-23-24, 1920, Indianapolis.—First conference of Department Adjutants."

The preamble of the National Constitution of the American Legion is as follows:

"For God and Country, we associate ourselves together for the following purposes: To uphold and defend the Constitution of the United States of America; to maintain law and order; to foster and perpetuate a one-hundred-per-cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, state and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness."—*Facts about the American Legion (Publications of the American Legion)*.—The American Legion's constitution is drafted on a non-partisan basis and prominent members from General Pershing down have stressed the importance of keeping it non-partisan. The forces likely to bring the American Legion to participation in political affairs have been thus presented:—"Can you picture the American soldier sitting idle in a crisis? Did he play a spectator's part at Château-Therry? Then can you picture the new civilian taking no part in government at a time when it is so obvious that the most important duty of an American is to see that changing conditions are changed rightly? It is too pessimistic a picture. Too large a part of the Nation is made up of returned soldiers. It is hard to see how they can hold aloof, for there are five millions of them with a similar point of view, and a body of men of that size would make its influence felt if it were deaf and dumb. In the light of many discussions at sea, it is impossible to believe that the soldier intends to neglect civil duties in which he showed such decided interest. He is too good an American. He feels too keenly that he has had an experience denied to most men, and is a better man for it. When the American Legion decides to stay out of politics, it must be because the former service man has decided that his ideal of government cannot be achieved by 'political' methods. Whatever power the American Legion is to exercise will be derived from the lessons learned in military life. In that, and in that alone, the returned soldier differs from the rest of the population. . . . The man in service learned to work his utmost at his own job. He learned that results were the only things which counted, and that two men doing one man's work was a clear waste, not of one man, but of two, for neither did it. He learned that the way to get things done was to take up the little things which were wrong one at a time and get them right, and not try to win the whole war by his lonesome. He learned chiefly to do his work and forget about promotion—to do his bit for the good of the service. He came back to this side and found that, as far as he could see, politicians were genuinely concerned with the triumph of the party at the next election. That he cannot stomach. It is in some such way as this that the American Legion will manifest itself in politics. For its members had an opportunity to see at first hand the methods and the results of monarchy. They returned determined to take more interest in the affairs of the republic."—R. R. Perry, *American Legion in politics (Outlook, Jan. 14, 1920)*.

September 27-28-29, 1920.—The annual convention of the American Legion was held in Cleveland, Ohio, September 27, 28 and 29, 1920. Eleven hundred delegates, representing a million members, took the following important action: "Pledged the American Legion to continued ser-

vice to the country in accordance with the Preamble of its Constitution. Reaffirmed the cardinal principle that the Legion's first thought is for the sick and wounded, and in accordance with that principle recommended that a new cabinet officer be created to coordinate and direct the Bureau of War Risk Insurance, the United States Public Health Service, the Federal Board for Vocational Education and other Government agencies for the assistance of the sick and wounded. Reiterated the Legion's intention to work unremittingly for justice to all veterans by obtaining the enactment in Congress of the fourfold plan of beneficial legislation, based on adjusted compensation. Reaffirmed emphatically the Legion's policy of absolute political neutrality. Confirmed the Legion's established stand for impartiality in disputes between capital and labor, while pledged to the preservation of law and order. Recorded its support of the new Army act of June 4, 1920, promising to help upbuild under that Act the National Guard and Organized Reserve and anticipating the adoption of universal military service. Extended to the Legion's affiliated women's organization full opportunity and encouragement for independent development and management. Condemned the Government agencies responsible for neglecting to take proper steps for the deportation of alien slackers and for withholding the publication of lists of known draft dodgers and deserters. Voted for the continuance of the Legion's work in Americanism to assist aliens to become good citizens and to foster the growth of patriotic devotion among all citizens. Designated that the 1921 Convention of the American Legion be held in Kansas City, Mo., October 31, November 1 and 2. Adopted the Shirley poppy as the official flower of the American Legion. . . . The convention declared with determination that the Legion should press ahead in its fight for justice to all veterans by continuing to champion before Congress the fourfold plan of beneficial legislation, embodying adjusted compensation, which already has passed the House of Representatives and now awaits action by the Senate. By a vote practically unanimous the convention recorded itself in favor of all four of the provisions which this bill contains—for aid in buying homes or farms, for vocational training, for land settlement and for adjusted cash compensation based on length of service. . . . Some southern delegates opposed the adjusted cash compensation, or 'bonus,' on the ground that it would have a bad effect on the negro ex-service men, and that it would probably be spent unwisely in many cases. . . . Several state delegations came instructed to secure some modification of the Legion's constitutional ban on political activities, and the Constitution Committee reported favorably what it called a clarifying resolution. The delegates, however, defeated the resolution by a vote of 963 to 142. The defeated resolution, after reaffirming the non-political and non-partisan character of the Legion, nevertheless went on to say: 'Now therefore, be it resolved by the American Legion in National convention assembled that the Legion is not prohibited by its Constitution and charter from supporting and promoting those policies and principles within the purposes enumerated in the preamble to its National Constitution, as interpreted by acts of its National conventions and rulings of its National Executive Committee; and be it further—Resolved, that the Legion through its organization has the right under its charter and constitution to ascertain, for the information of its members, the attitude of candidates for public office towards such policies and principles.'

The convention was unanimous in declaring the Legion's intention to give serious and continued support to the new Army plan provided for by the Army reorganization act of June 4, 1920. It expressed its belief that the success of the National Guard and Organized Reserve under that bill depends largely on the coöperation of the American Legion and pledged support for the recruiting and the maintenance of these forces at their proper standards. It also declared in favor of the policy of universal military training of young men and expressed the hope that this policy might later be legally adopted by a change in the new Army act. The creation of a new cabinet position to deal exclusively with the United States Air Service was advocated, and other recommendations were adopted favoring rules permitting Army enlisted men to retire on part pay after 10, 20 and 25 years of service and the extension of the war time system of family allowances for the benefit of the enlisted men of the Army in peace time.

"The report of the Convention Committee on Americanism was adopted after a lively debate on a single feature—the recommendation dealing with Japanese immigration. The committee merely reaffirmed the resolution adopted at Minneapolis the previous year: 'That we go on record as being in favor of the cancellation of the so-called "gentlemen's agreement," exclusion of "picture brides," and the rigorous exclusion of Japanese as immigrants,' and 'that we enter a vigorous protest against the demand of Japan that naturalization rights be granted to its nationals now located in the United States and that we earnestly request the State Department of the United States in its settlement of this question not to consider any proposition which will grant rights of naturalization to this unassimilable people.' . . . The other recommendations of the Committee were for the Americanization of the Territory of Hawaii, the continuance of the Legion's National Americanism Commission and its removal to headquarters at Indianapolis, and for free education in English, American history and civil government for foreign and native born illiterates."—*American Legion Weekly*, Oct. 15, 1920.

October 31, November 1-2, 1921, Kansas City.—Third national convention of The American Legion decided: "To support the Veterans Bureau in every way to carry out the plans for hospitalization and handling of claims, insisting that the letter and spirit of the law be observed in decentralizing the agencies for the benefit of disabled ex-service men and that politics must not interfere with the bureau's work. To continue the Legion's stand for the Adjusted Compensation Bill and to fight for its earliest possible enactment. To adopt the daisy as the official flower in place of the poppy. To continue its opposition to immigration and naturalization of Orientals. To ask a suspension of all immigration for five years, and to ask the strictest examination of immigrants at ports of embarkation in the absence of a restriction law. To urge legal punishment for disloyalty in the schools. To oppose a pardon for Eugene V. Debs and to insist on the return and prosecution of Grover Cleveland Bergdoll. To support limitation of armaments, while insisting upon adequate military protection for the United States. To recognize officially La Société des 40 Hommes et 8 Chevaux as the "Legion playground" and to consider the establishment of a Father's Auxiliary.' The American Legion Auxiliary [the re-christened Women's Auxiliary] came into being November 2nd at Kansas City—a perfected national organization . . . The name was selected by delegates of the Women's Auxiliary

of The American Legion from every State but Alabama, Arkansas, Maryland, Tennessee, Utah, West Virginia and Wyoming, and these seven States had unofficial representatives without vote on the floor. The Territory of Hawaii was represented by a duly authorized delegate."—*American Legion Weekly*, Nov. 18, 1921.—Hanford MacNider of Mason City was chosen national commander of the American Legion.

AMERICAN LITERATURE: General Characteristics.—"American literature is a branch of English literature, as truly as are English books written in Scotland or South Africa. Our literature lies almost entirely in the nineteenth century when the ideas and books of the western world were freely interchanged among the nations and became accessible to an increasing number of readers. In literature nationality is determined by language rather than by blood or geography. M. Maeterlinck, born a subject of King Leopold, belongs to French literature. Mr. Joseph Conrad, born in Poland, is already an English classic. Geography, much less important in the nineteenth century than before, was never, among modern European nations, so important as we sometimes are asked to believe. Of the ancestors of English literature 'Beowulf' is scarcely more significant, and rather less graceful, than our tree-inhabiting forebears with prehensile toes; the true progenitors of English literature are Greek, Latin, Hebrew, Italian, and French. . . .

"American literature is English literature made in this country. Its nineteenth-century characteristics are evident and can be analyzed and discussed with some degree of certainty. Its 'American' characteristics—no critic that I know has ever given a good account of them. You can define certain peculiarities of American politics, American agriculture, American public schools, even American religion. But what is uniquely American in American literature? Poe is just as American as Mark Twain; Lanier is just as American as Whittier. . . . The ideas at work among these English men of letters are world-encircling and fly between book and brain. The dominant power is on the British Islands, and the prevailing stream of influence flows west across the Atlantic. Sometimes it turns and runs the other way. Poe influenced Rossetti; Whitman influenced Henley. . . . For a century Cooper has been in command of the British literary marine. . . . The catholicity of English language and literature transcends the temporal boundaries of States.

"What, then, of the 'provincialism' of the American province of the empire of British literature? Is it an observable general characteristic, and is it a virtue or a vice? There is a sense in which American literature is not provincial enough. . . . The welcome that we gave Whitman betrays the lack of an admirable kind of provincialism; it shows us defective in local security of judgment. Some of us have been so anxiously abashed by high standards of European culture that we could not see a poet in our own back yard until European poets and critics told us he was there. This is queerly contradictory to a disposition found in some Americans to disregard world standards and proclaim a third-rate poet as the Milton of Oshkosh or the Shelley of San Francisco. . . . Of pro-

vincialism of the narrowest type American writers, like other men of imagination, are not guilty to any reprehensible degree. It is a vice sometimes imputed to them by provincial critics who view literature from the office of a London weekly review or from the lecture rooms of American colleges. Some American writers are parochial, for example, Whittier. Others, like Mr. Henry James, are provincial in outlook, but cosmopolitan in experience, and reveal their provinciality by a self-conscious internationalism."—J. Macy, *Spirit of American literature*, ch. 1.

1607-1740.—Colonial literature.—"An instructive impression of the character of literature in America during the seventeenth century may be derived from a glance at the titles recorded in Mr. Whitcomb's 'Chronological Outlines.' Speaking roughly,—and in considerations like this minute precision is of little importance,—we may say that out of about two hundred and fifteen of these titles one hundred and ten deal with matters which may unquestionably be described as religious, and that of these all but one name books produced in New England. The next most considerable class of writings includes matters which may be called historical or biographical, beginning with 'The True Relation' of Captain John Smith,—a work hardly to be included in any classification of American literature which should not equally include M. de Tocqueville's study of our democracy and Mr. Bryce's of our contemporary commonwealth; this list also includes such biographies as those of Cotton Mather, whose main purpose was quite as religious as it was biographical. Out of fifty-five titles thus comprehensively grouped, thirty-seven are of New England origin; the other eighteen, including the separate works of Captain John Smith, come either from Virginia or from the middle colonies. Twenty of Mr. Whitcomb's titles, including such things as 'The Freeman's Oath,' of 1630, said to have been the first product of the press in the United States, may be called political; only three of these twenty are not from New England. Of nineteen other titles, including almanacs and works of scientific character, which may best be classified with miscellanies, all but two originated in this same region. Finally there are nine titles to which the name of literature may properly be applied, if under the head of literature one include not only the poems of that tenth Muse, Mrs. Anne Bradstreet, but the 'Bay Psalm Book,' and so pervasively theological a poem as Michael Wigglesworth's 'Day of Doom,' and the first version of the 'New England Primer.' Of the nine books thus recorded only Sunday's translation of Ovid did not proceed directly from New England. Now, the men who founded the colonies of Virginia and of New England were on the one hand men of action, and on the other, men of God. It is precisely such matter as their Elizabethan prototypes left in books now remembered only as material for history that the fathers of America produced throughout the first century of our national inexperience."—B. Wendell, *Literary history of America*, ch. 4., pp. 35-37.

1750-1861.—Development of American drama.—"It is possible to trace in the development of the drama in this country before the Civil War certain fairly distinct periods. The first ends with the closing of the theatres in 1774 and has as its principal event the production of *The Prince of Parthia* in 1767. The second, from 1774 to 1787, includes the Revolutionary satirists and is a transition period. The third begins with the production of *The Contrast* in 1787 and closes with the termination of Dunlap's first period of managership

in 1805. It was a period of tentative effort, partly under the influence of German and French models. The fourth period from 1805 to 1825 is one of development, with considerable native effort, but still largely under foreign influence, both English and Continental. The fifth was a significant and creative period, from 1825 to the Civil War, with its climax in *Francesca da Rimini* in 1855. This development was interrupted naturally by the Civil War. What would have been its course had the war not occurred it is perhaps fruitless to speculate. There were signs of a quickening of dramatic interest in the late fifties under the encouragement of such managers as Lester Wallack and Laura Keane; but the domination of the stage by Dion Boucicault and John Brougham, while it resulted in some significant plays, especially in a later period, was not an unmixed blessing from the point of view of the production of American drama. The dramatization of English and French novels with resultant long runs; indeed the very success of Boucicault's original dramas, made for conditions in which the work of new play-wrights became less in demand. The old days in which a manager was willing to put on a play for a few nights were going fast, and with them went our early drama. That its significance in the history of our literature has never been appreciated is due largely perhaps to the fact that some of its most important monuments are still unprinted. But of its significance both in itself and for the later drama there is no shadow of doubt."—W. P. Trent, *History of American literature*, p. 231 et seq.

1775-1789.—Revolutionary period.—"A wide reader of Colonial literature notes two general characteristics: its narrowness and its isolation. Almost every writer dwells apart from the world; his book is as a voice crying in the wilderness; and life seems to him only a pilgrimage, a brief day of preparation for eternity. Hence poetry, history and biography are all alike theological, that is, they interpret the human in terms of the divine life. In Revolutionary literature there is no isolation, but rather a splendid sense of comradeship, strong and loyal. When the Colonies draw near together, after the Stamp Act, they find themselves one in spirit. Otis and Henry voice the thought and feeling of a multitude; Hamilton and Jefferson appeal not only to the new nation but to the men of every land who have pondered the problems of democracy. Even in the satires of Freneau, in the ballads of Hopkinson against the Tories, and of Odell against the Patriots, there is no sense of solitariness; for each writer is but the voice of a great party which cherishes the same ideals and follows the same leader. As American literature thus emerges from its isolation, we note instantly that it has become more practical, more worldly, more intent on solving the problems of the present than of the future life. In nearly all books of the period the center of interest shifts from heaven to earth; theology gives way to politics; and the spiritual yearnings of an earlier age, which reached a climax in Jonathan Edwards, are replaced by the shrewd, practical 'philosophy of common sense,' with Benjamin Franklin as its chief apostle. Not only the spirit but the form also of literature is changed in the Revolutionary period. The great social movement which we have outlined gave rise to numerous newspapers and magazines, with their poems, satires, essays, stories,—a bright and varied array compared with the Colonial product. More significant of the new social life are the crude plays of Royall Tyler and William Dunlap, which were immensely popular in the new play-houses, and the romances of Charles Brockden

Brown, which at the close of this period mark the beginning of the American novel. Just as the new social life brought forth this ephemeral writing—a kind of literature of amusement, to be enjoyed to-day and forgotten to-morrow—so the various political movements had each its distinctive form of literary expression. The years following the obnoxious Stamp Act saw the beginning of that brilliant oratory which was, and still is, one of the great molding influences in American life and literature. The strife of Whigs and Tories is mirrored in a host of ballads, songs and satires in verse; and the struggle between Federalists and Anti-Federalists over the Constitution produced, in the writings of John Adams, Washington, Madison, Jay, Hamilton, Jefferson, and many others, a new form of political writing, the first true literature of Democracy, which had influence far beyond the borders of the American nation.

"If the lonely Colonial writers impress us as voices crying in the wilderness, the Revolutionary authors seem like men speaking in a great assembly; and their words have power because they voice the thought and aspiration of a multitude. For a new problem has been suddenly thrust upon the Colonies by the Revolution. It is the problem of forming one union out of many states, of making one government out of many factions, of bringing a multitude of all sorts and conditions of men into national peace and harmony. Hence the orators and prose writers, if they are to help solve that mighty problem, must appeal to the love of freedom and the sense of justice which lie deep in the hearts of men; they must emphasize ideals which are acknowledged by rich and poor, wise and ignorant, and, like Bradford, they must have an eye single to the truth in all things. That they felt their responsibility, that they used voice and pen nobly in the service of the nation, is evident enough to one who reads even a part of the prose literature appearing between Henry's impassioned 'Liberty or Death' speech and Washington's calm and noble 'Farewell Address' to his people. Clearness, force, restraint; here a touch of humor, when the crowd must be coaxed; there a sudden exaltation of soul, when the old Saxon ideal of liberty is presented,—all the elements of a fine prose style are manifest; but it is not so much the form as the substance that appeals to us, and especially the greatheartedness of the Revolutionary writers. They gave the world the first example of what has been well called 'citizen literature,' that is, the expression of the ideals of a whole commonwealth, and to this day their work remains unrivaled in its own political field. This Revolutionary prose belongs largely to the 'literature of knowledge' and is seldom found in literary textbooks; but it is well to remember two things concerning it: that it began with our national life; and that it reflects a strong, original and creative impulse of the American mind. It was as if Democracy, silent for untold ages, had at last found a voice, and the voice spoke, not doubtfully, fearfully, but in trumpet tones of prophecy. It gave the startled old world something new and vital to think about; and it is quite as remarkable in its way as are the forest and sea romances of Cooper, which surprised and delighted all Europe a half century later."—W. J. Long, *American literature*, p. 92-99.

—"Springing from a common stock, the two branches of eighteenth-century English literature showed many similarities. The charge of imitation and even of plagiarism has been brought against the American writers of that period; but it seems in no way unsafe to point to the single origin as the probable cause of the same character-

istics appearing in the literature produced here, and that produced in the mother-country. No one can deny, of course, that not a few of our authors went to school to Englishmen, but the assertion that America until recently has produced nothing but pinchbeck literature is as false as it is absurd. That like produces like may be a trite saying, but its frequent repetition does not impair its truth. The English mind, whether expressing itself at home or in the colonies, naturally put forth the same kind of shoots: that their development was not in all respects equally rapid, that in time they became so much unlike as to appear unrelated, can be traced, no doubt, to the unsheltered fortune of the American scion in early days, and to the complete removal of the slip from the parent stem in after-years. With this thought in mind, the most thorough-going American may admit, without apologetic reserve, that the essayists of eighteenth-century England have counterparts in Irving and certain of his contemporaries, and that those of a slightly later date have much in common with Emerson and Thoreau. Should one feel, however, that excusable pride is to be taken only in those authors who exhibit qualities indigenous to America, one may triumphantly mention Warner, and Lowell, and Margaret Fuller; for, although these essayists show the racial instinct of English writers, they are none the less emphatically American in thought, tone, and expression."—F. Stanton, ed., *Manual of American literature*, p. 321.

1790-1860.—New tendencies.—Cooper and the novel.—Bryant and the new poetry.—Poe, Hawthorne and the short story.—"Aside from oratory and politics, in spite of the early literary superiority of the Puritan, the foundations of our really national literature were laid in the Middle States. Poetry really found its voice, not in the pretentious efforts of the New Englanders, Barlow, Trumbull, or Dwight, but in the verse of the Philadelphian William Clifton, or yet more indubitably in a few lyrics of the New Jersey poet Philip Freneau. In romance, through the stories of Charles Brockden Brown, the Middle States were not only in advance of the rest of the country, but were practically without a rival. In the first quarter of the century the leadership of the middle region of the country became even more marked, and in that great section New York succeeded Philadelphia as a literary center. . . . From the literary advent of Irving in 1807 to the decisive entrance of Longfellow and Emerson about 1836, the work of our greatest men of letters was centered in New York. Two of our then most famous authors, Irving and Cooper, were sons of the Middle States; the third, Bryant, chose New York city as the sphere of his literary career. Besides the greater lights, there were many others of lesser magnitude. Although our literature thus had, for the time, its center in New York, it must not be inferred that other parts of the country were entirely unproductive. While New England could boast of no writers comparable to those in the Middle States, we note the signs of the great literary awakening of New England which was near at hand. . . . A new spirit, the realization of the beautiful, was softening the crude but intense and vigorous intellect of the Puritan."—H. S. Pancoast, *Introduction to American literature*, pt. III, ch. 1.

"After the Revolution the novel-reading habit grew, fostered by American publishers and cried out against by many moralists whose cries appeared in magazines side by side with moral tales. Nearly every grade of sophistication applied itself to the problem. It was contested that novels were lies; that they served no virtuous purpose; that they

melted rigorous minds; that they crowded out better books; that they painted adventure too romantic and love too vehement, and so unfitted readers for solid reality; that, dealing with European manners, they tended to confuse and dissatisfy republican youth. In the face of such censure, native novelists appeared late and apologetically, armed for the most part with the triple plea that the tale was true, the tendency heavenward, and the scene devoutly American. Before 1800 the sweeping philippic of the older school had been forced to share the field of criticism with occasional efforts to distinguish good novels from bad. No critical game was more frequently played than that which compared Fielding and Richardson. Fielding got some robust preference, Smollett had his imitators, and Sterne fathered much 'sensitivity,' but until Scott had definitely set a new mode for the world, the potent influence in American fiction was Richardson. . . . The amiable ladies who produced most of these early novels commonly held, like Mrs. Rowson, that their knowledge of life had been 'simply gleaned from pure nature,' because they dealt with facts which had come under their own observation, but like other amateurs they saw in nature what art had assured them would be there. Nature and Richardson they found the same. Whatever bias they gave this Richardsonian universe was due to a pervading consciousness of the sex which read their novels. The result was a highly domestic world, limited in 'outlook, where the talk was of careless husbands, grief for dead children, the peril of many childbirths, the sentiment and the religion which enabled women to endure their sex's destiny. Over all hangs the furious menace of the seducer, who appears in such multitudes that one can defend the age only by blaming its brutality less than the pathetic example of Clarissa Harlowe. Thus early did the American novel acquire the permanent background of neutral domestic fiction against which the notable figures stand out."—*Cambridge history of American literature*, p. 284, et seq. —"In 1820, American literature, so far as it has survived, consisted of the novels of Brockden Brown then ten years dead, and of Irving's *Sketch Book*, which had begun to appear the year before. Apart from these works, what had been produced in this country was so obviously imitative as to express only a sense on the part of our numerous writers that they ought to copy the eminent authors of England. In 1820 appeared the first work of a new novelist, soon to attain not only permanent reputation in America, but also European recognition. This was James Fenimore Cooper (1789-1851). His first novel was *Precaution*, his second *The Spy*, published the following year. When *The Spy* was published, the novels of Brockden Brown were already almost forgotten; and Irving had produced only the *Knickerbocker History* and the admirable essays of his *Sketch Book*. *The Spy* is an historical novel of the American Revolution. . . . In *The Pilot* . . . instead of laying the scene on American soil, Cooper lays it for the first time in literature on board an American ship. . . . *The Last of the Mohicans*, published in 1826, is probably the best [of the Leatherstocking stories]. . . . These are, in their order as successive chapters in the life of their hero: *The Deerslayer* (1841); *The Last of the Mohicans* (1826); *The Pathfinder* (1840); *The Pioneers* (1823); *The Prairie* (1827). . . .

"The three writers . . . Brockden Brown, Irving, and Cooper—were the only Americans who between 1798 and 1832 achieved lasting names in prose. Though they form no school, though they are very different from one another, two or three

things may be said of them in common. They all developed in the Middle States, the names of all are associated with the chief city of that region, New York. The most significant work of all assumes a form which in the general history of literature comes not early but late,—prose fiction. . . . This prose . . . was the most important literature produced in New York, or indeed in America, during the period. . . ."—B. Wendell and C. N. Greenough, *History of literature in America*, pp. 148, 151-152, 156-157.

"By 1851 there were, or had been, many novelists whose names could find place only in an extended account of American fiction: writers of adventure stories more sensational than Simms's or of moral stories more obvious than Miss Sedgwick's and Mrs. Childs's, authors for children, authors preaching causes, authors celebrating fashionable or Bohemian life in New York. Not only regular novels and romances but briefer tales multiplied. The period which could boast in Cooper but one novelist of first rank could show three such tale-tellers as Irving, Hawthorne, and Poe. The annuals and magazines met the demand for such amusement and fostered it, but the novel was encouraged more than it was hurt by the new type. Prose fiction, in fact, though somewhat late in starting, had firmly established itself in the United States by the middle of the century, and Cooper, followed in Great Britain by the nautical romancers, and on the Continent by such writers about wild life as Karl Anton Postl ('Charles Sealsfield'), Friedrich Gerstäcker, and Gustave Aimard, and everywhere read, had become a world figure."—*Cambridge history of American literature*, p. 284, et seq.

"Our earlier poets, that is, [those who came] immediately after the Revolution, but again, and especially, after the War of 1812, had confirmed our sense of national solidarity, are much given to the utterance of their patriotism. . . . Key's 'Star-Spangled Banner' (1814), conceived at the close of the second war, antedates 'The American Flag' (1819) of Drake by but five years; these two, with Hopkinson's 'Hail Columbia' (1798), and 'America' (1832), the well-known hymn by S. F. Smith, whatever their relative or absolute merits as literature, remain our most cherished national poems."—L. Cooper, *Poets*, in T. Stanton, *Manual of American literature*, pp. 244-245.

"William Cullen Bryant is designated by Englishmen as the first American poet, and the Americans are not disinclined to subscribe to that judgment. And since the poem *Thanatopsis*, upon which this judgment is based, appeared in 1817, that year is straightway designated as the natal year of American poetry. This sort of criticism and literary history presupposes iron-bound rules of literary aesthetics. For the present, such do not exist for us. One cannot, therefore, go so far as to annihilate at a stroke the whole of the somewhat ample body of poetry before Bryant." Among poets of this period should be mentioned Philip Freneau (1752-1832), John Trumbull (1752-1831), J. H. Payne (1791-1852) author of "Home Sweet Home," Fitz-Green Halleck (1790-1867), Nathaniel Parker Willis (1806-1867), and Joseph Rodman Drake (1795-1820). William Cullen Bryant (1794-1878) was "by far the most eminent man of letters in our chief city [New York]. . . . His first published work—a very precocious one . . . —had appeared before Brockden Brown died. . . . Incidentally, Bryant was for a full half-century at the head of the *New York Evening Post* . . . a newspaper in which from beginning to end the editor could feel honest pride. As a journalist, indeed, Bryant belongs to [a later time]. . . . As a poet,

however,—and it is as a poet that we are considering him here,—he belongs to the earliest period of American letters.”—B. Wendell and C. N. Greenough, *History of literature in America*, p. 159.—“When ‘Thanatopsis’ was submitted by the poet’s father to *The North American Review* (in 1817), people would hardly believe that such an exalted strain had been conceived outside of England. . . . ‘To a waterfowl’ was published with several other poems, including ‘Thanatopsis,’ in 1821. . . . By 1832 he was ready to publish another edition of his ‘Poems,’ adding more than eighty pieces that were new—notably, the ‘Forest Hymn,’ the ‘Song of Marion’s Men,’ and ‘The Death of the Flowers.’ At intervals of a few years . . . other editions or volumes followed. . . . The achievement of Bryant’s declining years was his translation of Homer.”—L. Cooper, *Poets*, in T. Stanton, *Manual of American literature*, pp. 257-260.—“His work was really the first which proved to England what native American poetry might be. The old world was looking for some wild manifestation of this new, hardly apprehended, western democracy. Instead, what it found in Bryant, the one poetic contemporary of Irving and Cooper whose writings have lasted, was fastidious over-refinement, tender sentimentality, and pervasive luminosity. . . . In its beginning the American literature of the nineteenth century was marked rather by delicacy than by strength, by palpable consciousness of personal distinction rather than by any such outburst of previously unphrased emotion as on general principles democracy might have been expected to excite.”—B. Wendell, *Literary history of America*, p. 203.—“After Bryant it is convenient to speak of a few poets, very different from him, and for the most part from each other, whose contemporaneous presence in New York is almost the only thing that connects them.” Among these are John G. Saxe (1816-1887), Herman Melville (1810-1891), Alice Cary (1820-1871), and her sister Phæbe (1824-1871). “We turn to a number of writers whose careers are to be more closely identified with New England. Many of these, like Richard Henry Dana, senior (1787-1870), of Boston were only poets secondarily. Dana was a journalist and a politician.” Others are Sprague, Hillhouse, Pierpont, Warren. “The same generation produced several women of note, whose poetry demands some attention; in particular, Lydia Huntley Sigourney (1791-1865).” —L. Cooper, *Poets*, in T. Stanton, *Manual of American literature*, pp. 262-265.—Edgar Allan Poe (1800-1849) figures in American literature both as poet and prose-writer. He it was who developed the short story to its highest perfection. “Born fifteen years later than Bryant and dead twenty-nine years earlier, Poe . . . seems to belong to an earlier period of our letters; but really, as we have seen, Bryant’s principal work was done before 1832.”—B. Wendell and C. N. Greenough, *History of literature in America*, p. 171.—“In Boston in 1827 he had published a thin little book called ‘Tamerlane and Other Poems. . . . Two years later in Baltimore he had published what was really an enlargement of this first venture. . . . He began to write short-stories; and one of these, a tale of striking vigor and novelty, the ‘MS. found in a Bottle,’ won him a . . . prize. . . . At last in 1835, one of [his] friends got him the post of assistant editor of the *Southern Literary Messenger*. . . . Poe printed in it his own poems and short-stories, and thus began to make himself known as an imaginative writer of strange originality and power. As a critic also he revealed

unexpected strength. . . . After leaving Richmond Poe published, in 1838, the ‘Narrative of Arthur Gordon Pym, and . . . in 1840 . . . the ‘Tales of the Grotesque and the Arabesque,’ the most original collections of short-stories written by any American author. . . . As a writer his reputation steadily rose.” The “Murders in the Rue Morgue,” the “Gold Bug,” and other stories, as well as the “Raven” and other poems, added to his increasing fame. “By long study he had made himself a master of the technic of verse, and he combined with extraordinary skill all the effects to be derived from lilting rhythm, intricate rhyme, artful repetition, and an aptly chosen refrain. He bent words to do his bidding, and he made his verse so melodious that it had almost the charm of music.”—B. Matthews, *Introduction to American literature*, pp. 85-86, 90-93.—In 1837 Nathaniel Hawthorne published his “Twice-Told Tales.” “After the publication of this collection of short-stories, Hawthorne ceased to be what he once called himself, ‘the obscurest man of letters in America.’ . . . It was five years before his next book was published. . . . In 1846 [he published] ‘Mosses from an Old Manse.’ . . . [He] was forty-six when he sent forth the ‘Scarlet Letter’ in 1850. With the striking exception of ‘Uncle Tom’s Cabin,’ no American work of fiction has had the quick and lasting popularity of the ‘Scarlet Letter.’ . . . The ‘House of Seven Gables’ was published in 1851.”—*Ibid.*, pp. 115-119.—Other books appeared in following years, the “Marble Faun,” the last to be published during his life-time, appearing in 1860.

1830-1845.—Period of New England leadership.—Oratory.—Humanitarian movements.—“From about 1830-40 New England entered upon a long period of literary supremacy. The intellectual awakening which preceded and accompanied this literary period began in Boston and its vicinity, and Boston rapidly distanced New York as a literary center, as New York had distanced Philadelphia. Between 1826 and 1840 nearly all of the great New England writers of this period had definitely begun their work. Longfellow published his first collection of poems in 1826. Holmes began his work in 1827, and Hawthorne in 1828. Emerson, Prescott, Lowell, Whittier, and Motley all followed between 1830 and 1840. The expression of the New England mind in the works of this group of writers constitutes, as a whole, our most memorable contribution to literature; it is one of the greatest and most lasting achievements of our American civilization.”—H. H. Panoast, *Introduction to American literature*, p. 160.—“During her years of intellectual leadership New England led the country in oratory also, and the work of her succession of great orators belongs, at least in part, to literature. We have said that in the Revolutionary period and during the early days of the Republic the supremacy in oratory lay with the South. But as the present century advanced and the country passed into the shadow of those anxious years when slavery threatened the very existence of the Union, it was New England that gave America, in Daniel Webster (1782-1852), her greatest orator. It was New England also that gave us Edward Everett (1794-1865), the master of a finished and scholarly eloquence; Wendell Phillips (1811-1884), and Charles Sumner (1811-1874), the orators of the Abolitionists. . . . As we look back upon the work of these great orators of New England as a whole, from Webster to Sumner and Phillips, as we recall its sterling quality and its incalculable effects upon our national history, we see that it was by no means the

least important part of New England's service to the country at large. To all that the Puritan gave us we add this also. We appreciate that in those years of her full strength New England not only wrote our greatest poetry, our best histories, and our keenest political satire; that she not only charmed us with her humor, and led the way in scholarship, but that, besides all this, she gave us men who, in a time of national uncertainty and peril, could lead opinions and control events by their genius for speech."—*Ibid.*, pt. III, ch. 2, p. 236.

"There has been but one movement in the history of the American mind which has given to literature a group of writers having coherence enough to merit the name of a school. This was the great humanitarian movement, or series of movements, in New England, which, beginning in the Unitarianism of Channing, ran through its later phase in transcendentalism, and spent its last strength in the anti-slavery agitation and the enthusiasms of the Civil War. The second stage of this intellectual and social revolt was transcendentalism. . . . Ralph Waldo Emerson (1803-82) was the prophet of the sect, and Concord was its Mecca; but the influence of the new ideas was not confined to the little group of professed transcendentalists; it extended to all the young writers within reach, who struck their roots deeper into the soil that it had loosened and freshened. We owe to it in great measure, not merely Emerson, [A. B.] Alcott, Margaret Fuller, and Thoreau, but Hawthorne, Lowell, Whittier, and Holmes. In its strictest sense transcendentalism was a restatement of the idealistic philosophy, and an application of its beliefs to religion, nature, and life. But in a looser sense, and as including the more outward manifestations which drew popular attention the most strongly, it was the name given to that spirit of dissent and protest, of universal inquiry and experiment, which marked the third and fourth decades of this century in America, and especially in New England."—H. A. Beers, *Short hist. of Eng. and Amer. literature*, pp. 95-96.—"In 1836, he [Emerson] put forth his first book, 'Nature,' and the next year he delivered an oration on 'The American Scholar.' Hitherto little had happened to him except the commonplaces of existence; thereafter, though his life remained tranquil, he was known to the world at large. He was greeted as are all who declare a new doctrine; welcomed by some, abused by many, misunderstood by most. Proclaiming the value of self-reliance, Emerson denounced man's slavery to his own worldly prosperity, and set forth at once the duty and the pleasure of the plain living which permits high thinking. . . . He never put himself forward; and yet from that time on there was no denying his leadership of the intellectual advance of the United States. The most enlightened spirits of New England gathered about him; and he found himself in the center of the vague movement known as 'Transcendentalism.' . . . He edited for a while the *Dial*, a magazine for which the Transcendentalists wrote, and which existed from 1840 to 1844. But he took no part in an experiment of communal life undertaken by a group of Transcendentalists at Brook Farm 1841 to 1847. . . . In 1841 Emerson published his first volume of his 'Essays'; and he sent forth a second series in 1844. In his hands the essay returns almost to the form of Montaigne and Bacon; it is weighty and witty; but it is not so light as it was with Addison and Steele, with Goldsmith and Irving. He indulged in fancies sometimes, and he strove to take his readers by surprise, to startle them, and so to arouse them to the true view of

life. Nearly all his essays had been lectures, and every paragraph had been tested by its effect upon an audience. Thus the weak phrases were discarded one by one, until at last every sentence, polished by wear, rounded to a perfect sphere, went to the mark with unerring certainty. . . . Emerson's first volume of 'Poems' was published in 1846. Ten years before he had written the hymn sung at the completion of the monument commemorating the Concord fight. . . . This is one of the best, and one of the best known, of the poems of American patriotism. But Emerson cared too little for form often to write so perfect a poem. . . . Following Bryant, Emerson put into his verse nature as he saw it about him—the life of American woods and fields. . . . One of Emerson's poems most richly laden with emotion and experience is the 'Threnody,' which he wrote after the death of his first-born. . . . Certain of the lectures prepared for delivery in England supplied the material for his next book—'Representative Men'—published in 1850. Only two of Emerson's books have any singleness of scheme, and this is one of them."—B. Matthews, *Introduction to the study of American literature*, pp. 96, 100-103, 106.

"While several of those who composed the group of Transcendental thinkers in the Concord circle became more or less noted either for eccentricity or utterance, the most remarkable among them all, after Emerson, was Henry David Thoreau [1817-1862]. A genuine lover of nature—a naturalist first of all—he was also a philosopher and a poet, too, although a crude one. . . . His acquaintance with Emerson began early. . . . In 1845 Thoreau built for himself a cabin on the shore of Walden Pond, and here for two years he lived. . . . It is this experience in his life with its subsequent record which has more than anything else aroused interest in the personality of Thoreau. . . . *Walden, or Life in the Woods*, contains the story and the thought of these two years; it reveals Thoreau at his best and has long since become an American classic. . . . An earlier volume [1840] . . . was . . . *A Week on the Concord and Merrimack Rivers*. His journal was . . . drawn up by others after his death . . . and published. . . . Various articles by Thoreau were published in *The Dial* and, through the friendship and assistance of Horace Greeley, in the New York magazines as well as in the *Tribune* itself."—W. E. Simonds, *Student's history of American literature*, pp. 177-180, 182.

"The 'Autocrat of the Breakfast-Table' [by Oliver Wendell Holmes] has already given evidence that it will outlast 'Elsie Venner' and 'The Guardian Angel'; yet if the miscellanies of Dr. Holmes (1809-94) possess more vitality than his novels, this is in some measure due to the 'Autocrat's' occasional employment of verse. In the 'Breakfast-Table' series appeared 'The Chambered Nautilus' and 'The Wonderful "One-Hoss Shay,"' which, with his youthful 'Old Ironsides,' and 'The Broomstick Train,' have retained the firmest hold on the popular memory. Holmes was pleased to trace his ancestry back to Anne Bradstreet, the first American poetess. His own poetry commenced with a schoolboy rendering into heroic couplets from Virgil, and hardly ended with his tribute to the memory of Whittier in 1802. In the standard edition of his works his poems occupy three volumes. Many of them, corresponding to his turn for the novel, are narrative; for story-telling he had a knack amounting to a high degree of talent. His sense of order and proportion is stronger than that of other members of the New England school, and he has a command of at least formal structure. One may not unreasonably attribute this com-

mand in part to his studies in human anatomy. At the same time Holmes is beset with the temptation to value manner and brilliancy rather than substance, and he will go out of his way for a fanciful conceit or a striking expression. In the use of odds and ends of recondite lore his cleverness is amazing. He had a tenacious memory and a habit of rapid association, so that as a punster he is almost without a match. However, his glance is not deeply penetrating; he sees fantastic resemblances between things that are really far removed from one another, not so often the fundamental similarities in things whether near or apart. . . . A constructive criticism, however, will lay stress, not on his inheritance of New England provincialism or his slight tendency to be flippant, but on his kindliness, his inexhaustible good humour, his quick and darting intellectual curiosity, and on the appeal which his sprightly moralising makes to the young. It is not a little thing to say of a wit and a power of epigram like this that they were ever genial, and ever on the side of something better than a merely conventional morality."—T. Stanton, *Manual of American literature*, pp. 294-295; 297.

1830-1890.—Antislavery movement and Civil War.—"Uncle Tom's Cabin."—Lincoln.—Whittier.—Whitman.—Longfellow.—Lowell.—Many of the early "antislavery men did some of their chief work when the cause they advocated seemed far from public favor. We come to a book produced by the antislavery movement, which suddenly proved that movement popular. This was Mrs. Harriet Beecher Stowe's (1812-1896) *Uncle Tom's Cabin*, published in 1852, the year after Sumner had entered the Senate from Massachusetts, and two years after Webster's Seventh of March speech. . . . At first little noticed, this book rapidly attracted popular attention. During the next five years above half a million copies were sold in the United States alone; and it is hardly excessive to say that wherever *Uncle Tom's Cabin* went, public conscience was aroused. Written carelessly, and full of crudities, *Uncle Tom's Cabin* remains a remarkable piece of fiction. The truth is, that almost unawares Mrs. Stowe had in her the stuff of which good novelists are made. . . . Should any one doubt Mrs. Stowe's power as a writer, remembering only that in *Uncle Tom's Cabin* she achieved a great popular success, partly caused by the changing public opinion of her day, we need only glance at some of her later work to make sure that she had in her a power which, if circumstances had permitted its development, might have given her a distinguished place in English fiction. Her best book is probably *Oldtown Folks* (1869). . . . Mrs. Stowe differed from most American novelists in possessing a spark of genius. Had this genius pervaded her work, she might have been a figure of lasting literary importance. Even as it was, she had power enough to make *Uncle Tom's Cabin* the most potent literary force of the antislavery days.

"*Uncle Tom's Cabin* was published in 1852. To its unprecedented popularity may perhaps be traced the final turn of the public tide. [See also U. S. A.: 1852: Appearance of "*Uncle Tom's Cabin*."] Within ten years the conflict between the slave States and the free reached the inevitable point of civil war. The 1st of January, 1863, saw [the] final proclamation of emancipation. . . . We can hardly speak of the Emancipation Proclamation without touching for a moment upon the great name in American history of the nineteenth century. Abraham Lincoln (1800-1865) proved himself in the Lincoln-Douglas campaign such a master of debate,

and in his inaugural addresses and in the famous Gettysburg speech such a master of simple and powerfully eloquent English, that, aside from his great political services, any account of American oratory or of antislavery would be incomplete without some mention of him. But Lincoln's historical importance is so great that any discussion of him would lead us far afield. . . . Among the antislavery leaders of Massachusetts was one who, with the passing of time, seems more and more distinguished as a man of letters. John Greenleaf Whittier (1807-1892), born at Haverhill, Massachusetts, came of sound country stock, remarkably only because for several generations the family had been Quakers. . . . Though Whittier was precocious, and his literary career extended over more than sixty-five years, he was not prolific. He never wrote much at a time, and he never wrote anything long. . . . His masterpiece, if the word be not excessive, is 'Snowbound,' written when he was about fifty years old. . . . Such vividness as distinguishes the descriptive passages of 'Snowbound' appears throughout Whittier's descriptive verse, . . . for example, [in] . . . the 'Prelude' which take [s] one to the very heart of our drowsy New England summers. . . . In general, of course, the most popular literature is narrative. So Whittier's Yankee ballads often seem his most obvious works,—'Skipper Ireson's Ride,' for example, or that artlessly sentimental 'Maud Muller.'"—B. Wendell, and C. N. Greenough, *History of literature in America*, pp. 284-294.—"At heart Whittier was no more stirred than were the other antislavery leaders, nor was he gifted with such literary power as sometimes revealed itself in the speeches of Parker or of Phillips, or as enlivened Mrs. Stowe's novel with its gleams of creative genius. But Whittier surpassed all the rest in the impregnable simplicity of his inborn temper, derived from his Quaker ancestry and nurtured by the guilelessness of his personal life."—B. Wendell, *Literary history of America*, pp. 366-367.

"Walt Whitman (1819-1892) was almost exactly contemporary with Lowell. No two lives could have been much more different. . . . The contrast between Whitman and Whittier, however, is almost as marked as that between Whitman and Lowell. . . . The first edition of Whitman's *Leaves of Grass* appeared in 1855, the year which produced the *Knickerbocker Gallery*. During the Civil War he served devotedly as an army nurse. After the war, until 1873, he held some small Government clerkships at Washington. In 1873 a paralytic stroke brought his active life to an end; for his last twenty years he lived an invalid at Camden, New Jersey. Until 1855, when the first edition of *Leaves of Grass* appeared in a thin folio, some of which he set up with his own hands, Whitman had not declared himself as a man of letters. From that time to the end he was constantly publishing verse, which from time to time he collected in increasing bulk under the old title. He published, too, some stray volumes of prose,—*Democratic Vistas* (1871), *Specimen Days and Collect* (1882-83), and the like. Prose and poetry alike seem full of a conviction that he had a mission to express and to extend the spirit of democracy, which he believed characteristic of his country. Few men have ever cherished a purpose more literally popular. Yet it is doubtful whether any man of letters in this country ever appealed less to the masses. . . . Sometimes, of course, he was more articulate. The Civil War stirred him to his depths; and he drew from it such noble verses as 'My Captain,' his poem on the death of Lincoln, or such little pictures as 'Ethiopia Saluting

the Colors.' Even in bits like these, however, which come so much nearer form than is usual with Whitman, one feels his perverse rudeness of style. Such eccentricity of manner is bound to affect different people in different ways. One kind of reader, naturally eager for individuality and fresh glimpses of truth, is disposed to identify oddity and originality. Another kind of reader instinctively distrusts literary eccentricity. In both of these opinions there is an element of truth. . . . In one aspect he is thoroughly American. The spirit of his work is that of world-old anarchy; his style has all the perverse oddity of paralytic decadence; but the substance of which his poems are made—their imagery as distinguished from their form or their spirit—comes wholly from his native country. In this aspect, then, though probably in no other, he may, after all, throw light on the future of literature in America."—B. Wendell and C. N. Greenough, *History of literature in America*, pp. 371-378.

"Henry Wadsworth Longfellow . . . was born in Portland, Maine, February 27, 1807. . . . At the age of thirteen, Longfellow printed four stanzas, 'The Battle of Lovell's Pond,' in a corner of *The Portland Gazette*. Within the next six years he wrote a considerable number of poems for *The United States Literary Gazette*. By 1833, in addition to text-books for his classes, he had, in various magazines, published original articles, stories, and several reviews; among them an important estimate of poetry, especially the poetry of America, in a notice of 'Sidney's Defense of Poesy' contributed to *The North American Review*; as well as translations from the Spanish of Manrique and others, with an 'Introductory Essay on the Moral and Devotional Poetry of Spain' (1833). 'Outre-Mer,' first published as a series of sketches, appeared in book form in 1835, 'Hyperion' in 1839, and 'Voices of the Night' in the same year as 'Hyperion.' 'Voices of the Night' made Longfellow's reputation as a poet; the edition was immediately exhausted. 'Hyperion,' which eventually sold well, though at present it is not often enough read, was at first unfortunate, the publisher failing before this book had a fair start. Of Longfellow's better known works, published during the latter half of his lifetime, his 'Ballads and Other Poems' appeared in 1841, 'The Spanish Student,' in 1843, 'Evangeline' in 1847, 'Kavanaugh,' another prose romance, in 1840, 'Hiawatha' in 1855, 'The Courtship of Miles Standish' in 1858, 'The Golden Legend' in 1872, and 'Aftermath' in 1873. The 'Tales of a Wayside Inn' came out in 1863, 1872, and 1873, the First Day separately, the Second and Third Day in company with other writings. . . . Longfellow was the most popular poet ever brought forth on this continent. . . . "By general consent, Longfellow is our American poet, *par excellence*, Emerson our philosopher, James Russell Lowell our man of letters. . . . No one, however, when his initial talents are considered, has produced so much poetry as Longfellow; no one in the realm of philosophic thought has been so patiently influential as Emerson; and no one, not even Irving, had fared well in so many avenues of literature and popular scholarship as Lowell. He was poet, critic, professor, editor, diplomat, patriot, humanist; and withal he was a man and a friend. . . . It is well-nigh impossible to characterise Lowell briefly. An attempt to sum up a personality that chose so many avenues of expression, and that at bottom was not thoroughly unified, can hardly do justice to the component parts. The most striking thing about the man was his fertility, if not in great constructive ideas, at all

events in separate thoughts. What he writes is full of meat. His redundancy is not in the way of useless verbiage; he wants to use all the materials that offer. A less obvious thing in Lowell is what we may term his lack of complete spiritual organization. He lived in an age of dissolving beliefs and intellectual unrest. Though he was not tormented, as were others, by fierce internal doubts, he yet failed ever to be quite clear with himself on fundamental questions of philosophy and religion. He was never quite at one with himself. As a writer, his serious and his humorous moods were continually interrupting each other. Partly on his account, he did not possess an assured style. . . . The fact is that he wrote mainly for his own time, and was bound to have but a temporary reward. This is not saying that the reward was not worth while. His interpretations of Spenser, of Dante, of Milton, of the elder dramatists, sent to those poets many a reader who would not otherwise have gone; for America, he opened the road in the study of Chaucer; and his own 'Vision of Sir Launfal' has unlocked many a hard heart to divine influences. When he wrote in dialect, as in the 'Biglow Papers,' he was manifestly writing for a time; but in their time the second series did more to justify the Northern cause than almost any other publication that could be mentioned, Whittier's poems not excepted. It may be thought that his wonderful command of dialect, contrasted with a less perfect and less instinctive success in any higher medium, marks him as above all else a satiric poet. When he was once sitting for his portrait, he so denominated himself, speaking generally—'a bored satiric poet.' Yet were we to name Lowell the greatest of all American satirists, his urgent poems of patriotism—'The Washers of the Shroud,' the 'Commemoration Ode'—his 'Vision of Sir Launfal,' and 'The Cathedral' would immediately proclaim him something greater than any satiric poet could be. Last of all, nobler than the sum of his writings was the work which he effected in bringing together his native land and the mother country, England, in a bond of sympathy unknown since their separation."—T. Stanton, *Manual of American literature*, pp. 275-290.

1865-1900.—Literature after the Civil War.—Realistic school.—American humor.—"Following the lead of certain great contemporary novelists in Russia, France, and Spain, many of our later fiction-writers have aimed to reproduce, with an unrelieved and unswerving truth and minuteness, just those every-day aspects of American society which their great predecessors instinctively idealized or ignored. A so-called 'realistic' school of fiction has consequently risen up among us, which, according to one definition, 'aims at embodying in art the common landscape, common figures, and common hopes and loves and ambitions of our common life.' In nearly every great section of our huge country keen-eyed observers have been recording in fiction one or another of the almost innumerable phases of American society. Taken together, these studies give to the careful reader a fairly accurate notion of our composite national life. But life in this country is as yet such a roughly-pieced patchwork of local differences, that the novelist who aims at a faithful reproduction of it often gets no further than a study of some particular locality, which he paints over and over again up to the extreme limits of endurance. The last thirty years has given us a long procession of these local studies; it has produced writers who are practically specialists on some particular and often narrow plot of ground. We have had experts on the old lady of the New England village, on the Tennes-

see mountaineer and the plantation negro; or, among the novelists who have taken a somewhat wider outlook, we have had elaborate studies of society life in Boston, Washington, Newport, Philadelphia, or New York. . . . New England has not lacked some notable writers in recent years, some of whom have been clearly leaders in the especial line to which they have devoted themselves. In fiction, New England life, particularly in the country districts and the smaller towns, has been portrayed with minuteness and fidelity by such writers as Elizabeth Stuart Phelps, Harriet Prescott Spofford, Sarah Orne Jewett, and Mary E. Wilkins. John Fiske has become widely known as a scientist and philosophical thinker, and more recently as one of our ablest writers on American history. The labors of a group of writers in this last-named field—Justin Winsor (1831-1897), the author of a scholarly and elaborate history of America; Henry Adams, Henry Cabot Lodge, and others—are too important to be passed over. Indeed it may be said here that outside of New England as well as within its limits an increasing attention to our country's history and institutions has been one of the distinctions of these later years. In the South the labors of Professor Herbert B. Adams, of Johns Hopkins University, Baltimore, have been instrumental in raising up a school of capable students and historians of our institutions and our past. The Middle States have given us the admirable works of Professor [President] Woodrow Wilson, [formerly] of Princeton University and of John Bach McMaster, Professor of American History at the University of Pennsylvania. . . . One characteristic feature of our recent literature—its humor—we have reserved for a separate mention. Probably no other element in our literature is so distinctly and exclusively American. Imitative as much of our serious work may be, our humor is unmistakably a genuinely national production. Even the English, while their perception of the American joke is apt to be delayed and uncertain, admit that our humor is ours alone. They may call it 'vulgar,' or 'rudimentary,' or 'middle-class,' but they acknowledge that we are at least entitled to say of it, 'a poor thing, sir, but mine own.' A leading English critic and essayist, for instance, writes: "The Americans are of our own stock, yet in their treatment of the ludicrous how unlike us they are! As far as fun goes, the race has certainly become differentiated." In fact, humor is a characteristic element in the American people. Neither our poetry nor our scholarship rests on such a broad basis of popular appreciation. Our sense of the ludicrous is not the possession of a limited class; it is a national trait. It declares itself in the funny columns of countless newspapers, in our popular songs, our minstrels, our theatres, our slang: it is stamped on thousands of funny stories that, handed on from one to another, traverse the whole country with wonderful swiftness. No wonder, then, that when some of this popular sense of humor gets into literature we recognize in it marks of a national trait."—H. S. Pancoast, *Introduction to American literature*, pt. III, ch. 5.

"Samuel Langhorne Clemens, 'Mark Twain,' (1835-1910), after an apprenticeship to a printer, became a pilot on the Mississippi River in 1851. Later he tried mining, and still later journalism in California. Thence he removed to Hawaii, and finally to Hartford, Connecticut. . . . In 1884 he founded the publishing firm of C. L. Webster & Company; he lost heavily by its failure. His subsequent labor to pay its debts suggests the similarly heroic efforts of Sir Walter Scott. His first book,

The Jumping Frog and Other Sketches, came out in 1867, *Innocents Abroad* in 1869, *Adventures of Tom Sawyer* in 1876, *Life on the Mississippi* in 1883, *Adventures of Huckleberry Finn* in 1885, *Pudd'n-head Wilson* in 1894, and *Personal Recollections of Joan of Arc* in 1895-1896. The earlier work of Mark Twain seemed broadly comic—only another manifestation of that rollicking sort of journalistic fun which is generally ephemeral. As the years . . . passed, however, he . . . slowly distinguished himself more and more from anyone else. No other . . . writer, for one thing, so completely exemplifies the kind of humor which is most characteristically American—a shrewd sense of fact expressing itself in an inextricable confusion of literal statement and wild extravagance, uttered with no lapse from what seems unmoved gravity of manner."—B. Wendell and C. N. Greenough, *History of literature in America*, pp. 421-422.

"I suppose that Mark Twain transcends all other American humorists in the universal qualities. He deals very little with the pathetic, which he nevertheless knows very well how to manage, . . . but there is a poetic lift in his work, even when he permits you to recognize it only as something satirized. There is always the touch of nature, the presence of a sincere and frank manliness in what he says, the companionship of a spirit which is at once delightfully open and deliciously shrewd . . . His humor is at its best the foamy break of the strong tide of earnestness in him. But it would be limiting him unjustly to describe him as a satirist; and it is hardly practicable to establish him in people's minds as a moralist; he has made them laugh too long. . . . I prefer to speak of Mr. Clemens's artistic qualities because it is to these that his humor will owe its perpetuity. . . . He portrays and interprets real types, not only with exquisite appreciation and sympathy, but with a force and truth of drawing that makes them permanent. . . . One of the characteristics I observe in him is his sin-le-minded use of words. . . . He writes English as if it were a primitive and not a derivative language. . . . The result is the English in which the most vital works of English literature are cast. . . . What you will have in him is a style which is as personal, as biographical as the style of any one who has written, and expresses a civilization whose courage of the chances, the preferences, the duties, is not the measure of its essential modesty. It has a thing to say, and it says it in the word that may be the first or second or third choice, but will not be the instrument of the most fastidious ear, the most delicate and exacting sense, though it will be the word that surely and strongly conveys intention from the author's mind to the reader's. It is the Abraham Lincolnian word, . . . it is American, Western."—W. D. Howells, *My Mark Twain*, pp. 140-141, 143, 169-170.

"Among the representatives of the 'New South,' Sidney Lanier (1842-81), musician, poet, teacher of English, is easily foremost. . . . The poor reception given to his 'Tiger Lilies' (1867), a novel based on experiences in the army, did not dishearten him. In 1875 he definitely announced himself by his poem entitled 'Corn,' published in *Lippincott's Magazine*, a vision of the South restored through agriculture. This brought him the opportunity of writing the 'Centennial Cantata' for the Philadelphia Exposition, where he expressed the faith he now had in the future of the reunited nation. The Cantata finished, he immediately began a much longer centennial ode, his 'Psalm of the West' (1876), which appeared in *Lippincott's Magazine*, and which, with 'Corn' and 'The Symphony,' made part of a small volume published in

the autumn of 1876. Lanier's important critical works were the product of the years between 1876 and his death. Some three years after he died, his poems were collected and edited by his wife. If we had to rely upon one poem to keep alive the fame of Lanier, thinks his biographer, Mr. Edwin Mims, we "could single out 'The Marshes of Glynn' with assurance that there is something so individual and original about it, and that, at the same time, there is such a roll and range of verse in it, that it will surely live not only in American poetry but in English. He is the poet of the marshes as surely as Bryant is of the forests."—T. Stanton, *Manual of American literature*, pp. 272-274.

1894-1915.—Significant phases.—Howells and James.—"The death of Holmes in the fall of 1894, following fast upon the deaths of Whittier and of Parkman and of Lowell, marked the close of an epoch. The leaders of the great New England group of authors had gone; and the period of American literature which they had made illustrious was completed. In the first half of the nineteenth century the literary center of the United States had been in New York, where were Irving and Cooper, Bryant, Halleck, and Drake. Toward the middle of the century the literary center had shifted to Boston, in which city or in its immediate vicinity were the homes of Emerson, Longfellow, Whittier, Holmes, Parkman, Lowell, and Thoreau. When these had departed they left no successors there of the same relative influence. The nation has been spreading so fast and the men of letters are so scattered, that there is in the last years of the nineteenth century no single group of authors whose position at the head of American literature is beyond question. . . . The example set by Irving has been followed by writers who happened to have special knowledge of this or that portion of the country, until there is now hardly a corner of the United States which has not served as the scene of a story of some sort. Many of these local fictions are short stories, but some of them are long novels. As was natural, New England is the portion which has been most carefully explored. But of late the young writers of the South and of the West have been almost more successful in this department of literature than the writers of New England and of New York. In story and in sketch we have had made known to us the Southern gentleman of the old school, the old negro body-servant, the field hand, and the poor white. In like manner we have had faithfully observed and honestly presented to us the more marked types of Western character. What gives its real value to these studies of life in the South and in the West is that they are studies of life, that they have the note of sincerity and of reality, that they are not vain imaginings merely, but the result of an earnest effort to see life as it is and to tell the truth about it—the whole truth, and nothing but the truth. Many of these Southern and Western tales, even more than the New York and New England tales on which they are modeled, abound in humor, which sometimes refines itself into delicate character-drawing, and which sometimes breaks out into more hearty fun. Franklin was perhaps the earliest of American humorists; after him came Irving, and then Lowell; and they have to-day many followers not unworthy of them.

"The earlier American historians, Prescott and Motley and Parkman, have also many not unworthy followers, working to-day as loyally as did their great predecessors. At no time since the United States became an independent nation has there been greater interest in historical study. At no time have more able writers been devoting

themselves to the history of our own country. Although we have now no essayist of the stipulating force of Emerson, and no critic with the insight and the equipment of Lowell, yet there is no lack of delightful essayists and of accomplished critics. Indeed the general level of American criticism has been immensely raised since the days of Poc. American critics are far more self-reliant at the end of the nineteenth century than they were at the beginning. They have lost the colonial attitude, for they no longer look for light across the Atlantic to England only. They know now that American literature has to grow in its own way and of its own accord. Yet they are not so narrow as they were, and they are ready to apply far higher standards. An American poet or novelist or historian is not now either unduly praised or unduly condemned merely because he is an American. He is judged on his own merits, and he is compared with the leading contemporary, writers of England and of France, of Germany, of Italy, and of Spain. It is by the loftiest standards of the rest of the world that American literature must hereafter be measured"—B. Matthews, *Introduction to the study of American literature*, p. 229-233.

"One who compares American literature of the last fifty years with that of the preceding half century will be struck first of all by the scarcity of great writers, the very large number of minor authors, and the high average of talent shown, especially in prose. This literary talent is well distributed, New England and the Middle States having lost the preëminence they once had. The lack of a literary metropolis deprives American authors of a valuable stimulus and hinders an all-American point of view; yet the fact that our men of letters work alone, or in literary centres far apart in space and widely different in temper and traditions, encourages originality and the use of varied material; and if we ever have a more unitary and national literature, these pictures of local conditions in North, South, and West will prove to have been of much value as preliminary studies. Largely because of such studies there has emerged another marked feature of the new literature, its Americanism in subject and spirit. While American writers are more cosmopolitan than ever before in the sense of being open to the cultures of the world, foreign influence as a whole is relatively less apparent than formerly, and American literature is much more the product of American soil. This is due in part to the Civil War, which brought the country to a new sense of its power and even of its fundamental unity, for during that struggle the men of the East and the West and the South came to know one another better, recognizing in comrades and foes alike a common Americanism. The fading away of the Old South as a result of the war, and the disappearance of the most picturesque features of the West in the recent rapid expansion of population and wealth, gave a heightened value to these aspects of American life in the eyes of writers and readers. To these causes has been added of late a growing feeling of independence, the natural result of greater maturity and power. The present generation cares less than did its forefathers for the censure or the approval of Europe, and is rather amused than irritated by Old World misunderstanding and condescension, feeling that if it has much to learn it has also much to teach"—W. C. Bronson, *Short history of American literature*, p. 282-283.

"It is in accordance with the spirit of the time that recent tendencies in novel writings are in the direction of realism and character analysis. There

have been occasional violent reactions in the direction of ultra-romanticism, and about the close of the century the country suffered from an epidemic of hastily written historical novels. The two most distinguished [contemporary] American novelists, William Dean Howells [d. 1920] and Henry James [d. 1916] stand, however, for the study and portrayal of things as they are. In the recent development of the short story as a distinct literary form America has done its full share, and more; and perhaps American writers of short stories are relatively more distinguished than American authors in any other field of literature. The increasing number of magazines offers opportunities for the publication of short stories, and short stories in turn help to make the magazines possible and popular. Many young persons with literary interests have found time to attempt the briefer form when circumstances would have prevented them from writing an old-fashioned two volume novel; and though this has led to the production of an immense amount of experimental and mediocre work, it has developed a few writers who might not otherwise have been discovered. The valuable achievement of the last quarter-century in poetry has been small. The best work has been done by writers who made their reputation before 1883. The fashion has set toward short and epigrammatic lyrics, and few poems on an ambitious scale have been attempted. The Americans who have had most influence on their latest successors are Emerson and Whitman. There are many experiments in the manner of European poets and of other times, but there is little that seems a high and genuine expression of to-day. An increasing number of younger men have been tempted to the writing of plays, and some of them have produced work admirably suited to effective presentation by the complex art of the modern stage. There have, however, been no dramas of the first literary rank, and few of the second. The perpetual demand for sensational plays has been filled by melodramas which stage-craft is able to make more lurid than ever before; but the tendency in the drama, as in prose fiction, is toward realism. It may be partly as a result of that tendency that the successful action plays written within the last few years have been almost all in prose. Within recent years there have been many writers of good prose essays, but none of preëminent distinction. The sharp differentiation of the short story from the essay has modified the latter, and no recent writings are of the same order as some of the most charming work of Addison, Lamb, and Irving. Essays on various aspects of nature-study have become popular, and discussions of literary and artistic matters are more widely read than ever before. In the better newspapers lighter discussions of social questions and of evils of the day have been more refined and more truly humorous than formerly. Though these can hardly be classed as literature their improvement indicates better popular taste. With the development of modern ideals of scholarship the writings of scholars take less and less rank as literature. Thoroughness of investigation and impartiality of statement are the chief merits of the monograph or treatise; and many investigators seem to fear that literary graces are to be shunned lest they seduce the writer from accuracy in the presentation of facts."—W. B. Cairns, *History of American literature*, pp. 463-465.

"The first thing which it occurs to me to note is that the relation between American and British literature has become closer. I say 'British,' not for the sake of including more categorically Scottish

and Irish, but because American literature is necessarily 'English' in the larger, which is also the truer, sense of the term. All that is written in English, wherever it is written, is English literature because it descends from the same source—*viz.*, the great writers of the seventeenth century, when the people now politically separated were one people, and because every part of it has continued to affect and mold every other part. To-day people in Britain read books published in America and Americans read books published in Britain, far more generally than was ever the case before. The taste and the criticism of each country are more influenced by that of the other. When living in the United States [as British ambassador] I was constantly struck by the fact that a new British writer of some fresh quality was often sooner known and more promptly appreciated there than in his own country. The same thing happens, though less markedly, in Great Britain. . . . As respects what may be called 'solid literature,' that is to say books on history, philosophy, economics, and all the so-called human or 'social' sciences, the greatest change of recent years is the enormously increased American output. . . . These books and articles are eminently painstaking and accurate, disdaining no facts, however trivial they may seem. Comparatively few large historical works are produced, for the writers are occupied not so much in rearing edifices as in laying foundations, or perhaps in quarrying stones and carrying them to the place where the building is to be erected. They are regardful rather of the substance than of the style and manner of their compositions, and are right in this, for the work is of a class in which accuracy is the one essential thing. Nevertheless, the treatises of Henry C. Lea, most learned of all American historians, and those of Francis Parkman and of John Fiske, were of admirable quality; nor are their successors wanting among living writers, whom I do not mention because selection would be invidious where there are several of conspicuous excellence. Much of this work relates to local history or State history, and makes its special appeal to citizens of the United States. But much also deals with large constitutional questions and with problems in political science that are of universal interest. Americans have begun to realize that their country is both the workshop and the laboratory of democracy. In their forty-eight States and their Congress they are trying experiments in every form of popular government by which the whole world may profit, and indeed is profiting. The other field from whose heavy soil a large crop is being raised is the field of economics and of the social sciences in their application to social progress. Here the affinities of American authors are rather with England than with Germany, for the exaggerated doctrines of State omnipotence which German thinkers have (to their own injury) embraced do not commend themselves to English-speaking men nurtured in the principles of liberty. The substantial identity of industrial problems, and social problems generally, in Britain and the United States, as well as the similarity of spirit and aims, has made the experiments and the literature bearing on these subjects especially helpful to both countries. When one passes from these grave subjects to the greener and gayer meadows of fiction, the change from forty years ago shows itself rather in quality than in quantity. In the seventies few novels of literary merit were appearing in America, certainly very few that won reputation in Europe, until those who are now illustrious veterans—Mr. W. D. Howells and Mr. Henry James—made themselves known. Isolated works of striking indi-

NOTED AMERICAN WRITERS

viduality shone out now and then, like the best of Mark Twain's, but there was no such number of really finished and artistic story-tellers as America has to-day, when at least three novelists (besides the veterans just referred to) are admittedly equal to the best of their English competitors. The American novel is now no longer content to depict phases of local life, though that is still effectively done, and the romantic element that has long been associated with the Far West is now so fast fading away that it will soon cease to be available for local color. But several of the best writers of to-day are grappling with the newer issues of life, in an imaginative way, and in a more 'continental' spirit, so to speak, than any of their predecessors. They are less influenced by French models than most of our English writers have been; and in their hands realism does not so much occupy itself with small details. One is now struck by the presence of what European travelers when they return from America used to complain of as wanting there; I mean delicate elaboration in workmanship. This care and finish are now evident not only in fiction, but in literary criticism also. Good criticism is almost as rare both in literature and in art, as good original work; and in the United States there was but little of it in the seventies or eighties, and far less than one finds now. . . . It is now more than thirty years since the chief names in poetry were ceasing to write both in America and in Britain; and just as in the latter the places left vacant by the disappearance of Tennyson, Browning, Matthew Arnold, and Swinburne have not been filled, so neither have any successors to Longfellow, Lowell, Emerson, Bryant, Holmes, or Whittier—some might add Whitman—attained an equally conspicuous position. It is not that in either country people care less for poetry—all the verses of merit that appear are eagerly read—but not only these two countries, but the nations of continental Europe also, still await the great geniuses who will doubtless, as after former periods of comparative quiescence, at last swim into the sky. The question may also be put: Are British and American literature drawing closer to each other with the immensely increased personal intercourse of the two peoples and the better knowledge each has of the other? They are doubtless more occupied with the same subjects than they used to be, because the United States is altogether in fuller touch with the Old World. But the distinctive color or flavor, whichever one is to call it, of the New World is still evident. When one opens a book without knowing who the author is or where it is published, there is something not merely in the words or style, but in the way of thinking, and in the atmosphere (so to speak) which the thoughts breathe, which reveals the author's nationality. The difference between spirit and flavor of the literature of the two peoples seems to me personally less marked than are the differences between their institutions and their respective national characters. Nevertheless, it exists, and it seems likely to continue. That it should continue is much to be desired by those who value individuality and who feel that the ideas and tastes of mankind may some day find themselves in danger of becoming too uniform. The more variety there is, so much the more progress, for variety is stimulating as well as enjoyable."—J. Bryce, *Stray thoughts on American literature* (*North American Review*, March, 1915).

"Both in New York and in New England the most popular form of recent literature has probably been the short story. From influences in a

way common to both regions, combined with influences quite distinct, there have emerged meanwhile the three American novelists who have attained such eminence as to demand separate consideration. One—Howells—is completely American; the other two—James and Crawford—are Americans whose principal work has been deeply affected by European environment."—B. Wendell, and C. N. Greenough, *History of literature in America*, pp. 395.

AMERICAN POLITICAL SCIENCE ASSOCIATION.—In December, 1902, "at the Philadelphia meeting [of the American Historical Association, q. v.] a number of persons who were members either of the Historical Association or of the Economic Association met and discussed the advisability of forming an association devoted to the study and discussion of topics in political science. It was then decided to take the matter under advisement and to give it serious consideration. A committee, appointed at Philadelphia to investigate the subject and gather opinions, reported at New Orleans in favor of establishing an organization not affiliated formally with either of the older associations. In accordance with that recommendation, a new society called the American Political Science Association was formed. Its purpose is to advance the study of politics, public law, administration, and diplomacy. There was a general feeling among the men who formed this association that their fields of work were so decidedly different from the fields of economics and history that only by the formation of a separate society could their topics receive proper attention and be sufficiently discussed."—*Meeting of the American Historical Association at New Orleans* (*American Historical Review*, April, 1904, p. 430). —"The need for such an association as this, which should do for political science what the American Economic and American Historical Associations are doing for economics and history respectively, had been felt for a number of years. . . . At a meeting of those interested, in the Tilton Memorial Library of Tulane University, December 30, 1903, there was established, as has been said, The American Political Science Association. As its

first president was elected Dr. Frank J. Goodnow, professor of administrative law in Columbia University. . . . Professor W. W. Willoughby of Johns Hopkins University was elected as the secretary and treasurer."—W. W. Willoughby (*American Political Science Quarterly*, March, 1904, p. 100-111).—Since that time the Association has had, through its annual meetings and its publication, the *American Political Science Review*, a stimulating effect on political thought and teaching.

AMERICAN PROTECTIVE ASSOCIATION, or **A. P. A.**, a secret order formed in 1887 at Clinton, Iowa, under the leadership of Henry F. Bowers. It was an outgrowth of the Know-Nothing Party and was opposed to Roman Catholic influence in politics, and in the schools. Its influence was greatest in 1896, after which its power declined rapidly.

AMERICAN REPUBLICS, **International Union of**.—South and Central American nations: Their recent rapid advance in character, dignity, and importance.—In 1890, when Mr. Blaine, as secretary of state, opened the first well-planned endeavor of the government of the United States to put itself into such relations with them, of friendly influence, there was little appreciation of the importance of the movement. Even Mr. Blaine did not seem to be fully earnest and fully sanguine in it, or else his chief and his colleagues in the government were not heartily with him; for his admirable scheme of policy was almost wrecked in the second year of its working, by ill feelings aroused between Chile and the United States, casting suspicion on the motives with which the great republic of North America had made overtures of fraternity to the republics of the south and freshening an old distrust in their minds. Happily, however, Mr. Blaine, in 1890, had brought about the creation of a harmonizing and unifying agency which needed only time to effect great results. This was the bureau of the American republics, established at Washington, by a vote of the delegates from eighteen North, South and Central American governments, at an International American Conference, held in that city in March of the year named. Its immediate purpose was the promotion of commercial intercourse; but the information spread with that object, through all the countries concerned, has carried with it every kind of pacific understanding and stimulation. The common action with common interests thus organized must have had more than anything else to do with the generating of a public spirit in the Spanish-American countries very different from any ever manifested before. The Central and South American republics had so little standing among the nations that few of them were invited to the Peace Conference of 1890, and the invitation was accepted by none. Spanish America was represented by Mexico alone. At

the conference of 1907 at The Hague there were delegates from all, and several among their delegates took a notably important part, giving a marked distinction to the peoples they represented. It was by special effort on the part of our then secretary of state that they were brought thus into the council of nations. Mr. Root had great success, indeed, in realizing the aim of the policy projected and initiated by Mr. Blaine. He did much to clear away distrust and to win the confidence of the Americans at the middle and south of the hemisphere.

1890.—**First International American Conference at Washington**.—**Pan-American Union** and its bureau created.—A "bureau, or agency, representing the Republics of the Western Hemisphere, was suggested to the delegates accredited to the International American Conference held in Washington in 1889-90, by the conference held at Brussels in May, 1888, which planned for an international union for the publication of customs tariffs, etc. . . . On March 29, 1890, the International American Conference, by a unanimous vote of the delegates of the eighteen countries there represented, namely: The Argentine Republic, Bolivia, Brazil, Chile, Colombia, Costa Rica, Ecuador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Paraguay, Peru, Salvador, United States, Uruguay, and Venezuela, provided for the establishment of an association to be known as 'The International Union of American Republics for the Prompt Collection and Distribution of Commercial Information,' which should be represented at the capital of the United States by a Bureau, under the title of 'The Bureau of the American Republics.' This organ, so to speak, of the independent governments of the New World was placed under the supervision of the Secretary of State of the United States, and was to continue in existence for a period of ten years, and, if found profitable to the nations participating in its advantages, it was to be maintained for successive periods of ten years indefinitely. At the first session of the Fifty-first Congress of the United States, that body, in an 'Act making appropriations for the support of the Diplomatic and Consular Service, etc.' approved July 14, 1890, gave the President authority to carry into effect the recommendations of the Conference so far as he should deem them expedient, and appropriated \$36,000 for the organization and establishment of the Bureau, which amount it had been stipulated by the delegates in the Conference assembled should not be exceeded, and should be annually advanced by the United States and shared by the several Republics in proportion to their population. . . . The Conference had defined the purpose of the Bureau to be the preparation and publication of bulletins concerning the commerce and resources of the American Republics, and to furnish information of interest to manufacturers, merchants, and shippers, which should be at all times available to persons desirous of obtaining particulars regarding their customs tariffs and regulations, as well as commerce and navigation."—*Bulletin of the Bureau of American republics*, June, 1898.—A plan of government for the international union, by an executive committee composed of representatives of the American nations constituting the union, was adopted in 1896, but modified at a conference held in Washington, March 18, 1899. As then adopted, the plan of government is as follows: "The Bureau of the American Republics will be governed under the supervision of the Secretary of State of the United States, with the cooperation and advice of four representatives of the other Republics composing the International Union, the five persons indicated to

constitute an Executive Committee, of which the Secretary of State is to be ex-officio Chairman, or, in his absence, the Acting Secretary of State. The other four members of the Executive Committee shall be called to serve in turn, in the alphabetical order of the official names of their nations in one of the four languages of the Union, previously selected by lot at a meeting of the representatives of the Union. At the end of each year the first of these four members shall retire, giving place to another representative of the Union, in the same alphabetical order already explained, and so on until the next period of succession. . . . The interest taken by the various States forming the International Union of American Republics in the work of its organic bureau is evidenced by the fact that for the first time since its creation in 1890 all the republics of South and Central America are now [1899] represented in it. The unanimous recommendation of the International American Conference, providing for the International Union of American Republics, stated that it should continue in force during a term of ten years from the date of its organization, and no country becoming a member of the union should cease to be a member until the end of said period of ten years, and unless twelve months before the expiration of said period a majority of the members of the union had given to the Secretary of State of the United States official notice of their wish to terminate the union at the end of its first period, that the union should continue to be maintained for another period of ten years, and thereafter, under the same conditions, for successive periods of ten years each. The period for notification expired on July 15, 1899, without any of the members having given the necessary notice of withdrawal. Its maintenance is therefore assured for the next ten years."

—*Message of the president of the United States, December 5, 1899.*—See also U. S. A.: 1889-1891.

1901-1902.—**Second International American Conference, held at the City of Mexico.—Its proceedings, conventions, resolutions, etc.**—On the suggestion of President McKinley and on the invitation of President Diaz, of Mexico, a second conference was convened at the city of Mexico, on October 23, 1901. The sessions of this conference were prolonged until January 31, 1902. It was attended by delegates from every independent nation then existing in America, being twenty in number; but the delegation of Venezuela was withdrawn by the government of that state on January 14 and the withdrawal was made retroactive to and from the preceding December 31. The delegation from the United States was composed of ex-United States Senator Henry G. Davis; Mr. William I. Buchanan, formerly envoy extraordinary and minister plenipotentiary to the Argentine Republic; Mr. John Barrett, formerly minister resident of the United States to Siam; and Messrs. Charles M. Pepper and Volney W. Foster. The following account of the work of the conference and its results is compiled from the report made by the delegates of the United States to the Department of State: "Señor Raigosa, chairman of the Mexican delegation, was chosen temporary president, and the Conference then proceeded to its permanent organization by the election of his excellency Señor Lic. Don Ignaci Mariscal, minister of foreign affairs of Mexico, and Hon. John Hay, Secretary of State of the United States, honorary presidents; Señor Lic. Don Genaro Raigosa, of Mexico, president; Señor Don José Hygino Duarte Pereira, of Brazil, first vice-president, and Señor Doctor Don Baltasar Estupinian, of Salvador, second vice-president. . . . Under the rules adopted

19 committees were appointed and the work of the conference was apportioned among them. . . . Discussion between the representatives of the Republics that would constitute the conference began months previous to its opening upon the subject of arbitration, and while every desire was manifested then and thereafter by all to see a conclusion reached by the conference in which all might join, unsettled questions existed between some of the Republics that would participate in the conference of a character that made their avoidance difficult in any general discussion of the subject. . . . This difficulty became more apparent as the conference proceeded with its work. . . . It was tacitly agreed between delegations, therefore, that the discussion of the subject should be confined, so far as possible, to a committee. . . . There was at no time any difficulty with regard to securing a unanimous report favoring a treaty covering merely arbitration as a principle; all delegations were in favor of that. The point of discussion was as to the extent to which the principle should be applied. Concerning this, three views were supported in the conference: (a) Obligatory arbitration, covering all questions pending or future when they did not affect either independence or the national honor of a country; (b) Obligatory arbitration covering future questions only and defining what questions shall constitute those to be excepted from arbitration; and (c) Facultative or voluntary arbitration, as best expressed by The Hague convention. . . . A plan was finally suggested providing that all delegations should sign the protocol for adhesion to the convention of The Hague, as originally suggested by the United States delegation, and that the advocates of obligatory arbitration sign, between themselves, a project of treaty obligating their respective governments to submit to the permanent court at The Hague all questions arising or in existence, between themselves, which did not affect their independence or their national honor. Both the protocol and treaty were then to be brought before the conference, incorporated in the minutes without debate or action, and sent to the minister of foreign relations of Mexico, to be officially certified and transmitted by that official to the several signatory governments. After prolonged negotiations this plan was adopted and carried out as outlined above, all of the delegations in the conference, excepting those of Chile and Ecuador, signing the protocol covering adherence to The Hague convention before its submission to the conference. These, after a protracted debate on a point of order involving the plan adopted, later accepted in open conference a solution which made them—as they greatly desired to be, in another form than that adopted—parties to the protocol. The project of treaty of compulsory arbitration was signed by the delegations of the Argentine Republic, Bolivia, Santo Domingo, El Salvador, Guatemala, Mexico, Paraguay, Peru, Uruguay, and Venezuela. . . .

"In addition to accepting The Hague convention the conference went further. It accepted the three Hague conventions as principles of public American international law, and authorized and requested the President of the Mexican Republic, as heretofore explained, to enter upon negotiations with the several American Governments looking toward the most unrestricted application of arbitration possible should the way for such a step appear open. In addition to the protocol and treaty referred to, another step was taken in the direction of the settlement of international controversies by the adoption and signing, on the part of every country represented in the conference, of

a project of treaty covering the arbitration of pecuniary claims. Under this the several republics [obligated] themselves for a period of five years to submit to the arbitration of the court at The Hague all claims for pecuniary loss or damage which [might] be presented by their respective citizens and which [could not] be amicably adjusted through diplomatic channels when such claims [were] of sufficient importance to warrant the expense of arbitration. . . .

"Among the most important recommendations made by the First International American Conference, held in Washington in 1889-90, with a view to facilitating trade and communication between the American Republics, was that looking to the construction of an intercontinental railway, by which all of the republics on the American continent would be put into rail communication with each other. In pursuance of the recommendations of that conference, an international railway commission was organized, and under its direction surveys were made which showed that it would be entirely practicable, by using, as far as possible, existing railway systems and filling in the gaps between them. . . . The report of the intercontinental railway commission showed that the distance between New York and Buenos Ayres by way of the proposed line would be 10,471 miles, of which a little less than one-half had then been constructed, leaving about 5,456 miles to be built. Following up the work of the first conference and the intercontinental railway commission, the [second] conference adopted a strong report and a series of carefully considered recommendations on this subject. . . . Another resolution . . . is that regarding quarantine and sanitary matters. In dealing with this subject the object of the conference was to make sanitation take the place of quarantine. . . .

"The conference fully recognized the value and importance to all the Republics of the International Bureau of the American Republics, which was established in Washington in pursuance of the action of the First International American Conference. . . . With a view to rendering the Bureau still more useful to all the countries represented in its administration, and making it still more valuable in establishing and maintaining closer relations between them, the conference adopted a plan of reorganization, or rather of broadening and expanding the existing organization. . . . The new regulations adopted [provided] that the Bureau [should] be under the management of a governing board to be composed of the Secretary of State of the United States, who [was] to be its chairman, and the diplomatic representatives in Washington of all the other governments represented in the Bureau. This governing board [was] to meet regularly once a month, excepting in June, July, and August of each year. . . . In order that the archæological and ethnological remains existing in the territory of the several Republics of the Western Hemisphere might be systematically studied and preserved, the conference adopted a resolution providing for the meeting of an American international archæological commission in the city of Washington, D. C., within two years from the date of the adoption of the resolution. . . . The conference gave its most hearty indorsement to the project for the construction of an interoceanic canal by the Government of the United States. . . . The recommendation of the conference that there be established in New York, Chicago, San Francisco, New Orleans, Buenos Ayres, or any other important mercantile center, a bank with branches in the principal cities

in the American republics, [was] in line with the similar resolution adopted by the First International American Conference in Washington in 1889-90.

"In addition to the protocol for the adherence of the American Republics to the Convention of The Hague, the treaty of compulsory arbitration signed by nine delegations, and the treaty for the arbitration of pecuniary claims, the Conference agreed to and signed a treaty for the extradition of criminals, . . . including a clause making anarchy an extraditable offense when it shall have been defined by the legislation of the respective countries; a convention on the practice of the learned professions, providing for the reciprocal recognition of the professional diplomas and titles granted in the several Republics; a convention for the formation of codes of public and private international law; . . . a convention on literary and artistic copyrights; . . . a convention for the exchange of official, scientific, literary, and industrial publications; . . . a treaty on patents of invention, etc.; . . . and a convention on the rights of aliens." The treaty on patents and the convention on the rights of aliens could not be signed by the delegates of the United States, for reasons set forth in their report.—*57th Congress, 1st Session 1901-1902, Senate Document 330*.—See also *ARBITRATION, INTERNATIONAL: Modern period: 1902; MEXICO: 1904-1905*.

1906.—Third International American Conference, at Rio de Janeiro, Brazil.—Proceedings, conventions, resolutions.—The third international conference of American republics was held at Rio de Janeiro, Brazil, from July 21 to August 26, 1906. It was attended by delegates from each of the twenty-one American republics, excepting only Hayti and Venezuela. The delegates from the United States of America were the Hon. William I. Buchanan, chairman, formerly envoy extraordinary and minister plenipotentiary to the Argentine Republic; Dr. L. S. Rowe, professor of political science, University of Pennsylvania; Hon. A. J. Montague, ex-governor of Virginia; Mr. Tulio Larinaga, resident commissioner from Porto Rico in Washington; Mr. Paul S. Reinsch, professor of political science, university of Wisconsin; Mr. Van Leer Polk, ex-consul-general; with a staff of secretaries, etc., from several departments of the public service at Washington. The conference was attended also by the secretary of state of the United States, the Hon. Elihu Root, incidentally to an important tour through many parts of South America which he made in the months of that summer. In the course of his journey he visited, on invitation, not only Brazil, but Uruguay, Argentina, Chile, Peru, Panama, and Colombia; and, as stated in the next annual message of President Roosevelt, "he refrained from visiting Paraguay, Bolivia, and Ecuador only because the distance of their capitals from the seaboard made it impracticable with the time at his disposal. He carried with him a message of peace and friendship, and of strong desire for good understanding and mutual helpfulness; and he was everywhere received in the spirit of his message."

In the instructions to the delegates from the United States, prepared by Secretary Root, this wise admonition was conveyed:—It is important that you should keep in mind and, as occasion serves, impress upon your colleagues, that such a conference is not an agency for compulsion or a tribunal for adjudication; it is not designed to compel States to make treaties or to observe treaties; it should not sit in judgment upon the conduct of any State, or undertake to redress alleged

wrongs, or to settle controverted questions of right. A successful attempt to give such a character to the Conference would necessarily be fatal to the Conference itself, for few if any of the States represented in it would be willing to submit their sovereignty to the supervision which would be exercised by a body thus arrogating to itself supreme and indefinite powers. The true function of such a conference is to deal with matters of common interest which are not really subjects of controversy, but upon which comparison of views and friendly discussion may smooth away differences of detail, develop substantial agreement and lead to coöperation along common lines for the attainment of objects which all really desire. It follows from this view of the functions of the Conference that it is not expected to accomplish any striking or spectacular final results; but is to deal with many matters which, not being subjects of controversy, attract little public attention, yet which, taken together, are of great importance for the development of friendly intercourse among nations; and it is to make such progress as may now be possible toward the acceptance of ideals, the full realization of which may be postponed to a distant future. All progress toward the complete reign of justice and peace among nations is accomplished by long and patient effort and by many successive steps; and it is confidently hoped that this Conference will mark some substantial advancement by all the American States in this process of developing Christian civilization. Not the least of the benefits anticipated from the Conference will be the establishment of agreeable personal relations, the removal of misconceptions and prejudices, and the habit of temperate and kindly discussion among the representatives of so many Republics."

The following account of the conference and its action is derived from the subsequent official report of the delegates of the United States:—"The sessions of the Conference were held in a spacious and ornate building, erected especially for this purpose by the Brazilian Government, and situated on the superb new boulevard that for nearly four miles follows the shore of the Bay of Rio, and at the end of the new Avenida Central. The building is a permanent one, reproduced in granite and marble from the plans of the palace erected by Brazil at the Louisiana Purchase Exposition, at St. Louis. . . . It was christened 'The Monroe Palace' by special action of the Brazilian Government. The Brazilian Government installed in the palace a complete telegraph, mail, and telephone service, and telegrams, cables, and mail of the different delegations and of individual delegates were transmitted free. . . . The governments of the Argentine Republic, Paraguay, Uruguay, and Chili . . . officially extended, through the director of telegraphs of Brazil, the courtesy of free transit for all telegrams sent by delegates over the telegraph lines of their respective countries. . . . In connection with the work of the Conference, the Brazilian Government organized and maintained at its expense an extensive and competent corps of translators, stenographers, and clerical assistants, whose services were at all times at the command of the delegates. . . . The palace was elaborately lighted and was the center of attraction day and night for great crowds of people, and nothing in connection with its equipment and administration or that concerned the comfort or convenience of delegates was left undone by the Brazilian Government.

"The Conference was formally opened in the presence of a large and distinguished audience on the evening of July 23, 1906, by His Excellency the

Baron do Rio Branco, the distinguished Brazilian minister for foreign affairs. The approaches to the palace were lined with troops, the public grounds and avenues of the city brilliantly illuminated and packed with people. . . . The Conference unanimously chose as its president, His Excellency Señor Dr. Joaquim Nabuco, the Brazilian Ambassador to the United States; as honorary vice-presidents, His Excellency the Baron do Rio Branco, and the Hon. Elihu Root, Secretary of State of the United States, and as its Secretary-General, His Excellency, Señor Dr. J. F. de Assis-Brasil, the Brazilian envoy extraordinary and minister plenipotentiary to the Argentine Republic. The Conference was attended by delegates from each of the 21 American Republics, with the exception of Haiti and Venezuela. The extraordinary session of the Conference to receive the Secretary of State of the United States was held on the evening of July 31 and was one of great brilliancy. In introducing the Secretary of State to the Conference, His Excellency Dr. Joaquim Nabuco, the Brazilian Ambassador to the United States and President of the Conference, delivered a notable address, to which the Secretary of State replied." Mr. Root's address well deserved the distinction that was accorded to it by the president of the United States, when he appended it to his message to Congress the following December. Much of it gains new significance from the World War.

"I bring from my country," said the secretary, "a special greeting to her elder sisters in the civilization of America. Unlike as we are in many respects, we are alike in this, that we are all engaged under new conditions, and free from the traditional forms and limitations of the Old World in working out the same problem of popular self-government. It is a difficult and laborious task for each of us. Not in one generation nor in one century can the effective control of a superior sovereign, so long deemed necessary to government, be rejected and effective self-control by the governed be perfected in its place. The first fruits of democracy are many of them crude and unlovely; its mistakes are many, its partial failures many, its sins not few. Capacity for self-government does not come to man by nature. It is an art to be learned, and it is also an expression of character to be developed among all the thousands of men who exercise popular sovereignty. To reach the goal toward which we are pressing forward, the governing multitude must first acquire knowledge that comes from universal education, wisdom that follows practical experience, personal independence and self-respect befitting men who acknowledge no superior, self-control to replace that external control which a democracy rejects, respect for law, obedience to the lawful expressions of the public will, consideration for the opinions and interests of others equally entitled to a voice in the state, loyalty to that abstract conception—one's country—as inspiring as that loyalty to personal sovereigns which has so illumined the pages of history, subordination of personal interests to the public good, love of justice and mercy, of liberty and order. All these we must seek by slow and patient effort; and of how many shortcomings in his own land and among his own people each one of us is conscious! Yet no student of our times can fail to see that not America alone but the whole civilized world is swinging away from its old governmental moorings and intrusting the fate of its civilization to the capacity of the popular mass to govern. By this pathway mankind is to travel, whithersoever it leads. Upon the success of this our great un-

dertaking the hope of humanity depends. Nor can we fail to see that the world makes substantial progress towards more perfect popular self-government. . . . It is not by national isolation that these results have been accomplished or that this progress can be continued. No nation can live unto itself alone and continue to live. Each nation's growth is a part of the development of the race. There may be leaders and there may be laggards, but no nation can long continue very far in advance of the general progress of mankind, and no nation that is not doomed to extinction can remain very far behind. It is with nations as with individual men; intercourse, association, correction of egotism by the influence of others' judgment, broadening of views by the experience and thought of equals, acceptance of the moral standards of a community the desire for whose good opinion lends a sanction to the rules of right conduct—these are the conditions of growth in civilization. . . . To promote this mutual interchange and assistance between the American republics, engaged in the same great task, inspired by the same purpose, and professing the same principles, I understand to be the function of the American Conference now in session. There is not one of all our countries that cannot benefit the others; there is not one that cannot receive benefit from the others; there is not one that will not gain by the prosperity, the peace, the happiness of all. . . . The association of so many eminent men from all the Republics, leaders of opinion in their own homes; the friendships that will arise among you; the habit of temperate and kindly discussion of matters of common interest; the ascertainment of common sympathies and aims; the dissipation of misunderstandings; the exhibition to all the American peoples of this peaceful and considerate method of conferring upon international questions—this alone, quite irrespective of the resolutions you may adopt and the conventions you may sign, will mark a substantial advance in the direction of international good understanding. These beneficent results the Government and the people of the United States of America greatly desire. We wish for no victories but those of peace; for no territory except our own; for no sovereignty except the sovereignty over ourselves. We deem the independence and equal rights of the smallest and weakest member of the family of nations entitled to as much respect as those of the greatest empire, and we deem the observance of that respect the chief guaranty of the weak against the oppression of the strong. We neither claim nor desire any rights, or privileges, or powers that we do not freely concede to every American republic. We wish to increase our prosperity, to expand our trade, to grow in wealth, in wisdom, and in spirit, but our conception of the true way to accomplish this is not to pull down others and profit by their ruin, but to help all friends to a common prosperity and a common growth, that we may all become greater and stronger together. Within a few months, for the first time the recognized possessors of every foot of soil upon the American continents can be and I hope will be represented with the acknowledged rights of equal sovereign states in the great World Congress at The Hague. This will be the world's formal and final acceptance of the declaration that no part of the American continents is to be deemed subject to colonization. Let us pledge ourselves to aid each other in the full performance of the duty to humanity which that accepted declaration implies; so that in time the weakest and most unfortunate of our republics may come to march with equal step by

the side of the stronger and more fortunate. Let us help each other to show that for all the races of men the liberty for which we have fought and labored is the twin sister of justice and peace. Let us unite in creating and maintaining and making effective an all-American public opinion, whose power shall influence international conduct and prevent international wrong, and narrow the causes of war, and forever preserve our free lands from the burden of such armaments as are massed behind the frontiers of Europe, and bring us ever nearer to the perfection of ordered liberty. So shall come security and prosperity, production and trade, wealth, learning, the arts, and happiness for us all."—See also PEACE MOVEMENT: Attitude of governments.

The fruits of the conference were embodied in four conventions and a number of important resolutions. One convention agreed to, established between the states signing it the status of naturalized citizens who again take up their residence in the country of their origin. (See NATURALIZATION.) Another, which amended and extended the operation of a treaty signed at the second conference, at Mexico, in 1902, is as follows: "Sole article. The treaty on pecuniary claims signed at Mexico January thirtieth, nineteen hundred and two, shall continue in force, with the exception of the third article, which is hereby abolished, until the thirty-first day of December, nineteen hundred and twelve, both for the nations which have already ratified it, and for those which may hereafter ratify it." The third convention signed was a modification and extension of another of the agreements of the second conference, at Mexico, having relation to patents of invention, literary property, etc. The fourth convention provided for an "international Commission of Jurists, composed of one representative from each of the signatory States, appointed by their respective Governments, which Commission shall meet for the purpose of preparing a draft of a code of Private International Law and one of Public International Law, regulating the relations between the nations of America" The more important of the resolutions adopted were the following: "To ratify adherence to the principle of arbitration, and, to the end that so high a purpose may be rendered practicable, to recommend to the Nations represented at this Conference that instructions be given to their Delegates to the Second Conference to be held at The Hague, to endeavor to secure by the said Assembly, of world-wide character, the celebration of a General Arbitration Convention, so effective and definite that, meriting the approval of the civilized world, it shall be accepted and put in force by every nation. To recommend to the Governments represented therein that they consider the point of inviting the Second Peace Conference, at The Hague, to examine the question of the compulsory collection of public debts, and, in general, means tending to diminish between Nations conflicts having an exclusively pecuniary origin." Other resolutions of the conference were directed to a broadening of the work and an enlargement of the influence of the international bureau of the American republics; to the erection of a building for that bureau and for the contemplated library in memory of Columbus; to the erection in the bureau of a section having "as its chief object a special study of the customs legislation, consular regulations and commercial statistics of the Republics of America," with a view to bringing them into more harmony, and to securing the greatest development and amplification of commercial relations between American republics; to promote

the establishment and maintenance of navigation lines connecting the principal ports of the American continent; to bring about more effective co-operation in international sanitary measures; to advance the construction of lines that shall form, connectedly, the desired Pan-American railway, extending through the two continents.

1906-1908.—Bureau's increased efficiency.—Building given by Andrew Carnegie.—The international bureau of the American republics assumed larger functions and increased importance in 1906, after the return of Mr. Root, United States secretary of state, from his tour of visits to the South American states. The Hon. John Barrett, who had successively represented the government of the United States in Panama, in Argentina and in Colombia, as well as at the second Pan-American conference, in Mexico, was made Director of the Bureau and entered upon his duties with a strong belief in the possibilities of good to be done in the American hemisphere by an energetic promotion of more intimate relations between its peoples. At the same time a new dignity was given to the international union of the American republics, embodied in the work of the bureau, by the provision of a stately building for its use. Mr. Root had persuaded Congress to appropriate \$200,000 for the site and building of such a home, to be offered to the union, and this inadequate sum was supplemented by a generous private gift from Andrew Carnegie, who offered an addition of \$750,000 to the fund for the Pan-American building. The site secured for the structure was that of the old Van Ness mansion, about half-way between the State, War and Navy buildings and the Potomac River. It covers a tract of five acres, facing public parks on two sides. There the corner stone of a central seat of Pan-American coöperations and influences was laid in May, 1908, in the presence of official representatives from twenty-one American republics, and under their assembled flags.—See also A B C CONFERENCE.

1910.—Fourth International American Conference, at Buenos Aires.—"It was notable for having finally dealt with all the subjects on its program, including treaties relating to patents, trademarks, and copyrights. A treaty was also made for the indefinite extension of the agreement for the arbitration of pecuniary claims. In the report of the delegates to the fourth conference special reference is made to the harmony which characterized its deliberations. There can be no doubt that, quite apart from the actual work accomplished, the free interchange of views in friendly conference between representative men from all parts of America cannot fail to create a better understanding and to draw closer the relations between the countries concerned. This is indeed one of the chief benefits of the International American Conferences. The process of assimilating or harmonizing legal rules and remedies in countries whose systems of jurisprudence are derived from different sources is necessarily slow and uncertain. But this by no means implies the existence of a serious obstacle to the promotion of a free and beneficial intercourse."—J. B. Moore, *Principles of American diplomacy*, p. 392.—See also AMERICAN INSTITUTE OF INTERNATIONAL LAW.

1914.—Pan-American Neutrality.—On Dec. 8, 1914, a meeting of the governing board of the Pan-American Union was held in Washington to consider the question of Pan-American neutrality in the War, and appointed a committee to study the problems of the War.

1915.—Pan-American Financial Conference. See PAN-AMERICAN FINANCIAL CONFERENCE.

1915-1916.—Pan-American Scientific Congress. See PAN-AMERICAN SCIENTIFIC CONGRESS.

1915-1920.—Effect of World War.—Closer union.—"One of the most significant effects of the war upon the southern Republics was the change which it wrought in their relations with one another. I do not refer to the formation of such political or diplomatic associations as the so-called A B C arbitration league of May, 1915. . . . More significant and fundamental, though far less spectacular than this, are the prosaic commercial, economic, and social bonds which have grown up among them during the enforced cessation of many of their contacts with the outside world from 1914 to 1919. For the first time in their history they were compelled to become acquainted with one another, and the effects of this are strikingly apparent to any observer who has been in a position to compare prewar impressions with those of to-day. . . . Just as the preoccupations of Europe in its previous great cataclysm, the Napoleonic war, enabled Latin America to achieve her political independence, so has the recent upheaval in the Old World given the southern Republics their first real appreciation of their own capacity for self-development and interregional coöperation along economic and social lines. . . . Since 1918 detailed plans or arrangements have been made for the construction in Latin America of at least five international railways and six or more international cable and telegraph lines. . . . The noteworthy point is the fact that the majority of these enterprises are being undertaken with local capital. Commercial changes of the same sort are noticeable on every hand, due especially to the extraordinary diversification of industries and production in the past six years. Since 1914 the trade between Argentina and Brazil has grown 500 per cent, and all the latest statistics point to even further expansion. Mexican commerce with the more important South American countries, including such items as foodstuffs, oil, fibers, and even newsprint paper, has been more than quadrupled during the war, and the most rapid growth has come in the past two years. During 1919 and 1920 at least five inter-Latin American congresses were held, not with the object of exchanging those beautiful expressions of fraternal affection which too frequently befog the atmosphere of such assemblages. Quite the contrary; their subject matter in each case was prosaic and unpicturesque, but at the same time definite and constructive—dairying and pastoral agriculture, police regulations, immigration, architecture, and physical education. . . . Before 1914 there was not one American branch bank in Latin America, while to-day there are over a hundred; that there are nearly a dozen American chambers of commerce in the southern Republics, the oldest of them having been founded about two years ago; that important new American cable connections and the valuable services of the two great American news-gathering associations have been greatly extended in that field; and that American ships are now sufficiently numerous in southern waters to carry nearly 50 per cent of our trade there, which is five times the proportion carried in 1914. The Inter-American High Commission has since 1915 been unostentatiously but surely working out a definite and effective series of bonds in the shape of uniform commercial law and practice—a constructive program of the highest value."—J. Klein, *Monroe Doctrine as a regional understanding* (*Pan-American Union, Bulletin*, v. 52, No. 2,

Feb., 1921, pp. 140-142).—The same author states: "It would be absurd, of course, to suggest that the years 1914-1918 had delivered Latin America from any further economic dependence upon Europe; but in view of certain significant facts . . . it would be equally ridiculous to assume that Latin America will continue to look to Europe, or even to the United States, for the fulfillment of all of her needs for manufactured commodities, and even for capital and fuel. The amount of evidence on this point is ample, and instead of falling off after 1918, it has steadily increased. . . . Argentine citizens recently loaned 1,500,000,000 lire to the Italian Government; the Argentine Government has advanced 140,000,000 to the Allies."—*Ibid.*—See also PAN-AMERICANISM and names of American republics.

AMERICAN SYSTEM, a tariff system proposed by Henry Clay, about the time of the beginning of protectionism, by which home manufactures were to be protected for the greater development of the cities, and raw materials were to be protected for the advantage of western farmers. Such an arrangement would be mutually profitable to the North and the West, but distinctly unfavorable to the South, where high tariffs on imported manufactured goods created strong opposition to the American system.—See also TARIFF: 1808-1824, 1832.

AMERICANIZATION.—Early work for immigrants.—"Americanization is the educational process of unifying both native-born and foreign-born Americans in perfect support of the principles of liberty, union, democracy, and brotherhood. It selects and preserves the best qualities in our past and present Americanism; it singles out and fosters such traits of the foreign-born as will contribute to the welfare of our people."—E. S. Bogardus, *Essentials of Americanization*, pp. 11.—Most of the early work for immigrants was done by churches, Bible societies, etc. "The first and most primitive form of work among immigrants

was that of the Bible Society. The form this work took was 'colportage,' the peddling of Bibles. Yet something more than the ability of the book-agent to make sales was required of the 'colporteur'. . . . The men chosen to sell Bibles in immigrant communities were often foreigners, many of them men who were preparing themselves for missionary work in their own countries." The Young Women's Christian Association was one of the pioneers in the field, working through its department for foreign born women for the mothers and the industrial girls of foreign communities. "International Institutes," with both American and foreign-speaking nationality workers, provide education, recreation, and training in home-making and citizenship. "In point of time, the first societies for immigrants in the field were those maintained by their own people. Their object was chiefly benevolent. The German Society for example was organized in 1784, the French Benevolent Society goes back to 1809, the Irish Emigrant Society gives 1841 as the date of foundation, the Swiss Benevolent Society was organized in 1851, the Home for Scandinavian Immigrants in 1851, the Spanish Benevolent Society in 1882, the Society for Italian Immigrants in 1901 and so on. It is interesting that the society administering the Baron de Hirsch Fund for Roumanian, Russian and Galician Immigrants, as well as the Hebrew Sheltering and Immigrant Aid Society, are the only foreign societies which for years have made the Americanization of immigrants one of the objects of their organizations. Of course this is explained by the fact that the majority of the immigrants handled by these societies had a nationality—to gain and none to lose in coming to this country. However, we now have the swing-back of the pendulum and see the Jews claiming territorial rights in Palestine. . . .

"The Slavonic peoples also establish benefit societies for the purpose of aiding the needy among their co-nationals. Those coming from countries where they were deprived of the means of education often pursue educational aims. For example, the National Slovak Society of the United States of America states as its object: 'To educate the Slovak immigrants . . . to teach them to love their adopted country and to become useful citizens of this republic.' The non-sectarian Cleveland Slovak union insists that all members become U. S. citizens within six years after arrival. The Sokels, ostensibly an athletic organization, have everywhere a strong national background. In illustration of this, you will find its members in America enlisting in the Polish Army, the Czecho-Slovak Legions, etc., rather than under the U. S. flag. Representatives of various nationalities have joined in a League of Foreign-born Citizens of which Wm. Fellows Morgan, President of the Merchants Association, is the head. This League concerns itself with the education and naturalization of the foreign born. It is rather interesting that one of the earliest American societies concerning itself with immigrants was organized with a view to the restriction of immigrations. This is the Immigration Restrictions League with headquarters in Boston founded in 1804. This League was one of the warmest supporters of the Burnett bill—or literacy test. It has stood for a higher head-tax, the abolition of the bond, the deportation of aliens without time-limit, etc. In contrast to this League, we have five corrective (among them), the National Liberal Immigration League, which pleads for distribution and education and vigorously opposes indiscriminate restriction. Like the Restrictions League it disseminates information

and seeks to influence legislation. Like the Restriction League it has a racial axe to grind, with this difference—that the Restriction League would decrease the non-Anglo-Saxon percentage of our population, while the Liberal League discounts all legislation unfavorable to the admission of an oppressed people in Eastern Europe. . . . Like the National Liberal Immigration League, the Chicago Immigrant Protective League was founded in 1908 with Judge Mack as President, Jane Addams as Vice-president and Miss Grace Abbott, author of 'The Immigrant and the Community' as Director. . . . From the beginning the League has had a staff of *foreign visitors*. This League stresses what so many Americanization agencies either disregard or forget, and that is, the necessity for reaching the immigrant in his own language before he learns English and loses in the process the ideals of America which he brought with him. . . .

"The foregoing represent some of the agencies which for the last decade or so have been working for the gradual adjustment of the alien to American environment, without ever saying very much about Americanization. Their chief concern has been for the immigrant himself. The unemployment situation due to the great war drew the interest of quite different organizations into the field—whose chief concern became not the immigrant, but the rest of us—America! Their entrance is marked by such slogans as 'America First'; their platform is a common language, a united citizenship, an American standard of living, a home-stake in America. Their heaviest emphasis is laid on the teaching of English. Among them the Chamber of Commerce of the United States has taken first place and has rendered invaluable service in the way of publicity to the whole movement. Through its Committee on Immigration it has conducted preliminary surveys of immigration conditions in 165 industrial towns."—Address at National Training School, Y. W. C. A., February, 1919.—See also IMMIGRATION AND EMIGRATION; United States: 1910-1920; NATURALIZATION.

Effect of World War and later development.—"The current emphasis upon Americanization had its origin in 1914 when the European War started and a renaissance of nationalism occurred. Americanization Day had its beginning on July 4, 1914, in Cleveland, Ohio; it was fathered by the 'sane Fourth committee.' In 1915 at least 150 cities observed Americanization Day. In that same year, the National Americanization Committee was organized by the Committee for Immigrants in America for the purpose of furthering a nationalization movement that would unify the various peoples in the United States. In 1918, the government undertook specific Americanization work. In the Department of the Interior, the Bureau of Education outlined an Americanization program which has been endorsed and furthered by the National and State Councils of Defense and which has resulted in the appointment of county Americanization councils, and of regional directors under the supervision of the Division of Americanization of the Bureau of Education."—E. S. Bogardus, *Essentials of Americanization*, pp. 12.

The World War brought increased recognition of the importance of the work of Americanization. The census of 1910 had indicated an illiteracy of 7 or 8%, but investigations made at the army camps preliminary to the use of the intelligence tests showed that a much larger proportion of young men were practically illiterate, being unable to read the newspaper or to write a letter home. The proportion ran as high as 17.18% in one

camp, and as high as 41.08% in another. It has been estimated that one-fourth of the members of the American Expeditionary Forces were practically illiterate. This illiteracy was not confined to any particular section of the country. White soldiers from the South were almost as frequently illiterate as the colored soldiers. Non-English-speaking illiterate young men from New York, New Jersey, and New England were sufficiently numerous to shake the confidence of the North in the effectiveness of its education. Illiteracy seemed to be a national problem. The war revealed the fact that many of our naturalized citizens were not truly American in spirit. Early in the year 1916 there was held in Philadelphia a great national conference on immigration and Americanization, participated in by many people of note, such as Mary Antin, P. P. Claxton, United States Commissioner of Education, and Governor Brumbaugh of Pennsylvania. It was pointed out that there are ten million negroes and thirteen million white persons of alien birth in the United States, and that 330,000 men, women and children born outside of this country represent fifty-nine per cent of the depositors in postal banks and seventy-two per cent of the \$70,000,000 deposits. Among the valuable results of the conference was the formation of a National Americanization Council, for the cooperation of public and private agencies. Among the various suggestions were: a Congressional appropriation of \$50,000 for the Bureau of Education's work in eliminating illiteracy among the foreign; a Federal picture-poster of welcome to women aliens as well as to men; Federal protection for women as for men; the abolition of the head-tax on immigrants; the keeping of naturalization courts open at night, and Dr. Sidney Gulick's sane propositions for immigrant registration and the open door. Betterment of laws is anticipated to provide for the education of the foreigner, to guide him into suitable employment, to give him proper housing facilities, to protect him from accident and industrial diseases, and furnish accident compensation.

Hyphenism.—On several public occasions President Wilson called attention to the danger from hyphenated Americans. In May of 1917 he spoke in New York City at the unveiling of a monument to John Barry, the man who held the first commission in the American Navy. He said: "John Barry was an Irishman, but his heart crossed the Atlantic with him. He did not leave it in Ireland. Some Americans need hyphens in their names because only part of them have come over, but when the whole man has come over, heart and thought and all, the hyphen drops of its own weight out of his name. This man was not an Irish-American, but was an Irishman who became an American. I venture to say that if he voted, he voted with regard to the questions as they looked on this side of the water, and not on the other side, and that is my infallible test of the genuine American. This man illustrates for me all the splendid strength which was brought into this country by the magnet of freedom. Men have been drawn to this country by the same thing that made them love this country, by the opportunity to live their own lives and to think their own thoughts and to let their whole natures expand with the expansion of this free and mighty nation. We have brought out of the stocks of all the world all the best impulses, and have appropriated them and Americanized them and translated them into the glory and majesty of this great country." In his annual message to Congress in 1916 at the opening of its session President Wilson denounced the hyphenates

and asked for means to restrict their activities. He said: "I am sorry to say that the gravest threats against our national peace and safety have been uttered within our own borders. There are citizens of the United States, I blush to admit, born under other flags, but welcomed under our generous naturalization laws to the full freedom and opportunity of America, who have poured the poison of disloyalty into the very arteries of our national life; who have sought to bring the authority and good name of our Government into contempt, to destroy our industries wherever they thought it effective for their vindictive purposes to strike at them, and to debase our politics to the uses of foreign intrigue. Their number is not so great as compared with the whole number of those sturdy hosts by which our nation has been enriched in recent generations out of virile foreign stocks; but is great enough to have brought deep disgrace upon us and to have made it necessary that we should promptly make use of processes of law by which we may be purged of their corrupt distempers. . . . A little while ago such a thing would have seemed incredible. Because it was incredible we made no preparation for it. . . . But the ugly and incredible thing has actually come about, and we are without adequate Federal laws to deal with it. I urge you to enact such laws at the earliest possible moment and feel that in doing so I am urging you to do nothing less than save the honor and self-respect of the nation."

Theodore Roosevelt said: "There is no room in this country for hyphenated Americanism. When I refer to hyphenated Americans, I do not refer to naturalized Americans. Some of the very best Americans I have ever known were naturalized Americans, Americans born abroad. But a hyphenated American is not an American at all. This is just as true of the man who puts 'native' before the hyphen as of the man who puts German or Irish or English or French before the hyphen. Americanism is a matter of the spirit and of the soul. Our allegiance must be purely to the United States. We must unsparingly condemn any man who holds any other allegiance. But if he is heartily and singly loyal to this Republic, then no matter where he was born, he is just as good an American as any one else. The one absolutely certain way of bringing this nation to ruin, of preventing all possibility of its continuing to be a nation at all, would be to permit it to become a tangle of squabbling nationalities, an intricate knot of German-Americans, Irish-Americans, English-Americans, French-Americans, Scandinavian-Americans, or Italian-Americans, each preserving its separate nationality, each at heart feeling more sympathy with Europeans of that nationality than with the other citizens of the American Republic. The men who do not become Americans and nothing else are hyphenated Americans; and there ought to be no room for them in this country. The man who calls himself an American citizen and who yet shows by his actions that he is primarily the citizen of a foreign land, plays a thoroughly mischievous part in the life of our body politic. He has no place here; and the sooner he returns to the land to which he feels his real heart-allegiance, the better it will be for every good American. There is no such thing as a hyphenated American who is a good American. The only man who is a good American is the man who is an American and nothing else."—T. Roosevelt, *Fear God and take your own part*, pp. 361-363.

Program and methods.—Foreign-born peoples should be Americanized "by calling upon the fine

things that are within them; by appreciating what they have to offer us, and by revealing to them what we have to offer them. The best test of whether or not we are Americans will come when we, all together, recognize that there are defects in our land and lacks in our system; that our programs are not perfect; that our institutions can be bettered; but look forward constantly by co-operation, to making this a land in which there will be a minimum of fear and a maximum of hope."—F. K. Lane, (*World Outlook*, Nov., 1919).—"Americanization is the uniting of new with native-born Americans in fuller common understanding and appreciation to secure by means of self-government the highest welfare of all. Such Americanization should produce no unchangeable political, domestic and economic régime delivered once for all to the fathers, but a growing and broadening national life, inclusive of the best wherever found. With all our rich heritages Americanism will develop best through a mutual giving and taking of contributions from both newer and older Americans in the interest of the common weal."—*Evening schools of New York City (School and Society*, Jan. 12, 1918).—"The problems of Americanization usually are conceived as questions of assimilation of the European alien. . . . But it should be borne in mind that America of today has taken over also the assimilation of the Negro, the Indian, the Creole, the Filipino, the Porto Rican, the natives of Alaska, of Haiti, of San Domingo, of the Virgin Islands, and of Hawaii, as well as large numbers of Mexican peons, and a few hundred thousand Chinese, Nipponese and other Asiatic immigrants. [See also RACE PROBLEMS.] It is well to remind ourselves that we have not yet really set ourselves to work in earnest at Americanizing some of our native-born, for example the isolated mountain whites of Kentucky and West Virginia, the dwellers in the flatlands of the Mississippi Valley, the decadents and defectives of the New England Hinterland, the absentee director in industry, and the insulated devotee to wealth and class."—W. Talbot, *Americanization*, p. 74.—The necessity for Americanization work has been summarized as follows by Howard C. Hill, of the School of Education, University of Chicago: "(1) There are 13,000,000 persons of foreign birth and 33,000,000 of foreign origin living in the United States. (2) Over 100 different foreign languages and dialects are spoken in the United States. (3) Over 1,300 foreign-language newspapers are published in the United States, having a circulation estimated at 10,000,000. (4) Of the persons in the United States 5,000,000 are unable to speak English. (5) Of these persons 2,000,000 are illiterate. (6) Of the unnaturalized persons 3,000,000 are of military age. (7) In 1910, 34 per cent of alien males of draft age were unable to speak English; that is, about half a million of the registered alien males between twenty-one and thirty-one years of age were unable to understand military orders given in English. . . . (9) Only about 13 per cent of adult non-English-speaking aliens are reached by the schools. (10) Many large schools in American cities have been spending more for teaching German to American children than for teaching English and civics to aliens."—H. C. Hill, *Americanization movement (American Journal of Sociology*, May, 1910, pp. 600-642).—According to Henry Pratt Fairchild, Americanization is simply "assimilation into America." He sounds a warning against our assuming that the Melting-pot is melting because of the "readiness with which the immigrants adopt American clothes, the eagerness with which

they attend the night schools, the enthusiasm with which they sing *The Star-Spangled Banner*, and the fluency with which their children use American swear words." He says that "Americanization to a foreigner may mean locating him within a certain area, or mingling him with a certain group of people, or conferring naturalization upon him, or imbuing him with a certain set of ideas and ideals. It needs merely the statement to make plain that it is the last of these four possibilities which constitutes the only Americanization worth talking about."—H. P. Fairchild, *Americanizing the immigrant* (*Yale Review*, July, 1916, pp. 731-740).

Problems of language and segregation.—Theodore Roosevelt in his last public message, written just before his death, expressed as follows his conception of the Americanization problem: "There must be no discrimination because of creed or birth-place or origin in the case of any American who becomes an American and nothing but an American. But if he tries to keep segregated with men of his own origin and separated from the rest of America then he isn't an American. There can be no divided allegiance here. Any man who says he is an American, but something else also, isn't an American at all. We have room for but one flag, the American flag, and this excludes the red flag, which symbolizes all wars against liberty and civilization, just as much as it excludes any foreign flag of a nation to which we are hostile. We have room for but one language here, and that is the English language, for we intend to see that the crucible turns our people out as Americans, of American nationality, and not as dwellers in a polyglot boarding-house; and we have room for but one soul—loyalty, and that is loyalty to the American people." Some students of Americanization do not share Mr. Roosevelt's opposition to a foreign language. For example: "The persistent confusion exists in the popular mind that no one can be an American who does not readily understand, read and speak the English language. Senator Kenyon's bill (S. 3315—entitled 'Americanization of Aliens') provides for the expenditure of \$6,500,000 annually after June 30, 1920, for 'compulsory teaching of English to illiterates and those unable to speak, read or write the English language.' Secretary Lane in his report to the President says: 'Twenty-five per cent of the 1,600,000 men between 21 and 31 years of age who were first drafted into the Army could not read nor write our language, and tens of thousands could not speak it nor understand it. To them the daily paper telling what Von Hindenburg was doing was a blur. To them the appeals of Hoover came by word of mouth, if at all. To them the messages of their commander-in-chief were as so much blank paper. To them the word of mother or sweetheart came filtering in through other eyes that had to read their letters.' While the Secretary's pity for some of the foreign-born may not be amiss, it certainly cannot apply to those who could speak, read, or write some other language than English. It is absurd to suppose that because many of the men were ignorant of English, 'the daily paper telling what Von Hindenburg was doing was a blur.' Thousands of those men were diligently reading in another tongue every move made in the theater of war. They knew, moreover, the very territory over which the Armies were moving and had a more vital interest in the success of the Allied Armies than many of the native-born in this country could ever conjure up. Else why did tens of thousands of Czechs, Slovaks, Poles, Jugoslavs (Croatsians, Slovakes, Serbians), Italians and others enlist in the United States

Army and not wait for the draft?"—S. P. Hrbkova, *Bunk in Americanization* (*Forum*, April, 1920).—See also AMERICAN LEGION: Policies.—Several state legislatures, however, took action designated to suppress the foreign language newspaper and the teaching of foreign languages in the schools. Early in 1919 Nebraska passed the Siman law which wiped out temporarily instruction in every language except English. Oregon by an act of January, 1920, made it unlawful to print, publish, circulate, display, sell or offer for sale any newspaper or periodical in any language other than the English, unless the same contain a literal translation thereof in the English language of the same type and as conspicuously displayed, and providing a penalty thereof of imprisonment in the county jail not to exceed six months or by fine not exceeding five hundred dollars, or by both such imprisonment and fine.

"The measure of [the foreigners'] value as potential members of American citizenship is sometimes sought in the rapidity with which such potential citizens give up their methods of life, their language, their religion, their dress, their leisure-time predilections. The foreigner who changes his whole mode of life with the ease and carelessness with which he takes off his coat is erroneously considered a good prospective American. This standard of measuring assimilation is as dangerous as it is unfair to those who preserve a certain loyalty to their traditions and customs, etc., and change them only as they become convinced that the new is better than the old. 'In Rome do as the Romans do' is not assimilation but simulation. . . . The Americanization movement should not only tolerate these exotic manifestations of creative thought and creative functioning, but it should consider the conservation of these creative instincts as a means of accelerating progress and of increasing the variability and creative powers of the nation. Native music, native literature, native arts and crafts, the native dance, philosophic thought, political idealism, etc., are all to be found among the foreign people. These represent potentially their contribution toward native creative genius, they are capable of new interpretations for their own perfecting, and they may interpret America from new angles and with benefit to all. They constitute an aspect of Americanization that will save this country from the decadence that has overcome Spain and the stifling rigidity of the Pan-Germanic chamber of horrors. . . . The opening of adequate schools for the teaching of English, the proper subsidy of all institutions of learning which undertake the teaching of English to both adults and children, and similar friendly efforts are the only effective means of achieving this end. Love of country requires no special language, but it does require a spirit of loyalty and service and devotion beyond the bounds of any known tongue. . . . The evidence seems to lead to the conclusion that in so far as illiteracy or the learning of the English language is concerned there has been no serious difficulty created by the immigrants themselves. The main difficulties, however, are to be found in the lack of facilities for learning English, the low grade of teachers provided, the hours and conditions under which teaching must be done, the failure to employ teachers with experience in handling foreign adults, and above all the fact that most adult foreigners during their first years in the United States must earn their living in ill paid and exhausting occupations which leave them physically unfit for any mental effort. With about three million persons still to be trained in the use of the English language, the federal, state,

and local governments should develop well-trained teachers and proper conditions of teaching during hours when mental effort is least difficult. Perhaps there is no nation in the world that is so non-linguistic as are the natives of this country, and they should have a sympathetic understanding of the difficulties of learning a new language, particularly by people with a limited education or altogether without education. While language is the common denominator of all social and political education among the people already assimilated, it must be recognized that the most important period of political and social education in the life of the immigrant is during the first twelve months or two years in this country. It is then that the impressions are strongest and count the most in the future adjustments to the new environment. It is obvious, therefore, that a prohibition of the use of a foreign language in public meetings, and particularly the abolition of the foreign press in this country, would be nothing short of a calamity. They are the channels through which the foreigner can keep in touch with conditions, and all leadership of the foreigners is impossible unless it is expressed in the native tongue. To assume that any foreigner can acquire a knowledge of English so as to listen to or read intelligently during a period of less than two years is to expect a great deal more than many intelligent American travelers have been able to achieve in their sojourns in foreign lands. . . . We need the music of Italy, the clear thinking of France, the industry and thoroughness of Germany, the truthfulness and art of Russia. . . . The din of the reiterated panacea that the distribution of immigrants would solve the Americanization problem is in everyone's ears. Take the foreigner out of the congested cities, place him in small communities or on the farm, isolate him from his fellow-countrymen, surround him by Americans and compel him to speak nothing but English and you have solved the whole problem. This method sounds so simple and practical that it is bound to be impractical and inconsistent with the experience of society. It is clear to anyone familiar with immigrant life that congestion, poor sanitation, low standards of living, are not the reasons why the immigrants prefer the cities with all their attending evils. These conditions are merely the commodities as they find them when they reach these shores, and their control depends not upon the new arrival who has no voice in government and whose economic position is too precarious to afford a choice, but upon the already assimilated people participating in the conduct and control of our social and political institutions. The Irish and the German immigrants were the forerunners of the Italian and the Polish, and their transition into Americanism took place through slums that were even worse than what we now find on the lower east side of New York, or in the stockyard district of Chicago. When we analyze the causes of congestion among the immigrants we find that they are fundamentally economic. A large proportion of our immigrants are unskilled workers or tradesmen with skill and training which require new adjustments to industries in which the division of tasks, the trade processes, and the conditions of labor are essentially different from those found in the same industries in the old country. Unskilled trades and the semi-skilled trades employ large numbers of workers and these are largely open to the immigrant. Without a knowledge of the language and ignorant of American methods of work and employment he must depend upon the people of his own race or nationality for guidance and assistance.

In learning a new trade he must be able to understand instructions, and in looking for a job he must be able to speak and read the language of his employer or his agent. If he desires to go out on the farm the only choice he has is day labor, a very precarious occupation with all the attending evils of seasonal employment, ignorance of the newer methods of cultivation and complete isolation from those who in time of need can understand and help meet difficulties. To become a farm owner requires capital and a knowledge of American methods of cultivation, marketing, and business. For these reasons the immigrant remains in his colony. He also has certain social needs which he cannot get in an American environment. The church, the lodge, the social center, cannot exist except when there are present in the community or neighborhood large enough groups of the same nationality or race to justify their presence and guarantee their maintenance. All these institutions if conducted in English are of no value to the immigrant for at least the first two or three years of his stay in the United States. Even evening schools for foreigners for the purpose of teaching them the English language cannot be maintained with any degree of efficiency without having a certain amount of segregation. The very work of Americanization cannot function unless it can deal with groups instead of individuals. To endeavor Americanization by scattering individual immigrants in American communities is to attempt Americanization by a process of gradual social and economic suffocation." Aronovici holds that environment is an important socializing factor in Americanization; that the workers for social insurance and the abolishment of child labor have done more toward Americanizing the immigrant than all the special leagues, societies, and commissions organized for Americanization work. Concerning the American overseas army he says: "A polyglot army with differing traditions, born in every corner of the accessible areas of the globe, with religious beliefs representing every creed and denomination known to the civilized world, fought for democracy in the trenches of Europe. They were Yanks in spirit and in aspiration, those millions who went overseas prepared for the supreme sacrifice, but in their veins flowed the blood of all nations and in their hearts were hidden treasures of tradition and culture that have not been and will not be discovered and developed until the Americanization movement realizes that a new nationalism must be created out of the old."—C. Aronovici, *Americanization: its meaning and function* (*American Journal of Sociology*, May, 1920).—Another student stresses the following principles of Americanization work: "(1) Americanization cannot be defined as simply learning the language. It is exceedingly broad in its scope, and the learning process continues throughout the life of the individual. (2) Americanization work should not be confined to persons of non-American extraction. Many people born in the United States need to be brought into sympathy with the non-American just as much as he needs to be brought into sympathy with them. (3) The learning of the language provides only the tools of contact to the individual, so that he may be enabled to develop an intelligent appreciation of American conduct and ideals. (4) The menace of the non-English-speaking alien is so great to his community and to himself that we ought to consider carefully the desirability of insisting upon his learning the language if he is to remain in the country. (5) Those undertaking Americanization work should be absolutely sincere in their purpose, as any scheme which bears even

the faintest taint of exploitation will react harmfully upon the worker and upon the cause of Americanization. (6) It must be constantly borne in mind that no element of condescension can safely be introduced into Americanization work. There is much that the new American can teach us if we are in the right attitude of mind, and we can teach him very little if we are not. (7) Above all things avoid paternalism. (8) The final purpose of all Americanization work is to develop self-acting progressive Americans. (9) Education is primarily a public function and the industry should take the initiative only where the community has failed. It should always be ready to cooperate. (10) Above all things it should be borne in mind that 'Americanism' is a state of the heart as much as it is a state of the mind. It is a feeling as much as it is a thought."—C. H. Paull, *Aims and standards in industrial Americanization (Industrial Management, Feb., 1919, pp. 148-151)*.—The view of a naturalized American may be seen in these extracts from an address by Edward A. Steiner, Professor of Applied Christianity, Grinnell College, Iowa: "I am not sure that we can, or that we ought, to accelerate Americanization. Thus far it has been a contagion with no artificial stimulus. When we shall say 'Go to, we will Americanize you,' there will be organized efforts to resist us, and the resistance will grow with our insistence. We have, I am sure, lost many opportunities to interpret America to the immigrant, especially to the adult. He does not come in contact with any of our national institutions except the saloon and the police court. If he does become a citizen he usually attains to that high and holy privilege through the venal politician. The whole process of naturalization, which has received some attention in these later years, needs to be further revised and improved; especially by dignifying it and by making the applicant realize that it is a privilege which he may forfeit if he does not perform its duties conscientiously. I am not sure that the attempt to accelerate naturalization, by making the process easier, may not end in cheapening it still further. I believe that every man who wishes to become a citizen ought to be willing to take pains and make sacrifices, if necessary to gain that end. Citizenship is too valuable a possession to be thrown at people, and it is a mistaken notion to believe that because a man has taken out his naturalization papers he is necessarily a patriot. In fact, we know that the two are not identical, and I can easily imagine myself loving this country and being ready to sacrifice myself for it, even had I not the sometimes doubtful privilege of voting. We should apply a test more searching than the mere answering of a few questions which may be learned by rote. No man should be allowed to become a citizen unless his conduct, during five years' residence in this country, has proved that he is already an American in spirit; that he knows the meaning of liberty and has not abused it; and that he is capable of cooperating with others in realizing that freedom. He ought to be able to prove that he has left behind him Europe's racial, religious and national animosities and prejudices. He ought not to become a child of this democracy, and, as often happens, an added care, until he has proved that he knows its meaning and has lived up to it. . . . A rigid insistence upon economic and social justice, and the assurance that the state looks upon them as something more than animated machines, to be used and abused at the owners' will, would bind these millions in gratitude to the country of which they know little or nothing except when they are punished for breaking its laws. I have

strongly urged, but thus far in vain, that every ship which carries in immigrants should have on board a United States officer who would use the time of transit to instruct the people coming to us. They should be told of their privileges and their duties, the nature of our government and the part they may ultimately have in it. I have often acted voluntarily in such a capacity, and have found that by the aid of immigrants who are returning to us, such instruction can be effectively given. Much of the preliminary work of inspection could thus be done. I know there are difficulties in the way, but they are not insurmountable. The immigrant-receiving station should not be merely a heartless machine for this sifting of human material. The government ought to do something more for these people than put a chalk mark upon their coats, or open the gate of a strange and new country without a word of advice or warning. Consider the attitude of the average American toward the government of his city or country, the low tone of our discussion of public issues, the ridicule which we heap upon our officials, from which even the chief magistrate is not spared; the personal and partisan selfishness so strongly in evidence even in this most critical moment of our national life. Need we then wonder if every hyphenated citizen does not manifest the gracious unselfishness of a George Washington or the sacrificial devotion of an Abraham Lincoln?"—E. A. Steiner, *Confession of a hyphenated American*, pp. 51-63.

Coöperation by the libraries.—Mr. George B. Utley, secretary of the American Library Association, has summarized as follows what the libraries have done to promote good citizenship: "(1) They have gained the adult foreigner's confidence and good will. (2) They have educated themselves in his needs, prejudices, racial characteristics and native responses. (3) They have afforded him democratic, hospitable places—libraries—in which the usefulness and the recreational quality of books, magazines and newspapers have been discovered by him and to him. (4) They have coöperated with established organizations, local, state and federal, for his education. (5) They have instituted new ways of procedure in helping him, such as the use of the foreign-language press as a medium of instruction; of foreign-language lectures for teaching citizenship, English language and home-making. (6) They have given or promoted home-lands exhibits and municipal parties at which respect and admiration have been shown for his handiwork and customs with an increase of his own self-respect."—Statement furnished for *Americanization (Handbook Series, p. 344)*.

Coöperation by the public schools.—In the public schools of many large cities more attention has recently been given to the teaching of government. In the City of New York a required course of not less than four periods a week for one half year aims to acquaint freshmen high school pupils with the government of their city and its state and federal relations. The following are among the topics taught.—The city's water supply, The part of the citizen in government, Parties and elections, etc., Protecting the health of the people, Protecting the food of the people, Disposal of city's wastes, Regulation of buildings, Lighting, Heating, etc., Communication and transportation, Safeguarding life and property, Public regulation of work, Clothing, Public provision for recreation, City planning, and Civic beauty, Care of the city's wards (Public welfare), Care of the city's wards (Correction), Public education, Making the laws, Carrying out the laws, Judicial action and Paying

the city's bills. In the great work of making our population American in spirit, we can probably do nothing better than to strengthen the agencies already at work and furnish them adequate financial support, particularly the public schools, the libraries, the churches, the social settlements, the community centers, the immigrant protective leagues and the legal aid societies.

Various agencies.—Due to the present universality of the work, only a few of the leading agencies are enumerated under each heading.

Federal agencies.—Department of the Interior: Bureau of Education; Department of Labor: Bureau of Naturalization; Bureau of Immigration (controls immigration of entire country); Immigration stations.

State agencies.—Councils of national defense; immigrant commissions; industrial departments; state boards of education.

Municipal agencies.—City boards of education; community councils; official municipal agencies [Americanization committees, research bureaus, etc.]

Universities and colleges.—[Surveys, Americanization training courses, etc. Among these are] University of State of New York (maintains director of immigrant education, with a staff; makes surveys, . . . conducts institutes for teachers in Americanization, methods of teaching English to foreigners, etc.); Columbia University (maintains Columbia House . . . for centralization of American activities . . .); University of Wisconsin (first university to establish a chair of Americanization; [and others]).

Special immigrant organizations.—Immigrants' Protective League; North American Civic League for Immigrants; Immigration Restriction League; National Liberal Immigration League; Immigrant Education Society; Baron de Hirsch fund (established for the benefit of Galician, Russian and Roumanian Jews); Council of Jewish Women; Y. W. C. A.; Y. M. C. A.; Y. M. H. A.; National Committee for Constructive Immigration Legislation; World Alliance for International Friendship (specially concerned with adjustment of relations with the Orient); Hebrew Sheltering and Immigrant Aid Society of America; Jewish Agricultural and Industrial Aid Society.

Religious organizations.—Church home mission work, port work, recreation, etc.

Foreign organizations.—League of Foreign-born Citizens (first organization instituted for the purpose of helping the foreign-born to become American citizen and appreciate American institutions); American Waldensian Aid Society; Armenian Colonial Association; Ukrainian National Alliance; Ukrainian Federation of the United States; Greek-American National Union; Czech-Slovak National Alliance; Czech-Slovak Sokel Organizations; American Lettish Baptist Literary Society; Slavonic Immigrant Society; Syrian-American Club; Slovak League of America; Polish Falcon's Alliance in America.

Private organizations.—Sons of the American Revolution; Daughters of the American Revolution; Educational Alliance (Hebrew); Carnegie Corporation; Conference of Social Work; General Federation of Women's Clubs.

Women's Committees.—[Civic and municipal; conduct classes, clubs, lectures, etc.]

Miscellaneous.—Chambers of commerce; clubs; industries; libraries; settlements; parent-teacher associations.—From list compiled by division for foreign-born women, National Y. W. C. A., July 1919.

AMICITIÆ. See GUILDS OF FLANDERS.

AMIDA, Sieges of.—The ancient city of Amida, now Diarbekr, on the right bank of the Upper Tigris was thrice taken by the Persians from the Romans, in the course of the long wars between the two nations. In the first instance, A. D. 359, it fell after a terrible siege of seventy-three days, conducted by the Persian king Sapor in person, and was given up to pillage and slaughter, the Roman commanders crucified and the few surviving inhabitants dragged to Persia as slaves. The town was then abandoned by the Persians, reoccupied by the Romans and recovered its prosperity and strength, only to pass through a similar experience again in 502, when it was besieged for eighty days by the Persian king Kobadh, carried by storm, and most of its inhabitants slaughtered or enslaved. A century later, in 605, Chosroes took Amide once more, but with less violence.—G. Rawlinson, *Seventh great oriental monarchy*, ch. 9, 19 and 24.—See also PERSIA: (A. D.) 226-627.

AMIDEI FAMILY, Florence: Rise of Guelf and Ghibelline strife. See ITALY: 1215.

AMIENS, a city in northern France 81 miles from Paris, situated on the river Somme, a textile manufacturing center; surprised by the Spaniards in 1597 and recovered same year by Henry IX (see FRANCE: 1593-1598); gave its name to the treaty of 1802 between Great Britain, France, Spain and Holland [see ENGLAND: 1801-1806; FRANCE: 1801-1802]; captured by the Germans in 1870 (see FRANCE: 1870-1871) and again in 1914, when they held it for a time in the first advance on Paris, later withdrawing; was the objective of some of the greatest German onslaughts in 1918, but was held by the Allies. (See WORLD WAR: 1915: X. War in the air; 1918: II. Western front: c, 27; c, 32; j.) For origin of name, see BELGAE.

AMIENS, Cathedral of, the largest cathedral of France, begun in 1220 by Robert de Luzarches and continued by Thomas de Cormont and his son Renault. The plan of the building is typical of French Gothic architecture. The groin rib and pointed arch have taken the place of the sex-partite plan and the bays are oblong. While the area of Amiens is smaller than the Hypostyle Hall at Karnak the height of its nave is 140 feet as compared with 80 at Karnak. As in all French cathedrals the west front is a special feature of the exterior. The Romanesque twin towers are connected by an arcade and there is a rose or wheel window above the central recessed door. Speaking of its interior as an example of Gothic architecture, Charles H. Caffin says: "It is as if some power had pulled the older form upward into a slenderer, more elastic fabric; less massive, possibly less stately, but also less inert, infinitely alive in its inspiring growth, with grace of movement as well as dignity."—C. H. Caffin, *How to study architecture*, p. 284.

AMIENS, Treaty of (1527), negotiated by Cardinal Wolsey, between Henry VIII of England and Francis I of France, establishing an alliance against the emperor, Charles V. The treaty was sealed and sworn to in the cathedral church at Amiens, Aug. 18, 1527.—J. S. Brewer, *Reign of Henry VIII*, v. 2, ch. 26 and 28.—See also ITALY: 1527-1529.

AMIENS, Treaty of (1802). See FRANCE: 1801-1802. As affecting Knights of the Order of St. John, see HOSPITALERS OF ST. JOHN OF JERUSALEM: 1565-1870.

AMIN AL, Caliph, 809-813, son and successor of Harun al-Rashid. After a troublous reign, which was due to his own misgovernment, he was defeated by a revolting faction, captured and put to death.

AMINULLAH KHAN, Amir. See AFGHANISTAN: 1919.

AMIR, also written Ameer and Emir, Mohammedan title of nobility, especially used to refer to the rulers of Afghanistan and Scinde.

AMIR TOMAN, Persian army officer. See WORLD WAR: 1915: VII. Persia and Germany.

AMIRANTES. See MASCARENE ISLANDS.

AMISTAD, Case of.—The *Amistad* was a Spanish vessel bound from Havana to Puerto Principe with a cargo of slaves in 1839. The slaves killed the whites and took possession of the ship. A United States war vessel seized the *Amistad* off Long Island and took it into New London harbor. The United States district court of Connecticut held that the slaves were "property rescued from pirates" and that they should be returned to their Spanish owners according to the treaty between the United States and Spain. This decision was reversed by the Supreme court of the

United States. According to this tribunal the negroes were free men, having been kidnapped from a foreign country.—See also SLAVERY: Negro: 19th Century.

AMISUS, Siege of.—The siege of Amisus by Lucullus was one of the important operations of the third Mithridatic war. The city was on the coast of the Black sea, between the rivers Halys and Lycus; it is represented in site by the modern town of Samsun. Amisus, which was besieged in 73 B. C., held out until the following year. Tyrannion the grammarian was among the prisoners taken and sent to Rome.—G. Long, *Decline of the Roman republic*, v. 3, ch. 1 and 2.

AMITABHA. See MYTHOLOGY: Eastern Asia; Indian and Chinese influences.

AMMAN, Palestine.—Captured by British (1918). See WORLD WAR: 1918: VI. Turkish theater: c, 5; c, 13; c, 20.

AMMANATI, Bartolomeo (1511-1592), Florentine architect and sculptor; designed many buildings in Rome, Lucca and Florence, an addition to the Pitti Place being one of his most celebrated works.—See also SCULPTURE: High Renaissance.

AMMANN, title of the mayor, or president of the Swiss Communal Council or Gemeinderat. See SWITZERLAND: 1848-1890.

AMMISM. See MYTHOLOGY: Greek mythology: Anthropomorphic character of Greek myth.

AMMON, a god of Egypt.—Power of his priests. See EGYPT: B. C. 1379.

AMMON, Temple and Oracle of.—The Ammonium or Oasis of Ammon, in the Libyan desert, which was visited by Alexander the Great, has been identified with the oasis now known as the Oasis of Siwah. "The Oasis of Siwah was first visited and described by Browne in 1792; and its identity with that of Ammon fully established by Major Rennell (*Geography of Herodotus*, pp. 577-591). . . . The site of the celebrated temple and oracle of Ammon was first discovered by Mr. Hamilton in 1853. Its famous oracle was frequently visited by Greeks from Cyrene, as well as from other parts of the Hellenic world, and it vied in reputation with those of Delphi and Dodona."—E. H. Bunbury, *History of ancient geography*, ch. 8, sect. 1, and ch. 12, sect. 1 and note E.—An expedition of 50,000 men sent by Cambyes to Ammon, B. C. 525, is said to have perished in the desert, to the last man. See EGYPT: B. C. 525-332.

AMMONITES.—According to the narrative in Genesis ix: 30-39, the Ammonites were descended from Ben-Ammi, son of Lot's second daughter, as the Moabites came from Moab, the eldest daughter's son. The two people are much associated in Biblical history. "It is hard to avoid the conclusion that, while Moab was the settled and civilized half of the nation of Lot, the Bene Ammon formed its predatory and Bedouin section."—G. Grove, *Dictionary of the Bible*.—See also AMALEKITES; JEWS: Conquest of Canaan, and Israel under the Judges; MOABITES; CHRISTIANITY: Map of Sinaitic peninsula.

AMNESTY PROCLAMATION. See U. S. A.: 1863 (December).

AMOOR. See AMUR.

AMORIAN DYNASTY. See BYZANTINE EMPIRE: 820-1057.

AMORIAN WAR.—The Byzantine emperor, Theophilus, in war with the Saracens, took and destroyed, with peculiar animosity, the town of Zapetra or Sozopetra, in Syria, which happened to be the birthplace of the reigning caliph, Motassem, son of Harun al-Rashid. The caliph had condescended to intercede for the place, and his enemy's conduct was personally insulting to him, as well as atrociously inhumane. To avenge the outrage he invaded Asia Minor, A. D. 838, at the head of an enormous army, with the special purpose of destroying the birthplace of Theophilus. The unfortunate town which suffered that distinction was Amorium in Phrygia,—whence the ensuing war was called the Amorian War. Attempting to defend Amorium in the field, the Byzantines were hopelessly defeated, and the doomed city was left to its fate. It made an heroic resistance for fifty-five days, and the siege is said to have cost the caliph 70,000 men. But he entered the place at last with a merciless sword, and left a heap of ruins for the monument of his revenge.—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 52.

AMORITES.—"The Hittites and Amorites were . . . mingled together in the mountains of Palestine like the two races which ethnologists tell us go to form the modern Kelt. But the Egyptian monuments teach us that they were of very different origin and character. The Hittites were a people with yellow skins and 'Mongoloid' features, whose receding foreheads, oblique eyes, and protruding upper jaws, are represented as faithfully on their own monuments as they are on those of Egypt, so that we cannot accuse the Egyptian artists of caricaturing their enemies. If the Egyptians have made the Hittites ugly, it was because they were so in reality. The Amorites, on the contrary, were a tall and handsome people. They are depicted with white skins, blue eyes, and reddish hair, all the characteristics, in fact, of the white race. Mr. Petrie points out their resemblance to the Dardanians of Asia Minor, who form an intermediate link between the white-skinned tribes of the Greek seas and the fair-complexioned Libyans of Northern Africa. The latter are still found in large numbers in the mountainous regions which stretch eastward from Morocco, and are usually known among the French under the name of Kabyles. The traveller who first meets with them in Algeria cannot fail to be struck by their likeness to a certain part of the population in the British Isles. Their clear-white freckled skins, their blue eyes, their golden-red hair and tall stature, remind him of the fair Kelts of an Irish village; and when we find that their skulls, which are of the so-called dolichocephalic or 'long-headed' type, are the same as the skulls discovered in the prehistoric cromlechs of the country they still inhabit, we may conclude that they represent the modern descendants of the white-skinned Libyans of the Egyptian monuments. In Palestine also we still come across representatives of a fair-complexioned blue-eyed race, in whom we may see the descendants of the ancient Amorites, just as we see in the Kabyles the descendants of the ancient Libyans. We know that the Amorite type continued to exist in Judah long after the Israelitish conquest of Canaan. The captives taken from the southern cities of Judah by Shishak in the time of Rehoboam, and depicted by him upon the walls of the great temple of Karnak, are people of Amorite origin. Their 'regular profile of sub-aquiline cast,' as Mr. Tomkins describes it, their high cheek-bones and martial expression, are the features of the Amorites, and not of the Jews.

Tallness of stature has always been a distinguishing characteristic of the white race. Hence it was that the Anakim, the Amorite inhabitants of Hebron, seemed to the Hebrew spies to be as giants, while they themselves were but 'as grasshoppers' by the side of them (Num. xiii: 33). After the Israelitish invasion remnants of the Anakim were left in Gaza and Gath and Ashkelon (Josh. xi. 22), and in the time of David, Goliath of Gath and his gigantic family were objects of dread to their neighbors (2 Sam. xxi: 15-22). It is clear, then, that the Amorites of Canaan belonged to the same white race as the Libyans of Northern Africa, and like them preferred the mountains to the hot plains and valleys below. The Libyans themselves belong to a race which can be traced through the peninsula of Spain and the western side of France into the British Isles. Now it is curious that wherever this particular branch of the white race has extended it has been accompanied by a particular form of cromlech, or sepulchral chamber built of large uncut stones. . . . It has been necessary to enter at this length into what has been discovered concerning the Amorites by recent research, in order to show how carefully they should be distinguished from the Hittites with whom they afterwards intermingled. They must have been in possession of Palestine long before the Hittites arrived there. They extended over a much wider area."—A. H. Sayce, *Hittites*, ch. 1.—See also CANAAN; JEWS: Israel under the Judges.

AMORTIZATION. See RURAL CREDIT; Amortization.

AMOS, Hebrew prophet. See JEWS: Religion and the prophets.

AMOY, Chinese seaport on the south-eastern coast. See CHINA: 1830-1842; Map.

AMPERE, André Marie (1775-1836), a French physicist, famous for his service to science in establishing the relation between electricity and magnetism. The unit of measurement of the intensity of electric currents is named "ampere" after him.—See also ELECTRICAL DISCOVERY: 1784-1800.

AMPHICTYONIC COUNCIL, AMPHICTYONY.—"An Amphiktyonic, or, more correctly, an Amphiktionic, body was an assembly of the tribes who dwelt around any famous temple, gathered together to manage the affairs of that temple. There were other Amphiktyonic Assemblies in Greece [besides that of Delphi], amongst which that of the isle of Kalauria, off the coast of Argolis, was a body of some celebrity. The Amphiktyons of Delphi obtained greater importance than any other Amphiktyons only because of the greater importance of the Delphic sanctuary, and because it incidentally happened that the greater part of the Greek nation had some kind of representation among them. But that body could not be looked upon as a perfect representation of the Greek nation which, to postpone other objections to its constitution, found no place for so large a fraction of the Hellenic body as the Arkadians. Still the Amphiktyons of Delphi undoubtedly came nearer than any other existing body to the character of a general representation of all Greece. It is therefore easy to understand how the religious functions of such a body might incidentally assume a political character. . . . Once or twice then, in the course of Grecian history, we do find the Amphiktyonic body acting with real dignity in the name of united Greece. . . . Though the list of members of the Council is given with some slight variations by different authors, all agree in making the constituent members of the union tribes and not cities. The representatives of the Ionic and Doric races sat and voted as single mem-

bers, side by side with the representatives of petty peoples like the Magnésians and Phthiôtic Achæians. When the Council was first formed, Dorians and Ionians were doubtless mere tribes of northern Greece, and the prodigious development of the Doric and Ionic races in after times made no difference in its constitution. . . . The Amphiktyonic Council was not exactly a diplomatic congress, but it was much more like a diplomatic congress than it was like the governing assembly of any commonwealth, kingdom, or federation. The Pylagoroi and Hieromnêmo were not exactly Ambassadors, but they were much more like members of a British Parliament or even an American Congress. . . . The nearest approach to the Amphiktyonic Council in modern times would be if the College of Cardinals were to consist of members chosen by the several Roman Catholic nations of Europe and America."—E. A. Freeman, *History of federal government*, v. 1, ch. 3.—See also GREECE: B. C. 8th and 6th centuries: Economic conditions; and B. C. 357-336; IONIC (PAN-IONIC) AMPHICTYONY.

AMPHILOCHIANS. See ACARNANIANS.

AMPHIPOLIS.—This town in Macedonia, occupying an important situation on the eastern bank of the river Strymon, just below a small lake into which it widens near its mouth, was originally called "The Nine Ways," and was the scene of a horrible human sacrifice made by Xerxes on his march into Greece.—Thirlwall, *History of Greece*, ch. 15.—It was subsequently taken by the Athenians, B. C. 437, and made a capital city by them, dominating the surrounding district, its name being changed to Amphipolis. During the Peloponnesian war B. C. 424, the able Lacedæmonian general, Brasidas, led a small army into Macedonia and succeeded in capturing Amphipolis, which caused great dismay and discouragement at Athens. (See ATHENS: B. C. 426-422) Thucydides, the historian, was one of the generals held responsible for the disaster and he was driven as a consequence into the fortunate exile which produced the composition of his history. Two years later the Athenian demagogue-leader, Cleon, took command of an expedition sent to recover Amphipolis and other points in Macedonia and Thrace. It was disastrously beaten and Cleon was killed, but Brasidas fell likewise in the battle. Whether Athens suffered more from her defeat than Sparta from her victory is a question.—Thucydides, *History*, bk. 4, sect. 102-135, bk. 5, sect. 1-11.—Amphipolis was taken by Philip of Macedon, B. C. 358. See GREECE: 359-358; Map of ancient Greece.

AMPHISSA, Seige and capture by Philip of Macedon (B. C. 339-338). See GREECE: B. C. 357-336.

AMPHITHEATER, in Roman antiquity, a building much like a double theater, circular in plan, with the seats of the spectators surrounding the place of exhibition. Wooden theaters seem to have been numerous, but the first stone one, the Coliseum (q.v.), was built in the reign of Augustus. Amphitheaters were later erected in almost all of the large cities, the finest being at Verona, Capua, Pozzuoli and Nîmes. "There was hardly a town in the [Roman] empire which had not an amphitheatre large enough to contain vast multitudes of spectators. The savage excitement of gladiatorial combats seems to have been almost necessary to the Roman legionaries in their short intervals of inaction, and was the first recreation for which they provided in the places where they were stationed. . . . Gladiatorial combats were held from early times in the Forum, and wild beasts hunted in the Circus; but until Curio built

his celebrated double theatre of wood, which could be made into an amphitheatre by turning the two semi-circular portions face to face, we have no record of any special building in the peculiar form afterwards adopted. It may have been, therefore, that Curio's mechanical contrivance first suggested the elliptical shape. . . . As specimens of architecture, the amphitheatres are more remarkable for the mechanical skill and admirable adaptation to their purpose displayed in them, than for any beauty of shape or decoration. The hugest of all, the Coliseum, was ill-proportioned and unpleasing in its lines when entire."—R. Burn, *Rome and the campagna, introduction*.—See also ARENA; COLISEUM.

AMPHORA, MODIUS.—"The [Roman] unit of capacity was the Amphora or Quadrantal, which contained a cubic foot . . . equal to 5.687 imperial gallons, or 5 gallons, 2 quarts, 1 pint, 2 gills, nearly. The Amphora was the unit for both liquid and dry measures, but the latter was generally referred to the Modius, which contained one-third of an Amphora. . . . The Culeus was equal to 20 Amphoræ."—W. Ramsay, *Manual of Roman antiquities*, ch. 13.

AMPTHILL, Odo William Leopold Russell, 1st baron (1820-1884), British diplomat. Held various diplomatic positions in Vienna, Paris, Constantinople, Florence and Rome and was British ambassador to Berlin from 1871 until his death.—See also MASONIC SOCIETIES: England: Ideals of Freemasonry.

AMPUDIA, Pedro de, Mexican general. See MEXICO: 1846-1847.

AMR-IBN-EL-ASS, or Amru (d. 664), a distinguished Arabian general under Mohammed and his immediate successors. The conquest of Syria and Egypt and the final triumph of the Omayyads over the followers of Ali were due largely to him. See CALIPHATE: 640-646.

AMRITSAR, a city of British India, in the Punjab; long celebrated as a holy place of the Sikhs (q.v.); while the place is one of the richest trading bazars of India, the most remarkable feature is the great fortress built by Runjit Singh in 1809. In 1919 there were riots and disturbances which were quickly subdued by the British military under General Dyer, who was removed from his command and censured for his severity.—See also INDIA: 1919; Map.

AMRU, Mosque of, one of the oldest mosques in Cairo, Egypt, a splendid example of Mohammedan architecture. It was founded immediately after the conquest of the country in 643, and considerably enlarged in the succeeding periods. Its distinguishing features are "a square open court, surrounded by arcades, set at right angles to the mihrab and supported by columns taken from Byzantine and Roman buildings."—C. H. Caffin, *How to study architecture*, p. 223.

AMSTERDAM, the most important city of Holland, situated in the province of North Holland, on the Y river, an arm of the Zuider Zee. Amsterdam, or the "dyke of the Amstel," is named after the Amstel, the canalized river passing through the city to the Y. The city has a population of almost 640,000. Between the years 1640-1656, the famous portrait painter Rembrandt lived in the Jewish center of Amsterdam, which also boasts of the birth of the philosopher Spinoza (1632).

The city was virtually founded by Giesebrecht II and III of Amstel. The former, in 1204, found Amsterdam but a fishing hamlet, and constructed a castle in the vicinity. The latter, the son of the builder of the castle, constructed a dam in 1240 to keep the sea out. The place passed out

of the control of the house of Amstel in 1296 when Giesebrecht IV was found to have taken part in the murder of Count Floris V of Holland. The fief passed into the hands of Guy of Hainaut who gave the town its first charter (1300). "The town was early admitted to the fellowship of the Hansa League; and, in 1342, having outgrown its primary limits, required to be enlarged. For this an expensive process, that of driving piles into the swampy plain, was necessary; and to this circumstance, no doubt, it is owing that the date of each successive enlargement has been so accurately recorded."—W. T. McCullagh, *Industrial history of free nations*, v. 2, ch. 9.—The walls about the town were built in 1482. The city began to develop and prosper most rapidly. With the beginning of the 16th century the signing of the treaty of Westphalia in 1648 proved most favorable to the city inasmuch as, by one of its provisions, the Scheldt was closed, thereby bringing ruin upon Antwerp, Amsterdam's commercial rival. Holland's chief commercial center was occupied successively by the Prussians in 1787 and the French, under Pichegru, in 1795.—See also NETHERLANDS: Map of the Netherlands and Belgium.

AMURATH. See MURAD.

AMYCLÆ, chief city of Laconia while that district of Peloponnesus was occupied by the Achæans, before the Doric invasion and before the rise of Sparta. It maintained its independence against the Doric Spartans for a long period, but succumbed at length under circumstances which gave rise to a proverbial saying among the Greeks concerning "the silence of Amyclæ." "The peace of Amyclæ, we are told, had been so often disturbed by false alarms of the enemy's approach, that at length a law was passed forbidding such reports, and the silent city was taken by surprise."—C. Thirlwall, *History of Greece*, ch. 7.—This story is also told of a city of the same name in Latium, Italy.

ANABAPTISTS.—"None of the sects which sprang up in the wake of the Reformation produced so great a ferment as the Anabaptists. The name, which signifies rebaptizers, was affixed to them by their adversaries for the reason that they rejected infant baptism and baptised anew all of their number who had received the sacrament in infancy. The Anabaptists were the radicals of the Reformation. They considered that the Reformers had left their work half done. . . . The Church, they insisted, must be composed exclusively of the regenerate, and religion is not a matter to be regulated and managed by civil rulers. Under the name of Anabaptists are included different types of doctrine and of Christian life. It is a gross injustice to impute to them all the wild and destructive fanaticism with which a portion of them are chargeable. This fanatical class are first heard of in Germany, under Thomas Münzer, as a leader, who . . . in the Peasants' War in 1525 sought to establish his revolutionary doctrines. These involved the abolition of all existing authorities in Church and State, and the substitution of a kingdom of the saints, in which he was to be the chief. . . . Very different from the disciples of Münzer, however, were Grebel and other Anabaptists who organized themselves at Zurich. . . . They were enthusiasts but not fanatics. They were peaceful in their spirit, and, as it would appear, were sincerely devout. These traits, however did not protect them from harsh and unwarrantable treatment. . . . Some of them were put to death. . . . They went no farther, however, than to maintain that no Christian could be a magistrate, or take part in the infliction of capital punishment. . . . In the third and fourth decades of the sixteenth century 'Anabaptism spread like a burning fever through all Germany; from Swabia and Switzerland, along the Rhine to Holland and Friesland, from Bavaria, Middle Germany, Westphalia, and Saxony, as far as Holstein.' In the Netherlands, in the time of Charles V., Anabaptists were guilty of offences against decency and morality which were repaid with savage penalties. Afterwards, we find that a numerous body who were stigmatized by the same name but were of a totally different spirit were organized under the guidance of Menno Simonis, a religious and conscientious man. . . . English Brownists, or Independents, who came over to Holland, were brought into connection with the Mennonites. . . . After 1535 many Anabaptists crossed over to England and formed congregations. . . . They were reinforced by certain Brownists who had espoused Anabaptist opinions in Holland."—G. P. Fisher, *History of the Christian Church*, pp. 424-426.—See also ANABAPTISTS OF MÜNSTER; BAPTISTS; MENNONITES.

ANABAPTISTS OF MÜNSTER.—"Münster is a town in Westphalia, the seat of a bishop, walled round, with a noble cathedral and many churches; but there is one peculiarity about Münster that distinguishes it from all other old German towns; it has not one old church spire in it. Once it had a great many. How comes it that it now has none? In Münster lived a draper, Knipperdolling by name, who was much excited over the doctrines of Luther, and he gathered many people in his house, and spoke to them bitter words against the Pope, the bishops, and the clergy. The bishop at this time was Francis of Waldeck, a man much inclined himself to Lutheranism; indeed, later, he proposed to suppress Catholicism in the diocese, as he wanted to seize on it and appropriate it as a possession to his family. Moreover, in 1544, he joined the Protestant princes in a league against the Catholics; but

he did not want things to move too fast, lest he should not be able to secure the wealthy See as personal property. Knipperdolling got a young priest, named Rottmann, to preach in one of the churches against the errors of Catholicism, and he was a man of such fiery eloquence that he stirred up a mob which rushed through the town, wrecking the churches. The mob became daily more daring and threatening. They drove the priests out of the town, and some of the wealthy citizens fled, not knowing what would follow. The bishop would have yielded to all the religious innovations if the rioters had not threatened his temporal position and revenue. In 1532 the pastor, Rottmann, began to preach against the baptism of infants. Luther wrote to him remonstrating, but in vain. The bishop was not in the town; he was at Minden, of which See he was bishop as well. Finding that the town was in the hands of Knipperdolling and Rottman, who were confiscating the goods of the churches, and excluding those who would not agree with their opinions, the bishop advanced to the place at the head of some soldiers. Münster closed its gates against him. Negotiations were entered into; the Landgrave of Hesse was called in as pacificator, and articles of agreement were drawn up and signed. Some of the churches were given to the Lutherans, but the Cathedral was reserved for the Catholics, and the Lutherans were forbidden to molest the latter, and disturb their religious services. The news of the conversion of the city of Münster to the gospel spread, and strangers came to it from all parts. Among these was a tailor of Leyden, called John Bockelson. Rottman now threw up his Lutheranism and proclaimed himself opposed to many of the doctrines which Luther still retained. Amongst other things he rejected was infant baptism. This created a split among the reformed in Münster, and the disorders broke out afresh. The mob now fell on the cathedral and drove the Catholics from it, and would not permit them to worship in it. They also invaded the Lutheran churches, and filled them with uproar. On the evening of January 28, 1534, the Anabaptists stretched chains across the streets, assembled in armed bands, closed the gates and placed sentinels in all directions. When day dawned there appeared suddenly two men dressed like Prophets, with long ragged beards and flowing mantles, staff in hand, who paced through the streets solemnly in the midst of the crowd, who bowed before them and saluted them as Enoch and Elias. These men were John Bockelson, the tailor, and one John Mattheson, head of the Anabaptists of Holland. Knipperdolling at once associated himself with them, and shortly the place was a scene of the wildest ecstasies. Men and women ran about the streets screaming and leaping, and crying out that they saw visions of angels with swords drawn urging them on to the extermination of Lutherans and Catholics alike. . . . A great number of citizens were driven out, on a bitter day, when the land was covered with snow. Those who lagged were beaten; those who were sick were carried to the market-place and re-baptized by Rottman. . . . This was too much to be borne. The bishop raised an army and marched against the city. Thus began to siege which was to last sixteen months, during which a multitude of untrained fanatics, commanded by a Dutch tailor, held out against a numerous and well-armed force. Thenceforth the city was ruled by divine revelations, or rather, by the crazes of the diseased brains of the prophets. One day they declared that all the officers and magistrates were to

be turned out of their offices, and men nominated by themselves were to take their places; another day Mattheson said it was revealed to him that every book in the town except the Bible was to be destroyed; accordingly all the archives and libraries were collected in the market-place and burnt. Then it was revealed to him that all the spires were to be pulled down; so the church towers were reduced to stumps, from which the enemy could be watched and whence cannon could play on them. One day he declared he had been ordered by Heaven to go forth, with promise of victory, against the besiegers. He dashed forth at the head of a large band, but was surrounded and he and his band slain. The death of Mattheson struck dismay into the hearts of the Anabaptists, but John Bockelson took advantage of the moment to establish himself as head. He declared that it was revealed by him that Mattheson had been killed because he had disobeyed the heavenly command, which was to go forth with few. Instead of that he had gone with many. Bockelson said he had been ordered in vision to marry Mattheson's widow and assume his place. It was further revealed to him that Münster was to be the heavenly Zion, the capital of the earth, and he was to be king over it. . . . Then he had another revelation that every man was to have as many wives as he liked, and he gave himself sixteen wives. This was too outrageous for some to endure, and a plot was formed against him by a blacksmith and about 200 of the more respectable citizens, but it was frustrated and led to the seizure of the conspirators and the execution of a number of them. . . . At last, on midsummer eve, 1536, after a siege of sixteen months, the city was taken. Several of the citizens, unable longer to endure the tyranny, cruelty and abominations committed by the king, helped the soldiers of the prince-bishop to climb the walls, open the gates, and surprise the city. A desperate hand-to-hand fight ensued; the streets ran with blood. John Bockelson, instead of leading his people, hid himself, but was caught. So was Knipperdolling. When the place was in his hands the prince-bishop entered. John of Leyden and Knipperdolling were cruelly tortured, their flesh plucked off with red-hot pincers, and then a dagger was thrust into their hearts. Finally, their bodies were hung in iron cages to the tower of a church in Münster. Thus ended this hideous drama, which produced an indescribable effect throughout Germany. Münster, after this, in spite of the desire of the prince-bishop to establish Lutheranism, reverted to Catholicism, and remains Catholic to this day."—S. Baring-Gould, *Story of Germany*, ch. 36.

ANARCHISM.—Definition and theory.—Ancient theories.—"Anarchism, as its derivation indicates, is the theory which is opposed to every kind of forcible government. It is opposed to the State as the embodiment of the force employed in the government of the community. Such government as Anarchism can tolerate must be free government, not merely in the sense that it is that of a majority, but in the sense that it is that assented to by all. Anarchists object to such institutions as the police and the criminal law, by means of which the will of one part of the community is forced upon another part. In their view, the democratic form of government is not very enormously preferable to other forms so long as minorities are compelled by force or its potentiality to submit to the will of majorities. Liberty is the supreme good in the Anarchist creed, and liberty is sought by the direct road of abolishing all forcible control over the individual of the community. Anarchism, in this sense, is no new doctrine. It is set forth admirably by Chuang Tzu, a Chinese philosopher, who lived about the year 300 B.C. . . . Ancient Greece also had its anarchistic philosophers, of whom the most important was Zeno (342-267 B.C.). Zeno denied omnipotence such as Plato desired, to the state, and pled for the elevation of individual moral law in the place of organized police power as wielded by the state. The modern Anarchism, in the sense in which we shall be concerned with it, is associated with belief in the communal ownership of land and capital, and is thus in an important respect akin to Socialism. The doctrine is properly called Anarchist Communism, but as it embraces practically all modern Anarchism, we may ignore individualist Anarchism altogether and concentrate attention upon the communistic form. Socialism and Anarchist Communism alike have arisen from the perception that private capital is a source of tyranny by certain individuals over others. Orthodox Socialism believes that the individual will become free if the State becomes the sole capitalist. Anarchism, on the contrary, fears that in that case the State might merely inherit the tyrannical propensities of the private capitalist. Accordingly, it seeks for a means of reconciling communal ownership with the utmost possible diminution in the powers of the State, and indeed ultimately with the complete abolition of the State. It has arisen mainly within the Socialist move-

ment as its extreme left wing."—B. Russell, *Proposed roads to freedom*, p. 33.—See also **SOCIALISM:** Definition of terms.

"In the popular mind an anarchist is identified with one who desires to destroy existing government through the use of the bomb and other violent means. It is quite true that many adherents to this school do advocate the use of violence in achieving their ends. It is important to bear in mind, however, that we are here dealing only with means, not the end itself. The really important thing, at least from the standpoint of political science, is the end or the principle which the users of these means seek to make prevail. The anarchistic school represents the extreme school of individual rights. There are many persons who belong to this school who do not approve of the use of violence. They constitute what are known as scientific anarchists. Prince Kropotkin [died 1921] is probably the most distinguished representative of this class, and in his writings one can find the best exposition of the philosophy of this school. It is the belief of this school, not only that the principles for which they stand are theoretically sound, but are susceptible of successful application in practice. It is their belief that common action for the general welfare should rest upon voluntary association rather than state compulsion. They point to the fact that great branches of activities are now conducted in this way. Men form all sorts of associations for common action in which the principle of compulsion is absent. Especially is the great success achieved in the field of distributive cooperation in England and Europe generally referred to as an example of what can be done through purely voluntary association. In boards of trade, chambers of commerce, trade unions, and like organizations, are found other illustrations."—W. F. Willoughby, *Governments of modern states*, p. 170.

1578-1652.—Anarchy in Poland. See **POLAND:** 1578-1652.

1793.—Godwin's theory.—William Godwin, an Englishman (1756-1836), published his famous "Enquiry Concerning Political Justice, and Its Influence on General Virtue and Happiness," in 1793. It contained the first modern formulation of the principles of anarchism. He based his theory on the doctrine of natural rights and demanded the abolition of all laws and government as being false and unnecessary. Small, self-governing communities, he held, made up the most equitable society. From the conviction that "monarchy was a species of government unavoidably corrupt," he arrived at the conclusion that "government by its very nature counteracts the improvement of original mind." Despite its importance in the domain of political literature, however, Godwin's essay bore little fruit, and the history of anarchism proper begins with Pierre Joseph Proudhon (1809-1865).

1839-1894.—Proudhon and his doctrines.—Max Stirner and the individualistic school of anarchists.—"Of the Socialistic thinkers who serve as a kind of link between the Utopists and the school of Socialism of historical evolution, or scientific Socialists, by far the most noteworthy figure is Proudhon, who was born at Besançon in 1800. By birth he belonged to the working class, his father being a brewer's cooper, and he himself as a youth followed the occupation of cow-herding. In 1838, however, he published an essay on general grammar, and in 1839 he gained a scholarship to be held for three years, a gift of one Madame Suard to his native town. The result of his advantage was his most important though

far from his most voluminous work, published the same year as the essay which Madame Suard's scholars were bound to write: it bore the title of 'What is Property?' (*Qu' est-ce que la propriété?*) his answer being Property is Robbery (*La propriété est le vol*). As may be imagined, this remarkable essay caused much stir and indignation, and Proudhon was censured by the Besançon Academy for its production, narrowly escaping a prosecution. In 1841 he was tried at Besançon for a letter he wrote to Victor Considérant, the Fourierist, but was acquitted. In 1846 he wrote his 'Philosophie de la Misère' (Philosophy of Poverty), which received an elaborate reply and refutation from Karl Marx. In 1847 he went to Paris. In the Revolution of 1848 he showed himself a vigorous controversialist, and was elected Deputy for the Seine. . . . After the failure of the revolution of '48, Proudhon was imprisoned for three years, during which time he married a young woman of the working class. In 1858 he fully developed his system of 'Mutualism' in his last work, entitled 'Justice in the Revolution and the Church.' In consequence of the publication of this book he had to retire to Brussels, but was amnestied in 1860, came back to France and died at Passy in 1865."—W. Morris and E. B. Bax, *Socialism, its growth and outcome*, ch. 18.—"In anarchism we have the extreme antithesis of socialism and communism. The socialist desires so to extend the sphere of the state that it shall embrace all the more important concerns of life. The communist, at least of the older school, would make the sway of authority and the routine which follows therefrom universal. The anarchist, on the other hand, would banish all forms of authority and have only a system of the most perfect liberty. The anarchist is an extreme individualist. . . . Anarchism, as a social theory, was first elaborately formulated by Proudhon. In the first part of his work, 'What is Property?' he briefly stated the doctrine and gave it the name 'anarchy,' absence of a master or sovereign. In that connection he said: 'In a given society the authority of man over man is inversely proportional to the stage of intellectual development which that society has reached. . . . Property and royalty have been crumbling to pieces ever since the world began. As man seeks justice in equality, so society seeks order in anarchy.' About twelve years before Proudhon published his views Josiah Warren reached similar conclusions in America. But as the Frenchman possessed the originality necessary to the construction of a social philosophy, we must regard him as altogether the chief authority upon scientific anarchism. . . . Proudhon's social ideal was that of perfect individual liberty. Those who have thought him a communist or socialist have wholly mistaken his meaning. . . . Proudhon believed that if the state in all its departments were abolished, if authority were eradicated from society, and if the principle of *laissez faire* were made universal in its operation, every form of social ill would disappear. According to his views men are wicked and ignorant because, either directly or indirectly, they have been forced to be so: it is because they have been subjected to the will of another, or are able to transfer the evil results of their acts to another. If the individual, after reaching the age of discretion, could be freed from repression and compulsion in every form and know that he alone is responsible for his acts and must bear their consequences, he would become thrifty, prudent, energetic; in short he would always see and follow his highest interests. He would always respect the rights of others; that

is, act justly. Such individuals could carry on all the great industrial enterprises of to-day either separately or by voluntary association. No compulsion, however, could be used to force one to fulfil a contract or remain in an association longer than his interest dictated. Thus we should have a perfectly free play of enlightened self-interests: equitable competition, the only natural form of social organization. . . . Proudhon's theory is the sum and substance of scientific anarchism.

"Opposed to the communist anarchism of Godwin and Proudhon is revolutionary individualist anarchism, of which Max Stirner (pseudonym for Kaspar Schmidt) was the ablest exponent. Stirner's main thesis was the fullest development of the individual, the highest elevation of the ego—not of the majority of men, but of the better endowed,—and the abolition of morals in connection with 'the association of the egotists.' [See also INDIVIDUALISTIC SCHOOL.] . . . How closely have the American anarchists adhered to the teachings of their master? One group, with its centre at Boston and with branch associations in a few other cities, is composed of faithful disciples of Proudhon. They believe that he is the leading thinker among those who have found the source of evil in society and the remedy therefor. They accept his analysis of social phenomena and follow his lead generally, though not implicitly. They call themselves Individualistic Anarchists, and claim to be the only class who are entitled to that name. They do not attempt to organize very much, but rely upon 'active individuals, working here and there all over the country.' It is supposed that they may number in all some five thousand adherents in the United States. . . . They, like Proudhon, consider the government of the United States to be as oppressive and worthless as any of the European monarchies. Liberty prevails here no more than there. In some respects the system of majority rule is more obnoxious than that of monarchy. It is quite as tyrannical, and in a republic it is more difficult to reach the source of the despotism and remove it. They regard the entire machinery of elections as worthless and a hindrance to prosperity. They are opposed to political machines of all kinds. They never vote or perform the duties of citizens in any way, if it can be avoided. . . . Concerning the family relation, the anarchists believe that civil marriage should be abolished and 'autonomistic' marriage substituted. This means that the contracting parties should agree to live together as long as it seems best to do so, and that the partnership should be dissolved whenever either one desires it. Still, they would give the freest possible play to love and honor as restraining motives. . . . [Probably the most influential American anarchist was Benjamin R. Tucker, who was an admirer and follower of the economic doctrines of Proudhon, several of whose works he translated. *Liberty*, a leading anarchist journal, was established by him in 1881.] "The Individualistic Anarchists . . . profess to have very little in common with the Internationalists. The latter are Communicative Anarchists. They borrow their analysis of existing social conditions from Marx, or more accurately from the 'communistic manifesto' written by Marx and Engels in 1847. In the old International Workingman's association they constituted the left wing, which, with its leader, Bakunine, was expelled in 1872. Later the followers of Marx, the socialists proper, disbanded, and since 1883 the International in this country has been controlled wholly by the anarchists. Their views and methods are similar to those which Bakunine wished to

carry out by means of his Universal Alliance, and which exist more or less definitely in the minds of [the former] Russian Nihilists. [See also NIHIISM.] Like Bakunine, they desire to organize an international revolutionary movement of the laboring classes, to maintain it by means of conspiracy and, as soon as possible, to bring about a general insurrection. In this way, with the help of explosives, poisons and murderous weapons of all kinds, they hope to destroy all existing institutions, ecclesiastical, civil and economic. Upon the smoking ruins they will erect the new and perfect society. Only a few weeks or months will be necessary to make the transition. During that time the laborers will take possession of all lands, buildings, instruments of production and distribution. With these in their possession, and without the interposition of government, they will organize into associations or groups for the purpose of carrying on the work of society."—H. L. Osgood, *Scientific anarchism* (*Political Science Quarterly*, March, 1889).

ALSO IN: F. Dubois, *Anarchist peril*.

1861-1876.—Bakunin and the International.—“In the same sense in which Marx may be regarded as the founder of modern Socialism, Bakunin may be regarded as the founder of Anarchist Communism. . . . Michael Bakunin was born in 1814 of a Russian aristocratic family. . . . In 1857, after eight years of captivity, he was sent to Siberia. From there, in 1861, he succeeded in escaping to Japan, and thence through America to London. From this time onward, he devoted himself to spreading the spirit of Anarchist revolt, without, however, having to suffer any further term of imprisonment. For some years he lived in Italy, where he founded in 1864 an ‘International Fraternity’ or ‘Alliance of Socialist Revolutionaries.’ This contained men of many countries, but apparently no Germans. It devoted itself largely to combating Mazzini’s nationalism. In 1867 he moved to Switzerland, where the following year he helped to found the ‘International Alliance of Socialist Democracy,’ of which he drew up the program. This program gives a good succinct résumé of his opinions: ‘The Alliance declares itself atheist; it desires the definitive and entire abolition of classes and the political equality and social equalization of individuals of both sexes. It desires that the earth, the instrument of labor, like all other capital, becoming the collective property of society as a whole, shall be no longer able to be utilized except by the workers, that is to say, by agricultural and industrial associations. It recognizes that all actually existing political and authoritarian States, reducing themselves more and more to the mere administrative functions of the public services in their respective countries, must disappear in the universal union of free associations, both agricultural and industrial.’ The International Alliance of Socialist Democracy desired to become a branch of the International Working Men’s Association, but was refused admission on the ground that branches must be local and could not themselves be international. The Geneva group of the Alliance, however, was admitted later, in July, 1866. The International Working Men’s Association had been founded in London in 1864, and its statutes and program were drawn up by Marx. Bakunin at first did not expect it to prove a success and refused to join it. But it spread with remarkable rapidity in many countries and soon became a great power for the propagation of Socialist ideas. Originally it was by no means wholly Socialist, but in successive Congresses Marx won it over more and more to his views. At its

third Congress, in Brussels in September, 1868, it became definitely Socialist. Meanwhile Bakunin, regretting his earlier abstention, had decided to join it, and he brought with him a considerable following in French-Switzerland, France, Spain and Italy. At the fourth Congress, held at Basle in September, 1869, two currents were strongly marked. The Germans and English followed Marx in his belief in the State as it was to become after the abolition of private property; they followed him also in his desire to found Labor Parties in the various countries, and to utilize the machinery of democracy for the election of representatives of Labor to Parliaments. On the other hand, the Latin nations in the main followed Bakunin in opposing the State and disbelieving in the machinery of representative government. The conflict between these two groups grew more and more bitter, and each accused the other of various offences. The statement that Bakunin was a spy was repeated, but was withdrawn after investigation. Marx wrote in a confidential communication to his German friends that Bakunin was an agent of the Pan-Slavist party and received from them 25,000 francs a year. Meanwhile, Bakunin became for a time interested in the attempt to stir up an agrarian revolt in Russia, and this led him to neglect the contest in the International at a crucial moment. During the Franco-Prussian war Bakunin passionately took the side of France, especially after the fall of Napoleon III. He endeavored to rouse the people to revolutionary resistance like that of 1793, and became involved in an abortive attempt at revolt in Lyons. The French Government accused him of being a paid agent of Prussia, and it was with difficulty that he escaped to Switzerland. The dispute with Marx and his followers had become exacerbated by the national dispute. Bakunin, like Kropotkin after him, regarded the new power of Germany as the greatest menace to liberty in the world. He hated the Germans with a bitter hatred, partly, no doubt, on account of Bismarck, but probably still more on account of Marx. To this day, Anarchism has remained confined almost exclusively to the Latin countries, and has been associated with a hatred of Germany, growing out of the contests between Marx and Bakunin in the International. The final suppression of Bakunin’s faction occurred at the General Congress of the International at the Hague in 1872. The meeting-place was chosen by the General Council (in which Marx was unopposed), with a view—so Bakunin’s friends contend—to making access impossible for Bakunin (on account of the hostility of the French and German governments) and difficult for his friends. Bakunin was expelled from the International as the result of a report accusing him *inter alia* of theft backed up by intimidation. The orthodoxy of the International was saved, but at the cost of its vitality. From this time onward, it ceased to be itself a power, but both sections continued to work in their various groups, and the Socialist groups in particular grew rapidly. Ultimately a new International was formed (1889) which continued down to the outbreak of the [World] War. By this time Bakunin’s health was broken, and except for a few brief intervals, he lived in retirement until his death in 1876.”—B. Russell, *Proposed roads to freedom*, p. 36.

1872-1912. — Kropotkin’s system. — Scientific anarchism.—“We do not find in Bakunin’s works a clear picture of the society at which he aimed, or any argument to prove that such a society could be stable. If we wish to understand Anarchism we must turn to his followers, and espe-

cially to Kropotkin [died 1921], like him, a Russian aristocrat familiar with the prisons of Europe, and, like him, an Anarchist who, in spite of his internationalism, is imbued with a fiery hatred of the Germans. Kropotkin has devoted much of his writing to technical questions of production. In 'Fields, Factories and Workshops' and 'The Conquest of Bread' he has set himself to prove that, if production were more scientific and better organized, a comparatively small amount of quite agreeable work would suffice to keep the whole population in comfort. Even assuming, as we probably must, that he somewhat exaggerates what is possible with our present scientific knowledge, it must nevertheless be conceded that his contentions contain a very large measure of truth. In attacking the subject of production he has shown that he knows what is the really crucial question. If civilization and progress are to be compatible with equality, it is necessary that equality should not involve long hours of painful toil for little more than the necessities of life, since, where there is no leisure, art and science will die and all progress will become impossible. The objection which some feel to Socialism and Anarchism alike on this ground cannot be upheld in view of the possible productivity of labor. The system at which Kropotkin aims, whether or not it be possible, is certainly one which demands a very great improvement in the methods of production above what is common at present. He desires to abolish wholly the system of wages, not only, as most Socialists do, in the sense that a man is to be paid rather for his willingness to work than for the actual work demanded of him, but in a more fundamental sense: there is to be no obligation to work, and all things are to be shared in equal proportions among the whole population. Kropotkin relies upon the possibility of making work pleasant: he holds that, in such a community as he foresees, practically everyone will prefer work to idleness, because work will not involve overwork or slavery, or that excessive specialization that industrialism has brought about, but will be merely a pleasant activity for certain hours of the day, giving a man an outlet for his spontaneous constructive impulses. There is to be no compulsion, no law, no government exercising force; there will still be acts of the community, but these are to spring from universal consent, not from any enforced submission of even the smallest minority."—B. Russell, *Proposed roads to freedom*, p. 51.

1878.—Anarchist attempt to assassinate King Humbert of Italy. Two attempts on William I, German emperor.

1878-1879.—Two anarchist attempts on life of King Alfonso XII of Spain.

1883.—Repudiated by Socialists. See SOCIALISM: 1874-1901.

1885.—Anarchists expelled from Switzerland.

1892.—Bomb explosions by anarchists in Italy and Spain.

1892-1894.—Anarchist terrorism.—"We should be doing more than justice to Anarchism if we did not say something of its darker side, the side which has brought it into conflict with the police and made it a word of terror to ordinary citizens. In its general doctrines there is nothing essentially involving violent methods or a virulent hatred of the rich and many who adopt these general doctrines are personally gentle and temperamentally averse from violence. But the general tone of the Anarchist press and public is bitter to a degree that seems scarcely sane. One of the most curious

features of popular anarchism is its martyrology, aping Christian forms, with the guillotine (in France) in place of the cross. Many who have suffered death at the hands of the authorities on account of acts of violence were no doubt genuine sufferers for their belief in a cause, but others, equally honored, are more questionable. One of the most curious examples of this outlet for the repressed religious impulse is the cult of Ravachol, who was guillotined in 1892 on account of various dynamite outrages. As was natural, the leading Anarchists took no part in the canonization of his memory; nevertheless it proceeded, with the most amazing extravagances. It would be wholly unfair to judge Anarchist doctrine, or the views of its leading exponents, by such phenomena; but it remains a fact that Anarchism attracts to itself much that lies on the borderland of insanity and common crime. This must be remembered in exculpation of the authorities and the thoughtless public, who often confound in a common detestation the parasites of the movement and the truly heroic and high-minded men who have elaborated its theories and sacrificed comfort and success to their propagation. The terrorist campaign in which such men as Ravachol were active practically came to an end in 1894. After that time, under the influence of Pelloutier, the better sort of Anarchists found a less harmful outlet by advocating Revolutionary Syndicalism in the Trade Unions and Bourses du Travail. [See also LABOR ORGANIZATION: 1867-1912.] The economic organization of society, as conceived by Anarchist Communists, does not differ greatly from that which is sought by Socialists. Their difference from Socialists is in the matter of government: they demand that government shall require the consent of *all* the governed, and not only of a majority."—*Ibid.*, pp. 51-52.

1893 (February).—Bomb explosions in Rome.

1893 (Sept. 23).—At Barcelona, a bomb, thrown among a party of officers at a military review by an anarchist, killed Captain-General Martinez Campos and a guard. For this crime Codiña and five accomplices were shot on May 21, 1894.

1893 (Dec. 9).—Vaillant, an anarchist of German descent (real name, Königstein), threw a bomb from the gallery in the Chamber of Deputies in Paris. A woman caught his arm and the bomb, striking a chandelier, exploded without fatal results. A law was passed making attempts of this nature a capital crime, even if no deaths ensued, and Königstein was guillotined. A week after the execution another anarchist, Emile Henry, threw a bomb in the café of the Hôtel Terminus, Paris, for which he suffered the death penalty.

1894 (June 24).—French President, Marie F. Sadi Carnot, stabbed to death by an Italian anarchist named Caserio at a banquet in Lyons. The same year French government issued an "anarchist album" containing portraits of about 500 anarchists.—See also FRANCE: 1804-1895.

1894 (Nov. 7).—Bomb thrown by an anarchist in a Barcelona theater killed thirty people and wounded eighty. The perpetrator was executed.

1909.—Assassination of Colonel Falcon. See ARGENTINA: 1909; Assassination of Colonel Falcon.

1910.—Emma Goldman's definition.—"The philosophy of a new social order based on liberty unrestricted by man-made law; the theory that all forms of government rest on violence, and are therefore wrong and harmful, as well as unnecessary. The new social order rests, of course, on the materialistic basis of life; but while all Anarchists agree that the main evil today is an economic one, they maintain that the solution of that evil can be brought about only through the consideration of every phase of life,—individual, as well as the collective; the internal, as well as the external phases. A thorough perusal of the history of human development will disclose two elements in bitter conflict with each other; elements that are only now beginning to be understood, not as foreign to each other, but as closely related and truly harmonious, if only placed in proper environment: the individual and social instincts. The individual and society have waged a relentless and bloody battle for ages, each striving for supremacy, because each was blind to the value and importance of the other. The individual and social instincts,—the one a most potent factor for individual endeavor, for growth, aspiration, self-realization; the other an equally potent factor for mutual helpfulness and social well-being. The explanation of the storm raging within the individual, and between him and his surroundings, is not far to seek. The primitive man, unable to understand his being, much less the unity of all life, felt himself absolutely dependent on blind, hidden forces ever ready to mock and taunt him. Out of that attitude grew the religious concepts of man as a mere speck of dust dependent on superior powers on high, who can only be appeased by complete surrender. All the early sages rest on that idea, which continues to be the *leit-motif* of the biblical tales dealing with the relation of man to God, to the State, to society. Again and again the same motif, *man is nothing, the powers are everything*. Thus Jehovah would only endure man on condition of complete surrender. Man can have all the glories of the earth, but he must not become conscious of himself. The State, society, and moral laws all sing the same refrain: Man can have all the glories of the earth, but he must not become conscious of himself. Anarchism is the only philosophy which brings to man the consciousness of himself; which maintains that God, the State, and society are non-existent, that their promises are null and void, since they can be fulfilled only through man's subordination. Anarchism is therefore the teacher of the unity of life; not merely in nature, but in man. There is no conflict between the individual and the social instincts, any more than there is between the heart and the lungs; the one the receptacle of a precious life essence, the other the repository of the element that keeps the essence pure and strong. The individual is the

heart of society, conserving the essence of social life; society is the lungs which are distributing the element to keep the life essence—that is, the individual—pure and strong. Anarchism is the great liberator of man from the phantoms that have held him captive; it is the arbiter and pacifier of the two forces for individual and social harmony. To accomplish that unity, Anarchism has declared war on the pernicious influences which have so far prevented the harmonious blending of individual and social instincts, the individual and society. Religion, the dominion of the human mind; Property, the dominion of human needs; and Government, the dominion of human conduct, represent the stronghold of man's enslavement and all the horrors it entails."—Emma Goldman, *Anarchism*.

1912.—Assassination of Spanish premier Canalejas. See SPAIN: 1912.

1913.—Assassination of George I, king of the Hellenes, by an anarchist. See GREECE: 1913.

1919.—Compatibility with American citizenship.—"Michael Stuppiello, an Italian by birth, a cobbler by trade and an anarchist by profession, after residing in the United States for a period of fifteen years, became a naturalized citizen. In his declaration of intention and petition for naturalization he stated that he was not an anarchist nor opposed to organized government. Later he was arrested charged with being an anarchist, which, upon his examination, he admitted, but, being a citizen, he was released from custody. The Government subsequently brought an action in the Federal District Court for the Western District of New York to cancel his naturalization certificate, and the decree was in its favor. Judge Hazel, who wrote the opinion of the court, which is published in *United States vs. Stuppiello*, 260 Federal Reporter, 483, in discussing the case, said in part:

"At the trial the defendant frankly admitted that he was an anarchist, coupling his admission with the statement that he did not believe in the use of force or violence for the overthrow of the Government, but simply believed in philosophical anarchy—anarchy tantamount to that entertained by political philosophers—or, as he puts it, in "evolution by education, in order to reach a state of education of mind that it won't be necessary to have a Government." He limited his definition of an anarchist to a person who believed in violence or the destruction of the Government by force of arms. Although he testified before the Bureau of Immigration that he did not believe in the form of government of the United States, he now modifies such testimony by stating that he believes it necessary to have a Government as society is at present organized. He was uncertain as to whether or not he entertained such views at the time of his naturalization, but finally admitted having them for about five, six or seven years. If the defendant had declared on the hearing of his application for citizenship that he was a philosophical anarchist, as distinguished from a dynamic or nihilistic anarchist, or one who believes in destroying the Government by violence, and a disbeliever in organized Government as now constructed, it is inconceivable that his application would have been granted.

"In a popular sense, it is true, an anarchist is regarded as one who seeks to overturn by violence all constituted forms of society and government, including all law and order and all rights of property, without intending to establish any other system of order in place of that destroyed.—Century Dictionary. Yet the word is also defined as one who advocates the absence of government as a

political ideal—a believer in an anarchic theory of society. In using the word “anarchist” without qualification Congress intended to include all aliens who had in mind a theory of anarchy, or the absence of all direct government, in opposition to that of organized government. The former is diametrically opposed to the latter, and the philosophical anarchist who exploits and expounds his views is none the less dangerous to the welfare of the country than the anarchist who believes in overthrowing or destroying the Government by force or violence. The means of accomplishing the end, though different, are both destructive; one consisting of insidious propaganda to arouse sentiment in opposition to the Government, and the other to incite violence and disorder. Both are designed to discredit constituted authority.”—*New York Times*.—See also NATURALIZATION.

ANCHORITES, HERMITS. — “The fertile and peaceable lowlands of England . . . offered

few spots sufficiently wild and lonely for the habitation of a hermit; those, therefore, who wished to retire from the world into a more strict and solitary life than that which the monastery afforded were in the habit of immuring themselves, as anchorites, or in old English ‘Ankers,’ in little cells of stone, built usually against the wall of a church. There is nothing new under the sun; and similar anchorites might have been seen in Egypt, 500 years before the time of St. Antony, immured in cells in the temples of Isis or Serapis. It is only recently that antiquaries have discovered how common this practice was in England, and how frequently the traces of these cells are to be found about our parish churches.”—C. Kingsley, *Hermits*, p. 329.—The term anchorites is applied, generally, to all religious ascetics who lived in solitary cells.—J. Bingham, *Antiquities of the Christian church*, bk. 7, ch. 1, sect. 4.—“The essential difference between an anker or anchorite and a hermit appears to have been that, whereas the former passed his whole life shut up in a cell, the latter, although leading indeed a solitary life, wandered about at liberty.”—R. R. Sharpe, *Introduction to “Calendar of wills in the court of husting, London,” v. 2, p. 21*.—See also CHRISTIANITY: 312-337: Church and the Empire.

ANCIEN RÉGIME.—The political and social system in France that was destroyed by the Revolution of 1789 is commonly referred to as the “ancien régime.” Some writers translate this in the literal English form—“the ancient régime”; others render it more appropriately, perhaps, the “old régime.” Its special application is to the state of things described under FRANCE: 1789.

ANCIENTS, Council of the, governing body provided for by the Constitution of the year III. See FRANCE: 1795 (June-September); 1797 (September); 1799 (November).

ANCON, Treaty of. See CHILE: 1894-1900.

ANCONA, Italian city and seaport on the western coast of the Adriatic. The place played a minor part in the World War as the chief Italian naval base for operations against Austria.—See also ADRIATIC QUESTION.

1814.—Surrender to Murat. See ITALY: 1814.

1832.—Occupied by France. See AUSTRIA: 1815-1840.

1914.—Revolutionary riots. See ITALY: 1912-1914; LABOR STRIKES AND BOYCOTTS: 1914.

1915.—Bombarded by Austrians. See WORLD WAR: 1915: IX. Naval operations: b, 2.

ANCONA, an Italian steamship, which while sailing from Genoa with Americans on board, was shelled and torpedoed by an Austro-Hungarian submarine in November, 1915, before the crew and passengers had been put in a place of safety or even given sufficient time to leave the vessel. After two protests by the American Secretary of State Lansing, the Austro-Hungarian government acknowledged “that hostile private ships, in so far as they do not flee or offer resistance, may not be destroyed without the persons on board having been placed in safety,” and agreed to indemnify the American sufferers.—See also U. S. A.: 1915 (December).

ANCRE, the name of a region and river of France, the scene of intense fighting during the World War. See WORLD WAR: 1916: II. Western front: c, 1; e, 4; d, 3; d, 16; d, 17; e, e, 1; e, 4; 1917: II. Western front: a; 1918: II. Western front: c, 18; k, 1.

ANCRUM MOOR, Battle of.—A success obtained by the Scots over an English force making an incursion into the border districts of their

country in 1545.—J. H. Burton, *History of Scotland*, ch. 35, v. 3.

ANCUS MARCIUS (640-616 B. C.), fourth legendary king of Rome; conquered the Latins, fortified the Janiculum, founded the port of Ostia. As builder of a bridge across the Tiber, he may be a priestly duplicate of Numa, and his second name is Numa Marcius.—See also **ROME**: Ancient kingdom: 753-510.

ANCYRA. See **ANGORA**.

ANDALUSIA: Name.—“The Vandals, . . . though they passed altogether out of Spain, have left their name to this day in its southern part, under the form of Andalusia, a name which, under the Saracen conquerors, spread itself over the whole peninsula.”—E. A. Freeman, *Historical geography of Europe*, ch. 4, sect. 3.—See also **BALTICA**; **VANDALS**: 428.—Roughly speaking, Andalusia represents the country known to the ancients, first as Tartessus, and later as Turdetania.

1702.—Resistance to English and Dutch during the sacking of Cadiz. See **CADIZ**: 1702.

ANDALUSIAN SCHOOL.—A Spanish school of painting, “came into existence about the middle of the sixteenth century. Its chief centre was at Seville, and its chief patron the church rather than the king. Vergas (1502-1568) was probably the real founder of the school, though De Castro and others preceded him.”—J. C. Van Dyke, *Text-book of the history of painting*, p. 180.—Other prominent members of this school were Cespedes, Roelas, Pacheco, Herrera the Elder, Zurbaran, Cano, and Murillo.

ANDAMAN ISLANDS, a group of islands in the Bay of Bengal, in number 204, mentioned by Marco Polo. The British government established a penal colony there in 1858. See **INDIA**: Inhabitants, Aboriginal.

ANDASTES. See **IROQUOIS CONFEDERACY**; **SHAWANESE**; **SUSQUEHANNAS**.

ANDECAVI, the ancient name of the city of Angers, France, and of the tribe which occupied that region.

ANDECHY, town of France south-east of Amiens. See **WORLD WAR**: 1915: II. Western front: j, 6; 1918: II. Western front: c, 22.

ANDERIDA, or **Anderida Sylva**, or **Andredsweald**.—A great forest which anciently stretched across Surrey, Sussex and into Kent (southeastern England) was called **Anderida Sylva** by the Romans and **Andredsweald** by the Saxons. It coincided nearly with the tract of country called in modern times the **Weald of Kent**, to which it gave its name of the **Wald** or **Weald**. On the southern coast-border of the **Anderida Sylva** the Romans established the important fortress and port of **Anderida**, which has been identified with modern **Pevensy**. Here the Romano-Britons made an obstinate stand against the Saxons, in the fifth century, and **Anderida** was only taken by **Ella** after a long siege. In the words of the **Chronicle**, the Saxons “slew all that were therein, nor was there henceforth one Briton left.”—J. R. Green, *Making of England*, ch. 1.

Also in: T. Wright, *Celt, Roman, and Saxon*, ch. 5.

ANDERSON, Judge Albert Barnes (1857-). — Acquittal of the Standard Oil Company. See **TRUSTS**: U. S. A. 1904-1909.

ANDERSON, John (1833-1900). — Scottish scientist. Professor of comparative anatomy at Calcutta Medical College 1864-1886.

ANDERSONVILLE PRISON-PENS. See **PRISONS AND PRISON-PENS, CONFEDERATE**.

ANDES, or **Andi**, or **Andecavi**. See **VENETI OF WESTERN GAUL**.

ANDESANS.—“The term Andesians or Antesians, is used with geographical rather than ethnological limits, and embraces a number of tribes. First of these are the Cofan in Equador, east of Chimborazo. They fought valiantly against the Spaniards, and in times past killed many of the missionaries sent among them. Now they are greatly reduced and have become more gentle. The Huamaboya are their near neighbors. The Jivara, west of the river Pastaca, are a warlike tribe, who, possibly through a mixture of Spanish blood, have a European cast of countenance and a beard. The half Christian Napo or Quijo and their peaceful neighbors, the Zaporo, live on the Rio Napo. The Yamco, living on the lower Chambiva and crossing the Marañon, wandering as far as Saryacu, have a clearer complexion. The Pacamora and the Yguarazongo live on the Marañon, where it leaves its northerly course and bends toward the east. The Cochiquima live on the lower Yavari; the Mayo-run, or Barbudo, on the middle Ucayali beside the Campo and Cochibo, the most terrible of South American Indians; they dwell in the woods between the Tapiche and the Marañon, and like the Jivaro have a beard. The Pano, who formerly dwelt in the territory of Lalaguna, but who now live in villages on the upper Ucayali, are Christians. . . . Their language is the principal one on the river, and it is shared by seven other tribes called collectively by the missionaries Manioto or Mayno. . . . Within the woods on the right bank live the Amahuaca and Shacaya. On the north they join the Remo, a powerful tribe who are distinguished from all the others by the custom of tattooing. Outside this Pano linguistic group stand the Campa, Campo, or Antis on the east slope of the Peruvian Cordillera at the source of the Rio Beni and its tributaries. The Chontaquiros, or Piru, now occupy almost entirely the bank of the Ucayali below the Pachilia. The Mojos or Moxos live in the Bolivian province of Moxos with the small tribes of the Baure, Itonama, Pacaguara. A number of smaller tribes belonging to the Antesian group need not be enumerated. The late Professor James Orton described the Indian tribes of the territory between Quito and the river Amazon. The Napo approach the type of the Quichua. . . . Among all the Indians of the Provincia del Oriente, the tribe of Jivaro is one of the largest. These people are divided into a great number of sub-tribes. All of these speak the clear musical Jivaro language. They are muscular, active men. . . . The Morona are cannibals in the full sense of the word. . . . The Campo, still very little known, is perhaps the largest Indian tribe in Eastern Peru, and, according to some, is related to the Inca race, or at least with their successors. They are said to be cannibals, though James Orton does not think this possible. . . . The nearest neighbors of the Campo are the Chontakiro, or Chontaquiuro, or Chonquiuro, called also Piru, who, according to Paul Marcoy, are said to be of the same origin with the Campo; but the language is wholly different. . . . Among the Pano people are the wild Conibo; they are the most interesting, but are passing into extinction.”—*Standard natural history* (J. S. Kingsley, ed.), v. 6, pp. 227-231.

ANDEVANNE: 1918.—Taken by allies. See **WORLD WAR:** 1918: II. Western front: v, 10; x, 4.

ANDORRA, a little semi-republic in the Spanish Pyrenees. Enjoying a certain self-government since the French Revolution, it is practically a part of Spain. The inhabitants are exempt, however, from Spanish conscription.

ANDOVER, a town and borough of Hampshire, England. Site of several Roman villas and early earthworks, and of the traditional meeting between Æthelred and Olaf the Dane; meeting place of the Witenagemót.

ANDRADA E SYLVA, Bonifacio Jozé d' (1765-1838), Brazilian statesman. Was made minister of the interior and of foreign affairs when the independence of Brazil was declared in 1822, but was banished to France in 1823 because of his democratic principles and lived there in exile till 1829.

ANDRÁSSY, Count Julius (1823-1890), famous Hungarian statesman. Prominent adherent of the revolution of 1848; member of the Diet, 1861; prime minister after reconstruction of Austria and Hungary on a dual basis, 1867; minister of foreign affairs, 1871; with Bismarck drew up the famous "Andrássy note," 1876; chief representative of Austria-Hungary at the Congress of Berlin, 1878; largely responsible for the making of the Hungarian state and constitution.—See also **AUSTRIA:** 1866-1867; **BERLIN, CONGRESS OF;** **HUNGARY:** 1856-1868; **TRIPLE ALLIANCE:** Austro-German Alliance of 1879.

ANDRASSY, Count Julius (1860-), Hungarian political leader, son of the foregoing Count Andrássy. Minister of interior, 1906-1909, in Wekerle cabinet; as Austrian delegate tried to prevent Balkan War, 1912; opposition leader, 1912-1918.—See also **AUSTRIA-HUNGARY:** 1903-1905; 1905-1906; 1914-1915; **HUNGARY:** 1918 (November).

ANDRÉ, John (1751-1780), British soldier. Negotiated with Benedict Arnold in 1780 for the betrayal of West Point; taken prisoner by the Americans and hanged as a spy October 2, 1780.—See also **U. S. A.:** 1780 (August-September).

ANDREA, Johann Valentin (1586-1654), German theologian. See **ROSCRUCIANS:** Illuminati.

ANDREA DEL SARTO (1487-1531), Florentine painter of the Renaissance. The *Last Supper*, *Madonna de Sacco*, and the *Apparition of the Angel to Zacharias* are among his most celebrated works. See **PAINTING:** Italian: Early Renaissance.

ANDREANI, Andrea (c. 1540-1623), Italian engraver on wood, in chiaroscuro. Among others the most remarkable of his works are *Mercury and Ignorance*, the *Deluge*, and *Pharaoh's host drowned in the Red Sea*.

ANDREDSWEALD. See **ANDERIDA**, **ANDERIDA SYLVA**, **ANDREDSWEALD**.

ANDRÉE, Solomon August (1854-1897), Swedish engineer and aeronaut. See **AVIATION:** Development of balloons and dirigibles: 1870-1913.

ANDREEV, Leonid (Andreeff, Leonid Nikolaevich), Russian writer. See **RUSSIAN LITERATURE:** 1883-1905.

ANDREW I, king of Hungary, 1046-1060.

Andrew II (1175-1235), king of Hungary, 1205-1235; participated in the fifth Crusade in 1217; forced by Hungarian barons to sign the Golden Bull, the Magna Carta of Hungary, in 1222. See **Crusades:** 1216-1229; **HUNGARY:** 1116-1301.

Andrew III, king of Hungary, 1290-1301. See **HUNGARY:** 1116-1301.

Andrew, prince of Hungary, murder of. See **ITALY (SOUTHERN):** 1343-1389.

ANDREW, John Albion (1818-1867), American statesman; prominent as the Republican war governor of Massachusetts (1861-1866); was one of the first northern governors to send troops to the war; organized the first colored regiment (1863).

ANDREWS, Thomas (1813-1885), Irish chemist and physicist. Studied medicine and the physical sciences at Glasgow, Paris, Edinburgh, and Dublin; professor of chemistry in Queens College, Belfast, 1845-1879; made important discoveries on the liquefaction of gases. See **CHEMISTRY:** Physical.

ANDRONICUS I (Comnenus) (c. 1110-1185), Roman emperor in the East, 1183-1185. See **BYZANTINE EMPIRE:** 1203-1204.

Andronicus II (Palæologus) (1260-1332), Roman emperor in the East, 1282-1328.

Andronicus III (1296-1341), Roman emperor in the East, 1328-1341.

ANDRONICUS OF CYRRHUS, Greek architect and astronomer. Lived in the first century B. C. He erected at Athens the so-called Tower of the Winds on which was a turning figure of Triton with his spear, the prototype of the later weathercock.

ANDROPHAGI ("man-eaters"), a race of northern cannibals mentioned by Herodotus. It is supposed that they were related to the Finns.

ANDROS, Sir Edmund (1637-1714), English colonial governor in America. Served in the army of Prince Henry of Nassau, appointed governor of New York and the Jerseys, 1674; capable but unpopular governor. Recalled 1681. Knighted, 1678; governor of the "Dominion of New England," 1686-1689 (see also **CONNECTICUT:** 1685-1687); deposed by the colonists after the overthrow of James II; governor of Maryland, 1693-1694; governor of Guernsey, 1704-1706.—See also **MASSACHUSETTS:** 1686-1689; **NEW YORK:** 1688; **U. S. A.:** 1678-1780; 1686-1689.

ANDROS, the largest of the Cyclades, situated in the Ægean sea southeast of Eubœa. The island supplies ships to Xerxes in 480 B. C. In 408 B. C. the inhabitants of Andros successfully withstood an Athenian attack. Subsequently it became, in turn, the possession of Athens, Macedon, Pergamum and Rome.

ANECDOTE, Early use of. See **ARABIC LITERATURE.**

ANEGADA ISLAND. See **VIRGIN ISLANDS.**

ANERIO, Felice (1560-1630?), Italian composer of the Roman school. A boy soprano in the papal choir (1575-1579); upon the death of Palestrina succeeded him as composer to the choir in 1594.

ANFU CLUB, the name of a political faction prominent in the affairs of northern China, during the troublous times following the overthrow of the Manchu dynasty in 1912. The name is made up of the first syllables of the names of the provinces Anhwei and Fukien, and was meant to symbolize the combination of the leaders controlling the Chinese army and navy. The idea back of this union is similar to that which in Japan brought about the famous Sat-Cho combination. Traditionally, the Japanese army is controlled by the Satsuma clan, and the navy, by the clan of Choshu. Hence, the Anfu Club has been regarded as typifying a military clique, dominating the country by force.—See also **CHINA:** 1920.

ANGA, Bengal. See **BENGAL.**

ANGARIA, a relay system of mounted couriers for the transmission of intelligence, adopted under the Roman empire from the example of the ancient Persians.

ANGARY, Right of (Lat. *jus angariæ*), the right of a belligerent to commandeer and seize any sort of enemy or neutral property on belligerent territory if needed for military use. This right has been exercised from the earliest times, and is recognized by articles 53 and 54 of the Hague regulations of 1899, which further state that at the conclusion of peace the property must be restored and indemnity paid for its use. The seizure of Dutch merchantmen in 1918 by the United States was defended as being in conformity with the right of angary.

ANGAS, George Fife (1879-1879), a founder of South Australia, who devised a system of land settlement. See **SOUTH AUSTRALIA**: 1834-1836.

ANGELES, Felipe, Mexican revolutionary general. Executed, 1920.

ANGELICO, Fra (1387-1455), Italian painter. Entered Dominican order in 1408. Angelico's art is essentially pietistic. Two of the subjects he most frequently painted were the Last Judgment and the Annunciation.—See also **PAINTING: Italian: Early Renaissance**.

ANGÉLIQUE (Arnauld, Jacqueline Marie Angélique) (1591-1661), abbess at Port Royal. See **PORT ROYAL** and **THE JANSENISTS**: 1602-1700.

ANGELL, George Thorndike (1823-1909), American educator and philanthropist. Founded Massachusetts Society for Prevention of Cruelty to Animals and American Humane Education Society.

ANGELL, James Burrill (1829-1916), American educator and diplomat, professor of modern languages of Brown University, 1853-1860; editor of *Providence Journal*, 1860-1866; president of the University of Vermont, 1866-1871, and of University of Michigan, 1871-1909; United States minister to China, 1880-1881 and to Turkey, 1897-1898; made president emeritus of University of Michigan in 1909.

ANGELL, James Rowland (1860-), psychologist and educator, son of James Burrill Angell; professor of psychology at University of Chicago, 1905; dean of the university faculties, 1911; acting president, 1918-1919; president of Yale, 1921.

ANGELL, Norman, pseud. See **LANE, RALPH NORMAN ANGELL**.

ANGELO, Michael. See **MICHELANGELO**.

ANGELUS, Isaac, emperor in the East. See **BYZANTINE EMPIRE**: 1203-1204.

Defeat of the Angevins by Alphonso. See **ITALY**: 1412-1447.

ANGHIARI, Battle of (1425). See **ITALY**: 1412-1447.

ANGKOR, a group of ruins in Cambodia, relics of the ancient Khmer civilization. They include remains of the town of Angkor-Thom and the temple of Angkor-Vat. The ornamentation consists of reliefs of men, gods and animals displayed on every flat surface; the stones are cut in huge blocks carefully fitted together without the use of cement.

ANGLES.—The mention of the Angles by Tacitus is in the following passage: "Next [to the Langobardi] come the Reudigni, the Aviones, the Anglii, the Varini, the Eudoses, the Suardones, and Nuithones, who are fenced in by rivers or forests. None of these tribes have any noteworthy feature, except their common worship of Ertha, or mother-Earth, and their belief that she interposes in human affairs, and visits the nations in her car. In an island of the ocean there is a sacred grove, and within it a consecrated chariot, covered over with a garment. Only one priest is permitted to touch it. He can perceive the presence of the goddess in this sacred recess, and walks by her side with the utmost reverence as she is drawn along by heifers. It is a season of rejoicing, and festivity reigns wherever she deigns to go and be received. They do not go to battle or wear arms; every weapon is under lock; peace and quiet are welcomed only at these times, till the goddess, weary of human intercourse, is at length restored by the same priest to her temple. Afterwards the car, the vestments, and, if you like to believe it, the divinity herself, are purified in a secret lake. Slaves perform the rite, who are instantly swallowed up by its waters. Hence arises a mysterious terror and a pious ignorance concerning the nature of that which is seen only by men doomed to die. This branch indeed of the Suevoi stretches into the remoter regions of Germany."—Tacitus, *Germany*; translated by Church and Brodrick, *ch. 40*.—"In close neighbourhood with the Saxons in the middle of the fourth century were the Angli, a tribe whose origin is more uncertain and the application of whose name is still more a matter of question. If the name belongs, in the pages of the several geographers, to the same nation, it was situated in the time of Tacitus east of the Elbe; in the time of Ptolemy it was found on the middle Elbe, between the Thuringians to the south and the Varini to the north; and at a later period it was forced, perhaps by the growth of the Thuringian power, into the neck of the Cimbric peninsula. It may, however, be reasonably doubted whether this hypothesis is sound, and it is by no means clear whether, if it be so, the Angli were not connected more closely with the Thuringians than with the Saxons. To the north of the Angli, after they had reached their Schleswig home, were the Jutes, of whose early history we know nothing, except their claims to be regarded as kinsmen of the Goths and the close similarity between their descendants and the neighbour Frisians."—W. Stubbs, *Constitutional history of England*, v. 1, *ch. 3*.—"Important as are the Angles, it is not too much to say that they are only known through their relations to us of England, their descendants; indeed, without this paramount fact, they would be liable to be confused with the Frisians, with the Old Saxons, and with even Slavonians. This is chiefly because there is no satisfactory trace or fragment of the Angles of Germany within Germany; whilst the notices of the other writers of antiquity tell us as little as the one we find in Tacitus. And this notice is not only brief but complicated. . . . I still think that the Angli of Tacitus were—1: The Angles of England; 2: Occupants of the northern parts of Hanover; 3: At least in the time of Tacitus; 4: And that to the exclusion of any territory in Holstein, which was Frisian to the west, and Slavonic to the east. Still the question is one of great magnitude and numerous complications."—R. G. Latham, *Germany of Tacitus; Epilegomena*, *sect. 40*.—See also **AVIONES**; **SAXONS**.—The conquests and settlements of the Jutes and the Angles in Britain are de-

scribed under BARBARIAN INVASIONS: 5th-6th centuries; ENGLAND: 547-633; see also EUROPE: Ethnology: Migrations: Map.

ANGLO-JAPANESE ALLIANCE.—“Great Britain was the first to welcome Japan into the ranks of the Great Powers. In 1902 a treaty of friendship had been signed by the two island nations [see JAPAN: 1895-1902; 1894-1914]; in 1905 this compact was greatly strengthened by a treaty of alliance [see JAPAN: 1902-1905]. The latter provided for (1) the preservation of peace in Eastern Asia and India; (2) the maintenance of the integrity of China and of the principle of the ‘open door’; and (3) the defense of the territorial rights of each party in Eastern Asia and India. This treaty, which was renewed in 1911, gave Japan a free hand in the Far East, so far as England was concerned, in return for Japan’s promise to safeguard British rule in India.”—J. S. Schapiro, *Modern and contemporary European history*, pp. 670-671.

The text of the 1911 treaty between England and Japan continuing the alliance for a ten-year period, is as follows:

“PREAMBLE.—The Government of Great Britain and the Government of Japan, having in view the important changes which have taken place in the situation since the conclusion of the Anglo-Japanese Agreement of the 12th August, 1905, and believing that a revision of that Agreement responding to such changes would contribute to general stability and repose, have agreed upon the following stipulations to replace the Agreement above mentioned, such stipulations having the same object as the said Agreement, namely:—(a) The consolidation and maintenance of the general peace in the regions of Eastern Asia and of India; (b) The preservation of the common interests of all Powers in China by insuring the independence and integrity of the Chinese Empire and the principle of equal opportunities for the commerce and industry of all nations in China; (c) The maintenance of the territorial rights of the High Contracting Parties in the regions of Eastern Asia and of India, and the defence of their special interests in the said regions. ARTICLE I. It is agreed that whenever, in the opinion of either Great Britain or Japan, any of the rights and interests referred to in the preamble of this Agreement are in jeopardy, the two Governments will communicate with one another fully and frankly, and will consider in common the measures which should be taken to safeguard those menaced rights or interests. ARTICLE II. If by reason of unprovoked attack or aggressive action, wherever arising, on the part of any Power or Powers, either High Contracting Party should be involved in war in defence of its territorial rights or special interests mentioned in the preamble of this Agreement, the other High Contracting Party will at once come to the assistance of its ally, and will conduct the war in common, and make peace in mutual agreement with it. ARTICLE III. The High Contracting Parties agree that neither of them will, without consulting the other, enter into separate arrangements with another Power to the prejudice of the objects described in the preamble of this Agreement. ARTICLE IV. Should either High Contracting Party conclude a treaty of general arbitration with a third Power, it is agreed that nothing in this Agreement shall entail upon such Contracting Party an obligation to go to war with the

Power with whom such treaty of arbitration is in force. ARTICLE V. The conditions under which armed assistance shall be afforded by either Power to the other in the circumstances mentioned in the present Agreement, and the means by which such assistance is to be made available, will be arranged by the Naval and Military authorities of the High Contracting Parties, who will from time to time consult one another fully and freely upon all questions of mutual interest. ARTICLE VI. The present Agreement shall come into effect immediately after the date of its signature, and remain in force for ten years from that date. In case neither of the High Contracting Parties should have notified twelve months before the expiration of the said ten years the intention of terminating it, it shall remain binding until the expiration of one year from the day on which either of the High Contracting Parties shall have denounced it. But if, when the date fixed for its expiration arrives, either ally is actually engaged in war, the alliance shall, *ipso facto*, continue until peace is concluded. In faith whereof the Undersigned, duly authorized by their respective Governments, have signed this Agreement, and have affixed thereto their Seals. Done in duplicate at London, the 13th day of July, 1911."—E. C. Stowell, *Diplomacy of the War of 1914*, pp. 541-542.—See also PACIFIC OCEAN: 1918-1921; U. S. A.: 1910-1921; WORLD WAR: 1914; V. ANGLO-PERSIAN TREATY, an agreement concluded between Great Britain and Persia on August 9, 1919. In this treaty the British government agreed to respect the independence and integrity of Persia; to supply expert advisers for the various civil departments and the army; to grant a substantial loan; to aid in railway and road building and in tariff revision. Although Great Britain denied any intention of absorbing Persia, many foreign observers regarded the treaty as amounting to a protectorate. However, on Feb. 27, 1921, the treaty was abrogated.—See also PERSIA: 1919 (August).

ANGLO-PORTUGUESE CONVENTION (1891). See AFRICA: Modern European occupation: 1884-1889.

ANGLO-RUSSIAN AGREEMENT OF 1895. See AFGHANISTAN: 1895.

ANGLO-RUSSIAN AGREEMENT OF 1907.—Convention between Great Britain and Russia, containing arrangements on the subject of Persia, Afghanistan, and Tibet.—Parallel with the Agreements—the "*Entente Cordiale*"—of 1904 between England and France, in its purpose and in its importance to Europe, was the Convention between England and Russia in 1907, which harmonized the interests and the policy of the two nations in matters relating to Persia, Afghanistan, and Tibet. In each case the dictating motive looked not so much to a settlement of the particular questions involved, as to a general extinguishment of possible causes of contention which might at some time disturb the peaceful or friendly relations of the peoples concerned. Taken together, the two formally expressed understandings, Anglo-French and Anglo-Russian, added to the Franco-Russian Alliance of 1895 (see FRANCE: 1895) constituted, not a new Triple Alliance, set over against that of Germany, Austria-Hungary, and Italy, but an amicable conjunction which bore sug-

gestions of alliance, and which introduced a counterweight in European politics that made undoubtedly for peace. The Anglo-Russian Convention, signed August 31, 1907, contained three distinct "Arrangements," under a common preamble, as follows:

"His Majesty the King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, Emperor of India, and His Majesty the Emperor of All the Russias, animated by the sincere desire to settle by mutual agreement different questions concerning the interests of their States on the Continent of Asia, have determined to conclude Agreements destined to prevent all cause of misunderstanding between Great Britain and Russia in regard to the questions referred to, and have nominated for this purpose their respective Plenipotentiaries. . . . Who, having communicated to each other their full powers, found in good and due form, have agreed on the following:

"ARRANGEMENT CONCERNING PERSIA

"The Governments of Great Britain and Russia having mutually engaged to respect the integrity and independence of Persia, and sincerely desiring the preservation of order throughout that country and its peaceful development, as well as the permanent establishment of equal advantages for the trade and industry of all other nations;

"Considering that each of them has, for geographical and economic reasons, a special interest in the maintenance of peace and order in certain provinces of Persia adjoining, or in the neighbourhood of, the Russian frontier on the one hand, and the frontiers of Afghanistan and Baluchistan on the other hand; and being desirous of avoiding all cause of conflict between their respective interests in the above-mentioned Provinces of Persia;

"Have agreed on the following terms:

"I. Great Britain engages not to seek for herself, and not to support in favour of British subjects, or in favour of the subjects of third Powers, any Concessions of a political or commercial nature—such as Concessions for railways, banks, telegraphs, roads, transport, insurance, &c.—beyond a line starting from Kasr-i-Shirin, passing through Isfahan, Yezd, Kakhk and ending at a point on the Persian frontier at the intersection of the Russian and Afghan frontiers, and not to oppose, directly or indirectly, demands for similar Concessions in this region which are supported by the Russian Government. It is understood that the above-mentioned places are included in the region in which Great Britain engages not to seek the Concessions referred to.

"II. Russia, on her part, engages not to seek for herself, and not to support in favour of Russian subjects, or in favour of the subjects of third Powers, any Concessions of a political or commercial nature—such as Concessions for railways, banks, telegraphs, roads, transport, insurance, &c.—beyond a line going from the Afghan frontier by way of Gazik, Birjand, Kerman, and ending at Bunder Abbas, and not to oppose, directly or indirectly, demands for similar Concessions in this region which are supported by the British Government. It is understood that the above-mentioned places are included in the region in which Russia engages not to seek the Concessions referred to.

"III. Russia, on her part, engages not to oppose, without previous arrangement with Great Britain, the grant of any Concessions whatever to British subjects in the regions of Persia situated

between the lines mentioned in Articles I and II. Great Britain undertakes a similar engagement as regards the grant of Concessions to Russian subjects in the same regions of Persia. All Concessions existing at present in the regions indicated in Articles I and II are maintained.

"IV. It is understood that the revenues of all the Persian customs, with the exception of those of Farsistan and of the Persian Gulf, revenues guaranteeing the amortization and the interest of the loans concluded by the Government of the Shah with the 'Banque d'Escompte et des Prêts de Perse' up to the date of the signature of the present Arrangement, shall be devoted to the same purpose as in the past. It is equally understood that the revenues of the Persian customs of Farsistan and of the Persian Gulf, as well as those of the fisheries on the Persian shore of the Caspian Sea and those of the Posts and Telegraphs, shall be devoted, as in the past, to the service of the loans concluded by the Government of the Shah with the Imperial Bank of Persia up to the date of the signature of the present Arrangement.

"V. In the event of irregularities occurring in the amortization or the payment of the interest of the Persian loans concluded with the 'Banque d'Escompte et des Prêts de Perse' and with the Imperial Bank of Persia up to the date of the signature of the present Arrangement, and in the event of the necessity arising for Russia to establish control over the sources of revenue guaranteeing the regular service of the loans concluded with the first-named bank, and situated in the region mentioned in Article II of the present Arrangement, or for Great Britain to establish control over the sources of revenue guaranteeing the regular service of the loans concluded with the second-named bank, and situated in the region mentioned in Article I of the present Arrangement, the British and Russian Governments undertake to enter beforehand into a friendly exchange of ideas with a view to determine, in agreement with each other, the measures of control in question and to avoid all interference which would not be in conformity with the principles governing the present Arrangement.

"CONVENTION CONCERNING AFGHANISTAN

"The High Contracting Parties, in order to ensure perfect security on their respective frontiers in Central Asia and to maintain in these regions a solid and lasting peace, have concluded the following Convention:

"ARTICLE I. His Britannic Majesty's Government declare that they have no intention of changing the political status of Afghanistan. His Britannic Majesty's Government further engage to exercise their influence in Afghanistan only in a pacific sense, and they will not themselves take, nor encourage Afghanistan to take, any measures threatening Russia. The Russian Government, on their part, declare that they recognize Afghanistan as outside the sphere of Russian influence, and they engage that all their political relations with Afghanistan shall be conducted through the intermediary of His Britannic Majesty's Government; they further engage not to send any Agents into Afghanistan.

"ARTICLE II. The Government of His Britannic Majesty having declared in the Treaty signed at Kabul on the 21st March, 1905, that they recognize the Agreement and the engagements concluded with the late Ameer Abdur Rahman, and that they have no intention of interfering in the internal government of Afghan territory, Great Britain engages neither to annex nor to occupy in contra-

vention of that Treaty any portion of Afghanistan or to interfere in the internal administration of the country, provided that the Ameer fulfils the engagements already contracted by him towards His Britannic Majesty's Government under the above-mentioned Treaty.

"ARTICLE III. The Russian and Afghan authorities, specially designated for the purpose on the frontier or in the frontier provinces, may establish direct relations with each other for the settlement of local questions of a non-political character.

"ARTICLE IV. His Britannic Majesty's Government and the Russian Government affirm their adherence to the principle of equality of commercial opportunity in Afghanistan, and they agree that any facilities which may have been, or shall be hereafter obtained for British and British-Indian trade and traders, shall be equally enjoyed by Russian trade and traders. Should the progress of trade establish the necessity for Commercial Agents, the two Governments will agree as to what measures shall be taken, due regard, of course, being had to the Ameer's sovereign rights.

"ARTICLE V. The present Arrangements will only come into force when His Britannic Majesty's Government shall have notified to the Russian Government the consent of the Ameer to the terms stipulated above.

"ARRANGEMENT CONCERNING TIBET

"The Governments of Great Britain and Russia recognizing the suzerain rights of China in Tibet, and considering the fact that Great Britain, by reason of her geographical position, has a special interest in the maintenance of the *status quo* in the external relations of Thibet, have made the following Arrangement:—

"ARTICLE I. The two High Contracting Parties engage to respect the territorial integrity of Thibet and to abstain from all interference in its internal administration.

"ARTICLE II. In conformity with the admitted principle of the suzerainty of China over Thibet, Great Britain and Russia engage not to enter into negotiations with Thibet except through the intermediary of the Chinese Government. This engagement does not exclude the direct relations between British Commercial Agents and the Thibetan authorities provided for in Article V of the Convention between Great Britain and Thibet of the 7th September, 1904, and confirmed by the Convention between Great Britain and China of the 27th April, 1906; nor does it modify the engagements entered into by Great Britain and China in Article I of the said Convention of 1906.

"It is clearly understood that Buddhists, subjects of Great Britain or of Russia, may enter into direct relations on strictly religious matters with the Dalai Lama and the other representatives of Buddhism in Thibet; the Governments of Great Britain and Russia engage, as far as they are concerned, not to allow those relations to infringe the stipulations of the present Arrangement.

"ARTICLE III. The British and Russian Governments respectively engage not to send Representatives to Lhasa.

"ARTICLE IV. The two High Contracting Parties engage neither to seek nor to obtain, whether for themselves or their subjects, any Concessions for railways, roads, telegraphs, and mines, or other rights in Thibet.

"ARTICLE V. The two Governments agree that no part of the revenues of Thibet, whether in kind or in cash, shall be pledged or assigned to Great Britain or Russia or to any of their subjects.

"ANNEX TO THE ARRANGEMENT BETWEEN GREAT BRITAIN AND RUSSIA CONCERNING TIBET

"Great Britain reaffirms the Declaration, signed by his Excellency the Viceroy and Governor-General of India and appended to the ratification of the Convention of the 7th September, 1904, to the effect that the occupation of the Chumbi Valley by British forces shall cease after the payment of three annual instalments of the indemnity of 25,000,000 rupees, provided that the trade marts mentioned in Article II of that Convention have been effectively opened for three years, and that in the meantime the Thibetan authorities have faithfully complied in all respects with the terms of the said Convention of 1904. It is clearly understood that if the occupation of the Chumbi Valley by the British forces has, for any reason, not been terminated at the time anticipated in the above Declaration, the British and Russian Governments will enter upon a friendly exchange of views on this subject."

As an Inclosure with the Convention, Notes were exchanged by the Plenipotentiaries, of which that from Sir A. Nicolson was in the following words, M. Isvolsky replying to the same effect.

"St. PETERSBURG, August 18 (31), 1907.

"M. LE MINISTRE,

"With reference to the Arrangement regarding Thibet, signed to-day, I have the honour to make the following Declaration to your Excellency:—

"His Britannic Majesty's Government think it desirable, so far as they are concerned, not to allow, unless by a previous agreement with the Russian Government, for a period of three years from the date of the present communication, the entry into Thibet of any scientific mission whatever, on condition that a like assurance is given on the part of the Imperial Russian Government.

"His Britannic Majesty's Government propose, moreover, to approach the Chinese Government with a view to induce them to accept a similar obligation for a corresponding period; the Russian Government will as a matter of course take similar action.

"At the expiration of the term of three years above mentioned His Britannic Majesty's Government will, if necessary, consult with the Russian government as to the desirability of any ulterior measures with regard to scientific expeditions to Thibet."

I avail, &c.

(Signed) A. NICOLSON."

In authorizing Sir A. Nicolson to sign the above Convention, Sir Edward Grey, the British Secretary for Foreign Affairs, wrote, on August 29, as follows:

"I have to-day authorized your Excellency by telegraph to sign a Convention with the Russian Government containing Arrangements on the subject of Persia, Afghanistan, and Thibet.

"The Arrangement respecting Persia is limited to the regions of that country touching the respective frontiers of Great Britain and Russia in Asia, and the Persian Gulf is not part of those regions, and is only partly in Persian territory. It has not therefore been considered appropriate to introduce into the Convention a positive declaration respecting special interests possessed by Great Britain in the Gulf, the result of British action in those waters for more than a hundred years.

"His Majesty's Government have reason to believe that this question will not give rise to difficulties between the two Governments, should developments arise which make further discussion

affecting British interests in the Gulf necessary. For the Russian Government have in the course of the negotiations leading up to the conclusion of this Arrangement explicitly stated that they do not deny the special interests of Great Britain in the Persian Gulf—a statement of which His Majesty's Government have formally taken note.

"In order to make it quite clear that the present Arrangement is not intended to affect the position in the Gulf, and does not imply any change of policy respecting it on the part of Great Britain, His Majesty's Government think it desirable to draw attention to previous declarations of British policy, and to reaffirm generally previous statements as to British interests in the Persian Gulf and the importance of maintaining them.

"His Majesty's Government will continue to direct all their efforts to the preservation of the *status quo* in the Gulf and the maintenance of British trade; in doing so, they have no desire to exclude the legitimate trade of any other Power."—*Parliamentary Papers by Command*. ANGLO-RUSSIAN TREATY, 1825. See ALASKAN BOUNDARY QUESTION: Claims of both sides.

ANGLO-SAXON, a term which may be considered as a compound of Angle and Saxon, the names of the two principal Teutonic tribes which took possession of Britain and formed the English nation by their ultimate union. As thus regarded and used to designate the race, the language and the institutions which resulted from that union, it is only objectionable, perhaps, as being superfluous, because English is the accepted name of the people of England and all pertaining to them. But the term Anglo-Saxon has also been more particularly employed to designate the early English people and their language, before the Norman Conquest, as though they were Anglo-Saxon at that period and became English afterwards. Modern historians are making strong protests against this use of the term. Mr. Freeman (*Norman conquest*, v. 1, note A) says: "The name by which our forefathers really knew themselves and by which they were known to other nations was English and no other. 'Angli,' 'Engle,' 'Angel-cyn,' 'Englisc,' are the true names by which the Teutons of Britain knew themselves and their language. . . . As a chronological term, Anglo-Saxon is equally objectionable with Saxon. The 'Anglo-Saxon period,' as far as there ever was one, is going on still. I speak therefore of our forefathers, not as 'Saxons,' or even as 'Anglo-Saxons,' but as they spoke of themselves, as Englishmen—'Angli,' 'Engle,'—'Angelcyn.'"—See also ANGLES; SAXONS.

ANGLON, Battle of (543).—Fought in Armenia between the Romans and the Persians.

ANGOLA, the name now given to the territory which the Portuguese have occupied on the western coast of South Africa since the sixteenth century, extending from Belgian Congo, on the north, to Damaraland, on the south, with an interior boundary that is somewhat indefinite. It is divided into four districts, Congo, Loando, Benguela, and Mossamedes. For modern developments, railroads, etc., see AFRICA: Modern European occupation: Summary of European occupation: Modern railway and industrial development of Africa; Map.

ANGORA or **Ancyra**, a city of Asia Minor, famous in ancient times for its culture and trade. On the walls of the beautiful Greek temple dedicated to the emperor Augustus was found in 1553 the celebrated "Inscription of Ancyra" commemorating his exploits. Goats and similar animals in this district are famous for their long silky hair, due apparently to peculiar conditions.

ANGRO-MAINYUS, spirit of evil in dual doctrine of Zoroaster. See **ZOROASTRIANS**.

ANHALT, a free state, was a duchy of Germany and a state of the empire after 1871. It was formed of Anhalt-Dessau-Cöthen and Anhalt-Bernburg in 1863. Originally (in the eleventh century) a part of Saxony [see **SAXONY**: 1178-1183], it became united to the margravate of Brandenburg in the twelfth century by Albert the Bear, with whom the ruling dynasty of the duchy originated. In 1218, when Prince Henry became count of Anhalt, it was separated from Saxony, and was later divided by his sons into the three principalities of Bernburg, Aschersleben and Zerbst. After a subsequent reunion in 1570, it became again divided in 1603 into Dessau, Bernburg, Plötzkau, Zerbst, and Cöthen. This alternation of split and reunion continued until the interference of the Prussian rulers and the gradual extinction of the individual lines led to the establishment of a joint constitution in 1850, and a final unification under Leopold IV, in 1863. The last reigning duke was Edward, who succeeded to the throne on April 21, 1918. On July 18, 1919, Anhalt became a free state. Its constitution provides for a diet to be elected by the people every three years and for a state council of five members, the chairman of which bears the title of president. It is divided by Prussian Saxony into Eastern and Western Anhalt (the latter also called Upper Duchy or Ballenstedt), and is surrounded by the Prussian territories of Potsdam, Magdeburg and Merseburg and by Brunswick along five miles on the west. Its principal river is the Elbe, which intersects its eastern part from east to west, and is joined by

the Saale and the Mulde, and minor tributaries. It is mountainous in the southwest of its western part, to which the Harz range extends, and becomes level as it approaches the Elbe. Except for the portion east of the Elbe, which to a great extent is a sandy plain, the soil is rich. In 1910, of the total area of 888 miles, sixty per cent of the land was cultivated; seven per cent is pasture land, which stretches along the Elbe, and twenty-five per cent is forest-covered. The chief yields are rye, wheat, potatoes and oats. Vegetables, corn, fruits, beets, tobacco, flax, hops and linseed are also grown. The forests abound in game and the rivers in fish. Its chief mineral resources are salts of different kinds and lignite. Before the World War almost half of the population was occupied in the mineral and manufacturing industries. The country is crossed by 180 miles of railway. Its largest cities are Dessau, the capital, Bernburg, Cöthen, Zerbst, and Rossau. According to the census of 1910 its population is 331,128. The greater majority are Protestants; 12,755 are Catholics, and 1,383 Jews.

ANIMUCCIA, Giovanni (d. 1571), Italian composer; was choir-master at St. Peter's (1555-1571), filling the interval between Palestrina's terms; composed the famous "Laudi," which were sung at the Oratorio of St. Filippo after the regular office, and out of which the oratorio is said to have developed.

ANJOU, François (Hercule) de France, duc d', duke of Brabant, 1554-1584. See **NETHERLANDS**: 1577-1581, 1581-1584.

ANJOU, a former province in the west of France, now Maine-et-Loire. In ancient times inhabited by the Andecavi; became a center of power under Geoffrey Martel (1040-1060); a possession of the English crown during the Plantagenet monarchy (1154-1203); seized by Philip Augustus. United with Provence under the rule of the king of Naples; annexed to the royal dominions by Louis XI in 1480.

Counts and dukes of (Summary).—Line originated with Ingelgerius, seneschal of Gatinais, who received the countship from Charles the Bald in 870. Among his descendants were Fulk V, count of Anjou, king of Jerusalem in 1131; Geoffrey IV, le Plantagenet, who married Matilda, daughter of Henry I of England, and Henry, son of Geoffrey and grandson of Fulk V, who as Henry II was

the first Plantagenet king of England. In the reign of King John of England, the title of Anjou passed to Philip Augustus of France, who granted it to Charles, the brother of Louis IX.

Creation of the county.—Origin of the Plantagenets.—"It was the policy of this unfairly depreciated sovereign [Charles the Bald, grandson of Charlemagne, who received in the dismemberment of the Carolingian empire the Neustrian part, out of which was developed the modern kingdom of France, and who reigned from 840 to 877], to recruit the failing ranks of the false and degenerate Frankish aristocracy, by calling up to his peerage the wise, the able, the honest and the bold of ignoble birth. . . . He sought to surround himself with new men, the men without ancestry; and the earliest historian of the House of Anjou both describes this system and affords the most splendid example of the theory adopted by the king. Pre-eminent amongst these parvenus was Torquatus or Tortulfus, an Armorican peasant, a very rustic, a backwoodsman, who lived by hunting and such like occupations, almost in solitude, cultivating his 'quillets,' his 'cueillettes,' of land, and driving his own oxen, harnessed to his plough. Torquatus entered or was invited into the service of Charles-le-Chauve, and rose high in his sovereign's confidence: a prudent, a bold, and a good man. Charles appointed him Forester of the forest called 'the Blackbird's Nest,' the 'nid du merle,' a pleasant name, not the less pleasant for its familiarity. This happened during the conflicts with the Northmen. Torquatus served Charles strenuously in the wars, and obtained great authority. Tertullus, son of Torquatus, inherited his father's energies, quick and acute, patient of fatigue, ambitious and aspiring; he became the liegeman of Charles; and his marriage with Petronilla the King's cousin, Count Hugh the Abbot's daughter, introduced him into the very circle of the royal family. Château Landon and other benefices in the Gastinois were acquired by him, possibly as the lady's dowry. Seneschal, also, was Tertullus, of the same ample Gastinois territory. Ingelger, son of Tertullus and Petronilla, appears as the first hereditary Count of Anjou Outre-Maine.—Marquis, Consul or Count of Anjou,—for all these titles are assigned to him. Yet the ploughman Torquatus must be reckoned as the primary Plantagenet: the rustic Torquatus founded that brilliant family."—F. Palgrave, *History of Normandy and England*, bk. 1, ch. 3.

987-1129.—**Greatest of the old counts.**—"Fulc Nerra, Fulc the Black [987-1040] is the greatest of the Angevins, the first in whom we can trace that marked type of character which their house was to preserve with a fatal constancy through two hundred years. He was without natural affection. In his youth he burned a wife at the stake, and legend told how he led her to her doom decked out in his gayest attire. In his old age he waged his bitterest war against his son, and exacted from him when vanquished a humiliation which men reserved for the deadliest of their foes. 'You are conquered, you are conquered!' shouted the old man in fierce exultation, as Geoffrey, bridled and saddled like a beast of burden, crawled for pardon to his father's feet. . . . But neither the wrath of Heaven nor the curses of men broke with a single mishap the fifty years of his success. At his accession Anjou was the least important of the greater provinces of France. At his death it stood, if not in extent, at least in real power, first among them all. . . . His overthrow of Brittany on the field of Conquereux was followed by the gradual

absorption of Southern Touraine. . . . His great victory at Pontlevoi crushed the rival house of Blois; the seizure of Saumur completed his conquests in the South, while Northern Touraine was won bit by bit till only Tours resisted the Angevin. The treacherous seizure of its Count, Herbert Wake-dog, left Maine at his mercy ere the old man bequeathed his unfinished work to his son. As a warrior, Geoffrey Martel was hardly inferior to his father. A decisive overthrow wrested Tours from the Count of Blois; a second left Poitou at his mercy; and the seizure of Le Mans brought him to the Norman border. Here . . . his advance was checked by the genius of William the Conqueror, and with his death the greatness of Anjou seemed for the time to have come to an end. Stripped of Maine by the Normans, and weakened by internal dissensions, the weak and profligate administration of Fulc Rechin left Anjou powerless against its rivals along the Seine. It woke to fresh energy with the accession of his son, Fulc of Jerusalem. . . . Fulc was the one enemy whom Henry the First really feared. It was to disarm his restless hostility that the King yielded to his son, Geoffrey the Handsome, the hand of his daughter Matilda."—J. R. Green, *Short history of the English people*, ch. 2, sect. 7.

1206-1442.—**English attempts to recover the county.—Third and fourth houses of Anjou.—Creation of the dukedom.**—King John, of England, did not voluntarily submit to the sentence of the peers of France which pronounced his forfeiture of the fiefs of Anjou and Maine, "since he invaded and had possession of Angers again in 1206, when, Gothlike, he demolished its ancient walls. He lost it in the following year, and . . . made no further attempt upon it until 1213. In that year, having collected a powerful army, he landed at Rochelle, and actually occupied Angers, without striking a blow. But . . . the year 1214 beheld him once more in retreat from Anjou, never to reappear there, since he died on the 10th of October, 1216. In the person of King John ended what is called the 'Second House of Anjou.' In 1204, after the confiscations of John's French possessions, Philip Augustus established hereditary seneschals in that part of France, the first of whom was the tutor of the unfortunate Young Arthur [of Brittany], named William des Roches, who was in fact Count in all except the name, over Anjou, Maine, and Touraine, owing allegiance only to the crown of France. The Seneschal, William des Roches, died in 1222. His son-in-law, Amaury de Craon, succeeded him," but was soon afterwards taken prisoner during a war in Brittany and incarcerated. Henry III. of England still claimed the title of Count of Anjou, and in 1230 he "disembarked a considerable army at St. Malo, in the view of re-conquering Anjou, and the other forfeited possessions of his crown. Louis IX., then only fifteen years old . . . advanced to the attack of the allies; but in the following year a peace was concluded, the province of Guienne having been ceded to the English crown. In 1241, Louis gave the counties of Poitou and Auvergne to his brother Alphonso; and, in the year 1246, he invested his brother Charles, Count of Provence, with the counties of Anjou and Maine, thereby annulling the

rank and title of Seneschal, and instituting the Third House of Anjou. Charles I., the founder of the proud fortunes of this Third House, was ambitious in character, and events long favoured his ambition. Count of Provence, through the inheritance of his consort, had not long been invested with Anjou and Maine, ere he was invited to the conquest of Sicily [see ITALY (Southern): 1250-1268]. The third house of Anjou ended in the person of John, who became king of France in 1350. In 1350 he invested his son Louis with Anjou and Maine, and in 1360 the latter was created the first duke of Anjou. The fourth house of Anjou, which began with this first duke, came to an end two generations later with René, or Regnier—the “good King René” of history and story, whose kingdom was for the most part a name, and who is best known to English readers, perhaps, as the father of Margaret of Anjou, the stout-hearted queen of Henry VI. On the death of his father, Louis, the second duke, René became by his father’s will count of Guise, his elder brother, Louis, inheriting the dukedom. In 1434 the brother died without issue and René succeeded him in Anjou, Maine and Provence. He had already become duke of Bar, as the adopted heir of his great-uncle, the cardinal-duke, and duke of Lorraine (1430), by designation of the late duke, whose daughter he had married. In 1435 he received from Queen Joanna of Naples the doubtful legacy of that distracted kingdom, which she had previously bequeathed first, to Alphonso of Aragon, and afterwards—revoking that testament—to René’s brother, Louis of Anjou. King René enjoyed the title during his life-time, and the actual kingdom for a brief period; but in 1442 he was expelled from Naples by his competitor Alphonso (see ITALY: 1412-1447).—M. A. Hookham, *Life and times of Margaret of Anjou, introduction and ch. 1-2*.

Russia 1730-1740; participated in War of Polish Succession and was successful against the Turks in the Crimean War (1736-1739); reformed the army, and granted greater liberty to the landed gentry.—See also RUSSIA: 1725-1730.

ANNAHAWAS. See SIOUAN FAMILY: Sioux.

“ANNALES” (of William Camden). See HISTORY: 23.

ANNALS, from the Latin *annus*, year, a relation of events in chronological order, wherein each event is recorded under the year in which it occurred. In a broader sense, the word is not infrequently used by writers to designate history in general, as, for instance, “the most tremendous event in our annals.” In the singular, *annal*, it may signify a record of a single event. *Annals* differ from *chronicles* in that they are original records set down from day to day, perhaps by different writers, whereas by *chronicles* we understand a complete written or edited narrative; which may be the work of one author and bear the impress of his individuality. Thus, to draw a comparison, Hayden’s “Dictionary of Dates” contains the *annals* of the world; the “American Year Book” and the “Annual Register” each present the *chronicles* (a connected narrative) of a certain year. *Annals* are of Roman, *chronicles* of Greek, origin; the latter term is derived from *chronos*, meaning both *time* and *year*. Originally signifying a chronological table, the word *chronicle* during the Middle Ages came to include every form of history.

Roman annals.—Ennius.—Livy.—Tacitus.

—“The Romans did not begin to write the history of their city until about 200 B. C. Even then the first histories were meager annals. For the early centuries the composers found two kinds of material,—scant official records and unreliable family chronicles. . . . From such sources, early in the second century B. C., Fabius Pictor wrote the first connected history of Rome. He and his successors (mostly Greek slaves or adventurers) trimmed and patched their narratives ingeniously to get rid of gross inconsistencies; borrowed freely from incidents in Greek history, to fill gaps; and so produced an attractive story that hung together pretty well in the absence of criticism. These early works are now lost; but, two hundred years later, they furnished material for Livy and Dionysius, whose accounts of the legendary age were accepted as real history until after 1800 A. D.”—W. M. West, *Ancient world*, pp. 262-263.—“There grew up in Rome (as in other Italian towns) two important ‘colleges’ of city priests,—*pontiffs* and *augurs*. The six pontiffs had a general oversight of the whole system of divine law, and they were also the guardians of human science. Their care of the exact dates of festivals made them the keepers of the calendar and of the rude annals; they had oversight of weights and measures; and they themselves described their knowledge as ‘the science of all things human and divine.’”—*Ibid.*, pp. 272-273.—The Romans called these writings the *annales pontificum* or *annales maximi*, on account of their being issued by the *pontifex maximus*.

“Ennius possessed great power over words, and wielded that power skillfully. He improved the language in its harmony and its grammatical forms, and increased its copiousness and power. What he did was improved upon, but was never undone, and upon the foundations he laid the taste of succeeding ages erected an elegant and beautiful superstructure. His great epic poem—the ‘Annals’—gained him the attachment and admiration of his countrymen. In this he first introduced the hexameter to the notice of the Romans, and de-

tailed the rise and progress of their national glory, from the earliest legendary period down to his own times. The fragments of this work which remain are amply sufficient to show that he possessed picturesque power, both in sketching his narratives and in portraying his characters, which seem to live and breathe; his language, dignified, chaste and severe, rises as high as the most majestic eloquence, but it does not soar to the sublimity of poetry."—A. C. L. Botta, *Hand book of universal literature*, p. 132.—"Livy (50-18 B. C.) . . . was a warm and open admirer of the ancient institutions of the country, and esteemed Pompey as one of its greatest heroes; but Augustus did not allow political opinions to interfere with the regard which he entertained for the historian. His great work is a history of Rome, which he modestly terms 'Annals,' in 142 books, of which 35 are extant. Besides his history, Livy is said to have written treatises and dialogues, which were partly philosophical and partly historical."—*Ibid.*, p. 158.—The historical writings of Tacitus dealing with events before his time are called the *Annales*; those treating of his own period, events that happened within his own experience, bear the name *Historiæ*, though it is doubted whether this distinction was drawn by Tacitus himself or later editors.—"The 'Annals' consist of sixteen books; they commence with the death of Augustus, and conclude with that of Nero (14-68 A. D.). The object of Tacitus was to describe the influence which the establishment of tyranny on the ruins of liberty exercised for good or for evil in bringing out the character of the individual. In the extinction of freedom there still existed in Rome bright examples of heroism and courage, and instances not less prominent of corruption and degradation. In the annals of Tacitus these individuals stand out in bold relief, either singly or in groups upon the stage, while the emperor forms the principal figure, and the moral sense of the reader is awakened to admire instances of patient suffering and determined bravery, or to witness abject slavery and remorseless despotism."—*Ibid.*, p. 167.—See also LATIN LITERATURE.

Medieval annals.—**Roman prototype.**—**Ecclesiastical annals.**—**Sources of local history.**—**Froissart.**—**De Commines.**—The famous *Chronographus* or Calendar, an official document of the Roman empire, was completed in 354, and may be regarded as the prototype of the long catalogue of medieval annals. The range of its contents is quite remarkable: It is an official calendar and a universal chronicle (the latter to the year 338); it contains a record of consular annals, a list of the popes to Liberius (352-366), and the paschal tables worked out up to the year 412. Anglo-Saxon missionaries introduced the custom of compiling chronological lists into Germany and Gaul during the seventh century. Paschal tables, fixing the dates for Easter, were in use very early in the British Isles. Notes of important events were added down the margins opposite the years in which they occurred, and thus arose the institution of annals. Elaborations of and additions to the list of popes in the *Chronographus* gave rise to the *Pontificale Romanum*, better known as the *Liber Pontificalis*, from which there sprang a number of similar records compiled in monasteries, abbeys, and cathedrals, dealing in the main with local affairs. In the course of time these documents were copied, passed around and compared; discrepancies were brought into harmony; omissions were inserted and errors rectified. When these data had been arranged in chronological order, they represented a mine of original sources and contemporary evi-

dence for future historians to explore and delve in.

"Froissart (1337-1410) was an ecclesiastic of the day, but little in his life or writings bespeaks the sacred calling. Having little taste for the duties of his profession, he was employed by the Lord of Montfort to compose a chronicle of the wars of the time; but there were no books to tell him of the past, no regular communication between nations to inform him of the present; so he followed the fashion of knights errant, and set out on horseback, not to seek adventures, but, as an itinerant historian, to find materials for his chronicle. He wandered from town to town, and from castle to castle, to see the places of which he would write, and to learn events on the spot where they transpired. His first journey was to England; here he was employed by Queen Philippa of Hainault to accompany the Duke of Clarence of Milan, where he met Boccaccio and Chaucer. He afterwards passed into the service of several of the princes of Europe, to whom he acted as secretary and poet, always gleaning material for historic record. His book is an almost universal history of the different states of Europe, from 1322 to the end of the 14th century. He troubles himself with no explanations or theories of cause and effect, nor with the philosophy of state policy; he is simply a graphic story-teller. Sir Walter Scott called Froissart his master."—*Ibid.*, p. 264-265.

"Philippe de Commines (1445-1509) was a man of his age, but in advance of it, combining the simplicity of the 15th century with the sagacity of a later period. An annalist, like Froissart, he was also a statesman, and a political philosopher; embracing, like Machiavelli and Montesquieu, the remoter consequences which flowed from the events he narrated and the principles he unfolded. He was an unscrupulous diplomat in the service of Louis XI., and his description of the last years of that monarch is a striking piece of history, whence poets and novelists have borrowed themes in later times. But neither the romance of Sir Walter Scott nor the song of Béranger does justice to the reality, as presented by the faithful Commines."—*Ibid.*, p. 265.

English annals.—The more important annals in England developed from the tables of Bede and the paschal cycles. Among these the chief are the *Annales Cantuarienses* (Canterbury Annals) of 618-690; the *Annales Nordhumbriani* (Northumberland) of 734-802; the *Historia Eliensis Ecclesiæ* (Church of Ely) dated 700; the *Annales Cambriæ* (Welsh Annals) of 440 to the Norman Conquest in 1066, and the *Annales Lindisfarnenses* (Holy Island) of 532-903. The science of history writing with any degree of accuracy in England dates from 1066.

Irish annals.—"Among the various classes of persons who devoted themselves to literature in ancient Ireland, there were special Annalists, who made it their business to record, with the utmost accuracy, all remarkable events simply and briefly, without any ornament of language, without exaggeration, and without fictitious embellishment. The extreme care they took that their statements should be truthful is shown by the manner in which they compiled their books. As a general rule they admitted nothing into their records except either what occurred during their lifetime, and which may be said to have come under their own personal knowledge, or what they found recorded in the compilations of previous annalists, who had themselves followed the same plan. These men took nothing on hearsay;

and in this manner successive annalists carried on a continued chronicle from age to age, thus giving the whole series the force of contemporary testimony. We have still preserved to us many books of native Annals. . . . Most of the ancient manuscripts whose entries are copied into the books of Annals we now possess have been lost; but that the entries were so copied is rendered quite certain by various expressions found in the present existing Annals, as well as by the known history of several of the compilations. The Irish Annals deal with the affairs of Ireland—generally but not exclusively. Many of them record events occurring in other parts of the world; and it was a common practice to begin the work with a brief general history, after which the Annalist takes up the affairs of Ireland.”—P. W. Joyce, *Social history of ancient Ireland*, p. 224.—“The Irish Annals record about twenty-five eclipses and comets at the several years from A. D. 496 to 1066. The dates of all these are found, according to modern scientific calculation and the records of other countries, to be correct. This shows conclusively that the original records were made by eye-witnesses, and not by calculation in subsequent times: for any such calculation would be sure—on account of errors in the methods then used—to give an incorrect result. A well-known entry in the Irish account of the Battle of Clontarf, fought A. D. 1014, comes under the tests of natural phenomena. The author of the account, who wrote soon after the battle, states that it was fought on Good Friday, the 23rd of April, 1014; and that it began at sunrise, when the tide was full in. To test the truth of this . . . after a laborious calculation, Dr. [Rev. Samuel] Haughton found that the tide was at its height that morning at half-past five o'clock, just as the sun was coming over the horizon: a striking confirmation of the truth of this part of the narrative. It shows, too, that the account was written by, or taken down from, an eye-witness of the battle. Whenever events occurring in Ireland in the Middle Ages are mentioned by British or Continental writers they are always—or nearly always—in agreement with the native records. Irish bardic history relates in much detail how the Picts landed on the coast of Leinster in the reign of Eremon, the first Milesian king of Ireland, many centuries before the Christian era. After some time they sailed to Scotland to conquer a territory for themselves: but before embarking they asked Eremon to give them Irish women for wives, which he did, but only on this condition, that the right of succession to the kingship should be vested in the female progeny rather than in the male. And so the Picts settled in Scotland with their wives. Now all this is confirmed by the Venerable Bede, who says that the Picts obtained wives from the Scots (i. e., the Irish) on condition that when any difficulty arose they should choose a king from the female royal line rather than from the male; ‘which custom,’ continues Bede, ‘has been observed among them to this day.’ . . . All the Irish Annals record a great defeat of the Danes near Killarney in the year 812. This account is fully borne out by an authority totally unconnected with Ireland, the well-known Book of Annals, written by Eginhard (the tutor of Charlemagne), who was living at this very time. Under A. D. 812 he writes:—‘The fleet of the Northmen, having invaded Hibernia, the island of the Scots, after a battle had been fought with the Scots, and after no small number of the Norsemen had been slain, they basely took to flight and returned home.’ . . . References by Irishmen to Irish affairs are

found in numerous volumes scattered over all Europe:—Annalistic entries, direct statements in tales and biographies, marginal notes, incidental references to persons, places, and customs, and so forth, written by various men at various times; which, when compared one with another, and with the home records, hardly ever exhibit a disagreement. The more the ancient historical records of Ireland are examined and tested, the more their truthfulness is made manifest. Their uniform agreement among themselves, and their accuracy, as tried by the ordeals of astronomical calculation and of foreign writers’ testimony, have drawn forth the acknowledgments of the greatest Irish scholars and archæologists, that ever lived.”—*Ibid.*, pp. 225-228.

“The following are the principal books of Irish Annals remaining. The ‘Synchronisms of Flann,’ who was a layman, Ferleginn or chief professor of the school of Monasterboice; died in 1056. He compares the chronology of Ireland with that of other countries, and gives the names of the monarchs that reigned in the principal ancient kingdoms and empires of the world, with the Irish kings who reigned contemporaneously. Copies of this tract are preserved in the Books of Lecan and Ballymote. The ‘Annals of Tighernach’ (Teerna): Tighernach O’Brien, the compiler of these annals, one of the greatest scholars of his time, was abbot of the two monasteries of Clonmacnoise and Roscommon. He was acquainted with the chief historical writers of the world known in his day, compares them, and quotes from them; and he made use of Flann’s Synchronisms, and of most other ancient Irish historical writings of importance. His work is written in Irish mixed a good deal with Latin; it has lately been translated by Dr. Stokes. He states that authentic Irish history begins at the foundation of Emania, and that all preceding accounts are uncertain. Tighernach died in 1088. The ‘Annals of Innisfallen’ were compiled about the year 1215 by some scholars of the monastery of Innisfallen, in the Lower Lake of Killarney. The ‘Annals of Ulster’ were written in the little island of Senait MacManus, now called Belle Isle, in Upper Lough Erne. The original compiler was Cathal (Cahal) Maguire, who died of small-pox in 1408. They have lately been translated and published. The ‘Annals of Lough Ce’ (Key) were copied in 1588 for Bryan MacDermot, who had his residence on an island in Lough Key, in Roscommon. They have been translated and edited in two volumes. The ‘Annals of Connaught,’ from 1224 to 1502. The ‘Chronicon Scotorum’ (Chronicle of the Scots or Irish), down to A. D. 1135, was compiled about 1650 by the great Irish antiquary Duaid MacFirbis. These annals have been printed with translation. The ‘Annals of Boyle,’ from the earliest time to 1253, are written in Irish mixed with Latin; and the entries throughout are very meagre. The ‘Annals of Clonmacnoise,’ from the earliest period to 1408. The original Irish of these is lost; but we have an English translation by Connell MacGeoghegan of Westmeath, which he completed in 1627. The ‘Annals of the Four Masters,’ also called the Annals of Donegal, are the most important of all. They were compiled in the Franciscan monastery of Donegal, by three of the O’Clerys, Michael, Conary, and Cucogry, and by Ferfesa O’Mulconry, who are now commonly known as the Four Masters. They began in 1632, and completed the work in 1636. The ‘Annals of the Four Masters’ was translated with most elaborate and learned annotations by Dr. John O’Donovan; and it was published—Irish text, translation, and notes—in seven large volumes. A book of an-

nals called the 'Psalter of Cashel,' was compiled by Cormac MacCullenan, but this has been lost. He also wrote 'Cormac's Glossary,' an explanation of many old Irish words. This work has been translated and printed. The Annals noticed so far are all in the Irish language, occasionally mixed with Latin; but besides these there are Annals of Ireland wholly in Latin; such as those of Clyn, Dowling, Pembridge, Multyarnham, etc., most of which have been published."—*Ibid.*, pp. 228-230.

"None of the Irish writers of old times conceived the plan of writing a general history of Ireland. The first history of the whole country was the 'Forus Feasa ar Erin,' or History of Ireland, from the most ancient times to the Anglo-Norman invasion, written by Dr. Geoffrey Keating of Tubbrid in Tipperary, a Catholic priest; died 1644. Keating was deeply versed in the ancient language and literature of Ireland; and his history, though containing much that is legendary, is very interesting and valuable. The genealogies of the principal families were most faithfully preserved in ancient Ireland. Each king and chief had in his household a Shanachy or Historian, whose duty it was to keep a written record of all the ancestors and of the several branches of the family. Many of the ancient genealogies are preserved in the Books of Leinster, Lecan, Ballymote, etc. But the most important collection of all is the great Book of Genealogies compiled in the years 1050 to 1666 in the College of St. Nicholas in Galway, by Duaid MacFírbhis. In this place may be mentioned the Dinnsenchus (Din-Shan'shus), a topographical tract giving the legendary history and the etymology of the names of remarkable hills, mounds, caves, carns, cromlechs, raths, duns, plains, lakes, rivers, fords, islands, and so forth. The stories are mostly fictitious, invented to suit the really existing names; nevertheless this tract is of the utmost value for elucidating the topography and antiquities of the country. Copies of it are found in several of the old Irish Books of miscellaneous literature, as already mentioned. Another very important tract—one about the names of remarkable Irish persons, called Cóir Anmann ('Fitness of Names'), corresponding with the Dinnsenchus for place-names, has been published with translation by Dr. Stokes."—*Ibid.*, pp. 230-232.—See also BOOKS: Books in medieval times; CELTS: Ancient Irish sagas.

French, German, Italian and Spanish annals.—Early in the 8th century annals of Frankish origin began to appear. The German historian G. H. Pertz (1795-1876), in one of his numerous literary exploration journeys, discovered some valuable annals in a manuscript of the St. Germain-des-Près church in Paris, founded by King Childebert in 542 or 543. This collection of annals begin with some short annotations from Lindisfarne in the years 643-664 and from Canterbury for 673-690. The manuscript, it appears, was brought from England by Alcuin, adviser of Charlemagne and the most distinguished scholar of the 8th century, to that monarch's court. From 782 to 787 Alcuin had inserted for each year the names of the places where Charlemagne had spent the Eastertide. The monks of St. Germain-des-près had during later years added matter taken from the ancient annals of St. Denis up to 887. The earliest annals of the Carolingian period are divided by historians into three groups: the *Annales S. Amandi*, and their derivatives; those which grew out of the historical annotations of the convent of Laurissa or Lorsch in Germany; and the *Annales Murbacenses* (Murbach in Alsace). These are all bald records of events arranged in chronological order.

During the reign of Charlemagne, annals assumed something of an official stamp and began to develop a real historical character under patronage of the court. To distinguish them from the ecclesiastic annals, they were styled *Reichsannalen*, or "annals of the state." They betray a wide and intimate knowledge of state affairs, while unpleasant facts are diplomatically omitted. These state annals begin from the year 741 and contain much material borrowed from earlier documents, notably the *Liber Pontificalis*, *Gesta Francorum*, Bede's *Little Chronicle*, and the chronicles of Fredegarius and of Isidor of Seville. Under the Roman Emperor Louis the Pious (778-840) and his successors the *Annales Fuldenses* were brought out, containing the history of the realm, with matter taken from the *Annales Laurissenses minores* and others to fill in the history between 711 and 829. The *Annales S. Bertini* (830-835) are more ambitious in scope and appear to have been heavily drawn upon in the production of the *Chronicon de gestis Normannorum in Franciâ*. Another important collection of the 9th century are the so-called *Annales Einhardi* and the *Annales Laureshamenses*. From this stage the annals begin to develop into *chronicles*, or carefully-written histories. They passed from hand to hand as death removed the authors and became merged in latter compilations under other names. In Italy and Spain the output was poor in comparison with that of the northern countries. The principal Italian contributions are the *Chronica Sancti Benedicti Casinensis* (914-934); the chronicle of Benedict of St. Andrew (968); the *Constructio Farfensis* (about 848); and the more famous *Chronicon Salernitanum* (974). The chief Spanish products are: the *De Sex aetatibus mundi* (from B. C. 38), and the *Chronicon* of Bishop Idatius (870).

ANNAPOLIS ACADEMY. See ANNAPOLIS NAVAL ACADEMY.

ANNAPOLIS CONVENTION.—The necessity for amending the articles of confederation became patent immediately after peace was declared in 1783. The weakness of the union was emphasized by the many inadjustable causes of difference between the states; commercial regulations were from the beginning mutually incompatible, and it was with difficulty that Madison finally convinced the

Virginia legislature of the only possible remedy: calling the other states to a convention for common action. He finally succeeded in this purpose—delegates were to be sent from all states to consider commercial regulations. "The place was to be Annapolis, remote from New York, where congress then sat, and far away from any large port whose merchants might influence its deliberations. The time of meeting was to be September 11, 1786. This convention, be it remembered, was to be a creature of the states, to report to them, and was not concerned with the continental congress. At the appointed time delegates assembled from Virginia, Pennsylvania, Delaware, New York, and New Jersey; and Massachusetts, Rhode Island, New Hampshire, and North Carolina named delegates who did not attend. The other states, Georgia, South Carolina, Maryland, and Connecticut, took no notice of the call. More discouraging than these absences was the fact that no real good could be accomplished unless a power existed strong enough to enforce common regulations, if they were made. The convention, therefore, gave up the task before it and issued an address to the states urging them to call a constitutional convention to meet in Philadelphia the second Monday in May. Its action was to be binding when approved by congress and confirmed by all the state legislatures."—J. S. Bassett, *Short history of the United States*, pp. 241-242.

ANNAPOLIS NAVAL ACADEMY.—"Established at Annapolis [Maryland] in 1845, while George Bancroft, the historian, was Secretary of the Navy. It began on a small scale, by executive order; and Congress gradually provided it with buildings and funds. Its graduates enter the Navy with commissions as ensigns. By the act of February 15, 1916, three midshipmen may be appointed each year to the academy for each Senator, Representative, and Delegate in Congress, while, by a later act of the same year, the number of annual appointments at large was made 15, that from among enlisted men of the Navy 25, and the appointment of 4 Filipinos was authorized. Finally, by the act of April 25, 1917, the appointment of one additional midshipman for each Senator, Representative, and Delegate in Congress [was] authorized for the year 1917-18. [At that time] the possible maximum enrollment of the academy [was] about 2,200. The selection of candidates for nomination from any State, Territory, or congressional district is entirely in the hands of the member of Congress entitled to the appointment, but these appointments are now made upon the basis of competitive examination. A person securing such appointment must stand rigid physical and mental examinations before being admitted to the academy."—*War cyclopedia*, p. 184.

ANNATES, or First-fruits.—"A practice had existed for some hundreds of years, in all the churches of Europe, that bishops and archbishops, on presentation to their sees, should transmit to the pope, on receiving their bulls of investiture, one year's income from their new preferments. It was called the payment of Annates, or first-fruits, and had originated in the time of the crusades, as a means of providing a fund for the holy wars. Once established it had settled into custom, and was one of the chief resources of the papal revenue."—J. A. Froude, *History of England*, ch. 4.—"The claim [by the pope] to the first-fruits of bishoprics and other promotions was apparently first made in England by Alexander IV. in 1256, for five years; it was renewed by Clement V. in 1306, to last for two years; and it was in a

measure successful. By John XXII. it was claimed throughout Christendom for three years, and met with universal resistance. . . . Stoutly contested as it was in the Council of Constance, and frequently made the subject of debate in parliament and council the demand must have been regularly complied with."—W. Stubbs, *Constitutional history of England*, ch. 19, sect. 718.—The papal exaction was abolished in England in the reign of Henry VIII. and later, during the same reign, right to annates was annexed by the crown.

ANNE (1665-1714), queen of Great Britain and Ireland 1702-1714; last of the house of Stuart; sided with the Prince of Orange in the revolution of 1688 against her father; successful participation in the War of the Spanish Succession, and the union of Scotland and England in 1707 were the most important events in her reign.—See also ENGLAND: 1702-1714, and after.

ANNE BOLEYN. See BOLEYN, ANNE; ENGLAND: 1527-1534, and 1530-1543.

ANNE OF AUSTRIA (1601-1666), queen of France (1615-1666) through marriage to Louis XIII; was concerned in conspiracies of Chalais (1628) and Cinq-Mars (1642) against Richelieu; regent (1643-1661) for her son, Louis XIV.—See also FRANCE: 1642-1643, and 1651-1653.

ANNE OF BRITTANY (1477-1514), queen of France; by her marriage to Charles VIII in 1491, Brittany, the last of the great fiefs, was permanently united to the crown of France. See BRITTANY: 1491.

ANNE OF CLEVES (1515-1557), queen of England, fourth wife of Henry VIII; was divorced in the year of her marriage. See ENGLAND: 1530-1543.

ANNO, or Hanno, Saint (c. 1010-1075), archbishop of Cologne. Prominent in the government of Germany during the minority of Henry IV. At the synod of Mantua 1064, declared Alexander II the rightful pope.

ANNOBON ISLAND, an island in the Gulf of Guinea, belonging to Spain. Discovered in 1471 by the Portuguese; ceded to Spain in 1778.

ANNUNZIO, Gabriele d'. See D'ANNUNZIO, GABRIELE.

ANSBACH. See BRANDENBURG: 1417-1640.

ANSCHAR, Saint. See ANSGAR, SAINT.

ANSELM (c. 1033-1109), early scholastic philosopher. A monk under Lanfranc, whom he succeeded as prior of Bec. In 1092 he was called to England to become archbishop of Canterbury, involving a dispute over investiture lasting until 1107. He advanced the ontological proof of the existence of God, and is generally regarded as the first of the schoolmen.—See also ABBOT; ENGLAND: 1087-1135.

ANSGAR or Anskar, Saint (801-865), French preacher, called "the Apostle of the North" because of his labors to bring Christianity to Denmark, Sweden and Northern Germany; first archbishop of Hamburg. See CHRISTIANITY: 9th-11th centuries; SWEDEN: 9th-12th centuries.

ANSON, George Anson, Baron (1607-1762), English admiral and navigator. Fought against Spain in the South Sea, 1740-1744; during this period circumnavigated the globe and added much to the knowledge of navigation and geography; in 1747 defeated the French at Cape Finisterre.—See also ENGLAND: 1745-1747; PACIFIC OCEAN: 1513-1764.

ANSON, Sir William Reynell (1843-1914), English jurist, Member of Parliament; identified

with educational movements; active in the establishment of a school of law at Oxford; author of many standard books on legal subjects.

ANTALCIDAS, Peace of (386 B.C.), named after the Spartan statesman who defeated the Athenians. It was ratified by all the Greek states, and gave to Persia the Greek towns on the mainland of Asia Minor and guaranteed independence to all others.—See also GREECE: 399-387 B.C.

ANTARCTIC EXPLORATION: Problem of discovery.—Area.—Though quite as important from the geographical and scientific point of view as the North Pole, the Antarctic regions and the South Pole had been comparatively neglected until modern times. While the northern portion of this planet has been practically overrun by explorers and expeditions during the past 300 years and more, the south had long remained a *terra incognita*. So far as is known, the southern ocean was first navigated by Magellan during the first quarter of the sixteenth century. Circumnavigating the earth in 1774, Captain Cook proved the existence of a circumpolar ocean, and concluded that there was a great mass of land there. The most striking information he gathered was the isolation of the mythical Antarctic continent, and that the strongest evidence of the presence of land pointed to about 110 deg. W. long. and 71 deg. S. lat. More definite knowledge, however, was hidden from human ken until the Australian whaling fleet made incursions into those unknown waters. It seems that the extent of land diminished as investigations progressed; whalers discovered land close to the Antarctic circle a hundred years ago. The honor of original discovery of the Antarctic continent—or of the fact that it really is a continent—has been variously credited to the Russian, Capt. von Bellingshausen (1820-1822); to an American, Capt. N. B. Palmer (1821); and the Englishman, Capt. John Biscoe (1831). Of more than passing interest is the following excerpt from the *Annual Register* of 1821, p. 686: "In October, 1819, the brig *Williams*, of Blythe, Northumberland, Smith, master, on a voyage from Buenos Ayres to Valparaiso, stretching to the south, from contrary winds, discovered land, on which the captain landed, and performed the usual formalities of taking possession, in the name of his late majesty, George III." In 1839 began a systematic and international attack upon the South. British, American, French and Russian expeditions had already been dispatched, each returning with its quota of useful results.

"Since the introduction of steam power in ships, the facilities for fuller explorations have been utilized, so that data, somewhat scanty, exist for the outlining of the regions as a whole. Among distinguished scientists who have attempted to solve this indeterminate equation, Sir John Murray, of the *Challenger*, is the most advanced and definite. Basing his conclusions on a study of sediments from the southern sea, he outlined . . . a new southern continent, christened Antarctica."—A. W. Greely, *Handbook of polar discoveries*, p. 276.—According to Prof. T. W. Edgeworth David, of the University of Sydney, who has given considerable study to the Antarctic continent, the area of the land definitely known is estimated at 5,000,000 square miles. The coast line, Prof. David had calculated measures 14,000 miles long. This estimate includes the seaward boundary of thick fast ice, a large part of which, however, remains still undiscovered. The Antarctic region opens up an immense field for research in meteorology. When science acquires a more thorough knowledge of glaciology, oceanography and meteorology of this

region, the cycle of weather conditions over all the hemisphere will be understood much more readily.

1519-1819.—Early exploration.—Magellan.—Drake.—Bouvet.—Dufresne.—Captain Cook.—"The history of Antarctic discovery may be divided at the outset into two categories. In the first of these I would include the numerous voyagers who, without any definite idea of the form or conditions of the southern hemisphere, set their course toward the South, to make what landfall they could. These need only be mentioned briefly before passing to the second group, that of Antarctic travellers in the proper sense of the term, who, with a knowledge of the form of the earth, set out across the ocean, aiming to strike the Antarctic monster—in the heart, if fortune favoured them. . . . We then meet with the greatest of the older explorers, Ferdinand Magellan, a Portuguese by birth, though sailing in the service of Spain. Setting out in 1519, he discovered the connection between the Atlantic and Pacific Oceans in the strait that bears his name. No one before him had penetrated so far South—to about lat. 52° S. One of his ships, the *Victoria*, accomplished the first circumnavigation of the world, and thus established in the popular mind the fact that the earth was really round. From that time the idea of the Antarctic regions assumed definite shape. There must be something in the South: whether land or water the future was to determine. In 1578 we come to the renowned English seaman, Sir Francis Drake. . . . He rounded Cape Horn and proved that Tierra del Fuego was a great group of islands and not part of an Antarctic continent, as many had thought. . . . The Frenchman, Bouvet (1738), was the first to follow the southern ice-pack for any considerable distance, and to bring reports of the immense, flat-topped Antarctic icebergs. In 1756 the Spanish trading-ship *Leon* came home and reported high, snow-covered land in lat. 55° S. to the east of Cape Horn. The probability is that this was what we now know by the name of South Georgia. The Frenchman, Marion-Dufresne, discovered, in 1772, the Marion and Crozet Islands. In the same year Joseph de Kerguelen-Tremarec—another Frenchman—reached Kerguelen Land. This concludes the series of expeditions that I have thought it proper to class in the first group. . . . [See PACIFIC OCEAN: 1513-1764.]

"Captain James Cook—one of the boldest and most capable seamen the world has known—opens the series of Antarctic expeditions properly so called. The British Admiralty sent him out with orders to discover the great southern continent, or prove that it did not exist. The expedition, consisting of two ships, the *Resolution* and the *Adventure*, left Plymouth on July 13, 1772. . . . In the course of his voyage to the south Cook passed 300 miles to the south of the land reported by Bouvet, and thereby established the fact that the land in question—if it existed—was not continuous with the great southern continent. On January 17, 1773, the Antarctic Circle was crossed for the first time—a memorable day in the annals of Antarctic exploration. Shortly afterwards a solid pack was encountered, and Cook was forced to return to the north. A course was laid for the newly discovered islands—Kerguelen, Marion, and the Crozets—and it was proved that they had nothing to do with the great southern land. In the course of his further voyages in Antarctic waters Cook completed the most southerly circumnavigation of the globe, and showed that there was no connection between any of the lands or islands that had been discovered and the great

mysterious 'Antarctica.' His highest latitude (January 30, 1774) was $71^{\circ} 10'$ S. Cook's voyages had important commercial results, as his reports of the enormous number of seals round South Georgia brought many sealers, both English and American, to those waters, and these sealers, in turn, increased the field of geographical discovery. In 1810 the discovery of the South Shetlands by the Englishman, Captain William Smith, is to be recorded. And this discovery led to that of the Palmer Archipelago to the south of them."—R. Amundsen, *South Pole, v. i, pp. 3-7.*—See also NEW ZEALAND: 1642-1814.

1819-1838. — Bellingshausen. — Weddell. — d'Urville.—Wilkes.—"The next scientific expedition to the Antarctic regions was that despatched by the Emperor Alexander I. of Russia, under the command of Captain Thaddeus von Bellingshausen. It was composed of two ships, and sailed from Cronstadt on July 15, 1819. To this expedition belongs the honour of having discovered the first land to the south of the Antarctic Circle—Peter I. Island and Alexander I. Land."—*Ibid.*, p. 8.

"In 1823 Capt. James Weddell discovered and named the South Orkneys and penetrated 240 miles nearer the South Pole than any previous explorers. Among other valuable observations he noticed the same slow vibrations of the compass which Peary had noticed in the Arctic regions.

"The English firm of shipowners, Enderby Brothers, plays a not unimportant part in Antarctic exploration. The Enderbys had carried on sealing in southern waters since 1785. They were greatly interested, not only in the commercial, but also in the scientific results of these voyages, and chose their captains accordingly. In 1830 the firm sent out John Biscoe on a sealing voyage in the Antarctic Ocean with the brig *Tula* and the cutter *Lively*. The result of this voyage was the sighting of Enderby Land in lat. $66^{\circ} 25'$ S., long. $40^{\circ} 18'$ E. In the following year Adelaide, Biscoe, and Pitt Islands, on the west coast of Graham Land were chartered, and Graham Land itself was seen for the first time. . . . We then come to the celebrated French sailor, Admiral Jules Sebastien Dumont d'Urville. He left Toulon in September, 1837, with a scientifically equipped expedition, in the ships *Astrolabe* and *Zélée*. The intention was to follow in Weddell's track, and endeavour to carry the French flag still nearer to the Pole. Early in 1838 Louis Philippe Land and Joinville Island were discovered and named. Two years later we again find d'Urville's vessels in Antarctic waters, with the object of investigating the magnetic conditions in the vicinity of the South Magnetic Pole. Land was discovered in lat. $66^{\circ} 30'$ S. and long. $138^{\circ} 21'$ E. With the exception of a few bare islets, the whole of this land was completely covered with snow. It was given the name of Adélie Land, and a part of the ice-barrier lying to the west of it was called Côte Clarie, on the supposition that it must envelop a line of coast.

"The American naval officer, Lieutenant Charles Wilkes, sailed in August, 1838, with a fleet of six vessels. The expedition was sent out by Congress, and carried twelve scientific observers. In February, 1839, the whole of this imposing Antarctic fleet was collected in Orange Harbour in the south of Tierra del Fuego, where the work was divided among the various vessels. As to the results of this expedition it is difficult to express an opinion. [The land claimed to have been discovered by Wilkes has never been found.] Certain it is that Wilkes Land has subsequently been sailed over in many places by several expeditions. Of what may have been the cause of this inaccurate

cartography it is impossible to form any opinion. It appears, however, from the account of the whole voyage, that the undertaking was seriously conducted."—*Ibid.*, pp. 8-10.

1839-1845.—Ross.—"Then the bright star appears,—the man whose name will ever be remembered as one of the most intrepid polar explorers and one of the most capable seamen the world has produced—Admiral Sir James Clark Ross. The results of his expedition are well known. Ross himself commanded the *Erebus* and Commander Francis Crozier the *Terror*. The former vessel, of 370 tons, had been originally built for throwing bombs; her construction was therefore extraordinarily solid. The *Terror*, 340 tons, had been previously employed in Arctic waters, and on this account had been already strengthened. In provisioning the ships every possible precaution was taken against scurvy, with the dangers of which Ross was familiar from his experience in Arctic waters. The vessels sailed from England in September, 1839, calling at many of the Atlantic Islands, and arrived in Christmas Harbour, Kerguelen Land, in the following May. Here they stayed two months, making magnetic observations, and then proceeded to Hobart. Sir John Franklin, the eminent polar explorer, was at that time Governor of Tasmania, and Ross could not have wished for a better one. Interested as Franklin naturally was in the expedition, he afforded it all the help he possibly could. During his stay in Tasmania Ross received information of what had been accomplished by Wilkes and Dumont d'Urville in the very region which the Admiralty had sent him to explore. The effect of this news was that Ross changed his plans, and decided to proceed along the 170th meridian E., and if possible to reach the Magnetic Pole from the eastward. . . . After calling at the Auckland Island and at Campbell Island, Ross again steered for the South, and the Antarctic Circle was crossed on New Year's Day, 1841. The ships were now faced by the ice-pack, but to Ross this was not the dangerous enemy it had appeared to earlier explorers with their more weakly constructed vessels. Ross plunged boldly into the pack with his fortified ships, and, taking advantage of the narrow leads, he came out four days later, after many severe buffets, into the open sea to the South. . . . It was in lat. $60^{\circ} 15'$ S. and long. $176^{\circ} 15'$ E. that Ross found the open sea. On the following day the horizon was perfectly clear of ice. . . . The course was set for the Magnetic Pole, and the hope of soon reaching it burned in the hearts of all. Then—just as they had accustomed themselves to the idea of open sea, perhaps to the Magnetic Pole itself—the crew's-nest reported 'High land right ahead.' This was the mountainous coast of South Victoria Land. What a fairy-land this must have seemed to the first voyagers who approached it! Mighty mountain-ranges with summits from 7,000 to 10,000 feet high, some covered with snow and some quite bare—lofty and rugged, precipitous and wild. It became apparent that the Magnetic Pole was some 500 miles distant—far inland, behind the snow-covered ridges. On the morning of January 12 they came close under a little island, and Ross with a few companions rowed ashore and took possession of the country. They could not reach the mainland itself on account of the thick belt of ice that lay along the coast. The expedition continued to work its way southward, making fresh discoveries. On January 23 the two lofty summits, Mount Erebus and Mount Terror, were sighted for the first time. The former was seen to be an active volcano, from which smoke and flames shot up into the sky. It must

have been a wonderfully fine sight, this flaming fire in the midst of the white, frozen landscape. Captain Scott has since given the island, on which the mountains lie, the name of Ross Island, after the intrepid navigator. . . . From Ross Island, as far to the eastward as the eye could see, there extended a lofty, impenetrable wall of ice. . . . All they could do was to try to get round it. And then began the first examination of that part of the great Antarctic Barrier which has since been named the Ross Barrier. The wall of ice was followed to the eastward for a distance of 250 miles. Its upper surface was seen to be perfectly flat. The most easterly point reached was long. 167° W., and the highest latitude 78° 4' S. No opening having been found, the ships returned to the west, in order to try once more whether there was any possibility of reaching the Magnetic Pole. But this attempt soon had to be abandoned on account of the lateness of the season, and in April, 1841, Ross returned to Hobart. His second voyage was full of dangers and thrilling incidents, but added little to the tale of his discoveries. On February 22, 1842, the ships came in sight of the Barrier, and, following it to the east, found that it turned north-eastward. Here Ross recorded an 'appearance of land' in the very region in which Captain Scott, sixty years later, discovered King Edward VII. Land. On December 17, 1842, Ross set out on his third and last Antarctic voyage. His object this time was to reach a high latitude along the coast of Louis Philippe Land, if possible, or alternatively by following Weddell's track. Both attempts were frustrated by the ice conditions. On sighting Joinville Land, the officers of the *Terror* thought they could see smoke from active volcanoes, but Ross and his men did not confirm this. About fifty years later active volcanoes were actually discovered by the Norwegian, Captain C. A. Larsen, in the *Jason*. A few minor geographical discoveries were made, but none of any great importance. This concluded Ross's attempts to reach the South Pole. A magnificent work had been achieved, and the honour of having opened up the way by which, at last, the Pole was reached must be ascribed to Ross.

"The *Pagoda*, commanded by Lieutenant Moore, was the next vessel to make for the South. Her chief object was to make magnetic observations in high latitudes south of the Indian Ocean. The first ice was met with in lat. 53° 30' S., on January 25, 1845. On February 5 the Antarctic Circle was crossed in long. 30° 45' E. The most southerly latitude attained on this voyage was 67° 50' in long. 30° 41' E.

"This was the last expedition to visit the Antarctic regions in a ship propelled by sails alone. . . . Less known, but no less efficient in their work, were the whalers round the South Shetlands and in the regions to the south of them. . . ."—*Ibid.*, pp. 10-15.—See also PACIFIC OCEAN: 1764-1850.

1892-1893.—In 1802-1803 occurred the whaling voyage of the Dundee vessels, the *Balaena*, *Active*, *Diana* and *Polar Star*, equipped for geographical observation by the Royal Geographical Society and others interested, carrying William S. Bruce, C. W. Donald, and W. G. Burn Murdoch. They were accompanied by the Norwegian sealer *Jasen*, under Captain Larsen. South Shetlands and Graham Land were visited and valuable observations made.

1894-1895.—"A most important whaling expedition . . . is that of the *Antarctic*, under [the Norwegian] Captain Leonard Kristensen. Kristensen was an extraordinarily capable man, and achieved the remarkable record of being the first to set foot on the sixth continent, the great southern land—

'Antarctica.'"—*Ibid.*, p. 18.—This commercial expedition was sent out by Captain Svend Foyn, fitted out by H. J. Bull, and carried the scientist Carsten E. Borchgrevink. The valuable right whale was not found, but large beds of guano were discovered in Victoria Land, where a landing was made near Cape Adare.

1897.—"An epoch-making phase of Antarctic research is now ushered in by the *Belgica*, under the leadership of Commander Adrien de Gerlache. Hardly any one has had a harder fight to set his enterprise on foot than Gerlache. He was successful, however, and on August 16, 1897, the *Belgica* left Antwerp. The scientific staff had been able to secure the services of exceedingly able men. His second in command, Lieutenant G. Lecointe, a Belgian, possessed every qualification for his difficult position. It must be remembered that the *Belgica's* company was as cosmopolitan as it could be—Belgians, Frenchmen, Americans, Norwegians, Swedes, Rumanians, Poles, etc.—and it was the business of the second in command to keep all these men together and get the best possible work out of them. And Lecointe acquitted himself admirably; amiable and firm, he secured the respect of all. . . . The object of the expedition was to penetrate to the South Magnetic Pole, but this had to be abandoned at an early stage for want of time."—*Ibid.*, p. 18.—Near Alexander I Land the *Belgica* caught in the ice pack and held for a year, drifting as far south as lat. 71° 36', in long. 87° 30' W. Finally released by the cutting of a canal through the ice. This dreary winter was the first spent by men far enough south to lose sight of the sun. The continent found to be mountainous, glaciated, and without land animals except a few insects, though sea fowl abounded. One flowering grass, and a few mosses, rock lichens, and fresh-water algae constitute the flora. Some 500 miles of coast charted.

1897.—Anglo-Australasian Antarctic conference was held in London.

1898.—Conference on Antarctic exploration held in the rooms of the Royal Society, London, Feb. 24.

Carsten E. Borchgrevink, the Norwegian explorer, who had led an expedition to the Antarctic in 1894-1895, led another in 1898. The latter was equipped by the late Sir George Newnes, and was absent nearly two years. Borchgrevink penetrated to the farthest point south that had ever been reached, Lat. 78° 50' S., and fixed the magnetic position of the South Pole at about latitude 73 degrees 20 minutes south, and 146 east.

1898-1899.—German expedition for deep-sea exploration in Antarctic waters, in charge of Prof. Carl Chun, on the *Valdivia*. Southern ocean found to be of great depth.

1901-1909.—English, German, Swedish, and Scottish expeditions.—Successes of Lieutenant Shackleton.—In April 1901, several expeditions to the Antarctic region were reported as being under preparation, in England, Germany, and Sweden. The English expedition, for which the ship *Discovery* was being fitted out, sailed on August 6, 1901, under the command of Capt. Robert F. Scott, with Lieut. Ernest H. Shackleton of the British navy as second in command. Its object was a further exploration of the great mountainous region named Victoria Land, which Capt. James Ross had discovered half a century before. This coast the *Discovery* reached in January 1902, and followed it southward, to and beyond the Erebus volcano, skirting the great ice barrier which stretches far eastward, seeming to forbid a penetration of the frozen territory it hems in. In this survey the British explorers reached an unvisited

section, which they named King Edward Land. They wintered that year near Mount Erebus, pushing sledge expeditions southward over the snow fields, finding a more upheaved and broken surface of land, less ice-capped, than is the common feature of the Arctic polar zone. In the longest of these sledge-trips the latitude of $82^{\circ} 17' S.$ was attained,—far beyond any previous approach to the southern pole, but still more than 500 miles from that goal. Through a second winter the *Discovery* was held fast in the ice, with considerable sickness among officers and men, notwithstanding which important additions to their survey of the region were made. In January 1904, they were reached by two relief ships, and escaped from the ice in the following month, arriving at New Zealand not long after.

The German expedition commanded by Dr. Drygalski, left Kiel August 11, 1901, borne by the steamer *Gauss*, built specially for battling with ice. In January 1902, it took on stores at Kerguelen island, and proceeded thence to a point in the Antarctic circle far eastward of that chosen by the British explorers, being within the region of the discoveries made by Captain Wilkes, about sixty years before, and indefinitely named Wilkes Land. It was the purpose of Dr. Drygalski to establish a station on the section of this unexplored territory known as Termination Land and from thence make thorough surveys. He failed, however, to find the supposed land in its expected place, and was unfortunately frozen in for a year, with sledge expeditions baffled by the violence of winter storms. In geographical exploration the *Gauss* party seem to have accomplished little, but they made rich collections of scientific data. As soon as they were freed from the ice they received orders from Berlin to return home.

The Swedish expedition, under Dr. Otto Nordenskjöld [nephew of the famous discoverer of the Northeast Passage], left Europe in October 1901, in the ship *Antarctic*, destined for Graham Land, south of the South American continent. There, on the east coast of that land, in Admiralty inlet, Dr. Nordenskjöld established winter quarters in February 1902, and the *Antarctic* was sent to South America, to return thence some months later.

A Scottish expedition, under Dr. W. S. Bruce, in the steamer *Scotia*, was sent out in October 1903, for special oceanographic investigations in Weddell sea,—south of the Atlantic ocean.

All previous Antarctic explorations were eclipsed, in 1908-1909, by that of Lieutenant Shackleton, commanding the barkentine *Nimrod*, a converted whaling vessel, much smaller than the *Discovery*, on which Lieutenant Shackleton had accompanied Captain Scott to the same region some years before. The *Nimrod* sailed from England in July 1907, and from New Zealand on New Year Day, 1908, going to the same section of the Arctic circle that the *Discovery* had sought. Winter quarters were established at a point about twenty miles north of the spot where Scott and Shackleton had wintered in 1902-1903. One of the first achievements of the party was the ascent of Mount Erebus by six of the scientists of the expedition, who began their difficult climb on March 5. Caught in a blizzard on the second day of their undertaking, they had to lie in their sleeping-bags for thirty hours; but they made their way to the summit and looked down into the live fire of the crater. The party making this ascent were Lieutenant Adams, R. N. R. (geologist), Sir Philip Brocklehurst (surveyor and map maker), Professor David, of Sydney University, Mr. A. Forbes Mackay, assistant surgeon, Mr. Eric Marshall, surgeon and

cartographer, and Mr. Marson a scientist of Adelaide. Early in the spring the sledging journeys were begun.

Speaking at a reception given to him by the Royal Geographical Society, on his return to England in June 1909, Lieutenant Shackleton gave a brief account of the most important of these journeys, led by himself, with Lieutenant Adams, geologist, Surgeon Eric Marshall, and a third companion named Wild. The march of the party was directly toward the Pole:

On December 3 they climbed a mountain 4,000 feet high, and from its summit saw what they believed to be a royal road to the Pole—an enormous glacier stretching southwards. There was only one pony left at this time, and, taking this animal with them, they started the ascent of the glacier, which proved to be seamed with crevasses. Progress became very slow, for disaster threatened at every step. On December 7 the remaining pony was lost down a crevasse, very nearly taking Wild and a sledge with it. Finally the party gained the inland plateau, at an altitude of over 10,000 feet, and started across the great white snow plain toward the Pole.

They were short of food, and had cut down their rations to an absolute *minimum*; the temperature at the high altitude was extremely low, and all their spare clothing had been deposited lower down the glacier in order to save weight. On January 6 [1909], they reached latitude $88^{\circ} 8' S.$ south, after having taken the risk of leaving a *dépôt* of stores on the plateau, out of sight of all land. Then a blizzard swept down upon them, and for two days they were unable to leave their tent, while, owing to their weakened condition and the intense cold, they suffered from frostbite even in their sleeping bags. When the blizzard moderated on January 9 they felt that they had reached their limit of endurance, for their strength was greatly reduced and the food was almost done. They therefore left the camp standing, and pushing on for five hours, planted Queen Alexandra's flag in $88^{\circ} 23' S.$ south, took possession of the plateau for the King, and turned their faces north again.

Lieut. Shackleton described the difficulties of the journey back to the coast, when the men were desperately short of food and nearly worn out, and attacks of dysentery added to their troubles. One day on the Barrier they were unable to march at all, being prostrated with dysentery, and they reached each *dépôt* with their food finished. On February 23, however, they reached a *dépôt* prepared for them by a party from the ship, and on March 1. Lieut. Shackleton and Wild reached the *Nimrod*. Lieut. Shackleton at once led a relief party back to get Adams and Marshall, the latter having been unable to continue the march owing to dysentery, and on March 4 all the men were safe on board.

The following excerpts from the diary kept by the leader of the party are taken from E. H. Shackleton's *Heart of the Antarctic*, pp. 208-210.

"January 8. Again all day in our bags, suffering considerably physically from cold hands and feet, and from hunger, but more mentally, for we cannot get on south, and we simply lie here shivering. Every now and then one of our party's feet go, and the unfortunate beggar has to take his leg out of the sleeping-bag and have his frozen foot nursed into life again by placing it inside the shirt, against the skin of his almost equally unfortunate neighbour. We must do something more to the south, even though the food is going, and we weaken lying in the cold, for with 72° of frost the wind cuts through our thin tent, and even the drift is find-

ing its way in and on to our bags, which are wet enough as it is. Cramp is not uncommon every now and then, and the drift all round the tent has made it so small that there is hardly room for us at all. The wind has been blowing hard all day; some of the gusts must be over seventy or eighty miles an hour. This evening it seems as though it were going to ease down, and directly it does we shall be up and away south for a rush. I feel that this march must be our limit. We are so short of food, and at this high altitude, 11,600 ft., it is hard to keep any warmth in our bodies between the scanty meals. We have nothing to read now, having depoted our little books to save weight, and it is dreary work lying in the tent with nothing to read, and too cold to write much in the diary.

"January 9. Our last day outwards. We have

We stayed only a few minutes, and then, taking the Queen's flag and eating our scanty meal as we went, we hurried back and reached our camp about 3 p.m. We were so dead tired that we only did two hours' march in the afternoon and camped at 5.30 p.m. The temperature was minus 19 Fahr. Fortunately for us, our tracks were not obliterated by the blizzard; indeed, they stood up, making a trail easily followed. Homeward bound at last. Whatever regrets may be, we have done our best."

1908-1910.—Charcot expeditions.—In 1908 the French physician and explorer Dr. Jean Baptiste Charcot led his second scientific expedition to the Antarctic. The following account of the voyage of his ship the *Pourquoi-pas?* (Why Not?) is translated from the explorer's first published account: "On leaving Deception Island (lat. 62 deg.

MEMBERS OF SHACKLETON'S PARTY

Abandoning the sinking "Endurance," they hiked 1,000 miles to the nearest Norwegian whaling station

shot our bolt, and the tale is latitude 88° 23' South, longitude 162° East. The wind eased down at 1 a.m., and at 2 a.m. we were up and had breakfast. At 4 a.m. started south, with the Queen's Union Jack, a brass cylinder containing stamps and documents to place at the further south point, camera, glasses and compass. At 9 a.m. we were in 88° 23' South, half running and half walking over a surface much hardened by the recent blizzard. It was strange for us to go along without the nightmare of a sledge dragging behind us. We hoisted Her Majesty's flag and the other Union Jack afterwards, and took possession of the plateau in the name of His Majesty. While the Union Jack blew out stiffly in the icy gale that cut us to the bone, we looked south with our powerful glasses, but could see nothing but the dead white snow plain. There was no break in the plateau as it extended towards the Pole, and we feel sure that the goal we have failed to reach lies on this plain.

55 min. S.), we made our way to Port Lockray, where we commenced our work. From here I made a trip of observation with Godefroy and Gourdon to Wandel, in order to study the lay of the ice, which would save both coal and time. This little journey of forty miles was exciting enough, and the final result of it was satisfactory. Some days later we arrived with the *Pourquoi-pas?* at Wandel. . . . The creek was rather small for our vessel; we had not had the time to install a satisfactory barrage, and the small ice did not protect us. For a week we were in danger there—unable to come out, assailed by enormous ice-blocks, which had to be pushed off or lashed up night and day. . . . On January 1, Godefroy, Jacques, Gourdon, and I made a reconnaissance to find a better shelter . . . at Petermann Island. . . . A few days after we brought the *Pourquoi-pas?* round, having escaped from Wandel without suffering any serious damage by gently wriggling

Maps prepared specially for the **NEW LARNED** under direction of the editors and publishers.

round the icebergs. I set out the same day with Godefroy and Gourdon to explore the south, chiefly to climb some eminence to see whether we had any channels to pass with the *Pourquoi-pas?* between Biscoe Islands and the coast. As we reckoned upon returning the same day we had taken neither supplies nor change of clothes. Our mission was easily fulfilled, and we saw that the coast was blocked; but when we wanted to retrace our steps we found that our path was also blockaded by the ice. During a four days' blinding snow-storm we struggled to liberate ourselves—I will pass over the details of that trail. We were in peril of succumbing from hunger and cold; on the fourth day we shouldered our traps and determined to attempt some point of vantage on the ice cliffs, whence our signals might be observed by our comrades, when the *Pourquoi-pas?* came to our rescue, skilfully guided by Bongrain and Rouch, whose operations on the syren could be heard through the fog and snow. On the journey back, unfortunately, the vessel stranded violently upon one of the innumerable reefs level with the water; we had to unload, and, after three days' and three nights' incessant labour, we got her off again. But we had to leave behind a large piece of her prow, and it was with this vessel that we accomplished the whole of our expedition. From Petermann Island we went towards the South, skirting the coast, and completing the chart of the Français [his ship of the 1903 expedition]. We found the bay again which was marked by Pendleton, American whaler, and discovered to the north of Adelaide Island a large bay, which we have since named Matha Bay. We next took hydrographic observations of Adelaide Island, which has a very peculiar configuration. But instead of being eight miles in length, as is generally supposed, the configuration has a length of seventy miles! South of Adelaide, in a region neither explored nor even seen, we discovered a great bay, which I have named Marguerite. We entered here, despite the reefs and compact ice, and anchored at a little isle which I named 'Jenny,' after Bongrain's wife. We now encountered such violent weather for four days that it was a miracle the vessel escaped. An enormous iceberg appeared in front of us, from which only a very rapid tacking manœuvre saved us. . . . To the south of Marguerite Bay we were continually fighting our way through ice and icebergs, but we managed to explore the sea bottom round 120 miles of unknown coast. After two attempts to find our way across the ice to Alexander Land, we decided to abandon the project till the following summer. . . . Our winter station was organised as comfortably as possible. . . . During the autumn we made numerous excursions. We saw no sun for five days; the wind blew strongly from N. E., and the snow fell heavily. The ice floes were continually shifting. Many icebergs passed. Despite all precautions, our barrage was frequently broken. The ship was often in danger, and her rudder was smashed; we constructed a new one by cutting up a spar. . . . An expedition to cross Graham's Land was prepared with great care. I intended to lead it myself, but I was disabled by scurvy. Gourdon took my place, setting out with six companions. They brought back some interesting observations, but without being able to scale the insurmountable barrier of granite and ice. Other excursions were also made. After considerable trouble, towards the end of November, we were able to release the vessel. We returned to Deception Island, where we found some whalers who had been held up by ice and bad weather. . . . From Deception Island I wanted to make for Joinville

Land to seek for fossils, but the ice very quickly compelled me to change my plan. We did not wish to compromise our journey southward or to suffer the fate which befell the *Antarctic* in the same latitude. After a brief struggle we were beaten back to Bridgeman Island, where we landed; then to Admiralty Bay and the south coast of the Shetlands, where we did some good work. Thence we set out to the south, the weather all along being bad and misty, and the ice and icebergs abundant. Nevertheless, we were able to go beyond all the latitudes attained to the south-west of Alexander Land, and to complete the chart. We then discovered a series of new lands to the south and west of Alexander Land, in an unexpected place, thus solving an important problem. The deplorable ice-belt barred our nearer approach; in one hour we got no further than ten yards! We continued our route by following the ice barrier until we reached Peter I. Island, which has not been seen since Bellingshausen discovered it. There we were overwhelmed by a tempest and thick mist, during which we had to steer carefully among the icebergs. They were so numerous that I estimated we saw more than 5000 of them in less than a week. We had to drift without steam, all the time, through a fog so dense that we could not see further than twenty yards ahead. Despite this and the strong gusts of wind we reached the 126th deg. long. W., having sailed from the place where the *Belgica* set out, between 69 deg. and 71 deg. lat., that is to say, well to the south of both Cook and Bellingshausen. Our stock of coal being exhausted, the health of several of the party became alarming. We had to turn our faces northward; for a long time the icebergs had been innumerable, but they gradually diminished, and then we saw the last. The crossing of the Antarctic to Cape Pillar was extremely rapid, thanks to an uninterrupted series of southwesterly and northwesterly winds, but the sea was terrific. In ten days we arrived at the entrance of the Magellan Straits, where we encountered severe weather. . . . We anchored at Punta Arenas, where we were heartily received after fourteen months' absence."—*London Standard*, March 30, 1910.

1910-1913.—Scott's expedition; discovery of the Pole; fatal termination.—Results of the *Terra Nova* expedition.—"We find Captain Robert F. Scott in the spring of 1910 busily occupied in furthering the departure of another British Antarctic expedition. Captain Scott had planned this expedition with the utmost detail and thoughtfulness. Through the public press he had explained the manner in which he desired to conduct his enterprise, and aided by the members of the Royal Geographical Society and other learned bodies, a subscription fund of \$200,000 was raised to promote the expedition. The *Terra Nova*, a Dundee whaling ship, was selected and refitted. Prior to her last voyage she had made several trips to Arctic waters and had proved her efficiency in ice navigation. Captain Scott made every preparation for the equipment towards achieving the great results he hoped from his undertaking. He carried with him three newly devised motor sledges intended for ice travel, as well as the usual dog sledges. The 'problem of reaching the South Pole from a wintering station is purely one of transport,' wrote Captain Scott before his departure. 'The distance to be covered there and back is about 1,500 miles. The time at the disposal of an explorer in a single season never exceeds 150 travelling days. An average

of ten miles a day can easily be maintained by men of good physique, provided adequate transport facilities are made.' Accompanying him was a carefully selected crew, and a highly efficient scientific staff. Scott's plan was to arrange two parties, one to leave King Edward Land, the other to leave McMurdo Sound, to converge on the Pole. Captain Scott purposed to follow his own track and that of Sir Ernest Shackleton, except for the last hundred miles. The *Terra Nova* left England June 1, 1910, and sailed for New Zealand. Captain Scott joined the party at Port Chalmers, near Christchurch, and the final departure southward was made November 29, 1910. The personnel of the shore party and crew numbered fifty men, of which twenty-four officers and men were of the Royal Navy, one from the Army and two from the Public Services of India. The *Terra Nova* encountered bad weather and heavy seas from the outset, and was over three weeks in pushing her way through 380 miles of pack ice. By January 1st, 1911, she stood in open water in Ross Sea and

to establish a supply dépôt at Corner Camp. On the outward journey they passed the ponies going well. Again blizzards delayed the return to camp and when Scott returned he found the animals had suffered so severely that a prompt retreat to Hut Point was at once ordered. . . . The Western Geographical party which landed at Butter Point, below Farrar Glacier, January 27, 1911, had made a dépôt at Cathedral Rocks, and from this base they took a sledge journey westward for miles down the glacier. At an altitude of twenty-four hundred feet above the glacier a crater was discovered and basalt flows in places eighty feet in depth. From the glacier they entered a dry, snow-free valley trending toward the sea. A fresh-water lake was discovered estimated about four miles in length. On February 13th, they returned down the Farrar Glacier and crossed the dangerous ice of New Harbor . . . and finally reached Discovery Hut after an absence of six weeks. The Western party again set out on November 7, 1911, for Granite Harbor. Owing to the exceptionally heavy

ERNEST HENRY SHACKLETON

ROALD AMUNDSEN

ROBERT F. SCOTT

sighted the Admiralty Mountains, Victoria Land two days later. Pushing her way southward she passed Cape Crozier and reached McMurdo Sound, where winter quarters were established distant about fourteen miles north of Discovery Station, where the first Scott expedition had wintered, and eight miles to the south of Cape Royds. The work of landing stores proved exceedingly arduous as the distance of transportation was a mile and a half. Ponies, dogs and motor sledges were utilized by the men to assist in transportation and at the end of a week the main work had been completed and the building of the house was begun. The *Terra Nova* left Scott making ready for his preliminary journeys southward. She steamed eastward and surveyed the Great Ice Barrier as far as 170° West longitude, when a gale forced her to make for Cape Colbeck, where her further progress to the east was prevented by the pack. On the 4th of February the *Terra Nova* entered the Bay of Whales and there found the *Fram* of the Amundsen Antarctic Expedition. She then returned to the dépôt-laying party and found all well. . . .

"From the first Captain Scott seemed to have worked against great odds. The dépôt-laying party where left Cape Evans January 25, 1911, consisting of twelve men, eight ponies, and two dog teams, made the most difficult progress over the soft surface of the barrier and experienced a blizzard which exhausted both men and beasts and resulted in the loss of two ponies. On February 24th, Captain Scott started with men and a single pony

loads which they carried, they made the slow progress of about five miles a day, being forced to relay the distance to a cape about nine miles inside the harbor. Building a stone hut and erecting a store as a base for scientific operations they devoted the next two months to exploring the northern shores and sledging around West Harbor where remarkably large mineral deposits such as topaz were discovered. Another curious discovery at their headquarters was that of myriads of wingless insects of two distinct varieties which clustered in a half-frozen condition under every stone. Meanwhile Captain Scott had been completing his preparations for his final journey to the Pole. On November 2, 1911, the final start was made. . . . Bad weather seemed to persist from the outset. It soon became necessary to sacrifice some of the ponies to feed the dogs. December 4, 1911, the party had reached 83.24, about twelve miles distant from Mount Hope. Day by day these men plodded on, in the face of snows, storms and gales. . . . As the main party advanced, sections of the supporting parties turned back. Day and Hooper, who had left Scott first, returned safely to Camp, January 21st; a week later, Atkinson, Wright, Gerrard and Keohane showed up. On December 21st, Captain Scott had reached just beyond 85° South, longitude 163.04 East, and an altitude 6,800 feet. On January 3, 1912, he was within 150 miles of the South Pole, when he sent back the following message: 'I am going forward with a party of five men, sending three back under Lieu-

tenant Evans with this note. The names and descriptions of the advance party are: Capt. Scott, R.N., Dr. Wilson, Chief of the scientific staff; Captain Oates, Inniskillen Dragoons, in charge of the ponies and mules; Lieutenant Bowers, Royal Indian Marine, commissariat officer; Petty Officer Evans, R.N., in charge of sledges and equipment. The advance party goes forward with a month's provisions and the prospects of success seem good, providing the weather holds and no unforeseen obstacles arise. It has been very difficult to choose the advance party, as every one was fit and able to go forward. Those who return are naturally much disappointed. Every one has worked his hardest. The weather on the plateau has been good, on the whole. The sun has never deserted us, but the temperatures are low, now about minus twenty degrees, and the wind pretty constant. However, we are excellently equipped for such conditions, and the wind undoubtedly improves the surface. So far all arrangements have worked out most satisfactorily. It is more than probable no further news will be received from us this year, as our return must necessarily be late."—H. S. Wright, *Seventh continent*, pp. 330-336.

In the light of subsequent events there is something very touching in this last message before the final dash to the Pole. Lieutenant Evans and his companions bore it painfully, faithfully, in the face of scurvy and sickness, back over the frozen ice sheets through snow and storm to the Discovery Hut. "Our return must necessarily be late"—the words were a prophecy which he bravely fulfilled. On February 10, 1913, the news was flashed all over the world that Captain R. L. Scott and his four companions, who were returning to their base after reaching the South Pole [on Jan. 18, 1912] and finding Amundsen's records there, had perished from starvation and cold within 11 miles of a food depot and only 150 miles from their headquarters. According to Captain Scott's diary, which he kept up to the day of his death [March 25, 1912], the party had been caught in a nine-days' blizzard which prevented traveling until supplies were exhausted and death was caused by exposure.

"The British Museum has undertaken the publication of the Natural History results of the British Antarctic Expedition of 1910, better known as the Terra Nova Expedition. . . . An especial interest attaches to the small collection of geological specimens that were retrieved after the tragic death of Captain Scott and his heroic associates, and the present publication [part I, dealing with fossil plants] bears ample testimony to the fact that their efforts have not only furnished the world with a lasting monument to British pluck and manhood but have also yielded facts of the greatest scientific interest.

"Although determinable fossil plants are few in number traces were seen, as well as numerous carbonaceous laminae and small seams of coal, at a number of widely separated localities, particularly in what is called the Beacon sandstone, which at latitude 85° S. is 1,500 feet thick. This comprises an upper 500 feet of sandstone resting on 300 feet of interbedded sandstone and shale with several seams of coal, underlain by 700 feet of similar sandstone conglomeratic at the base. The character of the grains in the sandstone suggests wind action, and sun cracks and ripple marks have also been observed. This extensive formation has been traced from Mt. Nansen as far south as latitude 85°, a distance of over 700 miles. The most significant plants are those representing the genus *Glossopteris* found at Mount Buckley or

Buckley Island which is situated just west of the Beardmore Glacier in latitude 85°. These are partly referred to the wide-spread *Glossopteris indica* Schimper and in part described as a new variety of that species. There are also represented objects identified as those of *Vertebraria* and representing the axial organs of *Glossopteris*, and others doubtfully correlated with the scale leaves of the latter genus. From the Priestley Glacier rather indifferently preserved wood is described under the name *Antarcticoxylon Priestleyi* and considered as a new type probably Araucarian in its relationship. Winged pollen grains are described as *Pityosporites antarcticus*. These are suggestive of the Abietinæ, but may be those of the Podocarpinæ. The remainder of the collection has little interest beyond its indication of the presence of arboreal forms in high southern latitudes. The exact age of these plant-containing beds can not be definitely determined from the present collections, although there is no reason to doubt the legitimacy of the author's conclusion that the Beacon sandstone is probably Permo-Carboniferous in age with the further possibility that its upper part may be early Mesozoic. The demonstration of the former presence of *Glossopteris* in Antarctica is of the greatest importance. . . . Its presence in Antarctica supplies an important link in the chain connecting the now isolated land masses of the southern hemisphere and also suggests the possibility of this flora having originated on the broad bosom of the Antarctic continent."—E. W. Berry, *Scientific results of the Terra Nova expedition* (*Science*, June 4, 1915, pp. 830-831).

1911. — A Japanese expedition. — Lieutenant Shirase of the Japanese navy headed an expedition which sailed from Wellington, New Zealand, on Feb. 11, 1911, with the object of reaching the South Pole. Owing to insufficient equipment the expedition was obliged to turn back a few months later.

1911-1912.—Amundsen's successful expedition to the South Pole.—"Amundsen as a veteran Polar explorer and successful navigator of the Northwest Passage, had accompanied a previous expedition to the South Polar regions. His original plan, however, in equipping another expedition for scientific research in Polar waters was not to venture south but to continue work beyond the Arctic Circle. How the change of program was inaugurated which finally resulted in one of the greatest achievements on record is best told by himself. 'I was preparing my trip toward the North Polar regions,' Amundsen has explained, 'it may be to the North Pole—in 1909. It was not very easy to start an expedition from Norway, for it was hard work among us to raise money and I was preparing this expedition slowly. Then suddenly the news flashed all over the world that the North Pole had been attained, that Admiral Peary had planted the Stars and Stripes up there. The money which had been scarce now went down to nothing. I could not get a cent more, and I was in the midst of my preparations. One of the last mysterious points of the globe had been discovered. The last one still remained undiscovered, and then it was that I took the decision to turn from the north toward the south in order to try to discover this last problem in the polar regions.' Amundsen's party made a successful landing on the Ross Barrier in longitude 162° W. about fifty miles to the west of King Edward Land. He established his winter quarters at a station which he appropriately called [after his ship, the *Fram*] Framheim, and there in good health and spirits he and his sturdy companions passed a cheerful and

busy season. . . . The Norwegian expedition relied on the most primitive methods for its success, favored by unusually good conditions of weather and ice. 'Amundsen's victory is not due,' says Nansen, 'to the great inventions of the present day and the many new appliances of every kind. The means used are of immense antiquity, the same as were known to the nomad thousands of years ago when he pushed forward across the snow-covered plains of Siberia and Northern Europe. But everything, great and small, was thoroughly thought out, and the plan was splendidly executed. It is the man

of these canine friends who occupied every available foot of room upon the decks and were tethered upon the bridge as well. Amundsen's previous experience in the Arctic as well as his Norwegian training as a disciple of Nansen had convinced him of the importance depending on dogs in all human efforts to reach high latitudes. Their superiority over ponies was demonstrated by their being able to cross more easily the snow ridges that span the dangerous crevasses of the Barrier. . . . Another important factor in favor of dog teams is the fact that dog eats dogs in case of

AMUNDSEN TAKING OBSERVATIONS AT THE SOUTH POLE,

DECEMBER 14, 1911

that matters, here as everywhere. . . . Both the plan and its execution are the ripe fruit of Norwegian life and experience in ancient and modern times,' and he comments, 'Like everything great, it all looks so plain and simple.' Amundsen had placed his chief reliance for transportation of equipment and supplies on the service of dogs. Nearly one hundred of these animals had been secured from Greenland, and these had increased in numbers during the long voyage of nearly 16,000 miles through many waters and climes. The slogan 'Dogs first and all the time,' seems to have inspired the men from the start and the greatest care was taken

emergency, whereas extra food must be carried to support ponies during the entire journey. . . . From Amundsen's winter quarters at Framheim to the South Pole was a distance of 870 miles. To cover this distance and return, the party of five men took provisions for four months, with four sledges, drawn by fifty-two dogs. Amundsen left Framheim on October 20, 1911, and was absent three months and five days, returning to headquarters with two sledges and eleven dogs January 25, 1912. When one recalls the uneven surfaces over which the route was followed, the high altitude of the undulating plateau, the moun-

tainous region to be crossed before the goal could be reached and the herculean exertions which Shackleton had made to reach that goal, and been obliged to turn back, one marvels that these Norwegian vikings returned with any dogs at all; nevertheless, men and beasts not only returned safely but in excellent condition. To be sure Amundsen was singularly favored. There were few accidents. Nevertheless they encountered blizzards and were weather-bound in their tents on more than one occasion. On December the 9th they passed the record of the 'Furthest South,' Amundsen writes . . . 'eighty-eight degrees and 23 minutes was passed; we were further south than any human being had been. No other moment of the whole trip affected me like this. We all shook hands with mutual congratulations; we had won our way far by holding together and we would go further yet—to the end.' The distant horizon which Shackleton had seen with regretful eyes Amundsen now saw. The road was straight ahead, there to the south lay their goal. As was the case in Peary's final success, so it was with Amundsen, *nothing untoward happened*. No obstacles hindered them, the weather favored them and on December 14th [1911], the greatest day of all, they experienced that sense of nervousness incident to great expectations that were soon to be realized." On this day Amundsen and his party reached the South Pole, only four weeks before Captain Scott arrived at the same destination.—H. S. Wright, *Seventh continent*, pp. 337-342.

"Up to this moment the observations and our reckoning had shown a surprising agreement. We reckoned that we should be at the Pole on December 14. On the afternoon of that day we had brilliant weather—a light wind from the southeast with a temperature of -10° F. The sledges were going very well. The day passed without any occurrence worth mentioning, and at three o'clock in the afternoon we halted, as according to our reckoning we had reached our goal. We all assembled about the Norwegian flag—a handsome silken flag—which we took and planted all together, and gave the immense plateau on which the Pole is situated the name of 'King Haakon VII's Plateau.' It was a vast plain of the same character in every direction, mile after mile. During the afternoon we traversed the neighbourhood of the camp, and on the following day, as the weather was fine, we were occupied from six in the morning till seven in the evening in taking observations, which gave us $89^{\circ} 55'$ as the result. In order to take observations as near the Pole as possible, we went on, as near true south as we could, for the remaining nine kilometres. On December 16 we pitched our camp in brilliant sunshine, with the best conditions for taking observations. Four of us took observations every hour of the day—twenty-four in all. . . . We have thus taken observations as near to the Pole as was humanly possible with the instruments at our disposal. We had a sextant and artificial horizon calculated for a radius of 8 kilometres. On December 17 we were ready to go. We raised on the spot a little circular tent, and planted above it the Norwegian flag and the *Fram's* pennant. The Norwegian camp at the South Pole was given the name of 'Polheim.' The distance from our winter quarters to the Pole was about 870 English miles, so that we had covered on an average $15\frac{1}{2}$ miles a day. We began the return journey on December 17. The weather was unusually favourable, and this made our return considerably easier than the march to the Pole. We arrived at 'Framheim,' our winter quarters, in January, 1912, with two sledges and eleven dogs,

all well. On the homeward journey we covered an average of $22\frac{1}{2}$ miles a day. The lowest temperature we observed on this trip was -24° F., and the highest $+23^{\circ}$ F. The principal result—besides the attainment of the Pole—is the determination of the extent and character of the Ross Barrier. Next to this, the discovery of a connection between South Victoria Land and, probably, King Edward VII Land through their continuation in huge mountain-ranges, which run to the southeast and were seen as far south as lat. $88^{\circ} 8'$, but which in all probability are continued right across the Antarctic Continent. We gave the name of 'Queen Maud's Mountains' to the whole range of these newly discovered mountains, about 530 miles in length. The expedition to King Edward VII Land, under Lieutenant Prostrud, has achieved excellent results. Scott's discovery was confirmed, and the examination of the Bay of Whales and the Ice Barrier, which the party carried out, is of great interest. Good geological collections have been obtained from King Edward VII Land and South Victoria Land. The *Fram* arrived at the Bay of Whales on January 9, having been delayed in the 'Roaring Forties' by easterly winds. . . . We are all in the best of health."—R. Amundsen, *South Pole, Norwegian Antarctic expedition with the Fram, 1910-1912*, pp. 17-19.

1911-1913.—Dr. Mawson's Australasian expedition.—An Antarctic expedition, financed by grants amounting to \$130,000 from the Australian, New Zealand and British governments, set out from Adelaide, South Australia, in the ship *Aurora* under the leadership of Dr. D. Mawson on Nov. 20, 1911. The expedition was provided with an oceanographical equipment contributed by the prince of Monaco. Dr. Mawson returned to Sydney in the early spring of 1913, after having successfully mapped about a thousand miles of Termination Land. Two members of the expedition lost their lives—Lieutenant Innes, who fell into a deep ice crevasse, and Dr. Merz, who died from exposure.

1913.—Return of the German expedition under Filchner.—"News was received by telegraph on January 7 of the return of Lieut. Filchner in the *Deutschland* to Buenos Aires. The return was somewhat earlier than had been anticipated, for . . . the original programme had in view a complete crossing of the South Polar area from the Weddell to the Ross Sea; and though this was afterwards abandoned, it was hoped to push a long way south into the unknown region between the Weddell Sea and the Pole. According to the scanty telegrams made public at the time of writing, the farthest south reached seems to have been in the neighbourhood of 79° S. Even this marks an important advance on the farthest previously reached on this side of the globe, or in fact in any part of the Antarctic region apart from the Ross Sea, and the lands to the south of it; no previous navigator having crossed 75° S., except in the latter region—i. e. within the 60° of longitude between 150° E. and 150° W. After crossing an ice-belt 1200 (*sic*; probably 120) miles wide, the expedition is said to have discovered, in $76^{\circ} 35'$ S., 30° W., a new land which continued as far as 70° . To this land Lieut. Filchner gives the name Prince Regent Luitpold Land, after the late Regent of Bavaria, while an ice-barrier to the west has been named the Kaiser Wilhelm Barrier. From the position assigned to the new discovery it might seem to be a south-westward continuation of Coats Land, discovered by Bruce in 1904. The statement that in 78° S. the Weddell Sea forms its southern boundary is somewhat puzzling, for even were the new land an island, the Weddell Sea

would, of course, be mainly north of it. Possibly there is some mistake in the telegram, and the meaning intended is that the land forms the southern boundary of the Weddell Sea. Licut. Filchner hopes to return south to continue his explorations."

—*Geographical Journal, February, 1913, p. 173.*

1914-1916.—Shackleton's second Antarctic expedition.—"In February, 1914, Sir Ernest Shackleton presented before the Royal Geographical Society of London his program for a new Antarctic Expedition, the purpose of which was to cross the South Polar Continent from the Weddell Sea to the Ross Sea. Such a journey was a stupendous undertaking, but Shackleton hoped that from the geographical point of view the complete continental nature of the Antarctic might be solved. It was the purpose of the expedition to take continuous magnetic observations from Weddell Sea right across the Pole, and to follow conscientiously all branches of science, with the hoped-for result of greatly adding to the sum total of human knowledge. To carry out his bold project of a trans-Antarctic expedition Shackleton had planned to go with his party to the coast line on the Weddell Sea, while Captain Mackintosh and nine companies [in the *Aurora*] were to start from the coast of Ross Sea, on the other side of the Pole, and meet Shackleton's party at a point far inland. Having received the encouragement and support of the scientific world, Sir Ernest left Buenos Aires on board the *Endurance* October 25th, 1914, and the last word was heard from him in February of the following year. In May, 1916, Shackleton cabled his arrival in the Falkland Islands, bringing with him an account of his failure to reach his destination, through adverse ice conditions. No attempt at a trans-Antarctic journey could be made—the *Endurance* was beset in January, and from then on drifted at the mercy of the elements, reaching the farthest South of 77° in longitude 35° West. Then a zizzard drift was made across Weddell Sea and she continued Northwest. Intense ice pressure was experienced in June when the ridges of ice reached the height of twenty feet near the ship, and during July they reached twice that height. It was not until October, however, that the pressure against the hull of the *Endurance* became too much for the ship, and she was finally crushed by the ice; all hands abandoned her, taking to boats and sledges, with a part of their provisions. After a drift northward for two months, the ice became strong enough to travel over it and the march was pursued through deep snow. During the next few months the party lived on the ice floes, narrowly escaping death on more than one occasion. In April, 1916, the ice suddenly opened beneath them and forced them to take to the open sea in boats. They made their way to Elephant Island and here they found themselves in such dire straits that Sir Ernest with five men in a small boat started for South Georgia [750 miles] for assistance. This amazing journey, accomplished under such hazardous conditions, is one of the most daring and heroic feats in Antarctic history. After reaching the Falklands, Shackleton made several unsuccessful attempts to rescue his men left on Elephant Island. The first was made from South Georgia on May 23rd in a whaling vessel furnished by a Norwegian whaling station. The boat could not penetrate the pack ice and was obliged to return to the Falkland Islands, reaching Port Stanley on May 31st. On the 8th of June a second attempt was made in the steamer *Instituto Pesca* of the Uruguayan Bureau of Fisheries which left Montevideo, stopping en route at Port Stanley, June 17th, to pick

up Shackleton. It was found impossible to reach Elephant Island because of the ice and the trip was abandoned June 25th. The ship had approached to within twenty miles of the Island, and it was ascertained that penguins abounded in the vicinity, giving reasonable assurance that the men would be able to subsist until help came, although when their leader had left them they had only five weeks' rations. Shackleton's third attempt was made July 13th, when he set sail from Punta Arenas on the schooner *Emma*. The schooner was forced back by the terrific gales and ice fields; with engines injured and a battered hull she returned to the Falkland Islands on August 4th. Undaunted by repeated failures, worn in body and mind from exhaustion and anxiety, this heroic explorer renewed every effort to rescue the twenty-two marooned men whose trust in him had never wavered, and again set out upon his quest. The fourth and successful journey was made from Punta Arenas, where Sir Ernest chartered a steamer and finally reached his men, when they had all but given up hope of rescue. The party had endured many hardships during the [seventeen weeks'] absence of Shackleton. . . .

"Disaster had likewise pursued Captain Mackintosh and his party. The *Aurora*, in which he had sailed, broke away in a blizzard off Ross Barrier, leaving Mackintosh and his men stranded on shore. The ship drifted to New Zealand, where she was repaired and Sir Ernest Shackleton sailed in her to the final rescue of the remaining band of adventurous men. In their isolation of twenty months three of their number had died, including Captain Mackintosh, the leader, A. P. Spencer Smith, and Victor G. Hayward. Part of the program of the Ross Sea party had been to lay dépôts on the Ross barrier ice, for the use of the Shackleton party when it came down from the Antarctic plateau. This they did, in spite of their abandonment, the last dépôt being made in October, at Mount Hope (83 = 1½ S.), at the foot of Beardman Glacier. . . . Though at every turn disaster and misfortune followed Shackleton's last expedition to Antarctica, the indomitable courage, heroism, and faith exhibited by leader and men will ever stand in this story of 'failure' as an example to all and stir the heart with the deepest admiration and enthusiasm."—H. S. Wright, *Seventh continent*, pp. 372-378.

Scientific observations.—Problems of the ice age.—"Recent Antarctic explorations and researches have yielded significant evidence regarding the problems of the Ice Age, and of the similarity of the succession of geological climates in polar with those in other latitudes. These researches have been prosecuted to the ultimate limit of courage, devotion to duty and endurance—the noble sacrifice of life—as in the cases of Captain Scott, R.N., and his devoted companions and members of the expedition of Sir Ernest Shackleton. The data secured by these expeditions are alone sufficient to establish the following premises: (1) That Antarctic ice, although covering areas several times larger than all other ice covered areas, is slowly decreasing in extent and depth (2) That the same succession of geological climates have prevailed in Antarctic as in other latitudes. So vital are these evidences of the retreat of Antarctic ice that it may be well to briefly quote or refer to the most prominent instances: All these evidences and many others . . . lead up to one great fact—namely, that the glaciation of the Antarctic regions is receding. The ice is everywhere retreating. The high level moraines decrease in height above the present surface of the ice, the débris being two thousand feet

up near the coast and only two hundred feet above near the plateau.

"This observation applies to an ice-covered area of over 116,000 square miles. . . . In speaking of the evidence of ice retreat over Antarctic areas explored by him, Sir Ernest Shackleton said: 'Some time in the future these lands will be of use to humanity.' This impressive and conclusive evidence is corroborated by the greater and still more impressive evidences of the comparatively recent uncovering of temperate land areas, and the progressive retreat of the snow line to higher elevations in temperate and tropical latitudes and towards the poles at sea level, being far greater in Arctic than in Antarctic regions. We are therefore confronted with the conclusions: (1) That the disappearance of the Ice Age is an active present process and must be accounted for by activities and energies now at work, and that the use of assumptions and hypotheses is not permissible; (2) That the rates and lines of retreat are and have been determined by exposure to solar energy and the temperatures established thereby; and by the difference in the specific heat of the land and water hemispheres; (3) That the lines of the disappearance of ice are not conformable with those of its deposition, and mark a distinctly different exposure and climatic control from that which prevailed prior to the culmination of the Ice Age. (4) This retreat also marks a rise in mean surface temperature along these new lines, manifestly due to recently inaugurated exposure to solar radiation and also the inauguration of the trapping of heat derived from such exposure; which process is cumulative and has a maximum not yet reached.

"The researches under the direction of Captain Scott and Sir Ernest Shackleton have therefore very rigidly conditioned any inquiry as to the causes of glacial accumulation and retreat. These conditions are CORRECTIVE and DIRECTIVE—*corrective*, in that they have entirely removed any doubts as to the alternate glaciation of the poles under the alternate occurrence of aphelion and perihelion polar winters by the precession of the equinoxes, as advanced by Croll; *directive*, in that they have imposed an appeal to energies now active as causes of retreat, and divested the problem of resorts to the fascinating but dangerous uses of suppositions and hypotheses.

"They have, moreover, pointed out with unerring accuracy the vital conclusion that the same energies which have but recently converted the glacial lake beds of Canada into the most productive grain fields of the world will in time convert the tundras of to-day into the grain fields of to-morrow. The bearing of this conclusion upon the ultimate development of the human race is so far-reaching in its consequences that the great sacrifice of life attendant upon the prosecution of these researches stands forever as a memorial in the correction of the erroneous and wide spread conception that the earth is in a period of refrigeration, desiccation and decay; and establishes the conclusion that it is in the spring time of a new climatic control during which the areas fitted for man's uses are being extended and that the moss of polar wastes will be replaced by rye and wheat."—M. Manson, *Bearing of the facts revealed by Antarctic research upon the problems of the ice age* (*Science*, Dec. 28, 1917, pp. 639-640).

Climatic conditions.—Fauna.—"The great severity of climate in South Polar regions, the lack of vegetation, the desolation of unpeopled lands upon which no quadrupeds are to be found,—lands that are mere barren wastes of snow and ice, so

different from the more hospitable coasts and valleys of the Arctic, where at equal distances from the equator are found lands green with vegetation, abounding with animal life and the habitat of the hardy Esquimaux,—is accounted for by the predominance of sea in the South Polar regions. The vast continental masses in the north are warmed by the summer sun rays and become centers of radiating heat; while the Antarctic lands are isolated in the midst of frigid waters and constantly chilled by cold sea winds 'which act at every season as refrigerators of the atmosphere.'

"In the north," writes Hartwig, 'the cold currents of the Polar Ocean, with their drift-ice and bergs, have but the two wide gates of the Greenland Sea and Davis Strait through which they can emerge to the south, so that their influence is confined within comparatively narrow limits, while the gelid streams of the Antarctic seas branch out freely on all sides, and convey their floating ice-masses far and wide within the temperate seas. It is only to the west of Newfoundland that single icebergs have ever been known to descend as low as 39° of latitude; but in the southern hemisphere they have been met with in the vicinity of Cape of Good Hope (35° S. lat.) near Tristan da Cunha, opposite to the mouth of the Rio de la Plata, and within a hundred leagues of Tasmania. In the north, finally, we find the gulf stream conveying warmth even to the shores of Spitsbergen and Novaya Zembla; while in the opposite regions of the globe, no traces of warm currents have been observed beyond 55° of latitude. Thus the predominance of vast tracts of flat land in the boreal hemisphere, and of an immense expanse of ocean in the Antarctic regions, sufficiently accounts for the æstival warmth of the former, and the comparatively low summer temperature of the latter. In 1829 . . . the *Chanticleer*, Captain Foster, was sent to New Shetland for the purpose of making magnetic and other physical observations, and remained for several months at Deception Island, which was selected as a station from its affording the best harbour in South Shetland. Though these islands are situated at about the same distance from the Pole as the Farøe Islands, which boast of numerous flocks of sheep, and where the sea never freezes, yet, when the *Chanticleer* approached Deception Island, on January 5 (a month corresponding to our July), so many icebergs were scattered about that Foster counted at one time no fewer than eighty-one. A gale having arisen, accompanied by a thick fog, great care was needed to avoid running foul of these floating cliffs. After entering the harbour—a work of no slight difficulty, from the violence of the wind—the fogs were so frequent that, for the first ten days, neither sun nor stars were seen; and it was withal so raw and cold, that Lieutenant Kendall, to whom we owe a short narrative of the expedition, did not recollect having suffered more at any time in the Arctic regions, even at the lowest range of the thermometer. In this desolate land, frozen water becomes an integral portion of the soil; for this volcanic island is composed chiefly of alternate layers of ashes and ice, as if the snow of each winter, during a series of years, had been prevented from melting in the following summer by the ejection of cinders and ashes from some part where volcanic action still goes on. . . . The absence of quadrupeds south of 60° has already been noted, but mention should be made of innumerable seabirds which, though they belong to the same families as those of the north, are a 'distinct genera or species, for with rare exceptions no bird is found to inhabit both Arctic and Antarctic regions.'—

ANTHROPOLOGY: Definition.—Early researches.—The simplest definition of anthropology is found in the derivation of the word. “Anthropos” is the Greek word for man; “logos” in Greek means science or discourse; therefore anthropology is the science of man. Aristotle is supposed to be the first person to use the term. After that it is not met with again until the 16th century when the Latin word “anthropologium” is used to designate the study of bodily structure. In fact anthropological research in Europe until very recently was limited to the field now called physical anthropology. The development and growth of anthropology into the comprehensive science that it is to-day, is closely connected with the general scientific development of Europe during the 17th, 18th and 19th centuries. “In earlier days certain philosophers had been spoken of as anthropologists, and again in later times, i. e. in the 18th century, Anthropology was treated (by Kant and others) as a branch of philosophy, rather than of biology. The latter end of the 17th century was a most important epoch in the history of Physical Anthropology, using the term in the sense which it has now acquired and which will presently be explained. In the year 1699, Dr. Edward Tyson, a member of Corpus Christi College, Cambridge, published under the auspices of the Royal Society a treatise entitled ‘Orang-Outang, siva Homo Sylvestris. Or, the Anatomy of a Pygmic compared with that of a Monkey, an Ape, and a Man.’ Without entering upon detailed criticism of this work, it will suffice to remark that it constitutes a most remarkable anticipation of modern methods of research, and still serves as a model for investi-

gations into the structure of Man and Apes. Nevertheless, although so important in these respects, the work was not described as one on Anthropology, nor is it certain that Tyson made use of the term in connection with it. The 18th century in turn affords several notable names in the history of Physical Anthropology. The chief contributors to the subject were Linnæus, Daubenton, Camper, Hunter, Soemmering and Blumenbach. The *Systema Naturæ* of Linnaeus (of which the first edition appeared in 1735) will remain for ever memorable to anthropologists from the fact that Man was therein restored definitely to a place with other animals in a scheme of comparative zoology. Daubenton (1764), a colleague of Buffon, is to be credited with the first strictly scientific memoir in which the comparative anatomy of the skull was studied by means of angular measurements. Camper’s great work was first published in 1770. Born at Leyden in 1722, Camper had attained the age of sixty-seven when he died. But for the work of Tyson, that of Camper would hold the place of honour as anticipating the soundest and most productive methods of modern physical anthropology. Camper’s researches dealt with the comparative anatomy of the Orang-utan (a chapter being devoted specially to its comparison with Man), with the different varieties of anthropoid apes, with the organs of speech in the Orang-utan, with the significance and origin of pigmentation in the negro races, and finally with the comparative study of skulls. In this connection, special reference is due to the method employed, for it was based on the principle of projections, i. e., the comparison of forms and contours drawn in rectilinear projection. Errors due to perspective, such as occur when the object is viewed in the ordinary way, were thus eliminated. In the same treatise, Camper defines and explains the use of the facial angle which he devised, and through which his name will be perpetuated in the literature of craniometry. The work of John Hunter (1728-1793) stands in a category apart from all others. If not avowedly anthropological, the researches carried out by Hunter in Comparative Anatomy define the field or extent of the larger part of modern Physical Anthropology. For the rest, it must be added that while in Hunter’s work the anatomical notes are numbered in thousands, the physiological background is never lost to view. Herein, it is fair to believe, a clue will be found to Hunter’s success. This vitalizing principle was rigidly maintained and may be studied to-day, not only in the literary monuments left by Hunter, but also in the noble Collection by which his memory is perpetuated. The accomplished anatomist Soemmering published in 1785 a monograph on the anatomy of a Negro, which has become classical. The author extended the comparative methods employed by Camper in the case of the external characters, to the details of every part and structure of the body. In this research again, we may notice the substitution of exact and precise information for speculative surmise. Not the least important point made by Soemmering was his observation that the brain-weight of his subject exceeded that of most Europeans. This very paradox (as it seemed even then to Soemmering) led him to anticipate (in part at least) important researches carried out a century later by Snell and Dubois. For Soemmering found that while the Negro’s brain exceeded that of the European in weight, it held nevertheless a more lowly position when judged by a comparison of its size with the combined mass of the cerebral nerves. The absolute weight taken alone is thus deprived of value as an index of developmental

status. It is further shewn that for the interpretation of the significance of the brain-weight, the size and complexity of the organs supplied by those nerves must be held accountable for a certain part (now called the 'corporeal concomitant'). And finally, it is on the part which remains over, called by Soemmering the 'superfluous quantity,' that judgment as to the real 'size' of the brain is to be passed. [See also ARYANS: Distribution.] Blumenbach is distinguished particularly by his studies in comparative human craniology. Born at Gotha in 1752, . . . he studied . . . at Jena and at Göttingen, at which latter University he obtained a professorial chair; and at Göttingen Blumenbach died in 1840. Three characteristics seem to be prominent before all others in the character of this remarkable man. His extraordinary versatility in scientific pursuits has rarely been surpassed, even in the fatherland of Goethe, Helmholtz, and Virchow. Scarcely less impressive was his enormous range of literary acquaintance. A third point is that he was eminently a laboratory worker . . . for he travelled but little. Blumenbach's principal contributions to science consist of a treatise on the 'Natural Varieties of the Human Species' and of numerous craniological descriptions, to which must be added certain essays on the Natural History of Man, including an anatomical comparison of Man with other animals. And the chief advances determined by these researches may be summarized as follows: (1) The employment of the word 'anthropology' as descriptive of morphological studies. (2) Recognition of the fact that no sharp lines demarcate the several varieties of Mankind, the transition from type to type being imperceptible. (3) The clear enunciation of a classificatory scheme of the varieties of Mankind, admittedly arbitrary, but devised with the object of facilitating study: the classification was based on considerations of the characters of the skin, the hair, and the skull. (4) A clear enunciation of the external causes in producing and perpetuating variations in animals, including Man; recognition of the origin of varieties through 'degeneration'; Blumenbach thus very nearly anticipated some important discoveries reserved for Darwin at a later date. All differences in the cranial forms of Mankind were referred either to environment or to artificial interference. At the same time, it is suggested that artificial modifications may in time be inherited (cf. Blumenbach's *Works*, p. 121)."—W. L. H. Duckworth, *Morphology and anthropology*, pp. 1-5.—See also EUROPE: Prehistoric period: Earliest remains, etc.; PACIFIC OCEAN: People.

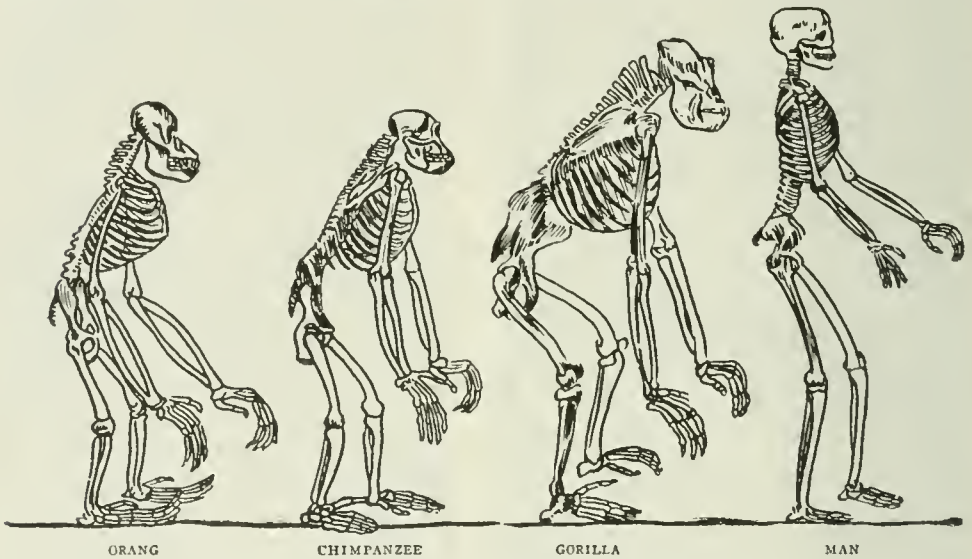

Scope of study.—Historical method.—Influence of evolutionary theories.—"This brings us to the point when anthropology begins to assume a wider aspect. Although in earlier periods men noticed the differences in physical appearance and culture existing among various peoples, the discussions of such facts were not within the field of anthropology. Observation of racial differences are recorded on Egyptian monuments and in the tales of early travellers. The Greek and Roman writers mention it and later in the travels of Marco Polo and explorers of the 15th, 16th and 17th centuries there are very accurate accounts of primitive customs. 'At the present time anthropologists occupy themselves with problems relating to the physical and mental life of mankind as found in varying forms of society from the earliest times up to the present period and in all parts of the world.' In this way Franz Boas, the leader of American anthropologists outlines the scope of anthropology. Naturally it is impossible for one

person to command such a range of knowledge, and so distinct fields of specialization have sprung up. The two main divisions are physical and cultural anthropology, the latter often termed ethnology. Under physical anthropology are included all studies relating to the physical characteristics of man, his place in nature, comparative anatomy and physiology, the antiquity of man as shown in fossil remains, which evidences are correlated with the findings of geology and a comparative study of the physical characteristics of the different races and subdivisions of races. Cultural anthropology or ethnology deals with the antiquity of man as shown by remains of his handiwork, a comparative study of the arts and industries of man, speculation as to their origin; their development and geographical distribution. On the sociological side we have the social and political organization of various peoples; their ethics and religion. The psychological side of life is studied through the languages and mythologies. And finally when these surveys are finished, the different peoples of the world can be arranged into ethnic groups exhibiting a certain degree of uniformity of culture. (See also ETHNOLOGY.) In anthropology two distinct methods of research have developed, the historical method which aims to reconstruct the actual history of mankind, the other is the generalizing method which attempts to establish the laws of its development.

"About this time the historical aspect of the phenomena of nature took hold of the minds of investigators in the whole domain of science. Beginning with biology, and principally through Darwin's powerful influence, it gradually revolutionized the whole method of natural and mental science and led to a new formulation of their problems. The idea that the phenomena of the present have developed from previous forms with which they are genetically connected and which determine them, shook the foundations of the old principles of classification and knit together groups of facts that hitherto had seemed disconnected. Once clearly enunciated, the historical view of the natural sciences proved irresistible and the old problems faded away before the new attempts to discover the history of evolution. From the very beginning there has been a strong tendency to combine with the historical aspect a subjective valuation of the various phases of development, the present serving as a standard of comparison. The oft-observed change from simple forms to more complex forms, from uniformity to diversity, was interpreted as a change from the less valuable to the more valuable and thus the historical view assumed in many cases an ill-concealed teleological tinge. The grand picture of nature in which for the first time the universe appears as a unit of ever-changing form and color, each momentary aspect being determined by the past moment and determining the coming changes, is still obscured by a subjective element, emotional in its sources, which leads us to ascribe the highest value to that which is near and dear to us. The new historical view also came into conflict with the generalizing method of science. It was imposed upon that older view of nature in which the discovery of general laws was considered the ultimate aim of investigation. . . . Anthropology also felt the quickening impulse of the historic point of view, and its development followed the same lines that may be observed in the history of the other sciences. The unity of civilization and of primitive culture that had been divined by Herder now shone forth as a certainty. The multiplicity and diversity of curious customs and beliefs appeared as early steps

in the evolution of civilization from simple forms of culture. The striking similarity between the customs of remote districts was the proof of the uniform manner in which civilization had developed the world over. The laws according to which this uniform development of culture took place became the new problem which engrossed the attention of anthropologists. This is the source from which sprang the ambitious system of Herbert Spencer and the ingenious theories of Edward Burnett Tylor. The underlying thought of the numerous attempts to systematize the whole range of social phenomena or one or the other of its features—such as religious belief, social organization, forms of marriage—has been the belief that one definite system can be found according to which all culture has developed, that there is one type of evolution from a primitive form to the highest civilization which is applicable to the whole of mankind, that notwithstanding many variations caused by local and historical conditions, the gen-

tian and Georg Gerland. Both were impressed by the sameness of the fundamental traits of culture the world over. Bastian saw in their sameness an effect of the sameness of the human mind and terms these fundamental traits 'Elementargedanken' [elementary thoughts], declining all further consideration of their origin, since an inductive treatment of this problem is impossible. For him the essential problem of anthropology is the discovery of the elementary ideas, and in further pursuit of the inquiry, their modification under the influence of geographical environment. Gerland's views agree with those of Bastian in the emphasis laid upon the influence of geographical environment on the forms of culture. In place of the mystic elementary idea of Bastian, Gerland assumes that the elements found in many remote parts of the world are a common inheritance from an early stage of cultural development. It will be seen that in both these views the system of evolution plays a secondary part only, and that the main stress is laid

COMPARISON OF SKELETONS OF VERTEBRATES, SHOWING EVOLUTIONARY SIMILARITIES

From specimens in Royal College of Surgeons, London

eral type of evolution is the same everywhere. This theory has been discussed most clearly by Tylor, who finds proof for it in the sameness of customs and beliefs the world over. The typical similarity and the occurrence of certain customs in definite combinations are explained by him as due to their belonging to a certain stage in the development of civilization. They do not disappear suddenly, but persist for a time in the form of survivals. These are, therefore, wherever they occur, a proof that a lower stage of culture of which these customs are characteristic has been passed through. . . . The generalized view of the evolution of culture in all its different phases which is the final result of this method may be subjected to a further analysis regarding the psychic causes which bring about the regular sequence of the stages of culture. Owing to the abstract form of the results, this analysis must be deductive. It can not be an induction from empirical psychological data. In this fact lies one of the weaknesses of the method which led a number of anthropologists to a somewhat different statement of the problem. I mention here particularly Adolf Bas-

on the causes which bring about modifications of the fundamental and identical traits. There is a close connection between this direction of anthropology and the old geographical school. Here the psychic and environmental relations remain amenable to inductive treatment, while, on the other hand, the fundamental hypotheses exclude the origin of the common traits from further investigation. The subjective valuation which is characteristic of most evolutionary systems, was from the very beginning part and parcel of evolutionary anthropology. It is but natural that in the study of the history of culture our own civilization should become the standard, that the achievements of other times and other races should be measured by our own achievements. In no case is it more difficult to lay aside the 'Culturbrille' [cultural spectacles]—to use Von den Steinen's apt term—than in viewing our own culture. For this reason the literature of anthropology abounds in attempts to define a number of stages of culture leading from simple forms to the present civilization, from savagery through barbarism to civilization, or from an assumed pre-savagery through the

same stages to enlightenment. The endeavor to establish a schematic line of evolution naturally led back to new attempts at classification in which each group bears a genetic relation to the other. Such attempts have been made from both the cultural and the biological point of view."—F. Boas, *History of anthropology* (*Science*, Oct. 21, 1904).—See also EVOLUTION: Historical development, etc.

After this brief summary of the general method of anthropology it is perhaps best to take each branch of the science separately and show its development, bearing in mind the aims of the entire subject.

Linguistics.—The point of view of the student of linguistics depends very much on his background. If he comes from physical anthropology he is interested in correlating the phonetic system with the structure of the organs of speech; the ethnologist studies language to gain light on ethnic affinity and cultural contact, or if he is interested in psychology, to learn categories of thought and the trend of mental processes. The study of linguistics was first directed to the investigation of the "Aryan" question. "The connection between linguistics and anthropology assumed its greatest importance in the middle of the nineteenth century, when the discoveries and theories of philologists were adopted wholesale to explain the problems of European ethnology, and the Aryan controversy became the *locus* of disturbance throughout the Continent. No other scientific question, with the exception, perhaps, of the doctrine of evolution, was ever so bitterly discussed or so infernally confounded at the hands of Chauvinistic or otherwise biased writers."—A. C. Haddon, *History of anthropology*, p. 144.

In recent years linguistics has assumed a broader outlook and is studied by the anthropologist today principally in the unwritten languages of primitive people. "The origin of language was one of the much-discussed problems of the nineteenth century, and owing to its relation to the development of culture, it has a direct anthropological bearing. The intimate ties between language and ethnic psychology were expressed by no one more clearly than by Steinthal, who perceived that the form of thought is molded by the whole social environment of which language is part. Owing to the rapid change of language, the historical treatment of the linguistic problem had developed long before the historic aspect of the natural sciences was understood. The genetic relationship of languages was clearly recognized when the genetic relationship of species was hardly thought of. With the increasing knowledge of languages they were grouped according to common descent, and when no further relationship could be proved, a classification according to morphology was attempted. To the linguist whose whole attention is directed to the study of the expression of thought by language, language is the individuality of a people, and therefore a classification of languages must present itself to him as a classification of peoples. No other manifestation of the mental life of man can be classified so minutely and definitely as language. In none are the genetic relations more clearly established. It is only when no further genetic and morphological relationship can be found, that the linguist is compelled to coordinate languages and can give no further clue regarding their relationship and origin. No wonder, then, that this method was used to classify mankind, although in reality the linguist classified only languages. The result of the classification seems eminently satisfactory on account of its definiteness as compared with the results of biological and

cultural classifications."—F. Boas, *History of anthropology* (*Science*, Oct. 21, 1904).

The study of linguistics together with the development of physical anthropology brought about theories which connected race and language. The modern anthropologists have fought valiantly to show why any such theory is untenable. "Meanwhile the methodical resources of biological or somatic anthropology had also developed and had enabled the investigator to make nicer distinctions between human types than he had been able to make. The landmark in the development of this branch of anthropology has been the introduction of the metric method, which owes its first strong development to Quetelet. . . . A clearer definition of the terms 'type' and 'variability' led to the application of the statistical method by means of which comparatively slight varieties can be distinguished satisfactorily. By the application of this method it soon became apparent that the races of man could be subdivided into types which were characteristic of definite geographical areas and of the people inhabiting them. The same misinterpretation developed here as was found among the linguists. As they identified language and people, so the anatomists identified somatic type and people and based their classification of peoples wholly on their somatic characters. The two principles were soon found to clash. Peoples genetically connected by language, or even the same in language, were found to be diverse in type, and people of the same type were found to be diverse in language. Furthermore, the results of classifications according to cultural groups disagreed with both the linguistic and the somatic classifications. In long and bitter controversies the representatives of these three directions of anthropological research contended for the correctness of their conclusions. This war of opinions was fought out particularly on the ground of the so-called Aryan question, and only gradually did the fact come to be understood that each of these classifications is the reflection of a certain group of facts. The linguistic classification records the historical fates of languages and indirectly of the people speaking these languages; the somatic classification records the blood relationships of groups of people and thus traces another phase of their history; while the cultural classification records historical events of still another character, the diffusion of culture from one people to another and the absorption of one culture by another. Thus it became clear that the attempted classifications were expressions of historical data bearing upon the unwritten history of races and peoples, and recorded their descent, mixture of blood, changes of language and development of culture. Attempts at generalized classifications based on these methods can claim validity only for that group of phenomena to which the method applies. An agreement of their results, that is, original association between somatic type, language and culture, must not be expected."—F. Boas, *History of anthropology* (*Science*, Oct. 21, 1904).

Just as the languages of Europe have been grouped into a great family, so linguists have attempted to do the same for America. The attitude toward this question as far as American position can best be seen in the following summary: "As symptomatic of the synthetic tendency so pronounced in recent years may be cited the significant utterance of one of the most competent collaborators, E. Sapir, to the effect that the fifty-seven linguistic families hitherto officially recognized will be ultimately reduced to not more than about sixteen. On the other hand, a more skep-

tical attitude is maintained editorially. In his 'Introductory' statement Boas explains that while far-reaching morphological resemblances may be based on community of origin the absence of historical data for primitive languages precludes the evidence from becoming demonstrative; what is interpreted by some as the result of an ultimate connection may be due merely to assimilation resulting from contact. Accordingly, Boas regards the minute study of dialectic differentiation as affording a more promising field for research than the quest for remote relationships. He likewise calls attention to the study of literary form as a well-nigh neglected but extremely fruitful task for the linguist. In spite of all methodological warnings the consolidation of languages once reckoned as distinct is progressing merrily, especially in California, where Yuki now remains as the solitary isolated form of speech, all others having been linked with larger groups."—*University of California publications, (American Archaeology and Ethnology, v. 13, no. 1)*.—See also INDIANS, AMERICAN: Linguistic characteristics.

In a similar way Father Schmidt, the editor of *Anthropos*, a German anthropological periodical, has worked on the languages of Australia, and British colonial offices and government ethnologists like N. W. Thomas are preparing the native languages of Africa.

Physical anthropology.—Physical anthropology deals with man past and present. In the late years of the 19th century several remarkable finds of remains of fossil man were made in Western Europe. Famous among these are the Heidelberg jaw, the Neanderthal skull, the Grunaldi and Cromagnon skeletons of Southern France and the Piltdown man of England. Still more important is the Pithecanthropus Erectus found in 1893 by E. DuBois near the Frimil River in Java. From these fossil remains physical anthropologists try to reconstruct the appearance of prehistoric man. After the pioneers mentioned by Duckworth, there is a group of distinguished men in the 19th century who each contributed something vital to physical anthropology. Among them are A. de Quatrefages, Topinard and Bertillon in France, Virchow in Germany and Sergi in Italy and Galton and Pearson in England. Bertillon first used the term anthropometry to designate a system of identification depending on the unchanging character of certain measurements of parts of the human frame. His methods were applied principally to criminology and have been replaced by the finger print system invented by Francis Galton. Craniometry was begun very early by artists who wished to get more accurate measurements of the human figure. Exact measuring of the head was developed further by Anders Retzius, who worked out the system of comparing various measurements of the skull in indices and classifying objects accordingly. The best known of these indices is the cephalic index, the formula of which is:

$$\frac{\text{Width of skull in millimeters} \times 100}{\text{Length of skull in millimeters} \times 100}$$

This gives a percentage index and these indices are classified:

- x - 74.9 dolichocephalic (long)
- 75.0 - 79.9 mesocephalic (medium)
- 80.0 - x brachycephalic (short)

Karl Pearson's contribution to physical anthropology is the application of the methods of statistical science in dealing with large numbers of biometric data.

Ethnology.—Altho the earliest ethnologists were Herodotus, Strabo and Lucretius, it was only comparatively recently that real ethnologies were written. In 1850 there appeared one of the first synthetic works which is still valuable to-day, Waetz, 'Anthropologie der Naturvölker.' In 1885 Ratzel began to publish his *Völkerkunde*. Later Kean's 'Ethnology' and Deruber's book were devoted to an account of a single people. This sort of monograph is becoming more and more comprehensive and is advocated especially by the historical school of anthropologists, for it gives those small blocks from which to build up culture. In America especially these monographs have been produced with great success. A good ethnological monograph must include: arts and industries with exact descriptions of techniques employed; food, how secured and its preparation; type of shelter, how built, materials used; clothing and personal decoration; social organization, political organization, religions, ceremonials; mythology, folk tale, and customs; relations to neighboring peoples; past history obtained through archaeology if possible. When an account like this is available for large areas then generalizations about economic life, social and religious developments, etc., can be made. Before this comprehensive ethnology was developed 19th century writers spent much time in the various fields of ethnology. In theories about social organizations the names of Bachofen, Morgan and McLennan must be mentioned. In primitive religion Tylor, Herbert Spencer, Frazer and Durkheim all figure as the authors of valuable treatises, the first three as exponents of the evolutionary theory of culture. Economic life and ethics have also been studied separately. The former is a monumental work by Halen and the latter by Westermarck on the 'Origin and Development of Moral Ideas', 'Morals in Evolution.' Folklore and mythology is not confined to primitive peoples but probably received its first stimulations from the collection of European fairy tales made by the Grimm Brothers.—See also ETHNOLOGY; MYTHOLOGY: Meaning of word. This summary of the progress of anthropology can best be closed by quoting what Franz Boas considers the outlook and value of anthropology:

"A last word as to the value that the anthropological method is assuming in the general system of our culture and education. I do not wish to refer to its practical value to those who have to deal with foreign races or with national questions. Of greater educational importance is its power to make us understand the roots from which our civilization has sprung, that it impresses us with the relative value of all forms of culture, and thus serves as a check to an exaggerated valuation of the standpoint of our own period, which we are only too liable to consider the ultimate goal of human evolution, thus depriving ourselves of the benefits to be gained from the teachings of other cultures and hindering an objective criticism of our own work."—F. Boas, *History of anthropology (Science, Oct. 21, 1904)*.—See also AFRICA: Races of Africa: Prehistoric peoples; HAWAIIAN ISLANDS: Anthropology of the islands; INDIANS, AMERICAN: Origins of the American Indian; MALAY, MALAYSIAN OR BROWN RACE; MATRIARCHATE; MEXICO: Aboriginal peoples; NEW ZEALAND: 1375-1642; SUPERSTITIONS.

ANTI-FEDERALISTS, a political party in the United States opposed to the ratification of the constitution, led by Patrick Henry and George Clinton, and others. Their opposition was manifested, though feebly, during the session of the First Congress. "At one extreme of the Antifederal party was a body of men, numerous, respectable, and not without influence, who leaned toward monarchy and were for setting up a king. They could, they protested, see no way out of the ills that lay so thick on either hand but by abandoning the attempt at republican government, and taking refuge in that very system they had with so much difficulty just thrown off. At the other extreme were to be found many men of note; almost all the first characters in the country, and a large proportion of the community. They abhorred, they said, the idea of a monarchy; they would never give up the idea of a republic. But they were convinced that no one republican government could rule harmoniously over so vast a country, and over such conflicting interests. They were therefore for three separate confederations, marked off by such boundaries as difference of climate, diversity of occupations, and the natural products of the soil required. Everybody knew that the eastern men were fishers and shippers and merchants, while the southern men were planters and farmers. The late discussion over the Mississippi had shown how impossible it was to reconcile the interests of men so variously employed. It was better, therefore, that they should part; and that, as Massachusetts built her ships and Virginia raised her tobacco and her slaves under different climates, they should do so under different flags. They hoped there would be three republics: a republic of the East, a republic of the Middle States, and a republic of the South. . . . And now the minority published an address. It was not, they said, till the termination of the late glorious contest that any defects were discovered in the

Confederation. Then of a sudden it was found to be in such a shocking condition that a convention was called by Congress to revise it. To this convention came a few men of the first character, some men more noted for ambition and cunning than for patriotism, and some who had always been enemies to the independence of the States. The session lasted four months, and what took place during that time no one could tell. The doors were closed. The members were put under the most solemn engagements of secrecy. The journals of the conclave were still hidden. Yet it was well known that the meeting was far from peaceful. Some delegates had quitted the hall before the work was finished; some had refused to lend their names to it when it was done. But the plan came out in spite of this, and was scarce an hour old when petitions, approving of the system and praying the Legislature to call a convention, were to be found in every coffee-house and tavern in the city. No means were spared to frighten the people against opposing it. The newspapers teemed with abuse; threats of tar and feathers were liberally made. The petitions came in, the convention was called by a Legislature made up in part of members who had been dragged to their seats to make a quorum, and so early a day set for the election of delegates that many people did not know of it till the time had passed. The lists of voters showed that seventy thousand freemen were entitled to vote in Pennsylvania, yet the convention had been elected by but thirteen thousand. Forty-six members had ratified the new plan, yet these represented but six thousand eight hundred voters. Some freemen had kept away from the polls because of ignorance of the plan, some because they did not think the convention had been legally called, and some because they feared violence and insult. The ratification was in their opinion worthless. Twenty-one of the twenty-three put their names to the address. . . . But the Antifederalists were not, they maintained, to be misled by the glamour of great names. They had seen names as great as any at the foot of the Constitution subscribed to the present reprobated Articles of Confederation. Nay, some of the very men who had put their hands to the one had also put their hands to the other. Had not Roger Sherman and Robert Morris recommended the Confederation? If these patriots had erred once, was there any reason to suppose that they, or a succeeding set, could not err a second time? Had a few years added to their age made them infallible? Was it not true that the Federalists, who so warmly supported the new plan and would force it down the throats of their fellows because Franklin had signed it, affected to despise the Constitution of Pennsylvania which was the work of no one so much as of that same venerable patriot? What, then, was the value of these boasted great names? Many of the signers, it was quite true, had done noble deeds. No one could forget the debt of gratitude the continent owed to the illustrious Washington. But it was well known that he was more used to command as a soldier than to reason as a politician. Franklin was too old. As for Hamilton and the rest of them, they were mere boys. These unkind remarks called forth the highest indignation from the Federalists. But party spirit ran high, and it was not long before one of their antagonists went so far as to assert, that to talk of the wisdom of the Great Commander and the Great Philosopher was to talk nonsense; for Washington was a fool from nature, and Franklin was a fool from age."—J. C. McMaster, *History of the people of the United States*. v. 1, pp. 393,

ANTIGUA, one of the British West Indian islands. Discovered by Columbus in 1493, settled by the British in 1632; in 1834 slavery was abolished.

ANTI-IMPERIALISTS, League of American. See U. S. A.: 1900 (May-November).

ANTI-JAPANESE AGITATION: California. See RACE PROBLEMS: 1913-1921.

ANTILLES, ANTILIA.—"Familiar as is the name of the Antilles, few are aware of the antiquity of the word; while its precise significance sets etymology at defiance. Common consent identified the Antilia of legend with the Isle of the Seven Cities. In the year 734, says the story, the Arabs having conquered most of the Spanish peninsula, a number of Christian emigrants, under the direction of seven holy bishops, among them the archbishop of Oporto, sailed westward with all that they had, and reached an island where they founded seven towns. Arab geographers speak of an Atlantic island called in Arabic El-tennyin, or Al-tin (Isle of Serpents), a name which may possibly have become by corruption Antilia. . . . The seven bishops were believed in the 16th century to be still represented by their successors, and to preside over a numerous and wealthy people. Most geographers of the 15th century believed in the existence of Antilia. It was represented as lying west of the Azores. . . . As soon as it became known in Europe that Columbus had discovered a large island, Española was at once identified with Antilia, . . . and the name . . . has ever since been applied generally to the West Indian islands."—E. J. Payne, *History of the New World called America*, v. 1, p. 98.—See also WEST INDIES.

ANTILLES, U. S. army transport sunk by submarine. See WORLD WAR: 1917: IX. Naval operations: c, 2.

ANTI-MASONIC PARTY, American, a party opposed to secret societies, especially to Free Masons. The deeper causes of this movement are probably to be found in the desire for social and political reorganization which came with the new democratic awakening after 1814. In 1826, William Morgan, of Batavia, N. Y., threatened to reveal the secrets of the Masonic order. He was arrested and a judgment was obtained against him for debt. After being taken to Niagara in a closed carriage, he was never again heard of. In western New York there developed an organized opposition to freemasonry as subversive of religion and good citizenship. A number of Anti-Masons were elected to the legislature, and there followed legislative investigations of the Morgan incident and of freemasonry in general. In 1830, Thurlow Weed founded the *Albany Evening Journal*, which became the leading Anti-Masonic newspaper. The Anti-Masonic party soon displaced the National Republicans as opponents of the Democrats in New York, its leaders being William H. Seward, Thurlow Weed and Millard Fillmore. The party was strong enough in some other states to affect the elections, notably in Pennsylvania and Ver-

mont. In their national convention in 1831, the first of the national nominating conventions, the Anti-Masons nominated William Wirt and Amos Ellmaker, hoping to force Clay, who was a Mason, out of the field. Wirt addressed the convention, declared that he was a Mason and offered to withdraw if he had been named under any misapprehension. The nomination was then unanimously reaffirmed. Some of the more radical of the party were alienated by Wirt's nomination. In several states the National Republicans endorsed the Anti-Masonic electoral ticket, although Clay was Jackson's chief opponent in the country at large. Vermont was the only state to give its electoral vote to Wirt. After 1832 the party rapidly declined, as it split on the questions of the United States Bank and the tariff.—See also MASONIC SOCIETIES: Anti-Masonic agitations; U. S. A.: 1832.

In Mexico. See MEXICO: 1822-1828.

ANTI-MILITARISM, the spirit of opposition to large standing armies and extensive armaments and to the growth of a military caste. In continental Europe during the years between the Franco-Prussian War and the World War the anti-militarists, including socialists and philosophical pacifists, denounced conscription—universal on the continent—and the increased production of arms and munitions. They condemned the spending of huge sums, the withdrawal of men from industry and the tendency to exalt the military over the civil power, and held that it was preparation for war that brought war. The sentiment of anti-militarism has always been prevalent in the United States of America, as is evidenced by the fact that the country has never been prepared for any of the wars in which it has engaged. America has always clung to a small standing army, has kept down expenditures for arms and munitions, has not developed a military caste as known in Europe and has adopted conscription only in the two critical emergencies of the Civil War and the World War.—See also PEACE MOVEMENT; INTERNATIONAL: 1880.

ANTIOCH, (mod. Antakia) a city near what is now Aleppo, Syria, founded by Seleucus Nicator, son of Antiochus, (301 B. C.) (See MACEDONIA, etc.: 310-301 B. C.; SELEUCIDA, EMPIRE OF THE; SYRIA: B. C. 332-107.) As the capital of Syria (until the year 65 B. C.), the city rose to great splendor. It became one of the earliest seats of Christianity during the period 33-100. (See CHRISTIANITY: A. D. 33-52. According to tradition the city was evangelized by Peter. It is also said that the converts were the first to be called "Christians." Antioch, more than any other ancient city, suffered keenly from sporadic earthquakes.

A. D. 115.—Great earthquake.—"Early in the year 115, according to the most exact chronology, . . . the splendid capital of Syria was visited by an earthquake, one of the most disastrous apparently of all the similar inflictions from which that luckless city has periodically suffered. . . . The calamity was enhanced by the presence of unusual crowds from all the cities of the east, assembled to pay homage to the Emperor [Trajan], or to take part in his expedition [of conquest in the east]. Among the victims were many Romans of distinction. . . . Trajan, himself, only escaped by creeping through a window."—C. Merivale, *History of the Romans*, ch. 65.

260.—**Surprise, massacre and pillage by Shapur, king of Persia.** See PERSIA: 226-627.

272.—**Battle of Antioch.** See PALMYRA.

526.—**Destruction by earthquake.**—During the reign of Justinian (518-565) the cities of the Roman empire "were overwhelmed by earthquakes more frequent than at any other period of history. Antioch, the metropolis of Asia, was entirely destroyed, on the 20th of May, 526, at the very time when the inhabitants of the adjacent country were assembled to celebrate the festival of the Ascension; and it is affirmed that 250,000 persons were crushed by the fall of its sumptuous edifices."—J. C. L. de Sismondi, *Fall of the Roman Empire*, ch. 10.

Also in: E. Gibbon, *Decline and Fall of the Roman Empire*, ch. 43.

638.—**Surrender to the Arabs.** See CALIPHATE: 632-639.

969.—**Recapture by the Byzantines.**—After having remained 328 years in the possession of the Saracens, Antioch was retaken in the winter of 969 by the Byzantine emperor, Nicephorus Phocas, and became again a Christian city. Three years later the Moslems made a great effort to recover the city, but were defeated. The Byzantine arms were at this time highly successful in the never ending Saracen war, and John Tzimiskes, successor of Nicephorus Phocas, marched triumphantly to the Tigris and threatened even Bagdad. But most of the conquests thus made in Syria and Mesopotamia were not lasting.—G. Finlay, *History of the Byzantine Empire*, A. D. 716-1007, bk. 2, ch. 2.—See also BYZANTINE EMPIRE: 963-1025.

1097-1098.—**Siege and capture by the Crusaders.** See CRUSADES: 1006-1099.

1268.—**Extinction of the Latin Principality.**—Total destruction of the city.—Antioch fell, before the arms of Bibars, the sultan of Egypt and Syria, and the Latin principality was bloodily extinguished, in 1268. "The first seat of the Christian name was despoiled by the slaughter of seventeen, and the captivity of one hundred thousand of her inhabitants." This fate befell Antioch only twenty-three years before the last vestige of the conquests of the crusaders was obliterated at Acre.—E. Gibbon, *Decline and Fall of the Roman Empire*, ch. 59.—"The sultan halted for several weeks in the plain, and permitted his soldiers to hold a large market, or fair, for the sale of their booty. This market was attended by Jews and pedlars from all parts of the East. . . . 'It was,' says the Cadi Mohieddin, 'a fearful and heart-rending sight. Even the hard stones were softened with grief.' He tells us that the captives were so numerous that a fine hearty boy might be purchased for twelve pieces of silver, and a little girl for five. When the work of pillage had been completed, when all the ornaments and decorations had been carried away from the churches, and the lead torn from the roofs, Antioch was fired in different places, amid the loud thrilling shouts of 'Allah Acbar,' 'God is Victorious.' The great churches of St. Paul and St. Peter burnt with terrific fury for many days."—C. G. Addison, *The Knights Templars*, ch. 6.

With the exception of the colossal ruins of the Roman walls and aqueducts modern Antakia holds little of the ancient city. Although superseded by Aleppo as capital of N. Syria, Antakia is constantly growing in importance. Its present population is 25,000.—See also SYRIA.

ANTIOCHUS, the name of thirteen kings of the Seleucid dynasty of Syria. The most famous are Antiochus III (223-187 B. C.) who sheltered Hannibal and made war on Rome (See SELEUCI-

DAE: 224-187 B. C.), and Antiochus IV (176-164 B. C.) who attempted the suppression of Judaism by persecution. See JEWS: B. C. 332-167; 166-40.

ANTIPATER (c. 398-319 B. C.), Macedonian general under Philip and Alexander the Great. Assisted the latter in establishing his kingdom; regent of Macedonia during Alexander's Eastern expedition (334-323), and was left as ruler on the death of the king.—See also GREECE: B. C. 323-322, 321-312.

ANTI-SALOON LEAGUE, United States. See LIQUOR PROBLEM: United States: 1913-1919.

ANTI-SEMITISM, a policy of agitation against the Jews, on religious, political, social and economic grounds. The anti-semitism of the half-century preceding the World War had its origin in Germany and Austria and for many years played a great part in parliamentary struggles. (See AUSTRIA: 1895-1896, and after; JEWS: Germany: 1914-1920.) In Russia and in Rumania it led to severe persecutions. In France anti-semitism culminated in the notorious Dreyfus case (1894-1899) in which justice was finally done. (See FRANCE: 1804-1906.) Since the World War, agitation against the Jews has been overshadowed in all countries by other political and social problems. (See JEWS: 20th Century.) In 1919 and 1920, however, there appears to have been a recrudescence of anti-semitism in Hungary and Poland.—See also JEWS: 18th-19th centuries; 1914-1920.

In Austria.—1919. See AUSTRIA: 1919 (September).

In England. See JEWS: England: 1189; JEWS: England: 11th century.

ANTIUM.—"Antium, once a flourishing city of the Volsci, and afterwards of the Romans, their conquerors, is at present reduced to a small number of inhabitants. Originally it was without a port; the harbour of the Antiates having been the neighbouring indentation in the coast of Ceno, now Nettuno, distant more than a mile to the eastward. . . . The piracies of the ancient Antiates all proceeded from Ceno, or Cerio, where they had 22 long ships. These Numicius took; . . . some were taken to Rome and their rostra suspended in triumph in the Forum. . . . It [Antium] was reckoned 260 stadia, or about 32 miles, from Ostia."—Sir W. Gell, *Topography of Rome*, v. 1.

ANTONELLI, Giacomo (1806-1876), Italian cardinal. Adviser of Pius IX, serving as president of the council of state in 1847; premier of the first constitutional ministry of Pius IX; secretary of state in 1848. Opposed all liberalism and especially the Risorgimento. See **ROME:** Modern city: 1850-1870.

ANTONELLO DA MESSINA (1430-1479), Italian painter, introduced Flemish tendencies and invention into Italian painting. His work comprises renderings of "Ecce Homo," Madonnas, saints, and half-length portraits, many of them painted on wood. The nameless picture of a man in the Berlin Museum is said to be the finest of them all.

ANTONINES. See **ROME:** A. D. 138-180.

ANTONINUS, Marcus Aurelius. See **MARCUS AURELIUS ANTONINUS.**

ANTONINUS PIUS, Roman emperor, A. D. 138-161. See **ROME:** Empire: 138-180.

ANTONIO, known as "The Prior of Crato" (1531-1595), a Portuguese monk, claimant of the throne of Portugal. Routed by the Duke of Alva in 1580 at Alcántara (See also **PORTUGAL:** 1570-1580); fled to France and later to England, whence in 1590 he accompanied Drake and Norris to Portugal in an unsuccessful attempt to provoke an uprising against Philip II.

ANTONIUS, the name of many prominent citizens of Rome, of the *gens* Antonia. The most important are the following:

Antonius, Lucius, brother of the triumvir. Tribune of the people in 44; supported his brother after Caesar's murder; consul in 41. As defender of those who suffered by the land distribution of the triumvirate, entered the Persian War; defeated and sent to Spain as governor by Octavius.

Antonius Marcus (143-87 B. C.), a distinguished orator; praetor in Cilicia; consul in 99 B. C.

Antonius Marcus (d. 72-71 B. C.), a military leader, who failed in his operations against the pirates and against the Cretans.

Antonius Marcus (83-30 B. C.), known as Mark Antony, the triumvir. Raised to power by Caesar; triumvir with Octavius and Lepidus, his province being Gaul; fell a victim to the charms of Cleopatra; by a new division of the empire, ruled the East, where he attempted to subdue the Parthians. In 32 B. C. the senate deprived him of power and

declared war on Cleopatra. Antony, fighting in her behalf, was defeated at Actium, 31 B. C. and both committed suicide.—See also **EGYPT:** B. C. 48-30; **ROME:** Republic: B. C. 50-49, 48, 44-42, 41-31, 44; After Caesar's death, 31.

ANTRIM, a county of Ulster in the north-east corner of Ireland. See **IRELAND:** Historical map.

ANTRUSTIONES.—In the Salic law, of the Franks, there is no trace of any recognized order of nobility. "We meet, however, with several titles denoting temporary rank, derived from offices political and judicial, or from a position about the person of the king. Among these the Antrustiones, who were in constant attendance upon the king, played a conspicuous part. . . . Antrustiones and Convivæ Regis [Romans who held the same position] are the predecessors of the Vassi Dominici of later times, and like these were bound to the king by an especial oath of personal and perpetual service. They formed part, as it were, of the king's family, and were expected to reside in the palace, where they superintended the various departments of the royal household."—W. C. Perry, *The Franks*, ch. 10.—See also **FRANKS:** 500-768.

ANTUNG-MUKDEN RAILWAY. See **CHINA:** 1905-1909.

ANTWERP.—Principal seaport and fortress of Belgium and one of the great commercial cities of the world. It is situated on the Scheldt sixty miles from the North sea and twenty-eight north of Brussels.

Name of the city.—Its commercial greatness in the 16th century.—"The city was so ancient that its genealogists, with ridiculous gravity, ascended to a period two centuries before the Trojan war, and discovered a giant, rejoicing in the classic name of Antigonus, established on the Scheld. This patriarch exacted one half the merchandise of all navigators who passed his castle, and was accustomed to amputate and cast into the river the right hands of those who infringed this simple tariff. Thus 'Hand-werpen,' hand-throwing, became Antwerp, and hence, two hands, in the escutcheon of the city, were ever held up in heraldic attestation of the truth. The giant was, in his turn, thrown into the Scheld by a hero, named Brabo, from whose exploits Brabant derived its name. . . . But for these antiquarian researches, a simpler derivation of the name would seem 'an t' werf,' 'on the wharf.' It had now [in the first half of the sixteenth century] become the principal entrepôt and exchange of Europe. . . . the commercial capital of the world. . . . Venice, Nuremberg, Augsburg, Bruges, were sinking, but Antwerp, with its deep and convenient river, stretched its arm to the ocean and caught the golden prize, as it fell from its sister cities' grasp. . . . No city, except Paris, surpassed it in population, none approached it in commercial splendor."—J. L. Motley, *Rise of the Dutch republic, Historical introduction*, sect. 13.—See also **NETHERLANDS:** Map of the Netherlands and Belgium.

16th century.—Commercial importance. See **COMMERCE:** Era of geographic expansion: 16th-17th centuries: Netherlands; and **COMMERCE:** Medieval: 8th-16th centuries.

16th century.—Famous school of art. See **PAINTING:** Flemish.

1566.—Riot of the image-breakers in the churches. See **NETHERLANDS:** 1566.

1576.—Spanish Fury. See **NETHERLANDS:** 1575-1577.

1577.—Deliverance of the city from its Spanish garrison.—Demolition of the citadel. See **NETHERLANDS:** 1577-1581.

1583.—Treacherous attempt of the duke of

Anjou.—French Fury. See NETHERLANDS: 1581-1584.

1584-1585.—Siege and reduction by Alexander Farnese, duke of Parma.—Downfall of prosperity. See NETHERLANDS: 1585.

1706.—Surrendered to Marlborough and the Allies. See NETHERLANDS: 1706-1707.

1832.—Siege of the citadel by the French.—Expulsion of the Dutch garrison. See BELGIUM: 1830-1832.

1914.—German occupation.—At the time of the German invasion of Belgium, August, 1914, Antwerp would have been the natural place of debarkation of the British Expeditionary forces, but this would have been a violation of international law because the seaward approaches of Antwerp (the mouths of Scheldt) lay in neutral Dutch territory. After the fall of Brussels the entire Belgian defense centered about Antwerp. On September 28, 1914, the Germans opened fire upon the outer forts. On October 5 the Belgian army began to withdraw from the city, and the Germans occupied it on October 9, 1914.—See also WORLD WAR: 1914: Western front: c, 1; also Western front.

1916-1918.—German rule.—Retaken by the Allies. See WORLD WAR: X. German rule in northern France and Belgium: b, 1; 1918; XI. End of war: c; d, 1.

Modern aspects.—For centuries the city has been regarded as one of the strongest fortified places in Europe and during the middle of the nineteenth century the fortifications were modernized by the celebrated Belgian engineer Brialmont. The waterfront of Antwerp was largely rebuilt by Napoleon, but of the vast docks and basins which he constructed but few remain in their original form. The new wharves which have been built since 1877 are over three miles in length, so that the modern harbor ranks with that of Hamburg as the best on the continent of Europe. The famous citadel dating from the sixteenth century was razed in 1874. The most recent of the modern constructions of the city is the great stadium specially erected for the Olympic games of 1920.—See also BELGIUM: 1920: Olympic games.

ANTWERP, School of, a sixteenth century school of Flemish painters begun with Matsys. The pupils of this school, Mabuse, Frans Floris, Bernard van Orley, Peter Pourbus, and Antonio Moro went to Italy and eventually became Italianized.—See also PAINTING: Flemish.

ANZAC, cove on the north-western coast of Gallipoli, so-called because of the landing of the Anzacs. See WORLD WAR: 1915: VI. Turkey: a, 4, xx; a, 6.

ANZACS, a composite word used to designate the British colonial troops engaged in the World War, made by taking the initial letters of the words Australia-New Zealand army corps.—See also AUSTRALIA: 1914-1915; WORLD WAR: 1915: VI. Turkey: a, 4, xvii; 1917: VI. Turkish theater: c, 1, ii; c, 1, iv.

AOSTA, Emmanuel Philibert, Duke of (1869-), Italian general, cousin of King Victor Emmanuel III and a grandson of King Amadeus of Spain; commanded the Italian 3d army in a well-conducted retreat to the Piave river after the Caporetto disaster of 1917. See WORLD WAR: 1917: IV. Austro-Italian front: e; d, 1.

Against Austrian offensive. See WORLD WAR: 1918: IV. Austro-Italian theater: b.

APA SAHIB (d. 1840): Revolts in India. See INDIA: 1816-1819.

APACHE INDIANS.—Under the general name of the Apaches "I include all the savage tribes roaming through New Mexico, the north-western

portion of Texas, a small part of northern Mexico, and Arizona. . . . Owing to their roving proclivities and incessant raids they are led first in one direction and then in another. In general terms they may be said to range about as follows: The Comanches, Jetans, or Naumi, consisting of three tribes, the Comanches proper, the Yamparacks, and Tenawas, inhabiting northern Texas, eastern Chihuahua, Nuevo Leon, Coahuila, Durango, and portions of south-western New Mexico, by language allied to the Shoshone family; the Apaches, who call themselves Shis Inday, or 'men of the woods,' and whose tribal divisions are the Chiricaguis, Coyoteros, Faraones, Gileños, Lipanes, Llaneros, Mescaleros, Mimbresños, Natages, Pelones, Pinalenos, Tejuas, Tontos, and Vaqueros, roaming over New Mexico, Arizona, Northwestern Texas, Chihuahua and Sonora, and who are allied by language to the great Tinneh family; the Navajos, or Tenuai, 'men,' as they designate themselves, having linguistic affinities with the Apache nation, with which they are sometimes classed, living in and around the Sierra de los Mimbres; the Mojaves, occupying both banks of the Colorado in Mojave Valley; the Hualapais, near the head-waters of Bill Williams Fork; the Yumas, on the east bank of the Colorado, near its junction with the Rio Gila; the Cosninos, who, like the Hualapais, are sometimes included in the Apache nation, ranging through the Mogollon Mountains; and the Yampais, between Bill Williams Fork and the Rio Haysayampa. . . . The Apache country is probably the most desert of all. . . . In both mountain and desert the fierce, rapacious Apache, inured from childhood to hunger and thirst, and heat and cold, finds safe retreat. . . . The Pueblos . . . are nothing but partially reclaimed Apaches or Comanches."—H. H. Bancroft, *Native races of the Pacific states*, v. 1, ch. 5.—Dr. Brinton prefers the name Yuma for the whole of the Apache group, confining the name Apache (that being the Yuma word for "fighting men") to the one tribe so called. "It has also been called the Katchan or Cuchan stock."—D. G. Brinton, *The American race*, p. 109.—See also ATHAPASCAN FAMILY; INDIANS, AMERICAN: Cultural areas in North America: Southwest area.

Subjugation. See ARIZONA: 1877; INDIANS, AMERICAN: 1886; U. S. A.: 1806-1870.

APALACHEE INDIANS.—"Among the aboriginal tribes of the United States perhaps none is more enigmatical than the Apalaches. They are mentioned as an important nation by many of the early French and Spanish travellers and historians, their name is preserved by a bay and river on the shores of the Gulf of Mexico, and by the great eastern coast range of mountains, and has been applied by ethnologists to a family of cognate nations that found their hunting grounds from the Mississippi to the Atlantic and from the Ohio river to the Florida Keys; yet, strange to say, their own race and place have been but guessed at." The derivation of the name of the Apalaches "has been a 'questio vexata' among Indianologists." We must "consider it an indication of ancient connections with the southern continent, and in itself a pure Carib word 'Apálché' in the Tamanaca dialect of the Guaranay stem on the Orinoco signifies 'man,' and the earliest application of the name in the northern continent was as the title of the chief of a country, 'l'homme par excellence,' and hence, like very many other Indian tribes (Apaches, Lenni Lenape, Illinois), his subjects assumed by eminence the proud appellation of 'The Men.' . . . We have . . . found that though no general migration took place from the continent southward, nor from the islands northward, yet there was a considerable in-

tercourse in both directions; that not only the natives of the greater and lesser Antilles and Yucatan, but also numbers of the Guaranay stem of the southern continent, the Caribs proper, crossed the Straits of Florida and founded colonies on the shores of the Gulf of Mexico; that their customs and language became to a certain extent grafted upon those of the early possessors of the soil; and to this foreign language the name Apalache belongs. As previously stated, it was used as a generic title, applied to a confederation of many nations at one time under the domination of one chief, whose power probably extended from the Alleghany mountains on the north to the shore of the Gulf; that it included tribes speaking a tongue closely akin to the Choktah is evident from the fragments we have remaining. . . . The location of the tribe in after years is very uncertain. Dumont placed them in the northern part of what is now Alabama and Georgia, near the mountains that bear their name. That a portion of them did live in this vicinity is corroborated by the historians of South Carolina, who say that Colonel Moore, in 1703, found them 'between the head-waters of the Savannah and Altamaha.' . . . According to all the Spanish authorities, on the other hand, they dwelt in the region of country between the Suwannee and Apalachicola rivers—yet must not be confounded with the Apalachicolas. . . . They certainly had a large and prosperous town in this vicinity, said to contain 1,000 warriors. . . . I am inclined to believe that these were different branches of the same confederacy. . . . In the beginning of the 18th century they suffered much from the devastations of the English, French and Greeks. [From 1702-1708 English from Carolina invaded Apalaches territory and nearly exterminated the tribe. The mission churches (Spanish) were burned, the missionaries slain, and over a 1,000 Indians were sold into slavery.] . . . About the time Spain regained possession of the soil, they migrated to the West and settled on the Bayou Rapide of Red River. Here they had a village numbering about 50 souls."—D. G. Brinton, *Notes on the Floridian peninsula*, ch. 2.—See also MUSKHOGEAN FAMILY.

APALACHEN. See CANADA: Names.

APAMEA.—Apamea, a city founded by Seleucus Nicator on the Euphrates, the site of which is occupied by the modern town of Bir, had become, in Strabo's time (near the beginning of the Christian era) one of the principal centers of Asiatic trade, second only to Ephesus. Thapsacus, the former customary crossing-place of the Euphrates, had ceased to be so, and the passage was made at Apamea. A place on the opposite bank of the river was called Zeugma, or "the bridge." Bir "is still the usual place at which travellers proceeding from Antioch or Aleppo towards Bagdad cross the Euphrates."—E. H. Bunbury, *History of ancient geography*, ch. 22, sect. 1, v. 2, pp. 298 and 317.

APANAGE. See APPANAGE.

APATURIA.—An annual family festival of the Athenians, celebrated for three days in the early part of the month of October (Pyaneption). "This was the characteristic festival of the Ionic race; handed down from a period anterior to the constitution of Kleisthenes, and to the ten new tribes each containing so many demes, and bringing together the citizens in their primitive unions of family, gens, phratry, etc., the aggregate of which had originally constituted the four Ionic tribes, now superannuated. At the Apaturia, the family ceremonies were gone through; marriages were enrolled, acts of adoption were promulgated and certified, the names of youthful citizens first entered

on the gentile and phratric roll; sacrifices were jointly celebrated by these family assemblages to Zeus Phratrius, Athênê, and other deities, accompanied with much festivity and enjoyment."—G. Grote, *History of Greece*, pt. 2, ch. 64, v. 7.

APELDERN, Albert von: Founder of town of Riga. See LIVONIA: 12th-13th centuries.

APELLA, Spartan assembly. See SPARTA: Constitution ascribed to Lycurgus.

APELLES, Greek painter of the fourth century B. C.; friend of Alexander, who sat for him frequently; his most famous works were mythological or allegorical; considered the greatest painter of ancient times.—See also Cos.

APHEK, Battle of (845 B. C.), a great victory won by Ahab, king of Israel, over Benhadad, king of Damascus.—H. Ewald, *History of Israel*, bk. 4, sect. 1.

APHETÆ. See GREECE: B. C. 480: Persian wars: Artemisium.

APHRODITE, or Venus, the Greek goddess of love and beauty; often connected with the sea, the lower world, and productivity in the animal and vegetable kingdom. Her oriental prototype was Astarte or Ashtoreth.

APIA, principal town in the Samoan islands, scene (March 15, 1886) of a hurricane which destroyed one American and two German war vessels. Seized in 1914 by an expeditionary force from New Zealand.

APIU. See THEBES, EGYPT.

APOCALYPSE, the last book of the New Testament, known as the Revelation of St. John the Divine. See CHRISTIANITY: 35-60.

APOCRYPHAL LITERATURE, works which claim to be sacred, although excluded from canonical scriptures. These books are purported to have been kept secret because they revealed events unfulfilled at the time of their writing. The apocryphal books found in the Greek text but not in the Hebrew or Aramaic are as follows: Ecclesiasticus, Wisdom of Solomon, Baruch, Epistle of Jeremiah, Tobit, Judith, First and Second Maccabees, sections of Esther and sections of Daniel. These were in the Latin Vulgate of the Middle Ages, and, by the Council of Trent in 1546, the Roman Catholic church declared them deuterocanonical or inspired, but the Protestant churches and the Greek Catholic (after the 18th century) pronounced them apocryphal. Other books considered apocryphal are First, Second, Third and Fourth Esdras and the Prayer of Manasses.

APODACA, Juan Ruiz de (1770-1835), Spanish soldier and viceroy of Mexico. See MEXICO: 1820-1826.

APODECTÆ.—"When Aristotle speaks of the officers of government to whom the public revenues were delivered, who kept them and distributed them to the several administrative departments, these are called, he adds, apodectæ and treasurers. In Athens the apodectæ were ten in number, in accordance with the number of the tribes. They were appointed by lot. . . . They had in their possession the lists of the debtors of the state, received the money which was paid in, registered an account of it and noted the amount in arrear, and in the council house in the presence of the council, erased the names of the debtors who had paid the demands against them from the list, and deposited this again in the archives. Finally, they, together with the council, apportioned the sums received."—A. Boeckh, *Public economy of the Athenians* (tr. by Lamb), bk. 2, ch. 4.

APOLLO, Greek divinity of the sun, second in importance only to Zeus; of his many attributes the most important were those of prophecy, music

and song; there are innumerable representations of him in art, notably in the temples of Delphi, Naucratis, Palatine, and Tolosa; of the many conceptions of him embodied in sculpture one extreme is represented by the giant Colossus of Rhodes, the other by the Apollo Belvedere, found at Frascati in 1455 and now in the Vatican.—See also MYTHOLOGY: Greek mythology: Anthropomorphic character of Greek myth; RELIGION: B. C. 750-A. D. 30; DELOS.

APOLLO, Oracles of. See ORACLES.

APOLLODORUS, of Damascus, a famous Greek architect of the second century A. D. See PAINTING: Greek.

APOLLONIA, an important group of more than thirty ancient cities in Illyria, founded by the Corinthians. (See CORCYRA.) They played a prominent part in the wars against Philip of Macedon and the struggle between Pompey and Cæsar for Roman supremacy. This group was the important center of culture and learning towards the close of the Roman republic, and was famed for Calamis' statue of Apollo, which was removed to Rome.

APOTHEOSIS.—Deification of a human being, thus raising him to the rank of a god; closely allied with ancestor worship. The ancients often deified the founder of a dynasty or a city. Several Roman emperors received divine honors after, and sometimes even before, death, by vote of the Senate, and many Christians suffered martyrdom for refusing to recognize such an apotheosis.

APPA SAHIB. See APA SAHIB.

APPAM.—"The *Appam*, a British merchant vessel, was captured by the German cruiser *Möwe* on January 15, 1916, and was brought by a German crew into Newport News, Va. The German government claimed that under certain provisions of the treaty of 1700 between Prussia and the United States, carried over into the treaty of 1828, the vessel might remain as long as it pleased in American waters. Secretary Lansing held that inasmuch as the provisions in question were contrary to general principles of international law, they must be strictly construed, and that they did not give a German prize the right to enter American ports unattended by the capturing vessel. The same view was adopted by Judge Waddell, of the United States District Court, and, on appeal, by the Supreme Court (Mar. 6, 1917)."—*War cyclopaedia*, p. 17.—See also U. S. A.: 1916 (February-October); WORLD WAR: 1916: IX. Naval operations: c.

APPANAGE.—"The term appanage denotes the provision made for the younger children of a king of France. This always consisted of lands

and feudal superiorities held of the crown by the tenure of peerage. It is evident that this usage, as it produced a new class of powerful feudatories, was hostile to the interests and policy of the sovereign, and retarded the subjugation of the ancient aristocracy. But an usage coeval with the monarchy was not to be abrogated, and the scarcity of money rendered it impossible to provide for the younger branches of the royal family by any other means. It was restrained however as far as circumstances would permit."—H. Hallam, *Middle Ages*, ch. 1, pt. 2.—"From the words 'ad' and 'panis,' meaning that it was to provide bread for the person who held it. A portion of appanage was now [in the reign of Louis VIII, 1223-1226] given to each of the king's younger sons, which descended to his direct heirs, but in default of them reverted to the crown."—T. Wright, *History of France*, v. 1, p. 308, note.—The creation of the appanage was an unfortunate reinforcement of feudalism. It opened the way to strife among the members of the king's family and retarded the consolidation of the kingdom. See FRANCE: 1226-1270.

APPELLANTS. See CONVULSIONISTS.

APPELOUSAS. See TEXAS: Aboriginal inhabitants.

APPERT, Benjamin Nicholas Marie (1797-1847), French philanthropist and educator. Gave much time and study to the question of educating inmates of schools, prisons, and hospitals; it is asserted that he taught at least 100,000 soldiers to read and write.

APPIAN WAY.—Appius Claudius, called the Blind, who was censor at Rome from 312 to 308 B. C. (See ROME: B. C. 312), constructed during that time "the Appian road, the queen of roads, because the Latin road, passing by Tusculum, and through the country of the Hernicans, was so much endangered, and had not yet been quite recovered by the Romans: the Appian road, passing by Terracina, Fundi and Mola, to Capua, was intended to be a shorter and safer one. . . . The Appian road, even if Appius did carry it as far as Capua, was not executed by him with that splendour for which we still admire it in those parts which have not been destroyed intentionally: the closely joined polygons of basalt, which thousands of years have not been able to displace, are of a somewhat later origin. Appius commenced the road because there was actual need for it; in the year A. U. 457 [297 B. C.] peperino, and some years later basalt (silex) was first used for paving roads, and, at the beginning, only on the small distance from the Porta Capena to the temple of Mars, as we are distinctly told by Livy. Roads constructed according to artistic principles had previously existed."—B. G. Niebuhr, *Lectures on the history of Rome*, lect. 45.

Also in: Sir W. Gell, *Topography of Rome*, v. 1.—H. G. Liddell, *History of Rome*, v. 1, p. 251.

APPIUS CLAUDIUS, surnamed Cæcus, Roman censor, 312-308 B. C.; consul in 307 and 206; leader of the spirited opposition of Rome to the invasion of Pyrrhus; began the construction of the Appian Way; in 312 extended the franchise to landless citizens.—See also ROME: Republic: B. C. 312.

APOLONIUS, Phodius (c. 235 B. C.), librarian. See ALEXANDRIA: B. C. 282-246: Reign of Ptolemy Philadelphus.

APPONYI, Count Albert (1846-), Hungarian statesman. Chosen President of Chamber of

Deputies by Liberals, 1901; minister of education, 1906, in Wekerle cabinet; delegate to World's Peace Conference in America, 1911; leader of Constitutional Democrats, 1917; minister of education in Hungarian cabinet, 1917.—See also AUSTRIA-HUNGARY: 1900-1903; 1904; 1905-1906; HUNGARY: 1914; 1918: End of the War; SLOVAKS.

APPORTIONMENT.—"Several methods of apportioning or distributing legislative representatives have been followed. One is to distribute them among the political divisions of the state without regard to their population, or at least without exclusive regard to it. In all the important federal unions except the [former] German Empire and the Dominion of Canada the principle of equality of representation among the component members prevails in the construction of the upper chambers. In the German *Bundesrath* the number of votes to which each state of the empire [was] entitled varied from one to seventeen; and in the Canadian House of Lords the number varies from four to twenty-four, the latter being the number allowed the province of Quebec. In the French Republic the number of senators from each department varies from one to ten. Another method of distribution is to apportion the representatives among the political divisions of the state with some regard to the amount or value of property in each. The chief merit of such a method is that it takes into consideration one of the important elements which enter into the physical make-up of the state. The doctrine that taxation should go hand in hand with representation has long been a cherished political theory of the people of America and England, and perhaps no better system could be devised for protecting the rights of property than by giving it a share of representation in the legislative branch. For other reasons, however, it has not commended itself to the people of democratic states; and outside of a few European monarchies where property is taken into consideration to some extent in organizing representation in the upper chambers, the system no longer prevails.—In no state is property to-day the sole basis of representation in either chamber, and the few remaining traces of the principle that have survived the nineteenth century will doubtless disappear in the course of time. Another principle is that which bases representation on the total population, citizens and aliens, male and female, enfranchised and unenfranchised alike, and not on the number of voters merely. This is now the almost universal rule governing the apportionment of representation in lower chambers, and in some states it is also the basis of representation in the upper chambers. It possesses the element of simplicity and uniformity and is regarded as being more in harmony with present day notions of representative government. The ratio of representation varies widely among different states. . . . The same variety prevails among the individual states composing the federal republic of the United States, where the principle of apportionment on the basis of population is generally the rule for the constitution of both the upper and lower chambers. Perhaps an ideal system would be one which would take into consideration the elements of population, geographical area, and property combined, if there are any criteria for determining the relative weight which should be given to each of these elements. As yet no satisfactory scheme of this kind has been devised. For convenience in choosing representatives it is customary to divide the state into electoral circumscriptions or districts. The entire body of representatives might be chosen from the state at large on a general ticket, each

elector being allowed to cast a vote for the entire number; but in states of considerable geographical area, where several hundred members are to be elected, such a method would obviously be impracticable. The time and effort involved in voting such a ticket would be very great; and, what is of more importance, the ignorance of the elector concerning the candidates from distant parts of the state would be so great that an election under such circumstances would be largely a farce. The practice of all states, therefore, is to divide their territory into electoral districts or to utilize for this purpose the political subdivisions already in existence. In constituting electoral districts two methods are employed: one is to parcel the state into as many districts as there are representatives to be chosen and allow a single member to be chosen from each; the other is to create a smaller number of districts, from each of which a number of representatives is chosen on the same ticket. The former is known as the single member district plan; the latter, as the general ticket method. Each has been employed by most states at different times in their history, though nearly all have come at last to the single member district method."—J. W. Garner, *Introduction to political science*, pp. 440-443.—See also SUFFRAGE; ELECTIONS, PRESIDENTIAL; CONGRESS OF THE U. S.: House: Reapportionment; U. S. A.: 1901 (January).

APPRENTICE SCHOOLS, Industrial. See EDUCATION: Modern developments: Vocational education: Industrial education in the U. S.

APPRENTICES, Statute of.—"The Statute of Apprentices (1562) [in England] was unquestionably the most notable embodiment of the policies that dominated industrial life until the Industrial Revolution was far advanced. It was in a measure a codification of older statutes which had been imperfectly administered, and the dominant purpose seems to have been to prevent change rather than to make innovations. In fact, however, the statute made a number of important innovations. It was hoped that the statute would check the decline of the corporate towns, provide for more adequate training of village artisans, assure a more considerable supply of agricultural labor, and afford some guarantee that wages would be adjusted to the 'advancement of prices of all things belonging to said servants and laborers.' Few social concerns were not in some measure affected by this great codification of industrial and social legislation. Thirty-two crafts, including all the more important and frequent occupations, are enumerated in the articles referring to the length of term for which such craftsmen should be hired. These crafts were later designated as crafts to be taught in corporate and market towns to the sons of freeholders. The mercers, drapers, goldsmiths, ironmongers, and clothiers were forbidden to take any person as apprentice whose father or mother was not possessed of a forty-shilling freehold. These were crafts whose masters were characteristically employers so that this distinction is significant. In another article twenty-one crafts are enumerated which were allowed to be taught either in towns or in the country; all of these crafts were to be open to persons whose parents had no property at all. There are thus implications that a wage-earning class was already established: it is assumed by the statute that the larger proportion of artisans work for hire, and it is for this reason that the regulation of the wages of town artisans became a matter of solicitude. The wages of agricultural laborers and of certain 'artificers' had long been regulated by

justices of the peace, but these 'artificers' seem to have been the masons, smiths, carpenters, and the like who were recognized as being a distinctly rural group. The artisans of the towns had not been included in earlier statutes, partly because their interests were presumed to be in charge of the municipality, but partly because they had not been mere wage-earners. The statute must have tended to accentuate the changes that were taking place because the status of the various classes was so specifically defined. The conditions of entrance into the crafts practiced in towns amounted to a real restriction. Every person was ordered to adopt a definite profession or calling. Excepting persons owning property, persons of gentle birth, and scholars, every one must needs choose between the sea, the crafts, and agriculture. Any person failing to make a decision could be required to work at agriculture. Freedom of movement was likewise curtailed: no person might leave the town or parish in which he had been employed unless he obtained a formal testimonial from appropriate authorities or from two householders. These restrictions destroyed the conditions that had made craft autonomy possible in the earlier period. In so far as craft organizations continued to exist they were mere shadows of what they had been formerly. The wage-fixing clauses constitute perhaps the most famous portion of the statute and their place in the history of the centuries that followed shows how great a change had taken place in the position of the craftsmen. The intent of these clauses, however, was other than might be supposed. The provisions were designed to assure the payment of not merely a living wage, but an equivalent of the wages that had prevailed before the rise in prices. The clauses were not intended to guarantee an improvement in the relative well-being of the artisan, but to protect him in his existing state against the unfavorable effects of the price revolution. The justices of the peace were presumed to ascertain the cost of maintaining the appropriate standards of life and to regulate wages accordingly. The notions underlying the statute were in some respects similar to the thought expressed by the phrase a 'living wage,' but there was no implication that the artisan had not been getting an appropriate living."—A. P. Usher, *Industrial history of England*, pp. 192-194.—See also GUILDS or GILDS: Operation.

APRAKSIN, Theodor Matvyeevich (1671-1728), Russian admiral, friend and advisor of Peter the Great. Creator of the Russian navy; in 1708, saved St. Petersburg from the Swedes. His victories in 1713 gained the Baltic Provinces for Russia at the peace of Nystad.

APRIES, an Egyptian king of the Twenty-sixth Dynasty, 589 to 570 B.C. Aided the Jews in their resistance to Nebuchadrezzar; ward off a Babylonian attack upon Egypt. Dethroned by Amasis.—See also EGYPT: B.C. 670-525.

AQUAVIVA, Ottavio (c. 1560-1612), archbishop of Naples and patron of learning. See EDUCATION: Modern: 1540-1756.

AQUEDUCTS, conduits for conveying water from a distant source to a city, the pipes usually, but not necessarily, being laid along elevated masonry for a considerable distance. Aqueducts of this kind, as well as inverted syphons (by means of which water is sent through pipes below the surface of the earth under pressure) were built by the ancients—the Persians, Phœnicians and Greeks using the subterranean type for the most part, the Romans coming eventually to use the arched aqueduct exclusively.

Peruvian.—The Indians of ancient Peru built aqueducts that are unequalled elsewhere. The best account of these is to be found in an article by O. F. Cook, *Staircase farms of the ancients* (*National Geographic Magazine*, May, 1916).—According to Mr. Cook the construction of channels presented an engineering work perhaps not equaled anywhere else in the world. According to Garcilasso, an early Spanish writer, one of them was 360 miles long and 12 feet deep. Many miles of the channels were paved with stones. Tunnels were drilled in the mountains and channels cut in the cliffs. Waters from these aqueducts seemed to have been used for shower baths.—See also PERU: 1200-1527.

Roman.—Between 312 B.C. and A.D. 226 eleven main aqueducts were built to supply the city of Rome with water. The most famous of these—the Aqua Claudia, begun by Caligula in A.D. 38 and completed by Claudius in A.D. 52, was forty-five miles long, of which ten miles are still in a remarkable state of preservation. Roman aqueducts are still to be found in Europe wherever the empire extended. The most remarkable of these are at Nîmes (Pont du Gard) and Segovia. (See also ARCHITECTURE: Etruscan.) Three tiers of arches are superimposed upon one another to form a bridge over the valley of the river Gard at Nîmes, the whole structure reaching a height of 160 feet. The Segovian aqueduct also crosses a river and consist of two tiers 102 feet high.—See

also ROME: Modern city: Population and water supply.

Byzantine.—The work of the Romans was continued by the Byzantine emperors Valens and Justinian, the latter providing many eastern cities with aqueducts.

Gothic.—The great viaduct at Spoleto is the work of the Goths.

Moorish.—The Spanish Moors took up the building of aqueducts which the Goths had begun in Spain, the most notable of which was the aqueduct of Elvas.

Middle Ages.—During the Middle Ages the building of aqueducts was more or less inactive. The best examples of the period are the aqueducts at Solmona and Constances.

Renaissance.—The Roman popes of the sixteenth century revived the construction of aqueducts.

the great artificial covered channel which leads the water from the Ashokan reservoir into the city [New York]. Owing to the varied character of country lying between the mountains and the city, the aqueduct is made up of several types of conduit. Some portions are of plain Portland cement concrete built in trenches and covered with earth, known as cut-and-cover; other portions are tunnels through the mountains and hills or beneath the broad, deep valleys; while still other portions are of steel and cast-iron pipes. It is of sufficient capacity to deliver water at the rate of about 600,000,000 gallons daily into the city, so that even if out of service for short periods occasionally for cleaning, inspection or repair, the average rate of delivery will be equivalent to 500,000,000 gallons daily. Along the aqueduct provisions have been made for storing a large quantity of water near the city in Kensico reser-

ANCIENT ROMAN AQUEDUCT, SEGOVIA, SPAIN

Modern.—In 1613 Marie de Medici built the Arceuil at Paris and Louis XIV that of Mante-non. The great aqueduct at Caserta was built by Charles III (of Spain) in 1753 and the forty-mile aqueduct of Marseilles was begun in 1847. From 1855 to 1860 an aqueduct was built from Loch Catrine to Glasgow, and in 1868 an aqueduct supplying Dublin was completed. In 1881 and 1885 conduits were built to supply Manchester and Liverpool. In 1873 the fifty-five mile aqueduct at Vienna was completed, and in 1800 the second Franz-Kaiser-Joseph aqueduct was begun to take the place of the inadequate system by the same name.

American (1800-1913).—Notable aqueducts were built for the following cities in the United States: New York, 1842 (Old Croton), 1800 (New Croton); Boston, 1848, 1878, 1897; Brooklyn, 1859; Baltimore, 1862, 1880; Washington, 1863, 1883; St. Louis, 1893; Jersey City, 1904; Los Angeles, 1913; New York, 1913 (Catskill aqueduct).

CATSKILL AQUEDUCT.—"The Catskill aqueduct is

voir; for equalizing the steady draft from Kensico reservoir against the hourly fluctuating demands of the city, by means of Hill View reservoir; for storing a few days' supply on Staten Island as a local safeguard; for improving the quality of the water by aëration, filtration and other means; and for measuring all the water drawn from the reservoirs and sent into the City. . . . From the Ashokan reservoir it is almost a three-days' journey for the water at the average velocity to flow through the aqueduct to the Silver Lake terminal reservoir on Staten Island, in the course of which it flows along many a steep hillside, crosses several broad plains, pierces mountains, descends beneath rivers and wide, deep valleys, traverses the Boroughs of The Bronx, Manhattan and Brooklyn, and crosses the Narrows of New York harbor. . . . For surveys, real estate, construction, engineering and general supervision, and all other items except interest on the bonds, the total cost of the completed Catskill system will be about \$177,000,000, of which \$22,000,000 are for the Schohari

works. . . . The cut-and-cover aqueduct and the tunnels are more than big enough for railroad trains to pass through them with ease. Catskill aqueduct is twice as long as the two Croton aqueducts put end to end. . . . The water used by New York City each day weighs about eight times as much as its population. The two deepest shafts of the City tunnel of the Catskill aqueduct, one at the corner of Clinton and South streets, and the other at the corner of Delancey and Eldridge streets, Manhattan, are each as deep as the tower of the Woolworth Building is high. If the Eiffel Tower could be stood with its foundations in the Hudson River tunnel, its top would not appear above the river surface, or if two Woolworth Buildings were stood one on top of the other, the lower

AQUILA, Battle of (1424). See ITALY: 1412-1447.

AQUILEIA.—Aquileia, at the time of the destruction of that city by the Huns, A.D. 452, was, "both as a fortress and a commercial emporium, second to none in Northern Italy. It was situated at the northernmost point of the gulf of Hadria, about twenty miles northwest of Trieste, and the place where it once stood is now in the Austrian dominions, just over the border which separates them from the kingdom of Italy. In the year 181 B.C. a Roman colony had been sent to this far corner of Italy to serve as an outpost against some intrusive tribes, called by the vague name of Gaul. . . . Possessing a good harbour, with which it was connected by a naviga-

AQUILLIUS, Manius, Roman general, consul in 101 B.C. Put down a revolt of the slaves in Sicily. In 88 acted as legate against Mithradates the Great; defeated and imprisoned by him.—See also MITHRADATIC WARS.

AQUINAS, Thomas, St. (c. 1227-1274), great philosopher and scholar. Made profound studies in theology in Naples, Cologne, Paris, London,

Rome, Bologna and other centers of learning; exercised great influence on the theological teachings of the Western church, his doctrines remaining authoritative to this day in the Roman Catholic church; in philosophy a follower of Aristotle; endorsed by various popes as a sound leader in religious doctrine and scholastic philosophy.—See also AVERROISM; ASTRONOMY: 130-1609; CAPITALISM: In antiquity; UNIVERSITIES AND COLLEGES: 1348-1826.

AQUITAINE, or Aquitania: Ancient tribes.—The Roman conquest of Aquitania was achieved, 50 B.C., by one of Cæsar's lieutenants, the Younger Crassus, who first brought the people called the Sotiates to submission and then defeated their combined neighbors in a murderous battle, where three-fourths of them are said to have been slain. The tribes which then submitted "were the Tarbelli, Bigerriones, Preciani, Vocates, Tarusates, Elusates, Garites, Ausci, Garumni, Sibuzates and Cocosates. The Tarbelli were in the lower basin of the Adour. Their chief place was on the site of the hot springs of Dax. The Bigerriones appear in the name Bigorre. The chief place of the Elusates was Elusa, Eause; and the town of Auch on the river Gers preserves the name of the Ausci. The names Garites, if the name is genuine, and Garumni contain the same element, Gar, as the river Garumna [Garonne] and the Gers. It is stated by Walckenaer that the inhabitants of the southern part of Les Landes are still called Cousiots. Cocosa, Causèque, is twenty-four miles from Dax on the road from Dax to Bordeaux."—G. Long, *Decline of the Roman republic*, v. 4, ch. 6.—"Before the arrival of the brachycephalic Ligurian race, the Iberians ranged over the greatest part of France. . . . If, as seems probable, we may identify them with the Aquitani, one of the three races which occupied Gaul in the time of Cæsar, they must have retreated to the neighbourhood of the Pyrenees before the beginning of the historic period."—I. Taylor, *Origin of the Aryans*, ch. 2, sect. 5.—See also GAUL: Cæsar's description.

681-768.—Independent dukes and their subjugation.—"The old Roman Aquitania, in the first division of the spoils of the Empire, had fallen to the Visigoths, who conquered it without much trouble. In the struggle between them and the Merovingians, it of course passed to the victorious party. But the quarrels, so fiercely contested between the different members of the Frank monarchy, prevented them from retaining a distant possession within their grasp; and at this period [681-718, when the mayors of the Palace, Pepin and Carl, were gathering the reins of government over the three kingdoms—Austria, Neustria and Burgundy—into their hands], Eudo, the duke of Aquitaine, was really an independent prince. The population had never lost its Roman character; it was, in fact, by far the most Romanized in the whole of Gaul. But it had also received a new element in the Vascones or Gascons a tribe of Pyrenean mountaineers, who descending from their mountains, advanced towards the north until their progress was checked by the broad waters of the Garonne. At this time, however, they obeyed Eudo." This duke of Aquitaine, Eudo, allied himself with the Neustrians against the ambitious Austrasian Mayor, Carl Martel, and shared with them the crushing defeat at Soissons, 718, which established the Hammerer's power. Eudo acknowledged allegiance and was allowed to retain his dukedom. But, half-a-century afterwards, Carl's son, Pepin, who had pushed the "fainçant" Merovingians from the Frank throne and seated himself

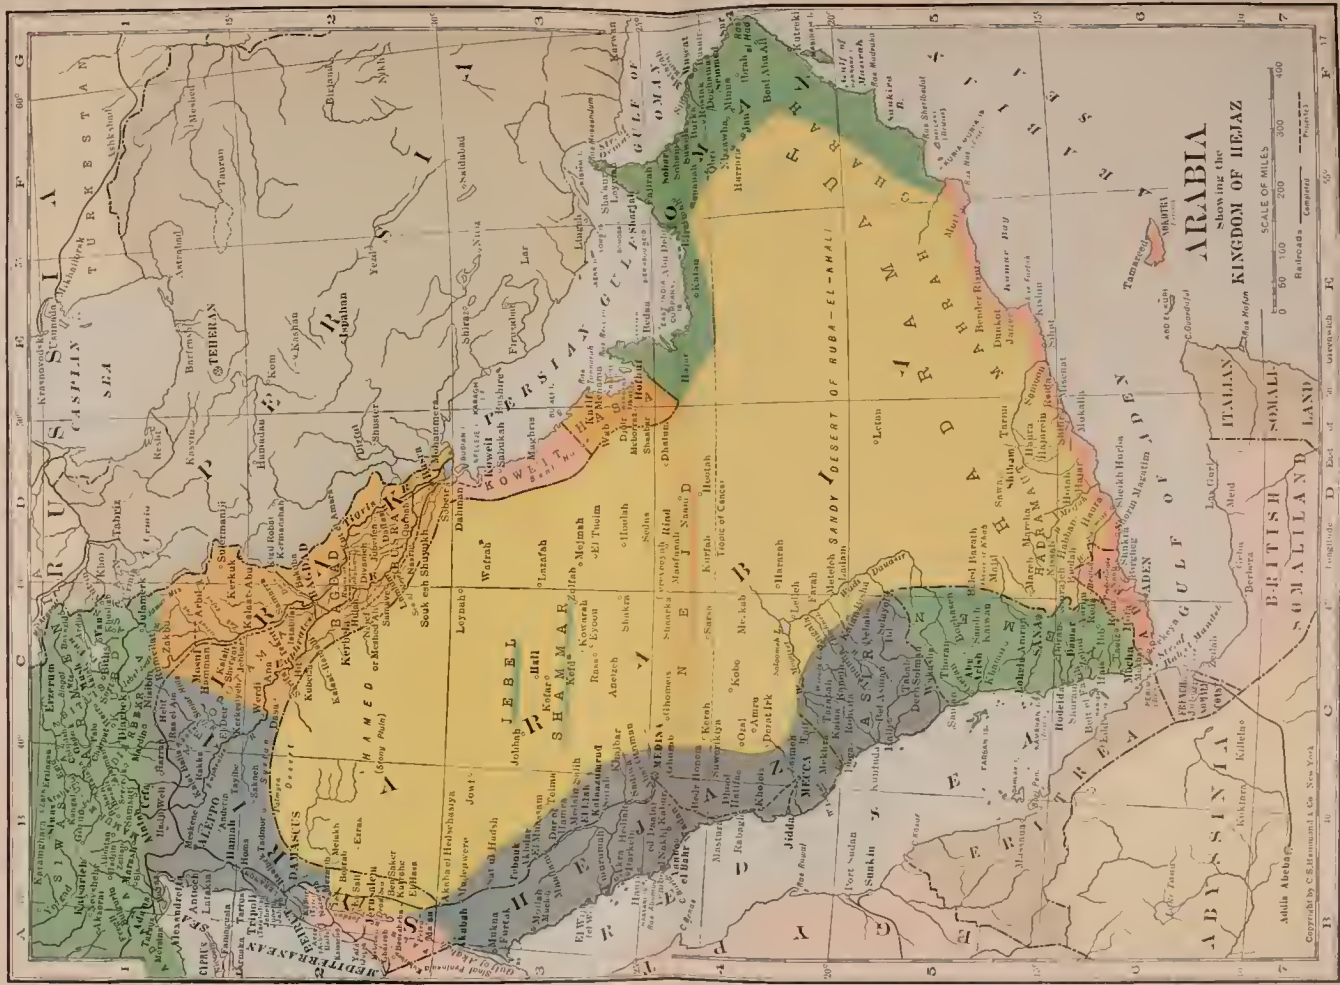

upon it, fought a nine years' war with the then duke of Aquitaine, to establish his sovereignty. "The war, which lasted nine years [760-768], was signalized by frightful ravages and destruction of life upon both sides, until, at last, the Franks became masters of Berri, Auvergne, and the Limousin, with their principal cities. The able and gallant Guaifer [or Waifer] was assassinated by his own subjects, and Pepin had the satisfaction of finally uniting the grand-duchy of Aquitaine to the monarchy of the Franks."—J. G. Sheppard, *Fall of Rome*, lect. 8.—See also GERMANY: 687-800.

732.—Ravaged by the Moslems. See CALIPHATE: 715-732.

781.—Erected into a separate kingdom by Charlemagne.—In the year 781 Charlemagne erected Italy and Aquitaine into separate kingdoms, placing his two infant sons, Pepin and Ludwig or Louis on their respective thrones. "The kingdom of Aquitaine embraced Vasconia [Gascony], Septimania, Aquitaine proper (that is, the country between the Garonne and the Loire) and the county, subsequently the duchy, of Toulouse. Nominally a kingdom, Aquitaine was in reality a province, entirely dependent on the central or personal government of Charles. . . . The nominal designations of king and kingdom might gratify the feelings of the Aquitanians, but it was a scheme contrived for holding them in a state of absolute dependence and subordination."—J. I. Mombert, *History of Charles the Great*, bk. 2, ch. 11.

884-1151.—End of the nominal kingdom.—Disputed ducal title.—"Carloman [who died 884], son of Louis the Stammerer, was the last of the Carolingians who bore the title of king of Aquitaine. This vast state ceased from this time to constitute a kingdom. It had for a lengthened period been divided between powerful families, the most illustrious of which are those of the Counts of Toulouse, founded in the ninth century by Fredelon, the Counts of Poitiers, the Counts of Auvergne, the Marquises of Septimania or Gothia, and the Dukes of Gascony. King Eudes had given William the Pious, Count of Auvergne, the investiture of the duchy of Aquitaine. On the extinction of that family in 928, the Counts of Toulouse and those of Poitou disputed the prerogatives and their quarrel stained the south with blood for a long time. At length the Counts of Poitou acquired the title of Dukes of Aquitaine or Guyenne [or Guienne, supposed to be a corruption of the name of Aquitaine, which came into use during the Middle Ages], which remained in their house up to the marriage of Eleanor of Aquitaine with Henry Plantagenet I. [Henry II], King of England (1151)."—E. De Bonnechose, *History of France*, bk. 2, ch. 3, foot-note.—"The duchy Aquitaine, or Guyenne, as held by Eleanor's predecessors, consisted, roughly speaking, of the territory between the Loire and the Garonne. More exactly, it was bounded on the north by Anjou and Touraine, on the east by Berry and Auvergne, on the south-east by the Quercy or County of Cahors, and on the south-west by Gascony, which had been united with it for the last hundred years. The old Karolingian kingdom of Aquitania had been of far greater extent; it had, in fact, included the whole country between the Loire, the Pyrenees, the Rhone and the ocean. Over all this vast territory the Counts of Poitou asserted a theoretical claim of overlordship by virtue of their ducal title; they had, however, a formidable rival in the house of the Counts of Toulouse."—

Maps prepared specially for the NEW LARNED under direction of the editors and publishers.

1034.—Origin of Truce of God. See TRUCE OF GOD; FRANCE: Maps of medieval period: 1154-1360.

1137-1152.—Transferred by marriage from the crown of France to the crown of England.—In 1137, "the last of the old line of the dukes of Aquitaine—William IX., son of the gay crusader and troubadour whom the Red King had hoped to succeed—died on a pilgrimage at Compostella. His only son was already dead, and before setting out for his pilgrimage he did what a greater personage had done ten years before: with the consent of his barons, he left the whole of his dominions to his daughter. Moreover, he bequeathed the girl herself as wife to the young king Louis [VII] of France. This marriage more than doubled the strength of the French crown. It gave to Louis absolute possession of all western Aquitaine, or Guyenne as it was now beginning to be called; that is the counties of Poitou and Gascony, with the immediate overlordship of the whole district lying between the Loire and the Pyrenees, the Rhone and the ocean:—a territory five or six times as large as his own royal domain and over which his predecessors had never been able to assert more than the merest shadow of a nominal superiority." In 1152 Louis obtained a divorce from Eleanor, surrendering all the great territory which she had added to his dominions, rather than maintain an unhappy union. The same year the gay duchess was wedded to Henry Plantagenet, then Duke of Normandy, afterwards Henry II. King of England. By this marriage Aquitaine became joined to the crown of England and remained so for three hundred years.—K. Norgate, *England under the Angevin kings*, v. 1, ch. 8.

1360-1453.—Full sovereignty possessed by the English kings.—Final conquest and union with France.—"By the Peace of Bretigny [see FRANCE: 1337-1360] Edward III. resigned his claims on the crown of France; but he was recognized in return as independent Prince of Aquitaine, without any homage or superiority being reserved to the French monarch. When Aquitaine therefore was conquered by France, partly in the 14th, fully in the 15th century [see FRANCE: 1360-1380], it was not the 'reunion' of a forfeited fief, but the absorption of a distinct and sovereign state. The feelings of Aquitaine itself seem to have been divided. The nobles to a great extent, though far from universally, preferred the French connexion. It better fell in with their notions of chivalry, feudal dependency, and the like; the privileges too which French law conferred on noble birth would make their real interests lie that way. But the great cities and, we have reason to believe, the mass of the people, also, clung faithfully to their ancient Dukes; and they had good reason to do so. The English Kings, both by habit and by interest, naturally protected the municipal liberties of Bourdeaux and Bayonne, and exposed no part of their subjects to the horrors of French taxation and general oppression."—E. A. Freeman, *Franks and the Gauls (Historical Essays, 1st series, no. 7)*.

ARABESQUE, a word technically used to denote "a fanciful, painted, modelled or carved ornamentation, composed of plant forms, often combined with human, animal and grotesque forms. Used by the Romans and revived by the Renaissance decorators. It was also used by the Arabs—

hence the name—for a flatly modelled and coloured ornament of intricate design, without human or, generally, animal forms."—C. H. Coffin, *How to study architecture*, pp. 479-480.

ARABI PASHA, Ahmed (1839-1911), an Egyptian soldier and nationalist revolutionary leader; said to have been a descendant of Mohammed; was the figure-head leader of a military insurrection fomented by an opposition party to Anglo-French domination; defeated at Tel-el-Kebir (1882) by the British and exiled to Ceylon, 1883; permitted to return in 1901. See EGYPT: 1875-1882; 1882-1883.

ARABIA, ARABS.—Arabia is a large peninsula in the southwestern part of Asia, bounded on the north by Syria and the Sinai peninsula, on the west by the Red sea, south by the Gulf of Aden and the Indian ocean, and east by the Persian gulf and the Gulf of Oman. The area is estimated at about 1,000,000 square miles, with a population of approximately 8,000,000. More than a third of this territory is desert; the rest is dotted with rich, fertile tracts, settled and cultivated. A large number of the population lead a nomadic life, driving their cattle and carrying their tents from place to place. These itinerant Arabs, known as Bedouins or Bedawi, entertain a profound contempt for house-dwellers and are not averse to combining the pursuit of guerrilla warfare and robbery with the ideals of a peaceful, pastoral existence. The two principal regions on the west, covering almost the entire length of the Red sea, are known as the Hejaz and the Yemen; they have an area of about 100,000 and 75,000 square miles respectively. The portions of the country capable of cultivation produce wheat, barley, dates, tobacco, indigo, cotton, sugar, coffee and spices. Dates and coffee are the most important exports. Arabia is a country better suited for grazing than agriculture and is famous for its horse-breeding, but in spite of this, the most useful and characteristic animal of the peninsula is the camel. The mineral resources of the country are iron, copper, lead and precious stones.

Political divisions.—(1) The Hedjaz or Hejaz, with a population of about 1,000,000, emerged from the World War as an independent Arab kingdom under the rule of Hussein Ibn Ali Pasha, the Grand Shereef of Mecca, who in June 1916 raised the standard of revolt against the Turkish rule and formally entered the war on the Allied side; (2) The imamate of Yemen, with the capital at Sana, is ruled by an imam of the Zeidi sect who traces his descent from the prophet's daughter; (3) Jbel Shammar, an emirate in the centre of the peninsula, with a capital at Hail, consists of a number of Bedouin tribes; (4) Nejd and Hasa, an emirate of the fanatical Wahhabite tribes of the eastern oases, has its center at Riadh; (5) Asir, on the Red sea, is ruled by an Arab prince of the Idrisi family; (6) The British protectorate of Aden, on the gulf of that name; (7) Koweit, a sultanate on the northwestern coast of the Persian gulf, is under British protection; and (8) Oman, a sultanate, the independence of which is guaranteed by Great Britain and France, on the gulf of Oman.

Name.—"There can be no doubt that the name of the Arabs was . . . given from their living at the westernmost part of Asia; and their own word 'Gharb,' the 'West,' is another form of the original Semitic name Arab."—G. Rawlinson, *Notes to Herodotus*, v. 2, p. 71.

Ancient succession and fusion of races.—"The population of Arabia, after long centuries, more especially after the propagation and triumph

of Islamism, became uniform throughout the peninsula. . . . But it was not always thus. It was very slowly and gradually that the inhabitants of the various parts of Arabia were fused into one race. . . . Several distinct races successively immigrated into the peninsula and remained separate for many ages. Their distinctive characteristics, their manners and their civilization prove that these nations were not all of one blood. Up to the time of Mahomet, several different languages were spoken in Arabia, and it was the introduction of Islamism alone that gave predominance to that one amongst them now called Arabic. The few Arabian historians deserving of the name, who have used any discernment in collecting the traditions of their country, Ibn Khaldoun, for example, distinguish three successive populations in the peninsula. They divide these primitive, secondary, and tertiary Arabs into three divisions, called Ariba, Motareba, and Mostareba. . . .

advanced civilisation analogous to that of Chaldæa, professing a religion similar to the Babylonian; a nation, in short, with whom material progress was allied to great moral depravity and obscene rites. . . . It was about eighteen centuries before our era that the Joktanites entered Southern Arabia. . . . According to all appearances, the invasion, like all events of a similar nature, was accomplished only by force. . . . After this invasion, the Cushite element of the population, being still the most numerous, and possessing great superiority in knowledge and civilisation over the Joktanites, who were still almost in the nomadic state, soon recovered the moral and material supremacy, and political dominion. A new empire was formed in which the power still belonged to the Sabæans of the race of Cush. . . . Little by little the new nation of Ad was formed. The centre of its power was the country of Sheba proper, where, according to the tenth chapter of Genesis,

TOMB OF EVE AT DJEDDAH (HEJAZ)

(From Arab Legend)

The Ariba were the first and most ancient inhabitants of Arabia. They consisted principally of two great nations, the Adites, sprung from Ham, and the Amalika of the race of Aram, descendants of Shem, mixed with nations of secondary importance, the Thamudites of the race of Ham, and the people of the Tasm, and Jadis, of the family of Aram. The Motareba were tribes sprung from Joktan, son of Eber, always in Arabian tradition called Kahtan. The Mostareba of more modern origin were Ismaelitic tribes. . . . The Cushites, the first inhabitants of Arabia, are known in the national traditions by the name of Adites, from their progenitor, who is called Ad, the grandson of Ham. All the accounts given of them by Arab historians are but fanciful legends. . . . In the midst of all the fabulous traits with which these legends abound, we may perceive the remembrance of a powerful empire founded by the Cushites in very early ages, apparently including the whole of Arabia Felix, and not only Yemen proper. We also find traces of a wealthy nation, constructors of great buildings, with an

there was no primitive Joktanite tribe, although in all the neighbouring provinces they were already settled. . . . It was during the first centuries of the second Adite empire that Yemen was temporarily subjected by the Egyptians, who called it the land of Pun. . . . Conquered during the minority of Thothmes III, and the regency of the Princess Hatasu, Yemen appears to have been lost by the Egyptians in the troublous times at the close of the eighteenth dynasty. Rameses II recovered it almost immediately after he ascended the throne, and it was not till the time of the effeminate kings of the twentieth dynasty, that this splendid ornament of Egyptian power was finally lost. . . . The conquest of the land of Pun under Hatasu is related in the elegant bas-reliefs of the temple of Deir-el-Bahari, at Thebes, published by M. Duemichen. . . . The bas-reliefs of the temple of Deir-el-Bahari afford undoubted proofs of the existence of commerce between India and Yemen at the time of the Egyptian expedition under Hatasu. It was this commerce, much more than the fertility of its own soil and

its natural productions, that made Southern Arabia one of the richest countries in the world. . . . For a long time it was carried on by land only, by means of caravans crossing Arabia; for the navigation of the Red Sea, much more difficult and dangerous than that of the Indian Ocean, was not attempted till some centuries later. . . . The caravans of myrrh, incense, and balm crossing Arabia towards the land of Canaan are mentioned in the Bible, in the history of Joseph, which belongs to a period very near to the first establishment of the Canaanites in Syria. As soon as commercial towns arose in Phœnicia, we find, as the prophet Ezekiel said, 'The merchants of Sheba and Raamah, they were thy merchants: they occupied in thy fairs with chief of all spices, and with all precious stones and gold.' . . . A great number of Phœnician merchants, attracted by this trade, established themselves in Yemen, Hadramaut, Oman, and Bahrein. Phœnician factories were also established at several places on the Persian Gulf, amongst others in the islands of Tylos and Arvad, formerly occupied by their ancestors. . . . This commerce, extremely flourishing during the nineteenth dynasty, seems, together with the Egyptian dominion in Yemen, to have ceased under the feeble and inactive successors of Ramses III. . . . Nearly two centuries passed away, when Hiram and Solomon despatched vessels down the Red Sea. . . . The vessels of the two monarchs were not content with doing merely what had once before been done under the Egyptians of the nineteenth dynasty, namely, fetching from the ports of Yemen the merchandise collected there from India. They were much bolder, and their enterprise was rewarded with success. Profiting by the regularity of the monsoons, they fetched the products of India at first hand, from the very place of their shipment in the ports of the land of Ophir, or Abhira. These distant voyages were repeated with success as long as Solomon reigned. The vessels going to Ophir necessarily touched at the ports of Yemen to take in provisions and await favourable winds. Thus the renown of the two allied kings, particularly of the power of Solomon, was spread in the land of the Adites. This was the cause of the journey made by the queen of Sheba to Jerusalem to see Solomon. . . . The sea voyages to Ophir, and even to Yemen, ceased at the death of Solomon. The separation of the ten tribes, and the revolutions that simultaneously took place at Tyre, rendered any such expeditions impracticable. . . . The empire of the second Adites lasted ten centuries, during which the Joktanite tribes, multiplying in each generation, lived amongst the Cushite Sabæans. . . . The assimilation of the Joktanites to the Cushites was so complete that the revolution which gave political supremacy to the descendants of Joktan over those of Cush produced no sensible change in the civilisation of Yemen. But although using the same language, the two elements of the population of Southern Arabia were still quite distinct from each other, and antagonistic in their interests. . . . Both were called Sabæans, but the Bible always carefully distinguishes them by a different orthography. . . . The majority of the Sabæan Cushites, however, especially the superior castes, refused to submit to the Joktanite yoke. A separation, therefore, took place, giving rise to the Arab proverb, 'divided as the Sabæans,' and the mass of the Adites emigrated to another country. According to M. Caussin de Perceval, the passage of the Sabæans into Abyssinia is to be attributed to the consequences of the revolution that established Joktanite supremacy in Yemen. . . . The date of the

passage of the Sabæans from Arabia into Abyssinia is much more difficult to prove than the fact of their having done so. . . . Yarub, the conqueror of the Adites, and founder of the new monarchy of the Joktanite Arabs, was succeeded on the throne by his son, Yashdjob, a weak and feeble prince, of whom nothing is recorded, but that he allowed the chiefs of the various provinces of his states to make themselves independent. Abd Shems, surnamed Sheba, son of Yashdjob, recovered the power his predecessors had lost. . . . Abd Shems had several children, the most celebrated being Himyer and Kahlan, who left a numerous posterity. From these two personages were descended the greater part of the Yemenite tribes, who still existed at the time of the rise of Islamism. The Himyarites seem to have settled in the towns, whilst the Kahlanites inhabited the country and the deserts of Yemen. . . . This is the substance of all the information given by the Arab historians."—F. Lenormant and E. Chevalier, *Manual of ancient history of the East*, bk. 7, ch. 1-2, v. 2.—See also SEMITES.

Sabæans.—"For some time past it has been known that the Himyaritic inscriptions fall into two groups, distinguished from one another by phonological and grammatical differences. One of the dialects is philologically older than the other, containing fuller and more primitive grammatical forms. The inscriptions in this dialect belong to a kingdom the capital of which was at Ma'in, and which represents the country of the Minæans of the ancients. The inscriptions in the other dialect were engraved by the princes and people of Sabâ, the Sheba of the Old Testament, the Sabæans of classical geography. The Sabæan kingdom lasted to the time of Mohammed, when it was destroyed by the advancing forces of Islam. Its rulers for several generations had been converts to Judaism, and had been engaged in almost constant warfare with the Ethiopic kingdom of Axum, which was backed by the influence and subsidies of Rome and Byzantium. Dr. Glaser seeks to show that the founders of this Ethiopic kingdom were the Habâsa, or Abyssinians, who migrated from Illyria to Africa in the 2d or 1st century B. C. [See also AFRICA: Ancient and medieval civilization; Arab occupation]; when we first hear of them in the inscriptions they are still the inhabitants of Northern Yemen and Mahrah. More than once the Axumites made themselves masters of Southern Arabia. About A. D. 300, they occupied its ports and islands, and from 350 to 378 even the Sabæan kingdom was tributary to them. Their last successes were gained in 525, when, with Byzantine help, they conquered the whole of Yemen. But the Sabæan kingdom, in spite of its temporary subjection to Ethiopia, had long been a formidable State. Jewish colonies settled in it, and one of its princes became a convert to the Jewish faith. His successors gradually extended their dominion as far as Ormuz, and after the successful revolt from Axum in 378, brought not only the whole of the southern coast under their sway, but the western coast as well, as far north as Mekka. Jewish influence made itself felt in the future birthplace of Mohammed, and thus introduced those ideas and beliefs which subsequently had so profound an effect upon the birth of Islam. The Byzantines and Axumites endeavoured to counteract the influence of Judaism by means of Christian colonies and proselytism. The result was a conflict between Sabâ and its assailants, which took the form of a conflict between the members of the two religions. A violent persecution was directed against the Christians of Yemen, avenged by the Ethiopian

conquest of the country and the removal of its capital to San'a. The intervention of Persia in the struggle was soon followed by the appearance of Mohammedanism upon the scene, and Jew, Christian, and Parsi were alike overwhelmed by the flowing tide of the new creed. The epigraphic evidence makes it clear that the origin of the kingdom of Sabâ went back to a distant date. Dr. Glaser traces its history from the time when its princes were still but Makârib, or 'Priests,' like Jethro, the Priest of Midian, through the ages when they were 'kings of Sabâ,' and later still 'kings of Sabâ and Raidân,' to the days when they claimed imperial supremacy over all the principalities of Southern Arabia. It was in this later period that they dated their inscriptions by an era, which, as Halévy first discovered, corresponds to 15 B. C. One of the kings of Sabâ is mentioned in an inscription of the Assyrian king Sargon (B. C. 715), and Dr. Glaser believes that he has found his name in a 'Himyaritic' text. When the last priest, Samah'ali Darrah, became king of Sabâ, we do not yet know, but the age must be sufficiently remote, if the kingdom of Sabâ already existed when the Queen of Sheba came from Ophir to visit Solomon. The visit need no longer cause astonishment, notwithstanding the long journey by land which lay between Palestine and the south of Arabia. . . . As we have seen, the inscriptions of Ma'in set before us a dialect of more primitive character than that of Sabâ. Hitherto it had been supposed, however, that the two dialects were spoken contemporaneously, and that the Minæan and Sabæan kingdoms existed side by side. But geography offered difficulties in the way of such a belief, since the seats of the Minæan power were embedded in the midst of the Sabæan kingdom, much as the fragments of Cromarty are embedded in the midst of other counties. Dr. Glaser has now made it clear that the old supposition was incorrect, and that the Minæan kingdom preceded the rise of Sabâ. We can now understand why it is that neither in the Old Testament nor in the Assyrian inscriptions do we hear of any princes of Ma'in, and that though the classical writers are acquainted with the Minæan people they know nothing of a Minæan kingdom. The Minæan kingdom, in fact, with its culture and monuments, the relics of which still survive, must have flourished in the grey dawn of history, at an epoch at which, as we have hitherto imagined, Arabia was the home only of nomad barbarism. And yet in this remote age alphabetic writing was already known and practised, the alphabet being a modification of the Phœnician written vertically and not horizontally. To what an early date are we referred for the origin of the Phœnician alphabet itself! The Minæan Kingdom must have had a long existence. The names of thirty-three of its kings are already known to us. . . . A power which reached to the borders of Palestine must necessarily have come into contact with the great monarchies of the ancient world. The army of Ælius Gallus was doubtless not the first which had sought to gain possession of the cities and spice-gardens of the south. One such invasion is alluded to in an inscription which was copied by M. Halévy. . . . But the epigraphy of ancient Arabia is still in its infancy. The inscriptions already known to us represent but a small proportion of those that are yet to be discovered. . . . The dark past of the Arabian peninsula has been suddenly lighted up, and we find that long before the days of Mohammed it was a land of culture and literature, a seat of powerful kingdoms and wealthy commerce, which cannot fail

to have exercised an influence upon the general history of the world."—A. H. Sayce, *Ancient Arabia* (*Contemporary Review*, Dec., 1889).

1908-1916.—Events leading up to the Arabian revolt.—"Up to 1870 the Arab tribes were left almost entirely alone by the Turks. The Sultan was recognized, but not obeyed. Tribes were often at war with each other, the one under Idriz having been during the last fifteen years the most powerful. During the same period an almost continuous attempt has been made to make Turkish rule effective, but it is, and always has been, hateful to the Arabs. The Governors who have been sent from Constantinople abused their position mainly to fill their own pockets. The distance from Constantinople, the absence of railways or other roads, except an unsafe desert track, infested always by robbers, were so great that Turkish officials were able to plunder the Arabs with impunity. When the Revolution in 1908 occurred, it was alleged that the Governor had made an arrangement with a small Arab tribe which commanded the route between Medina and Mecca, the two most Holy Places, by which no one was al-

lowed to pass unless he paid at least one Turkish pound (18s. 2d.), half of which was alleged to go into the pocket of the Governor. While the Arab tribes were often at war with one another, they were all hostile to the Turks. This hostility extended from Aden northward into Syria, where Christian as well as Moslem Arabs have been abominably treated. [See also ADEN.] A constant series of revolts against the Turks have occurred during the last ten years, and troops were sent from various parts of the Empire to attack the rebels. The troops disliked the service, because the Arabs fought bravely, and the Turks suffered badly from the climate. Almost immediately after the revolution of July, 1908, Ratib Pasha, with the Turkish troops under him, revolted against the Committee of Union and Progress, and joined the rebels. The Hedjaz Railway, however, was opened on September 1st, 1908, and Ratib himself was captured. The Committee promised various reforms, and for a few months no revolt took place. Indeed, an honest attempt was made by the Young Turks to make arrangements in the Hedjaz which would produce good government among the tribes. A careful project was drawn up, which is said to have been satisfactory to all the Arab leaders. Then there came a change of government. Kiamil lost his position, and his successor opposed the project, largely because it had been brought forward by the ex-Grand Vizier. No serious improvements were made to secure Arab loyalty. Among the many big blunders which the Committee made, the greatest was that of attempting to Turkify the whole country by forcing upon it the use of Turkish instead of Arabic or Albanian or any other of the native languages. So far as all the Arabs of the Empire were concerned, it was an act of madness. Arabic is the language of the Koran. Turkish is detested, not merely as a barbarous tongue, but as that of their oppressors. The feeling of hostility between Arabs and Turks was intensified. The Turk is a Moslem, on whom his religion sits somewhat lightly; the Arab is a fanatic. . . . So long as the Arabs were let alone by the Turks they do not seem to have greatly objected to Turkish domination, and they had grown used to the exactions of their Turkish Governors; but when the Young Turks set aside the arrangements which Kiamil and Hilmi and other leading statesmen in Turkey had made and their own leaders approved, they readily believed that the Turkish 'unbelievers,' as they were persuaded the Young Turks were, intended to gain the upper hand. They were then always ready for revolt."—E. Pears, *Arab revolt (Living Age, Aug. 12, 1916, pp. 438-440)*.—See also TURKEY: 1909.

1913.—Syrian Arab congress at Paris.—Program. See SYRIA: 1908-1921.

1916.—Arab revolt.—Shortly after the surrender of General Townshend at Kut, the Shereef of Mecca informed the British government that the Arabs could no longer submit to Turkish rule and tyranny. He asked for assistance in arms, food and money, which were duly promised by the Allies. Almost from the outbreak of the World War an attempt had been in progress under German direction to preach a *jihad* or holy war. "It was represented that the Kaiser was a convert to Islam, and that presently the Khalif would order a *Jehad* against the infidel. Stories were told of the readiness of the Mohammedan subjects of Britain, Russia and France to revolt at this call, and preparations were made for the manufacture of Indian military uniforms at Aleppo

to give proof to the Syrians that the Indian faithful were on their side. Egypt, which had long been the hunting-ground of German emissaries, was considered ripe for revolt, and the Khedive [Abbas Hilmi II, deposed in 1914] was known to be friendly. . . . [The Young Turk Party] envisaged a Holy War, engineered by unbelievers, which should beguile the Mohammedan populations of Africa and Asia, and they naturally leaned on the broad bosom of Germany, who made a speciality of such grandiose visions. There never was a chance of such a *Jehad* succeeding. . . . The Sultan's title to the Khalifate, too, was fiercely questioned. The Turks had won it originally by conquest from the Abbasids, and the Arabs had never done more than sullenly acquiesce. Most important of all, the Turco-German alliance was breaking its head against an accomplished fact. By September [1914] the whole of Mohammedan India and the leaders of Mohammedan opinion in British Africa were clearly on the Allied side, and their forces were already moving to Britain's aid, while forty thousand Arab Moslems were fighting for France in the battles of the West. Islam had made its choice before Enver sent his commissaries to buy Indian khaki in Aleppo and inform the Syrians that the Most Christian Emperor had become a follower of the Prophet."—J. Buchan, *Nelson's history of the war, v. iii, pp. 125-129*.—Another circumstance that undoubtedly contributed largely towards swaying the bulk of the Mohammedan world to the Allied cause as against the Turks was the powerful manifesto issued to Moslems by his highness the Aga Khan III, who is the recognized spiritual head of some 70,000,000 Mohammedans in India, and has, besides, a considerable following in Persia, Afghanistan, Central Asia, Syria and Morocco. Not only did the Aga Khan utterly condemn the proposed *jehad* and assert the justice of the Allied cause, but he even volunteered to serve as a private in any infantry regiment of the Indian Expeditionary Force.

"From the day when he took over the Emirate [of Mecca, in 1910], Shreef Hussein ibn Ali was a faithful counsellor and sincere supporter of the Ottoman government. . . . He and his four sons—the Emirs Ali, Abdullah, Feisal and Zeid—adhered so faithfully to this loyal policy that some of the Arab Emirs ascribed to him ardent Turkophilism. Then the 'Unionists' started their violent anti-Arab campaign of persecution and extermination. Free-minded Arabs in Syria and El Irak thereupon turned to the great Emir of Arabia, the guardian of the Holy Shrines of Islam, for succour and redress. He tried then to calm them and comfort them with earnest promises of intervention and at the same time he represented to the Unionists the gravity of the situation and the danger to which the Empire would be exposed if such a policy were persisted in. Soon afterwards the Great War broke out, and the Unionists were not long in siding with the Germanic Powers and throwing the fortunes of the Empire into the melting pot. They had consulted the Grand Shereef, informing him, at the same time, of their resolve to join the Central Powers. He wisely advised the strictest neutrality. Their object in consulting him, however, had doubtless been to sound his own and his people's feelings and intentions, rather than to seek his advice.

"About four months later a rumour was circulated in Constantinople as to the existence of a movement in Syria and El Irak unsympathetic to the alliance of Turkey with Germany. The Unionists seized this as an occasion, or rather pretext, to send out to Syria Jemal Pasha, in order to carry

out, with ruthless rigour, their programme for crushing out the life and spirit of this 'Arab movement,' by hanging its leaders, exiling the Arab notables, and starving the masses. On his arrival, however, Jemal found that the inhabitants were peaceful, and practically all supporting the Government with their lives and property in its conduct of the war which it had imposed on them; and that, therefore, there was nothing to justify the institution of a reign of terror. Thereon, he, with the characteristic cunning and deceit of the Turk, tried at first to pose as the friend of the Arabs, gathered round him the *élite* of Syria, and lured them into confidence by falsely pretending to approve and admire the Arab national movement. It is even said that he went so far as to make a speech, on the occasion of a banquet given in his honour at Damascus, wherein he said: 'How can we expect the fatherland to progress when Arab and Turk forget and neglect their respective national ideals and when ignorance prevails? On suitable occasions he gave expression to other views of a similar character, and thus entrapped the Arab patriots, who revealed to him their innermost hopes and aspirations, assuring him, at the same time, in all sincerity, that they were ready to sacrifice their very lives on the altar of Empire, provided the Government respected and recognised their national claims and rights. He then started dispersing Arab officers and men in the outlying provinces of the Empire, in the Caucasus, the Dardanelles and Persia, and organised an elaborate system of spying; and when finally he saw the country cleared of its militant elements, and his position absolutely secure, he brought down his heavy band on the helpless population and indulged in that series of atrocities that has horrified the civilised world. When all this was reported to the Grand Shereef, he at once sent his son Emir Faisal . . . to remonstrate with Jemal against this suicidal policy, and to advise him to refrain from it. The Pasha promised to do so; but hardly had Emir Faisal arrived back in the Hejaz when the same ruthless policy was revived with even greater violence. Cases of hanging and exile became more frequent, and, worse than all, the wilful starving of the population was inaugurated. Meantime, the blockade of the Turkish coasts had been declared, and as the Turks stopped the carriage of all foodstuffs by the railway and by caravan to the Hejaz, a state of famine was brought about.

"The Unionists, meantime, had become so drunk with the lust of blood that they actually set about condemning, wholesale, Arab officers who were fighting for them on distant fronts, and degrading Arab soldiers to the position of slaves, and driving them to menial work and calling them on every occasion 'traitors.' As a crowning of this mad career they finally attacked the Arabs in their most sensitive and vital point, the Sheriat, a well-known member of the Committee, going so far as to declare publicly his contempt for Islam and its teachings. Finding that persuasion and argument were worse than useless with a people of such temper and mind, the Grand Shereef finally drew the sword as the final arbiter."—*Near East*, Feb. 2, 1917.—On June 9, 1916, the Grand Shereef made his first move by declaring himself independent of the Turkish government. Mecca and the surrounding district were loyal to him and the Turkish garrison in Jeddah was overcome. Taif was soon captured, but with Turkish troops in Medina it was too strong for the Arabs to invest. The latter tore up over a hundred miles of the Hejaz Railway tracks and thus severely handi-

capped the Turks in sending reinforcements. The Turks, however, were too seriously involved elsewhere to be able to devote any large force to handle the rising. A decree was issued in Constantinople deposing the Grand Shereef, who in reply published a proclamation in Cairo setting forth numerous indictments against the Turkish Committee of Union and Progress in general and against Enver Pasha, Talaat Bey and Jemal Pasha in particular.—See also WORLD WAR: 1916: VI. Turkish theater: c.

1916 (June).—Proclamation of the sherif of Mecca.—"In the name of God, the Merciful, the Compassionate. This is our general proclamation to all our Moslem brothers. O God, judge between us and our people in truth; Thou art the Judge. The world knoweth that the first of all Moslem princes and rulers to acknowledge the Turkish Government were the Emirs of Mecca the Blessed. This they did to bind together and make strong the brotherhood of Islam, for they saw the Sultans of the House of Osman (may the dust of their tombs be blessed, and may they dwell in Paradise!), how they were upright, and how they carried out all the commandments and ordinances of the Faith and of the Prophet (prayers be upon him!) perfectly. Therefore they were obedient to them at all times. For a token of this, remember how in A. H. [Anno Hegira] 1327 [1908] I with my Arabs helped them against the Arabs, to save Ebhah from those who were besieging it, and to preserve the name of the Government in honor; and remember how again in the next year I helped them with my armies, which I entrusted to one of my sons; for in truth we were one with the Government until the Committee of Union and Progress rose up, and strengthened itself, and laid its hands on power. Consider how since then ruin has overtaken the State, and its possessions have been torn from it, and its place in the world has been lost, until now it has been drawn into this last and most fatal war. All this they have done, being led away by shameful appetites, which are not for me to set forth, but which are public and a cause for sorrow to the Moslems of the whole world, who have seen this greatest and most noble Moslem Power broken in pieces and led down to ruin and utter destruction. Our lament is also for so many of its subjects, Moslems and others alike, whose lives have been sacrificed without any fault of their own. Some have been treacherously put to death, others cruelly driven from their homes, as though the calamities of war were not enough. Of these calamities the heaviest share has fallen upon the Holy Land. The poor, and even families of substance, have been made to sell their doors and windows, yea, even the wooden frames of their houses, for bread, after they had lost their furniture and all their goods. Not even so was the lust of the [Party of] Union and Progress fulfilled. They laid bare all the measure of their wicked design, and broke the only bond that endured between them and the true followers of Islam. They departed from their obedience to the precepts of the Book. [Here follow a number of charges, sacrilegious, etc., against the Turkish government] . . . We leave all of this to the Moslem world for judgment. Yes, we can leave the judgment to the Moslem world; but we may not leave our religion and our existence as a people to be a plaything of the Unionists. God (Blessed be He!) has made open for us the attainment of freedom and independence, and has shown us a way of victory to cut off the hand of the oppressors, and to cast out their garrison from our midst. We have attained independence, an independence of

the rest of the Ottoman Empire, which is still groaning under the tyranny of our enemy. Our independence is complete, absolute, not to be laid hands on by any foreign influence or aggression, and our aim is the preservation of Islam and the uplifting of its standard in the world. We fortify ourselves on the noble religion which is our only guide and advocate in the principles of administration and justice. We are ready to accept all things in harmony with the Faith and all that leads to the Mountain of Islam, and in particular to uplift the mind and the spirit of all classes of the people in so far as we have strength and ability. This is what we have done according to the dictates of our religion, and on our part we trust that our brethren in all parts of the world will each do his duty also, as is incumbent upon him, that the bonds of brotherhood in Islam may be confirmed. We beseech the Lord of Lords, for the sake of the Prophet of Him who giveth all things, to grant us prosperity and to direct us in the right way for the welfare of the faith and of the faithful. We depend upon God the All-Powerful, whose defence is sufficient for us.—Shereef and Emire of Mecca, El Hussein ibn Ali, 25 Sha'ban 1334." [June 27, 1916.]

"Later in the year another manifesto was published, and finding that the Turkish government was unable to send any large army to suppress the revolt, Shereef Hussein became more daring. On November 4 the Shereef had himself formally proclaimed 'Sultan of Arabia'; and a large number of Arab chiefs assembled in Mecca for the ceremony."—*Annual Register*, 1916, p. 275.—"The official recognition by England, France, and Italy of the proclamation of the Grand Shereef of Mecca as King of the Hejaz invests a really remarkable figure with singular interest. . . . His Majesty the King of the Hejaz Hussein Ibn Ali, has the distinction of being able to claim what is probably the purest and oldest lineage of all the crowned heads of the world. Added to his personal qualities and achievements, this fact goes far to account for the remarkable phenomenon of a practically unanimous acknowledgment of him as their supreme lord by the great chieftains of Arabia, whose mutual jealousies and exaggerated love of personal authority are proverbial. Purity of lineage is a source of great pride with the Arabs, and, when it is traceable to their Prophet, it commands the highest veneration on their part. The high value they place on documents attesting the descent of their thoroughbred horses may be cited as a proof of the value they attach to the principle of selection. Shereef Hussein Ibn Ali comes from Beni Hashem, the quintessence, so to say, of the tribe of Koreish. His descent is traceable, through his immediate ancestors, Ali Ibn Mohammed, Ibn Abdul Aziz, Ibn Aoun, back in unbroken line to the Prophet Mohammed. All the Moslems of the world acknowledge this lineage, and believe in Ishmael as being the original ancestor of the Arabs, whose lineage is again traced back to Noah."—*Near East*, Feb. 2, 1917.—In their reply to President Wilson's note of Dec. 20, 1916, the Allied powers stated the general nature of their war aims, and included among them "the setting free of the populations subject to the bloody tyranny of the Turks." And Mr. Balfour, in his despatch of Jan. 16, 1917, in which he explained these aims from the point of view of Great Britain, observed that "the interests of peace and the claims of nationality alike require that Turkish rule over alien races should, if possible, be brought to an end." It was in the same spirit that President Wilson, in his speech to the Senate on Jan. 23,

1917, proposed that the Monroe Doctrine be adopted as the doctrine of the world, "that no nation should seek to extend its polity over any other nation or people." Thus the effort of the Arabs of Hejaz to free themselves from the oppressive rule of the Turks received the sanction of all the Allies. The province of Western Arabia to which the name of Hejaz has been given extends along the Red Sea coast from the Gulf of Akaba to the south of Taif. It is bounded on the north by Syria, on the east by the Nafud desert, and by Nejd, and on the south by Asir. Its length is about 750 miles, and its greatest breadth from the Harra, east of Khaibar, to the coast is 200 miles. Barren and uninviting mostly in its northern part, yet with many very fertile and well-cultivated portions in the southern section, sustaining a brave, hardy and fearless population, the chief claim of Hejaz to fame is that it contains the holy cities of Mecca and Medina, to which Mohammedan pilgrims come annually from all parts of the world. During the World War the Arabs rendered splendid services in fighting and harassing the Turks. Of particular interest is the romantic part played in the task of uniting the Arab tribes by a young English Oxford graduate, Thomas Lawrence. When the World War broke out he was studying archaeological inscriptions in Mesopotamia. He was then twenty-six years old and possessed a profound knowledge of the land and its languages. Though he had had no military experience, he was appointed an officer (colonel) in the British army, but he usually wore the costume of an Arab, which he carried like a native. Mounted on horse or camel, he led armies of Arabs in many fights with the Turks. The latter and their German allies were not slow to discover that Lawrence was a mighty factor in the Arab problem.—"Through their spies they learned that Lawrence was the guiding spirit of the whole Arabian revolution. They offered a reward of \$500,000 for him, dead or alive. But the Bedouins would not have betrayed their idolized leader for all the gold in the fabled mines of Solomon."—L. Thomas, *Thomas Lawrence, Prince of Mecca (Asia, Sept., 1919, p. 829)*.—After the capture of Bagdad the British commander, General Maude, issued a proclamation to the people of that ancient city on March 19, 1917, in which the following reference to the Arabs occurs: "In Hejaz the Arabs have expelled the Turks and Germans who oppressed them and proclaimed the Shereef Hussein as their king, and his lordship rules in independence and freedom, and is the ally of the nations who are fighting against the power of Turkey and Germany; so, indeed, are the noble Arabs, the lords of Koweyt, Nejd, and Asir. Many noble Arabs have perished in the cause of Arab freedom, at the hands of those alien rulers, the Turks, who oppressed them. . . . It is the hope and desire of the British people and the nations in alliance with them that the Arab race may rise once more to greatness and renown among the peoples of the earth, and that it shall bind itself together to this end in unity and concord. O people of Bagdad, remember that for twenty-six generations you have suffered under strange tyrants who have ever endeavored to set one Arab house against another in order that they might profit by your dissensions. This policy is abhorrent to Great Britain and her Allies, for there can be neither peace nor prosperity where there is enmity and misgovernment."

EMIR FEISAL, KING OF IRAK (MESOPOTAMIA)

1919.—Results of the Treaty of Versailles.—Spheres of influence and the Syrian problem.—Dissatisfaction of the Arabs.—“After the principal Allies had been allotted their quotas at the Peace Conference, there was a belated announcement that the Kingdom of the Hejaz would be given two seats. That little Arab kingdom, recognized by France and England as a belligerent Ally in 1916, had been left out, but Faisal, third son of the King of the Hejaz (or, as the King prefers to be called, Cherif of Mecca), and a young English colonel named Lawrence, who had been adopted into the family of the descendants of the prophet Mohammed and was a major-general in Faisal's Arab army, made a few spirited remarks about the share of the Arab army in the

liberation of Syria and the feelings which those Arabs might entertain if omitted from the Peace Conference; and the Kingdom of the Hejaz secured its two seats. . . . Meantime certain statesmen in Europe had drawn up secret treaties arranging for a division of Syria and Mesopotamia between Russia, France, and England. This was in 1916, before the Russian Revolution and before the Syrians had achieved their independence. France was to receive the coast strip of Syria, the Vilayet of Adana, and a large strip of land to the north; Russia, in addition to Constantinople, most of what is commonly called Armenia, and some of the south coast of the Black Sea; England, southern Mesopotamia and the Syrian ports of Caiffa and Acre. Palestine was to have a special régime; and the territory between the French and English acquisitions was to be formed into a confederation of Arab governments, or a single independent Arab government, and was divided into ‘zones’ in which France and England were to have varying degrees of ‘influence.’ Faisal did not know of this treaty when he led the Arab revolt; nor did the Arabs and Syrians when they revolted. No one was satisfied with the old treaty. The Russians no longer wanted a share of the spoils; the Syrians wanted real independence; and certain French interests wanted a ‘unified Syria’ under French tutelage. . . . To the Arab, Syria is simply a region where Arabs, a few of whom are Christians, live more settled industrial lives; there is no word for ‘Syria’ in the Arab tongue.”—*Nation, April 19, 1919.*—“The Arab world, where considerations into which the wishes of the inhabitants or the main interests of the country did not always enter, have led to its division into spheres of influence. It is unnecessary to go into the different agreements. . . . The French at present hold and administer the Syrian coast towns from Tyre to Alexandretta inclusive, while the Emir Feisal, the son of the King of the Hedjaz, whose services to the Allies in the war are a matter of common knowledge, rules inland Syria [whence he was expelled by the French in August, 1920]. The cities of Damascus, Hama, Homs, and Aleppo are [were until then] under his government. . . . [He is now ruler of Irak (Mesopotamia) under British mandate.] The Hedjaz itself is declared by the Treaty to be a free, independent state. Palestine is to remain under the direct administration of the mandatory. Mesopotamia and Syria are made independent states in accordance with Article 22 of the League of Nations, though they are to receive the advice and assistance of mandatories until they are able to stand alone. The boundaries of all three countries are to be fixed by the principal Allied Powers. Many of the Arabs object to the present arrangement. Their view, which is shared by not a few Europeans, is that it splits up into several parts a country which is essentially one. In the end they will, they say, certainly come together again either in the form of a single state or of a confederation. Nature herself favours this unity. The great rivers would disregard division. So would the nomad. He crosses the country from end to end. There is summer pasture in Syria, while winter grazing takes him as far as the Persian Gulf. He is also the carrier of the desert, so that neither Syria nor Arabia can be permanently cut off from Mesopotamia. And the desert will only support a limited number of people. In other countries the surplus goes to America. Here the Bedu has an America at his tent door. He just goes to the river strip or he settles in Syria, as he has done from time immemorial. Its outlying settlements

are his market towns. The differences between Arabs seem great to the stranger. They really only go skin deep. Townsman, settler, and Bedu may be kept apart by mutual contempt, but all are proud of their descent from the desert. Like their religion they belong to it. What keeps the country one is something deeper than Arab nationality, though the population is in any case mainly Arab. So are its language and its civilization. This applies to Syria and Palestine as well as to the rest. In Palestine the Zionist claims are based not on the present, but on the past and the future; they count on a large immigration of Jews, who at present form only one-sixth to one-ninth of the inhabitants. The Christian Syrians of the coast and in the Lebanon are against coming into an Arab confederation or kingdom. It is not, however, because they are likely to be ill-treated. Christians are already helping the Arabs to build a state at Damascus. But the Christian population is too small, and if the rest of the country one day comes together it will be impossible to keep it on its natural outlet to the Mediterranean. The Persian Gulf is only a back door."—*Round Table*, June, 1920, p. 511.

ALSO IN: L. Thomas, *King Hussein and his Arabian knights* (Asia, May, 1920).

1919.—King of Hejaz and the revolt of the Wahabites.—"The Lebanon Syrian Committee in the second week of August addressed to the Central Syrian Committee located in Paris the following telegram: 'The Arabian military authorities at Damascus are continuing their arbitrary recruiting. They have just decided to send an army of Syrians to the Hejaz, on a payment of three Egyptian pounds per man, probably to fight against the Wahabites. They are thus treating Syria as a country conquered by the Hejaz, and are misapplying the subsidies furnished by the Allies.' The Mussulman sect of the Wahabites is at war with Hussein, King of Arabia. The causes that led to these hostilities were briefly as follows: When the Ottoman Empire joined the European war the Hejaz and the other Emirates of Arabia joined the Allies, who created Hussein King of Arabia. Hussein played a prominent part from this time on. He only was represented at the Peace Conference. His son, Feisul, became a candidate for the throne of Hejaz under the aegis of England. Hussein's proclamation of himself as Khalif, or great religious leader of Islam, gave offense to the Wahabites among other sects. His subsequent proposal to unite Hedjaz with Nedj, where the Wahabites are mainly centred, brought on a crisis, and the conflict was declared by the Wahabite leader."—*Times Current History*, Oct., 1919, p. 172.—See also SYRIA.—"The Arab tribes are notoriously independent, and, so far as the outside world knows, have not acted together since the time of Mohammed and of the early conquests of Islam. Even then, some were lukewarm and worse. It will, therefore, be in point to consider the positions taken up by the other elements in Arabia. Of the maritime states to the east, Koweit, Bahrein, Oman, little need be said. The Persian Gulf has known English control since the seventeenth century, a control which is the oldest element in the British Empire. It has known also the Turks, and has no desire for further knowledge. The population of Oman, also, is Ibadite, a sect of Puritans, dissenting and protesting from the earliest Moslem history and standing apart from both Sunnites and Shi'ites. No call to a Holy War from a schismatic Ottoman Caliph would affect them. The great valley of Hadramaut has sent its sons over the farthest seas and is more

cosmopolitan than any other part of Arabia. It, too, has little use for Ottoman-German dreams. The Yemen is a land where recorded history reaches into Babylonian times. Since the renewed occupation by the Turks, in 1871, it has been fighting them; and at Sa'da and San'a there has been, and is a line of Imams, of the Zaidite branch of the Shi'ites, which dates its foundation back to a certain Rassi in A. D. 860. The Zaidites are very modified Shi'ites, holding principally to the divine right to rule inherent in the blood of the Prophet, and thus have found it possible to work together with the Sharifs of Mecca. In Athir, or Asir, a district on the Red Sea, a certain Imam Idrisi has been in insurrection against the Turks since, at least, the Turko-Italian war. The present Great Sharif assisted the Turks then in relieving the Turkish garrison of Ohba and securing for it a safe retreat. Now, naturally, he is at one with Idrisi and his followers. In the interior there are two states, settled round greater oases, which have made the politics of central Arabia for about a century. One, to the southeast of Riyad, is all of the Wahabite empire that maintains independence. Once it threatened Syria and Egypt, and indeed, the Moslem world, but now it is limited to a little island in the deserts. But it is still war-like and maintains the traditions of the earliest Islam. It is, in fact, a revival of the ideals of the monkish state of Medina under the first successors of Mohammed. To the north, at Hayil, is the dynasty of the Ibn Rashids. It may be best compared to the Arab court of the Umayyads at Damascus. The Ibn Rashids are orthodox Sunnite Moslems; but they wear their religion more lightly than do the austere Wahabites to the southeast of them. They appreciate literature and poetry and the joy of life. Between them and the Ibn Sa'ud at Riyad lies the headship of inner Arabia. Now one and now the other has held it. But, invariably, up till now, on every question they have taken opposite sides."—G. B. Macdonald, *Arabian situation* (*Nation*, Nov. 8, 1917, pp. 505-507).

ARABIA, Case of.—The sinking in the Mediterranean, on November 6, 1916, of the Peninsular and Oriental Company's steamer Arabia with one American on board was made the occasion of a protest by the Department of State to the German government, and a charge that the promise made after the Sussex case had been broken. "The German note on the Arabia, now made public, gave as the reason for sinking her the belief that she was a transport. November 6, one hundred miles west of the [Ionian] island of Cerigo, a German submarine, said the note, fell in with a large steamship coming from the Cerigo Straits. She was painted black, and did not, as was usual with the Peninsular and Oriental steamers, have light-colored superstructures. Though identical with the Arabia, she was off the route taken by steamers between Port Said and Malta, and on that taken by vessels of war. On board were

'large batches of Chinese and other colored persons in their national costumes.' Supposing them to be workmen soldiers, 'such as are used in great numbers behind the front by the enemies of Germany,' the submarine commander believed he was concerned with a transport ship, and 'attacked without delay and sank her.' Should the United States give the data showing that the *Arabia* was an ordinary passenger steamer, the action of the submarine commander would not then be in accordance with his instructions. The act would be a regrettable mistake 'from which the German Government would promptly draw the appropriate consequences.' The British Government, when informed of this reply and asked for the facts, answered that the *Arabia* was not, when sunk, and never had been, in the service of the Government; that there were no Asiatics on board save the Indian crew; and that she did not take the usual route, for fear of submarines."—J. B. McMaster, *United States in the World War*, pp. 280-281.—See also WORLD WAR: 1916: IX. Naval operations: b.

ARABIC, White Star liner, torpedoed by a German submarine on August 19, 1915, while on a voyage to New York. The attack, which occurred near the scene of the *Lusitania* tragedy, was without warning, and the vessel sank within 10 minutes, with resultant loss of fifty-four lives, including three Americans. The German Government at first asserted that the *Arabic* had attempted to ram the submarine but later waived this contention. While the case was in discussion between the two Governments, Count von Bernstorff, on September 1, gave a pledge for his Government that "liners will not be sunk by our (German) submarines without warning and without safety of the lives of noncombatants, provided that the liners do not try to escape or offer resistance." This pledge was given in ostensible answer to the third *Lusitania* note and without reference to the *Arabic* sinking, which, however, was adjusted under it. In a second note, dated October 5, the German ambassador notified the State Department that his Government "regretted and disavowed" the sinking of the *Arabic*, which "was undertaken against the instructions issued to the commander," and was "prepared to pay an indemnity for the American lives" lost.—See also U. S. A.: 1915 (May-September); 1915 (August); WORLD WAR: 1915: XI. Politics and diplomacy: d.

ARABIC LITERATURE.—Its characteristics.—"Of no civilization is the complexion of its literary remains so characteristic of its varying fortunes as is that of the Arabic. The precarious conditions of desert life and of the tent, the more certain existence in settled habitations, the grandeur of empire acquired in a short period of enthusiastic rapture, the softening influence of luxury and unwonted riches, are so faithfully portrayed in the literature of the Arabs as to give us a picture of the spiritual life of the people which no mere massing of facts can ever give. Well aware of this themselves, the Arabs at an early date commenced the collection and preservation of their old literary monuments with a care and a studious concern which must excite within us a feeling of wonder. For the material side of life must have made a strong appeal to these people when they came forth from their desert homes. Pride in their own doings, pride in their own past, must have spurred them on; yet an ardent feeling for the beautiful in speech is evident from the begin-

ning of their history. The first knowledge that we have of the tribes scattered up and down the deserts and oases of the Arabian peninsula comes to us in the verses of their poets. The early Teuton bards, the rhapsodists of Greece, were not listened to with more rapt attention than was the simple Bedouin, who, seated on his mat or at the door of his tent, gave vent to his feelings of joy or sorrow in such manner as nature had gifted him. As are the ballads for Scottish history, so are the verses of these untutored bards the record of the life in which they played no mean part. Nor could the splendors of court life at Damascus, Bagdad, or Cordova make their rulers insensible to the charms of poetry,—that 'beautiful poetry with which Allah has adorned the Muslim.' A verse happily said could always charm, a satire well appointed could always incite; and the true Arab of to-day will listen to those so adorned with the same rapt attention as did his fathers of long ago. This gift of the desert—otherwise so sparing of its favors—has not failed to leave its impression upon the whole Arabic literature. Though it has produced some prose writers of value, writing, as an art to charm and to please, has always sought the measured cadence of poetry or the unmeasured symmetry of rhymed prose. . . .

"Arabic poetry is thus entirely lyrical. There was too little, among these tribes, of the common national life which forms the basis for the Epos. The Semitic genius is too subjective, and has never gotten beyond the first rude attempts at dramatic composition. Even in its lyrics, Arabic poetry is still more subjective than the Hebrew of the Bible. . . . The horizon which bounded the Arab poet's view was not far drawn out. He describes the scenes of his desert life: the sand dunes; the camel, antelope, wild ass, and gazelle; his bow and arrow and his sword; his loved one torn from him by the sudden striking of the tents and departure of her tribe. The virtues which he sings are those in which he glories, 'love of freedom, independence in thought and action, truthfulness, largeness of heart, generosity, and hospitality.' His descriptions breathe the freshness of his outdoor life and bring us close to nature; his whole tone rings out a solemn note, which is even in his lighter moments grave and serious,—as existence itself was for those sons of the desert, who had no settled habitation, and who, more than any one, depended upon the bounty of Allah."—F. F. Arbuthnot, *Arabic authors*, pp. 23-24.—See also SEMITIC LITERATURE.—"The oral communications of the ancient Egyptians, Medes and Persians, the two classic tongues of Europe, the Sanscrit of the Hindus and the Hebrew of the Jews, have long since ceased to be living languages. For the last twelve centuries no Western language has preserved its grammar, its style, or its literature intact and intelligible to the people of the present day. But two Eastern tongues have come down from ages past to our own times, and continue to exist unchanged in books, and, to a certain extent, also unchanged in language, and these are Chinese and Arabic. . . . The unchangeable character of the Arabic language is chiefly to be attributed to the Koran, which has, from its promulgation to the present time, been regarded by all Muhammedans as the standard of religion and of literary composition. Strictly speaking, not only the history, but also the literature of the Arabs begins with Muhammad. Excepting the Muallakat, and other pre-Islamic poems collected in the Hamasas of Abu Tammam and Al-Bohtori, in Ibn Kutaiba and in the Mofaddhaliat, no literary monuments that preceded his time are in existence. The Koran became,

not only the code of religious and of civil law, but also the model of the Arabic language, and the standard of diction and eloquence. Muhammad himself scorned metrical rules; he claimed as an apostle and lawgiver a title higher than that of soothsayer and poet. Still, his poetic talent is manifest in numerous passages of the Koran, well known to those able to read it in the original, and in this respect the last twenty-five chapters of that book are, perhaps, the most remarkable. [See also KORAN.] Although the power of the Arabs has long ago succumbed, their literature has survived, and their language is still more or less spoken in all Muhammadan countries. Europe at one time was lightened by the torch of Arabian learning, and the Middle Ages were stamped with the genius and character of Arab civilization."—R. A. Nicholson, *Literary history of the Arabs*, pp. xxi-xxii.

Pre-Mohammedan literature.—"The oldest monuments of written Arabic are modern in date compared with the Sabæan inscriptions, some of which take us back 2,500 years or thereabout. Apart from the inscriptions of Hijr in the northern Hijâz, and those of Safâ in the neighborhood of Damascus (which, although written by northern Arabs before the Christian era, exhibit a peculiar character not unlike the Sabæan and cannot be called Arabic in the usual acceptance of the term), the most ancient examples of Arabic writing which have hitherto been discovered appear in the trilingual (Syriac, Greek, and Arabic) inscription of Zabâd, south-east of Aleppo, dated 512 or 513 A. D., and the bilingual (Greek and Arabic) of Harrân, dated 568 A. D. With these documents we need not concern ourselves further, especially as their interpretation presents great difficulties. Very few among the pre-Islamic Arabs were able to read or write. Those who could read or write generally owed their skill to Jewish and Christian teachers, or to the influence of foreign culture radiating from Hira and Ghassân. But although the Koran, which was first collected soon after the battle of Yamâma (633 A. D.), is the oldest Arabic book, the beginnings of literary composition in the Arabic language can be traced back to an earlier period. Probably all the pre-Islamic poems which have come down to us belong to the century preceding Islam (500-622 A. D.), but their elaborate form and technical perfection forbid the hypothesis that in them we have 'the first sprightly runnings' of Arabian song. It may be said of these magnificent odes, as of the Iliad and Odyssey, that 'they are works of highly finished art, which could not possibly have been produced until the poetical art had been practised for a long time.' They were preserved during hundreds of years by oral tradition . . . and were committed to writing, for the most part, by the Moslem scholars of the early Abbasid age, *i. e.*, between 750 and 900 A. D."—*Ibid.*, pp. xxi-xxii.

Influence of the Koran.—Mohammedan and later literature.—"None of the prose of those ancient times has come down to us. It was not written, and was, indeed, not reckoned of sufficient importance to merit such an honour. The researches of the Arab philologists give us some idea of what this very primitive stage of literature must have been like. There were evening tales (*samar*) told under the nomads' tents, stories which were already being carried from town to town by the professional story-tellers, such as Nadr ibn Hârith, of Mecca, who had learnt the fine legends of the ancient Persian kings at Hira, and by them gained a fame which at one moment counterbalanced that Mahomet owed to the Koran stories, drawn from the Bible. The battle of Bedr

put an end to this dangerous competition. There were also the legendary and not at all trustworthy recitals of the Arab *Days*—tales of the great desert battles; proverbs, collected at a later date by philologists, and founded on forgotten incidents, frequently incomprehensible, and explained by purely imaginary comments and allusions, whose makers flattered themselves they would impress the minds of their fellow-creatures. All these go to make up the elements of a literary art of which we possess no written specimens, but which was eventually to undergo a great development."—C. Huart, *History of Arabic literature*, pp. 31-32.—"With the rise of the Abbassides (750), that 'God-favored dynasty,' Arabic literature entered upon its second great development; a development which may be distinguished from that of the Umâyyids (which was Arabian) as, in the very truth, Muhammadan. With Bagdad as the capital, it was rather the non-Arabic Persians who held aloft the torch than the Arabs descended from Kurêsh. It was a bold move, this attempt to weld the old Persian civilization with the new Muhammadan. Yet so great was the power of the new faith that it succeeded. The Barmecide major-domo ably seconded his Abbasside master; the glory of both rests upon the interest they took in art, literature, and science. The Arab came in contact with a new world. Under Mansûr (754), Harun al-Rashid (780), and Ma'mûn (813), the wisdom of the Greeks in philosophy and science, the charms of Persia and India in wit and satire, were opened up to enlightened eyes. Upon all of these, whatever their nationality, Islam had imposed the Arab tongue, pride in the faith and in its early history. 'Qur'an' exegesis, philosophy, law, history, and science were cultivated under the very eyes and at the bidding of the Palace. And at least for several centuries, Europe was indebted to the culture of Bagdad for what it knew of mathematics, astronomy, and philosophy. The Arab muse profited with the rest of this revival. History and philosophy, as a study, demanded a close acquaintance with the products of early Arab genius. The great philologist al-Asmâi (740-831) collected the songs and tales of the heroic age; and a little later, with other than philological ends in view, Abu Tammân and al-Bûchturi (816-913) made the first anthologies of the old Arabic literatures (*Hamâsah*). Poetry was already cultivated; and amid the hundreds of wits, poets, and singers who thronged the entrance to the court, there are many who claim real poetic genius. . . . During the third period—from Ma'mûn (813), under whom the Turkish body-guards began to wield their baneful influence, until the break-up of the Abbasside Empire in 1258—there are many names, but few real poets, to be mentioned. . . . Withal, the taste for poetic composition grew, though it produced a smaller number of great poets. But it also usurped for itself fields which belong to entirely different literary forms. Grammar, lexicography, philosophy, and theology were expounded in verse; but the verse was formal, stiff, and unnatural. Poetic composition became a *tour de force*. . . . Such tales as these, told as an exercise of linguistic gymnastics, must not blind us to the presence of real tales, told for their own sake. Arabic literature has been very prolific in these. They lightened the graver subjects discussed in the tent,—philosophy, religion, and grammar,—and they furnished entertainment for the more boisterous assemblies in the coffee-houses and around the bowl. For the Arab is an inveterate story-teller; and in nearly all the prose that he writes, this character of the 'teller' shimmers clearly through the work of the

'writer.' He is an elegant narrator. Not only does he intersperse verses and lines more frequently than our own taste would license; by nature, he easily falls into the half-hearted poetry of rhymed prose, for which the rich assonances of his language pre-dispose him. His own learning was further cultivated by his early contact with Persian literature; through which the fable and the wisdom of India spoken from the mouths of dumb animals reached him. . . . Nor were the Arabs wanting in their own peculiar 'Romances,' influenced only in some portions of the setting by Persian ideas. Such were the 'Story of Saif ibn dhi Yāzan,' the 'Tale of al-Zir,' the 'Romance of Dālmah,' and especially the 'Romance of Antar' and the 'Thousand Nights and A Night.' The last two romances are excellent commentaries on Arab life, at its dawn and at its fullness, among the roving chiefs of the desert and the homes of revelry in Bagdad. . . . Though the Arab delights to hear and to recount tales, his tales are generally short and pithy. It is in this shorter form that he delights to inculcate principles of morality and norms of character. He is most adroit at repartee and pungent replies. He has a way of stating principles which delights while it instructs. The anecdote is at home in the East: many a favor is gained, many a punishment averted, by a quick answer and a felicitously turned expression. Such anecdotes exist as popular traditions in very large numbers, and he receives much consideration whose mind is well stocked with them. Collections of anecdotes have been put in writing from time to time. Those dealing with the early history of the caliphate are among the best prose that the Arabs have produced."—C. D. Warner, ed., *Library of the world's best literature*, v. 2, pp. 669-675.—See also MOHAMMEDANISM.

ARACAUNO INDIANS. See PAMPAS TRIBES.

ARACHOTI, a people who dwelt anciently in the Valley of the Arghandab, or Urgundab, in eastern Afghanistan. Herodotus gave them the tribal name of "Pactyes," and the modern Afghans, who call themselves "Pashtun" and "Pakhtun," signifying "mountaineers," are probably derived from them.—M. Duncker, *History of antiquity*, bk. 7, ch. 1.

ARAD, temporary capital of Hungary. See HUNGARY: 1847-1849.

ARADUS, or Arvad. See RUAD.

ARAGO, Dominique François Jean (1786-1853), French astronomer and physicist. Made important contributions to astronomy and to our knowledge of magnetism, galvanism and polarization of light; discovered the development of magnetism by rotation; as a Republican, took part in the revolution of 1830, was a member of the Chamber of Deputies on the extreme Left; minister of war and marine in the provisional government of 1848; opposed the election of Louis Napoleon.

ARAGON.—The kingdom of Aragon which was one of the important independent states of Western Europe during the Middle Ages, lay in the northeastern part of the Iberian peninsula. In the eleventh century, it had already acquired a position of considerable importance through its expansion, at the expense of the Moors. In 1076, by the annexation of the kingdom of Navarre, Aragon became perhaps the strongest Christian state in Spain. In the reign of Alfonso I (1104-1134) occurred the capture of Saragossa (1118) which now became the capital of the kingdom. Disputes over the succession to the crown distracted the kingdom for many years after the death of Alfonso. But

in the reign of Alfonso II the important union of Aragon and Catalonia took place (1164). In the course of the next few years Alfonso acquired extensive dominions in southern France though the natural frontiers, especially the Pyrenees, interfered with the real union of the French and Spanish elements in Alfonso's dominions. In 1179, he made a treaty with the King of Castile, by which the two sovereigns agreed upon their respective spheres of influence.

"The reign of Pedro II (1196-1213) was troubled by the religious disturbances in the French part of his dominion. Southern France was, at this time, perhaps the most civilized part of Europe, but was kept in a state of political distraction through the turbulence of the nobility and the ambition of the kings of France to extend their authority over this region. By the end of the twelfth century the Albigensian heresy had secured a foothold in the country and was accepted by the majority of the inhabitants and this was to involve Pedro in a conflict with the redoubtable Simon de Montfort who was engaged in the pious and lucrative exercise of punishing heresy and seizing the rich lands of the heretical nobility.

"In 1213 the wicked and bloody, Albigensian Crusade seemed drawing toward its end. The victorious Crusaders had reduced their chief enemy, the Count of Toulouse, and his allies the Counts of Foix and the Comminges, to the lowest depths of despair: there hardly remained anything to conquer save the towns of Toulouse and Montauban, and the majority of the victors were already turning homeward, leaving Simon de Montfort and the knights whom he had enfeoffed on the conquered land to deal the last blow at the exhausted enemy. At this moment a new actor suddenly appeared upon the scene. The King of Aragon had long possessed a broad domain in Languedoc, and looked with jealousy upon the establishment of a new North-French power upon his borders. Carcassonne and other smaller places which owed him homage had been stormed and plundered by the Crusaders: they sheltered themselves under the plea of religion, and King Peter had long been loth to intervene, lest he should be accused of taking the side of the heretics. But as it grew more and more obvious that the war was being waged to build up a kingdom for Simon de Montfort rather than to extirpate the Albigenses, he determined at last to interfere. His vassals had been slain, his towns harried, and he had every excuse for taking arms against the Crusaders. Accordingly he concluded a formal alliance with the Counts of Toulouse and Foix, and promised to cross the Pyrenees to their aid with a thousand men-at-arms. He spent some months in preparing his host, mortgaged royal estates and pawned his jewels to raise money, and finally appeared near Toulouse in the month of September with the promised contingent. Most of his followers were drawn from Catalonia; his Aragonese subjects showed little liking for the expedition, fearing that they might be sinning against Christendom by lending aid to heretics. At the news of Peter's approach the men of Languedoc took arms on all sides, and the Counts of Toulouse and Foix were soon able to assemble a large army beneath their banners. They stormed Pujols, the nearest hostile garrison, and slew sixty of De Montfort's followers. The whole countryside was with them, and Simon's newly-won realm seemed likely to disappear in a moment."—C. Oman, *History of the art of war*, pp. 448-449.—"In a few moments the fight was over: King Peter was recognised and slain by a band of Crusaders, who had sworn he-

fore the fight to mark him down and stoop at no meaner prey. The most faithful of the knights of his household fell around him, the rest dispersed and fled in all directions. The slaughter was great, for the victors gave little quarter to heretics, and the prisoners were much less numerous than the dead."—*Ibid.*, pp. 455-456.—See also ALBIGENSES: 1210-1213.

"After the death of Pedro II, the succession of the crown fell to James I, the conqueror (1213-1276). The first years of his reign were troubled by civil wars but by 1228 he was in secure possession of the throne. His first conquest was the Island of Majorca which had been, for many years, a thorn in the side of the Catalans and was now a strong center of Moslem power. This conquest was achieved in 1229 and in six more years all the Balearic Isles were in his possession. Soon after the conquest of the rich province of Valencia was undertaken and by 1228 was completed by the capture of the city of Valencia. In the years 1265-1266, the King of Aragon effected the conquest of Nurcia for the King of Castile. (See also ALBIGENSES: 1217-1229; SPAIN: 1212-1238.) "Jaime was not only a great conqueror; he was also a great administrator. Owing to the entry of feudalism into northeastern Spain his nobles had such power that even the able Jaime was obliged often to compromise or to yield to their wishes. He took steps to reduce their power, at the cost of civil war, and in many other respects bettered the administration of his kingdom. . . . In 1276 when the great king died he left a will which contradicted the policies of centralization and the aggrandizement of the kingdom which in his lifetime he had unflinchingly pursued. He divided his realms, giving Aragon, Catalonia, and Valencia to his eldest son, Pedro, and Majorca and the Roussillon (in southern France) to his son Jaime. The division was not to endure long, however."—C. E. Chapman, *History of Spain*, p. 82.—See also CATALONIA: 712-1106; SPAIN: 1035-1258.

ARAN ISLANDS, three small barren islands in Galway bay, off the west coast of Ireland. The life is exceedingly primitive and the entire population very poor, for the only means of livelihood is fishing. Gaelic costumes, language and customs are here preserved to a remarkable degree. The islands are famous for the number of antiquities they contain, the best known being that of Dun-Aengus, a fortress tower supposed to have been built in the first century A. D. The islands are the scene of several plays, particularly "Riders to the Sea," by John Millington Synge, who made four or five visits to them. It is from his account that the following quotation is taken. "There are three islands: Aranmor [or Inishmor], the north island, about nine miles long; Inishmaan, the middle island, about three miles and a half across, and nearly round in form; and the south island, Inishere—in Irish, east island,—like the middle island but slightly smaller. They lie about thirty miles from Galway, up the centre of the bay, but they are not far from the cliffs of County Clare, on the south, or the corner of Connemara on the north. Kilonan, the principal village on Aranmor, has been much changed by the fishing industry. The other islands are more primitive, but even on them many changes are being made."—J. M. Synge, *Aran Islands*, pp. 11-12.

ARANDA, Pedro Pablo Abarca de Bolea, Count of (1710-1798), Spanish statesman and general of the period of "enlightened despotism." Commanded the army against Portugal 1763; in 1764 became governor of Valencia. As president of the council from 1766 to 1773 (see SPAIN: 1759-1788) he restored order and expelled the Jesuits (see also JESUITS: 1757-1773); ambassador to Paris until 1787; prime minister under Charles IV for a brief time.

ARANJUEZ, town and royal residence of Spain, on the Tagus in New Castile, about thirty miles south of Madrid. It is noted for its beautiful parks and gardens. The treaty between France and Spain was signed here in 1772. The uprising of the populace in 1808 led to the ab-

dication of Charles IV and his flight into France, accompanied by the Queen and Godoy.

ARAPAHOE INDIANS. See ALGONQUIAN (ALGONKIN) FAMILY; INDIANS, AMERICAN: Cultural areas in North America: Plains area; also 1865-1876; PAWNEE FAMILY; SHOSHONEAN FAMILY; WYOMING: 1851-1865.

ARAR, the ancient name of the river Saone in France.

ARARAT, the name given to the high peak of the Armenian plateau, rising 17,000 feet above sea level; according to one tradition, the landing place of Noah's ark. See ALARODIANS; ARMENIA: B. C. 585-55.

ARARUD. See ALARODIANS.

ARAS, Armenian river. See ARAXES.

ARASON, Jon (1484-1551, the last Roman Catholic bishop in Iceland. A celebrated poet of his day, he introduced the art of printing in that island.

ARATUS (271-213 B.C.), Greek statesman, born at Sicyon, which he delivered from the ruling tyrant and enrolled in the Achæan League; as general of the League, won over Corinth, Megalopolis and Argos. His success in making the League a weapon against tyrants and foreign foes was undone by his opposition to democratic reforms. See ACHÆAN LEAGUE; ALEXANDRIA: B. C. 282-241: Culture; GREECE: B. C. 280-146.

ARAUCA (Arawak) INDIANS. See CARIBS; INDIANS, AMERICAN: Cultural areas in South America: Amazon area.

ARAUCANIAN INDIANS. See CHILE: Aborigines; INDIANS, AMERICA: Cultural areas in South America: Pampean area.

ARAUCANIAN WAR OF INDEPENDENCE. See CHILE: 1535-1724.

ARAUSIO, a Roman colony, was founded by Augustus at Arausio, which is represented in name and site by the modern town of Orange, in the department of Vaucluse, France, eighteen miles

north of Avignon.—P. Godwin, *History of France; Ancient Gaul, bk. 2, ch. 5.*

Battle of Arausio (B. C. 105). See CIMBRI AND TEUTONES: B. C. 113-101.

ARAVISCI AND OSI.—"Whether . . . the Aravisci migrated into Pannonia from the Osi, a German race, or whether the Osi came from the Aravisci into Germany, as both nations still retain the same language, institutions and customs, is a doubtful matter. The locality of the Aravisci was the extreme north-eastern part of the province of Pannonia, and would thus stretch from Vienna (Vindobona), eastwards to Raab (Arrabo), taking in a portion of the south-west of Hungary. . . . The Osi seem to have dwelt near the sources of the Oder and the Vistula. They would thus have occupied a part of Gallicia."—Tacitus, *Germany.*

ARAWAK (Arauaca) INDIANS. See CARIBS; INDIANS, AMERICAN: Cultural areas in South America: Amazon area.

ARAXES.—This name seems to have been applied to a number of Asiatic streams in ancient times, but is connected most prominently with an Armenian river, now called the Aras, which flows into the Caspian.

ARBAS, Battle of (581).—One of the battles of the Romans with the Persians in which the former suffered defeat.

ARBE, island in the Adriatic, part of northern Dalmatia, promised to territory of Croatia, Serbia, and Montenegro, by Treaty of London. See LONDON, TREATY OR PACT OF.

ARBELA, or Gaugamela, Battle of (331 B.C.). See MACEDONIA: B. C. 334-330.

ARBELEST; Its use in warfare. See LONGBOW.

ARBILITIS. See ADIABENE.

ARBITRATION: Defined.—Its place in law. See COMMON LAW: 1011-1921.

ARBITRATION, Industrial. See ARBITRATION AND CONCILIATION, INDUSTRIAL.

ARBITRATION, INTERNATIONAL

"The decision of disputes by international arbitration is a question of rapidly increasing importance, especially in view of the growing agitation for international peace. It is a mode of settling disputes between two or more states by submitting the controversy to the ultimate decision of third parties. This is done by a form of treaty, which provides for the appointment of the arbitrators, rules of procedure, and all other matters necessary to the arbitration. The award of the arbitrators is as binding upon the parties as any treaty obligation, and the United States courts have held that the finding of a court of arbitration will be given the same effect in courts as a regular treaty. The award may be avoided when the tribunal has clearly exceeded its powers as conferred by the treaty of arbitration, when the decision is an open denial of justice, when the award has been secured through fraud or corruption, and when the terms of the finding are equivocal."—A. B. Hall, *Outline of international law, p. 64.*—See also TREATIES, MAKING AND TERMINATION OF: Forms of international contract.—"A host of support could be marshalled for the contention that arbitral settlement is one and the same thing as judicial settlement, the distinction being not between law and arbitration, but between arbitration and mediation. The authorities have been collected by Balch in an article entitled '*Arbitration*' as a Term of Inter-

national Law wherein the use of the term in international law as opposed to municipal law is traced. He finds little support for the theory that international arbitration is a system of compromise. He quotes Pufendorf, Klüber, Rolin-Jacquemyns, Renault, Westlake, and Martens, all to the same effect as John Bassett Moore, who says [*History and digest of international arbitrations, v. 5, p. 5042*], "It is important, from the practical as well as the theoretical side of the matter, to keep in view the distinction between arbitration and mediation—a distinction either not understood or else lost sight of by many who have undertaken to discuss the one subject or the other. Mediation is an advisory, arbitration a judicial, function. Mediation recommends, arbitration decides."—F. C. Hicks, *New world order, pp. 152-153.*—See also INTERNATIONAL LAW.

ANCIENT TIMES

"As early as the seventh century before Christ the Greeks had already adopted the idea of arbitrating boundary questions and other disputes which arose between the different city-states. These must be regarded as real cases of interstate arbitration because the city-states concerned were, in the earlier period, politically independent and approximately equal in military

strength. In the period after the formation of the Hellenic League their freedom of independent action was, of course, curtailed. Philip of Macedon and Alexander made a conscious and apparent attempt to have the numerous disputes of the Greek states settled by arbitral decisions, using the General Council of the Hellenic League in the work. Under the Hellenistic kings who succeeded Alexander, many of the Greek states retained complete freedom and others a measure of their old independence in their foreign relations. The Aetolian and Achaean Leagues acknowledged the principle and resorted to the use of arbitration.—[See also ACILÉAN LEAGUE.] We may, therefore, regard the cases decided in that period as falling under the head of pure arbitration. With the advent of Rome and the ascendancy of the Roman senate in the affairs of the eastern Mediterranean, the balance of power had so markedly shifted to the senate that it becomes increasingly difficult to determine where arbitration ends and dictation to inferior and semi-dependent powers begins. It is safe to say that real arbitration between the Greek city-states ceased after 146 B. C.”—G. W. Botsford and E. G. Sihler, *Hellenic civilization*, p. 579.—“In ancient times, when war constituted the normal state of peoples and the foreigner was everywhere treated as an enemy, arbitrations were necessarily rare, and we do not find either a general system or harmonious rules governing the subject. There were a few cases of arbitration in the East and in Greece, but the mode of procedure was not suited to the temperament of the people, and, after the peace of Rome was established, with the civilized world under one government, there was no place for it, since arbitration presupposes a conflict between independent states.”—M. A. Mérignhac, *Traité théorique et pratique de l'arbitrage international*.

ALSO IN: M. N. Tod, *International arbitration amongst the Greeks*.

MIDDLE AGES

“In the Middle Ages, owing to the peaceful [and powerful] influence of the church, arbitrations were more frequent, and yet their influence was far from producing all the results which might have been expected, perhaps because Europe was then divided into a great number of petty states, or because the rude manners of the period were intolerant of the idea of conciliation. . . . The popes by degrees accepted the idea that they were placed above sovereigns and were the representatives of God on earth. In virtue of their divine power the Roman pontiffs, recognized everywhere as the delegates of God, from whom all sovereignty emanates, constituted themselves judges of all cases and evoked to their tribunal all differences between peoples and kings. Innocent III. declared that the pope was the sovereign mediator on earth. . . . The principle of pontifical sovereignty had so entered into the manners of the times that popes were often chosen also as voluntary arbitrators. It has sometimes been said that their intervention, whether spontaneous or specially invoked, was more frequently employed in matters of private interest and internal policy, than of actual international conflict. This may have been so in many instances, but it cannot be denied that they were also called upon to decide litigations much more important, as certain examples will readily show. Popes Alexander III., Honorius III., John XXII., Gregory XI. were chosen as arbitrators in quarrels which agitated Europe; and Pope Alexander VI., by a decision of arbitration which is still cele-

brated, traced an imaginary line from pole to pole, dividing between the Spaniards and the Portuguese the possession of all countries discovered in the new world. And even after the schism of England, when the Papacy had lost Teutonic and Gallo-Teutonic Europe, and when Gallo-Romanic Europe was itself formed, the prestige of the popes was still so great that it forced itself on the Poles and the Muscovites. But acts of opposition, which began to appear on the part of kings before the 16th century, were accentuated after that time, and the choice of the pope as arbitrator became less frequent. . . . Beside the religious influence of the popes, we should place, as having contributed during the Middle Ages to the development of arbitration, feudalism, which, while extending itself over all Europe, naturally predisposed vassals to accept their lords as judges of their respective grievances. The most eminent of these lords, the kings, were often chosen as arbitrators, chiefly the kings of France. Saint Louis was constituted judge between Henry III. of England and his barons, in 1263, and between the counts of Luxemburg and of Bar, in 1268. Owing to his great wisdom and to the authority of his character, Louis IX., says M. Lacoïnta, rivalled the Papacy in the rôle of conciliator and arbitrator. Philip VI., Charles V., Charles VII., and Louis XI. were all chosen as arbitrators. The other monarchs of Europe filled the rôle, though not so often, notably the kings of England, Henry II. and William III. But the commission of arbitration was not generally confided to sovereigns from whom were apprehended attempts at absolute domination. . . . Occasionally a city assumed the duties of arbitrator, but such occasions were rare. . . . The parliaments of France, renowned for their wisdom and equity, were chosen to settle disputes between foreign sovereigns. Besides popes, kings, cities, and great constituted bodies, we may mention commissions of arbitration instituted by parties in proportions fixed in advance and invested with full power over particular subjects. . . . The doctors of the Italian universities of Perugia and Padua, and particularly of the celebrated University of Bologna, were, says Wheaton, on account of their fame and their knowledge of law, often employed as diplomatists or arbitrators, to settle conflicts between the different states of Italy. . . . Under the influence of religious and feudal ideas arbitrations were very frequent in the Middle Ages, which afford the remarkable spectacle of conciliation and peace making their way amid the most warlike populations that have ever existed. They were especially frequent in Italy, where in the 13th century there were not less than a hundred between the princes and inhabitants of that country. But when the Papacy had renounced its rule over civil society, and absolute monarchies gradually became established in Europe on the ruins of feudalism, arbitrations became more rare. They diminished during the course of the 14th and 15th centuries, and it is stated that from the end of the 16th century till the French Revolution they had almost disappeared from international usage. . . . If we should try to find judicial rules that governed arbitration in the different periods at which we have glanced, we should discover that they did not present great stability. . . . The procedure, also, varied according to the case, but it usually afforded certain guarantees and was invested with a certain judicial aspect. . . . The arbitral clause, or stipulation for the arbitration of difficulties that may arise, does not appear to have been frequent in the Middle Ages, or in later times, though we have had occasion to cite some examples of it. It seems,

however, to have been in use between the commercial cities of Italy. Vattel relates that the Swiss, in the alliances which they contracted, whether among themselves or with foreign peoples, had recourse to it; and he justly praised them for it. We may cite two applications of it in the case of the cities of Italy and the Swiss Cantons. In a treaty of alliance concluded in 1235, between Genoa and Venice, there is an article which reads thus: 'If a difficulty should arise between the aforesaid cities, which cannot easily be settled by themselves, it shall be decided by the arbitration of the Sovereign Pontiff; and if one of the parties violate the treaty, we agree that His Holiness shall excommunicate the offending city.'—M. A. Méringhac, *Traité théorique et pratique de l'arbitrage international*.—The above is translated from the French and quoted by Prof. John Bassett Moore, in his *History and digest of the international arbitrations to which the U. S. has been a party*, v. 5, App. 3 (*House of R. Mis. Doc. 212, 53 Cong., 2d Sess.*).

MODERN PERIOD

The period of the absolute monarchies did not further the use of arbitration, but with the rise of modern states, built as they are upon a complexity of economic and social interdependence that constantly increases as the means of communication increase, arbitration has become a practical and accepted necessity. The tremendous economic cost of war has strengthened the case of the many humanitarians who support the societies and conventions of the Peace Movement (q. v.) and who urge arbitration as the basis of peace. For the most part, the reformers have set before themselves the ideal of an international tribunal possessing, if not compulsory jurisdiction, at least such moral weight that resort to its award, except in case of extreme necessity, may become a duty of customary obligation. This is an admirable ideal, and the progress now made towards it is considerable, when we remember how lately the most that seemed practicable was a vague suggestion of appeal to the good offices of some friendly third power. But we must not forget that arbitration in any form is only an instrument for settling disputes, and is not equally appropriate in all cases. It is not safe to assume that all questions between sovereign states are analogous to those which cause litigation between individuals, and that no difficulty remains in the way of judicial solution if once an adequate judicial authority can be found. This is far from being so.

Types and methods of arbitration.—"International controversies may be divided, for the purpose in hand, into four classes. . . . In the first are such as relate to boundaries and territorial rights, including the construction of any treaties or other authentic documents bearing on such rights. Here we have almost a perfect analogy to cases between private owners. The main problem is to find an arbitrator, board of arbitrators, or standing tribunal, whose decision will command the respect of both parties. . . . Moreover, it may be said of these cases, as of similar cases in men's private affairs, that a decision arrived at by competent persons after argument is more likely to be just in itself and, what is more, satisfactory to the parties, than a compromise arrived at by direct negotiation. We may place in the same category with boundary settlements, though in a less important rank, the adjustment of pecuniary claims by subjects of one State against the Government of another, arising out of transactions or events

as to which no matter of principle is in dispute. Such claims have often been dealt with by joint Commissions proceeding in a more or less judicial manner, and there is seldom much difficulty about them, though the justice ultimately done is not always prompt. Here there is still a good deal of analogy to the ordinary civil business of municipal Courts. A second class of controversies turns on alleged breach or non-performance of active obligations arising out of the interpretation of treaties or official declarations, or out of the common customary duty of nations in particular circumstances, as where a breach of neutrality or excess in the exercise of a belligerent's rights against neutrals is complained of. . . . A third class of cases is that which is analogous to civil actions for wrongs. Here, a sovereign State, for the most part representing individual grievances and claims of its subjects, though not always or necessarily so, seeks compensation for harm caused to innocent persons, as owners of property or otherwise, by the incidents of warlike operations or civil disorder within the jurisdiction of the State to which the complaint is addressed; by denial of justice to its subjects in that jurisdiction; by alleged illegal or excessive proceedings of that other State's officers; or by acts done under colour of exercising some international right, but alleged to be a manifest abuse. Arbitral proceedings and awards have been of great use in these cases, but chiefly when the rules to be applied have been already agreed upon by the parties or are otherwise too plain for serious dispute. Very difficult and delicate questions arise when an arbitrator or arbitral commission has to consider whether acts done, perhaps, in a remote quarter of the world and under a foreign system of public law and legislation are to be deemed illegal or in the nature of unfriendly conduct. To whatever class a settled claim belonged in its inception, it would not be possible, without enormous labour, to say with any certainty what proportion of such claims have in substance been incident to the working out of former agreements, or otherwise mere items in a series of diplomatic transactions, or what proportion of the residue were in themselves capable of leading to serious trouble between the nations concerned. But it may be observed as to doubts of this kind: first, that accumulation of unsettled differences is a source of risk directly and indirectly, though they may be individually small; secondly, that the prevention of war between powerful States, or the termination of dangerous recrimination and ill-will, is much to have been accomplished even in a few cases. It is true that Governments submit to arbitration only when they do not want to fight; but it is also true that peaceful intentions are not always easy to carry out in the face of excited public opinion, and the existence of a known procedure which provides an honourable way of accommodation may make all the difference. There are moments when any expedient is good if only it serves to gain time. But the following classification may be useful. Nearly 200 cases of arbitration between 1815 and the end of the nineteenth century are collected in Mr. W. Evans Darby's *International Tribunals*. Omitting from the total the cases (nearly 10 per cent.) in which the proceedings were only after hostilities, were not of a juridical character, led to no decision, or were not between independent States, a rough analysis shows the remaining effective arbitrations to fall into the following groups:—questions of title and boundaries, about 30 per cent.; pecuniary claims of citizens in miscellaneous civil matters, about 20 per cent.; construction of treaties (other than boundary),

about 10 per cent.; claims arising out of warlike operations and for alleged illegal proceedings, or denial of justice, about 40 per cent. . . . There remains a fourth kind of differences between States, and the most dangerous; those which do not admit of reduction to definite issues at all. . . . Contests for supremacy or predominant influence are not disposed of by argument, in whatever shape they are disguised; indeed, the Powers concerned are usually less willing to invite or tolerate interference in proportion as the formal cause of quarrel is weak. . . . Only one remedy would be quite effectual, namely, that a coalition of Powers of superior collective strength should be prepared to enforce the principles which now stand unanimously acknowledged by the Second Peace Conference of the Hague. A certain number of minor wars have already been prevented, or kept within bounds, by influence of this kind; but the beneficent arts of diplomacy as hitherto practised have certainly not lost their importance in maintaining peace among the Great Powers. It is a grave mistake to depreciate them, as unthinking or ignorant enthusiasts for arbitration have sometimes done. They have probably been successful in our own time oftener and on more critical occasions than the Governments concerned have yet thought it wise to make public. . . . Broadly speaking, there are two methods of international arbitration, and subdivisions of procedure within each of them. First, the parties may refer the matter in difference to a judge or judges of their own choice, in pursuance of a standing treaty or a special convention for the case in hand. The arbiter may be the ruler of a third State, or a tribunal composed of persons named by the parties directly, or in part by friendly Governments at their joint request. Secondly, the States concerned may prefer to use the machinery provided by a standing international agreement of more general scope."—F. Pollock, *Modern law of nations (Cambridge Modern History, pp. 716-719)*.

The lead in developing the principle of arbitration has been taken by United States and Great Britain. The two governments have intermittently advanced proposals for an Anglo-United States arbitral treaty since the time of William Jay's proposal (1842) and that of John Bright (1887).—See also DIPLOMATIC AND CONSULAR SERVICE; PEACE MOVEMENT.

1794.—Jay treaty.—The treaty between United States and Great Britain, negotiated by John Jay in 1794, which referred several questions to arbitration, may be said to have paved the way for the revival of modern arbitration. By this treaty three mixed commissions were provided; one to settle the boundary along the St. Croix river; one to settle the question of contraband, prizes, and rights of neutrals; and one to decide upon the compensation due Great Britain for the violation of the peace treaty (1783) by the states in preventing the collection of debts due British creditors. See U. S. A.: 1794.

1814.—Treaty of Ghent.—Three commissions were provided to arbitrate between the United States and Great Britain: one to settle the ownership of islands in the Bay of Fundy and Passamaquoddy Bay; a second to settle the boundary between the St. Croix and the St. Lawrence; a third to settle the boundary between U. S. and Canada along the middle of the Great Lakes to the Lake of the Woods.

1818.—Agreement between United States and Great Britain regarding restoration of slaves.—The question regarding the restoration of slaves taken by the British from their possessions up to

the signing of the treaty of Ghent was referred to the Emperor of Russia who judged that the United States was entitled to compensation.

1819.—Treaty of Florida.—United States agreed to settle by arbitration her claims against Spain during her occupation of Florida.

1827.—North-Eastern boundary question.—The United States and Great Britain agreed to arbitrate this question, but later the United States refused to accept the award of the King of the Netherlands who was chosen arbitrator. The question was compromised by the Webster-Ashburton treaty.

1831.—Settlement of claims between United States and France.—The two countries agreed to arbitrate the claims of United States citizens for losses at sea during the Napoleonic wars, the claim to commercial privileges under the Louisiana Cession Treaty and the French Beaumarchais claim.

1835.—Compromise between Russia and Great Britain regarding claims in North America. See OREGON: 1741-1836.

1855.—"Reserved Fisheries Rights."—This question was settled by a mixed commission agreed upon between Great Britain and the United States. Privileges renounced in 1818 of taking and curing fish in unsettled bays and harbors along the Canadian shore were renewed.

1856.—Creation of Commission of the Danube. See DANUBE: 1850-1916.

1871-1872.—Alabama claims.—"The arbitration between Great Britain and the United States on the claims generically known as the *Alabama* claims, for damage done by the Confederate cruisers equipped or harboured in British ports during the American Civil War, was provided for by the Treaty of Washington of 1871; the award was made by a composite tribunal sitting at Geneva in 1872. This case is commonly said to have given great encouragement to the promoters of international arbitration, and cited as a kind of prerogative instance. An admirable example was certainly set by the determination of the two Powers to come to an understanding, and by the skill and tact of the diplomatists who settled the Treaty under anything but favourable conditions. The immediate effect in England was certainly not to increase the favour in which international arbitration was held; nor could it well be disputed, in the result, that the damages were excessive, since the balance for which no claimants could be found was left in the hands of the United States. Nevertheless, a fruitful example remained. A dispute between two Powers of the first rank, which, reasonably or not, had in fact become acute and even dangerous, was reduced to terms of judicial compensation without loss of honour on either side. Perfection was not to be looked for in an experiment of such novelty. . . ."—F. Pollock, *Modern law of nations (Cambridge modern history, pp. 720-721)*.—See also ALABAMA CLAIMS: 1871-1872.

1884.—Berlin Act. See BERLIN ACT.

1889-1890.—Inter-Parliamentary Union for International Arbitration established.—In 1889 there was held in Paris the first meeting of the Inter-Parliamentary Union (founded in 1887) for International Arbitration (q. v.), an association composed of members or former members of the legislatures of the world. In this body centered the activities of the promoters of an international court and the Hague Tribunal was largely a result of these activities. The year 1889 also saw the initial meeting of the Pan-American Congress, attended by representatives of all the American states but Santo Domingo. The International Bureau of American Republics was established and

in 1890 a general treaty of compulsory arbitration was proposed, to apply to all the American states for a period of twenty years. The proposal failed of ratification.

1889-1899.—Claims to Samoa by the United States, Great Britain and Germany.—The three powers agreed in 1889 to arbitrate their claims, but resulting complication caused the joint high commission (in 1899) to proceed to the islands, and there an agreement was signed for their partition. See SAMOA: 1889-1900.

1890.—First Pan-American Conference. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1890.

1891.—Delagoa Bay arbitration. See DELAGOA BAY ARBITRATION.

1892.—Arbitration of Bering sea seal fisheries question between United States and Great Britain. See BERING SEA QUESTION; U. S. A.: 1889-1892.

1893.—Arbitration on bimetallism. See MONEY AND BANKING: Modern: 1867-1893.

1893.—Arbitration of boundary dispute between Colombia and Costa Rica. See COLOMBIA: 1893-1900.

1897.—Settlement of Nicaragua and Costa Rica boundary dispute. See CENTRAL AMERICA: 1897.

1897.—Proposed Anglo-American arbitration treaty.—Secretary of State Olney and Lord Pauncefote negotiated in 1897 an arbitration treaty between the United States and Great Britain. The treaty, submitted to the United States Senate by President Cleveland, was rejected by that body. It lacked only two votes of the necessary two-thirds because of the oft-recurrent question of Constitutional usage: the impairing of the Senate's treaty-making power by dispensing with the need for Senatorial consent in a matter adjusted by arbitration.

1897-1899.—Venezuela and Great Britain.—Guiana boundary. See VENEZUELA: 1896-1899; U. S. A.: 1897 (January-May).

1898.—Argentina and Chile. See ARGENTINA: 1898.

1898.—Treaty between Italy and Argentina. See ARGENTINA: 1898.

1898-1899.—Tsar's rescript.—First Hague Conference.—Permanent Court of Arbitration established.—In August, 1898, the late tsar Nicholas II issued his famous "Peace Manifesto" calling the nations to a conference. The stated object was the diminution and regulation of armaments to relieve the heavy burden of taxation which oppressed the peoples, and the prevention of war by diplomatic-judicial procedure. The first conference opened at The Hague on May 18, 1899, under the presidency of a Russian jurist, the late Frederic de Martens, and sat till July 29. The greatest achievement of the conference was the establishment of a permanent court of arbitration at The Hague. (See below: 1907: Second Peace Conference at The Hague. "At the First Peace Conference, of 1890, an attempt, strongly supported, was made to frame and secure the adoption of a treaty of arbitration by which the nations would bind themselves to arbitrate a carefully selected list of subjects. This failed, owing to the opposition of Germany. As a compromise, Article 10 of the convention for the peaceful adjustment of international differences was adopted: 'Independently of existing general or special treaties imposing the obligation to have recourse to arbitration on the part of any of the Signatory Powers, these powers reserve to themselves the right to conclude, either before the ratification of the pres-

ent convention or subsequent to that date, new agreements, general or special, with a view of extending the obligation to submit controversies to arbitration to all cases which they consider suitable for such submission' (re-enacted in 1907 as Article 40). The article did not seem at the time to be of any special importance and it was generally looked upon as useless because independent and sovereign States possess the right without special reservation to conclude arbitration agreements, general or special, without being specifically empowered to do so. The fact is, however, that this article, insignificant and useless as it may seem, marks, one may almost say, an era in the history of arbitration. The existence of the article has called attention to the subject of arbitration and by reference to it many States have negotiated arbitration treaties. It is true that there is no legal obligation created by the article and it is difficult to find a moral one, for it is not declared to be the duty of any State to conclude arbitration treaties. The moral effect of the article has, however, been great and salutary, and the existence of numerous arbitration treaties based upon the reservation contained in the article shows the attention and respect which nations pay to the various provisions of The Hague Conference."—J. B. Scott, *Hague Peace Conferences of 1899 and 1907*.

"For an unquestioned example of a court of arbitration open to the whole world we must turn to the Permanent Court of Arbitration set up by The Hague Conference of 1899. . . . Chapter II of the Convention sets up the court and provides rules of procedure. It has been said of this tribunal that it is neither a court nor permanent; but we have the opinion of Professor John Bassett Moore written in 1914 that the convention establishing it 'is the highest achievement of the past twenty years in the direction of an arrangement for the peaceful adjustment of international controversies.'—[J. B. Moore, *International arbitration; a survey of the present situation*.] The Convention was revised by the Conference of 1907, the changes being largely verbal, or concerned with procedure. The essential character of the court and its jurisdiction remain as originally provided. The features of permanent organization are: first, a list of judges made up of not more than four persons of known competency in questions of international law and of the highest moral reputation, chosen by each contracting state. By agreement the same person may be selected by different powers. The judges are appointed for six years and their appointments may be renewed. . . . The Court has no obligatory jurisdiction but is competent to decide all cases submitted to it by agreement of the contracting parties. Its jurisdiction may, within the regulations, be extended to disputes between non-contracting powers [i. e., those not signers of The Hague agreement] or between contracting powers and non-contracting powers, on joint petition of the parties to such disputes. . . . The decisions are not made jointly by all members of the Court. When it has been agreed to submit a case to the Court, each party must choose its arbitrators from the general list. The number may be decided upon by the parties, but if they cannot agree the Convention stipulates that each party shall choose two arbitrators from the list, only one of whom can be its national appointee to the list, and these four arbitrators choose an umpire. . . . Pleadings are conducted by the presentation of cases, counter cases, and replies, accompanied with papers and documents; and the arguments are developed by oral discussions. . . .

The decision of the court is arrived at in private by majority vote, and the proceedings remain secret. . . . As pointed out by Professor Wilson in the preface to his *Hague Arbitration Cases*, the work of the Court has amply justified its creation. Fifteen cases have been decided relating to a variety of questions, including not only financial questions, but those of more delicate character such as the violation of territory, the right to fly the flag, the delimitation of boundaries, etc. The fact that these questions have been submitted is of great significance. Seventeen different states in all have been parties in cases before the Court. . . ." F. C. Hicks, *New world order*, pp. 158-161.—See also HAGUE CONFERENCES: 1899.

Following is a list of the cases decided with the dates of the awards:

- Mexico *v.* United States, Pious fund case, October 14, 1902.
 Germany, Great Britain, Italy *v.* Venezuela, Venezuelan preferential claims, February 22, 1904.
 France, Germany, Great Britain *v.* Japan, Japanese house tax case, May 22, 1905.
 France *v.* Great Britain, Muscat Dhows case, August 8, 1905.
 France *v.* Germany, Casablanca case, May 22, 1909.
 Norway *v.* Sweden, Grisbadarna case, Oct. 23, 1909.
 Great Britain *v.* United States, North Atlantic fisheries case, September 7, 1910.
 United States *v.* Venezuela, Orinoco Steamship Co. case, October 25, 1910.
 France *v.* Great Britain, Savarkar case, February 24, 1911.
 Italy *v.* Peru, Canevaro case, May 3, 1912.
 Russia *v.* Turkey, Russian indemnity case, November 11, 1912.
 France *v.* Italy, Carbage and Manouba cases, May 6, 1913.
 Netherlands *v.* Portugal, Island of Timor case, June 25, 1914.

Commission of Inquiry Cases

- Great Britain *v.* Russia, Dogger Bank case, February 26, 1905.
 France *v.* Italy, Tavignano, Camouna, and Gaulois cases, July 23, 1912.
 Spain, France, Great Britain *v.* Portugal, Seizure of pious funds in Portugal, Pending.

In about one-half the cases no parties to the controversy have sat as arbitrators. Nearly one-half the cases have been before three judges.

1902.—Arbitration of Argentina and Chile boundary dispute. See ARGENTINA: 1902.

1902.—Second Pan-American Conference.—Compulsory arbitration project.—Central American states.—"Ten of the nineteen nations represented at the City of Mexico [Second Pan-American Conference, 1902] united in the project of a treaty, to be ratified by their respective governments, providing for compulsory arbitration of all controversies which, in the judgment of any of the interested nations, do not affect either their independence or national honor; and it is prescribed that in independence and national honor are not included controversies concerning diplomatic privileges, limits, rights of navigation, or the validity,

interpretation, and fulfillment of treaties. [The treaty was signed by Argentine, Bolivia, Guatemala, Mexico, Paraguay, Peru, Dominican Republic, Salvador and Uruguay and became effective Jan. 31, 1903.] "Mexico became a party to this project, but the United States declined; thus showing an entire change of attitude on the part of these two nations since the Washington conference of 1890. Mexico had in the meantime adjusted its boundary dispute with Guatemala. But since Mr. Blaine's ardent advocacy of compulsory arbitration the Senate of the United States had manifested its opposition to the policy by the rejection of the Olney-Pauncefote arbitration treaty of 1897, and it is to be inferred that the Secretary of State did not think it wise to commit our government to a measure which had been disapproved of by the coordinate branch of the treaty-making power."—J. W. Foster, *Pan-American diplomacy* (*Atlantic Monthly*, April, 1902).—In fulfillment of the agreement at Mexico City a treaty of compulsory arbitration and obligatory peace was signed on Jan. 20, 1902, by the Central American states: Nicaragua, Salvador, Honduras, and Costa Rica, and they were joined on March 1, 1902, by Guatemala. A third treaty was signed at the Conference, Jan. 30th, between seventeen states, including the United States, relating to the adjustment by means of arbitration of difficulties resulting from financial questions.—See also AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1901-1902.

1902-1904.—Claims against Venezuela. See VENEZUELA: 1902-1904.

1907.—Central American court of arbitration established.—The five Central American states, meeting at the Central American Peace Conference at Washington, established in 1907 a court of compulsory arbitration. To this Central American Court of Justice the states agreed "to submit all controversies or questions which might arise among them, of whatsoever nature, and no matter what their origin may be, in case the respective departments of foreign affairs should not be able to reach an understanding."—See also CENTRAL AMERICA: 1907.

1907.—Second Peace Conference at The Hague.—Representatives of forty-five states met at The Hague in 1907 at the call for the second

Peace Conference. The principal achievement of this conference was the revision and amplification of work initiated by the conference of 1899, especially in the case of consolidating the Permanent Court of Arbitration. Constructive work was also accomplished in laying foundations for the International Prize Court. "The Second Hague conference also declared itself in principle in favor of obligatory arbitration and stated that those differences relating to the interpretation of international conventional stipulations are susceptible of being submitted to obligatory arbitration without any reservation. The failure of this conference to agree upon a definite plan of obligatory arbitration was mainly due to the opposition of Germany and Austria."—C. H. Stowell, *Outlines of international law*, pp. 276-277.—"As to arbitration, the constitution of the permanent Court of Arbitration is confirmed. Its essential feature is a standing list of qualified arbitrators, not more than four being named by each contracting Power. When a Court has to be made up, each Power concerned in the cause chooses two members from the list, and the arbitrators choose an umpire; there are further and seemingly effectual provisions in case they fail to agree. The *bureau international*, which is the permanent office or chancellery of the Court, is under the direction of a diplomatic board at The Hague. Terms of reference are, as a rule, to be handed in by the parties; but the Court may settle them itself if so requested by both parties, or under certain conditions even if only required by one. Elaborate provisions are made for the conduct of the proceedings. Further, a more summary form of arbitration with two arbitrators and an umpire may be adopted in affairs of less weight. All this appears, from a lawyer's point of view, to be sound and businesslike work. Doubtless, the jurisdiction is voluntary: but so was all jurisdiction in its beginning. As time goes on, it will be less and less reputable among civilized States to talk of going to war without having exhausted the resources of the Hague Convention; and the necessity of any formal international declaration in that behalf may be avoided altogether, if the tribunal acquires by custom, as one hopes it will, a stronger authority than any express form of words would confer. That the time is not now ripe for any such form is shown by the vague and halting recognition 'in principle' of a general duty of arbitration which is embodied in the Final Act of the Conference. Nor do we see much reason to regret the failure of an attempt to set up a new tribunal of arbitral justice, with permanent paid judges, which was to be more formal, more continuous, and less dependent on the parties' choice, and, it was hoped, would eventually supersede the existing Court. This scheme was brought forward by the United States. It broke down on the impossibility of agreeing in what manner and proportions judges should be appointed by the several Powers; the recognized equality of all independent States before the law of nations being extended by several members of the Conference, especially the leading South American delegates, to a claim for absolute equality in all political and administrative schemes. This interpretation, we submit, is perverse; but, on more than one occasion, it was among the gravest hindrances to the work of the Conference. In our opinion, however, there were much better reasons for not being in haste to imitate the forms of a Court exercising true federal jurisdiction. What is wanted to promote peace is not the nearest approach to compulsion, nor the most imposing Court, nor the most learned decisions possible, nor yet the speediest (for sometimes delay is rather of

advantage), but a working plan for producing, with as little friction as may be, decisions likely to be accepted. This the two Peace Conferences at the Hague have given us, and it is much."—F. Pollock, *Modern law of nations (Cambridge modern history, v. 12, p. 726)*.—As regards the American plan for the arbitral tribunal, the position is made clear in Secretary Root's instructions to the American delegation. It reads as follows: "It has been a very general practice for arbitrators to act, not as judges deciding questions of fact and law, upon the record before them, under a sense of judicial responsibility but as negotiators effecting settlement of the questions brought before them in accordance with traditions and usages and subject to all the considerations and influences which affect diplomatic agents. The two methods are radically different, proceed upon different standards of honorable obligation, and frequently lead to widely differing results. It very frequently happens that a nation which would be willing to submit its differences to an impartial judicial determination is unwilling to subject them to this kind of diplomatic process. If there could be a tribunal which would pass upon questions between nations with the same impartial and impersonal judgment that the Supreme Court of the United States gives to questions arising between citizens of the different states, or, between foreign citizens and the citizens of the United States, there can be no doubt that nations would be more ready to submit their controversies to its decision than they are now to take the chance of arbitration. It should be your effort to bring about in the 2nd conference a development of The Hague tribunal into a permanent tribunal composed of judges who are judicial officers and nothing less, who are paid adequate salaries, who have no other occupation, and who will devote their entire time to the trial and decision of international causes by judicial methods and under a sense of judicial responsibility. These judges should be so selected from the different countries that the different systems of law and procedure and the principal languages shall be fairly represented. The court should be made of such dignity, consideration and rank that the best and ablest jurist will accept appointment to it, and that the whole world will have absolute confidence in its judgments."—See also HAGUE CONFERENCES: 1907.

1907-1909.—Casablanca incident, between Germany and France, at The Hague. See Morocco: 1907-1909.

1908-1909.—General treaties.—The extended confidence in the Permanent Court of The Hague after the second Hague Conference resulted in the signing of numerous treaties designating the Permanent Court as the agreed tribunal in cases of arbitration. At the outbreak of the World War the only great power which was not a party to one or more of these agreements was Germany. (See below, TREATIES.) The treaties of this date, technically called Conventions, were all very similar and practically all of five-year duration. Through the efforts of Elihu Root, then Secretary of State, the United States became a party to twenty-four of these agreements. Recognition is given to the constitutional position of the Senate in the United States by requiring a special agreement of reference to be entered into by the president "with the advice and consent of the Senate." The distinctive article of the 1908-1909 treaties is given under Treaties, Note "C," where it is stated in elastic phrasing that differences shall be arbitrated *provided, nevertheless*, "that they do not affect the vital interests, the independence, or the

honour of the two Contracting States, and do not concern the interests of third Parties. . . . Lord Salisbury wrote, in the course of the negotiations preceding the unratified treaty of 1897 with the United States: 'Neither Government is willing to accept arbitration upon issues in which the national honour or integrity is involved.' Clearly, no nation will submit to any tribunal the question whether it shall accede to demands which its rulers consider ruinous or humiliating. What arbitrable question was there between Elizabeth of England and Philip of Spain when the Armada was off the Lizard? or, as has been pertinently asked, between Austria and France in 1850, or Russia and Turkey in 1877? Therefore, some such clause of exception appears unavoidable if the good faith of treaties is to be upheld, and we confess that we do not attach much importance to its exact form. It may be said that these exceptions can be used frivolously or in bad faith. But the same drawback exists in the construction and application of all treaties whatever. Well-meant proposals were made at the Hague for settling a list of causes of differences which should not be deemed vital; but the only result that appeared practicable was an enumeration of such matters of current business as have commonly been found well within the resources of diplomacy, and the project was wisely dropped."—F. Pollock, *Modern law of nations* (Cambridge modern history, v. 12, p. 727).

1909.—Dutch Guiana boundary settlement with Brazil. See BRAZIL: 1909.

1909.—Also claim of United States against Chile. See CHILE: 1909.

1909.—World petition for a general treaty of obligatory arbitration.—At the annual meeting of the International Peace Bureau at Brussels, October 9, 1909, the following resolution was adopted, expressing approval of the world-petition to the third Hague conference in favor of a general treaty of obligatory arbitration: "Whereas, Public opinion, if recorded, will prove an influential factor at the third Hague Conference; and Whereas, The 'world-petition to the third Hague Conference' has begun to successfully establish a statistical record of the men and women in every country who desire to support the governments in their efforts to perfect the new international order based on the principal of the solidarity of all nations; Resolved, That the Commission and the General Assembly of the International Peace Bureau, meeting of Brussels October 8 and 9, 1909, urgently recommend the signing of the 'world-petition to the third Hague Conference.'"

1909 (October).—American proposal that the prize court now established be also a court of arbitral justice.—By reference to the proceedings of the second peace conference at The Hague, as set forth above, it will be seen that the conference gave favorable consideration to a draft convention for the creation of a "judicial arbitration court" (the text of which draft is given at the end of said proceedings), and that the conference went so far as to declare the "advisability of adopting . . . and of bringing it into force as soon as an agreement has been reached respecting the selection of the judges and the constitution of the Court." It will be seen, also, that the conference adopted measures for the creation of an international prize court, preliminary to which an international naval conference was held in London from December 4, 1908, until February 26, 1909. At that conference a suggestion was made that "the jurisdiction of the International Prize Court might be extended, by agreement between two or more of the signatory Powers, to cover cases at present excluded from

its jurisdiction by the express terms of the Prize Court Convention, and that in the hearing of such cases that Court should have the functions and follow the procedure laid down in the draft Convention relative to the creation of a Judicial Arbitration Court, which was annexed to the Final Act of the Second Peace Conference, of 1907."

In line with this suggestion, it was made known, in the later part of the past year, that the government of the United States, through its state department, had proposed in a circular note to the Powers, that the prize court should be invested with the jurisdiction and functions of the proposed judicial arbitration court. The difficulties in selecting judges for that contemplated court, which caused the creation of it to be postponed in 1907, would thus be happily surmounted, and, as remarked by Secretary Knox, there would be at once given "to the world an international judicial body to adjudge cases arising in peace, as well as controversies incident to war."

1910.—Fourth Pan-American conference at Buenos Aires. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1910.

1911.—German government's views on arbitration.—"World-embracing international arbitration treaties dictated by an international areopagus I consider just as impossible as general international disarmament. Germany takes up no hostile position toward arbitration. In all the new German treaties of commerce there are arbitration clauses. In the main it was due to Germany's initiative that an agreement was arrived at at the second Hague conference for the establishment of an International Prize Court. Arbitration treaties can certainly contribute in a great measure to maintain and fortify peaceful relations. But strength must depend on readiness for war. The dictum still holds good that the weak becomes the prey of the strong. If a nation can not or will not spend enough on its defensive forces to make its way in the world, then it falls back into the second rank."—*German Imperial Chancellor von Bethmann-Hollweg in Reichstag, Mar. 30, 1911.*

1913.—Bryan-Wilson treaties.—Body of the treaties.—Character.—List of treaties from 1896-1920, including the Bryan-Wilson treaties.—On entering upon his duties as secretary of state Mr. Bryan was faced with the problem of the renewal of the twenty-four treaties of 1908-1909. He proposed the insertion in the treaties of a clause requiring that if a disagreement should occur between the contracting parties which, in the terms of the arbitration treaty, need not be submitted to arbitration, they should, before declaring war, submit the matter to the Hague Court or to some other impartial tribunal for investigation and report. The final form of the Bryan-Wilson treaties, of which approximately thirty are in force, is the development of the commission of inquiry and is not technically an arbitration agreement. The body of these treaties is:

"ARTICLE I. The high contracting parties agree that all disputes between them, of every nature whatsoever, which diplomacy shall fail to adjust, shall be submitted for investigation and report to an International Commission, to be constituted in the manner prescribed in the next succeeding Article; and they agree not to declare

war or begin hostilities during such investigation and report.

"ARTICLE II. The International Commission shall be composed of five members, to be appointed as follows: One member shall be chosen from each country, by the Government thereof; one member shall be chosen by each Government from some third country; the fifth member shall be chosen by common agreement between the two Governments. The expenses of the Commission shall be paid by the two Governments in equal proportion. The International Commission shall be appointed within four months after the exchange of the ratifications of this treaty; and vacancies shall be filled according to the manner of the original appointment.

"ARTICLE III. In case the high contracting parties shall have failed to adjust a dispute by diplomatic methods, they shall at once refer it to the International Commission for investigation and report. The International Commission may, however, act upon its own initiative, and in such case it shall notify both Governments and request their coöperation in the investigation. The report of the International Commission shall be completed within one year after the date on which it shall declare its investigation to have begun, unless the high contracting parties shall extend the time by mutual agreement. The report shall be prepared in triplicate; one copy shall be presented to each Government, and the third retained by the Commission for its files. The high contracting parties reserve the right to act independently on the subject-matter of the dispute after the report of the Commission shall have been submitted.

"ARTICLE IV. Pending the investigation and report of the International Commission the high contracting parties agree not to increase their military or naval programs, unless danger from a third power should compel such increase, in which case the party feeling itself menaced shall confidentially communicate the fact in writing to the other contracting party, whereupon the latter shall also be released from its obligation to maintain its military and naval *status quo*.

"ARTICLE V. The present treaty shall be ratified by the President of the United States of America, by and with the advice and consent of the Senate thereof; and by [the President of the Republic of Salvador] with the approval of the Congress thereof; and the ratification shall be exchanged as soon as possible. It shall take effect immediately after the exchange of ratifications, and shall continue in force for a period of five years; and it shall thereafter remain in force until twelve months after one of the high contracting parties have given notice to the other of an intention to terminate it.

". . . The success of the Wilson-Bryan proposal may be defined as due to its strict adherence to the principle of the commission of inquiry; the advance it records is that of the greatest possible development within the limits of that principle. It brings forward into the range of practical affairs the well-attested maxim that war will not come in cold blood from a dispute the facts of which are thoroughly attested. It goes no further, for freedom of action is reserved by both parties after the commission's work is done. . . . The fact that the commission becomes a permanent one makes appointments to it on the part of the United States subject to confirmation by the Senate. On this account the Senate, as a coördinate part of the treaty-making power, is in a position always to secure commis-

sion members for the American quota who are satisfactory to it."—D. P. Myers, *Commission of inquiry* (World Peace Foundation Pamphlet series, v. 3, no. 2, p. 25).

ALSO IN: *Treaties for the advancement of peace between the United States and other Powers, negotiated by the Honorable William J. Bryan, Secretary of State of the United States.*

The treaties differ in the range given to the obligation imposed upon the signatory parties, as to the nature of the differences they shall submit to arbitration. Most of them, however, are divisible in this respect into three classes, distinguished by the reference letters "A," "B," and "C," and the distinctions are described in J. B. Scott, "Hague Peace Conferences of 1899 and 1907." Treaties concluded by the United States have otherwise distinctive characters, as explained in notes "D" and "E."

"A.—The article of reference in these treaties is substantially (when not identically) as follows:

"The high contracting parties agree to submit to the permanent Court of Arbitration established at The Hague by the Convention of July 29, 1890, the differences which may arise between them in the cases enumerated in Article 3, in so far as they affect neither the independence, the honor, the vital interests, nor the exercise of sovereignty of the contracting countries, and provided it has been impossible to obtain an amicable solution by means of direct diplomatic negotiations or by any other method of conciliation.

"1. In case of disputes concerning the application or interpretation of any convention concluded or to be concluded between the high contracting parties and relating—(a) To matters of international private law; (b) To the management of companies; (c) To matters of procedure, either civil or criminal, and to extradition.

"2. In cases of disputes concerning pecuniary claims based on damages, when the principle of indemnity has been recognized by the parties.

"Differences which may arise with regard to the interpretation or application of a convention concluded or to be concluded between the high contracting parties and in which third powers have participated or to which they have adhered shall be excluded from settlement by arbitration."

"B.—The treaties of this noble class are the few thus far concluded which pledge the parties engaged in them to submit *all differences that may arise between them to pacific arbitration*, reserving no dispute of any nature, to become a possible entanglement in war. The formula of reference in them is substantially this:

"The high contracting parties agree to submit to the permanent Court of Arbitration established at The Hague by the Convention of July 29, 1890, *all differences of every nature that may arise between them, and which cannot be settled by diplomacy, and this even in the case of such differences as have had their origin prior to the conclusion of the present Convention.*"

"C.—The reference clause in these treaties is substantially alike in all, to the following purpose:

"Differences which may arise of a legal nature, or relating to the interpretation of treaties existing between the two contracting parties, and which it may not have been possible to settle by diplomacy, shall be referred to the Permanent Court of Arbitration, established at The Hague by the convention of the 29th July, 1890; provided, nevertheless, that they do not affect the vital interests, the independence, or the honor of the two contracting States, and do not concern the interests of third parties."

"D.—In these treaties of arbitration negotiated by the United States the article of reference is like that last quoted, in note C; but the following is added to it:

"In each individual case the High Contracting Parties, before appealing to the Permanent Court of Arbitration, shall conclude a special Agreement, defining clearly the matter in dispute, the scope of the powers of the arbitrators, and the periods to be fixed for the formation of the Arbitral Tribunal and the several stages of the procedure. It is understood that on the part of the United States such special agreements will be made by the President of the United States, by and with the advice and consent of the Senate thereof, and on the part of Costa Rica shall be subject to the procedure required by the Constitution and laws thereof."

"This was required by the United States Senate, which rejected a number of earlier arbitration treaties, negotiated by Secretary Hay, because they would have allowed cases of controversy with other nations to be referred to The Hague tribunal by the president without specific consent from the Senate in each particular case. This brings the general treaty of arbitration down very close to absurdity, leaving almost nothing of its intended pacific influence to act."

E.—The Bryan-Wilson treaties are designated by the letter "E." The abbreviation "S" is used before the date of signature and "R" before the date of the final ratification, or, in the case of the Bryan-Wilson treaties, the "R" signifies the date of the exchange of ratifications.

Under each country is given a list of the treaties with other countries. Each treaty is mentioned only once, with references to it from the other countries concerned in Italics.

1914.—Arbitration agreements at the outbreak of the World War.—Considering the number of arbitration treaties in force in 1914 it is significant that only three were operative between those states which fought on opposing sides in the World War. Of the three, that between Germany and Great Britain expired by limitation on July 1, 1914, or thirty-five days before the contracting states were at war. The other two treaties were between Austria-Hungary and Great Britain and between Austria-Hungary and Portugal, respectively.

1914.—Arbitration proposals to avoid the war.—Count Berchtold, Austro-Hungarian foreign minister, launched the fateful ultimatum to Serbia on July 23, 1914. Of the ten demands presented in that document, the Serbian government, acting on Russian advice, acceded to all with only two reservations—articles 3 and 4, which they asked to be permitted to submit to The Hague tribunal. The request was rejected by Austria. The late tsar Nicholas II telegraphed to the former German emperor at the end of July a proposal to submit the Austro-Serbian dispute to The Hague tribunal—an appeal that received no answer.—See also WORLD WAR: Diplomatic background: 21; 22; 23; 26; 28.

1914.—Ratification of the convention adopted at the Third Pan-American Conference (1906).—Seventeen participants ratified this convention, the gist of which is as follows: The contracting Powers agree not to have recourse to armed force for the recovery of contract debts. This undertaking is, however, not applicable when the debtor state refuses or neglects to reply to an offer of arbitration, or after accepting the offer, prevents any compromise from being agreed on, or after the arbitration fails to submit to the award.

1919.—Obligatory general arbitration treaty between Paraguay and Uruguay. See PARAGUAY: 1919 (November).

1919-1920.—Arbitration provisions in the League of Nations.—The nations of the league agree to use arbitration to settle "arbitrable" disputes in which diplomacy has failed and while the league council stands as one tribunal it is generally conceded that only extreme cases will come before it, and a temporary arbitral commission or The Hague permanent court will be used. The league court for which provision is made in the covenant is in no way intended to take the place of The Hague permanent court of

arbitration. According to article 13 of the covenant "Disputes as to interpretation of a treaty, as to any question of international law, as to the existence of any fact which, if established, would constitute a breach of any international obligation, or as to the extent and nature of the reparation to be made for any such breach, are declared to be among those which are generally suitable for submission to arbitration." Article 21 reads: "Nothing in this covenant shall be deemed to affect the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe Doctrine, for securing the maintenance of peace."

On Dec. 13, 1920, the session of the League of Nations at Geneva adopted the proposal for the establishment of a "permanent court of international justice." "Before coming into operation, the plan must be ratified by a majority of the members of the League. The court, which is to sit at The Hague, will be composed of eleven judges chosen by the League, but not invested with compulsory jurisdiction. Of the forty nations represented, thirty-six favored compulsory jurisdiction, while France, Great Britain, Italy and Japan opposed it. The four great powers carried their point, as the alternative lay between no court at all or a court unendowed with compulsory jurisdiction. The plan to constitute the court had been drafted by an international group of jurists including Elihu Root, and compulsory jurisdiction had been attached for the valid reason that such a court would be useless or at least impotent if resort to its mediation were merely voluntary and not obligatory. Owing to the opposition of the 'Big Four,' however, that provision was eliminated, although particular stress was laid on the point that had such a court been in existence in 1914 it would have been powerless to prevent the war, since Austria could have refused to submit her quarrel with Serbia to its adjudication. A proposal to abolish the Hague arbitration court was rejected on the ground that the new court would "render decisions according to the rules and forms of law, and that an institution [as that at The Hague] organized for purely arbitral decisions will still be required."—*New York Times*, Dec. 14, 1920.—The league council has already proved its value as an arbitral court. On September 17, 1920, Poland and Lithuania invited its good offices as arbitrator and the following day Finland and Sweden referred to it the disputed ownership of the Aland islands (q. v.). "In production, in commerce and in finance, the progress of invention and of world organization has brought about an ever closer community of interest between the nations, and even the countries which have sought to be self-contained have been compelled to move with the times and to base their welfare in an ever increasing degree upon world production, upon international trade, and upon world finance. But politically, until the present war, the nations have continued to pursue a purely individualistic policy. Even now the policy of coöperation between the various nations for the purpose of making war has been pursued by most of them merely because of the imminent and great danger to which they were exposed until they did coöperate, not because it is the wiser policy in peace as well as in war, but because it is the only policy that can give to the nations security under modern conditions. It is true that some progress was made in this direction prior to the war, but when one considers the difficulty then experienced in inducing the nations to take collective action, even about matters upon

which every one seemed to be agreed in principle, and recollects the really trivial causes of international friction that were allowed to endanger the world's peace from time to time, one is compelled to realize that politically the nations had lagged far behind their economic, financial and intellectual development. . . . The reasons for the backwardness of the world from the standpoint of international relations are obvious. For one thing, national matters are usually so much more immediate and more pressing than international problems, and consequently monopolize the attention of politicians and statesmen to the exclusion of matters of more fundamental importance, except in periods of temporary crisis. The second reason is that in the past the number of persons who concerned themselves with international affairs was very limited, that consequently there was not the same amount of constructive criticism devoted to foreign affairs as to other branches of public policy, that the few experts deprecated, and in some measure resented, either public discussion or public criticism, and that in consequence of lack of information, lack of discussion and lack of criticism, the general public was kept almost in complete ignorance of world politics. The third reason is that hitherto very few statesmen or experts in foreign affairs have realized the community of economic interest in all countries which has been created by the wonderful improvements in the means of communication and of intercourse,

and by the introduction of the credit system, all of which have so greatly stimulated and assisted world production and distribution of the necessities of life."—Sir G. Paish, *Permanent league of nations*, pp. 24-28.

ARBITRATION AND CONCILIATION, INDUSTRIAL

The subject of industrial arbitration and conciliation is intimately connected with nearly every phase of the labor question, and the reader is therefore referred to the articles LABOR LEGISLATION, LABOR ORGANIZATION, LABOR REMUNERATION, and LABOR STRIKES AND BOYCOTTS for much information which supplements and amplifies the material in this article.

The interests of the public, of the employer, and of the employee are served by continuity of production, which depends in large part upon harmonious relations between the management and the workers. Conciliation, whereby a mediator or mediating board, bringing the two sides together or acting as a go-between, effects a compromise, has often been of service in preserving or renewing that harmony. In many cases, however, dependence has been placed upon arbitration, in which the decision is made by a third party; the process leading to it may be voluntary, or it may follow from investigation required by law, or, in addition to the investigation being compulsory, the award may be binding under law. Legislation along these lines has concerned itself chiefly with public utilities. Publicity for the facts has at times accomplished much through the force of aroused public opinion.

"In spite of its many obvious advantages the method of arbitration is not popular either with employers or employed. Employers object to it because it means that the method in which they are to carry on their business is decided for them by an outsider who is frequently not sufficiently acquainted with the practical and technical difficulties of the industry; while employees on the other hand object to it because they have found that the arbitrator bases his award upon fundamental assumptions which they do not accept. Thus, as Mr. and Mrs. Webb point out, arbitration

can only be successful when certain main points are agreed upon as common ground between the parties, as for example that a fixed minimum standard of life should be regarded as a first charge upon the industry of the country, or that wages should vary with the selling price of the product. So long as fundamental points and principles of this kind are not agreed on by both sides, arbitration does not stand much chance of satisfying the parties to a dispute; and the real value which an arbitrator performs as a rule in the settlement of disputes is in the work of conciliation. An impartial outsider, who is unaffected by any personal feeling in the matter, may do a great deal to bring the parties to a dispute together, and acting as a go-between may thus prevent them from resorting to extreme measures. The real defect of arbitration as a method of settling trade disputes is that the award is not binding on the parties, and there has consequently been a strong tendency in some quarters in recent years to provide a machinery which would have the effect of compelling employers and workmen to submit their disputes for arbitration and to abide by the result."—G. O'Brien, *Labour organization* (1921), pp. 02-03.—"It will be seen . . . that among the Australasian countries the general tendency of legislation is to place a limitation, and with practically one exception, a prohibition upon the right to strike upon railway and practically all other classes of industrial workers. Complete machinery, however, has been provided for the settlement of controversies. Another group of countries, on the other hand, such as Canada, the Transvaal, Spain, and Portugal, have not denied employees the right to strike, but have made the exercise of this right contingent upon certain conditions—a notification to the Government of the intention to strike or after a governmental investigation and report. In the case of other countries, as Rou-

mania, the right of railway workers or other public-utility employees to strike is absolutely prohibited, and no machinery is provided for ventilating grievances. Belgium and Holland also prohibit strikes but have devised methods for employees to take up grievances or requests with railroad managers. Strikes are not formally prohibited in Germany or Austria among railway workers, but are practically prevented by the control of the authorities over the trade-union affiliations of employees. In Germany, however, administrative machinery has been provided through which transportation workers may have a vent for their grievances. Strikes are not prohibited by formal legislative enactment on French railways, but are practically impossible, because of the policy of the Government in calling employees to the colors and placing them under military orders in the event of a strike. Italy depends upon the same policy to prevent industrial conflict on her railways. In Great Britain and the United States there is no abridgement of the right to strike. Both countries have provided official machinery for the adjustment of wage and other difficulties between the railroads and their operating forces."—*American Labor Year Book*, 1917-1918, p. 145.

AUSTRALIA

1891-1912.—Early legislation in Australian states. — Federal legislation. — Commonwealth court established by the Act of 1904.—The first Australian states to pass arbitration statutes were Victoria and New South Wales, whose laws were promulgated in 1891. South Australia followed in 1894, West Australia in 1900. "By the act of 1891, Victoria provided for the voluntary arbitration of collective disputes somewhat after the system of the English councils of conciliation act of 1867, except that the latter applied only to individual disputes and enforced arbitration. . . . In 1896, wages boards were introduced in Victoria. . . . These might be appointed on application of either party. A court of appeal, consisting of a supreme judge, had power under the act to review the determination of boards, and assessors might be appointed to assist the judge. The act fixed an absolute minimum wage. While it was originally designed to guarantee a minimum wage, it has gradually grown to be used more for the purpose of conciliation. . . . New South Wales passed its trade dispute conciliation and arbitration act after the great strike of 1891. . . . The act was passed to continue four years but it was a complete failure, only two of the sixteen cases referred having been settled during the first year of the operation of the act. . . . A compulsory arbitration law, following somewhat the outlines of the New Zealand act but which did not provide for conciliation, was passed in 1901. . . . The law was superseded by the industrial disputes act of 1908. . . . [which was in turn] superseded by the industrial arbitration act of 1912. This act created a court of industrial arbitration consisting of a Supreme Court judge and district court judge or barrister of five years' standing, appointed by the governor, also an additional judge and a deputy judge. Boards under the old act [of 1908] were dissolved. Twenty-seven industries were scheduled for which industrial boards were appointed on recommendation of the court by the minister of the Crown. . . . These boards have conciliatory powers. Special committees for conciliation are provided for metal and coal miners when more than five hundred are involved and a

special commissioner, appointed by the minister of the Crown, is charged with wide powers to bring about settlements in cases not covered by the act. Lockouts and strikes are punishable by heavy penalties, and heavy penalties are also prescribed for breaches of awards and other offenses. Boards have power to declare 'that preference of employment shall be given to any industrial union of employees over other persons offering their labor at the same time, other things being equal.' Declarations of preference may be suspended if employees engage in strikes. About seventy-five trades registered under the 1908 act. Twenty-four trades, including sixty-two per cent. of the employees, had come under the jurisdiction of the wages boards by 1911. In 1912, the court of arbitration had made awards in one hundred thirty cases, each affecting many other disputes. New South Wales provided for the legal incorporation of trade unions, under prescribed conditions, and imposed legal responsibilities for the care of trade union funds in 1912. South Australia provided for the registration of trade unions and employers' associations, industrial agreements and boards of conciliation, both public and private, in the act of 1894. Awards under the act were compulsory and it was an offense for a registered organization to engage in a strike or lockout. It was necessary for employers or employees to come under the act, and as late as 1905 it was pronounced a complete failure for the reason that neither employers nor work people chose to accept what it offered them. South Australia adopted a wages board system in 1908 and one hundred thirty-nine boards had been created by the middle of 1910. They had decided ninety cases. Queensland has the wages board system. Western Australia passed an act modeled after the New Zealand law in 1900 but this act was replaced by another in 1902. . . . In 1904, the Australian Parliament passed the commonwealth conciliation and arbitration act, which provided a system of compulsory arbitration similar to that in New Zealand for all interstate labor disputes. The commonwealth court was given power to employ the usual methods of conciliation, and failing in that, to make an equitable award binding on all parties. Strikes and lockouts were subjected to a penalty of four thousand eight hundred sixty dollars. Breaches of the court's award were subject to a penalty of four thousand eight hundred sixty dollars in case of the employer and forty-eight dollars and sixty cents in case of an individual employee. The power to fix a minimum wage was lodged in the commonwealth court, also the right to deprive those failing to observe an award of all rights and privileges under the act. One case arose under the act of 1904 during the first five years of its existence involving four thousand men in a New South Wales mine. It resulted in a victory for the men. The decision, however, was severely criticized by the employers and not wholly satisfactory to the men. This act was amended in 1900, 1910 and 1911. The amendments of 1900 prevented employers from discharging employees about to be registered under the act."—C. H. Mote, *Industrial arbitration*, pp. 154-163.

1913-1917.—Success of the court in preventing strikes.—"The Commonwealth Court of Arbitration has not had to deal with many disputes. During the years 1913-1917. . . the number settled under this Court amounted to only twenty, but these disputes, covering, as they did, employees in two or more states of Australia, affected large interests and many persons. The subjects in dispute comprised practically all conditions of the industry.

Thus, a claim made by the employees of the meat industry in Victoria and South Australia included regulation of rates of pay, hours of labor, holidays, terms and conditions of employment, and preference to unionists. The hearing of this claim occupied the attention of the Court for forty-two court days. There were 1,225 respondents in the case, and the printed award covers sixty pages. The award was preceded by a lengthy judgment in which the President of the Court entered into a full discussion of wages, prices, piece and time rates of wages, the effect of wages upon prices, budgets of income, questions of skill and efficiency, waiting time, hours and wages in small shops and apprenticeship. In short, the Commonwealth Court of Arbitration is significant, less for the number of disputes it handles than for their size and importance, and for its success in preventing strikes. No investigation is entered upon by its President till work has been resumed, and only once has the decision of the Court been followed by a strike."—*Arbitration and wage-fixing in Australia (Research report No. 10, Oct., 1918, pp. 37-38.)*

1915.—Arbitration in New South Wales coal strike. See LABOR STRIKES AND BOYCOTTS: 1915.

1917-1918.—Act of 1918.—"The war introduced political elements that were reflected in the state's industrial history. The question of conscription disrupted the Labor party and threw it out of office. Its experienced leaders were expelled. Extremists gained control, both of the unions and the Labor political organization, and in August, 1917, precipitated a trial of strength with organized government. The employees of the state-owned railways of New South Wales struck against a method adopted by the Railway Commissioners to obtain a better accounting system in their workshops. The unions issued an ultimatum demanding the withdrawal of the method. As all the employees were servants of the state, the Government of New South Wales, like the Government of France in 1910, joined issue on the question of control of public services. A sympathetic strike involved ultimately 76,000 persons, with a loss in wages estimated at £1,700,000 (approximately \$8,500,000). As the matter was one of principle, no measures of conciliation were attempted till the strikers seemed beaten. After ten weeks matters were adjusted. The penal provisions of the Act were set in motion against striking unions. The result was such altered conditions of industrial organization as to demand important amendments to the Act. In February, 1918, Mr. G. S. Beeby, author of the Act of 1912, introduced an amending bill which, after many alterations in the legislative process, became law on March 22, 1918. This measure is the most significant worked out in the Australian laboratory of social experimentation. Its chief provisions relate to the distinction made between legal and illegal strikes, the conditions under which strikes may be legal, more extended machinery for conciliation, and provisions for a more scientific calculation of the minimum and living wage. This historical summary shows that without any alteration in principle, arbitration in New South Wales has increased in complexity and extended in scope. The process through which it has passed has been one of experiment and amendment. From the very beginning it has had the definite aim of fixing a living wage and thereby minimizing industrial conflict. But in the process there has been a change of attitude toward strikes. It must be remembered that arbitration is an alternative to the strike as a method of industrial agreement. A system of arbitration, therefore, calls for measures to reduce or prevent strikes. From 1901 to 1910 the adminis-

trative policy was definitely to penalize striking by characterizing it as a misdemeanor, punishable with fine and imprisonment. From 1910 onwards a large measure of conciliation was added to the arbitration machinery, and striking was made 'an extravagant proceeding,' which might involve the offender in penalties and the attachment of his wages. In 1918 a more definite and extended system of conciliation was adopted, to minimize the number of trivial and resultless strikes, which involved little that could be subjected to arbitration. At the same time a distinction was made between legal and illegal strikes. Strikes are declared illegal in any industry under government or municipal control, or under an industrial award or agreement, or in case fourteen clear days notice had not been given of the intention to strike. Illegal strikes are to be heavily penalized, penalties are specified against the union, the individual strikers, and any one encouraging them by word or act. A union may, however, strike legally, but only after at least twelve months trial of an award; further, a secret ballot, in which two-thirds of its members take part must be held in all cases. The Act of 1918, therefore, while recognizing the right to strike under certain conditions, nevertheless sharply limits that right and lays far greater stress on the principle of arbitration."—*Ibid.*, pp. 20-21.

BELGIUM

1917-1918.—"Trade unions of employees of public utilities are permitted under Government supervision. Employees may present grievances or requests to the minister of railways, posts and telegraph through official channels. Strikes and lock-outs prohibited on railroads and in all forms of the public service (railway, postal, telegraph, and telephone service, all of which are under state control). . . . There has been no serious strike on Belgian railroads since their establishment. This is due to the fact that positions on the railways are much sought after because of stability of employment, pensions, and on account of the prestige of being in the Government service."—*American Labor Year Book*, 1917-1918, pp. 139-140.

CANADA

1900-1918.—Industrial Disputes Investigation Act.—Its predecessors.—Its successes.—Opposition to it.—"The Canadian Industrial Disputes Investigation Act of 1907 is an outgrowth from, and the result of experience under, earlier legislation. Two such earlier laws are of particular importance. One of these, the Conciliation Act of 1900, followed in a general way certain usages long in operation, first as custom, and later as law, in the coal-mining districts of England. That Act created a Department of Labour and provided a machinery for mediation or arbitration, but its use was left to voluntary action of the parties to a dispute. This Act had been supplemented to some extent by the Railway Disputes Act of 1903, which gave to the Minister of Labour a limited power of compulsion with respect to establishment of conciliation boards in labor disputes between railroad companies and their employees. Where such a dispute arose, a Board of Conciliation could be appointed by the Minister of Labour on the request of either of the parties, without consent of the other. These two Acts were consolidated,

forming the Conciliation and Labour Act of 1906, and are still [1918] operative. In 1906 a bitter and prolonged strike closed the coal mines of Lethbridge, Alberta. The Deputy Minister of Labour, Hon. W. L. Mackenzie King, succeeded in bringing about a settlement, but not until much public hardship had developed. The failure of the existing Conciliation Act to prevent this strike revealed the need of further legislation, and the Industrial Disputes Investigation Act of 1907 was a direct result of the sentiment thus aroused. The Canadian Industrial Disputes Investigation Act of 1907 applies specifically only to transportation companies, other public utilities and mines, but may also be invoked for settlement of disputes in other industries on application of both parties to a dispute, that is, by mutual consent. Since the beginning of the war, industries supplying war materials have been brought under the action of the provisions previously applying only to transportation companies, other public utilities and mines. On application in due form by either party, the Minister of Labour appoints a Board of Reference consisting of one nominee of each party and a chairman selected by the two. No person having a direct pecuniary interest in the dispute may be appointed. To prevent a deadlock, in case all other provisions of the Act governing applications for a Board have been complied with, but where either or both of the parties fail to agree on nominations, the Minister of Labour may both select and appoint a Board. The Board fully investigates the dispute and no strike or lockout may legally occur before or during such investigation. Boards are given power to summon witnesses, administer oaths, and to compel witnesses to testify and produce books and other evidence in the same manner as courts of record in civil cases. If settlement of a dispute is reached by the parties during the course of its reference to a Board, a brief memorandum drawn up by the Board and signed by the parties is filed with the Minister of Labour. If settlement is not arrived at during the reference, the Board is required to make a full written report to the Minister of Labour, setting forth the details of its investigation and its recommendation for settlement of the dispute. The report is filed in the office of the Registrar and copies are sent free of charge to the parties and to any newspapers in Canada which apply for them. The Minister may also distribute copies in such manner as he considers desirable, as a means of securing compliance with the Board's recommendation. In addition to this, for the information of Parliament and the public, a copy of the report must be published without delay in the *Labour Gazette*, and be included in the annual report of the Department of Labour to the Governor General. It cannot be too strongly emphasized that the Act of 1907 is not a compulsory arbitration law. While the Act undertook to carry the element of compulsion a step further, it did not alter the principle of voluntary adjustment on which the old law was founded. In pursuit of this aim, and to avoid difficulties involved in compulsory arbitration, the machinery was changed to consist of Boards of Conciliation and Investigation and, although it was the duty of these Boards to do all in their power to affect conciliations, and to offer recommendations of settlement, compulsion was restricted to their investigatory function. Compliance with the recommendations of the Reference Boards is optional; the weight of public opinion is relied on to make settlements effective. . . . The only provision giving mandatory power to the finding of a Board is that if, at any time before or after a Board

has made its report and recommendation, both parties to the dispute agree in writing to be bound by the recommendation of the Board in the same manner as parties are bound in the case of a reference to arbitration on the order of a court of record, the recommendation shall be made a rule of the court on application of either party, and shall be enforceable in like manner. Canadian courts, however, have hesitated to regard such an agreement as constituting a rule of court. . . . The commonly accepted statement that the Act was based on Australian labor legislation is historically incorrect, and tends to give a mistaken conception of the nature of the Act. Indeed, this statement has not been without influence in the development of a hostile attitude toward the Canadian Act, which, unlike the Australian legislation, as far as possible avoids compulsion, and instead is frankly based on an appeal to the power of public opinion. . . . The Minister of Labour, who is responsible for the administration of the Act, thus far has taken the stand that the penalty provided for strikes or lockouts prior to investigations will be imposed only where prosecution is initiated by one or the other of the disputants, and although there have been many 'illegal' strikes since the Act became effective, the penalty seldom has been imposed. This fact has led to the rather hasty assumption in the United States that the compulsory feature is a failure in Canada. . . . While this is to some extent true, it fails correctly to reflect the spirit and intention of the Canadian Act, which should be interpreted in the light of its original purpose. Hon. W. L. Mackenzie King has said: 'The Government has never laid particular stress on the penalty end of it. The penalty part . . . has always been treated much in the same light as penalty for trespass.' . . . A procedure which appears to be responsible for much of the opposition to the Act on the part of organized labor in Canada is the use made of the discretion which it allows to the Minister of Labour to grant or refuse Boards of Investigation. Boards have been refused in a number of cases where the workers felt that they had a real grievance. Thus, in strikes involving several employers or several unions where these employers or unions could not agree on a single representative, the Minister of Labour has declined to appoint a Board. A strike involving many companies is regarded by the Minister of Labour as a separate dispute for each company and, where the various interests agree on a single nomination, although one Board is appointed to investigate the whole trouble, it is legally considered that there are as many separate Boards as there are independent employers. . . . The operation of the Act has shown that the opinion of the chairman usually controls the finding of the Board. This arises naturally from the fact that employers and employees each select a representative favorable to their respective cause, and it has gradually come to pass that, in almost all cases, these two members of the Board disagree and the decision rests with the chairman. It has even been suggested on this account that, in the case of important disputes involving large public issues, the position of the chairman be strengthened by appointment by the Minister of Labour of three outside representatives. It is believed that decisions of a Board so constituted would inspire greater public confidence. . . . The operation of the Act has further developed the fact that Boards are most successful when least formal, and particularly when least legalistic in their attitude and procedure. Boards of which prominent jurists have been chairmen have notably failed. The difficulty of

securing acceptable chairmen is very great. . . . Yet another source of difficulty arising through the operation of the Act and not directly from its provisions, but apparently contrary to them, is the delay which may occur in the appointment of a Board. . . . For the nine-year period ending March 31, 1916, 191 applications for Boards have been made, and 160 have been established. Of this number only 60 were established within the 15 days. In 14 cases, between 46 and 61 days elapsed between the application and the establishment of the Board; in 21 cases, between 31 and 46 days; in 66 cases, between 16 and 31 days. . . . The Act also states that employers or employees shall give at least thirty days' notice of an intended change affecting conditions of employment with respect to wages or hours, and provides a penalty for disregard of this provision. . . . In spite of this provision no complaint among workmen is more common than that wages and hours are changed without notice, and are followed by delays in appointment of Boards. . . . In the first year of the operation of the Act only three applications for Boards were refused, in the second year two, in the third year one, in the fourth year five, in the fifth year five. . . . In the fourth and fifth years there were four failures each year to avert or end a strike after a Board had been appointed. . . . In 88% of the disputes referred to Boards, strikes or lockouts were averted or ended. If the number of applications refused is added to the number of cases in which strikes or lockouts were not prevented, as also indicating failure on the part of the Act to meet the situation, the percentage of successful conciliations is reduced to 78%. . . . For the first two years of the operation of the Act but little opposition appeared; but from that time to the present, hostility among organized labor unions has steadily increased. This opposition is most outspoken on the part of the international labor organizations. . . . The rank and file of Canadian labor express little opposition to the principles of the Act, although some modifications are desired; the official attitude of the international labor organizations in Canada, however, is increasingly hostile. . . . It is difficult to escape the conclusion that, whether or not the penalties of the Act are enforceable against workers, the very existence of the Act and the manner of its administration is felt by them to hamper the operations of the union, and particularly to limit use of the strike to enforce demands. This conclusion is strengthened by the fact that, of the recommendations of Boards since the enactment of the Act, 90% favored the employees and granted a major part of their demands. Also, more than 90% of the Boards have been instituted on application of employees. It is not, therefore, dissatisfaction in general with the recommendations of the Boards that can account for organized labor's opposition. This must arise from the general operation of the Act and the effect of its continued existence on the statute books, which deprives striking employees who have not applied for a Board of Investigation, of the moral support of the community. But perhaps the fundamental reason for this opposition, not to speak of possible antipathy to certain officials, is the fact that the settlement of disputes apart from the manipulation of the union leaders, tends to weaken their hold on the rank and file, and their relative importance in gaining concessions for their followers."—National Industrial Conference Board, *Canadian Industrial Disputes Investigation Act (Research report No. 5, pp. 3-6, 8-9, 11-14, 16, 17, 18, 19-20.*

DENMARK

1910-1918.—By a law passed in 1910 provision is made for the appointment of a permanent arbitration court of six members selected from organization of employers and employees with a president and vice-president with qualifications of an ordinary judge. It is the duty of this court to make the parties to a dispute respect any agreement between them. A government conciliator is appointed for two years. Whenever a strike or lockout is impending (public notice being compulsory) it is his duty to intervene and attempt to effect a settlement. Strikes or lockouts are prohibited in cases where court awards or trade agreements are broken. In cases where no trade agreements exist, a strike is legal, but public notice must be given before it is started."—*American Labor Year Book, 1917-1918, pp. 140-141.*

FRANCE

1806-1909.—*Conseils des prud'hommes*.—Arbitration council.—"Industrial arbitration and conciliation in France dates practically from the creation of the councils of experts (*Conseils des Prud'hommes*) by Napoleon I in 1806, after his return from Elba. These councils were the successors to the ancient corporative tribunals which had held certain jurisdiction in the silk trade and which were swept away when the trade guilds were abolished in 1791. . . . Inhabitants of Lyons, center of the silk industry, had been loyal to the first Napoleon and fêted him on his return. Incidentally, they took diplomatic advantage of his good feeling toward them in 1806 to ask the restoration of the corporative tribunals. The councils of experts were created in response to this request. The councils of experts originally were composed of five employers and four foremen, while the guild tribunal was composed entirely of manufacturers. The councils of experts were established to settle minor difficulties by conciliation, or, in the failure of conciliation, to adjudicate formally any matter involving less than sixty francs. The bureau of conciliation, composed of one manufacturer and one foreman, met once a day while the general bureau of arbitration met once a week to decide cases in which the bureau of conciliation had failed. By 1804, fourteen French towns had established councils of experts. In 1804, there were one hundred seventeen councils in France."—C. H. Mote, *Industrial arbitration, pp. 87-88.*—"The *Conseils des prud'hommes* . . . assumed jurisdiction of individual disputes only. It was not until the enactment of the conciliation and arbitration law of 1892 that legal machinery was created for the settlement of collective disputes. Under the act of 1892, the initiative may be taken by the parties themselves, or, in the case of actual strikes or lockouts, the initiative may be taken by a justice of the peace. Both parties may apply jointly for conciliation, or, if only one applies, it is the duty of the justice of the peace to notify the opposite party, who must reply within three days. In the application for, or acceptance of conciliation, each party must name five persons to act as its representatives in conciliation. If neither party applies for conciliation, it is the duty of the justice of the peace to request the parties to notify him of their willingness or refusal to accept conciliation or arbitration. The justice of the peace is ex-officio chairman of the conciliation committee. Conciliation failing, the justice of the peace must endeavor to

obtain arbitration, each side to name an arbitrator or both to agree on a common arbitrator. If arbitrators can not agree, they may name an umpire, and if they are unable to agree upon an umpire, he is named by the president of the local tribunal. Decisions must be in writing and the expenses of hearings are borne by the Communes. Every feature of the act is voluntary. Reports of conciliation committees, arbitration boards and requests for and refusal of conciliation or arbitration are to be made public."—*Ibid.*, pp. 100-101.—By an act of July 22, 1909, a permanent arbitration council was created by the French government with a view to investigating disputes between shipping companies and their crews. The council has headquarters in Paris. The council consists of three members appointed for three years by decree drawn up on the proposal of the keeper of seals, minister of justice, and selected from among the ordinary state councilors, also from the councilors of the Court of Cassation; also arbitrators selected for three years by the employers, who shall be present to the number of five at each arbitration; also arbitrators elected for three years by the employees, who shall be present to the number of five at each arbitration. The three members from the State Council and Court of Cassation elect a president and vice-president and constitute the central section of the Permanent Arbitration Council. In each maritime district, the ship owners elect five regular and five deputy arbitrators. Each of four specified classes of employees in each maritime district elects five regular and five deputy arbitrators. In detail the act sets out how the council is made up for the settlement of a collective dispute. The central section is always present. Detailed provisions are also set out for the election of arbitrators and deputy arbitrators every three years. When a collective dispute arises, the parties may submit their controversy to the Director of the Seamen's Register, or he may take the initiative in an endeavor to conciliate the parties. Upon the failure of conciliation, there is a roundabout process by which the services of the arbitration council are offered the parties. If they refuse arbitration, a certificate to that effect is entered by the central section of the council. If the parties agree to arbitration, the court is convened. It has full power of investigation, hearing and of giving judgment, although it does not appear that either party is bound by the judgment. The judgment is published. The public is not admitted to the council meetings."—*Ibid.*, pp. 112-113.

GERMANY

1890-1908.—**Industrial courts.**—"An act of 1890, regulating industrial courts, was the first [German] legislation recognizing the principle of collective disputes and providing for collective bargaining. These courts were empowered to act as conciliation bureaus in disputes concerning the 'terms of continuation or renewal of the labor contract,' but only on condition that both parties requested action, and, if they numbered more than three, appointed delegates to the hearing. Conciliation bureaus consisted of the president of the court and at least four members, two employers and two workmen, but there might be added, and it was compulsory when the delegates so requested, representatives in equal number of employers and employees. Representatives and members of the bureau could not act if concerned in the dispute. The bureau could hear and examine witnesses under

the act but could not compel their attendance. After hearing, each side was required to formulate its opinions of the allegations of the other side, whereupon an effort at conciliation was to be made. Failing in this, a decision followed and the delegates were required to declare within a specified time their acceptance or rejection of the award. At the expiration of this time the decision was published. In some cases, the president of these courts intervened informally with conspicuous success, but in three years, 1899, 1900 and 1901, there were nearly four thousand strikes, one hundred thirty-two only having been settled by the industrial courts. The German law of 1890 was quite successful in the settlement of individual disputes but not successful in the settlement of collective disputes. The act of 1901 took the appointment of arbitrators out of the hands of the president and lodged it with the parties concerned in a controversy. Not only regular assessors of the court may be chosen but any other persons in whom the parties have confidence. The new act made the appearance of parties to a dispute compulsory in the event one or both parties call upon the court to act as a board of arbitration. When both parties ask for arbitration, the court is constituted as a formal board of arbitration. If only one side applies, it is the president's duty to attempt to obtain the cooperation of the other party. If successful, the board is constituted for the purpose of conciliation. If neither party applies for arbitration, it is the president's duty to urge the arbitration of the controversy. This provision permits the court to intervene with a view to settling threatened strikes and lockouts. There is nothing novel in the proceedings before an industrial court sitting as a board of arbitration. Failure to appear before the court in answer to a summons of the president is punishable by a fine. Decisions are given by a majority but the president may abstain from voting if there is a tie. The acceptance of the decision is not compulsory and a failure to declare whether the decision is accepted is construed as a refusal. An award is binding, however, if both parties have previously agreed to such an award. The Berlin court, between 1902 and 1908, was appealed to by both sides in one hundred sixty-four cases and by one side in sixty instances. Most of the applications from one side are from the workers. Out of one hundred forty applications for arbitration in the empire in 1908, one hundred thirty-four were from workmen while only six came from the employers. Out of one thousand two hundred sixty disputes submitted by both parties in the empire between 1902 and 1908, nine hundred eight were settled either by agreement or awards acceptable to both parties. In seventy-six cases the board failed to reach a decision. Mercantile courts for the settlement of disputes between merchants and their employees were established in 1904. For the settlement of individual disputes, the German industrial courts are composed of at least four assessors and a president and vice-president. The latter must belong to neither side of the controversy. . . . Industrial courts operate not only for the conciliation or legal decision of individual disputes and the conciliation and arbitration of collective disputes, but for the guidance of public opinion and of public officials and legislative bodies in matters where expert advice is needed. The jurisdiction of industrial courts in individual disputes is limited by the arbitration courts of the guilds, organized quite like the industrial courts, or by legal statute, but generally extending over all industrial occupations. Special courts exist for special industries.

Even after a court is organized for hearing in an individual dispute or a collective dispute, it is charged with the duty of attempting conciliation at any time before a decision is given, if conciliation seems feasible. Hearings generally are public, though they may be private. The decisions of the court in individual disputes are determined by a majority vote."—*Ibid.*, pp. 73-77.

1915-1919.—Creation of a labor department.—"By an imperial decree of October 4, 1918, published in the *Beichsgesetzblatt*, matters relating to social policy administered hitherto by the Imperial Economic Office (*Beichswirtschaftsamt*), are henceforth to be within the province of a special central authority, entitled the Imperial Labor Department (*Beichsarbeitsamt*). The decree orders the imperial chancellor to arrange for the transfer of functions and officials from the Imperial Economic Office to the new department. . . .

"Two tasks confront organized labor at the present time: A chamber of labor law corresponding to their demands and the statutory regulation of employment exchanges in agreement with the proposals unanimously adopted by the Reichstag in the spring of 1915, but hitherto neglected. A conference of the combined associations of workmen, minor officials, and salaried employees had been called for the end of October, but it has been abandoned, as it is expected that the new labor department will itself submit legislative proposals satisfactory to the wage workers. A third task is the reform of the right of coalition; with this is connected the giving of a legal status to collective agreements and the extension of the conciliation principle to an imperial conciliation office."—*Labor bureau* (*Labor Review*, January, 1919).

GREAT BRITAIN

1562-1896.—Preliminary legislation.—"Provisions for the settlement of individual disputes between master and workmen were common in English laws as far back as the middle of the sixteenth century. Beginning with the Statute of Apprentices in 1562 and ending with a special act of Parliament in 1747, these laws simply referred all disputes between employer and employee to the local magistrate for adjudication. Reference of disputes was compulsory on the request of either party and decisions likewise were binding upon both parties and enforceable by proceedings of distress and sale or imprisonment. . . . With the rise of the industrial state and especially the cotton industry in England, disputes between employer and employee multiplied. . . . The local magistrates were notoriously under the influence of the employers, and justice was arbitrarily distorted to the prejudice of the working classes. A justice of the peace was wholly unfit to act as mediator between employer and employee, because he was always a party in interest. . . . In the midst of England's industrial revolution the English Parliament passed a series of four acts, in 1800, 1803, 1805 and 1813 applying to England, Scotland and Ireland, and designed to regulate the relations between master and workmen. A notable departure from the earlier forms of this legislation was made. Substantially the acts provided for the appointment of two arbitrators, one by the employers and one by the employees, from nominations made by the local justice of the peace. These laws applied only to the cotton trade. Like the former acts they made reference of disputes compulsory and decisions binding. The act of 1824, which consolidated the three acts then in force, extended

the operation of the principle of conciliation and arbitration, as defined by law, to all trades. To insure the maintenance of the freedom of contract between employer and employee, first secured by the repeal of the Statute of Apprentices in 1814, mutual consent of master and workmen was made necessary as a condition precedent to the fixing by local magistrates of rate of wages or price of labor or workmanship. This clause abolished the compulsory features of earlier legislation on the subject and is noteworthy only for this reason. The consolidation act of 1824 remained in force until 1896. . . . The act of 1824 was amended in 1837 to provide for compulsory arbitration between employers and workmen, upon the application of either party. The local magistrate was empowered to nominate four or six arbitrators, half workmen and half masters. In the event of the arbitrators' failure to agree, it was provided that the case should be referred to the appointing magistrate. Subjects for arbitration included price for work done, hours of labor, injury or damage to work, delay in completing work or bad material. The act provided that in emergencies, the justice of the peace might grant a summary hearing. Mutual consent was a condition precedent to the fixing of future rates of wages and standards of workmanship. The awards of the boards could be enforced by distress or imprisonment. This act was intended mainly for the textile industries. The council of conciliation act, drawn from the French system, was passed in 1867. It made it possible for any number of employers and workmen to agree to create a council of conciliation and arbitration and receive a license from the government with all the powers of the boards under the act of 1824. Fixing wages was expressly forbidden. Disputes, before reaching the council, must have been referred first to the 'committee on conciliation,' consisting of one master and one workman. Although this act remained in force until 1896, it was never more than a dead letter, no application for license ever having been made under it. The only definite answer offered in explanation of the failure of this act, according to Leonard W. Hatch, in referring to the later debates in Parliament, is that the act was too inelastic, laying down too many hard and fast rules as to the constitution and procedure of the councils, so that no latitude was left to employers and workmen who might desire to form them. The act provided for little more than conciliation committees for collective disputes. But this feature of the act is noteworthy for the reason that it is the first instance of legal recognition in England of collective disputes and consequently of collective bargaining between employer and employee. Councils were empowered to take cognizance of disputes involving one or more workmen. In 1872 Parliament passed the masters and workmen act. It provided that masters and workmen might contract as to terms of employment and bind both parties to submit their disputes to arbitration. It, however, offered no inducement to the parties to enter into contracts and permitted either party to withdraw from such contracts after a brief notice to the other party. Although penalties could be provided for under the contracts, no provision was made to enforce them. This act was in force until 1896, but no practical results ever came of it. Private boards of conciliation were established in England as early as 1856, and private voluntary boards were common in England at the time of the passage of the council of conciliation act in 1867. Trade boards of conciliation and arbitration, made up of an equal number each of employers and workmen, were

quite successful in averting trouble in the iron and steel industry in England. Joint committees of conciliation and arbitration similar to the trade boards but with less machinery and jurisdiction in particular establishments also made notable progress toward friendly relations between employer and employee. District boards of conciliation and arbitration had general jurisdiction over a variety of employments. The first permanent and successful board of conciliation was organized in 1800 in the hosiery and glass trade at Nottingham, England, by A. J. Mundella. Modern conciliation and arbitration in England dates from the dock laborers' strike in 1880. The movement for industrial peace following that strike was begun by Sir Samuel Boulton."—C. H. Mote, *Industrial arbitration*, pp. 23-25, 32, 34-38.

1850.—Rate war of railroads in England.—Gladstone's arbitration.—Octuple agreement. See RAILROADS: 1750-1881.

1889-1920.—Modern legislation.—"The Arbitration Act [of] 1889 is not to apply to the settlement by arbitration of such differences or disputes, but the proceedings are to be conducted in accordance with such of the provisions of that Act, or such of the regulations of any Conciliation Board, or under such other rules and regulations, as may be mutually agreed upon by the parties to the difference or dispute. The Act contains a further provision (sect. 4) enabling the Board of Trade (now the Minister of Labour), if it appears to it that in any district or trade adequate means do not exist for having disputes submitted to a Conciliation Board for the district or trade, to appoint any person or persons to inquire into the conditions of the district or trade, and to confer with employers and employed, and if the Board of Trade (now the Minister of Labour) thinks fit, with any local authority or body, as to the expediency of establishing a Conciliation Board for the district or trade. These are the main provisions of the Act, and it will be seen that they furnish the means of (1) conciliation, (2) arbitration on the application of the parties to the dispute, and (3) without any application by them, inquiry into the causes and circumstances of a difference. The Act was supplemented, however, on the 1st September, 1908, by certain very important administrative provisions. These had no statutory force or authority, but they came into practical operation, having continued since, and their principle was embodied in the Munitions of War Act, 1915, and the subsequent legislation, as will be seen presently. The Conciliation Act, 1896, only provided for one arbitration tribunal, that is to say, 'an arbitrator.' The administrative provision added a Court of Arbitration composed of representatives of employers and workers respectively, chosen from panels, with an independent Chairman, also taken from a panel. The administrative provisions were in the form of a Memorandum, communicated to Chambers of Commerce and Employers' and Workmen's Associations, and were published in the *Board of Trade Labour Gazette* for September, 1908. The Memorandum was as follows: '(1) Under the Conciliation Act of 1896 the Board of Trade has power to appoint a Conciliator in trade disputes and an Arbitrator at the request of both parties. These slender means of intervention have been employed in cases where opportunity has offered, and the work of the Department in this sphere has considerably increased of recent years. In 1905 the Board of Trade intervened in 14 disputes and settled them all; in 1906 they intervened in 20 cases and settled 16; in 1907 they intervened in 30 cases and settled

32; while during the first eight months of the present year [1908] no fewer than 47 cases of intervention have occurred, of which 35 have been already settled, while some of the remainder are still being dealt with. (2) It is not proposed to curtail or replace any of the existing functions or practices under the Conciliation Act, nor in any respect to depart from its voluntary and permissive character. The good offices of the Department will still be available to all in industrial circles for the settlement of disputes whenever opportunity offers; single Arbitrators and Conciliators will still be undertaken in special cases, and no element of compulsion will enter into any of these proceedings. But the time has now arrived when the scale of these operations deserves, and indeed requires, the creation of some more formal and permanent machinery; and, with a view to consolidating, expanding and popularising the working of the Conciliation Act, I propose to set up a Standing Court of Arbitration. (3) The Court, which will sit wherever required, will be composed of three (or five) members, according to the wishes of the parties, with fees and expenses to members of the Court, and to the Chairman during sittings. The Court will be nominated by the Board of Trade from three panels. The first panel—of chairmen—will comprise persons of eminence and impartiality. The second will be formed of persons who, while preserving an impartial mind in regard to the particular dispute, are nevertheless drawn from the "employer class." The third panel will be formed of persons similarly drawn from the class of workmen and Trade Unionists. . . . Lastly, in order that the peculiar conditions of any trade may be fully explained to the Court, technical assessors may be appointed by the Board of Trade at the request of the Court or of the parties to assist in the deliberations, but without any right to vote. (4) The state of public opinion upon the general question of Arbitration in Trade Disputes may be very conveniently tested by such a voluntary arrangement. Careful inquiry through various channels open to the Board of Trade justifies the expectation that the plan would not be unwelcome in industrial circles. The Court will only be called into being if, and in proportion as, it is actually wanted. No fresh legislation is necessary. (5) Steps will now be taken to form the respective panels.'

"The Munitions of War Act, 1915, in providing for the compulsory settlement of differences as to rates of wages, hours of work, or otherwise as to terms or conditions of, or affecting, employment on the manufacture or repair of munitions of war, provided three alternative forms of arbitral tribunals (Schedule I. to Munitions of War Act, 1915):—(a) The Committee on Production; (b) A single arbitrator to be agreed upon by the parties, or in default of agreement appointed by the Board of Trade (afterwards the Minister of Labour); or (c) A Court of Arbitration consisting of an equal number of persons representing employers, and persons representing workmen, with a chairman appointed by the Board of Trade (afterwards the Minister of Labour). The tribunal to which the reference was made was to be determined by agreement between the parties to the difference, or in default of agreement by the Board of Trade (afterwards Minister of Labour), and the Arbitration Act, 1880, was not to apply to such references. . . . On the conclusion of the armistice an Act was passed, shortly entitled 'The Wages (Temporary Regulation) Act, 1919' [1918?]. The principal object of this Act, the full title of which

was 'An Act for prescribing Minimum Rates of Wages during a limited period and for repealing certain provisions of the Munitions of War Acts,' and which was to be in force for six months only (afterwards extended for a further period of six months, to expire on the 21st November, 1918 [1919?]), was the stabilisation of wages during the abnormal conditions still prevailing on account of the war and which were expected to continue to prevail for a time. . . . On the 21st November the provisions of the Wages (Temporary Regulation) Act, 1918, as extended for six months, were due to come to an end. As a result all provisions for enforcing the payment of a prescribed or substituted rate of wages would then cease, and the Interim Court of Arbitration would determine. It was under these circumstances that the Industrial Courts Bill was introduced shortly before the 21st November, 1919. . . . Its objects may be summarised as (1) continuation of the stabilisation of wages until the 30th September, 1920; (2) provision of a standing Court for the settlement of industrial disputes; and (3) a provision for judicial inquiry and report into the causes and circumstances of apprehended or existing trade disputes. It was preservative for a limited period of some of the provisions of the Wages (Temporary Regulation) Act, 1918, creative concurrently with the Conciliation Act, 1896, of Courts and tribunals of arbitration, and further developed in this country [England] the machinery of Courts of Inquiry and Investigation. . . . By way of summary . . . conciliation is under the provisions of the acts of 1896 and 1919 . . . ; or under agreements between Federations or Associations of employers or workers; or under the National Industrial Councils which have been established in some industries. According to the *Labour Gazette* of December, 1919, there were at the end of 1919 fifty-one National Industrial Councils, the number formed during 1910 being thirty-one. Although these cover a number of industries and workers, yet they are very far short of [being] exhaustive of the various industries of the country, and a large margin is therefore left for procedure under the above Acts. . . . Arbitrations are now [1920] either under—(1) The Conciliation Act, 1896; or (2) The Industrial Courts Act, 1919. Under (1) all that is required is the application of the parties to the dispute for either a hearing before a single arbitrator, or before a Court of Arbitration . . . assuming that the provisions of the administrative Memorandum [of September, 1908] . . . are still in continuance. Under (2), assuming that there do not exist in the particular trade or industry concerned arrangements for settlement made in pursuance of an agreement between organizations of employers and organizations of workmen representative respectively of substantial proportions of the employers and workmen engaged in that industry, the Minister may at once, with the consent of the parties, refer the matter for settlement either to the Industrial Court or to the arbitration of one or more persons appointed by him, or refer the matter to a Board of Arbitration as set out in . . . the Industrial Courts Act, 1919. . . . Whether the matter has been referred for settlement under the Conciliation Act or under the Industrial Courts Act, the settlements or awards made are not compulsory on the parties."—W. H. Stoker, *Industrial courts act, 1919, and conciliation and arbitration in industrial disputes*, pp. B-VC, 23-24.—See also WHITLEY COUNCILS: Organization and method.

1915.—Arbitration in Clyde shipyard strike. See LABOR STRIKES AND BOYCOTTS: 1915.

HOLLAND

1903-1918.—"Delegates are selected from different groups of railway employees who are authorized to present the wishes and complaints of railway workers before the managers. Arbitration boards have been established for the enforcement of penalties imposed because of infractions of working rules and conditions. Strikes in railway service are prohibited. . . . Legislation prohibiting strikes was the outcome of a general strike in the Dutch railway service in 1903."—*American Labor Year Book*, 1917-1918, p. 142.

ITALY

1917-1920.—Effect of World War.—National Council of Labor instituted.—"The legislation relating to labour disputes . . . in force in 1918, could not be called complete. . . . The principle of state intervention for the amicable solution of labour conflicts had not, before the outbreak of the war, been applied to agriculture, except in isolated cases. The state of public opinion, and the peculiar industrial conditions which arose during the war . . . led the Government to enact measures similar to those adopted in industry. The Decrees of 6 May 1917 which codified several Decrees, including those of 30 May 1916 and 2 November 1916, established in every judicial district a district arbitration committee . . . empowered to intervene in disputes relating to the prolongation of agrarian contracts, and to the supply of horses, cattle, etc.; further, at the request of one or both of the parties or of the Prefect, in disputes relating to labour and wage agreements and general collective disputes concerning agricultural work in any way. . . . The conciliation settlement had the force of an agreement between the parties, who might also authorise the committee to decide the dispute, acting as arbitrators with power to effect an amicable settlement. . . . The system . . . was considerably altered by the Decree of 14 September 1919. . . . These committees are presided over by a member of the tribunal and are constituted of four members, two landowners or large tenant farmers and two workers, appointed by their respective organisations, or, failing this, by the provincial agricultural committees. They may intervene with a view to settlement by conciliation, at the request of the parties, or of the Prefect, or on their own initiative, in collective disputes relating to agricultural work. If conciliation is successful the settlement has the force of an agreement between the parties, but if conciliation fails, the committee embodies its own views in the form of a 'judgment' and suggests a possible solution of the dispute. Both the district arbitration committees and the committees attached to the provincial agricultural committees have met fairly regularly, and still continue to meet. They have helped to solve a large number of disputes, to the satisfaction of the disputants. . . . The machinery for the settlement of labour conflicts is not only increasing, but is gradually tending to assume the form of real labour tribunals. . . . The Decree of February 1919, on agreements in private employment, provided for the institution of special joint committees constituted of an equal number of representatives of managements and employees. These committees are competent to draw up draft agreements for particular firms, and to intervene in individual and collective disputes and in disagreements about the interpretation of employment contracts or work hours and work conditions. In cases of collective disputes, the functions of these committees are limited to attempting concilia-

tion. . . . Other cases are referred to special arbitration tribunals, constituted of five members, two nominated by the plaintiff, two by the defendant, and the fifth by agreement between the members. . . . The importance of the tribunals as regards collective disputes appears to consist less in their function of attempting to effect amicable settlements, than in their power to prevent disputes by drawing up draft agreements. . . . Both provincial committees, and later the joint tribunals, have in practice rendered very valuable service by providing peaceful solutions of a large number of disputes between employers and employees. . . . The Bill on the institution of a National Council of Labour, which was introduced in the Chamber of Deputies by the Minister of Labour on 10 November 1920, contains some very important clauses on arbitration. Article 1 (*d*) of the Bill provides that the Council shall arbitrate in industrial disputes at the request of the parties. For this purpose the Council at its first sitting appoints a conciliation and arbitration committee, constituted of twelve members, six elected by the representatives of employers and six by the representatives of the workers, and with the president of the Council as a chairman. The committee, or a sub-committee appointed by it from time to time, may intervene at the request of the Minister of Labour or of the parties, for the purpose of settling by conciliation such disputes and disagreements between employers and workers, as concern whole industries or large districts or a very large number of workers. If conciliation fails, the Minister of Labour, with the consent of the parties, may refer such disputes for arbitration to special arbitration tribunals, chosen as the need arises by the parties themselves, or, should they fail to agree, by the Minister. These tribunals are to be chosen from the members of the committee and are to consist of an equal number of representatives of employers and workers. The chairman shall be nominated by the members themselves, or, if they fail to agree, by the Minister of Labour."—*Labor conditions (International Labour Review, March, 1921)*.

NEW ZEALAND

1892-1913. — *Compulsory arbitration*.—"From the earliest times, New Zealand depended almost altogether upon water transportation for communication between various parts of the two islands. In 1892, there occurred the organized strikes of the workers in Australian colonies, in which the Seamen's Union took a leading part. Sympathy for the Australian cause practically resulted in a general strike of the New Zealand Seamen's Union, and trade was badly disorganized. As a result of this strike, the New Zealand arbitration law was passed in 1893 and became effective in 1894. The minister of labor was designated to administer the act. It provided for local boards of conciliation in 'industrial disputes' and a general court of arbitration. District boards were composed of three or five members, the chairman being chosen by the representative members from the working and employing classes who elected their members. They were appointed by the governor from nominations made by registered trade unions and registered employers' associations. The president of the court was chosen directly by the governor from the judges of the Supreme Court. Either party before a hearing had begun might require a dispute to be referred from the district boards of conciliation to the court of arbitration. Once a case was referred for conciliation, it was unlawful to call a strike or lockout. Agreements might be made be-

tween the parties, but their enforcement was compulsory, the same as an award by the arbitration court. Full power to compel the presence and testimony of witnesses was given the district boards of conciliation and the arbitration court. Every industrial dispute, except indictable offenses, came under the operation of the law, and since the act was based upon a free recognition of trade unionism, conciliation boards and the court were required to give preference to the members of trade unions. While this act was regarded as a compulsory arbitration statute, there was no penalty for failing to register, and unregistered organizations did not come under the act. Awards were automatically extended to whole industries by the act of 1900, the amendments of 1901 and 1903 and an interpretation of the court in 1904.

Between 1896 and 1903, two hundred thirteen employers were charged with violating awards and one hundred seventy-one were convicted. During the same period, four employees were charged with similar offenses and three convictions were obtained. The industrial conciliation and arbitration acts were consolidated in 1908 and amendments were added in 1908 and 1910. The *New Zealand Official Year-Book* for 1911 gives a summary of the main provisions. Under the act the Dominion of New Zealand is divided into eight industrial districts. Any society consisting of not less than three persons in the case of employers or fifteen in the case of workers in any specified industry or industries in an industrial district may be registered as an industrial union. Any incorporated company may be registered as an industrial union of employers. Any two or more industrial unions of employers or employees may form an industrial association and register under the act. Industrial associations are formed usually for the whole or greater part of New Zealand, comprising unions registered in the various industries. Registration enables any union or association to enter into and file an industrial agreement setting out the conditions of employment. Although this agreement is limited to a period of three years, it remains in force until superseded by another agreement or an award of the court of arbitration, except where the registration of the union of workers concerned is canceled. In the event of a failure to reach an industrial agreement, registration permits the parties to bring an industrial dispute before the council of conciliation and, if necessary, before the court of arbitration. A council of conciliation has no compulsory powers but merely makes an endeavor to bring about a settlement which, if made, is filed as an industrial agreement. If no settlement is reached, the council of conciliation is required to refer the dispute to the board of arbitration, which, after hearing the parties, may make an award. Such awards, like industrial agreements, are binding on all parties concerned. Unless otherwise provided, the award applies to the industrial district in which it is made. Awards are limited to a period of three years but remain in force until superseded by another award or by a subsequent agreement, except where registration of the union of workers has been canceled. It is now impossible to refer a dispute directly to the court of arbitration without waiting for a hearing by the board of conciliation. Four conciliation commissioners, holding office for three years, may be appointed and three were appointed in 1911, and each of the eight industrial districts was placed under the jurisdiction of the commissioner. When a dispute arises, the commissioner is notified and recommendations are received for one, two or three assessors to act

as representatives on the council of conciliation. Councils of conciliation are set up after notice to the other party by the commissioner and recommendations by them of an equal number of assessors. The court of arbitration is appointed for all New Zealand and consists of three members, one of whom, the permanent judge of the court, possesses the same powers and privileges as a judge of the Supreme Court. The other judges are nominated, one by the various unions of employers and one by the unions of workers and their appointments determined by a majority of the unions on each side respectively. They hold office for three years and are eligible to reappointment. The judge and one member constitute a quorum. There is no appeal from the decision of the court, except in cases beyond the scope of the act. Strikes and lockouts are illegal only if the parties concerned are bound by an award or agreement. Workers are subject to a penalty of forty-eight dollars and sixty cents and employers to a penalty of two thousand four hundred thirty dollars for strikes and lockouts. Gifts of money are deemed to be aiding or abetting a strike or lockout and these are punishable by a fine. In certain industries affecting the supply of water, milk, meat, coal, gas or electricity, or the operation of a ferry, tramway or railway, fourteen days' notice must be given within one month of an intended strike or lockout, whether subject to an award or agreement, or not. Strikes and lockouts are forbidden during the hearing of a dispute by the council or court of arbitration. Breaches of awards and industrial agreements are punishable by fines of four hundred eighty-six dollars against a union, association or employer, and twenty-four dollars and thirty cents against a worker. Since the passage of the New Zealand act in 1863 to the thirty-first of March, 1911, there was a total of forty-two strikes, of which twelve were of the slaughtermen. These twelve strikes occurred in 1907. Of the twelve slaughtermen strikes, six were within the scope of the act and twenty-two outside the scope of the act. In 1909, there were four strikes in New Zealand, in 1910, eleven, and in 1911, up to March 31, two strikes. . . . Perhaps nothing so completely demonstrates the strength of the New Zealand system of arbitration and its underlying basis of social justice as the Dominion's experiences with syndicalism and the efforts of the syndicalists to carry out a general strike during the latter part of 1911, 1912, and 1913. The effort was a complete failure, and although more than fifty strikes were called during the period, all of them were lost; direct action was thoroughly discredited; the arbitration system and the government which stood sponsor for it emerged from the contest with added glory. In December, 1913, a labor disputes investigation act, similar to the Canadian statute, was made to apply to workers' unions not registered under the arbitration act.—C. H. Mote, *Industrial arbitration*, 1916, pp. 137-145.—"The statute in force today [1910] is that of 1908, with the important amendment of that year and the minor amendments of 1911 and 1913. A proposed addition to the contemplated consolidated Act of 1913 was made into a separate measure and passed as the Labor Disputes Investigation Act, 1913. . . .

The Amending Act of 1911 dealt largely with the form and force of awards. The important feature of the Amending Act of 1913 was a provision that where the parties to a dispute did not object to a recommendation of a Council of Conciliation, this should operate as an industrial agreement and not as an award, thus limiting its application to the

parties specifically agreeing, whereas an award covers all employers and all workers in the industry in the particular district. . . .

The Amending Act of 1913 consisted of two clauses, and was passed expressly to provide that the recommendation of a Council of Conciliation to which the parties had not objected should operate as an industrial agreement, not an award. In explanation of this distinction it should be said that an industrial agreement binds only the parties agreeing thereto, while an award covers all employers and all workers in the industry in the district specified.—*Conciliation and arbitration in New Zealand* (*Research Report No. 23, Dec., 1919, pp. 6, 7-8, 40.*)—See also LABOR STRIKES AND BOYCOTTS: 1906-1913.

NORWAY

1914-1916.—Obligatory arbitration boards.—"In March 1914, a special congress of labor unions was held, to oppose an attempt of the government to make striking illegal and to introduce obligatory arbitration boards, by a general strike. When the proposed bill was brought before the Storting in May, a general strike was ordered for May 6th, which lasted until May 11, when the bill was withdrawn. This, however, did not prevent the government, a few months later, from again attempting to introduce a similar bill—without success. Later the government brought in a bill, which provided for the settling of labor disputes by arbitration boards. This bill, though not quite as severe as the first one, was also opposed by the Socialist Party, but was finally adopted by Parliament. This law contains a number of effective repressive measures. All workers employed in public industries must give 14 days' notice before laying down their work; furthermore the organization may be held responsible for the failure of any of its members to comply with the contract, through illegal strikes or lockouts. The public arbitration commission has the power to prohibit strikes and lockouts, so long as there seems a possibility of arbitration. In July, 1916, in the midst of tremendous conflicts between capital and labor, the government, under the direction of the employers, forced the passage of a bill providing for obligatory arbitration boards. After all parties, with the exception of the Social-Democratic Party, had declared themselves in favor of the bill, the labor unions, in accordance with the decision of the labor congress held two years before, declared a general strike. Although 120,000 persons answered the call, the law was passed, in spite of this protest of organized labor, and after eight days the strike was called off."—*American Labor Year Book*, 1916, pp. 203-204.

SWEDEN

1920.—Central arbitration board.—"In accordance with the decision of the Riksdag, a central arbitration board for the settlement of labor disputes has been appointed in Sweden [October, 1920]. This board consists of seven members; three of these are appointed by the Government and are neutral, representing the interests neither of employers nor of workpeople. Of the four remaining members, two are appointed by the Council of the Employers' Association, and two by the Workmen's National Council. The object of the board is to render it easier for workmen and their employers to have collective agreements correctly interpreted, thus obviating recourse to lock-

outs or strikes. Appeals to the board are to be voluntary, and the decision of the board will be final."—United States Bureau of Labor Statistics, *Monthly Labor Review*, January, 1921, p. 232.

SWITZERLAND

1897-1918.—Effect on railway problem.—"The Canton of Geneva has established a system of conciliation and arbitration. Conciliators are elected directly by the two parties to the dispute. If they cannot reach a settlement, recourse is had to an arbitration board under Government auspices. There is no law for the settlement of disputes in the Federal railway service. Strikes are prohibited in the Federal railway service and in the Canton of Geneva whenever an industrial agreement or award is broken. In the Federal service strikes are punishable by fines and reprimands. There are no penalties in the Canton of Geneva. There have been no strikes on the railways of Switzerland since their nationalization in 1897."—*American Labor Year Book*, 1917-1918, p. 143.

TURKEY

1917-1918.—"In the case of a dispute relative to wages or working conditions, a conciliation board is organized, composed of six members, three representing employers and three representing employees. The boards are presided over by an official appointed by the Government. The agreements reached by these boards are enforced by the Government. If the parties to the dispute cannot agree, the employees are free to stop work, but nothing must be done by them opposed to freedom of action. Strikes in public utilities are unlawful until grounds of dispute are communicated to the Government and attempts at conciliation have failed. . . . The organization of trade-unions in establishments carrying out any public service is forbidden."—*American Labor Year Book*, 1917-1918, p. 144.

UNITED STATES

1886-1920.—State legislation for arbitration.—"The seventeen states having permanent [arbitration] boards [in 1916] and the dates of their creation by statute are as follows: Massachusetts and New York, 1886; Missouri, 1889; California, 1891; Ohio, 1893; Louisiana, 1894; Illinois, Connecticut, Minnesota and Montana, 1895; Utah, 1896; Oklahoma, 1907; Maine, 1909; Alabama, 1911; Vermont, 1912; Nebraska and New Hampshire, 1913."—C. H. Mote, *Industrial arbitration*, p. 199.—"A majority of the states have [1920] legislation providing for the settlement of industrial disputes, and Wyoming has a constitutional provision to the same effect. Many of these states have permanent boards called boards of conciliation and arbitration or some similar title, with from two to six members, although three is the usual number. It is provided in every state except Alabama that one member shall be a representative of the employees, while all but Alabama and Connecticut provide for representation of employers. The Oklahoma board represents farmers in addition. Many states forbid that more than two members of the board be chosen from the same political party. In other states the labor commissioner acts as mediator, as in Idaho, Indiana, and Maryland. In states having industrial commissions, a chief mediator is appointed along with temporary boards for arbitration. In a score or so of states com-

pulsory investigation is provided for. The state board of arbitration *must* proceed to make an investigation (1) on failure to adjust the dispute by mediation or arbitration, as in Indiana and Massachusetts; (2) when it is deemed advisable by the governor, as in Alabama and Nebraska; or (3) simply when the existence of the dispute comes to the knowledge of the board, as in Colorado and Vermont. In other states such investigation is permissive. The board of arbitration *may* investigate (1) when it is deemed advisable by the industrial commission, as in New York. In Ohio the industrial commission can make an investigation, if it deems necessary, where a strike exists or is threatened, but if no settlement is obtained on account of the opposition of one of the parties investigation is to be made only if requested by the other party. Compulsory investigation may be employed (2) when both parties refuse arbitration and the public would suffer inconvenience, as in Illinois and Oklahoma, or simply where the parties do not agree to arbitration, as in New Hampshire; (3) or generally, whenever a dispute occurs, as in Connecticut and Minnesota. Provision for enforcement of an arbitration award when arbitration has been agreed to by representatives of both sides is made by about a dozen states. In Illinois, if the court has ordered compliance with an award, failure to obey is punishable as contempt, but not by imprisonment. In Idaho and Indiana the award is filed with the district court clerk, and the judge can order obedience, violation being punishable as contempt, but imprisonment may be inflicted only for wilful disobedience. In Missouri violation of a binding award is punishable by a fine or jail sentence, and in Ohio a binding award may be enforced in the county court of common pleas as if it were a statutory award. In Nevada, Texas, and Alaska the award is filed with the district court clerk, and may be specifically enforced in equity. In Nevada appeal is made to the supreme court, in Texas to the court of civil appeals, and in Alaska to the United States Circuit Court of Appeals. Colorado is the only state that has copied (1915) the Canadian act forbidding strikes or lockouts in certain industries pending investigation and recommendation. In about twenty states [Alabama, Alaska, California, Colorado, Connecticut, Indiana, Iowa, Louisiana, Maine, Massachusetts, Montana, Nebraska, New Hampshire, Ohio, Texas, Utah, Vermont] the voluntary agreement to arbitrate must contain a promise to abstain from strike or lockout pending arbitration proceedings. In Massachusetts it is the duty of the parties to give notice of impending stoppage of work. In Nevada and Alaska strikes or lockouts, during arbitration, and in Alaska for three months, after, without thirty days' notice, are unlawful and ground for damages."—J. R. Commons and J. B. Andrews, *Principles of labor legislation* (2nd ed.), pp. 136-138.

1888-1921.—Federal legislation.—"Federal legislation on mediation and arbitration is comprised in five acts concerning interstate commerce carriers," the acts of 1888, of 1898 (the Erdman act [See also U. S. A.: 1898 (June)], of 1913 (the Newlands act), "Section 8 of the act creating the Department of Labor, also enacted in 1913, and Title III of the transportation act by which the railroads were returned to private hands on March 1, 1920, at the end of the war-time period of government control and operation."—*Ibid.*, p. 138.—"The general popular belief is that arbitration is the main feature of our [American] present plan of settlement. . . . Few understand that the chief and most success-

ful part of our system is 'mediation,' or, as it is sometimes called, 'conciliation.' . . . In both the national and state laws a sharp distinction is made between mediation and arbitration. The first effort of public officials, when a dispute arises, is to 'mediate.' They interview each party to the dispute *separately* and secure the utmost concessions which each is willing to make. Next they try to bring about a settlement on the basis of these concessions. . . . Arbitration, however, is entirely different. If the officials fail to secure enough concessions to settle the dispute, they bend their efforts towards obtaining an agreement of the parties to refer the dispute to a board of arbitration. This is the substance of the Erdman Act, the Newlands Act and all the state arbitration laws. . . . The law of 1888 . . . provided that the President might appoint two investigators who, together with the United States Commissioner of Labor, should form a temporary commission to examine the causes of any interstate railway controversy, the conditions which accompanied it, 'and the best means for adjusting it.' The report of this body was to be transmitted to the President and Congress. Such a purely investigating commission might be appointed on the request of either party or by the President himself, or need not be appointed at all. The act also contained a weak provision for a board of arbitration to be chosen by the parties if they wished, which should render a decision on all the matters in dispute. This decision, however, was not binding. That is, the parties might agree to arbitration without consenting to abide by its awards. This statute, which remained a dead letter on the books for ten years, was never utilized. The reasons are very simple and easily discovered: (a) The balance of power lay entirely with the railway managers; many of the strikes were complete failures; the unions were on the defensive. (b) Both sides in the labor controversies of the time were poorly organized. No principles or methods of dealing between labor and capital had yet been worked out. There were no established habits of procedure, but each strike or dispute was an event in itself, separate and distinct from all others. We were in the 'rule of thumb' stage of opinion on labor controversies. For these reasons the decade 1883-1898, and even to 1905, represents an era in which arbitration was not the habitual but the most unusual thing to do. The second law, known as the Erdman Act, was passed in 1898 and provided that the federal officers, on learning of a serious interstate dispute, should attempt to mediate in the method already described. Failing in this they should, if possible, persuade the parties to sign a contract, the terms of which were fixed by the law itself. This contract provided for the submission of the dispute to a board of arbitration composed of three members chosen by the parties themselves. The award made by this board should be binding for a definite period. An appeal might be taken from the board's decision to the federal courts. It is a remarkable fact that only one case was brought up under this law in the first eight years of its history. This shows clearly that the parties concerned, and public opinion in general, had not yet developed to the point where arbitration was a natural and instinctive method of settlement. In the one case that was presented during this time the railways declined arbitration and the government system failed. The employees voted to strike by an almost unanimous ballot, whereupon the managers conceded the substance of the union's demands,—a settlement that could have been easily made by arbitration. Meanwhile in the period from 1901

to 1905 there were 329 strikes affecting the railways, with only this single case of attempted arbitration above described, and it a failure. This would seem to show conclusively that the unwillingness to make use of the previous act was not due to the weakness of the law, but to the lack of experience of the parties and the backward state of public opinion. Beginning with 1905, however, a complete reversal in conditions took place. Despite the failure of several abortive attempts, the unions had finally got a firm grip upon all the labor supply of the interstate trains. With this there had come a parallel development in the control of railway capital; mergers had taken place; railway systems had been more firmly cemented together; the 'community of interest' between competing lines had become a familiar feature of transport management. In 1902 the public had received that dramatic proof of the possibilities of arbitration which we still refer to as 'the' anthracite coal strike. This was probably the last great controversy in which the mining companies felt assured of success in a contest with labor organizations, and when victory was within their reach it was wrested from them by the national executive who forced arbitration. It is difficult to exaggerate the spectacular effect of this case. It established once for all the fact that arbitration on a grand scale in a crisis of national proportions is possible. The similarity of the issues with those arising on the railways was also helpful. This striking demonstration removed the chief obstacle to the use of the Erdman Law, and in the next eight years there followed in rapid succession a series of 61 cases, most of which were finally solved by mediation, there being only 12 in which arbitration was necessary. The third act, known as the Newlands Law, was passed in July, 1913. It differs from the Erdman Act in only two important points,—the boards of arbitration under the Erdman Act were considered too small by the railway managers; under the Newlands Act they may, by consent of the parties, be doubled to six members instead of three. The new law also provides that the work of mediation shall be undertaken by a special, permanent commissioner of mediation acting with one or two other federal officers, to be designated by the President, and forming a 'Board of Mediation and Conciliation.' Following the 61 cases presented for settlement under the Erdman Act, 60 more have already been brought up under the Newlands Law, that is, in the last three years [1914-1916] as many controversies have been submitted and settled as in the entire preceding twenty-five years. Of these 60 cases, 51 have been settled by mediation and 9 by arbitration. Taking the entire results of the Erdman and Newlands Laws since 1906, that is, since arbitration has become an accepted method, we observe that a total of 121 cases have been submitted. Of these over 70 were settled by mediation. Of the remainder, 21 cases were settled by arbitration, or by arbitration combined with mediation. In the remaining cases, the services of the mediators were either refused or a direct settlement made without resort to arbitration. This is an astonishing record. Two features stand out with especial prominence—the rapid increase in effectiveness of mediation, and the great importance and breadth of the problems submitted to arbitration. Mediation settled more than half of the controversies brought up to the board under the Erdman Law, and over four-fifths of those brought in the last three years under the Newlands Act. Among the matters subjected to arbitration were issues ranging from the most minute point up to the entire terms of employment

on over 40 railroads; from the discharge of an electric motorman for disobedience of orders to the settlement of pay and basic hours of work per day for many thousands of men."—J. T. Young, *Government arbitration and mediation* (*Annals of the American Academy of Political and Social Science*, January, 1917, pp. 268-272).—"For the four years ending June 30, 1917, the Federal Board of Mediation and Conciliation functioned in seventy-one controversies, fourteen of which were settled partly or wholly by arbitration, and fifty-two by mediation. One dispute was settled by Congressional action, the Adamson law, which meant, in effect, the breakdown of the Newlands act. The outstanding feature of events leading up to the Adamson law of September, 1916, was the failure of arbitration by existing agencies. The demands of the railway brotherhoods were met with counter-demands by the railway managers and the proposal to refer demands of both sides to arbitration under the Newlands act or by the Interstate Commerce Commission. The brotherhoods refused arbitration. Their experience with settlements by third parties had not been fortunate, they asserted. An overwhelming strike vote set the stoppage of work for September 2, 1916. The Federal Board of Mediation and Conciliation exercised its prerogative of offering mediation, but a four-day conference failed to bring agreement. Facing a country-wide railroad tie-up, the President conferred with both sides to the controversy and proposed (1) the concession of the eight-hour day, (2) postponement of the other demands until a commission appointed to investigate the effect of the eight-hour day reported. The brotherhoods agreed, but the managers delayed. The President asked Congress for legislation not only to deal with the existing situation, but also to remedy the all too apparent failure of the Newlands act. The Congressional answer was the Adamson law, passed on the day the strike was to have gone into effect. The law embodied just the proposals made by the President to the railroad men and employers.—[See also ADAMSON LAW; AMERICAN FEDERATION OF LABOR: 1884-1917; Railroads: 1916.] It was plainly evident that the Federal Board of Mediation and Conciliation met defeat largely through the refusal of the workers to submit voluntarily to arbitration. This difficulty was recognized by the President again in December, 1916, when he asked Congress for compulsory arbitration legislation. War legislation swamped Congress before action was taken on his recommendation. The Newlands act again failed in March, 1917. At that time the brotherhoods renewed strike threats, owing to the delay of the Supreme Court in deciding the constitutionality of the Adamson Law and to the alleged evasions of the railroad managers during the Supreme Court's delay. Disregarding the existing Federal Board, the President immediately appointed a committee of the Council of National Defense to mediate. Into the resulting agreement was written the establishment of the eight-hour day and provision for a commission of eight, representing employers and employees, to decide disputes under the agreement. The Eight-hour Commission appointed under the Adamson law reported inconclusively shortly after the railroads were taken under control by the government for the period of the war. The labor situation was immediately taken hold of when the government assumed railroad control and operation in December, 1917. . . . A Railway Wage Board was appointed in January to make recommendations to the Director-General, and a Division of Labor, headed by a brotherhood official, was created in February to be the connecting

link between employees and officials on one hand, and Railway Boards of Adjustment, when later instituted, on the other. The Railway Wage Board's recommendations were accepted by the Director-General and orders were issued providing for substantial increases in wages among all classes of employees. Thereafter a permanent advisory board on 'Railway Wages and Working Conditions' was created.—Successive orders of the Director-General formulated a liberal labor policy and established machinery for handling disputes under these orders. Board of Adjustment No. 1, dating from March, 1918, dealt with controversies affecting conductors, engineers, trainmen, firemen, and enginemen; up to December 1, 1918, it had docketed 408 cases and made 292 decisions. Board of Adjustment No. 2, authorized in May, 1918, for workers in mechanical departments, handled 147 cases and made 128 decisions up to December, 1918. Board of Adjustment No. 3, with jurisdiction over telegraphers, switchmen, clerks, and maintenance-of-way men, had docketed only one case in its fortnight's existence prior to December 1, 1918. In all cases coming before Boards of Adjustment it was obligatory that the usual attempt at carrying the disagreement to the chief operating official of the railroad be made before calling on the boards. The boards were composed equally of representatives of the administration and employees, and their liberal decisions did much to smooth out the differences remaining after the breakdown of the Newlands act and the enactment of the Adamson law. While the railroad employees officially voiced their approval of the government Boards of Adjustment, on which only the parties in dispute were the arbitrators, they have consistently opposed the submission of disagreements to a neutral party which is in their opinion either biased or ignorant.—[An order of Director General Payne, issued December 9, 1920, provided for the abolition of Board No. 1 on February 15, 1921, and of Boards No. 2 and 3 on January 10, 1921.] The act of March 4, 1913, creating a Department of Labor, provides that the Secretary of Labor shall have the power to act as mediator and to appoint commissioners of conciliation in labor disputes, whenever in his judgment the interest of industrial peace may require it to be done. No appropriation was made for the expenses of commissioners till October, 1913, and none for their compensation till April, 1914. Until the latter date, therefore, it was necessary to detail government employees from their regular work. An executive clerk was appointed in July, 1914, and the work systematized. In three important disputes the Secretary of Labor's offer of mediation was rejected. In the Père Marquette Railroad shop strike, the Calumet copper miners' strike, and the Colorado coal strike, mediation was desired by the employees, but declined by the employers. In case mediation fails, arbitration may be proposed by the mediators, but they do not themselves act as arbitrators. In the five years 1915 to 1919, inclusive, the Secretary of Labor took cognizance of 3,644 cases, effecting 2,539 adjustments. During 1919 alone, 1,780 assignments of commissioners of conciliation resulted in 1,233 adjustments, not including 219 cases referred to the National War Labor Board. . . . The policy of having disputes settled by representatives of the two parties most directly at interest, the workers and the employers, was in the main adopted in the transportation act of 1920. The act declares it the duty of the roads and of their employees to 'exert every reasonable effort and adopt every available means to avoid any interruption to the operation of any carrier'

growing out of any dispute. In case a dispute arises, it is to be decided if possible in conference between representatives of both sides. Such disputes involving only grievances, rules, or working conditions, as cannot be settled in this way, are to go before 'railroad boards of labor adjustment,' which may be established by agreement between any road or group of roads and the employees. Except that the boards are to [include] . . . representatives of the organized workers, their size and composition are left entirely to the parties concerned. Matters may come before the adjustment boards either upon application by the road or the organized workers affected, upon written petition of a hundred unorganized employees, upon the boards' own motion, or upon the request of the 'Railroad Labor Board.' This Railroad Labor Board is set up by the act as the final tribunal for the settlement of railroad labor disputes. It is composed of nine members, appointed by the President with the consent of the Senate, to represent in equal proportion the workers, the employers and the public. The three representatives of the first two groups are to be selected from a list of not less than six nominees submitted by the two groups, themselves. Members of the board may not, during their five-year term of office, be active members or officers of labor organizations or hold stocks or bonds of any carrier. Disputes come before the Railroad Labor Board either upon failure of the adjustment board, or directly. All of its decisions must be by majority vote, but on matters taken up directly one of the members representing the public must concur in the decision. The Railroad Labor Board also has power to suspend any decision on wages made by the initial conference, if it is of the opinion that the decision 'involves such an increase in wages or salaries as will be likely to necessitate a substantial readjustment of the rates of any carrier.' In such cases the Railroad Labor Board must, after a hearing, affirm or modify the suspended decision. As principles for settling standards of wages and working conditions, consideration must be given to wage scales in other industries, cost of living, hazards of the employment, training and skill required, degree of responsibility, character and regularity of the employment, and inequalities resulting from previous adjustments. Hearings on alleged violations of decisions are to be held by the Railroad Labor Board, which must publish its decision. [See also LABOR LEGISLATION: 1862-1920; RAILROADS: 1920: Esch-Cummins Act.] The Board of Mediation and Conciliation created in 1913 is still left in operation, but its jurisdiction does not extend to any dispute under investigation, by the boards established under the new act."—J. R. Commons and J. B. Andrews, *Principles of labor legislation* (2nd ed.), pp. 142-145, 147-148.

1898.—Interstate Commerce Commission created. See U. S. A.: 1898 (June).

1902-1920.—Arbitration in the coal industry.—"A semi-official instance of arbitration occurred in the case of the great anthracite coal strike in Pennsylvania in 1902. In this case the government appointed an arbitration commission on the request of the parties without any special authority in law. The miners wanted an agreement, the operators felt that it would not be binding and that the union obstructed discipline. In October, five months after the beginning of the strike, President Roosevelt appointed the Anthracite Coal Strike Commission. The men returned to work and the commission began its inquiry. It took the testimony of 558 witnesses. The losses of the strike were estimated at \$25,000,000 in wages,

\$1,800,000 in relief funds, \$46,100,000 to the operators, and \$28,000,000 in freight receipts to transportation companies. The commission found the underlying cause of the strike to be the issue of recognition of the union. The award stated that the commission would recommend recognition of the union, were the anthracite unions separated from the bituminous unions, but that difficulties should be referred to a permanent joint committee of miners' and operators' representatives, with an umpire appointed by the federal court, and that the life of the award should be till March, 1906. The commission further recommended a system of compulsory investigation. The agreement has been renewed, with modifications, and was still in force at the beginning of 1920."—J. R. Commons and J. B. Andrews, *Principles of labor legislation* (2nd ed.), pp. 148-149.—A bureau of labor was established in the United States fuel administration to take care of industrial disputes in the coal mining industry. [See also U. S. A.: 1902 (October).] For the settlement of the coal strike of 1919, see LABOR STRIKES AND BOYCOTTS: 1919: Bituminous coal strike.

1910-1916.—Protocol and arbitration in the garment industry.—An interesting experiment "in the adjustment of labor disputes is that represented by what is generally known as the Protocol System in the garment industry. The system derives its name from the collective agreement made between the Cloak Makers' Union of New York [and] . . . an association of employers on September 2nd, 1910. The agreement, formally designated 'Protocol of Peace,' was adopted at the conclusion of a long and embittered strike. It was drafted with great care and with the aid of several eminent students of social problems, prominent among whom was Mr. Louis D. Brandeis, now [1916] a Justice of the Supreme Court of the United States. . . . Essentially it was a collective agreement between an association of employers and a union of workers, regulating hours of labor, overtime-work, holidays, week-wages, methods of adjusting piece rates and other shop conditions. The novelty of the arrangements consisted mainly in the attempt to abolish all struggles between the individual employer and his workers and to substitute for them a peaceful method of adjusting disputes. To this end the workers surrendered their right to call shop strikes for any grievance whatsoever, and the Union bound itself to order its members back to work in all cases in which such shop strikes would break out. In return for this surrender of their most effective weapon, the workers were promised peaceful, fair and speedy adjustments of all their grievances. To secure such adjustments an elaborate joint machinery was devised, consisting of Chief Clerks with numerous staffs of assistance to investigate and adjust grievances, a Grievance Board, and subsequently a Committee on Immediate Action, to pass upon disputed cases, and finally a Board of Arbitration, acting as the supreme tribunal in the industry and vested with judicial and legislative powers. It is this joint machinery, which constitutes the distinguishing feature of a Protocol, as the arrangement has come to be generally known. The 'Protocol system' seemed to be well adapted to the peculiarities of the needle industries with their highly seasonal character, their irregular workings and countless daily problems and shop disputes. Within the first few years after its adoption in the New York cloak trade the system spread to a number of kindred trades. Collective agreements generally patterned after the 'Peace Protocol' were adopted by associations of employers and unions of the workers in

the various branches of the garment trade in the cities of New York, Philadelphia, Boston, Chicago, St. Louis and other centers of the tailoring industry. At the beginning of 1910, no less than 150,000 workers operated under that system.—M. Hillquit, "Protocol" in the needle industry (*American Labor Year Book*, 1916, pp. 55-56).—The employers' association broke up the arrangement by abrogating the Protocol of Peace, after an existence of almost five years, on May 20, 1915. . . . A number of forces were set to work to prevent a general conflict. Mayor Mitchel of New York organized a Council of Conciliation, composed of some of New York's best known citizens. . . . After a series of remarkable public hearings which lasted over three weeks at the New York City Hall, the Council of Conciliation handed down a decision which was . . . accepted by the union, and afterwards agreed to . . . by the Manufacturers' Association. . . . It raised the scale of wages for piece and week workers, granted the right of review of discharges, upheld the principle of collective bargaining and renewed the Protocol peace arrangements that existed heretofore. . . . Dissatisfaction grew with startling rapidity and . . . on April 30 [1916] . . . after a second abrogation of the Protocol the 400 members of the Association ordered a lockout in all their shops. It was quickly followed by the proclamation of a general strike by the union on May 3, . . . involving 60,000 workers. . . . The strike was finally settled on terms which represented strongly modified arrangements from those prevailing under the Protocol. The working hours were reduced from 50 to 49; the wages for both piece and week workers were materially increased, and principally, the right of shop strikes was conceded to the union.—M. Danish, *Brief history of the International Ladies' Garment Workers' Union* (*American Labor Year Book*, 1917-1918, pp. 110-111).

1917-1919.—President's mediation commission.—War Labor Board.—"In addition to the direct efforts of the Secretary of Labor, two arbitration boards were called into existence to meet exigencies of war. The President's Mediation Commission, appointed in the fall of 1917, under the chairmanship of the Secretary of Labor, made settlements or investigations in (1) the copper mines of Arizona, (2) the California oil fields, (3) the Pacific coast telephone dispute, (4) unrest in the lumber industry of the Northwest, (5) the packing industry. It should be recalled that this commission was a government enterprise beginning its study generally after an acute situation had arisen. Its primary intention was investigation rather than arbitration; but settlements were made in all disputes except the lumber industry, largely because existing means of arbitration had failed. The National War Labor Board was the outgrowth of conferences between representatives of employers' and employees' organizations, the public, and the government. Its existence was not sanctioned by specific legislation, but was the result of a Presidential proclamation in April, 1918. The membership of the board consisted of joint chairmen representing the public, selected respectively by employers' and employees' national organizations, and five representatives of each of the two groups. Premises to govern its decisions were the first business of the board, and the following were ar-

rived at: (1) No strikes or lockouts during the war, (2) settlement of controversies by mediation or conciliation, (3) provision of machinery for local mediation and conciliation, (4) summons of parties to the controversy before the national board in the event of failure of local machinery, (5) failing to reach decision in the national board, provision of an umpire appointed by national board or by the President from a panel of disinterested persons, (6) refusal to take cognizance of dispute where other means of settlement by agreement or federal law had not been invoked, (7) right of employers and employees to organize without discrimination, (8) right of collective bargaining. Acting on these principles as an official expression of the government's war labor policy, the board received 1,245 controversies up to May 31, 1919. In 462 of these cases awards or finds were made, 301 were dismissed because of voluntary settlement, lack of jurisdiction, or for other reasons, 315 were referred to other agencies having primary jurisdiction, fifty-three, involving only three distinct disputes, remained on the docket because the board was unable to agree, twenty-three were pending, and one was suspended. In the enforcement of awards the National War Labor Board had no specific legal sanction or penalty; appeal was usually made to patriotic motives. There were but three instances of resistance to the board's awards. In one case the Western Union Telegraph Company discriminated against union employees and refused to abide by the board's decision in favor of the men. The President was rebuffed in his appeal for patriotic acquiescence, but was sustained by Congress in taking over the telegraph lines for the government. Later, in September, 1918, the organized workers at Bridgeport, Conn., struck against an award of the board but on the President's threat of unemployment enforced by governmental agencies, they returned to work. Finally, the Smith and Wesson Company in Springfield, Mass., manufacturing fire-arms, refused to abide by the board's warning not to discriminate against union employees, and the President retaliated by ordering the War Department to take over the factory."—J. R. Commons and J. B. Andrews, *Principles of labor legislation* (2nd ed.), pp. 145-146.

"After the armistice was signed . . . there were very many cases in which both employers and employees disregarded complaints to the [War Labor] Board and refused to submit to its jurisdiction and carry out its findings. Shortly after the armistice the Board decided not to entertain complaints after December 5, 1918, unless both sides agreed to abide by its award or unless the President, through the Secretary of Labor, specially requested the Board to hear the case. In the absence of the extreme pressure for uninterrupted production, which had accompanied the war, the influence of the Board grew less and less until finally on June 25, 1919, the Board by resolution decided to receive no more new cases or applications, to finish up its work, and to transfer its records and files to the Department of Labor. [It ceased to exist on August 12.]"—A. M. Bing, *War-time strikes and their adjustment*, pp. 121-122.

1918-1919.—New York harbor strike. See LABOR STRIKES AND BOYCOTTS: 1018-1010: New York harbor strikes.

1918-1919.—War labor boards and the clothing industry.—On October 28, 1918, the joint board of the children's clothing grades began a

general strike to enforce the demand for the establishment of the forty-four hour week and for wage increases of 20 per cent. "In the midst of negotiations with Dr. William Z. Ripley, Administrator of Labor Standards for Army Clothing, leading to arbitration of the demands, the American Men's and Boys' Clothing Manufacturers' Association on November 9 locked out the workers in the men's clothing industry, adding 50,000 to the number on strike in the children's clothing trade. The New York Joint Board of the Amalgamated Clothing Workers on November 11 called out all workers from independent factories in a general strike to fight the lockout and to enforce demands for the forty-four hour week and for wage increases. The demand for the reduction in the work week was made primarily to provide places in the shops for thousands of clothing workers who had entered the nation's fighting forces and to ensure employment in civilian clothing factories of the workers who had been making military clothing. . . . The conclusion of the New York strike was brought about at conferences initiated by Chairman Felix Frankfurter of the War Labor Policies Board. Frankfurter on January 15 invited both parties to come together to discuss possible means of ending strife in the clothing industry. At a meeting with Frankfurter the union and the employers' association agreed to continue conferences with an Advisory Board composed of Frankfurter, Dr. William Z. Ripley and Louis Marshall. The Advisory Board on January 22 [1919] recommended the establishment of the forty-four hour week not only for the New York market affected by the general strike but also throughout the clothing industry. The Advisory Board urged the scientific computation of the effect of the increased cost of living before the granting of wage increases and recommended the selection of an impartial chairman to adjust differences in the shops. The award of the Advisory Board was approved at mass meetings of the strikers on January 23, and the return to work, with the forty-four hour week established, was begun on January 27. George R. Bell, Executive Officer of the National War Labor Policies Board, left that post on February 11 to become Impartial Chairman in the relations between the Amalgamated and the New York Employers' Association and the machinery for amicable relations was established."—I. W. Bird, *Strike of the Amalgamated Clothing Workers of America (American labor year book, 1919-1920, pp. 166-167)*.—In the summer of 1918 the Cleveland cloakmaker unions, affiliated with the International Ladies' Garment Workers' Union, presented demands to their employers for a raise in wages, standard union hours, with a request that these demands be arbitrated. The refusal by the employers to grant the cloakmakers' demands was followed by a general strike. "The National War Labor Board and Secretary of War Baker, however, quickly took a hand in the situation. The War Department asked both sides to agree to arbitration, and the manufacturers . . . accepted the invitation. Secretary Baker forthwith appointed a Board of Referees, headed by President Hopkins of Dartmouth College, then an assistant to the Secretary of War, which took up the grievances of the workers for investigation with powers of awarding an adjudication. The workers meanwhile returned to their shops. . . . After an exhaustive study of the conditions of the cloak trade in Cleveland and elsewhere, the earnings of the workers and their standards of work, the referees rendered a decision which was highly favorable to the workers. Later this decision was amplified; it provided for a scale of wages cover-

ing every part and section of the trade and for its thoroughness was equal to the best scales in the union towns in the East. It recognized shop committees and also recommended a Board of Arbitration to pass upon matters that could not be settled between the union and the employers. These were the maximum demands to which the Cleveland workers had ever aspired."—M. Danish, *Cleveland cloakmakers' strike (American labor year book, 1919-1920, p. 175)*.

1919.—**Bituminous coal strike.** See LABOR STRIKES AND BOYCOTTS: 1919: Bituminous coal strike.

1919-1920.—**Industrial conferences called by President.—Proposed remedy for strikes.**—On a call by President Wilson, the industrial conference met in Washington Oct. 6, 1919. It was composed of three groups, which represented the public, the employers and the employees; the secretary of the interior, Franklin K. Lane, was elected the permanent chairman. Lack of harmony in the conference was soon evident. On October 22, Mr. Gompers offered a resolution recognizing the right of workers to organize, to bargain collectively and to be represented by leaders of their own choice; the employers' group opposed it and the employees' group withdrew from the conference. The second industrial conference, representing only the public, was convened by President Wilson on December 1, 1919. Before the end of that month it issued "a tentative plan of machinery to adjust disputes in general industry by conference, conciliation, inquiry and arbitration." The conference reconvened on January 12, 1920, and issued its report on March 6, 1920. Its chairman was William B. Wilson, secretary of labor, and its vice-chairman, Herbert Hoover. The report says: "The Conference now proposes joint organization of management and employees as a means of preventing misunderstanding and of securing coöperative effort. It has modified the tentative plan of adjustment so as to diminish the field of arbitration and enlarge the scope of voluntary settlement by agreement. As modified the plan makes machinery available for collective bargaining, with only incidental and limited arbitration. The Conference has extended the plan to cover disputes affecting public utilities other than steam railroads and it has enlarged it to cover the services of public employees. . . . Industrial problems vary not only with each industry but in each establishment. Therefore, the strategic place to begin battle with misunderstanding is within the industrial plant itself. Primarily the settlement must come from the bottom, not from the top. The Conference finds that joint organization of management and employees where undertaken with sincerity and good will has a record of success. . . . It is not a field for legislation, because the form which employce representation should take may vary in every plant. The Conference, therefore, does not direct this recommendation to legislators but to managers and employees. If the joint organization of management and employees in the plant or industry fails to reach a collective agreement, or if without such joint organization, disputes arise which are not settled by existing agencies, then the Conference proposes a system of settlement close at hand and under governmental encouragement, and a minimum of regulation. The entrance of the Government into these problems should be to stimulate further coöperation. The system of settlement consists of a plan, nation-wide in scope, with a National Industrial Board, local Regional Conferences and Boards of Inquiry. . . . The plan provides machinery for prompt and fair adjustment of wages

and working conditions of government employees. It is especially necessary for this class of employees, who should not be permitted to strike. The plan involves no penalties other than those imposed by public opinion. It does not impose compulsory arbitration. It does not deny the right to strike. It does not submit to arbitration the policy of the 'closed' or 'open' shop. The plan is national in scope and operation, yet it is decentralized. It is different from anything in operation elsewhere. It is based upon American experience and is designed to meet American conditions. It employs no legal authority except the right of inquiry. Its basic idea is stimulation to settlement of differences by the parties in conflict, and the enlistment of public opinion toward enforcing that method of settlement." The general outline is as follows: "The United States shall be divided into a specified number of industrial regions, in each of which there shall be a chairman. Whenever a dispute arises in a region, which can not be settled by existing machinery, the regional chairman may request each side to submit the dispute to a Regional Adjustment Conference, to be composed of two representatives from each side, parties to the dispute, and two representatives to be selected by each side from the panels herein provided for. The regional chairman shall preside but not vote at the Conference. If the Conference reaches a unanimous agreement it shall be regarded as a collective bargain between the parties to the dispute and shall have the force and effect of a trade agreement. If the Conference does not reach an agreement and the disagreement relates to wages, hours or working conditions, it shall make a finding of the material facts, and state the reasons why it was unable to reach an agreement. The regional chairman shall report such finding and statement to the National Industrial Board herein provided for, which shall determine the matters so submitted as arbitrator. If the National Industrial Board shall reach a unanimous agreement, it shall report its determination back to the Regional Adjustment Conference, which shall in accordance therewith state the agreement between the parties to the dispute the same as if the Conference had reached a unanimous conclusion. If the National Industrial Board shall fail to reach a unanimous conclusion, it shall make majority and minority reports and transmit them to the regional chairman, who shall immediately publish such reports, or such adequate abstracts thereof, as may be necessary to inform the public of the material facts and the reasons why the Board was unable to reach an agreement. If the Conference does not reach an agreement and its disagreement relates to matters other than wages, hours, or working conditions, it shall make and publish its report, or majority and minority reports stating the material facts and the reasons why it was unable to reach an agreement. If the parties to the dispute so desire, they may select an umpire to act as arbitrator in place of the National Industrial Board, and in such case, the determination of the umpire shall be transmitted to the Regional Adjustment Conference with the same force and effect as a determination by the National Industrial Board. The appointment of representatives to the Regional Conference constitutes a voluntary agreement, (a) that there shall be no cessation of production during the processes of adjustment, (b) to accept as an effective collective bargain the unanimous agreement of the Regional Adjustment Conference, (c) to accept as an effective collective bargain, (in case of failure of the Regional Adjustment Conference) the decision of a mutually chosen umpire, (d) to accept

as an effective collective bargain, (in case of failure of the Regional Adjustment Conference, or upon failure of the parties to agree upon an umpire) the unanimous decision of the National Industrial Board upon wages, hours and working conditions. If both parties to the dispute refuse to submit it to a Regional Adjustment Conference through the failure to appoint representatives within the time allowed, the chairman shall organize forthwith, a Regional Board of Inquiry, consisting of two employers from the top of the employers' panel for the industry concerned, and two employees from the top of the employees' panel for the craft or crafts concerned. The four so chosen with the chairman shall constitute the Board of Inquiry. If either side shall have selected representatives, and thereby agreed to submit to the process of adjustment of the dispute, such representatives may select two names from their panel in the same manner as for a Regional Adjustment Conference. Such representatives of the party to the dispute, may sit on the Board of Inquiry and take full part as members thereof. The six thus selected, with the chairman, shall thereafter constitute the Board of Inquiry. The Board of Inquiry shall proceed forthwith to investigate the dispute, and make and publish its report, and if not in agreement, its majority and minority reports, in order that the public may know the facts material to the dispute, and the points of difference between the parties to it."—*Report of industrial conference called by the president, pp. 5, 7, 8, 13, 14.*

1920-1921.—*Kansas Court of Industrial Relations.*—"The Kansas law [of January, 1920] creates a Court of Industrial Relations [organized February 2, 1920] consisting of three judges, whose term of office is three years [and who are appointed by the governor]. The jurisdiction of the court is over the manufacture of food or clothing, the mining of fuel, the transportation of these commodities and over public utilities. . . . These industries are declared by the Kansas law to be 'affected with a public interest.' In these industries there must be no strikes, and there must be no suspension without the permission of the industrial court. The penalties for violation of the law are, if by a 'person' \$1,000, or one year in jail, or both; if by an official of a union or a corporation \$5,000, or two years in jail, or both. The court may intervene in the case of an industrial dispute, either on its own motion or when requested to do so by either one of the parties, or on the appeal of ten citizens, or on the complaint of the attorney-general of the state. It may issue a temporary award at the outset and then after its investigation a final award. The final award is to be retroactive, so that if wages are raised the employees will be entitled to back pay from the date that the investigation began. If the result is the reduction of wages the employees will have to pay back to the employer the amount that they have received over and above the amount awarded by the court. The court must proceed in accordance with the rules of evidence as laid down by the Supreme Court of the state. There are certain protective features. Wages and profits are to be 'reasonable.' The workers are not to be discharged on account of testimony given before the court, the employer is not to be boycotted for anything he has done in connection with the court, and the right of appeal to the Supreme Court of the state by either side is affirmed."—J. A. Fitch, *Government coercion in labor disputes (Annals of the American Academy of Political and Social Science, July, 1920, pp. 76-77).*—"The Industrial Welfare Commission and the Department of Labor of the

State of Kansas passed out of existence March 10, 1921, a bill having passed the legislature consolidating these two with the Industrial Court."—United States Bureau of Labor Statistics, *Monthly Labor Review*, April, 1921, p. 188.—"The first annual report of the Kansas Court of Industrial Relations covers a period of ten months, from the establishment of the court February 1, 1920, to November 30, 1920. The law providing for the court conferred upon it the duty of carrying on the work of the public utilities commission, so that the two undertakings have gone on side by side. On the industrial side only 28 cases were actually filed during the period. Of these, 25 were filed by labor and 1 by capital, while 2 were investigations initiated by the court. Of the 25 cases filed by labor, 20 received formal recognition and decision. In 13 cases a wage increase was granted, in 2 only working conditions were involved, in 3 wages were found to be fair so that no increase was allowed, while in 1 the complaint of the employees was satisfied by the action of the employers, the court simply approving the settlement made. The remaining case was merely referee action on a collective agreement. . . . Only low-paid labor, as a rule, has been before the court—a situation naturally resulting from the object of the law to establish a minimum wage."—*Ibid.*, June, 1921, p. 133.—"Employers are forbidden to discharge employees because of testimony given before the Court but no immunity is provided for discharge on account of union membership or activity, and inasmuch as strikes are forbidden, it would seem as though the workers were without any protection against the breaking up of their unions by systematic discriminatory discharges. The enactment of this law was vigorously opposed both by organized labor and by many employers and since its passage labor unions all over the country have made it the target for bitter attacks. President Howatt of the Kansas [coal] miners and a number of his associates were imprisoned because of their refusal to testify before the Court, and both the enactment of the law [and] . . . the imprisonment of Mr. Howatt resulted in strikes of the miners. . . . Governor Allen toured the country explaining the nature of the new Court and urging other states to adopt similar measures, and bills patterned after the Kansas statute having been introduced in the legislatures of a number of states."—A. M. Bing, *War-time strikes and their adjustment*, pp. 146-147.

1920-1921.—One national and one local arbitration agreement.—As examples of non-governmental attempts to provide conciliation and arbitration facilities, the following are described, one dealing naturally with the electrical construction industry and the other with the building industry in San Francisco. "As a result of joint meetings of five representatives each of the National Association of Electrical Contractors and Dealers and of the National Brotherhood of Electrical Workers, the following plan was drawn up early in 1920 and adopted in April [of the same year] . . . , providing for the creation of a council of industrial relations for the electrical construction industry in the United States and Canada [the foregoing being adopted as the council's official name]. The purposes of this council are stated to be the 'promotion of peace and harmony in the electrical industry, the adjudication of disputes between employers and employees, the establishment of friendly relations between all parties interested, which should ultimately result in the elimination of distrust, suspicion, and the wasteful methods of the old-fashioned strikes and lockouts.' The plan is

voluntary, no local union or employer being compelled to refer a case to the council. [Certain sections from the text of the plan follow.] . . . (3) That the Council shall consist of five representatives appointed by each of the [two] member organizations. . . . (11) That the council shall adopt the following procedure in the adjustment of disputes: When a dispute arises which can not be adjusted by the existing local machinery, and notice to that effect is received by the secretary of the council, from either of the parties to the dispute, the secretary of the council after investigation may, if circumstances warrant, request each side to submit the dispute to a board of conciliation to be composed of two representatives from each side, parties to the dispute, and one representative to be selected by the council who shall act as chairman but cast no vote. The appointment of representatives by the parties to the dispute to act for them on the board of conciliation shall constitute a voluntary agreement between the parties to accept as an effective agreement between them the unanimous decision of the board of conciliation. If the board of conciliation does not reach an agreement it shall make a finding of the material facts and state the reasons why it has been unable to reach an agreement. The chairman shall report such finding and statement to the council and the council shall determine the matters so submitted as arbitrator. If the council reaches a unanimous agreement, it shall report its decision back to the board of conciliation through its chairman, and the board shall then state the agreement between the parties to the dispute the same as if the board itself had reached a unanimous decision. If the council shall fail to reach a unanimous decision it shall make majority and minority reports and transmit them to the chairman of the board of conciliation who shall immediately publish them in order to inform the public of the material facts and the reasons why the council has been unable to reach an agreement."—United States Bureau of Labor Statistics, *Monthly Labor Review*, March 1921, pp. 126-127.—"All present and future disputes [written in January, 1921] relating to wages, hours, and working conditions in the building trades in San Francisco will be submitted to a permanent arbitration board for adjustment under an agreement recently signed by the San Francisco Building Trades Council representing the workers and the San Francisco Builders' Exchange representing employers. The board consist of three members. . . . [the] Archbishop of San Francisco, . . . [a] former justice of the Supreme Court of California, and . . . [a] consultant in industrial relations and management. The findings and decision of the board in each case will be accepted as final by the parties to the agreement. The board may initiate investigations into all conditions affecting the building trades and is empowered to call for contracts of agreements pertaining to any phase of the building situation. The hearings are to be public unless the board decides otherwise and the expense of operation is to be borne equally by each party."—*Ibid.*, p. 128.

ARBOGAST (d. 394), officer in the Roman army, though a barbarian (probably a Frank). In 388 overcame Maximus and pacified Gaul; made chief minister for Valentinian II by Theodosius. Overthrew Valentinian and invaded Italy, but was defeated at FRIDUS.—See also **ROME**: 379-395.

ARBOR DAY, a day set aside by most of the states of the United States of America for the planting of trees. In 1872 J. Sterling Morton of the Nebraska state board of agriculture successfully inaugurated the plan, which received official recognition in 1874 and spread rapidly to other states. The date is not uniform in the different states; in the North it is May or near that date, while in the South it is much earlier.

ARBUCKLE, Matthew (1776-1851), American brigadier-general, established Forts Gibson and Towson in 1824. See **OKLAHOMA**: 1806-1824.

ARBUTHNOT, Marriot (1711-1794), British admiral. See **U. S. A.**: 1780 (July).

ARBUTHNOT, Sir Robert Keith (1864-1916), British rear-admiral. Commanded 1st cruiser squadron in battle of Jutland (May 31, 1916), losing three of his four ships (the *Defence*, *Warrior* and *Black Prince*) and being killed in action.—See also **WORLD WAR**: 1916: IX. Naval operations: a, 1; also a, 9.

ARC DE TRIOMPHE DE L'ETOILE, ("triumphal arch of the star"), largest triumphal arch in the world, begun in 1806 by Napoleon I but not completed until 1836. It is situated at the head of the Champs Elysées, Paris, and commemorates the triumphs of the Revolutionary and Napoleonic troops. Famous not only for its architectural features but also for the beautiful sculptured monuments on its façades.—See also **ARCH**.

ARC DE TRIOMPHE DU CARROUSEL ("triumphal arch of the tilting match"), an arch built at Paris by Napoleon I to commemorate his victories of 1805-1806. It stands in the square enclosed by the Tuileries and the Louvre, and is a smaller copy of the Arch of Constantine at Rome.—See also **ARCH**.

ARC LAMP. See **ELECTRICAL DISCOVERY**: Electric light.

ARCADE, "a system or range of arches, supported on columns, e.g., the range of arches and columns on each side of the nave of a cathedral or church. When used as an embellishment of exterior or interior walls, it is distinguished as Open or Blind Arcade, according as it is detached from or attached to the plane of the wall."—C. H. Caffin, *How to study architecture*, p. 480.—The earliest arcade was in the palace of Diocletian in Dalmatia built c.300. During the middle ages the use of the arcade increased; the most noted example of a Gothic arcade is in the cathedral of Pisa. Beautiful street arcades are employed in Bologna and Paris.

ARCADELT, Jacob (1514-1556), one of the most prominent among the distinguished Flemish musicians who taught in Italy in the 16th century.—See also **MUSIC**: 16th century: Transition period.

ARCADIA, the central district of Peloponnesus, the great southern peninsula of Greece, sometimes called "the Switzerland of Greece." It is "a country consisting of ridges of hills and elevated plains, and of deep and narrow valleys, with streams flowing through channels formed by precipitous rocks; a country so manifestly separated by nature from the rest of the Peloponnesus that, although not politically united, it was always considered in the light of a single community."—C. O. Müller, *History and antiquity of the Doric race*, bk. 1, ch. 4.—Arcadia played an important part in Greek history owing to its strategic position be-

tween Sparta and the isthmus (of Morea). The Spartans' attempts to force a passage through the central plateau met with continual resistance from the Arcadian cities. (See **GREECE**: B. C. 480: Wars: Thermopylæ). It was not until the second Messenian war that the land was finally subjugated. Subsequent rebellions against Sparta's rule were easily quelled. In 420 B. C., however, the various cities, with the aid of Argos, consolidated, with the object of establishing their independence. (See **GREECE**: B. C. 421-418.) This attempt failed, as did a subsequent one in 371 (see **GREECE**: B. C. 371) when the Arcadians suffered a disastrous defeat at the hands of the Spartans (368). With the formation of the Achæan and the Aetolian leagues (q. v.) Arcadia once more became the battle-ground for the Spartan and Macedonian armies, due chiefly to the fact that the cities were divided in their allegiance between the two powers. Several centuries later the country suffered greatly from the internal disputes of its Frankish barons (1205-1460). Partly because of the way it was used by the later Roman poets, the name, Arcadia, has come to signify an idyllic land of pastoral simplicity and innocence.—See also **GREECE**: B. C. 371-362, 357-336, 280-146.

ARCADIAN ACADEMY. See **ITALIAN LITERATURE**: 1600-, 800.

ARCADIUS (378-408), Roman emperor, first emperor of the east. During his reign the control of the government was in the hands of a series of advisers and favorites. His rule was marked by the invasion of the Goths and the spread of Arianism.—See also **ROME**: Empire: 394-395.

ARCEUIL AQUEDUCT. See **AQUEDUCTS**.

ARCH, Joseph (1826-1919), English social reformer; founder of the National Agricultural Laborers' Union in 1872; member of Parliament 1885-1886, and 1895-1900.

ARCH, "generally, a structure supported at the sides or ends and composed of pieces, no one of which spans the whole interval. Specifically, a structure involving one or more curves, supported at the sides, spanning an opening and capable of supporting weight. Distinguished according to the nature of the curve, as, segmental, semi-circular, ogee, pointed, horseshoe, four-centred, trefoil, cinquefoil, and multi-foil. Arches involving straight lines as well as curved, are known as 'shouldered.'"—C. H. Caffin, *How to study architecture*, p. 480.

—The arch was used by the Egyptians, Babylonians, Assyrians, Greeks and Etruscans; but the Romans were the first to use it as a dominant feature of both external and internal design, especially in secular buildings. Later in Europe the arch became so great a feature in the construction of ecclesiastical edifices as to characterize distinct periods of architecture, notably the Romanesque, or round-arched, style and the more pointed Gothic. (See also **ARCHITECTURE**.) Triumphal or memorial arches, spanning a road, are built to commemorate great military triumphs, successful campaigns, or great events of peace. Although temporary arches such as those of the present day were erected in early Greece and Etruria, the Romans were the first to erect such structures in stone or marble and to enrich them with sculpture or to raise on their summit the quadriga with statues and trophies. There are two types of arches: the single arches and those having a central and two side arches which often displayed great skill in architectural as well as sculptural design. Several of the most famous are: the arch of Titus, the arch of Trajan recording the Dacian victories, the arches of Septimius Severus, Constantine, St. Rémy, Orange, and the Arc de Triomphe de

l'Étoile.—See also ARC DE TRIOMPHE DE L'ÉTOILE; ARC DE TRIOMPHE DU CARROUSEL; ARCHITECTURE; Oriental; India; Moslem architecture: 1300-1700.

ARCHÆANAKTIDAE OLIGARCHY. See BORPUS: City and kingdom.

ARCHÆOLOGICAL INSTITUTE OF AMERICA, a society founded in Boston in 1879 and incorporated by Act of Congress approved May 26, 1906, with Washington as its headquarters. Its purpose is to promote archæological research, to increase and diffuse archæological knowledge, to stimulate the love of art, and to contribute to the higher culture of the country. It has founded the American School for Oriental Research in Jerusalem, the American Schools for Classical Studies in Athens and in Rome, and the School of American Archæology in Santa Fé. It has also departments of Medieval and Renaissance Studies and Colonial and National Art. It has conducted notable excavations in Asia Minor, Greece, Cyrene, the Southwestern states and Central America. It publishes besides its reports, etc., a monthly illustrated magazine, *Art and Archæology*; a quarterly, the *American Journal of Archæology*; and a yearbook, the *Bulletin of the Archæological Institute*. The society also maintains lecture circuits in the United States and Canada, thus bringing regularly to its members several times a year the latest and most vital information in the fields of archæology and art. The institute is composed of affiliated societies, located in leading cities of the United States and Canada. The American school at Athens has been ably assisted in some of its undertakings by the School of Classical Studies at Rome, especially in its excavations at Heraeum and Argolid. The Carnegie Institute supports a fellowship in the school at Athens and pays \$1500 yearly for excavations. In 1912 the school at Rome was absorbed by the American Academy at Rome, and the American school at Jerusalem is working, since the war, in coöperation with the British school.

"The School of American Archeology was created in 1907 by the Council of the Archeological Institute of America, with the object of organizing and giving direction to the study in America of this and cognate branches, constituting the science of man in a broader sense—anthropology. It is controlled by a managing committee appointed by the institute, consisting of thirty-three prominent citizens and scientists of Canada, the United States and Mexico; and its field of activity embraces those countries, with the addition of Central America. After canvass of various localities the school was located at Santa Fé, New Mexico, because it is in the heart of a vast region of pre-historic cultures upwards of 1,000 miles long by 800 miles wide, extending from Utah to southern Chihuahua. It thus dominates a typical field for the investigation of the character and probable origin of the native races of this continent. . . . The general plan of the school contemplates that a portion of each year's work shall be done in the field, in direct contact with the things to be studied. The first fully organized session under this plan was held during the summer of 1910 in the region tributary to Santa Fé, under the personal direction of Dr. Edgar L. Hewett, Director of American Archeology, and of the school. . . . The United States Bureau of Ethnology collaborates with the school during four months of field work and two months for preparation of reports, under the joint authority of the chief of the bureau and the director of the school. . . . The bureau, however, has nothing to do with the administration or

maintenance of the school—collaboration being arranged only for mutual benefit, and to avoid duplication of work in the field."—F. Springer, *Field session of the School of American Archæology (Science, Nov., 1910)*.—See also ARCHÆOLOGY: Importance of American field.

ARCHÆOLOGY: Definition.—"The derivation of the word archæology gives little idea of its present use. 'The study of antiquity' is at once too broad in scope and too limited in time—for the followers of a dozen other 'ologies' are studying antiquity, while the archæologist does not confine himself to that period. . . . Actually, time has nothing whatever to do with the limitations of archæology; to think of it as leaving off where history begins, is to misconceive them both. The only proper limitation upon archæology lies in its subject matter. I conceive that it cannot further be defined than as, 'The scientific study of human remains and monuments.' . . . The first duty of the archæologist is to discover such material and to verify it; the next is to secure its preservation, preferably its actual tangible preservation—but if that is not possible, by description. Then comes the task of studying it, classifying and arranging it, and making it ready for use. At this point the function of the archæologist ceases, and the duty of the historian begins—to interpret it, and to bring it into harmony with the recognized body of information regarding the past. . . . When the archæologist ceases from the preparation of his material, and begins the reconstruction of the past, he commences to act as an historian."—C. R. Fish, *Relation of archæology and history*, pp. 146-148.—"Archæology is the history of civilization told through its monuments." Even this definition narrows the field possibly more than is strictly advisable, for archæology, or, in English parlance, the science of antiquities, is the broadest, most human and progressive of sciences. Its scope includes man and his history, the material things he has produced, the causes that produced them, the stories they tell, and the feelings they evoke. New discoveries are constantly adding to its material, opening up fresh fields, and forcing revisions of opinion. Such studies as religion and mythology, history, politics and economics, arts and industries, manners and customs, now depend largely on archæology for progress not only in material but in method. . . . All works of architecture, sculpture, and painting, of the industrial arts and numismatics, everything from a tombstone to an ivory carving or an illuminated manuscript, belongs to the domain of archæology. It is impossible to say where art ends and archæology begins, because art is merely one section of the subject. . . . The process by which a work of art is characterized and given its proper place, whether it is temple, cathedral, statue, or painted vase, is made up of elements both esthetic and archæological. For instance, the use of literary texts, of historical documents, of deductions from site, structure, circumstances of find, are all in the archæological domain. Also when generalization as to the character of the artistic development of any period or style are made, as in the case of Greek sculpture or Gothic architecture, nearly all the elements for the construction of a theory of artistic evolution are archæological. By their means the monuments are marshaled in ordered array, each made to take its place and yield its secret. In other words, without archæology as a basis and co-efficient, esthetics would not exist except in the form of subjective effusions of doubtful value. [See also ARCHITECTURE.] It is, then, archæology which creates the History of Art. Of course it is, con-

versely, true that complete appreciation either of a single work of art or of any group cannot be secured without the element of esthetic understanding which every true archaeologist should possess. . . . Thus far archaeology has been treated as furnishing the materials for exact knowledge of the past through the spade and through close study and observation. But it has done far more than this. It has developed gradually, during the course of a century and a half, certain valuable scientific methods by which to utilize this material and draw from it the most valuable conclusions. With these new methods, of which it borrowed the principles from the exact sciences, it has inoculated the fields of history and philology, helping to rid them of much loose and hypothetical thinking. In fact, it has given a scientific and observational basis to a large part of the field of the Humanities. Its careful application of the inductive and deductive methods in gathering and analyzing masses of material and in using them to formulate results and to state historic laws has made its work often safer than in the case even in some fields of pure science, because its data are more abundant and complete. This has not only given their full value to what has been discovered, but it has revolutionized the views held of monuments always seen and known, but never, as we now know, clearly understood."—A. L. Frothingham, *Where archaeology comes in* (*North American Review*, v. 104, Oct., 1911, pp. 580-582).—"The new conception, which perhaps first came obviously forward in the discoveries of prehistoric man, is that of materialized history in place of written history. The permanence of the traces of man and of the results of his acts and works has never been grasped till the present generation. Even to this day the sites of ancient cities and palaces are raked to pieces and destroyed in the search for inscriptions, regardless of the great amount of history shown in the material remains, often much wider and fuller than any that is recovered from inscriptions. The first use to which material history is applied is the confirmation and illustration of what is already recorded. . . . These confirmations are the least important use of material. The next use of material is to fill out and consolidate the fragmentary statements or bare outlines. . . . But the most valuable result from material history is the extension of it to ages before the written record of each country. So soon as man becomes a settler, and acquires anything beyond the skin and wood vessels of the nomad, he begins to lay by history; so soon as he disturbs the surface of the land by roads, entrenchments, or fields, he leaves the proof of his industry to the future, so soon as he even breaks a stone by skill and design he leaves an imperishable trace of his abilities. There is no land in which civilized man has lived, in which we cannot reconstruct his history entirely from his material remains. . . . The history of artistic influence is an immense subject still awaiting study and classification, but it will be seen to form an important part of the material history of man. We may perhaps sum up by saying that material history is the only trace left of far the greater part of man's development and duration; it is quite on a par with written history in ages where both are preserved, so far as the whole of a people is studied as a community; and the only peculiar province of written history is in dealing with individual character and influence. In the social view of history the material history is far more important than the written record as a whole; in the individualist view the written record is unapproachable, as dealing with the influences of the exceptional minds

which advance the frontier of ideas. Each has its fit place, and each is entirely powerless in the special region of the other means of research. The whole past of man during hundreds of thousands of years, down to the little clear fringe bordering on our own times, is entirely the province of material history; and even down to our own age it shares with written history that power of interpreting human action and change which is perhaps the most fascinating study that can engage our minds."—W. M. Flinders-Petrie, *Archaeological evidence* (*Lectures on the method of science*, pp. 225-230).—"The conservative historian might be tempted to object at the start that however important the development of man would seem to be before the opening of history, we can unfortunately know practically nothing about it, owing to the almost total lack of documents and records. Archaeology has, of course, he would admit, revealed a few examples of man's handiwork which may greatly antedate the earliest finds in Egyptian tombs; some skulls and bones and even skeletons have been found, and no one familiar with the facts doubts that man was living on the earth thousands of years before the Egyptian civilization developed. But what can be known about him, except the shape of his jaw and the nature of his stone and bone utensils, which alone survive from remote periods? If we feel ill-informed about the time of Diocletian or Clovis, how baseless must be our conjectures in regard to the habits of the cave man! It is certainly true that the home life of the cave man is still veiled in obscurity and is likely to remain so. Nevertheless, the mass of information in regard to mankind before the appearance of the earliest surviving inscriptions has already assumed imposing proportions. Its importance is perhaps partially disguised by the unfortunate old term 'prehistoric.' . . . However, . . . the distinction between 'historic' and 'prehistoric' is after all an arbitrary one. 'Prehistoric' originally meant such information as we had about man before his story was taken up by Moses and Homer, when they were deemed the earliest surviving written sources. History, however, in the fullest sense of the term, includes all that we know of the past of mankind, regardless of the nature of our sources of information. Archaeological sources, to which the student of the earlier history of man is confined, are not only frequently superior in authenticity to many written documents, but they continue to have the greatest importance after the appearance of inscriptions and books. We now accept as historical a great many things which are recorded neither in inscriptions nor in books."—J. H. Robinson, *New history*, pp. 84-85.—"It is from these diversified records, present and past, that the story of the race—the seven grand divisions of human history—must be drawn. Archaeology stands quite apart from this classification of the science of man, since, . . . [it] claims for its own more especially that which is old or ancient in this vast body of data. It is even called on to pick up the lost lines of the earlier written records, as in the shadowy beginnings of glyphic and phonetic writing, and restore them to history. It must recover the secrets of the commemorative monuments—the tombs, temples, and sculptures intended to immortalize the now long-forgotten great. It must follow back the obscure trails of tradition and substantiate or discredit the lore of the fathers. It must interpret in its way, so far as interpretation is possible, the pictorial records inscribed by the ancients on rock faces and cavern walls, these being among the most lasting of purposeful records. [See also PAINTING: Meaning of

painting: Its progress.] All that archæology retrieves from this wide field is restored to human knowledge and added to the volume of written history. Archæology is thus the great retriever of history. The science of archæology is equally useful in the field of the fortuitous records of humanity, for it reads or interprets that which was never intended to be read or interpreted. The products of human handicraft, present and past, which have automatically recorded the doings of the ages, are made to tell the story of the struggles, the defeats, and the triumphs of humanity. The fortuitous records embodied in the nonmaterial products also of man's activities are made to cast a strong light on the history and significance of the material things of the past. Even the body of knowledge gathered from many sources and stored in the memory of the living, though untrustworthy as a record, may be made, if wisely employed, to illuminate the past; and the physical and psychical man of to-day are in themselves records and may be made to tell the story of their own becoming, thus explaining the activities and the products of activity throughout the ages. All that archæology

Christ, while if the Greek historians had any inkling of the advanced civilization that developed in the Ægean in the early second millennium, it consisted only of such vague suggestions as are incorporated in the Platonic account of the lost Atlantis. Modern interest in archæology cannot be said to be older than the seventeenth century and dates from the time of the travels in the Levant undertaken chiefly by the French and English. . . . These early travelers have given us invaluable records of numberless ruins that have long since been destroyed; but they are not men who would initiate or advance a systematic study of objects or sites, and that great achievement was left to a German scholar, Winckelmann, who published his 'History of Art,' the first modern work on archæology, in the closing years of the eighteenth century. The realization that a work of art is not an isolated phenomenon, but can be understood only in relation to its predecessors and successors, was slow to penetrate, and after the discovery of the statues of the Æginetan pediments in 1811 Thorvaldsen was as supremely successful in reconstituting them perfect works of art as he was in-

gathers from this wide field of research is contributed to the volume of written history. It is thus not only the retriever of that which was 'treasured and lost, but equally the revealer of vast resources of history of which no man had previously taken heed.'—W. H. Holmes, *Place of archæology in human history* (*Proceedings of the Second Pan-American Scientific Congress, Jan. 8, 1916, p. 188*).

Method and scope.—'Archæology has been called the Queen of Sciences inasmuch as the science of antiquity comprises all that the mind of man in the past has conceived and then produced in concrete form, from the primitive stone axe of palæolithic times to Roman cities like Pompeii with their innumerable ramifications of complex life. Archæology, therefore, is not limited to the Ægean or the Mediterranean basin, but is all-comprehensive in its scope, proceeding far and wide and establishing branches in every continent, in far and near Asia, in Europe, North Africa, and both Americas. . . . The scientific study of archæology is a purely modern development, and it has become a commonplace to assert that the generation now living knows far more about the Homeric Greeks than did the dwellers in Athens five centuries before

genious in his efforts to conceal the intention and cover the hand of the artist who made them. The result is that the statues as now exhibited in Munich are not creations of the early fifth century B. C., but such works as interpreted by an artist who lived nearly twenty-five centuries later. The sculptures of the Parthenon, brought from Greece by Lord Elgin, escaped a similar fate only through the subtle feeling and unerring taste of Canova, who refused to desecrate masterpieces; and yet as late as 1816 the English Government showed much hesitancy about purchasing these very masterpieces for the British Museum. Artistic appreciation of these products of Greek sculpture was expressed grudgingly at first, but in due time with such measure that an incessant demand for new examples led to a general ransacking of ancient sites with much consequent destruction of interpretative landmarks. Schliemann went to the Troad in search of the city of Troy and returned with the 'Treasure of Priam'; but the brutal trench that he drove through the mound revealed to him nothing of its history while it obliterated countless records which his successors would have prized. It is only within the past few decades that a method of archæology has been universally rec-

ognized and adopted, and the secret of archæological method is the most intensively trained observation. . . . Perhaps this was first realized for a Greek site with the beginning of the excavation of the Acropolis at Athens (q. v.) in 1885, where the fact was appreciated that in order to wrest its secrets from a continuously occupied citadel no mark on the stone could be overlooked and no inch of earth disregarded. Moreover the results justified the method, and the history of the Acropolis was revealed, to the eye that can see, almost from the time of Erechtheus to the present day. But the best illustration of the way in which archæological method accomplishes remarkable results may be seen in the site of Knossos in Crete. When Sir Arthur Evans began excavations here in

ever uniform the training may have been, and is widely different at different periods of man's social development. The mental process of observation must, therefore, be immediately supplemented by physical records in the form of notes, measurements, drawings and photographs, which should be complete and accurate and made irrespective of preconceived theory on the subject treated. . . . This developed science of archæology has as its broad aim the reconstitution of the past in the terms of the present for the use of the future, and this aim may be most easily interpreted by discussing the relation of archæology to other important branches of knowledge. . . . The interrelations of archæology and history are very intimate. No archæologist approaches an ancient site with

EXCAVATIONS AT THEBES, 1918-1919.

Coffin of Prince Amenemhet

1000 everything he turned up was strange and new in type. There were no parallels, no material for comparison, no resemblances in product and style to sites elsewhere, uncovered. So he was entirely dependent on inductive reasoning, which through his care in excavation and closeness of observation has enabled him to reconstruct the development of Cretan civilization from a long period of stone-age occupation to an era of the highest bloom in art and culture about 2000-1800 B. C., with its subsequent decadence and practical end possibly by 1200 B. C.—This archæological method with observation as its basis is not limited to cities and citadels, but is equally applicable to the study of individual works of art. . . . [But] observation is not enough, because observation is a psychological phenomenon that varies with each individual, how-

the purpose of study or of excavation without perfect familiarity with every scrap of information available in earlier writers. . . . History also reveals important data by means of which sites have been identified and cities located. . . . Thus a knowledge of ancient, mediæval, and modern history is a necessary preliminary to practical archæology; but on the other hand archæology is the great maker of history. . . . Every inscription is a contemporary historical document; every site excavated writes a new chapter of history. But the spade has gone even further and constructed whole departments of history, which by way of distinction are called protohistory and prehistory; and the prehistory of Crete furnishes us more information of man's life, actions, and social development than is available for many periods comprised

within historical limits."—T. L. Shear, *Archæology as a liberal study* (Columbia University Quarterly, June, 1917, pp. 258-265).—See also ÆGEAN CIVILIZATION.

Development.—"The excavations that have given us the skulls of the earliest men, the rock-pictures some fifteen or twenty thousand years old, and the earliest fashioned implements and potteries are archæology's contribution to anthropology and pre-history. [See also EUROPE: Prehistoric period: Paleolithic art.] For the age when historic civilizations began, at the close of the Neolithic Age, after 5000 or 4000 B. C., it is only necessary, in order to realize the revolution brought about by archæology, to pick out any ancient history written more than seventy years ago, . . . and compare it with one written during the last two or three decades. It is difficult to realize that only a little more than a century ago, almost nothing was known of ancient history prior to the days of Greece and Rome, except the account given in the Old Testament. [See also MOABITES.] Following the discovery of the Rosetta Stone by one of Napoleon's soldiers in Egypt and its decipherment by Champollion a few years later, many events in the history of Egypt became known and interest was aroused in other fields. [See also ARCHITECTURE: Oriental: Egypt; EGYPT: About B. C. 1500-1400; JERUSALEM: 1850-1000; JEWS: Children of Israel in Egypt.] The rapid growth of modern science in the early years of the nineteenth century, the development of biblical criticism furnished further motives for archæological research. The excavation and resurrection of the ancient cities of Assyria, Babylonia [see also ARCHITECTURE: Oriental: Mesopotamia; BABYLON: Results of excavations; BABYLONIA: Nebuchadrezzar, and Hamurabi: His character and achievements], and Persia through the efforts of Rawlinson, Botta, Layard and others followed one after another with ever-increasing interest, while the decipherment by Rawlinson of the inscription of Behistun in 1837 opened the way for the interpretation of the whole series of inscriptions, cuneiform tablets and other records which had been unearthed. [See also ALPHABET: Deciphering the hieroglyphics.] Since 1840 or 1850 archæology has practically created for us four thousand years of history: a new heaven as well as a new earth for the pre-Hellenic world. Egypt, Babylonia, Assyria, the Hittites have emerged from an almost Cimmerian darkness. We can now decipher their writings, read their literature, reconstruct their annals, religion, and life, while looking into the faces of the men and women of their race. The Northern races that entered so much later into the arena and yet were even more intangible than these Eastern nations are being unveiled by archæology: Goths, Scandinavians, Celts [see OGAM INSCRIPTIONS], Gauls, Slavs, and Germans, from the mountains of Armenia and the Caucasus to Brittany, are being shown by their archæological remains as either half yielding to the influence of Greece and Rome or maintaining their primitive integrity. Our science is helped at times by literature, but often it is obliged to seek unaided for an answer in these fields of the primitive and undeveloped races. This illustrates how much broader as well as more faithful it is than literature. . . . After this, in the main currents of historic development, archæology must share with literature the credit of picturing the past. Yet we hardly realize, perhaps, how little Greece would be the Greece we visualize if we were to depend entirely on her literature, eliminating her architecture and her sculpture, the embodiments of her

sense of beauty, and the minor arts which give the picture of Greek dress, jewelry, arms, and furniture, with all those concrete details of the daily life, the games and wars, the religious ceremonies, and the thousand and one things that literature leaves untold while telling us so much. Even Greek literature itself owes most of its recent slender additions to the work of the archæologists who have unearthed the papyri preserved in the sands of the Fayûm. . . . The real significance of all the material things produced by man, their relation to thought and life and their correlation to one another, is so recent and so blinding that it is hardly as yet understood that any attempt to study the world's past without their help is bound to be futile, misleading, or superficial. It is, therefore, customary to consider archæology as a very modern study, and to speak of Winckelmann as its founder after the middle of the eighteenth century. While this is true in a large and critical sense, it is interesting to note that there has been at all times a certain amount of unconscious archæology, and that the work of a student traveler like Pausanias, under the Antonine emperors, is even conscious archæology. . . . When the Emperor Augustus insisted on having copies of the best works of Greek sculpture of different ages and styles made in the exact manners of the originals, including archaic works, he was obliging his sculptors to be archæologists. . . . It would not be difficult to find examples in post-classical times; among medieval miniaturists who reproduced illuminations several centuries old; among Renaissance artists like Michelangelo and Raphael, who were so successful in reincarnating antique forms. It is a curious fact that the one man who can be pointed to as preceding Winckelmann to a certain extent as a real scientific archæologist is not in the field of classical studies, but in that of Christian archæology. He is Bosio, a Roman priest of the seventeenth century (1620), who originated the scientific methods by which the Roman catacombs were made the basis for our study of early Christian life. Winckelmann's revolutionary idea was the formulation of a philosophy of the history of art and of the theory that works of art and archæology should be studied for their own sakes, instead of as illustrations of ancient literature, and as parts of a well-ordered whole instead of as unrelated objects of curiosity. It appears to be forgotten that what he did for a History of Ancient Art the Frenchman Seroux d'Agincourt attempted immediately after to do for the entire post-classic age. It seems also to be forgotten by many that, while Winckelmann's methods were published between 1760 and 1767, they did not bear full fruit until after the founding at Rome in 1828 of the International Archæological Institute, with its splendid series of publications and its co-ordination of effort. Otfried Müller gave, in 1830, the synthesis of the new movement in his *Manual of the archæology of art*. In the great era of excavation which had been opened by the discovery of Herculaneum in 1710 and continued at Pompeii after 1748, the increased knowledge of Roman art was paralleled by additional revelations regarding Greek sculpture through the bringing to Western Europe of the archaic sculptures of Ægina and those of Phigaleia and the Parthenon. Very soon the opening of numerous tombs in Italy disclosed the wonderful minor arts of Hellas and Etruria, especially in jewelry and painted vases. While these early excavations previous to 1850 were in the nature of looting forays, they afforded to archæologists for the first time a fairly well-rounded survey of the various branches of the

art and industry of Greece and of the peoples connected with her. The scholars of the Roman Institute took instant advantage of this, and to their inspiration was largely due the immediate emulation in discovery of France, Germany, and England. Previous centuries had been content to travel and study what was above ground. The new school realized that what was visible was but a small fraction of what could be unearthed. At the same time there was no surcease in exploration. The new science gave different eyes for

of Austrian, English, and German excavators the Greek cities of Asia Minor gave unexpectedly fruitful finds at Pergamon, Halicarnassus, Miletus, Ephesus, Priene, and Magnesia. At Priene an entire city of the Alexandrian age was laid bare. In several of these Asia Minor cities, and in others whose ruins are above ground, we can also study the amalgamation of Greek and Roman civilization. Then a revelation of the purely Roman work of extending civilization came in the exploration of the abandoned cities of Central Syria [see ASCA-

EXCAVATIONS IN ANCIENT BABYLON
The Esagila Temple built to the god Marduc

understanding the things above ground. There were also important regions of Asia Minor, Syria, and Roman Africa which had never been archæologically explored. Even now this work has not been completed. The founding of the German and French archæological schools at Athens gave a great impetus to excavation, especially after the spectacular success of Dr. Schliemann at Troy and Mycenæ, and that of the Germans at Olympia. [See *ÆGEAN CIVILIZATION: Excavations and antiquities; TROY.*] In quick succession came Eleusis, Epidaurus, Delos, and Delphi. In the hands

of those in North Africa through the occupation by the French of Algeria and Tunisia. At the same time the period immediately following, the age of the incubation of Christianity, was revealed in the exploration of the Roman catacombs by de Rossi and his masterly unveiling of their secrets. The sharpening of the critical and intuitive faculties upon this mass of new material affected, as we saw in the case of Gothic architecture, the attitude of scholars toward the rest of the field, especially those of the Medieval and Renaissance periods, where

there was little to uncover, but where application of the new historico-scientific methods effected quite as radical a revolution in the ability to understand and correlate the monuments. [See also ARCHITECTURE: Classic.] Between about 1850 and 1860 it may be said that the New Idea had penetrated every field and was being embodied in the literature of the subject, and especially well in such general histories of the monuments as Kugler and Schaaase. In each country a solid basis was being given to the history and science of the national antiquities by the organization of associations, by congresses, and by the new chairs for teaching the subject at the universities and even the schools. In this process the science and its irresistible trend is everything; the individual is of small account. Yet certain archæologists of the last fifty years emerge as among the greatest scholars that the world has seen, directing the current and setting a permanent seal upon men and things. Such men were Mommsen, who practically created the science of Roman antiquities and history; de Rossi, who gave us a complete science of Early Christian archæology; Evans, who has brought into being both the material and the science of Early Ægean civilization. Hundreds are following the paths they have blazed. In European universities the teaching of archæology as an independent department has long been recognized and is also carried on sometimes, as in the Ecole du Louvre, in connection with large museums. Special courses in Egyptian, Babylonian and Assyrian, Greek, Roman, Christian, Medieval, and Renaissance monuments in many branches, have been well established for thirty or forty years throughout Europe. Only American institutions have remained indifferent and retrograde. In the rank and file of workers the Germans show the greatest pertinacity in elaborating special themes; the French are paramount in clear-eyed and facile exposition without loss of scholarship."—A. L. Frothingham, *Where archæology comes in* (*North American Review*, v. 194, Oct., 1911, pp. 577, 578, 584-587).

Importance of the American field.—"In American archæology man in the cultural process is the unit of investigation. This establishes the limits of the science. Its subject matter lies mainly in the prehistoric period, but this must be studied in the light of auxiliary sciences which have for their field of investigation the living people. It necessitates the study of all phenomena that will add to our knowledge of the intellectual attainments of the native American races or illustrate the evolution of their culture. It aims at a reconstruction and interpretation of the order of civilization existing in America before the Caucasian occupancy. . . . The first task of the archæologist is to rescue the material and intellectual remains of the people whose history he is seeking to restore. It can never be hoped that a continuous record will be recovered, but the greater the amount of material secured the more nearly complete can it be made. But archæological research is more than the recovery and study of material. As history is not only a recital of events but an inquiry into their genesis, it is imperative to investigate and describe all phenomena upon which such events are conditioned. Therefore it is the belief of the writer that physiographic conditions are essentially correlative with facts of culture, that physical and psychic

causes are to be held in the closest possible relation if we are to correctly interpret the intellectual remains of the native races of America, whether in the form of myth, ritual and symbolism of plains and desert tribes, or in architectural, sculptural, pictorial, and glyphic remains of the Mexican and Central American civilization."—E. L. Hewett, *Groundwork of American archæology* (*American Anthropologist*, Oct., 1908, pp. 591-595).—See also AMERICA: Prehistoric.

"Perhaps no better indication of the importance of American archæology can be given than to refer to several of the questions which it and it only can solve. Among them are these,—1st. Who were the mound builders, especially of the Ohio region and other places where great heaps of dirt and stone seem to be effigies and represent animals of different kinds, or, as at Seltzertown in Mississippi, are terraced with architectural skill? Were they the same as Indians of historic times, or were they a separate race? If the former, were they not of Choctaw and Cherokee origin, as Brinton concludes? 2nd. Whence came the red men of this continent? Were they a separate creation or did they immigrate from other continents? If they did, was the Pacific slope crossed from China and Polynesia, and was the great Mississippi basin settled from some eastern source, or were all the red men of one stock? Here geology must tell us as to the connection of the continents in tertiary times. 3rd. There being evidently, as we have seen, a number of races on this continent, what were their inter-migrations? Did they come from North to South or East to West? And what were the limits of these movements? On this the spread of agriculture, particularly of maize and tobacco, native only to Tehuantepec, may throw great light, while strange to say the banana seems to come to America with the whites. This becomes a part of the interesting study of the distribution of plants on the earth. 4th. What were the limits and boundaries of the historic tribes? Language is teaching us something, but only by a systematic study of the districts inhabited by the respective tribes can we solve this with any satisfaction. 5th. What degree of civilization had been attained by these different tribes? What advance had Chickasaws made over the Choctaws or the Creeks over the Cherokees? How do all compare with those of Mexico and Yucatan? 6th. There is one matter of greater interest and greater value than all the others and yet it is seldom thought of. It is this,—can we reconstruct the primeval speech of the inhabitants of America? If we can, we shall contribute more than we imagine to the archæology of the whole world. This was first pointed out by Wilhelm Von Humboldt, and in our own times by D. G. Brinton. The reason is that the Indian languages seem to be based upon a different plan from those of any other continent. What was the speech of primeval man is a curious question but so far utterly insoluble. It is thought we can see on the earth's surface a few primary linguistic stocks. . . . It is the opinion of many good scholars that the Indians when first discovered by Europeans had preserved their ancient languages and language plan better than any other races on the globe. Even yet two hundred independent stocks are known. If this is so, a study of their languages presents a unique field, one which will carry us further back into the archæologic past than any other linguistic stock. This feature of American archæology has not been sufficiently noticed. The harvest truly is plentiful, but the laborers are few. Finally therefore in studying

Indian antiquities we are carrying ourselves further back into the past of the human race, getting closer to the primitive savage, than is possible in the study of any other tribes on the globe, and becoming better able to decipher the beginnings of all human civilization than is possible in any other way!"—P. J. Hamilton, *Importance of archaeology*, pp. 263-264.—"It is sufficient for me, in order to show what significant impulses have proceeded from both the archeology and the ethnography of America, to recall to you that the whole modern development of primitive sociology took its real beginning from the investigations of Lewis H. Morgan into the tribal constitution of the Iroquois, and that in the most recent researches into the philosophy of religion the old Mexican belief is beginning to play an increasingly important part. American archeology and ethnography are also of the greatest importance to general ethnology. . . . For that science, also, which tries to search out the mysteries of the laws which have governed the human mind in its development from its obscure beginnings, the observations which we have made or are in a position to make on American soil will be of greater importance than those made in any other part of the world. For the observations made here have all the advantages of pure experiment. That is the special privilege of American studies, and the special interest which attaches to them. To provide the material for that comprehensive science, the study of the human race as a whole is thus not only the real and greatest task of American archeology, but also its most rewarding. It will be a great joy to me if the conviction of this shall spread in ever wider circles, and bring to American archeology the new laborers of which it still has such pressing need."—G. E. Seler, *Problems of archeology* (*Congress of Arts and Sciences*, 1904, pp. 540-541).—"There is an awakening to the place of the native American race in culture history which Americanists are happy to see and encourage. There is a destiny for the American Indians more honorable than to be exploited as material for stirring fiction and spectacular exhibition. They are being recognized as representatives of a race of splendid works and noble characteristics—a people who, in spite of the appalling adversities of the last four centuries, may look forward to a future on the high plane of their ancient traditions. Masterpieces of art worthy of presentation to the public in museums, galleries, and publications devoted to art and culture; architecture which in design and construction commands the admiration of the master-builders of today; systems of government and religion, ideals of right and practice of justice matching the most exalted that civilization has brought forth—these are achievements of the Indian race worthy of the consideration of the educated. Classical archaeology has long had its constituency of scholars, consistently true to the ancient shrines, keeping alive the literature, art and drama of the people who set standards for the modern world. There has been no lack of capable exponents for every branch of Caucasian culture through its own racial eyes and mind and forms of expression. The Indian race has had few to maintain its sacred fires. The disposition has been to put them out rather than to preserve them. History affords no parallel to the absolute, relentless subjugation of an entire race inhabiting a whole continent. It has been interpreted to the world almost wholly by its alien conquerors; less and less unsympathetically as years go by, and in some instances with rare understanding, but, nevertheless, by those of other blood. . . . It would do no harm to forget

most of the efforts that have been made to explain the Indian race and let its works tell the story. . . . Literary record is absent and vocal representation not much used. But these can be spared, for the race has, like every other, revealed itself in its art. There was no conscious effort to do it. So the picture is true. What the race actually thought, felt, did, is clear. Words would only obscure it. The vast archaeological heritage from the unknown America of two or three millenniums furnishes an authentic history of the Indian people. It is their own picture of themselves, their testimony as to how they met and tried to solve the problems that all humanity has confronted. There has been a singular tendency to think of the ancient masterworks of the race found in Mexico [see MITLA], Central America and South America, as other than Indian art. It is necessary to repeat . . . that all native American remains, whether of plains, tribes, mound-builders, cliff-dwellers, Pueblo, Navaho, Toltec, Aztec, Maya [see AZTEC AND MAYA PICTURE-WRITING], Inca [see PERU: 1200-1527], are just the works of the Indian. Plain fiction and romantic archaeology have a firm hold on the reading public. The most homogeneous of all racial art is that of the American Indian. Chronologically it is without serious gaps, and ethnologically it is unbroken. . . . The Indian race and its achievements, then, constitute America's archaeological heritage. It has a very intimate and particular interest to us in the United States where we have forcibly intervened in its destiny and where it is being slowly incorporated into our citizenship. . . . Viewed from any standpoint it is a noble heritage that comes down to us from the long past of America—a heritage of experience, of thought, of expression, recorded in art, religion, social order; results of fervent aspiration and mighty effort; a race pressing its way toward the sun. Its study is the finest aspect of the conservation movement—the conservation of humanity; an attempt to rescue and preserve the life history of a great division of the human species."—E. L. Hewett, *America's archaeological heritage* (*Art and archaeology*, Dec., 1916, pp. 257-266).

For description and bibliography of archaeological research and antiquities, see names of the various continents, peoples and countries; also ARCHITECTURE; PAINTING; SCULPTURE.

Chronology of important events in the development of archaeological research:

- 1762-1816. Stuart and Revett's "Antiquities of Athens" (4 vols.).
- 1764. Winckelmann's "Geschichte der Kunst des Altertums."
- 1797. Treaty of Tolentino: Roman antiques delivered to France.
- 1798-1801. Bonaparte's Expedition to Egypt; London acquires the Rosetta Stone.
- 1799. Pompeii: excavations by Championnet.
- 1800-3. Athens: Elgin works there.
- 1801. Opening of the Musée Napoléon.
- 1804. Paris: Société des Antiquaires de France.
- 1805. London acquires the Townley collection.
- 1807. Wilkins, "Antiquities of Magna Græcia." Pompeii: excavations under Queen Caroline.
- 1811-12. Ægina: pediment groups of the temple; acquired by Munich.
- 1812. Burckhardt discovers Petra.
- 1812-14. Bassæ: the frieze; acquired by London.
- 1815. Visconti, "Mémoires sur des ouvrages de sculpture du Parthénon."
- 1816. The British Museum acquires the Elgin Marbles.

1816. The antiques of the Musée Napoléon are returned.
- 1816-17. Laborde, "Monuments de la France."
1818. Quatremère, "Lettres à M. Canova."
1820. Aphrodite of Melos.
1821. Nibby recognizes the groups of Galatians from Pergamon.
- 1821-2. The Athenian Acropolis bombarded by Voutier.
- 1822, 1824. Gerhard in Rome; in Etruria.
1823. Panofka in Rome; Society of the Roman Hyperboreans.
1826. The Athenian Acropolis bombarded by Reshid Pasha.
1827. Corneto: wall paintings.
- 1828-9. Vulci: mural paintings; discovery of vases
- 1828-30. Egypt: Italian expedition under the direction of Rosellini and Champollion.
1829. Rome: Instituto di corrispondenza archeologica.
- Olympia: French excavations at the Temple of Zeus.
1830. The conquest of Algeria begun.
- The Crimea: Dulux opens the Kul Oba, near Kertch.
- Opening of the Museum in Berlin and the Glyptothek in Munich.
1831. Pompeii: mosaic, Alexander the Great.
1832. Thomsen distinguishes the Stone Age, Bronze Age, and Iron Age.
- 1833-6. Athens: clearing of the citadel by Ross.
1834. Dodwell, "Views of Cyclopien Remains."
- 1834-42. Serradifalco, "Archita della Sicilia."
1835. Athens: reconstruction of the Temple of Aterios Nike.
1836. Cervetri: the Regulini-Galassi Tomb.
1837. Rawlinson deciphers the inscription of Behistun.
- Athens: Pennethorne discovers the horizontal curves on the Parthenon.
- Athens: Founding of Greek Archæological Society.
- Kramer on "The Origin and Style of Greek Painted Pottery."
- 1838-44. Fellows travels in Lycia.
1839. Discovery of the Sophocles statue.
- 1840-1. Coste and Flandin travel in Persia.
1842. Luni: pediment groups of terra-cotta.
- London acquires the Nereid Monument from Xanthos.
- 1843-4, 1845. Ross in Rhodes; inscriptions of artists; work in Cyprus.
- 1843-5. Egypt: Lepsius directs the Prussian expedition.
- 1843-6. Khorsabad excavated by Botta.
- 1845-7. Layard excavates Nimrud.
1846. Halicarnassos: reliefs sent to London.
- The Apollo of Tenea discovered.
- First find at Hallstatt.
- Boucher de Perthes begins a prehistoric publication.
- Athens: École Française.
1848. Rome: paintings of the Odyssey in the Via Graziosa.
1849. Rome: the Apoxyomenos of Lysippos.
- Rome: discovery of the Catacomb of Calixtus by De Rossi.
- 1849-51. Excavations at Kuyunjik by Layard and Rassam.
- 1849-52, 1853-5. Loftus in Babylonia.
1851. Penrose, "An Investigation of the Principles of Athenian Architecture."
- 1851-5. Memphis: Mariette discovers the Serapeum.
1852. The Heraion near Argos examined.
- Beginning of the excavations in southern Russia.
- 1852-3. Athens: Beulé uncovers the approach to the citadel.
1853. First discoveries in caves in southern France.
- The Marsyas of Myron recognized by Brunn.
- Vienna: Commission appointed for investigating and preserving architectural monuments.
1854. First discovery of pile-dwellings in Switzerland.
- Sardes: Spiegelthal examines the Tomb of Alyattes.
- 1855-60. Pompeii: the Stabian Thermae.
1857. Halicarnassos: Newton uncovers the Mausoleum.
1858. Athens: Odcion of Herodes Atticus.
1859. Eleusinian relief discovered.
- Lenormant discovers statuette of Athene.
- London acquires vases from Kameiros (Salzmann).
1860. Rénan travels in Phœnicia.
- Cyrene: Smith and Porcher.
- 1860-75. Pompeii: Fiorelli directs the excavations.
- 1861-2. Delphi: Foucart and Wescher.
- De Vogué travels in the Hauran.
- 1861-9. Rome: excavations on the Palatine.
1862. Athens: Bötticher (Acropolis), Curtius (Pnyx), and Strack (theatre).
- 1862-3. Nikopol: discoveries of tombs.
1863. Rome: Augustus from Prima Porta.
- Samothrace: Nike (Champoiseau).
- Kirchoff, "Studien zur Geschichte des griechischen Alphabets" (Chalcedian vases).
- Friedrichs recognizes the Doryphoros of Polykleitos.
1864. Thasos: Miller.
- First discoveries at La Tène.
1865. Rome: the temple on the Capitoline.
- Alexandria: the sanctuary of Arsinoe.
1866. Smintheion and Temple of Athene at Priene: Pullan.
- 1866-9. Humann in Asia Minor.
- 1867-9. Cyprus: Cesnola.
1868. Schliemann visits the Homeric sites.
- Hildesheim: discovery of the silver treasures.
1869. Rome: House of Livia.
- 1869-74. Ephesus: Wood discovers the Artemision.
1870. Brunn recognizes the statues from the votive offering of Attalos.
- Conze, "Zur Geschichte der Anfänge der griechischen Kunst" (Geometric style).
- 1870-71. Athens: the Street of Tombs at the Dipylon; vases.
- 1870-4. Tanagra; the discovery of terra-cottas.
1871. Troy: Schliemann.
- The Archæological Institute becomes a Prussian government institution.
- Helbig recognizes the Diadumenos of Polykleitos.
1872. Rome: the reliefs of the tribune in the Forum.
1873. Samothrace: Austrian excavations.
- Mau distinguishes the periods of Pompeian wall paintings.
- Helbig, "Untersuchungen über die campanische Wandmalerei" (Hellenism).
1874. Mycenæ: Schliemann.
- The German Archæological Institute becomes an imperial institution.
1875. Samothrace: Austrian excavations.

- 1875-80. Olympia: German excavations.
1875-6. Rome: Temple of the Capitoline Jupiter.
1876. Athens: Asklepieion: tower removed from south wing of Propylaea.
La Tène: beginning of excavations.
1877. Olympia: the Hermes of Praxiteles.
Sparta: Mycenaean finds.
1877-94. Delos: French excavations.
1877-1907. Carnuntum: excavations.
1878. Troy: Schliemann a second time.
Knossos: Kalokairinos' excavations.
Andreas at Persepolis.
1878-86. Pergamon: Prussian excavations.
1879. Samos: Girard investigates the Heraion.
London: Society for the Promotion of Hellenic Studies.
Boston: Archæological Institute of America.
1879-81. Duhn collects remains of the Augustan Ara Pacis.
1880. Flinders Petrie begins to work in Egypt.
Delphi: Haussoullier.
Orchomenos: Schliemann.
Menidi: vaulted tomb.
F. Lenormant in Southern Italy.
1880-2. Myrina: French excavations.
1881. Clermont-Ganneau travels in Phœnicia.
Maspero begins to work in Egypt.
Dörpfeld, Borrmann, and others study coloured architectural terra-cottas.
Tunis under a French protectorate.
Constantinople: Museum in the Tchinitli-Kiosk.
1881-3. Assos: American excavations.
1881-1903. Hieron of Epidauros: Greek excavations.
1882. Caria and Lycia: Austrian excavations (Giölbashi).
Sardes: Dennis opens a tumulus.
Clazomenai: first painted terra-cotta sarcophagi found.
Samos: conduits of Eupalinos.
Wilson visits Petra.
Robert distinguishes a class of vases as of Polygnotan style.
Athens: American School of Classical Studies.
London: Egypt Exploration Fund.
1882-90. Eleusis: Greek excavations.
Adamklissi: Rumanian excavations.
1884. Crete: the grotto of Zeus on Mt. Ida, Italian excavations.
Tiryns: Schliemann.
Athens: Stamátakes begins excavations on the Acropolis.
Wright, "Empire of the Hittites."
Dörpfeld elucidates the most ancient Greek architecture.
1885. Athens: British School.
Dörpfeld on the Propylaea.
1885-91. Athens: Kavvadias directs excavations on the Acropolis.
1886. Athens: statue of a woman by Antenor.
1886, 1889, 1895. Athens, Dionysic Theatre, Dörpfeld.
1887. Sidon: Tombs of princes, Alexander sarcophagus.
Tell-el-Amarna: Archives on clay tablets.
Fayum: the first paintings on mummies.
Delphi: Pomtow.
Eleusis: Eubouleus.
Rome: Ludovisi marble throne.
1887-8. Athens: the Stoa of Eumenes.
Mantinea: French excavations, Praxitelean reliefs.
1888. Vaphio, near Sparta: Greek excavations, Mycenaean gold cups found.
Senjirli: first German excavations.
1888-99. Marzabotto: Italian excavations plan of city.
1888-1900. Babylonia (Nippur): American excavations.
1889. Neandreaia: Koldewey.
Locroi: Italian excavations (Ionian temple).
1889-90. Sikyon: American excavations (theatre).
1890. Tell-el-Hesy: Flinders Petrie's excavations.
Troy: Schliemann works there a third time.
1890-1. Sinjirli: further German excavations.
Megalopolis: British excavations.
1890-3. Rome: investigations on the Pantheon.
1891. Delphi: agreement with France.
Rome: statue of Apollo found in the Tiber.
1891-3. Magnesia: excavations of the Berlin Museum.
1892-4. Sicily and lower Italy: Koldewey and Puchstein investigate temple ruins.
1892-5. Heraion, near Argos: American excavations.
1892-7. Athens: German excavations on the Pnyx.
1892-1903. Investigations of the Germanic Limes.
1893. Furtwängler recognizes the Lemnian Athene of Phidias.
1893-4. Troy: Dörpfeld.
1893-1901. Delphi: French excavations.
1894. Senjirli: German excavations.
Samos: Böhlau investigates the Necropolis.
Rome: Peterson reconstructs the Ara Pacis.
1894-5. Pompeii: House of the Vettii.
Boscoreale: *villa rustica*; the silver treasure.
1894-6. Deir-el-Bahari: Temple of Hatshepsut.
1895. Tell-el-Amarna: British excavations (Amnhotep IV).
Borchardt begins work in Egypt.
1895-6. Didymaion: French excavations.
1895-9. Priene: excavations of the Berlin Museum.
1896-7. Athens: the grotto of Pan, northwest corner of the Acropolis.
1896-1901. Thera: Hiller von Gärtringen.
1896-1907. Ephesos: Austrian excavations.
1897. Nagada: tomb of Menes.
Susa: French excavations.
1897-9. Thermos: Greek excavations.
1898. Vienna: Austrian Archæological Institute Berlin: Deutsche Orient Gesellschaft.
1898-9. Alexandria: German excavations.
1899. Megara: German excavations, fountain.
Preuner recognizes the Agias of Lysippos.
1899, 1904. Howard Crosby Butler travels in Syria.
Baalbec: German investigations.
1899-1907. Babylon: excavations by the Deutsche Orient Gesellschaft.
Miletos: excavations by the Berlin Museum.
1900. Antikythera: recovery of bronze statues from the sea.
1900-8. Knossos: Arthur Evans.
Pergamon; new German excavations.
1901. Waldstein recognizes the Hera of Polykleitos.
Ægina: Bavarian excavations of the Temple.
Romano-Germanic commission of the Archæological Institute.

1902. Samos: Greek excavations at the Heraion. Delos: the French resume their excavations. Treu recognizes the Maenad of Scopas. Peterson, Ara Pacis Augustae.
- 1902-4. Kos: German excavations of Asklepieion.
- Abusir: Borchardt investigates pyramids. Tell-Taaneek: Austrian excavations. Lindos: Danish excavations on the citadel. Argos: Dutch excavations.
- 1902-5. Geser: British excavations.
1903. Pergamon: head of the Hermes by Alkamenes found.
- 1903-4. Rome: excavations to recover the Ara Pacis.
- 1903-7. Assur: excavations by the Deutsche Orient Gesellschaft.
1904. Karnak: ancient statues found. Deir-el-Bahari: Temple of the Dead of Mentuhotep.
- 1904-8. Leukas-Ithaca: Dörpfeld's excavation.
1906. Abyssinia: German expeditions.
1907. Jericho: Austrian excavation.
1908. A. Evans excavating at Knossos. German School excavating at Pergamon. French School excavating at Delos. British School excavating at Sparta. American School excavating at Corinth. American School excavating at Moklos in Crete. Austrian School excavating at Ephesus.
1910. Opening of School of American Archæology.
- 1914-10. Research suspended by World War.
1920. Work resumed by British, American, and French Schools in Mediterranean area.

The above table with many omissions and some additions is taken from A. Michaelis, *Century of archaeological discoveries*, pp. 341-352.

Except for the maintenance of a very small staff, the various schools excavating in Egypt, Greece, Italy, Syria and other places of archaeological interest, were forced to suspend their work during the World War and are only now, in 1921, beginning to resume work on a normal basis. The war has in some ways opened up many new avenues of research, as for example the concordat of coöperation agreed upon between the British and American schools in Jerusalem; great results, consequently, are anticipated in the near future.

ARCHAGETÆ, Spartan kings. See SPARTA: Constitution ascribed to Lycurgus.

ARCHANGEL, a town of European Russia, capital of the government of the same name, the only large seaport on the north coast of Russia. From its settlement in the sixteenth century by English traders it flourished until the time of Peter the Great, who sacrificed its development for the benefit of St. Petersburg (Petrograd), which supplanted Archangel as the sole seaport of Russia at that time. The United States commercial attaché at Petrograd, Mr. H. D. Baker, describes the startling rise of Archangel to commercial eminence a year after the opening of the World War in *Commerce Reports (Washington: Government Printing Office)*: "Previous to the war the trade of this port was confined to comparatively small exports of timber, fish, furs, and other local products of northern Russia, and a relatively small return movement of goods required for local consumption. Now, however, Archangel is the only port of European Russia open for foreign business by direct sea communication. . . . From a comparatively unimportant port about a year ago, dependent chiefly upon its

sawmills and fishing fleet for prosperity, it has suddenly become one of the most important ports in the world, rivaling even New York in the number and tonnage of ships arriving and departing between about May 1 and the close of ice-free navigation. . . . The river begins freezing in October, but is expected to be kept open from Archangel out through the White Sea till December." Archangel was the most northerly point in the railroad system of Europe until 1916 when the Murmansk railroad was built. In 1918 a force of English, French and Americans seized the city and outlying district to keep it and its accumulated military stores from falling into the hands of the Russian Soviet government. The city later became the headquarters of various military undertakings launched against the Russian Soviet government.—See also RUSSIA: 1918-1920: Anti-Bolshevik movement; and MAP; WORLD WAR, 1918: III. Russia: d.

ARCHAVA, captured by the Russians during the World War. See WORLD WAR: 1916: VI. Turkish theater: d, 1.

ARCHBISHOP, or Metropolitan, in the Catholic hierarchy, is a bishop in a metropolis, who, in addition to the government of his own diocese, controls the bishops of other simple dioceses within a definite district. (See BISHOP: Investiture: Authority.) In the Anglican church there are two archbishops, those of York and Canterbury. In the Episcopal church in America, it was proposed in 1920 that there be an archbishop at Washington to act as the supervisory head of the church in America. See CHRISTIANITY: 312-337.

ARCHCHANCELLOR (Latin, *archicancellarius*), a title held by the highest official of the Holy Roman Empire; of modern interest mainly because the officer was the prototype of the powerful imperial German chancellor, 1871-1918.

ARCHDEACON, an official of the Christian church, with executive powers subordinate to the bishop. "Above the rural dean we find the archdeacon, an officer placed over a larger group of parishes and vested with much more extensive functions."—E. Emerton, *Medieval Europe*, p. 553.

ARCHDUKE, the title of princes of the imperial family of Austria. See AUSTRIA: Singularity of Austrian history.

ARCHELAUS (413-390 B. C.), king of Macedonia. Conducted internal reforms, organized the army; fostered the spread of Greek civilization by entertaining celebrated men at his court.—See also GREECE: B. C. 8th-5th centuries: Growth of Sparta.

ARCHELAUS OF CAPPADOCIA, general of Mithradates the Great in the war with Rome. In 87 B. C. he was sent to Greece and was defeated by Sulla in two battles; deserted to the Roman side in the second and third wars.—See also MITHRADATIC WARS.

ARCHERY: Use of bows as weapons. See LONGBOW.

ARCHIDAMUS, the name of five Spartan rulers of the Eurypontid line. The best known are the following:

Archidamus II, ruled 476-427 B. C. Tried to avert the Peloponnesian War; invaded Attica, 431-420. See GREECE: B. C. 477-461; 431; 420-427.

Archidamus III, 360-338 B. C. Led the relief force sent to the battle of Leuctra; defeated the Arcadians and their allies in the "tearless battle" and captured Caryae, 367; defended Sparta against Epaminondas.

Archidamus IV, defeated in 294 B. C. at Mantinea by Demetrius Poliorcetes.

ARCHILOCHUS, Greek lyric poet and writer

of scathing lampoons, who lived in the seventh century B.C. He contributed much to metrical form, especially the iambic and its application to satiric verse.

ARCHIMEDES (c. 287-212 B.C.), celebrated Greek geometrician and inventor of antiquity. He invented the spiral water-screw, known as the screw of Archimedes, and discovered the principle of the lever. By means of engines of war which he invented, he aided King Hiero in delaying the fall of Syracuse when attacked by Marcellus, the story being (erroneously) that he burned the Roman fleet by means of mirrors. Archimedes

was killed in the final capture of Syracuse.—See also **HELLENISM**: Science and invention; **SCIENCE**: Development of science; Ancient Greek science.

ARCHIPRESBYTER, an administrative office in the Christian church, between the parish clergy and the archdeacon. "The immediate execution of the episcopal orders was intrusted to the care of an official called the arch-priest (*archipresbyter*) or rural dean (*decanus ruralis*), himself a parish clergyman, but set over a group of other parishes as inspector of church life in general and with certain minor judicial functions."—E. Emerton, *Mediæval Europe*, p. 553.

ARCHITECTURE

Definition of Architecture.—"The art of architecture has been defined very variously. It was defined by Mr. Garbett as 'the art of well building; in other words, of giving to a building all the perfection of which it is capable.' Mr. Ruskin defined it as 'the art which so disposes and adorns the edifices raised by man, for whatever uses that the sight of them may contribute to his mental health, power, and pleasure.' In the American Dictionary of Architecture and Building

ments. Now these two operations, the preliminary and the subsequent one, may be carried on by the same individual, or they may not. . . . When a large and important building is erected nowadays, one and the same man does not undertake both divisions of the work; one part of the work is handed over to one man, the other part to another; in modern parlance the first is the architect, the second the builder. And we may be sure that at all periods when any great building was

STONEHENGE

Probably erected in 1680 B.C.

(1901) it is defined as 'the art of building with some elaboration and skilled labour; and, in a more limited sense, as 'the modification of the structure, form, and colour of houses, churches, and civic buildings, by means of which they become interesting as works of fine art.' But it can hardly be held that there is one art of making things well and another of making them badly. There is not one art of making clothes that fit and another art of making misfits. One and the same art makes flower-pots for the gardener and Worcester ware for the connoisseur. So it is with Architecture. It is simply 'the art of building.' Good architecture is indeed the art of building beautifully and expressively; and bad architecture is the reverse. But architecture is the art of building in general. . . . This seems clear enough. But as a matter of fact the definition contains an ambiguity in the use of the term 'building.' In the erection of every edifice the work necessarily falls into two parts. There is the preliminary process of planning and designing the buildings, and, it may be, of making drawings, whether rough sketches, or drawings to scale or full size, as well as that of superintendence. There is also the actual putting together of the materials by manual labour and the machinery so as to form roofs, supports, and abut-

erected, there was a similar division of functions. . . . To be accurate therefore, we must not, except in comparatively small and unimportant work, define 'architecture' as 'the art of building,' but as 'the art of planning, designing, and drawing buildings, and of directing the execution thereof.'—F. Bond, *Gothic architecture in England*, pp. 1-2.

PREHISTORIC

"Structures of the prehistoric period, although interesting for archaeological reasons, have little or no architectural value. . . . The remains may be classified under:—I. Monoliths, or single upright stones, also known as menhirs. . . . II. Dolmens (Daul, a table, and maen, a stone), consisting of one large flat stone supported by upright stones. . . . III. Cromlechs, or circles of stone, as at Stonehenge, Avebury (Wilts), and elsewhere, consisting of a series of upright stones arranged in a circle and supporting horizontal slabs. IV. Tumuli, or burial mounds, were probably prototypes of the Pyramids of Egypt. V. Lake Dwellings as discovered in the lakes of Switzerland, Italy and Ireland consisted of wooden huts supported on piles, so placed for protection against hostile attacks of all kinds. These fore-

going primitive or prehistoric remains have little constructive sequence, and are merely mentioned here to show from what simple beginnings the noble art of architecture was evolved."—B. Fletcher and B. F. Fletcher, *History of architecture on the comparative method*, p. 3.

America.—Architecture of American aborigines. See **INDIANS, AMERICAN:** Cultural areas in Mexico and Central America: Maya area; **MEXICO:** Aboriginal peoples; **PUEBLOS.**

ORIENTAL

Egypt: General characteristics.—Principal remains.—"We shall not attempt in such limited space, to trace the development of architecture during the successive dynasties of Egyptian history, but merely to note the conditions of climate, religion, and materials which gave rise to the style;

their massiveness that we realize their height. The obelisk, which is the only aspiring form in Egyptian architecture, is also the only one which has no counterpart in nature, and is distinctly a product of the imagination."—M. Brimmer, *Three essays on the history, religion and art of ancient Egypt*, p. 62.

"The brilliancy of light led to adopting an architecture of blank walls without windows. The reflected light through open doorways was enough to show most interiors; and for chambers far from the outer door, a square opening about six inches each way in the roof, or a slit along the wall a couple of inches high, let in sufficient light. The results of this system were, that as the walls were not divided by structural features, they were dominated by the scenes that were carved upon them. . . . The most gigantic buildings had their surfaces crowded with delicate

TEMPLE OF LUXOR AT THEBES

An example of Egyptian architecture

© Publishers' Photo Service

and to note the principal examples of it remaining. The essential conditions in Egypt are before all, an overwhelming sunshine; next, the strongest of contrasts between a vast sterility of desert and the most prolific verdure of the narrow plain; and thirdly, the illimitable level lines of the cultivation, of the desert plateau, and of the limestone strata, crossed by the vertical precipices on either hand rising hundreds of feet without a break."—W. M. F. Petrie, *Arts and crafts of ancient Egypt*, p. 2.—"Thus the outlines of the pyramid, of the flat-roofed temple with its massive columns and of the rock tomb must have been familiar to the eye of the early Egyptian architect from the natural forms about him. The Sphinx itself stands prefigured in its general outline by the hand of nature. Both the scenery and architecture of Egypt convey the same general impression of form, not lofty, but broad, massive and ponderous. Such is the effect of the pyramids themselves when one first sees them. It is not till our eyes have recovered from the effect of

sculpture and minute colouring. What would be disproportionate elsewhere, seems in harmony amid such natural contrasts."—W. M. F. Petrie, *Arts and crafts of ancient Egypt*, pp. 3, 5.—"The character of Egyptian architecture was also in part conditioned by religious beliefs, which demanded the utmost permanence and grandeur for tombs and temples, the residences of the dead and of the gods, in contrast with the light and relatively temporary houses which sufficed for even the greatest of the living. Such permanence was sought by the almost exclusive employment of fine stone, which the cliffs of the Nile Valley furnished in abundance, and by the adoption, as the dominant constructive types, of the simple mass, and of the column and the lintel. The arch (q.v.), occasionally used from the earliest times, was confined to substructures where it had ample abutment and was little in view. The architectural members, moreover, were generally of great size and massiveness, although sometimes of extreme refinement and . . . even of delicacy. Tra-

ditional elements of composition in plan recurred in many types of buildings. These were the open court, often surrounded by a continuous interior colonnade or peristyle, and the rectangular room opening on its broader front, with its coiling supported by columns."—F. Kimball and G. H. Edgell, *History of architecture*, pp. 15-16.—"The architect employed only straight lines, these being perpendiculars and horizontals, very boldly and felicitously combined. The arch, although known, was not employed as a member in architecture. In order to carry the roof across the void, either the simplest of stone piers, a square pillar of a single block of granite was employed, or an already elaborate and beautiful monolithic column of granite supported the architrave."—J. H. Breasted, *History of Egypt*, p. 107.—"Of a very ancient period, earlier than 2500 B. C., are the columns of the rock-cut tombs at Beni Hassan, famous for their resemblance to the Greek Doric, whose earliest standing example is more than fourteen hundred years later. Another form of column and capital found at Beni Hassan, and at Thebes, of the same early time, imitates a bunch of lotus buds and stems, bound together. . . . Forms of the capital are noticeable in these ruins, resembling an inverted bell and representing an open lotus flower, the closed lotus bud, etc. The Period of the existing Egyptian ruins is generally much later than that of the isolated columns of Beni Hassan just mentioned. Between 1800 B. C. and 1200 B. C., a period of great building activity, were erected most of the temples, now in ruins, at Thebes. These are variously known, from the sites of modern Arab villages erected at various points of the ancient city, as the ruins of Karnak, of Luxor, of Medinet Habou, and of Gourneh. . . . Of a still older period than any of the temple ruins now standing, and not later than 3800 B. C., are the royal pyramid tombs near Cairo. . . . In construction they consisted of a series of step-like platforms, diminishing from base to summit, and furnished with a casing of limestone or red granite, to fill the angles, and present four polished surfaces against the attacks of time and weather. . . . The largest pyramid, that of Shufu (Cheops [Keeops] as Grecianized in pronunciation), covers nearly thirteen acres of ground, and was once over four hundred and eighty feet high. The adjacent pyramid of King Shatra (Chephren) was four hundred and seventy feet. Beside it is the colossal Sphinx, with human head and lion's body, possibly of still more ancient date, now buried to the shoulders in sand, sixty-five feet high, and one hundred and forty-two feet long. This Sphinx is an emblem of the Egyptian Divinity Horus, one of the forms of the Sun-god. The most famous Egyptian temple ruin is the 'Great Hall' of Karnak, built in the 14th century B. C. by the kings Seti I and Ramses II. . . . The temple at Abydos is a construction of Seti I. The 'Ramesseum' at Thebes dates from Ramses II. There is a famous rock-cut temple in Nubia at Ipsamboul dating from this last king. On this upper portion of the Nile, above the limits of Egypt proper, there are many other Egyptian ruins. After the time of the ruin at Medinet Habou, Thebes, about 1270 B. C., many centuries passed of which no remains are now known. The temple of Edfou dates from the Greek rule over Egypt, B. C. 332-B. C. 30. Of the same time are the temple of Denderah and the temples at Philæ. The temples at Esneh and Kom Ambos belong to the period of Roman rule."—W. H. Goodyear, *History of art*, pp. 33-34.—See also EGYPT: MONUMENTS; MASTABA.

Mesopotamia: Chaldean.—Old Babylonian.—Assyro-Babylonian.—"Remains at the Sumerian center of Lagash, the modern Tello, include a building of the king Ur-Nina—the oldest structure yet found in Mesopotamia which can be dated—built perhaps 3000 years before Christ. There is also a fragment of the staged tower built by Gudea about 2450 B. C. incorporated in a later palace. The early Semitic religious center was at Nippur, where the ruins of the temple precinct include superposed remains of several staged towers, dating from the very earliest times. The general similarity of these buildings of Assyria and Babylon establishes the essential continuity of Mesopotamian architecture."—F. Kimball and G. H. Edgell, *History of architecture*, p. 25.—"The buildings of the Babylonians were made of brick, as there was very little stone to be had in their marshy and low-lying country. The clay from the banks of the great rivers, when moulded, was either dried in the sun or baked in kilns. When stone had to be used it was brought from a distance and was generally of a hard volcanic kind, such as basalt or diorite. Great brick platforms were used as foundations for buildings to raise them above the marshy ground. The Assyrians followed Babylonian traditions in building, as in everything else, and although drier and firmer ground often rendered platforms unnecessary, the people continued to build them as foundations for temples and palaces. In the same way bricks were universally used, although the country possessed a fair supply of limestone and alabaster. The latter materials were employed in decoration, and served to line walls and make pavements and sometimes columns and plinths. Wood was brought from a distance for pillars and roofs, although the latter are thought to have been frequently vaulted and made of brick. Many bas-reliefs represent buildings as surmounted by a series of small domes, and they also show, as an almost invariable feature of Mesopotamian architecture, a parapet with a crenelated edge as the decoration to a flat roof. Walls were of great thickness. In Sargon's palace at Khorsabad the inner ones measure from twelve to twenty-eight feet in width, and this has been mentioned in support of the theory of domed roofs which would necessitate strong walls. Babylonian and Assyrian temples have been discovered in a worse state of preservation than the palace. The earliest were probably built with only one or two stages, but later seven of these were frequently erected above the artificial platform on which the temple stood. These *ziggurats* or staged towers were built 'to reach the heavens,' and as kings were sometimes buried in them, some archaeologists have drawn a parallel between them and the Egyptian pyramids. The temples, which were enclosed by massive walls, contained chambers for the priests' treasure, houses, granaries, and enclosures for the sacrificial victims. . . . Hidden in their inmost recess, or sometimes erected on the highest stage of the tower, was the holy of holies, containing the golden table, mercy seat, altar, and statue of the god."—M. Bulley, *Ancient and medieval art*, pp. 77-78.—"In Babylonian and Assyrian architecture the tower is always separate from the temple proper—as though to symbolize the independent origin of the two structures, the mountain-motif and the house-motif. . . . In the case of many mosques the Babylonian-Assyrian tradition is followed through the virtual independence of the minarets [lofty towers] as adjuncts to the mosque, though in others the minaret is directly attached and eventually becomes a steeple placed on or at

the side of the mosque. . . . At Warka, Tello, Nippur and Babylon remains of arches were found at a depth which left no doubt as to the great antiquity to which the construction of arches is to be traced back in the Euphrates Valley—at least to 3000 B. C. . . . These early arches were used as tunnels through which drains passed to carry off the rain water and the refuse from the structures beneath which they were erected.”—M. Jastrow, *Civilization of Babylonia and Assyria*, pp. 377-378.—“Throughout ancient times, as now, the normal method of roofing in Mesopotamia was by wooden beams supporting a mat of reeds, and then a thick bed of clay graded with a slight inclination to permit water to run off. . . . Columns were used but sparingly, as supports for light, isolated structures, and in porticos along the sides of a court. They were, for the most part, apparently, of wood, painted or covered with metal plates. . . . Winged bulls of stone carved in high relief were used to decorate the jambs of arched gateways and the bases of towers. Friezes in low relief representing historical subjects or hunting scenes ornamented the state apartments of the palaces. Brick enameled in colors was also a favorite mode of surface decoration.”—F. Kimball and G. H. Edgell, *History of architecture*, pp. 30-32.—The palaces at Nimrud, Nineveh and Khorsabad are characteristic of the style of the Assyrians and Babylonians. These palaces were built on immense platforms of sun-dried bricks, enclosed in masonry, and covering, as in the case of the palace at Khorsabad, one million square feet, raised forty-eight feet above the town level. Factors of special note in the construction of the palaces are: the great length of halls as compared with the width; and the immense thickness of the walls. “The famous ‘hanging gardens’ of Babylon were built upon terraces supported by pillars and arches, and formed one of the most distinctive features of the palaces. It is noticeable that while in Egypt the temples were the buildings of the greatest grandeur, in Babylonia and Assyria the position is reversed, and the palaces were the most splendid monuments.”—M. H. Bulley, *Ancient and medieval art*, p. 79.—See also BABYLON: Nebuchadrezzar and the wall of Babylon; BABYLONIA: Earliest inhabitants.

Persia: Palaces.—Halls of Darius and Xerxes.—“The architecture of the Persians . . . borrowed certain forms from . . . Mesopotamia, Ionia and Egypt. Nevertheless it retained a large native element, suggestive of a primitive columnar architecture of wood. . . . The entablatures and roof framing remained of wood throughout the Achæmenian period, making possible the unusual slenderness and wide spacing of the columns. The roof itself was a thick mass of clay, terraced, with very slight inclination. Though the Persians drew some decorative forms from other countries, their chief source of them was Assyria. The winged bulls and bas-reliefs are but clumsily imitated and even the polychrome friezes of enameled brick from Susa are relatively crude compared with their prototypes at Babylon. Zoroastrianism, the ancient religion of Persia, required neither true temples nor sepulchres. . . . More important are the palaces, which reflect the proud absolutism of the Great King. The Persian palaces at Pasargadae and Persepolis stood on great platforms like those of Assyria. Here these were built of stone, and served at once to give military security and monumental setting. At Persepolis a vast double staircase leads up from the plain, giving access to the platform through a tall columnar porch flanked with winged bulls. On lower platforms

resting on the larger one stand three palaces, those of Darius, Xerxes and Artaxerxes III. They are similar in general arrangement with a large, square, columned hall, preceded by a deep portico and surrounded by minor rooms. Independent of the palaces are the magnificent audience-halls of Darius and of Xerxes, each covering more than an acre. In disposition they reproduce the central feature of the palaces, but on a larger scale. The hall of Darius has ten columns each way included by massive walls. . . . The hall of Xerxes has but six, . . . but has porticos the full width of this on three sides. With its columns thirty feet apart and almost seventy feet high, this building takes rank with the greatest columnar buildings of Egypt and of Greece. The earliest royal tomb, supposed to be that of Cyrus, . . . is obviously imitative of Ionian architecture. . . . Those of later monarchs seem to have been inspired by the rock-cut tombs of Egypt. Their chief interest lies in their representation of the Persian entablature of wood. With its architrave of three superposed hands, its projecting beam ends above, this is clearly related in its origin to the forms of the Ionic entablature in Greece. The Persian columns were slender, and crowned with a peculiar capital in which the heads and forequarters of two bulls are united back to back in the direction of the architrave. Beneath these were placed multiplied pairs of volutes on end, and then bells, upright and inverted, in incoherent sequence. Thus the capital became long out of all proportion to the shaft below. In its problems of the column and lintel, Persian architecture was related to the classic architecture of Greece, which was roughly contemporary with it, and which carried its solutions much further in technical facility and refinement.”—F. Kimball and G. H. Edgell, *History of architecture*, pp. 32-36.

Palestine: Temple.—Lack of indigenous art.—“The Hebrews borrowed from the art of every people with whom they had relations, so that we encounter in the few extant remains of their architecture Egyptian, Assyrian, Phœnician, Greek, Roman, and Syro-Byzantine features, but nothing like an independent national style. Among the most interesting of these remains are tombs of various periods, principally occurring in the valleys near Jerusalem, and erroneously ascribed by popular tradition to the judges, prophets, and kings of Israel. Some of them are structural, some cut in the rock; the former (tombs of Absalom and Zechariah) decorated with Doric and Ionic engaged orders, were once supposed to be primitive types of these orders and of great antiquity. They are now recognized to be debased imitations of late Greek work of the third or second century B. C. . . . The one great achievement of Jewish architecture was the national Temple of Jehovah, represented by three successive edifices on Mount Moriah, the site of the present so-called ‘Mosque of Omar.’ The first, built by Solomon (1012 B. C.) appears from the Biblical description to have combined Egyptian conceptions (successive courts, lofty entrance-pylons, the Sanctuary and the sekos or ‘Holy of Holies’) with Phœnician and Assyrian details and workmanship (cedar woodwork, emphatic decoration or overlaying with *repoussé* metal work, the isolated brazen columns Jachin and Boaz). The whole stood on a mighty platform built up with stupendous masonry and vaulted chambers from the valley surrounding the rock on three sides. This precinct was nearly doubled in size by Herod (18 B. C.) who extended it southward by a terrace-wall of still more colossal masonry. Some of the stones are twenty-two feet

long; one reaches the prodigious length of forty feet. The 'Wall of Lamentations' is a part of this terrace, upon which stood the Temple on a raised platform. As rebuilt by Herod, the Temple reproduced in part the antique design, and retained the porch of Solomon along the east side; but the whole was superbly reconstructed in white marble with abundance of gilding. Defended by the Castle of Antonia on the northwest, and embellished with a new and imposing triple colonnade on the south, the whole edifice, a conglomerate of Egyptian, Assyrian, and Roman conceptions and forms, was one of the most singular and yet magnificent creations of ancient art. The temple of Zerubbabel (515 B.C.), intermediate between those above described, was probably less a re-

Phœnicia.—Very little remains of the architecture of the Phœnicians. They . . . built in stone and like the Egyptians employed cyclopean masonry. The great fortifications of Arvad, Tyre and Sidon are the main examples of this. Their temples were merely small shrines, and in general their architecture was of a utilitarian nature.

China: Typical forms and materials.—Uses of color.—“Early records prove that contemporary Chinese architecture is still the same in essentials as that of the fourth and fifth centuries B.C. The most common form in building is the *Ting*, which consists of a large and massive roof supported by a number of wooden columns. The walls are formed by filling in the space between the columns with stone and brick. The roof, which is

TEMPLE OF HEAVEN, FORBIDDEN CITY, PEKING

edification of the first, than a new design.”—A. D. F. Hamlin, *Textbook of the history of architecture*, pp. 39-41.—See also JERUSALEM: B. C. 1400-700.—“The Hebrews . . . had no art, and never pretended to have one; they were contented with the art-products which other nations made for them, in perfect accordance with the clearly-expressed promise of the God of Abraham, Isaac, and Jacob: ‘That He would give them great and goodly cities, which they would not build; and houses full of good things, which they would not fill; and wells digged, which they would not dig; and vineyards and olive trees, which they would not plant.’ With such principles neither architecture, sculpture, nor ornamentation could flourish.”—G. G. Zerffi, *Manual of the historical development of art*, p. 151.

always the most important part of a Chinese building, is often a double or a triple one, with elaborately carved ridges and eaves, and is often covered with gay tiles. Another favourite architectural form is that of the *Pai-lou*, an elaborate stone or wooden archway, generally built with a tiled roof, and erected only by official consent in commemoration of some famous person. A third typical Chinese building is the *T'ai* or stone tower, also known as pagoda. It is an octagonal structure with thirteen stories, and probably owes its proportions to the same symbolic idea that suggested the Gothic spire, although in this instance the symbolism would refer to the Buddhist creed. The Great Wall is one of the most famous examples of Chinese building. It marks the boundaries of four northern provinces, and following

the windings, is 1500 miles in length. It was begun in the third century B. C., repaired in the fifteenth century A. D., and was extended some 300 miles in the sixteenth century. It generally measures from 20 to 30 feet in height, and its towers, which come at intervals of about 200 yards, are some 40 feet high. It measures 15 to 25 feet in breadth at its base."—M. H. Bulley, *Ancient and medieval art*, p. 111.—"The Chinese idea of an architectural triumph is not that of a single building rising in beautiful lines to a great height, but a large number of buildings and patios symmetrically arranged and covering a great deal of ground. Individualism has always appealed strongly to Western nations, and this ideal seems to be expressed in our architecture. In the Orient, on the contrary, the family has always been more important than the individual. It is therefore quite natural and in keeping that the group idea should find expression in Chinese architecture. . . . Instead of considering only how his buildings will look to a person standing on the ground, the architect plans them in such a way that they will present a symmetrical and harmonious group to any one viewing them from a hill or a pagoda. The fact that there may be no convenient hill or pagoda from which his masterpiece may be viewed does not concern him a great deal, for he expects all those who really care anything about art to have enough imagination to picture in their minds the general harmony of his design, even though they can only see a part of it at a time. Any one who visits a Chinese temple or palace without noticing that all the buildings in the enclosure blend into one harmonious whole has failed to get the comprehensive idea of Chinese architecture. . . . The Chinese house exhibits certain features which can be traced back to the tents of the barbarian ancestors of the Chinese who wandered in from the West. The roof, though made of heavy beams, rafters, and tiles, still retains to some extent the shape of a tent. . . . The roof does not rest on the walls, but on pillars corresponding to the poles of a tent. The roof hangs in graceful lines and is caught up at the corners like looped canvas. . . . A Chinese building owes a great deal of its beauty to these graceful roof lines. . . . Internally as well as externally the Chinese house reminds one of a tent. There is no ceiling to hide the surface of the sloping roof and its rafters. Instead of a wooden floor there is only a layer of bricks paving the cold earth, with mats and rugs covering this flooring. The various buildings composing a house are arranged so as to face a courtyard, much as one would pitch tents around a campfire. The beams and rafters supporting the roofs of the more pretentious houses are decorated with curious designs and miniature landscape paintings in pleasing colors. Some of the courtyards are transformed into miniature landscape gardens. There are miniature mountains, precipices, lotus ponds, bridges, grottos, and rustic nooks. The irregular rocks are so well fitted together and built up against the sides of the house that they seem to have been placed there by nature long before the houses were erected. The proportions are so carefully worked out that everything seems to be larger than it really is. And the arrangement is so irregular that nature is simulated to perfection. . . . A striking feature of Chinese architecture is the coloring. The boldness with which the Chinese employ bright colors is justified by their excellent good taste. They comprehend better the harmonious combination of bright colors than any other people and are therefore able to produce effects at once startling and pleasing. The walls

of a Chinese house are constructed of brick, wood being used for pillars, beams, rafters, window frames, and doors. As a rule, only the woodwork is painted, but in the more pretentious buildings, such as palaces and temples, the exterior brick work is covered with a coating of plaster which is painted a deep red. The roofs of temples, palaces, and pagodas are usually covered with tiles glazed in beautiful colors. The Temple of Heaven in Peking owes much of its beauty to the roof, which is covered with blue tiles of a rare hue. The palaces in Peking are roofed with yellow tiles, which shine like gold in the sunlight. . . . Comparing the buildings of the Chinese with those of the ancient Egyptians we find that Chinese architecture is weakest in that quality which the Egyptian buildings possessed to the highest degree, namely stability. The idea of building for future generations was never developed among the Chinese. Their thoughts have always been directed more to the past than to the future. Unless frequently repaired their buildings soon fall into decay."—L. Anderson, *Splendor of Chinese architecture* (*Asia*, June, 1917).

Japan: Relation to Chinese architecture.—Fragility.—"Japan, like China, possesses an architecture, but one exclusively of wood; for although the use of stone for bridges, walls, etc., had been general, all houses and temples were invariably built of wood until the recent employment of foreigners led to the erection of brick and stone buildings. The consequence has been that nearly all the old temples have been burnt down and rebuilt several times; and though it is probable that the older forms were adhered to when the buildings were reerected, it is only by inference that we can form an idea of the ancient architecture of the country. The heavy curved roofs which are so characteristic of Chinese buildings are found also in Japan, but only in the Buddhist temples, and this makes it probable that this form of roof is not of native origin, but was introduced with the Buddhist cult (q. v.). A peculiar feature of Japanese houses is that the walls, whether external or internal, are not filled in with plaster, but are constructed of movable screens which slide in grooves formed in the framing of the partitions. Thus all the rooms can easily be thrown together or laid open to the outer air in hot weather. . . . The chief effect in the buildings of the Japanese is intended to be produced by colour, which is profusely used; and they have attained to a height of perfection in the preparation of varnishes and lacquers that has never been equalled."—T. R. Smith and B. A. Slater, *Architecture*, pp. 77-79.

India.—It is impossible to do justice to the architecture of India in a brief sketch,—partly because there is so much of it; and partly because it is bound up with a long and exceedingly complex social, political, religious, and ethnological history, and the details of it are alien to the western imagination. Roughly speaking, however, the architecture may be divided into two chief types: Hindu architecture and Moslem architecture.

HINDU ARCHITECTURE: B. C. 300-A. D. 1300.—"While stone and brick are both used, sandstone predominating, the details are in large measure derived from wooden prototypes. Structural lines are not followed in the exterior treatment, purely decorative considerations prevailing. Ornament is equally lavished on all parts of the building, and is bewildering in its amount and complexity. Realistic and grotesque sculpture is freely used, forming multiplied horizontal bands of extraordinary richness and minuteness of execution. Spacious and

INDIAN ARCHITECTURE

Taj Mahal, Agra, India (1629-1650).

Jain temple of Rai Buddree Das Bahadur, Calcutta.

lofty interiors are rarely attempted, but wonderful effects are produced by seemingly endless repetition of columns in halls and corridors, and by external emphasis of important parts of the plan by lofty tower-like piles of masonry. The source of the various Indian styles, the origin of the forms used, the history of their development, are all wrapped in obscurity. All the monuments show a fully developed style and great command of technical resources from the outset. When, where, and how these were attained is as yet an unsolved mystery. In all its phases previous to the Moslem conquest Indian architecture appears like an indigenous art, borrowing little from foreign styles, and having no affinities with the arts of Occidental nations."—A. D. F. Hamlin, *Textbook of the history of architecture*, pp. 402-403.

MOSLEM ARCHITECTURE: 1300-1700.—Infinitely superior to the Hindu architecture in grandeur is the Moslem architecture. The Moslems understand pre-eminently the architectural value of space and size, the dignity of the blank wall, and the use of the arch and the dome. With the simplicity of the great spaces and massive walls, in the finest

the most beautiful building in the world. It is built of white marble so delicately sculptured in places as to seem almost a fine pattern of lace, and inlaid, in the interior, with semi-precious stones. It is set, in a garden, like most Moslem tombs, amidst pools and cypress trees, and if anything is needed to complete the singular charm of the building, it is supplied by the setting.

Moslem buildings there goes a mastery of exquisite and luxurious detail. Of the earlier Moslem structures one of the most perfect is the Kutab Minar on the plains outside of Delhi, one of the finest pillars in the world. It is a shaft of red sandstone 240 high, ornamented by projecting balconies and bands of fine sculpture. The most famous of the Moslem buildings are the mosques, tombs, and palaces in the Indian Saracenic style of the Mogul emperors at Agra and Delhi and Fatephur Sikri. The building material is either red sandstone often inlaid with fine patterns in white and black marble (as in the Jama Masjid, the noble mosque of Shah-jehan at Delhi) or marble, either exquisitely sculptured in geometrical patterns or inlaid with patterns in semi-precious stones.—cornelian, jade, lapis lazuli, blood-stone, etc. The structure depends for its effect on the fine proportioning of arch and dome, and massive size and simplicity in the main design, with detail in the ornament almost of the most delicate and elaborate type. Of all the buildings of the great line of Mogul emperors, the most renowned is the tomb of Mumtaz Mahal, the famous Taj Mahal (q. v.). Few who have seen the lyrical grace of its snowy domes, and delicate upspringing towers would dispute its claim to be

are lacking. But we can perfectly well comprehend the nature of Greek architecture. The moving principle is the column. In point of form the styles are divided into Doric and Ionic; for the Corinthian is but a development of the latter. The Doric style has a lofty simplicity, shown by the absence of a special base and by unadorned capital; the Ionic has more elegance: a diversified base, a slenderer shaft, and a more elaborate capital; the entablature of the columns is also more varied, but we miss the beautiful triglyphs and metopes. The Doric style with its greater severity (masculine as contrasted with the feminine Ionic) gives the impression of greater originality. It is highly probable that the Doric style was the result of Egyptian, and the Ionic more of Asiatic influence. What are called proto-Doric columns have been pointed out in Egypt. The characteristic element of the Ionic capital, the volute, is a very ancient mode of decoration, and appears sometimes single and sometimes double, as in the Ionic column. In its single form we meet with it on the roof of the thesaurus at Orchomenus discovered by Schliemann, and in its double form on the gold plates of Mycenæ. [See also ÆGEAN CIVILIZATION: Excavations and antiquities: Mycen-

near area.] But to apply this well-known kind of decoration to columns in such a way that it fits them as if it were specially created for them (as theorists have proved to their satisfaction), marks the inventive genius of Greek art. [See also ACANTHUS.] The remains of temples belonging to the [early] period . . . are in the Doric style. This may be due to the fact that the Doric style was more in vogue than the Ionic at that time. In any case, the Doric style was the favourite one in the west. The Ionic is said to have first come into use about the beginning of the sixth century B. C., at the restoration of the temple of Artemis at Ephesus; yet there can be no doubt that it is of higher antiquity. Strange to say, the architects of the Ephesian temple were Cretans, Chersiphron of Cnossus and his son Metagenes. The building was of vast extent, more than 400 feet

found in the swamps of Metapontum; at Paestum (Poseidonia) there are three, all in an excellent state of preservation, and presenting an imposing spectacle in the desert plain surrounded by mountains and the sea. At Syracuse there are also two on the site of Ortygia, but the effect is spoiled by the modern edifices, of which they actually form a part; a third, standing in the open, has barely two columns remaining. The ruins of Selinus are on the grandest scale of all, and have proved of great importance in the history of art; they have not, however, been sufficiently studied from an architectural point of view. Some remains of temples in Corfu and at Corinth are considered to be the oldest Doric buildings extant."—A. Holm, *History of Greece*, p. 354-357.—See also ALEXANDRIA: B. C. 282-246: Architecture; HELLENISM: Hellenism and Alexandria.

THE ACROPOLIS OF ATHENS

Restoration by G. Rehlender

long, and over 200 feet in breadth; it was a *dipteros*, i.e. provided with a double peristyle of separate columns. The Ionians had probably gazed on its colossal prototypes in Egypt and so been inspired with the idea of imitating them. The remains that have been lately discovered of the temple belong to the time of its reconstruction, after the famous fire at the birth of Alexander. Another equally colossal building was the temple of Hera in Samos, begun by the Samian Rhoecus and completed by Polycrates. There were other colossal temples of that period in Clarus, Phocæa and Branchidæ. The principal divinities of Asia Minor were meant to inhabit splendid dwellings; and Peisistratus wished to erect a no less colossal temple to the Olympian Zeus at Athens. In the west, we find few records of the building of temples, but some grand ruins, all in the Doric style, and in places which became unimportant at an early date in antiquity and have long since become desolate. The remains of two temples are

"The Athenians, although Ionians by blood, had for centuries been ruled by Doric institutions, and produced the most famous monument of Doric architecture just before the decline of this style. This was the Parthenon, the temple of the Virgin Goddess Minerva (Greek, Athenè), finished in 438 B. C. The supervising director of this building was the sculptor Phidias, who designed its sculpture decorations now known as the 'Elgin Marbles,' and himself constructed for the interior a colossal gold and ivory Minerva, long since destroyed. The present ruined condition of this building is the result of a gunpowder explosion in the 17th century. . . . The Propylæa, or entrance gates to the Acropolis (Citadel Hill), on which the Parthenon stood, were a scarcely less famous structure. They were completed, also under the direction of Phidias, between 437 and 430 B. C. On account of the extra height required for the columns of the passage-way, these were made of the Ionic order, whose proportions are more slender than the Doric.

This is a rare case of mixture of the orders, which, in the Greek period, were usually confined to distinct buildings. Even in the case of distinct buildings, the orders were not in general use simultaneously. They represent, on the contrary, successive tendencies of Greek history. The distinction between the period of conservative tendencies, religious belief, and stern patriotism, and the period of refined luxury, religious skepticism, and political decay. The period of the Ionic Order, when generally diffused over Greece, is, in round numbers, from 430 to 330 B. C. The Erechtheum is the most famous Ionic building and ruin. Also on the Athenian Acropolis, it was constructed between 430 and 400 B. C. The new Erechtheum was erected on the site of an older building, whose irregular ground plan was followed in the new structure from a sentiment of reverence and religious tradition. The name of the temple is derived from an Athenian king and hero of the mythical period, whose tomb was beneath the structure. [See also ACROPOLIS OF ATHENS.] The little Temple of Nike Apteros, or 'Wingless Victory,' generally so called, but now known to have been a temple of Minerva, has been chosen as type of the Ionic illustration because the small size of the building allows a larger view of its details. This little temple, also on the Acropolis, was built about twenty years before the Erechtheum. Its small dimensions show how modestly the style first made its appearance beside the older Doric at Athens.—W. H. Good-year, *History of art*, pp. 51-57.—It should be noted that in architecture, as in the other arts, the Greeks displayed their characteristic acute æsthetic perceptions. They did not plan great columnar halls as did the Egyptians, but rather relied on external effect, on proportion and refined line, one exact balance of delicacy and stability. In fact never until the period of decadence was there any attempt at impressive size. This balance, restraint and simplicity, given life and variety by masterly use of sculptural decoration, shows the intensely intellectual apprehension of integral design for which the Greeks have been so justly famed.—See also ART: Relation of art and history; ATHENS: B. C. 461-431: General aspect of Periclean Athens, and 1806; THEATER.

Etruscan: Character and effect on Roman architecture.—"In dealing with Roman Architecture mention must be made of the Etruscans or early inhabitants of central Italy, who were great builders, and those methods of construction had a marked effect on that of the Romans. The style dates from about B. C. 750, and from their buildings it is known that they were aware of the value of the true or radiating arch for constructive purposes, and used it extensively in their buildings. The architectural remains consist chiefly of tombs, city walls, gateways (as in Perugia), bridges and aqueducts, and their character is similar to the early Pelasgic work at Tiryns and Mycenæ. The walls are remarkable for their great solidity of construction, and for the cyclopean masonry, where huge masses of stone are piled up without the use of cement, or mortar of any kind. The 'Cloaca Maxima' (c. B. C. 578), or great drain of Rome, constructed to drain the valleys of Rome, has a semicircular arch of 11 feet span, in three rings of voussoirs, each 2 feet 6 inches high. There are no remains of Etruscan temples, but Vitruvius gives a description of them. The *Temple of Jupiter Capitolinus* was the most important Etruscan example (dedicated B. C. 509), and is generally taken as being typical. Its cella was divided into three chambers containing statues of Jupiter, Minerva (Livy VII., iii) and Juno, and was nearly

square in plan, with widely spaced columns and wooden architraves. It was burnt in B. C. 83 and rebuilt by Sulla, who brought some of the marble Corinthian columns from the Temple of Zeus Olympius at Athens."—B. Fletcher and B. F. Fletcher, *History of architecture on the comparative method*, pp. 110-120.

Roman: Derivation. — Examples. — Development of the arch and vaulting.—"What we call Roman art is not merely Hellenistic art imported into or copied in Italy, as has been too often asserted. It is true that the imitation of Greek works was an important factor in Roman art. From the third century before Christ onwards, the victorious generals of Rome enriched their city with a quantity of Greek masterpieces from Sicily and Southern Italy; later, after the year 150, the methodical pillage of Greece and Asia Minor began, carried on not only by military leaders and governors, but by influential private persons. On the other hand, the wealth of Rome attracted the Greek artists, who readily found purchasers for their imitations or copies of classic works; the houses, villas, and gardens of wealthy Romans, such as Lucullus or Crassus, were veritable museums."—S. Reinach, *Apollo*, pp. 87-88.—"We now reach the last of the classical styles of antiquity, the Roman,—a style which, however, is rather an adaptation or amalgamation of other styles than an original and independent creation or a development. . . . In the earlier styles temples, tombs, and palaces were the only buildings deemed worthy of architectural treatment; but under the Romans baths, theatres, amphitheatres, basilicas, aqueducts, triumphal arches &c., were carried out just as elaborately as the temples of the gods. It was under the Emperors that the full magnificence of Roman architectural display was reached. . . . It was not in Rome only that great buildings were erected. The whole known civilised world was under Roman dominion, and wherever a centre of government or even a flourishing town existed there sprang up the residences of the dominant race, and their places of business, public worship, and public amusement. . . . The ruins of a magnificent provincial Roman temple exist at Baalbek—the ancient Heliopolis—in Syria, not far from Damascus. This building was erected during the time of the Antonines. . . . Circular temples were an elegant variety, which seems to have been originated by the Romans, and of which two well-known examples remain—the Temples of Vesta at Rome and at Tivoli. . . . Although the Romans were not particularly addicted to dramatic representations, yet they were passionately fond of shows and games of all kinds: hence, not only in Rome itself, but in almost every Roman settlement, from Silchester to Verona, are found traces of their amphitheatres, and the mother-city can claim the possession of the most stupendous fabric of the kind that was ever erected—the Colosseum or Flavian Amphitheatre, which was commenced by Vespasian and finished by his son Titus. [See COLLOSSEUM.] An amphitheatre is really a double theatre without a stage, and with the space in the centre unoccupied by seats. This space, which was sunk several feet below the first row of seats, was called the arena, and was appropriated to the various exhibitions which took place in the building. The plan was elliptical or oval, and this shape [was] universal. [See also AMPHITHEATER; THEATER.] Nothing can give us a more impressive idea of the grandeur and lavish display of Imperial Rome than the remains of the huge Thermae, or bathing establishments, which still exist. Between the years 10 A. D., when Agrippa built the first public

baths, and 324 A. D., when those of Constantine were erected, no less than twelve of these vast establishments were erected by various emperors, and bequeathed to the people. . . . The baths of Caracalla and of Diocletian are the only ones which remain in any state of preservation, and these were probably the most extensive and magnificent of all. [See also BATHS.] . . . The Pantheon is the finest example of a domed hall which we have left. The building, which originally was consecrated as a temple, has been considerably altered at various times since its erection, and now consists of a rotunda with a rectangular portico in front of it."—T. R. Smith and B. A. Slater, *Architecture*, pp. 144-166.—See also PANTHEON AT ROME.—"Within the last few years we have learnt that the vault of the Pantheon was built in the time, not of Augustus, but of Hadrian (A. D.

one among the Roman triumphal arches, that of Titus, which commemorates the destruction of Jerusalem, shows any actual beauty of execution; the others are chiefly interesting to archæologists. [See also ARCH.] The same may be said of the vast utilitarian works, aqueducts [See AQUE-DUCTS: Roman], bridges, dams, and sewers with which Rome endowed all parts of her Empire. . . . A characteristic of the architecture of the Roman period, which gives it a certain affinity to that of Egypt and Assyria, is its tendency to colossal proportions, as exemplified in the temples of Baalbek and of Palmyra, in Syria. These temples, imitated from Greek models, are primarily remarkable for their size; the decoration is as careless as it is exuberant. But this exuberance, though it offends our taste, does not lack originality; it was in Syria mainly that the new style was elaborated,

EXCAVATED STREET IN POMPEII

Casa di Cornelio Rufo

117-138). This date is of importance in the history of art, for it marks the definite adoption of a system of construction, the further development of which was to produce Byzantine and Romanesque architecture. From the first century after Christ to the time of the completion of St. Peter's at Rome, the problem of the vault never ceased to occupy architects. The various solutions they essayed had a powerful influence on the successive styles. Vaulted architecture was so essentially a Roman product that it continued to develop when sculpture had sunk to uniform mediocrity. Constantine's basilica, built after 305 A. D., with its three colossal vaults, the central one nearly 120 feet high, with a span of more than 80 feet marks a great advance on former constructions; it served as a model to the architects of the Renaissance. Bramante, when he conceived the plan of St. Peter's, said that he intended 'to raise the Pantheon over the basilica of Constantine.' Only

which gave birth to Byzantine decorative art."—S. Reinach, *Apollo*, p. 89-90.—See also ART: Relation of art and history; BASILICAS; FORUMS OF ROME; ROME: Modern city: 1537-1621.

Sassanian: Contribution to vaulting and decoration.—"In return for its heritage from the pre-classical civilization of the Levant, Greece endowed the Asiatic empires of Alexander and his successors with a Hellenistic art, which extended even beyond their borders. When the Parthian rulers (130 B. C.-226 A. D.) overran Mesopotamia, they adopted the Greek columnar system. With the rise of the new Persian empire under the Sassanian dynasty (227-641 A. D.), however, the tide of art once more began to flow from East to West. The subterranean vaults and occasional domes of ancient Mesopotamia were taken as the basis of a consistently vaulted style. In such instances as the palace at Ctesiphon, with its great elliptically arched hall and façade of blank ar-

ades, this achieved new effects both monumental and decorative. In other cases the dome, supported over a square room by means of diagonal arches or squinches, was a notable feature. In its westward expansion this virile art contributed largely . . . to the formation of the Byzantine systems of construction and ornament."—F. Kimball and G. H. Edgell, *History of architecture*, p. 572.

Byzantine: Development.—St. Sophia and St. Marco.—Plan and decoration.—"Byzantine art

with the Persians, and later with the Saracens, almost stopped all building; and in the following centuries the fury of the iconoclasts against images and decoration generally, drove many of the best workmen out of the country, and still further impeded architectural progress. Under the dominion of the house of Macedonia, 867-1057, a revival commenced which is especially marked in Venetian territory, where St. Mark's stands as the rival of St. Sophia; but it was not until some

INTERIOR OF ST. SOPHIA
Byzantine style of architecture

is divided into two periods, each of which possesses distinct characteristics. The two are separated from one another by a considerable gap, during which time few churches were built. The first and greater period is that of the sixth century, when, under Justinian, 527-65, a powerful movement, which culminated in St. Sophia, Constantinople, lifted architecture on to a high pedestal, and produced a renaissance which influenced all work for many countries in the West. At the beginning of the seventh century, the struggles of the Empire

years later, under the Comneni, who were emperors of the Eastern Empire from 1057-1185, that this bore fruit. Most of the existing churches in the capital, in Greece, Armenia, and in other parts of the Empire belong to the second period." The plan of the typical Byzantine church is a Greek cross, the center covered with a dome supported on pendentives. The materials used are brick and stone, exteriors are as a rule plain and unimpressive, but "the simplicity of the exteriors is atoned for by the richness of the interiors. All the decora-

tion is of an applied character; that is to say the carcase of the building was built first, and was allowed to take its bearings before the mosaics and the marble linings for the doors, windows and walls were added."—F. M. Simpson, *History of architectural development*, v. 1, p. 213, 214, 219.—"If the architectural type of the basilica, characterised by its rectangular plan and flat roof, predominates in the churches in Italy, those of Constantinople applied and developed the principle of the dome. The great church of Byzantium, St. Sophia, was built between 532 and 562 under Justinian, by Anthemius of Tralles and Isidorus of Miletus, that is to say, by Asiatic architects. We have seen that the cupola was known to the Assyrians; the tradition had been preserved in Persia, whence it spread into Syria towards the third century after Christ, passing from Syria into Asia Minor in the following centuries. The architects of St. Sophia were probably inspired by Asiatic models, and not by the Roman Pantheon."—S. Reinach, *Apollo*, p. 99.—"Byzantine architecture at its best, which really means as seen in the interior of Hagia Sophia (for there is nothing else equal to that) is a remarkable combination of qualities not often found together; it seems to combine the refinement of Greek detail with the warmth and the colour of Oriental art. From the coldness and the superficial and pompous spirit of display which characterize Roman architecture, it is as alien as possible."—H. H. Statham, *Short critical history of architecture*, p. 219.—See also BYZANTINE EMPIRE: Part in history; SAINT SOPHIA.

MEDIEVAL

Early Christian: New spirit in architecture.—"The debt of universal architecture to the early Christian and Byzantine schools of builders is very great. They evolved the church types, they carried far the exploration of domical construction, and made wonderful balanced compositions of vaults and domes over complex plans. They formed the belfry tower from the Pharos and fortification towers. We owe to them the idea of the vaulted basilican church, which, spreading westward over Europe, made our great vaulted cathedrals possible. They entirely recast the secondary forms of architecture: 'the column was taught to carry an arch,' the capital was reconsidered as a bearing block and became a feature of extraordinary beauty. The art of building was made free from formulas, and architecture became an adventure in building once more. We owe to them a new type of moulding, the germ of the Gothic system, by the introduction of the roll-moulding and their application of it to 'strings' and the margins of doors. The first arch known to me which has a series of roll-mouldings is in the palace of M'shatta [Mashetta]. The tendency to cast windows into groups, the ultimate source of tracery, and the foiling of arches, has already been mentioned. We owe to Christian artists the introduction of delightfully fresh ornamentation, crisp foliage, and interlaces, and the whole scheme of Christian iconography."—W. R. Lethaby, *Architecture*, pp. 155-156.—"The Christian Church is a place for the gathering together of the faithful, thus differing essentially from the pagan temple, which was the abode of the divinity. The first Christian churches were accordingly modelled on those enclosed places of assembly known as basilicas. [q. v.] . . . Among the Roman basilicas, that of St. Paul without-the-Walls, built by Constantine and restored after a fire in 1823, may be cited as a characteristic example. It consists of a

large nave with a horizontal roof, and of two lower side-aisles; the central nave is lighted by windows above the side-aisles. At the end is a gate called the *Triumphal Arch*, behind which is the altar; the end wall is circular and forms the apse. Both apse and triumphal arch are richly decorated with glass mosaics on a blue or gold ground, the splendour of which rivals that of goldsmiths' enamels. . . . These mosaics ornament the vertical walls and the vaults, instead of forming pavements as in the Roman houses and temples. Specimens of them, very beautiful in colour, and grandiose though frigid in style, are to be seen in Rome, and at Ravenna, which was the seat of the Roman Court from 404, the residence of Theodoric, King of the Goths, about 500, and an appanage of Byzantium from 534 to 752. Several churches of the sixth century still exist, as Sant' Apollinare Nuovo, Sant' Apollinare in Classe (on the ancient port) and San Vitale: the last is a circular domed building, in which Byzantine influences are very apparent; the others are basilicas, the interiors of which are striking and majestic, though their external aspect is neither graceful nor dignified."—S. Reinach, *Apollo*, pp. 98-99.

Mohammedan: Origin and development.—General characteristics.—"The Sassanian empire was brought to an end by the sudden expansion of Mohammedanism. In a few years from the flight of its prophet from Mecca (622), his followers conquered Mesopotamia (637), Egypt (638), Persia (642), northern Africa and Spain (711). . . . At first Mohammedan architecture in these regions was little else than the art of the different conquered peoples adapted to the worship and the customs of the conquerors. In Syria, in Egypt, and in Spain the Romano-Byzantine column and arch were employed for the construction of buildings such as the mosque of Amru at Cairo (642), or the great mosques of Damascus and Cordova (785-848). In Mesopotamia and Persia the domed and vaulted halls of the Sassanians (q. v.) were adopted as prominent features of the designs. Besides the uniformity of the programs, however, a certain community of artistic character between different regions soon developed—a character pronouncedly Oriental. This was due in part to the taste and the traditions of the Arabs themselves, but more largely to the earlier conquest of the Eastern lands, the prestige of these as the seat of the early caliphates of Damascus and Bagdad, and the vitality of Eastern art as the general source of inspiration in the early Middle Ages. Thus the lace-like incised carving of M'shatta in Syria, which had earlier contributed to Byzantine development, now appeared in the earliest Arab monuments of Africa and Spain. Thus, too, the pointed arch, common in Persia from the eighth century, appeared in Syria and Egypt from the beginning of the ninth. The tall dome of pointed silhouette, and the court with vaulted halls abutting it—also Persian features—penetrated Egypt in the thirteenth and fourteenth centuries. The conquest of northern India and its conversion to Mohammedanism opened the way for Persian influence there in the fourteenth and fifteenth centuries, while Persia itself then borrowed from India the ogee arch and the bulbous dome. With the conquest of Constantinople by the Ottoman Turks (1453), finally, began a new return influence of Byzantine architecture in their Oriental empire, through the imitation of Hagia Sophia [Saint Sophia], which became the chief mosque of the Turkish caliphs. The development of the various schools which resulted from the mingling of local traditions and distinct influences continued

uninterruptedly until the eighteenth and even the nineteenth century, and has been checked only by internal disorganization and by the conquests of European powers. . . . For their formal places of worship, the mosques, the early believers naturally adopted the peristylar court—the universal scheme of the Levant—the porticoes of which furnished shelter from the tropical sun. The *Mirhab*, a small niche in the outer wall, indicated the direction of Mecca, and on this side of the court the porticoes were deepened and multiplied. This fundamental scheme is seen in the first great mosque built after the conquest of Egypt, the mosque of Amru at Cairo. [See also AMRU, MOSQUE OF.] The tendency was to develop the deeper side of the court into an inclosed building—often of vast extent, as at Cordova—with aisle after aisle of columns and arcades, carrying wooden beams and a terrace roof. In later western mosques the aisle leading to the *mirhab* was widened, and a special sanctuary preceded by a vast open nave or niche was early adopted, and corresponding features were introduced at the other cardinal points of the court. The Egyptian mosques based on Persian models, such as the mosque of Sultan Hassan, have a court so reduced that these features occupy the greater part of each side, and the scheme becomes cruciform. On the capture of Constantinople, Hagia Sophia—with its atrium, its main building to the east, its great central nave, and its eastern apse—was found perfectly adapted to Mohammedan worship. It was copied almost literally in the Mosque of Suleiman at Constantinople (1550). In other Ottoman mosques the possible variants were used, especially the scheme of a central dome with four abutting half domes, which the Byzantines themselves had not developed. Among minor elements of the mosques, which are yet among their most striking features, are the minarets, or slender towers, with corbeled balconies from which the muezzin gives the call to prayers. These were erected at one or more of the corners of the buildings, ingeniously incorporated with it. Their forms varied much in different regions, the Ottoman form, with a very tall cylindrical shaft ending in a slender cone, being especially daring. The enjoyment of worldly goods and pleasures was not despised by Mohammedanism, and the absolute power and vast revenue of the caliphs enabled them to gratify their taste for splendor and luxury by the construction of magnificent palaces. . . . The rooms were distributed about one or more courts, the façades made as blind as possible, except for loggias and balconies high above the ground and guarded by latticed screens. To relieve the heat of the climate, the courts were surrounded by shady porticoes and provided with basins and fountains. A complex axial system governed the relations of the principal rooms and the courts. The luxurious elegance sometimes attained is well seen in the Alhambra at Granada, built by the last Mohammedan rulers of Spain, chiefly in the fourteenth and fifteenth centuries. The Court of Lions, with its slender columns, its delicate stalactite decoration in stucco, colored and gilded, shows Mohammedan architecture in the final development of one of its local schools, when the elements of diverse origin had been fused in a characteristic whole. [See also ALHAMBRA.] In Egypt, in Persia, and especially in India, the tombs of great monarchs rival the palaces and mosques. The Indian type was a domed mausoleum, set in the midst of a garden. The most noted example is the Taj Mahal at Agra [q. v.], built by Shah Jahan in 1630, in which the central dome is flanked by four smaller domes, and the

principal, minor, and diagonal axes are marked on the exterior by great arches expressively and harmoniously proportioned. The Mohammedan builders were confronted by few structural problems for which solutions had not already been found by late Roman, Byzantine, and Sassanian architecture. At first, like the early Christian builders, they employed borrowed classical columns and capitals, supporting impost blocks and stilted arches. Their early domes rested on squinches. Later their treatment of fundamental structural elements, such as the arch and the vault, was governed by decorative conceptions. In Spain and Africa arches were given a horseshoe shape or were cusped; in Persia, Egypt, and Spain vaults were treated with a multitude of small squinches resembling stalactites. Stalactite motives were also used in some capitals, although in others modified Corinthian motives were used, much as in the most expressive Gothic examples. The ornamentation depended little on effects of bold relief, but greatly on effects of line, of material, and, above all, of color. The prohibition against representing man and animals, with the mathematical bent of the Arabs, resulted in a geometrical ornament of interlacing figures, extraordinarily fertile and intricate. Precious materials were freely used; in Persia whole buildings were faced with colored and glazed faience in patterns suggested by rugs and textiles.”—F. Kimball and G. H. Edgell, *History of architecture*, pp. 573-579.

Coptic: Relation to Byzantine.—“A side glance should be bestowed, in passing, on the evidences of Byzantine influence to be seen in the plans of some of the ancient Coptic churches of Egypt—not very certainly dated, but of a period probably not long subsequent to the rise of Byzantine architecture at Constantinople. These are mostly of the aisle type of plan, but combined with square domed compartments which are obviously of Byzantine suggestion. The plan of the church of Deir-Baramous with its three domed compartments at the east end, given by Gayet in his work on Coptic art, may be taken as a typical example. The nave is barrel-vaulted, and there is no central dome, but the three domed compartments betray Byzantine influence. As is pertinently remarked by Mr. Russell Sturgis in the article, ‘Coptic Architecture,’ in his dictionary: ‘It argues great vitality in the Coptic architecture proper, that, in the sixth century, it did not take over the Byzantine style in its completeness.’ Coptic architecture, however, can only now be regarded as a back-water outside of the main stream of architectural development.”—H. H. Statham, *Short critical history of architecture*, pp. 209-210

Romanesque.—“The term Romanesque is here used to indicate a style of Christian architecture, founded on Roman art, which prevailed throughout Western Europe from the close of the period of basilican architecture to the rise of Gothic; except in those isolated districts where the influence of Byzantium is visible. By some writers the significance of the word is restricted within narrower limits; but excellent authorities can be adduced for the employment of it in the wide sense here indicated. Indeed some difficulty exists in deciding what shall and what shall not be termed Romanesque, if any more restricted definition of its meaning is adopted; while under this general term, if applied broadly, many closely allied local varieties—as, for example, Lombard, Rhenish, Romance, Saxon, and Norman—can be conveniently included.”—T. R. Smith and J. Slater, *Architecture*, p. 222.—“Our Romanesque and our Gothic are not two styles but one style. Gothic

is perfected Romanesque; Romanesque is Gothic not fully developed, nor carried structurally to its logical conclusion."—F. Bond, *Gothic architecture in England*, p. 12.

LOMBARD AND GERMAN.—"By degrees, as buildings of greater extent and more ornament were erected, the local varieties . . . began to develop themselves. In Lombardy and North Italy, for example, a Lombard Romanesque style can be recognised distinctly; here a series of churches were built, many of them vaulted, but not many of the largest size. Most of them were on substantially the same plan as the Basilicas, though a considerable number of circular or polygonal churches were also built. Sant' Ambrogio at Milan, and some of the churches at Brescia, Pavia, and Lucca, may be cited as well-known examples of early date, and a little later the cathedrals of Parma, Modena, and Piacenza, and San Zenone at Verona. These churches are all distinguished by the free use of small ornamental arches and narrow pilaster-strips externally, and the employment of piers with half-shafts attached to them, rather than columns, in the arcades; they have fine bell-towers; circular windows often occupy the gables, and very frequently the walls have been built of, or ornamented with, coloured materials. The sculpture—grotesque, vigorous, and full of rich variety—which distinguishes many of these buildings, and which is to be found specially enriching the doorways, is of great interest, and began early to develop a character that is quite distinctive. . . . Turning to Germany, we find that a very strong resemblance existed between the Romanesque churches of that country and those of North Italy. At Aix-la-Chapelle [q. v.] a polygonal church exists, built by Charlemagne, which tradition asserts was designed on the model of San Vitale at Ravenna. The resemblance is undoubted, but the German church is by no means an exact copy of Justinian's building. Early examples of German Romanesque exist in the cathedrals of Mayence, Worms, and Spire."—T. R. Smith and J. Slater, *Architecture*, pp. 224-225.—"The Romanesque of Germany is, on the whole . . . the most distinctly national of the country's styles. [It] was extremely prolific and lingered longer than in any other country. . . . The most striking and typically German characteristic of the style is its complexity and picturqueness, acquired by a multiplication of architectural members."—F. Kimball and G. H. Edgell, *History of architecture*, pp. 242-243.

FRENCH AND NORMAN.—"France exhibits more than one variety of Romanesque; for not only is the influence of Greek or Venetian artists traceable in the buildings of certain districts, especially Perigueux, but it is clear that in others the existence of fine examples of Roman architecture affected the design of buildings down to and during the eleventh century. This influence may, for example, be detected in the use, in the churches at Autun, Valence, and Avignon, of capitals, pilasters, and in the employment through a great part of Central and Northern France of vaulted roofs. A specially French feature is the chevet, a group of apsidal chapels which were combined with it to make of the east end of a great cathedral a singularly rich and ornate composition. This feature, originating in Romanesque churches, was retained in France through the whole of the Gothic period, and a good example of it may be seen in the large Romanesque church of St. Sernin at Toulouse. . . . In Normandy, and generally in the North of France, round-arched architecture was excellently carried out, and churches remarkable both for their extent and their great dignity and

solidity were erected. Generally speaking, however, Norman architecture, especially as met with in Normandy itself, is less ornate than the Romanesque of Southern France; in fact some of the best examples seem to suffer from a deficiency of ornament. The large and well-known churches at Caen, St. Etienne, otherwise the Abbaye aux Hommes—interesting to Englishmen as having been founded by William the Conqueror immediately after the Conquest—and the Trinite, or Abbaye aux Dames, are excellent examples of early Norman architecture. . . . In Great Britain, as has been already pointed out, enough traces of Saxon—that is to say, Primitive Romanesque—architecture remain to show that many simple, though comparatively rude, buildings must have been erected previous to the Norman Conquest. . . . Shortly after the Conquest distinctive features began to show themselves. Norman architecture in England soon became essentially different from what it was in Normandy, and we possess in this country a large series of fine works showing the growth of this imported style, from the early simplicity of the chapel in the Tower of London to such elaboration as that of the later parts of Durham Cathedral. The number of churches founded or rebuilt soon after the Norman Conquest must have been enormous, for in examining churches of every date and in every part of England it is common to find some fragment of Norman work remaining from a former church: this is very frequently a doorway left standing or built into walls of later date; and, in addition to these fragments, no small number of churches, and more than one cathedral, together with numerous castles, remain in whole or in part as they were erected by the original builders. Norman architecture is considered to have prevailed in England for more than a century; that is to say, from the Conquest (1066) to the accession of Richard I. (1189). The oldest remaining parts of Canterbury Cathedral are specimens of Norman architecture executed in England immediately after the Conquest. . . . More complete and equally ancient is the chapel in the Tower of London, which consists of a small apsidal church with nave and aisles, vaulted throughout, and in excellent preservation. This building, though very charming, is almost destitute of ornament. A little more ornate, and still a good example of early Norman, is St. Peter's Church, Northampton. . . . To these examples of early Norman we may add a large part of Rochester Cathedral, and the transepts of Winchester. The transepts of Exeter present a specimen of rather more advanced Norman work; and in the cathedrals of Peterborough and Durham the style can be seen at its best. [The parish church at Ifley is also a notable example.] In most Norman buildings we find very excellent masonry and massive construction. The exteriors of west fronts, transepts, and towers show great skill and care in their composition, the openings being always well grouped, and contrasted with plain wall-spaces; and a keen sense of proportion is perceptible. The Norman architects had at command a rich, if perhaps a rather rude, ornamentation, which they generally confined to individual features, especially doorways; on these they lavished mouldings and sculpture, the elaboration of which was set off by the plainness of the general structure. In the interior of the churches we usually meet with piers of massive proportion, sometimes round, sometimes octagonal, sometimes rectangular, and a shaft is sometimes carried up the face of the piers; as, for example, in Peterborough Cathedral. The capitals of the columns and piers have a

square abacus, [q. v.] and, generally speaking, are of the cushion-shaped sort, commonly known as basket capitals, and are profusely carved. The larger churches have the nave roofed with a timber roof, and at Peterborough there is a wooden ceiling; in these cases the aisles only are vaulted, but in some small churches the whole building has been so covered. Buttresses are seldom required, owing to the great mass of the walls; when employed they have a very slight projection, but the same strips or pilasters which are used in German Romanesque occur here also. Low towers were common, and have been not infrequently preserved in cases where the rest of the building has been removed. As the style advanced, the proportions of arcades became more lofty, and shafts became more slender, decorative arcades became more common, and in these and many other changes the approaching transition to Gothic may be easily detected."—T. R. Smith and J. S. Slater, *Architecture*, pp. 226-235.—See also CATHEDRAL.

Gothic: Full development of vaulting.—Artistic value.—Centers of diffusion.—"In Gothic the possibilities of Romanesque reach their logical conclusions. More analytically and completely the vault determines the rest of the structure. Downward stress and lateral thrusts have been analyzed; they have been gathered up and then distributed in currents of pressure exerted along the lines of the ribs of the vaulting. Each thrust or stress is met by separate support of pillar or colonnette, or by directly counteracting pressure of pier and flying buttress. Through these the weight and lateral thrusts of the building are conducted downward and outward in channels as definite as the gutters which lead the rain-water from the roof. More especially the devices of rib and flying buttress have facilitated the use of the pointed arch, and have lifted Romanesque from the earth; while the confinement of stresses to definite channels has enabled the architect to replace opaque walls with a many-colored translucency of glass, in which the Christian story is painted in the light of heaven. The architectural ornament emphasizes the structure of the building as determined by the requirements of the vault. Constructively, artistically, and symbolically, the ornament of a Gothic church completes and perfects it and renders it articulate. The strength of the building is in its ribs and arches, columns, piers, and flying buttresses. Their sustaining forms render this strength visible."—H. O. Taylor, *Classical heritage of the Middle Ages*, pp. 311-312.—"If the aim of architecture, considered as an art, should be to free itself as much as possible from subjection to its materials, it may be said that no buildings have more successfully realized this idea than the Gothic churches."—S. Reinach, *Apollo*, p. 118.—"The new style evolved with great rapidity. The Gothic choir of the Abbey Church of St. Denis was begun in 1144, the Church of Noyon in 1150, Notre Dame (Paris) in 1163, Bourges in 1172, Chartres in 1194, Reims in 1211, Amiens in 1215. [See also AMIENS, Cathedral of.] The Sainte-Chapelle of Paris was consecrated in 1248. From the north of France the Gothic type—propagated more especially by the monks of Cîteaux—passed into Alsace (Strasbourg, 1277), into Germany (Cologne, 1248), into Italy (Milan), into Spain, Portugal, Sweden, Bohemia, and Hungary. The French Crusaders introduced it into the island of Cyprus and into Syria. In England, it assumed a national character, the main features of which were a greater structural sobriety and care for solidity, combined later with more richness and beauty in the ribbing of vaults and in ornament generally, and a ten-

dency to rely upon the length for sublimity of effect, rather than upon height, as did the French architects. It has, however, been made a reproach to the English Gothic artists that they made an excessive use of vertical lines, especially in their windows. In 1174, a French architect, William of Sens, rebuilt the cathedral of Canterbury which had been, for the second time, destroyed by fire. The choir of Lincoln was built from 1190 to 1200, that of Westminster Abbey from 1245 to 1269; Salisbury from 1220 to 1258. Everywhere else, the French type prevailed. Chartres and Bourges were the models for Spain; Noyon and Laon were imitated at Lausanne and at Bamberg (the towers); Cologne [q. v.] is a combination of Amiens and Beauvais. The country which least readily assimilated the Gothic style was Italy (Milan Cathedral). The Romanesque churches did not disappear here; there is an unbroken continuity between them and the buildings of the Renaissance, whereas Gothic art intervenes as a brilliant episode, the apogee of which was but little removed from its decline. Three periods have been discerned in Gothic architecture, determined by the shape and decoration of the windows; to these the terms *à lancettes* (lancet-shaped) or *Primitive*, *Rayonnant* or *Secondary*, and *Flamboyant* or *Third Period*, are applied in France, while in England three distinct periods are also recognised, and generically distinguished as Thirteenth Century, or *Early English*; Fourteenth Century, or *Decorated*, and Fifteenth Century, or *Perpendicular*. But all these terms are somewhat loosely applied. It will be enough to say here that the principle of Gothic architecture led it on incessantly to increase the height of vaults, to enlarge open spaces and windows, to multiply belfries and pinnacles. The Gothic churches of the fifteenth century are both mannered, and alarming in the overslenderness of their structure. Gothic art was not crushed by the art of the Renaissance; it fell a victim to its inherent fragility. Churches were not the sole fruit of Gothic art, though the cathedral is its most perfect expression. Among the monuments of its later period are the beautiful town-halls of Flemish cities, which rose confronting the churches, with belfries containing the municipal bells, as if to symbolise the growth of a new power, that of the civic laity. Other productions were magnificent abbeys [see also ABBEY: Abbeys in history, and Architectural features] notably that of Mont St. Michel, and charming private houses, such as the Hôtel de Cluny in Paris, and Jacques Cœur's House at Bourges. Fortified castles, and keeps, or donjons (from the Latin *dominium*) in the Romanesque style had multiplied from the tenth century onwards. The exigencies of defence forbade the full acceptance in these of a style in which open spaces predominated; but Gothic art inspired the interior arrangement, the decoration of the doors, the windows, and the roof; it will suffice to instance the castles of La Ferté-Milon and Pierrefonds, dating from the close of the fourteenth century, buildings which have been justly eulogised for 'their imposing masses, their noble outlines, the Doric pride and frankness of their perpendicular design.'"—S. Reinach, *Apollo*, pp. 116-117.—The Spanish use of the Gothic was freer and more genuine than that of Germany or Italy, and although the French influence was dominant, certain characteristic features of plan and proportion were developed, notably increased width of nave, position of choir, internal buttresses and wide vaulting. The Gothic style in Spain and also in southern Italy and Sicily is noteworthy for Saracen influence, as evidenced by rich surface decora-

tions, pierced stonework tracery, and the horse-shoe arch.—See also ART: Relation of art and history; CATHEDRAL: Historical importance.

RENAISSANCE

Relation to preceding styles.—“Greek architecture is the embodiment of supreme serenity, of self-restraint, and the sense of inevitable fate. It is the expression of an ideal of life that never sought to leave the earth, the ideal of a sound mind in a sound body. Its impulse is purely pagan. Roman architecture, with its bridges and aqueducts, its triumphal arches, its domes and its auditoriums, speaks of the majesty of the Roman government, of the imperial scope of its power and its law. When paganism had fallen and Christianity had built a new civilization upon the wreck of the old, Gothic architecture gave expression to the new spirit, to the new ideal of life, to the new vision that soared aloft until it was lost in the blue sky. Pure beauty was the sole object of Hellenic art, but Gothic architecture strove to voice the aspirations of the human soul. The predominant lines of classic architecture are horizontal lines, which are restful and belong to the earth, while those of Gothic architecture are vertical. In a Gothic cathedral, slender window, towering pillar, pointed arch, lofty vault, delicate pinnacle, and soaring spire, irresistibly carry the eye upward. Classic architecture was rooted in the rational faculty; Gothic was born of the spiritual. The rational faculty looks about it with understanding. The spiritual faculty aspires with rapture to God. But it is not form alone that creates the impression produced by a Gothic cathedral. The windows, made up of separate fragments of glass, ruby, or sapphire blue, or emerald green, let in mellow light and permit mysterious shadows. The lofty interior is steeped in the brooding richness and solemn splendor of a strange twilight. The effect is profoundly emotional. It is the language of the soul become articulate. . . . Gothic architecture could not express the combination of classicism and modernity that formed the spirit of the Renaissance. A new style of architecture was required. The pure Gothic of northern and central France had never found a congenial soil in Italy. Only a modified form of Gothic, in which the horizontal principle held an important part, had flourished there. Breadth rather than height was its characteristic attribute. The spire was almost unknown, its place being taken by the dome. In retaining something of the character of classic architecture Italian Gothic expressed the genius of the Italian people, a genius with classic inheritance, as contrasted with the genius of the French people, a genius with a marked Celtic strain. In the creation of an architecture that should give expression to the semi-classic spirit of the Renaissance, a less radical change was required of the Italians than of the northern nations. The spirit of the Renaissance appealed to the Italian mind promptly and decisively. A new style of architecture, that rapidly reached maturity, gave expression to that spirit.”—E. M. Hulme, *Renaissance, the Protestant Revolution and the Catholic Reformation*, pp. 108-110.

“Compared with the medieval architecture which preceded it, Renaissance architecture was less concerned with problems of structure and more with those of pure form. As in the case of Roman architecture, the forms of detail were sometimes used as trophies of classical culture, with relative indifference to their original structural functions. The forms were not merely ends in themselves,

however, but means for a rhythmical subdivision of space, more complex and more varied than either ancient or medieval times had known. A further contrast between the Middle Ages and the Renaissance, though one which has often been exaggerated, lay in the relation of the designer to his work. The architect, in the ancient and in the modern sense, reappeared. We now realize that in both the Middle Ages and the Renaissance the general design was controlled by a single mind, and that in both periods there were sculptured details of which the design was left to the initiative of individual sculptors. Unlike the medieval masterbuilder, however, the Renaissance architect did not himself work on the scaffold, whereas he did dictate, in a greater measure than his predecessors, the form of many uniform details.”—F. Kimball and G. H. Edgell, *History of architecture*, pp. 345-346.

Italy.—“The first period of Renaissance architecture in Italy may be characterized as the attempted fusion of the forms of the Middle Ages and those of antiquity. Novelty is less apparent at first in the conception of buildings than in their decorations, in which Graeco-Roman motives play a part. For the first time since the fall of the Empire, civil architecture becomes more important than religious architecture. This was a consequence of the progress of the secular spirit. The type of the new art is the Florentine palace, a massive structure built round a quadrangular court with a columned portico. The exterior still preserves the character of the mediæval fortresses, in which solid surfaces occupy far more space than apertures. It is in the interior, with its arcades, its rows of columns, the decoration of its pilasters and vaults that the imitation of antique models manifests itself. Some of this decoration, no longer realistic but fantastic, was inspired by that of the Roman tombs lately excavated, and known as *grottoes*; hence the term *grotesque*, which, in its original sense, implies no sort of censure or ridicule. The Renaissance church differs from the Gothic church mainly in that it is generally crowned by a cupola square in plan; clustered columns are replaced by pillars; the vault on intersecting arches by a barrel vault or a horizontal coffered ceiling; on the exterior we find columns, pediments, and niches, all the various elements of Roman art. The Florentine Brunellesco (1377-1466) was the initiator of the first Renaissance. From 1420 to 1434 he raised the dome of the Cathedral of Florence to a height of about 300 feet. . . . About the year 1445, [he] began the Pitti Palace at Florence. It is a building characterized by a severe beauty, due mainly to the clarity of the design and the perfection of the proportions. Classic influences are more apparent in the Riccardi Palace, the work of Michelozzo about 1430, and in the Strozzi Palace, Florence, built about 1489 by Benedetto da Majano and Cronaca. This is surmounted by an attic or cornice inspired by the best Roman models and justly celebrated. . . . The marvellous façade of the Certosa at Pavia was built in 1491, two years later than the Strozzi Palace. Here decoration abounds, infinitely rich and varied; if it borrows elements from antique art, it lavishes them with truly Gothic exuberance. . . .

“The centre of true Renaissance architecture, characterized by the constructive, non-decorative use of columns and pilasters, was not Florence but Rome, where the monuments of antiquity furnished models. It began with Bramante of Urbino (1444-1514), the director of the first works undertaken at St. Peter's. His influence was principally ex-

exercised to restrain parasitical decoration and emphasise the structure of a building; this formula has become the law of modern architecture. Perhaps the most gifted of his successors was Andrea Palladio, who worked at Venice (1518-1580). A characteristic work by him is the Church of the Redentore in that city. As an example of a palace built in this second phase of the Renaissance, we may cite the beautiful Library of St. Mark at Venice, the work of Jacopo Tatti, called Sansovino (1486-1570), with its Doric ground floor, its Ionic first floor, its graceful frieze and balustrade enriched with statues. The third period was entirely dominated by the influence of Michelangelo (1475-1564), especially from about the year 1550 onwards. This redoubtable genius imposed picturesque elements and individual fancies upon ar-

tendency developed, at the close of the sixteenth century, into the style known as Baroque, from the name given by the Portuguese to irregularly shaped pearls (barocco). It is a kind of degenerated Renaissance art, allied by its defects to the Flamboyant Gothic of the fifteenth century, its most pronounced characteristic being the preference of the curved to the straight line. In the interior of the churches of this period the so-called *Jesuit* style held sway; it aimed at dazzling the eye by wealth and variety of motive, without regard to the true function of ornament, which is to emphasize form. This was the period of decoration treated as an end in itself, introduced everywhere and in the most contradictory fashion, resulting in feverish visions of tortured lines and unexpected reliefs. The genius of the Renaissance

chitecture. He continued, but did not finish, the enormous Church of St. Peter, the plans of which had already been modified by several architects, Raphael among the number. After the death of Michelangelo, the huge cupola, some 430 feet high, was finished from his designs; but the façade was spoilt in the seventeenth century by Maderna, and more especially by Bernini, the author of two lateral towers by no means pleasing in their effect. . . . It is the largest church ever built, covering a superficies of over 225,000 square feet, while Milan Cathedral and St. Paul's in London occupy only some 118,300, St. Sophia some 107,000, and Cologne Cathedral some 86,000. . . . The example of Michelangelo inspired a taste for the colossal and a straining after effect, to the detriment of simplicity and good taste. His disciples have left many powerful and original works, which are marred by too great an exuberance of fancy. This

succumbed at last in this decorative orgy, though down to the end of the eighteenth century it never ceased to produce buildings remarkable for their boldness or their elegance. As an example of the latter, we may mention the Palazzo Pesaro [at Venice or Bevilacqua at Bologna] where, in spite of the profusion of useless ornament, the eye is charmed by the nobility of the proportions and the playful fancy of the decorations (about 1650).”—S. Reinach, *Apollo*, pp. 131-135.—See also VENICE: 16th century.

France.—“Next to Italy it was France that was the chief contributor to the Renaissance. But the change from Gothic to pseudo-classic ideals that began to overtake architecture in the fifteenth century in that country cannot correctly be called a revival because there had never been a time in French history when architecture had been classic in its spirit. . . . In France Gothic architecture,

born of the national spirit, had found its most logical and artistic development; and therefore its modification and replacement were not accomplished without a struggle. Some things there were that helped to make the change less difficult. . . . The architectural needs of the time were becoming secular and civic. . . . French artists went to learn in Italy, and Italian artists came to teach in France. It was not classic architecture that found its way into France but rather the varying Italian interpretations of that architecture. The fusion of the flamboyant Gothic with the florid Italian styles resulted at first in a transitional style that was the autumnal splendor of the medieval manner; but about the middle of the sixteenth century a decided break with the Gothic past took place."—E. M. Hulme, *Renaissance, the Protestant Revolution, and the Catholic Reformation*, pp. 391-392.—"The oldest monuments of the French Renaissance are the country mansions built in the valley of the Loire during the reign of Francis I. They retain the high sloping roof, the towers, turrets, and spiral staircases of the Middle Ages; it is only in the decoration, that Italian influences are revealed. . . . We need go no further than Paris to study the beautiful gate of the Château de Gaillon (1502-1510) built by the Cardinal d'Amboise, and now erected in the courtyard of the École des Beaux-Arts. A bolder example of the style is Chenonceaux on the Cher (1512-1523), a well-preserved building, in which Gothic forms are everywhere perceptible, under the veil of Renaissance decoration. The masterpiece of this style is Chambord, the work of Pierre Trinquieu (c. 1523), with its forest of chimneys and gables, a fairy apparition rising in the midst of a desolate sandy plain. But if we examine it closely, we are struck by the incongruities of construction: a Gothic roof, a Renaissance main building, and massive Romanesque towers. The older parts of the Castle of Blois (especially on the north) abound in charming Renaissance details, still allied to Gothic elements. Fontainebleau is severe in style, even a trifle wearisome; the most severe of all Francis I's châteaux is that of St. Germain, where the austerity of the façade and the flat roof recall the Florentine palaces of the early Renaissance. The hybrid union of Gothic and Renaissance is found in several of the churches of this period, as, for instance, in St. Etienne-du-Mont (1517-1540-1610) and St. Eustache (1532) in Paris. Towards 1540 a purification of style took place. Pierre Lescot, who worked at the Louvre from the year 1546, Jean Bullant (1515-1578), who built Ecouen and began the Tuileries, completed by Philibert Delorme, were thoroughly saturated with the spirit of the Italian Renaissance, but they also developed a decorative and picturesque talent which presaged the French art of the Eighteenth century. The masterpiece of French Renaissance architecture, and perhaps of all modern architecture, is the Louvre. Of the many who have seen it, but few know it, for its different portions date from various periods, and it requires careful scrutiny to grasp the distinctive characteristics. The part of the Louvre courtyard which we owe to Lescot (south-west) struck the note that was taken up by his successors, and it is not too much to say that this courtyard affords the most admirable view of a palace in existence. On the outside, facing the Rue du Louvre, Louis XIV. commissioned Claude Perrault to build a long monotonous façade with double columns, which gives the measure of the distance between the art of the French Renaissance and that of the age of Louis XIV. Even the exquisite grace of a Les-

cot seemed frivolous to that age; its artists no longer sought inspiration in the Italy of the sixteenth century, but found their models in imperial Rome. The style then adopted is known as the *academic* style, because it was enforced mainly by the Academies of Sculpture, Painting, and Architecture founded by Mazarin (1648) and by Colbert (1671). . . . Perrault's colonnade and the façade of the Palace of Versailles, completed by Jules Hardouin Mansard (1646-1708), are memorable examples of this sad, solemn, and lofty style, in which symmetry is the supreme law, and every picturesque and unexpected element is banished. Mansard's best work is the dome of the Invalides (1675-1706), the silhouette of which, at once elegant and majestic, is much finer than that of the Pantheon by Soufflot (1757-1784). The imposing façade of St. Sulpice (1733) is the work of an Italian architect, Servandoni. The two Garde-Meubles, on the Place de la Coucorde, akin to Perrault's colonnade, but greatly superior to it, are due to Gabriel, the best architect of the time of Louis XV. These fine buildings have one very unsuitable feature, the flat Italian roofs, so ill-adapted to the climate of Paris. As it is absolutely necessary to warm them, the roofs have been crowned by a forest of chimney-pots, which produce a somewhat grotesque effect."—S. Reinach, *Apollo*, pp. 131-135.

Germany.—"In Germany the Renaissance movement seems to have followed in the steps of French Renaissance rather than of Italian. . . . But it is somewhat difficult to assign any decisive tendency to German architecture in the Renaissance period; it seems to have varied very much with locality and individual influence. The later work at Heidelberg shows a more Renaissance spirit than the earlier part, but in a rather florid and tawdry manner; while the portico of the Rathaus at Cologne, with its two stories of orders on pedestals, with round arches between, is almost academic in style, and seems derived rather from Italian than French influence. On the other hand, reminiscences of Gothic . . . survive in the most surprising manner in buildings of much later date than this. A church at Bückeberg, for instance (1613), has aisles defined by Corinthian columns, with the orthodox architrave blocks above the capitals, and mullioned windows of the long three-light German Gothic type, only with circular instead of pointed tracery, and a façade of the most villainously *rococo* character; and the Marien-Kirche at Wolfenbüttel, about the same date, has buttresses of Gothic plan, but terminating in a frieze and cornice, and the long three-light mullioned window with pointed arches, but with the tracery-bars ragged with ornamentation in relief. One never knows what one may find in German Renaissance buildings; it is a period of experiments and vagaries, often crude and coarse to a degree, yet not without a certain picturesque effect, and Gothic feeling is often quite prevalent even where nearly all the details are Classic. One may take as an example the Rathaus at Bremen (1612), with its open arcade in the ground story, its balcony with *rococo* carved ornament, and its mullioned windows above, with Classic pediment heads, . . . and it can hardly be denied that the total spirit of this building, in spite of its little orthodox pediments over the windows, is mediæval rather than Renaissance. Mediæval in feeling, too, are the frequent high-gabled street fronts, such as that of the Gewandhaus at Brunswick (1502), with four stories each with an order, then an immense gable in several diminishing stages with crude details of pilasters and scrolls. The same kind of thing is

shown more in detail in the illustration of a house front at Heidelberg. There is a certain picturesqueness about it, but after all it is a kind of nursery architecture, like children building with toy bricks, that no French architect of the Renaissance would have descended to. Among German buildings which exhibit something of the refinement and sobriety of the Italian and French Renaissance a favourable example is the Gymnasium in the Bank Platz at Brunswick (1502) in which square-headed mullioned windows of the Francis I. type are grouped in pairs, with a niche and a statue between each pair; and one may mention also the Rathaus at Augsburg (1615), a plain building with pedimented windows, somewhat recalling the style of the Farnese Palace. But the general tendency of German Renaissance is to eccentricity and exuberance of ornamental detail, the unquestionable vigour of which hardly compensates for its want of refinement."—H. H. Statham, *Short critical history of architecture*, pp. 487-494.

Spain.—"In Spain, as in France and other countries outside of Italy, there was a mingling of Italian forms with those already existing in the native medieval architecture. Here, however, the medieval style itself included a large admixture of Moorish forms. Moriscoes, until their expulsion in 1610, remained prominent among artificers, and thus had their influence on the Renaissance forms as well. Thus arose the Plateresque or silversmith's style, so called from the intricate and delicate ornament abounding in it. This, which corresponds with the early Renaissance, extended from about 1500 to 1560. A notable example is the Town Hall at Seville, built in 1527-32. Here there is an application of engaged orders in two stories which in its main lines is thoroughly grammatical, but which has pilasters, columns, window enframements, and panels alike covered with the richest arabesques and candelabra-like forms. Even more characteristic in its mode of composition is the doorway of the University at Salamanca. Here the ornament is massed in a great panel above the opening, which contrasts with the broad neighboring surfaces of unbroken masonry. Other notable features of style are open arcaded loggias which often terminate a façade, as in the Casa de Monterey at Salamanca (1530), and the courts or patios surrounded by galleries which are found in all important buildings. Forms like those of the High Renaissance in Italy first appeared in the palace begun for Charles V. in the Alhambra (1527), by Pedro Machuca. This building is square in plan with a circular colonnaded court having superposed orders, Doric and Ionic. In purity and classical quality the building holds its own with contemporary monuments of Italy. . . . The conquest of the Indies made Spain, by the middle of the sixteenth century, the greatest power in Europe. Philip II. gave expression to this power by the building of the Escorial (1563-84), comprising a votive church and mausoleum, monastery, and palace, with every needful dependency for the service of both church and state. Its building lay chiefly in the hands of Juan de Herrera (1530-97), whose work, severely academic in its forms, established the post-Renaissance tendencies in Spain. In the Patio of the Evangelists, to be sure, he employed the Roman arch order with equal bays and unbroken entablatures, but elsewhere the numbering abounds in the complex grouping of supports, the breaking of horizontal members, the uniting of interior spaces by penetrating vaults, and the multiplication of aspects in perspective by the combination of dome and towers. Herrera's sobriety was soon superseded by baroque freedom,

which ultimately in the hands of José Churriguera (1650-1723) became the boldest license. The national traditions of the Plateresque were reflected in the 'Churrigueresque' style, which paid less attention to the creation of new forms of plan and space than to the luxuriant elaboration of detail. It reached its fullest development in the great portals and altar-pieces, such as the high altar of the church of El Salvador in Seville. The accession of the Bourbons in 1714, which marked the end of Spanish domination in politics, brought also a subordination of Spanish tendencies in art. The palaces of the new rulers at La Granja and Madrid imitated not only the worldliness of Versailles but its architectural formalism. The baroque tendency, which comported so well with national sympathies, persisted nevertheless, now creating novel forms of interior space, and still filling the framework of the orders with an exuberance of ornament."—F. Kimball and G. H. Edgell, *History of architecture*, pp. 387-388, 420-422.

England.—"Gothic architecture endured longer in England than elsewhere, and took a new lease of life under the name of Tudor Style (1485-1558). To this transitional style belong the Royal Chapels, St. George's at Windsor and Henry VII.'s Chapel, Westminster Abbey, with their unique system of fan-vaulting. Hampton Court Palace is a charming example of the Tudor Style as applied to domestic architecture. Renaissance architecture only flourished in the time of Charles I., when it was represented principally by Inigo Jones (1572-1662), the author of the beautiful Banqueting Hall of Whitehall, London, and by Christopher Wren (1632-1723), the architect of the vast church of St. Paul's, a building inspired by St. Peter's at Rome, though not copied from it."—S. Reinach, *Apollo*, p. 142.

MODERN

General tendencies.—Our discussion of modern architecture is necessarily diverse and incomplete. Any critical evaluation must be regarded rather as a proposition for debate than as a final dictum. "Although the kaleidoscopic interplay of forces makes it difficult to generalize regarding the architectural characteristics of the period, they may be conceived broadly as the result of a synthesis of retrospective and progressive tendencies, which exist side by side, not unlike the academic and baroque tendencies in the previous period. In matters of form and detail it is the newly-won historical understanding of previous styles which has been chiefly influential resulting in a series of attempted revivals followed by a season of eclecticism. In matters of plan and construction, however, the growth of material civilization and the development of new forms of government and commerce have produced a multitude of novel types of buildings as well as constant changes in the form and importance of the old types, making every supposed revival unconsciously a new creation. Finally there has begun a conscious movement to give the new functional types and structural systems an expression that shall also be novel and entirely characteristic."—F. Kimball and G. H. Edgell, *History of architecture*, pp. 460-461.

Belgium.—"Belgium has produced, in the Law Courts at Brussels, by Poelaert (1816-1870), a building which in the Classic revival period stands almost alone as an attempt to use Classic materials in a free and original spirit both of composition and detail. It is not altogether satisfactory; there is a want of unity of design as a whole, and a want of scholarly character in a class of

detail in which we seem to require that character; but it is a building which gives evidence of architectural genius."—H. H. Statham, *Short critical history of architecture*, p. 541.

England.—"The early part of the [19th] century was marked by a Greek revival; a revulsion from the austere and rather prim simplicity to which the Renaissance had been reduced in the Georgian era, when hardly anything of Renaissance architecture was left except the Classical cornice and the symmetrical arrangement of windows. 'Back to Greece,' was the cry, without any consideration as to whether the climate of England and the conditions of modern life were suitable to Greek architecture; and one of the earliest results was the formation (1822) of the steeple of St. Pancras' church by Inwood's simple process of putting imitations of two small Greek buildings one on the top of the other, above a main portico of Ionic columns. Sir John Soane's (1753-1837) earlier treatment of the Bank of England was much better than this; having to provide for a low building with all the windows opening on the interior courtyard, the employment of a large one-story order as a means of giving decorative effect to these blind walls was not a bad idea; and at all events the building looks like a bank, and could hardly be taken for anything else. Then we had Wilkins's National Gallery and University College, both with admirable details but rather weak in general effect. . . . The great building of the Greek revival is St. George's Hall at Liverpool, by Elmes (1814-1847). . . . St. George's Hall, Greek externally and Roman in the interior of its great hall, is a noble conception, and contains moreover a certain originality in portions of the exterior, which may be described as Egyptian *motifs* translated into Greek form; it is true that the interior is very badly planned for its purposes, and the corridors lamentably deficient in light; but in those days, and in Elmes's mind certainly, that was a matter of quite secondary consequence provided that a grand architectural effect were obtained; and perhaps, for architecture, that extreme is better than the opposite extreme of ultra-utilitarianism. . . . The Gothic revival in England, a little before the middle of the century, was more or less acted on by an ecclesiastical or religious revival—at all events the architectural and religious movements went hand in hand, and the result was a widespread erection of churches in imitation of those of the mediæval period, and a drastic restoration of the cathedrals; in both classes of operation Sir Gilbert Scott (1811-1878) was the largest operator. . . . His churches, it must be admitted, are quite uninteresting now; the stamp of imitation Gothic is over them all. Pugin (1812-1852), that impassioned modern mediævalist, was also a leading influence at the outset of the Gothic revival, and had the faculty of imparting a great impression of height and scale to the interiors of his plastered churches with their 'half-baked chalk rosettes,' as Bishop Blougram expressed it. Street's (1824-1881) churches have more individual character than Scott's, and Butterfield's (1814-1000) still more so; perhaps his All Saints', Margaret Street, is the one Gothic revival church which is still as interesting, externally at least, as when it was built. . . . The greatest modern Gothic building in England, or in the world, the Houses of Parliament, stands apart, as owing its style to influences outside of the Gothic revival movement, which, in fact, it rather preceded. The Tudor style appears to have been dictated to the architect mainly for historical reasons, as a typical English style; perhaps also owing to the proximity of Henry VII.'s

chapel. Sir Charles Barry . . . has the merit of having produced, though working in a style forced upon him and with which he was not in sympathy, one of the grandest and most picturesque groups of architecture in the world, based on a plan so fine and effective that it has been copied again and again in buildings for a similar purpose, notably in the Budapest Parliament House, which is practically a reproduction of Barry's plan. . . . Since the collapse of the Gothic revival, English architecture has taken a turn towards greater freedom of design, and a tendency once more to the employment of Renaissance materials and suggestions, without too great deference to precedent. Much may be hoped from this new movement in English architecture."—*Ibid.*, pp. 526-533.

France.—"France has had too much of the sense of tradition in architecture to be taken captive by revivals. There is the great modern Gothic church of Ste. Clotilde at Paris, about the middle of the century, but there has been no Gothic revival on a large scale in France. There was, under the first empire, a certain tendency to a Greek, or we should perhaps rather say a Roman, revival, illustrated in such columned structures as the Bourse and the Madeleine, by Brongniart and Vignon respectively; and the stupendous Arc de l'Étoile [see also ARC DE TRIOMPHE DE L'ÉTOILE], in which the general effect is better than the details, with the exception of Rude's grand sculpture. But there was no general movement like the Greek revival in England. There was for a time a certain tendency to build churches with details founded on Byzantine suggestions, which were not successful; the attempt was not in harmony with the French genius, which, in spite of the fact that France was the cradle of mediæval architecture, is now essentially Classic in its tendencies. The great church of the Sacré Cœur, by Abadie (1812-1884), which overlooks Paris from the hill of Montmartre, is (like the Roman Catholic cathedral in London) a frank adoption of Byzantine architecture, and a grand piece of work as such; but it is exceptional. The characteristic successes of the French architects of the century in church architecture are to be seen in such buildings as the church of La Trinité, by Ballu (1817-1885), in which a Gothic type of composition has been translated into Classic detail; in Baltard's (1805-1874) domed church of St. Augustin, where by a happy recognition of the fact that the streets which limit the site meet at an acute angle, the exterior lines of the building are made to expand from the entrance front to the base of the dome; and in Hittorff's (1703-1867) fine and severe basilica church of St. Vincent de Paul. The new Hôtel de Ville at Paris, built after the Commune [1871], keeps a good deal to the style of the earlier French Renaissance, being partly influenced by the fact that the design of the earlier building is reproduced in a portion of the new one. At present the tendency of French architecture is towards the use of the Classic order, in large buildings, combined with a modern school of decorative detail which tends to be a little too florid. The Opera House [built from 1861-1874], by Chas. Garnier (1825-1898), is a fine though somewhat too florid building, redolent (as one may say) of the Second Empire; but the modern French style receives its best exemplification in the two great art-palaces at the Champs Elysées, one of which, that called the Petit Palais (though it is a very large building), by M. Girault, is also a really original conception in plan. The Musée de Galliéra at Paris, by the late M. Ginain (1825-1898), is a little gem of modern

Classic architecture, treated in a style distinctively French but with perfect good taste and refinement of detail. Speaking generally, however, what modern French architecture needs is a greater simplicity and reticence in decorative detail. But France is the only country which seems to have anything like a recognised tradition and a consistent purpose in architecture."—H. H. Statham, *Short critical history of architecture*, pp. 533-536.

Germany.—"Germany anticipated the Greek revival, before the end of the eighteenth century, in the erection of the Brandenburg Gate at Berlin, with its great Doric columns. With the new century the Germans went into Classic revival with enthusiasm, and on a great scale, and their architects certainly did the thing exceedingly well. Klenze's (1784-1864) columned Ruhmes-Halle at Munich, with its two projecting wings, forming the architectural background to a colossal statue, is a grand conception of its kind; his Glyptothek at Munich, with its columned central portico and plain contrasting wings, is a good composition, and an appropriate façade for a sculpture gallery. The other and perhaps more important representative of Greek classicism in Germany in the early part of the century was Schinkel (1781-1841), who was an architect of some genius in rather columnar Classic buildings at Berlin—the Museum, a quadrangular building with an open colonnade in front, and the Royal Theatre; and his pupil Strack subsequently carried out, in a similar style, the National Gallery at Berlin, also a fine building of its type. Schinkel could perceive, however, that revived Greek was not everything in modern architecture, and endeavoured to treat the Bau-Akademie at Berlin in a modern style, with coloured brickwork and flat buttresses; but he was hardly at his best away from the Classic orders, which he understood thoroughly how to use. His Nikolai church at Potsdam, however, is a striking and rather original building, with a columned dome mounted on an immense square block of wall with turrets at the angles, which rather reminds one of the masses of walling in Soufflot's Panthéon, and was possibly suggested by it, though the building is by no means equal to the Panthéon. Semper (1803-1879) was a classical architect of somewhat the same school as Schinkel, and is credited with the designs of the Hofburg Theatre, and the new crescent-shaped wing of the Hofburg Palace at Vienna, though they were not carried out by him, but by Hasenauer after his death. Vienna also contributed largely to revived Classic architecture; the Parliament House, by Hansen (1830-1890), about the middle of the century, is to exterior appearance a group of temples of the Corinthian order. At Vienna, however, though there was nothing like a Gothic revival either there or elsewhere in Germany, some large Gothic churches were built, especially the Votive church by Ferstel (1828-1883), which may be described as a starved reproduction of Cologne Cathedral. Vienna has also a Gothic Town Hall, by Schmidt (1825-1891), which is better than the Votive church. The more recent architecture of Germany seems to present a dual aspect. It seems still to be considered that revived Classic is the style for national buildings of the first importance; but the new Houses of Parliament with its [ugly] square cupola and heavy details, is, as Classic architecture, a sad descent from the scholarly refinement of Klenze, Schinkel, and Semper; and the new Berlin cathedral is like a bad St. Peter's. But in the general trend of recent German architecture there is, along with a good deal of horrible stuff which has the trail of *l'art nouveau* all

over it, a great deal of interesting novelty and originality in design, sometimes rather eccentric, but which at least shows that there is a spirit of life in German architecture, in the more general class of buildings, however they seem to fail at present in great monumental works. . . . Moreover, the Germans pay great attention to sculptural decoration in connection with architecture, and introduce it so as to have a point and meaning in relation to the purpose of the building."—H. H. Statham, *Short critical history of architecture*, pp. 536-540.

Italy and Spain.—"In regard to recent architectural progress Italy and Spain may almost be considered negligible."—H. H. Statham, *Short critical history of architecture* (1912), p. 541.

United States.—"The United States of America occupy a somewhat important place in modern architecture. The short history of American architecture has been rather a curious one. In what is called the 'old Colonial' period the houses and other buildings, generally small, had often a good deal of architectural interest from the fact that they represented late English Renaissance carried out in wood, as the most available material, instead of in stone; and the difference in the character of the material, and the treatment suited to it, gave to the old architectural details a new effect and expression. And apart from this use of timber, the early Colonial buildings in stone or brick were of a simple and unaffected style which rendered them pleasing. With the development of civilised America into a national power as the United States, came a period of more pretentious architecture with no artistic feeling behind it. L'Enfant's scheme for the laying out of Washington was a fine one, which is only just now in process of being carried out; but the Capitol itself is only an effort at sublimity in cement; and till about thirty years ago American architecture (except for Richardson's short-lived movement in favour of a kind of Romanesque-Byzantine) was like bad English architecture. Since then it has been, as far as public buildings are concerned, like good French architecture, which in a sense is the highest praise. . . . There is no doubt that American architecture at the present moment takes a very high place indeed, especially in the application of Classic ideals to public buildings. It is superior to that of either Germany or England; and if we do not regard it as quite equal to that of France, that would mainly be because it is obviously derived from French study, and one naturally feels that the copy cannot claim to be put quite on a level with the original. As an example of the best American architecture of the day we might take perhaps the Field Columbian Museum at Chicago, than which it would be difficult to find anything better in its way. There are, however, two other phases of modern American architecture to be recognised. In small country houses, sea-side dwellings, &c., the American architects of late years have shown a great deal of invention and picturesqueness, combined as a rule with perfectly good taste; and their country houses of this class may be advantageously contrasted with the ugly vagaries of French and German country-house architecture. . . . A much less pleasing phase of modern American architecture is the development of the 'high building,' consisting of a framework of steel construction with an outer skin of masonry; a manner of building suggested entirely by the commercial consideration of getting the greatest possible amount of rent out of every square yard of site."—H. H. Statham, *Short critical history of architecture*, pp. 541-543.—Among

the significant contributions of the United States to architecture have been the colossal railway terminals such as the Union Railway station at Washington and the New York Central and Pennsylvania stations in New York City. Educational architecture has occupied a very important and prolific field during the early twentieth century, the most notable and extensive plans being carried out at West Point, Annapolis, University of California and Columbia University in New York City.—See also THEATER.

Recent tendencies: Classical tradition.—Modernism.—Functionalism.—"The modern and increasing use of reinforced concrete construction has been regarded by some as affording a basis for a new architectural style; but there is no sign as yet of anything worth calling by that name, nor does it seem likely that so intractable and unsuggestive a material could ever take the place of stone for architecture of the highest class. The ultra-commercial spirit in America, the spirit which regards a building merely as a thing to be run up as fast as possible to bring a commercial return, has invaded London and is beginning to invade Paris; and unless it is checked will be the death of architecture. If there is one thing that a survey of the history of architecture shows clearly, it is that all that is great in architecture has arisen from the desire to do something fine and noble for its own sake; and where there is not that desire there will be no great architecture."—H. H. Statham, *Short critical history of architecture*, pp. 544-545.—Other critics find the industrial phase of architecture not the most deplorable but the most hopeful. "Modern armoured concrete is only a higher power of the Roman system of construction. If we could sweep away our fear that it is an inartistic material, and boldly build a railway station, a museum, or a cathedral, wide and simple, amply lighted, and call in our painters to finish the walls, we might be interested in building again almost at once. . . . Our great difficulty is lack of spontaneous agreement; an expressive form of art is only reached by building out in one direction during a long time. No art that is only one man deep is worth much; it should be a thousand men deep. We cannot forget our historical knowledge, nor would we if we might. . . . Our survey should have shown us that there is not one absolute external form of beauty, but rather an endless series of changing modes in which the universal spirit of beauty may manifest itself; that, indeed, change of the form is one of the conditions of its continuance. In Egyptian architecture power, wonder, terror, are expressed; in the Greek, serenity, measure and balance, fairness; in the Roman, force and splendour; in the Byzantine, solemnity, mystery, adoration; in the Romanesque, strife and life; in the Arab, elasticity, intricacy and glitter, a suggestion of fountain spray and singing birds; in the Gothic, intensity, swiftness, a piercing quality, an architecture not only of stone, but of stained glass, bells and organ music. Beauty is the complexion of health, to reach it we must put aside our preoccupation about different sorts of rouge. We are always agonizing about design, but design, as Rodin has said, is as nothing compared to workmanship. Any one may see a beautiful landscape composition, but it needs a Turner to paint it. A rearing horse is a living statue, but the difficulty is to carve like Phidias. A skilful architect may design the lines of a cathedral bigger than Bourges, and embodying several excellent new ideas, before his breakfast, but there is little virtue in writing '700 feet long,' or in planning three transepts instead of one, or in

making the chapels quatrefoils instead of octagonal; these are nothing compared to great building skill."—W. R. Lethaby, *Architecture*, pp. 248-250.—This revolt from the conservative and historical tradition, strongest in Germany and America, is thus summarized. "The conscious endeavors in modern architecture to make the forms of individual members correspond to their structural duties, to make the aspect of buildings characteristic of their use and purpose, to make the style of the time expressive of the distinguishing elements in contemporary and national culture, may be inclusively designated by the name functionalism. . . . Sometimes the attempt has been to give to new materials like steel or glass, or new systems of construction like reinforced concrete, a form suggested by their own properties. Sometimes the effort has been to express on the exterior of buildings the function of each of their component elements, and to endow each building as a whole with a specific character in conformity with its purpose. More recently there has been a tendency not to remain satisfied unless all the forms employed, even in the solution of time-honored problems, owe as little as possible to the historic styles, and thus are peculiarly and emphatically modern. . . . At the moment of cessation of architectural activity in Europe due to the great war, two contrary tendencies were struggling for mastery in matters of style. One emphasizes the elements of continuity with the past, the other the elements of novelty in modern civilization. In the Germanic countries it is the radical emphasis on novel elements which has secured the advantage, in France and England it is the conservative emphasis on continuity which on the whole retains the supremacy. . . . Whether the present conservative or the present radical tendency may ultimately be victorious, we may be sure that change in architectural style is bound to be constant, and that architecture will remain a living art, not less expressive of the complicated texture of modern life than it has been of the life of earlier and simpler periods."—F. Kimball and G. H. Edgell, *History of architecture*, pp. 400, 502, 517.

was the public hearth, and his name appeared at the head of official lists."—J. B. Bury, *History of Greece*, p. 171.

ARCIS-SUR-AUBE, Battle of. See FRANCE: 1814 (January-March).

ARCOLA, Battle of (1796). See FRANCE: 1796-1797 (October-April).

ARCOT, the principal city in the district of North Arcot near Madras, British India. The city played a prominent part in the conquest of India. In the middle of the eighteenth century the British and the French supported rival claimants to the throne of the Carnatic. It was during the ensuing war that the famous episode of Clive's capture and defense of Arcot occurred, when with but a handful of native and white troops the British general forced the far superior forces of the enemy to abandon the city without a struggle.—See also INDIA: 1743-1752.

ARCTIC EXPLORATION: 1527-1773.—John Davis rounds the southern end of Greenland.—Hudson's record.—Dutch in the Arctic circle.—Phipp's farthest north.—"The struggle for the North Pole began nearly one hundred years before the landing of the Pilgrim Fathers at Plymouth Rock, being inaugurated (1527) by that king of many distinctions, Henry VIII of England. In 1588 John Davis rounded Cape Farewell, the southern end of Greenland, and followed the coast for eight hundred miles to Sanderson Hope. He discovered the strait which bears his name, and gained for Great Britain what was then the record for the farthest north, $72^{\circ} 12'$, a point 1128 miles from the geographical North Pole. Scores of hardy navigators, British, French, Dutch, German, Scandinavian, and Russian, followed Davis, all seeking to hew across the Pole the much-coveted short route to China and the Indies. The rivalry was keen and costly in lives, ships, and treasure, but from the time of Henry VIII for three and one-half centuries, or until 1882 (with the exception of 1594-1606, when, through Wm. Barents, the Dutch held the record), Great Britain's flag was always waving nearest the top of the globe. The same year that Jamestown was founded, Henry Hudson (1607), also seeking the route to the Indies, discovered Jan Mayen, circumnavigated Spitzbergen, and advanced the eye of man to $80^{\circ} 23'$. Most valuable of all, Hudson brought back accounts of great multitudes of whales and walrus, with the result that for the succeeding years these new waters were thronged with fleets of whaling ships from every maritime nation. The Dutch specially profited by Hudson's discovery. During the 17th and 18th centuries they sent no less than 300 ships and 15,000 men each summer to these arctic fisheries and established on Spitzbergen, within the Arctic Circle, one of the most remarkable summer towns the world has ever known, where stores and warehouses and reducing stations and cooperages and many kindred industries flourished during the fishing season. With the approach of winter all buildings were shut up and the population, numbering several thousand, all returned home. Hudson's record remained unequalled for 165 years, or until 1773, when J. C. Phipps surpassed his farthest north by twenty-five miles."—G. H. Grosvenor, in *Foreword* to Robert E. Peary's *North Pole*, pp. xv-xvi.

1819-1848.—Parry's explorations beyond the magnetic north pole.—His plan to dash to the pole on foot.—Discoveries of Ross.—Sir John Franklin's tragic expedition.—"The first half of the 19th century witnessed many brave ships and gallant men sent to the arctic regions. While

most of these expeditions were not directed against the Pole so much as sent in an endeavor to find a route to the Indies round North America—the Northwest Passage—and around Asia—the Northeast Passage—many of them are intimately interwoven with the conquest of the Pole, and were a necessary part of its ultimate discovery. England hurled expedition after expedition, manned by the best talent and energy of her navy, against the ice which seemingly blocked every channel to her ambitions for an arctic route to the Orient. In 1819 Parry penetrated many intricate passages and overcame one-half of the distance between Greenland and Bering Sea, winning a prize of £5000, offered by Parliament to the first navigator to pass the 110th meridian west of Greenwich. He was also the first navigator to pass directly north of the magnetic North Pole, which he located approximately, and thus the first to report the strange experience of seeing the compass needle pointing due south. So great was Parry's success that the British government sent him out in command of two other expeditions in search of the Northwest Passage. In explorations and discoveries the results of these two later expeditions were not so rich, but the experience in ice work so obtained gave Parry conclusions which revolutionized all methods in arctic navigation. Hitherto all attempts to approach the Pole had been in ships. In 1827 Parry suggested the plan of a dash to the Pole on foot, from a base on land. He obtained the assistance of the government, which for the fourth time sent him to the Arctic provided with well-equipped ships and able officers and men. He carried a number of reindeer with him to his base in Spitzbergen, purposing to use these animals to drag his sledges. The scheme proved impracticable, however, and he was compelled to depend on the muscles of his men to haul his two heavy sledges, which were in reality boats on steel runners. Leaving Spitzbergen on June 23 with twenty-eight men, he pushed northward. But the summer sun had broken up the ice floes, and the party repeatedly found it necessary to take the runners off their boats in order to ferry across the stretches of open water. After thirty days' incessant toil Parry had reached $82^{\circ} 45'$, about 150 miles north of his base and 435 geographical miles from the Pole. Here he found that, while his party rested, the drift of the ice was carrying him daily back, almost as much as they were able to make in the day's work. Retreat was therefore begun. Parry's accomplishments, marking a new era in polar explorations, created a tremendous sensation. Knighthood was immediately bestowed upon him by the King, while the British people heaped upon him all the honors and applause with which they have invariably crowned every explorer returning from the north with even a measure of success. In originality of plan and equipment Parry has been equaled and surpassed only by Nansen and Peary. In those early days, few men being rich enough to pay for expeditions to the north out of their own pockets, practically every explorer was financed by the government under whose orders he acted. In 1829, however, Felix Booth, sheriff of London, gave Captain John Ross, an English naval officer, who had achieved only moderate success in a previous expedition, a small paddle-wheel steamer, the *Victory*, and entered him in the race for the Northwest Passage. Ross was assisted, as mate, by his nephew, James Clark Ross, who was young and energetic, and who was later to win laurels at the opposite end of the globe. This first attempt to use steam for ice

navigation failed, owing to a poor engine or incompetent engineers, but in all other respects the Rosses achieved gloriously. During their five years' absence, 1829-1834, they made important discoveries around Boothia Felix, but most valuable was their definite location of the magnetic North Pole and the remarkable series of magnetic and meteorological observations which they brought back with them. No band of men ever set out for the unknown with brighter hopes or more just anticipation of success than Sir John Franklin's expedition of 1845. The frightful tragedy which overwhelmed them, together with the mystery of their disappearance, which baffled the world for years and is not yet entirely explained, forms the most terrible narrative in arctic history. Franklin had been knighted in 1827, at the same time as Parry, for the valuable and very extensive explorations which he had conducted by snowshoes and canoe on the North American coast between the Coppermine and Great Fish rivers, during the same years that Parry had been gaining fame in the north. In the interval Franklin had served as Governor of Tasmania for seven years. His splendid reputation and ability as an organizer made him, though now fifty-nine years of age, the unanimous choice of the government for the most elaborate arctic expedition it had prepared in many years. Franklin's fame and experience, and that of Crozier and his other lieutenants, who had seen much service in the north, his able ships, the *Terror* and the *Erebus*, which had just returned from a voyage of unusual success to the Antarctic, and his magnificent equipment, aroused the enthusiasm of the British to the highest pitch and justified them in their hopes for bringing the wearying struggle for the Northwest Passage to an immediate conclusion. For more than a year everything prospered with the party. By September, 1846, Franklin had navigated the vessels almost within sight of the coast which he had explored twenty years previously, and beyond which the route to Bering Sea was well known. The prize was nearly won when the ships became imprisoned by the ice for the winter, a few miles north of King William Land. The following June Franklin died; the ice continued impenetrable, and did not loosen its grip all that year. In July, 1848, Crozier, who had succeeded to the command, was compelled to abandon the ships, and, with the 105 survivors who were all enfeebled by the three successive winters in the Arctic, started on foot for Back River. How far they got we shall probably never know. Meanwhile, when Franklin failed to return in 1848—he was provisioned for only three years—England became alarmed and despatched relief expeditions by sea from the Bering Sea and the Atlantic and by land north from Canada, but all efforts failed to gather news of Franklin till 1854, when Rae fell in with some Eskimo hunters near King William Land, who told him of two ships that were beset some years previous, and of the death of all the party from starvation. In 1857 Lady Franklin, not content with this bare and indirect report of her husband's fate, sacrificed a fortune to equip a searching party to be commanded by Leopold McClintock, one of the ablest and toughest travelers over the ice the world has ever known. In 1859 McClintock verified the Eskimos' sad story by the discovery on King William Land of a record dated April, 1848, which told of Franklin's death and of the abandonment of the ships. He also found among the Eskimos, silver plate and other relics of the party; elsewhere he saw one of Franklin's boats on a sledge, with two skeletons

inside and clothing and chocolate; in another place he found tents and flags; and elsewhere he made the yet more ghastly discovery of a bleached human skeleton prone on its face, as though attesting the truthfulness of an Eskimo woman who, claiming to have seen forty of the survivors late in 1848, said 'they fell down and died as they walked.'—*Ibid.*, pp. xvi-xxi.

1850-1883.—Northwest passage accomplished by Robert McClure.—Kane's achievements.—Charles Francis Hall and the voyage of the *Polaris*.—British explorations in 1875 and 1876.—English record broken by Greely.—“The distinction of being the first to make the Northwest Passage, which Franklin so narrowly missed, fell to Robert McClure (1850-53) and Richard Collinson (1850-55), who commanded the two ships sent north through Bering Strait to search for Franklin. McClure accomplished the passage on foot after losing his ship in the ice in Barrow Strait, but Collinson brought his vessel safely through to England. The Northwest Passage was not again made until Roald Amundsen navigated the tiny *Gjoa*, a sailing sloop with gasoline engine, from the Atlantic to the Pacific, 1903-06. Yankee whalers each year had been venturing further north in Davis Strait and Baffin Bay and Bering Sea, but America had taken no active part in polar exploration until the sympathy aroused by the tragic disappearance of Franklin induced Henry Grinnell and George Peabody to send out the *Advance* in charge of Elisha Kent Kane to search for Franklin north of Smith Sound. In spite of inexperience, which resulted in scurvy, fatal accidents, privations, and the loss of his ship, Kane's achievements (1853-55) were very brilliant. He discovered and entered Kane Basin, which forms the beginning of the passage of the polar ocean, explored both shores of the new sea, and outlined what has since been called the American route to the Pole. Sixteen years later (1871) another American, Charles Francis Hall, who had gained much arctic experience by a successful search for additional traces and relics of Franklin (1862-69), sailed the *Polaris* through Kane Basin and Kennedy Channel, also through Hall Basin and Robeson Channel, which he discovered, into the polar ocean itself, thus completing the exploration of the outlet which Kane had begun. He took his vessel to the then unprecedented (for a ship) latitude of 82° 11'. But Hall's explorations, begun so auspiciously, were suddenly terminated by his tragic death in November from over-exertion caused by a long sledge journey. When the ice began to move the ensuing year, his party sought to return, but the *Polaris* was caught in the deadly grip of an impassable ice pack. After two months of drifting, part of the crew, with some Eskimo men and women, alarmed by the groaning and crashing of the ice during a furious autumn storm, camped on an ice floe which shortly afterwards separated from the ship. For five months, December to April, they lived on this cold and desolate raft, which carried them safely 1,300 miles to Labrador, where they were picked up by the *Tigress*. During the winter one of the Eskimo women presented the party with a baby, so that their number had increased during the arduous experience. Meanwhile the *Polaris* had been beached on the Greenland shore, and those remaining on the ship were eventually also rescued. In 1875 Great Britain began an elaborate attack on the Pole *via* what was now known as the American route, two ships most lavishly equipped being despatched under command of George Nares. He succeeded in navigating the *Alert* fourteen

miles further north than the *Polaris* had penetrated four years previous. Before the winter set in, Aldrich on land reached $82^{\circ} 48'$, which was three miles nearer the Pole than Parry's mark made forty-eight years before, and the following spring Markham gained $83^{\circ} 20'$ on the polar ocean. Other parties explored several hundred miles of coast line. But Nares was unable to cope with the scurvy, which disabled thirty-six of his men, or with the severe frosts, which cost the life of one man and seriously injured others. The next expedition to this region was that sent out under the auspices of the United States government and commanded by Lieutenant A. W. Greely, U. S. A., to establish at Lady Franklin Bay the American circumpolar station (1881). Greely during the two years at Fort Conger carried on extensive explorations of Ellesmere Land and the Greenland coast, and by the assistance of his two lieutenants, Lockwood and Brainard, wrested from Great Britain the record which she had held for 300 years. Greely's mark was $83^{\circ} 24'$, which bettered the British by four miles. As the relief ship, promised for 1883, failed to reach him or to land supplies at the prearranged point south of Fort Conger, the winter of 1883-84 was passed in great misery and horror. When help finally came to the camp at Cape Sabine, seven men only were alive."—*Ibid.*, pp. xxii-xxiv.

1867-1901.—Explorations in the polar area north of Siberia.—De Long's expedition.—Nansen and the *Fram*.—Explorations along the arctic coasts of Europe, Siberia and Greenland.—“While these important events were occurring in the vicinity of Greenland, interesting developments were also taking place in that half of the polar area north of Siberia. When in 1867 an American whaler, Thomas Long, reported new land, Wrangell Land, about 500 miles northwest of Bering Strait, many hailed the discovery as that of the edge of a supposed continent extending from Asia across the Pole to Greenland, for the natives around Bering Strait had long excited explorers by their traditions of an icebound big land beyond the horizon. Such extravagant claims were made for the new land that Commander De Long, U. S. N., determined to explore it and use it as a base for gaining the Pole. But his ship, the *Jeannette*, was caught in the ice (September, 1879) and carried right through the place where the new continent was supposed to be. For nearly two years De Long's party remained helpless prisoners until in June, 1881, the ship was crushed and sank, forcing the men to take refuge on the ice floes in mid ocean, 150 miles from the New Siberian Islands. They saved several boats and sledges and a small supply of provisions and water. After incredible hardships and suffering, G. W. Melville, the chief engineer, who was in charge of one of the boats, with nine men, reached, on September 26, a Russian village on the Lena. All the others perished, some being lost at sea, by the foundering of the boats, while others, including De Long, had starved to death after reaching the desolate Siberian coast. Three years later some Eskimos found washed ashore on the southeast coast of Greenland several broken biscuit boxes and lists of stores, which are said to be in De Long's handwriting. The startling circumstance that these relics in their long drift from where the ship sank had necessarily passed across or very near to the Pole aroused great speculation as to the probable currents in the polar area. Nansen, who had already made the first crossing of Greenland's ice cap, argued that the same current which had guided the relics

on their long journey would similarly conduct a ship. He therefore constructed a unique craft, the *Fram*, so designed that when hugged by the ice pack she would not be crushed, but would be lifted up and rest on the ice; he provisioned the vessel for five years and allowed her to be frozen in the ice near where the *Jeannette* had sunk, $78^{\circ} 50' N.$, $134^{\circ} E.$ (September 25, 1893). When at the end of eighteen months the ship had approached 314 miles nearer to the Pole, Nansen and one companion, Johansen, with kayaks, dogs, sledges, and three months' provisions, deliberately left the ship and plunged northward toward the Pole, March 14, 1895. In twenty-three days the two men had overcome one-third of the distance to the Pole, reaching $86^{\circ} 12'$. To continue onward would have meant certain death, so they turned back. When their watches ran down Providence guided them, and the marvelous physique of both sustained them through fog and storm and threatened starvation until they reached Franz Josef Land, late in August. There they built a hut of stones and killed bears for meat for the winter. In May, 1896, they resumed their southward journey, when fortunately they met the Englishman Jackson, who was exploring the Archipelago. Meanwhile the *Fram*, after Nansen left her, continued her tortuous drifting across the upper world. Once she approached as near as $85^{\circ} 57'$ to the Pole—only fifteen miles less than Nansen's farthest. At last, in August, 1896, with the help of dynamite, she was freed from the grip of the ice and hurried home, arriving in time to participate in the welcome of Nansen, who had landed a few days earlier. Franz Josef Land, where Nansen was rescued by Jackson, has served as the base of many dashes for the Pole. It was from its northernmost point that the illustrious young member of the royal family of Italy, the Duke of the Abruzzi, launched the party captained by Cagni that won from Nansen for the Latin race the honor of the farthest north, $86^{\circ} 34'$, in 1901. This land, which consists of numerous islands, had been named after the Emperor of Austria-Hungary by Weyprecht and Payer, leaders of the Austrian-Hungarian polar expedition of 1872-74, who discovered and first explored the Archipelago. It was from Spitzbergen that Andrée, with two companions, sailed his balloon toward the Pole, in July, 1897, never to be heard from again, except for three message buoys dropped in the sea a few miles from the starting-point. The Northeast Passage was first achieved in 1878-1879 by Adolph Erik Nordenskjöld. Step by step energetic explorers, principally Russian, had been mapping the arctic coasts of Europe and Siberia until practically all the headlands and islands were well defined. Nordenskjöld, whose name was already renowned for important researches in Greenland, Nova Zembla, and northern Asia, in less than two months guided the steam whaler *Vega* from Tromsø, Norway, to the most easterly peninsula of Asia. But when barely more than 100 miles from Bering Strait, intervening ice blocked his hopes of passing from the Atlantic to the Pacific in a single season and held him fast for ten months. . . . The preceding brief summary gives only an inadequate conception of the immense treasures of money and lives expended by the nations to explore the northern ice world and to attain the apex of the earth. All efforts to reach the Pole had failed, notwithstanding the unlimited sacrifice of gold and energy and blood which had been poured out without stint for nearly four centuries. But the sacrifice had not been without compensation. Those who had ventured their lives in the contest had

not been actuated solely by the ambition to win a race—to breast the tape first—but to contribute, in Sir John Franklin's words, 'to the extension of the bounds of science.' The scores of expeditions, in addition to new geographical discoveries, had brought back a wealth of information about the animals and vegetable life, the winds and currents, deep sea temperatures, soundings, the magnetism of the earth, fossils and rock specimens, tidal data, etc., which have enriched many branches of science and greatly increased the sum of human knowledge."—*Ibid.*, pp. xxiv-xxviii.

1886-1909.—Peary's three expeditions in search of the Pole.—Controversy between Peary and Cook.—Peary recognized as the discoverer of the Pole.—His account.—"A brief summer excursion to Greenland in 1886 aroused Robert E. Peary, a civil engineer in the United States navy, to an interest in the polar problem. . . . He realized at once that the goal which had eluded so many hundreds of ambitious and dauntless men could be won only by a new method of attack. The first arctic problem with which Peary grappled was considered at that time in importance second only to the conquest of the Pole; namely, to determine the insularity of Greenland and the extent of its projection northward. At the very beginning of his first expedition to Greenland, in 1891, he suffered an accident which sorely taxed his patience as well as his body. . . . As his ship, the *Kite*, was working its way through the ice fields off the Greenland shore, a cake of ice became wedged in the rudder, causing the wheel to reverse. One of the spokes jammed Peary's leg against the casement, making it impossible to extricate himself until both bones of the leg were broken. The party urged him to return to the United States for the winter and to resume his exploration the following year. But Peary insisted on being landed as originally planned at McCormick Bay, stating that the money of his friends had been invested in the project and that he must 'make good' to them. The assiduous nursing of Mrs. Peary, aided by the bracing air, so speedily restored his strength that at the ensuing Christmas festivities which he arranged for the Eskimos, he outraced on snowshoes all the natives and his own men! In the following May, with one companion, Astrup, he ascended to the summit of the great ice cap which covers the interior of Greenland, 5,000 to 8,000 feet in elevation, and pushed northward for 500 miles over a region where the foot of man had never trod before, in temperatures ranging from 10° to 50° below zero, to Independence Bay, which he discovered and named, July 4, 1892. Imagine his surprise on descending from the tableland to enter a little valley radiant with gorgeous flowers and alive with murmuring bees, where musk oxen were lazily browsing. This sledging journey, which he duplicated by another equally remarkable crossing of the ice cap three years later, defined the northern extension of Greenland and conclusively proved that it is an island instead of a continent extending to the Pole. In boldness of conception and brilliancy of results these two crossings of Greenland are unsurpassed in arctic history. The magnitude of Peary's feat is better appreciated when it is recalled that Nansen's historic crossing of the island was below the Arctic Circle, 1,000 miles south of Peary's latitude, where Greenland is some 250 miles wide. Peary now turned his attention to the Pole, which lay 306 geographical miles farther north than any man had penetrated on the western hemisphere. To get there by the American route he must break a virgin trail every mile

north from Greely's 83° 24'. No one had pioneered so great a distance northward. Markham and others had attained enduring fame by advancing the Flag considerably less than 100 miles, Parry had pioneered 150 miles, and Nansen 128 from his ship. His experiences in Greenland had convinced Peary, if possible more firmly than before, that the only way of surmounting this last and most formidable barrier was to adopt the manner of life, the food, the snowhouses, and the clothing of the Eskimos, who by centuries of experience had learned the most effective method of combating the rigors of arctic weather; to utilize the game of the northland, the arctic reindeer, musk ox, etc., which his explorations had proved comparatively abundant, thus with fresh meat keeping his men fit and good-tempered through the depressing winter night; and lastly to train the Eskimo to become his sledging crew. In his first North Pole expedition, which lasted for four years, 1898-1902, Peary failed to get nearer than 343 miles to the Pole. Each successive year dense packs of ice blocked the passage to the polar ocean, compelling him to make his base approximately 700 miles from the Pole, or 200 miles south of the headquarters of Nares, too great a distance from the Pole to be overcome in one short season. During this trying period, by sledging feats which in distance and physical obstacles overcome exceeded the extraordinary records made in Greenland, he explored and mapped hundreds of miles of coast line of Greenland and of the islands west and north of Greenland. On the next attempt, Peary insured reaching the polar ocean by designing and constructing the *Roosevelt*, whose resistless frame crushed its way to the desired haven on the shores of the polar sea. From here he made that wonderful march of 1906 to 87° 6' a new world's record. Winds of unusual fury, by opening big leads, robbed him of the Pole, and nearly of his life."—*Ibid.*, pp. xxix-xxx.

ALSO IN: F. Nansen, *In the mists: Arctic exploration in early times.*

Once more, in July, 1908, Commander Peary set his face Arcticward, on the staunch *Roosevelt*, with two scientific companions, and equipped himself at Etah with Eskimos and dogs for another journey across the ice-fields, from some point on the Grant Land coast. On Sept. 1, 1909, the whole world was startled and excited by a message, flashed first to Lerwick, in the Shetland islands, from a passing Danish steamer, the *Hans Egede*, and thence to all corners of the earth, saying: "We have on board the American traveller, Dr. Cook, who reached the North Pole April 21, 1908. [Dr. Frederick A. Cook was the physician on Peary's expedition (1891-1892) and the Belgian expedition (1897-1899) and had left for the Pole in 1907.] Dr. Cook arrived at Upernivik (the northernmost Danish settlement in Greenland, on an island off the west coast) in May of 1909 from Cape York (in the northwest part of Greenland, on Baffin Bay). The Eskimos of Cape York confirm Dr. Cook's story of his journey." The next day brought a cabled announcement from Dr. Cook himself, to the *New York Herald*, briefly telling of his triumph, "after a prolonged fight against famine and frost," and describing the emotions with which he had found himself at the goal which so many had striven vainly to attain. "What a cheerless spot," he moralized, "to have aroused the ambition of man for so many ages. An endless field of purple snows. No life. No land. No spot to relieve the monotony of frost. We were the

only pulsating creatures in a dead world of ice." Two days later the hero was landed at Copenhagen, and all the excited world devoured graphic descriptions of his reception by the enthusiastic Danes: by the Crown Prince, who hastened to welcome him before he had stepped from the ship; by the crowds who cheered him; by the King, who dined him; by the University of Copenhagen which awarded him an honorary degree, and whose faculty he made happy and proud by the promise that it should be the first to examine the record of his observations and the proofs in general that he had reached the Pole. Two more days passed, and then the climax of this world-spread excitement and astonishment was marked by another radio-electric flash of news out of the Arctic North,—this time from the American North,—proclaiming another conquest of the icy fortress of the Pole. It spoke "to the Associated Press, New York," from "Indian Harbor, via Cape Ray, Nova Scotia," saying: "Stars and Stripes nailed to North Pole. Peary." It reached New York a little after noon of September 6th, and before night, everywhere, people in all languages were asking each other: "Is it possible that two men had suddenly done what none have been able to do before?" Other messages from Commander Peary which soon followed the first one fixed the date of his attainment of the Pole as having been April 6, 1909,—being fifteen days less than a year after Dr. Cook claimed to have planted the American flag at the same spot. They brought angry denunciations, too, of Cook's pretension, which Peary had learned of from the Eskimos in the North. "Cook's story," he said in one despatch, "should not be taken too seriously. The two Eskimos who accompanied him say he went no distance north and not outside of land. Other members of the tribe confirm their story." In another he declared: "Cook has sold the public a gold brick." Dr. Cook, meantime, gave out expressions as to Peary's achievement very different in temper and tone. He had no doubt that Commander Peary had reached the Pole; but he, Cook, had been fortunately the first to enjoy the favorable conditions which gave success to them both. His magnanimity, his coolness, his easy self-confidence, in contrast with Peary's words and bearing, won public admiration and sympathy, and the majority in most communities inclined strongly, for a time, to the judgment that both explorers had done what they said they did, but that Cook, in character, was the more estimable man. When he arrived in New York, on the 21st of September, that city gave him almost as wild a hero worship as Copenhagen had done. Commander Peary was then just landing at Sydney, Nova Scotia, and it was some weeks before he would proceed to New York, or put himself at all in the way of receiving any public demonstrations of honor. But grounds of skepticism as to Dr. Cook were acquiring a rapid multiplication. When he published his story in detail, or told it in lectures, it started questions which people having critical knowledge insisted that he must answer if he could; but he made no attempt. He was in no haste to produce the records which he had insisted would prove his claims beyond a doubt. He required weeks of time to prepare them for examination, and they must go to the University of Copenhagen before any other tribunal of science could see them. Meanwhile, he was harvesting large gains from lectures and newspaper publications, and seemed more interested in that pursuit than in the vindication of his questioned

honor. Hence, suspicion of him grew, until it made itself heard and felt at last with a force which drove the Doctor to put his professed proofs in shape and send them by the hand of his secretary, Mr. Lonsdale, to Copenhagen. Before they reached their destination he, himself, disappeared mysteriously from public view, nervously shattered, it was said, and seeking some hidden place of refuge abroad. On the 21st of December the report of the scientific committee of Copenhagen university, to which the records forwarded by Dr. Cook were submitted, was made public by the University Council. "The report, which was sent in by the committee on December 18, states that the following papers were submitted to it for investigation: 1. A type-written report by Mr. Lonsdale on Dr. Cook's Arctic voyage, consisting of 61 folios. 2. A type-written copy of 16 folios, made by Mr. Lonsdale, comprising the note-books brought back by Dr. Cook from his journey and covering the period from March 18 to June 13, 1908, stated to have been written on the way from Svartevaag to the Pole and back until a place west of Heibergsland was reached. . . . The committee points out as a result of its investigations that the aforementioned report of the journey is essentially identical with that published some time ago in the *New York Herald*, and that the copy of the note-books did not contain astronomical records, but only results. In fact, the committee remarks that there are no elucidatory statements which might have rendered it probable that astronomical observations were really taken. Neither is the practical side—namely, the sledge journey—illuminated by details in such a way as to enable the committee to form an opinion. The committee therefore considers that from the material submitted no proof can be adduced that Dr. Cook reached the North Pole. The council of the University accordingly declares as a result of the committee's report that the documents submitted to Copenhagen University contain no observations or explanations to prove that Dr. Cook on his last Polar journey reached the North Pole."

That Commander Peary had accomplished at last the object of his indomitable striving was never in doubt. His own testimony to the fact had sufficed from the beginning, and the decision rendered on the 3d of November by a committee of the National Geographic Society, which examined the records of his march to the Pole, added nothing to the public belief. But his laurels had been lamentably blighted by the atmosphere of scandal, wrangle, and disgust with which Cook's monstrous imposture had vulgarized the whole feeling that attended the exploit. The incidents of the final Peary expedition, from start to finish, were summarized by the Commander in a message from Battle Harbor to the *London Times*, Sept. 8th, as follows: "The *Roosevelt* left New York on July 6, 1908. She left Sydney on July 17th; arrived at Cape York, Greenland, on August 1st; left Etah, Greenland, on August 8th; arrived at Cape Sheridan, Grant Land, on September 1st, and wintered at Cape Sheridan. The sledge expedition left the *Roosevelt* on February 15th, 1909, and started north of Cape Columbia on March 1st. It passed the British record on March 2d; was delayed by open water on March 2d and 3d; was held up by open water from March 4th to March 11th; crossed the 84th parallel on March 11th and encountered an open lead on March 15th; crossed the 85th parallel on March 18th; crossed the 86th parallel on March 22d and encountered an open lead on March 23d; passed the Norwegian

record on March 23d; passed the Italian record on March 24th and encountered an open lead on March 26th; crossed the 87th parallel on March 27th; passed the American record on March 28th and encountered a lead on March 28th; held up by open water on March 29th; crossed the 88th parallel on April 2d; crossed the 89th parallel on April 4th, and reached the North Pole on April 6th. On returning we left the Pole on April 7th; reached Camp Columbia on April 23d, arriving on board the *Roosevelt* on April 27th. The *Roosevelt* left Cape Sheridan on July 18th, passed Cape Sabine on August 8th, left Cape York on August 26th and arrived at Indian Harbor. All the members of the expedition are returning in good health except Professor Ross G. Martin, who unfortunately drowned on April 10th, 45 miles north of Cape Columbia, while returning from 86 degrees north latitude in command of a supporting party.

"The last march northward ended at ten o'clock on the forenoon of April 6th. I had now made the five marches planned from the point at which Bartlett turned back, and my reckoning showed that we were in the immediate neighborhood of

time, in case the sky should be clear, but at that hour it was, unfortunately, still overcast. But as there were indications that it would clear before long, two of the Eskimos and myself made ready a light sledge carrying only the instruments, a tin of pemmican, and one or two skins; and drawn by a double team of dogs, we pushed on an estimated distance of ten miles. While we traveled, the sky cleared, and at the end of the journey I was able to get a satisfactory series of observations at Columbia meridian midnight. These observations indicated that our position was then beyond the Pole. Nearly everything in the circumstances which then surrounded us seemed too strange to be thoroughly realized; but one of the strangest of those circumstances seemed to me to be the fact that, in a march of only a few hours, I had passed from the western to the eastern hemisphere and had verified my position at the summit of the world. It was hard to realize that, in the first miles of this brief march, we had been traveling due north, while, on the last few miles of the same march, we had been traveling south, although we had all the time been traveling precisely in the same direction. It would be

ROBERT E. PEARY

THE ROOSEVELT

VILHJALMUR STEFANSSON

the goal of all our striving. After the usual arrangements for going into camp, at approximate local noon, of the Columbia meridian, I made the first observation at our polar camp. It indicated our position as $89^{\circ} 57'$. We were now at the end of the last long march of the upward journey. Yet with the Pole actually in sight I was too weary to take the last few steps. The accumulated weariness of all those days and nights of forced marches and insufficient sleep, constant peril and anxiety, seemed to roll across me all at once. I was actually too exhausted to realize at the moment that my life's purpose had been achieved. As soon as our igloos had been completed and we had eaten our dinner and double-rationed the dogs, I turned in for a few hours of absolutely necessary sleep. Henson and the Eskimos having unloaded the sledges and got them in readiness for such repairs as were necessary. But, weary though I was, I could not sleep long. It was, therefore, only a few hours later when I woke. The first thing I did after awaking was to write these words in my diary: 'The Pole at last. The prize of three centuries. My dream and goal for twenty years. Mine at last. I cannot bring myself to realize it. It seems all so simple and commonplace.' Everything was in readiness for an observation at 6 P. M., Columbia meridian

difficult to imagine a better illustration of the fact that most things are relative. Again, please consider the uncommon circumstances that, in order to return to our camp, it now became necessary to turn and go north again for a few miles and then to go directly south, all the time traveling in the same direction. As we passed back along that trail which none had ever seen before or would ever see again, certain reflections intruded themselves which, I think, may fairly be called unique. East, west, and north had disappeared for us. Only one direction remained and that was south. Every breeze which could possibly blow upon us, no matter from what point of the horizon, must be a south wind. Where we were, one day and one night constituted a year, a hundred such days and nights constituted a century. Had we stood in that spot during the six months of the arctic winter night, we should have seen every star of the northern hemisphere circling the sky at the same distance from the horizon, with Polaris (the North Star) practically in the zenith. All during our march back to camp the sun was swinging around in its ever-moving circle. At six o'clock on the morning of April 7, having again arrived at Camp Jesup, I took another series of observations. These indicated our position as being four or five miles from the Pole, toward Bering Strait.

Therefore, with a double team of dogs and a light sledge, I traveled directly toward the sun an estimated distance of eight miles. Again I returned to the camp in time for a final and completely satisfactory series of observations on April 7 at noon, Columbia meridian time. These observations gave results essentially the same as those made at the same spot twenty-four hours before. In traversing the ice in these various directions as I had done, I had allowed approximately ten miles for possible errors in my observations, and at some moment during these marches and counter-marches, I had passed over or very near the point where north and south and east and west blend into one. Of course there were some more or less informal ceremonies connected with our arrival at our difficult destination, but they were not of a very elaborate char-

appropriate to raise the colors of the Delta Kappa Epsilon fraternity, in which I was initiated a member while an undergraduate student at Bowdoin College, the 'World's Ensign of Liberty and Peace,' with its red, white, and blue in a field of white, the Navy League flag, and the Red Cross flag. After I had planted the American flag in the ice, I told Hensen to time the Eskimos for three rousing cheers, which they gave with the greatest enthusiasm. Thereupon, I shook hands with each member of the party—surely a sufficiently unceremonious affair to meet with the approval of the most democratic. The Eskimos were childishly delighted with our success. While, of course, they did not realize its importance fully, or its world-wide significance, they did understand that it meant the final achievement of a task upon which they had seen me engaged for many years. Then, in a

MEMBERS OF PEARY'S POLAR EXPEDITION

Transferring supplies from the *Roosevelt* to winter quarters

acter. We planted five flags at the top of the world. The first one was a silk American flag which Mrs. Peary gave me fifteen years ago. That flag had done more traveling in high latitudes than any other ever made. I carried it wrapped about my body on every one of my expeditions northward after it came into my possession, and I left a fragment of it at each of my successive 'farthest norths': Cape Morris K. Jesup, the northernmost point of land in the known world; Cape Thomas Hubbard, the northernmost known point of Jesup Land, west of Grant Land; Cape Columbia, the northernmost point of North American lands; and my farthest north in 1906, latitude $87^{\circ} 6'$ in the ice of the polar sea. By the time it actually reached the Pole, therefore, it was somewhat worn and discolored. A broad diagonal section of this ensign would now mark the farthest goal of earth—the place where I and my dusky companions stood. It was also considered

space between the ice blocks of a pressure ridge, I deposited a glass bottle containing a diagonal strip of my flag and records of which the following is a copy:

“‘90 N. Lat., North Pole,

“April 6, 1909.

“Arrived here to-day, 27 marches from C. Columbia. I have with me 5 men, Matthew Henson, colored, Ootah, Egingwah, Seegloo, and Ookeah, Eskimos; 5 sledges and 38 dogs. My ship, the S. S. *Roosevelt*, is in winter quarters at C. Sheridan, 90 miles east of Columbia. The expedition under my command which has succeeded in reaching the Pole is under the auspices of the Peary Arctic Club of New York City, and has been fitted out and sent north by the members and friends of the club for the purpose of securing this geographical prize, if possible, for the honor and prestige of the United States of

America. The officers of the club are Thomas H. Hubbard, of New York, President; Zenas Crane, of Mass., Vice-president; Herbert L. Bridgman, of New York, Secretary and Treasurer. I start back to Cape Columbia to-morrow.

"90° N. Lat., North Pole,

"April 6, 1909.

"I have to-day hoisted the national ensign of the United States of America at this place, which my observations indicate to be the North Polar axis of the earth, and have formally taken possession of the entire region, and adjacent, for and in the name of the President of the United States of America.

"I leave this record and United States flag in possession.

"Robert E. Peary,

"United States Navy."

"If it were possible for a man to arrive at 90° north latitude without being utterly exhausted, body and brain, he would doubtless enjoy a series of unique sensations and reflections. But the attainment of the Pole was the culmination of days and weeks of forced marches, physical discomfort, insufficient sleep, and racking anxiety. It is a wise provision of nature that the human consciousness can grasp only such degree of intense feeling as the brain can endure, and the grim guardians of earth's remotest spot will accept no man as guest until he has been tried and tested by the severest ordeal. Perhaps it ought not to have been so, but when I knew for a certainty that we had reached the goal, there was not a thing in the world I wanted but sleep. But after I had a few hours of it, there succeeded a condition of mental exaltation which made further rest impossible. For more than a score of years that point on the earth's surface had been the object of my every effort. To its attainment my whole being, physical, mental, and moral, had been dedicated. Many times my own life and the lives of those with me had been risked. My own material and forces and those of my friends had been devoted to this object. This journey was my eighth into the arctic wilderness. In that wilderness I had spent nearly twelve years out of the twenty-three between my thirtieth and my fifty-third year, and the intervening time spent in civilized communities during that period had been mainly occupied with preparations for returning to the wilderness. The determination to reach the Pole had become so much a part of my being that, strange as it may seem, I long ago ceased to think of myself save as an instrument for the attainment of that end. To the layman this may seem strange, but an inventor can understand it, or an artist, or anyone who has devoted himself for years upon years to the service of an idea. But now, while quartering the ice in various directions from our camp, I tried to realize that, after twenty-three years of struggles and discouragement, I had at last succeeded in placing the flag of my country at the goal of the world's desire. It is not easy to write about such a thing, but I knew that we were going back to civilization with the last of the great adventure stories—a story the world had been waiting to hear for nearly four hundred years, a story which was to be told at last under the folds of the Stars and Stripes, the flag that during a lonely and isolated life had come to be for me the symbol of home and everything I loved—and might never see again."—R. E. Peary, *North pole*, pp. 287-300.

1901-1909.—Summary of other important explorations during the first decade of the twentieth century.—Two expeditions were fitted out in 1901 and 1903, by Mr. Ziegler, of New York, the former under Evelyn B. Baldwin, the latter under Anthony Fiala. The latter reached latitude 82° 13', remaining in the Arctic regions until the summer of 1905. In June, 1903, Captain Roald Amundsen, of Norway, sailed from Christiania in the small sloop *Gjoa*, beginning a voyage which carried him entirely through the Northwest Passage from Baffin bay to Bering strait and which occupied three years. Much of that time, however, was devoted to studies and searches of great value in determining the location of the Magnetic Pole. In 1905 the ranks of the Arctic explorers were joined by the Duke of Orleans, who sailed from Christiania in May, in the *Belgica*, commanded by Lieut. de Gerlache. In 1907, Mr. John R. Bradley, of New York, supplied Dr. Frederick A. Cook with equipments for an attempt to reach the North Pole, and accompanied him in a schooner yacht to Annatok, a little north of Etah, in North Greenland, where the Doctor, with one white man, Rudolph Francke, were landed, with their supplies, to begin the undertaking. Several attempts were made in successive years by Mr. Walter Wellman to make the journey to the Pole from Spitzbergen by a dirigible airship. Each of them, down to 1900, was frustrated by misfortunes of circumstance or weather. A tragically ended survey of the northeast coast of Greenland was accomplished in 1906-7 by Dr. Mylius Erichsen and Lieutenant Hagen-Hagen, who perished while groping their way southward in the growing darkness of the approaching winter. These fill out the important items of the record of Arctic exploration, since April, 1901, down to the 1st of September, 1900.

1910-1916.—Baffinland crossed by Hantzsch.—Expedition of Schröder-Stranz.—Russian arctic explorations.—"A young German traveller, hailing from Dresden, Bernard Hantzsch by name, has met his death in Baffinland, after effecting the first crossing of that island ever made by a European. Setting out in 1910, with the support of various German scientific bodies, the traveller, after a preliminary trip to Labrador, passed over to Cumberland sound, where he had the misfortune to lose most of his equipment through shipwreck. A relief fund was collected for him by the Dresden Geographical Society, but he had already set out for the interior before the fresh supplies reached him, and he appears to have been brought to some straits in consequence. Only last autumn, on the return of the yearly vessel from Baffinland, was the news received in Germany that he had already succumbed to his hardships in June, 1911, on Fox channel. Such results of the journey (undertaken with a view to natural history, ethnological, and geographical research) as had reached Berlin, gave promise of valuable additions to knowledge from the undertaking. The expedition planned by Lieut. Schröder-Stranz for the achievement once more of the northeast passage has already met with a severe check in its preliminary stage. The leader undertook an expedition to Spitsbergen last summer [1912] in order to prepare himself for the more serious undertaking to follow. He had intended to return in the autumn, but all accounts show that the Arctic winter set in unusually early last year, and when the last vessel reached Europe without bringing him back. It was realized that he would have to submit to an enforced detention. Accounts received in the autumn stated that the voyager had first attempted to push

north along the ice-obstructed east coast of Spitsbergen, but that, foiled here, he tried to reach the north coast by way of the west. Wireless messages received in Kristiania early in January from the Norwegian station in Spitsbergen show that the experiences of the expedition have been most unfortunate. Captain Ritschel, who commanded the small vessel *Herzog Ernst* in which the expedition sailed to Spitsbergen, arrived at Advent bay on December 27 in a miserable condition after various adventures, having pressed on and left his companions behind exhausted with cold and hunger—the oceanographer Dr. Rudiger at Wijde bay, and three others at Cape Petermann. He reports that the *Herzog Ernst* was frozen in at Treurenburg bay, but can be fetched off next summer. Lieut. Schröder-Stranz and his companions had left the ship on a sledging expedition in August, and had not since been heard of, though hopes are expressed that he may have reached the station at Cross bay. Otherwise, as he had but few supplies at his disposal, and an outbreak of scurvy is reported, his position would seem precarious. A relief party was at once organized at the wireless station at Advent bay on Captain Ritschel's arrival. Both he and Dr. Rudiger had suffered severely from frozen feet. Towards the end of the summer [1912] Captain Russanof was reported to be on the coast of Novaya Zemlya (having first visited the coal-bearing region of West Spitsbergen), about to set sail for the north-west coast on his way east. His further intentions seem somewhat obscure, but he is said to have referred to a design of possibly making his way to the New Siberia islands, or even farther. The particularly unfavourable conditions which prevailed last year have given rise to some uneasiness as to the fate of Lieut. Brussiloff's expedition in the *Saint Anna*, which sailed from Alexandrovsk on the Murman coast about the end of August. . . . At the opposite end of the Arctic waters of Asia some success has attended the renewed endeavours to promote navigation between Bering strait and the Kolyma and Lena. The ice-breakers *Taimyr* and *Vaigatz* passed Cape Deshnef on July 22 (Old Style), reaching the Lena in safety on August 25. Soundings and coast surveys were carried out *en route*. Depths of 15 feet were obtained in the mouth of the Lena. Two attempts to continue the voyage round the Taimyr peninsula to Archangel were frustrated by ice, shallow water, and unfavourable weather, it being necessary to turn back from 76°N. The return voyage through Bering strait was safely accomplished."—*Monthly record of polar regions (Geographical Journal, February, 1913)*.

Lieutenant Brussiloff, an officer of the Russian navy, sailed in the *Saint Anna* in 1912 by way of the Kara sea, through Yugor Shar, the strait at the northern extremity of Russia, which in recent years has been used by commercial vessels plying between the United States and the mouths of the Ob and Yenisei rivers. Brussiloff pushed his way north keeping close to the shore of the Yalmal Peninsula to avoid the danger of ice floes. He reached a point northeast of Franz Josef Land; beyond that little is known of the fate of Brussiloff's vessel or his party. It is believed that the *Saint Anna* drifted north and was crushed in the ice. The sea route to Siberia through the Kara sea, however, is considered as established and practical for commercial voyages. In 1916 Jonas Lied successfully completed his fifth trading voyage along this route. The Kara sea is now [1920] fringed with a number of wireless stations which give valuable aid to the navigators by sending out frequent

warnings when certain sea areas are obstructed by ice.

1913-1918.—Canadian Arctic expedition.—Stefansson expedition.—Anderson expedition.—In the early summer of 1913 Stefansson led the northern division of the Canadian Arctic Expedition into the Parry Archipelago and was not heard of again until 1915. "One of the most important events in the field of Arctic exploration was the sudden reappearance in the fall of 1915 of Vilhjalmur Stefansson, who had been given up as dead, with a record of distinct achievement. Arctic explorers believed that the ice drift north of Alaska had taken Stefansson farther west where a replenishment of his food supply would be an impossibility. The ice drift, in fact, took him east towards Banks Island where he purposed to establish his winter quarters. Stefansson stored up more than a sufficient food supply, while on his way toward Banks Island, which place he did not reach until the ice broke up. He finally landed and wintered within thirty miles of the location which was to have been his winter quarters. This fact led whalers who frequented Banks Island to spread the report that the whole crew probably perished. The party finally landed on Banks Island June 26, 1914, where it accumulated a large supply of food, and in early February started due north making but slow progress owing to thick fogs and soft snow. "In 1916 Stefansson again wintered on Banks Island, intermittently making extended sledge journeys on the adjoining islands, which, subsequently, he partly surveyed. On one of these trips the party reached point 80° 10' N. latitude, 98° west longitude. Stefansson spent his third winter (1916-1917) on Melville Island where fish as well as game was found to be plentiful. The Canadian Arctic Expedition under Stefansson ended in November 1918 with the safe return of S. Storkerson. Owing to the daring explorer's vast explorations the unknown areas of the polar western hemisphere is placed at 100,000 square miles. His discoveries, which cover about 70,000 square miles, are undoubtedly the most important contributions to geography of the unknown Arctic areas for many years. Other important contributions by Stefansson are his hydrographic observations which, among other achievements, have outlined the continental shelf of the Arctic Ocean from Alaska northeast to Prince Patrick Island. The Canadian Arctic Expedition consisted of two main divisions, the Northern Party, commanded by Vilhjalmur Stefansson, and the Southern Party, under my direction. The Northern Party was to devote its chief attention to the Beaufort Sea in the region west of the Parry Archipelago and north of Alaska and Yukon Territory. The Southern Party planned to explore the northern coast of Canada between Cape Parry (124°W.) and Kent Peninsula (108°W.). It was arranged to have its surveys extend inland about 100 miles and also cover the southern and eastern portions of Victoria Island. . . . We cleared from Nome in the gasoline schooner *Alaska*, July 19, 1913, reaching Point Barrow on August 19, after some difficulty with gales in Bering Sea and Kotzebue Sound. . . . East of Point Barrow we found the Arctic Ocean practically filled with heavy ice. In that part of the world there are no true icebergs; but enormous pressure ridges often form along tide-cracks or are heaped up by gales along the edge of the floefields, where they are cemented by spray and by spring thaws and augmented by snowdrifts. These masses are sometimes of immense size, rising thirty or forty feet out of the water—too large to melt during the short summer. . . . In 1913, for

the first time in about twenty-five years of whaling in that region, no ship from the west was able to reach Herschel Island. It was known as 'a bad ice year.' . . . The Southern Party of the Canadian Arctic Expedition entered upon the summer of 1916 with most of their originally outlined work completed. Many cases of specimens in all branches of science—geology, zoology, botany, ethnology, archæology—all had to be packed and compressed into one small 65-foot schooner. . . . We were well loaded down when we left Bernard Harbor on the evening of July 13, 1916. We made a quick and easy voyage out: Baillie Island, July 24; Herschel Island, July 28; Point Barrow, August 8; and Nome, August 15. Our weather-beaten schooner was left at Nome to be sold, while men and specimens went on to Seattle and Victoria through the famous Alaska and British Columbia Inside Passage. Everything ultimately reached Ottawa safely, and the scientific men of the expedition have spent the winter of 1916-1917 working up their reports. Maps have been computed and plotted, mineral analyses made, plants and animals are being identified and new species described. Some of the collections represent specimens of groups which have never been collected anywhere in the western Arctic area, and practically all of them are from districts and localities which are unrepresented in collections anywhere and from regions never before visited by a collector."—R. M. Anderson, *Recent explorations on the Canadian Arctic coast* (*Geographical Review*, Oct., 1917, p. 241-266).

"But the most striking features of the expedition's work must be the wonderful results attained in the application of the instruments developed during the past twenty years. We say 'instruments' with a 'feeling of apology'; for we are sure that the possibilities of the phonograph and the moving picture—perhaps even of the ordinary camera—as scientific instruments are not fully realized by all our readers. These have been of extraordinary value to the ethnological branch of the expedition. Phonographic records in considerable number have been made of the folk-songs, the music, even the language of various Eskimo tribes—notably of the blonde Eskimos discovered by Stefánsson himself at an earlier date. Several thousand feet of cinema films have been made showing certain features of Eskimo life. Altogether, these items present a most impressive demonstration of the present status of scientific methods."—*Return of the Scientific Section of the Stefánsson expedition* (*Scientific American*, Aug. 26, 1916, p. 194).

1917-1918.—*Journey round the arctic coast of Alaska*.—"A letter written by Archdeacon Stuck, at Fort Yukon, Alaska, in June of this year [1918] describing a journey made by him last winter round the whole Arctic coast of Alaska, is abstracted in the *British Geographical Journal*. The journey, which naturally involved no small amount of hardship, afforded an unrivalled opportunity for gaining acquaintance with the Eskimo throughout the great stretch of country traversed, as well as for a comparative study of the work carried on among them by the various Christian organizations busy in that remote region. These Eskimos, the writer says, are 'surely of all primitive peoples the one that has the greatest claim to the generous consideration of civilized mankind. Where else shall a people be found so brave, so hardy, so industrious, so kindly, and withal so cheerful and content, inhabiting such utterly naked country lashed by such constant ferocity of weather?' Everywhere he received from them the greatest possible help and kindness, and brought away the warmest

feeling of admiration and friendship. The start was made on the west coast first made known to the world by Cook and Kotzebue, Beechey, Collinson and Bedford Pim, and here it was possible to find some habitation, usually an underground igloo, on every night but one of the journey. Storms were encountered, but there were commonly fair winds and there were no special hardships, traveling being far more rapid than is usual in the interior. At Point Barrow a halt of two weeks gave opportunity for the study of the largest Eskimo village in Alaska. In spite of the advancing season the difficulties increased with the resumption of travel, March being the month in which the severest weather is to be expected here. Throughout the 250 miles to Flaxman Island the party saw only one human being and were housed only twice. 'It is,' says the writer, 'the barrenest, most desolate, most forsaken coast I have ever seen in my life: flat as this paper on which I write, the frozen land merging indistinguishably into the frozen sea; nothing but a stick of driftwood here and there, half buried in the indented snow, gives evidence of the shore.' The fortnight's travel along this stretch was a constant struggle against a bitter northeast wind with the thermometer 20° to 30° below zero Fahrenheit, and at night, warmed only by the *primus* oil cooking stove, the air within their little snow house was as low as from 48° to 51° below zero. The almost ceaseless wind was a torment, and the faces of all were continually frozen. There are Eskimo on the rivers away from the coast, but it was impossible to visit them. East of Point Barrow all the dog-feed had to be hauled on the sledge, and—for the first time since the archdeacon had driven dogs—they occasionally went hungry when there was no driftwood to cook with. The heaviest task however came on the journey inland to Fort Yukon. Beyond the mountains the winter's snow lay unbroken, and for eight days a trail down the Collen River had to be beaten ahead of the dogs. At the confluence of the Collen with the Porcupine Stefánsson and his party were met with, escorted on the way to Fort Yukon by Dr. Burke, of the hospital there. Stefánsson had lain ill all the winter at Herschel Island, and would never have recovered had he not finally resolved to be hauled 400 miles to the nearest doctor."—*Journey round the Arctic coast of Alaska* (*Science*, Nov. 29, 1918).

Another Arctic explorer of recent years who rendered distinguished services by his contributions to geography, botany and geology is Knud Rasmussen, a Danish-Greenlander. Accompanied by a Danish geologist, L. Koch and Dr. T. Wulff, Swedish botanist, he set out in April, 1917, with a small party of Eskimos, crossed the perpetual ice-cap of Greenland and surveyed the western shore while his colleagues accumulated a botanical and geological collection. The party fell into desperate straits owing to lack of food and the absence of game. The botanist and the Eskimo hunter of the expedition lost their lives. The rest of the party was saved by Rasmussen's feat of obtaining relief after a forced march to Etah and back, a round distance of 280 miles, accompanied by one Eskimo.

Chronological summary:

1262.—Hakonson wins Iceland for Norway. See ICELAND: 1262; and 12th-13th century.

14th-18th centuries.—Danish control of Iceland, Commerce, and English interests. See ICELAND: 14th-18th centuries.

1498.—Route of Sebastian Cabot in the exploration of Greenland. See AMERICA: Map showing voyages of discovery.

1500-1502.—Discovery and exploration of the coast of Labrador and the entrance of Hudson strait by the Corte-Reals.

1553.—Voyage of Willoughby and Chancellor from London, in search of a northeast passage to India. Chancellor reached Archangel on the White sea and learned that he was in the dominions of the sovereign of Muscovy or Russia. With much difficulty he obtained permission to visit the court at Moscow, and made the long journey to that city by sledge over the snow. There he was admitted to an interview with the Tsar, and returned with a letter which permitted the opening of trade between England and Russia. Willoughby, with two vessels and their crews, was less fortunate. His party, after wintering on a desolate shore, perished the next year in some manner, the particulars of which were never known. The two ships, with their dead crews, were found long afterwards by Russian sailors, and their log-book recovered, but it told nothing of the tragical end of the voyage. The chartered company of London merchants which sent out these expeditions is believed to have been the first joint stock corporation of shareholders formed in England. As the Russia Company, it afterwards became a rich and powerful corporation, and its success set other enterprises in motion.

1556.—Exploring voyage of Stephen Burroughs to the northeast, approaching Nova Zembla.

1576-1578.—Voyages of Frobisher to the coast of Labrador and the entrance to Davis strait, discovering the bay which bears his name, and which he supposed to be a strait leading to Cathay; afterwards entering Hudson strait. Having brought from his first voyage a certain glittering stone which English goldsmiths concluded to be ore of gold, his second and third voyages were made to procure cargoes of the imagined ore, and to found a colony in the frozen region from which it came. The golden ore proved delusive; the colony was never planted.

1580.—Northeastern voyage of Pet and Jackman, passing Nova Zembla.

1585-1587.—Three voyages of John Davis from Dartmouth, in search of a northwestern passage to India, entering the strait between Greenland and Baffinland which bears his name and exploring it to the 72nd degree north latitude.

1594-1595.—Dutch expeditions (the first and second under Barents) to the northeast, passing to the north of Nova Zembla, or Novaya Zemlya, but making no progress beyond it.

1596-1597.—Third voyage of Barents, when he discovered and coasted Spitsbergen, wintered in Nova Zembla with his crew, lost his ship in the ice, and perished, with one third of his men, in undertaking to reach the coast of Lapland in open boats.—See also SPITSBERGEN: 1596-1829.

1602.—Exploration for a northwest passage by Captain George Weymouth, for the Muscovy Company and the Levant Company, resulting in nothing but a visitation of the entrance to Hudson strait.

1607.—Polar voyage of Henry Hudson, for the Muscovy Company of London, attaining the northern coast of Spitsbergen.

1608.—Voyage of Henry Hudson to Nova Zembla for the Muscovy Company.

1610.—Voyage of Henry Hudson, in English employ, to seek the northwest passage, being the voyage in which he passed through the Strait and entered the great Bay to which his name has been given, and in which he perished at the hands of

a mutinous crew.—See also AMERICA: Map showing voyages of discovery.

1612-1614.—Exploration of Hudson bay by Captains Button, Bylot, and Baffin, practically discovering its true character and shaking the previous theory of its connection with the Pacific ocean.

1614.—Exploring expedition of the Muscovy Company to the Greenland coast, under Robert Fotherby, with William Baffin for pilot, making its way to latitude 80°.

1616.—Voyage into the northwest made by Captain Baffin with Captain Bylot, which resulted in the discovery of Baffin bay, Smith sound, Jones sound, and Lancaster sound.

1619-1620.—Voyage of Jens Munk, sent by the King of Denmark to seek the northwest passage; wintering in Hudson bay, and losing there all but two of his crew, with whom he succeeded in making the voyage home.

1632.—Voyages of Captains Fox and James into Hudson bay.

1670.—Grant and charter to the Hudson's Bay Company, by King Charles II. of England, conferring on the Company possession and government of the whole watershed of the bay, and naming the country Prince Rupert Land.

1676.—Voyage of Captain John Wood to Nova Zembla, seeking the northeastern passage.

1728.—Exploration of the northern coasts of Kamchatka by the Russian Captain Vitus Bering, and discovery of the strait which bears his name.

1741.—Exploration of northern channels of Hudson bay by Captain Middleton.

1743.—Offer of £20,000 by the British Parliament for the discovery of a northwest passage to the Pacific.

1746.—Further exploration of northern channels of Hudson bay by Captains Moor and Smith.

1753-1754.—Attempted exploration of Hudson bay by the colonial Captain Swaine, sent out from Philadelphia, chiefly through the exertions of Dr. Franklin.

1765.—Russian expedition of Captain Tchitschakoff, attempting to reach the Pacific from Archangel.

1768-1769.—Exploration of Nova Zembla by a Russian officer, Lieutenant Rosmysloff.

1769-1770.—Exploring journey of Samuel Hearne, for the Hudson's Bay Company, from Churchill, its most northern post, to Coppermine river and down the river to the Polar sea.

1773.—Voyage of Captain Phipps, afterwards Lord Mulgrave, toward the North Pole, reaching the northeastern extremity of Spitsbergen.

1779.—Exploration of the Arctic coast, east and west of Bering strait, by Captain Cook, in his last voyage.

1789.—Exploring journey of Alexander Mackenzie, for the Northwest Company, and discovery of the great river flowing into the Polar sea, which bears his name.

1806.—Whaling voyage of Captain Scoresby to latitude 81° 30' and longitude 19° east, a record until Parry eclipsed it.

1818.—Unsatisfactory voyage of Commander John Ross to Baffin bay and into Lancaster sound.

1818.—Voyage of Captain Buchan towards the North Pole, reaching the northern part of Spitsbergen.

1819-1820.—First voyage of Lieutenant Parry, exploring for a northwest passage, through Davis strait, Baffin bay, Lancaster sound, and Barrow strait, to Melville island.

1819-1820.—Journey of Captain (afterwards Sir John) Franklin, Dr. Richardson, and Captain (afterwards Sir George) Back, from Fort York, on

the western coast of Hudson bay by the way of Lake Athabasca, Great Slave lake, and Coppermine river, to Coronation gulf, opening into the Arctic ocean.

1819-1824.—Russian expeditions for the survey of Nova Zembla.

1820-1824.—Russian surveys of the Siberian polar region by Wrangell and Anjou.

1821-1823.—Second voyage of Captain Parry, exploring for a northwest passage to the Pacific ocean, through Hudson strait and Fox channel, discovering the Fury and Hecla strait, the northern outlet of the bay.

1821-1824.—Russian surveying expedition to Nova Zembla, under Lieutenant Lütke.

1822.—Whaling voyage of Captain Scoresby to the eastern coast of Greenland, which was considerably traced and mapped by him.

1822-1823.—Scientific expedition of Captain Sabine, with Commander Clavering, to Spitsbergen and the eastern coast of Greenland.

1824-1825.—Third voyage of Captain Parry, exploring for a northwest passage, by way of Davis strait, Baffin bay, and Lancaster sound, to Prince Regent inlet, where one of his ships was wrecked.

1825-1827.—Second journey of Franklin Richardson, and Back, from Canada to the Arctic ocean; Franklin and Back by the Mackenzie river and westward along the coast to longitude $149^{\circ} 37'$; Richardson by the Mackenzie river and the Arctic coast eastward to Coppermine river.

1826.—Voyage of Captain Beechey through Bering strait and eastward along the Arctic coast as far as Point Barrow.

1827.—Fourth voyage of Captain Parry, attempting to reach the North Pole, by ship to Spitsbergen and by boats to $82^{\circ} 45'$ north latitude.—See also SPITSBERGEN: 1596-1827.

1829-1833.—Expedition under Captain Ross, fitted out by Mr. Felix Booth, to seek a northwest passage, resulting in the discovery of the position of the north magnetic pole, southwest of Boothia, not far from which Ross' ship was ice-bound for three years. Abandoning the vessel at last, the explorers made their way to Baffin bay and were rescued by a whale-ship.

1833-1835.—Journey of Captain Back from Canada, via Great Slave lake, to the river which he discovered and which bears his name, flowing to the Polar sea.

1836-1837.—Voyage of Captain Back for surveying the straits and channels in the northern extremity of Hudson bay.

1837-1839.—Expeditions of Dease and Simpson, in the service of the Hudson Bay Company, determining the Arctic coast line as far east as Boothia.

1845.—Departure from England of the government expedition under Sir John Franklin, in two bomb-vessels, the *Erebus* and the *Terror*, which entered Baffin bay in July and were never seen afterward.

1848.—Expedition of Sir John Richardson and Mr. John Rae down the Mackenzie river, searching for traces of Sir John Franklin and his crews.

1848-1849.—Expedition under Sir James Clarke Ross to Baffin bay and westward as far as Leopold Island, searching for Sir John Franklin.

1848-1851.—Searching expedition of the Herald and the Plover, under Captain Kellett and Commander Moore, through Bering strait and westward to Coppermine river, learning nothing of the fate of the Franklin party.

1850.—Searching expedition sent out by Lady Franklin, under Captain Forsyth, for the examination of Prince Regent inlet.

1850-1851.—United States Grinnell expedition, sent to assist the search for Sir John Franklin and his crew, consisting of two ships, the *Advance* and the *Rescue*, furnished by Mr. Henry Grinnell and officered and manned by the U. S. government, Lieutenant De Haven commanding and Dr. Kane surgeon. Frozen into the ice in Wellington channel, in September, 1850, the vessels drifted helplessly northward until Grinnell Land was seen and named, then southward and westward until the next June, when they escaped in Baffin bay.

1850-1851.—Franklin search expedition, sent out by the British government, under Captain Penny, who explored Wellington channel and Cornwallis Island by sledge journeys.

1850-1851.—Discovery of traces of Franklin and his men at Cape Riley and Beechey island, by Captain Ommaney and Captain Austin.

1850-1852.—Franklin search expedition under Captain Collinson, through Bering strait and eastward into Prince of Wales strait, sending sledge parties to Melville island.

1850-1854.—Franklin search expedition under Captain McClure, through Bering strait and westward, between Banks Land and Prince Albert Land, attaining a point within 25 miles of Melville sound, already reached from the east; thus demonstrating the existence of a northwest passage, though not accomplishing the navigation of it. McClure received knighthood, and a reward of £10,000 was distributed to the officers and crew of the expedition.

1851.—Expedition of Dr. Rae, sent by the British government to descend the Coppermine river and search the southern coast of Wollaston Land, which he did, exploring farther along the coast of the continent eastward to a point opposite King William's Land.

1851-1852.—Franklin search expedition sent out by Lady Franklin under Captain Kennedy, for a further examination of Prince Regent inlet and the surrounding region.

1852-1854.—Franklin search expedition of five ships sent out by the British government under Sir Edward Belcher, with Captains McClintock, Kellett, and Sherard Osborn under his command. Belcher and Osborn, going up Wellington channel to Northumberland sound, were frozen fast; McClintock and Kellett experienced the same misfortune near Melville island, where they had received Captain McClure and his crew, escaping from their abandoned ship. Finally all the ships of Belcher's fleet except one were abandoned. One, the *Resolute*, drifted out into Davis strait in 1855, was rescued, bought by the United States government and presented to Queen Victoria.

1853-1854.—Hudson's Bay Company expedition by Dr. Rae, to Repulse bay and Pelly bay, on the Gulf of Boothia, where Dr. Rae found Eskimos in possession of articles which had belonged to Sir John Franklin, and his men, and was told that in the winter of 1850 they saw white men near King William's Land, traveling southward, dragging sledges and a boat, and afterwards saw dead bodies and graves on the mainland.

1853-1855.—Grinnell expedition, under Dr. Kane, proceeding straight northward through Baffin bay, Smith sound and Kennedy channel, nearly to latitude 70° , where the vessel was locked in ice and remained fast until abandoned in the spring of 1855, the party escaping to Greenland and being rescued by an expedition under Lieutenant Hartstein which the American government had sent to their relief.

1855.—Cruise of the U. S. ship *Vincennes*, Lieutenant John Rodgers commanding, in the Arctic sea, via Bering strait to Wrangell Land.

1855.—Expedition of Mr. Anderson, of the Hudson's Bay Company, down the Great Fish river to Point Ogle at its mouth, seeking traces of the party of Sir John Franklin.

1857-1859.—Search expedition sent out by Lady Franklin, under Captain McClintock, which became ice-bound in Melville bay, August, 1857, and drifted helplessly for eight months, over 1,200 miles; escaped from the ice in April, 1858; re-fitted in Greenland and returned into Prince Regent inlet, whence Captain McClintock searched the neighboring regions by sledge journeys, discovering, at last, in King William's Land, not only remains but records of the lost explorers, learning that they were caught in the ice somewhere in or about Peel sound, September, 1846; that Sir John Franklin died on the 11th of the following June; that the ships were deserted on the 22d of April, 1848, on the northwest coast of King William's Land, and that the survivors 105 in number, set out for Back or Great Fish river. They perished probably one by one on the way.

1860-1861.—Expedition of Dr. Hayes to Smith sound; wintering on the Greenland side at latitude $78^{\circ} 17'$; crossing the Sound with sledges and tracing Grinnell Land to about $82^{\circ} 45'$.

1860-1862.—Expedition of Captain Hall on the whaling ship *George Henry*, and discovery of relics of Frobisher.

1864-1869.—Residence of Captain Hall among Eskimos on the north side of Hudson strait and search for further relics of the Franklin expedition.

1867.—Tracing of the southern coast of Wrangell Land by Captains Long and Raynor, of the whaling ships Nile and Reindeer.

1867.—Transfer of the territory, privileges and rights of the Hudson's Bay Company to the Dominion of Canada.

1868.—Swedish Polar expedition, directed by Professor Nordenskiöld, attaining latitude $81^{\circ} 42'$, on the 18th meridian of east longitude.

1869.—Yacht voyage of Dr. Hayes to the Greenland coasts.

1869-1870.—German Polar expedition, under Captain Koldewey, one vessel of which was crushed, the crew escaping to an ice floe and drifting 1,100 miles, reaching finally a Danish settlement on the Greenland coast, while the other explored the east coast of Greenland to latitude 77° .

1871-1872.—Voyage of the steamer *Polaris*, fitted out by the U. S. government, under Captain Hall; passing from Baffin bay, through Smith sound and Kennedy channel, into what Kane and Hayes had supposed to be open sea, but which proved to be the widening of a strait, called Robeson strait by Captain Hall, thus going beyond the most northerly point that had previously been reached in Arctic exploration. Wintering in latitude $81^{\circ} 38'$ (where Captain Hall died), the *Polaris* was turned homeward the following August. During a storm, when the ship was threatened with destruction by the ice, a number of her crew and party were left helplessly on a floe, which drifted with them for 1,500 miles, until they were rescued by a passing vessel. Those on the *Polaris* fared little better. Forced to run their sinking ship ashore, they wintered in huts and made their way south in the spring, until they met whale-ships which took them on board.

1872-1874.—Austro-Hungarian expedition, under Captain Weyprecht and Lieutenant Payer, seeking the northeast passage, with the result of discovering and naming Franz Josef Land, Crown

Prince Rudolf Land and Petermann Land, the latter (seen, not visited) estimated to be beyond latitude 83° . The explorers were obliged to abandon their ice-locked steamer, and make their way by sledges and boats to Nova Zembla, where they were picked up.

1875.—Voyage of Captain Young, attempting to navigate the northwest passage through Lancaster sound, Barrow strait and Peel strait, but being turned back by ice in the latter.

1875-1876.—English expedition under Captain Nares, in the *Alert*, and the *Discovery*, attaining by ship the high latitude of $82^{\circ} 27'$, in Smith sound, and advancing by sledges to $83^{\circ} 20' 26''$, while exploring the northern shore of Grinnell Land and the northwest coast of Greenland.

1876-1878.—Norwegian North-Atlantic expedition, for a scientific exploration of the sea between Norway, the Faroe islands, Iceland, Jan Mayen, and Spitsbergen.—See also SPITSBERGEN: 1006-1021.

1878.—Discovery of the island named "Einsamkeit," in latitude $77^{\circ} 40'$ N. and longitude 86° E., by Captain Johannesen, of the Norwegian schooner Nordland.

1878-1879.—Final achievement of the long-sought, often attempted northeast passage, from the Atlantic to the Pacific ocean, by the Swedish geographer and explorer, Baron Nordenskiöld, on the steamer *Vega*, which made the voyage from Gothenburg to Yokohama, Japan, through the Arctic sea, coasting the Russian and Siberian shores.

1878-1883.—Six annual expeditions to the Arctic seas of the ship Willem Barents, sent out by the Dutch Arctic Committee.

1879.—Cruise of Sir Henry Gore-Booth and Captain Markham, R. N., in the cutter *Isbjorn* to Nova Zembla and in Barents sea and the Kara sea.

1879-1880.—Journey of Lieutenant Schwatka from Hudson bay to King William island, and exploration of the western and southern shores of the latter, searching for the journals and logs of the Franklin expedition.

1879-1882.—Polar voyage of the *Jeannette*, fitted out by the proprietor of the *New York Herald* and commanded by Commander De Long, U. S. N. The course taken by the *Jeannette* was through Bering strait towards Wrangell Land, and then northerly, until she became icebound when she drifted helplessly for nearly two years, only to be crushed at last. The officers and crew escaped in three boats, one of which was lost in a storm; the occupants of the other two boats reached different mouths of the river Lena. One of these, two boats, commanded by Engineer Melville, was fortunate enough to find a settlement and obtain speedy relief. The other, which contained Commander De Long, landed in a region of desolation, and all but two of its occupants perished of starvation and cold.

1880-1882.—First and second cruises of the United States revenue steamer *Corwin* in the Arctic ocean, via Bering strait, to Wrangell Land seeking information concerning the *Jeannette* and searching for two missing whaling ships.

1880-1882.—Two voyages of Mr. Leigh Smith to Franz Josef Land, in his yacht *Eira*, in the first of which a considerable exploration of the southern coast was made, while the second resulted in the loss of the ship and a perilous escape of the party in boats to Nova Zembla, where they were rescued.

1881.—Expedition of the steamer *Rodgers* to search for the missing explorers of the *Jeannette*; entering the Arctic sea through Bering strait, but

abruptly stopped by the burning of the *Rodgers*, on the 30th of November, in St. Lawrence bay.

1881.—Cruise of the *U. S. Alliance*, Commander Wadleigh, via Spitsbergen, to 79° 3' 36" north latitude, searching for the *Jeannette*.

1881-1884.—International undertaking of expeditions to establish Arctic stations for simultaneous meteorological and magnetic observations: by the United States at Smith sound and Point Barrow; by Great Britain at Fort Rae; by Russia at the mouth of the Lena and in Nova Zembla; by Denmark at Godhaab, in Greenland; by Holland at Dickson's Haven, near the mouth of the Yenisei; by Germany in Cumberland sound, Davis strait; by Austro-Hungary on Jan Mayen island; by Sweden at Mussel bay in Spitsbergen. The United States expedition to Smith sound, under Lieutenant Greely, established its station on Discovery bay. Exploring parties sent out attained the highest latitude ever reached, namely 83° 24'. After remaining two winters and failing to receive expected supplies, which had been intercepted by the ice, Greely and his men, twenty-five in number, started southward, and all but seven perished on the way. The survivors were rescued, in the last stages of starvation, by a vessel sent to their relief under Captain Schley, U. S. N.

1882-1883.—Danish Arctic expedition of the *Dijmph*, under Lieutenant Hovgaard; finding the Varna of the Dutch Meteorological Expedition beset in the ice; both vessels becoming frozen in together for nearly twelve months; the *Dijmph* escaping finally with both crews.

1883.—Expedition of Lieutenant Ray, U. S. N., from Point Barrow to Meade river.

1883.—Expedition of Baron Nordenskiöld to Greenland, making explorations in the interior.

1883-1885.—East Greenland expedition of Captain Holm and Lieutenant Garde.

1884.—Second cruise of the *U. S. revenue marine steamer Corwin* in the Arctic ocean.

1886.—Reconnaissance of the Greenland inland ice by Civil Engineer R. E. Peary, U. S. N.

1888.—Journey of Dr. Nansen across South Greenland.

1890.—Swedish expedition to Spitsbergen, under G. Nordenskiöld and Baron Klinckowström.

1890.—Danish scientific explorations in North and South Greenland.

1890.—Russian exploration of the Melo-Zemelskaya, or Timanskaya tundra, in the far north of European Russia, on the Arctic ocean.

1891-1892.—Expedition of Lieutenant Peary, U. S. N., with a party of seven, including Mrs. Peary, establishing headquarters on McCormick bay, northwest Greenland; thence making sledge journeys. The surveys of Lieutenant Peary have gone far toward proving Greenland to be an island.

1891-1892.—Danish East Greenland expedition of Lieutenant Ryder.

1891-1893.—Expeditions of Dr. Drygalski to Greenland for the study of the great glaciers.

1892.—Swedish expedition of Björling and Kallstenius, the last records of which were found on one of the Cary islands, in Baffin bay.

1892.—French expedition under M. Ribot to the islands of Spitsbergen and Jan Mayen.

1893.—Expedition of Dr. Nansen, in the *Fram* from Christiania, aiming to enter a current which flows, in Dr. Nansen's belief, across the Arctic region to Greenland.

1893.—Russian expedition, under Baron Toll, to the New Siberian islands and the Siberian Arctic coasts.

1893.—Danish expedition to Greenland, under

Lieutenant Garde, for a geographical survey of the coast and study of the inland ice.

1893-1894.—Expedition of Lieutenant Peary and party (Mrs. Peary again of the number), landing in Bowdoin bay, August, 1893; attempting in the following March a sledge journey to Independence bay, but compelled to turn back. An auxiliary expedition brought back most of the party to Philadelphia in September, 1894; but Lieutenant Peary with two men remained.

1893-1894.—Scientific journey of Mr. Frank Russell, under the auspices of the state university of Iowa, from Lake Winnipeg to the mouth of Mackenzie river and to Herschel island.

1893-1900.—Scientific exploration of Labrador by A. P. Low.

1894.—Expedition of Mr. Walter Wellman, an American journalist, purposing to reach Spitzbergen via Norway, and to advance thence towards the Pole, with aluminum boats. The party left Tromsø May 1, but were stopped before the end of the month by the crushing of their vessel. They were picked up and brought back to Norway.

1894.—Departure of what is known as the Jackson-Harmsworth North Polar Expedition, planned to make Franz Josef Land a base of operations from which to advance carefully and persistently towards the Pole.

1895.—Preparations of Herr Julius von Payer, for an artistic and scientific expedition to the east coast of Greenland, in which he will be accompanied by landscape and animal painters, photographers and savants.

1895.—Return of Peary relief expedition with Lieut. Robert E. Peary and his companions. In spite of great difficulties Lieut. Peary had again crossed the ice-sheet to Independence bay, determined the northern limits of Greenland, charted 1,000 miles of the west coast, discovered eleven islands and the famous Iron Mountain (three great meteorites), and obtained much knowledge of the natives. The purely scientific results of the expedition are of great value. The relief expedition was organized by Mrs. Peary.

1895.—Cruise of Mr. Pearson and Lieut. Feilden in Barents sea.

1895.—Return of Martin Ekroll from Spitzbergen after a winter's study of the ice conditions there. Convinced that his plan of reaching the pole by a sledge journey had little chance of success.

1895.—Survey of the lower Yenisei river and Ob bay by Siberian hydrographic expedition.

1895.—Commercial expedition of Capt. Wiggins from England to Golchika, at the mouth of the Yenisei.

1895.—Russian geological expedition to Nova Zembla.

1895.—Russian expedition under the geologist Bogdanovich to the Sea of Okhotsk and Kamchatka.

1895-1896.—Two scientific voyages of the Danish cruiser *Ingolff* in the seas west and east of Greenland.

1896.—Summer expedition of naturalists and college students to the northern coast of Labrador.

1896.—Attempt of Lieut. Peary to remove the great meteorite discovered by him at Cape York, Greenland. After dislodging it he was compelled by the ice to leave it. Small parties from Cornell university and Massachusetts Institute of Technology and one under Mr. George Bartlett, left by Peary at different points to make scientific observations and collections, returned with him.

1896.—Hydrographical survey of the Danish waters of Greenland and Iceland.

1896.—Hansen sent to Siberia to look for traces of Nansen.

1896.—Return of Dr. Nansen from voyage begun in 1893. After skirting the coast of Siberia almost to the Lena delta, the *Fram* was enclosed by the ice and drifted with it north and north-west. On March 14, 1895, in $84^{\circ} 4' N.$ lat., $102^{\circ} E.$ long., Nansen and Johansen left the *Fram* and pushed northward with dogs and sledges across an ice floe till they reached lat. $86^{\circ} 13.6'$, at about $95^{\circ} W.$ long., on April 8, within 261 statute miles of the pole. With great difficulty they made their way to Franz Josef Land, where they wintered, and in June met explorer Jackson. Returning on the Jackson supply steamer *Windward*, they reached Vardö Aug. 13. The *Fram* drifted to lat. $85^{\circ} 57' N.$, $66^{\circ} E.$ long., then southwestward, reaching Tromsø Aug. 20, 1896. Nansen demonstrated the existence of a polar sea of great depth, comparatively warm below the surface, apparently with few islands; though he did not find the trans-polar current he sought.

1896.—Spitsbergen crossed for the first time, by Sir W. Martin Conway and party.

1896.—Many parties visit the northern coast of Norway and Nova Zembla to view the total eclipse of the sun, Aug. 8-9.

1896.—Expedition sent by Russian Hydrographic Department to find site for a sealers' refuge in Nova Zembla. Bielusha bay, on the southwest coast, chosen.

1897.—Expedition sent by Canadian government to investigate Hudson bay and strait as a route to Central Canada. Passage found to be navigable for at least sixteen weeks each summer.

1897.—Seventh Peary expedition to Greenland. Accompanied by parties for scientific research. Preliminary arrangements made with the Eskimos for the expedition of 1898, and food-stations established. Relics of Greeley's expedition found on cape Sabine, and the great meteorite at cape York brought away at last.

1897.—Second expedition of Sir Martin Conway for the exploration of Spitsbergen.

1897.—A summer resort established on west coast of Spitsbergen, with regular steamer service for tourists during July and August.

1897.—Cruise of Mr. Arnold Pike and Sir Savile Crossley among the islands east of Spitsbergen.

1897.—Cruise of Mr. Pearson and Lieut. Feilden in the *Laura* in the Kara sea and along the east coast of Nova Zembla, for the purpose of studying the natural history of the region.

1897.—Expedition of F. W. L. Popham with a fleet of steamers through Yugor straits to the Yenisei.

1897.—Hydrological and commercial expedition, comprising seven steamers, under Rear-Admiral Makaroff, sent by the Russian government to the north Siberian sea.

1897.—Balloon voyage of Salomon August Andrée and two companions, Mr. Strindberg and Mr. Fraenkel, starting from Danes' island, north of Spitsbergen, in the hope of being carried to the Pole. Four buoys from the balloon have been found. The first, found in Norway in June, 1899, and containing a note from Andrée, was thrown out eight hours after his departure. The "North Pole buoy," to be dropped when the Pole was passed, was found empty on the north side of King Charles Island, north-east of Spitzbergen, Sept. 11, 1899. A third buoy, also empty, was found on the west coast of Iceland July 17, 1900. Another,

reported from Norway, Aug. 31, 1900, contained a note showing that the buoy was thrown out at 10 P. M., July 11, 1897, at an altitude of 250 metres (820 ft.), moving N. $45 E.$, with splendid weather. Many search expeditions, some equipped at great expense, have returned unsuccessful. In spite of many rumors nothing definite is known of the fate of any of the party. One message from Andrée was brought back by a carrier pigeon. It was dated July 13, 12.30 P. M., in lat. $82^{\circ} 2'$, long. $12^{\circ} 5' E.$, and stated that the balloon was moving eastward.

1897.—New islands on the southern coast of Franz Josef Land discovered by Capt. Robertson of the Dundee whaler *Balena*.

1897.—Return of Jackson-Harmsworthy expedition from three years' exploration of Franz Josef Land and the region north of it. Franz Josef Land was resolved into a group of islands and almost entirely mapped. Small parties journeying northward over the ice, establishing depots of supplies, the most northern in latitude $81^{\circ} 21'$, discovered and named Victoria sea, the most northern open sea in the world.

1897-1899.—Journey of Andrew J. Stone through the Canadian Rockies, down Mackenzie river and along the arctic coast, in search of rare mammals and information concerning the native tribes. Mr. Stone often had only one companion. He traveled rapidly, in one period of five months covering 3,000 miles of arctic coast and mountains, between 70° and $72^{\circ} N.$ lat. and between $117\frac{1}{2}^{\circ}$ and $140^{\circ} W.$ long.

1898.—Expedition of Dr. K. J. V. Steenstrup to Greenland to study the glaciers of Disco island.

1898.—Completion by Dr. Thoroddsen of his systematic exploration of Iceland, begun in 1881.

1898.—Spitsbergen circumnavigated and surveyed by Dr. A. G. Nathorst. Coast mapped and important scientific observations made.

1898.—Pendulum observations made in Spitsbergen by Prof. J. H. Gore, with instruments of the United States Coast and Geodetic Survey, for the determination of the force of gravity in that latitude.

1898.—Cruise of Prince Albert of Monaco, on coast of Spitsbergen, for the purpose of making scientific observations.

1898.—Some claim to Spitsbergen made by Russia. Never before claimed by any nation.

1898.—German arctic expedition under Theodor Lerner to the islands east of Spitsbergen, for scientific purposes and to obtain news of Andrée if possible.

1898.—Andrée search expedition under J. Stadling sent to the Lena delta, the mouth of the Yenisei and the islands of New Siberia by the Swedish Anthropological and Geographical Society.

1898-1899.—Reconnoitring expedition by Danish party under Lieut. G. C. Amdrup, to east coast of Greenland. Coast explored and mapped from Angmagssalik, $65\frac{3}{4}^{\circ} N.$ lat., to $67^{\circ} 22'$. Remains of a small extinct Eskimo settlement found.

1898-1899.—Second attempt by Walter Wellman to reach the North Pole. Wintered in Franz Josef Land, establishing an outpost, called Fort McKinley, in lat. $81^{\circ} N.$ In February Mr. Wellman, with three companions, started northward and seemed likely to succeed in their undertaking, but a serious accident befalling Mr. Wellman, and an icequake destroying many dogs and sledges, a hurried return to headquarters was necessary. Here important scientific observations were made. The $82d$ parallel was reached by the explorer.

1898.—Carefully planned expedition of Lieut. Peary, purposing to advance toward the pole by

west coast of Greenland, establishing food stations and depending upon picked Eskimos for coöperation with his small party. In the last dash for the pole, supply sledges to be sent back as emptied, and the returning explorer, with two companions only, to be met by a relief party of Eskimos. The *Hindward* was presented by Mr. Harmsworth for this expedition. Lieut. Peary was disabled for several weeks in 1898-9 by severe frost-bites, causing the loss of seven toes. The Greely records were found at Fort Conger and sent back by the annual supply vessel. Sextant and record of the Nares expedition found and sent back; presented by Lieut. Peary to the Lords of the Admiralty of Great Britain and placed in the museum of the Royal Naval College at Greenwich. Vessel sent to Greenland each summer to carry supplies and bring back letters, carrying also small parties of explorers, scientists, university students and hunters, to be left at various points and picked up by the vessel on its return.

1898.—Expedition of Capt. Sverdrup to northern Greenland—Lieut. Peary's especial field. Having planned a polar expedition similar to Peary's he sailed up the west coast, but the *Fram* was frozen in near cape Sabine. Sverdrup therefore explored the western part of Ellesmere Land, then sailed again in an attempt to round the northern coast of Greenland.

1899.—International conference held at Stockholm in June recommended a program for hydrographical and biological work in the northern parts of the Atlantic ocean, the North sea, the Baltic, and adjoining seas.

1899.—Scientific expedition of Edward Bay, a Dane, to Melville bay, Greenland.

1899.—Swedish expedition under Dr. A. G. Nathorst to search for Andrée in eastern Greenland. Valuable observations made and fjord systems of King Oscar fjord and Kaiser Franz Josef fjord mapped.

1899.—Explorations in Iceland by F. W. W. Howell and party.

1899.—Hydrographical surveys on the coasts of Iceland and the Faroe islands by MM. Holm and Hammer in the Danish guard-ship *Diana*.

1899.—Joint Russian and Swedish expedition to Spitsbergen, for the measurement of a degree of the meridian. Owing to the condition of the ice, the northern and southern surveying parties unable to connect their work.

1899.—Explorations in Spitsbergen by the Prince of Monaco, with a scientific staff.

1899.—Successful experimental voyage of the Russian Vice-Admiral Makaroff in his ice-breaking steamer, the *Yermak*, north of Spitsbergen.

1899.—Russian government expedition, to cost £5,400, to explore northern shores of Siberia to mouths of the Ob and Yenisei.

1899-1900.—Arctic expedition of the Duke of the Abruzzi. His ship, the *Stella Polare*, was left at Crown Prince Rudolf Land during the winter. The Duke became incapacitated by a fall and by the loss of two joints from the fingers of his left hand, incurably frost-bitten; but a small party under Capt. Cagni pushed northward till provisions were exhausted. Nansen's record was beaten, the Italian party reaching lat. 86° 33', at about 56° E. long. No land was found north or northwest of Spitsbergen. Three men were lost from Cagni's party.

1899.—Exploration of Ellesmere Land, Greenland, by Dr. Robert Stein, of the United States Geological Survey, Dr. Leopold Kann of Cornell, and Samuel Warmbath of Harvard, who took passage in the Peary supply ship *Diana*, trusting to

chance for conveyance home. Their totally inadequate outfit was generously augmented by Peary's friends of the *Diana*. Dr. Kann returned in 1900, leaving Dr. Stein.

1900.—Seward peninsula, the most westward extension of Alaska, explored and surveyed by five government expeditions.

1900.—Exploration of the interior of northern Labrador by a party from Harvard university. Soundings along the coast by schooner *Brave*.

1900.—Second Danish expedition under Lieut. Amdrup to east Greenland, completing the work of 1898-9 by mapping the coast between 67° 20' N. and cape Gladstone, about 70° N., and making valuable scientific collections.

1900.—Swedish expedition, under Gustav Koltthoff, to eastern Greenland, for study of the arctic fauna.

1900.—Swedish scientific expedition of Prof. G. Koltthoff to Spitzbergen and Greenland.

1900.—Exploration of Spitsbergen by a Russian expedition under Knipovich.

1900.—Russian expedition to east coast of Nova Zembla by Lieut. Borissoff to complete survey of the islands.

1900.—Dr. Nansen's expedition under the leadership of Dr. J. Hjort, for the physical and biological examination of the sea between Norway, Iceland, Jan Mayen and Spitsbergen.—See also SPITSBERGEN: 1906-1921.

1900.—German expedition, under Capt. Bade, to explore East Spitsbergen, King Charles' Land and Franz Josef Land, and to look for traces of Andrée.

1900.—Attempt of a German, Capt. Bauendahl, to reach the North Pole, leaving his vessel in the ice north of Spitsbergen and traveling over the ice with provisions for two years, weighing ten tons.

1900.—Scientific expedition of Baron E. von Toll to the unexplored Sannikoff Land, sighted in 1805 from the northern coast islands of New Siberia. Preceded by a party which established food depots at various places months before.

1901.—Three exploring parties sent to Alaska by the United States Geological Survey.

1901.—Expedition sent by the Duke of the Abruzzi to Franz Josef Land to search for the three men lost from his party in 1900.

1901.—Roald Amundson's investigation of the oceanographic conditions around Spitsbergen. See SPITSBERGEN: 1906-1921.

1901.—North polar expedition under Mr. Evelyn B. Baldwin of the United States Weather Bureau; splendidly equipped by Mr. Wm. Ziegler of New York.

1903-1905.—Expedition under Anthony Fiala, reaching a latitude 82° 13'.

1903.—Amundson's voyage through the north-west passage.

1905.—Explorations of the *Belgica* under Gerlache.

1906.—Prince of Monaco's survey of the western part of Spitsbergen. See SPITSBERGEN: 1906-1921.

1906-1907.—Erichsen and Hagen-Hagen's survey of Greenland which ended in a tragedy.

1907.—Expedition under Captain Isachsen and the mapping of northwestern Spitsbergen. See SPITSBERGEN: 1906-1921.

1907-1909.—Dr. Cook's attempt to reach the Pole.

1908.—Botanical survey of the fiord region in West Spitsbergen under Mrs. Hanna Resvoll-Holmsen. See SPITSBERGEN: 1906-1921.

1910.—Expedition to Spitsbergen under Captain Isachsen. See SPITSBERGEN: 1906-1921.

Maps prepared specially for the NEW LARNED
under direction of the editors and publishers.

1910-1911.—Hantzsch, the first European to cross Baffinland.

1911-1918.—Topographical and geographical surveys of Spitsbergen made under Adolf Hoel and Captains Arve Staxrud and Sverre Røvig. See SPITSBERGEN: 1906-1921.

1912.—Nansen's investigation of the waters on the northern and western coasts of Spitsbergen. See SPITSBERGEN: 1906-1921.

1912.—Brussiloff's voyage north, outcome never known.

1912.—Expedition under Lieutenant Schröder-Stranz.

1913-1918.—Stefansson expedition, its great importance in arctic explorations.

1917-1918.—Explorations along the arctic coast of Alaska by Archdeacon Stuck.

1917.—Rasmussen's surveys in the Arctic.

ARDAHAN, a fortified town of Russian Armenia, ceded to Russia by Turkey in 1878. On the outbreak of war between Turkey and Russia in the fall of 1914 a Turkish army was organized for the invasion of the Russian Caucasus with Ardahan as an immediate objective. The city was taken by Enver Pasha, January 1, 1915, but was quickly lost in the subsequent defeat of his troops. It was successively in the hands of Turks, Armenians and Bolsheviks in 1918 and 1919.

ARDASHIR, the modern form for Artaxerxes, the name of several Persian rulers.

ARDEN, Forest of, the largest forest in early Britain, which covered the greater part of modern Warwickshire and "of which Shakespeare's Arden became the dwindled representative."—J. R. Green, *Making of England*, ch. 7.

ARDENNES, Forest of.—"In Caesar's time there were in [Gaul] very extensive forests, the largest of which was the Arduenna (Ardennes), which extended from the banks of the lower Rhine probably as far as the shores of the North Sea."—G. Long, *Decline of the Roman republic*, v. 3, ch. 22.—"Ardennes is the name of one of the northern French departments which contains a part of the forest Ardennes. Another part is in Luxembourg and Belgium. The old Celtic name exists in England in the Arden of Warwickshire."—*Ibid.*, v. 4, ch. 14.—"This wild hilly region extending over parts of Belgium and France slopes gradually towards the plains of Flanders. The average height of these hills is about 1600 feet although Mt. Saint-Hubert rises to an altitude of 2100. Within this section are some of the finest forests of Europe where gently undulating areas are densely covered with oak and beech. The most important river flowing through the Ardennes is the Meuse which has cut a deep channel with precipitous walls 600 feet high in some places. Coal and iron mines lie in the northwest, and cattle and sheep are extensively raised. The district, both in Belgium and in France, was the scene of severe fighting (between the French and the Germans) in the first weeks of the World War. See WORLD WAR: 1914: I. Western front: j.

ARDESH, Caucasus region: Capture by Russians (1916). See WORLD WAR: 1916: VI. Turkish theater: d, 1.

ARDGLASS ("Green Height"), a small picturesque town on the Irish coast between Kingston mole and Belfast bay in County Down. The population in 1901 was 501. The harbor was one of importance from earliest times. After the Norman invasion it "was the outlet for the trade of the rich agricultural and wool-producing lands of Down, Tyrone, and Armagh, and traffic was carried on in wines, cloth, kerseys, all kinds of fish, wool, and tallow. . . . With the revival of Irish

life in the fourteenth century, and the gatherings of English merchants to Irish fairs, commerce increased and flourished [see COMMERCE: 14th century]. . . . It is said that a trading company with a grant from Henry IV built the famous 'New Works.'"—A. S. Green, *Old Irish World*, p. 137.—Wars of the English and Irish raged around this harbor and brought devastation to the town (see IRELAND: 1559-1603). . . . "In the course of the gloomy years that followed the old house fell into decay. [In June, 1911] the whole derelict property, long deserted by its landlords, both land and village, was sold for the benefit of English mortgages and bought by local people."—*Ibid.*, p. 149.

ARDRI, or **Ardrigh**, "over kings" of Ireland. See IRELAND, 1014; TUATH.

ARDSCUL, Battle near. See IRELAND: 1314-1318.

ARDSHIR. See **ARDASHIR**.

AREANS. See **MEDIA AND THE MEDES**.

ARECUNAS. See **CARIBS**: Their kindred.

AREIOS. See **ARIA**.

ARELATE. The ancient name of Arles. The territory covered by the old kingdom of Arles is sometimes called the Arelate. See **BURGUNDY**: 1127-1378, and **SALYES**.

ARENA, "in an amphitheatre the flat, open space enclosed by the seats for spectators and reserved for gladiatorial combats or other spectacles; so called because spread with sand. Hence, any level space wholly or partly surrounded by seats for athletic contests, combats, or sports."—R. Sturgis, *Dictionary of architecture and building*.

ARENGO (**Arringo**), general assembly. See **SAN MARINO, REPUBLIC OF**.

ARENISKY, Anton Stephanovich (1861-1906), distinguished Russian composer. In 1883 he became professor of composition at the Imperial Conservatory in Moscow and in 1895 succeeded Balakirev as conductor of the Imperial Court Chorus at St. Petersburg.

AREOPAGITICA (1644), a pamphlet by Milton, protesting against government supervision and control of literature; considered his greatest prose work. See **CENSORSHIP**: England; **PRINTING AND THE PRESS**: 1644.

AREOPAGUS.—"Whoever [in ancient Athens] was suspected of having blood upon his hands had to abstain from approaching the common altars of the land. Accordingly, for the purpose of judgments concerning the guilt of blood, choice had been made of the barren, rocky height which lies opposite the ascent to the citadel. It was dedicated to Ares, who was said to have been the first who was ever judged here for the guilt of blood; and to the Erinyes, the dark powers of the guilt-stained conscience. Here, instead of a single judge, a college of twelve men of proved integrity conducted the trial. If the accused had an equal number of votes for and against him, he was acquitted. The court on the hill of Ares is one of the most ancient institutions of Athens, and none achieved for the city an earlier or more widely-spread recognition."—E. Curtius, *History of Greece*, bk. 2, ch. 2.—"The Areopagus, or, as it was interpreted by an ancient legend, Mars' Hill, was an eminence on the western side of the Acropolis, which from time immemorial had been the seat of a highly revered court of criminal justice. It took cognizance of charges of wilful murder, maiming, poisoning and arson. Its forms and modes of proceeding were peculiarly rigid and solemn. It was held in the open air, perhaps that the judges might not be polluted by sitting under the same roof with the criminals. . . . The venerable character of the court seems to have determined Solon to apply it

to another purpose; and, without making any change in its original jurisdiction, to erect it into a supreme council, invested with a superintending and controlling authority, which extended over every part of the social system. He constituted it the guardian of the public morals and religion, to keep watch over the education and conduct of the citizens, and to protect the State from the disgrace or pollution of wantonness and profaneness. He armed it with extraordinary powers of interfering in pressing emergencies, to avert any sudden and imminent danger which threatened the public safety. The nature of its functions rendered it scarcely possible precisely to define their limits; and Solon probably thought it best to let them remain in that obscurity which magnifies whatever is indistinct. . . . It was filled with archons who had discharged their office with approved fidelity, and they held their seats for life."—C. Thirlwall, *History of Greece*, v. 1, ch. 11.—These enlarged functions of the Areopagus were withdrawn from it in the time of Pericles, through the agency of Ephialtes, but were restored about B. C. 400, after the overthrow of the Thirty. "Some of the writers of antiquity ascribed the first establishment of the senate of Areopagus to Solon. . . . But there can be little doubt that this is a mistake, and that the senate of Areopagus is a primordial institution of immemorial antiquity, though its constitution as well as its functions underwent many changes. It stood at first alone as a permanent and collegiate authority, originally by the side of the kings and afterwards by the side of the archons: it would then of course be known by the title of *The Boule*,—the senate, or council; its distinctive title 'senate of Areopagus,' borrowed from the place where its sittings were held, would not be bestowed until the formation by Solon of the second senate, or council, from which there was need to discriminate it."—G. Grote, *History of Greece*, pt. 2, ch. 10, v. 3.—See also ATHENS: B. C. 472-462.—In Roman times it still remained one of the governing bodies of Athens, and it was on the hill of the Areopagus that the Apostle Paul delivered his famous address to the Athenians.

AREQUIPA, the capital of a department of the same name in southern Peru, founded by Francisco Pizarro, the Spanish explorer and conqueror of the country, in the year 1540; captured by the Chileans in 1883 toward the close of the war between Peru and Chile.

ARETAS (Arab, *Haritha*), the name (Greek form) of a line of kings of the Nabataeans who reigned at Petra, Arabia.

ARETHUSA, Fountain of. See SYRACUSE.

AREVACÆ, one of the tribes of the Celtiberians in ancient Spain. Their chief town, Numantia, was the stronghold of Celtiberian resistance to the Roman conquest.

ARGADEIS. See GENTES; PHYLÆ: Phratriæ.

ARGALL, Sir Samuel (c. 1580-1626), English navigator and deputy governor of Virginia.

Quarrel with the French.—Attack on Nova Scotia. See CANADA: 1610-1613.

Control of Virginia settlement. See VIRGINIA: 1617-1619.

ARGAND, Aimé (1775-1803), Inventor of lamp chimneys. See INVENTIONS: 18th century: Artificial light.

ARGAUM, Battle of (1803). See INDIA: 1798-1805.

ARGENSON, the name of a French family which produced a long line of celebrated statesmen, men of letters and soldiers. Among the statesmen who were members of this prominent family

were René de Voyer, seigneur d'Argenson (1596-1651), entrusted by Cardinal Richelieu with many important state missions and appointed ambassador at Venice by Mazarin, and his son Marc René de Voyer, comte d'Argenson (1623-1700), who succeeded to the embassy at Venice at his father's death. Others of this influential family who distinguished themselves in public life were Marc René de Voyer, marquis de Paulmy and marquis d'Argenson (1652-1721), greatly feared for his intimate knowledge of state secrets and intrigues; the latter's eldest son, René Louis de Voyer de Paulmy, marquis d'Argenson (1694-1757) who was a prominent statesman, a writer of considerable ability and associate of Voltaire and the other great philosophers of his time; his younger brother, Marc Pierre de Voyer de Paulmy, comte d'Argenson (1696-1764), and the latter's son, Marc René, marquis de Voyer de Paulmy d'Argenson (1721-1782), who served as governor of Vincennes (1754) and was the father of Marc René Marie de Voyer de Paulmy, marquis d'Argenson (1771-1842), the most liberal-minded member of the historic family, who embraced the revolutionary cause at the outbreak of the French revolution.

ARGENTARIA, Battle of (378). See ALEMANNI: 378.

ARGENTARIUS, money dealer. See MONEY AND BANKING: Ancient: Rome.

ARGENTINA: Geographical description.—The federal republic of Argentina is next to Brazil the largest state in South America "To outline the physical basis of the Argentine nation we may take a glance at the country itself. The total area is [roughly] 1,500,000 square miles, or one-half that of the continental United States. It is a country long from north to south, wider in its northern and warmer section, and tapering to the point of Cape Horn. . . . Buenos Aires [the capital] lies in the latitude of Memphis, Tennessee, and has a mean annual temperature equivalent to that of South Carolina or Alabama. . . . Thus we may say that the central region of Argentina corresponds closely with the southern Gulf states and the southwest. . . . Thus Argentina, which reaches from within the tropics almost to the Antarctic Circle, experiences a range of temperatures less than those found in the United States, and must be characterized as a region of mild temperature or subtropical climate throughout the greater part of its extent. . . . The agricultural products of the country vary with the conditions of temperature and rainfall. . . . The orange grower of Florida and the cotton grower of the Gulf states would be at home in the northeastern part. . . . The corn planter might till his fields in the northern part of Buenos Aires province and the wheat farmer in the central and southern parts. The sugar grower from Louisiana would find cane and the sugar monopoly at Tucumán, the orchardist of California could grow grapes and fruits under irrigation in the valleys at the foot of the Andes about Mendoza. The cattlemen of northern Texas and the sheep-herder from Arizona and Wyoming might duplicate their ranges from Córdoba south to Santa Cruz, and in the far south, in Tierra del Fuego, the webfooted Oregonian would find congenial gray skies, mists, and rain. After this general survey it is desirable to distinguish more clearly the nuclear region of Argentina. The river provinces that range along both sides of the navigable Paraná and Paraguay on the north and east are Entre Ríos, Corrientes, and Misiones; on the south and west Buenos Aires, Sante Fé, and the territories of El Chaco and Formosa. These form the nucleus of the Argentine domain about which

the other provinces and territories are grouped. Here are the rich delta lands and the pampas favored by climate, soil and facile communication with the world. Here will gather a dense population and will always be the seat of Argentine wealth and commerce—the heart of the Argentine nation. . . . Here are immense plains now widely flooded by the tropical rains, but a slight change of level would convert them from swamps into rich extensive agricultural lands. . . . A peculiarity of the loess soils is their capacity to store up water and to retain their fertility under cultivation. The Chinese fields have been tilled for more than 4000 years without exhaustion, and there is every reason to believe that the fields of the Pampas, under intelligent culture, will also remain practically inexhaustible. . . . Eastward beyond the reach of the Andean streams, in the territories of central and southern Argentina is the great area of land which must always be devoted to grazing, and in large part to sheep raising. In the northern and drier regions of Patagonia the fine woolled Merino finds a congenial home, and there may be grown the wool suited to the manufacture of fine clothing and knitted goods. As we go south into the colder and moister districts toward the straits, the Merino gives place to the heavier and coarser English breeds, which are bred rather for mutton than for wool, and there already are located the freezing establishments which prepare mutton for the European markets. . . . Where it is practical it is more profitable to grow wheat and corn than to grow beef and mutton, and the economic advantage will in time displace the less profitable industry. . . . Argentina has no coal and throughout nine-tenths of her territory no large amount of water-power which can be utilized for manufacturing. Here she is definitely and narrowly limited, and must always be dependent for manufactured products upon countries more fortunately conditioned. . . . There are two districts in which water-power may be applied to manufacturing on a scale sufficient to affect the welfare of the nation. One of them is in the far northeast where the falls of Iguazú may yield twice the power of Niagara, and the other in the southwest where many streams in the valleys of the Cordillera will afford power to attract a manufacturing population. . . . The power of Iguazú is near the great centers of commerce, being situated on the Paraná and capable of transmission down the valley of the river to within reach of navigable waters. . . . The Cordilleran district is as far from Buenos Aires as St. Louis from New York, or Rome from London, and at present is still isolated for lack of communication; but railways are in process of extension toward it, and it will soon be brought within reach of freight and also of tourist traffic. Three raw materials of prime importance—wool, hides and wood—are immediately available in the district itself and the surrounding areas, and there will eventually be established important manufacturing industries to supply the great agricultural provinces.”—G. H. Blakeslee, *Latin America*, pp. 344-351.—See also LATIN AMERICA: Agriculture; and Map of South America.

Railroads.—“There are 20,000 miles of railroads in the Republic. The British showed the way in the initial building, and their lines pass through some of the fattest territory. The French have been tardy followers, but have constructed useful minor lines. The Argentine Government has built State lines through country that was suitable for colonisation, but which did not appeal to the outside investor. These State railways are financially

a failure. One reason is that the territory through which they run is not of the best. The principal reason is that they are the prey of the politicians. Constituencies have to be considered, and innumerable jobs found for the hangers-on of political parties. Business conditions are the last to be thought of, and, though the Government has done well in throwing these lines into distant regions needing development, they are not likely to succeed until placed under different control. Not only have the Argentines themselves not started railway companies, but they have no money invested in the foreign companies. One cause is that, though the Government insists on a local board of directors, the real board of directors is abroad, chiefly in London. Another cause is that dividends are limited by law to 7 per cent., and that is not a sufficient return for the Argentine. He does not care to touch investments that do not yield 12 per cent., and when he gets 30 per cent. he thinks that about fair—and the country is so prosperous it can afford it. Although within the last fifteen years millions of British money have poured into Argentina for railway construction, the investor in the old days cast a hesitating eye on South America as a place to sink his capital. In the 'fifties a railway a few miles long was all that Argentina could boast, and ten years later, when 7 per cent. was guaranteed, money was not forthcoming. As an inducement to construct a line between Rosario and Cordoba the absolute ownership of three miles on either side of the line was offered. Even with such an attraction the British investor was shy. Gradually, however, money was forthcoming, and lines were laid. In the 'eighties there came a spurt. It was not till the years following 1900 that money could be had for the asking. Lines cobwebbed the profitable country; distant points were linked up; land which previously had little beyond prairie value bounced up in price. Railway companies in England have had to fight landowners to make headway. In Argentina landowners welcome the coming of a railway, for obvious reasons. Most of the wealthy Argentines owe their fortunes to their land being benefited by the railways. As a rule, out in the far districts, a railway company can get the necessary land for nothing. Owners are willing to make financial contributions. The general managers of the big British railways in Argentina get large salaries—£7,000 [\$35,000] a year. This is partly to remove them from the range of temptation of being bribed by owners, syndicates, or land companies to authorise the making of railways where they would not be economically advisable. Of course, extensions near the big towns cost the railways as much as they would in England. I know a man who thirty years ago bought a piece of land for £1,600 [\$8,000]. He sold it to a railway company for over £200,000 [\$1,000,000]. Though foreign capital is having so extensive a run in networking the country with railways, the Argentine Government has a much closer grip on the working of the lines than the Board of Trade has on English companies. It is therefore no misrepresentation to say that, whilst private owners are glad to have their property enhanced in value by the juxtaposition of a railway, the Government puts obstacles in the way for what are ostensibly public reasons. Accordingly, expensive ‘diplomacy’ has sometimes to be used. The Government is sufficiently aware of the return the foreign investor gets—and when fresh extensions are sought it invariably withholds its consent until some concession has been wrung out of the company, such as an undertaking to construct a line through a

district that cannot, for some time at any rate, be a success. There is never any guarantee that another company will not be formed to work the same district. The Government smiles at the fight between the two lines for traffic—to the public benefit. When companies propose to amalgamate the Government either makes such demands in regard to uneconomic lines that the thing falls through or a veto is put upon the amalgamation altogether. All railway material comes in duty free, but one of the conditions is that 3 per cent. of the profits shall be used for the making of roads leading to railway stations. The companies do not object, because the call is not large, and it is to their interest that agriculturists should be able to get their produce to the railway station to be transported over the lines. The Dirección-General de *Ferrocarriles* [railroads] is the authority over the railways in Argentina. It decides the number of trains which shall be run, and it insists on the number of coaches. There must be a certain number of dormitory cars on all-night trains, and restaurant cars are obligatory over certain distances. Every train carries a letter-box, and recently the companies have been squeezed into carrying the mails for nothing. A medicine chest, a stretcher, a bicycle—so that quick communication can be made with the nearest station in case of accident—and all sorts of necessities in case of a breakdown are compulsory. Every carriage is thoroughly disinfected every month, and there is always a card to be initialled by an inspector. All bedding and mattresses are subject to scientific disinfection such as I have seen nowhere in Europe. No time-tables can be altered without the sanction of the National Railway Board at least two months before coming into operation. If trains stop at stations for which they are not scheduled a heavy fine is imposed; and all late trains, and the reason, have to be reported to the Government authority. No alteration, however small, to a station building or to the design of rolling stock is permissible without the sanction of the Government representatives. A complaint book is at every station, open to anyone to complain on any subject. The Republic lives by its exports of meat and agricultural produce. Ninety-five per cent. of this trade is carried to the ports by the railways. From the railroad cars one beholds productiveness; yet fifteen or twenty miles away lies land just as productive but as yet untouched by the plough, because there is neither sufficient population to cultivate nor railways to carry. Within the next dozen years there must inevitably be a further spurt in the making of feeding or auxiliary lines. Something like £20,000,000 a year is crossing the ocean for fresh railway enterprises in Argentina. Nearly 40,000,000 tons of goods are carried over the lines each year, and the receipts are something like £25,000,000 annually.”—J. F. Fraser, *Amazing Argentine*, pp. 45-40.—“Railways open, January 1, 1910, 22,578 miles, of which 3,816 miles (18 per cent.) belong to the State. The capital invested in Argentine railways amounts to 1,254,705,500 gold dollars.”—*Statesman's Year-Book*, 1920.—See also RAILROADS: 1017-1019.

Political divisions.—In 1921 the republic was composed of a group of one federal district: Buenos Aires with Martin Garcia island; fourteen provinces: Buenos Aires (La Plata), Córdoba, Mendoza, Santa Fé, Santiago del Estero, Salta, Entre Rios (Paraná), Corrientes, San Luis, Tucumán, San Juan, La Rioja, Catamarca and Jujui; ten territories: Santa Cruz (Gallegos), Chubut (Rawson), Rio Negro (Viedma), Pampa Central (Santa Rosa de Toay), Chaco (Resistencia), Formosa, Neu-

quén, Los Andes (San Antonio de los Cobres), Misiones (Posadas), Tierra del Fuego (Ushuaia).

Population.—Racial elements.—According to the first census taken in twenty years (1914) the population was 7,905,502. The number of foreigners, principally of Spanish and Italian origin, was 2,357,952, including about 40,000 of British extraction. Latest estimates of the total population were—1915: 7,979,259; 1919: 8,533,332.—“No other Spanish-American state, except Uruguay, has a people of a stock so predominantly European. The aboriginal Indian element is too small to be worth regarding. It is now practically confined to the Gran Chaco in the extreme north, but elsewhere the influence of Indian blood is undiscernible among the people to-day. The aborigines of the central Pampas have disappeared,—nearly all were killed off,—and those of Patagonia have been dying out. We have, therefore, a nation practically of pure South European blood, whose differences from the parent stock are due, not to the infusion of native elements but to local and historical causes. Till thirty or forty years ago this population was almost entirely of Spanish stock. Then the rapid development of the Pampas for tillage began to create a demand for labour, which, while it increased immigration from Spain, brought in a new and larger flow from Italy. The Spaniards who came were largely from the northern provinces and among them there were many Basques, a race as honest and energetic as any in Europe. . . . The Italians have flocked in from all parts of their peninsula, but the natives of the north take to the land, and furnish a very large part of the agricultural labour, while the men from the southern provinces, usually called Napolitanos, stay in the towns and work as railway and wharf porters, or as boatmen, and at various odd jobs. In 1909, out of 1,750,000 persons of foreign birth in the republic, there were twice as many Italians as Spaniards, besides one hundred thousand from France, the latter including many French Basques, who are no more French than Spanish. Between 1904 and 1909 the influx of immigrants had risen from 125,000 annually to 255,000. The Spaniards, of course, blend naturally and quickly with the natives, who speak the same tongue. The Italians have not yet blent . . . but there is so much similarity . . . that they will eventually become absorbed into the general population. Children born in the country grow up to be Argentines in sentiment, and are, perhaps, even more vehemently patriotic than the youth of native stock. . . . In considering the probable result of the commingling, and as a fact explaining the readiness with which Italian immigrants allow themselves to be Argentinized, one must remember that these come from the humblest and least-educated strata of Italian society. They are, like all Italians, naturally intelligent, but they have not reached that grade of knowledge which attaches men to the literature and the historical traditions of their own country. . . . The other foreigners, French, English (business men and landowning farmers), and German (chiefly business men in the cities) are hardly numerous enough to affect the Argentine type, and the two latter have hitherto remained as distinct elements, being mostly Protestants and marrying persons of their own race. They occupy themselves entirely with business and have not entered Argentine public life; yet as many of them mean to remain in the country, and their children born in it become thereby Argentine citizens, it is likely that they, also, will presently be absorbed, and their Argentine descendants may figure in politics here, as families of Irish and British origin do in

Chile."—Lord Bryce, *South America*, pp. 338-341.

1580-1777.—Final founding of the city of Buenos Aires.—Conflicts of Spain and Portugal over La Plata.—Creation of the viceroyalty of Buenos Aires.—"In the year 1580 the foundations of a lasting city were laid at Buenos Ayres by De Garay on the same situation as had twice previously been chosen—namely, by Mendoza, and by Cabeza de Vaca, respectively. [See BUENOS AIRES: 1580-1650.] The same leader [De Garay] had before this founded the settlement of Sante Fé on the Paraná. The site selected for the future capital of the Pampas is probably one of the worst ever chosen for a city . . . has probably the worst harbour in the world for a large commercial town. . . . Notwithstanding the inconvenience of its harbour, Buenos Ayres soon became the chief commercial entrepôt of the Valley of the Plata. The settlement was not effected without some severe fighting between De Garay's force and the Quehardies. The latter, however, were effectually quelled. . . . The Spaniards were now nominally masters of the Rio de La Plata, but they had still to apprehend hostilities on the part of the natives between their few and far-distant settlements [concerning which see PARAGUAY: 1515-1557]. Of this liability De Garay himself was to form a lamentable example. On his passage back to Asuncion, having incautiously landed to sleep near the ruins of the old fort of San Espiritu, he was surprised by a party of natives and murdered, with all his companions. The death of this brave Biscayan was mourned as a great loss by the entire colony. The importance of the cities founded by him was soon apparent; and in 1620 all the settlements south of the confluence of the rivers Paraná and Paraguay were formed into a separate independent government, under the name of Rio de La Plata, of which Buenos Ayres was declared the capital. This city likewise became the seat of a bishopric. . . . The merchants of Seville, who had obtained a monopoly of the supply of Mexico and Peru, regarded with much jealousy the prospect of a new opening for the South American trade by way of La Plata," and procured restrictions upon it which were relaxed in 1618 so far as to permit the sending of two vessels of 100 tons each every year to Spain, but subject to a duty of 50 per cent. "Under this miserable commercial legislation Buenos Ayres continued to languish for the first century of its existence. In 1715, after the treaty of Utrecht, the English . . . obtained the 'asiento' or contract for supplying Spanish colonies in America with African slaves, in virtue of which they had permission to form an establishment at Buenos Ayres, and to send thither annually four ships with 1,200 negroes, the value of which they might export in produce of the country. They were strictly forbidden to introduce other goods than those necessary for their own establishments; but under the temptation of gain on the one side and of demand on the other, the asiento ships naturally became the means of transacting a considerable contraband trade. . . . The English were not the only smugglers in the river Plate. By the treaty of Utrecht, the Portuguese had obtained the important settlement of Colonia [the first settlement of the Banda Oriental—or 'Eastern Border'—afterwards called Uruguay] directly

facing Buenos Ayres. . . . The Portuguese, . . . not contented with the possession of Colonia . . . commenced a more important settlement near Monte Video. From this place they were dislodged by Zavala [governor of Buenos Ayres], who, by order of his government, proceeded to establish settlements at that place and at Maldonado. Under the above-detailed circumstances of contention . . . was founded the healthy and agreeable city of Monte Video. . . . The inevitable consequence of this state of things was fresh antagonism between the two countries, which it was sought to put an end to by a treaty between the two nations concluded in 1750. One of the articles stipulated that Portugal should cede to Spain all of her establishments on the eastern bank of the Plata; in return for which she was to receive the seven missionary towns [known as the 'Seven Reductions'] on the Uruguay. But . . . the inhabitants of the Missions naturally rebelled against the idea of being handed over to a people known to them only by their slave-dealing atrocities. . . . The result was that when 2,000 natives had been slaughtered [in the war known as the War of the Seven Reductions] and their settlements reduced to ruins, the Portuguese repudiated the compact, as they could no longer receive their equivalent, and they still therefore retained Colonia. When hostilities were renewed in 1762, the governor of Buenos Ayres succeeded in possessing himself of Colonia; but in the following year it was restored to the Portuguese, who continued in possession until 1777, when it was definitely ceded to Spain. The continual encroachments of the Portuguese in the Rio de La Plata, and the impunity with which the contraband trade was carried on, together with the questions to which it constantly gave rise with foreign governments, had long shown the necessity for a change in the government of that colony; for it was still under the superintendence of the Viceroy of Peru, residing at Lima, 3,000 miles distant. The Spanish authorities accordingly resolved to give fresh force to their representatives in the Rio de La Plata; and in 1776 they took the important resolution to sever the connection between the provinces of La Plata and the Viceroyalty of Peru. The former were now erected into a new Viceroyalty, the capital of which was Buenos Ayres. . . . To this Viceroyalty was appointed Don Pedro Cevallos, a former governor of Buenos Ayres. . . . The first act of Cevallos was to take possession of the island of St. Katherine, the most important Portuguese possession on the coast of Brazil. Proceeding thence to the Plate, he razed the fortifications of Colonia to the ground, and drove the Portuguese from the neighbourhood. In October of the following year, 1777, a treaty of peace was signed at St. Ildefonso, between Queen Maria of Portugal and Charles III. of Spain, by virtue of which St. Katherine's was restored to the latter country, whilst Portugal withdrew from the Banda Oriental or Uruguay, and relinquished all pretensions to the right of navigating the Rio de La Plata and its affluents beyond its own frontier line. . . . The Viceroyalty of Buenos Ayres was sub-divided into the provinces of—(1.) Buenos Ayres, the capital of which was the city of that name, and which comprised the Spanish possessions that now form the Republic of Uruguay, as well as the Argentine provinces of Buenos Ayres, Santa Fé, Entre Rios, and Corrientes; (2.) Paraguay, the capital of which was Asuncion, and which comprised what is now the Republic of Paraguay; (3.) Tucuman, the capital of which was St. Iago del Estero, and which included what are to-day the Argentine

provinces of Cordova, Tucuman, St. Iago, Salta, Catamarca, Rioja, and Jujuy; (4.) Las Charcas or Potosi, the capital of which was La Plata, and which now forms the Republic of Bolivia; and (5.) Chiquito or Cuyo, the capital of which was Mendoza, and in which were comprehended the present Argentine provinces of St. Luiz, Mendoza, and St. Juan."—R. G. Watson, *Spanish and Portuguese South America*, v. 2, ch. 13-14.

1806-1820.—English invasion.—Revolution.—Independence achieved.—Confederation of the provinces of the Plate river and its dissolution.—“The trade of the Plate River had enormously increased since the substitution of register ships for the annual flotilla, and the erection of Buenos Ayres into a viceroyalty in 1778; but it was not until the war of 1797 that the English became aware of its real extent. The British cruisers had enough to do to maintain the blockade; and when the English learned that millions of hides were rotting in the warehouses of Monte Video and Buenos Ayres, they concluded that the people would soon see that their interests would be best served by submission to the great naval power. The peace put an end to these ideas; but Pitt's favourite project for destroying Spanish influence in South America by the English arms was revived and put in execution soon after the opening of the second European war in 1803. In 1806 . . . he sent a squadron to the Plate River, which offered the best point of attack to the British fleet, and the road to the most promising of the Spanish colonies. The English, under General Beresford, though few in number, soon took Buenos Ayres, for the Spaniards, terrified at the sight of British troops, surrendered without knowing how insignificant the invading force really was. When they found this out, they mustered courage to attack Beresford in the citadel; and the English commander was obliged to evacuate the place. The English soon afterwards took possession of Monte Video on the other side of the river. Here they were joined by another squadron, who were under orders, after reducing Buenos Ayres, to sail round the Horn, to take Valparaiso, and establish posts across the continent connecting that city with Buenos Ayres, thus executing the long-cherished plan of Lord Anson. Buenos Ayres was therefore invested a second time. But the English land forces were too few for their task. The Spaniards spread all round the city strong breastworks of oxhides, and collected all their forces for its defence. Buenos Ayres was stormed by the English at two points on the 5th of July, 1807; but they were unable to hold their ground against the unceasing fire of the Spaniards, who were greatly superior in numbers, and the next day they capitulated, and agreed to evacuate the province within two months. The English had imagined that the colonists would readily flock to their standard, and throw off the yoke of Spain. This was a great mistake; and it needed the events of 1808 to lead the Spanish colonists to their independence. . . . In 1810, when it came to be known that the French armies had crossed the Sierra Morena, and that Spain was a conquered country, the colonists would no longer submit to the shadowy authority of the colonial officers, and elected a junta of their own to carry on the Government. Most of the troops in the colony went over to the cause of independence, and easily overcame the feeble resistance that was made by those who remained faithful to the regency in the engagement

of Las Piedras. The leaders of the revolution were the advocate Castelli and General Belgrano; and under their guidance scarcely any obstacle stopped its progress. They even sent their armies at once into Upper Peru and the Banda Oriental, and their privateers carried the Independent flag to the coasts of the Pacific; but these successes were accompanied by a total anarchy in the Argentine capital and provinces. The most intelligent and capable men had gone off to fight for liberty elsewhere; and even if they had remained it would have been no easy task to establish a new government over the scattered and half-civilized population of this vast country. . . . The first result of independence was the formation of a not very intelligent party of country proprietors, who knew nothing of the mysteries of politics, and were not ill-content with the existing order of things. The business of the old viceregal government was delegated to a supreme Director; but this functionary was little more than titular. How limited the aspirations of the Argentines at first were may be gathered from the instructions with which Belgrano and Rivadavia were sent to Europe in 1814. They were to go to England, and ask for an English protectorate; if possible under an English prince. They were next to try the same plan in France, Austria, and Russia, and lastly in Spain itself: and if Spain still refused, were to offer to renew the subjection of the colony, on condition of certain specified concessions being made. This was indeed a strange contrast to the lofty aspirations of the Colombians. On arriving at Rio, the Argentine delegates were assured by the English minister, Lord Strangford, that, as things were, no European power would do anything for them; nor did they succeed better in Spain itself. Meanwhile the government of the Buenos Ayres junta was powerless outside the town, and the country was fast lapsing into the utmost disorder and confusion. At length, when Government could hardly be said to exist at all, a general congress of the provinces of the Plate River assembled at Tucuman in 1816. It was resolved that all the states should unite in a confederation to be called the United Provinces of the Plate River; and a constitution was elaborated, in imitation of the famous one of the United States, providing for two legislative chambers and a president. . . . The influence of the capital, of which all the other provinces were keenly jealous, predominated in the congress; and Puyrredon, an active Buenos Ayres politician, was made supreme Director of the Confederation. The people of Buenos Ayres thought their city destined to exercise over the rural provinces a similar influence to that which Athens, under similar circumstances, had exercised in Greece; and able Buenos Ayreans like Puyrredon, San Martin, and Rivadavia, now became the leaders of the unitary party. The powerful provincials, represented by such men as Lopez and Quiroga, soon found out that the Federal scheme meant the supremacy of Buenos Ayres, and a political change which would deprive them of most of their influence. The Federal system, therefore, could not be expected to last very long; and it did in fact collapse after four years. Artigas led the revolt in the Banda Oriental [now Uruguay], and the Riverene Provinces soon followed the example. For a long time the provinces were practically under the authority of their local chiefs, the only semblance of political life being confined to Buenos Ayres itself.”—E. J. Payne, *History of European colonies*, ch. 17.—See also LATIN AMERICA: 1778-1824; URUGUAY: 1806-1815.

1819-1874.—Anarchy, civil war, despotism.—Long struggle for order and confederation.—“A new Congress met in 1819 and made a Constitution for the country, which was never adopted by all the Provinces. Pueyrredon resigned, and on June 10th, 1819, José Rondeau was elected, who, however, was in no condition to pacify the civil war which had broken out during the government of his predecessors. At the commencement of 1830, the last ‘Director General’ was overthrown; the municipality of the city of Buenos-Aires seized the government; the Confederation was declared dissolved, and each of its Provinces received liberty to organize itself as it pleased. This was anarchy officially proclaimed. After the fall in the same year of some military chiefs who had seized the power, Gen. Martín Rodríguez was named Governor of Buenos-Aires, and he succeeded in establishing some little order in this chaos. He chose M. J. García and Bernardo Rivadavia—one of the most enlightened Argentines of his times—as his Ministers. This administration did a great deal of good by exchanging conventions of friendship and commerce, and entering into diplomatic relations with foreign nations. At the end of his term General Las Heras—9th May, 1824—took charge of the government, and called a Constituent Assembly of all the Provinces, which met at Buenos-Aires, December 16th, and elected Bernardo Rivadavia President of the newly Confederated Republic on the 7th February, 1825. This excellent Argentine, however, found no assistance in the Congress. No understanding could be come to on the form or the test of the Constitution, nor yet upon the place of residence for the national Government. Whilst Rivadavia desired a centralized Constitution—called here ‘unitarian’—and that the city of Buenos-Aires should be declared capital of the Republic, the majority of Congress held a different opinion, and this divergence caused the resignation of the President on the 5th July, 1827. After this event, the attempt to establish a Confederation which would include all the Provinces was considered as defeated, and each Province went on its own way, whilst Buenos-Aires elected Manuel Dorrego, the chief of the federal party, for its Governor. He was inaugurated on the 13th August, 1827, and at once undertook to organize a new Confederation of the Provinces, opening relations to this end with the Government of Córdoba, the most important Province of the interior. He succeeded in re-establishing repose in the interior, and was instrumental in preserving a general peace, even beyond the limits of his young country. The Emperor of Brazil did not wish to acknowledge the rights of the United Provinces over the Cisplatine province, or Banda Oriental [now Uruguay]. He wished to annex it to his empire, and declared war to the Argentine Republic on the 10th of December, 1826. An army was soon organized by the latter, under the command of General Alvear, which on the 20th of February, 1827, gained a complete victory over the Brazilian forces—twice their number—at the plains of Ituzaingó, in the Brazilian province of Rio Grande do Sul. The navy of the Argentines also triumphed on several occasions, so that when England offered her intervention, Brazil renounced all claim to the territory of Uruguay by the convention of the 27th August, 1828, and the two parties agreed to recognize and to maintain the

neutrality and independence of that country. Dorrego, however, had but few sympathizers in the army, and a short time after his return from Brazil, the soldiers under Lavalle rebelled and forced him to fly to the country on the 1st December of the same year. There he found aid from the Commander General of the country districts, Juan Manuel Rosas, and formed a small battalion with the intention of marching on the city of Buenos-Aires. But Lavalle triumphed, took him prisoner, and shot him without trial on the 13th December. . . . Not only did the whole interior of the province of Buenos-Aires rise against Lavalle, under the direction of Rosas, but also a large part of other Provinces considered this event as a declaration of war, and the National Congress, then assembled at Santa-Fé, declared Lavalle’s government illegal. The two parties fought with real fury, but in 1829, after an interview between Rosas and Lavalle, a temporary reconciliation was effected. . . . The legislature of Buenos-Aires, which had been convoked on account of the reconciliation between Lavalle and Rosas, elected the latter as Governor of the Province, on December 6th, 1829, and accorded to him extraordinary powers. . . . During this the first period of his government he did not appear in his true nature, and at its conclusion he refused a re-election and retired to the country. General Juan R. Balcarce was then—17th December, 1832—named Governor, but could only maintain [the office] some eleven months: Viamont succeeded him, also for a short time only. Now the moment had come for Rosas. He accepted the almost unlimited Dictatorship which was offered to him on the 7th March, 1835, and reigned in a horrible manner, like a madman, until his fall. Several times the attempt was made to deliver Buenos-Aires from his terrible yoke, and above all the devoted and valiant efforts of General Lavalle deserve to be mentioned; but all was in vain; Rosas remained unshaken. Finally, General Justo José De Urquiza, Governor of the province of Entre-Rios, in alliance with the province of Corrientes and the Empire of Brazil, rose against the Dictator. He first delivered the Republic of Uruguay, and the city of Monte-Video—the asylum of the adversaries of Rosas—from the army which besieged it, and thereafter passing the great river Paraná, with a relatively large army, he completely defeated Rosas at Monte-Caseros, near Buenos-Aires, on the 3rd February, 1852. During the same day, Rosas sought and received the protection of an English war-vessel which was in the road of Buenos-Aires, in which he went to England, where he [died in 1877]. . . . Meantime Urquiza took charge of the Government of the United Provinces, under the title of ‘Provisional Director,’ and called a general meeting of the Governors at San Nicolás, a frontier village on the north of the province of Buenos-Aires. This assemblage confirmed him in his temporary power, and called a National Congress which met at Santa-Fé and made a National Constitution under date of 25th May, 1853. [See also FEDERAL GOVERNMENT: Modern federations.] By virtue of this Constitution the Congress met again the following year at Paraná, a city of Entre-Rios, which had been made the capital, and on the 5th May, elected General Urquiza the first President of the Argentine Confederation. . . . The important province of Buenos-Aires, however, had taken no part in the deliberations of the Congress. Previously, on the 11th September, 1852, a revolution against Urquiza, or rather against the Provincial Government in alliance with him, had taken place and caused a temporary separation of the Province from the Republic. Several efforts to

pacify the disputes utterly failed, and a battle took place at Cepeda in Santa-Fé, wherein Urquiza, who commanded the provincial troops, was victorious, although his success led to no definite result. A short time after, the two armies met again at Pavon—near the site of the former battle—and Buenos-Aires won the day. This secured the unity of the Republic of which the victorious General Bartolomé Mitre was elected President for six years from October, 1862. At the same time the National Government was transferred from Paraná to Buenos-Aires, and the latter was declared the temporary capital of the Nation. The Republic owes much to the Government of Mitre, and it is probable that he would have done more good, if war had not broken out with Paraguay, in 1865 [see PARAGUAY: 1608-1873]. The Argentines took part in it as one of the three allied States against the Dictator of Paraguay, Francisco Solano Lopez. On the 12th October, 1868, Domingo Faustino Sarmiento succeeded Gen. Mitre in the Presidency. . . . The 12th October, 1874, Dr. Nicolas Avellaneda succeeded him in the Government."—R. Napp, *Argentine republic, ch. 2.*—See also BRAZIL: 1825-1865; URUGUAY: 1821-1905.

1824.—At first congress of South American republics. See LATIN AMERICA: 1822-1830.

1850-1891.—Constitution and its working.—

Governmental corruption.—Revolution of 1890, and the financial collapse.—“The Argentine constitutional system in its outward form corresponds closely to that of the United States. . . . But the inward grace of enlightened public opinion is lacking, and political practice falls below the level of a self-governing democracy. Congress enacts laws, but the President as commander-in-chief of the army, and as the head of a civil service dependent upon his will and caprice, possesses absolute authority in administration. The country is governed by executive decrees rather than by constitutional laws. Elections are carried by military pressure and manipulation of the civil service. . . . President Roca [who succeeded Avellaneda in 1880] virtually nominated, and elected his brother-in-law, Juarez Célman, as his successor. President Juarez set his heart upon controlling the succession in the interest of one of his relatives, a prominent official; but was forced to retire before he could carry out his purpose. . . . Nothing in the Argentine surprised me more than the boldness and freedom with which the press attacked the government of the day and exposed its corruption. . . . The government paid no heed to these attacks. Ministers did not trouble themselves to repel charges affecting their integrity. . . . This wholesome criticism from an independent press had one important effect. It gave direction to public opinion in the capital, and involved the organization of the Unión Cívica. If the country had not been on the verge of a financial revulsion, there might not have been the revolt against the Juarez administration in July, 1890; but with ruin and disaster confronting them, men turned against the President whose incompetence and venality would have been condoned if the times had been good. The Unión Cívica was founded when the government was charged with maladministration in sanctioning an illegal issue of \$40,000,000 of paper money. . . . The government was suddenly confronted with an armed coalition of the best battalions of the army, the entire navy, and the Unión Cívica. The manifesto issued by the Revolutionary Junta was a terrible arraignment of the political

crimes of the Juarez Government. . . . The revolution opened with every prospect of success. It failed from the incapacity of the leaders to cooperate harmoniously. On July 19, 1890, the defection of the army was discovered. On July 26 the revolt broke out. For four days there was bloodshed without definite plan or purpose. No determined attack was made upon the government palace. The fleet opened a fantastic bombardment upon the suburbs. There was inexplicable mismanagement of the insurgent forces, and on July 29 an ignominious surrender to the government with a proclamation of general amnesty. General Roca remained behind the scenes, apparently master of the situation, while President Juarez had fled to a place of refuge on the Rosario railway, and two factions of the army were playing at cross purposes, and the police and the volunteers of the Unión Cívica were shooting women and children in the streets. Another week of hopeless confusion passed, and General Roca announced the resignation of President Juarez and the succession of vice-President Pellegrini. Then the city was illuminated, and for three days there was a pandemonium of popular rejoicing over a victory which nobody except General Roca understood. . . . In June, 1891, the deplorable state of Argentine finance was revealed in a luminous statement made by President Pellegrini. . . . All business interests were stagnant. Immigration had been diverted to Brazil. . . . All industries were prostrated except politics, and the pernicious activity displayed by factions was an evil augury for the return of prosperity. . . . During thirty years [1862-1892] the country has trebled its population, its increase being relatively much more rapid than that of the United States during the same period.”—I. N. Ford, *Tropical America, ch. 6.*

1887.—Trans-Andean railway building with Chile. See RAILROADS: 1872-1912.

1890.—First International American Congress at Washington. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1800.

1892.—Presidential election.—Dr. Luis Saenz Peña, former chief justice of the Supreme Court, reputed a man of great integrity and ability, was chosen president, and inaugurated October 12, 1892.

1895.—Resignation of President Peña.—President Saenz Peña having refused to issue, at the request of Congress, a decree of amnesty, extended to all persons implicated in the last revolution, his cabinet resigned (January 16), and he found it impossible to form another. Thereupon the president himself resigned his office, on January 22, and his resignation was accepted by the Congress. Señor Uriburu was elected president on the following day, and promptly issued the desired decree.

1898.—Settlement of boundary dispute with Chile.—Election of president.—“A long unsettled dispute as to the extended boundary between the Argentine Republic and Chile, stretching along the Andean crests from the southern border of the Atacama Desert to Magellan Straits, nearly a third of the length of the South American continent, assumed an acute stage in the early part of the year, and afforded to this Government occasion to express the hope that the resort to arbitration, already contemplated by existing conventions between the parties, might prevail despite the grave difficulties arising in its application. I am happy to say that arrangements to this end have been perfected, the questions of fact upon which the respective commissioners were unable to agree being in course of reference to Her Britannic Majesty for determination. A residual difference touching

the northern boundary line across the Atacama Desert, for which existing treaties provided no adequate adjustment, bids fair to be settled in like manner by a joint commission, upon which the United States Minister at Buenos Aires has been invited to serve as umpire in the last resort."—*Message of the president of the United States of America, Dec., 1898.*—The arbitration of the United States minister, Hon. William I. Buchanan, proved successful in the matter last referred to, and the Atacama boundary was quickly determined. June, 1898, General Julio Roca was elected president and assumed the office in October. In July a treaty of arbitration was concluded with the government of Italy, which provides that there shall be no appeal from the decision of the arbitrators.

1901.—Second International American Congress at Mexico City. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1901-1902.

1902.—Drago's note to United States asking aid against foreign intervention. See DRAGO DOCTRINE.

1902.—Treaties between Argentina and Chile for obligatory arbitration of all disputes, and for restriction of naval armaments.—Notwithstanding the fortunate arrangement, in 1898, for arbitration of a serious boundary dispute between Argentina and Chile (see ante, 1898), there continued to be troublesome frictions between the two Spanish-American neighbors, while awaiting the decision of the arbitrator, King Edward VII, which was not rendered until Nov. 27, 1902. These had led to a ruinous rivalry in naval armament. Reporting on this state of affairs in May of that year, Mr. William P. Lord, the American minister to Argentina, wrote: "Both countries have incurred heavy expense for the equipment and maintenance of largely increased army and naval forces. Chile has recently contracted for two formidable warships involving a heavy cost with the object of putting her navy upon an equality with the Argentine navy, whereupon Argentina, not to be outdone, contracted for two warships larger in size and perhaps more formidable at a like heavy cost in order to continue and maintain her naval superiority. The costly expenditure incurred on account of war and naval preparations is paralyzing industrial activity and commercial enterprise. Both countries are largely in debt and confronted with a deficit. Both have appropriated their conversion funds which had been set apart for a specific purpose, and which, it would seem, should have been preserved inviolable. Neither is able to make a foreign loan without paying a high rate of interest and giving guarantees to meet the additional expenses which their war policy is incurring, and both Governments know and their people know that the only remedy to which either can resort to meet existing financial conditions is to levy fresh taxes of some description, notwithstanding nearly everything that can be taxed is now taxed to the utmost limit. The weight of taxation already imposed bears heavily upon the energies and activities of the people. The outlook is not promising, business being dull, wage employment scarce, and failures frequent." On June 3, 1902, the same writer forwarded to Washington the text of four remarkable "peace agreements" which had been signed on May 28, at the Chilean capital, by the Chilean minister of foreign relations and the Argentine minister plenipotentiary to Chile, who had been brought to negotiations by the friendly mediation of Great Britain. The four documents were: a political convention declaring a common international policy on the part of the two republics;

a broad treaty of general arbitration; an agreement for reducing naval forces; an agreement for the conclusive marking of boundary lines by the engineers of the arbitrator, King Edward. The general arbitration treaty is no less unreserved and comprehensive than that between Peru and Bolivia and offers another Spanish-American model for imitation in the interest of peace. Its articles are as follows:

"ART. 1. The high contracting parties bind themselves to submit to arbitration every difficulty or question of whatever nature that may arise between them, provided such questions do not affect the precepts of the respective constitutions of the two countries, and that they can not be solved through direct negotiation.

"ART. 2. This treaty does not embrace those questions that have given rise to definite agreements between the two parties. In such cases the arbitration shall be limited exclusively to questions of validity, interpretation, or fulfillment of these agreements.

"ART. 3. The high contracting parties designate as arbitrator the Government of His Britannic Majesty or, in the event of either of the powers having broken off relations with the British Government, the Swiss Government. Within sixty days from the exchange of ratifications the British Government and the Swiss Government shall be asked to accept the charge of arbitrators.

"ART. 4. The points of controversy, questions or divergencies shall be specified by the high contracting parties, who may determine the powers of the arbitrator or any other circumstance connected with the procedure.

"ART. 5. In the case of divergence of opinion, either party may solicit the intervention of the arbitrator, who will determine the circumstances of procedure, the contracting parties placing every means of information at the service of the arbitrator.

"ART. 6. Either party is at liberty to name one or more commissioners near the arbitrator.

"ART. 7. The arbitrator is qualified to decide upon the validity of the obligation and its interpretation, as well as upon questions as to what difficulties come within the sphere of the arbitration.

"ART. 8. The arbitrator shall decide in accordance with international law, unless the obligation involves the application of special rules or he have been authorized to act as friendly mediator.

"ART. 9. The award shall definitely decide each point of controversy.

"ART. 10. The award shall be drawn up in two copies.

"ART. 11. The award legally delivered shall decide within the limits of its scope the question between the two parties.

"ART. 12. The arbitrator shall specify in his award the term within which the award shall be carried out, and he is competent to deal with any question arising as to the fulfillment.

"ART. 13. There can be no appeal from the award, and its fulfillment is intrusted to the honor of the signatory powers. Nevertheless, the recourse of revision is admitted under the following circumstances: 1. If the award be given on the strength of a false document; 2. If the award be the result, either partially or totally, of an error of fact.

"ART. 14. The contracting parties shall pay their own expenses and each a half of the expenses of the arbitration.

"ART. 15. The present agreement shall last for ten years from the date of the exchange of the ratifications, and shall be renewed for another term

of ten years, unless either party shall give notice to the contrary six months before expiry."—*Papers relating to the Foreign Relations of the United States, 1902, pp. 13-20.*

In their convention on naval armaments the two governments "renounced the acquisition of the war vessels they have in construction and the making for the present of any new acquisitions, agreeing to reduce their fleets to "a prudent equilibrium."

1902-1909.—Controversy with Brazil over equilibrium of armament. See WAR, PREPARATION FOR: 1902-1909.

1903.—Population.—"Statistics of 1903 showed 1,000,000 foreigners in Argentina in a total of 5,000,000. Of these 500,000 were Italians, 200,000 Spaniards, 100,000 French, 25,000 English, 18,000 Germans, 15,000 Swiss, 13,000 Austrians, and the remainder of many nationalities. The number of Americans did not exceed 1,500, although many are coming now, to go into cattle-raising and farming in the country or into all kinds of business in Buenos Ayres. English influence is very strong, especially in financial circles, with the Germans almost equally active."—J. Barrett, *Argentina (American Review of Reviews, July, 1905).*

1904.—Inauguration of President Quintana.—Dr. Manuel Quintana, elected president of the republic, was inaugurated on October 12.

1905.—Revolutionary movement promptly suppressed.—A revolutionary undertaking, in Buenos Aires and several provinces, had its outbreak on February 4, but was suppressed so promptly that the public disturbance by it was very brief. Particulars of the affair were reported by the American minister at Buenos Aires, Mr. Beaupré, as follows: "On the afternoon of the 3d instant rumors of an intended movement subversive of the established government of this country came to the Federal authorities from various parts of the Republic. These rumors were at first discredited, but finally proved so persistent that the President and heads of the various departments of the government proceeded to take measures of precaution. In the early hours of the morning of the next day, the 4th instant, the anticipated outbreak came simultaneously in the capital, Rosario, Mendoza, Córdoba, and Bahía Blanca, these being the largest cities of the Republic and the principal political and military centers. In the capital the plan of the revolutionists seems to have been to attack the police stations and military arsenal, with a view perhaps of forcing the police of the capital into their ranks and of supplying themselves with arms and munitions. At the arsenal, by a simple stratagem of the minister of war, the malcontents were lured into the building and arrested. About the police stations there was some fighting, particularly at Station No. 14; but the insurgents proved unprepared and insufficiently organized, so that by dawn the movement had completely failed in this city. Except that many of the shops remained closed throughout the day of the 4th, and except for the presence of armed police in the streets, there were no evidences of any revolutionary effort. Some half dozen fatalities are reported. The prompt and effective suppression of the revolution in this city is due in large measure to the energy and judgment displayed by the President and his ministers, who spent the entire night in the Government House in council. . . . The President proceeded at 8 A. M. of the 4th to declare the Republic in a state of siege for a period of thirty days, to call out the reserves and to establish a censorship of the press and of the telegraph service. . . . The real center of the movement was

the city of Córdoba, while serious trouble seemed in view in the city of Mendoza, where the revolutionists were said to be in a strong position, and in the province of Buenos Aires, where troops and marines were already in movement from Bahía Blanca upon the capital. Forces despatched to those points made as quick an ending of the revolt there as at the capital. . . . The revolutionists, finding threats and resistance vain, fled yesterday before the government troops arrived. With the failure of the movement in Córdoba the revolution is considered at an end and the country has returned to its former condition of peace and tranquillity."

1906.—Death of President Quintana.—Dr. Manuel Quintana, president of Argentina, died in March, 1906, and was succeeded by the vice-president, Dr. Figuero Alcorta, whose term of office ended in 1910.

1906.—Third International American Congress at Rio de Janeiro. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906.

1909.—Assassination of Colonel Falcon.—As Colonel Falcon, prefect of police at Buenos Aires, was returning from a funeral, with his secretary, on November 14, a bomb was thrown into the carriage and exploded, with fatal effects to both. The assassin, a youth of nineteen years was captured. The murder had been preceded by a number of bomb explosions during a period of six months, all attributed to anarchists from Europe, of whom large numbers were said to have gathered in Buenos Aires.

1909.—Chief food supply to Great Britain.—"How many readers of *The Times* (said a special correspondent of the *London Times* writing from Buenos Aires, October 15, 1909), if asked to name the country which supplied the United Kingdom last year with the largest quantity of wheat, of maize, and of refrigerated and frozen cattle, would unhesitatingly award the first place to the Argentine Republic? How many English people realize that this South American Republic is changing places with the North American Republic in the exporting of these and other food products to the United Kingdom? The change is partly due to the shortage of meat in America, and partly to the fact that with their increasing population the United States will have less and less surplus provisions with which to supply the world."

1909.—Arbitration of the Acré boundary dispute between Bolivia and Peru. See ACÉ DISPUTES.

1909.—Mitre Law and the railroads.—"Until 1909 each of the Argentine railway companies was (as the Uruguayan still are) controlled by the terms of its particular concession or concessions. In that year, however, a law was passed, usually called the 'Mitre Law,' after its initiator, the late Senor Emilio Mitre (an eminent Argentine statesman and son of the famous General Mitre, perhaps Argentina's greatest president and historian, by which all then existing companies agreeing to be bound by its provisions should be exempt from all National, Provincial and Municipal taxation and Import Duties on material until the year 1947; they, on their part, to pay to the National Government a single tax of 3% on their net earnings, the amount of such earnings to be ascertained by deducting 10% (for working expenses) from their gross receipts. Only one Company was then enjoying even more favourable terms under its original concession than those given by the Mitre Law; but as that concession was approaching the time of its expiration it would have been ill-judged on the part of the Company to have shown itself

recalcitrant to the evident wishes of the Argentine Government. Therefore it exercised its option in favour of the Mitre Law, as did all the other Companies. . . . Besides British, considerable French and Belgian capital is invested in Argentine railways. The 'Province of Santa Fé' and the 'Province of Buenos Aires' railways are controlled by French Companies. Incidentally it may be mentioned that in recent years most of the shares of the 'Anglo-Argentine' Tramways Company (which owns the principal tramway system of the Capital) had found their way to Belgium. A short while ago a United States Syndicate, deemed powerful and feared as menacing a monopoly, obtained control of some of the River Plate lines, notably those of the Central Córdoba, Santa Fé and Entre Rios Companies, under certain arrangements. This Syndicate has since, however, been unable to command the capital necessary to fulfil its part of those arrangements, and, practically, the control of the lines has now reverted to the original companies, the first and last named of which are British."—G. Ross, *Argentina and Uruguay*, pp. 122-124.

1909.—Building of the Transandine railway tunnel. See RAILROADS: 1872-1912.

1910.—Agreement with Uruguay concerning the river Plate.—The following message came from Buenos Aires on January 6, 1910: "A burning question between Argentina and Uruguay, which for two years was seemingly insoluble and possibly involved Brazil, has been settled by Señor Roque Saenz-Peña. As Argentine Plenipotentiary he signed a Protocol at Montevideo yesterday, of which the following is a summary: Recognizing the reciprocal desire for friendly relations, fortified by the common origin of the two nations, the parties agree to declare that past differences are not capable of being regarded as a cause of offence and shall not be allowed to continue. The navigation and use of the waters of the River Plate will continue as heretofore without alteration, and differences which may arise in the future will be removed and settled in the same spirit of cordiality."

1910.—Fourth International American Conference at Buenos Aires. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1910.

1910-1914.—Political reform.—"Dr. Roque Saenz Peña, when he came into power in 1910, was convinced that the country was ready for reform. He thoroughly realised that it would be necessary, not merely to amend the existing laws or to make new ones, but to encourage and foster in every citizen an intelligent interest in all matters of national concern. In his presidential campaign, he promised to observe absolute impartiality in all political matters; and in order to carry out this promise, from his first day of office, he severed all ties with the party that had supported him in his candidature. But 'party' in the Argentine signifies men and not opinions, so that Saenz Peña did not in any way renounce his former views, though taking the greatest pains to show no special favour to those who had helped him to his position. For the sake of a forcible example, he permitted himself no outward display of gratitude or friendship. This step was specially significant in a country where, by tradition and a false conception of loyalty, the President had always felt it his duty to raise members of his party to the highest posts in the State. By a kind of tacit agreement his will was thus completely bound up with each individual will of his friends and colleagues. By accepting outside assistance he thereby pledged himself to repay it, and thus en-

tangled himself in a multiplicity of obligations, which hampered his every action. . . . Saenz Peña was desirous of putting a speedy end to this condition of things, a condition that crippled the power of the Executive and upset the whole machinery of constitutional government. He fully realised that, in separating himself from his friends and thus depriving himself of their support—which was relied on as a matter of course by all former Presidents—he was cutting himself completely adrift and was thus risking the failure of his policy. But his care was for the State and not for the security of his own office, and in acting thus he hoped to increase the prestige of the Executive and strengthen its hands for the future. In order to keep the Executive free from all corrupt influences, he chose his ministers for their integrity rather than for their political leanings. But he did not confine himself merely to showing his intention of governing without the help of any political group; he seized every opportunity of letting the Provincial Governors know that he could do without their costly friendship. But, though he could dispense with their protection, he still required their loyalty; and he therefore left to each of the federal states full responsibility for its actions and absolute autonomy. Thus Congress gradually became composed of conscientious members who eventually transformed the once submissive ally of the Executive into a powerful independent body. This step of Saenz Peña, which is clearly the indication of a master mind, may be regarded as the fundamental characteristic of his government. The change brought a sense of relief to the people, which had long awaited in vain its introduction. It meant no mere correction of past faults; it was the foundation stone of political and administrative honesty. Its effect was to keep each branch of the government within the bounds assigned to it by the constitution, and to make the people their own rulers. . . . The hearty reception accorded to this great change, both by the people and by the Press, showed clearly the feeling of grateful appreciation it had aroused among the whole nation. It was evident that the success of the legislation which was bound to follow was already assured. It was in fact but the first step towards the introduction of a bill for the reform of the whole electoral system, which was destined to effect a sweeping political change. . . . The obvious inference to be drawn from his conduct was that he felt, above all, anxious to prevent corruption in the elections, to guarantee the purity of the ballot and the free exercise of the vote, in order that the candidates elected should be the true representatives of the people. In January 1912, he laid before Parliament his Electoral Reform Bill, which at once met with keen, though not unexpected opposition; many members, elected under the old régime, perceived the risk of losing their seats under the proposed new system. The moral value of the Bill, however, was recognised, and the majority of members, though not pinning much faith to its working in actual practice, gave it their support; it seemed, on the face of it at any rate, a step in the right direction. Saenz Peña, strange as it may seem, found public opinion inclined the same way, both before and after the passing of the Bill. Though favourably disposed towards it, people were somewhat sceptical. They believed that it would be inoperative owing to the attitude of the politicians of the old school, who would probably find some means of evading the new law; they were afraid that corruption would still triumph, that the masses would vote no more freely than before; and they looked upon the

whole thing as an impracticable Utopia. After a brilliant defence by the Minister of the Interior, M. Indalecio Gomez, the measure, despite all opposition, passed through the Lower House to the Senate and shortly afterwards became law. The new statute established compulsory voting and the secret ballot, and provided for representation of the minority. The elector now no longer holds a civil certificate, as formerly, but a military one, which contains his signature, his photograph and his finger-prints; and the register used in the elections is compiled by the officials of the War Office. This arrangement not only acts as a great check upon impersonation, but has the advantage also of doing away with the old method of the census; the register, after being drawn up by the War Office, is revised by the federal judges, to ensure its accuracy. Any person on the list, who refuses to vote, is liable to a penalty of ten piastres or two days' imprisonment, while public servants are prohibited from taking any active part in the elections and from becoming candidates, without having previously handed in their resignations. In order to record his vote, the elector has to present himself at one of the polling booths of his parish and take his military certificate with him. The officer in charge, after identifying him, hands him a special envelope and allows him to pass into the voting-room, where he finds the voting papers of each candidate. There the voter exercises his choice and places the paper in the envelope, which he then seals and slips into the box as he goes out, in the presence of the presiding official. The counting takes place in public, and the validity of the voting papers is secured by a committee composed of the President of the Court of Appeal, the President of the Municipal Council, and one of the federal judges. As formerly, Congress is the supreme tribunal for all questions concerning the validity of elections. On April 7, 1912, the election of sixty deputies—to take the place of the half about to resign—gave the people their first opportunity of testing the new law and verifying the promises of strict impartiality that had been so freely given. . . . Out of an electorate of 934,401 persons, 840,852 voted at the 4,650 polling booths, whereas formerly scarcely 25 per cent. recorded their votes. The Radical Party, which for the past twenty years had taken no active part in any of the elections, the Civic Union, which in the end came near following the example of the Radicals; the Socialist Party, which had struggled in vain for eight years; the National Union, which under various different names had triumphed at many successive elections, and several other parties of minor importance,—all took part in the contest. Corruption was not entirely absent, but it frequently rebounded against those who resorted to it. The voter open to bribery accepted bribes, but, owing to the secrecy of the ballot, was able to cheat the giver and drop his voting paper into the box of the party of his choice. . . . The elections, which all took place on the same day, passed off peaceably and without any exercise of official pressure. The suffrage had been made free; the President had kept his word. The results were all declared together, some few weeks later. They formed a complete vindication of the new system and indicated the real views of the people, while showing up in their true colours the fictitious triumphs of past elections. Thus in Buenos Ayres the Radicals, who had not been able to enter the Chamber for twenty years, gained eight seats in the Lower House and one in the Upper; the Socialists won two seats, and the Civic Union one; while the National Union, which had formerly

swamped every other party, kept only one, and that solely on account of the personal qualifications of the candidate. . . . The compulsory vote has finally roused the people from the state of indifference into which they had drifted. It is no longer useless for them to record their votes, no longer excusable to hold themselves aloof from the affairs of the nation. . . . The new system, if it has not completely done away with corruption, has at any rate set a great check upon it. The compulsory vote has made the electors so numerous that it is impossible now for any candidate to purchase a majority; while no bribe, as the election of April 7 clearly proved, affords sufficient guarantee for any party to try again an experiment at once so costly and so meagre in its results. But it must not be forgotten that the Argentine is a Federal Republic, which means that, in order that this great reform shall become an effective reality throughout the country, it is necessary for each province to enforce it within its own boundaries. Now the provinces are by no means so advanced or civilised as the capital. They present, moreover, an obstacle that time alone can surmount; they are very sparsely populated, and the people are so scattered that compulsory voting is very difficult to enforce.”—*Political evolution in Argentina (Quarterly Review, Jan., 1916, pp. 43-51)*.

1916-1917.—Effects of the World War.—Election of Hipólito Irigoyen as president.—Dispute with Chile over the Straits of Magellan.—“The year witnessed a further development of the political and commercial life of this prosperous republic. With the exception of the United States, no country in the Western Hemisphere enjoyed such happy conditions as did Argentina. During the year the statistics of the census taken in 1914 were published, and these showed that the republic contained a population of 7,885,237 persons, as compared with a population of under four millions in 1895, the year of the previous census. The proportion of foreigners dwelling in the country was, however, extraordinarily high. No fewer than 2,358,000 foreign subjects were living in Argentina in 1914, but this total had since been reduced

by the European War, because many of the foreign men (amongst whom Italians were especially numerous) had returned to Europe to fight for their respective countries. The large majority of the foreign residents were males, but the Argentine population proper showed that slight excess of females which is usual in nearly all countries. During the earlier part of the year the attention of the country was fixed upon the presidential election and election of one moiety of the members of the Chamber, that is, sixty members. These elections were due in April. The Radical party was first in the field with its candidate for the Presidency, Dr. Hipólito Irigoyen being chosen. The Radicals selected Dr. Pelagio Luna as their candidate for the Vice-Presidency. The elections took place on April 2, and the polling was carried out without disturbances or rioting. The contest for the Presidency really lay between Dr. Irigoyen and Dr. de la Torre, the latter being the representative of the Democratic Progressives; but two other candidates were in the field, one of them being a Socialist. The system of election for the Argentine Presidency resembles that existing in the United States, that is, it is indirect, a college of 300 electors being chosen. The result is usually known, however, immediately after the popular election of the college, since the manner in which each member of the college will exercise his function is in practice usually known beforehand. On this occasion, however, the result remained uncertain for weeks, because nineteen electors belonged to the party of so-called Dissident Radicals, and those nineteen electors held the balance between the larger parties. It was not certain that they would vote for the candidate of the Radicals proper, Dr. Irigoyen. In the meantime, in the elections for the Chamber of Deputies, or rather, for one half of that Chamber, the Radicals had great successes, and secured thirty-five of the sixty vacant seats. The Socialists won only three seats, but it is notable that all three of these were for the city of Buenos Ayres. The voting in the College of Electors took place on June 12, and in the result a sufficient number of the Dissident Radicals voted for Dr. Irigoyen and Dr. Luna to ensure the election of those statesmen. These two candidates secured 152 votes, an absolute majority of the entire college, and were thus duly elected. The majority was made up of 145 Radicals and seven Dissident Radicals. The group of Dissident Radicals belonged to the province of Santa Fé. According to the laws of the republic the new President and the new Vice-President would not be installed in their respective offices until October 12. The outgoing President, Dr. de la Plaza, opened Congress on May 30, and delivered his last message to the legislature. He stated that although the republic had been suffering many injuries from the European War, it could face the unparalleled state of affairs with equanimity. The internal situation in Argentina was highly satisfactory, and resting on the foundation of a respect for law and for individual liberty, the commonwealth continued to develop. In foreign relations, both the Government and the nation had preserved strict neutrality in the war. The President then referred to the recent elections, and said that he had preserved strict impartiality in these contests, and had exercised no influence in the political battle. He informed Congress that of the 1,178,282 voters whose names were on the register, only 745,825 had gone to the polls. Speaking of the recent action of the Chilean Ministry in proclaiming jurisdiction over the Straits of Magellan and the Islets Canal, he said that his Government had

made representations to Chile on this question, and that it was gratifying to be able to record that the Chilean Government had agreed to refer the matter to the arbitration of the King of Great Britain. The remainder of the message dealt at great length with financial and commercial matters. The republic, said the President, had been less seriously affected by the war than had been anticipated, and the excellent harvest and the high prices to be obtained for all agricultural produce had done much to counteract the adverse influence of the European conflict. On July 9 an anarchist named Juan Mandrini made an attempt to assassinate the President which was happily unsuccessful. In October the new President and Vice-President were duly installed in office. The Budget for 1917 showed an expenditure of £31,200,000 and a revenue of £31,508,000.—*Annual Register, 1916, pp. 351-353.*

1918-1920.—Effect of World War.—Argentina like every other civilized nation was deeply affected by the widespread economic dislocation. As a great producer of raw material, particularly food-stuffs, the country found compensation for the interruptions of the normal course of finance and trade in the greatly increased prices for its products. Moreover, the closer knitting together of the commercial relation of Argentina and the United States made up in part for the disturbances of her European trade. This was reflected in the rates of foreign exchange and the Argentina "peso" has remained at a premium not only over the pound sterling but over the American dollar. The prosperity of Argentina, however, did not prevent industrial discontent and social unrest and the year 1919 was marked by a number of serious strikes and labor conflicts. During the early part of the year the transportation facilities of the city of Buenos Aires both for foreign and domestic trade were tied up for two months. Matters became so bad that a general strike was called May 1st, and although the government intervened the strikes were not completely ended. The economic readjustment after the World War was slow and painful and the great industrial revival which the war had brought about was seriously checked. In a general way the foreign policy of the republic continued to be favorable to Germany as it had been during the war, but in her relations with the United States Argentina preserved a correct if not altogether sympathetic attitude.—See also LATIN AMERICA: 1918-1921: Effect of natural resources.

1920.—Housing problem. See HOUSING: South America.

1920-1921.—Invited to join League of Nations.—Withdrawal from the assembly at Geneva.—"In the annex to the Covenant of the League of Nations thirteen countries, which had remained neutral during the war, were formally invited to accede to the Covenant. . . . In addition to . . . European countries, six American Republics were invited to join, these being, Argentina, Chile, Colombia, Paraguay, Venezuela, and Salvador. All these countries likewise joined; and the adhesion of Argentina and Chile (which together with Brazil constituted the three leading Republics of Latin America) may be regarded as only second in importance to the accession of the European neutrals."—*Annual Register, 1920, pp. 151-152.*—Consequently, on October 8, 1920, Señor Puyrerredon, Argentine foreign minister, left Buenos Aires to attend the Geneva meeting of the League of Nations. Among the first of important matters before the delegates was the question of amendments to the covenant of the League. In order to avoid serious clashes until more pressing

needs had been dealt with, amendments were waived after some discussion. This decision immediately precipitated a violent dispute. "Most prominent of all those to move for amendments had been the Argentinians, headed by Señor Puyerrdon. Argentina stood especially for compulsory arbitration by the International Court of Justice, the election of members of the Council by the Assembly, the admission of all States to the League, including Germany, and the admission of small States of undefined boundaries without a vote. It was clear from the start that Puyerrdon was leading the campaign of the small nations to undermine the power of the larger ones. The fight culminated on Dec. 4 [1920], when the Argentinian delegation had read a resolution advocating the admission of all sovereign States unless they voluntarily decided to stay outside. Señor Puyerrdon frankly admitted that the object was to open the way to the admission of Germany. This, with all the other changes proposed, was rejected, whereupon Señor Puyerrdon, with all the members of his delegation, withdrew from the Assembly, declaring that he would not return until all four proposals were accepted. The Assembly refused to rescind its action and accepted the departure of the Argentinians."—*New York Times Current History, Jan., 1921, pp. 7-8.*—"Argentina on May 12 [1921] sent an official communication to the Secretariat of the League of Nations on amendments offered last November by Honorio Puyerrdon, the Argentine Foreign Minister, showing that Argentina continues to consider herself a member of the League."—*Ibid., June, 1921, p. 536.*—For discussion of the League, see also LEAGUE OF NATIONS.

ARGENTINA, Constitution of.—The constitution is dated May 15, 1853, and amended in 1860, 1866 and 1898. At the head of the executive power is a president who is elected for six years by an electoral college chosen by the several provinces, and as in the case of the United States the number of electors is double the total number of senators and deputies. The legislative authority is vested in a national congress consisting of a senate and a chamber of deputies. The senate consists of thirty members, two from the capital and from each province, who are elected by a special body of electors and by the legislatures in the provinces. The chamber of deputies has one hundred and twenty members elected by the people in congressional districts. A deputy must have been a citizen for four years and must be twenty-five years of age. The term of office for the deputies is four years, but one-half of the chamber retires for two years. The senators must be thirty years of age and must have been a citizen for six years. One-third of the senate retires every three years. A vice-president, elected in the same manner and at the same time as the president, acts as chairman of the senate, and succeeds to the presidential office in case of the death, resignation or disability of the president. The president is commander-in-chief of the military and naval forces of the republic and has the appointing power to all federal offices as well as the right of presentation to bishops. The president and vice-president must be Roman Catholics, born in the country and cannot be candidates for re-election. The cabinet is ap-

pointed by and acts under the order of the president. It is made up of the heads of the departments of interior, foreign affairs, finance, war, justice and public instruction, agriculture, marine, and public works.

The constitution of Argentina was modeled on that of the United States. The Federal Government is in charge of matters affecting the republic as a whole. Like the United States the country is divided into states, territories and a federal district. The states, fourteen in number, are called provinces, at the head of which are elected governors, who have very extensive powers. The provinces have their own legislatures with complete control over local affairs. The governors of the territories are appointed by the president. The City of Buenos Aires is governed by a mayor, appointed by the president, subject to ratification by the senate.

The constitution of Argentina is a document of one hundred and ten articles arranged in the general way like the constitution of the United States. The first article is a simple enacting clause and the following thirty-four articles cover the ground of our Bill of Rights (q. v.) and the relative powers of the federal and state governments. The greater part of the document, articles thirty-six to one hundred and three inclusive, deals with the federal government, while the remainder of the document, articles one hundred and four to one hundred and ten, deals with the states or provincial governments. The outline immediately following may be used as an index to the principal matters dealt with in the document:

- Declarations, Rights, and Guaranties (Arts. 1-35)
- The Federal Government
 - The Legislative Power (Art. 36)
 - The House of Deputies (Arts. 37-45)
 - The Senate (Arts. 46-54)
 - Provisions Common to Both Houses (Arts. 55-66)
 - Powers of Congress (Art. 67)
 - Enactment and Approval of Laws (Arts. 68-73)
- The Executive Power
 - Its Nature and Duration (Arts. 74-80)
 - Manner and Time of Electing the President and Vice-President of the Nation (Arts. 81-85)
 - Powers of the Executive (Art. 86)
 - The Ministers of the Executive Power (Arts. 87-93)
- The Judicial Power
 - Its Nature and Duration (Arts. 94-99)
 - Functions of the Judicial Power (Arts. 100-103)
- Provincial Governments (Arts. 104-10)

PART I

ART. 1. The Argentine Nation adopts the federal-republican, and representative form of Government, as established by the present Constitution.

ART. 2. The Federal Government shall maintain the Apostolic Roman Catholic Faith.

ART. 3. The authorities of the Federal Government shall reside in the city which a special law of Congress may declare the capital of the Republic, subsequently to the cession by one or more of the Provincial Legislatures, of the territory about to be federalized.

ART. 4. The Federal Government shall administer the expenses of the Nation out of the revenue in the National Treasury, derived from import and

export duties; from the sale and lease of the public lands; from postage; and from such other taxes as the General Congress may equitably and proportionably lay upon the people; as also, from such loans and credits as may be decreed by it in times of national necessity, or for enterprises of national utility.

ART. 5. Each Province shall make a Constitution for itself, according to the republican representative system, and the principles, declarations and guarantees of this Constitution; and which shall provide for (secure) Municipal Government, primary education and the administration of justice. Under these conditions the Federal Government shall guarantee to each Province the exercise and enjoyment of its institutions.

ART. 6. The Federal Government shall intervene in the Provinces to guarantee the republican form of Government, or to repel foreign invasion, and also, on application of their constituted authorities, should they have been deposed by sedition or by invasion from another Province, for the purpose of sustaining or re-establishing them.

ART. 7. Full faith shall be given in each Province to the public acts, and judicial proceedings of every other Province; and Congress may by general laws, prescribe the manner in which such acts and proceedings shall be proved, and the effect thereof.

ART. 8. The citizens of each Province shall be entitled to all the rights, privileges and immunities, inherent to the citizens of all the several Provinces. The reciprocal extradition of criminals between all the Provinces, is obligatory.

ART. 9. Throughout the territory of the Nation, no other than the National Custom-Houses shall be allowed, and they shall be regulated by the tariffs sanctioned by Congress.

ART. 10. The circulation of all goods produced or manufactured in the Republic, is free within its borders, as also, that of all species of merchandise which may be dispatched by the Custom-Houses of entry.

ART. 11. Such articles of native or foreign production, as well as cattle of every kind, which pass from one Province to another, shall be free from all transit-duties, and also the vehicles, vessels or animals, which transport them; and no tax, let it be what it may, can be henceforward imposed upon them on account of such transit.

ART. 12. Vessels bound from one Province to another, shall not be compelled to enter, anchor, or pay transit-duties; nor in any case can preferences be granted to one port over another, by any commercial laws or regulations.

ART. 13. New Provinces may be admitted into the Nation; but no Province shall be erected within the territory of any other Province, or Provinces, nor any Province be formed by the junction of various Provinces, without the consent of the legislatures of the Provinces concerned, as well as of Congress.

ART. 14. All the inhabitants of the Nation shall enjoy the following rights, according to the laws which regulate their exercise: viz., to labor and to practice all lawful industry; to trade and navigate; to petition the authorities; to enter, remain in, travel over and leave, Argentine territory; to publish their ideas in the public-press without previous censure; to enjoy and dispose of their property; to associate for useful purposes; to profess freely their religion; to teach and to learn.

ART. 15. In the Argentine Nation there are no slaves; the few which now exist shall be free from the date of the adoption of this Constitution, and a special law shall regulate the indemnity acknowl-

edged as due by this declaration. All contracts for the purchase and sale of persons is a crime, for which those who make them, as well as the notary or functionary which authorizes them, shall be responsible, and the slaves who in any manner whatever may be introduced, shall be free from the sole fact that they tread the territory of the Republic.

ART. 16. The Argentine Nation does not admit the prerogatives of blood nor of birth; in it, there are no personal privileges or titles of nobility. All its inhabitants are equal in presence of the law, and admissible to office without other condition than that of fitness. Equality is the basis of taxation as well as of public-posts.

ART. 17. Property is inviolable, and no inhabitant of the Nation can be deprived of it, save by virtue of a sentence based on law. The expropriation for public utility must be authorized by law and previously indemnified. Congress alone shall impose the contributions mentioned in Art. 4. No personal service shall be exacted save by virtue of law, or of a sentence founded on law. Every author or inventor is the exclusive proprietor of his work, invention or discovery, for the term which the law accords to him. The confiscation of property is henceforward and forever, stricken from the Argentine penal-code. No armed body can make requisitions, nor exact assistance of any kind.

ART. 18. No inhabitant of the Nation shall suffer punishment without a previous judgment founded on a law passed previously to the cause of judgment, nor be judged by special commissions, or withdrawn from the Judges designated by law before the opening of the cause. No one shall be obliged to testify against himself; nor be arrested, save by virtue of a written order from a competent authority. The defense at law both of the person and his rights, is inviolable. The domicile, private papers and epistolary correspondence, are inviolable; and a law shall determine in what cases, and under what imputations, a search-warrant can proceed against and occupy them. Capital punishment for political causes, as well as every species of torture and whippings, are abolished for ever. The prisons of the Nation shall be healthy and clean, for the security, and not for the punishment, of the criminals detained in them, and every measure which under pretext of precaution may mortify them more than such security requires, shall render responsible the Judge who authorizes it.

ART. 19. Those private actions of men that in nowise offend public order and morality, or injure a third party, belong alone to God, and are beyond the authority of the magistrates. No inhabitant of the Nation shall be compelled to do what the law does not ordain, nor be deprived of anything which it does not prohibit.

ART. 20. Within the territory of the Nation, foreigners shall enjoy all the civil rights of citizens; they can exercise their industries, commerce or professions, in accordance with the laws; own, buy and sell real-estate; navigate the rivers and coasts; freely profess their religion, and testate and marry. They shall not be obliged to become citizens, nor to pay forced contributions. Two years previous residence in the Nation shall be required for naturalization, but the authorities can shorten this term in favour of him who so desires it, under the allegation and proof of services rendered to the Republic.

ART. 21. Every Argentine citizen is obliged to arm himself in defense of his country and of this Constitution, according to the laws which Congress

shall ordain for the purpose, and the decrees of the National Executive. For the period of ten years from the day on which they may have obtained their citizenship, this service shall be voluntary on the part of the naturalized.

ART. 22. The people shall not deliberate nor govern save by means of their Representatives and Authorities, created by this Constitution. Every armed force or meeting of persons which shall arrogate to itself the rights of the people, and petition in their name, is guilty of sedition.

ART. 23. In the event of internal commotion or foreign attack which might place in jeopardy the practice of this Constitution, and the free action of the Authorities created by it, the Province or territory where such disturbance exists shall be declared in a state of siege, all constitutional guarantees being meantime suspended there. But during such suspension the President of the Republic cannot condemn nor apply any punishment per se. In respect to persons, his power shall be limited to arresting and removing them from one place to another in the Nation, should they not prefer to leave Argentine territory.

ART. 24. Congress shall establish the reform of existing laws in all branches, as also the trial by Jury.

ART. 25. The Federal Government shall foment European immigration; and it cannot restrict, limit, nor lay any impost upon, the entry upon Argentine territory, of such foreigners as come for the purpose of cultivating the soil, improving manufactures, and introducing and teaching the arts and sciences.

ART. 26. The navigation of the interior rivers of the Nation is free to all flags, subject only to such regulations as the National Authority may dictate.

ART. 27. The Federal Government is obliged to strengthen the bonds of peace and commerce with foreign powers, by means of treaties which shall be in conformity with the principles of public law laid down in this Constitution.

ART. 28. The principles, rights and guarantees laid down in the foregoing articles, cannot be altered by any laws intended to regulate their practice.

ART. 29. Congress cannot grant to the Executive, nor the provincial legislatures to the Governor of Provinces, any "extraordinary faculties," nor the "sum of the public power," nor "renunciations or supremacies" by which the lives, honor or fortune of the Argentines shall be at the mercy of any Government or person whatever. Acts of this nature shall be irremediably null and void, and shall subject those who frame, vote, or sign them, to the pains and penalties incurred by those who are infamous traitors to their country.

ART. 30. This Constitution can be reformed in whole or in part. The necessity for the reform shall be declared by Congress by at least a two-thirds vote; but it can only be accomplished by a convention called ad hoc.

ART. 31. This Constitution, and the laws of the Nation which shall be made in pursuance thereof, and all treaties made or which shall be made with Foreign Powers, shall be the supreme law of the land; and the authorities of every Province shall be bound thereby, anything in the Constitution or laws of any Province to the contrary notwithstanding, excepting in the case of Buenos-Aires, in the treaties ratified after the compact of Nov. 11th, 1850.

ART. 32. The Federal Congress shall not dictate laws restricting the liberty of the press, nor establish any federal jurisdiction over it.

ART. 33. The enumeration in this Constitution of certain rights and guarantees, shall not be construed to deny or disparage other rights and guarantees, not enumerated; but which spring from the principle of popular sovereignty, and the republican form of Government.

ART. 34. The Judges of the Federal courts shall not be Judges of Provincial tribunals at the same time; nor shall the federal service, civil as well as military, constitute a domicile in the Province where it may be exercised, if it be not habitually that of the employé; it being understood by this, that all Provincial public-service is optional in the Province where such employé may casually reside.

ART. 35. The names which have been successively adopted for the Nation, since the year 1810 up to the present time; viz., the United Provinces of the Rio de la Plata, Argentine Republic and Argentine Confederation, shall henceforward serve without distinction, officially to designate the Government and territory of the Provinces, whilst the words Argentine Nation shall be employed in the making and sanction of the laws.

PART II.—SECTION I

ART. 36. All legislative powers herein granted shall be vested in a Congress composed of two Chambers, one of National Deputies, and the other of Senators of the Provinces and of the capital.

CHAPTER I

ART. 37. The Chamber of Deputies shall be composed of representatives elected directly by the people of the Provinces, for which purpose each one shall be considered as a single electoral district, and by a simple plurality of votes in the ratio of one for each 20,000 inhabitants, or for a fraction not less than 10,000.

ART. 38. The deputies for the first Legislature shall be nominated in the following proportion: for the Province of Buenos-Aires, twelve; for that of Córdoba, six; for Catamarca, three; Corrientes, four; Entre-Rios, two; Jujui, two; Mendoza, three; Rioja, two; Salta, three; Santiago, four; San Juan, two; Santa-Fé, two; San Luis, two; and for that of Tucumán, three.

ART. 39. For the second Legislature a general census shall be taken, and the number of Deputies be regulated by it; thereafter, this census shall be decennial.

ART. 40. No person shall be a Deputy who shall not have attained the age of twenty-five years, have been four years in the exercise of citizenship, and be a native of the Province which elects him, or a resident of it for the two years immediately preceding.

ART. 41. For the first election, the provincial Legislatures shall regulate the method for a direct election of the National Deputies. Congress shall pass a general law for the future.

ART. 42. The Deputies shall hold their place for four years, and are re-eligible; but the House shall be renewed each biennial, by halves; for which purpose those elected to the first Legislature, as soon as the session opens, shall decide by lot who shall leave at the end of the first period.

ART. 43. In case of vacancy, the Government of the Province or of the capital, shall call an election for a new member.

ART. 44. The origination of the tax-laws and those for the recruiting of troops, belongs exclusively to the House of Deputies.

ART. 45. It has the sole right of impeaching before the Senate, the President, Vice-President,

their Ministers, and the members of the Supreme Court and other inferior Tribunals of the Nation, in suits which may be undertaken against them for the improper discharge of, or deficiency in, the exercise of their functions; or for common crimes, after having heard them, and declared by a vote of two-thirds of the members present, that there is cause for proceeding against them.

CHAPTER II

ART. 46. The Senate shall be composed of two Senators from each Province, chosen by the Legislatures thereof by plurality of vote, and two from the capital elected in the form prescribed for the election of the President of the Nation. Each Senator shall have one vote.

ART. 47. No person shall be a Senator who shall not have attained the age of thirty years, been six years a citizen of the Nation, enjoy an annual rent or income of two thousand hard-dollars, and be a native of the Province which elects him, or a resident of the same for the two years immediately preceding.

ART. 48. The Senators shall enjoy their trust for nine years, and are indefinitely re-eligible; but the Senate shall be renewed by thirds each three years, and shall decide by lot, as soon as they be all re-united, who shall leave at the end of the first and second triennial periods.

ART. 49. The Vice-President of the Nation shall be President of the Senate; but shall have no vote, except in a case of a tie.

ART. 50. The Senate shall choose a President pro-tempore who shall preside during the absence of the Vice-President, or when he shall exercise the office of President of the Nation.

ART. 51. The Senate shall have sole power to try all impeachments presented by the House of Deputies. When sitting for that purpose they shall be under oath. When the President of the Nation is tried, the Chief Justice shall preside. No person shall be convicted without the concurrence of two-thirds of the members present.

ART. 52. Judgment in case of impeachment, shall not extend farther than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the Nation. But the party convicted shall, nevertheless, be liable to indictment, trial, judgment and punishment according to law, before the ordinary tribunals.

ART. 53. It belongs, moreover, to the Senate, to authorize the President to declare martial law in one or more points of the Republic, in case of foreign aggression.

ART. 54. When any seat of a Senator be vacant by death, resignation or other reason, the Government to which the vacancy belongs, shall immediately proceed to the election of a new member.

CHAPTER III

ART. 55. Both Chambers shall meet in ordinary session, every year from the 1st May until the 30th September. They can be extraordinarily convoked, or their session be prolonged by the President of the Nation.

ART. 56. Each House shall be the judge of the elections, returns, and qualifications of its own members. Neither of them shall enter into session without an absolute majority of its members; but a smaller number may compel absent members to attend the sessions, in such terms and under such penalties as each House may establish.

ART. 57. Both Houses shall begin and close

their sessions simultaneously. Neither of them whilst in sessions can suspend its meetings for more than three days, without the consent of the other.

ART. 58. Each House may make its rules of proceeding, and with the concurrence of two-thirds punish its members for disorderly behavior in the exercise of their functions, or remove, and even expel them from the House, for physical or moral incapacity occurring after their incorporation; but a majority of one above one-half of the members present, shall suffice to decide questions of voluntary resignation.

ART. 59. In the act of their incorporation the Senators and Deputies shall take an oath to properly fulfil their charge, and to act in all things in conformity to the prescriptions of this Constitution.

ART. 60. No member of Congress can be indicted, judicially interrogated, or molested for any opinion or discourse which he may have uttered in fulfilment of his Legislative duties.

ART. 61. No Senator or Deputy, during the term for which he may have been elected, shall be arrested, except when taken "in flagrant" commission of some crime which merits capital punishment or other degrading sentence; an account thereof shall be rendered to the Chamber he belongs to, with a verbal process of the facts.

ART. 62. When a complaint in writing be made before the ordinary courts against any Senator or Deputy, each Chamber can by a two-thirds vote, suspend the accused in his functions and place him at the disposition of the competent judge for trial.

ART. 63. Each of the Chambers can cause the Ministers of the Executive to come to their Hall, to give such explanations or information as may be considered convenient.

ART. 64. No member of Congress can receive any post or commission from the Executive, without the previous consent of his respective Chamber, excepting such as are in the line of promotion.

ART. 65. The regular ecclesiastics cannot be members of Congress, nor can the Governors of Provinces represent the Province which they govern.

ART. 66. The Senators and Deputies shall be remunerated for their services, by a compensation to be ascertained by law.

CHAPTER IV

ART. 67. The Congress shall have power:—(1) To legislate upon the Custom-Houses and establish import duties; which, as well as all appraisements for their collection, shall be uniform throughout the Nation, it being clearly understood that these, as well as all other national contributions, can be paid in any money at the just value which may be current in the respective Provinces. Also, to establish export duties. (2) To lay direct taxes for determinate periods, whenever the common defense and general welfare require it, which shall be uniform throughout the territory of the Nation. (3) To borrow money on the credit of the Nation. (4) To determine the use and sale of the National lands. (5) To establish and regulate a National Bank in the capital, with branches in the Provinces, and with power to emit bills. (6) To regulate the payment of the home and foreign debts of the Nation. (7) To annually determine the estimates of the National Administration, and approve or reject the accounts of expenses. (8) To grant subsidies from the National Treasury to those Provinces, whose revenues, according to their budgets, do not suffice to cover the ordinary expenses. (9)

To regulate the free navigation of the interior rivers, open such ports as may be considered necessary, create and suppress Custom-Houses, but without suppressing those which existed in each Province at the time of its incorporation. (10) To coin money, regulate the value thereof and of foreign coin, and adopt a uniform system of weights and measures for the whole Nation. (11) To decree civil, commercial, penal and mining Codes, but such Codes shall have no power to change local jurisdiction; their application shall belong to the Federal or Provincial courts, in accordance with such things or persons as may come under their respective jurisdiction; especially, general laws embracing the whole Nation, shall be passed upon naturalization and citizenship, subject to the principle of native citizenship; also upon bankruptcy, the counterfeiting of current-money and public State documents; and such laws as may be required for the establishment of trial by Jury. (12) To regulate commerce by land and sea with foreign nations, and between the Provinces. (13) To establish and regulate the general post-offices and post-roads of the Nation. (14) To finally settle the National boundaries, fix those of the Provinces, create new Provinces, and determine by a special legislation, the organization and governments, which such National territories as are beyond the limits assigned to the Province, should have. (15) To provide for the security of the frontiers; preserve peaceful relations with the Indians, and promote their conversion to Catholicism. (16) To provide all things conducive to the prosperity of the country, to the advancement and happiness of the Provinces, and to the increase of enlightenment, decreeing plans for general and university instruction, promoting industry, immigration, the construction of railways, and navigable canals, the peopling of the National lands, the introduction and establishment of new industries, the importation of foreign capital and the exploration of the interior rivers, by protection laws to these ends, and by temporary concessions and stimulating recompenses. (17) To constitute tribunals inferior to the Supreme Court, create and suppress public offices, fix their attributes, grant pensions, decree honors and general amnesties. (18) To accept or reject the resignation of the President or Vice-President of the Republic, and declare new elections; to make the scrutiny and rectification of the same. (19) To ratify or reject the treaties made with other Nations and the Concordats with the Apostolic See, and regulate the patronage of advowsons throughout the Nation. (20) To admit religious orders within the Nation, other than those already existing. (21) To authorize the Executive to declare war and make peace. (22) To grant letters of marque and reprisal, and to make rules concerning prizes. (23) To fix the land and sea forces in time of peace and war; and to make rules and regulations for the government of said forces. (24) To provide for calling forth the militia of all, or a part of, the Provinces, to execute the laws of the Nation, suppress insurrections or repel invasions. To provide for organizing, arming, and disciplining said militia, and for governing such part of them as may be employed in the service of the Nation, reserving to the Provinces respectively, the appointment of the corresponding chiefs and officers, and the authority of training the militia according to the discipline prescribed by Congress. (25) To permit the introduction of foreign troops within the territory of the Nation, and the going beyond it of the National forces. (26) To declare martial law in any or various points of the Nation in case of domes-

tic commotion, and ratify or suspend the declaration of martial law made by the Executive during the recess. (27) To exercise exclusive legislation over the territory of the National capital, and over such other places acquired by purchase or cession in any of the Provinces, for the purpose of establishing forts, arsenals, warehouses, or other needful national buildings. (28) To make all laws and regulations which shall be necessary for carrying into execution the foregoing powers, and all others vested by the present Constitution in the Government of the Argentine Nation.

CHAPTER V

ART. 68. Laws may originate in either of the Houses of Congress, by bills presented by their members or by the Executive, excepting those relative to the objects treated of in Art. 44.

ART. 69. A bill being approved by the House wherein it originated, shall pass for discussion to the other House. Being approved by both, it shall pass to the Executive of the Nation for his examination; and should it receive his approbation he shall publish it as law.

ART. 70. Every bill not returned within ten working-days by the Executive, shall be taken as approved by him.

ART. 71. No bill entirely rejected by one House, can be presented again during that year. But should it be only amplified or corrected by the revising House, it shall return to that wherein it originated; and if there the additions or corrections be approved by an absolute majority, it shall pass to the Executive. If the additions or corrections be rejected, it shall return to the revising House, and if here they be again sanctioned by a majority of two-thirds of its members, it shall pass to the other House, and it shall not be understood that the said additions and corrections are rejected, unless two-thirds of the members present should so vote.

ART. 72. A bill being rejected in whole or in part by the Executive, he shall return it with his objections to the House in which it originated; here it shall be debated again; and if it be confirmed by a majority of two-thirds, it shall pass again to the revising House. If both Houses should pass it by the same majority, it becomes a law, and shall be sent to the Executive for promulgation. In such case the votes of both Houses shall be by yeas and nays, and the names of the persons so voting shall be recorded, as well as the objections of the Executive, and shall be immediately published in the daily press. If the Houses differ upon the objections, the bill cannot be renewed during that year.

ART. 73. The following formula shall be used in the passage of the laws: "The Senate and Chamber of Deputies of the Argentine Nation in Congress assembled, etc., decree, or sanction, with the force of law."

SECTION II.—CHAPTER I

ART. 74. The Executive power of the Nation shall be exercised by a citizen, with the title of "President of the Argentine Nation."

ART. 75. In case of the sickness, absence from the capital, death, resignation or dismissal of the President, the Executive power shall be exercised by the Vice-President of the Nation. In case of the removal, death, resignation, or inability of the President and Vice-President of the Nation, Congress will determine which public functionary shall

then fill the Presidency, until the disability be removed or a new President be elected.

ART. 76. No person except a natural-born citizen or a son of a natural-born citizen brought forth abroad, shall be eligible as President or Vice-President of the Nation; he is required to belong to the Apostolic-Roman-Catholic communion, and possess the other qualifications required to be elected Senator.

ART. 77. The President and Vice-President shall hold office during the term of six years; and cannot be re-elected except after an interval of an equal period.

ART. 78. The President of the Nation shall cease in his functions the very day on which his period of six years expires, and no event whatever which may have interrupted it, can be a motive for completing it at a later time.

ART. 79. The President and Vice-President shall receive a compensation from the National Treasury, which cannot be altered during the period for which they shall have been elected. During the same period they cannot exercise any other office nor receive any other emolument from the Nation, or any of its Provinces.

ART. 80. The President and Vice-President before entering upon the execution of their offices, shall take the following oath administered by the President of the Senate (the first time by the President of the Constituent Congress) in Congress assembled: "I (such an one) swear by God our Lord, and by these Holy Evangelists, that I will faithfully and patriotically execute the office of President (or Vice-President) of the Nation, and observe and cause to be faithfully observed, the Constitution of the Argentine Nation. If I should not do so, let God and the Nation indict me."

CHAPTER II

ART. 81. The election of the President and Vice-President of the Nation, shall be made in the following manner:—The capital and each of the Provinces shall by direct vote nominate a board of electors, double the number of Deputies and Senators which they send to Congress, with the same qualifications and under the same form as those prescribed for the election of Deputies. Deputies or Senators, or officers in the pay of the Federal Government cannot be electors. The electors being met in the national capital and in that of their respective Provinces, four months prior to the conclusion of the term of the out-going President, they shall proceed by signed ballots, to elect a President, and Vice-President, one of which shall state the person as President, and the other the person as Vice-President, for whom they vote. Two lists shall be made of all the individuals elected as President, and other two also, of those elected as Vice-President, with the number of votes which each may have received. These lists shall be signed by the electors, and shall be remitted closed and sealed, two of them (one of each kind) to the President of the Provincial Legislature, and to the President of the Municipality in the capital, among whose records they shall remain deposited and closed; the other two shall be sent to the President of the Senate (the first time to the President of the Constituent Congress).

ART. 82. The President of the Senate (the first time that of the Constituent Congress) all the lists being received, shall open them in the presence of both Houses. Four members of Congress taken by lot and associated to the Secretaries, shall immediately proceed to count the votes, and to announce the number which may result in favor

of each candidate for the Presidency and Vice-Presidency of the Nation. Those who have received an absolute majority of all the votes in both cases, shall be immediately proclaimed President and Vice-President.

ART. 83. In case there be no absolute majority, on account of a division of the votes, Congress shall elect one of the two persons who shall have received the highest number of votes. If the first majority should have fallen to a single person, and the second to two or more, Congress shall elect among all the persons who may have obtained the first and second majorities.

ART. 84. This election shall be made by absolute plurality of votes, and voting by name. If, on counting the first vote, no absolute majority shall have been obtained, a second trial shall be made, limiting the voting to the two persons who shall have obtained the greatest number of suffrages at the first trial. In case of an equal number of votes, the operation shall be repeated, and should the result be the same, then the President of the Senate (the first time that of the Constituent Congress) shall decide it. No scrutiny or rectification of these elections can be made, unless three-fourth parts of all the members of the Congress be present.

ART. 85. The election of the President and Vice-President of the Nation shall be concluded in a single meeting of the Congress, and thereafter, the result and the electoral lists shall be published in the daily press.

CHAPTER III

ART. 86. The President of the Nation has the following attributes:—(1) He is the supreme chief of the Nation, and is charged with the general administration of the country. (2) He issues such instructions and regulations as may be necessary for the execution of the laws of the Nation, taking care not to alter their spirit with regulative exceptions. (3) He is the immediate and local chief of the National capital. (4) He participates in making the laws according to the Constitution; and sanctions and promulgates them. (5) He nominates the Judges of the Supreme Court and of the Inferior Federal tribunals, and appoints them by and with the consent and advice of the Senate. (6) He has power to pardon or commute penalties against officers subject to Federal jurisdiction, preceded by a report of the proper Tribunal, excepting in case of impeachment by the House of Deputies. (7) He grants retiring-pensions, leaves of absence and pawnbrokers' licences, in conformity to the laws of the Nation. (8) He exercises the rights of National Patronage in the presentation of Bishops for the cathedrals, choosing from a ternary nomination of the Senate. (9) He grants letters-patent or retains the decrees of the Councils, the bulls, briefs and rescripts of the Holy Roman Pontiff, by and with the consent of the Supreme Court, and must require a law for the same when they contain general and permanent dispositions. (10) He appoints and removes Ministers Plenipotentiary and Chargés d'Affaires, by and with the consent and advice of the Senate; and himself alone appoints and removes the Ministers of his Cabinet, the officers of the Secretaryships, Consular Agents, and the rest of the employés of the Administration whose nomination is not otherwise ordained by this Constitution. (11) He annually opens the Sessions of Congress, both Houses being united for this purpose in the Senate Chamber, giving an account to Congress on this occasion of the state of the Nation, of the

reforms provided by the Constitution, and recommending to its consideration such measures as may be judged necessary and convenient. (12) He prolongs the ordinary meetings of Congress or convokes it in extra session, when a question of progress or an important interest so requires. (13) He collects the rents of the Nation and decrees their expenditure in conformity to the law or estimates of the Public expenses. (14) He negotiates and signs those treaties of peace, of commerce, of navigation, of alliance, of boundaries and of neutrality, requisite to maintain good relations with foreign powers; he receives their Ministers and admits their Consuls. (15) He is commander in chief of all the sea and land forces of the Nation. (16) He confers, by and with the consent of the Senate, the high military grades in the army and navy of the Nation; and by himself on the field of battle. (17) He disposes of the land and sea forces, and takes charge of their organization and distribution according to the requirements of the Nation. (18) By the authority and approval of Congress, he declares war and grants letters of marque and reprisal. (19) By and with the consent of the Senate, in case of foreign aggression and for a limited time, he declares martial law in one or more points of the Nation. In case of internal commotion he has this power only when Congress is in recess, because it is an attribute which belongs to this body. The President exercises it under the limitations mentioned in Art. 23. (20) He may require from the chiefs of all the branches and departments of the Administration, and through them from all other employés, such reports as he may believe necessary, and they are compelled to give them. (21) He cannot absent himself from the capital of the Nation without permission of Congress. During the recess he can only do so without permission on account of important objects of public service. (22) The President shall have power to fill all vacancies that may happen during the recess of the Senate, by granting commissions, which shall expire at the end of their next session.

CHAPTER IV

ART. 87. Five Minister-Secretaries; to wit, of the Interior; of Foreign Affairs; of Finance; of Justice, Worship and Public Instruction; and of War and the Navy; shall have under their charge the dispatch of National affairs, and they shall countersign and legalize the acts of the President by means of their signatures, without which requisite they shall not be efficacious. A law shall determine the respective duties of the Ministers.

ART. 88. Each Minister is responsible for the acts which he legalizes, and collectively, for those which he agrees to with his colleagues.

ART. 80. The Ministers cannot determine anything whatever, by themselves, except what concerns the economical and administrative regimen of their respective Departments.

ART. 90. As soon as Congress opens, the Ministers shall present to it a detailed report of the State of the Nation, in all that relates to their respective Departments.

ART. 91. They cannot be Senators or Deputies without resigning their places as Ministers.

ART. 92. The Ministers can assist at the meetings of Congress and take part in its debates, but they cannot vote.

ART. 93. They shall receive for their services a compensation established by law, which shall not be increased or diminished, in favor or against, the actual incumbents.

SECTION III.—CHAPTER I

ART. 94. The Judicial Power of the Nation shall be exercised by a Supreme Court of Justice, and by such other inferior Tribunals as Congress may establish within the dominion of the Nation.

ART. 95. The President of the Nation cannot in any case whatever, exercise Judicial powers, arrogate to himself any knowledge of pending causes, or reopen those which have terminated.

ART. 96. The Judges of the Supreme Court and of the lower National Tribunals, shall keep their places *quamdiu se bene gesserit*, and shall receive for their services a compensation determined by law, which shall not be diminished in any manner whatever during their continuance in office.

ART. 97. No one can be a member of the Supreme Court of Justice, unless he shall have been an attorney at law of the Nation for eight years, and shall possess the qualifications required for a Senator.

ART. 98. At the first installation of the Supreme Court, the individuals appointed shall take an oath administered by the President of the Nation, to discharge their functions, by the good and legal administration of Justice according to the prescriptions of this Constitution. Thereafter, the oath shall be taken before the President of the Court itself.

ART. 90. The Supreme Court shall establish its own internal and economical regulations, and shall appoint its subaltern employés.

CHAPTER II

ART. 100. The Judicial power of the Supreme Court and the lower National Tribunals, shall extend to all cases arising under this Constitution, the laws of the Nation with the reserve made in clause 11 of Art. 67, and by treaties with foreign nations; to all cases affecting ambassadors, public Ministers and foreign Consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the Nation shall be party; to controversies between two or more Provinces; between a Province and the citizens of another; between the citizens of different Provinces; and between a Province or its citizens, against a foreign State or citizen.

ART. 101. In these cases the Supreme Court shall exercise an appellate jurisdiction according to such rules and exceptions as Congress may prescribe; but in all cases affecting ambassadors, ministers and foreign consuls, or those in which a Province shall be a party, it shall exercise original and exclusive jurisdiction.

ART. 102. The trial of all ordinary crimes except in cases of impeachment, shall terminate by jury, so soon as this institution be established in the Republic. These trials shall be held in the same Province where the crimes shall have been committed, but when not committed within the frontiers of the Nation, but against International Law, Congress shall determine by a special law the place where the trial shall take effect.

ART. 103. Treason against the Nation shall only consist in levying war against it, or in adhering to its enemies, giving them aid and comfort. Congress shall fix by a special law the punishment of treason; but it cannot go beyond the person of the criminal, and no attainder of treason shall work corruption of blood to relatives of any grade whatever.

ART. 104. The Provinces keep all the powers not delegated by this Constitution to the Federal Government, and those which were expressly re-

served by special compacts at the time of their incorporation.

ART. 105. They create their own local institutions and are governed by these. They elect their own Governors, their Legislators and other Provincial functionaries, without intervention from the Federal Government.

ART. 106. Each Province shall make its own Constitution in conformity with the dispositions of Art. 5.

ART. 107. The Provinces with the consent of Congress can celebrate contracts among themselves for the purposes of administering justice and promoting economical interests and works of common utility, and also, can pass protective laws for the purpose with their own resources, of promoting manufactures, immigration, the building of railways and canals, the peopling of their lands, the introduction and establishment of new industries, the import of foreign capital and the exploration of their rivers.

ART. 108. The Provinces cannot exercise any powers delegated to the Nation. They cannot celebrate compacts of a political character, nor make laws on commerce or internal or external navigation; nor establish Provincial Custom Houses, nor coin money, nor establish Banks of emission, without authority of Congress; nor make civil, commercial, penal or mining Codes after Congress shall have sanctioned those provided for in this Constitution; nor pass laws upon citizenship or naturalization; bankruptcy, counterfeiting money or public State documents; nor lay tonnage dues; nor arm vessels of war or raise armies, save in the case of foreign invasion, or of a danger so imminent that it admits of no delay, and then an account thereof must be immediately given to the Federal Government; or name or receive foreign agents; or admit new religious orders.

ART. 109. No Province can declare or make war against another Province. Its complaints must be submitted to the Supreme Court of Justice and be settled by it. Hostilities de facto are acts of civil-war and qualified as seditious and tumultuous, which the General Government must repress and suffocate according to law.

ART. 110. The Provincial Governors are the natural agents of the Federal Government to cause the fulfilment of the laws of the Nation. See ARGENTINA: 1880-1891.

The above text of the Constitution of Argentina is a translation "from the official edition of 1868," taken from R. Napp's work on "The Argentine Republic," prepared for the Central Argentine Commission on the Centenary Exhibition at Philadelphia, 1876.

ARGOLIS. See ARGOS.

ARGONAUTIC EXPEDITION.—"The ship Argo was the theme of many songs during the oldest periods of the Grecian Epic, even earlier than the Odyssey. The king Ætês, from whom she is departing, the hero Jason, who commands her, and the goddess Hêrê, who watches over him, enabling the Argo to traverse distances and to escape dangers which no ship had ever before encountered, are all circumstances briefly glanced at by Odysseus in his narrative to Alkinous. . .

Jason, commanded by Pelias to depart in quest of the golden fleece belonging to the speaking ram which had carried away Phryxus and Hellê, was encouraged by the oracle to invite the noblest youth of Greece to his aid, and fifty of the most distinguished amongst them obeyed the call. Hêraklês, Thêseus, Telamôn and Pêleus, Kastor and Pollux, Idas and Lynkeus—Zêtês and Kalais, the winged sons of Boreas—Meleager, Amphiarus, Kêpheus, Laertês, Autolykus, Menotius, Aktor, Erginus, Euphêmus, Ankæus, Pœas, Periklymenus, Augeas, Eurytus, Admêtus, Akastus, Kæneus, Euryalus, Pêneleôs and Lêitus, Askalaphus and Ialmenus, were among them. . . . Since so many able men have treated it as an undisputed reality, and even made it the pivot of systematic chronological calculations, I may here repeat the opinion long ago expressed by Heyne, and even indicated by Burmann, that the process of dissecting the story, in search of a basis of fact, is one altogether fruitless."—G. Grote, *History of Greece*, v. 1, pt. 1, ch. 13.—"In the rich cluster of myths which surround the captain of the Argo and his fellows are preserved to us the whole life and doings of the Greek maritime tribes, which gradually united all the coasts with one another, and attracted Hellenes dwelling in the most different seats into the sphere of their activity. . . . The Argo was said to have weighed anchor from a variety of ports—from Iolcus in Thessaly, from Anthedon and Siphæ in Bœotia: the home of Jason himself was on Mount Pelion by the sea, and again on Lemnos and in Corinth; a clear proof of how homogeneous were the influences running on various coasts. However, the myths of the Argo were developed in the greatest completeness on the Pagæan gulf, in the seats of the Minyi; and they are the first with whom a perceptible movement of the Pelagian tribes beyond the sea—in other words, a Greek history in Europe—begins."—E. Curtius, *History of Greece*, bk. 1, ch. 2-3.

ARGOS, the chief city of Argolis in the Peloponnesus and the foremost Dorian city up to the middle of the eighth century B. C. was Argos. She early dominated the cities of the district of Argolis and in 670 B. C. formed them into a union to withstand the rising power of Sparta. "No district of Greece contains so dense a succession of powerful citadels in a narrow space as Argolis [the eastern peninsular projection of the Peloponnesus]. Lofty Larissa, apparently designed by nature as the centre of the district, is succeeded by Mycenæ, deep in the recess of the land; at the foot of the mountain lies Midea, at the brink of the sea-coast Tiryns; and lastly, at a farther distance of half an hour's march, Nauplia, with its harbour. This succession of ancient fastnesses, whose indestructible structure of stone we admire to this day [consult Schliemann's "Ancient Mycenæ" and "Tiryns"] is clear evidence of mighty conflicts which agitated the earliest days of Argos; and proves that in this one plain of Inachus several principalities must have

arisen by the side of one another, each putting its confidence in the walls of its citadel; some, according to their position, maintaining an intercourse with other lands by sea, others rather a connection with the inland country. The evidence preserved by these monuments is borne out by that of the myths, according to which the dominion of Danaus is divided among his successors. Exiled Prætus is brought home to Argos by Lycian bands, with whose help he builds the coast-fortress of Tiryns, where he holds sway as the first and mightiest in the land. . . . The other line of the Danaidæ is also intimately connected with Lycia; for Perseus . . . [who] on his return from the East founds Mycenæ, as the new regal seat of the united kingdom of Argos, is himself essentially a Lycian hero of light, belonging to the religion of Apollo. . . . Finally, Heracles himself is connected with the family of the Perseidæ, as a prince born on the Tirynthian fastness. . . . During these divisions in the house of Danaus, and the misfortunes befalling that of Prætus, foreign families acquire influence and dominion in Argos; these are of the race of Æolus, and originally belong to the harbour-country of the western coast of Peloponnesus—the Amythaonidæ. . . . While the dominion of the Argive land was thus subdivided, and the native warrior nobility subsequently exhausted itself in savage internal feuds, a new royal house succeeded in grasping the supreme power and giving an entirely new importance to the country. This house was that of the Tantalidæ [or PELOPIDES, which see], united with the forces of Achæan population. . . . The residue of fact is, that the ancient dynasty, connected by descent with Lycia, was overthrown by the house which derived its origin from Lydia. . . . The poetic myths, abhorring long rows of names, mention three princes as ruling here in succession, one leaving the sceptre of Pelops to the other, viz., Atreus, Thyestes and Agamemnon. Mycenæ is the chief seat of their rule, which is not restricted to the district of Argos.”—E. Curtius, *History of Greece, bk. 1, ch. 3*.—After the Doric invasion of the Peloponnesus (see GREECE: Migrations of Hellenic tribes; also, DORLIANS AND IONIANS), Argos appears in Greek history as a Doric state, originally the foremost one in power and influence, but humiliated after long years of rivalry by her Spartan neighbours.

“Argos never forgot that she had once been the chief power in the peninsula, and her feeling towards Sparta was that of a jealous but impotent competitor. By what steps the decline of her power had taken place, we are unable to make out, nor can we trace the succession of her kings subsequent to Pheidon [8th century B. C.]. . . . The title [of king] existed (though probably with very limited functions) at the time of the Persian War [490-479 B. C.]. . . . There is some ground for presuming that the king of Argos was even at that time a Herakleid—since the Spartans offered to him a third part of the command of the Hellenic force, conjointly with their own two kings. The conquest of Thyreates by the Spartans [about 547 B. C.] deprived the Argeians of a valuable portion of their Periækis, or dependent territory. But Orneæ and the remaining portion of Kynuria still continued to belong to them: the plain round their city was very productive; and, except Sparta, there was no other power in Peloponnesus superior to them. Mykenæ and Tiryns, nevertheless, seem both to have been independent states at the time of the Persian War, since both sent contingents to the battle of Plataæ, at a time when Argos held aloof and rather favoured the Persians.”—G. Grote, *History of Greece, pt. 2, ch. 8, v. 2*.—“It was

. . . perhaps shortly after the victory over Tegea [c. 550 B. C.] that Sparta at length succeeded in rounding off the frontier of Laconia on the north-eastern side by wresting the disputed territory of Thyreatis from Argos. The armies of the two states met in the marchland, but the Spartan kings and the Argive chiefs agreed to decide the dispute by a combat between three hundred chosen champions on either side. The story is that all the six hundred were slain except three, one Spartan and two Argives; and that while the Argives hurried home to announce their victory, the Spartan—Othryades was his name—remained on the field and erected a trophy. In any case, the trial was futile, for both parties claimed the victory and a battle was fought in which the Argives were utterly defeated. Thyreatis was the last territorial acquisition of Sparta. She changed her policy, and instead of aiming at gaining new territory, she endeavoured to make the whole Peloponnesus a sphere of Lacedæmonian influence. This change of policy was exhibited in her dealing with Tegea. The defeat of Argos placed Sparta at the head of the peninsula. All the Peloponnesian states, except Argos and Achæa, were enrolled in a loose confederacy, engaging themselves to supply military contingents in the common interest, Lacedæmon being the leader. The meetings of the confederacy were held at Sparta, and each member sent representatives. [See also SPARTA: B. C. 743-510.] Corinth readily joined; for Corinth was naturally ranged against Argos, while her commercial rival, the island state of Aegina, was a friend of Argos. Periander [tyrant of Corinth, 625-585 B. C.] had already inflicted a blow upon the Argives by seizing Epidaurus and thus cutting off their nearest communications with Aegina. The other Isthmian state, Megara, in which the rule of the nobles had been restored, was also enrolled. Everywhere Sparta exerted her influence to maintain oligarchy, everywhere she discountenanced democracy; so that her supremacy had important consequences for the constitutional development of the Peloponnesian states. [See also SPARTA: 743-510 B. C.] In northern Greece the power of the Thessalians was declining; and thus Sparta became the strongest state in Greece in the second half of the sixth century. She was on the most friendly terms with Athens throughout the reign of Pisistratus [See also ATHENS: B. C. 560-510]; but the tyrant was careful to maintain good relations with Argos also. With Argos herself indeed Athens had no cause for collision; but the rivalry which existed between Athens and Aegina naturally ranged Athens and Argos in opposite camps. It was, perhaps, not long before the accession of Pisistratus that the Athenians had landed forces in Aegina and had been repulsed with Argive help. The policy of Pisistratus avoided a conflict with his island neighbour and courted the friendship of Argos; but the deeper antagonism is shown by the embargo which Argos and Aegina placed upon the importation of Attic pottery. The excavations of the temple of the Argive Hera have illustrated this hostile measure; hardly any fragments of Attic pottery, dating from the period of Pisistratus or fifty years after his death, have been found in the precinct.”—J. B. Bury, *History of Greece, pp. 203-204*.

B. C. 496-421.—Calamitous war with Sparta.—Non-action in the Persian War.—Slow recovery of the crippled state.—“One of the heaviest blows which Argos ever sustained at the hand of her traditional foe befell her about 496 B. C., six years before the first Persian invasion of Greece. A war with Sparta having broken out, Cleomenes, the Lacedæmonian king, succeeded in landing a

large army, in vessels he had extorted from the Æginetans, at Nauplia, and ravaged the Argive territory. The Argeians mustered all their forces to resist him, and the two armies encamped opposite each other near Tiryns. Cleomenes, however, contrived to attack the Argeians at a moment when they were unprepared, making use, if Herodotus is to be credited, of a stratagem which proves the extreme incapacity of the opposing generals, and completely routed them. The Argeians took refuge in a sacred grove, to which the remorseless Spartans set fire, and so destroyed almost the whole of them. No fewer than 6,000 of the citizens of Argos perished on this disastrous day. Cleomenes might have captured the city itself; but he was, or affected to be, hindered by unfavourable omens, and drew off his troops. The loss sustained by Argos was so severe as to reduce her for some years to a condition of great weakness; but this was at the time a fortunate circumstance for the Hellenic cause, inasmuch as it enabled the Lacedæmonians to devote their whole energies to the work of resistance to the Persian invasion without fear of enemies at home. In this great work Argos took no part, on the occasion of either the first or second attempt of the Persian kings to bring Hellas under their dominion. Indeed, the city was strongly suspected of 'medising' tendencies. In the period following the final overthrow of the Persians, while Athens was pursuing the splendid career of aggrandisement and conquest that made her the foremost state in Greece, and while the Lacedæmonians were paralyzed by the revolt of the Messenians, Argos retained strength and influence, which she at once employed and increased by the harsh policy . . . of depopulating Mycenæ and Tiryns, while she compelled several other semi-independent places in the Argolid to acknowledge her supremacy. [For alliance with Athens see ATHENS: B. C. 462-458.] During the first eleven years of the Peloponnesian war, down to the peace of Nicias (421 B. C.), Argos held aloof from all participation in the struggle, adding to her wealth and perfecting her military organization. As to her domestic conditions and political system, little is known; but it is certain that the government, unlike that of other Dorian states, was democratic in its character, though there was in the city a strong oligarchic and philo-Laonian party, which was destined to exercise a decisive influence at an important crisis."—C. H. Hanson, *Land of Greece*, ch. 10.

ARGOS, Acropolis of, the site of the structures composing the Heraeum, so-called from its dedication to the goddess Hera, whose statue in gold and ivory by Polyclitus was enthroned there. It was always a place of worship for the Argive people and seems to have been the first center of civilized life. The Heraeum served as sanctuary for both Mycenæ and Argos. Its architecture seems to show that it was founded many generations before Mycenæ was built, and before the Homeric age. Much has been learned from the extensive excavations of the American archaeological institute and school of Athens carried on from 1892 and 1895.

ARGYLL, Earls, marquesses and dukes of, titles borne by a long line of Scottish peers. The best known of them are the following:

Archibald Campbell, 5th earl of Argyll (1530-1573).—He was an adherent of John Knox; later supported Mary, queen of Scots, and was partly responsible for her defeat at Langside in 1568. Became lord high chancellor of Scotland.—See also SCOTLAND: 1557.

Archibald Campbell, 1st marquess and 8th earl of Argyll (1607-1661).—Supported the Presbyterian struggle against Charles I and Laud; leader of the Assembly which procured control over judicial and political appointments. Supported Charles II and later Cromwell; upon the restoration of the former was beheaded.—See also SCOTLAND: 1644-1645.

Archibald Campbell, 1st duke of Argyll (1651-1703), active partisan of William of Orange in 1688. A lord of the treasury 1696.—See also ENGLAND: 1685 (May-July).

Archibald Campbell, 3rd duke of Argyll (1682-1761), commanded the royal army in Scotland at the battle of Sheriffmuir. See SCOTLAND: 1715.

George John Douglas Campbell, 8th duke of Argyll (1823-1900).—Succeeded to title 1847; eloquent speaker, and a writer on scientific questions as related to religion; well known as a publicist.

John Douglas Sutherland Campbell, 9th duke of Argyll (1845-1914), governor-general of Canada 1878-1883.

ARGYRASPIDES, a corps of veteran soldiers of the Macedonian army. "He [Alexander the Great] then marched into India, that he might have his empire bounded by the ocean, and the extreme parts of the East. That the equipments of his army might be suitable to the glory of the Expedition, he mounted the trappings of the horses and the arms of the soldiers with silver, and called a body of his men, from having silver shields, *Argyraspides*."—Justin, *History*, bk. 12, ch. 7.—See also MACEDONIA: B. C. 323-316.

ALSO IN: C. Thirlwall, *History of Greece*, ch. 58.

ARGYRE, mythical island. See CHRYSÆ.

ARIA, a song with orchestral accompaniment often part of a larger composition such as an opera or oratorio.

ARIA, **AREIOS**, **AREIANS**, the name by which the Herirud and its valley, the district of modern Herat, was known to the ancient Greeks. Its inhabitants were known as the *Areians*.—M. Duncker, *History of antiquity*, bk. 7, ch. 1.

ARIADNE, steamer sunk by the Mōwe. See WORLD WAR: 1916: IX. Naval operations: c.

ARIANA.—"Strabo uses the name Ariana for the land of all the nations of Iran, except that of the Medes and Persians, i. e., for the whole eastern half of Iran"—Afghanistan and Beloochistan.—M. Duncker, *History of antiquity*, v. 5, bk. 7, ch. 1.

ARIAN-ATHANASIAN CONTROVERSY. See NICÆA: 325.

ARIANISM, ARIANS.—From the second century of its existence, the Christian church was divided by bitter controversies touching the mystery of the Trinity. "The word Trinity is found neither in the Holy Scriptures nor in the writings of the first Christians; but it had been employed from the beginning of the second century, when a more metaphysical turn had been given to the minds of men, and theologians had begun to attempt to explain the divine nature. . . . The Founder of the new religion, the Being who had brought upon earth a divine light, was he God, was he man, was he of an intermediate nature, and, though superior to all other created beings, yet himself created? This latter opinion was held by Arius, an Alexandrian priest, who maintained it in a series of learned controversial works between the years 318 and 325. As soon as the discussion had quitted the walls of the schools, and been taken up by the people, mutual accusations of the gravest kind took the place of metaphysical subtleties. The orthodox party reproached the Arians with blaspheming the deity himself, by refusing to acknowledge him in the person of Christ. The Arians accused the orthodox of violating the fundamental law of religion, by rendering to the creature the worship due only to the Creator. . . . It was difficult to decide which numbered the largest body of followers; but the ardent enthusiastic spirits, the populace in all the great cities (and especially at Alexandria) the women, and the newly-founded order of the monks of the desert . . . were almost without exception partisans of the faith which has since been declared orthodox. . . . Constantine thought this question of dogma might be decided by an assembly of the whole church. In the year 325, he convoked the council of Nice [see NICÆA, COUNCIL OF], at which 300 bishops pronounced in favour of the equality of the Son with the Father, or the doctrine generally regarded as orthodox, and condemned the Arians to exile and their books to the flames."—J. C. L. de Sismondi, *Fall of the Roman empire*, ch. 4.—"The victorious faction [at the Council of Nice] . . . anxiously sought for some irreconcilable mark of distinction, the rejection of which might involve the Arians in the guilt and consequences of heresy. A letter was publicly read and ignominiously torn, in which their patron, Eusebius of Nicomedia, ingeniously confessed that the admission of the homoousion, or consubstantial, a word already familiar to the Platonists, was incompatible with the principles of their theological system. The fortunate opportunity was eagerly embraced. . . . The consubstantiality of the Father and the Son was established by the Council of Nice, and has been unanimously received as a fundamental article of the Christian faith by the consent of the Greek, the Latin, the Oriental and the Protestant churches." Notwithstanding the decision of the Council of Nice against it, the heresy of Arius continued to gain ground in the East. Even the Emperor Constantine became friendly to it, and the sons of Constantine, with some of the later emperors who followed them on the eastern throne, were ardent Arians in belief. The Homoousians, or orthodox, were subjected to persecution, which

was directed with special bitterness against their great leader, Athanasius, the famous bishop of Alexandria. But Arianism was weakened by hair-splitting distinctions, which resulted in many diverging creeds. "The sect which asserted the doctrine of a 'similar substance' was the most numerous, at least in the provinces of Asia. . . . The Greek word which was chosen to express this mysterious resemblance bears so close an affinity to the orthodox symbol, that the profane of every age have derided the furious contests which the difference of a single diphthong excited between the Homoousians and the Homoioussians."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 21.—The Latin churches of the West, with Rome at their head, remained generally firm in the orthodoxy of the Homoousian creed. But the Goths, who had received their Christianity from the East, tinctured with Arianism, carried that heresy westward, and spread it among their barbarian neighbors—Vandals, Burgundians and Sueves—through the influence of the Gothic Bible of Ulfilas, which he and his missionary successors bore to the Teutonic peoples. "Almost all the barbarians when they entered the empire were converted, not to Catholicism, but to Arianism. The Visigoths of Spain, the Ostrogoths of Italy, the Burgundians of Gaul, the Vandals of Africa, and the Lombards who came in the sixth century, were all Arians. . . . It would seem that the Germans had difficulty in adopting the creed of Nicæa; perhaps they hesitated to make the Son equal with the Father. Their Roman subjects were orthodox. This difference in religion caused for more than a century much strife and many persecutions. Often the barbarian king would refuse to appoint orthodox bishops; the see of Carthage thus remained vacant for twenty-four years. The Vandal king Genseric, not content with exiling the bishops, endeavored to apply to his subjects the edicts that the emperors had proclaimed against the heretics."—C. Seignobos, *History of mediæval and of modern civilization to end of 17th century*, pp. 18-19.—"The Vandals and Ostrogoths persevered in the profession of Arianism till the final ruin [A. D. 533 and 553] of the kingdoms which they had founded in Africa and Italy. The bargarians of Gaul submitted [507] to the orthodox dominion of the Franks; and Spain was restored to the Catholic Church by the voluntary conversion of the Visigoths [589]."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 37.—Theodosius formally proclaimed his adhesion to Trinitarian orthodoxy by his celebrated edict of 380, and commanded its acceptance in the Eastern Empire. (See ROME: 379-395.) "Whatever may be one's personal belief upon the theological point, the fact which condemns Western Arianism in the sight of history, and makes its fate deserved, is that, at a time when there was the utmost need that the shattered fragments of the empire should be held together in some way, and when disorganization was most dangerous, it stood for separation and local independence, and furnished no strong bond of unity on the religious side, as did the Catholic faith, to replace that political unity which was falling to pieces. Burgundian and Visigoth, Vandal and Ostrogoth and Lombard, had no common religious organization and recognized no primacy in the Bishop of Rome, and though they tolerated the Catholicism of their Roman subjects, and did not break off the connection of these with the Roman church, that result would certainly have followed had they grown into strong and permanent states, still Arian in faith. The continued life of these nations would have meant not merely

the political, but also the religious disintegration of Europe. The unity of the future, in a Christian commonwealth of nations, was at stake in the triumph of the Roman church and the Frankish empire."—G. B. Adams, *Civilization during the Middle Ages*, p. 143.—See also **GOths**: 341-381; **FRANKS**: 481-511; **GOths (VISIGOTHS)**: 507-509; and **FILIOQUE CONTROVERSY**.

ARICIA, Battle of.—A victory won by the Romans over the Aurunci (497 B. C.), which summarily ended a war that the latter had declared against the former.—Livy, *History of Rome*, bk. 2, ch. 26.—See **ALBA**.

ARICIAN GROVE.—The sacred grove at Aricia (one of the towns of old Latium, near Alba Longa) was the center and meeting-place of an early league among the Latin peoples, about which little is known.—W. Ihne, *History of Rome*, bk. 2, ch. 3.—W. Gell, *Topography of Rome*, v. 1.—"On the northern shore of the lake [of Nemi] right under the precipitous cliffs on which the modern village of Nemi is perched, stood the sacred grove and sanctuary of Diana Nemorensis, or Diana of the Wood. . . . The site was excavated in 1885 by Sir John Saville Lumley, English ambassador at Rome. [For a general description of the site and excavations, consult the *Athenæum*, 10th October, 1885. For details of the finds consult 'Bulletino dell' Instituto di Corrispondenza Archeologica,' 1885]. . . . The lake and the grove were sometimes known as the lake and grove of Aricia. But the town of Aricia (the modern La Riccia) was situated about three miles off, at the foot of the Alban Mount. . . . According to one story, the worship of Diana at Nemi was instituted by Orestes, who, after killing Thoas, King of the Tauric Chersonese (the Crimea), fled with his sister to Italy, bringing with him the image of the Tauric Diana. . . . Within the sanctuary at Nemi grew a certain tree, of which no branch might be broken. Only a runaway slave was allowed to break off, if he could, one of its boughs. Success in the attempt entitled him to fight the priest in single combat, and if he slew him he reigned in his stead with the title of King of the Wood (Rex Nemorensis). Tradition averred that the fateful branch was that Golden Bough which, at the Sibyl's bidding, Æneas plucked before he essayed the perilous journey to the world of the dead. . . . This rule of succession by the sword was observed down to imperial times; for amongst his other freaks Caligula, thinking that the priest of Nemi had held office too long, hired a more stalwart ruffian to slay him."—J. G. Frazer, *Golden bough*, ch. 1, sect. 1.

ARICINI, the inhabitants of Aricia, an ancient Latin city.

ARICONIUM, a town of Roman Britain which appears to have been the principal mart of the iron manufacturing industry in the Forest of Dean.—T. Wright, *The Celt, the Roman and the Saxon*, p. 161.

ARID LANDS, Reclamation of. See **CONSERVATION OF NATURAL RESOURCES**.

ARII (Harii), barbarian invaders of Gaul. See **LYGIANS**.

ARIKARA INDIANS. See **INDIANS, AMERICAN**: Cultural areas in North America: Plains Area; **PAWNEE FAMILY**.

ARIKAREE, or South Fork, Battle of. See **U. S. A.**: 1866-1876.

ARIMASPI, an ancient and semi-mythical tribe dwelling in northeastern Scythia.

ARIMINUM, the Roman colony, planted in the third century B. C., which grew into the modern city of Rimini. (See **ROME**: B. C. 295-191.) When Cæsar entered Italy as an invader, crossing the frontier of Cisalpine Gaul—the Rubicon—his first movement was to occupy Ariminum. He halted there for two or three weeks, making his preparations for the civil war which he had now entered upon and waiting for the two legions that he had ordered from Gaul.—C. Merivale, *History of the Romans*, ch. 14.

ARIOBARZANES, the name of several kings of Pontus, the most famous being the founder of the kingdom, who revolted against Artaxerxes in 362 B. C. (See also **MITHRADATIC WARS**). A second was the son of Mithradates III, king 266-240 B. C., who enlisted the aid of the invading Gauls in Asia. Among the kings of Cappadocia by that name the most important is the ruler from 51 to 41 B. C. who aided Pompey against Cæsar.

ARIOSTO, Lodovico (1474-1533), Italian poet. During his service with Cardinal d'Este he wrote "Orlando Furioso," a great poem which uses the material of the chivalric romances in classical epic style. See **ITALIAN LITERATURE**: 1450-1505.

ARIOVALDUS, king of the Lombards, 626-638.

ARIOVISTUS (c. 60 B. C.), a German chief who invaded Gaul; aided the Sequani in their war with the Aedui; defeated by Cæsar in 58 B. C.—See also **Gaul**: B. C. 58-51.

ARISTA, Mariano (1802-1855), Mexican general. See **MEXICO**: 1846-1847; 1848-1861.

ARISTAGORAS (7-497 B. C.), leader of an unsuccessful revolt of Ionian cities against Persia. See **GREECE**: B. C. 500-493: Rising of Ionians.

ARISTARCHUS (c. 220-143 B. C.), Greek grammarian and critic. See **EDUCATION: Ancient: Alexandria**.

ARISTIDES (c. 530-468 B. C.), Athenian statesman and military leader, called "the Just"; took part in the battle of Marathon (490 B. C.); opposed Themistocles vigorously, which brought about his ostracism in 483 B. C.; returned to his native land in time to take part in the victory of Salamis (480 B. C.) and the battle of Plataea the following year; a strong advocate for civic reforms and founder of the League of Delos.—See also **ATHENS**: B. C. 472-462.

ARISTIPPUS, philosopher. See **ETHICS: Ancient Greece**: B. C. 4th Century.

ARISTOBULUS II (d. 49 B. C.), king of Judaea. Usurped the throne of Hyrcanus II; defeated by Pompey and removed from power. Supported by Cæsar against Pompey in 49. See **JEWS**: 166-40 B. C.

ARISTOCRACY.—"If the supreme governing authority is intrusted to a small group or class of

the population, the government is said to be aristocratic. It is a government in which only a minority of the citizens have a share, the rest of the population, as Montesquieu remarks, being in respect to the former the same as the subjects of a monarch in regard to the sovereign. . . . Aristocracies, like monarchies, may likewise be of several varieties. There may be aristocracies of wealth as at Carthage and later at Venice, and these may be based either on ownership of land or of all property in general; or they may be hereditary and hence based upon birth or family connection; or they may be official in character, that is, composed mainly of those who hold or have held public office such as the 'senatorial class' in both republican and imperial Rome; or they may be military or a combination of some or all of the above elements. . . . Originally it was one of the most respected, as it was one of the most widely distributed, of all forms of political organization; but in recent years the name has come to have an unsavory if not a disreputable ring about it. The ancient writers like Aristotle, as has been said, carefully distinguished between aristocracy, which they defined as government by the 'best,' and oligarchy, which they described as government by a wealthy minority in their own interest. [For establishment in Athens, see ATHENS: B. C. 753-650.] But with modern notions concerning government by the few the distinction has largely disappeared, so that aristocracy has come to possess the same disagreeable meaning which the ancients associated with oligarchy. In short, the two, as forms of government, are now regarded as substantially the same. One of the distinguishing characteristics of aristocracy, is that it emphasizes quality rather than quantity, character rather than mere numbers. It assumes that some are better fitted to govern than others, attaches great weight to experience and training as political virtues, and seeks to reward special talent and attract it into the public service. It is preëminently conservative government; it honors authority, especially when it has had the sanction of long acquiescence, and has great reverence for long-established custom and tradition. . . . But the weakness of aristocracy as a practical system of government lies in the difficulty of finding any safe and just principle of selection by which the fittest, politically speaking, may be differentiated from the unfit and, when this is done, of providing any adequate security against the temptation of the former class to exercise their powers in their own interest. It is now generally agreed that the most capable and fit of the population cannot be selected by conferring the power to govern upon certain families and their descendants, for political capacity and probity are qualities not always transmitted from father to son. . . . The possession of property, whether of land or personalty, is an equally unsatisfactory test of political capacity, especially if it be inherited wealth. . . . In other words, property, like birth, is not the only criterion, and therefore the governing power cannot wisely be restricted to either class or to both combined. And so with all other tests which do not rest upon intrinsic merit. Yet to prove that no just or adequate tests can be found really proves nothing against aristocracy itself. . . . Public opinion toward aristocracies in recent times has been so unfavorable that no example of a pure aristocracy has survived the middle of the nineteenth century. The ancient aristocracy of Rome gave way to democracy. The medieval aristocracies of Germany and Italy were superseded by the growing power of the princes, and the royal governments which they established

were in time overwhelmed by the rise of the democracy. In modern times they survive only in part, being associated wherever they exist with democracy and monarchy. . . . Aristocracy is a very common form of government in the infancy of states, when political consciousness manifests itself only in the minds of a few. . . . Aristocracy proper is a principle which all states have admitted and to some extent followed in practice. In all ancient states, democracies and aristocracies alike, large classes of persons were excluded from participation in public affairs. The laboring classes everywhere have been enfranchised only in comparatively recent years. . . . Modern democracies no longer exclude the laboring classes, yet practically all of them apply standards of fitness, even if they sometimes apply them indirectly and in a manner unconsciously. In this sense the governments of most states are aristocratic. Modern government is such a difficult art and requires so much skill and special knowledge that the whole number of persons really qualified is very small. In short, it must from the very nature of the case be largely government by specialists."—J. W. Garner, *Introduction to political science*, pp. 170-219.—Whoever may carry on the machinery of government, the source of political power is likely to be found in the dominant social class. "But leadership and aristocracy are progressive factors only in so far as they produce more than they cost: just to pay their way is not enough. Social differentiation into class with more or less fixed status has served in the past. But the social wastes through inhibited talent and productivity, through exploitation and fostering the mores of servility and resignation, make it doubtful whether aristocracy is worth the price. The only upper classes a progressive civilization can tolerate are men and women of superior mental ability who at the same time have social vision, and a sense of social solidarity."—A. J. Todd, *Theories of social progress*, pp. 404-405.—Historically an aristocracy developed from a primitive monarchy, the best known being those of ancient Greece. Among the states which were famous aristocracies, through part, at least, of their history are the following: Athens, Sparta, Rome, Carthage, Venice, Genoa, Dutch Netherlands, and the Free Imperial Cities of Germany. Great Britain was in practice an aristocracy from 1689-1832, and France to 1789.—See also DEMOCRACY: Progress following the industrial revolution; and Genesis of modern democracy; FEUDALISM.

ARISTOGEITON, Athenian hero, who slew the tyrant Hipparchus at the Panathenaic festival (514 B. C.).

ARISTOMNEAN WAR. See MESSENIAN WARS, FIRST AND SECOND.

ARISTOPHANES (c. 448-385 B. C.), greatest comic dramatist of Athens; notable also for the excellence of his poetry. His eleven extant plays are a commentary and criticism on Athenian life of his day.—See also ATHENS: B. C. 421; DRAMA; Greek comedy.

Ideas on position of women. See WOMEN'S RIGHTS: B. C. 600-300.

ARISTOPHANES OF BYZANTIUM, librarian. See ALEXANDRIA: B. C. 282-246; Reign of Ptolemy Philadelphus, etc.

ARISTOTLE (384-322 B. C.), the most celebrated of the Greek philosophers, "Aristotle, the tutor of Alexander, had come to Athens upon his pupil's accession to the throne, and from 334 B. C. to 323 B. C. he taught philosophy in the Lyceum in that city. He had been a pupil of Plato . . . but in his temperament, his method, and his conclusions he departed widely from his master.

Plato was a poet, full of imagination, aiming after lofty ideals which he saw by a kind of inspired vision. Aristotle was a cool and cautious thinker, seeking the meaning of the world by a study of things about him, not satisfied until he brought everything to the test of observation. Thus he investigated the laws which governed the arts of rhetoric and poetry; he collected the constitutions of many Greek states and drew from them some general principles of politics; he studied animals and plants to know their structure; he examined into the acts and ways of men to determine the essence of their right- and wrong-doing. He set his students to this kind of study and used the results of their work. Thus a new method of investigation was created and new light thrown on all sides of life. A most learned man, he had a passion for truth and reason; one of his most famous sayings is 'Plato and truth are both dear to me, but it is a sacred duty to prefer truth.' His works, especially his *Politics*, *Ethics*, and *Poetics*, have had vast power in guiding the thinking of men since his day."—G. S. Goodspeed, *History of the ancient world*, p. 224.—"The most striking peculiarity of the instruction in the mediæval university was the supreme deference paid to Aristotle. Most of the courses of lectures were devoted to the explanation of some one of his numerous treatises,—his *Physics*, his *Metaphysics*, his various treatises on logic, his *Ethics*, his minor works upon the soul, heaven and earth, etc. Only his *Logic* had been known to Abelard, as all his other works had been forgotten. But early in the thirteenth century all his comprehensive contributions to science reached the West, either from Constantinople or through the Arabs who had brought them to Spain. . . . Aristotle was, of course, a pagan. He was uncertain whether the soul continued to exist after death; he had never heard of the Bible and knew nothing of the salvation of man through Christ. One would have supposed that he would have been promptly rejected with horror by those who never questioned the doctrines of Christianity. But the teachers of the thirteenth century were fascinated by his logic and astonished at his learning. The great theologians of the time, Albertus Magnus (d. 1280) and Thomas Aquinas (d. 1274), did not hesitate to prepare elaborate commentaries upon all his works. He was called 'The Philosopher'; and so fully were scholars convinced that it had pleased God to permit Aristotle to say the last word upon each and every branch of knowledge that they humbly accepted him, along with the Bible, the church fathers, and the canon and Roman law, as one of the unquestioned authorities which together formed a complete guide for humanity in conduct and in every branch of science."—J. H. Robinson, *Introduction to the history of western Europe*, pp. 271-272.—See also EUROPE: Ancient; Greek civilization: Philosophy; Middle Ages: Scholasticism; and GREEK LITERATURE: Development of philosophical literature.

ARIUS, Alexandrian priest, founder of Arianism (318-325). See ARIANISM.

ARIZONA, a state in the southwestern part of the United States. It is bounded on the north by Utah, on the east by New Mexico, on the south by Mexico, and on the west by California and Nevada. It contains 113,956 square miles, ranking fifth in area among the states, and in 1920 had a population of 333,273.

Agricultural and mineral resources. See U. S. A.: Economic map.

Name.—"Arizona, probably Arizonac in its original form, was the native and probably Pima name of the place—of a hill, valley, stream, or some other local feature—just south of the modern boundary, in the mountains still so called, on the headwaters of the stream flowing past Saric, where the famous Planchas de Plata mine was discovered in the middle of the 18th century, the name being first known to Spaniards in that connection and being applied to the mining camp or real de minas. The aboriginal meaning of the term is not known, though from the common occurrence in this region of the prefix 'ari,' the root 'son,' and the termination 'ac,' the derivation ought not to escape the research of a competent student. Such guesses as are extant, founded on the native tongues, offer only the barest possibility of a partial and accidental accuracy; while similar derivations from the Spanish are extremely absurd. . . . The name should properly be written and pronounced Arisona, as our English sound of the z does not occur in Spanish."—H. H. Bancroft, *History of the Pacific states of North America*, v. 12, p. 520.

Aboriginal inhabitants. See APACHE GROUP; PIMAN FAMILY; PUEBLOS.

1540.—Exploration by Coronado. See AMERICA: 1540-1541.

1600-1800.—Beyond the establishment of Spanish ranches, and the activities of Jesuits and Franciscans, there was very little growth in the territory that is now Arizona until the nineteenth century. In 1772 there were only two missions, and two settlements: Tuscon and Tubac.

1800-1830.—The decay of the Spanish presidios attendant upon the struggle of Mexico for independence, the expulsion of the friars, and the hostility of the Apaches and other Indians prevented settlers from seeking homesteads in Arizona, but American trappers and traders appeared along the Gila river in the early nineteenth century.

1848.—Partial acquisition from Mexico. See MEXICO: 1848.

1853.—Purchase by the United States of the southern part from Mexico.—Gadsden Treaty.—

"On December 30, 1853, James Gadsden, United States minister to Mexico, concluded a treaty by which the boundary line was moved southward so as to give the United States, for a monetary consideration of \$10,000,000, all of modern Arizona south of the Gila, an effort so to fix the line as to include a port on the gulf being unsuccessful. . . . On the face of the matter this Gadsden treaty was a tolerably satisfactory settlement of a boundary dispute, and a purchase by the United States of a route for a southern railroad to California."—H. H. Bancroft, *History of the Pacific states of North America*, v. 12, ch. 20.

1863-1884.—Mormon settlements. — "Among the early settlers were the Mormons, who in 1863 had a settlement at St. Thomas, in Pah-Ute

county, a region later attached to Nevada. In 1873 the authorities in Utah formed a plan of colonization, and a pioneer party of 700 men was sent south, intending to get a start by working on the Texas Pacific Railroad, but became discontented with the prospect and went home. The project was revived in 1876-77, and a beginning was made in two districts—on the Upper Colorado Chiquito and on Salt River. At a meeting held at Salt Lake City, in January, 1876, missionaries were present from different parts of Utah, and an organization was effected under Lot Smith as president. The first party arrived in March at the Sunset crossing, and soon the camps of Sunset, Allen, Ballinger, and Obed were established. Progress was slow, the first season's crop not sufficing for the colony's needs, and teams having to be sent to Utah for supplies; but the pioneers were resolute men, and though many, first and last, abandoned the enterprise, at the end of 1877 the mission numbered 564 souls, and a year later 587. In 1884 the population is given by the newspapers as 2,507, the chief settlements being Sunset, St. Joseph, and Brigham City. . . . The Mormons have always been regarded as among the best of Arizona settlers, being quiet, industrious, and economical in their habits, and not disposed to intrude their religious peculiarities. As a rule polygamy has not been practised, though there are many exceptions. Their neat adobe houses, orchards, gardens, and well-tilled fields form veritable oases in the desert. Their lands are held by the community; work and trade are carried on for the most part on the co-operative plan, and they even live in community houses, eating at a common table, though each family has its separate rooms. It has been their aim to produce all that they eat and wear, sugar cane and cotton being among their crops. Notwithstanding their community system, much freedom is conceded to individuals, who may in most respects live as they please and mingle freely with the gentiles. Less despised and persecuted than in Utah [see also UTAH: 1857-1859], they are naturally less clannish, peculiar, and exclusive. In politics they are nominally democratic, but often divide their vote on local issues, or put their united vote where it will do most good for their own interests. 'As a rule, they are prosperous but not yet wealthy farmers.'—H. H. Bancroft, *Arizona and New Mexico*, pp. 533-534.

1864 (November).—**Organization of the territory.**—"The territorial act having been passed by Congress in February, 1863, and officials appointed by President Lincoln in March, the whole party of emigrant statesmen, headed by Governor John N. Goodwin, of Maine, started in August for the Far West, leaving Leavenworth on September 25th, Santa Fé November 26th, and Albuquerque December 8th, under the escort of troops from Missouri and New Mexico. It was on the 27th that the party crossed the meridian of 109 degrees into Arizona, and two days later in camp at Navajo Spring, the government was formally organized in the wilderness. The flag was raised and cheered; a prayer was said by H. W. Read; the oath of office taken by the officials; and a proclamation of Governor Goodwin was read, in which the vicinity of Port Whipple, established only a month earlier by Major Willis of the California column, was named as the temporary seat of government; and here all arrived on January 22, 1864. In May the fort was moved some 200 miles to the southwest, and near it by July a town had been founded on Granite Creek to become the temporary capital. It was named Prescott, in honor of the historian. Meanwhile the governor made a tour of inspection in the south and other parts of the territory; by

proclamation of April 9th three judicial districts were created and the judges assigned; the marshal was instructed to take a census; and an election proclamation was issued on the 26th of May. Accordingly, at the election of July 18th, there were chosen a council of nine members, and a house of eighteen; also a delegate to Congress in the person of Charles D. Poston. The legislature was in session at Prescott from September 26th to the 10th of November. Besides attending to the various routine duties, and passing special acts, this body adopted a mining law, and a general code of laws, prepared by Judge Howell, and called in his honor the Howell Code, being based mainly on the codes of New York and California. It also divided the territory into four counties under the aboriginal names of Pima, Yuma, Mojave, and Yavapai; and adopted a territorial seal, though for nearly 20 years a different seal appears to have been in use."—*Ibid.*, pp. 521-523.

1864-1883.—**Development of the Southern Pacific railroad.**—Arizona could not expect to progress until her resources were opened up by railroads. "From 1864 the subject was always under discussion, and various projects took more or less definite shape; but there was a broad region to be crossed before the iron road should even approach Arizona. In 1866 the Atlantic and Pacific was chartered with a land grant on the 35th parallel, but no western progress was made. In 1870-1 this company was reorganized, making some show of active work, and the Texas and Pacific was organized to reach San Diego by the Gila route, with a land grant like that of the Atlantic and Pacific, including the alternate sections for a width of 80 miles throughout the whole extent of Arizona from east to west. For a few years from 1872 Arizonans believed their railroad future assured from this source; but financial obstacles proved insuperable, and Scott's line never reached the eastern line of the territory. In 1877, however, the Southern Pacific from California was completed to the Arizona line at Yuma, and in the following years, not without some serious complications with the rival company, was rapidly continued eastward, reaching Tucson in 1880, and in 1881 effecting a junction with the Atchison, Topeka, and Santa Fé road at Deming, New Mexico. Practically by the latter company the Sonora road, connecting Guaymas with the Southern Pacific at Benson, was completed in 1882. . . . Meanwhile the completion of the Atchison line down the Rio Grande valley enabled the Atlantic and Pacific to resume operations in the west, and in 1880-3 this road was completed from Isleta to the Colorado at the Needles, connecting there with the California Southern. As all these roads were built, so they have been operated without any special regard to the interests of Arizona; yet they have necessarily—even as masters instead of servants of the people . . . been immensely beneficial to the territory."—*Ibid.*, pp. 603-604.

1877.—**Subjugation of the Apaches.**—"The principal events in the history of Arizona, since the reestablishment of the national authority, in 1864, have been those connected with the subjugation of the Apaches. This work was not fairly commenced until the appointment to command of General Crook, or rather, to be more just, to the appearance of Gen. O. O. Howard, as Special Indian Commissioner. In Arizona itself, the only comment, as a rule, is that of bitter hostility, not alone of the aborigines, but of all who have adopted or advocated any means other than those of destruction to bring about peace. Whatever else may be said of Gen. Howard, it must also be acknowledged that his policy was the first successful breach in

the long and unbroken line of savage warfare. It brought Cochise (the most annoying Indian Chieftain) to terms, so far as the Americans were concerned. The appointment of Gen. Crook to command, and the unrelenting warfare he waged, soon made other bodies of Apaches surrender. Crook adopted the policy of dividing his foes by employing them to fight one another. Under this policy a considerable number of Apache and Hualapai Indians have been used as scouts. . . . The Apaches were, under Gen. Howard's policy, first congregated on the Chiricahui Reservation, occupying the southeastern portion of the territory. The unwise nature of the location was soon exemplified by the Indians making it a base of operations for attack on the people of Sonora. Gen. Crook removed the savages to the White Mountains Reservation, north of Gila River, where they are now located. Since the severe chastisement given by Crook to the Tonto Apaches and others, there has been no general Indian marauding, but for a long period, . . . the New Mexican line and the Chiricahui were rendered unsafe by small parties of renegades—Indians who slipped off the Arizona or New Mexican reservations and went on predatory raids, generally following the valley of the Rio de Sauz, in the Chiricahui mountain region, or that of the San Simeon, down to the Sonora line. They would plunder and murder on either side of the New Mexican line, carry their plunder into Chihuahua or Sonora, trading it off with the Lipans or Mexicans. . . . The Santa Rita and San Pedro regions were concerned, in the spring of 1877, when a new era slowly but surely began to dawn upon this wonderfully rich but undeveloped frontier region; this territory, the oldest in civilization to all appearance of the vast continental area embraced by the American Union, but almost the newest and least advanced of any of our organized communities."—R. J. Hinton, *Handbook to Arizona*, p. 44.—See also U. S. A.: 1866-1876.

1906.—Refusal of statehood in union with New Mexico. See U. S. A.: 1906 (June).

1907.—I. W. W. agitation in mines. See INDUSTRIAL WORKERS OF THE WORLD: Recent tendencies.

1908-1911.—Admission to the Union.—"After the failure of several attempts to have Arizona and New Mexico territories enter the Union as a single state, a measure for the separate admission of Arizona, introduced in Congress in 1908, failed of passage in the Senate because of charges of corruption on the part of territorial officials. Finally, on January 20, 1910, an act was passed enabling the Governor of Arizona to call a Constitutional Convention composed of elected delegates, to form a constitution for the proposed state of Arizona. This was done, and an extremely radical constitution was submitted to the people for ratification. The approval of the people was signified by an overwhelmingly favorable vote—12,000 to 7,500. The provision that aroused most discussion was one providing for the recall of public officers by twenty-five per cent of all the voters for the office concerned, at the last general election. President Taft vetoed the joint resolution for the admission of Arizona as a state on account of the clause providing for the recall of judges, and Congress passed another resolution, permitting Arizona to join the Union if the obnoxious provision were omitted from the Constitution. Arizona complied, and was formally admitted as a state on February 14, 1912. The first legislature that convened under the new Constitution amended the Constitution again so as to provide for the recall of judicial officers. Following is a discussion of the question by Theodore Roosevelt: 'But Arizona also should

clearly, and as a matter of right and duty, at once be admitted to Statehood. The only objection of consequence to admitting her is that her Constitution provides for the recall of judges. Outside of this provision no serious objection has been made to her Constitution, and . . . as a whole, it is a Constitution well above the average. . . . The whole question, therefore, narrows down to the point as to whether it is legitimate to reject Arizona's plea because she has done what Oregon has done, what California has announced she will do. . . . Moreover, it must be remembered that, if the people of Arizona desire to exercise the right of recall of the judges their desire can be made effective immediately after their admission to Statehood; even though, in order to get in, they consent to alter the provision in their Constitution as proposed. It seems to me that the mere statement of these facts is sufficient to show that, on the ground alleged, there is no excuse for failure, to admit Arizona to Statehood. . . . It is the negation of popular government to deny the people the right to establish for themselves what their judicial system shall be. Arizona has the absolute right to try the recall just as any of the existing States has the absolute right to try it or not to try it, and to have an elective or appointive judiciary as it pleases. To keep Arizona from Statehood because she has adopted the recall as applied to the judiciary is a grave injustice to Arizona, and an assault upon the principles which underlie our whole system of free popular government.'"—T. Roosevelt, *Arizona and the recall of judiciary* (*Outlook*, June 24, 1911, pp. 378-379).

1911 (March 8).—Roosevelt dam opened.—The construction of the Roosevelt dam was a part of the United States plan for reclamation of arid lands. It consisted of a dam 283 feet high and 168 feet thick at the base. The water was supplied by the Salt river, which is high in winter but very low in summer. The reservoir is considered one of the largest artificial lakes in the world. By means of this supply of water over 200,000 acres of land are recovered for agricultural purposes.

1912.—First legislature.—Liberal measures adopted.—Ratification of the 16th and 17th amendments.—"The first legislature of the State of Arizona, the newest and last of the continental states to be admitted into the Union, has established a record for social betterment measures which will not be surpassed by any of her older sisters in many a long session. Arizona is youthful and virile, full of pluck and ambition, conscious of the magnitude of the great problems which confront her, and eager to work out their solution. She possesses rich natural resources, but is poor in point of numbers, in human resources. For thirty years she has been struggling for statehood, and for the right to put into law, through a legislature controlled only by her people, measures of social reform and betterment. Her capitalists have felt the need of developing her natural resources, but her people have felt the greater need of protecting and conserving her human resources. In the first session of her first legislature, recently concluded, constructive social measures were passed of which any of the older states of the Union might be justly proud. Many of the men who drew up the constitution continued their work as members of the legislature. There is, therefore, a close harmony between the two bodies of legislation. The members of the constitutional convention, some of whom were greatly interested in social reform, were unwilling to rest many reforms with the new-legislature-to-be, the character of which no man could foretell. Therefore there were embodied in the constitution several strikingly pro-

gressive measures, among the most important of which are the following:

"(1) The common law doctrine of fellow servant, so far as it affects the liability of master for injuries to his servant, is forever abrogated. (2) The right of action to recover damages for injuries shall never be abrogated, and the amount to be recovered shall not be subject to any statutory limitation. (3) An employers' liability law shall be passed, by the terms of which any employer . . . shall be liable for death or injury . . . in all cases in which death or injury shall not have been caused by the negligence of the employee killed or injured. (4) The legislature shall enact a workmen's compulsory compensation law applicable in such employments as the legislature may determine to be especially dangerous, by which compulsory compensation shall be required to be paid . . . by the employer . . . if accident is caused in whole or in part, or is contributed to, by a necessary risk or danger of such employment, or a necessary risk or danger inherent in the nature thereof or by failure of employer . . . to exercise due care . . . , it being optional with employee to settle for such compensation, or to retain the right to sue, etc. (5) The defence of contributory negligence, or assumption of risk, shall be a question of fact, and left to the jury. (6) No child under the age of fourteen shall be employed in any gainful occupation during any part of the school year. (7) It shall be unlawful for any corporation . . . to require of its employees as a condition of their employment any contract whereby such corporation . . . shall be released from liability on account of personal injuries.

"Other clauses of social importance, including the one of establishing the office of mine inspector, were embodied in the constitution. Permanence and dignity were added to the work of the legislature by the unpartisan action of the governor and legislators. Members of the same political party, they were yet actuated by the ambition to establish a record for nonpartisan and enlightened legislation and administration. Republicans as well as Democrats were put upon the most important committees, and both houses, as well as the governor, though differing upon smaller details, were in harmony on the larger questions and worked together with the one end in view—strong, progressive legislation that would stand the test of future political contests. Of the three hundred bills introduced, over 100 were passed, and of the hundred new laws, fully one-third are of important social significance. The most important bills dealt with the following topics: child labor; woman labor; mining code, with provisions for mine inspection and important limitations upon conditions of underground work in mines; miners' labor lien law; five laws regulating hours of labor, including eight-hour day for miners; several reformatory measures, including indeterminate sentence for criminals and care for unfortunate girls; anti-labor black list; workmen's compulsory compensation. It was the earnest desire of the legislature to pass the best child-labor law in the United States, and it must be conceded that they did remarkably well. The act was introduced by Mike Cunniff, president of the Senate and former managing editor of *World's Work*, a man who has been a miner and owner of mines and who is deeply interested in all labor questions. The most important provisions of this act are: no child under fourteen is permitted to work in any industrial or mercantile pursuit; it is unlawful for any person, firm or corporation to employ any child under fourteen in any

business whatever during any part of the school year; more than sixty dangerous and unhealthful occupations, in which no child under sixteen may be employed, are enumerated; the state board of health is empowered to determine from time to time what other occupations are dangerous and unhealthful, and may prohibit employment in such additional ones; females under sixteen are not permitted to work in any occupation requiring them to stand constantly; the right of corporations and others to employ any minors is conditioned upon strict examination by school officials and the board of health, and upon previously obtaining proper certificates as well as upon keeping correct records, the most important of which must be conspicuously posted; the state superintendent, truant officers, etc., are given right to enter any and all establishments at all times; no child under eighteen can be employed about blast furnaces, smelters and twenty other hazardous occupations; no female is permitted to work about any mine, quarry or coal breaker; no boy under sixteen and no girl under eighteen is permitted to work before seven in the morning or after seven in the evening. The presence of any child in an establishment is prima facie evidence of his employment there. Physical fitness of any child must be passed upon by the state board of health before he can be employed. In strict compliance with the constitutional mandate the legislature passed the employers' liability act and the workmen's compulsory compensation act. These strengthened the force of the constitutional provisions dealing with these important subjects, the latter by clearly laying down the principle that 'compulsory compensation shall be paid by his employer to any workman . . . if injury is caused in whole or in part . . . by failure of employer or his agents to exercise due care, etc.,' and further by declaring the common law doctrine of 'no liability without fault' to be abrogated. The employers' liability act clearly states that 'any employer shall be liable for death or injury . . . in all cases in which such death or injury . . . shall not have been caused by the negligence of the employee killed or injured.' Two very important bills were the one establishing the office and defining the duties of mine inspector, and the one containing the new mining code. A bill was passed making the miner's lien for wages take precedence of a first mortgage. The mining bill has been well received by both miners and operators. In addition to the foregoing, several other important laws have been enacted to protect the laboring classes in Arizona."—H. A. E. Chandler, *With Arizona's first legislature* (Survey, Aug. 17, 1912, pp. 647-648).—On April 9, the Arizona legislature ratified the sixteenth federal amendment, providing for a federal income tax, and on June 3, it ratified the seventeenth federal amendment, for the direct election of United States senators.

1915.—Alien Labor Law.—Foreign objection to.—Upheld by United States Supreme Court.—"At a recent general election the people of Arizona, by a majority of 10,604 in a popular vote upon a measure submitted to them, enacted into law these provisions: 'Any company, corporation, partnership, association, or individual who is or may hereafter become an employer of more than five workers at any one time, in the State of Arizona, regardless of kind or class of work, or sex of workers, shall employ not less than eighty per cent qualified electors or native-born citizens of the United States, or some subdivision thereof,' and making any violation of the provisions of the act a misdemeanor subject to

fine and imprisonment. The Ambassadors of the British and Italian Governments at once made representations to the Department of State to the effect that the Arizona law was in violation of the privileges accorded to the two countries under treaties with our Government. The State Department thereupon requested the Governor of Arizona to defer issuing his proclamation of the law. Under the Arizona Constitution and statutes it is made the duty of the Governor to issue that proclamation 'forthwith,' upon the certification of the returns by the Secretary of State."—*Arizona alien labor law (Outlook, Jan. 20, 1915, pp. 109-110)*.—When the constitutionality of the Arizona law was tested in the Federal District Court of Arizona in the case of *Raich v. Truax* (January 7, 1915, 219 Federal 273), the court rendered a decision unfavorable to the law on the ground that it did not give equal protection of the laws to all persons; aliens are entitled to the same protection of the laws as citizens. The United States Supreme Court reversed this decision on appeal, November 1, 1915.

1916.—State suffrage granted women. See SUFFRAGE, WOMAN; United States: 1851-1920.

1917.—Rival claimants for the governorship.—Deadlock in the capital.—"The Democratic governor of Arizona, G. W. P. Hunt, created a stir throughout the state when he refused to surrender his office to Thomas E. Campbell, the Republican governor-elect. Governor Hunt believes that when the ballots cast at the November election [1916] are recounted his reelection will be established beyond a doubt, and, acting upon that belief, he refuses to recognize in any way his opponent. Mr. Campbell is governor upon the face of the returns, and his election has been conceded by the Democratic State Central Committee. The question as to which of the two claimants is the rightful governor will be fought out in the courts. . . . On the first of January both governors were to be inaugurated, and the town of Phoenix filled with partisans of each side ready to take a hand if there should be a conflict. Governor Hunt, however, locked his rival out of the capitol building and governor-elect Campbell did not insist upon going through the formal ceremony. He had already satisfied the requirements of the law by taking the oath of office before a notary, and so he contented himself with an informal address to the crowd on the capitol grounds. Governor Hunt still refusing to accept his credentials, governor-elect Campbell established a temporary executive office in another part of the city. Feeling on both sides ran high, but trouble was averted by the large force of deputy police, by the new prohibition law, which made liquor inaccessible, and by the good sense and self-restraint which often characterizes even a very angry American crowd."—*State with two governors (Independent, Jan. 15, 1917, p. 96)*.—Ex-Governor Hunt eventually relinquished his untenable position.

1917.—Minimum wage law. See LABOR REMUNERATION: 1910-1920.

1918 (May 23-24).—Federal prohibition amendment ratified.—Arizona was the twelfth state to ratify the prohibition amendment.

1918.—Part played in the World War.—The state furnished about 10,000 soldiers.

1919.—Decision of United States Supreme Court.—This was the outgrowth of the employers' liability feature of the Workmen's Compensation act which provided that in all employments inherently dangerous the employer should be liable for accidents whether he or his agent were directly responsible for it or not. The de-

cision held that such provision is allowable and is not in violation of the fourteenth amendment, as claimed.—See also SUPREME COURT: 1888-1913; 1917-1921.

1920.—Woman suffrage amendment ratified.—Arizona ratified the woman suffrage (19th federal) amendment February 12.

ARKA: 1570 B. C.—Destroyed by Egyptians. See PHOENICIANS: Origin.

ARKANSAS, a south central state of the United States. It is bounded on the north by Missouri; on the east by the Mississippi River, which separates it from Tennessee and Mississippi; on the south by Louisiana, and on the west by Oklahoma and Texas. It contains an area of 53,335 square miles, and in 1920 had a population of 1,770,995.

Agricultural and mineral resources. See U. S. A.: Economic map.

Aboriginal inhabitants. See SIOUAN FAMILY: Sioux.

1542.—Entered by Hernando de Soto. See FLORIDA: 1528-1542.

1803.—Embraced in the Louisiana Purchase. See LOUISIANA: 1798-1803.

1815-1840.—Early settlement.—Origin of population.—"As is well known, the American pioneer has, as a rule, emigrated along lines of latitude. The Mississippi River was the route by which the earliest settlers came into Arkansas, either from New Orleans or down the River from St. Louis and the settlements farther north and east. Many came by boat from southern Indiana and Ohio and from river points in Kentucky and Tennessee, but with the development of the older states of the Middle West and the building of the great National Road the methods of immigration changed. The horse became the motive power and the covered wagon superseded the flat-boat; so that a large majority of the immigrants who entered Arkansas between 1815 and 1830 came overland on horseback or in wagons, entering the territory from Missouri at Davidsonville in old Lawrence County. In 1820 their line had extended through Batesville to Cadron in Pulaski County, and in 1821 down to Red River through Clark and Hempstead Counties. 'Far-away Hempstead,' says Shinn, 'then had more than one seventh of the population, and although for the most part from Georgia, North Carolina, Virginia, and Kentucky, they came in from Missouri in wagons guided by the National Road.' Prof. Shinn is also authority for the further statement that the English-speaking population who entered Arkansas before 1820 was largely cosmopolitan in character; that for the decades between 1820 and 1840 immigrants from Kentucky, Ohio, and Indiana were dominant, with the Kentuckians in the lead."—S. B. Weeks, *History of public school education in Arkansas (United States Bureau of Education, Bulletin No. 27, 1912)*.

1819-1836.—Detached from Missouri.—Organized as a territory.—Admitted as a state.—"Preparatory to the assumption of state government, the limits of the Missouri Territory were restricted on the south by the parallel of 36° 30' north. The restriction was made by an act of Congress, approved March 3, 1819, entitled an 'Act establishing a separate territorial government in the southern portion of the Missouri Territory.' The portion thus separated was subsequently organized into the second grade of territorial government, and Colonel James Miller, a meritorious and distinguished officer of the Northwestern army, was appointed first governor. This territory was known as the Arkansas Territory, and, at the period of its first organization, con-

tained an aggregate of nearly 14,000 inhabitants. Its limits comprised all the territory on the west side of the Mississippi between the parallels 33° and 36° 30', or between the northern limit of Louisiana and the southern boundary of the State of Missouri. On the west it extended indefinitely to the Mexican territories, at least 550 miles. The Post of Arkansas was made the seat of the new government. The population of this extensive territory for several years was comprised chiefly in the settlements upon the tributaries of White River and the St. Francis; upon the Mississippi, between New Madrid and Point Chicot; and upon both sides of the Arkansas River, within 100 miles of its mouth, but especially in the vicinity of the Post of Arkansas. . . . So feeble was the attraction in this remote region for the active, industrious, and well-disposed portion of the western pioneers, that the Arkansas Territory, in 1830, ten years after its organization, had acquired an aggregate of only 30,388 souls, including 4,576 slaves. . . . The western half of the territory had been erected, in 1824, into a separate district, to be reserved for the future residence of the Indian tribes, and to be known as the Indian Territory. From this time the tide of emigration began to set more actively into Arkansas, as well as into other portions of the southwest. . . . The territory increased rapidly for several years, and the census of 1835 gave the whole number of inhabitants at 58,134 souls, including 9,630 slaves. Thus the Arkansas Territory in the last five years had doubled its population. . . . The people, through the General Assembly, made application to Congress for authority to establish a regular form of state government. The assent of Congress was not withheld, and a Convention was authorized to meet at Little Rock on the first day of January, 1836, for the purpose of forming and adopting a State Constitution. The same was approved by Congress, and on the 13th of June following the State of Arkansas was admitted into the Federal Union as an independent state, and was, in point of time and order, the twenty-fifth in the confederacy. . . . Like the Missouri Territory, Arkansas had been a slaveholding country from the earliest French colonies. Of course, the institution of negro slavery, with proper checks and limits, was sustained by the new Constitution."—J. W. Monette, *Discovery and settlement of the valley of the Mississippi*, bk. 5, v. 2, ch. 17.—See also OKLAHOMA: 1824-1837; U. S. A.: 1818-1821.

1850.—Slavery question. See U. S. A.: 1850 (June).

1861 (March).—Secession voted down. See U. S. A.: 1861 (March-April).

1862-1864.—Beginnings of Reconstruction.—"There was not a time during the Civil War when there were not many Federal sympathizers in the State. Early in the struggle, the Confederate State government arrested many Union sympathizers in north Arkansas. In 1862, General Curtis, in his march at the head of a Union army from Pea Ridge to Batesville, met with loyal sentiments everywhere. During the winter of 1862-63

loyal citizens began to hold primary assemblies with a view to the re-establishment of a loyal state government; and after General Steele occupied Little Rock, many original Union men who had fled the State returned under protection of the Federal army and set about the establishment of a new state government loyal to the Union. The army at first did not encourage the movement; but October 30, fifty days after the fall of Little Rock, the loyal men held a convention at the capital, avowed Union sentiments and appointed a committee . . . to draft resolutions, assuring the President of their loyalty to the United States and of their desire to have a loyal state government established in Arkansas. Contemporary with this convention, similar gatherings were held at Fort Smith and Van Buren. October 24, twelve citizens of these two places met in Fort Smith and inaugurated a movement which resulted in the constitutional convention of 1864. After canvassing the situation, they called popular conventions to be tried for Sebastian County at Fort Smith and for Crawford County at Van Buren. At these conventions, loyalty was avowed, much enthusiasm was manifested and resolutions were adopted, calling upon the people of the several counties to hold conventions and elect delegates to a constitutional convention to be held in Little Rock January 4, 1864. The purpose of the convention, they declared, was to re-establish civil government, and to restore normal relations with the central government. The committee on Federal relations in the legislature of 1864 says that there was an enthusiastic response to this call. But at that time bushwackers were numerous and south Arkansas was under control of the Confederates. If the Conventions were held, many of them could not have been more than quiet, informal, irregular gatherings of loyal men in the several counties. Union sentiment, however, was developing rapidly. . . . The President at an early date looked upon Arkansas as a favorable field for beginning the work of reconstruction. In 1862, a few days after appointing Johnson military governor of Tennessee, the President appointed John S. Phelps to a similar position in Arkansas. Secretary Stanton, in notifying him of his appointment, said the main object of his appointment was to re-establish Federal authority in the State and provide protection to loyal inhabitants, until they could re-establish civil government. But the appointment was premature and nothing came of it. The office was abolished the following year."—E. Cypert (*Arkansas Historical Association*, v. 4).—See also U. S. A.: 1863-1864 (December-July); and U. S. A.: 1865 (May-July).

1865-1866. — Garland case. — Augustus Hill Garland was admitted to the Arkansas bar in 1853, and in 1860 was admitted to the Supreme Court of the United States as attorney and counselor, taking the oath then required. Although he

opposed secession in 1861, he finally went with his state and served as a member of the Confederate House of Representatives and later as a Confederate Senator. In 1862, the Congress of the United States passed an act requiring all candidates for office to take oath that they had never in any way engaged in hostility against the Union. In 1865 all persons admitted to the bar of the United States Courts were required to take this oath, known as the "Ironclad Oath." Garland, who had been pardoned for his participation in the rebellion, entered a plea before the Supreme Court in 1866 against his taking the prescribed oath in 1865. He contended that the act requiring this oath was unconstitutional and void, as affecting his status in court and that his pardon released him from complying with it, even if it were unconstitutional. The Court granted his plea on the ground that the act was *ex post facto*.

1868. — Constitutional Convention. — Reconstruction.—"The State of Arkansas had enjoyed comparative peace and quiet for three years succeeding the Civil War. Under the presidential method of reconstruction inaugurated by President Lincoln, the loyal people of the State had met in 1864, and adopted a constitution which abolished slavery, but did not enfranchise the negroes. The constitutional convention of 1868 was the result of reconstruction acts of Congress which had been vetoed by President Johnson, and passed by Congress over his veto. For the purpose of reconstruction in the Secession States under these various acts, all negroes and all other persons who had been in the State twelve months were entitled to vote and hold seats in the convention, 'Provided that no person who has been a member of the legislature of any State, or who has held any executive or judicial office in any State, whether he has taken an oath to support the constitution of the United States or not, and whether he was holding such office at the commencement of the rebellion or not, or had held it before, and who afterwards engaged in insurrection or rebellion against the United States, or given aid or comfort to the enemies thereof, should be entitled to vote.' The qualifications of all electors were to be passed on by registrars in the various counties who were appointed by the military authorities in the South. At that time Arkansas was in the same military district with Mississippi, and Gen. Edward O. C. Ord of the United States army was the commander. The apportionment in Arkansas was unequal; large negro counties like Pulaski, Jefferson and Phillips were allowed four delegates in the convention, while large white counties like Benton, Sebastian and Crawford were allowed one each. Six counties were joined, two in a district, each district being allowed only one delegate. Some of these counties thus joined together were not even adjoining each other. The whole membership of the convention consisted of seventy-five delegates, though several counties were, for some reason, not represented at all. The convention met at Little Rock on the 7th day of January, 1868, and all the proceedings were held in the old House of Representatives, where the first legislature had convened, and where also the Secession Convention had met in 1861. It was composed of two parties then known as Radical and Conservative. The radicals were largely in the majority. They elected Thomas M. Bowen, of Crawford, president of the convention by a vote of 43, the conservatives at that time being able to rally only seven votes against him."—E. Cypert, *Constitutional convention of 1868 (Arkansas His-*

torical Association, v. 4, pp. 7-8).—See also U. S. A.: 1868-1870: Reconstruction complete.

1868.—Readmitted to the Union.—On June 22, 1868, Arkansas was readmitted to the Union under the Reconstruction act of 1865.

1872-1874.—Brooks-Baxter war.—Democrats regained power.—Constitutional Convention.—Elisha Baxter, regular Republican candidate for governor in 1872, was opposed by Joseph Brooks, who was supported by disaffected Republicans and by the Democrats. Baxter was irregularly elected and Brooks contested the election. Baxter's election was confirmed by the legislature, but in April, 1874, Brooks got possession of the public buildings by means of a judgment of ouster. Federal aid was invoked and Federal troops maintained order during investigation by a Congressional committee, whose findings led President Grant to decide in favor of Baxter. The democrats, however, regained power, when in 1873 the article in the constitution disenfranchising the whites was repealed. A constitutional convention was held July to October, 1874, and the new constitution, which in the main returned to *ante-bellum* conditions, was ratified October 13, 1874.

1885-1908.—Amendments added to the constitution of the state.—"Down to 1908 . . . eight amendments to the constitution of 1874 had been adopted. The first (1885) was an act of repudiation, the second required a poll-tax receipt as a qualification for suffrage, the third and sixth were administrative, the fourth empowered the legislature to correct abuses and prevent unjust discriminations by transportation companies, the fifth provided for a road tax, the seventh re-enacted section 16 of the constitution providing pay of legislators, and the eighth increased the amount of taxes which may be raised for school purposes."—*Political Science Quarterly, v. 29, p. 84.*

1908-1916.—Political issues.—"In recent years [up to about 1916 at least] the chief issues in state politics have been the railroads, the state capitol, the deficit, state-wide prohibition, and the legislature. These have not been issues as between the Democratic and Republican parties; indeed, little consideration is given to what the Republicans want. The issues have hardly caused factions within the Democratic party, but they have been used as convenient tools in personal fights for office. The railroads have been pretty well excluded from the legislature since 1907, in which year the passenger and freight-rate reduction laws were passed. Everybody wanted a new capitol, but the politicians divided on the manner of its building. For years the expenditures of the state have exceeded its revenues. All candidates for governor have agreed that more revenue must be raised without increasing the taxes of the people, but each has denounced the specific proposals of the others. The liquor question has come nearer being a real issue than any of the foregoing, though most candidates have declined to take a decided stand on the matter of state-wide prohibition. Every two years each county votes on the question of license or no license. For some time the total vote against license has been considerably in excess of that for it. [Important only as history since the passage of the federal prohibition amendment, in effect January 16, 1920.] Encouraged by this the prohibitionists tried several times to get the legislature either to pass a state-wide law or to submit a prohibition amendment, but the liquor interests were always able to defeat every such measure. This led to a demand for the initiative."—*Political Science Quarterly, v. 29, pp. 84-85.*

1910.—16th federal amendment ratified.—State amendment added.—The state ratified the sixteenth federal amendment, allowing the federal income tax, on April 22, 1910. In September of the same year the state constitution was amended to include the initiative and referendum.

1913.—Commission government for cities.—17th federal amendment ratified.—A law passed in this year made the commission form of government permissible for all cities having between 18,000 and 40,000 population. In this same year the state ratified the seventeenth federal amendment, providing for direct election of senators.

1917.—Educational and other legislation.—“Many constructive measures for social reform were passed by the Arkansas legislature during its sixty-day session ending March 8 [1917]. An act that stimulated especial interest was that calling for a constitutional convention to be held in Little Rock, November 19. For the first time Arkansas will have compulsory education, requiring all children from seven to fifteen, inclusive, to attend school. A compulsory attendance law was passed in the state several years ago, but the counties having a large Negro population were exempt, and this left over half of the state without any such attendance law. Heretofore there had been no uniform textbooks, but they were changed indiscriminately, making a hardship, especially for those children who come from poor families. Now a commission is created which will make contracts for textbooks and arrange for their uniformity. The act also provides that school boards shall furnish books to children who are unable to buy them. Moreover, a commission composed of nine members appointed by the Governor is to investigate means of eliminating illiteracy in this state. The University of Arkansas and the normal schools have heretofore been in politics, since those interested in the university found it necessary to lobby at the state capital in order that the legislature vote a sufficient appropriation. The new law will remove these educational institutions from politics by the levying of a tax of one-eighth mill to pay the interest on the common school bonds held by the state. . . . A mother's pension bill was passed authorizing each county to allow pensions to indigent widowed mothers with children under fourteen. Fifty-one counties were exempt from its provisions, however, so the law applies to practically only one-third of the state. The wisdom of this law is questioned, since the county judges under the present law can and do give outdoor poor relief and the law itself does not qualify this relief. Therefore, even without the passage of this law, county judges can grant pensions if they choose, and since the law is not mandatory they are not obligated any more than formerly.”—*Making over Arkansas in sixty days* (Survey, Apr. 14, 1917).—The legislature also passed a road act, enabling the state to receive its proportion of funds according to the federal Shackleford Act, and an act giving women the right to vote in primary elections; as Democratic candidates have generally been elected, the right granted was practically that of voting for President.

1917-1918.—Constitutional Convention.—Radical nature.—Constitution defeated.—A constitutional convention met in Little Rock in November, 1917, but soon adjourned to July, 1918, when radical changes were proposed, including giving full vote to women, recasting the initiative and referendum provision, providing for the budget system, and establishing “bone-dry” prohibition instead of statutory prohibition. The proposed new constitu-

tion was submitted to the people December 14, 1918, and defeated.

1918.—Part played in the World War.—The state furnished 63,632 men to the military and naval forces. An army cantonment, Camp Pike, was located near Little Rock and an aviation field, Ebert Field, was located near Lonoke. See U.S.A.: 1919: Contribution to World War.

1919.—Legislation and legal decisions.—The year 1919 set a record in the state's legislative history since there were three sessions of the legislature and a fourth session was called before the year was ended. The governor was authorized by the legislature to appoint a commission to draft a workmen's compensation law. The existing limitations on working hours were extended to women engaged by employers hiring three or less. The regular session ratified the federal prohibition amendment. An extra session at the end of July ratified the federal woman suffrage amendment, Arkansas being the twelfth state. The regular and the second extra session enacted much highway construction legislation. Much of this legislation was declared invalid December 2, 1919, by the Supreme Court on the ground that the constitutional provision requiring publication of intention to apply for special acts had not been complied with. Consequently a third extra session was called for January 26, 1920.

ARLES, a town of south-eastern France, and the capital of the former kingdom of Arles.

Origin. See SALYES.

A. D. 200-600.—Ancient commercial importance. See COMMERCE: Ancient: 200-600.

407.—Seat of government of Constantine. See BRITAIN: 407.

411.—Double siege. See BRITAIN: 407.

425.—Besieged by the Goths. See GOTH (VISIGOTH): 410-451.

508-510.—Siege by the Franks.—After the overthrow of the Visigothic kingdom of Toulouse, 507, by the victory of Clovis, king of the Franks, at Vouclad, near Poitiers, “the great city of Arles, once the Roman capital of Gaul, maintained a gallant defence against the united Franks and Burgundians, and saved for generations the Visigothic rule in Provence and southern Languedoc. Of the siege, which lasted apparently from 508 to 510, we have some graphic details in the life of St. Casarius, Bishop of Arles, written by his disciples.” The city was relieved in 510 by an Ostrogothic army, sent by King Theodoric of Italy, after a great battle in which 30,000 Franks were reported to be slain. “The result of the battle of Arles was to put Theodoric in secure

possession of all Provence and of so much of Languedoc as was needful to ensure his access to Spain"—where the Ostrogothic king, as guardian of his infant grandson, Amalaric, was taking care of the Visigothic kingdom.—T. Hodgkin, *Italy and her invaders*, bk. 4, ch. 9.

ARMADA, Spanish. See ENGLAND: 1588: Spanish armada.

ARMAGEDDON, a place mentioned in the Bible (Rev. xvi, 16) as the location of the last great decisive battle of the nations before the final Judgment. (See MEGIDDO.) Often used by modern writers to signify any great conflict accompanied by much slaughter and perhaps involving the downfall of civilization. Applied specifically to a plain in Palestine famous as an ancient battlefield, where General Allenby in 1918 finally overwhelmed the Turkish army.

ARMAGH.—"Hardly any town of importance in Ireland is so little visited as Armagh, for it lies on no main thoroughfare of railroad; yet there is hardly any town or city, great or small, of equal interest to the historically minded. Its ecclesiastical primacy is continuous from the time when St. Patrick, after long wanderings, fixed there his own monastic settlement, fifteen hundred and sixty-four years ago. Yet through all that long tract of generations Armagh is never so salient in Ireland's history as it was in the day of its still earlier glory; for the Height of Macha rivalled Tara's fame when Dublin was only the Hurdle Ford across the Liffey; or rather, if the newest and most probable theory of Irish history be true, Tara itself was only the seat of a petty principality when the heroes of the Red Branch mustered round Conchobar MacNessa. All that is most glorious in Irish epic story springs from this root; and, legendary though the stories be, they have certainly a basis in fact. We can stand to-day in Conchobar's fortress where the sons of Usnach were foully done to death; and we can fix, by a tradition which has in it nothing improbable, the period of Cuchulain's feats. Emain Macha, the great rath with double enclosure of bank and mound, which lies rather more than a mile to the westward of Armagh, was none of Conchobar's building. According to the tradition which dates its foundation about 330 years before Christ, Macha was daughter of the High King, Aedh Ruadh, who left his life and his name in the dangerous ford of Erne at As-saroe, Eas Aedh Ruaidh, Red Hugh's Waterfall. After Aedh's drowning, Macha, like the Amazon that she was, claimed his throne, but found her succession disputed. One of the rival claimants, Cimbaeth, she wedded, and, as for the other princes, single-handed she captured them (by a stratagem which, says Archbishop Healy, did more credit to her cunning and valour than to her modesty); and she set the captives digging earth-works on a line, which she traced out with *éó*

muin, the broochpin of her neck; *unde*, Emain Macha."—S. Gwynn, *Fair hills of Ireland*, pp. 98, 141.—See also IRELAND: Historical map.

ARMATOLES, a body of irregular military police, recruited by the Turkish government from the Greek mountaineers who had turned brigands after the capture of Greece by the Turks in the fifteenth century. They were given certain rights and privileges during the sixteenth century in exchange for policing their districts against the ravages of the brigands. In the eighteenth century, the Turks sought to weaken their power by replacing them with Mohammedan Albanians. For this the armatoles gave their services to Ali Pasha against his government in 1820-22. During the Greek revolution they fought in the cause of Greece.

ARMED MERCHANTMEN, Legal status of.—"The enemy merchant ship has the right of defense against belligerent attack, and this right it can exercise against visit, for this indeed is the first act of capture. The attacked merchant ship can, indeed, itself seize the overpowered warship as a prize."—Dr. Hans Wehberg, German authority on international law, quoted in *American Journal of International Law*, Oct., 1916, p. 871.—As a corollary of this right, an enemy merchant ship may, of course, arm for purely defensive purposes, without prejudice to its status as a merchant vessel either in neutral harbors or on the high seas. This is the position which our government took at the outset of the war. Early in 1916, however, it approached both belligerents with the proposition that enemy merchantmen should forego their defensive right on condition that belligerent submarines should in all cases exercise visit and search preliminary to capture. This effort at compromise failing, our government returned to its original stand on the established principles of law. The test of defensive armament is the use to which it is put, not its size."—*War cyclopaedia*, p. 10. See McLEMORE RESOLUTION: Resistance, Right of.

"ARMED NEUTRALITY," a league of European states, headed by Russia, and including Prussia, the Empire, Sweden, Holland, Denmark, Austria, Portugal and the two Sicilies, formed in 1780 to protect neutral flags from the right of search claimed by Great Britain during the latter's struggle with France, Spain and the United States. "England's position became still more precarious on account of the Armed Neutrality, formed by the Baltic Powers and the Dutch as a protest against an unjust extension by the English of the term 'contraband' and the right of search.

This brought about war between England and the United Provinces."—H. E. Bourne, *Revolutionary period in Europe* (1763-1815), p. 68.—In December, 1800, the Armed Neutrality was revived by Bonaparte, but the league, consisting of Russia, Sweden, Denmark and Prussia, was short-lived.

ARMELLIN, member of a Roman triumvirate. See **ROME**: Modern city: 1849.

ARMENIA: Geographic description. — "Almost immediately to the west of the Caspian there rises a high table-land diversified by mountains, which stretches eastward for more than eighteen degrees, between the 37th and 41st parallels. This highland may properly be regarded as a continuation of the great Iranian plateau, with which it is connected at its southeastern corner. It comprises a portion of the modern Persia, the whole of Armenia, and most of Asia Minor. Its principal mountain ranges are latitudinal, or from west to east, only the minor ones taking the opposite or longitudinal direction. . . . The heart of the mountain-region, the tract extending from the district of Erivan on the east to the upper course of the Kizil-Irmak river and the vicinity of Sivas upon the west, was, as it still is, Armenia. Amidst these natural fastnesses, in a country of lofty ridges, deep and narrow valleys, numerous and copious streams, and occasional broad plains—a country of rich pasture grounds, productive orchards, and abundant harvests—this interesting people has maintained itself almost unchanged from the time of the early Persian kings to the present day. Armenia was one of the most valuable portions of the Persian empire, furnishing, as it did, besides stone and timber, and several most important minerals, an annual supply of 20,000 excellent horses to the stud of the Persian king."—G. Rawlinson, *Five great monarchies: Persia*, ch. 1.—See also **BABYLONIA**: Map of Egyptian, Assyrian, Babylonian and Median powers; **TURKEY**: Map of Asia Minor.

Physical features.—"Lake Van is the most important inland water, 5,100 feet above the sea level, with an area of about 1,300 miles, or, says Lynch: 'Six times as great as Lake Geneva.' It possesses two considerable islands, on which have stood for many centuries two Armenian convents. Other lakes are: Lake Urmia (4,000 feet above sea level), like Lake Van, a salt lake; and Lake Sevan (5,870 feet above sea level), discharging into the Arax [Aras]. . . . The monotony of the plateau is increased by the treelessness of vast areas. 'There is no reason why this country should not be strewn with woodlands and her plains verdant, with a kinder rainfall and an extended irrigation. Patches of forest, but thin and miserable, still struggle towards the interior from the luscious zone in the North. They are seen on the sides of the passes at a distance from the villages. But with the exception of Kighi and the Dersim and the slopes of the Soghanlu Mountains, southwest of Kars, the land has been denuded of any covering as a result of progressive economical decline. Centuries of unchecked license on the part of tribal shepherds—Tartars, Turkomans, Kurds—have brought about the destruction of a source of salubrity and wealth, which, under any circumstances, would require careful husbanding. If the plateaus are monotonous in their lack of adornment, on the other hand the gorges of the Euphrates and Tigris possess a wild beauty of scenery which is unsurpassed. The climate varies. On the higher reaches of the plateau the winter is long and the cold severe; summer is short, very dry and hot. The temperature at Erzeroum varies from 22° to 84°. Snow sometimes falls in June, and in July the wells

near Erzeroum are occasionally thinly frozen over. The mountain chains with their heavy snow accumulations are the sources of the many streams. But the rainfall is not heavy, and in summer the plains are scorched and demand irrigation. The soil shows volcanic products, especially in the vicinity of Maku, in the narrow valley which extends from the Araxene plain near Ararat towards Lake Van; and also in the country round Lake Gokcha. In the interior the few towns there are, lie high—from 4,000 to 6,000 feet above sea level. The villages are on the gentle slopes, and the peasantry, as their forefathers did 800 years ago, burrow in the hillsides, and find in the excavations protection against the rigours of the long and trying winter. Xenophon's description of the sufferings of the 10,000 Greeks in this climate is well known. Both the Taurus and the Anti-Taurus ranges are crossed at different points by passes, generally at low elevations and fairly easy of access. One of the most famous is the pass of Erkenek, the only one by which an army could descend from the interior of Asia Minor towards Syria or Mesopotamia. An even more famous pass, either from the military or commercial point of view, is the Golek Boghaz or 'Cilician Gates'—a deep gorge, 3,300 feet above sea level, running about 30 miles north of Tarsus, over the Taurus and connecting Anatolia with North Syria and the Euphrates Valley. The width of the road through the Gates proper is only 25 feet. Through the gorge between walls of perpendicular rock, rushes a tributary of the Tarsus River. This famous defile has been used in all ages by migrating peoples, traders and conquering hosts. Through it marched Alexander to the conquest of Persia and the far-distant East. In more modern times, Mehemet Ali, in his revolt against the Ottoman Sultan, twice penetrated through the 'Cilician Gates' into Anatolia on his march to Constantinople."—W. L. Williams, *Armenia*, pp. 8-11.—See also **ASIA MINOR**: Greek colonies; **CAUCASUS**: Ethnology; **TURKEY**: The Land. **B. C. 1500-1400**.—Relations with Egypt. See **EGYPT**: About B. C. 1500-1400.

B. C. 585-55.—Persian conquest.—Reign of King Tigranes.—"The strong compact Kingdom of Urartu [Urardhu, Ararat, included most of Armenia] lies at the dawn of Armenian history like a golden age. It had only existed two centuries when it was shattered by the invaders from the Russian steppes, and the anarchy into which they plunged the country had to be cured by the imposition of a foreign rule. In 585 B. C. the nomads were cowed and the plateau annexed by Cyaxares the Mede, and, after the Persians had taken over the Medes' inheritance, the great organizer Darius divided this portion of it into two governments or satrapies. One of these seems to have included the basins of Urmia and Van, and part of the valley of the Aras; the other corresponded approximately to the modern Vilayets of Bitlis, Mamouret-ul-Aziz and Diyarbekir, and covered the upper valleys of the Tigris and Euphrates. They were called respectively the satrapies of Eastern and Western Armenia, and this is the origin of the name by which the Haik and the Haiaasdan are now almost universally known to their neighbours. The word 'Armenia' (Armina) first appears in Darius's inscriptions; the Greeks adopted it from the Persian official usage, and from the Greeks it has spread to the rest of the world, including the Osmanli Turks. [See **ALARODIANS**; **IBERIANS**; **COLCHIANS**.] Under the Persian Dynasty of the Achæmenids and their Macedonian successors, the two Armenian satrapies remained mere administrative divisions.

Subject to the payment of tribute, the satraps were practically independent and probably hereditary, but the rulers' autonomy did not enable their subjects to develop any distinctive national life. In religion and culture the country took on a strong Persian veneer; and the situation was not essentially changed when, early in the second century B.C., the two reigning satraps revolted simultaneously from their overlord, the Seleucid King of Western Asia, and each founded a royal dynasty of his own. The decisive change was accomplished by Tigranes (Dikran) the Great (94 to 56 B.C.), a scion of the Eastern Dynasty, who welded the two principalities into one kingdom, and so created the first strong native sovereignty that the country had known since the fall of Urartu five centuries before.

"If Gregory the Illuminator is the ecclesiastical hero of Armenia, King Tigranes is his political forerunner and counterpart. He was connected by marriage with Mithradates, the still more famous King of Pontic Cappadocia, who may be taken as the first exponent of the Near Eastern idea. Mithradates attempted to build an empire that should be at once cosmopolitan and national, Hellenic and Iranian, of the West and of the East, and Tigranes was profoundly influenced by his brilliant neighbour and ally. He set himself the parallel ambition of reconstructing round his own person the kingdom of the Seleucids, which had been shaken a century before by a rude encounter with Rome, weakened still further by the defection of Tigranes' own predecessors, and was now in the actual throes of dissolution. He laid himself out a new capital on the northern rim of the Mesopotamian steppe, somewhere near the site of Ibrahim Pasha's Viran Shehr, and peopled it with masses of exiles, deported from the Greek cities he devastated in Syria and Cilicia. It was to be the Hellenistic world-centre for an Oriental King of Kings; but all his dreams, like Mithradates', were shattered by the methodical progress of the Roman empire. A Roman army ignominiously turned Tigranes out of Tigranokerta, and sent back his Greek exiles rejoicing to their homes. The new Armenian kingdom failed to establish its position as a great power, and had to accept the position of a buffer state between Rome on the west and the Parthian rulers of Iran. Nevertheless, Tigranes' work is of supreme political importance in Armenian history. He had consolidated the two satrapies of Darius into a united kingdom, powerful enough to preserve its unity and independence for nearly five hundred years. It was within this chrysalis that the interaction of religion and language produced the new germ of modern Armenian nationality; and when the chrysalis was rent at last, the nation emerged so strongly grown that it could brave the buffets of the outer world. Before Tigranes, Armenia had belonged wholly to the East. Tigranes loosened these links and knit certain new links with the West. The period that followed was marked by a perpetual struggle between the Roman and Parthian Governments for political influence over the kingdom, which was really a battle over Armenia's soul. Was Armenia to be wrested away altogether from Oriental influences and rallied to the European world, or was it to link back into being a spiritual and political appanage of Iran? It seemed a clear issue, but it was not destined to be decided in either sense. Armenia was to be caught for two millenniums in the uncertain eddy of the Nearer East."—J. Bryce, *Treatment of the Armenians*, pp. 600-601.

A. D. 387-900.—Swing from the Persian to Arabian rule.—"In this opposition of forces, the political balance inclined from the first in favour of the Oriental Power. The Parthians succeeded in replacing the descendants of Tigranes by a junior branch of their own Arsacid Dynasty; and when, in 387 A.D., the rivals agreed to settle the Armenian question by the drastic expedient of partition, the Sassanid kings of Persia (who had superseded the Parthians in the Empire of Iran) secured the lion's share of the spoils, while the Romans only received a strip of country on the western border which gave them Erzeroum and Diyarbekir for their frontier fortresses. [See also PERSIA: 226-627.] In the cultural sphere, on the other hand, the West was constantly increasing its ascendancy. King Tiridates was an Arsacid, but he accepted Christianity as the religion of the State he ruled; and when, less than a century after his death, his kingdom fell and the greater part of the country and the people came directly under Persian rule, the Persian propaganda failed to make any impression. No amount of preaching or persecution could persuade the Armenians to accept Zoroastrianism, which was the established religion of the Sassanian State. They clung to their national church in despite of their political annihilation, and showed thereby that their spiritual allegiance was given irrevocably to the West. The partition of 387 A.D. produced as long a political interregnum in Armenian history as the fall of Urartu in the seventh century B.C. In the second quarter of the seventh century A.D., the mastery of Western Asia passed from the Persians to the Arabs, and the Armenian provinces changed masters with the rest. Persian governors appointed by the Sassanid King of Kings were superseded by Arab governors appointed by the Omayyad and Abbasid Caliphs, and the intolerance of Zoroastrianism was replaced by the far stronger and hardly less intolerant force of Islam. Then, in the ninth century, the political power of the Abbasid Caliphate at Baghdad began to decline, the outlying provinces were able to detach themselves, and three independent [Bagratid] dynasties emerged on Armenian soil."—J. Bryce, *Treatment of the Armenians*, pp. 601-602.

908-1085.—Seljuk invasions.—The Ardzunian Kagig became king of Van in 908, and his successors ruled till 1080. For a century from 984 Arabs, Byzantines and Seljuks held the ruling power. Arabs drove many Armenians into Turkey.

"In the eleventh century A.D., a new power appeared in the East. The Arab Empire of the Caliphs had long been receiving an influx of Turks from Central Asia as slaves and professional soldiers, and the Turkish bodyguard had assumed control of politics at Baghdad. But this individual infiltration was now succeeded by the migration of whole tribes, and the tribes were organised into a political power by the clan of Seljuk. The new Turkish dynasty constituted itself the temporal representative of the Abbasid Caliphate, and the dominion of Mohammedan Asia was suddenly transferred from the devitalised Arabs to a vigorous barbaric horde of nomadic Turks. These Turkish reinforcements brutalised and at the same time stimulated the

Islamic world, and the result was a new impetus of conquest towards the borderlands. The brunt of this movement fell upon the unprepared and disunited Armenian principalities. In the first quarter of the eleventh century the Seljuks began their incursions on to the Armenian plateau. The Armenian princes turned for protection to the East Roman Empire, accepted its suzerainty, or even surrendered their territory directly into its hands. But the Imperial Government brought little comfort to the Armenian people. Centred at Constantinople and cut off from the Latin West, it had lost its Roman universality and become transformed into a Greek national state, while the established Orthodox Church had developed the specifically Near Eastern character of a nationalist ecclesiastical organization. The Armenians found that incorporation in the Empire exposed them to temporal and spiritual Hellenisation, without protecting them against the common enemy on the east. The Seljuk invasions increased in intensity, and culminated, in 1071 A.D., in the decisive battle of Melazkerd, in which the Imperial Army was destroyed and the Emperor Romanos II. taken prisoner on the field. Melazkerd placed the whole of Armenia at the Seljuk's mercy—and not only Armenia, but the Anatolian provinces of the Empire that lay between Armenia and Europe. The Seljuks carried Islam into the heart of the Near East. [See also *TURKEY*: 1063-1073.] The next four-and-a-half centuries were the most disastrous period in the whole political history of Armenia. It is true that a vestige of independence was preserved, for Roupen [Rupin] the Bagratid conducted a portion of his people southward into the mountains of Cilicia, where they were out of the main current of Turkish invasion, and founded a new principality which survived nearly three hundred years (1080-1375). There is a certain romance about this Kingdom of Lesser Armenia. It threw in its lot with the Crusaders, and gave the Armenian nation its first direct contact with modern Western Europe. But the mass of the race remained in Armenia proper, and during these centuries the Armenian tableland suffered almost ceaseless devastation. The Seljuk migration was only the first wave in a prolonged outbreak of Central Asiatic disturbance, and the Seljuks were civilised in comparison with the tribes that followed on their heels. Early in the thirteenth century came Karluks and Kharizmians, fleeing across Western Asia before the advance of the Mongols; and in 1235 came the first great raid of the Mongols themselves—savages who destroyed civilisation wherever they found it, and were impartial enemies of Christendom and Islam. All these waves of invasion took the same channels. They swept across the broad plateau of Persia, poured up the valleys of the Aras and the Tigris, burst in their full force upon the Armenian highlands and broke over them into Anatolia beyond. Armenia bore the brunt of them all, and the country was ravaged and the population reduced quite out of proportion to the sufferings of the neighboring regions. The division of the Mongol conquests among the family of Djengis Khan established a Mongol dynasty in Western Asia which seated itself in Azerbaijan, accepted Islam and took over the tradition of the Seljuks, the Abbasids and the Sassanids. It was the old Asiatic Empire under a new name, but it had now incorporated Armenia and extended north-westwards to the Kizil Irmak (Halys).—J. Bryce, *Treatment of the Armenians*, pp. 603-604.

12th-14th centuries. — *Medieval Christian kingdom.*—"The last decade of the 12th century

saw the establishment of two small Christian kingdoms in the Levant, which long outlived all other relics of the Crusades except the military orders; and which, with very little help from the West, sustained a hazardous existence in complete contrast with almost everything around them. The kingdoms of Cyprus and Armenia have a history very closely intertwined, but their origin and most of their circumstances were very different. By Armenia as a kingdom is meant little more than the ancient Cilicia, the land between Taurus and the sea, east of the frontier of the principality of Antioch, eastward, to Kelenderis or Palæopolis, a little beyond Seleucia; this territory, which was computed to contain 16 days' journey in length, measured from four miles of Antioch, by two in breadth, was separated from the Greater Armenia, which before the period on which we are now employed had fallen under the sway of the Seljuks, by the ridges of Taurus. The population was composed largely of the sweepings of Asia Minor, Christian tribes which had taken refuge in the mountains. Their religion was partly Greek, partly Armenian. . . . Their rulers were princes descended from the house of the Bagratidæ, who had governed the Greater Armenia as kings from the year 885 to the reign of Constantine Monomachus, and had then merged their hazardous independence in the mass of the Greek Empire. After the seizure of Asia Minor by the Seljuks, the few of the Bagratidæ who had retained possession of the mountain fastnesses of Cilicia or the strongholds of Mesopotamia, acted as independent lords, showing little respect for Byzantium save where there was something to be gained. . . . Rupin of the Mountain was prince [of Cilicia] at the time of the capture of Jerusalem by Saladin; he died in 1189, and his successor, Leo, or Livon, after having successfully courted the favour of pope and emperor, was recognised as king of Armenia by the emperor Henry VI., and was crowned by Conrad of Wittelsbach, Archbishop of Mainz, in 1198." The dynasty ended with Leo IV, whose "whole reign was a continued struggle against the Moslems," and who was assassinated about 1342. "The five remaining kings of Armenia sprang from a branch of the Cypriot house of Lusignan [see *CYPRUS*: 1192-1480]."—W. Stubbs, *Lectures on the study of mediæval and modern history*, lect. 8.—See also *CRUSADES*: Map of Mediterranean lands after 1204.

1453-1878.—Under Turkish dominion.—"The Osmanli State is the greatest and most characteristic Near Eastern Empire there has ever been. In its present decline it has become nothing but a blight to all the countries and peoples that remain under its sway; but at the outset it manifested a faculty for strong government which satisfied the supreme need of the distracted Near Eastern world. This was the secret of its amazing power of organisation, for it enabled the Osmanlis to monopolise all the vestiges of political genius that survived in the Near East. The original Turkish germ was quickly absorbed in the mass of Osmanlicised native Greeks. The first expansion of the State was westward, across the Dardanelles, and before the close of the fourteenth century the whole of South-Eastern Europe had become Osmanli territory, as far as the Danube and the Hungarian frontier. The seal was set on these European conquests when Sultan Mohammed II. entered Constantinople in 1453, and then the current of expansion veered towards the east. Mohammed himself absorbed the rival Turkish principalities in Anatolia, and annexed the Greek 'Empire' of Trebizond. In the second decade of the sixteenth century, Sultan

Selim I. followed this up with a sweeping series of campaigns, which carried him with hardly a pause from the Taurus barrier to the citadel of Cairo. Armenia was overrun in 1514; the petty Turkish chieftains were overthrown, the new Persian Empire was hurled back to the Caspian, and a frontier established between the Osmanli Sultans and the Shahs of Iran, which has endured, with a few fluctuations, until the present day. In the sixteenth century the whole Near Eastern world, from the gates of Vienna to the gates of Aleppo and Tabriz, found itself united under a single masterful Government, and once more Armenia was linked securely with the West. From 1514 onwards the great majority of the Armenian nation was subject to the Osmanli State. It is true that the province of Erivan (on the middle course of the Aras) was recovered by the Persians in the seventeenth century, and held by them till its cession to Russia in 1834. But, with this exception, the whole of Armenia remained under Osmanli rule until the Russians took Kars, in the war of 1878. These intervening centuries of union and pacification were, on the whole, beneficial to Armenia; but with the year 1878 there began a new and sinister epoch in the relations between the Osmanli State and the Armenian nation."—J. Bryce, *Treatment of the Armenians*, pp. 604-605.

1915.—Turkish atrocities.—Causes of hostility toward the Armenians.—This year of the World War witnessed some of the most terrible atrocities. The Turkish defeat at the hands of the Russians in the Caucasus campaign during the winter 1914-1915 had roused the bitter resentment of Enver Pasha and Talaat Bey against the Armenians, many of whom had joined the Russian forces and contributed in no small measure to their military successes. Hence, early in 1915 "the following proclamation was sent to all the officials in the interior of Turkey:—

"Our fellow countrymen the Armenians, who form one of the racial elements of the Ottoman

Empire, having, under foreign instigation, for many years past, adopted false ideas of a nature to disturb the public order and brought about bloody happenings and attempted to destroy the peace and security of the Ottoman State, the safety and interest of their fellow countrymen as well as their own; and, moreover, as they have presumed to join themselves to their mortal enemy, Russia, and to the enemies now at war with our State, Be it known that our Government is compelled to adopt extraordinary measures both for the preservation of order and security of the country and for the welfare and the continuation of the existence of the Armenian people itself. Therefore, as a measure to be applied until the conclusion of the war, the Armenians shall be sent away to places which have been prepared in the Vilayets of the interior; and a literal obedience to the following orders is categorically enjoined on all Ottomans: First. All Armenians, with the exception of the sick, shall leave their villages or quarters, under the escort of the gendarmerie, within five days from the date of this proclamation. Second. Though they are free to carry with them on their journey such articles of movable property as they may desire, they are forbidden to sell their lands or their extra effects, or to leave the latter with other persons, as their exile is only temporary, and their landed property and the effects they are unable to take with them will be taken care of under supervision of the Government, and stored in protected buildings. Any one who sells or attempts to dispose of his movable effects or landed property in a manner contrary to this order, shall be tried by court-martial. Persons are free to sell to the Government only such articles as may answer the needs of the army.' The third clause contains a promise of safe conduct. The fourth threatens with severe punishment any one attempting to molest the Armenians on their way to the interior. The fifth clause reads: 'Since the Armenians are obliged to submit to the decision of the Government, if any of them attempt to resist the soldiers or gendarmes by force of arms, arms shall be used against them, and they shall be taken dead or alive. In like manner, those who, in opposition to the Government's decision, refrain from leaving or seek to hide themselves, shall be sent before a court-martial; and if they are sheltered or given food and assistance, the persons who shelter or aid them shall be sent before the court-martial for execution.'

"In these few sentences a responsible government sanctioned and set in motion one of the most terrible of recorded tragedies—the Armenian deportation. To the average person, these two words convey little but a vague sense of injustice done, of suffering endured. Such, after all, are the chief associations connected with the name of the Ottoman Empire, which has enjoyed most of its world-prominence through wholesale barbarities. Massacres have been one of the common occurrences of Turkish history. No wonder, then, that at a time when all Europe is filled with blood and tears, and desolation stalks abroad among her nations, it is difficult to get people to lend an ear to the supreme ordeal of the Armenians, and to convince them that at this moment the Turks are writing unhindered what Professor Gibbons justly calls the 'blackest page in modern history.' It is difficult to convince them that the cruelties of Abdul Hamid were merciful by comparison with this final turn of the screw. The suffering caused by massacres was scattering; it smote only a fraction of the people, a thousand here, ten thousand there, while the bulk of the

race survived. Such was the policy or wisdom of the Old Turk; he kept the cow alive that he might continually milk her. Not so with the Young Turk. Intelligent, cultured, irreligious, and unscrupulous, the old-fashioned method of dealing with the Armenians was too slow for him; he set about finding a way to settle the problem once for all, and devised the scheme of deportation—which, bluntly, is another way of saying the extermination of the Armenian race in the Ottoman Empire.

"The full story of the deportation will never be written, for the reason that it deals so largely with suffering that is indescribable, heartlessness that is incredible. The central fact is, however, that under the pretext of war-measures the Armenians have been driven *en masse* from the shores of the Black Sea and Marmora southward as far as the Syrian desert. . . . For the completer evolution of the 'deportation' system, we may again examine the case of Marsovan. This town is an important missionary centre. Under the American Board, an extensive medical, evangelical, and educational work was carried on here. There was Anatolia College, with more than four hundred students; a girls' boarding school of almost three hundred pupils; a hospital, a theological seminary, and an industrial institution. Forces for good were at work which spread their influence throughout the Ottoman Empire, and beyond—into Russia, Greece, and Egypt. Ambassador Morgenthau had secured promises from Enver Pasha and Talaad Bey that the college people should not be molested but the governor of Marsovan declared that he had been notified of no such promise, and had received no orders save those to deport all Armenians. Once more the Turks had pulled wool over the diplomat's eyes. And so, on August 10, 1915, sixty-one ox-carts entered the college compound. The gendarmes forced the great gates open, and battered down every closed door. They entered even the homes of Americans, and took away every Armenian on the premises. . . . According to the testimony of the wives of the professors, seen near Sivas, they were all kept together until they passed Zileh . . . then they were separated. The men, bound with ropes, were driven in one direction, the women and young children in another. According to the testimony of the gendarmes, all the men were killed. It should be kept in mind that the tragedy of Marsovan was being enacted, on a greater or lesser scale, in hundreds of other villages and towns, in all of which the eliminative processes had been working on the Armenians in the same general fashion. . . . This 'selection' continued methodically all along the caravan routes which the refugees were following. Kurds, Turks, Arabs, attacked the defenseless victims and took their pick of them unhindered. The rest were forced to go on under the whips of gendarmes and other officials worse than slave-drivers. As fatigue and hunger made their inroads on the Armenians, the conditions became indescribable. . . . During my stay in Angora all the male Armenians were deported, chiefly toward the southern interior. Villagers and gendarmes reported that great numbers of them were killed a short distance outside the city. Every day I saw them hurrying through the streets in miserable droves, with the police brutally following them up. The Armenians of Angora were mostly Catholics. No massacres took place among them under Abdul Hamid. They were most loyal to the Turks; they took no part in nationalistic movements. They did not even call themselves Armenians. The Young Turks, however, made no

discrimination of creed: Gregorians, Protestants, and Catholics were all put on the same footing and ruthlessly deported. Gregorian and Catholic priests were often driven off in the same wagon and decapitated with the same axe. It is worth noting that while I was still in Angora the leaders of the Turkish Union and Progress Committee sent word to the Catholic bishop of the city that if he and his people would embrace Islam, they would all be spared. The refusal was unanimous.

"No one can hear the terrible tale of the Armenian deportation without asking what the underlying reasons for it all might be. Even beasts of prey, it will be said, do not kill for the mere lust of killing; what is the object to be attained? What results do the Turks hope to get in return for the energy they have expended in prosecuting this extermination? (1) According to the Turkish Government, the plan was necessitated by the exigencies of war. 'Turkey,' they said, 'was engaged in a tremendous struggle against overwhelming odds, fighting for her very life. The Armenians were plotting with the enemy and preparing internal disturbances; therefore they had to be removed to a place where they could be rendered harmless.' This charge of plotting is groundless. The only instance in which the Armenians made armed resistance to the Turks was at Van—and then only when they had been attacked and saw that they were doomed to extermination. It is true that, when the sale of arms was generally permitted after the revolution of 1908, many Armenians took advantage of the occasion to secure weapons of defense. The source of these arms was controlled by the government, however, coming as they did direct from Germany; and when, after the declaration of war, the Armenians were commanded to give them up, they voluntarily obeyed, those persons who were at first inclined to conceal their weapons finally yielding to the persuasion of their priests or pastors. Some slight excuse for the action of the Turks might seem to be found in the existence of the organized Armenian 'Hinchakist' and 'Tashuagist' societies which, under the reign of Abdul Hamid, were perforce kept secret. But after the revolution of 1908, these societies openly proclaimed themselves, and won the approval of the Young Turks, who declared that 'the Armenian revolutionists were among the pioneers of Ottoman liberty.' Their programme was broadly socialistic and educational, aiming at the instruction of the people and their elevation to those ideals which the Young Turks themselves had espoused with such high-sounding phrases. When the test came, it was shown how empty these phrases really were. (2) Race-jealousy is a factor to be reckoned with. The Turks are really aliens in the country they rule: they came as conquerors, and have maintained their supremacy by force. The Armenians, when they were subjugated by the Turks, were an ancient and civilized people, with an organized society which the Turks, in long centuries, have never been able to approximate: an enterprising race, thrifty, energetic, and capable of progress and culture along all lines. In spite of savage repression, they became the leading merchants, traders, lawyers, doctors of the country, especially in the interior. Even in the reign of Abdul Hamid the Minister of Finance was usually an Armenian. They amassed great wealth and property, and the Turkish peasant was usually dependent on them. Now [1916] the real programme of the Young Turk party is 'Turkey for the Turks.' Under the name of 'Ottomanization,' they were determined to assimilate or eliminate all the non-Turkish elements in the Empire and

uplift their own race at the expense of the non-Moslem peoples of the country. They were drunk with the idea of nationalism. They condemned the statesman-like policy of Mohammed II, conqueror of Constantinople, in organizing and establishing the Greek Patriarchate, with its special privileges and immunities, and bewailed the fact that the Old Turks had allowed the Greek, Armenian, Bulgarian, Serbian, and Jewish elements of the Empire to keep intact their religious, linguistic, and racial peculiarities for so many centuries. They were determined to be supreme in the land they conquered, absolute masters over the subject peoples. (3) All attempts to reform Turkey have been shattered against Mohammedanism. The very first article of the Turkish Constitution declares: 'The religion of the Ottoman Empire is Islam.' The Young Turks are mostly indifferent to matters of faith, if not actually irreligious, but they know the power of Islam over the people,—its value has often been proved in assimilating the non-Turkish elements. . . . Religious fanaticism was especially appealed to when the Russians withdrew from Van and the Gallipoli campaign collapsed, and the idea of the Jihad or Sacred War gained in popularity. That the cause of the Armenian atrocities was not wholly religious, however, is shown by the extremely limited categories of persons to whom the choice between deportation or acceptance of Islam was offered. (4) As a fourth factor one must mention the conflicting interests and the intrigues of European diplomacy. The Christians of Turkey have suffered untold misery because Europe cannot agree. Turkey owes her existence to-day to the backing England gave her in the nineteenth century."—*Calvary of a nation: A personal narrative (Atlantic Monthly, November, 1916)*.—"And now for nearly thirty years Turkey gave the world an illustration of government by massacre. . . . Through all these years the existence of the Armenians was one continuous nightmare. Their property was stolen, their men were murdered, their women were ravished, their young girls kidnapped and forced to live in Turkish harems. . . . And now the Young Turks, who had adopted so many of Abdul Hamid's ideas, also made his Armenian policy their own. . . . On April 15th [1915], about 500 young Armenian men of Akantz were mustered to hear an order of the Sultan; at sunset they were marched outside the town and every man shot in cold blood. This procedure was repeated in about eighty Armenian villages in the district north of Lake Van, and in three days 24,000 Armenians were murdered in this atrocious fashion. . . . Doctor Ussher, the American medical missionary whose hospital at Van was destroyed by bombardment, is authority for the statement that, after driving off the Turks, the Russians began to collect and to cremate the bodies of Armenians who had been murdered in the province, with the result that 55,000 bodies were burned."—*Ambassador Morgenthau's story*, pp. 289-290; 297, 299.—In a vivid description of how the "deportation" of the Armenians was carried out, and the barbaric procedure of Turkish gendarmes, Ambassador Morgenthau estimates that "at least 600,000 people were destroyed and perhaps as many as 1,000,000."—See also WORLD WAR: 1915; VI. 1919-1920.—Peace Conference on Armenia's destiny.—Problems of mandate.—"The liberation of Armenia was the one outstanding result expected from the Near Eastern negotiations at the Peace Conference. The failure to meet this general expectation was indirectly a result of the struggle among the Allied Powers for equality or priority of opportunity in the commercial exploitation of the old Turkish Empire in the case of a successful termination of the war. In the pursuit of these objects the independence and protection of Armenia became a thing men talked about, but did not work for. . . . In May, 1916, it was secretly agreed that Russia was to acquire in sovereignty the four Armenian vilayets of Trebizond, Erzerum, Van, and Bitlis. British and French negotiations, conducted at the same time, roughly defined the respective areal acquisitions or spheres of these two Powers by the ill-fated Sykes-Picot Treaty. . . .

"When the Peace Conference assembled, the Sazonof-Paleologue Agreement lay buried in the ruins of Russia. Constantinople and the four Armenian vilayets had lost their secret tags. The President of the United States sat in the chair which Sazonof or Isvolsky had expected to occupy. It was a natural thing for men to assume that the United States would replace Russia in the political settlement of the Turkish problems as she had in the war, by accepting, under provisions entirely adjustable to our own ideals of international fair play, the territorial assignments which the Russian collapse had left vacant. The Armenians desired this with all their hearts. Liberal British and French opinion urged upon our delegation the necessity of American acceptance of a mandate over Armenia. I was one who shared their opinion and I still share it. However strongly President Wilson favored this plan I never heard any man say that either he, or any one of his colleagues on the American Peace Commission, made any promise which would tend to preempt the constitutional right of the American people to answer this question through their representatives in Congress. . . . From behind it all came the sound of children's and women's voices crying for bread. American relief workers began to drift in and tell about the conditions in Armenia. The younger men always spoke passionately: 'Why do the American people permit this? Why do you, who are sitting at Paris, not do something?' The middle-aged men spoke more quietly, as if their hearts were old and their sympathies shrivelled. They were much the more terrible to listen to. . . . For Armenia has been betrayed by the civilized world and thrown upon the tender mercies of Bolshevik Russia and the Turkish Nationalist forces. . . . The efforts of the two Armenian delegations at Paris were directed toward the ultimate end of establishing an independent state, including the Armenians of Russian Transcaucasus and the four northeastern vilayets of Turkey, stretching southwestward so as to embrace a part of Cilicia, and debouching upon the Mediterranean Sea at the Bay of Alexandretta. Their immediate desire was to obtain

recognition of the Armenian Republic of the Transcaucasus as a *de facto* government, so that they might be in a position to obtain credits, money for food for the 400,000 refugees assembled in Russian Armenia, and for arms and ammunition with which they might defend themselves against Moslem Tartar and Turkish attacks and move the refugees back to their homes in Turkish Armenia. But the Armenian mountains have little to offer in exchange for help, except a brave, industrious, and broken people.

"The Armenian desire for Cilicia conflicted with the territorial assignment to France by the Sykes-Picot Treaty. Cilicia and central Anatolia, therefore, remain to Turkey in the Treaty of Sèvres, and are designated as a sphere of French interest in the Tripartite Agreement. Again, the secret treaties had won in the diplomatic field. But the attempt of the French to occupy Cilicia has been frustrated by the Turkish Nationalist opposition. Bitterly disillusioned, the French press is demanding that the entire Cilician adventure be abandoned."—E. M. House and C. Seymour, *What really happened at Paris*, pp. 178-180, 182, 187-188, 190, 195, 202-203.

1919-1920.—Relations with Georgian republic. —See GEORGIA, REPUBLIC OF: 1919-1920.

1920.—Treaty of Sèvres.—Independence established.—Boundaries fixed.—According to the terms of the treaty of peace imposed by the Allied powers upon Turkey, and signed at Sèvres, France, on Aug. 10, 1920, Armenia was definitely liberated from Turkish rule. Article 88 of the treaty, Section vi, stipulates that—"Turkey, in accordance with the action already taken by the Allied Powers, hereby recognizes Armenia as a free and independent State.

"ARTICLE 89.—Turkey and Armenia, as well as the other high contracting parties, agree to submit to the arbitration of the President of the United States of America the question of the frontier to be fixed between Turkey and Armenia in the Vilayets of Erzerum, Trebizond, Van and Bitlis, and to accept his decision thereupon, as well as any stipulations he may prescribe as to access for Armenia to the sea, and as to the demilitarization of any portion of Turkish territory adjacent to the said frontier.

"ARTICLE 90.—In the event of the determination of the frontier under Article 89 involving the transfer of the whole or any part of the territory of the said Vilayets to Armenia, Turkey hereby renounces, as from the date of such decision, all rights and title over the territory so transferred. The provisions of the present treaty applicable to territory detached from Turkey shall thereupon become applicable to the said territory. The proportion and nature of the financial obligations of Turkey which Armenia will have to assume, or of the rights which will pass to her, on account of the transfer of the said territory will be determined in accordance with Articles 241 to 244, Part viii. (Financial Clauses) of the present treaty. Subsequent agreements will, if necessary, decide all questions which are not decided by the present treaty and which may arise in consequence of the transfer of the said territory.

"ARTICLE 91.—In the event of any portion of the territory referred to in Article 89 being transferred to Armenia, a boundary commission, whose composition will be determined subsequently, will be constituted within three months from the delivery of the decision referred to in the said article to trace on the spot the frontier between Armenia and Turkey as established by such decision

"ARTICLE 92.—The frontiers between Armenia and Azerbaijan and Georgia respectively will be

determined by direct agreement between the States concerned. If in either case the States concerned have failed to determine the frontier by agreement at the date of the decision referred to in Article 89, the frontier line in question will be determined by the Principal Allied Powers, who will also provide for its being traced on the spot.

"ARTICLE 93.—Armenia accepts and agrees to embody in a treaty with the principal allied powers such provisions as may be deemed necessary by these powers to protect the interests of inhabitants of that State who differ from the majority of the population in race, language or religion. Armenia further accepts and agrees to embody in a treaty with the principal allied powers such provisions as these powers may deem necessary to protect freedom of transit and equitable treatment for the commerce of other nations."—*British treaty, series No. 11, 1920 (Cd. 964)*.—See also SÈVRES, TREATY OF: 1920: Part III. Political clauses: Armenia.

"By the Treaty of Sèvres President Wilson was asked to fix by arbitration the boundaries between Armenia and the Turkish state. His competence was limited to drawing these boundaries within the four vilayets of Erzerum, Trebizond, Bitlis, and Van. In other words, the territory which he could possibly assign to Armenia approximates that formerly given to Russia by the Paleologue-Sazonof Treaty. Here, too, the territorial dispositions of the Treaty of Sèvres are the offspring of the secret treaties. Though the Turkish treaty declares them to be free, in actuality the Armenians have been betrayed by the western world. Lenine and Mustapha Kemal have cracked the whip and they have sovietized. Who of us dares look an Armenian in the face and upbraid him for this."—E. M. House and C. Seymour, *What really happened at Paris*, p. 203.—See also SÈVRES, TREATY OF: 1920: Part II.

1920.—Free passage to Black sea granted. See SÈVRES, TREATY OF: 1920: Part XI. Ports, waterways and railways.

1920.—Turk and Bolshevist attacks.—League of Nations membership denied.—"In October, 1920, the Turkish Nationalists and the Bolsheviks made a concerted attack upon Armenia. The Armenians resisted bravely for two months, not without some success against the Turks, but at the end of the year the Russians overran the country and established a Bolshevist régime at Erivan. The original Armenian Government asked for admission [December 16] to the League of Nations, but was refused. President Wilson suggested that Armenia's frontiers should be extended so as to include Trebizond, Erzerum, Kars, Mush, and Bitlis. This, of course, applied to the non-Bolshevik State, which existed until December."—*Annual Register, 1920*, pp. 269-270.—The refusal to admit Armenia, as well as Lithuania, Esthonia and Latvia was based on the ground that those countries were not sufficiently established.—*Ibid.*, p. 156.

1921.—Conditions of self-government of Sèvres Treaty changed in Near East Conference. See SÈVRES, TREATY OF: 1921: Near East Conference: Armenia.

ARMENIA, Lesser. See ARMENIA: 908-1085. ARMENIAN CHURCH.—"The origin of this Church is clearly discernible. It was beyond doubt Apostolic. Primitive and unvarying traditions agree in regarding St. Thaddeus and St. Bartholomew as the first preachers of the Gospel in Armenia, and as the founders of the Christian

churches in the land. These two are spoken of as *First Illuminators of Armenia*. St. Bartholomew's labours and martyrdom in Armenia are as well authenticated as any facts in the history of the founding of the first churches during the great forty years after our Lord's ascension. Concerning Thaddeus there is less certainty. Some affirm him to be Thaddeus Didymus, brother of the Apostle St. Thomas, whilst a second tradition sees in him the Apostle St. Judas Thaddeus, surnamed Lebbeius. The details are lost, but the broad fact remains that the earliest preaching was by these two men, and that the first communities of Christians in Armenia were gathered from the mass of heathendom as the result of their labours. Beyond these facts we know little or nothing. The primitive era is shrouded in darkness. But the work did not cease when the Apostolic workers received the crown of martyrdom. The best guarantee for the spread of the Gospel was the missionary zeal of the first converts. The Armenian Church grew in numbers, influence, endured persecution, and had its martyrology. There are records of religious persecutions by King Artaxerxes (c. 110 A. D.), by Chosroes (c. 250), and by Tiradates (c. 287). It is permissible to argue that had the Christians been small in numbers, and of small social importance, they would have escaped persecution. The fact points to the existence of a large body of Christians. Indeed, only on the supposition of a widespread acceptance of the faith can the almost instantaneous conversion to Christianity of the whole land in the first years of the Fourth Century be explained. It had already taken deep root in the life of the nation when the events occurred which issued in Armenia becoming the *first Christian State*. [See also CHRISTIANITY: A. D. 33-100.] What are the Distinctive Claims of the Armenian Church? (1) It claims to be *Apostolic*. That is, in *origin* it claims a place alongside the proudest Churches in Christendom. Hence it is equal in point of antiquity and authority with any Churches of the East or West which make these the indispensable notes of a true branch of the Catholic Church. 'The Apostolic origin of the Armenian Church,' says Ormanian, 'is established as an incontrovertible fact in ecclesiastical history. And if tradition and historic sources which sanction this view should give occasion for criticism, these have no greater weight than the difficulties created with regard to the origin of other Apostolic Churches, which are universally admitted as such.' (*The Church of Armenia*, p. 5). (2) It claims to be *Independent*. The dominant Churches of the East and West repudiate this claim, and affirm that the Armenian Church owns allegiance to them. It is certain that through long and troubled centuries both Churches have made endless and forcible attempts to assert their *mastery* over this small national Church. These efforts to bring her into a state of dependency and submission the Armenians have resisted with all the strength, energy, and passion of their nature. Deprived of political independence they have clung all the more tenaciously to the integrity of their Church, whatever may have been the grounds upon which these attacks have been made. (3) It claims to be *National*. This claim rests equally upon an unassailable basis of historical fact. Through the ages whilst every other bond has been broken save that of language, the Church has knit the scattered units of the nation into one indivisible whole. Its head has stood for each succeeding generation as the symbol of the national life. Deprived of a political head and even a political capital the people have, for at least five hundred years, looked to Etchmiadzin as the

home of their people, the centre to which they looked for guidance, unfailing sympathy, and practical aid. It is 'National' in a more complete sense than any other Church in Christendom which employs the term. Two facts emphasise its national character. First, wherever are members of the race, whatever may be their dogmatic creed or ecclesiastical polity, Etchmiadzin and the Catholicos are still the representative of their race, the depository of their traditions, and the fountain and centre of their hopes. Secondly, for perfectly obvious and adequate reasons, the Armenian Church commands no adherents outside the limits of the nation. Moslem, Orthodox Greek, Roman Catholic, and Evangelical Protestants have all in turn proselytised, weakened her still further by drawing away from the national fold members of the flock. She herself has proselytised no Church or nation. The missionary spirit which in the earliest days of its history drove heroic men far and wide in the Caucasus, and steeled them to win the crown of martyrdom has vanished under the oppressive regimen of successive conquerors. Whether under the happier conditions which will follow this world-war, this spirit will not again lay hold of a race eminently aggressive and enterprising, is a question those who know Armenia best will have no difficulty in answering in the affirmative. (4) It claims to be *Democratic*. It is also episcopal. In other Churches the hierarchical principle has to a greater or lesser degree banished the democratic principle and shown itself opposed to the democratic spirit. 'Among the Armenians,' says Ormanian (p. 151), 'the clergy are not looked upon as absolute masters and owners of the Church. The Church since its institution has belonged as much to the faithful as to the ministers of worship. In virtue of this principle, and apart from sacramental acts, for the performance of which ordination is indispensable, nothing is done in ecclesiastical administration without the co-operation of the lay element.' Logically it follows that every ministering servant at its altars occupies his place from the highest to the lowest by the free choice of the people. Equally the pastor of a remote village, and the Catholicos who addresses Popes and Potentates as 'Dear Brother,' are where they are by virtue of the power exercised by the laity. The village priest is elected by the people, often one of their own number, and his support is from their free-will offerings. The head of the Church is similarly elected by an assembly of delegates who are first elected by their various dioceses. The check upon the election of the Catholicos does not invade this principle in any vital degree. In a word, so far as representation and administration go, the Armenian Church is an ancient and successful blend of two opposite principles of church government, *viz.*, the Congregational and the Episcopal. Further, the democratic principle has been applied from most ancient times not only to government but also to the determination of doctrine. 'The Armenian Church is the one wherein the democratic spirit,' says Ormanian, 'excels in all vividness and truth. . . . The leading men and the deputies, in a word, the representatives of the people, have ever continued to take their place, side by side, with bishops and doctors in the Council. They are known to have taken an active part in all discussions bearing on questions of doctrine and discipline, and have set their sign manual at the foot of deeds and canons as effective members of councils.' It is, therefore, not to be marvelled at that 'clericalism' is unknown on the one hand, and indifference on the other. (5) It claims to be *Liberal*. Not for a moment must that be confused with lax views or with vagueness

of belief in Christian dogmas. Her liberalism arises from her historical attitude towards that development of Christian doctrine which it has been the function of Church councils to mark, stereotype, and make binding upon the consciences of the faithful. The Armenian Church has limited that function to the lowest possible degree by strictly limiting the number of Councils she recognises. Each successive Council has added to the number of dogmas which must be received under penalty of forfeiting eternal salvation. The Latin Church recognises twenty; the Greek Orthodox Church admits seven; the Armenian Church only three, viz., Nicea, Constantinople, in the Fourth Century, and Ephesus in the Fifth Century."—L. Williams, *Armenia: past and present*, pp. 100-102, 130-136.

"The religion of Armenia could not derive much glory from the learning or the power of its inhabitants. The royalty expired with the origin of their schism; and their Christian kings, who arose and fell in the 13th century on the confines of Cilicia, were the clients of the Latins and the vassals of the Turkish sultan of Iconium. The helpless nation has seldom been permitted to enjoy the tranquillity of servitude. From the earliest period to the present hour, Armenia has been the theatre of perpetual war; the lands between Tauris and Erivan were despoiled by the cruel policy of the Sophis; and myriads of Christian families were transplanted, to perish or to propagate in the distant provinces of Persia. Under the rod of oppression, the zeal of the Armenians is fervent and intrepid; they have often preferred the crown of martyrdom to the white turban of Mahomet; they devoutly hate the error and idolatry of the Greeks."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 47.—Statistics show thirty-four church organizations with 27,450 members in the United States.—United States Census, *Religious bodies*, 1916, pt. 2, p. 40.

ARMENTIERES, a manufacturing town of France, department of Nord, on the river Lys, nine miles northwest of Lille. The town was bombarded, sacked, and ruined by the German armies in the World War.

1914.—Occupied by British. See WORLD WAR: 1914: I. Western front: t, 1; u, 1; w.

1918.—Battle.—Capture by Germans and withdrawal of British. See WORLD WAR: 1918: II. Western front: a, 2; d, 3; d, 7.

1918.—Taken by Allies and abandoned by Germans. See WORLD WAR: 1918: II. Western front: i; m; q, 1.

ARMIES, European and American. See MILITARY ORGANIZATION; WAR, PREPARATION FOR.

ARMINA: See ARMENIA: B. C. 535-55.

ARMINIANS, a religious group of the seventeenth century among the Calvinists, followers of Arminius (Jakob Hermansen, 1560-1609), professor at the university of Leyden; declared their opinions in the year 1610 opposing, among other things, the former doctrine that Christ died for the elect alone; were also designated by the name of *Remonstrants*.—See also NETHERLANDS: 1603-1610.

ARMINIUS (17 B. C.-A. D. 21), early German national hero of the tribe of Cherusci. He was an officer in the Roman legions in his youth, but, re-

turning to his tribe, he led a rebellion against Quintilius Varus, Roman governor, in A. D. 9. Varus was disastrously defeated. (See GERMANY B. C. 8-A. D. 11). In the year A. D. 15, Germanicus Cæsar led the Romans against Arminius and in the year after defeated him. (See GERMANY A. D. 14-16). Arminius was murdered in A. D. 21.

ARMISTICE.—A cessation of fighting, a short truce, during which it is possible to make terms for a longer truce, or for peace. A modern armistice provides that a neutral zone shall be fixed between the fronts of the respective armies who are parties to the agreement, forbids naval bombardment, the taking of maritime prizes, and the sending of reinforcements into the theater of war.—See also HAGUE CONFERENCES: 1899: Convention with respect to the laws and customs on land.

1797.—Such an armistice was signed during the Napoleonic wars at Léoben on April 7, 1797, after the battle of Ball-Platz, and provided the preliminaries for the treaty of Campo-Formio between the Emperor Joseph and Napoleon. See FRANCE: 1796-1797 (Oct.-Apr.).

1805.—In 1805 an armistice signed at Austerlitz paved the way for peace (Pressburg) between Austria and France. See GERMANY: 1805-1806.

1859.—In 1859 the armistice signed at Villedfranca between Napoleon III and the Emperor Francis Joseph, resulted in the treaty of Zurich signed on November 10, 1859. See ITALY: 1856-1859.

1801.—An unusually interesting instance of a naval armistice is that which was arranged between the Danes and the British in April, 1801, after which there were in fact no other negotiations between the two belligerents.

1884.—On May 11, 1884, an armistice between France and China provided the preliminary base of the definitive treaty which was concluded at Tien Tsin on April 4, 1885, and which gave Tonquin to China. See FRANCE: 1875-1889.

1895.—An armistice was signed between the Japanese and Chinese at the close of the Chino-Japanese war in 1895, which preceded the treaty of Shimonoseki. See CHINA: 1894-1895.

1905.—The peace negotiations held at Portsmouth, New Hampshire, which ended the Russo-Japanese war, were preceded by an armistice between the warring countries. (See JAPAN: 1905-1914). The agreement for a general armistice is made between the commanders-in-chief of the contending armies; but, unless express authority has been conferred upon them for this purpose, the agreement must be ratified by their respective governments. On the other hand, a partial armistice may be entered into between commanders, under the general powers which they possess.—See also TREATIES OF PEACE.

1918.—Those ending hostilities in the World War were chronologically as follows:

September 30, 1918, armistice signed by Bulgaria, yielding control of railways to the Allies, and cutting the connection between the Teuton powers and Turkey. See WORLD WAR: Miscellaneous auxiliary services: I. Armistices: c.

October 31, 1918, armistice signed by Turkey, involving opening the Dardanelles and substantially an unconditional surrender. See WORLD WAR: Miscellaneous auxiliary services: I. Armistices: d.

November 3, 1918, armistice signed by Austria-Hungary, yielding completely to the Allies and opening her territory for an Allied attack upon Germany. See WORLD WAR: Miscellaneous auxiliary services: I. Armistices: e.

November 11, 1918, armistice signed by Germany, including such great concessions as to make it physically impossible for Germany to renew the struggle. The terms of this armistice assured to

the Allies the power absolutely to dictate the conditions of the peace treaty. All of these armistices were successively requested by the four defeated countries. See **WORLD WAR: Miscellaneous auxiliary services: I. Armistices: f.**

There was also an armistice between Germany and the Bolsheviks, (December, 1917), preliminary to the signing of the abortive treaty of Brest-Litovsk on March 3, 1918. That treaty was repudiated in the final settlement forced by the Allies. —See also U. S. A.: 1918 (September-November); **WORLD WAR: Miscellaneous auxiliary services: I. Armistices: a.**

ARMORIAL BEARINGS, Origin of.—"As to armorial bearings, there is no doubt that emblems somewhat similar have been immemorially used both in war and peace. The shields of ancient warriors, and devices upon coins or seals, bear no distant resemblance to modern blazonry. But the general introduction of such bearings, as hereditary distinctions, has been sometimes attributed to tournaments, wherein the champions were distinguished by fanciful devices; sometimes to the crusades, where a multitude of all nations and languages stood in need of some visible token to denote the banners of their respective chiefs. In fact, the peculiar symbols of heraldry point to both these sources and have been borrowed in part from each. Hereditary arms were perhaps scarcely used by private families before the beginning of the thirteenth century. From that time, however, they became very general."—H. Hallam, *Europe during the middle ages, ch. 2, pt. 2.*

ARMORICA, ARMORICANS.—The peninsular projection of the coast of Gaul between the mouths of the Seine and the Loire, embracing modern Brittany, and a great part of Normandy, was known to the Romans as Armorica. The most important of the Armorican tribes in Cæsar's time was that of the Veneti. "In the fourth and fifth centuries, the northern coast from the Loire to the frontier of the Netherlands was called 'Tractus Aremoricus,' or Aremorica, which in Celtic signifies 'maritime country.' The commotions of the third century, which continued to increase during the fourth and fifth, repeatedly drove the Romans from that country. French antiquaries imagine that it was a regularly constituted Gallic republic, of which Chlovis had the protectorate, but this is wrong."—B. G. Niebuhr, *Lectures on ancient ethnography and geography, v. 2, p. 318.*—See also **BRITANNY: 409; 818-912; VENETI OF WESTERN GAUL; and IBERIANS, WESTERN.**

ARMS EMBARGO.—Just before the World War, the United States placed an embargo on ship-

ments of arms and munitions to Mexico in their recent civil war. (See **MEXICO: 1912, 1914.**) During the first years of the World War, there was much agitation in the United States against shipping arms and munitions to the Allies, and an embargo was advocated. The president, however, maintained that such shipments were in accord with international usage and that an embargo would set a precedent that might be dangerous in the future to America. The Mexican government also appealed to the United States to place an embargo on shipping arms and munitions to Europe. See **MEXICO: 1917-1918.**

ARMSTRONG, Vice-Consul J. P.: Reports on affairs in the Congo state. See **BELGIAN CONGO: 1906-1909.**

ARMSTRONG, John (1758-1843), American soldier, diplomatist and political leader. Served in the Revolutionary War. Wrote and issued anonymously the famous Newburgh addresses. (See U. S. A. 1782-1783). United States senator, 1801-1802 and 1803-1804; minister to France, 1804-1810; brigadier-general, 1812-1813; secretary of war, January, 1913-August, 1814 (see U. S. A.: 1813 (October-November)); forced to resign because of unpopularity.

ARMSTRONG, Samuel Chapman (1839-1893), American soldier and educator. Founded Hampton Normal and Agricultural Institute to educate the Negro and Indian races, and became its principal.

ARMSTRONG, William George, first Baron (1810-1900), English engineer, inventor and scientist. He was celebrated for his invention of rifled cannon and breech-loading ordnance. Founded great armament works at Elswick, on the Tyne.

ARMSTRONG, GENERAL (privateer). See **GENERAL ARMSTRONG, CASE OF.**

ARMY, a body of soldiers systematically organized, trained and equipped. In its broadest sense, the term applies to a nation's entire force under arms; in a narrower sense to a portion of that force in a particular locality, as Great Britain's Indian army or France's army in Indo-China. There is also the definite technical meaning, of army, viz., a force of three army corps with additional auxiliary units classed as army troops. In this sense the United States in the World War formed in France a first, a second and a third army, and the other principal combatants each organized several armies. Such an army is properly commanded by a general, while a group of several armies is properly commanded by a field marshal, and the entire armed forces of a nation or an alliance by a generalissimo or commander-in-chief. In 1918, the United States had only one general, Pershing, in the war zone, and the three armies organized by him were commanded by officers of lower rank. The first and second armies were commanded by lieutenant-generals, and the third army, which was the army of occupation, by a major-general. The proper command of a lieutenant-general is an army corps and the proper command of a major-general is a division. (The history of the armies of the principal military nations, and accounts of important military institutions, such as the general staff, conscription, etc., are dealt with in the article **MILITARY ORGANIZATION**).

ARMY CANTEEN. See U. S. A.: 1901 (February).

ARMY CORPS, the largest complete tactical and administrative unit in an army, which is composed of two or more corps. The corps is the appropriate command of a lieutenant-general. In the United States service an army corps is formed by combining two or more divisions, under orders given by the president when he deems such a formation necessary. Such a corps may consist of corps headquarters, six complete divisions, and special corps troops, including one pioneer regiment of infantry, two regiments of cavalry, one anti-aircraft machine-gun battalion, one anti-aircraft artillery battalion, one trench mortar battalion, one field battalion, signal corps, one telegraph battalion, one aéro wing, one regiment of engineers, one pontoon train, one corps artillery park, one remount depot, one veterinary hospital, one bakery company, one supply train, one troop transport train. In addition, one artillery brigade, one sanitary train, and one corps engineer park may be formed from detachments from the divisional organizations. Its approximate strength is 185,000 officers and men.—See also DIVISION; MILITARY ORGANIZATION; TANK CORPS, U. S. ARMY.

ARMY EQUIPMENT: In World War. See WORLD WAR: Miscellaneous auxiliary services: VI. Military and naval equipment.

ARMY LAW. See MILITARY LAW.

ARMY WAR COLLEGE, a school in Washington to which selected officers (captains and above) are sent to study the higher problems of war, and to work upon detailed plans of national defense. It was first organized in 1901, after the Spanish War, and our present military system is largely based upon its leadership.

ARNÆANS. See GREECE: Migration of Hellenic Tribes in the Peninsula.

ARNAUD AMAURY, pope's legate, 13th century. See ALBIGENSES or ALBIGEOIS: 1209; 1210-1213.

ARNAULD, Jacqueline Marie Angélique, Abbess of Port Royal monastery. See PORT ROYAL AND THE JANSENISTS: 1602-1700.

ARNAUTS. See ALBANAINS: MEDIEVAL PERIOD.

ARNAY-LE-DUC, Battle of (1570). See FRANCE: 1563-1570.

ARNDT, Ernst Moritz (1769-1860), German poet and patriot. By his writings stirred German sentiment against Napoleon. After the revolution of 1848, he took his seat in the National Assembly at Frankfort. He was one of the deputation that offered the crown to Frederick William IV.

ARNE, Thomas Augustine (1710-1778), eminent English composer. He wrote numerous operas, masques and other dramatic works. The melody to "Rule Britannia," which was originally given in a popular performance, the "Masque of Alfred," is his composition. The words are by James Thomson (1700-1748). See MUSIC: Modern: 1750-1870.

ARNIM, Sixt von, Prussian general in command of the army operating in the Flanders sector (from the North sea to south of Ypres) during 1917 and 1918. He was beaten to death by peasants on his estate in March, 1919.—See also WORLD WAR: 1914: I. Western front: c, 2; WORLD WAR: 1918: II. Western front: t.

ARNO (c. 750-821), archbishop of Salzburg. Acted in 787 as envoy from Tassilo III, duke of the Bavarians, to Charlemagne; drew up a catalogue of church lands and rights in Bavaria, called the *Indiculus* or *Congestum Arnonis*.

ARNOLD, Benedict (1741-1801), American general and traitor. Served under Ethan Allen in the capture of Ticonderoga (see U. S. A.: 1775: May). Fought in campaign against Montreal and Quebec, and was wounded at the attack of the latter (see Canada: 1775-1776; U. S. A.: 1775; August-December). With a flotilla he had constructed on Lake Champlain, he engaged the British fleet off Valcour Island (Oct. 11, 1776) and after inflicting severe damage on a superior enemy, managed to escape at Crown Point (see U. S. A.: 1776-1777; Washington's retreat through New Jersey). Raised the siege of Fort Stanwix, or Schuyler (see U. S. A.: 1777: July-October). In command of Philadelphia after the British retired. Was placed in command of West Point, 1780; was frustrated in plot to surrender it to the British (see U. S. A.: 1780: August-September). Fleed to the British army, where, as brigadier-general, he served against the Colonial forces until December, 1781 (see U. S. A.: 1781: January-May). He died in London, June 14, 1801.

ARNOLD, Matthew (1822-1888), English poet, essayist and literary critic, son of the famous Dr. Arnold of Rugby and uncle of Mrs. Humphry Ward, the novelist. Educated at Rugby and Oxford. His annual reports as inspector of schools, 1851-1886, greatly hastened educational reforms, particularly in secondary schools; was sent abroad by the government to study foreign educational systems. Professor of poetry at Oxford 1857-1867. Among his poems, "Thyrsis, The Forsaken Mermaid," "Dover Beach," and "The Grande Chartreuse" reveal his Hellenic desire for pure beauty, common to many poets of the Victorian period. His essays emphasize the thoughtful, poised attitude in criticism, among the best being "Sweetness and Light," "Culture and Anarchy," and "Essays in Criticism." Some of his finest pieces are "Sohrab and Rustum," "Rugby Chapel" and "The Scholarly Gypsy." He wrote several critical works on theology, notably "Literature and Dogma."—See also BIBLE, ENGLISH: Modern estimates of the Bible; ENGLISH LITERATURE: 1832-1880.

ARNOLD, Thomas (1795-1842), English clergyman and head-master of Rugby School, August, 1828, to December, 1841, when he took the chair of modern history at Oxford. See also **CLASSICS**.

ARNOLD OF BRESCIA (c. 1100-1155), Italian churchman. Opposed the property-owning power of the Catholic church. Leader in the revolt in 1143 against the temporal power of the papacy, which ended in a papal interdict and the execution of Arnold. See **ROME**: Medieval city: 1145-1155.

ARNOLD VON WINKELRIED. See **WINKELRIED**, **ARNOLD**.

ARNOLDSSEN, K. P. See **NOBEL PRIZES**: Peace: 1908.

ARNULF I (d. 965), Count of Flanders, son of Baldwin II of Flanders and Aelfthrytha, daughter of Alfred the Great. See **BELGIUM**: Ancient and medieval history.

ARNULF OF CARINTHIA (c. 850-899), duke of Bavaria, king of the East Franks (Germany), 888-899, king of Italy and emperor, 894-899. See **ITALY**: 843-951.

Capture of Louvain by. See **SCANDINAVIAN STATES**: 8th-9th centuries.

War with Svatopulk. See **MORAVIA**: 9th century.

ARONDE, northern France: 1918.—Captured by Germans. See **WORLD WAR**: 1918: II. Western front: d, 19.

AROOSTOOK WAR.—This disturbance, which occurred during the presidency of Van Buren, threatened to bring on war with Great Britain.—“The blame for this condition of affairs was laid, by the Whigs, on the new Democratic Governor (Fairfield) of Maine. In that State, indeed, the boundary dispute had never been a party issue, and men of every shade of political belief had held but one view. In the country at large, however, the acts of Governor Fairfield found no support, and his Aroostook War was condemned as a piece of political folly. The Aroostook country, the section of Maine where trouble arose, must not be confounded with the Madawaska region, where Greeley had been arrested two years before. The River St. John, it should be remembered, flows, from its source in the west, almost due northeast into the northern part of the State, then turns a right angle and flows almost due southeast into New Brunswick. Just at the right angle it is entered by the Madawaska River, coming down from the northwest. Near where it enters New Brunswick the St. John is joined by the Aroostook River, coming up from the southwest. Along the Madawaska the Crown had made grants before the Revolution, and Great Britain had thus some show of right to exclusive jurisdiction till the boundary line was determined. Along the Aroostook she had no claim to jurisdiction, for there were no settlements there prior to 1822, when they were made by citizens of the United States and by men who came from New Brunswick that they might be beyond the reach of creditors. Along the Aroostook again jurisdiction had been exercised by Massachusetts, while Maine belonged to her. After the monument was placed at the source of the St. Croix, Massachusetts ran from it a due north line and located two ranges of townships, six miles square, contiguous to the line and extending many miles north of the Aroostook. In 1807 townships, including a part of the river, were sold and conveyed by Massachusetts, and still others in later years. In 1826 townships west of the two ranges and extending nearly to the St. John were surveyed by Maine and Massachusetts and divided between them. Later still a military

road was laid out from the Matawaukeog, a tributary of the Penobscot, across the Aroostook to the St. John. Land agents of both states had long been accustomed each year to sell timber, grant permits to cut down trees, and had driven out trespassers in this region. In 1838, following the usual custom, agents of Maine and Massachusetts entered the Aroostook country in April, and in October, and served processes on certain men cutting timber, broke up their camps, and drove off their teams. Later still a third official visited the region. At Grand River he found fifty trespassers; at Fish River, seventy-five with sixteen yoke of oxen and ten teams. These men not only refused to depart, but told the agent they defied Maine to put them out. When Governor Fairfield was informed of these things he sent a special and confidential message to the Legislature and asked for authority to provide the agent with a force sufficient to disperse the trespassers. (Senate Documents, 25th Congress, 3d Session, Vol. IV, Document 270, pp. 8, 9.) The authority was at once given and ten thousand dollars appropriated to meet the expense. (*Ibid.*, p. 12.) With one hundred and fifty men the land agent, Mr. Rufus McIntire, set off from Bangor and, accompanied by the sheriff of Penobscot County, repaired to the mouth of the Aroostook River where three hundred trespassers, well armed, were ready to resist. Finding he had with him a six-pound cannon, they retreated down the river toward New Brunswick. The agent then dispatched a letter to the British warden of the disputed territory asking for a meeting at the house of a certain settler; but one night, while asleep in the house, Mr. McIntire was seized by a party of trespassers, was carried to Woodstock in New Brunswick, and then under guard to the jail at Frederickton. When the land agent reached Woodstock, and news of his capture and the presence of Maine troops on the Aroostook spread, a mob broke into the arsenal, took out several hundred stand of arms and set off for the disputed country. On the arrival of the prisoner at Frederickton, Lieutenant-Governor Harvey, of New Brunswick, issued a proclamation, summoned all who had carried off arms and munition to return them, denounced the presence of the Maine forces on the Aroostook as an invasion and outrage, and ordered the militia to be ready to march at a moment's notice. (Senate Document 270, p. 13.) A copy of the proclamation was forwarded to the Governor of Maine, with a letter in which General Harvey demanded the recall of the Maine forces, asserted exclusive jurisdiction of Great Britain over the Aroostook region, said that his instructions did not permit him to suffer any interference with this exclusive jurisdiction, and that he had ordered a strong force of Her Majesty's troops to be in readiness to support her authority. The Governor at once demanded that General Harvey release Mr. McIntire, and transmitted the copy of the proclamation to the Legislature. General Harvey replied that the land agent was a State prisoner, and that his fate rested with Her Majesty's Government; but that he had ordered the release, on parole, of Mr. McIntire; that if it was the desire of the Governor of Maine that the friendly relations existing between Great Britain and the United States should not be disturbed, the armed force then within the disputed territory must be immediately withdrawn; and that Mr. James MacLauchlan the British warden of the territory who, while on a visit to the camp of the land agent, had been seized by way of reprisal, should be released. The Governor answered that Mr. MacLauchlan should be released on parole of honor, but refused to withdraw the troops. Reinforcements

were meantime hurried to the Aroostook camp which, since the arrest of McIntire, was commanded by Charles Jarvis, and a thousand militia were ordered to assemble at Bangor. The Legislature as soon as the Governor's message was received unanimously resolved that a sufficient body of men should be stationed on the Aroostook and if practicable on the St. John near the boundary line; appropriated eight hundred thousand dollars for the purpose and instructed the Governor to request the coöperation of Massachusetts, and to write to the President and ask the aid of the Federal Government. When the appeal for aid reached Van Buren he sent it with a message to Congress. The acts of the British Governor, he said, were based on the assumption that the United States had agreed to leave Great Britain in sole possession of, and with exclusive jurisdiction over, the disputed territory till the question of boundary was settled. No such agreement existed. Maine had a right to stop the depredations of the timber cutters. But between an effort on the part of Maine to preserve the timber and a military occupation by that State of the disputed territory, there was an essential difference. In such an enterprise he did not think Maine should call on the Government for aid. Amicable means alone should be used. On the other hand, should the authorities in New Brunswick seek to enforce their claim to exclusive jurisdiction by a military force he should feel bound to consider a call from Maine for aid in repelling the invasion. The proper course in the present case was for Maine to disband her force of militia and for each party to release the captured agent of the other. (Messages and Papers of the Presidents; Richardson, Vol. III, pp. 512-21.) The end of the session was near, but in the Senate the message and documents were referred to the Committee on Foreign Relations, and in the House to the Committee on Foreign Affairs. The House Committee recommended that a special minister should be sent to Great Britain to aid the resident minister in an attempt to settle the long-pending controversy, and reported a bill, which promptly passed. (Congressional Globe, 25th Congress, 3d Session, pp. 217, 218.) The Senate Committee could find no trace of any understanding, expressed or implied, much less of any agreement, that the disputed territory should be under the exclusive jurisdiction of Great Britain. There was, however, a clear understanding that neither party should exercise jurisdiction over any portions of it save such as had been in the actual possession of the one or the other. In sending armed men to drive out the intruders Maine had not violated the understanding, and should Her Majesty's Government persist in the attempt to maintain exclusive jurisdiction by force then the President would be justified in using the military power of the United States to repel invasion. When, therefore, the House bill to give the President authority to resist any attempt of Great Britain to enforce by arms her claim to exclusive jurisdiction over the disputed territory in Maine, use the land and naval forces if necessary, and in the event of the actual invasion of our territory, call for fifty thousand volunteers, borrow ten million dollars, arm and equip the naval force, and put such a fleet of vessels on the lakes as he thought proper, reached the Senate it was passed unanimously. One section made an appropriation for the outfit and salary of a special minister to Great Britain if the President saw fit to send one. Yet another limited the duration of the act to sixty days after the meeting of the first session of the next Congress.

"While the two committees were considering the

question, Forsyth (J. Forsyth, Sec. of State, June 27, 1834 to March 5, 1841), and the British Minister drew up and signed a memorandum. This stated the views of Great Britain and of the United States as to jurisdiction, declared that the issue could only be settled by friendly discussion, and that meantime Her Majesty's officers would not seek to drive out the armed party sent by Maine; that the Governor of Maine would withdraw it; and that the agents of both parties who had been taken into custody should be released. [Congressional Globe, 25th Congress, 3d Session, pp. 526, 527.] As soon as the memorandum was signed copies were sent post-haste to the Governors of Maine and New Brunswick, and General Scott was ordered to Augusta. There he found a new levy of a thousand men about to start for the Aroostook. But the arrival of the memorandum and the presence of Scott induced the Governor to delay the march till the Legislature had considered the action of the Secretary of State. Scott meantime dispatched a proposition to Governor Harvey. If the Governor of New Brunswick would agree not to attempt to take military possession of the disputed territory, or seek by force of arms to drive out the armed posse or troops of Maine, Scott was sure the Governor of Maine would agree not to disturb New Brunswick in the possession of the Madawaska settlements, or seek to dislodge the British by force of arms. Harvey at once agreed to this (Harvey to Scott, March 23, 1839, National Intelligencer, April 1, 1839), the Governor of Maine also assented (Governor Fairfield to Scott, March 25, 1839, *Ibid.*); the troops at Augusta were sent home, others were recalled from the Aroostook country, and the prospect of war, for the present, was averted.—J. B. McMaster, *History of the people of the United States*, v. 6, pp. 513-518.—See also U. S. A.: 1842: Ashburton Treaty with England; MAINE: 1841-1842.

ARPAD, ancient city of Syria, near Aleppo. Siege conducted by the Assyrian conqueror Tiglath-Pileser, beginning 742 B. C. and lasting two years. The fall of the city brought with it the submission of all northern Syria.—A. H. Sayce, *Assyria*, ch. 2.

ARPAD, Dynasty of, Magyar line founded by Arpad, who was elected chief by the tribes which began the conquest of Hungary in 899. See HUNGARY: 896; 972-1116; 1116-1301.

ARQUES, Battles at (1589). See FRANCE: 1589-1590.

ARRABBIATI, political party in Florence. See FLORENCE: 1498-1500.

ARRAN, a large island off the west coast of Scotland at the mouth of the Firth of Clyde. Its caves were the refuge of Robert Bruce.

ARRAN, Earls of, a line of Scottish nobles, whose title, derived from the island of Arran, was first given to Thomas Boyd and later transferred to the Hamilton family. The latter was active in border wars and in the support of Mary, queen of Scots. See SCOTLAND: 1544-1548; and 1546.

ARRAPACHITIS, Semitic country northeast of Nineveh. See JEWS: Early Hebrew History.

ARRAS, a town and fortress of France, on the Scarpe one hundred miles northeast of Paris. It was formerly the capital of Artois, was fortified by Vauban in the reign of Louis XIV and was the birthplace of Robespierre. The city is partly situated on high ground and has always been a place of considerable military importance. [For origin of Arras, see BELGE.] Arras lies in the industrial region of northern France and near the Lens coal mines. Here was held the first congress between European powers, in 1435. In the spring of 1917 the British prepared for an offensive north of

Arras instead of planning to continue the battle of the Somme as the Germans had expected. In the great German offensive of the spring and early summer of 1918 all attempts to wipe out the British bastion around Arras were shattered in some of the bitterest fighting of the war.

1414-1435.—Treaties of Arras. See FRANCE: 1380-1415, and 1431-1453.

1482.—Treaty between Louis XI and Maximilian I.

1583.—Submission to Spain. See NETHERLANDS: 1584-1585.

1654.—Unsuccessful siege by the Spaniards under Condé. See FRANCE: 1654.

1914.—Scene of attack by Germans. See WORLD WAR: 1914: I. Western front: u, 4.

1915.—Region of fighting. See WORLD WAR: 1915: II. Western front: d.

1916.—Near Hindenburg line. See WORLD WAR: 1916: II. Western front: e, 7.

1917.—Battle of Arras. See WORLD WAR: 1917: I. Summary: b, 2; II. Western front: c; c, 1; c, 19.

1918.—German attack. See WORLD WAR: 1918: II. Western front: b, 1; c, 2; c, 28; k.

ARREBOE, Anders Christensen (1587-1637), Danish poet. See SCANDINAVIAN LITERATURE: 1479-1750.

ARRELLANO, Don Cayetano, Chief Justice of Philippine Islands. See PHILIPPINE ISLANDS: 1900: Progress toward civil government.

ARRETIUM, Battle of (285 B. C.). See ROME: B. C. 205-191.

ARRHENIUS, Svante August (1859-), a distinguished Swedish organic and electrical chemist; since 1905 director of the physico-chemical department of the Nobel Institute; in 1887 promulgated the important modern theory of dissociation in electrolytes, known as the ionization hypothesis; was awarded in 1902 the Davy medal of the Royal Society; in 1903 received the Nobel Prize for physics, and in 1914 received the Faraday medal from the Chemical Society.—See also NOBEL PRIZES: Chemistry: Modern: Lavoisier.

ARRIAGA, Dr. Manoel (1842-1917), Portuguese statesman, formerly a journalist; member of Chamber of Representatives, 1861-1889; helped establish the republic and became first president, 1911; resigned 1915. See PORTUGAL: 1910-1912; 1911-1914.

ARRIAN (Latin, Flavius Arrianus), Greek historian and philosopher of the second century A. D. His most important work is the "Anabasis of Alexander," the most reliable account now existing of the life of Alexander the Great.

ARRONDISSEMENT, an administrative division of a French department (q. v.), similar to a "congressional district" in U. S. A. Since the Revolution France has been divided into departments and arrondissements. The latter are divided again into cantons and communes. There are 362 arrondissements in France.—See also SOCIALISM: 1904-1921.

ARROW, Canton river vessel, whose possession was disputed by China and England. See CHINA: 1856-1860.

ARROW HEAD COPSE, in the Somme region, northern France; captured by the Allies in 1916. See WORLD WAR: 1916: II. Western front: d, 7.

ARROW HEAD WRITING. See CUNEIFORM WRITING.

ARROWS, the name of a United States army division active in the Meuse-Argonne region during the World War. See WORLD WAR: 1918: II. Western front: v, 6.

ARSACIDÆ.—The dynasty of Parthian kings were so called, from the founder of the lines, Arsaces, who led the revolt of Parthia from the rule of the Syrian Seleucidæ and raised himself to

the throne. According to some ancient writers Arsaces was a Bactrian; according to others a Scythian.—G. Rawlinson, *Sixth great oriental monarchy*, ch. 3.

ARSEN.—In one of the earlier raids of the Seljukian Turks into Armenia, in the eleventh century the city of Arsen was destroyed. "It had long been the great city of Eastern Asia Minor, the centre of Asiatic trade, the depot for merchandise transmitted overland from Persia and India to the Eastern Empire and Europe generally. It was full of warehouses belonging to Armenians and Syrians and is said to have contained 800 churches and 300,000 people. Having failed to capture the city, Togrul's general succeeded in burning it. The destruction of so much wealth struck a fatal blow at Armenian commerce."—E. Pears, *Fall of Constantinople*, ch. 2.

ARSENALS AND NAVY YARDS WAGE COMMISSION (U. S. A.).—During the World War "the arsenals of the [United States] War Department and the navy yards of the Navy Department were direct competitors for many classes of labor. It was manifestly both inequitable and detrimental to efficiency that these two classes of institutions should pay different rates of wages for the same labor or in other respects provide for divergent labor conditions. To secure unity of action between the two Departments in respect to such matters, the Secretaries of War and of the Navy, acting in cooperation with the Secretary of Labor, in August, 1917, created a body known as the Arsenals and Navy Yards Wage Commission. This Commission, composed of Franklin D. Roosevelt, Assistant Secretary of the Navy, Stanley King, Assistant to the Secretary of War, and Rowland B. Mahaney, mediator of the Department of Labor, had as its function to pass upon all wage questions arising in arsenals and navy yards. On September 17, 1917, announcement was made in the *Official Bulletin* that the Commission had completed its work of revising the scale of wages paid in arsenals and navy yards. In making this revision the Commission, although paying attention to wages paid in other local establishments, sought to standardize wages as far as possible."—W. F. Willoughby, *Government organization in war time and after*, pp. 217-218.

ARSENE, Lake.—An ancient name of the lake of Van, in Armenia, which is also called Thopitis by Strabo.—E. H. Bunbury, *History of ancient geography*, ch. 22, sect. 1.

ARSIERO, a town of northern Italy; during the World War captured by the Austrians in their invasion of May, 1916; recaptured in June when the Russian offensive called Austrian troops back from the Italian front. This, with the similar events at Asiago, marked the turning point of the Austrian effort to break through into the Venetian plain. See WORLD WAR: 1916: IV. Austro-Italian front: b, 2; also b, 4.

ARSUF, or Arsouf, a small town on the coast of Palestine, scene of the victory of Richard I of England over Saladin in the third Crusade (1191). See CRUSADES: Military aspect of the Crusades.

ART: Application of the term.—"The term 'art' covers a vast field. In its broader sense it includes the mechanical arts and the fine arts. The fine arts fall into three divisions: the arts of poetry and literature; [also] the arts of music (q. v.); and the arts of sculpture (q. v.), painting (q. v.) and architecture (q. v.). To this last group, the term is in its narrowest sense applied; that is, to "the fine arts depending on the sense of vision or sight; the glyptic [relating to carving], plastic and graphic arts; the arts of form and color; the arts of sculpture, carving, drawing, painting, etching,

engraving, tattooing, decoration, costume (q. v.), pottery, architecture . . . the arts of space, and not to the arts of thought or sound."—E. S. and E. M. Balch, *Art and man*, p. 11.

Distribution.—"Art is found in every part of the world except Antarctica. Some of its branches, such as modern European art, Roman art, Greek art, Egyptian art and Assyrian art have been studied carefully and voluminous treatises have appeared upon them. But when we turn to such arts as African art or Brazilian art, there have been no special publications about them. In the case of the wonderful art of China, it is only in the twentieth century that the first serious attempt was made to trace it back. From an artistic or an ethnological standpoint, the art of the world as a whole is so far almost untouched. . . . From one point of view, namely from that of the same kind of development, art might be divided into art families as follows: Pleistokene, Bushman and Arctic; Neolithic; Ægean, Greek and European; Egyptian and West Asiatic; South Asiatic; East Asiatic; African, Australasian and Amerind. Possibly the best way of classifying the main arts of the world is geographically, namely in accordance with their distribution in the five great inhabited divisions of the world. In Europe one might perhaps specify Pleistokene art; Neolithic-Bronze Age art; Ægean art; Græco-Roman art; Byzantine art; modern European art. In Africa: Bushman art, Negro art, Zimbabwe art, Egyptian art. In Asia: West Asiatic art; Early East-South Asiatic art; South Asiatic art; East Asiatic art. In Asia and Africa: Arab art. . . . In Australasia: Polynesian art; Melanesian art. In Asia and America: Arctic art. In America: Amerind art. Whilst there are certainly many more arts than these, it seems as if most of them were derived from one or more of these primary arts, and that they may be considered as secondary arts."—*Ibid.*, pp. 13-14, 27-28.

Definitions.—Croce's *Æsthetic*.—"Among the ancients the fundamental theory of the beautiful was connected with the notions of rhythm, symmetry, harmony of parts: in short, with the general formula of unity in variety. Among the moderns we find that more emphasis is laid on the idea of significance, expressiveness, the utterance of all that life contains; in general, that is to say, on the conception of the characteristic."—B. Bosanquet, *History of æsthetic*, pp. 4, 5.—"Not reckoning the thoroughly inaccurate definitions of beauty which fail to cover the conception of art, and which suppose beauty to consist either in utility, or in adjustment to a purpose, or in symmetry, or in order, or in proportion, or in smoothness, or in harmony of the parts, or in unity amid variety, or in various combinations of these—not reckoning these unsatisfactory attempts at objective definition, all the æsthetic definitions of beauty lead to two fundamental conceptions. The first is that beauty is something having an independent existence (existing in itself), that it is one of the manifestations of the absolutely Perfect, of the Idea, of the Spirit, of Will, or of God; the other is that beauty is a kind of pleasure received by us, not having personal advantage for its object. The first of these definitions was accepted by Fichte, Schelling, Hegel, Schopenhauer, and the philosophizing Frenchmen, Cousin, Jouffroy, Ravaisson, and others, not to enumerate the second-rate æsthetic philosophers. And this same objective-mystical definition of beauty is held by a majority of the educated people of our day. It is a conception very widely spread, especially among the elder generation. The second view, that beauty is a certain kind of pleasure received by us, not having

personal advantage for its aim, finds favor chiefly among the English æsthetic writers, and is shared by the other part of our society, principally by the younger generation. . . . What is art, if we put aside the conception of beauty, which confuses the whole matter? The latest and most comprehensible definitions of art, apart from the conception of beauty, are the following: (1 a) Art is an activity arising even in the animal kingdom, and springing from sexual desire and the propensity to play (Schiller, Darwin, Spencer), and (1 b) accompanied by a pleasurable excitement of the nervous system (Grant Allen). This is the physiological-evolutionary definition. (2) Art is the external manifestation, by means of lines, colors, movements, sounds, or words, of emotions felt by man (Véron). This is the experimental definition. According to the very latest definition (Sully), (3) Art is 'the production of some permanent object or passing action, which is fitted, not only to supply an active enjoyment to the producer, but to convey a pleasurable impression to a number of spectators or listeners, quite apart from any personal advantage to be derived from it.' Notwithstanding the superiority of these definitions to the metaphysical definitions which depended on the conception of beauty, they are yet far from exact. . . . The inaccuracy of all these definitions arises from the fact that in them all (as also in the metaphysical definitions) the object considered is the pleasure art may give, and not the purpose it may serve in the life of man and of humanity. In order correctly to define art, it is necessary, first of all, to cease to consider it as a means to pleasure, and to consider it as one of the conditions of human life. Viewing it in this way, we cannot fail to observe that art is one of the means of intercourse between man and man. Every work of art causes the receiver to enter into a certain kind of relationship both with him who produced, or is producing, the art, and with all those who, simultaneously, previously, or subsequently, receive the same artistic impression. Speech, transmitting the thoughts and experiences of men, serves as a means of union among them, and art acts in a similar manner. The peculiarity of this latter means of intercourse, distinguishing it from intercourse by means of words, consists in this, that whereas by words a man transmits his thoughts to another, by means of art he transmits his feelings. . . . If a man infects another or others, directly, immediately, by his appearance, or by the sounds he gives vent to at the very time he experiences the feeling; if he causes another man to yawn when he cannot help yawning, or to laugh or cry when he himself is obliged to laugh or cry, or to suffer when he himself is suffering—that does not amount to art. Art begins when one person, with the object of joining another or others to himself in one and the same feeling, expresses that feeling by certain external indications. To take the simplest example: a boy, having experienced, let us say, fear on encountering a wolf, relates that encounter; and, in order to evoke in others the feeling he has experienced describes himself, his condition before the encounter, the surroundings, the wood, his own light-heartedness, and then the wolf's appearance, its movements, the distance between himself and the wolf, etc. All this, if only the boy, when telling the story, again experiences the feelings he lived through and infects the hearers and compels them to feel what the narrator has experienced, is art. . . . Art is not, as the metaphysicians say, the manifestation of some mysterious Idea of beauty, or God; it is not, as the æsthetic physiologists say, a game in which man lets off his excess of stored-up energy; it is not the expression of man's

emotions by external signs; it is not the production of pleasing objects; and, above all, it is not pleasure; but it is a means of union among men, joining them together in the same feelings, and indispensable for the life and progress toward well-being of individuals and of humanity.—L. Tolstoy, *What is art*, pp. 38-50.—“That art must have a moral motive is another confusing proposition. . . . It is at this point that Tolstoy in bearing with his whole colossal weight upon the *subject and purpose* of art gives us after all but a one-sided answer to his question, ‘What is Art?’ insisting as he does in the conclusion of his exhaustive treatise that ‘the destiny of art is to transmit from the realm of reason to the realm of feeling the truth that the well-being of men consists in being united together.’ . . . This is a true epitome of the *privilege* of art, but the enthusiasm of the moral teacher blinds him to the simple fact that this could not be done if it were not possible to interest men in art by pleasing them therewith. The emotion (or feeling) which will unite two men over the painting of a landscape *cannot be evoked* unless they enjoy the picture, nor can the design of a Turkish rug unite men unless it first pleases them. [Poore does not, however, define this pleasure in terms of a special aesthetic faculty; his argument, on the other hand] places the apprehension and appreciation of art upon the basis of the intellectual process and denies that there is such a thing as indefinable beauty in art.”—H. R. Poore, *Conception of art*, pp. 41, 63, 95-96.—Clive Bell explicitly dissociates beauty from art, and defines the essential quality of art as “significant form.” The theory of Rodin, although less consistently phrased, is similar in intention. “In fact, in art, only that which has *character* is beautiful. Character is the essential truth of any natural object whether ugly or beautiful; it is even what one might call a *double truth*, for it is the inner truth translated by the outer truth; it is the soul, the feelings, the ideas, expressed by the features of a face, by the gestures and actions of a human being, by the tones of a sky, by the lines of a horizon.”—P. Gsell, *Art, by Rodin*, p. 44.

Reasoning from the point of view of the philosopher as distinct from that of the artist, Benedetto Croce has formulated the Expressionist Theory, which is at present widely accepted. “Croce’s theory of Beauty rests on the affirmation of an aesthetic activity as a special sphere of mental activity, distinct alike from the logical activity on one hand and from the ethical activity on the other hand. . . . Beauty is successful expression. We may even leave out the qualification ‘successful’ and say simply, Beauty is expression, for unsuccessful expression is not expression. What then is expression? It is the form the mind gives to its intuitions, the form intuition takes as it expresses itself. And as there is no matter without form and no form without matter, the intuition is expression. . . . ‘When we have mastered the internal word, when we have vividly and clearly conceived a figure or a statue, when we have found a musical theme, expression is born and is complete, nothing more is needed. If then, we open our mouth and speak or sing, the action is voluntary, and what we then do is say aloud what we have already said within, sing aloud what we have already sung within. If our hands strike the keyboard of the pianoforte, if we take up pencil or chisel, such actions are willed and what we are then doing is executing in great movements what we have already executed briefly and rapidly within. By these actions we stamp our intuitions on a material which will hold the traces of them more or less enduringly. . . . The work of art is always and

only internal, and what is called external is no longer a work of art.’ (Croce, *Estetica*, p. 58). . . . The beautiful then is aesthetic value and aesthetic value is successful aesthetic activity, that is, expression. The ugly is spoilt expression, a short-comed or a failure to express. . . . We are accustomed to accept the truth of the saying *poeta nascitur non fit*. Croce tells us the true doctrine is *homo uascitur poeta*. Every man is born a poet, little poets some, great poets others. . . . There is no difference between the intuition of the artist of genius and the intuition of the humblest individual who finds enjoyment in contemplating the work of genius so far as pure intuition is concerned, notwithstanding the utter incompetence the one may feel in himself to accomplish what the other has performed. It is always our own intuition we express when we are enjoying a work of genius. The great artist enables me to express my intuition, his work assists me. I cannot, that is to say, have any intuition but my own, and it can only be my own intuition when reading Shakespeare I form the image of Hamlet or Othello, but the greatness of Shakespeare is that he enables me to rise to higher and more extensive ranges of intuition than I could hope to reach without his assistance.”—H. W. Carr, *Philosophy of Benedetto Croce*, pp. 70, 72, 161-165.

Relation of art and history.—Spirit of antiquity and Renaissance in architecture, sculpture and painting.—“Art is a language. It gives expression to the spirit of the age, the nation, and the individual that produced it. These three creating forces of the age, the nation, and the individual may be discerned in every work of art. They make of art the most eloquent expression of life.”—E. M. Hulme, *Renaissance, Protestant Revolution, and Catholic Reformation, in continental Europe*, p. 108.—“It is true that in recent centuries, those namely of recent modern history, the arts of painting and sculpture, at least, have become mainly matters of luxury, and that as arts of popular education and instruction they have been displaced by printed books. Hence the difficulty of making immediately apparent, before the subject itself has been opened up, that a *history* of art is not so much a history of the arts of design as it is a history of civilization. But if this point is not apparent in advance, it is notwithstanding the point which in recent years has drawn more and more attention to the subject, until it is beginning to figure as an indispensable part of the philosophy and knowledge of general history. As soon as history ceases to be conceived as a series of disconnected national chronicles, as soon as it begins to be conceived as a sequent evolution of races and of epochs—which has been unbroken in continuity since the time of the Chaldeans and Egyptians down to the nineteenth century—the history of art appears as a study of the first importance. This is because it deals with the now visible relics of the past; not only with buildings, statues, reliefs, and paintings, but with fabrics, utensils, coins, furniture, and all the accessories of daily life; for in historic periods all these things were given an appropriate artistic treatment and setting forth. As revelations of the life of a nation or an epoch these relics appeal to the imagination because they appeal to the eye and assist each student to picture the past to himself. The student is no longer, then, dependent on the descriptions and accounts of another student; he becomes himself an independent historian, for whoever evokes in imagination the life of the past deserves this title. The history of art has, moreover, especial value for a true philosophy of history in that it forces the student to subordinate the history of nations to the history

of epochs. The grand divisions between the successive epochs of the ascendancy of the ancient oriental nations—of the Greeks [see also ÆGEAN CIVILIZATION; ATHENS; SPARTA], of the Romans, of the Germanic races (the Middle Ages), and of the Italians (the Renaissance)—are only seen distinctly when the history of art is called in evidence.”—W. H. Goodyear, *Roman and medieval art*, pp. iii-iv.—“Each epoch of the world develops its own proper form of expression. Greek architecture is the embodiment of supreme serenity, of self-restraint, and the sense of inevitable fate. It is the expression of an ideal of life that never sought to leave the earth, the ideal of a sound mind in a sound body. Its impulse is purely pagan. Roman architecture, with its bridges and aqueducts, its triumphal arches, its domes and its auditoriums, speaks of the majesty of the Roman government, of the imperial scope of its power and its law. When paganism had fallen and Christianity had built a new civilization upon the wreck of the old, Gothic architecture gave expression to the new spirit, to the new ideal of life, to the new vision that soared aloft until it was lost in the blue sky. Pure beauty was the sole object of Hellenic art, but Gothic architecture strove to voice the aspirations of the human soul. The predominant lines of classic architecture are horizontal lines, which are restful and belong to the earth, while those of Gothic architecture are vertical. In the Gothic cathedral, slender window, towering pillar, pointed arch, lofty vault, delicate pinnacle, and soaring spire, irresistibly carry the eye upward. Classic architecture was rooted in the rational faculty; Gothic was born in the spiritual. . . . The Renaissance was in part a harking back to the classic ideals. The new classicism of the time demanded an architecture that could give it expression. Gothic architecture could not express the lucidity and the sanity of Greek thought, nor the grandiose nature of the Roman civilization. Nor could it express the combination of classicism and modernity that formed the spirit of the Renaissance. A new style of architecture was required. The pure Gothic of northern and central France had never found a congenial soil in Italy. Only a modified form of Gothic, in which the horizontal principle held an important part, had flourished there. Breadth rather than height was its characteristic attribute. The spire was almost unknown, its place being taken by the dome. In retaining something of the character of classic architecture Italian Gothic expressed the genius of the Italian people, a genius with a classic inheritance, as contrasted with the genius of the French people, a genius with a marked Celtic strain. In the creation of an architecture that should give expression to the semi-classic spirit of the Renaissance a less radical change was required of the Italians than of the northern nations. The spirit of the Renaissance appealed to the Italian mind promptly and decisively. A new style of architecture, that rapidly reached maturity, gave expression to that spirit. . . . The Greeks serenely enjoyed the external world. They drew the inspiration for their sculpture from the men and women they saw about them. They were not much disturbed by the moral struggles and the ceaseless and often-times painful questionings regarding the destiny of the individual soul that Christianity emphasized. . . . As we have seen, this change in the attitude towards life, coming by imperceptible degrees, brought with it a change in the ideals of art. The Greek temple gave place to the Gothic cathedral. And when men began to recover something of the pagan attitude towards life the architecture of the early Renaissance gave

expression to that spirit. A similar change took place in all the arts, in sculpture and in painting. In sculpture the Italian, sense of reality had never been completely extinguished. The carving of leaves and flowers and fruit in the medieval churches of the peninsula give testimony to a certain power of observation. Yet the Italian sculptors were in no small measure bound by the subjection of their art to the exclusive service of the Church. The men of the medieval centuries were exceedingly skilful carvers of stone. Indeed, the medieval sculptors made the thirteenth century one of the great periods of their art. But the spell of the Church under which sculpture worked is seen in the almost exclusive devotion to ecclesiastical subjects, in the thin and gaunt figures, the emaciated faces, the angular gestures, and above all in the spirit that informs it. It was Nicholas of Pisto (1207(?)–80), . . . who, disregarding the limiting traditions of the past, first instilled something of the new life into the forms of medieval sculpture. . . . He went direct to nature. And from him onwards not one of the Italian sculptors copied classical statuary in a slavish manner. So into the sculpture of the Renaissance, as into its literature, its architecture and its painting, there flowed from the beginning two streams of inspiration, that of classic art and that of nature itself. . . .

“In the Middle Ages painting was merely the handmaid of the Church. Its function was not to reveal to man the beauty of the present world, but to help him to win the salvation of his soul in the next. In the latter medieval centuries the only school of painting was the Byzantine school. It is true that the Greek church had been separated from the Latin church for centuries, but the painting of the former dominated that of the latter. Byzantine painting was completely under the spell of the Church. The subjects of the pictures were taken from the Scriptures, from the legends of the Church, or from the lives of the saints. An arid symbolism, void of all initiative, dominated art. . . . The style of treatment, the attitudes, the composition, and the colors, were all determined by traditional rules. . . . There was no direct reference to nature. All that painting had to do was to assist the Church in its teaching. . . . But softly and unnoticed a new era dawned upon the world. In the thirteenth century life began to animate painting once more as it had done in the days of Greece and Rome, and as it was already doing in Italy in literature and sculpture. Men once again became sensitive to the beauty of nature and the significance of humanity. Among the painters who first made their art more expressive of life were Guido of Siena, Giunta of Pisa, and more important, Cimabue (1240(?)–1302) of Florence. . . . The beginning of the revival of sculpture preceded that of painting by almost half a century; but the genius of one great man, Giotto (1276–1336), raised painting to so high a pitch that it overtook and overshadowed the development of sculpture. . . . Fra Angelico had adjoined antiquity and Mantegna had discarded the inheritance of the Middle Ages. But up to this time most of the artists of the Renaissance had striven to unite the pagan and the Christian elements. It was only very gradually that the classical and the modern were amalgamated.”—E. M. Hulme, *Renaissance, Protestant Revolution and Catholic Reformation in continental Europe*, pp. 108, 111–112, 116–117, 121.

“Now I think it may well profit us to turn away from the art of our own Western tradition and consider an art which has grown up and flowered among races of a quite different civilization, among

a different order of ideas and nourished by a different inspiration: the art of Asia. That is the only other body of creative art which can be compared with our art, the art of the Western world, on equal terms. . . . We have always thought of perfection as something completed, and therefore finite. But, as Mr. Okakura tells us in his charming *Book of Ted*, Laoist thought rejects the finite, because where there is an end, where there is completion, there is death. Growth has stopped. Therefore we find a dwelling on the idea of the imperfect, the uncompleted, when the capacity for growth still remains. . . . The Chinese seem never to have felt the need to throw their imagination of the life-force into a human image. They have kept their thought strangely vague and impersonal. . . . It is characteristic of this art and poetry that this spirit in it goes out exulting to the immensities and profundities, as to its natural home. . . . We in the West have found that the vitality of our art has been nourished chiefly by the influx of new material. The spur to our artists has been the zest of exploration. The painters of the East have remained content to repeat the same motive century after century. And not only this, but they have remained content with the same means of expression. . . . The art of the West has been like a fire, choked with the fuel which we have heaped on it so eagerly; burning fiercely but turbidly, with smoke and crackling. In the art of the East the flame has burned far clearer and purer; the danger for it is rather inanition from want of fresh fuel. How much, what a plenitude of material has our Western art to consume! how grand an inspiration remains!"—L. Binyon, *Ideas of design in east and west* (*Atlantic Monthly*, Nov., 1913).

ART COLLECTIONS. See ART GALLERIES AND MUSEUMS.

ART EDUCATION. See EDUCATION, ART.

ART GALLERIES AND MUSEUMS.—The term "museum," derived from the Museion or

"Temple of the muses" at Alexandria, covers a collection of all sorts of art objects, while an art gallery is occasionally, though not as a rule, restricted to a collection of pictures. Public museums are those supported by public money, to which the public has free access. "While the Romans were industrious collectors of statues and paintings they sought them merely as decorative objects and not for the purpose of cultivating taste, or as instruments for the study and teaching of the arts of design. At first they were employed exclusively for the decoration of temples and places of public resort; but private collections began to be formed and by the close of the Republic it had become fashionable for wealthy citizens to have a room in their houses for the reception and display of works of art. . . . Natural objects, such as we call curiosities, had long been preserved in temples, both in Greek and Roman times. . . . By far the most important museum of antiquity was the great institution at Alexandria (Museion) founded by Ptolemy Philadelphus in the third century before Christ. . . . In the Middle Ages many monasteries had collections of curiosities. . . . Every church had its treasury, and most treasuries contained relics. . . . The vast treasures of art which had been recovered in Italy [during the Renaissance] were gradually absorbed into special collections and formed the foundation of the museums of the Vatican and the Lateran at Rome, of the museum of Florence and of those of Vienna, Dresden, Munich, Paris, St. Petersburg, and London."—D. Murray, *Museums*, pp. 1-18.—"It is only within recent years that communities have taken or shared the initiative in the foundation of museums of art. The older museums abroad and at home have originated in private collections either bequeathed to the public or taken possession of in the name of the nation. [See ALBRIGHT GALLERY.] The purchase of Sir Hans Sloane's collection in 1753 was the nucleus of the British Museum; the Pitti and the Uffizi collections gathered by the Medici family have now been acquired by the Italian Government. Some great museums, like the Vatican in Rome, still remain private property, while open in a measure free to the public. Some, like our American museums, mostly established during the past half-century, are the property of corporations created for the purpose."—B. I. Gilman, *Museum ideals of purpose and method*, p. 383.—"The character of the buildings which, as time went on, were here and there erected to house these collections of priceless originals, was determined by several factors. As most of the collections had found their first homes in the palaces of rulers or members of the nobility, it was quite naturally concluded that their new homes should be also in the style of the local palace or royal residence. As the things collected were objects of art, it seemed obvious that they should be housed in artistic buildings, and as for several centuries it has been difficult for architects or those having power over art collections to conceive of an artistic building save in terms of Greek or Renaissance architecture, nearly all special museum buildings imitated either the Greek temple or the Italian palace. In Europe, therefore, we find museums to be either old buildings of the loyal palace type or later constructions copying the palace or the Greek temple, containing priceless originals in all lines of art, craftsmanship and archæology, arranged as the characters of the several buildings compel. . . . The prevalence of the European idea of a museum determined not only the character of our museum buildings, but also their

location. As they must be works of art, and as only those buildings which took the form of temples and palaces could be considered works of art, and as temples and palaces need open space about them to display their excellence, and as space in the centers of towns is quite expensive, donors, architects, trustees and city fathers all agreed that the art museum building should be set apart from the city proper, preferably in a part with open space about it."—J. C. Dana, *Gloom of the museum*, pp. 11-13.—"There is imposed upon museums of the fine arts by the nature of their contents an obligation paramount to the duty of public instruction incumbent on all museums, . . . namely, to promote public appreciation of certain visible and tangible creations through which the fancy of man has bidden his sense follow its flight. . . . An art museum is a selection of objects adapted to impress; a scientific or technical museum is a selection of objects adapted to instruct. . . . Art is an end, education a means to an end. The office of an art museum is one which is warranted in itself; that of an educational museum is one whose fruits are its warrant. . . . Thus neither in scope nor in value is the purpose of an art museum a pedagogic one. An institution devoted to the preservation and exhibition of works of the fine arts is not an educational institution, either in essence or in its claims to consideration. . . . In their chief function, it is theirs to gather up the art of the past, whose public no longer exists, and offer hospitality to the art of foreign lands, whose public is another than ours. They are instrumentalities by which civilization provides that neither shall antique art be lost, nor exotic art be non-existent to us. The distinctive purpose of an art museum may be precisely defined as the aim to bring about that perfect contemplation of the works of art it preserves which is implied in their production and forms their consummation. . . . While museums of other kinds are at bottom educational institutions, a museum of fine art is not didactic but æsthetic in primary purpose, although formative in its influence, and both admitting of and profiting by a secondary pedagogical use. The true conception of an art museum is not that of an educational institution having art for its teaching material, but that of an artistic institution with educational uses and demands."—B. I. Gilman, *Museum ideals of purpose and method*, pp. 80-08.

"The educational value of museums is recognised by all universities, inasmuch as every department, where possible, has its museum to enable the student to see the things and realise sensually the qualities described in lessons or lectures—in short, to learn what cannot be learned by words. But the 'Teaching Museums' of a university are very different in character from Public Museums. In the first place the *clientèle* is altogether different. The university student comes to his museum primed with the teaching of the classroom, and inspired to acquire knowledge from what may be seen there. There is not the necessity for special preparation to attract the interest, or even to preserve the life-like characters of specimens."—*Proceedings and transactions of the Liverpool Biological Society*, v. 32, 1917-1918, pp. 3-4.—See also EDUCATION, ART: United States: Museums used for art education.

The following is a selected list of art galleries and museums in various parts of the world:

Argentina, Buenos Aires.—Museo Nacional de Bellas Artes.

Australia.—National Gallery, Melbourne.

Austria.—Art-history Museum, Gallery of Paint-

ings, Lichtenstein Gallery and Imperial Museum, Vienna (q.v.).

Belgium.—Galleries of old and modern pictures in the Royal Museums, Brussels.

Brazil, Rio de Janeiro.—Eschola Nacional de Bellas Artes.

China.—Peking Imperial Museum in Peking.

Denmark.—Art Museum at Copenhagen.

Egypt.—Musée Gréco-Romain at Alexandria, and Museum of Egyptian Antiquities and National Museum of Arab Art at Cairo.

France.—Louvre (q.v.), Musée du Luxembourg, Musée de Cluny and Musée Carnavalet (see CARNAVALET, MUSÉE), Paris, and Musée Nationale at Versailles. Musées des Départements that have shown positive evidence of growth during the last quarter of a century are those of Amiens, Abbéville, Boulogne-sur-mer, Clermont, Douai, Lille, Poitiers, Saint-Quentin, Senlis and Valenciennes.

Germany.—Old and New Museums and National Gallery at Berlin, the Royal Gallery of Paintings at Dresden (see DRESDEN MUSEUM), and the Glyptothek and the Old and New Pinakothek at Munich (q.v.), Darmstadt Museum (q.v.).

Great Britain.—Museum and Art Gallery at Birmingham, the National Gallery and the Municipal Gallery of Modern Art at Dublin (see DUBLIN MUSEUM), the National Gallery of Scotland at Edinburgh, the Art Gallery and Museum at Glasgow (see GLASGOW MUSEUM), the Walker Art Gallery at Liverpool, the Ashmolean Museum, Oxford (q.v.), the Ruskin Museum at Sheffield, and the following in London: National Gallery, National Portrait Gallery, National Gallery of British Art (formerly the Tate), Victoria and Albert Museum (q.v.) (formerly South Kensington Museum), British Museum (q.v.), and Wallace Collection.

Greece.—National Museum at Athens.

Holland.—Koninklyk Kabinet van Schilderyen and Municipal Museum at The Hague and Ryks Museum at Amsterdam (q.v.).

India.—The Indian Museum at Calcutta.

Italy.—The Accademia di Belle Arti, the Uffizi, the Pitti Palace and the Bargello, at Florence, the Brera at Milan, the Museo Nazionale at Naples (q.v.), Museo Nazionale at Florence (q.v.), the Vatican (q.v.), the Capitoline, the Borghese and the Doria at Rome, and the Accademia ed Istituto di Belle Arti at Venice.

Japan.—The Imperial Museums In Tokio, in Kioto, and in Nara.

Mexico, Mexico City.—Museo de Arte de Academia de Ciencias.

Peru, Lima.—Gallery of Paintings in the Museo de Historia Natural, Palacio de la Exposición.

Portugal.—Museo Nacional de Antiga and Museu Nacional de Arte Contemporanea at Lisbon.

Russia.—The Hermitage (q.v.) and the Russian Museum of Alexander III at Petrograd.

Spain.—Museo del Prado (see PRADO, MUSEO DEL) and Academia de Bellas Artes at Madrid, the Casa Greca at Toledo, and the Palacio de Bellas Artes at Barcelona, Museo de Artilleria.

Sweden.—National Museum at Stockholm.

United States and Canada.—Art Institute of Chicago (q.v.); Brooklyn Institute of Arts and Science; Hispanic Society of America, Metropolitan Museum of Art (q.v.), and Public Library (paintings and prints department), New York City [see also NEW YORK CITY: 1870-1921]; Carnegie Institute, Pittsburgh; Museum of Fine Arts, Boston; The National Gallery of Canada (Ottawa); Corcoran Gallery of Art, Washington, D. C.

ART INSTITUTE, Chicago.—"From an art school founded in 1866 rose the Chicago Academy

of Design, which until 1882 was the only notable art center of the city. In 1879 it was organized anew as the Chicago Academy of Fine Arts, and incorporated by the State 'for the founding and maintenance of schools of art and design, the formation and exhibition of collections of objects of art, and the cultivation and extension of the arts of design, by appropriate means.' In 1883 it was given its present name. First installed in rented rooms, the society obtained in 1882 and 1885 (obliquely across from its present home) a large piece of ground, upon a part of which it built, but in 1886 it erected there a fine museum, 100 feet long and 87 feet wide, of a Romanesque style, after plans of J. W. Root. As this soon became too small it was in 1892 sold for \$400,000 to the Chicago Club in order that there might be erected in 1893 the present spacious building, near the edge of the lake, in the extensive Lake Front Park. . . . The Chicago Exposition in 1893 needed a building for holding congresses, and by mutual agreement with the art institute this one was built upon a site belonging to the city, on the lake front, near the busiest section. The exposition paid \$200,000, the art institute \$500,000, and the city gave the site, 425 feet long, on the broad Michigan avenue under the condition that the property rights in the building should belong to it, but that the art institute should occupy it rent free, so long as they use it for its present purposes. The art institute therefore presented it to the city. . . . The Art Institute is entirely independent and obtains no support from the city, to say nothing of the State, except that the city, as already mentioned, gave the ground for a site, in exchange for which it obtained the property right of the building. The yearly expenditure for 1899-1900 was about \$90,000 the art school costing \$38,000, which was, however, wholly repaid by the pupils. . . . At the head of the institute is a board of trustees of 23 persons, who from their number select a president and a vice-president, as well as an executive committee of seven and an art committee of five members."—A. B. Meyer, *Studies of the museums and kindred institutions of New York City, Albany, Buffalo and Chicago*, pp. 442-447.

"The museum has collections of paintings, especially Dutch, Flemish, French, and American; Egyptian and classical antiquities; about 1,400 casts of sculpture of all periods, including architectural sculpture; prints, including very fine collections of etchings by Méryon, Whistler, and Zorn; modern medals and plaquettes; ceramics, notably old Wedgwood and other English wares; textiles, furniture, and other examples of industrial art. Two organizations exist for the purpose of adding to the collections—the Antiquarian Society and the Friends of American Art. Besides the permanent exhibitions there are held annually more than 40 diverse temporary exhibitions, foreign as well as American. . . . 2,200 students are included in the day, night, Saturday juvenile classes in drawing, painting, sculpture, design, illustration, architecture, and normal instruction, and Summer School. Forty teachers including visiting instructors compose the regular faculty. [See ART EDUCATION.] The Ryerson Library of Art and the Burnham Library of Architecture have 16,000 volumes, 46,000 photographs, and 20,000 lantern slides. The Extension Department, in existence since November 1916, has carried exhibitions of modern American painting to forty or fifty cities; has conducted art institutes of three to five days' duration in these cities, and has provided lectures and assisted in the organization of local exhibitions in many cities of the

Middle Western states."—*Year's art 1920*, pp. 238-239.—See also PAINTING: Modern: American.

ART MUSEUMS. See ART GALLERIES AND MUSEUMS.

ART SCHOOLS. See EDUCATION, ART; AMERICAN ACADEMY IN ROME; ART INSTITUTE, Chicago.

ARTABA, ancient Persian dry measure. See EPHAH.

ARTAGUETTE (d. 1736), French military leader under Bienville; became colonial governor of Louisiana during which period he engaged in wars against the Chickasaw Indians. See LOUISIANA: 1719-1750.

ARTAPHERNES.—Persian satrap of Sardis. Took prominent part in suppressing the Ionian revolt. (See GREECE: B. C. 500-493: Rising of Ionians.) His son, of the same name, together with Datis, commanded the expedition sent by Darius against Athens and Eretria for their share in this revolt. The expedition was defeated at Marathon. See GREECE: B. C. 490.

ARTAXATA, the ancient capital of Armenia, said to have been built under the superintendence of Hannibal, while a refugee in Armenia. At a later time it was called Neronia, in honor of the Roman Emperor Nero.

Siege of. See ROME: Republic: B. C. 78-68.

ARTAXERXES, the name of three ancient Persian kings of the Achæmanian dynasty.

Artaxerxes I (Longimanus), reigned 465-425 B. C. See ATHENS: B. C. 460-455; PERSIA: B. C. 486-405.

Artaxerxes II (Mnemon), ruled from 404 to 359 B. C. (See PERSIA: B. C. 486-405 and 401-400.) Persian supremacy in Greece was proclaimed at the Peace of Antalcidas (see GREECE: B. C. 399-387); but the last years marked the weakening and disintegration of his kingdom.

Artaxerxes III (Ochus), King of Persia, 359-338 B. C. A cruel and despotic ruler; subjugated Egypt about 343 B. C. and gave his support to Perinthus and Byzantium (340 B. C.) against Philip of Macedon.

The same name was also borne by the founder and two other rulers of the Sassanid dynasty, though they are generally known as Ardashir or Ardshir. See PERSIA: B. C. 150-A. D. 226; and SASSANIAN DYNASTY.

ARTEMIS, a Greek divinity known among the Romans as Diana, the protectress of young men and maidens, the goddess of chastity, of nature and of the hunt, and later regarded as the moon-goddess. She has many symbols in art, notably the hind, the bear, the bow and arrow, the torch, and the crescent. There are beautiful representations of her on the coins of Arcadia, Aetolia, Crete and Sicily; her most famous statue, the Diana of Versailles, is now in the Louvre.

Temple of. See TEMPLES: Stage of culture represented by temple architecture.

ARTEMISIA.—(1) Sister and wife of Mausolus, king of Caria, whom she followed as ruler, 353-350 B. C. Built the famous Mausoleum in Halicarnassus in honor of her husband. (See CARIANS.) (2) A queen of Halicarnassus and Cos (c. 480 B. C.); fought at the battle of Salamis (see GREECE: B. C. 480: Persian Wars) on the side of Xerxes against the Greeks. She became a mythological heroine.

ARTEMISIUM, a promontory in the north-west coast of Euboea. The Greeks, under Eurybiades, won a naval battle against the Persians off the point (480 B. C.). See GREECE: B. C. 480: Persian Wars: Artemisium; also Map of ancient Greece.

ARTEMITA, city in Assyria. See DASTAGERD.

ARTEVELDE, Jacques van (1290-1345), a Flemish leader of the fourteenth century who was successful in repulsing the Count of Flanders, a French vassel, and was instrumental in forming a league between Ghent, Bruges and Ypres which later made a treaty with Edward III of England. He was killed in 1345 during an uprising of the populace.—See also **FLANDERS**: 1335-1337; 1345.

ARTEVELDE, Philip van (about 1340-1382), a son of Jacques van Artevelde. He lost his life in the battle of Roosebeke in which he led the Flemings against the French army under Charles VI.—See also **FLANDERS**: 1382.

ARTHUR, King, and Knights of the Round Table. See **ARTHURIAN LEGEND**; and **CUMBRIA**.

ARTHUR, Chester Alan (1830-1886), the twenty-first president (Republican) of the United States; appointed collector of the port of New York in 1871 by President Grant; in 1880 was Garfield's running mate for vice-presidency and subsequently elected; succeeded Garfield (who died on September 19) as president in 1881 and remained in office until 1885.—See also **CIVIL SERVICE REFORM**: United States; **TARIFF**: 1883; **U. S. A.**: 1880: Twenty-fourth presidential election; 1881; 1881-1885.

ARTHURIAN CYCLE. See **ARTHURIAN LEGEND**.

ARTHURIAN LEGEND.—An early medieval romance of Britain, laid in the latter part of the fifth, and first quarter of the sixth, centuries. The story concerns a semi-mythical hero, King Arthur. "On the difficult question, whether there was a historical Arthur or not, . . . a word or two must now be devoted . . . ; and here one has to notice in the first place that Welsh literature never calls Arthur a gwledig or prince but emperor, and it may be inferred that his historical position, in case he had such a position, was that of one filling, after the departure of the Romans, the office which under them was that of the Comes Britanniae or Count of Britain. The officer so called had a roving commission to defend the Province wherever his presence might be called for. The other military captains here were the Dux Britanniarum, who had charge of the forces in the north and especially on the Wall, and the Comes Littoris Saxonici [Count of the Saxon Shore], who was entrusted with the defence of the south-eastern coast of the island. The successors of both these captains seem to have been called in Welsh gwledigs or princes. So Arthur's suggested position as Comes Britanniae would be in a sense superior to theirs, which harmonizes with his being called emperor and not gwledig. The Welsh have borrowed the Latin title of emperor, 'emperor,' and made it into 'amherawdyr,' later 'amherawdwr,' so it is not impossible, that when the Roman emperor ceased to have anything more to say to this country, the title was given to the highest officer in the island, namely the Comes Britanniae, and that in the words 'Yr Amherawdyr Arthur,' 'the Emperor Arthur,' we have a remnant of our insular history. If this view be correct, it might be regarded as something more than an accident that Arthur's position relatively to that of the other Brythonic princes of his time is exactly given by Nennius, or whoever it was that wrote the *Historia Brittonum* ascribed to him: there Arthur is represented fighting in company with the kings of the Brythons in defence of their common country, he being their leader in war. If, as has sometimes been argued, the uncle of Maglocunus or Maelgwn, whom the latter is accused by Gilda of having slain and superseded, was no other than Arthur, it would supply one reason why that writer called Maelgwn 'insularis draco,' 'the dragon or

war-captain of the island,' and why the latter and his successors after him were called by the Welsh not gwledigs but kings, though their great ancestor Cuneda was only a gwledig. On the other hand the way in which Gilda alludes to the uncle of Maelgwn without even giving his name, would seem to suggest that in his estimation at least he was no more illustrious than his predecessors in the position which he held, whatever that may have been. How then did Arthur become famous above them, and how came he to be the subject of so much story and romance? The answer, in short, which one has to give to this hard question must be to the effect, that besides a historic Arthur there was a Brythonic divinity named Arthur, after whom the man may have been called, or with whose name his, in case it was of a different origin, may have become identical in sound owing to an accident of speech; for both explanations are possible, as we shall attempt to show later. Leaving aside for a while the man Arthur, and assuming the existence of a god of that name, let us see what could be made of him. Mythologically speaking he would probably have to be regarded as a Culture Hero; for, a model king and the institutor of the Knighthood of the Round Table, he is represented as the leader of expeditions to the isles of Hades, and as one who stood in somewhat the same kind of relation to Gwalchmei as Gwydion did to Lleu. It is needless here to dwell on the character usually given to Arthur as a ruler: he with his knights around him may be compared to Conchobar, in the midst of the Champions of Emain Macha, or Woden among the Anses at Valhalla, while Arthur's Knights are called those of the Round Table, around which they are described as sitting; and it would be interesting to understand the signification of the term Round Table. On the whole it is the table, probably, and not its roundness that is the fact to which to call attention, as it possibly means that Arthur's court was the first early court where those present sat at a table at all in Britain. No such thing as a common table figures at Conchobar's court or any other described in the old legends of Ireland, and the same applies, we believe, to those of the old Norsemen. The attribution to Arthur of the first use of a common table would fit in well with the character of a Culture Hero which we have ventured to ascribe to him, and it derives countenance from the pretended history of the Round Table; for the Arthurian legend traces it back to Arthur's father, Uthr Bendragon, in whom we have under one of his many names the king of Hades, the realm whence all culture was fabled to have been derived. In a wider sense the Round Table possibly signified plenty or abundance, and might be compared with the table of the Ethiopians, at which Zeus and the other gods of Greek mythology used to feast from time to time."—J. Rhys, *Studies in the Arthurian legend*, ch. I.—See also **CUMBRIA**.

Historical basis.—The simple ungarlished story of Arthur's birth, as set forth in Welsh tradition, is as follows: "Uter Pendragon, son of Cystennyn Vendigaïd or 'Constantine the Blessed,' King of Britain, falls in love with Eigyr, wife of Gorlais, Duke of Cornwall, and by a subtlety gains access to her and begets Arthur. Besides Uter Pendragon, Constantine had two older sons. The eldest Constans, a Monk, was of weak intellect, but nevertheless upon his father's death succeeded to the British throne, and was shortly afterwards murdered at the instigation of Vortigern, who thereupon became King of Britain. The second son was one Emrys Wledig, or Ambrosius

Aurelianus, who revenged his brother's death by overthrowing Vortigern, and was elected King of Britain in his stead. Upon the death of Ambrosius Aurelianus, Uter Pendragon, the third son, succeeded to the British throne. So much for the Welsh tradition. The first historian of any repute to mention Arthur is Nennius, who wrote his *British History* circa 796. He calls him *Artur Mab Uter*, which means 'Arthur, son of Uther,' and he states that as '*Dux bellorum cum regibus Britonum*,' he led the British forces victoriously twelve times against the Saxons. The twelfth and last battle of this series was Badon Mount. . . . *The Anglo Saxon Chronicle* gives the date of the landing of the Saxons as circa 449, so the battle of Badon Mount would take place circa 493. . . . Taking the two statements of Gildas and Nennius it seems to me that we are justified in saying that Arthur was a descendant of Ambrosius Aurelianus. The statement in Gildas that Ambrosius was the last of his race left alive [in his own generation, must be understood, as he left '*soboles*' or 'issue'], altogether upsets the Welsh tradition that his younger brother Uther Pendragon succeeded him upon the throne. . . . There can be little doubt but that Geoffrey of Monmouth, king of imaginative historians, is responsible for this splitting up of one man into two, and this is somewhat indicated by the complete failure of his imagination to deal with them; he states that both Ambrosius and Uther were poisoned, and buries them both at Stonehenge, which is a very tame effort on his part. So I would suggest that King Arthur was the son of the 'victorious commander-in-chief,' in British, 'Uther Pendragon,' whose name, Latinized, was, 'Ambrosius Aurelianus,' or, in British, 'Emrys Wledig.' . . . Although a Briton by descent, with such progenitors, he must have been in cultivation and at heart a Roman. His grandfather and great grandfather Constantine the Blessed and Maximus, held their courts in Gaul. His father Ambrosius Aurelianus would have no time for courtly functions, as he must have been fully employed fighting against the enemies of his country; not only had he to keep in check the Saxon invasion and the inroads of the Picts and Scots, but also to fight against and overthrow the de-based British rule under Vortigern. To Arthur alone of this line of Romano-British warriors and kings did the opportunity arise of holding court in Britain. After the battle of Badon Mount A. D. 493, comparative peace reigned in the island for a considerable period. [See also ENGLAND: 449-473 to 547-633]. Then it would be that Arthur settled down to social life, and we may be sure that, with his Roman education and tastes, his court must have been a surprise indeed to the rough untutored British kings and chieftains, his immediate followers. We get a glimpse of the civilization of this period in the ruins, now being excavated, of the Romano-British city of Silchester. Arthur, no doubt, had accumulated great wealth in the only way in which wealth could be amassed in those days, by the power of the sword, and his court would therefore be surrounded with all the luxuries of the then modern Roman civilization."—A. S. Scott-Gatty, (*Genealogist*, n. s. v. 18, pp. 209-216).

Sources and growth of the legend.—Composite nationality.—"At present there are two conflicting views on the question. Professor Zimmer, Professor Foerster, and others—mostly German scholars—have thought that the chief source of the Arthurian romances and pseudo-chronicles was continental. The kernel, at least, was Celtic; and it began to germinate in Brittany, where it

had been carried from Britain in the great migration of southwestern Cymri in the second half of the sixth century. From Brittany, after taking on various legendary additions, the Arthur-story spread to the Normans; and from them over all northern France. On its native heath, however, the Arthurian hero-story remained comparatively undeveloped; there it got but little beyond the stage at which it appears in Nennius. . . . While the writers holding this view are inclined to minimize the Celtic element in the Arthurian romances, they differ considerably as to its importance. Professor Zimmer, for instance, sees a great deal that is Celtic. He seems to think that the romances of Chrétien de Troies, the greatest of the early French Arthurian writers, have substantially the same relation to the original Celtic tales as Shakespeare's plays to those 'novels' which gave him so much dramatic material. Professor Foerster, on the other hand, sees much less that is Celtic; and some scholars would see little more of a Celtic element than a few names of people and of places. The Arthurian romances, they hold, came almost wholly from general European folklore, and from the invention of French writers, conscious literary artists, especially of Chrétien de Troies. [See also FRENCH LITERATURE: 1050-1350.] Professor Gaston Paris and other scholars—French, English and American—have held a different view. They think that the French gave literary finish to the Arthurian stories, but little else. Incidents, often plots, sometimes even the spirit of a romance, they regard as Celtic. The stories took shape, they think, not so much among the northern French as among the Anglo-Normans, that is, in England. Before the conquest, the Saxons had got the stories to some extent from the Welsh, among whom the stories were fairly well developed; and the Saxons gave them to the Normans. . . . The antecedent probability seems to be that there is truth in both theories; there is no reason why a story should not flourish in the land in which it was born and in that to which it has been transported. . . . The forms of many proper names in Round Table romances of the twelfth century point to a Breton rather than a Welsh origin. The only way to explain Arthurian proper names in the south of Italy at the beginning of this century, is that the Arthurian stories were carried there by the Normans who conquered Sicily about the middle of the preceding century. The conclusion seems inevitable, therefore, that the Normans knew Arthur and his knights before they went to England, where the legend of the hero had had independent growth. . . . Not all the Celtic material in Arthurian legends came from the Britons; some of it came from the Irish. The more medieval literature is studied, the more it becomes evident that Ireland had considerable influence in shaping the Round Table stories. . . . Irish influence on the Arthurian legends appears in many proper names. Even Arthur's sword, the famous Excalibur, seems to have come from Ireland. . . . Stray incidents, too, of Arthurian romance are paralleled in Irish story. The hideous damsels that Perceval meets in the Grail romances, some of whom, apparently, can change at will into creatures of radiant beauty, are the counterparts of Irish hags who are resplendent fairies in disguise. And, finally, several whole stories connected with Arthur appear to have come from Irish sources. That excellent story of the Green Knight; the tale, likewise, of the knight who was changed into a were-wolf; and the story of the Marriage of Sir Gawain . . . all these are manifestly of Irish origin. So now we have some idea

of the popular beginnings of the Arthurian legends. The historical hero, a semi-barbarous British warrior, became a romantic hero through the tendency of human nature to fasten stories to noted characters. Once he had attracted a few stories to himself, he attracted tales more and more marvellous. As the hero-story went on growing, it attracted popular material of all kinds. . . . Thus on both sides of the British Channel, but probably more in the British Isles than on the Continent, there grew up a conglomerate mass of romantic material, which has given us the stories of Arthur as we know them."—H. Maynadier, *Arthur of the English poets*, pp. 43-49.

Reflex of Age of Chivalry.—Poetic expansion of the legend.—"One of the strangest phenomena in the history of literature is the outburst of Arthurian romance in the second half of the twelfth century. A few years suffice to lift the hero of obscure and half-subjugated tribes into unrivalled popularity and fame, and the exploits of his followers, a little while before unknown to the world at large, become all at once the engrossing topic for the imagination of Europe. Whatever circumstances may have contributed to this sudden success, it cannot be fully explained save by supposing that the new matter was exceptionally suitable to the spirit of the time. It must have met a deep-felt want, and shown itself capable of receiving the stamp of the medieval spirit and expressing the medieval modes of life and thought more perfectly, than any previous theme. And in the history of the typical and international fiction of the Middle Ages there are indications that this was the case. The imaginative activity of these centuries seems to attempt the satisfaction of certain spiritual demands, but till the Arthurian stories become available, the attempt has only partial success. . . . Now the ideals that swayed the higher classes in those days were almost summed up in what is styled Chivalry. It would be wrong to call the romances chivalrous, for only one group of them fully answers this description; but, at least, they are all of chivalrous tendency and aim at embodying its conceptions. And these conceptions were essentially ideals. It has once and again been shown that there never was an actual age of chivalry, and that when in later times people tried, as they thought, to restore it, they were attempting to import into practical life what was in truth a minstrel's dream. Nevertheless, as it was a dream that flitted before the eyes of many generations, it was in its way a very substantial reality. There never was a time when the feudal knights were exactly knights errant, but there was a time when the best of them wished that they might be such, eagerly attaching themselves to any hazardous enterprise that had been set on foot for more politic objects; and that time was practically over when the semblances and outward trappings of knighthood were most in vogue for spectacle and pageantry. The real meaning of chivalry lay deeper. It had arisen as a kind of compromise between the ascetic theology of the medieval church and the unsanctified life of the world which that church rejected as wholly bad. . . . Faithful service, unselfish virtue, chaste constancy in love, are celebrated in several popular poems especially of England and Germany, which are all more modern, though more rude in feeling, than the international romances. But for that very reason they are less representatively medieval. But the adaptation of lay ethics to clerical ethics was the problem of the higher classes, and its solution was found in chivalry. The transition from the primitive to the medieval

state of things is marked by the picturesque trait, that the hero becomes a knight. This short statement implies a very important change, which is symbolised in the complicated ceremonies of knightly investiture, very different from the few simple rites that used to accompany the Teutonic youth's assumption of arms. . . . The principle of honour is introduced, which appeals to the individual's desire for pre-eminence and mastery, but which gratifies it only if he submit to a certain code of conditions. His valour must be carried to an extravagant pitch; he must seek out adventures, and face the greatest odds; he must refuse advantages and show mercy to the suppliant and courtesy to all: his quarrel must be just, and he must succour the poor and the distressed. Far removed is the knight from the old heathen who fought and fled, waylaid and slew, precisely as it pleased himself. And in the third place, while only some of the knightly orders were pledged to celibacy, they were all bound to uphold the honour of women; and gradually, without oath, they submitted themselves to that strange kind of gallantry known as the Service of Love, which at this distance of time strikes one almost as the most obvious feature of the chivalrous character. . . . Arthur's story, congenial in all essential respects to the spirit of the day but without the rigidity of a fixed historical tradition, was still plastic in the hands of the medieval poets and lent itself to all their desires. His exploits and feats could be made to reflect the adventurousness, the sense of honour, the *courtoisie* in love which were the dream of knighthood in the twelfth century. There were only two limitations to the perfect adequacy of the material. In the first place no single person could completely exhaust the possibilities of chivalry (q. v.); the biography of Arthur was insufficient to portray its whole fulness and wealth, and though it might fulfil the requirements in little, it could not bring out the various developments of the one scheme. Arthur's career invited supplements from the careers of his followers. . . . But in the second place, these personages were in some ways ever more suitable for chivalrous treatment than their chief. For they were knights while he was king. His exploits were necessarily on the large public scale, while they had leisure for the private adventures of errantry. They offered themselves for the illumination of the knightly character in the individual, which was the more important side, in all its various aspects. It was natural, therefore, that medieval poetry should occupy itself with them rather than with the king. To make room for them he is thrust aside, as Charlemagne had been by the peers, and his historical significance is altogether forgotten."—M. W. Macalium, *Tennyson, Idylls of the King and Arthurian story from the sixteenth century*, pp. 36-52.—See also CHIVALRY.

"In order to form a true estimate of the subject, we must never lose sight of the fact that the Anglo-Norman romancers set themselves the task of drawing, not simply a series of separate tales, but a connected epic cyclus. Consistency and unity were to them, therefore, the very soul of their labours. What Arthur was as a simple squire in Sir Hector's Cornish castle, that must he be as the dying hero of Camlan, modified only by such changes of character as the circumstances of his life would naturally bring about. He must be drawn in accordance with twelfth century notions, idealised, as matter of necessity, since he was the hero of a romance, but, nevertheless, a being with all the passions and failings of humanity clinging to him. He must not, in word,

thought, or deed, contradict the majestic movement of the story, whether with respect to the Grail Quest or the working out of the tragic curse. He must be true King, true knight, true warrior, true husband, true man; and yet, withal, true to the honest failings as well as to the noblest aspirations of poor, frail humanity. If Lancelot is the ideal of earthly knighthood, Galahad of earthly purity, Merlin of worldly wisdom, Elaine and Vivienne of human love; so Arthur must be the ideal *King*, surpassing neither Lancelot in knighthood, Galahad in purity, Elaine in love, nor Merlin in wisdom; but surpassing all his knights in kingly character. And we hold that this delicate balance has been maintained in the narrative of the Norman trouvères. In the Anglo-Norman version of the epic there is a curse that dogs the whole life of King Arthur, and which stands out as one of the grand projections of the picture; an idea too vast to have had its birth in the imagination of one man; a dark, overhanging shadow, doubtless cast by some national tradition of a terrible disaster. This tragic element was seized upon by the Norman romancer and worked into the legend. Following older traditions, Map [or Mapes, medieval author, d. 1208] had to bring about the fall of the King, in a final battle, the utter ruin and desolation of which required the richest imagination to scheme and the broadest genius to depict. It was to be the *finale* of a knightly epoch; the closing scene of a curse; the death of King and knights at the hands of an abandoned and traitorous wretch. How could the Norman romancer heighten the colouring of the picture more effectively than by adopting the story already in existence, and depicting the wretch whose hands were to be stained with the blood of his sovereign, as the natural offspring of the monarch? And if, in addition, this miscreant should be painted not only as a natural son, but as the result of a terrible sin, an incest, on the part of the King himself, what could possibly be wanting to render the ending, in the highest degree, tragic? But the deadly sin of incest must be unwittingly committed, else the King would be a villain. And all this is duly carried out by the Norman romancer. To draw Arthur as Tennyson does, 'Blameless King and stainless man,' or 'selfless man and stainless gentleman,' is to eliminate the curse, the tragic element from the romance, and destroy the most appalling, and at the same time the most telling part of the narrative. A 'blameless' king, whether of the sixth, twelfth or nineteenth century, is unthinkable. Even Tennyson himself tells us: 'He is all fault who is no fault at all.' To make Arthur 'blameless' and 'stainless' is to confound two distinct personages, Galahad and Arthur, and by so doing, to destroy the perfection of the epic."—S. H. Gurnee. *Arthurian epic*, pp. 328-331.

ARTS AND CRAFTS MOVEMENT.—"In the preface to the Catalogue of the Arts and Crafts Exhibition at Copley Hall, Boston, in 1907, it is written: 'The Arts-and-Crafts movement is founded on the belief that the objects of daily use are just as capable in their lesser degree, of being made the vehicles of artistic expression and thus of being works of art, as are the works of painting or of sculpture. If they are to be so, it is clear that they must be the work of men and women who in their degree are artists, and that they must thus be made by the hand of the artist himself.'"—C. Peabody, *Arts and crafts movement (American Anthropologist, v. 9, p. 437, New Series)*.

—The arts and crafts movement, as a conscious development of modern art, is to be attributed largely to William Morris and the others of the pre-Raphaelite group; although Ruskin's emphasis on the same points was also influential. [See **English literature**.] The first Arts and Crafts Society in America was organized in Boston in 1897. About 1900 the German government, after a systematic study of English organizations and methods, founded the German "Werkbund." Although more or less interrupted by the war, the movement has increased steadily in influence and popular interest throughout Europe and America. It is everywhere characterized by a return to the comparatively spontaneous and unconscious art of the medieval, oriental, or primitive craftsman, as a guide to technique and a source of artistic inspiration. "The movement, indeed, represents in some sense a revolt against the hard mechanical conventional life and its insensibility to beauty (quite another thing to ornament). [See **Art**.] It is a protest against that so-called industrial progress which produces shoddy wares, the cheapness of which is paid for by the lives of their producers and the degradation of their users. It is a protest against the turning of men into machines, against artificial distinctions in art, and against making the immediate market value, or possibility of profit, the chief test of artistic merit.

... It asserts, moreover, the value of the practice of handicraft as a good training for the faculties, and as a most valuable counteraction to that overstraining of the purely mental effort under the fierce competitive conditions of the day; apart from the very wholesome and real pleasure in the fashioning of a thing with claims to art and beauty, the struggle with the triumph over the stubborn technical necessities which refuse to be gainsaid."—W. Crane, *Arts and crafts essays*, pp. 12-14.—"To give people pleasure in the things they must perform use, that is one great office of decoration; to give people pleasure in the things they must perform make, that is the other use of it."—W. Morris, *Hopes and fears for art*, p. 4.

ARYA SAMAJ (Society of the Noble), was founded in India, 1875, by Mul Sankar, better known as Swami Dayanand Sarasvati, who was born as a member of the Shiva cult, broke away from it for the Vedanta philosophy, and finally became a religious reformer on the basis of the Sankhya-Yoga philosophies. (See also INDIA: Aboriginal Inhabitants). Dayanand Sarasvati had come in contact with modern civilization through many channels, and endeavored to reform Hinduism to meet the conditions of modern life. He taught belief in a personal God, who is all-truth, all-knowledge, incorporeal, almighty, just, merciful, unbegotten, unchangeable, all-pervading, and the cause of the universe. "The Vedas are the books of true knowledge; one should always be ready to accept truth; all ought to be treated with love, justice, and in disregard of their merits; ignorance should be dispelled; and everyone should regard his prosperity as included in that of others. His great cry was 'back to the Vedas.'" [See also INDIA: Immigration and Conquest.] He professed to derive all his teaching from them, but the method of interpretation by which he extracted the true doctrine and put aside all that contradicted it was peculiarly his own. It conformed neither to Hindu canons of interpretation nor to those of scientific exegesis. According to him salvation was to be accomplished by effort. No distinctions of caste are regarded valid. It is estimated that the adherents of the Arya Samaj now [1917] number about 100,000. The Samaj is now divided into a 'cultured' and a conservative party. The former eats meat and fosters modern education, maintaining a creditable

college at Lahore; the latter is vegetarian, and adheres to the ancient ideas of education."—G. A. Barton, *Religions of the world*, pp. 198-199.—"Originally it was a purely religious movement, based upon the teaching of the Vedas. It promotes the abolition of caste and idolatry, condemns early marriages, and permits the remarriage of widows. At the same time it is violently hostile to Christianity. There can be no question that large numbers of members of the Arya Samaj are only concerned with its spiritual side; but there can be equally no question that the organization, as a whole, has developed marked political tendencies subversive of British rule. . . . The members of the Samaj strenuously deny that their organization has a political side. The literature of the sect, and particularly the writings of their founder, who came from Kathiawar, show no trace of any interest in mundane politics. Dayanand was an enthusiast who denounced the idolatrous tendencies of modern Hinduism, and advocated a return to the earlier, purer faith. . . . Dayanand's clarion call of 'Back to the Vedas' produced a complete revulsion of feeling, and he made the Punjab a stronghold of the new creed. For that reason, the Arya Samaj is to this day the bitterest opponent of Christianity in India; and Punjab Mahomedans declare that it is also their most formidable foe."—*India correspondence of The London Times*.

ARYABHATTA, (c. 476), Hindu astronomer. See ALGEBRA.

ARYANS, or Aryas.—Meaning of term.—Theories of origin.—"This family (which is sometimes called Japhetic, or descendants of Japhet) includes the Hindus and Persians among Asiatic nations, and almost all the peoples of Europe. It may seem strange that we English should be related not only to the Germans and Dutch and Scandinavians, but to the Russians, French, Spanish, Romans and Greeks as well; stranger still that we can claim kinship with such distant peoples as the Persians and Hindus. . . . What seems actually to have been the case is this: In distant ages, somewhere about the rivers Oxus and Jaxartes, and on the north of that mountainous range called the Hindoo-Koosh, dwelt the ancestors of all the nations we have enumerated, forming at this time a single and united people, simple and primitive in their way of life, but yet having enough of a common national life to preserve a common language. They called themselves Aryas or Aryans, a word which, in its very earliest sense, seems to have meant those who move upwards, or straight; and hence, probably, came to stand for the noble race as compared with other races on whom, of course, they would look down. . . . As their numbers increased, the space wherein they dwelt became too small for them who had out of one formed many different peoples. Then began a series of migrations, in which the collection of tribes who spoke one language and formed one people started off to seek their fortune in new lands. . . . First among them, in all probability, started the Kelts or Celts, who, travelling perhaps to the South of the Caspian and the North of the Black Sea, found their way to Europe and spread far on to the extreme West. . . . Another of the great families who left the Aryan home was the Pelagic or the Græco-Italic. These, journeying along first Southwards and then to the West, passed through Asia Minor, on to the countries of Greece and Italy, and in time separated into those two great peoples, the Greeks (or Hellenes, as they came to call themselves), and the Romans. . . . Next we come to two other

great families of nations who seem to have taken the same route at first, and perhaps began their travels together as the Greeks and Romans did. These are the Teutons and the Slavs. . . . The word Slav comes from Slawan, which in old Slavonian meant to speak, and was given by the Slavonians to themselves as the people who could speak in opposition to other nations whom, as they were not able to understand them, they were pleased to consider as dumb. The Greek word barbaroi (whence our barbarians) arose in obedience to a like prejudice, only from an imitation of babbling such as is made by saying, 'bar-bar-bar.'—C. F. Keary, *Dawn of history* (1878), *ch.* 4.—The above passage sets forth the older theory of an Aryan family of nations as well as of languages in its unqualified form. Its later modifications are indicated in the following: "The discovery of Sanscrit and the further discovery to which it led, that the languages now variously known as Aryan, Aryanic, Indo-European, Indo-Germanic, Indo-Celtic and Japhetic are closely akin to one another, spread a spell over the world of thought which cannot be said to have yet wholly passed away. It was hastily argued from the kinship of their languages to the kinship of the nations that spoke them. . . . The question then arises as to the home of the 'holetnos,' or parent tribe, before its dispersion and during the protohnic period, at a time when as yet there was neither Greek nor Hindoo, neither Celt nor Teuton, but only an undifferentiated Aryan. Of course, the answer at first was—where could it have been but in the East. And at length the glottologist found it necessary to shift the cradle of the Aryan race to the neighbourhood of the Oxus and the Jaxartes, so as to place it somewhere between the Caspian Sea and the Himalayas. [See also INDIA: B. C. 2000-600.] Then Doctor Latham boldly raised his voice against the Asiatic theory altogether, and stated that he regarded the attempt to deduce the Aryans from Asia as resembling an attempt to derive the reptiles of this country from those of Ireland. Afterwards Benfey argued, from the presence in the vocabulary common to the Aryan languages of words for bear and wolf, for birch and beach, and the absence of certain others, such as those for lion, tiger and palm, that the original home of the Aryans must have been within the temperate zone in Europe. . . . As might be expected in the case of such a difficult question, those who are inclined to believe in the European origin of the Aryans are by no means agreed among themselves as to the spot to be fixed upon. Latham placed it east, or south-east of Lithuania, in Podolia, or Volhynia; Benfey had in view a district above the Black Sea and not far from the Caspian; Peschel fixed on the slopes of the Caucasus; Cuno on the great plain of Central Europe; Fligier on the southern part of Russia; Pösche on the tract between the Niemen and the Dnieper; L. Geiger on central and western Germany; and Penka on Scandinavia."—J. Rhys, *Race theories* (*New Princeton Review*, Jan., 1888).

Distribution.—Anthropological characteristics.—**Race relations.**—"For the last two thousand years, at least, the southern half of Scandinavia and the opposite or southern shores of the Baltic have been occupied by a race of mankind possessed of very definite characters. Typical specimens have tall and massive frames, fair complexions, blue eyes, and yellow or reddish hair—that is to say, they are pronounced blonds. Their skulls are long, in the sense that the breadth is usually less, often much less, than four-fifths of the length, and they are

usually tolerably high. But in this last respect they vary. Men of this blond, long-headed race abound from eastern Prussia to northern Belgium; they are met with in northern France and are common in some parts of our own islands. The people of Teutonic speech, Goths, Saxons, Alemanni, and Franks, who poured forth out of the regions bordering the North Sea and the Baltic, to the destruction of the Roman Empire, were men of this race; and the accounts of the ancient historians of the incursions of the Gauls into Italy and Greece, between the fifth and the second centuries B. C., leave little doubt that their herdes were largely, if not wholly, composed of similar men. The contents of numerous interments in southern Scandinavia prove that, as far back as archæology takes us into the so-called neolithic age, the great majority of the inhabitants had the same stature and cranial peculiarities as at present, though their bony fabric bears marks of somewhat greater ruggedness and savagery. There is no evidence that the country was occupied by men before the advent of these tall, blond long-heads. But there is proof of the presence, along with the latter, of a small percentage of people with broad skulls; that is, the breadth of which is more, often very much more, than four-fifths of the length. At the present day, in whatever direction we travel inland from the continental area occupied by the blond long-heads, whether south-west into central France; south, through the Walloon provinces of Belgium into eastern France; into Switzerland, South Germany, and the Tyrol; or south-east into Poland and Russia; or north, into Finland and Lapland, broad-heads make their appearance, in force, among the long-heads. And, eventually, we find ourselves among people who are as regularly broad-headed as the Swedes and North Germans are long-headed. As a general rule, in France, Belgium, Switzerland, and South Germany, the increase in the proportion of broad skulls is accompanied by the appearance of a larger and larger proportion of men of brunet complexion and of a lower stature; until, in central France and thence eastwards, through the Cevennes and the Alps of Dauphiny, Savoy, and Piedmont, to the western plains of North Italy, the *tall blond long-heads* practically disappear, and are replaced by *short brunet broad-heads*. The ordinary Savoyard may be described in terms the converse of those which apply to the ordinary Swede. He is short, swarthy, dark-eyed, dark-haired, and his skull is very broad. Between the two extreme types, the one seated on the shores of the North Sea and the Baltic, and the other on those of the Mediterranean, there are all sorts of intermediate forms, in which breadth of skull may be found in tall and in short blond men, and in tall brunet men. There is much reason to believe that the brunet broad-heads, now met with in central France and in the west central European highlands, have inhabited the same region, not only throughout the historical period, but long before it commenced; and it is probable that their area of occupation was formerly more extensive. For, if we leave aside the comparatively late incursions of the Asiatic races the centre of eruption of the invaders of the southern moiety of Europe has been situated in the north and west. In the case of the Teutonic inroads upon the Empire of Rome, it undoubtedly lay in the area now occupied by the blond long-heads; and, in that of the antecedent Gaulish invasions, the physical characters ascribed to the leading tribes point to the same conclusion. Whatever the causes which led to the breaking out of bounds of

the blond long-heads, in mass, at particular epochs, the natural increase in numbers of a vigorous and fertile race must always have impelled them to press upon their neighbours, and thereby afford abundant occasions for intermixture. If, at any given pre-historic time, we suppose the lowlands verging on the Baltic and the North Sea to have been inhabited by pure blond long-heads, while the central highlands were occupied by pure brunet short-heads, the two would certainly meet and intermix in course of time, in spite of the vast belt of dense forest which extended, almost uninterruptedly, from the Carpathians to the Ardennes; and the result would be such an irregular gradation of the one type into the other as we do, in fact, meet with. On the south-east, east, and north-east, throughout what was once the kingdom of Poland, and in Finland, the preponderance of broad-heads goes along with a wide prevalence of blond complexion and of good stature. In the extreme north, on the other hand, marked broad-headedness is combined with low stature, swarthyness, and more or less strongly Mongolian features, in the Lapps. And it is to be observed that this type prevails increasingly to the eastward, among the central Asiatic populations. The population of the British Islands, at the present time, offers the two extremes of the tall blond and the short brunet types. The tall blond long-heads resemble those of the continent; but our short brunet race is long-headed. Brunet broad-heads, such as those met with in the central European highlands, do not exist among us. . . . The short brunet long-heads are not peculiar to our islands. On the contrary, they abound in western France and in Spain, while they predominate in Sardinia, Corsica, and South Italy, and, it may be, occupied a much larger area in ancient times. Thus, in the region which has been under consideration, there are evidences of the existence of four races of men—(1) blond long-heads of tall stature, (2) brunet broad-heads of short stature, (3) mongoloid brunet broad-heads of short stature, (4) brunet long-heads of short stature. The regions in which these races appear with least admixture are—(1) Scandinavia, North Germany, and parts of the British Islands; (2) central France, the central European highlands, and Piedmont; (3) Arctic and eastern Europe, central Asia; (4) the western parts of the British Islands and of France, Spain, and South Italy. And the inhabitants of the localities which lie between these *foci* present the intermediate gradations, such as short blond long-heads, and tall brunet short-heads, and long-heads which might be expected to result from their intermixture. The evidence at present extant is consistent with the supposition that the blond long-heads, the brunet broad-heads, and the brunet long-heads have existed in Europe throughout historic times, and very far back into pre-historic times. There is no proof of any migration of Asiatics into Europe, west of the basin of the Dnieper, down to the time of Attila. On the contrary, the first great movements of the European population of which there is any conclusive evidence is that series of Gaulish invasions of the east and south, which ultimately extended from North Italy as far as Galatia in Asia Minor.—T. H. Huxley, *Man's place in nature* (1863), pp. 230-243.

“(a) It is held, on the one hand, that there is but a single blond race, type or stock (Keane, Lapouge, Sergi), and on the other hand that there are several such races or types, more or less distinct but presumably related (Deniker, Beddoe, and other, especially British, ethnologists). (b) There is no good body of evidence going to estab-

lish a great antiquity for the blond stock, and there are indications, though perhaps inconclusive, that the blond strain, including all the blond types, is of relatively late date—unless a Berber (Kabyle) blond race is to be accepted in a more unequivocal manner than hitherto. (c) Neither is there anything like convincing evidence that this blond strain has come from outside of Europe—except, again, for the equivocal Kabyle—or that any blond race has ever been widely or permanently distributed outside of its present European habitat. (d) The blond race is not found unmixed. In point of pedigree all individuals showing the blond traits are hybrids, and the greater number of them show their mixed blood in their physical traits. (e) There is no community, large or small, made up exclusively of blonds, or nearly so, and there is no good evidence available that such an all-blond or virtually all-blond community ever has existed, either in historic or prehistoric times. The race appears never to have lived in isolation. (f) It occurs in several (perhaps hybrid) variants—unless these variants are to be taken (with Deniker) as several distinct races. (g) Counting the Dolicho-blond as the original type of the race, its nearest apparent relative among the races of mankind is the Mediterranean (of Sergi), at least in point of physical traits. At the same time the blond race, or at least the Dolicho-blond type, has never since neolithic times, so far as known, extensively and permanently lived in contact with the Mediterranean. (h) The various (national) ramifications of the blond stock—or rather the various racial mixtures into which an appreciable blond element enters—are all, and to all appearance have always been, of Aryan (‘Indo-European,’ ‘Indo-Germanic’) speech—with the equivocal exception of the Kabyle. (i) Yet far the greater number and variety (national and linguistic) of men who use the Aryan speech are not prevalingly blond, or even appreciably mixed with blond. (j) The blond race, or the peoples with an appreciable blond admixture, and particularly the communities in which the Dolicho-blond element prevails, show little or none of the peculiarly Aryan institutions—understanding by that phrase not the known institutions of the ancient Germanic peoples, but the range of institutions said by competent philologists to be reflected in the primitive Aryan speech. (k) These considerations raise the presumption that the blond race was not originally of Aryan speech or of Aryan culture, and they also suggest (l) that the Mediterranean, the nearest apparent relative of the Dolicho-blond, was likewise not originally Aryan.”—T. B. Veblen, *Place of science in modern civilization and other essays*, pp. 459-460.—The theories which dispute the Asiatic origin of the Aryans are strongly presented by Canon Taylor in “Origin of the Aryans,” by G. H. Rendall, in “Cradle of the Aryans,” and by Dr. O. Schrader in “Prehistoric antiquities of the Aryan peoples.”

Aryan types.—“And the man himself, this older Aryan? What of him? Is it possible after so many ages to form a race picture of that Proto-Aryan, the manner of man he was physically, mentally, spiritually? A composite portrait might after a fashion be made by combining the salient features of his various race descendants. He certainly had within him the germs at least of a masterful man, for each of his descendants has been somewhere, at some time in the world's history, one of its masters, and the history of the world is largely of their making. In fact, the history of the world is largely only the history of the Aryan man. It must have been a vigorous stock that could thus stamp its impress

so indelibly upon the ages. Reconstructing him physically from the transmitted features which mark his children in all lands, as one produces from a group of photographs a composite picture, and especially reproducing the picture from the race types of those of his children who are living their race life amid climatic environments similar to those of the original Proto-Aryan race home, and making due allowance for the variations which are incident to migration and civilization, we may judge him to have been in stature of medium height, yet varying from this toward tallness rather than toward undersize; full-chested; long-limbed, yet symmetrical of build; a free stepper; a clear striker whether with the hand or the sword; in build rather spare, of active habit; a lover of outdoor life, of the field, of the chase; a man already feeling that he was the superior of the races about him, feeling already the stir of the masterful spirit within him, features well-marked and clean-cut; nose finely chiseled but rather prominent; chin well developed; mouth large yet not gross; teeth regular, showing ample jaw space; eyes blue or gray, rather than dark, and set well under brows that project in a strongly developed supra-orbital ridge; a forehead high rather than broad, yet swelling out above and behind the temples; dome of the head well arched; head long rather than thick through, the dolichocephalous rather than the brachicephalous type, broad above rather than at the base; hair fine, light in color, reddish or brown rather than black, straight or slightly wavy; complexion tanned by the winds of his life afield, yet back of the tan the ruddy skin of the blonde: in all things the opposite of the Mongol upon the east or the Negroid upon the south; more akin in form and feature to the Semite. This tall, fair, dolichocephalous type we find everywhere among the Aryan peoples; and where another type is mixed with it, the first type as here given dominates as leader. It is inferentially, and indeed may be assumed to be logically, the true Aryan type, as, while it remains constant in all the family ramifications, the other types vary and change."—J. P. Widney, *Race life of the Aryan peoples*, pp. 26-27.—See also ANTHROPOLOGY: Linguistics; BALKAN STATES: Races existing; BREHON LAWS: General character of ancient Irish laws; EUROPE: Introduction to the historic period: Distribution of races; GEORGIA, REPUBLIC OF: Ethnology; INDIA: People; INDIA: B. AS, LIBRA, DENARIUS, SESTERTIUS.—"The term As [among the Romans] and the words which denote its divisions, were not confined to weight alone, but were applied to measures of length and capacity also, and in general to any object which could be regarded as consisting of twelve equal parts. Thus they were commonly used to denote shares into which an inheritance was divided." As a unit of weight the as, or libra, "occupied the same position in the Roman system as the pound does in our own. According to the most accurate researches, the As was equal to about 11 4/5 oz. avoirdupois, or .7375 of an avoirdupois pound." It "was divided into 12 equal parts called uncia, and the uncia was divided into 24 equal parts called scrupula." "The As, regarded as a coin

[of copper] originally weighed, as the name implies, one pound, and the smaller copper coins those fractions of the pound denoted by their names. By degrees, however, the weight of the As, regarded as a coin, was greatly diminished. We are told that, about the commencement of the first Punic war, it had fallen from 12 ounces to 2 ounces; in the early part of the second Punic war (B. C. 217), it was reduced to one ounce; and not long afterwards, by a Lex Papiria, it was fixed at half-an-ounce, which remained the standard ever after." The silver coins of Rome were the denarius, equivalent (after 217 B. C.) to 16 asses; the quinarius and the sestertius, which became, respectively, one half and one fourth of the denarius in value. The sestertius, at the close of the republic, is estimated to have been equivalent in value to two pence sterling of English money. The coinage was debased under the Empire. The principal gold coin of the Empire was the denarius Aureus, which passed for 25 silver denarii.—W. Ramsay, *Manual of Roman antiquities*, ch. 13.

ASCALON, Ashkelon or Askelon, one of the five chief cities of ancient Philistia, situated on the Mediterranean thirty-nine miles southwest of Jerusalem; birthplace of Herod I; scene of victory of Crusaders under Godfrey of Bouillon (1099); captured by the Crusaders under Baldwin III in 1157, and by Saladin in 1187; destroyed in 1270. "The Philistine city where Samson slew the 30 men and took their spoil, is now being excavated by the Palestine Exploration Fund, under the direction of Professor Garstang. The site of Ascalon has been uninhabited practically since the end of the thirteenth century. The prophecies in Zephaniah (ii, 4), 'For Gaza shall be forsaken and Ashkelon a desolation,' and Zechariah (ix, 5), 'and the king shall perish from Gaza and Ashkelon shall not be inhabited,' have been fulfilled. When the British troops occupied Ascalon in 1917, a few squalid huts were found among the ruins of this once great city. Terraced gardens and orchards cover the site, and a mound runs round it composed of the fallen ramparts partly covering the Byzantine and medieval ramparts and the many towers. In the Crusades Ascalon was the last place to hold out against the Crusaders, being finally taken by them, retaken by Saladin, and again taken by Richard Cœur-de-Lion, who renovated the destroyed walls and towers. By mutual consent and cooperation the fortifications were again destroyed. In 1240 an attempt was made to refortify the town, but in 1270 the complete destruction came under the Sultan Bibars. So thorough was this destruction that not a single architectural fragment has been found in its original position, and the stones and sculptures were destroyed, many being sawn through. During the Roman period Ascalon was an important city, and in 104 B. C. was made a free state under Roman protection. In the preliminary excavations two statues already known to exist were unearthed, one a statue of Fortune, the other of Victory, half built into the walls. These statues of large size are in half relief. The statue of Victory stands with feet resting on

the earth, which is supported on the shoulders of Atlas. There has been excavated a third statue presumed to be of Peace. A sixth century writer, Antonius the Martyr, speaks of a Pool of Peace, with steps like the seats in a Greek or Roman theater and a portico of steps leading to the water's edge; this has now been revealed by the excavations. Near by is the legendary well of Abraham, presumably the legendary sacred lake of Ascalon. Since the recommencement of the excavations this spring, a gigantic sandaled foot, a yard long, and an arm of a huge marble statue have been found in a marble shrine. The history of Ascalon can be taken back to about 1370 B. C., in the Teleg-Amarna tablets; at this time its inhabitants were still Canaanites. The Philistines came about 1184 B. C. This Philistine period is one known little about. Caphtor, the Biblical home of the Philistines, is the land of Kefti of the Egyptian records, presumed to be Crete. The Philistines had some connection with Crete, but they do not appear to have been Cretans; it is also more doubtful that they came from Cyprus. They are represented on ancient reliefs, etc., as wearing peculiar headdresses with a band under the chin, and carrying round shields. There is a resemblance in the Kefti dress on the Egyptian monuments to the Hittite. Kefti may possibly be greater Cilicia; some of their vessels and gold even have a similarity to those from the Taurus. From the present excavations it is hoped to fill up the gap in the Philistine period of the history of Ascalon, and to clear up many doubts on the origin of the Philistines, the circumstances of their invasion, their relations with the Jews and their position in the early Mediterranean civilizations." — *Christian Science Monitor*, July 21, 1921.—See also JERUSALEM: 1090-1131, 1100; 1144-1187; SYRIA: B. ASHANTI, a British possession on the west coast of Africa, made up of negro tribes, included for practical purposes under the Gold Coast Colony, in as much as the governor of the Gold Coast is the governor of Ashanti. The area is about 20,000 square miles and the population in 1911 was 287,814. See AFRICA: Map.

1700-1807.—Conquests of the Ashantis.—King Osei Tiktum I made Kumasi his capital and conquered most of the important neighboring states. About 1807 the Ashantis reached the coast where they came into conflict with the British.

1807-1873.—Conflicts with British.—These years were marked by a series of wars, truces broken and renewed wars, the British frequently suffering serious defeats.

1873-1874.—War with the British. See ENGLAND: 1873-1880.

1895-1900.—British occupation of the country.—Rising of the tribes.—Siege and relief of Kumasi.—In 1895, King Prempeh, of Ashanti, provoked a second expedition of British troops against his capital, Kumasi, or Coomassie (for some account of the former expedition see ENGLAND: 1873-1880), by persistence in slave-catching raids and in human sacrifices, and by other violations of his treaty engagements. Late in the year a strong force was organized in Gold Coast Colony, mostly made up of native troops. It marched without resistance to Kumasi, which it entered on the 17th of January, 1896. Prempeh made complete submission, placing his crown at the feet of the Governor of the Gold Coast; but he was taken prisoner to Sierra Leone. A fort was built and garrisoned in the center of the town, and the country was then definitely placed under British protection, politically attached to the Gold Coast Colony. It submitted quietly to the practical conquest until the spring of 1900, when a fierce and general rising of the tribes occurred. It was said at the time that the outbreak was caused by efforts of the British to secure possession of a "golden stool" which King Prempeh had used for his throne, and which had been effectually concealed when Kumasi was taken in 1896; but this has been denied by Sir Frederic Hodgson, the Governor of the Gold Coast. "The 'golden stool,'" he declared, "was only an incident in the affair and had nothing to do with the cause of the rising, which had been brewing for a long time. In his opinion the Ashantis had been preparing ever since the British occupation in 1896 to reassert their independence." The Governor was, himself, in Kumasi when the Ashanti first attacked it, on the 25th of March, and he has given an account of the desperate position in which the few British officials, with their small native garrison and the refugees whom they tried to protect, were placed. "Our force," said Sir Frederic Hodgson, "consisted of only some 200 Hausas, while there is reason to believe that we had not less than 15,000 Ashantis surrounding us. In addition to our own force we had to protect some 3,500 refugees, chiefly Mahomedan traders, Fantis, and loyal Kumassis, none of whom we were able to take into the fort, where every available bit of space was required for military purposes. It was heartrending to see the

efforts of these poor people to scale the walls or break through the gate of the fort, and we had to withdraw the Hausas from the cantonments and draw a cordon round the refugees. It is impossible to describe the horror of the situation with these 3,500 wretched people huddled together without shelter under the walls of the fort. That same night a tornado broke over Kumassi, and the scene next morning with over 200 children was too terrible for words. Afterwards they were able to arrange shelters for themselves." Near the end of April, two small reinforcements from other posts reached Kumasi; but while this strengthened the numbers for defense, it weakened the food supply. Taking stock of their food, the besieged decided that they could hold out until June 23, and that if the main body then marched out, to cut, if possible, their way through the enemy, leaving a hundred men behind, the latter might keep the fort until July 15. This, accordingly, was done. On the 23d of June Governor Hodgson, with all but 100 men, stole away from Kumasi, by a road which the Ashantis had not guarded, and succeeded in reaching the coast, undergoing great hardships and dangers in the march. Meantime, an expedition from Cape Coast Castle was being energetically prepared by Colonel Sir J. Willcocks, who overcame immense difficulties and fought his way into Kumasi on July 15, the very day on which the food-supply of the little garrison was expected to give out. The following account of his entry into Kumasi is from Colonel Willcocks' official report: "Forming up in the main road, we marched towards Kumassi, a mile distant, the troops cheering wildly for the Queen and then followed silence. No sound came from the direction of the fort, which you cannot see till quite close. For a moment the hideous desolation and silence, the headless bodies lying everywhere, the sickening smell, &c., almost made one shudder to think what no one dared to utter—"Has Kumassi fallen? Are we too late?" Then a bugle sound caught the ear—"the general salute"—the tops of the towers appeared, and again every man in the column, white and black, broke into cheers long sustained. The brave defenders had at last seen us; they knew for hours past from the firing growing ever nearer, that we were coming, yet they dared not open their only gate; they performe must wait, for even as we appeared the enemy were making their last efforts to destroy the outlying buildings, and were actually setting them on fire until after dark, when a party of 100 men went out and treated them to volleys and cleared them out. If I have gone too fully into details of the final scene, the occasion was one that every white man felt for him comes perhaps but once, and no one would have missed it for a kingdom."

1901.—Annexed by British.—Sept. 26, 1901, the country was definitely annexed to Great Britain.

ASHMOLEAN MUSEUM (Oxford).—"The nucleus of this museum, which is the oldest in England, consists of the collection formed by the travellers, John Tradescant, and his son, about 1600-1650. 'Tradescant's Ark,' as it was then popularly known, subsequently passed into the possession of Elias Ashmole, and was transferred by him to the University of Oxford in 1683. . . . Thanks to the large contributions made by the late Dr. Fortnum, a new Museum building was erected behind the building formerly known as the University Galleries in Beaumont Street. The museum contains a collection of objects of ancient art beginning from prehistoric times. The Anglo-Saxon series includes King Alfred's jewel, one of the most important historical relics in England. The Celtic and other West and North European collections are of special interest, and include those of the late Sir John Evans. The prehistoric period in Egypt and that of the earliest dynasties are better illustrated here than in any other Museum, as is also the Merotic culture of Nubia and the Sudan. A unique section illustrates Sir Arthur Evan's excavations in the Palace of Knossos, in Crete, and the various periods of 'Minoan' and Aegean culture. Among other collections are the best exhibition of small Hittite objects in Europe. . . . The gallery of Greek sculpture has become of great importance largely through acquisitions from the Hope and other collections. The Department of Fine Art, in which is incorporated the contents of the former University Galleries, contains a collection of pictures rich in specimens of the Primitive Italian Schools, and of the Dutch and Flemish Schools of the XVII and British School of the XVIII century."—*Year's Art*, 1921, pp. 179-180.

ASIA: Name.—"There are grounds for believing Europe and Asia to have originally signified 'the west' and 'the east' respectively. Both are Semitic terms, and probably passed to the Greeks from the Phœnicians. . . . The Greeks first applied the title [Asia] to that portion of the eastern continent which lay nearest to them, and with which they became first acquainted—the coast of Asia Minor opposite the Cyclades; whence they extended it as their knowledge grew. Still it had always a special application to the country about Ephesus."—G. Rawlinson, *Notes to Herodotus*, v. 3, p. 33.

Influence of geography on the political problems of Asia.—Climate.—Topography.—Movement of Asia from north to south.—Powerful position of Russia.—Central position of Great Britain in India.—"As we look at the continent

of Asia, in its length and breadth, we may note, first, that it lies wholly north of the equator, and in great part between the northern tropic and the arctic circle—that is, in the so-called temperate zone. The inferences as to climate which might be drawn from this are deceptive, owing to modifications occasioned by physical conditions. The great plains of the north and of the south—of Siberia and of India—are subject, respectively, to extremes of cold and of heat, due primarily to the vast extent of land in the continent itself, which precludes the moderating power of the sea from exercising extensive influence. The effect of this immense region upon temperature is most strikingly shown in the monsoons, the periodical winds which alternate with the seasons—as land and sea breezes change with night and day—but which during their continuance have the steadiness characteristic of the permanent trades. This phenomenon, which prevails throughout the Indian Ocean, the Bay of Bengal, and the China Sea, is attributable to the alternate heating and cooling of the continent, as the sun moves north or south of the equator, in inducing a periodical set of the atmosphere—from the northeast during the winter, and from the southwest during the summer. Within its main outlines, the greatest breadth of the continent from east to west is about five thousand statute miles, following the thirtieth degree of north latitude; but along the fortieth this distance is increased by some hundreds of miles, through the projection of two peninsulas—Asia Minor on the west, and Korea on the east. Between these two parallels are to be found, speaking roughly, the most decisive natural features, and also those political divisions the unsettled character of which renders the problem of Asia in the present day at once perplexing and imminent. Within this belt are the Isthmus of Suez, Palestine and Syria, Mesopotamia, the greater part of Persia, and Afghanistan—with the strong mountain ranges that mark these two countries and Armenia—the Pamir, the huge elevations of Tibet, and a large part of the valley of the Yang-tse-kiang, with the lower and most important thousand miles of that river's course. Within it also are the cities of Aleppo, Mosul, and Bagdad, of Teberan and Ispahan, of Merv and Herat, Kabul and Kandahar, and in the far east of China, Peking, Shanghai, Nanking, and Hankow. No one of these is in the territory of a state the stability of which can be said to repose securely upon its own strength, or even upon the certainty of non-interference by ambitious neighbors. The chain of the Himalayas is exterior to, but only a little south of, the zone indicated. Although Japan is extra-continental, it may be interesting to note that the greater part of her territory and the centre of her power lie also within the belt, and extend almost across it, from north to south. Within these bounds, speaking broadly and not exclusively, is the debatable and debated ground. North and south of it, in similar wide generalization, political conditions are relatively determined, though by no means absolutely fixed. Along the northern and southern borders, where exterior impulses impinge, there are uncertainty and jealousy, aggression and defence, not as yet military, but political. Still, whatever its form, such action is at bottom that of conflicting, if not contending, impulses. The division of Asia is east and west, movement is north and south. It is the character of that movement, and its probable future, as indicated by the relative forces, and by the lines which in physics are called those of least resistance, that we are called to study; for in the greatness of the stake, and in the relative settledness of conditions elsewhere, there is assurance that there will

continue to be motion until an adjustment is reached, either in the satisfaction of everybody, or by the definite supremacy of someone of the contestants. . . . That the dividing line of unsettled political status is along the belt defined may be ascertained by a brief examination of a map. That movement is from and to the north and the south is a matter of history—not yet a generation old—and of names familiar to all readers of news. The mere sound of Turkestan, Khiva, Merv, Herat, Kandahar, Kabul, attests the fact; as do Manchuria and Port Arthur. Thus both in the western half and in the extreme east is observed the same tendency, which would be still more amply demonstrated by an appeal to history but little more remote. It is, in fact, no longer consistent with accuracy of forecast to draw a north and south line of severance; to contemplate eastern Asia apart from western; to dissociate, practically, the conditions and incidents in the one from those in the other. Both form living parts of a large problem, to which both contribute elements of perplexity. The relations of each to the other, and to the whole, must therefore be considered. Accepting provisionally the east and west belt of division as one stage in the process of analysis, we may profitably consider next the character and distribution of the forces whose northward and southward impulses constitute the primary factors in the process of change already initiated and still continuing. Upon a glance at the map one enormous fact immediately obtrudes itself upon the attention—the vast, uninterrupted mass of the Russian Empire, stretching without a break in territorial consecutiveness from the meridian of western Asia Minor, until, to the eastward, it overpasses that of Japan. In this huge distance no political obstacles intervene to impede the concentrated action of the disposable strength. Within the dominion of Russia only the distances themselves, and the hindrances—unquestionably great and manifold—imposed by natural conditions, place checks upon her freedom and fulness of movement. To this element of power—central position—is to be added the wedge-shaped outline of her territorial projection into central Asia, strongly supported as this is, on the one flank, by the mountains of the Caucasus and the inland Caspian Sea—wholly under her control—and on the other by the ranges which extend from Afghanistan northeasterly, along the western frontier of China. From the latter, moreover, she as yet has no serious danger to fear. The fact of her general advance up to the present time, most of which has been made within a generation, so that the point of the wedge is now inserted between Afghanistan and Persia, must be viewed in connection with the tempting relative facility of farther progress through Persia to the Persian Gulf, and with the strictly analogous movement, on the other side of the continent, where long strides have been made through Manchuria to Port Arthur and the Gulf of Pe-chi-li. Thus, alike in the far east and in the far west, we find the same characteristic of remorseless energy, rather remittent than intermittent in its symptoms. Russia, in obedience to natural law and race instinct, is working, geographically, to the southward in Asia by both flanks, her centre covered by the mountains of Afghanistan and the deserts of eastern Turkestan and Mongolia. . . . As north and south are logically opposed, so it might be surmised that practically the opposition to this movement of Russia from the north would find its chief expression to the south of the broad dividing belt, between the thirtieth and fortieth parallels. In a measure this is so, but with a very marked distinction, not only in degree

but in kind. In the progress of history, in which, as it unrolls, more and more of plan and of purpose seems to become evident, the great central peninsula of southern Asia, also projecting wedge-shaped far north into the middle debatable zone, has come under the control of a people the heart of whose power is far removed from it locally, and who, to the concentration of territory characteristic of Russia's geographical position, present an extreme of racial and military dispersal. India, therefore, is to Great Britain not the primary base of operations, political and military—for military action is only a specialized form of political. It is simply one of many contingent—secondary—bases, in different parts of the world, the action of which is susceptible of unification only by means of a supreme sea power. Of these many bases, India is the one best fitted, by nearness and by conformation, both for effect upon Central Asia and for operations upon either extremity of the long line over which the Russian front extends. Protected on the land side and centre by the mountains of Afghanistan and the Himalayas, its flanks, thrown to the rear, are unassailable, so long as the navy remains predominant. They constitute also frontiers, from which, in the future as in the past, expeditions may make a refreshed and final start, for Egypt on the one hand, for China on the other; and, it is needless to add, for any less distant destination in either direction.

"It is not intrinsically only that India possesses the value of a base to Great Britain. The central position which she holds relatively to China and to Egypt obtains also towards Australia and the Cape of Good Hope, assisting thus the concentration upon her of such support as either colony can extend to the general policy of an Imperial Federation. Even in its immediate relations to Asiatic problems, however, India is not unsupported. On land and in the centre, the acquisition of Burmah gives a continuous extension of frontier to the east, which turns the range of the Himalayas, opening access, political or peaceful, for influence or for commerce, to the upper valley of the Yang-tse-kiang, and to the western provinces of China proper. By sea, the Straits Settlements and Hong-Kong on the one side, Aden and Egypt on the other, facilitate, as far as land positions can, maritime enterprises to the eastward or to the westward, directed in a broad sense upon the flanks of the dividing zone, or upon those of the opposing fronts of operations that mark the deployment of the northern and southern powers, which at the present time are most strongly established upon Asian territory."—A. T. Mahan, *Problem of Asia*, pp. 20-29.—See also BALUCHISTAN; PACIFIC OCEAN; B. C. 2500-A. D. 1500.

Unity of Asiatic civilization.—Unifying force of Buddhism.—Embodied in the spirit of Japan.—Contrast to western currents of thought.—"While the psychological unity of the Oriental nations has not been so clearly and definitely worked out as it has been in the West, notwithstanding all minor national idiosyncrasies, still the Orient has also had its share of international unifying influences. The sacred places in India where the great teacher lived have for two thousand years attracted pilgrims from all parts of the Buddhist world; and earnest students have sought deeper wisdom by communing with the monks of famous monasteries in Burmah and Ceylon. Ever since the embassy of Emperor Ming-ti sought for the new gospel in the year 67, and the sage Fa-hien undertook his great journey, India has thus been visited by seekers after new light. Also the apostles of India's missionary religion, in its first age of flourishing enthusiasm, spread the teaching of Gotama to all

the lands of southern and eastern Asia, even from Palestine, where they implanted the germs of the Western monastic system, to the far islands of the rising sun. Thus Buddhism became the greatest unifying force in eastern Asia, and no mind nor personality commands a wider and more sincere homage than he who found the light and pointed the way, the great teacher 'who never spake but good and wise words, he who was the light of the world.' So it is that also in more recent epochs down to our own day, his thought and life have been and are the chief centre of the common feelings and enthusiasms of Asia. [See also BUDDHISM: Buddha and his mission.] The great age of illumination under the Sung dynasty in China saw the beginning of the attempts to merge and fuse Taoist, Buddhist, and Confucian thought, in Neo-Confucianism, called by Okakura 'a brilliant effort to mirror the whole of Asiatic consciousness.' It was Buddhist monks and missionaries who acted as messengers between China and Japan in that great formative period of a thousand years, in which all the currents of Indian and Chinese civilization made their impress upon Japanese national character. Then, under the Tokogawa régime the independent spirits of Japan trained themselves for the demands of an exacting epoch in the thought of Wang-yang-ming, or Oyomei, which combined with the noblest ideals and the deepest insight of Buddhism, joins to these a zest in active life, an ardent desire to participate in the surging development in which the universe and human destiny are unfolding themselves. In this school, which combines a truly poetic sentiment for the pathos of fading beauty and fleeting fragrance, for the ghostliness of an existence made up of countless vibrations of past joy and suffering, with the courageous desire to see clearly and act with energy, to share to the full in this great battle we call life,—in this school were trained the statesmen and warriors of Satsuma and Choshu who have led Japan to greatness in peace and glory in war. [See also BUDDHISM: Later history; and Different forms of Buddhism.] The unity of Asiatic civilization has found an actual embodiment in the spirit of Japan. There it is not the product of political reasoning, nor the discovery of philosophical abstraction. All the phenomena of the overpowering natural world of Asia are epitomized in the islands of the morning sun, where nature is as luxuriant and as forbidding, as caressing and as severe, as fertile and as destructive, as in all that cyclorama of storm, earthquake, typhoon, flood, and mountain vastness which we call Asia. Even thus has Japan in the course of her historic development received by gradual accretion the spirit of all Asiatic thought and endeavor. Nor have these waves from the mainland washed her shores in vain; her national life has not been the prey of capricious conquerors—imposing for a brief time a sway that would leave no permanent trace on the national life. Her mind and character have received and accepted these continental influences, as the needs of her own developing life have called for them; they have not been adopted perforce or by caprice, but have exerted a moulding influence and have been assimilated into a consistent, deep, and powerful national character. A psychological unity has thus been created—an actual expression of the flesh and blood of life—in touch with the national ideals and ambitions of a most truly patriotic race. This is a far different matter from the mere intellectual recognition of certain common beliefs, ideals, and institutions throughout the Orient. On such a perception of unity at most a certain intellectual sympathy could be founded. But in Japan the Oriental spirit has become flesh—it has ceased to be a

bloodless generalization, and it now confronts the world in the shape of a nation conscious of the complicated and representative character of its psychology, and ardently enthusiastic over the loftiness of its mission. We know Japanese patriotism as national, inspired by loyalty to the Mikado and by love for the land of Fujiyama; we are also learning to know it as Asiatic—deeply stirred by the exalting purpose of aiding that Asiatic thought-life which has made Japan to come to its own and preserve its dignity and independence through all the ages. . . . It is said that Asia is pessimistic. Yet her pessimism is not the sodden gloom of despair, whose terrifying scowl we encounter in European realistic art, and which is the bitter fruit of perverted modes of living. The pessimism of Asia, which makes the charm of her poetry from Firdusi to the writers of the delicate Japanese Haikai, is rather a soothing, quieting, æsthetic influence, like the feeling of sadness that touches the heart at the sight of great beauty, and which perhaps is due to the memory of all the yearnings and renunciations in the experience of a long chain of lives. The pessimism of the Orient is tragic, rather than cynical, and Japan at the present time gives proof of the fact that the spirit of tragedy belongs to strong nations. . . . It is but a short time since the broader and more representative minds among the Asiatic races have begun to realize the unity of Asiatic civilization. The endless variety in speech and custom, the difference in character and temper between the Chinese and the Hindu, the opposite political destiny that has made one nation subject to foreigners while it has led another into an honored position among the independent Powers—all these differences can no longer obscure the deep unity of customs and of ideals that pervades the entire Orient. This unified character of Oriental life, in its essence so totally different from Western civilization, frequently expresses itself on the surface in customs and institutions which seem to us bizarre and even barbarous, and which invite the active reformer from the West to sweep them away and put in their place a more enlightened system. But whoever considers carefully the conditions of the Orient may arrive at a very different conclusion, and may see even in these apparently backward institutions the marks of a broad and noble ideal of life. The vastness of Oriental populations, the long duration of their institutions, create a feeling of permanence and peace. The frequency of natural catastrophes, the overpowering aspect of mountains, torrents, and typhoons, have given the Orientals an entirely deferential attitude toward nature, which they have not tried to conquer or subdue. Busied rather with the causes of things and with the general laws of existence, they turned to religion and philosophy, and gave but little attention to practical facts, to scientific control of the forces of nature, and to the betterment of social conditions. The pessimistic tinge of Oriental thought is due to this feeling of helplessness, which causes the world and existence to appear as a great procession of shadows, full of suffering and evil. But in all this impermanence, in the multitude of fleeting and ephemeral individual existences, the Oriental mind sees the manifestation of an omnipresent force."—P. S. Reinsch, *Intellectual and political currents in the Far East*, pp. 20-28.—See also CHINA: Origin of the people; MYTHOLOGY: Eastern Asia; Indian and Chinese influences.

Art of writing. See ALPHABET: Theories of origin and development.

Earliest history.—**Movements of Asiatic races.**—**Invasions into Europe.**—"When we search into the remotest past of Asia, the geolo-

gist, not the historian, presents a very surprising spectacle to our view: two lands stand opposite; one, to the north, shaping a long arch round what is to-day Irkutsk; the other, to the south, constitutes a portion of the future peninsula of Hindustan; a large mediterranean sea, to which M. Suess has given the name of Tethys, separates the two continents; this ocean, in gradually drying up, has by its folds given rise to the Pamirs, the Himalayas, the high Tibetan tableland—and its total disappearance and the union of the two, northern and southern, lands gave birth to Asia. If we seek in this vast continent for the territory having an authentic record of the oldest times, we find it in the lands of biblical tradition, Chaldea and Elam, where Asia tells again the story of its past with the most irrefragable evidence in the inscriptions registered on stones which, lying buried for centuries have withstood the wear and tear of ages; thus has been revealed to us the oldest code of the world, the Law of Hammurabi, discovered at Susa by M. J. de Morgan, and described by the Dominican Father V. Scheil, both Frenchmen. However, if Elam carries us back to a period further than four thousand years before Christ, other countries of Asia, including those which are supposed to possess the most ancient civilization, are far from giving the material proof of the high antiquity to which their books and their legends lay an unfounded claim. [See also BABYLONIA: Earliest inhabitants.] India cannot boast of a single monument which for age is to be compared with those of Nineveh and of Egypt, and before the eighth century B. C., no solid basis to the history of China is to be found. The perishable quality of the materials used in rearing the edifices of this last country cannot allow us to hope that the zeal of modern archaeologists will unearth the secret of monuments vanished long ago. . . . At the present time [1904] nothing definite gives us a right to broach an opinion with regard to the primitive inhabitants of Oriental Asia and their cradle.

. . . During a long time Europe remained in complete ignorance of the steady though irregular movements of the populations of Asia, which was really a volcano in eruption, the terrible effects of which were felt afar. When the Roman Empire crumbling to pieces was threatened westwards by the barbarians of Germanic race,—Teutonic, Gothic, or Scandinavian,—these, pressed in their turn by the wild hordes from Asia, like a rolling wave invaded the Empire and, crushed in by the newcomers, founded as far as Spain, more or less flourishing kingdoms at the expense of the domain of the Caesars. The march of the Huns from the heart of Asia is in great part the cause of these migrations of people; menacing the Chinese territory, driving away the Yue-chi, a branch of the Eastern Tartars, who, after several halts of which we shall speak further on, carved for themselves an empire on the banks of the Indus at the cost of the occupiers of the valley of this river. The invading Huns, like a huge wave, gained gradually on from horde to horde, from tribe to tribe, from people to people, till they reached Europe which, when struck by the Scourge of God, could not discern whence the blow was first dealt. During the course of the fifth century, the Huns under Attila had not only subdued all the Tartar nations of Central Asia, but had also brought under the yoke the whole of the German tribes between the Volga and the Rhine. The defeat of the great chief by the allied armies of the Franks, the Visigoths, and the Romans at the battle of the Catalaunic Fields (451), his death two years later, stopped the tide of the Eastern invaders; as the victory of Charles Martel at Poitiers (732), three centuries later, set

bounds to the throng of Arabs, who after having torn the north of Africa from the Roman Empire, had crossed the sea, destroying the power of the Visigoths, who after a long migratory period throughout Europe, had apparently found a permanent home in the Iberian Peninsula. [See also HUNS.] The invasion of the barbarians, who flocked together to share the spoils of the agonizing Roman Empire in the fifth century, will continue later with the Mongol raids and till 1453 [See also MONGOLIA: 1206-1500], the year of the capture of Constantinople by the Turkish Osmanlis, which we may consider to mark the climax of the Asiatic encroachments."—H. Cordier, *General survey of the history of Asia (International Congress of Arts and Science, v. 2, pp. 86-89, St. Louis, 1904)*.

B. C. 334-A. D. 1498.—European invasions into Asia.—Alexander.—Romans.—Crusaders.—Modern movement.—“(1) Taking the European advances into Asia first, and dealing with them only, in order of date, there have been within historic times four great European invasions of Asia. The first was the wonderful campaign of Alexander of Macedon and his Greek armies. His forces marched unbeaten to the Indus and defeated Porus on the borders of Hindustan. As a military feat the whole expedition was a marvellous success. But, great as were his victories in the field and far-reaching his projects for founding an Eastern Empire, the fact remains that Alexander's exploits and those of his lieutenants produced no permanent effect whatever upon the important countries over which they and their immediate descendants ruled. There is nothing to show, either in arms or in arts, in philosophy or in religion, that the Asiatics, who were compelled to submit for the time being, adopted Greek methods or absorbed Greek ideas. It was conquest without colonisation: victory without continuous influence. The wave of invasion receded and matters went on below the surface much as they did before. [See also MACEDONIA: B. C. 345-336, to B. C. 315-310.] (2) Even the Roman mastery of a large portion of Asia scarcely influenced Eastern thought or Eastern customs at all. Yet this second great European invasion lasted for many centuries, and was maintained, alike when Rome was at the height of her power, and when her magnificent system of civil and military organisation was slowly tottering to its fall. Those long, long years of peaceful and successful rule failed to impress European conceptions, or European methods, upon the mass of the subject population, or even upon the educated classes as a whole. They remained essentially Asiatic, in all important respects, below the surface. The Pax Romana passed away and the Asiatics of centuries before became Asiatics again for centuries after. This was so, first and foremost and all through, from the days when the Parthians on the frontier routed Crassus and his army, to the period when the Byzantine emperors were vainly struggling against the Arabs and Turks. . . . [There was] the great legacy of administration, laws and jurisprudence in Asia. The splendid roads, harbours, water-conduits and other public works, of which the ruins still bear witness to the genius and foresight of her Emperors and engineers, conduced to great material prosperity, as the wealth and luxury of the principal cities testified. But the whole elaborate system left the psychology, habits and beliefs of the people untouched. The Asiatic mind remained impervious to European thought. Asiatic customs, Asiatic tribal and family relations, Asiatic religions long survived Greek and Latin teaching and Greek and Latin cults. Nay, in all these departments of human activity,

as in some others, Asia, even under Roman supremacy, had a continuous and peaceful influence upon her conquerors at a period when all hope of shaking off the Roman yoke had been practically abandoned. In Rome itself and in other great cities of the Western Empire, Asiatic philosophy and Asiatic superstitions made way long before the Asiatic religion of Christianity spread its network from Palestine over the European provinces. At Constantinople imitations of Asiatic forms and ceremonies pervaded the whole Imperial Court. [See also JEWS: B. C. 40-A. D. 44.] (3) Where the powerful organisation and efficiency of the Roman Empire had failed after hundreds of years of successful domination to produce a permanent effect, it was little likely that other disorderly and spasmodic efforts from the West would prevail. . . . The motley hosts who went forth under the banners of the Crusaders formed the third important invasion of Asia by Europe. Whatever may have been the hopes and intentions of the more capable statesmen and warriors of Europe we can now see that they were doomed to disappointment, even if the attacks upon 'the infidel' had been far better organised and disciplined than in fact they were. At first, at any rate, the Crusades were nothing more than spasmodic religious raids, bred of hysteria and inspired by fanaticism. Later they may have had some conscious, or unconscious, economic motive; and unquestionably racial antagonism developed as a result of the long series of encounters with the Moslem armies. These freebooters of Christianity and marauders of feudalism, however, were as little animated by any great scheme of polity as were their opponents. Here and there the leaders carved out short-lived kingdoms for themselves and their followers, chiefly at the expense of the decadent Christian Empire of the East, whose outposts in Asia Minor and Palestine they went forth to defend. But the Crusades . . . made no lasting impression whatever upon 'the East.' The Holy City of Christianity, Jerusalem, remained for centuries afterwards and continued till yesterday in the custody of those rival monotheists, the followers of Mohammed. Thus the third assault of Europe upon Asia produced even less effect than its two predecessors. . . . [See also CRUSADES.] (4) The fourth European invasion of Asia has taken place in modern times. It is a much wider, more continuous and far more formidable assault than any of its predecessors. This great movement is still in progress, and we are by no means as yet in a position to judge of its final effect. French, English and Russians, following upon the early religious and commercial efforts of the Portuguese and Dutch, have carried on for three centuries a steady pressure of, firstly religious propaganda, then mercantile persuasion, and lastly armed conquest at the expense of the inhabitants. The result is that Europeans have now seized and dominate more than half of the area and little less than half of the population of the great Eastern Continent, with its adjacent islands."—H. M. Hyndman, *Awakening of Asia, pp. 3-7*.

1500-1900.—Latest European invasion.—Advance upon China.—Portuguese in the East.—Spaniards in the Philippines.—East opened by the English after defeat of French.—Russian movements across Asia.—Japan transformed by western civilization.—"The decline of China coincides with the efforts of the Western Powers to break her doors open. Until the middle of the nineteenth century, with the exception of a few Catholic missionaries, retained as savants at the court of Peking or hidden in the provinces, where they led a precarious existence, foreigners were

lodged in a quarter of the single port of Canton without the right of moving freely about the city; moreover, they could only stay at the place the time strictly necessary to the settlement of their affairs, that is to say, during a pretty short portion of the year; afterwards they had to return to the Portuguese Colony of Macao, where lived their families, who were not allowed to accompany the cargoes to the Chinese port. Business was not conducted freely with the natives, but through the medium of privileged merchants, called *hong* merchants, whose monopoly was finally abolished by the fifth article of the treaty signed at Nanking by England August 29, 1842. [See also CHINA: 1839-1842.] Wanton vexations were inflicted upon foreigners; it was forbidden to the natives to teach their language to any "Western Devil" (Yang-kwei-tse); the *lex talionis*, man for man, was applied with all its cruelty and injustice. This state of things lasted till the Opium War, which gave England the means of opening China more widely to the foreign trade and of making way for the introduction of Western ideas, without abating, however, the arrogant pretensions of the mandarins. In the course of the sixteenth century began the double march toward China, by the north and the south, by land and by sea, which brought into contact nations of the Occident and those of the Far East. Ermak's Cossacks were the pioneers of the northern route, Vasco da Gama's sailors and Albuquerque's soldiers were the pilots and the conquerors of the southern route. To the Portuguese we owe the discovery, or more exactly the reopening, of the road of Asia in modern times. The cape discovered by Bartholomew Diaz in 1485, doubled by Vasco da Gama in 1497, was the great port of call from Europe to Asia, until the ancient way of Egypt was resumed during the nineteenth century. [See also PORTUGAL: 1463-1498.] Masters of the Indian Ocean, the capture of Malacca in 1511, their first voyage to Canton in 1514, a wreck in 1542 at Tanegashima, in the Japanese Archipelago, gave to the Portuguese the possession of an immense empire and the control of an enormous trade which they were not able to keep. The annexation of Portugal to Spain, 'The Sixty Years' Captivity,' under Philip the Second, was as harmful to the first, drawn by its conqueror into a struggle fatal for her prosperity, as was to the Dutch colonies the absorption of Holland by Napoleon I.

"The Spaniards settled in the Philippine Islands; the Dutch, with the enterprising Cornelius Houtman, landed in 1596 at Bantam, created the short-lived colony of Formosa, and a lasting empire in the Sunda Islands, where in 1619 they laid the foundations of the town of Batavia, on the ruins of the old native port of Jacatra. However, one may say that England really opened Eastern Asia to foreign influence, at least by sea, from the day in 1634 when the gun of Captain Weddell thundered for the first time in the Canton River. It was with the accompaniment of British powder that during two centuries the countries of the Far East carried on trade with the Western merchants. It was on sea, and of course by the south, that England fought for the supremacy in Asia. A terrible struggle in India against the French, where Clive and Hastings got the benefit of the labors and exertions of François Martin, Dumas, Dupleix, and others, three wars against the Mahrattas, the conquest of the Punjab, the crushing of the great rebellion of 1857, the suppression of the Empire of the great Mogul, have secured to Great Britain the possession of the Indies, threatened only as of yore by the northwestern invaders. Three lucky campaigns have given Burmah to England, al-

ready master of the greater part of the Malay Peninsula. [See also INDIA: 1823-1833, 1852: and BRITISH EMPIRE: Expansion: 19th century: Asia.] The treaty signed by Great Britain at Nanking in August, 1842, broke up the Chinese barrier; the various Powers followed in emulation the example of England; the United States, France, Belgium, Sweden and Norway, by turn signed treaties or conventions with the Son of Heaven. At that time England was truly without a rival in the Far East, but was not far-sighted enough; the pledge she took at Hong Kong, important as it was, was but a small one with regard to the hopes of the future. England gave back to the Chinese the Chusan Islands, which had been in her hands, as the French returned the Pescadores after the settlement of the Tonquin question; of course, loyal and honest acts, but also acts of improvident politics. . . .

"However, the two facts dominating the political history of the Far East during the last fifty years are the spread of the Russian power through Asia on the one hand, and the revolution and the transformation of the Japanese Empire on the other. During the reign of Ivan IV, in the middle of the sixteenth century, to the east of the Ural Mountains began this tremendous march of the Russians which drove them beyond the sea, since the authority of the Tsar was formerly extended to this side of the Straits of Behring; indeed, it was but in 1867 that the Russian possessions in America, Alaska, were acquired by the United States. The unification of the states of Great Russia, the conquest of the Tartar Kingdoms of Kazan (1552) and of Astrakhan (1553), removed the boundaries of Russia to the east; the Russian advance to the Baltic had been stopped by the victories of Stephen Bathory; the East only was left open to their enterprise. In 1558 a certain Gregori Strogonov obtained from the Tsar the cession of the wild lands on the Kama River. With some companions he settled in that region, created colonies, and some of the hardy fellows went as far as the Ural Mountains. An adventurous Cossack of the Don, Ermak Timofeevitch, whose services had been secured by Strogonov, crossed the Ural Mountains at the head of eight hundred and fifty plucky men, and advanced as far as the Irtysh and Ob rivers, on the way subduing the Tartar princes. Ermak was the real conqueror of Western Siberia, but if he had the luck and the glory of adding a new kingdom to the states of the prince who has been surnamed the Terrible, to his immediate successors was due the foundation of the first town in the territory snatched from the Tartars, for Ermak was drowned in the Irtysh in 1584, and Tobolsk dates only from 1587. The effort of the Russians was then directed to the north of Siberia; they did not meet with any resistance until they reached the Lena River; in 1632 they built the fort of Yakutsk on the banks of this river, and pushed their explorations on to the sea of Okhotsk. In 1636 tidings of the Amoor River were for the first time heard from Cossacks of Tomsk, who had made raids to the south. Wasili Poyarkov (1643-46) is the first Russian who navigated the Amoor from its junction with Zeia to its mouth. In 1643-51, Khabarov led an expedition in the course of which he built on the banks of the river several forts, Albasine among them. In 1654, Stepanov for the first time ascended the Sungari, where he met the Chinese, who compelled him to trace his way back to the Amoor. In spite of all their exertions, after two sieges of Albasine by the Chinese, the Russians were obliged on the 27th of August, 1689, to sign at Nerchinsk a treaty by which they were driven out of the basin of the Amoor. The Rus-

sians, bound to carry their efforts to the north, subdued Kamchatka. What is perhaps most remarkable in the history of the relations of the two great Asiatic empires is the tenacity of the Muscovite grappling with the cunning of the Chinese, and the comparison between the starting-point of these relations, the Russia of Michael and Alexis and the China of K'ang-hi, and their culminating-point in 1860, when these very nations shall have passed, one through the iron hands of Peter the Great and become the Russia of Alexander II, and the other under the backward government of Kia-K'ing and Tao-kwang and become the China of their feeble successor Hien-Fung. Only on the 18th of May, 1854, did the Governor-General Muraviev navigate again the waters of the Amoor River; on the 16th of May, 1858, he signed at Aigun a treaty which made the Amoor until its junction with the Usuri the boundary between the Russian and Chinese Empires, the territory between the Usuri and the sea remaining in the joint possession of the two Powers, but after the Pe-king Convention (2-14 November, 1860) this land was abandoned to Russia and the Usuri became the boundary. In the meantime, the treaty signed at T'ien-tsin by Admiral Euthymus Putiatin (1-13 June, 1858) secured for Russia all the advantages gained by France and England after the occupation of Canton and the capture of the Taku forts. [See also *SIBERIA: 1578-1890.*] The second Russian move had Central Asia as its aim; it was the result of the foundation of the town of Orenburg, the exploration of the Syr-Daria by Batiakov the building of Kazalinsk (1848) near the mouth of this river; the unsuccessful effort of General Perovsky (1839) turned the enterprise of the Russians to the Khanate of Khokand; the storming of Tashkend by Colonel Chernaiev on the 27th of June, 1865, was the crowning point of the conquest of Turkestan by the Russians. The road to the T'ien-Shan Nan Lu, had already been opened to the Russians by the treaty signed at Kulja (July 25-August 8, 1851) by Colonel Kovalesky, which, however, was known only ten years later (28 February-11 March, 1861). While Yakub Bey had founded a Mohammedan Empire in the T'ien-Shan Nan Lu, the Russians took possession of the Ili Territory on the 4th of July, 1871. The retrocession of this territory to China after the death of the Attalik Ghazi was the cause of long and difficult negotiations between Russia and China, which ended with the treaties of Livadia (October, 1879) and of St. Petersburg (February 12-23, 1881). Russia restored the lands which she detained illegitimately, keeping, however, a small portion, not the least valuable. . . . The third Russian move was aimed at the countries beyond the Caspian Sea, and was the result of the conquest of the Crimea by Potemkin in the name of the great Catherine, and of the treaty of Kutschuk Quainardji (1774), which gave to the Russians the free navigation of the Black Sea. Under the reign of Nicholas I, Putiatin established a permanent maritime station on the Island of Akurade in the Gulf of Astrabad, and a line of ships on the Caspian Sea, securing from the Persian Government facilities for Russian fishermen and traders on the southern coast of that sea. At last, in 1860, Russia took a definite position on the eastern coast of the Caspian Sea in settling at Kranovodsk. Later, on the break-up of the Turkish barrier of Geok-tepe by Skobelev, the occupation of the Oasis of Merv by Aliknanov, the capture of Samarkand, made of the Transcaspiian country a Russian possession, rendered Russian influence paramount in the north of Persia, and threatened Herat and the route of India. [See also *RUSSIA: 1850-1876.*]

The railway which the ingenuity and tenacity of Annenkov threw across the burning desert, united the Caspian Sea to Bokhara and Samarkand, crossing the Oxus at Charjui. The continuation of this railway from Samarkand to Tashkend and the Siberian line was to place the whole of Asia beyond the Ural Mountains and the Caspian Sea in the hands of the Russians. It seems as if nothing could put a stop to this expansion; on the contrary, the bold and rapid construction of a railway across the frozen steppes of Siberia was to unite Russia directly with the Far East by an unbroken chain; the ports of Manchuria and Korea, watered by the seas of China and Japan, being considered the termini of the long line. Work on the western part of the Siberian Railway began on July 7, 1802. Its extension beyond the Baikal Lake was to take it on the one hand to Vladivostock at the eastern extremity of the Russian possessions in Asia, and on the other to Port Arthur in the south of the Liao-tung Peninsula. It was fair to think that the point where the two lines met, in the very heart of Manchuria, should become a most important centre of industry and population; indeed, this has been realized, and in a few years, in the place of a barren spot, the considerable town of Kharbin (Harbin) has been built in the twinkling of an eye so to speak. . . . [See also *RAILROADS: 1805-1910.*] While Russia was making this enormous extension in the northwest of Asia, Japan was pursuing the series of reforms which were to secure for her a very special position in the concert of the nations of the world. Previous to the revolution of 1868, which altered entirely the state of things in Japan, a real duality in the government existed in this country; while the Tenno, or Mikado, the only Emperor, reigned nominally at Kioto, the power was held in fact by the Shogun, a sort of Mayor of the Palace, residing at Yedo. From Iyeyasu, at the beginning of the seventeenth century, who gave to feudality the definitive constitution which lasted to our days, the power remained in his house, that of Tokugawa. The foreigners, who landed in Japan in the sixteenth and the beginning of the seventeenth century—Portuguese and English—were expelled in 1637, and by the end of 1630 the Dutch and the Chinese were the only outsiders allowed to live on the islet of Deshima, in the Bay of Nagasaki, in order to supply the Japanese with the goods they required. This state of things, notwithstanding the attempts vainly made by Great Britain and Russia during the first years of the nineteenth century, was to last until the arrival of the American Commodore Matthew Calbraith Perry, who in July, 1853, anchored at Uruga at the entrance of the Bay of Yedo, and who signed on March 31, 1854, at Kanagawa, the first treaty concluded between Japan and a foreign power. . . . [See also *JAPAN: 1854-1863.*] Europe used to consider Asia, except in her western part, as a domain where events rolled on without any distant effect and having therefore but an interest of mere curiosity. China, Bossuet could pass over in silence, that is to say the third of the total population of the globe, in his *Discours sur l'histoire universelle* . . . admired only by those who have not read it. However, during the course of the fifth century the invasion of the barbarians, and in the thirteenth the raids of the Mongols, should have opened the eyes of the most blind of observers. And these considerable events were not the result of fortuitous causes, but the natural consequence of important events which had happened in the interior of Asia, while our ancestors had not the faintest suspicion of them. Moreover, the great navigators of the sixteenth century unraveled the mystery which shrouded the remote countries

Maps prepared specially for the **NEW LARNED**
 under direction of the editors and publishers.

and helped to make clear the interest Europe had in knowing them better, and let us say, with frank cynicism, in speculating upon them. The first attempts to create factories, then the conquests at the end of the seventeenth and during the eighteenth centuries, showed that Europe had abandoned her majestic indifference, and was feeling the necessity of a policy which reached beyond the horizon bounded by her small and greedy continent.

"At the close of the wars of the First Empire, as soon as peace is signed, we see the Western nations resume the routes to Asia, for a short period neglected. England in India and China, the Dutch in the Spice Islands, France in Indo-China, later on the Russians in Central Asia, then in the basin of the Amoor River, all rush to the conquest of new territories; appetites are sharpened, rivalries created; means of more rapid locomotion shorten distances; a new nation, Japan, is born to civilization, or to what it pleases us to call civilization; and Central and Eastern Asia, being no more isolated, are dragged into the inharmonious concert of universal politics."—H. Cordier, *General survey of the history of Asia (International Congress of Arts and Science, v. 2., pp. 95-103, St. Louis, 1904)*.

Results of European exploitation.—The following is a comparison and recapitulation of relations between Asia and Europe by a very liberal Englishman, Mr. H. M. Hyndman, who expresses a rather pessimistic attitude toward the aims and methods of Europeans in Asia.

"It is well to recall that, within comparatively recent times, wave after wave of conquering Asiatic armies broke in upon Europe; and barbarian as most of these warlike hordes were, great generals, great organisers, great administrators rose up from among them, both in West and East, whose equals could not be found in the Europe of their day. The Arabs of Spain, the various Moslem rulers of Baghdad, Egypt and Adrianople left, directly or indirectly, their mark on the civilisation of the West. The Mongols of Delhi, the Bahmany dynasty of the Deccan, Kublai Khan in China, and the rulers of the Khanates of Central Asia showed splendid capacity, in arts as in arms. These men and others built up Empires which the white races saw and heard of dimly from afar. But whether as distant rulers or as terribly near invaders these Asians were very formidable foes, and in the changing course of time we may yet have good cause to fear Asians again. We now know to our cost what a war to the death between nations and races, provided with equal means of destruction, really is. In the long run, should no exceptional military genius manifest himself, nor any incalculable spirit animate one of the combatants, the number of the trained soldiers on either side determines who shall be the victor. In numbers the East has an enormous advantage over the West. And there is no reason why a really great admiral, or general, should not appear in the countries which border upon the Pacific Ocean, as well as in those whose outlet is the Atlantic. While all the Powers of Europe were engaged in a desperate war of resistance to Teutonic aggression, and we were looking on, practically helpless, at the internecine butchery of the white race, there has been a steady revival among the vast populations which inhabit the territories extending from the Persian Gulf to the Sooloo Sea, and from the Amoor River to the Straits of Singapore. Nevertheless, we still talk with confidence of capturing more of Asiatic trade and influencing for all time Asiatic development.

"Not long ago, European nations were calmly

discussing and deciding among themselves how much more of sleepy Asia they should appropriate, for the benefit, no doubt, of the peoples brought under this foreign rule. But now our sense of conscious superiority is being shaken, and when we find the inscrutable Asiatic learning to meet us successfully with our own weapons, we draw back a little. We even begin to see that he may have good grounds for regarding his white rivals as the uncultured and discourteous barbarians that, in many respects, we really are. Compared with the madness of Europe, also, the comparative quietude of Asia has been sanity itself. Yet this may not endure. With all the facts before us, and with prejudice thrown aside, we are still unable to lay bare the causes of the gigantic Asian movements of the past. They were certainly not all economic in their origin, unless we stretch the boundaries of theory so far as to include the massacre of whole populations and the destruction of their wealth within the limits of the invader's desire for material gain. And, whether these movements arose from material or emotional causes, they have been before, and they may occur again. Forecast here is impossible. . . . Japan herself, whose leadership of Asia, afield and afloat, may yet, unless we are very careful, teach white men a lesson all over the world, was driven into close contact with Europe and America against her will, first, by Commodore Perry's dexterous diplomacy, supported by the power of the United States, and then by the much less justifiable measures of other white nations. . . . Asia raided and scouraged Europe for more than a thousand years. Now for five hundred years the counter-attack of Europe upon Asia has been going steadily on, and it may be that the land of long memories will cherish some desire to avenge this period of wrong and rapine in turn. The seed of hatred has already been but too well sown. The continent which has long regarded itself as the home of the progressive peoples and the hope of the entire planet is beginning to forfeit its assumed supremacy. The warlike and industrial potentialities of the near future are passing slowly but surely to the Far East. . . . If all those portions of the globe which are inhabited or dominated by the white races are seriously taking account at the present moment of their strength, their population, and their possibilities for the increase of their wealth on a larger scale than ever before, we may be sure the ablest men in Asia are not blind to what can be achieved in their own countries in peace and in war. It is true that the differences between the Asiatic peoples are as acute as any which exist in Europe. But against the white man they are practically all at one. Yet the white man still holds control over nearly half of Asia and its vast population: Asia comprises, including its islands, little less than 1,000,000,000 of the human race; England, France, Russia, Holland and the United States are all deeply concerned in the future of this mass of people, in view of the scope of territory and population they control. All will be greatly affected by the general political, economic and social movement of Japan, China and India. In a word, the position of Great Britain foremost, and of the other Powers in their degree, is now being steadily undermined. The determined effort to secure Asia for the Asiatics, once begun as earnestly in action as it is now being seriously considered in thought, might spread with a rapidity which would paralyse all attempts of reconquest, if, indeed, such attempts could ever be effectively made. The West deprived of British India, the Asiatic Provinces of Russia, French Tonquin and Cochin China, Dutch Java, Sumatra and the

Celebes, the Philippines under the United States, would be a very different Europe from that to which we have been accustomed. That is a possibility of which the West, with forces now weakened and depleted to a wholly unprecedented extent, must soon take account. Unconsciously, but none the less certainly, it is making way. Where fifty, or even twenty years ago, the continuous expansion of Western domination over the East was taken for granted, now an uneasy but not yet openly admitted feeling is growing that the tide has turned, and that ere long the area of European influence in the East will be considerably reduced. The partition of China among the 'Great Powers' is not to-day within the sphere of practical politics, and Japan pursues her policy in respect to that magnificent Empire with little regard to the susceptibilities of the white man and his burden. Whether the appeal of China herself to the White Powers, that they should aid her to resist the unwarranted demands of Japan, will obtain a favourable reception remains to be seen. But while 'The League of Nations' is being generally discussed it is certain that, in the opinion of the Chinese, the national independence of China is seriously menaced if the much-cherished 'Open Door' is being carefully, though silently, closed. All this is more remarkable since the Ottoman Turks, for centuries the advance guard of Asia in Europe, are at last being driven from their hereditary camping-ground. Even their mastery over Asia Minor, (q.v.), irrespective of the baffled German programme of appropriation, is obviously threatened by Great Britain and France. What, under other circumstances, would undoubtedly be considered additional evidence of the growing predominance of Europe, seems to-day scarcely a makeweight against the probable insecurity of the white race in the Far East. . . . Happily the same views as to the madness of modern warfare which are now being forced upon the rest of the world are also making way with Asiatic statesmen. They too see that friendly coöperation for common advantage might be far more advantageous to all than rivalry for power or competition for gain. Freedom of nationalities, equality of rights, respect for treaties and conventions, international arrangements for securing permanent peace are as important for Asia as for any other continent. But the responsibility for adopting them, should the Japanese democratic party prevail, and India and China press their demands without violence, rests entirely with Europe. The Asiatic nations are so far threatening no legitimate European interest: they ask only that the principles for which the Allies justly claim they fought Germany should be applied in the most populous regions of the world. But it is useless to disguise from ourselves that this concession would involve of itself a complete revolution in the East. For such policy honestly applied would mean: (1) The emancipation of India from foreign rule by peaceful agreements with its numerous peoples. (2) The cessation of attempts to force foreign capitalism and foreign trade upon Asiatic countries. (3) The recognition that Japanese and Chinese are entitled, in countries and colonies inhabited or controlled by Europeans, to rights equal with those of Europeans in China and Japan. (4) The granting of similar rights to Indians on the same basis. (5) The general acceptance by Europeans of the principle of 'Asia for the Asiatics' as a rightful claim. But no student and no statesman would contend that such a wide policy of justice can be suddenly realised. Yet, if, in the near future, public opinion in Europe and America were to endorse such a programme, and the nations in-

terested would take the first steps towards its realisation, much of the antagonism which is already manifesting itself in Asia might be removed. Past injuries cannot now be remedied. The most to hope for is that, in the Asiatic mind, they may be held to balance those Eastern attacks upon the West which belong to a past more remote."—H. M. Hyndman, *Awakening of Asia*, pp. 275-282.

European influences on education, industry, medicine, political movements, social reform and ethical reform.—(1) *Education*.—"The education which the Orient used to give to the favored few had little relation to modern life or thought, and nothing which fitted for leadership in competition with the West. The missionary was the pioneer in introducing western education into the East. Started by the missionary, the work has now been taken up by the people in each country. Under the lead of the British officials, India has been given an educational system heading up in five universities, which prescribe courses of study, set examinations, and confer degrees, which are the gateway through which the young men of India pass into public or commercial life. . . . India contains schools of every grade, from the kindergarten to the university, including technical and professional schools. India is headed in the direction of universal compulsory education, which Ceylon has already, in theory at least, attained. Japan has created within a few years a system of education from the elementary schools, attendance upon which is compulsory, up to the universities. China has discarded entirely its centuries-old system of examinations in the Chinese Classics, and has provided on paper a comprehensive system of universal education, which is gradually being put into effect. Siam, too, has its schools which teach western science and other western subjects. The effect of this education is to break down old superstitions, broaden the vision, and bring the students into touch with the life, thought, and ideals of the West. All this is good, but there is another side. The system of education is too exclusively literary, as, apart from technical schools, it all looks to preparation for university courses, which are taken by a very small fraction of the student body. The remainder get the idea that they are above a life of productive activity in the industrial world and must be clerks, teachers, or officials. The supply of such candidates far exceeds the demand. Again, the education is too western in its character and tends to unfit the student for life and work among his own people. This is especially true in India and Ceylon, where the history and literature of Greece and Rome are over emphasized as compared with the literature and history of India. An extreme instance of this occurred in Ceylon, where there is no local university and English examinations are used. It was only after a struggle that pupils were permitted to offer themselves for examination upon the botany of Ceylon and not upon the botany of Great Britain. Instances are by no means rare of students who cannot communicate with their parents because they have lost their command of the vernacular. The university men of India believe that the political theories of the West cannot be put into immediate operation among people whose whole history and life have been along different lines. Japan has solved this problem of adaptation with tolerable success, and China believes in both western and Chinese education, but the two are not sufficiently welded. Again, the education is apt to be superficial. This is true in India. Japanese education is more comprehensive than thorough, and few schools in China have competent teachers. Still more serious is the moral ef-

fect of this education. It breaks down the old religious beliefs, the old standards and sanctions, and it puts almost nothing in their place. The teaching is for the most part agnostic, if not positively anti-religious, and pupils, in the life of whose nation religion and ethics have played a prominent part, cannot so easily and safely adjust themselves to the agnostic position as pupils who have back of them generations of believers in Christian standards of conduct. The moral waste of the new education of the Orient is discouraging. Men are cast adrift and have no way of getting their bearings.

"2. *Industry.*—There are two phases in the industrial development of the East, the development of means of communication—railroads, steamer lines, telegraphs, and postal facilities—and the growth of the factory system. Much of the provincialism of India and China has been due to isolation. The marvel is that there has been so much intercommunication by foot and by cart. These barriers are now breaking down. The railroad, the telegraph, and the post-office have extended themselves all over India and Japan. In China, the telegraph and the mail carrier are penetrating the most inaccessible parts of the empire, and the railroad will soon bring the remotest provinces within a few days' journey of the capital. The effect of this is to break down caste in India and provincialism in China, to unify the political life of these countries, and, by greater centralization of administration, to stop the graft and injustice of local officials. On the other hand, the railroads and steamers are throwing into the ranks of the unemployed of China thousands of coolies, boatmen, carters, and innkeepers, whose occupation has vanished. It is no longer possible in India to isolate the effects of such calamities as famine and pestilence. All parts now bear their share of the burden, through the prevalence of famine prices and the spread of contagion. Industrially, too, there have been great changes. The factory system is invading India, and the Indian artisans are feeling the competition, not only of imported goods, but also of the local factory-made product. China is moving in the same direction. In weaving, it is using a more efficient hand loom, while at Hanyang, across the river from the Chicago of China, Hankow, is an up-to-date steel plant, which has even exported its products to the United States. Japan is in the full swing of industrial development along western lines. Its great industrial plants closely resemble those of the United States. All this gives promise of increasing wealth, higher standards of living, greater comforts, and a richer life. At the same time, it means that China, India, and Japan are either facing or are already struggling with all these phases—industrial, social, sanitary, and moral—of industrial centers with which the West is far too familiar. It is a suggestive fact that the slum problem has entered Asia through following the example of the West. What is worse is that these people do not have the high western sense of the value of the life of the individual, and are, comparatively speaking, without any restraining influence similar to our enlightened public opinion, which has been aroused by the struggles of a century of industrial strife. Unless these elements can be supplied, there is danger of suffering and of abuses worse than any the West has known.

"3. *Medicine.*—Within a generation, Japan has created for herself a corps of competent physicians and surgeons. She is also as rapidly as possible applying the principles of sanitation to the problems of public health. In India, the British government recognizes the importance of medicine and

sanitation and there is a regular body of scientifically trained physicians throughout the country. However, their number and their training are often inferior, and the ignorance of the people and their social customs make it impossible fully to relieve suffering or to do more than reduce the ravages of cholera and plague. China is practically without competent physicians. Medical missionaries and those trained by them have the field almost to themselves, although now the government is aiding and supporting medical schools. Those in a position to judge affirm that there is a greater amount of unnecessary physical suffering in China today than in any other part of the world. Western medicine is now entering China, both helpfully and otherwise, for China is now getting, not only fully trained European and Chinese physicians, but also charlatans, who pretend to a knowledge and skill utterly foreign to them, and dealers in patent medicines as well. In nearly every bazaar drugs are sold to those who have no knowledge whatever of their proper use. The poster nuisance is found in China and the most widely advertised medicines are nostrums for the diseases of vice. [See also MEDICAL SCIENCE: China.]

"4. *Political movements.*—In the sphere of government the most significant change is the growth of the nationalistic spirit. The day when the West could dominate and control with arrogance the great peoples of Asia has passed. Japan has always possessed a spirit of proud independence, and ever since she emerged from her isolation she has bent every effort to secure recognition as the peer of any western power. The same purpose is back of the political and social development of China. China is proud of her ancient civilization and of the fact that she has gone serenely on her way during the rise and fall of the successive empires of the West. She is firmly resolved to end forever the day when the young western nations can hully and despoil her. The provincial spirit is growing into a national spirit and China is resolved, at the earliest possible day, to make herself strong enough to control China for the Chinese. Into the question of the unrest of India, which has voiced itself in protests and in bombs, we cannot enter. Suffice to say that leaders who have been trained and educated by Britain and have been taught the political philosophy of the western nations are demanding a greater control over their own affairs, either as a member of the British Empire or as an independent people. . . .

"5. *Social reform.*—The oriental social reformer has been very active in recent years. In India, his agitation has chiefly concerned the two great institutions of caste and the family. The minute subdivision of the people of India into hundreds or even thousands of endogamous subdivisions, many of which have but a comparatively small membership, has resulted in an interbreeding which has reduced the virility of the race. Caste is an almost insurmountable barrier to the creation of a true public spirit or to hearty coöperation between the sections of society. The range of sympathy is narrowed, as a member of one caste has no feeling of obligation to assist a member of another caste. Millions, who are below even the lowest of castes, are condemned by the caste system to an existence which is too often unworthy of a human being and with no possibility of relief. Closely connected with the caste system is the institution of child marriage, which has made present-day India the offspring of children, which puts on mere boys and girls the responsibilities of marriage, saps the vitality and ambition of the boy fathers, and prevents the education of the girl mothers. Racial deterioration and physical suf-

fering are other results of the prevailing marriage customs, while the position of widows and the joint-family system bring in their turn evils all their own. All these evils are fully recognized by the leaders of the social-reform movement and one can read such condemnations by them of these customs as no foreigner would dare to make. Progress had been made, caste is in many respects disintegrating, and the agitation for raising the marriage age of girls, for the remarriage of widows, especially child widows, and for intercaste marriages has not been without results, some of which are seen on the statute book. At the same time, the present nationalistic movement tends strongly toward a reactionary clinging to those institutions which are peculiarly Indian, and the agitators are stronger in talking than in acting. . . . One of the social reforms most agitated in China is the natural-foot movement. So rapidly is this spreading, that the time may not be far distant when no girl in China will undergo the physical suffering, with its resulting disabilities, which comes from binding the feet. These movements mean also that woman is coming to her own. While, as has already been said, she has never been without her influence, yet she has too often been denied education and freedom to develop her own individuality. In India, the government, and the Christian, Moslem, and Hindu communities are now all providing schools for girls, and educated young men are demanding educated wives, who can be real companions in their intellectual life and social work, as well as the mothers of their children. There is already a new woman in China, but, like all other pioneers, she tends to go to the extreme, and these new women are not always models. Many of them are too bold, openly and brazenly defy all conventions of Chinese society, and do not always know where liberty ends and license begins.

"6. *Ethical reform.*—The ethical standards of the Orient have changed greatly under western influence. It must be confessed at the outset that all western influence has not been ethically helpful. The moral conditions of the port cities are a disgrace to that western civilization upon the representatives of which the chief responsibility rests. There can be found in the bookstalls of Japan and Korea pictures and postcards of a sort all too familiar to us of the West, but which formerly Japan would never have tolerated outside of a brothel. Nearly every nation has its intoxicating beverages, but these are usually less injurious physically and morally than the strongest western liquors, which have been introduced into the Orient by westerners, and which those who imitate the foreigners are beginning to use, often to excess. Westerners are trying to drive out of China the Chinese pipe, which is used almost universally, and to substitute the cigarette. The effect is physically harmful and at the same time impoverishing, a week's or at least a month's supply of cigarettes costing nearly as much as a year's supply of tobacco for the Chinese pipe. On the other hand, it is undeniable that there has been a great ethical revival throughout the great nations of Asia. India has been going through a process of louse-cleaning and the immoralities connected with religious ceremonies are being reduced. Teachers devise sports to prevent their pupils from sharing in the ribaldry, if not shameless indecencies, connected with the great festival of *Holi*. . . . Many temple cars, with their obscene carvings, are now kept under cover when not in actual use. The marriage of girls to the gods and their condemnation to a life of prostitution is now under the ban. China is in the midst

of its great anti-opium crusade, and it looks as if, within a reasonable time, the world would witness, for the first time, the spectacle of a great nation curing itself of a habit which was tending to ruin it physically and ethically. Ethical standards in Japan have been raised, although there are many discouraging features in the life of present-day Japan. But note this, the whole tone of present-day literature, including magazines and periodicals, is no longer Buddhistic but Christian. Japan means so to readjust her customs and standards that no western people can point at her a finger of scorn. In this whole matter of ethical reform, the chief difficulty is in the character of the leaders, some of whom are themselves faithless to the new standards. In other words, the greatest need of the Orient today is for a larger number of intelligent leaders, unselfish and ethically sound, and for the spread of a spirit of enlightened progress through the ranks of the common people." —E. W. Capen, *Sociological appraisal of western influence in the Orient* (*American Journal of Sociology*, May, 1911, pp. 738-745).

Chronology of the chief events in Asiatic history.—It is among the Asiatics that we find the earliest known stratum of population, such as some of tribes of China and the Malay Archipelago, the Veddas of Ceylon and the Ainu of Japan; but, outside of Babylonia and Assyria, the authentic history of Asia does not date back of 1500 B. C.

B. C. 4500-2000.—Babylonia, the ruling power in Asia. See **BABYLONIA**.

B. C. 1500.—Chinese advance along the Hwang Ho; entrance of Aryans into India from the northwest.

B. C. 1450-1300.—Height of Hittite power in Asia Minor and Syria. See **HITTITES**.

B. C. 10th century.—Jewish kingdom at its height, overcome by the Assyrians. See **ASSYRIA**; **ASSYRIAN EMPIRE**.

B. C. 9th-8th centuries.—Assyria chief power in western Asia. See **ASSYRIA**.

B. C. 6th-5th centuries.—Rise of the Asiatic empire of Cyrus and its conflicts with the earliest European civilization (Greek). See **PERSIA**; **B. C. 540-521**.

B. C. 4th century.—Alexander's conquest of western Asia to the Indus river; marked influence of Greco-Persian civilization on India and Asia Minor. See **INDIA**; **B. C. 327-312**; **MACEDONIA**; **B. C. 334-330**; **B. C. 330-323**.

B. C. 264-227.—Empire of Asoka in India from Afghanistan to Madras. See **INDIA**; **B. C. 312**.

B. C. 250-A. D. 227.—Rule of the Parthians over Western Asia. See **PARTHIA**, AND THE **PARTHIAN EMPIRE**.

B. C. 200-A. D. 1127.—China a great Asiatic power under the Han, T'ang and Sung dynasties. See **CHINA**; **Origin**, etc.

B. C. 2nd century-A. D. 5th century.—Conquest of the Romans over Hellenistic kingdoms of Alexander; conflicts with rebellious Asiatic Monarchs. See **ROME**; **Republic**; **B. C. 211-202**, to **ROME**; **Empire**; **404-408**; **SELEUCIDÆ**; **B. C. 224-187**.

A. D. 3rd century-7th century.—Sassanids rule Persia and western Asia as the Roman power declines. See **PERSIA**; **B. C. 150-A. D. 226**; **226-627**.

4th-6th centuries.—Invasion of Europe by Huns, Bulgarians and Avars. See **AVARS**; **HUNS**.

7th century.—Conquest by Mohammedans of many of the Asiatic provinces under the Eastern Roman empire (Byzantine). See **CALIPHATE**; **632-630**, to **680**.

7th-15th centuries.—Arabia a prominent Asiatic state as the center of Mohammedan power; Arabs

in contact with Europe in Spain. See ARABIA; SPAIN: 711-713, to 1031-1086.

8th century.—India invaded by the Moslems.

10th-11th centuries.—Seljuk Turks in Persia, Asia Minor and Palestine; Hindus in Indo China, later in Malaysia. See TURKEY: 999-1183, to 1002-1160.

1096-1272.—Crusades last medieval struggle between Europe and Asia; power of Mohammedan state in southwest Asia cut off the western world from Asia and deprived Europe of knowledge of Asia. See CRUSADES.

1162-1227.—Rise of Mongol power under Jenghis Khan and its spread to the borders of Europe; Tibet nominally under the suzerainty of Jenghis Khan; spread of the Chinese to Siam. See MONGOLIA: 1153-1227.

13th century.—The thirteenth century was marked by the power of the Mongol descendants of Jenghis Khan, and the conquests of Timur. See MONGOLIA: 1229-1294; 1238-1391.

1241.—Russia invaded by Batu and the Golden Horde; Silesia entered. See RUSSIA: 1237-1294.

1259.—Kublai Khan, grandson of Jenghis, came into possession of China, Korea, Mongolia, Manchuria and Tibet; attempted to invade Japan (which has never been invaded) but was repulsed. See MONGOLIA: 1229-1294.

1281.—Argun who came into possession of the Mongolian dominions in Persia, Georgia, Armenia, Khorosan, etc., opened up diplomatic relations with Europe and proposed an alliance against the Mohammedan powers.

1299-1326.—Growing power of the Ottoman Turks within the confines of the Byzantine Empire. See TURKEY: 1240-1326.

14th century.—Ming dynasty in China gained control and ruled 300 years; sent out far-reaching expeditions into neighboring states and Pacific islands; Ottoman Turks a menace to Europe. See CHINA: 1294-1736.

1453.—Ottoman Turks enter Europe. See CONSTANTINOPLE: 1453.

Early 16th century.—Portuguese established factories at Goa and Macao; built up a littoral empire on coasts of India and China; traded with Japan. See COMMERCE: Era of geographic expansion: 15th-17th centuries.

16th century.—Rise of modern European powers and their commercial explorations brought Europe into contact with Asia. See COMMERCE: Era of geographic expansion.

1526-1707.—Mogul domination in India; came from Transoxiana and seized Delhi; lasted nominally to the mutiny of 1857. See INDIA: 1399-1605, to 1747-1761.

Later 16th century.—Dutch in the Indian Ocean and Pacific (India, East Indies and China). See NETHERLANDS: 1594-1620.

1565.—Philippines taken by Spain. See PHILIPPINE ISLANDS: 1564-1572.

1580.—Siberia invaded by Russians under the Cossack Yermak. See SIBERIA: 1578-1800.

1592.—Korea taken by Japan. See JAPAN: 600-1853.

1603-1868.—No foreign contact with Japan except through Dutch under restrictions. See JAPAN: 1542-1593; 1593-1625.

1627.—Manchus capture Korea. See KOREA.

1644-1912.—Manchus overcame the Mings; ruled China to the Revolution of 1912. See CHINA: 1662-1838, to 1912.

17th century.—Rivalry of the Dutch and English for possession of India; English successful. See INDIA: 1600-1702.

1745-1761.—Wars between French and English

for possession of India; English successful. See INDIA: 1743-1752.

1840-1842.—English forced China to open her ports to trade. See CHINA: 1839-1844.

1854-1859.—Japan opened to European trade; Japanese set themselves to assimilate Western civilization. See JAPAN: 1797-1854.

1895.—China defeated by Japan; Korea taken. See CHINA: 1894-1895.

1905.—Russia defeated by Japan; first instance in modern history where an Asiatic power has competed on equal terms with a European power. See JAPAN: 1902-1905; 1905-1914.

For a detailed treatment of the historical development of the various countries in Asia, see under names of countries, e.g., CHINA, INDIA, etc.

ASIA, Eastern.—Common elements in mythology. See MYTHOLOGY: Eastern Asia: Indian and Chinese influences.

ASIA, Masonic societies in. See MASONIC SOCIETIES: Asia, Persia and India.

ASIA, Roman province (so called).—"As originally constituted, it corresponded to the dominions of the kings of Pergamus . . . left by the will of Attalus III to the Roman people 133 B. C. . . . It included the whole of Mysia and Lydia, with Æolis, Ionia and Caria, except a small part which was subject to Rhodes, and the greater part, if not the whole, of Phrygia. A portion of the last region, however, was detached from it."—E. H. Bunbury, *History of ancient geography*, ch. 20, sect. 1.—See also CILICIA.

ASIA MINOR: Name.—Geographical and physical characteristics.—"The name of Asia Minor, so familiar to the student of ancient geography, was not in use either among Greek or Roman writers until a very late period. Orosius, who wrote in the fifth century after the Christian era, is the first extant writer who employs the term in its modern sense."—E. H. Bunbury, *History of ancient geography*, ch. 7, sect. 2.—The name Anatolia, which is of Greek origin, synonymous with "The Levant," signifying "The Sunrise," came into use among the Byzantines, about the 10th century, and was adopted by their successors, the Turks.—"The western portion of Asia Minor was known in the time of the Byzantine Empire, as Anatolia (the land of 'the rising sun'), and the term was used to distinguish the peninsular portion of Asia from continental Asia. From East to West parallel with the Black Sea and the Mediterranean run two ranges of mountains at no great distance from the seas. Between them lies the great elevated table-land plateau from 2,500 to 4,500 feet high, broken up by other mountains which give a peculiar character to the whole country, making it difficult of access, and tending to keep it what it has been from the very

dawn of history, a pastoral country, inhabited by a people in the main nomad, lawless, and intractable. The southernmost range of mountains are known as the Taurus and the Anti-Taurus, of which the highest point is the Akjah-Dagh (11,000 feet). Till very recent times, these mountains and the country generally were little known. They form the south and south-west boundary of the six Vilayets or provinces which are known as Armenia, and it is in their most northerly reaches that the great rivers Euphrates and Tigris take their rise. 'Both branches of the Euphrates,' says Lynch, 'wind their way by immense stages at the foot of these mountains, in the lap of these plains; the eastern branch, called Murad Su, rising . . . near the base of the Ararat system, and traversing Armenia almost from one extremity to the other. The more westerly channel is composed in its infancy by two streams . . . one . . . flowing sluggishly through the plain of Erzeroum; the other springing in the neighbourhood of the sources of the Chorokh. The Kelkid and Chorokh are both in their upper courses typical Armenian rivers. What a contrast,' he concludes, 'between this wealth of water, many of which might be rendered navigable, and the hopeless sterility of great parts of Persia, from which no river finds its way to the ocean!'

"It is the mountain systems and the numerous and fertilising rivers which give to Asia Minor its striking beauty, its salubriousness, its wealth, and its extraordinary economic promise. 'There is nothing needed,' Lynch declares, 'but less perversity on the part of the human animal to convert Armenia into an almost ideal nursery of his race. The strong highland air, the rigorous but bracing winters, and the summers when the nights are always cool; a southern sun, great rivers, immense tracts of agricultural soil, an abundance of minerals—such blessings and subtle properties are calculated to develop the fibre in man, foster with material sufficiency the growth of his winged mind and cause it to expand like a flower in a generous light. One feels that for various reasons outside inherent qualities, this land has never enjoyed at any period of history the fulness of opportunity. And one awaits her future with expectant interest.' The country which is known as Armenia lies in the extreme east of the peninsula, south of the Black Sea and of the Caucasus."—W. L. Williams, *Armenia, past and present*, pp. 4-6.—See also ASIA: Influence of geography on the political problems; TURKEY: Map of Asia Minor.

B. C. 1100.—Greek colonies.—"The tumult . . . caused by the irruption of the Thesprotians into Thessaly and the displacement of the population of Greece [see GREECE: Migrations to Asia Minor and islands of the Ægean] did not subside within the limits of the peninsula. From the north and the south those inhabitants who were unable to maintain their ground against the incursions of the Thessalians, Arnaeans, or Dorians, and preferred exile to submission, sought new homes in the islands of the Ægean and on the western coast of Asia Minor. The migrations continued for several generations. When at length they came to an end, and the Anatolian coast from Mount Ida to the Triopian headland, with the adjacent islands, was in the possession of the

Greeks, three great divisions or tribes were distinguished in the new settlements: Dorians, Ionians, and Aeolians. In spite of the presence of some alien elements, the Dorians and Ionians of Asia Minor were the same tribes as the Dorians and Ionians of Greece. The Aeolians, on the other hand, were a composite tribe, as their name implies. . . . Of these three divisions the Aeolians lay farthest to the north. The precise limits of their territory were differently fixed by different authorities. . . . The Aeolic cities fell into two groups: a northern, of which Lesbos was the centre, and a southern, composed of the cities in the immediate neighbourhood of the Hermus, and founded from Cyme. . . . The northern group included the islands of Tenedos and Lesbos. In the latter there were originally six cities: Methymna, Mytilene, Pyrrha, Eresus, Arisba, and Antissa, but Arisba was subsequently conquered and enslaved by Mytilene. . . . The second great stream of migration proceeded from Athens [after the death of Codrus—according to Greek tradition, the younger sons of Codrus leading these Ionian colonists across the Ægean, first to the Carian city of Miletus—[see MILETUS]—which they captured, and then to the conquest of Ephesus and the island of Samos]. . . . The colonies spread until a dodecapolis was established, similar to the union which the Ionians had founded in their old settlements on the northern shore of Peloponnesus. In some cities the Ionian population formed a minority. . . . The colonisation of Ionia was undoubtedly, in the main, an achievement of emigrants from Attica, but it was not accomplished by a single family, or in the space of one life-time. . . . The two most famous of the Ionian cities were Miletus and Ephesus. The first was a Carian city previously known as Anactoria. . . . Ephesus was originally in the hands of the Leleges and the Lydians, who were driven out by the Ionians under Androclus. The ancient sanctuary of the tutelary goddess of the place was transformed by the Greeks into a temple of Artemis, who was here worshipped as the goddess of birth and productivity in accordance with Oriental rather than Hellenic ideas." The remaining Ionic cities and islands were Myus (named from the mosquitoes which infested it, and which finally drove the colony to abandon it), Priene, Erythrae, Clazomenae, Teos, Phocaea, Colophon, Lebedus, Samos and Chios. "Chios was first inhabited by Cretans . . . and subsequently by Carians. . . . Of the manner in which Chios became connected with the Ionians the Chians could give no clear account. . . . The southern part of the Anatolian coast, and the southernmost islands in the Ægean were colonised by the Dorians, who wrested them from the Phoenician or Carian occupants. Of the islands, Crete is the most important. . . . Crete was one of the oldest centres of civilisation in the Ægean [see CRETE; and ÆGEAN CIVILIZATION]. . . . The Dorian colony in Rhodes, like that in Crete, was ascribed to the band which left Argos under the command of Althaemenes. . . . Other islands colonised by the Dorians were Thera, . . . Melos, . . . Carpathus, Calydnæ, Nisyros, and Cos. . . . From the islands, the Dorians spread to the mainland. The peninsula of Cnidus was perhaps the first settlement. . . . Halicarnassus was founded from Troezen, and the Ionian element must have been considerable. . . . Of the Dorian cities, six united in the common worship of Apollo on the headland of Triopium. These were Lindus, Ialysus, and Camirus in Rhodes, Cos, and, on the mainland, Halicarnassus and Cnidus. . . . The territory which the Aeolians acquired is described

by Herodotus as more fertile than that occupied by the Ionians, but of a less excellent climate. It was inhabited by a number of tribes, among which the Troes or Teucri were the chief. . . . In Homer the inhabitants of the city of the Troad are Dardani or Troes, and the name Teucri does not occur. In historical times the Gergethes, who dwelt in the town of the same name . . . near Lampsacus, and also formed the subject population of Miletus, were the only remnants of this once famous nation. But their former greatness was attested by the Homeric poems, and the occurrence of the name Gergethians at various places in the Troad [see TROY]. To this tribe belonged the Troy of the Grecian epic, the site of which, so far as it represents any historical city, is fixed at Hissarlik. In the Iliad the Trojan empire extends from the Aeseopus to the Caicus; it was divided—or, at least, later historians speak of it as divided—into principalities which recognised Priam as their chief. But the Homeric descriptions of the city and its eminence are not to be taken as historically true. Whatever the power and civilisation of the ancient stronghold exhumed by Dr. Schliemann may have been, it was necessary for the epic poet to represent Priam and his nation as a dangerous rival in wealth and arms to the great kings of Mycenae and Sparta. . . . The traditional dates fix these colonies [of the Greeks in Asia Minor] in the generations which followed the Trojan war. . . . We may suppose that the colonisation of the Ægean and of Asia Minor by the Greeks was coincident with the expulsion of the Phœnicians. The greatest extension of the Phœnician power in the Ægean seems to fall in the 15th century B.C. From the 13th it was gradually on the decline, and the Greeks were enabled to secure the trade for themselves. . . . By 1100 B.C. Asia Minor may have been in the hands of the Greeks, though the Phœnicians still maintained themselves in Rhodes and Cyprus. But all attempts at chronology are illusory.”—E. Abbott, *History of Greece*, v. 1, ch. 4.—See also MILETUS; PHOCÆANS.

B. C. 724-539.—Prosperity of the Greek colonies.—Their submission to Cræsus, king of Lydia, and their conquest and annexation to the Persian empire.—“The Grecian colonies on the coast of Asia early rose to wealth by means of trade and manufactures. Though we have not the means of tracing their commerce, we know that it was considerable, with the mother country, with Italy, and at length Spain, with Phœnicia and the interior of Asia, whence the productions of India passed to Greece. The Milesians, who had fine woollen manufactures, extended their commerce to the Euxine, on all sides of which they founded factories, and exchanged their manufactures and other goods with the Scythians and the neighbouring peoples, for slaves, wool, raw hides, bees-wax, flax, hemp, pitch, etc. There is even reason to suppose that, by means of caravans, their traders bartered their wares not far from the confines of China [see MILETUS]. . . . But while they were advancing in wealth and prosperity, a powerful monarchy formed itself in Lydia, of which the capital was Sardes, a city at the foot of Mount Tmolus.” Gyges, the first of the Mermnad dynasty of Lydian kings (see LYDIANS), whose reign is supposed to have begun about 724 B.C., “turned his arms against the Ionian cities on the coast. During a century and a half the efforts of the Lydian monarchs to

reduce these states were unavailing. At length (Ol. 55) [568 B.C.] the celebrated Cræsus mounted the throne of Lydia, and he made all Asia this side of the River Halys (Lycia and Cilicia excepted) acknowledge his dominion. The Æolian, Ionian and Dorian cities of the coast all paid him tribute; but, according to the usual rule of eastern conquerors, he meddled not with their political institutions, and they might deem themselves fortunate in being insured against war by the payment of an annual sum of money. Cræsus, moreover, cultivated the friendship of the European Greeks.” But Cræsus was overthrown, 554 B.C., by the conquering Cyrus and his kingdom of Lydia was swallowed up in the great Persian empire then taking form [see PERSIA: B. C. 549-531.] Cyrus, during his war with Cræsus, had tried to entice the Ionians away from the latter and win them to an alliance with himself. But they incurred his resentment by refusing. “They and the Æolians now sent ambassadors, praying to be received to submission on the same terms as those on which they had obeyed the Lydian monarch; but the Milesians alone found favour: the rest had to prepare for war. They repaired the walls of their towns, and sent to Sparta for aid. Aid, however, was refused; but Cyrus, being called away by the war with Babylon, neglected them for the present. Three years afterwards (Ol. 50, 2), Harpagus, who had saved Cyrus in his infancy from his grandfather Astyages, came as governor of Lydia. He instantly prepared to reduce the cities of the coast. Town after town submitted. The Teians abandoned theirs, and retired to Abdera in Thrace; the Phocæans, getting on shipboard, and vowing never to return, sailed for Corsica, and being there harassed by the Carthaginians and Tyrrhenians, they went to Rhegium in Italy, and at length founded Massalia (Marseilles) on the coast of Gaul. The Grecian colonies thus became a part of the Persian empire.”—T. Keightley, *History of Greece*, pt. 1, ch. 9.

His resignation. See WORLD WAR: 1916: XII. Political conditions in the belligerent countries: f.

ASSAM, a province of British India near Bengal. with which it was united in 1905 under the title Eastern Bengal and Assam. (See INDIA: 1905-1910; also Map.) For the English acquisition of Assam, see INDIA: 1823-1833.

ASSANDUN, Battle of.—The sixth and last battle, 1016, between Edmund Ironsides, the English King, and his Danish rival, Cnut, or Canute, for the crown of England. The English were terribly defeated and the flower of their nobility perished on the field. The result was a division of the kingdom; but Edmund soon died, or was killed. Ashington, in Essex, was the battle-ground.

ASSASSINATIONS.—Of the political assassinations, many of which had a great influence upon the history of a country, the most important are the following:

Abbas Pasha, of Egypt. See EGYPT: 1840-1860.

Abdul Aziz, Sultan. See TURKEY: 1861-1876.

Albert I, German king. See AUSTRIA: 1291-1349.

Alexander, King, and Queen Draga. See SERBIA: 1885-1903.

Alexander II. See RUSSIA: 1879-1881.

Ali, Caliph. See CALIPHATE: 661.

ASSASSINS, a secret order developed from one of the Islamic sects, but ultimately rejecting the Koran and all Mohammedan teachings. It was founded about 1090 by Hassan Sabbah, a discontented politician, in the fortress of Alamut, Persia, and for more than 150 years terrorized surrounding peoples by its system of secret murder. (See also CARMATHIANS.) It was practically destroyed in 1255 by a Mongol army, led by Hulagu, though some fragments are said to be in existence. The name was derived from *hashishin*, or hemp-eaters, referring to the practice of stupefying the members of the order with a drug derived from hemp, the intoxicating fumes of which created fantastic dreams, which were explained as a foretaste of the paradisaical joys awaiting those who obeyed blindly the commands of the heads of the order. "I must speak . . . of that wonderful brotherhood of the Assassins, which during the 12th and 13th centuries spread such terror through all Asia, Mussulman and Christian. Their deeds should be studied in Von Hammer's history of their order, of which however there is an excellent analysis in Taylor's *History of Mohammedanism*. The word *Assassin*, it must be remembered, in its ordinary signification, is derived from this order, and not the reverse. The Assassins were not so called because they were murderers, but murderers are called assassins because the Assassins were murderers. The origin of the word *Assassin* has been much disputed by oriental scholars; but its application is sufficiently written upon the Asiatic history of the 12th century. The Assassins were not, strictly speaking, a dynasty, but rather an order, like the Templars; only the office of Grand-Master, like the Caliphate, became hereditary. They were originally a branch of the Egyptian Ishmaelites [see CALIPHATE: 908-1171] and at first professed the principles of that sect. But there can be no doubt that their inner doctrine became at last a mere negation of all religion and all morality. 'To believe nothing and to dare everything' was the summary of their teaching. Their esoteric principle, addressed to the non-initiated members of the order, was simple blind obedience to the will of their superiors. If the Assassin was ordered to take off a Caliph or a Sultan by the dagger or the bowl, the deed was done; if he was ordered to throw himself from the ramparts, the deed was done likewise. . . . Their founder was Hassan Sabah, who, in 1090, shortly before the death of Malek Shah, seized the castle of Alamout—the Vulture's nest—in northern Persia, whence they extended their possessions over a whole chain of mountain fortresses in that country and in Syria. The Grand-Master was the Sheikh-al-Jebal, the famous Old Man of the Mountain, at whose name Europe and Asia shuddered."—E. A. Freeman, *History and conquests of the Saracens*, lect. 4.—"In the Fatimide Khalif of Egypt, they [the Assassins, or Ismailiens of Syria and Persia] beheld an incarnate deity. To kill his enemies, in whatever way they best could, was an action, the merit of which could not be disputed, and the reward for which was certain." Hassan Sabbah, the founder of the Order, died at Alamut 1124. "From the day he entered Alamut until that of his death—a period of thirty-five years—he never emerged, but upon two occasions, from the seclusion of his house. Pitiless and inscrutable as Destiny, he watched the troubled world of Oriental politics, himself invisible, and whenever he perceived a formidable foe, caused a dagger to be driven into his heart." It was not until more than a century after the death of its founder that the fearful

organization of the Assassins was extinguished (1257) by the same flood of Mongol invasion which swept Bagdad and the Caliphate out of existence.—R. D. Osborn, *Isham under the Khalifs of Bagdad*, pt. 3, ch. 3.—W. C. Taylor, *History of Mohammedanism and its sects*, ch. 9.—The Assassins were rooted out from all their strongholds in Kuhistan and the neighboring region, and were practically exterminated, in 1257, by the Mongols under Hulagu or Khulagu, or Houla-gou, brother of Mongu Khan, the great sovereign of the Mongol empire, then reigning. Alamut, the Vulture's Nest, was demolished.—H. H. Howorth, *History of the Mongols*, part 1, p. 193; and part 3, pp. 31-108. See BAGDAD: 1258.

ASSAYE, a small village in southern India, in 1803 the scene of the victory of Major-General Wellesley (later the Duke of Wellington) over a large Indian force. See INDIA: 1798-1805.

ASSIUT DAM. See EGYPT: 1898-1901.

ASSIZES.—"The formal edicts known under the name of Assizes, the Assizes of Clarendon and Northampton, the Assize of Arms, the Assize of the Forest, and the Assizes of Measures, are the only relics of the legislative work of the period [reign of Henry II in England]. These edicts are chiefly composed of new regulations for the enforcement of royal justice. . . . In this respect they strongly resemble the capitularies of the Frank Kings, or, to go farther back, the edicts of the Roman prætors. . . . The term Assize, which comes into use in this meaning about the middle of the twelfth century, both on the continent and in England, appears to be the proper Norman name for such edicts. . . . In the 'Assize of Jerusalem' it simply means a law; and the same in Henry's legislation. Secondly, it means a form of trial established by the particular law, as the Great Assize, the Assize of Mort d'Ancester; and thirdly the court held to hold such trials, in which sense it is commonly used at the present day."—W. Stubbs, *Constitutional history of England*, ch. 13.—See also ENGLAND: 1170-1189.

Development of assize courts. See CRIMINAL LAW: 1066-1272.

Trial by assize. See COMMON LAW: 1164-1176.

Assize of arms. See ENGLAND: 1170-1189; LONGBOW.

Bloody assize. See ENGLAND: 1685 (September).

Assizes to the borough. See BIRMINGHAM, England: 1884.

Assize of bread and ale.—The assize of bread and ale was an English ordinance or enactment, dating back to the time of Henry III in the thirteenth century, which fixed the price of those commodities by a scale regulated according to the market prices of wheat, barley and oats. "The Assize of bread was re-enacted so lately as the beginning of the last century and was only abolished in London and its neighbourhood about thirty years ago"—that is, early in the nineteenth century.—G. L. Craik, *History of British commerce*, v. 1, p. 137.

Assize of Clarendon. See ENGLAND: 1162-1170.

Assize of Jerusalem.—"No sooner had Godfrey of Bouillon [who was elected king of Jerusalem, after the taking of the Holy City by the Crusaders, 1099] accepted the office of supreme magistrate than he solicited the public and private advice of the Latin pilgrims who were the best skilled in the statutes and customs of Europe. From these materials, with the counsel and approbation of the Patriarch and barons, of the clergy and laity, Godfrey composed the Assize of Jerusalem, a precious monument of feudal jurisprudence. The new code, attested by the seals of the King, the Patriarch, and the Viscount of Jerusalem, was deposited in the holy sepulchre, enriched with the improvements of succeeding times, and respectfully consulted as often as any doubtful question arose in the tribunals of Palestine. With the kingdom and city all was lost; the fragments of the written law were preserved by jealous tradition and variable practice till the middle of the thirteenth century. The code was restored by the pen of John d'IBelin, Count of Jaffa, one of the principal feudatories; and the final revision was accomplished in the year thirteen hundred and sixty-nine, for the use of the Latin kingdom of Cyprus."—E. Gibbon, *His-*

tory of the decline and fall of the Roman empire, ch. 58.—See also JERUSALEM: 1100.

ASSOCIATION INTERNATIONALE DU CONGO. See BELGIAN CONGO.

ASSOCIATION OF EASTERN MARCHES: Its organization. See POLAND: 1872-1910.

ASSOCIATIONS, French Law of.—A new era in agricultural and industrial organization in France was launched with "the repeal, by a law of March 23, 1884, of the restrictions on professional associations which had been imposed by the Constituent Assembly and later had been incorporated in the Napoleonic Penal Code. It had been required that no association of any sort comprising more than twenty members should be formed except with the consent of the government. Now, by the law of 1884, it was stipulated that associations having exclusively for their object 'the study and defence of commercial and agricultural economic interests,' might be formed and maintained without special authorisation, and that such organisations should be accorded full legal rights, including those of owning property and appearing in the courts."—F. A. Ogg, *Economic development of modern Europe*, pp. 196-197.—The growth of French syndicalism—in the theory of political thinkers like Sorel and Lagardelle—and in the concrete organization of *syndicats* in France—dates from the repeal of this law. In 1901 Parliament again passed an Associations Law mainly designed to limit reactionary Catholic education by requiring authorization for all orders of monks or nuns. This was one of the first radical measures embodying state opposition to the Church, which was finally entirely separated from the state in 1905. See FRANCE: 1900-1904.

ASSUAN, or Aswan, town and capital of a province of the same name in upper Egypt; situated on the east bank of the Nile; popular health resort and stopping-place for tourists. (For origin of word, see EGYPT: Position and nature of the country.) The Assuan Dam, which stretches across the Nile three miles above the town proper, is a great feat of engineering, completed at the close of 1902. The capacity of the reservoir was at first 1,065,000,000 cubic meters, but later the level of the dam was raised and the present capacity is 2,423,000,000 cubic meters. A regrettable fact, incident to this improvement, was the flooding of the island of Philæ.—See also EGYPT: 1898-1901; and 1902 (December).

ASSUR. See ASSYRIA: People, religion and early history; BABYLONIA: Creation myths; RELIGION: B. C. 2000-200.

ASSUR-BANI-PAL, king of Assyria 668-626 B. C.; last of the great kings of the Sargonide dynasty; suppressed coalition of Babylonia, Arabia, Ethiopia, Phœnicia, and Palestine which revolted against him; captured and destroyed Susa (646-640 B. C.); under his protection and promotion, Assyrian art attained its highest development; [see also EDUCATION: Ancient: B. C. 35th-6th centuries: Babylonia and Assyria] caused the re-editing of the whole cuneiform literature then in existence, from which we to-day get our knowl-

edge of Assyrian history and civilization; largely responsible for the creation of the great Nineveh library.—See also ASSYRIA: People, religion and early history; Later Assyrian Empire, and LIBRARIES: Ancient: Babylonia and Assyria.

ASSUR-NAZIR-PAL, king of Assyria, 884-860 B. C.; one of the greatest and most warlike of Assyrian kings; most important of his numerous campaigns were those against Nairi and Syria and those which culminated in a westward extension of his boundaries, rebuilt Colah, his capital, adorning it with a magnificent palace and temple of Adar.—See also ASSYRIA: Later Assyrian Empire.

ASSYRIA: The Land.—"There is, on carefully drawn maps of Mesopotamia, a pale undulating line (considerably to the north of the city of Accad (q. v.) or Agad), which cuts across the valley of the two rivers, from Is or Hit on the Euphrates,—the place famous for its inexhaustible bitumen pits,—to Samarah on the Tigris. This line marks the beginning of the alluvium, *i. e.*, of the rich, moist alluvial land formed by the rivers, and at the same time the natural boundary of Northern Babylonia. Beyond it the land, though still a plain, is not only higher, rising till it meets the transversal limestone ridge of the Sinjar Hills, but of an entirely different character and formation. It is distressingly dry and bare, scarcely differing in this respect from the contiguous Syrian Desert, and nothing but the most laborious irrigation could ever have made it productive, except in the immediate vicinity of the rivers. What the country has become through centuries of neglect and misrule, we have seen. It must have been much in the same condition before a highly developed civilization reclaimed it from its natural barrenness and covered it with towns and farms. It is probable that for many centuries a vast tract of land south of the alluvium line, as well as all that lay north of it, was virtually unoccupied; the resort of nameless and unclassed nomadic tribes, for Agade is the most northern of important Accadian cities we hear of. Yet some pioneers must have pushed northward at a pretty early time, followed at intervals by a steadier stream of emigrants, possibly driven from their populous homes in Accad by the discomfort and oppression consequent on the great Elamite invasion and conquest. At least there are, near the present hamlet of Kileh-Sherghat, on the right bank of the Tigris, the ruins of a city, whose most ancient name is Accadian—Aushar—and appears to mean, 'well-watered plain,' but was afterwards changed into Asshur, and which was governed by king-priests—*patesis*—after the manner of the ancient Caldean cities. There are temple-ruins there, of which the bricks bear the names of Ishmi-Dagan and his son, Shamash-Raman, who are mentioned by a later king in a way to show that they lived very close on 1800 B. C. The colony which settled here and quickly grew, spreading further north, appropriating and peopling the small but fertile region between the Tigris, its several tributary streams and the first hills of the Zagros highlands, was Semitic; their first city's name was extended to all the land they occupied, and they also called themselves by it. They were the 'people of Asshur'; their land was 'the land of Asshur'; and not many centuries elapsed before all their neighbors, far and wide, had good reason to know and dread the name. This sheltered nook, narrowly circumscribed, but exceptionally well situated as regards both defence and natural advantages, may well be called the cradle of the

great Assyrian Empire, where the young nation built its first cities, the stronghold in which, during many years, it gathered strength and independence, gradually working out its peculiarly vigorous and aggressive character, and finding its military training in petty but constant conflicts with the surrounding roving tribes of the hill and the plain. Accordingly, it is this small district of a few square miles,—with its three great cities, Kalah, Nineveh, and Arbela, and a fourth, Dur-Sharrukin, added much later,—which has been known to the ancients as Asuria or Assyria proper, and to which the passage in the tenth chapter of Genesis (11-12) alludes. At the period of its greatest expansion, however, the name of 'Assyrian'—'land of Asshur'—covered a far greater territory, more than filling the space between the two rivers, from the mountains of Armenia to the alluvial line. This gives a length of 350

But the kinship goes deeper than that, and asserts itself in certain spiritual tendencies, which find their expression in the national religion, or, more correctly, in the one essential modification introduced by the Assyrians into the Babylonian religion, which they otherwise adopted wholesale, just as they brought it from their Southern home. [For ancient mythology, see BABYLONIA: Creation myths.] Like their Hebrew brethren, they arrived at the perception of the Divine Unity; but while the wise men of the Hebrews took their stand uncompromisingly on monotheism and imposed it on their reluctant followers with a fervor and energy that no resistance or backsliding could abate, the Assyrian priests thought to reconcile the truth, which they but imperfectly grasped, with the old traditions and the established religious system. They retained the entire Babylonian pantheon, with all its theory of successive

Reconstructed by Layard

miles by a breadth, between the Euphrates and the Zagros, varying from above 300 to 170 miles. The area was probably not less than 75,000 square miles, which is beyond that of the German provinces of Prussia or Austria, more than double that of Portugal, and not much below that of Great Britain. Assyria would thus, from her mere size, be calculated to play an important part in history; and the more so, as, during the period of her greatness, scarcely any nation with which she came in contact possessed nearly so extensive a territory."—Z. A. Ragozin, *Story of Assyria*, pp. 1-4.—See also ADIABENNE; ASIA; HISTORY: 14; and MESOPOTAMIA.

People, religion and early history.—"That the nation of Asshur, which the biblical table of nations places second among Shem's own children, was of purely Semitic race, has never been doubted. The striking likeness of the Assyrian to the Hebrew type of face would almost alone have sufficed to establish the relationship, even were not the two languages so very nearly akin.

emanations, its two great triads, its five planetary deities, and the host of inferior divinities, but, at the head of them all, and above them all, they placed the one God and Master whom they recognized as supreme. They did not leave him wrapped in uncertainty and lost in misty remoteness, but gave him a very distinct individuality and a personal name: they called him Asshur; and whether the city was named after the god or the god after the city, and then the land and people after both,—a matter of dispute among scholars,—one fact remains, and that the all-important one: that the Assyrians identified themselves with their own national god, called themselves 'his people,' believed themselves to be under his especial protection and leadership in peace and war. [See also RELIGION: B. C. 2000-200.] . . . Whether Assyria in its infancy was a mere dependency of the mother country, ruled, may be, by governors sent from Babylon, or whether it was from the first an independent colony (as the young hee-swarm when

it has flown from the old hive), has never yet been ascertained. There have been no means of doing so . . . as there is no narrative monumental inscription earlier than 1100 B. C. Still, all things considered, the latter supposition appears the more probable one. The Semitic emigrants who retired to the distant northern settlement of Aushar, possibly before the Elamitic conquerors, took their departure at a time when the mother country was too distracted by wars and the patriotic struggle against the hated foreigners to exercise much control or supervision over its borders; and they will have experienced as little of both as did their brethren of Ur, when they wandered forth into the steppes of Canaan. The bond must have been merely a moral one, that of community in culture, language, and religion—a bond that could not prevent rivalry as soon as the young country's increasing strength allowed it, and, as a consequence, a frequently hostile attitude. At all events, border feuds must have begun early and proved troublesome, from the indefiniteness of the natural boundary, if the slight elevation of the alluvial line may be so termed, and the first positive record we have of Assyria as a political power is one which shows us a king of Assyria and a king of Kar-Dunyash (Babylon) making a treaty in order to determine the boundaries of the two countries, and giving each other pledges for the observance thereof; this happened about 1450 B. C., and the successors of the two kings renewed the treaty about 1400 B. C.—*Ibid.*, pp. 5, 10-20.—“With the possible exception of the Huns, or the wild hordes of Tamerlane, there has probably never existed in the history of the world a power so purely and solely destructive, so utterly devoid of the slightest desire to make any real contribution to the welfare of the human race, as Assyria. But the Huns and the hordes of Tamerlane were untaught savages. In the case of Assyria you have a highly organized and civilized people, skilled to an astounding degree in the arts, with all the power to do great things for humanity, but absolutely deficient in the will. If you can imagine a man with no small amount of learning, with all the externals of civilization, with a fine taste in certain aspects of art, and a tremendous aptitude for organization and discipline, and then imagine such a man imbued with the ruthless spirit of a Red Indian brave and an absolute delight in witnessing the most ghastly forms of human suffering, you will have a fairly accurate conception of the ordinary Assyrian, king or commoner; the outside, a splendid specimen of highly developed humanity—the inside a mere ravaging tiger. There have been other great conquering races which could be cruel enough on occasion, but at least they contributed something to the sum of human knowledge or achievement. The Roman Empire, for instance, ruthless as were its methods often, was actually a great boon to the world. Assyria made no such contribution to human life. Totally lacking in originality, she took her art, her language, her literature, and her science from the elder Babylonian race upon which she waged such constant war. She created nothing; she existed simply to destroy; and when she ceased to destroy, she was destroyed. In a word, she was the scourge of God, or, as Isaiah put it, with his vivid insight, her function in the world was just to be God's ax and saw to do the rough hewing that Providence needed for the shaping of the race. Early in their history the Babylonians seem to have sent a colony northward up the rivers into the land of Mesopotamia. There the colonists founded a city which

they called Assur, after their god Ashur. In the time of Hammurabi, Assur was still merely a colony of Babylonia and subject to the empire.”—J. Baikie. *Lands and peoples of the Bible*, pp. 97-98.

“When and why the Semites first occupied Assyria is not clear; but the conquest certainly preceded the time of Hammurabi, who held Assyria as a garrisoned province; and it may very well have been part of either or both of the first two Semitic movements. It is still less clear what the conquerors found there. Probably it was a simple upland culture like that of early Elam, only little removed from the neolithic phase. What the Semites brought with them was knowledge and organization. With experience won in Babylonia, they practised extensive irrigation; they exploited metals and timber in the hills, rapidly dominated the moister upper valley, civilized its Kurdish occupants, and completely interbred them.”—J. L. Myres. *Dawn of history*, p. 126.—See also SEMITES: Primitive Babylonia.—“During the thousand years which go roughly from 1600 to 600 B. C. the centre of power is no longer in Shinar (Babylonia), but with the kindred Semitic people farther up the Tigris—the Assyrians. Babylon sees itself outshone by its rivals Asshur or Nineveh. The Assyrian kingdom presents the aspect of a strongly organized monarchy with a restless appetite for conquest. Its culture, its writing, its art, its religion, are still those of Shinar, but it is animated by a new aggressive spirit. And yet for Assyria to maintain its position required a continued effort, and it could not but be that its periods of supremacy should alternate with periods when its arm failed against the pressure from outside. For on its eastern and northern frontiers Assyria adjoined a mountain country whose races were not easily held under, and were always ready to attack the conqueror; and if it strove to extend its power across Mesopotamia to the west, it again came into contact with the peoples of Northern Syria and of the mountains which separate Northern Syria from Asia Minor. It was part of the ambition of the kings of Assyria to dominate the land of Shinar. The old cities and temples of that land, the cradle of their culture, had for their imagination a prestige, which, with all their military predominance, they must bow. And, besides, the riches of the alluvial country continued to make it in one way the centre of the world. In Shinar, since the days of Hammurabi, the city of Babylon held its place as the capital city, and the cities lower down, which had been great before Babylon was heard of, decayed or fell to a subordinate grade. And the kings of Babylon did not readily submit to the supremacy of the kings of Assyria. The history of these thousand years are, therefore, full of wars between the Assyrians and their Babylonian cousins. Sometimes the king of Assyria succeeded in combining with his title of ‘King of Assyria’ the title of ‘King of Sumer and Akkad’; sometimes the kings of Babylon were able to drive back the Assyrian armies and assert their independence. The first expansion of the Assyrian power took place in the twelfth century. King Tiglath-pileser I . . . conquered on the west the Moschians and the Commagenians in the hill-country of the Upper Euphrates between Mesopotamia and Asia Minor, marched victoriously eastwards into the mountains of Kurdistan, penetrated into what is now Armenia to the north, subjugated the petty kingdoms of Northern Syria, crossed over Lebanon to the Phœnician coast, and looked upon the Mediterranean Sea. The king of Egypt, alarmed at his approach, sent him pres-

ents, amongst them crocodiles and hippopotami for the royal menagerie on the Tigris. Tiglath-pileser on another campaign marched down the Tigris and subjugated the land of Shinar, but here the king of Babylon succeeded in inflicting bloody reverses upon the Assyrian armies and driving them back to their own land. The son of Tiglath-pileser took revenge and we hear of Baghdad (not yet of great importance among the towns of Shinar) being captured by the Assyrians. But within a few reigns the empire of Tiglath-pileser had broken up, and the peoples of Syria and Palestine did not know again the Assyrian terror for many generations to come."—E. Bevan, *Land of the two rivers*, pp. 38-42.—See also **BABYLONIA**: Earliest inhabitants.

Later Assyrian empire.—"According to all appearance it was the Egyptian conquest about sixteen centuries B. C., that led to the partition

ture her revolts were always suppressed, and the Assyrian supremacy re-established after more or less desperate conflicts. During nearly half a century, from about 1060 to 1020 B. C., Babylon seems to have recovered the upper hand. The victories of her princes put an end to what is called the First Assyrian Empire. But after one or two generations a new family mounted the northern throne, and toiling energetically for a century or so to establish the grandeur of the monarchy, founded the Second Assyrian Empire. The upper country regained its ascendancy by the help of military institutions whose details now escape us, although their results may be traced throughout the later history of Assyria. From the tenth century onwards the effects of these institutions become visible in expeditions made by the armies of Assyria, now to the shores of the Persian Gulf or the Caspian, and now through

KING TIGLATH-PILESER IN HIS CHARIOT

From a wall-frieze found at Nineveh

of Mesopotamia [see **EGYPT**: About B. C. 1500-1400.] Vassals of Thothmes and Rameses, called by Berosus the 'Arab kings,' sat upon the throne of Babylon. The tribes of Upper Mesopotamia were farther from Egypt, and their chiefs found it easier to preserve their independence. At first each city had its own prince, but in time one of these petty kingdoms absorbed the rest, and Nineveh became the capital of an united Assyria. As the years passed away the frontiers of the nation thus constituted were pushed gradually southwards until all Mesopotamia was brought under one sceptre. This consummation appears to have been complete by the end of the fourteenth century, at which period Egypt, enfeebled and rolled back upon herself, ceased to make her influence felt upon the Euphrates. Even then Babylon kept her own kings, but they had sunk to be little more than hereditary satraps receiving investiture from Nineveh. Over and over again Babylon attempted to shake off the yoke of her neighbour; but down to the seventh cen-

the mountains of Armenia into the plains of Cappadocia, or across the Syrian desert to the Lebanon and the coast cities of Phœnicia. [See also **SAMARIA**: Samaritans: Repopulation of city and district by Assyrian conqueror.] The first princes whose figured monuments—in contradistinction to mere inscriptions—have come down to us, belonged to those days. The oldest of all was Assurnazirpal, whose residence was at Calach (Nimroud). The bas-reliefs with which his palace was decorated are now in the Louvre and the British Museum, most of them in the latter. . . . To Assurnazirpal's son Shalmaneser III. belongs the obelisk of basalt which also stands in the British Museum. . . . Shalmaneser was an intrepid man of war. The inscriptions on his obelisk recall the events of thirty-one campaigns waged against the neighbouring peoples under the leadership of the king himself. . . . Under the immediate successors of Shalmaneser the Assyrian prestige was maintained at a high level by dint of the same lavish bloodshed and truculent energy; but towards the eighth

century it began to decline. There was then a period of languor and decadence, some echo of which, and of its accompanying disasters, seems to have been embodied by the Greeks in the romantic tale of Sardanapalus. No shadow of confirmation for the story of a first destruction of Nineveh is to be found in the inscriptions, and, in the middle of the same century, we again find the Assyrian arms triumphant under the leadership of Tiglath Pileser II., a king modelled after the great warriors of the earlier days. This prince seems to have carried his victorious arms as far east as the Indus, and west as the frontiers of Egypt. And yet it was only under his second successor, Saryoukin, or, to give him his popular name, Sargon, the founder of a new dynasty, that Syria, with the exception of Tyre, was brought into complete submission after a great victory over the Egyptians (721-704). . . . His son Sennacherib equalled him both as a soldier and as a builder. [See also JERUSALEM: B. C. 1400-700.]

rebel king, Assur-dain-pal, who reigned B. C. 827-820, and whose name and history fit the tale], pushed the adventures and conquests of the Assyrian arms still farther. They subdued the whole north of Arabia, and invaded Egypt more than once. [See also EGYPT: B. C. 670-525.] . . . There was a moment when the great Semitic Empire founded by the Sargonides touched even the Ægæan, for Cyges, king of Lydia, finding himself menaced by the Cimmerians, did homage to Assurbanipal, and sued for help against those foes to all civilization."—G. Perrot and C. Chipiez, *History of art in Chaldæa and Assyria*, v. 1, ch. 1, sect. 5.—See also SYRIA: B. C. 700-500.—"The power of Assurbanipal was equal to the task of holding under control the subjects of Assyria at all points. He boasts of having compelled the king of Tyre to drink sea-water to quench his thirst. The greatest opposition he met with was in Elam, but this too he was able to suppress. . . . Assurbanipal says that he in-

PALACE OF SENNACHERIB, KING OF ASSYRIA, 705 B. C.

Restoration

He began by crushing the rebels of Elam and Chaldæa with unflinching severity; in his anger he almost exterminated the inhabitants of Babylon, the perennial seat of revolt; but, on the other hand, he repaired and restored Nineveh: Most of his predecessors had been absentees from the capital, and had neglected its buildings. . . . He chose a site well within the city for the magnificent palace which Mr. Layard has been the means of restoring to the world. This building is now known as Kouyoundjik, from the name of the village perched upon the mound within which the buildings of Sennacherib were hidden. Sennacherib rebuilt the walls, the towers and the quays of Nineveh at the same time, so that the capital, which had never ceased to be the strongest and most populous city of the empire, again became the residence of the king—a distinction which it was to preserve until the fast approaching date of its final destruction. The son of Sennacherib, Esarhaddon, and his grandson, Assurbanipal [long identified with the Sardanapalus of the Greeks; but Prof. Sayce now finds the Sardanapalus of Greek romance in a

increased the tributes, but that his action was opposed by his own brother, whom he had formerly maintained by force of arms in Babylon. This brother now seduced a great number of other nations and princes from their allegiance. . . . The king of Babylon placed himself, so to speak, at their head. . . . The danger was immensely increased when the king set up by Assurbanipal in Elam joined the movement. It was necessary to put an end to this revolt, and this was effected for once without much difficulty. . . . Thereupon the rebellious brother in Babylon has to give way. The gods who go before Assurbanipal have, as he says, thrust the king of Babylon into a consuming fire and put an end to his life. His adherents . . . are horribly punished. . . . The provinces which joined them are subjected to the laws of the Assyrian gods. Even the Arabs, who have sided with the rebels, bow before the king, whilst of his power in Egypt it is said that it extended to the sources of the Nile. His dominion reached even to Asia Minor. . . . Assyria is the first conquering power which we encounter in the history of the world. The most

effective means which she brought to bear in consolidating her conquests consisted in the transportation of the principal inhabitants from the subjugated districts to Assyria, and the settlement of Assyrians in the newly acquired provinces. . . . The most important result of the action of Assyria upon the world was perhaps that she limited or broke up the petty sovereignties and the local religions of Western Asia. . . . It was . . . an event which convulsed the world when this power, in the full current of its life and progress, suddenly ceased to exist. Since the 19th century every event of importance had originated in Assyria; in the middle of the 7th she suddenly collapsed. . . . Of the manner in which the ruin of Nineveh was brought about we have nowhere any authentic record. . . . Apart from their miraculous accessories, the one circumstance in which . . . [most of the accounts given] agree, is that Assyria was overthrown by the combination of the Medes and Babylonians. Everything else that is said on the subject verges on the fabulous; and even the fact of the alliance is doubtful, since Herodotus, who lived nearest to the period we are treating of, knows nothing of it, and ascribes the conquest simply to the Medes."—L. von Ranke, *Universal history: Oldest historical group of nations*, ch. 3.—See also BABYLONIA: Map; PHœNICIANS: B. C. 850-538.

Fall of the empire.—The story, briefly told, of the alliance by which the Assyrian monarchy is said to have been overthrown, is as follows: About 626 or 625 B. C., a new revolt broke out in Babylonia, and the Assyrian king sent a general named Nabu-pal-usur or Nabopolassar to quell it. Nabu-pal-usur succeeded in his undertaking, and seems to have been rewarded by being made governor of Babylon. But his ambition aimed higher, and he mounted the ancient Babylonian throne, casting off his allegiance to Assyria and joining her enemies. "He was wise enough to see that Assyria could not be completely crushed by one nation, and he therefore made a league with Pharaoh Necho, of Egypt, and asked the Median king, Cyaxares, to give his daughter, Amytes, to Nebuchadnezzar, his son, to wife. Thus a league was made, and about B. C. 609 the kings marched against Assyria. They suffered various defeats, but eventually the Assyrian army was defeated, and Shalman, the brother of the king of Assyria, slain. The united kings then besieged Nineveh. During the siege the river Tigris rose and carried away the greater part of the city wall. The Assyrian king [Sardanapalus of legend] gathered together his wives and property in the palace, and setting fire to it, all perished in the flames. The enemies went into the city and utterly destroyed all they could lay their hands upon. With the fall of Nineveh, Assyria as a power practically ceased to exist."—E. A. W. Budge, *Babylonian life and history*, ch. 5.—See also AKKAD; BABYLONIA; CHALDEA; and SUMER.

Art and archæological remains.—"The architecture of the Assyrians is the brickwork of Babylonia, faced heavily with sculptured stone, the doorways guarded by monstrous human-headed bulls; everywhere are scenes and long cuneiform inscriptions glorifying Asshur and the king. Their art, Babylonian at bottom, gains in technical skill, but forfeits originality to the sombre realism of the national temper. Only in its last days does it borrow, perhaps from the far west, a new grace, and joy in the natural beauty of landscape, horses, hounds, and hunted lions, which strike us as almost modern."—J. L. Myres, *Dawn of history*, p. 128.—See ARCHITECTURE: Oriental;

Mesopotamian; and TEMPLES: Stage of culture represented by temple architecture.—"M. Botta, who was appointed French consul at Mosul in 1842, was the first to commence excavations on the sites of the buried cities of Assyria, and to him is due the honour of the first discovery of her long lost palaces. M. Botta commenced his labours at Kouyunjik, the large mound opposite Mosul, but he found here very little to compensate for his labours. New at the time to excavations, he does not appear to have worked in the best manner; M. Botta at Kouyunjik contented himself with sinking pits in the mound, and on these proving unproductive abandoning them. While M. Botta was excavating at Kouyunjik, his attention was called to the mounds of Khorsabad by a native of the village on that site; and he sent a party of workmen to the spot to commence excavation. In a few days his perseverance was rewarded by the discovery of some sculptures, after which, abandoning the work at Kouyunjik, he transferred his establishment to Khorsabad and thoroughly explored that site. . . . The palace which M. Botta had discovered . . . is one of the most perfect Assyrian buildings yet explored, and forms an excellent example of Assyrian architecture. Besides the palace on the mound of Khorsabad, M. Botta also opened the remains of a temple, and a grand porch decorated by six winged bulls. . . . The operations of M. Botta were brought to a close in 1845, and a splendid collection of sculptures and other antiquities, the fruits of his labours, arrived in Paris in 1846 and was deposited in the Louvre. Afterwards the French Government appointed M. Place consul at Mosul, and he continued some of the excavations of his predecessor. . . . Mr. Layard, whose attention was early turned in this direction, visited the country in 1840, and afterwards took a great interest in the excavations of M. Botta. At length, in 1845, Layard was enabled through the assistance of Sir Stratford Canning to commence excavations in Assyria himself. On the 8th of November he started from Mosul, and descended the Tigris to Nimroud. . . . Mr. Layard has described in his works with great minuteness his successive excavations, and the remarkable and interesting discoveries he made. . . . After making these discoveries in Assyria, Mr. Layard visited Babylonia, and opened trenches in several of the mounds there. On the return of Mr. Layard to England, excavations were continued in the Euphrates valley under the superintendence of Colonel (now Sir Henry) Rawlinson. Under his directions, Mr. Hormuzd Rassam, Mr. Loftus, and Mr. Taylor excavated various sites and made numerous discoveries, the British Museum receiving the best of the monuments. The materials collected in the national museums of France and England, and the numerous inscriptions published, attracted the attention of the learned, and very soon considerable light was thrown on the history, language, manners, and customs of ancient Assyria and Babylonia."—G. Smith, *Assyrian discoveries*, ch. 1.—"One of the most important results of Sir A. H. Layard's explorations at Nineveh was the discovery of the ruined library of the ancient city, now buried under the mounds of Kouyunjik. The broken clay tablets belonging to this library not only furnished the student with an immense mass of literary matter, but also with direct aids towards a knowledge of the Assyrian syllabary and language. Among the literature represented in the library of Kouyunjik were lists of characters, with their various phonetic and ideographic meanings, tables of synonyms, and catalogues of the names of plants

and animals. This, however, was not all. [See also LIBRARIES: Ancient: Babylonia and Assyria.] The inventors of the cuneiform system of writing had been a people who preceded the Semites in the occupation of Babylonia, and who spoke an agglutinative language utterly different from that of their Semitic successors. These Accadians, as they are usually termed, left behind them a considerable amount of literature, which was highly prized by the Semitic Babylonians and Assyrians. A large portion of the Ninevite tablets, accord-

later ones by Mr. Hormuzd Rassam, have added largely to the stock of tablets from Kouyunjik originally acquired for the British Museum by Sir A. H. Layard, and have also brought to light a few other tablets from the libraries of Babylonia."—A. H. Sayce, *Fresh light from the ancient monuments*, ch. 1.—See also EDUCATION: Ancient: B. C. 35th-6th centuries: Babylonia and Assyria.

Development of music. See MUSIC: Ancient: B. C. 3000-7th century.

ASSYRIA, Eponym canon of.—"Just as there were archons at Athens and consuls at Rome who were elected annually, so among the Assyrians there was a custom of electing one man to be over the year, whom they called 'limu,' or 'eponym.' . . . Babylonia and Assyrian documents were more generally dated by the names of these eponyms than by that of the reigning King. . . .

In 1862 Sir Henry Rawlinson discovered the fragment of the eponym canon of Assyria. It was one of the grandest and most important discoveries ever made, for it has decided definitely a great many points which otherwise could never have been cleared up. Fragments of seven copies of this canon were found, and from these the chronology of Assyria has been definitely settled from B. C. 1330 to about B. C. 620."—E. A. W. Budge, *Babylonian life and history*, ch. 3.

ASSYRO-CHALDEANS.—This interesting little people, the last surviving fragment of two great empires, adopted Christianity at an early date and have maintained it against every persecution, under the Nestorian Patriarchate. See **CHRISTIANITY**: A. D. 33-52; 35-60.

In World War.—The following is a brief summary of the part which was played by the Assyro-Chaldeans during the war—as put forward by their two official delegates to the Peace Conference. "On 18 September, 1914, at the instigation of Mr. Vedeniski, Russian Consul at Urmia, and of his military attaché, Colonel Andreviski, who had been officially instructed by their Government and its Allies to treat with our nation, the Assyro-Chaldeans, after a long discussion decided to reject the overtures made by representatives of the Central Powers and to join the ranks of the Allies. This action was to assure our autonomy at the end of the war. Our declaration of war was followed by an enthusiastic demonstration. Thousands of our future soldiers paraded the streets of Urmia, carrying Allied flags, before the French, Russian and American agencies. There exist photographs taken on this occasion by the heads of these agencies. The Russian authorities provided our men with 3,000 rifles of the Burdenka model. On the same day the German flag was pulled down and the flagstaff smashed. During the first three years of war, till the collapse of Russia, these men fought side by side with the Russians, under Cernizohov, Andreviski and Simonov, in many fierce combats. Meanwhile in Turkey the Assyro-Chaldeans of the mountain district of Hakkari enjoyed a real autonomy. When war broke out, we realised that it was being waged by the great western democracies for the cause of civilisation and the liberty of oppressed peoples. Moreover, our brothers of Persia had already ranged themselves on the side of the Entente, despite all the pressure and promises of the Turks and Germans. Early in 1915, then, our nation in Turkey also threw in its lot with the Allies. Kurdish tribes, urged on by the Turkish Government, attacked us, but were driven off during May, 1915. . . . The Turks then sent regular troops to the aid of the Kurds; but, aided by our kinsmen in neighbouring districts, we were able to hold at bay, first the Governor of Mosul, Haider Bey, and then a second army of mixed regular and Kurdish bands, commanded by Djevdet Bey, Governor of Van (brother-in-law of the notorious Enver Pasha), advancing from the north. Out-numbered by ten to one, our forces withdrew in good order towards the Persian frontier, and, fusing with their kinsmen on the Russian front, continued the struggle. At the beginning of the Bolshevik revolution, a British General, and soon after Colonel Chardigny of the French Army, reached Urmia. They encouraged the Assyro-Chaldeans to continue the war against the Turks, replacing the Russians on the Turco-Persian frontier. The Russian troops were retiring homewards in disorder, leaving the whole front (extending from Serai through Bashkala, Deza, Oashnou to Saoutchboulak) to our sole defence. At the end

of 1917, Captain Gracey, as special envoy of the British Government, took part at Urmia in a meeting between the civil and religious chiefs of the Assyro-Chaldeans and representatives of the greater Allies. Among them were the Russian Consul, the American Vice-Consul, Colonel Caujol of the French Army, the Apostolic Delegate Monsignor Lentak, and several Russian generals and other French and Russian officers. Captain Gracey encouraged the Assyro-Chaldeans and confirmed the engagements made to him by Mr. Vedeniski regarding the autonomy which they would receive from the Allies if they continued the struggle. He further declared that the Allies were ready to accord them moral and material support, and to supply arms, munitions, money and officers. These guarantees were confirmed by the representatives of France, America and Russia. They were unanimously accepted by the Assembly, which decided to reorganise the Assyro-Chaldean army, with a view to replacing the Russian."—Nedjib and Namik (*New Europe*, April 15, 1920, pp. 21-22).—See also **WORLD WAR**: 1918: VI. Turkish theater: a, 9.

ASTELL, Mary (1668-1731), English author and educator. Proposed plan for a college for women. See **WOMEN'S RIGHTS**: 1673-1800.

ASTOLF, or Aistulf, king of the Lombards, 749-756.—Laid siege in 756 to Rome, which was relieved by Pepin. See **ITALY**: 568-800; **LOMBARDS**: 754-774.

ASTON, Sir George (Grey) (1861-), British general; served as brigadier general on the general staff in South Africa (1908-1912); commandant Royal Marine Artillery (1914-1917); led an expedition to Ostend (1914); in the secretariat of the war cabinet (1918-1919).

ASTOR, John Jacob (1763-1848), American merchant. In an attempt to establish the fur trade from the Great Lakes to the Pacific and thence to China and India, he founded Astoria on the Columbia river in 1811, which was later seized by the English. (See **OREGON**: 1808-1826; **ST. LOUIS**: 1810; **WISCONSIN**: 1812-1825.) Erected many buildings in New York City and founded the Astor Library, since 1895 part of the New York public library.—See also **LIBRARIES**: Modern: U. S. A.: New York Public Library; **GIFTS AND BEQUESTS**.

Also in: J. Parton, *Life of John Jacob Astor*.

ASTOR, John Jacob (1864-1912), American capitalist, inventor, and soldier, fourth of the name. Devoted himself to the management of his vast interests in New York; in 1898 commissioned lieutenant-colonel of the United States. Volunteered and served as a staff officer in the Santiago campaign; presented to the Government fully equipped mountain battery which did useful work before Manila. He invented some useful devices, notably bicycle brake, a pneumatic road improver, and a marine turbine. (See also **INVENTIONS**: 19th century: Piano.) He was drowned at sea at the sinking of the Titanic. See **TITANIC**.

ASTOR, Nancy Langhorne, Lady. Elected to House of Commons, 1919, on the Unionist ticket, being the first woman to serve in the British Parliament.

ASTOR, William Backhouse (1792-1875), son of John Jacob Astor.

Gift to Astor library. See **GIFTS AND BEQUESTS**.

ASTOR, William Waldorf, 1st Viscount of Hever (1848-1919). Served in the legislature of New York state 1877-1881; United States minister to Italy, 1882-1885; moved to England, 1800, and in 1899 was naturalized. Created a peer, 1916; encountered much criticism in both his native and his adopted country.

ASTOR, Lenox and Tilden foundation. See LIBRARIES: Modern: U. S.: New York Public Library.

ASTOR OF HEVER, 1st viscount. See ASTOR, WILLIAM WALDORF.

ASTORIA, a city and county seat of Clatsop County, Oregon, situated on the Columbia river, 100 miles northwest of Portland; was founded by John Jacob Astor in 1811, although the Lewis and Clark expedition established Fort Clatsop there in 1805. See OREGON: 1808-1826; WASHINGTON STATE: 1811-1846.

ASTRAKHAN, the khanate. See MONGOLIA: 1238-1391; RUSSIA: Map of Russian and border states.

1569.—Russian repulse of the Turks. See RUSSIA: 1560-1571.

1918.—In union with Soviet Russia. See WORLD WAR: 1918: VI. Turkish theater: b, 1.

ASTROLABE, an instrument used for the purpose of determining stellar, solar and lunar altitudes and consequently the latitude of the observer. The instrument was considerably improved by the astronomer Tycho, whose astrolabes ("armillae") resembled the modern equatorial. The mariner's astrolabe, the same instrument used by Columbus, which is modeled after those of the astronomers, was first constructed by Martin Behaim (1480), but later (1731) superseded by John Hadley's quadrant.

ASTROLOGY: Origin and history.—"The first inhabitants of the world were compelled to accommodate their acts to the daily and annual alternations of light and darkness and of heat and cold, as much as to the irregular changes of weather, attacks of disease, and the fortune of war. They soon came to regard the influence of the sun, in connection with light and heat, as a cause. This led to a search for other signs in the heavens. If the appearance of a comet was sometimes noted simultaneously with the death of a great ruler, or an eclipse with a scourge of plague, these might well be looked upon as causes in the same sense that the veering or backing of the wind is regarded as a cause of fine or foul weather. For these reasons we find that the earnest men of all ages have recorded the occurrence of comets, eclipses, new stars, meteor showers, and remarkable conjunctions of the planets, as well as plagues and famines, floods and droughts, wars and the deaths of great rulers. Sometimes they thought they could trace connections which might lead them to say that a comet presaged famine, or an eclipse war."—G. Forbes, *History of astronomy*, p. 2.—"The oldest work which has come down to our day upon astrology is the *Tetrabiblos*, or *Quadripartite* of Claudius Ptolemy, which was written about A. D. 133; indeed, this work, as an eminent writer remarks, 'is the entire groundwork of those stupendous tomes in folio and quarto on the same subject which were produced in myriads during the sixteenth and seventeenth centuries.' Ptolemy, however, does not claim to have invented, or rather discovered, the principles of astral influence, but to have completed, as he says, 'the rules of the ancients, whose observations were founded in nature.' It is quite probable, however, that the science took its rise in Egypt. Sir Isaac Newton says that astrology was studied in Babylon seven hundred and fifty years before Christ. The science flourished in Persia in the time of Zoroaster, who was himself a star-worshipper; and to this day it is held in great repute in that country, as high as six million livres being paid to astrologers annually by the Persian kings. According to Pliny, who himself believed in stellar influences, Anaximander, the friend and disciple

of Thales, by the rules of astrology 'foretold the earthquake which overthrew Laedemon.' This was in Greece, nearly six hundred years before Christ. Anaxagoras, a famous philosopher of Greece, and preceptor of Socrates, is said to have devoted his whole life to astrology. Pythagoras, Plato, Porphyry, Aristotle, and the great Hippocrates, the Father of Medicine, were all supporters of the doctrines of this ancient science. In Rome the science was equally popular at an early day among the most cultivated and enlightened. Among others who speak in its favor may be mentioned Virgil, Cicero, and especially Horace. Macrobius wrote a poem on astrology. The name of the most learned proctor of Rome, Nigidius Figulus, should not be omitted, as he was a most gifted philosopher and astrologer. In Arabia, China, India, and among the Buddhists, astrology was first established centuries before the Christian era; and even in Mexico traces of this ancient science are found on the ruins of massive temples and crumbling pyramids built by a race long since extinct."—E. H. Bennett, *Astrology*, pp. 2-3.—During the 14th, 15th and 16th centuries astrology had a strong hold on many minds, both of scientific thinkers such as Tycho Brahe and Kepler and of the common people. Its mode of thought was curiously interwoven with that of more recognized sciences and its influence is still recorded in modern language. But the acceptance of the Copernican theory did much to discredit astrology and in England Dean Swift's famous satire, *Prediction for the year 1708*, by Isaac Bickerstaff, Esq., was largely effective in turning popular opinion away from it.—See also ASTRONOMY: Ptolemaic and Copernican theories; CHALDEA: Wise men of the East; MEDICAL SCIENCE: Medieval: 12th century; CHINA: Origin of the people.

Theory and methods.—"It would be impossible to give even a brief history of astrology without mentioning the basis of the entire science—the zodiac. The zodiac is composed of twelve constellations, or star-groups, through which the sun apparently passes in his so-called path around the earth. The fact that this ecliptic is formed by the motion of the earth, rather than that of the sun, was known to the Egyptians, to Pythagoras in 700 B. C. and to Plato in 400 B. C., though in 317 A. D. Lactantius, the preceptor of Crispus Cæsar, son of the Emperor Constantine, taught his pupil that the earth was a plane surrounded by sky, and warned the lad against accepting the 'wicked heresy of a round world.' . . . Planets are worlds revolving around the sun, they shine principally by the solar light which they receive and reflect into space. Their visible luminosity as compared with that of either the sun or the moon is inconsiderable and this fact has long been one of the strongest scientific arguments against astrology. The recently discovered knowledge that the most powerful vibrations are invisible has to a great extent rehabilitated the ancient science. The planets being comparatively near the earth may be brought within range of observation by the telescope, but this instrument has no apparent effect upon our knowledge of the stars, which are suns in infinitude and at such vast distances that drawing them a few thousand times nearer our world does not make them appreciably clearer to our vision. Astrology teaches that each planet possesses its own specific vibration, and students learn the effect of the positions, relations and distinctive forces emanating from each body or group of bodies in the solar system, and recognize their influence upon the moral, mental and physical nature of mankind."—K. T. Craig, *Stars of destiny*, pp. 10, 65-66.—"The alphabet of astrology is simple.

It consists of the twelve signs of the zodiac and the nine planets, Neptune, Herschel [Uranus], Saturn, Jupiter, Mars, the Sun, Venus, Mercury, and the Moon. The rules to be observed are few. Each sign contains 30 degrees, and thus there are 360 degrees in the zodiac. Mars is most powerful in Aries and Scorpio, Venus in Taurus and Libra, Mercury in Gemini and Virgo, the Moon in Cancer, the Sun in Leo, Jupiter in Sagittarius and Pisces, Saturn in Capricorn, and Herschel in Aquarius. Neptune seems to delight in Pisces, but no sign has yet been accorded to him. When the planets are in the signs opposite to those in which they are powerful, they are very weak and unfortunate. . . . A horoscope, or map of the heavens, contains twelve houses, of which the first, or ascendant, rules the personal appearance and temperament; the second wealth; the third brothers and sisters and short journeys; the fourth the father, property and condition at close of life; the fifth children, speculation and pleasures; the sixth servants and health, the seventh marriage, lawsuits and public enemies; the eighth death legacies, the ninth religion and long journeys chiefly by water, the tenth the mother and the trade or profession, the eleventh friends, hopes and wishes, and the twelfth private enemies, sorrow, and imprisonment. The position of the signs and planets as regards these houses at the time of any one's birth will show conclusively the good and evil fortune and the causes thereof that will befall him or her during life. The strongest houses are the first, tenth, eleventh, and seventh, and the weakest are the fifth, sixth and eighth. . . . A map or figure of the heavens is erected as follows: First learn where and when the person for whom the horoscope is desired was born, and then after you have drawn the map with its twelve houses, find in an almanac or ephemeris for the year required the sidereal time for the exact moment of birth. Next place the signs and planets in the proper places, as shown by the ephemeris, always remembering to observe the correct latitude. The aspects can then be calculated and predictions made."—J. Hingston, *Gospel of the stars*, pp. 38-42.

ASTRONOMIA NOVA: Kepler's great work on astronomy. See **ASTRONOMY:** Ptolemaic and Copernican theories.

ASTRONOMY: Early history of. — "The astronomy of Egyptians, Babylonians, and Assyrians is known to us mainly through the Greek historians, and for information about the Chinese we rely upon the researches of travellers and missionaries in comparatively recent times. The testimony of the Greek writers has fortunately been confirmed, and we now have in addition a mass of facts translated from the original sculptures, papyri, and inscribed bricks, dating back thousands of years. In attempting to appraise the efforts of the beginners we must remember that it was natural to look upon the earth (as all the first astronomers did) as a circular plane, surrounded and bounded by the heaven, which was a solid vault, or hemisphere, with its concavity turned downwards. The stars seemed to be fixed on this vault; the moon, and later the planets, were seen to crawl over it. . . . Probably the greatest step ever made in astronomical theory was the placing of the sun, moon, and planets at different distances from the earth instead of having them stuck on the vault of heaven. It was a transition from 'flatland' to a space of three dimensions. . . . The Chaldeans, being the most ancient Babylonians, held the same station and dignity in the State as did the priests in Egypt, and spent all their time in the study of philosophy and astronomy, and the arts of divination and astrology. They held

that the world of which we have a conception is an eternal world without any beginning or ending, in which all things are ordered by rules supported by a divine providence, and that the heavenly bodies do not move by chance, nor by their own will, but by the determinate will and appointment of the gods. They recorded these movements, but mainly in the hope of tracing the will of the gods in mundane affairs. Ptolemy (about 130 A. D.) made use of Babylonian eclipses in the eighth century B. C. for improving his solar and lunar tables. [See **ASTROLOGY.**] Fragments of a library at Agade have been preserved at Nineveh, from which we learn that the star-charts were even then divided into constellations, which were known by the names which they bear to this day, and that the signs of the zodiac were used for determining the courses of the sun, moon, and the five planets Mercury, Venus, Mars, Jupiter, and Saturn. We have records of observations carried on under Assurbanapal, who sent astronomers to different parts to study celestial phenomena. . . . The Phenicians are supposed to have used the stars for navigation, but there are no records. The Egyptian priests tried to keep such astronomical knowledge as they possessed to themselves. It is probable that they had arbitrary rules for predicting eclipses."—G. Forbes, *History of astronomy*, pp. 6-15.—"While their oriental predecessors had confined themselves chiefly to astronomical observations, the earlier Greek philosophers appear to have made next to no observations of importance, and to have been far more interested in inquiring into causes of phenomena. *Thales*, the founder of the Ionian school, was credited by later writers with the introduction of Egyptian astronomy into Greece, at about the end of the 7th century B. C.; but both *Thales* and the majority of his immediate successors appear to have added little or nothing to astronomy, except some rather vague speculations as to the form of the earth and its relation to the rest of the world. On the other hand, some real progress seems to have been made by *Pythagoras* and his followers. *Pythagoras* taught that the earth, in common with the heavenly bodies, is a sphere, and that it rests without requiring support in the middle of the universe."—A. Berry, *Short history of astronomy*, p. 24.—See also **CHALDEA:** Wise men of the East; **HELLENISM:** Science and Invention; and **SCIENCE:** Ancient: Egyptian and Babylonian, also Greek, Arabian; **CHRONOLOGY:** Solar chronological scheme of the Egyptians; Babylonian method; Basis of Hindu calendar; Use of astronomical constants.

B. C. 4th century.—**Aristotelian astronomy.**—"Only the second of the four books on the Heavens is devoted to astronomy. He considers the universe to be spherical, the sphere being the most perfect among solid bodies, and the only body which can revolve in its own space. . . . He holds that the stars are spherical in form, that they have no individual motion, being merely carried all together by their one sphere.

"Furthermore, since the stars are spherical, as others maintain and we also grant, because we let the stars be produced from that body, and since there are two motions of a spherical body, rolling along and whirling, then the stars, if they had a motion of their own, ought to move in one of these ways. But it appears that they move in neither of these ways. For if they whirled (rotated), they would remain [in] the same spot and not alter their position, and yet they manifestly do so. . . . It would also be reasonable that all should [move] in the same motion, and yet among the stars the sun only seems to do so at

its rising or setting. . . . The planets are so near that the eyesight reaches them in its full power, but when turned to the fixed stars it shakes on account of the distance, . . . now its shaking makes the motion seem to belong to the star, for it makes no difference whether . . . the sight or the seen object be in motion. But that the stars have not a rolling motion is evident; for whatever is rolling must of necessity be turning.—*Dreyer*.

"Aristotle adopts the system of spheres of Eudoxus and Calippus, but seems to suppose these spheres to be concrete, and not a merely geometrical device for interpreting the phenomena or determining the positions. In order however to secure what he conceives to be the necessary relation between the motions of the spheres, he is obliged to increase their total number from 33 to not less than 55. The earth is fixed at the centre of the universe. That the earth is a sphere is shown logically, and is also evident to the senses. During eclipses of the moon, namely, the boundary line, which shows the shadow of the earth, is always curved. . . . If we travel even a short distance south or north, the stars over our heads show a great change, some being visible in Egypt, but not in more northern lands, and stars are seen to set in the south which never do so in the north. It seems therefore not incredible that the vicinity of the pillars of Hercules is connected with that of India, and that there is thus but one ocean. The bulk of the earth he considers to be 'not large in comparison with the size of the other stars.' The estimated circumference of 400,000 stadia—about 30,000 miles—is the earliest known estimate of the size of the earth, and is of unknown origin, but may quite likely be due to Eudoxus. While the heavens proper are characterized by fixed order and circular motion, the space below the moon's sphere is subject to continual change, and motions within it are in general rectilinear—a theory destined long to block progress in mechanics. Of the four elements, earth is nearest the centre, water comes next, fire and air form the atmosphere, fire predominating in the upper part, air in the lower. In this region of fire are generated shooting stars, auroras, and comets, the latter consisting of ignited vapors, such as constitute the Milky Way. Against any orbital motion of the earth Aristotle urges the absence of any apparent displacement of the stars. Reviewing his astronomical theories, *Dreyer* says:—

"His careful and critical examination of the opinions of previous philosophers makes us regret all the more that his search for the causes of phenomena was often a mere search among words, a series of vague and loose attempts to find what was according to nature and what was not; and even though he professed to found his speculations on facts, he failed to free his discussion of these from purely metaphysical and preconceived notions. It is, however, easy to understand the great veneration in which his voluminous writings on natural science were held for so many centuries, for they were the first, and for many centuries the only, attempt to systematize the whole amount of knowledge of nature accessible to mankind; while the tendency to seek the principles of natural philosophy by considering the meaning of the words ordinarily used to describe the phenomena of nature, which to us is his great defect, appealed strongly to the mediæval mind, and, unfortunately, finally helped to retard the development of science in the days of Copernicus and Galileo."

"At times Aristotle shows consciousness that his theories are based on inadequate knowledge of facts. 'The phenomena are not yet sufficiently in-

vestigated. When they once shall be, then one must trust more to observation than to speculation, and to the latter no farther than it agrees with the phenomena.' . . . 'An astronomer,' he says, 'must be the wisest of men; his mind must be duly disciplined in youth; especially is mathematical study necessary; both an acquaintance with the doctrine of number, and also with that other branch of mathematics, which, closely connected as it is with the science of the heavens, we very absurdly call geometry, the measurement of the earth.'"—*W. T. Sedgwick and H. W. Tyler, Short history of science, pp. 81-82.*

A. D. 130-1609.—Ptolemaic and Copernican theories.—Popular ideas regarding astronomy in the Middle Ages.—Great discoveries of Johann Kepler.—Ptolemy (130 A.D.) wrote the *Suntaxis* [*Syntaxis*] or *Almagest*, which includes a cyclopædia of astronomy, containing a summary of knowledge at that date. We have no evidence beyond his own statement that he was a practical observer. He theorised on the planetary motions, and held that the earth is fixed in the centre of the universe. He adopted the excentric and equant of Hipparchus to explain the unequal motions of the sun and moon. He adopted the epicycles and deferents which had been used by Apollonius and others to explain the retrograde motions of the planets. We, who know that the earth revolves round the sun once a year, can understand that the apparent motion of a planet is only its motion relative to the earth. If, then, we suppose the earth fixed and the sun to revolve round it once a year, and the planets each in its own period, it is only necessary to impose upon each of these an additional *annual* motion to enable us to represent truly the apparent motions. . . . The cumbersome system advocated by Ptolemy answered its purpose, enabling him to predict astronomical events approximately. He improved the lunar theory considerably, and discovered minor inequalities which could be allowed for by the addition of new epicycles. We may look upon these epicycles of Apollonius, and the excentric of Hipparchus, as the responses of these astronomers to the demand of Plato for uniform circular motions. Their use became more and more confirmed, until the seventeenth century, when the accurate observations of Tycho Brahe enabled Kepler to abolish these purely geometrical makeshifts, and to substitute a system in which the sun became physically its controller."—*G. Forbes, History of astronomy, pp. 27-20.*

"In the early Church, in view of the doctrine so prominent in the New Testament, that the earth was soon to be destroyed, and that there were to be 'new heavens and a new earth,' astronomy, like other branches of science, was generally looked upon as futile. Why study the old heavens and the old earth, when they were so soon to be replaced with something infinitely better? This feeling appears in St. Augustine's famous utterance, 'What concern is it to me whether the heavens as a sphere inclose the earth in the middle of the world or overhang it on either side?' As to the heavenly bodies, theologians looked on them as at best only objects of pious speculation. Regarding their nature the fathers of the Church were divided. Origen, and others with him, thought them living beings possessed of souls, and this belief was mainly based upon the scriptural vision of the morning stars singing together, and upon the beautiful appeal to the 'stars and light' in the song of the three children—the *Benedicite*—which the Anglican communion has so wisely retained in its *Liturgy*. Other fathers thought the stars abiding-places of the angels, and that stars were moved by

angels. The Gnostics thought the stars spiritual beings governed by angels, and appointed not to cause earthly events but to indicate them.

"As to the heavens in general, the prevailing view in the Church was based upon the scriptural declarations that a solid vault—a 'firmament'—was extended above the earth, and that the heavenly bodies were simply lights hung within it. This was for a time held very tenaciously. St. Philastrius, in his famous treatise on heresies, pronounced it a heresy to deny that the stars are brought out by God from his treasure-house and hung in the sky every evening; any other view he declared 'false to the Catholic faith.' This view also survived in the sacred theory established so firmly by Cosmas in the sixth century. Having established his plan of the universe upon various texts in the Old and New Testaments, and having made it a vast oblong box, covered by the solid 'firmament,' he brought in additional texts from Scripture to account for the planetary movements, and developed at length the theory that the sun and planets are moved and the 'windows of heaven' opened and shut by angels appointed for that purpose. How intensely real this way of looking at the universe was, we find in the writings of St. Isidore, the greatest leader of orthodox thought in the seventh century. He affirms that since the fall of man, and on account of it, the sun and moon shine with a feebler light; but he proves from a text in Isaiah that when the world shall be fully redeemed these 'great lights' will shine again in all their early splendour. But, despite these authorities and their theological finalities, the evolution of scientific thought continued, its main germ being the geocentric doctrine—the doctrine that the earth is the centre, and that the sun and planets revolve about it. This doctrine was of the highest respectability: it had been developed at a very early period, and had been elaborated until it accounted well for the apparent movements of the heavenly bodies; its final name, 'Ptolemaic theory,' carried weight; and, having thus come from antiquity into the Christian world, St. Clement of Alexandria demonstrated that the altar in the Jewish tabernacle was 'a symbol of the earth placed in the middle of the universe': nothing more was needed; the geocentric theory was fully adopted by the Church and universally held to agree with the letter and spirit of Scripture. Wrought into this foundation, and based upon it, there was developed in the Middle Ages, mainly out of fragments of Chaldean and other early theories preserved in the Hebrew Scriptures, a new sacred system of astronomy, which became one of the great treasures of the universal Church—the last word of revelation. Three great men mainly reared this structure. First was the unknown who gave to the world the treatises ascribed to Dionysius the Areopagite.

"It was unhesitatingly believed that these were the work of St. Paul's Athenian convert, and therefore virtually of St. Paul himself. Though now known to be spurious, they were then considered a treasure of inspiration, and an emperor of the East sent them to an emperor of the West as the most worthy of gifts. In the ninth century they were widely circulated in western Europe, and became a fruitful source of thought, especially on the whole celestial hierarchy. Thus the old ideas of astronomy were vastly developed, and the heavenly hosts were classed and named in accordance with indications scattered through the sacred Scriptures.

"The next of these three great theologians was Peter Lombard, professor at the University of Paris. About the middle of the twelfth century

he gave forth his collection of *Sentences*, or Statements by the Fathers, and this remained until the end of the Middle Ages the universal manual of theology. In it was especially developed the theological view of man's relation to the universe. The author tells the world: 'Just as man is made for the sake of God—that is, that he may serve Him,—so the universe is made for the sake of man—that is, that it may serve *him*; therefore is man placed at the middle point of the universe, that he may both serve and be served.' The vast significance of this view, and its power in resisting any real astronomical science, we shall see, especially in the time of Galileo. The great triad of thinkers culminated in St. Thomas Aquinas—the sainted theologian, the glory of the mediæval Church, the 'Angelic Doctor,' the most marvellous intellect between Aristotle and Newton; he to whom it was believed that an image of the Crucified had spoken words praising his writings.' . . . With great power and clearness he brought the whole vast system, material and spiritual, into its relations to God and man. Thus was the vast system developed by these three leaders of mediæval thought; and now came the man who wrought it yet more deeply into European belief, the poet divinely inspired who made the system part of the world's *life*. Pictured by Dante, the empyrean and the concentric heavens, paradise, purgatory, and hell, were seen of all men; the God Triune, seated on his throne upon the circle of the heavens, as real as the Pope seated in the chair of St. Peter; the seraphim, cherubim, and thrones, surrounding the Almighty, as real as the cardinals surrounding the Pope; the three great orders of angels in heaven, as real as the three great orders, bishops, priests, and deacons, on earth; and the whole system of spheres, each revolving within the one above it, and all moving about the earth, subject to the *primum mobile*, as real as the feudal system of western Europe, subject to the Emperor. . . . Its first feature shows a development out of earlier theological ideas. The earth is no longer a flat plain inclosed by four walls and solidly vaulted above, as theologians of previous centuries had believed it, under the inspiration of Cosmas; it is no longer a mere flat disk, with sun, moon, and stars hung up to give it light, as the earlier cathedral sculptors had figured it; it has become a globe at the centre of the universe. Encompassing it are successive transparent spheres, rotated by angels about the earth, and each carrying one or more of the heavenly bodies with it: that nearest the earth carrying the moon; the next, Mercury; the next, Venus; the next, the sun; the next three, Mars, Jupiter, and Saturn; the eighth carrying the fixed stars. The ninth was the *primum mobile*, and inclosing all was the tenth heaven—the Empyrean. This was immovable—the boundary between creation and the great outer void; and here, in a light which no one can enter, the Triune God sat enthroned, the 'music of the spheres' rising to Him as they moved. Thus was the old heathen doctrine of the spheres made Christian. . . . All this vast scheme had been so riveted into the Ptolemaic view by the use of biblical texts and theological reasonings that the resultant system of the universe was considered impregnable and final. To attack it was blasphemy. It stood for centuries. Great theological men of science, like Vincent of Beauvais and Cardinal d'Ailly, devoted themselves to showing not only that it was supported by Scripture, but that it supported Scripture. Thus was the geocentric theory embedded in the beliefs and aspirations, in the hopes and fears, of Christendom down to the middle of the sixteenth century. . . . But, on the other hand,

there had been planted, long before, the germs of a heliocentric theory. In the sixth century before our era, Pythagoras, and after him Philolaus, had suggested the movement of the earth and planets about a central fire; and, three centuries later, Aristarchus had restated the main truth with striking precision. Here comes in a proof that the antagonism between theological and scientific methods is not confined to Christianity; for this statement brought upon Aristarchus the charge of blasphemy, and drew after it a cloud of prejudice which hid the truth for six hundred years. Not until the fifth century of our era did it timidly appear in the thoughts of Martinus Capella: then it was again lost to sight for a thousand years, until in the fifteenth century, distorted and imperfect, it appeared in the writings of Cardinal Nicholas de Cusa. . . . Copernicus had been a professor at Rome, and even as early as 1500 had announced his doctrine there, but more in the way of a scientific curiosity or paradox, as it had been

the leaders of Protestantism no less hostile; he therefore intrusted it to Osiander, at Nuremberg. . . . But Osiander's courage failed him; he dared not taunt the new thought boldly. He wrote a grovelling preface, endeavouring to excuse Copernicus for his novel idea, and in this he inserted the apologetic lie that Copernicus had propounded the doctrine of the earth's movement not as a fact, but as a hypothesis. He declared that it was lawful for an astronomer to indulge his imagination, and that this was what Copernicus had done. Thus was the greatest and most ennobling, perhaps, of scientific truths—a truth not less ennobling to religion than to science—forced, in coming before the world, to sneak and crawl. On the 24th of May, 1543, the newly printed book arrived at the house of Copernicus. It was put into his hands; but he was on his deathbed. A few hours later he was beyond the reach of the conscientious men who would have blotted his reputation and perhaps have destroyed his life. . . . The preface of Osiander, pretending that the book of Copernicus suggested a hypothesis instead of announcing a truth, served its purpose well. During nearly seventy years the Church authorities evidently thought it best not to stir the matter, and in some cases professors like Calgani were allowed to present the new view purely as a hypothesis. There were, indeed, mutterings from time to time on the theological side, but there was no great demonstration against the system until 1616. Then, when the Copernican doctrine was upheld by Galileo as a *truth*, and proved to be a truth by his telescope, the book was taken in hand by the Roman curia. The statements of Copernicus were condemned, 'until they should be corrected'; and the corrections required were simply such as would substitute for his conclusions the old Ptolemaic theory. . . . Doubtless many will exclaim against the Roman Catholic Church for this; but the simple truth is that Protestantism was no less zealous against the new scientific doctrine. All branches of the Protestant Church—Lutheran, Calvinist, Anglican—vied with each other in denouncing the Copernican doctrine as contrary to Scripture; and, at a later period, the Puritans showed the same tendency. Said Martin Luther: 'People gave ear to an upstart astrologer who strove to show that the earth revolves, not the heavens or the firmament, the sun and the moon. Whoever wishes to appear clever must devise some new system, which of all systems is of course the very best. This fool wishes to reverse the entire science of astronomy; but sacred Scripture tells us that Joshua commanded the sun to stand still, and not the earth.' Melancthon, mild as he was, was not behind Luther in condemning Copernicus. In his treatise on the *Elements of Physics*, published six years after Copernicus's death, he says: 'The eyes are witnesses that the heavens revolve in the space of twenty-four hours. But certain men, either from the love of novelty, or to make a display of ingenuity, have concluded that the earth moves; and they maintain that neither the eighth sphere nor the sun revolves. . . . Now, it is a want of honesty and decency to assert such notions publicly, and the example is pernicious. It is the part of a good mind to accept the truth as revealed by God and to acquiesce in it.' Melancthon then cites the passages in the Psalms and Ecclesiastes, which he declared assert positively and clearly that the earth stands fast and that the sun moves around it, and adds eight other proofs of his proposition that 'the earth can be nowhere if not in the centre of the universe.' So earnest does this mildest of the Reformers become, that he suggests severe measures

COPERNICUS

previously held by Cardinal de Cusa, than as the statement of a system representing a great fact in Nature. About thirty years later one of his disciples, Widmanstadt, had explained it to Clement VII; but it still remained a mere hypothesis, and soon, like so many others, disappeared from the public view. But to Copernicus, steadily studying the subject, it became more and more a reality and as this truth grew within him he seemed to feel that at Rome he was no longer safe. To announce his discovery there as a theory or a paradox might amuse the papal court, but to announce it as a truth—as *the* truth—was a far different matter. He therefore returned to his little town in Poland. To publish his thought as it had now developed was evidently dangerous even there, and for more than thirty years it lay slumbering in the mind of Copernicus and of the friends to whom he had privately intrusted it. At last he prepared his great work on the *Revolutions of the Heavenly Bodies*, and dedicated it to the Pope himself. He next sought a place of publication. He dared not send it to Rome, for there were the rulers of the older Church ready to seize it; he dared not send it to Wittenberg, for there were

to restrain such impious teachings as those of Copernicus.

"While Lutheranism was thus condemning the theory of the earth's movement, other branches of the Protestant Church did not remain behind. Calvin took the lead, in his *Commentary on Genesis*, by condemning all who asserted that the earth is not at the centre of the universe. He clinched the matter by the usual reference to the first verse of the ninety-third Psalm, and asked, 'Who will venture to place the authority of Copernicus above that of the Holy Spirit?' Turretin, Calvin's famous successor, even after Kepler and Newton had virtually completed the theory of Copernicus and Galileo, put forth his compendium of theology, in which he proved, from a multitude of scriptural texts, that the heavens, sun, and moon move about the earth, which stands still in the centre. . . . But the new truth could not be concealed; it could neither be laughed down nor frowned down. Many minds had received it, but within the hearing of the papacy only one tongue appears to have dared to utter it clearly. This new warrior was that strange mortal, Giordano Bruno. He was hunted from land to land, until at last he turned on his pursuers with fearful invectives. For this he was entrapped at Venice, imprisoned during six years in the dungeons of the Inquisition at Rome, then burned alive, and his ashes scattered to the winds. Still, the new truth lived on. Ten years after the martyrdom of Bruno the truth of Copernicus's doctrine was established by the telescope of Galileo. Herein was fulfilled one of the most touching of prophecies. Years before, the opponents of Copernicus had said to him, 'If your doctrines were true, Venus would show phases like the moon.' Copernicus answered: 'You are right; I know not what to say; but God is good, and will in time find an answer to this objection.' The God-given answer came when, in 1611, the rude telescope of Galileo showed the phases of Venus. . . . The war on the Copernican theory, which up to that time had been carried on quietly, now flamed forth. It was declared that the doctrine was proved false by the standing still of the sun for Joshua, by the declarations that 'the foundations of the earth are fixed so firm that they can not be moved,' and that the sun 'runneth about from one end of the heavens to the other.' But the little telescope of Galileo still swept the heavens, and another revelation was announced—the mountains and valleys in the moon. This brought on another attack. It was declared that this, and the statement that the moon shines by light reflected from the sun, directly contradict the statement in Genesis that the moon is 'a great light.' . . . Still another struggle was aroused when the hated telescope revealed spots upon the sun, and their motion indicating the sun's rotation. Monsignor Elci, head of the University of Pisa, forbade the astronomer Castelli to mention these spots to his students. Father Busaeus, at the University of Innsbruck, forbade the astronomer Scheiner, who had also discovered the spots and proposed a safe explanation of them, to allow the new discovery to be known there. At the College of Douay and the University of Louvain this discovery was expressly placed under the ban, and this became the general rule among the Catholic universities and colleges of Europe. The Spanish universities were especially intolerant of this and similar ideas, and up to a recent period their presentation was strictly forbidden in the most important university of all—that of Salamanca."—A. D. White, *History of the warfare of science with theology*, pp. 114-118, 120-124, 126-127, 129-130, 132-133.

"New champions pressed on. Campanella, full of vagaries as he was, wrote his *Apology for Galileo*, though for that and other heresies, religious and political, he seven times underwent torture. And Kepler comes: he leads science on to greater victories. Copernicus, great as he was, could not disentangle scientific reasoning entirely from the theological bias: the doctrines of Aristotle and Thomas Aquinas as to the necessary superiority of the circle had vitiated the minor features of his system, and left breaches in it through which the enemy was not slow to enter; but Kepler sees these errors, and by wonderful genius and vigour he gives to the world the three laws which bear his name, and this fortress of science is complete. He thinks and speaks as one inspired. His battle is severe. He is solemnly warned by the Protestant Consistory of Stuttgart 'not to throw Christ's kingdom into confusion with his silly fancies,' and as solemnly ordered to 'bring his theory of the world into harmony with Scripture': he is sometimes abused, sometimes ridiculed, sometimes imprisoned. Protestants in Styria and Württemberg, Catholics in Austria and Bohemia, press upon him; but Newton, Halley, Bradley, and other great astronomers follow, and to science remains the victory. Yet this did not end the war. During the seventeenth century, in France, after all the splendid proofs added by Kepler, no one dared openly teach the Copernican theory, and Cassini, the great astronomer, never declared for it. In 1672 the Jesuit Father Riccioli declared that there were precisely forty-nine arguments for the Copernican theory and seventy-seven against it. Even after the beginning of the eighteenth century—long after the demonstrations of Sir Isaac Newton—Bossuet, the great Bishop of Meaux, the foremost theologian that France has ever produced, declared it contrary to Scripture."—*Ibid.*, pp. 153-154.

"It is still well under four hundred years since the modern, or Copernican, theory of the universe supplanted the Ptolemaic, which had held sway during so many centuries. In this new theory, propounded towards the middle of the sixteenth century by Nicholas Copernicus (1473-1543), a Prussian [Polish] astronomer, the earth was dethroned from its central position and considered merely as one of a number of planetary bodies which revolve around the sun. As it is not a part of our purpose to follow in detail the history of the science, it seems advisable to begin by stating in a broad fashion the conception of the universe as accepted and believed in to-day. The Sun, the most important of the celestial bodies so far as we are concerned, occupies the central position; not, however, in the whole universe, but only in that limited portion which is known as the Solar System. Around it, in the following order outwards, circle the planets Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. At an immense distance beyond the solar system, and scattered irregularly through the depth of space, lie the stars. The two first-mentioned members of the solar system, Mercury and Venus, are known as the Inferior Planets; and in their courses about the sun, they always keep well inside the path along which our earth moves. The remaining members (exclusive of the earth) are called Superior Planets, and their paths lie all outside that of the earth."—C. G. Dolmage, *Astronomy of to-day*, pp. 20-22.

"Johann Kepler is the name of the man whose place, as is generally agreed, would have been the most difficult to fill among all those who have contributed to the advance of astronomical knowledge. . . . Kepler's first great discovery was that the planes of all the orbits pass through the sun;

his second was that the line of apses of each planet passes through the sun; both were contradictory to the Copernican theory. He proceeds cautiously with his propositions until he arrives at his great laws, and he concludes his book by comparing observations of Mars, of all dates, with his theory. His first law states that the planets describe ellipses with the sun at a focus of each ellipse. His second law (a far more difficult one to prove) states that a line drawn from a planet to the sun sweeps over equal areas in equal times. These two laws were published in his great work, *Astronomia Nova, seu Physica Cœlestis Tradita Commentariis de Motibus Stellæ Martis*, Prague, 1609. It took him nine years more to discover his third law, that the squares of the periodic times are proportional to the cubes of the mean distances from the sun. These three laws contain implicitly the law of universal gravitation. They are simply an alternative way of expressing that law in dealing with planets, not particles. Only, the power of the greatest human intellect is so utterly feeble that the meaning of the words in Kepler's three laws could not be understood until expounded by the logic of Newton's dynamics."—G. Forbes, *History of astronomy*, pp. 48-53.—See also SCIENCE: Middle Ages and the Renaissance.

1781-1846.—Planets and Asteroids.—Constellations, comets and meteors.—"The five planets, Mercury, Venus, Mars, Jupiter, and Saturn, have been known from all antiquity. Nothing then can bring home to us more strongly the immense advance which has taken place in astronomy during modern times than the fact that it is only 127 years since observation of the skies first added a planet to that time-honoured number. It was indeed on the 13th of March, 1781, while engaged in observing the constellation of the Twins, that the justly famous Sir William Herschel caught sight of an object which he did not recognise as having met with before. He at first took it for a comet, but observations of its movements during a few days showed it to be a planet. This body, which the power of the telescope alone had thus shown to belong to the solar family, has since become known to science under the name of Uranus. By its discovery the hitherto accepted limits of the solar system were at once pushed out to twice their former extent, and the hope naturally arose that other planets would quickly reveal themselves in the immensities beyond. For a number of years prior to Herschel's great discovery, it had been noticed that the distances at which the then known planets circulated appeared to be arranged in a somewhat orderly progression outwards from the sun. This seeming plan, known to astronomers by the name of Bode's Law, was closely confirmed by the distance of the new planet Uranus. There still lay, however, a broad gap between the planets Mars and Jupiter. Had another planet indeed circulated there, the solar system would have presented an appearance of almost perfect order. But the void between Mars and Jupiter was unfilled; the space in which one would reasonably expect to find another planet circling was unaccountably empty. On the first day of the nineteenth century the mystery was however explained, a body being discovered which revolved in the space that had hitherto been considered planetless. But it was a tiny globe hardly worthy of the name of planet. In the following year a second body was discovered revolving in the same space; but it was even smaller in size than the first. During the ensuing five years two more of these little planets were discovered. Then came a pause, no more such bodies being added to the system until halfway through the century, when suddenly the dis-

covery of these so called 'minor planets' began anew. Since then additions to this portion of our system have rained thick and fast. The small bodies have received the name of Asteroids or Planetoids; and up to the present time some six hundred of them are known to exist, all revolving in the previously unfilled space between Mars and Jupiter.

"In the year 1846 the outer boundary of the solar system was again extended by the discovery that a great planet circulated beyond Uranus. The new body, which received the name of Neptune, was brought to light as the result of calculations made at the same time, though quite independently, by the Cambridge mathematician Adams, and the French astronomer Le Verrier. The discovery of Neptune differed, however, from that of Uranus in the following respect. Uranus was found merely in the course of ordinary telescopic survey of the heavens. The position of Neptune, on the other hand, was predicted as the result of rigorous mathematical investigations undertaken with the object of fixing the position of an unseen and still more distant body, the attraction of which, in passing by, was disturbing the position of Uranus in its revolution around the sun. Adams actually completed his investigation first; but a delay at Cambridge in examining that portion of the sky, where he announced that the body ought just then to be, allowed France to snatch the honour of discovery, and the new planet was found by the observer Galle at Berlin, very near the place in the heavens which Le Verrier had mathematically predicted for it."—C. G. Dolmage, *Astronomy of to-day*, pp. 22-24.—"The most careless observer of the sky has noticed that the stars are not uniformly spread over it. Almost everyone is familiar with the Big Dipper and the Pleiades, otherwise known as the Little Dipper. These natural groups of stars were given names in antiquity by early observers and are called *constellations*. Their names often strike us as being most fantastic and far-fetched. Many of them are the names of wild animals. For example, we have the Great Bear, the Lesser Bear, the Lion, the Eagle, the Leopard, etc. . . . Comets are wandering bodies which pass around the sun, usually in sensibly parabolic orbits. If their orbits are exactly parabolas it means they have come in from the sun from an infinite distance, and will go out again to an infinite distance, never to return. . . . While the statement is true that the great majority of comets move in sensibly parabolic orbits, and that it is not certain that they move in exactly parabolic orbits, there are certainly some which move in elliptical orbits. These comets come in from finite, through in some cases great distances and go out again to the same distances. They return to the sun time after time, their periods of revolution depending upon the lengths of their orbits. There are a very few cases in which it seems that comets move in hyperbolic orbits, though there is some room for doubt regarding the conclusion. . . . If the comets, as a whole, move in parabolic orbits they can not be considered as permanent members of the solar system. On the other hand, if their orbits, instead of being parabolas, are very elongated ellipses they are permanent members of the system. The opinion seems to be growing among astronomers that the comets are actually in this sense permanent members of the solar system, though no rigorous proof of the statement is at present at hand. It has been seen that the orbits of the planets are all nearly in the same plane and that the planets revolve around the sun in the same direction. In the case of comets it is quite different. Their or-

bits lie in every plane and they revolve in all directions. There is no uniformity in their distribution. The only thing that can be said is that there is a tendency for the perihelia of comet orbits to cluster on the side of the sun which is ahead in its motion through space. . . . Comets consist of a head containing in it, usually, a small bright nucleus, and a long tail streaming out in the direction opposite to the sun. The head may vary anywhere from 10,000 miles up to more than 1,000,000 miles. The nucleus is generally a few hundred, and at the most a few thousand, miles in diameter. The tails are in length from a few millions up to more than 100,000,000 miles."—F. R. Moulton, *Descriptive astronomy*, pp. 660, 185-186.

"Occasionally, on a clear night, a long trail of light flashes for a moment across the sky. This is the well-known phenomenon of the 'falling'- or 'shooting-star.' Sometimes, in a tremendous blaze and with a great rushing sound, often almost explosive, a mass of stone or metal hurls from the sky to the Earth, is found, and called a meteorite, an aërolite, a bolide, or half a dozen other technical names. They are really all one and the same thing—a meteor. The meteors are particles of matter of various sizes and compositions, revolving through the Solar System in regular orbits, usually very elliptical. Most of them travel in swarms, and it is when the Earth meets such that we have the 'shower of shooting stars.' The orbits of most of these swarms are well-known. The visibility of a meteor depends entirely upon its collision with the atmosphere of the Earth at very high speed—up to 40 miles a second. This, by the great friction, generates a terrific heat, and the meteor (1) is either dissipated in fine dust, (which is often found on the Arctic ice) or, (2) if it be a large one, reaches the surface of the Earth as a much pitted and scarred mass of stone or metal, or, (3) only grazing the atmosphere, passes out before being entirely consumed. The Earth is undergoing a constant meteoric bombardment, and were it not for our protective atmospheric shield, we undoubtedly should suffer greatly."—E. W. Putnam, *Essence of astronomy*, pp. 100-101.

1796-1921.—Laplacian and planetesimal hypotheses of the origin of the solar system.—Nebulæ.—Sun.—Moon.—"In outline the theory of Laplace [1749-1827] is that originally the solar atmosphere was a nebulous envelope in an intensely heated condition, and that it extended out beyond the orbit of the farthest planet. He supposed the whole mass rotated as a solid, in the direction in which the planets now revolve. It was supposed in this theory that the dimensions of the system were maintained by gaseous expansions the same as the dimensions of the sun or the earth's atmosphere are at present. This great nebulous mass would lose heat by radiation into space and consequently would contract. . . . If a mass rotates faster, the tendency for the material at its equator to fly off because of the centrifugal acceleration continually increases. Laplace said that it seemed reasonable that the contracting solar mass would reach such a state that this tendency of the particles at its equator to fly out would exactly balance their tendency to go in because of the attraction of the mass interior to it. When this state was reached he supposed a ring would be left off. . . . Unless the ring were perfectly circular and uniform, and subject to no disturbing influences, it would have a tendency to break, Laplace thought, at some place and to concentrate on the place in it where there was the greatest mass. That is, if there were a nucleus unit at any point, this excess of matter would gradually draw

to it all the rest of the whole ring, while it would continue to revolve around the sun in the same period as the ring did at the time it was abandoned. . . . Laplace then supposed the system of planets grew up from a system of rings abandoned successively by the sun, beginning with the outermost and ending with the innermost. The rings concentrating would give rise to large, globular masses revolving around the sun at their respective distances from it. These globular masses might in turn be rotating so rapidly that they would abandon rings which in a similar manner would give rise to satellites. He supposed that perhaps Saturn's rings were examples of this process in which the satellites were not yet formed. . . . The solar system exists and is in the midst of an evolution; the problem is to trace out the mode of this evolution. The Laplacian theory has been seen to have fatal weaknesses and to be no longer tenable. We shall now outline a theory which has been developed by Professor Chamberlin and the author to take its place.

"Instead of supposing that the solar system started from a vast gaseous mass in equilibrium under the law of gravitation and the laws of gaseous expansion, the Planetesimal Hypothesis postulates that the matter of which the sun and planets are composed was at a previous stage of its evolution in the form of a great spiral swarm of separate particles whose positions and motions were dependent upon their mutual gravitation and their velocities. Gaseous expansion preserved the dimensions of the Laplacian nebula but had no sensible influence in the spiral. Because of the fact that every particule according to this theory is considered as being an essentially independent unit it is called the *planetesimal* theory. Before considering in detail the planetesimal hypothesis . . . attention should be called to the fact that there is not in all the heavens a single example known of a nebula of the Laplacian type. On the other hand, recent discoveries, particularly those made at the Lick Observatory, show that the spiral nebula is not only a common form but is, indeed, the dominant type. There are within range of our instruments at least ten times as many of them as of all other types combined, and they range in extent and brightness from the great Andromeda nebula down to small faint masses which are barely distinguishable with long exposure photographs taken with the most powerful instruments."—F. R. Moulton, *Descriptive astronomy*, pp. 239-244.

"In the star-catalogs of the early writers [before the eighteenth century] we find mentioned a class of 'nebulous or cloudy stars.' The telescope proved that the very great majority of these are merely clusters of stars so apparently close together that they shine, except under fairly high magnification, as a blur of misty light. With the improvement of the telescope, however, many other 'patches of light' were found, some of which could be resolved into separate stars, while others could not. The former of these were called *star-clusters*, and the latter nebulae. There are many thousands of these nebulae; but only about ten thousand of them have been cataloged, and only two are visible to the naked eyes, the great nebula in Andromeda, and the great Orion nebula. For many years [until the end of the eighteenth century], the nebulae were considered as anomalies in the cosmic system. Now, however, they are believed to be a regular and usual step in stellar evolution. It is considered that they are stellar systems in embryo."—E. W. Putnam, *Essence of astronomy*, pp. 128-129.

"The sun is the chief member of our system. It

controls the motions of the planets by its immense gravitative power. Besides this it is the most important body in the entire universe, so far as we are concerned; for it pours out continually that flood of light and heat, without which life, as we know it, would quickly become extinct upon our globe. . . . It is extremely difficult to arrive at a precise notion of the temperature of the body of the sun. However, it is far in excess of any temperature which we can obtain here, even in the most powerful electric furnace. A rough idea of the solar heat may be gathered from the calculation that if the sun's surface were coated all over with a layer of ice 4000 feet thick, it would melt through this completely in one hour. The sun cannot be a hot body merely cooling; for the rate at which it is at present giving off heat could not in such circumstances be kept up, according to Professor Moulton (1914), for more than 3000 years. Further, it is not a mere burning mass, like a coal fire, for instance; as in that case about a thousand years would show a certain drop in temperature. No perceptible diminution of solar heat having taken place within historic experience, so far as can be ascertained, we are driven to seek some more abstruse explanation. The theory which seems to have received most acceptance is that put forward by Helmholtz in 1854. His idea was that gravitation produces continual contraction, or falling in of the outer parts of the sun; and that this falling in, in its turn, generates enough heat to compensate for what is being given off. The calculations of Helmholtz showed that a contraction of about 100 feet a year from the surface towards the centre would suffice for the purpose. In recent years, however, this estimate has been extended to about 180 feet. Nevertheless, even with this increased figure, the shrinkage required is so slight in comparison with the immense girth of the sun, that it would take a continual contraction at this rate for about 6000 years, to show even in our finest telescope that any change in the size of that body was taking place at all. Upon this assumption of continuous contraction, a time should, however, eventually be reached when the sun will have shrunk to such a degree of solidity, that it will not be able to shrink any further. Then, the loss of heat not being made up for any longer, the body of the sun should begin to grow cold. But we need not be distressed on this account; for it will take some 10,000,000 years, according to the above theory, before the solar orb becomes too cold to support life upon our earth."—C. G. Dolmage, *Astronomy of to-day*, pp. 127-129.

"The Moon is the only visible satellite of the Earth, and revolves about it. . . . The diameter of the Moon is 2,162 miles; like Venus and Mercury it shows no polar flattening. Its surface contains about 15,000,000 square miles, about one thirteenth that of the Earth. Its volume is about one fiftieth that of the Earth. . . . Its mean distance from the Earth is nearly 230,000 miles. Its orbit, like all celestial orbits, is more or less elliptical and its distance may vary between slightly more than 221,000 miles and 253,000 miles. Its usual variation is such, however, that in one revolution it amounts to a difference in distance from us of about 25,000 miles. It revolves around the Earth in 27 days 7 hours 43 minutes and 11.5 seconds. It rotates upon its axis in the same time, and, in consequence, always keeps the same side turned to the Earth, as do Mercury and Venus to the Sun. . . . It has no atmosphere, or at least, if any, but the veriest ghost of one. It is for this reason that the details of the lunar surface are so clear-cut when viewed through a telescope, and that the

shadows are so intensely black. . . . The surface of the moon is broken into great mountain ranges, enormous 'craters,' wide and deep cracks or 'clefts,' and innumerable smaller cracks or rills. The whole of its visible surface has been mapped and measured more carefully and accurately than that of the Earth, and over 30,000 craters have been counted on the Earthward hemisphere. . . . The height of the mountains is enormous in proportion to the size of the Moon, several being over 18,000 feet high. The craters vary in size from tiny pits to vast cavities over 100 miles in diameter. Many of the larger craters have great central mountain peaks rising from their floors, and many others show smaller craters within their boundaries."—E. W. Putnam, *Essence of astronomy*, pp. 38-45.

Photographic astronomy.—"If we speak of the progress of astronomy in the past fifty years, we must constantly refer to photography, for without it the progress would have been relatively small. Photography as it was when the Dearborn Observatory was young could never have done much for astronomy. It has passed through two periods, the wet and dry processes. It was in the earlier period at that time, where the plate must remain wet throughout the process of making the negative, and was relatively very slow in its action. As the plate must remain wet, long exposures could not be given to overcome the want of sensitiveness. At that time, in the hands of Rutherford, it had pictured the surface of the Moon and had recorded the spots on the Sun. In both these cases there was plenty of light. It had had a try at the Stars but with little success. It had attempted to show the great comet of 1858 but had made a failure of it. No one had even hoped that it could register the forms of the fainter nebulae. It had made no promise to the spectroscope, which itself was just beginning to awaken to the marvels of astronomy. In the application of photography to almost every branch of astronomy the Harvard College Observatory, under the administration of Prof. E. C. Pickering, has attained to the very highest importance. In the case of the discovery of a nova, its early history and the actual time of its appearance within close limits are always found on the plates of this one observatory. The entire history of a variable star can be traced back almost from day to day for many years and in some cases for over a quarter of a century. Though no new worlds, in the ordinary sense, have been discovered there have been added to the known worlds at least eight new moons, five to the planet Jupiter, one to Saturn, and two to Mars. Five of these are due to the sensitiveness of the photographic plate. At least two of them have not yet been seen with the human eye. The known asteroids or small planets, which lie in a zone between the orbits of Mars and Jupiter, have increased rapidly until not far from a thousand are now known. The discovery of these small bodies since 1802, when Dr. Max Wolf first found one by the new process, has been almost wholly due to photography. New ones are constantly being found. Sometimes as many as five or six are shown on one plate. Our knowledge of the Sun has increased tremendously in recent years. This has been due almost entirely to the spectroscope and to its applications to the spectro heliograph. The spectroscope has introduced to us a new class of double stars, whose periods in many cases are only a few hours or a few days, and which will never be seen separately with any telescope.—E. E. Barnard, *A few astronomical events of the past fifty years* (*Scientific American Supplement*, Dec. 16, 1916).—See also **ASTROLABE**.

"The discovery of double and multiple stars
