Division of Crop and Livestock Estimates. Included in "Apples" (preceding table).
By commercial crop is meant that portion of the total crop which is sold for consumption as fresh fruit. One barrel is equivalent to three boxes.

Division of Statistical and Historical Research. Compiled from data of the Fruit and Vegetable Division. Shipments as shown in carlots include those by boat reduced to carlot basis.
${ }^{1}$ The crop movement season normally begins in June and extends through June of the following year, with irregular shipments continuing into July.
${ }_{5}$ Includes 1 car in May.
${ }^{6}$ Includes 15 cars in July.

FLORIDA.

Division of Crop and Livestock Estimates; California estimates in cooperation with California Department of Agriculture. 1923 estimates are preliminary.
${ }^{1}$ Dried basis.
${ }^{2}$ Representing the commercial crop year beginning Oct. 1; the numbers for 1923, for instance, represent the fruit that set during the season of 1923 and will be picked and marketed from Oct. 1, 1923, to Sept. 30, 1924.
${ }^{2}$ Freeze during January, 1924, promises to reduce the stated figures for oranges by about one million boxes. Damage to lemons still undetermined.

Division of Statistical and Historical Research. Compiled from data of the Fruit and Vegetable Division. Shipments as shown in cariots include those by boat reduced to carlot basis.

1 Shipments from Texas and from the southern district of California were principally Bermudas. For Texas various common varieties comprised approximately 80 cars in 1917-18, 69 in 1918-19, 40 in 1919-20, 101 in 1920-21, 172 in 1921-22 and 215 in 1922-23; for the southern district of California they comprised $2 \theta$ in 1918-19, 178 in 1919-20, 56 in 1920-21, 30 in 1921-22, and 13 in 1922-23.

Division of Statistical and Historical Research. Compiled from data of the Fruit and Vegetable Division.
Average prices as shown are based on stock of good merchantable quality and condition only; they are simple average of selling prices. In some cases conversions have been made from larger to smaller units or vice versa, in order to obtain comparability.
${ }^{1}$ Quotations began Aug. 22, 1921, and August 14, 1923.
${ }^{2}$ Last quotation June 14, 1922.
${ }^{3}$ Sales direct to retailers.

Division of Statistical and Historical Research. Compiled from data of the Fruit and Vegetable Division. Shipments as shown in carlots include those by boat reduced to carlot basis.

[^185]- Fncludes 36 cars in March
- Includes 9 cars in August.

7 Includes 20 ears in March.
8 Includes 115 cars in March.

Division of Statistical and Historical Research: Compiled from data of the Fruit and Vegetable Division. Crop movement season for each crop extends from April-of one year through May of the following year, with irregular quotations continuing through June and July. Average prices as shown are based on stock of good merchantable quality and condition only; they are simple averages of selling prices. In some cases conversions have been made from larger to smaller units or vice versa, in order to obtain comparability.

[^204]Table 300.-Cotton (bales of 478 pounds net): Production in undermentioned countries, 1909-1923-Continued.

NORTHERN HEMISPHERE-Continued.

:From an unofficial source.
${ }^{4}$ For one year.
${ }^{6}$ Average for 4 years.
${ }^{7}$ Exports.
${ }^{10}$ Territory formerly German Togo, and exports for 4 years only.
${ }^{11}$ The official estimate is $1,015,000$ bales, but receipts into Alexandria and exports indicate a larger crop.
${ }^{12}$ The commercal crop of India according to figures compiled by the United States Department of Commerce, was $3,448,000$ bales in 1921-22, 4,048,000 bales in 1922-23 and 3,811,000 bales in 1923-24.
${ }^{13}$ Official estimates which include the most important cotton producing provinces where the commercial crop is grown. Cotton grown in other provinces is used for home rand loom consum ption. Various estimates made from time to time of the total production of China range from $2,000,000$ to $7,000,000$ bales but are considered unreliable. The commercial crop for China, according to figures compiled by the United States Department of Commerce, was 1,175,000 bales for 1921-22, 1,300,000 bales for 1922-23, and 1,450,000 bales for 1923-24.

## Division of Crop and Livestock Estimates.

${ }^{1}$ Acreage and production of beets are credited to the State in which the beets are made into sugar. Year shown is that in which beets were grown. Sugar-making campaign extends into succeeding year. ${ }^{2}$ The planted acreage is that covered by factory contracts, agreements, understandings, all of which is not always actually planted by growers. Therefore abandonment may not represent actual loss of acreage.
${ }^{3}$ Preliminary.

Table 356.-Sugar beets and beet sugar: Production in the United States, 1914-1923-Continued.

| State and year. ${ }^{1}$ | Factories oper-ating. | Averlength of cam paign. | Sugar made (chiefly refined). | Beets worked (sliced). | Analysis of beets. |  | Recovery of sucrose. ${ }^{4}$ |  | Loss. ${ }^{5}$ |

Division of Statistical and Historical Research.
Beetsugar production preceding 1897-98 and for 1898-99 through 1900-1901 from Willett \& Gray "Weekly Statistical Sugar Trade Journal" annual reports; 1897-98, 1901-2 and subsequently from United States Department of Agriculture. Cane sugar production previous to 1903-4 from Bouchereau's annual "Louisiana Sugar Report"; 1903-4 through 1910-11 from Willett \& Gray; 1911-12 and subsequently from United States Department of Agriculture. Porto Rico production previous to 1885-86 from Rueb \& Co.; 1885-86 through 1899-1900 from Willett \& Gray; 1900-1901 through 1906-7 are shipments to the Continental United States. Hawaii from Rueb \& Co., previous to 1885-86; 1885-86 through 1900-1901 from Willett \& Gray; 1901-2 and subsequently from Hawaitian Sugar Planters Association.

Division of Statistical and Historical Research.
See Table 359 for source of production figures. Trade figures, Department of Commerce.
${ }^{1}$ Predominately raw except beet sugar production and domestic exports which are chiefly refined; 1903
to date production and domestic exports converted to raw.
${ }^{2}$ From Hawaii, Porto Rico, and Philippine Islands (Virgin Islands included, 1917-18 and subsequently).
${ }^{3}$ Cuba included. Philippine Islands excluded 1900-1901 and subsequently.
4 Shipments to Hawaii and Porto Rico included.
${ }^{6}$ Consumption for all purposes. No account taken of stocks at beginning or end of year.

Table 361.-Sugar: Quantity and per cent of total consumption supplied the United States by Cuba, 1866-1922.

CANE SUGAR (RAW).

Table 364.-Sugar: Production in undermentioned countries-Continued.
CANE SUGAR (RAW)-Continued.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture unless otherwise stated.

Figures are for the crop years 1909-10 to 1923-24 for the countries in which the sugar season begins in the autumn months and is completed during the following calendar year, except in the case of cane-sugar producing countries where the season begins in May or June and is completed in the same calendar year.

13 Three-year average.

Table 390.-Tobacco: Acreage, production, and farm value, by types and districts, 1922 and 1923-Continued.

## Division of Crop and Livestock Estimates.

${ }^{1}$ The prices used in this report more nearly reflect the average price for the season than do the December 1 prices, and the values obtained differ from those published in the December, 1923, crop summary for that reason.
${ }^{2}$ Preliminary.

[^226]Table 395.-Tobacco: Production in undermentioned countries.-Continued.
SOUTHERN HEMISPHERE.

Division of Statistical and Historical Research.
Official sources and International Institute of Agriculture, Rome, unless otherwise stated
Five-year averages are of the crops harvested during the calendar years 1909-1913 in the Northern Hemisphere, and during the crop seasons 1909-10 through 1913-14 in the Southern Hemisphere. For each individual year is shown the harvest in the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.
${ }^{3}$ One year only.
${ }^{4}$ Four-year average.
${ }^{7}$ Exclusive of native reserves (production of 2,428,553 pounds in 1917-18 and 1,614,400 pounds in 1920-21).

Division of Crop and Livestock Estimates. Based on reports of about 7,500 farmers reporting monthly for their own farms.
${ }^{1}$ Number on hand, Jan. 1, each year $=100$ per cent
${ }^{2}$ Corrective factor 0.96 applied to births and brought on farms figures.
Table 408.-Cattle: Yearly losses per 1,000 from disease and exposure, 1890-1924:

Division of Cost of Marketing.
${ }^{1}$ Shrinkage represents the difference between the shipping-point weight and the terminal weight, including the weight of all crippled and dead. Hence the shrinkage figure is over and above the direct losses due to crippled and dead.
:Straight shipments contain but one species of livestock.
:Mixed shipments contain more than one species of livestock.

Division of Crop and Livestock Estimates. Based on reports of about 140,000 farmers gathered in cooperation with Post Office Department through the rural mail carriers. Periods covered: December 1 to June 1 (spring), June 1 to Đecember 1 (fail).

1 Based on estimated number per sow as reported by farmers.
2 Total pigs saved divided by sows farrowed as reported by farmers, and probably not strietly comparable with 1921 and 1922 data
8 Intentions are as of the ctose of the preceding 6 months period; for example, those for spring farrowing 1924 were intentions expressed as of December 1 , 1923.

Livestock, Meats and Wool Division. Production figures 1870-1892 and 1914-1923 from the Division of Crop and Livestock Estimates; 1893-1913, from the National Association of Wool Manufacturers; imports and exports from the Bureau of Foreign and Domestic Commerce.
${ }^{1}$ Imports and reexports include hair of camel, goat, alpaca, etc. Imports of hair not separately stated prior to July 1, 1913; since that date it has constituted less than 2 per cent of the total every year except 1915, when it was 2.4 per cent.
${ }_{2}^{2}$ Exports for fiscal years ending June 30 of the years shown.
${ }^{4}$ No transactions.
${ }^{3}$ Included in all other articles.

## LIVESTOCK, ALI CLASSES.

Table 588.-Livestock in undermentioned countries.

[^284] note (1); otherwise the figures are for cattle only.
${ }^{2}$ Census 1910.
${ }^{3}$ Census 1920.
${ }^{4}$ Less than 500 .
${ }^{5}$ Includes 22,000 reindeer and 20,000 work dogs in 1910 and 93,000 reindeer and 18,000 work dogs in 1920.
${ }^{6}$ Unofficial.
${ }_{8}^{7}$ Year 1918 .
${ }^{8}$ Census figures for goats, horses, etc., not yet avainde, 10,738 camels and 1,908 ostriches in 1913 and 11,73 and 780 ostriches in 1921
10 Former boundaries.
${ }_{12}$ Not including cattle of interior prairies estimated at 30,000 head in 1913 and at 38,980 in 1921.

Table 588.-Livestock in undermentioned countries-Continued.

[^285] note (1), otherw ise the figures are for cattle only.
${ }^{4}$ Less than 500.
${ }^{13}$ Camels.
14 The number of work animals only in 1921 compared with 1913 was as follows, the 1913 figures being given in parentheses: Cattle, $875,000(754,000)$; buffaloes, $148,000(146,000)$; horses, 174.000 ( 141,000 ).
${ }_{15}^{15}$ Llamas and alpacas.
${ }^{16}$ Hogs over 1 year old not included.
${ }_{17}$ Includes South Jutland, where the number of livestock on July 15, 1923, was as follows: Cattle, 213,000;
swine, 288,000; sheep, 19,000; goats, 2,000; horses, 38,000
${ }_{18}^{18}$ Animals belonging to British Army excluded.
${ }_{19}$ Preliminary estimate for numbers within present boundaries in 1913.

Table 588.-Livestock in undermentioned countries-Continued.

${ }^{1}$ Buffaloes are included with cattle for countries giving estimates for buffaloes. These are indicated by note (1); otherwise the figures are for cattle only.
${ }^{4}$ Less than 500 .
${ }^{10}$ Former boundaries.
${ }^{13}$ Camels.
${ }^{20}$ Animals owned by Europeans.
${ }^{21}$ Number of reindeer in 1921.
${ }_{22}$ Data for preceding year.
${ }^{23}$ Aray horses excluded. A ccording to the Ministry for National Defense they numbered 40,289 in 1922.
${ }_{4} 4$ Year 1917.

Table 588.-Livestock in undermentioned countries-Continued.

[^286] note (1); otherwise the figures are for cattle only.
${ }^{4}$ Less than 500.
${ }^{13}$ Camels.
${ }_{19}$ Preliminary estimate for numbers within present boundaries in 1913.
${ }_{22}^{20}$ Animals owned by Europeans.
${ }_{22}$ Data for preceding year.
${ }_{25}$ Zebus.
${ }^{20}$ Animals on sugar estates only.
${ }^{27}$ In addition there were 216,400 designated as "sheep and goats."
${ }_{28}$ Apr. 30, 1923.
${ }^{20}$ In rural districts only. The numbers in cities on Jan. 1, 1918, compared with Dec. 31, 1907, in parentheses, were as follows: Cattle, $3,754(5,133)$; swine, $4,478{ }^{(5,772)}$; sheep, 1,479 (1,650); goats, $843(500)$; horses, 7,945 (8,580).

Table 588.-Livestock in undermentioned countries-Continued.

${ }^{1}$ Buffaloes are included with cattle for countries giving estimates for buffaloes. These are indicated by note (1); otherwise the figures are for cattle only.
4 Eess than 500.
${ }^{18}$ Camels.
${ }^{15}$ Llamas and alpacas.
19 Preliminary estimate for numbers within present boundaries in 1913.
${ }^{20}$ Animals owned by Europeans.
${ }^{22}$ Data for preceding year.
${ }^{30}$ Carabao
${ }_{31}$ Former Kingdom and Bessarabia. The number in 1911, excluding Bessarabia, was as follows: Cattle and buffaloes, $2,667,000$; swine, $1,021,000$; sheep, $5,269,000$; goats, 187,000 ; horses, 825,000 ; mules and asses, 4,000.
${ }_{32}$ The 1920 census figures for Turkestan and Azerbaijan have been included in the 1922 figures for Asiatic Russia, as estimates for these republics were not included in the 1922 estimate.
${ }^{33}$ Elephants.

Division of Statistical and Historical Research. In order to secure comparable totals, that pre-war estimate nearest to 1913 giving statistics for each class of animal, is compared with the latest estimate available. Census returns are in italics, other returns are in roman.
${ }^{1}$ Buffaloes are included with cattle for countries giving estimates for buffaloes. These are indicated by note (1); otherwise the figures are for cattle only.
${ }^{4}$ Less than 500 . ${ }^{6}$ Unofficial. ${ }^{33}$ Camels.
${ }_{34}$ Comprised of the 1907 estimate for European Turkey and the 1909 estimate for Asiatic Turkey.
${ }^{35}$ As no estimate for the numbers of livestock in native locations and reserves was included in the 1922 estimate, the 1921 census figures for the numbers in these regions have been added to the 1922 estimate.
They are as follows: Cattle, 2,355,678; swine, 353,988; sheep, 3,005,572; goats, 2,728,071; horses, 155,853; mules, 1,619 ; asses, 123,200 .
${ }^{36}$ Year 1922.
${ }^{87}$ Pre-war and postwar totals are for approximately the same territory. Rough pre-war estimates have been included for former Russian territory according to 1923 boundaries, i. e., European and Asiatic Russia, Poland, Esthonia, Latvia, and Lithuania, Bessarabia being added to the pre-war Rumania estimate. Figures for Czechoslovakia and Yugoslavia are included in the total of recent estimates, since they were included in the pre-war estimates of the countries to which they formerly belonged.
${ }^{38} 13,124,000$ designated as "sheep and goats" included with sheep.
${ }^{89} 5,674,000$ designated as "sheep and goats" included with sheep.
40219,000 designated as "horses, mules, and asses" and "horses and mules" included with horses.
41278,000 designated as "horses, mules, and asses" and "horses and mules" included with horses
${ }^{42} 3,428,000$ designated as "mules and asses", included with mules.
43 2,229,000 designated as " mules and asses" included with mules.

'Forest Service. Compiled from report on Senate Resolution 311 and "Forest Resources of the World."
${ }^{1}$ The areas given in this table refer only to land capable of producing saw timber or pulp timber in commercial quantities, and do not include the open woodland and chaparral of the Southwest.
${ }_{2}$ Alaskan areas are not tabulated because so little is known of the interior forests that the best estimates are only approximations. The figures now commonly used indicate $65,000,000$ acres of coniferous forest and $5,000,000$ acres of hardwoods. The bulk of the merchantable timber is confined to a belt along the coast of the southeastern part of the Territory, containing approximately $5,000,000$ acres of forest.

Forest Service. Compiled from reports of Bureau of the Census.
${ }^{1}$ The total embraces all land on farms covered with natural or planted forest trees, which produce or later may produce firewood or other forest products.
${ }_{2}$ Timberland is that part of the total forested area on farms which is covered with trees mostiy of sawlog sizes.

## Forest Service.

1 Includes some hemlock.
2 Includes balsam, white fir, hemlock, and others.
${ }^{3}$ Includes piñon pine, tamarack, hemlock.
4 Includes Mexican white pine, cork bark fir, foxtail pine, Chihuahua pine, cypress, etc.
5 Includes balsam, dead, and other species not specified.
6 Includes Coultor pine, big cone spruce, and miscellaneous.
7 Presented separately due to difference in species.
${ }^{8}$ Includes shortleaf, Virginia scrub, table-mountain, and pitch pine.

Table 615.-Forest planting.
AREAS PLANTED PRIOR TO JANUARY, 1923.

AREAS PLANTED DURING CALENDAR YEAR 1922.

Forest Service. Includes relatively small areas sown with forest seeds.
${ }^{1}$ New England: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut.
${ }^{3}$ Middle Atlantic: New York, New Jersey, Pennsylvania.
${ }_{8}$ Central hardwoods: Ohio, Indiana, Illinois, Kentucky, Tennessee, Arkansas, Missouri.
${ }^{4}$ Lake: Michigan, Wisconsin, Minnesota.
${ }^{5}$ South Atlantic: Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida.
${ }^{6}$ Gulf Coast: Alabama, Mississippi, Louisiana, Texas.
${ }^{7}$ Plains and prairie: North Dakota, South Dakota, Iowa, Nebraska, Kansas, Oklahoma.
${ }^{8}$ Rocky Mountain: Idaho, Montana, W yoming, Nevada, Utah, Colorado, Arizona, New Mexico.
${ }^{\circ}$ Pacific Coast: Washington, Oregon, California.

## Forest service.

"Cost" sales are special sales made to farmors and settlers who are entitled by law to purchase for domestic use mature or dead national forest timber at the cost of making and administering the sale.
${ }^{2}$ Value of other timber products, not convertible into board feet, taken from the national forests.
¿ Estimated.
Table 621.-Timber granted without charge from national forests, to local residents, under "free use" regulations, 1907-1922.

Forest Service. Compiled from Forest Service and Bureau of the Census reports. Figures 1915-1918 and for 1920 include estimates for firms not reporting.

Northeastern: Connecticut, Delaware, Maine, Maryland, Massachusetts, NewHampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont
Central: Illinois, Indiana, Kentucky, Missouri, Ohio, Tennessee, West Virginia.
Southern: Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, Oklahoma, Texas
North Carolina Pine: North Carolina, South Carolina, Virginia.
Lake: Michigan, Minnesota, Wiseonsin.
North Pacific: Oregon, W ashington.
South Pacific: California, Nevada.
North Rocky Mountain: Idaho, Montana.
South Rocky Mountain: Arizona, Colorado, New Mexico, Utah, Wyoming.
Prairie: Iowa, Kansas, Nebraska, South Dakota, North Dakota.
${ }^{1}$ Includes cut of Nevada.
${ }_{2}$ Includes cut of Nebraska
${ }^{3}$ Included in "All other."
${ }^{4}$ Included with Kansas.
${ }^{6}$ Included with California.
${ }^{6}$ Includes cut of Kansas, Nebraska, and Nevada.

1068 Yearbook of the Department of Agriculture, 1923.
Table 623.-Lumber value: Production by Siates, calendar years, 1840, 1850, and 1860 compared with 1920.

Forest Service. Compiled from Forest Service and Bureau of the Census reports.

## Forest Service. Compiled from "Forest Resources of the World."

${ }^{1}$ The figures for total world consumption do not exactly correspond with those for production, although they must be approximately equal. The differences are due to various discrepancies in tire data, such as differences in the years for which figures on individual countries are based, different converting factors used in different cerantries, and differences in the completeness of customs statistics. Data represent averages of recent years.

1078 Yearbook of the Department of Agriculture, 1923.

Forest Service. Averages of recept years.
${ }^{1}$ Based on values of approximately 1919, milled products at the mill, fuel at point of production, all others at point of consumption except exports (declared raluation).
${ }_{2}$ These figures express mainly that part of the damage done by fire which can be readily stated in dollars, namely, the loss of merchantable timber. Other damages suffered are the loss of young growth and forage, the injury of trees, resulting in admitting the inroads of insects and disease, the deterioration of orest types resulting from the decrease of
valuable species which are sensitive to fire, accelerated run-off followed by soil erosion and irregular stream flow, destruction of animals, fish, and birds, and the prevention of valuable species which are sensitive to fire, accelerated run-off followed by soil erosion and irregular stream flow, destruction of animals, fish, and birds, and the prevention of
recreational uses. One of the most menacing features of the present forest situation is the lowered productivity of forest soils sometimes amounting to absolute sterility, which recreational uses. One of the $m$
results from the action of fires.

Forest Service.
1 United States production.

Table 632.-Lumber: Imports and exports, and pulpwood imports, 1907-1923.

Forest Service. Compiled from reports of the Bureau of Foreign and Domestic Commerce. Pulpwood is stated in cords of 128 cubic feet. The earliest Government record of pulpwood commerce shows 322,758 cords imported in the last half of 1906. Reports of manufacturers, which are not comparable with the Government record, show foreign pulpwood, consumed in calendar years antedating this table, as follows: In $1899,369,217$ cords; in 1905, 645,428 cords; in 1906, 738,872 cords.

## Forest Service.

Converting factors: To obtain the number of crossties, divide figures shown by 3. To obtain the number of linear feet of piling, divide the figures shown by 0.6763 . To obtain the number of poles, divide the figures shown by 17.6. To obtain the number of square yards of wood blocks, divide the figures shown by 2.825. To obtain the number of board feet of construction timbers, multiply the figures shown by 12. To obtain the number of crossarms, divide the figures shown by 0.6198 . To obtain the number of board feet of miscellaneous lumber, multiply the figures shown by 12.
${ }^{1}$ None reported.
2 Figures if used would reveal identity of reporting firms

Division of Statistical and Historical Research.
Compiled from Foreign Commerce and Navigation of the United States, 1852-1918, and Monthly Summaries of Foreign Commerce of the United States, June, 1920, 1922 and 1923, Bureau of Foreign and Domestic Commerce.
Where figures are lacking, either there were no exports or they were not separately classified for pubiication. "Beef salted or pickled," and "Pork, salted or pickled," barrels, 1851-1865, were reduced to pounds at the rate of 200 pounds per barrel, and tierces, $1855-1865$, at the rate of 300 pounds per tierce; cottonseed oil, 1910, pounds reduced to gallons at the rate of 7.5 pounds per gallon. It is assumed that 1 barrel of corn meal is the product of 4 bushels of corn, and 1 barrel of wheat flour the product of 5 bushels of wheat prior to 1880 and $4 \frac{1}{2}$ bushels of wheat in 1880 and subsequently.

Division of Crop and Livestock Estimates. Estimated total acreage of 19 crops-corn, wheat, oats, barley, rye, buckwheat, potatoes, sweet potatoes, tobacco, flax, rice, all hay, cotton, peanuts, kafirs, beans, broom corn, hops, and cranberries.
${ }^{1}$ Based on census proportions in 1919.
${ }^{2}$ Includes cotton acreage in Lower California (85,000 acres in 1921, 135,000 acres in 1922, and 148,000 acres in 1923).

## 1140 Yearbook of the Department of Agriculture, 1923.

Division of Crop and Livestock Estimates. Estimated total value of 22 crops-corn, wheat, oats, barley, rye, buckwheat, flaxseed, rice, potatoes, sweet potatoes, all hay, tobacco, lint cotton, beans, broom corn, grain sorghums, hops, oranges, cloverseed, peanuts, cranberries, and apples-in the United States, by States, in 1919 (census), 1922, and 1923; the value of all crops in 1919 (census); and the value of all crops in 1922 and 1923, based upon ratio of the 22 crops to all crops in census year. The slight differences in the total value of crops in the United States between Tables 670 and 672 are due to different methods of estimating. In Table 670, where each State is shown separately, a more detailed method is used than is practicable in Table 672.

Table 671.-Farm production: Estimated value, principal products and groups of products, calendar years, 1919-1923.

JBased on farm price Dec. 1, except cotton, 1919 to 1922; cotton weighted, year beginning Aug. 1.

## 1144 Yearbook of the Department of Agriculture, 1923.

Table 671.-Farm production: Estimated value, principal products and groups of products, calendar years 1919-1923-Continued.

Division of Crop and Livestock Estimates.
${ }^{1}$ Based on farm price Dec. 1, except cotton, 1919 to 1922; cotton weighted, year beginning Aug. 1.
${ }_{2}^{2}$ Includes milk equivalent of cream for household use.
${ }^{3}$ For cream powder and ice cream.
${ }^{1}$ Less than $\$ 500,000$.
Table 672.-Farm production: Value of farm products, based on prices at the farm, 1897-1923.

| Calendar year. | Crops. | Animal products. | Total (estimated) value, excluding crops fed to livestock. ${ }^{1}$ |
| :---: | :---: | :---: | :---: |
| 1897. | \$2,519, 000,000 | \$1, 442, 000, 000 | \$2,904, 000, 000 |
| 1898 | 2, 760, 000, 000 | $1,579,000,000$ | 3, 161, 000, 000 |
| 1889 (census) | 3, 020, 000, 000 | 1,718, 000, 000 | 3, 355, 000, 000 |
| 1900. | 3, 192, 000,000 | 1, 818, 000,000 | 3, 549, 000, 000 |
| 1901 | 3, 385, 000, 000 | 1, 917, 000, 000 | 3, 643, 000, 000 |
| 1902 | 3, 578, 000, 000 | 2, 016, 000, 000 | 3, 807, 000, 000 |
| 1903 | 3, 772, 000, 000 | 2, 116, 000, 000 | 4, 136,000, 000 |
| 1904 | 3, 982, 000,000 | 2, 140, 000, 000 | 4, 262, 000, 000 |
| 1905 | 4, 013, 000, 000 | 2, 261, 000, 000 | 4,387, 000,000 |
| 1906 | 4, 263, 000, 000 | 2, 501, 000, 000 | 4, 784, 000,000 |

${ }^{1}$ Estimates of the values of crops fed to livestock have been made by multiplying the value of the following crops by the percentages given: Barley, 75; corn, 85 ; grain sorghums, 90 ; oats, 80 ; rye, 20; wheat, 6 ; hay, 85 ; forage, 100; potatoes, 10 ; and sweet potatoes. 15.

Table 672.-Farm production: Value of farm products, based on prices at the farm, 1897-1923-Continued.

| Calendar year. |  |  |  |

## FARM EQUIPMENT.

Table 690.-Farm equipment manufactured and sold in the United States, 1920-1922.-

1 The sales statistics for 1921 relate exclusively to complete machines and were compiled almost wholly from returns made by 427 establishments classified in the "agricultural implements" industry. No sales data were collected for that year from establishments manufacturing gas tractors, horse-drawn vehicles, barn equipment, and miscellaneous farm equipment.
${ }_{2}$ Figures for 1921 relate to barn equipment only. No daia fer 1920.

Table 690.-Farm equipment manufactured and sold in the United States, 1920-1922-Continued.

| Calendar year. | Manufactured. |  | Sold in the United States. |  | Sold for export. |  |

| Return to all unpaid labor----------- | 225 | 424 | 300 | 211 | 106 | 365 | --43 |
| Return to operator (prorated) ${ }^{5}$ | 158 | 334 | 226 | 156 | 70 | 295 | -37 |
| Return to operator (family labor at hired labor rates) ${ }^{6}$ | 9 | 244 | 176 | 13 | -182 | 273 | -170 |

Division of Farm Management. Computed from reports of 6,094 owner-operators and other information. In computing this table certain arbitrary assumptions are explicitly or implicitly made.
${ }^{1}$ A verage of estimates of 4,748 farmers.
2 A verage as estimated by 5,248 farmers.
${ }^{8}$ Based on reported value of farm property January 1, 1922.
4 Many men recall paying much more than 6 per cent.
${ }^{5}$ Assumes that all unpaid family labor shared the reduced amount according to the amount of its claim established. (1) For the operator as 12 times the monthly wages without board and (2) for the rest of the family, the difference between operator's labor so figured and the reported value of unpaid labor.
${ }^{6}$ The assumption is that the operator bears all the burden of failure to earn common hired labor wages, and attributes such wages to his family before computing his remainder or wages.

Table 695.-Farmers' incomes: Summary of the business of 14 farms operated by the same men for 11 consecutive years, Palmer Township, Washington Co., Ohio, 1912-1922.

${ }^{1}$ A productive animal unit in this area equals 1 horse, 1 cow, 5 hogs, 10 sheep, or 100 chickens.

Table 695.-Farmers' incomes: Summary of the business of 14 farms operated by the same men for 11 consecutive years, Palmer Township, Washington Co., Ohio, 1912-1922-Continued.

[^341]Thale 707.-Freight and express rates, per 100 pounds, on purebred livestock, in effect April 1,1923-Continued.

SWINE.

## Division of Statistical and Historical Research. Supplied by lnterstate Commerce Commission.

${ }^{1}$ These freight rates are on less than cariot shipments and apply to livestock described as "Livestock, chiefly valuable for breeding, racing, show purposes, and other special uses," subject to basie valuation as follows:

$$
\begin{aligned}
& \text { Each cow. }
\end{aligned}
$$

If values stated in Livestock contract exceed above basic values, an addition of 2 per cent should be made to the freight rate for each 50 per cent or fraction thereof in excess of the basic value.

These freight rates are further subject to the following minima :
Pounds.
One cow, calf over 6 months old, ox, steer, bull, each 3, 000
Each additional animal of above kind (except bull over 1 year old) 1, 500
Each additional bull over 1 year old. 2, 000
One cow with calf not orer 6 months old 3, 500
Each additional cow with calf over 6 months old 2, 500
Calves 6 months old or under, sheep, or hogs, minimum for each shipment
3, 000
${ }^{\text {t }}$ Express rates on beef and dairy cattle and calves, crated, each weighing not over 750 pounds gross; each weighing over 750 pounds gross, or when two or more are shipped in one crate and gross exceeds 750 pounds, subject to an additional charge of 50 per cent of the rate. When declared or released value exceeds $\$ 75$ each on cows, calves 6 months old or over, oxen, steers; $\$ 25$ each on calves under 6 months; $\$ 25$ each on hogs; $\$ 25$ each on sheep; charges should be made as follows: Between points where rate is not over $\$ 2,1$ per cent of excess value; where rate is not over $\$ 3,1 \frac{3}{2}$ per cent of excess value; where rate is not over $\$ 5,2$ per cent of excess value; where rate exceeds $\$ 5,2 \frac{1}{2}$ per cent of ex cess value.

Division of Statistical and Historical Research.
The commodities and rates on which this index is based will be found in the Yearbook, 1922, pp. 1013-18. Except for the following corrections of rates in effect Jan. 1, 1923, no changes in the rates used in the index took place during 1923:

Rate on potatoes from Greeley, Colo., to Chicago should be
Rate on potatoes from Idaho Falls, Idaho, to St. Louis should be
Rate on eggs from Petaluma, Calif., to Chicago should be ${ }^{260}$
Rate on corn from Sperry, Iowa, to Los Angeles City should be-

Rate on cattle from Amarillo, Tex., to Kansas City, Mo., should be-
Rate on cattle from Garretson, S. Dak., to Sioux City, Iowa, should be. 20

[^0]:    $85813^{\circ}$ - увк 1923-6 6

[^1]:    ${ }^{1}$ Paid direct to States by Treasury Department.

[^2]:    ${ }^{1}$ Including expenditures of $\$ 152,511.28$ from fund of $\$ 175,000$ set aside for road materiai investigations.
    2 Paid direct to States by 'Treasury Department.

[^3]:    ${ }^{1}$ These balances, no longer available for expenditure, totaling $\$ 502.03$, were returned to the departments from which the allotments originated.
    ${ }^{2}$ Includes $\$ 5,721,137.91$ in annual appropriations for regular work of department for fiscal years 1921 and 1922.
    8 Includes $\$ 2,981,134.71$ expended from annual appropriations for regular work of department in payment of obligations incurred during fiscal years 1921 and 1922.

    4 Includes $\$ 2,740,003.20$ unexpended balances of annual appropriations for regular work of department or fiscal years 1921 and 1922.

[^4]:    ${ }^{1}$ This report, prepared by members of the Bureau of Agricultural Economics, was submitted to the President Nov. 30, 1923. The following committee had charge of the study, under the direction of H. C. Taylor: W. A. Schoenfeld, chairman; Nils A. Olsen, executive secretary; O. C. Stine. H. R. Tolley, V. N. Valgren, O. E. Baker. W. F. Callander, and R. H. Wilcox. The committee was assisted by G. C. Haas, Donald Jackson, R. S. Washburn, H. B. Gardner, L. V. Steere, C. L. Luedtke, L. M. Harrison, M. R. Cooper, L. A. Reynoldson, E. O. Wooton, C. R. Chambers, H. Killough, A. V. Swarthout, E. B. Ballow, H. J. Besley, C. O. Brannen, R. W. Newton, G. A. Collier, H. K. Holman, jr., A. W. McKay, and R. H. Elsworth.

[^5]:    ${ }^{2}$ A one-year base for an individual commodity is not satisfactory. The index of the price of wheat is therefore based on the 1909-1913 average.

[^6]:    ${ }^{3}$ All estimates of production for $1923-24$ are subject to change by report of revisions and by receipt of official estimates for countries not officially reported.

[^7]:    ${ }^{4}$ The net imports of European importing countries, $1922-23$, preliminarr $\mathbf{-} \mathbf{6 7 , 0 0 0 , 0 0 0}$ bushels wheat and flour as wheat: $1921-22,535,000,000 ; 1909-1913,505,000,000$, of which European exporting countries supplied about $11,000,000,20,000,000$ and $27 \%$, 000,000 , respectively.

[^8]:    ${ }^{5}$ Computed on the basis of the average annual disappearance in the United States for food and feed distributed per capita by States as found in a survey made in 1911, and seed requirements with a reduction of 15 per cent in the winter wheat area. Spring wheat area same as last year.

[^9]:    ${ }^{6}$ These combined rates may vary from day to day on account of variations in lake and ocean rates.

[^10]:    ${ }^{1}$ The feeding value of a pound of wheat in pounds of corn is 1 for poultry and sheep, 1.05 for hogs, and 1.15 for becf cattle.

[^11]:    Figure 33.-Corn Belt (Ohio, Indiana, Illinois, Iowa, Missouri), western winter wheat region (Kansas; Nebraska, Oklahoma, Texas, Colorado), spring wheat region (Minnesota, North Dakota, South Dakota, Montana), Pacific Northwest region (Idaho; Washington, Oregon).

[^12]:    ${ }^{1}$ Doctor Townsend was originally chairman of the committee which began the preparation of this article. While the work was in progress he was transferred to the Tariff Commission. The article has been extensively revised and rewritten.
    ${ }_{2}$ H. S. Paine, Bureau of Chemistry, contributed a portion of the material on manufacture of sugar from beets; and W. E. McLendon, Bureau of Soils, a portion of the ma terial on soils of the Louisiana sugar-cane district, also of the sugar-beet districts.
    ${ }^{3}$ P. F. Brookens assisted Doctor Arner in the preparation of the material on price and consumption.
    ${ }_{4}$ The contribution of Mr. Stevens, Louisiana Agricultural College, on labor requirements and costs of producing cane in Louisiana was prepared in cooperation with the Bureau of Agricultural Economics and was summarized for publication by O. A. Juve, L. E. Long, and R. H. Wilcox of that bureau.

[^13]:    ${ }^{1}$ These figures are from reports of sugar factories received by United States Department of Agriculture. ${ }^{2}$ Bad seasonal conditions in Louisiana and Texas in 1919 caused an abnormally low yield. Ordinarily the yields per acre are a half to two-thirds higher.
    ${ }^{3}$ Of this amount 179,900 acres were grown for sugar only, producing $1,883,000$ tons of cane, according to reports of United States Department of Agriculture.
    4 Sugar produced per acre of cane used for sugar. See footnote No. 2.
    ${ }^{5}$ Short tons.
    ${ }_{6}^{6}$ Virgin Islands census of 1917.
    ${ }^{7}$ 21st Annual Report, Philippine Bureau of Agriculture, 1922.

[^14]:    1 Average, man 0.95 day; mule 1.73 days per acre.

[^15]:    1 The terms "men" and "man" are used in showing labor requirements as a composite including men, women, and children.
    ${ }_{2}$ This labor is charged to the crop furnishing the seed. It is shown here as a part of the labor actually involved in the propagation of sugar cane.

[^16]:    ${ }^{1}$ The labor requirements per acre do not change materially with increased yields, while, on a ton basis, the labor requirements per ton decrease as the yield increases.
    ${ }^{2}$ Mechanical loaders are now used on many of the larger plantations.
    :Weigher, driver, and forkman.

[^17]:    ${ }^{1}$ A verage fall and spring plant.
    ${ }_{2}$ Composite of stripping and cutting for fall plant and cutting and laying in windrow for spring plant. Loading and hauling included in storage and transporting seed cane.

[^18]:    $85813^{\circ}$ - увк $1923-13+14$

[^19]:    ${ }^{5}$ The cost data contained in this article are based on information taken from the following United States Department of Agriculture Bulletins: 693. Farm Practice in Growing Sugar Beets for Three Districts in Utah and Idaho, 1914-15; 726, Farm Practice in Growing Sugar Beets for Three Districts in Colorado, 1914-15; 735, Farm Practice in Growing Sugar Beets in the Billings Region of Montana: 748, Farm Practice in Growing Sugar Beets in Michigan and Ohio; 760, Farm Practice in Growing Sugar Beets in Three California Districts; 763, Cost of Producing Sugar Reets in Utah and Idaho, 1918-19; 917, Farm Practice in Growing Field Crops in Three Sugar-Beet Districts of Colorado.

[^20]:    ${ }^{1}$ Manure applied on a negligible number of farms.
    2 The quantities of rianure and commercial fertilizer shown are the result of prorating the total amount used over the entire beet acreage.
    ${ }^{3}$ Operating expense includes all items of cost except use of land.
    ${ }^{1}$ Commercial fertilizers were not used in these States in growing sugar beets.

[^21]:    Fig. 25.-The labor cost of delivering sugar beets to the sugar factory or loading station depends largely upon the distance hauled. In Utah and Idaho, in 1918, the cost increased about 13 cents per ton for each mile after the first mile.

[^22]:    $85813^{\circ}$ - Үвк $1923-14$

[^23]:    Fig. 46.-The great increase in cane-sugar production in the last 25 years has been chiefly in Cuba and Java. The Philippines, Hawaii, Porto Rico, and Formosa have also increased their production. The average production of cane sugar in the United States increased until 1908 and has since declined slightly. The production of beet sugar has, either declined in recent years, or advanced but slightly in every country except the United States, which in 30 years has advanced from small beginnings to the third position among the beet-sugar producing countries of the world.

[^24]:    $85813^{\circ}-$ rbe $1923-15+16$

[^25]:    ${ }^{1}$ The distribution of some of the poisonous plants of the West is shown in Figures 75 and 76 of the article "Our Forage Resources," page 401.

[^26]:    ${ }^{2}$ For further information see Farmers' Bulletin No. 1330.

[^27]:    ${ }^{3}$ Indiana Experiment Station Rulletin 202.
    ${ }^{4}$ Indiana Experiment Station Bulletin 221.

[^28]:    5 Indiana Experiment Station Bulletin 263.
    ${ }^{6}$ Nebraska Experiment Station Bulletin 153.
    7 Nebraska Experiment Station Bulletin 157.

[^29]:    ${ }^{8}$ The bulk of slaughter credited to Jersey City actually occurs in Greater New York.

[^30]:    ${ }^{9}$ The estimated domestic production, net imports, and estimated consumption of. wool for 54 years- 1870 to 1923 -are shown in Table 546 -entitled "Wool, raw : Production, Imports, Exports, and Apparent Consumption, United States, 1870-1923," in Statistical Appendix, page 1001 .

[^31]:    85813 ${ }^{\circ}$ - ybi 1923- 20

[^32]:    ${ }^{1}$ A J. Pieters and W. J. Morse, Bureau of Plant Industry ; H. W. Hawthorne and W. J. Spillman, Bureau of Agricultural Economics; J. B. Bain and E. C. Semple, Bureau of Animal Industry, furnished valuable data and criticisms.
    ${ }^{2}$ In the broad consideration here given the relations of forage to livestock production, and indeed to agriculture as a whole, the word "forage" is used in its wide significance; that is, all vegetable nutriment, fresh or cured, consumed by domestic animals, such as pasturage, browse, mast, green feed, hay, straw, silage, and grain. The term "feed" includes all plant and animal products consumed by livestock, and "food" refers to the nutriment of man.
    ${ }^{3}$ These acreages of the several classes of pasture are estimates based on the replies made to the questions on "Uses of land," contained in the 1920 census schedule; on various Federal and State reports; and on correspondence with officials and other well-informed persons in the several States. Special acknowledgment is due W. R. Chapline and W. N. Sparhawk, of the Forest Service and A. E. Aldous, of the Land Classification Board, United States Geological Survey, for assistance and valuable criticism. Additional data are contained in Table 22. These estimates and others that follow are not final. If they serve to call attention to the importance of forage, especially our pastures, and stimulate students in the various States to study the problems in more deail, the writers will be fully satisfied.

[^33]:    ${ }^{4}$ Livestock and domestic animals as hereinafter referted to include horses, mules, cattle, sheep, goats, hogs, and poultry. All are purely herbivorous except hogs and poultry, which are omnivorous.
    ${ }_{5}$ Forage crops properly include only those plants grown primarily for feed, and of which animals consume all or most of the harvested herbage or roots or both. Strictly speaking, the term crop applies only to products that are harvested by man, and therefore does not include pasturage: but it is extended in common use to include planted crops like corn, oats, soybeans, etc., even if they are grazed down by animals.

[^34]:    ${ }^{6}$ Forty-one per cent of the crop land in the Cotton Belt was in cotton, but after the value of the seed, most of which is used for feed and food, is allowed for, the acreage allotted to the production of cotton fiber becomes only 35 per cent.

[^35]:    ${ }^{7}$ Exception to this general statement should be noted in the case of the study by E. W. Shanahan, entitled "Animal Foodstuffs," London, 1920.

[^36]:    8 The "animal unit" is employed to reduce the different kinds of livestock to one class, in so far as their relation to the consumption of feed is concerned. It is roughly estimated that the amount of forage required to maintain 1 adult cow one year would be sufficient to maintain for the same period 1 horse, mule, or steer, 5 hogs, 7 sheep or goats, or 100 poultry. Colts, calves. pigs, and lambs are estimated to require one-half as much feed as the adult animal. These ratios have been used in farm management surveys for many years, and have proved fairly satisfctory.

[^37]:    ${ }^{2}$ In many European countries dual-purpose cattle are very common and the statistics often do not distinguish carefully between dairy and beef animals. The ratios given are, therefore, not strictly comparable with those for the United States, but it is believed they are satisfactory for a broad comparison of this kind.

[^38]:    $85813^{\circ}$ - YBK 1923-22

[^39]:    ${ }^{10}$ Wisconsin Agricultural Experiment Station Circular No. 37, by F. W. Woll, Table No. 1, supplied the basis for the calculation, but the feed value of a few items was slightly altered. The following theoretical annual rations per animal unit were used :

    | Concentrated feeds : | Tons. | Hays and fodders-Continued. | Tons. |
    | :---: | :---: | :---: | :---: |
    | Cottonseed or flaxseed meal and peanuts $\qquad$ | 2. 10 | Timothy, wild hay, miscellaneous tame hays, and sorghum fodder | 8. 00 |
    | Corn, barley, rye, emmer, and spelt | 2. 65 | Straws and stovers: Corn and sorghum stover | 10.00 |
    | Wheat, mixed grains, dry beet pulp | 2.7 | Oat and rice straw_- | 11.00 12.00 |
    | Oats, sorghums, | 2.85 | Warley straw - | 13.00 15.00 |
    | Hays and fodders: |  | Silage and roots : |  |
    | Alfalfa, annual legumes, clover- | 5. 00 | Silage and sweet pot | 16. 00 |
    | Corn fodder and small-grain |  | Potatoes | 20.00 |
    | hays | 7. 00 | Wet beet pulp and roots | 32.00 |

    The feed value of mature crops pastured off was estimated by using for the annual legumes the same ration as for the hays, since both contain the seed; and for corn the same ration as for fodder.

[^40]:    ${ }^{11}$ The word " fodder" in the United States is applied mostly to harvested and drycured corn or similar plants, like sorghum, when the whole plant, both herbage and grain, are fed together. It is hereafter used in that sense. In the South, corn fodder refers to the leaves and tops of the plants which are dried after removal from the living plant before the ears are mature.

[^41]:    ${ }^{1}$ Includes half of the "timothy and clover mixed"' acreage and production.
    ${ }^{2}$ It is estimated that of the 14,502,932 acres of corn cut for forage, as given in the census, approximately $10,000,000$ acres were also reported to the census enumerator under "Corn harvested for grain." Consequently only the product from 4,500,000 acres is included as corn fodder in this table.
    ${ }^{3}$ Includes redtop, orchard grass, Bermuda grass, Johnson grass, millet, Kentucky blue grass, crab grass, and Sudan grass.
    ${ }^{4}$ Includes sugar cane cut for forage, but this is a negligible quantity.
    ${ }^{5}$ The census gives only the total for "small grains cut for hay." This has been divided among the four small grains according to the best information available.
    ${ }^{6}$ The census gives only the total for "Annual legumes cut for hay." This has been divided among the six annual legume crops (excluding velvet beans), according to the best information available. (See Table 20.)
    ${ }^{7}$ The census gives only a total acreage of velvet beans; this has been divided among the different methods of harvesting according to the best information available.
    ${ }_{8}$ In 1919 there was a net import of 165,000 tons of hay, mostly from Canada. The variety is not given, but the hay probably consists mostly of timothy and clover. It has been included only in the totals.

[^42]:    ${ }^{12}$ The term " stover" is applied to the harvested and dry-cured stalks and leaves of corn and similar plants after the grain has been removed.

[^43]:    ${ }^{1}$ A large part of the corn-stover item is from stalks left standing in the field after the grain has been harvested. This forage is really pastured off and is not stover according to the commonly accepted definition of the term, but for the purpose of estimating its feeding value it has been classed with the stovers.
    ${ }_{2}^{2}$ Cotton-seed hulls do not belong in any of the chief groups, but are similar to straw in unit feeding value and are therefore considered here.

[^44]:    1 The data on which this table is based are found in the summary tables of the various crops and those under the preceding discussion of classes of forage.

[^45]:    ${ }^{1}$ The acreage of grain is included also in the stover acreage; hence it is omitted from the total, which represents the actual acreage of sorghums including broomcorn.
    ${ }_{2}{ }^{2}$ The production figures of grain and fodder are taken from the 1919 census. The stover production is estimated by applying to the grain sorghum acreage plus the broomcorn acreage a theoretical yield of $1 \frac{1}{2}$ tons per acre. The quantity of silage is based on the best information available regarding the percentage of the total silage that is made from sorghums in States where sorghum is an important crop.
    ${ }_{3}$ It is estimated that all the grain not used for seed, all the silage, 70 per cent of the fodder, and 50 per cent of the stover are eaten by animals.

[^46]:    1:The actual acreage of these legumes is very difficult to determine, owing to the extent to which they are interplanted with corn and other crops. The acreage reported by the Census is much less than that estimated by the Department of Agriculture, especially for velvet beans. (See Farmers' Bulletin 1276, p.9, and for soybeans and cowpeas the Monthly Crop Reporter for December, 1920.)

[^47]:    ${ }^{14}$ Pasturage includes all herbaceous feed gathered directly by domestic animals. When the plants are shrubs or trees the pasturage is called "browse." Feed consisting of acorns and other nuts that have fallen from forest trees is termed " mast." This term is aiso extended to include the berries of palm trees and the seeds of pine trees.

[^48]:    ${ }^{15}$ See next article, The Utilization of the Land for Crops, Pastures, and Forests, p. 469.
    ${ }^{18}$ See "The Utilization of Our Land for Crops, Pasture, and Forest," p. 427.

[^49]:    ${ }^{1}$ These estimates, which are subject to change, are based on 1920 and 1910 census statistics; data supplied by the Forest Scrvice, Indian Office, Land Office, and other Federal bureaus; reports of various State commissions; and on correspondence with state officials and others.
    ${ }^{2}$ It is estimated that at present about $57,000,000$ acres of desert are too dry for grazing, but with the development of wells and tanks this area may ultimately be reduced to about $30,000,000$ acres. There are also about $20,000,000$ acres, mostly in the West, of rocky peaks and rock out-crops unusable for pasture.
    ${ }^{3}$ The remaining $51,000,000$ acres of pinon-juniper and chaparral used for grazing are located in Indian reservations, the public domain, and privately owned land in farms and not in farms. These items, as given in the table, have been correspondingly reduced.
    ${ }_{5}^{4}$ Of the forest, cut-over, and burned-over land, it is estimated $246,000,000$ acres are not pastured.
    5 Does not include corn ficlds pastured off, nor corn stalks grazed, which have been included under crops. See Table 13.
    ${ }_{6}{ }^{6}$ The forage supplied by pasture is, therefore, almost cqual to that supplied by all the crops (Table 12). In order that responsibility may be placed for these basic estimates, it may be noted that the rations of the various crops and crop products, as measured in tons, required (theoretically) to support an animal unit for one year, were supplied by Mr. Sheets and Mr. Semple, that the resulting tables of feeding value of the crops (Tables 6 to 21 ) were prepared by Miss Bradshaw under the joint direction of Mr. Vinall and Mr. Baker, and that the estimates of the acreage and carrying capacity of the pastures and range lands (Table 22 above) were prepared by Mr. Baker.

[^50]:    ${ }^{1}$ Table furnished by H. W. Hawthorne, Division of Farm Management, Bureau of Agricultural Economics.
    ${ }_{3}^{2}$ Dairy products constituted 39 per cent, poultry 19 and apples 12 per cent of the total farm receipts.
    ${ }^{3}$ Dairy products constituted 39 per cent, hay 14, potatoes 9 , wheat 8 , and poultry 8 per cent of total farm receipts.
    ${ }^{5}$ Dairy products constituted 26 per cent, cattle 24 , poultry 10 , and hogs 8 per cent of the total farm receipts.
    ${ }_{6}^{5}$ Dairy products constituted 24 per cent, hogs 12 , wheat 7 , and poultry 6 per cent of the total farm receipts.
    ${ }^{6}$ Dairy products constituted 49 per cent, hogs 28 , cattle 14, and poultry 4 per cent of the total farm receipts.
    ${ }_{8}^{7}$ Cattile constituted 21 per cent, poultry 19 , hogs 12 , and sheep 11 per cent of the total farm receipts.
    ${ }_{9}^{8}$ Hogs constituted 41 per cent, corn 13 , oats 12 , and cattle 10 per cent of the total farm receipts.
    ${ }^{9}$ Hogs constituted 43 per cent, cattle 18, and corn 13 per cent of the total farm receipts.
    ${ }^{10}$ Hogs constituted 43 per cent, cattle 19, and wheat 14 per cent of the total farm receipts.

[^51]:    1 Fall pasture includes aftermath of hay meadows, stubble fields, corn stalks, etc.
    $\mathbf{2}^{\mathbf{2}}$ Regular pasture includes only the farm area that is fenced and used to carry stock throughout the entire sumimer.

[^52]:    Table compiled by J. B. Bain, Market Milk Specialist. Data obtained from studies of requirements for producing milk conducted by Dairy Division, Bureau of Animal Industry.

    2 The feed units obtained from pasture were figured by using the feed-unit consumption of the same cows during the winter. According to this method, pasture furnished an average of 8.78 feed units per cow per day.

    3 The cost of pasture was based upon the interest on the value of the land, taxes, upkeep of fences and similar items.

[^53]:    18 These rental values are based on cost of production and other surveys and on reports of the Forest Service and the Commissioner of Indian Affairs. The rental value in normal years is considerably less than this amount.

[^55]:    ${ }^{1}$ This article grew out of the work of the Land Utilization Committee appeinted by the Secretary of Agriculture in 1921. The contribution of C. V. Piper, Bureau of Plant Industry, a member of this committee, has been included in the preceding article, "Our Forage Resources." S. J. McCrory, Bureau of Public Roads, a member of the committee, provided much of the basic data for the map of wet lands (fig. 8), and C. F. Marbut, Bureau of Soils, much of the basic data for the map of forest and cut-over land available for crops without drainage (fig 9) and for the map of land physically suitable for forest only (fig. 13). Suggestions concerning the economic value of wild life as a consideration in land utilization were made by W. L. McAtee, Biological Survey. L. C. Gray, Chairman of the Committee, was in general charge of the preparation of this article. Many of the estimates of land area were made by O. E. Baker, who acted as secretary to the committee. Dr. Sewell Wright, Bureau of Animal Industry, who was not, however, a member of the committee, prepared the maps in this article showing the quantity of livestock by counties, $1850-1920$ (figs. 22 to 29 ) ; C. W. Warburton, Director of Extension Work, contributed to the discussion of the means of increasing crop yields ; and W. N. Sparhawk, Forest Service, furnished valuable assistance in checking the various estimates.

[^56]:    ${ }^{2}$ In certain parts of the semiarid territory scrubby forests of mesquite and live oaks, or of piñon pine and juniper occur. This arid woodland may be of considerable value in supplying fence posts and fuel. Also along the borders of streams, species characteristic of humid regions are found.
    ${ }^{3}$ These estimates are derived as far as possible from calculations based on census statistics, on reports and maps prepared by the Soil Survey and the Forest Service and on the field notes and plats in the General Land Office. These materials were supplemented by information obtained from various sources, especially the Division of Agricultural Engineering (Drainage Investigations), of the Burcau of Public Roads, the Geological Survey, and various State surveys. More complete data have made necessary changes in certain rough estimates previously issued of the present and potential uses of land.
    ${ }^{4}$ The land area of the United States is $1,903,289.000$ acres. In the following discus sion the round number is used, and the various estimated subdivisions of the entire are are made to total $1,903,000,000$.

[^57]:    5 The various classes of land outside the boundaries of farms and not employed for crops, pasture, or forest were estimated as follows: City area was estimated by finding the density per square mile for a number of representative cities for which the area was the density per square missifying these by size, and then dividing the factor of density into the population living in incorporated places of each.class. The estimates were made by states. Area in public roads was estimated by multiplying the mileage of various classes of roads in each State by estimates of average width of these roads supplied by the Bureau of Public Roads. Since the estimates were obtained as of 1914 , about 2,$500 ; 000$ acres were added for increase in the area devcted to public roads. In reporting the area of farms to census enumerators, farmers living in the regions where the rectilinear system of survey prevails frequently give the total area originally in the tract without making deduction for the area, devoted to public roads. Thus, a 160 -acre farm from which a portion was subtracted for reads is very commonly still reported as 160 acres. On this account, the estimate of $20,000,000$ acres in public roads was arbitrarily divided equally between the area in farms and the area not in farms. The area in farms is less than the area not in farms, but it contains a much larger proportion of the roads. The area of unused desert land is a rough estimate, based on such information as could be obtained in the Department of Agriculture and from the Land Classification Board of the United States Geological Survey. The area of rocky peaks and rock outcrop is merely a rough estimate based on the ruggedness of the country. The area of coastal and interior marshes not pastured or cut for hay and not in farms is computed from soil survey maps, topographic sheets, coast survey charts, etc., and includes $7,500,000$ acres in tidal marshes ind $6,500,000$ acres in sweetwater marshes. The estimate of $1,000,000$ acres of coastal lieaches is derived from the same sources. The area of national parks is an official figure, and the area of railroad rights of way was obtained by multiplying the railroad mileage, courteously provided by the Interstate Commerce Commission, by an estimated a cerage width of the rights of way.

    The various items included in the $115,000,000$ acres of land in farms not used for crops, pasture, or forests were estimated as follows: Various local surveys have indicated that a little less than 4 acres per farm is occupied by what may be called "the farmstead "; that is, the land occupied by buildings. barn yards, feed lots, etc. On this basis and the number of farms, the area in farmsteads is estimated at about $24,000,000$ acres. The area in private lanes and roads not used for grazing or in timber was roughly estimated by assuming an eighth of a mile per farm, 2 rods wide. The acreages of crops not harvested because of crop failure and of crop land lying idle or fallow are based on partial results of a tabulation of this census inquiry now being made by the Bureau of the Census in cooperation with the Bureau of Agricultural Economics (Division of Land Economics). The estimate of marsh lands in farms is based in part on soil surveys and in part on the census. The item of idle and fallow crop land is a rough estimate based on incomplete tabulations of replies to a census question on this subject. The item om waste land is a residuum.
    ${ }_{6}^{6}$ Most of the items in this total of $134,000,000$ acres have been mentioned. They include the following in round millions of acres: Public roads, 20; cities and villages, 10 ; railroads, 4 ; naticnal parks. 6; farmsteads, 24 ; lanes in farms, 3 : sandy beaches, 1 ; rocky peaks and other rocky outcrop areas. 20 : land too arid for grazing and nonirrigable, 30 ; marsh and swamp land of no potential value for any of the three uses. 16.

[^58]:    ${ }^{7}$ It is probable that the area of cities, roads, railways, and farmstcads will not increase so rapidly as the increase of population.
    ${ }^{8}$ Includes $15,000.000$ acres of crop failure.
    ${ }^{9}$ The animal unit is a means of measuring the feed requirements of livestock. It is the equivalenti of a mature horse, cow. or steer, 5 hogs, 7 sheep or 100 poultry. For very young animals double the equivalent of an animal unit for mature stock of the same kind is allowed. On semiarid grazing land the ratio is more properly 3 to 5 mature sheep to each cow.

[^59]:    ${ }^{10}$ For method of estimating the area and carrying capacity of pasture in the United States see the preceding article, "Our Forage Resources," p. 369.
    ${ }^{11}$ See discussion of pasture land in preceding article entitled "Our Forage Resources."

[^60]:    ${ }^{13}$ These estlmates are somewhat larger than those given in the so-called Capper lieport ("'rimber Depletion, Lumber Prices, Lumber Exports and Concentration of Timber Owncrship," lepport m Senate Resolution No. 311, United States Forest Service, 1920), or the article "Timber : Mine or Crop?" in the 1921 Yearbook. In the eastern originally forested region the figures are based on tabulations, by counties, of census statistics with duc allowance for roads, railroads, cities, etc., except that where forest surveys have been made these figures were used instead. In the West the figures are based on estimates by the Forest Service of timberland in the national forests and privately owned. These estimates have been increased to allow for forest land in Indian reservations and in the public domain. Further study is being given the matter, and the figures will doubtless be modified as a consequence.

    18 The area for the various harvested crops whose acreage was reported in the census totaled only $348,000.000$ acres. but estimated additions for corn fodder, fruits, and ot?rer items bring the total up to $365,000,000$.

[^61]:    14 These various items were estimated as follows: Improved land potentially capable of being added to crop area: From the total area of improved land reported in the census of 1920 (503,000,000 acres) was subtracted the estimated areas in harvested crops (365,000,000), farmsteads $(24,000.000)$, all of which was considered improved land, and a small allowance for roads and lanes and other minor items. There was included an area of $60,000,000$ acres of improved pasture, estimated on the basis of 1909 statistics which were tabulated by the Department of Agriculture from the census schedules and published in Department Bulletin 626. and similar statistics for 1919 , now available for certain States.

    Land capable of irrigation : Estimated by R. P. Teele, Bureau of Agricultural Economics (Division of Land Economics), on the basis of various surveys made by the Reclamation Service, Bureau of Public Roads (Irrigation Investigations), and the United States Geological Survey.

    Estimates of drainable land were compiled by I. A. Jones and F. J. Marschner from data in the Bureau of Public Roads (Drainage. Investigations), reports and maps of the Soil Survey, topographical maps of the Geological Survey, and various State reports, supplemented by the results of the 1920 census. The total drainable area of $91,000,000$ acres has been reduced to $75,000,000$ acres to allow for certain areas of very deep peat and some of the coastal marsh which would not be suitable for creps.

    Humid unimproved land: This estimate is based on a classification of the land by counties, made by F. J. Marschner, Bureau of Agricultural Economics (Division of Land Economics), with the cooperation of Dr. C. F. Marbut, Bureau of Soils. This classification was made largely on the basis of available data in the United States Soil Survey, United States Geological Survey, United States Land Office, and various State surveys and other State sources of information.
    The subhumid prairie region and the semiarid and arid portions of the Great Plains and of the Rocky Mountains interior plateaus. and I acific coast regions: The estimates were made by O. E. Baker, Bureau of Agricultural Economics (Division of Land Economics), on the basis of the census statistics on the use of land in farms, in process of tabulation, and for land outside of farms, on the basis of data assembled by the Land Classification Board of the United States Geological Survey, supplemented by climatic records and data from the Soil Survey and the Forest Service.
    ${ }^{15}$ Including areas classified as bare fallow; green manure crops and fields under natural grass; "trees, shrubs, and bushes" (i. e.. orchards and small fruits). For a given year, of course, fields under natural grass are more properly considered pasture, but they comprise land that comes into crops during the course of the rotation.

[^62]:    Figs. 18 and 19.-While the area of land in farms generally decreased throughout the region east of the Great Plains (figs. 16 and 17), there was a widespread increase in the area of harvested crops in this section as well as in the Great Plains and various parts of the West. Patriotic motives, together with the inducements represented by high prices for farm products during the war and for some time thereafter, were mainly responsible for this increase, which consisted largely in the employment for crops of land formerly used for pasture. The large increase in the acreage of crops in the Great Plains corresponds with an increase in land in farms already noted. The principal regions where a decrease in crop acreage occurred were New England, the Black Prairie of Alabama, and northeastern Mississippi, a district along the Mississippi River in the southwestern Mississippi and northeasterm Louisiana, and a part of northern Oklahoma. In all of the southern districts mentioned, with the exception of Oklahoma, the ravages of the boll weevil are largely accountable for the reduction in the acreage of harvested crops.

[^63]:    ${ }^{17}$ Since the various crops involve products of such widely different value in proportion to weight as hay and cotton or tobacco, it was necessary te reduce them to some common denominator which would reflect their relative value over a long period. For this purpose the 43 -year average price of each crop ( 1879 to 1922) was used as a weight in obtaining the index of average yield per acre of the principal crops.

    18 In 1880 a considerable part of the range land in the West, especially in the Dakotas and Montana, was not in use for pasture; but by 1890 nearly all of the land in the West, outside the absolute deserts, was employed for grazing, as is shown by the local distribution of livestock in the census of 1890 (fig. 26). Consequently, since 1890 it is fair to assume that all grassland brought into the classes of improved land or unimproved land other than woodland was still used for pasture, except in so far as it was devoted to increasing the crop area.
    ${ }_{19}$ Some of this forest land was used for pasture before clearing, but its value for pasture was very low in comparison with its value after clearing.

[^64]:    ${ }^{20}$ This result was obtained by tabulating the acreage of improved and of unimproved land other than woodland separately for the counties originally forested and for those originally cervered mostly with grass or desert vegetation. The increase in crop land harvested in each decade, less the increase in improved and unimproved land in forested counties, is assumed to indicate roughly the net loss in pasture area for the decade. To whatever extent these forest areas were formerly pastured before clearing, to that extent the loss in pasture acreage was greater than the figures indicate. However, the carrying capacity of woodland is so small that to allow for it on an acreage basis would be misleading.

[^65]:    ${ }^{21}$ Compare also article " Farm Ownership and Tenancy," p. 541.

[^66]:    ${ }^{22}$ In this last decade the relationship was abnormal, because the prices of commodities had been moving upward with great rapidity while the valuation of land, being apparently slower to respond to the influence of inflation, had tended to lag behind. Consequently the decrease shown from 1910 to 1920 may be only a nominal decrease due to the taking of the statistical picture at a time when the valuation of land had not yet caught up with the upward movement of commodity prices.

[^67]:    ${ }^{23}$ Calculated on the basis of direct exports.
    24 In the latter half of 1923 there was a marked decrease in exports of cereals and cereal products. If this lower level is maintained during the remainder of the fiscal year, the acreage required to produce these cereal exports will be only about half the annual average 1919-22.

[^68]:    ${ }^{25}$ Besides the cereal crops, the acreage of tobacco was considerably larger in the postwar period than in the pre-war period, but this is more than offiset by a decrease in the acreage of cotton.

[^69]:    ${ }^{28}$ As shown above, these changes are largely the outcome of the reduction in the number of sheep and beef cattle per 1,000 people, and also in the number of horses per 1,000 people due to the substitution of other forms of motive power.
    ${ }_{27}$ The acreage harvested in 1920 was $14,500,000$ acres less than in 1919 , nearly $5,000,000$ in 1920 not being harvested because of crop failure. In 1923 over $6,000,000$ acres were not harvested. The acreage harvested was about $17,000,000$ acres less than in 1919 and $3,000,000$ less than in 1920 , but $11,000,000$ acres more than the pre-war acreage, 1909-13.
    ${ }_{28}$ Yearbook of the International Institute of Agriculture, 1921, p. 65 . Since 1921 there has been an increase in world production due largely to the expansion of wheat production in Europe outside of Russia.

    ${ }_{30}$ Tylor, W. Russell. The Natural. Increase of Eontemporary Peoples. An unpublished doctoral dissertation prepared at the University of Wisconsin.

[^71]:    ${ }^{1}$ The 12 crops are corn, wheat, oats, rye, barley, rice, flax, hay, potatoes, cotton, tobacco, and buckwheat. ${ }^{2}$ The term "net exports" is employed not in the sense of total excess of all agricultural exports over agricultural imports, but merely to indicate that in the case of the principal export crops included in the table reductions were made for the comparatively minor imports of the same crops.
    ${ }^{3}$ This includes the area used in feeding livestock for export.

[^72]:    ${ }^{31}$ See preceding article, " Our Forage Resources," p. 311.
    ${ }^{22}$ Based on estimates made from results of a survey by United States Department of Agriculture in 1918, showing farm consumption of feed crops by each class of livestock. See Yearbook for 1920, p. 811.

[^73]:    ${ }^{33}$ The large importation of mutton in 1920 was due to an extraordinary combination of conditions. The English market at that time was glutted with an oversupply of mutton, and favorable ocean freight rates on ships outbound and high prices in the United States were the primary causes of the movement.

[^74]:    ${ }^{34}$ This, of course, assumes that we could increase our imports of agricultural products in the same proportion.

[^75]:    ${ }^{35}$ For more detailed discussion see article, "Timber: Mine or Crop," Yearbook, 1922.
    ${ }^{36}$ Some students of the subject have even believed the effect of immigration is merely to displace an equivalent number of native population, so that at the end of a given period the native population is smaller than it otherwise would have been by approximately the volume of immigration during the period.
    ${ }^{37}$ Rossiter, W. S., "Increase of Population in the United States, 1910-1920." Census monograph No. 1, 1922, p. 204.

[^76]:    ${ }^{38}$ The productivity per acre of each country is weighted by the average annual acreage for the particular crop during the five years 1909-13. inclusive.
    ${ }^{39}$ It may be doubted if we could hope to attain so high an average product per acre as obtains in Great Britain, Germany, and Belgium, for a large part of our small-grain crops is produced under semiarid conditions. Some of the European countries, notably Great Britain, Belgium, and Germany, import large quantities of concentrates, which are fed to livestock, and the manure applied to field crops. Morecver, it is wise to allow for the inertia which may retard the general adoption of the most approved agricultural methods in so large a country as our own.
    ${ }^{40}$ The statistics comprise separate figures for production of clovers, sainfoin, etc., on the one hand, and for hay cut from permanent meadows on the other hand. However, the averages per acre for the two classes are not greatly different, and may be safely combined as a basis of comparison with our own statistics.

[^77]:    ${ }^{41}$ This involves the assumption, of course, that the remaining 10 per cent or more of crop acreage may be made to show an average per cent of increase in yield equal to that estimated for the 10 crops considered.
    ${ }^{42}$ The method of estimate was as follows: The acreage now required for domestic consumption was divided into two parts: (1) The acreage used to maintain horses and (2) the acreage employed for other domestic uses. The ratio of the one quantity to the other was determined. The area required for uses other than the maintenance of horses was increased by the ratio of $150,000,000$ to the population in 1920 , and the resulting quantity was then divided by the ratio of crop acreage required at present for uses other than for the maintenance of horses to the area required for horses. This quotient was then divided by 1.468 , in order to allow for increase of yield, and the area required for other crop uses was also divided by 1.468 . The two quotients were added to give the estimated crop acreage.

[^78]:    ${ }^{1}$ International Yearbook of Agricultural Statistics, Rome, 1921.
    ${ }_{2}$ The number of animal units is calculated by the usual method. The livestock statistics from which the animal units are calculated are averages for the three years 1911-13, inclusive, for all the European countries with the following exceptions: All German figures are an average for 1912 and 1913, except that for asses and mules statistics for 1912 only are available; all statistics for the Netherlands are averages for 1910 and 1913; for Denmark the statistics for horses, cattle, sheep, and goats are for 1909, and the statistics of hogs are an average of 1909 and 1914. For Belgium the statistics of sheep and goats are for 1910.
    ${ }^{3}$ No statistics available or number insignificant.
    ${ }^{4}$ Includes marsh, heath, and uncultivated productive land.
    ${ }^{5}$ Included under natural meadows and pastures.

[^79]:    ${ }^{43}$ See Bulletin 588, United States Department of Agriculture, by J. T. Jardine and L. C. Hurtt-"Increased Cattle Production in Southwestern Ranges."
    ${ }^{44}$ Computed from unpublished reports in Forest Service. ${ }^{45}$ United States Department of Agriculture Bulletin 367, by E. O. Wooton-" Carrying Capacity of Grazing Ranges in Southern Arizona."

[^80]:    ${ }^{46}$ The above estimate was made as follows: The number of animal units other than work stock required for a population of $150,000,000$ people was calculated. The number of horse animal units was estimated as follows: The fraction of a horse animal unit per acre of crop land at present was determined. This requirement was increased by 40 per cent (see $p .478$ ) and the resulting horse requirement per acre was multiplied by the crop acreage required for $150,000,000$ people under the assumption of an incrase of 46.8 per cent in productivity, as previously estimated. The required number of horse units was then added to the number of other animal units. The estimated number of animal units carried on semiarid pasture, increased by 50 per cent, was added to the estimated number maintained on woodland pasture. The sum was subtracted from the required number of animal units. The percentage of the remainder to the number now maintained on humid pasture other than woodland was then ascertained, and the present acreage of humid pasture other than woodland was multiplied by this percentage.

[^81]:    ${ }^{47}$ This is on the basis of the United States census for 1920 , which was taken as of January 1, and which shewed fewer persons engaged in agriculture by about $1,500,000$ than were reported in the 1910 census, which was taken as of April 15 . It is believed that the difference in date of enumeration is partly responsible for the smaller number shown for 1920.
    ${ }^{48}$ It should be recognized that the statistical comparison is a very rough one and should be regarded only as suggestive rather than an exact measure of the differences involved. In the first place, occupational statistics are very inaccurate because the time of year in taking the census makes a considerable difference. Moreover, the proportions of casual labor and of woman and child labor vary considerably in the different countries. Again, the production figures are for only seven principal crops. America produces at least two important crops not grown in the four European countries; and some of these countries in turn lay a greater emphasis on small fruits and vineyard, truck, and other intensive products than is the case in the United States. In some of the European countries a good deal of the time of the agricultural population is employed in by-industries, such as domestic manufactures, or in making things for themselves or performing services for which American farmers have to pay. Finally, it must be recognized that no account has been taken of the relative amounts of labor employed in producing and caring for livestock.

[^82]:    ${ }^{16}$ Even as compared with English requirements the assumption of an increase of 40 per cent in number of horses and mules appears a conservative one and makes considerable allowance for the substitution of tractors and other forms of mechanical power. It is difficult to allow for this factor. Some would make greater allowance for the future displacement of horses by these means. Apparently, thus far, there has been some progress in this regard. During the past decade the number of horses and mules per thousand acres of cultivated land decreased from 75 to 69 . On the other hand, such studies as have been made indicate that the tractor does not displace more than 15 to 20 per cent of the horses on the average farm outside of the wheat regions. Moreover, there are probably large areas of the country where topographic conditions do not favor the introduction of tractors.

[^83]:    ${ }^{1}$ The figures for beef and veal, mutton and lamb, and pork do not correspond exactly to the statistics gathered by the Bureau of Crop Estimates in an attempt to obtain from crop correspondents the consumption of these products by sections. See Yearbook 1920, p. 828.
    ${ }_{2}$ Game is not included in the United States figure.

[^84]:    50 The data for United Kingdom are derived from the report of "A Committce of the Royal Society at the Request of the President of the Board of Trade," London, H. M. Stationery Office, 1917, and comprise the average annual consumption for the years 1909-13. The American figures comprise the average annual consumption for the years 1918-23.

[^85]:    ${ }^{51}$ The estimate was made as follows: The acreage required for each class of livestock other than horses for a population of $150,000,000$ was calculated, and this was multiplied by the percentage the British per-capita consumption for this class of livestock is of the American per-capita consumption. The sum of the average requirements for the various classes of livestock was then added to the acreage required for other domestic uses under a population of $150,000,000$. This total was divided by a factor representing the ratio of acreage required for domestic consumption exclusive of the maintenance of horses to the acreage required for horses. The quotient added to the other acreage previously estimated gives the requirement under the British standard. The American consumption of poultry is relatively very much higher as compared with that of the United Kingdom than it is for eggs. This is partly due to the fact that the United Kingdom imports a large part of its supply of eggs, while the greater part of the American supply is produced at home, with the consequence that the surplus poultry incidental to egg production is consumed at home. It was therefore considered best to take the relative consumption of eggs rather than the relative consumption of poultry as a basis of obtaining the economy in acreage. To determine the proportionate consumption of all dairy products the percapita consumption of butter and of cheese was reduced to whole milk.
    ${ }_{52}$ The estimate was made as follows: The number of animal units for each class of livestock required for $150,000,000$ people under the American standard of consumption was calculated. This was multiplied by the percentage the British standard of consumption fer that particular class of livestock is of the American. The necessary number of horse units was determined by multiplying the horse units that would be required under the American standard of consumption by the ratio of crop acreage required for horses under the British standard to the crop acreage required for the maintenance of horses under the American standard previously estimated. From the total number of animal units that wculd be required under the British standard thus determined was subtracted the number of animal units now maintained by semiarid pasture and woodland. The ratios of the remainder to the number of animay units now maintained by humid grassland pasture was determined and this ratio multiplied by the acreage of humid grassland pasture now employed for domestic consumption, thus giving the area required under the British standard.

[^86]:    ${ }_{53}$ " Report on Food Conditions in Germany," by Ernest H. Starling, with Memoranda on Agricultural Conditions in Germany, by A. P. McDougall, and on Agricultural Statistics, by G. W. Guillebaud (London, H. M. Stationery Office, 1919). The statistics on food consumption used herein are based on official statistics.
    ${ }^{54}$ By "average man" is meant a figure in which the women and children, for whom the food requirement is less than for men, are converted into equivalent man units. For the German Empire this was done by multiplying the total pepulation by 80 per cent. After the war, however, as a result of the loss of man power, it was found that the equivalent was 84 per cent (in 1919).
    ${ }^{56}$ The undoubted undernourishment which resulted from the war is attributed in the above-mentioned report largely to the disorganization in production and distribution.

[^87]:    ${ }^{1}$ Derived with minor modifications and adjustments for purposes of comparison from "Report on Food Conditions in Germany" by Ernest H. Starling and others.
    ${ }^{2}$ Animal products consumed in the United States-Beef and veal, pork and pork products, including lard, mutton and lamb are based on average consumption, 1918 to 1922, inclusive; statistics furnished by John Roberts, United States Department of Agriculture. Statistics on average consumption of dairy products in the United States, 1918 to 1922, inclusive, furnished by T. R. Pirtle, United States Department of Agriculture.
    ${ }^{8}$ From" The Nation's Food," by Raymond Pearl. Average consumption, 1911-18, inclusive, calculated from tables in Chapter XI.

[^88]:    ${ }^{56}$ In making this estimate allowances were made for seed requirements and for the proportion of the area of the several crops employed in feeding livestock. The economy in sugar consumption is applied only to the acreage of cane and sugar beets in this country, not to the acreage required for the proportion of those crops imported. In calculating the respective acreage requirements for rye the percentage in Table 7 was not employed, because of the tendency to exaggerate unduly possible errors in the small estimate of rye employed for human consumption in the United States. Consequently, it was found best to calculate the rye requirement direct from the statistics of German production and consumption.

[^89]:    ${ }^{57}$ On the basis of the population in 1920.

[^90]:    Fig. 54.-Of the total timber annually removed from the forests of the United States a little over 4 per cent is destroyed by fire and a little over 5 per cent by insects and disease. Lumber, dimension material, and sawed ties comprise about one-third of the total, ${ }^{\text {b }}$ but the timber of saw-timber size removed for various purposes amounts to more than half of the timber annually removed. About two-fifths of the total is employed for fuel. Pulp wood, though economically of great importance, represents only a little over 2 per cent of the timber annually removed. As indicated in Figure 55, nearly half of the total timber removed represents waste, but only a small part of this waste could be prevented without considerable increase in cost of utilization.

[^91]:    58 With either a corresponding economy in wool or increased importation.
    ${ }^{59}$ See p. 463.

[^92]:    ${ }^{60}$ The requirement for crops was estimated as follows: The changes in crop acreage used in producing food for direct consumption were estimated by assuming that the per capita consumption of certain items for $150,000,000$ people will be the following percentages of present consumption: 103 per cent for cereals, 110 per cent for potatoes, 90 per cent for sugar, 95 per cent for hogs, 80 per cent for beef cattle, and 80 per cent for poultry, the other classes of food remaining unchanged. The requirement for work stock was estimated as follows: The areas at present used in producing food crops for domestic consumption, employed in producing crops used in feeding livestock, and for producing

[^93]:    crops for export were added. The sum was subtracted from the total acreage in harvested crops (1919), leaving the area employed at present in producing nonfood crops for domestic consumption. This figure was increased by the ratio of $150,000,000$ to the population of 1920, and the resulting figure added to the estimated acreages required for food crops, and for livestock other than work stock, the sum of the three items being the estimated acreage of crops required for $150,000,000$ people under the assumed changes in consumption, not including the area used to produce feed for work stock. The ratio of this figure to the corresponding figure for the population of 1920 was determined, the result being the ratio of work stock required for $\mathbf{1 5 0 , 0 0 0}, 000$ people under the assumed changes, as compared with the number now required. The acreage required at present for work stock employed in producing for domestic consumption was multiplied by this ratio, and the result added to the acreage required for domestic purposes other than feeding work stock, as previously estimated. The sum was divided by 1.1 in order to allow for the assumed increase of 10 per cent in the average yield per acre of crop land.

    The requirement of humid pasture was estimated as follows: The numbers of animal units of the different classes of livestock other than work stock to supply $150,000,000$ people, under the assumed changes in consumption, were calculated by employing the same factors as in the case of crop acreage above. The percentage increase of work stock was calculated on the basis of the ratio of crop acreage required under the assumed changes in consumption and production, as previously estimated, to the acreage of crops in 1919. The number of animal units on semiarid pasture in 1920 was multiplied by 1.2 to allow for an increase of 20 per cent in carrying capacity. The sum added to the number of animal units on woodland pasture was subtracted from the total number of animal units required, the remainder being the number to be maintained by humid pasture. The ratio of this to the number of animal units now on humid pasture was determined and the acreage of humid pasture now employed for domestic consumption was multiplied by this ratio.
    ${ }^{{ }^{1}} \mathbf{F}$ For statistical reasons the estimates have been made on the basis of harvested crops. Allowance would also have to be made for the small additional acreage for crop failure, estimated at about $15,000,000$ acres in 1919. However, it is probable that the proportionate requirements for this purpose would not greatly change. In a given year there is also a certain acreage of crop land in rotation devoted to pasture.
    ${ }_{62}$ If we should fail to economize as much as the very moderate modifications in consumption and production assumed as the basis of these estimates imply, the requisite increases of crop and pasture land would fall somewhere between the above estimates and the increase of $96,000,000$ acres of crop land and $116,000,000$ acres of humid pasture that would be necessary if no economies in consumption and production are effected (p. 462), allowing in each case half the acreage at present employed for exports.

[^94]:    ${ }^{63}$ On account of new materials made available, these estimates are somewhat different from those given in testimony by L. C. Gray before the Senate Committee on Reforestation (S. Res. 398) and also quoted-in the article "Timber: Mine or Crop," Yearbook. 1922. While the estimated areas are not identical, the essential conclusions are the same.

[^95]:    ${ }^{64}$ The method of calculation was as follows: The per capita area of humid pasture other than woodland that would be required under the German standard of consumption, if no semiarid or woodland pasture was available, was calculated on the basis of relative carrying capacities of the several classes of pasture. This per capita figure was divided by 2.22 to allow for a potential increase of 122 per cent in carrying capacity. The per capita crop area under the German standard of consumption divided by 1.468 to allow for a potential increase of 46.8 per cent in average yield was added to the per capita requirement of humid pasture, and this sum was divided into $1,004,000,000$ acres, indicating a provisional population of $330,000,000$ people without allowing for use of semiarid and woodland pasture. This allowance was made as follows: The number of livestock that would be carried on the area of semiarid land capable of being used only for pasture was estimated on the basis of present carrying capacity. This was increased by 50 per cent to allow for potential increase in carrying capacity, and the resulting number added to the number of animal units carried on woodland pasture. The total was then divided by the number of animal units per capita required under the German standard of consumption. This gave the number of people that could be provided for by the available semiarid and woodland pasture. This number divided by the per capita requirement of humid pasture under the assumed economies in consumption and production. as previously calculated, indicated the area of humid pasture to which the semiarid and woodland pasture would be equivalent. This equivalent was added to the $1,004,000.000$ acres and the sum divided by the total per capita requirement of crop land and humid pasture.
    ${ }^{65}$ On the basis of calories for human consumption, including animal products used in the diet, it is estimated that Germany was about 85 per cent self-sufficient.

[^96]:    ${ }^{66}$ Including an allowance for the larger area required for our maximum population.

[^97]:    ${ }^{67}$ By a study of the relation of cultivated acreage to population in Germany, France, and Belgium, Prof. E. M. East has concluded: "The maximum population the United States can support under any conditions conceivable to those of us who live at the present day, therefore, is $331,000,000$." "The Agricultural Limits of Our Population" in The Scientific Monthly, XII, No. 6, p. 555. By an entirely different method of calcula-tion-that is, by the projection of a population curve-Profs. Raymond Pearl and L. J. Reed have reached the conclusion that our maximum population will be $197,000,000$. "On the Rate of Growth of the Population of the United States since 1790 and its Mathematical Representation", in Proceedings of the National Academy of Science, VI, pp. 275-286. If the population should become stationary at the figure suggested by Professor Pearl it would be due to economic and social motives working to limit population, rather than to the physical incapacity of our land resources to maintain a larger number.

[^98]:    ${ }^{69}$ An estimate by R. P. Teele, associate economist, Bureau of Agricultural Economics (Division of Land Economics).

[^99]:    ${ }^{1}$ Tenure in this country, though commonly referred to as allodial, is, in all cases, held subject to the paramount authority of the State. The classes referred to as tenure classes in this study are somewhat more inclusive than when defined legally. One class, managers, is included here, although as such they can scarcely be said to have tenure with reference to land.

[^100]:    ${ }^{2}$ No attempt was made by the Census Bureau to separate croppers from tenants before 1920. In that census they were defined and enumerated as tenants to whom the work stock was furnished by the landlord. The tabulations were made only for the South and showed 561,091 croppers in that section. Some farmers corresponding to the above description are to be found in other parts of the country, although relatively few in number.

[^101]:    ${ }^{8}$ In the census of 1920 , the land owned by part owners was not enumerated separately from that rented. This was done in 1900 . In 1910 the figures were not published, but they have been available for the present study. Estimates have been made for 1920 by assuming that the proportion of the two classes of land are the same as they were found to be in 1910.

[^102]:    "The terms " landlords" and " landlordism" are not used in an invidious sense. Landlordism is employed merely as a convenient expression to designate the system of letting land to those who will use it. The term landlords is used to indicate individuals or corporations who let land to others, whether on a large or a small scale.
    corporations believed that this promiscuous and unregulated use should be replaced by a system of regulated grazing. (See pp. 404, 405, and 505.)

[^103]:    - The grant does not involve the exclusive or assured use of a specific area but only the ight to graze a certain number of stock under carefully drawn regulations and for a certain charge per head. This right is revocable.

[^104]:    7 The census shows that 75.2 per cent of all tenant farms were owned by landlords definitely reported to reside in the county where the farms were located. However, 4.:) per cent were owned by landlords of unreported residence. By prorating this 4.5 per cent, the total percentage is changed to 76.8 .

[^105]:    ${ }^{8}$ It should also be noted that in this region no small part of the number of tenant farmers is accounted for by the renting of State lands and Indian lands.

[^106]:    ${ }^{10}$ For the purpose of measuring the relationship between income from farm real estate and its valuation cash rent proves more serviceable than share rent, because the former represents more nearly payment for the use of the farm real estate as distinguished from some of the other elements which enter into share rent, such as payment for a larger amount of risk assumed by the landlord, for supervision contributed by him, and frequently a participation in some of the expenses of production. It is true, cash rent is not exactly identical with the net income received from the real estate by the landlord, for taxes are yet to be deducted and certain minor expenses, including repairs and depreciation oi buildings. However, it is the best statistical measure available.

[^107]:    ${ }^{11}$ Gray, L. C. "Accumulation of Wealth by Farmers," Proceedings of American Eco. nomic Association, March. 1923. The estimate, though made with care, is considered a rough one because of numerous gaps in available statistics.

[^108]:    ${ }^{1}$ Based on census statistics.

[^109]:    ${ }^{12}$ Local surveys have shown that the percentage of returns on operating capital of tenants is frequently several times as great as the percentage of rent to the valuations of real estate. However, this is due in part to the fact that the income includes wages of management and return for risk and enterprise, the whele being calculated as a percentage on a much smaller base than in the case of owner farmers.

[^110]:    ${ }^{13}$ Census officials have expressed the opinion that a considerable number of farmers failed to report previous farm experience as laborers or as tenants, and this failure tends to exaggerate unduly the proportion who became ewners without previous farming experience. The results of a number of local surveys appear to confirm this conclusion.

[^111]:    ${ }^{24}$ This difficulty also applies to the otherwise interesting calculations in the Census anomograph entitled "Farm Tenancy in the United States," 1924.

[^112]:    ${ }^{15}$ These surveys are as follows: One each in Illinois and Indiana by the Interchurch World Movement; a survey in Iowa, in Missouri. and in Georgia, by the Bureau of Agricultural Economics, Division of Farm Population; surveys in Texas, Nebraska (nine localities), Kentucky, and in Tennessee (two localities) by the Bureau of Agricultural Economics, Division of Land Economics. State universities cooperated in the Nebraska, Kentucky, and Tennessee surveys.

[^113]:    ${ }^{16}$ The importance of these aids to farm ownership would, of course, be different during a time when land valuations were not rapidly rising.
    ${ }^{17}$ See article by George Stewart, "Can Farms Pay for Themselves?" Journal of Farm Economics, Vol. III, No. 3.
    ${ }^{18}$ In so far as the difference in years makes a difference in the valuation of the farms, there is a tendency toward corresponding changes in income.

[^114]:    ${ }^{2}$ These farms yield less than $\$ 600$ annual income,

[^115]:    ${ }^{18}$ It should be noted that most of the surveys do not reffect the decrease in the value of the dollar which resulted from the World War. Probably, the $\$ 600$ represented a larger amount of purchasing power at the time the surveys were taken than it would represent, at present.

[^116]:    ${ }^{i}$ Surveys in 3 areas (Georgia, Iowa, and Missnuri) by Bureau of Agricultural Economics, Division of Farm Population; and in 11 areas (California, Illinois, Indiana, Maryland, Missouri, Nebraska, New Jersey, New York, Oklahoma, Pennsylvania, and Wisconsin) by Inter-Church World Movement.

[^117]:    ${ }^{1}$ Sources as follows: Southwestern Ohio, A Rural Survey in Southwerstern Ohio, Department of Church and Country Life, Board of Home Missions of the Presbyterian Church, 1913 ; North Carolina, Economic and Social Conditions of North Carolina Farmers, State Board of Agriculture in cooperation with United States Department of Agriculture, 1923; Nebraska, University of Nebraska Agricultural Experiment Station in cooperation with Bureau of Agricultural Economics, Divisions I and Economics and Farm Population, data unpublished in this form; Kentucky, Tennessee, and Texas, same sources as in Table 7, footnote 1, data unpublished; Virginia, Bureau of Agricultural Economics, Division Land Economics, data unpublished.
    ${ }^{2}$ Including religious magazines.
    ${ }^{3}$ Reported as "news" hence probably not all dailies, probably includes local weeklies.
    4 Women's magazines. 5 Standard magazines. ${ }^{6}$ Cheap advertising. 7 Children's papers
    ${ }^{8}$ For the Texas and Virginia survey, the total number of operators reporting on other periodicals than dailies varied with each, hence percentages here given are not on basis of those reporting for dailies.

[^118]:    ${ }^{1}$ The New York figures are from United States Department of Agriculture Bulletin 1214, Family Living in Farm Homes, in cooperation with the Cornell Agricultural Experiment Station. The figures for Texas, Tennessee, and Kentucky are from the same sources as those in Table 7, footnote 1.

[^119]:    ${ }^{20}$ For 971 owner farmers and 1,065 tenants. For sources of statistics for first three States, see rable 7, footnote 1. The Nebraska data are from sources cited in Table 9 , footnote 1 .

[^120]:    ${ }^{21}$ Although 37.1 per cent were reported in the group of "cash and unspecified " in 1900, the unspecified were such a proportion of the whole ( 4.8 per cent in 1910) that it is unsafe to say that more than a third of the tenants were on a cash basis in 1900.

[^121]:    ${ }^{22}$ In a number of Southern. States they are legally classified as laborers rather than as tenants and, therefore, are adjudged to have no rights of ownership in the implements and work stock advanced for their use, nor in the crop itself until after division by the plantation operator.

[^122]:    ${ }^{23}$ In 1910 the census did not enumerate as farm occupants persons operating farms but not living on them. In 1920 this group, estimated at about 4 per cent of the total number of farm operators, was included. The census of 1910 was taken as of April 15, while the census of 1920 was taken as of January 1, a time when a large proportion of tenants are shifting or just have shifted. The effect was to decrease the proportion of operators in 1920 classed in the group on farms less than one year and to increase the group who had been on their farms for longer periods.
    ${ }_{24}$ In the following references to differences between classes of operators and sections of the country, only the statistics of past occupancy are used.
    ${ }^{25}$ In the case of owners free of mortgage debt it is probable that the relatively shorter period of occupancy for colored farmers is due in part to the large percentage of negro owner farmers who had recently succeeded in achieving farm ownership shortly before the census of 1910 .

[^123]:    ${ }^{27}$ Local tenure surveys in Kentucky, Tennessee, and Texas, referred to previously.

[^124]:    ${ }^{28}$ The following number of county landlord-tenant conferences were held in the period, 1921-1923: Illinois, 4; Iowa, 26 ; North Dakota, 1; Ohio, 1; and South Dakota, 4.
