from the effects of the gravitational attraction on their luminous components is known as the 'Astronomy of the Invisible.' It was first suggested by the illustrious Bessel about 1840. . . . The greatest extension of the Astronomy of the Invisible has been made by Professor Campbell, of the Lick Observatory. In the course of the regular work on the motion of stars in the line of sight, carried out with a powerful spectroscopic apparatus presented to the Observatory by Hon. D. O. Mills, of New York, he has investigated . . . the motion of several hundred of the brighter stars of the northern heavens. . . . With such unprecedented telescopic power and a degree of precision in the spectrograph which can be safely depended upon, it is not unnatural that some new and striking phenomena should be disclosed. These consisted of a large number of spectra with double lines, which undergo a periodic displacement, showing

"The development of planetary astronomy has not been in keeping with the rapid progress of the science in almost all other directions. This has been due mainly to the fact that, as in the case with the double stars, the magnifying power of the telescopic eyepiece is a necessary factor in the work. The direct image formed by the object glass must be magnified before the components of a close double star can be seen—and the close double stars in general are the most interesting. In the same way the unmagnified image of a planet is so small even in the largest telescopes that the surface features either cannot be seen or are so crowded together that they become one on the photograph. To overcome this difficulty the direct image of a planet must be magnified before it falls on the sensitive plate. Much progress has been made in this direction by the use of a secondary enlarging lens which projects an enlarged

MOUNT WILSON SOLAR OBSERVATORY

that the stars in question were in reality double, made up of two components, moving in opposite directions,—one approaching, the other receding from the Earth. There were thus disclosed spectroscopic binary stars, systems with components so close together that they could not be separated in any existing telescope, yet known to be real binary stars by the periodic behaviour of the lines of the spectra so faithfully registered on different days. . . .

"Campbell's work at the Lick Observatory derives increased importance from its systematic character, which enables us to draw some general conclusions of the greatest interest. He has thus far made known the results of his study of the spectra of two hundred and eighty of the brighter stars of the northern heavens. Out of this number he finds thirty-one spectroscopic binaries, or one ninth of the whole number of objects studied."

—T. J. J. See, *Recent progress in astronomy (Atlantic Monthly, January, 1902)*.

image of the planet directly on the plate. This process was first used with considerable success by Prof. W. H. Pickering at the temporary station of Harvard University on Mount Wilson in 1880. He secured fairly good enlarged images of Saturn and excellent ones of Jupiter at that time with the thirteen inch Boyden telescope and a positive eyepiece to enlarge the image. The real advance in planetary photography, however, is due to Lampland at the Lowell Observatory, who has succeeded in making excellent photographs of the planets—especially of Mars. Similar work has also been carried out at Mount Wilson by Prof. Hale and at the Yerkes Observatory. Astronomers with usual telescopes are greatly indebted to color-filter photography, as adapted by Richey at the Yerkes Observatory to ordinary refractors, which from their nature were not intended for photography. The splendid photographs of the Moon and of the star clusters made by him with the forty-inch telescope were a great advance over

earlier work with regular photographic telescopes. This simple application of the color-filter and the isochromatic plate has made the forty-inch telescope one of the most important instruments for the determination of the distances of the fixed stars. Photographic parallax work was first done with it by Dr. Frank Schlesinger, who showed the remarkable accuracy that could be obtained by this method. Van Moanen has shown that parallax determinations made with the five-foot reflector of the Solar Observatory at Mount Wilson (a regular photographic telescope) are of the very highest accuracy. Astronomers now know quite accurately the distances of a large number of the fixed stars. In this way we find that it is not always the brightest stars that are nearest to us. A considerable percentage of the nearest stars are not visible to the naked eye. There are perhaps (if we leave out the work of the spectroscope) no astronomical subjects that have been so vastly benefited by photography as the nebulae and the comets—the comets and the nebulae, which at times look so much alike and at other times are so wonderfully different, and which have no relationship in reality. The ordinary photographic plate is sensitive to a region of the spectrum to which the eye is almost blind. Many of the nebulae shine mostly with this light and thus the photograph has a great advantage over the eye, for though seen but dimly they are bright to the photographic plate. Faint nebulasities whose light could never affect the eye, are finally shown as a clear and accurate picture which can be preserved and studied afterwards for the detection of changes in these bodies." In 1908 appeared Morehouse's comet "which in the telescope was a rather insignificant affair, and which was only feebly visible to the naked eye for almost one day. This object has given us a greater knowledge of the physical conditions of these bodies than all other comets that have appeared. The photographic plate was especially sensitive to its light, while the eye was not. A bewildering amount of structure was shown in its tail, which was frequently twisted and distorted in its rapid changes. Several times the tail was discarded and new ones formed within a few hours' time. All of these remarkable peculiarities would have been wholly unknown were it not been for the photographic plate. Through the information thus gained from this comet and others that preceded it we have learned that though comets are dependent on the Sun for most of their activity, they really take a larger part in the formation of the tail and the direction of the streamers than we had previously given them credit for. These photographs show that perhaps electrical conditions have much to do with the phenomena of a comet's tail. They also suggest that other forces are at work in the interplanetary spaces than gravity alone. The investigations of Kapteyn on the star streams of the sky gives us an insight into the makeup of our stellar universe that is new, impressive, and of the utmost importance."—E. E. Barnard, *A few astronomical events of the past fifty years* (*Scientific American Supplement*, Dec. 16, 1916).—In 1914, the ninth satellite of Jupiter was discovered, in a photographic search conducted by Nicholson at the Lick Observatory in California. The satellite accomplishes its revolution in three years, and is the most distant of the satellites. Like the eighth, it has a retrograde motion. In 1915, from perturbations in the orbit of Uranus, Professor Percival Lowell calculated that a trans-Neptunian planet exists with an orbit about 12,000,000,000 miles in diameter.

Measuring star distances.—Parallax method.—The parallax of a star is its apparent displace-

ment in the sky due to the change in the earth's position in its orbit. It is the angle that 93,000,000 miles, the distance from the earth to the sun, subtends at the star. Viewed from the vast majority of the stars this base-line shrinks to an immeasurable point. The direct measurement of the parallax of the stars by the triangulation method, by which the star's displacement at different times of year is determined either photographically or visually with reference to faint stars so distant as to have zero parallax, is possible only for a few stars near the solar system. The distances of nearly a thousand stars have been determined with more or less accuracy by this method. Since to express the distance of the stars in miles would be as cumbersome and meaningless as to express the distance from the earth to the moon or neighboring planets in inches, a new unit for the measurement of stellar distances has been found in the velocity of light. In one second light travels 186,000 miles, in one year it travels nearly six trillion miles. The distance light travels in one year is spoken of as the light year. The triangulation method is long and tedious and care must be taken to avoid systematic as well as accidental errors. The finally determined parallax is usually the result of a large number of independent measurements. At a meeting of the Royal Society on November 6, 1910, its president, Sir J. J. Thompson, is reported to have stated that the Einstein theory was the greatest discovery in connection with gravitation since Newton enunciated that principle. "The Einstein theory may be said to have its origin in an effort to explain the experiment on the so-called ether-drift, made by Professors Michelson and Morely somewhat more than thirty years ago (1890) at the Western Reserve University. Michelson suggested that the negative result of the experiment could be accounted for by supposing that the apparatus underwent a shortening in the direction of the line of motion. Later Professor Lorenz, the Dutch physicist, assumed that everything gets shortened as it moves through space; that the 8,000 miles of the earth diameter is shortened up by three or four inches, an amount sufficient to provide a scientific explanation for the failure of the Michelson and Morely attempt to detect that the earth was moving through the ether. Then Einstein proposed his generalization that it is impossible to detect the effects of motion, except when it is relative to another material body, or that it is impossible to detect the absolute velocity of any body moving through space."—*Principle of relativity and the deflection of light by gravitation* (*Scientific Monthly*, December, 1910, pp. 586-587).—Since the exposition of this theory, photographic plates, taken during the solar eclipse of May 29, 1919, show a deflection of the rays of light from the stars in their passage past the sun that accords with the theoretical degree, 1.7 second of arc, predicted by the relativity theory of Einstein. It has also been confirmed by observation of the motion of the planet Mercury which is in accord with the theory of relativity, but cannot be accounted for on the exact assumptions of Newton's law of gravitation.

Measuring the size of stars.—Michelson's discoveries.—Measuring of Betelgeuse.—Professor Albert A. Michelson of the University of Chicago, speaking before the American Association for the Advancement of Science, on Dec. 29 [1920], told of his achievement in measuring the sizes of stars, and of the astounding results shown by his measurement of Betelgeuse (Alpha Orionis), the dull red star in the upper shoulder of Orion.

The distances of stars have long been measured by means of the parallax, the angle between lines made by viewing a star from two different

size. He had been using this instrument for some years in spectroscopic analysis, and even in determining the diameter of Jupiter's satellites; but its chief triumph came last Summer at the Mount Wilson Observatory in Southern California, when he succeeded in measuring Betelgeuse.

"If the professor's instrument is correct—and he believes it is—the diameter of Betelgeuse is 260,000,000 miles, or 300 times the diameter of our sun, making its volume 27,000,000 times that of the sun. In other words, if Betelgeuse were placed where our sun now is, its solid sphere would extend far beyond the whole orbit in which the earth swings, out almost to the orbit of Mars.

"Professor Michelson used the eight-foot reflecting telescope of the observatory, with the mirror of the telescope obscured by an opaque cap, in which were two slits adjustable in width and distance apart. Thus, when the telescope was focused on a star, it showed, instead of an image of the star, a series of interference bands arranged at equal distances apart and parallel to the two slits. He separated the slits to a distance at which the fringes disappeared. Then, by a simple formula, he obtained the angle subtended by the star. The distance of the star had been obtained long before by the parallax method, and, having both the distance and the angle, he readily calculated the star's diameter, approximately. In its perfected form the interferometer attachment to the telescope has two adjustable mirrors instead of the slits. The great service of the interferometer is that it obviates the atmospheric tremor which has been the chief obstacle in the way of measurements. Heretofore star diameters have been calculated, but have never been actually measured.

"This achievement by Professor Michelson is the crowning one among many in his long years of experimentation in the phenomena of light. It was the Michelson-Morely light experiment which raised the problem out of which grew the famous Einstein theory of relativity."—*New York Times Current History, March, 1921*.—For further discussion see **ASTROLOGY**; and **SCIENCE: Modern: 20th century: Astronomy**.

ASTURIAS, Princes of.—In 1388 the heir of Juan I, Prince Henry, was married to the English duke of Lancaster's daughter. "Thus was the conflict of Pedro I and Henry II [rivals for the crown of Castile, 1363-1369] resolved. Their descendants, though tainted with illegitimacy in both cases, had joined to form the royal family of Spain. The young prince and his consort took the titles of Prince and Princess of Asturias, which have been used ever since by the heirs to the Spanish throne."—C. E. Chapman, *History of Spain*, p. 121.

ASTURIAS, ASTURIANS.—"It has usually been held, although the matter is in dispute, that the Visigoths resisted the invaders continuously at only one point in Spain,—in Asturias. In the mountains of Asturias there gathered various nobles of the centre and south of Spain, a number of bishops, and the remains of the defeated Christian armies, and, aided perhaps by the natives of that land, they prepared to make a stand against the Moslems. . . . Since the invaders respected the religion and customs of the conquered,

points; but until the perfection of Professor Michelson's 'interferometer' [1887] there had been no known means of direct measurement of a star's

the war of the Christian kingdom of Asturias against them did not at first have a religious or even a racial character. It was a war of the nobles and clergy for the reconquest of their landed estates and of the king for the restoration of his royal authority over the peninsula. The little Asturian kingdom was like the old Visigothic state in miniature; for example, there were the struggles between the nobility and the crown for precisely the same objects as formerly. For a century the history of Asturias reduced itself primarily to these quarrels. Nevertheless, the Moslem frontier tended to withdraw from the far northwest, not that the Moslems were forced out by the Christians, but possibly because their own civil wars drew them together in the centre and south, or because their numbers were not great enough to make them seek the less desirable lands in the northwest. The frontier became fixed south of the Douro along a line running through Coimbra, Coria, Talavera, Toledo, Guadalajara, and Pamplona, although the last-named place was not long retained. It cannot be said that the Christians took a conscious offensive until the eleventh century. In this period, despite the internal dissension of the Moslem state, the Christian frontier did not pass the Guadarrama Mountains even at the most favorable moments, leaving Aragon and central and southern Spain in the enemy's hands. The line of the Douro was far from being held consistently,—as witness the conquests of Abd-er-Rahman III and Almansor. The only notable kings of Asturias in the century following the death of Pelayo (737) were Alfonso I 'the Catholic' (739-757) and Alfonso II 'the Chaste' (791-842). Both made successful campaigns against the Moslems, although their principal importance was that they brought back many Mozárabes [as the Christians living under Moslem rule were called] from the temporarily conquered regions, and these helped to populate the north. [See also SPAIN: 713-950.] To assure his power Alfonso II sought an alliance with the Holy Roman Emperor, Charlemagne, and with his son, Louis the Pious. It is this which gave rise to the legend of Bernardo del Carpio, who is said to have compelled the king to forbear making treaties with foreign rulers which lowered the dignity of the Spanish people. Some writers have found in this supposed incident (for the figure of Bernardo is a later invention) an awakening sense of nationalism, but it seems rather to reflect the traditional attitude of the nobility lest the king become too strong for them, for real patriotism did not exist. The two Alfonsos did much to reorganize their kingdom internally, and Alfonso the Chaste moved the capital to Oviedo. In his reign, too, there occurred a religious event of great importance,—the finding of what was believed to be the tomb and body of the apostle Santiago (Saint James) in northwestern Galicia. The site was made the seat of a bishopric, and a village grew up there, named Santiago de Compostela. Compostela became a leading political and industrial factor in the Christian northwest, but was far more important as a holy place of the first grade, ranking with Jerusalem, Rome and Loreto. Thenceforth, bands of pilgrims not only from Spain but also from all parts of the Christian world came to visit the site, and, through them, important outside influences began to filter into Spain. More noteworthy still was the use of the story of the miraculous discovery to fire the Christian warriors with enthusiasm in their battles against the Moslems, especially at a later period, when the war entered upon

more of a crusading phase."—C. E. Chapman, *History of Spain*, pp. 54-55.—See also CANTABRIANS AND ASTURIANS.

1833.—The Province of Asturias received the name of Oviedo, the capital; total area, 4,205 square miles; population (1918), 715,476.

ASYLUM, Right of.—The ancient Greeks held that all temples and altars were inviolable, and that the curse of the gods would rest upon him who took a suppliant from an altar or temple by force. This curse would be transmitted to the descendants of the one who did violence to a suppliant. The curse rested upon the descendants of Megacles, archon of Athens, for fully two centuries. Abuses of this right of sanctuary led to the limiting of the number of temples that gave perfect security to the refugee. When Greece came under Roman rule the number of such temples was further reduced. Under the Roman Empire the eagles of the legions and the statues of the emperors gave similar protection. The right of asylum or sanctuary was attached to Christian churches and churchyards.

Immunity from arrest when asylum is sought on board vessels of war.—"Under the general rule of international law and courtesy it is considered wrong to offer or afford an asylum to a criminal or to a person charged solely with a crime against the state in whose friendly waters a vessel of war happens to be for the time. If, however, a criminal of any kind succeeds in getting on board a foreign vessel of war, he cannot be apprehended or followed on board by the police or local authorities. The commanding officer has a right to judge for himself whether the crime charged as non-political is so or is only used as a pretext to prevent asylum being

granted to a person in flight for his life on account of his political acts. The regulations of the United States navy read as follows upon this subject: 'The right of asylum for political or other refugees has no foundation in international law. In countries, however, where frequent insurrections occur and constant instability of government exists, usage sanctions the granting of asylum; but even in the waters of such countries, officers should refuse all applications for asylum except when required by the interests of humanity in extreme or exceptional cases, such as the pursuit of a refugee by a mob. Officers must not, directly or indirectly, invite refugees to accept asylum.' It is hardly necessary to add that a rigid impartiality should prevail in all such cases between political parties, and that refugees granted asylum should not be allowed to open nor maintain communication with the shore for political or any other purpose. In former times, when slavery existed in countries that were classed as enlightened, it was customary to surrender fugitive slaves who had sought refuge on board vessels of war. This was urged as a policy of the United States in the earlier days of the republic. Since slavery is now practically abolished by all members of the family of nations, the right of such slaves to refuge and freedom has become the usage. By Article 28 of the general act of the Brussels conference relative to the African slave trade, signed July 2, 1890, and ratified by the United States and most of the civilized states, it is agreed that any slave who may have taken refuge on board a ship of war flying the flag of one of the signatory powers shall be immediately and definitely freed. Such freedom, however, shall not withdraw him from the competent jurisdiction if he has committed a crime or offence at common law. Before closing this portion of the subject which deals with the conduct and privileges and obligations of the officers and men of a man-of-war in foreign ports, it is well to give an article of the *United States Navy Regulations* upon the subject of their dealings with foreigners when in foreign ports. The commander-in-chief of a fleet, or in his absence the commanding officer, is directed to 'impress upon all officers and men that when in foreign ports it is their duty to avoid all possible causes of offence to the authorities or inhabitants; that due deference must be shown by them to the local laws, customs, ceremonies, and regulations; that in all dealings with foreigners moderation and courtesy should be displayed, and that a feeling of good-will and mutual respect should be cultivated.' No officer or man can be allowed to violate the jurisdiction on shore by arresting or attempting to arrest a deserter or straggler from his vessel. If any officer or member of the crew while on shore commits an offence against the laws of the country, the local authorities have jurisdiction over such persons while they are on shore and may cause them to be arrested while there and to be tried and punished in accordance with the laws of the foreign state. The commanding officer of the vessel, or the admiral if he should be present, should be at once informed of the arrest and the causes which led to it, so that either he or the diplomatic or consular agents of his government may procure the return of the person accused to his vessel or be enabled to observe the manner of treatment and trial. If the offender, however, escapes to his vessel he cannot be apprehended by the local authorities; but the commanding officer can, if he sees fit, without loss of dignity or prestige, surrender the offender for trial and punishment by

the local courts, or the matter can be left to the usual diplomatic channels, as mentioned above."—C. H. Stockton, *Outlines of international law*, pp. 162-164.

Right of asylum in legations and embassies.—"The privileges of immunity from local jurisdiction do not embrace the right of asylums for persons outside of a representative's diplomatic or personal household. In regard to the right of asylum Bynkershoek states very strongly 'that, whether common sense, the reason of the thing, or the end and object of embassies be considered, there is not even that faint color of reason which the most absurd pretensions can generally put forth to be alleged in favor of such a custom.' Spain seems to be the only nation in Europe in which the right of asylum for political refugees is sanctioned or tolerated in later years. In the revolutionary period of 1865-75, which in respect of disorder and violence reproduced the decade of 1840-50, the practice was resumed. In 1873, after the abdication of Amadeus, Marshal Serrano, who had taken an active part in placing that prince on the throne, was hunted by a mob. He fled from house to house, but at last repaired to the abode of the British minister, Mr. Layard, who subsequently disguised him and accompanied him by rail to Santander, where he embarked for St. Jean de Luz. Secretary Fish in a letter to Mr. Caleb Cushing, our minister to Spain in 1875, says: 'The frequency of resort in Spain to the legations for refuge and the fact mentioned by you that nobody there disputes the claim of asylum but that it has become, as it were, the common law of the land may be accounted for by the prevalence of 'conspiracy as a means of changing a cabinet or a government,' and the continued tolerance of the usage is an encouragement of this tendency to conspiracy. It is an annoyance and embarrassment probably to the ministers whose legations are thus used but certainly to the governments of those ministers, and, as facilitating and encouraging chronic conspiracy and rebellion, it is wrong to the government and to the people where it is practised—a wrong to the people, even though the ministry of the time may not remonstrate, looking to the possibility of finding a convenient shelter when their own day of reckoning and of flight may come.' To a limited extent the practice of asylum still exists in certain Spanish-American countries. In these countries, where frequent insurrections occur and consequent instability of government exists, the practice of seeking asylum has become so firmly established that it is often invoked by unsuccessful insurgents and is practically recognized by the local government. 'The government of the United States does not sanction the usage and enjoins upon its representatives in such countries the avoidance of all pretexts for its exercise. While indisposed to direct its representatives to deny temporary shelter to any person whose life may be threatened by mob violence, it deems it proper to instruct them that it will not countenance them in any attempt knowingly to harbor offenders against the laws from the pursuit of the legitimate agents of justice.'"—C. H. Stockton, *Outlines of international law*, pp. 210-211.—See also **EXTERRITORIALITY: Application to diplomatic agents.**

Arrest of Mason and Slidell. See U. S. A.: 1861 (November).

Right of asylum on merchant ships.—"Apart from acts affecting their internal order and discipline and not disturbing the peace of the port, merchant vessels, as a rule, enjoy no exemption from local jurisdiction. It is, therefore, generally

laid down that they cannot grant asylum. Certain cases in which opposite ground was taken, especially as to passengers in transit, are here-with mentioned as matters of interest and information. The case of Sotelo is one of interest and is given by Moore as follows: 'In 1840 the French packet-boat *L'Océan*, which made regular voyages between Marseilles and the coast of Spain and Gibraltar, received on board, at her anchorage at Valencia, M. Sotelo, a Spanish ex-minister who was under prosecution for political offences. The vessel, having put to sea without knowledge of the number and personality of the passengers who had embarked, entered the port of Alicante, where, during the customs and police inspection, M. Sotelo was recognized, seized, taken ashore, and imprisoned. The captain of *L'Océan* protested against what he described as a violation of his flag and in vain demanded that his passenger be set at liberty, invoking at the same time the right of asylum and the principle of extraterritoriality. Diplomatic communications on the subject which were exchanged between the governments of France and Spain established it in the clearest manner that the conduct of the authorities at Alicante was above reproach; that no injury was done to the flag, since the acts in question pertained to an ordinary merchant ship and to a high measure of police power executed inside the port; that M. Sotelo, surreptitiously embarked at Valencia, a Spanish port, could have been regularly seized and arrested on *L'Océan* at another port of the same country; and, finally, that the fact that she had been on the high seas a certain time before entering Alicante could not alter the nature of the act done at the place of departure and proved at the place of arrival, under the dominion of the same laws and of the same territorial legislation.'

'The case of Gámez [1885] was that of a political fugitive from Nicaragua who voluntarily took passage at San José de Guatemala for Punta Arenas, Costa Rica, on board the Pacific mail steamship *Honduras*, knowing that the vessel would enter en route the port of San Juan del Sur, Nicaragua. Upon learning the fact of his being on board this steamer, the government of Nicaragua ordered the commandant of the port of San Juan del Sur, Nicaragua, to arrest Gámez upon the arrival of the *Honduras*. When the *Honduras* reached San Juan the authorities of that port requested the captain of the steamer to deliver up Mr. Gámez, which he declined to do, and set sail without proper clearance papers. Of this case Mr. Bayard, the secretary of state, says: 'It is clear that Mr. Gámez voluntarily entered the jurisdiction of a country whose laws he had violated.' Under the circumstances, it was plainly the duty of the captain of the *Honduras* to deliver him up to the local authorities upon their request. It may be safely affirmed that when a merchant vessel of any country visits the ports of another for the purposes of trade it owes temporary allegiance and is amenable to the jurisdiction of that country and is subject to the laws which govern the port it visits so long as it remains, unless it is otherwise provided by treaty. Any exemption or immunity from local jurisdiction must be derived from the consent of that country. No such exemption is made in the treaty of commerce and navigation concluded between this country and Nicaragua, on the 21st day of June, 1867.' In the Barrundia case [1800] the facts were as follows: General Barrundia, an ex-minister of war of Guatemala, had been attempting for some time

to incite an insurrection in Guatemala from his temporary residence within the Mexican border, Guatemala being at war with Salvador at the time. When, upon complaint of Guatemala, the government of Mexico required Barrundia to leave the borders of Guatemala, he proceeded with two of his followers to Acapulco, a Mexican port, and embarked on board an American mail-steamer ostensibly for Panama, but with reasonable certainty for Salvador, to join the Salvadoran forces against Guatemala. Upon reaching a Guatemalan port, Champerico, his arrest was determined upon by the Guatemalan authorities, but the master of the mail-steamer declined to give him up without the written authority of the American minister resident in Guatemala City. Upon arrival at San José, the second Guatemalan port of call, the letter of the minister was brought on board by the arresting force, which advised the master to give Barrundia up to the Guatemalan officials, stating that the government had promised that his life would be spared. The arrest was then permitted, but Barrundia, resisting arrest with firearms, was killed on board the steamer by the officials attempting arrest. The American minister was removed by the government of the United States for authorizing the arrest, and the senior naval officer of the United States in port, commanding the U.S.S. *Ranger*, was relieved from his command for not offering an unsolicited asylum to Barrundia on board of his vessel. The Guatemalan Government desired the arrest of Barrundia both for common crimes and as an enemy of the country within its borders. The arrest was desired as a matter of self-preservation, as Barrundia was on his way to wage war from the southern border, as he already had attempted to do upon the northern border. It can hardly be claimed that Barrundia possessed immunity from arrest because he was on board of a merchant vessel carrying the American flag, as there is no foundation in international law for this position. As to offering an unsolicited asylum on board the *Ranger*, it is needless to say that the position of both the State and Navy Departments is in opposition to such voluntary action. The reason given for claiming immunity from arrest under the circumstances is that an exceptional rule should be adopted or usage acknowledged to exist in Spanish-American states which is in violation of their rights as sovereign states. Secretary Gresham's letter of December 30, 1893, must be conceded to give the final and authoritative statement of our policy in the matter. In the paragraph that is applicable to the Barrundia case he states as follows: 'The so-called doctrine of asylum having no recognized application to merchant vessels in port, it follows that a ship-master can find no exercise of his discretion on the character of the offence charged. There can be no analogy to proceedings in extradition when he permits a passenger to be arrested by the arm of the law. He is not competent to determine whether the offence is one justifying surrender or whether the evidence in the case is sufficient to warrant arrest and commitment for trial or to impose conditions upon the arrest. His function is passive merely, being confined to permitting the regular agents of the law, on exhibition of lawful warrant, to make the arrest. The diplomatic and consular representatives of the United States in the country making the demand are as incompetent to order surrender by way of quasi-extradition as the ship-master is to actively deliver the accused. This was established in the celebrated Barrundia case by the disavowal and rebuke of Minister Mizner's

action in giving to the Guatemalan authorities an order for the surrender of the accused. If it were generally understood that the masters of American merchantmen are to permit the orderly operations of the law in ports of call, as regards persons on board accused of crime committed in the country to which the port pertains it is probable, on the one hand, that occasions of arrest would be less often invited by the act of the accused in taking passage with a view to securing supposed asylum and, on the other hand, that the regular resort to justice would replace the reckless and offensive resort to arbitrary force against an unarmed ship which, when threatened or committed, has in more than one instance constrained urgent remonstrance on the part of this government."—C. H. Stockton, *Outlines of international law*, pp. 169-173.—See also HAGUE CONFERENCE: 1907.

ASYUT (Assiut) DAM. See EGYPT: 1898-1901.

ATABEGS, Attabegs, or Attabecks.—"From the decline of the dynasty of Seljook to the conquest of Persia by Hulakoo Khan, the son of Chenghis, a period of more than a century, that country was distracted by the contests of petty princes, or governors, called Attabegs, who, taking advantage of the weakness of the last Seljookian monarchs, and of the distractions which followed their final extinction, established their authority over some of the finest provinces of the Empire. Many of these petty dynasties acquired such a local fame as, to this day, gives an importance to their memory with the inhabitants of the countries over which they ruled. . . . The word Attabeg is Turkish: it is a compound word of 'atta,' master, or tutor, and 'beg,' lord; and signifies a governor, or tutor, of a lord or prince."—J. Malcolm, *History of Persia*, v. 1, ch. 9.—"It is true that the Atabeks appear but a short space as actors on the stage of Eastern history; but these 'tutors of princes' occupy a position neither insignificant nor unimportant in the course of events which occurred in Syria and Persia at the time they flourished."—W. H. Morley, *Preface to Mirkhond's history of the Atabeks.*—See also SALADIN, EMPIRE OF.

ATACAMA: Taken from Bolivia by Peru, Dispute over. See CHILE: 1804-1900.

ATAHUALPA, son of the Peruvian sovereign, Huayna Capac, at whose death (1527) he became ruler of Quito while his brother, Huascar, succeeded his father. War broke out between the two brothers and Atahualpa, 'the last of the Incas,' succeeded in capturing his brother and threw him into prison. Pizarro tried to force the Inca to accept the Roman Catholic faith, give up his kingdom to Spanish rule and pay tribute to Charles V. Atahualpa refused Pizarro's conditions, was seized and was condemned to death for plotting against the Spaniards. He, however, accepted the Christian faith and received baptism. For this his sentence was commuted from death at the stake to strangulation.—See also PERU: 1531-1533.

ATAKPAME, a town in southern Togoland on the coast of Guinea, Africa, captured by the British in 1914. See WORLD WAR: 1914: VI. Africa: a.

ATAMAN, or Hetman (title). See COSSACKS.

ATAULF, Atawulf, or Ataulphus (d. 415), king of the West Goths. Evacuated Italy 412; conquered Aquitaine; went to Spain to subdue the Vandals and Suevi. See BARBARIAN INVASIONS: 408-423.

ATAULPHUS. See Ataulf, or Atawulf or Ataulphus (d. 415).

ATBARA, a river in the Sudan. See SUDAN: 1914.

Battle of (1808). See EGYPT: 1807-1808.

ATCHIN. See ACHIN.

ATCHINSON, David Rice (1807-1886), American politician. Strong agitator for the passage of the Kansas-Nebraska act, which would involve the repeal of the Missouri Compromise. See U. S. A.: 1853-1854.

ATELIERS NATIONAUX, Paris (1848). See FRANCE: 1848; and 1848 (April-December).

ATH, a town southwest of Brussels in the province of Hainaut, Belgium.

1697.—Captured by French. See FRANCE: 1695-1696.

1706.—Taken by Marlborough. See NETHERLANDS: 1706-1707.

ATHABASCA, a region of the Canadian Northwest (covering 251,300 square miles), formerly a distinct political division, but in 1905 divided between Alberta and the new province of Saskatchewan; in 1912 the east part was included in Manitoba. The western territory, now in Alberta, is highly fertile; wheat, potatoes, and the hardier cereals are raised in abundance. Athabasca also gives name to a river and a lake.—See also CANADA: 1905.

ATHALARIC (516-534), king of the Ostrogoths.

ATHALAYAS. See SARDINIA, THE ISLAND: Name and early history.

ATHALIAH: Worship of Baal. See JERUSALEM: B. C. 1400-700.

ATHANAGILD (d. 547), king of the Visigoths in Spain.

ATHANARIC (d. 381), ruler of the Visigoths, with the title of jud'e.

ATHANASIAN CREED. See ARIANISM; NICÆA.

ATHANASIUS, Saint (293-373), bishop of Alexandria. Chief opponent of Arianism at the Council of Nicæa (Nice) in 325. See ARIANISM; MONASTICISM: Primitive forms; NICÆA.

ATHAPASCAN FAMILY: Chippewyans.—Tinneh.—Sarcees.—"This name [Athapascans or Athabascans] has been applied to a class of tribes who are situated north of the great Churchill river, and north of the source of the fork of the Saskatchewan, extending westward till within about 150 miles of the Pacific Ocean. . . . The name is derived, arbitrarily, from Lake Athabasca, which is now more generally called the Lake of the Hills. Surrounding this lake extends the tribe of the Chippewyans, a people so-called by the Kenistenos and Chippewas, because they were found to be clothed, in some primary encounter, in the scanty garb of the fisher's skin. . . . We are informed by Mackenzie that the territory occupied by the Chippewyans extends between the parallels of 60° and 65° north and longitudes from 100° to 110° west."—H. R. Schoolcraft, *Information respecting the Indian tribes*, pl. 5, p. 172.—"The Tinneh may be divided into four great families of nations; namely, the Chippewyans, or Athabascas, living between Hudson Bay and the Rocky Mountains; the Tacullies, or Carriers, of New Caledonia or North-western British America; the Kutchins, occupying both banks of the Upper Yukon and its tributaries, from near its mouth to the Mackenzie River, and the Kenai, inhabiting the interior from the lower Yukon to Copper River."—H. H. Bancroft, *Native races of the Pacific states*, ch. 2.—"The Indian tribes of Alaska and the adjacent region may be divided into two groups . . . : 1. Tinneh—Chippewyans of authors. . . . Father Petitot discusses the terms Athabaskans, Chippewyans,

Montagnais, and Tinneh as applied to this group of Indians. . . . This great family includes a large number of American tribes extending from near the mouth of the Mackenzie south to the borders of Mexico. The Apaches and Navajos belong to it, and the family seems to intersect the continent of North America in a northerly and southerly direction, principally along the flanks of the Rocky Mountains. . . . The designation [Tinneh] proposed by Messrs. Ross and Gibbs has been accepted by most modern ethnologists. . . . 2. 'Tlinkets,' which family includes the Yakutats and other groups.—W. H. Dall, *Tribes of the extreme Northwest (Contributions to N. Am. Ethnology, v. 1)*.—"Wherever found, the members of this group present a certain family resemblance. In appearance they are tall and strong, the forehead low with prominent superciliary ridges, the eyes slightly oblique, the nose prominent but wide toward the base, the mouth large, the hands and feet small. Their strength and endurance are often phenomenal, but in the North, at least, their longevity is slight, few living beyond fifty. Intellectually they rank below most of their neighbors, and nowhere do they appear as fosterers of the germs of civilization. Where, as among the Navajos, we find them having some repute for the mechanical arts, it turns out that this is owing to having captured and adopted the members of more gifted tribes. . . . Agriculture was not practised either in the north or south, the only exception being the Navajos, and with them the inspiration came from other stocks. . . . The most cultured of their bands were the Navajos, whose name is said to signify 'large corn-fields,' from their extensive agriculture. When the Spaniards first met them in 1541 they were tillers of the soil, erected large granaries for their crops, irrigated their fields by artificial water courses or acequias, and lived in substantial dwellings, partly underground; but they had not then learned the art of weaving the celebrated 'Navajo blankets,' that being a later acquisition of their artisans."—D. G. Brinton, *American race*, pp. 60-72.—See also APACHE GROUP; BLACKFEET; INDIANS, AMERICAN: Cultural areas in North America: North Pacific coast area; also Southwest area; and Linguistic characteristics.

ATHARVAVEDA. See MYTHOLOGY: India: Unparalleled length of life.

ATHEISM, a mode of thought resting on total disbelief in the existence of a God. It should not be confounded with agnosticism (q. v.), which is a profession of ignorance on the subject of a possible deity, nor with deism, which admits a God of nature, unrevealed except in his works. Unlike the different systems of pantheism, polytheism and non-Christian theism, as well as the several distinct religions based on a belief in some form of immediate revelation, atheism contains no body of doctrine, and is consistent with many widely differing views of the universe. In the case of many modern scientists and philosophers, it consists simply in the tacit omission of God from their conception of the universe and in the formation of hypotheses to account for the existence and development of the cosmos without any interposition of deity. Atheism has been improperly used as a term of reproach against dissenters from prevailing religious doctrine. Thus, Socrates was condemned to death as an atheist, although the exponent of a pure belief in God. A like reproach was brought by the polytheistic world against the early Christians. Spinoza, whose philosophy posited God as the one reality, was nevertheless branded as an atheist, as in modern times have been Thomas Paine, the deist, and Colonel Robert G. Inger-

soll, the eloquent champion of agnosticism. The most notable atheists of antiquity were Democritus and Leucippus in Greece and Lucretius in Rome. Among its strongest partisans in later times may be cited d'Holbach and Feuerbach in the eighteenth and Charles Bradlaugh in the nineteenth century. At the present time, the more radical wing of the Freethought and various anti-clerical movements which are organized and active in various countries denominates itself as atheistic.

"In 1674 Hume, at a dinner in Paris, happened to say that he had never chanced to meet an atheist. 'You have been somewhat unfortunate,' said his host; 'but at the present moment you are sitting at table with seventeen of them.' Indeed, it is altogether probable that in no other age has the great mass of intelligent persons so uniformly endeavored to fulfill the law of atheistic philosophy and rid themselves of 'the fear of invisible powers.' Horace Walpole, who would scarcely be classed among radical Christians, writes with fine sarcasm from France in 1765, 'They think me quite profane for having any belief left.' Yet it is possible that as in so many aspects of French life a reaction had set in by 1780, for the more atheistic philosophy of Diderot had quite given way to the teachings of Rousseau, in which the idea of God played no small logical part. The philosophical opinions contained in the Encyclopedia itself are by no means conservative, as its history may very well suggest, but it gave its name to the group of scholars and philosophers most intimately concerned in its production, and the philosophical and political opinions expressed in other works of these Encyclopedists were radical in the extreme. In religion they did not stop with the deism of Voltaire, plead with them though he might, but they attacked not only Christianity, but immortality and God as well. If, according to Voltaire, God wound up the universe like a clock, and then from unknown space watched it go, according to Diderot, D'Alembert, Helvetius, Holbach, and their confrères there never was any God, and the universe wound up itself. In politics they were quite as extreme. As for morality, Diderot will have none of such conventions as marriage, and champions the most extreme of free-love doctrines. He finds in the 'natural,' the uncivilized man the ideal being, and believes that he continues to live in every person. To give this 'natural man' free scope was the ideal of the Encyclopedist school. Government was 'a mere handful of knaves' who impose their yoke upon men. 'We see,' they said, 'on the face of the globe only incapable, unjust sovereigns, enervated by luxury, corrupted by flattery, depraved through unpunished license, and without talent, morals, or good qualities.' And all this philosophical madness was set forth with such a wealth of learning and such a delightful self-assurance that the philosophers of France and the brilliant talkers of the salons were soon atheists and anarchists of the most fashionable sort. When these enthusiasts went further and preached doctrines of natural rights to the masses, results could not fail to be revolutionary. In truth the theorists of the eighteenth century were summoning a dangerous genius when they undertook to inspire restless, ignorant, ill-regulated minds with dreams of liberty. Voltaire put the matter to the Encyclopedists distinctly: 'Philosophize between yourselves as much as you please. I fancy I hear dilettanti giving for their own pleasure a refined music; but take good care not to perform this concert before the ignorant, the brutal, the vulgar; they might break your

instruments over your heads.' It was this same sense of the danger attending the destructive philosophy of the day that led to Voltaire's other remark: 'Atheism and fanaticism are two monsters which may tear society to pieces.' But neither the Encyclopedists nor these philanthropic enemies of the privileges upon which they depended for their incomes saw the wisdom of the observation, and the ferment was ever the greater."—S. Mathews, *French revolution*, pp. 48, 62-63, 85-86.—"Men who cherished the opinions of Voltaire and the Encyclopedists confused their contempt of Catholicism with love of country. The [French Revolutionary] Convention [elected 1792] gave countenance to this feeling by adopting a new calendar and by substituting for the Christian era a new republican era. In the same anti-Christian spirit they welcomed deputations which offered at the bar of the Convention the spoils of parish churches. . . . The radicals of the Commune concluded that they were in the presence of a great popular movement which would lift to supreme influence those who managed to appear as its leaders. They forced Gobel, metropolitan bishop of Paris, and his vicars, to proceed to the Convention and renounce their offices. Three days later, on November 10, they organized a festival of liberty in the cathedral of Nôtre Dame, transformed for the occasion into a 'Temple of Reason.' In the municipal council they ventured still further, voting to close all churches in Paris and to place the priests under surveillance. The Convention was at first intimidated by the Parisian phase of the movement, and many of the ecclesiastics among its members renounced their functions or abjured their faith. A few, led by Bishop Grégoire, stood firm. The most influential men in the Convention and in the Committee of Public Safety realized that such a movement would compromise the cause of the Republic abroad, foment civil strife at home, and jeopardize the national defense. Robespierre became the spokesman of this feeling and denounced the leaders of the movement as ill-disguised emissaries of the invader. The Convention solemnly reaffirmed the liberty of worship, but threw so many qualifications about the act that in most cases the decree remained a dead letter. Nôtre Dame was still called the Temple of Reason, and the movement spread from Paris to other large towns, sometimes supported by the 'deputies on mission,' occasionally restrained by them. . . . Before the anti-Christian movement ran its course it led to violent factional struggles within the

Jacobin party and was responsible for a long list of proscriptions. The faction which had organized the festival of liberty and the Worship of Reason was called Hébertist because its leading member was Hébert, assistant city solicitor and editor of the *Père Duchesne*."—H. E. Bourne, *Revolutionary period in Europe*, pp. 210-212.—See also DEISM; THEISM.

ATHELBY. See ADEL, AOELING; ÆTHEL.

ATHELNEY, a small district in the county of Somerset, England, at one time an island, famous as the retreat of Alfred the Great in 878-879, where he planned the overthrow of the Danes.

ATHELSTANE, or Aethelstan (895-940), king of the West Saxons. Defeated the Danes and Celts at Brunanburgh 937. By marriages, brought England into close touch with the continent. See ENGLAND: 938.

ATHENA, also called by the Greeks Pallas Athene, and by the Romans Minerva, the goddess of knowledge, arts, sciences and righteous wars. She, together with Zeus and Apollo constituted a triad, regarded as the embodiment of all divine power. To her as the patron deity of Athens, the Acropolis was dedicated and the Parthenon erected. (See also ATHENS: B. C. 461-431: General aspect of Periclean Athens.) Many other temples were built in her honor, notably at Ægina, Assus, and Syracuse. (See also TEMPLES: Stage of culture represented by temple architecture.) Among the most famous of the ancient representations of her were the colossal bronze statue on the Acropolis, known as Athena the Defender, and the ivory and gold statue in the Parthenon.

ATHENRY, Battle of.—The most desperate battle fought by the Irish in resisting the English conquest of Ireland. They were terribly slaughtered and the chivalry of Connaught was crushed. The battle occurred Aug. 10, 1316.—M. Haverty, *History of Ireland*, p. 282.—See also IRELAND: 1314-1318.

ATHENS

B. C. 1000-700.—Attica in the Mycenaean Age.—Unification of Attica with Athens the metropolis.—"When recorded history begins, the story of Athens is the story of Attica, the inhabitants of Attica are Athenians. But Attica, like its neighbour Boeotia and other countries of Greece, was once occupied by a number of independent states" (J. B. Bury, *History of Greece*, p. 163), "each having its own court-house . . . and magistrates . . . and uniting only under a central government in times of some pressing national danger. At times there was even war between these communes, as between the Eleusinians under Eumolpus and the Athenians under Erectheus; and, since some of the small independent states of early Greece subdued one another, a part of the unity of Attica may have been the result of conquest. But the main bond of union seems to have been

religion."—A. H. J. Greenidge, *Handbook of Greek constitutional history*, p. 125.—See also ATTICA.—"Of all the lordships between Mount Cithaeron and Cape Sunium the two most important were those of Eleusis and Athens, severed from one another by the hill-chain of Aegaleos. It was upon Athens, the stronghold in the midst of the Cephisian plain, five miles from the sea, that destiny devolved the task of working out the unity of Attica. . . . The first Greeks who won the Pelagic acropolis were probably the Cecropes, and, though their name was forgotten as the name of an independent people, it survived in another form. For the later Athenians were always ready to describe themselves as the sons of Cecrops. This Cecrops was numbered among the imaginary pre-historic kings of Athens; he was nothing more than the fabulous ancestor of the Cecropes.

But the time came when other Greek dwellers in Attica won the upper hand over the Cecropes, and brought with them the worship of Athena. It was a momentous day in the history of the land when the goddess, whose cult was already established in many other Attic places, took possession of the hill which was to be pre-eminently, and for all time, associated with her name. . . . In the course of time the feeling of unity in Attica became so strong that all the smaller lordships, which formed parts of the large state, but still retained their separate political organisations, could be induced to surrender their home governments and merge themselves in a single community with a government centralised in the city of the Cephisian plain. . . . From this time forward she is no longer merely the supreme city of Attica. She is neither the head of a league of partly independent states, nor is she a despotic mistress of subject-communities. . . . She is the central city of an united state; and to the people of every village in Attica belong the same political rights as to the people of Athens herself. The man of Marathon or the man of Thoricus is no longer an Attic, he is an Athenian. It is generally supposed that the synoecism was the work of one of the kings [legend attributed it to Theseus]. It was undoubtedly the work of one man; but it is possible that it belongs to the period immediately succeeding the abolition of the royal power."—J. B. Bury, *History of Greece*, 163-166.—See also DORIANS AND IONIANS; GREECE: Migrations of Hellenic tribes.

B. C. 753-650.—Transition from monarchy to aristocracy.—Magistrates and assembly.—"The transition from monarchy to aristocracy was gradual; and though no ancient writer informs us we may be sure that it was brought about by the council of nobles, who alone benefited by the change. [See also ARISTOCRACY.] It must therefore have been this body which, about the middle of the eighth century, reduced the tenure of the royal office to a single decade. Although the incumbent was still termed king, the monarchy in fact ceased, the supreme power passing to the council. At this point accordingly dates the beginning of the aristocracy (753). As the decennial kings proved incapable of efficient military leadership, the office of 'polemarch'—war archon—was instituted, probably to lead the army in the conflict with Eleusis. No long time afterward the Medontidae [a royal family] were deposed, and the royal office thrown open to all the nobles. Then, about 700, the office of archon was instituted with the function of caring for widows and orphans and their estates. As the decennial magistrates proved too strong and independent to serve the interests of the ruling power, all offices were made annual in 683-2; and at the same time the archon superseded the king as head of the state. In this way the government became in form as well as in fact a republic. In this year or shortly afterward were instituted the six thesmothetæ, 'that they might record the customary laws and keep them for the trial of offenders.' (Arist. Const. Ath. 3.) In the time of Solon the archon, king, polemarch and thesmothetæ were brought together under the name of archons. [See ARCHON.] The aristocracy was now at the summit of its power. The assembly of citizens, which had never been really important, fell into practical desuetude. The elective power resided in the Council, who 'called up men and on its own judgment assigned them according to their qualifications to the several offices for the year.' (Arist. Const. Ath. 8.) It supervised their administration, and watched rig-

grously over the lives of the citizens, with power to punish for immoral as well as for lawless conduct. The members of this body were powerful lords, recruited annually from those who had worthily filled the nine magistracies described above."—G. W. Botsford, *Hellenic history*, ch. 6.

B. C. 700-565.—Beginnings of Athenian expansion.—Annexation of Eleusis (700) and the conquest of Salamis (570-565).—One important achievement of the aristocracy was the conquest of the little Eleusinian kingdom, bound in by Athens on one side and Megara on the other (700 B. C.) Before the middle of the sixth century Megara had developed into a formidable rival to Athens. Almost equidistant between these two states lay an island, Salamis, whose possession must decide the future history of both states. Therefore, "The Athenians sought to occupy Salamis, but all their efforts to gain a permanent footing failed, and they abandoned the attempt in despair. Years passed away. At length Solon saw that the favourable hour had come. . . . An intimate friend of Solon took part in the enterprise,—Pisistratus, son of Hippocrates, whose home and estates were near Brauron. . . . He helped the expedition to a successful issue. Not only was the disputed island wrested from Megara, but he captured the port of Nisaea over against the island. . . . But Salamis now became permanently annexed to Attica. The island was afterwards divided in lots among Athenian citizens, who were called *cleruchs* or 'lot-holders.' Salamis, unlike Eleusis, was not incorporated in Attica, though it was nearer Athens. . . . The conquest of Salamis was a decisive event for Athens. Her territory was now rounded off; she had complete command of the landlocked Eleusinian bay; it was she who now threatened Megara."—J. B. Bury, *History of Greece*, 190-192.—See also MEGARA.

B. C. 650-594.—Timocracy of the heavy infantry.—Constitution.—Threatened by foreign conquest the Athenian nobles found it necessary to adopt the Spartan phalanx. Since their number was small they were compelled to take into the ranks of the phalanx all the commoners who were wealthy enough to provide a complete military equipment. With a view to determine who could afford to supply the necessary equipment, a general census was taken. The result was that these newly recruited men of wealth immediately began to take part in the government, and since political privileges were based on property, the government became a timocracy ("rule of the wealthy"). This occurred about 650 B. C., and after this date it became customary to divide the citizens into four census classes according to the productive value of their land. [See also LITURGIES.] It was not, however, until a later period of the history of Athens that the census classes became important. The chief features of the Athenian Constitution were as follows:

- " I. Territorial Divisions of Attica
The four tribes and forty-eight townships (naucraries) for the local administration.
- " II. The Four Census Classes
For determining the public burdens and privileges of the citizens; not known in detail for this period.
- " III. The Principal Magistrates
 1. The Archon
 - (a) Chief executive.
 - (b) Judge in cases affecting family rights.
 - (c) Head of the board of 'nine archons.'

2. The King
 - (a) A priest.
 - (b) Judge in murder cases.
3. The Polemarch
 - (a) Commander of the army.
 - (b) Judge in cases affecting alien residents.
4. The six *Tresmothetæ*, 'legislators'
 - (a) Keepers of the laws and public documents.
 - (b) Judges in certain civil cases.

"These nine magistrates sometimes acted as a board under the presidency of the Archon.

"IV. The Councils

1. The Council (*Boulé*) of the Areopagus
 - (a) Composed of retired archons; membership lifelong.
 - (b) As highest authority in the state it supervised the magistrates and the conduct of the citizens.
 - (c) As a court it tried wilful murder.
2. The Council (*Boulé*) of Four Hundred and One
 - (a) Representing the tribes and townships
 - (b) Assisted the magistrates in the government.
 - (c) Prepared decrees for presentation to the assembly.

"V. The Assembly—Ecclesia

1. Composed of all those who could furnish a complete military equipment.
2. It elected magistrates and voted on questions brought before it by the Four Hundred and One.

"VI. Form of Government

As political rights were graded according to property assessments, the government was a timocracy.

"The above is an outline of the Athenian Constitution. Occasionally parts of it were changed and new features added, but it was never displaced by a new constitution. In brief Athens had but one constitution."—G. W. Botsford, *History of the ancient world*, p. 127.

B. C. 624-621.—**Draco, the law-giver, and his reforms.**—Among the common people "one chief cause of complaint was that they alone (the nobles) knew the law and administered it according to their own will. Hence, the demand arose for the publication of the law. It was secured in a truly Greek fashion. One man was chosen, the best man in the state, to whom all power was given that he might prepare, publish, and administer a code of law which should be binding upon the people. Thus, almost every Greek state of the time had its law-giver, or in later times traced its law-code back to some great man who was thought to be its author."—G. S. Godspeer, *History of the ancient world*, p. 104-105.—"The Athenians accordingly appointed Draco as their law-giver (about 624). "His legislation gave Athens written provisions for settling business and other disputes, thus limiting the power of magistrates in recognizing cases, conducting trials and imposing penalties. The most durable of these drew a noteworthy distinction between the penalty for different sorts of murder. Heretofore, all killing had been murder and its penalty death at the hands of the relatives of the dead man. Now, accidental or justifiable homicide was distinguished in its punishment from wilful murder. As Draco's laws were chiefly a collection of the old customs of the land, they seemed to the later Athenians exceedingly severe and were said to have been 'written in blood.'"—*Ibid.*, p. 117.—"Draco's laws were very

harsh, death being the punishment for many minor offences such as stealing, and enslavement being the punishment of a person who got in debt and could not pay the debt when due. Although the people had made some progress in obtaining a written law, they found that they were not much better off, because the laws were so severe."—R. L. Ashley, *Ancient civilization*, p. 116.

B. C. 612-595.—**Conspiracy of Cylon.—Banishment of the Alcmaeonidæ.**—The first attempt at Athens to overturn the oligarchical government and establish a personal tyranny was made, 612 B. C., by Cylon (*Kylon*), a patrician, son-in-law of the tyrant of Megara, who was encouraged and helped in his undertaking by the latter. The conspiracy failed miserably. The partisans of Cylon, blockaded in the acropolis, were forced to surrender; but they placed themselves under the protection of the goddess *Minerva* and were promised their lives. More effectually to retain the protection of the goddess until their escape was effected, they attached a cord to her altar and held it in their hands as they passed out through the midst of their enemies. Unhappily the cord broke, and the archon *Megacles* at once declared that the safeguard of *Minerva* was withdrawn from them, whereupon they were massacred without mercy, even though they fled to the neighboring altars and clung to them. The treachery and bad faith of this cruel deed does not seem to have disturbed the Athenian people, but the sacrilege involved in it caused horror and fear when they had had time to reflect upon it. *Megacles* and his whole family—the *Alcmaeonidæ* as they were called, from the name of one of their ancestors—were held accountable for the affront to the gods and were considered polluted and accursed. Every public calamity was ascribed to their sin, and at length, after a solemn trial, they were banished from the city (about 596 or 595 B. C.), while the dead of the family were disinterred and cast out. The agitations of this affair exercised an important influence on the course of events, which opened the way for *Solon* and his constitutional reforms.—C. Thirlwall, *History of Greece*, ch. 11.—See also DELPHI.

B. C. 6th century.—**Relations with Argos.** See ARGOS, ARGOLIS, ARGIVES.

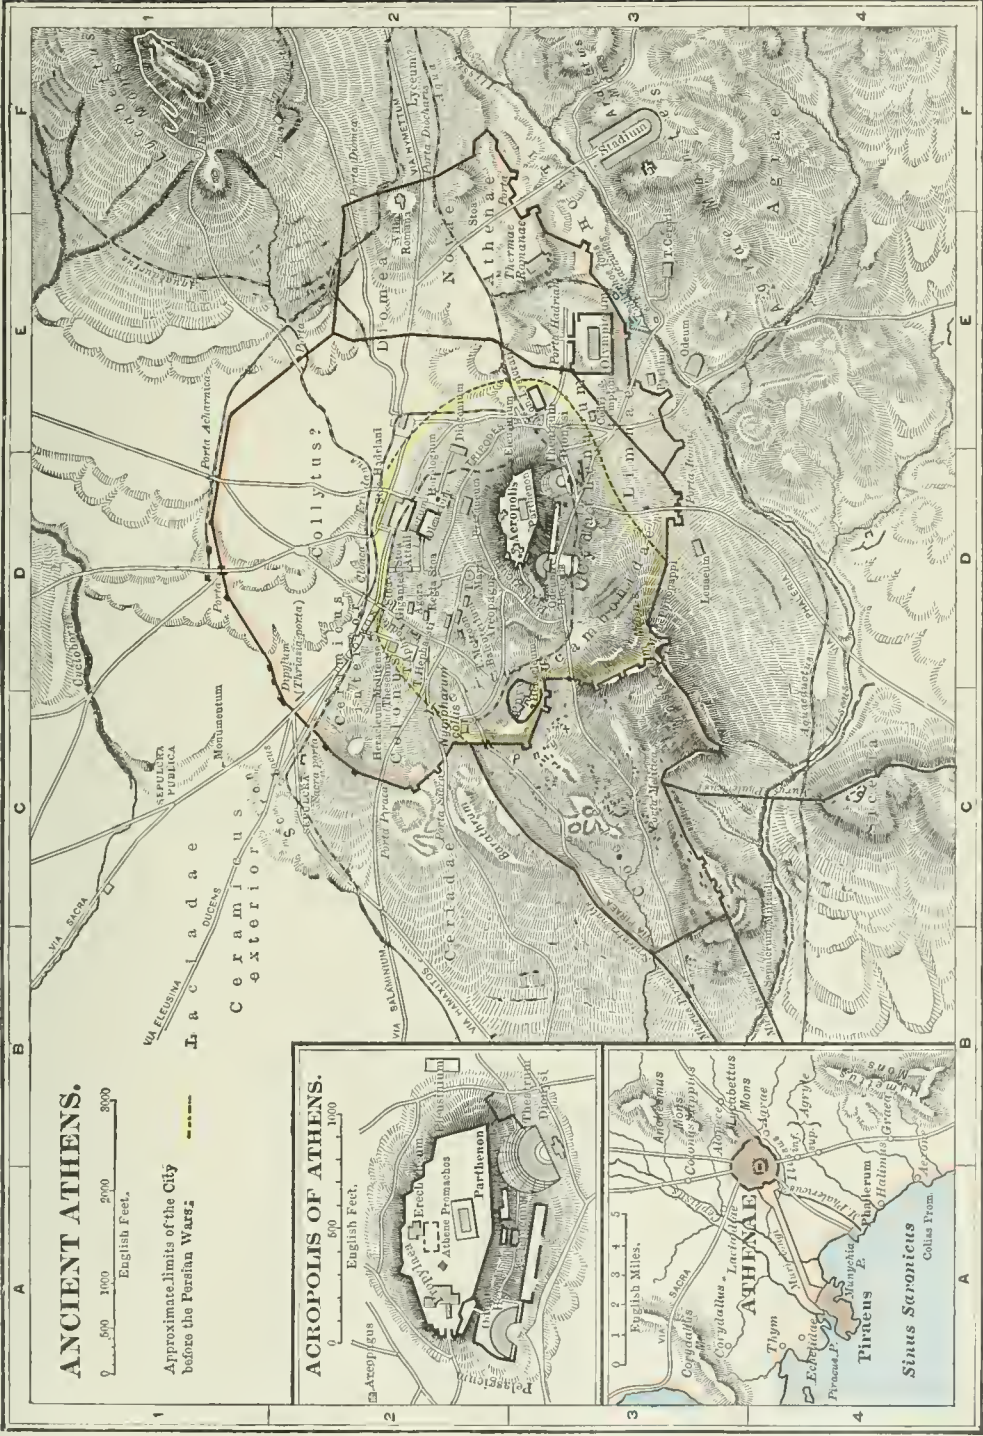

B. C. 594.—**Constitution and reforms of Solon.**—"The necessity for drastic reform was as great as before and in 594 or 593 B. C., Solon was appointed law-maker, with full power to relieve the social distress and revise the constitution. His social reforms cancelled debts and thus cleared the land from mortgages and set free debtors from selfdom; others, who had been sold as slaves, he ransomed from abroad, and he enacted that for the future no one should be allowed to pledge his liberty."—L. Whibley, ed., *Companion to Greek studies*, p. 355.—See also DEBT, LAWS CONCERNING: Ancient Greek.—"He fixed a limit for the measure of land which could be owned by a single person, so as to prevent the growth of dangerously large estates. And he forbade the exportations of Attic products, except oil. For it had been found that so much corn was carried to foreign markets, where the prices were higher, that an insufficient supply remained for the population of Attica. It is to be observed that at this time the Athenians had not yet begun to import Pontic corn."—J. B. Bury, *History of Greece*, p. 182.—"Solon then repealed the laws of Draco and pro-

ceeded to reconstruct the constitution. He divided the citizens into four property classes, based on the produce of corn, oil, or wine from their land. . . . Only members of the first three classes were eligible for offices of state, only members of the first class for the highest offices."—L. Whibley, ed., *Companion to Greek studies*, p. 355.—"He laid the foundation of the future Athenian democracy by extending the franchise to the Thetes (literally, 'hirelings') the lowest of the four classes, by instituting the *Heliæa* (q.v.), or popular courts of justice, in which every citizen in turn could take his place among the dicasts (judges or jurors), and by introducing election by lot. Moreover, he formed a new council (*Boulé*) of 400 members chosen from the whole people except the Thetes, and transferred to this council from the Areopagus the work of preparing measures to be submitted to the *Ecclisia*."—H. B. Cotterill, *Ancient Greece*, pp. 139-140.—"The Assembly had the decision of war and peace, and perhaps of some other important questions. Solon introduced the right of appeal from the sentence of the judicial magistrates to the law court, and this was regarded as his most important democratic institution. . . . The Council of the Areopagus (q.v.) was left in possession of its extensive power to watch over the laws and the constitution, to supervise the administration and to exercise a censorship over the citizens."—L. Whibley, ed., *Companion to Greek studies*, p. 355.—"Solon's laws were written or inscribed on tablets or pillars, which revolved on a pivot, and were first kept in the Acropolis, but later, by the advice of Ephialtes, were placed in the Agora." [Compare Constitution of the Timocracy: Athens, 650-594 B.C.]—H. B. Cotterill, *History of Greece*, p. 140.—See also PRYTANES.

B. C. 560-510.—The tyranny.—Reforms and public works under Pisistratus and his sons.—"When Solon had made his laws he went abroad for ten years, so as to give his constitution a fair run. When he returned he found that everything was once more in confusion. As usual the trouble was economic. . . . The village population was unhappy and restless. The peasants had been put back on their holdings and plied with good advice as to how to manage their vines and olive trees; but they had no capital to go on with and of course they could not borrow. The craftsmen and small traders, whose interests were bound up with theirs, were equally clamorous. Discontent grew more and more fierce, till finally the state was openly divided into three hostile parties, each prepared to fight for its own economic and territorial interests. There were the men of the plain, with their city interests. There were the men of the shore, that is, the population living in the country villages and small ports of South-Eastern Attica, from the settlements behind Hymettus down to Sunium. Thirdly, there were the men of the mountains, the poorer peasants and shepherds and woodcutters and charcoal-burners from the rough region of northern Attica. It seemed for a moment as if Theseus had attempted too much in trying to make a united nation out of a territory larger than that of any other Greek City State. But fortunately for Athens 'a man arose in Israel.' The Mountaineers had at their head a leader, Pisistratus, who was not only a friend of the poor but also a noted soldier and a man of large private means and influential connections. He succeeded, after some vicissitudes, in making his party supreme in the State, as he had already made himself supreme in his party. . . . But Pisistratus's most

durable achievement was his settlement of the economic difficulties. He solved them once and for all by advancing capital out of his private fortune to the poorer landowners, largely of course his own political supporters. Once they had margin enough to keep them through lean years, or while their trees were growing to maturity, their troubles were at an end. There is no more land question in Attica till the Spartans came and ruined the cultivation one hundred and fifty years later."—A. E. Zimmern, *Greek commonwealth*, pp. 183-184.—"It is difficult to estimate his services to Athens, for later generations did their utmost to deny and conceal them, giving some of his achievements to Solon and some to Theseus, and some even to Erechtheus. He [Pisistratus] founded an early Athenian empire. He won the island of Salamis from Megara, and until she possessed Salamis, Athens had no open road to the sea. [See also MEGARA.] Later Athenians ascribed this feat to Solon. He regained Sigeum, on the Troad, after a war with Mytilene. He established the elder Miltiades as tyrant of the Thracian Chersonese. In these movements his policy was obviously to open up trade with the Black Sea, the granary of Greece. He extended olive-culture in Attica. He probably began to work the silver mines at Laurium, which were thenceforth the principal source of Athenian revenue. He made the unfree tillers of the soil into peasant proprietors by confiscating the estates of his noble opponents. He was allied with Sparta and Argos, Thebes and Thessaly and Naxos. He introduced a police armed with bows into the city of Athens. He probably did much of what Theseus is supposed to have done in synoecising Athens—that is, transforming Attica from a number of villages with a capital into a city-state with surrounding territory. We know that he sent judges on circuit round the country demes. The other indications are that Pisistratus pulled down the city wall in order that she might be able to expand, that he constructed a proper water-supply, and that he fostered the worship of the Olympian or city deities. At the same time he fostered agriculture, and tried to get the poor of Athens back to the land."—J. C. Stobart, *Glory that was Greece*, pp. 110-111.—See also CERAMICUS.—"Tyranny lasted, with two interruptions, until 510. After his second restoration Pisistratus established his power and ruled with a wise moderation. The constitution was not changed, but the tyrant took care that the chief offices should be held by his friends. He relied on the support of poets for his dynasty, and extended the power of Athens in the Aegean. Hippias succeeded his father in 527, and after the assassination of Hipparchus became a harsh and suspicious despot, until the Alcmaeonidæ, who had been exiled by Pisistratus, gained the support of Sparta and overthrew the tyranny."—L. Whibley, ed., *Companion to Greek studies*, p. 356.

B. C. 509-506.—Hostile undertakings of Cleomenes and Sparta.—Help solicited from the Persian king.—Subjection refused.—Failure of Spartan schemes to restore tyranny.—Protest of the Corinthians.—Successful war with Thebes and Chalcis.—"With Sparta it was obvious that the Athenians now had a deadly quarrel, and on the other side they knew that Hippias was seeking to precipitate on them the power of the Persian king. It seemed therefore to be a matter of stern necessity to anticipate the intrigues of their banished tyrant; and the Athenians accordingly sent ambassadors to Sardis to make an independent alliance with the Persian despot. The envoys, on being brought into the presence of

Maps prepared specially for the NEW LARNED under direction of the editors and publishers.

Artaphernes, the Satrap of Lydia, were told that Darius would admit them to an alliance if they would give him earth and water,—in other words, if they would acknowledge themselves his slaves. To this demand of absolute subjection the envoys gave an assent which was indignantly repudiated by the whole body of Athenian citizens. . . . Foiled for the time in his efforts, Kleomenes was not cast down. Regarding the Kleisthenian constitution as a personal insult to himself, he was resolved that Isagoras should be despot of Athens. Summoning the allies of Sparta [including the Bœotian League headed by Thebes, and the people of Chalcis in Eubœa], he led them as far as Eleusis, 12 miles only from Athens, without informing them of the purpose of the campaign. He had no sooner confessed it than the Corinthians, declaring that they had been brought away from home on an unrighteous errand, went back, followed by the other Spartan King, Demaratos, the son of Ariston; and this conflict of opinion broke up the rest of the army. This discomfiture of their enemy seemed to inspire fresh strength into the Athenians, who won a series of victories over the Bœotians and Eubœans—completely overthrowing the latter—the Chalcidians—taking possession of their city, and making it a peculiar colony and dependency of Athens. [See CLERUCHS.] The anger of Cleomenes “on being discomfited at Eleusis by the defection of his own allies was heightened by indignation at the discovery that in driving out his friend Hippias he had been simply the tool of Kleisthenes and of the Delphian priestess whom Kleisthenes had bribed. It was now clear to him and to his countrymen that the Athenians would not acquiesce in the predominance of Sparta, and that if they retained their freedom, the power of Athens would soon be equal to their own. Their only safety lay, therefore, in providing the Athenians with a tyrant. An invitation was, therefore, sent to Hippias at Sigeion, to attend a congress of the allies at Sparta, who were summoned to meet on the arrival of the exiled despot.” The appointed congress was held, and the Spartans besought their allies to aid them in humbling the Athenian Democracy, with the object of restoring Hippias to power. But again the Corinthians protested, bluntly suggesting that if the Spartans thought tyranny a good thing they might first try it for themselves. Hippias, speaking in his own behalf, attempted to convince them that the time was coming “in which they would find the Athenians a thorn in their side. For the present his exhortations were thrown away. The allies protested unanimously against all attempts to interfere with the internal administration of any Hellenic city; and the banished tyrant went back disappointed to Sigeion.”—G. W. Cox. *Greeks and the Persians*, ch. 4.

B. C. 508.—Reforms of Cleisthenes.—Ostracism.—Beginnings of democracy.—“In the confusion which ensued Cleisthenes, the Alcmaeonid, adopted the cause of democracy, triumphed over his rivals, and in 508 or 507 B. C. was given authority to revise the constitution. The tyranny had broken the power of the nobles and thus prepared the way for democracy, but the laws of Solon had in great part fallen into disuse. The aim of Cleisthenes was to give free play to the democratic elements in the constitution of Solon, to prevent the domination of the nobles or the usurpation of tyrants. To effect this end, he took measures to abolish the political importance of the old divisions . . . based upon birth, and

to substitute new artificial divisions, so arranged as to obviate the possibility of local factions. He enrolled the citizens in ten new tribes, which superseded the four Ionic tribes for political and administrative purposes. Further the whole of Attica was divided into thirty [demes or districts] . . . , ten of which included the city and its neighbourhood, ten the coast and ten the interior. Each tribe was composed of three [demes] . . . chosen one from each of these sections. Each [deme] . . . contained a number of townships. . . . Both tribes and demes had their own officers and administered their own affairs. The tribes served for military purposes, each furnishing contingents of infantry and cavalry; and in the administration of the State, magistrates, appointed in general to form boards of ten, were appointed one from each tribe or one for each tribe. Solon's Council of Four Hundred was increased to Five Hundred, and fifty members were chosen from each tribe. The election of archons, Cleisthenes seems to have given to the assembly.”—L. Whibley, ed., *Companion to Greek studies*, pp. 356-357.—“Not content with fostering the tendencies that might make for democracy in the existing members of the state, Cleisthenes infused into Athens a fresh strain of plebeian blood and sentiment by conferring civil rights on a large number of individuals of foreign birth, or of the lowest origin. These were metœci [metics]—either stranger residents or enfranchised slaves, doubtless engaged in mercantile callings and therefore of advanced and liberal views—whom he enrolled in his new tribes.”—A. H. J. Greenidge, *Greek constitutional history*, p. 158.—“Ostracism (see OSTRACISM) was introduced to guard against tyranny (though within a few years it was employed to remove politicians who had no designs against the constitution).”—L. Whibley, ed., *Companion to Greek studies*, p. 357.—See also DEMOCRACY: During classical period.—“Cleisthenes introduced into the constitution no new principle, but brought into far greater prominence the democratic elements already existing in it. This he did chiefly by equalizing the ranks, as above described, and by slighting the power of the Areopagus. The government was democratic, strictly speaking, only in potentiality. In its practical working it was a timocracy of the milder class, while the state was still a clan-state, and remained such through the whole period of its freedom. Yet the adoption of the Cleisthenean constitution, exhibiting greatly strengthened democratic tendencies, may be justly regarded as the beginning of a new period,—the fifth in the history of the government. The yoke of the tyranny was broken, and the Solonian constitution, as lately modified and improved, became, for the first time, a living, political organism. This constitution, by conferring large benefits upon the people, and by opening to them new and attractive spheres of activity, inspired them with a patriotism hitherto unknown. A great tide of public enthusiasm and public energy, arising at this point, surged onward through the Persian wars, carrying the Athenians victoriously through those crises in the history of their country and the world, liberating the Ionic Greeks, founding a great maritime empire, gaining in height and strength, with each political advance, till it reached its climax in the marvelous activity of the Periclean age.”—G. W. Botsford, *Development of the Athenian constitution*, pp. 207-208.

B. C. 500-493.—Aid to Ionians against Persia. See GREECE: B. C. 500-493; Rising of Ionians of Asia Minor against Persians; PERSIA: B. C. 521-493.

B. C. 492-479.—War between the Greeks and Persia.—Athens' share in the victory.—Summary of the war.—(1) "After the conquest of Ionia, the Persians attempted to subdue Greece. (2) The first expedition was led by Mardonius through Thrace into Macedon. Its failure was owing to the wreck of the fleet and attacks upon his army by the natives. (3) The second expedition crossed the Aegean Sea, captured Eretria, and landed at Marathon. There the Persian army met defeat at the hands of the Athenians (490). [See also PERSIA: B. C. 521-493.] The event encouraged the Greeks to hope for success in the war. While the Persians were preparing for another invasion, (4) the Athenians built a navy and (5) the Peloponnesian League was expanded into a union of all the loyal Greek states. (6) Xerxes in person led his great army in the third expedition. (7) It annihilated a Spartan force at Thermopylae (480), and destroyed Athens. (8) But the Persian fleet suffered an overwhelming defeat at Salamis; and in the following year (9) the Greeks defeated the Persians decisively at Plataea and at Mycale. (10) Meanwhile a Carthaginian army which invaded Sicily was overthrown at Himera (480)." —G. W. Botsford, *History of the ancient world*, p. 180.—"When the great attack from the East was visibly impending over that collection of small states that we call Greece, all was confusion and disorder. The jealousies of Argos and Sparta, of Thebes and Athens, and other similar jealousies elsewhere, made resistance by united Greece impossible. If the oracle at Delphi had boldly championed the national defence, the effect upon the wars and upon its own future influence could not have failed to be great. But the oracle gave answers sometimes ambiguous, sometimes directly counselling submission and despair. In this crisis, putting aside for the present the vices and follies of the Persians, Greece was saved by two influences. In the first place, at this crisis Athens displayed an absence of petty vanity, and a Panhellenic patriotism, rarely met with in any Greek state, along with an activity and clear-sightedness of the most remarkable kind. It was the supremacy of Sparta which gave to Greece the very moderate amount of unity that she showed during the contest; but in every instance it was from Athens that the ablest leaders and the best ideas came. And thus Greece weathered the storm. Athens had borne the brunt of the first attack in 490, and alone, save for the not very important help rendered by Plataea, had fought the battle of Marathon. [See also GREECE: B. C. 490.] In 480 and 479, through Argos, Thebes, Thessaly, and others stood sullenly aloof, most of the Greek states followed the leadership of Sparta, and were represented in the glorious struggles of Thermopylae, Salamis (480) [See GREECE: B. C. 480; Persian wars: Salamis], Plataea, and Mycale (479). With these last bat-

tles Greece emerged victoriously from the contest." —A. J. Grant, *Greece in the Age of Pericles*, pp. 93-94.—See also GREECE: B. C. 481-479. For separate battles see GREECE: B. C. 480; Persian wars; PERSIA: B. C. 486-405.

B. C. 490-485.—Athenian politics.—Struggle between Aristides and Themistocles.—"Aristides insisted upon laying the foundation of Athenian military power in the heavy-armed as most conducive to the stability of private and public character, while he regarded the navy as the seed-bed of novelty and change." Athens, engaged at this time in a war with Aegina, was meeting with ill-success owing to her weakness by sea. But Themistocles must have looked beyond the present, to the defense of his country against a more formidable enemy, already far advanced in its preparations for overwhelming Europe with a flood of barbarians. Nor was his view most probably confined to this horizon, but included all the future greatness of Athens, her walls and Peiraeus, her hegemony and empire. For these were the results of his decree. Aristides was ostracised and an obstacle to the furtherance of the Themistoclean naval policy thus removed. It was probably in the following year that Themistocles held the office of archon, and began his great work of fortifying the Peiraeus. . . . Thus the fortifications of the Peiraeus was but a natural continuation of his naval policy. The building of triremes went on. . . . The fear of the Persian invaders brought about a reconciliation of political opponents, the ostracised were recalled, and all united in loyal service to their country in its supreme peril." —G. W. Botsford, *Development of the Athenian constitution*, p. 209.

B. C. 479.—Significance of the Greek victory over Persia.—"Persian domination, had it been possible, would certainly have checked the growth of Greek civilization in Europe, just as it did in Asia Minor. Europe might have become for centuries a part of Asia. It would be idle to speculate at length on what might have been; but certainly the victory saved Europe from even the possibility of such a misfortune. It left the continent free to advance along the lines marked out for it by Greek genius. From these considerations it is clear that the Greco-Persian war was one of the most important events in the world's history." —G. W. Botsford, *History of the ancient world*, p. 180.—"The former terror of the Persian arms passed into contempt, and though between East and West there was constant friction until the time when, a hundred and fifty years later, Alexander the Great broke up the Persian Empire, never again did Persia seem at all likely to overwhelm Greek civilization. The Persian wars, by their result, allowed the Greek world freely to bequeath its inheritance of art, science, and thought to later centuries. That is the great significance of the struggle." —A. J. Grant, *Greece in the Age of Pericles*, p. 94.

B. C. 479-476.—Fortification of Athens and of Peiraeus.—Athens the first state of Hellas.—"Immediately after the danger of Persian invasion was removed, Athens set about to rebuild her city and its defences. To this latter project several Greek states, including Sparta, objected. By skillfully delaying discussion on this subject with Sparta, Themistocles afforded Athenian builders sufficient time in which to complete this work. Of even greater importance perhaps was the fortification of Peiraeus. This town, the seaport of Athens, Themistocles proceeded to surround with a massive wall seven miles in circuit. It was due in large measure to the farsightedness and energy of Themistocles that Peiraeus

became a famous mart of industry and trade, and for centuries remained one of the most flourishing commercial cities of the ancient world. [See also COMMERCE: Ancient: B. C. 1000-200.] Athens lay now right in the centre of the Greek world, and before long city and harbour were linked by strong walls and made into a twin fortress impregnable by land. And if she did not own the wheat-growing regions, she controlled the trade in grain. The cornfields of Southern Russia had only one outlet—by the Hellespont, and Athens held it—held it in virtue of her fleet of warships. Meanwhile, from the days of Solon and Pisistratus foreigners with trades had been settling in the city. Solon was one of the greatest economists of antiquity and Pisistratus one of the shrewdest of rulers; and they meant to have an Athens economically strong and prosperous. Industries grew, free labour moved in from the country, and slave labour was imported from abroad. And then the slave began to encroach on the freeman's labour market, and the freeman took to another and a greater trade—the greatest of all, Empire-ruling; and that too brought wealth to Athens. Mines were opened up, and Laurium (q. v.) still continued to yield silver, while on Thasos and in Thrace Athenian valour and enterprise made Athenians masters of gold production. The horrible condition of the slaves in the silver mines of Attica is sometimes noticed by ancient writers, but there is no indication that it troubled the capitalists or the public conscience. Mining and manufacture, grain and the carrying trade of the world, brought wealth and brought with it new standards—a new scale for the measurement of riches and of poverty—new tastes in food, and perhaps a new sense of hunger.”—T. R. Glover, *From Pericles to Philip*, pp. 44-55.

B. C. 478.—Transfer of naval leadership from Sparta to Athens.—“The first task which awaited the victors was to drive the Persians from the coasts of the Ægean Sea and deliver the Asiatic Greeks from Persian domination. The Greek fleet under the Spartan king Pausanias undertook this task. That, as things were, it must prove too great an undertaking for a state like Sparta with not more than four thousand citizens, who, moreover, lacked money, ships and maritime experience, and had, besides, to stand on guard at home against a serf population of sixty thousand males, was

foreseen by both Pausanias and the authorities at home; but whereas the latter were loath to conduct naval operations in far distant Asia, the over-ambitious victor of Plataea was set on keeping his own country at the head of all Greek enterprises, even though to do so he must secure the assistance of Persia. He accordingly offered his services to the Great King as satrap of Greece and conducted himself as the master and not as the leader of the forces serving under his command. His arrogance together with the indifference of the ruling powers at Sparta, however, provoked a prompt reaction which resulted in the transference of the leadership to the Athenians under Aristides. They had by far the largest number of ships and hence an irresistible claim to naval command. The work was brilliantly accomplished. With the exception of a few isolated cities, the Greek settlements on the entire Ægean coast and in the eastern Mediterranean as far as Cyprus were made free.”—G. S. Goodspeed, *History of the ancient world*, pp. 144-145.

B. C. 478-477.—Reduction of Byzantium.—Asiatic Greeks. See GREECE: B. C. 478-477.

B. C. 477.—Organization of the Delian Confederacy and its aims.—This league was the outgrowth of the Panhellenic union brought about by the Persian war, with Athens, by right of her character and past achievements, as its logical head. “The arrangement of the Delian League had been largely the work of Aristides. His reputation for fairness had given the allies full confidence in the justice of his assessments. . . . It had been formed to carry on the war against Persia, and to give to its members security in their lately won liberties. To this end an army and a navy, a fund of money and a recognised leader, were necessary. (1) Athens was of course the leader. No other state in the alliance could possibly command the same amount of obedience. She was at first by no means a despot city. Representatives from the various states met year by year in the island of Delos, there to deliberate on matters concerning the whole confederacy, and especially on the military and naval operations of the year. That every state had a vote is certain. But of the procedure of the synod we know almost nothing. Yet both the future history of the league and analogous cases in Greek history go to show that Athens would not be merely the executive officer of the decrees of the league. Her power and prestige would give her from the first a commanding position. (2) The contributions to the common fund were arranged by Aristides. That we know; and we know also that these contributions amounted at first to 460 talents. . . . (3) At the head of every expedition, naval or military, stood an Athenian commander. . . . (4) The centre of the whole league during its early and independent period was Delos. That small and barren island had been once the great religious centre of the Ionian race. Its glory had declined, but still there was the great temple of Apollo. The place was full of venerable legends and memories of the past. This then was naturally chosen as the centre of the revival of the Ionian race, for as such the Delian league must have been regarded. Here the yearly meetings of the synod were held; here was the treasury of the contributions of the allies. The general aims of the league must commend themselves to every modern observer. That some check should be given to the state-independence of Greece; that some union should be created in which each separate state should recognize something higher than her own personal interests; that some broad political basis should be formed capable of insuring stability,—some-

thing of this sort was quite essential if Greece was to remain independent. But it may be doubted whether it was possible to make the Delian League strong enough for the task that it would have to face. The league was the same sort of organisation that the supporters of Imperial [British] Federation propose to create: a confederacy of independent states with a common origin, and supposed common interests for common purposes. But in Greece the instinct for state-independence was so deeply rooted that even the slack bonds of the league proved too tight. No single state in its internal government showed cohesion or a sufficient discipline; and it was little likely, therefore, that their union should display these qualities. There was no power except that of physical force that would in the long run be able to hold the various states together. Panhellenic patriotism was hardly felt; the god Apollo was losing his power; Athens was unable to inspire the states with sufficient personal veneration for herself, nor did she try to keep the league together by conciliation and kindness."—A. J. Grant, *Greece in the Age of Pericles*, pp. 132-135.—See also GREECE: B. C. 478-477.

B. C. 472.—Ostracism of Themistocles.—Estimate of his genius.—"The boldness of Themistocles in opposing Spartan interests at every turn, added to envy of a greatness which eclipsed all his contemporary politicians, stirred against him a formidable combination headed by Cimon, which forced his ostracism (472 B. C.)."—G. W. Botsford, *Hellenic history*, ch. xii.—He finally died an exile in Asia Minor, but not until he had been accused by his enemies of the ridiculous charge of seeking to regain his former power through the help of the Persian king. "Of the genius of Themistocles it is needless to speak. It is attested by the victory which he won, and the career of the great city, to which he gave, as it were, a second foundation. In defence of his honesty, we may say that there is no reason to suppose that he cherished treasonable designs against his country before the moment when it was no longer possible for him to remain safely in it; and when the combination of his enemies in Sparta and Athens drove him out of Hellas, there was no place but Persia to which he could retire. It is extremely doubtful whether there was any real ground for the charge of mediocrity upon which he was hunted out of Greece. The evidence comes to us from a very suspicious source—from the Spartans, who knew that Themistocles was their enemy, and who had at the time very urgent reasons for securing his expulsion from the Peloponnese. Unhappily, the enemies of Themistocles at Athens were only too ready to join in the work. They had succeeded in banishing him from the city, but they knew that while he was in Greece he might return and find some means of revenging himself upon them.

It did not occur to their minds that the honour of their city was bound up with that of her greatest citizen. In the malice of party spirit they forgot what they owed to the world and posterity."—E. Abbott, *Pericles*, p. 63.

B. C. 472-462.—Aristides and the growth of democracy.—Political parties at Athens and their attitude toward Sparta.—"While Athens was thus entering upon an imperial policy, she was engaged in making her own government more democratic. The patriotic and efficient conduct of the Areopagites in supervising the exodus of the inhabitants in the face of Xerxes' invasion had given them an ascendancy in public life which they had scarcely known since the time of Solon; but their authority was rapidly undermined by the admission of the nine ex-archons appointed by lot, and hence of mediocre talent, and even more by the genuine advance of democracy. [See also AREOPAGUS.] In the opinion of Aristotle, Aristides was chiefly responsible for this development. . . . (He) introduced pay for military service and to some extent for official duty, thus making it possible for any Athenian, however poor, to take part in public affairs. He more than any other, therefore, was the founder of the radical democracy. The double object was to furnish subsistence to the populace and to gain a more thorough control of the alliance. . . . While there was among the leading statesmen of Athens no difference of opinion as to the treatment of the confederacy, a sharp line of cleavage was drawn through the group in relation to home politics. Those who favored the popularization of the constitution were led by Aristides; the conservatives, by Cimon. Inevitably the latter party clung close to the Peloponnesian league, and looked to Sparta as an example and a moral support; whereas the democrats, understanding the incompatibility of the two states, were ready to break with the Peloponnesian league. Their hands were strengthened by the fact that Sparta gave secret encouragement to rebellion within the Confederacy, and stood forth as the champion of particularism—of the complete independence and isolation of the city states—in opposition to the Athenian efforts at political aggregation."—G. W. Botsford, *Hellenic history*, ch. xii.

B. C. 466-454.—Revolt of Allies and beginning of the Athenian empire.—Completion of the change from confederacy to empire.—Individual treaties.—Duties of the allies to Athens.—Imperial funds.—In the confederacy "only the Chians, Lesbians, and Samians were allowed to retain their constitutions, that they might, in return for assured freedom, aid in maintaining the empire. Undoubtedly Athens was forced to this policy by the character of the Ionians, their indisposition to long-continued personal military service, and their desire to shake off the burden of taxation, when once the danger from the Persians had been removed from their doors. To most of the other allies Athens permitted the substitution of money payments for military or naval service. With the danger of Persian aggression removed [see GREECE: B. C. 480; PERSIA: B. C. 486-495], however, even the payment of this tribute soon became irksome. In 466 Naxos revolted, but was reduced by siege and deprived of its autonomy by the Athenians. Soon after, the example set by Naxos was followed by Thasos. The Thasians were encouraged in their revolt by the Spartans, who, however, failed to give the promised aid because of troubles at home. Thasos fell, apparently in 463, after a siege of two years. Athens now deprived the seceding states of their autonomy, and although still legally allies, in actual fact the de-

pendent states formed an Athenian empire. One by one the remaining states were brought into subjection until, in the Age of Pericles, the entire confederacy became an empire. The majority of its citizens were well pleased with this change, for they retained complete freedom of local government. In another sense, however, the coercion of a free state was in direct opposition to the ideals of the Greeks, many of whom came to look upon Athens more and more as a tyrant city.—G. W. Botsford, *Hellenic history*, ch. xii.—“But no efforts could be made to stay the development of the confederacy into an empire, which was finally attained in the year 454, when the common treasury was transferred from Delos to Athens, and the first-fruits of the tribute (one-sixtieth of each state's assessment), which had formerly been paid to Apollo of Delos, were now presented to Athene of the Athenians. At this time the only states whose autonomy was guaranteed by the supply of ships in place of tribute were apparently Samos, Lesbos, Chios, and the Eubæan towns; and it is probable that tributary states had now been excluded from all direct influence in the league—that, in fact, the votes of the great congress had dwindled down to the votes of these four islands and the city of Athens. After the defection of the greater part of Lesbos and its reduction in 427, one of its towns, Methymna, still shared with Chios the honour of remaining a free city; while Samos for good service to the democracy regained its autonomy in 412. These autonomous allies were strictly speaking not under the dominion of Athens at all, and their independence was defined as consisting in control of their own courts and of their own finances. They brought neither suits nor tribute to Athens, and were perhaps bound only by the prescriptions of the old Delian league, but they were by no means free from the practical interference of the leading state, which stopped any procedure likely to lead to their revolt. The charter of Erythrae gives that state a constitution, and is a remarkable and no doubt exceptional instance of the detailed reorganisation of a city which, when it passed into the power of Athens, possessed no regular form of polity. The constitution is closely modelled on that of Athens. The general duties of the allies to Athens may be easily gathered from these two charters. They consist in a promise of fealty, a promise to pay the required tribute and to furnish active assistance in case Athens required it, and, further, in an agreement to give up some of their autonomous rights, the chief of these rights surrendered being that of jurisdiction in exceptional cases, such as those of treason to the central state and to the empire. The return that Athens made for all this was her protection. She is irresponsible, a ‘tyrant city,’ and in the position of one who commands. If she makes concessions, they are in the nature of privileges. She might impose limits to her own irresponsible power, and she sometimes grants special favours—such as immunity to individuals or practical exemption from tribute to whole states, which she allows to pay only the sixtieth, as first-fruits to the goddess. But these are acts of grace, and the exemption granted to states was perhaps as much intended to promote differences of interests as to cultivate the loyalty of important outposts. The chief burden was the tribute, but its variations show it to have been always on a moderate scale. The amount imposed at the formation of the league in 478 is said by Thucydides to have amounted to four hundred and sixty talents. By the beginning of the Peloponnesian War in 431 it had risen to only six hundred talents. . . . The moderation of the tribute is

shown by the fact that this commutation could be made with the hope of increasing the total; but the tribute list, when the assessment is at its highest, tells the same tale.”—A. H. J. Greenidge, *Handbook of Greek constitutional history*, pp. 192-194.

B. C. 466-445.—Colonization.—Material benefits of empire.—Thurii, a model town.—“But the surplus was employed by Athens for public buildings and for the theoric fund, and land was annexed in the conquered districts for the establishment of cleruchies. The primary object of these settlements was to provide land for the poorer citizens of Athens; they seem usually to have been settled on territory that had become the prize of war, and their advent came to be dreaded rather as a sign of military coercion than because they interfered with the rights of peaceful members of the league. For their strategic came to outweigh their social importance, and one of their main functions was to inspire fear into the allies and to serve as a guard against intended revolt. They assumed the form of organized communities, and as such mark the last stage in the history of state-directed colonisation. The settlement was decreed by the people and the settlers chosen from the poorer citizens by lot. The cleruchs remained Athenian citizens; collectively they were but a fragment of the demos settled in a distant outpost, individually they still bore the designations which marked them as members of the Attic tribes. These settlements present rather the theory of an extended local government than that of the possession of a twofold citizenship by the same individuals. In some respects they resembled the states of the empire, and their jurisdiction was limited by the provision that all important cases had to be brought to Athens. Their structure was that of the typical democracy, and decrees were voted by their council and assembly. But they paid no tribute, and, unlike the allied cities, received magistrates from Athens.”—A. H. J. Greenidge, *Handbook of Greek constitutional history*, p. 199.—“It was not a mere collection of houses, like the Grecian cities, where old and new jostled each other in gay confusion, but a town constructed with a view to convenience, health, and protection. It is from these points of view that Thurii becomes the ideal colony of the Periclean era; other cities were of far more use to Athens by supporting her citizens, or holding places of strategical value; but none reflects so much of the mind of Pericles as the Hellenic town by the waters of the Crathis [river Crati]—where Herodotus, the most Hellenic of Greek historians, was wont to talk and meditate.”—E. Abbott, *Pericles*, pp. 148-149.

B. C. 466-431.—Spread of Athenian culture and influence.—“Athens has thus become recognized as a model state; and Greece was in the mood to adopt or imitate her ways in small things as in great. We can see this in the rapid spread of Athenian weights and measures and the Athenian coinage, or of systems arranged so as to work in with them. Athens was standardizing Greek coinage as she was unifying Greek law. She did not, of course, compel her allies to use only Attic money, or money coined on the Attic standard. But she naturally preferred that contributions should be paid in it; and there were indirect ways by which she could encourage it. It was only decent to pay Apollo and later Athena, in the coinage they preferred to see. And as Athenian coins could always be relied upon for good weight, and as the device upon them, the famous owl, was so conveniently uncouth that you could tell it at a glance, there was really no need for a compul-

sion which would have been against the principle of free exchange. Example was better than precept. Attic silver began to be known and used not only in the Confederacy but all over Greece and among distant barbarians. When Gylippus after Aegospotami kept back some of the Spartan State booty, and hid it under his roof tiles, the man who denounced him merely said that there were 'owls in the potters' quarter.' In fact, much as the Spartans hated strangers, and Athenians above all, there were a great many such owls' nests all over their city. Athenian influence was thus spreading, as Pericles realized, far beyond the Ægean and the confines of the Empire. Her traders were moving East and West, finding their way into every land and every sea, fetching goods and paying for them in owls and pottery, from the iron mines of Elba or the caravans at Gaza and Cyrene. For this also was part of the imperial mission—to mix freely with all mankind and to give of their best to men and nations. Friendships were knit and alliances made with Greek, and even with barbarian, powers without a thought of the Persians or the original object of the league. . . . We must imagine houses without drains, beds without sheets or springs, rooms as cold, or as hot as the open air, only draughtier, meals that began and ended with pudding, and cities that could boast neither gentry nor millionaires. We must learn to tell the time without watches, to cross rivers without bridges, and seas without a compass; to fasten our clothes (or rather our two pieces of cloth) with two pins instead of rows of buttons, to wear our shoes or sandals without stockings, to warm ourselves over a pot of ashes, to judge open-air plays or law suits on a cold winter's morning, to study poetry without books, geography without maps, and politics without newspapers. In a word we must learn how to be civilized without being comfortable . . . for it was the doom of Athens that Poverty and Impossibility dwelt in her midst from first to last. It is to the immortal glory of her citizens that, though they were too clear-eyed not to behold them, they bravely refused to submit, either in mind or in body, to the squalid tyranny which they have imposed upon the great mass of humankind."—A. E. Zimmern, *Greek commonwealth*, pp. 100-101.—See also EDUCATION: Ancient: B. C. 7th-A. D. 3rd centuries: Greece; and LIBRARIES: Ancient: Greece.

B. C. 462-461.—Withdrawal of Athens from the Peloponnesian League following her break with Sparta.—Ostracism of Cimon.—"During the absence of Cimon the popular party, led by Ephialtes, held complete control of the government, and proceeded to make it more democratic than it had ever been before. Meanwhile the Athenian troops at Ithome were unsuccessful (see GREECE: B. C. 477-461); and the Lacedæmonian authorities, suspecting them of treachery, insolently dismissed them. Cimon returned to Athens an unpopular man. In trying to check the rising tide of democracy, he was met with taunts of over-fondness for Sparta. Athens abandoned his policy, broke loose from Sparta, and began to form an alliance of her own, wholly independent of the Peloponnesian League. Cimon's resistance to these new movements caused his ostracism in 461 B. C. For fifteen years (476-461 B. C.) he had been leading the Athenian fleets to victory or upholding the principles of old Athens against what he believed to be the dangerous tendencies of demagogues, such as Themistocles and Ephialtes; during this time his influence maintained friendship between his city and Sparta and harmony among the states of Greece. Under his patronage Athens advanced beyond all other Hellenic

cities in civilization. But with his ostracism the political leadership of his state passed into other hands."—G. W. Botsford, *History of the ancient world*, p. 189.

B. C. 461-431.—Periclean democracy.—Ideal of equality at its zenith.—Law courts.—Assembly.—Magistrates.—"Seldom, indeed, has 'equality' been pushed to so extreme a point as it was, politically at least, in ancient Athens. The class of slaves, it is true, existed there as in every other state; but among the free citizens, who included persons of every rank, no political distinction at all was drawn. All of them, from the lowest to the highest, had the right to speak and vote in the great assembly of the people which was the ultimate authority; all were eligible to every administrative post; all sat in turn as jurors in the law-courts. The disabilities of poverty were minimized by payment for attendance in the assembly and the courts. And, what is more extraordinary, even distinctions of ability were levelled by the practice of filling all offices, except the highest, by lot. [See also LOT, IN ELECTION: Athens.] Had the citizens been a class apart, as was the case in Sparta, had they been subjected from the cradle to a similar discipline and training, forbidden to engage in any trade or business, and consecrated to the service of the state, there would have been nothing surprising in this uncompromising assertion of equality. But in Athens the citizenship was extended to every rank and calling; the poor man jostled the rich, the shopman the aristocrat, in the Assembly; cobblers, carpenters, smiths, farmers, merchants, and retail traders met together with the ancient landed gentry, to debate and conclude on national affairs; and it was from such varied elements as these that the lot impartially chose the officials of the law, the revenue, the police, the highways, the markets, the ports, as well as the jurors at whose mercy stood reputation, fortune, and life. The consequence was that in Athens, at least in the later period of her history, the middle and lower classes tended to monopolize political power. Of the popular leaders, Cleon, the most notorious, was a tanner; another was a baker, another a cattle-dealer. Influence belonged to those who had the gift of leading the mass; and in that competition the man of tongue, of energy, and of resource, was more than a match for the aristocrat of birth and intellect. In Athens, as in every Greek state, the greater part of the population was unfree; and the government which was a democracy from the point of view of the freeman, was an oligarchy from the point of view of the slave. For the slaves, by the nature of their position, had no political rights; and they were more than half of the population. It is noticeable, however, that the freedom and individuality which were characteristic of the Athenian citizen, appear to have reacted favourably on the position of the slaves. Not only had they, to a certain extent, the protection of the law against the worst excesses of their masters, but they were allowed a license of bearing and costume which would not have been tolerated in any other state."—A. E. Zimmern, *Greek commonwealth*.—See also DIOBALY.—"Several thousands of the citizens—men over thirty years of age—spent their time in deciding the differences which arose between Athenians or between Athenians and foreigners. All offences except murder, arson, and one or two more, which were left to the cognisance of the Areopagus, were decided in these courts, which without any direct participation in politics exercised by this means a great influence on the policy of the Athenians. . . . It was through the law-courts that Athens, in the

days of Pericles, maintained her authority over the executive of the government, an authority enforced by the severest penalties and extending to the most minute details. It was through them that she controlled the trade of her great empire. And from the decision of these courts there was no appeal. The public Assembly often referred matters to the decision of the court, but the converse process was unknown. Nor was any decision of a law-court ever cancelled or revised. The jurors were exempt from all responsibility—a privilege which they shared with the public Assembly and with that only. They were also the only power capable of enacting laws. . . . The Assembly was competent to change the whole constitution of Athens; it could decide whether the laws of Solon should be maintained or superseded by a new code; it could close the law-courts; it could give permission for new laws to be passed, or withhold it, but it had not the power, by a mere resolution, to add to the statute-book."—E. Abbott, *Pericles*, pp. 259-261.—"The administrative offices held by individuals were particularly large in number, and were at least doubled when Athens became an imperial state and a new Athens grew up in the cleruchies and colonies beyond the sea. . . . It is sufficient to observe that the Constitution of Athens, in an attempt to estimate the numbers of the bureaucracy for the middle of the fifth century, makes the total reach the alarming proportions of fourteen hundred, of which half were 'home' and half 'foreign' offices. As appointment to most of these was made by lot, the Athenian citizen was unfortunate who did not once in his lifetime get his share of individual rule. . . . Few states have ever been more completely under the sway of great personalities. . . . It is a phase of national life which, on general grounds, should not create the least surprise; for it is one of the oldest lessons in history that, while oligarchy is the true leveller of merit, a democracy brings with it a hero-worship generally of an extravagant kind, and that the masses attain sufficient union for the exercise of power only through the worship of a supposed intellectual king. The first (and most important) office which attracts attention is that of the generals, who formed, as we saw, a college of ten based on the ten Cleisthenean tribes. Their most distinctive right was that of procuring special meetings of the ecclesia, debate in which seems to have been strictly limited to proposals put before them by the general. . . . The *strategoí* were thus ministers of finance for foreign affairs, and controlled the details of expenditure in their own departments, all the funds voted from the treasuries for military purposes passing through their hands. Amongst their special military duties we may reckon, besides their actual leadership in war, the general command of the home forces and control of the home defences. They possessed jurisdiction in military matters, for the appeal against the levy was made to them, and they had the direction of the court in all offences against martial law, which they either undertook in person or remitted to the taxiarchs; while in the field they had the right of punishing summarily with death the most serious offences; such as treasonable negotiations with the enemy. One of their chief responsibilities at home was the care of the corn supply of Athens. In the details of foreign administration their influence must also have been very great. It was they who introduced most of such business to the assembly and brought forward questions arising from treaties or from negotiations with foreign states. They officiated in treaties and were responsible for their formal execution, seeing that the oath was taken and

that the proper sacrifices were then offered on the occasion. The existence of the Athenian Empire added to the sphere of their powers. They were the commanders-in-chief of the garrisons and of the captains of the guard whom we find in the subject states. They saw to the exaction of the tribute when it was in arrears by commanding the 'tribute-collecting ships,' and probably had the levying of the contingents from the allies both in ships and men. It will be seen from this enumeration of their functions that the Athenian generals were at once leaders in war, ministers of war, foreign ministers, and to a great extent ministers of finance."—A. H. J. Greenidge, *Handbook of Greek constitutional history*, pp. 178-181.

B. C. 461-431.—General aspect of Periclean Athens.—Public works and art under Pericles.—The Pnyx, Theseum and the Acropolis.—"Some years after the Persian Wars, Peiræus was laid out by the Milesian architect Hippodamus in rectangular blocks, but Athens itself, like most ancient and, indeed, most modern cities until recent times, grew up after no comprehensive plan. A few wide avenues led from the principal gates in

the city wall. The broadest was the street leading from the Dipylum to the Agora, which was lined with colonnades on both sides. At the eastern end of the Acropolis was the impressive street of the Tripods, a favorite promenade. South of the Areopagus a considerable stretch of the famous road along which the Panathenaic procession passed, has been uncovered, but this is found to be only thirteen to eighteen feet wide, and shut in closely on either side by blank walls of precincts and dwellings. The streets debouching on these main arteries were narrow, in great part like alleys. Few of the streets were paved, and sidewalks were unknown. We have little information about the private houses of the city and must depend chiefly for our knowledge upon those excavated at such places as Priene and Delos. The

Along the more frequented streets the lower front rooms seem often to have been used as shops, either by owners or tenants, as at Pompeii. The erection, in a niche or a vestibule before the house, of a pillar altar of Apollo of the Streets, or a herm, or a hecateum, or all three, was a general custom. Herms were also set up at street crossings. The location of a house was rarely or never designated by streets, the names of which, in fact, were usually without marked significance, but by some well-known building or site near which it stood. The traces of dwellings in Coele [Coela], between the extremities of the Long Walls on the western slopes of the Pnyx hills, deserve mention. The exposed rock of this district is scarred by hundreds of cuttings where once stood the simple habitations of a considerable population. At one

The Acropolis is seen in the distance

houses were built about central courts, which afforded light and air, and most of them were but one story in height. The front wall, built on the edge of the street, was pierced only by an occasional window and by the door, the latter sometimes set back in a vestibule. A traveler of the Hellenistic period remarks (P.-Dicæarchus 1, 1): "The majority of the houses are cheap, but there are a few good ones; strangers who come upon them unexpectedly could hardly be made to believe that this is the celebrated city of the Athenians." This statement, however, has a bearing only upon the general appearance of the exterior, for the interiors of many houses must have been fairly ornate. Alcibiades is said to have had his walls decorated by a painter, and after his time some houses must have been still more sumptuous. In the fourth century B. C., we find Demosthenes complaining that 'some have built private houses more magnificent than the public buildings.'

point, possibly an open meeting place, seven rude seats are hewn in the native rock. Another deep cutting, with three adjacent rock-hewn chambers (now closed by iron gratings), has long been called the Prison of Socrates, with whom it has nothing to do; it was doubtless the site of an unusually pretentious dwelling. The patriotic Athenian spent most of his time in the open, and the glory of his city was the public buildings. The center of Athenian life was the Agora, situated on the lower ground north of the Areopagus. It was entered from the northwest by the brilliant avenue leading from the Dipylum gate, and was flanked on all sides by works of architecture, sculpture, and painting. [See PAINTING: Greek.] To mention only the objects of chiefest note, the entering visitor, if he turned to the right, saw the Royal Stoa, or Colonnade, the Stoa of Zeus Savior, and the temple of Paternal Apollo. The ridge behind these bore the temple of Hephæstus and

LIFE IN ANCIENT ATHENS

An incident in the life of a lady of ancient Greece

the shrine of the hero Eurysaces. Against the slope of the Areopagus stood the sanctuary of the Mother of the Gods, where were the public archives; in her precinct, too, were the senate house and the circular Tholos. Not far away were the Orchestra, with the revered images of the Tyrannicides, the temple of Ares, and the statues of the Namesake Heroes of the tribes. On the left stood the Painted Porch and the Treseum. Back of these rose the imposing Stoa of Attalus, and near it the Ptolemaeum. Still farther on stood the spacious Stoa of Hadrian and the great Market of Cæsar and Augustus; in the rear of these the octagonal Tower of the Winds. Then, among and within all the buildings and precincts we must imagine almost countless images of gods and heroes and distinguished men; while everywhere graceful and brightly appareled men and women, not a few of whom are known and dear to us, round out the brilliant picture with warmth and life. Following the road from the Prytaneum about the east end of the Acropolis, our traveler came upon another famous quarter in southeast Athens. Here the huge temple of Olympian Zeus and, across the river, the Stadium, stood out conspicuously; while not far away were the famous Gardens and the shaded parks of the Lyceum [see EDUCATION: Ancient: B. C. 7th-A. D. 3rd centuries; University of Athens] and Cynosarges. Or, following the street of Tripods at the east foot of the Acropolis, he passed the Music Hall of Pericles to the great theater of Dionysus and the two temples hard by; then continuing westward he came to the shrine of Asclepius and Health, or walked through the long colonnade of Eumenes to the lofty Music Hall of Herodes, with its spreading roof of cedar. To crown all, the visitor ascended the Acropolis, past the delicate temple of Wingless Victory, between the exquisite columns and through the open doors of the Propylæa, into the middle of the sacred area. All about him were scores of statues, masterpieces in marble and bronze [see SCULPTURE: Greek sculpture: 5th century!]; on every side great works of architecture; the whole a marvelous harmony of brightness and color. Foremost among the buildings, the graceful Erechtheum and the stately Parthenon; and in the Parthenon, towering on its pedestal the awe-compelling statue, in gold and ivory, of Athena, the city's guardian."—C. H. Weller, *Athens and its monuments*, pp. 21-26.—See also ACROPOLIS at ATHENS.

"Athens reached the zenith of her majesty under the administration of *Pericles*, during approximately the third quarter of the fifth century B. C. The administrative center of the Delian Confederacy, which was formed after the war, in order to resist Persia, was, in 454 B. C., transferred from Delos to Athens, and Pericles found a way to make its funds available for beautifying the new capital. The defensive policy of Themistocles and Cimon was approved and continued. The harbor of Peiræus was supplied with an elaborate and costly system of shipsheds, and the seaport town itself was laid out regularly by Hippodamus of Miletus. The long Walls connecting Peiræus with Athens were finally completed, a new South Wall, parallel with the North Wall being erected in place of the less direct Phaleric Wall. The earliest of the splendid buildings of this period seems to have been the Odeum, or Music Hall, of Pericles, on the southeast slope of the Acropolis. Its conical roof is said to have been made of masts from the ruined ships of Xerxes. The gymnasium of the Lyceum was also constructed, and numerous other buildings in the lower city, to say nothing of scores of statues and paintings, of which we have only scanty knowledge, or have even lost the names. But the buildings of the Acropolis are the glory

of the age. Whether or not at the outset Pericles had conceived a systematic plan for adorning the sacred hill, is still a moot question. At about the middle of the century, perhaps after the battle of Oenophytæ, in 457 B. C., when Athens first triumphed over her old rival, Sparta, a decree was passed providing for the construction of the little temple of Athena Victory on the high bastion beside the entrance to the sacred inclosure. Some doubt has been entertained as to its immediate erection, but this seems most likely. The Parthenon, as a worthy home of the city's protectress, Athena, was probably begun in 447 B. C. on the site of the building destroyed by the Persians. In 438 B. C. the temple was ready for the great gold and ivory statue of Athena, by Pheidias, and five or six years later it was completed. Built entirely of white Pentelic marble, like the majority of the buildings of this age, it was executed throughout with extraordinary painstaking, and was richly decorated with sculptures, as it would seem by several of the leading artists of the day. On the south the wall of the Acropolis was increased in height to support the terrace, which was thus brought to a level with the rock on the north

TEMPLE OF NIKE (VICTORY)
ACROPOLIS

side and afforded a wide promenade about the temple."—*Ibid.*, pp. 36-37.

"The *Pnyx*, as we now have it, consists of an irregularly semi-circular space nearly 400 feet in its longitudinal diameter and about 230 feet wide. The ground here by nature slopes toward the north, and the area was raised on its curved side by a supporting wall of carefully joined stones, some of them of enormous size. . . . In the obtuse angle at the middle of the south side lies the bema, or orators' platform. The rock has been hewn down vertically along this side of the area, a portion at the east corner never having been removed, and the bema with its steps is cut from a projection of the solid rock. Niches for votive offerings are cut in the scarped rock at one side of the bema, and inscriptions referring to Most High Zeus indicate that a sanctuary of Zeus was at some time located here. Above and behind the bema are seats, probably seats of honor, cut from the rock and facing the assembly, while back of these are remains of an altar and various bases belonging to some shrine."—*Ibid.*, pp. 111-113.—See also PNYX.

"The name '*Theseum*' was first applied to this building in the Middle Ages, probably because on

some of its metopes and a part of its frieze deeds of Theseus are depicted. But inference from the sculptural decoration of a temple has been shown to be hazardous. . . . The claim of Hephaestus seems most conclusive, though complete agreement of scholars has not been reached. The temple measures 104 by 45 feet. . . . It is built of Pentelic and Parian marble, save the lowest of the three steps, which is of poros. . . . The temple was richly decorated with sculptures. Of the pedimental groups only the traces remain, unfortunately not enough to indicate clearly their motive. A plausible argument has been offered to show that the east pediment represented the birth of Erichthonius, the west, Hephaestus with Thetis and Eurynome."—*Ibid.*, pp. 117-119.

The Parthenon—"It is a noble building by mere size; 228 feet measure its side, 101 feet at its front. Forty-six majestic Doric columns surround it; they average thirty-four feet in height, and six feet three inches at the base. All these facts, however, do not give the soul of the Parthenon. Walk around it slowly, tenderly, lovingly. Study the elaborate stories told by the pediments,—on the east front the birth of Athena, on the west the strife of Athena and Poseidon for the possession of Athens. Trace down the innumerable lesser sculptures on the 'metopes' under the cornice,—showing the battles of the Giants, Centaurs, Amazons, and of the Greeks before Troy; finally follow around, on the whole inner circuit of the body of the temple, the frieze, showing in bas-relief the Panathenaic procession, with the beauty, nobility, and youth of Athens marching in glad festival; comprehend that these sculptures will never be surpassed in the twenty-four succeeding centuries; that here are supreme examples for the artists of all time,—and then, in the face of this final creation, we can realize that the Parthenon will justify its claim to immortality. One thing more. There are hardly any straight lines in the Parthenon. To the eye, the members and the steps of the substructure may seem perfectly level; but the measuring rod betrays marvelously subtle curves. As nature abhors right angles in her creations of beauty, so did these Greeks. Rigidity, unnaturalness, have been banished. The Parthenon stands, not merely embellished with inimitable sculptures, but perfectly adjusted to the natural world surrounding."—W. S. Davis, *Day in old Athens*, pp. 218-219.—See also PARTHENON; and ARCHITECTURE: Classic: Greek Doric and Ionic.

B. C. 461-431.—Age of rationalism and scepticism.—Sophists and Protagoras.—"The intellectual spirit of the age was stimulated to inquiry and to scepticism. Herodotus is wholly sceptical, and the agnostic tendency of the time is shown by the entire lack of mythology and superstition displayed by Thucydides. A further stimulus was furnished by the development of a higher educa-

tion given by professional teachers—the Sophists. The last half of the fifth century is often called with good reason the 'Age of the Sophists.' . . . The Sophists of the fifth century neither formed a philosophic school nor were they charlatans. The most prominent among them was Protagoras of Abdera whose ability and character is shown by the fact that Pericles selected him to draw up the laws for Thurii in 444-43 B. C. . . . These Sophists were simply men devoted to the pursuit of wisdom, frequently professional teachers who undertook to give a general culture, to train their pupils to take part in society and the state. For the old training which had been gained by observation they substituted a formal discipline; they offered instruction in rhetoric, politics, music, in short in all the higher branches, as we should call them. But they had no unity of doctrine. By the close of the fifth century they had fallen somewhat into disrepute and were under suspicion, since in the Athenian state all the youths who could afford to pay the fees which these professional teachers charged belonged to the aristocratic class, which frequently voted against the democracy. The Sophists owed their great influence to the fact that they met an actual need in the small society of Athens which included an unusual number of men with eager alert minds and great intellectual curiosity. . . . Furthermore the Sophists were sceptical as to the possibility of acquiring absolute knowledge about anything. . . . Protagoras maintained that all knowledge was relative, since the only way in which a man can know anything is through his senses; through them he perceives that an object is hot or cold, round or square, sweet or bitter. He pointed out, also, that the same object will not always appear the same even to the same individual; hence he declared that there is no such thing as absolute truth, but that whatever seems true to you or to me at the moment is the truth for you or for me, and that it is not at all necessary that you and I should hold the same thing to be true at one and the same time. Whatever seems to the individual true is true, according to him. From this came his famous dictum that man, that is the individual, is the measure of all things. It is clear that this doctrine when applied to politics, morals, or religion was upsetting. So long as men studied nature, they were concerned with discovering the inflexible laws which govern the world. But when they turned their attention from nature to society or government, they realized that human institutions seemed to be the result on the whole of conventions agreed upon and adopted by mankind. The Sophists held in general that the form of the state, the current moral and religious beliefs and social customs had no absolute validity; that they were the results of convention; and that their only warrant was that they worked well in practice, that they were profitable to the individual and to society. This pragmatic view of institutions fell in well with the temper of the last half of the fifth century, both in the period of Athens' imperial supremacy and in the time of her trial during the Peloponnesian War, when in passion or despair the people disregarded law and, as in the case of the Melians, all that humanity had counted sacred. It was an age when many held that might and right were identical, and for this view the Sophists, even though unwittingly, furnished arguments; for if the test of an institution or act is that it works well when put into practice, success proves validity. The Sophists, too, taught that virtue was nothing else than what we call today efficiency. It is not strange that the conservative Athenians came to look on them with

suspicion. With regard to the gods Protagoras was naturally agnostic. He began his 'Treatise on the Gods' with the words: 'So far as the gods are concerned, I cannot know whether they exist or do not exist; or what their nature is. Many things prevent our knowing. The matter is obscure and life is short.' One may be curious to know what large matter Protagoras found for his discussion when he began with this frank confession of ignorance; but it should be observed that in this confession there is nothing necessarily antagonistic to the popular theology of his day. It only shows what the words plainly declare, that a belief in the gods cannot depend upon knowledge. Another Sophist, Prodicus, maintained that the divinities were nothing but the kindly powers of nature which man had deified; and the 'Gentle Critias,' one of the worst of the Thirty Tyrants, and a ready pupil of the earlier Sophists, is said to have set forth in a satyric drama the theory that the gods were the clever invention of someone who wished to scare men out of their desire to do evil. The effect of such scepticism and agnosticism we can easily imagine. [See also AGNOSTICISM.] Many things had been wrongly laid at the door of the Sophists, but it is small wonder that the conservative Athenian citizens came to look with distrust and alarm on these new-fangled subversive notions; that they banished Protagoras and burned his books in the market place; or finally that they should have put Socrates to death."—C. H. Moore, *Religious thought of the Greeks, from Homer to the triumph of Christianity*, pp. 124-129.

B. C. 461-431.—Development of Greek drama.
—**Sophocles.**—"Sophocles was born at Colonus, a village about a mile northwest of Athens, in 497 B. C., twenty-eight years after the birth of Æschylus. His father, Sophilus, was wealthy, though not of noble descent. The boy Sophocles was carefully educated, receiving instruction in music from Lamprus, a well-known teacher of the time. He excelled in personal beauty, in dancing, and in music, so that when a chorus of boys was to chant the pæan of victory after the battle of Salamis he was chosen to be the leader. The first appearance of Sophocles as a tragic poet was in 468 B. C., when he was twenty-eight years old. . . . More than one hundred plays are ascribed to him, and with these he won eighteen victories at the city Dionysia, besides others at the Lenæa. . . . For over sixty years he composed a tetralogy every second year, showing no falling off in invention, imagination, dramatic skill, or poetic diction. He died in 405 B. C., more than ninety years of age, and his latest tragedy, the *Œdipus at Colonus*, was brought out after his death by his grandson. Several innovations in the dramatic art are ascribed to Sophocles. The most important of these is the introduction of the third actor, which made the dialogue henceforth more important than the choral songs, though the latter continued to occupy nearly half the time of the performance. The second innovation consisted in enlarging the chorus from twelve to fifteen members, which doubtless occasioned some changes in its arrangement and movements. Sophocles also ceased to compose tetralogies of four plays on connected subjects, but competed at the festivals with separate plays—three tragedies and a satyr drama, to be sure, but not dealing with one myth. This, with the reduction of the length of the lyric portions of his plays, made it possible for him to make his plots less simple than those of Æschylus and to introduce more dramatic situations. It is also said that Sophocles was the first to use painted scenery to any great extent, and several minor

changes in the costume of the chorus as well as in the music employed are attributed to him. [See also DRAMA; Origin.] All these things show that he was interested in the practical side of his profession as well as in the writing of tragedies. He even wrote a book in prose, *On the Chorus*, defending his innovations. In his early days he was himself an actor in his plays, but his weak voice compelled him to give up acting. Sophocles is justly regarded as the greatest of the great Greek tragic poets. He found the drama already developed by the genius of Æschylus to a high degree of beauty and power, and he carried it further . . . by refining the language employed, by giving more variety to the plot, which he enriched with many fine details, and by perfecting the portrayal of character."—H. N. Fowler, *History of ancient Greek literature*, pp. 205, 218.

B. C. 461-431.—Pericles: Estimate of his character.—"But though Greece hated him, and Athens spoke of him with mingled feelings, the debt which the world owes to Pericles is immense. Without him and his personal government; without the money which he lavished on shows and spectacles, on temples and statutes; without the sophists and philosophers whom he sheltered, we should have been the poorer by the loss of half our intellectual life. And in his political aims, however unfortunate the results, we can trace the outlines of a purpose which must always be the guiding light of the greatest statesmen; the wish to give to every citizen in and through the state, not only the blessings of peace and prosperity, but the still greater blessing of unimpeded action in all noble aspirations; to awaken in him such a devotion to his state as shall prove an unerring guide in conduct; to train his intellectual and moral powers, not with the lessons of a school, but by the experience of life; to develop an equal balance between the individual and the citizen; to make duty a delight, and service an honour; to remove the sting from poverty and the charm from wealth; and to recognise benefits to the community as the only ground of civic distinction. Such a purpose was perhaps a distant ideal, even at Athens, and it is far more distant now; but near or far away, it is from such ideals that the spark is sent which kindles the flame of our highest efforts. A few details have come down to us of the personal appearance and manners of Pericles. . . . His head, which was of unusual size and shape, was a common theme of merriment with the comedians; they compared it to a kind of bean, called Schinus, and exercised their wits in all kinds of allusions to the heavy head of the new Olympian. To conceal the defect, Pericles was accustomed, when in public, to wear a helmet, a practice which, as we have said, provoked Cratinus into declaring that he went 'about with the Odeum on his head.' The suspicions which his appearance excited were not diminished by his education and manners. His tutor in 'music,' which at Athens included most of the intellectual part of education, as opposed to the physical, was Damon, the 'friend of tyrants' and a 'consummate sophist,' who, under cover of his art, was thought to cherish designs against the democracy. Whether this view was correct or not, Damon was ostracised from Athens. Another teacher was Zeno, from whom Pericles learned the art of disputation as it was practised in the Eleatic School. More important still was his connexion with Anaxagoras. In the society of this eminent man he not only acquired a knowledge and an elevation of thought which raised him above the superstitions of his time, but the influence extended to his language and demeanor. As an orator, Pericles

was stately and dignified, carefully avoiding anything familiar or common in his language; calm and quiet in his delivery, and by these very qualities producing a deep impression on his audience. His movements were at all times sedate; his dress was careful and becoming; he was rarely seen to smile, and nothing could provoke him to anger. . . . His power was far greater than that of any other man of his time. Yet he never abused it for mean or malicious purposes. In his last utterance . . . he declared that no Athenian had ever put on mourning owing to any act of his. . . . In graciousness and clemency, in the forbearance and patience with which they endured the attacks of foolish and ignorant enemies, the Roman and the Grecian were fairly matched. But not less admirable than his clemency was the loftiness of spirit which prompted Pericles to utter that last noble speech, giving the foremost place among his triumphs to the self-restraint which had governed his exercise of supreme authority."—E. Abbott, *Pericles*, pp. 363-366.

B. C. 461-431.—Appreciation of the age of Pericles and summary of its achievements.—

"Thus far we have been considering Periclean Athens chiefly as the most perfect example of Greek civic life; as an imperial city, in which the fullest individual freedom was enjoyed without prejudice to the strength of the State; as a great seat of industry and a focus of commerce. The memorials of all these things have well-nigh vanished; but the modern world still possesses monuments of the literature, and at least fragments of the art, which proclaim Athens to have been, above all, the great intellectual centre of that age. The influence of Periclean Athens is deeply impressed on the History of Herodotus, and moulded the still greater work of Thucydides; Athens was the home of the philosopher Anaxagoras, and the astronomer Meton [inventor of the Metonic Cycle]; it was at Athens that prose composition, which had hitherto been either colloquial or poetical, was first matured; at Athens, too, oratory first became the effective ally of statesmanship; both tragedy and comedy were perfected; the frescoes of Polygnotus, the architecture of Ictinus, the sculpture of Phidias, combined to adorn the city; and when we think of these great writers and artists, we must remember that they are only some of the more eminent out of a larger number who were all living at Athens within the same period of thirty years. How far can this wonderful fact be directly connected with the influence of the political work done by Pericles, or with the personal influence of the man? We must beware of exaggerating such influences. Statesmanship may encourage men of genius, but it cannot make them. When we look back on that age, we seem to recognize in its abounding and versatile brilliancy rather the golden time of a marvelously gifted race, than merely the attraction which a city of unique opportunities exercised over the rest of the world. The great national victory over Persia had raised the vital energy of the Greek spirit to the highest. But we must also recollect that, owing to the very nature of Greek literature and art, such a city as the Athens of Pericles could do more for it than any modern city could do for modern art or literature. Greek literature was essentially spontaneous, the free voice of life, restrained in its freedom only by a sense of measure which was part of the Greek nature; the Greek poet, or historian, or philosopher, was not merely a man of letters in the narrower modern meaning of the term; he was first, and before all things, a citizen, in close sympathy, usually in active contact, with the public life of the city.

For a Greek, therefore, as a poet or historian or philosopher, nothing could be more directly important than that this public life should be as noble as possible; since, the nobler it was, the higher and the more invigorating was the source from which he drew his inspiration. Among the great literary men who belonged to the age of Pericles, there are especially two who may be regarded as representative of it—its chief historian and its most characteristic poet—Thucydides and Sophocles. The mind of Thucydides had been moulded by the ideas of Pericles, and probably in large measure by personal intercourse with him. We recognize that Periclean stamp in the clearness with which Thucydides perceives that the vital thing for a state is the spirit in which it is governed; and that, apart from this spirit, there is no certain efficacy in the form of a constitution, no sovereign spell in the name. In Sophocles, again, we feel the Periclean influence working with the same general tendency as in the plastic arts; he holds with the ancient traditions of piety, but invests them with a more spiritual and more intellectual meaning. With regard to the fine arts, it was the resolve of Pericles that they should find their supreme and concentrated manifestation in the embellishment of Athens. Thucydides, with all his reticence as to art, is doubtless a faithful interpreter of the spirit in which that work was done, when he makes Pericles speak of the abiding monuments which will attest to all posterity the achievements of that age. This feeling was not prompted merely by Athenian patriotism; Athens was the city which the Persian invader, bent on avenging Cardis, had twice laid in ruins. The fact that Athens should have risen from its ashes in unrivaled strength and grace was, as Pericles might well feel, the most impressive of all testimonies to the victory of Hellene over barbarian. It is well to remember that the story of Greece was not closed when the Greek genius reached the brief term of its creative activity. It is well to follow the work of the Greek mind through later periods also; but those qualities which were distinctive of its greatness can best be studied when the Greek mind was at its best. That period was unquestionably the Fifth Century before Christ—the Age of Pericles."—S. R. Jebb, *Age of Pericles* (L. Cooper, *Greek genius and its influence*, pp. 73-75).—"Accepting this (the will to be good) as a concise description of the Hellenic ideal, we find that the period during which it was most fully realized was that which we are accustomed to call the age of Pericles. The period so named may be roughly defined as extending from 460 to 430 B. C. Within those thirty years the political power of Athens culminated; the Athenians developed that civic life which, as sketched in the great oration attributed to Pericles by Thucydides, made Athens, as the orator says, the school of Greece, and, as we moderns might add, the teacher of posterity; within those thirty years were created works of art, in literature, in architecture, and in sculpture, which the world has ever since regarded as unapproachable masterpieces. This period, so relatively short and yet so prolific in varied excellence, followed closely on the war in which united Greece repelled the Persian invasion. It immediately preceded the war of the two leading Greek cities against each other, in which Sparta ultimately humbled Athens. Athens, as it appears in the national struggle against Persia, is not yet the acknowledged head of Hellas. The formal leadership belongs, by common consent, to Sparta; and though Athens is already pre-eminent in moral qualities—in unselfish devotion to the national cause, and in a spirit

which no reverses can break,—these qualities appear as they are embodied in a few chosen men, in a Themistocles and an Aristides; the mass of Athenians whom they lead is still a comparatively rude multitude, not yet quickened into the full energy of conscious citizenship. If, on the other hand, we look to the close of the age of Pericles—if we pass to the opening years of the Peloponnesian war—we find that the Athenian democracy already bears within it the seeds of decay. The process of degeneration has already begun, though a century is still to elapse before Philip of Macedonia shall overthrow the liberties of Greece at Chæronea.”—*Ibid.*, pp. 63-64.

B. C. 460-455.—The disastrous expedition to Egypt.—Attacks on the Peloponnesian coast.—Defeat at Tanagra.—“Inarus, king of some of the Libyan tribes on the western border of Egypt, had excited an insurrection there against the Persians [about 460 B. C.], and his authority was acknowledged throughout the greater part of the country. Artaxerxes sent his brother Achæmenes with a great army to quell this rebellion. An Athenian armament of 200 galleys was lying at the time off Cyprus, and Inarus sent to obtain its assistance. The Athenian commanders, whether following their own discretion, or after orders received from home, quitted Cyprus, and having joined with the insurgents, enabled them to defeat Achæmenes, who fell in the battle by the band of Inarus. They then sailed up the Nile to Memphis, where a body of Persians, and some Egyptians, who still adhered to their cause, were in possession of one quarter of the city, called White Castle. The rest was subject to Inarus, and there the Athenians stationed themselves, and besieged the Persians. . . . Artaxerxes sent a Persian, named Megabazus, to Sparta, with a sum of money, to be employed in bribing the principal Spartans to use their influence, so as to engage their countrymen in an expedition against Attica. Megabazus did not find the leading Spartans unwilling to receive his money; but they seem to have been unable to render him the service for which it was offered. Ithome still held out: and Sparta had probably not yet sufficiently either recovered her strength or restored internal tranquility, to venture on the proposed invasion. Some rumours of this negotiation may have reached Athens, and have quickened the energy with which Pericles now urged the completion of the long walls. . . . But among his opponents there was a faction who viewed the progress of this great work in a different light from Cimon, and saw in it, not the means of securing the independence of Athens, but a bulwark of the hated commonalty. They too would have gladly seen an invading army in Attica, which might assist them in destroying the work and its authors.”—C. Thirlwall, *History of Greece*, v. 3, ch. 17.—This party was accused of sympathy with the Spartan expedition which came to the help of Doris against the Phocians in 457 B. C., and which defeated the Athenians at Tanagra (See also GREECE: B. C. 458-456). In 455, “the Spartans were reminded that they were also liable to be attacked at home. An Athenian armament of 50 galleys, and, if we may trust Diodorus, with 4,000 heavy armed troops on board, sailed round Peloponnesus under Tolmides, burnt the Spartan arsenal at Gythium, took a town named Chalcis belonging to the Corinthians, and defeated the Sicyonians, who attempted to oppose the landing of the troops. But the most important advantage gained in the expedition was the capture of Naupactus, which belonged to the Ozolian Locrians, and now fell into the hands of the Athenians at very seasonable juncture. The third Mes-

senian war had just come to a close. The brave defenders of Ithome had obtained honourable terms. . . . The besieged were permitted to quit Peloponnesus with their families, on condition of being detained in slavery if they ever returned. Tolmides now settled the homeless wanderers in Naupactus. . . . But these successes were counter-balanced by a reverse which befell the arms of Athens this same year in another quarter. After the defeat of Achæmenes, Artaxerxes, disappointed in his hopes of assistance from Sparta, . . . raised a great army, which he placed under the command of an abler general, Megabyzus, son of Zopyrus. Megabyzus defeated the insurgents and their allies, and forced the Greeks to evacuate Memphis, and to take refuge in an island of the Nile, named Prosopitis, which contained a town called Byblus, where he besieged them for 18 months. At length he resorted to the contrivance of turning the stream. . . . The Greek galleys were all left aground, and were fired by the Athenians themselves, that they might not fall into the enemy's hands. The Persians then marched into the island over the dry bed of the river: the Egyptians in dismay abandoned their allies, who were overpowered by numbers and almost all destroyed. . . . Inarus himself was betrayed into the hands of the Persians and put to death. . . . Egypt . . . was again reduced under the Persian yoke, except a part of the Delta, where another pretender, named Amyrtæus, who assumed the title of king . . . maintained himself for several years against the power of the Persian monarchy. But the misfortune of the Athenians did not end with the destruction of the great fleet and army which had been first employed in the war. They had sent a squadron of 50 galleys to the relief of their countrymen, which, arriving before the news of the recent disaster had reached them, entered the Mendesian branch of the Nile. They were here surprised by a combined attack of the Persian land force and a Phœnician fleet, and but few escaped to bear the mournful tidings to Athens. Yet even after this calamity we find the Athenians, not suing for peace, but bent on extending their power, and annoying their enemies.”—G. Grote, *History of Greece*, v. 5, pt. 2, ch. 45.

B. C. 458.—Athens' triumph over Corinth.—Long walls.—Now that her break with Sparta was complete, Athens proceeded to conclude an alliance with Megara, and that meant war with Corinth, the ally of Sparta (462-461 B. C.). Similar alliances were concluded with Argos and Thesaly, while Corinth won the aid of Ægina. In 458 B. C., the Athenians administered a crushing defeat to the allied fleets of the enemy at Cœryphalea. At the same time they drove back in disorder the Corinthian army, which they finally annihilated. Meanwhile the Athenians were taking steps to render their own position impregnable. Themistocles had been the first to insist that the real strength of Athens lay in the wooden walls of her ships. Carrying out this policy, the Athenians proceeded to join Athens to the Peiræus and the sea by lines of fortified walls. To understand the magnitude of the task, we have only to remember that it meant the construction of nine miles of wall impregnable to the siege apparatus of the time. Upon the advice of Pericles this work was begun.—See also LONG WALLS.

B. C. 457-456.—Battle of Oenophyta.—New Athenian alliances.—Fall of Ægina.—“Sixty-two days after the battle of Tanagra an Athenian force, under Myronides, entered Bœotia, and in a great battle at Oenophyta (456), of which we know nothing but the fact and the result, entirely overthrew the Theban army. The smaller

cities were freed from the supremacy of Thebes, and the oligarchies overthrown. Even in Thebes the defeat brought about a political change and the establishment of a democracy. The cities of Bœotia became members of the Athenian Alliance and furnished troops. And soon afterwards Phocis, already hostile to Sparta for her recent raid into their territory, joined Athens also. Soon afterward the long blockade of Ægina came to a successful conclusion; the fortifications were destroyed, the ships of war surrendered, the obligation to pay tribute for the future recognized. And meanwhile the long walls that connected Athens with the sea were completed."—A. J. Grant, *Greece in the Age of Pericles*, p. 123.

B. C. 456.—Height of Athenian power on land.—"The year 456 gave new evidence of the unapproachable power of Athens at sea. Her admiral Tolmides sailed round the Peloponnese. He burnt the Spartan dock-yard at Gythium, and nowhere met with any resistance at sea. Corinth found herself hemmed in on all sides by the dependencies of Athens. On the west, Megara, Ægina, and Troezen closed her round. On the east, at the very narrowest part of the Corinthian Gulf, the Athenians had captured the important station of Naupactus, and when, in 455, the Helots on Mount Ithome surrendered on condition that they should be allowed to depart freely, they were planted in Naupactus by Athens. The bitter enemies of Sparta, and therefore of Corinth, they held the gate of the western waters against her. It was by her commerce that Corinth lived and now she could only carry on her commercial enterprises with the permission of Athens. For the jealousy which she then created she was to pay dearly at the time of the Peloponnesian war. Athens had reached the highest point of her material power. The Ægean Sea was hers, and hers was the centre of Greece. No power on earth could cope with her on the waters; on land Sparta could boast no assured superiority. The extent of territory that she controlled was greater than any that in historical times had belonged to any state of Greece. Her revenues were for the age, immense. And her intellectual supremacy, though doubtless to contemporaries not so important as her material greatness, helped to increase her splendour in the eyes of Greece. But this increase in dominion was too sudden a growth to last. Such extraordinary energy was feverish, and could not be permanent. She could not hope to win many victories with those who were too old or young for regular service. Side by side with her conquests went the development of the democracy, and we shall see shortly how quite unsuitable were the institutions of the democracy for the management of an empire. And so the might of Athens from this point changes only to decrease."—A. J. Grant, *Greece in the Age of Pericles*, pp. 124-125.—See also **BALANCE OF POWER: Ancient Greece and Rome.**

B. C. 454 or 453.—Return of Cimon.

B. C. 449-446.—Cimon's expedition.—Peace with Persia.—"And during these years the contest with Persia was renewed by Cimon with conspicuous success. The war is of importance, and it would be interesting to watch in detail the last struggle between the great combatants. But our authorities here are meagre, and, except for the main features, contradictory; nor does the war in the East bear directly upon the development of Athenian power in Central Greece. It is enough then to say that in 440 Cimon at the head of the Athenian armament was engaged in the attempt to reduce Cyprus, when he was attacked by the Persian fleet. He died before the

engagement, but his spirit animated his troops. And off Salamis, in Cyprus, the Persians were entirely defeated on the same day, both by sea and land. The defeat was an exceedingly severe one, and now the Persian king acquiesced in an arrangement whereby the *status quo* was accepted and all hostilities terminated. It is forty years before there is any further collision between Greeks and Persians. Meanwhile the fleet returned with Cimon's body. Athens never again produced a commander of such distinction."—A. J. Grant, *Greece in the Age of Pericles*, pp. 126-127.—For second Sacred war, see **SACRED WAR, SECOND.**

B. C. 447.—Battle of Coronea.—Fall of Athenian Continental League.—"The first blow came from Bœotia. There by a sudden revolution the democracies were overthrown, and several of the cities of Bœotia declared against the Athenian supremacy. It was clear that the movement must be suppressed at once. . . . The Athenian forces were surprised at Coronea (447) and entirely defeated. Tolmides and many were slain; the rest were taken prisoners. The Egyptian catastrophe had already depleted Athens; she could ill afford to spare any more citizens. To get back those who had been taken prisoners, she consented to abandon Bœotia. The oligarchs at once came back; again Bœotia was organized under the supremacy of Thebes; and Athens had upon the north a jealous and victorious rival, embittered by the memory of a recent humiliation. The loss of Bœotia was followed by blows still more dangerous. First, in the summer of 445 the cities of the great and most important island of Eubœa revolted from Athens. Eubœa had been from the first a member of the Delian League; her position and her wealth made her friendship or her hostility of the first importance to Athens. Pericles with all the available forces marched to repress the revolt. But no sooner was his back turned than the storm broke from the west. . . . Bœotia, Eubœa, Megara, Sparta—attacked by these formidable foes and taken by surprise, it seemed impossible for Athens to survive. Pericles turned hastily back from Eubœa. But Pleistoanax made no attack on Athens herself. The Spartan army got as far as the plain of Eleusis, within fifteen miles of Athens, and then turned back and retired over the Isthmus to Sparta. . . . So the greatest danger of all had rolled away. Megara could not be retaken; it was doubtless held by a Spartan garrison. But from this day forth Athens hated Megara as she hated no state in Greece, though she hated many. But the Spartans could not get at Eubœa, and thither Pericles marched. We hear of no resistance, and quickly the island became a portion of the Athenian power once more. But not on the old terms: Eubœa was no longer a free member of the confederacy. She was now strictly subject to Athens. Everywhere the oligarchical constitutions were destroyed and democracies were set up. All adherents of the old system were expelled and not allowed to return. And the new democracies were not free to govern themselves as they liked. They were free only as long as they freely chose to be subjects of Athens."—A. J. Grant, *Greece in the Age of Pericles*, pp. 127-129.—See also **GREECE: B. C. 478-477, 440-445.**

B. C. 446-445.—Thirty years' peace.—"Pericles and his colleagues saw clearly the exhaustion of their state. The disaster in Egypt, the substantial failure of the great expedition to Cyprus, the heavy loss in men from the domestic wars, and the vast expense of all these undertakings had overstrained the ability of Athens and had necessitated a breathing time. In 445, accordingly, after

the Euboic campaign, the Athenians agreed with the Peloponnesians to a Thirty Years' Peace on the basis of the *status quo*. Athens gave up all her recently acquired continental allies, retaining only Plataea and Naupactus. On the other hand, she received an acknowledgment of her maritime empire. Neither party was to interfere with the allies of the other but each remained free to make treaties with neutral states. The principle of the 'open door' was established for their commercial relations; and it was agreed that disputes should be settled by arbitration. The lack of a clear understanding as to the means and method of arbitration, however, rendered the last-mentioned article inoperative. However faulty the terms, both parties to the treaty, freed from the heavy burden of the conflict, rejoiced in the advantages of neutral commerce, of internal recuperation, and improvement promised them by the truce."—G. W. Botsford, *Hellenic history*, ch. xiv.—See also GREECE: B. C. 449-445.

B. C. 431.—Peloponnesian War (431-404 B. C.): Causes of the war.—Conflict of economic interests.—Athenian designs upon Megara.—Athenian interests in Corcyra.—Trouble with Corinth.—Athenian menace to Peloponnesians.—Political parties as a cause.—Spartan fear and Corinthian jealousy of Athens.—"The Thirty Years' Peace put an end to open hostilities between Athens and Sparta, but it failed to settle the fundamental and vexing questions of rivalry and to remove the mutual bad feeling and distrust. The balance was too delicate. To avoid giving Sparta any occasion for opposition, Pericles departed from his earlier aggressive policy to one of conservation and consolidation. The first step in the direction of aggrandizement was certain to be challenged. Events and exigencies of Athenian trade and industry forced the leaders of Athens into such a step and trouble followed. The Megarian decrees formed the first piece of renewed aggression on the part of Athens. A small, over-populated state, once of great commercial importance, Megara had sunk to the position of a second-rate industrial city. However, her farmers furnished vegetables and meat to the Athenian markets, and her wares, which were good, made her merchants strong competitors of the Athenian merchants and manufacturers. In response to local demands for protection the Athenian assembly passed a decree excluding the Megarians from the markets of the empire. The Athenians had resented the withdrawal of Megara from their federation and probably hoped to force the Megarians into subjection that they might regain the favorable position on the Gulf of Corinth. This decree meant financial ruin and starvation to the Megarians and served as a warning to any other state of the Spartan alliance which might block the Athenians. It aroused much apprehension on the part of other commercial states, particularly in Corinth. The Corcyraean episode added another element to Corinthian unrest at the increasing power of Athens. Corcyra, a colony of Corinth, but one of the few remaining independent naval powers, finding herself at war with Corinth, appealed to Athens for aid. They had cogent arguments—their navy, which would be a valuable addition to the Athenian fleet, and the control which they were able to exercise over the trade route to Sicily. In vain did the Corinthians argue that the true path of expediency is the path of right.

Athenian refusal of the Corcyraean offer meant the strengthening of the only important naval rival of Athens and a loss of prestige to Athens itself if it yielded to the desires of Corinth. To avoid any infraction of the peace the Athenians concluded a defensive alliance with Corcyra. In the resulting war the Corinthians were worsted. The enmity thus aroused between Athens and Corinth was increased by a minor difficulty at Potidæa. The crisis in Hellenic affairs and the test of the Thirty Years' Peace came when the Corinthians, fully aroused, invited the envoys of the Peloponnesian League to meet at Sparta to consider the situation. The grievances were submitted to the Spartan assembly. Thucydides made use of the situation to draw a comparison between the Spartans, conservative, reluctant to assume the aggressive and willing to take defensive action only when absolutely necessary, and the Athenians, revolutionary, always on the alert to seize the advantage, ready to risk all to gain their ends. They were born, said the Corinthian ambassadors, neither to have peace themselves nor to allow it to other men. The Corinthians made the veiled threat that if their plea met with no success they would turn elsewhere for aid. Sparta was in this way forced into action. Athenians present endeavored to prevent such a result. They recounted the glorious deeds of Athens in the past. They explained the establishment of their empire and justified it on the ground of necessity. They pointed out the risks involved in war and called upon the Spartans to submit the disputes to arbitration according to the treaty. Archidamus, the conservative king of Sparta, counseled delay. He supported the Athenian demand for arbitration, pointing out the absence of a real cause, the superiority of the Athenians in the materials of war and in money, and the uncertainty of the issue. The war party, however, was the stronger. They realized that the basic issue was not the immediate charges against Athens but the existence of the Athenian empire itself, which was not a debatable question. . . . It was voted then that the Athenians were guilty of an infraction of the treaty. At the assembly of the league which followed at Sparta the keynote of the war was sounded. Athens was a menace to all. Some states she already ruled. If from a love of peace and ease the Peloponnesians failed to make war upon her, she would soon dominate the rest. . . . The league voted for war. A series of minor demands were made upon Athens, followed by a peremptory order for the dissolution of the empire. The Athenians refused to yield. The least concession would be a confession of wrong-doing or of weakness. Pericles regarded the war as inevitable and felt that Athens was ready. Acting on his advice they made counter-propositions to Sparta, put the onus of blame for the beginning of the war upon that city by offering arbitration 'upon fair terms according to the treaty, well aware that war was at hand, anxious for peace, but ready and willing to defend themselves.' (Thucydides, i, 140). . . . When the issue came it was found to be unarbitrable. The existence of the Athenian empire was not a debatable question. Spartan fear and Corinthian jealousy of Athenian expansion could not be submitted to a tribunal. Considerations of individual expediency founded on fear or ambition were more powerful than the most binding of sacred oaths."—W. E. Caldwell, *Hellenic conceptions of peace*, pp. 87-91.—See also GREECE: B. C. 435-432; B. C. 432 and B. C. 432-431.

B. C. 431-429.—Attitude of Hellas toward war.—Spartan preparations (431).—Gathering

of Athenian population into the city.—Plague (430).—Death of Pericles (429).—"All Hellas was excited by the coming conflict. Prodigies and prophecies abounded. Enthusiasm was manifest on both sides. Outside of the Athenian empire the war was extremely popular and the Spartans were hailed as the liberators of Hellas. The Spartan youth were eager for the excitement of war. Nor was this feeling confined to Sparta. The Athenian young men gladly exchanged soft cloaks and snow-white slippers, flowing ringlets, baths and oil, for the breastplate and the greaves, and dropped the games of the banquet for the greater game of war, to fight for gods and country as their fathers had fought before them. In the defence of the city all parties were united. In the spring of 431 the Spartan king Archidamus prepared his forces for an invasion of Attica. Pericles countered by bringing all the Athenians within the Long Walls (q. v.) and thus avoided a decisive battle on land, while the fleet was ravaging the Peloponnesian coasts. The suffering among the Athenians, most of whom were small farmers unused to city life, was great, and their enmity toward Sparta was increased by the destruction of their crops and their olive orchards. The plague which ravaged Athens added to the general discomfort and brought the peace party temporarily into power. Pericles triumphed over their attacks, but the following year himself died of the disease. His place as leader of the people was taken by a new type of men, products of the people, like Cleon, the tanner, and Hyperbolus, the lamp-maker."—W. E. Caldwell, *Hellenic conceptions of peace*, p. 92.

B. C. 429-427.—Siege and destruction of Plataea. See GREECE: B. C. 429-427: Peloponnesian war.

B. C. 428-427.—Revolt of Lesbos.—Invasion of Attica.—Longing for peace.—"In the year after Cleon had come to the front, the oligarchs of Lesbos induced Mytilene and nearly all the other cities of the island to revolt. There was danger that all the maritime cities would follow this example. But the Peloponnesians were too slow in sending the promised aid, and the Athenians made desperate efforts to conquer the island. As a last resort (427 B. C.) the oligarchs of Mytilene armed the commons; but the latter promptly surrendered the city to the Athenian commander. Thereupon he sent the oligarchs, who alone were guilty of revolt, to Athens for trial. The Athenians were angry because the Lesbians had revolted without cause; they feared, too, for the safety of their empire, and indeed for their own lives. With no great difficulty, therefore, Cleon persuaded them to condemn and put to death all the captive oligarchs. Cleon's idea was to make an example of them that other communities might fear to revolt. The punishment, decreed under excitement, was too severe, and out of keeping with the humane character of the Athenians. In putting down this revolt, they passed the dangerous crisis, and were again undisputed masters of the Ægean Sea."—G. W. Botsford, *History of the ancient world*, p. 222.—The invasion of Attica in the year 427 B. C. Thucydides regarded as unusually severe. As a result the peace party gained new courage. The wealthier noble class had suffered particularly. They had lost their fair estates in the country, with all their houses and rich furniture; their pleasures were restricted in the city; the exigencies of war had led to the imposition of a property tax, which fell upon them with heavy weight; and they were bitterly opposed to the new developments of the democracy. The center of their opposition

was in the oligarchic clubs. The small farmer, through his hatred of Sparta was so strong that he refused to support any movement for peace and demanded revenge for the destruction of his vineyards and orchards, had grown weary of the cramped and confused life in the city and was longing for the end of the war.

B. C. 426-422.—War-weariness.—Barbarous war practices.—Battle of Pylos (425).—Peace proposals.—Athenian defeats.—Battle of Amphipolis.—"All of Hellas was in confusion as a result of the war. In most of the cities factions had arisen. The democratic leaders were endeavoring to establish or to assure their power by appealing to the Athenians, and the leaders of the oligarchs to the Lacedæmonians. Party strife brought many terrible calamities; anarchy and violence, crime and perfidy were rife; religion and oaths were forgotten. The practices of war were hardened by the intensity of feeling. Sailors who fell into Spartan hands were killed forthwith and the Athenians retaliated in kind. When Plataea fell the Spartans put to death all the men who remained and sold the women and children into slavery with no softening of the ancient custom. After the defeat of the oligarchic revolt in Mytilene the Athenians on the motion of Cleon, voted to put all male citizens to death. They reconsidered this action, and on the ground of better policy killed only the most guilty. Against the general policy of Cleon towards the allies as exemplified in this affair, and in a later increase of the tribute, the comic poets protested. . . . The capture of the Spartans at Pylos in 425 furnished an opportunity for peace. The Spartans offered peace, alliance and friendly relations. 'Let us be reconciled and, choosing peace instead of war ourselves, let us give relief and rest to all the Hellenes.' The credit for the peace would go to Athens. The peace party were hopeful, but the imperialistic element among the democracy, led by Cleon, had gained new hopes and the Spartan offer was rejected. Athenian forces were defeated in the following years at Delium and by Brasidas, the ablest of the Spartan generals, in the Chalcidice. The Athenians then attempted to secure peace, but without success. In the final battle of Amphipolis both Cleon and Brasidas were killed. The two chief obstacles to the making of terms were thus removed. The conservatives on both sides came into control and peace was agreed upon. The Spartan allies were dissatisfied, but they were overruled. The treaty, which is known as the Peace of Nicias, after the Athenian commander, provided for mutual restoration and peace for fifty years."—W. E. Caldwell, *Hellenic conceptions of peace*, pp. 95-96.—See also GREECE: B. C. 425.

B. C. 421.—Peace of Nicias.—Joys of peace.—Return to the farms.—"The Peace, of which Nicias and Pleistoanax were the chief authors, was fixed for a term of fifty years. Athens undertook to restore all the posts which she had occupied during the war against the Peloponnesians. . . . All captives on both sides were to be liberated. [See also GREECE: B. C. 424-421.] It appeared immediately that the situation was not favorable to a durable peace; for, when the terms were considered at Sparta by a meeting of deputies of the Peloponnesian allies, they were emphatically denounced as unjust by three important states, Corinth, Bœotia, and Megara. . . . But since the deepest cause of the war lay in the commercial competition between Athens and Corinth, and since the interests of Sparta were not at stake, the treaty might seem at least to have the merit of simplifying the situation."—J. B. Bury, *History of*

Greece, pp. 455-456.—“Aristophanes burst forth into jubilation in a play called *The Peace*. He represented the farmers as rejoicing in the advent of peace. One Trygæus has scaled Olympus to find the goddess Peace, only to be told by Hermes that the gods, disgusted with Hælas because of its failure to end the war, had buried Peace and determined to grind the cities to pieces in a huge mortar. With the death of Cleon and of Brasidas their pestles had been lost, however. Trygæus hails this as a glorious opportunity and calls upon all Hellenes, farmers, merchants, artisans, craftsmen, aliens, islanders and all, to unite with him in the task of digging up Peace. The whole Hellenic nation throws away its ranks and squadrons to engage in the task, midst laughter and dancing. Only the Megarians, the dissatisfied ones, the Argives who have been gaining from both sides, the professional soldier who desires a commission, and the merchant who sells spears and shields, stand aside. Hermes must be bribed to keep quiet. After an effort Peace is brought into view. The cities are reconciled. The crest-maker and the sword-cutter and the spear-burnisher may despair, but the pitchfork-maker and the manufacturer of sickles rejoice. The farmers lay aside their arms and return to their fig trees and their farms. Peace smells of ‘harvests, banquets, festivals, flutes, thrushes, plays, the odes of Sophocles, Euripidean wordlets . . . the bleating lambs, the ivy-leaf, the vat, full-bosomed matrons . . . the tipsy maid, the drained and empty flask, and many another blessing.’ (Aristophanes, *Peace*, 204 ff).”—W. E. Caldwell, *Hellenic conceptions of peace*, pp. 96-97.

B. C. 419-416.—**Rise of Alcibiades.—Renewal of hostilities.—Slaughter of the Melians.**—Educated by his kinsman Pericles in democratic traditions, he was endowed by nature with extraordinary beauty and talents, by fortune with the inheritance of wealth which enabled him to indulge an inordinate taste of ostentation. He had shocked his kinsfolk and outraged the city, not by his dissoluteness, but by the incredible insolence which accompanied it. . . . Alcibiades indeed had not in him the stuff of which true statesmen are made; he had not the purpose, the perseverance, or the self-control. An extremely able and dexterous politician he certainly was; but he wanted that balance which a politician, whether scrupulous or unscrupulous, must have in order to be a great statesman. Nor had Alcibiades any sincere belief in the democratic institutions of his country, still less any genuine sympathy with the advanced democratic party whose cause he espoused. . . . The accession of Alcibiades was particularly welcome to the radical party, not so much on account of his family connexions, his diplomatic and rhetorical talents, but because he had a military training and could perform the functions of strategos. Unfitness for the post of strategos was, as we have seen, the weak point in the position of men like Hyperbolus and Cleon. When Alcibiades was elected a strategos and Nicias was not re-elected, the prospects of the radical party looked brighter. The change was immediately felt. Athens entered into an alliance with Argos, and her allies Elis and Mantinea, for a hundred years; and the treaty was sealed by a joint expedition against Epidaurus. Sparta assisted Epidaurus, and then the Athenians declared that the Lacedæmonians had broken the Peace.”—J. B. Bury, *History of Greece*, pp. 459-460.—“The armies of these two unions met in battle at Mantinea in 418 B. C. The Lacedæmonians, who still had the best organization and discipline in Greece, were victorious. This success

wiped out the disgrace which had lately come upon them, and enabled them to regain much of their former influence in Peloponnese. Argos and Mantinea now made peace with Lacedæmon apart from Athens.”—G. W. Botsford, *History of the ancient world*, p. 224.—See also GREECE: B. C. 421-418.—“The island of Melos had hitherto remained outside the sea-lordship of the Athenians, and Athens, under the influence of Alcibiades, now attacked her. The town of Melos was invested in the summer by land and sea, and surrendered at discretion in the following winter. All the men of military age were put to death, the other inhabitants were enslaved, and the island was colonised by Athenians.”—J. B. Bury, *History of Greece*, p. 462.—See also GREECE: B. C. 416.

B. C. 415-413.—**Disastrous Athenian expedition against Syracuse.—Alcibiades a fugitive in Sparta.—His enmity for Athens.** See SYRACUSE: B. C. 415-413.

B. C. 413-412.—**Consequence of Sicilian expedition.—Spartan alliance with Persians.—Plotting of Alcibiades.—Decelian War.—Revolt of Chios, Miletus, Lesbos and Rhodes from Athens.—Revolution of Samos.** See GREECE: B. C. 413-412, and B. C. 413.

B. C. 413-411.—**Democracy curbed.—New system of taxation.—Probuli.—Intrigues of Alcibiades.—Conspiracy against the constitution.—The Four Hundred and the Five Thousand.**—“The Sicilian expedition was part of the general aggressive policy of Athens which made her unpopular in Greece. . . . If there were ever an enterprise of which the wisdom cannot be judged by the result, it is the enterprise against Syracuse. All the chances were in its favour. . . . The necessity of a counterweight to Corinthian influence in Sicily and Italy had long ago been recognised; some attempts had been made to meet it; and when peace with Sparta set Athenian forces free from service outside Greece and the Ægean, it was natural that the opportunity should be taken to act effectively in the west. . . . And after the disaster . . . there was a feeling that some change must be made in the administration. . . . The treasury was at a low ebb, and there were no men to replace those who were lost in Sicily. It was felt that the committees of the Council of Five Hundred were hardly competent to conduct the city through such a crisis; a smaller and more permanent body was required; and the chief direction of affairs was entrusted to a board of Ten, named *Probuli* [q. v.], which practically superseded the Council for the time being. A very important change in the system of taxation was made at the same time. The tribute, already as high as it could be put with impunity, was abolished; and was replaced by a tax of 5 per cent on all imports and exports carried by sea to or from the harbours of the Confederacy. It was calculated that this duty would produce a larger income than the tribute, and it would save the friction which generally occurred in the business of collecting the tribute and caused more than anything else the unpopularity of Athens. But further, the change had a great political significance. The duty was collected in the Peiræus as well as elsewhere, and thus fell on Athens herself. This might prove a step towards equalising Athens with her allies, and converting the Confederacy or dominion into a national state.”—J. B. Bury, *History of Greece*, pp. 485-486.—See also ΑΡΟΠΕΤ.Æ.—Immediately after the dreadful calamity at Syracuse became known, “extraordinary measures were adopted by the people; a number of citizens of advanced

age were formed into a deliberative and executive body under the name of Probuli, and empowered to fit out a fleet. Whether this laid the foundation for oligarchical machinations or not, those aged men were unable to bring back men's minds to their former course; the prosecution of the Hermocopidæ had been most mischievous in its results; various secret associations had sprung up and conspired to reap advantage to themselves from the distress and embarrassment of the state; the indignation caused by the infuriated excesses of the people during that trial, possibly here, as frequently happened in other Grecian states, determined the more respectable members of the community to guard against the recurrence of similar scenes in future, by the establishment of an aristocracy. Lastly, the watchful malice of Alcibiades, who was the implacable enemy of that populace, to whose blind fury he had been sacrificed, baffled all attempts to restore confidence and tranquillity, and there is no doubt that, whilst he kept up a correspondence with his partisans at home, he did everything in his power to increase the perplexity and distress of his native city from without, in order that he might be recalled to provide for its safety and defence. A favourable opportunity for the execution of his plans presented itself in the fifth year of his exile, Ol. 82, 1; 411 B. C.; as he had incurred the suspicion of the Spartans, and stood high in the favour of Tissaphernes, the Athenians thought that his intercession might enable them to obtain assistance from the Persian king. The people in Athens were headed by one of his most inveterate enemies, Androcles; and he well knew that all attempts to effect his return would be fruitless, until this man and the other demagogues were removed. Hence Alcibiades entered into negotiations with the commanders of the Athenian fleet at Samos, respecting the establishment of an oligarchical constitution, not from any attachment to that form of government in itself, but solely with the view of promoting his own ends. Phrynichus and Pisander were equally insincere in their co-operation with Alcibiades. . . . Their plan was that the latter should reconcile the people to the change in the constitution which he wished to effect, by promising to obtain them the assistance of the great king; but they alone resolved to reap the benefit of his exertions. Pisander took upon himself to manage the Athenian populace. It was in truth no slight undertaking to attempt to overthrow a democracy of a hundred and twenty years' standing, and of intense development; but most of the able bodied citizens were absent with the fleet, whilst such as were still in the city were confounded by the imminence of the danger from without; on the other hand, the prospect of succour from the Persian king doubtless had some weight with them, and they possibly felt some symptoms of returning affection for their former favourite Alcibiades. Nevertheless, Pisander and his accomplices employed craft and perfidy to accomplish their designs; the people were not persuaded or convinced, but entrapped into compliance with their measures. Pisander gained over to his purpose the above named clubs, and induced the people to send him with ten plenipotentiaries to the navy at Samos. In the mean time the rest of the conspirators prosecuted the work of remodeling the constitution."—W. Wachsmuth, *Historical antiquities of the Greeks*, v. 2, pp. 252-255.—The people, or an assembly cleverly made up and manipulated to represent the people, were induced to vote all the powers of government into the hands of a council of Four Hundred, of which

council the citizens appointed only five members. Those five chose ninety-five more, to make one hundred, and each of that hundred then chose three colleagues. The conspirators thus easily made up the Four Hundred to their liking, from their own ranks. This council was to convene an assembly of Five Thousand citizens, whenever it saw fit to do so. But when news of this constitutional change reached the army at Samos, where the Athenian headquarters for the Ionian war were fixed, the citizen soldiers refused to submit to it—repudiated it altogether—and organized themselves as an independent state. The ruling spirit among them was Thrasybulus, and his influence brought about a reconciliation with Alcibiades, then an exile sheltered at the Persian court. Alcibiades was recalled by the army and placed at its head. Presently a reaction at Athens ensued, after the oligarchical party had given signs of treasonable communication with Sparta, and in June the people assembled in the Pnyx and reasserted their sovereignty. "The Council was deposed, and the supreme sovereignty of the state restored to the people—not, however, to the entire multitude; for the principle was retained of reserving full civic rights to a committee of men of a certain amount of property; and, as the lists of the Five Thousand had never been drawn up, it was decreed, in order that the desired end might be speedily reached, to follow the precedent of similar institutions in other states and to constitute all Athenians able to furnish themselves with a complete military equipment from their own resources, full citizens with the rights of voting and participating in the government. Thus the name of the Five Thousand had now become a very inaccurate designation; but it was retained, because men had in the last few months become habituated to it. At the same time, the abolition of pay for civic offices and functions was decreed, not merely as a temporary measure, but as a fundamental principle of the new commonwealth, which the citizens were bound by a solemn oath to maintain. This reform was, upon the whole, a wise combination of aristocracy and democracy; and, according to the opinion of Thucydides, the best constitution which the Athenians had hitherto possessed. On the motion of Critias, the recall of Alcibiades was decreed about the same time; and a deputation was despatched to Samos, to accomplish the union between army and city."—E. Curtius, *History of Greece*, bk. 4, ch. 5.—Most of the leaders of the Four Hundred fled to the Spartan camp at Decelea. Two were taken, tried and executed.—Thucydides, *History of the Peloponnesian War*, bk. 8, sect. 48-49.—See also GREECE: B. C. 413-412.

B. C. 405.—Peloponnesian War.—Decisive defeat at Ægospotami. See GREECE: 405 B. C.

B. C. 404.—Surrender to Lysander.—After the battle of Ægospotami (August, 405 B. C.), which destroyed their navy, and cut off nearly all supplies to the city by sea, as the Spartans at Decelea had long cut off supplies upon the land side, the Athenians had no hope. They waited in terror and despair for their enemies to close

in upon them. The latter were in no haste, for they were sure of their prey. Lysander, the victor at Ægospotami, came leisurely from the Hellespont, receiving on his way the surrender of the cities subject or allied to Athens, and placing Spartan harmosts and garrisons in them, with the local oligarchs established uniformly in power. About November he reached the Saronic gulf and blockaded the Athenian harbor of Peiræus, while an overwhelming Peloponnesian land force, under the Lacedæmonian king Pausanias, arrived simultaneously in Attica and encamped at the gates of the city. The Athenians had no longer any power except the power to endure, and that they exercised for more than three months, mainly resisting the demand that their Long Walls—the walls which protected the connection of the city with its harbors—should be thrown down. But when famine had thinned the ranks of the citizens and broken the spirit of the survivors, they gave up. "There was still a high-spirited minority who entered their protest and preferred death by famine to such insupportable disgrace. The large majority, however, accepted them [the terms] and the acceptance was made known to Lysander. It was on the 16th day of the Attic month Munychion,—about the middle or end of March,—that this victorious commander sailed into the Peiræus, twenty-seven years, almost exactly, after the surprise of Platæa by the Thebans, which opened the Peloponnesian War. Along with him came the Athenian exiles, several of whom appear to have been serving with his army and assisting him with their counsel."—G. Grote, *History of Greece*, pt. 2, ch. 65 (v. 8).—The Long Walls and the fortifications of Peiræus were demolished, and then followed the organization of an oligarchical government at Athens, resulting in the reign of terror under "The Thirty."—E. Curtius, *History of Greece*, bk. 4, ch. 5.

ALSO IN: Xenophon, *Hellenica*, bk. 2, ch. 2.—Plutarch, *Lysander*.

B. C. 404-403.—Tyranny of the Thirty.—Year of anarchy.—In the summer of 404 B. C., following the siege and surrender of Athens, and the humiliating close of the long Peloponnesian War, the returned leaders of the oligarchical party, who had been in exile, succeeded with the help of their Spartan friends, in overthrowing the democratic constitution of the city and establishing themselves in power. The revolution was accomplished at a public assembly of citizens, in the presence of Lysander, the victorious Lacedæmonian admiral, whose fleet in the Peiræus lay ready to support his demands. "In this assembly, Dracontides, a scoundrel upon whom repeated sentences had been passed, brought forward a motion, proposing the transfer of the government into the hands of Thirty persons; and Theramenes supported this proposal which he declared to express the wishes of Sparta. Even now, these speeches produced a storm of indignation; after all the acts of violence which Athens had undergone, she yet contained men outspoken enough to venture to defend the constitution, and to appeal to the fact that the capitulation sanctioned by both parties contained no provision as to the internal affairs of Athens. But, hereupon, Lysander himself came forward and spoke to the citizens without reserve, like one who was their absolute master. . . . By such means the motion of Dracontides was passed; but only a small number of unpatriotic and cowardly citizens raised their hands in token of assent. All better patriots contrived to avoid participation in this vote. Next, ten members of the government were chosen by Critias and his colleagues [the Critias of Plato's Dialogues, pupil of Socrates, and now the

violent and blood-thirsty leader of the anti-democratic revolution], ten by Theramenes, the confidential friend of Lysander, and finally ten out of the assembled multitude, probably by a free vote; and this board of Thirty was hereupon established as the supreme government authority by a resolution of the assembly present. Most of the members of the new government had formerly been among the Four Hundred, and had therefore long pursued a common course of action." The Thirty Tyrants so placed in power were masters of Athens for eight months, and executed their will without conscience or mercy, having a garrison of Spartan soldiers in the Acropolis to support them. They were also sustained by a picked body of citizens, "the Three Thousand," who bore arms while other citizens were stripped of every weapon. Large numbers of the more patriotic and high-spirited Athenians had escaped from their unfortunate city and had taken refuge, chiefly at Thebes, the old enemy of Athens, but now sympathetic in her distress. At Thebes these exiles organized themselves under Thrasybulus and Anytus, and determined to expel the tyrants and to recover their homes. They first seized a strong post at Phyle, in Attica, where they gained in numbers rapidly, and from which point they were able in a few weeks to advance and occupy the Peiræus. When the troops of The Thirty came out to attack them, they drew back to the adjacent height of Munychia and there fought a battle which delivered their city from the Tyrants. Critias, the master-spirit of the usurpation, was slain; the more violent of his colleagues took refuge at Eleusis, and Athens, for a time, remained under the government of a new oligarchical Board of Ten; while Thrasybulus and the democratic liberators maintained their headquarters at Munychia. All parties waited the action of Sparta. Lysander, the Spartan general, marched an army into Attica to restore the tyranny which was of his own creating; but one of the two Spartan kings, Pausanias, intervened, assumed the command in his own person, and applied his efforts to the arranging of peace between the Athenian parties. The result was a restoration of the democratic constitution of the Attic state, with some important reforms. Several of The Thirty were put to death,—treacherously, it was said,—but an amnesty was extended to all their partisans. The year in which they and The Ten controlled affairs was termed in the official annals of the city the Year of Anarchy, and its magistrates were not recognized.—E. Curtius, *History of Greece*, bk. 4, ch. 5, and bk. 5, ch. 1.—See also GREECE: B. C. 404-359.

B. C. 378-357.—New confederacy and the Social War.—Upon the liberation of Thebes and the signs that began to appear of the decline of Spartan power—during the year of the archonship of Nausinicus, 378-377 B. C., which was made memorable at Athens by various movements of political regeneration,—the organization of a new confederacy was undertaken, analogous to the confederacy of Delos, formed a century before. Athens was to be, "not the ruling capital, but only the directing city in possession of the pri-

macy, the seat of the federal council. . . . Callistratus was in a sense the Aristides of the new confederation and doubtless did much to bring about an agreement; it was likewise his work that, in place of the 'tributes' of odious memory, the payments necessary to the existence of the confederation were introduced under the gentler name of 'contributions.' . . . Amicable relations were resumed with the Cyclades, Rhodes and Perinthus; in other words, the ancient union of navies was at once renewed upon a large scale and in a wide extent. Even such states joined it as had hitherto never stood in confederate relations with Athens, above all Thebes."—E. Curtius, *History of Greece*, bk. 6, ch. 1.—See also GREECE: B. C. 4th century.—This second confederacy renewed much of the prosperity and influence of Athens for a brief period of about twenty years. But in 357 B. C., four important members of the confederacy, namely, Chios, Cos, Rhodes, and Byzantium leagued themselves in revolt, with the aid of Mausolus, prince of Caria, and an inglorious war ensued, known as the Social War, which lasted three years. Athens was forced at last to assent to the secession of the four revolted cities and to recognize their independence, which greatly impaired her prestige and power, just at the time when she was called upon to resist the encroachments of Philip of Macedonia.—C. Thirlwall, *History of Greece*, ch. 42.

B. C. 370-362.—Alliance with Sparta against Thebes.—Battle of Mantinea. See GREECE: B. C. 371-362.

B. C. 359-338.—Collision with Philip of Macedonia.—Policy of Demosthenes and policy of Phocion.—"A new period opens with the growth of the Macedonian power under Philip (359-336 B. C.). We are here chiefly concerned to notice the effect on the City-State [of Athens], not only of the strength and policy of this new power, but also of the efforts of the Greeks themselves to counteract it. At the time of Philip's accession the so-called Theban supremacy had just practically ended with the death of Epaminondas. There was now a kind of balance of power between the three leading States, Sparta, Athens, and Thebes, no one of which was greatly stronger than the others; and such a balance could easily be worked upon by any great power from without. Thus when Macedon came into the range of Greek politics, under a man of great diplomatic as well as military capacity, who, like a Czar of to-day [1893], wished to secure a firm footing on the sea-board of the Ægean [see GREECE: B. C. 359-358], she found her work comparatively easy. The strong imperial policy of Philip found no real antagonist except at Athens. Weak as she was, and straitened by the break-up of her new confederacy, Athens could still produce men of great talent and energy; but she was hampered by divided counsels. Two Athenians of this period seem to represent the currents of Greek political thought, now running in two different directions. Demosthenes represents the cause of the City-State in this age, of a union, that is, of perfectly free Hellenic cities against the common enemy. Phocion represents the feeling, which seems to have been long growing up among thinking men at Athens, that the City-State was no longer what it had been, and could no longer stand by itself; that what was needed was a general Hellenic peace, and possibly even an arbiter from without, an arbiter who not wholly un-Hellenic like the Persian, yet one who might succeed in stilling the fatal jealousies of the lead-

ing States. . . . The efforts of Demosthenes to check Philip fall into two periods divided by the peace of Philocrates in 346 B. C. In the first of these he is acting chiefly with Athens alone; Philip is to him not so much the common enemy of Greece as the dangerous rival of Athens in the north. His whole mind was given to the internal reform of Athens so as to strengthen her against Philip. In her relation to other Greek States he perhaps hardly saw beyond a balance of power. . . . After 346 his Athenian feeling seems to become more distinctly Hellenic. But what could even such a man as Demosthenes do with the Hellas of that day? He could not force on the Greeks a real and permanent union; he could but urge new alliances. His strength was spent in embassies with this object, embassies too often futile. No alliance could save Greece from the Macedonian power, as subsequent events plainly showed. What was needed was a real federal union between the leading States, with a strong central controlling force; and Demosthenes' policy was hopeless just because Athens could never be the centre of such a union, nor could any other city. Demosthenes is thus the last, and in some respects the most heroic champion of the old Greek instinct for autonomy. He is the true child of the City-State, but the child of its old age and decrepitude. He still believes in Athens, and it is on Athens that all his hopes are based. He looks on Philip as one who must inevitably be the foe alike of Athens and of Greece. He seems to think that he can be beaten off as Xerxes was, and to forget that even Xerxes almost triumphed over the divisions of the Greek States, and that Philip is a nearer, a more prominent, and a far less barbarian foe. . . . Phocion was the somewhat odd exponent of the practical side of a school of thought which had been gaining strength in Greece for some time past. This school was now brought into prominence by the rise of Macedon, and came to have a marked influence on the history of the City-State. It began with the philosophers, and with the idea that the philosopher may belong to the world as well as to a particular city. . . . Athens was far more open to criticism now than in the days of Pericles; and a cynical dislike betrays itself in the Republic for the politicians of the day and their tricks, and a longing for a strong government of reason. . . . Aristotle took the facts of city life as they were and showed how they might be made the most of. . . . To him Macedon was assuredly not wholly barbarian; and war to the death with her kings could not have been to him as natural or desirable as it seemed to Demosthenes. And though he has nothing to tell us of Macedon, we can hardly avoid the conclusion that his desire was for peace and internal reform, even if it were under the guarantee of the northern power. . . . Of this philosophical view of Greek politics Phocion was in a manner the political exponent. But his policy was too much a negative one; it might almost be called one of indifferentism, like the feeling of Lessing and Goethe in Germany's most momentous period. So far as we know, Phocion never proposed an alliance of a durable kind, either Athenian or Hellenic, with Macedon; he was content to be a purely restraining influence. Athens had been constantly at war since 432; her own resources were of the weakest; there was little military skill to be found in her, no reserve force, much talk, but little solid courage. Athens was vulnerable at various points, and could not possibly defend more than one at a time, therefore Phocion de-

spaired of war, and the event proved him right. The faithfulness of the Athenians towards him is a proof that they also instinctively felt that he was right. But he was wanting on the practical and creative side, and never really dominated either Athens, Greece, or Philip. . . . A policy of resistance found the City-State too weak to defend itself; a policy of inaction would land it in a Macedonian empire which would still further weaken its remaining vitality. The first policy, that of Demosthenes, did actually result in disaster and the presence of Macedonian garrisons in Greek cities. The second policy then took its place, and initiated a new era for Greece. After the fatal battle of Chæronea (338 B. C.) Philip assumed the position of leader of the Greek cities."—W. W. Fowler, *City State of the Greeks and Romans*, ch. 10.—See also GREECE: B. C. 357-336.

B. C. 351-348.—In league with Olynthus. See GREECE: B. C. 351-348.

B. C. 340.—Alliance with Byzantium against Philip of Macedon. See GREECE: B. C. 340.

B. C. 336-322.—End of the struggle with the Macedonians.—Fall of democracy.—Death of Demosthenes.—Athenian decline.—"An unexpected incident changes the whole aspect of things. Philip falls the victim of assassination; and a youth, who as yet is but little known, is his successor. Immediately Demosthenes institutes a second alliance of the Greeks; but Alexander suddenly appears before Thebes; the terrible vengeance which he here takes, instantly destroys the league; Demosthenes, Lycurgus, and several of their supporters, are required to be delivered up; but Demades is at that time able to settle the difficulty and to appease the king. His strength was therefore enfeebled as Alexander departed for Asia; he begins to raise his head once more when Sparta attempts to throw off the yoke; but under Antipater he is overpowered. Yet it was about this very time that by the most celebrated of his discourses he gained the victory over the most eloquent of his adversaries; and Æschines was forced to depart from Athens. But this seems only to have the more embittered his enemies, the leaders of the Macedonian party; and they soon found an opportunity of preparing his downfall. When Harpalus, a fugitive from the army of Alexander, came with his treasures to Athens, and the question arose, whether he could be permitted to remain there, Demosthenes was accused of having been corrupted by his money, at least to be silent. This was sufficient to procure the imposition of a fine; and as this was not paid, he was thrown into prison. From thence he succeeded in escaping; but to the man who lived only for his country, exile was no less an evil than imprisonment. He resided for the most part in Ægina and at Træzen, from whence he looked with moist eyes toward the neighbouring Attica. Suddenly and unexpectedly a new ray of light broke through the clouds. Tidings were brought, that Alexander was dead. The moment of deliverance seemed at hand; the excitement pervaded every Grecian state; the ambassadors of the Athenians passed through the cities; Demosthenes joined himself to the number and exerted all his eloquence and power to unite them against Macedonia. In requital for such services, the people decreed his return; and years of sufferings were at last followed by a day of exalted compensation. A galley was sent to Ægina to bring back the advocate of liberty. . . . It was a momentary glimpse of the sun, which still darker clouds were soon to conceal. Antipater and Craterus were victorious; and with them the

Macedonian party in Athens; Demosthenes and his friends were numbered among the accused, and at the instigation of Demades were condemned to die. . . . Demosthenes had escaped to the island of Calauria in the vicinity of Træzen; and took refuge in the temple of Neptune. It was to no purpose that Archias, the satellite of Antipater, urged him to surrender himself under promise of pardon. He pretended he wished to write something; bit the quill, and swallowed the poison contained in it."—A. H. L. Heeren, *Reflections on the politics of ancient Greece*, trans. by G. Bancroft, pp. 278-280.—See also MACEDONIA: B. C. 345-336 and also, on the "Lamian War," the suppression of democracy at Athens, and the expulsion of poor citizens, GREECE: B. C. 323-322.—"With the decline of political independence, . . . the mental powers of the nation received a fatal blow. No longer knit together by a powerful *esprit de corps*, the Greeks lost the habit of working for the common weal; and, for the most part, gave themselves up to the petty interests of home life and their own personal troubles. Even the better disposed were too much occupied in opposing the low tone and corruption of the times, to be able to devote themselves, in their moments of relaxation, to a free and speculative consideration of things. What could be expected in such an age, but that philosophy would take a decidedly practical turn, if indeed it were studied at all? And yet such were the political antecedents of the Stoic and Epicurean systems of philosophy. . . . Stoic apathy, Epicurean self-satisfaction, and Sceptic imperturbability, were the doctrines which responded to the political helplessness of the age. They were the doctrines, too, which met with the most general acceptance. The same political helplessness produced the sinking of national distinctions in the feeling of a common humanity, and the separation of morals from politics which characterise the philosophy of the Alexandrian and Roman period. The barriers between nations, together with national independence, had been swept away. East and West, Greeks and barbarians, were united in large empires, being thus thrown together, and brought into close contact on every possible point. Philosophy might teach that all men were of one blood, that all were equally citizens of one empire, that morality rested on the relation of man to his fellow men, independently of nationalities and of social ranks; but in so doing she was only explicitly stating truths which had been already realised in part, and which were in part corollaries from the existing state of society."—E. Zeller, *Stoics, Epicureans, and Sceptics*, pp. 16-18.—"What we have said concerning the evidence of comedy about the age of the first Diadochi amounts to this: Menander and his successors—they lasted barely two generations—printed in a few stereotypes a small and very worthless society at Athens. There was no doubt a similar set of people at Corinth, at Thebes, possibly even in the city of Lycurgus. These people, idle, for the most part rich, and in good society, spent their earlier years in debauchery, and their later in sentimental reflections and regrets. They had no serious object in life, and regarded the complications of a love affair as more interesting than the rise and fall of kingdoms or the gain and loss of a nation's liberty. They were like the people of our day who spend all their time reading novels from the libraries, and who can tolerate these eternal variations in twaddle not only without disgust but with interest. They were surrounded with slaves, on the whole more intelligent and interesting, for

in the first place slaves were bound to exercise their brains, and in the second they had a great object—liberty—to give them a keen pursuit in life. The relations of the sexes in this set or portion of society were bad, owing to the want of education in the women, and the want of earnestness in the men. As a natural consequence a class was found, apart from household slaves, who took advantage of these defects, and, bringing culture to fascinate unprincipled men, established those relations which brought estrangements, if not ruin, into the home life of the day.”—J. P. Mahaffy, *Greek life and thought from death of Alexander to Rome*, pp. 123-124.—“The amount of Persian wealth poured into Greece by the accidents of the conquest, not by its own industries, must have produced a revolution in prices not since equalled except by the influx of the gold of the Aztecs and Incas into Spain. I have already pointed out how this change must have pressed upon poor people in Greece who did not share in the plunder. The price of even necessary and simple things must have often risen beyond their means. For the adventurers brought home large fortunes, and the traders and purveyors of the armies made them; and with these Eastern fortunes must have come in the taste for all the superior comforts and luxuries which they found among the Persian grandees. Not only the appointments of the table, in the way of plate and pottery, but the very tastes and flavours of Greek cookery must have profited by comparison with the knowledge of the East. So also the furniture, especially in carpets and hangings, must have copied Persian fashion, just as we still affect oriental stuffs and designs. It was not to be expected that the example of so many regal courts and so much royal ceremony should not affect those in contact with them. These influences were not only shown in the vulgar ‘braggart captain,’ who came to show off his sudden wealth in impudent extravagance among his old townspeople, but in the ordinary life of rich young men. So I imagine the personal appointments of Alcibiades, which were the talk of Greece in his day, would have appeared poor and mean beside those of Aratus, or of the generation which preceded him. Pictures and statues began to adorn private houses, and not temples and public buildings only—a change beginning to show itself in Demosthenes’s day, but coming in like a torrent with the opening of Greece to the Eastern world. It was noticed that Phocion’s house at Athens was modest in size and furniture, but even this was relieved from shabbiness by the quaint wall decoration of shining plates of bronze—a fashion dating from pre-historic times, but still admired for its very antiquity.”—J. P. Mahaffy, *Greek life and thought*, pp. 105-106.—“The modern historians of Greece are much divided on the question where a history of Hellas ought to end. Curtius stops with the battle of Charoneia and the prostration of Athens before the advancing power of Macedon. Grote narrates the campaigns of Alexander, but stops short at the conclusion of the Lamian War, when Greece had in vain tried to shake off the supremacy of his generals. Thirlwall brings his narrative down to the time of Mummius, the melancholy sack of Corinth and the constitution of Achaia as a Roman province. Of these divergent views we regard that of the German historian as the most correct. . . . The historic sense of Grote did not exclude prejudices, and in this case he was probably led astray by political bias. At the close of his ninety-sixth chapter, after mentioning the embassies sent by

the degenerate Athenians to King Ptolemy, King Lysimachus, and Antipater, he throws down his pen in disgust, ‘and with sadness and humiliation brings his narrative to a close.’ Athens was no longer free and no longer dignified, and so Mr. Grote will have done with Greece at the very moment when the new Comedy was at its height, when the Museum was founded at Alexandria, when the plays of Euripides were acted at Babylon and Cabul, and every Greek soldier of fortune carried a diadem in his baggage. Surely the historian of Greece ought either to have stopped when the iron hand of Philip of Macedon put an end to the liberties and the political wranglings of Hellas, or else persevered to the time when Rome and Parthia crushed Greek power between them, like a ship between two icebergs. No doubt his reply would be, that he declined to regard the triumph abroad of Macedonian arms as a continuation of the history of Hellas. . . . The truth is, that the history of Greece consists of two parts, in every respect contrasted one with the other. The first recounts the stories of the Persian and Peloponnesian wars, and ends with the destruction of Thebes and the subjugation of Athens and Sparta. The Hellas of which it speaks is a cluster of autonomous cities in the Peloponnesus, the Islands, and Northern Greece, together with their colonies scattered over the coasts of Italy, Sicily, Thrace, the Black Sea, Asia Minor, and Africa. These cities care only to be independent, or at most to lord it over one another. Their political institutions, their religious ceremonies, their customs, are civic and local. Language, commerce, a common Pantheon, and a common art and poetry are the ties that bind them together. In its second phase, Greek history begins with the expedition of Alexander. It reveals to us the Greek as everywhere lord of the barbarian, as founding kingdoms and federal systems, as the instructor of all mankind in art and science, and the spreader of civil and civilized life over the known world. In the first period of her history Greece is forming herself, in her second she is educating the world. We will venture to borrow from the Germans a convenient expression, and call the history of independent Greece the history of Hellas, that of imperial Greece the history of Hellenism. . . . The Athens of Pericles was dictator among the cities which joined her alliance. Corinth, Sparta, Thebes, were each the political head of a group of towns, but none of the three admitted these latter to an equal share in their councils, or adopted their political views. Even in the Olynthian League, the city of Olynthus occupied a position quite superior to that of the other cities. But the Greek cities had not tried the experiment of an alliance on equal terms. This was now attempted by some of the leading cities of the Peloponnesus, and the result was the Achæan League, whose history sheds a lustre on the last days of independent Greece, and whose generals will bear comparison with the statesmen of any Greek Republic [see GREECE: B. C. 280-146]. . . . On the field of Sellasia the glorious hopes of Cleomenes were wrecked, and the recently reformed Sparta was handed over to a succession of bloodthirsty tyrants, never again to emerge from obscurity. But to the Achæans themselves the interference of Macedon was little less fatal. Henceforth a Macedonian garrison occupied Corinth, which had been one of the chief cities of the League; and King Antigonos Doson was the recognized arbiter in all disputes of the Peloponnesian Greeks. . . . In Northern Greece a strange contrast presented itself. The historic races of the Athenians and

Bœotians languished in peace, obscurity, and luxury. With them every day saw something added to enjoyments and elegancies of life, and every day politics drifted more and more into the background. On the other hand, the rude semi-Greeks of the West, Ætoliens, Acarnanians, and Epirotes, to whose manhood the repulse of the Gauls was mainly due, came to the front and showed the bold spirit of Greeks divorced from the finer faculties of the race. The Acarnanians formed a league somewhat on the plan of the Achæan. But they were overshadowed by their neighbors the Ætoliens, whose union was of a different character. It was the first time that there had been formed in Hellas a state framed in order to prey upon its neighbours. . . . In the course of the Peloponnesian War Greek religion began to lose its hold on the Greeks. This was partly the work of the sophists and philosophers, who sought more lofty and moral views of Deity than were furnished by the tales of popular mythology. Still more it resulted from growing materialism among the people, who saw more and more of their immediate and physical needs, and less and less of the underlying spiritual elements in life. But though philosophy and materialism had made the religion of Hellas paler and feebler, they had not altered its nature or expanded it. It still remained essentially national, almost tribal. When, therefore, Greeks and Macedonians suddenly found themselves masters of the nations of the East, and in close contact with a hundred forms of religion, an extraordinary and rapid change took place in their religious ideas. In religion, as in other matters, Egypt set to the world the example of prompt fusion of the ideas of Greeks and natives. . . . Into Greece proper, in return for her population which flowed out, there flowed in a crowd of foreign deities. Isis was especially welcomed at Athens, where she found many votaries. In every cult the more mysterious elements were made more of, and the brighter and more materialistic side passed by. Old statues which had fallen somewhat into contempt in the days of Pheidias and Praxiteles were restored to their places and received extreme veneration, not as beautiful, but as old and strange. On the coins of the previous period the representations of deities had been always the best that the die-cutter could frame, taking as his models the finest contemporary sculpture; but henceforth we often find them strange, uncouth figures, remnants of a period of struggling early art, like the Apollo at Amyclæ, or the Hera of Samos. . . . In the intellectual life of Athens there was still left vitality enough to formulate the two most complete expressions of the ethical ideas of the times, the doctrines of the Stoics and the Epicureans, towards one or the other of which all educated minds from that day to this have been drawn. No doubt our knowledge of these doctrines, being largely drawn from the Latin writers and their Greek contemporaries, is somewhat coloured and unjust. With the Romans a system of philosophy was considered mainly in its bearing upon conduct, whence the ethical elements in Stoicism and Epicureanism have been by their Roman adherents so thrust into the foreground, that we have almost lost sight of the intellectual elements, which can have had little less importance in the eyes of the Greeks. Notwithstanding, the rise of the two philosophies must be held to mark a new era in the history of thought, an era when the importance of conduct was for the first time recognized by the Greeks. It is often observed that the ancient Greeks were more modern than our

own ancestors of the Middle Ages. But it is less generally recognized how far more modern than the Greeks of Pericles were the Greeks of Aratus. In very many respects the age of Hellenism and our own age present remarkable similarity. In both there appears a sudden increase in the power over material nature, arising alike from the greater accessibility of all parts of the world and from the rapid developments of the sciences which act upon the physical forces of the world. In both this spread of science and power acts upon religion with a dissolving and, if we may so speak, centrifugal force, driving some men to take refuge in the most conservative forms of faith, some to fly to new creeds and superstitions, some to drift into unmeasured scepticism. In both the facility of moving from place to place, and finding a distant home, tends to dissolve the closeness of civic and family life, and to make the individual rather than the family or the city the unit of social life. And in the family relations, in the character of individuals, in the state of morality, in the condition of art, we find at both periods similar results from the similar causes we have mentioned."—P. Gardner, *New chapters in Greek history*, ch. 15.

B. C. 317-316.—Siege by Polyperchon.—Democracy restored.—Execution of Phocion.—Demetrius of Phaleron at the head of the government. See GREECE: B. C. 321-312.

B. C. 307-197.—Under Demetrius Poliorcetes and the Antigonids. See GREECE: B. C. 307-197.

B. C. 288-263.—Twenty years of independence.—Siege and subjugation by Antigonus Gonatas.—When Demetrius Poliorcetes lost the Macedonian throne, 288 B.C., his fickle Athenian subjects and late worshippers rose against his authority, drove his garrisons from the Museum and the Peiræus and abolished the priesthood they had consecrated to him. Demetrius gathered an army from some quarter and laid siege to the city, but without success. The Athenians went so far as to invite Pyrrhus, the warrior king of Epirus, to assist them against him. Pyrrhus came and Demetrius retired. The dangerous ally contented himself with a visit to the Acropolis as a worshipper, and left Athens in possession, undisturbed, of her freshly gained freedom. It was enjoyed after a fashion for twenty years, at the end of which period, 268 B.C., Antigonus Gonatas, the son of Demetrius, having regained the Macedonian crown, reasserted his claim on Athens, and the city was once more besieged. The Lacedæmonians and Ptolemy of Egypt both gave some ineffectual aid to the Athenians, and the siege, interrupted on several occasions, was prolonged until 263 B.C., when Antigonus took possession of the Acropolis, the fortified Museum and the Peiræus as a master (see MACEDONIA: B. C. 277-244). This was sometimes called the Chremonidean War, from the name of a patriotic Athenian who took the most prominent part in the long defence of his city.—C. Thirlwall, *History of Greece*, ch. 61.

B. C. 229.—Liberation by the Achæan league. See GREECE: B. C. 280-146.

B. C. 200.—Vandalism of the second Macedonian Philip.—In the year 200 B.C. the Macedonian king, Philip, made an attempt to surprise Athens and failed. "He then encamped in the outskirts, and proceeded to wreak his vengeance on the Athenians, as he had indulged it at Thermus and Pergamus. He destroyed or defaced all the monuments of religion and of art, all the sacred and pleasant places which adorned the suburbs. The Academy, the Lyceum, and Cynosarges, with their temples, schools, groves and gardens, were all wasted with fire. Not even

the sepulchres were spared."—C. Thirlwall, *History of Greece*, ch. 64.

B. C. 197-A. D. 138.—Under Roman rule.—"Athens . . . affords the disheartening picture of a commonwealth pampered by the supreme power, and financially as well as morally ruined. By rights it ought to have found itself in a flourishing condition. . . . No city of antiquity elsewhere possessed a domain of its own, such as was Attica, of about 700 square miles. . . . But even beyond Attica they retained what they possessed, as well after the Mithridatic War, by favour of Sulla, as after the Pharsalian battle, in which they had taken the side of Pompeius, by the favour of Cæsar;—he asked them only how often they would still ruin themselves and trust to be saved by the renown of their ancestors. To the city there still belonged not merely the territory, formerly possessed by Haliartus, in Bœotia, but also on their own coast Salamis, the old starting-point of their dominion of the sea, and in the Thracian Sea the lucrative islands Scyros, Demnos, and Imbros, as well as Delos in the Ægean. . . . Of the further grants, which they had the skill to draw by flattery from Antoninus, Augustus, against whom they had taken part, took from them certainly Ægina and Eretria in Eubœa, but they were allowed to retain the smaller islands of the Thracian Sea. . . . Hadrian, moreover, gave to them the best part of the great island of Cephallenia in the Ionian Sea. It was only by the Emperor Severus, who bore them no good will, that a portion of these extraneous possessions was withdrawn from them. Hadrian further granted to the Athenians the delivery of a certain quantity of grain at the expense of the empire, and by the extension of this privilege, hitherto reserved for the capital, acknowledged Athens, as it were, as another metropolis. Not less was the blissful institute of alimentary endowments, which Italy had enjoyed since Trajan's time, extended by Hadrian to Athens, and the capital requisite for this purpose certainly presented to the Athenians from his purse. . . . Yet the community was in constant distress."—T. Mommsen, *History of Rome*, bk. 8, ch. 7.—See also GREECE: B. C. 146-A. D. 180.

ALSO IN: J. P. Mahaffy, *Greek world under Roman sway*.

B. C. 87-86.—Siege and capture by Sulla.—Massacre of citizens.—Pillage and depopulation.—Lasting injuries.—The early successes of Mithradates of Pontus, in his savage war with the Romans, included a general rising in his favor among the Greeks [see MITHRADATIC WARS], supported by the fleets of the Pontic king and by a strong invading army. Athens and the Peiræus were the strongholds of the Greek revolt, and at Athens an adventurer named Aristion, bringing from Mithradates a body-guard of 2,000 soldiers, made himself tyrant of the city. A year passed before Rome, distracted by the beginnings of civil war, could effectively interfere. Then Sulla came (B. C. 87) and laid siege to the Peiræus, where the principal Pontic force was lodged, while he shut up Athens by blockade. In the following March, Athens was starved to such weakness that the Romans entered almost unopposed and killed and plundered with no mercy; but the buildings of the city suffered little harm at their hands. The siege of the Peiræus was carried on for some weeks longer, until Sulla had driven the Pontic forces from every part except Munychia, and that they evacuated in no long time.—W. Ihne, *History of Rome*, bk. 7, ch. 17.—"Athens was . . . taken by assault. . . . The majority of the citizens was slain; the carnage was so fearfully great

as to become memorable even in that age of bloodshed; the private movable property was seized by the soldiery, and Sulla assumed some merit to himself for not committing the rifled houses to the flames. . . . The fate of the Peiræus, which he utterly destroyed, was more severe than that of Athens. From Sulla's campaign in Greece the commencement of the ruin and depopulation of the country is to be dated. The destruction of property caused by his ravages in Attica was so great that Athens from that time lost its commercial as well as its political importance. The race of Athenian citizens was almost extirpated, and a new population, composed of a heterogeneous mass of settlers, received the right of citizenship."—G. Finlay, *Greece under the Romans*, ch. 1.

A. D. 54 (?).—Visit of St. Paul.—Planting of Christianity.—"When the Jews of Thessalonica had knowledge that the word of God was proclaimed of Paul at Berea also, they came thither likewise, stirring up and troubling the multitude. And then immediately the brethren sent forth Paul to go as far as to the sea: and Silas and Timotheus abode there still. But they that conducted Paul brought him as far as Athens; and receiving a commandment unto Silas and Timotheus that they should come to him with all speed, they departed. Now while Paul waited for them at Athens, his spirit was provoked within him, as he beheld the city full of idols. So he reasoned in the synagogue with the Jews, and the devout persons, and in the market place every day with them that met with him. And certain also of the Epicureans and Stoic philosophers encountered him. And some said, what would this babler say? other some, He seemeth to be a setter forth of strange gods: because he preached Jesus and the resurrection. And they took hold of him, and brought him unto the Areopagus, saying, May we know what this new teaching is which is spoken by thee? For thou bringest certain strange things to our ears: we would know therefore what these things mean. (Now all the Athenians and the strangers sojourning there spent their time in nothing else, but either to tell or to hear some new thing.) And Paul stood in the midst of the Areopagus, and said, Ye men of Athens, in all things I perceive that ye are somewhat superstitious. For as I passed along and observed the objects of your worship, I found also an altar with this inscription, 'To an Unknown God.' What therefore ye worship in ignorance, this set I forth unto you. . . . Now when they heard of the resurrection of the dead, some mocked; but others said, We will hear thee concerning this yet again. Thus Paul went out from among them. Howbeit certain men clave unto him, and believed: among whom also was Dionysius the Areopagite, and a woman named Damaris, and others with them."—*Acts of the Apostles, Revised Version*, ch. 17.—"Consider the difficulties which must have beset the planting of the Church in Athens. If the burning zeal of the great Apostle ever permitted him to feel diffidence in addressing an assembly, he may well have felt it when he addressed on Mars' Hill for the first time an Athenian crowd. No doubt the Athens of his time was in her decay, inferior in opulence and grandeur to many younger cities. Yet even to a Jew, provided he had received some educational impressions beyond the fanatical shibboleths of Pharisaism, there was much in that wonderful centre of intelligence to shake his most inveterate prejudices and inspire him with unwilling respect. Shorn indeed of her political greatness, deprived even of her philosophical supremacy, she still shone with a brilliant afterglow of æsthetic and intellectual pres-

tige. Her monument flashed on the visitor memories recent enough to dazzle his imagination. Her schools claimed and obtained even from Emperors the homage due to her unique past. Recognising her as the true nurse of Hellenism and the chief missionary of human refinement, the best spirits of the age held her worthy of admiring love not unmixed with awe. As the seat of the most brilliant and popular university, young men of talent and position flocked to her from every quarter, studied for a time within her colonnades, and carried thence the recollection of a culture which was not always deep, not always erudite, but was always and genuinely Attic. To subject to the criticism of this people of doctrine professing to come direct from God, a religion and not a philosophy, depending not on argument but on revelation, was a task of which the difficulties might seem insuperable. When we consider what the Athenian character was, this language will not seem exaggerated. Keen, subtle, capricious, satirical, sated with ideas, eager for novelty, yet with the eagerness of amused frivolity, not of the truth-seeker: critical by instinct, exquisitely sensitive to the ridiculous or the absurd, disputatious, ready to listen, yet impatient of all that was not wit, satisfied with everything in life except its shortness, and therefore hiding all references to this unwelcome fact under a veil of complacent euphemism—where could a more uncongenial soil be found for the seed of the Gospel? . . . To an Athenian the Jew was not so much an object of hatred (as to the Roman), nor even of contempt (as to the rest of mankind), as of absolute indifference. He was simply ignored. To the eclectic philosophy which now dominated the schools of Athens, Judaism alone among all human opinions was as if non-existent. That Athenians should be convinced by the philosophy of a Jew would be a proposition expressible in words but wholly destitute of meaning. On the other hand, the Jew was not altogether uninfluenced by Greek thought. Wide apart as the two minds were, the Hebraic proved not insensible to the charm of the Hellenic; witness the Epistle to the Hebrews, witness Philo, witness the intrusion of Greek methods of interpretation even into the text-books of Rabbinitism. And it was Athens, as the quintessence of Hellas, Athens as represented by Socrates, and still more by Plato, which had gained this subtle power. And just as Judæa alone among all the Jewish communities retained its exclusiveness wholly unimpaired by Hellenism, so Athens, more than any Pagan capital, was likely to ignore or repel a faith coming in the garb of Judaism. And yet within less than a century we find this faith so well established there as to yield to the Church the good fruits of martyrdom in the person of its bishop, and of able defences in the person of three of its teachers. The early and the later fortunes of the Athenian Church are buried in oblivion; it comes but for a brief period before the scene of history. But the undying interest of that one dramatic moment when Paul proclaimed a bodily resurrection to the authors of the conception of a spiritual immortality, will always cause us to linger with a strange sympathy over every relic of the Christianity of Athens.”—C. T. Cruttwell, *Literary history of early Christianity*, v. 1, bk. 3, ch. 4.—See ALSO CHRISTIANITY: A. D. 35-60.

ALSO IN: W. J. Conybeare and J. S. Howson, *Life and letters of St. Paul*, v. 1, ch. 10.—F. C. Baur, *Paul*, v. 1, pt. 1, ch. 7.—On the inscription, see E. de Pressensé, *Early years of Christianity: Apostolic era*, bk. 2, ch. 1.

125-134.—Works of Hadrian.—The Emperor

Hadrian interested himself greatly in the venerable decaying capital of the Greeks, which he visited, or resided in, for considerable periods, several times, between 125 and 134. These visits were made important to the city by the great works of rebuilding which he undertook and supervised. Large parts of the city are thought to have been reconstructed by him, “in the open and luxurious style of Antioch and Ephesus.” One quarter came to be called “Hadrianapolis,” as though he had created it. Several new temples were erected at his command; but the greatest of the works of Hadrian at Athens was the completing of the vast national temple, the Olympieum, the beginning of which dated back to the age of Pisistratus, and which Augustus had put his hand to without finishing.—C. Merivale, *History of the Romans under the Empire*, ch. 66.

267.—Captured by the Goths. See GOTHS: 258-267.

395.—Surrender to Alaric and the Goths.—When the Goths under Alaric invaded and ravaged Greece, 395, Athens was surrendered to them, on terms which saved the city from being plundered. “The fact that the depredations of Alaric hardly exceeded the ordinary license of a rebellious general, is . . . perfectly established. The public buildings and monuments of ancient splendour suffered no wanton destruction from his visit; but there can be no doubt that Alaric and his troops levied heavy contributions on the city and its inhabitants.”—G. Finlay, *Greece under the Romans*, ch. 2, sect. 8.—See also GOTHS: A. D. 395: Alaric’s invasion of Greece.

ALSO IN: E. Gibbon, *Decline and fall of the Roman Empire*, ch. 30.

A. D. 529.—Suppression of the schools by Justinian.—“The Attic schools of rhetoric and philosophy maintained their superior reputation from the Peloponnesian War to the reign of Justinian. Athens, though situate in a barren soil, possessed a pure air, a free navigation, and the monuments of ancient art. That sacred retirement was seldom disturbed by the business of trade or government; and the last of the Athenians were distinguished by their lively wit, the purity of their taste and language, their social manners, and some traces, at least in discourse, of the magnanimity of their fathers. In the suburbs of the city, the Academy of the Platonists, the Lycæum of the Peripatetics, the Portico of the Stoics and the Garden of the Epicureans were planted with trees and decorated with statues; and the philosophers, instead of being immured in a cloister, delivered their instructions in spacious and pleasant walks, which, at different hours, were consecrated to the exercises of the mind and body. The genius of the founders still lived in those venerable seats. . . . The schools of Athens were protected by the wisest and most virtuous of the Roman princes. . . . Some vestige of royal bounty may be found under the successors of Constantine. . . . The golden chain, as it was fondly styled, of the Platonic succession, continued . . . to the edict of Justinian [529] which imposed a perpetual silence on the schools of Athens, and excited the grief and indignation of the few remaining votaries of Greek science and superstition.”—E. Gibbon, *Decline and fall of the Roman Empire*, ch. 40.

6th-11th centuries.—Between the sixth and eleventh centuries Athens practically disappeared from history. Here in 1018 Basil II celebrated his victory over the Bulgarians. Michael Akominatus became metropolitan of Athens in 1260 and from his writings we get a desolate picture of the state into which the city had fallen.

1205-1308.—Founding of the Latin dukedom.

—Otto de la Roche takes title of "Lord of Athens."—Guy de la Roche created "Duke of Athens."—Prosperity of Athens under Guy II.—"The portion of Greece lying to the south of the kingdom of Saloniki was divided by the Crusaders [after their conquest of Constantinople, 1204—see BYZANTINE EMPIRE: 1203-1204] among several great feudatories of the Empire of Romania. . . . The lords of Boudonitza, Salona, Negropont, and Athens are alone mentioned as existing to the north of the isthmus of Corinth, and the history of the petty sovereigns of Athens can alone be traced in any detail. . . . Though the Byzantine aristocracy and dignified clergy were severe sufferers by the transference of the government into the hands of the Franks, the middle classes long enjoyed peace and security. . . . The social civilization of the inhabitants, and their ample command of the necessaries and many of the luxuries of life, were in those days as much superior to the condition of the citizens of Paris and London as they are now inferior. . . . The city was large and wealthy, the country thickly covered with villages, of which the ruins may still be traced in spots affording no indications of Hellenic sites. . . . The trade of Athens was considerable, and the luxury of the Athenian ducal court was celebrated in all the regions of the West where chivalry flourished."—G. Finlay, *History of Greece from its conquest by the Crusaders*, ch. 7.—"Boniface [king-marquis of Montferrat] having settled a dispute with the Emperor Baldwin I. which threatened to undermine the Latin dominion in the Levant at the outset, marched into Greece at the head of an army of Crusaders in order to assert his claim to that country, which had been included, although it was still unconquered, in his share. At the moment of the Latin expedition against Constantinople the two themes of Hellas and the Peloponnesos had been a prey to anarchy. Instead of combining in the presence of the common danger which menaced the existence of the Byzantine Empire, the wealthy families thought only of advancing their own interests even at the expense of the Government. Of these *archontes*, by far the ablest and most ambitious was Léon Sgourós of Nauplia, who was bent upon carving out for himself an independent principality in the Peloponnesos and Central Greece. His first step was to obtain possession of Argos; Corinth was his next acquisition. . . . He then traversed the Isthmus, and invested Athens by land and sea. The city, whose walls had fallen into decay, succumbed without a struggle; but the Akropolis was defended by a second Dexippos, the noble Archbishop Akominatos, who appealed to the patriotism of the Athenians, with such success that Sgourós had to content himself with burning the unprotected houses before the eyes of the garrison. . . . At Lárisa Sgourós met the fugitive Emperor Alexios III., and received from him the hand of his daughter in marriage. But the advance of Boniface's army cut short the further success of the bold adventurer. . . . Boniface's march now became a royal progress. He first secured the Pass of Thermopylae by bestowing the neighbouring position of Boudonitza as a fief on Guido Pallavicini, and then proceeded southward. The inhabitants of the towns, which had so lately felt the tyranny of Sgourós, welcomed the foreigner as a deliverer. Without disturbing those municipal institutions which the Greeks have always specially prized, the King of Salonica lost no time in distributing the classic lands of Greece as feudal fiefs among his trusty followers. . . . Attica and Bœotia were bestowed upon Otto de la Roche, a Burgundian noble, who had distinguished himself at the siege of Constantinople and had

successfully mediated in the dispute between Baldwin I. and Boniface. Athens made no opposition to the Franks, for this time even the heroic Archbishop saw that resistance would be in vain. It was with a bitter pang that he beheld his cathedral, the venerable Parthenon, robbed of its relics by men who were hostile to the orthodox religion and ignorant of classic learning. For the first time since the days of Sulla a Latin army was in possession of Athens; yet the Roman conqueror had been kinder to the ancient seat of culture than the Christian Franks. Leaving his beloved church in the occupation of Latin monks, Akominatos left with a heavy heart the city where he had lived so long. After wandering from one place to another in search of rest, he finally settled in the island of Kéa, from which he could still see the Attic coast. Akominatos had once been disappointed with Athens; but he had learned to love it as his second home, and now, in his island cell, he lamented the loss of his books and wrote of Attica as 'a second garden of Eden.' Once, in secret, he ventured over to Athens; but he could not endure the galling spectacle of a Roman Catholic archbishop officiating in what had once been his own cathedral. At length he died in exile, the last of a long line of heroes whose names are associated with the story of the violet-crowned city. Central Greece was now in the possession of the Franks. . . . Otto de la Roche . . . had time to instal himself in his dominions, which included, besides Attica and Bœotia, the ancient Megarid, with its coasts on the Saronic and Corinthian Gulfs, and the former land of the Opuntian Locrians to the north. His first care was to select a title, and he chose that of *Sire d'Athènes*, or 'Lord of Athens,' which was magnified by the Greeks into that of *Mégas Kyr* . . . , or 'Great Lord.' He then proceeded to organize his State on the feudal system, just as Guy of Lusignan had done in Cyprus, reserving Athens and Thebes as his private domains, and assigning the lands of the former Greek proprietors to his own followers. No opposition was offered to these confiscatory measures, which scarcely affected the peasants at all. . . . The Church question was far more difficult, for the difference between the two religions formed an insuperable barrier between the two races. A Frenchman named Berard was appointed first Latin Archbishop of Athens, and was duly confirmed by Pope Innocent III. as successor of Akominatos in the cathedral on the Akropolis. An army of monks followed in the steps of the soldiers. The Franciscans founded numerous monasteries, and the famous Convent of Daphne, between Athens and Eleusis, was bestowed on a body of Cistercians from the Burgundian home of the Lord of Athens. But Otto soon incurred the censure of the Latin clergy by his refusal to allow donations of land to the Church, and by his appropriation of Greek ecclesiastical property. He felt that it was essential to his position as a conqueror in a foreign country that only those who could render him military service should be entitled to receive estates. Events in the Kingdom of Salonica caused Otto de la Roche to transfer his allegiance from the King to the Emperor of Romania. . . . Otto extended his dominions by the acquisition of Sgourós's old possessions, Argos and Nauplia, which Villehardouin gave him as fiefs in return for his valuable assistance in the conquest of those cities. . . . Otto thus owed feudal service to Villehardouin for fiefs; and this relationship was extended by another Prince of Achaia to a claim of overlordship over Athens and Thebes. . . . Otto was a firm ally of Villehardouin, and numbers of his relatives flocked from distant

Burgundy to settle in the El Dorado which he ruled. Yet twenty years of state in Athens and Thebes were enough for the 'Great Lord.' In 1225 he departed for Burgundy with his wife and sons, leaving his Greek dominions to his nephew, Guy de la Roche. Guy I. resided during the greater part of his reign of nearly forty years at Thebes, then the most flourishing town which owned his sway; . . . while the continuance of the silk manufacture there had attracted colonies of Jews and Genoese, to the latter of whom Guy I. gave special privileges both in Thebes and in Athens. . . . Villehardouin now aimed at an extension of his sway beyond the Isthmus, and this led to the first civil war between the Franks in Greece. The occasion of the war was the State of Eubœa, or Negroponte as the Franks called it. That island, after its conquest by Jacques d'Avesnes, had been divided by Boniface of Salonica into three fiefs, which were bestowed upon the Veronese family of Dalle Carceri, and gave them the title of *Terzieri*, or 'the three lords.' But the Venetians, to whom the north and south of the island had been assigned by the partition treaty, soon established a factory there and acquired authority over the three barons. Villehardouin, who had married into the Dalle Carceri family, demanded his wife's third of the island and claimed the overlordship of the whole. The claim was resisted, and Villehardouin summoned all his vassals to assist him in the conflict. Among others he called upon Guy of Athens, as holder of the fiefs of Nauplia and Argos, and that energetic ruler promptly repudiated the idea that he was bound to render military service to the Prince of Achaia, whose manifest aim was to establish his supreme authority over all the Frank States in the East. In fact, it was pretended that Boniface of Salonica had placed Athens under the suzerainty of the first Prince of Achaia. War at once began between the allied forces of Venice, the lords of Eubœa, and Guy on the one hand, and Villehardouin on the other. Defeated in Eubœa, the Prince of Achaia marshalled his forces at Nikli, near the site of Tegœa, and then marched against Guy. A battle between them was fought at the pass of Karidi, on the road from Megara to Thebes; the Athenian troops were routed, and Villehardouin was only induced by the prayers of the Archbishop to spare the Theban residence of his enemy. The nobles in Villehardouin's army pleaded for peace between old comrades in arms; Guy submitted, and promised to perform any penance which should be imposed upon him by the high court of the barons of Achaia. The court met at Nikli, and the penitent Guy was arraigned before it. But its members, when the moment for pronouncing sentence arrived, decided to refer the question to Louis IX. of France, the most chivalrous and saintly monarch of that age. Guy set out for Paris, where Louis received him graciously and the matter was satisfactorily settled. Louis considered that his journey was more than sufficient punishment for any breach of the feudal law which Guy might have committed, and asked him what favour he could grant him. Guy replied that he would prize above all else the title of 'Duke of Athens,' which was accordingly conferred upon him in 1260. The title has become famous in literature, as well as in history, from its bestowal, by a pardonable anachronism, upon Theseus by Dante, Boccaccio, Chaucer, and Shakespeare, who transferred to the legendary founder of Athens the style of its mediæval Dukes. When the Duke of Athens returned to Greece, he found his late conqueror a captive himself. Villehardouin had recently married a daughter of Michael II., despot

of Epiros, the rival of Michael VIII., Emperor of Nice, for the succession to the tottering throne of Constantinople. The Prince of Achaia had become involved in the dispute through this matrimonial alliance, and had assisted his father-in-law with Peloponnesian and Athenian troops in the war which had broken out between the two Michaels. On the Plain of Pelagonia, in Macedonia, Villehardouin and his ally were defeated, and the Prince of Achaia was subsequently taken prisoner. At this juncture Guy landed in the Morea, and was invited by the barons of Achaia to assume the regency of the principality during the captivity of their sovereign. Guy at once accepted the honourable task, and was negotiating for the release of his former enemy, when suddenly another and yet more startling message arrived, that the Latin Empire of Romania had fallen, and that the last Latin Emperor, Baldwin II., was a fugitive. For the second time, but as a suppliant, not as a ruler, a Latin emperor visited Thebes and Athens, where his former vassals gathered round him on the old Akropolis. Few scenes in the long history of that venerable rock are so pathetic as this, the last in the brief drama of the Latin Empire of Constantinople. Then Baldwin left Athens for the West, there to play the sorry part of an emperor in exile. The capture of Constantinople by the Greeks of Nice in 1261 had naturally strengthened the hold of Michael VIII. upon his captive. After a long struggle, Villehardouin realised that he had no option but to accept the Greek Emperor's terms—to cede to him the important fortresses of Maina, Misithra, Geraki, and Monemvasia, and to pay him homage for the rest of the Morea which he was allowed to keep. These terms had, however, to be submitted to the high court of the barons of Achaia at Nikli—the same spot where, a few years before, Guy, who now convened the court, had been summoned to appear before it. The composition of the Parliament had changed no less than the circumstances of its meeting. Many of the Achaian barons were dead or in captivity, and, as the Salic law did not obtain in the Morea, their widows or wives appeared in their place. The Duke of Athens addressed the Court in a dignified and generous tone; but while he offered to pledge his person and Duchy for the release of the Prince, he strongly opposed the cession of the fortresses to the Greek Emperor. 'It were better,' he said in Scriptural language, 'that one man should die for the people—better that the Prince should perish than that we should admit the Greeks into the Morea.' Guy spoke as a statesman, but he had to yield to the feelings of the feminine assembly, moved by sentiment rather than by policy. Two noble dames were sent to Constantinople as hostages, Villehardouin was released after doing homage to the Greek Emperor, and the Byzantine troops occupied in 1262 the ceded fortresses. From that moment Misithra became the centre of Greek intrigues in the Morea, and the decline of the Frank Principality of Achaia began. Guy laid down the regency, which he had so loyally conducted, and soon afterwards died, in 1264, leaving his son John to reign over his Athenian Duchy. We have little information about the internal state of Athens, or Setines, as it now began to be vulgarly called, at this period, beyond the fact that the neighbouring monastery of Daphne was then a flourishing Catholic institution. But we hear much about the vigorous foreign policy of the new Duke, who did not scruple to practise piracy in the classic waters of the Ægean. . . . Not long afterwards John died. His brother William, who succeeded him, began his reign by formally admitting the claim to the

overlordship of the Athenian Duchy which Charles of Anjou had advanced in virtue of the Treaty of Viterbo. He only begged to be excused from going in person to Naples to render homage, and he was always ready to assist in fighting against the Greeks in the Morea, although this policy exposed his own territory to the reprisals of the Byzantine forces under the traitor Licario. So friendly were his relations with the house of Anjou that, on the death of Villehardouin, he was appointed by the suzerain Regent of Achaia during the minority of Villehardouin's daughter Isabella. Both there, as well as at Athens, his government was successful, and his premature death was deeply regretted, especially as his son, Guy II., was a minor at the time. During Guy's infancy Athens was at first governed by his mother, Helena Angela, the daughter of the Thessalian Prince, so that the ancient Greek city was once more under the influence of a Greek. But the fair widow soon married her brother-in-law, Hugh de Brienne, a member of a famous family from Champagne, which had already produced a King of Jerusalem and Emperor of Romania. Hugh, who was Count of Lecce, in Southern Italy, thus became regent for his stepson until the latter came of age. . . . From Thebes Guy hastened to seek the hand of Isabella Villehardouin's five-year-old daughter, Matilda, and thus by a matrimonial alliance to end the vexed question of the feudal dependence of Athens upon Achaia, which had lately been revived by Charles II. of Anjou. Before he had been long on the throne Guy was able to extend his influence in another direction. Ever since the days of Duke John there had been a close friendship between the Courts of Athens and Neopatras, the seat of the Thessalian princes. Accordingly, when the Prince died, he left Guy guardian of, and regent for, his infant son; so that Thessaly, already Latinised through the marriage connection between its reigning dynasty and that of Athens, came yet more under Frankish control. But this connection involved Guy in war with the ambitious widow of the despot of Epiros, who seized the opportunity to attack the Thessalian Principality. The Duke of Athens at once levied a considerable army—which shows how strong he was at that period—and led it from Domoko, . . . into Epiros. The warlike zeal of his opponent at once subsided, and Guy accepted a favourable peace. A few years later he was appointed Regent of Achaia, where he already possessed the Villehardouins' family fief of Kalamata by virtue of his marriage. But his career suddenly closed; he died in 1308, and was buried in the Cistercian monastery of Daphne. . . . Under his rule the Duchy had reached a high degree of culture and prosperity. Muntaner remarked that at the Ducal Court, which was usually held at Thebes, 'just as good French was spoken as in Paris itself'; even in Thessaly we hear of French-speaking nobles, and, owing to the difference of religion, which usually interposed a barrier to marriage between the Franks and the Greeks, the barons of Athens imported their wives from France. Guy II., as the son of a Greek princess spoke Greek as well, and doubtless looked on Greece as his native land. But everywhere the Franks had introduced their own mode of life. Thus the Duke took part in a magnificent tournament on the classic soil of the Isthmus at which all the Frankish aristocracy of Greece was present. . . . Under the house of la Roche the Duchy had acquired a renown and a prosperity such as the kingdom of Greece under its first sovereign might have envied. . . . The Duke of Athens, apart from the vexed question of suzerainty, to which we have alluded, was far more of an absolute

monarch than his neighbour in the Morea. At the time of the conquest there had been no prominent local families in Attica, nor did any great French houses grow up to dispute the supremacy of the Duke. . . . The last Duke of the house of la Roche died. His first-cousin and successor, Walter of Brienne, Count of Lecce, was not in Greece at the time of Guy's death; but he met with no opposition from rival competitors to the throne. The dangers which beset him, and which were destined to cut short his career and that of many another Frankish noble, arose from a very different quarter—that of the dreaded Catalans, who now assumed a decisive part in the history of the Duchy."—W. Miller, *Athens under the Franks* (*Gentleman's Magazine*, v. 296, Jan., 1904, pp. 23-35).

1311-1456.—Under the Catalans and the Florentines. See CATALAN GRAND COMPANY.

1456.—Turks in possession.—Athens was not occupied by the Turks until three years after the conquest of Constantinople (see CONSTANTINOPLE: 1453). In the meantime the reign of the Florentine dukes of the house of Acciajuoli came to a tragical close. The last of the dukes, Maurice Acciajuoli died, leaving a young son and a young widow, the latter renowned for her beauty and her talents. The duchess, whom the will of her husband had made regent, married a comely Venetian named Palmerio, who was said to have poisoned his wife in order to be free to accept her hand. Thereupon a nephew of the late duke, named Franco, stirred up insurrections at Athens and fled to Constantinople to complain to the sultan, Mohammed II. "The sultan, glad of all pretexts that coloured his armed intervention in the affairs of these principalities, ordered Omar, son of Tourakhan, chief of the permanent army of the Peloponnesus, to take possession of Athens, to dethrone the duchess and to confine her son in his prison of the citadel of Megara." This was done; but Palmerio, the duchess's husband, made his way to the sultan and interceded in her behalf. "Mahomet, by the advice of his viziers, feigned to listen equally to the complaints of Palmerio, and to march to reestablish the legitimate sovereignty. But already Franco, entering Megara under the auspices of the Ottomans, had strangled both the duchess and her son. Mahomet, advancing in turn to punish him for his vengeance, expelled Franco from Athens on entering it, and gave him, in compensation, the inferior and dependent principality of Thebes, in Bœotia. The sultan, as lettered as he was warlike, evinced no less pride and admiration than Sylla at the sight of the monuments of Athens. "What gratitude," exclaimed he before the Parthenon and the temple of Theseus, "do not religion and the Empire owe to the son of Tourakhan, who has made them a present of these spoils of the genius of the Greeks."—A. Lamartine, *History of Turkey*, bk. 13, sect. 10-12.

1466.—Capture and plundering by the Venetians. See GREECE: 1454-1479.

1687-1688.—Siege, bombardment and capture by the Venetians.—Destructive explosion in the Parthenon.—"The campaign of 1687 [of the Venetians against the Turks] is memorable in the history of Europe for the destruction of the Parthenon of Athens, the most wonderful combination of architecture and sculpture, and perhaps the most perfect work of art, which has yet been executed. . . . Morosini [Venetian commander-in-chief] now [in August] proposed to attack Negrepont, as it was the key of continental Greece, and its cap-

ture would have rendered the republic master of the whole country south of Thermopylae. His plan was opposed by the generals of the land forces, who all agreed in thinking that the season was too far advanced for an operation of such magnitude; and after much deliberation, it was determined to attack Athens, where it was thought that the army would find good winter-quarters. . . . On the 21st of September the Venetians entered the Piraeus, and Koenigsmark [in command of the land forces] encamped the same evening in the olive-grove near the sacred way to Eleusis. The army consisted of nearly ten thousand men, including eight hundred and seventy cavalry. The town of Athens was immediately occupied, and the siege of the Acropolis commenced. The attack was directed against the Propylaea, before which the Turks had constructed strong batteries. The Parthenon, and the temple of Minerva Polias, with its beautiful porticoes, were then nearly perfect, as far as regarded their external architecture. Even the sculpture was so little injured by time, that it displayed much of its inimitable excellence. Two batteries were erected, one at the foot of the Museum, and the other near the Pnyx. Mortars were planted under cover of the Arcopagus, but their fire proving uncertain, two more were placed under cover of the buildings of the town, near the north-east corner of the rock, which threw their shells at a high angle, with a low charge, into the Acropolis. In the mean time the Othoman troops descended into the plain from Thebes and Negrepont; and Koenigsmark as had been the case at the siege of Coron, Navarin, and Nauplia, was compelled to divide his army to meet them. On the 25th of September a Venetian bomb blew up a small powder-magazine in the Propylaea, and on the following evening another fell in the Parthenon, where the Turks had deposited all their most valuable effects, with a considerable quantity of powder and inflammable materials. A terrific explosion took place; the centre columns of the peristyle, the walls of the cella, and the immense architraves and cornices they supported, were scattered around the remains of the temple. Much of the unrivalled sculpture was defaced, and a part utterly destroyed. The materials heaped up in the building also took fire, and the flames, mounting high over the Acropolis, announced the calamity to the besiegers, and scathed many of the statues which still remained in their original positions. Though two hundred persons perished by this explosion, the Turks persisted in defending the place until they saw the seraskier defeated in his attempt to relieve them on the 28th of September. They then capitulated on being allowed to embark with their families for Smyrna in vessels hired at their own expense. On the 4th of October, two thousand five hundred persons of all ages, including five hundred men of the garrison, moved down to embark at the Piraeus. . . . Count Tomeo Pompei was the first Venetian commandant of the Acropolis. Athens was now a Venetian possession. The German troops remained in the town. One of the mosques near the bazaar was converted into a Lutheran church, and this first Protestant place of worship in Greece was opened on the 10th of October, 1687, by the regimental chaplain Beithman. Another mosque in the lower part of the town, towards the temple of Theseus, was given to the Catholics, who possessed also a monastery at the eastern end of the town, containing the choragic monument of Lysicrates. . . . A short time convinced the Venetian leaders that it would be impossible to retain possession of Athens. The plague, which was making great ravages in the Morea, showed itself in the

army. The seraskier kept two thousand cavalry at Thebes, and, by a judicious employment of his force, retained all Attica, with the exception of the plain of Athens, under his orders. The Venetians found it necessary to fortify the road to the Piraeus with three redoubts, in order to secure the communications of the garrison in Athens with the ships in the port. The departure of the Hanoverians weakened the army, and in a council of war held on the 31st of December, it was resolved to evacuate Athens at the end of the winter, in order to concentrate all the troops for an attack on Negrepont. Lines were thrown across the isthmus of Munychia, to cover the evacuation and protect the naval camp, which could be distinctly traced until they were effaced by the construction of the new town of the Piraeus. It was also debated whether the walls of the Acropolis were to be destroyed; and perhaps their preservation, and that of the antiquities they enclose, is to be ascribed to the circumstance that the whole attention of the army was occupied by the increased duties imposed upon it by the sanitary measures requisite to prevent the ravages of the plague, and the difficulties created by the emigration of the Greek population of Athens. Between four and five thousand Athenians were compelled to abandon their native city and seek new homes in the Morca. Some were established at Vivares and Port Tolon, on the coast of Argolis, as colonists; the poorest were settled at Corinth, and others were dispersed in Aegina, Tinos, and Nauplia. About five hundred Albanians, chiefly collected among the peasantry of Corinth and Attica, were formed into a corps by the Venetians, but no Greeks could be induced to enter the army. The last act of Morosini at Athens was to carry away some monuments of ancient sculpture as trophies of his victory. An attempt was made to remove the statue of Neptune and the Chariot of Victory, which adorned the western pediment of the Parthenon, but, in consequence of an oversight of the workmen employed, and perhaps partly in consequence of a flaw or crack in the marble, caused by the recent explosion, which destroyed a considerable part of the building, the whole mass of marble was precipitated to the ground, and so shivered to pieces by the fall that the fragments were not deemed worthy of transport. This misfortune to art occurred on the 10th of March, 1688. Instead of these magnificent figures from the hand of Phidias, Morosini was obliged to content himself with four lions, which still adorn the entrance of the arsenal at Venice. One of these, taken from the Piraeus, is remarkable for its colossal size, its severe style, and two long inscriptions, in runic characters, winding over its shoulders. The complete evacuation of Attica was at length effected. Six hundred and sixty-two families quitted their native city, and on the 9th of April the Venetians sailed to Poros. These records of the ruin of so much that interests the whole civilized world, awaken our curiosity to know something of the character and feelings of the modern Athenians, Greeks and Albanians, who then dwelt under the shadow of the Acropolis. Neither Morosini nor his German auxiliaries, though they joined in lamenting the destruction of the ancient marbles, seemed to think the modern Greeks deserving of much attention, merely because they pretended to represent the countrymen of Pericles and still spoke Greek. Venetian statesmen perceived the same degeneracy in their national character as German philologists discovered in their language. The Greek population, from its unwarlike disposition, was only an object of humanity; the Albanian peasantry, though a hardier

and more courageous race, was not sufficiently numerous in the immediate vicinity of the city to be of much military importance. Yet, to a Hessian officer, Athens appeared a large and populous town, with its ten thousand inhabitants, and the Athenians were found to be a respectable and well-disposed people. But they were so completely destitute of moral energy, that they were unable to take any part in the public events of which their city was the theatre. They had no voice to give utterance to their feelings, though Europe would have listened with attention to their words. Perhaps they had no feelings deserving of utterance. Greece was thus the scene of important events, in which every nation in Europe acted a more prominent part than the Greeks."—G. Finlay, *History of Greece*, v. 5, pp. 182-189.—See also **TURKEY**: 1684-1696.

1821-1829.—Greek revolution and war of independence.—Capture by the Turks. See **GREECE**: 1821-1829.

1835.—**Modern capital**.—Athens was made the capital of the new kingdom and from that date begins the history of the modern city.

1896.—**Revival of Olympic games**.—As the result of a movement instituted in France by the Baron de Coubertin, an interesting attempt to give athletic sports the spirit and semblance of the ancient Olympic games was made at Athens in the spring of 1896. A number of wealthy Greeks in different parts of the world joined generously in the undertaking, one gentleman especially, M. Averoff, of Alexandria, bearing the cost of a restoration in marble of the stadium at Athens, for the occasion. The games were held in April, from the 6th to the 15th, and were witnessed by a great number of people. Besides Greek competitors, there were forty-two from Germany, twenty-three from England, twenty-one from America, fifteen from France. The great event of the occasion was the long foot-race from Marathon to Athens, which was won by a young Greek. The United States consul at Athens, writing of the reconstruction of the ancient stadium for the games, described the work as follows:

"The stadium may be described as an immense open air amphitheater constructed in a natural ravine, artificially filled in at the end. It is in the shape of an elongated horseshoe. The spectators, seated upon the sloping sides of the ravine, look down into the arena below, which is a little over 600 feet in length and about 100 feet wide at the widest part. . . . The stadium, as rebuilt for the games, will consist of (1) the arena, bounded by a marble curbing, surmounted by an iron railing adorned with Athenian owls; (2) a walk between this curbing and the first row of seats; (3) a low retaining wall of marble on which rests the first row of seats, the entire row being of marble; (4) the seats; (5) the underground tunnel. In addition to these features there will be an imposing entrance, a surrounding wall at the top of the hill, and two supporting walls at the entrance. As far as possible, in the reconstruction of the stadium, the old portions will be used, where these are in a sufficient state of preservation, and an effort will be made to reproduce, as nearly as practicable, the ancient structure. The seats at present will not all be made of pentelic marble, as there is neither time nor money for such an undertaking. At the closed end of the arena, seventeen rows will be made of pentelic marble, as well as the first row all the way around. The remaining rows up to the first aisle are being constructed of Piræus stone. These will accommodate 25,000 seated spectators. From this aisle to the top will be placed wooden benches for 30,000

seated spectators. Add to these standing room for 5,000, and we have the holding capacity of the stadium 60,000 without crowding."—*United States consular reports*, March, 1896, pp. 353-354.

ATLANTIC OCEAN.—“Much as the Old World corresponds to the Pacific, so the two Americas correspond to the two basins of the Atlantic, and the Antarctic Sea to the Antarctic land. In the coast lines of the continents other points of correspondence reveal themselves. . . . The Atlantic shores . . . are low and shelving, except where they pass round the margins of high plateaux, or cut across mountain chains, of which the directions are rarely parallel to the shores. The islands are few and irregularly scattered instead of being hung in festsoons. Moreover, both Atlantic shore lines follow the same course, as if moulded by the same influences; thus the Gulf of Guinea occurs opposite the projection of Brazil; the Mediterranean offset on the east corresponds to the Caribbean on the west; the eastward recession of Europe is followed by the eastward advance of America.”—H. R. Mill, *International geography*.—The Challenger expedition determined the area of the Atlantic Ocean to be 24,536,000 square miles, and the greatest depth 7,366 feet, at a point north of Porto Rico. The greatest breadth is 4,500 miles; the mean depth of the North Atlantic is 2,047 fathoms, and that of the South Atlantic 2,067 fathoms.

Ancient geography of the Atlantic.—“The Greeks as a whole before the Hellenistic age knew little of the Atlantic. For a long time their knowledge ceased absolutely at Gibraltar or, as the Greeks named it, the Pillars of Heracles. The name itself suggests that the early Greeks had only seen Gibraltar from the East: for the long ridge of the Rock, throwing out a tongue, or, as the Greeks called it elsewhere, a Dog's Tail, into the strait, looks anything but a pillar to seamen approaching from the West. Then stray traders were blown by the Levanter through the funnel of the straits, past Trafalgar, into the bay of Cadiz, and discovered the ‘virgin market’ of Tarshish on the Guadalquivir. But beyond Cape St. Vincent they knew nothing at all; even Heracles got no further than Geryon's island in Cadiz Bay; ‘man cannot sail into the darkness West of Cadiz; turn back the ship to the land of Europe,’ says Pindar, as one of his many ways of breaking off a long tale. Herodotus had heard stories of tin being brought from the Tin Islands, but he could find out nothing definite. Moreover it is significant that he tells us of two different pioneering companies who found their way to Tartessus—the Phocæans and the Samian Coleaus. This is probably not because, as with the North Pole, there was a competition for the honour of discovery, but because the route was so hazardous that communications had not been properly kept up. It was, however, not only the difficulty of the Gibraltar passage but the competition of Carthage which kept Greeks out of the Atlantic. The Carthaginians traded all along the nearer coasts of the Atlantic, both in Spain and Africa. They had rounded the Cape of Good Hope and sailed far into the Northern sea for the

tin of Cornwall and the Scillies. A Carthaginian account of the West African route is extant in Greek—the so-called Itinerary of Hanno. It was of course to the interest of the Carthaginians, as of all pioneer sea powers, to keep their voyages secret and to exaggerate their danger. It was a long time before their next rivals, the Romans, found their way to the British tin mines. The geographer Strabo has an interesting passage about this British trade and how its monopoly was safeguarded:—“The Tin Islands,’ he says, ‘are ten in number. . . . One of them is desert, but the others are inhabited by men in black cloaks, clad in tunics reaching to the feet, girt about the breast and walking with sticks, like Furies in a tragedy. They subsist by their cattle, leading for the most part a wandering life. Of the metals they have tin and lead, which with skins they barter with the merchants for earthenware, salt, and brazen vessels. Formerly the Phoenicians alone carried on this traffic from Gades, concealing the passage from every one; and when the Romans followed a certain skipper in order to discover the market for themselves, the skipper purposely ran his vessel on to a shoal, luring the Romans to the same fate. He himself escaped on a piece of wreckage and received from the State the value of the cargo he had lost. Nevertheless the Romans persevered until they discovered the passage.”—Zimmern, *Greek commonwealth*, pp. 21-22.—“Nor is it likely that the Atlantic Ocean is divided into two seas of narrow isthmuses so placed as to prevent circumnavigation; how much more probable that it is confluent and uninterrupted! Those who have returned from an attempt to circumnavigate the earth, do not say they have been prevented from continuing their voyage by an opposing continent, for the sea remained perfectly open, but through want of resolution, and the scarcity of provision.”—Strabo.—“In one of his digressions Herodotus has communicated to us his conception of the general features of the world. . . . He considered that the ocean extended continuously from the coast of India to that of Spain; this he regarded as sufficiently proved by two expeditions, which had accomplished between them the entire circumnavigation of the intervening continent. One of these was the voyage of Seylax of Caryanda. . . . The other was the expedition which was despatched by Necho from Egypt to explore the coast of Africa, and had succeeded in reaching the Pillars of Hercules by the southern route. The first part of this sea to the eastward of Africa, which we now call the Indian Ocean, was known to him as the Erythraean Sea, while that to the west he names the Atlantic—an appellation which here occurs for the first time, though he implies that it was already in familiar use.”—H. F. Tozer, *History of ancient geography*, p. 80.—See also COMMERCE: Era of geographic expansion.

Transatlantic steamers, cables, airplanes.—The first steamer to cross the Atlantic was the Savannah, which made the trip in May and June of 1819. The first successful transatlantic cable was laid in August, 1857. The second was laid in June, 1858, but proved a failure. The first messages passed on August 5, 1858, between President Buchanan and Queen Victoria. “On May 17 [1919] the United States flying-boats N. C. 1, 3, and 4 . . . started from Trepassey, Newfoundland, for the Azores. . . . Only one, the N. C. 4, reached the Azores, at Horta. . . . The R. 34 (a British rigid airship of the Zeppelin type) . . . left East Fortune (Scotland) on July 2 [1919]. . . . She crossed the Atlantic . . . and landed at Mineola. . . . On July 10 she started for home, and . . . returned to Pulham, Norfolk.”—*New Hasell's Annual and Al-*

manack, 1920, p. 766.—See also AVIATION: Important flights since 1900: 1910; 1919.

ATLANTIS, a fabled island in the Atlantic Ocean, mentioned in the "Timaeus" of Plato. He describes it as having been a large and powerful kingdom some nine thousand years before the birth of Solon; the entire land was supposed to have since been overwhelmed by the sea. Plato in the *Critias* gives a history of this reputed ideal commonwealth. From ancient until modern times many similar legends have been current in Western Europe, and some writers have believed them to have a basis of fact.

ATROPATENE, MEDIA ATROPATENE. —"Atropatene, as a name for the Alpine land in the northwest of Iran (now Aderbeijan), came into use in the time of the Greek Empire [Alexander's]; at any rate we cannot trace it earlier. 'Athrapaiti' means 'lord of fire'; 'Athrapata,' 'one protected by fire'; in the remote mountains of this district the old fire-worship was preserved with peculiar zeal under the Seleucids."—M. Duncker, *History of antiquity*, bk. 7, ch. 4.—Atropatene "comprises the entire basin of Lake Urumiyeh, together with the country intervening between that basin and the high mountain chain which curves round the southwestern corner of 'the Caspian.'"—G. Rawlinson, *Five great monarchies: Media*, ch. 1.—Atropatene was "named in honour of the satrap Atropates, who had declared himself king after Alexander's death."—J. P. Mahaffy, *Story of Alexander's empire*, ch. 13.

ATTACAPAN FAMILY.—"Derivation: From a Choctaw word meaning 'man eater.' Little is known of the tribe, the language of which forms the basis of the present family. The sole knowledge possessed by Gallatin was derived from a vocabulary and some scanty information furnished by Dr. John Sibley, who collected his material in the year 1805. Gallatin states that the tribe was

reduced to 50 men. . . . Mr. Gatschet collected some 2,000 words and a considerable body of text. His vocabulary differs considerably from the one furnished by Dr. Sibley and published by Gallatin. . . . The above material seems to show that the Attacapa language is distinct from all others, except possibly the Chitimachan."—J. W. Powell, *Seventh annual report, Bureau of ethnology*, p. 57. —See also INDIANS, AMERICAN: Cultural areas in North America; Southeastern area.

ATTACOTTI. See BRITAIN: Celtic tribes.

ATTAINDER, BILL OF ATTAINDER.—"An attainder ('attinctura') is a degradation or public dishonouring, which draws after it corruption of blood. It is the consequence of any condemnation to death, and induces the disinheritance of the heirs of the condemned person, which can only be removed by means of parliament. A bill of attainder, or of pains and penalties, inflicts the consequences of a penal sentence on any state criminal. . . . By the instrumentality of such bill the penalties of high treason are generally imposed. Penalties may, however, be imposed at pleasure, either in accordance with, or in contravention of, the common law. No other court of law can protect a person condemned in such manner. The first bill of the kind occurred under Edward IV., when the commons had to confirm the statute condemning Clarence to death. This convenient method of getting rid of disagreeable opponents was in high favour during the reign of Henry VIII. . . . What had been an instrument of kingly despotism, under Tudor sway, was converted, under the Stuarts, into a parliamentary engine against the crown. The points of indictment against Strafford were so weak that the lords were for acquitting him; Thereupon, Sir Arthur Haselrig introduced a bill of attainder in the commons. The staunch friends of freedom, such as Pym and Hampden, did not support this measure. A bill of attainder may refer simply to a concrete case, and contrive penalties for acts which are not specially punishable by statute, whereas an impeachment applies to some violation of recognized legal principles, and is a solemn indictment preferred by the commons to the house of lords."—E. Fischel, *English constitution*, bk. 7, ch. 9.—"By the 33 & 34 Vict. c. 23, forfeiture and attainder for treason or felony have been abolished."—T. P. Taswell-Langmead, *English constitutional history, from the Teutonic conquest to the present time*, ch. 10, 2d ed., p. 393, foot-note.—By the constitution of the United States both Congress and the states are prohibited from passing a bill of attainder. Congress is given power to punish treason, but it is provided that "no attainder of treason shall work corruption of blood." The bill of attainder is objectionable in that legislative bodies are likely to be moved by popular clamor, whereas in regular court procedure a decision is reached on the basis of evidence submitted.

ATTALUS, the name of several kings of Pergamum. See PERGAMUM.

Attalus I (269-197 B.C.). Made himself master of Asia Minor west of Mt. Taurus, ally of Philip V of Macedon against Rome.

Attalus II (220-138 B.C.). Sent as ambassador to Rome before becoming king; founded Philadelphia and Attalia.

Attalus III (171-133 B.C.), a patron of art and literature; his will made the Roman people his heirs.

ATTIC TRIBES. See PHYLAE; PHRATRIÆ; GENES.

ATTIC WAR. See TEN YEARS' WAR; also ATHENS: B. C. 421.

ATTICA.—"It forms a rocky peninsula, separated from the mainland by trackless mountains, and jutting so far out into the Eastern Sea that it lay out of the path of the tribes moving from north to south. Hence the migratory passages which agitated the whole of Hellas left Attica untouched, and for this reason Attic history is not divided into such marked epochs as that of Peloponnesus; it possesses a superior unity, and presents an uninterrupted development of conditions of life native in their origin to the land. . . . On the other hand Attica was perfectly adapted by nature for receiving immigrants from the sea. For the whole country, as its name indicates, consists of coast-land; and the coast abounds in harbours, and on account of the depth of water in the roads is everywhere accessible; while the best of its plains open towards the coast. . . . Into the centre of the entire plain advances from the direction of Hymettus a group of rocky heights, among them an entirely separate and mighty block which, with the exception of a narrow access from the west, offers on all sides vertically precipitous walls, surmounted by a broad level sufficiently roomy to afford space for the sanctuaries of the national gods and the habitations of the national rulers. It seems as if nature had designedly placed this rock in this position as the ruling castle and the centre of the national history. This is the Acropolis of Athens. . . . So far from being sufficiently luxuriant to allow even the idle to find easy means of sustenance, the Attic soil was stony, devoid of a sufficient supply of water, and for the most part only adapted to the cultivation of barley; everywhere . . . labour and a regulated industry were needed. But this labour was not unremunerative. Whatever orchard and garden fruits prospered were peculiarly delicate and agreeable to the taste; the mountain-herbs were nowhere more odorous than on Hymettus; and the sea abounded with fish. The mountains not only by the beauty of their form invest the whole scenery with a certain nobility, but in their depths lay an abundance of the most excellent building-stone and silver ore; in the lowlands was to be found the best kind of clay for purposes of manufacture. The materials existed for all arts and handicrafts; and finally Attica rejoiced in what the ancients were wise enough to recognize as a special favour of Heaven, a dry and transparent atmosphere. . . . The immigrants who domesticated themselves in Attica were . . . chiefly families of superior eminence, so that Attica gained not only in numbers of population, but also in materials of culture of every description."—E. Curtius, *History of Greece*, bk. 2, ch. 2.—See also ATHENS: B. C. 1000-700; GREECE: Map of ancient Greece.

ATTILA (d. 453), king of the Huns, called "the scourge of God." Invaded Gaul in 451, was stopped by the Visigoths under Theodoric at the battle of Châlons; in the next year invaded Italy, driving many people into the lagoons of the Adriatic, where they founded Venice; was persuaded to turn back by Pope Leo I.—See also BALKAN STATES: Races existing; BARBARIAN INVASIONS: 423-455; EUROPE: Ethnology: Migrations: Map showing Barbaric migrations; HUNS: 433-453 to 453; VENICE: 452.

ATTIWANDARONKS. See IROQUOIS CONFEDERACY.

ATTORNEY-GENERAL, chief law officer of the state.—"Of all the great offices established in 1789 [United States], that of the Attorney-General was in some respects the least satisfactory in its organization. . . . The office was an innovation in connection with that government. But the incumbent, recognized as legal adviser to the President and the heads of departments, was inevitably brought within the range of executive control, and became, like the Secretaries, a ministerial officer. When, in 1790, Edmund Randolph, first of the Attorneys-General, wrote of himself as 'a sort of mongrel between the State and U. S.; called an officer of some rank under the latter, and yet thrust out to get a livelihood in the former,' he cast no doubtful reflection on the status and relation of his position. He knew that he was head of no department. Moreover, his salary of fifteen hundred dollars was so small that probably he could not have been expected to support himself by it. He was obliged to trust to legal practice to eke out a living. There is no evidence to indicate that he was even expected to remain at the seat of government, although he was obliged to keep in touch with the President, at least by occasional correspondence. And, should the federal business warrant it, the President might summon him to a conference with the Secretaries. He was certainly reckoned an adviser in legal matters by Washington from the start. The place and functions of the Attorney-General remained for many years after 1789 subjects of reflection on the part of thoughtful men. Several Presidents, beginning with James Madison, urged reform in the office, although apparently having no clear notions at first as to what measures of reform were needed. The Attorneys-General themselves were helpful in the solution of the problem, none more so than William Wirt and Caleb Cushing. The problem became clearer under the stress of numerous circumstances in the growth and requirements of federal administration. By the close of the Civil War it was forced into the foreground; and Congress, acting in 1870 after long deliberation, established the office on a new footing, giving the Attorney-General a place as head of the department of justice. The act of 1870, it should be added, made no change in law as to the duty of the Attorney-General in giving official opinions and advice. 'The Attorney-General,' said Monroe, 'has been always, since the adoption of our Government, a member of the executive council, or cabinet. For that reason as well as for a better discharge of his other official duties, it is proper

that he should reside at the seat of Government. . . . His duties in attending the cabinet deliberations are equal to those of any other member. . . . Being at the Seat of Government throughout the year,' Monroe continued, 'his labors are increased by giving opinions to the different Departments and public officers. . . . Being on the spot, it may be supposed that he will often be resorted to verbally in the progress of current business. Such is the fact.' Then turning to another aspect of the theme, Monroe declared: 'The present Attorney-General (Richard Rush) has not embarked in the practice of the local courts of the city of Washington. The practice is, in itself, of little moment; to engage in it upon a scale to make it, in any degree, worth his attention, would be incompatible with the calls to which he is liable from the Executive, and the investigations due to other official engagements.' Monroe knew that the office had been shabbily treated at the hands of Congress, for after calling attention to the facts that it had no apartment for business, no clerk, and not even a messenger, he added that it had had neither stationery nor fuel. 'These have been supplied,' he concluded, 'by the officer himself, at his own expense.' Monroe's letter is an extraordinarily interesting and authoritative commentary on the primitive conditions that surrounded an officer of some rank in the national government of 1817. It came from the most experienced and tried administrative official serving Madison, for Monroe had held both the office of Secretary of State and that of Secretary of War, sometimes sustaining them together for brief periods during the six years preceding. It revealed a man thoroughly prepared to appreciate the need of a capable occupant of the office. Although it took Monroe some time to select his Attorney-General, he had good reason, as we shall presently see, to feel by the close of his administration as President great satisfaction over his choice. William Wirt of Virginia accepted the post of Attorney-General offered him by President Monroe late in October, 1817, with a clear understanding that there was nothing in the duties of his office to prevent him from carrying on general practice in Washington, where he took up his residence, or from attending occasional calls to Baltimore, Philadelphia or elsewhere, if time allowed. He knew, however, that his first obligation was to Monroe and to the regular duties of his new position. Wirt began with an examination of the Judiciary Act of September 24, 1789. There the duties of the Attorney-General were briefly set forth. They had not been more clearly elaborated in any later enactment. Wirt next sought for the records of opinions as given by his predecessors in the office—for letter-books, official correspondence and documentary evidence, but could not find a trace of these. Accordingly he concluded that there could have been neither consistency in the opinions nor uniformity in the practices of the Attorneys-General. He indicated that in various ways he had discovered that his forerunners had been called on for opinions from many sources—committees of Congress, district attorneys, collectors of customs and of public taxes, marshals, and even courts-martial. Clearly these practices went far beyond the provisions of law. Resting on courtesy merely, they impress Wirt as dangerous. It was his opinion that 'from the connection of the Attorney-General with the executive branch of the government . . . his advice and opinions, given as Attorney-General, will have an official influence, beyond, and independent of, whatever intrinsic merit they may possess; and whether it be sound policy to permit this officer or any other under the

government, even on the application of others, to extend the influence of his office beyond the pale of law, and to cause it to be felt, where the laws have not contemplated that it should be felt, is the point which I beg leave to submit.' The conclusions which Wirt drew may be summarized. First, and above all things, provision should be made in law for keeping the records and preserving the documents of the office. This would make for consistency of opinions and uniformity of practices. Second, there should be a depository in the office of the Attorney-General for the statutes of the various States, statutes which might be needed at short notice for aid in solving legal problems. In this matter Wirt was asking simply for a special library to facilitate his work. Finally, he suggested that legal restrictions be placed on the duties of the officer for the obvious reason that one man could not find time to perform the work if he were obliged to attend to such miscellaneous calls as had been made upon the time and energy of his predecessors. There is good reason to believe that Caleb Cushing was the first Attorney-General of the United States who held himself strictly to the residence obligation—an ideal, as we have seen, that had been gaining ground since 1814—and refrained from the general practice of the law during his term as a federal officer. At any rate, many of Cushing's suggestions for a better organization of the work of the Attorney-General were enacted into the laws between March, 1854—the date of his 'Opinion'—and June, 1870, when the Attorney-General was named in the law as head of the Department of Justice. The act of 1870 brought the solicitors in the various departments under the ultimate control of the Attorney-General. Whatever official opinions these solicitors might be called upon to give, must henceforth be recorded in the office of the Attorney-General. There, before they could become the executive law for the guidance of inferior officials, these opinions were stamped with the Attorney-General's final approval. 'It is,' asserted Representative Jenckes, 'for the purpose of having a unity of decision, a unity of jurisprudence, if I may use that expression, in the executive law of the United States, that this bill proposes that all the law officers therein provided for shall be subordinate to one head.' The act made provision for the creation of one new law officer of large importance—the Solicitor-General of the United States. It was proposed to have in this new position 'a man of sufficient learning, ability and experience that he can be sent to New Orleans or to New York, or into any court wherever the Government has any interest in litigation, and there present the case of the United States as it should be presented.' The express language of the law required him to be 'learned in the law'—a requirement that had originally, in the law of 1789, been exacted of the Attorney-General, but for some unknown reason was omitted in the law of 1870, so far as the latter officer was concerned. By an act approved on January 19, 1886, the Attorney-General was definitely reckoned as fourth in the line of possible succession to the Presidency in case of the removal, death, resignation or disability of President and Vice-President."—H. B. Learned, *President's cabinet*, pp. 159-100.—The salaries of the attorney-general and of the solicitor-general are \$12,000 and \$10,000 respectively.—See also JUSTICE, DEPARTMENT OF.—The salary of the attorney-general in England is £7,000 (\$35,000). His office is one of great authority and dignity, and as chief law officer of the Crown he is nominal head of the bar.

AUBAINE, Right of.—"A prerogative by

which the Kings of France claimed the property of foreigners who died in their kingdom without being naturalized." It was suppressed by Colbert, in the reign of Louis XIV.—J. A. Blanqui, *History of political economy in Europe*, p. 285.

AUBE, Hyacinthe Laurent **Théophile** (1826-1890), French admiral, an advocate of a torpedo system. See **SUBMARINES**: 1914-1918.

AUBER, Daniel François **Esprit** (1782-1871), French operatic composer. In 1842 he succeeded Cherubini as head of the Conservatoire and in 1857 was imperial choir master to Napoleon III. He is often spoken of as the last of the masters of the old *opéra comique*. See **MUSIC**: Modern: 1730-1816.

AUBERIVE, a village on the Suippe river, southeast of Rheims. It was captured by the French during World War. See **WORLD WAR**: 1915: II. Western front: i, 8; also 1917: II. Western front: b, 1.

AUBERS, a village in northern France, southwest of Lille. It was captured by the Allies 1914. See **WORLD WAR**: 1914: I. Western front: w, 2.

AUBIGNY, Robert **Stuart** (d. 1544), French general under Louis XII. See **ITALY**: 1499-1500; 1501-1504.

AUBIGNY, a village of northern France, northwest of Arras. It was taken by the Germans in 1918. See **WORLD WAR**: 1918: II. Western front: c, 11.

AUBRIOT, Hughes (d. 1382), Provost of Paris. See **BASTILLE**.

AUBURN PRISON, New York. See **PRISON REFORM**: Results of prison reform movement.

A. U. C., or **U. C.** (**Ab urbe condita**), from the founding of the city; or "Anno urbis conditæ," the year from the founding of the city of Rome, 753 B. C.—See also **CHRONOLOGY**: Era of the foundation of Rome.

AUCH: Origin of the name. See **AQUITAINE**: Ancient tribes.

AUCHMUTY, Sir **Samuel** (1756-1822), British general; served as loyalist in the War of the American Revolution; served in India, Egypt and in the disastrous Buenos Aires expedition in 1806-1807; in command at Madras, 1810, and of the Java expedition in 1811, when he practically conquered the island.

AUCKLAND, **George Eden**, earl of (1784-1849), an English statesman; took his seat in House of Lords, 1814; appointed governor-general of India, 1835, and in 1846 first lord of the admiralty. Auckland, New Zealand, was named after him.—See also **AFGHANISTAN**; **INDIA**: 1836-1845.

AUCKLAND, city and former capital of New Zealand (until 1865); on Waitemate Inlet, a beautiful and commodious harbor; settled in 1840, now chief port of the Dominion. It has a college, forming part of the University of New Zealand, and there is a large freight and passenger traffic with England, Australia and the United States. See **AUSTRALIA**: Map; **LABOR STRIKES AND BOYCOTTS**: 1906-1913; **NEW ZEALAND**: Land; and 1850-1855.

AUDENARDE. See **OUDENARDE**.

AUDIENCIAS.—"For more than two centuries and a half the whole of South America, except Brazil, settled down under the colonial government of Spain, and during the greater part of that time this vast territory was under the rule of the Viceroy of Peru residing at Lima. The impossibility of conducting an efficient administration from such a centre . . . at once became ap-

parent. Courts of justice called Audiencias were, therefore, established in the distant provinces, and their presidents, sometimes with the title of captains-general, had charge of the executive under the orders of the Viceroy. The Audiencia of Charcas (the modern Bolivia) was established in 1559. [See **BOLIVIA**: 1533-1809.] Chile was ruled by captains-general, and an Audiencia was established at Santiago in 1568. [See **CHILE**: 1568.] In New Grenada the president of the Audiencia, created in 1564, was also captain-general. The Audiencia of Quito, also with its president as captain-general, dated from 1542; and Venezuela was under a captain-general."—C. R. Markham, *Colonial history of South America (Narrative and Critical History of America, v. 8, p. 295)*.—"It was during the great Christian conquests of the twelfth and thirteenth centuries, that a definite judiciary culminating in a royal *audiencia* was perfected. This was a period of royal consolidation and centralization. The nobles conceded the majority of their governmental prerogatives to the increasing royal authority, and the ecclesiastical jurisdiction was confined, in theory at least, to spiritual matters. The municipalities developed a system by which they regularly elected their *regidores* (councillors) and their *alcaldes*, (q.v.), with judicial, legislative, and executive attributes, submitting at the same time to the inspection of the King's visitor. It is clear, therefore, that the royal jurisdiction was recognized during this period, with the king at the head of the judicial and administrative system. This tribunal was called an *audiencia* because the king gave audience therein, and from it and around it developed the centralized system which was later to administer justice in Spain and in the colonies. It first exercised jurisdiction in Castile and Leon, and later in Andalusia. The king gave three days a week of his personal attention to this tribunal at first. It was the royal *audiencia*. The time soon arrived, however, when he could not devote so much of his time to matters of individual justice, and in proportion as this was the case did the powers and importance of the judges who composed this court increase. Ferdinand VI. and Alfonso XI. were able to give one day a week to the *audiencia*, in 1307 and 1329 respectively. The creation and growth of judicial and administrative institutions in Catalonia were parallel with those of Castile. The eleventh century saw *audiencias*, municipalities, and above all, a powerful nobility, but this province was independent of Castile during a period of four centuries. The *audiencias* of Catalonia were composed of ecclesiastical and secular judges appointed by the counts of Barcelona, and authorized by them to render sentence. Without going into further detail with regard to matters of provincial administration, in Spain, it is sufficient to say that certain institutions of justice and administration developed in common throughout the Peninsula, and that by the end of the thirteenth century political and judicial administration had come to be controlled by a central authority whether in Castile or in Catalonia. In the Ordinance of Toro, in 1369, we find mention of four grades or instances for the administration of justice in Spain. The lowest category was occupied by the *alcaldes ordinarios* of the municipalities. We have noted already that these were local judges, with original jurisdiction, and dependent on the municipal councils. The *merinos* exercised royal and original jurisdiction in certain feudal districts and provinces where there were no municipalities. The *adelantados* (q.v.) heard appeals from the *merinos* and *alcaldes mayores*. These officials, it must be

remembered, exercised administrative functions as well as judicial authority, and for the latter work they were accompanied by *asesores*, or legal assistants. The next step in the hierarchy of justice and administration was occupied by the *adelantados mayores* who stood between the *adelantados*, on the one hand, and the king's tribunal on the other. The king and royal *audiencia* constituted the final court of appeal."—C. H. Cunningham, *Institutional background of Spanish-American history*, pp. 28-31.

"The perfectly normal and obvious thing to do, when it is desired to tie the hands of a governor or viceroy, is to impose upon that official a body of responsible colleagues, which English-speaking people call a council. Such a body was imposed upon the viceroy of New Spain (Mexico) early in the sixteenth century, under the name of an *audiencia*, and in order to guarantee the independence of this body it was allowed to correspond directly with the home government without the viceroy as an intermediary. As a further means of holding the viceroy to his duty, the well-known method of taking official account of his administration was accomplished through the institution known as a *residencia*. This was in substance a trial conducted by the crown with the intent of bringing to light any malpractices of which the retiring viceroy might have been guilty during his official term. It was not only a means of setting right any wrongdoing or injustice which could be remedied after such a lapse of time, but it was also regarded as giving a significant warning to possible future violators of the law. This combination of the *audiencia* and the *residencia* constituted the approved method of keeping the viceroy well in hand; but it had broken down utterly by the middle of the eighteenth century, when the reforms inaugurated by Gálvez brought about a complete readjustment of the relations of the viceroy to his superiors in Madrid and to his colleagues and subordinates in Mexico."—D. E. Smith, *Viceroy of New Spain*, v. I, pp. 108-109.—For re-establishment in Philippines, see PHILIPPINE ISLANDS: 1581.—See also ADELANTADOS; ALCALES; PERU: 1550-1816.

AUDIFFRET-PASQUIER, Edmé Armand Gaston, duc d' (1823-1905), French statesman. In 1873 became president of the right center in the National Assembly; directed negotiations among the royalists to re-establish the kingdom, but failed; president of the Senate 1876-1879; tried to dissuade MacMahon from following advice of the extreme royalists.

AUDION, in wireless telegraphy. See ELECTRICAL DISCOVERY: Telephony and telegraphy: Dr. Pupin's revolutionary improvement.

AUDRAN, Gérard, or Girard (1640-1703), the most celebrated French engraver. "Constantine's battle with Maxentius," the "Triumph" and the "Stoning of Stephen" are among his most noted works.

AUDUBON, John James (1785-1851), American naturalist. Studied drawing under the French painter, David; settled in Philadelphia and later in Kentucky and Louisiana, devoting himself to collecting and sketching birds; in London, in 1827, he published *Birds of America*, a very beautiful set of colored plates in eighty-seven parts.

AUERSTÄDT, Battle of. See GERMANY: 1806 (October).

AUFFENBERG, Moritz von (1852-), Austrian commander of the armies in central and eastern Galicia at the beginning of the World War. After his defeat at Lemberg (September 1-3, 1914) and at Rawa Ruska (September 10) the whole Aus-

tro-Hungarian offensive collapsed. See WORLD WAR: 1914: II. Eastern front: b; d, 1.

AUGEREAU, Pierre François Charles (1757-1816), duke of Castiglione, marshal of the Empire. One of Napoleon's most skillful generals, especially during the years 1797-1807. See FRANCE: 1797 (September); GERMANY: 1806 (October); SPAIN: 1809 (February-June); and RUSSIA: 1812 (June-September).

AUGHRIM, or Aghrim, Battle of (1691). See IRELAND: 1689-1691.

AUGIER, Emile (1820-1889), French dramatist. See FRENCH LITERATURE: 1850-1921.

AUGSBURG, Bavarian town situated on the junction of Wertach and Lech rivers, and capital of the districts of Swabia and Neuberg. It was founded in 14 B.C. and reached the height of its power at the close of the 14th century. At the time of the Reformation it was the commercial center between north and south Europe, but the change in the trade routes, resulting from the discoveries of the 15th and 16th centuries, and the devastations of the Thirty Years war, destroyed its prosperity.—See also AUGUSTA VINDELICORUM; HANSA TOWNS.

955.—Great defeat of the Hungarians. See HUNGARIANS: 934-955.

16th century.—Art center. See PAINTING: German.

AUGSBURG INTERIM. See GERMANY: 1546-1552.

AUGURS, PONTIFICES, FETIALES.—"There was . . . enough of priesthood and of priests in Rome. Those, however, who had business with a god resorted to the god, and not to the priest. Every suppliant and inquirer addressed himself directly to the divinity . . . ; no intervention of a priest was allowed to conceal or to obscure this original and simple relation. But it was no easy matter to hold converse with a god. The god had his own way of speaking, which was intelligible only to those acquainted with it; but one who did rightly understand it knew not only how to ascertain, but also how to manage, the will of the god, and even in case of need to overreach or to constrain him. It was natural, therefore, that the worshipper of the god should regularly consult such men of skill and listen to their advice; and thence arose the corporations or colleges of men specially skilled in religious lore, a thoroughly national Italian institution, which had a far more important influence on political development than the individual priests or priesthoods. These colleges have been often, but erroneously, confounded with the priesthoods. The priesthoods were charged

with the worship of a specific divinity. . . . Under the Roman constitution and that of the Latin communities in general there were originally but two such colleges: that of the augurs and that of the pontifices. The six augurs were skilled in interpreting the language of the gods from the flight of birds; an art which was prosecuted with great earnestness and reduced to a quasi-scientific system. The five 'bridge builders' (pontifices) derived their name from their social function, as sacred as it was politically important, of conducting the building and demolition of the bridge over the Tiber. They were the Roman engineers, who understood the mystery of measures and numbers; whence there developed upon them also the duties of managing the calendar of the state, of proclaiming to the people the time of new and full moon and the days of festivals, and of seeing that every religious and every judicial act took place on the right day. . . . Thus they acquired (although not probably to the full extent till after the abolition of the monarchy) the general oversight of Roman worship and of whatever was connected with it. [The president of their college was called the Pontifex Maximus.] . . . They themselves described the sum of their knowledge as 'the science of things divine and human.' . . . By the side of these two oldest and most eminent corporations of men versed in spiritual lore may be to some extent ranked the college of the twenty state-heralds (fetiales, of uncertain derivation) destined as a living repository to preserve traditionally the remembrance of the treaties concluded with neighboring communities, to pronounce as authoritative opinion on alleged infractions of treaty rights, and in case of need to demand satisfaction and declare war."—T. Mommsen, *History of Rome*, bk. 1, ch. 12.—See also ANNALS; Roman annals; AUSPICES; FETIALES; and HARUSPICES.

AUGUSTIN I, Title of Iturbide as Emperor of Mexico. See MEXICO: 1820-1826.

AUGUSTINE, Saint (354-430), the greatest of the four Church fathers; became a Christian in 387; ordained 391; in 395 became bishop of Hippo in Africa. "Trained in the best culture of the day, he devoted his powerful mind to the defence and upbuilding of orthodox Christianity. He wrote innumerable books, the greatest of which was 'The City of God.' This book was inspired by the capture of Rome by Alaric (410), and compared the splendid city of the Empire, now fallen, with the true spiritual capital of mankind, the Christian Church. Its eloquence

and its logic, its splendid survey of the past, and its prophetic insight into the future have given this work a place among the classics of all time."—G. S. Goodspeed, *History of the ancient world*, p. 439.—"The City of God" is the first contribution to the philosophy of history. See CHRISTIANITY: 337-476; also AUSTIN CANONS; HISTORY: 18.

AUGUSTINE (d.c. 613), first Archbishop of Canterbury. Sent to England from Rome by Pope Gregory I, where he converted the king and established the Christian religion. See CHRISTIANITY: 553-800; 597-800; and ENGLAND: 597-685.

AUGUSTODUNUM.—The emperor Augustus changed the name of Bibracte in Gaul to Augustodunum, which time has corrupted, since to Autun.

AUGUSTONEMETUM. See GERGOVIA OF THE ARVERN.

AUGUSTOWO, a town and forest northwest of Grodno, on the borders of East Prussia, where, after the battle of Tannenberg, General Rennenkampf claimed to have inflicted losses upon Hindenberg's forces amounting to over 60,000 men. See WORLD WAR: 1914: II. Eastern front: d, 1; 1915: III. Eastern front: h.

AUGUSTUS, the name by which the Romans used to distinguish the most venerated in the state, was conferred upon Gaius Julius Cæsar Octavianus (63 B.C.-A.D. 14) by the Roman Senate, 27 B.C. Upon the death of Julius Cæsar he found that his uncle had made him his heir. He adroitly contrived to gain popular support, particularly among the troops. In the year 42 B.C. Octavianus and Antoninus (Mark Antony), with whom the future Augustus aligned himself to overcome his enemies, defeated the forces of Brutus and Cassius at Philippi. Antony's relations with Cleopatra of whom he had become enamored, and his repudiation of his wife, Octavianus' sister, brought about a declaration of war, seemingly against Cleopatra who was reputed to have an ambition to form a Greco-Oriental empire. Antony's fleet was completely destroyed at Actium (31 B.C.) and the following year saw the capture of Alexander by Octavianus. See ROME: Republic: B.C. 31.—"In estimating the position finally held by Augustus, let us notice that his military authority was the same as that of the President of the United States; his civil authority was far less. All the old republican magistrates still existed, and continued to exercise the same functions as before. Constitutionally, Augustus was on a level with the Consuls. In honor and in personal influence, however, he overshadowed all the other officials. He was always consulted on the suitability of candidates for the various offices and on every other matter; and his policy was usually carried out. It is clear that most of his power was exercised, not as a Magistrate but as a political 'boss.'"—G. W. Botsford, *History of ancient world*, p. 452.—Augustus spent many years in war against the Germans, tribes of Pannonia and in the conquest of the Parthian empire.—"Octavius [See ROME: Republic: B.C. 31-14] had warily declined any of the recognized designations of sovereign rule. Antonius had abolished the dictatorship; his successor respected the acclamations with which the people had greeted this decree. The voices which had saluted Caesar with the title of king were peremptorily commanded to be dumb. Yet Octavius was fully aware of the influence which attached to distinctive titles of honour. While he scrupulously renounced the names upon which the breath of human jealousy had blown, he conceived the subtler policy of creating another for himself, which bor-

rowing its original splendour from his own character, should reflect upon him an untarnished lustre. . . . The epithet Augustus . . . had never been borne by any man before. . . . But the adjunct, though never given to a man, had been applied to things most noble, most venerable and most divine. The rites of the gods were called august, the temples were august; the word itself was derived from the holy auguries by which the divine will was revealed; it was connected with the favour and authority of Jove himself. . . . The illustrious title was bestowed upon the heir of the Caesarian Empire in the middle of the month of January, 727 [B. C. 27], and thenceforth it is by the name of Augustus that he is recognized in Roman history."—C. Merivale, *History of the Romans*, ch. 30.—"When Octavianus had firmly established his power and was now left without a rival, the Senate, being desirous of distinguishing him by some peculiar and emphatic title, decreed, in B. C. 27, that he should be styled Augustus, an epithet properly applicable to some object demanding respect and veneration beyond what is bestowed upon human things. . . . This being an honorary appellation . . . it would, as a matter of course, have been transmitted by inheritance to his immediate descendants. . . . Claudius, although he could not be regarded as a descendant of Octavianus, assumed on his accession the title of Augustus, and his example was followed by all succeeding rulers . . . who communicated the title of Augusta to their consorts."—W. Ramsay, *Manual of Roman antiquities*, ch. 5.—See also RELIGION: B. C. 750-A. D. 30; ROME: Empire: B. C. 31-A. D. 14; and SEVASTOS.

AUGUSTUS I (1526-1586), became elector of Saxony at the death of his brother Maurice (1553); encouraged the Flemish people to immigrate and settle the country; was an enlightened although sometimes cruel ruler.

AUGUSTUS II (1670-1733), king of Poland, and, under the name Frederick Augustus I, elector of Saxony. See SWEDEN: 1707-1718; 1710-1721.

AUGUSTUS III (1696-1763), king of Poland, and, as Frederick August II, elector of Saxony. See POLAND: 1732-1733.

AULA, (1) an open yard, or court; (2) Trinity Hall, Cambridge University, founded by Bishop Bateman in 1350, referred to as "aula," denoting the building inhabited by the scholars.

AULDEARN, Battle of (1645). See SCOTLAND: 1644-1645.

AULERCI.—The Auleri were an extensive nation in ancient Gaul which occupied the country from the lower course of the Seine to the Mayenne. It was subdivided into three great tribes—the Auleri Cenomanni, Auleri Diablintes and Auleri Ebuovices.—Napoleon III, *History of Cæsar*, bk. 3, ch. 2.—See also VENETI OF WESTERN GAUL.

AULETES, or Ptolemy XIII of Egypt. See EGYPT: B. C. 80-48.

AULIATA, Turkestan, Fall of (1864). See RUSSIA: 1850-1876.

AULIC COUNCIL, a judicial and to a slight

extent executive body of the Holy Roman empire from 1497 to 1806. It consisted of about twenty members, held its meetings at Vienna and was under the influence of the emperor. See FRANCE: 1700 (August-December); and GERMANY: 1493-1510.

AULICK, Commodore, Hungarian officer who carried on negotiations with Japan. See JAPAN: 1707-1854.

AUMALE, Henri Eugène Philippe Louis d'Orleans, duc d' (1822-1807), French prince and statesman. Distinguished himself in the campaign in Algeria 1843; governor of that colony 1847. After the Franco-Prussian War was elected deputy; presided over the military council that condemned Marshal Bazaine for the surrender of Metz.—See also BARRAZA STATES: 1830-1846.

AUMALE, Battle of (1591). See FRANCE: 1591-1593.

AUMETZ, town in the northwestern part of Lorraine; occupied by Americans after armistice. See WORLD WAR: 1918: XI. End of the war: c.

AUMONT, the name of an important French family. One Jean, sire d'Aumont, accompanied Louis IX on a crusade. Fought for the dukes of Burgundy, later returning to the support of the crown. Jean d'Aumont (d. 1505), marshal of France, fought against the Huguenots, but recognized Henry IV and was made governor of Champagne and Brittany. Louis Marie Cèleste d'Aumont, duc de Piennes, emigrated during the Revolution. During the Hundred Days captured Bayeux and Caen.

AUNEAU, Battle of (1587). See FRANCE: 1584-1589.

AURANGZEB (1618-1707), one of the greatest and most unscrupulous of the Mogul emperors; imprisoned his father, Shah Jahan, and disposed of his brothers by means of assassination in order to gain the throne, which he ascended in 1658. See INDIA: 1605-1658; 1662-1748.

AURAY, Battle of (1365). See BRITANNY: 1341-1365.

AURELIAN (Lucius Domitius Aurelianus) (c. 212-275), a soldier emperor of Rome. Made vigorous war on the invading barbarians (see ALEMANNI: 270; CHALONS, Battle at (271)); began the construction of the fortified walls around Rome; overcame Zenobia, queen of Palmyra (see PALMYRA: Rise and fall); instituted strict discipline and reforms in Rome. See ROME: Empire: 192-284.

AURELIAN ROAD, one of the great Roman roads of antiquity, which ran from Rome to Pisa and Luna.—T. Mommsen, *History of Rome*, bk. 4, ch. 11.

AURELIANUS. See AURELIAN.

AUREOLUS (d. 268), leader of the Roman army of the Upper Danube and rival claimant for the Imperial throne; sought refuge in Milan after revolt against Gallienus. See MILAN: 268.

AURELIUS, Marcus. See ANTONIUS, MARCUS AURELIUS.

AURELLE de Paladines, Louis Jean Baptiste d' (1804-1877), French general. Served in Algeria and in the Crimean War; commanded the army of the Loire in the Franco-Prussian War; member of the National Assembly, assisted in the peace negotiations. As life senator, supported the monarchical majority of 1876. See FRANCE: 1870-1871; 1871 (March-May).

AURUM TOLOSANUM. See TOULOUSE.

AURUNCI, Auruncans or Ausones, a tribe of the ancient Volscians, who dwelt in the lower valley of the Liris, and who are said to have been exterminated by the Romans, B.C. 314.—W. Ihne, *History of Rome*, bk. 3, ch. 10.—See also **OSCAN**.

AUS, Southwest Africa, taken by British. See **WORLD WAR**: 1915: VIII. Africa: a, 1.

AUSCI. See **AQUITAINE**: Ancient tribes.

AUSGLEICH (agreement), the written statement by which Austria and Hungary united their governments and formed the dual monarchy in 1867. (See **AUSTRIA**: 1866-1867.) The Emperor Francis Joseph assumed the title of Emperor of Austria and King of Hungaria, although the two autonomous divisions were to manage all their local affairs. Questions of common interest were to be managed by a joint ministry, and a joint parliament made up of an Austrian legislature and an Hungarian legislature, termed "Delegations" which were to meet alternately in Vienna and Budapest. See **AUSTRIA-HUNGARY**: 1866; **HUNGARY**: 1856-1868; also **AUSTRIA-HUNGARY**: 1900-1903; and 1907.

AUSHAR, ancient name of Kileh-Sherghat. See **ASSYRIA**: The land.

AUSPICES, Taking the.—"The Romans, in the earlier ages of their history, never entered upon any important business whatsoever, whether public or private, without endeavouring, by means of divination, to ascertain the will of the gods in reference to the undertaking. . . . This operation was termed 'sumere auspicia;' and if the omens proved unfavourable the business was abandoned or deferred. . . . No meeting of the Comitia Curiata nor of the Comitia Centuriata could be held unless the auspices had been previously taken. . . . As far as public proceedings were concerned, no private individual, even among the patricians, had the right of taking auspices. This duty devolved upon the supreme magistrate alone. . . . In an army this power belonged exclusively to the commander-in-chief; and hence all achievements were said to be performed under his auspices, even although he were not present. . . . The objects observed in taking these auspices were birds, the class of animals from which the word is derived ('Auspicium ab ave spicienda'). Of these, some were believed to give indications by their flight. . . . others by their notes or cries. . . . while a third class consisted of chickens ('pulli') kept in cages. When it was desired to obtain an omen from these last, food was placed before them, and the manner in which they comported themselves was closely watched. . . . The manner of taking the auspices previous to the Comitia was as follows:—The magistrate who was to preside at the assembly arose immediately after midnight on the day for which it had been summoned, and called upon an augur to assist him. . . . With his aid a region of the sky and a space of ground, within which the auspices were observed, were marked out by the divining staff ('lituus') of the augur. . . . This operation was performed with the greatest care. . . . In making the necessary observations, the president was guided entirely by the augur, who reported to him the result."—W. Ramsay, *Manual of Roman antiquities*, ch. 4.—See also **AUGUR**.

Also in: W. Ihne, *History of Rome*, bk. 6, ch. 13.

AUSTEN, Jane (1775-1817), English novelist. Her pictures, in an ironic vein, of provincial society in the upper middle class went far to establish the realistic novel. Her best-known

works are "Pride and Prejudice" (1796, published 1813), "Sense and Sensibility" (1797-1798), "Emma" (1816), and "Northanger Abbey" (1818).

—See also **ENGLISH LITERATURE**: 1660-1780.

AUSTERLITZ, a town in Moravia in what was formerly Austrian territory but now forms part of Czecho-Slovakia; situated some fifteen miles east of Brünn; the scene of the great battle of Austerlitz (Dec. 2, 1805), where Napoleon decisively defeated the Austrian and Russian forces. —See also **AUSTRIA**: 1798-1806; and **FRANCE**: 1805.

AUSTIN, Stephen Fuller (1793-1836), American pioneer. Upon a grant obtained by his father, Moses Austin, he colonized Texas, and assisted in establishing the republic in 1835; was defeated in its first presidential election. See **TEXAS**: 1819-1835; 1824-1835.

AUSTIN CANONS, or **Canons of St. Augustine**.—"About the middle of the 11th century an attempt had been made to redress the balance between the regular and secular clergy, and restore to the latter the influence and consideration in spiritual matters which they had, partly by their own fault, already to a great extent lost. Some earnest and thoughtful spirits, distressed at once by the abuse of monastic privileges and by the general decay of ecclesiastical order, sought to effect a reform by the establishment of a stricter and better organized discipline in those cathedral and other churches which were served by colleges of secular priests. . . . Towards the beginning of the twelfth century the attempts at canonical reform issued in the form of what was virtually a new religious order, that of the Augustinians, or Canons Regular of the order of S. Augustine. Like the monks and unlike the secular canons, from whom they were carefully distinguished, they had not only their table and dwelling but all things in common, and were bound by vow to the observance of their rule, grounded upon a passage in one of the letters of that great father of the Latin Church from whom they took their name. Their scheme was a compromise between the old-fashioned system of canons and that of the monastic confraternities; but a compromise leaning strongly towards the monastic side. . . . The Austin canons, as they were commonly called, made their way across the channel in Henry's reign."—K. Norgate, *England under the Angevin kings*, v. 1, ch. 1. —See also **MONASTICISM**: 11th-13th centuries.

AUSTRALIA

Location and physical features.—Population and area.—Australia is the island continent lying southeast of Asia and the East Indies and is the only continent entirely south of the equator. Its area is approximately 2,046,601 square miles; its coast line is about 8,850 miles, giving it a smaller proportion of coast line than that of any other continent. The estimated population in 1919 was 5,247,019. The commonwealth of Australia includes the original states of New South Wales, Victoria, Queensland, South Australia, Western Australia and Tasmania (island) (see also BRITISH EMPIRE: Extent; NEW ZEALAND; TASMANIA).

"From a physical point of view, the appearance of Australia is disappointing to any one familiar with the variety of scenery to be found in Great Britain and Ireland. Here and there, in the settled parts of the country, are mountainous districts, covered with luxurious vegetation, and watered by beautiful streams. But the general aspect of the temperate parts of the continent is one of mild undulation or absolute flatness, covered with somewhat monotonous vegetation, or (in the summer months) bare and parched; while there is neither the artificial beauty of high cultivation nor the natural beauty of primitive wildness. Except in the tropical north, there are practically no navigable rivers on the mainland; even the Murray and the Darling are apt to become impassable in the summer. The scarcity of water is, indeed, one of the most disastrous natural features of Australia; and, unless artificial means can be used to correct it, vast tracts of country must for ever remain unsettled. Tasmania, however, is a country of noble rivers and striking scenery, though the painful monotony of Australian forest or 'bush' is to be met with there also. On the other hand the climate, in the temperate regions, is, perhaps, one of the finest in the world. Except in the mountainous districts there is no severe cold, frost and snow being unknown; and, though in the summer the temperature rises very high, the air is, as a rule, so dry, that neither lassitude nor other ill effects follow, and cases of sunstroke are extremely rare. A man may be prostrated by a temperature of 80° Fahr. in London, and yet feel quite brisk in experiencing 100° in Melbourne. The soil, too, in spite of the scarcity of water, is in many parts exceedingly fertile, both for pasture and agriculture; and these conditions of climate and soil must be regarded as important factors in the history of the colonies. It is, however, in its productive aspect, that Australia occupies such a unique position. Though possessing native fauna and flora of great extent and variety, it is almost barren of native products in any way useful for the prime necessities of life. The native animals and birds are curious rather than valuable. With few exceptions, they can be used neither for food nor service. The same remark applies to the native vegetable life. The universal gum tree is now becoming famous for its sanitary qualities; but early colonists cannot live on medicine, and the gum forests of Australia furnished but little timber for building houses and making furniture, nor did her uncultivated plains yield edible roots or grain. On the other hand, the soil of Australia has shown a remarkable capacity for fostering and developing imported animal and plant life. The consequence has been that the economic side of Australian life has been almost purely European. It is simply a reproduction of British economy, slightly modified to suit new con-

ditions. This feature has been intensified by the absence of competition. The aborigines of Australia (the word 'native' is now always reserved for those of European descent) have had no influence on Australian history. Absolutely barbarous and unskilled in the arts of life, dragging out, according to the accounts of all travellers, a wretched and precarious existence even before the arrival of European settlers, they could offer no resistance to the invaders, and they have, in fact, been entirely ignored (except as objects of charity or aversion) in the settlement of the country. Probably always few in numbers, they are now, at the highest estimate, considerably less than one hundred thousand. In Tasmania they have entirely disappeared; and though in the barren interior of the mainland they may prolong their existence for generations, there seems to be no hope that they will improve their lot. Most of the colonies have passed laws intended to protect them from personal cruelty and fraud; but these laws serve only still more to separate them from civilized life. The one pursuit in which they have hitherto been regarded as useful is that of tracking criminals or missing travellers; but white settlers in the 'bush' are rapidly becoming more expert than the aborigines in such matters, and the 'black trackers' are falling into discredit."—E. M. A. Jenks, *History of the Australasian colonies*, pp. 15-17.

Agriculture.—Effect of drought.—Main crops.—Cultivated area.—Artesian water supply.—Pastoral industry.—"Though much has been said and written about the recurrence and the evil effects of droughts in Australia in past years, when the agriculturists suffered loss chiefly in consequence of their having been too speculative and not sufficiently provident, the beneficial influences of the droughts have been to a large extent overlooked. In nearly all countries in the Northern Hemisphere the harvesting of crops for fodder has to be undertaken every year, so that the stock may be fed during the winter months, when the soil is resting and regaining its fertility and chemical constituents. In Australia the droughts will probably recur, but, with reasonable care and the proper conservation of water and fodder by the experienced agriculturist in the years when there is a superabundance of rain and herbage, they will be looked upon in future as by no means an unmixed evil, but rather as one of the provisions by which nature enables the soil to regain those properties which have been exhausted during a succession of bountiful seasons. The beneficial effect of resting the soil in times of drought is shewn by the very rapid recovery, by the increased fertility, and by the abundance of the harvests, in the seasons immediately following the droughts. . . . Wheat is the main crop in the Commonwealth, the cereal occupying over 63 per cent. of the total cultivated area in 1913-14. . . . [In 1875 the acreage under wheat was 1,422,614 with a production of 18,712,051 bushels, while in 1913-14 the acreage had increased to 9,295,256 and a production of 103,517,725 bushels.] Despite the checks to progress due to the vagaries of the season, . . . [there is] evidence of solid advancement. . . . According to the returns for 1913-14, the yield was equivalent to over 21 bushels per head of population. The estimated value of the Commonwealth wheat crop in that year was over \$92,464,716. For some years [prior to 1913-1914] Australia [was] in a position to export a fair quantity of wheat and flour to other countries. . . . Other ce-

real crops grown to fair extent in Australia are oats, barley, and maize. . . . Oats and barley are grown throughout [the Commonwealth] although Queensland grows very little oats, and only 8826 and 7723 acres were under barley in the States of Queensland and Tasmania and respectively during the latest season under review."—*Australian Commonwealth, its resources and production* (Commonwealth bureau of census and statistics, Melbourne, 1915, pp. 23, 27-28, 36).—In 1918-1919, the total area under cultivation was 13,332,393 acres, which produced crops of a total value of £58,080,000. Wheat, the most important grain crop yielded in 1919-1920 45,753,298 bushels from a total acreage of 6,379,560. Production from pastoral activities, in 1918-1919 included a total of 657,911,710 lbs. of wool, valued at £42,490,000. 181,802,675 lbs. of butter, of which 41,114,800 lbs. valued at £3,193,086 were exported. In addition exports of tallow and sheepskins brought a return of £4,117,699, and frozen meat, a growing industry, was exported to the value of £4,471,942. "Praiseworthy efforts to overcome [the] handicap of unsuitable natural conditions mark the economic development of Australia. The scanty rainfall has been supplemented by a certain amount of water conservation, mainly tapping the vast reservoir of artesian water which underlies 576,000 square miles of the arid regions of New South Wales, Queensland and South Australia, where the pastoral industry is supreme. . . . Adverse conditions have called for improvement in the breed of sheep so as to fit them to their environment. . . . This has been achieved. Merino sheep do best in New South Wales where they form 83 per cent of the whole. In order to suit other climates, to obtain a hardier sheep which would be more useful for mixed farming, the merino has been crossed with other sheep, without loss to its wool-bearing powers. The fleece cut from each sheep has risen [1918-1920] to an average of eight pounds at the present day. In addition, the quality of the wool has improved, and the weight of the original sheep nearly doubled. (3) The State has pursued a railway and land policy which has led to an increase of productivity. The large areas, as a result, are being replaced by small holdings. Yet all these efforts have not fully succeeded in putting the pastoral industry in a condition of continuous increase. The number of sheep in Australia has declined in recent years. The pastoral industry is limited, through climatic conditions, to about 28 per cent of the country, though an area embracing another 19½ per cent would be available, if provision could be made for the transport of stock to wetter areas in dry seasons. . . . As in the case of the pastoral industry, the progress of agriculture has involved the overcoming of great difficulties. The land laws favored large estates, and thus restricted settlement. A scanty rainfall led men to consider large areas of land in New South Wales, Victoria and South Australia unsuitable for wheat growing. Scarcity of labour threatened to make the cost of production too high for the average yield of wheat to repay the farmer. Most of these obstacles are being overcome. Legislation has diminished the number of large holdings, at the same time increasing the number of settlers. The use of scientific methods of cultivation has tended to overcome the other difficulties. . . . Ploughing is done by multiple ploughs, which throw six to eight furrows at one time. . . . Harvesting is done by the combined stripper and harvester, an Australian invention. As a result of this economy so low an average production as ten bushels of wheat per acre is profitable. Again, the [farmer] has had to guard against insufficient rainfall, and, as dry farming in its real sense has not yet been attempted, the

precautions taken have been those of fallowing and a rotation of crops. The fallowing is so conducted as to conserve in the soil two winters' rainfall and thus to obviate the evils of a dry harvest season."—C. H. Northcott, *Australian social development* (Studies in history, economics and public law, Columbia University, v. 81, No. 2, 1918, pp. 210-214).

Mythology. See MYTHOLOGY: Oceania: Australian myths.

1601-1800.—Discovery and early exploration. —"Australia has had no Columbus. It is even doubtful if the first navigators who reached her shores set out with any idea of discovering a great south land. At all events, it would seem, their achievements were so little esteemed by themselves and their countrymen that no means were taken to preserve their names in connexion with their discoveries. Holland long had the credit of bringing to light the existence of that island-continent, which until recent years was best known by her name. In 1861, however, Mr. Major, to whom we are indebted for more recent research upon the subject, produced evidence which appeared to demonstrate that the Portuguese had reached the shores of Australia in 1601, five years before the Dutch yacht *Duyphen*, or *Dove*,—the earliest vessel whose name has been handed down,—sighted, about March, 1606, what is believed to have been the coast near Cape York. Mr. Major, in a learned paper read before the Society of Antiquaries in 1872, indicated the probability that the first discovery was made 'in or before the year 1531.' The dates of two of the six maps from which Mr. Major derives his information are 1531 and 1542. The latter clearly indicates Australia, which is called *Jave la Grande*. New Zealand is also marked."—F. P. Labilliere, *Early history of the colony of Victoria*, ch. 1.—In 1606, De Quiros, a Spanish navigator, sailing from Peru, across the Pacific, reached a shore which stretched so far that he took it to be a continent. "He called the place 'Tierra Australis de Espiritu Santo,' that is 'Southern Land of the Holy Spirit.' It is now known that this was not really a continent, but merely one of the New Hebrides Islands, and more than a thousand miles away from the mainland. . . . In after years, the name he had invented was divided into two parts; the island he had really discovered being called *Espiritu Santo*, while the continent he thought he had discovered was called *Tierra Australis*. This last name was shortened by another discoverer—Flinders—to the present term *Australia*."—A. and G. Sutherland, *History of Australia and New Zealand*, ch. 1.—"In 1611 Hendrik Brouwer, a commander of marked ability who subsequently became Governor-General of the Dutch East Indies, made a discovery. He found that if, after leaving the Cape, he steered due east for about three thousand miles, and then set a course north for Java, he had the benefit of favourable winds, which enabled him to finish the voyage in much less time than the old route required. Brouwer wrote to the directors of the Dutch East India Company [see NETHERLANDS: 1594-1620] pointing out that he had sailed from Holland to Java in seven months, and recommending that ships' captains should be instructed to take the same course in future. The directors followed his advice; and from the year 1613 all Dutch commanders were under instructions to follow Brouwer's route. The bearing of this change on the discovery of the west coast of Australia will be immediately apparent to any one who glances at the map of the southern Indian Ocean. The distance from the Cape of

Good Hope to Cape Leeuwin is about 4,300 miles. A vessel running eastward with a free wind, and anxious to make the most of it before changing her course northward, would be very likely to sight the Australian coast. That is precisely what occurred to the ship *Eendragt* (i.e., Concord). Her captain, Dirk Hartog, ran farther eastward than Brouwer had advised, reaching Shark's Bay and landing on the island which to this day bears his name. He erected there a post, and nailed to it a tin plate upon which was engraved the record that on October 25, 1616, the ship *Eendragt* from Amsterdam had arrived there, and had sailed for Bantam on the 27th. Dirk Hartog's plate was found by Captain Vlaming, of the Dutch ship *Geelvink*, eighty years later. The post had decayed, but the plate itself was 'unaffected by rain, air, or sun.' Vlaming sent it to Amsterdam as an interesting memorial of discovery, and erected another post and plate in place of it; and Vlaming's plate in turn remained until 1817, when Captain Louis de Freycinet, the commander of a French exploring expedition, took it away with him to Paris. Dirk Hartog's discovery was recognized by the seamen of his nation as one which conduced to safer navigation. Brouwer's sailing direction had left it indefinite at what point the turn northward should be commenced. But now there was a landmark, and amended instructions were issued to Dutch mariners that they should sail from the Cape between the latitudes of thirty and forty degrees for about four thousand miles until the 'New Southland of the *Eendragt*' was sighted. 'The land of the *Eendragt*'—'T'Landt van de *Eendragt*'—that was the first name given by the Dutch to this country; and it so appears upon several early maps of the world published at Amsterdam. In this way the western coasts of Australia were brought within sight of the regular sailing track of vessels from Europe; and as soon as that occurred the finding of other portions of the coast was only a matter of time. Of course all the captains did not reach the coast at the same spot. Violent winds would sometimes blow a vessel hundreds of miles out of her planned course. Both going to and coming from the East Indies ships would discover fresh pieces of coastline in quite a chance manner. Thus, *De Wit* sailing homeward from Batavia in 1628 in the *Vyanen* was by headwinds driven aground upon the north-west coast, and had to throw overboard a quantity of pepper and copper, 'upon which through God's mercy she got off again without further damage.' That bit of coast was named 'De Wit's Land.'—E. Scott, *Short history of Australia*, pp. 18-19.—After the visit to the Australian coast of the small Dutch ship, the *Dave*, it was touched, during the next twenty years, by a number of vessels of the same nationality. "In 1622 a Dutch ship, the *Leeuwin*, or *Lioness*, sailed along the southern coast, and its name was given to the south-west cape of Australia. . . . In 1628 General Carpenter sailed completely round the large Gulf to the north, which has taken its name from this circumstance. Thus, by degrees, all the northern and western, together with part of the southern shores, came to be roughly explored, and the Dutch even had some idea of colonizing this continent. . . . During the next fourteen years we hear no more of voyages to Australia; but in 1642 Antony Van Diemen, the Governor of the Dutch possessions in the East Indies, sent out his friend Abel Jansen Tasman, with two ships, to make discoveries in the South Seas." Tasman discovered the island which he called Van Diemen's Land, but which has since

been named in his own honor—Tasmania. "This he did not know to be an island; he drew it on his maps as if it were a peninsula belonging to the mainland of Australia." In 1699, the famous buccaneer, William Dampier, was given the command of a vessel sent out to the southern seas, and he explored about 900 miles of the north-western coast of Australia; but the description which he gave of the country did not encourage the adventurous to seek fortune in it. "We hear of no further explorations in this part of the world until nearly a century after; and, even then, no one thought of sending out ships specially for the purpose. But in the year 1770 a series of important discoveries were indirectly brought about. The Royal Society of London, calculating that the planet Venus would cross the disc of the sun in 1769, persuaded the English Government to send out an expedition to the Pacific Ocean for the purpose of making observations on this event which would enable astronomers to calculate the distance of the earth from the sun. A small vessel, the *Endeavour*, was chosen; astronomers with their instruments embarked, and the whole placed under the charge of" the renowned sailor, Captain James Cook. The astronomical purposes of the expedition were satisfactorily accomplished at Otaheite, and Captain Cook then proceeded to an exploration of the shores of New Zealand and Australia. Having entered a fine bay on the south-eastern coast of Australia, "he examined the country for a few miles inland, and two of his scientific friends—Sir Joseph Banks and Dr. Solander—made splendid collections of botanical specimens. From this circumstance the place was called Botany Bay, and its two head-lands received the names of Cape Banks and Cape Solander. It was here that Captain Cook . . . took possession of the country on behalf of His Britannic Majesty, giving it the name 'New South Wales,' on account of the resemblance of its coasts to the southern shores of Wales. [See also AUSTRALIA: 1773; BRITISH EMPIRE: Expansion; 18th century.] Shortly after they had set sail from Botany Bay they observed a small opening in the land, but Cook did not stay to examine it, merely marking it on his charts as Port Jackson, in honour of his friend Sir George Jackson. . . . The reports brought home by Captain Cook completely changed the beliefs current in those days with regard to Australia." In 1792 Captain Phillip, governor of the Botany bay settlement, broken in health, had resigned, and in 1795 he had been succeeded by Governor Hunter. "When Governor Hunter arrived, in 1795, he brought with him, on board his ship, the *Reliance*, a young surgeon, George Bass, and a midshipman called Matthew Flinders. They were young men of the most admirable character. . . . Within a month after their arrival they purchased a small boat about eight feet in length, which they christened the *Tom Thumb*. Its crew consisted of themselves and a boy to assist." In this small craft they began a survey of the coast, usefully charting many miles of it. Soon afterwards, George Bass, in an open whale-boat, pursued his explorations southwards, to the region now called Victoria, and through the straits which bear his name, thus discovering the fact that Van Diemen's Land, or Tasmania, is an island, not a peninsula. In 1798, Bass and Flinders, again associated and furnished with a small sloop, sailed round and surveyed the entire coast of Van Diemen's Land. Bass now went to South America and there disappeared. Flinders was commissioned by the British government in 1800 to make an extensive survey of the Australian coasts, and did so. Returning to

England with his maps, he was taken prisoner on the way by the French and held in captivity for six years, while the fruits of his labor were stolen. He died a few years after being released.—A. and G. Sutherland, *History of Australia*, ch. 1-3.—See also ANTARCTIC EXPLORATION: 1519-1819; PACIFIC OCEAN: 1764-1850.

1787-1840.—Penal settlements.—Beginning of the prosperity of New South Wales.—Introduction of sheep-farming.—Founding of Victoria and South Australia.—“It so happened that, shortly after Cook's return, the English nation had to deal with a great difficulty in regard to its criminal population. In 1776 the United States declared their independence, and the English then found they could no longer send their convicts over to Virginia, as they had formerly done. In a short time the gaols of England were crowded with felons. It became necessary to select a new place of transportation; and, just as this difficulty arose, Captain Cook's voyages called attention to a land in every way suited for such a purpose, both by reason of its fertility and of its great distance. Viscount Sydney, therefore, determined to send out a party to Botany Bay, in order to found a convict settlement there; and in May, 1787, a fleet was ready to sail.” After a voyage of eight months the fleet arrived at Botany Bay, in January, 1788. The waters of the bay were found to be too shallow for a proper harbor, and Captain Phillip, the appointed governor of the settlement, set out, with three boats, to search for something better. “As he passed along the coast he turned to examine the opening which Captain Cook had called Port Jackson, and soon found himself in a winding channel of water, with great cliffs frowning overhead. All at once a magnificent prospect opened on his eyes. A harbour, which is, perhaps, the most beautiful and perfect in the world, stretched before him far to the west, till it was lost on the distant horizon. It seemed a vast maze of winding waters, dotted here and there with lovely islets. . . . Captain Phillip selected, as the place most suitable to the settlement, a small inlet, which, in honour of the Minister of State, he called Sydney Cove. It was so deep as to allow vessels to approach within a yard or two of the shore.”—A. and G. Sutherland, *History of Australia and New Zealand*, ch. 1-3.—Great difficulties and sufferings attended the founding of the penal settlement, and many died of actual starvation as well as of disease; but in twelve years the population had risen to between 6,000 and 7,000 persons. Meantime a branch colony had been established on Norfolk island. “For twenty years and more no one at home gave a thought to New South Wales, or ‘Botany Bay,’ as it was still erroneously called, unless in vague horror and compassion for the poor creatures who lived there in exile and starvation. The only civilizing element in the place was the presence of a devoted clergyman named Johnson, who had voluntarily accompanied the first batch of convicts. . . . Colonel Lachlan Macquarie entered on the office of governor in 1810, and ruled the settlement for twelve years. His administration was the first turning point in its history. . . . Macquarie saw that the best and cheapest way of ruling the convicts was to make them freemen as soon as possible. Before his time, the governors had looked on the convicts as slaves, to be worked for the profit of the government and of the free settlers. Macquarie did all he could to elevate the class of emancipists, and to

encourage the convicts to persevere in sober industry in the hope of one day acquiring a respectable position. He began to discontinue the government farms, and to employ the convicts in road-making, so as to extend the colony in all directions. When he came to Sydney, the country more than a day's ride from the town was quite unknown. The growth of the settlement was stopped on the west by a range called the Blue Mountains, which before his time no one had succeeded in crossing. But in 1813, there came a drought upon the colony: the cattle, on which everything depended, were unable to find food. Macquarie surmised that there must be plenty of pasture on the plains above the Blue Mountains: he sent an exploring party, telling them that a pass must be discovered. In a few months, not only was this task accomplished, and the vast and fertile pastures of Bathurst reached, but a road 130 miles long was made, connecting them with Sydney. The Lachlan and Macquarie rivers were traced out to the west of the Blue Mountains. Besides this, coal was found at the mouth of the Hunter river, and the settlement at Newcastle formed. . . . When it became known that the penal settlement was gradually becoming a free colony, and that Sydney and its population were rapidly changing their character, English and Scotch people soon bethought them of emigrating to the new country. Macquarie returned home in 1822, leaving New South Wales four times as populous, and twenty times as large as when he went out, and many years in advance of what it might have been under a less able and energetic governor. The discovery of the fine pastures beyond the Blue Mountains settled the destiny of the colony. The settlers came up thither with their flocks long before Macquarie's road was finished; and it turned out that the downs of Australia were the best sheep-walks in the world. The sheep thrives better there, and produces finer and more abundant wool, than anywhere else. John Macarthur, a lieutenant in the New South Wales corps, had spent several years in studying the effect of the Australian climate upon the sheep; and he rightly surmised that the staple of the colony would be its fine wool. In 1803, he went to England and procured some pure Spanish merino sheep from the flock of George III. . . . The Privy Council listened to his wool projects, and he received a large grant of land. Macarthur had found out the true way to Australian prosperity. When the great upland pastures were discovered, the merino breed was well established in the colony; and the sheep-owners, without waiting for grants, spread with their flocks over immense tracts of country. This was the beginning of what is called squatting. The squatters afterwards paid a quit-rent to the government and thus got their runs, as they call the great districts where they pastured their flocks, to a certain extent secured to them. . . . Hundreds upon hundreds of square miles of the great Australian downs were now explored and stocked with sheep for the English wool-market. . . . It was in the time of Macquarie's successor, Sir Thomas Brisbane, that the prospects of New South Wales became generally known in England. Free emigrants, each bringing more or less capital with him, now poured in; and the demand for labour became enormous. At first the penal settlements were renewed as depots for the supply of labour, and it was even proposed that the convicts should be sold by auction on their arrival; but in the end the influx of free labourers entirely altered the question. In Brisbane's time, and that of his successor, Sir Ralph Darling, wages fell and work

became scarce in England; and English working men now turned their attention to Australia. Hitherto the people had been either convicts or free settlers of more or less wealth, and between these classes there was great bitterness of feeling, each, naturally enough, thinking that the colony existed for their own exclusive benefit. The free labourers who now poured in greatly contributed in course of time to fusing the population into one. In Brisbane's time, trial by jury and a free press were introduced. The finest pastures in Australia, the Darling Downs near Moreton Bay, were discovered and settled [1825]. The rivers which pour into Moreton Bay were explored: one of them was named the Brisbane, and a few miles from its mouth the town of the same name was founded. Brisbane is now the capital of the colony of Queensland; and other explorations in his time led to the foundation of a second independent colony. The Macquarie was traced beyond the marshes, in which it was supposed to lose itself, and named the Darling; and the Murray river was discovered [1820]. The tracing out of the Murray river by the adventurous traveller Sturt, led to a colony on the site which he named South Australia. In Darling's time, the Swan River Colony, now called Western Australia, was commenced. Darling . . . was the first to sell the land at a small fixed price, on the system adopted in America. . . . Darling returned to England in 1831; and the six-years' administration of his successor, Sir Richard Bourke, marks a fresh turning-point in Australian history. In his time the colony threw off two great offshoots. Port Phillip, on which now stands the great city of Melbourne, had been discovered in 1802, and in the next year the government sent hither a convict colony. This did not prosper, and this fine site was neglected for thirty years. When the sudden rise of New South Wales began, the squatters began to settle to the west and north of Port Phillip; and the government at once sent an exploring party, who reported most favourably of the country around. In 1836, Governor Bourke founded a settlement in this new land, which had been called, from its rich promise, Australia Felix; and under his directions the site of a capital was laid out, to be called Melbourne, in honour of the English Prime Minister. This was in 1837, so that the beginning of the colony corresponds nearly with that of Queen Victoria's reign; a circumstance which afterwards led to its being named Victoria. Further west still, a second new colony arose about this time on the site discovered by Sturt in 1820. This was called South Australia, and the first governor arrived there at the end of the year 1836. The intended capital was named Adelaide, in honour of the Queen of William IV." Owing to the institution of a system of scientific colonization into the two colonies, a sudden boom and an equally swift business and real estate depression visited South Australia. "The depression of South Australia, however, was but temporary. It contains the best corn land in the whole island; and hence it of course soon became the chief source of the food supply of the neighbouring colonies, besides exporting large quantities of corn to England. It contains rich mines of copper, and produces large quantities of wool."—E. J. Payne, *History of European colonies*, ch. 12. See NEW SOUTH WALES, VICTORIA, and SOUTH AUSTRALIA.

1810-1837.—Attempts at scientific colonization.

—"In pursuance of their objects the Colonization Society had in 1830 approached the Government,

but they met with no success while the Duke of Wellington was in office. Sir George Murray, then Secretary of State for the Colonies, told them that the Government rather wished to discourage emigration. With a change of Ministry and the advent of Lord Goderich and Lord Howick to the Colonial Office at the end of 1830, their renewed representations had a more favourable reception. They achieved their first public success when, in January, 1831, the Government determined to adopt some measure of the Wakefield theory by making a great change in the disposal of waste lands in New South Wales, Van Diemen's Land and Western Australia. In New South Wales land had been given away without regard to its existing or future value. . . . Up to 1810, the usual method had been to grant land to emancipated convicts or to free settlers, subject to conditions as to quit-rents. These grants were made at the absolute discretion of the Governor, and during this period were large in [extent] though not in number. . . . During this period, up to 1810, there had been granted in New South Wales 117,260 acres. During the next stage, 1810-1822, while Governor Macquarie held office, the Home Government seems to have determined to encourage capitalists to come to Australia. Anyone arriving there received, on conditions as to quit-rents and cultivation, a free grant of land in proportion to the capital which he could persuade the Governor that he possessed and was prepared to invest in the colony. Sometimes the capital was fictitious or was obligingly lent to the applicant by any accommodating friend. This system, though not the sole method of granting land, lasted until 1830. . . . By 1828 the land alienated in New South Wales amounted to 2,906,346 acres. This very large increase was due, not only to the necessity of meeting the claims of an increasing population, but also to the fact that, in 1824, a large grant of about 1,000,000 acres in New South Wales had been made to the Australian Agricultural Company, on the usual conditions as to quit-rents. In Van Diemen's Land, in 1825, a similar grant of about 350,000 acres was made to the Van Diemen's Land Company. By the end of 1830, no fewer than 3,344,030 acres had been alienated in New South Wales. . . . The first intimation of a change in 1831 was a despatch from Lord Goderich to Governor Darling on the 9th January, announcing his intention to introduce, in the near future, a uniform system of sale in New South Wales, and instructing Darling, in the meantime, to discontinue all further grants except by way of sale. His intention was realized in a despatch of the 14th February, 1831, containing Royal Instructions to Darling as to the disposal of waste lands, and enclosing the printed terms of the new regulations for intending settlers—afterwards well known as the Ripon Regulations. The Governor was instructed that all lands not hitherto granted, and not appropriated for public purposes, were to be disposed of in no other way than by sale at auction at a minimum price of not less than five shillings per acre. A deposit of 10 per cent. was required from the purchaser, and the remainder was to be paid within a month, or possession was not granted and the sale was void. Grants thus obtained were to be subject to no conditions whatever except a nominal quit-rent of a peppercorn. The land was to be put up for sale in lots of not less than 640 acres, except in special circumstances when, on application to the Governor, the quantity might be reduced. With the Governor, however, rested the sole power of deciding what lands should be exposed for sale

and what lands withheld. Lands which were required for grazing purposes were to be let on lease from year to year, but, if applied for by intending purchasers, were to be sold at auction in the same way as other land. At the same time another reform was instituted by this despatch. Crown reserves for Church or School establishments were, in accordance with a recommendation of the Commissioners of Inquiry into Colonial Expenditure in 1830, abolished as a tax upon the industry and capital of the colonists. These changes applied both to New South Wales and Van Diemen's Land, and similar instructions and regulations were sent out a little later to the Governor of Western Australia. . . . The Ripon Regulations, then, were an attempt to put into practice the chief principle of the Wakefield theory. It was the first attempt in the nineteenth century to proceed systematically in disposing of the waste lands of the Crown in the colonies."—R. C. Mills, *Colonization of Australia*, pp. 155-194.—See also NEW SOUTH WALES: 1821-1831.

1821-1845.—Need for free labor.—Wakefield system in South Australia.—“Not less important to a young colony than a good system of disposing of land, is immigration, which brings to the land the necessary complement of labour and capital. During the years 1821 to 1830 inclusive, emigration from Great Britain to Australia was not a steady stream, but a mere trickle. On an average only 880 free settlers arrived each year, and this included those who went to form the new settlement at Swan River. Not until 1828 did the numbers amount to over one thousand in any one year. During the corresponding period the average annual number of convict emigrants to the penal colonies of New South Wales and Van Diemen's Land was 2,447. But by 1830 these colonies had come to be something more than mere overseas prisons. In 1828, when a census was taken in New South Wales, the free settlers (including emancipated convicts) numbered about 21,000, while the convicts numbered about 16,000. The time had gone by when Governor Macquarie could preach and practise the doctrine that a penal colony existed primarily for convicts and ex-convicts. But, at the rate at which convicts were pouring in, something more than the trivial stream of free emigrants was required if the free population was definitely to predominate in these colonies. The Home Government showed no sign of checking the supply of convicts, much less of abandoning the system of transportation. Indeed from 1826 to 1830 the number of convict emigrants gradually increased. . . . Throughout the decade beginning with 1830 complaints were common in all the Australian colonies of the scarcity of labour. Indeed, so great was the demand for labour that, in 1837, the Legislative Council of New South Wales entertained the proposal to introduce into the colony natives of India bound by indenture to work for a given period. In all the Australian colonies the system of indentured labour had failed. . . . Convict labour was still more unsatisfactory. . . . One particular drawback under which these colonies suffered, and which concerned both immigration and the scarcity of labour, was the extreme disproportion between the sexes. . . . A supply of immigrants, then, selected on a system adapted to their needs, was the most urgent need of the penal colonies of Australia in 1830. Bad, indeed, as was convict labour, the colonists clung to it as their only support. Labour of some description they needed, and free labour did not exist in any quantity. The reputation of the penal

colonies was so unattractive to the ordinary emigrant that, as the returns showed, there was at that time no voluntary emigration of labouring people to Australia. . . . Canada, and particularly the United States, made an equal demand for labour and were much easier to reach. What the Australian colonies needed was some means of overcoming the handicap of distance, and this they found in Wakefield's 'golden bridge' of an emigration fund produced as the result of land sales. The Home Government was not at first disposed to pay the whole of the passages of emigrants. . . . But circumstances compelled the Government to abandon this position. The attempt to base a system of emigration upon the repayment of advances by the emigrant failed conclusively. . . . Step by step then the Home Government was forced, first to increase the amount of that portion of the passage money which was a gift to the emigrant, and finally to pay the whole of the fare. Soon after a commencement had been made with female emigration, of a fare of £17 the share paid by the Government was increased to £12, £6 of which was paid on departure of the emigrant and £6 on her arrival in the colony. In 1834, a change was made whereby the Government paid the whole of the £17 and required the emigrant to repay £6. Finally, in 1835, the whole of the passage became a free gift to the emigrant. Similarly in regard to emigrant mechanics and agricultural labourers the amount advanced to them was considerably increased in 1836, and, in 1837, the system became one of free passages for all emigrants selected by the Government. In both cases, too, the Home Government, despairing of the repayment of the advances, instructed the Governors of New South Wales and Van Diemen's Land in 1835 to remit these debts and to treat the loans as free gifts. In the selection of emigrants to New South Wales and Van Diemen's Land the Home Government was conspicuously unsuccessful. . . . In the Australian colonies there was inevitably a good deal of dissatisfaction with this kind of emigration. The reputation of the better class of emigrants was likely to be gauged by the character of the worst, and this adversely affected the popularity of emigration. . . . In New South Wales in 1835, they suggested that emigration should in Britain be managed by those who had a personal interest in the colony. This suggestion was . . . approved by the Home Government. Accordingly naval surgeons, who had been superintendents of convict ships and therefore were familiar both with the needs of the colonies and the management of emigrants during a long voyage, were appointed by the colonial government to proceed to Great Britain to manage emigration. There each surgeon was to select and bring out under his personal supervision a shipload of emigrants. . . . At the end of 1836, . . . the London Emigration Committee expressed a desire to relinquish their functions, . . . and had recommended that emigration should be managed by a central Board responsible to the Government or directly to Parliament. The resignation of the London Emigration Committee was accepted and Lord Glenelg, early in 1837, took the opportunity of . . . appointing as Agent-General for Emigration Mr. T. F. Elliot, who had been secretary to the Emigration Commission of 1831-2. His duty was to exercise a general superintendence over emigration to all colonies, and, in regard to Australia, to help in carrying on the system of Government emigration which he found in force. Emigration . . . became at length a department of government administered by an officer responsible to the Colonial Office and therefore indirectly to

Parliament."—R. C. Mills, *Colonization of Australia*, pp. 155-194.

The Wakefield system was employed to secure immigrants for both South Australia and Victoria. In the former of the two colonies the experiment had a fairer opportunity to show its value because of the greater independence and lack of prejudice of the Melbourne government. Wakefield's "notion was that the new colonies ought to be made 'fairly to represent English society.' His plan was to arrest the strong democratic tendencies of the new community, and to reproduce in Australia the strong distinction of classes which was found in England. He wanted the land sold as dear as possible, so that labourers might not become land-owners; and the produce of the land was to be applied in tempting labourers to emigrate with the prospect of better wages than they got at home. A Company was easily formed to carry out these ideas in South Australia. . . . Like the settlement of Carolina as framed by Locke and Somers, it was really a plan for getting the advantages of the colony into the hands of the non-labouring classes: and by the natural laws of political economy, it failed everywhere. Adelaide became the scene of an Australian 'bubble.' The land-jobbers and money-lenders made fortunes: but the people who emigrated, mostly belonging to the middle and upper classes, found the scheme to be a delusion. Land rapidly rose in value, and as rapidly sank; and lots for which the emigrants had paid high prices became almost worthless. The labourers emigrated elsewhere, and so did those of the capitalists who had anything left."—E. J. Payne, *History of European colonies*, ch. 12.—See also SOUTH AUSTRALIA: 1834-1836.

1839-1855.—Progress of the Port Phillip district.—Its separation from New South Wales and erection into the colony of Victoria.—Discovery of gold.—Constitutional organization of the colony.—"In 1839 the population of Port Phillip amounted to nearly 6,000, and was being rapidly augmented from without. The sheep in the district exceeded half a million, and of cattle and horses the numbers were in proportion equally large. The place was daily growing in importance. The Home Government therefore decided to send an officer, with the title of Superintendent, to take charge of the district, but to act under the Governor of New South Wales. Charles Joseph La Trobe, Esq., was appointed to this office. . . . He arrived at Melbourne on the 30th September, 1839. Soon after this all classes of the new community appear to have become affected by a mania for speculation. . . . As is always the case when speculation takes the place of steady industry, the necessities of life became fabulously dear. Of money there was but little, in consideration of the amount of business done, and large transactions were effected by means of paper and credit. From highest to lowest, all lived extravagantly. . . . Such a state of things could not last forever. In 1842, by which time the population had increased to 24,000, the crash came. . . . From this depression the colony slowly recovered, and a sounder business system took the place of the speculative one. . . . All this time, however, the colony was a dependency of New South Wales, and a strong feeling had gained ground that it suffered in consequence. . . . A cry was raised for separation. The demand was, as a matter of course, resisted by New South Wales, but as the agitation was carried on with increased activity, it was at last yielded to by the Home authorities. The vessel bearing the intelligence arrived on the 11th November, 1850. The news

soon spread, and great was the satisfaction of the colonists. Rejoicings were kept up in Melbourne for five consecutive days. . . . Before, however, the separation could be legally accomplished, it was necessary that an Act should be passed in New South Wales to settle details. . . . The requisite forms were at length given effect to, and, on the 1st July, 1851, a day which has ever since been scrupulously observed as a public holiday, it was proclaimed that the Port Phillip district of New South Wales had been erected into a separate colony to be called Victoria, after the name of Her Most Gracious Majesty. At the same time the Superintendent, Mr. C. J. La Trobe, was raised to the rank of Lieutenant-Governor. At the commencement of the year of separation the population of Port Phillip numbered 76,000, the sheep 6,000,000, the cattle 380,000. . . . In a little more than a month after the establishment of Victoria as an independent colony, it became generally known that rich deposits of gold existed within its borders. . . . The discovery of gold . . . in New South Wales, by Hargreaves, in February, 1851, caused numbers to emigrate to that colony. This being considered detrimental to the interests of Victoria, a public meeting was held in Melbourne on the 9th of June, at which a 'gold-discovery committee' was appointed, which was authorized to offer rewards to any that should discover gold in remunerative quantities within the colony. The colonists were already on the alert. At the time this meeting was held, several parties were out searching for, and some had already found gold. The precious metal was first discovered at Clunes, then in the Yarra ranges at Anderson's Creek, soon after at Buninyong and Ballarat, shortly afterwards at Mount Alexander, and eventually at Bendigo. The deposits were found to be richer and to extend over a wider area than any which had been discovered in New South Wales. Their fame soon spread to the adjacent colonies, and thousands hastened to the spot. . . . When the news reached home, crowds of emigrants from the United Kingdom hurried to our shores. Inhabitants of other European countries quickly joined in the rush. Americans from the Atlantic States were not long in following. Stalwart Californians left their own gold-yielding rocks and placers to try their fortunes at the Southern Eldorado. Last of all, swarms of Chinese arrived, eager to unite in the general scramble for wealth. . . . The important position which the Australian colonies had obtained in consequence of the discovery of gold, and the influx of population consequent thereon, was the occasion of the Imperial Government determining in the latter end of 1852 that each colony should be invited to frame such a Constitution for its government as its representatives might deem best suited to its own peculiar circumstances. The Constitution framed in Victoria, and afterwards approved by the British Parliament, was avowedly based upon that of the United Kingdom. It provided for the establishment of two Houses of Legislature, with power to make laws, subject to the assent of the Crown as represented generally by the Governor of the colony; the Legislative Council, or Upper House, to consist of 30, and the Legislative Assembly, or Lower House, to consist of 60 members. Members of both Houses to be elective and to possess property qualifications. Electors of both Houses to possess either property or professional qualifications [the property qualification of members and electors of the Lower House has since been abolished]. . . . The Upper House not to be dissolved, but five members to retire every two years, and to be eligible

for re-election. The Lower House to be dissolved every five years [since reduced to three], or oftener, at the discretion of the Governor. Certain officers of the Government, four at least of whom should have seats in Parliament, to be deemed 'Responsible Ministers.' . . . This Constitution was proclaimed in Victoria on the 23d November, 1855.—H. H. Hayter, *Notes on the colony of Victoria*, ch. 1.—See also NEW SOUTH WALES: 1831-1855.

1859.—Separation of the Moreton bay district from New South Wales.—Its erection into the colony of Queensland.—“Until December, 1859, the north-west portion of the Fifth Continent was known as the Moreton Bay district, and belonged to the colony of New South Wales; but at that date it had grown so large that it was erected into a separate and independent colony, under the name of Queensland. It lies between lat. 10° 43' S. and 20° S., and long. 138° and 153° E., bounded on the north by Torres Straits; on the north-east by the Coral Sea; on the east by the South Pacific; on the south by New South Wales and South Australia; on the west by South Australia and the Northern Territory; and on the north-west by the Gulf of Carpentaria. It covers an area . . . twenty times as large as Ireland, twenty-three times as large as Scotland, and eleven times the extent of England. . . . Numerous good harbours are found, many of which form the outlets of navigable rivers. The principal of these [is] Moreton Bay, at the head of which stands Brisbane, the capital of the colony. . . . The mineral wealth of Queensland is very great, and every year sees it more fully developed. . . . Until the year 1867, when the Gympie field was discovered, gold mining as an industry was hardly known.”—C. H. Eden, *Fifth continent*, ch. 10.

1866.—Tariff legislation of Victoria and New South Wales. See TARIFF: 1862-1892.

1885-1892.—Proposed federation of the colonies.—“It has been a common saying in Australia that our fellow countrymen in that part of the world did not recognise the term 'Australian,' each recognised only his own colony and the empire. But the advocates of combination for certain common purposes achieved a great step forward in the formation of a 'Federal Council' in 1885. It was to be only a 'Council,' its decisions having no force over any colony unless accepted afterwards by the colonial Legislature. Victoria, Queensland, Tasmania and West Australia joined, New South Wales, South Australia, and New Zealand standing out, and, so constituted, it met twice. The results of the deliberations were not unsatisfactory, and the opinion that the move was in the right direction rapidly grew. In February of 1890 a Federation Conference, not private but representative of the different Governments, was called at Melbourne. It adopted an address to the Queen declaring the opinion of the conference to be that the best interests of the Australian colonies require the early formation of a union under the Crown into one Government, both legislative and executive. Events proceed quickly in Colonial History. In the course of 1890 the hesitation of New South Wales was finally overcome: powerful factors being the weakening of the Free Trade position at the election of 1890, the report of General Edwards on the Defences, and the difficulties about

Chinese immigration. A Convention accordingly assembled at Sydney in March, 1891, which agreed upon a Constitution to be recommended to the several Colonies.”—A. Caldecott, *English colonization and empire*, ch. 7, sect. 2.—“On Monday, March 2nd, 1891, the National Australasian Convention met at the Parliament House, Sydney, New South Wales, and was attended by seven representatives from each Colony, except New Zealand, which only sent three. Sir Henry Parkes (New South Wales) was elected President of the Convention, and Sir Samuel Griffith (Queensland), Vice-President. A series of resolutions, moved by Sir Henry Parkes, occupied the attention of the Convention for several days. These resolutions set forth the principles upon which the Federal Government should be established, which were to the effect that the powers and privileges of existing Colonies should be kept intact, except in cases where surrender would be necessary in order to form a Federal Government; that intercolonial trade and intercourse should be free; that power to impose Customs duties should rest with the Federal Government and Parliament; and that the naval and military defence of Australia should be entrusted to the Federal Forces under one command. The resolutions then went on to approve of a Federal Constitution which should establish a Federal Parliament to consist of a Senate and a House of Representatives; that a Judiciary, to consist of a Federal Supreme Court, to be a High Court of Appeal for Australia, should be established; and that a Federal Executive, consisting of a Governor-General, with responsible advisers, should be constituted. These resolutions were discussed at great length, and eventually were adopted. The resolutions were then referred to three Committees chosen from the delegates, one to consider Constitutional Machinery and the distribution of powers and functions; one to deal with matters relating to Finance, Taxation, and Trade Regulations; and the other to consider the question of the establishment of a Federal Judiciary. A draft Bill, to constitute the 'Commonwealth of Australia,' was brought up by the first mentioned of these Committees, and after full consideration was adopted by the Convention, and it was agreed that the Bill should be presented to each of the Australian Parliaments for approval and adoption. On Thursday, April 6th, the Convention closed its proceedings. The Bill to provide for the Federation of the Australasian colonies entitled 'A Bill to constitute a Commonwealth of Australia,' which was drafted by the National Australasian Convention, has been introduced into the Parliaments of most of the colonies of the group, and is still (October, 1892), under consideration. In Victoria it has passed the Lower House with some amendments.”—*Statesman's year-book*, 1893, p. 308.

1890.—New South Wales and Victoria.—Progress in these separated colonies.—New South Wales most important of the Australian colonies.—“New South Wales bears to Victoria a certain statistical resemblance. The two colonies have [1890] about the same population, and, roughly speaking, about the same revenues, expenditure, debt and trade. In each, a great capital collects in one neighbourhood more than a third of the total population. . . . But . . . considerable differences lie behind and are likely to develop in the future. New South Wales, in the opinion of her enemies, is less enterprising than Victoria, and has less of the go-ahead spirit which distinguishes the Melbourne people. On the other hand she possesses a larger territory, abundant supplies of coal, and will have probably, in consequence, a greater fu-

ture. Although New South Wales is three and a half times as large as Victoria, and has the area of the German Empire and Italy combined, she is of course much smaller than the three other but as yet less important colonies of the Australian continent [see QUEENSLAND, SOUTH AUSTRALIA and WESTERN AUSTRALIA.] As the country was in a large degree settled by assisted emigrants, of whom something like half altogether have been Irish, while the English section was largely composed of Chartists, . . . the legislation of New South Wales has naturally shown signs of its origin. Manhood suffrage was carried in 1858; the abolition of primogeniture in 1862; safe and easy transfer of land through the machinery of the Torrens Act in the same year; and also the abolition of state aid to religion. A public system of education was introduced, with other measures of democratic legislation. . . . Public education, which in Victoria is free, is still paid for by fees in New South Wales, though children going to or returning from school are allowed to travel free by railway. In general it may be said that New South Wales legislation in recent times has not been so bold as the legislation of Victoria. . . . The land of New South Wales has to a large extent come into the hands of wealthy persons who are becoming a territorial aristocracy. This has been the effect firstly of grants and of squatting legislation, then of the perversion of the Act of 1861 [for 'Free Selection before Survey'] to the use of those against whom it had been aimed, and finally of natural causes—soil, climate and the lack of water. . . . The traces of the convict element in New South Wales have become very slight in the national character. The prevailing cheerfulness, running into fickleness and frivolity, with a great deal more vivacity than exists in England, does not suggest in the least the intermixture of convict blood. It is a natural creation of the climate, and of the full and varied life led by colonists in a young country. . . . A population of an excellent type has swallowed up not only the convict element, but also the unstable and thriftless element shipped by friends in Britain to Sydney or to Melbourne. The ne'er-do-weels were either somewhat above the average in brains, as was often the case with those who recovered themselves and started life afresh, or people who drank themselves to death and left no descendants. The convicts were also of various classes; some of them were men in whom crime was the outcome of restless energy, as, for instance, in many of those transported for treason and for manslaughter; while some were people of average morality ruined through companions, wives, or sudden temptation, and some persons of an essentially depraved and criminal life. The better classes of convicts, in a new country, away from their old companions and old temptations, turned over a new leaf, and their abilities and their strong vitality, which in some cases had wrought their ruin in the old world, found healthful scope in subduing to man a new one. Crime in their cases was an accident, and would not be transmitted to the children they left behind them. On the other hand, the genuine criminals, and also the drunken ne'er-do-weels, left no children. Drink and vice among the 'assigned servants' class of convicts, and an absence of all facilities for marriage, worked them off the face of the earth, and those who had not been killed before the gold discovery generally drank themselves to death upon the diggings."—Sir C. W. Dilke, *Problems of greater Britain*, pt. 2, ch. 2.

1890-1891.—Great strike.—Its failure and aid

to the Labor party.—As the result of a downward movement in prices, numerous employers attempted to reduce wages. This intensified a growing labor unrest and what is known as the great strike followed, with its center in Sydney. Shearers, miners and other trades stopped work in September and October, 1890, at the height of the wool season, to such an extent that the maritime and pastoral industries of practically all of Australia were injuriously affected. The strike ended, however, in November, 1890, in favor of the employers. The failure of the great strike gave effective impetus to the growth of the Labor party in New South Wales, where in the election of 1891 the party won thirty-five seats out of one hundred and twenty-five.—See also LABOR PARTIES: 1886-1906; NEW SOUTH WALES: 1891.

1894-1895.—New South Wales.—Defeat of the protectionist policy.—Adoption of a liberal tariff.—At the general elections of July, 1894, in New South Wales, the tariff issue was sharply defined. "Protection" was inscribed on the banners of the ministerial party, led by the then Premier, Sir George Dibbs, while the aggressive opposition, led by Mr. Reid, . . . fought under the banner of 'free trade.' The Free Traders won the battle in that election, as there were 63 Free Traders, 40 Protectionists, and 22 labor members, mostly with free-trade leanings, returned. On the reassembling of Parliament, Sir George Dibbs was confronted with a large majority, and Mr. George H. Reid was called to form a government on the lines suggested by the issues of the campaign. The Council or 'upper house,' consisting of Crown nominees for life, rejected the measures suggested by Mr. Reid and passed by the Assembly by an overwhelming majority, and Mr. Reid dissolved Parliament on July 6, 1895, and appealed to the country. The election was held on July 24, and again the issues, as set forth in the measures, were fought out vigorously. The great leader of protection, Sir George Dibbs, with several of his ablest followers, was defeated, and the so-called Free Trade party came back, much stronger than before. Thus, it was claimed that the mandate of the people, declaring for free trade and direct taxation, had been reaffirmed, and on the reassembling of Parliament, on August 13, the same measure, as passed by the Assembly and rejected by the Council, was again presented and passed by the Assembly by a majority of 50 to 26, and again went to the upper house. Again it was met with great hostility, but the Government party in that chamber, having been augmented by ten new appointments, the temper of the house was softened and the bill was passed with some two hundred and fifty amendments. As the Assembly could only accept some eighty of these without yielding material points . . . a conference was suggested, which, after several days of discussion, agreed to a modified measure, embracing the principle of free trade, as interpreted in this colony, and direct taxation, and the new law goes into effect as above stated, on January 1, 1896.—It may be well here to remark that there are a few articles, notably raw sugar, glucose, molasses, and treacle, upon which the duty will be removed gradually, so as not to wantonly disturb vested interests, but, with these exceptions, the change is a very sweeping one."

1900.—Federation of the Australian colonies. —Steps by which the union was accomplished. —Passage of the "Commonwealth of Australia Constitution Act" by the imperial Parliament. —"The first indication of a plan for united action among the colonies is to be found in a proposal of Earl Grey in 1850. The main object of the proposal was to bring about uniformity in colonial tariffs; but, though partially adopted, it came to nothing. From 1850 to 1860 the project of federation was discussed from time to time in several of the colonial legislatures, and committees on the subject were appointed. But there seems to have been little general interest in the question, and up to 1860 all efforts in the direction of federation met with complete failure. Shortly after, however, a new form of united action, less ambitious but more likely of success, was suggested and adopted. From 1863 to 1883 conferences of colonial ministers were held at various times to discuss certain specified topics, with a view to introducing identical proposals in the separate colonial legislatures. Six of these conferences were held at Melbourne and three at Sydney; and one also was held at Hobart in 1895, though the period of the real activity of the conference scheme practically closed in 1883. The scheme proved a failure, because it was found impossible to carry out the measures concerted in the conferences. But material events were doing more than could any public agitation to draw attention to the advantages of closer union. The colonies were growing in population and wealth, railroads were building and commerce was extending. The inconveniences of border customs duties suggested attempts at something like commercial reciprocity between two or more colonies. New political problems also helped to arouse public interest. Heretofore there had been little fear of foreign aggression and, hence, no feeling of the need of united action for common defense; nor had there been any thought of the extension of Australian power and interests beyond the immediate boundaries of the different colonies. But the period from 1880 to 1890 witnessed a change in this respect. It was during this period that much feeling was aroused against the influx of French criminals, escaped from the penal settlements in New Caledonia. The difficulties in regard to New Guinea belong also to this decade. Suspicion of the designs of Germany upon that part of the island of New Guinea nearest the Dutch boundary led to the annexation of its eastern portion by the Queensland government. This action was disavowed by the British government under Gladstone, and the fears of the colonists were ridiculed; but almost immediately after the northern half of New Guinea was forcibly taken possession of by Germany. The indignation of Australians was extreme, and the opinion was freely expressed that the colonies would have to unite to protect their own interests. Finally, this was the time of the French designs on the New Hebrides Islands and of German movements with reference to Samoa. These conditions, economic and political, affected all the colonies more or less intimately and resulted in the first real, though loose, form of federal union. At the instigation of the Honorable James Service, premier of Victoria, a convention met at Sydney, November,

1883, composed of delegates from all the colonial governments. This convention adopted a bill providing for the establishment of a Federal Council, with power to deal with certain specified subjects and with such other matters as might be referred to it by two or more colonies. . . . New South Wales and New Zealand refused to agree to the bill, but it was adopted by the other colonies; and the Imperial Parliament, in 1885, passed an act permitting such a Council to be called into existence at the request of any three colonies, to be joined by other colonies as they saw fit. Meetings of the Council took place in 1886, 1888, 1889 and 1891, but very little was accomplished. That the Federal Council was a very weak affair is obvious. . . . Meanwhile, interest in a more adequate form of federation was growing. In 1890 Sir Henry Parkes proposed a plan for federal union of a real and vigorous sort. At his suggestion, a conference met at Melbourne, February 6, 1890, to decide on the best method of getting the question into definite shape for consideration. . . . Provision was made . . . for the calling of a convention to draw up a constitution. . . . In accordance with the decision of the conference, delegates from the several colonies convened at Sydney, March 2, 1891; and with the work of this convention began the third and final stage in the federation movement. The Sydney convention formulated a bill, embodying a draft of a federal constitution, and then resolved that provision should be made by the several parliaments to submit it to the people in such manner as each colony should see fit. . . . But there was not sufficient external pressure to bring about an immediate discussion and an early settlement. . . . The result was that nothing was done. . . . Meanwhile, federation leagues had been organized in different colonies, and in 1893 delegates from a number of these leagues met at Bendigo, Victoria. . . . After adopting the bill of 1891 as a basis of discussion, the Bendigo conference resolved to urge the colonial governments to pass uniform enabling acts for a new convention—its members to be elected by popular vote—to frame a constitution which should be submitted to the people for approval. This proposal met with general favor and resulted in the calling of a meeting of the premiers of all the colonies at Hobart in January, 1895. There an enabling bill was drafted which five premiers agreed to lay before their respective parliaments. . . . It took two years to get this machinery into working order. At length, however, the requisite authority was granted by five colonies: New South Wales, Victoria, South Australia, Western Australia and Tasmania, Queensland and New Zealand declining to participate. On March 22, 1897, the second constitutional convention assembled at Adelaide. This convention drew up a new federal constitution, based upon the draft of 1891. Between May 5 and September 2 the constitution was discussed in each of the parliaments. When the convention reassembled at Sydney on March 2, as many as 75 amendments were reported as suggested by the different colonies. Many were of an insignificant character and many were practically identical. The constitution and proposed amendments were discussed in two sessions of the convention, which finally adjourned March 16, 1898, its work then being ready to submit to the people. In June a popular vote resulted in the acceptance of the constitution by Victoria, Tasmania, and South Australia; but the failure of the parent colony, New South Wales, to adopt it blocked all hope of federal union for the moment. [Later] at a conference of colonial premiers certain amendments demanded by New South Wales were agreed to in part, and upon a second

vote the constitution, as amended, was accepted by that colony.”—W. G. Beach, *Australian federal constitution* (*Political Science Quarterly*, Dec., 1899).—In August, 1899, the draft of a constitution thus agreed upon was transmitted to England, with addresses from the provincial legislatures, praying that it be passed into law by the Imperial Parliament. Early in the following year delegates from the several colonies were sent to England to discuss with the colonial office certain questions that had arisen, and to assist in procuring the passage by Parliament of the necessary act. Looked at from the imperial standpoint, a number of objections to the draft constitution were found, but all of them were finally waived excepting one. That one related to a provision touching appeals from the high court of the Australian commonwealth to the queen in council. As framed and adopted in Australia, the provision in question was as follows: “74. No appeal shall be permitted to the Queen in Council in any matter involving the interpretation of this Constitution or of the Constitution of a State, unless the public interests of some part of Her Majesty’s Dominions, other than the Commonwealth or a State, are involved. Except as provided in this section, this Constitution shall not impair any right which the Queen may be pleased to exercise, by virtue of Her Royal Prerogative, to grant special leave of appeal from the High Court to Her Majesty in Council. But The Parliament may make laws limiting the matters in which such leave may be asked.” This was objected to on several grounds, but mainly for the reasons thus stated by Mr. Chamberlain: “Proposals are under consideration for securing a permanent and effective representation of the great Colonies on the Judicial Committee, and for amalgamating the Judicial Committee with the House of Lords, so as to constitute a Court of Appeal from the whole British Empire. It would be very unfortunate if Australia should choose this moment to take from the Imperial Tribunal the cognizance of the class of cases of greatest importance, and often of greatest difficulty. Article 74 proposes to withdraw from the Queen in Council matters involving the interpretation of the Constitution. It is precisely on questions of this kind that the Queen in Council has been able to render most valuable service to the administration of law in the Colonies, and questions of this kind, which may sometimes involve a good deal of local feeling, are the last that should be withdrawn from a Tribunal of appeal with regard to which there could not be even a suspicion of prepossession. Questions as to the constitution of the Commonwealth or of a State may be such as to raise a great deal of public excitement as to the definition of the boundaries between the powers of the Commonwealth Parliament and the powers of the State Parliaments. It can hardly be satisfactory to the people of Australia that in such cases, however important and far-reaching in their consequences, the decision of the High Court should be absolutely final. Before long the necessity for altering the Constitution in this respect would be felt, and it is better that the Constitution should be enacted in such a form as to render unnecessary the somewhat elaborate proceedings which would be required to amend it.”—*Great Britain, Parliamentary publications* (*Papers by Command, April and May, 1900, Australia—Cd. 124 and 158*).—In reply, the Australian delegates maintained that they had no authority to amend, in any particular, the instrument which the people of the several colonies had ratified by their votes; but the imperial authorities were inflexible, and the article 74 was modified in the act which passed Parliament, on July 7, 1900, “to

constitute the Commonwealth of Australia,” as may be seen by reference to the text. See AUSTRALIA; CONSTITUTION OF; also BRITISH EMPIRE: Colonial federation: Authority of imperial Parliament.

1900.—Question of the federal capital.—By the constitution of the commonwealth, it is required that the seat of government “shall be determined by the Parliament, and shall be within territory which shall have been granted to or acquired by the Commonwealth, and shall be vested in and belong to the Commonwealth, and shall be in the State of New South Wales, and be distant not less than one hundred miles from Sydney;” and “such territory shall contain an area of not less than one hundred square miles.” “New South Wales,” says a correspondent, writing from Sydney, “is naturally anxious to get the question decided as quickly as possible; but Victoria will equally be inclined to procrastinate, and the new Parliament—which cannot be more comfortable than it will be at Melbourne—will not be in a hurry to shift. The necessity for a new and artificial capital arises entirely out of our provincial jealousies, and it would have been a great saving of initial expense and a great diminution of inconvenience if we could have used one of the old capitals for a quarter of a century.” To remove preliminary difficulties and avoid delay, the government of New South Wales appointed a commissioner to visit and report on the most likely places. The report of this commissioner, made early in October, “reduces the possible positions to three—one near Bombala in the south-east corner of the colony at the foot of the Australian Alps, one near Yass on the line of the railway between Sydney and Melbourne, and one near Orange on our western line. On the whole he gives the preference to the first named.”

1900 (August).—Vote of West Australia to join the commonwealth.—The question of union with the other colonies in the commonwealth, from which the West Australians had previously held aloof, was submitted to them in August (women voting for the first time), and decided affirmatively by 44,704 against 19,691 (see also WESTERN AUSTRALIA: 1900). Adding the West Australian totals to the aggregate vote at the decisive referendum in each of the other federating colonies, the following is the reported result:

For federation	422,647
Against federation	161,024
Majority	261,623

1900 (September—December).—Queen’s proclamation of the Australian commonwealth.—Contemplated visit of the duke and duchess of York to open the first session of the federal parliament.—Appointment of Lord Hopetoun to be governor-general.—First federal cabinet.—On September 17, the following proclamation of the Australian commonwealth was issued by the queen: “Whereas by an Act of Parliament passed in the sixty-third and sixty-fourth years of Our reign, intituled ‘An Act to constitute the Commonwealth of Australia,’ it is enacted that it shall be lawful for the Queen, with the advice of the Privy Council, to declare by Proclamation that, on and after a day therein appointed, not being later than one year after the passing of this Act, the people of New South Wales, Victoria, South Australia, Queensland, and Tasmania, and also, if Her Majesty is satisfied that the people of Western Australia have agreed thereto, of Western Australia, shall be united in a Federal Commonwealth, under

the name of the Commonwealth of Australia. And whereas We are satisfied that the people of Western Australia have agreed thereto accordingly. We therefore, by and with the advice of Our Privy Council, have thought fit to issue this Our Royal Proclamation, and We do hereby declare that on and after the first day of January, one thousand nine hundred and one, the people of New South Wales, Victoria, South Australia, Queensland, Tasmania, and Western Australia shall be united in a Federal Commonwealth under the name of the Commonwealth of Australia. Given at Our Court at Balmoral, this seventeenth day of September, in the year of our Lord one thousand nine hundred, and in the sixty-fourth year of Our Reign. God save the Queen." At the same time, the following announcement, which caused extreme delight in Australia, was published officially from the colonial office: "Her Majesty the Queen has been graciously pleased to assent, on the recommendation of the Marquis of Salisbury, to the visit of their Royal Highnesses the Duke and Duchess of York to the colonies of Australasia in the spring of next year. His Royal Highness the Duke of York will be commissioned by her Majesty to open the first Session of the Parliament of the Australian Commonwealth in her name. Although the Queen naturally shrinks from parting with her grandson for so long a period, her Majesty fully recognizes the greatness of the occasion which will bring her colonies of Australia into federal union, and desires to give this special proof of her interest in all that concerns the welfare of her Australian subjects. Her Majesty at the same time wishes to signify her sense of the loyalty and devotion which have prompted the spontaneous aid so liberally offered by all the colonies in the South African war, and of the splendid gallantry of her colonial troops. Her Majesty's assent to this visit is, of course, given on the assumption that at the time fixed for the Duke of York's departure the circumstances are as generally favourable as at present and that no national interests call for his Royal Highness's presence in this country." To manifest still further the interest taken by the British government in the event, it was made known in October that "when the Duke of York opens the new Commonwealth Parliament, the guard of honour, it is directed, shall be so made up as to be representative of every arm of the British Army, including the Volunteers. To the Victoria and St. George's Rifles has fallen the honour of being selected to represent the entire Volunteer force of the country. A detachment of the regiment, between 50 and 60 strong, will accordingly leave for Australia in about a month and will be absent three or four months." The honor of the appointment to be the first governor-general of the new commonwealth fell to a Scottish nobleman, John Adrian Louis Hope, seventh early of Hopetoun, who had been governor of Victoria from 1880 to 1895, and had held high offices at home, including that of lord chamberlain in the household of the queen. Lord Hopetoun landed at Sydney on December 15 and received a great welcome. On the 30th, his cabinet was formed, and announced, as follows: Mr. Barton, prime minister and minister for external affairs; Mr. Deakin, attorney-general; Sir William Lyne, minister for home affairs; Sir George Turner, treasurer; Mr. Kingston, minister of trade and commerce; Mr. Dickson, minister of defence; Sir John Forrest, postmaster-general.

1901.—Control of New Guinea. See NEW GUINEA or PIPUA: 1901; and PACIFIC OCEAN: 1800-1914.

1901 (January).—Inauguration of the federal

government.—The government of the commonwealth was inaugurated with splendid ceremonies on the first day of the new year and the new century, when the governor-general and the members of the federal cabinet were sworn and assumed office. Two messages from the British secretary of state for the colonies were read, as follows:

"The Queen commands me to express through you to the people of Australia her Majesty's heartfelt interest in the inauguration of the Commonwealth, and her earnest wish that, under divine Providence, it may ensure the increased prosperity and well-being of her loyal and beloved subjects in Australia."

"Her Majesty's Government send cordial greetings to the Commonwealth of Australia. They welcome her to her place among the nations united under her Majesty's sovereignty, and confidently anticipate for the new Federation a future of ever-increasing prosperity and influence. They recognize in the long-desired consummation of the hopes of patriotic Australians a further step in the direction of the permanent unity of the British Empire, and they are satisfied that the wider powers and responsibilities henceforth secured by Australia will give fresh opportunity for the display of that generous loyalty and devotion to the Throne and Empire which has always characterized the action in the past of its several States."—See also FEDERAL GOVERNMENT: Australia.

1901 (May).—Opening of the first parliament of the commonwealth by the heir to the British crown.—Program of the federal government.—The duke of Cornwall and York, heir to the British crown (but not yet created Prince of Wales), sailed, with his wife, from England in March, to be present at the opening of the first Parliament of the federated commonwealth of Australia, which was arranged to take place early in May. He made the voyage in royal state, on a steamer specially fitted and converted for the occasion into a royal yacht, with an escort of two cruisers. Preliminary to the election and meeting of Parliament, the new federal government had much organizing work to do, and much preparation of measures for Parliament to discuss. The premier, Mr. Barton, in a speech made on January 17, announced that the customs were taken over from the several states on January 1, and the defences and post-offices would be transferred as soon as possible. "Probably the railways would be acquired by the Commonwealth at an early date. Whether the debts of the several States would be taken over before the railways was a matter which had to be decided, and was now engaging the attention of the Treasurer. The Ministry would not consider the appointment of a Chief Justice of the High Court until Parliament had established that tribunal." In the same speech, the main features of the programme and policy of the federal government were indicated. "The Commonwealth," said the premier, "would have the exclusive power of imposing Customs and excise duties, and it would, therefore, be necessary to preserve the States' power of direct taxation. There must be no direct taxation by the Commonwealth except under very great pressure. Free trade under the Constitution was practically impossible; there must be a very large Customs revenue. . . . The policy of the Government would be protective, not prohibitive, because it must be revenue-producing. No one colony could lay claim to the adoption of its tariff, whether high or low. The first tariff of Australia ought to be considerate of existing industries. The policy of the Government could be summed up in a dozen words. It would give Australia a tariff that would be Australian. Regard-

ing a preferential duty on British goods, he would be glad to reciprocate where possible, but the question would have to receive very serious consideration before final action could be taken. Among the legislation to be introduced at an early date, Mr. Barton continued, were a Conciliation and Arbitration Bill in labour disputes, and a Bill for a transcontinental railway, which would be of great value from the defence point of view. He was in favour of womanhood suffrage. Legislation to exclude Asiatics would be taken in hand as a matter of course."

1901-1902.—Tariff question in the first parliament of the commonwealth.—Issue between the senate and the representative chamber.—"The tariff originally proposed by the government was framed on lines of extreme protection, with special reference to the languishing industries of Victoria; it was inevitable that the opposition, mainly representing New South Wales, should fight tooth and nail to prevent its becoming law. The result of the struggle, which lasted almost without a serious interruption for nine months, has been a compromise which leaves the tariff of the commonwealth neither one thing nor the other. There can be little doubt that in debating power and political generalship the victory lay generally with the opposition; but after all the result, so far as it was a victory for the party of free trade, was due to the action of the Senate. To many, and apparently not least to the cabinet, the prompt and effective interference of the Senate in a question of taxation, which was generally supposed to be practically placed by the constitution almost as much beyond their control as custom has placed it beyond that of the House of Lords in England, was a great surprise, and as the first test of the respective powers of the two chambers of the legislature it can hardly fail to be of great political importance. It was provided by the constitution not only that all bills involving the taxation of the people, directly or indirectly, should, as in this country, originate in the representative chamber of the legislature, but further that such bills should not be altered or amended in their passage through the Senate. As a concession to the less populous states, it was agreed when the constitution was framed that while only the chamber, elected on a strict basis of population, should impose or control taxation, the Senate, in which all the states enjoy, as in America, equal representation, should have the right to suggest, for the consideration of the other chamber, any amendments it thought desirable in any money bill sent on for its assent. This provision, mild and inoffensive as it was supposed to be, has now been used in a way to upset the policy of the government, and practically to compel the assent of the representative chamber to the views of a Senate majority. The tariff bill as passed by the government majority was subjected to an exhaustive criticism by the Senate, and finally fully fifty items of the schedule imposing duties were referred back to the representative chamber, with a request for their reconsideration and reduction or excision. The government attempted to meet the difficulty by agreeing to a few trifling amendments on the lines suggested, and got the chamber peremptorily to reject all the others, sending the bill back in effect as it was. To this the Senate replied by calmly adhering to the views it had already expressed, and sending the bill back again for further consideration, allowing it to be pretty plainly understood that, in the event of their views being ignored, they would place their reasons on record and reject the bill altogether, thus preventing any uniform tariff being established during the session.

Face to face with so grave a difficulty the cabinet gave way, and agreed to a compromise which they would not have dreamed of doing but for the action of the Senate, with its free-trade majority of two votes. The immediate result of the long struggle has been the passing of a tariff act which pleases neither party, but will apparently raise the required revenue of \$40,000,000, needed to meet the wants of the federal and state governments."—H. H. Lusk, *First parliament of Australia* (*American Review of Reviews*, March 1903).

1901-1911.—Child labor legislation. See CHILD WELFARE LEGISLATION: 1001-1011.

1902.—"States rights" temper.—Question of constitutional relations between commonwealth and states in external affairs, as raised by South Australia.—Decision of the imperial government.—"State-rights" questions and the provincial spirit behind them made a prompt appearance in the Australian commonwealth after its federation was accomplished. One of the first wrangles to occur between the general government and that of a state was appealed necessarily to the imperial government at London, because it arose out of a call from the latter, in September, 1902, for information about an incident which concerned a Dutch ship. The request for information went from London to the commonwealth government, and from the latter to the government of South Australia, where the incident in question occurred, involving some act of its officials. The South Australian ministry declined to pass the desired information through the channel of the commonwealth ministry, but would give it to the British colonial office, direct. A long triangular argumentative correspondence ensued, in the course of which much that seems like a repetition of the early history of the United States of America appears. Such as this, for example, in one of the letters of the acting premier of South Australia to the lieutenant-governor of that state: "The importance to the States, especially to the smaller States, of strictly maintaining the lines of demarcation between Commonwealth and State power is manifest. Already a movement has begun to destroy the Federal element in the Constitution. A remarkable indication of this may be gathered from a speech made by Sir William Lyne, the Commonwealth Minister for Home Affairs, at Kalgoorlie, in Western Australia, on the 2nd day of the present month. Speaking of the Constitution, Sir William Lyne said: 'If the population increased in the States as he expected, he did not think three of the larger States would still consent to be governed by four of the smaller ones. He hoped that when the time came there would not be bloodshed, but that things would settle themselves in a manner worthy of the records of the first Parliament.' Believing, as Ministers do, that the peaceful and successful working of the Constitution depends upon the strict maintenance of the lines of demarcation between the powers of the Commonwealth and those of the States, and that that line is drawn clearly in the Constitution, they cannot agree to the opinions of the Right Honourable the Secretary of State for the Colonies, which increase, by implication, the power of the Commonwealth, and which seem to Ministers to tend to Unification, and to a sacrifice of the Federal to the National principle." This communication, transmitted to London, drew from the then colonial secretary, Mr. Chamberlain, a reply addressed to the lieutenant-governor and dated April 15, 1903, in part as follows: "Your Ministers contend 'that the grant of power to the Commonwealth, notwithstanding the general terms of Section 3 of the Act, is strictly limited to the Departments transferred,

and to matters upon which the Commonwealth Parliament has power to make laws and has made laws,' and that 'in the distribution of legislative and consequently of executive power, made by the Constitution, all powers not specifically ceded to the Commonwealth remain in the States.' They are unable to agree 'with the contention that there does not appear to be anything in the Constitution to justify this limitation,' and argue that the validity of any claim of the Commonwealth to any particular power, should be tested by enquiring:—Does the Constitution specifically confer the power? The view of the Act which I take is that it is a Constitution Act, and creates a new political community. It expressly declares that 'the people of New South Wales, Victoria, South Australia, Queensland, and Tasmania, and also, if Her Majesty is satisfied that the people of Western Australia have agreed thereto, of Western Australia, shall be united in a Federal Commonwealth under the name of the Commonwealth of Australia.' The object and scope of the Act is defined and declared by the preamble to be to give effect to the agreement of the people of New South Wales, Victoria, South Australia, Queensland, and Tasmania 'to unite in one indissoluble Federal Commonwealth under the Crown of the United Kingdom of Great Britain and Ireland, and under the Constitution hereby established.' The whole Act must be read in the light of this declaration and the provisions of Section 3. So far as other communities in the Empire or foreign nations are concerned, the people of Australia form one political community for which the Government of the Commonwealth alone can speak, and for everything affecting external states or communities, which takes place within its boundaries, that Government is responsible. The distribution of powers between the Federal and State Authorities is a matter of purely internal concern of which no external country or community can take any cognizance. It is to the Commonwealth and the Commonwealth alone that, through the Imperial Government, they must look, for remedy or relief for any action affecting them done within the bounds of the Commonwealth, whether it is the act of a private individual, of a State official, or of a State government. The Commonwealth is, through His Majesty's Government, just as responsible for any action of South Australia affecting an external community as the United States of America are for the action of Louisiana or any other State of the Union. The Crown undoubtedly remains part of the constitution of the State of South Australia and, in matters affecting it in that capacity, the proper channel of communication is between the Secretary of State and the State Governor. But in matters affecting the Crown in its capacity as the central authority of the Empire, the Secretary of State can, since the people of Australia have become one political community, look only to the Governor-General, as the representative of the Crown in that community." The published correspondence ends with this, and it is to be assumed that South Australia had no more to say.—*Correspondence respecting the constitutional relations of the Australian Commonwealth and states in regard to external affairs (Parliamentary papers, Cd. 1587)*.

1902.—British colonial conference at London. See BRITISH EMPIRE: Colonial and imperial conferences: 1902.

1902.—Governor-generalship.—Lord Hopetoun resigned as governor-general in the summer, and was succeeded by Lord Tennyson.

1902-1909.—Undertakings of irrigation and forestry. See CONSERVATION OF NATURAL RESOURCES: Australia.

1903.—Governor-generalship.—In August, Lord Northcote, previously governor of the presidency of Bombay, was appointed governor-general of Australia, succeeding Lord Tennyson.

1903-1913.—The Naval Agreement Act.—The Naval Agreement Act of 1903 provided that the naval force at the Australian naval headquarters at Sydney was to consist of not less than one first class armoured cruiser, two second class and four third class cruisers, four sloops and a Royal Naval Reserve of 700 seamen and stokers and twenty five officers. It was also stipulated that the base of the force should be the ports of Australia and New Zealand and the field of operation be in the waters of Australia, China and the East Indian stations. Another provision stated that one ship be held in reserve and that three others, partly manned, be used for the training of the Royal Naval Reserve. Special rates were paid to Australians and new Zealanders who manned the training ships, which were under the command of officers of the Royal Navy and Royal Naval Reserve. The act expired in 1913.

1903-1904.—Resignation of Premier Barton.—Deakin ministry.—Four months of power for the Labor party.—Its influence in the Commonwealth.—Sir Edmund Barton, who had been the prime minister of the Australian Commonwealth since its union in 1900, resigned in 1903 to accept a place on the bench of the high federal court, and was succeeded by Mr. Alfred Deakin, previously attorney-general in the federal cabinet. The most important occurrence of the year in the Commonwealth was the election of a new house of representatives in the federal Parliament and of one third of its senate. These were the first federal elections occurring since those of 1900 which constituted the original Parliament, opened in May, 1901, and the first in which women went to the polls. The main issue in the elections was between the Labor party and its opponents, and the rising power of the former was shown by its gain of six seats in each house, four from the ministry and two from the opposition in the senate, and all six from the ministry in the lower house. This threw the balance of power into its hands in both branches of Parliament. Naturally, in these circumstances, labor questions became dominant in Australian politics, with Socialistic tendencies very strong. The Deakin ministry was defeated in April 1904, on an industrial arbitration bill which excluded state railway employes and other civil servants from its provisions, contrary to the demands of the Labor party. The adverse majority was made up of twenty-three Labor representatives, thirteen opponents of the protectionist policy of the government, and four from the ranks of its own ordinary supporters. The ministry resigned, and the leader of the Labor party, Mr. J. C. Watson, a young compositor by trade, was called to form a government, which he did, drawing all but its law officer from the Labor party. It is creditable to the capability of this Labor ministry that, with so precarious a backing in the house, it should have held the management of government, with apparently good satisfaction to the public, for about four months. It was defeated in August on another labor question, and gave way to a coalition ministry of Free Traders and Moderate Protectionists, formed under Mr. George Houston Reid. An account of the Labor ministry and its leader, from which the following facts are taken, was given by *Review of Reviews for Australasia* at the time of its ascendancy: The average age of the members was only forty-three years, while in England sixty is the average age at which corresponding rank is attained. The nationalities of

the members were as follows: One, the prime minister, was a New Zealander, two were Australian-born, two were Irish, two were Scotch, and one was Welsh. There was not one who had been born in England. Mr. John Christian Watson, the premier, was but thirty-seven years of age. He was born in Valparaiso, where his parents were on a visit, but was only a few months old when they returned to New Zealand. At an early age he began his apprenticeship as a compositor, joining the typographical union. When nineteen, he came to Sydney and joined the composing staff of the *Star*. Then he became president of the Sydney Trades and Labor Council, and president of the Political Labor League of New South Wales. In 1894, he was returned to a New South Wales Parliament, and took the leading place among the Labor members. In 1901, he was returned to the first federal Parliament. He was selected to lead the Labor party in the federal house. The situation developed in this period is described by an American writer, whose sympathies were with the Labor party, as follows: "Protectionists and Free Traders (so called) were so divided in the Australian Parliament that neither could gain a majority without the Labor Party. A succession of governments bowled over by labor votes drove this hard fact into the political intelligence. The Labor Party was then invited to take the government. For five months men that had been carpenters, bricklayers, and painters administered the nation's affairs. No convulsion of nature followed, no upheavals and no disasters. It is even admitted that the government of these men was conspicuously wise, able, and successful. But having a minority party, their way was necessarily precarious, and on the chance blow of an adverse vote they resigned. Some scene shifting followed, but in the end the present arrangement was reached, by which the government is in the hands of the Protectionists that follow Mr. Deakin, and the ministry is supported by the Labor Party on condition that the Government adopt certain legislation. And that is the extent of the 'absolute rule of the Labor gang.' The Deakin Government does not greatly care for the Labor Party, nor for the Labor Party's ideas, but it rules by reason of the Labor Party's support, and in return therefor has passed certain moderate and well-intentioned measures of reform. Indeed the sum-total of the 'revolutionary, radical, and socialistic laws' passed by the Labor Party, directly or by bargaining with the Deakin or other ministries, indicates an exceedingly gentle order of revolution. It has done much in New South Wales and elsewhere to mitigate the great estate evil by enacting graduated land taxes; it has passed humane and reasonable laws regulating employers' liability for accidents to workmen and laws greatly bettering the hard conditions of labor in mines and factories. It has passed a law to exclude trusts from Australian soil. It has stood for equal rights for men and women. In New South Wales it has enormously bettered conditions for toilers by regulating hours of employment even in department and other stores and by instituting a weekly half-holiday the year around for everybody. It has tried with a defective Arbitration and Conciliation Act to abolish strikes. To guard Australia against the sobering terrors of the race problem that confronts America, it has succeeded in keeping out colored aliens. It has agitated for a Henry George land tax and for the national ownership of public services and obvious monopolies. And with one exception this is the full catalogue of its misdeeds." The "one exception" was the abolition of coolie labor.—C. E. Russell, *Uprising of the many*, ch. 24.

1903-1908.—Anti-Indian agitations. See RACE PROBLEMS: 1903-1908.

1905-1906.—Mr. Deakin's precarious ministry. —Power of the Labor party without responsibility.—Its principles and its "Fighting platform."—Important legislation of 1905.—Federal capital question.—General election of 1906.—Mr. Reid, the Free Trade premier, had taken office on an agreement with Mr. Deakin, the Protectionist leader, that the tariff question should not be opened during the term of the existing Parliament. But the truce became broken early in 1905, each party attributing the breach to the other, and the Reid ministry, beaten on an amendment to the address replying to the governor-general's speech, resigned. The Protectionists, in provisional alliance with the Labor party, then came back to power, with Mr. Deakin at their head. Of the political situation in 1905 it was said by a writer in one of the English reviews: "The Labour Party can dictate terms to the Ministry, and ensure that its own policy is carried out by others. It is strongest whilst it sits on the cross benches. During the few months it was in office it was at the mercy of Parliament; it left most of the planks of its platform severely alone, and it had, during that time, less real power than it has had either before or since. It is not likely again to take office, unless it can command an absolute majority of its own members to give effect to its own ideas, and, indeed, it perhaps would be better for Australia that it had responsibility as well as power, rather than as at present power without responsibility. However, if not at the next general election, the party is bound ere long to get the clear Parliamentary majority it seeks. Under these circumstances, great importance attaches to its aims and organisation. . . . To quote from the official report of the decisions of the last Triennial Conference of the Political Labour organisations of the Commonwealth, which sat in Melbourne last July, the objective of the Federal Labour party is as follows: (a) The cultivation of an Australian sentiment, based upon the maintenance of racial purity, and the development in Australia of an enlightened and self-reliant community. (b) The security of the full results of their industry to all producers by the collective ownership of monopolies, and the extension of the industrial and economic functions of the State and Municipality. The Labour party seek to achieve this objective by means of a policy that they invariably refer to as their platform. The planks of what is called the 'Fighting Platform' are as follows: (1) The maintenance of a white Australia. (2) The nationalisation of monopolies. (3) Old age pensions. (4) A tariff referendum. (5) A progressive tax on unimproved land values. (6) The restriction of public borrowing. (7) Navigation laws. (8) A citizen defence force. (9) Arbitration amendment."—J. U. Kirwan, *Australian labour party* (*Nineteenth Century*, Nov., 1905.)

A strike in one of the coal mines of New South Wales during 1905 brought the arbitration act of that province to an unsatisfactory test. The dispute, concerning wages, went to the arbitration court and was decided against the miners. They refused to accept the decision, abandoning work, and the court, when appealed to by the employers, found itself powerless to enforce the decision it had made. The judge resigned in consequence, and there was difficulty in finding another to take his seat. The Labor party secured the passage of an act which gives the trades-union label the force of a trade mark. Another important act of 1905 modified the immigration restriction act, so far as to admit Asiatic and other

alien students and merchants, whose stay in the country was not likely to be permanent, and, furthermore, permitted the introduction of white labor under the contract, subject to conditions that were expected to prevent any lowering of standard wages. The location of a federal capital became a subject of positive quarrel between the government of the commonwealth and that of New South Wales. By agreements which preceded the federation, the commonwealth capital was to be in New South Wales, but not less than a hundred miles from Sydney. This hundred-mile avoidance of Sydney was considerably exceeded by the federal government when it chose a site, to be called Dalgety, about equidistant from Sydney and Melbourne. New South Wales objected to the site and objected to the extent of territory demanded for it. Mr. Deakin proposed a survey of 90 square miles for the Federal District. New South Wales saw no reason for federal jurisdiction over more than 100 square miles. Ultimately Dalgety was rejected and a site named Yass-Canberra, or Canberra, was agreed upon and the choice confirmed by legislation. It is in the Murray district, about 200 miles southwest of Sydney. A general election in the commonwealth, near the close of 1906, gave the protectionists a small increase of strength in Parliament, and the Labor party gained one seat, raising its representation from twenty-five to twenty-six. The losers were the so-called Free Traders, or opponents of protective tariff-making. Their leader, Mr. Reid, in the canvass, dropped the tariff and made war on the state socialism of the Labor party. He held in the new Parliament a considerably larger following than the Protectionist premier, Mr. Deakin, could muster, but it contained more protectionists than Free Traders.

1907-1920.—Trans-Australian railway.—Transfer of Northern territory to the commonwealth.—“A question of vital interest to Western Australia was that of the construction of a railway connecting Perth with the eastern States. Forrest was wont to say that the principal reason which led the western State to join the Commonwealth was that assurances were given to him that the railway would be built. The railway, he maintained, was the inducement offered to Western Australia, just as the possession of the federal capital within her territory was the inducement to New South Wales. But the Constitution imposed no obligation to construct the line, and nobody had any authority to pledge the Commonwealth in advance to do anything which the Constitution did not require to be done. The alleged compact may not have weighed with the Federal Parliament, but the undesirableness of having a whole State cut off by a great distance from the rest of the Commonwealth, without railway connexion, certainly did. If only for military reasons, it was felt that the chain of steel should be forged. The project was promised in the programme of the Barton Government in 1901, and had been part of the policy of every successive Ministry. The whole of the Western Australian members were continually insistent about it. At length, in 1907, an Act was passed providing money for the survey of the 1,063 miles of route between Port Augusta, at the head of Spencer's Gulf, and Kalgoorlie, in the western

State, whence a railway already ran to Perth. The surveyors found, as was expected, that the country to be traversed by the line is largely unfit for human habitation; but they also found plenty of good grass land which in favourable seasons will be valuable. Acting on the surveyor's report, the Fisher Government, in 1911, secured the passage of a measure to authorize the construction of the line, which was estimated to cost about four million pounds.”—E. Scott, *Short history of Australia*, p. 323.—How to attract population to the Northern Territory has been a problem which invited many experiments since 1863, when it was annexed by royal letters patent to South Australia. The prospects for the development of that region were brighter than ever at the end of 1920, chiefly owing to the approaching completion of the Trans-Australian railway which would permit of extensive migration, settlements and exploitation of the country's natural resources. The Northern Territory entered the commonwealth as a part of the state of South Australia in 1901 upon the formation of the federation. In accordance with a provision in the commonwealth constitution act of 1900 and a contract agreement entered into in 1907, the Northern Territory was transferred to the commonwealth. This was formally approved in 1911 when the necessary legislation was passed by the two parliaments concerned. At the same time the commonwealth assumed all responsibility for the state loans contracted by South Australia in the interest of the territory. It also purchased the railway from Port Augusta to Oodnadatta, and began the arduous undertaking of constructing the Trans-Australian railway system. A great deal of the development of the Northern Territory, which opened up large areas of unoccupied land to graziers and settlers from the southern parts of Australia, is chiefly due to the expert management of Dr. Gilruth, the administrator of the territory. As a result of his energetic work profitable settlements are springing up along the nearly completed lines. The whole situation is an improvement over the condition of the territory when controlled from Adelaide. When completed, the Trans-Australian railway will be linked with the Western Australian system 387 miles from the sea and with the South Australian railway system at about 260 miles from Adelaide. Considerable work still remains undone although the railway was officially opened in November, 1917. Throughout the course of the construction work many difficult situations presented themselves. Frequent failures by contractors to meet the terms of the contracts delayed the immense undertaking. A lack of suitable water for locomotives, causing numerous delays and heavy unforeseen expenses, was another handicap of no slight importance. The sub-normal industrial conditions brought on by the Great War held up the construction of large sections of the road for fully a year and often longer. Lack of water for locomotives is still a very serious problem which must be solved, since there is no running stream throughout the length of the railway. In order to determine whether possibilities for pastoral and mineral development existed in the section, and whether conditions were favorable to the construction of reservoirs, explorations were made in 1917-1918 extending to seventy miles north of the line. The road runs almost entirely through unexplored territory. It opens up vast spaces in western and southern Australia. It is expected that the mining fields along this line will be developed to the great advantage of this region. All along the route of the railway valuable clays, salt and barytes have been discovered. Gold, opal, copper, tin and gypsum mines are also in evidence. According to the

South Australian government geologist, "there is ample justification for any opal miner going to Stuart Range to look forward to the discovery of valuable opal."—See also RAILROADS: 1908-1918.

1908.—Population of the commonwealth.—Change of ministry.—Governor-generalship.—According to a letter to the *London Times*, from Sydney, "the population of Australia on December 31, 1908, was estimated at 4,275,304 (exclusive of full-blooded blacks), showing an increase of 509,965, or of 13.5 per cent. in the eight years of federation. That," said the writer, "is not a satisfactory expansion, and we should have fared better. New South Wales gained 231,367, or 17 per cent, and Western Australia 87,143, or 48.4 per cent, but all the other States fared indifferently. There is reason to hope that in the change of fashion, Australia will again grow into some favour with the emigrant from home." Late in the year, the ministry of Mr. Deakin lost the provisional support of the Labor party, which had kept it in control of the government for nearly four years, and suffered a defeat in Parliament which threw it out. For the second time a short-lived Labor ministry was formed, under Mr. Andrew Fisher. After five years of service as governor-general, Lord Northcote returned to England in the fall of 1908 and was succeeded by Lord Dudley.

1909.—Attitude of the people toward immigration.—Land-locking against settlement. See IMMIGRATION AND EMIGRATION: Australia: 1909-1921.

1909.—A Summary of sixty years of growth and progress.—Sir John Forrest, treasurer of the commonwealth of Australia, in his budget speech to the federal house of representatives, in August, 1909, surveyed the position of Australia as part of the British nation,—a continent, he observed, containing two billion acres, with a coast line of 12,000 miles, no other nation having right or title to any part of this splendid heritage of the southern hemisphere, which was another home for the British race. Sixty years ago, said Sir John, the population of Australia was 400,000 and there were no railways. Now the inhabitants numbered nearly four-and-a-half millions, of whom 06 per cent. were British. They had £112,000,000 deposited in banks and deposits in savings banks to the amount of over £46,000,000, the depositors in these being one-third of the entire population. They had produced minerals to the value of £713,000,000. Ten million acres were under crop. During 1908 Australia had produced 62,000,000 bushels of wheat. It had exported butter of the value of £2,387,000 and wool of the value of £23,000,000. Australia had 90,000,000 sheep, 10,000,000 cattle, and 2,000,000 horses. The overseas trade in 1908 represented £114,000,000.—See also DEMOCRACY: Progress in the early part of the 20th century.

1909 (May-June).—Opening of the session of Parliament.—Program of business proposed.—Political situation.—Coalition under Mr. Deakin against the ministry.—Its success.—Resignation of Premier Fisher and cabinet.—Return of Mr. Deakin to power.—His program.—The federal Parliament was opened at Melbourne on May 26. In the speech of the governor-general, Lord Dudley, as reported to the English press, he stated that "notwithstanding a decrease in the Customs and postal revenue, arrangements had been made to pay old-age pensions from July 1. Large financial obligations would be incurred in the near future and would demand careful attention. Parliament would be invited to consider the financial relations between the Commonwealth and the States, with

a view to an equitable adjustment of them. Proposals would be submitted for the establishment of a Commonwealth silver and paper currency. The governor-general went on to refer to the coming Imperial Defence Conference and the establishment of a General Staff for the Empire. Engagements had, he said, been entered into for the building of three destroyers, and Parliament would be asked to approve a policy of naval construction including the building of similar vessels in Australia and the training of the necessary crews. A measure providing for an effective citizens' defence force would be introduced at an early stage. It being recognized that the effective defence of Australia required a vast increase in the population, it was proposed to introduce a measure of progressive taxation on improved land values, leading to a subdivision of large estates, so as to offer immigrants the inducement necessary to attract them in large numbers. Proposals would be submitted for the amendment of the Constitution, so as to enable Parliament to protect the interests of the consumer while ensuring a fair and reasonable wage to every worker, to extend the jurisdiction of Parliament in regard to trusts and combinations, and to provide for the nationalization of monopolies."

In an editorial article on the situation at this juncture in Australia, which was, it remarked, "as interesting as it is obscure," the *London Times* rehearsed the main facts of it as follows: "It will be remembered that towards the close of last year the withdrawal of its support by the Labour party led somewhat unexpectedly to the defeat and resignation of Mr. Deakin's Cabinet. A Labour Ministry was subsequently formed, and was enabled by Mr. Deakin's refusal to combine with the Opposition against it to prorogue Parliament and get into recess. It has since elaborated a programme, announced by Mr. Fisher, the Prime Minister, to his constituents at Gympie, a few weeks ago, and recapitulated yesterday in the Governor-General's speech, which strongly resembles in most particulars the national policy advocated by Mr. Deakin when in power, and includes besides one or two additional proposals, such as 'the nationalization of monopolies,' more exclusively the property of the Labour party itself. These latter aspirations are probably more pious than practical, and are certainly not the issues on which the Labour Ministry is now to stand or fall. It will stand or fall by its proposals for the readjustment of the financial relations between the Commonwealth and the States, the establishment of a local flotilla designed for coastal defence, the creation of a citizen army based on universal training, and the imposition of a progressive land tax calculated to bring about the subdivision of large estates. This latter proposal is the only one in which the Labour party cannot claim to be carrying out the spirit, if not the letter, of Mr. Deakin's own programme; but, curiously enough, it does not seem to be the question on which Mr. Deakin has taken immediate issue with them. He is taking issue, we gather, first and foremost on the question of defence. The Labour Ministry is to be censured for refusing to make the offer of the Australian Dreadnought in the name of the Commonwealth. In taking this line Mr. Deakin has already made it clear that he has not in any way modified his previous views on the necessity of providing immediately for the creation of an Australian flotilla, but he considers that this necessity should in no way prevent Australia from adding in emergency to the strength of the British fleet. Speaking at Sydney last month, he said: 'Our defence needs not only our own flotilla but a fleet on the high

seas as well. It is for us to recognize that by joining New Zealand and making our offer of a Dreadnought for the Imperial Navy . . . the Commonwealth must do its share to prove the reality of Australia's federal unity, to prove the unity of the Empire, to stand beside the stock from which we came.' On this point there is no obscurity. It presents a clear difference of view dividing Mr. Deakin and the two sections of the Opposition with which he has now coalesced from the policy of the Ministry in power. But while it provides a rallying ground from which the coalition may defeat the Ministry, it provides no subsequent line of united advance. The terms on which the coalition has been formed seem indeed to contemplate no definite policy at all."

The coalition against the ministry of Mr. Fisher, referred to above, accomplished its purpose on the day after the opening of Parliament, by carrying a vote of adjournment which the ministry accepted as a vote of want of confidence, and resigned. The former premier, Mr. Deakin, then resumed the reins of government, with a following that does not seem to have been expected to hold together very long. On the reassembling of Parliament, June 23, the prime minister made a statement of the business to be submitted to the house, including along with other measures the following: "A Bill would be introduced establishing an inter-State commission which, in addition to the powers conferred by the Constitution, would undertake many of the functions of the British Board of Trade. It would also undertake the duties of a Federal Labour Bureau, which would comprise the study of the question of unemployment and a scheme for insurance against unemployment. The commission would also assist in the supervision of the working of the existing Customs tariff. . . . An active policy of immigration would be undertaken, it was hoped with the co-operation of all the States. . . . The appointment of a High Commissioner in London with a well-equipped office was necessary to take charge of the financial interests of the Commonwealth, to supervise immigration, and to foster trade and commerce. . . . The Old Age Pensions Act was to be amended in the direction of simplifying the conditions for obtaining the pensions. . . . The policy of the Government in the matter of land defence would be founded on universal training, commencing in youth and continuing towards manhood. A military college, a school of musketry, and probably a primary naval college would be established to train officers. The counsel of one of the most experienced commanders of the British Army would be sought for with regard to the general development and disposition of Australia's adult citizen soldiers. In view of the approaching termination of the ten-year period of the distribution of the Customs revenue provided for in the Constitution, a temporary arrangement was being prepared, pending a satisfactory permanent settlement of the financial relation between the State and the Commonwealth."

1910.—Last year of a troublesome constitutional requirement.—Article 87 of the constitution of the commonwealth of Australia, reads as follows: "During a period of ten years after the establishment of the Commonwealth, and thereafter until the Parliament otherwise provides, of the net revenue of the Commonwealth from duties of custom and of excise not more than one fourth shall be applied annually by the Commonwealth towards its expenditure. The balance shall, in accordance with this Constitution, be paid to the several States, or applied toward the payment of interest on debts of the several States taken over by the Commonwealth." This, which has been known as the Braddon section, has imposed a serious handicap on the federal government. As its working was described recently by an English press correspondent, "it made the Commonwealth raise four pounds whenever it wanted to spend one. It made the States begrudge the Commonwealth every penny it spent, even out of its own quarter—for every penny saved out of that quarter was an extra penny for the States. And it prevented every State Treasurer from knowing, until the Federal Treasurer had delivered his Budget speech, how much money he was likely to get from Federal sources for his own spending." At the end of the year 1910 the requirement of the article ceased to be obligatory, and the federal Parliament was free to make a different appropriation of the revenue from customs and excise. Meantime the subject was under discussion, and in August, 1909, it was announced that a conference of the state governments had come to an agreement—subject to ratification by the federal government—which provided for the annual *per capita* payment of 25s. in lieu of the three-fourths of the customs revenue which had hitherto been returned to them. Western Australia was to receive a special extra contribution of £250,000, decreasing by £10,000 annually until it ceased. Until the arrangement became operative, the commonwealth might deduct from the statutory payments to the states £600,000 annually towards the cost of old-age pensions. The readjustment of state shares in the customs revenue was said to involve an annual loss to New South Wales of £1,000,000. According to a London newspaper correspondent, "the main effects to the Commonwealth are the abolition of the book-keeping system between the States, the power to issue Australian stamps, telegrams, &c., and the securing of about £2,300,000 a year, or more, additional revenue. The States lose revenue to a similar amount, but there is a transfer of old-age pensions to the amount of nearly £1,000,000, of which they are relieved. In three of the States, all of which suffer little by the change, the pensions are new, and a considerable boon to the people. But more than half the money sacrifice falls upon New South Wales, and it goes to relieve her less prosperous neighbours. Well, that is true Federation! Naturally the Southern States would have nothing but a *per capita* distribution from the Commonwealth and in New South Wales Ministers agreed to it with their eyes open. At present the Commonwealth Government secures the further revenue needed. But whether this agreement will so distinctly suit that Government as the State populations grow is another matter." A bill for the required amendment of the federal constitution was introduced in the house of representatives by the prime minister, Mr. Deakin, on September

8. On November 4, in opposition to the government, an amendment to the bill, limiting the duration of the agreement, instead of giving it force in perpetuity, was carried in committee of the whole by the casting vote of the chairman. On December 1 the bill had its third reading in the senate.

1910-1915.—Labor government under Fisher.—"At the general election held in April, 1910, the electors of the Commonwealth . . . showed themselves adverse to the Ministry. The tide ran high and full for the Labour Party, and swept it back to Parliament with a majority in both the Senate and the House of Representatives. In the former House it captured every seat—that is, eighteen, for only half the members of the Senate retire at a general election—and counted 23 votes in a House of 36. In the House of Representatives it secured 42 seats for its own members, and had in addition the benevolent neutrality of two independents. Fisher was thus for the second time Prime Minister. His Government was chosen on this occasion by a method that was quite new in the history of constitutional government. The usual mode in Australia, as in England, was for the Governor-General—in England the Sovereign—to send for the political leader who was indicated by the debates and divisions to possess the confidence of the majority, to commission him to form a Ministry, and for the Prime Minister so chosen to select his ministers. But the Federal Labour Party was differently organized from other political parties. Its members were pledged to a political programme drawn up by an annual Labour Conference. This Conference in 1905 had registered the decree that henceforth Labour Governments should not be chosen by the Prime Minister, but should be selected by the full body of the federal Labour members. Fisher, recognizing that his strength depended upon the widespread and very powerful organizations of the party in the country, initiated the observance of this rule. The members of the Government which held office from April, 1910, till the next general election in May, 1913, were therefore chosen by ballot by the party which supported them in Parliament. The election of 1913 witnessed the retirement from active politics of Deakin, whose health had been shaken by the strain of so many years of official work and bitter conflict. Cook was chosen to head the Fusion party, and fortune turned a rather wry smile upon him at the polls. So wry was it that it was hardly a smile. The Labour Party lost some seats, and Cook was able to reënter the House of Representatives with a majority of one. That meant that when his supporters had elected a Speaker they had no majority at all. Moreover, the Labour Party still had an overwhelming preponderance in the Senate. So that the new Cook Government could not carry a scrap of legislation without the grace of its opponents, who very soon showed their determination to exert their power to the full. The parliamentary machine was clearly unworkable under these conditions. Cook met the situation by a bold, deliberate challenge. He was pledged to two items of policy in regard to which the issue between his party and Fisher's was clearly drawn. These were, a measure to restore voting by post, which the Labour Party had abolished because of allegations of improper practices in the use of it; and a measure to destroy the preferential treatment of trade unionists by the Arbitration Court. The two bills were forced through the House of Representatives after very tough fighting, and were promptly rejected by the Senate. Planning then to bring into use the machinery of the Constitution for the removal of deadlocks, the Government forced their bills

through the House of Representatives again, expressly to provoke the Senate to reject them a second time. This having been done, the Prime Minister advised the Governor-General to dissolve both Houses. A new Governor-General, Sir Ronald Munro-Ferguson, had only just assumed office, and the situation was a very perplexing one for him to handle. The Labour Party denied that there was justification for dissolving a Parliament not yet one year old, and in which only one political leader had been tried. There was no precedent for such a stroke in the history of constitutional Government. But there was no precedent for the situation which existed. Munro-Ferguson was himself a very experienced parliamentarian. He was no amateur amid the whirl and clang of party, for he had been a 'whip' in the House of Commons; and he was endowed with a capacity for cool judgment and firm decision. Moreover, he knew what his own powers were under the Constitution. His reading of the position was that no satisfactory results could be expected from a Parliament such as the last election had provided. He therefore dissolved both Houses. Events justified the discretion which he exercised. The Labour Party at the election of 1914 was returned with an ample majority in both Houses, and the third Fisher Government took office less than three months before the outbreak of the great European War. The difficulties they had to face then were not parliamentary, but imperial and international. Fisher resigned at the end of 1915 in order to take up the duties of High Commissioner in succession to Reid. The Prime Ministership then fell to his brilliant and energetic Attorney-General, William Morris Hughes."—E. Scott, *Short history of Australia*, pp. 317-319.

1911-1913.—Attempts to amend the constitution.—"Very much of the energy, and a large expenditure of the passion, of political parties has been devoted to efforts to amend the Constitution. That instrument itself provides the machinery for its own alteration. A proposed law having amendment in view must first be passed by an absolute majority of each house of Parliament; it must then be voted upon by the people; and if a majority of the electors voting, in a majority of the States, signify their approval, the Constitution is altered accordingly. The Labour Party, after experiencing some failure to carry out its designs in reference to the scope of the Conciliation and Arbitration Act and the control of commercial trusts and monopolies, decided to ask the people to amend the Constitution in two aspects mainly. First, they desired to remove the limitation which confined the jurisdiction of the Federal Arbitration Court to industrial disputes extending beyond the limits of any one State. They wished to give power to the Court to act as to wages and conditions of labour and employment in any trade, industry, or calling, including disputes which might arise among the employees of state railways. Secondly, they wished to have power to make laws for the control of commercial corporations, for regulating trade and commerce within any State as well as Inter-State, and for 'nationalizing' any industry which Parliament might declare to be 'the subject of any monopoly.' These propositions were first submitted to the electors in 1911, but were rejected by five States out of the six—Western Australia being the only State favourable

to the enlargement of federal power. Regardless of this defeat, the Labour Party, considering that it could make little headway with its policy without the proposed amendments of the Constitution, submitted them to a second referendum in 1913. They were then carried by three States, Western Australia, South Australia, and Queensland—but were rejected by the other three. Failing a majority in a majority of States, the attempt failed again. But the affirmative votes in 1913 showed a marked advance on those recorded in 1911. Then the Labour policy was rejected by majorities of over a quarter of a million. In 1913, however, the difference between success and failure was very narrow—less than 50,000. Encouraged by the advance, the party nailed its flag to the mast and announced that it would try again; and there would have been a third referendum on the same questions at the end of 1915 but that the outbreak of the European War induced the dropping of schemes of constitutional alteration.”—E. Scott, *Short history of Australia*, p. 324.

1912.—**Maternity Allowances Act.**—Other legislation for mothers and children.—“First among the methods of helping the mothers stands what is known as the Commonwealth Maternity Bonus, provided for by the Maternity Allowances Act, passed in October, 1912. An allowance of £5 is paid to the mother of a viable child immediately on satisfactory proof of its birth. More than 95 per cent. of the mothers who have borne children since the passing of the act have applied for and received the allowance. These applications are invariably made promptly within a fortnight after the birth of the child, and the bonus is used in payment for better medical and nursing attendance than could have been obtained otherwise. The mothers of the future are being helped towards the fulfilment of their function by lectures given to the senior girls in the public schools. As yet, the subject of sex instruction has not been introduced, but it is probable that lectures on sex hygiene will soon be added to those on allied topics already given. These cover the questions of the care of babies in health and disease, their feeding and clothing, sick nursing, home and personal hygiene. The course is most highly appreciated both by the girls and the parents. There is a distinct demand for the most complete nursing facilities in the interests of motherhood. Provision for a maternity annex to every hospital, for the free services of a thoroughly qualified and registered midwife where desired, with medical attendance under government contract, and for the full instructions of expectant mothers by clearly-written pamphlet literature, has been made in New South Wales and is in line with the Australian purpose of ‘assisting motherhood in her hour of trial.’ . . . Care for the dependent child commences in New South Wales before its birth and is continued thenceforth in stages proportionate to the needs and development of the child. A Children’s Protection Act (1902) compels the registration and supervision of all nursing homes and the registration of the custodianship of infants under three years of age. Every effort is made to rear every child born in these homes, and to do so by educating the mother, who is very often young and unmarried, in the responsibilities and possibilities of her position. In infants’ homes, provision is made for the girl-mothers to stay with their children for some months, while foster-mothers, who undertake guardianship, are required within the metropolitan area to take their infant wards to a children’s hospital for consultation and advice every fortnight. By the Infants’ Protection Act (1904)

provision is made for the supervision of the maintenance, education and care of children, up to seven years of age, who have been placed in private homes or religious establishments apart from their parents. No private house may take more than five foster children, and these children are often those taken as babies under the Children’s Protection Act. The children must be fed, clothed and educated to the satisfaction of competent inspectors who show themselves the friends and advisers of the dependent child. The principle of the intervention of the State as the overparent is carried farther in the State Children’s Relief Act of 1901. This act provides for the boarding out of the dependent children with approved guardians or with their own mothers, when the latter are deserving widows or deserted wives with children under twelve years for whom they cannot provide. By a later regulation the payments made to mothers and foster-mothers are continued till the child is fourteen. In the year 1915 there were 12,391 of these wards boarded out amid the civilizing influences of home life. On their behalf the State spent a total sum of £156,631-6s., equivalent to an actual cost to the State, after deducting parents’ contributions, of £17-os.-11d. per head for children boarded at home with the mother. Inspectors and honorary lady visitors keep in touch with the home and see that the children attend school regularly, and that their moral interests are being cared for.”—C. H. Northcott, *Australian social development*, pp. 171-172, 195-106.

1913.—**Navigation Act.** See RACE PROBLEMS: 1904-1913.

1913.—Australia assumes the responsibility of building her own ships.—In 1913 the Naval Agreement Act of 1903 expired, and Australia began to build up a navy of her own. In 1911 the Australian Government had agreed to furnish its own navy as an Australian unit of the Eastern fleet with the understanding that it would provide one cruiser of the *Indefatigable* class, three unarmoured cruisers of the *Bristol* class, six destroyers of the improved “River” class, and two submarines of the “E” class. This unit received the title “Royal Australian Navy” from King George. By 1921 the ships of this navy were the following: the battle cruiser *Australia*, and the light cruisers, *Adelaide*, *Melbourne*, *Sidney*, *Brisbane*, and *Encounter*. Besides these Australia possessed a flotilla of destroyers and two submarines. In time of peace this navy (working in close coöperation with the China and East Indies Squadrons of the Royal Navy) is controlled by the Commonwealth government, but in time of war it is under imperial control.

1914.—**Taking over of Norfolk island.**—Norfolk island, which has been a New South Wales dependency since 1788, was taken over by the commonwealth in 1914.

1914-1915.—**Participation in the World War.**—**Destruction of German cruiser, Emden.**—“Anzacs” at Gallipoli.—Although geographically far removed from the battlefields of the World War, Australia, and the Dominion of New Zealand as well, played a notable part in the ultimate defeat of the Teuton nations. Both countries, or, to be more inclusive, Australasia, gave freely, throughout the conflict, of their men, munitions, ships, etc. The valiant conduct of Australian and New Zealand regiments on the European fronts was exemplary. At the outset of the war a New Zealand military force under Colonel Robert Logan descended upon German Samoa and captured it without any resistance. German New Guinea fell into the hands of an Australian naval and military force under Colonel

William Holmes shortly after. Acting under the British admiralty, the Australian navy, within the short period of two months, completely destroyed Germany's wireless chain in the Pacific ocean and seized its Pacific colonies. [See also NEW GUINEA, or PAPUA: 1914.] By November 1914, Australia and New Zealand successfully dispatched 30,000 soldiers, including infantry, artillery and cavalry, to the Suez Canal without a mishap, a military feat which was unequaled throughout the war when it is considered that the transportation was over a distance of 6,750 sea miles. It was on this voyage that the Australian cruiser *Sydney*, which was convoying the troopships, defeated and forced the German raiding cruiser *Emden*, under Captain Müller, to surrender. The *Emden*, up to the time of its defeat, had sunk or captured twenty-one British merchantmen and caused other serious damage to the Allies, amounting to a loss of \$125,000,000. The *Sydney*, which was manned chiefly by Australians, was commanded by British Captain Glossop. The courage and morale displayed by the Australian and New Zealand soldiers at Gallipoli was, however, the achievement which has given to the Australasian troops a high position in the history of the World War. Under General Sir Ian Hamilton and later under General Sir William Birdwood, the Australian and New Zealand Army Corps fought courageously at "Anzac Cove" and throughout the Gallipoli campaign. All through the unfortunate campaign the Anzacs characterized themselves by their dashing courage, tenacity and exceptional confidence under fire. Following the ill-fated campaign at Gallipoli, the greater part of Australasia's fighting men were merged with the Allied armies on the western front. Their conduct was particularly conspicuous at Monquet Farm, Bullecourt, Messines and Pozières. They also took part in the operations on the Sinai Peninsula and in Southern Palestine.—See also ANZACS; WORLD WAR: 1914: VII. German Pacific Islands; and 1915: VI. Turkey: a; a, 4, xx; a, 4, xxii.

1915.—Program of the Labor party.—"The present Labour Government of the Commonwealth is pledged (i.e. in 1915), to the introduction of the 'initiative referendum' on the lines of the Swiss experiment. It might be thought that Liberalism is to support such reform in view of its dependence on the maxim, 'Trust the People.' A closer examination of the aims of Liberals will reveal that Parliament is considered something more than a machine for registering the commands of that vague and occasionally ambiguous abstraction 'the voice of the people.' Apart from the absurdity of 'asking the electors to send along a picture postcard and tell us what they think about the Budget,' it must be remembered that Parliament is to be considered a responsible institution and not a mere delegation. The movement for the 'initiative referendum' is not a very significant or powerful agitation, and only shows that a section of the people is dissatisfied with a particular party, or with the inadequacy of the party system; and for those two evils there are other remedies. By far the most important question Liberalism in Australia has now to solve is that of readjusting the powers of States and Commonwealth. In the absence of external or

strong internal pressure, the Constitution naturally reserved a very important series of functions to the States, and we find that the Commonwealth Parliament of 1906-10, practically unanimous in its efforts to introduce the New Protection with Government regulation of the conditions in protected industries, was thwarted at every step by the limitations which had been placed upon Federal powers. The rejection of the Referendum of 1911 proposing the granting of far larger powers was not final, and similar proposals were submitted by the Federal Labour party in 1913, and failed by the narrowest of majorities to pass. The significance of the latter fact has altered the attitude of many Conservatives, and, as has been pointed out, both Federal parties are now (i.e. in 1915), pledged to extend the powers of the National Parliament. The Labour party claims to be the champion of the sentiment of 'Australia for the Australians,' and opposed to this is the intense local patriotism of the State Parliaments, supported enthusiastically by the great portion of the press. The opposition is not between Liberty and Nationalism, but between two forms of nationalism; and the success of the defence scheme, with its appeals to a patriotism that transcends the State boundaries, combined with other factors, has immensely strengthened the ideal of Australia as 'one and indivisible.' It might be thought that such a sentiment is opposed to that of British Imperialism, and to a certain extent it is, and has been encouraged by the English Liberals and discouraged by the English Unionists. But there is no real antagonism between the conceptions of Australian unity and Empire unity, and recent events have clearly shown this to be the case. It seems quite certain that the cry of 'State rights' will not be sufficient to prevent the Commonwealth Parliament receiving additional powers by the will of the people."—H. V. Evatt, *Liberalism in Australia*, pp. 70-71.

1916-1917.—Conscription twice defeated.—"At the very outset of the war . . . there was considerable agitation throughout Australia for the enactment of a conscription law, although in but a short time more than 320,000 men had volunteered for active service. But the Australian Government was in the hands of the Labor Party, which found itself in an almost impossible situation. The Labor Party was quite aware that its supporters were opposed to conscription, but the seriousness of the situation, which demanded that 16,000 fresh troops be sent monthly to the western front, forced them to hold a national referendum on the question. Every man and woman in Australia and every Australian soldier serving abroad were asked to vote for or against conscription" on October 28, 1916.—*Nation*, Nov. 9, 1916, p. 438.—"Returns upon the referendum election in Australia to determine the question of conscription for European service leave [1917] no doubt of Premier Hughes's defeat. The result was close and mixed. While the latest figures show in the populous industrial State of New South Wales 264,000 for and 378,000 against, in Victoria they show 287,000 for and 275,000 against; while in the comparatively rural South Australia they show 65,000 for and 90,000 against, in West Australia they show 50,000 for and 25,000 against. But it is indicated that out of a vote of two millions the anti-conscriptionists will have a majority of 100,000. . . . The opposition undoubtedly found its chief strength in labor men whom the Premier could not drag with him, and in the women—though the latter's vote was thought doubtful to the end. With the extreme radicals Hughes had already clashed over the refusal of the

Broken Hill miners last summer to accept arbitration. But it was the disaffected moderates in labor ranks who proved his chief opponents. F. G. Tudor, Minister of Customs, early resigned to come out against him. There was wide fear that the country was bowing to militarism, and the men who have won in Australasia the most favorable working conditions known responded to the sentiment that human life should not be at the disposal of arbitrary state mandate. Others were fearful that military conscription might pave the way to industrial conscription, and that future Governments might use this power to coerce labor when it was at odds with capital. . . . It was argued that conscription would defame the patriotic reputation Australia had made at Gallipoli and in France; that Australia, considering the demands for men at home in a new country, was

WILLIAM MORRIS HUGHES
Prime Minister of Australia since 1915

doing her share; and that the difference in the numbers brought out by the conscriptive and voluntary systems would be far too small to justify such a departure from democratic principles. The defeat of conscription is the more eloquent in that Australia had already gone far on the road to it. It was Mr. Hughes, Senator Pearce, and the ex-Premier, Watson, who several years ago, aided by Roberts, converted a pacifist Labor party to the present system of universal training for home defence. Conscription for home defence was instituted a month before the election by Government action without a referendum. The campaign just waged was one of the hottest in Australian history. . . . With sentiment in Canada and South Africa what it is the Australian election adds to the general assurance that the great self-governed Dominions will not act as Prussianism would have them do. Australia's gravest political crisis in many years happily spent itself in the

general election and referendum, which, if bitterly fought by both sides, and notwithstanding the number of accompanying riots, was, after all, a most hopeful indicator of the feasibility of the democratic principle of government by the people. To be sure, Englishmen in Australia as well as abroad were bitterly disappointed to see the Dominion refuse to conscript its citizens, taking such a refusal as indicating a want of the proper degree of patriotism."—*Spectator*, May 17, 1917, p. 336.—See also WORLD WAR: 1917: XII. 1917.—Coalition ministry.—Formation of the "nationalist party."—"This Ministry [Hughes's ministry] had been formed originally in February, 1917, by a coalition of that minority of the Labour Party which supported Mr. Hughes' war-policy on the one hand and the Liberal Party on the other hand. After their union these two groups had taken the name of the 'Nationalist Party,' and the Coalition Government thus formed included such well-known politicians as Senator G. F. Pearce, Sir J. Forrest, and Mr. Cook. . . . And although at a General Election held in 1917 the Nationalists had been confirmed in office, they had obtained their majority partly owing to a pledge that they would not introduce conscription for Foreign Service without taking a direct poll of the people upon that question."—*Annual Register*, 1910, p. 202.

1919 (July).—Seamen's strike.—The harbors of Melbourne and Sydney were virtually tied-up on July 13, 1919, when the seamen's strike, which originated a few months earlier in Queensland, extended to Victoria and New South Wales. The Queensland government applied for permission to charter cargo vessels in order to relieve the serious situation, but this was refused by Acting Prime Minister Watt. No other attempt was ventured to break the strike because it was evident that the central government of Australia was sympathetic to the seamen.

1919.—Premier Hughes at the Paris Peace Conference.—Question of the Pacific colonies.—Policy of a "White Australia."—Ratification of the treaty by the Australian parliament.—"At the beginning of the year [1919], Mr. W. M. Hughes was still at the head of the Commonwealth Government. . . . Throughout the earlier

part of the year, the Prime Minister was absent from Australia and was representing his country at the Paris Peace Conference. At the Conference Mr. Hughes played a prominent part; and the terms of the League of Nations covenant itself were not uninfluenced by the arguments brought forward by the Australian statesman. Mr. Hughes found himself on more than one occasion in conflict with the Japanese delegates. The question of the Pacific colonies of Germany was, of course, an important one for Australia; and the ultimate decision of the Conference was to give the mandate for the islands north of the Equator to Japan, and the mandates for the much more important colonies south of the Equator to the two Australasian dominions. New Zealand was to have the mandate for German Samoa, whilst Australia herself was authorised to take over German New Guinea and the neighbouring islands. Even this arrangement did not wholly satisfy public opinion in Australia, as the southward advance of the Japanese was viewed with some anxiety. The debates on the German colonies were not, however, the only occasion on which a difference of opinion arose between the Japanese and Australian statesmen. Another question of even greater importance was that of the Japanese amendment to the League of Nations covenant asserting the so-called principle of racial equality. On this question opinion, both in Australia and in New Zealand, was very strong. The policy of a White Australia was the very foundation of the political creed of nearly all Australians, without distinction of party, and therefore any principle of so-called racial equality which might restrict the power of the Commonwealth Government to exclude coloured immigrants roused the determined opposition of all Australians. Mr. Hughes urged this point with great force during the debates in Paris, and it was partly owing to his advocacy that the Japanese amendment, even in the milder form in which it was subsequently brought forward, was excluded entirely from the covenant. The stand which Mr. Hughes made on this point increased his reputation in Australia, and, as already stated, on this question he had the support of his political opponents. . . . Immediately after the signing of the Treaty of Peace with Germany [1919], Mr. Hughes and Sir Joseph Cook (who had also been at the Peace Conference) left England for their return journey to Australia. Early in September the Commonwealth Parliament met to consider the ratification of the Treaty of Peace, and the House of Representatives was crowded on September 10 when Mr. Hughes moved a resolution approving of the Treaty of Peace. The Prime Minister, who had landed at Perth three weeks earlier, and had made a public progress through Western Australia, South Australia, and Victoria, made a long and memorable speech in describing the Treaty. Mr. Hughes described at length the course of the negotiations at Versailles, and in regard to the new project of a League of Nations. . . . He dealt at length with the general question of the Pacific Ocean, and the natural rights therein of the two Australasian States. He said that the Monroe doctrine, to which America still held, forbade the interference of European countries in the affairs of the two American continents. The question of the Pacific was, said Mr. Hughes, a parallel case; and the people of the United States should understand that they ought not to interfere there. Mr. Hughes went on to describe how he, with the support of Sir Joseph Cook, had fought in Paris for the principle of a White Australia; but he declared that it was his hope that the

Japanese would remain on friendly terms both with Great Britain and with Australia. The Treaty of Peace was duly ratified by the Australian Parliament."—*Annual Register*, 1919, pp. 292-294.—See also VERSAILLES, CONFERENCE OF: 1919: Outline of work; VERSAILLES, TREATY OF: Conditions of peace.

1919-1920.—Conflict between the Nationalists and the Labor party.—Confusion of political issues.—General election (December, 1919).—New Tariff.—Lord Forster becomes governor-general.—“The Federal Parliament was dissolved before its full three years had expired, because, in the opinion of the Prime Minister, it had exhausted its mandate and had no authority to deal with post-war problems. The Nationalist coalition had been formed to enable Australia effectively to coöperate with the Allies during the war, and there was no necessary agreement among its members on any other point. Mr. Watt, who, during Mr. Hughes's absence at the Peace Conference, had carried out the thankless duties of an acting Prime Minister with full responsibility, but without liberty of action, had expressed a somewhat different opinion. In view of the seamen's strike, the leaders of which had uttered threats of revolutionary action, and of many other expressions of contempt for the authority of Parliament and for the decree of the Arbitration Court, he had urged that the Coalition should remain in existence for the defence of constitutional government. Mr. Hughes, however, on his return declared that he did not know which partly he belonged to, and was himself still a Labour man and a Socialist. He had left Europe at a time of great industrial disturbance, much of which was attributable to the high cost of living and to the resentment aroused by disclosures of extortionate profits. He realised that the same conditions of class hatred, uncertainty, and general apprehension existed in Australia, and, before leaving, announced his policy as death to profiteers and Bolsheviks. Mr. Hughes appears to have sincerely believed that, with a policy stated in these general terms and on the strength of his achievements in Europe, he would be given the position of a National leader with full authority to cure the ills of the Commonwealth; but conferences with friends and colleagues appear to have convinced him that except as a member of the National Party there was no place for him in Australian politics, and he found the Nationalist Party by no means united. Some of its members, including members of the Government, were apprehensive of the effect on trade and industry of an indiscriminate campaign against the profiteer; others resented his dictatorship and his tendency to ignore Parliament, and even his war Cabinet, in important transactions. There was no attempt to supersede Mr. Hughes in the leadership, but his followers, while admitting his strength of personality, were by no means confident that they would be able to accept all he might say or do. The Labour Party in Parliament was weak, both in numbers and in ability. . . . In his speeches delivered before the opening of the campaign Mr. Hughes appealed for support on three main grounds. He claimed to have represented the true spirit of Australia during the war, and to have defended her interests successfully at the Peace Conference. He appealed to the returned soldiers as the protector of their special interests. He prescribed a gospel of work and increased production, and he promised in equally vague terms to remove the legitimate causes of industrial discontent. In order to fulfil this last

promise he claimed that new powers should be conferred on the Commonwealth Parliament, so that it would be able to deal with trade and commerce within as well as between the States, and in particular that it should have power to regulate prices and control monopolies. Price-fixing during the war had been sustained by a decision of the High Court, which, somewhat unexpectedly, had treated it as an exercise of the power of defence. But it was claimed that unless the Constitution were amended the control of intra-State trade and commerce, including the right of price-fixing, would revert to the States. Here, however, Mr. Hughes had an experience of the difficulties of his position as a Nationalist leader. The party was agreed that the time had come for a general revision of the Constitution, and on the whole, that if prices or wages were to be regulated by law, the task should be carried out by an authority having jurisdiction over the whole of Australia. But it was as a whole opposed to so extensive and indefinite an increase of Commonwealth power as had formerly been championed by Mr. Hughes; and in all the States but Queensland it had a majority in the State Parliament. Mr. Hughes was compelled, therefore, to propose a bargain with the State Premiers in order to prevent a schism within the party. After negotiations with them which were not wholly successful, he proposed that the Commonwealth should be entrusted with authority to deal with what he described as the aftermath of the war, that a referendum should be held at the General Election by which the necessary additional powers should be secured for the Commonwealth, that these powers should be exercisable for a limited period only, and that before the end of 1920 a Convention should be held to prepare a general scheme of constitutional revision. This compromise was supported by the Nationalist members in the Federal Parliament, and was accepted by some Labour members as a step towards unification which could not be retraced without considerable difficulty. But it was never accepted by the Nationalists in the country, and it was opposed by the farmers, not on constitutional grounds, but because it foreshadowed the increase of government interference with trade and commerce. The Labour manifesto furnishes documentary evidence of the decline in political vision and in sense of responsibility which began in the party at the time of the first conscription referendum, and has not since been arrested. It contains a series of promises without suggestion of the means necessary for their redemption. Offers are made to invalids, old age pensioners and others involving new expenditure to the amount of some seventeen millions per annum. The Government is to take control of banking and insurance businesses to an unspecified amount. The compulsory system of naval and military training is to be abandoned in favour of a voluntary army on a more democratic basis. This proposal is followed by a demand for the more complete self-determination of Australia, and for a change in her position as a member of the British family of nations. The campaign began with an incident which, unfortunately, can be regarded as to some extent characteristic of both leaders. Mr. Hughes, on his return, declared himself to be the friend of the soldiers, and promised to do for them whatever they asked. He was no doubt sincere, but the promise was stated in the same vague terms as his other proposals. Shortly afterwards the New Zealand Government made a promise to pay the members of the Expeditionary Force a gratuity of 1s. 6d. per day. Thereupon the soldiers de-

manded that Mr. Hughes should translate his promise into action and make a gift to them at the same rate. . . . Mr. Hughes . . . announced that the payment must be made, and stated that it would take the form of non-negotiable bonds, which would be taken at their face value for repatriation purposes. . . . Mr. Ryan, however, saw his chance, and announced that the Labour Party would pay the same amount in cash. . . . Thereupon began a competition between the two leaders in which the last thing considered was the interest of the community as a whole. Ultimately the Government made an arrangement by which bonds were to be taken at their face value by certain large employers, and the greater part were to be redeemed out of the first instalment of the German indemnity. . . . It is due to the soldiers to say that the greater number refused to take any part in what looked like an auction sale of their interest in the country to the highest bidder. This incident is also in one respect typical of the spirit in which the campaign was conducted between the two leaders. It became very largely a personal contest between Mr. Hughes and Mr. Ryan. Mr. Hughes insisted on his services as the defender of the White Australian policy at the Peace Conference and on Mr. Ryan's lack of loyalty or patriotism. Mr. Ryan's general answer was to say that Mr. Hughes had imposed unnecessary sacrifices on Australia, and that the Nationalist Government was incapable of dealing with profiteering through its association with large commercial businesses. The attention of the electors was never seriously directed to the crying needs of the country, to its growing taxation, to its heavy burden of debt, to disclosures of extravagant expenditure, which have been made during the war by one commission after another, or to the steady decrease in production which has been caused mainly by the drought but partly by the attraction of loan expenditure in the big cities."—*Round Table, March, 1920, pp. 432-436.*—*"The General Election [1919] was fought very largely on the Labour proposal for the unification of Australia. In the spring the Labour Organisations published a highly interesting programme on this important problem. It was apparently the intention of the Labour Party to advocate an entire change of the Australian Constitution, with the setting up of a Constitution more comparable to that of the Union of South Africa."*—*Annual Register, 1920, p. 301.*—*"As a result of elections held in Australia in December [1919] the Nationalists in the lower House controlled 39 seats, the Labor party, 26, and the Country party (anti-labor), 10. In the Senate the Nationalists had 35 seats and Labor 1. In the new parliament, which met on February 26, Premier Hughes was severely criticised for his attempt to rid the country of strikes by use of the war power vested in him; his order prohibiting banks 'or any one else' from giving money or goods to strikers proved abortive. By its new tariff Australia provides three sets of rates: the British preferential, to be applied to imports from the United Kingdom; intermediate, to be granted upon the conclusion of reciprocity treaties; and general rates, to be applied to all countries not entitled to either of the other tariffs. While the new tariff will undoubtedly bind Australia more closely to the empire, its object as stated by the Premier is 'to protect industries born during the war and to encourage others that are desirable and will diversify and extend existing ones.'"*—*E. D. Graper and H. J. Carman, Record of political events (Political Science Quarterly, Supplement, Sept., 1920, p. 105).*—See also *TARIFF: 1919-1920;*

World wide tariff tendency.—In 1920 the term of the governor-general, Sir R. Munro-Ferguson expired and he was succeeded by the Rt. Hon. Lord Forster. A list of the governors-general since the proclamation of the Commonwealth is as follows: Marquess Linlithgow, 1901-1903; Lord Tennyson, 1903-1904; Lord Northcote, 1904-1908; Earl of Dudley, 1908-1911; Lord Denman, 1911-1914; Sir R. Munro-Ferguson, 1914-1920.

1921.—Australia's mandate published.—Premier Hughes endorsed as representative to the coming Imperial Conference.—"Australia's mandate for the former German islands in the Pacific south of the equator was published on Feb. 9 [1921] by the League of Nations Council. It also published Japan's waiver of the clause respecting equal trading opportunities, which, however, the declaration said, should not be considered acquiescence by Japan."—*N. Y. Times Current History, March, 1921, p. 502.*—"Premier Hughes was defeated in the Australian Parliament on April 14 by an adverse majority of two, which, however, was purely accidental. In a plea to the members, he [Premier Hughes] stated that the vote made his position impossible, and that he could not attend the coming British imperial conference unless there was a clear indication that the vote did not mean censure or an attempt to take the control of business out of the hands of the Government. He received an emphatic endorsement on April 20, when resolutions reiterating confidence in the Government and declaring in favor of Premier Hughes as Australia's representative at the imperial conference were passed by a vote of 46 to 23. [Since then] debate on the Empire's foreign policy has occupied the attention of Parliament."—*N. Y. Times Current History, June, 1921, p. 510.*

AUSTRALIA, Constitution of.—The following is the "Act to constitute the Commonwealth of Australia," as passed by the Imperial Parliament, July 9, 1900 (63 & 64 Vict. ch. 12) (see AUSTRALIA: 1900). The text is from the official publication of the act:

Whereas the people of New South Wales, Victoria, South Australia, Queensland, and Tasmania, humbly relying on the blessing of Almighty God, have agreed to unite in one indissoluble Federal Commonwealth under the Crown of the United Kingdom of Great Britain and Ireland, and under the Constitution hereby established: And whereas it is expedient to provide for the admission into the Commonwealth of other Australasian Colonies and possessions of the Queen: Be it therefore enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

1. This Act may be cited as the Commonwealth of Australia Constitution Act.

2. The provisions of this Act referring to the Queen shall extend to Her Majesty's heirs and successors in the sovereignty of the United Kingdom.

3. It shall be lawful for the Queen, with the advice of the Privy Council, to declare by proclamation that, on and after a day therein appointed, not being later than one year after the passing of this Act, the people of New South Wales, Victoria, South Australia, Queensland, and Tasmania, and also, if Her Majesty is satisfied that the people of Western Australia have agreed thereto, of Western Australia, shall be united in a Federal Commonwealth under the name of the Commonwealth of Australia. But the Queen may, at any time after the proclamation, appoint a Governor-General for the Commonwealth.

4. The Commonwealth shall be established, and the Constitution of the Commonwealth shall take effect, on and after the day so appointed. But the Parliaments of the several colonies may at any time after the passing of this Act make any such laws, to come into operation on the day so appointed, as they might have made if the Constitution had taken effect at the passing of this Act.

5. This Act, and all laws made by the Parliament of the Commonwealth under the Constitution, shall be binding on the courts, judges, and people of every State and of every part of the Commonwealth, notwithstanding anything in the laws of any State; and the laws of the Commonwealth shall be in force on all British ships, the Queen's ships of war excepted, whose first port of clearance and whose port of destination are in the Commonwealth.

6. "The Commonwealth" shall mean the Commonwealth of Australia as established under this Act. "The States" shall mean such of the colonies of New South Wales, New Zealand, Queensland, Tasmania, Victoria, Western Australia, and South Australia, including the northern territory of South Australia, as for the time being are parts of the Commonwealth, and such colonies or territories as may be admitted into or established by the Commonwealth as States; and each of such parts of the Commonwealth shall be called "a

Maps prepared specially for the **NEW LARNED**
 under direction of the editors and publishers.

State." "Original States" shall mean such States as are parts of the Commonwealth at its establishment.

7. The Federal Council of Australasia Act, 1885, is hereby repealed, but so as not to affect any laws passed by the Federal Council of Australasia and in force at the establishment of the Commonwealth. Any such law may be repealed as to any State by the Parliament of the Commonwealth, or as to any colony not being a State by the Parliament thereof.

8. After the passing of this Act the Colonial Boundaries Act, 1895, shall not apply to any colony which becomes a State of the Commonwealth; but the Commonwealth shall be taken to be a self-governing colony for the purposes of that Act.

9. The Constitution of the Commonwealth shall be as follows:—

CONSTITUTION

This Constitution is divided as follows:—

- Chapter I.—The Parliament:
 - Part I.—General:
 - Part II.—The Senate:
 - Part III.—The House of Representatives:
 - Part IV.—Both Houses of the Parliament:
 - Part V.—Powers of the Parliament:
- Chapter II.—The Executive Government:
- Chapter III.—The Judicature:
- Chapter IV.—Finance and Trade:
- Chapter V.—The States:
- Chapter VI.—New States:
- Chapter VII.—Miscellaneous:
- Chapter VIII.—Alteration of the Constitution. The Schedule.

CHAPTER I. THE PARLIAMENT: PART I.—GENERAL

1. The legislative power of the Commonwealth shall be vested in a Federal Parliament, which shall consist of the Queen, a Senate, and a House of Representatives, and which is herein-after called "The Parliament," or "The Parliament of the Commonwealth."

2. A Governor-General appointed by the Queen shall be Her Majesty's representative in the Commonwealth, and shall have and may exercise in the Commonwealth during the Queen's pleasure, but subject to this Constitution, such powers and functions of the Queen as Her Majesty may be pleased to assign to him.

3. There shall be payable to the Queen out of the Consolidated Revenue fund of the Commonwealth, for the salary of the Governor-General an annual sum which, until the Parliament otherwise provides, shall be ten thousand pounds. The salary of a Governor-General shall not be altered during his continuance in office.

4. The provisions of this Constitution relating to the Governor-General extend and apply to the Governor-General for the time being, or such person as the Queen may appoint to administer the Government of the Commonwealth; but no such person shall be entitled to receive any salary from the Commonwealth in respect of any other office during his administration of the Government of the Commonwealth.

5. The Governor-General may appoint such times for holding the sessions of the Parliament as he thinks fit, and may also from time to time, by Proclamation or otherwise, prorogue the Parliament, and may in like manner dissolve the House of Representatives. After any general elec-

tion, the Parliament shall be summoned to meet not later than thirty days after the day appointed for the return of the writs. The Parliament shall be summoned to meet not later than six months after the establishment of the Commonwealth.

6. There shall be a session of the Parliament once at least in every year, so that twelve months shall not intervene between the last sitting of the Parliament in one session and its first sitting in the next session.

PART II.—THE SENATE

7. The Senate shall be composed of senators for each State, directly chosen by the people of the State, voting, until the Parliament otherwise provides, as one electorate. But until the Parliament of the Commonwealth otherwise provides, the Parliament of the State of Queensland, if that State be an Original State, may make laws dividing the State into divisions and determining the number of senators to be chosen for each division, and in the absence of such provision the State shall be one electorate. Until the Parliament otherwise provides there shall be six senators for each Original State. The Parliament may make laws increasing or diminishing the number of senators for each State, but so that equal representation of the several Original States shall be maintained and that no Original State shall have less than six senators. The senators shall be chosen for a term of six years, and the names of the senators chosen for each State shall be certified by the Governor to the Governor-General.

8. The qualification of electors of senators shall be in each State that which is prescribed by this Constitution, or by the Parliament, as the qualification for electors of members of the House of Representatives; but in the choosing of senators each elector shall vote only once.

9. The Parliament of the Commonwealth may make laws prescribing the method of choosing senators, but so that the method shall be uniform for all the States. Subject to any such law, the Parliament of each State may make laws prescribing the method of choosing the senators for that State. The Parliament of a State may make laws for determining the times and places of elections of senators for the State.

10. Until the Parliament otherwise provides, but subject to this Constitution, the laws in force in each State, for the time being, relating to elections for the more numerous House of the Parliament of the State shall, as nearly as practicable, apply to elections of senators for the State.

11. The Senate may proceed to the despatch of business, notwithstanding the failure of any State to provide for its representation in the Senate.

12. The Governor of any State may cause writs to be issued for elections of senators for the State. In case of the dissolution of the Senate the writs shall be issued within ten days from the proclamation of such dissolution.

13. As soon as may be after the Senate first meets, and after each first meeting of the Senate following a dissolution thereof, the Senate shall divide the senators chosen for each State into two classes, as nearly equal in number as practicable; and the places of the senators of the first class shall become vacant at the expiration of the third year, and the places of those of the second class at the expiration of the sixth year, from the beginning of their term of service; and afterwards the places of senators shall become vacant at the expiration of six years from the beginning of their term of service. The election to fill vacant

places shall be made in the year at the expiration of which the places are to become vacant. For the purposes of this section the term of service of a senator shall be taken to begin on the first day of January following the day of his election, except in the cases of the first election and of the election next after any dissolution of the Senate, when it shall be taken to begin on the first day of January preceding the day of his election.

14. Whenever the number of senators for a State is increased or diminished, the Parliament of the Commonwealth may make such provision for the vacating of the places of senators for the State as it deems necessary to maintain regularity in the rotation.

15. If the place of a senator becomes vacant before the expiration of his term of service, the Houses of Parliament of the State for which he was chosen shall, sitting and voting together, choose a person to hold the place until the expiration of the term, or until the election of a successor as hereinafter provided, whichever first happens. But if the Houses of Parliament of the State are not in session at the time when the vacancy is notified, the Governor of the State, with the advice of the Executive Council thereof, may appoint a person to hold the place until the expiration of fourteen days after the beginning of the next session of the Parliament of the State, or until the election of a successor, whichever first happens. At the next general election of members of the House of Representatives, or at the next election of senators for the State, whichever first happens, a successor shall, if the term has not then expired, be chosen to hold the place from the date of his election until the expiration of the term. The name of any senator so chosen or appointed shall be certified by the Governor of the State to the Governor-General.

16. The qualifications of a senator shall be the same as those of a member of the House of Representatives.

17. The Senate shall, before proceeding to the despatch of any other business, choose a senator to be the President of the Senate; and as often as the office of President becomes vacant the Senate shall again choose a senator to be the President. The President shall cease to hold his office if he ceases to be a senator. He may be removed from office by a vote of the Senate, or he may resign his office or his seat by writing addressed to the Governor-General.

18. Before or during any absence of the President, the Senate may choose a senator to perform his duties in his absence.

19. A Senator may, by writing addressed to the President, or to the Governor-General if there is no President or if the President is absent from the Commonwealth, resign his place, which thereupon shall become vacant.

20. The place of a senator shall become vacant if for two consecutive months of any session of the Parliament he, without the permission of the Senate, fails to attend the Senate.

21. Whenever a vacancy happens in the Senate, the President, or if there is no President or if the President is absent from the Commonwealth, the Governor-General shall notify the same to the Governor of the State in the representation of which the vacancy has happened.

22. Until the Parliament otherwise provides, the presence of at least one-third of the whole number of the senators shall be necessary to constitute a meeting of the Senate for the exercise of its powers.

23. Questions arising in the Senate shall be determined by a majority of votes, and each senator

shall have one vote. The President shall in all cases be entitled to a vote; and when the votes are equal the question shall pass in the negative.

PART III.—THE HOUSE OF REPRESENTATIVES

24. The House of Representatives shall be composed of members directly chosen by the people of the Commonwealth, and the number of such members shall be, as nearly as practicable, twice the number of the senators. The number of members chosen in the several States shall be in proportion to the respective numbers of their people, and shall, until the Parliament otherwise provides, be determined, whenever necessary, in the following manner:—(i.) A quota shall be ascertained by dividing the number of the people of the Commonwealth, as shown by the latest statistics of the Commonwealth, by twice the number of the senators. (ii.) The number of members to be chosen in each State shall be determined by dividing the number of the people of the State, as shown by the latest statistics of the Commonwealth, by the quota; and if on such division there is a remainder greater than one-half of the quota, one more member shall be chosen in the State. But notwithstanding anything in this section, five members at least shall be chosen in each Original State.

25. For the purposes of the last section, if by the law of any State all persons of any race are disqualified from voting at elections for the more numerous House of the Parliament of the State, then, in reckoning the number of the people of the State or of the Commonwealth, persons of that race resident in that State shall not be counted.

26. Notwithstanding anything in section twenty-four, the number of members to be chosen in each State at the first election shall be as follows:—New South Wales, twenty-three; Victoria, twenty; Queensland, eight; South Australia, six; Tasmania, five; provided that if Western Australia is an Original State, the numbers shall be as follows:—New South Wales, twenty-six; Victoria, twenty-three; Queensland, nine; South Australia, seven; Western Australia, five; Tasmania, five.

27. Subject to this Constitution, the Parliament may make laws for increasing or diminishing the number of the members of the House of Representatives.

28. Every House of Representatives shall continue for three years from the first meeting of the House, and no longer, but may be sooner dissolved by the Governor-General.

29. Until the Parliament of the Commonwealth otherwise provides, the Parliament of any State may make laws for determining the divisions in each State for which members of the House of Representatives may be chosen, and the number of members to be chosen for each division. A division shall not be formed out of parts of different States. In the absence of other provision, each State shall be one electorate.

30. Until the Parliament otherwise provides, the qualification of electors of members of the House of Representatives shall be in each State that which is prescribed by the law of the State as the qualification of electors of the more numerous House of Parliament of the State; but in the choosing of members each elector shall vote only once.

31. Until the Parliament otherwise provides, but subject to this Constitution, the laws in force in each State for the time being relating to elections for the more numerous House of the Parliament of the State shall, as nearly as practicable, apply to elections in the State of members of the House of Representatives.

32. The Governor-General in Council may cause writs to be issued for general elections of members of the House of Representatives. After the first general election, the writs shall be issued within ten days from the expiry of a House of Representatives or from the proclamation of a dissolution thereof.

33. Whenever a vacancy happens in the House of Representatives, the Speaker shall issue his writ for the election of a new member, or if there is no Speaker or if he is absent from the Commonwealth the Governor-General in Council may issue the writ.

34. Until the Parliament otherwise provides, the qualifications of a member of the House of Representatives shall be as follows:—(i.) He must be of the full age of twenty-one years, and must be an elector entitled to vote at the election of members of the House of Representatives, or a person qualified to become such elector, and must have been for three years at least a resident within the limits of the Commonwealth as existing at the time when he is chosen: (ii.) He must be a subject of the Queen, either natural-born or for at least five years naturalized under a law of the United Kingdom, or of a Colony which has become or becomes a State, or of the Commonwealth, or of a State.

35. The House of Representatives shall, before proceeding to the despatch of any other business, choose a member to be the Speaker of the House, and as often as the office of Speaker becomes vacant the House shall again choose a member to be the Speaker. The Speaker shall cease to hold his office if he ceases to be a member. He may be removed from office by a vote of the House, or he may resign his office or his seat by writing addressed to the Governor-General.

36. Before or during any absence of the Speaker, the House of Representatives may choose a member to perform his duties in his absence.

37. A member may by writing addressed to the Speaker, or to the Governor-General if there is no Speaker or if the Speaker is absent from the Commonwealth, resign his place, which thereupon shall become vacant.

38. The place of a member shall become vacant if for two consecutive months of any session of the Parliament he, without the permission of the House, fails to attend the House.

39. Until the Parliament otherwise provides, the presence of at least one-third of the whole number of the members of the House of Representatives shall be necessary to constitute a meeting of the House for the exercise of its powers.

40. Questions arising in the House of Representatives shall be determined by a majority of votes other than that of the Speaker. The Speaker shall not vote unless the numbers are equal, and then he shall have a casting vote.

PART IV.—BOTH HOUSES OF THE PARLIAMENT

41. No adult person who has or acquires a right to vote at elections for the more numerous House of the Parliament of a State shall, while the right continues, be prevented by any law of the Commonwealth from voting at elections for either House of the Parliament of the Commonwealth.

42. Every senator and every member of the House of Representatives shall before taking his seat make and subscribe before the Governor-General, or some person authorised by him, an oath or affirmation of allegiance in the form set forth in the schedule to this Constitution.

43. A member of either House of the Parliament

shall be incapable of being chosen or of sitting as a member of the other House.

44. Any person who—(i.) Is under any acknowledgment of allegiance, obedience, or adherence to a foreign power, or is a subject or a citizen or entitled to the rights or privileges of a subject or a citizen of a foreign power: or (ii.) Is attainted of treason, or has been convicted and is under sentence, or subject to be sentenced, for any offence punishable under the law of the Commonwealth or of a State by imprisonment for one year or longer: or (iii.) Is an undischarged bankrupt or insolvent: or (iv.) Holds any office of profit under the Crown, or any pension payable during the pleasure of the Crown out of any of the revenues of the Commonwealth: or (v.) Has any direct or indirect pecuniary interest in any agreement with the Public Service of the Commonwealth otherwise than as a member and in common with the other members of an incorporated company consisting of more than twenty-five persons: shall be incapable of being chosen or of sitting as a senator or a member of the House of Representatives. But sub-section iv. does not apply to the office of any of the Queen's Ministers of State for the Commonwealth, or of any of the Queen's Ministers for a State, or to the receipt of pay, half pay, or a pension by any person as an officer or member of the Queen's navy or army, or to the receipt of pay as an officer or member of the naval or military forces of the Commonwealth by any person whose services are not wholly employed by the Commonwealth.

45. If a senator or member of the House of Representatives—(i.) Becomes subject to any of the disabilities mentioned in the last preceding section: or (ii.) Takes the benefit, whether by assignment, composition, or otherwise, of any law relating to bankrupt or insolvent debtors: or (iii.) Directly or indirectly takes or agrees to take any fee or honorarium for services rendered to the Commonwealth, or for services rendered in the Parliament to any person or State: his place shall thereupon become vacant.

46. Until the Parliament otherwise provides, any person declared by this Constitution to be incapable of sitting as a senator or as a member of the House of Representatives shall, for every day on which he so sits, be liable to pay the sum of one hundred pounds to any person who sues for it in any court of competent jurisdiction.

47. Until the Parliament otherwise provides, any question respecting the qualification of a senator or of a member of the House of Representatives, or respecting a vacancy in either House of the Parliament, and any question of a disputed election to either House, shall be determined by the House in which the question arises.

48. Until the Parliament otherwise provides, each senator and each member of the House of Representatives shall receive an allowance of four hundred pounds a year, to be reckoned from the day on which he takes his seat.

49. The powers, privileges, and immunities of the Senate and of the House of Representatives, and of the members and the committees of each House, shall be such as are declared by the Parliament, and until declared shall be those of the Commons House of Parliament of the United Kingdom, and of its members and committees, at the establishment of the Commonwealth.

50. Each House of the Parliament may make rules and orders with respect to—(i.) The mode in which its powers, privileges, and immunities may be exercised and upheld: (ii.) The order and conduct of its business and proceedings either separately or jointly with the other House,

PART V.—POWERS OF THE PARLIAMENT

51. The Parliament shall, subject to this Constitution, have power to make laws for the peace, order, and good government of the Commonwealth with respect to:—(i.) Trade and commerce with other countries, and among the States: (ii.) Taxation; but so as not to discriminate between States or parts of States: (iii.) Bounties on the production or export of goods, but so that such bounties shall be uniform throughout the Commonwealth: (iv.) Borrowing money on the public credit of the Commonwealth: (v.) Postal, telegraphic, telephonic, and other like services: (vi.) The naval and military defence of the Commonwealth and of the several States, and the control of the forces to execute and maintain the laws of the Commonwealth: (vii.) Lighthouses, lightships, beacons and buoys: (viii.) Astronomical and meteorological observations: (ix.) Quarantine: (x.) Fisheries in Australian waters beyond territorial limits: (xi.) Census and statistics: (xii.) Currency, coinage, and legal tender: (xiii.) Banking, other than State banking; also State banking extending beyond the limits of the State concerned, the incorporation of banks, and the issue of paper money: (xiv.) Insurance, other than State insurance; also State insurance extending beyond the limits of the State concerned: (xv.) Weights and measures: (xvi.) Bills of exchange and promissory notes: (xvii.) Bankruptcy and insolvency: (xviii.) Copyrights, patents of inventions and designs, and trade marks: (xix.) Naturalization and aliens: (xx.) Foreign corporations, and trading or financial corporations formed within the limits of the Commonwealth: (xxi.) Marriage: (xxii.) Divorce and matrimonial causes; and in relation thereto, parental rights, and the custody and guardianship of infants: (xxiii.) Invalid and old-age pensions: (xxiv.) The service and execution throughout the Commonwealth of the civil and criminal process and the judgments of the courts of the States: (xxv.) The recognition throughout the Commonwealth of the laws, the public Acts and records, and the judicial proceeding of the States: (xxvi.) The people of any race, other than the aboriginal race in any State, for whom it is deemed necessary to make special laws: (xxvii.) Immigration and emigration: (xxviii.) The influx of criminals: (xxix.) External affairs: (xxx.) The relations of the Commonwealth with the islands of the Pacific: (xxxi.) The acquisition of property on just terms from any State or person for any purpose in respect of which the Parliament has power to make laws: (xxxii.) The control of railways with respect to transport for the naval and military purposes of the Commonwealth: (xxxiii.) The acquisition, with the consent of a State, of any railways of the State on terms arranged between the Commonwealth and the State: (xxxiv.) Railway construction and extension in any State with the consent of that State: (xxxv.) Conciliation and arbitration for the prevention and settlement of industrial disputes extending beyond the limits of any one State: (xxxvi.) Matters in respect of which this Constitution makes provision until the Parliament otherwise provides: (xxxvii.) Matters referred to the Parliament of the Commonwealth by the Parliament or Parliaments of any State or States, but so that the law shall extend only to States by whose Parliaments the matter is referred, or which afterwards adopt the law: (xxxviii.) The exercise within the Commonwealth, at the request or with the concurrence of the Parliaments of all the States directly concerned, of any power which can at the establishment of this Constitution be ex-

ercised only by the Parliament of the United Kingdom or by the Federal Council of Australasia: (xxxix.) Matters incidental to the execution of any power vested by this Constitution in the Parliament or in either House thereof, or in the Government of the Commonwealth, or in the Federal Judicature, or in any department or officer of the Commonwealth.

52. The Parliament shall, subject to this Constitution, have exclusive power to make laws for the peace, order, and good government of the Commonwealth with respect to—(i.) The seat of government of the Commonwealth, and all places acquired by the Commonwealth for public purposes: (ii.) Matters relating to any department of the public service the control of which is by this Constitution transferred to the Executive Government of the Commonwealth: (iii.) Other matters declared by this Constitution to be within the exclusive power of the Parliament.

53. Proposed laws appropriating revenue or moneys, or imposing taxation, shall not originate in the Senate. But a proposed law shall not be taken to appropriate revenue or moneys, or to impose taxation, by reason only of its containing provisions for the imposition or appropriation of fines or other pecuniary penalties, or for the demand or payment or appropriation of fees for licences, or fees for services under the proposed law. The Senate may not amend proposed laws imposing taxation, or proposed laws appropriating revenue or moneys for the ordinary annual services of the Government. The Senate may not amend any proposed law so as to increase any proposed charge or burden on the people. The Senate may at any stage return to the House of Representatives any proposed law which the Senate may not amend, requesting, by message, the omission or amendment of any items or provisions therein. And the House of Representatives may, if it thinks fit, make any of such omissions or amendments, with or without modifications. Except as provided in this section, the Senate shall have equal power with the House of Representatives in respect of all proposed laws.

54. The proposed law which appropriates revenue or moneys for the ordinary annual services of the Government shall deal only with such appropriation.

55. Laws imposing taxation shall deal only with the imposition of taxation, and any provision therein dealing with any other matter shall be of no effect. Laws imposing taxation, except laws imposing duties of customs or of excise, shall deal with one subject of taxation only; but laws imposing duties of customs shall deal with duties of customs only, and laws imposing duties of excise shall deal with duties of excise only.

56. A vote, resolution, or proposed law for the appropriation of revenue or moneys shall not be passed unless the purpose of the appropriation has in the same session been recommended by message of the Governor-General to the House in which the proposal originated.

57. If the House of Representatives passes any proposed law, and the Senate rejects or fails to pass it, or passes it with amendments to which the House of Representatives will not agree, and if after an interval of three months the House of Representatives, in the same or the next session, again passes the proposed law with or without any amendments which have been made, suggested, or agreed to by the Senate, and the Senate rejects or fails to pass it, or passes it with amendments to which the House of Representatives will not agree, the Governor-General may dissolve the Senate and the House of Representatives simultane-

ously. But such dissolution shall not take place within six months before the date of the expiry of the House of Representatives by effluxion of time. If after such dissolution the House of Representatives again passes the proposed law, with or without any amendments which have been made, suggested, or agreed to by the Senate, and the Senate rejects or fails to pass it, or passes it with amendments to which the House of Representatives will not agree, the Governor-General may convene a joint sitting of the members of the Senate and of the House of Representatives. The members present at the joint sitting may deliberate and shall vote together upon the proposed law as last proposed by the House of Representatives, and upon amendments, if any, which have been made therein by one House and not agreed to by the other, and any such amendments which are affirmed by an absolute majority of the total number of the members of the Senate and House of Representatives shall be taken to have been carried, and if the proposed law, with the amendments, if any, so carried is affirmed by an absolute majority of the total number of the members of the Senate and House of Representatives, it shall be taken to have been duly passed by both Houses of the Parliament, and shall be presented to the Governor-General for the Queen's assent.

58. When a proposed law passed by both Houses of the Parliament is presented to the Governor-General for the Queen's assent, he shall declare, according to his discretion, but subject to this Constitution, that he assents in the Queen's name, or that he withholds assent, or that he reserves the law for the Queen's pleasure. The Governor-General may return to the house in which it originated any proposed law so presented to him, and may transmit therewith any amendments which he may recommend, and the Houses may deal with the recommendation.

59. The Queen may disallow any law within one year from the Governor-General's assent, and such disallowance on being made known by the Governor-General by speech or message to each of the Houses of the Parliament, or by Proclamation, shall annul the law from the day when the disallowance is so made known.

60. A proposed law reserved for the Queen's pleasure shall not have any force unless and until within two years from the day on which it was presented to the Governor-General for the Queen's assent the Governor-General makes known, by speech or message to each of the Houses of Parliament, or by Proclamation, that it has received the Queen's assent.

CHAPTER II. THE EXECUTIVE GOVERNMENT

61. The executive power of the Commonwealth is vested in the Queen and is exercisable by the Governor-General as the Queen's representative, and extends to the execution and maintenance of this Constitution, and of the laws of the Commonwealth.

62. There shall be a Federal Executive Council to advise the Governor-General in the government of the Commonwealth, and the members of the Council shall be chosen and summoned by the Governor-General and sworn as Executive Councillors, and shall hold office during his pleasure.

63. The provisions of this Constitution referring to the Governor-General in Council shall be construed as referring to the Governor-General acting with the advice of the Federal Executive Council.

64. The Governor-General may appoint officers to administer such departments of State of the

Commonwealth as the Governor-General in Council may establish. Such officers shall hold office during the pleasure of the Governor-General. They shall be members of the Federal Executive Council, and shall be the Queen's Ministers of State for the Commonwealth. After the first general election no Minister of State shall hold office for a longer period than three months unless he is or becomes a senator or a member of the House of Representatives.

65. Until the Parliament otherwise provides, the Ministers of State shall not exceed seven in number, and shall hold such offices as the Parliament prescribes, or, in the absence of provision, as the Governor-General directs.

66. There shall be payable to the Queen, out of the Consolidated Revenue Fund of the Commonwealth, for the salaries of the Ministers of State, an annual sum which, until the Parliament otherwise provides, shall not exceed twelve thousand pounds a year.

67. Until the Parliament otherwise provides, the appointment and removal of all other officers of the Executive Government of the Commonwealth shall be vested in the Governor-General in Council, unless the appointment is delegated by the Governor-General in Council or by a law of the Commonwealth to some other authority.

68. The command in chief of the naval and military forces of the Commonwealth is vested in the Governor-General as the Queen's representative.

69. On a date or dates to be proclaimed by the Governor-General after the establishment of the Commonwealth the following departments of the public service in each State shall become transferred to the Commonwealth: Posts, telegraphs, and telephones: Naval and military defence: Lighthouses, lightships, beacons, and buoys: Quarantine. But the departments of customs and of excise in each State shall become transferred to the Commonwealth on its establishment.

70. In respect of matters which, under this Constitution, pass to the Executive Government of the Commonwealth, all powers and functions which at the establishment of the Commonwealth are vested in the Governor of a Colony, or in the Governor of a Colony with the advice of his Executive Council, or in any authority of a Colony, shall vest in the Governor-General, or in the Governor-General in Council, or in the authority exercising similar powers under the Commonwealth, as the case requires.

CHAPTER III. JUDICATURE

71. The judicial power of the Commonwealth shall be vested in a Federal Supreme Court, to be called the High Court of Australia, and in such other federal courts as the Parliament creates, and in such other courts as it invests with federal jurisdiction. The High Court shall consist of a Chief Justice, and so many other Justices, not less than two, as the Parliament prescribes.

72. The Justices of the High Court and of the other courts created by the Parliament—(i.) Shall be appointed by the Governor-General in Council: (ii.) Shall not be removed except by the Governor-General in Council, on an address from both Houses of the Parliament in the same session, praying for such removal on the ground of proved misbehaviour or incapacity: (iii.) Shall receive such remuneration as the Parliament may fix; but the remuneration shall not be diminished during their continuance in office.

73. The High Court shall have jurisdiction, with such exceptions and subject to such regulations

as the Parliament prescribes, to hear and determine appeals from all judgments, decrees, orders, and sentences—(i.) Of any Justice or Justices exercising the original jurisdiction of the High Court: (ii.) Of any other federal court, or court exercising federal jurisdiction; or of the Supreme Court of any State, or of any other court of any State from which at the establishment of the Commonwealth an appeal lies to the Queen in Council: (iii.) Of the Inter-State Commission, but as to questions of law only: and the judgment of the High Court in all such cases shall be final and conclusive. But no exception or regulation prescribed by the Parliament shall prevent the High Court from hearing and determining any appeal from the Supreme Court of a State in any matter in which at the establishment of the Commonwealth an appeal lies from such Supreme Court to the Queen in Council. Until the Parliament otherwise provides, the conditions of and restrictions on appeals to the Queen in Council from the Supreme Courts of the several States shall be applicable to appeals from them to the High Court.

74. No appeal shall be permitted to the Queen in Council from a decision of the High Court upon any question, howsoever arising, as to the limits inter se of the Constitutional powers of the Commonwealth and those of any State or States, or as to the limits inter se of the Constitutional powers of any two or more States, unless the High Court shall certify that the question is one which ought to be determined by Her Majesty in Council. The High Court may so certify if satisfied that for any special reason the certificate should be granted, and thereupon an appeal shall lie to Her Majesty in Council on the question without further leave. Except as provided in this section, this Constitution shall not impair any right which the Queen may be pleased to exercise by virtue of Her Royal prerogative to grant special leave of appeal from the High Court to Her Majesty in Council. The Parliament may make laws limiting the matters in which such leave may be asked, but proposed laws containing any such limitation shall be reserved by the Governor-General for Her Majesty's pleasure.

75. In all matters—(i.) Arising under any treaty: (ii.) Affecting consuls or other representatives of other countries: (iii.) In which the Commonwealth, or a person suing or being sued on behalf of the Commonwealth, is a party: (iv.) Between States, or between residents of different States, or between a State and a resident of another State: (v.) In which a writ of Mandamus or prohibition or an injunction is sought against an officer of the Commonwealth: the High Court shall have original jurisdiction.

76. The Parliament may make laws conferring original jurisdiction on the High Court in any matter—(i.) Arising under this Constitution, or involving its interpretation: (ii.) Arising under any laws made by the Parliament: (iii.) Of Admiralty and maritime jurisdiction: (iv.) Relating to the same subject-matter claimed under the laws of different States.

77. With respect to any of the matters mentioned in the last two sections the Parliament may make laws—(i.) Defining the jurisdiction of any federal court other than the High Court: (ii.) Defining the extent to which the jurisdiction of any federal court shall be exclusive of that which belongs to or is invested in the courts of the States: (iii.) Investing any court of a State with federal jurisdiction.

78. The Parliament may make laws conferring rights to proceed against the Commonwealth or

a State in respect of matters within the limits of the judicial power.

79. The federal jurisdiction of any court may be exercised by such number of judges as the Parliament prescribes.

80. The trial on indictment of any offence against any law of the Commonwealth shall be by jury, and every such trial shall be held in the State where the offence was committed, and if the offence was not committed within any State the trial shall be held at such place or places as the Parliament prescribes.

CHAPTER IV. FINANCE AND TRADE

81. All revenues or moneys raised or received by the Executive Government of the Commonwealth shall form one Consolidated Revenue Fund, to be appropriated for the purposes of the Commonwealth in the manner and subject to the charges and liabilities imposed by this Constitution.

82. The costs, charges, and expenses incident to the collection, management, and receipt of the Consolidated Revenue Fund shall form the first charge thereon; and the revenue of the Commonwealth shall in the first instance be applied to the payment of the expenditure of the Commonwealth.

83. No money shall be drawn from the Treasury of the Commonwealth except under appropriation made by law. But until the expiration of one month after the first meeting of the Parliament the Governor-General in Council may draw from the Treasury and expend such moneys as may be necessary for the maintenance of any department transferred to the Commonwealth and for the holding of the first elections for the Parliament.

84. When any department of the public service of a State becomes transferred to the Commonwealth, all officers of the department shall become subject to the control of the Executive Government of the Commonwealth. Any such officer who is not detained in the service of the Commonwealth shall, unless he is appointed to some other office of equal emolument in the public service of the State, be entitled to receive from the State any pension, gratuity, or other compensation, payable under the law of the State on the abolition of his office. Any such officer who is retained in the service of the Commonwealth shall preserve all his existing and accruing rights, and shall be entitled to retire from office at the time, and on the pension or retiring allowance, which would be permitted by the law of the State if his service with the Commonwealth were a continuation of his service with the State. Such pension or retiring allowance shall be paid to him by the Commonwealth; but the State shall pay to the Commonwealth a part thereof, to be calculated on the proportion which his term of service with the State bears to his whole term of service, and for the purpose of the calculation his salary shall be taken to be that paid to him by the State at the time of the transfer. Any officer who is, at the establishment of the Commonwealth, in the public service of a State, and who is, by consent of the Governor of the State with the advice of the Executive Council thereof, transferred to the public service of the Commonwealth, shall have the same rights as if he had been an officer of a department transferred to the Commonwealth and were retained in the service of the Commonwealth.

85. When any department of the public service of a State is transferred to the Commonwealth—(i.) All property of the State of any kind, used exclusively in connexion with the department, shall

become vested in the Commonwealth; but, in the case of the departments controlling customs and excise and bounties, for such time only as the Governor-General in Council may declare to be necessary: (ii.) The Commonwealth may acquire any property of the State, of any kind used, but not exclusively used in connexion with the department: the value thereof shall, if no agreement can be made, be ascertained in, as nearly as may be, the manner in which the value of land, or of an interest in land, taken by the State for public purposes is ascertained under the law of the State in force at the establishment of the Commonwealth: (iii.) The Commonwealth shall compensate the State for the value of any property passing to the Commonwealth under this section; if no agreement can be made as to the mode of compensation, it shall be determined under laws to be made by the Parliament: (iv.) The Commonwealth shall, at the date of the transfer, assume the current obligations of the State in respect of the department transferred.

86. On the establishment of the Commonwealth, the collection and control of duties of customs and of excise, and the control of the payment of bounties, shall pass to the Executive Government of the Commonwealth.

87. During a period of ten years after the establishment of the Commonwealth and thereafter until the Parliament otherwise provides, of the net revenue of the Commonwealth from duties of customs and of excise not more than one-fourth shall be applied annually by the Commonwealth towards its expenditure. The balance shall, in accordance with this Constitution, be paid to the several States, or applied towards the payment of interest on debts of the several States taken over by the Commonwealth.

88. Uniform duties of customs shall be imposed within two years after the establishment of the Commonwealth.

89. Until the imposition of uniform duties of customs—(i.) The Commonwealth shall credit to each State the revenues collected therein by the Commonwealth. (ii.) The Commonwealth shall debit to each State—(a) The expenditure therein of the Commonwealth incurred solely for the maintenance or continuance, as at the time of transfer, of any department transferred from the State to the Commonwealth; (b) The proportion of the State, according to the number of its people, in the other expenditure of the Commonwealth. (iii.) The Commonwealth shall pay to each State month by month the balance (if any) in favour of the State.

90. On the imposition of uniform duties of customs the power of the Parliament to impose duties of customs and of excise, and to grant bounties on the production or export of goods, shall become exclusive. On the imposition of uniform duties of customs all laws of the several States imposing duties of customs or of excise, or offering bounties on the production or export of goods, shall cease to have effect, but any grant of or agreement for any such bounty lawfully made by or under the authority of the Government of any State shall be taken to be good if made before the thirtieth day of June, one thousand eight hundred and ninety-eight, and not otherwise.

91. Nothing in this Constitution prohibits a State from granting any aid to or bounty on mining for gold, silver, or other metals, nor from granting, with the consent of both Houses of the Parliament of the Commonwealth expressed by resolution, any aid to or bounty on the production or export of goods.

92. On the imposition of uniform duties of customs, trade, commerce, and intercourse among the States, whether by means of internal carriage or ocean navigation, shall be absolutely free. But notwithstanding anything in this Constitution, goods imported before the imposition of uniform duties of customs into any State, or into any Colony which, whilst the goods remain therein, becomes a State, shall, on thence passing into another State within two years after the imposition of such duties, be liable to any duty chargeable on the importation of such goods into the Commonwealth, less any duty paid in respect of the goods on their importation.

93. During the first five years after the imposition of uniform duties of customs, and thereafter until the Parliament otherwise provides—(i.) The duties of customs chargeable on goods imported into a State and afterwards passing into another State for consumption, and the duties of excise paid on goods produced or manufactured in a State and afterwards passing into another State for consumption, shall be taken to have been collected not in the former but in the latter State: (ii.) Subject to the last subsection, the Commonwealth shall credit revenue, debit expenditure, and pay balances to the several States as prescribed for the period preceding the imposition of uniform duties of customs.

94. After five years from the imposition of uniform duties of customs, the Parliament may provide, on such basis as it deems fair, for the monthly payment to the several States of all surplus revenue of the Commonwealth.

95. Notwithstanding anything in this Constitution, the Parliament of the State of Western Australia, if that State be an Original State, may, during the first five years after the imposition of uniform duties of customs, impose duties of customs on goods passing into that State and not originally imported from beyond the limits of the Commonwealth; and such duties shall be collected by the Commonwealth. But any duty so imposed on any goods shall not exceed during the first of such years the duty chargeable on the goods under the law of Western Australia in force at the imposition of uniform duties, and shall not exceed during the second, third, fourth, and fifth of such years respectively, four-fifths, three-fifths, two-fifths, and one-fifth of such latter duty, and all duties imposed under this section shall cease at the expiration of the fifth year after the imposition of uniform duties. If at any time during the five years the duty on any goods under this section is higher than the duty imposed by the Commonwealth on the importation of the like goods, then such higher duty shall be collected on the goods when imported into Western Australia from beyond the limits of the Commonwealth.

96. During a period of ten years after the establishment of the Commonwealth and thereafter until the Parliament otherwise provides, the Parliament may grant financial assistance to any State on such terms and conditions as the Parliament thinks fit.

97. Until the Parliament otherwise provides, the laws in force in any Colony which has become or becomes a State with respect to the receipt of revenue and the expenditure of money on account of the Government of the Colony, and the review and audit of such receipt and expenditure, shall apply to the receipt of revenue and the expenditure of money on account of the Commonwealth in the State in the same manner as if the Commonwealth, or the Government or an officer of the Commonwealth, were mentioned whenever

the Colony, or the Government or an officer of the Colony, is mentioned.

98. The power of the Parliament to make laws with respect to trade and commerce extends to navigation and shipping, and to railways the property of any State.

99. The Commonwealth shall not, by any law or regulation of trade, commerce, or revenue, give preference to one State or any part thereof over another State or any part thereof.

100. The Commonwealth shall not, by any law or regulation of trade or commerce, abridge the right of a State or of the residents therein to the reasonable use of the waters of rivers for conservation or irrigation.

101. There shall be an Inter-State Commission, with such powers of adjudication and administration as the Parliament deems necessary for the execution and maintenance, within the Commonwealth, of the provisions of this Constitution relating to trade and commerce, and of all laws made thereunder.

102. The Parliament may by any law with respect to trade or commerce forbid, as to railways, any preference or discrimination by any State, or by any authority constituted under a State, if such preference or discrimination is undue and unreasonable, or unjust to any State; due regard being had to the financial responsibilities incurred by any State in connexion with the construction and maintenance of its railways. But no preference or discrimination shall, within the meaning of this section, be taken to be undue and unreasonable, or unjust to any State, unless so adjudged by the Inter-State Commission.

103. The members of the Inter-State Commission—(i.) Shall be appointed by the Governor-General in Council; (ii.) Shall hold office for seven years, but may be removed within that time by the Governor-General in Council, on an address from both Houses of the Parliament in the same session praying for such removal on the ground of proved misbehaviour or incapacity; (iii.) Shall receive such remuneration as the Parliament may fix; but such remuneration shall not be diminished during their continuance in office.

104. Nothing in this Constitution shall render unlawful any rate for the carriage of goods upon a railway, the property of a State, if the rate is deemed by the Inter-State Commission to be necessary for the development of the territory of the State, and if the rate applies equally to goods within the State and to goods passing into the State from other States.

105. The Parliament may take over from the States their public debts as existing at the establishment of the Commonwealth, or a proportion thereof according to the respective numbers of their peoples as shown by the latest statistics of the Commonwealth, and may convert, renew, or consolidate such debts, or any part thereof; and the States shall indemnify the Commonwealth in respect of the debts taken over, and thereafter the interest payable in respect of the debts shall be deducted and retained from the portions of the surplus revenue of the Commonwealth payable to the several States, or if such surplus is insufficient, or if there is no surplus, then the deficiency or the whole amount shall be paid by the several States.

CHAPTER V. THE STATES

106. The Constitution of each State of the Commonwealth shall, subject to this Constitution, continue as at the establishment of the Common-

wealth, or as at the admission or establishment of the State, as the case may be, until altered in accordance with the Constitution of the State.

107. Every power of the Parliament of a Colony which has become or becomes a State, shall, unless it is by this Constitution exclusively vested in the Parliament of the Commonwealth or withdrawn from the Parliament of the State, continue as at the establishment of the Commonwealth, or as at the admission or establishment of the State, as the case may be.

108. Every law in force in a Colony which has become or becomes a State, and relating to any matter within the powers of the Parliament of the Commonwealth, shall, subject to this Constitution, continue in force in the State; and, until provision is made in that behalf by the Parliament of the Commonwealth, the Parliament of the State shall have such powers of alteration and of repeal in respect of any such law as the Parliament of the Colony had until the Colony became a State.

109. When a law of a State is inconsistent with a law of the Commonwealth, the latter shall prevail, and the former shall, to the extent of the inconsistency, be invalid.

110. The provisions of this Constitution relating to the Governor of a State extend and apply to the Governor for the time being of the State, or other chief executive officer or administrator of the government of the State.

111. The Parliament of a State may surrender any part of the State to the Commonwealth; and upon such surrender, and the acceptance thereof by the Commonwealth, such part of the State shall become subject to the exclusive jurisdiction of the Commonwealth.

112. After uniform duties of customs have been imposed, a State may levy on imports or exports, or on goods passing into or out of the State, such charges as may be necessary for executing the inspection laws of the State; but the net produce of all charges so levied shall be for the use of the Commonwealth; and any such inspection laws may be annulled by the Parliament of the Commonwealth.

113. All fermented, distilled, or other intoxicating liquids passing into any State or remaining therein for use, consumption, sale, or storage, shall be subject to the laws of the State as if such liquids had been produced in the State.

114. A State shall not, without the consent of the Parliament of the Commonwealth, raise or maintain any naval or military force, or impose any tax on property of any kind belonging to the Commonwealth, nor shall the Commonwealth impose any tax on property of any kind belonging to a State.

115. A State shall not coin money, nor make anything but gold and silver coin a legal tender in payment of debts.

116. The Commonwealth shall not make any law for establishing any religion, or for imposing any religious observance, or for prohibiting the free exercise of any religion, and no religious test shall be required as a qualification for any office or public trust under the Commonwealth.

117. A subject of the Queen, resident in any State, shall not be subject in any other State to any disability or discrimination which would not be equally applicable to him if he were a subject of the Queen resident in such other State.

118. Full faith and credit shall be given, throughout the Commonwealth to the laws, the public Acts and records, and the judicial proceedings of every State.

119. The Commonwealth shall protect every

State against invasion and, on the application of the Executive Government of the State, against domestic violence.

120. Every State shall make provision for the detention in its prisons of persons accused or convicted of offences against the laws of the Commonwealth, and for the punishment of persons convicted of such offences, and the Parliament of the Commonwealth may make laws to give effect to this provision.

CHAPTER VI. NEW STATES

121. The Parliament may admit to the Commonwealth or establish new States, and may upon such admission or establishment make or impose such terms and conditions, including the extent of representation in either House of the Parliament, as it thinks fit.

122. The Parliament may make laws for the government of any territory surrendered by any State to and accepted by the Commonwealth, or of any territory placed by the Queen under the authority of and accepted by the Commonwealth, or otherwise acquired by the Commonwealth, and may allow the representation of such territory in either House of the Parliament to the extent and on the terms which it thinks fit.

123. The Parliament of the Commonwealth may, with the consent of the Parliament of a State, and the approval of the majority of the electors of the State voting upon the question, increase, diminish, or otherwise alter the limits of the State, upon such terms and conditions as may be agreed on, and may, with the like consent, make provision respecting the effect and operation of any increase or diminution or alteration of territory in relation to any State affected.

124. A new State may be formed by separation of territory from a State, but only with the consent of the Parliament thereof, and a new State may be formed by the union of two or more States or parts of States, but only with the consent of the Parliaments of the States affected.

CHAPTER VII. MISCELLANEOUS

125. The seat of Government of the Commonwealth shall be determined by the Parliament, and shall be within territory which shall have been granted to or acquired by the Commonwealth, and shall be vested in and belong to the Commonwealth, and shall be in the State of New South Wales, and be distant not less than one hundred miles from Sydney. Such territory shall contain an area of not less than one hundred square miles, and such portion thereof as shall consist of Crown lands shall be granted to the Commonwealth without any payment therefor. The Parliament shall sit at Melbourne until it meet at the seat of Government.

126. The Queen may authorise the Governor-General to appoint any person, or any persons jointly or severally, to be his deputy or deputies within any part of the Commonwealth, and in that capacity to exercise during the pleasure of the Governor-General such powers and functions of the Governor-General as he thinks fit to assign to such deputy or deputies, subject to any limitations expressed or directions given by the Queen; but the appointment of such deputy or deputies shall not affect the exercise by the Governor-General himself of any power or function.

127. In reckoning the numbers of the people of the Commonwealth, or of a State or other part of the Commonwealth, aboriginal natives shall not be counted.

CHAPTER VIII. ALTERATION OF THE CONSTITUTION

128. This Constitution shall not be altered except in the following manner:—The proposed law for the alteration thereof must be passed by an absolute majority of each House of the Parliament, and not less than two nor more than six months after its passage through both Houses the proposed law shall be submitted in each State to the electors qualified to vote for the election of members of the House of Representatives. But if either House passes any such proposed law by an absolute majority, and the other House rejects or fails to pass it or passes it with any amendment to which the first-mentioned House will not agree, and if after an interval of three months the first-mentioned House in the same or the next session again passes the proposed law by an absolute majority with or without any amendment which has been made or agreed to by the other House, and such other House rejects or fails to pass it or passes it with any amendment to which the first-mentioned House will not agree, the Governor-General may submit the proposed law as last proposed by the first-mentioned House, and either with or without any amendments subsequently agreed to by both Houses, to the electors in each State qualified to vote for the election of the House of Representatives. When a proposed law is submitted to the electors the vote shall be taken in such manner as the Parliament prescribes. But until the qualification of electors of members of the House of Representatives becomes uniform throughout the Commonwealth, only one-half the electors voting for and against the proposed law shall be counted in any State in which adult suffrage prevails. And if in a majority of the States a majority of the electors voting approve the proposed law, and if a majority of all the electors voting also approve the proposed law, it shall be presented to the Governor-General for the Queen's assent. No alteration diminishing the proportionate representation of any State in either House of the Parliament, or the minimum number of representatives of a State in the House of Representatives, or increasing, diminishing, or otherwise altering the limits of the State, or in any manner affecting the provisions of the Constitution in relation thereto, shall become law unless the majority of the electors voting in that State approve the proposed law.—See also BRITISH EMPIRE: Character of the British empire: Characteristics of self-governing colonies.

AUSTRALIAN BALLOT: Origin.—Adoption in England.—Under the Australian system the ballots are printed under government supervision, at public expense, and contain the names of all candidates duly nominated. The ballots can be obtained by the voters only within the polling places, on election day, and are marked by them in entire secrecy. "As its name implies, this system originated in Australia. The population of this land in the first half of the nineteenth century included many gold-seekers, bent upon gain, and a large class of criminals. In this environment the vices of the *viva voce* method flourished even more than in England. Mr. Francis S. Dutton in his testimony before the Marquis of Hartington

committee in 1869 said: 'Before the ballot was in operation our elections were exceedingly riotous. Of course our community had the rowdy elements as well as other countries, and on election days these troublesome elements came to the surface; and I have been in the balcony of an hotel during one of the city elections, when the raging mobs down in the street were so violent that I certainly would not have risked my life to have crossed the street.' Many men in Australia saw the dangers of open voting, and began to work to secure a remedy. The secret ballot was first proposed by Francis S. Dutton in the Legislative Council of South Australia in 1851. For several years no action was taken, but in 1857 Mr. Dutton became a member of the government, and made excellent use of his opportunity to advance his measure. A bill embodying this plan was introduced, and, after some modification in the House, became a law in 1857-58. In Victoria the secret ballot was championed by Mr. William Nicholson, who, at the head of the government, secured the enactment of the law in 1856. The system spread very rapidly. It was adopted by Tasmania and New South Wales in 1858; New Zealand in 1870; Queensland in 1874; and West Australia in 1877. [See also SURFRAGE, MANHOOD: British Empire: 1921.] In England, where the *viva voce* method was in use with all its attending vices, the secret ballot had been agitated continually since 1830. In that year it was proposed by O'Connell and received the support of twenty-one members. The ballot formed a part of the reform bill as reported to the Cabinet by Lord John Russell, Sir James Graham, and others, but it was not included in the act as presented to Parliament. During the next three years many petitions for the measures were presented to Parliament and debated. On April 23, 1833, George Grote brought forward a resolution affirming the expediency of its adoption and until 1840 this was yearly presented and affirmed by Mr. Grote. After the retirement of Grote, Mr. Ward and later Mr. H. Berkley became the champions of the measure. It was supported by such statesmen as Macaulay, Bright, Cobbett, Hume, and O'Connell, and was opposed by Lord Derby, the Duke of Wellington, and Lord Palmerston. Although this movement was retarded by the revolution of 1848 and the opposition of John Stuart Mill, the long period of agitation finally bore fruit. In the Queen's speech from the throne in 1868-69, a recommendation was made that the present mode of conducting elections be inquired into and further guarantees adopted for promoting their tranquility, purity, and freedom. A committee of twenty-three, with the Marquis of Hartington as chairman, was appointed. This committee not only examined the English situation, but questioned witnesses from France, Italy, Greece, the United States, and Australia; and in 1870 it recommended that the secret ballot be adopted. The result was the ballot act which became a law in 1872. With the prestige gained by its success in England, the principles of the Australian ballot were soon adopted in Canada, Belgium, Luxemburg, and Italy."—E. C. Evans, *History of the Australian ballot system in the United States*, pp. 17-20.

1882-1916.—Australian ballot supersedes early methods of voting in the United States.—Evils of early methods.—Types of Australian ballots.—History of its spread in the United States.—"Although the departure from the English *viva voce* system of voting was begun in colonial times, it was not completed until late in the nineteenth century. Nine of the ten state constitutions framed between 1776 and 1780 required the secret

ballot for the election of certain officials, but the majority were still chosen by oral vote. 'As the voter appeared, his name was called out in a loud voice. The judges inquired, "John Smith, for whom do you vote?" He replied by proclaiming the name of his favorite. Then the clerks enrolled the vote, and the judges announced it as enrolled. The representative of the candidate for whom he voted arose, and bowed, and thanked him aloud; and his partisans often applauded.' In Kentucky, the last state to give up the system, the election for sheriff consisted in ranging the friends of one candidate on one side of the road, the backers of the other on the opposite side. As in an old-fashioned spelling bee, the longest line won. The class which strongly advocated the open vote were in America, as elsewhere, the propertied classes. The system naturally continued longest in the South. The conservatives dreaded the effect of secrecy upon the honesty of elections. John Randolph of Virginia said in 1839: 'I scarcely believe that we have such a fool in all Virginia as even to mention the vote by ballot, and I do not hesitate to say that the adoption of the ballot would make any nation a nation of scoundrels, if it did not find them so.' The ballot had been introduced in all the seaboard states but one by 1800. In that year it was adopted for the government of the Northwest Territory, and has since been the rule in states organized in the West. But Arkansas preserved the ancient *viva voce* system until 1846, Missouri and Virginia until the sixties, and Kentucky abandoned it only in 1890. By the middle of the nineteenth century, however, some form of ballot was employed in most of the United States. The generic term was applied to a motley variety of voting papers, both written and printed. As there was no rule for the size and color of the ballot, each party sought to make its ticket recognizable by the ignorant voter by peculiar marks. One Republican ballot had a flaming pink border, with rays projecting towards the center, and letters half an inch high. Ballots of colored tissue paper were common in the South. Such pronounced differences made it easy to distinguish a Republican from a Democratic paper, as far as it could be seen. The use of the ballot conformed to no rules. If he chose, the voter could make his own and bring it with him, usually in his vest-pocket, whence the name of 'vest-pocket tickets.' The labor involved in this led candidates generally before 1825 to print their tickets to allure the indolent. When the party took over the ballot, usage varied widely as to how many names should be put on one paper; some states required a man to cast nine, ten, or more papers before he had voted for all the candidates. The ballot was entirely a party affair, gotten up, printed, and peddled on election day, by party workers, who hawked their wares so diligently as to be an unmitigated nuisance. Unregulated political peddlers were given virtually complete control of an essential part of the electoral system. An unsystematic institution such as the above was prey to a multitude of abuses. Besides involving an enormous expense through the duplication of effort, the money spent did not insure the public . . . a correct ballot. The voter relied upon his party organization, and that often betrayed him. An irresponsible ring could 'unbunch' the party slate, remove a good candidate, and substitute one of its own, with little fear of penalty. The machines of two parties sometimes agreed to compromise by trading certain places on each other's ballots, unknown to the party members, who took what the peddlers gave them without inspection. If the politicians did not agree, a party got out counterfeit ballots

of the opposition with its own candidates on them, so skilfully contrived that detection was difficult even on close examination. Grosser frauds were practiced as well, because of the fact that the ballot was really hardly secret at all. This had two important results: bribery and intimidation. When a candidate had paid for a vote, he was naturally anxious to see that what he had bought was delivered. A better system than the old-style ballot for stabilizing this traffic in votes could hardly be conceived. Watchers stationed at the polls could tell, even at a distance, what ticket a man voted. The tissue-paper ballot even made it possible to deliver double or triple the value of the bribe, by folding smaller ballots inside a blanket one, and shaking them out as the ballot was dropped into the urn. Intimidation was probably not so common as in England, but it was carried on to far too large an extent. Men were transported to the polls in their employers' carriages. They were then given ballots and told to keep them in sight until the moment when they dropped them into the urn. If the voters stayed away from the polls or did not obey orders, they were thrown out of work, and, in mill-towns, out of the company's tenements as well. . . . [See also CORRUPT AND ILLEGAL PRACTICES AT ELECTIONS: United States.] The essential parts of the Australian system as employed in the United States are the printing and distribution of the ballot, the choosing of the names which shall appear upon it, and the regulation of the method in which it is cast. After its introduction the Australian ballot became the only one which the voter might cast. It is prepared by the state at public expense, so that in a sense the state guarantees the authenticity of the nominations on it. As it is necessary to restrict the size, the law provides that only names proposed by parties of a certain numerical strength, or by petition of a large number of electors, shall appear. In effect this is state recognition of parties, or of the party machine. The ballots are marked in a secret booth, from the neighborhood of which all but the voter are excluded. The system attempts to shield him from all outside influence from the moment he receives the ticket until he drops it into the ballot-box, and to keep his vote entirely from the knowledge of any one but himself. The Massachusetts ballot . . . is the nearest approach to the [Australian ballot] system in its entirety. Upon this the names of the candidates are grouped in alphabetical order under the offices for which they stand, with the name of the party following that of the nominee. Such is the general style of the ballot in fourteen states. It has been urged against the Massachusetts ballot that the amount of marking required discourages the voter and leads to neglect of all but the leading offices on the ticket. On the other hand, it diminishes laxness in the shape of straight ticket voting by demanding separate consideration for each nominee. That the system does actually favor independent voting was shown in the election of 1904. . . . It is claimed, however, that the arrangement of names on the ballot constitutes a literacy test, and some twenty-five states use the party-column type, the other main style of the Australian ballot. The entire ticket of each party is printed in a single column with the party emblem at its head to enlighten ignorant voters. The artistic taste of the political parties is most diverse and catholic. The Socialists come nearest to uniformity, two hands clasped before a globe being their insignia in seven states. The Prohibitionists employ a hatchet in Alabama, a house and yard in Delaware, a phoenix in Kentucky, an armorial device in Michigan, an anchor in New Hampshire, a fountain in New

York, a rose in Ohio, while the only picture on which two states agree is the sun rising over the water, used in Indiana and Kansas. These superficial differences merely reflect deeper variations on more important points. The size of the ballot varies from a huge blanket, four or five feet square, to a narrow strip three inches wide and thirty-one inches long, in Florida, or the note-paper size used in Oregon. Of more importance is the relative ease with which a man can vote a straight ticket or can exercise intelligence in picking the best candidate of several parties. A simple cross in the circle beneath the party emblem casts a straight ballot. In many states the independent voter is put to twenty times as much trouble even though he would vote for but one officer outside of his own party. Here is a serious matter for there is no doubting the American voter's proclivity to choose the easiest way in marking his ballot. The party column system often places a direct penalty on an effort to smash the weak spots in a party slate. To be sure the illiterate voter would be at sea without the party emblem; but it is a question whether haphazard or hidebound voting is the lesser evil. It would seem practicable to add the party symbol to the party name on the Massachusetts ballot and thus to avoid both Scylla and Charybdis. At any rate the problem deserves at least as diligent attention as our great corporations give to the efficiency of their advertising. . . . A partial remedy for the evils of the present ballot has been secured by the use of the voting machines, which combine relative simplicity with ease in splitting a party ticket. Absolute accuracy in counting the returns is assured. Their cost is perhaps the main obstacle in the way of their universal adoption."—C. Seymour and D. P. Fray, *How the world votes*, v. 1, pp. 246-254.—The New York state ballot in recent years has combined the party emblem and the Massachusetts arrangement by officers. This makes it as easy to vote a split ticket as a straight one and at the same time aids the illiterate voter.—"At first this new reform in Australia and England does not appear to have created much of an impression in this country. According to Mr. John S. Wigmore, it was first advocated by a member of the Philadelphia Civil Reform Association in 1882 in a pamphlet called *English Elections*. The following year Henry George in the *North American Review* advocated the adoption of the English system as a cure for the vices arising from use of money in elections. The first attempt that the writer could discover to secure the passage of the reform was made in Michigan in 1885. A bill modeled on the Australian act was introduced into the lower house of the legislature by Mr. George W. Walthew, but it failed to pass. A bill similar to that of Mr. Walthew's, advocated by Mr. Judson Grenell, passed the House in 1887, but was lost in the Senate. In Wisconsin a compromise measure applying to cities of fifty thousand or over was adopted in 1887. Under this law the party organizations printed the ballots and the state distributed them. But the honor of enacting the first Australian-ballot law belongs to Kentucky. This measure was introduced by Mr. A. M. Wallace, of Louisville, and was enacted February 24, 1888. The act applied only to the city of Louisville, because the state constitution required *viva voce* voting at state elections. The ballots were printed by the mayor at the expense of the city. Candidates had to be nominated by fifty or more voters in order to have their names placed upon the ballot. The blanket form of the ballot was provided, with the names of the candidates arranged in alphabetical order according to surnames, but

without party designations of any kind. The manner of obtaining and marking the ballots was the same as the Massachusetts act. . . . The original centers of organized agitation for the reform were New York and Boston, and the two movements, while simultaneous, were independent. In Boston the earliest discussion and demand for ballot reform grew out of the discussions of public questions by the members of a club called the 'Dutch Treat.' Later the Boston City Council and the labor organizations began to demand reform. One of the members of the 'Dutch Treat,' Mr. H. H. Sprague, was elected to the state Senate and was made chairman of a committee on election law. Encouraged by these favorable signs, the club drafted a bill which was presented by Mr. Sprague. Another bill was presented in the House by Mr. E. B. Hayes, of Lynn, [Mass.] Mr. Hayes lent his support to the bill introduced by Mr. Sprague, a large number of petitions for the bill were received, and on May 20, 1888, the law was enacted. In New York a systematic discussion began in 1887 in the Commonwealth Club. After a thorough discussion of this reform, a committee was appointed composed of some of the leading lawyers and men of legislative and administrative experience, taken equally from the Republican and Democratic parties. This committee was subsequently joined by a like committee from the City Reform Club; and after some months of study, it drafted an act which, after having been approved by the Commonwealth Club, the City Reform Club, and the Single Tax party, was presented in the Assembly of 1888 and was known as the 'Yates bill.' The bill was referred to the Committee on Judiciary and was amended by certain provisions taken from similar bills introduced by Mr. Saxton and Mr. Hamilton. The measure was supported by the Republicans and passed both houses of the legislature, but was vetoed by Governor Hill. Agitation was started anew by its friends and a ballot league was formed. In the session of the legislature of 1889 the Saxton bill was amended and again introduced, the bill as amended having received the indorsement of a committee of the Young Men's Democratic Club of New York. The legislature again passed the Saxton bill and it was vetoed a second time by Governor Hill. In 1890 the Yates-Saxton bill with some modifications was again introduced, and a monster petition from New York City containing over one hundred thousand signatures was presented to the legislature. Governor Hill saw that something had to be done, so he expressed a willingness to sign a bill looking to the improvement of the election laws, but declared that under no circumstance would he approve any bill following the Massachusetts or the Australian system. Certain of the leaders, despairing of the adoption of their reform, decided to accept the governor's overtures. The result was the unsatisfactory compromise law of 1890 which provided for the so-called 'party and paster ballot.' The rapidity of the spread of the Australian ballot in the United States during the next few years was most gratifying to its friends, but its triumph was not secured without a hard struggle. The opposition came from two sources: the ultra-conservative members of the community, and the machine politicians who profited by the vices of the old system. The *New York Herald*, in an editorial, said: "The only persons who can have an interest in elections as they are, are the leaders and managers, whose power depends upon their successes in manipulating the ballot so that the suffrage will express, not the will of the people, but the success of their schemes." As Mr. Wigmore shows in his summary of party

votes, the success of the measure in the country as a whole cannot be claimed by either of the two great political parties, and its enemies were also bipartisan. The movement for reform, which reaped its first fruits of victory in Louisville and Massachusetts, received great impetus by the unprecedented use of money in the election of 1888. The effect is easily seen in the record of legislation of the next four years. In 1889 seven states enacted reform laws based on the Australian ballot. In the legislative sessions of the following year five states and one territory placed this law on their statute books. Before the presidential election in 1892 thirty-two states and two territories had provided for the Australian ballot; and by 1896 seven other states were added to this list. In 1897 Missouri abandoned in part the Australian ballot, and adopted separate party ballots. This is the only state which has given up the blanket form of the ballot after once adopting it. By 1916 Georgia and South Carolina remain the only states entirely unreformed. North Carolina has [1916] only a local act applying to New Hanover County. New Mexico has a very unsatisfactory compromise law under which separate ballots are printed by the county recorders under the supervision of the chairmen of the county committees of each party; and the ballots are distributed by the parties in advance of the election. Tennessee has applied the Australian-ballot law only to counties having fifty thousand population or over, and to towns having a population of twenty-five hundred or more. Missouri has all the features of the Australian ballot except that it has separate party ballots. Delaware has taken a very reactionary step by permitting an elector to obtain a ballot in advance of the election from the chairmen of the various political organizations, and she has also introduced an element of danger by the use of envelopes."—E. C. Evans, *History of the Australian ballot system in the United States*, pp. 17-20.—See also SUFFRAGE, MANHOOD; United States.

1902.—Secret ballot in Porto Rico. See PORTO RICO: 1901-1905.

1913.—Secret ballot in France.—"The continued efforts of the Chamber of Deputies to get the Senate to agree to a completely secret ballot resulted in 1913 in a law providing for voting under envelope, as in the elections to the German Reichstag, and for secret voting booths. All ballots must be cast in a uniform, opaque envelope, provided by the prefect, and bearing an official stamp. The voter goes into the *isoloir*, or booth, and in secrecy folds his ballot and puts it into the envelope. He then deposits it in the urn himself, so that the president may have no chance to mark it surreptitiously. This reform will do away with intimidation, ballot stuffing, marking of ballots, and their identification by outsiders. It came slowly, and in the face of great opposition in the Senate during a whole decade."—C. Seymour and D. P. Frary, *How the world votes*, v. 1, pp. 379-380.

AUSTRALIAN MAN. See EUROPE: Prehistoric period: Earliest remains.

AUSTRASIA and NEUSTRIA, or Neustrasia.—"It is conjectured by Luden, with great probability, that the Ripuarians were originally called the 'Eastern' people to distinguish them from the Salian Franks who lived to the West. But when the old home of the conquerors on the

right bank of the Rhine was united with their new settlements in Gaul, the latter, as it would seem, were called Neustria or Neustrasia (New Lands); while the term Austrasia came to denote the original seats of the Franks, on what we now call the German bank of the Rhine. The most important difference between them (a difference so great as to lead to their permanent separation into the kingdoms of France and Germany by the treaty of Verdun) was this: that in Neustria the Frankish element was quickly absorbed by the mass of Gallo-Romanism by which it was surrounded; while in Austrasia, which included the ancient seats of the Frankish conquerors, the German element was wholly predominant. The import of the word Austrasia (Austria, Austrifracia) is very fluctuating. In its widest sense it was used to denote all the countries incorporated into the Frankish Empire, or even held in subjection to it, in which the German language and population prevailed; in this acceptance it included therefore the territory of the Alemanni, Bavarians, Thuringians, and even that of the Saxons and Frises. In its more common and proper sense it meant that part of the territory of the Franks themselves which was not included in Neustria. It was subdivided into Upper Austrasia on the Moselle, and Lower Austrasia on the Rhine and Meuse. Neustria (or, in the fulness of the monkish Latinity, Neustrasia) was bounded on the north by the ocean, on the south by the Loire, and on the southwest [southeast?] towards Burgundy by a line which, beginning below Gien on the Loire, ran through the rivers Loing and

Yonne, not far from their sources, and passing north of Auxerre and south of Troyes, joined the river Aube above Arcis."—W. C. Perry, *The Franks*, ch. 3.—"The northeastern part of Gaul, along the Rhine, together with a slice of ancient Germany, was already distinguished, as we have seen, by the name of the Eastern Kingdom, or Oster-rike, Latinized into Austrasia. It embraced the region first occupied by the Ripuarian Franks, and where they still lived the most compactly and in the greatest number. . . . This was, in the estimation of the Franks, the kingdom by eminence, while the rest of the north of Gaul was simply not it—'ne-osterrike,' or Neustria. A line drawn from the mouth of the Scheldt to Cambrai, and thence across the Marne at Chateau-Thierry to the Aube of Bar-sur-Aube, would have separated the one from the other, Neustria comprising all the northwest of Gaul, between the Loire and the ocean, with the exception of Brittany. This had been the first possession of the Salian Franks in Gaul. . . . To such an extent had they been absorbed and influenced by the Roman elements of the population, that the Austrasians scarcely considered them Franks, while they, in their turn, regarded the Austrasians as the merest untutored barbarians."—P. Godwin, *History of France: Ancient Gaul*, bk. 3, ch. 13, with note.—See also FRANKS (MEROVINGIAN EMPIRE): 511-752; GERMANY: 687-800; SCANDINAVIAN STATES: 8th-9th centuries.

AUSTRIA

Introduction.—Singularity of Austrian history.—A Power which was not a national power.—The peculiarities of Austrian and Austro-Hungarian history down to the outbreak of the World War are set forth in the following quotations: "The very first fact with which any student of Austria-Hungary is confronted is that he is dealing *with a state and not with a nation*. Nationalities are plentiful within the limits of the empire—more nationalities and more languages than in any other European state except Russia—but there is no Austro-Hungarian nation. When the emperor wishes to address a manifesto to his subjects it is not 'to my people' that he speaks, but 'to my peoples.' Nor have these nationalities anything in common except their government. Race, religion, all that tends to make nationalities different from one another are present. And so whether we apply to it the terms of one of its severe critics, 'a ramshackle empire,' or describe it, as its friends do, as an exceedingly hopeful experiment in racial federalization, we are necessarily brought back to the conclusion that the Austria of to-day is not a nation but a government functioning over a group of struggling nationalities each differing from the other in race, religion and methods of life. Nor does the Austrian difficulty end there. In their struggle with each other the nationalities look not merely to their own strength for aid but also to their brothers outside the borders of Austria-Hungary. The German looks to Germany, the Slav to Serbia and Russia for assistance in their hopes of strengthening their position within the Dual Empire. The result is that this question has been too often regarded by the Austrian statesmen as a question of foreign policy to be settled with these outside powers rather than an internal question to be settled within the empire. Moreover, the Austro-

Hungarian Empire has been constantly endeavoring to expand either its territory or its influence, at first in Italy and Germany, and more lately in the Balkan peninsula. And these attempts at expansion have brought it into acute conflict: in the first case with Italy, France and Prussia; in the second case with Russia. So the Dual Empire, whether on the defensive or offensive, has always made foreign policy its chief aim, and has given far too little attention to the pressing questions at home. There are some nations which suffer from too little attention to foreign policy; Austria seems to have suffered from giving it too much. Finally the Austro-Hungarian Empire shares the fate of all empires on the borderland between two civilizations. 'Asia,' says a Viennese proverb, 'begins on the Ringstrasse,' and there seems to be an element of truth in the saying. The traveller who goes from the Tyrol to Bosnia or to northwestern Hungary passes into a different world. One is European, the other is Oriental, and all the efforts of the rulers to Europeanize their subjects and to mitigate this difference have only partially succeeded. And this difference has increased still further the dissension within the Dual Empire and prevented the formation of a united nation.

"This is Austria, a state, a foreign policy, an army, a ruler, but never a nation. How did such a state come to be formed? To answer this question we must go back into the late Middle Ages, to the period when the old Holy Roman Empire of the Germans was struggling with the non-German races on its borders, Slavs and Magyars. To provide for defence against these races was formed the so-called East March—the kernel of modern Austria. Originally purely German, it extended to the south to take in the Slavs along the northern Adriatic. But the genesis of modern Austria begins with a certain Ferdinand, brother of Charles

V, whom Luther faced at Worms in 1521. By a fortunate marriage and by equally fortunate deaths he acquired Hungary and Bohemia. But he acquired something in addition to these territories, he acquired a Turkish war among his possessions in Hungary. And for the next two centuries Austria waged almost unceasing war against the Turks. At first the struggle went rather against them; in 1529 and again in 1683, the Turks nearly captured Vienna and settled the problem of Austria in a Turkish sense. But after 1683 the war went steadily in Austria's favor. She gradually extended down the Danube and into the Balkans, taking under her dominion large numbers of Slavs who welcomed her armies as deliverers from the hated oppression of the Turk. In 1914 they were singing in the streets of Vienna a song commemorating the exploits of the great Austrian general, Prince Eugene of Savoy, who had led the Austrian armies during one of the most successful periods of these wars. Formerly many a Slav has joined in this song because he realized that it was this Prince Eugene who had delivered his race from the Turk. But these voices have long been still. Because they have discovered that they have merely exchanged one set of bonds for another, the cramping rule of the Ottoman for the equally cramping rule of the German and the Magyar, they have ceased to celebrate these Austrian victories over the Turk. All the opportunity that Austria has enjoyed, all the tragedy of her failure to realize it, lies in this situation. And thus was formed a state which never was the expression of a nation, a mere machine, a *thing* in which the breadth of national life has never really stirred. It was given the great opportunity to reconcile Slav and Magyar and German, East and West, and, on the whole, it has failed. Opportunities countless it has had; some it has utilized—enough to tantalize yet not to satisfy; but the great majority it has left unutilized. It has, at best, but partially fulfilled its destiny and now it comes for its accounting before the judgment-bar of the nations.”

—W. S. Davis, *Roots of the war*, pp. 289-291.

It is not easy “to tell the story of the various lands which have at different times come under the dominion of Austrian princes, the story of each land by itself, and the story of them all in relation to the common power. A continuous narrative is impossible. . . . Much mischief has been done by one small fashion of modern speech. It has within my memory become usual to personify nations and powers on the smallest occasions in a way which was formerly done only in language more or less solemn, rhetorical or poetical. We now talk every moment of England, France, Germany, Russia, Italy, as if they were persons. And as long as it is only England, France, Germany, Russia, or Italy of which we talk in this way, no practical harm is done; the thing is a mere question of style. For those are all national powers. . . . But when we go on to talk in this way of ‘Austria,’ or ‘Turkey,’ direct harm is done; thought is confused, and facts are misrepresented. . . . I have seen the words ‘Austrian national honour;’ I have come across people who believed that ‘Austria’ was one land inhabited by ‘Austrians,’ and that ‘Austrians’ spoke the ‘Austrian’ language. All such phrases are misapplied. It is to be presumed that in all of them ‘Austria’ means something more than the true Austria, the archduchy; what is commonly meant by them is the whole dominions of the sovereign of Austria. People fancy that the inhabitants of those dominions have a common being, a common interest, like that of the people of England, France, or Italy. . . . There is no Austrian language, no Austrian nation; therefore

there can be no such thing as ‘Austrian national honour.’ Nor can there be an ‘Austrian policy’ in the same sense in which there is an English or a French policy, that is, a policy in which the English or French government carries out the will of the English or French nation. . . . Such phrases as ‘Austrian interests,’ ‘Austrian policy,’ and the like, do not mean the interests or the policy of any land or nation at all. They simply mean the interests and policy of a particular ruling family, which may often be the same as the interests and wishes of particular parts of their dominions, but which can never represent any common interest or common wish on the part of the whole. . . . We must ever remember that the dominions of the House of Austria are simply a collection of kingdoms, duchies, etc., brought together by various accidental causes, but which have nothing really in common, no common speech, no common feeling, no common interest. In one case only, that of the Magyars in Hungary, does the House of Austria rule over a whole nation; the other kingdoms, duchies, etc., are only parts of nations, having no tie to one another, but having the closest ties to other parts of their several nations which lie close to them but which are under other governments. The only bond among them all is that a series of marriages, wars, treaties, and so forth, have given them a common sovereign. The same person is king of Hungary, Archduke of Austria, Count of Tyrol, Lord of Trieste, and a hundred other things. That is all. . . . The growth and the abiding dominion of the House of Austria is one of the most remarkable phenomena in European history. Powers of the same kind have arisen twice before; but in both cases they were very short-lived, while the power of the House of Austria has lasted for several centuries. The power of the House of Anjou in the twelfth century, the power of the House of Burgundy in the fifteenth century, were powers of exactly the same kind. They too were collections of scraps, with no natural connexion, brought together by the accidents of warfare, marriage, or diplomacy. Now why is it that both these powers broke in pieces almost at once, after the reigns of two princes in each case, while the power of the House of Austria has lasted so long? Two causes suggest themselves. One is the long connexion between the House of Austria and the Roman Empire and kingdom of Germany. So many Austrian princes were elected Emperors as to make the Austrian House seem something great and imperial in itself. I believe that this cause has done a good deal towards the result; but I believe that another cause has done yet more. This is that, though the Austrian power is not a national power, there is, as has been already noticed, a nation within it. While it contains only scraps of other nations, it contains the whole of the Magyar nation. It thus gets something of the strength of a national power. . . . The kingdom of Hungary is an ancient kingdom, with known boundaries which have changed singularly little for several centuries; and its connexion with the archduchy of Austria and the kingdom of Bohemia is now of long standing. Anything beyond this is modern and shifting. The so-called ‘empire of Austria’ dates only from the year 1804. This is one of the simplest matters in the world, but one which is constantly forgotten. . . . A smaller point on which confusion also prevails is this. All the members of the House of Austria are commonly spoken of as archdukes and archduchesses. I feel sure that many people, if asked the meaning of the word archduke, would say that it was the title of the children of the ‘Emperor of Austria,’

as grandduke is used in Russia, and prince in most countries. In truth, archduke is the title of the sovereign of Austria. He has not given it up; for he calls himself Archduke of Austria still, though he calls himself 'Emperor of Austria' as well. But by German custom, the children of a duke or count are all called dukes and counts for ever and ever. In this way the Prince of Wales is called 'Duke of Saxony,' and in the same way all the children of an Archduke of Austria are archdukes and archduchesses. Formally and historically then, the taking of an hereditary imperial title by the Archduke of Austria in 1804, and the keeping of it after the prince who took it had ceased in 1806 to be King of Germany and Roman Emperor-elect, was a sheer and shameless imposture. But it is an imposture which has thoroughly well served its ends."—E. A. Freeman, *Preface to Leger's History of Austro-Hungary*.—"Medieval History is a history of rights and wrongs; modern History as contrasted with medieval divides itself into two portions; the first a history of powers, forces, and dynasties; the second, a history in which ideas take the place of both rights and forces. . . . Austria may be regarded as representing the more ancient form of right. . . . The middle ages proper, the centuries from the year 1000 to the year 1500, from the Emperor Henry II. to the Emperor Maximilian, were ages of legal growth, ages in which the idea of right, as embodied in law, was the leading idea of statesmen, and the idea of rights justified or justifiable by the letter of law, was a profound influence with politicians. . . . The house of Austria . . . lays thus the foundation of that empire which is to be one of the great forces of the next age; not by fraud, not by violence, but here by a politic marriage, here by a well advocated inheritance, here by a claim on an imperial fief forfeited or escheated; honestly where the letter of the law is in her favour, by chicanery it may be here and there, but that a chicanery that wears a specious garb of right. The imperial idea was but a small influence compared with the superstructure of right, inheritance, and suzerainty, that legal instincts and a general acquiescence in legal forms had raised upon it."—W. Stubbs, *Seventeen lectures on the study of medieval and modern history*, pp. 209-215.

Geography.—Danube valley.—"The Danube plays a most important part in European history, greater even than the Rhine. . . . Heterogeneous as it is in the races and languages it includes [in 1907], and still more in constitutional machinery, the Austro-Hungarian monarchy is by no means an anomaly on the map. It comprises all the Danube region except the immediate upper basin of the great river itself, which after all is more clearly divided from the Inn than from the Main, down to where the Danube turns eastwards parallel to the Balkans. It includes Bohemia, which is as it were the converse of Bavaria, historically but not technically belonging to the Danube region. In two places only, if we ignore details, does it pass beyond its natural boundaries: it possesses the strip of Adriatic coast beyond the mountains—an acquisition vital to Austria and not tenable by any other power—and Galicia beyond the Carpathians, which is a real anomaly and source of weakness. That there are various and mutually jealous races within the monarchy is a misfortune: that some of them have kindred outside the frontiers may prove a worse evil eventually. Meanwhile, Austria affords one more illustration of the readiness with which peoples may overpass rational dividing features that are not barriers.

"The military history of the Danube region corresponds, as is natural, with the geographical con-

ditions. The great river flows through it from west and east, and most of the aggressive movements, both migrations of peoples and organized invasions, are from the eastwards, or are driven back in the opposite direction. Moreover, the Danube down to Presburg runs near to the northern boundary, leaving a comparatively wide space on the south, traversed by a series of tributaries, being in this respect the exact converse of the Po. Accordingly, the great battle which checked the onward progress of the Hungarians was fought on the Lech: the less conspicuous but equally significant encounter which terminated the Mongol inroad of the thirteenth century took place near the eastern frontier of Austria proper. After the Hungarians have become Christian, they are inevitably the foremost defence of Christendom against the Ottoman Turks. On the Hungarian plain, usually within no great distance of the Danube, were fought the battles which brought Ottoman conquests up to the gates of Vienna, and drove them ultimately back to the Balkan peninsula. When the conditions have changed entirely, and aggression in central Europe comes habitually from France, the first conflict is naturally for access to the head of the Danube valley. . . . Accordingly, campaigns which concerned the Danube region began by the French forcing their way through the Black Forest hills."—H. B. George, *Relations of geography and history*, pp. 251, 257-259.

Name.—"The name of Austria, Oesterreich—Ostrich as our forefathers wrote it—is, naturally enough, a common name for the eastern part of any kingdom. The Frankish kingdom of the Merwings had its Austria; the Italian kingdom of the Lombards had its Austria also. We are half inclined to wonder that the name was never given in our own island either to Essex or to East-Anglia. But, while the other Austrias have passed away, the Oesterreich, the Austria, the Eastern mark, of the German kingdom, its defence against the Magyar invader, has lived on to our own times. It has not only lived on, but it has become one of the chief European powers. And it has become so by a process to which it would be hard to find a parallel."—E. A. Freeman, *Historical geography of Europe*, v. 1, ch. 8, p. 305.

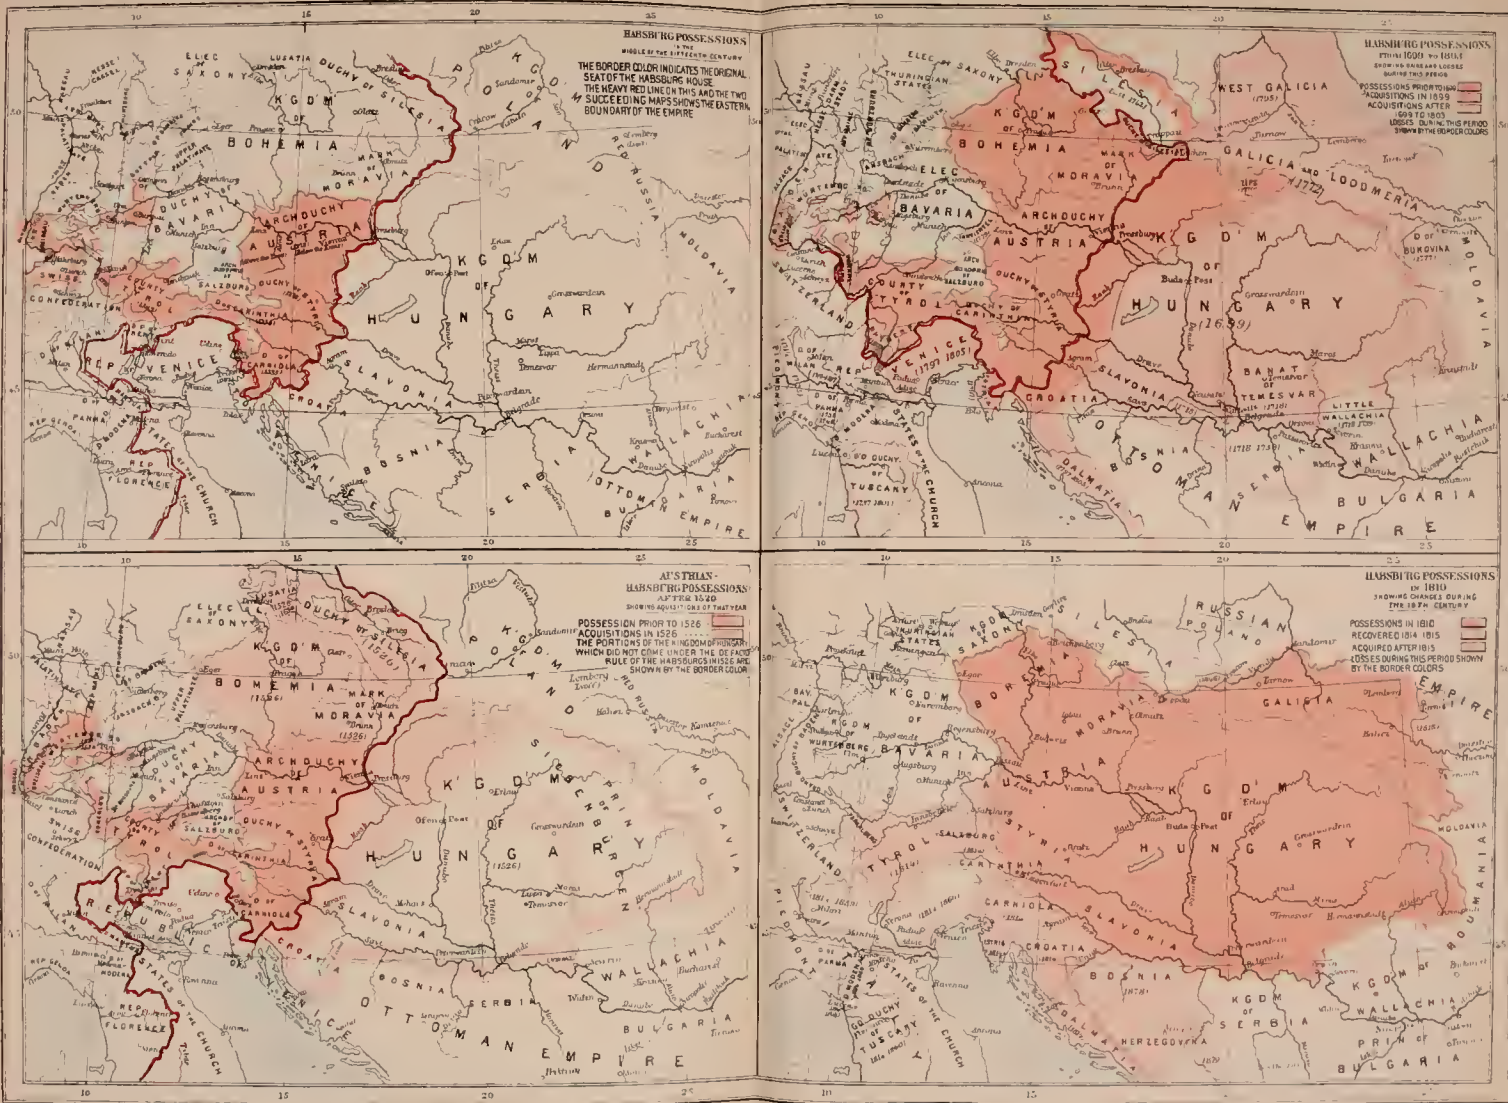

Birthplace.—"On the disputed frontier, in the zone of perpetual conflict, were formed and developed the two states which, in turn, were to dominate over Germany, namely, Austria and Prussia. Both were born in the midst of the enemy. The cradle of Austria was the Eastern march, established by Charlemagne on the Danube, beyond Bavaria, at the very gate through which have passed so many invaders from the Orient. . . . The cradle of Prussia was the march of Brandenburg, between the Elbe and the Oder, in the region of the exterminated Slavs."—E. Lavisse, *General view of the political history of Europe*, ch. 3, sect. 13.

Races of Austria.—"The Austrian problem, then, is, at bottom, a problem of nationalities. . . . Roughly speaking, they are comprised in five grand divisions, the German, the Magyar, the Slav, the Roumanian and the Italian. Of Slavs there are numerous subdivisions, Czechs, Poles, Ruthenians, Slovaks, Slovenes, Croats and Serbs. But the fundamental characteristics of them all are the same, and for introductory purposes we may group them together. . . . They settled mainly in the upper basin of the Danube along the north and west borders of Bohemia. There is also a little island of Teutondom in western Hungary formed from the descendants of sturdy German settlers sent during the Middle Ages to hold this region against the Slav, but today lost in the surrounding sea of

Hungarians and Roumanians. . . . If you travel by the Danube steamer from Vienna to Budapest you pass, about half way, the citadel of Pressburg. This old frontier fortress of the Hungarian kingdom may be taken as the boundary where one passes from the land of the Germans into that of the Magyars. From that point on this race inhabits the great Hungarian plain, until, in its western part, it gives way to the Roumanian. . . . From the two ruling nationalities, German and Magyar, we pass to the ruled nationalities, the Slav, the Roumanian and the Italian. To link together the Slavs as one nationality involves a certain stretching of the term, for, even yet, it is doubtful if the Czechs of Bohemia feel their kinship with the Croats or Serbs in Hungary, and in at least one case, that of the Poles and Ruthenians, the feeling is still decidedly antagonistic. . . . History tells us but little, for they pushed into Europe unheralded and unsung in the centuries immediately following the fall of Rome. They were evidently of a low grade of civilization, hunters and fishermen, wanderers on the face of the earth, with few if any political bonds to confine them, individualists by choice. They always seem to have lacked, to some extent, the ability to organize, although it may be said that this defect has been somewhat exaggerated by those who write concerning this race. . . . Geographically the Slavs form a fringe along the northern and southern borders of the empire, although they have pushed many outposts into the central position as well. Numerically they are the leading race in the empire, having a larger population than the two ruling races, German and Magyar, taken together. The majority are Roman Catholics. The eastern part of Hungary is occupied, in the main, by Roumanians. They seeped in across the Carpathians some time during the later Middle Ages, and ever since the thirteenth century seem to have made up the peasant class in this district, 'first as serfs, later as political helots'—to quote the characterization of Mr. Seton Watson. They claim to be the descendants of the Latin colonists left by Trajan in the Roman province of Dacia; actually they are probably a mixed race from many origins and their Roman antecedents are much more certain as to their language than their blood. . . . Last among the nationalities come the Italians, who are almost entirely found in the coast cities along the northern and eastern shores of the Adriatic. Originally they came as colonists, sometimes under the control of Venice, sometimes independent, in order to trade with the people of the back country, and they brought with them an Italian culture that has never died out, even though the Italians today are a minority among the population. Traders and culture-bearers they are still, these lost children of Italy, living, for the most part, in the cities which are little Italian fortresses in the surrounding hosts of Slavdom."—W. S. Davis, *Roots of the war*, pp. 291-295.

805-1246.—Rise of the margraviate, and the creation of the duchy, under the Babenbergs.—Changing relations to Bavaria.—End of the Babenberg dynasty.—"Austria, as is well known, is but the Latin form of the German Oesterreich, the kingdom of the east [see AUSTRASIA]. This celebrated historical name appears for the first time in 906, in a document signed by the emperor Otto III. ('in regione vulgari nomine Osterrichi'). The land to which it is there applied was created a march after the destruction of the Avar empire [805], and was governed like all the other German marches. Politically it was divided into two margraviates; that of Friuli, including Friuli properly so called, Lower Pannonia to the south of the

Drave, Carintbia, Istria, and the interior of Dalmatia—the sea-coast having been ceded to the Eastern emperor;—the eastern margraviate comprising Lower Pannonia to the north of the Drave, Upper Pannonia, and the Ostmark properly so called. The Ostmark included the Traungau to the east of the Enns, which was completely German, and the Grunzvittigau. . . . The early history of these countries lacks the unity of interest which the fate of a dynasty or a nation gives to those of the Magyar and the Chekh [Czech-Bohemian]. They form but a portion of the German kingdom, and have no strongly marked life of their own. The march, with its varying frontier, had not even a geographical unity. In 876, it was enlarged by the addition of Bavaria; in 890, it lost Pannonia, which was given to Bracislaw, the Croat prince, in return for his help against the Magyars, and in 937, it was destroyed and absorbed by the Magyars, who extended their frontier to the river Enns. After the battle of Lechfeld or Augsburg (955), Germany and Italy being no longer exposed to Hungarian invasions, the march was re-constituted and granted to the margrave Burkhard, the brother-in-law of Henry of Bavaria. Leopold of Babenberg succeeded him (973), and with him begins the dynasty of Babenberg, which ruled the country during the time of the Premyslides [in Bohemia] and the house of Arpad [in Hungary]. The Babenbergs derived their name from the castle of Babenberg, built by Henry, margrave of Nordgau, in honor of his wife, Baba, sister of Henry the Fowler. It reappears in the name of the town of Bamberg, which now [1879] forms part of the kingdom of Bavaria. . . . Though not of right an hereditary office, the margraviate soon became so, and remained in the family of the Babenbergs; the march was so important a part of the empire that no doubt the emperor was glad to make the defence of this exposed district the especial interest of one family. . . . The marriages of the Babenbergs were fortunate; in 1138 the brother of Leopold [Fourth of that name in the Margraviate] Conrad of Hohenstaufen, Duke of Franconia, was made emperor. It was now that the struggle began between the house of Hohenstaufen and the great house of Welf [or Guelph: See GUELF AND GIBELLINE] whose representative was Henry the Proud, Duke of Saxony and Bavaria. Henry was defeated in the unequal strife, and was placed under the ban of the Empire, while the duchy of Saxony was awarded to Albert the Bear of Brandenburg, and the duchy of Bavaria fell to the share of Leopold IV. (1138). Henry the Proud died in the following year, leaving behind him a son under age, who was known later on as Henry the Lion. His uncle Welf would not submit to the forfeiture by his house of their old dominions, and marched against Leopold to reconquer Bavaria, but he was defeated by Conrad at the battle of Weinsberg (1140). Leopold died shortly after this victory, and was succeeded both in the duchy of Bavaria and in the margraviate of Austria by his brother, Henry II." Henry II endeavored to strengthen himself in Bavaria by marrying the widow of Henry the Proud, and by extorting from her son, Henry the Lion, a renunciation of the latter's rights. But Henry the Lion afterwards repudiated his renunciation, and in 1156 the German diet decided that Bavaria should be restored to him. Henry of Austria was wisely persuaded to yield to the decision, and Bavaria was given up. "He lost nothing by this unwilling act of disinterestedness, for he secured from the emperor considerable compensation. From this time forward, Austria, which had been largely increased by the addition of the greater part of the lands lying between the

Enns and the Inn, was removed from its almost nominal subjection to Bavaria and became a separate duchy [Henry II being the first hereditary duke of Austria]. [See also GERMANY: 1125-1272.] An imperial edict, dated the 21st of September, 1156, declares the new duchy hereditary even in the female line, and authorizes the dukes to absent themselves from all diets except those which were held in Bavarian territory. It also permits them, in case of a threatened extinction of their dynasty, to propose a successor. . . . Henry II. was one of the founders of Vienna. He constructed a fortress there, and, in order to civilize the surrounding country, sent for some Scotch monks, of whom there were many at this time in Germany." In 1177 Henry II was succeeded by Leopold V, called the Virtuous. "In his reign the duchy of Austria gained Styria [Steiermark], an important addition to its territory. This province was inhabited by Slovenes and Germans, and took its name from the castle of Steyer, built in 980 by Otokar III., count of the Trungau. In 1056, it was created a margraviate, and in 1150 it was enlarged by the addition of the counties of Maribor (Marburg) and Cilly. In 1180, Otokar VI. of Styria (1164-1102) obtained the hereditary title of duke from the Emperor in return for his help against Henry the Lion." Dying without children, Otokar made Leopold of Austria his heir. "Styria was annexed to Austria in 1192, and has remained so ever since. . . . Leopold V. is the first of the Austrian princes whose name is known in Western Europe. He joined the third crusade," and quarrelled with Richard Cœur de Lion at the siege of St. Jean d'Acre. Afterwards, when Richard, returning home by the Adriatic, attempted to pass through Austrian territory incognito, Leopold revenged himself by seizing and imprisoning the English king, finally selling his royal captive to a still meaner emperor for 20,000 marks. Leopold VI, who succeeded to the Austrian duchy in 1198, did much for the commerce of his country. "He made Vienna the staple town, and lent a sum of 30,000 marks of silver to the city to enable it to increase its trade. He adorned it with many new buildings, among them the Neue Burg." His son, called Frederick the Fighter (1230-1246) was the last of the Babenberg dynasty. His hand was against all his neighbors, including the Emperor Frederick II, and their hands were against him. He perished in June, 1246, on the banks of the Leitha, while at war with the Hungarians.—L. Leger, *History of Austro-Hungary*, ch. 9.

1246-1282.—Rudolf, or Rodolph, of Hapsburg and the acquisition of the duchy for his family. —"The House of Austria owes its origin and power to Rhodolph of Hapsburgh, son of Albert IV. count of Hapsburgh. The Austrian genealogists, who have taken indefatigable but ineffectual pains to trace his illustrious descent from the Romans, carry it with great probability to Ethico, duke of Alsace, in the seventh century, and unquestionably to Guntram the Rich, count of Alsace and Brisgau, who flourished in the tenth." A grandson of Guntram, Werner by name, "became bishop of Strasburgh, and on an eminence above Windisch, built the castle of Hapsburgh ['Habichtsburg' 'the castle of hawks'], which became the residence of the future counts, and gave a new title to the descendants of Guntram. . . . The successors of Werner increased their family inheritance by marriages, donations from the Emperors, and by becoming prefects, advocates, or administrators of the neighbouring abbeys, towns, or districts, and his great grandson, Albert III., was possessor of

no inconsiderable territories in Suabia, Alsace, and that part of Switzerland which is now called the Argau, and held the landgraviate of Upper Alsace. His son, Rhodolph, received from the Emperor, in addition to his paternal inheritance, the town and district of Lauffenburgh, an imperial city on the Rhine. He acquired also a considerable accession of territory by obtaining the advocacy of Uri, Schweitz, and Underwalden, whose natives laid the foundation of the Helvetic Confederacy, by their union against the oppressions of feudal tyranny."—W. Coxe, *History of the house of Austria*, ch. 1.—"On the death of Rodolph in 1232 his estates were divided between his sons Albert IV. and Rodolph II.; the former receiving the landgraviate of Upper Alsace, and the county of Hapsburg, together with the patrimonial castle; the latter, the counties Rheinfelden and Lauffenburgh, and some other territories. Albert espoused Hedwige, daughter of Ulric, count of Kyburg; and from this union sprang the great Rodolph, who was

RUDOLF I (1278-1291)
Founder of the House of Hapsburg

born on the 1st of May 1218, and was presented at the baptismal font by the Emperor Frederic II. On the death of his father Albert in 1240, Rodolph succeeded to his estates; but the greater portion of these were in the hands of his paternal uncle, Rodolph of Lauffenburgh; and all he could call his own lay within sight of the great hall of his castle. . . . His disposition was wayward and restless, and drew him into repeated contests with his neighbours and relations. . . . In a quarrel with the Bishop of Basle, Rodolph led his troops against that city, and burnt a convent in the suburbs, for which he was excommunicated by Pope Innocent IV. He then entered the service of Ottocar II. King of Bohemia, under whom he served, in company with the Teutonic Knights, in his wars against the Prussian pagans; and afterwards against Bela IV King of Hungary." The surprising election, in 1272, of this little known count of Hapsburg, to be king of the Romans, with the substance if not the title of the imperial dignity which that election carried with it, was due to a singular friendship which he had acquired some fourteen

years before. When Archbishop Werner, elector of Mentz, was on his way to Rome in 1250, to receive the pallium, he "was escorted across the Alps by Rodolph of Hapsburg, and under his protection secured from the robbers who beset the passes. Charmed with the affability and frankness of his protector, the Archbishop conceived a strong regard for Rodolph;" and when, in 1272, after the great interregnum [see GERMANY: 1250-1272], the Germanic electors found difficulty in choosing an emperor, the elector of Mentz recommended his friend of Hapsburg as a candidate. "The Electors are described by a contemporary as desiring an Emperor but detesting his power. The comparative lowliness of the Count of Hapsburg recommended him as one from whom their authority stood in little jeopardy; but the claims of the King of Bohemia were vigorously urged; and it was at length agreed to decide the election by the voice of the Duke of Bavaria. Lewis without hesitation nominated Rodolph. . . . The early days of Rodolph's reign were disturbed by the contumacy of Ottocar, King of Bohemia. That Prince . . . persisted in refusing to acknowledge the Count of Hapsburg as his sovereign. Possessed of the duchies of Austria, Styria, Carniola and Carinthia, he might rely upon his own resources; and he was fortified by his resistance by the alliance of Henry, Duke of Lower Bavaria. But the very possession of these four great fiefs was sufficient to draw down the envy and distrust of the other German Princes. To all these territories, indeed, the title of Ottocar was sufficiently disputable. On the death of Frederic II, fifth duke of Austria [and last of the Babenberg dynasty] in 1246, that duchy, together with Styria and Carniola, was claimed by his niece Gertrude and his sister Margaret. By a marriage with the latter, and a victory over Bela IV, King of Hungary, whose uncle married Gertrude, Ottocar obtained possession of Austria and Styria; and in virtue of a purchase from Ulrich, Duke of Carinthia and Carniola, he possessed himself of those duchies on Ulrich's death in 1269, in defiance of the claims of Philip, brother of the late Duke. Against so powerful a rival the Princes assembled at Augsburg readily voted succour to Rodolph; and Ottocar having refused to surrender the Austrian dominions, and even hanged the heralds who were sent to pronounce the consequent sentence of proscription, Rodolph with his accustomed promptitude took the field [1276], and confounded his enemy by a rapid march upon Austria. On his way he surprised and vanquished the rebel Duke of Bavaria, whom he compelled to join his forces; he besieged and reduced to the last extremity the city of Vienna; and had already prepared a bridge of boats to cross the Danube and invade Bohemia, when Ottocar arrested his progress by a message of submission. The terms agreed upon were severely humiliating to the proud soul of Ottocar," and he was soon in revolt again, with the support of the duke of Bavaria. Rodolph marched against him, and a desperate battle was fought at Marschfeld, August 26, 1278, in which Ottocar, deserted at a critical moment by the Moravian troops, was defeated and slain. "The total loss of the Bohemians on that fatal day amounted to more than 14,000 men. In the first moments of his triumph, Rodolph designed to appropriate the dominions of his deceased enemy. But his avidity was restrained by the Princes of the Empire, who interposed on behalf of the son of Ottocar; and Wenceslaus was permitted to retain Bohemia and Moravia. The projected union of the two families was now renewed: Judith of Hapsburg was affianced to the young King of Bohemia; whose sister Agnes was married to Rodolph, youngest son of

the King of the Romans." In 1282, Rudolf, "after satisfying the several claimants to those territories by various cessions of lands . . . obtained the consent of a Diet held at Augsburg to the settlement of Austria, Styria, and Carniola, upon his two surviving sons; who were accordingly jointly invested with those duchies with great pomp and solemnity; and they are at this hour enjoyed by the descendants of Rodolph of Hapsburg."—Sir R. Comyn, *History of the western empire*, ch. 14.

1282-1315.—Relations of the house of Hapsburg to the Swiss forest cantons.—Wilhelm Tell legend.—Battle of Morgarten. See SWITZERLAND: Three forest cantons.

1290.—Beginning of Hapsburg designs upon the crown of Hungary. See HUNGARY: 1116-1301; 1301-1442.

1291-1349.—Loss and recovery of the imperial crown.—Liberation of Switzerland.—Conflict between Frederick and Lewis of Bavaria.—Imperial crown lost once more.—Rudolf of Hapsburg desired the title of King of the Romans for his son. "But the electors already found that the new house of Austria was becoming too powerful, and they refused. On his death, in fact, in 1291, a prince from another family, poor and obscure, Adolf of Nassau, was elected after an interregnum of ten months. His reign of six years is marked by two events; he sold himself to Edward I. in 1294, against Philip the Fair, for 100,000 pounds sterling, and used the money in an attempt to obtain in Thuringia a principality for his family as Rudolf had done in Austria. The electors were displeased and chose Albert of Austria to succeed him, who conquered and killed his adversary at Göllheim, near Worms (1298). The ten years' reign of the new king of the Romans showed that he was very ambitious for his family, which he wished to establish on the throne of Bohemia, where the Slavonic dynasty had lately died out, and also in Thuringia and Meissen, where he lost a battle. He was also bent upon extending his rights, even unjustly—in Alsace and Switzerland—and it proved an unfortunate venture for him. For, on the one hand, he roused the three Swiss cantons of Uri, Schwyz, and Unterwalden to revolt; on the other hand, he roused the wrath of his nephew John of Swabia, whom he defrauded of his inheritance (domains in Switzerland, Swabia, and Alsace). As he was crossing the Reuss, John thrust him through with his sword (1308). The assassin escaped. One of Albert's daughters, Agnes, dowager queen of Hungary, had more than a thousand innocent people killed to avenge the death of her father. The greater part of the present Switzerland had been originally included in the Kingdom of Burgundy, and was ceded to the empire, together with that kingdom, in 1033. A feudal nobility, lay and ecclesiastic, had gained a firm footing there. Nevertheless, by the 12th century the cities had risen to some importance. Zurich, Basel, Bern, and Freiburg had an extensive commerce and obtained municipal privileges. Three little cantons, far in the heart of the Swiss mountains, preserved more than all the others their indomitable spirit of independence. When Albert of Austria became Emperor [King?] he arrogantly tried to encroach upon their independence. Three heroic mountaineers, Werner Stauffacher, Arnold of Melchthal, and Walter Fürst, each with ten chosen friends, con-

spired together at Rütli, to throw off the yoke. The tyranny of the Austrian bailiff Gessler, and William Tell's well-aimed arrow, if tradition is to be believed, gave the signal for the insurrection [see SWITZERLAND: three forest cantons]. Albert's violent death left to Leopold, his successor in the duchy of Austria, the care of repressing the rebellion. He failed and was completely defeated at Morgarten (1315). That was Switzerland's field of Marathon. . . . When Rudolf of Hapsburg was chosen by the electors, it was because of his poverty and weakness. At his death accordingly they did not give their votes for his son Albert. . . . Albert, however, succeeded in overthrowing his rival. But on his death they were firm in their decision not to give the crown for a third time to the new and ambitious house of Hapsburg. They likewise refused, for similar reasons, to accept Charles of Valois, brother of Philip the Fair, whom the latter tried to place on the imperial throne, in order that he might indirectly rule over Germany. They supported the Count of Luxemburg, who became Henry VII. By choosing emperors [kings?] who were poor, the electors placed them under the temptation of enriching themselves at the expense of the empire. Adolf failed, it is true, in Thuringia, but Rudolf gained Austria by victory; Henry succeeded in Bohemia by means of marriage, and Bohemia was worth more than Austria at that time because, besides Moravia, it was made to cover Silesia and a part of Lusatia (Oberlausitz). Henry's son, John of Luxemburg, married the heiress to that royal crown. As for Henry himself he remained as poor as before. He had a vigorous, restless spirit, and went to try his fortunes on his own account beyond the Alps. . . . He was seriously threatening Naples, when he died either from some sickness or from being poisoned by a Dominican in partaking of the host (1313). A year's interregnum followed; then two emperors [kings?] at once: Lewis of Bavaria and Frederick the Fair, son of the Emperor Albert. After eight years of war, Lewis gained his point by the victory of Mühlendorf (1322), which delivered Frederick into his hands. He kept him in captivity for three years, and at the end of that time became reconciled with him, and they were on such good terms that both bore the title of King and governed in common. The fear inspired in Lewis by France and the Holy See dictated this singular agreement. Henry VII. had revived the policy of interference by the German emperors in the affairs of Italy, and had kindled again the quarrel with the Papacy which had long appeared extinguished. Lewis IV. did the same. . . . While Boniface VIII. was making war on Philip the Fair, Albert allied himself with him; when, on the other hand, the Papacy was reduced to the state of a servile auxiliary to France, the Emperor returned to his former hostility. When ex-communicated by Pope John XXII., who wished to give the empire to the king of France, Charles IV., Lewis IV. made use of the same weapons. . . . Tired of a crown loaded with anxieties, Lewis of Bavaria was finally about to submit to the Pope and abdicate, when the electors perceived the necessity of supporting their Emperor and of formally releasing the supreme power from foreign dependency which brought the whole nation to shame. That was the object of the Pragmatic Sanction of Frankfort, pronounced in 1338 by the Diet, on the report of the electors. . . . The king of France and Pope Clement VI., whose claims were directly affected by this declaration, set up against Lewis IV., Charles of Luxemburg, son of John the Blind, who became king of Bohemia in 1346, when his father had been killed fighting on the French side at the battle of Crécy. Lewis died

the following year. He had gained possession of Brandenburg and the Tyrol for his house, but it was unable to retain possession of them. The latter county reverted to the house of Austria in 1363. The electors most hostile to the French party tried to put up, as a rival candidate to Charles of Luxemburg, Edward III., king of England, who refused the empire; then they offered it to a brave knight, Gunther of Schwarzburg, who died, perhaps poisoned, after a few months (1349). The king of Bohemia then became Emperor as Charles IV. by a second election."—V. Duruy, *History of the Middle Ages*, bk. 9, ch. 30.—See also GERMANY: 1314-1347.

1330-1364.—Forged charters of Duke Rudolf. —Privilegium majus.—His assumption of the archducal title.—Acquisition of Tyrol.—Treaties of inheritance with Bohemia and Hungary.—King John, of Bohemia, had married his second son, John Henry, at the age of eight, to the afterwards notable Margaret Maultasche (Pouchmouth), daughter of the duke of Tyrol and Carinthia, who was then twelve years old. He hoped by this means to reunite those provinces to Bohemia. To thwart this scheme, the emperor, Louis of Bavaria, and the two Austrian princes, Albert the Wise and Otto the Gay, came to an understanding. "By the treaty of Hagenau (1330), it was arranged that on the death of duke Henry, who had no male heirs, Carinthia should become the property of Austria, Tyrol that of the emperor. Henry died in 1335, whereupon the emperor, Louis of Bavaria, declared that Margaret Maultasche had forfeited all rights of inheritance, and proceeded to assign the two provinces to the Austrian princes, with the exception of some portion of the Tyrol which devolved on the house of Wittelsbach. Carinthia alone, however, obeyed the Emperor; the Tyrolese nobles declared for Margaret, and, with the help of John of Bohemia, this princess was able to keep possession of this part of her inheritance. . . . Carinthia also did not long remain in the undisputed possession of Austria. Margaret was soon divorced from her very youthful husband (1342), and shortly after married the son of the emperor, Louis of Bavaria, who hoped to be able to invest his son, not only with Tyrol, but also with Carinthia, and once more we find the houses of Hapsburg and Luxemburg united by a common interest. . . . When . . . Charles IV. of Bohemia was chosen emperor, he consented to leave Carinthia in the possession of Austria. Albert did homage for it. . . . According to the wish of their father, the four sons of Albert reigned after him; but the eldest, Rudolf IV., exercised executive authority in the name of the others [1358-1365]. . . . He was only 19 when he came to the throne, but he had already married one of the daughters of the Emperor Charles IV. Notwithstanding this family alliance, Charles had not given Austria such a place in the Golden Bull [see GERMANY: 1347-1403] as seemed likely to secure either her territorial importance or a proper position for her princes. They had not been admitted into the electoral college of the Empire, and yet their scattered possessions stretched from the banks of the Leitha to the Rhine. . . . These grievances were enhanced by their feeling of envy towards Bohemia, which had attained great prosperity under Charles IV. It was at this time that, in order to increase the importance of his house, Rudolf, or his officers of state, had recourse to a measure which was often employed in that age by princes, religious bodies, and even by the Holy See. It was pretended that there were in existence a whole series of charters which had been granted to the

house of Austria by various kings and emperors, and which secured to their princes a position entirely independent of both empire and Emperor. According to these documents, and more especially the one called the 'privilegium majus,' the duke of Austria owed no kind of service to the empire, which was, however, bound to protect him; . . . he was to appear at the diets with the title of archduke, and was to have the first place among the electors. . . . Rudolf pretended that these documents had just come to light, and demanded their confirmation from Charles IV., who refused it. Nevertheless on the strength of these lying charters, he took the title of palatine archduke, without waiting to ask the leave of Charles, and used the royal insignia. Charles IV., who could not fail to be irritated by these pretensions, in his turn revived the claims which he had inherited from Premysl Otokar II. to the lands of Austria, Styria, Carinthia, and Carniola. These claims, however, were simply theoretical, and no attempt was made to enforce them, and the mediation of Louis the Great, King of Hungary, finally led to a treaty between the two princes, which satisfied the ambition of the Habsburgs (1364). By this treaty, the houses of Habsburg in Austria and of Luxemburg in Bohemia each guaranteed the inheritance of their lands to the other, in case of the extinction of either of the two families, and the estates of Bohemia and Austria ratified this agreement. A similar compact was concluded between Austria and Hungary, and thus the boundaries of the future Austrian state were for the first time marked out. Rudolf himself gained little by these long and intricate negotiations, Tyrol being all he added to his territory. Margaret Maultasche had married her son Meinhard to the daughter of Albert the Wise, at the same time declaring that, in default of heirs male to her son, Tyrol should once more become the possession of Austria, and it did so in 1363. Rudolf immediately set out for Botzen, and there received the homage of the Tyrolese nobles. . . . The acquisition of Tyrol was most important to Austria. It united Austria Proper with the old possessions of the Habsburgs in Western Germany, and opened the way to Italy. Margaret Maultasche died at Vienna in 1360. The memory of this restless and dissolute princess still survives among the Tyrolese."—L. Leger, *History of Austro-Hungary*, pp. 143-148.—See also HUNGARY: 1301-1442.

1437-1516.—Contests for Hungary and Bohemia.—Right of succession to the Hungarian crown secured.—"Europe would have had nothing to fear from the Barbarians, if Hungary had been permanently united to Bohemia, and had held them in check. But Hungary interfered both with the independence and the religion of Bohemia. In this way they weakened each other, and in the 15th century wavered between the two Slavonic and German powers on their borders (Poland and Austria) [see HUNGARY: 1301-1442, and 1442-1458]. United under a German prince from 1455 to 1458, separated for a time under national sovereigns (Bohemia until 1471, Hungary until 1400), they were once more united under Polish princes until 1526, at which period they passed definitely into the hands of Austria. After the reign of Ladislas of Austria, who won so much glory by the exploits of John Hunniades, George Podiebrad obtained the crown of Bohemia, and

Matthias Corvinus, the son of Hunniades, was elected King of Hungary (1458). These two princes opposed successfully the chimerical pretensions of the Emperor Frederick III. Podiebrad protected the Hussites and incurred the enmity of the Popes. Matthias victoriously encountered the Turks and obtained the favour of Paul II, who offered him the crown of Podiebrad, his father-in-law. The latter opposed to the hostility of Matthias the alliance of the King of Poland, whose eldest son, Ladislas, he designated as his successor. At the same time, Casimir, the brother of Ladislas, endeavoured to take from Matthias the crown of Hungary. Matthias, thus pressed on all sides, was obliged to renounce the conquest of Bohemia, and content himself with the provinces of Moravia, Silesia, and Lusatia, which were to return to Ladislas if Matthias died first (1475-1478). The King of Hungary compensated himself at the expense of Austria. On the pretext that Frederick III. had refused to give him his daughter, he twice invaded his states and retained them in his possession [see HUNGARY: 1471-1487]. With this great prince Christendom lost its chief defender, Hungary her conquests and her political preponderance (1490). The civilization which he had tried to introduce into his kingdom was deferred for many centuries. . . . Ladislas (of Poland), King of Bohemia, having been elected King of Hungary, was attacked by his brother John Albert, and by Maximilian of Austria, who both pretended to that crown. He appeased his brother by the cession of Silesia (1401), and Maximilian by vesting in the House of Austria the right of succession to the throne of Hungary, in case he himself should die without male issue. Under Ladislas, and under his son Louis II., who succeeded him while still a child, in 1516 Hungary was ravaged with impunity by the Turks."—J. Michelet, *Summary of modern history*, ch. 4.—See also BOHEMIA: 1458-1471.

1438-1493.—Imperial crown lastingly regained.—Short reign of Albert II and the long reign of Frederick III.—"After the death of Sigismund, the princes, in 1438, elected an emperor [king?] from the house of Austria, which, with scarcely any intermission, has ever since occupied the ancient throne of Germany. Albert II, of Austria, who, as son-in-law of the late Emperor Sigismund, had become at the same time King of Hungary and Bohemia, was a well-meaning, distinguished prince, and would, without doubt, have proved of great benefit to the empire; but he died . . . in the second year of his reign, after his return from an expedition against the Turks. . . . In the year 1431, during the reign of Sigismund, a new council was assembled at Basle, in order to carry on the work of reforming the church as already commenced at Constance. But this council soon became engaged in many perplexing controversies with Pope Eugene IV. . . . The Germans, for a time, took no part in the dispute; at length, however, under the Emperor [King?] Albert II, they formally adopted the chief decrees of the council of Basle, at a diet held at Mentz in the year 1439. . . . Amongst the resolutions then adopted were such as materially circumscribed the existing privileges of the pope. . . . These and other decisions, calculated to give important privileges and considerable independence to the German church, were, in a great measure, annulled by Albert's cousin and successor, Duke Frederick of Austria, who was elected by the princes after him in the year 1440, as Frederick III. . . . Frederick, the emperor, was a prince who meant well but, at the same time, was of too quiet and easy a nature; his long reign presents but little that was

calculated to distinguish Germany or add to its renown. From the east the empire was endangered by the approach of an enemy—the Turks, against whom no precautionary measures were adopted. They, on the 20th of May, 1453, conquered Constantinople. . . . They then made their way towards the Danube, and very nearly succeeded also in taking Hungary [see HUNGARY: 1442-1458]. . . . The Hungarians, on the death of the son of the Emperor Albert II., Wladislas Posthumus, in the year 1457, without leaving an heir to the throne, chose Matthias, the son of John Corvinus, as king, being resolved not to elect one from amongst the Austrian princes. The Bohemians likewise selected a private nobleman for their king, George Padriabrad [or Podiebrad], and thus the Austrian house found itself for a time rejected from holding possession of either of these countries. . . . In Germany, meantime, there existed numberless contests and feuds; each party considered only his own personal quarrels. . . . The emperor could not give any weight to public measures; scarcely could he maintain his dignity amongst his own subjects. The Austrian nobility were even bold enough to send challenges to their sovereign; whilst the city of Vienna revolted, and his brother Albert, taking pleasure in this disorder, was not backward in adding to it. Things even went to such an extremity, that, in 1462, the Emperor Frederick, together with his consort and son, Maximilian, then four years of age, was besieged by his subjects in his own castle of Vienna. A plebeian burgher, named Holzer, had placed himself at the head of the insurgents, and was made burgomaster, whilst Duke Albert came to Vienna personally to superintend the siege of the castle, which was intrenched and bombarded. . . . The German princes, however, could not witness with indifference such disgraceful treatment of their emperor, and they assembled to liberate him. George Padriabrad, King of Bohemia, was the first who hastened to the spot with assistance, set the emperor at liberty, and effected a reconciliation between him and his brother. The emperor, however, was obliged to resign to him, for eight years, Lower Austria and Vienna. Albert died in the following year. . . . In the Germanic empire, the voice of the emperor was as little heeded as in his hereditary lands. . . . The feudal system raged under Frederick's reign to such an extent, that it was pursued even by the lower classes. Thus, in 1471, the shoeblacks in Leipsic sent a challenge to the university of that place; and the bakers of the Count Palatine Lewis, and those of the Margrave of Baden defied several imperial cities in Swabia. The most important transaction in the reign of Frederick, was the union which he formed with the house of Burgundy, and which laid the foundation for the greatness of Austria. . . . In the year 1486, the whole of the assembled princes, influenced especially by the representations of the faithful and now venerable Albert, called the Achilles of Brandenburg, elected Maximilian, the emperor's son, King of Rome. Indeed, about this period a changed and improved spirit began to show itself in a remarkable degree in the minds of many throughout the empire, so that the profound contemplator of coming events might easily see the dawn of a new era. . . . These last years were the best in the whole life of the emperor, and yielded to him in return for his many sufferings that tranquillity which was so well merited by his faithful, generous disposition. He died on the 19th of August, 1493, after a reign of 54 years. The emperor lived long enough to obtain, in the year 1490, the restoration of his hereditary estates by the

death of King Matthias, by means of a compact made with Wladislas, his successor."—F. Kohlrausch, *History of Germany*, ch. 14.—See also GERMANY: 1347-1493.

1468.—Invasion by George Podiebrad of Bohemia.—Crusade against him. See BOHEMIA: 1458-1471.

1471-1491.—Hungarian invasion and capture of Vienna.—Treaty of Pressburg.—Succession to the throne of Hungary secured.—"George, King of Bohemia, expired in 1471; and the claims of the Emperor and King of Hungary being equally disregarded, the crown was conferred on Wladislaus, son of Casimir IV. King of Poland, and grandson of Albert II. To this election Frederic long persisted in withholding his assent; but at length he determined to crush the claim of Matthias by formally investing Wladislaus with the kingdom and electorate of Bohemia, and the office of imperial cup-bearer. In revenge for this affront, Matthias marched into Austria: took possession of the fortresses of the Danube; and

MAXIMILIAN I (1459-1519)

Ruler of the Austrian dominions and Holy Roman
Emperor

compelled the Emperor to purchase a cessation of hostilities by undertaking to pay an hundred thousand golden florins, one-half of which was disbursed by the Austrian states at the appointed time. But as the King of Hungary still delayed to yield up the captured fortresses, Frederic refused all further payment; and the war was again renewed. Matthias invaded and ravaged Austria; and though he experienced formidable resistance from several towns, his arms were crowned with success, and he became master of Vienna and Neustadt. Driven from his capital the terrified Emperor was reduced to the utmost distress, and wandered from town to town and from convent to convent, endeavouring to arouse the German States against the Hungarians. Yet even in this exigency his good fortune did not wholly forsake him; and he availed himself of a Diet at Frankfort to procure the election of his son Maximilian as King of the Romans. To this Diet, however, the King of Bohemia received no summons, and therefore protested against the validity of the election. A full apology and admission of his right easily satisfied Wladislaus,

and he consented to remit the fine which the Golden Bull had fixed as the penalty of the omission. The death of Matthias Corvinus in 1490, left the throne of Hungary vacant, and the Hungarians, influenced by their widowed queen, conferred the crown upon the King of Bohemia, without listening to the pretensions of Maximilian. That valorous prince, however, sword in hand, recovered his Austrian dominions; and the rival kings concluded a severe contest by the treaty of Pressburg, by which Hungary was for the present secured to Wladislaus; but on his death without heirs was to rest in the descendants of the Emperor."—Sir R. Comyn, *History of the western empire*, v. 2, ch. 28.—See also HUNGARY: 1471-1487, and 1487-1526.

1477-1495.—Marriage of Maximilian with Mary of Burgundy.—His splendid dominion.—His joyous character.—His vigorous powers.—His ambitions and aims.—"Maximilian, who was as active and enterprising as his father was indolent and timid, married at eighteen years of age, the only daughter of Charles the Bold, duke of Burgundy [see NETHERLANDS: 1477]. She brought him Flanders, Franche-Comté, and all the Low Countries. Louis XI., who disputed some of these territories, and who, on the death of the duke, had seized Burgundy, Picardy, Ponthieu, and Artois, as fiefs of France, which could not be possessed by a woman, was defeated by Maximilian at Guinegate; and Charles VIII., who renewed the same claims, was obliged to conclude a disadvantageous peace." Maximilian succeeded to the imperial throne on the death of his father in 1493.—W. Russell, *History of modern Europe*, v. 1, letter 49.—"Between the Alps and the Bohemian frontier, the mark Austria was first founded round and about the castles of Krems and Melk. Since then, beginning first in the valley towards Bavaria and Hungary, and coming to the House of Habsburg, it had extended across the whole of the northern slope of the Alps until where the Slavish, Italian, and German tongues part, and over to Alsace; thus becoming an archduchy from a mark. On all sides the Archdukes had claims; on the German side to Switzerland, on the Italian to the Venetian possessions, and on the Slavish to Bohemia and Hungary. To such a pitch of greatness had Maximilian by his marriage with Maria of Burgundy brought the heritage received from Charles the Bold. True to the Netherlanders' greeting, in the inscription over their gates, 'Thou art our Duke, fight our battle for us,' war was from the first his handicraft. He adopted Charles the Bold's hostile attitude towards France; he saved the greater part of his inheritance from the schemes of Louis XI. Day and night it was his whole thought, to conquer it entirely. But after Maria of Burgundy's premature death, revolution followed revolution, and his father Frederick being too old to protect himself, it came about that in the year 1483 he was ousted from Austria by the Hungarians, whilst his son was kept a prisoner in Bruges by the citizens, and they had even to fear the estrangement of the Tyrol. Yet they did not lose courage. At this very time the father denoted with the vowels, A. E. I. O. U. ('Alles Erdreich ist Oesterreich unterthan')—All the earth is subject to Austria), the extent of his hopes. In the same year, his son negotiated for a Spanish alliance. Their real strength lay in the imperial dignity of Maximilian, which they had from the German Empire. As soon as it began to bestir itself, Maximilian was set at liberty; as soon as it supported him in the persons of only a few princes of the Empire, he became lord in his Netherlands.

... Since then his plans were directed against Hungary and Burgundy. In Hungary he could gain nothing except securing the succession to his house. But never, frequently as he concluded peace, did he give up his intentions upon Burgundy. . . . Now that he had allied himself with a Sforza, and had joined the Liga, now that his father was dead, and the Empire was pledged to follow him across the mountains, and now, too, that the Italian complications were threatening Charles, he took fresh hope, and in this hope he summoned a Diet at Worms. Maximilian was a prince of whom, although many portraits have been drawn, yet there is scarcely one that resembles another, so easily and entirely did he suit himself to circumstances. . . . His soul is full of motion, of joy in things, and of plans. There is scarcely anything that he is not capable of doing. In his mines he is a good screener, in his armoury the best plater, capable of instructing others in new inventions. With musket in hand, he defeats his best marksman, George Purkhard; with heavy cannon, which he has shown how to cast, and has placed on wheels, he comes as a rule nearest the mark. He commands seven captains in their seven several tongues; he himself chooses and mixes his food and medicines. In the open country, he feels himself happiest. . . . What really distinguishes his public life is that presentiment of the future greatness of his dynasty which he has inherited of his father, and the restless striving to attain all that devolved upon him from the House of Burgundy. All his policy and all his schemes were concentrated, not upon his Empire, for the real needs of which he evinced little real care, and not immediately upon the welfare of his hereditary lands, but upon the realization of that sole idea. Of it all his letters and speeches are full. . . . In March, 1495, Maximilian came to the Diet at Worms. . . . At this Reichstag the King gained two momentous prospects. In Wurtemberg there had sprung of two lines two counts of quite opposite characters. . . . With the elder, Maximilian now entered into a compact. Wurtemberg was to be raised to a dukedom—an elevation which excluded the female line from the succession—and, in the event of the stock failing, was to be a 'widow's portion' of the realm to the use of the Imperial Chamber. Now as the sole hopes of this family centred in a weakling of a boy, this arrangement held out to Maximilian and his successors the prospect of acquiring a splendid country. Yet this was the smaller of his two successes. The greater was the espousal of his children, Philip and Margaret, with the two children of Ferdinand the Catholic, Juana and Juan, which was here settled. This opened to his house still greater expectations,—it brought him at once into the most intimate alliance with the Kings of Spain. These matters might possibly, however, have been arranged elsewhere. What Maximilian really wanted in the Reichstag at Worms was the assistance of the Empire against the French with its world-renowned and much-envied soldiery. For at this time in all the wars of Europe, German auxiliaries were decisive. . . . If Maximilian had united the whole of this power in his hand, neither Europe nor Asia would have been able to withstand him. But God disposed that it should rather be employed in the cause of freedom than oppression. What an Empire was that which in spite of its vast strength allowed its Emperor to be expelled from his heritage, and did not for a long time take steps to bring him back again? If we examine the constitution of the Empire, not as we should picture it to ourselves in Henry III.'s time,

but as it had at length become—the legal independence of the several estates, the emptiness of the imperial dignity, the electiveness of a head, that afterwards exercised certain rights over the electors, —we are led to inquire not so much into the causes of its disintegration, for this concerns us little, as into the way in which it was held together. What welded it together, and preserved it, would (leaving tradition and the Pope out of the question) appear, before all else, to have been the rights of individuals, the unions of neighbours, and the social regulations which universally obtained. Such were those rights and privileges that not only protected the citizen, his guild, and his quarter of the town against his neighbours and more powerful men than himself, but which also endowed him with an inner independence. . . . Next, the unions of neighbours. These were not only leagues of cities and peasantry, expanded from ancient fraternities—for who can tell the origin of the Hansa, or the earliest treaty between Uri and Schwyz?—into large associations, or of knights, who strengthened a really insignificant power by confederations of neighbours, but also of the princes, who were bound together by joint inheritances, mutual expectancies, and the ties of blood, which in some cases were very close. This ramification, dependent upon a supreme power and confirmed by it, bound neighbour to neighbour; and, whilst securing to each his privilege and his liberty, blended together all countries of Germany in legal bonds of union. But it is only in the social regulations that the unity was really perceivable. Only as long as the Empire was an actual reality, could the supreme power of the Electors, each with his own special rights, be maintained; only so long could dukes and princes, bishops and abbots hold their neighbours in due respect, and through court offices or hereditary services, through fiefs and the dignity of their independent position give their vassals a peculiar position to the whole. Only so long could the cities enjoying immediateness under the Empire, carefully divided into free and imperial cities, be not merely protected, but also assured of a participation in the government of the whole. Under this sanctified and traditional system of suzerainty and vassalage all were happy and contented, and bore a love to it such as is cherished towards a native town or a father's house. For some time past, the House of Austria had enjoyed the foremost position. It also had a union, and, moreover, a great faction on its side. The union was the Suabian League. Old Suabia was divided into three leagues—the league of the peasantry (the origin of Switzerland); the league of the knights in the Black Forest, on the Kocher, the Neckar, and the Danube; and the league of the cities. The peasantry were from the first hostile to Austria. The Emperor Frederick brought it to pass that the cities and knights, that had from time out of mind lived in feud, bound themselves together with several princes, and formed, under his protection, the league of the land of Suabia. But the party was scattered throughout the whole Empire.”—L. von Ranke, *History of the Latin and Teutonic nations*, bk. 1, ch. 3.

1496-1526.—Extraordinary aggrandizement of the house of Austria by its marriages.—Heritage of Charles V.—His cession of the German

inheritance to Ferdinand.—Division of the house into Spanish and German branches.—Acquisition of Hungary and Bohemia.—In 1496, Philip the Fair, son of Maximilian, archduke and emperor, by his marriage with Mary of Burgundy, “espoused the Infanta of Spain, daughter of Ferdinand [of Aragon] and Isabella of Castile. They had two sons, Charles and Ferdinand, the former of whom, known in history by the name of Charles V., inherited the Low Countries in right of his father, Philip (1506). On the death of Ferdinand, his maternal grandfather (1516), he became heir to the whole Spanish succession, which comprehended the kingdoms of Spain, Naples, Sicily, and Sardinia, together with Spanish America. To these vast possessions were added his patrimonial dominions in Austria, which were transmitted to him by his paternal grandfather, the Emperor Maximilian I. [See also NETHERLANDS: 1494-1519.] About the same time (1519), the Imperial dignity was conferred on this prince by the electors [see GERMANY: 1519]; so that Europe had not seen, since the time of Charlemagne, a monarchy so powerful as that of Charles V. This Emperor concluded a treaty with his brother Ferdinand; by which he ceded to him all his hereditary possessions in Germany. The two brothers thus became the founders of the two principal branches of the House of Austria, viz., that of Spain, which began with Charles V. (called Charles I. of Spain), and ended with Charles II. (1700); and that of Germany, of which Ferdinand I. was the ancestor, and which became extinct in the male line in the Emperor Charles VI. (1740). These two branches, closely allied to each other, acted in concert for the advancement of their reciprocal interests; moreover they gained each their own separate advantages by the marriage connexions which they formed. Ferdinand I. of the German line married Anne (1521), sister of Louis, King of Hungary and Bohemia, who having been slain by the Turks at the battle of Mohács (1526), these two kingdoms devolved to Ferdinand of the House of Austria. Finally, the marriage which Charles V. contracted with the Infanta Isabella, daughter of Emmanuel, King of Portugal, procured Philip II. of Spain, the son of that marriage, the whole Portuguese monarchy, to which he succeeded on the death of Henry, called the Cardinal (1580). So vast an aggrandisement of power alarmed the Sovereigns of Europe.”—C. W. Koch, *Revolutions of Europe*, period 6.

1519-1555.—Imperial reign of Charles V.—Objects of his policy.—His conflict with the Reformation and with France.—“Charles V. did not receive from nature all the gifts nor all the charms she can bestow, nor did experience give him every talent; but he was equal to the part he had to play in the world. He was sufficiently great to keep his many-jewelled diadem. . . . His ambition was cold and wise. The scope of his ideas, which are not quite easy to divine, was vast enough to control a state composed of divers and distant portions, so as to make it always very difficult to amalgamate his armies, and to supply

them with food, or to procure money. Indeed its very existence would have been exposed to permanent danger from powerful coalitions, had Francis I. known how to place its most vulnerable points under a united pressure from the armies of France, of England, of Venice, and of the Ottoman Empire. Charles V. attained his first object when he prevented the French monarch from taking possession of the inheritance of the house of Anjou, at Naples, and of that of the Viscontis at Milan. He was more successful in stopping the march of Solymán into Austria than in checking the spread of the Reformation in Germany. . . . Charles V. had four objects very much at heart: he wished to be the master in Italy, to check the progress of the Ottoman power in the west of Europe, to conquer the King of France, and

CHARLES V (1500-1558)

Ruler of the Austrian dominions and Holy Roman Empire, King of Spain and the Netherlands

to govern the Germanic body by dividing it, and by making the Reformation a religious pretext for oppressing the political defenders of that belief. In three out of four of these objects he succeeded. Germany alone was not conquered; if she was beaten in battle, neither any political triumph nor any religious results ensued. In Germany, Charles V. began his work too late, and acted too slowly; he undertook to subdue it at a time when the abettors of the Reformation had grown strong, when he himself was growing weaker. . . . Like many other brilliant careers, the career of Charles V. was more successful and more striking at the commencement and the middle than at the end, of its course. At Madrid, at Cambrai, at Nice, he made his rival bow down his head. At Crépy he again forced him to obey his will, but as he had completely made up his mind to have peace, Charles dictated it, in some manner, to his own detriment. At Passau he had to yield to the terms of his enemy—of an enemy whom Charles V. encountered in his old age, and when his powers had decayed. Al-

though it may be said that the extent and the power of the sovereignty which Charles V. left to his successor at his death were not diminished, still his armies were weakened, his finances were exhausted, and the country was weary of the tyranny of the imperial lieutenants. The supremacy of the empire in Germany, for which he had struggled so much, was as little established at the end as at the beginning of his reign; religious unity was solemnly destroyed by the 'Recess' of Augsburg. But that which marks the position of Charles V. as the representative man of his epoch, and as the founder of the policy of modern times, is that, wherever he was victorious, the effect of his success was to crush the last efforts of the spirit of the middle ages, and of the independence of nations. In Italy, in Spain, in Germany, and in the Low Countries, his triumphs were so much gain to the cause of absolute monarchy and so much loss to the liberty derived from the old state of society. Whatever was the character of liberty in the middle ages—whether it were contested or incomplete, or a mockery—it played a greater part than in the four succeeding centuries. Charles V. was assuredly one of those who contributed the most to found and consolidate the political system of modern governments. His history has an aspect of grandeur. Had Francis I. been as sagacious in the closet as he was bold in the field, by a vigorous alliance with England, with Protestant Germany, and with some of the republics of Italy, he might perhaps have balanced and controlled the power of Charles V. But the French monarch did not possess the foresight and the solid understanding necessary to pursue such a policy with success. His rival, therefore, occupies the first place in the historical picture of the epoch. Charles V. had the sentiment of his position and of the part he had to play."—J. Van Praet, *Essays on the political history of the 15th, 16th and 17th centuries*, pp. 190-194.—See also GERMANY: 1510 to 1552-1561, and FRANCE: 1520-1523, to 1547-1559.

1525-1527.—Successful contest for the Hungarian and Bohemian crowns.—In Hungary, "under King Matthias the house of Zapolya, so called from a Slavonic village near Poschega, whence it originated, rose to peculiar eminence. To this house, in particular, King Wladislas had owed his accession to the throne; whence, however, it thought itself entitled to claim a share in the sovereign power, and even a sort of prospective right to the throne. Its members were the wealthiest of all the magnates; they possessed seventy-two castles. . . . It is said that a prophecy early promised the crown to the young John Zapolya. Possessed of all the power conferred by his rich inheritance, Count of Zips, and Voivode of Transylvania, he soon collected a strong party around him. It was he who mainly persuaded the Hungarians, in the year 1505, to exclude all foreigners from the throne by a formal decree; which, though they were not always able to maintain in force, they could never be induced absolutely to revoke. In the year 1514 the Voivode succeeded in putting down an exceedingly formidable insurrection of the peasants with his own forces; a service which the lesser nobility prized the more highly, because it enabled them to reduce the peasantry to a still harder state of servitude. His wish was, on the death of Wladislas, to become Gubernator of the kingdom, to marry the deceased king's daughter Anne, and then to await the course of events. But he was here encountered by the policy of Maximilian. Anne was married to the Archduke Ferdinand; Zapolya

was excluded from the administration of the kingdom; even the vacant Palatinate was refused him and given to his old rival Stephen Báthory. He was highly incensed. . . . But it was not till the year 1525 that Zapolya got the upper hand at the Rakos. . . . No one entertained a doubt that he aimed at the throne. . . . But before anything was accomplished—on the contrary, just as these party conflicts had thrown the country into the utmost confusion, the mighty enemy, Soliman, appeared on the frontiers of Hungary, determined to put an end to the anarchy. . . . In his prison at Madrid, Francis I. had found means to entreat the assistance of Soliman; urging that it well beseeemed a great emperor to succour the oppressed. Plans were laid at Constantinople, according to which the two sovereigns were to attack Spain with a combined fleet, and to send armies to invade Hungary and the north of Italy. Soliman, without any formal treaty, was by his position an ally of the Ligue, as the king of Hungary was, of the emperor. On the 23d of April, 1526, Soliman, after visiting the graves of his forefathers and of the old Moslem martyrs, marched out of Constantinople with a mighty host, consisting of about a hundred thousand men, and incessantly strengthened by fresh recruits on its road. . . . What power had Hungary, in the condition we have just described, of resisting such an attack? . . . The young king took the field with a following of not more than three thousand men. . . . He proceeded to the fatal plain of Mohács, fully resolved with his small band to await in the open field the overwhelming force of the enemy. . . . Personal valour could avail nothing. The Hungarians were immediately thrown into disorder, their best men fell, the others took to flight. The young king was compelled to flee. It was not even granted him to die in the field of battle; a far more miserable end awaited him. Mounted behind a Silesian soldier, who served him as a guide, he had already been carried across the dark waters that divide the plain; his horse was already climbing the bank, when he slipped, fell back, and buried himself and his rider in the morass. This rendered the defeat decisive. . . . Soliman had gained one of those victories which decide the fate of nations during long epochs. . . . That two thrones, the succession to which was not entirely free from doubt, had thus been left vacant, was an event that necessarily caused a great agitation throughout Christendom. It was still a question whether such an European power as Austria would continue to exist;—a question which it is only necessary to state, in order to be aware of its vast importance to the fate of mankind at large, and of Germany in particular. . . . The claims of Ferdinand to both crowns, unquestionable as they might be in reference to the treaties with the reigning houses, were opposed in the nations themselves, by the right of election and the authority of considerable rivals. In Hungary, as soon as the Turks had retired, John Zapolya appeared with the fine army which he had kept back from the conflict; the fall of the king was at the same time the fall of his adversaries. . . . Even in Tokay, however, John Zapolya was saluted as king. Meanwhile, the dukes of Bavaria conceived the design of getting possession of the throne of Bohemia. . . . Nor was it in the two kingdoms alone that these pretenders had a considerable party. The state of politics in Europe was such as to insure them powerful supporters abroad. In the first place, Francis I. was intimately connected with Zapolya: in a short time a delegate from the pope was at his side, and the Germans

in Rome maintained that Clement assisted the faction of the Voivode with money. Zapolya sent an agent to Venice with a direct request to be admitted a member of the Ligue of Cognac. In Bohemia, too, the French had long had devoted partisans. . . . The consequences that must have resulted, had this scheme succeeded, are so incalculable, that it is not too much to say they would have completely changed the political history of Europe. The power of Bavaria would have outweighed that of Austria in both German and Slavonian countries, and Zapolya, thus supported, would have been able to maintain his station; the Ligue, and with it high ultra-montane opinions would have held the ascendancy in eastern Europe. Never was there a project more pregnant with danger to the growing power of the house of Austria. Ferdinand behaved with all the prudence and energy which that house has so often displayed in difficult emergencies. For the present, the all-important object was the crown of Bohemia. . . . All his measures were taken with such skill and prudence, that on the day of election, though the Bavarian agent had, up to the last moment, not the slightest doubt of the success of his negotiations, an overwhelming majority in the three estates elected Ferdinand to the throne of Bohemia. This took place on the 23d October, 1526. . . . On his brother's birth-day, the 24th of February, 1527, Ferdinand was crowned at Prague. . . . The affairs of Hungary were not so easily or so peacefully settled. . . . At first, when Zapolya came forward, full armed and powerful out of the general desolation, he had the uncontested superiority. The capital of the kingdom sought his protection, after which he marched to Stuhlweissenburg, where his partisans bore down all attempts at opposition: he was elected and crowned (11th of November, 1526); in Croatia, too, he was acknowledged king at a diet; he filled all the numerous places, temporal and spiritual, left vacant by the disaster of Mohács, with his friends. . . . [But] the Germans advanced without interruption; and as soon as it appeared possible that Ferdinand might be successful, Zapolya's followers began to desert him. . . . Never did the German troops display more bravery and constancy. They had often neither meat nor bread, and were obliged to live on such fruits as they found in the gardens: the inhabitants were wavering and uncertain—they submitted, and then revolted again to the enemy; Zapolya's troops, aided by their knowledge of the ground, made several very formidable attacks by night; but the Germans evinced, in the moment of danger, the skill and determination of a Roman legion; they showed, too, a noble constancy under difficulties and privations. At Tokay they defeated Zapolya and compelled him to quit Hungary. . . . On the 3d November, 1527, Ferdinand was crowned in Stuhlweissenburg: only five of the magnates of the kingdom adhered to Zapolya. The victory appeared complete. Ferdinand, however, distinctly felt that this appearance was delusive. . . . In Bohemia, too, his power was far from secure. His Bavarian neighbours had not relinquished the hope of driving him from the throne at the first general turn of affairs. The Ottomans, meanwhile, acting upon the persuasion that every land in which the head of their chief had rested belonged of right to them, were preparing to return to Hungary; either to take possession of it themselves, or at first, as was their custom, to bestow it on a native ruler—Zapolya, who now eagerly sought an alliance with them—as their vassal.”—L. von Ranke, *History of the reformation in Germany*, v. 2, bk. 4, ch.

1564-1618.—Tolerance of Maximilian II.—Bigotry and tyranny of Rodolph and Ferdinand II.—Prelude to the Thirty Years' War.—“There is no period connected with these religious wars that deserves more to be studied than these reigns of Ferdinand I., Maximilian [the Second], and those of his successors who preceded the thirty years' war. We have no sovereign who exhibited that exercise of moderation and good sense which a philosopher would require, but Maximilian; and he was immediately followed by princes of a different complexion. . . . Nothing could be more complete than the difficulty of toleration at the time when Maximilian reigned; and if a mild policy could be attended with favourable effects in his age and nation, there can be little fear of the experiment at any other period. No party or person in the state was then disposed to tolerate his neighbour from any sense of the justice of such forbearance, but from motives of temporal policy alone. The Lutherans, it will be seen, could not bear that the Calvinists should have the same religious privileges with themselves. The Calvinists were equally opinionated and unjust; and Maximilian himself was probably tolerant and wise, chiefly because he was in his real opinions a Lutheran, and in outward profession, as the head of the empire, a Roman Catholic. For twelve years, the whole of his reign, he preserved the religious peace of the community, without destroying the religious freedom of the human mind. He supported the Roman Catholics, as the predominant party, in all their rights, possessions, and privileges; but he protected the Protestants in every exercise of their religion which was then practicable. In other words, he was as tolerant and just as the temper of society then admitted, and more so than the state of things would have suggested. . . . The merit of Maximilian was but too apparent the moment that his son Rodolph was called upon to supply his place. . . . He had always left the education of his son and successor too much to the discretion of his bigoted consort. Rodolph, his son, was therefore as ignorant and furious on his part as were the Protestants on theirs; he had immediate recourse to the usual expedients—force, and the execution of the laws to the very letter. . . . After Rodolph comes Matthias, and, unhappily for all Europe, Bohemia and the empire fell afterwards under the management of Ferdinand II. Of the different Austrian princes, it is the reign of Ferdinand II. that is more particularly to be considered. Such was the arbitrary nature of his government over his subjects in Bohemia, that they revolted. They elected for their king the young Elector Palatine, hoping thus to extricate themselves from the bigotry and tyranny of Ferdinand. This crown so offered was accepted; and, in the event, the cause of the Bohemians became the cause of the Reformation in Germany, and the Elector Palatine the hero of that cause. It is this which gives the great interest to this reign of Ferdinand II., to these concerns of his subjects in Bohemia, and to the character of this Elector Palatine. For all these events and circumstances led to the thirty years' war.”—W. Smyth, *Lectures on modern history*, v. 1, lect. 13. See BOHEMIA: 1611-1618; and GERMANY: 1618-1620.

1618-1648.—Thirty Years' War.—Peace of Westphalia.—“The thirty years' war made Germany the centre-point of European politics. . . . No one at its commencement could have foreseen the duration and extent. But the train of war was everywhere laid, and required only the match to set it going; more than one war was joined to it, and swallowed up in it; and the melancholy truth, that war feeds itself, was never more clearly displayed. . . . Though the war, which first broke out in Bohemia, concerned only the house of Austria, yet by its originating in religious disputes, by its peculiar character as a religious war, and by the measures adopted both by the insurgents and the emperor, it acquired such an extent, that even the quelling of the insurrection was insufficient to put a stop to it. . . . Though the Bohemian war was apparently terminated, yet the flame had communicated to Germany and Hungary, and new fuel was added by the act of proscription promulgated against the elector Frederic and his adherents. From this the war derived that revolutionary character, which was henceforward peculiar to it; it was a step that could not but lead to further results, for the question of the relations between the emperor and his states, was in a fair way of being practically considered. New and bolder projects were also formed in Vienna and Madrid, where it was resolved to renew the war with the Netherlands. Under the present circumstances, the suppression of the Protestant religion and the overthrow of German and Dutch liberty appeared inseparable; while the success of the imperial arms, supported as they were by the league and the co-operation of the Spaniards, gave just grounds for hope. . . . By the carrying of the war into Lower Saxony, the principal seat of the Protestant religion in Germany (the states of which had appointed Christian IV. of Denmark, as duke of Holstein, head of their confederacy), the northern states had already, though without any beneficial result, been involved in the strife, and the Danish war had broken out. But the elevation of Albert of Wallenstein to the dignity of duke of Friedland and imperial general over the army raised by himself, was of considerably more importance, as it affected the whole course and character of the war. From this time the war was completely and truly revolutionary. The peculiar situation of the general, the manner of the formation as well as the maintenance of his army, could not fail to make it such. . . . The distinguished success of the imperial arms in the north of Germany unveiled the daring schemes of Wallenstein. He did not come forward as conqueror alone, but, by the investiture of Mecklenburg as a state of the empire, as a ruling prince. . . . But the elevation and conduct of this *novus homo*, exasperated and annoyed the Catholic no less than the Protestant states, especially the league and its chief; all implored peace, and Wallenstein's discharge. Thus, at the diet of the electors at Augsburg, the emperor was reduced to the alternative of resigning him or his allies. He chose the former. Wallenstein was dismissed, the majority of his army disbanded, and Tilly nominated commander-in-chief of the forces of the emperor and the league. . . . On the side of the emperor sufficient care was taken to prolong the war. The refusal to restore the unfortunate Frederic, and even the sale of his upper Palatine to Bavaria, must with justice have excited the apprehensions of the other princes. But when the Jesuits finally succeeded, not only in extorting the edict of restitution, but also in

causing it to be enforced in the most odious manner, the Catholic states themselves saw with regret that peace could no longer exist. . . . The greater the success that attended the house of Austria, the more actively foreign policy laboured to counteract it. England had taken an interest in the fate of Frederic V. from the first, though this interest was evinced by little beyond fruitless negotiations. Denmark became engaged in the quarrel mostly through the influence of this power and Holland. Richelieu, from the time he became prime minister of France, had exerted himself in opposing Austria and Spain. He found employment for Spain in the contests respecting Veltelin, and for Austria soon after, by the war of Mantua. Willingly would he have detached the German league from the interest of the emperor; and though he failed in this, he procured the fall of Wallenstein. . . . Much more important, however, was Richelieu's influence on the war, by the essential share he had in gaining Gustavus Adolphus' active participation in it. . . . The nineteen years of his [Gustavus Adolphus'] reign which had already elapsed, together with the Polish war, which lasted nearly that time, had taught the world but little of the real worth of this great and talented hero. The decisive superiority of Protestantism in Germany, under his guidance, soon created a more just knowledge, and at the same time showed the advantages which must result to a victorious supporter of that cause. . . . The battle at Leipzig was decisive for Gustavus Adolphus and his party, almost beyond expectation. The league fell asunder; and in a short time he was master of the countries from the Baltic to Bavaria, and from the Rhine to Bohemia. . . . But the misfortunes and death of Tilly brought Wallenstein again on the stage as absolute commander-in-chief, bent on plans not a whit less extensive than those he had before formed. No period of the war gave promise of such great and rapid successes or reverses as the present, for both leaders were determined to effect them; but the victory of Lützen, while it cost Gustavus his life, prepared the fall of Wallenstein. . . . Though the fall of Gustavus Adolphus frustrated his own private views, it did not those of his party. . . . The school of Gustavus produced a number of men, great in the cabinet and in the field; yet it was hard, even for an Oxenstiern, to preserve the importance of Sweden unimpaired; and it was but partially done by the alliance of Heilbronn. . . . If the forces of Sweden overrun almost every part of Germany in the following months, under the guidance of the pupils of the king, Bernard of Weimar and Gustavus Horn, we must apparently attribute it to Wallenstein's intentional inactivity in Bohemia. The distrust of him increased in Vienna the more, as he took but little trouble to diminish it; and though his fall was not sufficient to atone for treachery, if proved, it was for his equivocal character and imprudence. His death probably saved Germany from a catastrophe. . . . A great change took place upon the death of Wallenstein; as a prince of the blood, Ferdinand, king of Hungary and Bohemia, obtained the command. Thus an end was put to plans of revolutions from this quarter. But in the same year the battle of Nördlingen gave to the imperial arms a sudden preponderance, such as it had never before acquired. The separate peace of Saxony with the emperor at Prague, and soon after an alliance, were its consequences; Sweden driven back to Pomerania, seemed unable of herself, during the two following years, to maintain her ground in Germany: the victory of Wittstock turned the scale in her favour. . . . The war was

prolonged and greatly extended by the active share taken in it by France: first against Spain, and soon against Austria. . . . The German war, after the treaty with Bernhard of Weimar, was mainly carried on by France, by the arming of Germans against Germans. But the pupil of Gustavus Adolphus preferred to fight for himself rather than others, and his early death was almost as much coveted by France as by Austria. The success of the Swedish arms revived under Baner. . . . At the general diet, which was at last convened, the emperor yielded to a general amnesty, or at least what was so designated. But when at the meeting of the ambassadors of the leading powers at Hamburg, the preliminaries were signed, and the time and place of the congress of peace fixed, it was deferred after Richelieu's death (who was succeeded by Mazarin), by the war, which both parties continued, in the hope of securing better conditions by victory. A new war broke out in the north between Sweden and Denmark, and when at last the congress of peace was opened at Münster and Osnabrück, the negotiations dragged on for three years. . . . The German peace was negotiated at Münster between the emperor and France, and at Osnabrück between the emperor and Sweden; but both treaties, according to express agreement, Oct. 24, 1648, were to be considered as one, under the title of the Westphalian."—A. H. L. Heeren, *Manual of the history of the political system of Europe and its colonies*, pp. 91-99.—"The Peace of Westphalia has met manifold hostile comments, not only in earlier, but also in later, times. German patriots complained that by it the unity of the Empire was rent; and indeed the connection of the States, which even before was loose, was relaxed to the extreme. This was, however, an evil which could not be avoided, and it had to be accepted in order to prevent the French and Swedes from using their opportunity for the further enslavement of the land. . . . The religious parties also made objections to the peace. The strict Catholics condemned it as a work of inexcusable and arbitrary injustice. . . . The dissatisfaction of the Protestants was chiefly with the recognition of the Ecclesiastical Reservation. They complained also that their brethren in the faith were not allowed the free exercise of their religion in Austria. Their hostility was limited to theoretical discussions, which soon ceased when Louis XIV. took advantage of the preponderance which he had won to make outrageous assaults upon Germany, and even the Protestants were compelled to acknowledge the Emperor as the real defender of German independence."—A. 1672-1714.—Wars with Louis XIV of France: War of the Grand Alliance.—Peace of Ryswick.—“The leading principle of the reign [in France] of Louis XIV. . . . is the principle of war with the dynasty of Charles V.—the elder branch of which reigned in Spain, while the descendants of the younger branch occupied the imperial throne of Germany. . . . At the death of Mazarin, or to speak more correctly, immediately after the death of Philip IV., . . . the early ambition of Louis XIV. sought to prevent the junior branch of the Austrian dynasty from succeeding to the inheritance of the elder branch. He had no desire to see reconstituted under the imperial sceptre of Germany the monarchy which Charles V. had at one time wished to transmit entire to his son, but which, worn out and weakened, he subsequently allowed without regret to be divided between his son and his brother. Before making war upon Austria, Louis XIV. cast his eyes upon a portion of the territory belonging to Spain, and the expedition against Holland, begun in 1672 [see NETHERLANDS (HOLLAND): 1672-1674, and 1674-1678], for the purpose of absorbing the Spanish provinces by overwhelming them, opened the series of his vast enterprises. His first great war was, historically speaking, his first great fault. He failed in his object: for at the end of six campaigns, during which the French armies obtained great and deserved success, Holland remained unconquered. Thus was Europe warned that the lust of conquest of a young monarch, who did not himself possess military genius, but who found in his generals the resources and ability in which he was himself deficient, would soon threaten her independence. Condé and Turenne, after having been rebellious subjects under the Regency, were about to become the first and the most illustrious lieutenants of Louis XIV. Europe, however, though warned, was not immediately ready to defend herself. It was from Austria, more directly exposed to the dangers of the great war now commencing, that the first systematic resistance ought to have come. But Austria was not prepared to play such a part; and the Emperor Leopold possessed neither the genius nor the wish for it. He was, in fact, nothing more than the nominal head of Germany. . . . Such was the state of affairs in Europe when William of Orange first made his appearance on the stage. . . . The old question of supremacy, which Louis XIV. wished to fight out as a duel with the House of Austria, was now about to change its aspect, and, owing to the presence of an unexpected genius, to bring into the quarrel other powers besides the two original competitors. The foe of Louis XIV. ought by rights to have been born on the banks of the Danube, and not on the shores of the North Sea. In fact, it was Austria that at that moment most needed a man of genius, either on the throne or at the head of affairs. The events of the century would, in this case, doubtless have followed a different course: the war would have been less general, and the maritime nations would not have been involved in it to the same degree. . . . The treaties of peace would have been signed in some small place in France or Germany, and not in two towns and a village in Holland, such as Nimeguen, Ryswick, and Utrecht. . . . William of Orange found himself in a position soon to form the Triple Alliance which the very policy of Louis XIV. suggested. For France to attack Holland, when her object was eventually to reach Austria, and keep her out of the Spanish succession, was to make enemies at

one and the same time of Spain, of Austria, and of Holland. But if it afterwards required considerable efforts on the part of William of Orange to maintain this alliance, it demanded still more energy to extend it. It formed part of the Stadtholder's ulterior plans to combine the union between himself and the two branches of the Austrian family, with the old Anglo-Swedish Triple Alliance, which had just been dissolved under the strong pressure brought to bear on it by Louis XIV. . . . Louis XIV., whose finances were exhausted, was very soon anxious to make peace, even on the morrow of his most brilliant victories; whilst William of Orange, beaten and retreating, ardently desired the continuance of the war. . . . The Peace of Nimeguen was at last signed, and by it were secured to Louis XIV. Franche-Comté, and some important places in the Spanish Low Countries on his northern frontier [see NIMEGUEN, PEACE OF]. This was the culminating point of the reign of Louis XIV. Although the coalition had prevented him from attaining the full object of his designs against the House of Austria, which had been to absorb by conquest so much of the territory belonging to Spain as would secure him against the effect of a will preserving the whole inheritance intact in the family, yet his armies had been constantly successful, and many of his opponents were evidently tired of the struggle. . . . Some years passed thus, with the appearance of calm. Europe was conquered; and when peace was broken, because, as was said, the Treaty of Nimeguen was not duly executed, the events of the war were for some time neither brilliant nor important, for several campaigns began and ended without any considerable result. . . . At length Louis XIV. entered on the second half of his reign, which differed widely from the first. . . . During this second period of more than thirty years, which begins after the Treaty of Nimeguen and lasts till the Peace of Utrecht, events succeed each other in complete logical sequence, so that the reign presents itself as one continuous whole, with a regular movement of ascension and decline. . . . The leading principle of the reign remained the same; it was always the desire to weaken the House of Austria, or to secure an advantageous partition of the Spanish succession. But the Emperor of Germany was protected by the coalition, and the King of Spain, whose death was considered imminent, would not make up his mind to die. . . . During the first League, when the Prince of Orange was contending against Louis XIV. with the co-operation of the Emperor of Germany, of the King of Spain, and of the Electors on the Rhine, the religious element played only a secondary part in the war. But we shall see this element make its presence more manifest. . . . Thus the influence of Protestant England made itself more and more felt in the affairs of Europe, in proportion as the government of the Stuarts, from its violence, its unpopularity, and from the opposition offered to it, was approaching its end. . . . The second coalition was neither more united nor more firm than the first had been; but, after the expulsion of the Stuarts, the germs of dissolution no longer threatened the same dangers. . . . The British nation now made itself felt in the balance of Europe, and William of Orange was for the first time in his life successful in war at the head of his English troops. . . . This was the most brilliant epoch of the life of William III. . . . He was now at the height of his glory, after a period of twenty years from his start in life, and his destiny was accomplished; so that until the Treaty of Ryswick, which in 1698 put an

end to his hostilities with France, and brought about his recognition as King of England by Louis XIV., not much more was left for him to gain; and he had the skill to lose nothing. . . . The negotiations for the Treaty of Ryswick were conducted with less ability and boldness, and concluded on less advantageous terms, than the Truce of Ratisbon or the Peace of Nimeguen. Nevertheless, this treaty, which secured to Louis the possession of Strasbourg, might, particularly as age was now creeping on him, have closed his military career without disgrace, if the eternal question, for the solution of which he had made so many sacrifices, and which had always held the foremost place in his thoughts, had not remained as unsettled and as full of difficulty as on the day when he had mounted the throne. Charles II. of Spain was not dead, and the question of the Spanish succession, which had so actively employed the armies of Louis XIV., and taxed his diplomacy, was as undecided as at the beginning of his reign. Louis XIV. saw two alternatives before him: a partition of the succession between the Emperor and himself (a solution proposed thirty years before as a means to avoid war), or else a will in favour of France, followed of course by a recommencement of general hostilities. . . . Louis XIV. proposed in succession two schemes, not, as thirty years before, to the Emperor, but to the King of England, whose power and whose genius rendered him the arbiter of all the great affairs of Europe. . . . In the first of the treaties of partition, Spain and the Low Countries were to be given to the Prince of Bavaria; in the second, to the Archduke Charles. In both, France obtained Naples and Sicily for the Dauphin. . . . Both these arrangements . . . suited both France and England as a pacific solution of the question. . . . But events, as we know, deranged all these calculations, and Charles II., who, by continuing to live, had disappointed so much impatient expectation, by his last will provoked a general war, to be carried on against France by the union of England with the Empire and with Holland—a union which was much strengthened under the new dynasty, and which afterwards embraced the northern states of Germany. . . . William III. died at the age of fifty-two, on the 8th of March, 1702, at the beginning of the War of Succession. After him, the part he was to have played was divided. Prince Eugene, Marlborough, and Heinsius (the Grand Pensionary) had the conduct of political and especially of military affairs, and acted in concert. The disastrous consequences to France of that war, in which William had no part, are notorious. The battles of Blenheim, of Ramilies, and of Oudenarde brought the allied armies on the soil of France, and placed Louis XIV. on the verge of ruin."—J. Van Praet, *Essays on the political history of the 15th, 16th, and 17th centuries*, pp. 390-414 and 441-455. See also GERMANY: 1686; and FRANCE: 1680-1600 to 1607.

1711.—War of the Spanish Succession.—Its circumstances changed.—"The death of the Emperor Joseph I., who expired April 17, 1711, at the age of thirty-two, changed the whole character of the War of the Spanish Succession. As Joseph left no male heirs, the hereditary dominions of the House of Austria devolved to his brother, the Archduke Charles; and though that prince had not been elected King of the Romans, and had therefore to become a candidate for the imperial crown, yet there could be little doubt that he would attain that dignity. Hence, if Charles should also become sovereign of Spain and the Indies, the vast empire of Charles V. would be again united in one person; and that very evil of an almost universal monarchy would be established, the prevention of which had been the chief cause for taking up arms against Philip V. . . . After an interregnum of half a year, during which the affairs of the Empire had been conducted by the Elector Palatine and the Elector of Saxony, as imperial vicars for South and North Germany, the Archduke Charles was unanimously named Emperor by the Electoral College (Oct. 12th). . . . Charles . . . received the imperial crown at Frankfort, Dec. 22d, with the title of Charles VI."—T. H. Dyer, *History of modern Europe*, bk. 5, v. 3, ch. 6.

1718-1738.—Question of the succession.—Pragmatic Sanction of Charles VI, and its guarantee by the powers.—"On the death [1711] of Joseph, the hopes of the house of Austria and the future destiny of Germany rested on Charles [then, as titular king of Spain, Charles III., ineffectually contesting the Spanish throne with the Bourbon heir, Philip V.; afterwards, as Emperor, Charles VI.] who was the only surviving male of his illustrious family. By that event the houses of Austria, Germany and Europe were placed in a new and critical situation. From a principle of mistaken policy the succession to the hereditary dominions had never been established according to an invariable rule; for it was not clearly ascertained whether males of the collateral branches should be preferred to females in lineal descent, an uncertainty which had frequently occasioned many vehement disputes. To obviate this evil, as well as to prevent future disputes, Leopold [father of Joseph and Charles] had arranged the order of succession: to Joseph he assigned Hungary and Bohemia, and the other hereditary dominions; and to Charles the crown of Spain, and all the terri-

ories which belonged to the Spanish inheritance. Should Joseph die without issue male, the whole succession was to descend to Charles, and in case of his death, under similar circumstances, the Austrian dominions were to devolve on the daughters of Joseph in preference to those of Charles. This family compact was signed by the two brothers in the presence of Leopold. Joseph died without male issue; but left two daughters." He was succeeded by Charles in accordance with the compact. "On the 2nd of August, 1718, soon after the signature of the Quadruple Alliance, Charles promulgated a new law of succession for the inheritance of the house of Austria, under the name of the Pragmatic Sanction. According to the family compact formed by Leopold, and confirmed by Joseph and Charles, the succession was entailed on the daughters of Joseph in preference to the daughters of Charles, should they both die without issue male. Charles, however, had scarcely ascended the throne, though at that time without children, than he reversed this compact, and settled the right of succession, in default of his male issue, first on his daughters, then on the daughters of Joseph, and afterwards on the queen of Portugal and the other daughters of Leopold. Since the promulgation of that decree, the Empress had borne a son who died in his infancy, and three daughters, Maria Theresa, Maria Anne and Maria Amelia. With a view to insure the succession of these daughters, and to obviate the dangers which might arise from the claims of the Josephine archduchesses, he published the Pragmatic Sanction, and compelled his nieces to renounce their pretensions on their marriages with the electors of Saxony and Bavaria. Aware, however, that the strongest renunciations are disregarded, he obtained from the different states of his extensive dominions the acknowledgment of the Pragmatic Sanction, and made it the great object of his reign, to which he sacrificed every other consideration, to procure the guaranty of the European powers." This guaranty was obtained in treaties with the several powers, as follows: Spain in 1725; Russia, 1726, renewed in 1733; Prussia, 1728; England and Holland, 1731; France, 1738; the Empire, 1732. The inheritance which Charles thus endeavored to secure to his daughter was vast and imposing. "He was by election Emperor of Germany, by hereditary right sovereign of Hungary, Transylvania, Bohemia, Austria, Styria, Carinthia and Carniola, the Tyrol, and the Brisgau [Breisgau] and he had recently obtained Naples and Sicily, the Milanese and the Netherlands."—W. Coxe, *History of the House of Austria*, v. 3, ch. 80, pp. 84-85.—"The Pragmatic Sanction, though framed to legalize the accession of Maria Theresa, excludes the present Emperor's daughters and his grandchild by postponing the succession of females to that of males in the family of Charles VI."—J. D. Bouchier, *Heritage of the Hapsburgs* (*Fortnightly Review*, Mar., 1889).

1740 (October).—Treachery among the guarantors of the Pragmatic Sanction.—Inheritance of Maria Theresa disputed.—"The Emperor Charles V. . . died on the 20th of October, 1740. His daughter Maria Theresa, the heiress of his dominions with the title of Queen of Hungary, was but twenty-three years of age, without experience or knowledge of business; and her husband Francis, the titular Duke of Lorraine and reigning Grand Duke of Tuscany, deserved the praise of amiable qualities rather than of commanding talents. Her Ministers were timorous, irresolute, and useless: 'I saw them in despair,' writes Mr. Robinson, the British envoy, 'but that very despair was not capable of rendering them

MARIA THERESA (1717-1780)
Empress of Austria

bravely desperate.' The treasury was exhausted, the army dispersed, and no general risen to replace Eugene. The succession of Maria Theresa was, indeed, cheerfully acknowledged by her subjects, and seemed to be secured amongst foreign powers by their guarantee of the Pragmatic Sanction; but it soon appeared that such guarantees are mere worthless parchments where there is strong temptation to break and only a feeble army to support them. The principal claimant to the succession was the Elector of Bavaria, who maintained that the will of the Emperor Ferdinand the First devised the Austrian states to his daughter, from whom the Elector descended, on failure of male lineage. It appeared that the original will in the archives at Vienna referred to the failure, not of the male but of the legitimate issue of his sons; but this document, though ostentatiously displayed to all the Ministers of state and foreign ambassadors, was very far from inducing the Elector to desist from his pretensions. As to the Great Powers—the Court of France, the old ally

of the Bavarian family, and mindful of its injuries from the House of Austria, was eager to exalt the first by the depression of the latter. The Bourbons in Spain followed the direction of the Bourbons in France. The King of Poland and the Empress of Russia were more friendly in their expressions than in their designs. An opposite spirit pervaded England and Holland, where motives of honour and of policy combined to support the rights of Maria Theresa. In Germany itself the Elector of Cologne, the Bavarian's brother, warmly espoused his cause; and 'the remaining Electors,' says Chesterfield, 'like electors with us, thought it a proper opportunity of making the most of their votes,—and all at the expense of the helpless and abandoned House of Austria!' The first blow, however, came from Prussia, where the King Frederick William had died a few months before, and been succeeded by his son Frederick the Second, a Prince surnamed the Great by poets."—Lord Mahon (Earl Stanhope), *History of England, 1713-1783, v. 3, ch. 23*.—"The elector of Bavaria acted in a prompt, honest, and consistent manner. He at once lodged a protest against any disposition of the hereditary estates to the prejudice of his own rights; insisted on the will of Ferdinand I.; and demanded the production of the original text. It was promptly produced. But it was found to convey the succession to the heirs of his daughter, the ancestress of the elector, not, as he contended, on the failure of male heirs, but in the absence of more direct heirs born in wedlock. Maria Theresa could, however, trace her descent through nearer male heirs, and had, therefore, a superior title. Charles Albert was in an event only one of several claimants. The King of Spain, a Bourbon, presented himself as the heir of the Hapsburg emperor Charles V. The King of Sardinia alleged an ancient marriage contract, from which he derived a right to the duchy of Milan. Even August of Saxony claimed territory by virtue of an antiquated title, which, it was pretended, the renunciation of his wife could not affect. All these were, however, mere vultures compared to the eagle [Frederick of Prussia] which was soon to descend upon its prey."—H. Tuttle, *History of Prussia, 1740-1745, ch. 2*.

1740 (October-November).—War of the succession—Conduct of Frederick the Great as explained by himself.—"This Pragmatic Sanction had been guaranteed by France, England, Holland, Sardinia, Saxony, and the Roman empire; nay by the late King Frederic William [of Prussia] also, on condition that the court of Vienna would secure to him the succession of Jülich and Berg. The emperor promised him the eventual succession, and did not fulfil his engagements; by which the King of Prussia, his successor, was freed from this guarantee, to which his father, the late king, had pledged himself, conditionally. . . . Frederic I., when he erected Prussia into a kingdom, had, by that vain grandeur, planted the seed of ambition in the bosom of his posterity; which, soon or late, must fructify. The monarchy he had left to his descendants was, if I may be permitted the expression, a kind of hermaphrodite, which was rather more an electorate than a kingdom. Fame was to be acquired by determining the nature of this being: and this sensation certainly was one of those which strengthened so many motives, conspiring to engage the king in grand enterprises. If the acquisition of the duchy of Berg had not even met with almost insurmountable impediments, it was in itself so small that the possession would add little grandeur to the house of Brandenburg. These reflections occasioned the king

to turn his views toward the house of Austria, the succession of which would become matter of litigation, at the death of the emperor, when the throne of the Cæsars should be vacant. That event must be favourable to the distinguished part which the king had to act in Germany, by the various claims of the houses of Saxony and Bavaria to these states; by the number of candidates which might canvass for the Imperial crown; and by the projects of the court of Versailles, which, on such an occasion must naturally profit by the troubles that the death of Charles VI could not fail to excite. This accident did not long keep the world in expectation. The emperor ended his days at the palace La Favorite, on the 26th [20th] day of October, 1740. The news arrived at Rheinsberg when the king was ill of a fever. . . . He immediately resolved to reclaim the principalities of Silesia; the rights of his house to which [long dormant, the claim dating back to a certain covenant of heritage-brotherhood with the duke of Liegnitz, in 1537, which the emperor of that day caused to be annulled by the states of Bohemia] were incontestable: and he prepared, at the same time, to support these pretensions, if necessary, by arms. This project accomplished all his political views; it afforded the means of acquiring reputation, of augmenting the power of the state, and of terminating what related to the litigious succession of the duchy of Berg. . . . The state of the court of Vienna, after the death of the emperor, was deplorable. The finances were in disorder; the army was ruined and discouraged by ill success in its wars with the Turks; the ministry disunited, and a youthful unexperienced princess at the head of the government, who was to defend the succession from all claimants. The result was that the government could not appear formidable. It was besides impossible that the king [Frederick of Prussia] should be destitute of allies. . . . The war which he might undertake in Silesia was the only offensive war that could be favoured by the situation of his states, for it would be carried on upon his frontiers, and the Oder would always furnish him with a sure communication. . . . Add to these reasons, an army fit to march, a treasury ready prepared, and, perhaps, the ambition of acquiring renown. Such were the causes of the war which the king declared against Maria Theresa of Austria, queen of Hungary and Bohemia."—Frederick II. (Frederick the Great), *History of my own times: posthumous works* (translated by Holcroft), v. 1, ch. 1-2.

1740-1741.—War of the Succession.—Fatlessness of the king of Prussia.—Macaulay verdict.—"From no quarter did the young queen of Hungary receive stronger assurances of friendship and support than from the King of Prussia. Yet the King of Prussia, the 'Anti-Machiavel,' had already fully determined to commit the great crime of violating his plighted faith, of robbing the ally whom he was bound to defend, and of plunging all Europe into a long, bloody, and desolating war, and all this for no end whatever except that he might extend his dominions and see his name in the gazettes. He determined to assemble a great army with speed and secrecy, to invade Silesia before Maria Theresa should be apprized of his design, and to add that rich province to his kingdom. . . . Without any declaration of war, without any demand for reparation, in the very act of pouring forth compliments and assurances of good will, Frederic commenced hostilities. Many thousands of his troops were actually in Silesia before the Queen of Hungary knew that he had set up any claim to any part of her territories. At

length he sent her a message which could be regarded only as an insult. If she would but let him have Silesia, he would, he said, stand by her against any power which should try to deprive her of her other dominions: as if he was not already bound to stand by her, or as if his new promise could be of more value than the old one. It was the depth of winter. The cold was severe, and the roads deep in mire. But the Prussians pressed on. Resistance was impossible. The Austrian army was then neither numerous nor efficient. The small portion of that army which lay in Silesia was unprepared for hostilities. Glogau was blockaded; Breslau opened its gates; Oblau was evacuated. A few scattered garrisons still held out; but the whole open country was subjugated: no enemy ventured to encounter the king in the field; and, before the end of January, 1741, he returned to receive the congratulations of his subjects at Berlin. Had the Silesian question been merely a question between Frederic and Maria Theresa it would be impossible to acquit the Prussian king of gross perfidy. But when we consider the effects which his policy produced, and could not fail to produce, on the whole community of civilized nations, we are compelled to pronounce a condemnation still more severe. . . . The selfish rapacity of the king of Prussia gave the signal to his neighbours. . . . The evils produced by this wickedness were felt in lands where the name of Prussia was unknown; and, in order that he might rob a neighbour whom he had promised to defend, black men fought on the coast of Coromandel, and red men scalped each other by the great lakes of North America. Silesia had been occupied without a battle; but the Austrian troops were advancing to the relief of the fortresses which still held out. In the spring Frederic rejoined his army. He had seen little of war, and had never commanded any great body of men in the field. . . . Frederic's first battle was fought at Mollwitz [April 10, 1741], and never did the career of a great commander open in a more inauspicious manner. His army was victorious. Not only, however, did he not establish his title to the character of an able general, but he was so unfortunate as to make it doubtful whether he possessed the vulgar courage of a soldier. The cavalry, which he commanded in person, was put to flight. Unaccustomed to the tumult and carnage of a field of battle, he lost his self-possession, and listened too readily to those who urged him to save himself. His English gray carried him many miles from the field, while Schwerin, though wounded in two places, manfully upheld the day. The skill of the old Field-Marshal and the steadiness of the Prussian battalions prevailed, and the Austrian army was driven from the field with the loss of 8,000 men. The news was carried late at night to a mill in which the king had taken shelter. It gave him a bitter pang. He was successful; but he owed his success to dispositions which others had made, and to the valour of men who had fought while he was flying. So unpromising was the first appearance of the greatest warrior of that age."—Lord Macaulay, *Frederic the Great* (*Essays*, v. 4).

1741 (April-May).—War of the succession.—French responsibility.—Carlyle verdict.—“The battle of Mollwitz went off like a signal shot among the Nations; intimating that they were one and all, to go battling. Which they did, with a vengeance; making a terrible thing of it, over all the world, for above seven years to come. . . . Not that Mollwitz kindled Europe; Europe was already kindled for some two years past;—especially since the late Kaiser died, and his Pragmatic Sanction was superadded to the other troubles afoot. But

ever since that image of Jenkins's Ear had at last blazed-up in the slow English brain, like a fiery constellation or Sign in the Heavens, symbolic of such injustices and unendurabilities, and had lighted the Spanish-English War [see ENGLAND: 1739-1741], Europe was slowly but pretty surely taking fire. France ‘could not see Spain humbled,’ she said: England (in its own dim feeling, and also in the fact of things), could not do at all without considerably humbling Spain. France, endlessly interested in that Spanish-English matter, was already sending out fleets, firing shots,—almost, or altogether, putting her hand in it. ‘In which case, will not, must not, Austria help us?’ thought England,—and was asking, daily, at Vienna . . . when the late Kaiser died. . . . But if not as cause, then as signal, or as signal and cause together (which it properly was), the Battle of Mollwitz gave the finishing stroke and set all in motion. . . . For directly on the back of Mollwitz, there ensued, first, an explosion of Diplomatic activity, such as was never seen before; Excellencies from the four winds taking wing towards Friedrich; and talking and insinuating, and fencing and fugging, after their sort, in that Silesian camp of his, the centre being there. A universal rookery of Diplomats, whose loud cackle is now as if gone mad to us; their work wholly fallen putrescent and avoidable, dead to all creatures. And secondly, in the train of that, there ensued a universal European War, the French and the English being chief parties in it; which abounds in battles and feats of arms, spirited but delirious, and cannot be got stilled for seven or eight years to come; and in which Friedrich and his War swim only as an intermittent Episode henceforth. . . . The first point to be noted is, Where did it originate? To which the answer mainly is . . . with Monseigneur, the Maréchal de Belle-Isle principally; with the ambitious cupidities and baseless vanities of the French Court and Nation, as represented by Belle-Isle. . . . The English-Spanish War had a basis to stand on in this Universe. The like had the Prussian-Austrian one; so all men now admit. If Friedrich had not business there, what man ever had in an enterprise he ventured on? Friedrich, after such trial and proof as has seldom been, got his claims on Schlesien [Silesia] allowed by the Destinies. . . . Friedrich had business in this War; and Maria Theresa versus Friedrich had likewise cause to appear in Court, and do her utmost pleading against him. But if we ask, What Belle-Isle or France and Louis XV. had to do there? the answer is rigorously Nothing. Their own windy vanities, ambitions, sanctioned not by fact and the Almighty Powers, but by Phantasm and the babble of Versailles; transcendent self-conceit, intrinsically insane; pretensions over their fellow-creatures which were without basis anywhere in Nature, except in the French brain; it was this that brought Belle-Isle and France into a German War. And Belle-Isle and France having gone into an Anti-Pragmatic War, the unlucky George and his England were dragged into a Pragmatic one,—quitting their own business, on the Spanish Main, and hurrying to Germany,—in terror as at Doomsday, and zeal to save the Keystone of Nature there. That is the notable point in regard to this War: That France is to be called the author of it, who, alone of all the parties, had no business there whatever.”—T. Carlyle, *History of Friedrich II.*, bk. 12, ch. 11 (v. 4).—See also FRANCE: 1733.

1741 (May-June).—Mission of Belle-Isle.—Thickening of the plot.—“The defeat of Maria Theresa's only army [at Mollwitz] swept away all the doubts and scruples of France. The fiery Belle-Isle had already set out upon his mission to

the various German courts, armed with powers which were reluctantly granted by the cardinal [Fleury, the French minister], and were promptly enlarged by the ambassador to suit his own more ambitious views of the situation. He travelled in oriental state. . . . The almost royal pomp with which he strode into the presence of princes of the blood, the copious eloquence with which he pleaded his cause, . . . were only the outward decorations of one of the most iniquitous schemes ever devised by an unscrupulous diplomacy. The scheme, when stripped of all its details, did not indeed at first appear absolutely revolting. It proposed simply to secure the election of Charles Albert of Bavaria as emperor, an honor to which he had a perfect right to aspire. But it was difficult to obtain the votes of certain electors without offering them the prospect of territorial gains, and impossible for Charles Albert to support the imperial dignity without greater revenues than those of Bavaria. It was proposed, therefore, that provinces should be taken from Maria Theresa herself, first to purchase votes against her own husband, and then to swell the income of the successful rival candidate. The three episcopal electors were first visited, and subjected to various forms of persuasion,—bribes, flattery, threats,—until the effects of the treatment began to appear; the count palatine was devoted to France; and these four with Bavaria made a majority of one. But that was too small a margin for Belle-Isle's aspirations, or even for the safety of his project. The four remaining votes belonged to the most powerful of the German states, Prussia, Hanover, Saxony and Bohemia. . . . Bohemia, if it voted at all, would of course vote for the grand-duke Francis [husband of Maria Theresa]. Saxony and Hanover were already negotiating with Maria Theresa; and it was well understood that Austria could have Frederick's support by paying his price." Austria refused to pay the price, and Frederick signed a treaty with the king of France at Breslau on June 4, 1741. "The essence of it was contained in four secret articles. In these the king of Prussia renounced his claim to Jülich-Berg in behalf of the house of Sulzbach, and agreed to give his vote to the elector of Bavaria for emperor. The king of France engaged to guarantee Prussia in the possession of Lower Silesia, to send within two months an army to the support of Bavaria, and to provoke an immediate rupture between Sweden and Russia."—H. Tuttle, *History of Prussia, 1740-1745, ch. 4.*

ALSO IN: W. Coxe, *History of the house of Austria, v. 3, ch. 99.*

1741 (June-September).—**Maria Theresa and the Hungarians.**—"During these anxious summer months Maria Theresa and the Austrian court had resided mainly at Pressburg, in Hungary. Here she had been occupied in the solution of domestic as well as international problems. The Magyars, as a manly and chivalrous race, had been touched by the perilous situation of the young queen; but, while ardently protesting their loyalty, insisted not the less on the recognition of their own inalienable rights. These had been inadequately observed in recent years, and in consequence no little disaffection prevailed in Hungary. The magnates resolved, therefore, as they had resolved at the beginning of previous reigns, to demand the restoration of all their rights and privileges. But it does not appear that they wished to take any ungenerous advantage of the sex or the necessities of Maria Theresa. They were argumentative and stubborn, yet not in a bargaining, mercenary spirit. They accepted in June a qualified compliance with their demands; and when on the 25th of that month the queen appeared before the diet to receive

the crown of St. Stephen, and, according to custom, waved the great sword of the kingdom toward the four points of the compass, toward the north and the south, the east and the west, challenging all enemies to dispute her right, the assembly was carried away by enthusiasm, and it seemed as if an end had forever been put to constitutional technicalities. Such was, however, not the case. After the excitement caused by the dramatic coronation had in a measure subsided, the old contentions revived, as bitter and vexatious as before. These concerned especially the manner in which the administration of Hungary should be adjusted to meet the new state of things. Should the chief political offices be filled by native Hungarians, as the diet demanded? Could the co-regency of the grand-duke, which was ardently desired by the queen, be accepted by the Magyars? For two months the dispute over these problems raged at Pressburg, until finally Maria Theresa herself found a bold, ingenious, and patriotic solution. The news of the Franco-Bavarian alliance and the fall of Passau determined her to throw herself completely upon the gallantry and devotion of the Magyars. It had long been the policy of the court of Vienna not to entrust the Hungarians with arms. . . . But Maria Theresa had not been robbed, in spite of her experience with France and Prussia, of all her faith in human nature. She took the responsibility of her decision, and the result proved that her insight was correct. On the 11th of September she summoned the members of the diet before her, and, seated on the throne, explained to them the perilous situation of her dominions. The danger, she said, threatened herself, and all that was dear to her. Abandoned by all her allies, she took refuge in the fidelity and the ancient valor of the Hungarians, to whom she entrusted herself, her children, and her empire. Here she broke into tears, and covered her face with her handkerchief. The diet responded to this appeal by proclaiming the 'insurrection' or the equipment of a large popular force for the defence of the queen. So great was the enthusiasm that it nearly swept away even the original aversion of the Hungarians to the grand-duke Francis, who, to the queen's delight, was finally, though not without some murmurs, accepted as co-regent. . . . This uprising was organized not an hour too early, for dangers were pressing upon the queen from every side."—H. Tuttle, *History of Prussia, 1740-1745, ch. 4.*

ALSO IN: Duc de Broglie, *Frederick the Great and Maria Theresa, v. 2, ch. 4.*

1741 (August-November).—**French-Bavarian onset.**—"France now began to act with energy. In the month of August [1741] two French armies crossed the Rhine, each about 40,000 strong. The first marched into Westphalia, and frightened George II. into concluding a treaty of neutrality for Hanover, and promising his vote to the Elector of Bavaria. The second advanced through South Germany on Passau, the frontier city of Bavaria and Austria. As soon as it arrived on German soil, the French officers assumed the blue and white cockade of Bavaria, for it was the cue of France to appear only as an auxiliary, and the nominal command of her army was vested in the Elector. From Passau the French and Bavarians passed into Upper Austria, and on Sept. 11 entered its capital, Linz, where the Elector assumed the title of Archduke. Five days later Saxony joined the allies. Sweden had already declared war on Russia. Spain trumped up an old claim and attacked the Austrian dominions in Italy. It seemed as if Belle-Isle's schemes were about to be crowned with complete success. Had the allies pushed forward,

Vienna must have fallen into their hands. But the French did not wish to be too victorious, lest they should make the Elector too powerful, and so independent of them. Therefore, after six weeks' delay, they turned aside to the conquest of Bohemia."—F. W. Longman, *Frederick the Great and the Seven Years' War*, ch. 4, sect. 4.—"While . . . a portion of the French troops, under the command of the Count de Ségur, was left in Upper Austria, the remainder of the allied army turned towards Bohemia; where they were joined by a body of Saxons, under the command of Count Rutowsky. They took Prague by assault, on the night of the 25th of November, while the Grand Duke of Tuscany, the husband of Maria Theresa, was marching to its relief. In Prague, 3,000 prisoners were taken. The elector of Bavaria hastened there, upon hearing of the success of his arms, was crowned King of Bohemia, during the month of December, and received the oath of fidelity from the constituted authorities. But while he was thus employed, the Austrian general, Khevenhüller, had driven the Count de Ségur out of Austria, and had himself entered Bavaria; which obliged the Bavarian army to abandon Bohemia and hasten to the defence of their own country."—Lord Dover, *Life of Frederick II.*, bk. 2, v. 1, ch. 2.

ALSO IN: Frederick II., *History of my own times* (*Posthumous works*, v. 1, ch. 5).

1741 (October).—Secret treaty with Frederick.—Lower Silesia conceded to him.—Austrian success.—"By October, 1741, the fortunes of Maria Theresa had sunk to the lowest ebb, but a great revulsion speedily set in. The martial enthusiasm of the Hungarians, the subsidy from England, and the brilliant military talents of General Khevenhüller, restored her armies. Vienna was put in a state of defence, and at the same time jealousies and suspicions made their way among the confederates. The Electors of Bavaria and Saxony were already in some degree divided; and the Germans, and especially Frederick, were alarmed by the growing ascendancy, and irritated by the haughty demeanour of the French. In the moment of her extreme depression, the Queen consented to a concession which England had vainly urged upon her before, and which laid the foundation of her future success. In October, 1741, she entered into a secret convention with Frederick [called the convention of Ober-Schnellendorf], by which that astute sovereign agreed to desert his allies, and desist from hostilities, on condition of ultimately obtaining Lower Silesia, with Breslau and Neisse. Every precaution was taken to ensure secrecy. It was arranged that Frederick should continue to besiege Neisse, that the town should ultimately be surrendered to him, and that his troops should then retire into winter quarters, and take no further part in the war. As the sacrifice of a few more lives was perfectly indifferent to the contracting parties, and in order that no one should suspect the treachery that was contemplated, Neisse, after the arrangement had been made for its surrender, was subjected for four days and four nights to the horrors of bombardment. Frederick, at the same time, talked, with his usual cynical frankness, to the English ambassador about the best way of attacking his allies the French; and observed, that if the Queen of Hungary prospered, he would perhaps support her, if not—everyone must look out for himself. He only assented verbally to this convention, and, no doubt, resolved to await the course of events, in order to decide which Power it was his interest finally to betray; but in the meantime the Austrians obtained a respite, which enabled them to throw their whole forces upon their other enemies. Two brilliant

campaigns followed. The greater part of Bohemia was recovered by an army under the Duke of Lorraine, and the French were hemmed in at Prague; while another army, under General Khevenhüller, invaded Upper Austria, drove 10,000 French soldiers within the walls of Linz, blockaded them, defeated a body of Bohemians who were sent to the rescue, compelled the whole French army to surrender, and then, crossing the frontier, poured in a resistless torrent over Bavaria. The fairest plains of that beautiful land were desolated by hosts of irregular troops from Hungary, Croatia, and the Tyrol; and on the 12th of February the Austrians marched in triumph into Munich. On that very day the Elector of Bavaria was crowned Emperor of Germany, at Frankfort, under the title of Charles VII, and the imperial crown was thus, for the first time, for many generations, separated from the House of Austria."—W. E. H. Lecky, *History of England*, 18th century, v. 1, ch. 3.

1741-1743.—Successes in Italy. See ITALY: 1741-1743.

1742 (January-May).—Frederick breaks faith again.—Battle of Chotusitz.—"The Queen of Hungary had assembled in the beginning of the year two considerable armies in Moravia and Bohemia, the one under Prince Lobkowitz, to defend the former province, and the other commanded by Prince Charles of Lorraine, her brother-in-law. This young Prince possessed as much bravery and activity as Frederick, and had equally with him the talent of inspiring attachment and confidence. . . . Frederick, alarmed at these preparations and the progress of the Austrians in Bavaria, abruptly broke off the convention of Ober-Schnellendorf, and recommenced hostilities. . . . The King of Prussia became apprehensive that the Queen of Hungary would again turn her arms to recover Silesia. He therefore dispatched Marshal Schwerin to seize Olmütz and lay siege to Glatz, which surrendered after a desperate resistance on the 9th of January. Soon after this event, the King rejoined his army, and endeavoured to drive the Austrians from their advantageous position in the southern parts of Bohemia, which would have delivered the French troops in the neighbourhood and checked the progress of Khevenhüller in Bavaria. The king advanced to Iglau, on the frontiers of Bohemia, and, occupying the banks of the Thaya, made irruptions into Upper Austria, his hussars spreading terror even to the gates of Vienna. The Austrians drew from Bavaria a corps of 10,000 men to cover the capital, while Prince Charles of Lorraine, at the head of 50,000 men, threatened the Prussian magazines in Upper Silesia, and by this movement compelled Frederick to detach a considerable force for their protection, and to evacuate Moravia, which he had invaded. Broglie, who commanded the French forces in that country, must now have fallen a sacrifice, had not the ever-active King of Prussia brought up 30,000 men, which, under the Prince of Anhalt-Dessau, entering Bohemia, came up with Prince Charles at Czaslau, about thirty-five miles from Prague, before he could form a junction with Prince Lobkowitz. Upon this ensued [May 17, 1742] what is known in history as the battle of Czaslau [also, and more commonly, called the battle of Chotusitz]. . . . The numbers in the two armies were nearly equal, and the action was warmly contested on both sides. . . . The Prussians remained masters of the field, with 18 cannon, two pairs of colours and 1,200 prisoners; but they indeed paid

dearly for the honour, for it was computed that their loss was equal to that of their enemy, which amounted to 7,000 men on either side; while the Prussian cavalry . . . was nearly ruined. . . . Although in this battle the victory was, without doubt, on the side of the Prussians, yet the immediate consequences were highly favourable to the Queen of Hungary. The King was disappointed of his expected advantages, and conceived a disgust to the war. He now lowered his demands and made overtures of accommodation, which, on the 11th of June, resulted in a treaty of peace between the two crowns, which was signed at Breslau under the mediation of the British Ambassador."—Sir E. Cust, *Annals of the wars of the 18th century*, v. 2, p. 19.

ALSO IN: T. Carlyle, *History of Friedrich II. of Prussia*, bk. 13, v. 5, ch. 13.

1742 (June).—Treaty of Breslau with the king of Prussia.—"The following are the preliminary articles which were signed at Breslau: 1. The queen of Hungary ceded to the king of Prussia, Upper and Lower Silesia, with the principality of Glatz; except the towns of Troppau, Jaegerndorf and the high mountains situated beyond the Oppa. 2. The Prussians undertook to repay the English 1,700,000 crowns; which sum was a mortgage loan on Silesia. The remaining articles related to a suspension of arms, an exchange of prisoners, and the freedom of religion and trade. Thus was Silesia united to the Prussian States. Two years were sufficient for the conquest of that important province. The treasures which the late king had left were almost expended; but provinces that do not cost more than seven or eight millions are cheaply purchased."—Frederick II., *History of my own times* (Posthumous works, v. 1, ch. 6).

1742 (June-December).—Expulsion of the French from Bohemia.—Belle-Isle's retreat from Prague.—"The Austrian arms began now to be successful in all quarters. Just before the signature of the preliminaries, Prince Lobkowitz, who was stationed at Budweiss with 10,000 men, made an attack on Frauenberg; Broglie and Belle-Isle advanced from Piseck to relieve the town, and a combat took place at Sabay, in which the Austrians were repulsed with the loss of 500 men. This trifling affair was magnified into a decisive victory. . . . Marshal Broglie, elated with this advantage, and relying on the immediate junction of the King of Prussia, remained at Frauenberg in perfect security. But his expectations were disappointed; Frederic had already commenced his secret negotiations, and Prince Charles was enabled to turn his forces against the French. Being joined by Prince Lobkowitz, they attacked Broglie, and compelled him to quit Frauenberg with such precipitation that his baggage fell into the hands of the light troops, and the French retreated towards Braunau, harassed by the Croats and other irregulars. . . . The Austrians, pursuing their success against the French, drove Broglie from Braunau, and followed him to the walls of Prague, where he found Belle-Isle. . . . After several consultations, the two generals called in their posts, and secured their army partly within the walls and partly within a peninsula of the Moldau. . . . Soon afterwards the duke of Lorraine joined the army [of Prince Charles], which now amounted to 70,000 men, and the arrival of the heavy artillery enabled the Austrians to commence the siege."—W. Coxe, *History of the house of Austria*, v. 3, ch. 102.—"To relieve the French at Prague, Marshal Maillehois was directed to advance with his army from Westphalia. At these tidings Prince Charles changed the siege of Prague to a blockade, and marching against his new opponents,

checked their progress on the Bohemian frontier; the French, however, still occupying the town of Eger. It was under these circumstances that Belle-Isle made his masterly and renowned retreat from Prague. In the night of the 16th of December, he secretly left the city at the head of 11,000 foot and 3,000 horse, having deceived the Austrians' vigilance by the feint of a general forage in the opposite quarter; and pushed for Eger through a hostile country, destitute of resources and surrounded by superior enemies. His soldiers, with no other food than frozen bread, and compelled to sleep without covering on the snow and ice, perished in great numbers; but the gallant spirit of Belle-Isle triumphed over every obstacle; he struck through morasses almost untrodden before, offered battle to Prince Lobkowitz, who, however, declined engaging, and at length succeeded in reaching the other French army with the flower of his own. The remnant left at Prague, and amounting only to 6,000 men, seemed an easy prey; yet their threat of firing the city, and perishing beneath its ruins, and the recent proof of what despair can do, obtained for them honourable terms, and the permission of rejoining their comrades at Eger. But in spite of all this skill and courage in the French invaders, the final result to them was failure; nor had they attained a single permanent advantage beyond their own safety in retreat. Maillehois and De Broglie took up winter quarters in Bavaria, while Belle-Isle led back his division across the Rhine; and it was computed that, of the 35,000 men whom he had first conducted into Germany, not more than 8,000 returned beneath his banner."

—Lord Mahon (Earl Stanhope), *History of England*, 1713-1783, v. 3, ch. 24.—"Thus, at the termination of the campaign, all Bohemia was regained, except Eger; and on the 12th of May, 1743, Maria Theresa was soon afterwards crowned at Prague, to the recovery of which, says her great rival, her firmness had more contributed than the force of her arms. The only reverse which the Austrians experienced in the midst of their successes was the temporary loss of Bavaria, which, on the retreat of Kevenhüller, was occupied by Marshal Seckendorff; and the [German] Emperor [Charles VII.] made his entry into Munich on the 2d of October."—W. Coxe, *History of the House of Austria*, v. 3, ch. 103.

1743.—England drawn into the conflict.—Pragmatic army.—Battle of Dettingen.—"The cause of Maria Theresa had begun to excite a remarkable enthusiasm in England. . . . The convention of neutrality entered into by George II. in September 1741, and the extortion of his vote for the Elector of Bavaria, properly concerned that prince only as Elector of Hanover; yet, as he was also King of England, they were felt as a disgrace by the English people. The elections of that year went against Walpole, and in February 1742 he found himself compelled to resign. He was succeeded in the administration by Pulteney, Earl of Bath, though Lord Carteret was virtually prime minister. Carteret was an ardent supporter of the cause of Maria Theresa. His accession to office was immediately followed by a large increase of the army and navy; five millions were voted for carrying on the war, and a subsidy of £500,000 for the Queen of Hungary. The Earl of Stair, with an army of 16,000 men, afterwards reinforced by a large body of Hanoverians and Hessians in British pay, was despatched into the Netherlands to cooperate with the Dutch. But though the States-General, at the instance of the British Cabinet, voted Maria Theresa a subsidy, they were not yet prepared to take an active part in a war which might ultimately involve them in hostilities

with France. The exertions of the English ministry in favour of the Queen of Hungary had therefore been confined during the year 1742 to diplomacy, and they had helped to bring about . . . the Peace of Breslau. In 1743 they were able to do more." In April, 1743, the Emperor, Charles VII., regained possession of Bavaria and returned to Munich, but only to be driven out again by the Austrians in June. The Bavarians were badly beaten at Simbach (May 9), and Munich was taken (June 12) after a short bombardment. "Charles VII. was now again obliged to fly, and took refuge at Augsburg. At his command, Seckendorf [his general] made a convention with the Austrians at the village of Niederschönfeld, by which he agreed to abandon to them Bavaria, on condition that Charles's troops should be allowed to occupy unmolested quarters between Franconia and Suabia. Maria Theresa seemed at first indispensed to ratify even terms so humiliating to the Emperor. She had become perhaps a little too much exalted by the rapid turn of fortune. She had caused herself to be crowned in Prague. She had received the homage of the Austrians, and entered Vienna in a sort of triumph. She now dreamt of nothing less than conquering Lorraine for herself, Alsace for the Empire; of hurling Charles VII. from the Imperial throne, and placing on it her own consort." She was persuaded, however, to consent at length to the terms of the Niederschönfeld convention. "Meanwhile the allied army of English and Germans, under the Earl of Stair, nearly 40,000 strong, which, from its destined object, had assumed the name of the 'Pragmatic Army,' had crossed the Meuse and the Rhine in March and April, with a view to cut off the army of Bavaria from France. George II. had not concealed his intention of breaking the Treaty of Hanover of 1741, alleging as a ground that the duration of the neutrality stipulated in it had not been determined; and on June 10th he had joined the army in person. He found it in a most critical position. Lord Stair, who had never distinguished himself as a general, and was now falling into dotage, had led it into a narrow valley near Aschaffenburg, between Mount Spessart and the river Main; while Marshal Noailles [commanding the French], who had crossed the Rhine towards the end of April, by seizing the principal fords of the Main, both above and below the British position, had cut him off both from his magazines at Hanau, and from the supplies which he had expected to procure in Franconia. Nothing remained but for him to fight his way back to Hanau." In the battle of Dettingen which followed (June 27), all the advantages of the French in position were thrown away by the ignorant impetuosity of the king's nephew, the duke of Grammont, who commanded one division, and they suffered a severe defeat. "The French are said to have lost 6,000 men and the British half that number. It is the last action in which a king of England had fought in person. But George II., or rather Lord Stair, did not know how to profit by his victory. Although the Pragmatic Army was joined after the battle of Dettingen by 15,000 Dutch troops, under Prince Maurice of Nassau, nothing of importance was done during the remainder of the campaign."—T. H. Dyer, *History of modern Europe*, bk. 6, v. 3, ch. 4.

1743-1744.—Prussian king strikes in again.—Union of Frankfurt.—Siege and capture of Prague.—"Everywhere Austria was successful, and Frederick had reason to fear for himself unless the tide of conquest could be stayed. He explains in the 'Histoire de Mon Temps' that he feared lest France should abandon the cause of the Emperor, which would mean that the Austrians, who now boldly spoke of compensation for the war, would turn their arms against himself. . . . France was trembling, not for her conquests, but for her own territory. After the battle of Dettingen, the victorious Anglo-Hanoverian force was to cross the Rhine above Mayence and march into Alsace, while Prince Charles of Lorraine, with a strong Austrian army, was to pass near Basle and occupy Lorraine, taking up his winter quarters in Burgundy and Champagne. The English crossed without any check and moved on to Worms, but the Austrians failed in their attempt. Worms became a centre of intrigue, which Frederick afterwards called 'Cette abyme [abime] de mauvaise foi.' The Dutch were persuaded by Lord Carteret to join the English, and they did at last send 14,000 men, who were never of the least use. Lord Carteret also detached Charles Emanuel, King of Sardinia, from his French leanings, and persuaded him to enter into the Austro-English alliance [by the treaty of Worms, September 13, 1743, which conceded to the king of Sardinia Finale, the city of Placentia, with some other small districts and gave him command of the allied forces in Italy]. It was clear that action could not be long postponed, and Frederick began to recognize the necessity of a new war. His first anxiety was to guard himself against interference from his northern and eastern neighbours. He secured, as he hoped, the neutrality of Russia by marrying the young princess of Anhalt-Zerbst, afterwards the notorious Empress Catherine, with the Grand-Duke Peter of Russia, nephew and heir to the reigning Empress Elizabeth. . . . Thus strengthened, as he hoped, in his rear and flank, and having made the commencement of a German league called the Union of Frankfurt, by which Hesse and the Palatinate agreed to join Frederick and the Kaiser, he concluded on the 5th of June, 1744, a treaty which brought France also into this alliance. It was secretly agreed that Frederick was to invade Bohemia, conquer it for the Kaiser, and have the districts of Königgrätz, Bunzlau, and Leitmeritz to repay him for his trouble and costs; while France, which was all this time at war with Austria and England, should send an army against Prince Charles and the English. . . . The first stroke of the coming war was delivered by France. Louis XV. sent a large army into the Netherlands under two good leaders, Noailles and Maurice de Saxe. Urged by his mistress, the Duchesse de Château-roux, he joined it himself early, and took the nominal command early in June. . . . The towns [Menin, Ypres, Fort Knoque, Furnes] rapidly fell before him, and Marshal Wade, with the Anglo-Dutch-Hanoverian army, sat still and looked at the success of the French. But on the night of the 30th June—1st July, Prince Charles crossed the Rhine by an operation which is worth the study of military students, and invaded Alsace, the French army of observation falling back before him. Louis XV. hurried back to interpose between the Austrians and Paris. . . . Maurice de Saxe was left in the Netherlands with 45,000 men. Thus the French army was paralysed, and the Austrian army in its turn was actually invading France. At this time Frederick struck in. He sent word to the King

that, though all the terms of their arrangement had not yet been fulfilled, he would at once invade Bohemia, and deliver a stroke against Prague which would certainly cause the retreat of Prince Charles with his 70,000 men. If the French army would follow Prince Charles in his retreat, Frederick would attack him, and between France and Prussia the Austrian army would certainly be crushed, and Vienna be at their mercy. This was no doubt an excellent plan of campaign, but, like the previous operations concerted with Broglie, it depended for success upon the good faith of the French, and this turned out to be a broken reed. On the 7th of August the Prussian ambassador at Vienna gave notice of the Union of Frankfurt and withdrew from the court of Austria; and on the 15th the Prussian army was put in march upon Prague [opening what is called the Second Silesian War]. Frederick's forces moved in three columns, the total strength being over 80,000. . . . Maria Theresa was now again in great danger, but as usual retained her high courage, and once more called forth the enthusiasm of her Hungarian subjects, who sent swarms of wild troops, horse and foot, to the seat of war. . . . On the 1st of September the three columns met before Prague, which had better defences than in the last campaign, and a garrison of some 16,000 men. . . . During the night of the 9th the bombardment commenced. . . . and on the 16th the garrison surrendered. Thus, one month after the commencement of the march Prague was captured, and the campaign opened with a brilliant feat of arms."—Col. C. B. Brackenbury, *Frederick the Great*, ch. 7.

1744-1745.—Frederick's retreat and fresh triumph.—Austria recovers the imperial crown.—Saxony subdued.—Peace of Dresden.—After the reduction of Prague, Frederick, "in deference to the opinion of Marshal Belle-Isle, but against his own judgment, advanced into the south of Bohemia with the view of threatening Vienna. He thus exposed himself to the risk of being cut off from Prague. Yet even so he would probably have been able to maintain himself if the French had fulfilled their engagements. But while he was conquering the districts of the Upper Moldau, the Austrian army returned unimpaired from Alsace. The French had allowed it to cross the Rhine unmolested, and had not made the slightest attempt to harass its retreat [but applied themselves to the siege and capture of Freiburg]. They were only too glad to get rid of it themselves. In the ensuing operations Frederick was completely outmanoeuvred. Traun [the Austrian general], without risking a battle, forced him back towards the Silesian frontier. He had to choose between abandoning Prague and abandoning his communications with Silesia, and as the Saxons had cut off his retreat through the Electorate, there was really no choice in the matter. So he fell back on Silesia, abandoning Prague and his heavy artillery. The retreat was attended with considerable loss. Frederick was much struck with the skill displayed by Traun, and says, in his 'Histoire de mon Temps,' that he regarded this campaign as his school in the art of war and M. de Traun as his teacher. The campaign may have been an excellent lesson in the art of war, but in other respects it was very disastrous to Frederick. He had drawn upon himself the whole power of Austria, and had learnt how little the French were to be depended upon. His prestige was dimmed by failure, and even in his own army doubts were entertained of his

capacity. But, bad as his position already was, it became far worse when the unhappy Emperor died [Jan. 20, 1745], worn out with disease and calamity. This event put an end to the Union of Frankfurt. Frederick could no longer claim to be acting in defence of his oppressed sovereign; the ground was cut from under his feet. Nor was there any longer much hope of preventing the Imperial Crown from reverting to Austria. The new Elector of Bavaria was a mere boy. In this altered state of affairs he sought to make peace. But Maria Theresa would not let him off so easily. In order that she might use all her forces against him, she granted peace to Bavaria, and gave back to the young elector his hereditary dominions, on condition of his resigning all claim to hers and promising to vote for her husband as Emperor. While Frederick thus lost a friend in Bavaria, Saxony threw herself completely into the arms of his enemy, and united with Austria in a treaty [May 18] which had for its object, not the reconquest of Silesia merely, but the partition of Prussia and the reduction of the king to his ancient limits as Margrave of Brandenburg. Saxony was then much larger than it is now, but it was not only the number of troops it could send into the field that made its hostility dangerous. It was partly the geographical position of the country, which made it an excellent base for operations against Prussia, but still more the alliance that was known to subsist between the Elector (King Augustus III. of Poland) and the Russian Court. It was probable that a Prussian invasion of Saxony would be followed by a Russian invasion of Prussia. Towards the end of May, the Austrian and Saxon army, 75,000 strong, crossed the Giant Mountains and descended upon Silesia. The Austrians were again commanded by Prince Charles, but the wise head of Traun was no longer there to guide him. . . . The encounter took place at Hohenfriedberg [June 5], and resulted in a complete victory for Prussia. The Austrians and Saxons lost 9,000 killed and wounded, and 7,000 prisoners, besides 66 cannons and 73 flags and standards. Four days after the battle they were back again in Bohemia. Frederick followed, not with the intention of attacking them again, but in order to eat the country bare, so that it might afford no sustenance to the enemy during the winter. For his own part he was really anxious for peace. His resources were all but exhausted, while Austria was fed by a constant stream of English subsidies. As in the former war, England interposed with her good offices, but without effect; Maria Theresa was by no means disheartened by her defeat, and refused to hear of peace till she had tried the chances of battle once more. On Sept. 13 her husband was elected Emperor by seven votes out of nine, the dissentients being the King of Prussia and the Elector Palatine. This event raised the spirits of the Empress-Queen, as Maria Theresa was henceforward called, and opened a wider field for her ambition. She sent peremptory orders to Prince Charles to attack Frederick before he retired from Bohemia. A battle was accordingly fought at Sohr [Sept. 30], and again victory rested with the Prussians. The season was now far advanced, and Frederick returned home expecting that there would be no more fighting till after the winter. Such, however, was far from being the intention of his enemies." A plan for the invasion of Brandenburg by three Austrian and Saxon armies, simultaneously, was secretly concerted; but Frederick had timely warning of it and it was frustrated by his activity and energy. On the 23d of November he surprised and defeated Prince Charles at Hennersdorf. "Some three weeks afterwards [Dec.

15] the Prince of Dessau defeated a second Saxon and Austrian army at Kesselsdorf, a few miles from Dresden. This victory completed the subjugation of Saxony and put an end to the war. Three days after Kesselsdorf, Frederick entered Dresden, and astonished every one by the graciousness of his behaviour and by the moderation of his terms. From Saxony he exacted no cession of territory, but merely a contribution of 1,000,000 thalers (£150,000) towards the expenses of the war. From Austria he demanded a guarantee of the treaty of Breslau, in return for which he agreed to recognize Francis as Emperor. Peace was signed [at Dresden] on Christmas Day.—F. W. Longman, *Frederick the Great and the Seven Years War*, ch. 5.

1745 (September-October).—Consort of Maria Theresa elected and crowned emperor.—Rise of the new House of Hapsburg-Lorraine.—Francis of Lorraine, grand duke of Tuscany and husband of Maria Theresa, was elected emperor, at Frankfurt, Sept. 13, 1745, and crowned Oct. 1, with the title of Francis I. "Thus the Empire returned to the New House of Austria, that of Hapsburg-Lorraine, and France had missed the principal object for which she had gone to war." By the treaties signed at Dresden, Dec. 25, between Prussia, Austria and Saxony, Frederick, as elector of Brandenburg, assented to and recognized the election of Francis, against which he and the elector palatine had previously protested.—T. H. Dyer, *History of modern Europe*, bk. 6, v. 3, ch. 4.

1765-1790.—Joseph II, the enlightened despot.—"The prince who best sums up the spirit of the century is not Frederic [the Great, of Prussia], it is Joseph II. [the emperor]. Frederic was born a master, Joseph II. a disciple, and it is by disciples that we judge schools. The king of Prussia dammed up the waters, directed their flow, made use of the current; the emperor cast himself upon them and permitted himself to be carried. With Frederic the statesman always dominates, it is he who proposes and finally decides; the philosopher is subordinate. . . . With Joseph II. rational conception precedes political calculation and governs it. He had breadth of mind, but his mind was superficial; ideas slipped from it. He had a taste for generosity, a passion for grandeur; but there was nothing profound in him but ambition, and it was all counter-stroke and reflection. He wished to surpass Frederic; his entire conduct was but an awkward, imprudent and ill-advised imitation of this prince whom he had made his hero, whom history made his rival and whom he copied while detesting him. The political genius of Frederic was born of good sense and moderation; there was nothing in Joseph II. but the immoderate. He was a man of systems; he had only great velleities. His education was mediocre, and, as to methods,

entirely jesuitical. Into this contracted mould he cast confusedly notions hastily borrowed from the philosophers of France, from the economists especially. He thus formed a very vague ideal of political aspirations and an exaggerated sense of the power at his disposition to realize them. 'Since I ascended the throne and have worn the first crown of the world,' wrote he in 1781, 'I have made Philosophy the lawmaker of my empire. Her logical applications are going to transform Austria.' He undertakes reforms in every direction at once. History is null for him, traditions do not count, nor do facts acquired. There is no race, nor period, nor surrounding circumstances: there is the State which is everything and can do everything. He writes in 1782, to the bishop of Strasbourg: 'In a kingdom governed conformably to my principles, prejudice, fanaticism, bondage of mind must disappear, and each of my subjects must be reinstated in the possession of his natural rights.' He must have unity, and, as a first condition, the rejection of all previous ideas. Chance makes him operate on a soil the most heterogeneous, the most incoherent, the most cut up, parceled out and traversed by barriers, that there is in Europe. Nothing in common among his subjects, neither language, nor traditions, nor interests. It is from this, according to him, that the defect of monarchy arises. 'The German language is the universal language of my empire. I am the emperor of Germany, the states which I possess are provinces which form but one body with the State of which I am the head. If the kingdom of Hungary were the most important of my possessions, I should not hesitate to impose its tongue on the other countries.' So he imposes the German language on the Hungarians, the Croats, the Tchêques [Czechs], the Poles, on all the Slavs. He suppresses the ancient territorial divisions; they recall the successive agglomerations, the irregular alluvions which had formed the monarchy; he establishes thirteen governments and divides them into circles. The diets disappear; the government passes into the hands of intendants according to the French formula. In the cities the burgomaster appointed by the government becomes a functionary. The nobles lose the part, already much curtailed, that they still had, here and there, in the government. He taxes them, he taxes the ecclesiastics; he meditates establishing a tax proportional to incomes and reaching all classes. He protects the peasants, alleviates serfdom, diminishes the corvées, builds hospitals, schools above all, in which the state will form pupils to obey her. His ideal would be the equality of his subjects under the uniform sway of his government. He unifies the laws; he institutes courts of appeal with a supreme court for the entire empire. He makes regulations for manufactures, binds commerce to the most rigorous protective system. Finally he puts a high hand on the church and decrees tolerance. . . . This immense revolution was accomplished by means of decrees, in less than five years. If we compare the state of cohesion which the Bourbon government had brought about in France in 1780, with the incoherence of the Austrian monarchy on the death of Maria Theresa in 1780, it will be seen that the revolution which caused the Constituent Assembly was a small matter compared with that which Joseph II. intended to effect."—A. Sorci, *L'Europe et la révolution française* (trans. from the French), pt. I, pp. 119-122.

1790-1797.—Death of Joseph II and Leopold II.—Accession of Francis II.—Coalition against and war with revolutionary France, to the peace of Campo Formio.—“It is a mistake to imagine that the European Powers attacked the Revolution in France. It was the Revolution which attacked them. The diplomatists of the 18th century viewed at first with cynical indifference the meeting of the States-General at Versailles. . . . The two points which occupied the attention of Europe in 1789 were the condition of Poland and the troubles in the East. The ambitious designs of Catherine and the assistance lent to them by Joseph threatened the existence of the Turkish Empire, irritated the Prussian Court, and awakened English apprehensions, always sensitive about the safety of Stamboul. Poland, the battlefield of cynical diplomacy, torn by long dissensions and ruined by a miserable constitution, was vainly endeavouring, under the jealous eyes of her great neighbours, to avert the doom impending, and to reassert her ancient claim to a place among the nations of the world. But Russia had long since determined that Poland must be a vassal State to her or cease to be a State at all, while Prussia, driven to face a hard necessity, realised that a strong Poland and a strong Prussia could not exist together, and that if Poland ever rose again to power, Prussia must bid good-bye to unity and greatness. These two questions to the States involved seemed to be of far more moment than any political reform in France, and engrossed the diplomatists of Europe until the summer of 1791. In February, 1790, a new influence was introduced into European politics by the death of the Emperor Joseph and the accession of his brother, Leopold II. Leopold was a man of remarkable ability, no enthusiast and no dreamer, thoroughly versed in the selfish traditions of Austrian policy and in some of the subtleties of Italian statecraft, discerning, temperate, resolute and clear-headed, quietly determined to have his own way, and generally skilful enough to secure it. Leopold found his new dominions in a state of the utmost confusion, with war and rebellion threatening him on every side. He speedily set about restoring order. He repealed the unpopular decrees of Joseph. He conciliated or repressed his discontented subjects. He gradually re-established the authority of the Crown. . . . Accordingly, the first eighteen months of Leopold's reign were occupied with his own immediate interests, and at the end of that time his success was marked. Catherine's vast schemes in Turkey had been checked. War had been averted. Poland had been strengthened by internal changes. Prussia had been conciliated and outmanœuvred, and her influence had been impaired. At last, at the end of August, 1791, the Emperor was free to face the French problem, and he set out for the Castle of Pillnitz to meet the King of Prussia and the Emigrant leaders at the Saxon Elector's Court. For some time past the restlessness of the French Emigrants had been causing great perplexity in Europe. Received with open arms by the ecclesi-

astical princes of the Rhine, by the Electors of Mayence and Trèves, they proceeded to agitate busily for their own restoration. . . . The object of the Emigrants was to bring pressure to bear at the European Courts, with the view of inducing the Powers to intervene actively in their behalf. . . . After his escape from France in June, 1790, the Comte de Provence established his Court at Coblenz, where he was joined by his brother the Comte d'Artois, and where, on the plea that Louis was a prisoner, he claimed the title of Regent, and assumed the authority of King. The Court of the two French princes at Coblenz represented faithfully the faults and follies of the Emigrant party. But a more satisfactory spectacle was offered by the camp at Worms, where Condé was bravely trying to organise an army to fight against the Revolution in France. To Condé's standard flocked the more patriotic Emigrants. . . . But the German Princes in the neighbourhood looked with disfavour on the Emigrant army. [See also GERMANY: 1791-1792.] It caused confusion in their dominions, and it drew down on them the hostility of the French Government. The Emperor joined them in protesting against it. In February, 1792, Condé's army was compelled to abandon its camp at Worms, and to retire further into Germany. The Emperor was well aware of the reckless selfishness of the Emigrant princes. He had as little sympathy with them as his sister. He did not intend to listen to their demands. If he interfered in France at all, it would only be in a cautious and tentative manner, and in order to save Marie Antoinette and her husband. Certainly he would not undertake a war for the restoration of the Ancien Régime. . . . Accordingly, the interviews at Pillnitz came to nothing. [See also PILLNITZ, DECLARATION OF.] . . . Early in March, 1792, Leopold suddenly died. His heir Francis, unrestrained by his father's tact and moderation, assumed a different tone and showed less patience. The chances of any effective pressure from the Powers declined, as the prospect of war rose on the horizon. Francis' language was sufficiently sharp to give the Assembly the pretext which it longed for, and on the 20th April, Louis, amid general enthusiasm, came down to the Assembly and declared war against Austria. The effects of that momentous step no comment can exaggerate. It ruined the best hopes of the Revolution, and prepared the way for a military despotism in the future.”—C. E. Mallet, *French Revolution*, ch. 7. 1798-1806.—Congress of Rastadt.—Second coalition against France.—Peace of Lunéville.—Third coalition.—Ulm and Austerlitz.—Peace of Pressburg.—Extinction of the Holy Roman empire.—Birth of the empire of Austria.—“When

Bonaparte sailed for Egypt he had left a congress at Rastadt discussing means for the execution of certain articles in the treaty of Campo Formio which were to establish peace between France and the Empire. . . . Though openly undertaking to invite the Germans to a congress in order to settle a general peace on the basis of the integrity of the Empire, the Emperor agreed in secret articles to use his influence to procure for the Republic the left bank of the Rhine with the exception of the Prussian provinces, to join with France in obtaining compensation in Germany for those injured by this change, and to contribute no more than his necessary contingent if the war were prolonged. The ratification of these secret provisions had been extorted from the Congress by threats before Bonaparte had left; but the question of indemnification had progressed no farther than a decision to secularise the ecclesiastical states for the purpose, when extravagant demands from the French deputies brought negotiation to a deadlock. Meanwhile, another coalition war had been brewing. Paul I. of Russia had regarded with little pleasure the doings of the Revolution, and when his protégés, the knights of St. John of Jerusalem, had been deprived of Malta by Bonaparte on his way to Egypt, when the Directory established by force of arms a Helvetic republic in Switzerland, when it found occasion to carry off the Pope into exile and erect a Roman republic, he abandoned the cautious and self-seeking policy of Catherine, and cordially responded to Pitt's advances for an alliance. At the same time Turkey was compelled by the invitation of Egypt to ally itself for once with Russia. Austria, convinced that the French did not intend to pay a fair price for the treaty of Campo Formio, also determined to renew hostilities; and Naples, exasperated by the sacrilege of a republic at Rome, and alarmed by French aggressiveness, enrolled itself in the league. The Neapolitan king, indeed, opened the war with some success, before he could receive support from his allies; but he was soon vanquished by the French, and his dominions were converted into a Parthenopean republic. Austria, on the contrary, awaited the arrival of the Russian forces; and the general campaign began early in 1799. The French, fighting against such generals as the Archduke Charles and the Russian Suvaroff, without the supervision of Carnot or the strategy and enterprise of Bonaparte, suffered severe reverses and great privations. Towards the end the Russian army endured much hardship on account of the selfishness of the Austrian cabinet; and this caused the Tsar, who thought he had other reasons for discontent, to withdraw his troops from the field. When Bonaparte was made First Consul the military position of France was, nevertheless, very precarious. . . . The Roman and Cisalpine republics had fallen. The very congress at Rastadt had been dispersed by the approach of the Austrians; and the French emissaries had been sabred by Austrian troopers, though how their insolence came to be thus foully punished has never been clearly explained. At this crisis France was rescued from foreign foes and domestic disorders by its most successful general. . . . In the campaign which followed, France obtained signal satisfaction for its chagrin. Leaving Moreau to carry the war into Germany, Bonaparte suddenly crossed the Alps, and defeated the Austrians on the plain of Marengo. The Austrians, though completely cowed, refrained from concluding a definite peace out of respect for their engagements with England; and armistices, expiring into desultory warfare, prolonged the contest till Moreau laid the way open to Vienna, by winning a splendid

triumph at Hohenlinden. A treaty of peace was finally concluded at Lunéville, when Francis II. pledged the Empire to its provisions on the ground of the consents already given at Rastadt. In conformity with the treaty of Campo Formio, Austria retained the boundary of the Adige in Italy; France kept Belgium and the left bank of the Rhine; and the princes, dispossessed by the cessions, were promised compensation in Germany; while Tuscany was given to France to sell to Spain at the price of Parma, Louisiana, six ships of the line, and a sum of money. Shortly afterwards peace was extended to Naples on easy terms. . . . The time was now come for the Revolution to complete the ruin of the Holy Roman Empire. Pursuant to the treaty of Lunéville, the German Diet met at Ragensburg to discuss a scheme of compensation for the dispossessed rulers. Virtually the meeting was a renewal of the congress of Rastadt. . . . At Rastadt the incoherence and disintegration of the venerable Empire had become painfully apparent. . . . When it was known that the head of the nation, who had guaranteed the integrity of the Empire in the preliminaries of Leoben, and had renewed the assurance when he convoked the assembly, had in truth betrayed to the stranger nearly all the left bank of the Rhine—the German rulers greedily hastened to secure every possible trifle in the scramble of redistribution. The slow and wearisome debates were supplemented by intrigues of the most degraded nature. Conscious that the French Consul could give a casting vote on any disputed question, the princes found no indignity too shameful, no trick too base, to obtain his favour. . . . The First Consul, on his side, prosecuted with a duplicity and address, heretofore unequalled, the traditional policy of France in German affairs. . . . Feigning to take into his counsels the young Tsar, whose convenient friendship was thus easily obtained on account of his family connections with the German courts, he drew up a scheme of indemnification and presented it to the Diet for endorsement. In due time a servile assent was given to every point which concerned the two autocrats. By this settlement, Austria and Prussia were more equally balanced against one another, the former being deprived of influence in Western Germany, and the latter finding in more convenient situations a rich recompense for its cessions on the Rhine; while the middle states, Bavaria, Baden, and Würtemberg, received very considerable accessions of territory. But if Bonaparte dislocated yet further the political structure of Germany, he was at least instrumental in removing the worst of the anachronisms which stifled the development of improved institutions among a large division of its people. The same measure which brought German separatism to a climax, also extinguished the ecclesiastical sovereignties and nearly all the free cities. That these strongholds of priestly obscurantism and bourgeois apathy would some day be invaded by their more ambitious and active neighbours, had long been apparent. . . . And war was declared when thousands of British subjects visiting France had already been ensnared and imprisoned. . . . Pitt had taken the conduct of the war out of the hands of Addington's feeble ministry. Possessing the confidence of the powers, he rapidly concluded offensive alliances with Russia, Sweden, and Austria, though Prussia obstinately remained neutral. Thus, by 1805, Napoleon had put to hazard all his lately won power in a conflict with the greater part of Europe. The battle of Cape Trafalgar [1805] crushed for good his maritime power, and rendered England safe from direct attack. The campaign on land, however, made him master of central Europe.

Bringing the Austrian army in Germany to an inglorious capitulation at Ulm, he marched through Vienna, and, with inferior forces won in his best style the battle of Austerlitz against the troops of Francis and Alexander. The action was decisive. The allies thought not of renewing the war with the relays of troops which were hurrying up from North and South. Russian and Austrian alike wished to be rid of their ill-fated connection. The Emperor Alexander silently returned home, pursued only by Napoleon's flattering tokens of esteem; the Emperor Francis accepted the peace of Pressburg, which deprived his house of the ill-gotten Venetian States, Tyrol, and its more distant possessions in Western Germany; the King of Prussia, who had been on the point of joining the coalition with a large army if his mediation were unsuccessful, was committed to an alliance with the conqueror by his terrified negotiator. And well did Napoleon appear to make the fruits of victory compensate France for its exertions. The empire was not made more unwieldy in bulk, but its dependents, Bavaria, Würtemberg, and Baden, received considerable accessions of territory, and the two first were raised to the rank of kingdoms; while the Emperor's Italian principality, which he had already turned into a kingdom of Italy to the great disgust of Austria, was increased by the addition of the ceded Venetian lands. But the full depth of Europe's humiliation was not experienced till the two following years. In 1806 an Act of Federation was signed by the kings of Bavaria and Würtemberg, the Elector of Baden, and thirteen minor princes, which united them into a league under the protection of the French Emperor. The objects of this confederacy, known as the Rheinbund were defence against foreign aggression and the exercise of complete autonomy at home. . . . Already the consequences of the Peace of Lunéville had induced the ruling Hapsburg to assure his equality with the sovereigns of France and Russia by taking the imperial title in his own right; and before the Confederation of the Rhine was made public he formally renounced his office of elective Emperor of the Holy Roman Empire and released from allegiance to him all the states and princes of the Reich. The triumph of the German policy of the Consulate was complete."—A. Weir, *Historical basis of modern Europe*, ch. 4.—See also FRANCE: 1798-1799, to 1805; and GERMANY: 1801-1803, to 1805-1806.

1809-1814.—Second struggle with Napoleon and the second defeat.—Marriage alliance.—Germanic War of Liberation.—Final alliance and the overthrow of Napoleon.—"On the 12th of July, 1806, fourteen princes of the south and west of Germany united themselves into the confederation of the Rhine, and recognised Napoleon as their protector. On the 1st of August, they signified to the diet of Ratisbon their separation from the Germanic body. The Empire of Germany ceased to exist, and Francis II. abdicated the title by proclamation. By a convention signed at Vienna, on the 15th of December, Prussia exchanged the territories of Anspach, Cleves and Neufchâtel for the electorate of Hanover. Napoleon had all the west under his power. Absolute master of France and Italy, as emperor and king, he was also master of Spain, by the dependence of that court; of Naples and Holland, by his two brothers; of Switzerland, by the act of mediation; and in Germany he had at his disposal the kings of Bavaria and Würtemberg, and the confederation of the Rhine against Austria and Prussia. . . . This encroaching progress gave rise to the fourth

coalition. Prussia, neutral since the peace of Bâle, had, in the last campaign, been on the point of joining the Austro-Russian coalition. The rapidity of the emperor's victories had alone restrained her; but now, alarmed at the aggrandizement of the empire, and encouraged by the fine condition of her troops, she leagued with Russia to drive the French from Germany. . . . The campaign opened early in October. Napoleon, as usual, overwhelmed the coalition by the promptitude of his marches and the vigour of his measures. On the 14th of October, he destroyed at Jena the military monarchy of Prussia by a decisive victory. . . . The campaign in Poland was less rapid, but as brilliant as that of Prussia. Russia, for the third time, measured its strength with France. Conquered at Zurich and Austerlitz, it was also defeated at Eylau and Friedland. After these memorable battles, the emperor Alexander entered into a negotiation, and concluded at Tilsit, on the 21st of June, 1807, an armistice which was followed by a definitive treaty on the 7th of July. The peace of Tilsit extended the French domination on the continent. Prussia was reduced to half its extent. In the south of Germany, Napoleon had instituted the two kingdoms of Bavaria and Würtemberg against Austria; further to the north, he created the two feudatory kingdoms of Saxony and Westphalia against Prussia. . . . In order to obtain universal and uncontested supremacy, he made use of arms against the continent, and the cessation of commerce against England. But in forbidding to the continental states all communication with England, he was preparing new difficulties for himself, and soon added to the animosity of opinion excited by his despotism, and the hatred of states produced by his conquering domination, the exasperation of private interests and commercial suffering occasioned by the blockade. . . . The expedition of Portugal in 1807, and the invasion of Spain in 1808, began for him and for Europe a new order of events. . . . The reaction manifested itself in three countries, hitherto allies of France, and it brought on the fifth coalition. The court of Rome was dissatisfied; the peninsula was wounded in its national pride by having imposed upon it a foreign king; in its usages, by the suppression of convents, of the Inquisition, and of the grandees; Holland suffered in its commerce from the blockade, and Austria supported impatiently its losses and subordinate condition. England, watching for an opportunity to revive the struggle on the continent, excited the resistance of Rome, the peninsula, and the cabinet of Vienna. . . . Austria . . . made a powerful effort, and raised 550,000 men, comprising the Landwehr, and took the field in the spring of 1809. The Tyrol rose, and King Jerome was driven from his capital by the Westphalians; Italy wavered; and Prussia only waited till Napoleon met with a reverse, to take arms; but the emperor was still at the height of his power and prosperity. He hastened from Madrid in the beginning of February, and directed the members of the confederation to keep their contingents in readiness. On the 12th of April he left Paris, passed the Rhine, plunged into Germany, gained the victories of Eckmühl and Essling, occupied Vienna a second time on the 15th of May, and overthrew this new coalition by the battle of Wagram, after a campaign of four months. . . . The peace of Vienna, of the 11th of October, 1809, deprived the house of Austria of several more provinces, and compelled it again to adopt the continental system. . . . Napoleon, who seemed to follow a rash but inflexible policy, deviated from

his course about this time by a second marriage. He divorced Josephine that he might give an heir to the empire, and married, on the 1st of April, 1810, Marie-Louise, arch-duchess of Austria. This was a decided error. He quitted his position and his post as a parvenu and revolutionary monarch, opposing in France the ancient courts as the republic had opposed the ancient governments. He placed himself in a false situation with respect to Austria, which he ought either to have crushed after the victory of Wagram, or to have reinstated in its possessions after his marriage with the arch-duchess. . . . The birth, on the 20th of March, 1811, of a son, who received the title of king of Rome, seemed to consolidate the power of Napoleon, by securing to him a successor. The war in Spain was prosecuted with vigour during the years 1810 and 1811. . . . While the war was proceeding in the peninsula with advantage, but without any decided success, a new campaign was preparing in the north. Russia perceived the empire of Napoleon approaching its territories. . . . About the close of 1810, it increased its armies, renewed its commercial relations with Great Britain, and did not seem indisposed to a rupture. The year 1811 was spent in negotiations which led to nothing, and preparations for war were made on both sides. . . . On the 9th of March, Napoleon left Paris. . . . During several months he fixed his court at Dresden, where the emperor of Austria, the king of Prussia, and all the sovereigns of Germany, came to bow before his high fortune. On the 22nd of June, war was declared against Russia. . . . Napoleon, who, according to his custom, wished to finish all in one campaign, advanced at once into the heart of Russia, instead of prudently organizing the Polish barrier against it. His army amounted to about 500,000 men. He passed the Niemen on the 24th of June; took Wilna, and Witepsk, defeated the Russians at Astrowno, Polotsk, Mohilow Smolensko, at the Moskowa, and on the 14th of September, made his entry into Moscow. . . . Moscow was burned by its governor. . . . The emperor ought to have seen that this war would not terminate as the others had done; yet, conqueror of the foe, and master of his capital, he conceived hopes of peace which the Russians skilfully encouraged. Winter was approaching, and Napoleon prolonged his stay at Moscow for six weeks. He delayed his movements on account of the deceptive negotiations of the Russians; and did not decide on a retreat till the 19th of October. This retreat was disastrous, and began the downfall of the empire. . . . The cabinet of Berlin began the defections. On the 1st of March, 1813, it joined Russia and England, which were forming the sixth coalition. Sweden acceded to it soon after; yet the emperor, whom the confederate power thought prostrated by the last disaster, opened the campaign with new victories. The battle of Lutzen, won by conscripts, on the 2nd of May, the occupation of Dresden; the victory of Bautzen, and the war carried to the Elbe, astonished the coalition. Austria, which, since 1810, had been on a footing of peace, was resuming arms, and already meditating a change of alliance. She now proposed herself as a mediatrix between the emperor and the confederates. Her mediation was accepted; an armistice was concluded at Pleswitz, on the 4th of June, and a congress assembled at Prague to negotiate peace. It was impossible to come to terms. . . . Austria joined the coalition, and war, the only means of settling this great contest, was resumed. The emperor had only 280,000 men against 520,000. . . . Victory seemed, at first, to

second him. At Dresden he defeated the combined forces; but the defeats of his lieutenants deranged his plans. . . . The princes of the confederation of the Rhine chose this moment to desert the cause of the empire. A vast engagement having taken place at Leipsic between the two armies, the Saxons and Württembergers passed over to the enemy on the field of battle. This defection to the strength of the coalesced powers, who had learned a more compact and skilful mode of warfare, obliged Napoleon to retreat, after a struggle of three days. . . . The empire was invaded in all directions. The Austrians entered Italy; the English, having made themselves masters of the peninsula during the last two years, had passed the Bidassoa, under General Wellington, and appeared on the Pyrenees. Three armies pressed on France to the east and north. . . . Napoleon was . . . obliged to submit to the conditions of the allied powers; their pretensions increased with their power. . . . On the 11th of April, 1814, he renounced for himself and children the thrones of France and Italy, and received in exchange for his vast sovereignty, the limits of which had extended from Cadiz to the Baltic Sea, the little island of Elba."—F. 1815-1835.—Emperor Francis, Prince Metternich, and "the system."—"After the treaty of Vienna in 1809, and still more conspicuously after the pacification of Europe, the political wisdom of the rulers of Austria inclined them ever more and more to the maintenance of that state of things which was known to friends and foes as the System. But what was the System? It was the organisation of do-nothing. It cannot even be said to have been reactionary: it was simply inactionary. . . . 'Mark time in place' was the word of command in every government office. The bureaucracy was engaged from morning to night in making work, but nothing ever came of it. Not even were the liberal innovations which had lasted through the reign of Leopold got rid of. Everything went on in the confused, unfinished, and ineffective state in which the great war had found it. Such was the famous System which was venerated by the ultra-Tories of every land, and most venerated where it was least understood. Two men dominate the history of Austria during

this unhappy time—men who, though utterly unlike in character and intellect, were nevertheless admirably fitted to work together, and whose names will be long united in an unenviable notoriety. These were the Emperor Francis and Prince Metternich. The first was the evil genius of internal politics; the second exercised a hardly less baneful influence over foreign affairs. . . . For the external policy of Prince Metternich, the first and most necessary condition was, that Austria should give to Europe the impression of fixed adherence to the most extreme Conservative views. So for many years they worked together, Prince Metternich always declaring that he was a mere tool in the hands of his master, but in reality far more absolute in the direction of his own department than the emperor was in his. . . . Prince Metternich had the power of making the most of all he knew, and 'constantly left upon persons of real merit the impression that he was a man of lofty aspirations and liberal views, who forced himself to repress such tendencies in others because he thought that their repression was a *sine qua non* for Austria. The men of ability, who knew him intimately, thought less well of him. To them he appeared vain and superficial, with much that recalled the French noblesse of the old régime in his way of looking at things, and emphatically wanting in every element of greatness. With the outbreak of the Greek insurrection in 1821, began a period of difficulty and complications for the statesmen of Austria. There were two things of which they were mortally afraid—Russia and the revolution. Now, if they assisted the Greeks, they would be playing into the hands of the second; and if they opposed the Greeks, they would be likely to embroil themselves with the first. The whole art of Prince Metternich was therefore exerted to keep things quiet in the Eastern Peninsula, and to postpone the intolerable 'question d' Orient.' Many were the shifts he tried, and sometimes, as just after the accession of Nicholas, his hopes rose very high. All was, however, in vain. England and Russia settled matters behind his back; and although the tone which the publicists in his pay adopted towards the Greeks became more favourable in 1826-7, the battle of Navarino was a sad surprise and mortification to the wily chancellor. Not less annoying was the commencement of hostilities on the Danube between Russia and the Porte. The reverses with which the great neighbour met in his first campaign cannot have been otherwise than pleasing at Vienna. But the unfortunate success which attended his arms in the second campaign soon turned ill-dissembled joy into ill-concealed sorrow, and the treaty of Adrianople at once lowered Austria's prestige in the East, and deposed Metternich from the commanding position which he had occupied in the councils of the Holy Allies. It became, indeed, ever more and more evident in the next few years that the age of Congress politics, during which he had been the observed of all observers, was past and gone, that the diplomatic period had vanished away, and that the military period had begun. The very form in which the highest international questions were debated was utterly changed. At Vienna, in 1814, the diplomatists had been really the primary, the sovereigns only secondary personages; while at the interview of Münchengrätz, between Nicholas and the Emperor Francis, in 1833, the great autocrat appeared to look upon Prince Metternich as hardly more than a confidential clerk. The dull monotony of servitude which oppressed nearly the whole of the empire was varied by the agitations of one

of its component parts. When the Hungarian Diet was dissolved in 1812, the emperor had solemnly promised that it should be called together again within three years. Up to 1815, accordingly, the nation went on giving extraordinary levies and supplies without much opposition. When, however, the appointed time was fulfilled, it began to murmur. . . . Year by year the agitation went on increasing, till at last the breaking out of the Greek revolution, and the threatening appearance of Eastern politics, induced Prince Metternich to join his entreaties to those of many other counsellors, who could not be suspected of the slightest leaning to constitutional views. At length the emperor yielded, and in 1825 Pressburg was once more filled with the best blood and most active spirits of the land, assembled in parliament. Long and stormy were the debates which ensued. Bitter was, from time to time, the vexation of the emperor, and great was the excitement throughout Hungary. In the end, however, the court of Vienna triumphed. Hardly any grievances were redressed, while its demands were fully conceded. The Diet of 1825 was, however, not without fruit. The discussion which took place advanced the political education of the people, who were brought back to the point where they stood at the death of Joseph II.—that is, before the long wars with France had come to distract their attention from their own affairs. . . . The slumbers of Austria were not yet over. The System dragged its slow length along. Little or nothing was done for the improvement of the country. Klebelsberg administered the finances in an easy and careless manner. Conspiracies and risings in Italy were easily checked, and batches of prisoners sent off from time to time to Mantua or Spielberg. Austrian influence rose ever higher and higher in all the petty courts of the Peninsula. . . . In other regions Russia or England might be willing to thwart him, but in Italy Prince Metternich might proudly reflect that Austria was indeed a 'great power.' The French Revolution of 1830 was at first alarming; but when it resulted in the enthronement of a dynasty which called to its aid a 'cabinet of repression,' all fears were stilled. The Emperor Francis continued to say, when any change was proposed, 'We must sleep upon it,' and died in 1835 in 'the abundance of peace.'—M. E. Grant Duff, *Studies in European politics*, pp. 140-149.—See also GERMANY: 1819-1847.

1815-1846.—Gains of the Hapsburg monarchy.—Its aggressive absolutism.—Death of Francis I.—Accession of Ferdinand I.—Suppression of revolt in Galicia.—Extinction and annexation of the republic of Cracow.—"In the new partition of Europe, arranged in the Congress of Vienna [see VIENNA, THE CONGRESS OF], Austria received Lombardy and Venice under the title of a Lombardo-Venetian kingdom, the Illyrian provinces also as a kingdom, Venetian Dalmatia, the Tirol, Vorarlberg, Salzburg, the Innviertel and Hausrucks-viertel, and the part of Galicia ceded by her at an earlier period. Thus, after three and twenty years of war, the monarchy had gained a considerable accession of strength, having obtained, in lieu of its remote and unprofitable possessions in the Netherlands, territories which consolidated its power in Italy, and made it as great in extent as it had been in the days of Charles VI., and far more compact and defensible. The grand duchies of Modena, Parma, and Placentia, were moreover restored to the collateral branches of the house of Hapsburg. . . . After the last fall of Napoleon . . . the great powers of the continent . . . constituted themselves the champions

of the principle of absolute monarchy. The maintenance of that principle ultimately became the chief object of the so-called Holy Alliance established in 1816 between Russia, Austria and Prussia, and was pursued with remarkable steadfastness by the Emperor Francis and his minister, Prince Metternich [see HOLY ALLIANCE]. . . . Thenceforth it became the avowed policy of the chief sovereigns of Germany to maintain the rights of dynasties in an adverse sense to those of their subjects. The people, on the other hand, deeply resented the breach of those promises which had been so lavishly made to them on the general summons to the war of liberation. Disaffection took the place of that enthusiastic loyalty with which they had bled and suffered for their native princes; the secret societies, formed with the concurrence of their rulers, for the purpose of throwing off the yoke of the foreigner, became ready instruments of sedition. . . . In the winter of 1819, a German federative congress assembled at Vienna. In May of the following year it published an act containing closer definitions of the Federative Act, having for their essential objects the exclusion of the various provincial Diets from all positive interference in the general affairs of Germany, and an increase of the power of the princes over their respective Diets, by a guarantee of aid on the part of the confederates" (see GERMANY: 1814-1820). During the next three years, the powers of the Holy Alliance, under the lead of Austria, and acting under a concert established at the successive congresses of Troppau, Laibach and Verona (see VERONA, CONGRESS OF), interfered to put down popular risings against the tyranny of government in Italy and Spain, while they discouraged the revolt of the Greeks (see ITALY: 1820-1821; and SPAIN: 1814-1827). "The commotions that pervaded Europe after the French Revolution of 1830 affected Austria only in her Italian dominions, and there but indirectly, for the imperial authority remained undisputed in the Lombardo-Venetian kingdom. But the duke of Modena and the archduke of Parma were obliged to quit those states, and a formidable insurrection broke out in the territory of the Church. An Austrian army of 18,000 men quickly put down the insurgents, who rose again, however, as soon as it was withdrawn. The pope again invoked the aid of Austria, whose troops entered Bologna in January, 1832, and established themselves there in garrison. Upon this, the French immediately sent a force to occupy Ancona, and for a while a renewal of the oft-repeated conflict between Austria and France on Italian ground seemed inevitable; but it soon appeared that France was not prepared to support the revolutionary party in the pope's dominions, and that danger passed away. The French remained for some years in Ancona, and the Austrians in Bologna and other towns of Romagna. This was the last important incident in the foreign affairs of Austria previous to the death of the Emperor Francis I. on the 2nd of March, 1835, after a reign of 43 years. . . . The Emperor Francis was succeeded by his son, Ferdinand I., whose accession occasioned no change in the political or administrative system of the empire. Incapacitated, by physical and mental infirmity, from labouring as his father had done in the business of the state, the new monarch left to Prince Metternich a much more unrestricted power than that minister had wielded in the preceding reign. . . . The province of Galicia began early in the new reign to occasion uneasiness to the government. The Congress of Vienna had constituted the city of Cracow an independent republic—a futile representative of that Polish na-

tionality which had once extended from the Baltic to the Black Sea. After the failure of the Polish insurrection of 1831 against Russia, Cracow became the focus of fresh conspiracies, to put an end to which the city was occupied by a mixed force of Russians, Prussians, and Austrians; the two former were soon withdrawn, but the latter remained until 1840. When they also had retired, the Polish propaganda was renewed with considerable effect. An insurrection broke out in Galicia in 1846, when the scantiness of the Austrian military force in the province seemed to promise it success. It failed, however, as all previous efforts of the Polish patriots had failed, because it rested on no basis of popular sympathy. The nationality for which they contended had ever been of an oligarchical pattern, hostile to the freedom of the middle and lower classes. The Galician peasants had no mind to exchange the yoke of Austria, which pressed lightly upon them, for the feudal oppression of the Polish nobles. They turned upon the insurgents and slew or took them prisoners, the police inciting them to the work by publicly offering a reward of five florins for every suspected person delivered up by them, alive or dead. Thus the agents of a civilized government became the avowed instigators of an inhuman 'jacquerie.' The houses of the landed proprietors were sacked by the peasants, their inmates were tortured and murdered, and bloody anarchy raged throughout the land in the prostituted name of loyalty. The Austrian troops at last restored order; but Szela, the leader of the sanguinary marauders, was thanked and highly rewarded in the name of his sovereign. In the same year the three protecting powers, Austria, Russia, and Prussia, took possession of Cracow, and, ignoring the right of the other parties to the treaty of Vienna to concern themselves about the fate of the republic, they announced that its independence was annulled, and that the city and territory of Cracow were annexed to, and forever incorporated with, the Austrian monarchy. From this time forth the political atmosphere of Europe became more and more loaded with the presages of the storm that burst in 1848."—W. K. Kelly, *Continuation of Cox's history of the House of Austria*, ch. 5-6. See GERMANY: Map: After the Congress of Vienna.

1815-1849.—Arrangements in Italy of the Congress of Vienna.—Heaviness of the Austrian yoke.—Italian risings.—"By the treaty of Vienna (1815), the . . . entire kingdom of Venetian-Lombardy was handed over to the Austrians; the duchies of Modena, Reggio, with Massa and Carrara, given to Austrian princes; Parma, Piacenza, and Guastalla to Napoleon's queen, Marie Luisa, because she was an Austrian princess; the grand-duchy of Tuscany to Ferdinand III. of Austria; the duchy of Lucca to a Bourbon. Rome and the Roman states were restored to the new Pope, Pius VII.; Sicily was united to Naples under the Bourbons, and later deprived of her constitution, despite the promised protection of England; the Canton Ticino, though strictly Italian, annexed to the Swiss Confederation; the little republic of San Marino left intact, even as the principality of Monaco. England retained Malta; Corsica was left to France. Italy, so Metternich and Europe fondly hoped, was reduced to a geographical expression. Unjust, brutal, and treacherous as was that partition, at least it taught the Italians that 'who would be free himself must strike the blow.' It united them into one common hatred of Austria and Austrian satellites. By substituting papal, Austrian, and Bourbon despotism for the free institutions, codes, and constitutions of

the Napoleonic era, it taught them the difference between rule and misrule. Hence the demand of the Neapolitans during their first revolution (1820) was for a constitution; that of the Piedmontese and Lombards (1821) for a constitution and war against Austria. The Bourbon swore and foreswore, and the Austrians 'restored order' in Naples. The Piedmontese, who had not concerted their movement until Naples was crushed—after the abdication of Victor Emmanuel I., the granting of the constitution by the regent Charles Albert, and its abrogation by the new king Charles Felix—saw the Austrians enter Piedmont, while the leaders of the revolution went out into exile [see ITALY: 1820-1821]. But those revolutions and those failures were the beginning of the end. The will to be independent of all foreigners, the thirst for freedom, was universal; the very name of empire or of emperor, was rendered ridiculous, reduced to a parody—in the person of Ferdinand of Austria. But one illusion remained—in the liberating virtues of France and the French; this had to be dispelled by bitter experience, and for it substituted the new idea of one Italy for the Italians, a nation united, independent, free, governed by a president or by a king chosen by the sovereign people. The apostle of this idea, to which for fifty years victims and martyrs were sacrificed by thousands, was Joseph Mazzini; its champion, Joseph Garibaldi. By the genius of the former, the prowess of the latter, the abnegation, the constancy, the tenacity, the iron will of both, all the populations of Italy were subjugated by that idea: philosophers demonstrated it, poets sung it, pious Christian priests proclaimed it, statesmen found it confronting their negotiations, baffling their half-measures."—J. W. V. Mario, *Introduction to autobiography of Garibaldi*. See ITALY: 1830-1832, and 1848-1849; WORLD WAR: Causes: Indirect: b, 1.

1848.—Germanic revolutionary rising.—National Assembly at Frankfort.—Archduke John elected administrator of Germany.—"When the third French Revolution broke out, its influence was immediately felt in Germany. The popular movement this time was very different from any the Governments had hitherto had to contend with. The people were evidently in earnest, and resolved to obtain, at whatever cost, their chief demands. . . . The Revolution was most serious in the two great German States, Prussia and Austria. . . . It was generally hoped that union as well as freedom was now to be achieved by Germany; but, as Prussia and Austria were in too much disorder to do anything, about 500 Germans from the various States met at Frankfort, and on March 21 constituted themselves a provisional Parliament. An extreme party wished the assembly to declare itself permanent; but to this the majority would not agree. It was decided that a National Assembly should be elected forthwith by the German people. The Confederate Diet, knowing that the provisional Parliament was approved by the nation, recognized its authority. Through the Diet the various Governments were communicated with, and all of them agreed to make arrangements for the elections. . . . The National Assembly was opened in Frankfurt on May

18, 1848. It elected the Archduke John of Austria as the head of a new provisional central Government. The choice was a happy one. The Archduke was at once acknowledged by the different governments, and on July 12 the President of the Confederate Diet formally made over to him the authority which had hitherto belonged to the Diet. The Diet then ceased to exist. The Archduke chose from the Assembly seven members, who formed a responsible ministry. The Assembly was divided into two parties, the Right and the Left. These again were broken up into various sections. Much time was lost in useless discussions, and it was soon suspected that the Assembly would not in the end prove equal to the great task it had undertaken."—J. Sime, *History of Germany*, ch. 19, sects. 8-11. See GERMANY: 1848 (March-September).

1848 (December).—Accession of the emperor Francis Joseph I.

1848-1849.—Revolutionary risings.—Bombardment of Prague and Vienna.—Abdication of the Emperor Ferdinand.—Accession of Francis Joseph.—The Hungarian struggle for independence.—"The rise of national feeling among the Hungarian, Slavonic, and Italian subjects of the House of Hapsburg was not the only difficulty of the Emperor Ferdinand I. Vienna was then the gayest and the dearest centre of fashion and luxury in Europe, but side by side with wealth there seethed a mass of wretched poverty; and the protective trade system of Austria so increased the price of the necessaries of life that bread-riots were frequent. . . . The university students were foremost in the demand for a constitution and for the removal of the rigid censorship of the press and of all books. So, when the news came of the flight of Louis Philippe from Paris [see FRANCE: 1841-1848, and 1848] the students as well as the artisans of Vienna rose in revolt (March 13, 1848), the latter breaking machinery and attacking the houses of unpopular employers. A deputation of citizens clamoured for the resignation of the hated Metternich: his house was burnt down, and he fled to England. A second outbreak of the excited populace (May 15, 1848), sent the Emperor Ferdinand in helpless flight to Innsbruck in Tyrol; but he returned when they avowed their loyalty to his person, though they detested the old bureaucratic system. Far more complicated, however, were the race jealousies of the Empire. The Slavs of Bohemia . . . had demanded of Ferdinand the union of Bohemia, Moravia, and Austrian Silesia in Estates for those provinces, and that the Slavs should enjoy equal privileges with the Germans. After an unsatisfactory answer had been received, they convoked a Slavonic Congress at Prague. . . . But while this Babel of tongues was seeking for a means of fusion, Prince Windischgrätz was assembling Austrian troops around the Bohemian capital. Fights in the streets led to a bombardment of the city, which Windischgrätz soon entered in triumph. This has left a bitterness between the Tsechs or Bohemians and the Germans which still divides Bohemia socially and politically. . . . The exciting news of the spring of 1848 had made the hot Asiatic blood of the Magyars boil; yet even Kossuth and the democrats at first only demanded the abolition of Metternich's system in favour of a representative government. . . . Unfortunately Kossuth claimed that the Magyar laws and language must now be supreme, not only in Hungary proper, but also in the Hungarian 'crown lands' of Dalmatia, Croatia, and Slavonia, and the enthusiastic Magyars wished also to absorb the ancient principality of Transylvania; but this again was stoutly resisted by the Roumanians, Slavs, and

Saxons of that little known corner of Europe, and their discontent was fanned by the court of Vienna. Jellachich, the Ban or Governor of Croatia, headed this movement, which aimed at making Agram the capital of the southern Slavs. Their revolt against the Hungarian ministry of Batthyany was at first disavowed in June, 1848, but in October was encouraged, by the perfidious government of Vienna. A conference between Batthyany and Jellachich ended with words of defiance: 'Then we must meet on the Drave,' said the Hungarian. 'No, on the Danube,' retorted the champion of the Slavs. The vacillating Ferdinand annulled his acceptance of the new Hungarian constitution and declared Jellachich dictator of Hungary. His tool was unfortunate. After crossing the Drave, the Slavs were defeated by the brave Hungarian 'honveds' (defenders); and as many as 9,000 were made prisoners. Unable to subdue Hungary, Jellachich turned aside towards Vienna to crush the popular party there. For the democrats, exasperated by the perfidious policy of the government, had, on October 6, 1848, risen a third time: the war-minister, Latour, had been hanged on a lamp-post, and the emperor again fled from his turbulent capital to the ever-faithful Tyrol. But now Jellachich and Windischgrätz bombarded the rebellious capital. It was on the point of surrendering when the Hungarians appeared to aid the city; but the levies raised by the exertions of Kossuth were this time outmaneuvered [and defeated] by the imperialists at Schwechat (October 30, 1848), and on the next day Vienna surrendered. Blum, a delegate from Saxony [to the German Parliament of Frankfurt, who had come on a mission of mediation to Vienna, but who had taken a part in the fighting], and some other democrats, were shot. By this clever but unscrupulous use of race jealousy the Viennese Government seemed to have overcome Bohemians, Italians, Hungarians, and the citizens of its own capital in turn; while it had diverted the southern Slavonians from hostility to actual service on its side. . . . The weak health and vacillating spirit of Ferdinand did not satisfy the knot of courtiers of Vienna, who now, flushed by success, sought to concentrate all power in the Viennese Cabinet. Worn out by the excitements of the year and by the demands of these men, Ferdinand, on December 2, 1848, yielded up the crown, not to his rightful successor, his brother, but to his nephew, Francis Joseph. He, a youth of eighteen, ascended the throne so rudely shaken, and . . . in spite of almost uniform disaster in war, [ruled till 1916] over an empire larger and more powerful than he found it in 1848. The Hungarians refused to recognise the young sovereign thus forced upon them; and the fact that he was not crowned at Pressburg with the sacred iron crown of St. Stephen showed that he did not intend to recognise the Hungarian constitution. Austrian troops under Windischgrätz entered Buda-Pesth, but the Hungarian patriots withdrew from their capital to organise a national resistance; and when the Austrian Government proclaimed the Hungarian constitution abolished and the complete absorption of Hungary in the Austrian Empire, Kossuth and his colleagues retorted by a Declaration of Independence (April 24, 1849). The House of Hapsburg was declared banished from Hungary, which was to be a republic. Kossuth, the first governor of the new republic, and Görgei, its general, raised armies which soon showed their prowess." The first important battle of the war had been fought at Kápolna, on the right bank of the Theiss, on February 26, 1849, Görgei and Dembinski commanding the Hungarians and

Windischgrätz leading the Austrians. The latter won the victory, and the Hungarians retreated toward the Theiss. About the middle of March, Görgei resumed the offensive, advancing toward Pesth, and encountered the Austrians at Isaszeg, where he defeated them in a hard-fought battle, —or rather in two battles which are sometimes called by different names: viz., that of . . . Bieské . . . and that of Gödöllő [in April]. It was now the turn of the Austrians to fall back, and they concentrated behind the Rakos, to cover Pesth. The Hungarian general passed round their left, carried Waitzen by storm, forced them to evacuate Pesth and to retreat to Pressburg, abandoning the whole of Hungary with the exception of a few fortresses, which they held. The most important of these fortresses, that of Buda, the "twin-city," opposite Pesth on the Danube, was besieged by the Hungarians and carried by storm on May 21. "In Transylvania, too, the Hungarians, under the talented Polish general Bem, overcame the Austrians, Slavonians, and Roumanians in many brilliant encounters. But the proclamation of a republic had alienated those Hungarians who had only striven for their old constitutional rights, so quarrels arose between Görgei and the ardent democrat, Kossuth. Worse still, the Czar Nicholas, dreading the formation of a republic near his Polish provinces sent the military aid which Francis Joseph in May 1849 implored. Soon 80,000 Russians under Paskievitch poured over the northern Carpathians to help the beaten Austrians, while others overpowered the gallant Bem in Transylvania. Jellachich with his Croats again invaded South Hungary, and Haynau, the scourge of Lombardy, marched on the strongest Hungarian fortress, Komorn, on the Danube." The Hungarians, overpowered by the combination of Austrians and Russians against them, were defeated at Pered, June 21; at Acs, July 3; at Komorn, July 11; at Waitzen, July 16; at Samobor, July 20; at Segesvar, July 31; at Debrecin, August 2; at Szegedin, August 4; at Temesvar, August 10. "In despair Kossuth handed over his dictatorship to his rival Görgei, who soon surrendered at Vilagos with all his forces to the Russians (August 13, 1849). About 5,000 men with Kossuth, Bem, and other leaders, escaped to Turkey. Even there Russia and Austria sought to drive them forth; but the Porte, upheld by the Western Powers, maintained its right to give sanctuary according to the Koran. Kossuth and many of his fellow-exiles finally sailed to England [and afterwards to America], where his majestic eloquence aroused deep sympathy for the afflicted country. Many Hungarian patriots suffered death. All rebels had their property confiscated, and the country was for years ruled by armed force, and its old rights were abolished."

1848-1850.—Failure of the movement for Germanic national unity.—End of the Frankfurt assembly.—"Frankfurt had become the centre of the movement. The helpless Diet had acknowledged the necessity of a German parliament, and had summoned twelve men of confidence charged

with drawing up a new imperial constitution. But it was unable to supply what was most wanted—a strong executive. . . . Instead of establishing before all a strong executive able to control and to realise its resolutions, the Assembly lost months in discussing the fundamental rights of the German people, and thus was overhauled by the events. In June, Prince Windischgrätz crushed the insurrection at Prague; and in November the anarchy which had prevailed during the whole summer at Berlin was put down, when Count Brandenburg became first minister. . . . Schwarzenberg [at Vienna] declared as soon as he had taken the reins, that his programme was to maintain the unity of the Austrian empire, and demanded that the whole of it should enter into the Germanic confederation. This was incompatible with the federal state as contemplated by the National Assembly, and therefore Gagern, who had become president of the imperial ministry [at Frankfort], answered Schwarzenberg's programme by declaring that the entering of the Austrian monarchy with a majority of non-German nationalities into the German federal state was an impossibility. Thus nothing was left but to place the king of Prussia at the head of the German state. But in order to win a majority for this plan Gagern found it necessary to make large concessions to the democratic party, amongst others universal suffrage. This was not calculated to make the offer of the imperial crown acceptable to Frederic William IV., but his principal reason for declining it was, that he would not exercise any pressure on the other German sovereigns, and that, notwithstanding Schwarzenberg's haughty demeanour, he could not make up his mind to exclude Austria from Germany. After the refusal of the crown by the king, the National Assembly was doomed; it had certainly committed great faults, but the decisive reason of its failure was the lack of a clear and resolute will in Prussia. History, however, teaches that great enterprises, such as it was to unify an empire dismembered for centuries, rarely succeed at the first attempt. The capital importance of the events of 1848 was that they had made the German unionist movement an historical fact; it could never be effaced from the annals, that all the German governments had publicly acknowledged that tendency as legitimate, the direction for the future was given, and even at the time of failure it was certain, as Stockmar said, that the necessity of circumstances would bring forward the man who, profiting by the experiences of 1848, would fulfil the national aspirations."—F. H. Geffcken, *Unity of Germany (English Historical Review, Apr., 1891)*. See GERMANY: 1848-1856.

1849-1859.—Return to pure absolutism.—Bureaucracy triumphant.—"The two great gains which the moral earthquake of 1848 brought to Austria were, that through wide provinces of the Empire, and more especially in Hungary, it swept away the sort of semi-vassalage in which the peasantry had been left by the Urbarium of Maria Theresa [an edict which gave to the peasants the right of moving from place to place, and the right of bringing up their children as they wished, while it established in certain courts the trial of all suits to which they were parties], and other reforms akin to or founded upon it, and introduced modern in the place of middle-age relations between the two extremes of society. Secondly, it overthrew the policy of do-nothing—a surer guarantee for the continuance of abuses than even the determination, which soon manifested itself at headquarters, to make the head of the state more absolute than ever. After the taking of

Vienna by Windischgrätz, the National Assembly had, on the 15th of November 1848, been removed from the capital to the small town of Kremsier, in Moravia. Here it prolonged an ineffective existence till March 1849, when the court camarilla felt itself strong enough to put an end to an inconvenient censor, and in March 1849 it ceased to exist. A constitution was at the same time promulgated which contained many good provisions, but which was never heartily approved by the ruling powers, or vigorously carried into effect—the proclamation of a state of siege in many cities, and other expedients of authority in a revolutionary period, easily enabling it to be set at naught. The successes of the reaction in other parts of Europe, and, above all, the coup d'état in Paris, emboldened Schwartzberg to throw off the mask; and on the last day of 1851 Austria became once more a pure despotism. The young emperor had taken 'Viribus unitis' for his motto; and his advisers interpreted those words to mean that Austria was henceforth to be a state as highly centralised as France—a state in which the minister at Vienna was absolutely to govern everything from Salzburg to the Iron Gate. The hand of authority had been severely felt in the prerevolutionary period, but now advantage was to be taken of the revolution to make it felt far more than ever. In Hungary, for example, . . . it was fondly imagined that there would be no more trouble. The old political division into counties was swept away; the whole land was divided into five provinces; and the courtiers might imagine that from henceforth the Magyars would be as easily led as the inhabitants of Upper Austria. These delusions soon became general, but they owed their origin partly to the enthusiastic ignorance of those who were at the head of the army, and partly to two men"—Prince Schwartzberg and Alexander Bach. Of the latter, the "two leading ideas were to cover the whole empire with a German bureaucracy, and to draw closer the ties which connected the court of Vienna with that of Rome. . . . If absolutism in Austria had a fair trial from the 31st of December 1851 to the Italian war, it is to Bach that it was owing; and if it utterly and ludicrously failed, it is he more than any other man who must bear the blame. Already, in 1849, the bureaucracy had been reorganised, but in 1852 new and stricter regulations were introduced. Everything was determined by precise rules—even the exact amount of hair which the employé was permitted to wear upon his face. Hardly any question was thought sufficiently insignificant to be decided upon the spot. The smallest matters had to be referred to Vienna. . . . We can hardly be surprised that the great ruin of the Italian war brought down with a crash the whole edifice of the reaction."—M. E. G. Duff, *Studies in European politics, ch. 3*.

1856-1859.—War in Italy with Sardinia and France.—Reverses at Magenta and Solferino.—Peace of Villafranca.—Surrender of Lombardy.—"From the wars of 1848-9 the King of Sardinia was looked upon by the moderate party as the champion of Italian freedom. Charles Albert had

failed: yet his son would not, and indeed could not, go back, though, when he began his reign, there were many things against him. Great efforts were made to win him over to the Austrian party, but the King was neither cast down by defeat and distrust nor won over by soft words. He soon showed that, though he had been forced to make a treaty with Austria, yet he would not cast in his lot with the oppression of Italy. He made Massimo d'Azeglio his chief Minister, and Camillo Benso di Cavour his Minister of Commerce. With the help of these two men he honestly carried out the reforms which had been granted by his father, and set new ones on foot. . . . The quick progress of reform frightened Count Massimo d'Azeglio. He retired from office in 1853, and his place was taken by Count Cavour, who made a coalition with the democratic party in Piedmont headed by Urbano Rattazzi. The new chief Minister began to work not only for the good of Piedmont but for Italy at large. The Milanese still listened to the hopes which Mazzini held out, and could not quietly bear their subjection. Count Cavour indignantly remonstrated with Radezky for his harsh government. . . . The division and slavery of Italy had shut her out from European politics. Cavour held that, if she was once looked upon as an useful ally, then her deliverance might be hastened by foreign interference. The Sardinian army had been brought into good order by Alfonso della Marmora; and was ready for action. In 1855, Sardinia made alliance with England and France, who were at war with Russia: for Cavour looked on that power as the great support of the system of despotism on the Continent, and held that it was necessary for Italian freedom that Russia should be humbled. The Sardinian army was therefore sent to the Crimea, under La Marmora, where it did good service in the battle of Tchernaya. . . . The next year the Congress of Paris was held to arrange terms of peace between the allies and Russia, and Cavour took the opportunity of laying before the representatives of the European powers the unhappy state of his countrymen. . . . In December, 1851, Louis Napoleon Buonaparte, the President of the French Republic, seized the government, and the next year took the title of Emperor of the French. He was anxious to weaken the power of Austria, and at the beginning of 1850 it became evident that war would soon break out. As a sign of the friendly feeling of the French Emperor towards the Italian cause, his cousin, Napoleon Joseph, married Clotilda, the daughter of Victor Emmanuel. Count Cavour now declared that Sardinia would make war on Austria, unless a separate and national government was granted to Lombardy and Venetia, and unless Austria promised to meddle no more with the rest of Italy. On the other hand, Austria demanded the disarmament of Sardinia. The King would not listen to this demand, and France and Sardinia declared war against Austria. The Emperor Napoleon declared that he would free Italy from the Alps to the Adriatic. . . . The Austrian army crossed the Ticino, but was defeated by the King and General Cialdini. The French victory of Magenta, on June 4th forced the Austrians to retreat from Lombardy. . . . On June 24th the Austrians, who had crossed the Mincio, were defeated at Solferino by the allied armies of France and Sardinia. It seemed as though the French Emperor would keep his word. But he found that if he went further, Prussia would take up the cause of Austria, and that he would have to fight on the Rhine as well as on the Adige. When, therefore, the French army came before

Verona, a meeting was arranged between the two Emperors. This took place at Villafranca, and there Buonaparte, without consulting his ally, agreed with Francis Joseph to favour the establishment of an Italian Confederation. . . . Austria gave up to the King of Sardinia Lombardy to the west of Mincio. But the Grand Duke of Tuscany and the Duke of Modena were to return to their States. The proposed Confederation was never made, for the people of Tuscany, Modena, Parma, and Romagna sent to the King to pray that they might be made part of his Kingdom, and Victor Emmanuel refused to enter on the scheme of the French Emperor. In return for allowing the Italians of Central Italy to shake off the yoke, Buonaparte asked for Savoy and Nizza. . . . The King . . . consented to give up the 'glorious cradle of his Monarchy' in exchange for Central Italy."—W. A. Hunt, *History of Italy*, ch. 11.

1860.—Constitutional development.—"The diploma of October 20, 1860, the price paid by the government for the disasters of the Italian war, was a turning point in Austrian constitutional history. By it the number of provincial representatives in the Reichsrat was increased to one hundred, and that body was given a share in imperial legislation. The Patent of February 26, 1861, completed the development of the Reichsrat into a full-fledged, national Parliament, with an appointive House of Lords, and a Chamber of Deputies of 343 members, elected by the provincial Landtags. The government of Austria-Hungary was no longer a feudal despotism, but a constitutional monarchy, at least in the Tory sense."—C. Seymour and D. P. Frary, *How the world votes*, p. 56.

1862-1866. — Schleswig-Holstein question. — Quarrel with Prussia.—Humiliating Seven Weeks' War.—Conflict with Prussia grew out of the complicated Schleswig-Holstein question, reopened in 1862 and provisionally settled by a delusive arrangement between Prussia and Austria, into which the latter was artfully drawn by Prince Bismarck. (See DENMARK: 1848-1862; and GERMANY: 1861-1866). No sooner was the war with Denmark over, than "Prussia showed that it was her intention to annex the newly acquired duchies to herself. This Austria could not endure, and accordingly, in 1866, war broke out between Austria and Prussia. Prussia sought alliance with Italy, which she stirred up to attack Austria in her Italian possessions. The Austrian army defeated the Italian at . . . [Custoza (see ITALY: 1862-1866)]; but the fortunes of war were against them in Germany. Allied with the Austrians were the Saxons, the Bavarians, the Württembergers, Baden and Hesse, and Hanover. The Prussians advanced with their chief army into Bohemia with the utmost rapidity, dreading lest the Southern allies should march north to Hanover, and cut the kingdom in half, and push on to Berlin. The Prussians had three armies, which were to enter Bohemia and effect a junction. The Elbe army under the King, the first army under Prince Frederick Charles, and the second army under the Crown Prince. The Elbe army advanced across Saxony by Dresden. The first army was in Lusatia, at Reichenberg, and the second army in Silesia at Heisse. They were all to meet at Gitschin. The Austrian army under General Benedek was at Königgrätz, in Eastern Bohemia. . . . As in the wars with Napoleon, so was it now; the Austrian generals . . . never did the right thing at the right

moment. Benedek did indeed march against the first army, but too late, and when he found it was already through the mountain door, he retreated, and so gave time for the three armies to concentrate upon him. The Elbe army and the first met at Münchengrätz, and defeated an Austrian army there, pushed on, and drove them back out of Gitschin on Königgrätz. . . . The Prussians pushed on, and now the Elbe army went to Smidar, and the first army to Horzitz, whilst the second army, under the Crown Prince, was pushing on, and had got to Gradlitz. The little river Bistritz is crossed by the right road to Königgrätz. It runs through swamp ground, and forms little marshy pools or lakes. To the north of Königgrätz a little stream of much the same character dribbles through bogs into the Elbe. . . . But about Chlum, Nedelist and Lippa is terraced high ground, and there Benedek planted his cannon. The Prussians advanced from Smidar against the left wing of the Austrians, from Horzitz against the centre, and the Crown Prince was to attack the right wing. The battle began on the 3d of July, at 7 o'clock in the morning, by the simultaneous advance of the Elbe and the first army upon the Bistritz. At Sadowa is a wood, and there the battle raged most fiercely. . . . Two things were against the Austrians; first, the incompetence of their general, and, secondly, the inferiority of their guns. The Prussians had what are called needle-guns, breach-loaders, which are fired by the prick of a needle, and for the rapidity with which they can be fired far surpassed the old-fashioned muzzle-loaders used by the Austrians. After this great battle, which is called by the French and English the battle of Sadowa (Sadōwa, not Sadōwa, as it is erroneously pronounced), but which the Germans call the battle of Königgrätz, the Prussians marched on Vienna, and reached the Marchfeld before the Emperor Francis Joseph would come to terms. At last, on the 23d of August, a peace which gave a crushing preponderance in Germany to Prussia, was concluded at Prague."—S. Baring-Gould, *Story of Germany*, pp. 390-394. See GERMANY: 1866.

1866-1867.—Concession of nationality to Hungary.—Formation of the dual Austro-Hungarian empire.—"For twelve years the name of Hungary, as a State, was erased from the map of Europe. Bureaucratic Absolutism ruled supreme in Austria, and did its best to obliterate all Hungarian institutions. Germanisation was the order of the day, the German tongue being declared the exclusive language of official life as well as of the higher schools. Government was carried on by means of foreign, German, and Czech officials. No vestige was left, not only of the national independence, but either of Home Rule or of self-government of any sort; the country was divided into provinces without regard for historical traditions; in short, an attempt was made to wipe out every trace denoting the existence of a separate Hungary. All ranks and classes opposed a sullen passive resistance to these attacks against the existence of the nation; even the sections of the nationalities which had rebelled against the enactments of 1848, at the instigation of the reactionary Camarilla, were equally disaffected in consequence of the short-sighted policy of despotical centralisation. . . . Finally, after the collapse of the system of Absolutism in consequence of financial disasters and of the misfortunes of the Italian War of 1859, the Hungarian Parliament was again convoked; and after protracted negotiations, broken off and resumed again, the im-

practicability of a system of provincial Federalism having been proved in the meantime, and the defeat incurred in the Prussian War of 1866 having demonstrated the futility of any reconstruction of the Empire of Austria in which the national aspirations of Hungary were not taken into due consideration—an arrangement was concluded under the auspices of Francis Deák, Count Andrassy, and Count Beust, on the basis of the full acknowledgment of the separate national existence of Hungary, and of the continuity of its legal rights. The idea of a centralised Austrian Empire had to give way to the dual Austro-Hungarian monarchy. . . . [a] federation of two equal States, under the common rule of a single sovereign, the Emperor of Austria and King of Hungary, each of the States having a constitution, government, and parliament of its own, Hungary especially retaining, with slight modifications, its ancient institutions remodelled in 1848. The administration of the foreign policy, the management of the army, and the disbursement of the expenditure necessary for these purposes, were settled upon as common affairs of the entire monarchy, for the management of which common ministers were instituted, responsible to the two delegations, co-equal committees of the parliaments of Hungary and of the Cisleithanian (Austrian) provinces. Elaborate provisions were framed for the smooth working of these common institutions, for giving weight to the constitutional influence, even in matters of common policy, of the separate Cisleithanian and Hungarian ministries, and for rendering their responsibility to the respective Parliaments an earnest and solid reality. The financial questions pending in the two independent and equal States were settled by a compromise; measures were taken for the equitable arrangement of all matters which might arise in relation to interests touching both States, such as duties, commerce, and indirect taxation, all legislation on these subjects taking place by means of identical laws separately enacted by the Parliament of each State. . . . Simultaneously with these arrangements the political differences between Hungary and Croatia were compromised by granting provincial Home Rule to the latter. . . . Thus the organisation of the Austro-Hungarian monarchy on the basis of dualism, and the compromise entered into between the two halves composing it, whilst uniting for the purposes of defence the forces of two States of a moderate size and extent into those of a great empire, able to cope with the exigencies of an adequate position amongst the first-class Powers of Europe, restored also to Hungary its independence and its unfettered sovereignty in all internal matters."—A. Pulszky, *Hungary (National Life and Thought, lecture 3)*.—"The Ausgleich (q.v.) or agreement with Hungary, was arranged by a committee of 67 members of the Hungarian diet, at the head of whom was the Franklin of Hungary, Francis Deák, the true patriot and inexorable legislator, who had taken no part in the revolutions but who had never given up one of the smallest of the rights of his country. . . . On the 8th of June [1867], the emperor Francis Joseph was crowned with great pomp at Pesh. On the 28th of the following June, he approved the decisions of the diet, which settled the position of Hungary with regard to the other countries belonging to his majesty, and modified some portions of the laws of 1848. . . . Since the Ausgleich the empire has consisted of two parts. . . . For the sake of clearness, political language has been increased by the invention of two new terms, Cisleithania and Transleithania, to describe the two groups, separated a little below Vienna by a small affluent of

the Danube, called the Leitha—a stream which never expected to become so celebrated.”—L. Leger, *History of Austro-Hungary*, ch. 35.—See also HUNGARY: 1856-1868.

1889 (January 30).—Tragedy of Myerling.—Death of the Archduke Rudolph, only son of the Emperor Francis Joseph.—Various conflicting reports have appeared during the past thirty years as to the manner in which the heir-apparent to the Austro-Hungarian thrones met his death in the hunting lodge at Meyerling, near Vienna. The official and generally accepted theory points to suicide; and other accounts declare that the archduke and the young Baroness Vecsra (or Vetsera) were slain. Perhaps the most recent version is that published by H. Vivian, “Francis Joseph and his court” (1917).

1893-1900.—Race jealousies and conflicts.—Curtailment of the power of the Germans in Austria.—Ministry of Badeni.—Enlarged franchise.—Count Badeni's language decrees for Bohemia.—Its effect on Austrian constitutional history.—“While the Monarch thus showed himself alive to the importance of maintaining dynastic rights in Hungary, he succeeded in Austria in reducing the Germans to a position comparatively commensurate with their numerical strength. The process of reduction naturally caused race friction, since almost every advantage obtained by the non-Germans implied some loss to vested German interests and to German predominance in the Bureaucracy. Taaffe, the Emperor's chief agent in the execution of this policy, fell in 1893 in an attempt to fulfil the Imperial wish that, as a means of curtailing the power of German cliques and corporations, a certain section of the Austrian Chamber should be elected by universal suffrage. Three years later Badeni, a Pole, who succeeded Taaffe, actually introduced a universal suffrage section, or Curia, of seventy-two deputies into the Austrian system of franchise—a proceeding which shows how tenaciously the Emperor, as head of the dynasty, clung to the idea of enfranchising and using the masses for dynastic purposes. But Badeni, in his eagerness to strengthen the Slav position, imprudently issued ministerial ordinances to establish the administrative equality of the Czech language with German throughout Bohemia. [See also BOHEMIA: 1848-1897.] Thereupon the Germans revolted and obstructed all parliamentary business until the language ordinances were withdrawn. The Emperor, yielding to the pressure of a popular agitation in Vienna, hurriedly dismissed Badeni, and, after German in-

dignation had found vent in a pseudo-Protestant, anti-Hapsburg movement, known by its catchword, ‘*Los von Rom!*’ ultimately sanctioned the withdrawal of the ordinances. The rapidity with which the *Los von Rom!* movement subsided as soon as its Pan-German, anti-Hapsburg character became apparent, and the growth of a loyal German ‘Christian Social’ party under Lueger, speedily demonstrated the power of the dynasty even over its German subjects; but a not less important feature of the crisis was the gradual establishment of ‘constitutional absolutism’ by the abuse or elastic use of the Clause 14, the ‘Emergency Paragraph’ of the 1867 Constitution. Unspeakably tiresome as were the vicissitudes of the conflict arising out of Badeni's Language Ordinances, they marked a turning-point in Austrian Constitutional history. Under the influence of parliamentary obstruction, carried on by the Germans until the ordinances were withdrawn and, after their withdrawal, by the Slavs of Bohemia, the Government employed with increasing frequency the ‘Emergency Paragraph’ for the despatch of public business. Austrian Parliamentarism was gradually turned into a system under which, on the one hand, the divergent interests of races, groups and parties were exploited by the Government, and the necessities of the Government were, on the other hand, exploited by races, groups and parties at the expense of taxpayers; and the fact was clearly revealed that no Austrian race or party would hesitate to sell the Constitution at a price. Each party in turn obstructed parliamentary business in order to extort concessions from a government composed mainly of officials. Had the Austrian Constitution been imposed upon the Crown by popular will, the position of parliament might have been stronger, and the respect of political parties for the integrity of the Constitution might have been greater. Watchfulness would have been the more necessary in that the Austrian Constitution of 1867 is so framed as to facilitate an occasional return to absolutism. The ‘Emergency Paragraph,’ the widest of the doors through which the return could be made, runs:—‘Should, at a time when the Reichsrath is not sitting, urgent necessity arise for enactments to which the assent of the Reichsrath is constitutionally requisite, these enactments can be promulgated by Imperial ordinance on the responsibility of the whole Cabinet provided such ordinances aim at effecting no change of the Constitutional Statute itself, at placing no permanent burden upon the Treasury, and concern no sale of State property. Such ordinances possess provisionally the force of law when they are signed by all the Ministers and are promulgated with express reference to this Clause of the Constitution. Their legal validity lapses if the government fails to submit them for approval to the next Reichsrath, and, in the first place, to the Chamber of Deputies within three weeks of its meeting; or if the ordinances fail to receive the assent of either of the two Houses of the Reichsrath. The Cabinet as a whole is responsible for the immediate abrogation of such ordinances when they have lost their provisional validity.’—H. W. Steed, *Hapsburg monarchy*, pp. 33-36.

1897 (October-December).—Scenes in the Austrian Reichsrath described by Mark Twain.—“Here in Vienna in these closing days of 1897 one's blood gets no chance to stagnate. The atmosphere is brimful of political electricity. All conversation is political: every man is a battery, with brushes overworn, and gives out blue sparks when you set him going on the common topic. . . . Things have happened here recently which

would set any country but Austria on fire from end to end, and upset the government to a certainty; but no one feels confident that such results will follow here. Here, apparently, one must wait and see what will happen, then he will know, and not before; guessing is idle; guessing cannot help the matter. This is what the wise tell you; they all say it; they say it every day, and it is the sole detail upon which they all agree. There is some approach to agreement upon another point: that there will be no revolution. . . . Nearly every day some one explains to me that a revolution would not succeed here. 'It couldn't, you know. Broadly speaking, all the nations in the empire hate the government—but they all hate each other too, and with devoted and enthusiastic bitterness; no two of them can combine; the nation that rises must rise alone; then the others would joyfully join the government against her, and she would have just a fly's chance against a combination of spiders. This government is entirely independent. It can go its own road, and do as it pleases; it has nothing to fear. In countries like England and America, where there is one tongue and the public interests are common, the government must take account of public opinion; but in Austria-Hungary there are nineteen public opinions—one for each state. No—two or three for each state, since there are two or three nationalities in each. A government cannot satisfy all these public opinions; it can only go through the motions of trying. This government does that. It goes through the motions, and they do not succeed; but that does not worry the government much.' . . .

"The recent troubles have grown out of Count Badeni's necessities. He could not carry on his government without a majority vote in the House at his back, and in order to secure it he had to make a trade of some sort. He made it with the Czechs—the Bohemians. The terms were not easy for him: he must pass a bill making the Czech tongue the official language in Bohemia in place of the German. This created a storm. All the Germans in Austria were incensed. In numbers they form but a fourth part of the empire's population, but they urge that the country's public business should be conducted in one common tongue, and that tongue a world language—which German is. However, Badeni secured his majority. The German element was apparently become helpless. The Czech deputies were exultant. Then the music began. Badeni's voyage, instead of being smooth, was disappointingly rough from the start. The government must get the *Ausgleich* through. It must not fail. Badeni's majority was ready to carry it through; but the minority was determined to obstruct it and delay it until the obnoxious Czech-language measure should be shelved.

"The *Ausgleich* is an Adjustment, Arrangement, Settlement, which holds Austria and Hungary together [see AUSTRIA: 1866-1867]. It dates from 1867, and has to be renewed every ten years. It establishes the share which Hungary must pay toward the expenses of the imperial government. Hungary is a kingdom (the Emperor of Austria is its King), and has its own parliament and governmental machinery. But it has no foreign office, and it has no army—at least its army is a part of the imperial army, is paid out of the imperial treasury, and is under the control of the imperial war office. The ten-year rearrangement was due a year ago, but failed to connect. At least completely. A year's compromise was arranged. A new arrangement must be effected before the last day of this year. Otherwise the two

countries become separate entities. The Emperor would still be King of Hungary—that is, King of an independent foreign country. There would be Hungarian custom-houses on the Austrian frontier and there would be a Hungarian army and a Hungarian foreign office. Both countries would be weakened by this, both would suffer damage. The Opposition in the House, although in the minority, had a good weapon to fight with in the pending *Ausgleich*. If it could delay the *Ausgleich* a few weeks, the government would doubtless have to withdraw the hated language bill or lose Hungary.

"The Opposition began its fight. Its arms were the Rules of the House. It was soon manifest that by applying these Rules ingeniously, it could make the majority helpless, and keep it so as long as it pleased. It could shut off business every now and then with a motion to adjourn. It could require the ayes and noes on the motion, and use up thirty minutes on that detail. It could call for the reading and verification of the minutes of the preceding meeting, and use up half a day in that way. It could require that several of its members be entered upon the list of permitted speakers previously to the opening of a sitting; and as there is no time limit, further delays could thus be accomplished. These were all lawful weapons, and the men of the Opposition (technically called the Left) were within their rights in using them. They used them to such dire purpose that all parliamentary business was paralyzed. The Right (the government side) could accomplish nothing. Then it had a saving idea. This idea was a curious one. It was to have the President and the Vice-Presidents of the parliament trample the Rules under foot upon occasion! . . .

"And now took place that memorable sitting of the House which broke two records. It lasted the best part of two days and a night, surpassing by half an hour the longest sitting known to the world's previous parliamentary history, and breaking the long-speech record with Dr. Lecher's twelve-hour effort, the longest flow of unbroken talk that ever came out of one mouth since the world began. At 8.45, on the evening of the 28th of October, when the House had been sitting a few minutes short of ten hours, Dr. Lecher was granted the floor. . . . Then burst out such another wild and frantic and deafening clamor as has not been heard on this planet since the last time the Comanches surprised a white settlement at midnight. Yells from the Left, counter-yells from the Right, explosions of yells from all sides at once, and all the air sawed and pawed and clawed and cloven by a writhing confusion of gesturing arms and hands. Out of the midst of the thunder and turmoil and tempest rose Dr. Lecher, serene and collected, and the providential length of him enabled his head to show out above it. He began his twelve-hour speech. At any rate, his lips could be seen to move, and that was evidence. On high sat the President imploring order, with his long hands put together as in prayer, and his lips visibly but not hearably speaking. At intervals he grasped his bell and swung it up and down with vigor, adding its keen clamor to the storm weltering there below. Dr. Lecher went on with his pantomime speech, contented, untroubled. . . . One of the interrupters who made himself heard was a young fellow of slight build and neat dress, who stood a little apart from the solid crowd and leaned negligently, with folded arms and feet crossed, against a desk. Trim and handsome; strong face and thin features; black hair roughed up; parsimonious moustache; resonant great voice, of good tone and pitch. It

is Wolf, capable and hospitable with sword and pistol. . . . Out of him came early this thundering peal, audible above the storm:

"I demand the floor. I wish to offer a motion."

"In the sudden lull which followed, the President answered, 'Dr. Lecher has the floor.'"

"Wolf. 'I move the close of the sitting!'"

"P. 'Representative Lecher has the floor.' [Stormy outburst from the Left—that is, the Opposition.]

"Wolf. 'I demand the floor for the introduction of a formal motion. [Pause.] Mr. President, are you going to grant it, or not? [Crash of approval from the Left.] I will keep on demanding the floor till I get it.'"

"P. 'I call Representative Wolf to order. Dr. Lecher has the floor.' . . ."

"Which was true; and he was speaking, too, calmly, earnestly, and argumentatively; and the official stenographers had left their places and were at his elbows taking down his words, he leaning and orating into their ears—a most curious and interesting scene. . . . At this point a new and most effective noisemaker was pressed into service. Each desk has an extension, consisting of a removable board eighteen inches long, six wide, and a half-inch thick. A member pulled one of these out and began to belabor the top of his desk with it. Instantly other members followed suit, and perhaps you can imagine the result. Of all conceivable rackets it is the most ear-splitting, intolerable, and altogether fiendish. . . . Wolf went on with his noise and with his demands that he be granted the floor, resting his board at intervals to discharge criticisms and epithets at the Chair. . . . By-and-by he struck the idea of beating out a tune with his board. Later he decided to stop asking for the floor, and to confer it upon himself. And so he and Dr. Lecher now spoke at the same time, and mingled their speeches with the other noises, and nobody heard either of them. Wolf rested himself now and then from speech-making by reading, in his clarion voice, from a pamphlet.

"I will explain that Dr. Lecher was not making a twelve-hour speech for pastime, but for an important purpose. It was the government's intention to push the Ausgleich through its preliminary stages in this one sitting (for which it was the Order of the Day), and then by vote refer it to a select committee. It was the Majority's scheme—as charged by the Opposition—to drown debate upon the bill by pure noise—drown it out and stop it. The debate being thus ended, the vote upon the reference would follow—with victory for the government. But into the government's calculations had not entered the possibility of a single-barrelled speech which should occupy the entire time-limit of the sitting, and also get itself delivered in spite of all the noise. . . . In the English House an obstructionist has held the floor with Bible-readings and other outside matters; but Dr. Lecher could not have that restful and recuperative privilege—he must confine himself strictly to the subject before the House. More than once, when the President could not hear him because of the general tumult, he sent persons to listen and report as to whether the orator was speaking to the subject or not.

"The subject was a peculiarly difficult one, and it would have troubled any other deputy to stick to it three hours without exhausting his ammunition, because it required a vast and intimate knowledge—detailed and particularized knowledge—of the commercial, railroading, financial, and international banking relations existing between two

great sovereignties, Hungary and the Empire. But Dr. Lecher is President of the Board of Trade of his city of Brünn, and was master of the situation. . . . He went steadily on with his speech; and always it was strong, virile, felicitous, and to the point. He was earning applause, and this enabled his party to turn that fact to account. Now and then they applauded him a couple of minutes on a stretch, and during that time he could stop speaking and rest his voice without having the floor taken from him. . . .

"The Minority staid loyally by their champion. Some distinguished deputies of the Majority staid by him too, compelled thereto by admiration of his great performance. When a man has been speaking eight hours, is it conceivable that he can still be interesting, still fascinating? When Dr. Lecher had been speaking eight hours he was still compactly surrounded by friends who would not leave him and by foes (of all parties) who could not; and all hung enchanted and wondering upon his words, and all testified their admiration with constant and cordial outbursts of applause. Surely this was a triumph without precedent in history. . . .

"In consequence of Dr. Lecher's twelve-hour speech and the other obstructions furnished by the Minority, the famous thirty-three-hour sitting of the House accomplished nothing. . . . Parliament was adjourned for a week—to let the members cool off, perhaps—a sacrifice of precious time, for but two months remained in which to carry the all-important Ausgleich to a consummation. . . .

"During the whole of November things went from bad to worse. The all-important Ausgleich remained hard aground, and could not be sparrowed off. Baden's government could not withdraw the Language Ordinance and keep its majority, and the Opposition could not be placated on easier terms. One night, while the customary pandemonium was crashing and thundering along at its best, a fight broke out. . . . On Thanksgiving day the sitting was a history-making one. On that day the harried, bedeviled and despairing government went insane. In order to free itself from the thralldom of the Opposition it committed this curiously juvenile crime: it moved an important change of the Rules of the House, forbade debate upon the motion, put it to a stand-up vote instead of ayes and noes, and then gravely claimed that it had been adopted. . . . The House was already standing up; had been standing for an hour; and before a third of it had found out what the President had been saying, he had proclaimed the adoption of the motion! And only a few heard that. In fact, when that House is legislating you can't tell it from artillery-practice. You will realize what a happy idea it was to sidetrack the lawful ayes and noes and substitute a stand-up vote by this fact; that a little later, when a deputation of deputies waited upon the President and asked him if he was actually willing to claim that that measure had been passed, he answered, 'Yes—and unanimously.' . . .

"The *Lex Falkenhayn*, thus strangely born, gave the President power to suspend for three days any deputy who should continue to be disorderly after being called to order twice, and it also placed at his disposal such force as might be necessary to make the suspension effective. So the House had a sergeant-at-arms at last, and a more formidable one, as to power, than any other legislature in Christendom had ever possessed. The *Lex Falkenhayn* also gave the House itself authority to suspend members for thirty days. On these terms the Ausgleich could be put through in an hour—

apparently. The Opposition would have to sit meek and quiet, and stop obstructing, or be turned into the street, deputy after deputy, leaving the Majority an unvexed field for its work.

"Certainly the thing looked well. . . . [But next day, when the President attempted to open the session, a band of the Socialist members made a sudden charge upon him, drove him and the Vice President from the House, took possession of the tribune, and brought even the semblance of legislative proceedings to an end. Then a body of sixty policemen was brought in to clear the House.] Some of the results of this wild freak followed instantly. The Badeni government came down with a crash; there was a popular outbreak or two in Vienna; there were three or four days of furious rioting in Prague, followed by the establishing there of martial law; the Jews and Germans were harried and plundered, and their houses destroyed; in other Bohemian towns there was rioting—in some cases the Germans being the rioters, in others the Czechs—and in all cases the Jew had to roast, no matter which side he was on. We are well along in December now; the new Minister-President has not been able to patch up a peace among the warring factions of the parliament, therefore there is no use in calling it together again for the present; public opinion believes that parliamentary government and the Constitution are actually threatened with extinction, and that the permanency of the monarchy itself is a not absolutely certain thing!

"Yes, the Lex Falkenhayn was a great invention, and did what was claimed for it—it got the government out of the frying-pan."—S. L. Clemens (Mark Twain), *Stirring times in Austria* (*Harper's Magazine*, Mar., 1898).

1897 (December).—Imperial action.—On the last day of the year the emperor closed the sittings of the Austrian Reichsrath by proclamation and issued a rescript continuing the Ausgleich provisionally for six months.

1898.—Prolongation of factious disorders.—Paralysis of constitutional government.—Though scenes in the Austrian Chamber were not quite so violent, perhaps, as they had become near the close of 1897, the state of factious disorder continued much the same throughout the year, and legislation was completely stopped. The work of government could be carried on only by imperial decrees. The ministry of Baron von Gautsch, which had succeeded that of Count Badeni, attempted a compromise on the language question in Bohemia by dividing the country into three districts, according to the distribution of the several races, in one of which German was to be the official tongue, in another Czech, while both languages were to be used in the third. [See also BOHEMIA: 1848-1897.] But the Germans of the empire would accept no such compromise. In March, Baron von Gautsch retired, and Count Thun Hohenstein formed a ministry made up to represent the principal factions in the Reichsrath; but the scheme brought no peace. Nor did appeals by Count Thun, "in the name of Austria," to the patriotism and the reason of all parties, to suspend their warfare long enough for a little of the necessary work of the state to be done, have any effect. The turbulence in the legislature infected the whole community, and especially, it would seem, the students in the schools, whose disorder caused many lectures to be stopped. In Hungary, too, there was an increase of violence in political agitation. A party, led by the son of Louis Kossuth, struggled to improve what seemed to be an opportunity for breaking the political union of Hungary with Austria, and realizing the

old ambition for an independent Hungarian state. The ministry of Baron Banffy had this party against him, as well as that of the clericals, who resented the civil marriage laws, and legislation came to a deadlock nearly as complete in the Hungarian as in the Austrian Parliament. There, as well as in Austria, the extension of the Ausgleich, provisionally for another year, had to be imposed by imperial decree.

"At the same time, the party regarded it as their obvious duty to emancipate themselves from Rome in a political but not religious sense—that is to say, to free themselves from the influence of the Roman Curia in affairs of state. This boycotted party and program now threatened to win the voluntary or enforced adherence of the advanced section of the other German groups which had hitherto declined to commit themselves to such an extreme policy. The most moderate of all the German parties, that of the constitutional landed proprietors, felt called upon to enter an energetic and indignant protest against the foregoing Pan-Germanic program. While they were convinced supporters of the Austro-German alliance, they unconditionally rejected aspirations which they held to be totally inconsistent with the tried and reliable basis of that agreement, and which would constitute an undignified sacrifice of the independence of the monarchy. They further declined to make their manifestations of loyalty to the sovereign dependent upon any condition; and they strongly condemned the emancipation from Rome movement as a culpable confusion of the spheres of religion and politics, and an infringement of the liberty of conscience which was calculated to sow dissension among the German element in Austria. The opening session of the newly elected Reichsrath was held January 31, and the disorderly temper in it was manifested upon a reference by the president to the death of Queen Victoria, which called out cries of hostility to England from both Germans and Czechs. . . . In the course of the proceedings some of the members of the extreme Czech faction warned the prime minister in threatening terms against introducing a single word hostile to the Czech nation in the coming speech from the throne. They also announced their intention of squaring accounts with him as soon as the speech from the throne should be delivered. The whole sitting did not last an hour, but what happened sufficed to show that not only the Pan-Germanic Union, but also the extreme section of the German People's party and a couple of radical Czechs, were ready at a moment's notice to transform the Reichsrath into a bear garden. On February 4 the two houses of the Reichsrath were assembled at the palace and addressed by the emperor, in a speech from the throne of which the following is a partial report: "His Majesty referred to various features of legislation, including the budget, the revision of the customs tariff, the promotion of trade, industry, and navigation, the protection of the working classes and the regulation of the hours of labour, the government railway projects and the Bosnian lines, and bills for the regulation of emigration, the construction of dwellings for the lower classes, the repression of drunkenness, the development of the university system and other educational reforms, and a revision of the press laws—in fact a whole inventory of the important legislative arrears consequent upon the breakdown of Parliament. The following passage occurs in the further course of the speech: 'The constitution which I bestowed upon my dominions in the exercise of my free will ought to be an adequate guarantee for the development of my people. The finances

of the state have been put in order in exemplary fashion and its credit has been raised to a high level. The freedom of the subject reposes upon a firm foundation, and thanks to the scholastic organization and the extraordinary increase of educational establishments general culture has reached a gratifying standard, which has more especially contributed to the efficiency and intelligence of my army. The provincial diets have been able to do much within the limits of their jurisdiction. The beneficial influence of the constitutional system has penetrated as far as the communal administrations. I am thus justified in saying that the fundamental laws of the state are a precious possession of my loyal people. Notwithstanding the autonomy enjoyed by certain kingdoms and provinces, they constitute for foreigners the symbol of the strength and unity of the state. I was, therefore, all the more grieved that the last sessions of the legislature should have had no result, even if I am prepared to acknowledge that such business as affected the position of the monarchy was satisfactorily transacted by all parties.

"The emperor then expressed his regret that other matters of equal importance affecting the interests of Austria had not been disposed of. His majesty made an appeal to the representatives of the Reichsrath to devote their efforts to the necessary and urgent work awaiting them, and assured them that they might count upon the government. All attempts at the moral and material development of the empire were, he said, stultified by the nationality strife. Experience had shown that the efforts of the government to bring about a settlement of the principal questions involved therein had led to no result and that it was preferable to deal with the matter in the legislature. The government regarded a generally satisfactory solution of the pending language question as being both an act of justice and a necessity of state. Trusting in the good will manifested by all parties, the ministry would do its utmost to promote a settlement which would relieve the country of its greatest evil. At the same time, the cabinet was under the obligation of maintaining intact the unity of language in certain departments of the administration, in which it constituted an old and well-tested institution. Success must never again be sought through paralysing the popular representation. The hindrance of parliamentary work could only postpone or render quite impossible the realization of such aspirations as most deeply affected the public mind. The sovereign then referred to the damage done to the interests of the empire by the obstacles placed in the way of the regular working of the constitution, and pointed to the indispensable necessity of the vigorous co-operation of Parliament in the approaching settlement of the commercial relations between the two halves of the monarchy. The speech concluded with a warmly-worded appeal to the representatives to establish a peace which would correspond to the requirements of the time and to defend as their fathers had defended 'this venerable state which accords equal protection to all its peoples.'" 1899-1901.—Change in ministries.—Continued obstruction by German parties in Austria.—Secession of German Roman Catholics from their church.—Clerical parties.—Decline in the Reichsrath.—In September, 1899, the Austrian ministry of Count Thun resigned, and was succeeded by one formed under Count Clary-Aldrin-

gen. The new premier withdrew the language decrees, which quieted the German obstructionists, but provoked the Czechs to take up the same rôle. Count Clary-Aldringen resigned in December, and a provisional ministry was formed under Dr. Wittek, which lasted only until January 19, 1900, when a new cabinet was formed by Dr. von Körber. In Hungary, Baron Banffy was driven from power in February, 1899, by a state of things in the Hungarian Parliament much like that in the Austrian. M. Koloman Szell, who succeeded him, effected a compromise with the opposition which enabled him to carry a measure extending the Ausgleich to 1907. This brought one serious difficulty of the situation to an end. During most of the year 1899 the German parties in the Austrian Reichsrath continued to make legislation impossible by disorderly obstruction, with the avowed purpose of compelling the government to withdraw the language decrees in Bohemia. A still more significant demonstration of German feeling and policy appeared, in a wide-spread and organized movement to detach German Roman Catholics from their church, partly, it would seem, as a proceeding of hostility to the Clerical party, and partly as a means of recommending the Germans of the Austrian states to the sympathy of the German empire, and smoothing the approach to an ultimate union of some of those states with the Germanic federation. The agitation against the Catholic church is called "Los von Rom."—"The Church in Austria is less a State Church than an ecclesiastical department of the State, working like the army, the bureaucracy, and the police in the interests of 'government.' The 'Los von Rom,' or rather 'Los von Habsburg' movement . . . led to the formation of clerical societies, notably the Societies of St. Boniface and St. Raphael, to combat anti-Catholic and anti-Habsburg tendencies and to support a German race-movement on Catholic lines. The Heir-Apparent, Archduke Francis Ferdinand, accepted the protectorship of a Catholic *Schulverein* or Schools Association; Dr. Lueger and his Christian Social followers attacked the preponderance of anti-Clerical and Jewish influence in the Universities; and subsequently the *Piusverein* was founded to support the Catholic anti-Jewish press, several of whose organs gradually acquired considerable circulation and influence. . . . The 'Los von Rom' peril having been warded off, the Clerical organizations engaged in a violent and sometimes thoroughly unscrupulous campaign against Social Democracy, whose progress had inspired uneasiness in the highest quarters."—H. W. Steed, *Hapsburg monarchy*, pp. 106-107, 116-117.—From the parliamentary elections held in January the Clerical and anti-Semitic parties came back to the Reichsrath shorn of about one-third of their strength, while the various radical factions, especially those among the Germans, appear to have made considerable gains. Even in the Tyrol, one of the strongest of the Clerical leaders, Baron Di Pauli, was defeated, and in Vienna the anti-Semitic majority was cut to less than one-fourth of what it had been three years before.

1900 (February).—Attempted pacification of German and Czech parties by a conciliation board.—"On Monday last [February 5] the German and Czech Conciliation Board met for the first time in Vienna, under the presidency of the Austrian Premier, Dr. von Körber, and conferred for two hours. . . . Dr. von Körber is at the head of what may be called a 'business' Ministry, composed largely of those who had filled subordinate offices in previous Ministries. It was hoped, perhaps, that, since the leading politicians with a

political 'past' could apparently do nothing to bring about a settlement, men with no past, but with a capacity for business, and in no way committed on the racial question, might do better in effecting a working arrangement. The appointment of this Conciliation Board seemed a promising way of attempting such a settlement. Dr. von Körber opened Monday's proceedings with a strong appeal to both sides, saying: 'Gentlemen, the Empire looks to you to restore its happiness and tranquillity.' It cannot be said that the Empire is likely to find its wishes fulfilled, for when the Board came down to hard business, the old troubles instantly revealed themselves. The Premier recommended a committee for Bohemia of twenty-two members, and one for Moravia of fifteen members, the two sitting in joint session in certain cases. Dr. Engel then set forth the historical claims of the Czechs, which immediately called forth a demand from Dr. Funke, of the German party, that German should be declared the official language throughout Austria. Each speaker seems to have been supported by his own party, and so no progress was made, and matters remain in 'statu quo ante.' The singularly deficient constitution of this Board makes against success, for it seems that the German Nationalists and Anti-Semites have only one delegate apiece, the Social Democrats were not invited at all, while the extreme Germans and extreme Czechs, apparently regarding the Board as a farce, declined to nominate delegates to its sittings. . . . There is unhappily little reason for believing that the Board of Conciliation will effect what the Emperor himself has failed to accomplish."—*Spectator* (London), Feb. 10, 1900.

1900 (September-December).—Economic decline. See AUSTRIA-HUNGARY: 1900 (September-December).

1900-1904.—Cessation of obstruction during the Koerber ministry.—Administration of public finance.—"The Austrian Chamber has never revised or rejected an Imperial ordinance issued under the Emergency Paragraph. It has never seriously called a blameworthy ministry to account for abuse of its powers; and when, under the Koerber Ministry of 1900-1904, obstruction ceased for a time and supply was normally voted, this result was obtained not by a revival of Constitutional feeling on the part of the Chamber of Deputies, but by the announcement of an enormous programme of railway and canal construction, estimated to cost some £40,000,000 and costing in reality as much again. All the chief parties then sank their differences for a time in order to feed at the Government manger. Not even the provision that the Emergency Paragraph may not be used 'to place any permanent burden on the Treasury' has been respected in practice. . . . Tezner rightly deploras the dangers to which the administration of public finance in Austria is thus exposed, and points out that it would be difficult to find, even in the absolutist epochs of Austrian history, a parallel for the Imperial Ordinance of July 16, 1904, by which suits pending before the Imperial Tribunal against the Treasury, were simply quashed because previous decisions of the Tribunal in similar cases had rendered a condemnation of the Treasury probable. Though this denial of justice was committed by Imperial Ordinance, the absolutist spirit from which it proceeded was rather that of the bureaucracy than

that of the Monarch. Between these two absolutisms the difference is considerable, and, of the two, Imperial absolutism is the less insidious."—H. W. Steed, *Hapsburg monarchy*, pp. 38, 30.

1905-1911.—Suppression of Socialist agitations for universal suffrage.—Press muzzled.—"In the autumn of 1905 a Socialist manifestation in favour of universal suffrage was violently suppressed; blood was shed and arrests were made. But within a week the wind in the higher regions had changed, and the Government had veered round in favour of universal suffrage. A huge Socialist demonstration was organized in agreement with the police which was instructed by the Government to evacuate the main thoroughfare of Vienna, the Ringsrasse, and to leave it for several hours entirely to the Socialists. The police guarded only the Hofburg or Imperial Palace. In the autumn of 1911, a Socialist agitation of which the Government did not approve was directed against the Agrarians and the rise in the prices of food for which the Agrarians were held responsible. The police and the military suppressed it with vigour, a number of lives being lost. On this occasion the Courts inflicted severe sentences upon boys not out of their teens, and punished with long terms of imprisonment any culprit who confessed that he had thrown a stone. . . . The Austro-Hungarian press is almost entirely under official control when dealing with questions of foreign policy and that the public rarely gets an inkling of the merits of a situation that may involve the country in war. During the Morocco crisis of 1905-1906, Austro-Hungarian ignorance of the position of affairs in Europe was complete. Not until after the Conference of Algeciras in April 1906, did any Austrian journal lay before its readers an intelligible account of the origin and course of the crisis. The German Press Bureau conducted its campaign against France and England even more in Austro-Hungarian than in German journals. Even when, after the diplomatic defeat of Germany at Algeciras, the *Neue Freie Presse* allowed M. Georges Clemenceau to state in its columns the bare facts concerning the recent past—facts that gave the lie to the inventions which the *Neue Freie Presse* and its contemporaries had previously foisted upon the public—it continued tranquilly its campaign of conscious untruthfulness and left its readers bewildered. Similarly, before and during the annexation crisis of 1908-1909, Austrian journals, under the influence of Count Aehrenthal's Press Bureau, rigorously excluded from their columns all information contrary to the official thesis, and waged war, not only against Russia and Serbia, but against the best interests of the Monarchy itself. Nemesis overtook the Press Bureau and its organs during the recent Balkan war. Events belied official and semi-official doctrine so rapidly and unmistakably that the public actually awoke to the situation and understood for a moment the deleterious effects, moral and material, of Government control of the press and of the constant inoculation of the public mind with mendacious statement and misleading suggestion."—H. W. Steed, *Hapsburg monarchy*, pp. 96, 110-200.

1906-1909.—Reformed electoral law of Austria.—"December 1906 saw the passing of the law which granted the franchise to every male Aus-

trian citizen over twenty-four years of age and resident for at least a year in the place of the election; each elector had only one vote. The number of deputies was now increased from 425 to 516. It was a vast unprepared revolution, a new and unlooked-for freedom, described by some one as a leap in the dark. Conjectures as to its results seemed impossible, because with the abandonment of the old electoral system of the *curiae* a new army of millions of electors entered the field, and because, too, by the new arrangement established in the constituencies new conditions were created for the elections. The constituencies, which under the new system are divided into town and country districts, have not all—as in Germany—the same number of voters, but a varying quantity, ranging from 12,000 to 80,000; thus relatively the towns elect more deputies than the rural districts. The new Parliament had two great tasks before it: the final suppression of the nationalist wars and the introduction of an active and productive popular social policy—in short, the complete cure of the two maladies which had destroyed and killed the old Chamber of Privileges. Every one hoped that it would accomplish them. The General Election was announced for May 1907. An obscure, interminable crowd rose up from the depths. In the last elections of 1897, under the old system 1,217,993 electors recorded their votes; in 1907, 4,615,020 voters went to the poll. The people were animated by a new and lively spirit. Under the former régime the political life of the country and its Parliament had left the masses cold and indifferent; the average percentage of voters in the fifth *curia*, which, as we have said, practically gave the franchise to every Austrian citizen, did not exceed 34 per cent. In 1907 the number of those voting was 82 per cent.; in certain provinces it increased enormously—in Dalmatia from 4 to 48 per cent.; in Galicia from 33 to 85 per cent.; in the Bukovina from 13 to 69 per cent. Under this formidable popular pressure the old political world broke up completely. In the former system of the privileged classes there were only individuals—there was no definite party idea: a small group supported each individual who then represented its interests. With universal suffrage the modern principle of party politics became a necessity. The general party idea, expressed in a programme intelligible to every one, was the only thing which appealed to the bulk of the electors, who had no personal knowledge of the candidate for whom they voted. Again: in the open competition of universal suffrage the real organizations would naturally triumph over the fluctuating electoral circles of the former parties. This explains the marvellous and unexpected triumph of the two new elements, really the only ones which formed a solid party: the Christian Socialists and the Socialists. Both of them commanded vast economic organizations, which now became powerful political forces. The representatives of the former in the Chamber rose from 27 to 66, those of the latter from 11 to 86. In 1907 no Parliament in Europe had a Socialist party so strong as the Austrian one. . . . On the other hand, the old political ranks were decimated. Notwithstanding the addition of nearly a hundred seats in Parliament, only a third of the former members were returned. The three dominant groups of the old Chamber fell to pieces: of the 45 Young Czechs of former days only 4 were re-elected at the first count, of the 100 and more German Liberals only 60 survived, while the proud Polish nobility disappeared altogether. Even the very Ministers of the old Parliament, who had prepared the suffrage reform, fell before

the rising tide of the new people. The Parliament of Universal Suffrage was divided into two great parties: the 'Red' or Socialist and the 'Black' or Christian Socialist (or Clerical). The 'Blue' represented by the Agrarian nobility had disappeared. It was called the 'Small Man's Parliament,' and, in truth, rested entirely on the lower strata. The great majority of its electors belonged to the lowest categories as regards incomes, those ranging from a mere daily wage to an annual return of 3,000 crowns (£125). Politically, this was certainly its weak point, but at the same time it might have become its strength socially. In all important European Parliaments, even those elected by a democratic suffrage, there is always a select minority, representing the rich and cultured classes, which directs the general policy and legislation. In the German Reichstag, side by side with the Socialists and the Clericals, there is still [1915] a Conservative party of Protestant Agrarians and a National Liberal party representing the interests of industry, trade, and circulating capital. In the new Austrian Parliament, on the other hand, the 'Blacks' and the 'Reds' were not longer opposed by another real cohesive group, but by little ghosts of parties. Above all, that intermediate element known as Liberal was lacking. Capital, industry, trade, and culture, represented principally by the old German Liberal middle classes, had been turned out. The host of small people, risen at one bound, was entirely new to politics and below the average level of education. Twenty-five of the deputies were professors in a university or in higher-grade schools, 106 were professional men, more than 40 were priests; the remainder were recruited from school-masters, artisans, and workingmen, many of whom, being editors of small technical newspapers, posed as journalists. Any valuable elements that still remained were almost all a legacy from the old régime. Socially, the Austrian Parliament of 1907 should have possessed a formidable new power; it was united and homogeneous on the economic and social side as it had never been before. The two victorious parties, the Christian Socialists and the Socialists, at the opposite poles in their political opinions, in their social spirit, on the other hand, seemed to meet and be at one. Both of them, springing from the working classes, the peasants, and the small tradespeople, represented the poor. They stood for an economic Radicalism, surmounting racial antagonisms, and they professed a political Radicalism in their programme. Had the policy of the new Parliament been directed on the basis of statistical data, on the relative strength of the different parties, it would have meant a complete change and renewal. In its composition the Chamber of Universal Suffrage seemed to possess all the conditions necessary for the great popular social reforms that were expected from it. The speech from the Throne solemnly announced them; the people's hopes were raised. It was the dawn of freedom and progress, a thrilling historic moment for the new Austria. Time went by, however, and disillusionment commenced. The stuff the new Chamber was made of was quickly seen. The appointment of the first President, Weisskirchner—a man without individuality, drawn from that Christian Socialist party which has its stronghold in the Municipal Council of Vienna, and nominated for the position by the Burgomaster Lueger, whose creature he was—denoted the complete subjection of the Austrian Empire to the Municipal Council of the capital. The years passed, still the Parliament lived and discussed, the newspapers dedicated long reports to it, but the hoped-for reforms still tarried. At the end of four years

the net result of its labours could be summed up in one word: Nothing. Beyond the compromise with Hungary, the Austrian Chamber had proved itself absolutely incapable of accomplishing anything new. A general and radical reform of the State and provincial finances was promised; they did not even attempt to discuss it; there was not even, one may say, a real general debate on the Budget. When money was needed recourse was had to small makeshift remedies to safeguard the fiscal interests alone, while new taxes and new debts were sanctioned. A promise had been given of a revision of administration and justice, a remodelling of the bureaucracy, of the civil and penal laws, survivals from other times, and of outworn laws relating to the Press and to Friendly Societies; but nothing got beyond commissions and subcommissions, if even so far as that. A new active social policy had been promised, a magnificent scheme of insurance for the working classes, for old age, and for sickness was proposed, and it was not passed nor even pushed forward for decision. The task of the Parliament of Universal Suffrage reduced itself merely to dispatching day by day the immediately necessary business, with provisional legislation renewable at short notice. Meanwhile the old national struggles had begun afresh; the policy of obstruction was regularly practised by the Czechs, who once (December 15-19, 1909) by their continuous lengthy speeches contrived that a session should last uninterruptedly for eighty-six hours. The old spirit remained unchanged. The Socialist party was unable to defend the liberty of education, to break the all-powerful Clerical monopoly of the schools, or to save the mass of the town-dwellers from the tragic rise in the cost of living caused by the unbridled egoism of the Agrarian party. No Liberal party knew how to profit by the critical and decisive moments—when there was urgent need of money or of a reform of the army at enormous cost—to strengthen its constitutional rights against the superior powers. Even the popular impetus which should have flooded and inspired the whole of the new policy was lacking. Thirty years ago the Parliament of the *Civix* fiercely opposed the occupation of Bosnia, several times even provoking the intervention of the Crown; the new Peoples' Parliament meekly ratified the annexation, costing some 500,000,000 crowns (about £20,800,000).—V. Gayda, *Modern Austria: Its racial and social problems*, pp. 52-57.—See also AUSTRIA-HUNGARY: 1905-1906.

1907.—Effects of universal and equalized suffrage in Austria.—Elections were held in Austria a few months after the passage of the law which introduced equal and universal male suffrage, and the character and disposition of the elected Reichsrath, which met in June, 1907, afforded indications of some remarkable effects from the extension and equalizing of the franchise. It was expected, of course, to popularize the Reichsrath, and break the domination of the upper classes in that body; but, according to reports, it has done much more. Prior to 1896, the members of the *abgeordneten* or lower house of the Reichsrath, then numbering 353, were all divided into four sections, elected by four classes of people. The new law swept away the whole system of a classified representation, and the representative house was leveled to one footing, as a body of deputies from the people at large. The most conspicuous effect of this in the elections appears to have been a sudden break of the power which the German element in the much-mixed population of the Austrian dominion had been able to exercise hitherto. Hence, it must be the fact that the Germans held far more than

their proportion of the property which the old system represented, and derived from that, formerly, a weight in the Reichsrath which their numbers cannot give them on the equalized vote. Altogether, in the various Cisleithan states—the two Austrias proper, Bohemia, Moravia, Galicia, Silesia, Salzburg, Tyrol, Styria, Carinthia, Carniola, Istria, Dalmatia—they formed a little more than one third of the total population, the other two thirds being mainly Slavonic, in many divisions, principally Czech, Polish, and Slovene.—See also SUFFRAGE, MANHOOD: Austria.

1909.—Language quarrel in Austria.—“Amid deafening uproar from the Czech Radicals, the Austrian premier has submitted to the Chamber [February 3, 1909] two bills for the regulation of the Bohemian language question. The bills, which in present circumstances appear to have little chance of becoming law, divide Bohemia into 239 judicial and 20 administrative districts. Of the former, 95 are German, 138 Czech, and the remainder mixed, while of the administrative districts five are German, 10 Czech, and five mixed. In the German districts German is to be the predominant language, and in the Czech districts Czech, while in the mixed districts, which include Prague, the two languages are placed on an equal footing. Provision is, however, made for the use of either language if necessary throughout the whole province.”—*N. Y. Evening Post*.

A telegram to the same journal from Vienna, March 10, reported: “The Lower House of the Austrian Parliament, which closed on February 5, after a scene of extraordinary turbulence arising from old racial ill-feeling between the Germans and the Czechs, reopened to-day with every promise of a continuance of the disorders. The galleries of the House were crowded with partisans of the two factions, and as soon as the ministers appeared hostile shouts came from the Czech and radical benches, drowning the cheers of the members of the Left party and the Poles.

“Premier von Bienerth, amid an incessant tumult, declared the nineteenth session opened, saying he hoped the work would be crowned with success and the proceedings not disturbed. His statement sounded ironical in face of the unbroken uproar.”

The following is a later press despatch, November 2, from Vienna: “The Emperor has accepted the resignations of the two Czech Ministers in the Austrian Cabinet, and has sanctioned the laws adopted by the Diets of Upper and Lower Austria, Salzburg and Vorarlberg, to establish the unilingual German character of those provinces. In the name of the Czech people the Czech National Council addressed yesterday a telegram to the Emperor begging that the laws might not be sanctioned, since, runs the telegram, they affect the honour of the Czech people and must cause constant racial strife both in the provinces and in Vienna, ‘which is not only the capital of Lower Austria, but is also the capital of the whole empire and of all its races. These laws are a dangerous beginning of constitutional changes in your Majesty’s glorious empire.’ A copy of the telegram was sent to the Polish leader, Dr. Glombinski, with an ‘expression of the deepest regret that members of the Polish party should have supported as Ministers these anti-Slav laws.’”

A revival of turbulent obstruction to legislative proceedings in the lower house of the Austrian

Reichsrath led, at last, in December, to the enactment of rules which so enlarged the powers of the speaker as to enable him to suppress factious obstruction and to suspend deputies who outrage the decencies of behavior in the Chamber. The measure was limited in its operation to a year, but was expected to be prolonged.

1916 (November 21).—Death of the Emperor Francis Joseph. See AUSTRIA-HUNGARY: 1916 (November 21).

1916-1917.—Accession of Charles I.—Great interest was centered on the appearance of Charles I (emperor of Austria and king of Hungary), before the Reichsrath in the spring of 1917. The youthful monarch (twenty-nine years old at the coronation) succeeded his great-uncle, Francis Joseph I (whose reign up to his death lasted for sixty-eight years), on November 21, 1916. With war raging for over two years on all the fronts of the empire, Emperor Charles' address vaguely held forth promises of giving recognition to the aspirations of the people in Galicia and the kingdom of Bohemia. He alluded to the new phase the Russian situation had taken and declared that Austria-Hungary was always ready to extend a helping hand to its neighbor on the East, at the same time inferring that with another such loss to the Allies the "good end of the war will be achieved."—He also declared, "I shall always be a just, affectionate, and conscientious ruler of my dear peoples in the sense of the constitutional idea which we have taken over as a heritage from our forefathers, and in the spirit of that true democracy which during the storms of the world war has wonderfully stood the ordeal of fire in the achievements of the entire people at home and at the front."—See also AUSTRIA-HUNGARY: 1916-1917.

1918-1919.—New political factions.—Abdication of Charles I.—Karl Seitz elected president.—The signing of the armistice on November 11, 1918, brought out four political groups striving for ascendancy in German Austria. One of these was the German National Committee, of which a number of Socialists like Herr Seitz were members. Another was the Viennese Democrats who were opposed to any union with Germany. The third group was chiefly made up of workmen who held extreme views, and lastly, a party headed by Cardinal Piffl, which was aiming, through underground methods, at the restoration of the monarchy. This plot was soon discovered and Cardinal Piffl was placed under guard. At the

very outset German Austria voiced its desire to be annexed by Germany. Under Secretary of State Bauer at Vienna, in a telegram to Commissioner Haase of Berlin, declared on November 15, 1918, "German Austria has given expression to its will to be united again with the other parts of the German Nation from which it was forcibly separated fifty-two years ago." The telegram also urged that negotiations for such a union be entered into without delay. "Austrian general elections were held on February 15, 1919, with four million men and women participating. The National Constituent Assembly, thus chosen, convened on March 4, its membership comprising 70 Social Democrats, 64 Christian Socialists (Clericals), and 91 adherents of minor groups. Karl Seitz, leader of the Social Democrats, was elected president; a coalition ministry of Social Democrats and Christian Socialists was formed under Karl Renner as chancellor; and a republican constitution for German Austria was drafted and subsequently adopted. [See below 1920 (October-December)]. Ex-Emperor Charles [who had abdicated November 12] sought refuge in Switzerland in March, 1919."—C. J. H. Hayes, *Brief history of the great war*, p. 356.—See also AUSTRIA-HUNGARY: 1918: German Austria becomes a republic.

1919 (June).—Boundaries with Germany fixed at Peace Conference.—Independence recognized by Germany. See VERSAILLES, TREATY OF: Part II; Part III: Section VI.

1919.—Austrian settlement.—Treaty of St. Germain (Sept. 10, 1919).—"The preliminary draft of the Austrian Treaty had been presented to the enemy delegates on June 2. The terms were regarded in Vienna as a 'death sentence,' and the government strove desperately to secure some amelioration. The remnant of the Austrian Empire, however, which constituted the republic with which the Allies were dealing was bankrupt, starving, and threatened with revolution, and it was in no position to resist. [For reduced dominions, see EUROPE: Modern Period: New map of Europe.] The attitude of the Austrian negotiators was more conciliatory than that of the Germans had been, and as a result of the exchange of notes during July and August some concessions were made by the Allies. France, however, remained firm in refusing to permit a union with Germany. The Allies pointed out to the Austrian Germans their responsibility in forcing the war, and insisted that the plight in which they now found themselves was the natural and inevitable outcome of their prolonged 'policy of ascendancy' within the old empire. With bitterness of spirit the Austrian Assembly bowed to the inevitable, and voted to accept the Treaty, though they protested particularly at the detachment of the Germans of Bohemia and the Tyrol, and at the prohibition of union with Germany, which they asserted violated the terms of the armistice. They also declared that the reparation clauses were impossible of fulfilment. On September 10 the Treaty was signed at St. Germain. By joining in this act, China became a member of the League of Nations. Rumania refused at the time to sign the Treaty, because of its references to future agreements guaranteeing the rights of minorities. On December 9, after considerable discussion, Rumania agreed to the wishes of the Allies and the next day signed the Treaties with Austria and Bulgaria, and the special treaty dealing with minorities within Rumania. [See RUMANIA: 1919: Rumania's treatment at Paris.] The Jugo-Slavs also withheld their signature from the Treaty with Austria."—A. P. Scott, *Introduction to the peace treaties*, pp. 211, 223.—See also ST. GERMAIN,

TREATY OF.—The treaty was signed on Sept. 10, 1919; it delimited the boundaries of German-speaking Austria to comprise the states of Upper and Lower Austria, Styria, Carinthia, Salzburg, Northern Tyrol and Vorarlberg.

1919.—Attitude on question of Fiume.—Disputes with Italy. See **FIUME: 1919:** Orlando's withdrawal from the Peace Conference.

1919 (September).—**Protest against the treaty.**—**Economic distress.**—"Confined within the narrow boundaries of a few provinces, with a starving, unemployed population dependent for food and coal upon none too friendly neighboring countries and subject to the ravages of disease, with trade completely paralyzed and a government drifting helplessly toward bankruptcy, the remnant of the former Austrian Empire has had a desperate struggle for existence during the year under review. On September 6 the National Assembly by a vote of 97 to 23 accepted under protest the Treaty of St. Germain . . . which was later ratified, the German party being a unit in opposition. Following the disposition of the treaty the cabinet was reorganized; Dr. Karl Renner, the Chancellor, became Minister of Foreign Affairs; Herr Jodok Fink, Vice-Chancellor; Herr Eldersch, Interior; Dr. Rudolph Ramek, Justice; Dr. Julius Deutsch, Military Affairs; Dr. Richard Reisch, Finance; Herr Stockler, Agriculture; Herr Zerdik, Commerce; Herr Paul, Transportation; Herr Hanusch, Social Administration; Dr. Johann Lowenfeld, Food Supplies; Professor Michael Mayr, Constitutional and Administrative Reforms. Despite this reorganization, conditions did not improve. During November it was reported that in Vienna alone 100,000 men were unemployed, 6,000 families homeless, 2,500,000 persons on the verge of starvation, and 80 per cent of the children suffering from rickets. . . . A long-anticipated political upheaval came on June 11, when the cabinet tendered its resignation. For some weeks before, the Left had felt that the Christian Socialist or government party has steadily blocked legislation to which the former were pledged, but the crisis was hastened when at Epatz gendarmes fired into a crowd which was demonstrating against profiteering in food and many were killed. The government was accused of blocking an investigation and punishment of the soldiers. Reports of a strong movement in Tyrol, Salzburg and portions of Upper Austria to join Bavaria and create a Catholic kingdom under Prince Rupprecht contributed to the fall of the government. Anti-Semitic demonstrations as well as threatened monarchist uprisings frequently occurred during the last months of the year."—E. D. Graper and H. J. Carman, *Record of political events (Political Science Quarterly, Sept., 1920).*

1919-1921.—Unemployment insurance. See **SOCIAL INSURANCE:** Recent developments: 1919-1921; Later unemployment insurance legislation.

1920.—Resignation of Chancellor Renner.—**Mediation of President Seitz.**—The long drawn out struggle within the coalition between the Social Democrats and the Christian Socialists came to a climax when Chancellor Renner and his Social Democratic colleagues resigned from the cabinet on June 11. The resignation was a direct result of the attack made on the minister of war, Herr Deutsch, in the National Assembly, because of the latter's new Army decree, which was ve-

hemently denounced, both by the Christian Socialists and the Pan-Germans, who were bitterly opposed to the provision making the soldiers' councils of the new army immune from all supervision of officers. The Pan-Germans and the Christian Socialists charged that the purpose of the provision was evidently to destroy discipline and to bolshevize the army. Rather than give in to the Social Democrats the Christian Socialists threatened to resign from the cabinet. This step was, however, anticipated by the Social Democrats who themselves withdrew from the cabinet. In order to understand the underlying causes of the break in the coalition government, the fundamental differences in the program of the two important groups of the coalition must be remembered. The Social Democrats are primarily advocates of a constitutional settlement of the federalization of the important industries along centralistic lines. The Christian Socialists also avowed a policy for federalization, but demanded on the other hand, that provinces be given autonomy in the matter. Then, too, while the Social Democrats looked toward a union with Germany the Christian Socialists strictly opposed that scheme. A faction of the latter group openly demanded that a new Austro-Bavarian monarchy be formed, with a Hapsburg on the throne. Dr. Heim, leader of the Bavarian Catholic Peasant party and acting as dictator of Bavaria, supported this plan, it being favored particularly by the agricultural people of Tyrol and Salzburg. The Social Democrats, charged that the Christian Socialists were deliberately obstructing the work of the National Assembly and that they are also scheming jointly with the reactionaries of Hungary and Bavaria. The split which brought about Chancellor Renner's withdrawal from the cabinet was hastened also by the boycott declared against Hungary by international labor. While the Social Democrats supported the blockade in every possible way, the Christian Socialists bitterly opposed it. In order to solve the crisis a proposal was made to the effect that a bourgeois block be formed in which the Christian Socialists, the Pan-Germans and other less important anti-Socialist factions should form their own cabinet. Another suggestion called for the dissolution of the assembly and a new general election. Both proposals were welcomed by the Social Democrats, particularly the first one, since they argued that the bourgeois coalition would soon find itself helpless and thus leave the field open for a clear working class government. In the interim, however, the president of the republic, Herr Seitz, took matters in hand by acting as mediator in negotiations between the two opposing factions. The negotiations, which closed on July 4 with a compromise, provided for a so-called "concentrated cabinet." This new cabinet was to be made up of representatives of all parties and proportionally to each party's strength in the assembly. Thereupon Chancellor Renner was urged to retain his former post, and, in addition, the portfolio of foreign affairs. Renner consented to resume his work and the crisis was averted.

1920.—Intentions in Albania.—**Admitted to League of Nations.** See **ITALY: 1920 (June);** and **LEAGUE OF NATIONS:** First meeting of the assembly.

1920.—New ministry.—**Census statistics.**—**Treaty with Rumania.**—The second cabinet of the Austrian republic was formed under the leadership of the Christian Socialist, Dr. Mayr. An innovation was introduced in the process of selecting the candidates, who were elected by their respective parties on the basis of proportional representation in the Assembly, instead of, as

heretofore, being appointed by the president. This departure was the outcome of the compromise effected by President Seitz between the Christian Socialists and the Social Democrats. The head of the cabinet holds the portfolio of constitutional reform and does not bear the title of chancellor. A census of the republic taken on Jan. 31, 1920, revealed a population of 6,067,430—a decrease in the same territorial limits of 227,209 since the previous (1910) census. The population of Vienna, the capital, was 1,842,000, against 2,149,800 just before the outbreak of the war in 1914.

A commercial treaty with Rumania, to hold for one year, was concluded. Among the provisions for commercial exchange Rumania agreed to furnish Austria with oil, cereals, and raw material, receiving railroad supplies, manufactured products and agricultural machinery in return.

1920 (October-December).—**Constitution adopted.**—President Hainisch elected.—On Oct. 1, 1920, a constitution was adopted for the Austrian republic which provided for a president chosen by the two houses (*Nationalrat and Bundesrat*) for a term of four years. In accordance with this provision President Michael Hainisch was elected to office on Dec. 9, 1920. Dr. Michael Mayr was appointed State Chancellor and Minister of Foreign Affairs.

1921 (August 23).—**Treaty of Peace with United States.** See U. S. A.: 1921 (July-August): Peace with Germany and Austria.

1921.—**Incorporation of provinces in Jugo-Slavia.** See BALKAN STATES: 1921: Jugo-Slavia.

AUSTRIA, Constitution of.—Principal provisions.—The new constitution of the Austrian republic was framed in a series of legal enactments during 1919 and 1920. Austria was declared a federal democratic republic comprising eight states,

namely, seven provinces and the city of Vienna. The basic law established the federal legislature to consist of two chambers, the National Council or Diet (*Nationalrat*), to be elected by universal suffrage on the basis of proportional representation, and the Federal Council (*Bundesrat*), to be chosen by the Landtags of the states. The National Council serves four years and its enactments are subject to a strictly limited veto power of the Federal Council, which consists of forty-six delegates, apportioned as follows: Lower Austria (*Niederösterreich*), twenty-two—city of Vienna twelve and the province ten; Upper Austria and Styria (*Oberösterreich und Steiermark*), six each; Carinthia (*Kärnthen*), Salzburg, Tyrol and Vorarlberg, three each. The German portion of Western Hungary, named Burgenland, awarded to Austria by the Treaty of Saint-Germain (q. v.) was still unrepresented in the National Council at the close of 1921. The two councils in joint assembly constitute the Federal Assembly, whose sole functions are to elect the president and to declare war. The president's term is four years, and he may be re-elected only once. The cabinet is chosen by the National Council, to which it is responsible. Each province has a Provincial Assembly (*Landesversammlung*) consisting of a single chamber also elected by universal suffrage. Local government—education, agriculture, charities, ecclesiastical affairs, public works, etc., fall within the scope of the Provincial Assemblies, each of which is headed by a committee or *Landesausschuss*. Each commune is represented by a council to manage its affairs and to select the *Bürgermeister* (mayor) from its members.

AUSTRIA-HUNGARY

Introduction.—The defeat of Austria by Prussia in 1866 awoke the Empire to the necessity of reconstructing its political organization so as to grant Hungary national existence, which had been denied that country for twelve years. Consequently an arrangement was concluded by Francis Deak, Count Andrassy and Count Beust which transformed the centralized Austrian Empire into the dual Austro-Hungarian Monarchy.

1866.—**Austro-Hungarian monarchy.**—Its new national life.—Its difficulties and promises.—Its ambitions and aims in southeastern Europe.—“Peace politicians may say that a war always does more harm than good to the nations which engage in it. Perhaps it always does, at any rate, morally speaking, to the victors; but that it does not to the vanquished, Austria stands as a living evidence. Finally excluded from Italy and Germany by the campaign of 1866, she has cast aside her dreams of foreign domination, and has set herself manfully to the task of making a nation out of the various conflicting nationalities over which she presides. It does not require much insight to perceive that as long as she held her position in Germany this fusion was hopeless. The overwhelming preponderance of the German element made any approach to a reciprocity of interests impossible. The Germans always were regarded as sovereigns, the remaining nationalities as subjects; it was for these to command, for those to obey. In like manner, it was impossible for the Austrian Government to establish a mutual understanding with a population which felt itself attracted—alike by the ties of race, language,

and geographical position—to another political union. Nay more, as long as the occupation of the Italian provinces remained as a blot on the Imperial escutcheon, it was impossible for the Government to command any genuine sympathy from any of its subjects. But with the close of the war with Prussia these two difficulties—the relations with Germany and the relations with Italy—were swept away. From this time forward Austria could appear before the world as a Power binding together for the interests of all, a number of petty nationalities, each of which was too feeble to maintain a separate existence. In short, from the year 1866 Austria had a *raison d'être*, whereas before she had none. . . . Baron Beust, on the 7th of February, 1867, took office under Franz Joseph. His programme may be stated as follows. He saw that the day of centralism and imperial unity was gone past recall, and that the most liberal Constitution in the world would never reconcile the nationalities to their present position, as provinces under the always detested and now despised Empire. But then came the question—Granted that a certain disintegration is inevitable, how far is this disintegration to go? Beust proposed to disarm the opposition of the leading nationality by the gift of an almost complete independence, and, resting on the support thus obtained, to gain time for conciliating the remaining provinces by building up a new system of free government. It would be out of place to give a detailed account of the well-known measure which converted the ‘Austrian empire’ into the ‘Austro-Hungarian monarchy.’ It will be necessary, how-

ever, to describe the additions made to it by the political machinery. The Hungarian Reichstag was constructed on the same principle as the Austrian Reichsrath. It was to meet in Pesth, as the Reichsrath at Vienna, and was to have its own responsible ministers. From the members of the Reichsrath and Reichstag respectively were to be chosen annually sixty delegates to represent Cisleithanian and sixty to represent Hungarian interests—twenty being taken in each case from the Upper, forty from the Lower House. These two 'Delegations,' whose votes were to be taken, when necessary, collectively, though each Delegation sat in a distinct chamber, owing to the difference of language, formed the Supreme Imperial Assembly, and met alternate years at Vienna and Pesth. They were competent in matters of foreign policy, in military administration, and in Imperial finance. At their head stood three Imperial ministers—the Reichskanzler, who presided at the Foreign Office, and was ex officio Prime Minister, the Minister of War, and the Minister of Finance. These three ministers were independent of the Reichsrath and Reichstag, and could only be dismissed by a vote of want of confidence on the part of the Delegations. The 'Ausgleich' or scheme of federation with Hungary is, no doubt, much open to criticism, both as a whole and in its several parts. It must always be borne in mind that administratively and politically it was a retrogression. At a time in which all other European nations—notably North Germany—were simplifying and unifying their political systems, Austria was found doing the very reverse. . . . The true answer to these objections is, that the measure of 1867 was constructed to meet a practical difficulty. Its end was not the formation of a symmetrical system of government, but the pacification of Hungary. . . . The internal history of the two halves of the empire flows in two different channels. Graf Andrassy, the Hungarian Premier, had a comparatively easy task before him. There were several reasons for this. In the first place, the predominance of the Magyars in Hungary was more assured than that of the Germans in Cisleithania. It is true that they numbered only 5,000,000 out of the 16,000,000 inhabitants; but in these 5,000,000 were included almost all the rank, wealth, and intelligence of the country. Hence they formed in the Reichstag a compact and homogeneous majority, under which the remaining Slovaks and Croats soon learnt to range themselves. In the second place, Hungary had the great advantage of starting in a certain degree afresh. Her government was not bound by the traditional policy of former Vienna ministries, and . . . it had managed to keep its financial credit unimpaired. In the third place, as those who are acquainted with Hungarian history well know, Parliamentary institutions had for a long time flourished in Hungary. Indeed the Magyars, who among their many virtues can hardly be credited with the virtue of humility, assert that the world is mistaken in ascribing to England the glory of having invented representative government, and claim this glory for themselves. Hence one of the main difficulties with which the Cisleithanian Government had to deal was already solved for Graf Andrassy and his colleagues."—*Austria since Sadowa (Quarterly Review, v. 131, pp. 90-95)*.—See also TURKEY: 1878: Excitement in England.

1867.—Description of the constitution.—Political system in the dual empire.—The Austro-Hungarian constitution is not a uniform state constitution in the same sense as the German imperial constitution. Its older stages are, in respect to the German Austrian crown lands, the same as

those of the German empire. But the homogeneity of Austria-Hungary is expressed in principle in the Pragmatic Sanction of the emperor Charles V. in 1713, wherein all the sectional possessions of the whole monarchy bound themselves to the same order of succession and thus to permanent association. [See AUSTRIA: 1718-1738; 1740.] The unity of the state is from the outset monarchical. The title of emperor of Austria dates from 1804. "The constitution of the centralised State was legally formed by the Imperial Diploma of 1860 and the Patent of 1861, depending on it. This constitution comprises a Landtag and Reichsrath with almost the same principle of division as in the German Imperial draft constitution of 1848, except that there is only the one sovereign in question throughout. A distinction is also made in this Act of the Constitution between the countries belonging to the Hungarian Crown and those of the Austrian section, but the preponderating intention is centralization. . . . The legal independence and territorial integrity of Hungary and its neighbouring countries is solemnly declared by the oath of the sovereign. In this the older Hungarian constitutions are recurred to, and especially the revolutionary legislation of 1848. By this act of separation two States, themselves divided several times, arose with foundation and superstructure, each of which already has an imperial constitution superior to its provincial constitutions, but which have the same monarch, and hence carry on certain joint institutions either naturally or by means of a treaty. The principal concerns of the united State are: the joint Ministry for Foreign Affairs, the Imperial Ministry for War for all matters relating to the joint army and the navy (the Landwehr on both sides being still maintained), the joint Ministry for Finance for joint expenses, whilst the financial systems are separate, a joint administration for Bosnia and Herzegovina. The preliminary estimate for joint expenses is presented to a meeting of the Delegations for deliberation (and to be passed), which meeting consists of deputations from the parliaments of both sides. . . . The agreements at present [1917] valid between Austria and Hungary date from December, 1907, and last till December 31, 1917. They include the determination of the contribution obligatory on both sides (*Beitragspflicht*) and the customs and commercial treaty. There is a Court of Arbitration for disputed questions. Bosnia and Herzegovina were taken into the joint customs union in 1879. In this respect nothing was altered by the declaration of the hereditary sovereignty of the Imperial house in 1908. The administration there is inspected by Austria and by Hungary. Central European treaties are prepared by the joint Foreign Office, but must be passed by the separate national representative bodies. Hence it is true to say: we do not know exactly whether we have to deal with one or with two States."—F. Naumann, *Central Europe*, pp. 325-327.—"The study of politics in Austria-Hungary is complicated for the British or American reader by the fact that although he may be acquainted with the theory of parliamentary government upon which the systems of the two countries rest, he will not necessarily be able to understand the way in which it is worked. One of the Hungarian leaders recently took advantage of this circumstance to enlist the sympathies of English people by postulating a case in which the scene was moved from Hungary to Great Britain. The defeat on vital questions of a great political party was described as being followed by the calling of the Opposition by the King, who, instead of instructing the putative Prime Minister to form

a government to carry out the mandate given to his party by the electors, asked him, certainly, to form a cabinet, but at the same time required him to carry out the desires of the sovereign, and not of the nation as expressed at the election. Naturally this presentation of the case is likely to win sympathy from the British public, and, moreover, it is in its broad features a true account of what happened after the final destruction of the Liberal party in Hungary in 1904. It is, however, at the same time utterly misleading, because the parliamentary systems of Austria and Hungary are quite different in their workings from that of Great Britain. It is, indeed, impossible to appreciate the political situation without a knowledge of history. . . . [It is therefore necessary to recapitulate the main points involved.] Every thing in Austro-Hungarian political life dates from 1867. At that time the King ratified the Hungarian Constitution and bestowed a similar one on his Austrian lands. In doing so he entered, as Emperor of Austria, into an arrangement with the independent allied kingdom of Hungary. His own constitutional position was defined in so doing. Hungarians accepted the arrangement, though a certain number of irreconcilables refused to acknowledge it, and Louis Kossuth died abroad rather than do so. Like all constitutions, the Hungarian one is not in the form of a treaty or single document but is the growth of centuries, partly founded on fundamental principles recognised by the rulers and partly on long-established custom. The position of a king in such a constitutional monarchy is affected more by precedent than by actual law. . . . The King of Hungary both reigns and governs, though he is bound to govern with the will of the people; but conversely the people cannot govern without him. The King and Parliament are indivisible for this purpose. King Francis Joseph has successfully asserted his prerogatives, in that he has actually refused to sanction bills passed by both houses of parliament. Without his sanction they are of course invalid, as they would be in any constitutional monarchy. . . . The relations of the Crown and the ministers, and of the ministers and the political parties, are quite foreign to anything within the experience of parliamentary life in Britain. The ministers are the servants of the Crown rather than of parliament, and the political parties have to shape a programme which the Crown will sanction before they are likely to be asked to take office. In the event of a deadlock the Crown, which is bound to summon parliament at stated intervals, can exercise its prerogative and dismiss it on the same day. . . . Besides the Austrian parliament and the Hungarian parliament, and the Austrian government and the Hungarian government, there is that debated land of Common Affairs over which the Delegations hold sway. The Hungarian dislike of creating anything like a dual parliament led to the extraordinary device of these two bodies, debating separately and not allowed even to speak to each other, like two children whose mothers will not 'make friends.' They communicate in writing and, if it is necessary to take a joint vote, they vote without debating! The position of the Emperor and King towards this amorphous creation was naturally defined by the compact of 1867 which gave rise to it. [See also JUGO-SLAVIA: 1848-1867.] The ministers of common affairs (*Kaiserlich and Königlich*) are also responsible to the Emperor and King, a mutual responsibility complicated by the obligation to obtain a third ratification, from the Delegations, who in their turn are answerable to the parliaments of the two countries. The King on his

side is responsible also to the ministers and parliaments, with one extremely important reservation. In the department of defence he is, as Commander-in-Chief, not responsible to anyone in the appointment of officers or the organisation of the army. The minister of war is not required to countersign acts dealing with these, though responsible for such matters as commissariat, equipment, and the technical side, while the parliaments of the two countries, by the standing laws, retain the control of recruiting. The contingent of recruits is voted annually by each parliament, and in case either refuses to contribute their quota there is no possible means of coercion."—A. R. and E. Colquhoun, *Whirlpool of Europe*, pp. 289-293.

1867.—Foreign policy before 1867.—Subsequent change.—"In past times, when Austria had held France tight bound between Spain, Germany, and the Netherlands, she had aspired to a dominant position in Western Europe; and, so long as her eyes were turned in that direction, she naturally had every interest in preserving the Ottoman Empire intact, for she was thus guaranteed against all attacks from the south. But, after the loss of her Italian possessions in 1805, and of part of Croatia in 1800, after the disasters of 1840, 1850 and 1866, she thought more and more seriously of indemnifying herself at the expense of Turkey. It was moreover evident that, in order to paralyze the damaging power of Hungary, it was essential for her to assimilate the primitive and scattered peoples of Turkey, accustomed to centuries of complete submission and obedience, and form thus a kind of iron band which should encircle Hungary and effectually prevent her from rising. If, in fact, we glance back at the position of Austria in 1860, and take the trouble carefully to study the change of ideas and interests which had then taken place in the policy of France and of Russia, the tendencies of the strongly constituted nations who were repugnant to the authority and influence of Austria, the basis of the power of that empire, and, finally, the internal ruin with which she was then threatened, we cannot but arrive at the conclusion that Austria, by the very instinct of self-preservation, was forced to turn eastwards and to consider how best she might devour some, at least, of the European provinces of Turkey. Austrian statesmen have been thoroughly convinced of this fact, and, impelled by the instinct above-mentioned, have not ceased carefully and consistently to prepare and follow out the policy here indicated."—V. Caillard, *Bulgarian imbroglio* (*Fortnightly Review*, Dec., 1885).—For policy in Balkans, see also JUGO-SLAVIA: 1867-1914.

1898 (Sept.).—Assassination of the empress.—On Sept. 10, Elizabeth, empress of Austria and queen of Hungary, was assassinated at Geneva by an Italian anarchist, Luigi Luccheni, who stabbed her with a small stiletto, exceedingly thin and narrow in the blade. The murderer rushed upon her and struck her, as she was walking, with a single attendant, on the quay, towards a lake steamer on which she intended to travel to Montreux. She fell, but arose, with some assistance, and walked forward to the steamer, evidently unaware that she had suffered worse than a blow. On the steamer, however, she lost consciousness, and then, for the first time, the wound was discovered. It had been made by so fine a weapon that it showed little external sign, and it is probable that the empress felt little pain. She lived nearly half an hour after the blow was struck. The assassin attempted to escape, but was caught. As Swiss law forbids capital punishment, he could be only condemned to solitary confinement for life. This terrible tragedy came soon after the festivities in Austria which had celebrated the jubilee year of the emperor Francis Joseph's reign.

1900.—Archduke Francis Ferdinand renounces the right of his children to succeed to the thrones.—Since the tragically mysterious death in 1889 of the emperor's only son, Rudolph, the heir presumptive to the several Hapsburg crowns had been the Archduke Francis Ferdinand, son of the emperor Francis Joseph's brother, the late Archduke Karl Ludwig. In order to contract a morganatic marriage in 1900 he renounced the right of his children to the imperial and regal succession.—See also AUSTRIA: 1900.

1900-1903.—Attitude of Hungary toward the Dual Monarchy.—Clerical interference in politics.—Elections of 1901.—Austrian-German dissatisfaction with the commercial Ausgleich.—Promises of electoral reform.—Its effect on the various nationalities of the Austro-Hungarian empire.—On Sept. 25, 1900, the *Times* correspondent summarized an important speech by the Hungarian statesman, Count Apponyi, to his constituents, in which the same forecast of a political catastrophe in Austria was intimated. Count Apponyi,—"after dwelling upon the importance of maintaining the Ausgleich, remarked that affairs in Austria might take a turn which would render its revision indispensable owing either to a complete suspension of the constitutional system in Austria,

the maintenance of which was one of the conditions of the arrangement of 1867, or such modifications thereof as would make the existing form of union between the two countries technically untenable or politically questionable. In either case the revision could only confirm the independence of Hungary. But even then Count Apponyi believed that by following the traditions of Francis Deák it would be possible to harmonize the necessary revision with the fundamental principles of the Dual Monarchy. It would, however, be a great mistake to raise that question unless forced to do so by circumstances. Count Apponyi went on to say that the importance of Hungary, not only in the Monarchy but throughout the civilized world, was enormously increased by the fact that it secured the maintenance of Austria-Hungary, threatened by the destructive influence of the Austrian chaos, and thus constituted one of the principal guarantees of European tranquillity. The peace-abiding nations recognized that this service to the dynasty, the Monarchy, and the European State system was only possible while the constitutional independence and national unity of Hungary was maintained. It was clear to every unprejudiced mind that Hungarian national independence and unity was the backbone of the Dual Monarchy and one of the most important guarantees of European peace. But the imposing position attained by Hungary through the European sanction of her national ideal would be imperilled if they were of their own initiative to raise the question of the union of the two countries and thus convert the Austrian crisis into one affecting the whole Monarchy." In November a significant speech in the Reichsrath at Budapesth, by the very able Hungarian prime minister, M. Szell, was reported. "He foreshadowed the possibility of a situation in which Austria would not be able to fulfil the conditions prescribed in the Ausgleich Act of 1867 with regard to the manner of dealing with the affairs common to both halves of the Monarchy. He himself had, however, made up his mind on the subject, and was convinced that even in those circumstances the Hungarians would by means of provisional measures regulate the common affairs and interests of the two States, 'while specially asserting the rights of Hungary and its independence.' Another version of this somewhat peculiar statement runs as follows:—'Hungary, without infringing the Ausgleich law, will find ways and means of regulating those affairs which, in virtue of the Pragmatic sanction, are common to both States, while at the same time protecting her own interests and giving greater emphasis to her independence.' M. Szell added:—'When the right time comes I shall explain my views, and eventually submit proposals to the House. Meanwhile, let us husband our strength and keep our powder dry.' The self-confident and almost defiant tone of this forecast, coming from a responsible statesman accustomed to display such prudence and moderation of language as M. Szell, has made a profound impression in Austria. It assumes the breakdown of the Austrian Parliamentary system to be a certainty, and anticipates the adoption by Hungary of one-sided measures which, according to M. Szell, will afford more effective protection to its interests and confirm its independence. This seems to be interpreted in Vienna as an indication that the Hungarian Premier has a cut and dried scheme ready for the revision of the Ausgleich in a direction which bodes ill for Austria. An article in the *Neue Freie Presse*, of Vienna, on the hostility of the Vatican to Austria and Hungary was partially communicated in a despatch of October 11. The

Vienna journal ascribes this hostility in part to resentment engendered by the alliance of Catholic Austria with Italy, and in part to the Hungarian ecclesiastical laws. It remarked: "Never has clericalism been so influential in the legislation and administration of this Empire. The most powerful party is the one that takes its 'mot d'ordre' from the Papal Nunciature. It guides the feudal nobility, it is the thorn in the flesh of the German population, it has provoked a 20 years' reaction in Austria, and, unhindered and protected, it scatters in Hungary that seed which has thriven so well in this half of the Monarchy that nothing is done in Austria without first considering what will be said about it in Rome." A day or two later some evidence of a growing resentment in Austria at the interference of the clergy in politics was adduced: "Thus the Czech organ, inspired by the well-known leader of the party, Dr. Stransky, states that a deputation of tradespeople called on the editor and expressed great indignation at the unprecedented manner in which the priests were joining in electoral agitation. They added that they 'could no longer remain members of a Church whose clergy took advantage of religious sentiment for political purposes.' The Peasants' Electoral Association for Upper Austria has just issued a manifesto in which the following occurs:—'We have for more than 20 years invariably elected the candidates proposed by the Clerical party. What has been done during that long period for us peasants and small tradespeople? What have the Clerical party and the Clerical members of Parliament done for us? How have they rewarded our long fidelity? By treason. . . . We have been imposed upon long enough. It is due to our self-respect and honour to emancipate ourselves thoroughly from the mamelukes put forward by the Clerical wire pullers. We must show that we can get on without Clerical leading-strings.'

"In the year 1900 the Emperor called a fresh ministry, with Körber at its head, which at first seemed likely to get along peacefully. In a short time, however, the Czechs began to reiterate their demands, and after more stormy scenes the Reichsrath was again dissolved. At the elections of 1901 the Clericals lost heavily and the Extreme Left increased its numbers, the Schoenerer group of Pan-German Radicals now numbering twenty-one. A feature of this period was the increasing enmity between these parties and the Church. In 1902 the German Popular Party separated from the more moderate sections. The relationship with Hungary came up for debate on the question of the renewal of the commercial compromise. A number of Austrian-Germans were entirely dissatisfied with the basis of the arrangement, and still more with the way in which it was always worked by Hungary, which is able, by political solidarity in the Delegations, to get the whip hand. Körber went so far as to declare that without more favourable terms for Austria he would not sanction a fresh commercial Ausgleich, and the difficulties reached such an acute stage that he wanted to resign, but was persuaded to remain in office to avoid the chaos which otherwise must ensue. The new army bills were a great bone of contention, and the action of Hungary in refusing to ratify them led to a similar policy of obstruction on the part of the Czechs and Croats. In 1905 Gautsch took office again, an appointment which was made by the Crown in much the same spirit as that which, shortly after, dictated the calling of Fejerváry to form a Hungarian cabinet. The Emperor and King, faced with irreconcilable opposition in each country,

was making a desperate attempt to obtain a majority for the policy he favoured by means of compromises, but the unsuccess of these tactics ultimately led to a fresh phase (described more fully later on) in which the question of electoral reform was used to disarm the opposition in both countries. The expedient of giving his sanction to universal suffrage was not dictated by any demand for that reform in the Austrian Parliament, though a measure of electoral reform had long been pressed for. On the whole, all the Slav nationalist parties are favourable to the scheme, except the Poles, who naturally oppose bitterly any measure which would put power in the hands of the Ruthenian peasants. The German Liberals are somewhat divided in their opinions, but the Clerical Party are not opposed to it, except that portion closely allied with the old Conservatives. The Socialists are naturally delighted, and the Government is now devoting itself to a consideration of the best basis for the reform. In this rapid survey of the course of Austrian parliamentary history since the Ausgleich too little has, perhaps, been said of the Hungarian question in Austria—that is the ever-recurring problem of the relations of the two halves of the monarchy. If all internal questions between Germans, Czechs, Poles, Slovenes, Clericals and Anti-Clericals, Nationalists and Federalists could by some miracle have disappeared there would still have remained this perennial source of discontent. The German party particularly, although in its old form responsible for the Ausgleich, is now far from united in approving the basis on which the two countries are joined together, and is practically unanimous in declaring that, whatever the changes made, they must not be in favour of Hungary, which already has much the best of the bargain."—A. R. and E. Colquhoun, *Whirlpool of Europe*, pp. 302-305.

1903-1905.—Language struggle.—Count Tisza's ministry.—Rise of new parties.—"In 1903 began the agitation over the new army bills, and the 'language of command' question became a prominent feature in the Nationalist propaganda. A campaign of obstruction ensued, which led to the most violent scenes both in and out of the chamber. Count Stephen Tisza, son of the old Liberal Premier and heir to the Liberal traditions, tried in vain to form a Cabinet. He and his party are upholders of the Ausgleich, and although identified with the name Liberal in Hungary are rather the Tory Moderate Party. Baron Hedervary, the successful autocratic Ban of Croatia, was asked to form a Cabinet, and did so by dropping the army bills for the time, but King Francis Joseph was by no means in favour of these concessions, and announced his intention of maintaining all his prerogatives as regards 'my army.' He flung down the gauntlet to the Independents, and summoned Hedervary again, but in 1903 this minister was succeeded by one who was expected to be more successful in obtaining a genuine support from parliament, and Count Stephen Tisza took office. For two years he held things together with a

strong hand, but despite his high character, his autocratic temper made him enemies, and private jealousies, aided by his lack of tact and organising power, eventually caused his downfall. When he saw the opposition gathering force he tried to put through a *coup d'état* to smash the obstruction. An alteration in the standing orders was carried, but the most violent scenes followed, and after a struggle Tisza was forced to resign. The break up of the once great Liberal Party and the final defeat of Count Stephen Tisza took place in 1905, and by this time the second great reorganisation of parties in Hungary was accomplished. With Tisza's fall the old Liberal Party melted as if by magic, nor are there any signs at present of its revival. The defeat of the Liberals was effected by a coalition of four groups which have been formed out of the Extreme Right and Extreme Left of earlier days. These were the Clerical Independents, the Independence party under Kossuth and Apponyi, the Clerical People's party, and the Liberal Dissenters or Andrassy group. The Clerical Independents have been fused with the Independence Party, which for various reasons is now [1907] the most prominent in the state and the one whose leaders make most noise in the world. In 1905 this party represented the old Irreconcilables or Extreme Nationalists, who seemed at one time to have almost disappeared, merged in the Liberals. They desired the abolition of the compromise of 1867 so that Hungary might return to the status of 1848, when for a short time she was an entirely separate kingdom. The connection of the son of Louis Kossuth with this group gives it a fictitious resemblance to the Patriotic Party of 1848, and with him is associated the picturesque figure of Albert Apponyi, the Magyar orator, whose fine periods and impressive appearance have made him the effective representative of his country in England and America. The two Clerical parties are united in their desire to increase the influence of the church, to check the growing power of the Jews, and to repeal the civil marriage and divorce laws, but, while the Clerical Independents join with Kossuth's party, the Clerical Populists desire the maintenance of the *Ausgleich* with a progressively separatist interpretation. The Andrassy group, whose leader belonged to the Liberals by tradition and was originally the close friend of Tisza, has considerable influence through his great historic name and family. He was left somewhat stranded by the events of 1905 and maintained a sort of balance between Tisza and the Opposition, but finally threw his weight against the former, influenced, it is said, by personal feelings, which had much to do with the fall of the Liberal premier. Like his father, Count Tisza, a man of high attainments and sterling character, was lacking in the tact and suppleness essential for the difficult task before him. Besides the four main groups there was one other, composed of the personal supporters of ex-Premier Banffy, and these five bodies, all taking such different points of view, were in 1905 bound together by a solemn pact for the overthrow of the Liberal party and government."—A. R. and E. Colquhoun, *Whirlpool of Europe*, pp. 309-311.

1905-1906.—Count Tisza's resignation.—Fejerváry ministry.—Hungarian demands.—Deadlock between the king and parliament.—Forceable

dissolution of parliament.—Final agreement between the king and the coalition party.—Wekerle cabinet.—Universal male suffrage adopted.—“One of the last acts of Count Tisza was to put through the commercial treaties with Germany, to which reference has been made, his desire being to checkmate the Independence party by presenting them with the accomplished fact, so that the commercial compromise must be renewed. The King wished Tisza to continue to hold office, but that minister was neither able nor willing to continue to govern without parliamentary support. The King therefore called on Baron Fejerváry, an old soldier, whose personal devotion to his sovereign did not permit him to refuse, and who had been Minister of National Defence for a quarter of a century. With some difficulty Fejerváry got a cabinet together, but, despite his high character and personal popularity, it was impossible not to realise that he was appointed against the sense of the parliamentary majority and represented the sovereign but not the people. He was, in fact, defeated at once in the House, but was instructed by his sovereign to remain in office and try to come to terms with the Coalition.”—A. R. and E. Colquhoun, *Whirlpool of Europe*, pp. 312-313.—In the August number (1905) of *The American Review of Reviews*, Count Albert Apponyi, leader of one of the parties united more or less in the Hungarian opposition, gave the Hungarian side of the political issues with Austria. In part, he wrote: “The writer had the honor of delivering at St. Louis, at the Arts and Science Congress of last year, a short historical account of our relation with the Austrian dynasty. There are to be found the chief facts, which show: (1) That our forefathers called that dynasty to the Hungarian throne; not in order to get Hungary absorbed into an Austrian or any other sort of empire, but, on the contrary, under the express condition of keeping the independence and the constitution of the Hungarian kingdom unimpaired; (2) that this condition has been accepted and sworn to by all those members of the dynasty (Joseph II. alone excepted) who ascended the Hungarian throne; (3) that, nevertheless, practical encroachments on our independence, followed by conflicts and reconciliations, have been at all epochs frequent; (4) but that a judicial fact *never* occurred which could be construed into a modification of that fundamental condition of the dynasty's title to Hungary. . . . The physical person of the ruler is, in truth, the same in both countries, but the juridical personality of the King of Hungary is distinct and, as to the contents of its prerogative, widely different from the judicial personality of the Emperor of Austria. Hungary is the oldest constitutional country on the European Continent. The royal prerogative in her case is an emanation of the constitution,—not prior to it,—and consists in such rights as the nation has thought fit to vest in her king. In Austria, on the other hand, the existing constitution is a free gift of the Emperor, and has conferred on the people of Austria such rights as the Emperor has thought fit to grant to them. The title of ‘Emperor of Austria-Hungary’ . . . [sometimes used] is simply nonsense. The time-hallowed old Hungarian crown has not been melted into the brand-new Austrian imperial diadem. That imperial title does not contain, to any extent, the Hungarian royal title. The Emperor of Austria, as such, has just as much legal power in Hungary as the President of the United States has. He is, juridically speaking, a foreign potentate to us. On these fundamental truths, no Hungarian—to whatever party he may belong—admits discussion. . . .

The Liberal party, vanquished at the last elections, does not in the least differ from the victorious opposition as to the principles laid down in these pages; it only advocated a greater amount of forbearance against the petty encroachments which practically obscured them. That policy of forbearance became gradually distasteful to the country; seeing it shaken in the public mind, the recent prime minister, Count Tisza, formed the unhappy idea of gaining a new lease of power on its behalf by a parliamentary *coup d'état*. The rules of the House were broken, in order to prevent future obstruction, chiefly against military bills. This brought matters to an acute crisis. The parliament in which that breach of the rules had taken place became unfit for work of any sort, the country had to be consulted, and down went the Liberal party and the half-hearted policy it represented with no hope for revival.

"The army question, with its ever-recurring difficulties, is a highly characteristic feature of the chronic latent conflict between the Austrian and the Hungarian mentality. It amounts to this, that, as we are a nation, we mean to have an armed force corresponding to our national individuality, commanded in our language, and serving under our flags and emblems. It would be unnatural for any nation, and would be, in fact, an abdication of the title of 'nation,' to renounce such a national claim. The Austrians, on the other hand,—and, unhappily, their influence is still prevalent in this question,—not yet having abandoned the idea of a pan-Austrian empire, uncompromisingly adhere to the present military organization, which makes the German language and the imperial emblems prevalent throughout the whole army, its Hungarian portion included. The latter [the coalition] had now crystallised their joint ambitions into a demand for the use of Hungarian as the language of command, a plank in the nationalist platform which is discussed on its own merits in Chapter X. The suggestion of minor concessions, as we have seen, was rejected by the Coalition, and with frank cynicism some of the party allowed that the language question was not the end but the beginning of their demands. The new Minister of the Interior, a young Liberal, Mr. Kristoffy, now had the idea that the only way to break up the Coalition was to raise some question on which they were fundamentally divided, and accordingly he proposed a scheme of universal suffrage. The opposition of the Crown to such a revolutionary proposal delayed its sanction for some time, and gave the Coalition time to consider its position and to organise resistance on new lines. The quondam leader of the Liberal government, Count Tisza, came forward as a bitter opponent of the proposal, which is indeed far from palatable to a large majority of the conservative and liberal landowners, who have the old aristocratic prejudices against popular government and who are also afraid that the vote given to the Slav and Roumanian population will shake the dominant position of the Magyars. This suffrage question must be touched on again, as it is undoubtedly one of the most crucial in the history of modern Hungary. Meanwhile, because of the condition of deadlock caused by the disagreement between the King and Parliament, affairs throughout the country were in a state of *ex lex*. Taxes could not be collected, officials resigned rather than be identified with an unpopular government, and it was with the greatest difficulty that a cabinet could be kept together. Fejerváry, a high-souled and high-principled Magyar, was placed in a most painful position, but the debt of gratitude he owed to his sovereign

(who had saved his life during a severe illness by sending to Berlin for the necessary surgical help and paying all expenses himself) did not allow the old soldier to waver in his fidelity. The Coalition were offered office on terms, but these they would not entertain, and Fejerváry had to remain at the post of duty as the target of the Opposition. The Parliament had, by law, to be summoned at intervals every year, but the Crown has the power to dissolve it at once, and this was done by the King in June, September, October, and December, 1905, and again in February, 1906. In view of the opposition shown to the commissary who, in February, was charged to enter the House and read the Royal rescript, Francis Joseph promptly backed his prerogatives with force and sent a colonel and soldiers with drawn swords to carry out his orders. The Coalition leaders, being advised that their legal position did not allow them to resist this order, submitted for the time, but signed a declaration that, on March 1st, 1906, when by law the Parliament must again be summoned, they would refuse to be dissolved and would remain sitting. Such procedure would be flat rebellion. The most dramatic situation which, in modern times, has occurred in any State or Parliament was thus created. . . . The Coalition, it must be mentioned, had at first tried to make terms with the Crown, but their tactics had severely angered Francis Joseph, because, while their representatives avowed that all they wanted was the dismissal of the Fejerváry-Kristoffy Cabinet, the leaders openly declared that they would only make peace on terms of substantial concession. After this the old monarch refused to negotiate, and, summoning the Coalition to his presence, read them his list of conditions and curtly dismissed them. Up to the end of the first week in April nothing was done and chaos reigned. Fejerváry, it is said, urged his master to avoid the crisis by not summoning the parliament at all, but Francis Joseph was firm in his determination that he would fulfil the letter of the constitution and let the first breach (if made) come from the other side. On Monday, April 9th, the summons for the new Parliament had to go out. On Saturday the miracle happened. At the eleventh hour the Coalition and the Crown came to terms, which were actually arranged on the last day of grace, and by these terms the Coalition took office. . . . The vital questions of the language of command, economic independence, and, practically, of the continuance of the Dual Monarchy, are thus postponed. . . . And the transition government contains practically all the leaders of any note except, of course, Count Tisza, who has retired into private life on his estate. There is Francis Kossuth, leader of the Independence party and heir to the prestige and popularity, as well as the rather inflated eloquence of his father, but not to the mental and physical stamina of that remarkable man. That the son of Louis Kossuth, who died in exile rather than recognise the hated Habsburg as King of Hungary, should now be a minister of that same Habsburg is one of time's revenges. The younger Kossuth is more pliable than his father, but he and his party still stand [1907] for the idea of complete separation and the repudiation of the *Ausgleich*. With him is Count Andrassy, one of the party who wrought the work of '67, the inheritor of the Deak tradition, if there is such a thing as political consistency. Dr. Wekerle, who introduced the anti-clerical laws, and Count Zichy, a Catholic, are colleagues, and towering over all is that handsome, specious, frothy politician who, beginning life as a Don Quixote, now gives one the impression of

an American demagogue—the great Hungarian nobleman, Count Albert Apponyi. [The king requested Wekerle to form a cabinet including in it Kossuth, Apponyi, Andrassy and Zichy. At the election held shortly afterward the Independence party won about 250 out of 400 seats. The new parliament was opened on May 22, 1906.] . . . By Autumn, 1906, a new crisis arose, with reference to the levy of recruits for the common army, which the King desired and the Hungarian government refused. A secret pact with the Coalition gave the King the right to demand recruits in case of 'unavoidable necessity,' and the European situation seemed to him to fulfil those conditions. The Hungarians, however, saw only an opportunity for wringing from him fresh concessions."—A. R. and E. Colquhoun. *The whirlpool of Europe*, pp. 313-316, 316, 316-317, 317.—In Austria, the grand event of 1906 was the franchise reform, which extinguished the whole system of class representation and established a representative Parliament on the broad basis of a manhood vote. "Every male citizen who had completed his twenty-fourth year and was not under any legal disability was entitled to be registered as a voter after one year's residence. Every male, including members of the Upper House, who had possessed Austrian citizenship for at least three years and had completed his thirtieth year, was eligible for election as a deputy; but members of the Upper House elected to the Lower could not sit in both at once. Voting was to be direct in all provinces. In Galicia, however, every constituency would return two deputies, each voter having one vote, so as to permit of the representation of racial minorities, the population being composed of Poles and Ruthenians. Voting was to be obligatory under penalty of a fine wherever a provincial Diet should so decide. This Bill was passed, in the face of the opposition of the Conservative and aristocratic members of both Houses and of the extreme representatives of the various nationalities, mainly through the influence of the Emperor. He regarded it as the only way to get rid of Parliamentary obstruction, and the best means of stimulating loyalty to the dynasty."

Two changes of ministry occurred in Austria during 1906, Baron Gautsch, as premier, giving way to Prince Hohenlohe in April, and the latter resigning in June, to be succeeded by Baron Beck. Count Goluchowski, who had been Austro-Hungarian minister of foreign affairs since 1895, resigned in October, because of ill-feeling against him in Hungary, and was succeeded by Baron Aehrenthal.

1907.—Final negotiation of a new financial Ausgleich.—Adjustment of the vexed questions of tariff, joint debt, and revenue quotas.—The long struggle toward a readjustment of the Ausgleich or agreement of 1867 between Austria and Hungary, on its financial side, was brought to a close on October 8, 1907, by the signing of a new agreement that day. It continued the common customs arrangement until 1917, and provided that commercial treaties concluded with foreign powers must be signed by the representatives of both Austria and Hungary—a concession by Austria to Hungary. Hitherto the Austrian minister of foreign affairs had conducted such negotiations. On its part, Hungary made the minor concession of conforming its stock exchange laws to those of

Austria. Previously, excise duties had been common to both states; henceforth they were to be left to each state to be determined and levied. In the joint fiscal burden, Hungary's contribution was increased from 34.4 per cent to 36.4 per cent. Provision was made for a court of arbitration, composed of four Austrian and four Hungarian members, who must chose a ninth member as chairman.

1908-1909.—"Greater Serbia Conspiracy."—Agram trials.—Friedjung trial.—Among the statements made to defend the annexation of Bosnia-Herzegovina [see TURKEY: 1908] was one by Dr. Friedjung, the Austrian historian, who asserted that the Southern Slavs were planning a conspiracy against Austria-Hungary. As a result a long prosecution was conducted at Agram which excited wide attention throughout Europe. After a trial lasting seven months (from April to October) sentences were handed down in the cases of fifty-two school teachers, priests, and other persons charged with connection with what was known as the "Greater Serbia conspiracy." The prisoners were accused of high treason in participating in a movement for the union of Croatia, Slavonia, and Bosnia to Serbia, even carrying the propaganda among the troops of the Austro-Hungarian army. Thirty of the accused were condemned to terms of rigorous imprisonment varying from four to twelve years, and twenty-two were acquitted. The persons condemned gave notification of appeal. In the meantime attacks were being made on the authenticity of Dr. Friedjung's statement. "Dr. Friedjung, then an intimate friend and adviser of Baron von Aehrenthal, stated in the *Neue Freie Presse* of March 25, 1900—the famous article that led to the Friedjung trial of December 1909 . . . Early in 1909 when war, or, as the Austrian expression ran, a 'punitive expedition' against Serbia was believed to be imminent, a selection of these 'proofs' [of a conspiracy] was placed at the disposal of Dr. Friedjung, who based upon them a series of articles intended to be a war blast. . . . Dr. Friedjung accused M. Supilo, the Serbo-Croatian leader, and several other prominent Serbs and Croats of the Monarchy, of corrupt and treasonable intercourse with the Serbian government. The publication led to the trial, in which the 'proofs' were demonstrated to be clumsy forgeries; and to the disclosure made by Professor Masaryk in the Delegations of 1910 that the forgeries had been largely the work of a man named Vasitch who had been employed for the purpose of forging them by Captain von Svientochowski of the Austro-Hungarian Legation at Belgrade. During the Friedjung trial, Count Aehrenthal informed a foreign visitor that he had never believed in the authenticity of the 'proofs' of the conspiracy; and he hastened, as soon as their veritable character was revealed, to disavow them in his official organ, the *Fremdenblatt*. He appeared insensible to the discredit which the exposure of his methods had cast upon the Monarchy. His principles that all is fair in diplomacy and that 'accomplished facts are the most conclusive proofs,' doubtless explain his conduct; and but for the withdrawal of Russian support from Serbia after the intervention of the German Ambassador at St. Petersburg on March 24, 1909—the day before the publication of the Friedjung article—Aehrenthal's methods might have been placed beyond possibility of detection by an Austro-Hungarian invasion of Serbia and by the execution, under martial law, of the Serbo-Croatians whom the forgeries charged with high treason. But, according to a homely

Italian proverb, 'Il diavolo fa le pentole ma non i coperchi.'"—H. W. Steed, *Hapsburg monarchy*, pp. 245, 259-260.—On December 31 it was announced from Vienna that all but two of the condemned had been set at liberty pending their appeal, this being consequent on the revelations of forgery in the documents on which they were convicted.

1909 (December).—Alleged plan of a federated triple monarchy.—"There has been circulated in Paris a curious document, full of figures, supposed to be based on authentic information. This document relates to the plan attributed to Prince Lentur and Count d'Aehrenthal to change the dual monarchy of Austria-Hungary into a triple monarchy. Croatia, Bosnia-Herzegovina, and Dalmatia, according to the scheme, would be united into an independent and constitutional kingdom, corresponding to the old Illyria. The double state, Austria-Hungary, would be changed into a three-fold Austria-Hungary-Illyria. A Slav nation would thus stand side by side with the Teutonic nation of Austria and the Magyar nation of Hungary. Its extent would be a good deal smaller, a little more than one-third, of the other two, and its population about a quarter of the Hungarian and one-sixth of the Austrian. According to this document, which is declared to have strong claims to be considered authentic, this change would no doubt be followed by a further one. Bohemia and Moravia would also want home rule. The monarchy would thus become a kind of Federal state. Hungary alone would remain standing strong and united as the centre and leader of this federation."—*N. Y. Evening Post*, Dec. 29, 1909.

1914.—Austro-Hungarian foreign policy.—Rivalry between Russia and Austria-Hungary.—Growth of hostility between Serbia and Austria-Hungary.—"The foreign policy of Austria-Hungary . . . had to do mostly with ambitions in the Balkans and attempts to extend to the south. With the new German Empire cordial relations were established. With respect to Italy the old ambitions were completely given over. In the latter part of the nineteenth century, while other European powers were making themselves greater by colonial expansion the Dual Monarchy hoped to reach southward along the eastern shore of the Adriatic and down through the Balkans to an outlet, perhaps at Salonica. As early as the War for Greek Independence it was evident that Austria and Russia were suspicious of each other in rivalry about the Balkans. This was more apparent in 1877, when the Russo-Turkish War began. In the next year, at the Congress of Berlin, when Russia was forced to let a great part of what she had accomplished be undone, Austria-Hungary was given the administration of the two Turkish provinces of Bosnia and Herzegovina, peopled with South Slavs, and conveniently adjoining her own Slavic provinces of Dalmatia and Croatia-Slavonia. In the following year she joined the German Empire in alliance, from which she got added protection against Russia, though Germany was not yet disposed to forfeit the friendship of Russia. Year by year the rivalry of Austria-Hungary and Russia for greater power and influence in the Balkans increased."—E. R. Turner, *Europe*, p. 444.—"Austria came more and more to be Russia's principal opponent in the Balkans, dreading the extension of Russian power southward. During much of this time either Russia or Austria would gladly have got the Ottoman provinces, but failing that, each was resolved that no other power should get them."—*Ibid.*, p. 449.—"Not only did Austria-Hungary desire to expand southward through the Balkans, but her great river, the Danube, emptied into the Black Sea, and much of her commerce went out past Constantinople. That is to say, if Russia succeeded in her ambition, then Austria-Hungary could be largely closed in and at Russia's mercy, while if Austria got what she desired, then Russia would be largely at her mercy in like manner."—*Ibid.*, p. 516.—In this matter Hungary was quite as hostile as Austria to the aggrandizement of Russia and the ambitions of Rumania and Serbia. In their foreign policy, therefore, the two members of the dual monarchy presented a united front to the world and were both equally anxious to build up a powerful army and navy. "In 1908 Austria-Hungary annexed Bosnia and Herzegovina, in spite of a general European treaty, and in direct defiance of Russia. By the Treaty of Berlin the two Turkish provinces of Bosnia and Herzegovina had been put under the control of Austria-Hungary, though sovereignty continued to be vested in Turkey. Actual connection with Turkey ceased, however, and the government of the Dual Monarchy set to work to bring order to the districts and make them thoroughly subservient to its rule. The people were largely debarred from professional and government positions and treated as inferior to Hungarians or Germans, but considerable material prosperity was brought about, and in many respects the condition of the South Slavs in these provinces was better than that of those who ruled themselves in Serbia and Montenegro. As time went on therefore, Austria-Hungary came to regard them as part of her dominion, and Turkish own-

ership as a fiction. Thus things continued until 1908. In that year occurred the so-called Young Turk revolution in the Ottoman Empire. Ignoring the Austrian possession of Bosnia and Herzegovina, the Young Turks invited the population of the provinces to send representatives to an assembly in Constantinople. This seemed an attempt to prepare for Turkish possession of the country again later on. But complete mastery of the district was now necessary for the Teutonic scheme of controlling the way down to Turkey and the greater domain across the straits. Under no circumstances would either Germany or Austria see the loss of Bosnia and Herzegovina threatened, and so Austria acted at once. October 3d, the Dual Monarchy cast aside the Treaty of Berlin, without consulting the other parties to the treaty, and announced that the provinces were annexed. A dangerous crisis ensued. Turkey, most directly aggrieved, strongly protested, but could do nothing, and after a while accepted pecuniary compensation. Great Britain and France, who had signed the Treaty of Berlin, protested. To Russia—also a signatory, and much more greatly interested because of her position and ambition in the Balkans—the affront was far greater and she insisted that the matter be laid before a European congress. Most furious of all was Serbia, the neighboring South Slavic state, who had long hoped that, on the breaking up of European Turkey, Bosnia and Herzegovina would be hers. If now the provinces were finally incorporated into Austria-Hungary, then the dream of future Serbian greatness would never be realized. Accordingly, while Russia was prepared to oppose the action as strongly as she could, Serbia was resolved to fight to the death, and could with difficulty be restrained from attacking her powerful neighbor.”—*Ibid.*, pp. 500-501.—See also BOSNIA-HERZEGOVINA: 1908—and TURKEY: 1908.—“But in 1913, after the Second Balkan War, not only was the strength of Turkey as a European power so weakened that she counted for little more than possessor of the incomparable site of Constantinople and territories in Asia, but Serbia, the bitter enemy of Austria, had come out of both wars with increased power and territory and greatly increased prestige. . . . Altogether, the position of Germany and Austria-Hungary was much less good with respect to the Balkans than before. Austria greatly desired to settle at once her account with Serbia, and reduce her permanently to a position in which she could never again be a source of apprehension. It was learned afterward that in August 1913 Austria-Hungary tried to get her partners in the Triple Alliance to join her in proceeding against Serbia. But the Italian government refused to give sanction, and the matter was dropped until the next year.”—*Ibid.*, pp. 510-511.—See also BALKAN STATES: 1914; and ITALY: 1913: Austrian plan to attack Serbia.—The aspiration of Austro-Hungarian capitalists to finance railways and exploit in general the whole of the Balkan peninsula to Greece—an aspiration which had largely influenced the annexation of Bosnia-Herzegovina—was seriously checked by the wars of 1912-1913, and was the direct cause of the World War.—See also WORLD WAR: Diplomatic background: 5; 8; 69.

1914 (June).—Assassination of the archduke Francis Ferdinand.—On Sunday morning, June 28, the archduke Francis Ferdinand, nephew of the emperor Francis Joseph and heir to the Hapsburg throne, was assassinated by a Pan-Serbian agitator named Gavrilo Princip, who fired several shots from a Browning pistol. Both the archduke and hismorganatic wife, the duchess of Hohenberg,

who accompanied him, were fatally wounded. “He was just the man, in a word, that the decrepit monarchy needed to be set up once more. All that, however, the Serbian plotters cared little about. The circumstance that signed his death warrant in Belgrade was that Francis Ferdinand stood committed to the *Trias* idea. The *Trias* in lieu of the Dual Monarchy. The *Ausgleich* had reached, according to him, the end of its usefulness, and in place of it was to come a Triple Monarchy, a confederation of three distinct political entities; each part was to be independent of the others, save in a few reserved points. These reserved points were to be confined to absolute essentials—the field of foreign relations, political and economic treaties, army and navy—in the main, then, those provided for in the Austrian compromise with Hungary of 1867. . . . Francis Ferdinand, though of purely Teuton stock himself, was known as a Slavophil. He not only had mastered Czech completely, but had written much in that difficult tongue. He had likewise possessed himself of a familiar knowledge of the other Slav tongues in Austria-Hungary, and the Serbo-Croatian language he spoke perfectly.”

1914-1915.—Attitude of the peoples in the Dual Monarchy towards the war.—Hungarian enthusiasm.—“From the very beginning of the Austro-Serbian crisis, those natural pillars of the empire, the nobility, the army, the bureaucracy, and the Church, together with the German and Magyar populations, rallied enthusiastically round the Government and the Hapsburg throne. The almost passionate phraseology of the Austrian ultimatum to Serbia, so unusual in a diplomatic document of this nature, was an accurate reflection of the popular mood. The Viennese press unanimously demanded decisive measures. ‘The situation between our Government and that of King

Peter has become intolerable,' asserted the *Neue Freie Presse*. 'Our ultimatum has been the natural result.' The *Reichspost* urged the Government to take decisive measures against the Serbian foe, 'who is as implacable and relentless as he is dastardly.' The formal outbreak of hostilities was hailed with jubilation. 'When we consider the provocations of which Serbia has been guilty for so many years,' exclaimed the *Tageblatt*, 'the solemn pledges made and broken, the defiance which we have put up with from an unscrupulous neighbor whom no kindness can appease, we experience a sense of relief on this outburst of war.' Hungarian sentiment was even more enthusiastic. 'The whole nation joyfully hastens to follow the call of his Majesty to the flag,' cried Premier Tisza amid the frantic cheers of the Hungarian deputies. 'If we had stood these conditions any longer,' exclaimed Count Albert Apponyi, head of the Opposition, 'we would have reached the point where Europe would have called us her second "Sick Man."' 'It is peace and not war that we want; but a peace which leads to life, not to death,' asserted the Archbishop of Esztergom, Roman Catholic primate of Hungary. 'There are situations in political life,' said Count Julius Andrássy, 'that can be likened only to the encircling of Sedan, which demoralizes and vanquishes the surrounded foe before the first shot is fired. Such would have been our fate if, after the continued vexations of years, after the expenditure of many millions, caused by Serbia, we should have continued to submit to the invidious attacks of Russian-protected Serbia. . . . Had we waited longer, our self-esteem, our self-trust, would have been torn to shreds, and so would our power of resistance, our inner unity, our integrity.' The Magyar press displayed a decidedly bitter tone against the enemy. That leading Budapest paper, the *Pester Lloyd*, wrote, 'The Serbian Government will be shown up as a nest of pestilential rats which come from their territory over our border to spread death and destruction.' The broadening of the conflict into a war with Russia caused no surprise, since Serbia had from the first been considered merely the catspaw of Russian imperialism. 'The true cause of the war,' asserted Count Julius Andrássy, 'is the Eastern ambition [of hegemony in the Balkans] of Russia, which is as old as her position as a great Power, and which has long been hanging over us like a sword of Damocles.' Dr. Dumba, Austro-Hungarian ambassador to the United States, undoubtedly voiced the prevailing Austrian opinion when he wrote in the *North American Review* for September, 1914: 'The war between Austria-Hungary and Russia may well be said to be the outcome of conflicting civilizations and conflicting aims. The controversy between the Dual Monarchy and the Serbian Kingdom is only an incident in the greater struggle between German civilization as represented by Austria-Hungary, and the Russian outpost on the southern frontier of the Dual Monarchy. . . . The Serbian Kingdom is the torpedo which Russia has launched at the body of Austria.' Hungarian opinion tended to give the war an even broader interpretation. 'Pan-Russianism, that is the word!' exclaimed the *Revue de Hongrie* (Budapest). 'No! The present war is not, as certain persons assert, a war of Slavism against Germanism. It is a war of a great part of civilized Europe against Russian autocracy and Serb terrorism. . . . If the Triple Entente (in which the empire of the Tsars holds a preponderant place), should win in this war, it would mean the European sluice-gates open to Muscovite autocracy, to Cossack militarism, to all sorts of politi-

cal and religious heresies. The dyke once broken, it would be the end of European civilization.'

"Such was the temper of the governing classes and of the German and Magyar populations. . . . Unquestionably there was much disloyalty among certain racial groups. The Serb element of the Yugo-Slavs, in particular, appears to have been honeycombed with secessionism, and even among the Croats many malcontents were discovered. Some of these escaped abroad, notably the Croat deputy, Hinkovitch, and these exiles presently founded the 'South Slav Committee' in London, to influence Entente public opinion. . . . The Croats, though desirous of Yugo-Slav unity, generally wished it in the 'Austrian' sense; i. e., the supremacy of the Croat over the Serb element in any future Yugo-Slav state. . . . Croat mobs marched through the streets crying, 'Death to the Serbs!' Serb shops were sacked and Serb leaders roughly handled. The Croat deputy, Dr. Susterics, voiced the feelings of the great majority of his people when he declared: '. . . Francis Ferdinand was bound to come to this end, especially as he was the friend of the southern Slavs. Imperialistic Serbia saw with alarm the rise of this potent personality, this knight "without fear and without reproach," who showed both the will and the power to promote peaceful relations between the southern Slavs and the Hapsburg dynasty.' The Croats thus entered the war against their Serbian kindred in a far more loyal frame of mind than would have been possible under any other circumstances. . . . The Czechs displayed neither the indignant loyalty nor the bitter secessionism of the Yugo-Slav populations. . . . The fierce struggles which had long raged in Bohemia between the Czechs and the large German minority constantly protected by Vienna had engendered widespread Czech resentment against the Austrian Government. Russian propaganda had of course made the most of this golden opportunity, and for some years previous to the war a genuine secessionist party had existed among the Czechs, with the erection of a Czech-Slovak national state under Russian protection as its goal. But these extremists were comparatively few in number, and drastic government measures at the outbreak of war quickly broke up their party organization. Some of their leaders, like Professor Masaryk, escaped abroad; others, such as Dr. Kramar, were imprisoned. A few were shot for high treason. The most serious result of Czech discontent was the poor spirit shown by Czech troops, whole regiments surrendering to the enemy with practically no resistance. On the other hand, there existed a fairly strong loyalist minority which disliked the thought of Austrian disruption and feared the results of Russian victory. Typical of Czech loyalist press comment are the words of the *Hlas Naroda* (Prague): 'The crime of Serajevo revealed, as by a lightning flash, the monarchy's deplorable situation. . . . But, at one stroke, all dissension disappeared. In vain did the enemy make advances to the non-German nationalities.' 'We are all glad to assert the close union of nationalities. . . . All the nationalities are defending the throne and the empire,' declared the *Hlásyz Hane* of Prossnitz. 'We belong voluntarily to the Austro-Hungarian Monarchy,' said the *Cesky Dennik* of Pilsen, 'that monarchy beneath whose protection the Czech people has arrived at its present maturity.' [See also CZECHO-SLOVAKIA; and JUGO-SLAVIA.] The attitude of . . . the Poles was not left for a moment in doubt. Almost without exception, the Austrian Poles proved loyalist to the core. For many years the Poles of Galicia had enjoyed complete local self-government and full

cultural liberty—a situation doubly appreciated by contrast to the depressed condition of their kinsmen under Russian and Prussian rule. Galicia was full of Polish refugees from Russian persecution. The Austrian Poles, therefore, hailed the war as a crusade for the liberation of their race from Russian domination. The exiles at once raised several Polish legions, 20,000 strong, which, under their gifted leader, Josef Pilsudski, fought with fanatical bravery against the Russian troops. The attitude of the Austrian Poles comes out strongly in the manifesto of the National Polish Committee issued at the beginning of the war: Should Russia keep Russian Poland, and add Galicia and Posen thereto, Europe would be exposed to the infiltration of Russian despotism and Byzantinism. If, on the other hand, Poland is torn from Russia, it will mean a guarantee for the progressive expansion of Western civilization toward eastern Europe, as well as protection against the introduction of Cossack principles into modern life. . . . Let no one accuse the Poles now fighting in the legions side by side with the Austrian armies of being unfaithful to their historic traditions. Russian was Poland's arch-enemy in the past, and will be in the future. It is precisely their part in Western civilization and the national individuality of their country that the Poles are now defending against the Russians, contemners of the one and persecutors of the other.' In an appeal addressed to Poles throughout the world, the noted Polish poet, George Zulawski, wrote: 'We stand to-day by Austria, and do not doubt for a moment her goodwill. Let the Grand Duke Nicholas juggle with promises never meant to be kept; we know how we are treated here. After having lost our liberty we have found in this monarchy, the most liberal in Europe, shelter and protection. We are full-fledged citizens; we enjoy here the liberty of autonomy and of our national advance. . . . To-day, God had entrusted the honor of the Polish nation to us Polish volunteers, and we will return it into the hands of God alone.' 'The historic mission of the Poles throughout the whole course of Polish history,' wrote Professor Josef Buzek in the *Oesterreichische Rundschau* of September, 1914, 'consists in the protection they have afforded as foreposts of the Occident to the Western civilization founded upon the principles of the Catholic Church, against attack by the Byzantine Orient. . . . In the present world-war the Poles will take up once more their historic mission in closest union with Austria-Hungary. Their struggle will concern the driving of the hereditary Russian foe from Polish ground.' So strong was Polish fear and hatred of Russia that the outbreak of war and the example of their Galician kinsmen swept even the Prussian Poles into the stream, notwithstanding the bad relations which had existed between Poles and Germans for many years. Accordingly, most of the Prussian Polish leaders endorsed the pastoral letter of Monsignor Likowski, archbishop of Gnesen and primate of Poland, issued August 9, 1914, which accused Russia of being the provoker of the war and the persecutor of the Catholic Church, and exhorted the Poles to fight valiantly for the king of Prussia—'for it is he who will free from the yoke our oppressed brethren beyond the frontier.' [See POLAND: 1914-1917.] Almost identical was the attitude of . . . the Ruthenians. For many years the Ruthenians of Eastern Galicia had regarded their province as a 'Piedmont'—the nucleus of a future Ukrainian national state carved out of South Russia; much as the Serbs had regarded Serbia as the nucleus for a future Yugo-Slav state carved out of South-

west Austria-Hungary. To the Ruthenians, therefore, the war appeared as a golden opportunity, the words of the proclamation issued by the Ukrainian National Committee, composed both of Ruthenians and exiles from the Russian Ukraine. 'Unless the Ukrainian provinces are separated from Russia,' runs this manifesto, 'even the most crushing defeat for that country will be but a feeble blow, from which Czarism would recover in a few years, to take up again its ancient rôle of a disturber of the peace of Europe. Only a free Ukraine, which would be supported by the Triple Alliance (i. e., the Central Powers), could form, with its extensive domain, reaching from the Carpathians to the Don and to the Black Sea, the necessary protective wall between Europe and Russia, a bulwark that would defeat forever the greed for expansion on the part of Czarism, and free the Slavic world from the baneful influence of Pan-Muscovitism.'

"Such optimistic notes were, however, quickly stilled by the crushing series of disasters that now overtook the Hapsburg Monarchy. The failures in Serbia, the Russian conquest of Eastern Galicia, and the destructive Cossack raids into Northern Hungary, spread consternation and alarm throughout the empire. The disloyal rejoiced, and only the severest military repression prevented seditious disturbances among the Serbo-Croats of the south and in Bohemia. The Entente press was full of rumors that Austria-Hungary meditated a separate peace, but such rumors seem to have been without serious foundation. Undoubtedly the empire was pessimistic, but it was a pessimism of desperate resolution, not of abject despair. The Magyars, to whom rumor had assigned the leading peace rôle, breathed, as a matter of fact, only defiant fury. At the end of 1914, the *Pester Lloyd* exclaimed hotly, 'Let our opponents understand once and for all: We are going to hold out to the end, and we have not for a single moment meditated a separate peace with any one.' . . . At first sight, one might have thought that Italy's declaration of war upon the empire in May, 1915, would have greatly accentuated the prevailing gloom. As a matter of fact, it did more than anything else to solidify patriotic feeling and rouse Austria to fresh exertions. The whole empire quivered with furious wrath and scornful contempt for Italy, the 'traitor' nation. Emperor Franz-Joseph's proclamation to his people, with its stinging words—'Perfidy whose like history does not know'—was an accurate reflection of the popular emotion. 'If war be indeed only a continuation of political policy with different means,' wrote that leading Austrian publicist, Freiherr von Chlumecky, in the *Oesterreichische Rundschau*, 'then Italy can point to the fact that, free from all scruples of political faith and morality, she has consistently pursued a course in the world war which she followed in peace for many years. To be at once Austria's ally and her most malignant foe—that has for decades been Italy's policy. . . . Italy dares the war, not so much for territorial aggrandizement as for the realization of the aim she pursued in peace as well with all the means at her command—to hurl Austria from her position of a great power. . . . Against this design, however, the whole Empire will rise to defend itself as one man. Austrian blood is not easily stirred, but now when we are threatened by cowardly brigands with a dagger thrust in the back, now will our wrath rise to a mighty flame, and all Austria echo the cry, "Down with the traitors!" . . . Revenge for a breach of faith unexampled in history—that will continue to be the watchword; and we shall not rest, nor our

children, or children's children, if that be necessary, until a people devoid of all political and moral loyalty shall have paid a heavy penalty for the crime committed against our sovereign and our country!' Hungarian opinion equaled Austrian in its fury. 'We are persuaded,' exclaimed the *Revue de Hongrie* of June, 1915, 'that the Italian Government's breach of plighted faith will be stigmatized by posterity, and that without distinction of nations. But, in awaiting this, we Hungarians, who formerly fought for Italian independence under Garibaldi, will take care that the infamy of Salandra and his ilk, who seek to revive the epoch of the Borgias, shall not pass unavenged. We shall not wait for history to punish them; we shall charge ourselves with that duty.' Much more significant, however, was the attitude of the Slavs. Italy's avowed intention to seize, not only Italian-speaking Trentino and Trieste, but also large tracts of territory inhabited by a Serbo-Croat population, roused all the Austrian Slavs to wrathful indignation. Even the Czech press warmed to unwonted interest and loyalty. 'The peoples of Austria-Hungary,' asserted the *Hlas Naroda* of Prague, 'prefer war with Italy to a boughten peace, precarious and uncertain.' 'Because of the perfidy of Italian policy,' wrote the *Cech* (Prague), bitterly, 'a war to-day breaks out which is just another raid of the brigands of the Abruzzi.' And the *Proudy* of Olmütz exclaimed defiantly, 'One more or less; what does it matter!'

"It was, however, the Serbo-Croats of the South who manifested the hottest indignation. 'Not an inch of Austro-Hungarian territory to these perfidious "Allies"!' exclaimed the *Hrvatska* of Agram. 'The solid fists of the Croats and Slovenes will be plenty strong enough to smash any Italian attempt to grab our littoral.' . . . 'We pray with all our heart for the crushing of Italy and the complete failure of its vile speculations,' wrote the *Hrvatski Pokret* (Agram), 'and we are convinced that our Croatian and Slovene soldiers will have a good big share in bringing this about.'

"Very interesting was the attitude of the Austrian Italians. These people, numbering about 800,000, are divided into three geographically separate groups: the Trentino district of South Tyrol; the Istrian region at the head of the Adriatic, centering about the city of Trieste; and the isolated colonies of the islands and port towns of the Dalmatian coast. The longing of Italian 'Irredentists' to 'redeem' these race brethren by incorporating them into the kingdom of Italy was undoubtedly shared by a majority of the Austrian Italians, and the Austrian military authorities had to take sharp measures to check disloyalty. Nevertheless, the loyalist minority was larger than is generally supposed, and on this occasion did not fail to express their sentiments. In Trentino, loyalist addresses were signed by leading notables, including five Italian members of the Tyrolese Provincial Diet, while the *Risveglio* of Trent asserted: 'No one has ever solicited Italy's intervention. This war serves particular interests which are absolutely opposed to the interests of Italian Tyrol.' . . . In Dalmatia, *Il Dalmata* of Zara wrote: 'The Dalmatians of Italian speech declare in this solemn hour that they will make every sacrifice asked of them. . . . Dalmatian fidelity is traditional. We have inherited it from our fathers, and we will give a new proof of it by attesting our loyalty both to Emperor Francis Joseph and to the institutions of the Austro-Hungarian state.' [See also ADRIATIC QUESTION: Relations between Italy and Jugo-Slavia.] . . . After the fall of Warsaw, the *Nowa Reforma* of Cracow

wrote: 'That which to-day fills Polish hearts is something far beyond the bounds of ordinary human delight. Entire generations of Poles have not been permitted to experience this sentiment, which only a Pole can understand. The solid walls of our prison have crumbled into dust. They have been cast down by the mighty breath of civilization.' The *Czar* said: 'Russia to-day suffers a hard and merited chastisement. The loss of Warsaw is the first step in her downfall.' The Ruthenian press joined in this chorus of jubilation, which was further swelled by the voices of the loyalist Czechs. The *Hlas Naroda* of Brünn wrote: 'All the peoples of our monarchy are to-day filled with enthusiasm. The Czech nation turns grateful eyes upon its valorous sons who, with the other Austro-Hungarian nations, bring liberty to the Polish nation. Not, be it noted, the liberty promised by the false friends of Slavism at Petersburg, nor the liberty of the Chinovniks of Moscow, but a liberty based upon civilization, morality, and conscience. The Russian despotism reaps the first-fruits of the seeds which it has sown.' The *Lidove Noviny* remarked: 'Under Russian rule, the Poles knew only servitude. Equally lamentable is the fate of the Ukrainians. Under the pretext of liberating the Balkan states, the empire of the Tsars wished only to engulf them in its tyranny. It even allies itself with the Italians—those declared adversaries of Slavism—in order jointly to enslave the Slovenes and Croats.'—T. L. Stoddard, *Present-day Europe*, pp. 123-137.—See also WORLD WAR: Diplomatic background; 12; 75.

1915.—Political changes.—Rupture with Italy.—Count Berchtold, the foreign minister, "the man who started the war," resigned in January and was succeeded by Baron Burian, a Hungarian of Slovak descent. The dominating influence of Count Tisza, Hungarian premier, gradually eclipsed that of the Austrian premier, Count Stürgkh, so that the war policy of the Dual Monarchy was directed with increasing energy from Budapest rather than Vienna. The outstanding events of the year were the critical negotiations with Italy—a diplomatic duel between Baron Burian and the Italian foreign minister, Baron Sonnino, assisted by the persuasive intervention of Prince Bülow as German representative in Rome. The negotiations fell through and on May 23 Italy broke away from the Triple Alliance and declared war on Austria-Hungary. The German emperor visited Vienna in November, and shortly afterwards the Austrian cabinet underwent several changes in ministerial posts.—See also ITALY: 1901-1918; 1915: Italy declares war; TRIPLE ALLIANCE: Break up of Triple Alliance.

1916.—Legislative standstill.—Racial dissensions.—Assassination of the premier.—Except in Hungary, all parliamentary and legislative activity had ceased since the outbreak of war. The Reichsrath and nearly a score of provincial legislatures had ceased to function. Racial riots and antagonisms were sternly suppressed. On October 21 the Austrian premier, Count Stürgkh, was shot dead in a restaurant by Dr. Friedrich Adler, a journalist, who was subsequently acquitted of the charge of murder. Dr. Ernst von Koerber succeeded as premier and formed a new cabinet.

1916 (November 21).—Death of Francis Joseph.—A tragic figure was removed from world history by the death, on November 21, of the Emperor Francis Joseph. Born on August 18, 1830, he ascended the throne in his nineteenth year. The numerous political crises that harrassed his long reign were overshadowed by a remarkable series of domestic tragedies. His brother, Maximilian of Mexico, was executed; the latter's widow, living in 1921, lost her reason over fifty years ago; his wife, the Empress Elizabeth, fell under the dagger of an assassin; his only son and heir committed suicide or was murdered; his nephew and heir-presumptive was murdered with his consort in the streets of Serajevo—an event that formed the prelude to the World War. The venerable monarch himself lived to see his realm gradually being shattered in the greatest crisis of its checkered history, and died in the shadow of defeat. Within two years later, the unwieldy empire which he had so laboriously held together lay crushed, bleeding and bankrupt, while his successor on the throne was a refugee in a foreign land. "He was in his eighty-sixth year—the oldest sovereign in the world. He had reigned for sixty-eight years, having begun his active political life just after the fall of Metternich. He had fought many wars, and had always been beaten; he had had to yield time and again his most cherished convictions; he had suffered the deepest public and private sorrows; and in the end he had come to be regarded as one of the permanent things in Europe from his sheer length of life and tenacity in suffering. He was the last believer in the old theory of the divine right of monarchs . . . and this passionate faith gave him strength and constancy. To this creed everything was sacrificed—ease, family affection, private honour, the well-being of individuals and of nations—until he became an inhuman monarchical machine, grinding out decisions like an automaton. His age and his afflictions persuaded the world to judge him kindly, and indeed the tragic loneliness of his life made the predominant feeling one of pity."—J. Buchan, *Nelson's history of the war*, v. 18, p. 124.

1916-1917.—Accession of Charles (Karl) I.—Ministerial changes.—Domestic disorder.—Morale.—Francis Joseph's "successor on the throne was his great-nephew, the Archduke Charles Francis Joseph, the son of that Archduke Otto who was the younger brother of the murdered Francis Ferdinand. He was in his thirtieth year, and had for some months been commander in chief on the southern section of the Eastern front. . . . He was known as a good sportsman and a young man of frank and engaging manners; but he had scarcely the education to fit him to sit on the most difficult throne in Europe. . . . He wished to safeguard the remains of his sovereignty, and it was believed that he might show a certain independence in policy."—J. Buchan, *Nelson's history of the war*, v. 18, p. 125.—Immediately an attempt was made to clean house, which led to the inference that the young ruler was opposed to the war policy of Germany and was working for peace.—"Koerber [the premier] was an honest and fairly liberal bureaucrat," wrote J. Buchan; "strongly pro-Austrian, and he was not disposed to listen readily to Pan-German extremism. His task was threefold—to agree with Germany on the future of Poland, to carry a new *Ausgleich* with Hungary, and to strengthen the non-Slav elements in the Austrian Parliament by the grant of a larger autonomy to Galicia. All three tasks raised the question of relations with Germany. . . . It was clear that Koerber was inclined to prove refractory to German guidance on all points, and the pro-German faction in Austria took alarm. . . . On 13th December he found himself compelled to resign."—*Ibid.*, p. 123.—Koerber's administration had lasted only two months when Dr. Spitzmüller was called to the helm. He "was entrusted with the formation of a fresh Ministry, whose immediate business was to carry the new *Ausgleich*. But Spitzmüller found it impossible to proceed without summoning Parliament, and such a step would raise other controversial matters which he wished to keep slumbering. By 20th December [1916] he had failed to make any headway, and a Bohemian noble, Count Clam-Martinitz, was called to the task. At first sight this appeared to mark the dawn of a new policy. . . . Baron Burian, the faithful disciple of Tisza . . . was replaced by a Czech, Count Ottokar Czernin, who had been noted in the past for his anti-Magyar leanings. . . . On the whole the new Ministry had a federalist complexion. The more reactionary of the Court officials and the permanent civil servants disappeared. . . . It looked as if the Emperor Charles intended to make a stand against the tyranny alike of Berlin and Budapest. But the appearance was illusory. . . . The Dual Monarchy depended for its very existence upon Germany, and so long as it remained so long would Germany dominate its attitude. The Austrian Germans would refuse, as in 1870, to permit any anti-German tendency in Austria's foreign policy, and they would insist upon their own domination in the Austrian Government. The Magyar minority in Hungary would never admit any interference with their political supremacy or allow an acre of soil within the boundaries of Hungary to be removed from their authority. Their attitude had remained the same since 1848, and the ideas of Andrassy the Elder and Koloman Tisza were the ideas of their sons. As long as the Dual Monarchy continued, there must be German domination in Austria and Magyar domination in Hungary, intense dissatisfaction among the subject races, and

irredentist claims by the border states. While this lasted the Hapsburg power must be in a condition of unstable equilibrium, and be compelled to look outside for support. That support could come only from Germany."—*Ibid.*, pp. 120-127, 132.—Clam-Martinitz failed in his domestic policy as well as in an attempt to make terms with Russia. He reconvened the Reichsrath, which assembled on May 30, 1917. Racial antagonism broke out afresh; the Poles opposed the budget, and the premier resigned. He was succeeded by a stop-gap ministry under Dr. Seidler on June 24. The all-powerful Tisza fell in Hungary during May, though he still retained much of his pro-German influence. His successor, Count Esterhazy, was a former Oxford student. The collapse of Russia gave Austria-Hungary a breathing-space and enabled the ministry to concentrate its efforts on the Italian front.—Austria "had long ago lost heart in the war, and was faced with the unpleasing alternatives of defeat—which meant disruption—and victory, which involved a phantom existence under German tutelage. In either case her bankruptcy was assured. Count Czernin . . . courted popularity, and showed an amiable weakness for the rhetoric as opposed to the substance of democracy. At a public dinner at Budapest early in October he gave his own views of peace, forecasting a general disarmament and a League of Nations, now that Central Europe had shown that it could not be subdued by force of arms."—J. 1917-1918.—Breakdown of the Dual Monarchy.—Opposition of subject-nationalities.—"Long before the surrender of Bulgaria and Turkey, long before the German defeat on the Western Front, the Dual Monarchy faced disaster. Unlike her confederates, Austria-Hungary suffered less from foreign prowess than from internal weakness. Ever since the Russian Revolution, in March, 1917, the task of dominating a majority of Slavs by a minority of Magyars and German-Austrians, under any theory of democracy or national self-determination, had become utterly hopeless. At first each of the subject nationalities, —Czechoslovaks, Jugoslavs, Poles, Ruthenians (Ukrainians), and Rumanians,—clamored for autonomy within the Dual Monarchy, but as time went

on they all demanded complete separation from German Austria and from Hungary. Each of the subject nationalities developed remarkable solidarity, the clergy and the university professors vying as a rule with the business-men, the peasants, and the artisans, in the furtherance of national interests. Separatist propaganda was carried on in the open and by stealth. Loyalty to the Hapsburgs was undermined. In such cities as Prague, Agram, Laibach, Cracow, and Lemberg there were increasingly frequent riots and demonstrations. Mutinies in the Austro-Hungarian army were everyday occurrences; and many Czechoslovak, Yugoslav, and Polish troops deserted to the Allies and served the Allied cause in Russia or on the Western Front or in Italy. 'National Councils' of the several subject nationalities were organized in Paris, or London, or Rome, or Washington; and these 'provisional governments' not only fanned the flame of sedition within Austria-Hungary but strove to secure active Allied assistance in their efforts to disintegrate the Dual Monarchy."—C. J. H. Hayes, *Brief history of the great war*, pp. 348-349.—See also **BREST-LITOVSK TREATIES: 1918.**

"In 1917 'disloyal' agitation had been less prevalent among Poles than among Czechoslovaks and Jugoslavs. The Poles of Galicia had always been treated rather liberally by the Habsburgs, and the erection of a kingdom of Poland by Austro-German decree of November 5, 1916, had temporarily appeased the Austrian Poles and enabled Premier von Seidler to control a majority of votes in the Austrian *Reichsrat*. But in the winter of 1917-1918 Austria lost the support of her Poles, for she was obliged to agree to Germany's policy respecting Poland, and Germany's policy was to strengthen Ukrainian at Poland's expense. Thus the Polish province of Cholm was incorporated into the new Ukrainian state, despite the vehement protests of the German-appointed Polish Regency at Warsaw (February 14, 1918) and the bitter imprecations of the Austrian Poles in Galicia. Thenceforth the Poles, as well as the Jugoslavs and the Czechoslovaks, were openly hostile to the Dual Monarchy. General Joseph Pilsudski, a great national hero and formerly quite pro-Austrian, directed such an agitation in Poland against the Teutons that for the safety of *Mittel-Europa* he was arrested and deported to Germany. Joseph Haller, a colonel in the Austrian army, deserted after the treaty of Brest-Litovsk, with his Polish regiment, and, after joining the Czechoslovaks in Russia, made his way to Paris, where he assumed supreme command of a Polish army fighting for the Allies in France. And when the Polish deputies in the Austrian *Reichsrat* united with the already numerous opposition of Czech and Yugoslav deputies, parliamentary government in Austria became impossible. The only session of the *Reichsrat* during the Great War was closed abruptly by Emperor Charles and Premier von Seidler on May 4, 1918.

"The majority of the population of the Dual Monarchy were at last becoming articulate, and, what was far more significant, they were uniting in common opposition to the continuance of the Habsburg Empire. This was the burden of the Pan-Slavic Congress held at Prague on January 6, 1918, of a second Congress held at Agram on March 2, and of a third held at Laibach in July. But greater freedom of speech naturally prevailed outside of Austria-Hungary than within; and consequently the clearest statement of the aims of the subject peoples of the Dual Monarchy was made at the famous Congress of Oppressed Austrian Nationalities convened at Rome under the auspices of the Italian Government on April 10,

1918. This Congress, which included leading representatives of the Czechoslovaks, Yugoslavs, Rumanians, and Poles, unanimously adopted the following resolutions: (1) Every people proclaims it to be its right to determine its own nationality and to secure national unity and complete independence; (2) Every people knows that the Austro-Hungarian Monarchy is an instrument of German domination and a fundamental obstacle to the realization of its free development and self-government; (3) The Congress recognizes the necessity of fighting against the common oppressors.

"That the Congress at Rome faithfully reflected the sentiments of the subject nationalities in Austria-Hungary was amply demonstrated three days later by a noteworthy assembly at Prague. On this occasion the *Reichsrat* deputies of the Czech nation and those of the Yugoslav nation, the latter speaking in the name of the Croats, Slovenes, and Serbs, met and made a joint agreement, through an oath worthy of everlasting remembrance, to suffer and struggle relentlessly to free their peoples from the foreign yoke and bring down into the dust the old imperialistic Empire, covered, as they said, with the maledictions of mankind. To the appeals of the oppressed Austrian nationalities the Allies did not turn deaf ears. Already, in 1917, France had authorized the organization of Polish and Czechoslovak armies on the Western Front and had recognized them as belligerent units; and now, on April 21, 1918, Italy recognized the Czechoslovak National Council as a *de facto* government and placed a Czechoslovak legion beside her own troops on the Piave Front. On May 29 Secretary Lansing, in behalf of the United States, declared 'that the nationalistic aspirations of the Czechoslovaks and the Yugoslavs for freedom have the earnest sympathy of this Government'; and a week later the sixth session of the Supreme War Council, meeting at Versailles and attended by the prime ministers of France, Great Britain, and Italy, adopted resolutions that 'the creation of a united, independent Polish state, with free access to the sea, constitutes one of the conditions of a solid and just peace and the rule of right in Europe,' and that 'the Allies have noted with satisfaction the declaration of the American Secretary of State, to which they adhere, expressing the greatest sympathy with the national aspirations of the Czechs and Yugoslavs for freedom.' [See also JUGO-SLAVIA: 1918 (April-October).] Of the complete independence of Czechoslovakia, formal recognition was accorded by France on June 30, by Great Britain on August 13, by the United States on September 2, and by Japan on September 9. No other course could honorably be taken by the Allies toward a country whose soldiers at the time were waging war against the Central Empires in France, in Italy, and most thrillingly in Russia. Under the circumstances the Habsburg officials at Vienna and Budapest bent all their energies to the task of preserving some semblance of order in their dominions until such time as the Germans should have won the war and come to their assistance. They proclaimed martial law in Bohemia and in Croatia. They imprisoned 'seditious' persons and endeavored to suppress 'revolutionary' publications. They kept a fairly large army on the Italian Front, though they discovered to their chagrin that it was no longer fit for any offensive operations. They sent some artillery and a few regiments of infantry to aid Ludendorff in his supreme effort on the Western Front. Most of all, for the success of the great German offensive in France they prayed ceaselessly and imploringly. There was little else that they could do. There

was no other hope for them. German defeat would mean for Germany simply defeat; for the Dual Monarchy, it would signify dissolution."—C. J. H. Hayes, *Brief history of the great war*, pp. 349-352.—See also ADRIATIC QUESTION: Torrens-Trumbic agreement.

1918.—Military débacle.—Dissolution of the monarchy.—In the late summer of 1918 it had become evident to the Hungarians and German-Austrians that the great German offensive in France was a failure, and that the continued success of the allied armies in the Balkans under General Franchet d'Esperey, who by October had actually reached Hungarian territory in the valley of the Danube, made it manifest that utter defeat menaced the Central Powers. The actual ruin of the Austro-Hungarian military machine, however, did not come till the last week of October. [See also HUNGARY: 1918: End of world war.] It was on the 24th of this month that the Italian commander General Diaz began his great offensive from the mouth of the Piave river on the south to the Trentino on the north. The Italian army was keyed up to the highest point of efficiency and had been reinforced by French and British troops as well as considerable artillery to replace what they had lost the year before at Carporetto. Throughout these last days of October the battle raged over the same ground that had seen the mighty struggle of the preceding months. The Italians themselves captured Monte Grappa with over 30,000 prisoners, while the French stormed Monte Seisemol on the Asiago plateau. The advance of the Allied forces cut the Austro-Hungarian army in two, thrusting the northern half back into the mountains in utter confusion while the southern half was driven eastward across the Venetian plains with the heaviest losses in men and material. Already by November 3 the cities of Trent and Trieste had been recovered for Italy and all semblance of even defensive power had gone from the beaten enemy. The political repercussions of this series of defeats were even more interesting. By October 20, the foreign ministry of Austria-Hungary, Count Julius Andrássy, had communicated to President Wilson his willingness to make peace independent of Germany. On November 3 the fateful armistice involving as it did the unconditional surrender of the Hapsburg State was signed. This military collapse on the Italian front involved a similar collapse of the Hapsburg political system and Professor Lammasch, who represented the anti-militaristic elements of the monarchy, became the head

of the transition government.—See also *WORLD WAR: 1918: IV. Austro-Italian theater: c, 9; c, 15; d; XI. End of the war: a, 5; Miscellaneous auxiliary services: I. Armistices: e.*

1918.—Independence of Czecho-Slovakia.—The first of the submerged peoples of Austria-Hungary to emerge into their new independence was that of the Czechs and Slovaks. Already at Paris on the 18th of October, the independence of Czecho-Slovakia had been proclaimed, and on October 29, Dr. Kramarcz announced the existence of the new republic. During the next few days representatives of the Czechs and Slovaks drafted a constitution

Charles relinquishes power.—Count Tisza assassinated.—There now remained, out of all the heterogeneous elements which had formerly constituted the Austro-Hungarian monarchy, only the German-speaking territories of Austria proper and the Tyrol, and the purely Magyar districts of central Hungary. In Vienna a popular revolution broke out on October 30 and eventually an Austrian Republic composed of the old Archduchy of Austria and Tyrol was created, with the Hapsburgs left out. The formal proclamation of this fact was made at Vienna by the National Assembly on November 13. In Hungary the slumbering fires of national independence burst out into flame. The people had never forgotten the events of 1848-1849, nor renounced entirely a certain fierce spirit of nationalism. On Octo-

DISSOLUTION OF AUSTRIA-HUNGARY

for their state along the lines of the constitution of the United States. Professor Masaryk was chosen president a few days later.

1918.—Independence of Jugo-Slavia, Transylvania, Temesvar and Galicia.—Cession of Dalmatia and Carniola.—What took place in Bohemia, Moravia, and Slovakia was duplicated among the south Slavs of Croatia, Slavonia and Bosnia-Herzegovina. The independence of these provinces and a desire to be united with Serbia and Montenegro was proclaimed October 29. At Agram, on November 24, "the Unitary Kingdom of Serbs, Croats, and Slovenes" was established by a convention made up of representatives of all these different peoples. By the Peace Treaty this kingdom was increased by the cession of Dalmatia and Carniola.

1918.—Freedom of Poland. See *POLAND: 1918.*

1918.—German Austria becomes a republic (November 13).—Hungary a republic.—Emperor

ber 28, a popular tumult in Budapest began the new revolution. By November 16, Hungary was a republic and the Austrian connection was at an end. Count Michael Karolyi, long known for his advocacy of independence for Hungary and his antipathy to the house of Hapsburg, became the head of the new government. Emperor Charles, the last of the Hapsburgs, on November 11, 1918, the date of the German armistice, addressed his people as follows, "Since my accession, I have incessantly tried to rescue my peoples from this tremendous war. I have not delayed the re-establishment of constitutional rights or the opening of a way for the people to substantial national betterment. Filled with an unalterable love for my people, I will not, with my person, be a hindrance to their free development. I acknowledge the decision taken by German Austria to form a separate state. The people have by their deputies taken charge of the government. I

relinquish all participation in the administration of the state. Likewise I have released the members of the Austrian government from their offices. May the German Austrian people realize harmony from the new adjustment. The happiness of my people was my aim from the beginning. My warmest wishes are that an interval of peace will avail to heal the wounds of this war." "The Great War began in July, 1914, with the attack of the Dual Monarchy of Austria-Hungary upon the little Slav state of Serbia. By the autumn of 1918, however, Serbia (q. v.) was free and amply avenged. Within the former confines of the Dual Monarchy were now the three independent republics of Czecho-Slovakia, German Austria, and Hungary, while large portions of its erstwhile territories were added to Poland, to Italy, to Rumania, and to Serbia. The Habsburg Empire was destroyed; it had taken the sword, and by the sword it had perished."—C. J. H. Hayes, *Brief history of the great war*, p. 356.—On November 1 Count Stephen Tisza, "the strong man of Hungary," was assassinated.

AUSTRIA-HUNGARY, Constitution of, Principal provisions.—For a general account of the Ausgleich, or agreement, under which the duality of the former Austro-Hungarian Empire was arranged in 1867, see AUSTRIA: 1866-1867, and AUSTRIA-HUNGARY: 1867. The following describes the principal features of the constitutional organization under which the empire existed from 1867 to 1918: "The emperor has an absolute veto on all measures in all of the three parliaments after named. He can also dissolve any of them. The legislative and administrative assemblies of the empire are four in number, viz.: (1). The Delegationen, which is the imperial parliament. (2). The Reichsrath and the Reichstag, which are the parliaments for Austria proper and Hungary respectively. (3). The Landtag, which is the parliament for the provinces of the empire of Austria. (4). The Gemeinderath or the Gemeindeausschuss, which are the councils of the communes, but they have no legislative functions proper." The Delegationen, or imperial parliament of the dual empire, "acts as one House, but meets in two chambers or bodies, one for Austria and one for Hungary. Each chamber has 60 members, composed of 20 members elected from the upper house of each part of the united empire, and 40 from the lower. It is elected for one year only. The chambers of the imperial parliament meet at the same time and in the same place, alternately in Austria and Hungary, and, as a rule, in the cities of Vienna and Buda-Pesth. They legislate for the united empire on (1) its foreign policy, (2) its finances, (3) its army and navy, and (4) for the affairs of Bosnia and Herzegovina, as they have no Landtag of their own. A minister of state for each of the first three of these matters controls its departments, while the fourth is under the management of the common finance minister. The ministers are appointed by the emperor after consultation with leaders of parties. The presidents of the Delegationen, as also the vice-presidents, must be members of the chambers, but they receive no special salary. They are elected by the members. Each chamber meets separately, and discusses the measures and bills submitted to it by the ministers of state, or by any six of its members. If both chambers agree upon the matter submitted to them, the emperor's sanction is obtained to it, and it becomes law. If the chambers cannot agree, after each of them has discussed the matter three times, upon written communication from the other, a session of both chambers is convened, and the question is decided by a majority of those present. Two thirds of the members of the house must, however, in this

case be in attendance. In the ordinary case the quorum of each chamber is 30 members. The sittings of the chambers are public, but they may be private on the proposition of the president or of five members, and voted upon. The chambers are convened by the writ of the emperor. . . . Each chamber appoints 24 judges to hear and determine any cases which may be brought against the ministers of the crown for breach of power. . . . Two per cent. being first paid by Hungary, the balance of the imperial expenditure is borne in the proportion of 70 per cent. by Austria and 30 per cent. by Hungary, the former being the wealthier country. . . . The Reichsrath [the Austrian parliament] . . . consists of two houses—one called the Herren House, or Upper House; the other called the Abgeordneten House, i. e. the House of Deputies, or the Lower House. It is elected for six years. The Herren House is composed of (1) Princes of the imperial house, who are majors. (2) Chiefs of noble houses, owning large estates, nominated by the emperor, who, being once nominated, are members for life, and their successors after them, and so this class, to some extent, is one of hereditary legislators. (3) Archbishops and bishops with the dignity of prince. (4) Men who have distinguished themselves in science, art, commerce, law, or medicine, who are nominated by the emperor for life, on the advice of the ministers of state. The number of members of the Upper House is not fixed, but it is about 200. . . . The Lower or Abgeordneten House is that of the deputies, elected by the people, and consists of 353 members. It is elected for six years. The people vote for its members in four classes in their various provinces. The first class are the owners of large estates, who elect 85 members. . . . The second class are those who pay five florins of direct taxation in towns, and includes all doctors of the universities, whether they pay taxes or not. The towns are grouped so as to give one member for each group. The groups need not be of equal size. This class elects 115 members. The third class is the chambers of commerce and industry, which elect 22 members. . . . The fourth class are the members of the country communes who pay five florins of direct taxation. They elect 131 members. The communes for this purpose are divided into groups of 500 voters, and a certain number of communes make an electoral district. . . . The elections are not all held on one day, and each class votes by itself in each province on a particular day. The communes vote first, then the citizens, then the chambers, and then the landowners, all on different days. The election takes place in a public hall, where the voters gather; and their names being called over, if present, they go up to the presiding officer, and vote orally, or by a card placed by them in a box. If not present when called upon, they can attend and vote later on."—J. P. Coldstream, *Institutions of Austria*, ch. 2.

AUTO-DA-FÉ, the ceremony during which the sentences of the Spanish Inquisition (q.v.) were read. It was often regarded as an interesting spectacle, and became one of the formative elements in the development of the Spanish drama. "The *auto da fé* represented, as the words imply, merely the decision in the given case, and not the imposition of the penalty as has often been stated. The general rule was for the executions to take place on holidays, which in Spain are indeed 'holy days,' or days in celebration of events in church history. A procession was held, in which the functionaries of the Inquisition took part. A public announcement of the decisions was made, and those who were condemned to death were turned over to the civil authorities, who carried out the execution in the customary place."—C. E. Chapman, *History of Spain*, p. 224.—See also MEXICO: 1535-1822.

AUTOMOBILE RACES, Early. See AUTOMOBILES: 1804-1806.

AUTOMOBILES: 1678-1803.—Early experiments in France and England.—"Although internal combustion to drive a piston in a cylinder was produced with gunpowder in 1678 by Abbé D'Hautefeuille, and a carriage to be driven without the horse was a chaise propelled by human foot work, first conceived by John Vevers of England in 1760, there is no record that the two ideas were combined until it was done in France somewhere between 1760 and 1770. The first automobile ever made was that produced by Nicholas Joseph Cugnot, a Frenchman, and it is today on exhibition in the Conservatory of Arts and Trades in Paris. There is no record of how Cugnot came to conceive the idea of his invention, but it is surmised that he had read about James Watt, in England, having discovered the principle of steam as motive power. This was about 1755. . . . The visible expression of this idea which we can see in the Paris Conservatory is in the form of a tractor for a field gun, Cugnot having been a captain in the engineering corps of the French army.

"The tractor has a single drive wheel actuated by two single acting brass cylinders, connected by an iron steam pipe with a round boiler of copper containing fire pot and chimneys. Attached to this first motor-driven road vehicle is a wagon, on which it was Cugnot's idea to have a field gun mounted. On either side of the single drive wheel of this clumsy contrivance are located ratchet wheels. Pis-

tons acting alternately on these ratchet wheels revolved the drive wheel in quarter revolutions. For the copper boiler of this first motor car, additional water was needed after the machine had travelled a few feet, the exhaust of steam quickly leaving the boiler dry. The speed attained was very slow, by reason of the mechanical complications in transmitting power to the drive wheel. As for running smoothly, the machine wobbled, and bumped, and strained, and groaned, and finally ran into a wall. This was because it was overbalanced by its boiler and engine and had no steering gear."—H. L. Barber, *Story of the automobile*, pp. 50-52.—"About the time that Cugnot ran his machine into a wall, William Murdock, a mechanic, was working for Watt, the English inventor of steam. Whether he knew of Cugnot's automobile attempt or not, there is no evidence extant. . . . Despite Watt and his mournful views of the impossibility of building an engine-run road carriage that would advance over English roads, Murdock went ahead and built a model of an engine-run road carriage; but when he had it finished, Watt's discouraging views prevailed, and Murdock did not attempt to enlarge his model to a full sized form. He stopped with the model, which is at the present day in the British Museum. Murdock's invention was tested, and the tests showed that an advance in efficiency over the creation of Cugnot had been made. The model was driven by a single cylinder of three-inch bore. It had a one-and-a-half-inch stroke. A crank converted the reciprocating motion of the steam engine into rotary motion, the service performed in the Cugnot invention by the quarter revolution ratchet drive. Murdock's idea was patented by a man named Pickard, in 1780. The first automobile known to have been constructed and put on the road was built by Richard Trevithick at Camborne, England, in 1801. It was in the form of a stagecoach, accommodating six or seven persons. The engine, boiler and firebox were at the rear. The engine was one of the first high pressure engines. A single cylinder motor was employed, and spur gear and crank axle were used to transmit the motion of the piston rod to the drive wheels. With this coach Trevithick carried six or seven men over hills for a mile the first day of the trial. The second day it made six miles. Even with these performances, the invention's impracticability must have been decreed, because it was not continued in operation. Trevithick himself felt, no doubt, that it must be improved upon, for, in 1803, he built another contrivance driven by a horizontal single cylinder with 5½-inch bore and a 30-inch stroke. But the driving wheels were ten feet in diameter. Fatal were these great clumsy wheels to popular approval of the invention, and no further advance was made. Trevithick had made one further step, and there the matter rested. He had developed the high pressure steam engine, and he had really made the first automobile, if such it could be called."—*Ibid.*, pp. 54-57.

1780-1824.—America's early efforts in automobile making.—English water tube boiler.—"Just as the English, represented by Murdock and Trevithick, were laboring on the steam propulsion idea, and France, in the person of Cugnot, was experimenting with it, so America was groping to find the solution. Cugnot's activities began about 1760 and ended with his death in 1804. Trevithick's period was from 1780 to 1803. The American experiments started about 1784. The man whom records show to have been the pioneer in practical excursions into the realm of carriages driven by steam, was Oliver Evans, born in Delaware but living in Philadelphia. He developed the high pressure, non-condensing engine although his only

knowledge of steam was derived from reading what little was then printed about it, and his own discoveries. . . . In 1787, four years before Trevithick built his steam coach at Camborne, England, Evans secured a patent from the State of Maryland, giving him the exclusive right to make and use, within its borders, carriages propelled by steam. That he immediately built a steam carriage in pursuance of this authority is doubtful. The only authentic record of an attempt is of one that he constructed in Philadelphia seven years later."—H. L. Barber, *Story of the automobile*, pp. 57-58.—"In 1824, W. H. James [in England] who had patented a water tube boiler for locomotives, built a passenger coach, of which each drive wheel was revolved by two cylinders receiving steam by means of a pipe from a boiler. A pressure of 200 pounds of steam to the inch was maintained. The equivalent of differential action was supplied by independent application of power to the two drive wheels. The coach accommodated twenty persons. The contrivance ran satisfactorily on trials, and James secured financial backing and built another coach weighing 6,000 pounds which ran 12 to 15 miles an hour. But the higher the rate of speed, the worse off the early automobile builder was. Although James equipped his coach with laminated steel springs, the road shocks and vibration stopped it every few miles. Steam joints and connections were broken as fast as they could be put together. The great need was a method of shock absorption, and either no one knew that this was the key to the problem, or, if it was realized, no one knew the remedy. . . ."—*Ibid.*, pp. 61-62.

1826-1895.—Later American, French and English attempts.—Principle of the "differential."—First application for motor patent.—"A year after James built his first motor-coach in England—in 1825—Thomas Blanchard of Springfield, Mass., revived the horseless carriage subject which, in America, had been last experimented with by Oliver Evans in 1804. Blanchard built a road vehicle that was one of the best produced up to that time. It was easy of manipulation and climbed hills successfully. Blanchard took out a patent on it, but when he started to find people who would buy a completed carriage he could discover none. . . . At the time James was building his two coaches, and after Blanchard had given up trying to interest Americans in his invention, a Frenchman named Pecqueur was experimenting on phases of the auto-carriage. He discovered the principle of the 'differential,' the balance mechanism which enables one wheel to revolve faster than the other in turning corners. He invented a planet gearing in this connection, which was the origin of the idea of the differential, and applied it to a steam wagon which he built in 1828. The differential of today is based on the principle discovered by Pecqueur. While Pecqueur was evolving this invention, Goldsworthy Gurney in England made a car which was a practical failure in about everything except that it demonstrated that sufficient friction between the drive wheels and the roadbed could be created to produce propulsion. A trip of almost 200 miles from London and return was made in 1823 by Gurney in the second vehicle he built, in which the engine was concealed in the rear. His car made 12 miles an hour for part of the trip. From this time—1828 to 1840—the automobile really had a vogue in England. A number of them were made and run as passenger carriers. For four months a motor carriage made the nine mile trip from Gloucester to Cheltenham four times a day. The 'Infant' built by Walter Hancock made trips between London and Stratford. The 'Era,' also made by Hancock, ran from London to Greenwich. To such an extent

did the auto-bus business develop, that speed of 30 miles an hour was claimed, and one conveyance in 1834 ran over 1,700 miles without repairs or readjustment. At least, that was the claim made, and as a claim it has a familiar sound. . . . But there was one feature about these early English motor busses that was their undoing. They weighed three tons and over, and the wheel rims were metal. The diameter of the wheels was six feet. The rubber tire was unthought of. The effect on roads of running a 3-ton, metal rimmed vehicle, carrying eleven to twenty passengers, was disastrous, and parliament, incited by horse owners and others, legislated them out of existence by making the toll charges prohibitive. . . . In 1878 Bollée built a steam omnibus which ran between Paris and Vienna, making 22 miles an hour. In this car was reached the highest efficiency the art had attained up to that time. Practically an identical car was built in 1880 by Bollée, which was entered by him 15 years later and won honors in the Paris-Bordeaux race. . . . In 1870 an American did a thing which has had much to do with giving the United States its long delayed start in the automobile industry. This man was George B. Selden of Rochester, N. Y. He applied for the first patent for the gasoline motor, as the driving force of a road vehicle. This was before any automobile had been equipped with an internal combustion hydro-carbon motor. This motor had, however, been in use for some time in running stationary engines. . . . Selden built a gasoline motor under the specifications contained in his application for a patent, and it performed satisfactorily in experiments. But he did not build an automobile containing the gasoline motor. He did not secure his patent until 1895, 16 years after he had made application for it. . . . In 1000 Selden disposed of it to the Electric Vehicle Company of New Jersey."—H. L. Barber, *Story of the automobile*, pp. 65-68.

1858-1919.—Origin and development of motor transport.—Steam wagons.—Electric trucks.—Traction enterprise in America.—Caterpillar tractor in war uses.—"Although in a commercial sense the truck industry is still in its infancy, it is not so young in its engineering development. Inquirers are often surprised to learn that it really antedates the pleasure automobile. The earliest inventors of the self-propelled road vehicle had their thoughts influenced in that respect by the commercial possibilities of the steam stage coach and traction engine. For illustration, the Cugnot steam wagon built in France in 1769-70 was designed to haul heavy artillery; the Hancock, the Gurney and the Russell steam vehicles built in England in the period from 1820 to 1840 were stage coaches that were actually operated in service as paying passenger conveyances. The earliest recorded road vehicle in the United States was a combined boat and road wagon built in 1804 by or for Oliver Evans, who obtained privileges to operate road wagons in Pennsylvania and Maryland. The first power road vehicle that is known to have operated on its own power of which there is authentic knowledge was a huge steam traction engine built in New York City in 1858 to be used for hauling merchandise from the Mississippi River to Colorado. The idea originated with Major General Joseph R. Brown, an Indian agent in Minnesota. The engine was designed and built by J. A. Reed, of New York, and after being driven under its own power through the streets of the city up to Twenty-third Street and back to the Christopher Street Ferry, was shipped by rail and river steamer to Nebraska City. The populace gave it a great reception there, and a string of about a dozen wagons filled with people was hauled through the city, preparatory to driv-

ing the engine to Denver under its own power. About 7 miles out of Nebraska City, a crank was broken and the machine was stored in Arbor Lodge, owned by J. Sterling Morton. The Civil War and the beginning of construction of the Union Pacific Railroad prevented the making of repairs and ended the venture, which had cost thousands of dollars. Eventually the machine was sold for \$200 and the boiler and engine removed for use in a mill. . . . The earliest experiments with steam road engines had very little if any influence, however, on the development of the commercial vehicle either in Europe or America. Besides the Reed steam traction engine referred to already, other early American self-propelled vehicles belonged to the class of commercial or utility vehicles. A steam fire engine driven by its own power was built in 1840 by Captain Ericsson. How successful it was is not known, but in 1867-70 the Amoskeag Corporation, in Manchester, N. H., built several self-propelled steamers, one of which, after being hurriedly sent to Boston during the great Boston fire in 1872, and performing efficient service, was purchased by the city of Boston. In 1876 the city of Hartford bought a self-driven steamer, which was named Jumbo, and was kept in service for many years. Development of the modern commercial vehicle was practically contemporaneous with that of the pleasure car. As early as 1805, in the pioneering days of Duryea, Winton, Haynes & Apperson, Woods, Riker, Olds, Morris & Salom and others, when the *Horseless Age* was started and the *Times-Herald* road race in Chicago on Thanksgiving Day inaugurated the automobile contest era in this country, the possibilities of the motor vehicle for industrial and commercial purposes were foreseen by many constructors. A gasoline delivery wagon, built by the Langert Company of Philadelphia, was entered in the Cosmopolitan race. Charles E. Woods, a Chicago carriage builder, had constructed one or more electric delivery wagons and C. S. Fairfield, of Portland, Oregon, had built a sightseeing stage seating eighteen to twenty passengers which was driven by a kerosene engine. To Woods seems to belong the credit for being the first American manufacturer to produce business vehicles commercially. The delivery wagons built by the Woods Motor Vehicle Co. in the early 90's were driven by two 1200-watt electric motors giving $3\frac{1}{2}$ horsepower output for five hours with a 32 cell battery. The running gear had carriage wheels and the front wheels were steered by a vertical rod on the left side fitted with a streetcar brake handle. Charles E. Woods, of the C. E. Woods Co., well known electrical engineer of Chicago and New York, made a long and very careful study of the motor vehicle from an engineering and practical standpoint in the early experimental days in America and reached the conclusion that the first demand of the public would be for light delivery wagons, then for public conveyances, next for liveries and finally for heavy private trucks. . . . In 1806 a horse van was converted into a steam wagon to haul furniture for the Shepard & Co. department store of Providence, R. I., by the Cruickshank Engineering Works of the same city. The design was by L. F. N. Baldwin and showed a boiler and 6-horsepower engine mounted under the wagon bed, with side chain drive. That the truck industry as well as the passenger car industry abroad was considerably further advanced than in America at this period is shown by the fact that the first heavy vehicle trials were held in France from August 5 to 11, 1807, by the Automobile Club of France. Ten vehicles competed, including four omnibuses, two tractors, one wagonette, one freight or merchandise truck and one brake. It will be seen how the pas-

senger-carrying vehicle predominated. The steam vehicles showed superiority in hill-climbing and hauling loads exceeding one ton, but the Panhard gasoline omnibus was highly commended for cleanliness, fuel economy and management. The Winton delivery wagon, brought out in 1898, was the first gasoline commercial vehicle to be produced on a commercial scale in the United States. Eight of these vehicles were under construction in October of that year. The panel body was mounted on the regular Winton pleasure chassis, which was driven by a 6-horsepower 5 by 6 inch single-cylinder horizontal engine suspended under the body with a planetary change-speed gear mounted on an extension of the crank-shaft. The running gear had tubular axles and reaches and final drive was by a single chain to the differential gear on the rear axle. The machine was steered by a tiller and the wheels were of the wire spoke suspension type. In the same year the Duryea Motor Wagon Co., of Springfield, Mass., brought out a light delivery model having a panel body mounted on the three-wheel passenger car chassis designed by Charles E. Duryea; and S. Messinger, of Newark, N. J., produced a gasoline delivery wagon weighing 1000 pounds and driven by a 6-horsepower 4 by 6-inch engine. A. L. Riker, pioneer American experimenter with electricity as a motive power for tricycles and pleasure cars, had produced an electric delivery wagon model, and one of these machines, built for B. Altman & Co., dry goods merchants in New York, was placed on exhibition in the electrical show held in Madison Square Garden in May, 1898. It had a rated capacity of 500 pounds and weighed 2900 pounds. The battery alone weighed 1000 pounds. The vehicle was mounted on wire wheels fitted with 3-inch pneumatic tires and had a radius of action of 30 miles at a speed of 10 miles an hour. Mr. Riker, who was born in New York City in 1868 and graduated from the Columbia College Law School, began experimenting with electrically driven vehicles and in 1895 built a self-propelled quadricycle made of two bicycles placed side by side for experimental purposes. In the 90's he produced designs for large electric 4-wheeled passenger and delivery vehicles. He had already formed the Riker Electric Motor Co. of Brooklyn, of which he was president. This was succeeded in 1901 by the Electric Vehicle Co. of Hartford, which continued the manufacture of electric vehicles under the name Columbia, acquired from the Pope Manufacturing Co. . . . A crude oil tractor built in 1898 by the Best Manufacturing Co., of San Leandro, Cal., was probably the first American internal combustion tractor for hauling merchandise. It is interesting to note that it was driven by a 75-horsepower 4-cylinder motor and was designed to haul a gross weight of 120,000 pounds on two trailer wagons at a speed of 4 to 8 miles an hour. The first Waverley electric wagon announced made its appearance the same year in Indianapolis as the product of the American Electric Vehicle Co. Its chief characteristics were a tubular frame, ball-bearing wood wheels fitted with cushion tires, single $3\frac{1}{2}$ -horsepower motor supported longitudinally on the frame with enclosed direct drive from the armature shaft to the rear axle differential; a 44-cell battery concealed in the body bed and tiller steer. . . . Now came a brief period, in 1898-9, when the struggling young industry was burdened by the flotation of many heavily capitalized stock companies to exploit public service electric cab and compressed air trucking services. Anticipating big profits in such undertakings or believing the public anticipated them and was ready to invest heavily, the Whitney-Widener-Elkins syndicate, of Philadelphia and New York, secured control of the patents

owned by the Pope Manufacturing Co. for the construction of motor vehicles and those owned by the Electric Storage Battery Co. for the manufacture of vehicle batteries and formed the Columbia Automobile Co. This company then united these patents with those owned by the Electric Vehicle Co. under the ownership of a third company organized as the Columbia & Electric Vehicle Co., whose stock was taken equally by the Columbia Automobile Co. and the Electric Vehicle Co. The new company purchased the entire plant of the Columbia Automobile Co. in Hartford and soon afterward acquired the stock and plant of the New Haven Carriage Co. at New Haven. About the same time the Electric Vehicle Co. bought up the Seamans & Halske Electric Co. of America for the production of motors and other electric equipment. With this combination of manufacturing plants, having facilities for the production of about 8000 vehicles a year, the Electric Vehicle Co. began organizing transportation companies in leading cities as an outlet for the product. The first four formed were the New York, the New England and the Illinois Electric Vehicle Transportation companies, each capitalized at \$25,000,000, and the Pennsylvania Electric Vehicle Co., capitalized at \$6,000,000.—J. R. Doolittle, ed., *Romance of the automobile industry*, pp. 351-356.—See also below 1920.

"An innovation in this war [World War], development of which in the future promises to be even more important, was the increased use of motor transportation. As applied to the artillery, this meant the use of caterpillar tractors to haul the big guns, especially over rough ground. When we entered the war no suitable designs existed for caterpillar tractors of size appropriate for the medium heavy artillery. But new 5-ton and 10-ton types were perfected in this country, put into production, and 1,100 shipped overseas before November 1 [1918]. About 300 larger tractors were also shipped and 350 more secured from the French and British. The tank was an even more important application of the caterpillar tractor to war uses. In the case of the small 6-ton tanks, the efforts of this country were largely concentrated on improvement of design and on development of large scale production for the 1919 campaign. Up to the time of the armistice 64 had been produced in this country, and the rate at which production was getting under way is shown by the fact that in spite of the armistice the total completed to March 31, 1919, was 778. The burden of active service in France was borne by 227 of these tanks received from the French. The efforts of this country in the case of heavy 30-ton tanks were concentrated on a cooperative plan, by which this country was to furnish Liberty motors and the rest of the driving mechanism, and the British the armor plate for 1,500 tanks for the 1919 campaign. It has been estimated that about one-half the work on the American components for this project had been completed before November 11 [1918], and the work of assembly of the initial units was well under way. For immediate use in France, this country received 64 heavy tanks from the British."—*The War with Germany: United States official statistical summary*, p. 80.—During the war, "motor trucks to the number of 47,018 went forward, and when fighting ceased were being shipped at the rate of 10,000 a month. . . . Beyond the range of the narrow-gauge railway [in the war zones] came the motor truck. The truck could go over roads that were under shell fire. It could retire with the Army or push forward with advancing troops. Trucks were used on a larger scale in this war than was ever before thought possible. The American Infan-

try division on the march with the trucks, wagons, and ambulances of its supply, ammunition, and sanitary trains stretches for a distance of 30 miles along the road. The 650 trucks which the tables of organization of the division provide are a large factor in this train. The need for trucks increased moreover during the latter months of the war as trench warfare gave place to a war of movement. As the forces moved forward on the offensive away from their railway bases, more and more trucks were demanded. The Army overseas never had all the trucks it needed during the period of hostilities. . . .

The supply was least adequate during the last four months of the war, when the shipment of trucks fell behind the accelerated troop movement. The difficulty was almost entirely a shortage of ships. At practically all times there were quantities of trucks at the ports of embarkation, but trucks take enormous amounts of cargo space on ships. It is slow and difficult work to load them, and time after time embarkation officials were forced to leave the trucks standing at the ports and load their ships rapidly with supplies needed still more urgently overseas. In October and November [1917] more ships were pulled out of the trades and the trucks were shipped even at the expense of other essential supplies. The shipment kept pace with the troop movement, but the initial shortage could not be overcome until February. The number of trucks sent overseas prior to the armistice was 40,000 and of these 33,000 had been received in France. The trucks ranged in size from three-quarters of a ton to 5 tons."—*Ibid.*, pp. 46, 54-55.

1885-1894.—Benz and Daimler gasoline motors.—"In 1885, Benz, a German, built the first road vehicle to be run by the internal-combustion, hydro-carbon motor. It was a tricycle, and its motor was single-cylindere, four-cycled, after the type of an engine developed in 1876, in Germany, by Otto, and water cooled. It had electric ignition and a mechanical carburetor. Benz secured a patent in 1886 on his invention and it ran successfully, making ten miles an hour. Benz was limited to the use of certain streets in Mannheim, Germany, for running his machine, out of deference to the tendency to nerves of horses and their drivers or riders. This tricycle by Benz was the forerunner of the Benz automobile. This is one of the most successful and popular cars in Germany—and before the war, in all Europe. The first automobile imported to the United States was a Benz car brought to the Chicago World's Fair in 1893. Up to 1917 the Benz car was an entrant in most automobile speed contests. While Benz was perfecting the gasoline motor in its attachment to the tricycle, Gottlieb Daimler, another German, was producing, in 1885, the motorcycle. Daimler had devoted himself sedulously to the problem of reducing the weight and increasing the power of the gas engine, in order to adapt it to high efficiency road vehicles. He invented the hot tube ignition to take the place of ignition by flame. By regulation of the heat of the tube, the compressed charge of hydro-carbon vapor could be fired automatically at a specific point in the cycle. Through the increased speed thus produced the size and weight of the motor could be reduced."—H. L. Barber, *Story of the automobile*, pp. 69-70.—"Daimler got into touch with M. Levassor, who was so impressed with the patrol boat and a quadricycle shown at the Paris Exhibition in 1889 that he set to work to build a complete motor-car. After many failures he succeeded, and one of the most extraordinary things in connection with his success is the fact that the form of construction adopted by him—in fact, one may say invented by him—is the form adopted even to this present day. His first car had the engine in front, a sliding change-

speed gear arranged for various speeds, a counter-shaft carrying a differential gear, and sprockets for a chain-drive on to the back wheels, and was similar in a number of other points."—C. Jarrott, *Ten years of motoring and motor racing*, p. 16.—"The Daimler motor was a big step in advance, as was proved by the supremacy which the German and French automobile makers at once attained. The French secured rights to the Daimler motor and operated under them with such success that from 1889 to 1894, before the United States had really waked up to motor car making, they were beginning to put out gasoline automobiles successfully."—H. L. Barber, *Story of the automobile*, p. 70.

1889-1905.—America builds steam and electric cars.—First American gasoline car.—French improvements.—"At this time, we, in this country, were following the steam and storage battery fetishes. The first steam car in the United States that might be called modern was built by S. H. Roper of Massachusetts, in 1889. In 1900, steam car building in America gave promise of disputing the gasoline car records then being made in France, but by 1905 the gasoline car manufacturers had taken the cue from the European gasoline successes, and this form of motor came to the front. Contemporaneously with the activities in steam car building in the United States, was the pioneer electric car construction era. The first electric automobile was built in 1891, and made its first exhibit on appearance in the streets of Chicago in September, 1892. The builder of this, the first electric driven vehicle, was William Morrison of Des Moines, Iowa. It was brought by J. B. McDonald, president of the American Battery Company, Chicago. . . . The date of the building of the first American gasoline automobile that ran was 1892. The man who performed the feat was Charles E. Duryea. He had the assistance of his brother, Frank Duryea, but what was more, he had the benefit of knowledge of what had been accomplished in Europe in the gasoline motor field. Panhard, Levassor, Peugeot, De Dion, Bouton, and Serpollet were Frenchmen who had done things with gasoline cars, all (except Serpollet and Levassor) principally through the manufacture of finished cars. Levassor conceived the idea of a central frame to carry the power plant, and thus solved the problem of road shock. Serpollet had done more. He had invented the flash boiler, reviving an art the English had previously discovered, which made the use of dry or superheated steam possible. Higher pressure could be used, water economies effected and weight reduced. When Duryea and others, about 1892, gave concentrated thought to gasoline propulsion, all the problems of automobile making had found solution, except two: . . . a method of cushioning wheel rims, and some method by which the motor could be so placed that it would be immune from shocks and vibrations. So, when Duryea, in 1892, built the first American gasoline car that would run successfully, he merely 'assembled' the ideas that had then accumulated. Duryea built his first car in 1892. Henry Ford built his in 1893. Elwood Haynes built his in 1894. There were but four gasoline cars in the United States in 1896—Duryea, Ford, Haynes, and Benz, the last being the German car which was imported. With the accomplishments of the builders of steam, electric and gasoline motored vehicles at this time—1895—the practical success of horseless carriages had been definitely settled. Practically all fundamental problems had been solved. To make them finally an accepted addition to the world's methods of transportation in general use, two things only were needed. One was the devel-

opment of perfecting devices, such as rubber tires, the production of which began about 1889; and the other was the general acceptance of automobiles by the people—a cordial, popular approval, manifested by their purchase and use. . . . The first American made gasoline automobile sold in the United States was disposed of March 24, 1898. The sale of steamers and electrics had been going on for several years before, but not very extensively."—*Ibid.*, pp. 70-75.

1892-1916.—Rise of Henry Ford.—Standardization.—"The real 'fathers' of the automobile are Gottlieb Daimler, the German who made the first successful gasoline engine, and Charles Goodyear, the American who discovered the secret of vulcanized rubber. Without this engine to form the motive power and the pneumatic tire to give it four air cushions to run on, the automobile would never have progressed beyond the steam carriage stage. It is true that Charles Baldwin Selden, of Rochester, has been pictured as the 'inventor of the modern automobile' because, as long ago as 1879, he applied for a patent on the idea of using a gasoline engine as motive power, securing this basic patent in 1895, but this, it must be admitted, forms a flimsy basis for such a pretentious claim. The French apparently led all nations in the manufacture of motor vehicles, and in the early nineties their products began to make occasional appearances on American roads. The type of American who owned this imported machine was the same that owned steam yachts and a box at the opera. Hardly any new development has aroused greater hostility. It not only frightened horses, and so disturbed the popular traffic of the time, but its speed, its glamour, its arrogance, and the haughty behavior of its proprietor, had apparently transformed it into a new badge of social cleavage. It thus immediately took its place as a new gewgaw of the rich; that it had any purpose to serve had occurred to few people. Yet the French and English machines created an entirely different reaction in the mind of an imaginative mechanic in Detroit. Probably American annals contain no finer story than that of this simple American workman. Yet from the beginning it seemed inevitable that Henry Ford should play this appointed part in the world. Born in Michigan in 1863, the son of an English farmer who had emigrated to Michigan and a Dutch mother, Ford had always demonstrated an interest in things far removed from his farm. Only mechanical devices interested him. . . . Henry Ford at the age of sixteen ran away to get a job in a machine shop. Here one anomaly immediately impressed him. No two machines were made exactly alike; each was regarded as a separate job. With his savings from his weekly wage of \$2.50, young Ford purchased a three dollar watch, and immediately dissected it. If several thousand of these watches could be made, each one exactly alike, they would cost only thirty-seven cents a-piece. 'Then,' said Ford to himself, 'everybody could have one.' He had fairly elaborated his plans to start a factory on this basis when his father's illness called him back to the farm. This was about 1880; Ford's next conspicuous appearance in Detroit was about 1892. This appearance was not only conspicuous; it was exceedingly noisy. Detroit now knew him as the pilot of a queer affair that whirled and lurched through her thoroughfares, making as much disturbance as a freight train. In reading his technical journals Ford had met many descriptions of horseless carriages, the consequence was that he had again broken away from the farm, taken a job at \$45 a month in a Detroit machine shop, and devoted his evenings to the production of a gasoline engine. His young

wife was exceedingly concerned about his health; the neighbors' snap judgment was that he was insane. Only two other Americans, Charles B. Duryea and Elwood Haynes, were attempting to construct an automobile at that time. Long before Ford was ready with his machine . . . foreign makes began to appear in considerable numbers. But the Detroit mechanic had a more comprehensive inspiration. He was not working to make one of the finely upholstered and beautifully painted vehicles that came from overseas. "Anything that isn't good for everybody is no good at all," he said. Precisely as it was Vail's ambition to make every American a user of the telephone and McCormick's to make every farmer a user of his harvester, so it was Ford's determination that every family should have an automobile. He was apparently the only man in those times who saw that this new machine was not primarily a luxury but a convenience. Yet all manufacturers, here and in Europe, laughed at his idea. Why not give every poor man a Fifth Avenue house? Frenchmen and Englishmen scouted the idea that any one could make a cheap automobile. Its machinery was particularly refined and called for the highest grade of steel; the clever Americans might use their labor-saving devices on many products, but only skillful handwork could turn out a motor car. European manufacturers regarded each car as a separate problem; they individualized its manufacture almost as scrupulously as a painter paints his portrait or a poet writes his poem. The result was that only a man with several thousand dollars could purchase one. But Henry Ford—and afterward other American makers—had quite a different conception. . . . [About 1902] Ford had built a machine which he entered in the Grosse Point races that year. It was a hideous-looking affair, but it ran like the wind and outdistanced all competitors. From that day Ford's career has been an uninterrupted triumph. But he rejected the earliest offers of capital because the millionaires would not agree to his terms. They were looking for high prices and quick profits, while Ford's plans were for low prices, large sales, and use of profits to extend the business and reduce the cost of his machine. Henry Ford's greatness as a manufacturer consists in the tenacity with which he has clung to this conception. Contrary to general belief in the automobile industry he maintained that a high sale price was not necessary for large profits; indeed he declared that the lower the price, the larger the net earnings would be. Nor did he believe that low wages meant prosperity. The most efficient labor, no matter what the nominal cost might be, was the most economical. The secret of success was the rapid production of a serviceable article in large quantities."—B. J. Hendrick, *Age of big business*, pp. 174-180.—See also DETROIT: 1812-1916.—"Thus Henry Ford did not invent standardization; he merely applied this great American idea to a product to which, because of the delicate labor required, it seemed at first unadapted. He soon found that it was cheaper to ship the parts of ten cars to a central point than to ship ten completed cars. There would therefore be large savings in making his parts in particular factories and shipping them to assembling establishments. In this way the completed cars would always be near their markets. Large production would mean that he could purchase his raw materials at very low prices; high wages meant that he could get the efficient labor which was demanded by his rapid fire method of campaign. It was necessary to plan the making of every part to the minutest detail, to have each part machined to its exact size, and to have every screw, bolt, and bar precisely interchangeable. About the year 1907

the Ford factory was systematized on this basis. In that twelvemonth it produced 10,000 machines, each one the absolute counterpart of the other 9999. American manufacturers until then had been content with a few hundred a year! From that date the Ford production has rapidly increased; until, in 1910, there were nearly 4,000,000 automobiles in the United States—more than in all the rest of the world put together—of which one-sixth were the output of the Ford factories. Many other American manufacturers followed the Ford plan, with the result that American automobiles are duplicating the story of American bicycles; because of their cheapness and serviceability, they are rapidly dominating the markets of the world. In the Great War American machines have surpassed all in the work done under particularly exacting circumstances."—*Ibid.*, pp. 182-183.—"A few years ago an English manufacturer, seeking the explanation of America's ability to produce an excellent car so cheaply, made an interesting experiment. He obtained three American automobiles, all of the same 'standardized' make, and gave them a long and racking tour over English highways. Workmen then took apart the three cars and threw the disjointed remains into a promiscuous heap. Every bolt, bar, gas tank, motor, wheel, and tire was taken from its accustomed place and piled up, a hideous mass of rubbish. Workmen then painstakingly put together three cars from these disordered elements. Three chauffeurs jumped on these cars, and they immediately started down the road and made a long journey just as acceptably as before. The Englishman had learned the secret of American success with automobiles. The one word 'standardization' explained the mystery."—*Ibid.*, p. 173.

1894-1896.—Prevailing conditions in early automobile races.—Paris-Rouen race.—First races in America and England.—Variety of cars.—"What were the conditions prevailing at the time of those good old days—the days of Paris-Berlin, Paris-Bordeaux, and Paris-Vienna races? Obviously the competitive element existed between the various manufacturers of cars taking part; they entered for a race in the hope that they could successfully beat their rivals; but the general idea underlying the whole event was the desire to prove to the world that motor-cars would go, and that they were capable of travelling long distances in a reliable and speedy manner. The events were looked upon as educational both to the public and to the manufacturer, in the evolution of vehicles, which were something more than mere pieces of machinery made for sale and barter. And lessons were learned, experience and knowledge gained, and that side of the sport which was influenced by the financial aspect of the event was satisfied in these rewards, and the extermination of all opposition to each individual interest was not thought of. The men who drove were also dominated by this idea. Dozens of them were independent, racing their own cars; others were racing, if not on their own cars, at any rate at their own expense; and none but were so enamoured of the sport as a sport, as to make the mere question of money subservient to the keen desire to drive a racing-car and to race. To race against one's friends, against one's compatriots, and against one's foreign rivals, to drive one's car faster and reach the distant goal sooner than somebody else in the event. And good fellowship and good sportsmanship prevailed amongst all, to add pleasure and enjoyment to the actual racing itself. And then the conditions of actual racing were so different. In the rapid march of progress new cars were built for each event. Months saw extraordinary progress, and working

as the makers were in order to get their machines out for the event, they invariably failed to do so until the very last minute. They were not particularly handicapped in consequence because every maker was in the same plight, and consequently in each event a long line of practically untried new motor-cars formed up, their capabilities to be tested and their merits discovered over hundreds of miles of unknown road. And much of the charm of the sport lay in its glorious uncertainty. Where a result is bound to happen there is no real sport, and never were results more obscure than the results of those races. The fact of travelling successfully three-parts of the distance proved nothing, because probably some part would break and trouble ensue which placed one hopelessly *hors de combat*, and we all struggled on, making the best of our troubles, sympathizing with each other's misfortunes, and doing our best to arrive at the finish. In addition to the excitement of driving a new and practically untried machine, you had also the fact that you were driving a much faster machine than you had ever driven before, because the power of the motors was increased for each event, and with all these glorious elements of uncertainty, a feeling that you were perhaps driving faster than any one had ever driven before, and there was a lack of that grimness and ferocity which marks latter-day motor-racing. To secure real and exciting sport obviously the spice of danger was an added interest, because since we were not then accustomed to the speeds, this sense of danger always existed."—C. Jarrott, *Ten years of motors and motor racing*, pp. 97-98.—"Levassor's experiments [see above 1885-1894] and successes were copied, and eventually sufficient vehicles were in existence to warrant the holding of a race—or rather a trial—in [July] 1894, from Paris to Rouen. [Forty-six cars were entered of which twelve only were steam cars.] The first to arrive was a steam vehicle, built by De Dion et Bouton, but the success of the petrol vehicles was sufficiently pronounced to establish it as a fact beyond all question that they were practical and successful. The excitement in France in connection with this race was very great, the new road vehicles being welcomed by the French populace with open arms. Although the first arrival was the De Dion Bouton steamer, nevertheless the Panhard and Peugeot cars were given the first prize, a De Dion steamer gaining the second, and a Serpollet steam car being awarded the third. A movement was soon after started for the holding of another race for the following year, in which the Count De Dion and the Baron de Zuylen took an active part. It was eventually decided that a race should be run from Paris to Bordeaux and back, without stoppages of any kind. M. Levassor built a special car for the event, having a small $4\frac{1}{2}$ h. p. motor, and a number of other cars were also turned out by the various firms interested to take part. The race was held on 11 June, 1895, the start being from Versailles, and twenty-three vehicles presented themselves at the starting-point. Of these, nine completed the journey, eight of them being petrol-driven carriages and one steam. M. Levassor won the event, by accomplishing the journey in forty-eight hours on his little car—a magnificent performance, considering the stage of development to which the motor vehicles had attained at that time."—*Ibid.*, pp. 6-7.—On "Thanksgiving Day, 1895, the first American automobile race was run from Chicago to Waukegan. The organizer and patron was a newspaper—the *Chicago Times-Herald*. Of two entrants, the 'Buggyaut' of Charles E. Duryea was one."—H. L. Barber, *Story of the automobile*, p. 73.—"November 14, 1896. A foggy, dull, wet, typical November morning found me making my way along Holborn

to the Central Hall. This had been engaged for the purposes of a garage for the use of the intrepid people who were on that morning to make a run, involving much danger and personal risk, from London to Brighton [52 miles]. For the first time in English history legal restrictions in regard to the use of motor-cars on the public highways, except when preceded by a man with a red flag, had been removed, and we were to be allowed to drive a car on the road at a speed not exceeding twelve miles an hour. The run from London to Brighton had been arranged to celebrate this important event. . . . Léon Bollée was there, with a small fleet of those extraordinary little machines invented by him which always, to my mind, resembled land torpedoes more than anything else. The Panhard and Levassor machines, which had previously taken part in the great Paris-Marseilles race, were also there; and a dozen other notabilities in what was then the somewhat limited automobile world. . . . Most of the cars were historical, in view of the fact that they had, even then, accomplished great deeds. In the first, driven by M. Meyer, was seated Mr. H. J. Lawson, President of the Motor-Car Club, the car itself being the identical Panhard-Levassor on which M. Levassor had achieved his great victory of the previous year in the Paris-Bordeaux race. No. 2 was a German Daimler landaulette, which had the previous week occupied a prominent position in the Lord Mayor's Show, and contained, amongst other distinguished personages, Herr Gottlieb Daimler himself. No. 3 was a Panhard-Levassor car, which had won the Paris-Marseilles race. No. 4 belonged to the Hon. Evelyn Ellis. McRobie Turrell . . . was also driving a Panhard-Levassor car, whilst Léon and Amédee Bollée and H. O. Duncan were all handling Bollée tandem machines. Another machine of great interest was driven by Mr. E. J. Pennington, who, at that time, was claiming great things for the motor invented by him. And an American-made machine, in the shape of the Duryea, also figured prominently. Another bold person, in the shape of Mr. Gorton, junior, rode a fearful and wonderful tricycle, which started off with many kicks and jumps, much to the alarm of the crowd."—C. Jarrott, *Ten years of motors and motor racing*, pp. 1-3.

1898-1916.—Foundation of automobile companies.—Diversity of types.—"The year of the Spanish-American war—1898—saw the beginning of a veritable rain of automobile manufacturers in the United States. In that year the Stanley, Stearns, Thomas, Matheson, Wintou, and the Waverley Company entered the field. In 1899, there appeared the Locomobile Company, Olds, Baker-Electric and Pierce-Racine (later absorbed by J. I. Case and now the Case car). In 1900, Packard, Peerless, Glide, National Electric, Lambert, Elmora, Babcock, Jackson, Knox and Lane were entrants in the lists. In 1901, Acme, Gaeth, Pierce-Arrow, White, Royal Tourist, Stevens-Duryea, Waltham-Orient, Pope-Toledo, Welch, Pullman and Rambler. In 1902, Cadillac, Franklin, Pope, Studebaker, Sultan, Okey, Walter and Schacht. In 1903, Ford, Auburn, Overland, Moline, Premier, Corbin, Bergdall, Holsman, Columbus and Chadwick. In 1904, Buick, Cleveland, American Napier, Stoddard-Dayton, Marmon, Mitchell, Jewel, McIntyre, Pittsburgh Electric, Ranch & Lang and Simplex. In 1905, Alco, American, Dorris, Johnson, Jonz, Kisselcar, Maxwell, Monarch, Reo, Studebaker, Garford and American Mors. In 1906, Anderson, A.B.C., Cartecar, Brunn, Thomas-Detroit, Kearns, Sterling, Mora, Moon, Pennsylvania, Palmer & Singer and Staver. In 1907, Albany, Atlas, Brush, Bertolet, Ryder, Carter, Chalmers, Coppock, De Luxe, Oakland, Regal, Selden, Speedwell, Interstate,

Lozier and Great Western. In 1908, Sharp-Arrow, Pittsburgh 6, Crown Midland, Rider-Lewis, Paige-Detroit, Velie, Cole, E.M.F. and Hupmobile. In 1909, Hudson, Advance, Cunningham, Coates-Goshen, Ohio and Abbott. Since 1909 to date new cars put on the market include: Stutz (1911), Chevrolet (1912), Grand, Chandler, Saxon and Scripps-Booth (1913), Dodge and Dort (1914), Owen Magnetic (1915), Drexel and Elgin (1916). Other automobiles in the field are the Maibohm, Allen, Ben-Hur, Crow-Elkhart, Harroun, Lexington and Madison. . . . The earlier manufacturers of motor cars included many who had been engaged in manufacturing bicycles, and following them was a group that had successfully manufactured wagons and carriages. Still another set of manufacturers were machinery men. In the list of names of automobile companies which have been organized during the period of the industry's development, there are some which have gone out of business; but not many. The industry, generally speaking, has had comparatively few complete failures. Mortality has been lower with it than with many other business enterprises. This is chiefly due to the intelligence which the manufacturers brought to the business, plus the demand which sprang up for the automobile as soon as the people, instructed with great and liberal space by the press, realized it was the vehicle that could give what they wanted. Never was the value of a concerted campaign of education better demonstrated. That unusually intelligent study of the subject of suiting the popular desire was given by manufacturers is evidenced in many ways, but in none that is so typical as was the standardization of motor cars. At one stage of the industry its very life was threatened by a lack of uniformity in the mechanical construction of the various types of the automobile. The big idea that has made Henry Ford's millions was a combination one. It was the building of a motor and car combined which could be constructed at a cost that would command large quantity production. This conception by Ford, alone, simple though it was, proclaims him the genius he undoubtedly is. The purchase of cars between 1898, when sales first began to be made, and 1903, when Ford put out his car, was practically confined to people of wealth and leisure. It required both to own and operate an automobile. Men bought them at a cost of \$3,000 to \$12,000 each. Purchasers were exhilarated by auto-intoxication—with little thought of the practical uses the invention could be put to. Snob-bishness, social impression and display of superior wealth were back of many purchases."—H. L. Barber, *Story of the automobile*, pp. 95-98.

1900-1920.—Fuel problem.—Starting devices.—"It seems amusing to us, today, to turn back to 1910-12 and read that the vast increase in the use of the automobile had caused such a demand for gasoline that the quality had gone down to a point that constituted a problem. We will understand this better if we realize that the cars of 1900 and 1905, burning the high-grade gasoline then on the market, were expected to start, under all conditions and without priming, on a half or even a quarter turn of the crank. When the fuel became of such sort that this was not feasible, there was a universal consensus that some sort of starting motor would have to be devised. A great many sorts were put forward, but those that worked pneumatically or through springs or by introducing a preliminary charge of acetylene or some other violent explosive and touching it off with the spark went overboard when it was shown clearly that a wet battery could be built that would not be damaged by such roughing as it would get from riding in a car, and that a generator could be installed that would keep it

charged to the necessary voltage for starting. The development of the electric starter began in 1910, and by 1913 was complete, all the better cars being by that time so equipped. But if a battery must be carried for this purpose, economy demands that it be used also for lighting and ignition, relieving the car of weight and installation expense represented by oil lamps and magneto. So we find at this time the very general reversion to battery ignition, referred to above. The magneto, however, has not submitted tamely to this. Admitting that at the slow engine-speeds of cranking whether manually or by motor, the battery gives a better spark than the magneto, the advocates of the latter point out that its spark increases in intensity with engine speed and that it ought therefore to be better after the car gets under way. Opinion here is still in a point of flux; and it is difficult to say whether the present vogue of dual ignition represents really an effort to get the best of both systems, or merely a desire to sidestep the question of choosing between them."—*Rise of the automobile (Scientific American, Oct. 2, 1920, p. 358)*.

1902-1915.—Development of engines.—Cooling devices.—Steering gear.—"In 1907 the first six-cylinder model appeared in England, the work of Napier, and the precedent was quickly followed, until by, say, 1910, it might have been said that the two-cylinder car of 1902 had become a four, and the four a six. At the same time Hewitt produced an eight, but this precedent was ignored for nearly a decade; the earliest of the existing eights appears to be the Cadillac, of 1914. The tendency toward sixes, and later eights, continued; and finally, in 1915, the Packard, almost the last car to give up the single cylinder, was the first to set the mark at twelve. A change of importance that ought to be mentioned is that from chain drive, universal in the early models, to the propeller shaft with bevel gears. If a date were to be set at which this became first effective, it would be somewhere in the vicinity of 1905. The early designers surrounded the single cylinder with a water jacket, but made no definite provision for water economy. Perhaps they did not expect their cars to run far enough, on one stretch, to require fresh water. But by 1900 the cruising radius had gone up, and radiators recognizable as such made their appearance, though as late as 1902 they were universally low with sloping fronts. The higher, vertically up-standing type appeared in 1904-05, and swept the field clean within two years at the most. Circulation was by pump, until the Renault designers incorporated the thermo-siphon, which spread to a few other models after 1907. But it must be emphasized that air-cooling is not a recent development; the Franklin, which would be the Wilkinson if named after its creator, dates back continuously to 1902-03, and the Knox and Marmon, among others, were air-cooled for a time. The dividing line between horseless carriage and automobile may perhaps be drawn from the point where the motor was transferred to the front and the conservative upright steering post with horizontal rod replaced by the more sporty wheel. Among the names that lived, the Knox, Duryea, Haynes, Oldsmobile, Stearns and Pierce were all handled through rods in 1902; the vogue of the wheel appears to have become definitely established not earlier than 1904. And Levassor's example in putting the engine where it belongs was still defied in 1902 by the Stearns, Pierce, Packard, Oldsmobile and others, but had become universal two years later. So perhaps we might say that the period before 1900 was that of the horseless carriage, and that after four years of transition we come to the automobile."—*Ibid.*, p. 358.

1909-1916.—Growth of production.—Reduced

prices.—“The average price of all motor vehicles, combining pleasure cars and trucks, was, in 1916, \$636. The preponderance of passenger cars at the lower prices brought the average down, since the average price of motor trucks alone was about \$1,800. For every motor truck sold, eighteen passenger cars were disposed of in 1916. With standardization and the consequent lowering of cost, the automobile industry acquired a momentum that has carried production forward on a constantly ascending scale, as witness these figures of passenger cars alone:

Year	No. of cars made	Year	No. of cars made
1909.....	80,000	1912.....	250,000
1910.....	185,000	1915.....	842,249
1911.....	200,000	1916.....	1,617,708

The manufacture of motor trucks almost doubled in one year. The number produced in 1915 was 50,300. In 1916 the number made was 92,130. The above table, showing the rate of increase in passenger cars made in seven years, makes it clear that the greatest growth in the passenger car business has been since and including the year 1911. That was the year in which the largest number of medium and low priced standardized cars with refinement of detail and added equipments, selling from \$1,500 down to \$500, was first put on the market. Ford almost doubled his output in that year. The next years, 1912 and 1913, also he more than doubled each year his output of the previous year. And in 1916 he made nearly one-third of all the passenger cars produced in the entire United States in that year. Could anything demonstrate more conclusively than these facts, that if you have an article within the price of the mass of the people, it will sell, if the people want it? The one idea of Henry Ford—quantity sales—saved to the United States the premiership in automobile making. For other manufacturers adopted it, some radically, others in a modified form. Its influence was unquestioned in putting the price of motor cars at a figure at which a person happening to have less than the income of a millionaire could afford to buy one, so that when every one of the many values and benefits of the existence of the modern automobile is scheduled, let us, in giving credit for them, place the name of Ford at the head of the list. When we have arrived at our destination, or have attained an object much desired, our satisfaction is such that we are in a forgiving mind and prone to forget the sacrifices we had to make, the difficulties we had to overcome, the strenuous work we had to do. The end justified the means, and we don't think long about the hardships in the means. Preëminence of the United States in the motor field has not been gained without hardships, sacrifices and disappointments by those engaged in it, nor was it reached by the immediate and uninterrupted success of all companies organized to commercialize the invention.”—H. L. Barber, *Story of the automobile*, pp. 100-102.

1920.—Immense spread of automotive industry and traffic.—“The present survey may well be concluded with a word about the position held today in the world's economy by the automotive industries. It is in a way hardly necessary to dilate upon this, yet one or two concrete statements may help to a true realization of the vital importance of the automobile to our way of doing things. For one thing, we are told that while all the railroads of the United States in the course of a year yield about 45 billion passenger-miles, the automobiles of the entire nation are responsible for 70 billion of these units of transportation. Again, with the

3,700 passenger cars manufactured in 1899, the first year for which records exist, and with the 411 trucks of 1904, we may compare the present normal production of some two million passenger cars and three hundred thousand, plus, trucks. Finally, we have the fact that there are something like seven million automotive vehicles of all sorts in operation in this country today. Figures are given for the United States for the very simple reason that, alike in manufacture and use, this is the land of the automobile. Under the head of general remarks about the rôle of the automobile in twentieth century economy the difficulty is wholly that of finding a brief statement that shall do the subject justice. In every single thing that we do today the automobile or the truck or the tractor occupies a position of importance. Perhaps the most illuminating statement that could be made would have to do with the manner in which all distances up to fifty, seventy-five, or even a hundred miles are made to vanish into nothing by the magic influence of the motor. The isolation of farm life is a thing of the past, for the farmer cannot possibly be more than an hour from a town that gives him access to high-class schools and stores and amusements. City congestion, serious as it is, would be vastly worse were it not for the manner in which the automobile extends the suburbs and the area of food supply far beyond the remotest possibilities of twenty years ago. Trucks carry freight from New York to Philadelphia in less time than it would take to get it to the freight yards and loaded on a train. In a word, the automobile—taking this term to include all gasoline-driven vehicles—is with little question the greatest ameliorating influence in modern life.”—*Rise of the automobile* (*Scientific American*, Oct. 2, 1920, p. 360).

AUTONOMY, self-government; administrative independence of a city or state. The term was applied to the states of ancient Greece where every city or small community claimed sovereign power. In modern history it is used to describe the condition of a country which has complete control of its own affairs while nominally under the power of another state.

AUTUN, Origin of. See GAUL: The people.
287 A. D.—Sacked by the Bagauds. See BAGAUDS.

AUVERGNE, an ancient government of France which came under the French crown in 1532; inhabited by the Arverni in Cæsar's time, Vercingetorix at one time leading them against the Romans. See ÆDUI; BURGUNDY: 1364; GAUL: The people; FRANCE: 1665; also Maps of mediæval period: 1154-1360.

AUVERGNE, School of.—“The school of Auvergne arose in a region where the worship of Mercury had been popular in the days of the Roman Empire, where many Gallo-Roman statues and reliefs existed. From such remains of antiquity the early mediæval sculptors seem to have derived their inspiration. They produced works in high relief, often with a good deal of undercutting. . . . In choice of subjects this school shows a preference for allegorical figures, especially for the conflict of the Virtues with the Vices; among these the punishment of Avarice is most popular. . . . The capitals of the church of Notre Dame du Pont, at Clermont, of the early part of the twelfth century, are good examples of the work of this school.”—H. N. Fowler, *History of sculpture*, p. 197-108.

AUXILIUM, old English tax. See TALLAGE.
AVA, a town and former capital of the empire of Burma; situated on the Irrawaddy river, six miles south of Mandalay, the present capital. See BURMA: Early history; INDIA: 1823-1833.

AVALON, Lord Baltimore's name for his province of Newfoundland. See NEWFOUNDLAND: 1610-1655.

AVARICUM. See BOURGES, ORIGIN OF.

AVARS.—The true Avars are represented to have been a powerful Turanian people who exercised in the sixth century a wide dominion in Central Asia. Among the tribes subject to them was one called the Ogors, or Ouigours, or Quiars, or Ouar Khouni, or Varchonites (these diverse names have been given to the nation) which is supposed to have belonged to the national family of the Huns. Some time in the early half of the sixth century, the Turks, then a people who dwell in the very center of Asia, at the foot of the Altai mountains, making their first appearance in history as conquerors, crushed and almost annihilated the Avars, thereby becoming the lords of the Ouigours, or Ouar Khouni. But the latter found an opportunity to escape from the Turkish yoke. "Gathering together their wives and their children, their flocks and their herds, they turned their waggons towards the Setting Sun. This immense exodus comprised upwards of 200,000 persons. The terror which inspired their flight rendered them resistless in the onset; for the avenging Turk was behind their track. They overturned everything before them, even the Hunnic tribes of kindred origin, who had long hovered on the north-east frontiers of the Empire, and, driving out or enslaving the inhabitants, established themselves in the wide plains which stretch between the Volga and the Don. In that age of imperfect information they were naturally enough confounded with the greatest and most formidable tribe of the Turanian stock known to the nations of the West. The report that the Avars had broken loose from Asia, and were coming in irresistible force to overrun Europe, spread itself all along both banks of the Danube and penetrated to the Byzantine court. [See BYZANTINE EMPIRE: Part in history.] With true barbaric cunning, the Ouar Khouni availed themselves of the mistake, and by calling themselves Avars largely increased the terrors of their name and their chances of conquest." The pretended Avars were taken into the pay of the empire by Justinian and employed against the Hun tribes north and east of the Black sea. They presently acquired a firm footing on both banks of the Danube, and turned their arms against the empire. The important city of Sirmium was taken by them after an obstinate siege and its inhabitants put to the sword. Their ravages extended over central Europe to the Elbe, where they were beaten back by the warlike Franks, and, southwards, through Moesia, Illyria, Thrace, Macedonia and Greece, even to the Peloponnesus. Constantinople itself was threatened more than once, and in the summer of 626, it was desperately attacked by Avars and Persians in conjunction (see *ROME*: 565-628), with disastrous results to the assailants. But the seat of their empire was the Dacian country—modern Rumania, Transylvania and part of Hungary—in which the Avars had helped the Lombards to crush and extinguish the Gepidæ. [See *RUMANIA*: B. C. 5th century to A. D. 1241.] The Slavic tribes which, by this time, had moved in great numbers into central and south-eastern Europe, were largely in subjection to the Avars and did their bidding in war and peace. "These unfortunate creatures, of apparently an imperfect, or, at any rate, imperfectly cultivated intelligence, endured such frightful tyranny from their Avar conquerors,

that their very name has passed into a synonyme for the most degraded servitude."—J. G. Sheppard, *Fall of Rome*, lect. 4.—See also *ALBANIA*: Name and people; *BALKAN STATES*: Races existing; and *EUROPE*: Introduction to historic period: Migrations.

7th century.—**Slavic revolt**.—The empire of the Avars was shaken and much diminished in the seventh century by an extensive rising of their oppressed Slavic subjects, roused and led, it is said, by a Frank merchant, or adventurer, named Samo, who became their king. [See *BULGARIA*: 7th century.] The first to throw off the yoke were a tribe called the Vendes, or Wendes, or Venedi, in Bohemia, who were reputed to be half-castes, resulting from intercourse between the Avar warriors and the women of their Slavic vassals. Under the lead of Samo, the Wendes and Slovenes or Slavonians drove the Avars to the east and north; and it seems to have been in connection with this revolution that the emperor Heraclius induced the Serbs or Servians and Croats—Slavic tribes of the same race and religion—to settle in depopulated Dalmatia. "From the year 630 A. D.," writes M. Thierry, 'the Avar people are no longer mentioned in the annals of the East; the successors of Attila no longer figure beside the successors of Constantine. It required new wars in the West to bring upon the stage of history the khan and his people.' In these wars [of Pepin and Charlemagne] they were finally swept off from the roll of European nations."—J. G. Sheppard, *Fall of Rome*, lecture 4.

626.—**Attack on Constantinople with Persians**. See *ROME*: Medieval City: 565-628.

640.—**Devastation of Albania**. See *ALBANIA*: Early history.

791-805.—**Conquest by Charlemagne**.—"Hungary, now so called, was possessed by the Avars, who, joining with themselves a multitude of Hunnish tribes, accumulated the immense spoils which both they themselves and their equally barbarous predecessors had torn from the other nations of Europe. . . . They extended their limits towards Lombardy, and touched upon the very verge of Bavaria. . . . Much of their eastern frontier was now lost, almost without a struggle on their part, by the rise of other barbarous nations, especially the various tribes of Bulgarians." This was the position of the Avars at the time of Charlemagne, whom they provoked by forming an alliance with the ambitious duke of Bavaria, Tassilo,—most obstinate of all who resisted the Frank king's imperious and imperial rule. In a series of vigorous campaigns, between 791 and 797 Charlemagne crushed the power of the Avars and took possession of their country. The royal "ring" or stronghold—believed to have been situated in the neighborhood of Tatar, between the Danube and the Theiss—was penetrated, and the vast treasure stored there was seized. Charlemagne distributed it with a generous hand to churches, to monasteries and to the poor, as well as to his own nobles, servants and soldiers, who are said to have been made rich. There were subsequent risings of the Avars and wars, until 805, when the remnant of that almost annihilated people obtained permission to settle on a tract of land between Sarwar and Haimburg, on the right bank of the Danube, where they would be protected from their Slavonian enemies. This was the end of the Avar nation.—G. P. R. James, *History of Charlemagne*, bks. 9 and 11.

ALSO IN: J. I. Mombert, *History of Charles the Great*, bk. 2, ch. 7.

AVARS, Rings of the.—The fortifications of the Avars were of a peculiar and effective construction and were called Hrings, or Rings. "They seem to have been a series of eight or nine gigantic ramparts, constructed in concentric circles, the inner one of all being called the royal circle or camp, where was deposited all the valuable plunder which the warriors had collected in their expeditions. The method of constructing these ramparts was somewhat singular. Two parallel rows of gigantic piles were driven into the ground some twenty feet apart. The intervening space was filled with stones, or a species of chalk, so compacted as to become a solid mass. The sides and summit were covered with soil, upon which were planted trees and shrubs, whose interlacing branches formed an impenetrable hedge."—J. G. Sheppard, *Fall of Rome*, lecture 9.

AVEBURY, a village of Wiltshire, England. It is the site of the ruins of an ancient monument, similar to Stonehenge but more primitive. "The numerous circles of stone or of earth in Britain and Ireland, varying in diameter from 30 or 40 feet up to 1,200, are to be viewed as temples standing in the closest possible relations to the burial-places of the dead. The most imposing group of remains of this kind in this country [England] is that of Avebury [Abury], near Devizes, in Wiltshire, referred by Sir John Lubbock to a late stage in the Neolithic or to the beginning of the bronze period. It consists of a large circle of unworked upright stones 1,200 feet in diameter, surrounded by a fosse, which in turn is also surrounded by a rampart of earth. Inside are the remains of two concentric circles of stone, and from the two entrances in the rampart proceeded long avenues flanked by stones, one leading to Beckhampton, and the other to West Kennett, where it formerly ended in another double circle. Between them rises Silbury Hill, the largest artificial mound in Great Britain, no less than 130 feet in height. This group of remains was at one time second to none, 'but unfortunately for us [says Sir John Lubbock] the pretty little village of Avebury [Abury], like some beautiful parasite, has grown up at the expense and in the midst of the ancient temple, and out of 650 great stones, not above twenty are still standing. In spite of this it is still to be classed among the finest ruins in Europe.'"—W. B. Dawkins, *Early man in Britain*, ch. 10.—See also **STONEHENGE**.

AVERNUS, Lake and cavern.—A gloomy lake called Avernus, which filled the crater of an extinct volcano, situated a little to the north of the Bay of Naples, was the object of many superstitious imaginations among the ancients. "There was a place near Lake Avernus called the prophetic cavern. Persons were in attendance there who called up ghosts. Any one desiring it came thither, and, having killed a victim and poured out libations, summoned whatever ghost he wanted. The ghost came, very faint and doubtful to the sight."—Maximus Tyrius, quoted by C. C. Felton, *Greece, ancient and modern*, c. 2, lecture 9.—See also **CUMÆ** and **BALE**.

AVERROES (Abul-Walid Muhammad ibn-Ahmad Ibn-Muhammad ibn-Rushd) (1126-1198), Arabian philosopher. See **AVERROISM**.

AVERROISM.—"The works of the Arab free-thinker Averroes (twelfth century) which were based on Aristotle's philosophy, propagated a small wave of rationalism in Christian countries. Averroes held the eternity of matter and denied the immortality of the soul; his general view may be described as pantheism. But he sought to avoid difficulties with the orthodox authorities of Islam by laying down the doctrine of *double truth*, that is the coexistence of two independent and contradictory truths, the one philosophical, and the other religious. This did not save him from being banished from the court of the Spanish caliph. In the University of Paris his teaching produced a school of freethinkers who held that the Creation, the resurrection of the body, and other essential dogmas, might be true from the standpoint of religion but are false from the standpoint of reason. . . . This dangerous movement was crushed, and the saving principle of double truth condemned, by Pope John XXI. The spread of Averroistic and similar speculations called forth the Theology of Thomas, of Aquino in South Italy (died 1274), a most subtle thinker, whose mind had a natural turn for scepticism. He enlisted Aristotle, hitherto the guide of infidelity, on the side of orthodoxy, and constructed an ingenious Christian philosophy which is still authoritative in the Roman Church."—J. B. Bury, *History of freedom of thought*, pp. 68-69.

AVESNES, a railroad town of France, thirty miles east of Cambrai, overrun by the Germans in August, 1914, and recovered by the British, November 8, 1918. See **WORLD WAR**: 1918: II. Western front: w, 2; x, 3.

AVESTA, or *Zend-Avesta*, sacred writings of the Parsees ascribed by them to Zoroaster and his immediate disciples. The present collection which exists in Pahlavi is only a fragment of the original Zoroastrian scriptures. The name "Zend-Avesta" came into use in Europe about 1771 when Anquetil Duperron translated the remnants of the Avesta. Although Hyde, an Oxford scholar, had written on the subject at an earlier date, he failed to create the interest that Duperron aroused. A century later Spiegel made a noteworthy translation, interpreting the Parsee documents from a viewpoint entirely different from that of Duperron. In fact the interpretation of the Avesta is a matter of such philological difficulty that no agreement has been reached even on the most important points. It was from these translations of the Pahlavi books where the text and translation are spoken of as "Avesta and Zend" that the misnomer *Zend-Avesta* arose. The book is not contained in a single manuscript, but in a collection of writings as the Old Testament is. Although these do not measure up to the Old Testament, nevertheless, as the basis of the Zoroastrian faith, and as the only literary legacy of the ancient Iran, they hold a place of unique importance in the world's literature.—See also **MAGIANS**; **PARSEES**; **PERSIAN LITERATURE**; **ZOROASTRIANS**.

AVIATION

DEVELOPMENT OF BALLOONS AND DIRIGIBLES

Early history.—Inception of the balloon.—It is not improbable that when primitive man first began to think he instinctively felt a desire to emulate the flight of birds as his eyes followed their inexplicable progress through the air. During later ages, as records show, he has philosophized, schemed and experimented to conquer the

about the time of the founding of Rome, caused to be built an apparatus with which he sailed in the air above the chief city of Trinovantes, but that losing his balance he fell upon a temple and was killed. . . . A better authenticated legend seems to be that of Simon the Magician, who in the thirteenth year of the reign of the Emperor Nero (about 67 A.D.) undertook to rise toward heaven like a bird in the presence of everybody. The legend relates that 'the people assembled to

TYPES OF EARLY ATTEMPTS AT FLYING-MACHINES

air, only to be thrown back upon the conclusion—apparently definite and final—that he had not, and could not hope to attain the necessary power to operate a pair of wings of sufficient spread to carry him through the air. A famous pioneer of aviation, Octave Chanute, has traced the probable inception of these ambitious projects to the beginning of the Roman era. In 1894 he published a book "Progress in flying machines," in which he fixes "the earliest legend of an experiment which we may fairly suppose to have been tried with an aeroplane . . . in the somewhat fabulous chronicles of Britain, wherein it is related that King Bladud, the father of King Lear, who is supposed to have reigned in Britain

view so extraordinary a phenomenon, and Simon rose into the air through the assistance of the demons in the presence of an enormous crowd, but that St. Peter having offered up a prayer, the action of the demons ceased and the magician was crushed in the fall and perished instantly.' It seems, therefore, certain from this tale, which has come down to us without any material alteration, that even in that barbarous age a man succeeded in rising into the air from the earth by some means which have unfortunately remained unknown. . . . There is a tradition of the eleventh century concerning Oliver of Malmesbury who, in some of the accounts, is styled 'Elmerus de Malemeria,' and who was an English Benedictine

monk, said to have been a deep student of mathematics and of astrology, thereby earning the reputation of a wizard. The legend relates that having manufactured some wings, modeled after the description that Ovid has given of those of Daedalus, and having fastened them to his hands, he sprang from the top of a tower against the wind. He succeeded in sailing a distance of 125 paces, but either through the impetuosity or whirling of the wind, or through nervousness resulting from his audacious enterprise, he fell to the earth and broke his legs. . . . A more explicit tradition of the same kind comes from Constantinople where, under the reign of the Emperor Manuel Comnenus, probably about the year 1178, a Saracen (reported to be a magician, of course), whose name is not given, undertook to sail into the air from the top of the tower of the Hippodrome in the presence of the Emperor. . . . The Saracen kept extending his arms to fetch the wind. At

SPHERICAL BALLOONS

Start of a balloon race

last when he deemed it favorable, he rose into the air like a bird, but his flight was as unfortunate as that of Icarus, for the weight of his body having more power to draw him down than his artificial wings had to sustain him, he fell and broke his bones. . . . One of the most celebrated traditions of partial success with a flying machine refers to J. B. Dante, an Italian mathematician of Perugia, who, toward the end of the fourteenth century, seems to have succeeded in constructing a set of artificial wings with which he sailed over the neighboring lake of Trasimene. We have no description of the apparatus, but this was presumably an aeroplane, soaring upon the wind, for we have seen abundantly that all experiments have failed with flapping wings, man not having the strength required to vibrate with sufficient rapidity a surface sufficient to carry his weight in the air"—O Chanute, *Progress in flying machines*, pp. 76-78, 80, 81.

13th century.—Roger Bacon (1214-1202) suggested a plan of flotation of a large hollow sphere of very thin copper, to be filled with "etherial

air or liquid fire," which he conceived would navigate the air as a ship does the water. There is no definite record that he submitted his theories to a practical test.

14th century.—Bishop Albert of Halberstadt believed it would be possible to enclose hot air in a sphere and raise the same into the air.

17th century.—A Portuguese Jesuit, Francis Mendoza, and Gaspar Schott, a German Jesuit, respectively evolved different theories to make hollow spheres float in the air by fire and "etherial fluid." A more impractical suggestion was that of an Italian Jesuit, Francesco Lana (1631-1687), who proposed four thin copper balls each of twenty or twenty-five feet diameter, entirely exhausted of air. One of these balls or balloons was to be attached to the corners of a square basket or car, which latter was to carry a mast and sail. The fallacy underlying his theory consisted in the physical condition that the envelopes would be too thin to withstand atmospheric pressure. Yet it was upon this principal that the modern balloon was subsequently evolved.

1783-1784.—The earliest practical experiments in ballooning were made in this year, during which, it may be said, a new science was born. Until the eighteenth century, aeronautics still appeared to be an impracticable idea. In 1783, however, the brothers Joseph and Etienne Montgolfier at Annonay, France, invented the free balloon which proved the simplest method of overcoming gravity. The heated air used in the Montgolfier balloon was soon replaced with hydrogen, an important advance, since this gas lifts about sixty-eight pounds per 1,000 cubic feet as against some ten pounds for the highest temperature that is practical for a hot-air balloon. The largest of this type ever built was *Le Flesselles*, which was launched at Lyons, France, in 1784 and measured 100 feet in diameter and 130 feet in height. Its volume is given as 500,000 cubic feet. The important events of these two years are summarized as follows:

Sept. 10, 1783.—Joseph Montgolfier sent up a balloon charged with hot air, carrying a cage containing a sheep, a cock and a duck, these being, so far as we know with any degree of certainty, the first living creatures to ascend into the air by means of a human invention; height, about 1,500 feet.

Oct. 15.—Jean François Pilâtre de Rozier (1756-1785) ascended in a Montgolfier captive balloon—the first human air passenger.

Nov. 21.—Pilâtre de Rozier and the marquis d'Arlandes ascended in a free fire balloon from the Bois de Boulogne to about 500 feet. They traveled about five miles within twenty-five minutes and descended in safety.

November.—The first balloon ascended from British soil, without any passenger. It was made by an Italian, the Conte Zambecari, and inflated with hydrogen gas. The balloon, which rose in London, traveled forty-eight miles in two hours and a half.

Dec. 1.—Jacques Alexandre César Charles (1746-1823), a French mathematician and physicist, was the first to inflate a balloon with hydrogen gas. He made an ascent from Paris in company with one of the brothers Robert, who had manufactured the balloon. They rose to about 2,000 feet and sailed twenty-seven miles, when they came to earth and Robert left the car. Charles continued the trip alone. The lightened balloon shot up to a height of two miles. The device of suspending the car from a hoop attached to the netting and also the valve on top of the balloon,

both of which are still in use to-day, were introduced by Charles.

Feb. 22, 1784.—First balloon across the channel.—A balloon, without a passenger, flew from Kent to Warneton, French Flanders, seventy-five miles.

Aug. 27.—The first human being to ascend from British soil is believed to have been J. Tytler. He went up in a balloon of his own make at Edinburgh and traveled half a mile.

Sept. 15.—Vincente Lunardi, attached to the Neapolitan embassy in London, ascended in a balloon, accompanied by a pigeon, a dog and a cat.

1821.—Coal gas for inflation of balloons first used by George Green, an English aeronaut.

1844.—John Wise, America's pioneer balloonist, invented the rip panel, a ribbon covering a vertical seam on the upper half of the balloon, which on landing, can promptly be pulled off to allow instant deflation and thus prevent dragging by the wind.

1862 (May 24).—In American Civil War, General Stoneman ascended in a captive balloon and directed his artillery fire.

1870-1913.—Balloon developments.—Kite-balloons.—Parachutes.—Remarkable flights.—The modern free balloon varies in size to contain from 9,000 to 80,000 cubic feet. Larger balloons have been constructed and successfully operated. During the siege of Paris in the Franco-Prussian War (1870-1871), some 164 passengers were carried out of Paris, together with valuable documents and 3,000,000 despatches. Out of sixty-six balloons, only five were captured by the Germans besieging the city, and two were lost in the Atlantic. One balloon, carrying two passengers, was driven by wind storms from Paris to Norway, where it fell into a snow drift. So great was the moral and material success of this enterprise that Bismarck threatened to shoot every aeronaut as a spy, while Krupp produced the first anti-aircraft gun. In 1893, the defects of the captive balloon were overcome by two German officers, Captains Parseval and Siegsfeld, who devised the so-called kite balloon. This consists of an elongated gas-bag divided into two unequal portions, the larger of which (comprising about four-fifths of the total volume) is filled with hydrogen, the remaining one-fifth constituting the ballonet or air-cell, which is automatically inflated by the wind through a convenient aperture. In the World War the kite balloon was used by practically all the belligerents; on the Western front alone hundreds of them were to be seen behind both Allied and German lines. Since the occupants of these kite balloons have no means of defending themselves against airplane attacks, they are provided with parachutes which enable them to jump from the fired balloon and descend in safety. In balloons men have risen higher than any airplane has mounted yet. Coxwell and Glaisher were once credited, upon their own report, of having reached an altitude of 37,000 feet, about seven miles, in a balloon which ascended at Wolverhampton, England, on Sept. 5, 1862. One of the aeronauts lost consciousness at five and a half miles; the other, though dazed and frozen numb, retained his wits and managed to bring the balloon safely to earth. It is doubted now if they even reached a height of six miles. On July 11, 1897, Salomon A. Andrée, Swedish engineer and aeronaut, started from Danes island, Spitsbergen, in a balloon with two companions, Strindberg and Fänkel, in an attempt to reach the North Pole. They were never heard of again, and nothing is known of their fate, though several relief expeditions were sent to search for

them between 1897 and 1899. Two days after their departure they had released a carrier pigeon bearing a message indicating that the balloon was at the time about 145 miles northeast of the starting point. In a very large balloon, the *Preussen* (Prussia), Professor Berson and Dr. Suring ascended near Berlin on July 31, 1901, to a height of 34,430 feet, which has been accepted as a record. On May 28, 1913, three Frenchmen, MM. Bienaimé, Schneider and Lenorique, in the *Icare*, provided with oxygen respiration apparatus, rose to 33,074 feet and were almost frozen. Two companions of Gaston Tissandier succumbed to the cold at 28,160 feet in the balloon *Zenith* on April 15, 1875, but apparently these aeronauts carried no oxygen outfit. In relation to aviation, balloon records are pertinent only as indicating the peril to vitality at very high altitudes. Piloting an airplane is different from sitting in the car of a balloon. Once the pilot's limbs are benumbed

"TURTLE" OBSERVATION BALLOON

there is danger that he will lose control of his machine, and this danger naturally increases the higher he goes.

1884-1897.—Transition from balloon to dirigible.—Flight of La France.—By a process of natural sequence, the free balloon led to the dirigible. The former cannot be guided, and is at all times at the mercy of the winds: the balloon must travel in whatever direction the wind blows. Combine a power plant with a suitable free balloon and the result is an airship. Whereas the spherical shape is the only one for free balloons, quite a variety of forms have been constructed and proposed for airships, or, as they may be called, motor-balloons. Roze, a Frenchman, placed two separate balloons side by side; another attempt was made with an elliptical cross-section form, to resist the influence of the wind in landing. But the great majority of constructors adopt the more or less oblong and rounded shapes. One of the earlier theories in vogue some twenty years ago with regard to the shape best adapted for air-

ships was that cone-shaped bodies fly better than cylindrical ones. The swiftest fliers, swallows and seagulls, have a tapered form, rounded in front the same as a drop of water, which, in a sense, has the property of assuming the most favorable form for cleaving the air during its fall. Experiments with models, such as are made before a marine vessel is built, yield no useful results in the case of large airships, on account of the elasticity of the air and its capacity to accept instantly a high rate of speed. Little success attended experiments with a fish-like form of balloon, severely tapered, because this shape demands a larger resisting cross-section, from which no advantage accrues. Fishes, therefore, cannot be taken as models for aerial craft, seeing that the rigidity of the airship body excludes the possibility of propulsion with or from its rear end, as in the case of fishes. All this applies only to airships whose lengths do not exceed from six to eight times their diameter. The longer types are better oblong, with pointed ends, as adopted by Count Zeppelin. The tapered form is the best for shorter airships, but of no value for long vessels.

There are three main classes of dirigibles, the rigid, semi-rigid, and non-rigid. The rigid system is that in which the carrying body is firmly built. This type can only be constructed on a very large scale, as the skeleton alone requires from 25 to 33 per cent. of the total lifting power. Such a vessel, however, is much safer in the air than one of the limp or semi-rigid type, but dangerous when standing on the ground; although there is less necessity for frequent descents in order to replenish the gas, it runs considerable risk in descending during rough weather, and is liable to destruction if it does not land near a garage. Still more dangerous would be a descent upon the sea, as the waves and wind would speedily destroy the whole vessel. The rigid framework is covered with fabric, which encloses a number of drum-shaped gas bags. In the semi-rigid type the carrying body is made of limp material like an ordinary balloon, but fixed upon a metal or wooden frame, which supports the balloon underneath, retaining at least its longitudinal form, though not the shape of the gas bag. The third system renounces the solidity of the first as well as the supporting frame of the second, and is therefore styled the non-rigid limp system. The forms of all these bodies vary: some are more or less tapered at the ends, others are cylindrical in shape. The covers are made of waterproof cotton, silk, gold-beaters' skin or sheet metal. In most cases the propellers are attached to the front or at both sides, as near the center of resistance as possible. The cars are attached to the balloon bodies either rigidly or non-rigidly; that is to say, loosely suspended. In the rigid Zeppelin type, the gas is regulated after the manner of free balloons; in the semi-rigid and non-rigid systems, this is done by inflating ballonets or airbags, which may aptly be described as "lung ballonets." The elevating and descending appliances are either movable planes or sliding weights, by which the center of gravity is shifted. The dirigible represents the collaboration of almost countless inventors. No one man can be accorded credit for the dirigible as we know it to-day. Three men were the founders of the science of airship construction, namely, General Meusnier of the French army, who in 1784 laid down the fundamental principles of the non-rigid airship; Renard and Krebs, also French officers, who designed and built in 1884 the first airship, *La France*, which conclusively demonstrated its ability—and conse-

quently the possibility—to navigate the air in any desired direction; and finally, the late Count Zeppelin, a German cavalry general, who began the construction of a rigid airship in 1897, which in its trial flight in June, 1900, made eighteen miles an hour. Renard and Krebs had been drawn to the "conquest of the air" from the results previously achieved by Henri Giffard in 1855, who sought to propel a gas-inflated vessel through the air by means of a steam engine; the experiments of Dupuy de Lôme in 1870-1872; and the results achieved by Albert and Gaston Tissandier in 1883. "Dupuy de Lôme attempted to solve this vexatious problem, which had been occupying the minds of men—brilliant and otherwise—for centuries, and the knowledge which he accumulated from his experiments provided the foundation upon which Captains Renard and Krebs pursued their studies. Dupuy de Lôme conceived his idea from the German investiture of the city of Paris. On February 2nd, 1872, a vessel was built according to his designs, and despite the indifferent propelling resources available, he succeeded in imparting a speed of about five miles an hour to his craft in calm air. In 1883 the brothers Tissandier attacked the issue because by this time an alternative means of propelling an airship had been devised. Gramme had given the world the electric dynamo, and it was thought that thereby aerial navigation might be solved. . . . Several experiments . . . were carried out, but the first decisive flight was not made until September, 1884,—after the maiden trip of *La France*—when the vessel made a two hours' sojourn in the air during which it attained a speed of thirteen and a half feet per second and performed various evolutions. But it was *La France* and the work of Renard and Krebs which really constituted the starting-point of aerial navigation."—F. A. Talbot, *All about inventions and discoveries*, pp. 239-240.

1896-1914.—Count von Zeppelin's achievements.—Forlanini's dirigible.—Progress in construction.—The blimp.—"The Zeppelin has always aroused the world's attention, although this interest has fluctuated. Regarded at first as a wonderful achievement of genius, afterwards as a freak, then as the ready butt for universal ridicule, and finally with awe, if not with absolute terror—such in brief is the history of this craft of the air. Count von Zeppelin [1838-1917] developed his line of study and thought for one reason only. As an old campaigner and a student of military affairs he realised the shortcomings of the existing methods of scouting and reconnoitering. He appreciated more than any other man of the day perhaps, that if the commander-in-chief of an army were provided with facilities for gazing down upon the scene of operations, and were able to take advantage of all the information accruing to the man above who sees all, he would hold a superior position, and be able to dispose his forces and to arrange his plan of campaign to the most decisive advantage. In other words, Zeppelin conceived and developed his airship for one field of application and that alone—military operations. . . . As is well known, Zeppelin evolved what may be termed an individual line of thought in connection with his airship activities. . . . He clung tenaciously to his pet scheme [of a rigid airship] and to such effect that in 1896 a German Engineering Society advanced him some funds to continue his researches. This support sufficed to keep things going for another two years, during which time a full-sized vessel was built. The grand idea began to crystallise rapidly, with the result that when a public company was formed

in 1898, sufficient funds were rendered available to enable the first craft to be constructed. It aroused considerable attention, as well it might, seeing that it eclipsed anything which had previously been attempted in connection with dirigibles. . . . The vessel was of great scientific interest, owing to the ingenuity of its design and construction. . . . The construction of the vessel subsequently proved to be the easiest and most straightforward part of the whole undertaking. There were other and more serious problems to be solved. How would such a monster craft come to earth? How could she be manipulated upon the ground? How could she be docked? Upon these three points previous experience was silent. One German inventor [Dr. Wölfert] who likewise had dreamed big things, and had carried them into execution, paid for his temerity and ambitions with his life [1897], while his craft was reduced to a mass of twisted and torn metal. [Dr. Wölfert was experimenting with a dirigible balloon driven by

certain influential Teuton aeronautical experts who had previously ridiculed Zeppelin's idea had made a perfect *volte-face*. They became staunch admirers of the system, while other meteorological *savants* participated in the trials for the express purpose of ascertaining just what the ship could do. As a result of elaborate trigonometrical calculations it was ascertained that the airship attained an independent speed of 30 feet per second, which exceeded anything previously achieved. The craft proved to be perfectly manageable in the air, and answered her helm, thus complying with the terms of dirigibility. The creator was flushed with his triumph, but at the same time was doomed to experience misfortune. In its descent the airship came to "earth" with such a shock that it was extensively damaged. The cost of repairing the vessel was so heavy that the company declined to shoulder the liability, and as the Count was unable to defray the expense the wreck was abandoned. Although a certain meed of success

A ZEPPELIN IN FLIGHT

COUNT ZEPPELIN

a gasoline motor which exploded during flight. In the same year an aluminum dirigible operated by a Daimler motor was wrecked.] Under these circumstances Count Zeppelin decided to carry out his flights over the waters of the Bodensee [Lake Constance] and to house his craft within a floating dock. In this manner two uncertain factors might be effectively subjugated. . . . The first ascent was made on July 2nd, 1900, but was disappointing, several breakdowns of the mechanism occurring while the vessel was in mid-air, which rendered it unmanageable, although a short flight was made which sufficed to show that an independent speed of thirteen feet per second could be attained. The vessel descended and was made fast in her dock, the descent being effected safely, while manoeuvring into dock was successful. At least three points about which the inventor had been in doubt appeared to be solved—his airship could be driven through the air and could be steered; it could be brought to earth safely; and it could be docked. . . . On October 17th and 21st of the same year further flights were made. By this time

had been achieved the outlook seemed very black for the inventor. No one had any faith in his idea. He made imploring appeals for further money, embarked upon lecturing campaigns, wrote aviation articles for the Press, and canvassed possible supporters in the effort to raise funds for his next enterprise. Two years passed, but the fruits of the propaganda were meagre. It was at this juncture, when everything appeared to be impossible, that Count Zeppelin discovered his greatest friend. The German Emperor, with an eye ever fixed upon new developments, had followed Zeppelin's uphill struggle, and at last, in 1902, came to his aid by writing a letter which ran:—

"Since your varied flights have been reported to me it is a great pleasure to me to express my acknowledgment of your patience and your labours, and the endurance with which you have pressed on through manifold hindrances till success was near. The advantages of your system have given your ship the greatest attainable speed and dirigibility, and the important results you have obtained

have produced an epoch-making step forward in the construction of airships and have laid down a valuable basis for future experiments.

"This Imperial appreciation of what had been accomplished proved to be the turning point in the inventor's fortunes. It stimulated financial support, and the second airship was taken in hand. But misfortune still pursued him. Accidents were of almost daily occurrence. Defects were revealed here and weaknesses somewhere else. So soon as one trouble was overcome another made itself manifest. The result was that the whole of the money collected by his hard work was expended before the ship could take to the air. A further crash and blasting of cherished hopes appeared imminent, but at this moment another Royal personage came to the inventor's aid. The King of Württemberg took a personal interest in his subject's uphill struggle, and the Württemberg Government granted him the proceeds of a lottery. With this money, and with what he succeeded in raising by hook and by crook, and by mortgaging his remaining property, a round £200,000 [\$700,000] was obtained. With this capital a third ship was taken in hand, and in 1905 it was launched. It was a distinct improvement upon its predecessors. . . . The trials with this vessel commenced on November 30th [1905], but ill-luck had not been eluded. The airship was moored upon a raft which was to be towed out into the lake to enable the dirigible to ascend. But something went wrong with the arrangements. A strong wind caught the ungainly airship, she dipped her nose into the water, and as the motor was set going she was driven deeper into the lake, the vessel only being saved by hurried deflation. Six weeks were occupied in repairs, but another ascent was made on January 17th, 1906. The trials were fairly satisfactory, but inconclusive. . . . The vessel was brought down, and was to be anchored, but the Fates ruled otherwise. A strong wind caught her during the night and she was speedily reduced to indistinguishable scrap. Despite catastrophe the inventor wrestled gamely with his project. The lessons taught by one disaster were taken to heart, and arrangements to prevent the recurrence thereof incorporated in the succeeding craft. Unfortunately, however, as soon as one defect was remedied another asserted itself. It was this persistent revelation of the unexpected which caused another period of indifference towards his invention. Probably nothing more would have been heard of the Zeppelin after this last accident had it not been for the intervention of the Prussian Government at the direct instigation of the Kaiser, who had now taken Count Zeppelin under his wing. A State Lottery was inaugurated, the proceeds of which were handed over to the indefatigable inventor, together with an assurance that if he could keep aloft 24 hours without coming to earth in the meantime, and could cover 450 miles within this period, the Government would repay the whole of the money he had lavished upon his idea, and liquidate all the debts he had incurred in connection therewith.

"Another craft was built, larger than its predecessors, and equipped with two motors developing 170 horse-power. . . . The crucial test was essayed on August 5th, 1908. . . . Victory appeared within measurable distance; the arduous toil of many patient years was about to be rewarded. The airship was within sight of home when it had to descend owing to the development of another motor fault. But as it approached the ground, Nature, as if infuriated at the conquest, rose up in rebellion. A sudden squall struck the unwieldy monster. Within a few moments it be-

came unmanageable, and through some inscrutable cause, it caught fire, with the result that within a few moments it was reduced to a tangled mass of metallic framework. It was a catastrophe that would have completely vanquished many an inventor, but the Count was saved the gall of defeat. His flight, which was remarkable, inasmuch as he had covered 380 miles within 24 hours, including two unavoidable descents, struck the Teuton imagination. . . . The German nation sympathised with the indomitable inventor, appreciated his genius, and promptly poured forth a stream of subscriptions to enable him to build another vessel. The intimation that other Powers had approached the Count for the acquisition of his idea became known far and wide, together with the circumstance that he had unequivocally refused all offers. He was striving for the Fatherland, and his unselfish patriotism appealed to one and all. Such an attitude deserved hearty national appreciation, and the members of the great German public emptied their pockets to such a degree that within a few weeks a sum of £300,000 or \$1,500,000 was voluntarily subscribed. All financial embarrassments and distresses were now completely removed from the Count's mind. He could forge ahead untrammelled by anxiety and worry. Another Zeppelin was built and it created a world's record. It remained aloft for 38 hours, during which time, it covered 600 miles, and, although it came to grief upon alighting, by colliding with a tree, the final incident passed unnoticed. Germany was in advance of the world. It had an airship which could go anywhere, irrespective of climatic conditions, and in true Teuton perspective the craft was viewed from the military standpoint. Here was a means of obtaining the mastery of the air: a formidable engine of invasion and aerial attack had been perfected. Consequently the Grand Idea must be supported with unbounded enthusiasm. The Count was hailed by his august master as 'The greatest German of the twentieth century,' and in this appreciation the populace whole-heartedly concurred."—F. A. Talbot, *Aeroplanes and dirigibles of war*, pp. 25, 29-30, 32-33, 35, 37.—"The disasters experienced by all early airships and most particularly by the Zeppelins were always seized upon by those who desired to convince the country what unstable craft they were, and however safe in the air they might be were always liable to be wrecked when landing in anything but fine weather. Those who might have sunk their money in airship building thereupon patted themselves upon the back and rejoiced that they had been so far-seeing as to avoid being engaged upon such a profitless industry."—G. Whale, *British airships*, pp. 101-102.—Besides turning out a large number of skillful and daring pilots, Italy has produced some remarkable innovations both in dirigibles, airplanes, machinery and appliances. Senator Enrico Forlanini holds as high a reputation in airship construction as the late Count Zeppelin. The Italian inventor began his airship experimenting and dreaming many years before his German competitor. Forlanini's first airship, the *Leonardo da Vinci*, was begun in 1901 and completed in 1909. He had constructed a second and improved dirigible by 1912, called *Città di Milano*. The reliability of his construction became recognized by the Italian government, which ordered one for the navy, the *F-3*. From that time he turned out an airship almost every year, each one an improvement on its predecessors. These dirigibles are of the semi-rigid type, and thus differ considerably from the Zeppelin rigid form; they are lighter and can rise to great heights in less time. Another important point of difference

is that Forlanini builds his cars close to and into the rigid keel instead of suspending them underneath. Like Zeppelin, he also has experienced disasters and aerial shipwrecks. "Count von Zeppelin, despite anything which may be said to the contrary, may be regarded as the inventor, pioneer, and only successful exponent of the rigid type of airship. Imitators have striven to eclipse his achievements, but have only met with exasperating failure and disappointment."—F. A. Talbot, *All about inventions and discoveries*, London, 1916, p. 246.—"As regards the future development of aircraft," said an expert addressing the Institution of Naval Architects in London on March 13, 1913, "there is no visible limit to the growth of the rigid airship. It is on the same footing in this respect as an ordinary [marine] ship. If we double their size they will lift eight times more and will have eight times the buoyancy, but they will require only four times the propelling power to move at the same speed."—By the time Zeppelin appeared among the air conquerors, "the high-speed internal combustion motor, owing to its success in the world of mechanical propulsion over the highways, had become recognized as a suitable engine for aeronautical duty, while a great deal of knowledge concerning the comparatively new metal aluminum had been acquired. Zeppelin admittedly knew nothing about aeronautics, but he set out to build an airship which differed from all its prototypes in every sense, and particularly in one connection—its colossal dimensions. His first craft measured 420 feet in length by thirty-eight feet in diameter. Two cars were provided—near the bow and towards the stern respectively—in each of which was placed a sixteen horse-power motor, driving independent propellers. But it was the design of this monster craft which aroused the greatest interest, inasmuch as it differed entirely from any which had gone before. The outer shell was polygonal in section, and was built up of a metallic girder skeleton over which was stretched the fabric or skin. Instead of the envelope, as it may be called, being charged with gas in the usual manner—such as a balloon—the interior was subdivided into a number of compartments insulated from one another by a thin wall or diaphragm of fabric. Consequently, the interior of the skin became resolved into a number of cells, and in each of these was placed a balloon inflated with hydrogen. The balloons themselves favoured the conventional spherical form, so that the whole of the cell was not occupied by the gas-bag. This arrangement was adopted because it left a space around the gas-bag through which the air was free to circulate. It was maintained that this arrangement would render the gas-bag less susceptible to the fluctuations of temperature, which cause the hydrogen to expand and to contract respectively, according to heat and cold."—*Ibid.*, pp. 243-244.—It was the progressive efforts of Zeppelin that gave the greatest impetus to modern airship construction, while the various setbacks he encountered owing to the disasters which befell several of his creations, served as useful object lessons not only for his own guidance, but for that of all airship builders and navigators. *Zeppelin I* taught that a movable weight, suspended from wires, was insufficient to effect the necessary stability in straight sailing. *Zeppelin II* was wrecked in storm near Kisslegg; *Zeppelin III*, completed in 1907, worked better than its predecessors and attained a speed of over thirty-three miles an hour. *Zeppelin IV* was burnt in August, 1908, near Echterdingen. The Count had once driven this 440-foot balloon from Friedrichshafen, on Lake Constance, to Lu-

cerne, 248 miles, within twelve hours. Starting once again from Friedrichshafen, intending a 500-mile trip, he made a landing at Oppenheim, 260 miles distant, returned thence to Stuttgart, and finally to Echterdingen, where a hurricane wrecked the airship. The cause of the disaster was said to be due to the ignition of detonating gas by atmospheric electricity. From the advent of Zeppelin the skill, ingenuity and efforts of many engineers of various nationalities have contributed to bring the airship to its present efficient stage of development. "In the early days of the [world] war an airship was constructed by Mr. Marshall Fox which is worthy of mention, although it never flew. It was claimed that this ship was a rigid airship, although from its construction it could only be looked upon as a non-rigid ship, having a wooden net-work around its envelope. The hull was composed of wooden transverse frames forming a polygon of sixteen sides, with radial wiring fitted to each transverse frame. The longitudinal members were spiral in form and were built up of three-ply lathes. A keel of similar construction ran along the under side of the hull which carried the control position and compartments for two Green engines, one of 40 horse-power, the other of 80 horse-power, together with the petrol, bombs, etc. In the hull were fitted fourteen gasbags giving a total capacity of 100,000 cubic feet. The propeller drive was obtained by means of a wire rope. The gross lift of the ship was 4,276 lb., and the weight of the structure, complete with engines, exceeded this. It became apparent that the ship could never fly, and work was suspended. She was afterwards used for carrying out certain experiments and at a later date was broken up."—G. Whale, *British airships*, pp. 68-69.

"The diminutive airship . . . has the distinction of being the first commercial airship to be sold in the United States. It is known as Goodyear's Pony Blimp. The builders had in view the need for small, efficient, inexpensive airships, which might be used for commercial service or for purposes of sport. In the tests which have already been made, it has demonstrated its air-worthiness, showing a quick response to the propeller and the controls, and decided economy in operation. It is believed that aéro clubs will take advantage of this opportunity to train their members in airship navigation so that they may become competent pilots for larger dirigibles, particularly as the costs of operation are relatively low. This particular ship has been sold to a western syndicate which announces that it will use it for the development of commercial service. The Blimp is 95 feet long, has a maximum diameter of 28 feet and a height of 40 feet. Its volume is 35,000 cubic feet. The car, which is 12 feet in length, can accommodate a crew of two people. Driven by its 40 horse-power engine, it has a maximum speed of 40 miles per hour and a range, at full speed, of 400 miles, with a ceiling at 6,000 feet. This means that with two men aboard, and at an elevation of 6,000 feet, it can travel some 400 miles at a speed in still air of 40 miles per hour. Of course, by taking advantage of favorable winds, with the motor idle, the fuel may be conserved and the total range under such conditions may be increased considerably over 400 miles. For landing, the Blimp is equipped with mooring harness and anchors which permit ground stops to be made when desired for the replenishment of gas and supplies."—*Scientific American*, Apr. 24, 1920, p. 459.

DEVELOPMENT OF AIRPLANES
AND AIR SERVICE

1809-1874.—The airplane.—Beginnings.—The fundamental theory of the airplane was set forth by an Englishman, Sir George Cayley, as early as 1809, and actually furnished the basis upon which the modern "heavier-than-air" flying machine was subsequently built. It was he who invented that well-known toy made of two screws of four feathers each, fixed horizontally one above the other, with a flexible attachment like a bow and cord between them. By winding the string of the bow around the axle of the two screws the bow is bent taut. On being thrown into the air, the bow relaxes, unwinds the cord and thus speedily revolves the screws, though in opposite directions, which causes the apparatus to mount in the air. The date of this invention is 1796, and Cayley published an account of it in 1809. He calculated that if the area of the screws was enlarged to 200 feet, they would lift a man provided the power to revolve them could be applied. Other models were produced on the vertical screw or helicopter principle by J. Degen in 1816

OTTO LILIENTHAL IN HIS GLIDER
Stöllen, Germany, 1896

and O. Sarti in 1823, while a steam model by W. Phillips appeared in 1842, which is said to have risen to a great height and traveled a considerable distance. The earliest attempt at aviation on a considerable scale was that of Henson, an Englishman, who in 1843 began to work on the plans of what became famous in aeronautical history as Henson's aerostat, a combination of aerial screws with supporting structures occupying a nearly horizontal position. According to records in the patent office, Henson's apparatus consisted of an airplane of canvas or oiled silk stretched upon a frame made rigid by trussing, both above and below. Under this was to have been attached a car intended to house the steam engine that was to generate the motive power. Two rotating wheels were to propel the machine, acting upon the air after the manner of windmills. Stretched upon a triangular frame was a long tail, likewise covered with canvas or oiled silk, and which could be expanded or contracted, moved up or down, as desired for ascending or descending. Unfortunately, this ancestor of the airplane never reached the stage of actual construction—it remained a dream on paper. Another Englishman, named Stringfellow, who cooperated with Henson, built a successful flying model in 1847. With these two ex-

amples before him, F. H. Wenham in 1866 invented an apparatus which he called "Wenham's aeroplane," and two years later Stringfellow came along with another model combining Wenham's machine with Henson's aerial screws. Exhibited at the Crystal palace in London, this model won a \$500 prize. In 1874 Thomas Moy devised an "aerial steamer," a light powerful skeleton frame resting on three wheels, a new type of light engine, two long, narrow, horizontal planes and large aerial screws. Moy's idea was to obtain initial velocity by a run on the ground, a theory that was justified many years later by the experiments of the Wright Brothers.

1889-1900.—Langley and Maxim experiments.—German and English gliding machines.—Octave Chanute.—The old, yet still youthful, science of aviation made long steps forward owing to the experiments and research of Professor Langley, secretary of the Smithsonian Institution in Washington, and of Sir Hiram Maxim in England. Their investigations began in 1880-1890. The former devised numerous small models and one large flying plane, to which he gave the name of "aerodromes." All were constructed on a common principle and were provided with extensive flying surfaces in the shape of rigid planes inclined at an upward angle applied somewhat after the pattern of Henson's idea. Langley flew his smaller models in the lecture room of the Smithsonian Institution and the large one on the Potomac river below Washington. In 1893 he experimented with steam-driven machines made of steel and aluminum. In 1896 one of his machines flew half a mile, the greatest achievement for a heavier-than-air machine up to that time. Congress provided \$50,000 for the construction of a Langley "aerodrome" of sufficient dimensions to carry passengers and to be used for military purposes. The machine was built, but failed to meet the stipulated requirements. The valuable aerotechnic work of Dr. S. P. Langley (1834-1906) may be briefly summarized as follows:—(1) His aerodynamic experiments were sufficiently complete to form a substantial basis for practical pioneer aviation. (2) He built and launched the first steam model airplane capable of prolonged free flight and possessing good inherent stability. (3) He built the first internal-combustion motor suitable for a practical man-carrying airplane. (4) He developed and successfully launched the first gasoline model airplane capable of sustained free flight. (5) He developed and built the first man-carrying airplane capable of free flight. A "Langley Day" was celebrated by the Aero Club of Washington on May 5, 1913, in the Smithsonian Institution for the unveiling of a tablet to commemorate the services performed by Langley in demonstrating the practicability of mechanical flight. In 1910 a Handley-Page airplane was named "Langley" in his memory, and an airway in the United States (Virginia) was named after him. Meanwhile, Maxim designed a machine consisting of a platform bearing a large water tube boiler and a number of concave-convex planes arranged in tiers. Two large vertical screws placed aft were propelled by steam engines. Like that of Langley, the apparatus of Maxim proved a failure in its trial during 1894. Yet these failures were not devoid of value; the errors and mistaken theories of all these pioneers became landmarks for their successors in the same field, who gathered the useful lesson of what to avoid—of what was practical or impossible. Simultaneously, there were other earnest workers striving to solve the problems, namely, Chanute in America, Percy Pilcher in England and Lilienthal in Germany, each contributing valuable data to the stock

of common experience in aviation. Otto Lilienthal "built a machine comprising wings and rudder, which might be described as a huge kite, with which he indulged in sailing flights. He approached the problem from the severely scientific point of view, discovering new facts and data for himself. With this contrivance by starting from an artificial hill nearly one hundred feet in height he was able to sail over distances up to 1,000 feet. Flushed with the success thus achieved, he endeavored to propel himself through the air, for which purpose he installed a two-and-a-half horse-power motor, the idea being to move through the air in any direction. Unfortunately, his researches were brought to an abrupt conclusion. While testing a new steering contrivance which he had designed, he fell from a height of forty-five feet and broke his spine, from which accident he died on August 10th, 1896."—F. A. Talbot, *All about inventions and discoveries*, p. 247.—In his early experiments Lilienthal "constructed wings (14-ft. span), striving to mount the air as the bird does, by pushing against it the inclined plans of his wings. . . . It is pretty generally admitted that the first airplane to have actually left the ground, carrying a man, was the bat-shaped machine, fitted with a twenty horse-power steam engine, with which M. C. Ader of France made several short flights from 1890-1896."—*Scientific American*, Oct. 2, 1920.—"Contemporaneously with these experiments in Germany, an English marine engineer, Mr. Percy S. Pilcher, was attacking the self-same problem and along almost identical lines. He contrived a gliding apparatus, the knowledge gained from the use of which was quite as, if not more, valuable than that advanced by Lilienthal. Pilcher selected the biplane form of gliding apparatus for his investigations. Flushed with the measure of success which he achieved, he was also tempted to install a motor in his machine. Indeed, he contrived an aeroplane which may be said to be the father of those in use to-day. He built an oil motor developing four horse-power, but although this machine was constructed he never tested it. He resolved to carry out further experiments with his gliding apparatus before trusting himself to a motor-driven machine, and in October, 1890, while giving a demonstration in a park near Rugby, while he was sailing at a height of about thirty-two feet, a weak part of the machine broke. The accident threw Pilcher to the ground, and he died thirty-four hours later, at the early age of thirty-two years."—F. A. Talbot, *All about inventions and discoveries*, pp. 247-248.—"The dangerous character of the Lilienthal flying apparatus was brought home very convincingly by Mr. A. M. Herring while acting as assistant to Mr. Octave Chanute, of Chicago, Illinois, U. S. A. He built an exact copy of the German investigator's apparatus with which experiments were carried out a month after Lilienthal's untimely end. These trials served to prove how the German worker's fatal accident occurred, and although about one hundred successful glides therewith were made, it was discarded as being far too dangerous and fickle. Mr. Octave Chanute was deeply interested in the problem of human flight, and expended considerable time and money in a series of beautiful experiments, the information gleaned from which has played an important part in the contemporary flying era. He built several machines with which to test his theories. The first practical appliance had twelve wings, and the outstanding feature, which served to differentiate it from any which had gone before, was the incorporation of facilities whereby the wings might be moved in accord-

ance with the desires of the operator, who stood upright within the machine. Hitherto the equilibrium of gliding apparatuses depended upon the movement of the man in relation to the machine. That is to say, the man moved his body. Chanute reversed this practice. He caused the man to be rigid, and the wings to be movable. As events subsequently proved, this was the correct line of experiment. The multiple-winged machine completed three hundred highly successful flights. Then Chanute decided to reduce the number of wings and built a double-decker, or, as we should term it to-day, a biplane, thereby virtually reverting to Pilcher's apparatus. This machine made some seven hundred flights, or rather glides, and without a single accident. This machine was remarkable for the introduction of a rudder at the rear, which was the idea of Mr. Herring, and this rudder was of such design and operation that the relative wind, catching either its horizontal or vertical planes, altered the angle of incidence of the supporting planes to meet the conditions which arose. Consequently, stability and safety became accentuated. In view of the success which Chanute had achieved with his double-decker, the question arose as to whether the stage had not been reached at last when a motor might be introduced. . . . Chanute, however, maintained that the introduction of the motor was premature. . . . Forthwith he built another machine—a three-decker, or triplane, this time—which was subjected to many searching tests. In this machine the glider gripped the lower front upright members supporting the planes, his legs dangling beneath. When flying and when approaching the ground the man doubled up his legs. This arrangement was adopted for the purpose of facilitating alighting. Chanute has been described as the father of the heavier-than-air machine, or dynamic flight, and the distinction is well merited. . . . Certainly his work contributed such valuable results as to prompt other industrious and persevering experimenters to embrace the problem, not only in the United States, but throughout Europe as well. There were, in particular, two men who, fascinated by Chanute's achievements, took up the subject. They had a small cycle store in the eastern American city of Dayton, Ohio. They were also first-class mechanics, and, in fact, built their own machines. In 1900 these two bicycle makers, Wilbur and Orville Wright, built a gliding machine upon the broad lines favoured by Chanute, but with planes having quite twice the superficies of any which had been tested previously. They also abandoned the upright position for the flier in favor of one prone upon the bottom plane."—*Ibid.*, pp. 247-251.—Not long after the experiments of Langley and Chanute the scientific students of the problem were pointed by the veteran inventor of the telephone, Dr. Alexander Graham Bell.

1896-1910.—Wright brothers.—Blériot's cross-Channel flight.—French pioneers.—Prophecies of Newcomb and Edison.—In 1896 there came the two workers who advanced from empiricism to science in their undertaking, and who won the first great successes by a happy combination of the two. The brothers Orville and Wilbur Wright have told, in an article contributed to *The Century Magazine*, how they were stirred to serious interest in the aviation problem in 1896 and began to read what Langley, Chanute, Mouillard and others had written on it. Entering purely as a sport, on experiments in gliding flight, on Lilienthal's lines, they became fascinated by the pursuit. From the first they appear to have chosen what is known as the biplane structure for their

machines, the invention of which they credit to a previous inventor, Wenham, whose design of it had been improved by Stringfellow and Chanute. To this construction they steadfastly adhered. At the outset of their experimenting the Wrights found a difficulty in the balancing of "flyers" which previous workers did not seem to have treated seriously enough, and they settled themselves to the conquest of it at once. This and other problems soon carried them from empirical testing into scientific studies, which occupied several years. They found that the accepted measurements of wind pressure, on given plane surfaces exposed at different angles, were unreliable, and they applied themselves to the making and tabulating of measurements of their own. It was not until this work had given them "accurate data for making calculations, and a system of balance effective in winds as well as in calms," as well as the necessary data for designing an effective screw propeller, that they felt themselves prepared "to build a successful power-flyer."

So far, these thorough-going workers at the problems of aviation had been experimenting with a machine designed, as they said, "to be flown as a kite, with a man on board," or without the man, "operating the levers through cords from the

chine in circles of flight; and then, at the end of September, 1905, they suspended experiments for more than two years, which they spent in business negotiations and in the construction of new machines. Their experimenting was not resumed until May, 1908 (again at Kitty Hawk). At this time it was directed to the testing of the ability of their machine to meet the requirements of a contract with the United States government to furnish a flyer capable of carrying two men and sufficient fuel supplies for a flight of twenty-five miles, with a speed of forty miles an hour.

Meantime, during the two years of suspended experimenting by the Wrights, other workers in Europe and America had been approaching their successes, so far as to be competitors for the important prizes now being offered for winning in the aviation field. M. Santos-Dumont, turning his attention from dirigible balloons to aeroplanes, had made, at Paris, the first public flight on that side of the ocean; and though he covered no more than 220 yards, it was a long stride in practical success. Henri Farman, Louis Blériot, M. Delagrangé, in France, Glenn H. Curtiss and A. M. Herring, in the United States, were making ready to dispute honors with the Dayton aviators, of whose actual achievements the public knew little,

ORVILLE WRIGHT

WRIGHT MACHINE IN FIRST LONG FLIGHT

WILBUR WRIGHT

ground." Their active experimenting began in October, 1900, at Kitty Hawk, North Carolina. In 1901 they made the acquaintance of Mr. Chanute, and he spent some weeks with them, observing and encouraging their work. In September and October, they say, "nearly one thousand gliding flights were made, several of which covered distances of over 600 feet. Some, made against a wind of thirty-six miles an hour, gave proof of the effectiveness of the devices for control." Late in 1903 they had reached the point of testing a power-machine, and sailed into the air with it for the first time on December 17 in the presence of five lookers-on. "The first flight," they tell us, "lasted only twelve seconds; a flight very modest compared with that of birds; but it was, nevertheless, the first in the history of the world in which a machine carrying a man had raised itself by its own power into the air in free flight, had sailed forward on a level course, without reduction of speed, and had finally landed without being wrecked. The second and third flights were a little longer, and the fourth lasted fifty-nine seconds, covering a distance of 852 feet over the ground against a twenty-mile wind." In the spring of 1904 the experimenting of the Wright Brothers was transferred from Kitty Hawk, N. C., to a prairie not far from their home, at Dayton, Ohio. There they overcame final difficulties in the maintaining of equilibrium when turning their ma-

as yet. On all sides there was readiness for surprising and astonishing the public in 1908. Farman, at Paris, in March, exceeded a flight of two miles; Delagrangé, at Milan, in June, covered ten miles, and more; Farman, in July, raised his record to eleven miles, and Delagrangé carried his to fifteen and a half in September. The Wrights had made flights that ranged from eleven to twenty-four miles in the fall of 1905; and now, in their renewed trials of 1908, these distances were more than doubled. Wilbur Wright went abroad, to exhibit their machine in France and elsewhere, while Orville, in September, submitted it to official tests at Fort Myer, near Washington. There, on different days in that month, rounding circuits of the parade ground, he made time records of continuous flight that ran from fifty-six to seventy-four minutes, travelling estimated distances that stretched in one instance over fifty-one and a third miles. These trials at Fort Myer were interrupted sadly by an accident, from the breaking of a propeller-blade, which caused the machine to drop to the ground while in flight. Lieutenant T. E. Selfridge, U. S. A., who rode with Mr. Wright at the time, was killed, and Mr. Wright suffered a broken leg. Wilbur Wright, meantime, was entering on great triumphs in France. At Le Mans, on September 21, he traversed sixty-eight miles in a continuous flight of a little more than an hour and a half.

This achievement, which won him the Michelin prize, was far surpassed by him on December 18, when ninety-five miles were travelled in an hour and fifty-four minutes, and again, on December 31, when the stay in the air was prolonged to two hours, nine minutes and some seconds, and the distance covered was 76½ miles. These records of the Wrights for time of continuous flight were subsequently beaten by a number of European competitors. Otherwise, the records of 1909 show no very marked advance beyond those of 1908; but the year had excitements in aviation, connected especially with attempted flights over the English channel. Hubert Latham, a recent French practitioner in aviation, was the first to venture this leap through the air from France to England. His machine was an Antoinette monoplane, designed by M. Levasseur. He launched it from Calais in the early morning of July 19, and traversed about six miles of the passage when his motor failed and he fell to the water, unhurt, and was rescued by an attendant steamer. Six days after Latham's failure, on July 25, Louis Bleriot, using another monoplane machine, made the crossing with brilliant success, flying from Calais to Dover, twenty-one miles, in twenty-three minutes, and winning the prize of £1000 which the London *Daily Mail* had offered for the performance of the feat. Latham then repeated his attempt and was unfortunate again, his motor giving out after it had carried him within two miles of the Dover shore. Orville Wright, at this time, July 27, was demonstrating at Fort Myer the ability of his aeroplane to carry two persons in a well-sustained flight. With Lieutenant Frank P. Lahm, of the Signal Corps, as a passenger, and having President Taft among his spectators, he made a flight of one hour, twelve minutes and forty seconds, accomplishing upwards of fifty miles at an average speed of forty miles an hour. A day or two afterwards he carried Lieutenant Benjamin D. Foulois over the ten-mile course from Fort Myer to Alexandria at a speed of more than forty-two miles an hour.

In the last week of August, 1909, the first race meeting for heavier-than-air flying machines occurred at Rheims, France, and a dozen aviators from France, England and America competed for large prizes in long distance and duration flights. A number of new records was made, and new names acquired note. Louis Paulhan kept the air for two hours and forty-three minutes with a Voisin biplane, covering 83 miles. Latham surpassed this in distance and speed, making 96 miles in two hours and eighteen minutes; and this again was beaten by Henri Farman, who travelled 118 miles, remaining in the air over three hours. Mr. Glenn H. Curtiss won the prize for speed, doing 18 miles in twenty-five minutes and forty-five seconds.

In 1909 the Wright brothers delivered an airplane to the United States government which met the specifications dictated by the War department. The salient features demanded were: Parts to be assembled in one hour; capable of being transported in army wagons, dis-assembled; carry two persons weighing 350 pounds; speed, forty miles per hour; perfect control and equilibrium; steerable in all directions; safety devices, etc.

Orville Wright had now gone abroad and his brother had returned to America. The latter had established a flying school at Pau, in France, and trained a number of pupils. During 1909 he had also visited England and Italy. He had sold the French patent rights on his machine for \$100,000. In August and September Orville Wright gave exhibitions in Berlin, breaking some of his own

records, carrying a passenger in his machine for an hour and thirty-five minutes, on September 18, and rising, on October 1, to an unexampled height, believed to have exceeded 1000 feet. This, however, was greatly exceeded in January, 1910, by Hubert Latham, at Mourmelon, France, who rose to 3,280 feet, and by Louis Paulhan, at Los Angeles, California, 4,165 feet. On October 3 the crown prince of Germany was Wright's companion in a short flight. Meantime Wilbur Wright, in America, had endeavored to supply one of the spectacles arranged for the Hudson-Fulton celebration at New York; but the intended program of aviation was spoiled by forbidding winds. He did, however, make one astonishing flight, on October 4, from Governor's island, up the Hudson to Grant's tomb, and, on his return, passing over the British battle-ships then lying in the river. The distance travelled was about twenty miles and the time of the journey thirty-three minutes and a half. Unfortunately it was unexpected, and was seen by a small part only of the millions who had been watching several days for a flight. On the next day Mr. Wright made the statement that no more public exhibitions would be given by his brother or himself. "Hereafter," he said, "we shall devote all our efforts to the commercial exploitation of our machines, and fly only as a matter of experiment, to test the value of whatever changes we decide to make in the construction."

The following is by Dr. Simon Newcomb (d. 1909), the distinguished astronomer: "It would seem that, at the present time, the public is more hopeful of the flying-machine than of the dirigible balloon. The idea that because such a machine has at last been constructed which will carry a man through the air, there is no limit to progress, is a natural one. But to judge of possibilities, we must advert to the distinction already pointed out between obstacles interposed by nature, which cannot be surmounted by any invention, and those which we may hope to overcome by possible mechanical appliances. The mathematical relations between speed, sustaining power, strength of material, efficiency of engine, and other elements of success are fixed and determinate, and cannot be changed except by new scientific discoveries, quite outside the power of the inventor to make. That the gravitation of matter can in any way be annulled seems out of the question. Should any combination of metals or other substances be discovered of many times the stiffness and tensile strength of the fabrics and alloys with which we are now acquainted, then might one element of success be at our command. But, with the metals that we actually have, there is a limit to the weight of an engine with a given driving power, and it may be fairly assumed that this limit is nearly reached in the motors now in use. . . . Owing to the levity of the air, the supporting surface must have a wide area. We cannot set any exact limit to the necessary spread of sail, because the higher the speed the less the spread required. But, as we increase the speed, we also increase the resistance, and therefore we must have a more powerful and necessarily heavier motor. . . . Bearing in mind that no limit is to be set to the possible discovery of new laws of nature or new combinations of the chemical elements, it must be understood that I disclaim any positive prediction that men will never fly from place to place at will. The claim I make is that they will not do this until some epoch-making discovery is made of which we have now no conception, and that mere invention has nearly reached its limit. It is very natural to reason that men have done hundreds of things which formerly

seemed impossible, and therefore they may fly. But for every one thing seemingly impossible that they have succeeded in doing there are ten which they would like to do but which no one believes that they can do. No one thinks of controlling wind or weather, of making the sun shine when we please, of building a railroad across the Atlantic, of changing the ocean level to suit the purposes of commerce, of building bridges of greater extent than engineers tell us is possible with the strength of the material that we have at command, or of erecting buildings so high that they would be crushed by their own weight. Why are we hopeless as to all these achievements, and yet hopeful that the flying-machine may be the vehicle of the future, which shall transport us more rapidly than a railroad train now does? It is simply because we all have so clear a mental view of the obstacles in the way of reaching such ends as those just enumerated that we do not waste time in attempting to surmount them, and we are hopeful of the flying-machine only because we do not clearly see that the difficulties are of the same nature as those we should encounter in erecting a structure which would not be subject to the laws of mechanics.

"I have said nothing of the possible success of the flying-machine for the purposes of military reconnaissance or any other operations requiring the observer to command a wide view of all that is on the landscape. This is a technical subject which, how great soever may be its national importance, does not affect our daily life."—S. Newcomb, *Prospect of aerial navigation* (*North American Review*, March, 1908).

More optimistic and prophetically accurate in parts was the following prognostication by Thomas A. Edison, the inventor: "In ten years flying machines will be used to carry mails. They will carry passengers, too, and they will go at a speed of 100 miles an hour. There is no doubt of this." These were the words of Mr. Edison in an interview published in the *New York Times*, August 1, 1909. But while sure that the "flying machine has got to come," he was not at all sure that it would come along the lines pursued in the experiments of that time. "The flying problem now consists of 75 per cent. machine and 25 per cent. man," he said, "while to be commercially successful the flying machine must leave little to the peculiar skill of the operator and must be able to go out in all weathers." He continued: "If I were to build a flying machine I would plan to sustain it by means of a number of rapidly revolving inclined planes, the effect of which would be to raise the machine by compressing the air between the planes and the earth. Such a machine would rise from the ground as a bird does. Then I would drive the machine ahead with a propeller."

Mr. Edison believed it to be a question of power. "Is it not thinkable that a method will be discovered of wirelessly transmitting electrical energy from the earth to the motor of the machine in mid-air?" He asked and answered his own question, saying:—"There is no reason to disbelieve that it can and will be done." He added, however, that there was great room for improvement in explosive engines. "Any day we are likely to read that somebody has made picric acid or something else work—done some little thing that will transform the flying machine from a toy into a commercial success." And when it is perfected, he said, the flying machine may end war by becoming a means of attack that cannot be resisted.

1908-1920. — Altitude records. — Aeronautic

maps.—Number of pilots in different countries.—Safety record in airplane flight.—Qualifications for aviators.—Parachutes.—The remarkable progress made since 1908 in the construction and manipulation of flying craft may best be illustrated by the ever-rising barometer of altitude records achieved by daring aviators. Yet all the skill and physical courage required to perform these thrilling feats would be unavailing without the efficient machinery and reliable construction of the craft to which these men entrust their lives. In 1908 the record was 400 feet, which was more than quadrupled in the following year, when it rose to 1,640 feet. In 1910 it was 10,745 feet; in 1911 it grew to 13,950; in 1912,—17,882; in 1913,—19,600; in 1914,—25,756. The next four years were devoted to the war, during which period competitive flying rested in abeyance, so far as exhibition "aerobatics" were concerned. More wonderful records were piled up in the grim business of war of which the outside world heard but little at the time. On Sept. 18, 1918, Major R. W. Schroeder, an American army aviator, ascended 28,900 feet at Dayton, Ohio, which was beaten by Captain Lang, an American, in England on Jan. 2, 1919, who rose to 30,500 feet. Roland Rohlfs broke the American record on July 30, 1919, by making 30,700 feet in a 400 h.p. Curtiss triplane. Adjutant Casale and Lieutenant Romanet, French aviators, raised the record to 33,136 and 34,200 feet respectively, which was almost equalled by Rohlfs on Sept. 18, 1919, when he attained 32,450 feet. Major Schroeder was reported to have broken all previous records on Feb. 27, 1920. He climbed 36,020 feet above the earth, over six miles. He lost consciousness due to the exhaustion of his oxygen supply, and fell more than five miles in two minutes, according to the instruments on his machine. When 2,000 feet from the ground he recovered sufficiently to right his plane and make a safe landing at McCook field. He was picked up temporarily blinded and paralyzed by cold. He recovered a few days later and gave the following details of his experience:

"The temperature at the peak of the climb was sixty-seven degrees below, Fahrenheit. The center section of my machine was coated an inch thick with ice. The exhaust from the motor sprayed fumes of carbon monoxide over me, and I was breathing this continually along with the oxygen. I had set out with three hours' supply of oxygen, and four hours' fuel supply. I was getting along rapidly. I knew by reading my instruments that I had broken the record; that I was flying higher than any man had ever flown before. I had an hour and one-half supply of fuel left and was quite elated. I was wondering just how far I could climb in that time when I found my reserve tank of oxygen emptied. I had discarded the original tank some minutes before, because it did not function properly, and when I exhausted my reserve I turned back to it. It would not work. I had torn off my heavy goggles, because the motor exhaust was crystallizing on them and interfered with my vision. I turned toward the instruments—then everything went blank and I fell into a flat nose dive. As far as I can remember, part of the fall was in a straight dive. The rest was a spinning nose dive. I believe I was really 34,000 feet high when I fell against the switchboard. My motor was on at the time I was trying to turn off the switch as I nosed the plane head down. I must have turned the switch off, lost consciousness completely, but revived long enough to make a landing."—In certifying the record, however, the Aero Club of America fixed the height at 33,113 feet. At the tenth International Geographical

Congress held in Rome during 1913, an Italian naval officer, G. Roncagli, proposed the preparation of an aeronautic map of the world, while an Austrian, T. Scheinflug, suggested that photographs of the earth taken from aeroplanes should be converted into topographical maps. Statistics collected in the summer of 1913 showed that France led the way with a supply of 600 trained pilots, Germany coming second with 300, Italy third with 175, Great Britain fourth with 135, Russia fifth with eighty, Japan sixth with twenty, United States seventh with nineteen, and Mexico eighth with five. The war made aviators by the tens of thousands. Until 1914, an aviator was a rare person; it was a great distinction to hold a pilot's license; few persons had gone aloft in airplanes. But with the call for fighting aviators, the various countries soon trained thousands of young men for flying duty.

The Information Branch of the United States Air Service in 1919 prepared for the Manufacturers' Aircraft Association a tabulation showing the comparative safety of flying when reasonable precautions are observed. The conclusions were based on records kept at the various army training fields, and tend to show that the safety of the airplane is such as to warrant the interest of the business world. Summed up, the army records show that there was only one fatality for every 2,919 hours of flight, or the equivalent of almost 235,000 miles of travel in the air. Even then, allowance must be made for the intensiveness with which the wartime training was carried on. An analysis of the accident report showed that the greater majority of the mishaps at the flying fields were the result of bad judgment or physical difficulty experienced by the student, and not through structural weakness in the plane or engine. A recapitulation of the reports apparently substantiates this view, as there were only 298 fatalities among 20,142 aviators. The increasing safety of the airplane received further corroboration by experience gained in Great Britain during the first year after the war. During that year (1919) a total of 70,000 passengers were carried in 38,954 flights with but one fatal accident. The number of miles flown was 734,200 and the goods carried totaled 116,498 pounds. No fewer than 114 aerodromes were licensed and 519 machines registered during the year. Commenting on these figures, Major Gen. Sir F. H. Sykes, controller general of civil aviation, was quoted as saying:

"We have conquered the air and our immediate task is to exploit our victory in the interest of commercial development." Of paramount importance is the personal equation or temperamental composition of a successful aviator. A perfect knowledge of all the rules of the game of flying will not save a man who lacks confidence in himself and is inclined to hesitate. A half-second of indecision may be fatal. Initiative, the sporting instinct and a certain irresponsibility, qualities inherent in American youth, have been found of far greater value in the air than the logical, scientific, severely disciplined character of the Germans, and account for the superiority of the Allied aviators in general. The most eminent of British scientists have devoted special study to the psychological and physiological aspects of flying. One authority says that good eyesight, normal hearing, good "muscle sense," and equilibration are indispensable qualifications. But most important of all is the right temperament—not an easy thing for a medical board to examine. Of the types—the imaginative and the unimaginative—the imaginative youth is said to make the better pilot if he can keep his imagination under control. He who has

led an outdoor life and has played many games is most likely to pass the test, although, of course, there are exceptions. Splendid, powerfully built sportsmen have been known to fail altogether, and anaemic, frail-looking youths of the student type have blossomed into brilliant pilots. "It is exceptionally interesting . . . that the natural desire of the flying man to diminish the boredom of aerodrome flying by the practice of 'stunting' was met by the French military authorities with precisely the same discouragement as was accorded to the corresponding enthusiasts by the British authorities in pre-war and early war days. The 'stunts' which in 1918 are dignified by the name of 'aerobatics,' and which eventually formed the basis of the tactics of military flying were . . . rigorously forbidden by the French, and military flyers were punished for having dived too steeply or turned too quickly. . . . We may also note that the noble art of looking with a blind eye upon a military order has saved British aeronautics from the extinction which would have been its fate had our fliers suppressed with self-denying acquiescence their instinctive desire to acquire the art of rapid manoeuvring, looping, diving, spinning, fluttering, rolling and the like. In France the same seems to have taken place. Those who disobeyed the order acquired the art of manoeuvring, and those who acquired the art of manoeuvring survived. Thus even in so tightly organized an institution as the army can we detect the advantage of individualist effort."—*Future of aeronautics* (*London Times Literary Supplement*, Jan. 9, 1919).—"A considerable controversy raged in the press and elsewhere a few months before the cessation of hostilities [1918] on the subject of equipping the aeroplane with parachutes as a life-saving device. In the airship service this had been done for two years. The best type of parachute available was selected, and these were fitted according to circumstances in each type of ship. The usual method is to insert the parachute, properly folded for use, in a containing case which is fastened either in the car or on the side of the envelope as is most convenient. In a small ship the crew are all the time attached to their parachutes and in the event of the ship catching fire have only to jump overboard and possess an excellent chance of being saved. In rigid airships where members of the crew have to move from one end of the ship to the other, the harness is worn and parachutes are disposed in the keel and cars as are lifebuoys in seagoing vessels. Should an emergency arise, the nearest parachute can be attached to the harness by means of a spring hook, which is the work of a second, and a descent can be made. It is worthy of note that there has never been a fatal accident or any case of a parachute failing to open properly with a man attached."—G. Whale, *British airships, past, present and future*, pp. 31-32.

1910-1920.—Development of the seaplane.—All metal planes.—Liberty motor.—Airplane types.—Hangars and floating airdromes.—The first float seaplane that left the water under its own power and returned thereto was built by Henri Fabre, of France, the trials taking place on March 28, 1910, near Marseilles. Thence the development of the seaplane was chiefly due to the persistent efforts of Glenn H. Curtiss, of Hammondsport, N. Y., who produced the first practical float-seaplane in 1911 and developed the following year, simultaneously with M. Denhaut of France, the boat seaplane, or flying boat. The seaplane differs from the land machine, in having the car shaped like a boat, so that it can alight on the water, upon which it floats, and hydro-

planes permit it to arise without difficulty. In the United States and other navies, most large ships carry at least one seaplane, while special vessels carrying ten to twenty-five planes accompany large naval forces. "At first glance, the giant seaplane of our Navy appears formidable while resting on the water, and still more so when hauled up on the shore where its boat-like body lies fully uncovered to view. In flight it does not seem so large; indeed, it might well be mistaken for the smaller flying boats by the layman, since all aircraft are deceptive while in flight. But viewed close up there can be no mistake about size of this craft, with its 110-foot span, two Liberty motors developing from 400 to 500 horse-power each and driving propellers 10½ feet in diameter, and a body over 50 feet in length. The fact is that the body, or hull, is nothing short of a 50-foot yacht, but instead of velvet cushioned berths and other comforts its interior is given over to a tangle of braces, wires, steering and controlling devices, instruments, a wireless station, a six-station intercommunicating telephone system, fuel tanks and guns, all of which are the means of combating the U-boat and of carrying out long-distance patrols at sea. On the water the seaplane develops a speed up to 50 miles an hour, and the moment it slips off the surface and soars upwards the speed increases to 100 miles an hour. As in every other heavier-than-air machine, the naval aircraft engineers have had to secure strength in their structure while keeping a strict eye on the weight. Thus the required strength of every piece of material entering into the construction is determined by exhaustive tests; and in a hundred ways both wood and metal parts are thinned and lightened until this maximum of strength is preserved and the minimum weight reached. A completed wing, painted in battleship gray, looks like a solid steel armor plate; but strip off the fabric which carries the paint and inside is seen a skeleton frame of spruce webs and piano wire braces. The webs, or ribs, which form this frame are set between full length beams, these beams being reduced to the smallest possible size consistent with the great strain to which they are subjected. . . . Every part is carefully varnished as if for display and the whole covered by fabric stretched until it rings like a drum. The strength is there, to be sure, but the weight is not; so that a 40-foot wing, eight feet in width, which appears to weigh at least a ton, is readily lifted by one man. This same construction is followed in the entire seaplane. The keel is but little more than a strip of wood, but a perfect system of bracing makes it strong as a steel girder. . . . There is no haphazard work about the building of one of these boats. Every piece of wood or metal is given an individual part number. Each one is designed for a particular place and the use of jigs and dies makes possible a degree of standardization of wood and metal parts which is as near perfect as can be reached in aircraft production."—A. C. Les-carabourra (*Scientific American*, Dec. 14, 1918, pp. 481, 486).

"Canvas, wood and a maze of bracing wires have been the materials of the airplane builder ever since the Wrights flew their first machine over the sand dunes of Kitty Hawk. From time to time some one has come forth with the suggestion that metal be used instead of wood, but the suggestion has received little serious thought. The bracing wires have been slowly reduced in number by improved designs; but the wood and canvas might have remained to the present day if German aircraft constructors had not departed from the time-honored idea and experimented with metal

planes. During the closing months of the war German airmen appeared over the Allied lines flying marvelous all-metal machines. At the time these were considered freaks of little if any real value. Aeronautical men outside of Germany were only too hasty in their condemnation of the all-metal German machines. How, they asked, could one make a practical all-metal machine? Was not the weight of even the lightest aluminum alloy considerably heavier than wood, matching strength with strength? And so the German aircraft constructors stole a long march on the aircraft constructors of all other nations. With the ending of hostilities certain all-metal German machines came into the possession of the Allied experts, and then the advantage of this new form of construction became known. Still, it was a much mooted question whether such construction was practical in any machine other than one intended for aerial combat, wherein engine power was almost unlimited since the main consideration was performance irrespective of expense.

"Several weeks ago [June-July, 1920] an all-metal monoplane made a new American record. This machine, the JL-6, is nothing more than a German Junkers' limousine six-seater—one of several machines of this type brought to these United States by an enterprising business man who has the future of aviation at heart. The speed of the all-metal monoplane was surprising. But most surprising was the low fuel consumption. This seemingly heavy machine excelled by a good deal the efficiency of the relatively flimsy wood and canvas planes. Germany has scored a very decisive success in airplane construction. To deny that fact would be foolhardy. It appears that Dr. Junkers of Germany has gone ahead along new lines, ignoring the old misconceptions about the heaviness of metals and the necessity of canvas for the wing surfaces. He has produced machines with thick, unbraced cantilever planes, corrugated aluminum alloy for the wing surfaces, and all-metal struts. At one stroke he has wiped out canvas, wood and the maze of wires, and in their stead he has introduced tremendous strength, unapproached wearing qualities, fireproof characteristics, and unrivalled efficiency.—The wood and canvas airplane—the airplane which we know so well—is a frail structure compared with this all-metal machine. The wood and canvas machine has a life of about a year or two with steady use; the all-metal airplane, with little to deteriorate from exposure to the elements, has a life of several years. The all-metal machine can withstand hard landings, which would cost the usual airplane smashed members. Germany is not confining the all-metal construction to small airplanes. Already she has constructed several giant airplanes, one of the largest being the Zeppelin-Staaken monoplane. This machine proved one of the greatest surprises in store for the Allied officials who visited Germany right after the armistice. It is powered with four 260 horse power motors, mounted as tractors on the leading edge of the wings. The mechanics can actually get about inside the monoplane wings and repair and adjust the engines while in the air. This giant accommodates eighteen passengers, or it can carry a one-ton load of useful cargo. All comforts are included for the passengers—easy chairs, large windows, pantry, lavatory, a luggage compartment, and a sleeping cabin which also serves as a collision buffer in a bad landing."—*Independent*, Sept. 4, 1920, p. 282.

"When the war first broke out, airplanes were fitted with 100 horse-power engines. Very soon they were found to be insufficient and engines of

125 horse-power were made. The engine power then gradually increased to 150, 175, 200, 250; and it was about in that neighborhood when Major Hall and Mr. [J. G.] Vincent were called upon to furnish the United States standard motor. It was felt that a motor should be designed so far ahead in power of anything else that had been produced that, by the time it could be turned out in quantity, it would still be well in the lead. Accordingly, a horse-power of between 350 and 400 was sought and the size of the cylinders was changed from 4 x 6 to 5 x 7. Because of the larger cylinders required in the new motor, the angle of the V was changed from 40 to 45 degrees. The larger pistons and cylinders required slightly greater clearances. . . . These and other slight modifications were thoroughly discussed and decided upon by the two motor experts who worked unceasingly and arrived at the finished design in a conference lasting five days. They had a herculean task before them and deserve the highest praise for the successful outcome of their efforts. As soon as the conference was over, telegraphic instructions were sent on to the Packard plant and work was started immediately upon the new motor. Even before blue prints arrived the wood model was prepared in the general form and essential features of the new motor. Work on the new engine was pushed at the highest speed possible, and on the third day of July, it was completed and shipped to Washington. The next day it arrived there, on the Nation's birthday, and was christened the 'Liberty Motor.'

"After the first experimental motor had been completed it was subjected to a great many trying tests, and was found to be exceedingly efficient and very light. It developed a horse-power of considerably over 400 and its weight was but little over 800 pounds. Its weight per horse-power was therefore about two pounds, which is much lighter than the majority of airplane motors. On endurance tests it stood up wonderfully. It was tested at the summit of Pike's Peak in order to determine its action under conditions of rarified atmosphere—and proved very satisfactory. At the Bureau of Standards in Washington, a special room was set aside in which a partial vacuum was created equivalent to that which exists at the maximum height to which an airplane engine has been carried. In this room the engine was found to operate perfectly. At one of its first altitude tests in a plane the American record for altitude was smashed. Not until September was the order to proceed with the manufacture of the Liberty Motor definitely given, and immediately work was started in the Packard plant. It is interesting to note that the first experimental motor was delivered to the Government on the 4th day of July, and the first production motor was sent to Washington on Thanksgiving Day. This, however, did not mean that the production problems had all been solved. . . . The motor which was delivered to the Government on Thanksgiving Day developed a number of small troubles. One of these was the difficulty of lubrication, and eventually it was found necessary to change the scupper system to the original forced lubrication system. But the most important change was made in the production of the cylinders. In the first Liberty Motor, the cylinders had to be bored from the solid—an operation that was very costly in time and money. This, however, was a copy of the best foreign engineering practice, and was followed as a necessary detail by our engineers. It was at this juncture that the engineers of the Ford Motor Car Company made a notable contribution. They developed a cylinder forged out of steel tubing, which

enabled the manufacturers to turn out the cylinders at very low cost and in exceedingly large quantities. Seamless steel tubing is used, and this in but four operations under the forge press and bulldozer, is converted into a headed and flanged cylinder blank on which a minimum of machining need be done. The manufacture of these cylinders was not undertaken until the end of January and . . . [later were] turned out in very large quantity. One of the difficulties encountered in the Liberty Motor had to do with the form of ignition. In the original Packard motor, the 'Delco' system of ignition was used. This consists in generating current with a small electric generator geared to the engine shaft and then transmitting the current by means of a pair of distributors to the spark plugs. Magneto ignition was tried, but it proved impossible to design a single magneto which would operate with the irregular timing required in an engine in which the cylinders were set at the unusual angle of 45 degrees. A single magneto could not be used and so a battery of four magnetos had to be employed. This added somewhat to the weight of the engine. Then further difficulties were encountered. Owing possibly to the vibration of the engine at high speed, the magnets of the magneto showed fatigue and gradually lost their magnetic property. So that eventually it was decided to return again to the original system of ignition. It is rather remarkable that in a number of very important features, it has been necessary to revert to the original design. . . . The efficiency of the Liberty Motor is not to be questioned by anyone who has examined it thoroughly. It is far more powerful than any other airplane engine ever produced on a quantity production basis. It exceeds in power all but a few experimental machines. Although rated at 400 horse-power it has shown on test as high as 485 horse-power; and its weight is 820 pounds."—*Scientific American*, June 1, 1918, pp. 500, 515.—"England, France, and Italy had reached the point where they could build airplanes much faster than they could build engines, when hostilities ceased. Both countries had accepted the Liberty motor as the best airplane engine, and both were building their planes to fit this American engine, when the order came to cease firing. How much faster we were building engines than were our European associates is indicated by the fact that the largest day's production of the engine most closely approximating the Liberty in quality, the Rolls-Royce, was fifty-nine, while the Liberties were being turned out at the rate of 150 a day! In October, America's production of airplane engines was 5,603. *This is more than the total production of France and England together for the whole four years of the war!*"—*World's Work*, Feb., 1919, p. 473.

King and Leslie give the following classification of types of airplanes:

Monoplane. Having one main lifting surface.

Biplane. Having two main lifting surfaces mounted one above the other.

Triplane. Having three main lifting surfaces mounted one above the other.

Tractor. A tractor airplane is drawn forward by means of a propeller placed in front of the main lifting surfaces.

Pusher. A pusher airplane is thrust forward by means of a propeller at the rear of the main lifting surfaces.

Aeroplane. A land machine equipped with a landing gear with free running wheels, which enable it to take off and land on the earth.

Hydro-aeroplane (or seaplane). A water machine equipped with either single or double floats

which enable it to take off and alight on water, *Flying boat*. Equipped with a boat-shaped hull which takes the place of fuselage and pontoons of a hydro-aeroplane.

The term *hangar* is applied to the structures in which flying machines are stored. There are many and varied types constructed to meet the needs of the various aircraft, those built to house airplanes necessarily being of different construction from those built to enclose the huge modern airships. During the World War, to meet the needs of the navy, floating carriers were constructed. These might practically be called floating *airdromes*, since, besides carrying the airplanes, they also served as the field for their starting off and alighting. "The first one of these was merely a large commercial steamer equipped with a deck on which the airplanes could take off and land, with a hangar deck immediately below this in which the airplanes could be kept ready for flight, and with machine-shop facilities, spare parts for the airplanes, and all other accessories for keeping them in condition on the ship. The first carrier was the *Argus*, which had a deck 535 feet long and 68 feet broad. Her hangar held twenty airplanes, or practically a squadron. Her speed was only twenty knots. It was evident at once that any vessel having such a slow speed would not only be a prey to other warships, but also to submarines—not to mention destruction by hostile air attack—and there were many other things about this carrier which were not satisfactory, as it was the first attempt in this direction. The next carrier to be built was a warship being constructed for a South American country, which was transformed into a carrier and renamed the *Eagle*. This ship is capable of carrying about forty airplanes in her hangars, or two squadrons. Still another carrier is the *Hermes*, with a speed of twenty-five knots; while more are being built. The British, however, recognized that these vessels could not operate far enough in advance of their fleets so as to go out and fight for control of the air, but would have to stay near the fleet and be protected, because their speed was not great enough to protect themselves. Consequently, they took the vessels that were most readily available, that had the required speed and at the same time fighting power to ward off other vessels—that is, their battle cruisers—and transformed them into a combination carrier and battle cruiser. They are now reported to have a division of battle cruisers, or four of these high-speed vessels, equipped with airplanes. They all have a speed of about thirty-five knots, or forty miles an hour; and have very heavy gun power—equal to that of any battleship—and with the airplane carriers attached to them they have the power of concentrating the equivalent of one or more groups of pursuit aviation wherever they desire. . . . It should be noted that the whole development for the use of aircraft over the water is not in air tactics, in types of airplanes particularly, or in the securing and training of air personnel; but is essentially a development of floating airdromes. It is, therefore, evident that floating airdromes must be made to suit the requirements of the airplanes first—that is, if we are going to fight and drive out of the air an opposing aviation, we must bring to bear against it airplanes that can do the work. Next, the airplane carriers must be able to defend themselves against attack on the water. As to the first requirement, the airplane carriers should be capable of accommodating a complete tactical unit, or one group of 100 pursuit airplanes; and in the second case, in order to be able to defend itself, and be capable of taking the offensive quickly, it

should have a speed of at least forty knots, or around fifty miles an hour, which is entirely possible at this time. To answer these requirements, the airplane carrier should be about 1000 feet in length, with a landing deck of this size. Its width would be over 100 feet and it could be equipped with all the facilities for handling the airplanes quickly either by day or by night. Even one airplane carrier of this kind would give the side possessing it complete control over the water at the present time, and render an opposing fleet incapable of acting with its observation aviation." —W. Mitchell, *Aviation over the water* (*American Review of Reviews*, Oct., 1920, pp. 393-395). —For the aviator, the problem of the landing field is of vital importance, as, next to the actual trials of flight itself, the greatest danger is in making the landing. To alight safely, a landing field must be properly constructed, and in recognition of this situation, municipal and private corporations are beginning to construct fields to meet the requirements of aviation. The word "hangar," which is French, signifies a shed, barn or outhouse.

1914-1918.—Great European progress during World War.—Growth of American air service.—Great progress was made in aviation during the World War. So thoroughly did the airplane prove its military worth on the battlefields of Europe, that all possible efforts and facilities were concentrated on the development of the airplanes of the belligerents. The airplane was improved by leaps and bounds. Airplanes became "the eyes of the army and navy." "In the years before the war it had become the fashion to announce that the next European conflict would witness a phenomenal use of aircraft. Ingenious romancers had pictured an Armageddon in the clouds, and lovers of peace had clung to the notion that the novelty and frightfulness of such a warfare would make the Powers of the world hesitate to draw the sword. The results have been both below and in excess of expectation. The air was a realm of pure guesswork, for in the Tripoli and Balkan wars there was no serious aerial service, though various adventurers experimented in the new arm. . . . France led the way in aerial experiment, and her government between 1900 and 1914 acquired the largest air fleet in the world. Her aviators were brilliant performers, especially in long-distance flights, but they were not thoroughly absorbed into the military machine. They had less knowledge of the tactical use of aircraft than of their mechanical capabilities, and the organization of the French Air Corps was severely criticized by the Committee of the Senate just before the war. . . . There was no government standardized pattern, and hence supply of spare parts and accessories became a difficulty. The French airmen had brilliant technical skill and endless courage—men like Garros and Pégoud [the latter was the first to 'loop the loop'] had no rivals—but as a corps they were not so fully organized for war as their neighbours. [See also LAFAYETTE ESCADRILLE.] The Germans had preferred at first to interest themselves rather in airships than in aeroplanes, but their military advisers were well aware of the value of the latter, and had prepared a strong corps. The German aviator could not fly as well as the French; on the whole he had not as useful a machine; but he understood perfectly his place in the military plan. He was thoroughly trained to reconnaissance work, and especially to the task of range-finding for the field guns. The Austrian air service was much inferior, though it contained some dashing pilots. The Russian had enormously improved, under the Grand Duke Alexander, but it suffered from a shortage of ma-

TYPES OF AEROPLANES

1, German Aviatik A-C; capacity, 25 passengers. 2, British Handley-Page passenger machine. 3, American Martin bomber. 4, French Farman plane; capacity, 27 passengers. 5, Caproni triplane, Italian. 6, All-metal Larsen monoplane. 7, United States "Owl" plane used by air mail service; 3 motors, 420 h.p. each. 8, German seaplane fitted with pontoons; type of plane carried on warships. 9, De Havilland-4 plane used in London-Paris service.

chines and a chronic difficulty in rapid manufacture. It possessed, however, several giant biplanes, useful for destructive purposes, for each could carry over a ton's weight of explosives. The British air service, the last to be started . . . had a good type of machine and enough of them, a number of highly qualified pilots and observers accustomed to go out in all weathers and under every condition of difficulty, and, above all, trained in tactical co-operation with other arms. . . . The British Royal Flying Corps contained a military and a naval wing. Each wing was divided into squadrons, consisting of twenty-four aeroplanes and twenty-four pilots, under a major or commander."—J. Buchan, Nelson's *History of the war*, v. 5, pp. 54-56.—The World War broke out at a moment of unprecedented activity in aeronautical development. "It was a time of particular interest to the student, the evolution of the larger sea-planes and of aeroplanes driven by two or more engines having begun under promising conditions. Improvements in design and construction, that in various combinations were responsible for these developments, also accounted for the making of new and important records in duration of flight and load-carrying during the first six months of 1913. . . . Perhaps the most important line of development in the aeroplane has been towards multiple-engine craft—i. e., machines driven by two or more motors employable either together or independently—for this promises to solve the problem of reliability, and to obviate unpremeditated landings due to failure of driving power, hitherto the principal drawbacks to flying. . . . The principal multiple-engine aeroplane is of Russian design—the Sikorsky, a machine with a span of 120 feet and of great lifting capacity; it has carried seventeen passengers into the air in a flight of eighteen minutes. The Curtiss flying boat, designed to fly across the Atlantic, is driven by two motors. . . . The development of the high-speed biplane has continued, and the former association of the monoplane type with the highest speeds has been broken down. . . . A great advance in the armouring of aeroplanes has been made in France, and in many military machines the engine and the pilot are protected by thin nickel-steel plates capable of stopping a rifle bullet at 600 yards. . . . In comparison with the overland flying machine the seaplane is in an undeveloped stage, and although Great Britain has made more progress than any other country, the machines hitherto built are not really seaworthy. . . . There is little to record under this head [of airships]. As regards military aircraft, the need for armament on top of the gas-container is now acknowledged, its object being to repel aeroplane attacks. Some of the German airships are so armed. . . . As to arming semi-rigid and non-rigid airships on top, it appears to be almost impossible."—C. C. Turner, *Aviation in 1914* (*Hazell's Annual*, 1915, pp. 426-427).—See also ACES.

The American Air Service may be said to have started on March 3, 1911, which "deserves to be marked as a red-letter day in American aviation history;" for on that day, "when aviators were in the air all over the world, and when France was asking for \$1,000,000 for aviation, the new science was formally recognized in the United States with an appropriation of \$125,000." Officers, however, did not come forward to the new service in any numbers, and up to December, 1913, only nineteen had qualified. The result was the introduction of a bill in Congress on August 23, 1913, providing for an establishment within the Signal Corps of an aviation section with an in-

crease to sixty officers and 260 men, who were to receive prestige and extra rewards in this "extra-hazardous" service. This bill did not become law until July 18, 1914; so that on the outbreak of war America, although decidedly behind the great powers in Europe, had at last a definite line along which aviation might develop. During the period of American neutrality up to April, 1917, aviation in Europe was being forced to remarkable developments, which were to a great extent hidden from America. "This complete exclusion from scientific developments abroad, unavoidable though it was, was destined to have a most serious effect on America's later preparation." It appears that it was not so much the achievement of aircraft in Europe which spurred the American aviation program, but the lessons learned from the Pershing expedition into Mexico, which followed the raids across the Mexican border in March, 1916. This punitive expedition, with its "long tenuous line across the sands of Northern Mexico" afforded the first practical demonstration of the value of aircraft for reconnaissance in the history of the American Service, and showed as nothing else could the vital necessity of airplanes." On April 6, 1917, war was declared on Germany, and plans were made to "meet the aerial programme approved by the General Staff as a balanced branch of a many sided military establishment." On May 26 a cablegram was received in Washington from the French premier, M. Ribot, at a time when the American air service possessed fewer than 300 airplanes. The message read as follows:

"It is desired that, in order to cooperate with the French aeronautics, the American Government should adopt the following programme: the formation of a flying corps of four thousand five hundred aeroplanes—personnel and material included—to be sent to the French front during the campaign in 1918. The total number of pilots, including reserve, should be five thousand, and fifty thousand mechanics. Two thousand planes should be constructed each month, as well as four thousand engines, by the American factories. That is to say that during the first six months of 1918 sixteen thousand five hundred planes (of the last type) and thirty thousand engines will have to be built. The French Government is anxious to know if the American Government accepts this proposition, which will allow the Allies to win the supremacy of the air."

This cablegram was translated into a bill which was rushed through Committee and on June 13 reported unanimously with an amendment to the effect that \$640,000,000 be appropriated. This enormous sum could not be asked for without a "very special preparation of the public mind." How that preparation was carried out forms a story of absorbing interest. Then on July "the great programme was launched with President Wilson's signature of the Aviation Act."—Adapted from A. Sweetser, *American air service*.—See also ORDNANCE: 20th century; U. S. 1918-1921.—Air service after the World War.—British air routes.—Mail service opened in Great Britain and United States.—Forest patrol work.—Lawson air-liner.—Air routes in Italy.—

London-Paris air route.—Royal Dutch air service.—Commercial aeronautics.—Although passenger and mail service did not make great strides in most countries until after the World War, in Germany passenger air lines were in operation several years before. "The German airship passenger services continue their popularity, and again there was a complete freedom from mishaps. In 1913 the three vessels employed made 310 trips, covering an aggregate of 16,000 miles, and carrying 1,471 passengers, besides their crews."—C. C. Turner, *Aviation in 1914 (Hazell's Annual, 1915, p. 427)*.—Between 1918 and 1921 air routes were opened up in rapid succession and air lines were established. "The Air Ministry has issued details of some of the aerial routes which will be declared open. The routes are to be regarded as provisional, since experience alone can decide upon the arrangement of aerodromes which is most suitable for carrying out the aerial business of the country. . . . At the date of the armistice there were 337 aerodromes and landing grounds in the British Isles. About 100 will be required for the Royal Air Force, while 116 have already been relinquished for cultivation and other purposes. This leaves about 120 aerodromes, some with extensive accommodation, which will ultimately be available for civilian purposes. . . . The main routes at present outlined are summarised below, the London terminus being situated at Hounslow:—(1) London-Scotland; (2) London-Dublin; (3) London-Manchester-Belfast; (4) Continental route via Lympne; (5) Dutch route via Hadleigh; (6) Scandinavian route via New Holland; (7) London-Plymouth; and (8) London-Bristol. The various aerodromes along these routes are clearly shown . . . and when any route has been declared open pilots using it will find petrol, accommodation, and, where possible, mechanics to handle their machines at each of these aerodromes. Such pilots must, of course, comply with the regulations as regards licensing and inspection of machines. The Government makes no promise of help to aviators who descend, whether by choice or by force of circumstances, at places other than the official 'air stations.' It has been decided to limit the overseas traffic for the present to four 'appointed' aerodromes. Three of these will be those named under routes (4), (5), and (6) of the above list, while the fourth will be at Hounslow in order to facilitate direct communication between London and the Continent. . . . Rigid supervision with regard to the construction and air-worthiness of machines intended for passenger services will be insisted upon, but progress will not be hampered by any inspection of inventions or of purely experimental machines."—*Nature, May 1, 1910, p. 171*.—During May and June, 1918, aerial mail service was established in America and Europe. Army aviators carried mail from New York to Washington in three hours—twenty-two minutes, and on June 3 a mail service was established between New York, Boston and Montreal. Aerial mail service between London and Paris began on May 28. First mail airplane flew between New York and Chicago on September 10. On July 31, 1910, Senator Harry S. New of the Senate Committee on Military Affairs, advocated the uniting of the army, navy, and postal air service under one administrative head. "The last report of the British Air Ministry discloses to the world the fact that Great Britain has had the vision to comprehend not only the possibilities but the certainties of aeronautics and is determined to derive for England all the benefits that they afford. Of course it is known to those in the air

service of the Government and the comparatively small public which has kept informed that England, for instance, has appropriated \$330,000,000 for aeronautical equipment and experimentation for the next fiscal year. The people of our country as a class know nothing of it and I fear have no conception of the real meaning of this fact. I am more concerned with the commercial future of aeronautics than I am concerned with it as a purely military arm; for it is in the commercial field that its greatest development is next to occur. I believe that the next war will be brought to a very quick decision by that power which is best equipped with aeronautical devices.

"The United States appropriated \$25,000,000 for her navy and \$25,000,000 for her army for the purpose of aviation, which includes expenditures of every kind and will really provide for very little in the way of equipment. As I have said, the great progress to be expected is in the near future along commercial lines. Great Britain is projecting mail and express routes all over the world, from London to the Continent, London to South Africa, London to India, London to Brazil. Similar programs are planned for Australia, New Zealand, and Canada. Many lines are being put into operation in Europe, France, England, Spain, and Germany. There is no longer any question that airships of various types will be employed to a very considerable extent in the transportation of mails, express, and passengers—to what an extent, nobody can foresee, and only the future can determine. The only question now is: How far behind the other nations will the United States start? Having created these agencies, shall she permit herself to be completely outclassed in their development and utilization."—*American and European aerial activity contrasted (New York Times, Aug. 3, 1910)*.—"Now that the war is over and the War Department finds itself with more airplanes than are likely to be needed for departmental purposes, it has been decided to try out the plan of patrolling the national forests from the sky, and on June 1 the work will begin. On the same day, under an arrangement between the forest service of the Department of Agriculture and the War Department, observations covering a large part of the Angeles National Forest will be begun from a captive balloon stationed over the Army Balloon School near Arcadia, Cal. Two routes of airplane patrol work will be operated from March Field, twelve miles southeast of Riverside, Cal. Two planes will be used on each route, each route will be approximately 100 miles long and will be covered twice a day. This will be the beginning of experimental work in which the adaptability of aircraft to forest patrol work is to be thoroughly tried out. If the tests prove successful it is expected that the airplane patrols will be extended before the end of the 1919 season, and that airplanes will become a permanent feature of the ceaseless battle against fires in the national forests. The airplane routes from March Field will afford an opportunity to survey about 2,000 square miles in the Angeles and Cleveland National Forests. The airplanes are not equipped with wireless telephone apparatus of such a nature that they can communicate with the ground without the installation of expensive ground instruments, so warnings of fires will be transmitted by means of parachute messages dropped over a town, the finder to telephone them to the Forest Service; by special landings made to report by telephone; and by returning to the base and reporting from March Field direct to the forest supervisor. Fires will be located and reported by squares drawn on duplicate maps, one to be in

the possession of each airplane observer and another to be in the office of the forest supervisor."—*New York Times*, May 14, 1919.—During the same year (1919) the Lawson air-liner began operations. This airplane, operated as a passenger-carrying machine, made trips during the autumn, traveling between Milwaukee, Wis., New York and Washington. It carried twenty-six passengers in a comfortable cabin, and was specially designed for high speed and fuel economy. On December 26, 1919, the Cape-to-Cairo air route was declared open. During 1920 there was a strong upward movement in aerial activity in Italy. Aerial mail services were established between the principal cities; plans were in preparation for a regular service to Athens and communications with the Italian colonies in Africa. In March, 1921, the Information Bureau of the Post Office Department announced that airplanes in the air mail service of the United States government, totaling twenty-one in all, had flown more than 1,500,000 miles and carried in the neighborhood of 49,000,000 letters.

British aircraft reappeared on the London-Paris air route on March 10, 1921. "A working arrangement was come to between the Air Ministry and Messrs. Handley Page and Messrs. Instone, by which it has been possible to resume the daily air services to and from Paris. The single fare from London to Paris is six guineas [\$31] and the return fare £12 [\$60]. It was the adoption of this fare by the French air transport companies that drove the British machines off the service. . . . In addition to passengers, mails and goods will again be carried. The charge for goods will be one shilling [25 cents] per lb. for 100 lb. weight, and 10d. [20 cents] for each lb. over that quantity. The contract with the French firms for the carriage of mails was a temporary one and no technical difficulties were met in handing the mails back to the British firms. . . . The Handley Page and Instone firms to maintain two services daily. . . . All machines are fitted with Rolls-Royce engines."—*London Times*, March 21, 1921.—In April, 1921, the Royal Dutch air service inaugurated a regular passenger service between London and Rotterdam-Amsterdam. From the last-named city airplane connections can be made for Paris, Brussels and Hamburg.—"There is being formed in the United States an organization of recognized mechanical and financial strength to manufacture and operate a fleet of . . . gigantic airships for trans-continental air lines, to be employed in passenger, freight, express and mail traffic. Minor organizations are now under way for operating with airships of the non-rigid or blimp type in this country, and from this country to neighboring ports in the Caribbean. One concern intends to operate between Key West and Havana, and along the coast from Key West to New York; also from New York to Chicago, with intermediate stops at Washington or Pittsburg, or the Lake Ports. Another corporation is embarking on a lighter-than-air enterprise between Detroit and Cleveland. Other corporations are either operating, or planning to operate in the near future, heavier-than-air traffic lines between Key West and Havana, and along the Atlantic Coast; also across the continent from New York to San Francisco, on the Great Lakes, and on the Atlantic Coast from New York to Boston, and one giant seaplane has recently flown from Key West to New York in less than fifteen hours. These are a few of the indications that we are entering the era of commercial aeronautics."—C. A. Tinker, *Commercial aeronautics* (*North American Review*, Apr., 1921, p. 452-453).—The R-36, the first British-built air-

ship adapted for commercial purposes was completed in March. It was built by Messrs. William Beardmore and Co., Ltd., and was designed three years before by the admiralty. Changes of policy placed it under the control of the civil side of the air ministry, along with other big dirigibles. The two principal characteristics of the R-36 are its passenger accommodation and mooring gear. Her constructional features may be tabulated as follows:

Length: 672 ft., 30 ft. longer than R-34.
Maximum diameter: 78 ft. 0 in.
Cubic capacity: 2,100,000 ft. of hydrogen gas.
Nominal lift: 63.8 tons.
Maximum speed: 65 miles an hour.
Normal cruising speed: 50 miles an hour.
Range: Over 4,000 miles.

The normal complement of the R-36 is four officers and twenty-four men. A full wireless equipment is carried, and all the engine-carrying cars are in telephonic communication with the control-car. It is possible, also, to walk from any one part of the ship to any other. "It is not too much to say that at the present time there has been designed only one plane primarily for commercial use: that is, the Giant Caproni, of one hundred passenger capacity, now in a hangar in Italy. It has never been tested. The reason is that the military authorities controlling Italian aviation have never given permission for it to leave the ground because Caproni did not include certain features which would permit his plane to be converted to military use."—C. A. Tinker, *Commercial aeronautics* (*North American Review*, Apr., 1921, p. 451).—See also CAPE-TO-CAIRO RAILWAY: Air route established; CITY PLANNING: Aeroplane in city planning.

1918-1921.—Aerial law.—Control of navigation.—Peace conference commission.—Aerial League of the World.—Air diplomats.—Aeronautic schools.—Aeronautic nomenclature.—"A new branch of the law is being developed—the law of the air. The development is going on right before your eyes. The present generation [1921] has seen the origin of this new branch of law and will see much of its development. . . . Nobody thinks of the airplane as a trespasser or as a nuisance, yet this is precisely what the craft of the air is; the law always follows the facts. The facts determine the fundamental conditions out of which the law springs, and the customs and habits which aircraft make necessary are already shaping the legal principles that will guide us in the future. When we watch an aviator soaring over the earth, we do not think of him as a violator of the law, yet, technically, that is what he is; for, throughout his journey, unless he be over the seas, he is flying over the land of others, and this flight is a trespass over the land. When we look into the old common law, we find that the theory of ownership has always been this: A man who owns a piece of land owns not only the surface of the land and the immediate subsoil, but he owns straight downward as far as he may wish to go and he owns straight upward into the sky. Unquestionably, in the view of the common law, every airplane flying over the land of others is, no matter at what height, a trespasser. If we wish to be more technical and pursue this matter as a lawyer might follow it, we can turn to an ancient case that has a most interesting bearing upon the development of airplane law. The balloon offered the first situation out of which the development of air law may be said to have begun. In 1815 mention is made for the first time of the rights of

a man in a balloon, in *Pickering vs. Rudd*, 1 Starkie, page 56, 4 Campb. 219, 16 Revised Rep. 777, and then as dictum. The plaintiff was objecting because the defendant had climbed on a temporary platform above his ground and lopped off a troublesome Virginia creeper that overhung the defendant's close. Lord Ellenborough observed: 'I recollect a case where I held that firing a gun loaded with shot into a field was a breaking of the close. . . . I never yet heard that firing in *vacuo* could be considered as a trespass. . . . Would trespass lie for passing through the air in a balloon over the land of another?' And here is an even more authoritative pronouncement. Pollock, the great English law writer on torts and other subjects, discusses the whole question in a brilliant manner. On page 423 of his work on 'Torts' he says: 'It has been doubted whether it is a trespass to pass over the land without touching the soil, as one may in a balloon, or to cause a material object, as shot fired from a gun, to pass over it. . . . It does not seem possible, on the principles of the common law, to assign any reason why an entry at any height above the surface should not also be a trespass. The improbability of actual damage may be an excellent practical reason for not suing a man who sails over one's land in a balloon; but this appears irrelevant to the pure legal theory. . . . Then one can hardly doubt that it might be a nuisance, apart from any definite damage, to keep a balloon hovering over another man's land.' Before we leave the purely legal side of this subject there is another interesting principle which the aviator must keep in mind, especially if he be flying anywhere over the State of New York, and that principle, expressed in plain human terms, is this: If his plane makes an unexpected descent, and thereby attracts a crowd which swarms on to some person's property and destroys something, the aviator may be liable. It will be enough to quote the language of the Court in this case. The layman will enjoy it as much as the lawyer: 'I will not say that ascending in a balloon is an unlawful act, for it is not so; but it is certain that the aeronaut has no control over its motion horizontally; he is at the sport of the winds and is to descend when and how he can; his reaching the earth is a matter of hazard. . . . Now, if his descent under such circumstances would ordinarily and naturally draw a crowd of people about him, either from curiosity or for the purpose of rescuing him from a perilous situation, all this he ought to have foreseen and must be responsible for.' This was the famous case of *Guille vs. Swan*, New York case, found at 10 Johns, page 381. The balloonist in this case had to pay \$50 for potatoes, turnips, and flowers that were ruined by the onrush of his admirers who tried to rescue him; and the aviator who goes up must bear in mind that he may have to pay something for damages also."—W. C. Williams (*Outlook*, Sept. 22, 1920, pp. 144-145).

"The year following the armistice witnessed many remarkable achievements in air navigation, demonstrating its future commercial value as a new means of intercommunication and transportation. The crossing of the Atlantic Ocean from the mainland of the United States to England, via the Azores and the European Continent, was closely followed by a continuous flight from Newfoundland to Ireland in about fifteen hours. The distance between New York and San Francisco and return was traversed in slightly more than forty-eight hours. The use of aircraft for the regular transportation of mails and passengers increases day by day both here and abroad. An art thus expanding by leaps and bounds requires a wise

system of legal regulation and control, both in its own interest and for the safety of the community. Aerial navigation, like the navigation of the seas, is international in scope, and its adequate regulation by law presupposes the coöperation of nations through international conventions. This has long been recognized both by scientific experts and by jurists. It was also accepted as a basic principle by the official International Conference upon Aerial Navigation held in Paris upon the call of the French Government in May, June and November, 1910, and also by the unofficial conference for the Regulation of Aerial Locomotion held at Verona in June, 1910. The Commission on Air Navigation was one of a number of commissions created under the authority of the Peace Conference [1918] having nothing whatever to do with the adjustments of the war itself. Its labors, so far as they were connected with the work of the Peace Conference, consisted of the regulation of the new means of intercourse between nations in such a manner as to promote friendly relations and to avoid friction. The Convention relating to International Air Navigation is reported to have been signed on October 13, 1919, by all the Allied and Associated Powers, excepting Japan and the United States. The convention is restricted wholly to peace times and does not affect the freedom of action of the contracting states in time of war, either as belligerents or as neutrals. The convention recognizes that every state has complete and exclusive sovereignty in the air space above its territory and territorial waters. But each state undertakes in time of peace to accord freedom of innocent passage to foreign aircraft without distinction as to nationality, provided the conditions of the conventions are observed. . . . Any nation has the right to map out areas prohibited for military reasons or for public safety, but notice of such areas must be given to the central bureau and published. The fact that prohibited areas must apply alike to domestic as well as to foreign aircraft will serve as a counterbalance to any extreme view of military needs. The right of innocent passage is therefore practically assured. The convention determines the nationality of aircraft according to rules similar to those established for seagoing vessels. . . . Aircraft cannot be validly registered in more than one country at the same time. No nation may permit the flight above its territory of aircraft not possessing the nationality of one of the contracting states. This marks an important variance from the rule of maritime shipping because vessels of all duly recognized countries are permitted to enter the territorial waters of other nations. . . . The issuance of certificates of air-worthiness and the competence of officers and crew are matters within the jurisdiction of the contracting states so long as they observe the technical minimum standards set forth in the annexes. A permanent International Commission for Air Navigation is established which may vary these standards from time to time. Certificates which are issued or rendered valid by the state of the aircraft's flag must be recognized in all other states. . . . The annexes also provide in detail for the marks and numbers which aircraft must carry, also the lights and signals, rules of airway and markings of aerodromes. . . . The annexes provide the details to be embodied in documents which aircraft must carry, which include the following: (a) certificates of registration; (b) certificate of air-worthiness; (c) certificate of minimum technical skill for commanding officer and pilot; (d) licenses for pilots, navigators and engineers; (e) list of passengers; (f) bill of lading

and manifest; (g) log book; (h) special license for wireless equipment. These requirements presuppose some coordination between the local and the national authorities, which federal regulation can alone provide. The convention provides for the organization of an international union for the administration of international air navigation and for the elaboration of legislation to be applicable to it from time to time. The organ of the union will be the International Commission for Air Navigation. Its organization is to be under the control of the League of Nations. Representation is measured somewhat after the principle adopted for the Assembly of the League. The five great Allies have each two representatives. All other contracting states have each one representative, the self-governing British Dominions and India counting for this purpose as states. The vote is taken according to states, but the five great Powers reserve to themselves the majority of the votes by the provision that each shall have 'the least whole number of votes which, when multiplied by five, will give a product exceeding by at least one vote the total number of votes of all the other contracting states.' The greatly extended use of aircraft for commercial transportation which now seems impending will require entirely new methods of customs administration. The convention essays to lay down certain rules by which the states are to cooperate in administering customs and in the prevention of customs fraud. Aircraft must depart from and alight only upon especially designated 'customs aerodromes.' Places for crossing a frontier are to be indicated on aeronautical maps. The inspection of documents is regulated in a manner analogous to marine vessels; but the convention wisely allows a certain latitude for aircraft over which strict control at or near the frontier is not required. Any disagreement relating to the interpretation of the convention is to be referred to the Permanent Court of International Justice to be established by the League of Nations and, until its establishment, to arbitration. But the International Commission for Air Navigation is competent to determine, by a majority of votes, a dispute upon any of the technical regulations."—A. K. Kuhn, *International aerial navigation and the Peace Conference, 1919* (*American Journal of International Law, July, 1920, pp. 370-375, 378-379*).—See also INTERNATIONAL LAW; VERSAILLES, TREATY OF: Part XI.

Plans for the foundation of an international aeronautic association, to be known as the Aerial League of the World, have been completed. It is planned to have affiliations in nearly every country of the world. Its purposes, as set forth in *Flying* (New York), are: "(1) To encourage the use of aircraft for all purposes throughout the world. (2) To promote safety in aerial navigation and in the construction of aircraft, aerodromes, accessories, etc. (3) To encourage and urge the establishing of suitable landing-places for aircraft all over the world and standardize said landing-places and equip them with standardized lighting and signaling devices and guiding lights to facilitate aerial navigation. (4) To cause and urge the establishing of recognized airways throughout the world to interconnect aeri-ally all the world's commercial centers, and wherever aircraft can solve problems of transportation. (5) To provide a scientific and practical solution to the difficult problem of operating permanent aerial transportation lines at night and in fogs, over fixed routes, without danger of collision to aircraft flying in opposite directions, by bringing about the adoption of airways eighty miles wide, which will permit aircraft, by keeping to the right, to avoid collision even if they

should deviate from their course, owing to wind drift. (6) To establish a protective organization which will undertake to protect airmen legally in securing national and international legislation and the adoption of proper rules of the air and regulations to govern aerial navigation and to protect the interests of owners and users of aircraft against unjust and unreasonable legislation, and to maintain the lawful right and privileges of owners and users of all forms of aircraft whenever and wherever such rights and privileges are menaced, as, for instance, in preventing the adoption of restrictive aerial laws, discouraging over-charging when airmen damage property, prosecuting persons for wilfully placing obstructions on aviation fields, or crowding aircraft landing-fields, extinguishing guide lights, destroying landmarks, selling watered gasoline to aviators, selling inferior hydrogen and gas to balloonists, etc. (7) To standardize aircraft insurance rates and insurance adjusting. (8) To establish aeronautic information bureaus throughout the world. (9) To study the possibility of air travel in different countries and prepare maps of airways. (10) To establish a clearing-house of aeronautic activities where people interested in aerial touring, commercial aerial transportation, and air travel can get practical information and assistance. (11) To organize aerial exploration and surveying expeditions. (12) To cooperate with aerial leagues, aero clubs, and other organizations, aerial transportation companies, travel agencies, chambers of commerce, manufacturers, and other established organizations to carry out the above-mentioned purposes and advance the science and art of aerial navigation. . . . The president of the League is Maj. Charles J. Glidden, the founder of the Glidden Automobile Tours, a pioneer in aeronautics since 1905 and acting chairman of the contest committee of the Aero Club of America."—*World-wide league to promote flying* (*Literary Digest, Oct. 9, 1920, p. 82*).—On Feb. 19, 1919, the appointment of an air attaché to the British embassy at Washington was announced. In the following year Italy also appointed air attachés to several of their embassies.

"The University of Detroit has gone ahead with plans to establish a five-year course in aeronautics. The university is confident that Detroit will eventually become an aircraft and aircraft-equipment center, and that the demand for men trained in aerial science will be greater than the visible supply here below.

"The uninitiated may wonder what there is in aeronautics to require five years' training. The average man who has flown an airplane in war or peace is more likely to wonder if it is possible to cram all there is to know about aerial navigation and aerial equipment into five years. Whether or not it is possible to do the subject justice in that length of time remains to be seen, but judged by present standards the University of Detroit can produce aeronautical engineers of a caliber superior to anything now known. Like medicine, law, chemistry, and a multitude of other sciences, theory in aeronautics is one thing; practise is quite another.

"Lieut. Thomas F. Dunn, dean of the new department of aeronautics at the University of Detroit, puts it this way: 'There are lots of engineers who can tell you all about aeronautics on the ground, but when they get up into the thin air their theory is like a ship without a rudder and no compass—very active, but with indefinite plans as to the future.' The impression that takes hold of us is that there are two ways of getting an aeronautical education. One is to go up in

the air first and gather some experience, and if spared for future investigation, return to solid earth and tackle the theory. The other way is to tackle the theory first and then try it out on the air.

"Some idea of the latitude of this subject is conveyed by the following subjects to be taught: Higher mathematics, communication, mapping, astronomy, physics, meteorology, weather calculations, theory of flight, balloons, aerodynamics, aerostatics, aircraft mechanics, testing drawing, administration, chemistry, electricity, engineering principles, metal-working, working design and construction, topography, wireless telephony and telegraphy, safety devices, uses of instruments, some commercial law, and all there is or will be on aerial navigation laws, principles of law as it is or will be applied to the air, and aerial photography."—F. W. Hersey, in *Michigan Manufacturer and Financial Record*, quoted by *Literary Digest*, July 16, 1921.

It is estimated that aviation has introduced over 200 new words into the English language, either original or taken over from other languages. Those words or phrases in common use on the flying fields or in aircraft plants are strangers to the average reader. For the benefit of those who are unacquainted with the meanings of such words as "fuselage," "nacelle," "drift," "aileron," and such phrases as "air pockets," "parasite resistance," "trailing edge," etc., the Manufacturers' Aircraft Association issued in 1919 a "Flying dictionary" with the aid of a report compiled by the national advisory committee for aeronautics at Washington. Quite a number of books on aviation contain glossaries with technical details, yet one of the handicaps is the proper description of equipment so as to give the public—generally uneducated—an accurate idea of the magnitude of current happenings. This difficulty has also been encountered in government aircraft activities and appears more than ever now that commercial aviation, with proper encouragement, promises to develop in the near future.

1921.—New aircraft for U. S. Navy.—Early in the year the United States Navy Department was building, at its yard at League island, a giant flying boat intended to be the largest of its kind in the world, to tower above a three-story building in height and have a wing spread of nearly a New York city block. As given in official figures, the dimensions were: height, 48 feet; wing spread, 150 feet; length, 67 feet; designation to be the *G-B* type. On April 14 it was announced that the great rigid airship *ZR-2*, then in its final stages of trial flights and equipment in England and purchased by the United States government, would make the trip to America late in July, 1921, under command of Commander Maxfield, U. S. N. American officers and enlisted men had been training in England for nearly a year in anticipation of the transatlantic flight to bring the airship over. The cost of the airship—the largest in the world—was stated to be about \$2,500,000. Its original British name was the *R-38*; its length 600 feet; height, 93 feet; diameter, 86 feet; gas capacity, 2,724,000 cubic feet, and a useful weight-carrying capacity of forty-five tons. On August 24, however, just as it was completing satisfactorily its final trial cruise, the *ZR-2* met with a tragic fate. At 5.45 p.m., while traveling over the city of Hull, the monster aircraft "buckled"; flames instantly broke out and several explosions followed. It seemed to the horrified spectators on the ground that the vessel would fall upon the city, but the commander, Captain A. A. Wann, steered it over the river Humber, into which it fell. Three mem-

bers of the crew made successful parachute descents; two others, including Wann, were subsequently taken off the wreck. These were the only survivors out of forty-nine—thirty-two British and seventeen Americans. The disaster was attributed to structural weakness.

IMPORTANT FLIGHTS SINCE 1900

1900.—First *Zeppelin's* trial flight.

1901 (Oct. 19).—Alberto Santos-Dumont navigated a dirigible from St. Cloud to Paris, around the Eiffel tower and back to starting-point; time, thirty minutes.

1903 (Dec. 17).—"Wright Bros. fitted a biplane glider with a 16 H.P. motor, driving double screws behind the planes. Total weight of machine, 750 pounds. Flew at speed of 30-25 miles per hour for a period of twelve seconds. Tests made on the Kill-Devil dunes, N. C., ultimately sustained flight for a period of 50 seconds, covering 852 feet. *First successful sustained flight in the world.*"—*Aircraft year book, 1910, p. 311, Aeronautical Chamber of Commerce of America.*

1904.—Pierre and Paul Lebaudy navigated a dirigible of their own construction, fitted with a 40 h.p. motor, a distance of twenty-five miles near Paris.

1907 (October).—A British war dirigible *Nulli Secundus* sailed from Farnborough to London, circled St. Paul's cathedral and flew to the Crystal palace, about fifty miles; time, three hours thirty-five minutes.

1909 (July 25).—French aviator Louis Blériot made first flight across English channel, from Calais to Dover, in thirty-one minutes.

1910 (April 20).—Roger Sommer, at Mourmelon, France, went up with four passengers.

May 21.—Count Jacques de Lesseps flew from Calais to Dover; the second cross-Channel flight.

May 29.—Glenn Curtiss flew from Albany to New York city, making two stops on the way; distance—145 miles.

June 2.—Charles Stewart Rolls (of Rolls-Royce), an Englishman, made the first round-trip flight over the English channel, in a Wright biplane.

June 13.—Charles K. Hamilton, flying for the *New York Times*, made the first round-trip flight between New York and Philadelphia.

July 9.—René Labouchere, at Reims, France, made a continuous non-stop flight of 211.27 miles, the world record at that time.

July 10.—Jan Oliaslaegers, at Reims, broke Labouchere's record, with a continuous flight of 244 miles in five hours, three minutes and fifty-one seconds.

Aug. 7-17.—Alfred Leblanc flew over a circular course, Paris, Troyes, Nancy, Mezieres, Douai, Amiens, and back. Total distance 485 miles.

Aug. 7.—John B. Moisant made the first flight over the English channel with a passenger.

Sept. 23.—Peruvian aviator Jorge Chavez-Dartnell flew over the Alps; crossed Simplon pass at Dondo, flying towards Italy. He was killed a few days later by fall of his machine in Switzerland.

October.—First dirigible attempt to cross Atlantic. In October, Walter Wellman, an American explorer, and Melvin Vaniman made a courageous attempt to cross the Atlantic ocean. The undertaking was all the greater when it is remembered that aviation was still an undeveloped science. These two pioneers set out from Atlantic city in the rigid dirigible *America* with a crew of four men, including two Americans, one Englishman and an Australian. Not possessing the machinery and other appliances of the necessary strength and

efficiency to dictate their route, the utmost they could hope for was to reach some point on the coast of Great Britain or France wherever the wind might carry them. The elements were against them; bad weather made it impossible to reach any European shore. The balloon was blown out of its course and soon came to grief; it was finally picked up by a steamer midway between New York and Bermuda, 1,000 miles off Cape Hatteras. The crew were rescued but the dirigible had to be abandoned.

Oct. 28.—Maurice Tabuteau, at Buc, France, broke the world record with a continuous flight of six hours and covered a distance of 280 miles.

Oct. 11.—Archie Hoxsey, at St. Louis, took Colonel Theodore Roosevelt up as a passenger.

1911.—(Feb. 1).—Captain C. Bellenger flew from Paris to Bordeaux, 330 miles, in eight hours and twenty-two minutes.

Feb. 2.—Bellenger flew from Bordeaux to Pau, France, 140 miles.

Bologna, Italy, over the Apennines, at an altitude of 4,500 feet.

1912.—(March 7).—Salmet, in a Bleriot machine, flew from London to Paris in three hours and sixteen minutes.

April 16.—First cross-Channel flight by a woman.—Miss Harriet Quimby, a British aviatrix, piloted an airplane across the channel.

April 28.—Hewitt flew from Holyhead to Dublin in one hour and fifteen minutes.

May 25.—Fish flew from Chicago to Milwaukee in two hours and twenty minutes.

June 15 to July 10.—Andreadi flew from Sebastopol to Petrograd, 1,670 miles.

July 2.—During a test flight of a second dirigible (after the *America*) named the *Akron*, Melvin Vaniman and four of the crew were killed by an explosion of the hydrogen gas with which the balloon was inflated.

Aug. 18-19.—Andemars made first Paris to Berlin flight, 541 miles, in two days.

FIRST AERIAL CROSSING OF THE CHANNEL, 1909

Bleriot monoplane just before landing at Dover

April 22.—P. Védérines flew from Paris to Pau, a distance of 310 miles, in six hours and fifty-five minutes.

June 28.—L. Beachey flew over Niagara Falls.

June 30 to July 11.—Harry N. Atwood flew from Boston to Washington via New London, New York, Atlantic city, and Baltimore.

July 24.—M. Vasselieff flew from St. Petersburg to Moscow.

Aug. 14 to 25.—Atwood flew from St. Louis to New York via Chicago, Cleveland, and Buffalo. Air distance, 1,266 miles. Flying time, twenty-eight hours and fifty-three minutes; average daily flight, 105 miles. Average speed, fifty-one miles an hour.

Sept. 9.—First aerial mail in United Kingdom inaugurated between Hendon (London) and Windsor.

Sept. 17 to Dec. 10.—G. P. Rodgers flew from New York to Long Beach, Cal., a distance of 4,231 miles. Time in air was three days ten hours and four minutes.

Oct. 21.—De Hansey flew from Florence to

Sept. 28.—Daucourt circled Paris seven times, 497 miles, in twelve hours and twenty-two minutes.

1913.—(Jan. 25).—Brelovuccic flew over the Alps, fifty miles, in twenty-five minutes.

March 28.—Lieutenant T. De W. Milling, U. S. A., with passenger, flew from Texas city to San Antonio, 240 miles, in three hours and twenty minutes.

April 15.—Daucourt flew from Paris to Berlin in thirteen hours and thirty-nine minutes.

April 17.—Hamel flew from Dover, England, to Cologne, Germany, 245 miles, in four hours and eighteen minutes.

May 17.—Rosillio flew from Florida to Cuba, 100 miles, in two hours and eight minutes.

June 1 to July 2.—Brindejous des Moulinais made the round trip from Paris to Warsaw via Stockholm, Petrograd, and the Hague, 3,002 miles.

Aug. 25-27.—Hawker flew around the British Isles, 1,043 miles, in two and one-half days.

Sept. 1.—Alphonse Pégoud, French aviator, made

the first loop-the-loop maneuver in a Blériot monoplane.

1914.—One of the most noteworthy flights during the year occurred on Feb. 11, when the French pilot Agener Parmelin flew from Geneva, Switzerland, over Mont Blanc in France, to Aosta in Italy, attaining an altitude of over 16,000 feet. This feat was rivalled in America by Silas Christofferson, who flew on June 25 over the peak of Mount Whitney in California. This mountain is 14,898 ft. high and Christofferson attained an altitude of 15,728 feet, about a thousand feet above the peak. In London, the American aviator W. L. Brock won the British Aerial Derby flight around London and the round flight London-Manchester, winning the *Daily Mail* gold cup and \$2,000 offered by the Anglo-American Oil company. Against seven competitors on July 11, Brock also won the London to Paris and back race. The French aviator Gilbert, starting on June 6, flew 2,000 miles round France in two days; Lieut. Geyer flew 805 miles in a day in Germany; Verrier won the Pommery cup with a flight from Buc to Genthin, Germany, a distance of 520 miles, in May; Adjutant Quennehen made a 625 miles' flight across country on June 12, without stopping, in thirteen hrs. forty min.; the German aviator Basser in four days, spending eighteen hrs. 12 min. in the air, flew with a passenger from Berlin to Constantinople, via Buda-Pesth and Bucharest; flights over the Alps were made by Parmelin, on Feb. 11, from Geneva to Aosta over Mont Blanc; by Bider, from Berne to Brigues, by the Jungfrau, on April 23; and by Landini, over the Alps Apennines, on July 27; a number of flights through Asia Minor by French and Turkish aviators bound for Jerusalem and Cairo were made, the Turkish aviators suffering two double fatal accidents besides minor mishaps.—*Hazell's Annual*, 1915, p. 431.—Sikorsky, with his "giant" airplane at Petrograd, remained in the air with ten passengers for one hour and forty-six minutes, on June 18.—On July 4, H. Kantner circled New York city, forty-six miles, in forty-three minutes and twenty-six seconds.

"A number of accidents to airships have occurred [during 1914]. Of these may be mentioned: April 18th, the *City of Milan* (Italian). During deflation after landing the gas was ignited by a smoker's match and about forty persons were injured in the resulting explosion, one fatally. June 20th, the *Körting-Wimpasing* (Austrian). This airship was run into by a Farman biplane and its gas exploded by a flame from the motors. The seven occupants of the airship and the two occupants of the biplane were all killed. June 14th, the *Ersatz Z1* (German Zeppelin), wrecked while landing in a storm at Diedenhofen; no loss of life. June 24th, a Russian military airship, wrecked in a storm, the crew escaping with slight injuries."—C. C. Turner, *Aviation in 1914* (*Hazell's Annual*, 1915, p. 427).

1915.—In this year the war in Europe completely put an end to aviation so far as competitive long-distance and cross-country flights were concerned. In Europe all airplanes were commandeered for military purposes and practically all aviators entered the service of their respective countries.

1916.—(April 1).—S. McGordon flew from Newport News, Va., to Washington and return, 300 miles; in four hours and twenty-nine minutes.

April 30.—E. T. McCauley, at Newport News, flew eighty-eight miles with six passengers in one hour, ten minutes and five seconds.

May 20.—Victor Carlstrom flew from Newport News, Virginia, to New York without a stop in four hours and one minute, covering between 350

and 400 miles, thereby making the longest and fastest cross-country record in the United States. On Nov. 19 Miss Ruth Law broke that record by flying from Chicago to Hornell, N. Y., 668 miles, without a stop.

May 24.—Victor Carlstrom flew from New York to Washington, 237 miles, in three hours and seven minutes.

June 20.—Lieut. A. Marchal, French Army, flew from west front in France to Poland, a continuous flight of 812 miles. Time not stated.

Nov. 2-3.—Victor Carlstrom, flying for the *New York Times*, flew from Chicago to New York, with one stop, due to engine trouble. Distance 967 miles. Time in air, eight hours, twenty-eight minutes and thirty seconds.

Nov. 19-20.—Miss Ruth Law flew from Chicago to New York, with one stop. Time in air, eight hours, fifty-five minutes and thirty-five seconds.

1917.—(Aug. 29).—Captain G. Lauriati flew from Turin to Naples and return, 920 miles, in ten hours and thirty-three minutes.

Sept. 24.—Captain Lauriati flew from Turin to London, 700 miles, in twelve hours and two minutes.

Oct. 22.—Captain A. Silvio flew from Norfolk, Va., to Mineola, L. I., 330 miles, in four hours and twenty-five minutes.

Oct. 22.—Lieutenant Baldioli flew from Norfolk to Mineola in two hours and fifty-five minutes.

1918.—German Zeppelin *L-59* flew from Bulgaria to south of Khartum and back without landing *en route*, a distance of over 4,000 miles.

First non-stop airplane flight from Chicago to New York city was made April 19 of this year by Captain E. F. White, an American Army aviator. He traveled 727 miles in a *De Havilland-4* army reconnaissance plane at an average speed of about 106 miles an hour.

April 26, the naval seaplane *F-5*, with Lieutenant Commander Grow and Ensign Thomas as pilots, broke all records for an endurance flight by remaining in the air a little over twenty hours for a flight of 1,250 miles.

December.—For the first time, an aerial concert was performed over London. A big bombing plane carried a band aloft, shut off the engines and had a concert while it glided to earth. Another powerful machine, a *Handley-Page* which was to have been used for dropping 600 pound bombs on Berlin had the war continued, was regularly carrying forty persons at a time over London.

1919.—Captain E. F. White made the first non-stop flight from Chicago to New York, between breakfast and dinner, in six hours and fifty minutes, a trifle more than one-third of the time required by the fastest express train.

May.—*Attempts to cross Atlantic*.—Before the World War broke out the London *Daily Mail* offered a prize of £10,000 (\$50,000) for the first crossing of the Atlantic. Directly after the war the capabilities of airplanes and airships, strenuously developed during that conflict, justified the belief that the crossing could be accomplished under favorable circumstances. Early in the year several entries were made for the prize. Independently of the competition, the United States naval air service prepared a flying-boat to cross *via* the Azores islands, and the British air ministry announced that the rigid airship *R-34* would attempt the double crossing of the ocean.—"One of the greatest adventures ever undertaken by men—the crossing of the Atlantic Ocean by aerial flight—was attempted both by American and British aviators in May, 1919. Some of the Americans who dared the dangers of this crossing knew

the joy of Columbus when he first spied the hazy outline of the New World coast. . . . Two British aviators [Hawker and Grieve], staking all on the desperate resolve to reach the other hemisphere by direct flight, disappeared from the world's knowledge for six days and were considered lost in midocean until news came that they had been rescued. Two others later achieved success and fame. Curiously enough, the project of transatlantic flight developed in America as a national, not a private, enterprise, and the pioneer airmen who reached Portugal from Newfoundland were enlisted men in the service of the United States Navy; the British attempt, on the other hand, was purely a private venture. Harry Hawker and Lieutenant Commander Grieve flew to fulfill the conditions of a \$50,000 prize. . . . Captain Raynham, another British competitor for the same prize, met with disaster in 'hopping off' and had to give up the project for a time."—*New York Times Current History*, July, 1919, p. 99.—See also ATLANTIC OCEAN: Trans-Atlantic steamers, cables, airplanes.

May.—*American seaplane first across Atlantic*.—On Nov. 30, 1918, it was announced from Washington that the navy's newest seaplane, the *Giant NC-1*, the largest seaplane in the world, had broken all records for the number of passengers carried in any airplane when it made a flight with fifty men on board on Wednesday, Nov. 27, at the naval air station at Rockaway, Long Island. This was the first American tri-motor seaplane and was propelled by three Liberty motors that developed a maximum of 1,200 h.p., giving it a cruising speed of eighty miles an hour.—"The 'NC' flying boats—the 'N' for Navy and the 'C' for Curtiss, these two combined letters indicating the joint production of the United States Navy and the Curtiss Engineering Corporation—have an interesting history. This airplane type is not only of extraordinary size, but of unusual construction, and represents an original American development. According to a statement issued by Acting Secretary of the Navy Roosevelt, the design was initiated in the Fall of 1917 by Rear Admiral D. W. Taylor, chief instructor in the navy, who had in mind the development of a seaplane of the maximum size, radius of action, and weight-carrying ability for use in putting down the submarine menace. . . . It was the intention of the Navy Department to fly a fleet of these planes overseas, and if the war had continued this intention would have been fulfilled. . . . Plans for the flight were in process of making as early as March 22, 1919, when six officers of the navy and one of the Marine Corps were assigned to the transatlantic section of the office of the Director of Naval Aviation for the preparation of such plans. . . . Test trials at Rockaway Beach toward the end of March gave auspicious results, one of the NC boats leaving the water with 26,000 pounds gross load, as against the 22,000 believed at one time to be the limit of carrying capacity. This test demonstrated that these craft could carry sufficient gasoline to cross from Newfoundland to the Azores Islands without alighting for fuel. These trial flights went on continuously from April 22. . . . Meanwhile it was announced by Commander John H. Towers . . . that the details of the destroyer and dreadnought patrols to be stationed along the entire course of the contemplated flight had been completed; the advance guard had already sailed, and others were scheduled to leave daily. Ultimately half a hundred destroyers, cruisers, and dreadnoughts took part in the work of patrolling the route. Each of the crews of the three NC ships to at-

tempt the flight, as officially announced, included six members. . . . The seaplanes began the historic effort to cross the Atlantic through the air at 9:59 o'clock in the morning of May 8. . . . Two of the planes reached Halifax the same day at 8 o'clock (7 o'clock New York time). This first flight, 540 nautical miles, took exactly nine hours. The *NC-4*, however, was missing. . . . (It had) dropped out of wireless touch and was not heard from until the following day, May 9, when it was learned that this plane had been forced by engine trouble to come down at sea, and had proceeded under its own power to Chatham Bar, on the Massachusetts coast. . . . Meantime the *NC-1* and *NC-3*, not waiting for the *NC-4*, took flight from Halifax in the morning of May 10, and reached Trepassey Harbor, N. F., at 4:14 and 7:50 A. M., respectively. . . . They had just completed an unsuccessful attempt to get away on *Many 15*, when the *NC-4* arrived at Trepassey. . . . The three planes, thus reunited, went to their moorings, and began preparations for a common departure at the first favorable moment."—*New York Times Current History*, July, 1919, pp. 99-102.—"The *NC-1*, 3, and 4 . . . left Trepassey Bay at 6:05 P.M. (Friday, May 16). It was a clear moonlight night, and as twenty-one United States destroyers were stationed along the route from North latitude 46-17 to 39-40, the airships were in communication with the fleet all the way over. Because of a thick fog which obtained near the Azores the *NC-4* landed at Horta of the eastern group at 9:20 A.M., just 15 hours and 18 minutes after starting. The *NC-1* landed at sea and sank, and the *NC-3*, which flew out of its course, landed at Ponta Delgada. The *NC-4* in its flight from Trepassey to Lisbon covered a distance of 2,150 nautical miles in 26.47 hours' actual flying, or at an average speed of 80.3 nautical miles."—E. J. David, *Aircraft, its development in war and peace and its commercial future*, pp. 259-260.—According to the report of Lieutenant-Commander Read, of the *NC-4* as published in the *World* (New York), "The Three and Four together left Mistaken Point at 10.16, and ten minutes later sighted the One, several miles to the rear, and flying higher. We were flying over icebergs, with the wind astern and the sea smooth. Our average altitude was 800 feet. The *NC-4* drew ahead at 10.50 (P.M.), but when over the first destroyer made a circle to allow the *NC-3* to catch up. We then flew on together until 11.55, when we lost sight of the *NC-3*, her running lights being too dim to be discerned. From then on we proceeded as if alone. . . . As it grew lighter the air became bumpy, and we climbed to 1,800 feet, but the air remained bumpy most of the night. . . . At 5.45 we saw the first of dawn. As it grew lighter all our worries appeared to have passed. The power-plant and everything else was running perfectly. The radio was working marvellously well. . . . At 8 o'clock we saw our first indications of trouble, running through light lumps of fog. It cleared at 8.12, but at 9.27 we ran into more fog for a few minutes. At 9.45 the fog became thicker and then dense. The sun disappeared and we lost all sense of direction. The compass spinning indicated a steep bank, and I had visions of a possible nose dive. Then the sun appeared and the blue sky once more, and we regained an even keel and put the plane on a course above the fog, flying between the fog and an upper layer of clouds. We caught occasional glimpses of the water, so we climbed to 3,200 feet, occasionally changing the course and the altitude to dodge the clouds and fog. . . . At 11.13 we sent a radio to the

destroyer and could hear Corvo reply that the visibility was ten miles. Encouraged by this promise of better conditions farther on, we kept going. Suddenly, at 11.27, we saw through a rift what appeared to be a tide-rip on the water. Two minutes later we saw the outline of rocks. The tide-rip was a line of surf along the southern end of Flores Island. It was the most welcome sight we had ever seen. . . . The visibility then was about 12 miles. We had plenty of gasoline and oil, and decided to keep on to Ponta Delgada. Then it got thick and we missed the next destroyer, No. 23. The fog closed down. . . . At 1.04 we sighted the northern end of Fayal, and once more felt safe. We headed for the shore, the air clearing when we reached the beach. We rounded the island and landed in a bight we had mistaken for Horta."

Meanwhile, NC-3 was thrown out of her course by the high velocity of the upper winds. Com-

[May 10]. Off the port we declined proffered aid by the destroyer *Harding*, which had been sent out to meet us, and 'taxied' into port under our own power. During the two days' vigil of seeking land or rescue ships we fired all our distress signals, none of which apparently were seen. Without informing the crew of the fear that I had that we would be lost, I packed our log in a waterproof cover, tied it to a life-belt, and was prepared to cast it adrift when the NC-3 sank. The nervous strain was terrible while we were drifting, and the men smoked incessantly. This was the only thing that kept them awake." —E. J. David, *Aircraft*, pp. 270-272.—The NC-1 was less fortunate, as described in the following statement by Lieutenant Commander P. N. L. Bellinger: ". . . We proceeded on the course, being guided by the smoke and searchlights from the destroyers, and the star shells they sent up. After passing most of the station ships we did

Official Photograph, U. S. Navy

NC-4 AT LISBON AFTER FLIGHT FROM NEWFOUNDLAND

mander Towers reported that "having run short of fuel and encountered a heavy fog, the NC-3 came down at 1 o'clock Saturday afternoon in order that we might obtain our bearings. The plane was damaged as it reached the water, and was unable to again rise. While we were drifting the 205 miles in the heavy storm the high seas washed over or pounded the plane, and the boat began to leak. So fast did the water enter the boat that the members of the crew took turns in bailing the hull with a small hand-pump, while others stood on the wings in order to keep the plane in balance. Meanwhile we were steering landward. . . . The clearing of the weather proved only temporary, for later a storm came up and continued for 48 hours. With both lower wings wrecked, and pontoons lost, and the hull leaking, and the tail of the machine damaged, the plane was tossed about like a cork. In order to conserve the remaining 470 gallons of fuel we decided to 'sail' landward, hoping to sight a destroyer on the way. But we did not pass a single ship until we reached Ponta Delgada

not meet with any trouble until we got into fog at 11:10 A. M. Saturday, when we were near Station 18. After being in the fog for some time we alighted on the water at 1:10 P. M. Saturday. We kept to our course until we struck the fog, when we lost our bearings. We deemed it advisable to head into the wind, toward land, to get our bearings before proceeding. We were then flying about 3,000 feet up. We dropped to fifty feet in order to sight water, and found that the wind was in a different direction on the surface of the water than it was above, and also that the fog was more dense at the lower altitude. We made a good landing on the sea, which was rough and choppy with heavy swells. The strong wind continued until we were picked up. At 6 P. M. (Greenwich time), we sighted the masts of the *Ionia* on its way to Fayal and Gibraltar above the horizon. We were unable to see the hull of the *Ionia*, and, as she did not have wireless, we were unable to communicate with her. We therefore started taxiing toward

her. About this time the *Ionia* sighted us, and lowered a boat which picked us up at 6:20 P.M. Our position when we were picked up was latitude 39 degrees 58 minutes north, longitude 30 degrees 15 minutes west. We tried to salvage the plane, but the towings of the *Ionia* broke and we were forced to give up the attempt. We were rescued with difficulty because the small boat of the *Ionia* was tossed about like a cork. All of us were seasick, otherwise we did not suffer. We sent out S O S calls after landing, but the radio sending radius was only fifty miles on the surface of the water. While awaiting rescue we intercepted messages between destroyers. . . . If the fog had not been so thick we could have continued to Ponta Delgada. Our

days that the aviators were lost. From the destroyer to which Hawker and Grieve were transferred off the Scottish coast, the former sent this brief report to the *Daily Mail*: "My machine stopped owing to the water filter in the feed pipe from the radiator to the water pump being blocked with refuse, such as solder and the like, shaking loose in the radiator. It was no fault of the Rolls-Royce motor, which ran absolutely perfect from start to finish, even when all the water had boiled away. We had no trouble in landing on the sea, where we were picked up by the tramp ship *Mary*, after being in the water for ninety minutes." It was officially announced by the admiralty that the aviators were picked up in latitude 50° 20', longitude 29° 30'. The

VICKERS-VIMY PLANE AS IT LANDED AT CLIFDEN, IRELAND, AFTER CROSSING FROM
NEWFOUNDLAND

Aviators, Alcock and Brown

engines worked splendidly throughout. The average altitude of the flight was between 500 and 3,500 feet."—*New York Times Current History*, July, 1919, pp. 103-104.

May.—*Hawker's attempted Atlantic flight.*—On May 19, Harry Hawker and Lieut.-Commander Mackenzie Grieve, two British aviators, started from St. John's, Newfoundland, to make a direct flight to Ireland. They flew fourteen and a half hours, and although swept off their course they were able to take their bearings when radiator trouble compelled them to make a descent. Shortly before this became imperative, they steered for the shipping route, over which they zigzagged and finally descended upon the water about two miles in front of the Danish ship *Mary*, which picked them up. As the *Mary* was not fitted with wireless apparatus no news of the rescue could be transmitted, and it was feared for some

airplane, badly battered, was brought in a few days later by a vessel that had picked it up. On July 12, 1921, Hawker was killed at Hendon, when his machine crashed to earth and burst into flames.

June.—*First continuous transatlantic flight.*—"The great achievement of flying across the Atlantic Ocean without a single stop was accomplished for the first time June 14-15, 1919, by Captain John Alcock and Lieutenant Arthur W. Brown, one an Englishman, the other an American, when they covered the 1,980 miles between Newfoundland and Ireland in 16 hours and 12 minutes at a speed of 120 miles an hour. The night of June 14-15 thus became a permanent landmark in the history of the conquest of the air."—*New York Times Current History*, July, 1919.—Describing the experiences of himself and Lieutenant Brown, Captain Alcock, in a message

from Galway to the London *Daily Mail*, which awarded them the \$50,000 prize for making the first non-stop flight across the Atlantic between Europe and America, said: "We had a terrible journey. The wonder is that we are here at all. We scarcely saw the sun or moon or stars. For hours we saw none of them. The fog was dense, and at times we had to descend within 300 feet of the sea. For four hours our machine was covered with a sheet of ice carried by frozen sleet. At another time the fog was so dense that my speed indicator did not work, and for a few minutes it was alarming. We looped the loop, I do believe, and did a steep spiral. We did some comic stunts, for I have had no sense of horizon. The winds were favorable all the way, northwest, and at times southwest. We said in Newfoundland that we could do the trip in sixteen hours, but we never thought we should. An hour and a half before we saw land we had no certain idea where we were, but we believed we were at Galway or thereabouts. Our delight

17, 1919, when the airplane which he was driving crashed to earth at Côte d'Evrard, about twenty-five miles north of Rouen, France. He was twenty-seven years old.

July.—*First dirigible flight across Atlantic.*—The British dirigible *R-34*, with thirty (plus a stowaway) on board, commanded by Major G. H. Scott, left East Fortune, near Edinburgh, Scotland, at 2 A. M. on July 2, crossed the Atlantic making deviations over Newfoundland and Nova Scotia, and landed at Mineola, N. Y. at 9 A. M. on Sunday, July 6. The voyage took 108 hours, twelve minutes; the distance covered was 3,521 miles. On July 10 the airship started on the return voyage, and after circling New York city recrossed the Atlantic and arrived safely at Pulham, Norfolk, in seventy-five hours, having maintained constant wireless communication with land *en route*, thus rounding out one of the greatest achievements in the history of transatlantic travel. Among those who made the first voyage was a representative of the United States naval air service and two

BRITISH DIRIGIBLE, *R-34*

At Mineola, Long Island, N. Y., after its transatlantic flight

in seeing Eastal Island and Tarbot Island, five miles west of Clifden, was great. The people did not know who we were, and thought we were scouts looking for Alcock. We encountered no unforeseen conditions. We did not suffer from cold or exhaustion, except when looking over the side; then the sleet chewed bits out of our faces. We drank coffee and ale, and ate sandwiches and chocolate. Our flight has shown that the Atlantic flight is practicable, but I think it should be done, not with an aeroplane or seaplane, but with flying-boats. We had plenty of reserve fuel left, using only two-thirds of our supply. The only thing that upset me was to see the machine at the end get damaged. From above the bog looked like a lovely field, but the machine sank into it to the axle, and fell over on her side."—E. J. David, *Aircraft*, pp. 201-202. —The machine used in this flight was a Vickers-Vimy biplane and the total time occupied for the voyage was sixteen hours and twelve minutes. The aviators received the \$50,000 prize offered by the *Daily Mail* and both were knighted by the king. Sir John Alcock lived to enjoy his triumph for only six months, for he was killed on Dec.

officers representing the British air ministry.—"The *R-34* and her sister dirigible, the *R-33*, were constructed by the British Government both for naval scouting and for bombing German cities. The *R-34* is 672 feet long, and 79 feet in diameter at her greatest girth. From the top of the cigar-shaped bag to the lower point of her five gondolas she measures about 90 feet. But it is well to bear in mind at this point that the *R-34* is by no means the largest dirigible in the world; the Germans, at this moment, have larger Zeppelins in the air, and the British still larger rigid dirigibles pretty well under way. Under the cigar-shaped bag of the *R-34* are suspended the four gondolas that carry the crew while on active duty, as well as the five engines. The forward gondola contains the navigating quarters, wireless station, and an engine. The other engines are disposed in the following manner: One engine in each of the gondolas amidship, and two in the gondola aft, a propeller being provided for each engine with the exception of the rear gondola, which has but one propeller for the two engines. The engines are of the Sunbeam Maori type, each developing 250-275 horse-power, and with a speed of

2,500 revolutions per minute, enabling the airship to make some 70 miles an hour under favorable conditions. However, under ordinary circumstances the engines are not operated at full speed, and the airship cruises along at about 50 miles an hour in fairly still air. . . . The lifting power of the *R-34* is obtained from 19 gas bags contained within the dur-alumin skeleton, which is covered with a taut fabric skin. Each gas bag is placed in a compartment and separated from its neighbors by netting, in order to prevent rubbing; and a valve fastened to each gas bag and controlled by hand wheels or wires from the navigating quarters up forward permits gas to be released from any bag at will, in order to regulate the buoyancy and trim."—*Scientific American*, July 19, 1919, pp. 58-66.—"The story of the actual flight across the Atlantic, as told by the informal log kept by General Maitland and other officers, was not particularly eventful. The most difficult moment after departure was in crossing the hills of Scotland; owing to the large quantity of petrol carried (almost 5,000 gallons, weighing 15.8 tons) the dirigible had to fly low, and at the same time pass over Northern Scotland, where the hills in places rise to a height of 3,000 feet. The wind here was broken up into violent currents and air pockets. The most disturbed conditions were met in the mouth of the Clyde, south of Loch Lomond, which, surrounded by high mountains, looked particularly beautiful in the gray dawn light. The islands at the mouth of the Firth of Clyde were quickly passed. The north coast of Ireland appeared for a time, and soon faded from view as the *R-34* headed out into the Atlantic. Most of the day-by-day log following the description of this first stage of the journey was taken up by cloud observations, color effects, accounts of wireless exchanges, and of sleeping and eating arrangements. Icebergs were sighted toward Newfoundland. A message of congratulation from the Governor of Newfoundland was received. Anxieties consequent on the serious depletion of the fuel supply marked the last stages of the journey. Immediately after the news [of arrival in America] had been officially received, Secretary Daniels sent this message of congratulation: 'Major G. H. Scott, Commanding the *R-34*: The American Navy extends its greetings to you and the heroic crew of the *R-34*, and congratulates you on the success of your great flight across the ocean. The arrival in America of the first lighter-than-air craft to cross the Atlantic marks another decided advance in the navigation of the air. Coming so soon after the flights of Read, Alcock, and Hawker, it completes a remarkable series of achievements in aviation in which British and Americans may take a just pride, and which have served to increase the cordial relations and comradeship of the two navies which have prevailed throughout the war. America joins with the British in honoring you and the service you represent. Josephus Daniels.'"—*New York Times Current History*, Aug. 1919, p. 257.—"For more than 300 years after the crossing of the Atlantic by Columbus, wind power remained the sole means for propelling ships across the ocean until in 1810 the *Savannah*, an American steamship of 350 tons, with a length of 100 feet, crossed from Savannah, Georgia, to Liverpool in twenty-five days. The *Savannah*, however, was also provided with sails. The first real steam transit was effected by the *Sirius* and the *Great Western*, both in April, 1838, in eighteen and fifteen days respectively. Just 100 years after the sailing of the *Savannah* three successful flights were made across the Atlantic, one by the American hydroplane

NC-4, another by the British biplane of Alcock and Brown, the third by the giant British dirigible *R-34*.—*New York Times Current History*, Aug., 1919, p. 254.—In its seventy-fifth anniversary number, October 2, 1920, the *Scientific American*, p. 338, states: "The Burton family, encircling the fireside, read with unconcealed wonder the account of a hollow globe of oiled-silk filled with hydrogen gas, thus giving it a sufficient buoyancy to travel through the air. And they marveled still more at the spindle-shaped saloon, suspended beneath the balloon, carrying 5,000 pounds of passengers and luggage. Twenty-five passengers in a balloon traveling at 100 miles per hour! What of it? Nothing alarming or startling, in view of our present-day achievements. But the foregoing facts were being read in the *Scientific American* of September 18th, 1845. . . . For (in 1919) the *R-34* in 108 hours traveled 6,300 air miles from East Fortune, Scotland to Mineola, Long Island, due to adverse winds. And on the passenger list were thirty officers and men, and a stowaway!"

August.—A Caproni airplane was wrecked on Aug. 2, when all its fourteen occupants—principally newspaper editors—were killed. The giant Caproni airplane is an Italian production. It was reported in 1919 that Signor Caproni would be a competitor for the "blue ribbon" of transatlantic flight, and not a few American newspapers hailed with enthusiasm the prospect of an Italian making the first voyage by air to the new world which his compatriot Columbus had laboriously reached by water 427 years before.

October.—*American trans-continental race*.—The War Department organized a reliability race across the continent, which opened on Oct. 8. Sixty-two army aviators started from New York or San Francisco on a round flight. The contest was won by Lieut. B. W. Maynard, who covered 5,400 miles in net flying time of sixty-seven hours, three minutes, forty seconds.

1919-1920.—Capt. Ross Smith and Lieut. K. M. Smith, with three mechanics, flew a Vickers-Rolls-Royce two-engine airplane from London to Australia, starting on Nov. 12 and arriving at Melbourne on Feb. 25, 1920. This feat won the \$50,000 prize offered by the Australian government for the first airplane flight from Great Britain to Australia. British airplane flight from London to Karachi, 5,200 miles.

1920 (January).—Lieutenants H. Parer and J. McIntosh started from London on Jan. 8, 1920, and reached Port Darwin (Northern territory, Australia), after remarkable adventures on August 2.

February.—Lieut. Col. P. Van Ryneveld and Flight-Lieut. C. J. Q. Brand, with two mechanics, started from Brooklands (near London) on February 4 to fly to the Cape. Their machine was wrecked at Korosko, Egypt; they returned to Cairo, secured another machine, in which they reached Buluwayo, Rhodesia, where they were again smashed up. A third machine was secured, with which they reached the Cape on March 20.

Captains Cockerell and Broome, pilots, accompanied by Dr. P. Chalmers Mitchell, the zoölogist, and two mechanics, flew from England February 6 in an attempt to reach the Cape. The machine crashed at Tabora, in the Kenya Protectorate (former German East Africa).

Two Italian airplanes, piloted by Lieutenants Masiero and Ferrari, ascended from Rome on February 12 and arrived at Tokyo on May 30.

December 12.—Sadi Lecoq breaks world's speed record in France (Dec. 12, 1920), flying two-and-a-half miles in 46 seconds, or 198 miles an hour
1921 (March).—A United States naval balloon

piloted by G. K. Wilkinson of Houston, Texas, accompanied by four student pilots, ascended from the Pensacola naval station on March 22. Two days later carrier pigeons released from the balloon brought messages saying that the balloon was sinking and drifting out into the Gulf of Mexico. Nothing further was learnt about the missing men, and on April 8 the balloon was picked up drifting in the gulf by a fishing boat, which brought the wreck to Panama city, Florida. No trace of the crew was found.

AZO DYES. See **CHEMISTRY**: Practical application: Dyes: Theoretical investigation.

AZOF. See **AZOV**.

AZORES, an archipelago in the Atlantic ocean, an integral part of the republic of Portugal. The name (Portuguese Açores, hawks) comes from the numerous hawks or buzzards once common there. These islands are situated between the 37th and 40th degrees of north latitude. They comprise three groups rather widely separated. At the northwest are Corvo and Flores about 1000 miles southeast of Newfoundland. At the southeast are St. Michaels and St. Mary and the very small island of Formigas. Cape da Roca, Portugal, the nearest point on the continent, is over 800 miles distant, while the nearest part of the African mainland is over 600 miles away. The central group of islands consists of Fayal, Pico, St. George, Terceira and Graciosa. "There is no evidence that the Azores were known to the Greeks and Romans, but many Carthaginian coins have been found in Corvo. Arabian geographers of the 12th and 14th centuries describe islands in the Western Ocean beyond the Canaries. These seem to have been the Azores, for they are the same in number, have a similar climate and possess many hawks. In a map of 1351 these islands [are shown], the western group bearing the name Brazil Island the southern group Goat Islands and the middle group Wind or Dove Islands. In that day the word Brazil meant any red dye stuff. [The Portuguese captain] Gonzalo Velho Cabral reached Santa Maria in 1432 and St. Michaels in 1434 [and laid claim to the islands]. By 1457 the other islands had been found. [Between 1432-1461 Portuguese] colonization was rather rapid. So many Flemish settlers came in the latter part of the 15th century that the islands became known as the Flemish Islands. The inhabitants of Santa Maria were the first Europeans to receive the news of the discovery of America by Columbus, for he stopped there on his return in 1493. After the discovery of Brazil trading vessels from America and from India frequently stopped in the Azores and many sea-fights for valuable cargoes took place there. During the Elizabethan period many such encounters occurred. One of these was the notable fight off Flores in 1501 between the English ship 'Revenge' commanded by Sir Richard Grenville and a Spanish fleet of over fifty vessels. In the 18th century the British government secured from the Barbary pirates an immunity which enabled her American colonies

to carry on a large trade in fish, lumber and provisions to the Azores, Madeira and the Mediterranean."—*Annual report of the American historical association*, 1908, v. 1, p. 120.—These islands are in the earthquake belt and have had many severe shocks. The emigration from the Azores has been heavy. There are about 100,000 Azoreans in the United States. Many emigrants return to the Azores. Ponta Delgada on St. Michael's, the largest city, had 17,600 inhabitants in 1919. It was from this harbor that the *NC-4* began the final leg of its epochal transatlantic flight [see AVIATION: Important flights since 1900: 1919 (May).] At one time Easter lilies were raised for the export trade. An agronomer's station is maintained by the government to examine all plants brought into St. Michael's. This is because the lilies, orange trees and vineyards were once destroyed. Many pineapples are shipped to England and much wine is exported. Lobsters are exported, and dairy products are important. On Fayal there is considerable pottery and lace-making. The inhabitants of St. Michael's are ambitious to make their island a famous summer and winter resort. The Azores were a naval base in the World War.—See also AMERICA: Map showing voyages of discovery.

AZOTUS. See SYRIA: B. C. 64-63.

AZOV, a fortified town on the left bank of the river Don, six miles from the sea of Azov. It is an important Russian sea port serving as the principal outlet for southeastern Russia. The population in 1913 was about 27,000. The Greek colony of Tanais located near the present site of Azov was a flourishing mart of trade.

B. C. 115.—Azov was conquered by Mithradates.

A. D. 10th century.—It fell under the rule of successive Asiatic tribes until captured by Vladimir I of Russia in the tenth century.

13th century.—Captured by the Genoese.—During this period it was strongly fortified by the Genoese, and became a place of great importance as the commercial center of Indo-Chinese trade.

1395.—Timur captured and sacked it.

1471.—Turks took the town and by closing the trade routes to the East ruined its prosperity.

1696.—Taken by the Russians. See TURKEY: 1684-1696.

1699.—Controlled by Russia through Peace of Carlowitz. See HUNGARY: 1683-1690.

1711.—Restoration of the Turks. See SWEDEN: 1707-1718.

1736-1739.—Captured by the Russians.—Secured to them by the Treaty of Belgrade. See RUSSIA: 1734-1740.

AZTEC AND MAYA PICTURE-WRITING.

—“No nation ever reduced it [pictography] more to a system. It was in constant use in the daily transactions of life. They [the Aztecs] manufactured for writing purposes a thick coarse paper from the leaves of the agave plant by a process of maceration and pressure. An Aztec book closely resembles one of our quarto volumes. It is made of a single sheet, 12 to 15 inches wide, and often 60 or 70 feet long, and is not rolled, but folded either in squares or zigzags in such a man-

ner that on opening there are two pages exposed to view. Thin wooden boards are fastened to each of the outer leaves, so that the whole presents as neat an appearance, remarks Peter Martyr, as if it had come from the shop of a skillful book-binder. They also covered buildings, tapestries and scrolls of parchment with these devices. . . . What is still more astonishing, there is reason to believe, in some instances, their figures were not painted, but actually printed with movable blocks of wood on which the symbols were carved in relief, though this was probably confined to those intended for ornament only. In these records we discern something higher than a mere symbolic notation. They contain the germ of a phonetic alphabet, and represent sounds of spoken language. The symbol is often not connected with the idea, but with the word. The mode in which this is done corresponds precisely to that of the rebus. It is a simple method, readily suggesting itself. In the middle ages it was much in vogue in Europe for the same purpose for which it was chiefly employed in Mexico at the same time—the writing of proper names. For example, the English family Bolton was known in heraldry by a ‘tun’ transfigured by a ‘bolt.’ Precisely so the Mexican Emperor Ixcoatl is mentioned in the Aztec manuscripts under the figure of a serpent, ‘coatli,’ pierced by obsidian knives, ‘ixtli.’ . . . As a syllable could be expressed by any object whose name commenced with it, as few words can be given the form of a rebus without some change, as the figures sometimes represent their full phonetic value, sometimes only that of their initial sound, and as universally the attention of the artist was directed less to the sound than to the idea, the didactic painting of the Mexicans, whatever it might have been to them, is a sealed book to us, and must remain so in great part. . . . Immense masses of such documents were stored in the imperial archives of ancient Mexico. Torquemada asserts that five cities alone yielded to the Spanish governor on one requisition no less than 16,000 volumes or scrolls! Every leaf was destroyed. Indeed, so thorough and wholesale was the destruction of these memorials, now so precious in our eyes, that hardly enough remain to whet the wits of antiquaries. In the libraries of Paris, Dresden, Pesth, and the Vatican are, however, a sufficient number to make us despair of deciphering them, had we for comparison all which the Spaniards destroyed. Beyond all others the Mayas, resident on the peninsula of Yucatan, would seem to have approached nearest a true phonetic system. They had a regular and well understood alphabet of 27 elementary sounds, the letters of which are totally different from those of any other nation, and evidently originated with themselves. But besides these they used a large number of purely conventional symbols, and moreover were accustomed constantly to employ the ancient pictographic method in addition as a sort of commentary on the sound represented. . . . With the aid of this alphabet, which has fortunately been preserved, we are enabled to spell out a few words on the Yucatan manuscripts and façades, but thus far with no positive results. The loss of the ancient pronunciation is especially in the way of such studies. In South America, also, there is said to have been a nation who cultivated the art of picture-writing, the Panos, on the river Ucayale.”—D. G. Brinton, *Myths of the new world*, ch. 1.—See also ALPHABET: Early stages; INDIANS, AMERICAN: Cultural area in Mexico and Central America: Maya area.

AZTEC INDIANS, a group of semi-civilized tribes of central and southern Mexico. The prin-

capital fixed their capital at Tenochtitlan (Mexico City) and gradually conquered all of the south, founding the Mexican Empire. This flourished for about two centuries, until it was overthrown by Cortez in the 16th century.—See also AMERICA, PREHISTORIC; INDIANS, AMERICAN: Cultural areas in Mexico and Central America: Aztec area; and MAYAS.

Development of civilization.—Its similarity to Egyptian. See AMERICA: Theory of a land bridge.

B

BAAL, the supreme deity of the Canaanites. Was known by various names to other peoples; worshiped by some of the Jews in the time of Ahab. [See also JERUSALEM: B. C. 1100-700.] The name was originally a title, signifying lord.—See also BAALBEK.

BAALBAC.—See BAALBEK.

BAALBEK, or Baalbac, "city of Baal," the sun-god; an ancient city in Syria, northwest of Damascus, famous for its ruins which date back to Roman times. During the period of the Seleucids the name was changed to the Greek Heliopolis. In its early history it was one of the most splendid of Syrian cities, while the little

village now on its site had a population in 1914 of only 2000. "The disappointment experienced by some visitors on first approaching Ba'albek is partly owing to the vast proportions of the surrounding region. The valley of Cœlesyria, now called el Bukâ'a, extends to a great distance northward and southward, and is shut in by the long and lofty range of Lebanon on the north-west, and that of Anti-Lebanon on the south-east. During the many hours of approach along its undulating surface towards Ba'albek the eye grows familiar with such magnitudes as the extreme length of the plain, the great height of the mountains, and the profound depths of the valleys, and in com-

TEMPLE OF THE SUN AND JUPITER, BAALBEK

parison with them any structure of man's designing, no matter how imposing, is as nothing. . . . The modern traveller, however, does not linger amongst the remains of the old city, nor loiter about the narrow streets and crooked lanes of the present town. The main attractions of Ba'albek are the wonderful ruins of these temples, which surpass even those of Greece and Rome in the vastness and boldness of their design, their symmetrical proportions, and the delicate execution of their elaborate decorations. It has been well said of them that 'these temples have been the wonder of past centuries, and they will continue to be the wonder of future generations.' . . . As Heliopolis, Ba'albek is mentioned by several writers during the first centuries of the Christian era; but the principal notices of it are derived from the coins of the second and third centuries, which represent it as a Roman colony, styled Julia Augusta Felix. The coins of Septimius Severus show two temples, one a larger and another a smaller, and a coin of Valerian has two temples upon it. The oracle at Ba'albek, or Heliopolis, was consulted by the Emperor Trajan, in the second century, before he undertook his second expedition against the Parthians; but the earliest authentic record of these temples is found in the writings of John of Antioch, surnamed Malalas, about the seventh century. He mentions that 'Elius Antoninus Pius erected at Heliopolis, in Phœnicia of Lebanon, a great temple of Jupiter, one of the wonders of the world.' It is possible that the original design here at Ba'albek was to construct a platform surrounded by cyclopean stones, and to erect upon it an altar consecrated to the worship of Baal. That design appears never to have been fully accomplished, and the Phœnicians probably adopted this site for one of their temples. The Greeks and Romans, in their turn, may have adopted both the site and the ruins of the Phœnician temple for their own purposes; and Antoninus Pius perhaps began to build his temple out of the remains of one more ancient, and it was probably finished by Septimius Severus fifty years later. That may have been the smaller temple, and it was probably consecrated to Jupiter; the great temple of Baal or the sun was apparently never finished. . . . The Canaanite and the Hebrew, the Assyrian and Egyptian, the Greek and the Roman, Saracen and Christian, Tartar and Turk—all have been here; and for centuries to come travellers from every nation will visit these ruins with wonder and admiration."—W. M. Thomson, *Land and the book*, pp. 318-321, 340, 341.

"BAB." See BABISM.

BABAR (1483-1530), founder of the Mogul dynasty in India. He became king of Ferghana in 1404 and king of Kabul in 1504. In 1526 and 1527 he conquered the Empire of Delhi and was Mogul Emperor or Padishah of India 1526-1530.—See also INDIA: 1300-1605.

BAB-EL-MANDEB (Gate of Tears), the strait connecting the Red sea and Indian ocean. On the water route to India, this strategic channel is dominated by the British fortified islands of Perim and more substantially by the British outpost of Aden.

BABENBERG DYNASTY. See AUSTRIA: 805-1246.

BABEUF, François Noël, pseudonym Caius Gracchus (1760-1797), a French revolutionary conspirator and journalist, propounder of the first practical socialist policy (named from him, Babouvisme), and father of the socialist movements of 1848 and 1871. He edited several papers, notably *Le Tribun du peuple*, and, advancing his communist doctrines, organized a conspiracy against the Directory. In April, 1797, he was arrested and guillotined.—See also SOCIALISM: 1753-1797.

BABINGTON'S PLOT. See ENGLAND: 1585-1587.

BABIS: Relations with Persia (1806). See PERSIA: 1806.

BABISM, from "Bab," the "gate" or "door," a title given to a young religious reformer, named Mirza Ali Mohammed, who appeared in Persia about 1844, claiming to bring a divine message later and higher than those for which Jesus and Mohammed were sent.—M. F. Wilson, *Story of the Bab* (*Contemporary Review*, Dec., 1885).—"Mirza Ali Mohammed, known as The Bab, was born in October, 1819, in the city of Shiraz, in southern Persia. . . . On May 23d, 1844, moved by the Spirit of God, Mirza Ali Mohammed gave His teachings to the world. . . . At that time from various parts of Persia were gathered together in Shiraz eighteen prepared souls, men of wisdom to whom it had been given to understand spiritual realities, and to these chosen disciples Mirza Ali Mohammed revealed His mission. He was the door ('Bab') or forerunner of a great prophet and teacher soon to appear. He, The Bab, had been divinely sent as a herald to warn the people of the coming of The Promised One and to exhort them to purify themselves and prepare for His advent. One—whom He entitled 'He whom God shall manifest,' the Latter-Day Messiah, promised in all the revealed writings of the past—was soon to come and establish The Kingdom of God upon earth. . . . Among the most prominent of The Bab's followers was Kurrat ul'Ayn, poet, orator and heroine of the cause, who, after an eventful career in which she stood forth as a powerful exponent of the new faith, suffered a martyr's death. As a woman many decades ahead of her time, her life and example are an inspiration to all, and especially to her sisters of the Orient who, through the cause for which she died, are now being lifted from their former condition of ignorance and oppression into one of knowledge and freedom. . . . At length, His following having attained to great proportions, the clergy became thoroughly alarmed and instigated a heresy trial or public examination of His doctrines. This investigation was held in Tabriz by the authority of the governor of the province, and before the tribunal The Bab was brought a prisoner. All manner of insults and indignities were heaped upon Him, and finally He was flogged, one of the chief mullahs applying the rods with his own hands. After this The Bab was returned to his former prison in the fortress of Chih-rik. About this time began the early persecutions and massacres of the Babis in Persia. Aroused by their priests, the fanatical Moslems fell upon the believers in many parts of the land, pillaging and burning their homes, and torturing and murdering men, women and children. . . . Islam is the state religion of Persia, therefore that which shakes its power produces a like effect in the workings of the government. At length, seeing the cause to be steadily on the increase, the prime minister of the state ordered that The Bab be killed, hoping thus to put an end to the matter and to place himself in security with the clergy and the people. Accordingly, The Bab was again removed

from the prison of Chih-rik and taken to Tabriz, the seat of the local government of the province. Here, on the 9th of July, 1850, He suffered martyrdom. . . . By night the body of The Bab was removed by some of the faithful, and after being swathed in silk it was disguised as a bale of merchandise and deposited in a place of safety. As conditions and wisdom demanded, from time to time this hiding place was changed, and finally, on the 21st of March, 1850, in the presence of a notable gathering of pilgrims from various parts of both the Orient and the Occident, the body of The Bab was laid to rest by Abdul-Bahak, in a sarcophagus, in the crypt of the shrine of The Bab in the Holy Land. . . . During the four years of The Bab's imprisonment His numerous letters and epistles were, with the greatest difficulty, smuggled out of the prison and sent to the followers in various parts of the country. These writings contain His injunctions to the believers for their guidance and protection until the coming of 'Him whom God shall manifest.' The Bab's ordinances were given for the people of His time only, and were commensurable with the needs and conditions of the believers during the interim between His manifestation and the manifestation of the greater One to come. The Bab was the 'First Point' of this revelation, the precursor of the greater One. In His teachings He reiterated again and again that, when 'He whom God shall manifest' appeared, all should turn unto Him, and that He would reveal teachings and ordinances which would replace the Babi sacred literature."—C. M. Remy, *Bahai movement*, ch. 2.—See also BAHAIISM.

BABLI (Babylonian) TALMUD. See TALMUD. **BABOEUF**, a village of France, northeast of Paris near Noyon. It was taken by the British in 1918. See WORLD WAR: 1918: II. Western front: c, 20.

BABOUVISM, the socialistic doctrines propounded by Babeuf during the French Revolution, —namely, state communism or state ownership of property; social equality in rank as well as property; criticism of the solution of the agrarian question.—See also BABEUF, FRANÇOIS NOËL.

BABU, a Hindu title of respect, but commonly applied to a native clerk able to write English, with a disparaging implication of superficial education.

BA-BUMANTSU. See BUSHMEN.

BABUNA PASS, a locality near Prilep, Macedonia, where the French army during the World War attempted (1916) to give aid to the retreating Serbian army which was forced to abandon its line along the Vardar river. See WORLU WAR: 1915: V. Balkans: b, 5.

BABYLON: The city.—"The city stands on a broad plain, and is an exact square, a hundred and twenty furlongs [fifteen miles] in length each way, so that the entire circuit is four hundred and eighty furlongs. While such is its size, in magnificence there is no other city that approaches it. [See also BABYLONIA: Position and importance of Babylon.] It is surrounded, in the first place, by a broad and deep moat, full of water, behind which rises a wall fifty royal cubits [a cubit was about 18 inches] in width and two hundred in height. . . . On the top, along the edges of the wall, they constructed buildings of a single chamber facing one another, leaving between them room for a four-horse chariot to turn. In the circuit of the wall are a hundred gates, all of brass, with brazen lintels and side posts. The bitumen used in the work was brought to Babylon from the Is, a small stream which flows into the Euphrates

at the point where the city of the same name stands, eight days' journey from Babylon. Lumps of bitumen are found in great abundance in this river. The city is divided into two portions by the river which runs through the midst of it. This river is the Euphrates. . . . The city wall is brought down on both sides to the edge of the stream; thence, from the corners of the wall, there is carried along each bank of the river a fence of burnt bricks. The houses are mostly three and four stories high; the streets all run in straight lines; not only those parallel to the river, but also the cross streets which lead down to the water side. At the river end of these cross streets are low gates in the fence that skirts the stream, which are, like the great gates in the outer wall, of brass, and open on the water. The outer wall is the main defence of the city. There is, however, a second inner wall, of less thickness than the first, but very little inferior to it in strength. The centre of each division of the town was occupied by a fortress. In the one stood the palace of the kings, surrounded by a wall of great strength and size: in the other was the sacred precinct of Jupiter Belus, a square enclosure, two furlongs each way, with gates of solid brass; which was also remaining in my time. In the middle of the precinct there was a tower of solid masonry, a furlong in length and breadth, upon which was raised a second tower, and on that a third, and so on up to eight. The ascent to the top is on the outside, by a path which winds round all the towers. . . . On the topmost tower there is a spacious temple."—Herodotus, *History* (translated by G. Rawlinson), bk. 1, ch. 178-181.

Origin and influence.—Added historical knowledge through excavations.—"The origin of the city of Babylon is veiled in impenetrable obscurity. The first city built upon the site must have been founded fully four thousand years before Christ, and it may have been much earlier. The city is named in the Omen tablet of Sargon, and, though this is no proof that the city was actually in existence more than three thousand years before Christ, it does prove that a later tradition assigned to it this great antiquity. At this early date, however, it seems not to have been a city of importance. During the long period of the rise of the kingdom of Sumer (q. v.) and Accad few kings in the south find Babylon worthy of mention, though Babylon must have been developing into a city of influence during the later centuries of the dominion of Isin and Larsa. From about 2200 B. C. the influence of this city extends almost without a break to the period of the Seleucides. [See also SELEUCIDAE.] No capital in the world has ever been the center of so much power, wealth, and culture for a period so vast. It is indeed a brilliant cycle of centuries upon which we enter. The rise of Babylon to supremacy over the more ancient cities both of northern and of southern Babylonia, is associated with the development of a new strain of blood and life among the Semites. The Semites, who had poured in successive streams of migration from Arabia, had found homes in many and diverse places, and in each of these the originally homogeneous race had developed civilizations differing in some points from each other."—R. W. Rogers, *History of Babylonia and Assyria*, p. 75.—See also SEMITES: Primitive Babylonia.—During the past three years, namely from 1898 to 1901 "a party of German explorers has been busy excavating from two to five miles north of the village of Hillah,—about forty miles to the south of Bagdad. These mounds cover the remains of the famous city of Babylon,

so familiar to us all from its associations with Nebuchadnezzar, the destroyer of Jerusalem. While the work of the explorers is far from complete, they have already been fortunate enough to discover the exact site of the great palace begun by Nabopolassar, the father of Nebuchadnezzar, and completed by the latter. This edifice was famous throughout the ancient world. It is this palace to which the author of the Book of Daniel refers in his story of the mystical handwriting on the wall that foretold the downfall of the great city. In it Cyrus, on his conquest of Babylon, in the year 538 B. C. [see PERSIA: B. C. 549-521], took up his official residence, and the same

balustrade running round the tower to the top. It is probably this tower that the biblical writer in Genesis had in mind in narrating the curious tale of the dispersion of mankind. [See also TEMPLES: Stage of culture represented by temple architecture.] The city that is thus being brought to light through the pick and spade is essentially the creation of Nebuchadnezzar, so that the words which the author of Daniel puts into the mouth of the King, 'Is not this great Babylon, which I have built for the royal dwelling place, by the might of my power and for the glory of my majesty?', receive a significance through the excavations of the twentieth century far greater and

EXCAVATIONS AT BABYLON

building two centuries later witnessed the pathetic death scene of Alexander the Great. Besides the palace the explorers have also discovered the exact site of one of the most important edifices in the entire history of Babylonia, the great temple of Marduk, or Bel, the head of the Babylonian pantheon. Although the beginning of this structure goes back to a very ancient period, it was Nebuchadnezzar who restored and enlarged it beyond its former proportions, and within the sacred precinct in which the temple stood he erected numerous shrines to various gods and goddesses, who constituted, as it were, the court of the chief god. A feature of the precinct was a huge tower of eight stories in height, formed by a series of stages, one above the other, with a

more realistic than was ever dreamed of."—M. Jastrow, *Palace and temple of Nebuchadnezzar* (*Harper's Monthly Magazine*, v. 104, pp. 809-810).

Nebuchadnezzar and the wall of Babylon.—"In all Nebuchadnezzar's [or Nebuchadnezzar's] inscriptions that have been found—and we have a great many—he especially glories in his constructions. He seems to have repaired almost every great temple in the land and built not a few new ones. . . . But what he did at Babylon not only surpasses all his other works, but eclipses those of all former kings, even those of Sargon at Dur-Sharrukin, not so much in splendor as in the vastness and originality of his conceptions,—an originality due probably to that besetting idea of coupling adornment with military requirements,

which consistently underlies most of the public works he undertook. In this, however, he appears to have followed a line traced out first by his father. Of some of his greatest constructions,—such as the new palace, the great city walls, and the embankments of the Euphrates,—he especially mentions that they were begun by Nabopolassar, but left unfinished at his death. Babylon, sacked once by Sennacherib, then rebuilt by Esarhaddon, had gone through a conflagration when besieged and taken by Assurbanipal, and must have been in a sad condition when the Chaldean usurper made it once more the seat of empire. Hence, perhaps, the thought of reconstructing it in such a manner as would make it a capital not only in size and magnificence, but in strength: it was to be at once the queen of cities and the most impregnable of fortresses. The last time that Babylon had been taken it had been reduced by famine. This was the first contingency to be guarded against. For this purpose the city was to be protected by a double enclosure of mighty walls, the inner one skirting its outlines narrowly, while the outer was moved to such a distance as to enfold a large portion of the land, which was to be cultivated so that the capital could raise enough grain and fodder for its own consumption. This vast space also would serve to shelter the population of the surrounding villages in case of an invasion. It has not been possible to trace the line of this outer wall, which received the name of Nimitti-Bel, nor consequently to determine how many square miles it protected, and the reports of ancient writers are somewhat conflicting, as none of them, of course, took exact scientific measurements after the manner of our modern surveyors. Herodotus gives the circumference as somewhat over fifty English miles. A large figure certainly. But it has been observed that it scarcely surpasses that yielded by the circumvallation of Paris; and besides the arable and pasture land, it must have embraced suburbs, not impossibly Borsip itself, which was also well fortified at the same time. This is the highest estimate. The lowest (and later) gives forty miles. The Nimitti-Bel rampart was protected on the outside by a wide and deep moat, which at the same time had supplied the material for the wall. . . . The reports about the height and thickness of this celebrated wall vary still more considerably. Herodotus says it was 350 feet high (apparently including the height of the towers, which were built at regular intervals on the top of it), with a thickness of 75 feet. Now no effort of imagination, even with the knowledge that the walls of Babylon were numbered among the 'Seven Wonders of the World,' (q.v.) can well make us realize a city wall, high on fifty miles long, surpassing in height the extreme height of St. Paul's of London. The estimates of various later writers range all the way between that exorbitant figure and that of 75 feet,—very possibly too moderate. For the fact remains undisputed that the Nimitti-Bel rampart was stupendous both in height and in thickness; that towers were built on the top of it, on the edges, two facing each other, and that there remained room between for a four-horse chariot to turn. And the contemporary Hebrew prophet, Jeremiah, speaks of Babylon as 'mounting up to heaven,' of 'the broad walls of Babylon' and her 'high gates.' Of these there were a hundred in the circuit of the wall, according to Herodotus, 'and they were all of brass, with brazen lintels and side-posts.' This outer wall Herodotus calls 'the main defence of the city.' The second or inner wall, named Ingur-Bel, he described as being 'of less thickness than the first,

but very little inferior to it in strength.' Then there were the walls which enclosed the two royal palaces, the old one on the right bank of the Euphrates, and the new one on the left,—and made of each a respectable fortress; for it was part of the plan of reconstruction that the city should be extended across the river, to gain a firmer seat and full control of this all-important thoroughfare; and an entire new quarter was built on the left bank around the new and magnificent palace. And as it was desirable, both for convenience and defence, that the two sides should be united by permanent means of communication, Nebuchadnezzar built [a] great bridge [across the river], but so that it could be kept open or shut off at will, as a further safeguard against surprises. This was effected by means of platforms made of beams and planks, which were laid from pier to pier in the daytime, and removed for the night. Of course one solitary bridge could not suffice for the traffic of a population which cannot have been under half a million, and the river was gay with hundreds of boats and barges darting with their load of passengers from bank to bank, or gliding down the current, or working against it. There were many landing-places, but no quays or broad paved walls bordered with handsome buildings, such as in our ideas appear as the necessary accompaniment of a beautiful river in a great city. The Euphrates flowed along imprisoned between a double wall, of burnt brick like the others, which followed its course on either bank and close to the edge from end to end of the city. Only where the streets abutted on the river—and these were disposed at regular intervals, in straight lines and at right angles—there were low gates to allow pedestrians to descend to the landing-places. The general effect must have been peculiar and rather gloomy."—Z. A. Ragozin, *Media, Babylon and Persia*, pp. 227-232.—"The Babylon of Nebuchadnezzar occupied a square of which each side was nearly fifteen miles in length, and was bisected by the Euphrates diagonally from northwest to southeast. . . . The great squares of the city were not all occupied by buildings. Many of them were used as gardens and even farms, and the great fertility of the soil, caused by irrigation, producing two and even three crops a year, supplied food sufficient for the inhabitants in case of siege. Babylon was a vast fortified province rather than a city. . . . There is a curious fact which I do not remember to have seen noticed, and of which I will not here venture to suggest the explanation. Babylon stands in the Book of Revelation as the emblem of all the abominations which are to be destroyed by the power of Christ. But Babylon is the one city known to history which could have served as a model for John's description of the New Jerusalem: 'the city lying four square,' 'the walls great and high,' 'the river which flowed through the city,' 'and in the midst of the street of it, and on either side of the river the tree of life, bearing twelve manner of fruits,' 'the foundations of the wall of the city garnished with all manner of precious stones,' as the base of the walls inclosing the great palace were faced with glazed and enameled bricks of brilliant colors, and a broad space left that they might be seen,—these characteristics, and they are all unique, have been combined in no other city."—W. B. Wright, *Ancient cities from the dawn to the daylight*, pp. 41-44.

Decline.—Use of ancient wall and buildings as a quarry.—"The policy he [Cyrus] inaugurated in the provinces of his empire was a complete reversal of Assyrian methods. For the nationality of each conquered race was respected, and it was en-

couraged to retain its own religion and its laws and customs. Hence Babylon's commercial life and prosperity suffered no interruption in consequence of the change in her political status. Taxation was not materially increased, and little was altered beyond the name and title of the reigning king in the dates upon commercial and legal documents. The sieges of Babylon by Darius mark the beginning of the city's decay. [See also BABYLONIA: Hammurabi: His character and achievements.] Her defences had not been seriously impaired by Cyrus, but they now suffered considerably. The city was again restless during Darius's closing years, and further damage was done to it in the reign of Xerxes, when the Babylonians made their last bids for independence. For Xerxes is said not only to have dismantled the walls, but to have plundered and destroyed the great temple of Marduk itself. [See PERSIA: B. C. 486-405.] Large areas in the city, which had been a wonder of the nations, now began to lie permanently in ruins. Babylon entered on a new phase in 331 B. C., when the long struggle between Greece and Persia was ended by the defeat of Darius III. at Gaugamela. For Susa and Babylon submitted to Alexander, who on proclaiming himself King of Asia, took Babylon as his capital. We may picture him gazing on the city's great buildings, many of which now lay ruined and deserted. Like Cyrus before him, he sacrificed to Babylon's gods; and he is said to have wished to restore E-sagila, Marduk's great temple, but to have given up the idea, as it would have taken ten thousand men more than two months to remove the rubbish from the ruins. But he seems to have made some attempt in that direction, since a tablet has been found, dated in his sixth year, which records a payment of ten manehs of silver for 'clearing away the dust of E-sagila.' [For Alexander's conquest, see MACEDONIA: B. C. 330-323.] While the old buildings decayed, some new ones arose in their place, including a Greek theatre for the use of the large Greek colony. Many of the Babylonians themselves adopted Greek names and fashions, but the more conservative elements, particularly among the priesthood, continued to retain their own separate life and customs. In the year 270 B. C. we have a record that Antiochus Soter restored the temples of Nabû and Marduk at Babylon and Borsippa, and the recent diggings at Erech have shown that the old temple in that city retained its ancient cult under a new name. In the second century we know that in a corner of the great temple at Babylon, Marduk and the God of Heaven were worshipped as a two-fold deity under the name of Anna-Bêl; and we hear of priests attached to one of Babylon's old shrines as late as the year 29 B. C. Services in honour of the later forms of the Babylonian gods were probably continued into the Christian era. [See JEWS: 604-536 B. C. to 166-40 B. C.] The life of the ancient city naturally flickered longest around the ruined temples and seats of worship. On the secular side, as a commercial centre, she was then but a ghost of her former self. Her real decay had set in when Seleucus, after securing the satrapy of Babylon on Alexander's death, had recognized the greater advantages offered by the Tigris for maritime communication. On the foundation of Seleucia, Babylon as a city began rapidly to decay. Deserted at first by the official classes, followed later by the merchants, she decreased in importance as her rival grew. Thus it was by a gradual and purely economic process, and through no sudden blow, that Babylon slowly bled to death."—L. W. King, *History of Babylon, from the foundation of the*

monarchy to the Persian conquest, pp. 285-288.

—"From this time onward the burnt brick of the ancient royal buildings was re-used for all manner of secular buildings. The Greek theatre at Homera is built of such material. Thus the pillared buildings of Amran and houses at Merkes, that are built of brick rubble, belong either to the Greek (331-130 B. C.) or the Parthian (130 B. C.-226 A. D.) periods, but to which of them cannot be determined. At that time began the process of demolishing the city area, which perhaps was now only occupied by isolated dwellings, a process that certainly continued throughout the Sassanide period (226-636 A. D.). Amran alone was inhabited, and that only scantily, as is shown by the uppermost levels there, which reach down as late as the Arab middle age (circa 1200 A. D.). When we gaze to-day over the wide area of ruins we are involuntarily reminded of the words of the prophet Jeremiah (L. 39): 'Therefore, the wild beasts of the desert, with the wild beases of the islands, shall dwell there, and the owls shall dwell therein: and it shall be no more inhabited for ever; neither shall it be dwelt in from generation to generation.'"—R. Koldewey, *Excavations at Babylon*, pp. 313-314.—"The walls of Babylon were destined to serve still another purpose. The spread of Mohammedanism caused new cities to be built, and Babylon was the quarry for their building material. The walls of Babylon were transformed into the sacred cities of Kerbela and Nejef. In the eleventh century, on the site of the southern part of Babylon, the city of Hillah was built. Hillah might be called a child of Babylon, for it is almost entirely constructed with Nebuchadnezzar's bricks. The walls of the houses are built of them. The court-yards and streets are paved with them, and as you walk about the city the name of Nebuchadnezzar everywhere meets your eye. Many of the ten thousand people living in Hillah still gain their livelihood by digging the bricks from the ruins to sell to the modern builders. The great irrigating dams across the Euphrates are constructed entirely of them. The people of Hillah, too, are a survival of Babylonian times. Some are Arabs of the same tribes which used to roam the desert in Nebuchadnezzar's days. Some are the children of the Hebrew exiles of old. Some, calling themselves Christians, are the descendants of Babylonians, perhaps of Nebuchadnezzar himself. There among the ruins they still live in the same kind of houses, dressing the same, eating the same food as did their ancestors when Nebuchadnezzar built the walls of Babylon."—E. J. Banks, *Seven wonders of the ancient world*, p. 67.—See also BABYLONIA.

Hanging Gardens of Babylon.—The Hanging gardens of Babylon were considered by the Greeks to be one of the seven wonders of the ancient world. They consisted of trees and flowers apparently planted upon the roof of some building. The structure was one square terrace built upon another to about 150 feet in height and resting upon hollow pillars of burnt brick which were filled with earth. It was necessary to keep a force of men employed pumping up water from the Euphrates for irrigation. It is said that Nebuchadnezzar, aiming to please his Median Queen, had these gardens constructed so that they may recall to her mind the mountain scenery of her native land.—See also ARCHITECTURE: Oriental: Mesopotamia.

BABYLONIA

Land and its characteristics.—"Babylonia is the joint delta of the Tigris and Euphrates, and owes its prosperity and ruin alike to man's use or abuse of the gifts of these two rivers. The Euphrates, like the Nile, passes through three distinct phases in its course to the sea. Its two main sources lie deep in the Armenian highland, and carve out parallel courses of over 400 miles before their joint streams leave the mountains through a tremendous gorge. [See also ARMENIA: Physical features.] Then for 720 miles from Samsat to Hit the river crosses open treeless country, more level and barren as it recedes from the hills. From the west it receives only one important tributary, the Sajur, which comes in quite high up near Carchemish, and from the east only two, the Belikh and the Khabur, both in the middle third of this section. As far as the Sajur, both banks are habitable; and the east bank was formerly so as far as the Khabur, forming the district of Harran, and the ancient Kingdom of Mitanni. Beyond this the country is desert, both on the Arabian side and in the greater part of Mesopotamia, the region between the Two Rivers. The river itself flows with swift stream and intermittent rapids within a deep rock-walled bed, usually a few miles wide and capable of cultivation, but naturally a jungle of tamarisk and reeds, infested by wild pig. The few sedentary Arabs, who practise a primitive irrigation with water-wheels, pay blackmail to powerful nomad tribes of the desert. The palm replaces the olive about half way down. Above Hit the river has narrows and is full of islands; but at Hit itself solid ground ends in a reef of harder rocks with springs of sulphur, brine, and bitumen. The river here is about 250 yards in width, and still flows briskly through this last obstruction. The third section consists wholly of alluvial soil, and extends for 550 miles from Hit to the Persian Gulf. The river soon divides into two principal channels, and these into minor backwaters, the wreck of ancient canals. It first deposits copious silt, and then fine mud like that of the Nile. The shore line has therefore been advancing rapidly within historic time: Eridu, for example, which was a chief port of early Babylonia, lies now 125 miles from the sea. If the present rate of advance, about a mile in thirty years, may be taken as an average—which is, however, not demonstrable yet—Eridu may have begun to be mud-bound about 1800 B. C. The course of the Tigris is geographically similar. Two chief sources, rising near those of the Euphrates, drain the south-eastern ranges of Armenia. From their junction to Samarra, where the Tigris fairly enters the delta, is about 250 miles, first through rolling foothills, in an open valley which is the home-country of the Assyrians; then through steppe and desert. On the west bank there are now no tributaries, though there was formerly a flood-channel from the south-east of the Khabur basin. On the east bank, however, the copious drainage of the Median highlands, which lie nearly parallel with its course, is brought in by a number of streams, of which the most notable are the Greater and Lesser Zab. Consequently, the Tigris brings down eventually rather more water than the Euphrates: and also on its swifter current a good deal more silt. In the latitude of Bagdad, about 100 miles below Samarra, and consequently well within the alluvial area, Euphrates and Tigris approach within 35 miles of each other but soon diverge again to a distance of 100 miles. It was a little above this point that the Euphrates was first divided in an-

tiquity into two main branches, of which the eastern Saklawic canal is in part, at least, artificial, designed to water a large district west of Bagdad, and also as an overflow, for in Upper Babylonia the Euphrates lies higher than the Tigris. Lower down, the levels are reversed, and the great Shatt-el-Hai canal, past the site of Lagash, relieves the Tigris, and at times overloads the Euphrates at Ur and below. In addition, the whole of the joint delta has been from very early times a network of canals designed both to distribute irrigation water, and also to defend the cultivated lands against the desert. The most important are the Shatt-Hindie, which diverges at Babylon, and follows the western edge of the delta, rejoining near ancient Erech; and the transverse Shatt-el-Hai already mentioned. The management of these great canals needs some skill; the rivers rise rather irregularly, as the mountain snow melts, from March to May, and often carry away the soft earthen dams and embankments. They also carry down so much silt, that centuries of deposition and dredging have raised the main channels, and the country near them, above the general level. The two main streams, whose mouths were still a day's journey apart in Alexander's time, now unite [near] Basra, 300 miles below Bagdad. Their joint channel, the Shatt-el-Arab, is 1,000 yards wide, and navigable. A little further down again, it receives on the east side the main stream of the Karun River, from the highlands of ancient Elam. Under careful management, the whole alluvial region is of amazing fertility. The date palm is indigenous, and wheat was anciently believed to be so. In ancient times it raised two, or even three, crops of wheat a year, with a yield of 200 or 300 grains from one seed. The rice, which is now the principal grain crop, came in under the Arab régime. The present desolation is due, first to the Turkish nomads in the eleventh century; then to the reckless behaviour of Mesopotamian Arabs. All through the summer, the principal streams are navigable, or can easily be made so, and sailing boats ascend as far as Hit and Samarra; but by September the flood is over, and in November the rivers are at their lowest; and natural shoals and the remains of old dams are grievous obstacles.

"Such is Babylonia. But before we enquire what human enterprize was to make of it, we must note equally briefly the regions which enclose it. West of the Euphrates lies the great plain of Arabia (q. v.), rising gently towards the Jordan and the Red Sea. It is nearly featureless, grassland at best, and in great part utter desert now. Its nomad pastoral inhabitants, however, have exercised, as we shall see, an influence on the fortunes both of Babylonia and all other regions which fringe it, which is one of the great facts of history. Eastward, beyond the Tigris, towers the highland zone, range upon range of massive limestone mountains, till the passes to the plateau behind them rise to 5,000 and 6,000 feet, and the peaks to over 11,000 feet. The nearer parts of the plateau vary in altitude from 3,000 to 1,500 feet. The width of the mountain belt averages about 300 miles, and its parallel ranges from five to ten in number. Between them lie valleys of varying size and elevation, all more or less habitable, but secluded from each other and from the outer world on either side. A few have no outfall, but enclose considerable lakes, like Van and Urmia in the north, and Shiraz in the south; but the majority discharge the copious water which pours

from the snow-clad ridges, through great gorges into more westerly troughs, and so eventually into a few large rivers. Some of these, as we have seen, are tributary to the Tigris; others further south issue independently into the Persian Gulf, and form their own hot sodden deltas; while in a middle section three of the largest, Karun, Jarahi, and Tab, now join their mudflats with those of the Shatt-el-Arab, and have created an alluvial area nearly half as large as Babylonia 'between the rivers'; more encumbered indeed by silt, but with lowlands almost as fertile under cultivation. Above these foreshores the hills between Karun and Tigris, lying nearest to the ancient head of the gulf, rise gently at first, in a wide expanse of rolling country. Then, where the first mountains stand up, and catch the moisture from the winds, comes a long narrow belt of forest, dense oak below, passing to cedar and pine; and extending from the Diyala River as far south as Shiraz. Access to this, in a region so timberless otherwise, seems to have been one of the great objects of contention in ancient times. On the greater heights come more alpine conditions, with some moisture and hardy vegetation in deep valleys; but on the eastern slopes, prevalent drought, with aromatic scrubland locally, and some output of medicinal resins and gums. Then, interspersed with marginal oases, wherever a mountain stream runs out into the plain, begins a desolate and often salt-strewn plateau, the dead heart of Persia, ancient as well as modern. With this dead heart, however, and even with the fringe of oases—medieval and modern Persia—we are not now concerned; only with the sequence of alluvium, foothills, and forest belt, which make up the ancient region of Elam (q. v.), and with the intermont plains and upland valleys which sustained the old Medes and Persians, the first highlanders to play a part in universal history.

"Pausing now for a moment to compare the situation in Mesopotamia with that on the Nile, we note first that through the difference in direction of the two valleys the Nile has its sub-tropical region upstream, and its almost temperate delta in the north; the Euphrates has its delta in one of the hottest summer climates of the world. The Nile has its cataracts all far upstream, so that the fall of the valley is concentrated at a few points, and a sluggish navigable fairway is reserved from Assuan to the coast: far away beyond these rapids, moreover, the Nile has already deposited its obstructive silt, and bears down to Egypt only beneficial mud, which is invisibly fine, and causes little trouble in irrigation. The Euphrates, on the contrary, descends rapidly, for so large a river, all through its upper course; its last barrier is at Hit, which in the anatomy of this valley corresponds rather to Cairo than to Assuan; it consequently enters the fenland still laden with silt, and in all ages has industriously blocked one bed after another, and spread the disastrous floods of which memory was preserved by Babylonian legends of a deluge which flooded even the desert; as we read in the best known version 'all the high hills that were under the whole heaven were covered: fifteen cubits upwards did the waters prevail'; and there are very few 'mountains' in alluvial Babylonia which would not be devastated by a flood of this moderate depth. Like the ordinary summer flood of the Euphrates which begins in April and May, and is highest in August, that deluge lasted about twenty-one weeks; and in September, 'the seventh month', it abated. Frob anxieties the Nile is free. In Egyptian religion it is the sun which is all-beneficent, or all-destroying, and therefore (in due course) chief god, and the

'power behind the throne.' His enemies are powers of dark and cold, not of wet. In Babylonia, and still more in Assyria, which lies closer under the hills, men and the high gods were alike powerless when the storm-demons were out. The first victory of good was the binding of the dragon which broods in dark water; a fit emblem of the creeping silt-shoal which grows till it throttles the canal. For many reasons, therefore, it is in the delta, and not in the valley, that Babylonian civilization grows; as it might indeed have grown in Egypt too, had not the valley culture ripened sooner. Consequently, again, the Babylonian centres—some dozen in all—lie in a cluster, not strung on one green thread for hundreds of miles. And as the Tigris and the Euphrates interweave their currents, first one receiving, and then the other, internal communication is abnormally complete; a striking contrast with the perils of cross-delta travel in Egypt. No one went up to Babylon to go from Lagash to Ur, as train and boat alike go almost up to Cairo from Alexandria to Port Said; almost everywhere there was direct canal. The Euphrates, however, is barred to large navigation at Hit, and though the Tigris is navigable by steamers to Mosul, ancient traffic on it, and on the Euphrates, too, was exclusively downstream; the rivers being over-rapid and unfit for towing; the upstream wind which overcomes the Nile quite absent; and the boats (or more often rafts) far more valuable for timber in so woodless a country than for laborious haulage upstream. The best were, and are, made like coracles, of skins on a wooden frame, and returned, folded up, on donkey-back.

"The basis of Babylonian culture was the intense fertility of the alluvial soil, wherever water could be applied to it in due amount. With excess of water it became noisome fen: in defect, it parched to a desert: and there are now large tracts of utter desert within the limits of irrigation. But the two valleys were there, nevertheless, and could bring goods in, if they could not convey them out. They flowed, moreover, as we have just seen, from regions of produce which Babylonia lacked; wine in particular, and olive oil; timber, too, and bitumen from Hit, for building and for waterproofing; and stone, above all. It is difficult for us now to conceive the limitations under which an architect worked, when a stone door-socket was a rich gift of a king to his god, and was rescued from one ruin after another, to be re-used and proudly rededicated. Then again eastward, beyond Tigris, there was trade through the foothills to a nearer timber-country, and beyond it to sun-burned lands of spices and drugs. Across the desert, too, you could reach another spice-country in the south; and westward lay the Red Sea coast, for coral, copper, and other hard stones. In return, what Babylonia had to offer was, first its inexhaustible surplus of foodstuff, corn, and dates; much wool, of finer quality, because better nourished, than that of the desert breeds; still richer cargoes of woven woollens, 'Babylonian garments,' and in due time other kinds of manufactures too. It became, also, needless to say, a supreme centre of exchange; a kind of ancient London, whither the world's produce converged into wholesale hands, and was retailed over vast distances by regular correspondents and branch houses. The beasts of burden were the ass and man; camel and horse alike belong to a far later age, the former introduced from Arabia, where it is native, the latter from the east beyond the hills."—J. L. Myres, *Dawn of history*, pp. 84-96.—See also COMMERCE: Ancient: B. C. 1500-1000.

Historical sources.—"The sources for the his-

tory of the Babylonians and Assyrians may be grouped under four main heads: I. The monumental remains of the Assyrians and Babylonians themselves; II. The Egyptian hieroglyphic texts; III. The Old Testament; IV. The Greek and Latin writers. Of these four by far the most important in every particular are the monumental remains of the Babylonians and Assyrians. . . . From the mounds that cover the ancient cities of Babylonia and Assyria there has come a vast store of tablets, which now number certainly not less than five hundred thousand in the various museums of the world. These tablets contain the literature of the two peoples, a literature as varied in form and content as it is vast in extent. In the end all of this literature may be considered as sources for history. Many business tablets are dated, and from these dates much may be learned for chronology, while even in the tablets themselves there is matter relating to the daily life of the people, all of which must ultimately be valuable in the reconstruction of the social history. So also are all religious texts, all omens and incantations, sources for the study of the history of religious development. But the primary sources are the so-called royal inscriptions, those, namely, that were written for kings, for their libraries and collections or for their glorification. These divide, roughly, into two main classes: A. Legendary, and B. Historical and Chronological. The legends begin in mythological explanations of the mysteries of the physical universe and pass on slowly into stories of heroes with whom were mingled various threads of real history. A number of similar legends have been preserved for us in their original cuneiform, of which the myth of Adapa, the king of Kutha, and the legend of the birth of Sargon are excellent examples. From these and similar legends there may, in some instances, be extracted kernels of historic truth not to be overlooked by the serious investigator. The Babylonian historical inscriptions may be divided into two great periods: (a) Those belonging to the period before Hammurapi (circa 2000 B.C.), and (b) those from Hammurapi to Nabonidus (555-539 B.C.). In the first period by far the larger portion of the texts are votive inscriptions, inscribed upon objects of beauty or of value dedicated to the deities, or describing such, or they are building inscriptions primarily given to the description of temples erected by kings or princes to the gods. . . . The only historical material of importance upon such documents as these consists in the names, titles, and more or less extended genealogical connections of the kings. Some, however, of the earlier kings . . . give various details of political affairs useful in the reconstruction of events. By far the most important, as also the most extended, inscriptions of this early period belong to Gudea, patesi of Lagash (circa 2450 B.C.), whose two great cylinders, the one containing about eight hundred lines of writing and the other about five hundred, give a marvellous picture of the common life and thought and feeling, as well as some details of political life in that far distant age. . . . All these kings wrote in Sumerian, although signs of Semitic influence are not altogether wanting in them. . . . With Hammurapi begins the new period of historical writing, as there also began new political conditions after northern and southern Babylonia had been united under his skillful and beneficent sway. From this time onward the language is prevailingly Semitic, but the style and form of the Sumerian records is carefully followed as the norm. . . . From Hammurapi to Nabonidus, a period of about fifteen millenniums, the Babylonian kings wrote always with a deep religious

tone, and paying almost no heed to military glory, wrote ever of the building of temples and palaces, the digging of canals, or other great works of peace. The tone of all these texts is epic rather than historical, and their rhythm and cadence poetical rather than prosaic. The texts of Hammurapi are both numerous and lengthy, and from him come also a large number of letters and despatches, valuable for social and institutional history. No other king of the first Babylonian dynasty has left considerable documents except Samsuiluna. From that time onward there are periods of bloom in historiography in the periods Kassites, the Tellel-Amarna letters (q.v.), and Nebuchadrezzar I, after whom comes a great dearth of the longer texts. There is a renaissance of such literature again in the days of Shamashshumikin (668-648 B.C.), reaching its height in Nebuchadrezzar II (604-561 B.C.) and Nabonidus (556-540 B.C.). In addition to these historical sources the Babylonians and Assyrians have left a great mass of chronological material. . . . In respect of their value as sources of knowledge these monumental remains can only be said to be as valuable as the records of other ancient peoples. They bear for the most part the stamp of reasonableness. Often, indeed, do they contain palpable exaggerations of kingly prowess, of victories, and of conquests. They therefore require sifting and rigid criticism. But in most cases it is possible to learn from the issue of the events the relative importance of them, and so be able to check the measure of extravagance in the narrative. . . . [See also HISTORY: 14.]

"Egyptian hieroglyphic texts are of very slight importance as direct sources of knowledge concerning the political history of Babylonia and Assyria, but they contain many places and personal names useful in the elucidation of corresponding names in Assyrian texts. The gain of the Old Testament has been greater from Assyrian studies than the reverse, though the apologetic value of monumental testimony has often been greatly exaggerated. Nevertheless, it must not be forgotten that it was interest in the Old Testament which inspired most of the early explorers and excavators and some of the earlier decipherers and interpreters, and that from the historical notices in the Old Testament came not a few points for the outworking of details in the newly discovered inscriptions. The historical portions of the Old Testament which are still of importance as sources for Assyrian and Babylonian history are especially 2 Kings, while of even greater importance, in many instances, are the prophets Isaiah, Nahum, Jeremiah, and Ezekiel. It is to be noted that the Old Testament makes direct and valuable contributions as a historical source only from 745 B.C., the beginning of the reign of Tiglathpileser IV. The notices of the earlier periods are too vague, or too doubtful, as to the period of their origin to be more valuable than as confirmatory or supplementary to the original Babylonian or Assyrian texts.

"As sources the Greek and Latin writers once held first place, but are now reduced to a very insignificant position by the native monumental records. Nevertheless, they still retain some importance, and need constantly to be used to check and control the native writers as well as to assist in the ordering of their more detailed materials. First in importance among all the classical writers stands Berossos, or Berosos, for so the name is also transliterated into Greek. He was a Babylonian by origin, and a priest of the great god Bel. The dates of his birth and of his death are equally unknown, but it is clear that he was living in the

days of Alexander the Great (356-323 B. C.), and continued to live at least as late as Antiochus I Soter (280-261 B. C.). [See SELEUCIOAE: B. C. 281-224 and B. C. 224-187.] He wrote a great work on Babylonian history, the title of which was probably *Babyloniaca*. . . . Unhappily, the original work has perished, and all that remains is excerpts which have come to us after much copying and many transfers from hand to hand. . . . From Berossos but little is to be learned of direct value, but the support which we gain from these fragmentary remains for the general course of the history is very great. . . . The next Greek writer who comes before us as a possible source is Ktesias, a contemporary of Xenophon. He came . . . as a prisoner of war to Persia, where he spent seventeen years at the court. . . . In 390 he returned to his native city, and in the ease thus achieved proceeded to work up into historical form the materials he had collected. He wrote in twenty-three books a history of Persia in the Ionic dialect. The first six books treated the history of Assyria and Media. . . . His work was extensively used in the ancient world, and wherever quoted became at once the object of sharp controversy. He was accused of being untrustworthy and indifferent to truth, and the charges and the controversy continue until today. . . . The first six books, relating to the early history of Assyria, are valueless. . . . The books themselves have perished. Only fragments of them survive in the quotations by Diodorus and Eusebius and others, and in an epitome by Photius. For our purpose they scarcely come into the question at all. Last of all among the classical writers we come to Herodotus, the father of history. Of the value of his works as a source very diverse opinions have been and are still held. From him surely much was expected. Born in Halicarnassus, in Caria, B. C. 484, he had associations with the greatest men of his time, and apparently planned his history with skill and care. He desired to tell of the famous events in the struggle between the Greek and the barbarian, and this led him to treat of the causes which led to the Persian war. In the very first book (chapters 1-5) he begins with the assaults of the East upon the West by telling the story of the rape of Helen on the one side and the story of Europa and Media on the other. From this mythological foundation he is carried first to the Lydians, whose king, Cræsus, made the first attack upon the Greeks of the Ægean coast of Asia Minor. From these he passes to the Egyptians, the Babylonians, and the Scythians, who prepare the way for the Persians. . . . The work of Herodotus, as it has come down to us, divides naturally into three main parts. The first is mainly concerned with Asia, including Egypt, and covers the reigns of Cyrus and Cambyses, with the accession of Darius; the second deals with Europe, and the third with Hellas. . . . His position was very different from the modern historian, for he could learn very little from books. He seems, indeed, to have used the *Logographi* to a certain extent, and among them quite certainly Hecataeus, and probably Xanthus, and Hellanicus, and possibly also Dionysius. From them he had to turn to see what might be learned from visits to the countries which he was to describe, and whose story he was to tell. His first long journey was probably to Pontus, and the interior of Asia Minor, and this was probably undertaken before 445, while he was still a subject of the Persian king. His next great journey was to Phœnicia and southern Syria. . . . From there he went southward, along the coast or always near it to Gaza and the very confines of Egypt at Pelusium, and from

there he entered Egypt. Before this journey along the coast he had made the great voyage into the heart of ancient kingdoms, starting from Tyre, or from Poseidon on the coast farther north. From this he probably reached the Euphrates and went southward to Babylon upon its waters. So much seems reasonably certain. . . . Professor Sayce has attempted to prove, with much learning and great acuteness, that 'he never visited Assyria and Babylonia.' . . . That Professor Sayce has proved upon Herodotus a host of inaccuracies, some travelers' tales, and has effectually disposed of his claims to rank as an independent source of ancient history there can be no doubt. Yet that in this case, as in other similar modern judgments, there is an excess of skepticism is perhaps no less true. There is good reason for believing that Herodotus had really visited Babylon, for the topographical details which he gives bear frequently the stamp of an eyewitness. . . . He still remains, what Cicero called him, the father of history, though he also was able to recognize that his books contained material that could hardly be called historical. When this is granted quite freely, and the mistakes, inaccuracies, and love of marvels have all been mentioned, we have gone far enough. It were better not to have doubted his essential veracity, nor to have despised his worth. After these there remain among classical writers few who deserve to be mentioned as sources."—R. W. Rogers, *History of Babylonia and Assyria*, pp. 377-306.

Earliest inhabitants.—"If we call up before us the land of Babylonia, and transport ourselves backward until we reach the period of more than four thousand years before Christ, we shall be able to discern here and there signs of life, society, and government in certain cities. Civilization has already reached a high point, the arts of life are well advanced, and men are able to write down their thoughts and deeds in intelligible language and in permanent form. All these presuppose a long period of development running back through millenniums of unrecorded time. At this period there are no great kingdoms, comprising many cities, with their laws and customs, with subject territory and tribute-paying states. Over the entire land there are visible, as we look back upon it, only cities dissevered in government, and perhaps in intercourse, but yet the promise of kingdoms still unborn. In Babylonia we know of the existence of the cities Agade, Babylon, Kutha, Kish, Umma, Shirpurla (afterward called Lagash), Guti, and yet others less famous. . . . Impelled by religion, by hunger, and by ambition, the peoples of Babylonia, who have dwelt apart in separate cities, begin to add city to city, concentrating power in the hands of kings. Herein lies the origin of the great empire which must later dominate the whole earth, for these little kingdoms thus formed later united under the headship of one kingdom and the empire is founded. At the very earliest period whose written records have come down to us the land which we now call Babylonia was divided into two great parts, of which the southern was later called Sumer (q.v.) and the northern Accad (see АККАД), the dividing line between them being approximately drawn from Samarra on the Tigris to Hit on the Euphrates. North of this line Accad is somewhat undulating in surface, and rises gradually to unite with the steppe-like lands of Mesopotamia on the north-western and Assyria on the northeastern slopes. South of this imaginary line lies the monotonously level and alluvial land of Sumer. The earliest Sumerian inhabitants known to us called the northern part of the country, later known as Accad, by the strange and still unexplained name of Ki-uri

or Ki-urra. In later times the name of the city of Agade was extended by the Semites to cover the whole of the northern land, and was Semitized in the form Akkadu or Accad. The southern part of the country, in which the Sumerians were first settled, they called simply *Kanag*. . . . At the earliest period of which we have knowledge the land of Sumer was inhabited by the rounded-headed, clean-shaven Sumerians, and the land of Accad by the long-headed and bearded Semites. Both of these races were dwelling in cities, with settled agricultural communities about them. The Sumerians were writing upon carefully prepared clay their own language, agglutinative in character, and in a script which they had either devised or at least perfected from an original picture writing. With their language there was early evident some intermixture with or borrowing of Semitic words, and there was presumably also a Semitic element in the population, and racial intermixture already in progress. At this same period Accad was inhabited by Semites who had taken over from their Sumerian neighbors the cumbersome and awkward cuneiform script, and were using it to write their own tongue—[see CUNEIFORM INSCRIPTIONS] a language inflected and not agglutinative, and quite unrelated in form and vocabulary to the Sumerian. They also borrowed Sumerian words and adapted them to their own modes of speech. . . . The early history of both Semites and Sumerians is lost in a dim past from which no ray of light has penetrated to our time. The Semites . . . probably came originally from Arabia, but the course they followed is quite unknown.”—R. W. Rogers, *History of Babylonia and Assyria*, 1-4.—See SEMITES: Primitive Babylonia.—“We are now able to trace the history of the Euphrates Valley back to a period considerably beyond 3000 B. C. At that early date there were two distinct ethnic groups forming the main body of the population. As depicted on the monuments and works of art the one group is clean shaven, the other bearded, though not infrequently with the upper lip shaved. The former group is marked by obliquely set eyes and a long but not thick nose, and by thin lips and rather high cheek bones, the other has the fleshy nose and thick lips as well as other features characteristic of the Semitic race. The variation extends to the dress, a flounced garment hanging from the waist in the one case, a plaid thrown across the shoulder and draping the entire body in the other. The group with the racial characteristics of the Semites was known as the Akkadians; the other, a non-Semitic group, but whose possible affinities with other races has not yet been determined, bore the name Sumerian. The centre of the Semitic settlements, at the time when the monumental material comes into view, was in the northern section of the Euphrates Valley, while the strongholds of the Sumerians were in the south. The Semites appear to have entered the valley from the northwest, coming down from the mountain regions of Syria, while the Sumerians—also a people of mountainous origin—probably came from the northwest, though this is still a mooted point. Which of the two groups came first is likewise a question to which as yet no definite answer can be given, though there is much in favor of Eduard Meyer’s view that the Semites or Akkadians were the first on the ground and that the Sumerians entered the land as conquerors, holding the Akkadians in subjection for many centuries, until, about 2500 B. C., the tide began to turn. At about 2100 B. C. we find the Akkadians definitely in control in the entire Euphrates Valley and maintaining the supremacy over the Sumerians, though not without some periods of

temporary reaction especially in the extreme southern section where the Sumerians managed to retain a semblance of political independence.

“More important than the question of the original settlement of the Valley is the rivalry between Sumerians and Akkadians which directly stimulated the intellectual qualities of both groups and led to the high order of culture for which the Euphrates Valley became distinguished. It will be found to be a general rule that civilizations of the first rank develop through the commingling of the two distinct races, entering into rivalry with each other. Such a commingling develops the best qualities in both. To distinguish in detail the elements contributed by each as a task that lies beyond the scope of a survey of the religious views and practices unfolded in the Euphrates Valley. Obviously, the share of the Sumerians in the earlier periods was far greater. The cuneiform script developing from picture writing is of Sumerian origin. The oldest documents of all kinds are written in Sumerian. Later, when the Akkadians began to obtain control, the script was adapted to conveying thoughts, facts and data in Akkadian, while the Sumerian, though for a long time surviving in the cult, became archaic, and even before this stage was reached, was modified by the introduction of Akkadian elements. In return many distinctly Sumerian features passed over into Akkadian, and externally in the use of hundreds of characters used ideographically, the Akkadian continued to show a Sumerian aspect. In the domain of architecture, one may see the result of the commingling of the two races in the two types of religious edifices that arose in the important centres of the Euphrates Valley, (1) the house as the dwelling of the deity modelled after the human habitation, and (2) the stage tower, a huge brick construction of considerable height with a winding ascent, clearly in imitation of a mountain with a road leading to the top, as the seat of the deity. The house-*motif* for the temple is of Semitic origin, while the stage tower is the contribution of the Sumerians who, accustomed in their mountain homes to worship their deities on mountain tops, endeavored to symbolize this belief by the imitation of a mountain when they came to a perfectly flat country like the Euphrates Valley.”—M. Jastrow, Jr., *Religion of Babylonia and Assyria*, pp. 50-52. See ARCHITECTURE: Oriental: Mesopotamia.—“Since Sumir, the Shinar of the Bible, was the first part of the country occupied by the invading Semites, while Accad long continued to be regarded as the seat of an alien race, the language and population of primitive Chaldea have been named Accadian by the majority of Assyrian scholars. The part played by these Accadians in the intellectual history of mankind is highly important. They were the earliest civilizers of Western Asia, and it is to them that we have to trace the arts and sciences, the religious traditions and the philosophy not only of the Assyrians, but also of the Phœnicians, the Aramæans, and even the Hebrews themselves. It was, too, from Chaldea that the germs of Greek art and of much of the Greek pantheon and mythology originally came. Columnar architecture reached its first and highest development in Babylonia; the lions that still guard the main entrance of Mykenæ are distinctly Assyrian in character; and the Greek Herakles with his twelve labours finds his prototype in the hero of the great Chaldean epic. It is difficult to say how much of our present culture is not owed to the stunted, oblique-eyed people of ancient Babylonia; Jerusalem and Athens are the sacred cities of our modern life; and both Jerusalem and Athens were profoundly influenced

by the ideas which had their first starting-point in primæval Accad. The Semite has ever been a trader and an intermediary, and his earliest work was the precious trade in spiritual and mental wares. Babylonia was the home and mother of Semitic culture and Semitic inspiration; the Phœnicians never forgot that they were a colony from the Persian Gulf, while the Israelite recounted that his father Abraham had been born in Ur of the Chaldees. Almost the whole of the Assyrian literature was derived from Accad, and translated from the dead language of primitive Chaldea."—A. H. Sayce, *Babylonian literature*, pp. 6-7, and in his *Ancient empires of the East*, app. 2.—"The place of China in the past and future is not that which it was long supposed to be. Recent researches have disclosed that its civilization, like ours, was variously derived from the same old focus of culture of south-western Asia. . . . It was my good fortune to be able to show, in an un-interrupted series of a score or so of papers in periodicals, of communications to the Royal Asiatic Society and elsewhere, published and unpublished, and of contributions to several works since April 1880, downwards, that the writing and some knowledge of arts, science and government of the early Chinese, more or less enumerated below, were derived from the old civilization of Babylonia, through the secondary focus of Susiana, and that this derivation was a social fact, resulting not from scientific teaching but from practical intercourse of some length between the Susian confederation and the future civilizers of the Chinese, the Bak tribes, who, from their neighbouring settlements in the N., moved eastwards at the time of the great rising of the XXIII. century B. C. Coming again in the field, Dr. J. Edkins has joined me on the same line."—T. de Lacouperie, *Babylonia and China (Academy, Aug. 7, 1880.)*—"We could enumerate a long series of affinities between Chaldean culture and Chinese civilization, although the last was not borrowed directly. From what evidence we have, it seems highly probable that a certain number of families or of tribes, without any apparent generic name, but among which the Kutta filled an important position, came to China about the year 2500 B. C. These tribes, which came from the West, were obliged to quit the neighbourhood, probably north of the Susiana, and were comprised in the feudal agglomeration of that region, where they must have been influenced by the Akkado-Chaldean culture."—T. de Lacouperie, *Early history of Chinese civilization*, p. 32.—See also CHINA: Origin of the People.

Religion.—From animism to polytheism.—"The Babylonian-Assyrian religion in its oldest form as revealed by the votive inscriptions of Sumerian rulers and by specimens of literature that may with great probability be carried back to the earliest period, is long past the stage of primitive beliefs, though it shows traces that in its conception of divine government of the universe it started from what is commonly termed animism. By this term is meant a view of nature ascribing life to all phenomena and of the same order as the vital force that manifests itself in human and animal activity. Under this view the gods worshipped by man are personifications either of phenomena of nature or of objects in nature, primarily the sun, the moon, the storm (with its accompaniment of rain, thunder and lightning), the earth, water (including streams and wells), trees and rocks. Religion being the partly emotional, partly intellectual response to an instinct, confirmed by experience, that man is not the arbiter of his fate, it is natural for him to make the effort to supplement his inherent and self-evident weakness in

the presence of nature by securing the aid of powers upon whose favor he is dependent. The storm destroys his handiwork, and therefore to avoid the catastrophe he seeks the favor of the power manifesting itself in the storm. The stream may sink his primitive craft and therefore, before trusting himself to the treacherous element, he endeavors to assure himself of the favor of the spirit or power residing in the water. When he advances to the agricultural stage, the earth and the sun are the two forces that in the main condition his welfare; and as a consequence he personifies the earth as a mother in whose womb the seed has been placed, which with the coöperation of the sun is brought to fruition. Starting from this animistic conception of nature, the Sumerians and Akkadians developed a pantheon, all the members of which take their rise as personified powers of nature. In thus grouping the gods into a more or less definite relationship—and that is involved in the creation of a pantheon—the religion passes beyond the animistic stage. The gods in the larger centres become, primarily, the protectors of the place, and as the group enlarges its geographical boundaries, the jurisdiction and the attributes of a local god are correspondingly increased. He becomes, irrespective of his original character, the protector of the fields, the guardian of the army; it is he who gives victory over the enemy and when misfortunes come, it is the god who sends the punishment because of anger that has been aroused in him. The combination of little groups into a powerful state brings about further changes, and as one state comes to exercise a sovereignty over other combinations of groups, the gods of the various localities are organized after the pattern of human society into a royal court with gradations in rank, corresponding to the class distinctions that grow in complication as combinations of groups result in the formation of a political unit.

"Of the chief local gods which thus take on a larger character we may single out Enki, whom the Akkadians designated as Ea, and who from being the patron deity of Eridu, lying at the head of the Persian Gulf, becomes the god of waters in general. Another deity, Enlil, originally a storm-god and associated with the old Sumerian centre, Nippur, becomes the head of the Sumerian pantheon because of the importance which Nippur acquired, in part political, in part due to the position of Nippur as a religious centre. As such, Enlil acquires attributes originally foreign to his nature. He becomes an agricultural deity and is addressed in terms which show that he has absorbed the power ascribed to the sun and water as well. At Shirpuria, another Sumerian centre, the chief deity is Ningirsu [Ninib], a personification of the sun, who becomes a powerful warrior, with a mighty net in which he catches the soldiers of the enemy. In the later period Marduk, again a solar deity, as the patron of the city of Babylon, becomes supreme over all the gods when Babylon rises to the position of the capital of the Babylonian empire. With this step, finally achieved by the great Hammurapi (2123-2081 B. C.), the attributes of all the other great gods are bestowed on Marduk, and such tendencies toward a monotheistic conception of the universe as are to be noted in the course of the development of the Babylonian religion gather about his cult. The proximity of Borsippa to Babylon (lying almost opposite the latter) brought about a close association between Marduk and the local deity of Borsippa, known as Nabu [Nebo], who may have been originally a personification of the watery element—perhaps the god of the Euphrates more

particularly. The relationship between Marduk and Nabu is pictured as that of father to son, and to such an extent are the original traits of Nabu obscured that he becomes merely a somewhat pale reflection of Marduk—a junior Marduk by the side of a senior. In the same way we have in the many other localities of southern and northern Babylonia deities closely associated with a place as patron and guardian who are originally personifications of the sun, moon, water, earth or the storm, but whose original character tends to become obscured through one circumstance or another, concomitant with changes in the political kaleidoscope and with advancing social conditions.

"It thus happens that a widely diffused polytheism continues to be the striking feature of the Babylonian-Assyrian religion, despite the counter endeavors to devise theological systems that aimed to reduce the many gods to a limited number of superior powers in actual control of the universe. Between these two tendencies, the one towards providing a place for literally hundreds of deities, the other towards concentrating actual divine power in a limited number, the Babylonian-Assyrian religion runs its course. The former tendency leads further towards recognizing, besides hundreds of deities, a large number of minor divine beings, demons pictured in human or animal form to whom diseases and all kinds of mishaps are assigned. The latter tendency has its outcome in the division of divine government among three powers. There are several groups of such triads. Foremost stands a triad composed of Anu, to whom the control of the heavens is assigned; Enlil, who rules the earth and the atmosphere above it, and Ea, who represents the watery element surrounding the earth, and on which the earth is supposed to float like a rubber ball. In the case of all three gods all local limitations have entirely disappeared, as have all traces of the specific power of nature originally personified by each of them. Less artificial in character and of more practical import is another triad frequently occurring in inscriptions and invariably depicted by symbols on the boundary stones, consisting of Sin, the moon-god, Shamash, the sun-god, and Ishtar, the planet Venus, symbolizing the great mother goddess, the source of life and fertility. These three gods represent the chief powers upon which man is dependent, summing up, as it were, the chief protectors of human life and the chief guides of his being. In place of Ishtar, Adad, a general god of storms who never appears to have had any specific local cult, is introduced, and not infrequently we have, instead of a triad, a group of four,—Sin, Shamash, Adad and Ishtar, in which combination the latter represents the female element in general, essential as a complement to the male to produce the manifestation of life in the universe.

"The gods exist according to the Babylonian-Assyrian point of view in order to be worshiped. They feel lonely without temples, and in one of the accounts of creation the gods are represented as creating mankind in order to have temples and worshippers. In return, the gods act as protectors of humanity, although in the early period of predominating local cults each god is interested only in those who dwell within his jurisdiction. Success in undertakings, good crops, business ventures, health, possessions, victory in arms—all come through the favor of the gods. The aim of the cult, therefore, is to secure and happily to retain the good-will of the gods. The gods must be kept in good humor. They crave homage, and woe to the ruler or people who neglect to pay the proper respect to the gods. By a natural corollary, all misfortunes are ascribed to the anger of

the gods. Bad crops, defeat in battle, pestilence, destructive storms, mishaps of all kinds, including failure in business, are the punishments sent by offended gods. The theory was a convenient one, for it shifted the responsibility from one's own shoulders for ill-fortune and placed it on the gods, but on the other hand there was also some reason for the anger of the superior powers, albeit one was not always able to fathom it. This theory of the alternate favor and anger of the gods formed the basis of religious ethics as well; it dominates the view taken of sin, for sin meant the commission of an act or an omission of one, resulting in arousing the anger of some deity. Such an omission might consist in not bringing tribute or in not asking for his assistance in any undertaking, while the commission might be an error in pronouncing certain formulæ or a mistake in the performance of some religious rite. By the side of such acts or misdeeds, not involving a breach of ethics from our point of view, there were also actual transgressions, such as lying, cheating, stealing, adultery, treachery, cruelty, failure to show proper consideration for one's parents or for one's fellows or neglect of other duties that would arouse the displeasure of a god. The genuine ethical element thus enters into the religion, but it is characteristic of the status of the religion that down to the latest period no distinction is made between an ethical misdeed and a purely ritualistic transgression or omission. The appeal to the gods was made by certain acts and rites, more or less symbolical, accompanied by the recital of certain formulæ supposed to have the power of making a direct appeal either for the manifestation of divine power or for the removal of a god's displeasure. The aspects of the cult thus resulting may be grouped under two categories, (1) incantations, shading off into prayers and hymns, accompanied by rites to symbolize the release of a sufferer from disease or from some other evil, and (2) divination methods to ascertain the disposition and by implication the intention of a deity, and thus to forestall impending evil, or at all events to be prepared for the blow, if it was inevitable."—M. Jastrow, Jr., *Religion of Assyria and Babylonia*, pp. 53-63.—See also ASSYRIA: People, religion and early history; RELIGION: B. C. 2000-200.

Creation myths.—"In Babylonia and Assyria various creation myths were developed. One of the oldest assumes the existence of the earth and narrates the building of cities and the development of agriculture. Another, which is known only through the broken tablet written about 2100 B. C., attributes the creation of the world to the triad Anu, Bel, and Ea, together with the goddess Ninkharsag, while Nintu or Ishtar created mankind. The best known of these myths was in late Assyrian and Babylonian times developed into an epic in seven tablets or cantos. The essence of this story is that Tiamat, the great mother-dragon of the sea, determined to destroy the gods whom she had borne. They then chose one of their number, Marduk, to fight her; he overcame her, split her in two, and formed of one part of her the heavens and of the other the earth. This is evidence that in substance this myth is very old and that, in earlier forms of it, Enlil of Nippur and Ea of Eridu had stood in place of Marduk. In still another creation-myth the god Ashur is the chief actor. Such a myth was the natural product of lower Babylonia, where, on account of the annual overflow of the rivers, the sea seems to come and try to overwhelm the land. Other myths relate to various matters. Two are concerned with the acquisition of knowledge on the

part of man. According to one of these, preserved to us by Berossos, Oannes (a late name for Ea) was a fish-god who lived in the water at night, but came up by day and taught men agriculture, horticulture, the art of building houses, and how to make laws. According to another, called the Adapa-myth, Ea feared lest man, who had become intelligent, should partake of the food of the gods and become immortal. At a time when Ea knew that other gods would offer Adapa such food he warned Adapa not to partake of it, lest it destroy him. Adapa obeyed Ea and thus missed immortality. These myths reflect the feeling that, while the gods are willing to help man up to a certain point, they are jealous of his too great advancement."—G. A. Barton, *Religions of the world*, pp. 26-28.

Social structure.—Temple as civic center.—"With manufactures and commerce standing so high in the economy of Babylonia, it is not to be wondered at if the social structure of the country developed some of the same features as begin to perplex our modern world. In particular, the right was fully recognized, to practise industry and skill and enjoy the fruits of them, irrespective of sex. Not only was the status of married women high (for their partnership was valued) and their freedom great, but a distinct industrial status had been found for unmarried women, in large co-operative societies under religious sanction, with vows of celibacy and strict attention to business. Unlike mediæval nuns, however, members of these orders were free mistresses of their time and labour: they lived where they would and worked at what they liked, insured by their membership, so long as they kept their vows, and paid their dues. The only social distinctions were those between slaves and freemen, and between landless (which practically meant industrial) persons, and land owners. The latter class included all public servants, because public services, as in mediæval Europe, were rewarded, not by salaries, but by a grant of land sufficient to maintain the official and meet the expenses of his duty. Privilege entailed responsibility; and offenders were punished more heavily if they belonged to the 'upper classes'; doctors' fees were graduated, too, according to the status of the patient. At the other end of the scale, slaves could save, hold property, and buy their freedom; their state, as throughout the ancient world, was at bottom a compulsory initiation into culture higher than their own.

"Each Babylonian city centered round the temple of its patron god; and the antiquity of this whole system of society is nowhere better illustrated than in the overwhelming power of the temple authorities. It recalls more nearly the despotism of the priest-kings of the Twenty-first Dynasty than any earlier phase in the growth of society in Egypt. The chief priest of the temple was ruler of the city. When conquests took place, and Babylonian empires were built up, the conqueror provided all the viceroys he required, by appointing a man whom he could trust, to be chief priest in each place. This personal rule was well suited to the needs of such cities. In a close-knit industrial society, preëminent ability discovers itself, incompetence is found out; and as the patron god was at the same time largest landlord, chief employer, and master merchant, he had the largest interest of any one in the selection of an efficient minister. In this way a city got approximately the government it deserved. It is to the centralized personal responsibility, which is the mainspring of these simple constitutions, that we owe a large part of our knowledge of their working, through the copious official correspondence which passed between

over-lords like Hammurabi and his viceroys, or the natural pride of an administrator like Gudea of Tello, in recording his own efficiency. The temple formed a distinct quarter of the city, and had usually a distinctive name. It consisted of an artificial mound, high enough, like the 'Tower of Babel' itself, to out-top the severest inundation, with a platform large enough to contain the house of the god, which was exactly modelled on the palace of a king, just as his daily service was, on the routine of a royal household. The deity takes his meals, hears music, sleeps, walks in his garden or tends his pet animals, just like a human sovereign. If he is not there when you call upon him, it is because he is a-hunting, like Baal on Carmel. Below clustered the stores, workshops, and dwellings of the temple servants, who included masons, smiths, and other industrials: as well as the quarters of the lay population. Other important buildings occupied similar platforms. Originally perhaps these mounds were the normal accumulation of ages of débris, more copious than ever when architecture was almost wholly in mud; but in later times they seem to have been faced with decorative brickwork and adapted as flood-platforms, like those of the temples. Any building in fact which was intended to last, had perforce to be defended so, in this home-country of the deluge. But the ordinary houses were not worth preserving long. They were the merest hovels of mud-brick, little more than sleeping-rooms and shelters from the sun, with verandahs of shittim-wood from the fen poplar. Baked brick was indeed in use, even in the earliest layers, but mainly for palaces and temples. In the absence of native stone, sculpture was a rarity; and the Euphrates mud bakes to a dull brown, which defies decoration. Of all the great civilizations, Babylonia alone contributes nothing essential to the potter's art."—J. L. Myres, *Dawn of history*, pp. 98-100.—See also **TEMPLES**: Stage of culture represented by temple architecture.

Early (Chaldean) monarchy.—"Our earliest glimpse of the political condition of Chaldea shows us the country divided into numerous small states, each headed by a great city, made famous and powerful by the sanctuary or temple of some particular deity, and ruled by a patesi, a title which is now thought to mean priest-king, i.e., priest and king in one. There can be little doubt that the beginning of the city was everywhere the temple, with its college of ministering priests, and that the surrounding settlement was gradually formed by pilgrims and worshippers. That royalty developed out of the priesthood is also more than probable. . . . There comes a time when for the title of patesi is substituted that of king. . . . It is noticeable that the distinction between the Semitic newcomers and the indigenous Shumiro-Accadians continues long to be traceable in the names of the royal temple-builders, even after the new Semitic idiom, which we call the Assyrian, had entirely ousted the old language. . . . Furthermore, even superficial observation shows that the old language and the old names survive longest in Shumir,—the South. From this fact it is to be inferred with little chance of mistake that the North,—the land of Accad,—was earlier Semitized, that the Semitic immigrants established their first headquarters in that part of the country, that their power and influence thence spread to the South. Fully in accordance with these indications, the first grand historical figure that meets us at the threshold of Chaldean history, dim with the mists of ages and fabulous traditions, yet unmistakably real, is that of the Semite Sharrukin, king of Accad, or Agade, as the great Northern city came to be called—more

generally known in history under the corrupt modern reading of Sargon, and called Sargon I., 'the First,' to distinguish him from a very famous Assyrian monarch of the same name who reigned many centuries later. As to the city of Agade, it is no other than the city of Accad mentioned in Genesis x, 10. It was situated close to the Euphrates on a wide canal just opposite Sippar, so that in time the two cities came to be considered as one double city, and the Hebrews always called it 'the two Sippars'—Sefharvaim, which is often spoken of in the Bible. . . . The tremendously ancient date of 3800 B. C. is now generally accepted for Sargon of Agade—perhaps the remotest authentic date yet arrived at in history."—Z. A. Ragozin, *Story of Chaldea*, ch. 4.—See also AKKAD; ASSYRIA; CHALDAEA; ELAM; KHASSITES; SUMER.

Position and importance of Babylon (q.v.).—"This continued preëminence of a single city is in striking contrast to the ephemeral authority of earlier capitals, and it can only be explained by some radical change in the general conditions of the country. One fact stands out clearly: Babylon's geographical position must have endowed her during this period with a strategical and commercial importance which enabled her to survive the rudest shocks to her material prosperity. A glance at the map will show that the city lay in the north of Babylonia, just below the confluence of the two great rivers in their lower course. Built originally on the left bank of the Euphrates, she was protected by its stream from any sudden incursion of the desert tribes. At the same time she was in immediate contact with the broad expanse of alluvial plain to the south-east, intersected by its network of canals. But the real strength of her position lay in her near neighbourhood to the trans-continental routes of traffic. When approaching Baghdad from the north the Mesopotamian plain contracts to a width of some thirty-five miles, and, although it has already begun to expand again in the latitude of Babylon, that city was well within touch of both rivers. She consequently lay at the meeting-point of two great avenues of commerce. The Euphrates route linked Babylonia with Northern Syria and the Mediterranean, and was her natural line of contact with Egypt; it also connected her with Cappadocia, by way to the Cilician Gates through the Taurus, along the track of the later Royal Road. Farther north the trunk-route through Anatolia from the west, reinforced by tributary routes from the Black Sea, turns at Sivas on the Upper Halys, and after crossing the Euphrates in the mountains, first strikes the Tigris at Diarbekr; then leaving that river for the easier plain, it rejoins the stream in the neighbourhood of Nineveh and so advances southward to Susa or to Babylon. A third great route that Babylon controlled was that to the east through the Gates of Zatos, the easiest point of penetration to the Iranian plateau and the natural outlet of commerce from Northern Elam. Babylon thus lay across the stream of the nations' traffic, and in the direct path of any invader advancing upon the southern plains. That she owed her importance to her strategic position, and not to any particular virtue on the part of her inhabitants, will be apparent from the later history of the country. It has indeed been pointed out that the geographical conditions render necessary the existence of a great urban centre near the confluence of the Mesopotamian rivers. And this fact is amply attested by the relative positions of the capital cities, which succeeded one another in that region after the supremacy had passed from

Babylon. Seleucia, Ctesiphon and Baghdad are all clustered in the narrow neck of the Mesopotamian plain, and for only one short period, when normal conditions were suspended, has the centre of government been transferred to any southern city. The sole change has consisted in the permanent selection of the Tigris for the site of each new capital, with a decided tendency to remove it to the left or eastern bank. That the Euphrates should have given place in this way to her sister river was natural enough in view of the latter's deeper channel and better water way, which gained in significance as soon as the possibility of maritime communication was contemplated."—L. W. King, *History of Babylon*, pp. 4-5.—See also MESOPOTAMIA.

First Babylonian empire.—"The rise of Babylon to a position of preëminence among the warring dynasties of Sumer and Akkad may be regarded as sealing the final triumph of the Semite over the Sumerian. His survival in the long racial contest was due to the reinforcements he received from men of his own stock, whereas the Sumerian population, when once settled in the country, was never afterwards renewed. The great Semitic wave, under which the Sumerian sank and finally disappeared, reached the Euphrates from the coast-lands of the Eastern Mediterranean. But the Amurru, or Western Semites, like their predecessors in Northern Babylonia, had come originally from Arabia. For it is now generally recognized that the Arabian peninsula was the first home and cradle of the Semitic peoples. [See SEMITES: Primitive.]

"There is no doubt that Sumu-la-ilum was the real founder of Babylon's greatness as a military power. We have the testimony of his later descendant Samsuiluna to the strategic importance of the fortresses he built to protect his country's extended frontier; and, though Dûr-Zakar of Nippur is the only one the position of which can be approximately identified, we may assume that the majority of these lay along the east and south sides of Akkad, where the greatest danger of invasion was to be anticipated. It does not seem that Nippur itself passed at this time under more than a temporary control by Babylon, and we may assume that, after his successful raid, Sumu-la-ilum was content to remain within the limits of Akkad, which he strengthened with his line of forts. In his late years he occupied the city of Barzi, and conducted some further military operations, details of which we have not recovered; but those were the last efforts on Babylon's part for more than a generation. The pause in expansion gave Babylon the opportunity of husbanding her resources, after the first effort of conquest had been rendered permanent in its effect by Sumu-la-ilum. His two immediate successors, Zabum and Apil-Sin, occupied themselves with the internal administration of their kingdom and confined their military activities to keeping the frontier intact. Zabum indeed records a successful attack on Kazallu, no doubt necessitated by renewed aggression on that city's part; but his other most notable achievements were the fortification of Kâr-Shamash, and the construction of a canal or reservoir. Equally uneventful was the reign of Apil-Sin, for though Dûr-muti, the wall of which he rebuilt, may have been acquired as the result of conquest, he too was mainly occupied with the consolidation and improvement of the territory already won. He strengthened the walls of Barzi and Babylon, cut two canals, and rebuilt some of the great temples. As a result of her peaceful development during this period the country was rendered capable of a still greater struggle, which was to free

Sumer and Akkad from a foreign domination, and, by overcoming the invader, was to place Babylon for a time at the head of a more powerful and united empire than had yet been seen on the banks of the Euphrates. The country's new foe was her old rival, Elam, who more than once before had by successful invasion affected the course of Babylonian affairs. But on this occasion she did more than raid, harry, and return: she annexed the city of Larsa, and by using it as a centre of control, attempted to extend her influence over the whole of Sumer and Akkad. It was at the close of Apil-Sin's reign at Babylon that Kudur-Mabuk, the ruler of Western Elam, known at this period as the land of Emutbal, invaded Southern Babylonia and, after deposing Sili-Adad of Larsa, installed his own son Warad-Sin upon the throne. It is a testimony to the greatness of this achievement, that Larsa had for some time enjoyed over Nisin the position of leading city in Sumer. Nûr-Adad, the successor of Sumu-la-ilum, had retained control of the neighbouring city of Ur, and, though Enlil-bani of Nisin had continued to lay claim to be King of Sumer and Akkad, this proud title was wrested from Zambia or his successor by Sin-idinnam, Nur-Adad's son. Sin-idinnam, indeed, on bricks from Mukayyar in the British Museum makes a reference to the military achievements by which he had won the position for his city. In the text his object is to record the rebuilding of the Moon-god's temple in Ur, but he relates that he carried out this work after he had made the foundation of the throne of Larsa secure and had smitten the whole of his enemies with the sword. It is probable that his three successors on the throne, who reigned for less than ten years between them, failed to maintain his level of achievement, and that Sin-magir recovered the hegemony for Nisin. But Ur, no doubt, remained under Larsa's administration, and it was no mean nor inferior city that Kudur-Mabuk seized and occupied. . . . At first Kudur-Mabuk's footing in Sumer was confined to the city of Larsa, though even then he laid claim to the title *Adda* of Amurru, a reference to be explained perhaps by the suggested Amorite origin of the Larsa and Nisin dynasties, and reflecting a claim to the suzerainty of the land from which his northern foes at any rate boasted their origin. Warad-Sin, on ascending the throne, assumed merely the title King of Larsa, but we soon find him becoming the patron of Ur, and building a great fortification-wall in that city. He then extended his authority to the south and east, Eridu, Lagash, and Girsu all falling before his arms or submitting to his suzerainty. During this period Babylon remained aloof in the north, and Sin-muballit is occupied with cutting canals and fortifying cities, some of which he perhaps occupied for the first time. It was only in his fourteenth year, after Warad-Sin had been succeeded at Larsa by his brother Rim-Sin, that we have evidence of Babylon taking an active part in opposing Elamite pretensions. In that year Sin-muballit records that he slew the army of Ur with a sword, and, since we know that Ur was at this time a vassal-city of Larsa, it is clear that the army referred to was one of those under Rim-Sin's command. Three years later he transferred his attention from Larsa to Nisin, then under the control of Danik-ilishu, the son and successor of Sin-magir. On that occasion Sin-muballit commemorates his conquest of Nisin, but it must have been little more than a victory in the field, for Danik-ilishu lost neither his city nor his independence. In the last year of his reign we find Sin-muballit fighting on the other front, and claiming to have slain the army

of Larsa with the sword. It is clear that in these last seven years of his reign Babylon proved herself capable of checking any encroachments to the north on the part of Larsa and the Elamites, and, by a continuance of the policy of fortifying her vassal-cities, she paved the way for a more vigorous offensive on the part of Hammurabi, Sin-muballit's son and successor. Meanwhile the unfortunate city of Nisin was between two fires, though for a few years longer Danik-ilishu succeeded in beating off both his opponents."—L. W. King, *History of Babylon*, pp. 119, 148-160.

Hammurabi.—His character and achievements.—"The military successes of Hammurabi fall within two clearly defined periods, the first during the five years which followed his sixth year of rule at Babylon, and a second period, of ten years' duration, beginning with the thirteenth of his reign. On his accession he appears to have inaugurated the reforms in the internal administration of the country, which culminated towards the close of his life in the promulgation of his famous Code of Laws; for he commemorated his second year as that in which he established righteousness in the land. The following years were uneventful, the most important royal acts being the installation of the chief-priest in Kashbaran, the building of a wall for the Gagûm, or great Cloister of Sippar, and of a temple to Nannar in Babylon. But with his seventh year we find his first reference to a military campaign in a claim to the capture of Erech and Nisin. This temporary success against Danik-ilishu of Nisin was doubtless a menace to the plans of Rim-Sin at Larsa, and it would appear that Kudur-Mabuk came to the assistance of his son by threatening Babylon's eastern border. At any rate Hammurabi records a conflict with the land of Emutbal in his eighth year, and, though the attack appears to have been successfully repulsed with a gain of territory to Babylon, the diversion was successful. Rim-Sin took advantage of the respite thus secured to renew his attack with increased vigour upon Nisin, and in the following year, the seventeenth of his own reign, the famous city fell, and Larsa under her Elamite ruler secured the hegemony in the whole of Central and Southern Babylonia. Rim-Sin's victory must have been a severe blow to Babylon, and it would seem that she made no attempt at first to recover her position in the south, since Hammurabi occupied himself with a raid on Malgûm in the west and with the capture of the cities of Rabikum and Shalibi. But these were the last successes during his first military period, and for nineteen years afterwards Babylon achieved nothing of a similar nature to commemorate in her date-formulae. For the most part the years are named after the dedication of statues and the building and enrichment of temples. One canal was cut, and the process of fortification went on, Sippar especially being put in a thorough state of defence. But the negative evidence supplied by the formulae for this period suggests that it was one in which Babylon completely failed in any attempt she may have made to hinder the growth of Larsa's power in the south. [See also ELAM.] It was not until nearly a generation had passed, after Rim-Sin's capture of Nisin, that Hammurabi made any headway against the Elamite domination, which for so long had arrested any increase in the power of Babylon. But his success, when it came, was complete and enduring. In his thirtieth year he records that he defeated the army of Elam, and in the next campaign he followed up this victory by invading the land of Emutbal, inflicting

a final defeat on the Elamites, and capturing and annexing Larsa.

"An estimate of the extent of Hammurabi's empire may be formed from the very exhaustive record of his activities which he himself drew up as the Prologue to his Code. He there enumerates the great cities of his kingdom and the benefits he has conferred upon each one of them. The list of cities is not drawn up with any administrative object, but from a purely religious standpoint, a recital of his treatment of each city being followed by a reference to what he has done for its temple and its city-god. . . . While Sumu-la-ilum may have laid the foundations of Babylon's military power, Hammurabi was the real founder of her greatness. To his military achievements he added a genius for administrative detail, and his letters and despatches, which have been recovered, reveal him as in active control of even subordinate officials stationed in distant cities of his empire. That he should have superintended matters of public importance is what might be naturally expected; but we also see him investigating quite trivial complaints and disputes among the humbler classes of his subjects, and often sending back a case for retrial or for further report. In fact, Hammurabi's fame will always rest on his achievements as a law-giver, and on the great legal code which he drew up for use throughout his empire. It is true that this elaborate system of laws, which deal in detail with every class of the population from the noble to the slave, was not the creative work of Hammurabi himself. Like all other ancient legal codes it was governed strictly by precedent, and where it did not incorporate earlier collections of laws, it was based on careful consideration of established custom. Hammurabi's great achievement was the codification of this mass of legal enactments and the rigid enforcement of the provisions of the resulting code throughout the whole territory of Babylonia. Its provisions reflect the king's own enthusiasm, of which his letters give independent proof, in the cause of the humbler and the more oppressed classes of his subjects. Numerous legal and commercial documents also attest the manner in which its provisions were carried out, and we have evidence that the legislative system so established remained in practical force during subsequent periods."—L. W. King, *History of Babylon*, pp. 148-160.—"The great code closes with a long passage in which the king, who is 'a father to his subjects,' enjoins obedience to these upon all people and upon the kings who should rule after him 'forever and ever.' No king is to forget them: 'The law of the land, which I have given, the decisions which I have pronounced he shall not alter, nor efface my image. If that man have wisdom, if he wish to keep his land in order, he shall take heed to the words which I have written upon my monument. The procedure, the administration, and the law of the land, which I have given, the decisions which I have pronounced, this monument will show unto him. He shall so rule his subjects, pronounce judgment, give decisions, drive the wicked and evildoers from the land, and promote his people's prosperity.' Hammurabi also displayed extraordinary care in the development of the resources of the land, and in thus increasing the wealth and comfort of the inhabitants. The chiefest of his great works is best described in his own ringing words—the words of a conqueror, a statesman, and a patriot: 'Hammurabi, the powerful king, king of Babylon, . . . when Anu and Bel gave unto me to rule the land of Sumer and Accad, and with their scepter filled my hands, I dug the canal Hammurabi, the

abundance of the people, which bringeth abundance of water unto the land of Sumer and Accad. Its banks upon both sides I made arable land; much grain I garnered upon it. Lasting water I provided for the land of Sumer and Accad. The land of Sumer and Accad, its separated peoples I united, with blessings and abundance I endowed them, in peaceful dwellings I made them to live.' This was no idle promise made to the people before the union of Sumer and Accad under the hegemony of Babylon, but the actual accomplishment of a man who knew how to knit to himself and his royal house the hearts of the people of a conquered land. There is a world of wisdom in the deeds of this old king. No work could possibly have been performed by him which would bring greater blessing than the building of a canal by which a nearly rainless land could be supplied with abundant water. After making the canal, Hammurabi followed the example of his predecessors in Babylonia and carried out extensive building operations in various parts of the land. On all sides we find evidences of his efforts in this work. In Babylon itself he erected a great granary for the storing of wheat against times of famine—a work of mercy as well as of necessity, which would find prompt recognition among Oriental peoples then as now. The temples to the sun god in Larsa and in Sippar were rebuilt by him; the walls of the latter city were reconstructed 'like a great mountain'—to use his own phrase—and the city was enriched by the construction of a new canal. The great temples of E-sagila in Babylon and E-zida in the neighboring Borsippa showed in increased size and in beauty the influence of his labors. There is evidence, also, that he built for himself a palace at the site now marked by the ruin of Kalwadhah, near Baghdad. But these buildings are only external evidences of the great work wrought in this long reign for civilization. The best of the culture of the ancient Sumerians was brought into Babylon, and there carefully conserved. What this meant to the centuries that came after is shown clearly in the later inscriptions. To Babylon the later kings of Assyria look constantly as to the real center of culture and civilization. No Assyrian king is content with Nineveh and its glories, great though these were in later days; his greatest glory came when he could call himself king of Babylon, and perform the symbolic act of taking hold of the hands of Bel-Marduk. Nineveh was the center of a kingdom of warriors, Babylon the abode of scholars; and the wellspring of all this is to be found in the work of Hammurabi. But if the kings of Assyria looked to Babylon with longing eyes, yet more did later kings in the city of Babylon itself look back to the days of Hammurabi as the golden age of their history. Nabopolassar and Nebuchadnezzar acknowledged his position in the most flattering way, for they imitated in their inscriptions the very words and phrases in which he had described his building, and, not satisfied with this, even copied the exact form of his tablets and the style of their writing. In building his plans were followed, and in rule and administration his methods were imitated. His works and his words entitle him to rank as the real founder of Babylon."—R. W. Rogers, *History of Babylonia and Assyria*, pp. 86-90.—"The canal to which this king boasts of having given his name, the 'Nahar-Hammurabi,' was called in later days the royal canal, Nahar Malcha [Radhwaniya]. Herodotus saw and admired it, its good condition was an object of care to the king himself, and we know that it was considerably repaired by Nebuchadnezzar.

When civilization makes up its mind to reënter upon that country, nothing more will be needed for the reawakening in it of life and reproductive energy, than the restoration of the great works undertaken by the contemporaries of Abraham and Jacob."—G. Perrot and C. Chipiez, *History of art in Chaldæa and Assyria*, v. 1, p. 40.—"After a reign of fifty-five years, Chamurabi [or Hammurabi] bequeathed the crown of Babylon and the united kingdoms of Babylonia to his son Samsu-iluna (2209-2180 B. C.). This ruler, reigning in the spirit of his father, developed still further the national system of canalization. . . . Five kings after Chamurabi, till 2098 B. C., complete the list of the eleven kings of this first dynasty, who reigned in all 304 years. The epoch made memorable by the deeds and enterprise of Chamurabi is followed by a period of 368 years, of the occurrences of which absolutely nothing is known, except the names and regnal years of another list of eleven kings reigning in the city of Babylon. . . . The foreign non-Semitic race, which for nearly six centuries (c. 1730-1153), from this time onward, held a controlling place in the affairs of Babylonia, are referred to in the inscriptions by the name Kassæ. These Kassites came from the border country between Northern Elam and Media, and were in all probability of the same race as the Elamites. The references to them make them out to be both mountaineers and tent-dwellers. . . . The political sway of the foreign masters was undisputed, but the genius of the government and the national type of culture and forms of activity were essentially unchanged. . . . Through century after century, . . . the dominant genius of Babylonia remained the same. It conquered all its conquerors, and moulded them to its own likeness by the force of its manifold culture, by the appliances as well as the prestige of the arts of peace. . . . The Babylonians were not able to maintain perpetually their political autonomy or integrity, not because they were not brave or patriotic," but because "they were not, first and foremost, a military people. Their energies were mainly spent in trade and manufacture, in science and art. . . . The time which the native historiographers allow to the new [Kasshite] dynasty is 577 years. . . . This Kasshite conquest of Babylonia . . . prevented the consolidation of the eastern branch of the Semites, by alienating from Babylonia the Assyrian colonists. . . . Henceforth there was almost perpetual rivalry and strife between Assyria and the parent country. Henceforth, also, it is Assyria that becomes the leading power in the West."—J. F. McCurdy, *History, prophecy and the monuments*, bk. 2, ch. 3, and bk. 4, ch. 1. (v. 1), *Assyria*.—See also AKKAD; ASSYRIA; CODES: Hammurabi; EGYPT: About B. C. 1500-1400; HITTITES; KASSITES; WOMEN'S RIGHTS: B. C. 2250-538.

Later empire.—"When Ashurbanipal [king of Assyria, 668-626 B. C.] died the time had come to make a fresh attempt for Chaldean independence of Assyria and Chaldean dominance over Babylonia. Immediately after the death of Ashurbanipal we find Nabopolassar (Nabuapul-usur) king of Babylon. We do not know what his origin was. It has been supposed that he might be a son of Kandalanu; and this supposition would explain the readiness and quickness with which he secured the throne. There is, however, not a shadow of evidence for the view. If it were the case, it would certainly seem natural for him to have spoken of his royal origin in one or the other of the few inscriptions which have come down to us. On the other hand, it is not possible

to prove that he was either of pure Babylonian or of Chaldean origin. The kingdom which he founded was, however, plainly Chaldean. The king's supporters were Chaldeans, and as the years went on the Babylonian influence quite gave way to Chaldean, so that the Babylonians may be considered as also losing their historic identity when Nineveh fell. The change of rulers from Ashurbanipal to Nabopolassar was momentous in consequences. With that change the headship of Assyria over the Semitic peoples of Asia came to an end forever, and leadership among them passed to the Chaldeans, whose Semitic blood was probably almost, if not quite, as pure as that of the Assyrians. They had apparently not suffered so great an intermixture with other peoples as had the Babylonians. With this change of rulers there was founded not merely a new dynasty, but also a new kingdom. It is indeed possible to consider this new monarchy as a reëstablishment of the old Babylonian empire, but it is more in accordance with the facts to look on it as a new Chaldean empire succeeding to the wealth and position of the ancient Babylonian empire. As the monarchy which he founded was so plainly Chaldean, it lies near to the other facts to consider Nabopolassar himself a Chaldean."—R. W. Rogers, *History of Babylonia and Assyria*, pp. 492-493.—"Having seated himself firmly upon the throne of the dual monarchy of Babylonia and Assyria, Nabopolassar proceeded to assure to himself the western domains over which the Assyrian kings had held sway. To this end he set out to reëstablish Babylonian power in Syria, where Sargon of Agadé had made his influence felt 2200 years earlier, and Hammurabi had warred as overlord. Unfortunately the Bible narrative does not help us here, and we are indebted to Berosus, as quoted by Josephus, for the history of this period. After the division of the territory of Assyria, of which Egypt formed a part, the eastern allies began to quarrel among themselves, and the King of Babylon decided to act on his own account. Syria at that time was in reality a vassal of Egypt, Egypt having taken possession of it on the fall of Assyria. Having received news that the governor whom he had set over Egypt, and over parts of Cœle-Syria and Phœnicia, had revolted from him, he was not able to bear it any longer, and, committing certain parts of his army to his son Nabuchodonosor (Nabu-kudurri-usur or Nebuchadrezzar), who was then but young, he sent him against the rebel. This is regarded as having taken place in 605 B. C. The governor attacked by the young Nebuchadrezzar was apparently Necho, who was completely defeated at Carchemish, and expelled from Syria."—T. G. Pinches, *From world-dominion to subjection* (*Journal of the Victoria Institute*, v. 49, pp. 113-114).—See also EGYPT: B. C. 670-525; CHALDEA: Chaldeans; PHœNICIANS: B. C. 850-538.

Nebuchadrezzar.—"When Nebuchadrezzar stood at the borders of Egypt and a messenger advised him of his father's death in far-away Babylonia, a crisis had come in the history of a new empire. But for that death Nebuchadrezzar would almost certainly have added Egypt to his laurels, and that were a thrilling possibility. But a danger fully as stirring lay also before him. If he had failed to reach Babylonia before the discordant elements in the new world empire were able to gather unity and force, all that his father had built might readily be destroyed. The day cried for a man of decision and of quick movement. Nebuchadrezzar reached Babylon from the borders of Egypt in season to prevent any outbreak in favor of a usurper, if any such were intended. He

was received as king of Babylon without a sign of any trouble. So began one of the longest and most brilliant reigns (604-562 B. C.) of human history. Nebuchadrezzar has not left the world without written witnesses of his great deeds. In his inscriptions, however, he follows the common Babylonian custom of omitting all reference to wars, sieges, campaigns, and battles. Only in a very few instances is there a single reference to any of these. The great burden of all the inscriptions is building. In Babylon was centered his chief pride, and of temples and palaces, and not of battles and sieges, were his boasts."—R. W. Rogers, *History of Babylonia and Assyria*, p. 504.—"When Nebuchadrezzar came to the throne, he found himself king of a mighty nation, consolidated by his father's talent, and he could boast of having had a hand himself in its enlargement and in measures for its greater security. Everything was, to all appearance, at peace, and the new king had no reason to fear either a pretender to the throne or attack from without. This satisfactory state of things, however, was not to last, for Jehoiakim, King of Judah, as related in 2 Kings xxiv, 1 ff., after paying tribute for three years, rebelled, but was again reduced to subjection (604-602 B. C.). Later, apparently owing to the promises of the King of Egypt, Jehoiachin, son of Jehoiakim, in his turn incurred the hostility of the King of Babylon, who sent an army to besiege Jerusalem, and afterwards journeyed thither himself. The capture of the city followed, and the Jewish king, with his Court, were carried away to Babylon (598 B. C.). The number of captives on this occasion exceeded 10,000, and the treasures of the palace and the Temple formed part of the spoil. The country was annexed, however, for Nebuchadrezzar made Mattaniah, King of Judah instead of Jehoiachin, changing his name to Zedekiah (Bab. form *Sidqâ*, *Sidqaa*, or *Sidqaya*). Passing years seemingly weakened any gratitude Zedekiah may have felt to the power which had raised him, and, encouraged by Pharaoh Hophra, he rebelled in the ninth year of his reign, the result being that Jerusalem was once more besieged. Pharaoh Hophra thereupon marched with an army to the help of his ally; but this move gave the Jewish capital but little relief, for Nebuchadrezzar's army merely raised the siege of Jerusalem long enough to defeat the Egyptians. The city was taken at the end of a year and a half, notwithstanding a very courageous resistance (July, 586 B. C.) [see also JERUSALEM: B. C. 976-168]. Zedekiah, with his army, fled, but was pursued by the Chaldeans and captured near Jericho. Nebuchadrezzar was then at Riblah with his officers (2 Kings xxv, 6), and there judgment was at once pronounced against the faithless vassal, whose sons were slain before his eyes, his own sight destroyed, and he himself carried captive to Babylon. It was a barbarous sentence, but quite in accordance with the customs of the age, just as the legal formalities apparently conformed to Babylonian usage. The destruction of the Temple and all the principal houses in the city, by Nebuzaradan (Nabû-zêr-iddina), the captain of Nebuchadrezzar's guard, followed, and those remaining in the city were carried captive. The lowest class of the people only remained, in order to carry on the cultivation of the land. Naturally a new governor was appointed—not, as might reasonably have been expected, a Babylonian, but a Jew—Gedaliah, son of Ahikam. His death at the hands of his own countrymen took place shortly afterwards, and with him disappeared the last vestige of Jewish rule in Palestine.

"The turn of Tyre came next, and it is said

that Nebuchadrezzar blockaded this maritime port no less than thirteen years (585-573 B. C.). From a fragment of a tablet in the British Museum, referring to Nebuchadrezzar's thirty-seventh year (567 B. C.), we learn that he made an expedition against an Egyptian king, who seems, from the remains of his name, to have been Amasis. In this record a city—or, perhaps, a province—called Putu-yaman is referred to, and described, apparently, as being a distant district 'within the sea.' This idiom is used by Aššur-bani-apli when speaking of Cyprus. [See also PERSIA: B. C. 549-521.] Notwithstanding the doubt which exists with regard to Tyre, it is certain that the Babylonian king ultimately became master of the city, for a contract exists dated there on the 20th of Tammuz, in Nebuchadrezzar's fortieth year. . . . In addition to these two rulers [Sennacherib and Esarhaddon], however, both his sons—Šamaš-šum-ukin or Saosduchinos and Aššur-bani-apli, 'the great and noble Asnapper'—worked at restoring the temples. Nebuchadrezzar, in spite of this, doubtless found much to do there, and numerous records bearing his name deal at length with his architectural work. The great temple of Belus (Merodach), in Babylonia E-sagila, together with E-temen-ana-ki, 'the temple of the foundation of heaven and earth,' also called 'the tower of Babylon,' connected with it, were restored by him, as were likewise many, if not all, of the other fanes of the great city. His inscriptions also confirm what the classical authors say in recording that he made Babylon practically impregnable by means of high and massive walls and a well-constructed moat. To the above must be added the quays which he built along the banks of the Euphrates, which flowed through the city, and the augmentation of the great palace which Nabopolassar, his father, had built, by another just as extensive, which, he states (and this is confirmed by Herodotus), was erected in fifteen days! It is to be noted, however, that all the provisions for the defence of Babylon which he places to his own credit are attributed by Herodotus to Nitocris, who was probably one of Nebuchadrezzar's queens. The hanging gardens, [for description of, see ARCHITECTURE: Oriental: Babylonia] said by Herodotus to have been built by Nebuchadrezzar for his 'Median' queen, Amuhia, were probably already in existence, as is implied by one of the bas-reliefs in the Assyrian Salon of the British Museum; it was carved for Aššur-bani-apli, the 'great and noble Asnapper.' It shows a slope, the highest portion of which is supported on arches, and the whole is richly planted with trees and irrigated by streams of water—a real oasis in a land which, during the hot season, is simply a desert. The celebrated 'Istar-Gate,' discovered by the German explorers, is specially referred to by Nebuchadrezzar in the India House of Inscription. [See also BABYLON: Nebuchadrezzar and the walls of Babylon.] Wise, warlike, energetic, and religious, the second Nebuchadrezzar will always live in history as the type of an Eastern ruler of old who knew how to raise the nation which he governed to the highest pitch of its ancient glory and power. He was succeeded by his son, Awil-Maruduk (Evil-Merodach) in 561 B. C."—T. G. Pinches, *From world-dominion to subjection* (Journal of the Victoria Institute, v. 49, pp. 114-117).—See also JEWS: B. C. 724-604 to B. C. 536-A. D. 50.

Decline of the empire.—"Nebuchadrezzar's son, Amêl-Marduk, was an unworthy successor to his father. During his short reign he was restrained neither by law nor decency, and it is not surprising that in less than three years the priestly party

should have secured his assassination and have set Neriglissar, his brother-in-law, in his place, a man of far stronger character and a soldier. The son of a private Babylonian, Bêl-shum-ishkun, Neriglissar had married a daughter of Nebuchadnezzar, and we may certainly identify him with Nergal-Sharezer, the Rab-mag or Babylonian general who was present at the siege of Jerusalem. Neriglissar's death, less than four years after his accession, must certainly have been the death-blow to any hopes his generals may have entertained of placing the country's military organization and defence upon a sound footing. For his son was little more than a child, and after nine months' reign the priestly party at the capital succeeded in deposing him in favour of one of their own number, Nabonidus, a man of priestly descent and thoroughly imbued with the traditions of the hierarchy. The new king carried on Nebuchadnezzar's tradition of temple-reconstruction with enthusiasm, but he had none of his great predecessor's military aptitude. To his own priestly detachment he added the unpractical character of the archæologist, loving to occupy himself in investigating the past history of the temples he rebuilt, in place of controlling his country's administration. The bent of his mind is well reflected in the account he has left us of the dedication of his daughter, Bêl-shalti-Nannar, as head of the college of votaries attached to the Moon-temple at Ur. It is clear that this act and the accompanying ceremonial interested him far more than the education of his son; and any military aptitude Belshazzar may have developed was certainly not fostered by his father or his father's friends. It was only when the enemy was at the frontier that the king must have realized his own fatuity. Thus with the accession of Nabonidus the close of Babylon's last period of greatness is in sight. But the empire did not crumble of its own accord, for in one of his foundation-records the king boasts that the whole of Mesopotamia and the West, as far as Gaza on the Egyptian border, continued to acknowledge his authority. It required pressure from without to shatter the decaying empire, which from the first must have owed its success in no small measure to the friendly and protective attitude of Media. When that essential support was no longer forthcoming, it lay at the mercy of the new power before which Media herself had already gone down."—L. W. King, *History of Babylon*, pp. 280-282.

Invasion by Cyrus the Persian.—"We next hear that in the seventeenth year of Nabonidus, Cyrus, who had already conquered the rest of Asia, marched upon Babylon [538 B. C.—see PERSIA: 549-521 B. C.]. The native forces met the Persians in battle, but were put to flight, with their king at their head, and took refuge behind the ramparts of Borsippa. Cyrus thereupon entered Babylon, we are told, and threw down her walls. . . . Herodotus states that the last king of Babylon was the son of the great Nebuchadnezzar—to give that monarch his true name—for in so doing he bears out, so far as his testimony is of any value, the words of the Book of Daniel, which not only calls Belshazzar son of Nebuchadnezzar, but also introduces the wife of the latter monarch as being the mother of the ill-fated prince who closed the long line of native rulers. Such being the only testimony of secular writers, there was no alternative but to identify Belshazzar with Nabonidus. . . . Yet the name Nabonidus stood in no sort of relation to that of Belshazzar; and the identification of the two personages was, undoubtedly, both arbitrary and difficult. The cuneiform inscriptions brought to

Europe from the site of Babylon and other ancient cities of Chaldæa soon changed the aspect of the problem. . . . Nabonidus, or, in the native form, Nabu naïd, that is to say, 'Nebo exalts,' is the name given to the last native king of Babylon in the contemporary records inscribed on clay. This monarch, however, was found to speak of his eldest son as bearing the very name preserved in the Book of Daniel, and hitherto known to us from that source alone. . . . 'Set the fear of thy great godhead in the heart of Belshazzar, my firstborn son, my own offspring; and let him not commit sin, in order that he may enjoy the fulness of life.' . . . 'Belshazzar, my firstborn son, . . . lengthen his days; let him not commit sin. . . .' These passages provide us, in an unexpected manner, with the name which had hitherto been known from the Book of Daniel, and from that document alone; but we were still in the dark as to the reason which could have induced the author to represent Belshazzar as king of Babylon. . . . In 1882 a cuneiform inscription was for the first time interpreted and published by Mr. Pinches; it had been disinterred among the ruins of Babylon by Mr. Hormuzd Rassam. This document proved to contain the annals of the king whose fate we have just been discussing—namely, Nabonidus. Though mutilated in parts, it allowed us to learn some portions of his history, both before and during the invasion of Babylonia by Cyrus; and one of the most remarkable facts that it added to our knowledge was that of the regency—if that term may be used—of the king's son during the absence of the sovereign from the Court and army. Here, surely, the explanation of the Book of Daniel was found: Belshazzar was, at the time of the irruption of the Persians, acting as his father's representative; he was commanding the Babylonian army and presiding over the Babylonian Court. When Cyrus entered Babylon, doubtless the only resistance he met with was in the royal palace, and there it was probably slight. In the same night Belshazzar was taken and slain."—B. T. A. Evetts, *New light on the Bible and the Holy Land*, ch. 11, pt. 2.—"In Xenophon's account of the taking of Babylon, the well-known story of the entering of the city through the river-bed whilst a festival was in progress is given. It was apprehended that the Babylonians might try to drive back the invaders by attacking them from the house-tops, but Cyrus pointed out that this could easily be stopped by setting fire to the porches, as the doors were of palm-wood, painted over with bitumen. The entry into the city was duly effected, and by a ruse they got the people within the palace to open the gates. The King (Belshazzar) was found with his sword in his hand, surrounded by his friends, eager to defend him. Overpowered by numbers, he died fighting for his life and his throne; as for saving his country, that was past hoping for. The castles—that is, the palaces of Nabopolassar and Nebuchadnezzar—having been given up by their now demoralized defenders, the people were commanded to deliver up their arms, which they did. The Magi (evidently the Babylonian priesthood) were then ordered to choose for the gods the first-fruits of certain lands owned by them, in accordance with the usage in conquered countries; and houses, palaces, and property were delivered to Cyrus's followers as rewards for their services. The Babylonians were then directed to cultivate their lands, pay their taxes, and serve those to whom they were severally given. Cyrus having let it be known that people might seek his presence, either to pay homage or to consult with him, they came

in such disorderly multitudes that precautions against a renewal of this state of things had to be taken. The crowds who sought him seem to be referred to in the Babylonian Chronicle, but this record contains no mention of disturbances of any kind. The statements of the Chronicle, an official document, are probably to be preferred. When Cyrus entered the palace, he sacrificed to Vesta (doubtless one of the forms of Zerpanitu) and 'Regal Jove' (Bel-Merodach), with other deities whom the Magi (Babylonian priesthood) thought proper. Cyrus seems to have been of opinion that the common people of Babylonia entertained considerable enmity toward him, and he therefore surrounded himself with guards, those most closely attached to him being eunuchs. For the keeping of the city a Persian garrison was installed, for which the Babylonians had to provide. A long speech is attributed to him, in which he tells his followers that according to the laws of war all the property of the conquered belonged to them, and they were entitled to take it if they so chose. Whether this was in any case actually done does not appear, but it may be regarded as hardly probable, as the Babylonians seem to have lived fairly contentedly under his rule—or, rather, under that of Cambyses and Gobryas the Mede, both of whom acted as governors-general in turn. Notwithstanding all possible defects that may have belonged to his nature, Cyrus showed consideration for the country, friendliness toward the people, but severity in matters which concerned his own safety and authority after having assumed the title 'King of Babylon.' In an age far more barbarous than our own he exhibited a moderation and a breadth of view which but few, in more civilized times, have shown; and it may truly be said that if his dynasty did not last the fault was not his."—T. G. Pinches, *From world-dominion to subjection* (*Journal of Victoria Institute*, v. 49, pp. 123-124).

Significance of the fall of Babylon.—"Babylon was now in the possession of an entirely new race of men. The Indo-Europeans, silent for centuries, had come at last to dominion. Nineveh, the greatest center for the pure Semitic stock, had fallen first; it was now Babylon's hour, and Babylon likewise was fallen. The fall of a city which had long wielded a power almost world-wide would at any period be a matter of great moment. But this fall of Babylon was even more than this. Babylon was now the representative city not merely of a world-wide power, it was the representative of Semitic power. The Semites had built the first empire of commanding rank in the world when Hammurapi conquered Sumer and Accad and made Babylon capital of several kingdoms at once. Out of this center had gone the colonists who had built another and, after a time, a great empire at Nineveh. For centuries two Semitic centers of power had vied with each other for the dominion of the world. Both had held it, each in his turn. For nearly a century Nineveh had been in the hands of another race, and the Semitic civilization had been supplanted there. Babylon had been made the center of a new world power by the Chaldean people, but they also were Semites. This branch of the Semitic people had had a short lease of power indeed. The power was now taken from them as the representatives of the Semitic race. Never from that hour until the age of Islam was a Semitic power to command a world-wide empire. The power of the Semite seemed hopelessly broken in that day, and that alone makes the peaceful fall of Babylon a momentous event. But Babylon stood for more than mere Semitic power. It stood

in a large sense for Semitic civilization. . . . Assyria represented far more than Babylonia the prowess of the Semite upon fields of battle. Babylon had stood for Semitic civilization, largely intermixed with many elements, yet Semitic after all. Here were the great libraries of the Semitic race. Here were the scholars who copied so painstakingly every little omen or legend that had come down to them out of the hoary past. Here were the men who calculated eclipses, watched the moon's changes, and looked nightly from observatories upon the stately march of constellations over the sky. Here were the priests who preserved the knowledge of the ancient Sumerian language, that its sad plaints and solemn prayers might be kept for use in temple worship. Much of all this was worthy of preservation—if not for any large usefulness, certainly for its record of human progress upward. All this was now fallen into alien hands. Would it be preserved? Would it be ruthlessly or carelessly destroyed? The greatest thoughts of the Semitic mind and the greatest emotions of its heart were not, indeed, Babylonian, and even if they were, they could not die. Not for many centuries would the Semite be able to found another such center. It was indeed a solemn hour of human history. The glory of Babylon is ended. The long procession of princes, priests, and kings has passed by. No city so vast had stood on the world before it. No city with a history so long has even yet appeared. From the beginnings of human history it had stood. It was in other hands now, and it would soon be a shapeless mass of ruins, standing alone in a sad, untilled desert."—R. W. Rogers, *History of Babylonia and Assyria*, pp. 574-576.—See also CHRONOLOGY: Babylonian method; EDUCATION: Ancient: B. BACCHIC FESTIVALS. See DIONYSIA AT ATHENS.

BACCHUS (Roman), or Dionysus (Greek), god of the vine and of life. His worship was widespread and appeared in numerous forms but was always connected with vegetation and fruitfulness generally. His chief attributes were the thyrsus, a rod ending in a pine cone and decorated with ivy, and the cantharus, a two-handled drinking cup. One form of his worship was the Attic Dionysia, a joyous and rather boisterous celebration (see DIONYSIA AT ATHENS), but another called the Triatic Dionysia took the form of a wild orgy. It was introduced into Rome in the 2nd century B. C. and called the Bacchanalia. Bacchus was the offspring of Zeus and Semele, the

daughter of Cadmus. Through the jealousy of Hera, Semele was destroyed by a thunderbolt but her unborn child was saved by Zeus, and intrusted to Hemes who delivered it to the nymphs of Nysa to be reared. At Nysa (which has never been localized) Bacchus discovered the powers of the grape and became the leader of a band of nymphs and satyrs.

BACH, John Sebastian (1685-1750), German composer, greatest master of the contrapuntal school of musical composition, whose works mark the culmination of the polyphonic style and at the same time reflect the new homophonic style; equally great as composer, organist and harpsichord player. His enormous output includes organ sonatas, preludes and fugues, compositions for harpsichord and orchestra, passion-music, sacred cantatas, etc. They constitute the source of modern music.—See also MUSIC: Modern: 1650-1827.

BACH, Karl Philipp Emanuel (1714-1788), German composer, third son of John Sebastian Bach; founder of the forms of instrumental composition which mark the transition from his father's style to that of Haydn and Mozart. He wrote church music including many cantatas, passions and oratorios. See MUSIC: Modern: 1650-1827.

BACON, Augustus Octavius (1830-1914), American legislator.—Resolutions introduced January 11, 1899.—Address of January 18, 1899. See U. S. A.: 1899 (January-February).

BACON, Francis (Baron Verulam, Viscount St. Albans) (1561-1626), English philosopher, statesman and essayist. "Made Lord Chancellor, in 1618, and created Viscount St. Albans, in 1621, he had, in spite of his unusual abilities, risen very slowly. At once a man of affairs and a man of letters, he wrote on many subjects, philosophy, scientific theory, literature, history, and law. . . . He favored a strong monarchy resting on the support of the people and acting for the popular good, informed and advised by a loyal Parliament. . . . Always prone, however, to overlook practical difficulties, he failed to recognize that Parliament would no longer tolerate even a benevolent despot, and that, in any event, James was not the man to exercise such power."—A. L. Cross, *History of England and greater Britain*, p. 296.—Bacon was impeached by Parliament in 1621 on a charge of bribery. [See ENGLAND: 1625: Gains of Parliament.] The years following his impeachment he devoted to literature and science. "The significance of Lord Bacon's work lies not in the application of his method of reasoning [see EUROPE: Middle Ages: Scholasticism followed by humanism], but rather in his insistence upon experimentation and observation of nature, instead of blind reliance upon a perverted logic and an unsubstantiated authority. . . . Bacon shows up the obstacles that lie in the path of human progress,—the ignorance and prejudice, traditional views and blind worship of authority which hold man slave to nature. . . . The great object of

all science is to recover man's sovereignty over nature. . . . He is the first to formulate the idea of modern progress through man's conscious adjustment to and scientific control over the natural forces of the universe. . . . [See also EDUCATION: Modern: 1561-1626.] It is true that Bacon did not himself make any real contribution to scientific knowledge and that his fear of accepting improved hypotheses led him to reject the Copernican theory of the solar system,—led him also to underestimate and even disregard the work which was being done by some of his contemporaries. . . . But perhaps the most significant effect of Bacon's influence upon the progress of natural science . . . was the impetus given by his 'New Atlantis' to the organization of the Royal Society of London for the Advancement of Science, which took place in 1662."—G. F. Caldwell, *English contributions to scientific thought (English leadership, pp. 240-244)*.—As for Bacon's literary career, he was undoubtedly the greatest man of his time. The so-called Baconian theory, which originated in the nineteenth century, holds that Bacon was the author of Shakespeare's plays. Among his greatest works are: "Novum organum," "New Atlantis," "The advancement of learning," and the celebrated series of "Essays."—See also ENGLISH LITERATURE: 1530-1660.—For his part in the intellectual revolution of the time, see EUROPE: Modern Period: Revolutionary Period.

BACON'S REBELLION, an uprising directed originally against the murderous and predatory assaults of the Indian population of Virginia upon the frontier people in the middle of the seventeenth century. It was headed by Nathaniel Bacon, who was impeded at every step in his defense of the white border population by the unwillingness of Governor Berkeley to assist his cause, and finally culminated in successive attacks by Bacon and his followers on the capital of Virginia. At the height of his success, Bacon died and the movement collapsed.—See also VIRGINIA: 1660-1677.

BACTRIA, or Bactriana, the ancient name of a country in Asia situated north of the Hindu Kush range. "Where the edge [of the tableland of Iran] rises to the lofty Hindu Kush, there lies on its northern slope a favored district in the region of the Upper Oxus. . . . On the banks of the river, which flows in a north-westerly direction, extend broad mountain pastures, where support is found in the fresh mountain air for numerous herds of horses and sheep, and beneath the wooded hills are blooming valleys. On these slopes of the Hindu Kush, the middle stage between the table-land and the deep plain of the Caspian Sea, lay the Bactrians—the Bakhtri of the Achaemenids, the Bakhdihi of the Avesta. . . . In ancient times the Bactrians were hardly distinguished from nomads; but their land was extensive and produced fruits of all kinds, with the exception of the vine. The fertility of the land enabled the Hellenic princes to make great conquests."—M. Duncker, *History of antiquity, bk.*

6, *ch. 2*.—The Bactrians were among the people subjugated by Cyrus the Great and their country formed part of the Persian empire until the latter was overthrown by Alexander (see MACEDONIA, &c.: B. C. 330-323). In the division of the Macedonian conquests, after Alexander's death, Bactria, with all the farther east, fell to the share of Seleucus Nicator and formed part of what came to be called the kingdom of Syria. About 256 B. C. the Bactrian province, being then governed by an ambitious Greek satrap named Diodotus, was led by him into revolt against the Syrian monarchy, and easily gained its independence, with Diodotus for its king (see SELEUCIDÆ: 281-224 B. C.). "The authority of Diodotus was confirmed and riveted on his subjects by an undisturbed reign of eighteen years before a Syrian army even showed itself in his neighbourhood. . . . The Bactrian Kingdom was, at any rate at its commencement, as thoroughly Greek as that of the Seleucidæ." "From B. C. 206 to about B. C. 185 was the most flourishing period of the Bactrian monarchy, which expanded during that space from a small kingdom to a considerable empire"—extending over the greater part of modern Afghanistan and across the Indus into the Punjab. But meantime the neighboring Parthians, who threw off the Seleucid yoke soon after the Bactrians had done so, were growing in power and they soon passed from rivalry to mastery. The Bactrian kingdom was practically extinguished about 150 B. C. by the conquests of the Parthian Mithridates I., "although Greek monarchs of the Bactrian series continued masters of Cabul and Western India till about B. C. 126."—G. Rawlinson, *Sixth great oriental monarchy*, *ch. 3-5*.—Bactria now forms part of Afghanistan, bordering on Bokhara. Since the World War the Russian soviet government has acquired considerable influence in this whole region and conditions are unsettled.

BADAKSHAN. See TURKESTAN.

BADEN.—A German republic, formerly a grand duchy under the empire.

Early Suevic population.—The original inhabitants of the territory which now constitutes Baden, were the Suevi, a wandering tribe which had spread throughout Germany, probably during the reign of Alexander Severus, about A. D. 235. See SUEVI.

1112-1813.—**Early history**.—Charles Frederick.—**Aggrandizement in Napoleonic wars**.—**Made an Electorate**.—**A Grand Duchy**.—**Member of the Confederation of the Rhine and later of the French alliance**.—The history of Baden practically begins with Hermann, the son of the margrave of Verona, who took the title of margrave of Baden in 1112. With his sons and grandsons originated the lines of Baden-Baden and Baden-Hochberg, and about a century later, Baden-Hochberg was divided into Baden-Hochberg and Baden-Sausenberg. After subsequent aggrandizement and subdivisions the territories of Baden-Baden and Baden-Hochberg were united under margrave Bernard I in 1307, and with the extinction of the Baden-Sausenberg line in 1503, the whole of Baden was united under Christopher. He divided it, however, again among his sons, who in 1535 founded the lines of Baden-Baden and Baden-Pforzheim, the latter called Baden-Durlach since 1565. After further strife and subdivision Baden became definitely united in 1771 under a single ruler. "The ruler at this time was the Margrave Charles Frederick, one of the noblest and most enlightened princes of his time; a man of learn-

ing, and the patron of science and art; a true father to his people, who through his exemplary administration rescued his land from imminent financial ruin; and, favored by the fertility of its soil as well as by the natural intelligence and industry of the inhabitants, raised it again to prosperity; in 1767 he abolished torture, and in 1783 serfdom, thereby sacrificing 40,000 florins of yearly income."—M. Philippon, *Age of Frederick the Great*, v. 15 of *History of all nations*, p. 280.—Though greatly devastated in 1796 owing to its participation in the wars of the French Revolution, on the side of Austria, its territories became enlarged during the Napoleonic wars. (See also AUSTRIA: 1798-1806.) After the treaty of Lunéville, by which it acquired considerable territory (see GERMANY: 1801-1803), Charles Frederick took the title of elector, in 1803, and upon further aggrandizement by the Treaty of Pressburg, he took the title of grand-duke, in 1806. (See GERMANY: 1805-1806, and 1806: January-August.) The same year Baden joined the Confederation of the Rhine, but abandoned it in 1813 to join the Allies against Napoleon. (See FRANCE: 1814: January-March.)

1812.—**Extent of territory**. See EUROPE: Modern: Map of Central Europe in 1812.

1815.—**Embraced in Germanic confederation**. See VIENNA, CONGRESS OF.

1818-1831.—**Constitution granted**.—**Leader of German states in constitutional movement**. See SUFFRAGE, MANHOOD: Germany: 1800-1840; and 1840-1850.

1833.—**Member of Zollverein**. See TARIFF: 1833.

1848.—During the German uprisings of 1848, Baden became the center of revolutionary activities, its fortress Rastadt serving as an entrenched camp for the revolutionists. After several unsuccessful attempts the revolution was suppressed by Prussian troops and the leaders executed. See GERMANY: 1848-1850.

1862-1866.—**Allied with Austria in war against Prussia**. See AUSTRIA: 1862-1866.

1866.—**Seven weeks' war**.—**Indemnity and territorial cession to Prussia**. See GERMANY: 1866.

1870-1871.—**Member of North German confederation**.—**State of the German empire**.—By a treaty of November 15, 1870, Baden became a member of the North German confederation, and with the transformation of the latter into the German empire in 1871, it became one of its states.—See also GERMANY: 1870 (September-December), and 1871 (January).

1918.—**Declared a republic**.—**Its constitution**.—"November, 1918, the Grand Duke abdicated and a republic was declared. The Constitution calls for a cabinet of six members elected by the legislature, equal male and female suffrage for all over 20 years. The Initiative and Referendum are also part of the Constitution."—J. Moody, *Moody's Analyses of investments* (1910), p. 1172.

1919.—**Economic reconstruction after the World War**.—**Trade provisions**.—"The Baden Ministry of Home Affairs has created a Foreign Trade Office for the promotion of imports and exports, with business premises at Karlsruhe. An Advisory Council, on which the import and export organization concerned will be represented, will be formed in conjunction with the Office. There will be a representative also in Berlin. It is further intended to appoint a Baden representative of Commerce in Switzerland."—*Weltwirtschaftszeitung*, May 23, quoted by the *Daily Review of the Foreign Press, Economic Supplement*, June 25, 1919.

1920.—General survey.—Physical conditions.—Resources and industries.—Area.—Population.—Cities.—Education.—Baden occupies a territory which belongs to the basin of the Rhine and is surrounded by Bavaria, Hesse-Darmstadt, Alsace-Lorraine, Switzerland, Württemberg, and the Bavarian Palatinate, from which it is separated by the Rhine, extending along its whole length on the west. Eighty per cent of the area is covered by the Schwarzwald and the less elevated ranges of the Odenwald, which slope down towards the Rhine valley, the only great plain in Baden. Besides the Rhine, its greatest rivers are the Main and the Neckar. The Danube also takes its rise here. Of its numerous lakes, the Bodensee is best known. It has also famous mineral springs. "The leading manufactures are tiles, machinery, chemicals, jewelry, and clocks. The chief agricultural products are cereals, potatoes, hay, tobacco, hops, grapes, and vegetables. Salt and building stone are the only mineral products."—J. Moody, *Moody's analyses of investments* (1919), p. 1172.—According to the latest census of 1910, its area is 5,817 square miles with a population of 2,208,503. The majority (1,271,015 in 1910) are Catholics; the remainder are Protestants and Jews. The principal cities are Mannheim (an important river port), Karlsruhe (the capital), Freiburg, Pforzheim and Heidelberg.—See also GERMANY: Map.

BAFFIN, William (?-1622), English navigator and explorer. His voyage in 1616, in search of a northwest passage to India, resulted in the discovery of the bay between Greenland and Canada which he named Baffin's bay. His account of the trip was published by the Hakluyt Society, 1849.

BAFFIN BAY, a great gulf in northeastern Canada, part of the strait separating Baffin Land from Greenland. It was named by William Baffin who discovered and explored it in 1615-1616. The bay is sheeted with ice in the winter, but is navigable through channels in the ice during the summer. It communicates with the Atlantic ocean by Davis strait, and with the Arctic ocean through Lancaster, Jones and Smith straits, also named by Baffin. It was explored in the early twentieth century. See ARCTIC EXPLORATION: 1910-1916.

BAFFIN LAND, large island opposite Greenland. See ARCTIC EXPLORATION: Map of Arctic regions.

Extent of territory. See CANADA: Map.

BAGAMOYO, a seaport in Tanganyika territory, formerly German East Africa, about fifty miles north of Dar-es-Salaam. In 1916, during the World War was taken from the Germans by the British. [See WORLD WAR: 1916: VII. African theater: a, 11.] "North of Dar-es-Salaam the principal ports are Pagan and Bagamoyo. The latter is immediately opposite the island of Zanzibar and was at one time the most important port of the country, because, prior to the construction of the railroads, the development of towns, and the establishment of regular and direct communication with Europe, the bulk of the trade of German East Africa was carried on through Zanzibar. Caravan routes from the interior centered at Bagamoyo and the products of the country were transported in sailing vessels to Zanzibar only 30 miles away. Similarly the imports were first brought into Zanzibar and then distributed, largely by Indian merchants, to German East Africa via Bagamoyo. The building of the Uganda Railway, which diverted a large part of the trade of the north and northwestern sections to the route via Lake Victoria and Mombasa, the decline of the dhow traffic through the absorption of the trade by the German line of steamers, the building of the railroads to the interior from Dar-es-Salaam and Tanga, and the lack of a good harbor are the main factors that have contributed to the decline of Bagamoyo. A certain amount of trade still follows the old route, but it is rapidly decreasing."—U. S. Consular report, 1914.

BAGAUDS, Insurrection of the (A. D. 287).—The peasants of Gaul, whose condition had become very wretched during the distractions and misgovernment of the third century, were provoked to an insurrection, A. D. 287, which was general and alarming. It was a rising which seems to have been much like those that occurred in France and England eleven centuries later. The rebel peasants were called Bagauds,—a name which some writers derive from the Celtic word "bagad" or "bagat," signifying "tumultuous assemblage." They sacked and ruined several cities,—taking Autun after a siege of seven months,—and committed many terrible atrocities. The Emperor Maximian—colleague of Diocletian,—succeeded, at last, in suppressing the general outbreak, but not in extinguishing it everywhere. There were traces of it surviving long afterwards.—P. Godwin, *History of France*, v. 1: *Ancient Gaul*, bk. 2, ch. 6.—See also SERFDOM.

762-763.—Founding of the new capital of the Caliphs.—"The history of Baghdad, as a metropolis, coincides with the history of the rise and fall of the Abbasid Caliphs [see also **CALIPHATE**: 715-750; 763; and 815-945]; for in the East it would appear to be almost a necessity of the case that every new dynasty should found a new capital . . . The last Omayyad Caliph, Marwān II, was routed and slain in the year 132 (A.D. 750), and the first Abbasid Caliph well merited his name of Saifāh—the 'Shedder of blood'—he having been constantly occupied, during the four years of his reign, in hunting down and putting to death every male descendant of the house of Omayyah, save one youth only who, escaping to Spain, ultimately obtained rule there, and founded the dynasty which afterwards came to be known as the Caliphate of Cordova. [See also **CALIPHATE**: 756-1031.] In 136 (A.D. 754) Mansūr succeeded his brother Saifāh on the throne, and during the twenty-two years of his reign built Baghdad, and there organized the government of the Abbasids, which first established in power, and then suffering a long decay, was destined to last for five centuries seated on the banks of the Tigris. . . . During the last period of the Sassanian dynasty, Persian Baghdad, on the western side of the Tigris, had been a thriving place, and at the period of the Moslem Conquest a monthly market was held here. It became very famous in the early annals of Islam for the very successful raid of which it was the scene. During the Caliphate of Abu Bakr, Khālid, the general of the Arab army, after advancing some way into Mesopotamia, suddenly dispatched a body of troops against this Suk Baghdād, as the 'Market' held at the Sarāt Point was then called; the raiders surprised the town 'and the Moslems filled their hands with gold and silver, obtaining also the wherewithal to carry away their booty,' for they promptly returned again to Anbār on the Euphrates, where Khālid lay encamped. After this incident of the year 13 (A.D. 634) Baghdad appears no more in history until Mansūr, seeking out a site for the new capital, encamped here in the year 145 (A.D. 762). We are told that the spot was then occupied by several monasteries (*Dayr*), chiefly of Nestorian monks, and from them Mansūr learned that among all the Tigris lands this district especially was celebrated for its freedom from the plague of mosquitoes, the nights here being cool and pleasant even in the height of summer. These lesser advantages, doubtless, had no inconsiderable influence with Mansūr in the final choice of this as the place for the new capital of the Abbasids in Mesopotamia; but the practical foresight shown by the Caliph has been amply confirmed by the subsequent history of Baghdad. This city, called into existence as by an enchanter's wand, was second only to Constantinople in size during the Middle Ages, and was unrivalled for splendour throughout Western Asia, becoming at once, and remaining for all subsequent centuries, the capital of Mesopotamia. Wars, sieges, the removal for a time by the Caliphs of the seat of government to Sāmarrā (higher up the Tigris), even the almost entire destruction of the city by

the Mongols in A. D. 1258, none of these have permanently affected the supremacy of Baghdad as capital of the Tigris and Euphrates country, and now after the lapse of over eleven centuries, the Turkish governor of Mesopotamia still resides in the city founded by the Caliph Mansūr."—G. Le Strange, *Bagdad during the Abbasid Caliphate*, pp. 1-13.—See also **AFGHANISTAN**.

ALSO IN: M. Sykes, *Caliphs' last heritage*, pp. 216-218.

763-833.—Seat of the Abbasid Caliphs.—Wealth and intellectual leadership.—"The reasons which had made the plain of Mesopotamia the site where, one after another, all the great empires of Western Asia had set up the centre of their power dictated the choice of the same region to the Caliphs. In the eighth century it was still one of the richest agricultural countries in the world, as it had been from immemorial time, and then, as for ages before, the chief commercial land routes between the East and the West passed through it. Basra and Kufa were too turbulent for the home of the Caliph, and El Mansur's first aim was to make the imperial residence secure. . . . It was enclosed by three walls and a ditch. The outer wall was about four miles round, and between it and the second, or main, wall there was an open ring which could be patrolled. This prevented enemies or traitors outside from communicating with their friends within. Between the second and the third wall lay the houses of the city. Inside the third wall was another open space, more than a mile across, and therefore large enough for troops to manœuvre in. In the centre was the Caliph's palace, the 'Golden Gate.' Roads from the four city gates to the central space divided the four quarters of the city. These roads were flanked by barracks and lateral walls with side gates, so that in case of disturbance each quarter could be shut off from the others. It grew rapidly, and towards the close of the ninth century it is said to have covered 25 square miles.

"It is impossible even to sketch the history of which it now became the centre. All the wealth, the learning, and the art of the East found their chief home in the city which claimed both the civil and religious allegiance of Islam from the Great Wall of China and the Indus to the shores of the Atlantic, and from the Caucasus to the Sahara. Its wonderful system of irrigation canals, its mosques and palaces, its vast and luxuriant gardens, its flourishing colleges, famous wherever the Koran was read, its baths and its bazaars thronged by merchants from all the East, its looms, its cunning artificers, and its immense population made it the greatest and the most renowned city in the world. The revenue of the Caliphs has been estimated at from £72,000,000 to £96,000,000 of money at its present value, and they lavished it upon every form of Oriental luxury at their Court. The fellow-countrymen of Sindbad, whose home was Baghdad and his port Basra, and of Hasan, who sailed to the Islands of Wak, were daring seamen and observant travellers. They were mathematicians, geographers, astronomers, alchemists, physicians, and surgeons. Algebra and Arabic numerals, the names of many constellations, the gilding and silvering of pills, with its mystic relation to the influence of the planets, are faint memorials of their almost forgotten labours. Avicenna himself was the most famous of Arab physicians, and his works were still commented upon in the University of Montpellier—itsself of Arab origin—well on into the nineteenth century. It was under Mamun (813-833) that an event in letters took place which still continues to influence the thought of the world. The Caliph, a noble

patron of learning, directed that a number of Greek authors should be translated into Arabic. Amongst them was Aristotle, and it was from Latin renderings of this version and of the Arabic commentaries upon it that the medieval schoolmen derived their first acquaintance with fundamental portions of the Aristotelian system."—*The Times* (London), *weekly edition*, Mar. 16, 1917.—See also **BARNECIDES**; **CALIPHATE**: 763.

1258.—The Fall of the Caliphate.—Destruction of the city by the Mongols.—In 1252, on the accession of Mangu Khan, grandson of Jingis Khan, to the sovereignty of the Mongol Empire [see **MONGOLS**], a great Kuriltai or council was held, at which it was decided to send an expedition into the West, for two purposes: (1), to exterminate the Ismaileans or Assassins, who still maintained their power in northern Persia; (2), to reduce the Caliph of Bagdad to submission to the Mongol supremacy. The command of the expedition was given to Mangu's brother Khulagu, or Houlagou, who performed his appointed tasks with thoroughness and unmerciful resolution. In 1257 he made an end of the Assassins, to the great relief of the whole eastern world, Mahometan and Christian. In 1258 he passed on to Bagdad, preceded by an embassy which summoned the caliph to submit, to raze the walls of Bagdad, to give up his vain pretensions to the sovereignty of the Moslem world, and to acknowledge the Great Khan for his lord. The feeble caliph and his treacherous and incapable ministers neither submitted nor made vigorous preparations for defence. As a consequence, Bagdad was taken after a siege which only excited the ferocity of the Mongols. They fired the city and slaughtered its people, excepting some Christians, who are said to have been spared through the influence of one of Khulagu's wives, who was a Nestorian. The sack of Bagdad lasted seven days. The number of the dead, we are told by Raschid, was 800,000. The caliph, Mostasim, with all his family, was put to death.—H. H. Howorth, *History of the Mongols*, v. 1, pp. 193-201.

For a considerable period before this final catastrophe, in the decline of the Seljuk Empire, the Caliphate at Bagdad had become once more "an independent temporal state, though, instead of ruling in the three quarters of the globe, the caliphs ruled only over the province of Irak Arabi. Their position was not unlike that of the Popes in recent times, whom they also resembled in assuming a new name, of a pious character, at their inauguration. Both the Christian and the Moslem pontiff was the real temporal sovereign of a small state; each claimed to be spiritual sovereign over the whole of the Faithful; each was recognized as such by a large body, but rejected by others. But in truth the spiritual recognition of the Abbasside caliphs was more nearly universal in their last age than it had ever been before." With the fall of Bagdad fell the caliphate as a temporal sovereignty; but it survived, or was resurrected, in its spiritual functions, to become merged, a little later, in the supremacy of the sultan of the Ottoman Turks. "A certain Ahmed, a real or pretended Abbasside, fled [from Bagdad] to Egypt, where he was proclaimed caliph by the title of Al Mostanser Billah, under the protection

of the then Sultan Bibars. He and his successors were deemed, in spiritual things, Commanders of the Faithful, and they were found to be a convenient instrument both by the Mameluke sultans and by other Mahometan princes. From one of them, Bajazet the Thunderbolt received the title of Sultan; from another, Selim the Inflexible procured the cession of his claims, and obtained the right to deem himself the shadow of God upon earth. Since then, the Ottoman Padishah has been held to inherit the rights of Omar and of Haroun, rights which if strictly pressed, might be terrible alike to enemies, neutrals, and allies."—E. A. Freeman, *History and conquest of the Saracens*, lecture, 4.

1393-1638.—Under Mongol rule.—Timur.—Persian and Turkish domination.—"Baghdad had ceased to be the spiritual centre of Islam. . . . Bagdad and Mesopotamia have been blasted for six centuries by the Mongol devastation. By ruining the whole system of irrigation, Hulagu in a single year "destroyed the work of three hundred generations." The pagan empire of the Il Khans which he founded presently became a feeble Shiah monarchy, and when the terrible Timur the Lame (Tamerlane) arose to imitate and to surpass the career of Chingiz, Bagdad opened its gates on his approach. Nine years later in 1401 it defied the conqueror and was taken by assault. [See **TIMUR**.] . . . Timur died in his splendid palace at Samarcand in 1405, and Bagdad fell into the hands of the 'Black Sheep' and then of the 'White Sheep' Mongol dynasties. In the last year of the 15th century Shah Ismail founded the dynasty of the Safavis—the 'Sophys' of Shakespeare and Milton—who at once gained the loyalty of the Shiah Persians because the blood of Ali ran in their veins. Against Shah Ismail the Turks, led by Selim 'the Grim,' won the great battle of Chaldiran in 1514 and occupied Tabriz, but the Sultan was prevented from prosecuting his conquests by the mutinous temper of his troops.

"In 1534 the greatest of the Ottoman Sultans, Suleiman 'the Law-giver,' 'the Magnificent,' the conqueror of Belgrade and of Rhodes, the victor of Mohács, the besieger of Vienna, turned his arms against Persia. After he had recaptured Tabriz, Bagdad surrendered without a blow. . . . Suleiman's eastern conquests were not long retained. In 1604 Shah Abbas the Great, with whose troops Sir Robert Sherley charged, utterly defeated the Turks near Lake Urumiah. Bagdad and Mosul, the holy places Nejj and Kerbela, and the provinces of Azerbaijan and Kurdistan were the fruits of the victory. Bagdad seems to have again passed into the possession of the Turks soon after, for in November, 1623, it was betrayed to the Shah by the son of the Turkish commandant. . . .

"Bagdad, however, was not long to remain in Persian hands. Two attempts to recapture it failed, and ruined the Grand Viziers who made them. Hafiz Pasha vainly besieged it for nine months in 1625-6, and Khosru Pasha retired defeated from its walls in 1630. But eight years later the bloodthirsty Murad IV., the last of the fighting Sultans, led a great army against it. The Persians made a valiant defence for 40 days and the Grand Vizier was killed in an assault. Then, as no relief came, the city surrendered on Christmas Day, 1638. Pretexes were found first for slaughtering the garrison and then for a wholesale butchery."—*The Times* (London), *weekly edition*, Mar. 16, 1917.—See also **TURKEY**: 1623-1640.

1638-1919.—**Turkish rule.**—From its recapture by the Turks, Bagdad remained a Turkish possession with a brief interval during the first half of the nineteenth century, when it became an independent pashalic.

1919-1921.—**Strategic, economic and political center.**—Objective in the World War.—Bagdad controls much of the trade of Mesopotamia and Arabia, and is the strategic center for the region between Constantinople and the Persian gulf. It is the terminus of a railroad from Constantinople projected before the war and hurried to completion since 1914. (See also MESOPOTAMIA.) It was the objective of the Russian and British campaign of 1915-16 which was temporarily abandoned after the fall of Kut-el-Amara in April, 1916. (See WORLD WAR: 1916: VI. Turkish theater: d, 3.) In January, 1917, the British began a new advance up the Tigris and occupied Bagdad on March 11, 1917. The continuation of the advance from the city caused a Turkish retreat into Mesopotamia, whither they were pursued by the Russians from Persia. A junction of the British and Russian forces on April 4 was followed by a British drive up the Bagdad railway to Samara, and the British occupation of the Euphrates valley. Operations in this theater were retarded by the Russian revolution.—See also BAGDAD RAILWAY; MESOPOTAMIA; WORLD WAR: 1917: VI. Turkish theater: a, 1; a, 1, iv; a, 1, v; and I. Summary: b.

By the peace treaty with Turkey, Mesopotamia was created an independent state and allotted under a mandate to Great Britain by the Supreme Council. See SÈVRES, TREATY OF: 1920: Part III. Political clauses: Syria and Mesopotamia.

BAGDAD RAILWAY: The Plan.—German designs.—“In 1888, a group of German financiers, backed by the Deutsche Bank, which was to have so powerful a future in Turkey, asked for the concession of a railway line from Ismid to Angora. The construction of this line was followed by concessions for extension from Angora to Cæsarea and for a branch from the Ismid-Angora line going south-west from Eski Sheir to Konia. The extension to Cæsarea was never made. That was not the direction in which the Germans wanted to go. The Eski-Sheir-Konia spur became the main line. The Berlin-Bagdad-Bassorah “all rail route” was born. The Germans began to dream of connecting the Baltic with the Persian Gulf. The Balkan Peninsula was to revert to Austria-Hungary, and Asia Minor and Mesopotamia to Germany. The south Slavs and the populations of the Ottoman Empire would be dispossessed (the philosopher Hæckel actually prophesied this in a speech in 1905 before the Geographical Society of Jena). Russia would be cut off from the Mediterranean. This was the Pan-Germanist conception of the Bagdadbahn. From the moment the first railway concession was granted to Germans in Asia Minor, which coincided with the year of his accession, Wilhelm II has been heart and soul with the development of German interests in the Ottoman Empire. His first move in foreign politics was to visit Sultan Abdul Hamid in 1889, when he was throwing off the yoke of Bismarck. In 1898, the Kaiser made his second voyage to Constantinople. This voyage was followed by the concession extending the railway from Konia to the Persian Gulf. It was the beginning of the Bagdadbahn in the official and narrower sense. After this visit of the Kaiser to Abdul Hamid, the pilgrimage was continued to the Holy Land. The great Protestant German Church, whose corner-stone was laid by his father in 1869, was solemnly inaugurated by the Kaiser.

As solemnly, he handed over to Catholic Germans the title to land for a hospital and religious establishment on the road to Bethlehem. Still solemnly, at a banquet in his honour in Damascus, he turned to the Turkish Vali, and declared: ‘Say to the three hundred million Moslems of the world that I am their friend.’ To prove his sincerity he went out to put a wreath upon the tomb of Saladin. Wilhelm II at Damascus is reminiscent of Napoleon at Cairo. Egypt and Syria and Mesopotamia have always cast a spell over men who have dreamed of world empires; and Islam, as a unifying force for conquest, has appealed to the imagination of others before the . . . [former] German Kaiser. The revelation of Germany’s ambition by the granting of the concession from Konia to the Persian Gulf, and the application of the German financiers for a firm constituting the Bagdad Railway Company, led to international intrigues and negotiations for a share in the construction of the line through Mesopotamia. It would be wearisome and profitless to follow the various phases of the Bagdad question. Germany did not oppose international participation in the concession. The expense of crossing the Taurus and the dubious financial returns from the desert sections influenced the Germans to welcome the financial support of others in an undertaking that they would have found great difficulty in financing entirely by their own capital. The Bagdadbahn concession was granted in 1899. The firm constituting the company followed in 1903. Russia did not realize the danger of German influence at Constantinople, and of the eventualities of the German ‘pacific penetrations’ in Asia Minor. She adjusted the Macedonian question with Emperor Franz Josef in order to have a free hand in Manchuria, and she made no opposition to the German ambitions. She needed the friendly neutrality of Germany in her approaching struggle with Japan. Once the struggle was begun, Russia found herself actually dependent upon the goodwill of Germany. It was not the time for Petrograd to fish in the troubled waters of the Golden Horn. The situation was different with Great Britain. The menace of the German approach to the Persian Gulf was brought to the British Foreign Office just long enough before the Boer crisis became acute for a decision to be made. Germany had sent engineers along the proposed route of her railway. She had neglected to send diplomatic agents! The proposed—in fact the only feasible—terminus on the Persian Gulf was at Koweit. Like the Sultan of Muscat, the Sheik of Koweit was practically independent of Turkey. While showing deference to the Sultan as Khalif, Sheik Mobarek resisted every effort of the Vali of Bassorah to exercise even the semblance of authority over his small domain. In 1899, Colonel Meade, the British resident of the Persian Gulf, signed with Mobarek a secret convention which assured to him ‘special protection,’ if he would make no cession of territory without the knowledge and consent of the British Government. The following year, a German mission, headed by the Kaiser’s Consul General at Constantinople, arrived in Koweit to arrange the concession for the terminus of the Bagdadbahn. They were too late. The door to the Persian Gulf was shut in the face of Germany. Wilhelm II set into motion the Sultan. The Sublime Porte suddenly remembered that Koweit was Ottoman territory, and began to display great interest in forcing the Sheik to recognize the fact. A Turkish vessel appeared at Koweit in 1901. But British warships and British bluejackets upheld the independence of Koweit! Since the Constitution of

1908, all the efforts of the Young Turks at Koweit have been fruitless. Germany [stood] blocked. British opposition to the German schemes was not limited to the prevention of an outlet of the Bagdadbahn at Koweit. Since 1708, when the East India Company established a resident at Bagdad to spy upon and endeavour to frustrate the influence of the French, just beginning to penetrate towards India through the ambition of Napoleon to inherit the empire of Alexander, British interests have not failed to be well looked after in Lower Mesopotamia. After the Lynch Brothers in 1860 obtained the right of navigating on the Euphrates, the development of their steamship lines gradually gave Great Britain the bulk of the commerce of the whole region, in the Persian as well as the Ottoman hinterland of the Gulf. In 1895, German commerce in the port of Bushir was non-

increased, if it passed by the Mediterranean littoral around the head of the Gulf of Alexandretta. Then the control of the railway would have been at the mercy of the British fleet. When the 'revised' plans went from the Ministry of Public Works to the Ministry of War, it was not hard for the German agents to persuade the General Staff to restore the original route inland across the Amanus, following the old plan agreed upon in the time of Abdul Hamid. More than that, the Germans secured concessions for a branch line from Aleppo to the Mediterranean at Alexandretta, and for the construction of a port of Alexandretta. The Bagdadbahn was to have a Mediterranean terminus at a fortified port, and Germany was to have her naval base in the north-east corner of the Mediterranean, eight hours from Cyprus and thirty-six hours from the Suez Canal!

BAGDAD RAILROAD

existent, while British commerce surpassed twelve million francs yearly. In 1905, the Hamburg-American line established a service to Bassorah. British merchants began to raise the cry that if the Bagdadbahn appeared the Germans would soon have not only the market of Mesopotamia but also that of Kermanshah! The Lynch Company declared that the Bagdadbahn would ruin their river service, and their representations were listened to at London, despite the absurdity of their contention. The Lynches were negotiating with Berlin also. The mixture of politics and commerce in Mesopotamia is a sordid story, which does not improve in the telling. Germany strengthened her railway scheme, and her hold on the territories through which it was to pass, by the accord with Russia at Potsdam in 1910. The last clever attack of British diplomacy on the Bagdadbahn was successfully met. In tracing the extension of the railway beyond Adana, it was suggested to the Department of Public Works that the cost of construction would be greatly reduced and the usefulness of the line

[See also MEDITERRANEAN SEA.] This was the revenge for Koweit.

"In seeking for the causes of the present conflict [the World War], it is impossible to neglect Germany in the Ottoman Empire. As one looks up at Pera from the Bosphorus, the most imposing building on the hill is the German Embassy. It dominates Constantinople. There has been woven the web that has resulted in putting Germany in the place of Great Britain to prevent the Russian advance to the Dardanelles, in putting Germany in the place of Russia to threaten the British occupation of India and the trade route to India, and in putting Germany in the place of Great Britain as the stubborn opponent of the completion of the African Empire of France. The most conspicuous thread of the web is the Bagdadbahn. In the intrigues of Constantinople, we see develop the political evolution of the past generation, and the series of events that made inevitable the European war of 1914."—H. A. Gibbons, *New map of Europe*, pp. 62-70.—See also *TURKEY: 1914*.

"But the Germans were attracted not so much by the commercial and industrial opportunities which the Bagdad Railway was to open to them, as by the political advantage which control of the Ottoman Empire would offer. If in the future there should arise a struggle with Great Britain for the control of the seas and colonial empire, German domination in Mesopotamia would threaten the British Empire in two vital points: India and Egypt. This was the point of view adopted by Rohrbach, whose views on German policy were accepted as sound and who by no means belonged to the belligerent party in Germany. 'One factor,' said he in 1911, 'and one alone will determine the possibility of a successful issue for Germany in such a conflict: whether or not we succeed in placing England in a perilous position. A direct attack upon England across the North Sea is out of the question; the prospect of a German invasion of England is a fantastic dream. It is necessary to discover another combination in order to hit England in a vulnerable spot—and here we come to the point where the relationship of Germany and Turkey and the conditions prevailing in Turkey become of decisive importance for German foreign policy, based as it now is upon watchfulness in the direction of England. . . . England can be attacked and mortally wounded by land from Europe only in one place—Egypt.' The loss of Egypt would mean for England not only the end of her dominion over the Suez Canal, and of her connections with India and the Far East, but would probably entail the loss also of her possessions in Central and East Africa. The conquest of Egypt by a Mohammedan Power like Turkey would also imperil England's hold over her sixty million Mohammedan subjects in India, besides prejudicing her relations with Afghanistan and Persia. Turkey, however, can never dream of recovering Egypt until she is mistress of a developed railway system in Asia Minor and Syria, and until, through the progress of the Anatolian Railway to Bagdad, she is in a position to withstand an attack by England upon Mesopotamia. The Turkish army must be increased and improved, and progress must be made in her economic and financial position. . . . The stronger Turkey grows, the more dangerous does she become for England. . . . Egypt is a prize which for Turkey would be well worth the risk of taking sides with Germany in a war with England. The policy of protecting Turkey, which is now pursued by Germany, has no other object but the desire to effect an insurance against the danger of a war with England."—C. Seymour, *Diplomatic background of the war*, p. 205.

Route. See TURKEY: Map of Asia Minor.

Importance to western world.—"The region of Asia Minor along the great highway leading from Constantinople to Bagdad has from the most ancient times determined the fate of the Near East. Its rôle in the distant past has ever been to threaten the existence of civilizations and powers that arose in the valley of the Euphrates, as in the intervening lands of Palestine and Arabia. . . . In our own days we are witnessing what promised to be the reopening of the old historic highway—the bridge uniting Europe to Asia—to Western control, through the project of a great railway stretching along a distance of nearly 2000 miles from a point opposite Constantinople to Bagdad, and thence to Basra and to the Persian Gulf. That project, which was well under way at the time of the outbreak of the war, is thus marked through its historical background as one of the most momentous enterprises of our age—more momentous because of the issue involved than the

opening up of the two other world highways, the Suez and Panama canals. The creation of a railway from Constantinople to Bagdad under European control is at once a symptom of the dissolution of the Turkish Empire which has become a mere shadow of its former wide extension, and a significant token of the new invasion of the East by the spirit of Western enterprise. Passing along a highway over which armies have marched forward and backward ever since the days of antiquity, the railway is also a link connecting the present with the remote past. . . . The modern world fights for this region as the ancient world did, with the railroad as the new symbol of a possession stronger and firmer than the garrisons and outposts of antiquity and the fortresses of the Roman and mediæval periods. The importance of Constantinople lies in its position as the starting point of the great highway that has as its natural outlets the Bay of Alexandretta on the one hand, and the Persian Gulf on the other. The historical rôle of this highway gives to the Bagdad Railway a political import far transcending its aspect as one of the great commercial enterprises of our days. Backed as the project was by the German government, steadily growing in power and aggressiveness since the establishment of the united German Empire, it added to the already complicated Eastern Question an aggravating factor that contributed largely to the outbreak of the great war. The present struggle for supremacy among European powers resolves itself in its ultimate analysis into a rivalry for the control of the East as an adjunct to commercial expansion. The 'trend towards the East' did not originate with modern Germany. It began with Greece, was taken up by ancient Rome and has actuated every Western power with ambitions to extend its commerce and its sphere of influence—Spain, Holland, England and France, and in days nearer to us Russia and Germany, Austria and Italy. Through a curious combination of circumstances, superinduced by the gradual weakening of the once dominant Turkish Empire, the struggle has shaped itself into its present aspect for a control of the great highway that is the key to the East—the nearer and the farther East. . . . From the historical point of view there are thus two aspects to the Bagdad Railway. It represents, on the one hand, the last act in the process of reopening the direct way to the East which became closed to the West by the fall of Constantinople in 1453, and which began to be reopened with the loosening of Turkey's hold on one end of the historic highway stretching across Asia Minor. On the other hand, the conflict to which the railway gave rise illustrates once more the crucial rôle that this highway has always played in determining the fate of the Near East from the most ancient days down to our times. The opposition of the European powers to the Bagdad Railway, used as a political scheme for the aggrandizement of a particular country, registers the instinctive protest of the West against the domination of the East by any one power—no matter which. . . . The Bagdad Railway in the hands of Germany, stretching from Constantinople *via* Bagdad to the Persian Gulf, would have meant the practical closing of the highway to all other nations—as effectively as the taking of Constantinople accomplished this in 1453. The history of Asia Minor gives the verdict that the highway *must be kept open*—if the world is to progress peaceably and if the nations of the West are to live in amicable rivalry, while once more passing through the period of an exchange between Orient and Occident—such as first took place in the days of Alexander the Great. This

verdict suggests 'internationalization' of the highway as the solution, and it also voices a warning to the West that the reopening of the highway must not be used for domination over the East but for *co-operation* with it, not for exploiting the East, but for a union with it."—M. Jastrow, *War and the Bagdad railway*, pp. 26-30, 121.—"When the fertility of Irak has been restored, it must be put in communication by railway with Arabia's chief ports.

(I) Bagdad has heretofore communicated with the Mediterranean by circuitous routes to the North-West, which cling to the tiny ribbon of moisture and vegetation deposited across the Northern section of the steppe by the Tigris and Euphrates, in their descent from the Armenian mountains towards the Gulf. The harvests of Irak, when they are reaped once more, will fully repay the construction of a railway from Bagdad to Damascus, which will cross Euphrates and run due West over the steppe. The distance is under five hundred miles, less by one-third than the course the German company has surveyed from Bagdad to Iskanderun, and Damascus, lying on the inner rim of the Syrian retaining wall near the middle point of its extent, is the natural railway-centre of Arabia. Besides being the starting-point of the pilgrim-line to Medina, it is already connected by a full-gauge railway with Haifa, the harbour under Carmel's shadow, and by a narrow-gauge line over Lebanon with Beirut, the greatest port of the Syrian coast. (II) Immediately after it has put Euphrates behind it, this new Bagdad-Damascus railway will detach a branch to the South, which will pass through Kerbela, skirt the Eastern foot of the plateau parallel with the Euphrates' course, touch the Shatt-al-Arab at Basra, and find its terminus on the Persian Gulf at Koweit. (III) Direct connection between Bagdad and Europe will be established by a line following up the Right bank of the Tigris as far as Mosul. There it will change direction from North-West to West, and run across the head-waters of the Khabor, between the Sinjar and Tor-Abdin hills. After passing through Harran, it will strike the Euphrates, cross it by a bridge at Jerabis, and continue in the same westerly direction through the hilly country between Aleppo and Aintab, up to the wall of Amanus, which it will have to penetrate by a tunnel before it can make a junction with the Adana-Iskanderun line in Anatolian territory. A branch line between Jerabis and Aleppo is already completed, and the last link in the chain, the direct connection between Aleppo and Damascus along the plateau East of Lebanon, has been in working order several years. (IV) Owing to the lack of any accessible port on the North Syrian coast, the cutting of the Amanus tunnel will probably bring a large area in Northern Arabia, as far as Mosul, within the commercial hinterland of the favourably situated Anatolian ports, Mersina and Iskanderun. If this happens, Aleppo will forfeit to Adana much of its importance as an urban centre, unless it can find a new harbour of its own. At present its nearest outlet towards the South is Tarabolus, reached through a convenient gap in Lebanon by a branch line that leaves the Aleppo-Damascus railway at Homs; unless Aleppo can open up more direct communication with the sea, and establish a port for itself either at the mouth of the Orontes or slightly further South at Laticia, its future will seriously be compromised."—A. Toynbee, *Nationality and the war*, pp. 442-445.—See also BOSPORUS: 1878-1914; and RAILROADS: 1800-1016.

BAGIMONT'S ROLL.—"Popes taxed the Church in Scotland to the extent of about three per cent., and in the end of the 13th century the Pope reestimated Scottish ecclesiastical property, which had immensely increased in value. The task was performed by Benemund ('Bagimund') [Boiamund or sometimes Bajimont] de Vicci in 1275; the object was to collect a tenth of benefices for relief of the Holy Land. The clergy resisted and protested in favour of the old rating. The Pope was firm and 'Bagimond's Roll' was long the basis of taxation ecclesiastical."—A. Lang, *History of Scotland*, v. I, p. 154.

BAGLIONI.—"The Baglioni first came into notice during the wars they carried on with the Oddi of Perugia in the 14th and 15th centuries. This was one of those duels to the death, like that of the Visconti with the Torrensi of Milan, on which the fate of so many Italian cities of the middle ages hung. The nobles fought; the town-folk assisted like a Greek chorus, sharing the passions of the actors, but contributing little to the catastrophe. The piazza was the theatre on which the tragedy was played. In this contest the Baglioni proved the stronger, and began to sway the state of Perugia after the irregular fashion of Italian despots. They had no legal right over the city, no hereditary magistracy, no title of princely authority. The Church was reckoned the supreme administrator of the Perugian commonwealth. But in reality no man could set foot on the Umbrian plain without permission from the Baglioni. They elected the officers of state. The lives and goods of the citizens were at their discretion. When a Papal legate showed his face, they made the town too hot to hold him. . . . It was in vain that from time to time the people rose against them, massacring Pandolfo Baglioni on the public square in 1393, and joining with Ridolfo and Braccio of the dominant house to assassinate another Pandolfo with his son Niccolo in 1466. The more they were cut down, the more they flourished. The wealth they derived from their lordship in the duchy of Spoleto and the Umbrian hill-cities, and the treasures they accumulated in the service of the Italian republics, made them omnipotent in their native town. . . . From father to son they were warriors, and we have records of few Italian houses, except perhaps the Malatesti of Rimini, who equalled them in hardihood and fierceness. Especially were they noted for the remorseless vendette which they carried on among themselves, cousin tracking cousin to death with the ferocity and craft of sleuth-hounds. Had they restrained these fratricidal passions, they might, perhaps, by following some common policy, like that of the Medici in Florence or the Bentivogli in Bologna, have successfully resisted the Papal authority, and secured dynastic sovereignty. It is not until 1495 that the history of the Baglioni becomes dramatic, possibly because till then they lacked the pen of Matarazzo. But from this year forward to their final extinction, every detail of their doings has a picturesque and awful interest. Domestic furies, like the revel described by Cassandra above the palace of Mycenæ, seem to take possession of the fated house; and the doom which has fallen on them is worked out with pitiless exactitude to the

last generation."—J. A. Symonds, *Sketches in Italy and Greece*, pp. 70-72.

BAGUIO, the summer capital of the Philippine islands. "About 132 miles in a straight line north of Manila, in the mountain region of Benguet, lies Baguio, the summer capital of the Philippine Islands. Before the American occupation, the country around Baguio was an inaccessible wilderness, inhabited almost exclusively by the heathen Igorot, but already its splendid, invigorating climate had attracted the attention of the authorities. The Spanish government, anxious to secure a place where its soldiers could recuperate from disease in a climate more favorable than that of the lowlands, appointed, shortly before the Spanish-American war, a commission to investigate the climatic conditions of the Benguet region, looking towards the establishment of a military sanitarium. This commission, after an exhaustive investigation, recommended that the proposed sanitarium be established at Baguio, in the province of Benguet. This matters stood when the change of sovereignty took place. Upon the establishment of civil government under the United States, the Philippine Commission took up the question of a health resort for government employes and others, and the committee appointed by that body . . . came practically to the same conclusions as the Spanish commission. . . . To make this region accessible, it was proposed to connect Baguio with Dagupan, the terminus of the Manila and Dagupan Railroad, by means of highways, the portion to be constructed by the Insular Government beginning at Pozorrubio, in the Province of Pangasinan. As the construction of this road proceeded, numerous difficulties arose, and when it was finally completed, it had cost the Government two million dollars. Another, much less expensive road was constructed to connect Baguio with San Fernando, a seaport in the Province of La Union. In 1902 the Insular Government began the construction of a civil sanitarium and of several cottages, and in May and June, 1903, the Commission held for the first time its sessions at Baguio. During the following years the same course was adopted, and as transportation facilities continued to improve, a little town sprang up. The several religious denominations purchased land and built churches, mission schools and cottages; private parties and Manila firms bought lots and constructed cottages on them; two hotels opened their doors; a military post was established in the vicinity of Baguio; the Jesuits built a large observatory on Mount Mirador, and the Insular Government established several schools for the Igorot, a training school for officers of the Philippine Constabulary, and an agricultural experimental station and stock farm. A water system was established and roads and drives were built, and before long the surrounding country was dotted with private residences. The gold mines in the vicinity of Baguio, which had been worked in a crude fashion by the native Igorot, also came in for a great deal of attention, and a number of them are now being worked by American syndicates. Several of the latter have imported modern plants, and all seem to be doing well. . . . Governor-General W. Cameron Forbes

took a special interest in Baguio. At the very beginning of his administration, in the fall of 1909, he began to make active preparations to carry out his plan to transfer the entire Insular Government to Baguio during the hot season. Several large buildings were erected for the accommodation of the offices of the Government, also a Mess Hall for the employees and some twenty cottages. A franchise was granted for the construction and operation of an electric light plant; an automobile service was established between Baguio and Camp One, the terminus of the branch line of the Manila and Dagupan Railroad; the existing roads were improved, and everything was done to convert Baguio into a modern city. At the end of February [1910] . . . the general exodus of the government offices to Baguio began. Soon the place presented a lively aspect. A special session of the Philippine Legislature had been called by the Governor-General and was held from March 28th to April 19th, and the teachers held their annual vacation assembly in a huge camp in the woods near Baguio. Since the close of the special session of the Legislature and of the teachers' assembly, Baguio has ceased to be overcrowded, and its floating population will continue to diminish until, in July, Baguio will be once more a quiet mountain village, with the torrential tropical rain beating down on the deserted office buildings and cottages, and the few permanent residents confined to their homes."—L. Fischer (*New Age*, v. 13, pp. 407-413).

BAHADUR SHAH II (d. 1862), Last Mogul of India, 1837-1857. See INDIA: 1857 (June-September).

BAHAISM: Baha'u'llah.—Development from Babism to Baháism.—"Among the most influential Babis was Mirza Husain Ali Nuri, born at Nur, in Mazandaran, on November 12, 1817. His family was eminently noble, and had contributed viziers and councillors to the royal court. In the natural course of events, therefore, this child would have become a courtier and official, but from his early youth he turned toward his own spiritual development, and refused to enter upon a public career. He was imprisoned for four months during these persecutions, confined in a dungeon, heavily chained to five other Babis. When no political conspiracy could be proved in his conduct or impelled in his religious convictions, his property was confiscated and he himself, with his family, banished to Baghdad, beyond the Persian border and under the jurisdiction of the Sultan of Turkey. A great number of Babis, feeling in him the intelligence, sympathy, and courage necessary to guide them through such trying times, followed with their families in voluntary banishment. This took place in 1852. The condition of the Babi community on its arrival at Baghdad represented economic chaos, complicated by the various opinions, social positions, and temperaments of the individual members. Mirza Ali, however, arranged their lives and activities, constructing from these helpless but willing emigrants an efficient, happy settlement. As soon as the foundations had been laid for their order and prosperity, he withdrew to the mountains north of Sulaimanziah, where for two years he lived in solitude, continually meditating and drawing freely from the source of all human inspiration and power. His presence even there became known, and holy men from near and far visited the hermit to discuss spiritual problems and experience. After two years, the Babi community at Baghdad urgently begged his return, as their circumstances had become difficult during his absence. Returning to Baghdad, Mirza Ali gradually created so prosperous a settlement that

Babis and others from all parts of Asia began to join themselves to the community. Their increasing numbers and influence frightened the clergy, and the Persian Government treated with the Sultan for the surrender of the religious leader. Preferring to retain him on Turkish territory, the Sultan summoned Mirza Ali to Constantinople. Outside Baghdad, on his way to Constantinople, he stopped his first day's journey at an estate called the 'Garden of Rizwan,' where he was joined by his followers, nearly all having preferred to attend him in his new exile. Twelve days were spent in the Garden of Rizwan, during which time Mirza Ali Nuri, by the authority of his own personality, gave an eternal, world-wide significance to this religious movement, and transferred its scope from Persia and Mohammedanism to humanity and religion. In this garden he announced to his followers that he was the supreme manifestation of God foretold by the Bab, and publicly assumed the name of 'Baha'ollah,' the *Glory of God*. He commanded the Babis to look no more to the Bab for their prophet, but to himself, whose revelation would fulfil the Bab's prophecy and dissolve their Mohammedan sect in the larger synthesis of Bahaism.—H. Holley, *Modern social religion*, pt. 5, pp. 161-162.—See also BABISM.—“At that time he and his followers, now known as Bahais, were removed to Constantinople and soon after to Adrianople, where they remained until 1868 A.D. when, under pressure from enemies, they were transported to the political prison of Acca in Syria. Acca is about twenty miles from Nazareth, the home of Jesus, and nine miles from Mt. Carmel, the scene of many scriptural events.”—T. Chase, *Bahai revelation*, p. 55.—“During the latter years of His ministry, Baha'ollah was allowed to spend much time in the country in the vicinity of Akka [the modern Acre, on the coast of Syria], even visiting Haifa and Mt. Carmel. . . . He departed this life in the month of May, 1892, after forty years of hardship, imprisonment, and exile, that the soul of the world might be quickened with the life of the spirit. The tomb of Baha'ollah, at Behje, is greatly venerated by the many pilgrims who yearly visit it from all parts of the world.”—C. M. Remy, *Bahai movement*, ch. 3.

Teachings of Baha'ollah.—“Manifold 'tablets' and treatises of instruction fell from Baha'ollah's pen. One Treatise, entitled *The Book of Laws*, contains text upon text of commandments invaluable not to Bahais alone but to 'all the men of all the world.' In it he orders the sword to be set aside for ever, to be replaced by the Word. He inculcates the settlement of national differences by arbitration. He enjoins the acquirement of One Universal Language to be taught to all children in all schools so that 'the whole world may become one homeland.' Boys and girls are to be educated alike, and the education must be the best possible, participated in by the children of the poor as well as those of the wealthy. Progress is impossible while ignorance spreads its roots. So eager was he in this connection that he wrote: 'He who educates his own son or the son of another, it is as though he educated the Son of God.' That 'work is prayer' he taught decisively. The highest act of prayer and worship consists in the acquirement of some profession or handicraft and using it thoroughly and conscientiously. By the advancement of art and science he set great store. Disapproving of celibacy, he advocated marriage. Objecting to asceticism, he advised his followers to mix freely with all people, and on all occasions to exhibit signs of a glad and joyous but practically righteous life. Naturally, therefore, in-

temperance and gambling are forbidden, together with the use of opium. . . .

“Practical charity, practical goodwill and kindness to all and sundry, including the lower animal world, Baha'ollah insisted upon. . . .

“Baha'ollah declared himself utterly opposed to priesthood. He built no church 'made with hands.' Teachers of his Gospel of The Light may not take fees or stipends for their teaching. The necessities of living must be earned by them, even as St. Paul wrought at sail-making for food. . . .

“Distrust of fellow-men; intemperance of speech or action; love of wealth; above all, disunion: these are strenuously disapproved of by Bahaism.”—*Splendour of God (Wisdom of the East series*, pp. 34-38).

Abdul Baha.—“Before his departure in May, 1892, Baha'ollah appointed his son Abbas Effendi, Abdul-Baha, to be 'Center of the Covenant' of Light, Love and Peace which he founded in the Name of God. He commanded all to turn their faces to Abdul-Baha for understanding, thus making him the authorized Interpreter of writings. The only claim that Abdul-Baha makes for himself is this authority of interpretation and that he is Abdul-Baha—the Servant of God in this Revelation. Abdul-Baha Abbas was born in Teheran, Persia, on the evening of May 23rd, 1844 A.D. At nine years of age he accompanied his father in the journey of exile to Baghdad, and from that time he shared every hardship, suffering and imprisonment.”—T. Chase, *Bahai revelation* p. 59.—“The name Abdul-Baha signifies the title of its bearer, 'The Servant of God.' Abdul-Baha is an exile from his country and until the reestablishment of the Turkish Constitution in the summer of 1908, he was a religious prisoner, held in the fortress of Akka. With this political change, he—with many other prisoners and exiles—was freed and is no longer under military surveillance. Since his release Abdul-Baha has made but few changes in his daily life. Now it is possible for many more of his followers to visit him than formerly, consequently his duties and labors are increased. . . . While imprisoned Abdul-Baha received a stipend from the Turkish government. Now that he is freed, this no longer continues. He holds cultivated lands in the vicinity of Akka which render him an income. His personal needs and those of his family are few. In reality, that which he possesses is for the benefit of all, while he is but the guardian of it.”—C. M. Remy, *Bahai movement*, ch. 4, pp. 27, 31.—For detailed account of Abdul Baha's journey through Europe and the United States in 1911-1913, consult H. Holley, *Modern social religion*, pt. 5, pp. 173-178.

Progress of the Bahai cause.—“Bahaism is now by no means confined to one personality or one region. . . . Persia itself . . . contains more than a million believers. Adherence to the cause nowhere else implies so much courage and steadfastness. Though tolerating neither priesthood nor ecclesiasticism, the Bahai revelation makes ample provision for social control of its teaching. For every city it defines a special organization to unite the followers, instruct them in practical social work, concentrate their activity, and renew their vision. . . . No order or precedence between persons or the sexes is observed, and the Bahai services resemble those of the Quakers more than any other religious gathering known to our environment. The cause is propagated in the natural manner, by those who are moved to serve by their own impulse. . . . Such assemblies or centres, deviating from type according to local circumstances, exist in great numbers throughout Persia, Southern Russia, India, Burma, and Egypt, where their

membership includes every class, people, and sect. In the West, Bahai centres have been established in Germany, France and England, with unorganized but increasing sentiment in Italy and Russia; while in America, as the history of the development of religious freedom would have foretold, Baháism is especially strong. No other race has evolved so far from the deadening influence of dogma and orthodoxy, thanks to the westward impulse of popular liberty; yet, on the other hand, no people have so completely lost the clue to mysticism and personal religious vision. Opportunity and need, therefore, meet in particularly close contact throughout the United States and Canada—the rapid spread of the Bahai teaching proves its capacity to satisfy the Western hunger for the spiritual life. In the United States more than thirty cities possess assemblies, and a constant stream of liberalizing and invigorating thought circulates from city to city and from State to State. To summarize, we find that Baháism has taken active root from California eastward to Japan, and from Edinburgh south to Cape Town.”—H. Holley, *Modern social religion*, pt. 5, pp. 181-182.

“The Bahá’í doctrines of universal brotherhood, mutual tolerance among rival creeds, patience under persecution, and the cultivation of the quietist virtues are accessible in a large number of publications and cheap manuals published by the faithful or by sympathizers with the movement. But for a scientific account of their theology and their metaphysics, for the various modifications of doctrinal teaching set forth by the different exponents of it, and for a sober recital of the genesis of the movement and the historical development of its various sects, the wise student will turn to the works of Professor Edward G. Browne with a feeling of assurance that in them he will find a lucid and well-documented exposition. For the last thirty years Professor Browne has been making a profound and patient study of this religious movement; he has been in personal contact with its most authoritative teachers, such as Subh-i-Azal and Baha’u’llah, the heads of the two rival sections into which the original community split, and with ‘Abdu’-Bahá, the son and successor of the latter, and with many other prominent Babis and Baha’is. His own writings and his edition of Bábí texts have gained for him the reputation of being the greatest living authority on this subject in Europe; his works are distinguished by sound and painstaking scholarship, and are free from the partisanship which detracts from the merit of several other American and European writings. . . . They range over a period of seventy years, from contemporary documents relating to the judicial examination of the Báb in 1848 and an account of him by a Dr. Cormick—who is the only European who is known to have ever seen and conversed with the Báb—to an account of the latest lucubration by Dr. Khayru’lláh, published in 1917. Nearly a fourth of the volume is taken up with the mission of this Dr. Khayru’lláh in America and the notable success he has achieved there. The extraordinary receptivity for Oriental theologies and theosophies of various kinds, and the unquestioning acceptance of hard doctrines propounded with insistent authority by such teachers as Swami Vivekananda, Swami Ram Tirath, and the Bahá’í mission, are among the most remarkable features of the religious life of America in the present generation, and have excited considerable disquietude among the Churches in that country. It might have been expected that after conducting a mission in America for twenty-five years Dr. Khayru’lláh would have imbibed something of the ethical spirit of the

American people. But his latest work, ‘O Christians! Why do ye not believe in Christ?’ contains an outspoken defence of polygamy, and apologizes for the assassination of Azalis by Bahá’is as ‘proving the veracity of Bahá’ism and Christianity.’ Such teaching is hardly calculated to confirm the hopes centred on the Bahá’í movement by the late Professor Cheyne in ‘The Reconciliation of Races and Religions,’ 1914 and others. . . . Such persons have failed to recognize how much the Bahá’í teachings have retained of the source from which they sprang. The ‘manifestation’ of the Báb came in response to the millennial expectations of those Shíahs who believed in the possibility of there being a follower of the Hidden Imám—a so-called Báb, or ‘Gate,’ in direct spiritual communication with the Imám; and Mirzá ‘Ali Muhammad’ in 1844 announced himself as such exactly a thousand years after the last Imám had succeeded to that exalted office. Though cruelly persecuted by the orthodox Shíahs, the Bábís retained many characteristically Shíah doctrines; but the breach with Islam became irremediable, when Baha’u’lláh made his appeal to the whole world. The fact that his followers henceforth called themselves Bahá’is rather than Bábís was no mere change of nomenclature, but marked the transition from Persian sectarianism to the claim to a world-wide mission. But, as Professor Browne with scholarly insight has pointed out, ‘almost every single doctrine held by the Bábís and Bahá’is was previously held and elaborated by one or another of the earlier cognate sects grouped together under the general title of *Ghulát*, whereof the Ismá’ílís are the most notable representative. For these Ghulát, or extreme Shíahs of the Left, our sources of information are not abundant, and we are chiefly dependent for our knowledge of their tenets on writers who were hostile to them. But we know the enthusiasm with which their doctrines were often received and the persecutions which the faithful heroically endured; along with a carefully graduated series of initiation, suited to the capacity of the neophyte, went such an economy of truth as, it appears from the documents Professor Browne publishes, some of the Bahá’í teachers still practice; and these modern representatives of the earlier sects make a similar demand for unhesitating acceptance of the dogmatic utterances of their respective theophanies. These parallelisms are not worked out in detail by Professor Browne in his new volume; but he provides the student with the details for such an investigation, while, on the other hand, he gives a synopsis, from the work of a Persian Shíah, of the Bahá’í doctrines which are considered to be deviations from the orthodox creed of Islam. Across the historical record set out in immense detail in this volume is drawn a trail of blood. Relentlessly persecuted by the Mahomedan Governments under which they have lived, neither Bábís nor Bahá’is have exemplified that dictum of Cardinal Manning’s that the children of the martyrs cannot be persecutors. The early history of the Bábís was marked by a succession of armed risings against the Persian Government. They took no pains to conceal their hatred of the Shah and were ready to condemn to death those who rejected the mission of the Báb. Since the death of the Báb, two great schisms have divided the faithful. On each occasion bloodshed has marked the struggle between the rival factions. In this respect the Bahá’is are strangely reminiscent of the earliest of the Ghulát who became known to Christian Europe—the Assassins who obeyed the Old Man of the Mountains.”—*Times Literary Supplement*, June 14, 1918.

BAHAMA ISLANDS, most northerly group of the British West Indies.

The government is representative, with a governor and an executive council, a legislative council and an assembly composed of 29 members. Education is free, compulsory, and non-sectarian. The total area is 4,403 square miles, embracing twenty inhabited islands and some 3,000 islets and rocks; the population (1919) was 61,000, the majority negroes; Nassau, on the island of New Providence, is the capital.

1492-1783.—“The landfall of Columbus on his first voyage to America was one of the Bahama Islands. [See AMERICA: 1492.] The question as to whether it was the present San Salvador or Watlings Island on which he first set foot is still a matter of controversy, and from evidence that has been brought to light it would seem that the dispute can never be definitely settled. But this coincidence, interesting though it is, influenced little the later history of the Bahamas. At the time of the discovery the Islands were inhabited by Indians who received the name of ‘Lucayans.’ [See also CARIBS: their kindred.] Subsequently the Spaniards came and enticed them away, or forcibly deported them, to end their miserable lives in slavery in Spanish mines at Hispaniola and elsewhere. It is said that the Spaniards returned again and again to the Bahamas to kidnap the Indians until the Islands were completely depopulated of their native inhabitants, and left desolate. This may be too strong a statement of the case, but it is certain that there are no Lucayan Indians living in the Bahamas to-day, nor are there any traces of Lucayan blood to be seen in the present inhabitants. . . . The title to the Lucayan Islands, as the Bahamas were first called, which was given to the Spaniards by the Pope, was not left undisputed. English sea-rovers haunted the West Indies in order to prey on Spanish commerce, and pirates who early resorted to these waters and rapidly increased in numbers, found among the keys of the Bahamas, havens of retreat where they could easily elude the clumsy Spanish galleons. . . . On October 30, 1629, another grant including the Bahama Islands was made by the sovereign of Great Britain, this time to Sir Robert Heath, the Attorney-General. A few colonists were sent out under this patent and a settlement was formed on New Providence. This settlement was ill-fated, for the island was visited in 1641 by a force of Spanish seamen and the small band of Englishmen was captured and carried away. The place was then taken possession of by the Spaniards and held for about twenty years. . . . The colony at New Providence did not attract a large number of settlers. It had a small force of defenders, generally less than fifty in number, and was consequently a prey for the spoiler [see also BRITISH EMPIRE: Expansion: 17th century: West Indies: 1647.] . . . But the Spanish were not long to enjoy the possession of New Providence. . . . Buccaneers were indulged in freely by the inhabitants of the place. For brief periods, to be sure, during the next thirty years attempts were made to preserve law and order, but without avail, as so large a number of the population was engaged in piracy or at least in sympathy with it, that it was not possible for the government with the force at its command to stamp it out [see BUCCANEERS]. . . . Piracy with this settlement as a base became such a menace to the commerce passing through these waters that merchants in Great Britain pressed upon George I to put a stop to it. The Lords Proprietors, who had so poorly succeeded in their enterprise, surrendered their control of the civil government to

the Crown, and in 1718 Captain Woodes Rogers, a hardy and fearless sea-man, became Governor of Nassau. He restored order, punished or drove out the buccaneers and made the place a respectable one in which to live. He was supported with forces sufficient to establish his control, and with funds to make fortifications for security against invaders. The Colony prospered from this time, attracting numerous settlers, among whom was a company of German Protestants from the Palatinate. More extensive fortifications were undertaken in 1738 under the direction of Peter Henry Bruce, of the engineer corps of the Royal Navy. He has left an interesting account of his work here in his memoirs. . . . Upon the separation of the Thirteen Colonies on the continent from Great Britain many of their inhabitants preferred to remain British subjects rather than become citizens of the States. . . . For these and other reasons many emigrated from the States to territory that still remained British. This exodus was encouraged by the favorable conditions offered to those who wished to settle in the Bahamas. . . . The white population of the Bahamas was doubled by these immigrants, and the negro population was nearly trebled. Many of the new-comers were cotton planters. These set to work at once with their slaves clearing lands and planting crops, and soon brought the Colony to some importance as a producer of cotton.”—J. M. Wright, *Bahama Islands*, pp. 420-425.—In 1781 the islands were surrendered to the Spaniards, but at the conclusion of the war they were restored by the Peace of Versailles in 1783. The Turks and Caicos Islands, which geographically form part of the Bahamas chain, were separated in 1848 and formed into a distinct presidency.—See also BERMUDAS: 1719-1783.

1834-1900.—Economic decline.—Disestablishment of the church.—Period of quiet.—“Among the factors contributing to the economic weakening of the Bahamas, perhaps the most important was the abolition of the slave-trade in 1834. In 1848 the separation of the Turks and Caicos Islands, which had never been contented under the Bahama Government, withdrew the most productive of the salt-producing islands from the group. From 1860 to 1875 legislation was passed for the disestablishment of the Anglican church. Opposition to the measures was at no time very strong, and the legislature was able to deal with the question in a liberal and impartial spirit. During the latter half of the nineteenth century the people of the Bahamas have remained contented under British rule. The slavery question passed out of men’s minds and the control of local affairs was taken into other hands than those of the radical, former slaveholders. The Colony now entered upon a period of internal quiet, which with a few temporary interruptions has continued to the present time.”—*Ibid.*, p. 560.

BAHAMED, or **Ahmed bin Musa** (d. 1900), Grand Vizier of Morocco. See MOROCCO: 1903.

BAHARIA, an oasis in the Libyan desert, Egypt. It was the scene of fighting during the World War. See WORLD WAR: 1916: VI. Turkish theater: b, 1; 1917: VI. Turkish theater: b, 2.

BAHA'ULLAH (1817-1892), the founder of the Bahai movement.—See also BAHAIISM: Teachings.

BAHIA, a state of Brazil, on the Atlantic seaboard (see LATIN AMERICA: Map of South America); has an area of 164,650 square miles and a population of about 3,372,000, including the largest negro population in the republic. Agriculture is the principal industry, while gold and diamonds are found in some parts. Bahia, the capital, also known

as Sao Salvador, is a flourishing seaport, possesses a great harbor and is the metropolis of the Brazilian church. The bay (Portuguese bahia) on which the city is situated was discovered by Amerigo Vespucci in 1503. Until 1763 the city was the capital of Brazil.—See also BRAZIL.

1831.—Revolts. See BRAZIL: 1825-1865.

BAHIA HONDA.—Coaling and naval station leased to the United States. See CUBA: 1903.

BAHIMA, an African tribe of Hamitic type found in the region of Victoria Nyanza.

BAHREIN ISLANDS, a group of islands in the Persian gulf, and the center of its pearl industry; now under British protection. See ARABIA: Map.

BAHRITE SULTANS. See EGYPT: 1250-1517.

BAIÆ.—Baia, in Campania, opposite Puteoli on a small bay near Naples, was the favorite watering place of the ancient Romans. "As soon as the reviving heats of April gave token of advancing summer, the noble and the rich hurried from Rome to this choice retreat; and here, till the raging dogstar forbade the toils even of amusement, they disported themselves on shore or on sea, in the thick groves or on the placid lakes, in litters and chariots, in gilded boats with painted sails, lulled by day and night with the sweetest symphonies of song and music, or gazing indolently on the wanton measures of male and female dancers. The bath, elsewhere their relaxation, was here the business of the day; . . . they turned the pools of Avernus and Lucrinus into tanks for swimming; and in these pleasant waters both sexes met familiarly together, and conversed amidst the roses sprinkled lavishly on their surface."—C. Merivale, *History of the Romans*, ch. 40.

BAIBURT, an Armenian town in north-eastern Asia Minor, south of Trebizond (q. v.) on the main highway to Erzerum. Occupied by General Paskevich during the Russian invasion of 1829 and again captured by the Russians under General Yudenich during the World War, July 15, 1916. See WORLD WAR: 1916: VI. Turkish theater: d, 6.

BAIF, Jean Antoine (1523-1580), French poet. See FRENCH LITERATURE 1540-1580.

BAIKAL, the sixth largest lake in the world, situated in the western part of eastern Siberia. For some years it formed a break in the trans-Siberian railway, trains being ferried across or, in winter, temporary tracks being laid on the ice; eventually the road was carried through the rugged region around the southern end of the lake.—See also TRANS-SIBERIAN RAILWAY.

BAILLE, one to whom goods are committed in trust. See COMMON LAW: 1623.

BAILEN, or Baylen, a town in the province of Jaén in southern Spain; the scene of the Roman victories against the Carthaginians (209 and 206 B. C.) and of the surrender of the French general Dupont's corps of 17,000 to the Spaniards under Castaños. This was the first serious Napoleonic reverse in Spain.

Capitulation of. See SPAIN: 1808 (May-September).

BAILEY, Daniel Julian, English private who, together with Sir Roger Casement, stood trial (June 27-29, 1916) on a charge of high treason. Unlike Casement he was found not guilty and acquitted.—See also IRELAND: 1916 (June-August).

BAILEY, Liberty Hyde (1858-), author and educator; writer on botanical and horticultural subjects and on rural problems, chairman of the Roosevelt commission on country life 1908. Director of the college of agriculture, Cornell University, 1903-1913.—See also U. S. A.: 1908-1909 (August-February).

BAILLEUL, a town northwest of Lille, France. Was the scene of hard fighting in the World War, changing hands in 1914 and again in 1918. See WORLD WAR: 1914: I. Western front: t; w, 3; 1915: II. Western front: i, 3; 1918: II. Western front: d, 10; d, 12; k, 5.

BAILLEUL, a village captured by the Allies at Vimy Ridge in 1917. See WORLD WAR: 1917: II. Western front: c, 9.

BAILLIE (Scotch for bailiff), a superior officer or magistrate of a municipal corporation in Scotland with judicial authority within the city or burgh.

BAILLOUD, Maurice Camille, French general. See WORLD WAR: 1915: V. Balkans: c, 3 (i); 1917: VI. Turkish theater: c, i (vi).

BAILLY, Blanchard A.: At second Peace Conference. See HAGUE CONFERENCES: 1907.

BAILLY, Jean Sylvain (1736-1793), French statesman. Conduct in demonstration in Champs de Mars. See FRANCE: 1791 (July-September).

BAILMENTS, Law of. See COMMON LAW: 1689-1710.

BAINBRIDGE, Sir Edmond Guy Tulloch (1867-), Major-General in the British army. See WORLD WAR: 1918: II. Western front: c, 8.

BAINBRIDGE, Commodore William (1774-1833), American officer.

In Tripolitan War. See BARBARY STATES: 1803-1805.

In War of 1812. See U. S. A.: 1812-1813: Indifference to the navy.

BAINSIZZA PLATEAU, an elevated region north of Trieste. In 1917 during the World War the Italian general Cadorna captured these heights in his operation against Trieste, losing them later in the same year at the time of the Caporetto disaster.—See also WORLD WAR: 1917: IV. Austro-Italian front: d, 1.

BAIRD, David, Sir (1757-1829), British general who was in command at Corunna. See SPAIN: 1808-1809 (August-January).

BAIREUTH. See BAYREUTH.

BAJA (or Vieja) **CALIFORNIA**, or Lower California, is a long narrow peninsula forming a territory of the republic of Mexico. (See also MEXICO: Land.) "The great Californian peninsula, or Lower California, as it is called, . . . in area is a little larger than England and Wales, measuring 61,562 square miles. The frontier line with the United States begins on the Pacific seaboard, in a dreary and solitary desert in a place called Initial Point, a little south of the 33rd parallel and running eastwards towards the Gulf of California as far as Fort Yuma, at the junction of the Rio Gila with the Rio Colorado. The peninsula terminates southwards at Cape Palms . . . and Cape S. Lucas . . . whose sandy shoals, strewn with fragments of rock, serve as an excellent natural bed for shell fish of a choice quality. . . . Watered by two seas, one of which, reaching to the Pole, brings with it warm and cold breezes alternately, according as they blow from the north or from the equator, while the other, being almost completely land-locked, is retained at a high temperature, Lower California apparently combines all the conditions of a damp climate. Hence we may well wonder at its remarkable dryness and sterility."—H. W. Bates, *Stanford compendium of geography and travel, Central and South America*, pp. 41-42.—"Lower California, except the Cape region, is virtually a desert, though in places, especially in favourable years, there is enough grass for a little stock-raising."—*Handbook of Mexico* (Prepared by the geographical section of the naval intelligence division, naval staff, admiralty).—"If Baja California is poor in species of organic

life, nature has compensated it in the mineral world, and that peninsula is considered one of the most highly mineralized parts of the North American continent. Copper, silver, and gold are among its most important products and quick-silver, opal, sulphur, and rock-salt exist. The famous Boleo copper mine is situated in this territory."—C. R. Enock, *Mexico*, pp. 207-208.

BAJAUR. See INDIA: 1895 (March-September).

BAJAZET I. See BAYEZID I and II of Turkey.

BAJER, M. F. Dane, awarded Nobel peace prize in 1908. See NOBEL PRIZES: Peace, 1908.

BAJI RAO, Mahratta peshwa (prime minister), who led an insurrection against British rule. See INDIA: 1816-1819.

BAJURA, the standard of Mohammed.

BAKAIRI. See CARIBS: their kindred.

BAKER, Colonel Edward Dickinson (1811-1861), killed at Ball's Bluff. See U. S. A.: 1861 (October: Virginia).

BAKER, Newton Diehl (1871-), American lawyer, graduate of Johns Hopkins University; city solicitor of Cleveland, 1902-1912; mayor of Cleveland, 1912-1914 and 1914-1916; secretary of war from March, 1916, to March, 1921. See U. S. A.: 1916-1917; and 1917 (February-May); WORLD WAR: 1917: VIII. United States and the war: h.

BAKER, Sir Samuel White (1821-1893).—Conquest of Central Africa. See EGYPT: 1870-1883.

BAKER, Valentine (1827-1887), British soldier. Known as Baker Pasha. Served in Kaffir War 1852-1853; in 1877 entered service of the sultan and was major-general unattached in Mehmet Ali's army in the Russo-Turkish War; in 1882 commander of Egyptian police. In 1885 was appointed to General Wolseley's staff, but appointment not ratified; returned to Egypt and in 1887 was killed in battle of El-Teb.

BAKER'S ISLAND, a small uninhabited island, less than a square mile in area, situated in the Pacific southwest of Hawaii. It was discovered by Baker sailing under the United States flag in 1832, but the United States government did not take possession of it until 1850. It is useless as a coaling station, as it lacks facilities for anchorage and drinking water. It has valuable deposits of guano.

BAKHCHI-SARAI, a town of the Crimea between Simferopol and Sevastopol. As the Tatar capital it was captured by the invading Russians in 1735.

BAKHDHI. See BACTRIA.

BAKHMETIEV, or Bakhmeteff, Boris Alexandrovich (1880-), Russian ambassador to the United States for the Kerensky government. In Russia: professor of mechanics, hydraulics and hydraulic engineering at the Institute of Ways and Communication and at the Polytechnical Institute in Petrograd. Came to the United States in 1915 as representative of the Central War Industrial Committee of Russia, a war supply committee for the Russian army, and in the summer of 1917 as ambassador and head of the Russian Extraordinary Mission, representing the Kerensky government.

BAKHMETIEV, Madame.—Her humane work in Macedonia. See TURKEY: 1902-1903.

BAKHMUT, town of Russia in Ekaterinoslav, captured by Bolsheviki in 1919. See RUSSIA: 1918-1919.

BAKHTASHIYAH. See DERVISHES.

BAKHTIARI, political party in Persia. See PERSIA: 1908-1909.

BAKHTIYAR KHILTI, conquered Bengal c. 1200. See BENGAL.

BAKHTRI. See BACTRIA.

BAKSAR, or Baxar, or Buxar, Battle of (1764). See INDIA: 1757-1772.

BAKU, the capital of Azerbaijan, the center of the petroleum industry on the Caspian sea, and one of the great oil centers of the world; was an integral part of Russia until October, 1917, when the people of Transcaucasia, Azerbaijan, Georgia, and Armenia joined to form a federation of republics. After the breakup of the federation in 1918, the Bolsheviki obtained control, March 17, but were driven out after a two months' siege. The British forces entered the port of Baku on November 17, 1918, by request of the Azerbaijan government and remained until the end of 1919. (See WORLD WAR: 1918: VI. Turkish theater: a, 8; b, 2; b, 4; b, 9.) In April, 1920, the Bolshevik party overthrew the government and in May, Baku was recaptured.—See also CAUCASUS: 1902-1917.

Destruction of oil industry, strikes. See RUSSIA: 1904-1905: Outline of leading events in Revolution; 1905 (April-November).

BAKUFU, Japan. See JAPAN: 1641-1779.

BAKUNIN, Mikhail (1814-1876), Russian anarchist. In 1840 he joined younger Hegelians in Berlin; in 1844-1847 met Proudhon in Paris. Stirred up popular insurrections in Bohemia and Saxony, 1848; arrested in 1849, condemned to death, spared by Russian intervention; 1857, sentenced to life exile in Siberia; escaped to United States and went to France and Switzerland; established headquarters in Italy. In 1872 disagreed with Karl Marx and the Socialists and was expelled from the International Workingmen's Association, which he had joined in 1869. See ANARCHISM: 1861-1876; SOCIALISM: 1860-1920.

BALAKHOVITCH, General: His defeat. See RUSSIA: 1920 (October-November).

BALAKIREV, Mily Alexeivich (1836-1910), Russian composer; a pioneer of the neo-Russian school which was consolidated by the idea of nationality in music in the middle of the nineteenth century. Director of the Imperial chapel and conductor of the Imperial Russian Musical Society. Among his disciples were César Cui, Borodin, Moussorgsky and Rimsky-Korsakov.—See Music: Folk music and nationalism: Russia.

BALAKLAVA, Battle of. See RUSSIA: 1854-1856.

BALANCE OF POWER: Definition.—"The joint resistance of several nations to Cæsarism, or the domination of a single nation, is designated as the maintenance of the balance of power. This principle implies that no state shall be permitted to become so powerful as to menace the safety of other states; that no one nation shall be permitted to exalt itself above all other nations. This is the end and aim of the balance of power. It impels nations to protect the integrity, freedom, and separate nationality of each other. . . . The balance of power is a negative check upon overgrown dominion. It was known to antiquity as to modern times but is commonly supposed to have emanated from England. . . . 'You know as well as we do,' said the Athenians to the people of Melos, 'that, as the world goes, the question of right is only discussed between equals; while, among those who differ in power, the strong do what they can, the weak suffer what they must.' This is a fair statement of the struggle for existence between the nations of the ancient world. . . . When rightly understood, the balance of power does not mean an exact equi-

poise but rather an overwhelming weight against the aggressor, the evil-doer. . . . An equipoise leads to exhausting wars; a preponderance of power gives assured peace. The Concert of Europe is a perfect example of the preponderance of power; the division of Europe into the Triple Alliance (q. v.) and the Triple Entente (q. v.) is a good example of an equipoise of power. The world will adopt peaceful habits only when the aggressor among nations is as certain to encounter overwhelming force as would an aggressor among the states of the American Union. The balance of power, if carried to its logical conclusion, would bind the states of the world into a league for mutual defence against all aggressors."—S. C. Vestal, *Maintenance of peace*, pp. 101-105.—See also CONCERT OF EUROPE.

Ancient Greece and Rome.—"It is a question, whether the *idea* of the balance of power be owing entirely to modern policy, or whether the *phrase* only has been invented in the later ages? It is certain that Xenophon, in his *Institution of Cyrus*, represents the combination of the Asiatic powers to have arisen from a jealousy of the increasing force of the Medes and Persians; and though that elegant composition should be supposed altogether a romance, this sentiment, ascribed by the author to the Eastern princes, is at least a proof of the prevailing notion of ancient times. In all the politics of Greece, the anxiety with regard to the balance of power is apparent, and is expressly pointed out to us, even by the ancient historians. Thucydides represents the league which was formed against Athens, and which produced the Peloponnesian war, as entirely owing to this principle. And after the decline of Athens, when the Thebans and Lacedæmonians disputed for sovereignty, we find that the Athenians (as well as many other republics) always threw themselves into the lighter scale, and endeavoured to preserve the balance. They supported Thebes against Sparta, till the great victory gained by Epaminondas at Leuctra; after which they immediately went over to the conquered, from generosity, as they pretended, but in reality from their jealousy of the conquerors. Whoever will read Demosthenes's oration for the Megalopolitans, may see the utmost refinements on this principle that ever entered into the head of a Venetian or English speculator. And upon the first rise of the Macedonian power, this orator immediately discovered the danger, sounded the alarm throughout all Greece, and at last assembled that confederacy under the banners of Athens which fought the great and decisive battle of Chæronea. It is true, the Grecian wars are regarded by historians as wars of emulation rather than of politics; and each state seems to have had more in view the honour of leading the rest, than any well-grounded hopes of authority and dominion. If we consider, indeed, the small number of inhabitants in any one republic, compared to the whole, the great difficulty of forming sieges in those times, and the extraordinary bravery and discipline of every freeman among that noble people; we shall conclude, that the balance of power was, of itself, sufficiently secured in Greece, and need not to have been guarded with that caution which may be requisite in other ages. But whether we ascribe the shifting of sides in all the Grecian republics to *jealous emulation* or *cautious politics*, the effects were alike, and every prevailing power was sure to meet with a confederacy against it, and that often composed of its former friends and allies. . . . The successors of Alexander showed great jealousy of the balance of power; a jealousy founded on true politics and prudence,

and which preserved distinct for several ages the partition made after the death of that famous conqueror. The fortune and ambition of Antigonus threatened them anew with a universal monarchy; but their combination, and their victory at Ipsus, saved them. And in subsequent times, we find, that, as the Eastern princes considered the Greeks and Macedonians as the only real military force with whom they had any intercourse, they kept always a watchful eye over that part of the world. The Ptolemies, in particular, supported first Aratus and the Achæans, and then Cleomenes, king of Sparta, from no other view than as a counterbalance to the Macedonian monarchs. For this is the account which Polybius gives of the Egyptian politics. The reason why it is supposed that the ancients were entirely ignorant of the *balance of power*, seems to be drawn from the Roman history more than the Grecian; and as the transactions of the former are generally more familiar to us, we have thence formed all our conclusions. It must be owned, that the Romans never met with any such general combination or confederacy against them, as might naturally have been expected for their rapid conquests and declared ambition, but were allowed peaceably to subdue their neighbours, one after another, till they extended their dominion over the whole known world. Not to mention the fabulous history of the Italic wars, there was, upon Hannibal's invasion of the Roman state, a remarkable crisis, which ought to have called up the attention of all civilized nations. It appeared afterwards (nor was it difficult to be observed at the time) that this was a contest for universal empire; yet no prince or state seems to have been in the least alarmed about the event or issue of the quarrel. Philip of Macedon remained neuter, till he saw the victories of Hannibal: and then most imprudently formed an alliance with the conqueror, upon terms still more imprudent. He stipulated, that he was to assist the Carthaginian state in their conquest of Italy; after which they engaged to send over forces into Greece, to assist him in subduing the Grecian commonwealth. The Rhodian and Achæan republics are much celebrated by ancient historians for their wisdom and sound policy; yet both of them assisted the Romans in their wars against Philip and Antiochus. And what may be esteemed still a stronger proof, that this maxim was not generally known in those ages, no ancient author has remarked the imprudence of these measures, nor has even blamed that absurd treaty above mentioned, made by Philip with the Carthaginians. Princes and statesmen, in all ages, may, beforehand, be blinded in their reasonings with regard to events, but it is somewhat extraordinary, that historians, afterwards, should not form a sounder judgment of them. . . . The only prince we meet with in the Roman history, who seems to have understood the balance of power, is Hiero, king of Syracuse. Though the ally of Rome, he sent assistance to the Carthaginians during the war of the auxiliaries; 'Esteeming it requisite,' says Polybius, 'both in order to retain his dominions in Sicily, and to preserve the Roman friendship, that Carthage should be safe; lest by its fall the remaining power should be able, without control or opposition, to execute every purpose and undertaking. And here he acted with great wisdom and prudence: For that is never, on any account, to be overlooked; nor ought such a force ever to be thrown into one hand, as to incapacitate the neighbouring states from defending their rights against it.' Here is the aim of modern politics pointed out in ex-

press terms. In short the maxim of preserving the balance of power is founded so much on common sense and obvious reasoning, that it is impossible it could altogether have escaped antiquity, where we find, in other particulars, so many marks of deep penetration and discernment. If it was not so generally known and acknowledged as at present, it had at least an influence on all the wiser and more experienced princes and politicians. And indeed, even at present, however generally known and acknowledged among speculative reasoners, it has not, in practice, an authority much more extensive among those who govern the world."—D. Hume, *Essays and treatises*, v. I (1825), pp. 331-336.

Modern application.—Policy of Wolsey and Temple.—English position.—Division of Poland.—"The idea of the balance of power and equilibrium of forces found its first modern application in the interstate relations of the leading Italian cities in the fifteenth century. . . . In the seventeenth and eighteenth centuries they [the leading powers of Europe] frequently combined to preserve the Balance of Power. . . . Endangered by Louis XIV, this system was revived by the Peace of Utrecht in 1713. [See UTRECHT: 1712-1714.] Temporarily destroyed by Napoleon it was restored at the Congress of Vienna in 1815. [See VIENNA, CONGRESS OF. 1815.] In the name of the so-called 'Holy Alliance', (q.v.) the Quadruple Alliance formed at Paris, November 20, 1814, undertook to prevent and to crush revolution in Italy and Spain and even threatened to extend its activities to the Western Hemisphere. It was mainly against the extension of this system of intervention to Latin America that the Monroe Doctrine was proclaimed in 1823."—A. S. Hershey, *International law and diplomacy of the Russo-Japanese war*, p. 151.—Two names which are connected with the growth of the idea are Cardinal Wolsey and Sir William Temple. Henry VIII, influenced by Wolsey, shaped his foreign policy accordingly and gave either moral or real support to the weaker participant in any European quarrel. Sir William Temple, in the reign of Charles II, upheld the doctrine in the case of England's relations with Spain, France, and the Netherlands.

"A Nation which had the mastery of the Continent could hardly allow Great Britain to maintain an independent existence. . . . Our [the English] position in Europe is secure and will remain secure only as long as the various powers or groups of powers in Europe are so nearly equal in strength that no power or group of powers is able to obtain that supremacy which earlier or later would cause it to attack Great Britain. . . . When Spain, France and Russia in turn tried to obtain the supremacy in Europe by land and when Holland tried to obtain the supremacy in Europe on the sea each came into collision with . . . and was prevented by Great Britain from attaining that supremacy which would undoubtedly have endangered our [English] national existence."—J. E. Barker, *Great and Greater Britain*, p. 281.

"If the division of Poland was the first event which an *abuse of form* deranged the political balance of Europe, it was likewise one of the first which begot an *apathy of spirit*, and stupid insensibility to the general interest. The silence of France and England, the silence of all Europe, when a measure of so much importance was planned and executed, is almost as astonishing as the event itself. The weakness of the French cabinet toward the conclusion of the reign of Louis XV, throws some light upon the circum-

stance, but does not sufficiently explain it. No effectual resistance could have been expected from England alone, and still less from the other powers after France declined to interfere. But it will not escape the observation of the future historian, that the omission on that occasion of any public measure, of any energetic remonstrance, of any serious protest, nay, even of any expression of disapprobation, was an indubitable symptom of general debility and relaxation. . . . It is impossible that the history of our time [written in 1806] should pass without producing some beneficial fruits for us and our posterity. Whether Buonaparte, in the recesses of his haughty and gloomy mind, has really conceived the idea of a universal monarchy; under what form he has conceived it; what progress he has made in forming the project, and when, and how he thinks of realizing it, all this futurity will disclose. But so much is clear and certain, that in the course of six frightful years he has been doing, without intermission, all that he must do on the very worst supposition, and that he has succeeded in things which seem very unequivocally to prognosticate the most pernicious and desperate issue. Were every thing here to close, were his career to be terminated, were our undertakings to be crowned with complete success, and his star to set for ever, is it possible that we could forget what sorrows, what bitterness, what disgrace, what troubles, what convulsions, what a grievous load of present evils, and what anguish for every coming day, was felt throughout the greatest and best part of Europe, from a bare attempt and beginning to effect such a project? And shall we not therefore adopt every expedient which wisdom can devise to prevent the return of these hard trials?"—F. Gentz, *Fragments upon the balance of power* [1806], pp. 90, 108-109.

Views of a publicist in the Napoleonic era.—"The balance of power among states has always been a chimera; in all times the weak have received laws from the strong; whether the law is pronounced by one individual, or twenty, is the same to him whose fortune it is to obey." . . . What is usually termed a balance of power, is that constitution subsisting among neighbouring states more or less connected with one another; by virtue of which no one among them can injure the independence or the essential rights of another, without meeting with effectual resistance on some side, and consequently exposing itself to danger. . . . The allusion in the term to corporeal objects has given occasion to various misconceptions. It has been represented that those who recognized the principles of a combination among states founded on an equal balance of power, had in view the most perfect possible *equality* or *equalization* of powers, and required that the different states composing a great population, riches, resources, and so forth, be exactly measured, squared and rounded by a common standard. Out of this false hypothesis, according as it has been applied by credulity or scepticism to the relations between states, have sprung two opposite errors, the one almost as hurtful as the other. Those who adopted that imaginary principle in its full extent, were thereby led to believe that in every case in which a state gains an accession of strength, either by external acquisitions, or by the development of its internal resources, the rest must oppose, and contend with it till they have either obtained an equivalent or reduced it to its former situation. . . . A different set justly persuaded of the impossibility of such a system have, on the other hand, declared the whole idea of a political balance to be a

chimera invented by dreamers, and artfully made use of by designing men as a pretext for disputes, injustice and violence. The former of these errors would banish peace from the earth; the latter would open the most desirable prospects to every state which, under the influence of ambition, aspired to universal dominion. . . . There was formed among the states of this quarter of the globe [Europe] an extensive social commonwealth, of which the characteristic object was the preservation and reciprocal guarantee of the rights of all its members. From the time that this respectable object came to be distinctly and clearly recognized, the necessary eternal conditions, on which it was attainable, unfolded themselves by degrees. Men were soon aware that there were certain fundamental principles, arising out of the proportional power of each of the component parts to the whole, without the constant influence of which order could not be secured; and the following maxims were gradually set down as a practical basis, which was not to be deviated from:

"That if the states system of Europe is to exist and be maintained by common exertions, no one of its members must ever become so powerful as to be able to coerce all the rest put together;—

"That if that system is not merely to exist, but to be maintained without constant perils and violent concussions; each member which infringes it must be in a condition to be coerced, not only by the collective strength of the other members, but by any majority of them, if not by one individual;—

"But that to escape the alternate danger of an uninterrupted series of wars, or of an arbitrary oppression of the weaker members in every short interval of peace; *the fear* of awakening common opposition, or of drawing down common vengeance, must of itself be sufficient to keep every one within the bounds of moderation;—and

"That if ever a European state attempted by unlawful enterprizes to attain to a degree of power, (or had in fact attained it,) which enabled it to defy the danger of a union of several of its neighbours, or even an alliance of the whole, such a state should be treated as a common enemy; and that if, on the other hand, it had acquired that degree of force by an accidental concurrence of circumstances, and without any acts of violence, whenever it appeared upon the public theatre, no means which political wisdom could devise for the purpose of diminishing its power, should be neglected or untried. These maxims contain the only intelligible theory of a balance of power in the political world. (Note.—It perhaps would have been with more propriety called a system of *counterpoise*. For perhaps the highest of its results is not so much a perfect *equipoise* as a constant alternate *vacillation* in the scales of the balance, which, from the application of *counterweights*, is prevented from ever passing certain limits.)

"It is only when a state with open wantonness, or under fictitious pretences and titles artificially invented, proceeds to such enterprizes as immediately, or in their unavoidable consequences, prepare the way for the subjugation of its weaker neighbours, and for perpetual danger to the stronger, that conformably to sound conceptions of the general interest of the commonwealth, a rupture of the balance is to be apprehended; it is only then that several should unite together to prevent the decided preponderance of one individual power. By this system, which has been acted upon since the beginning of the sixteenth

century, with more or less good fortune, but with great constancy, and often with uncommon prudence; at first more in a practical way, and, as it were from political instinct, afterwards with clear, reflecting, and methodical constancy, two great results were obtained, in the midst of a tumultuous assemblage of the most decisive events. The one was, that no person succeeded in prescribing laws to Europe, and that, (till our times,) all apprehension, even of the return of a universal dominion, was gradually banished from every mind. The other, that the political constitution, as it was framed in the sixteenth century, remained so entire in all its members till the end of the eighteenth (when all ancient ordinances were abolished), that none of the independent powers, which originally belonged to the confederacy, had lost their political existence. . . .

"A system of political counterpoise has both in its structure and operations, a remarkable analogy with what, in the internal economy of states, is called a mixed constitution, or constitutional balance. When this, as in England for example, has attained to the highest pitch of perfection of which it is susceptible; when every thing is arranged and constituted in the wisest manner, when none of the different powers of which it is composed can surpass the bounds of their respective spheres, or in any way transgress their limits without encountering a repelling force, there is yet another danger which baffles all human skill to avoid. As the divided powers must necessarily act in concert for good and salutary purposes, they can also, in extraordinary cases, voluntarily combine for bad ones; and thus, what would have been impossible for any one singly to operate had the principle of mutual counteraction continued, may be effected by a fatal understanding between them, to the prejudice of the state, and the ruin of its constitution."—F. Gentz, *Fragments upon the balance of power*, xxii, 55, 60, 57, 60-65, 71-72.

British foreign policy.—Its contribution to the fall of Napoleon.—"The Emperor [Alexander I of Russia] has the greatest merit, and must be held high,' [Lord Castlereagh] wrote on April 20 [1814] to Lord Liverpool, 'but he ought to be grouped, and not made the sole feature for admiration.' Here we have the key to the continental policy of the British Government, as represented by Castlereagh, during the following years. Its consistent aim was the traditional one of establishing and maintaining the balance of power. After the downfall of Napoleon this balance was seriously threatened by Russia alone, and to preserve it Great Britain—as the secret treaty of Jan. 3, 1815, showed—would have used against Alexander the same weapons that had prevailed against Napoleon. Between Napoleon and Alexander, however, there was from the first this essential difference, namely, that Napoleon could never have been grouped, whereas Alexander could—was, indeed, an enthusiast for grouping, so long as he was allowed to pose in the centre of the picture."—W. A. Phillips, *Confederation of Europe*, p. 83.—"The constitution of the Congress [of Vienna] well illustrates the essential conditions of any international organization. . . . In theory all sovereign States are equal and should have an equal voice in the councils of the nations. But in practice their influence always has been, and always must be, in proportion to the force behind them; which means that, in the last resort, all important decisions will depend on an agreement between the Great Powers, with or without the consent of

the lesser. The proceedings of the Congress of Vienna have also a permanent interest, from the same point of view, as showing the difficulty of arriving at such an agreement, when there is a fundamental conflict of views and interests between the Powers, and the methods by which this difficulty is overcome. The method at Vienna was, as it always must be if one Power or group of Powers is not to dominate the rest, the application of the principle of the balance of power. This truth Castlereagh had from the first realized, and when in January 1814 he entered the councils of the Allies he announced the policy of Great Britain to be the restoration of a 'just equilibrium' in Europe. Napoleon was now overthrown, but the equilibrium had not been thereby restored; for his overthrow had left the immense power of Russia without an effective counterpoise on the Continent. 'The drawback to Russia as an ally,' said Moltke, 'is that she arrives on the field very late and is then too strong.' In the struggle against Napoleon Russia had arrived late, and she was now present in Northern and Central Europe in alarming force."—*Ibid.*, pp. 101-102.—"Those federations which have survived have done so because, as in the case of the United States, they have developed a common sentiment far stronger than any which may divide their constituent States, a sentiment based on the consciousness of interests, traditions and ideals distinguishing them from other political groups. They have survived, in short, because they have become nations. Seeing the world as it is, it is difficult to believe that any such powerful cement of sentiment could be found to bind together even the civilized peoples, not to mention the semi-civilized and the uncivilized. In the absence of such a sentiment the stability of the League of Nations must depend on a system of checks and balances, and this in the long run is unlikely to prove any more effective in keeping the peace than were the expedients of the old diplomacy."—*Ibid.*, pp. 300-301. See CONCERT OF EUROPE; EUROPE: Modern period: New balance of power.

Neutralization of states.—Dual and Triple Alliances.—"The reason why a state may desire to become neutralized is that it is weak, that its independence is guaranteed, that it has no desire or ability to participate in international affairs, in the usual struggles or competitions of states. The reason why the great powers have consented to the neutralization of such states have differed in different cases. But the chief reason has been connected with the theory of the balance of power, the desire to keep them as buffers between two or more neighboring large states."—C. D. Hazen, *Fifty years of Europe, 1870-1910*, p. 203.—See also NEUTRALITY.—The "Dual Alliance (q. v.) [France and Russia] was the inevitable outcome of the existence and power of the Triple Alliance, concluded between Germany, Austria, and Italy in 1882. The Dual Alliance grew out of the need which both Russia and France felt of outside support in the presence of so powerful a combination. If there was to be anything like a balance of power in Europe, Russia and France must combine. Both alliances were defensive. The action of Austria against Serbia brought Russia upon the scene. Russia's action brought Germany forward. Germany's action necessitated action on the part of France. One state was free to act as it saw fit, its conduct not controlled by entangling alliance, England."—*Ibid.*, p. 326.

Aftermath of World War.—"The truth is that, though the Americans and British alike fought

[against Germany] for a principle, it was not because of a principle that they entered the war, but because their honour and their vital interests left them no alternative. . . . After all, a nation is in its essence a group consciously separated from other groups by a vivid sense of its common and separate interests. The problem of preserving peace then remains, after [the World War] as before, the old one of holding the balance between these groups; and the problem of international organization is that of creating and keeping in order a mechanism by which this balance shall be kept steady. The task of the allied and associated nations at the present time, that is to say, is the same as that which confronted the Congress of Vienna [1814] and during the succeeding years; and, though in many respects the conditions have changed, the problem remains essentially the same."—W. A. Phillips, *Confederation of Europe*, p. 16.

Relation to principles of International Law.—"It is the task of history, not only to show how things have grown in the past, but also to extract a moral for the future out of the events of the past. Five morals can be said to be deduced from the history of the development of the Law of Nations:

"(1) The first and principal moral is that a Law of Nations can exist only if there is an equilibrium, a balance of power, between the members of the Family of Nations. If the Powers cannot keep one another in check, no rules of law will have any force, since an over-powerful State will naturally try to act according to discretion and disobey the law. As there is not and never can be a central political authority above the Sovereign States that could enforce the rules of the Law of Nations, a balance of power must prevent any member of the Family of Nations from becoming omnipotent. The history of the times of Louis XIV. and Napoleon I. shows clearly the soundness of this principle. . . . As regards interventions for the purpose of self-preservation, it is obvious that, if any necessary violation committed in self-preservation of the International Personality of other States is, as shown above, excused, such violation must also be excused as is contained in an intervention. And it matters not whether such an intervention exercised in self-preservation is provoked by an actual or imminent intervention on the part of a third State, or by some other incident. As regards intervention in the interest of the balance of power, it is likewise obvious that it must be excused. An equilibrium between the members of the Family of Nations is an indispensable condition of the very existence of International Law. If the States could not keep one another in check, all Law of Nations would soon disappear, as, naturally, an over-powerful State would tend to act according to discretion instead of according to law. Since the Westphalian Peace of 1648 the principle of balance of power has played a preponderant part in the history of Europe. It found express recognition in 1713 in the Treaty of Peace of Utrecht [see UTRECHT: 1712-1714], it was the guiding star at the Vienna Congress (q. v.) in 1815 when the map of Europe was re-arranged, at the Congress of Paris in 1856, the Conference of London in 1867, and the Congress of Berlin (see BERLIN, CONGRESS AND TREATY OF) 1878. The States themselves and the majority of writers agree upon the admissibility of intervention in the interest of balance of power. Most of the interventions exercised in the interest of the preservation of the Turkish Empire must, in so far as they are not based on treaty

rights, be classified as interventions in the interest of balance of power. Examples of this are supplied by collective interventions exercised by the Powers in 1886 for the purpose of preventing the outbreak of war between Greece and Turkey, and in 1807 during the war between Greece and Turkey with regard to the island of Crete. . . . Although subjugation is an original mode of acquiring territory and no third Power has as a rule a right of intervention, the conqueror has not in fact an unlimited possibility of annexation of the territory of the vanquished State. When the balance of power is endangered or when other vital interests are at stake, third Powers can and will intervene, and history records many instances of such interventions. But it must be emphasised that the validity of the title of the subjugator does not depend upon recognition on the part of other Powers. And a mere protest of a third Power is of no legal weight either."—L. Oppenheim, *International Law*, v. 1, *Peace*, pp. 73-74, 185-186, 292.—See also **CONCERT OF EUROPE**: History and meaning of term.

BALANCE OF TRADE. See **COMMERCE**: Commercial age: 1914-1921; **Tariff**: 1689-1721; 17th and 18th centuries; 18th century; 1776.

BALBOA, Vasco Nuñez de (1475-1517), discoverer of the Pacific ocean. Sailed for America 1500; went to Darien, where he was elected alcalde 1510; caused the imprisonment of Governor Encisco; received a commission to act as governor 1512; explored the country; discovered and took formal possession (1513) of the Southern sea (the name Pacific ocean was not applied until seven years later) in the name of the Spanish monarch; continued his explorations; returned to Darien 1514. Upon complaints of former governor Encisco to the king of Spain, Pedro Arias de Avila was sent to replace Balboa. The new governor had him arrested on a charge of contemplated revolt and beheaded. See **AMERICA**: 1513-1517; and **Map showing voyages of discovery**; **COLOMBIA**: 1499-1536; **PACIFIC OCEAN**: 1513-1764.

BALBRIGGAN, a town on the east coast of Ireland north of Dublin; textile manufacturing center; the scene of reprisals by the Royal Irish Constabulary, September 21, 1920, which originated in a quarrel between District Inspector Burke, his brother, Sergeant Burke, together with five or six other police and local Republican Volunteers, during which Inspector Burke was killed and his brother wounded. Later, the "Black and Tans" began a campaign of incendiarism, the outcome of which was the burning of many homes and the shooting of two civilians. Included among the razed buildings was the factory of Deeds, Templar and Company, which was completely destroyed.

BALCARCE, Antonio Gonzalez (1774-1819), South American soldier who served in the defence of Buenos Aires (1807). Joined the revolutionary movement; went with an army into upper Peru; was defeated at Huaqui, 1811.

BALCARCE, Juan Ramon (1773-1833), Argentine general. Governor of Buenos Aires, 1818 and 1820; member of the constituent assembly, 1825; minister of war and marine, 1827; chosen governor of Buenos Aires, 1832; driven out by Rosas, 1833.

BALCHITAS INDIANS. See **PAMPAS TRIBES**.

BALDER, sun-god of Norse mythology. He was loved by gods and men, and treacherously slain by the device of Loki, the fire-spirit and subtle enemy of the gods.

BALDWIN I, Latin emperor of Constantinople (Romania), 1204-1205, previous to which, as Count

of Flanders and Hainut, participated in the crusades. See **BYZANTINE EMPIRE**: 1204-1205; **CRUSADES**: 1201-1203.

Baldwin II, last Latin emperor of Constantinople, 1237-1261.

Baldwin I, Prince of Edessa (1098-1100), king of Jerusalem (1100-1118). See **JERUSALEM**: 1099-1131.

Baldwin II (Baldwin du Bourg), Count of Edessa (1100-1118), king of Jerusalem (1118-1131). See **JERUSALEM**: 1099-1131.

Baldwin III, king of Jerusalem, 1143-1162. See **JERUSALEM**: 1144-1187.

Baldwin IV, king of Jerusalem, 1173-1183. See **JERUSALEM**: 1144-1187.

Baldwin I (d. 879), Count of Flanders. See **BELGIUM**: Ancient and medieval history; and **FLANDERS**: 863.

Baldwin II (d. 918), Count of Flanders.

Baldwin V (d. 1067), Count of Flanders. See **BELGIUM**: Ancient and medieval history.

BALEARIC ISLANDS, a group of four large and eleven small islands in the Mediterranean sea, off the east coast of Spain. They form a province of Spain, with Palma as capital. The most important islands are Minorca, Majorca and Iviza.—See also **MINORCA**.

1235.—Controlled by Aragon. See **ARAGON**.

BALFE, Michael (1808-1870), popular Irish composer of opera in English, Italian and French. In 1835 he produced at Drury Lane his first English opera, "The Siege of Rochelle." His most famous opera "The Bohemian Girl" is still a popular favorite. The popular air "Killarney" is by Balfe.—See also **MUSIC**: Modern: 1750-1870.

BALFOUR, Arthur James (1848-), British statesman and essayist. Member of Parliament since 1874; member of Berlin Congress, 1878, as private secretary to Lord Salisbury; chief secretary for Ireland, 1887-1891 (see **IRELAND**: 1885-1903); president of local government board, 1885-1886; created Congested Districts Board for Ireland, 1890; leader of the house and first lord of the treasury, 1891-1892, 1895-1905 (see **ENGLAND**: 1894-1895; and 1900); premier, 1902-1905 (see **ENGLAND**: 1902 [July]; 1903 [May-Sept.]; and 1905-1906); first lord of admiralty in Asquith's coalition cabinet; secretary of state for foreign affairs in Lloyd George's cabinet, 1916-1919; British representative at the peace conference, Paris, 1919; chancellor of Cambridge University, 1919; lord president of the council, 1919. Chosen to act as British official representative on the League of Nations, 1920. Chairman of league's committee on organization, 1920. Leader of British delegation to Washington Disarmament Conference, 1921. Has written several books on philosophical and other subjects.

BALIA OF FLORENCE.—The chief instrument employed by the Medici to establish their power in Florence was "the pernicious system of the Parlamento and Balia, by means of which the people, assembled from time to time in the public square, and intimidated by the reigning faction, entrusted full powers to a select committee nominated in private by the chiefs of the great house. . . . Segni says: 'The Parlamento is a meeting of the Florentine people on the Piazza of the Signory. When the Signory has taken its place to address the meeting, the piazza is guarded by armed men, and then the people are asked whether they wish to give absolute power (Balìa) and authority to the citizens named, for

their good. When the answer, yes, prompted partly by inclination and partly by compulsion, is returned, the Signory immediately retires into the palace. This is all that is meant by this parlamento, which thus gives away the full power of effecting a change in the state."—J. A. Symonds, *Renaissance in Italy: Age of the Despots*, p. 180, and foot-note.—See also FLORENCE: 1378-1427; 1433-1464; and 1458-1469.

BALKAN STATES

Geographical position.—Physical aspects of the country.—The Balkan peninsula is the easternmost of the three great southern peninsulas of Europe. The peninsula embraces the following territories and states:—Albania (q.v.), Bosnia (q.v.) and Herzegovina (q.v.), Bulgaria (q.v.), Croatia-Slavonia (see CZECHO-SLOVAKIA), Dalmatia (q.v.), the Dobrudja (Rumania, (q.v.)), Greece (q.v.), Serbia (q.v.), Montenegro (q.v.), the former Sanjak of Novibazar (see NOVIBAZAR), or Novi Pazar, now a department of Serbia, Macedonia and Thrace. Rumania, though generally included in the list, is not, strictly speaking, a Balkan state. They occupy mainly the regions known in Roman times as Moesia, Dacia and Illyricum, to which names the reader is referred for some account of scanty incidents of their early history. (See AVARS.) For full details of the Balkan states, see articles under the respective political divisions, under EASTERN QUESTION and under WORLD WAR.

"We should begin our detailed study of the Balkan Peninsula with a realization of the broad outlines of its structure. A complex mass of upland, roughly triangular in shape, composed of hard, resistant rocks, rests with its apex on the Danube at Belgrade, its base stretching from the Black Sea to the Aegean. Its southern end, once continuous with the central mass of Asia Minor, lies sunk beneath the Aegean, which is fringed with the inlets and peninsulas which mark its shattered margin. The two sides of the triangle are bordered by young folded mountains, in which limestones largely predominate. But, necessarily, there is no sudden transition between central mass and folded margin. Balkans and western mountains alike are separated from the Central Upland by areas whose special feature is the presence of fertile basins, which alternate with low ridges, offering no great obstacle to through transit, and with mountain-tracts. Within these two belts lie the best lands of the peninsula, but they themselves are the natural highways of traffic from north to south and from south to north, from north-west to south-east, from Asia to Europe, from the Aegean to the European plains. It has been remarked by an acute observer that in the Balkan Peninsula the villages, contrary to the usual rule, tend to avoid the main road.

Along that main road one may find a few large towns, but the smaller settlements, too well aware that the highway's main function throughout historical time has been to allow of the passage of armies, seek safety in the byways. But it has been the curse of the Balkan States that they could not, like small groups of individuals, thus avoid the main lines of communication. To fly to the hills to starve there; to remain along the main route and be crushed by trampling feet; it is scarcely too much to say that these have been the main alternatives before the nations of that troubled land. We have said that the central mass of upland is roughly triangular in shape. In a quite general fashion we may say that the town of Belgrade is placed near the apex of the triangle, while Salonika and Constantinople occupy approximately the ends of the base line and most of the more important towns of the peninsula are strung along the sides of the triangle, which are themselves the main lines of communication. To grasp these facts is to realize some of the essential difficulties which have retarded the political development of the peninsula. It results necessarily from what has been said that, not only is there no natural centre within the peninsula about which, as nucleus, a great state might form, but that rivalries are almost certain to develop between small states. The fact that the peninsula is so easy of access from without—a point to which we shall return in a moment—means that weak peoples within will surge upwards from the plains on the main routes to mountains and uplands for safety. The danger past, they tend to descend, and are then confronted with the problem of how to divide among themselves the fertile plains which fringe the temporarily deserted highway. As fresh incursions from without are always liable to occur before internal adjustment has become possible, the problem is not one easily settled. We have already seen that incursion from the north is easy, because, beyond the Save and the Danube, the peninsula lies open to the wide Hungarian plain; but it may be well to emphasize the contrast here with the Italian and Iberian Peninsulas. Both of these are separated from continental Europe by mountain-chains, not absolutely continuous

from sea to sea, not, as history has shown, giving perfect and easily drawn frontier lines, but still of great value as constituting in each case a northern belt of relatively scantily-peopled land, permitting of the development of more or less demarcated nationalities respectively within and without the peninsular areas. In contrast with the Balkan region, it is worth note, the Iberian Peninsula is further remarkable in that it narrows where it is attached to the Continent—a fact which has helped to promote a distinction between intra-peninsular and extra-peninsular nationalities. On the other hand, the Balkan Peninsula is widest where it joins the Continent, no notable barrier to human progress separates the one region from the other, and, in association with this, many of the peoples of the peninsula have representatives, sometimes numerous representatives, beyond its largely artificial boundary lines. In other words, their interests are never wholly within the peninsula—are sometimes largely outside it. What are its boundary lines? As usually defined, the Balkan Peninsula is the land area to the south of a line drawn along the line of the Lower Danube, then of the Save and of its insignificant tributary, the Kulpa, and from the headwaters of this stream to the shore near Fiume. How artificial this 'geographical' frontier is may be realized from the fact that only along part of its course does it correspond to political boundaries, and from the other fact that few maps of the region go so far to the north-west. In reality, while the southern part of the Balkan region is a true peninsula, the northern quadrilateral, separated from Asia Minor only by the narrow submerged river valleys which we call the Bosphorus and the Dardanelles respectively, is really continental, in climate as well as in many of its characters. Europe stops, not at Constantinople, but in the steppe region behind it, for the city itself has but little relation to the northern part of the peninsula on which it stands. If we bear in mind that the factors we have stressed—the absence of a natural centre, of isolation from surrounding regions, the existence of broad, diverging highways leading through the heart of the land—have been in action for long centuries, then the welter of races and of creeds within the peninsula, the jealousies and quarrels, the short-lived triumphs of one race or another, will be readily understood. Here within a total area of some 101,000 square miles—that is, considerably less than Spain—no less than six native races dwell, in addition to representatives of not a few others."—M. I. Newbiggin, *Geographical aspects of Balkan problems*, pp. 11, 14-15.

Races existing.—Evolution from the past.—Migrations and activities from the year A. D. 117 to 1453.—"In no part of Western Europe do we find districts inhabited by men differing in speech and national feeling, lying in distinct patches here and there over a large country. A district like one of our larger counties in which one parish, perhaps one hundred, spoke Welsh, another Latin, another English, another Danish, another Old French, another the tongue of more modern settlers, Flemings, Huguenots or Palatines, is something which we find hard to conceive, and which, as applied to our own land or to any other Western land, sounds absurd on the face of it. When we pass into South-eastern Europe, this state of things, the very idea of which seems absurd in the West, is found to be perfectly real. All the races which we find dwelling there at the beginning of recorded history, together with several races which

have come in since, all remain, not as mere fragments or survivals, but as nations, each with its national language and national feelings, and each having its greater or less share of practical importance in the politics of the present moment. Setting aside races which have simply passed through the country without occupying it, we may say that all the races which have ever settled in the country are there still as distinct races. And, though each race has its own particular region where it forms the whole people or the great majority of the people, still there are large districts where different races really live side by side in the very way which seems so absurd when we try to conceive it in any Western country. We cannot conceive a Welsh, an English, and a Norman village side by side; but a Greek, a Bulgarian, and a Turkish village side by side is a thing which may be seen in many parts of Thrace. The oldest races in those lands, those which answer to Basques and Bretons in Western Europe, hold quite another position from that of Basques and Bretons in Western Europe. They form three living and vigorous nations, Greek, Albanian, and Rouman. They stand as nations alongside of the Slavs who came in later, and who answer roughly to the Teutons in the West, while all alike are [1877] under the rule of the Turk, who has nothing answering to him in the West. . . . When the Romans conquered the South-eastern lands, they found there three great races, the Greek, the Illyrian, and the Thracian. Those three races are all there still. The Greeks speak for themselves. The Illyrians are represented by the modern Albanians. The Thracians are represented, there seems every reason to believe, by the modern Roumans. Now had the whole of the South-eastern lands been inhabited by Illyrians and Thracians, those lands would doubtless have become as thoroughly Roman as the Western lands became. . . . But the position of the Greek nation, its long history and its high civilization, hindered this. The Greeks could not become Romans in any but the most purely political sense. Like other subjects of the Roman Empire, they gradually took the Roman name; but they kept their own language, literature, and civilization. In short we may say that the Roman Empire in the East became Greek, and that the Greek nation became Roman. The Eastern Empire and the Greek-speaking lands became nearly coextensive. Greek became the one language of the Eastern Roman Empire, while those that spoke it still called themselves Romans. Till quite lately, that is till the modern ideas of nationality began to spread, the Greek-speaking subjects of the Turk called themselves by no name but that of Romans. . . . While the Greeks thus took the Roman name without adopting the Latin language, another people in the Eastern peninsula adopted both name and language, exactly as the nations of the West did. If, as there is good reason to believe, the modern Roumans represent the old Thracians, that nation came under the general law, exactly like the Western nations. The Thracians became thoroughly Roman in speech, as they have ever since kept the Roman name. They form in fact one of the Romance nations, just as much as the people of Gaul or Spain. . . . In short, the existence of a highly civilized people like the Greeks hindered in every way the influence of Rome from being so thorough in the East as it was in the West. The Greek nation lived on, and alongside of itself, it preserved the other two ancient nations of the peninsula. Thus all three have lived on to the present as distinct

nations. Two of them, the Greeks and the Illyrians, still keep their own languages, while the third, the old Thracians, speak a Romance language and call themselves Roumans. . . . The Slavonic nations hold in the East a place answering to that which is held by the Teutonic nations in the West. . . . But though the Slaves in the East thus answer in many ways to the Teutons in the West, their position with regard to the Eastern Empire was not quite the same as that of the Teutons towards the Western Empire. . . . They learned much from the half Roman, half Greek power with which they had to do; but they did not themselves become either Greek or Roman, in the way in which the Teutonic conquerors in the Western Empire became Roman. . . . Thus, while in the West everything except a few survivals of earlier nations, is either Roman or Teutonic, in the East, Greeks, Illyrians, Thracians or Roumans, and Slavs, all stood side by side as distinct nations when the next set of invaders came, and they remain as distinct nations still. . . . There came among them, in the form of the Ottoman Turk, a people with whom union was not only hard but impossible, a people who were kept distinct, not by special circumstances, but by the inherent nature of the case. Had the Turk been other than what he really was, he might simply have become a new nation alongside of the South-eastern nations. Being what he was the Turk could not do this. . . . The original Turks did not belong to the Aryan branch of mankind, and their original speech is not an Aryan speech. The Turks and their speech belong to altogether another class of nations and languages. . . . Long before the Turks came into Europe, the Magyars or Hungarians had come; and, before the Magyars came, the Bulgarians had come. Both the Magyars and the Bulgarians were in their origin Turanian nations, nations as foreign to the Aryan people of Europe as the Ottoman Turks themselves. But their history shows that a Turanian nation settling in Europe may either be assimilated with an existing European nation or may sit down as an European nation alongside of others. The Bulgarians have done one of these things; the Magyars have done the other; the Ottoman Turks have done neither. So much has been heard lately of the Bulgarians as being in our times the special victims of the Turk that some people may find it strange to hear who the original Bulgarians were. They were a people more or less nearly akin to the Turks, and they came into Europe as barbarian conquerors who were as much dreaded by the nations of South-eastern Europe as the Turks themselves were afterwards. The old Bulgarians were a Turanian people, who settled in a large part of the South-eastern peninsula, in lands which had been already occupied by Slaves. They came in as barbarian conquerors; but, exactly as happened to so many conquerors in Western Europe, they were presently assimilated by their Slavonic subjects and neighbours. They learned the Slavonic speech; they gradually lost all traces of their foreign origin. Those whom we now call Bulgarians are a Slavonic people speaking a Slavonic tongue, and they have nothing Turanian about them except the name which they borrowed from their Turanian masters. . . . The Bulgarians entered the Empire in the seventh century [see BULGARIA: 7th century], and embraced Christianity in the ninth. They rose to great power in the South-eastern lands, and played a great part in their history. But all their later history, from a comparatively short time after the first Bulgarian conquest, has been that of a Slavonic and

not that of a Turanian people. The history of the Bulgarians therefore shows that it is quite possible, if circumstances are favourable, for a Turanian people to settle among the Aryans of Europe and to be thoroughly assimilated by the Aryan nation among whom they settled."—E. A. Freeman, *Ottoman power in Europe*, ch. 2.—See also VLAKHIS.

"After Trajan's death [117] these semi-Romanized Thracians could not longer be held in subjection; during his short reign of three years, Maximin, himself a Thracian who had risen from the ranks to the purple, maintained a semblance of order among his kinsfolk, but to the natural restlessness of the people was now added a new cause of disturbance. The Goths had settled on the northern shore of the Euxine [Black Sea], the Vandals had boldly entered the province, and from the great plains further beyond was pouring out a flood of humanity which pressed hard upon both from behind, breaking through in places and emptying itself into the valley of the Danube. Hadrian was forced (270-275) to withdraw his troops to the right bank of that great river and rename the province Riparian Dacia. The left shore to the north was thus lost to the empire, but some of the Romans and much of the Romanized population continue to dwell there. These and the traders kept the prevalent low Latin a living tongue. About the year 450 the Huns, and a century later the Avars, permeated the land, until finally there was a mechanical mixture of races, peoples, and tongues in which the old order was utterly disintegrated and the way prepared for the latest inundation, that of the Slavs, whose very name, Slave, indicated the contempt in which they were long held. . . . Slowly the great horde of Goths on the north shore of the Euxine had differentiated itself into two stocks, somewhat different in character and widely different in their historical career; the west, or Visigoths, and the east, or Ostrogoths. The next important migration under Alaric, who actually settled in the central portion of it in 382, in 395 threatened Constantinople and pressed on into Epirus and Hellas. It is to the ruthless occupation of the mainland by barbarians that the islands of Hellas owe to this day their almost homogeneous Greek population, descendants of the Greeks who nearly fourteen centuries ago fled before this Germanic invasion. In time the invaders were more or less Hellenized and established themselves in Epirus as vassals of the emperors at Constantinople. Restless and uncertain as was their temperament, they soon began to fear lest they should be further absorbed into Byzantium, and at last withdrew across the Adriatic to their kindred in Italy. During the period of their settlement in that peninsula they destroyed the art treasures of the country most ruthlessly, and the process which they began was continued by the Huns, who poured their Mongolian flood along the same highway of nations. These in turn were followed by the Ostrogoths under Theodoric, who laid waste the Peloponnesus, and by the Vandals who perpetrated every form of theft and destruction along the Greek coast line; whatever was left after this devastating process substantially disappeared under the rule of the Bulgars, who in 517 ravaged Epirus and Thessaly as far as Thermopylæ. The Byzantine emperor Anastasius sought to protect his capital behind the wall stretching from Propontis to the Euxine, a line of defense so often mentioned in this latest period,

Maps prepared specially for the NEW LARNED under direction of the editors and publishers.

and abandoned all his unhappy provinces to their fate. He and his successor, Justin, were utterly paralyzed when the Slavs, abiding their time on the south shore of the Danube, began a further advance and established many permanent colonies in the districts deserted by their former inhabitants. Justinian, however (527-565), was a man of different temper, and while he left the Slavic colonists already established in their new seats, yet he inaugurated a system of fortifications on the Danube and in the interior of his empire which checked any further inroads. The last quarter of the sixth century is marked by the further invasion of the peninsula by the Avars, a people of extremely warlike nature. Coming from their previous home between the Caspian and the Sea of Azov, they had occupied the valley of the Theiss [Tisza], whence for two and a half centuries they terrorized all their neighbors. They now pushed forward into the east Roman empire and found their advantage sometimes in supporting the emperor, sometimes in strengthening the Slavic invasion. They, too, succeeded in establishing settlements at various places in Greece, but, in the main, the result of all this confusion was the greater and greater preponderance of the Slav element. At the beginning of the sixth century there were more Avars to the north of the Danube than beyond it, and more Slavs to the south than on the other side. Pliny, in the first century of our era, makes mention of the Slavs, and in their legendary lore the emperor Trajan occupies so important a position that many have thought there must have been some contact of a peaceful nature between him and the Slavic tribes. Inasmuch as Slavic folklore expresses nothing but kindness and admiration for the Roman powers, which were afterwards their bitterest enemies, their kindly relations may have continued to the end of the fourth century. Traces of prehistorical Slav migrations and settlements have been found clear across Europe as far as Hanover, but the Germans forced them back over the Elbe. Their primitive seat appears to have been the banks of the Dnieper River in what is known to-day as southern Russia. A prevailing hypothesis makes them descendants of, or close kin to, the Scythians, but so commingled with the race stocks just mentioned that they appear to be a composite race. The Bulgars, whose seats had been on the lower Volga, were nearest in kin to the Turks. From the time of their earliest appearance they, too, assimilated themselves, and very closely, with the nomads about them, and it was Bulgarized Slavs who founded the empire which included the lands of the Danube, Wallachia, with a part of Hungary, as well as their own territory—a mighty empire which lasted for over three centuries (702-1014). During their ascendancy three peoples of unknown descent—the Hungarians, a Ugrian-Turcoman folk from Asia, and two Turkish stocks, the Patzinakians [Petchenegs] and Cumanians [Kumans]—entered the districts north of the Danube. It was into the very heart of the vast Slavic territory that the Hungarians drove themselves like a wedge; and for generations the northern and southern groups lived in different environments and under different conditions—a fact which created and perpetuated substantial variations. In type, language, and even in basic institutions they are perhaps as much differentiated as the Spanish from the Portuguese, much less than the Italians and Spanish or any other two of the Romance peoples. It was the south Slavs who were first discernible in the Balkans during the sixth century. In the seventh they began to settle westward of the Bulgarians, occupying the Roman

province of Moesia, and it was there that they first received the contemptuous name which they still bear, that of Servians, Slaves. In the eighth century they accepted Christianity, and thence down to the eleventh century they were at best a protectorate, and more often a dependency of Byzantium. [See CHRISTIANITY: 9th century: Bulgarian church]. Thereupon, separate stocks began successively and successfully to assert independence, and in 1105 they were united under a dynasty which in 1222 was recognized by both the Pope and by the emperor of Constantinople. They developed a civilization which was quite remarkable; and under the Czar Stephen Dushan (1330-1335) the empire embraced, in addition to its original domains, Macedonia, Albania, Thessaly, Bulgaria, and northern Greece. This great Servian conqueror reached the very gates of Constantinople with a summons to surrender, but there he died; and his lands, united only by his imperious will, fell apart, a prey to warring ambitions. It was in 1453 that Mahomet II, the great Osman Turk, mentioned in another connection, after capturing Constantinople, marched onward with his invincible horde and soon brought all the Balkans under Turkish sway, a grinding tyranny that lasted nearly four centuries. [See TURKEY: 1360-1389; 1402-1451; 1451-1481.] With the appearance in the Balkan peninsula of the Turks, an outline of whose career has already been given, the long roll-call of national and race elements in that distracted portion of Europe is completed. Not one of these elements has remained entirely pure. Of those considered, four have admitted alien strains, and the same is true of their languages and institutions; yet all survive, and all hold fast to their traditions, and all look forward to the restoration of their ancient dominion and glory. The situation is complicated by the strife of confession; Islam with Christianity—alas! a divided Christianity—the adherents of the Greek Church, at least among the masses, regarding those of the Roman confession as utter outcasts, and vice versa.—W. Sloane, *Balkans—a laboratory of history*, pp. 63-68.

19th century.—Nationalism.—Growth of democracy.—Characteristics of the peoples.—“The nationality movement, which is the main historic tendency of the nineteenth century, is a phase of the acquisition of political power by the people, even as is the related movement for democratic popular government. Near Eastern nationalism is a result of the same renaissance that took among western peoples the form of a movement for democratic institutions. They are both movements for government of the people by the people to the exclusion of absolutism and autocracy. This movement caused wars among the Anglo-American and

Latin communities towards the end of the eighteenth century in the regions bordering the Atlantic, and ever since has been steadily making its way through the people of Europe and Asia. After revitalizing the mid-European races, it has passed into Asia with the beginning of this twentieth century; its successive invasions of the Iberian, Italian, and Balkan peninsulas being specially instructive. . . . Its effect on the Balkan Peninsula was exceptionally erratic, for whereas the Greeks were reached by it even before many of the Latin races, the Turks were affected a full century later. Thus it comes about that the arrival of the nationality movement among the Greeks and the War of Emancipation of the beginning of the nineteenth century is the first historical cause of the Balkan war; while its arrival among the Turks and the Ottoman revolution of a century later is the very last. It would be easy, though it would be too long, to explain this by the particular circumstances and character of each place and people. It would be of the greatest interest to examine in detail the political or social conditions under which, for instance, Greece, which had so long a start of Bulgaria, has been overtaken within our generation; or why Servia as a national democracy is a higher political organism than autocratic Russia. But the geographical method of studying the movement makes such detailed inquiries unnecessary; for these irregularities, if traced to their source, are to be explained either by direct geographical circumstances such as the checks opposed by mountains and deserts or the channels offered by seas and rivers, or else by indirect geographical influences working on national character. This brings us back again to the geographical origins of history. Balkan politics can only be understood through a knowledge of the stage of development of the Balkan peoples. The Balkan peoples can only be understood by a knowledge of the configurations and characteristics of the peninsula. When, moreover, the main configurations and characteristics of the peninsula are observed it will be found that the character of the populations has a regional rather than a racial basis, and is indigenous to the locality rather than inherent in the stock. This can be illustrated in the case of every community in question. Greece is inhabited, and, so far as investigation shows, always has been inhabited, by people of the Greek type of character in spite of renewals or even removals of its inhabitants by Cretans, Dorians, Slavs, Albanians, and such alien types. The assertion can be advanced beyond this, and it might even be said that records suggest that the population of Boeotia, or of Sparta, or even of Athens, have maintained through all vicissitudes each their distinct sub-species. Again, Montenegrins and certain Albanian tribes are of very similar physical type; but their mental and moral character is distinct, and while one represents an essentially Slav culture, Albanian civilization is peculiar to itself and long antedated the advent of the Slavs. Bulgars are of Finnish stock, have a Slav tongue, and a Mongol name; but their national character is also peculiar to themselves, though it strongly resembles that of the Finland Finns. The Bulgar national type is evidently one which has had time to adapt itself perfectly to its surroundings, or, as suggested above, to have been perfectly assimilated by its surroundings, physical and political. Back through Byzantine history we find Bulgars playing the same political rôle and exhibiting the same peculiarities. Roumanians are also a composite race of Latins and Vlachs with some borrowings from Jews and Gypsies; but the dominant characteristics of their culture cannot be accounted for from any of these

sources. It will help to explain much that is astonishing in the development of the Balkan nationality movements if we can account for the very marked and matured national characteristics of these very youthful nations by peculiarities in the natural conditions and configuration of the countries they inhabit. For instance, the most marked characteristic of the peninsula of Greece is that it has a deeply indented coastline and that the mainland is cut up into valleys by difficult ranges. These valleys are even more independent of and isolated from each other than the islands of which a large portion of the Greek national territory consists. Greek civilization centres in and surrounds the Aegean just as Anglo-Saxon civilization surrounds the North Atlantic. The Hellenes, like the Anglo-Saxons, have in consequence always consisted of independent communities of valley or island folk in a sea-faring, that is a foreign, relation to each other, united only by a common culture and civilization. The course of the early development of the small Greek democracies was by competition rather than by combination. Consequently the natural characteristics of the Greeks in political and social relations are rather intelligence and independence than gregariousness and generosity. This Greek 'separatism' was due also in part to disadvantages attending the development of maritime communities in those days from which our later maritime civilizations have been free. In primitive times the sea was more of a barrier than now; for while it was already the high road for culture it was also the open road for piracy, and the pirate of that age was as important a factor in regulating and restricting the free growth of a community as the wolf which kept prehistoric man to the hilltops. But Greek national culture and character were due to more peculiar geographical advantages than an indented coastline and intersecting ranges. From its situation at the juncture of the three continents Greece became the first country in Europe to enjoy the stimulus of Egyptian culture and Phoenician commerce, and owing to its configuration it was especially well adapted for assimilating these advantages. Greece thus became a group of politically compact but socially complex urban communities. Compact because their political relationship to each other and to the outside world was a foreign and frequently hostile one; complex socially because their situation demanded independent municipal life and commercial pursuits tend to subdivide a community into social strata. Such a collection of communities and such a category of classes Greece has remained to this day; for while the leading political feature of Greece nowadays is the all-dominating idea of national fraternity, yet this great motive principle of Greek public life has not levelled out the local feeling and local characteristics that differentiate the component Hellenic communities. So also, while the dominant social note is democratic equality, this again has not affected the essential classifications of Greek society. Again, the principal pride of the individual Greek is his liberty of thought, his independence of mind, but no man is more dependent on the opinions of others or on obtaining from abroad the raw material of culture for the industry of his intellect. In a word, the typical Greek is an islander, a townsman, and a brainworker. The Greek is a cultivator of necessity, the Bulgar by choice; as appears in the fact that the Bulgars of Constantinople are market gardeners and market they produce through Greeks. The Greek village is a country town; the Bulgar village is a collection of farms. Greek nationalism may be described perhaps rather

as an imperial than a national consciousness. The Greeks of Crete and Corfu are one as the British of Montreal and Liverpool are one, but not as the Serbs of Belgrade and Cetinje are one. As we go north from the islands of the Morea the valleys widen into plains. First the Boeotian valley; then the broad vales or narrow plains of Thessaly and of Epirus: north of them the wider Macedonian valley, until, across the Balkans, Greek influence dies away in the vast Danubian plains. The Greeks of these plain lands have throughout been the least Greek in character. This Boeotian temperament we all know from the Classics, and it is still the butt of the Kafeneion. The Thessalian temperament was the basis of Alexander's empire, which was as non-Greek in its constitution, its phalanx, and its inspiration as the empire of Napoleon was non-Latin. This national character explains why the Greek has had so much difficulty in retaining the interior of the Peninsula, although holding the coastline—contrary to the usual rule that who holds the coast holds the country. He has exploited the coasts of the Aegean and of the Black Sea, while the Bulgars, Slavs, Turks, and other plainsmen have exploited the plains. The Greek has found the process of recovering Thessaly and Epirus a long and laborious task; and Thessaly is the northernmost plain country the acquisition of which can be justified as ethnological. If the Greek national character had allowed of the Greeks being plainsmen, there would have been no 'Eastern Question.' (q.v.) Their northern neighbours, the Bulgars and Serbs, offer very illustrative contrasts. The Serbs in their broken forest country have retained in their character many more of the mystic qualities of an earlier civilization. In their social structure may still be found relics of early social institutions, such as the 'zadruga' [family community], long lost elsewhere. Their main national occupations are that pastoral pursuit which reformed the prodigal son and the idyllic industry of making plum jam. Their national character is best explained by the fact that they are nearly all poets and pig dealers; and if their national policy seems sometimes to be more inspired by their trade than by their temperament, it is perhaps chiefly the fault of modern civilization, which has given them cause to seek a political rather than a poetical expression of their woodland nature. Bulgar nationalism is as different in character from that of Greek or Serbs as the Bulgar fertile plains and grassy downs differ from the wooded hills of Servia or the stony ranges of Greece; and the Bulgar ploughman and shepherd both have the true plainman's character. Rural life on open plains and pastures develops character in its moral rather than in its mental or mystical capacities. It is a common mistake to assume that highlanders are more devoted to liberty and more diligent in moral discipline than lowlanders. Mountains have offered a refuge and a stronghold for temporary resistance against oppression, but it is in the plain that liberty, equality, and fraternity can best find the air, the soil, and the springs necessary for their growth. To their plains the Bulgarians owe the fraternity and equality—the ethical solidarity, and the economic socialism—which have made their moral and material renaissance so surprising in its swiftness and smoothness. The moral qualities of the Bulgar character are in a different sphere from that of the Greek mental qualities or from that of the mysticism of the Slav. If the political position of the British Isles in the sixteenth century were to be compared to that of the Balkan peninsula of to-day, we should call the Bulgars Lowland Scotch, the Serbs Irish, the Albanians

Welsh, the Greeks English, and the Roumanians French. The analogy is of course very imperfect, but may be a help in placing these peoples politically. While the Balkans offer an especially favourable field for studying the effects of nature on nationality and of geographical conditions on the character of nations, the phenomenon is of course not peculiar to the Balkans. The same thing can be observed in any country of marked configuration and character. . . . Although attention has only lately been directed to national consciousness as a moulding moral force, and to the possibility, of its possessing subliminal qualities, the effects of this force have long been observed by the democratic diplomatist; and nowhere are they more remarkable than in the Balkans. In Balkan politics, such a subliminal national consciousness can alone explain events which otherwise would be extraordinary but not enlightening. Events such as the sudden emergence of nations like Bulgaria, fully equipped for, and expert in, the difficult functions of national democracy, from an inchoate mass of corruption and degradation such as was Roumelia in the nineteenth century. Events such as the course taken and the centre chosen by the Greek renaissance, which developed through the Moreote peasants instead of through the national culture centre in the Phanar. Events such as the postponement of the renaissance of Turkish democracy until it was too late to save the Turkish predominance. These and many other phenomena require something more than an explanation drawn from current politics. The striking persistence in the Balkan peninsula of national character and national culture, both through long periods of submergence and through operations such as the substitution of a new race for the old, suggests that this power of endurance may stand in some relation to the period of duration of culture before the submergence or the shock. We find encouragement in this theory when we note that the Balkan peninsula, with its two broken bridges thrust out towards Africa and Asia—one being the Morea with Crete, the other Thrace with the Troad—must always have been the European port of entry and centre of production for supplying to Europe the culture products of Egypt, Phœnicia, Mesopotamia, and Asia Minor. The Balkan valleys and plains were the channels and reservoirs through which eastern culture flowed into and fertilized the desert of European raw humanity. The prototypes of those national cultures which we call nowadays Greek or Latin can be dug out of the Aegean islands or Balkan plains even as we dig out the prototypes of our domestic animals. Still they are prototypes only; for Minoan 'nationality' is not Greek, any more than the tree-climbing hipparion is a race-horse. To these primitive prototypes of national character may be assigned an intermediate place between, on the one hand, unconscious habits and modes of expression common to all mankind, formed during whole geological epochs of primeval darkness, and, on the other, the conscious civic functions of the short noonday of civilization. It is the differences in subconscious habits of religious and political thought, and of artistic and literary expression, formed during the long dim dawn of our modern social civilization, that constitute the ineradicable and immutable atmosphere of nationality and connect it indissolubly with the area in which it was born. Those who oppose a nationality movement from arbitrary policy, as do reactionaries, or from artificialities of reasoning, as do some revolutionaries, are only one degree less foolish than those who pervert the habits of man's body. Civilization has rendered

our body independent of the natural changes of sun, moon, and stars under which its habits developed; but that does not permit us to ignore these habits. We can live now as conveniently by night as by day, but we must still have sleep and sunlight. Even so, political progress can civilize Russian or Bulgar serfdom into self-government and Russian or Turkish autocracy into a democracy, but did not and cannot civilize a Bulgar into either a South Russian or a North Hellenic, a 'Young Turk' or—shall we add—an 'Old Servian.' The Balkan peninsula contains those regions where early European culture existed longest, where early European national civilizations were most completely extinguished, and where modern European national democracies have been most perfectly and speedily evolved. It is argued that there must be a relation between these facts; a gospel of national resurrection full of hope to the worn and weak among the nations. If this conjecture be permitted us, a corollary to it suggests itself which will carry us still further into an understanding of Balkan events. These early Balkan civilizations, some of which were more completely extinguished than others, seem to have revived with a completeness and quickness proportionate to the severity of their suppression. Bulgaria is by far the most perfect national democracy in the Balkans, and in its case all traditions of nationality and self-government were so completely wiped out that intelligent travellers, such as Kinglake in mid-nineteenth century, ignored even the existence of the Bulgar as a distinct race stock. The Serb, the Rouman, the Greek, the Turk, take rank for perfection of national democracy in the order named, and that order also represents the degree of suppression suffered by their cultures and civilizations. On the reflux of the Turkish inundation the Bulgar reappeared a Bulgar, and all the more Bulgarian for having so long been a Greek rayah and an Ottoman subject; the Serb reappeared as the most Slav of Slavs, and all the more Slavonic for having been a Turk, an Austrian, or a Hungarian, according to the vicissitudes of the time. It would seem as though the deeper the submergence and the more sweeping the inundation the more does anything atrophied or alien get purged out of the national character, leaving only the efficient and essential elements. The virtues of Balkan nationalities suggest the good qualities peculiar to the original national temperament, but deepened and broadened; whereas their vices seem to be the general evil effects of their temporary subjection. For this reason perhaps the vices of the Balkan nationalities are all the same sort of servile vices, dissimilar only in the same respects that the national characters are different. Thus the Balkan races, like all subject races, are cruel to their inferiors with a cruelty somewhat different in each case. The cruelty of the Slav is the emotional cruelty of a certain class of poet or of pork butcher. That of the Greek is the logical cruelty of the student and the sweater. That of the Bulgar is the moral cruelty of the diplomatist and the drover. The cruelty of the Turk, on the other hand, is that of a ruling class. The lovable Turkish kindness to inferiors—domestic animals or Christian rayahs—changes in a moment to the cruelty of a class fighting for its privileges. Even in an English landed estate or in an American factory it is but a short step from this sort of kindness to that sort of cruelty. Thus also the Balkan races have all the servile vices of crookedness in dealing with superiors. But the Greeks will be tortuous from mere mental exuberance and the joy of running rings round a slow-witted adversary.

The Serb will be crooked from natural incapacity, because he loses his way in the arbitrary moral conventions of a complicated and uncongenial civilization. The Bulgar will give the effect of crookedness from a love of working out for himself the line of least moral resistance towards a goal he has chosen for and keeps to himself. Since we Anglo-Saxons are apt to adopt a moral standpoint in dealing with younger nations—as we do with our so-called social inferiors—the result is that we find the Bulgars most worthy of our approbation. Indeed, whether the standards of modern morality by which they are tried are those of Nietzsche or of Kipling, under either the Bulgars will be almost in a class by themselves, as 'supermen' of energy and efficiency or as 'legionaries of the law.' This, it is argued, is partly due to their original national character, but principally to the purgatory of oppression through which the nation has passed. If, as must be admitted, a war may be a phase of progress towards the emergence of a nationality or the emancipation of a democracy, then, to go a step further back, a war which submerges a nationality and suppresses popular rights may serve a social purpose under certain conditions. This is a hard saying, but if nations that have sinned are to be saved, they perhaps can only be saved by fire. It does not follow that oppression is not an offence or that arbitrary alien rule is not an anomaly for which the penalty will be paid by the party responsible. The partition of Poland was a crime for which the penalty has been paid and is being paid both by the accomplices, at the price of a century of antagonisms and armaments, and by the civilization which permitted it, in the loss of the Polish national contribution to the arts. But the Poland that succumbed as an aristocracy has been helped by its submergence to become, as it is now becoming, a democracy. A people must be a democracy before it can be a nation; though it can, as Bulgaria has done, combine in one effort the achievement of both grades. If the Bulgar, as he has evolved, is to the Anglo-Saxon the least antipathetic of the Balkan nations, the Serb, including the Montenegrin, has emerged so intensely a Slav that probably the Russian people alone are capable of properly appreciating his national qualities. This, quite as much as present-day political considerations, accounts for the Russo-Serb relationship which has been a ruling factor in the late Balkan war [of 1912-1913]. The Greek is most sympathetic to the Latin races. But the general mistake which western peoples are apt to make in judging the Balkan peoples is that of expecting from the latter the principles and point of view peculiar to the more advanced civilization of the West; and the further west the point of observation is placed, the more likely is this mistake to be made. American or English public opinion is harder in its judgments of the Balkan peoples, even as it is warmer in its sympathies, than the public opinion of central Europe."¹²—Lord G. 1878.—Treaty of San Stefano.—Berlin Congress.—Turkish territorial losses.—“On March 3, 1878, the Treaty of San Stefano was concluded between Russia and Turkey, and its provisions revolutionised the whole situation in the Near East. The independence of Roumania and Serbia was definitely secured; but while certain territorial concessions were made to Serbia and Montenegro, Bessarabia was to be taken from Roumania, who only received the Dobrudja as a sorry exchange; and Bosnia-Herzegovina, instead of being united to their kinsmen on the East, were to receive an autonomy of their own. But the outstanding feature of the treaty was the creation of a Big Bulgaria, under the suzerainty of the Sultan, comprising the whole of Bulgaria proper, Eastern Roumelia with the town of Philippopolis and the whole of Macedonia, to the very gates of Salonica, and extending westwards as far as the Sar Mountains, Dibra and Koritza, and even eating right into the heart of Albania to the west of the Lake of Ohrida. The Treaty of San Stefano was an absolutely impossible arrangement for two reasons. In the first place it was an essentially Slavonic settlement, which neglected or did grave injustice to the non-Slav races of the Peninsula, the Greeks, the Albanians and the Roumanians. In the second place it left Turkey with frontiers such as defied every law of geography, politics or common sense. Autonomous Bosnia was to retain its nominal connection with Turkey; but a narrow, wholly indefensible, and absurdly unnatural corridor through the Sandjak of Novibazar was still to connect Bosnia with the plain of Kosovo and to separate Serbia from Montenegro—a corridor infinitely less satisfactory and narrower by two-thirds than that which was actually created by the Treaty of Berlin. Salonica remained Turkish, but was entirely separated from its hinterland. Novibazar, Kosovo, Albania, Epirus and Thessaly were left in Turkish hands, as mere fragments, unworkable and disconnected. Adrianople and the

valley of the Arta were retained by the Turks; but the whole connection between Adrianople and Constantinople was directly threatened by the assignment to Bulgaria of an enclave of territory including Kirk Kilissé and extending south to within a few miles of the river Erzene, near Luleburgas. But if the settlement was unjust and fatal on general grounds, it is just upon Slavonic grounds that it had its most fatal effect. For it would have aggrandised Bulgaria at the expense of all her neighbours; and though it never became effective, its memory provided that tenacious race with a programme which struck deep root in the minds of its leaders, and has ever since been regarded by them as their excuse and justification for aiming at the hegemony of the Balkan Peninsula. Meanwhile this settlement displeased and alarmed the Great Powers on purely selfish grounds. Britain still looked upon Russian control of Constantinople as a real danger, and with more reason regarded with disfavour the clauses which seemed to secure to Russia complete control of the new Bulgarian administration and of the Prince's election. Public opinion in England was influenced by the sentimental appeals of Indian Moslems in favour of their Turkish co-religionists. Moreover, Austria-Hungary was determined to have Bosnia for herself and was highly displeased at an arrangement which would have placed Bulgaria across her own path to Salonica. The British Government took a strong line in demanding a revision of the Treaty, and was backed up by the mobilisation of Austria, and by protests from the Greeks and other rivals of Bulgaria. Russia was not prepared to risk an extension of the war and consented to the convocation of an European Congress, which in due course met in Berlin under the presidency of Bismarck as the 'honest broker' (June 13-July 13, 1878). The attitude and outlook of the Congress were at once revealed in its decision not to admit the Greek and Roumanian delegates to direct representation or to the vote, but merely to allow them to state their views. Thus the fate of the Balkan Peninsula for the next thirty years was decided by the Great Powers over the heads, and generally in defiance of the wishes, of the states and races concerned. If the settlement of San Stefano was unjust to all but the Slavs and did not draw a just line even between those Slavs themselves, the settlement of Berlin succeeded in being equally unjust to all. It was frankly based upon force, upon the interests of the Great Powers, and upon the negation of the rights of small nations.”—R. W. Seton-Watson, *Rise of nationality in the Balkans*, pp. 107-109.—See also TURKEY: 1878.—The actual result of the war was by no means so disastrous to Turkey as might have been expected. The loss of the Balkan principalities had long been inevitable, but the Sultan was still permitted to retain his suzerainty over Eastern Rumelia.—See also WORLD WAR: Causes: Indirect: d, 2.

1878-1891.—Proposed Balkan confederation and its aims.—“During the reaction against Russia which followed the great war of 1878, negotiations were actually set on foot with a view to forming a combination of the Balkan States for the purpose of resisting Russian aggression. . . . Prince Alexander always favoured the idea of a Balkan Confederation which was to include Turkey; and even listened to proposals on the part of Greece, defining the Bulgarian and Greek spheres

of influence in Macedonia. But the revolt of Eastern Roumelia, followed by the Servo-Bulgarian war and the chastisement of Greece by the Powers, provoked so much bitterness of feeling among the rival races that for many years nothing more was heard of a Balkan Confederation. The idea has lately been revived under different auspices and with somewhat different aims. During the past six years the Triple Alliance, with England, has, despite the indifference of Prince Bismarck, protected the Balkan States in general, and Bulgaria in particular from the armed intervention of Russia. It has also acted the part of policeman in preserving the peace throughout the Peninsula, and in deterring the young nations from any dangerous indulgence in their angry passions. The most remarkable feature in the history of this period has been the extraordinary progress made by Bulgaria. Since the revolt of Eastern Roumelia, Bulgaria has been treated by Dame Europa as a naughty child. But the Bulgarians have been shrewd enough to see that the Central Powers and England have an interest in their national independence and consolidation; they have recognised the truth that fortune favours those who help themselves, and they have boldly taken their own course, while carefully avoiding any breach of the proprieties such as might again bring them under the censure of the European Areopagus. They ventured, indeed, to elect a Prince of their own choosing without the sanction of that august conclave; the wisecracks shook their heads, and prophesied that Prince Ferdinand's days in Bulgaria might, perhaps, be as many as Prince Alexander's years. Yet Prince Ferdinand remains on the throne, and is now engaged in celebrating the fourth anniversary of his accession; the internal development of the country proceeds apace, and the progress of the Bulgarian sentiment outside the country—in other words, the Macedonian propaganda—is not a whit behind. The Bulgarians have made their greatest strides in Macedonia since the fall of Prince Bismarck, who was always ready to humour Russia at the expense of Bulgaria. . . . What happened after the great war of 1878? A portion of the Bulgarian race was given a nominal freedom which was never expected to be a reality; Russia pounced on Bessarabia, England on Cyprus, Austria on Bosnia and Herzegovina. France got something elsewhere, but that is another matter. The Bulgarians have never forgiven Lord Beaconsfield for the division of their race, and I have seen some bitter poems upon the great Israelite in the Bulgarian tongue which many Englishmen would not care to hear translated. The Greeks have hated us since our occupation of Cyprus, and firmly believe that we mean to take Crete as well. The Servians have not forgotten how Russia, after instigating them to two disastrous wars, dealt with their claims at San Stefano; they cannot forgive Austria for her occupation of Bosnia and Herzegovina, and every Servian peasant, as he pays his heavy taxes, or reluctantly gives a big price for some worthless imported article, feels the galling yoke of her fiscal and commercial tyranny. Need it be said how outraged Bulgaria scowls at Russia, or how Roumania, who won Plevna for her heartless ally, weeps for her Bessarabian children, and will not be comforted? It is evident that the Balkan peoples have no reason to expect much benefit from the next great war, from the European Conference which will follow it, or from the sympathy of the Christian Powers. . . . What, then, do the authors of the proposed Confederation suggest as its ultimate aim and object? The Balkan States are to act independently of the foreign Powers, and in concert

with one another. The Sick Man's [Turkey's] inheritance lies before them, and they are to take it when an opportunity presents itself. They must not wait for the great Armageddon, for then all may be lost. If the Central Powers come victorious out of the conflict, Austria, it is believed, will go to Salonika; if Russia conquers, she will plant her standard at Stamboul, and practically annex the Peninsula. In either case the hopes of the young nations will be destroyed forever. It is, therefore, sought to extricate a portion at least of the Eastern Question from the tangled web of European politics, to isolate it, to deal with it as a matter which solely concerns the Sick Man and his immediate successors. It is hoped that the Sick Man may be induced by the determined attitude of his expectant heirs to make over to them their several portions in his lifetime; should he refuse, they must act in concert, and provide euthanasia for the moribund owner of Macedonia, Crete, and Thrace. In other words, it is believed that the Balkan States, if once they could come to an understanding as regards their claims to what is left of the Ottoman Empire in Europe, might conjointly, and without the aid of any foreign Power, bring such pressure to bear upon Turkey as to induce her to surrender peaceably her European possessions, and to content herself henceforth with the position of an Asiatic Power." —J. D. Bourchier, *A Balkan Confederation* (*Fortnightly Review*, Sept., 1891).—See also BULGARIA: 1885-1886.

1885.—In September Eastern Rumelia rose in revolt. Here the Sultan was anxious to intervene, but owing mainly to British diplomatic support of Prince Alexander of Bulgaria, Turkish action was stayed. Serbia declared war on Bulgaria in November, and by the Peace of Bucharest the real independence of the two Bulgarias was confirmed. See SERBIA: 1875-1878.

1899-1901.—Condition of Balkan States.—"The States of the Balkan Peninsula, ever since the practical disruption of European Turkey after the war of 1877-78, have been in a condition of chronic restlessness. Those who desire the repose of Europe have hoped against hope that the new communities which were founded or extended on the ruins of the Ottoman dominion in Europe would be able and willing to keep the peace among themselves and to combine in resisting the intrusion of foreign influences. These expectations have been too frequently disappointed. The lawlessness of Bulgaria and the unsettled state of Servia, more especially, continue to constitute a periodical cause of anxiety to the diplomacy of Europe. The recent murder at Bukharest of Professor Mihaileano, a Macedonian by birth and a Rumanian by extraction, appears to be a shocking example of the teaching of a school of political conspirators who have their centre of operations at Sofia. These persons had already combined to blackmail and terrorise the leading Rumanian residents in the capital of Bulgaria, where the most abominable outrages are stated to have been committed with impunity. Apparently, they have now carried the war, with surprising audacity, into the Rumanian capital itself. Two persons marked out for vengeance by the terrorists of Sofia had previously been murdered in Bukharest, according to our Vienna Correspondent, but these were Bulgarians by birth. It is a further step in this mischievous propaganda that a Rumanian subject, the occupant of an official position at the seat of the Rumanian government, should be done to death by emissaries from the secret society at Sofia. His crime was that, born of Rumanian parents in Macedonia, he had the boldness to controvert in

the Press the claims of the Bulgarians to obtain the upper hand in a Turkish province, where Greeks, Turks, Bulgarians, Albanians, and Serbs are inextricably mixed up. Professor Mihaileano had probably very good reasons for coming to the conclusion that, whatever may be the evils of Ottoman rule, they are less than those which would follow a free fight in the Balkans, ending, it may be, in the ascendancy of Bulgarian ruffianism.

"It is for this offence that M. Mihaileano suffered the penalty of death by the decree of a secret tribunal, and at the hands of assassins sent out to do their deadly work by political intriguers who sit in safety at Sofia. The most serious aspect of the matter, however, is the careless and almost contemptuous attitude of the Bulgarian Government. The reign of terror at Sofia and the too successful attempts to extend it to Rumania have provoked remonstrances not only from the government at Bukharest, but from some of the Great Powers, including Austria-Hungary, Germany, and Italy. . . . There is only too much reason to fear, even now, that both the Bulgarian Government and the ruler of the Principality are afraid to break with the terrorists of Sofia. Political assassination is unfortunately among the traditions of the Bulgarian State, but it has never been practised with such frequency and impunity as under the rule of Prince Ferdinand. . . . His own conduct as a ruler, coupled with the lamentable decline of the spirit of Bulgarian independence, which seemed to be vigorous and unflinching before the kidnapping of Prince Alexander, has steadily lowered his position. The Bulgarian agitation—to a large extent a sham one—for the 'redemption,' as it is called, of Macedonia is a safety-valve that relieves Prince Ferdinand and those who surround him from much unpleasant criticism. . . .

"The situation in the Balkans is in many respects disquieting. The Bulgarian agitation for the absorption of Macedonia is not discouraged in high quarters. The hostility of the Sofia conspirators to the Koutzo-Wallachs, the Rumanians of Macedonia, is due to the fact that the latter, being a small minority of the population, are ready to take their chance of equal treatment under Turkish rule, subject to the supervision of Europe, rather than to be swallowed up in an enlarged Bulgaria, dominated by the passions that now prevail in the Principality and that have been cultivated for obvious reasons. Russia, it is believed, has no wish to see Bulgarian aspirations realized, and would much rather keep the Principality in a state of expectant dependence. Serbia and Greece would be as much embarrassed as Rumania by the success of the Bulgarian propaganda, and Austria-Hungary would regard it as a grave menace. Of course the Turkish government could not be expected to acquiesce in what would, in fact, be its knell of doom. . . . In Greece, the insubordination in certain sections of the army is a symptom not very alarming in itself, but unpleasantly significant of latent discontent. In Turkey, of course, the recrudescence of the fanaticism which periodically breaks out in the massacres of the Armenians cannot be overlooked. A more unfortunate time could not be chosen for endeavouring to reopen the Eastern question by pressing forward the Bulgarian claim to Macedonia. Nor could a more unfortunate method be adopted of presenting that claim than that of the terrorists who appear to be sheltered or screened at Sofia."—J. D. Bouchier (*London Times*, August 30, 1900).—See also BULGARIA: 1875-1878 to 1895-1896; MONTENEGRO: 1389-1868 to 1898; RUMANIA: 1856-1875; 1866-1914.

1912.—Balkan League.—The idea of a Balkan confederation aimed at Turkish rule in the peninsula, dates back to the later seventies of last century. Mutual distrust and jealousies had prevented the fruition of the idea, and it fell through from the sheer impossibility of securing the essential harmony among the Balkan peoples themselves. Turkish rule was safe so long as the discord of centuries continued. How those differences were temporarily overcome and the league finally came into being; how it speedily and almost completely achieved its object only to fall apart again, forms one of the political romances of modern times. The prominent part played by James David Bouchier (died January, 1921), for many years Balkan correspondent of the *London Times*, is thus told by Colonel Rankin of the British army: "Bouchier, with a knowledge of the conditions prevailing in Turkey and in the Balkans, on the one hand, and at the councils of the Great Powers on the other, superior to that of any other man living, saw that things must go from bad to worse. The end would be the extinction of the subject nationalities. All hope of the intervention of the Powers had gone shipwreck. Bouchier realised that the only remedy was a combination of the free nations, kinsmen of the oppressed peoples, either to bring such pressure, to bear on the Young Turks as to induce them to mitigate their rule, or, if they resisted, to put them out by force. He came to this conclusion at the end, I believe, of 1910. He did not want an immediate war; the first thing to be done was to apply pressure. But there was little probability that this would succeed. The Young Turks were elated by success and by the praise which their admirers in Western Europe had lavished on them. They had spent all the money which they could obtain from their financial friends or by taxation in creating a powerful army, and could snap their fingers at the little States; so the programme of pacific remonstrance seemed to end in a *cul-de-sac*. So Bouchier turned his attention to the other possible solution of the problem. What forces could the four States of the Balkans—Bulgaria, Serbia, Greece, and Montenegro—command for the purposes of bringing pressure, of one kind or another, to bear upon the oppressors of their co-religionists and kinsmen? The Bulgars were ready; their army was excellent, reorganised by Savoff, who had seen the evil effects on other armies of politics in cafés, and had inspired in his junior officers an enthusiasm for hard work which has borne its due fruit. The Bulgars could put 250,000 men in the field on the day of mobilisation. The

Servian army had improved since the Bulgars hammered it; it could provide at least another 150,000. The Greek army had had latterly the advantage of the instruction of French officers. English officers had been reorganising the fleet, and their *Azerof* was a bigger and better man-of-war than any the Turks possessed. Little Montenegro could certainly put up a gallant fight. . . . Here was the germ of the Balkan League—the first cause of the war which drove the Turks out of Europe after nearly five hundred years of misrule—a calculation simmering in the brain of an unofficial Irishman who, for love of them, had given half his life to the service of the Balkan peoples. So it came about that during the winter of 1910-11 Bouchier had long talks with M. Venezelos, the Greek Prime Minister [who was the moving spirit of the plan], and the two men discussed the scheme of a defensive and eventually offensive alliance between the Balkan States against the Turk. . . . At last, one day in May, 1911, the decisive step was taken. . . . Venezelos told Bouchier that he had finally approved the draft treaty of an alliance with Bulgaria against Turkey. . . . As before narrated, the Greek proposals were sent to Bulgaria in May, 1911. Some months later, Bouchier went to Sofia and put his arguments in favour of the alliance before King Ferdinand and M. Gueshoff. Just so, nearly a year before, he had persuaded Venezelos and King George [of Greece] to take the first step towards the formation of the Balkan League, so again in Sofia he persuaded the Bulgarian Government to fall into line with Greece. In February, 1912, he himself brought back to Athens from Sofia a reply favourable to Venezelos' proposal of a defensive alliance. Up to that moment only five people had an inkling of what was going on, namely, King George of Greece and M. Venezelos, King Ferdinand of Bulgaria and M. Gueshoff, and Bouchier. After Bouchier's return to Athens negotiations were put on a diplomatic basis, and the Greek Minister at Sofia was informed of the alliance and instructed to conduct the negotiations at the Bulgarian capital. That made six people in the plot. February and March passed; the negotiations went on in absolute secrecy; in April a definitive treaty was signed between Greece and Bulgaria. Bouchier had not left Servia out of the hunt. At the end of December, 1911, he went to Belgrade, and broached his plan to M. Milovanovitch, the Foreign Minister. He urged on him the idea of a combination between the Balkan States—a defensive combination to protect and maintain the rights of the Christian nationalities in Turkey. Milovanovitch was favourable in principle, but he pointed out the great risks that Servia would run—in the first place from Austria, if that Power got wind of the project, and in the second from Turkey herself, who could kill Servian commerce by closing the Salonika route. But M. Milovanovitch, who had already had a secret interview with M. Gueshoff, was sound on the question, and Bouchier left him, not doubting the ultimate issue, and went back to Bulgaria to inform his friends there how matters stood in Belgrade. In due course the Serbo-Bulgar Treaty was signed a week or two before the Bulgar-Greek Treaty. Montenegro had no treaty with either Bulgaria or Greece, but there was a definitive treaty between her and Servia. Bouchier went back to England in July, 1912, and at that time the Balkan League was practically formed, although further details and military conventions were agreed on a little later. . . . In the early autumn things got rapidly worse between the Turks and Bulgarians on the one hand, and

the Turks and the Servians and Montenegrins on the other. There was a frontier dispute, followed by a series of massacres which did nothing to alleviate the situation. But matters did not come to a head till September, when the assembling of a large Turkish force at Adrianople caused the fear of invasion to spread throughout Bulgaria. At last, on September 30, the four States mobilised.—R. Rankin, *Inner history of the Balkan war*, pp. 11-15.—See also EASTERN QUESTION.—“What is known as the ‘Berchtold Proposition’ was an ambiguous appeal made to Europe in August 1912 (by the Power [Austria] that in 1903 took from Turkey, Bosnia-Herzegovina) to assist the Ottoman Government in applying a policy of progressive decentralization in favour of the Macedonian nationalities, and to urge upon the Balkan States a peace-policy. This proposal, made while the French Prime Minister, M. Poincare, was in Russia conferring with the Tsar's Government, aroused suspicion in Europe. It was generally regarded as an attempt to steal a march on Russia and to checkmate the policy of the Triple Entente. Yet the good faith of the Austro-Hungarian Government would seem to have been demonstrated by the subsequent course of events. Count Berchtold's initiative was perhaps one of the efficient causes, it was not necessarily the final cause, of the Balkan Crusade. The Balkan States, crushed between the Young Turks and Austria-Hungary, fearing both the growth of Ottoman imperialism and the descent of Austria to Salonica, had—by 1911—achieved their miraculous union under the hegemony of the Bulgarian tsar. Meanwhile the prolongation of the Turco-Italian war aroused their dormant ambition. . . . Count Berchtold formulated his famous proposal calculated to forestall and avert just such irreparable action on the part of the Balkan League as took place in October 1912, when the four Balkan States declared war.”—W. M. Fullerton, *Problems of power*, p. 327.—See also BULGARIA: 1912; SERBO-BULGARIAN PACT; CONCERT OF EUROPE: History and meaning of term; ITALY: 1912-1914.

1912.—First Balkan war.—Bulgaria allied with Serbia, Greece and Montenegro declared war on Turkey.—“What was the occasion of the war between Turkey and the Balkan states in 1912? The most general answer that can be given to that question is contained in the one word *Macedonia*. Geographically Macedonia lies between Greece, Servia, and Bulgaria. Ethnographically it is an extension of their races. And if, as Matthew Arnold declared, the primary impulse both of individuals and of nations is the tendency to expansion, Macedonia both in virtue of its location and its population was fore-ordained to be a magnet to the emancipated Christian nations of the Balkans. Of course the expansion of Greeks and Slavs meant the expulsion of Turks. Hence the Macedonian question was the quintessence of the Near Eastern Question. But apart altogether from the expansionist ambitions and the racial sympathies of their kindred in Bulgaria, Servia, and Greece, the population of Macedonia had the same right to emancipation from Turkish domination and oppression as their brethren in these neighboring states. The Moslems had forfeited their sovereign rights in Europe by their unutterable incapacity to govern their Christian subjects. Had the Treaty of Berlin sanctioned, instead of undoing the Treaty of San Stefano,

the whole of Macedonia would have come under Bulgarian sovereignty; and although Serbia and especially Greece would have protested against the Bulgarian absorption of their Macedonian brethren (whom they had always hoped to bring under their own jurisdiction when the Turk was expelled), the result would certainly have been better for all the Christian inhabitants of Macedonia as well as for the Mohammedans (who number 800,000 persons or nearly one third of the entire population of Macedonia). As it was these people were all doomed to a continuation of Turkish misgovernment, oppression, and slaughter. The Treaty of Berlin indeed provided for reforms, but the Porte through diplomacy and delay frustrated all the efforts of Europe to have them put into effect. For fifteen years the people waited for the fulfillment of the European promise of an amelioration of their condition, enduring meanwhile the scandalous misgovernment of Abdul Hamid II. But after 1893 revolutionary societies became active. The Internal Organization was a local body whose programme was 'Macedonia for the Macedonians.' But both in Bulgaria and Greece there were organized societies which sent insurgent bands into Macedonia to maintain and assert their respective national interests. This was one of the causes of the war between Turkey and Greece in 1897, and the reverses of the Greeks in that war inured to the advantage of the Bulgarian propaganda in Macedonia. Servian bands soon after began to appear on the scene. These hostile activities in Macedonia naturally produced reprisals at the hands of the Turkish authorities. In one district alone 100 villages were burned, over 8,000 houses destroyed, and 60,000 peasants left without homes at the beginning of winter. Meanwhile the Austrian and Russian governments intervened and drew up elaborate schemes of reform, but their plans could not be adequately enforced and the result was failure. The Austro-Russian *entente* came to an end in 1908, and in the same year England joined Russia in a project aiming at a better administration of justice and involving more effective European supervision. Scarcely had this programme been announced when the revolution under the Young Turk party broke out which promised to the world a regeneration of the Ottoman Empire. [See TURKEY: 1903-1907.] Hopeful of these constitutional reformers of Turkey, Europe withdrew from Macedonia and entrusted its destinies to its new master. Never was there a more bitter disappointment. If autocratic Sultans had punished the poor Macedonians with whips, the Young Turks flayed them with scorpions. Sympathy, indignation, and horror conspired with nationalistic aspirations and territorial interests to arouse the kindred populations of the surrounding states. And in October, 1912, war was declared against Turkey by Bulgaria, Serbia, Montenegro, and Greece.—J. G. Schurman, *Balkan wars* (1912-1913), pp. 30-32.—See also TURKEY: 1912-1913.

1912.—War opened by Montenegro.—The smallest member of the Balkan League started the conflict on its own account, before the others were ready.—“On Wednesday, October 9, the astounding news of Montenegro's declaration of war took every one aback, especially as the earlier press telegrams had announced Turkey's decision to introduce into Macedonia the reforms sanctioned by the law of 1880, which would at least afford a convenient basis for negotiation. The diplomatic corps was furious and did not hesitate to term it an insult to the Great Powers. Relatively, however, it created little excitement in the capital [Belgrade], although a few unscrupulous news-

papers did a thriving business by selling extra editions which did not contain any additional news. . . . On the next day it became more and more apparent that the Montenegrin *coup de force* had created a serious flutter in diplomatic dovecots, and no secret was made of the fact that every one suspected Russia of having egged on King Nicholas. The chief argument given as proof of Russian support was that Nicholas declared war with such indecent haste in order to prevent the Russian and Austrian ministers presenting the pacific advice of their governments in Cettigne, as they did on the same day in Sofia, Belgrade and Athens. . . . From October 11 events moved apace, and it became more and more apparent, even to the dullest, that any intervention of the Powers would now come too late. . . . The next step was the presentation of the Turkish Ministers in the four capitals of the allied States of a Note dictating the reforms which must be applied by the Sublime Porte to improve the conditions of the Christian population in the vilayets of Macedonia and Adrianople.”—Special correspondent, *Balkan war drama*, London, 1913, pp. 66-68.—“Nor was it, perhaps, unfitting that the Balkan country, over whose rude crags the Crescent had never flown, should be the champion to throw down the glove of defiance in that death-struggle which was to free the Balkans from the Turk. Pretexts for war were not wanting, for the normal state of life upon the frontier between Montenegro and Albania is one of disguised warfare. A Montenegrin post had been besieged by the Turks, and the apologies of the Turkish Minister at Cettigne were not accepted. Nothing further was needed to set alight the conflagration. War against Turkey was declared, and at once every Montenegrin sprang to arms.”—R. Rankin, *Inner history of the Balkan war*, p. 160.—See also MONTENEGRO: 1912-1913.

1912-1913.—Entrance of Bulgaria, Serbia and Greece.—“Turkey was attacked on four sides at the same time, as the movements of the Allies were well coördinated. The Montenegrins invaded Albania; the Serbians, Northern Macedonia; the Bulgarians, Thrace; and the Greeks, Southern Macedonia. General Savoff, with an army of three hundred thousand Bulgarians, captured Kirk-Kilisseh. He then engaged the enemy at the great Battle of Lule Burgas (October 27 to November 2), where a Turkish army of one hundred and fifty thousand was completely routed by the Bulgarians, who displayed great skill and courage. The Turks were driven to seek refuge behind the fortress of Tehatalja, which barred the way to Constantinople. [Behind the Tchatalja lines the Turks were strongly entrenched and in uninterrupted communication with Constantinople.] The Serbians, too, won notable successes in the western field. They occupied Prishtina, Novi Bazaar, and Monastir; and on November 28 they captured the important seaport of Durazzo. The Greeks invaded Macedonia from the south; and, after a series of victories, they laid siege to Saloniki, which surrendered on November 8. The Greek navy did notable service by blockading Turkish ports and by capturing many islands in the Ægean.” On November 14, 1912, simultaneous proposals with a view to mediation were made to the Balkan States by representatives of the Great Powers. At Sofia, Belgrade, and Athens the governments agreed to take the matter into consideration. At Cettigne the King's representative declared that Montenegro could not now consent to an armistice except subject to the unconditional surrender of Skutari. “At the instance of Sir Edward Grey, the English Foreign Minister, an ar-

mistice preliminary to peace was signed in London on December 3, 1912. The armistice, however, accomplished nothing, for Turkey refused to surrender Adrianople to Bulgaria and the Ægean Islands to Greece. Hostilities were resumed early in February of the following year. The Greeks captured Janina, and a combined army of Serbs and Bulgarians forced their way into Adrianople. Scutari, an important town in Albania, was invested by an army of Montenegrins, who continued to besiege it even after a second armistice was made to negotiate a peace. It fell on April 23, 1913. Representatives of the belligerent nations met in London, where, on May 30, 1913 they concluded peace. Turkey was practically ousted from Europe, as she was compelled to cede to the Allies all her European territory except Constantinople and the adjacent region, which lay between the Sea of Marmora and the line connecting Midia on the Black Sea with Enos on the Ægean. Crete was given to Greece. The status of the islands in the Ægean and that of Albania were left for a later decision"—J. S. Schapiro, *Modern and contemporary European history*, pp. 646-647.—"Kirk-Kilissé marks the end of an epoch, the Bismarckian, and the beginning of a new era, not merely of European, but of world history. Thirty-nine years before the discovery of America the Turks took Constantinople. Four hundred and fifty-nine years later Turkey virtually ceased to be a European power. Although, in consequence of Bulgarian treason to the cause of Balkan Unity, Turkey ultimately recovered Adrianople from which she had been driven, she has, in reality, been thrust back into Asia by a military coalition of the small Slav States. This is the first result of the Balkan War of 1912. . . . The War has put an end to the dream of Catherine II: the road to Byzantium is closed to Russia. At the same time the enforced concentration of the Turks in Asia will oblige Russia to exercise special vigilance in the region between the Black Sea and the Caspian, and particularly in her sphere of influence in Armenia. But while Russia has been arrested in her overland march to the Middle Sea, Austria has been arrested as well, and Germany also: a new Slav empire, a potential United States of Balkany, is taking the place left vacant by the Ottomans, closing the road to Salonica, and the Pan-German hopes of eventually making Trieste an integral part of the national patrimony of Greater Germany have thus been dissipated."—W. M. Fullerton, *Problems of power*, pp. 333-334 (London, 1914).—See also BULGARIA: 1912; First Balkan War; GREECE: 1912; SERBIA: 1909-1913; WORLD WAR: Causes: Indirect: d, 3.

1912-1913.—Effect of wars on England, Germany and Austria.—London conference. See WORLD WAR: Diplomatic background: 71 (viii); and (ix.)

1913.—Second Balkan war.—Serbo-Bulgarian quarrel.—Break-up of League.—Bulgarian defeat and losses.—"By the Treaty of London, Bulgaria had gained not only the much-coveted territories in Macedonia, but nearly the whole of Thrace, and it was to be left to the Powers to lay down the frontier between the extreme points of Enos and of Midia, which was to determine how near she was to be brought to Gallipoli, to the Sea of Marmora, and to Constantinople. Serbia, on the other hand, had profited but little by the war. The jealousy of Austria and of Italy had excluded her from the Adriatic, which she could only reach under conditions which made her in fact if not in name the humble servant of Montenegro and of Albania; her gains in the Sanjak with its bleak pasture lands would have to be

shared with Montenegro; whilst those in Kossovo and in old Serbia neither gave her a direct access to the seaboard of the Ægean nor provided her with any compensation for the blood and treasure which she had expended for Bulgaria in Thrace. . . . In short, by the Treaty of London the sole Power which had gained far more than could have been anticipated even by the wildest dreamers at the outbreak of the war, was Bulgaria, and those gains she had to a great extent made with the help of her Allies. Yet, of all the Allied Powers, Bulgaria was the only one which showed herself unreasonable. The Bulgarians ignored the sacrifices of their Allies, and held only to their ethnographical claims, real or pretended. . . . But Serbia held, and probably rightly, that as she had been cut off from the Adriatic, and as the war had been prolonged for four months so as to enable Bulgaria to acquire Adrianople at the cost of Servian blood, she was entitled to a revision of these arrangements [as made in the Treaty of March 13, 1912], especially as much of the disputed territory, for instance, Prilip and Monastir, was already held by Servian troops. This revision Bulgaria refused to grant mainly upon the grounds that Serbia had not been called upon to give her the military support in Western Thrace which had been provided for by the military convention. . . . In both Serbia and in Bulgaria the war fever was rising. . . . Greece, Montenegro, and Serbia accepted, moreover, without reserve, the invitation to the Conference of Prime Ministers at St. Petersburg [Petrograd]; Bulgaria alone held back on the pretext that she wished to submit the questions at issue to the arbitration of the six Great Powers, and not to that of those of the Triple Entente alone. . . . Serbia, on June 22, rejected the Bulgarian proposals, and suggested that the original Treaty should be torn up and a newer and wider basis created for Russian arbitration. . . . In vain the Great Powers made representations both at Belgrade and Sofia to induce the disputants to submit to arbitration: the military element was too strong to be disregarded."—R. Rankin, *Inner history of the Balkan war*, pp. 524-526, 529.—"A second Balkan war broke out in July, 1913, this time between Bulgaria and her erstwhile allies. Hostile armies began to converge on Bulgaria from three directions, Serbians and Montenegrins from the west [see MONTENEGRO: 1912-1913], Greeks from the south [see GREECE: 1913; Second Balkan War], and Rumanians from the south. Several battles were fought in which the Bulgarians were defeated. Frightful atrocities were committed on both sides, who now hated each other more than they hated the Turks. The latter, taking advantage of the dissensions among their foes, reopened hostilities and recaptured Adrianople from the Bulgarians. At the instance of Austria the Second Balkan War was brought to a close by the Treaty of Bucharest, which was concluded on August 10, 1913. Bulgaria was shorn of nearly all her conquests. . . . By the Treaty of Constantinople (Sept. 20, 1913) between Turkey and Bulgaria, the former doubled the European territory left to her by the Treaty of London, as Adrianople and Eastern Thrace were given back to the Sultan."—J. S. Schapiro, *Modern and contemporary European history*, p. 648.—Rumania had remained neutral during the first Balkan war. When the Serbo-Bulgarian dispute became acute, a significant communication from Bucharest appeared in a Vienna journal stating that Rumania would not remain neutral in the event of another war: "Any government which should remain inactive during a new Balkan war would be swept away by the force of public opin-

ion." After the defeat of Bulgaria, Rumania took from that country a large strip of territory on the Black sea.—See also BULGARIA: 1913; Second Balkan war; PAN-TURANISM.

That the Balkan situation was fraught with danger for the peace of Europe was vividly revealed after the assassination of the King of the Hellenes on March 13, 1913, who was struck down at Salonika, which he had won for Greece.—“But whilst the heirs to the Bulgarian and Servian thrones were kneeling in homage to a monarch, of whom even the Turkish press spoke with the courtesy due to a chivalrous foe, and whilst the funeral chants were sounding through the flower-decked Cathedral at Athens, the wranglings of the Great Powers continued till, suddenly, Europe started back appalled when an article in *The Times* and a speech by Sir Edward Grey raised the cur-

Balkan wars of 1912-1913 as the progenitors of the vastly greater struggle which followed a year later. The Eastern question, which involved the Balkan peninsula, was merely a peculiar and aggravated form of the European question—the tradition whereby nations regulated their affairs by dominance within and competition without. This was especially apparent in Central and Eastern Europe, where the three empires—Russia, Germany and Austria-Hungary—formed, as it were, a triangle of reaction. With the German-Austrian alliance of 1879—“the policy of the *Drang nach Osten* reached its full stature, and the breach with Russia steadily widened. Germany, working through Austria-Hungary, wished to drive a corridor through the Balkans, hold Constantinople, and control Turkey. Russia, in the name of Pan-Slavism, and moved by mystic and idealistic rea-

BALKAN STATES AFTER TREATY OF BERLIN AND AFTER
BALKAN WARS

tain which had concealed from her the fact that she had, all unconsciously, been standing on the very brink of war. The obstinacy of Montenegro and of Serbia with regard to the delimitations of the northern and north-eastern frontiers of Albania . . . had all but brought the difficulties between Russia and Austria to a head. . . . The dispute about these delectable possessions, with their joint population of 61,000 inhabitants, scarcely exceeding that of Bath, might well have brought into collision six great Empires, with a population amounting in all to at least a third of the total population of the globe. It may well be asked if diplomatic folly and *amour-propre* could go further.”—R. Rankin, *Inner history of the Balkan war*, pp. 206-207.—See also WORLD WAR: Causes: Indirect: d, 3.

1913-1914.—Causes and results of Balkan wars.—According to a competent British observer, the historic chain of events clearly marks the

sons, wished to control the Balkans, possess Constantinople and the Straits, and turn the Black Sea into a Russian Lake. France and England appeared on the scene, first as the enemies of Russia and the upholders of Turkey in the name of the balance of power, and then, by the same token, as the friends of Russia and the opponents of Germany. The net result of the play of intrigue and counter-intrigue was that the Balkan States were set by the ears, national hatreds inflamed, domestic reforms checked all over Europe, and the Turk allowed to harry his subjects at his own sweet will. [See also CONCERT OF EUROPE: History and meaning of term.] In 1907 it looked as if Austria-Hungary would make a bold and wise reform, raising herself from a dualistic to a trifurcated state by giving the Slavs self-government. Instead, came Count Aehrenthal's annexation of Bosnia and Herzegovina, throwing Serbia into the arms of Russia. In 1912, under Russian auspices and

through the statesmanship of M. Venizelos, came the Balkan League and the war against Turkey. But by checking Serbia's access to the Adriatic and setting up an independent Albania, Austria succeeded in causing strife among the Balkan Allies, and the League broke up in the Second Balkan War. A weakened and exasperated Serbia was at once an easy victim and a dangerous neighbor to the Dual Monarchy, and so arose the machinations of the nationalist societies, the murder at Serajevo, and the great European war. Austria threatened Serbia. Russia backed her up; Germany supported Austria, France supported Russia, England supported France; Austria attacked Serbia, and Europe entered upon the fiercest and most barbarous war that the world has ever seen."—N. Buxton, *Austria-Hungary and the Balkans (Atlantic Monthly, March, 1918, p. 371)*.—The collapse of the Balkan League and the disastrous consequences to Bulgaria in 1913 were directly responsible for Bulgaria's fatal resolve to cast in her lot with Germany and Austria in the World War.—"The Allies could offer her freedom and coöperation, but could not satisfy Bulgaria's national aspirations, owing to the reluctance of Serbia, Roumania, and Greece to yield the necessary territory, in spite of the compensations offered elsewhere." Hence, "Bulgaria entered the camp of the Central Powers reluctantly, deliberately accepting the bird in the hand after patient and vain waiting for the two in the bush. Her aims were perfectly definite. She wished to unite under her flag the territories inhabited by her nationals and allotted to her in February, 1912, by the treaty with Serbia, namely, the so-called uncontested zone in Northeast Macedonia, which was taken by Serbia in the Second Balkan War; the great trade-route down the Struma Valley debouching at Kavala, taken by the Greeks, and the Southern Dobrudja, taken by the Roumanians, in the same war. In addition, the *imponderabilia* weighing for her decision were her dislike of Russian imperialism and her dread of Russia at Constantinople."—*Ibid.*, p. 373.—"In the secret treaty with Bulgaria just before the first Balkan War, Serbia agreed to the definition of a neutral strip running east-northeast to Lake Okhrida, one hundred miles northwest of Saloniki, which was to be the subject of later negotiation between her and Bulgaria. The later negotiation never took place, for Bulgaria made unexpected gains in eastern Thrace, and the powers decided to form an independent Albania in the regions where Serbia had hoped to increase her territory. Serbia and Greece denounced the territorial terms of the alliance, Bulgaria insisted on them in spite of changed conditions, and the second Balkan War resulted. With the complete success of Serbia and Greece, as opposed to Bulgaria, they divided Macedonia between them, leaving only the Strumnitsa salient and the country immediately northeast and east of it to Bulgaria; and the Treaty of Neuilly [Nov. 27, 1910], by taking away the Strumnitsa salient, has shut the door on Bulgaria's expansion in this direction."—E. M. House and C. Seymour, *What really happened at Paris*, pp. 160-170.—"As a result of the Balkan Wars, the German *drang nach Osten* was summarily checked, and Austria called back westward. It has already been shown that the Balkan ambitions of Austria were the result of her disasters. Napoleon drove her out of Italy and Germany, and offered her Istria and Dalmatia. Bismarck, continuing the work of Napoleon, took from her Venice, promised her Bosnia and Herzegovina, and, constructing a solid German bulwark at her back, launched her on her perilous voyage down the Danube. He gave her a free pass across Macedonia, and thereby

lured her forth on her ambiguous destiny. Although Austria is a Power essentially German, Bismarck sought to make her Slav; and she went on assimilating the territories of the Slavs until she became positively 'saturated' with them. 'Saturated' is, indeed, the very word employed by Comte d'Aehrenthal, the first of her public men to recoil before the consequences of pursuing a German, rather than a purely Austrian policy. When Uskub and Ipek were captured by the Servians six million men of their blood in Austria-Hungary applauded."—W. M. Fullerton, *Problems of power*, p. 335.—See also WORLD WAR: Causes: Indirect: d, 3; Diplomatic background: 71 (iv); (viii); (ix).

1914-1916.—Balkans and the World War.—"In the autumn of 1914 Austria-Hungary launched a terrific attack upon Serbia, and after four months of sanguinary fighting succeeded (December 2) in capturing Belgrade. [See WORLD WAR: 1914: Balkans.] But their triumph was short-lived. By an heroic effort the Serbians, three days later, recaptured their capital; the Habsburg assault was repelled, and for the first half of 1915 Serbia enjoyed a respite, from the attacks of external enemies. An epidemic of typhus fever in its most virulent form wrought terrible havoc, however, upon an exhausted, ill-fed, and, in certain parts, congested population. From this danger Serbia was rescued by the heroism of English doctors and English nurses, warmly seconded by American and other volunteers. Had the methods of English diplomacy been as energetic and effective as those of the English Medical Service, Serbia might still have escaped the terrible fate in store for her. Judged by results, and as yet we have no other materials for judgment, nothing could have been more inept than the efforts of allied English diplomacy in the Balkans throughout the year 1915. . . . [See also AUSTRO-HUNGARY: 1914-1915.] The Triple Entente needed all the friends they could muster in southeastern Europe. In February the world learnt that an English fleet, assisted by a French squadron, was bombarding the forts of the Dardanelles, and high hopes were entertained in the allied countries that the passage of the Straits would be quickly forced. Nothing would have done so much to frustrate German diplomacy in south-eastern Europe as a successful blow at Constantinople. But the hopes aroused by the initiation of the enterprise were not destined to fulfilment. It soon became evident that the navy alone could not achieve the task entrusted to it. Towards the end of April a large force of troops was landed on the Gallipoli Peninsula; but the end of May came, and there was nothing to show for the loss of nearly 40,000 men. On August 6th a second army, consisting

largely of Australians, New Zealanders, and English Territorials, was thrown onto the peninsula. The troops displayed superb courage, but the conditions were impossible; Sir Ian Hamilton, who had commanded, was succeeded by Sir C. C. Munro, to whom was assigned the difficult and ungrateful task of evacuating an untenable position. To the amazement and admiration of the world a feat, deemed almost impossible, was accomplished before the end of December, without the loss of a single man. How far the expedition to the Dardanelles may have averted dangers in other directions it is impossible, as yet, to say; but, as regards the accomplishment of its immediate aims, the enterprise was a ghastly though a gallant failure. [See DARDANELLES.] The failure was apparent long before it was proclaimed by the abandonment of the attempt. Nor was that failure slow to react upon the situation in the Balkans. "On the outbreak of the European War Greece had proclaimed its neutrality, though the Premier, M. Venizelos, at the same time declared that Greece had treaty obligations in regard to Serbia, and that she intended to fulfil them. But in Greece, as elsewhere in the Near East, opinions if not sympathies were sharply divided. The Greek kingdom owed its existence to the Powers comprising the Triple Entente; the dynasty owed its crown to their nomination; to them the people were tied by every bond of historical gratitude. No one realized this more clearly than M. Venizelos, and no one could have shown himself more determined to repay the debt with compound interest. Moreover, M. Venizelos believed that the dictates of policy were identical with those of gratitude. The creator of the Balkan League had not abandoned, despite the perfidious conduct of one of his partners, the hope of realizing the dream which had inspired his policy in 1912. The one solution of a secular problem at once feasible in itself and compatible with the claims of nationality was and is a Balkan Federation. A German hegemony in the Balkans, an Ottoman Empire dependent upon Berlin, would dissipate that dream for ever. To Greece, as to the other Balkan States, it was essential that Germany should not be permitted to establish herself permanently on the Bosphorus. If that disaster was to be averted mutual concessions would have to be made, and Venizelos was statesman enough to make them. Early in 1915 he tried to persuade his sovereign to offer Kavalla and a slice of 'Greek' Macedonia to Bulgaria. He was anxious also to co-operate in the attack upon the Dardanelles with allies who had offered to Greece a large territorial concession in the Smyrna district. To neither suggestion would King Constantine and his Hohenzollern consort listen. Venizelos consequently resigned. If Venizelos desired harmony among the Balkan States, so also, and not less ardently, did the allies. Macedonia still remains the crux of the situation. Hohenzollern-Habsburg diplomacy had, as we have seen, thrown oil upon the flames of inter-Balkan rivalries in that region. Bulgaria, the willing cat's-paw of the Central Empires, had in 1913 drawn down upon herself deserved disaster, but that she would permanently acquiesce in the terms imposed upon her by the Treaty of Bucharest was not to be expected. Venizelos was quick to recognize this truth. Had his advice been followed Bulgaria would have gained a better outlet to the Aegean than that afforded by Dedeagatch. Serbia possessed no statesman of the calibre of Venizelos. But the situation of Serbia was in the last degree hazardous, and under the pressure of grim necessity Serbia might have been expected to listen to the voice of prudence. How far that

voice reached her ears in the early summer of 1915 we cannot yet know for certain. . . . "Not until August, 1915, was Serbia induced to offer such concessions in Macedonia as might possibly have sufficed, in May, to keep Bulgaria out of the clutches of the Central Empires. In Bulgaria, as elsewhere, opinion was sharply divided. Both groups of Great Powers had their adherents at Sofia. Had the Russian advance been maintained in 1915; had the Dardanelles been forced; had pressure been put by the Entente upon Serbia and Greece to make reasonable concessions in Macedonia, Bulgaria might not have yielded to the seductions of German gold and to the wiles of German diplomacy. But why should a German king of Bulgaria have thrown in his lot with Powers who were apparently heading for military disaster; whose diplomacy was as inept as their arms were feeble? What more natural than that when the German avalanche descended upon Serbia in the autumn of 1915 Bulgaria should have co-operated in the discomfiture of a detested rival? Yet the Entente built their plans upon the hope, if not the expectation, that Bulgaria might possibly be induced to enter the war on the side of the allies against Turkey. Serbia was anxious to attack Bulgaria in September, while her mobilization was still incomplete. It is generally believed that the allies intervened to restrain the Serbian attack; hoping against hope that a concordat between the Balkan States might still be arrived at. To that hope Serbia was sacrificed. A great Austro-German army, under the command of Field-Marshal von Mackensen, concentrated upon the Serbian frontier in September, and on the 7th of October it crossed the Danube. Two days later Belgrade surrendered, and for the next few weeks von Mackensen, descending upon the devoted country in overwhelming strength, drove the Serbians before him, until the whole country was in the occupation of the Austro-German forces. The Bulgarians captured Nish on November 5 and effected a junction with the army under von Mackensen; Serbia was annihilated; a remnant of the Serbian army took refuge in the mountains of Montenegro and Albania, while numbers of deported civilians sought the hospitality of the allies. On November 28 Germany officially declared the Balkan campaign to be at an end. For the time being Serbia had ceased to exist as a Balkan State. [See WORLD WAR: 1915: V. Balkans.] What had the Allies done to succour her? On September 28 Sir Edward Grey, from his place in the House of Commons, uttered a grave, though not unfriendly, warning to Bulgaria, and declared that Great Britain was determined, in concert with her allies, to give to her friends in the Balkans all the support in her power in a manner that would be most welcome to them 'without reserve and without qualification.' How was this solemn promise fulfilled? Russia was not, at the moment, in a position to afford any effective assistance, but on October 4 she dispatched an ultimatum to Bulgaria, and a few days later declared war upon her. On October 5 the advance guard of an Anglo-French force, under General Sarrail and Sir Bryan Mahon, began to disembark at Salonica. The force was miserably inadequate in numbers and equipment, and it came too late. Its arrival precipitated a crisis in Greece. As a result of an appeal to the country in June, King Constantine had been reluctantly compelled to recall Venizelos to power in September. Venizelos was as determined as ever to respect the obligations of Greece towards Serbia, and to throw the weight of Greece into the scale of the allies. But despite his parliamentary majority he was no longer master of the situation.

The failure of the Dardanelles expedition, the retreat of Russia, the impending intervention of Bulgaria on the Austro-German side, the exhortations and warnings which followed in rapid succession from Berlin, above all, the knowledge that von Mackensen was preparing to annihilate Serbia, had stiffened the back of King Constantine. Venizelos had asked England and France whether, in the event of a Bulgarian attack upon Serbia, the Western Powers would be prepared to send a force to Salonica to take the place of the Serbian contingent contemplated by the Greco-Serbian treaty. The landing of the Anglo-French force in October was the practical response of the allies to the 'invitation' of Venizelos. Technically, however, the landing looked like a violation of Greek neutrality, and Venizelos was compelled by his master to enter a formal protest against it. But the protest was followed by an announcement that Greece would respect her treaty with Serbia, and would march to her assistance, if she were attacked by Bulgaria. That announcement cost Venizelos his place. He was promptly dismissed by King Constantine, who, flouting the terms of the Constitution, effected what was virtually a monarchical *coup d'état*. The king's violation of the Hellenic Constitution was the opportunity of the protecting Powers. They failed to seize it, and King Constantine remained master of the situation. From an attitude of neutrality professedly 'benevolent,' he passed rapidly to one of hostility almost openly avowed. That hostility deepened as the year 1916 advanced. On May 25, in accordance with the terms of an agreement secretly concluded between Greece, Germany, and Bulgaria, King Constantine handed over to the Bulgarians Fort Rupel, an important position which commanded the flank of the French army in Salonica. A few weeks later a whole division of the Greek army was instructed to surrender to the Germans and Bulgarians at Kavalla. Kavalla itself was occupied by King Constantine's friends, who carried off the Greek division, with all its equipment, to Germany. Nearly the whole of Greek Macedonia was now in the hands of Germany and her allies, and the Greek patriots, led by Venizelos, were reduced to despair. In September a Greek Committee of National Defence was set up at Salonica, and in October Venizelos himself arrived there.

"By this time, however, the Balkan situation had been further complicated by the military intervention of Roumania on the side of the allies. In Roumania, as elsewhere, opinion was, on the outbreak of the war, sharply divided. The sympathies of King Carol were, not unnaturally, with his Hohenzollern kinsmen, and, had he not been, in the strict sense of the term, a constitutional sovereign, his country would have been committed to an Austro-German alliance. Nor was the choice of Roumania quite obviously dictated by her interests. If the coveted districts of Transylvania and the Bukovina were in the hands of the Habsburgs, Russia still kept her hold on Bessarabia. A 'Greater Roumania,' corresponding in area to the ethnographical distribution of population, would involve the acquisition of all three provinces. Could Roumania hope, either by diplomacy or by war, to achieve the complete reunion of the Roumanian people? In October, 1914, the two strongest pro-German forces in Roumania were removed almost simultaneously, by death: King Carol himself, and his old friend and confidant Demetrius Sturdza. Roumania had already declared her neutrality, and that neutrality was, for some time, scrupulously observed. The

natural affinities of the Roumanians attract them . . . towards France and Italy, and it was anticipated that Italy's entrance into the war would be speedily followed by that of Roumania. But not until August, 1916, was the anticipation fulfilled. On August 27 Roumania declared war and flung a large force into Transylvania. The Austrian garrisons were overwhelmed, and in a few weeks a considerable part of Transylvania had passed into Roumanian hands. But the success, achieved in defiance of sound strategy, and also, it is said, in complete disregard of warnings addressed to Roumania by her allies, was of brief duration. In September Mackensen invaded the Dobrudja from the south, entered Silistria on September 10, and, though checked for awhile on the Rasova-Tuzla line, renewed his advance in October and captured Constanza on the twenty-second. Meanwhile, a German army, under General von Falkenhayn, advanced from the west, and on September 26 inflicted a severe defeat upon the Roumanians at the Rothen Thurm pass. The Roumanians, though they fought desperately, were steadily pressed back; at the end of November Mackensen joined hands with Falkenhayn, and on December 6 the German armies occupied Bucharest. Thus another Balkan State was temporarily crushed. From Belgrade to Constantinople, from Bucharest to the valley of the Vardar, the Central Empires are [April, 1917] in undisputed command of the Balkan Peninsula. A corner of Greek Macedonia is still held by the Anglo-French force under General Sarrail, and towards the end of November a Serbian army, reformed and re-equipped, had the gratification of reoccupying Monastir. But the German successes in the north-east of the peninsula naturally emboldened their friends in the south-west, and the increasing hostility of the Athenian Government rendered the position of the allies in Salonica exceedingly precarious."—J. A. R. Marriott, *Eastern question*, pp. 432-441.—See WORLD WAR: 1916: V. Balkan theater; 1917: V. Balkan theater.

"The fundamental reasons which have forced the Near East into prominence before and since the outbreak of the war are in many ways identical. The real point is that the Balkan Peninsula and the waterways which it controls constitute the natural highway, the natural means of communication between the West and East on the one hand and the North and South on the other. While it is the former condition which makes the domination of this area one of Germany's primary objects it is the latter which constitutes its real importance for Russia. Consequently, whereas by military penetration across the Balkans into southern Russia and Asiatic Turkey the Central Powers have temporarily greatly increased the strength of their military position, still more by the driving of a permanent wedge through the same areas would they have triumphed by endangering the safety of the Allies throughout the world. On the other hand, were good relations to be established between the Balkan states and were an anti-German barrier therefore to be established, what would amount to an Allied wedge would prevent the expansion of the Central Powers toward the East and at the same time assure to Russia her legitimate access to warm water. For years, therefore, the question of these wedges has constituted the real *raison d'être* of the Near East in the world's politics—a *raison d'être* the importance and meaning of which has become more apparent to the everyday man since the outbreak of the war."—*Geographical Review*, July, 1918, p. 19.

1921.—Results of World War.—Division of spoils.—Losses and gains.—Geographical grievances.—Settlement problems and complications.—Reconstruction.—The end of the World War and the resultant peace treaties had not the effect of spreading perfect peace and general satisfaction among the various Balkan states. In allocating the spoils of a great war, losses and gains are inevitable. Territories are wrested from one nation and incorporated by another, giving rise to complaints of injustice and prognostications of future troubles. The following excerpts illustrate the situation as it stood in the peninsula during the first quarter of 1921:

ALBANIA, an autonomous Adriatic state under the Mpret William of Wied as the result of the Peace of London (1913), was abandoned by its rulers in 1914 and became a prey to internal dissensions. The faction of Essad Pasha notably failed to establish a stable government and the Austrians invaded the country in 1916. Already in 1914 Italy had taken possession of the seaport of Valona and its fortress, and later proclaimed a protectorate. At the Peace Conference, the Albanians claimed independence, but Italy maintained her position; Greece demanded the southern part of Albania as a portion of Epirus, while the northern provinces were desired as an addition and compensation to Serbia. Moreover, France, having military occupation, was ready to turn Scutari and Koritza over to Serbia and Greece respectively. The partition of the country with the assent of the Peace Conference seemed thus almost a *fait accompli*. Appeals to the Great Powers to stop Serbian aggressions were made.—“How was . . . [a] complete change of policy toward Albania brought about? The answer is clear: It was effected through the instrumentality of the United States government. The American government intervened on behalf of Albania, and actually saved her from destruction and dismemberment. The first intervention took place after the Supreme Council had agreed on applying to Albania the provisions of the secret Treaty of London, which partitioned her territories among the Italians, Greeks and Serbians. President Wilson caused this decision to be reconsidered; but immediately upon the departure of the American representatives from the Supreme Council the great European powers, left alone, reverted again to the policy of the dismemberment of Albania. In the session of Jan. 14, 1920, Great Britain, France and Italy decreed anew the complete partition of Albania among the Italians, Serbs and Greeks. When all again seemed lost President Wilson came out in

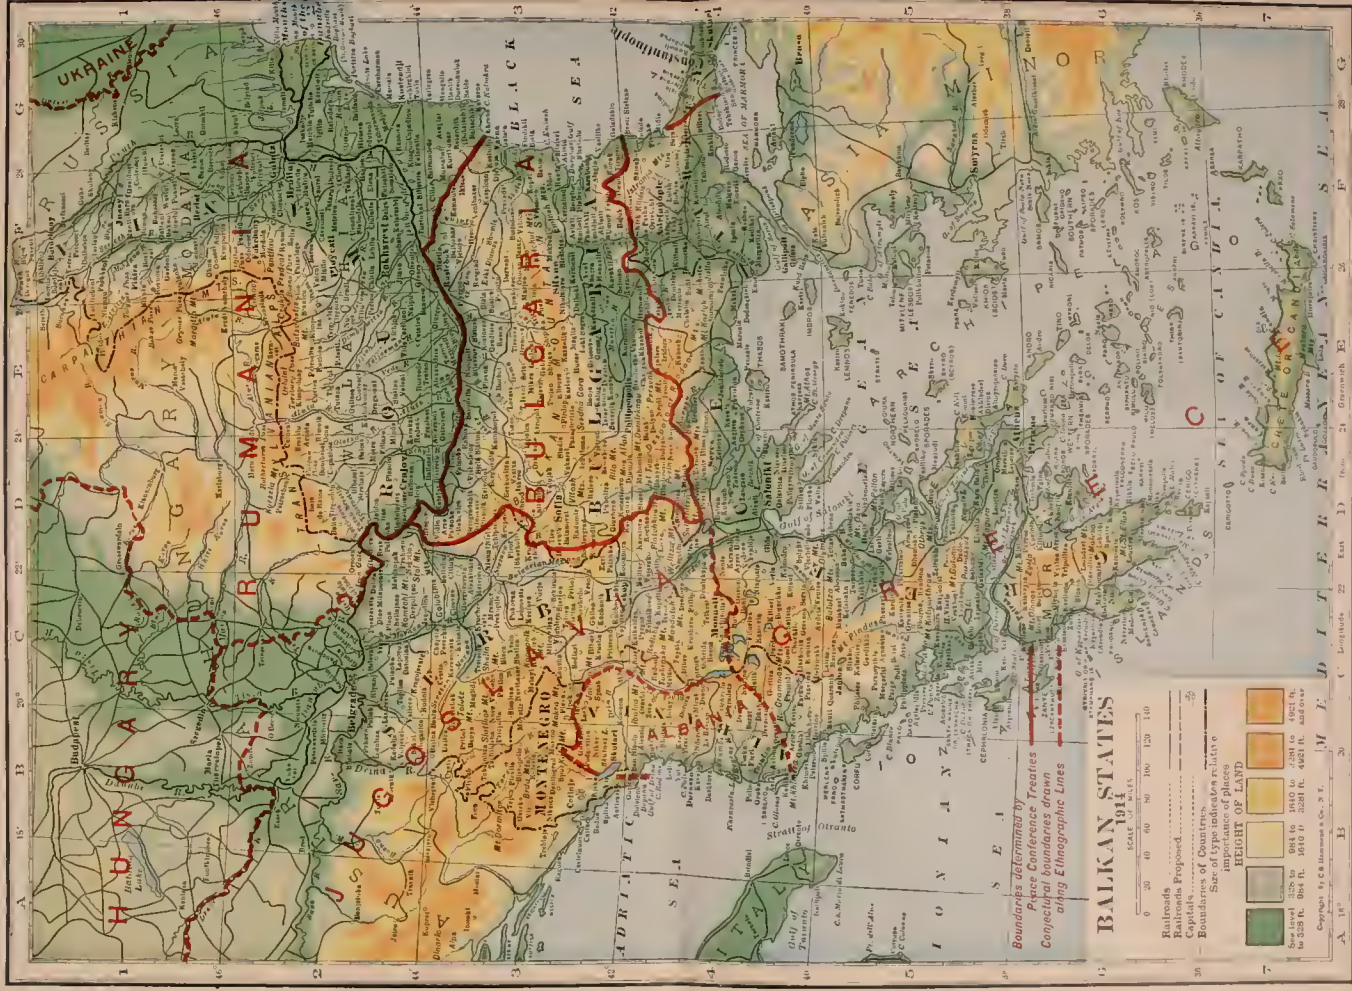

his Adriatic notes, and vigorously opposed the plan of partition. Thanks to the moral influence of America alone, the plan of partition was definitely discarded. . . . What a strange contrast to this outlook is now presented by Albania! And what spectacular changes have taken place within a few months, altering the situation entirely! Somehow the Peace Conference—or its successor, the Supreme Council—has practically held its hands off from Albanian affairs, to the benefit of the little nation. More strange is the revulsion of feeling that must have taken place in high French circles, as evidenced by the action of the French military authorities in turning over to the Albanian government the vital Provinces of Scutari and Koritza, in May, 1920. . . . But the most spectacular event was the struggle with Italy, which began early in June last [1919], and continued until about the end of July, with a complete triumph for Albania. Several weeks of fierce fighting between the Albanians and the Italians ended in the expulsion of the latter from Albania to such an extent that even the powerful and modern fortress of Valona, which was held as a last resort by the Italians, was eventually turned over to the Albanian government. That government is now in possession of the territories assigned to the Albanian state by the London Conference of 1912-1913. Italy, the very power that was fatally in the way of Albania's independence and national unity, not only has been compelled to give up all its claims, which the Peace Conference had recognized, such as the protectorate and the perpetual possession of Valona, but has now become, by the clauses of the Italian-Albanian agreement, signed at Tirana on Aug. 2, 1920, the guarantor of those two essential attributes of sovereignty over the young State, with the result that there exist now the most cordial relations between the two countries. Thus has Albania won recognition of her statehood from the power that was most bitterly opposed to it only a few months ago. The successful termination of the conflict with Italy had also the salutary effect of sobering the claims of the Serbs and the Greeks, to the extent that they were induced to find a *modus vivendi* with Albania. In consequence, the conflicting claims between these two countries and Albania are no longer a cause for direct strife. . . . Not less striking is the internal transformation that has taken place in Albania within the last few months. The people, who had been distracted and disunited as a result of continuous foreign interference, have found an opportunity to unite and mold themselves into a single national entity, with the transcendent aspiration to preserve the national independence and territorial integrity of their country at all costs. Regional and religious differences, which were formerly played upon by foreign powers, have disappeared to the extent that there is now but one authority over the whole people, the authority of the central government established by the representatives of the Albanian people assembled in parliament—a parliament to which the government is strictly responsible. This government, with its seat at Tirana, has been in undisturbed power for more than a year. It has not only won the confidence of the people, but has also established law and order throughout the Albanian territories, one might candidly say, for the first time since the impotent Turkish occupation made Albania a synonym for anarchy and lawlessness. . . . The Tirana Government has already set out to organize the nation. Schools are being opened in a country where teaching was deliberately prohibited by former conquering

powers, such as the Turks, and negotiations are now being carried on for the establishment of an American university modeled on Robert College at Constantinople. But the chief attention of the Albanian government is turned toward the development of the large resources of the country, especially its mineral resources, including iron, copper, oil, asphalt, coal, together with the splendid water power the country is provided with. However, in order to make possible this development, the first essential is the construction of roads, railroads, tramways, and the government is already out in quest of capital, which the Albanian people want to have come from America. Unfortunately, the fact that Albania has not been recognized by the United States acts as a bar to the employment of American capital in that country."—C. A. Chekrezi, *How Albania won independence* (N. Y. Times Current History, Dec., 1920, pp. 534-536).

BULGARIA.—"It is a well-established fact that Bulgaria concluded an armistice with the Allies on September 30, 1918, because the people and army refused to go on with the war. As early as July of that year the soldiers, who in the absence of any military caste in Bulgaria really form a part of the people, declared in writing and orally to their officers that they would not fight beyond the middle of September. This decision was reached, as the soldiers themselves declared, after the famous Fourteen Points of President Wilson became known to them. 'Why,' they said, 'should we go on fighting, if these points are to be the basis of the future settlement of questions affecting Europe in general and the Balkan Peninsula in particular?' . . . The forced abdication of King Ferdinand was accomplished without any trouble, and the accession of his eldest son, Boris, to the throne was hailed with universal approval. In the general political and social perturbation of Europe, Bulgaria also was threatened with a revolution by the extreme radical elements; but the firmness and courage displayed by the present Premier of Bulgaria, Mr. Stambolisky, the leader of the Farmers' party, in coping with the Bolshevik agitation, saved the country from Bolshevism and assured the reign of law and order. . . . He has refused to be drawn into any wild political schemes, has frankly accepted the situation created by the Treaty of Neuilly, and, while protesting against its injustice, has promised to carry out loyally its terms."—T. Vladimiroff, *Bulgaria's novel methods of reconstruction* (N. Y. Times Current History, Nov., 1920, pp. 217-218).—Bulgaria, by the treaty of Neuilly, November 27, 1919, lost to Serbia on the western frontier three small pieces of territory, besides the Strumnitza projection on the southwest about fifty miles north of Saloniki. More important still, Bulgaria was not to possess any portion of the Ægean littoral which she had naturally coveted with its Greek and Turk population, though she was allowed commercial access to Dedeagatch, a small roadstead where goods may be transferred by lighters.—"That the Treaty of Neuilly has not settled the Balkan question justly and satisfactorily is indisputable. On the contrary, it has aggravated the mistakes made forty-two years ago by the Berlin Congress, and if these mistakes are not corrected in the near future by the League of Nations or by an international court the Balkan peninsula will enjoy a temporary truce and not a lasting peace. . . . It is too early yet to predict what the relations of Bulgaria to her neighbors will be. She has been despoiled by them of territory that rightly belongs to her; she has

been practically debarred from free and unrestricted access to the Ægean sea. A progressive and enterprising people, as the Bulgarians have proved themselves to be during the forty years of their political existence, cannot allow their future commercial and economic development to be hampered by making it dependent upon the mercy or good-will of those who have invariably been their enemies. . . . So long as Serbia and Rumania maintain their possession of Macedonia and Dobrudja [respectively] as a matter of conquest, so long as they treat the large Bulgarian majority in these provinces as aliens whom by violent means and oppressive measures they seek to terrorize and denationalize, no real friendship can exist between them and Bulgaria."—*Ibid.*, pp. 220-221.—"With Bulgaria a treaty was made which imposed upon her an indemnity, and took from her the territories which she had seized from Serbia, Rumania, and Greece, during the war, while the disposition of the territory giving her access to the Ægean was to be decided by plebiscite of the local population. Bulgaria was left, therefore, the least important of the Balkan states, in the midst of rivals who had grown great by the war."—E. R. Turner, *Europe*, p. 590.—"The financial burdens laid upon Bulgaria by the Treaty of Neuilly are undoubtedly very heavy. She is required to pay an indemnity of 2,250,000,000 francs in gold or \$450,000,000 at the normal rate of exchange. Her external pre-war debt [and debt] incurred during the war, the current state expenses, and the payment of interest on the debts make it very doubtful whether a small country containing about 35,000 square miles and 4,500,000 people can successfully meet its financial obligations. The low rate of exchange of the Bulgarian currency aggravates the situation. Probably this will not be remedied easily or soon, owing to the fact that Bulgaria is not an industrial country, and that her imports have always been in excess of her exports."—*Ibid.*, pp. 222-223.

GREECE.—By the treaty of Sèvres, 1920, the great Western powers severed from Turkey the larger part of its European territory west of the famous Chatalja defense lines in favor of Greece, and further gave to the latter the Ægean littoral south of Bulgaria, at least Western Thrace which had been transferred to the Allies by the treaty of Neuilly,—thus extending peninsular Greece continuously to the Black sea; also Italy yielded to Greece the Dodecanese Islands in the Ægean; and in Asia Minor the Greek government received Smyrna and adjacent territory (under Turkish suzerainty) for administration as mandatory of the League of Nations, and for decision by the League at the end of five years of the question of definitive incorporation in the kingdom of Greece. Mr. Venizelos, the Greek representative, engaged that Greek forces would undertake in cooperation with the Allies in Constantinople to drive back and suppress the Kemalists or Turkish Nationalists in Anatolia. This left the question of the disposal of Eastern Thrace undecided and when King Alexandros died October, 1920, and the Greeks recalled Constantine to the throne, the Allies being opposed to the latter, it even jeopardized apparently some of the settlements of the Sèvres treaty, which was already in process of revision. The new Greek administration and both Turkish factions were summoned to send representatives to the London conference to arrange their differences among themselves and suppress hostilities in Asia Minor. The delegates convened in St. James's Palace on February 21, 1921, and sat until March 12.

JUGO-SLAVIA.—“Jugo-Slavia is summed up in the reply of a deputation of Serbs to the question, ‘What do you understand by a nation?’ The question was put in 1848, when the Serbs were petitioning for recognition of their national language in the Magyar state, and they replied: ‘A nation is a race which possesses its own language, customs, culture, and enough self-consciousness to preserve them.’ According to this view, a single nation could exist divided among several political rulers. . . . Political organization came in those dark days of 1917, when the present kingdom’s territory was altogether in the hands of the enemy, and the government had fled, with the remnants of the army, to the Greek island of Corfu. There on July 20, 1917, the so-called ‘Declaration of Corfu’ was signed by ‘the President of the Council, Minister of Foreign Affairs of the Kingdom of Serbia, Nikola Pashitch, and the President of the Jugo-Slav Committee, Dr. Anton Trumbic.’ This declaration, practically all of whose terms have since been put into effect, runs, in its most essential parts, as follows:

“(1) The state of the Serbs, Croats and Slovenes, who are also known by the name of Southern Slavs or Jugo-Slavs, will be a free and independent kingdom, with an indivisible territory and unity of power. This state will be a constitutional, democratic, and parliamentary monarchy, with the Karageorgewitch dynasty, which has always shared the ideals and feelings of the nation in placing above everything else the national liberty and will, at its head. (2) The name of this state will be the Kingdom of the Serbs, Croats and Slovenes, and the title of the sovereign will be King of the Serbs, Croats and Slovenes. . . .

(9) The territory of the Serbs, Croats and Slovenes will comprise all the territory where our nation lives in compact masses and without discontinuity. . . .”—*New kingdom of Jugo-Slavia (Literary Digest, Jan. 8, 1921, pp. 10, 25-26).*

—“The official name of the country is the Kingdom of the Serbs, Croats and Slovenes, which is generally abbreviated in Europe to the Kingdom of the S. H. S., these letters being the initials of the name in the native tongue—Srba, Hrvata i Slovenica. . . . This kingdom is made up of the old kingdoms of Serbia and Montenegro and the Austro-Hungarian provinces of Slovenia, Croatia, Slavonia, Bosnia-Herzegovina, Dalmatia, and what is now known as the Voivodine, which includes the several small provinces north of the Danube between Slavonia and the new Rumanian boundary. The population of the kingdom is practically all Slav, with a small admixture of Turks in southern Serbia, a few Italians in some of the cities along the Adriatic, and groups of Hungarians, Austrians and Germans in some of the other provinces. Aside from the Turks in southern Serbia and the Hungarians and Germans in the Voivodine, the non-Slav population is confined almost entirely to the cities and towns. This is especially true along the Adriatic, where even the hinterland of Trieste, which has been given to the Italians, is almost entirely Slav, while the city itself has a large Italian majority.”—W. G. Atwood, *Jugoslavia’s resources and beauty (N. Y. Times Current History, Feb., 1921, p. 278)*.—As the result of a plebiscite in its southern part, the entire district of Klagenfurt on the Austrian frontier remained Austrian, the Serb troops therein being withdrawn. “The question of the South Slavs presented no fundamental difficulty. It was generally agreed that the people of the provinces of Carniola, Croatia, Slavonia, Dalmatia, Bosnia, and Herzegovina should be given their freedom;

and there was already a movement on foot to have them all unite with their kinsmen of Montenegro and Serbia in a large Jugo-Slavic state. It would undoubtedly be difficult to hold in one union these people, of the same race, indeed, but differing much in culture and religion. The immediate difficulty, however, was to reconcile conflicting ambitions of Italians and South Slavs on the Adriatic coast, and assure the new federation an outlet to the sea. . . . All down the Dalmatian coast, on the eastern side of the Adriatic, were old Italian towns and a fringe of Italian population, while the great mass of the people, in the country behind, were South Slavs. The islands and the seaport towns were, indeed, largely unredeemed Italian land, but if they were all given to Italy then an outlying fringe of Italians would shut off from the sea a far greater number of Jugo-Slavs. As a matter of fact, because of the broad untracked Dinaric Alps, just back from the coast, the South Slavic people would be effectively shut off from the sea if they were not given Fiume. . . .”—E. R. Turner, *Europe, 1789-1920, pp. 582-584.*—By the Treaty of Rapallo, the independence of Fiume was recognized by both Italy and Jugoslavia; Zara and adjacent communes and the islands of Cherso, Lussin, Lagosta and Pelagosa were recognized as forming parts of the Kingdom of Italy.

MACEDONIA, THE APPLE OF DISCORD.—“In the Balkans, may be transformed into a fruit of content and happiness if the vision of a greater Jugo-Slavia now looming should become realized. Thus it seems to a political correspondent of the *Paris Temps* at Sofia, who believes in the coming of this greater Jugo-Slavia, which will unite all the southern Slavs, including the Macedonians and the Bulgarians. The first evidence of the solidification of the southern Slavs, he reminds us, was the formation of the kingdom of Serbs, Croats, and Slovenes. . . . In the new kingdom of Serbs, Croats, and Slovenes. . . . the spirit of federalism will triumph, and in this frame of greater Jugo-Slavia, Macedonia might find sufficient independence so that she would cease to be a bone of contention between the Serbians and the Bulgarians. . . . Macedonia is ‘no longer an object of conquest by force of arms among the Bulgarians.’ ‘Two cruel experiences have cured them of this policy of expansion,’ . . . and have made them understand that they must not mix up selfishly in Macedonian affairs. It is noted as a significant fact that the present Bulgarian Government includes no Macedonians, altho all former cabinets had one or even several Macedonians. . . . ‘Nevertheless, even if the principle of federation remain in abeyance, Jugo-Slavia is solemnly bound by the terms of the convention on the protection of minorities to confer the freedom of cultural liberty under the protection of the League of Nations. If to this obligation be added the effect of parliamentary government and universal suffrage—for there is no doubt that young Jugo-Slavia is inspired with a spirit of broad liberalism—Belgrade and Sofia will gradually find in Macedonia, which formerly held them apart, the instrument of reconciliation. . . . At present there are in Bulgaria more than 200,000 Macedonians who took refuge there during recent decades and are organized strongly in an association of Macedonian fraternities. These are sixty-eight in number and correspond to the different districts and cities of Macedonia from which their members have come. Once a month these societies send their delegates to Sofia, where they meet in a kind of Macedonian parliament, presided over by an executive committee. The parliament of 1920 con-

vened in Sofia."—*Vision of a happy Balkans (Literary Digest, Jan. 8, 1921, p. 26)*.

MONTENEGRO.—"Montenegro, included in the new state of the Serbs, Croats and Slovenes, in spite of some objections on the part of its former rulers, has lately inspired a resolution of protest signed by some fifty prominent members of the British parliament, including Viscounts Bryce and Gladstone and Earl Curzon. This protest, as reported by *Current History* (New York), reads: 'Having regard to the most gallant services rendered by Montenegro, the smallest of our Allies, and to the heavy cost she has sustained, her people have the clear right to determine their future form of government; it is, therefore, necessary that a Parliament should be elected under the Montenegrin Constitution to decide this question, free voting being secured by the withdrawal of all the Serbian troops and officials at present occupying the country.'"—*New kingdom of Jugoslavia (Literary Digest, Jan. 8, 1921, p. 26)*. "Two events occurred which have gone far to remove the Montenegrin question from being a thorn in the side of the Belgrade government, . . . —the death of the dethroned King Nicholas and the reports of the British commissioners, Roland Bryce and Major L. E. Otterley, in regard to the elections in Montenegro. As long as King Nicholas lived he could not help but have a following, particularly among the older Montenegrins, who had regarded him as the natural head of the Serbo-Montenegrin people. . . . Although he declared war on Austria-Hungary shortly after Vienna had declared war on Serbia, his negotiations for a separate peace with the enemy show that he believed the cause of the Allies to be lost. There are documents in existence even betraying his lack of sincerity toward the Entente. Since the armistice he had been a pensioner of the French Government at Antibes, where he conducted a propaganda for the recovery of his throne until his death there, on March 1. It is now expected that the Nationalist party in Montenegro, which has been campaigning for independence, but without a restoration, will gradually cease hostilities toward the established government, and that the Supreme Council will finally define the actual status of Montenegro as a part of the monarchy of the Croats, Serbs and Slovenes—Jugoslavia."—*Jugoslavia complains about Bulgaria (New York*

Times Current History, Apr., 1921, pp. 173-174).

RUMANIA.—Rumania, "crushed almost as completely as Serbia" in the war, triumphed in the peace arrangements, being more than "doubled in size by having taken Transylvania (Romania Irredenta) from the Magyars, and a portion of Bukovina, regaining Bessarabia from Russia, as well as retaining the Dobrudja on the south. . . . She became greater and more important than her neighbors, Austria, Bulgaria or any of the Balkan states. . . . The domestic history of the country reveals steady development and increase in material prosperity. . . . Large estates were divided among the peasants and universal suffrage granted. . . . The people claim descent from Roman colonists of the time of Trajan, and their language is an offspring of the Latin, but most of the people are Slavic and . . . of the Greek Orthodox church."—E. R. Turner, *Europe, 1789-1920, pp. 465-466*.—Their treatment of the Jews has been harsh in spite of the guarantees for the protection of religious and racial minorities contained in the treaty which the Rumanians finally signed at Paris, December 9, 1919. Withdrawing at the same time their forces in Budapest and other parts of Hungary on the one hand and from Russia beyond the Bessarabian frontier on the other, Rumania is nevertheless compelled to maintain huge defensive forces against white and red foreign enemies, while struggling to repair the tremendous devastation of the war and to heal internal dissensions.—See also ALBANIA; BULGARIA; GREECE; MONTENEGRO; RUMANIA; SERBIA; TURKEY, etc.
