## P R E F A C E

This volume is intended to place in succession before the reader general and specific delineations of the natural and political features of the globe. An attempt has been faithfully made to present it as a GALLERY OF GEOGRAPHY, in which exactness in the details has been sought with care, and a popular mode of treatment, has been adopted. Though the writer is fully conscious of having fallen short of his own ideal, he yet ventures to hope that some fair estimation has been made to it; and that in the department of geographical knowledge an acceptable offering is here contributed to the middle and high-class education, while, at the same time, a convenient volume is afforded to those who have the ordeal of *competitive examinations* in that respect.

In such a work there can obviously be no room for originality of discovery. Nature and public policy have indicated the course to be pursued by dividing countries and states from each other, either by the ocean, the river, the mountain-ridge, or the artificial landmark. But attention has been paid to the grouping together, for descriptive purposes, of those countries which are physically related, instead of adopting an alphabetical arrangement or a promiscuous selection, while the due appropriation of space to them has been observed in accordance with their political influence, commercial importance, or natural interest. In this introductory part, the progress of Geographical Discovery has been traced, from the limited travel and timid navigation of the ancients, to the bold enterprises of the moderns, by land and sea, in the Arctic regions and in burning zones, which have resulted in solving the mystery of the North-West Passage, disclosing Antarctic shores, penetrating the mystery from Central Africa, reaching the long-sought source of the Nile, and crossing the interior wilds of the vast continent of Asia.

In the general descriptions of the surface in various regions—mountains, valleys, plains, lakes, and rivers—special notices are given of what is prominently important or rare, grand or sublime in their scenery. Climate is not only considered in its general bearing upon interesting phenomena, but in its bearing upon the

character and habits of nations, as tending to foster either indolence, or to promote hardihood and industry, and to spontaneously places the fruits of the earth within reach, and exacts labour for their production. Vegetable forms are especially when of value as objects of commerce, or related to their peculiar properties or floral beauty. Populations are referred to their place in the family of nations and to the successive stages by which the principal states have advanced through the great epochs in their history, and the principal industries by which they are distinguished are indicated, whether commercial, manufacturing, mining, agricultural, or pastoral. Graphical details are given upon a somewhat extended scale, and discrimination has been studied in the selection of cities and towns which have claims upon public attention for ampler notice, while the manners and customs of urban and of rural life are noted where they bear any speciality, or features of interest. In the countries of antiquity as well as those of later times, the localities famous for deeds of patriotism or valour, or for events which have influenced the destinies of empires, are characterised, as well as the natural and social changes which have subsequently transpired. Prominence is given to the British Isles and to the British Dependencies in every part of the globe.

With respect to the Illustrations, the Publishers beg to state in proof of their general correctness, that they are from Photographs where these could be obtained; in other cases, from Original Sketches and in some few instances, from published authorities, British and foreign; generally with the consent of the parties to whom they belong. To the Earl of Caithness, Lord Dufferin, Dr Holden, Mr Wilson, and other amateur and professional photographers, they owe the best acknowledgments. They also take this opportunity of acknowledging the services of Messrs Skelton, Simpson, Andrew Melville, from whose portfolios they have obtained many Indian, American, and Australian sketches. Nor must they forget to notice the late Mr Sargent's large collection of original sketches of England, Spain, Portugal, and France, to which they had access, as well as Mr Bartholomew's carefully-prepared and beautifully coloured maps.

*November 1864.*

LIST OF  
ILLUSTRATIONS

| Illustrations.   | Artists.          | Authorities.                       | Page |

## ERRATA.

- Page 115, 23d line from top, for 'First descried,' read 'Descried for the second time.'  
 184, beneath engraving, for 'Hastings Hill,' read 'Athelstane Hill.'  
 201, 3d line from bottom, for 'Addiscombe,' read 'Addington.'  
 201, last line but one, for 'Richmond higher up,' read 'Richmond lower down.'  
 237, for 'Perth from below St John's Bridge,' beneath engraving, read 'Perth from above the Bridge.'  
 250, 5th line from top, for 'south bank,' read 'north bank.'  
 251, 22d line from bottom, for 'at one extremity of which the Gaelic language is spoken,' read 'at one extremity of which, until recently, the Gaelic language was spoken.'  
 255, Mr Cleghorn's theory is said not to be borne out by facts.  
 255, 11th line from bottom, it appears that no herrings have been sent to Italy or the West Indies for many years.  
 255, 12th line from bottom, for '600 miles,' read '1600 to 1800 miles,' and omit the concluding clause of the sentence.  
 417, 11th line from bottom, for 'Duke of Burgundy,' read 'Duke of Austria.'  
 532, description of cut, for 'Banana Tree,' read 'Banyan Tree.'

MODES of TRAVEL and NAVIGATION  
of the ANCIENTS

CHAPTER I.

MODES OF TRAVEL AND NAVIGATION OF THE ANCIENTS.

THE diffusion of the human race, with extended knowledge of the surface of the earth as its consequence, was promoted in the earliest ages of the world by a variety of causes. Among the most influential may be noted, the necessity of providing means of subsistence for an increase of population, and the growing demand for luxuries grafted upon an acquaintance with them; the feuds resulting in open violence, which compel the vanquished to fly before the victor, or the dissensions which simply render it desirable for a weaker party to retire to a safe distance from the stronger; together with the desire for independence, the love of adventure, and the feeling of curiosity, an instinct of great power in almost every breast. Motives of this kind contributed in the infancy of society to induce migration on the part of its members, temporary or permanent, and thus added to the stock of information respecting the extent of the terrestrial superficies, and its features of mountain and valley, plain and forest, river, lake, and sea. But thousands of years passed away; great empires rose, flourished, and fell; splendid cities were founded and made desolate; civilisation followed states of barbarism, declined, and

repeatedly shifted its locality, while only a comparatively inconsiderable area of the globe was known to its most enlightened inhabitants.

The most ancient geographical records extant are contained in the Pentateuch of Moses. It is difficult and often impossible to identify many of the localities and communities named by the writer; but they were certainly included in the countries bordering the eastern side of the Mediterranean, and extending from thence to the Persian Gulf and Caspian Sea. Still, it is clear, from the mention made of various products with which the Jewish legislator was familiar, that intercourse subsisted in his age between the banks of the Nile and the shores of Arabia and India, though maintained by no direct chain of communication. Morning and evening, incense was burned upon the altars of Jehovah from the time when Israel encamped in the wilderness,\* to the final desolation of Jerusalem. Three times a day in Egypt—as the solar glory appeared in the east, reached the zenith, and declined to the western horizon—the priests greeted the sun-god with offerings of perfume. At a later date, the disciples of Zoroaster in Persia honoured the luminary in a similar manner; and in all the temples of Greek and Roman idolatry

‘Treasured odours breathed a costly scent,’

as gifts peculiarly acceptable to the imaginary beings which the sculptured marbles coldly personified.

The gum burned upon the incense altars—frankincense—is a native production of Southern Arabia, as well as of India, where the tree yielding it grows much more luxuriantly. But the specification of cinnamon and cassia as in use is more significant. These spices were ingredients of the holy anointing oil of the tabernacle, which was employed in the act of consecration to the priesthood, at its institution in the wilderness. Both of the shrubs producing them are peculiar to Ceylon and the adjacent coasts of India. Hence it follows, that at the era of the Exodus intercourse had been opened between those regions and the Nile countries; and it can scarcely be doubted by whose agency it was carried on. The Hindus themselves are not, and have never been, a seafaring people. Enterprising individuals indeed among them may have conducted short coasting voyages, but the great body of the nation have ever recoiled from hazardous adventure, content to gaze passively upon the barrier of the ocean, without a wish to cross it. On the contrary, the Arabs of the coast, a people altogether different in their habits from those of the desert, have been from time immemorial active commercialists and mariners, in possession of ships and ports. To them the countries on the shores of the Mediterranean were in the first instance indebted for the spices and precious products of India, conveyed both by the way of the Red Sea and the Persian Gulf, and from thence overland to the markets of Egypt and of Tyre. This gave rise to a popular error prevalent through all antiquity. It was imagined that the articles of luxury obtained through the medium of Arabian traders were the produce of their own soil; and hence a region composed largely of burning sands, with a pestilential climate, and only fertile tracts of limited extent, came to be distinguished by the still extant title of Arabia the Happy, Araby the Blest.

The earliest accounts on record of travelling, whether for domestic or commercial objects, are found in the sacred document referred to. In almost all of them a company of wayfarers is mentioned, and the camel is conspicuous. The stern realities of nature in vast tracts of country dividing different communities within the tropics, or bordering on them—dry and thirsty lands where no water is, but still the same burning sun, with a soil either of sterile rock or shifting sand, disdaining to hold a footprint as a testimony of subjection—an unsettled state of society, with bands of lawless rovers

whose hand is against every man, unless overawed by numbers, or expensive contributions purchase immunity from indiscriminate pillage—these circumstances have enforced the association of individuals in traversing such regions in all subsequent ages, both for mutual protection, and the provision of resources adequate for the journey. These companies, termed caravans, are now, as they have been since primitive times, the chief means by which the internal communication of Asia and Africa is conducted.

It is a striking instance of adaptation to particular circumstances, that an invaluable beast of burden has been bestowed upon the arid wastes, without which their passage would be to a great extent impossible under existing arrangements. The camel, perhaps, more than any other creature, exhibits a marked adaptation to a peculiar position. It appears as if Nature had been economical of material in the organisation of this animal, designed to range over districts affording the scantiest supply of nourishment. 'She has not given him the fulness of form of the ox, the horse, or the elephant; but, limiting him to the purely indispensable, she has bestowed upon him a small head, almost without external ears, supported by a fleshless neck. She has stripped his thighs and legs of every muscle not essential to their movements, and has furnished his dry and meagre body with only the vessels and tendons required to knit the framework together. She has supplied him with a powerful jaw to crush the hardest aliments; but that he might not consume too much, she has narrowed his stomach, and made him a ruminant. She has cushioned his foot with a mass of muscle, which, sliding in mud, and ill adapted for climbing, unfits him for every soil but a dry, even, and sandy surface. She has condemned him to servitude by refusing him all means of defence against his enemies.' Accordingly, the camel has been the ship of the desert from the dawn of history, employed in the transit of both passengers and goods. A vegetable native of the desert, the Camel's Thorn (*Hedysarum alhagi*), a prickly plant, occurs in profusion in various districts, and affords a similar beautiful exemplification of benevolent design. The animal browses upon it in preference to other products; its lasting verdure and bright crimson flowers delight the eye of the traveller in the unfriendly wastes; and its property of collecting by deep-searching roots the scanty moisture of the plains, is made subservient to the production of nourishment for man. The Arab divides the stem of the plant in spring near the root. A seed of the water-melon is then inserted in the fissure, and the soil replaced. The seed becomes a parasite. The moisture which it could not collect for itself is supplied by the far-penetrating roots of the plant which sustains it, and thus a crop of water-melons is periodically raised from a soil incapable of other culture.

Oriental manners and customs have been remarkably permanent; and hence a modern caravan is in its principal features a picture of an ancient one. The travellers follow each other in single or double file; and form a line of procession of considerable length along the great routes, where numbers of mere wayfarers, religious pilgrims, and merchants journey together for safety and convenience. If there are horsemen, as is usually the case, the camels have to carry skins of water for the horses, as well as for the passengers, for there is frequently no other source of supply for several days together. Water is a daily want with the horse; but the camel will go three or four days without it, drinking only at the wells or reservoirs, and is capable of enduring even a ten days' thirst. The halts are made whenever practicable at watering-places, where there is some verdure, shade, and the song of birds. In many places the bleached bones of dead camels form a line of landmarks, and indicate with melancholy exactness the route to be pursued.

The chieftainship of a caravan was deemed an honourable office by the ancients, and its safe-conduct a very creditable achievement. Previous to starting, its principal members elected a leader and head, a man of experience in travelling, well acquainted

with the direction, and qualified by firmness and conciliation to deal with the wild tribes by the way. By a prosperous journey, he established a claim to gratitude; and after several, a kind of honorary title was in some instances conferred, similar to that of Emperor, with which the Roman legions greeted a successful general. Inscriptions at Palmyra supply information to this effect. Thus one commemorates Aurelius Zehida, who discharged his office of conductor with great credit while leading a company of merchants from that city to Vologesia, a town on the Euphrates, in order to attend the markets held there. Another is in honour of a certain Schalmalath, who is expressly said to have been a Jew, and whose services had procured for him a statue, as well as an inscription, erected by the senate and people of the city. The inscriptions were found in the court of the Temple of the Sun, the tutelary divinity of the place. This court is a spacious square area, capable of holding an entire encampment of Arabs, and paved throughout with marble. The temple stood in the centre, and outside are colonnades with numerous apartments. At the entrance are two large tanks, eight feet deep, furnished with steps to go down to the water. Its modern name is the Court of Camels. The name and the arrangements sanction the surmise, that as the commercial interests of the city were supposed to be under the special protection of the tutelary deity, the caravans wended their way to the temple on arriving, and started from it. Hence it had appurtenances for their accommodation, answering the purpose of a caravanserai: the apartments being for the passengers; the court and tanks for the beasts of burden, and the goods they conveyed.

The rise of a splendid city like Palmyra in the heart of the wilderness, surrounded on all sides by an inhospitable desert of rock and sand, seems an anomaly, but is susceptible of an easy and natural explanation. It was founded by Solomon under the name of Tadmor, by which its ruins are at present known to the neighbouring tribes. Both names signify the city of palm-trees. The site is an oasis, furnished with an abundant supply of wholesome water. Lying in the direct route of the caravans between Central and Western Asia, its copious fountains and shady palms rendered it peculiarly eligible for a long halt during a wearisome pilgrimage. But such a resting-place would speedily become a mart, by merchants from the east and west meeting at the spot, exchanging commodities, and thus shortening their respective journeys. In order to profit by this commerce, Solomon, who had a strong appetite for wealth, and sagacity to apprehend the means of acquiring it, founded Tadmor, furnished it with accommodation for traffic and traders; and might obtain his own remuneration both by the levy of customs' duties, and by employing factors to buy up and re-sell the wares. In a similar manner, for the mutual accommodation of merchants of different countries, shortening their journeys, marts were established at convenient points on the great commercial routes. They gradually grew up into cities, and went to decay upon commerce shifting its direction. Such we may conclude were Petra in the Edomite defile, Baalbec in Hollow Syria, Gerasa and Gadara on the margin of the desert beyond Jordan.

But regular commercial journeys were made extending three thousand miles or more, and requiring the space of three years for their accomplishment, going and returning. Thus caravans started from Barygaza in Western India, now Baroatch in the presidency of Bombay, and from Western Asia, bound to the frontiers of China, for raw and spun silk and silk stuffs. The earliest notice of the former occurs in a writer of the fourth century before the Christian era; and Greeks from Cilicia are named as taking part in the latter. The two companies of adventurers met in the high mountain region eastward of Bokhara, near the significantly called Roof of the World, the loftiest plateau of the old continent, and thence descended together into the great Mongolian desert. The rendezvous, obviously

an important station, was called the Stone Tower, from a monument of that kind at the spot. From this place to the capital of the Seres, silk, was a journey of seven months—a length of time which indicates with sufficient distinctness that the route must have reached at least to the frontier provinces of China Proper. Accommodation for rest, and other arrangements after a long journey, before starting afresh, was naturally provided at the site, particularly as it skirted the vast expanse of the desert of Cobi. There is some historical evidence that it was a caravanserai under the protection of a sanctuary, a temple of the sun. This idea is supported by present appearances, for the place still exists, and is used as a grand caravan station. The first information respecting it was obtained from a Russian, who, being taken prisoner on the frontiers of Siberia, was sold as a slave to the Usbeck Tartars. In the year 1780, he accompanied his master, a merchant, to the spot; and upon recovering his liberty, he went to India, and related his adventures to Sir Eyre Coote. The Stone Tower, in a narrow pass of the Belur-tag,

Indian Choultry or Caravanserai of Forty Pillars.—From a Drawing by Daniel.

is one of nature's erections which man has modified for his own convenience. It is a massy rock, the face of a mountain which forms one side of the defile, hewn into a regular form, with two rows, each of twenty columns, now in a ruinous condition. Hence its modern name of Chihel-Sutum, or the Forty Columns. It is a most wonderful work, venerated by the natives far and wide, who ascribe it to supernatural agents. But by the traders who rendezvous at the station, it is styled Tahkti-Saleiman, the Throne of Solomon.

Buildings for the reception of caravans, or caravanserais, in situations remote from towns, may be traced to a very early age in districts under regularly constituted government. Xenophon refers their foundation to Cyrus, who, he states, caused them to be erected at the distance of a day's journey from each other, and supplied persons to take charge of them. They are now very characteristic of Persia, and of provinces once included in the empire. However differing in detail, they are all constructed essentially on the same model; and consist of large quadrangular structures, divided into a series of naked chambers enclosing on every side an

open court. Passengers, whether traders, pilgrims, or general travellers, may occupy any of the apartments that are vacant, but all further accommodation, as well as food, must be provided by themselves. The Persians also took the lead in the formation of highways, which extended from the capital cities to the remotest parts of the empire, and were constructed at an immense cost. Though lines of military communication, intended to secure conquered frontier provinces, they were open to general use, and greatly facilitated traffic and intercourse. One of these roads, the principal, described by Herodotus, stretched from Susa, through the north of Mesopotamia, into Asia Minor, and terminated at Ephesus on the west coast. It had one hundred and eleven lodging-places or caravanserais; and as the route passed through an inhabited and safe region all the way, it might be traversed by passengers singly or in company. The same road, with few deviations, is now used by caravans between Ispahan and Smyrna. But the whole economy of overland transit in these countries is on the eve of a change, after having subsisted with but slight alterations from the patriarchal age to the present. Egypt, Asia Minor, and India, have railways in action; and a grand trunk-line has been surveyed, intended to connect the Mediterranean with the Euphrates and the Persian Gulf. The time will certainly come, and is perhaps not far distant, when to a great extent the camel's occupation will be gone; when the winds will daily bear across the desert the whistle of the steam-engine; and 'tickets,' 'tickets,' may, perchance, be heard within sight of the ruins of Babylon.

The Nile and the Euphrates, intimately associated with the great monarchies of antiquity, were applied to the purposes of transit at an early era. But flowing

The Nile Raft.—By Clark Stanton.

principally through level tracts of pasture or wastes, unsupplied with wood for the construction of vessels, the circumstance was unpropitious to their navigation by a people dependent upon local resources. Boats of papyrus were used upon the Nile

for the conveyance of light produce and passengers for short distances; and are perhaps the 'swift ships' to which one of the sacred writers compares the rapid passage of human life. Though swift with the current, the navigation against it, at least above Elephantina, was accomplished by the boats being hauled along with ropes from the banks. On the lower course of the river, comparatively large sailing vessels were employed. But it is probable that the produce of Ethiopia and interior Africa was brought down into Lower Egypt on rafts or rude craft which never returned, being broken up at the termination of the voyage. This we know to have been the case with reference to the navigation of the Euphrates. Descending from the highlands of Armenia to the level plains of Babylonia, the people of the former country sent their commodities by the stream, principally wine, to the latter, which they could not produce themselves. The barks were floats with only a skeleton of wood. This was covered with skins, overlaid with reeds; and an oval form was given to the whole, so that there was no difference between the stern and prow. The wine was placed in casks upon them, with other goods; and they were carried along with the current under the guidance of two oars. On arriving at their destination, the conductors sold the cargo and the skeleton of the craft, carrying back the skins by land, since the force of the stream rendered it impossible for them to return up the river. Thus in the present day, the market-boats which go down the Danube to Vienna, and the corn-rafts which drift with the Vistula to Dantzic, never return, but are sold with the cargoes they convey.

The old Egyptians, however expert in the navigation of the river, eschewed that of the sea on account of its perils, and viewed the great deep with horror as an emblem of the evil being, Typhon, the implacable enemy of their god Osiris. But the Babylonians, at the height of their power, had a direct maritime commerce, as well as a river and land trade. However impossible for barks like those described to proceed against the current of the Euphrates, it was ascended from the Persian Gulf by vessels of a different description; and the rich produce of India was not only brought to the luxurious capital, but conducted up the river to Thapsacus, and from thence transferred by caravans to the marts of Western Asia. Æschylus refers to its inhabitants as a promiscuous multitude, 'who both embark in ships, and boast of their skill in archery;' and prophecy indicates them as a people 'whose cry is in the ships.' These were probably built at the island of Tylos, a dependency in the Persian Gulf. It is expressly said to have possessed a species of timber for ship-building, possibly the teak-wood of India, an important historical notice, since Babylonia is totally destitute of trees, with the exception of the date and cypress, neither of which furnishes a suitable material.

Mankind settled upon the shores in far remote times, invited to such localities by the novelty of marine scenery, as well as by the facility for procuring food offered by the tenants of the deep, along with the cool refreshing sea-breeze, for it was beneath the hot sun towards the tropics that the primitive generations of men seem to have flourished. History has not recorded the people who first launched upon the ocean, and passed its billows to another strand. But history sufficiently intimates that the hope of plunder as well as the love of adventure was the impelling motive to the enterprise, and that the earliest sea-navigations were piratical descents upon stranger shores, as the mode of obtaining gain most obvious to unenlightened races. In this way the maritime states of modern times have generally commenced their career. But such a method of dealing speedily becomes of difficult execution, as experience of surprise and spoil in a single instance is sufficient to put a population upon its guard against a second. Necessity,

therefore, with an apprehension of the superior advantages of peaceable traffic to perilous rapine, grafted commerce upon piracy; and good gradually grew out of the original evil.

Boats from Ancient Sculptures.

The ancients had ships of passage, of merchandise, and of war. In their management, the course of invention seems to have been, first rowing, then both rowing and sailing, and ultimately sailing only. The sailing vessels had but one mast, which was usually taken down when in harbour, and put up as occasion offered, commonly alone when the wind was favourable, as the art of sailing upon a tack was an accomplishment but slowly acquired. They were not adapted for quick movement, owing to the flatness of their bottoms and clumsy construction. Distant voyages were rarely undertaken, and never directly performed. The extreme point was gained by touching at a number of intermediate points, often out of the way, for the slowness of navigation, and the small size of ships, rendered it impossible to victual them for a long distance. As a general rule, mariners were reluctant to venture out to sea beyond sight of land. Storms must of course have imposed this at times as a necessity, but when possible, shelter was sought from the rising gale in the nearest harbour. Thus Ulysses declares :

'Wide o'er the waste the rage of Boreas sweeps,  
And night rushed headlong on the shaded deeps.  
Now here, now there, the giddy ships are borne,  
And all the rattling shrouds in fragments torn;  
We furled the sail, we plied the labouring oar,  
Took down our masts, and rowed our ships to shore.'

From the autumnal to the vernal equinox, the Greeks and Romans considered it unsafe to put to sea, not so much on account of storms, but because the rains prevailed, narrowing the horizon of the sailor, while mists hid the land, and clouds obscured the sky. Still, in the finest weather, some trading voyages necessarily involved the spectacle of scenery exclusively marine, while adventurous spirits sought to signalise themselves by departing from cautious and timid usages. But ordinarily the shore was kept in view for direction by day, and if anchorage at night was impracticable, seamen attended to the position of certain stars, their rise and setting, for guidance on their course.

The origin of nautical astronomy is generally ascribed to the Phœnicians, who made use of the Little Bear as indicating the true north. Hence, Aratus tells us, referring to the constellation,

'Observing this, Phœnicians plough the main.'

The Greeks, also, in their earliest ages, were accustomed to guide themselves by the stars in their navigations. Thus, Ulysses is represented sailing on his raft, sitting at the helm, and watching the heavens through the night. But from ignorance, the Greek sailors long confined themselves to the rough approximation to the north afforded by the Great Bear, the *Helicè* of classical antiquity, mentioned in the beautiful description in the *Argonautics* :

'Night on the earth poured darkness : on the sea  
The wakeful sailor to Orion's star  
And *Helicè* turned heedful. Sunk to rest,

The traveller forgot his toil; his charge  
 The sentinel; her death devoted babe  
 The mother's painless breast. The village dog  
 Had ceased his troublous bay. Each busy tumult  
 Was hushed at that dead hour; and darkness slept  
 Locked in the arms of silence. She alone,  
 Medea slept not.'

The two asterisms are appropriately described by Aratus :

'The one called Helix, soon as day retires,  
 Observed with ease, lights up his radiant fires;  
 The other, smaller, and with feebler beams,  
 In a less circle drives its lazy teams;  
 But more adapted for the sailor's guide,  
 Whene'er by night he tempts the briny tide.'

The philosopher Thales is said to have improved the navigation of his countrymen by introducing the knowledge of the Little Bear, derived from the Phœnicians.

The provision of coast-lights for the guidance of the mariner in early times is attested by allusions to them. Homer beautifully describes the flash of a beacon-light in some solitary place, as seen by seamen leaving their friends. The Pharos of Alexandria, built in the reign of Ptolemy Philadelphus, about three centuries before the Christian era, seems to have been a proper light-house; and was regarded as one of the seven wonders of the world. Strabo describes it as built in an extraordinary manner, in many stories of white stone, on a rock forming the promontory of the island of Pharos, whence the tower derived its name. It bore the inscription 'Sostratus of Cnidos, the son of Dexiphanes, to the gods, the saviours, for the benefit of seamen.' The geographer mentions the neighbouring shores as low, enumbered with shoals and snares, requiring therefore the establishment of a lofty and bright beacon, as a sign for sailors arriving from the ocean to guide them into the entrance of the haven. The poet Lucan speaks of the Pharos as having indicated to Julius Cæsar his approach to Egypt on the seventh night after he set sail from the coast of Asia Minor; and Pliny, after a reference to it, states that there were light-houses also at Ostia and Ravenna.

St Michael's Mount, Cornwall.—From a Sketch by G. F. Sargent.

## CHAPTER II.

### GEOGRAPHICAL KNOWLEDGE OF THE ANCIENTS.

ERTAINLY the Phœnicians were the greatest maritime people of antiquity, and—so far as we have any knowledge—the first to traverse habitually the broad highway of the deep. They were naturally directed to a seafaring life by local position, occupying an advantageous coast-line, in possession of ample supplies of material for ship-building from the forests of Lebanon, while an outlet was required for the products of Asia, continually accumulating in their cities. They explored the shores of the Mediterranean, and crept along the Atlantic coast of Europe; planted settlements in Crete, Cyprus, Sicily, Malta, Sardinia, Northern Africa, and Southern Spain; conveyed the commodities of the east, with their own manufactures, to these colonies; returned with their peculiar products; and not only commanded for ages the carrying trade of the western waters, but aspired

to wrest that of the Indian Ocean out of the hands of the Arabians. The attempt to effect this was made by Hiram, king of Tyre, in conjunction with the Hebrew monarch, Solomon; for neither party was competent to undertake it independently. The latter had command of ports in the land of Edom, communicating through the Red Sea with the Indian Ocean, but he had no seamen, ships, shipwrights, or timber. The former could furnish them in abundance, but had no access to a southern sea-board without permission from his neighbour. Both therefore confederated to fit out a Hebrew-Phœnician fleet, which made the celebrated voyages to Ophir, starting from the northern extremity of the Red Sea, and bringing back gold, ivory, ebony, precious stones, apes, and peacocks.

The situation of Ophir has given rise to much learned research and ingenious speculation. The opinion is, however, very probable, that the name denotes no particular spot, but only a certain region or part of the world, analogous to the East and West Indies of modern geography. It may therefore be understood as a general term for the rich countries of the south, lying on the African, Arabian, and Indian coasts, as far as they were at that time known. The vessels are styled ships of Tarshish, which may mean ships of a certain size and build, similar to those which traded to the Phœnician colony of Tartessus in Spain. They returned once every three years. It is not necessarily implied that they were absent the whole period, for as broken years were reckoned by the Hebrews as whole ones, the actual time of the outward and homeward voyage would not be more than eighteen months, supposing the fleet to have sailed in the autumn of one year, staying out the next, and returning in the spring of the third. But even this length of time sufficiently shews the slowness of ancient navigation, owing to seamen proceeding coast-wise, frequently landing for provisions, and seeking a harbour on the appearance of every storm. Solomon's successors lost all direct communication with the Indian Ocean, being driven from the countries of the Red Sea during the civil wars which followed his death; and the monopoly of commerce in that direction reverted to the Arabians.

It is only from scanty notices in the pages of Hebrew and Greek writers that we have any knowledge of the maritime enterprises of the Phœnicians, for commercial jealousy led to their concealment as far as possible from other nations. The circumnavigation of Africa, ascribed to them, is inherently improbable. But their colonists at Gades, near the modern Cadiz, seem to have extended their voyages to our south-western shores, as certainly their brethren, the Carthaginians, did. An expedition was despatched by that people under Himilco, which, after a four months' sail, reached the country where tin and lead were to be procured. This was distinguished by a promontory, a bay, and some islands contiguous to the coast of Albion, and within two days' sail of the sacred island, Ierne, or Ireland. Heeren supposes the Lizard Point of the present day, Mount's Bay, and the semi-island of St Michael's Mount, to represent these localities. But Carthage at the same date, conceived to be about 570 B.C., sent out a fleet in an opposite direction, which deserves notice as the first voyage of discovery of which a circumstantial record is extant. This is styled the *Periplus*, or 'Voyage of Hanno, commander of the Carthaginians,' and may be viewed as a Greek translation of the official report of the admiral in the Punic language. The original is said to have been inscribed on a tablet, and placed in the temple of Saturn at Carthage.

The fleet had colonisation in view on the north-west coast of Africa, and hence took out persons of both sexes in sixty large vessels. Two days after passing the Pillars of Hercules, or the Strait of Gibraltar, the first disembarkation took place; the settlers were left on an extensive plain, a position answering to that of the present town of Mogadore. The expedition went on following the sinuosities of the shore, and successively landed

five more detachments of the passengers. It is impossible to identify the capes doubled, and the inlets entered, by the names given. But the description of the river—large and broad, full of crocodiles and hippopotami—seems to point to the Senegal; while the highland region afterwards coasted, covered with odoriferous trees, and inhabited by timid blacks, reminds us of Senegambia. By day all was still and lifeless on the shore, but upon the approach of night, fires were observed on the hills, and cries of wild merriment were heard, with the sounds of music, according to existing negro usages. The voyagers retraced their course owing to the want of provisions, and met with their most remarkable adventure at the extreme point reached. There was a large inlet of the sea, where, on an island, strange-looking savages were encountered, the females being covered with hair. This was a band of *Gorillas*, as the interpreters called them, so notorious in our own time. The males defended themselves vigorously with stones, but three females were captured. These soon broke their bonds, and fought so furiously with their teeth and nails that they were killed. The skins were stuffed, and taken home. Thus Carthage, twenty-five centuries ago, had specimens of the fierce brutes which our museums have only very recently acquired.

During the most flourishing period of Phœnician trade and power, the Greeks gradually became formidable upon the seas, and encroached upon their commerce. Abandoning their homes in a body to avoid subjection, the Phœceans emigrated to the mouth of the Rhone, and founded Massilia, the modern Marseille; Greek settlements were likewise early planted in Southern Italy, Sicily, and Spain; and thus they were in the way of acquiring information respecting the expeditions and discoveries of the Phœnician colonists. But it is remarkable, that at a later date—namely, 484 B. C.—the age of Herodotus, who may be called the Father of Descriptive Geography as well as of History, little was known by him of Western Europe. He was well acquainted by his travels with the countries of the Nile, the Euphrates, and the Tigris, and with those around the Caspian and Black Seas. His information—obtained by report, extended to the higher regions of the Nile, the banks of the Indus, the confines of Tartary, the shores of the Sea of Aral, the line of the Ural Mountains, and towards the heart of modern Russia. But he was dubious respecting the fact of a great river in Europe flowing into the sea towards the north—an obvious reference to the Rhine; he was even equally so of there being a sea in that direction. He never mentions Rome, then beginning the fourth century of its existence; and though the Cassiterides, or tin islands, are named, it is in entire ignorance of their local position. Herodotus was strikingly correct in relation to the Caspian. It is described as a sea by itself, having no communication with any other; of oblong form, with the greatest extent north and south; and estimates of the length and breadth are given which are believed to be accurate. Four centuries later, Strabo introduced it in his pages as an arm of the Northern Ocean, connected with it by a narrow channel. A century still later, Ptolemy restored the representation of its distinctness, but made it an oblong, trending east and west. So it figured on all maps down to the middle of the sixteenth century, when an Englishman, who twice crossed its waters, Anthony Jenkinson, contributed to correct the distortion, without any idea that he was vindicating the geography of Herodotus.

The first Greek adventurer into western and northern seas, Pytheas of Marseilles, flourished soon after the first Greek historian and geographer, though his age cannot be fixed with greater precision than in the interval between Herodotus and Alexander the Great. He coasted Spain and Gaul, arrived at Britain, called Albion by the natives; and after passing along its southern and eastern shores, he estimated from their extent the circuit of the island at forty thousand stadia. Sailing further north, he reached

Thule, clothed with perpetual fogs, where earth, air, and sea seemed blended in chaotic confusion, and the sun was beheld above the horizon for twenty-four hours together at the summer solstice. It is impossible to define the particular region indicated, to which the term *Ultima* was afterwards added to indicate its remoteness. But a part of the peninsula of Jutland anciently bore the name of Thiu-land; a portion of the Norwegian coast is still called Thele-mark; and the Shetland Isles—the shattered relics of an old land, where the length of the longest day is nearly twenty hours—have been referred to as answering generally to the description. Of no locality outside the Arctic Circle is it true that the sun at midsummer is above the horizon for the entire day. But Pytheas might gather information respecting this phenomenon of higher latitudes, and suppose it applicable to those he visited, owing to the observation of the long days there. It is certain that several centuries later the Romans imagined there was constant daylight in summer in the northern parts of our island, from the fact of the nights being then so brief and bright. Tacitus expressly affirms that ‘in the furthest part of Britain, the nights are so clear, you can hardly tell when daylight begins or ends; and when the sky is not overcast with clouds, you may see all night long, the light of the sun, which does not rise, or go down, but moves quite round.’

The navigator passed into the Baltic, and undoubtedly reached its amber coast, the shores of modern Prussia, between Dantzic and Memel, the grand repository of this carbonaceous mineral. He speaks of the sea throwing it up in considerable quantities, as at present; of the natives selling it to their neighbours, the Teutones; and through their hands it no doubt passed to the south. This we know to have been the case in a subsequent age; for Pliny represents the mineral coming overland into the north of Italy, where the women wore it in necklaces as an amulet. The trade might have existed for centuries, and this seems intimated by the old tradition of a sacred road across the Alps. Amber, a very costly article in early times, was known and wrought into various personal ornaments in the Homeric age. Thus a kidnapped prince speaks in the *Odyssey*:

‘An artist, such he seemed, for sale produced,  
Beads of bright amber, riveted in gold.’

Electrical properties were first noticed by the Greeks in amber, which it develops in a high degree on being rubbed. It is from their name for the mineral, *electron*, that we have our word *electricity*. Pytheas was not only an expert and daring seaman, but a physical inquirer in general. He originated a classification of climates according to the lengths of the days and nights; determined the latitude of his native city, Massilia, with remarkable accuracy; was aware of the influence of the moon upon the tides; and knew that the pole-star in the Lesser Bear did not mark the true polar point. His intercourse with the Gothic nations is evident from a reference being made to mead, their favourite beverage.

While various opinions were set afloat by the Greek philosophers respecting the figure of the earth, the offspring of the fancy—that of a plain, a cylinder, a cube, a drum, and a high mountain, with a base of infinite extension, around the summit of which the stars circulated—its spherical shape, taught by Thales, was placed on the basis of evidence by Pythagoras, who observed the varying attitudes of the stars occasioned by their change of place. Soon afterwards, the opinion of the earth being suspended *in equilibrio*, and supported by the air, became widely prevalent, or as Socrates says in Plato’s *Phædo*, it is wrapped about and pressed equally in every direction by the universe. By Aristotle its globular form was firmly held, because some stars seen in Greece were not visible in Egypt, being lost beneath the more northerly horizon. He also inferred it from the appearance of the circular shadow projected by the earth on the disc of the moon in eclipses; and

came to the conclusion, from the same circumstance, that the globe could not be a very large one. Reasoning on the hypothesis of the earth being a ball of moderate dimensions, he conceived the coasts of Spain to be at no great distance from the shores of India—the very conclusion which eighteen centuries later led Columbus to attempt the passage of the Atlantic. Aristotle, a universal genius, was in possession of all the geographical knowledge of his day. He mentions Taprobana or Ceylon; the great river Crametes, rising from a source near that of the Nile, and flowing westward to the ocean, either the Senegal or the Niger; and the two large islands Albion and Ierne, on the north of Celtica, which are for the first time associated under a common name, that of Britannicæ.

The career of his pupil, Alexander the Great, illustrated to his countrymen the productions and people of India, of which they had only previously heard, and to a very limited extent. After the overthrow of the Persian empire, he led his troops to the banks of the Oxus, crossed the Hindu-Koosh, passed the Indus near the modern Attock, and reached the heart of the Punjaub. The Greeks now obtained personal knowledge of the multitudinous population of the country, consisting of races corresponding to the Ethiopians in colour, but without the crisp hair of the negro; of their well-watered rice-fields and finely-woven fabrics; and of their peculiar habits, as the existence of castes, devoting widows to the funeral-pile, and the austerities practised by their wandering faqueers. With astonishment the luxuriant vegetation was noticed, the fan-like palms, the trees whose summits were beyond the reach of the arrow, the leaves larger than the shield of an infantry soldier, and the vast spread of the banyan or Indian fig, which takes root by its branches, and is described as forming a leafy arbour like a tent with pillars, under which a thousand persons may assemble. Not less surprise was excited by the number of elephants, wild and domesticated; the Bactrian camel, with

Bactrian Camel.—By Harrison Weir.

two humps; the large-bearded stag, with a horse's mane; and the Indian buffalo. Constructing a fleet, 'Macedonia's madman' descended the Indus to its mouth, sent part of his army home by sea, and returned himself with the remainder, through the burning

wilds of Beloochistan. Nearchus, the admiral, occupied nearly three months, from September 21 to December 9, 325 B.C., in a coasting voyage to the Persian Gulf, which would be performed at present in little more than a fortnight.

Upon the rise of Alexandria on one of the mouths of the Nile, its position and the activity of its Greek settlers, together with the ruin of Tyre, speedily made it the first commercial mart in the world; and the city became also a great centre of information respecting all known countries, owing to the resort of strangers to it for trading purposes. This stimulated the study of geography in all its branches, the mathematical, physical, and political, by the literati connected with the celebrated library gathered by the Ptolemæan sovereigns. Under Eratosthenes, its president, who was the first to insert parallels of latitude on maps, the attempt was made to measure an arc of the meridian, the first on record, in order to ascertain the magnitude of the globe. The arc fixed upon for the purpose was that between Alexandria and Syene, now Assouan in Upper Egypt, under the Tropic of Cancer. It was known that on the day of the summer solstice the sun was vertical at the latter place. Mention is made of a deep well there, which was visited at the bottom by the direct sunbeams at high noon on the solstitial-day, while vertical bodies threw no shadow for a considerable distance around it. The two places were likewise supposed to be on the same meridian. In possession of these data, Eratosthenes, by means of a concave hemisphere, with a stile fixed in its centre, found that the meridian sun at Syene caused the stile to deflect a shadow at Alexandria, which was one-fiftieth of the whole circumference. Hence he inferred, that the arc of the heavens comprised between the two places must be the same; and that their distance must be a similar arc, or one-fiftieth part of the terrestrial circuit. On estimating their distance by the difference of latitude, it was found to be 5000 stadia, which multiplied by 50, gave 250,000 stadia for the circumference of the globe. As we are ignorant of the stadium employed, the result cannot be expressed in common measures. But several important errors were committed in the practical application of a right principle, for instead of the two places being under the same meridian, they differ nearly three degrees in longitude. Great credit, however, belongs to Eratosthenes, and he was honoured by his contemporaries as the Surveyor of the Earth, the Measurer of the Universe.

The Romans, in their career of conquest, rendered familiar various countries known before, though obscurely on the west, south, and east. Spain was traversed by the legions under the Scipios; Numidia and Mauritania were explored during the Jugurthine war; Armenia and the defiles of the Caucasus were penetrated in the contest with Mithridates. But northward, Julius Cæsar may be said to have made great discoveries. Before his campaigns in Gaul and Britain, of which he became the historian, the civilised world was completely ignorant of their interior regions. He found the maritime provinces of our island in the south, occupied by a Germanic race, the Belgæ, in the enjoyment of considerable social comfort—inhabiting towns, and possessing abundance of cattle. In the next age, the Augustan, soon after the commencement of the Christian era, Strabo produced his *Geography*, in which minute details are given, chiefly of the regions visited by the Roman arms, founded partly upon his own observation as a traveller, and partly upon report. But ample evidence is afforded in his work of the imperfect state of knowledge. Thus, he was dubious respecting the shape of Italy, whether a square or a triangle. He represented the Pyrenees as running north and south; thought the coasts of Spain and Gaul formed nearly a straight line; and connected the Caspian with the Northern Ocean. Africa, he considered, did not extend far to the south, a fortunate error, as it stimulated the Portuguese to attempt its circumnavigation. Deeming the earth a sphere, and the southern hemisphere to correspond to the northern, Strabo divided

it into five zones; one torrid, between the tropics, a region of burning heat, and consequently uninhabitable; two frigid, towards the poles, void of life from the intense cold; and two intervening temperate zones, favoured with a moderate temperature, admitting of the existence of man, animals, and plants. The remarkable speculation also occurs, that where the temperate zone crosses the Atlantic Ocean, 'there are inhabited worlds, distinct from that in which we dwell.'

Under the early emperors, Midland and Northern Europe were further disclosed by the Roman generals. Drusus led his soldiers to the river Weser in Germany; and Germanicus marched to the Ems and the Elbe. South Britain, into which Cæsar merely made a foray, was conquered in the time of Claudius, and constituted a province of the empire. North Britain, up to the foot of the Grampians, was traversed by the troops under Agricola, who sent out a fleet from the Firth of Forth on a voyage of discovery northward, which made the circuit of the shores. 'This fleet,' says Tacitus, the son-in-law of the general, 'first ascertained that Britain was an island. It discovered also and subjected the Orcades (Orkneys), a cluster of islands not known before, and saw Thule hitherto concealed by snow and winter.' But the historian had a very erroneous idea of the position of our islands, for Britain is said to have Spain on the west, and Ireland is placed midway between the two. The earliest mention of Scandinavia occurs at this time; in the pages of Pliny, it is represented as an island of unknown extent, separated by an arm of the sea from the Cimbric Peninsula, the modern Jutland, and marked by a mountain called Sevo; the existing name of a hill near Gottenburg. Norway is apparently indicated by the same writer under the name of Nerigon, the inhabitants of which are said to have customarily sailed as far as Thule. An adventurous traveller from Pannonia to the amber country made the Baltic, near the mouth of the Vistula, known to the Romans; information was acquired by them of the tribes on the coast, up to the Gulf of Finland; the Sviones, sea-men, or Swedes, are mentioned; but they were never aware that Scandinavia was an integral portion of Europe. The rumour also reached them in Spain, of islands existing in the Atlantic, off the coast of Africa—the Fortunate Isles of Pliny, believed to be the Canaries—but their knowledge of them was limited to the tidings.

In the second century of our era, during the reigns of the Antonines, the best scholar of his age flourished at Alexandria. This was Ptolemy, a discoverer, observer, and careful compiler, who, from the recorded experience of ages, and the itineraries of merchants resorting to the city, produced a *Geography*, in eight books, accompanied with maps, which remained a text-book through the middle ages, and was not superseded till the fifteenth century. He announced with certainty the existence of the Niger, flowing from west to east; described correctly the course of the Volga; but erred egregiously in many of his delineations. The north coast of Africa is made nearly a straight line; Scotland has its greatest extent east and west; the Mediterranean is stretched out to nearly double its proper length; the whole peninsula of India is suppressed; Ceylon is enormously exaggerated in its dimensions; and Asia is prolonged to the south, then brought round westward to join Africa, thus enclosing the Indian Ocean. But the descriptive department of geography was foreign to the aim of the writer. His object was to fix the astronomical position of places by means of parallels and meridians, which, though in use before, were far more largely applied by him, and indicated as measurers of latitude and longitude. Ptolemy's chief parallels are the equator; that of  $16^{\circ}\frac{3}{4}$  north, through Meroë; that of  $36^{\circ}$ , through Rhodes, an old standard line; and that of  $63^{\circ}$ , through Thule, with which the latitude of the Shetlands, the supposed Thule, nearly agrees. But

he greatly erred in his longitudes, which were computed from the meridian passing through the Fortunate or Canary Islands as a starting-point. He made the length of the Mediterranean  $20^{\circ}$  more than its true measure, and placed the mouth of the Ganges  $46^{\circ}$  eastward of its real position, an error of about three thousand miles, equal to one-eighth of the circumference of the globe. This exaggerated eastern longitude had, however, the happy effect of leading the navigators of the fifteenth century, who knew nothing of the true dimensions of the globe, to imagine that India and China lay at no great distance across the waters of the western ocean, and confirmed them in their purpose to attempt its passage.

The world, as known to the ancient civilised nations, may be generally defined as extending from the extremity of Britain on the north, to the banks of the Upper Nile on the south, and from the shores of the Atlantic on the west, to the borders of China on the east. It thus embraced but a small proportion of the terrestrial surface, little more than the half of Europe, a fourth of Asia, and a fifth of Africa. But within the limits named, there was a vast area, very vaguely disclosed, while the most erroneous conceptions were entertained of the extent and configuration of long visited lands; and even such a familiar circumstance as the annual inundation of the Nile was an unsolved problem. It was commonly ascribed to the special interposition of the Deity; and though Lucretius rightly mentions periodical rains towards the equator as one cause, he gives greater prominence to the influence of the Etesian winds, which have no effect at all in arresting the current of the river, and speaks of the event as without a parallel on the face of the globe.

The connection between the flow and ebb of the sea, and the positions of the moon, was too obvious to have escaped the attention of mankind, whose geographical position brought oceanic phenomena under their notice in early ages. Accordingly, the variation of the tides with the moon was remarked by physical inquirers; and Pliny, in a striking passage of his *Natural History*, directly attributes them to lunar action, and gives an accurate description of their leading features. But in the prior age of Alexander, the Greeks, although not ignorant of the ordinary tides, beheld with surprise and dismay the *bore*, or rushing tide of the Indus, common to the mouths of most great rivers; and to Caesar, the higher tidal rise on the coast of Britain, at the period of the full moon, which damaged his fleet, was an entirely unexpected event. But it is remarkable that references occur to the phenomena of high northern latitudes, certainly never visited by any of the ancients, which must have either been deduced by reasoning from facts observed elsewhere, or supplied to northern voyagers by those with whom they communicated, who had heard of them. Thus the sea is said to be languid and nearly motionless in that direction; the sun is described as neither rising nor setting, but going round the horizon; and the figures of the gods are affirmed to appear there covered with luminous beams. These are evidently allusions to the ice-bound ocean, and the long summer day of the polar circle, with the brilliant coruscations of the aurora borealis.

The wonderful power of the magnet, by which it attracts iron, was not unknown to the ancients. In fact, from Magnesia, in Asia Minor, where the Greeks first met with a kind of iron-ore endowed with it, we have the terms 'magnet' and 'magnetism.' But they were not aware that the property could be communicated to the iron attracted, so that artificial magnets might be readily constructed; and the polarity of the magnet, or its property of pointing, when freely suspended, towards the poles of the earth, on which account our ancestors gave it the name of loadstone, leading or guiding stone, was either not discovered, or not taken advantage of. From obscure

intimations, it may be gathered that the Chinese were acquainted with this quality, as exemplified in the mariner's compass, prior to the Christian era; but as they neither learned the habitual application of it, nor acquired any proficiency in the art of navigation, it was practically useless to them. The same knowledge has been assigned to Solomon, on account of the voyages he ordered; and the Arabians are said to have used the compass at an early period to guide them through the trackless sands of the desert. But these are ill-supported assertions. The voyages directed by Solomon, though comparatively distant, were doubtless simply coasting expeditions, and the latter people were found in the sixteenth century steering wholly by the stars or by the land. It is very likely that the germs of this, as of other important applications of natural phenomena, have long been known in the world; but it is certain that the magnetic needle, as an instrument of use, belongs entirely to the modern age, and is due to the practical genius of Western Europe.

### CHAPTER III.

#### GEOGRAPHICAL KNOWLEDGE IN THE MIDDLE AGES.

NEW era dawns. The disorganised state of society which attended and followed the fall of the Roman empire, had the effect of obscuring the light of science kindled in past ages, repressing the spirit of inquiry, and interfering with the cultivation of all kinds of knowledge. A few solitaries pored over manuscripts and maps in monastic cells; ecclesiastics went out to proclaim a new faith to the barbarians who had overthrown the ancient civilisation, and thus changed their landscapes; enthusiasts repaired on pilgrimage to the sacred shrines of the Holy Land; but no services of moment were rendered to geography in disclosing fresh regions, or illustrating those previously known, till the ninth century, in which our own King Alfred took part. At that period a fresh race of disturbers, issuing chiefly from the archipelagoes of Denmark and Norway, made themselves formidable to the settled and gradually improving maritime communities of Europe. They are variously styled Norsemen or Northmen and Danes by our own annalists, Normans by the French, and Normanni by the Italians, for their cruises extended from the stormy rocks of the Shetlands to the balmy shores of the Mediterranean, and permanent settlements were made by them in Britain, France, and Italy. Their creed was a ferocious paganism; their standard, the ominous raven; their profession, piracy. Originally haunting inlets of the coast, bays, and estuaries,

they were called Children of the Creeks, while the chieftains had the title of Sea-kings, from the ocean being their ordinary scene of adventure, and the boldness with which its perils were encountered. Ships were the sea-horses of the marauders—their ocean-skates. 'The strength of the tempest aids the arm of the rower; the storm is our servant; it throws us where we desired to go.' Such were the maxims of the Northmen.

While information respecting foreign countries and people was eagerly sought by the inquiring mind of Alfred, his attention was directed with special interest to these wild rovers, owing to their descents upon the shores. Two of them appeared at his court, refugees compelled by civil strife to quit their homes. The king took down from their own lips an account of their voyages, and appended it to the *Geography* of Orosius, the work of a Spanish monk who flourished in the beginning of the fifth century, which he translated from the Latin into Anglo-Saxon.

One of the narrators, named Other, came from the most northerly part of Norway, where he had possessed a hundred reindeer, six decoy deer, with twenty head of cattle; and had enjoyed the distinction of a chieftain, receiving an annual tribute from the Fins of valuable furs, feathers, whalebone, and ships' cables made of the skins of seals. Anxious to know how far the country extended to the north of his own locality, and to discover new fishing or hunting-grounds, he set sail, keeping close to the shore. Having passed the bounds of the whale-fishers, three days' sail brought him to a point where the coast changed its course, and turned to the east. Continuing his voyage in the new direction for four days, he found it bend towards the south; and after five days' southerly sailing, he came to the country of the Beormians or Permians, who seemed to speak the same language as the Fins. Thus Other rounded the North Cape of Europe, and passed into the White Sea, the eastern side of which was the land of the Permians, now occupied by the Samoiedes. The voyager met with the walrus or 'horse-whale,' as Alfred appropriately styles it, in such abundance that his party killed threescore in the space of as many days. To discover the haunts of the walrus was one object he had in view, for the teeth of the animal were highly valued, supplying the ivory of the period; and the ropes used for shipping were made of the strong and pliant skin. The walrus, though driven by navigation and the havoc of centuries to more solitary waters, is still occasionally captured in the same region. The island of Morshovet, in Mezen Bay, is called after it, being derived from *morsh*, the Russian name for the animal, the original of our word *morse*, by which the walrus is often denoted. In the same neighbourhood lie the Morshowuja Koschki, or the walrus sand-banks and shoals. Alfred received some walrus teeth from the refugee mariner; and they were the first articles ever brought to England from the north of Europe.

The other stranger, Wulfsten, had explored the eastern regions of the Baltic, for the islands of Oland and Gottland are mentioned in his narrative, with the mouth of the river Wisla or Vistula, all beyond which was called by the general name of Estland or Eastland. This district, according to the voyager, had a great number of towns, in each of which there was a king. It abounded in honey, and had a plentiful supply of fish. The chiefs and great men drank mares' milk; the poor people and slaves used mead. No ale was brewed among them. It was a custom of the country, when any one died, to award the property of the deceased to the best horsemen at his funeral. For this purpose, it was divided into five or six heaps, sometimes into more, according to its amount. The heaps were placed at intervals of about a mile from each other, and regularly increased in size, so that the largest heap was at the greatest distance from the town to which the dead man belonged. All parties in the neighbourhood were

allowed to contend for the prizes, the fleetest horse winning the most distant and valuable portion. The name of Eastland survives in that of Esthonia, one of the Baltic provinces of Russia. But pilots still use the ancient form of the word. The nobles style themselves Eastländers, and are thus distinguished from the peasants, who are simply Esthes. Germans and Scandinavians of the present day term the Baltic the East Sea, *Ost See*, which discriminates it from the ocean on the west.

Piratical squadrons of the Northmen permanently occupied the Shetlands and Orkneys in the tenth century, as convenient stations from which to harass the adjoining mainland. Their power extended over the Hebrides; and to this insular dominion a considerable portion of the north of Scotland was added, as the county of Sutherland, their *southern land*. They had previously discovered accidentally the Faröe Islands; about the year 861, as one of the Sea-kings was endeavouring to reach this group, a violent tempest drove him to an unknown and more northern coast. He effected a landing, and from the summit of a hill surveyed the country. No human habitation appeared; no sound or sign of life was observed; and heavy snow descending, he called the desolate territory Snowland, a name superseded by that of Iceland. Colonists from Norway, to escape from social disturbances, afterwards sought the newly disclosed region, found it to be an island, and settled on the south-western coast, which has ever since been an inhabited site. At that time the valleys were well clothed with forests of fir and birch. These woods have now wholly disappeared from some unknown cause, rendering the drift-timber cast upon the shores of great importance to the present population.

In the course of their seafaring life, the Icelandic settlers became aware of the existence of a still more westerly land, to which adventurers proceeded. Making acquaintance with it at the south extremity, and in spring-time, when a pleasing verdure here and there met the eye, it received the name of Greenland, but was speedily found to be a region, for the most part, of naked rocks and ice-bound shores. Still colonisation followed, probably beginning about the year 982, and little settlements were planted on the west coast, between Cape Farewell and Disco Bay, which can be traced through several centuries. This isolated people contrived to maintain occasional intercourse with Norway, the mother-country; received bishops from thence; and paid their Peter's-pence to the pope in walrus teeth. But at length they perished to a man. History has no record of them after the year 1418. Yet it could scarcely be through the inhospitality of nature that they became extinct, after having braved it for upwards of four centuries. It is conceived likely, that the terrible pestilence called the 'black-death,' which largely depopulated Europe, and was specially fatal in the north, extended its ravages to the Greenland colonists, cut off the greater number, and so enfeebled the survivors, that they fell an easy prey to the Esquimaux. Runic inscriptions, ruins of buildings, fragments of church-bells, relics of utensils and implements, have been found in recent times in sheltered and now desolate spots, the memorials of life where life has ceased to be.

A much more interesting discovery was made by the Northmen, for they unquestionably reached the continent of America five centuries before any other European. The documentary evidence of the fact is universally admitted to be conclusive. About the year 1000, Biorn, an Icelander, while sailing to visit his relatives in Greenland, was driven out of his course by a storm, and met with land, covered with wood, far to the south-west. He reported its existence to his friends upon gaining his destination, and took part in an expedition equipped to examine the region deserted. After a voyage of some length, the adventurers fell in with a rocky shore, wholly without herbage, to which they gave the name of Helleland, or the land of stone. The south-eastern extremity of Newfoundland answers to the description. Writers of the present day speak of it as

consisting of 'bare and large flat rocks, without tree or shrub; the surface everywhere uneven, and covered with large stones; the mountains almost devoid of every sort of herbage.' Continuing the voyage, a low country was met with, but with many white sandy cliffs, thickly covered with trees, to which the name of Markland, or the land of wood, was given. Nova Scotia is referred to in a precisely similar manner by modern describers: 'From Port Haldimand to Cape Sable the land appears level and low, and on the shore are some cliffs of exceedingly white sand—Cape Sable is a low woody island at the south-eastern extremity of a range of sand-cliffs, which are very remarkable at a considerable distance in the offing.' After some days further sailing, the explorers came to a river, on the banks of which were trees loaded with agreeable fruits, and as the climate was genial, while the soil seemed fertile, and salmon abounded; they resolved to winter at the spot. It was noted that on the shortest day the sun remained nine hours above the horizon, from which it results that the party could not be far from the latitude of 41°—that of Nantucket on the coast of Massachusetts. The wanderers agreed to call the country Vinland, or the land of the vine, from the quantity of wild grapes at the site; and it is a curious coincidence, that centuries later the first English settlers of New England, from the same circumstance, gave the name of Martha's Vineyard to an island along the shore. Visits were subsequently paid to Vinland—one by Eric, bishop of Greenland, in 1121; and sometimes the visitors made a considerable stay, but it does not appear that permanent settlement was attempted. The old Icelandic sagas relate the circumstantial details which have been given, and while the identification of particular localities is fairly open to challenge, it is impossible to doubt the Scandinavian discovery of the American continent, at a period prior to the Norman Conquest of England. Columbus was himself well aware of it. He made a voyage to Iceland previous to his own attempt, for the purpose of inquiry; and his doing so impairs not his fame in the least, since it transpired by accident, and was fruitless of any result except so far as the great navigator derived encouragement from it.

While northerners braved the perils of the Atlantic, the southerners viewed it long as a barrier which it was hopeless to attempt to pass, and filled their imaginations with appalling pictures of its storms and dangers. The Arabs, who rapidly extended their conquests from the country of the Prophet eastward towards India, and westward into Spain, bestowed upon this ocean the epithet of 'The Sea of Darkness,' deeming it a region of impenetrable obscurity. Xerif al Edrisi, one of the most eminent of their geographers, in the middle of the twelfth century, at the court of Roger I., king of Sicily, composed a work which he styled *The Going Abroad of a Curious Man to explore all the Wonders of the World*. The Atlantic is thus noticed: 'No one has been able to verify anything concerning it, on account of its difficult and perilous navigation, its great obscurity, its profound depths, and frequent tempests; through fear of its mighty fishes and haughty winds; yet there are many islands in it, some peopled, others uninhabited. There is no mariner who dares to enter into its deep waters; or if any have done so, they have merely kept along its coasts, fearful of departing from them. The waves of this ocean, although they roll as mountains, yet maintain themselves without breaking; for if they broke, it would be impossible for a ship to plough them.' Travel was stimulated among the Arabs by the obligation to make a pilgrimage to Mecca, once at least, wherever they might be settled; and trading journeys were made by them to the more remote parts of Asia. With the same object in view, but as timid navigators following the line of the shores, they visited the islands of the Indian Archipelago, and conducted regular voyages along the east coast of Africa, as far southward as the Mozambique Channel.

The Arabs thus became familiar with the celestial phenomena of the southern

hemisphere long before Europeans caught sight of its imposing objects, and hailed the four stars which now figure in the constellation of the Cross. Hence a passage in Dante may be explained which has somewhat perplexed his commentators. In the Vision of Purgatory, the poet refers to the stars in question as symbolising the four cardinal virtues, Prudence, Justice, Fortitude, and Temperance :

‘To the right hand I turned, and fixed my mind  
On the other pole attentive, where I saw  
Four stars ne’er seen before save by the ken  
Of our first parents. Heaven of their rays  
Seemed joyous. O thou northern site! bereft  
Indeed and widowed since of these deprived.’

This passage, containing a clear allusion to the south pole and its quadruple stars, two of which serve as pointers, is very remarkable, since the time of Dante, 1265—1321, long antedated the maritime expeditions which made the Portuguese and Spaniards, first among the Europeans, acquainted with the skies of the opposite hemisphere. After passing within the tropics, the constellation may be seen, but is not conspicuous till the equator is approached, owing to great southerly declination. It is the finest and most interesting object in the night sky of the south, and never fails to arrest the attention of all travellers and voyagers. If Dante’s lines involve simply a poetic invention, it is certainly one of the most felicitous and extraordinary on record. But very probably some accurate information respecting these southern circumpolar stars had been circulated in Europe prior to his age, through the medium of the Arabs, from which the ‘Poet-Sire’ of Italy derived his knowledge of them. Mention is made of a celestial globe, on which the stars alluded to were figured, constructed by an Arabian in Egypt, with the date of the year 622 of the Hegira upon it, corresponding to the year 1225 of our era.

In the first half of the thirteenth century, the invasion of Eastern Europe by the Mongol Tartars inspired the western powers with alarm for the safety of their own dominions. The consternation indeed extended to the common people in remote situations, for the Frieslanders did not venture to leave their homes in the herring season, lest the enemy should come in their absence, and a prime article of food rose in consequence to a famine price in the market. Under Batu Khan, a prince of the race of Zenghis Khan, the terrible Asiatics rapidly overran Russia, Poland, Hungary, and Silesia, specially directing their fury against the towns and cities, as useless to a people who wanted only space for their tents and pasture for their horses. When weary of conquest, the chief fixed his capital, commonly called the Camp of the Golden Horde, in the neighbourhood of the present Astrachan, and ruled the conquered territory as one of the lieutenants of the Grand Khan, at Karakorum, on the verge of the Mongolian desert. By this event, information was obtained respecting parts of Asia very little known in Europe, as the western sovereigns sent various embassies to the dreaded barbarians, in the hope of averting hostility, if not of conciliating friendship. One of the ambassadors, John de Plano Carpini, an Italian friar, with some companions, was despatched by Pope Innocent IV. in 1245, ‘lest there might arise some danger from their proximity to the church of God.’ He accomplished the difficult pilgrimage, saw Batu Khan in his tent, and after another long journey, gained the presence of the Grand Khan. Carpini returned safely home, having had experience of climatic extremes in the steppes he had traversed; intense heat in summer and cold in winter, with suffocating sand-storms in the former season, and the hard fate in the latter—of having to sleep on the snow exposed to the biting blast.

France participated strongly in the excitement of the time. 'This terrible irruption of the Tartars,' exclaimed Queen Blanche, 'seems to threaten us with a total ruin, and our holy church.' 'Mother,' replied Louis IX., 'let us look to heaven for consolation. If these Tartars come,' remarked he, playing upon the name, 'either we will make them return to the Tartarus whence they have issued forth, or else we ourselves will go to find in heaven the happiness of the elect.' But the king deemed it prudent to send an envoy, William de Rubruquis, a Flemish friar, who departed upon his mission in 1253. Beyond the river Ural, he found himself in 'a huge and vast desert, which was in dimensions like unto the ocean-sea.' He was soon acquainted with the koumis of the Tartars, a liquor prepared from mares' milk, and found it palatable. 'It biteth a man's tongue,' says he, 'like the wine of raspes. But it leaveth behind it a taste like the taste of almond milk, and goeth down very pleasantly, intoxicating weak braynes.' He remarks further, 'In very deede it is marvellous sweet and wholesome liquor,' but gives explicit assurance that he and his companions were 'very warie of the drinke.' At times he had occasion to state, 'of hunger, thirst, cold, and weariness, there was no end.' Our traveller reached Karakorum amid extreme wind and snow. The city, though the only considerable one in that part of Asia, he thought not equal to the village of St Denis, near Paris. It was surrounded by a mud wall, and had four gates. In this barbaric capital there were Chinese who occupied a street by themselves; and their mode of writing is accurately described. 'They write,' it is observed, 'with a pencil like that used by painters, and in a single figure they comprehend many letters, forming one word.' A description occurs for the first time in the pages of a western author of an interesting animal in the neighbourhood, the yak, or Thibetian ox, an inhabitant of the mountains. Rubruquis found the Grand Khan to be 'a flat-nosed man,' who could not comprehend the object of his mission, but dismissed him with a civil message for his master.

The most remarkable traveller by far of the middle ages was no emissary of either pope or king, but a simple citizen of Venice, who reached the remotest parts of Eastern Asia under the influence of curiosity, and the hope of personal advancement. This was Marco Polo. Accompanied by his father and uncle, who had previously visited the far east, he set out in the year 1271 for the court of Kublai Khan, who had recently effected the conquest of China, and established himself upon the throne. The younger traveller had an illness by the way, on account of which twelve months were spent in the country bordering on the table-land of Pamir, a part of Central or High Asia. Opportunities for acquiring information of that elevated region were not neglected; and the difficulty of supporting combustion there was noted as perfectly well known to the mountaineers, though all parties were ignorant of the cause. 'Fires,' it is said, 'do not burn so bright in this place, and do not so effectually boil or dress victuals as elsewhere. The fact, which is owing to the diminished pressure of the atmosphere, has been repeatedly verified in lofty situations. At the Hospice of St Bernard, water boils at about 187° of Fahrenheit, and it must be kept boiling five hours, to cook a piece of meat which would be ready for the table in three hours at the ordinary boiling-point of 212°. This costs fuel, and obliges the monks to use an inordinate quantity of wood in preparing their *bouilli*. Pamir is described as a district 'said to be the highest in the world—a plain between two vast hills, through which flows a very fine river, issuing from a large lake; and it is the best pasturage in the world, for a lean animal becomes fat here in ten days.' The river referred to is the Oxus, and the lake the Sir-i-kol, from which it emerges. No known visit was ever paid to the spot by any European for five centuries and a half, or till Lieutenant Wood reached it, on the 19th of February 1838, after grappling with great difficulties. He confirmed in every respect the accuracy of the Venetian. 'The table-

land of Pamir,' he remarks, 'is 15,600 feet high, or sixty-two feet lower than the summit of Mont Blanc. The natives name this place Bam-i-duniah, or Roof of the World; and it would indeed appear to be the highest table-land in Asia, and probably in any part of our globe. Before us lay stretched a noble sheet of water, from whose western end issued the infant river of the Oxus. According to the Kirghis, the grass is so rich, that a sorry horse is brought into good condition in less than twenty days, and its nourishing qualities are evidenced in the productiveness of their ewes, which almost invariably bring forth

A Peep into Siberia.—Reduced, by permission, from Sir R. I. Murchison's *Geology of Russia*.

two lambs at a birth.' The country of the Kirghis has been most graphically described and illustrated by Sir Roderick Murchison, in his great work on the *Geology of the Ural Mountains*; by whose permission we are enabled to give the above 'Peep into Siberia.' 'From the summit of Mount Sugomac,' says Sir Roderick, 'the panoramic view is very striking. To the west is a vast rolling surface of mountains made up of ridges separated from each other by dark depressions, and all, with the exception of the distant crest of the "Ural Tau," covered with dense forest—a primeval woodland, in short, with its graceful wavy outline. On the east lies Siberia, absolutely at your feet, all minor inequalities of outline being merged; it looks like a vast plain, lake and river mingling with rich meadows in the middle ground, the distance being composed of a woody and partially pastoral track, inhabited by Bashkirs; in the Zavod of Kishtymask alone, a hundred lakes exist.' On quitting the axis of the mountains, the view becomes flat and boundless, and the spires of Orenburg—as represented at the end of the chapter—burst on the travellers amid the burning plain at an immense distance. To return, however:

The visitors from the west were kindly received by the eastern potentate, and Kublai

Khan took special interest in the youthful Marco Polo, on account of his address and evident abilities. He was appointed to a post in the imperial household, adopted the dress and manners of his associates, acquired the four languages of the empire, and was intrusted with diplomatic missions, while the important office of governor of a province was held by him for the usual term of three years. In course of time the foreigners naturally wished to see once more their own land, and after repeated refusals, the emperor reluctantly consented to part with them. They returned home by the Indian Archipelago and Persian Gulf; and reached their native city in the year 1295, having been absent nearly a quarter of a century. Their relatives and friends, who had long thought of them as dead, were with difficulty brought to recognise them, owing to their eastern costume and habits, with the change which time and varying climates had produced in their personal appearance. It was soon afterwards the misfortune of Marco Polo to be taken captive in a naval engagement between the Genoese and Venetian fleets, and to endure an imprisonment of four years in Genoa. He beguiled the time during this term of confinement by relating some of his adventures to visitors, and then by writing a narrative of his travels, which, after being charged with both inventions and exaggerations, is now admitted to be a faithful account of what he saw himself, or heard from others.

The work of Marco Polo opened the interior of China, or as the country is styled in his pages, Cathay, for the first time to the knowledge of the western world. It depicts the gorgeous splendour of the court of Kublai Khan, the number of his guards and armies, his vast palaces and gay summer residences, with their gardens watered by beautiful streams, adorned with the fairest flowers, and stocked with the choicest fruits. The principal cities are minutely described, their extent and populousness, arts and architectural wonders, now for the most part passing under different names, as Cambalu, or the 'royal residence,' consisting of two distinct cities, the old and new towns. This is the Peking of the present day, which has its two grand divisions, respectively occupied by Tartars and Chinese. The porcelain manufacture is noticed, with silk-worms, and coal as the common fuel, which the Venetian calls 'a kind of black stone, cut from the mountains in veins, which burns like logs, and maintains the fire better than wood.' Tea is not mentioned by name, but is supposed to be included in the wine of spices repeatedly referred to. Graphic sketches are given of the great rivers, the Hoang-ho and Yang-tse-Kiang, with the multitudinous villages on their banks, the crowds of vessels carrying merchandise, and the numerous idol-temples erected on rocky eminences overhanging the water.

Intercourse subsisted between China and Northern Asia in the time of the traveller, as is evident from the accurate hearsay information reported concerning the bleak and barren region. It is said to be a series of marshes, frozen over for the greater part of the year, and covered with snow. The features of Siberia far to the north appear in the statement, that the sun is not seen in the winter months; the inhabitants use sledges drawn by dogs or reindeer instead of chariots; and the most valuable furs are brought from thence. On the homeward route, the coasts of India, Ceylon, the Nicobar and Andaman Isles, Java and Sumatra were visited. Five months were passed in the latter island, where acquaintance was made with the one-horned rhinoceros, noticed as of smaller size than the elephant, but having feet like that animal, and hair like that of the buffalo, generally carrying the head hanging down towards the ground—'filthy beasts, that love to stand and wallow in the mire.' The use by the natives of a kind of meal for bread was observed, obtained from the pith of large trees, some of which was conveyed to Venice, and thus was imported the first sago into Europe. Marco Polo also was the first to disclose to Europeans a country still further east than Cathay, equally abounding in

wealth, Zipangu, the modern Japan, inhabited by a people of fair complexion, well made, and of civilised manners. 'They have gold,' he states, 'in the greatest plenty, its sources being inexhaustible; but as the king does not allow of its being exported, few merchants visit the country, nor is it frequented by much shipping from other parts. To this circumstance we are to attribute the extraordinary richness of the sovereign's palace, according to what we were told by those who have access to the place. The entire roof is covered with a plating of gold, in the same manner as we cover houses, or more properly churches, with lead. The ceilings of the halls are of the same precious metal; many of the apartments have small tables of pure gold, considerably thick; and the windows also have golden ornaments. So vast, indeed, are the riches of the palace, that it is impossible to convey an idea of them!'

The narrative of Marco Polo, containing these glowing descriptions, as it came into circulation, made a profound impression upon inquisitive minds, and contributed largely to the maritime enterprises of the fifteenth century. Imagination ran riot in figuring the wealth and wonders of the lands which were lying beyond the sphere of communication with the western nations, and cupidity was excited to participate in their riches and luxuries. As Ptolemy, the old geographer, whose authority was undisputed, had enormously exaggerated the easterly extension of the Asia of his time, while the countries illustrated by the Venetian lay still further eastward beyond his limit, it was thought that no great breadth of ocean rolled between the east of Asia and the west of Europe. Hence Columbus launched on the waters of the Atlantic in search of an opposite coast, with his mind fully occupied with the idea that the first shores encountered would be those of Zipangu and Cathay.

Valley of Machico, Madeira.

#### CHAPTER IV.

##### PASSAGE OF THE CAPE AND THE ATLANTIC—FIRST CIRCUMNAVIGATION OF THE GLOBE.

**P**ORTUGAL, now a second-rate power, occupies a high place in the history of navigation. To the Portuguese belongs the honour of taking the lead in the career of modern maritime discovery. Their efforts, dating from the early part of the fifteenth century, had reference to the Atlantic coasts of Africa; and transpired under the auspices of Don Henry, fifth son of John I. of Portugal, who married the eldest daughter of our John of Gaunt. The prince served under his father on African soil at the capture of Ceuta from the Moors; and was appointed governor of the city in acknowledgment of his bravery. While in this position, his curiosity was roused respecting the unknown western coast of the continent, by vague intelligence concerning the rich country of Guinea, obtained from the conquered natives around him; and having already entertained the design of attempting discoveries by sea, he resolved to devote all his means, ability, and influence to the prosecution of the task. Europeans, at that time, had not followed the line of the shore beyond Cape Non, about six hundred miles south of the Strait of Gibraltar.

This was soon doubled, and the navigation extended to Cape Boyador, a hundred and eighty miles further south. The bold promontory long baffled every effort made to pass it by mariners who proceeded closely hugging the land, as shoals extend from it far to seaward, giving rise to strong conflicting currents and a dangerous surf. Two cavaliers of the prince's household volunteered to renew the enterprise in the year 1418, but when near the dreaded cape, they were driven out into the open ocean by a violent gale, and the ship's company gave themselves up for lost. Land was, however, sighted on the abatement of the tempest. It proved to be a small island, to which the name of Puerto Santo was given, from its discovery upon the feast of All Saints. A dark spot was soon observed on the distant horizon, varying in distinctness with the weather. This was found to be a larger island, of lovely appearance, wholly uninhabited, and well clothed with trees, which, from that circumstance, was called by the explorers Madeira, 'wood.' A colony was sent thither from Portugal; the vine and sugar-cane were introduced, the latter procured from Sicily; and valuable produce was obtained, at a time when sugar was an article of luxury, strictly limited to the rich. But the island had been occupied for a short time before; according to a romantic tale, the leading features of which are historically true—in the reign of Edward III., a young Englishman in the service of the Black Prince, named Markham, fled the country with the fair Anne of Dorset, in order to avoid the anger of her relations. They intended to make their way from the Bristol Channel to the coast of France. But contrary winds drove the vessel far out of its course, and after a long series of tossings to and fro, it was cast upon the Madeira shores. Here the lovers are said to have both died, while their companions succeeded in reaching Marocco, and proceeded from thence to Spain.

Upon retiring from the seat of his government, Don Henry fixed his residence at Sagres, near Cape St Vincent, where the ocean was constantly in view. He devoted himself to the study of mathematics, astronomy, geography, and navigation; established an academy for the instruction of his countrymen in these sciences; and employed the greater part of his income as Grand-master of the Order of Christ in fitting out nautical expeditions, hoping to reach the southern extremity of Africa, and open round it a maritime path to the riches of India and the east. For the long period of half a century, this object was pursued with steadiness and perseverance. During his lifetime, the Canary and Cape Verde Islands were again discovered; and the coast of the continent was examined to the extent of fifteen hundred miles. Soon after his death, which took place in 1463, Portuguese mariners gave to their sovereign the title of 'Lord of Guinea,' and advanced to the islands of Fernando Po, St Thomas, and Annabon, the latter beyond the equator. Prince's Island, immediately north of the line, received that name in honour of Don Henry. In 1484, Diego Cam sailed along the shores of Congo and Benguela nearly to the southern tropic; and the problem of the southerly extension of Africa was solved by the next adventurer. This was Bartholomew Diaz, a knight of the royal household, whose name is at present borne by a steam corvette belonging to the Portuguese navy. He set out with three vessels in 1486. Having passed the limit of his predecessor, heavy gales carried the ships out to sea, and the land was lost sight of for a considerable period. Upon regaining it, and sailing some distance, its direction was found to be due east, and, without being aware of the fact at the time, the squadron had doubled the extremity of the continent. As the voyagers returned, they speedily came within view of the grand altar-like mountain, generally capped with clouds, which now overlooks Cape Town and Table Bay. Owing to the terrible storms encountered in the neighbourhood, the commander denominated the headland *Cabo Tormentoso*,

or the Stormy Cape, for which his sovereign substituted *Cabo de Boa Esperanza*, the Cape of Good Hope, as of better augury.

Ten years elapsed before Emanuel, king of Portugal, determined to send a fleet to explore the route to India through the gate which had thus been opened. Vasco de Gama, a man of good family, great courage, and tried skill in naval affairs, was at length commissioned to undertake this office, and put in command of three vessels, carrying altogether about a hundred and sixty men. As the time for sailing approached, Lisbon was thrown into excitement by the event. On the preceding day the crews repaired to a chapel four miles from the city, close to the sea, and spent there the whole night in prayer for success. The next morning the shore was crowded with spectators to witness the embarkation, while numerous processions of priests appeared in their robes chanting litanies. Gama left the Tagus on the 8th of July 1497, encountered severe tempests off the Cape of Good Hope towards the close of November, but safely crossed the Indian Ocean, arriving at Calicut, on the Malabar coast, in the spring of the following year.

Camoens, the national poet of Portugal, in his *Lusiad*, has celebrated this expedition. In a memorable passage, while the fleet lay near the Cape, he represents an apparition rising in the night, and hovering athwart the ships—the Spirit of the stormy deep—forbidding the mariners to disturb his repose by violating the unploughed waters beyond. This is one of the grandest of poetical fictions.

‘Rising through the darkened air,  
Appalled, we saw a hideous phantom glare;  
High and enormous o’er the flood he towered,  
And ’thwart our way with sullen aspect loured.  
An earthly paleness o’er his cheeks was spread,  
Erect uprose his hair of withered red—  
His haggard beard flowed quivering on the wind,  
Revenge and horror in his mien combined;  
His clouded brow, by withering lightnings scarred,  
The inward anguish of his soul declared;  
His red eyes glowing from their dusky caves,  
Shot livid fires :—far echoing o’er the waves  
His voice resounded; as the caverned shore  
With hollow groan repeats the tempest’s roar.’

Bartholemew Diaz, who perished in a tempest a few years later, is represented by the poet as having been engulfed in the abysses of the ocean, to satisfy the vengeance of the spectral guardian of the southern waters, upon whose solitude he was the first to intrude.

Gama returned by the same route, and arrived at Lisbon in September 1499, after an absence of nearly two years and two months. He was received with universal joy, obtained a patent of nobility, an annual pension, and the rank of admiral. But only fifty-five men returned with him, or little more than one-third, the rest having perished from natural causes, or by accident, or in skirmishes with natives of the shores at which they touched. Great mortality doubtless attended these early expeditions, but the statement of Father Vieyra, made in one of his sermons, is an obvious exaggeration. He says that ‘if the dead who had been thrown overboard between the coast of Guinea and the Cape of Good Hope, and between that Cape and Mozambique, could have monuments placed for them each on the spot where he sunk, the whole way would appear like one continued cemetery.’ King, court, and people now exulted in the thought of having secured a monopoly of the rich commerce of the east. The sovereign obtained from the pope the proud title of ‘Lord of the Navigation, Conquests,

and Trade of Ethiopia, Arabia, Persia, and India.' But other nations were speedily upon the track of the Portuguese, though for a time the value of the discovery of a passage to India by the Cape was little appreciated by Europeans in general, owing to a far greater achievement effected five years before. This was the Spanish discovery of utterly unknown lands across the Atlantic, at first supposed to be identical with those containing 'the wealth of Ormuz and of Ind.'

The brilliant exploit referred to, accomplished by Christopher Columbus, was long contemplated by him, and diligently prepared for. By birth a Genoese, by predilection a Spaniard, Columbus early mastered all the science of his time, directed special attention to ancient and modern geography, and firmly embraced the theory that lands lay at an accessible distance beyond the western waters of the Atlantic, forming the eastern boundary of Asia. In search of information he visited Madeira, the Azores, the Canaries, and England, proceeding from thence to Iceland; and by these voyages he became expert in all the arts of practical seamanship. Various circumstances of significant import confirmed him in his convictions. Thus, navigators had found canes and plants afloat on the ocean, which could not be recognised as the productions of any known region. At Madeira, pieces of carved wood, but evidently not cut with a knife, had been cast ashore; and at the Azores, bodies of men had been thrown on the coast, with features not at all resembling those of Europeans or Africans. These objects had been drifted from the western world by the Gulf Stream, precisely as at present, plants, seeds, and fruits, belonging to the torrid zone of America, are annually transported by that current to the coasts of Europe. The curious assertion was also made by the inhabitants of Madeira, that occasionally, in particular states of the weather, land might be seen on the horizon westward—an optical deception, analogous to that of the mirage of the desert. The same illusion is still common with the islanders along the west coast of Ireland, who call the imaginary territory St Brandon's Land.

Columbus was far from being alone in his belief concerning the existence of a great western region. Maps appeared on which lands were figured in the Atlantic entirely on speculation; and with remarkable foresight, Pulce, a Florentine poet, wrote respecting the old vulgar opinion of the Pillars of Hercules being the boundary of the world, as well as of other facts of physical science not clearly established in his day—

'Know that this theory is false; his bark  
The daring mariner shall urge far o'er  
The western wave, a smooth and level plain,  
Albeit the earth is fashioned like a wheel.  
Man was, in ancient days, of grosser mould;  
And Hercules might blush to learn how far  
Beyond the limits he had vainly set,  
The dullest sea-boat soon shall wing her way!  
Men shall descry another hemisphere.  
Since to one common centre all things tend,  
So earth, by curious mystery divine,  
Well balanced, hangs amid the starry spheres.  
At our antipodes are cities, states,  
And thronged empires, ne'er divined of yore.  
But see, the sun speeds on his western path,  
To glad the nations with expected light!'

While intensely anxious to put his views to the test by experiment, Columbus was too poor to equip an expedition with his own means; and had a long and tedious battle to fight with disappointments arising from vain appeals to others for help. He was often dispirited, and occasionally in despair, for fruitless applications were made to the governments of Genoa, Portugal, and England. Fortune smiled upon him at last, when his

prospects seemed most gloomy, owing to the failure of a negotiation with the court of Spain. But the sovereigns, Ferdinand and Isabella, suddenly changed their minds, and placed the requisite means at his disposal.

Three vessels were fitted out at the little port of Palos, for the bold attempt to remove the mystery from the western ocean, the Sea of Darkness of the Arabian geographers. These were the *Santa Maria*, the ship of the commander; the *Pinta*, under the orders of Alonzo Pinzon; and the *Nina*, under Yanez Pinzon, the brother of the preceding. The total number of the crews is not known with exactness, accounts varying from ninety to a hundred and twenty men. Columbus sailed on Friday the 3d of August 1492, made for the Canary Islands, and left them on the 6th of September for the westward, when the navigation of unknown waters commenced. A month passed away, in which great progress was made. But nothing had been visible except sky, sea, and seaweed, with some birds towards the close of the interval, which raised hopes of a shore being nigh at hand. Upon the failure of this expectation, and a change of wind favouring a return to Europe, the sailors became clamorous to be allowed to avail themselves of it. They remonstrated with the commander for persisting in an enterprise so obviously hopeless; then reproached him with being careless of their lives; and finding him inflexible, proceeded to threaten a general mutiny. Fortunately for Columbus, at this juncture birds appeared in greater numbers; a reed quite green floated by; the branch of a tree was seen with the berries upon it; and he ventured upon the prediction, that land would be met with the next day. That very night he saw a light ahead, while sitting in the stern of his vessel, and called the attention of others to it. But it passed away, and twice returned and disappeared. The light came from the "NEW WORLD, first discovered about ten o'clock on the night of October 11, 1492, after a sail of thirty-five days from the Canaries.

With the early dawn Columbus saw before him a low island covered with trees, and a shore upon which some astonished natives were collected. At sunrise he proceeded to it in a boat, accompanied by his fellow-commanders, with the standard of Castile and Leon displayed. Immediately on landing, the party reared a rude cross, paid their devotions before it, and then took formal possession of the island on behalf of their sovereigns, giving it the name of St Salvador. This was one of the Bahamas, with which Cat Island is commonly identified, where the spot is marked, on a prominent rock overhanging the bay, upon which the cross is supposed to have been planted. But Watling Island, another of the group, best answers to the description which Columbus has given of his land-fall. After some communication with the natives, a very inoffensive race, he resumed the voyage, fell in with several small islands, sailed along part of the north coast of Cuba, made a boating excursion up one of the rivers, and was in raptures with the scenery. 'Such was the delightfulness of the place,' he observed in his report, 'that I could have been tempted to remain there for ever. The water was so clear that we could see the sand at the bottom. The finest and tallest palm-trees I had ever seen in great abundance on either shore, with an infinite number of large verdant trees of other kinds. The soil seemed exceedingly fertile, being everywhere covered with the most luxuriant verdure; and the woods abounded with vast varieties of birds of rich and variegated plumage. This country, most serene prince, is so wonderfully fine and so far excels all others in beauty and delightfulness as the day exceeds the night.' He next visited the island of Haiti or St Domingo; and having loaded his ships with specimens of the inhabitants and productions of this new country, returned to Europe, entering the port of Palos on the 15th of March 1493, seven months and a half after sailing from it.

The public enthusiasm was unbounded on the return of the voyager. Ferdinand and

Isabella, when he appeared at court, rose to receive him; he was allowed free access to the royal presence; and a coat of arms was assigned him, representing a group of islands surrounded by waves, to which the motto was subsequently added:

‘To Castile and Leon  
Columbus gave a new world.’

To secure themselves in the possession of the discovered territories, and of all additions that might be made to them, the Spanish sovereigns obtained a bull from Pope Alexander VI., which made over to them all islands and mainlands, all cities, castles, places, and towns, with all their rights, jurisdictions, and appurtenances, found, or to be found, westward of an ideal line drawn from pole to pole, at the distance of a hundred leagues west of the Azores, as far as the meridian of 180°. All newly-disclosed lands, or lands hereafter to be met with, eastward of this line as far as the same meridian, were similarly vested in the Portuguese. ‘Let no person,’ said the pontiff, ‘presume with rash boldness to contravene this our donation, decree, inhibition, and will. For if any person presumes to do so, be it known to him that he will incur the indignation of Almighty God, and of the blessed apostles Peter and Paul.’ However consolatory this allotment might be to the parties named, it gave no satisfaction whatever to other princes, and the most orthodox of them were not disposed to acquiesce in it. England sent out expeditions into the region thus given away, without asking leave of the papal court; the French king shrewdly stated, that he should wish to see the will of Father Adam before he consented to such a partition of the globe; and both Spaniards and Portuguese disregarded the assignment when it suited their purpose to do so.

The impression of Columbus, that he had visited the skirts of India, was commonly adopted throughout Europe. It led to the natives being called Indians, a name applied to the aborigines of the entire continent of America; and when the error was found out, the discriminating epithet of West Indies was bestowed upon the group of islands. No difficulty was experienced in preparing a squadron for a second voyage, except what arose from the number of applicants eager to take part in it, some candidates for fame, others anxious for adventure, but most flushed with the hope of obtaining gold by the gathering. Seventeen vessels were this time assembled in the Bay of Cadiz, carrying about fifteen hundred persons of all classes, with a considerable number of horses and cattle. The admiral exulted in the prospect of speedily realising immense wealth. Yet his was no sordid ambition, for having seen the last of the Moors expelled from Spain, he proposed to expend the expected treasures in raising a vast army to rescue Jerusalem and the Holy Land from the yoke of the Saracens. He regarded this idea as suggested by divine inspiration; viewed himself as an instrument consecrated by Providence for the work of deliverance; and ventured to suppose himself the hero indicated in some passages of sacred prophecy. The fleet sailed on the 25th of September 1493. The islands of Dominica, Guadaloupe, and Jamaica were now added to the fruits of the former expedition; the coast of Cuba was further explored, with an increased belief in its continental character; a colony was planted in Haiti; the pine-apple was seen for the first time; but the anticipated gold, though often heard of, was not met with by the greedy adventurers, who vented their disappointment in quarrelling among themselves.

During the third voyage, commenced on the 30th of May 1498, the island of Trinidad, the mouth of the river Orinoco, and consequently the coast of South America, were discovered. In the fourth, last, and least successful expedition of Columbus, begun on the 9th of May 1502, he visited the coast of Honduras and the Mosquito shore. The great navigator was now an old man, in possession of ample experience of ingratitude

from coadjutors, and of the uncertainty of courtly dependence, soon to be increased. His first grand success made him an object of envy, and this laid the foundation for ill-usage when practicable from his associates, while defamatory voices succeeded in so far prejudicing the court against him, that the fulfilment of promised dignities and emoluments was evaded, when the latter were most needed. Had he died upon completing his first voyage, years of fatigue and anxiety would have been avoided, with not a little indignity, while all that he personally obtained by eight times crossing the Atlantic would have been acquired—the honour of an immortal name. Columbus returned to Spain in the year 1504, in impoverished circumstances; and even in personal want, while the crown was his debtor. ‘I receive nothing of the revenue due to me,’ he wrote to his son, ‘but live by borrowing. Little have I profited by twenty years of toils and perils, since at present I do not own a roof in Spain. I have no resort but an inn, and for the most part have not wherewithal to pay my bill.’ He died at Valladolid, on the 20th of May 1506, being about seventy years of age; and was first interred there, afterwards removed to Seville, then transported to St Domingo, and finally laid in the cathedral of Havannah. He never knew the real grandeur of his achievement, but retained to the last the firm conviction that he had but found a new path to countries known of old, instead of having opened the way to a continent containing the mightiest rivers and forests of the globe, with the longest line of towering mountains, including every variety of climate, and far surpassing in extent the world of classical geography.

An immediate and powerful impulse was given to naval adventure by the knowledge that the Atlantic might be passed in a few weeks to fair and fertile countries, apparently the portal to the long-heard-of oriental lands, teeming with wealth and wonders. The ocean seemed to have been suddenly divested of its power to harm, such was the general eagerness to traverse its waves. Many, doubtless, rushed upon death by too lightly regarding its perils, and hence embarking in fragile and ill-furnished craft. England was the first to follow the example of Spain. In the reign of Henry VII. there resided at Bristol a Venetian by birth, John Cabot, who, with his celebrated son Sebastian, sailed from that port under letters-patent from the crown, with the view of getting to Cathay and India by a passage northward of the route to the new Spanish discoveries. Though the immediate object proved a visionary one, they reached Newfoundland and the coast of Labrador in the summer of 1497, while Columbus did not see the mainland of America at the mouth of the Orinoco till the summer of 1498; and thus the first view of the actual continent was obtained by an expedition from our own shores. A local manuscript records the fact, that ‘in the year 1497, the 24th of June, on St John’s Day, was Newfoundland found by Bristol men, in a ship called the *Matthew*.’ Sebastian Cabot visited the same region in the following spring, and explored a considerable extent of coast, ‘affirming that in the month of July there was such cold and heaps of ice that he durst pass no further; also, that the days were very long, and in a manner without night.’ It is a remarkable instance of capricious fortune that *Amerigo Vespucci* had not at this time crossed the ocean, yet his name was allowed to overspread the whole continent, while no bay, cape, or headland, recalls the memory of the Cabots. The Italian went out under a Spanish commander in the year 1499, and returned to produce an account of the countries he had visited. It appeared just before the death of Columbus, and as the readers of that day were indebted to him for the first supply of information relating to the New World, they, unconscious of any practical injustice, awarded to him the honour of furnishing it with a general denominative.

The Portuguese followed in the track of the English, influenced by the same chimerical

hope of finding a north-west passage to the 'gorgeous east;' but sore misfortune attended their efforts. Gaspar Cortereal, in the year 1500, sailed from Lisbon northward as far as Greenland, ran along the coast of Labrador and Newfoundland, and entered the mouth of the St Lawrence, which seemed to be the opening he was in search of. Returning to examine it in the following year, with a companion-vessel, his ship was separated from her consort in a storm, and never heard of again. Michael Cortereal then went out with three vessels to seek for his lost brother, but he too parted company with his comrades, and no trace of him was ever found. A third brother, the eldest, connected with the court of Portugal, wished to sail in the route of his relatives, hoping to find them still alive on some friendly shore, or to ascertain their fate, but the king would not allow the peril to be encountered a third time. In memory of these disasters, the sea at the entrance of the St Lawrence was long called by the Portuguese The Gulf of the Three Brothers, and one of its sinuosities bears at present the name of Gaspar Bay. At the same period a great fleet under Cabral sailed in the path of Vasco de Gama, which, being carried westerly by the equatorial current, fell in with the coast of Brazil. Though this expedition afterwards met with a severe calamity, four ships foundering during a furious hurricane, one of which contained Bartholemew Diaz, the remainder doubled the Cape, made for the second time the voyage to India, and returned freighted with valuable cargoes.

Before the decease of Columbus, his adopted countrymen, some of whom had been his companions, enlarged the field of his discoveries; and with singular rapidity the illustration of transatlantic shores was advanced, owing to the activity of the navigators of Spain. Yanez Pinzon, one of the commanders under the great admiral in his first voyage, reached South America near Cape St Roque, sailed northward from thence to the vast mouth of the Amazon River, and conveyed to Europe the first specimen of a marsupial quadruped—a living opossum. He made known also, on a subsequent occasion, in company with De Solis, the country of Yucatan. Bastidas examined the shores of Venezuela; and interesting results were obtained by adventurers in pursuit of most fantastic objects. Thus it passed current for some time that in the midst of a region bright with gems there was a life-renovating fountain, which endowed with perpetuity of youth the happy man who should quaff its ever-flowing waters. In quest of this fairyland, said to be an island by the Indians who reported the fable, Ponce de Leon sailed from Porto Rica, in 1512, with a squadron of three ships fitted out at his own expense, and effected the discovery of Florida. But there the arrow of an Indian extinguished for ever in his breast the hope of gaining a terrestrial immortality.

The inland exploration of the new continent was commenced by Nunez de Balboa, who made his appearance as a mere soldier of fortune, and raised himself to the post of governor of the small colony of Santa Maria, established on the shore of the Gulf of Darien. He was the first European who caught sight of the Pacific Ocean. Pizarro served under him. To obtain gold was his supreme aim, as it was unhappily that of his countrymen in general. Coming into possession of a considerable quantity of the precious metal, acquired from the natives in a marauding expedition, the Spaniards eagerly divided the spoil, yet brawls arose from a suspicion of unfair proceedings. A friendly Indian stood by, the son of a cacique, and observed with surprise the anxiety relative to an object of small value in his own esteem. Striking the scales with his hand, and scattering the gold on the ground, he exclaimed: 'Why should you quarrel for such a trifle? If this gold is indeed so precious in your eyes, that for it you forsake your homes, invade the peaceful lands of strangers, and expose yourselves to such sufferings and perils, I can tell you of a province where you may gratify your wishes to the utmost. Behold

those lofty mountains!' said he, pointing to the south. 'Beyond these lies a mighty sea, which may be discerned from their summit. It is navigated by people who have vessels not much less than yours, and furnished like them with sails and oars. All the streams which flow down the southern side of those mountains into that sea abound with gold; and the kings who reign upon its borders eat and drink out of golden vessels. Gold is as plentiful and common among these people of the south as iron is among you Spaniards.' From that moment Balboa was intent upon a journey inland. Yet, well aware of hostile tribes lying in the way, he sent to St Domingo for reinforcements, and received a small contingent.

With some native guides, and a hundred and ninety soldiers and followers, Balboa set forth, and after a toilsome journey of twenty-six days across the isthmus, passing through tangled woods and over difficult heights, the party approached the base of the last ridge to be surmounted. There a halt was made for the night. In the early dawn of September 26, 1513, the ascent commenced; and by ten o'clock the summit only remained to be climbed. The leader went up alone, and beheld the wondrous scene. Immediately below, his eyes fell on rock and forest, green savannahs and rushing streams, while beyond were the waters of an ocean apparently interminable, resplendent with the light of the morning sun. Balboa fell upon his knees, stretched out his arms towards the sea, wept for joy, and returned thanks to Heaven for conducting him to such a grand discovery. Poetry has not overlooked this scene, though strangely enough, the conqueror of Mexico is associated with it:

'Then felt I like some watcher of the skies,  
When a new planet swims into his ken;  
Or like stout Cortez, when with eagle eyes  
He stared at the Pacific, and all his men  
Looked at each other with a wild surmise,  
Silent, upon a peak in Darien.'

Beckoning to his followers, they ascended, and displayed the same transport. A priest among them began the chant, *Te Deum laudamus*. After this, a tall tree was felled, of which a cross was formed, and erected on the spot. On descending to the shore, the commander advanced into the water; and holding his sword in one hand, with the banner of Castile in the other, he exclaimed in a loud voice: 'Long live the high and powerful king and queen of Castile; in their name I take possession of these seas and regions; and if any other prince, either Christian or Pagan, should pretend to have any claim or right to them, I am ready to oppose him, and defend the right of their lawful possessors.' From some natives, the information respecting a gold country to the south was confirmed, referring to Peru; and the figure of one of its characteristic animals, the llama, was rudely sketched on the sand. The Spaniards mistook the form for that of the camel, a beast of burden peculiar to eastern countries, and as they were presented with some pearls, a noted oriental product, they believed themselves to be at the gates of the East Indies. Owing to the isthmus running nearly east and west at the point where it was crossed, the ocean was seen in a southerly direction. Thence it was called the South Sea, a name which was in use long after its inappropriateness to the vast Pacific was known. The particular site was styled after St Michael, on whose festival it was discovered, and his name is still attached to a great bay on the east of Panama. Though tidings of the event were received by the court of Spain with delight and triumph, no reward for the service was bestowed; but, in the spirit of favouritism, a successor was despatched, with an ample force to occupy a post which was likely to become important and profitable. The minion appointed, acted with infamous perfidy towards Balboa. Jealous of his fame and dreading

his ability, he caused him to be brought to trial on a false charge, procured his condemnation; and he was publicly executed in the scene of his late government.

In search of a passage to the great ocean which had thus been revealed, De Solis, in 1514, examined the coast of Brazil from north to south, found the mouth of the great La Plata river, and unfortunately landed on the shore. Proceeding incautiously, he was captured by the natives, with five of his companions, and they were all killed, roasted, and devoured, in the sight of those who remained on board. Had it not been for this horrible catastrophe, he would in all probability have reached the strait leading westerly out of the Atlantic, through which another navigator very soon groped his way, and with which his name is permanently associated. Ferdinand Magellan, or, according to the orthography given to Sir Joseph Banks by one of his descendants, Fernando de Magalhaens, by birth a Portuguese, had made a voyage to India and Malacca, regions with which a lucrative commerce was by this time carried on by his countrymen. Thus familiar with the south extremity of Africa, he sagaciously conjectured that most likely the southern part of America corresponded to it in being washed by an open sea. His own sovereign not encouraging an attempt to verify this idea, he turned to Spain, and laid the proposal before the emperor Charles V. at Valladolid, to explore a westerly route to the Moluccas, and thus share in the profit of direct communication with the Spice Islands. This project being approved, five ships were equipped, the *Trinidad*, carrying his own flag as admiral, the *San Antonio* commanded by Juan de Carthagena, the *Vittoria* by Luis de Mendoza, the *Conception* by Gaspar de Quesada, and the *Santiago* by Rodriguez Serrano. The total number of the men amounted to two hundred and thirty; Pigafetta, an Italian, who wrote an account of the expedition, went out as a gentleman-adventurer. To his narrative Shakspeare seems to have been indebted for his demon Setebos, said to have been revered by the Patagonians, thus mentioned in the *Tempest*:

‘I must obey: his art is of such power,  
It would control my dam’s god, Setebos,  
And make a vassal of him.’

The squadron sailed on the 20th or 21st of September 1519, from the port of San Lucar, steered for the Canary Islands, and then westward for the coast of Brazil.

The commander had early experience of great difficulties from the mutinous spirit of his officers, and shewed the energy of his character in repressing it, but some of his measures have left a stain upon his name. One of his captains, Luis de Mendoza, a principal malcontent, he caused to be privately assassinated, and openly executed another the next day, Gaspar de Quesada. More than a twelvemonth passed away before Magellan discovered the strait which separates the mainland of South America from the island of Tierra del Fuego. He entered it towards the close of October 1520, and gained the opposite extremity, opening into a vast sea, on the 27th of November. But before quitting the Atlantic, one of his vessels, the *Santiago*, was lost by shipwreck; while the *San Antonio* parted company, intentionally, from the commander’s cowardice, and returned to Europe. Having cleared the channel, which has since been called the Strait of Magellan, he commenced with three ships the passage of an ocean of unknown extent, wholly untried by Europeans, and gave it the misleading name of the Pacific, as delightful weather and fair breezes wafted the mariners smoothly across it. But the crews suffered fearfully owing to a strange disease, evidently the scurvy, and from the want of provisions. They had to drink putrid water, chew scraps of leather, eat saw-dust, and the mice on board were so highly prized as to sell for half a ducat apiece. For more than three months, and through a course of 2500 geographical miles, no land was

seen except two barren and solitary islets. But on the 6th of March 1521, three beautiful and apparently fertile islands were met with, which were called the Ladrões or Thieves, from the pilfering propensity of the inhabitants. Some members of the present Philippine group were subsequently visited; and here, on the 27th of April, Magellan lost his life in a rash skirmish with the natives. Though thus cut off, he may be justly considered the first circumnavigator of the globe, on account of his previous voyage by the Cape to India and Malacca, while he fell on the skirts of those regions, and gained them by a westerly route.

The squadron proceeded to Borneo, and then to the Moluccas, where the spices of the islands were noticed—nutmegs, cloves, mace, ginger, and cinnamon, growing almost spontaneously—and a bird of exquisite beauty was remarked, called by the natives the 'bird of God,' now familiar as the bird of Paradise. But the three vessels were speedily reduced to one. Sickness had so thinned the crews, that the *Conception* was burned, after guns and stores had been removed, while the *Trinidad*, not being sea-worthy, was left behind, and ultimately fell into the hands of the Portuguese. The remaining ship, the *Vittoria*, under Sebastian del Cano, elected to the command, was brought safely home by the Cape, and entered the port of San Lucar, on the 6th of September 1522, after an absence of nearly three years. Only eighteen men out of two hundred and thirty returned. 'Thus,' says Pigafetta, 'our wonderful ship, taking her departure from the Straits of Gibraltar, and sailing southwards, through the great ocean towards the Antarctic Pole, and then running west, followed that course so long that, passing round, she came into the east, and thence again into the west, not by sailing back, but proceeding constantly forward; so compassing about the globe of the world, until she marvellously regained her native country, Spain.' The ship is said to have been long preserved, and called forth many an effusion from the national poets and romancers. Her commander was liberally rewarded, obtained a patent of nobility, with a globe for a crest, and the motto *Primus me circumdedisti*, 'You first encompassed me;' and beyond the possibility of doubt, the spherical form of the earth had now been demonstrated.

While this memorable voyage was in process, and during the next twenty years, the interior of the New World was extensively made known to Europeans by their aggressions and conquests, dictated by rapacity, in which the natives largely perished by the sword, and more slowly by exhausting labour in the mines. Cortes overran Mexico, accomplished an extraordinary march of a thousand miles to Honduras, discovered the peninsula of California, and sailed within its gulf. Pizarro reduced Peru; Almagro and Valdivia effected the conquest of Chili; and Orellana traversed the breadth of South America, from the Andes to the ocean, by the Amazon and its tributaries. In 1531 the Portuguese started their first Brazilian colony at Rio Janeiro, and soon afterwards founded Buenos Ayres. Within the interval referred to, the French began to contribute to geographical discovery, surveying the whole Atlantic coast of the North American States, and ascending the river St Lawrence to the neighbourhood of the great lakes. This last enterprise was effected by Jacques Cartier, an experienced Breton mariner, who reached the shore of Gaspé Bay in the year 1534, and erected a cross thirty feet high, with a shield bearing the *fleurs de lys* of France, thus taking possession of it for his sovereign, according to the fashion of the time. During a second voyage, in the following year, he pushed his way up the stream to a bold headland frowning over it—part of a rocky wall three hundred feet high—and moored his craft hard by in a convenient haven. With the exception of his three small barks and a little Indian village, the country seemed as if freshly come from the hand of the Creator. No other trace of man or of his works appeared. From the top

of the highest eminences to the distant horizon, in every direction, down to the water's edge, the eye wandered over the dense forest; and hill and valley, mountain and plain, were covered with the deep green mantle of the summer's foliage. At this very spot there are now verdant pastures and cultivated fields, ships of war and merchandise, with a large and opulent capital—Quebec.

Leaving two of his vessels at this station, intended to serve for winter-quarters, the bold Bréton proceeded up the river, anxious to make further discoveries. He reached the native town of Hochelaga, ascended a lofty hill in the neighbourhood, overlooking a prospect of singular beauty, and called the eminence Mont Royal. The name has since been corrupted into Montreal, and extended to the fine modern city on the site of the old wigwams, and to the island on which it stands. On a subsequent occasion he attempted to advance more to the westward, but was baffled by the difficult navigation, and only heard of a great lake in the distance—the fine expanse of Lake Ontario. European eyes had now gazed for the first time on the grand rapids above Montreal, which are only to be safely passed by hardy boatmen familiar with them; on the junction of the Ottawa with the St Lawrence, at the rapids of St Anne; and on the numerous wooded islands, of every variety of size and shape, which divide the main stream into a labyrinth of tortuous channels. The natives consisted chiefly of the Iroquois, or Five Nations, on the south bank of the river, independent of each other, but usually acting in concert to resist an enemy; of the Hurons and Algonquins, their hereditary foes, on the northern shore—tribes of the Red Indian family, whose fate forms one of the saddest chapters in the history of the sons of Adam. They gradually faded away before the whites, struck down by unknown weapons of destruction, consumed by the deadly fire-water, and ravaged by small-pox, while dispossessed of their hunting-grounds by the stranger, till only a remnant now remains, few and feeble, faint and weary, 'fast travelling to the shades of their fathers, towards the setting sun!'

Quebec, from the St Lawrence.

The Falkland Islands.

## CHAPTER V.

### NORTH-EASTERN, NORTH-WESTERN, AND NORTH-POLAR VOYAGES.

**V**IEWED in the light of present knowledge, it is scarcely possible to conceive of a wilder project, than that of sailing round the northern shores of Europe and Asia, as a practicable route to India and China. Yet a scheme to this effect commended itself to the judgment of Sebastian Cabot; and the merchants of London resolved to attempt to open a north-east passage to the mysterious region of Cathay. This was in the year 1553, during the reign of Edward VI. The capture of Constantinople by the Turks, and the discovery of the passage by the Cape, had broke up the ancient channels of oriental commerce, and thrown the carrying-trade between the east and west almost entirely into the hands of the Portuguese, with whose naval strength the English did not feel themselves competent to cope. This circumstance suggested the endeavour to find out a new and perhaps an easier route in the direction stated. The obstacles to such an undertaking could not then be appreciated. Nothing was known of the northerly extension of Asia, and of the immense masses of ice with which its polar shores are encumbered through the greater part of the year. Three vessels were fitted

out for the enterprise, and licensed by the crown to 'discover strange countries.' So confident were the promoters of the expedition of its success, that the ships were sheathed with lead to defend them from the worms of the tropical waters, a practice long adopted by the Spaniards, but now for the first time mentioned in our annals. The squadron consisted of the *Bona Esperanza*, of 120 tons, on board of which was the commander, Sir Hugh Willoughby, with a master, mate, and thirty-six seamen; the *Edward Bonaventura*, of 160 tons, under Richard Chancellor, pilot-major of the fleet, with a master, mate, chaplain, surgeon, and fifty seamen; and the *Bona Confidentia*, of 90 tons, under Cornelius Durforth, with twenty-two seamen. Besides the crews, six merchants embarked with the commander, nine with the pilot-major, and three in the third vessel. The ships were victualled for fifteen months; but more than half the adventurers were cut off by a grave disaster close to the western side of the entrance to the White Sea, though some very interesting results were attained by the survivors. Sir Hugh was the third son of Sir Henry Willoughby, of Wollaton, near Nottingham, ancestor of the present Lord Middleton. He had served with distinction in several campaigns on the Scottish border, and was recommended to the mercantile community by his 'goodly personage, for he was of tall stature, and also of singular skill in the services of war.' Cabot held at that time the office of grand pilot of England, but is supposed to have been prevented by age from accompanying the expedition. But he prepared a series of instructions for the guidance of the mariners, which enjoined them to employ persons skilful in writing to record the course taken, the appearances of the land by which they passed, and of the heavenly bodies. Morning and evening prayers were to be read on board each ship. It was ordered that there should be 'no ribaldry or ungodly talk, dicing, carding, tabling, or other devilish games.' The foreigner was to be treated with gentleness and courtesy, but the hint was given, worthy of all reprobation: 'If he be made drunk by your wine or beer, you shall know the secrets of his heart.'

The vessels sailed from Deptford on the 11th of May. They fired guns on passing Greenwich, where Edward VI. was then residing; and the crews appeared in their best attire, a light blue. But the youthful sovereign was fast sinking under a mortal malady, and could not quit his couch to witness the spectacle. Contrary winds detained the squadron near the coast till towards the close of June. Off Harwich, two surgeons were taken on board the ship of the commander. By the end of July, the North Cape had been passed, which then first received that title; and soon afterwards the vessels were separated by a storm. The *Bona Esperanza* and *Bona Confidentia* again joined company; but Chancellor's ship, the *Edward Bonaventura*, finally parted from them, and safely entered the White Sea. The separation took place early in August, and from that time the only information respecting the companion-vessels, while the crews were alive, is derived from a journal purporting to be Sir Hugh Willoughby's, found on board the ill-fated *Esperanza*.

After beating about on the tempestuous ocean, the two ships entered an inlet with convenient anchorage-ground on the Lapland coast, September the 14th. This has been identified as Nekouev Bay, near the Sviätoi Noss, or Holy Point, at the mouth of the White Sea, where a whirlpool forms at intervals diurnally, and was formerly the dread of mariners. The point is a long tongue of land, projecting from the main shore in a direction diagonal to it. The inlet formed between them opens towards the flood-tide, which rushes into it with considerable velocity; but, being arrested at the extremity, the accumulated water escapes from the *cul-de-sac* by a return current along the side of the promontory. Encountering at an angle off its termination the general tide-waves of the

ocean, the collision occasions violent disturbance and a powerful eddy, which starts into activity with the flood-tide, and relaxes with the ebb. The ignorant natives of the coast, on approaching the spot in their frail craft, were long accustomed to propitiate the spirit of the waters with offerings of meal, butter, and other victuals, placed on an adjoining rock, hoping thereby to secure for themselves a safe passage. Attempting to round the Sviatoi Noss, baffling winds were encountered by Sir Hugh, which, together with the foaming billows, induced him to return to his station in Nekouev Bay. This was reached September the 18th. After waiting in vain a week for favourable weather, and seeing only the signs of winter, which commenced with severity and at an unusually early date, the commander despaired of continuing his voyage, and determined to pass the dreary season where he was. It became the harbour of death to the entire party. 'This haven,' says the journal, 'runneth into the main about two leagues, and is in breadth half a league, wherein are many seal fishes and other great fishes; and upon the main we saw bears, great deer, foxes, with divers strange beasts, as clans and such others, which were to us unknown and also wonderful. There, remaining in the haven the space of a sevendnight, seeing the year far spent, and also very evil weather, as frost, snow, and hail, as though it had been the depth of winter, we thought it best to winter there. Wherefore we sent out three men south-south-west to search if they could find people, who went three days' journey, but could find none. After that we sent other three westward four days' journey, which also returned without finding any people. Then sent we three men south-east three days' journey, who, in like sort, returned without finding of people, or any similitude of habitation.'

This desolation of the country is an annual occurrence, for the fishermen who visit the shores in summer retire into the interior to spend the winter. The month of October must have been far advanced before the last exploring-party returned from the fruitless quest of succour. The days were then rapidly shortening. Towards the close of November, the sun would cease to appear above the horizon, leaving the mariners exposed to the cold of a two months' wintry night. They were not prepared for its severity by experience, or probably by correct information, nor could they obtain the means of sustaining it, as the neighbourhood supplied no wood for fuel. To add to their misery, there is evidence that the season was unusually rigorous in the Arctic zone. Hence, in the following spring, when the native fishermen repaired to the coast, the two ships were found in Nekouev Bay, deeply covered with the snow-drift, and the stiffly-frozen corpses of the crews lay beneath the chilling pall which nature had thrown over them. How much they suffered—when their last agony came—and who survived the longest—no one knows.

'Miserable they,

Who, here entangled in the gathering ice,  
Take their last look of the descending sun;  
While full of death, and fierce with tenfold frost,  
The long, long night, incumbent o'er their heads  
Falls horrible. Such was the Briton's fate,  
As with *first* prow—  
He for the passage sought, attempted since  
So much in vain.'

Sir Hugh Willoughby's signature to the will of his kinsman on board, Gabriel Willoughby, dated towards the end of January 1554, proves that he was alive at that period. He may have lingered to witness the sun remount the horizon, expiring as the winter was about to relax its icy grasp. At Lord Middleton's seat, Wollaton House, Nottinghamshire, a portrait of Sir Hugh was formerly shewn, with some clothes reputed to have been those in which his body was found. His remains are said to have been brought to

England, but this is very doubtful. Their disposal has escaped a chronicle, owing to the distracted state of the nation after the accession of Queen Mary, which largely diverted public attention from the fate of the unfortunate voyager.

The first English ship to enter the White Sea was thus the *Edward Bonaventura*, under Chancellor. Its commander, and his companions, Stephen Burrough the celebrated navigator, John Stafford the chaplain, Thomas Walter the surgeon, George Burton and Arthur Edwards, two merchants, with the remainder of the crew, were the first Englishmen who set foot upon its shores, and entered the Muscovite dominions. This was on the 24th of August, while Willoughby was tossing on the ocean westward of the Sviatoi Noss. The adventurers landed at Nenocksa, a small place on the main shore of the southernmost mouth of the Dwina, hard by the convent of St Nicholas, where some salt-works were carried on, and have been since continued. They proceeded up the river to Cholmogory, the head town of the district, Archangel not being then in existence; and were from thence forwarded by the authorities more than a thousand miles in sledges to Moscow, where an open letter from Edward VI., already in his grave, was presented to the czar, Ivan IV. the Terrible, written in several languages. It recited, among other particulars, as follows: 'We have permitted the honourable and brave Hugh Willoughby, and others of our dear and faithful servants who accompany him, to proceed to regions previously unknown, in order to seek such things as we stand in need of, as well as to take to them from our country such things as they require. This will be productive of advantage both to them and to us, and establish a perpetual friendship and an indissoluble league between them and us; whilst they permit us to receive such things as abound in their territories, and we furnish them with those of which they are destitute.' Ivan received his visitors graciously, sanctioned the project of trade between the two countries, and admitted them to view familiarly the barbaric splendour of his court. 'The prince called them to his table, to receive each a cup from his hand to drinke, and took into his hand Master George Killingworthe's beard, which reached over the table, and pleasantly delivered it over to the metropolitan, who, seeming to bless it, said in Russ: "This is God's gift." A most extraordinary beard it was, according to the account in Hakluyt, 'not only thick, broad, and yellow coloured, but in length five foot and two inches of assize.' Chancellor was dismissed in the following spring, with a letter from the czar to Edward IV., dated from 'our lordly house and castle,' and returned home in safety by the route he had pursued.

The merchant-adventurers deputed their agent to revisit Moscow, arrange more explicitly with reference to trade, and special instructions were given to ascertain if there was any passage through Russia, by land or sea, to Cathay. On coming back from this mission in 1556, having obtained favourable commercial terms, Chancellor was accompanied by Osep Neped as ambassador from the czar, with sixteen of his countrymen. The voyage was most disastrous. The ship was wrecked in Pitsligo Bay on the east coast of Scotland, and Chancellor perished, with most of his crew. But the ambassador escaped, and was the first Russian who ever visited our shores. He entered London amid the acclamations of the crowd, was feasted at Guildhall, appeared at the court of Queen Mary, and the English Russian Company was incorporated, occupying a house in Seething Lane. Ship after ship, and agent after agent were despatched from the Thames to the Dwina. A factory was established at the mouth of the latter river, on Rose Island, which obtained that name from the quantity of wild-roses seen on it by the commercial settlers. They covered from four to five acres, near a birch and pine wood. Beautiful pinks were also observed. Some of the roses were brought to England, and are mentioned by Parkinson, in the former part of the seventeenth century, under

the name of the 'wild bryer of Muscovie.' Other factories were established at Cholmogory, Vologda, and Moscow; and the town of Archangel arose in consequence of the opening commerce.

The produce imported by the company consisted of train-oil, tallow, flax, hemp, tarred ropes, elk hides, and hides in general for tanners. Inquiry was made after a certain kind of wool, 'very good in those parts for hats and felts, of which the Tartarians are accustomed to make their cloaks;' and upon information being obtained of the country yielding a great quantity of yew, the directors pricked up their ears, and ordered it to be examined, 'because it is a special commodity for our realm.' The age of Robin Hood and Chevy Chase, of which the line is characteristic—

'Draw, archers, draw your arrows to the head,'

was not entirely over then in England. The bow was still distinctive of our yeomen in war and foresting. But the silver fir had been mistaken for the yew, which does not flourish so far to the north. The first shipment of English goods to any amount arrived at the Dwina in 1557. It consisted chiefly of London cloth, so called from the outport; and of Hampshire kerseys, the manufactures of that county. Already the Russian taste for gay colours seems to have been known, for, of the kerseys, two pieces were yellow, fifteen green, five ginger-coloured, fifty-three red, forty-three blue, and four hundred were sky-blue. Salt, sugar, manufactured goods of various descriptions, artillery, and warlike stores followed in considerable quantities, with some musical instruments, for the tones of the organ and virginal were now for the first time heard in Moscow. 'The people wondered and delighted,' says the agent, 'at the loud and musical sound thereof, never seeing nor hearing the like before. Thousands resorted and stayed about the palace to hear the same; my man that played upon them much made of, and admitted into such presence often where myself could not come.' It is curious to find corn among the early shipments, but this was during a dreadful famine. Sharp practices on the part of the native dealers seem to have been suspected by the company, for its servants were early admonished to make their bargains plain, and set them down in writing. At the same time, some of its own representatives misconducted themselves, for they were rebuked for tippling, hound and bear keeping, and extravagant expenditure in silks and velvets.

Elizabeth, having ascended the throne, returned the compliment of the czar, by appointing a representative at his court. This was Mr Anthony Jenkinson, an intelligent and resolute man, who published the first map of Russia that was ever made. Previous to his appearance as ambassador, he had been in the country as an agent of the company, and made an extensive journey with the view of finding a commercial route into the interior of Asia, and thereby communicating with India and China. He started from Moscow in April 1558, and descended the Volga to Astrachan with some companions and goods. It was a year of famine, pestilence, and civil war; the country was largely depopulated; and so intense was the distress of the survivors, that they offered their children for sale into slavery at the price of a small loaf of bread apiece. Ramparts of earth surrounded the city; all the houses were of the meanest description, except the governor's; and fish, especially sturgeon, was the only food of the inhabitants. They were hung up in the streets and dwellings to dry, in consequence of which the air was infected; and the myriads of flies attracted to the carcasses formed an intolerable pest. Jenkinson gained the Caspian in August, and coasted it to the opposite side, exhibiting the St George's Cross at the head of his vessel. From the eastern shore he proceeded with a caravan of camels to the Oxus, and advanced as far as the city of Bokhara, where he learned that the trade with China had been suspended by wars for

upwards of three years. Thus disappointed in his principal object, he retraced his steps, and reached Moscow in September 1559. A journey of seventeen months through unknown countries and lawless tribes, conducted with safety, is in the highest degree creditable to the boldness and prudence of the traveller.

His employers at home were not discouraged by this result. They procured a letter from the queen, written in Latin, Italian, and Hebrew; placed under his care not only kerseys and scarlet, but cloth of gold, plate, sapphires, and other jewels; and Jenkinson was once more upon the Caspian in 1562, seeking to establish trade with the Persian provinces on the southern shore, and through them with the remoter East. But the scheme was marked by the ignorance not less than by the boldness of early mercantile enterprise, for it was speedily apparent that no goods could bear the cost entailed by the transport, even had no obstacle been offered to trade by the unsettled state of society. But the whole country was in extreme confusion. 'To travel,' wrote one of those employed, 'is miserable and uncomfortable, for lacke of townes and villages to harbour in when night cometh; beside the great danger we stand in for robbing by these infidels, who do account it remission of sinnes to wash their hands in the blood of one of us. Better it is, therefore, in mine opinion, to continue a beggar in England.' Of much the same opinion was Mr George Turberville, though a resident within the walls of Moscow as secretary to the embassy. He was a rhymster, and occupied his leisure in writing poetical epistles to his friends at home, one of whom had the name of Dancie. A ditty begins as follows, modernising the orthography:

'My Dancie, dear, when I recount within my breast,  
My London friends and wonted mates, and thee above the rest;  
I feel a thousand fits of deep and deadly woe,  
To think that I from land to sea, from bliss to bale did go.  
I left my native soil, full like a reckless man,  
And unacquainted with the coast, among the Russies ran;  
A people passing rude, to vices vile inclined,  
Folk fit to be of Bacchus' train, so quaffing is their kind;  
Drink is their whole desire, the pot is all their pride,  
The soberest head doth once a day stand needful of a guide.  
If he to banquet bid his friends, he will not shrink  
On them at dinner to bestow a dozen kinds of drink.'

Failing in this direction, the English merchants turned their thoughts to another quarter, and sought to establish trading intercourse with the East by way of the Levant, Aleppo, the Euphrates, and Persian Gulf. But after the days of the Armada, confidence being felt in their own navy, as able to cope with the Spanish and Portuguese forces on the seas, the route by the Cape was adopted towards the close of the century.

In the meantime, the project of sailing round the north of Asia had not been lost sight of, for, while Chancellor was negotiating with Russia, the attempt was renewed by Stephen Burrough, who had taken part in the original expedition. He went out in the *Speedthrift* in 1556, made the island of Waigatz, and discovered the south coast of Nova Zembla across the intervening channel, where further progress was arrested by ice and easterly winds. Another effort was made in 1580 by Pet and Jackman in two vessels. Great perils were encountered and a sore disaster occurred. Dense fogs enveloped the ships, while ice-fields separated them, and they communicated by beating drums and firing muskets. They finally parted company, and Pet made good his passage home, while nothing was ever heard of Jackman till our own time, and though his fate was conjectured, it was different to the general supposition. Dr Hamel has illustrated it from Russian sources. It seems that the unfortunate navigator gained the mouth of the Obi, with the view of entering the river to pass the winter, but there his vessel was wrecked.

At that time Yermak the Cossack was engaged in the conquest of western Siberia. Mistaking the Englishmen for his confederates, or at least hostile visitors, the Samoiedes despatched the entire crew.

The Dutch now took up the question of a north-east passage. Having but recently emancipated themselves from the yoke of Spain after a terrible struggle, they were anxious to avoid the seas where the Spaniards were formidable, and therefore sought to find a route to India where there was no chance of meeting with their old oppressors. This led to the three voyages of Barentz, 1594—1597, who discovered Spitzbergen, and reached the north extremity of Nova Zembla. In that dreary and inhospitable region, on the last occasion, towards the close of August, the ice suddenly closed around the voyagers, reduced in number to seventeen persons; and they were compelled to remain through the winter, enduring the hardships of their imprisonment with admirable resignation. They were doubtless the first human beings from the civilised world to survive the rigour of the season in so high a latitude. An interesting journal remains of their sufferings from the cold, their contrivances to protect themselves from it, and their schemes to measure time, for the touch of the ice-king stopped all their time-pieces. The ship being so much damaged as to be uninhabitable, they built a cabin on the adjoining shore, for which, happily, there was drift-wood at hand. It served them as well for fuel, though the search for it exposed them to the utmost severity of the weather, and to great danger of attack from the bears. Often was Bruin heard snuffing and growling around the hut, anxious to get in, and make a meal of the inmates. On the 4th of November, the sun ceased to rise above the horizon, and at the same time the bears discontinued their visits. White foxes succeeded them in great numbers, and being readily taken in traps, furnished a supply of food and clothing. On the twelfth night after Christmas, the men were so far cheerful as to elect a gunner as king of Nova Zembla. The sun re-appeared on the 27th of January, and the bears returned to resume their prowls and growls. But the weather continued so inclement and boisterous, that it was not till June that escape became practicable. The ship was far too much disabled for the weak crew to repair the damage. They embarked therefore on the 13th, in the two small boats belonging to the vessel; but on the 26th Barentz died, overcome with hardships, to the great grief of his men. The survivors marvellously succeeded in escaping destruction from the masses of floating ice in such frail barks; and made a voyage of eleven hundred miles to a port on the White Sea; one of the most remarkable voyages on record.

We now turn from the north-east to the north-west, in which direction the hope was long cherished of finding a practicable navigable path to the eastern world. Under the patronage of Dudley, Earl of Warwick, in 1576, two vessels sailed with Martin Frobisher in quest of such an outlet. He sighted the south extremity of Greenland, steered to the coast of Labrador, entered an inlet running westward, and returned to be 'highly commended of all men for the great hope he brought of the passage to Cathaia.' The inlet, now known to be a bay, long figured on our maps as Frobisher's Strait, is one of the entrances into Hudson's Bay. But the public mind was quickly diverted to a different object. One of the sailors had brought home with him a stone picked up as a relic on a shore which had been visited. It was supposed to contain gold, and being handed to the refiners, they precipitately pronounced this to be the case. London was thrown into a ferment by the news. A wakeful avarice seized the city. Men congratulated themselves upon the road to boundless opulence thus opened, for the conclusion was embraced, without a doubt, that all the stones of the land must be golden. Capitalists bid high for leases from the crown of the auriferous

territory; and three vessels were despatched in 1577 to the gold-bearing region. Queen Elizabeth, who had only contributed a wave of her hand to the voyage of discovery, as the ships passed Greenwich, now fitted out one of the three at her own expense. More men volunteered their services than could be employed. With a 'merrie wind' the mariners arrived at the Orkneys, and crossed in safety the ocean. But Frobisher was unable to reach the particular haven from which the precious stone had been brought. Still, on some islands, large heaps of earth were found, which seemed to contain the precious product. Spiders also abounded; and it was affirmed that 'spiders be true signs of great store of gold.' So the crews set to work to freight the ships; the admiral himself toiled like a common labourer; and the fleet returned with a cargo corresponding to the refuse of a gravel-pit.

Though disappointed, the public were not in the least daunted. They had decided that there was gold to be had for the seeking, in the regions guarded by the thick-ribbed ice; and the indications of it afforded by the spiders were irresistible. Besides a great success is rarely achieved by a single effort. Thus reasoned the monied men, and the spendthrift courtiers. Hence the outrageous folly was committed of equipping a more costly expedition, consisting of not less than fifteen vessels, in which many young men of the better classes embarked; and the queen gave the name of *Meta Incognita* to the imaginary land of promise. Discreet men were despatched with the squadron to settle on shores too inhospitable to produce either tree or shrub; and some soldiers were sent out to keep order in the contemplated colony. Twelve of the ships were to return immediately with cargoes of ore; and three were to remain to aid the settlement. The general ignorance respecting arctic regions and the terrors of a polar winter, may be inferred from these arrangements. Frobisher conducted the fleet to the North American coast in 1578. Then troubles and dangers began to beset its course. Dense mists prevailed, and immense icebergs encumbered the sea. One of the ships was crushed and sunk, though the men on board were saved. With invincible courage the admiral struggled with difficulties, and led the fleet through the ice, 'getting in at one gap and out at another,' till he gained a haven in the Countess of Warwick's Sound. But by this time all the young volunteers had become terribly alarmed, and heartily wished themselves out of the adventure. The intended settlers likewise were quite as anxious to get back to their old homes; sailors and soldiers were on the verge of mutiny; and one vessel, laden with provisions for the intended colony, deserted and returned. The whole squadron was soon homeward-bound; yet not till an island had been discovered which wore an aspect of promise to the eye of credulity. Lumps of 'black ore' were scattered over the surface, enough to satisfy 'all the gold gluttons in the world;' and the folly was repeated of taking in a freight of useless dirt and shingle. Frobisher is not responsible for the visionary schemes of his employers. He did his duty as an able and dauntless seaman, as he did on a later occasion, when the honour of knighthood was conferred upon him for gallant conduct in the defeat of the Spanish Armada. The queen testified her approval of his services by conferring upon him Althoff's Hall, four miles from Wakefield, in Yorkshire, with the manor and grounds, which before sequestration belonged to the abbey of Newland. This estate remained in his family till the time of Cromwell, when it changed hands, but a portion of the furniture remained with the new possessors. Among other articles, a richly-carved chair, bearing the name of M. Frobisher, cut in antique characters, has been preserved to the present day, and was presented, in the year 1853, to the Royal Geographical Society of London. In 1862, some interesting relics of the navigator's arctic expeditions, consisting of fragments of iron, wood, tile, and glass, were gathered from the shore of the inlet he discovered, by Captain C. F. Hall, of the United States' navy.

At this period a patent was granted to Sir Humphrey Gilbert, empowering him to make western discoveries, and take possession of unappropriated lands. At the same time his younger brother, Adrian Gilbert, became head of a company which was incorporated under the title of 'The Colleagues of the Fellowship for the Discovery of the North-west Passage.' Sir Humphrey was the brother-in-law of Sir Walter Raleigh. He had been a soldier, a member of parliament, was a very chivalrous man, and had rational schemes of colonisation in view. In 1583, he sailed with five ships, and on the eve of departure received from the queen a golden anchor, guided by a lady, as a token of her regard. Yet the fever of the times beset him, too, for he took a 'mineral man' on board, a pious and honest Saxon, and a man of letters from Hungary. Music in good variety was provided for the amusement of the crews and the allurements of savages, not forgetting 'toys, morrice-dancers, hobby-horses, and May-like conceits,' for the delight of barbarous people. The fleet gained the harbour of St John's, Newfoundland, on the 30th of July; and a survey was made of the neighbourhood for the site of a settlement. All agreed that the 'mountains made a show of mineral substance,' and the mineralogist protested that silver ore abounded. The strictest secrecy was at once enjoined, as there were Spaniards and Portuguese at hand engaged in the fisheries, who might attempt to get a share of the spoil. Leaving the foreigners to capture cod-fish, the precious ore, as it was supposed to be, was carried on board the largest of the ships, with such mystery that the nature of the freight did not transpire.

Having started the little settlement, Sir Humphrey sailed to the south-west with three ships, leaving two behind him, intending to plant another colony on some suitable site. But a grave calamity occurred. The treasure-laden vessel, the *Delight*, was wrecked, and of more than a hundred men on board—the principal part of the force—only twelve escaped. Among the unfortunates was the mineral man, and the Hungarian scholar, who was to have been the historian of the expedition. Upon this loss, the commander deemed it expedient to return to England with the remaining vessels, two small barks—the *Squirrel* and the *Hind*. He was in the former, which was not more than twice the size of the long-boat of a modern merchantman. Terrible weather set in. Never had the oldest mariners seen more 'outrageous seas.' When the wind abated, and the vessels were near enough, the admiral was constantly seen sitting in the stern with a book in his hand. On the 9th of September, he was thus seen for the last time, and was heard by the people on board the *Hind* to say, 'Courage, my lads! we are as near Heaven by sea as by land.' In the following night the lights of the ship suddenly disappeared, and nothing more was observed of the bark by her companion.

' Eastward from Campobello,  
Sir Humphrey Gilbert sailed;  
Three days or more seaward he bore,  
Then, alas! the land wind failed.

Alas! the land wind failed,  
And ice-cold grew the night;  
And never more, on sea or shore,  
Should Sir Humphrey see the light.

He sat upon the deck,  
The book was in his hand;  
"Do not fear: Heaven is as near,"  
He said, "by water as by land."

The *Hind* outrode the tempest and arrived safely at Falmouth.

Abandoning the delusive quest of gold for simple discovery, John Davis, a good seaman and excellent commander, was employed in the northern seas to resume the search for

a western passage. His principal patrons were opulent merchants of the west of England, along with Walsingham, the secretary of state. He sailed from Dartmouth on the 7th of June 1585, with the *Moonshine* and *Sunshine*, and took along with him a band of music for the recreation of his men, and the amusement of any natives who might be encountered. On approaching the arctic boundary, the crews were alarmed by hearing loud noises while the sea was calm and covered with fog. They were found to proceed from icebergs grinding against each other. The south-west coast of Greenland came in sight the next day, and was called the Land of Desolation, on account of its bleak and dreary appearance. A headland there still bears the name of Cape Desolation. Leaving it for the open sea, an opposite shore was reached, where deceptive indications of precious ore were observed, many of the cliffs being 'orient as gold.' Here a fine sound stretching to the westward was discovered, from twenty to thirty leagues wide, free from ice, with water resembling in colour and quality that of the main ocean. This is now named Cumberland Strait, and lies to the north of Frobisher's. It seemed the desired passage to the mariners, and was explored for a considerable distance, when thick fogs and contrary winds compelled them to desist, and direct their course homeward. Two voyages in the next two years were made by Davis to the same waters, sailing each time from Dartmouth. He reached the high latitude of 72°, and as this led him to the great sea now styled Baffin's Bay, his name has properly been given to the broad entrance, Davis Strait. Icebergs were seen of such vast magnitude that the navigator declined the description of them, lest his veracity should be suspected.

No advance having been made in the main object, its pursuit was abandoned for some time. In fact, while commanders continued sanguine of success, they frequently found it impossible to induce their crews to prosecute the search, after some acquaintance with the perils of ice-clad seas and shores. The firm though respectful remonstrance was addressed to Davis, on one occasion, by his sailors, that 'by his over-boldness he might cause their widows and fatherless children to give him bitter curses.' A few years later, this intrepid seaman took part in Cavendish's attempt to circumnavigate the globe a second time, and while separated from the squadron, he was the first to fall in with the group of isles now known by the designation of the Falklands. He had the rare good-fortune afterwards to make five voyages to the East Indies in the service of the Dutch, and at last lost his life in 1605 in a quarrel with the Japanese. His discoveries were traced on a globe of the time, constructed by Molyneux, and still preserved in the library of the Middle Temple.

With the commencement of the seventeenth century, the English made their first successful visit to India by the way of the Cape, under the auspices of the East India Company, incorporated on the 31st of December 1600. But the great length of time consumed by the voyage, together with the apprehension of difficulties from the Portuguese, determined the merchants to renew the search for a northerly route. Accordingly, George Weymouth was despatched in 1602, but was compelled to return by the mutinous conduct of his men; and an expedition under John Knight in 1606 was abruptly arrested by the attacks of the Esquimaux. Landing on the coast of Labrador, he left three persons in charge of the boat, while with the mate and another he repaired to some high ground to take a survey of the country. Not returning at the appointed time, guns were fired, and every imaginable signal was given by the party at the boat, but without effect. Knight and his comrades were never heard of, and as a desperate attack was speedily made upon the ship by the natives, the fate of the commander may readily be inferred. The remaining crew consisted only of eight men; assailed at night and amidst torrents of rain, they succeeded in defeating the savages, made their way to Newfoundland, and from thence to England.

A north-east and a north-west direction having been tried in vain, it was now resolved to attempt a new route, and proceed if possible directly across the pole. The execution of this daring design was intrusted to Henry Hudson, one of the bravest and most unfortunate of all navigators. He sailed in 1607 in a small bark with only ten men and a boy. But after reaching Spitzbergen, much incommoded by the ice, he deemed the sea completely barred by it further north, and brought back his little vessel in safety. In the following year, he was commissioned to resume the old north-eastern course, but met with no greater success than any of his predecessors. A singular instance of the credulity of sailors is related during this attempt: two seamen, Thomas Hilles and Robert Rayner, solemnly affirmed, that while standing on deck, they saw a mermaid; and signed their names to a certificate to that effect. They described the creature in the document as having 'breasts like a woman's; her body as big as one of us; her skin very white; and long haire hanging down behind, of colour blacke.' It is uncertain which of the cetaceous animals led to the misconception. Hudson was next sent to the north-west; and started on the voyage from which he never returned on the 17th of April 1610. Arrived on the shores of Labrador, he followed them to the north-western extremity, which received the name of Cape Wolstenholme, after one of his principal patrons, while an opposite headland, on an island, was called Cape Digges, after another. At this point, he beheld before him, apparently, a wide ocean, which must have been viewed with exultation, being probably regarded as a portion of the mighty Pacific, the object of his expedition. It was really the great inland sea which has since been called Hudson's Bay; but of his progress in it no knowledge remains except what is derived from the doubtful testimony of a conspirator against him.

Seeing the coast on the left turn to the south, Hudson seems to have followed it in the hope of gaining a milder climate, and more fertile district in which to spend the winter. But no considerable distance had been made, owing to boisterous weather, and the difficulty of doubling unknown headlands shrouded with mist, when, in a haven called Michaelmas Bay, from the day on which it was entered, the ice closed in on all sides, and the winter began its reign. It does not appear to have been a season of special severity; but having brought out only provisions for six months, the stock remaining was scanty, and hardship excited ill-feeling in the crew against the commander. Every effort was made by him to make the original store serve as long as possible, and a reward was promised to every one who should kill beast, bird, or fish. At first, the white partridges came in such numbers that twelve hundred were secured in the space of three months. As these passed away with the approach of spring, flights of geese, ducks, swans, and teal, made their appearance, migrating from south to north; and when they were gone, the breaking up of the ice allowed of fish being taken.

On leaving the bay, in June 1611, Hudson was no doubt intent upon continuing the voyage through the summer for the purpose of discovery, content with such provisions as could be procured; while most of the crew secretly resolved to sail for England as soon as a sufficient supply of food for the voyage was obtained. Their ringleader, a young man named Green, of profligate character, had been taken out by the commander as an act of humanity, being without any other resource for a livelihood. The following strange oath was taken by the mutineers: 'You shall swear truth to God, your prince, and country; you shall do nothing but to the glory of God, and the good of the action in hand, and harm to no man.' When the abominable scheme was ripe for execution, Hudson was seized, bound, and lowered into a boat; the carpenter, as his devoted adherent, was treated in the same manner; and nine persons in all, several of whom were sick, were turned adrift, with a fowling-piece, some ammunition, and a small quantity of meal. They were never heard

of again, but perished in those dreary regions, though when, or how, or what extremity of distress was previously endured, remains unknown. Green, elected captain, did not long escape punishment, being killed in an affray with natives; Ivet, another principal, died of absolute starvation on the way home; and the rest were in dreadful destitution on gaining the north coast of Ireland. Such is the substance of the relation of one of the survivors, Abacuk Pricket, of whom Purchas remarked: 'Well, Mr Pricket, I am much in doubt of thy fidelity.' The deed is, however, described by him in all its dark atrocity; but whether the describer was simply constrained to be a consenting party, or was more implicated in the tragedy, could not be ascertained.

The inland sea, discovered with such a terrible result, was entered the next year by captain, afterwards Sir Thomas Button, who, finding it open to the westward, sailed in that direction, fully expecting that it would conduct him to the shores of Japan. But soon a long range of desolate coast, running north and south, came into view, and dissipated the illusion. This was the mainland of America, forming the western boundary of Hudson's Bay, to which the name of *Hopes Checked* was given, in memory of the disappointment. Sailing to the south, Button entered the mouth of the present Nelson River, where the principal settlement of the Hudson's Bay Company was afterwards founded, and where he passed the winter of 1612-1613. The cold proved fatal to some of his men, though he endeavoured to arm them against the depressing influence of a rigorous climate and an inactive life by friendly meetings, in which instruction was blended with amusement. In the ensuing summer, the great sea was further examined; and was soon afterwards assumed to be a close sea, in which it was hopeless to look for a western passage. The next attempt of note to find the long-desired outlet, and the last that was made, with any signal result, for the space of two centuries, was conducted by Robert Bylot as master and William Baffin as pilot, two experienced mariners, the latter the most scientific nautical observer of his age. In the instructions supplied upon this occasion, it was ordered that, 'you William Baffin, as pilot, keep along the coast of Greenland, and up Davis's Strait, until you come toward the height of 80°, if the land will give you leave.' It was expected, that in that high latitude the extreme north point of America would be reached, from whence a course to the south-westward would lead to the northern part of Japan. 'Although our desires be,' say the instructions, 'if your voyage prove so prosperous that you may have the year before you, that you go so farre southerly as that you may touch the north part of Japan, from whence or from Yedzo, if you can so compass it without danger, we would have you to bring home one of the men of the country; and so, God blessing you, with all expedition to make your return home againe.'

The details of this remarkable cruise, the most extensive in its range hitherto made in the northern zone, are very meagre. It commenced on the 26th of March 1616, when a small bark, the *Discovery*, sailed from the Thames, with a complement of seventeen officers and men. Greenland was sighted on the 2d of May, within Davis's Strait, and that navigator's furthest point, Sanderson Hope, was passed on the 30th. As the ship proceeded, interviews were had with the natives on shore, who brought large quantities of the bones of sea-unicorns, or narwhals, great numbers of which animals were seen in the water. Snow fell every day towards midsummer; the weather was occasionally dreadfully cold; and the shrouds and sails were so hard frozen, that to handle them became almost impossible. In latitude 76° a fair headland was seen, and then a goodly sound, which were called Cape Digges and Wolstenholme Sound, after two main promoters of the undertaking, whose names had previously been associated with localities at the entrance of Hudson's Bay. Another sound, the widest and greatest of all, running to

the north of  $78^{\circ}$ , was named after Sir Thomas Smith. It is noted by Baffin as 'admirable in one respect, because in it is the greatest variation in the compass of any part of the world known; for, by divers good observations, I found it to be above five points, or  $56^{\circ}$ , varied to the westward.' Following the general direction of the coast, the course now lay west, south-west, and then south, by an inlet designated Alderman Jones's Sound, but which has long been clipped of its civic style, merging in a broader opening called Sir James Lancaster's Sound, the important channel leading to the Polar Ocean in which Parry acquired his renown. The discoverer did not stop to examine it, but pushed southward. Finding his crew sickly, he sailed across to Greenland, where scurvy-grass and other salads quickly restored them. He accomplished the homeward voyage by the middle of August, 'for the which,' says he, 'and all other His blessings, the Lord make us thankful.' Baffin returned from the great sea he had traversed with the full conviction that it was completely landlocked. It was therefore styled Baffin's Bay, a title which has been retained notwithstanding its inappropriateness to an ocean-like expanse; and thus the honour belongs to him of having stamped his name upon perhaps the largest sheet of water which bears the name of a human being. He did not fail, however, in pointing out the great use that might be made of it in the whale-fishery; and while all these northern voyages were disappointing in their immediate object, they were of immense service in improving seamanship, and disclosing the fishing-grounds which have given comfort, wealth, and independence to thousands.

## CHAPTER VI.

### ENGLISH AND DUTCH CIRCUMNAVIGATORS OF THE SEVENTEENTH CENTURY.

IT was confidently affirmed by Pigafetta, the historian of the first voyage round the globe, that the enterprise would never more be repeated, owing to the difficulties, perils, and hardships connected with it. The opinion was also current for some time, that it was offering defiance to the will of Providence to attempt to pass the barriers placed by nature between the Atlantic and Pacific oceans; and it was even rumoured that the channel which Magellan had traversed, no longer existed, having in some mysterious manner been closed, as if intentionally to interdict communication. Many dwelt with superstitious fear upon the fate of the principal adventurers who had associated themselves in any way with the great expanse, so long hidden from the knowledge of the civilised world, as evidence of its illustration involving a transgression of the bounds of legitimate effort. Thus Balboa, the first European to gaze upon its waters, had been put to death by his own countrymen; De Solis, while seeking access to them, had been murdered by savages at the mouth of the La Plata; and Magellan had been slain in the new region he had ventured to enter. As a still more terrible catastrophe, at least in the esteem of all good Catholics, the very mariner who first saw from the mast-head the strait through which the Pacific was reached, had survived to become a renegade, and turn Mohammedan.

Nor was this all; for the second time the strait was passed, by a well-equipped squadron, under Loyasa, bound from Spain to the Moluccas, a series of sore disasters occurred. A tempest instantly assailed the fleet, and scattered the ships never to meet again. Four commanders elected in succession died one after the other; and one of them was the celebrated Sebastian del Cano, the companion and successor of Magellan. The crews perished by wholesale, struck down by disease; and only a handful survived to return to Europe, after being held in durance for years by the Portuguese. Fortunately, there were men who defied both real and imaginary dangers; and, the way from the one ocean to the other having been discovered, the particular track of the discoverer was followed at intervals, till the easier route round Cape Horn was made known.

The first English circumnavigator, Sir Francis Drake, was a daring man by land and sea. His ship was the second vessel to trace the circuit of the earth. He rose from comparative obscurity, became a voyager in early life, acquired a small bark of his own, and made some trading ventures in it with profit, while gaining reputation for skill and courage. But he lost his all by a treacherous attack of the Spaniards, when with Sir John Hawkins in the West Indies, and thenceforth deemed it right, whenever practicable, to compensate himself by making reprisals, without caring to inquire when the precise equivalent had been exacted. According to the maritime logic, or 'sea divinity' of the age, nothing could be clearer than his case, as quaintly expounded by a contemporary: that whereas the 'king of Spain's subjects had undone Mr Drake, therefore Mr Drake was entitled to take the best satisfaction he could of the subjects of the king of Spain.' He faithfully acted upon the maxim:

'That they should take who have the power,  
And they should keep who can.'

Enabled by friends to equip two vessels, Drake sailed to Darien, and having moored and concealed his ships, he marched across the isthmus with a number of his men and some Indians. It was his object to intercept Spanish treasure, which was then conveyed by mules from Panama to the Atlantic coast for shipment to Europe. During the excursion an interesting incident occurred which determined much of his future course. Upon arriving at a certain hill, the chief of the Indians took him by the hand, and led him to the summit. Here was 'a goodly and great high tree,' in which steps had been cut to ascend near the top, where a convenient bower had been constructed, capable of accommodating ten or twelve men seated. It commanded a view of two oceans, the Atlantic on the one hand, and the Pacific on the other. The trees had been felled in the neighbourhood to make the prospect clearer. 'After our captain had ascended to this bower,' says the narrator, 'and having, as it pleased God at this time by reason of the breeze, a very fair day, had seen that sea of which he had heard such golden reports, he besought of Almighty God of His goodness to give him life and leave to sail once in an English ship in that sea; and then calling up all the rest of our men, acquainted John Oxenham especially with this his petition and purpose, if it should please God to give him that happiness.'

Having relieved a file of treasure-mules of their burden, Drake returned home with large booty, and reached Plymouth on the 9th of August 1573. This was a Sunday. News of his arrival being carried to church, 'there remained few or no people with the preacher,' as the congregation broke up to welcome the seamen. His thoughts were now intently fixed upon sailing on the ocean at which he had glanced; but he was anticipated in this project by one of his own followers, the John Oxenham just mentioned, who was the first Englishman to appear upon its waters. This man, who had capacity as well as courage, set up privateering on his own account, and procured associates to sail with him

to Darien. Hiding the vessel, he led them across the isthmus, carrying two pieces of ordnance with him, he built a little pinnace on a stream falling into the South Sea, where he was soon at work capturing gold and silver bars. But the Spaniards were quickly upon his track, and being at length taken by them, he was executed at Panama as a pirate. Oxenham was the first of the bucaniers, the 'sea-rovers,' or 'brethren of the coast,' as they were sometimes called, and also 'flibustiers,' a supposed French corruption of our word freebooter. The desperadoes were long a terror on sea and shore, and were pictured by excited imaginations as beings of scarcely human appearance, owing to the fear they inspired. A lady of Panama, curious to see the extraordinary animal, a bucanier, exclaimed aloud on being gratified with the sight: 'Jesu bless me! these thieves be like unto us Spaniards.' Another had her prejudices so far softened by the civilities of Morgan, a noted ringleader, who made love to her, as to admit that 'neither did she now think them to be so bad, or to have the shapes of beasts, as from the relations of several people she had heard oftentimes.'

Meanwhile Drake was actively endeavouring to interest his countrymen in his project; and five vessels were at length placed at his disposal, with which to disturb the repose of the Spaniards in the Pacific Ocean. But it was necessary to proceed with caution, as peace nominally subsisted between the two nations. The object of the expedition was of course carefully concealed. Its destination was also falsely indicated, and while Queen Elizabeth secretly approved of the scheme, she gave no open sanction to it. The squadron sailed from Plymouth on the 13th of December 1577. It consisted of the *Pelican*, with the commander on board, the *Elizabeth*, the *Swan*, the *Christopher*, and the *Marigold*. Upon reaching Port St Julian, on the coast of South America, a gibbet was seen upon the shore. This was one of Magellan's stations, where he caused one of his mutinous commanders to be put to death; and Drake signalled his stay there by the execution of an officer of great ability, Mr Thomas Doughtie, on a very vague charge of disaffection. Never did such a tragedy transpire under stranger circumstances. Having his choice of being either abandoned on the coast, taken back to England to answer before the lords of the council, or suffer death at once, the unfortunate man chose the latter, simply requesting that he might 'once more receive the holy communion with the captain-general, and that he might not die other than the death of a gentleman.' The chaplain relates that he celebrated the sacrament on the next day; and Drake received it with the condemned man. Afterwards they dined together 'at the same table, as cheerfully in sobriety as ever in their lives they had done; and taking their leaves, by drinking to each other, as if some short journey only had been in hand.' Immediately all things being in readiness, Doughtie walked out to his doom, requested the bystanders to pray for him, and submitted his neck to the axe.

Upon passing through the Strait of Magellan, which was effected in seventeen days, a violent tempest greeted Drake on entering the Pacific, and illustrated the impropriety of its name. The *Marigold* was borne away by the gale and never heard of again. Soon afterwards the *Elizabeth* parted company, repassed the strait, and returned to England. The *Swan* had previously been broken up for firewood, as the vessel was too weak for the long voyage. The fate of the *Christopher* does not appear. But the commander was certainly left to pursue his course with his own ship, the name of which he changed from the *Pelican* to the *Golden Hind*. Eight of the seamen were now doomed to have mournful experience of the perilous and fatal incidents frequently connected with these early navigations. They were out in a shallop with only provisions for the day, when the weather separated them from the captain-general, and his vessel was speedily out of sight. They were so far fortunate as to regain the strait, where some penguins were killed and salted

for future supply. In an open boat, exposed to storms, the little party crept along the coast more than a thousand miles to the mouth of the La Plata. Here six of them went on shore, and wandered to the woods in search of food. Two only returned to their two comrades left in charge of the bark, the others having been captured and killed by the Indians. The savages soon made their appearance, and the four survivors were all wounded by their arrows before they could get out of reach in the shallop. They escaped to a small island about three leagues from the shore, where two of them soon died of their wounds; and the chance of escape was cut off from the remaining two by the shallop being dashed to pieces in a storm. On this island Peter Carver and William Pitcher remained two months, subsisting on crabs, eels, and fruit, but driven to the most horrible extremities from the want of fresh water. At last a plank ten feet long was found on the beach, and having made some paddles of the boughs of trees, they succeeded with this raft in regaining the main land. But it took them three days and two nights to accomplish the short distance. 'At our first coming on land,' says Peter Carver, 'we found a little river of sweet and pleasant water, where William Pitcher, my only comfort and companion, although I dissuaded him to the contrary, overdrank himself, being perished before with extreme thirst; and, to my unspeakable grief and discomfort, died half an hour after in my presence, whom I buried as well as I could in the sand.' Carver, strange to say, now a solitary man, mingled with the natives safely, reached a Portuguese settlement, and returned after an absence of nine years to his native country, where he had the honour of relating some of his adventures before Queen Elizabeth.

Sailing along the coasts of Chili and Peru, the settlements of the Spaniards were touched at, and keenly scrutinised by Drake with an eye to what was valuable. They were then in their infancy. Arica contained little more than twenty houses, and Valparaiso numbered about a dozen families. But near the latter port a large ship was plundered of many jars of Chili wine, jewels, and merchandise, with 60,000 pesos of gold, worth about £24,000. On landing occasionally for water and other stores, wealth was unexpectedly acquired. Thus a Spaniard was found asleep with silver bars lying beside him, equal in value to 4000 ducats; and on another occasion, eight llamas were met with in charge of a guide, each carrying a 100 pounds' weight of silver. Drake's richest prize, however, was a treasure-ship bound for Panama, from which he obtained twenty-six tons of silver bullion, thirteen chests of ryals of plate, eighty pounds' weight of gold, the whole estimated at 360,000 pesos, equal to nearly £150,000. Nothing could exceed the astonishment of the Spaniards at finding the English in waters which they regarded as peculiarly their own. To secure themselves from intrusion, they had propagated the rumour, that the Strait of Magellan had been closed by some great convulsion of nature, and would have been well pleased had that been the case, as they generally communicated with Europe across the isthmus of Darien. Not expecting an enemy, they were not prepared to meet one, and became an easy prey to the daring visitor.

Satisfied with spoil, Drake became anxious to secure it by a speedy passage home. But he did not like to retrace his route, lest the Spaniards should have prepared themselves to intercept him. To avoid this consequence, he sailed to the north on a voyage of discovery, hoping to find in that direction a channel corresponding to the Strait of Magellan in the south, by which to return to the Atlantic. He penetrated beyond the limits of former navigators, advanced along a mountainous coast to north latitude 48°, landed and had communication with natives, and named the country New Albion, which is now divided between the states of California, Oregon, and Washington territory. But having just left the tropics, the lowering temperature so affected his men, that he desisted from a northerly course. Drake now determined to steer across the Pacific Ocean to the

Moluccas, and thus return home by circumnavigating the globe, a project which was not originally contemplated. After a sail of sixty-eight days without seeing land, he fell in with the Pelew Islands, touched at the Philippines and Moluccas, refitted his ship, doubled the Cape of Good Hope, 'the most stately thing and goodliest cape seen in the circumference of the whole earth,' and arrived at Plymouth on the 26th of September 1580.

Astoria, at the Mouth of the Columba River.

The day of the week was Monday, but according to the reckoning of the voyagers, it was Sunday, and the true time of the month the 25th. This loss of a day had been noticed with great surprise, on the occasion of the first circumnavigation, for Sebastian del Cano reached San Lucar on the 5th of September, following his own reckoning, whereas it was the 6th in every calendar of Europe. Reflection soon suggested the true and easy explanation, that in sailing round the globe from east to west, or in the same direction as the sun's diurnal motion, that luminary must of course make, with respect to the vessel, one revolution less than in relation to any fixed point upon the earth's surface.

The commander and his vessel were objects of no common curiosity to his countrymen. Upon the *Golden Hind* being taken round to the Thames, and moored off Deptford, thousands hastened to see the famous bark; and after some little reserve, owing to the loud complaints of the Spanish ambassador, Queen Elizabeth herself was a visitor, dined on board, and knighted Drake. So great was the throng, that the temporary bridge leading from the bank of the river to the ship broke down, though no misadventure occurred beyond the immersion of a few hundreds in the stream. Latin epigrams were composed for the occasion, and attached to various parts of the masts and rigging, one of which has been rendered as follows :

'The stars above will make thee known,  
If man were silent here ;  
The Sun himself cannot forget  
His fellow-traveller.'

More boisterous doings on board 'the ship of famous Draco,' as it was called, may be inferred from the old play of *Eastward Hoe!* where Sir Petronel Flash is introduced saying : 'We'll have our provided supper brought aboard Sir Francis Drake's ship, that

hath compassed the world, where, with full cups and banquets, we will do sacrifice for a prosperous voyage. My mind gives me that some good spirit of the waters should haunt the desert ribs of her, and be auspicious to all that honour her memory, and will with like orgies enter their voyages.' The *Golden Hind* was long preserved, but seems to have been eventually disposed of to one John Davis of Deptford, for a person of that name had a chair made of one of the planks, which he presented to the university of Oxford. This inspired the muse of Cowley to write the lines—

'To this great ship, which round the globe has run,  
And matched in race the chariot of the sun,  
This Pythagorean ship (for it may claim  
Without presumption, so deserved a name,  
By knowledge once, and transformation now)  
In her new shape this sacred port allow.  
Drake and his ship could not have wished from fate,  
A more blessed station, or more blessed estate.

The expedition under Magellan occupied three years and fourteen days, in compassing the globe; Drake's voyage was performed in a briefer period—two years and ten months; and the next circumnavigation, Cavendish's, was made in still shorter time—namely, two years and two months.

As nature refused to block up the Magellanic channel, the court of Spain resolved to close it to all foreign vessels, by fortifications at the narrows, and colonies to keep watch and ward, wholly overlooking the rigorous climate and inhospitable shores. A fleet of twenty-three ships, carrying 3500 men, sailed from Cadiz in 1581, with this object in

Orange Harbour, Straits of Magellan.

view, and proved one of the most disastrous expeditions on record. Five vessels went down with 800 souls on board in a storm at the outset, and owing to a series of misfortunes only a remnant of the force reached its destination. Two settlements were founded with high-sounding names, wooden houses, and bastions. But the mother-country seems not to have bestowed a thought upon the colonists, after sending them out, and they perished by scores of cold and famine during the first winter. It set in with uncommon severity, snow falling incessantly for fifteen days in April. When Cavendish arrived at the strait in 1587, he found many lying dead in their houses and in their clothes, the survivors not having had strength to bury them. Fifteen men and three women were alive, miserable beings, harassed by the natives while wandering along the shore

in search of shell-fish and herbs, occasionally stumbling upon the dead body of a comrade to remind them of their own approaching doom. Yet these wretched outcasts hesitated to trust themselves to the English heretics, when offered a passage to Peru, and a favourable wind bore away the vessels in which they might have been saved.

Thomas Cavendish, a gentleman of good, but perhaps encumbered, estate in the county of Suffolk, followed the track of Drake in search of fame and fortune, and became the second English circumnavigator. He sailed with three vessels bearing the queen's commission, and like his predecessor lost his companions on the voyage, returning home in his own ship, the *Desire*. Of his proceedings, a report is extant drawn up by his own hand, in which he takes no little credit to himself for indiscriminate havoc. 'It hath pleased Almighty God,' he writes, 'to suffer me to circumpass the whole globe of the world, entering in at the Strait of Magellan, and returning by the Cape de Buena Esperança; in which voyage I have either discovered or brought certain intelligence of all the rich places of the world, which were ever discovered by any Christian. I navigated along the coasts of Chili, Peru, and New Spain, where I made great spoils. I burned and sunk nineteen sails of ships, small and great. All the villages and towns that ever I landed at, I burned and spoiled. And had I not been discovered upon the coast, I had taken great quantity of treasure. The matter of most profit unto me was a great ship of the king's, which I took at California; which ship came from the Philippines, being one of the richest of merchandise that ever passed those seas. From the Cape of California, being the uttermost part of all New Spain, I navigated to the islands of the Philippines, hard upon the coast of China, of which country I have brought such intelligence as hath not been heard of in these parts: the stateliness and riches of which I fear to make report of, lest I should not be credited—I found out by the way homeward the island of Santa Helena, where the Portuguese used to relieve themselves; and from that island God hath suffered me to return into England. All which services, with myself, I humbly prostrate at her Majesty's feet, desiring the Almighty long to continue her reign among us.' St Helena was then covered with trees, but they disappeared with remarkable rapidity, upon the introduction of goats and rabbits to the island. Cavendish is said to have brought home wealth sufficient to 'buy a fair earldom;' and it was commonly reported, that when he entered Plymouth harbour, his sails were all of silk. The fact appears to be, that a storm in the Channel having swept away his sails, he either put up for a temporary purpose some damasks, or canvas made of silk-grass, which, being lustrous, originated the misconception. He attempted to repeat the voyage with a larger squadron in 1591, but was signally baffled. Meeting early with almost all the mishaps which can possibly befall the mariner, he was compelled to put back, and the combined influence of fatigue and anxiety terminated his life before the crew regained their native land.

A new enemy speedily appeared in the ocean which the Spaniards wished to keep to themselves. This was the Dutch under Oliver Van Noort, who sailed on the 13th of September 1598, and employed nearly three years in circumnavigating the globe, as he cast anchor before the city of Rotterdam, on the 26th of August 1601. This voyage added nothing to geographical discovery, nor was it attended with any incidents of interest. But while the commander was in the Magellanic strait, he encountered a party of his countrymen in great difficulties, under De Weert, being in a bad sailing vessel; and seems to have quitted them without rendering the slightest assistance. The ship had sailed from Holland, in company with three others fitted out by an opulent merchant, but had been left behind by the companion-vessels. De Weert, however, managed to retrace the Atlantic safely, while the three ships which passed on to the

Pacific were separated by a storm, never again joined company, and never returned home. In one of these was the chief pilot, an Englishman, named William Adams, born at Gillingham, in Kent, who appears to have been long in the service of the Dutch, and was a man of very considerable ability. The vessel in which he sailed reached the coast of Japan, but with the crew in such an exhausted condition from toil and want, that only five of the men were capable of any kind of duty. Though detained as prisoners by the authorities, they were kindly treated; and Adams, being brought before the emperor, conducted himself with such discretion as to become an imperial favourite. He built for him two vessels after the European model, and was allowed means of living 'like unto a lordship in England,' but could never obtain leave to return home, though desiring greatly to 'see his poore wife and children, according to conscience and nature.' He procured, however, the release of his shipmates, who made their way to Bantam, forwarded by them a letter to his friends which reached its destination, and remained in favour to the hour of his death, which took place at Firando, in Japan, in 1621.

Hitherto, little was known of the immense number of islands, with which the southern regions of the Pacific are strewed, for navigators had generally endeavoured

to follow the track of Magellan, which led him clear of them through a vast watery waste. But their illustration proceeded rapidly during the first half of the seventeenth century, in which the Spaniards took the lead, and the Dutch 'gained the most distinction. New Guinea and Australia had been sighted, while four of the superbly verdant Marquesas, were certainly discovered and named, in 1595, by an expedition from Peru, in which Quiros served as pilot-major. This officer was then sent out with a consort, in the capacity of commander, and sailed from the port of Callao, in 1605, to make further observations. During this cruise, he fell in with an island divided by a narrow isthmus, from which columns of smoke rose in various parts, shewing that it was inhabited. The natives soon made their appearance, and received their visitors in a friendly manner. They were mulattoes in colour, naked and armed, and lived in thatched houses near the margin of the sea, among groves of palms. This island, which was named Sagittaria, is generally

Valley of Nunanu from the Gorge of Pali, Honolulu.

believed to be the beautiful Tahiti. Pursuing his course, Quiros came at length to so many points of land of mountainous form and indefinite extent, that he conceived himself on the borders of a great southern continent, of which formal possession was taken under the name of *Australia del Espiritu Santo*. A city was designed as its capital,

to be called New Jerusalem. Two rivers were observed, one of which was of size equal to that of the Guadalquivir at Seville. The country seemed like the Garden of Eden. 'From the breaking of the dawn,' says the chronicler, 'is heard through all the neighbouring woods a very great harmony of thousands of different birds, some to appearance nightingales, black-birds, larks, and goldfinches, and infinite numbers of swallows, and besides them many other kinds of birds, even the chirping of grasshoppers and crickets. Every morning and evening were enjoyed sweet scents wafted from all kinds of flowers, amongst them that of orange flowers and sweet basil.' A storm separated Quiros from this land of promise; and being driven out to sea, he was separated likewise from his companion, and made the best of his way to Mexico, while the other vessel, under the command of Torres, prosecuted discovery.

The supposed continent was soon found, by Torres, to be an archipelago; and is usually understood to be represented by the Grandes Cyclades of the French, and the New Hebrides of Cook. Continuing the voyage, the navigator sailed through the passage, but without knowing it, which separates New Guinea from Australia. This was in the month of June 1606; and as it is distinctly said that he saw land on the south, some northerly part of the great island-continent, most probably Cape York, must have been in view. He finally arrived at Manilla, in the Philippines, and left there a copy of the letter

City of Manilla.

in which he described the expedition. Upon this city being taken by the English in 1762, the document was discovered in the archives by Dalrymple, who paid a fitting tribute to the memory of the Spaniard by calling the passage he traversed Torres Strait, a name which it has ever since retained. The Dutch had, however, been beforehand with

him by some three months in visiting the same region, in a similarly unconscious manner. It may be gathered from the course of a yacht called the *Duyfhen* or *Dove*, despatched from Bantam to explore New Guinea, that the vessel made the Australian coast about March 1606, a little to the west and south of Cape York, where the name of Cape Keer-Weer, or Turn-again, was given to the farthest point of land seen.

But very recently Mr Major of the British Museum has shewn, that the Portuguese have a prior claim to be considered the discoverers of the great region. An old map exists in the national establishment, marked with a legend inserted at the north-west corner of a country, which can be indisputably proved to be Australia: *Nuca antara foi descoberta o anno 1601 por mano el Godinho de Eredia por mandado de Vice Rey Ayves de Saldaha*—‘Nuca Antara was discovered, in the year 1601, by Manoel Godinho de Eredia, by command of the Vice Roy Ayves de Saldanha.’ The orthographic blunders of the inscription are rather evidence of integrity than otherwise. Another legend, immediately below the foregoing, shews Australia to be the country intended: ‘Land discovered by the Dutch, which they named Eendracht, or Concord.’ A considerable portion of the west coast is still called Eendracht’s Land, after the name of the Dutch discovery-ship, in 1616. The viceroy mentioned, Saldanha, held the government of the Portuguese East Indies from the year 1600 to 1604; and the discoverer specified, Eredia, was a distinguished mathematician and cosmographer, alive at Goa in the year 1615. In acknowledgment of his services in illustrating the claim of Portugal in this respect, the young king of that country, shortly before his death in 1861, conferred upon Mr Major an honorary distinction. But very probably the *first* discovery of Australia goes back to an earlier date by more than half a century than the one recorded, though still due to the Portuguese East India colonists. Various maps are extant, executed in the first half of the sixteenth century, which exhibit a vast region to the south of Java, separated from it by a narrow channel, and thence extended indefinitely southwards as far as limits allow of delineation. It may therefore be reasonably concluded, that actual knowledge was thus early acquired of the north coast, while the country received this southerly extension in harmony with the old fancy, of some immense continent being necessary in the southern hemisphere as an equipoise to the great amount of land in the northern.

The finding of a new passage into the Pacific Ocean by sailing round the islands of Tierra del Fuego, while it extinguished for ever any lingering hope which Spain might cherish of being able to guard the entrance, gave a stimulus to nautical adventure. Thereby the navigation of the Strait of Magellan, which its sinuous course and strong baffling gusts rendered in general excessively tedious, was avoidable. This was accomplished by Schouten, a practical seaman, and Le Maire, the son of a rich merchant of Amsterdam. The latter conceived it probable, if not certain, by information received from English sailors, and originally derived from Sir Francis Drake, who had been driven by rough weather far to the south, that an open sea washed the southernmost extremity of America. The event illustrated his sagacity, and justified his enterprise in despatching two vessels to make the experiment, chiefly at his own expense. Though, from boisterous winds, difficulty was experienced in rounding the islands, it was effected in the month of January 1616; and for joy of its accomplishment, an allowance of three cups of wine was dealt out to all the men. Their ordinary rations are on record, consisting of ‘a can of beere a day, foure pound of bisket, and halfe a pound of butter a weeke, besides sweet suet, and five cheeses for the whole voyage.’ Schouten called the terminating headland, which was covered with snow, Cape Hoorn or Horn, from the name of his native place, a town in West Friesland; a considerable island in the neighbourhood was styled Staten Land, in honour of the States of Holland; and the channel between it and the main shore, through

which the expedition passed, was termed Strait Le Maire, from the projector of the voyage. These names all acquired permanence. On approaching the promontory to be doubled, there was no lack of rain or mist, snow or hail. Whales were so numerous in the waters, which no ship before had cleaved, as to embarrass the pilots. Sea-birds, unused to the sight of a vessel, flew screaming around it, and, unscared by human beings, alighted upon the rigging. The scene was somewhat different a century later, as described by Captain Shelrocke, except in relation to fog, cold, and tempest. 'We had not,' says he, 'the sight of one fish of any kind since we were come to the southward of Strait Le Maire, nor one sea-bird, except a disconsolate black albatross, which accompanied us for several days, hovering about us as if it had lost itself; till Mr Hatley, observing in one of his melancholy fits that this bird was always hovering near us, imagined from its colour that it might be an ill omen; and so, after some fruitless attempts, at length shot the albatross, not doubting that we should have a fair wind after it.' This incident is supposed to have suggested Coleridge's wild *Rime of the Ancient Mariner*.

'And now there came both mist and snow,  
And it grew wond'rous cold,  
And ice mast-high came floating by,  
As green as emerald—

At length did cross an albatross,  
Thorough the fog it came—

And a good south wind sprung up behind;  
The albatross did follow,  
And every day, for food or play,  
Came to the mariner's hollo!

With my cross-bow  
I shot the albatross.

Then all aver'd I had kill'd the bird  
That brought the fog and mist.  
'Twas right, said they, such birds to slay,  
That bring the fog and mist.'

Mariners long congratulated themselves upon getting round Cape Horn, but needlessly incurred difficulty and danger by keeping too close to the headland. Still is it notorious for tempestuous gales and mountainous billows, yet regularly passed with comparative ease and safety by the improved seamanship of our time.

It was towards the close of the same year, 1616, that the Dutch began to distinguish themselves by discovery in the waters of Australia. At that date, the ship *Eendracht*, before mentioned, made the west coast, part of which bears its name, while that of the commander, Dirk Hatichs, or, as it is commonly written, Hertoge, still denotes a cape and roadstead in one of its bays. In a very brief period afterwards, Zeachen, Edels, Leuwin, De Nultz, De Witte, and Carpenter, all Dutchmen, ran along the whole coast, north and west, with part of that on the south, and originated names which now figure in our maps. But the most important accessions to knowledge in this region were made by Tasman, who was sent out by Anthony Van Diemen, the governor of Batavia, in 1642. He proved the southerly insulation of Australia, before supposed to extend indefinitely to the pole; and reached a coast from the westward, which he called Van Diemen's Land, 'in honour of our high magistrate, the governor-general, who sent us out to make discoveries,' but which is now more generally styled Tasmania, in memory of the discoverer. A nearly-detached tract on the eastern side, to which convicts were deported, commemorates him also, as Tasman's Peninsula; and a little to the north, the name of Maria Island, where Smith

O'Brien passed his confinement, originated with the navigator in remembrance of a daughter of his patron. He subsequently came in sight of New Zealand on the north, visited several islands more fully made known by Cook, and was only occupied with the voyage for the short space of nine months and a few days. His published note-book thus commences: 'Journal or Description by me, Abel Jansz Tasman, of a Voyage from Batavia, for making Discoveries of the unknown South Land, in the year 1642. May God Almighty be pleased to give His Blessing to this Voyage! Amen.' So highly did his countrymen appreciate his services, that upon the erection of a new stadthouse at Amsterdam, they placed among its ornaments a map of the world cut in stone, marked with his discoveries. These enterprises of the Dutch led them to call the great south land New Holland, which the states-general formally imposed, and which was retained generally till the present century, when the name of Australia was adopted.

The region destined to form such an important part of our empire, and attract universal notice, owing to its auriferous wealth, was not visited by any Englishman till the time of Captain Dampier, who, while with the bucaniers, appeared on the north-west coast. After leaving the rovers, he was expressly despatched to it again by King William III, in 1689, and to him we are indebted for the first notice of its products and people. He now hit the land in the bay discovered by Dirk Hatichs, and denominated it Sharks' Bay, from the number of sharks observed in it, a name which has been retained. Dampier, one of the most faithful and graphic of all describers, having landed for water, came into contact with the natives, whose mental and physical inferiority he duly noted. 'All the signs we could make,' says he, 'were to no purpose, for they stood like statues without motion, and grinned like so many monkeys, staring upon one another.' He considered them the most miserable people in the world, in comparison with whom the Hottentots might rank as gentlemen. 'Their eyelids,' he adds, 'are always half closed, to keep the flies out of their eyes, so that they never open their eyes like other people; and therefore they cannot see far, unless they hold up their heads as if they were looking at something over them. They have no houses; lying in the open air, without covering—the earth their bed, the heaven their canopy.' When a gun was fired with a view of alarming them, they simply tossed up their arms, and after a momentary pause, said something like 'Poo, poo,' as if in mimicry of the noise. The characteristic animals of the country, the kangaroos, came under notice, and are spoken of as a kind of racoons, differing from those of the West Indies chiefly in having very short fore-legs, with which they go jumping about. Sailing to the north, a labyrinth of small islands was encountered, the Dampier Archipelago of the present day. One of them he called Rosemary Island, from a plant which seemed to be of that kind growing there in abundance. Hence Brown, the great botanist, in honour of this celebrated navigator, formed the genus *Dampiera*, consisting of thirteen species of shrubby or perennial herbaceous plants, all natives of Australia. Dampier, eulogised by Humboldt and Malte-Brun as a prince among observers, returned to his native land to sink into complete obscurity, after forty years of wandering over the world. No record exists of how he fared in his old age, or when and where he died.

The veil had by this time begun to be lifted up from the interior of the more northerly parts of America by the European colonisation of the shores. In 1607, after several abortive efforts, the English planted the first permanent settlement, fifty miles up the Powhatan, or James's river, Virginia, where James's Town still exists. In the following year, Champlain, the agent of a French trading company, who gave his name to the beautiful lake in the state of New York, founded Quebec. On the 3d of July 1608, he arrived at the high rocky wall of the St Lawrence, where his predecessor, Cartier, had moored his barks, and chose it as the site of the future capital. Experience has amply

Longitude West 20° of Greenwich

shewn the wisdom of the selection, the position being nearly impregnable, while completely commanding the navigation of the river, and quite as much adapted for commerce as for war. Having felled a few trees, and uprooted the wild vines, he erected some rude huts in which to pass the winter. The first snow was seen on the 18th of November, but rapidly melted away. It fell again in December, and remained upon the ground to the end of April. From that time to the present, the climate has exhibited much the same rigour. The new settlement was very humble; for twenty years later it numbered only fifty souls, of all ages and both sexes, with a stone fort for their protection. In 1615, the Dutch established themselves on the Hudson River, and founded New York; in 1620, the second English settlement was planted by the Pilgrim Fathers at New Plymouth, near Boston; and in 1638, the Swedes commenced their colony on the Delaware.

But at the beginning of the reign of Charles II., an immense tract of country in the western world, to the south of Virginia, was an untilled wilderness, with only a few families of whites from the old settlements dotting the woods on the skirts of civilisation. Though comparatively little known, it was well reported of as a region capable of producing all the staples which thrive on the borders of the tropics; and the name of Carolina was given to it in honour of the reigning sovereign. Imagination regarded it as the 'beauty and envy of North America,' a chosen spot for the cultivation of the olive, where groves of orange-trees, and silk-worms supported by plantations of mulberries, might readily be substituted for the old forests of oak, cedar, and pine. Anthony Ashley Cooper, created Lord Ashley, and afterwards Earl of Shaftesbury, along with seven other needy and greedy courtiers, coveted this splendid territory, and it was made over to them in recognition of their services to the restored monarchy. Two of its streams—the Ashley and Cooper rivers, at the junction of which Charleston is situated—are called after him. A stroke of the royal pen constituted the proprietary sole lords of all the lands lying between the parallels of 29° and 36° 30' north latitude, from the Atlantic to the Pacific Ocean, an allotment including the present provinces of North and South Carolina, Georgia, Alabama, Tennessee, Louisiana, Mississippi, Arkansas, much of Florida and Missouri, nearly all Texas, and a large portion of Mexico. Agents were sent to spy out the country, who published flattering reports concerning it, to stimulate emigration and the purchase or rental of lands from the corporation. Bears are spoken of as in great numbers, but the more the better, since there would be no lack of bear's grease, which, it is stated, the Indians used with great effect to make the hair to grow; and if rattlesnakes abounded, there were three sorts of rattlesnake root at hand, 'all sovereign against the mortal bites of that snake.' The first batch of emigrants sailed in the year 1670, and from that period the illustration of the interior dates. They settled at Oyster Point, as the neck of land was called at the junction of the Ashley and Cooper rivers, where arose first a village, then a town, and next a city. Amidst ancient groves of pine, cedar, and cypress trees, sweeping down to the water's edge, covered with the yellow jasmine, the log-cabins of graziers antedated Charleston, with its merchants, wharfs, and shipping.

While the southern settlements were thus in progress, North America was traversed overland to its oceanic boundary towards the pole, as well as across its entire breadth from the Atlantic to the Pacific. This was effected by hardy Scotchmen in the service of the fur-trading companies. Samuel Hearne, starting from Fort Prince of Wales, in Hudson's Bay, reached the Coppermine River, and, in 1772, descended it to its mouth in the Polar Ocean, accompanied by two countrymen, and some native Indians. During this journey, which extended over sixteen months, the auroral coruscations were frequently so vivid that he could see to read very small print at midnight; and he expressly states, that these northern meteors were distinctly heard to make a crackling and rushing noise, like the

waving of a large flag in a fresh gale of wind. Other northern explorers have listened in vain for similar sounds. Hearne witnessed a scene of great horror, owing to the deadly animosity of his Indians to the Esquimaux, a common feeling between the two nations. They were constantly on the look-out for them, and finding a party at hand, nothing could restrain their fury. They crept stealthily to the neighbourhood of the unsuspecting victims; and rushed out of their concealment in the dead of night, butchering men, women, and children. The traveller likewise met with a remarkable adventure. In a desolate part of the country, the track of a snow-shoe was observed and followed. It led to a hut in which a young Indian woman was sitting alone, who told a tale of misfortune with affecting simplicity. She had been taken prisoner with her child by hostile natives, after the loss of most of her relatives. The child, too, they destroyed, upon which she contrived to effect her escape; but despairing of being able to reach any surviving friends, she had built the hut, and had lived for the last eight moons in absolute solitude. This female Crusoe had snared partridges, rabbits, squirrels, and a few beavers, for subsistence, and made clothing of their skins. Hearne describes her as one of the finest Indian women he had ever seen, and while she joined his party, it was not from any impatience of her desolate condition.

From Fort Chipewyan, at the head of the Athabasca Lake, Alexander Mackenzie, another adventurer, started in the summer of 1789, and explored the river which bears his name to the Polar Sea, where the tidal oscillation was observed, and several whales were seen sporting among the ice. Immediately afterwards he performed a more difficult undertaking; with a band of hunters and natives, he was the first to cross the continent from east to west in a northerly latitude. Setting out from Montreal for Fort Chipewyan, at that time the remotest European station westward, he passed the barrier of the Rocky Mountains, and descended to the Pacific Ocean, striking it at the head of an inlet, about latitude  $52\frac{1}{2}^{\circ}$ . There, on the face of a rock, beneath whose shelter the party slept, he painted the inscription with vermilion and grease, which the elements must soon have effaced: 'Alexander Mackenzie from Canada by land, the 22d of July 1793.' Under President Jefferson, in 1804, the government of the United States organised its first expeditions for interior discovery, as the result of which, the Rocky Mountains were crossed to the mouth of the Columbia River, while the Mississippi was ascended to its source. At this period, also, Humboldt brought to a close his remarkable researches in the equatorial regions of the continent, extending over four years, conducted in company with the naturalist Bonpland. During his travels, he determined astronomically the position of more than three hundred places; ascertained the bifurcation of the Orinoco, and its connection with the Amazon; studied the phenomena of earthquakes and volcanoes; marked the forms of animal and vegetable life in the great rivers and forests; crossed the icy ridges of the Andes five times; and scaled the side of Chimborazo to the height of 19,300 above the sea, the greatest altitude that had then been attained by man.

## CHAPTER VII.

### RUSSIAN DISCOVERIES—CIRCUMNAVIGATIONS OF THE EIGHTEENTH CENTURY.

IN the path of geographical discovery thus commenced by the more advanced European nations, they were soon to be followed by the great northern people. The Russians, during this era, made acquaintance with the vast extent of northern Asia, and became its masters. Though rapidly effected, this conquest was the fruit of desultory movements, not of systematic action, and was accomplished much more by stealthy occupation than open force. Armies were not engaged in reducing this enormous tract of country, but private hunters after the fur animals, merchants, and small auxiliary bands of Cossacks. They presented themselves at first, in general, to the spare indigenous population as traders, and were received with hospitality, till, having intrenched themselves, the guests assumed the attitude of conquerors. Though some tribes submitted only to the sword, after making a brave resistance, the majority, consisting of feeble barbarians, few in number, separated by dreary distances, and ignorant of the art of war, were readily overcome by the superior address and skill of the European adventurers. It was long remembered in the local chronicles of Yakutsk, how a site was obtained for the four wooden towers and palisades of a fort, by the first settlers. Though the tale

is exactly similar to the one told respecting the foundation of Carthage, it is hardly likely to have been copied from it in the heart of Siberia, but probably refers to something which actually took place at the spot. The Yakuts granted so much land for the erection as their visitors could compass with a few cow-hides, upon which they shrewdly cut the hides into very thin thongs, and surrounded with them an area sufficient for a town, as well as a fort. However easy to overcome the natives—strangers to firearms and European modes of warfare—the task of exploring and occupying a vast region like Northern Asia, crossing immense rivers and compassing endless lakes, passing sterile mountains and barren steppes, contending with the severities of nature and encountering savage races, required indomitable energy. It strikingly illustrates the boldness, vigour, and patient endurance of the Russian colonists, with the strong temptation which valuable commercial commodities offer to perilous adventure.

It was in the year 1639, sixty years after the invasion of western Siberia, while the first Romanoff was reigning, that his subjects are said first to have caught sight of the ocean to the eastward; and when the great river Amour was first heard of. Four years later, in 1643, Pojarkof left Yakutsk, then a recent foundation on the banks of the Lena, with a party of about 130 men, in search of the southern stream. He gained the river, followed its course to the sea, then journeyed northward along the coast, and returned by a different route to his starting-point, after an absence of three years. In consequence of the favourable report made by the leader of this expedition, a stronger force was despatched to take possession of the country on the Amour. No difficulty was experienced in reducing a few Tungusian hordes; and a chain of small forts was built along the river, the principal of which were Albasin and Kamarskoi Ostrog. But eventually the Chinese interposed, and the Russians were compelled to abandon their acquisition. In 1661, Pokhabov, a Cossack, commenced a settlement upon the site of the present Irkutsk; and twenty years later, Abbot Feodosyi, with a few monks from Moscow, founded the existing monastery of the Trinity on the farther side of Lake Baikal.

The progress of the Russians was as rapid in northern as in southern Siberia. From the banks of the Lena they passed to those of the Kolyma, and erected the first fort there in 1644. Two years later, a company of adventurers descended to the Arctic

Danger Rocks near the Mouth of the Amour.

Ocean; and followed the coast eastward to a bay of the Tchouktski, from whom a supply of walrus teeth was obtained in exchange for trifles, which tempted to another visit and further exploration. Led on by the grand attraction of furs and peltry, aptly called the 'golden fleece' of the north, the banks of the Anadir were reached in 1650, by Deshniev and Staduchin, two bold Cossacks, at the head of distinct parties, who established the fort of Anadirsk on the river, and treated the natives with great barbarity. In 1696, the first expedition to Kamtchatka started from this fort. It consisted of sixteen Cossacks, who plundered the villages under the pretence of exacting tribute; and carried

off some writings in an unknown language, afterwards ascertained to be Japanese. A larger body of invaders in the following year took possession of the river of Kamtchatka, by erecting a cross upon its banks; and soon afterwards the whole peninsula was reduced, while Bolcheresk, with the Upper and Lower Kamtchatkoi forts, were built to secure it. For some years this acquisition was of little advantage, as only a very scanty tribute of furs could be wrung from the small population. But upon the extension of the Russian fur-trade to America, the peninsula became of great importance as a point of communication between the Asiatic and the American mainland; and Petropaulovski was founded to facilitate the commerce. It is to be regretted that accounts of these

Petropaulovski.

early enterprises are meagre and obscure, for they must have involved many a romantic incident and exciting adventure, which the imagination is left to supply. It is stated that the Russians were at first treated by the more northern tribes with great veneration, and almost deified; nor did they believe it possible to hurt them by human power until the strangers quarrelled among themselves, and blood was seen to flow from the wounds they inflicted upon each other. They seem only to have encountered vigorous resistance from the Tchouktski; a warlike nation inhabiting the north-east extremity of the continent, who faced the Cossacks with intrepidity, sometimes defeated them, and when overcome themselves, killed one another to escape subjection. It was found impossible to conquer this race, though their country was repeatedly penetrated; and they have remained to the present day practically independent.

On advancing to the north-eastern extremity of Asia, a great country beyond the sea was heard of by the Russians, which might be seen in clear weather from an island in the intervening channel—a reference to America. Some men were also met with, who differed from the indigenous people; having ‘holes pierced in their lips, in which were stuck pieces of the teeth of the sea-horse’—natives of the adjoining continent. But not satisfied with vague rumours, Peter the Great determined to have the problem of the relative position of Asia and America solved. In almost his last moments he wrote instructions to Admiral Apraxin for a voyage as follows: 1. To construct at Kamtchatka,

or other commodious place on the eastern ocean, one or two vessels; 2. With them to examine the coasts towards the north and towards the east, to see whether they were not contiguous with America, since their end was not known; 3. To see whether there was any harbour belonging to Europeans in those parts; and to keep an exact journal of all that should be discovered, with which the commander was to return to St Petersburg. The execution of this mission was committed to Captain Vitus Behring, a Dane by birth, who was accompanied by Alexei Tchirikof, as his second in command.

Owing to the vast distance between St Petersburg and the nearest Siberian ports, which had to be traversed by officers, mariners, shipwrights, and other artificers, who had then to construct the vessels, more than three years elapsed after the instructions were given before the expedition was equipped. On the 14th of July 1728 it sailed from the river of Kamtchatka. The commander ascertained the separation of Asia from America on this voyage by passing up the intervening channel; and posterity has justly bestowed upon it the name of Behring's Strait. But either from unfavourable weather, or from keeping close to the Asiatic shore, he never caught sight of the American coast. This was reserved for Krupishef, a Cossack, who sailed from Kamtchatka in 1731, in order to co-operate with a land-expedition into the country of the Tchouktski. Forced by a gale of wind from the point of land where Behring's voyage had terminated, and driven to the eastward, he found, first an island, and then a country of great extent. Soon after it was seen, a man came off in a canoe resembling those of the Greenlanders. It could only be ascertained that he was an inhabitant of a large country, where there were many animals and forests. The Russians followed the coast of this region two whole days without landing, when a storm came on, and they returned to Kamtchatka. This completed the discovery of the strait by observation of both sides of the channel; and the fact of the proximity of the continents was added to that of their separation.

Ten years later, in 1741, Behring was commissioned to undertake another voyage, and sailed on the 4th of June in the *St Peter*, with a companion-vessel, the *St Paul*, under the command of Tchirikof. Being separated by a storm in the midst of a thick fog, soon after starting, they proceeded independently, and never met again. Both were successful in their immediate object, and both encountered mournful reverses. Tchirikof made the coast of America, where the shore was steep and rocky, the surf high, and remained at anchor in deep water, while the mate went in the long-boat with ten men to endeavour to effect a landing. They were seen from the ship to row into a bay. A small cape then hid them from view, and neither barge nor men ever reappeared. In search of them, the boatswain and six men were despatched. These likewise never returned, nor was any intelligence gathered of the fate of either party. But a large volume of smoke was observed ascending from the shore; and two canoes came off towards the ship, filled with natives, who, as soon as they saw the number of persons on deck, instantly ceased rowing, and remained at a cautious distance. They then stood up, shouting, 'Agai, agai!' and returned with all speed to the strand. After cruising in the neighbourhood for some days, in the hope of recovering his men, Tchirikof reluctantly took his leave, and regained Kamtchatka. Behring likewise came in sight of the continent at a point where the prospect was grand but gloomy. Mountains of great elevation were discovered covered with snow, to the highest of which, some distance inland, Steller, the German naturalist, who accompanied the expedition, gave the name of Mount St Elias, which it still bears. This is the culminating-point of North America, rising to the height of 17,860 feet above the level of the sea. A party landed, and noticed many traces of natives, but none of them were seen. Some islands were afterwards met with, part of the Aleutian chain, and communication was held with the islanders, who seem to have

made friendly advances with foul intentions, but had no opportunity to carry them into execution.

A succession of disasters now befell Behring and his crew, which have seldom been equalled in the annals of navigation. He became ill; scurvy made its appearance among the men; and the weather was frightful. A storm raged without ceasing for seventeen days, during which the vessel drifted before the wind. The most experienced seaman on board, who had been in almost all parts of the world, declared he had never witnessed such a long and terrible gale. No sun was seen by day, and no stars by night. 'The general distress and misery increased so fast,' says Steller in his journal, 'that not only the sick died, but those who still struggled to be numbered on the healthy list, when relieved from their posts, fainted and fell down dead, of which the scantiness of water, the want of biscuits and brandy, cold, wet, nakedness, vermin, fear and terror, were not the least causes.' While the commander was hopelessly disabled, the ship was cast on a desolate shore, now known as Behring's Island, where, from the advance of the season, and the damaged condition of the vessel, the crew was compelled to take up winter-quarters. There were no inhabitants, no grass or antiscorbutic plants, no trees, though drift-wood was found on the beach. Pits or caverns were excavated in some sand-hills to serve for dwellings. Behring was carried ashore by four men, on the 9th of November, and placed in one of them. 'We saw,' states Steller, 'the most dreadful and terrifying objects. The foxes mangled the dead before they could be buried, and were even not afraid to approach the living and helpless who lay scattered here and there, and smell to them like dogs. This man exclaimed that he was perishing of cold; the other complained of hunger and thirst; and their mouths were so much affected by scurvy, that their gums grew over their teeth like a sponge. The stone-foxes, which swarmed round our dwellings, became so bold and mischievous, that they carried away and destroyed different articles of provision and clothing. One took a shoe, another a boot, a third a glove, a fourth a coat; and they even stole the iron implements, while all attempts to drive them away were ineffectual.'

Behring died on the 8th of December, having been previously half-buried alive. The sand rolled down continually from the sides of the cavern in which he lay, and covered his feet. He would not allow it to be removed as it kept them warm, while the other parts of his body were cold. It thus gradually increased upon him till he was almost wholly concealed, and when he expired, it was found necessary to unearth him, before he could be interred. He displayed, according to Steller, 'the most affecting resignation to the will of the Supreme Being, and enjoyed his understanding and speech to the last. He was convinced that the crew had been driven to an unknown land; yet he would not terrify others by declaring his opinion, but cherished their hopes, and encouraged their exertions. He was buried according to the Protestant ritual, and a cross was erected over his grave to mark the spot, and to serve also as an evidence that the Russians had taken possession of the country.' A remnant survived the winter in this dreadful residence, subsisting on the flesh of the sea-otter, with the carcass of a stranded whale; and were able, in the ensuing summer, to construct a vessel out of the timbers of the wreck with which to return to Kamtchatka.

A Russian America was the result of this ill-fated voyage. Hearing from the returned crew, that the shores visited abounded with foxes, sables, ermines, and sea-otters, the Siberian merchants formed themselves into small trading companies to fit out vessels, and sail in the same track. The sea-otters, or sea-beavers, as the traders called them, from the resemblance of their fur to that of the common beaver, were eagerly sought after, as their skins always realised a high price from the Chinese. The animals were taken

in nets, surprised in caverns, speared while asleep, and hunted in boats till they were worn out. In 1745, the agents of these private companies reached the Aleutian Islands, and brought the first tribute of furs from thence to Okhotsk in 1750. To this archipelago the attention of the governor of Siberia at Tobolsk was directed, in 1750, as an imperial possession included in his government. Upon the stock of fur-animals supplied by the islands becoming exhausted, the hunters passed to the adjoining continent; and gradually established these settlements and factories, upon more than 300 leagues of coast, which now constitute the American possessions of the Russian crown, and stretch to the British territories. Great horrors were perpetrated in this Trans-Pacific extension of the empire. The proceedings of one of the first parties to visit the Aleutians, being submitted to a court of inquiry in Kamtchatka, upon information of some of the men, it appeared in evidence, that fifteen of the male islanders had been shot in order to seize their wives; and that the merchant Tsiuproff had deliberately proposed to poison the other males with a mixture of corrosive sublimate, with the same object in view. Afterwards, to secure the services of the able-bodied, it was the usual practice, upon visiting a new island, to kidnap the children, and hold them as hostages for the due performance of slave-labour, in hunting and fishing, by the unhappy parents. Under oppressions of this kind, the aborigines rapidly dwindled, and were nearly exterminated.

Soon after ports had been established on the east coast of Siberia, the attention of the Russians was directed to Japan, as a convenient mart for their furs. Shipwreck first made them personally acquainted with the people of that remarkable empire. A Japanese vessel, richly laden with silks, cotton, rice, and pepper, being driven by stress of weather out of its course, was stranded upon the coast of Kamtchatka. The crew reached the land, and saved the most valuable part of the cargo. But some Cossacks murdered the whole party except two, and seized the property. The survivors, an old man and a boy, were sent to St Petersburg, and arrived there in 1732. This called the notice of the government to their country; and in order to ascertain the exact situation of Japan with respect to Siberia, two officers, Spangberg and Walton, were directed to sail thither in 1739. They accomplished the mission, and had some intercourse with the inhabitants, till the authorities interfered, and prohibited personal communication with the ships. During this expedition, the subjects of Russia approached for the first time the tracks of other Europeans in the Pacific Ocean. Another shipwreck of a Japanese vessel on the Copper Island, off the coast of Kamtchatka, occurred in the reign of the Empress Catherine II., and led to a new attempt to establish commercial dealings. The master and sixteen sailors were saved, and conducted to Irkutsk, where they resided several years, when the former was brought by Professor Laxmann to St Petersburg. Deeming the opportunity favourable for negotiation, the empress sent the strangers back, accompanied with an envoy and presents. But only permission to trade under the same restrictions as the Dutch, by sending a vessel annually to the harbour of Nungasaky, was obtained from the Japanese government.

The illustration of the Asiatic portion of the empire was zealously prosecuted in the reign of Catherine, by both inland and maritime expeditions, at the expense of the government. The Academy of Sciences was charged with the selection of competent men to travel, and drew up instructions for their guidance. They were to examine and report upon the nature of the soil and of the waters, the means of putting the desert places into cultivation, the actual state of agriculture, the most common diseases both of men and cattle, with the methods in use for healing and preventing them, the breeding of cattle, particularly sheep, and that of bees and silk-worms, the fisheries and the chase, minerals and mineral-waters, valuable plants, and the position of places, with miscellaneous points

of geography and meteorology. The celebrated six years' journey of Pallas, from 1768 to 1774, resulted from this project, with whom Gmelin, Georgi, Falk, Rytshkof, Lepekhin, and Guldenstadt were associated, prosecuting independent inquiries. But an obscure fur-trader, named Lachow, accomplished more than the learned travellers. In 1770, having occasion to visit the shore of the Arctic Ocean, he saw while there a herd of reindeer coming from the north over the ice. Guided by the track of the deer, he travelled with sledge and dogs over the ice-fields nearly fifty miles, till he came to an island, beyond which was another. Having readily obtained the right of exclusive hunting on these islands, he proceeded further in another journey, and discovered the largest in the group, which has since borne his name, and is also called New Siberia. There are few spots geologically more remarkable on the face of the globe. Hills of fossil-wood line the shores, while immense tracts, even whole islands, are composed of the tusks and bones of mammoths, rhinoceroses, and other extinct pachyderms, rolled in sand, gravel, or alluvial earth, cemented by ice. These 'Adamic things,' or 'things of Adam's time,' as the uneducated hunters call the remains, in allusion to their antediluvian origin, mysteriously occur in the frozen soil of Siberia, though in much smaller quantity. Upon the discovery, the search for ivory was added to the quest for furs.

To define the north coast of Siberia—an object often-attempted, but not yet completely performed—Billings, an officer who accompanied Captain Cook on his last voyage, was employed by the empress in 1787. He descended the Kolyma River to its mouth, and attempted to follow the coast eastward, but soon abandoned the enterprise, owing to difficulties from the ice. Being subsequently appointed to survey the country of the Tchouktski, he was equally unsuccessful. That bold and independent people jealously watched the movements of the exploring-party; would not allow their visitors to write any observations; and took away their measuring-lines. Water and fuel for cooking they supplied, but required immediate payment, while, taking a fancy to the ornamental buttons on the coats of their guests, they cut them off without ceremony. In 1790, Billings visited the Aleutian archipelago, and has the merit of having revealed to the government the abominable cruelty with which the natives were treated by the Russian traders. But his representations had little or no effect in arresting oppression, owing to remoteness from the seat of authority. A few years afterwards, the Russian-American Company was formed, consisting of merchants chiefly at Irkutsk, who obtained from the emperor Paul the exclusive right to the peltry of the Aleutian Islands and adjacent coasts—a privilege soon extended to that of all Russian America. Under the auspices of this body, New Archangel, on the southern Sitka Island, also called Baranoff Island, was founded as the capital. Here, for a long term of years, Count Baranoff reigned as governor, answering the expectations of the Company, but otherwise consulting his own humour in the administration of affairs, encouraged by the proverb, 'God high, and the emperor afar off!'

The navigation of the Pacific Ocean, long neglected by the countrymen of Drake and Cavendish, was resumed by them towards the middle of the eighteenth century with ardour and remarkable success. In 1740, Captain, afterwards Lord Anson, sailed thither in the *Centurion*, with a considerable squadron; but as this was a warlike armament commissioned to attack the trade and possessions of Spain, nothing was effected in the way of geographical discovery. The voyage was very memorable on account of the dreadful sufferings of the crews, the fortitude they displayed, and the prudence of the commander. Off Cape Horn, the mountainous billows encountered seem to have taken them by surprise, and occasioned many severe injuries. 'Our ship,' says one on board the *Centurion*, 'was nothing to them; but, notwithstanding her large bulk and deep hold in the water, was

tossed and bandied as if she had been no more than a little pitiful wherry.' The scurvy then broke out, and took off the old men so rapidly, while enfeebling the rest, that it was not uncommon to see four or five dead bodies at a time rolling about on the decks for want of help to bury them in the sea. The wounds of veterans, received more than fifty years before, broke out afresh, as if they had never been healed. An anecdote related by Dr Beattie conveys a livelier idea of the intense misery than any description. He once asked a survivor if he had read the history of the voyage, written by the chaplain; and received the reply, that he had read the whole except the description of the run from Cape Horn to Juan Fernandez, during which the suffering was so great, that he durst not recollect or think of it. Anson, by various mishaps, lost all the ships but his own, which he brought home, after an absence of three years and nine months, laden with a vast amount of treasure taken from the Spanish galleons, having circumnavigated the earth. This, being still regarded in the light of a feat, along with the value of the cargo, caused his return to be hailed with general exultation. The *Centurion* had for her figure-head a lion carved in wood, which was long preserved in the stable-yard of a small inn at Waterbeach, in Sussex, with the following inscription :

'Stay, traveller, awhile, and view  
One who has travelled more than you.  
Quite round the globe, through each degree,  
Anson and I have ploughed the sea,  
Torrid and frigid zones have past ;  
And safe ashore arrived at last,  
In ease with dignity appear,  
He in the House of Lords, I here.'

Anson lost an anchor at Tinian, one of the Ladrone Islands, where he landed his sick. It remained submerged nearly a century, when it was hooked up by a whaler, comparatively little corroded, but with the wooden stock completely rotted off.

With discovery expressly in view, the government despatched the Hon. Captain Byron, who had been out in Anson's fleet, as a midshipman, on board the *Wager*, which was wrecked, and Byron wrote a graphic narrative of the horrors of its shipwreck. 'So terrible was the scene of the foaming breakers,' he remarks, 'that one of the bravest men we had could not help expressing his dismay at it, saying it was too shocking a sight to bear, and he would have thrown himself over the rails of the quarter-deck into the sea had he not been prevented.' Lord Byron, his grandson, is supposed to have had this passage in view in the lines :

'Then shrieked the timid, and stood still the brave—  
Then some leaped overboard with dreadful yell,  
As eager to anticipate their grave.'

Byron sailed in the *Dolphin*, in 1764, the first vessel in our navy that was sheathed with copper. He surveyed the Falkland Islands, of which only a glimpse had before been caught. Dreading Cape Horn, of which he had experience in the former voyage, he entered the Pacific by the old route of the Strait of Magellan, but was more than seven weeks in effecting the passage of the gusty channel. The *Dolphin* was commissioned a second time for enterprise, in 1766, under Captain Wallis, who was accompanied by Captain Carteret in the *Swallow*. These ships were nearly four months in getting through the strait, and immediately parted company, not to meet again. Wallis discovered Whitsunday, Egmont, and Queen Charlotte's Islands, described Tahiti for the first time, and did not see a single vessel, after separating from his comrade, till he reached Batavia. Carteret made known a spot without inhabitants, but with wood and water, destined to become famous as the place to which the mutineers of the *Bounty* repaired. He gave it

the name of Pitcairn's Island, from that of the young officer to whose eye it first appeared.

The French were at this time making their first circumnavigation of the globe under Bougainville, who returned to St Malo on the 16th of March 1769, after an absence of two years and a quarter. Some six months before, the great illustrator of the southern hemisphere, Captain Cook, had sailed from the Channel. This eminent man, born in a mud-built cottage near Stockton-upon-Tees, employed his leisure hours as a common seaman to remedy the defects of early education, and obtained the notice of his superiors by professional ability; he was selected, while a lieutenant, to go out to some suitable station south of the equator to observe the transit of Venus in 1769. Upon the recommendation of Wallis, who had just returned from his circumnavigation, Tahiti was fixed upon as the most eligible spot. The Royal Society appointed Mr Green, of the Greenwich Observatory, astronomer of the expedition; Dr Solander, a Swede, connected with the British Museum, was engaged as naturalist; and Mr, afterwards Sir Joseph Banks, with draughtsmen and other assistants, enlisted in the enterprise at his own expense. Cook sailed from Plymouth in the *Endeavour* on the 26th of August 1768, and touching at Rio Janeiro, found it impossible to convey any other idea of his mission to the Portuguese governor than that he was going to witness the north star on its passage through the south pole! Cape Horn was doubled in thirty-four days, and on the 9th of April 1769, the high mountains of Tahiti were faintly discerned. Received in a friendly manner by the islanders, and having a stay of some length in view, the commander drew up a set of rules to be observed by the men, in order to preserve a good understanding with the natives. The astronomical instruments were landed, and the observatory set up on the 1st of May. To guard as much as possible against the main object of the expedition

Mount Egmont, New Zealand.

being frustrated by transient obscurations of the heavens, two parties were detached to observe at different stations, one on the same island, the other at Eimeo, at some distance to the westward. The evening prior to the important day, June the 3d, was a beautiful

one. But solicitude did not allow the parties to take much rest during the night, one or the other rising to report the changes of the sky. All were on foot by daybreak, and saw the sun rise from the sea without a cloud. Scarcely a vapour dimmed the heavens from sunrise to sunset; and the whole passage of Venus over the disk was observed in the most satisfactory manner.

Having fulfilled the immediate object of the mission, Cook, in pursuance of his instructions, addressed himself to discovery, and visited the neighbouring islands, giving them the name of the Society Islands, by which they are still distinguished. In October a great range of land was observed on the horizon, which, from its extent, and mountainous aspect, was at first conceived to be part of the long-conjectured southern continent, *Terra Australis Incognita*. Its circumnavigation dispelled this idea. Landing at one point, the commander saw to his surprise, from the top of a lofty hill, the country divided by the sea into two large islands, since called New Zealand; he sailed through the channel thus discovered, which geographers have since recognised as Cook's Strait. He next sailed 2000 miles along the whole eastern side of Australia, previously unvisited; and originated the name of New South Wales, from some fancied resemblance of the country to the South Wales of England. The first point at which the expedition landed was a bay, on the shores of which Banks and Solander botanised, and called it Botany Bay from the number of new plants observed, afterwards a well-known name at home, as the site first selected for a penal colony. A brass-plate on the cliffs now marks the supposed landing-place. While here, one of the crew, Forbes Sutherland, a native of the Orkneys, died, and was carried on shore and interred, May 1, 1770, being the first British subject buried in Australian soil. The grave was chosen near a small fresh-water creek, and from the circumstance an adjoining tongue of land is now known as Sutherland Point. Eighteen years later, the first Frenchman was interred near the same spot, M. le Receveur, an ecclesiastic and naturalist, belonging to the expedition of the unfortunate La Perouse. Resuming the voyage northward along the coast, the *Endeavour* struck on a coral-rock; and, as was afterwards discovered, only escaped foundering by a fragment of the rock remaining in the hole made in the bottom of the vessel. A convenient harbour being found, the ship was hauled ashore to undergo repairs, when the naturalists were equally surprised and delighted by the appearance of some kangaroos. Cape Tribulation, Endeavour Reef, and Endeavour River, are memorials of the incident. Passing through Torres Strait, the navigator made the best of his way home, and came in sight of it on the 10th of June 1771, having employed two years and eleven months in his voyage round the earth.

Though it was evident that neither New Zealand nor Australia answered to the imagined southern continent, speculative geographers' clung to the idea of its existence in the higher latitudes of the southern hemisphere; and Cook was commissioned to undertake a second voyage for the express purpose of settling this long-controverted point. He took his departure in the *Resolution*, on the 13th of July 1772, accompanied by Captain Furneaux in the *Adventure*. Messrs Wales and Bayley went out as astronomers; Reinhold Forster and his son as naturalists, who were joined by Dr Sparrmann at the Cape of Good Hope; and a competent artist was engaged as draughtsman. This voyage was the greatest maritime achievement hitherto performed, and no expedition has since been conducted with greater skill and success. It exploded the notion of any habitable world existing in high southern latitudes. Three times the antarctic seas were traversed; the high latitude of  $71^{\circ} 15'$  was on one occasion reached; and the entire extent of the South Pacific and Atlantic Oceans was crossed. No land was seen in the course of a run of one hundred and seventeen days over 3660 leagues. But with a sagacity

which has been justified, the navigator expressed the conviction, that 'there is a tract of land near the pole, which is the source of most of the ice that is spread over this vast southern ocean.' Besides determining the question for which he was specifically employed, Cook explored the group of the New Hebrides, and gave them that name; discovered the large island of New Caledonia, Norfolk Island, and New South Georgia; and illustrated the Marquesas and Friendly Islands. He landed at Portsmouth on the 13th of July 1775, after an absence of three years and a sail of 20,000 leagues, having lost but four men of his own vessel, and only one of them by sickness. Omai, a native of Ulitea, one of the Society Islands, came back with the voyagers at his own request, and as the first South-sea islander seen in England, naturally excited intense curiosity. George III. allowed him a pension during his stay; Dr Johnson dined by his side; Reynolds painted his portrait; and Cowper sung of his lot on returning to his countrymen.

'The dream is past; and thou hast found again  
Thy cocoas and bananas, palms and yams,  
And homestall thatched with leaves. But hast thou found  
Their former charms? And, having seen our state,  
Our palaces, our ladies, and our pomp  
Of equipage, our gardens, and our sports,  
And heard our music; are thy simple friends,  
Thy simple fare, and all thy plain delights,  
As dear to thee as once? And have thy joys  
Lost nothing by comparison with ours?—  
Methinks I see thee straying on the beach,  
And asking of the surge that bathes thy foot,  
If ever it has washed our distant shore.  
I see thee weep, and thine are honest tears,  
A patriot's for his country; for thou art sad  
At thought of her forlorn and abject state,  
From which no pow'r of thine can raise her up.  
Thus Fancy paints thee, and, though apt to err,  
Perhaps errs little, when she paints thee thus.  
She tells me, too, that duly every morn  
Thou climb'st the mountain-top, with eager eye  
Exploring far and wide the wat'ry waste  
For sight of ship from England.'

The imagination indulged by the poet of *The Task* was not destined to be realised, for when again among his countrymen, Omai laid aside his European dress, lapsed into the indolence and habits of former life, and soon died.

Without waiting to be solicited, Cook offered to attempt the solution of another geographical problem, which engaged the attention of the government. This was whether any water-passage existed from the north-west coast of America to Hudson's or Baffin's Bay. His services being gladly accepted, he sailed in the *Resolution*, on the 12th of July 1776, with Omai on board, and was joined by the *Discovery* under Captain Clerke at the Cape of Good Hope. Upon landing at a small island never visited before by any Europeans, it was found to contain three natives of the Society Isles, the countrymen of Omai. They were the sole survivors of about twenty persons of both sexes, who, while proceeding in a canoe from Tahiti to Ulitea, had been overtaken by a storm, and driven to the spot, a distance of at least 200 leagues from home. Before reaching it, their comrades perished through the upsetting of the canoe, to which the three who escaped had been able to cling. This incident, as the great navigator states in his journal, 'will serve to explain, better than a thousand conjectures of speculative reasoners, how the detached parts of the earth, and, in particular, how the islands of the South Sea, may have been first peopled, especially those that lie remote from any inhabited continent

or from each other.' Leaving the southern for the northern regions of the Pacific, four of the Sandwich Islands were discovered in January 1778, and received that name in honour of the First Lord of the Admiralty. New Albion was then coasted; and Cook anchored in a bay on the west side of Vancouver's Island, which he called Nootka Sound, from the name of an Indian village on the shore. After some harmless trafficking, he departed for high latitudes, in search of a passage round the continent. Sailing through Behring's Strait, in the middle of August, the latitude of  $70^{\circ} 44'$  was attained, where further advance was arrested by a wall of compact ice. A headland at this point, called Icy Cape, remained the limit of discovery till the year 1816, when it was passed by Captain Beechey.

Expecting to renew the attempt in the ensuing summer, the ships returned to the Sandwich Islands to pass the winter, and employ it in completing the survey of the group. The largest of them was now met with, Hawaii. But here, in the convenient harbour of Karakaooa Bay, the illustrious commander was destined to lose his life in a collision with the natives. This tragic and mournful event took place on the 14th of February 1779. It might have been prevented but for the humanity of the victim, who would not allow the marines to fire, even when the danger was imminent, still hoping to quell the tumult by peaceful means. His remains were mutilated and partly burned by the savages; but some portions were recovered, and committed to the deep with the usual military honours. It is affirmed also, that fragments were long preserved and worshipped by the islanders. In 1828, the officers of the *Blonde* raised on the place where the body of the distinguished voyager is said to have been burned a cross of oak with an inscription; and many a pilgrimage has been paid by Europeans to the spot where he fell, not without taking away pieces of the dark lava rock of the site as memorials. The highest honours were paid to the memory of Captain Cook by his countrymen; but his noblest monument are the five Australian colonies, for it was owing to his report respecting Botany Bay that the first was commenced. After an ineffectual attempt to get further north than on the former occasion, Captain Clerke, who had succeeded to the command of the expedition, expired at sea of a decline. He was buried at Petropaulovski, while minute-guns were fired by the Russian garrison. The two ships, thus deprived of their original commanders, at once returned home, and reached the Nore on the 4th of October 1780, after an absence of four years and two months. During this long interval, only five persons had died by sickness on board the *Resolution*, while not a single death had taken place in the *Discovery*; and the vessels had never lost sight of each other for a whole day together except twice.

The more northerly waters of the Pacific were next visited by La Perouse, with two fine frigates, the *Boussole* and the *Astrolabe*, in the year 1786; and a considerable extent of coast was examined on both sides, in compliance with instructions received from the French government. He left his name to the strait which separates the island of Saghalien from the northerly part of the Japanese Archipelago. Touching at Petropaulovski, he repaired to the tomb of Captain Clerke, and caused the inscription to be engraved on a brass-plate the better to preserve it. From this point he sent a young officer, M. Lesseps, overland to France with dispatches, who effected the arduous journey, and was the first to cross the old world in the line of its greatest extent. Perouse was a highly-accomplished man, but most unfortunate as a navigator. On the north-west coast of America, he lost twenty-one of his men by the upsetting of two boats at the entrance of a harbour, through the violence of the surf; and while at the Navigators' Isles, his fellow-commander in the *Astrolabe*, with the naturalist of the expedition, and nineteen men, fell in an affray with the natives. The two ships were in Botany Bay in 1788, when the

English vessels were there which took out the first Australian colonists, and Perouse sent from thence his last communication to Europe. Nothing was heard of him after sailing away through nearly forty years, though diligently sought for. In 1827, Captain Dillon partly removed the mystery from his fate. From various articles of French manufacture found at one of the Queen Charlotte Islands, as well as from some information obtained at the spot, it was certainly proved that both ships were there lost on a coral-reef. What became afterwards of the crews was not clearly ascertained, but not a man ever returned to the civilised world. The relics, consisting of a sword-guard bearing the initials of La Perouse, fragments of a theodolite and of barometer tubes, several brass guns, and fragments of china, were carefully collected and conveyed to Paris.

During the second and third voyages of Captain Cook, a midshipman served under him, George Vancouver, who is mentioned as having been sent to Captain Clerke for instructions on the morning after the murder of the commander. Rising in his profession, he was despatched in 1791, with two vessels, to renew the examination of the north-western shores of America. In this service, he proved the insularity of the land which has been called after him, Vancouver's Island. Having entered the channel which separates it from the territory of Washington, before thought to be simply an inlet of the sea, he followed its course, and landed on a small islet nearly opposite the spot on which the new city of Victoria has been planted. It was a beautiful May-day morning. The landscape, upon which no white man had gazed till then, was comparable to the most elegantly-finished pleasure-grounds. There were lawns covered with luxuriant grass, diversified with an abundance of flowers, and studded with clumps of noble pines. It was difficult to conceive of being in a country which had not been subject to the softening hand of cultivation, and the explorers were reminded of 'certain delightful and beloved situations in Old England.' Strawberries, gooseberries, raspberries, currants, sweetbrier, and roses, were noticed in a state of considerable forwardness. Pushing through a labyrinth of isles and examining numerous inlets, the main ocean was regained upwards of two hundred miles north of the point where it had been left, thus proving the insularity of the intervening ground. The principal channel separating it from the continent was called the Gulf of Georgia. The region in general received the name of New Georgia, but is now known as British Columbia, of gold-bearing celebrity, constituted in our own time a distinct colony of the crown.

Dillon's Rock, Queen Charlotte's Island.

Christmas Harbour, Kerguelen Island.

## CHAPTER VIII.

### ARCTIC AND ANTARCTIC EXPEDITIONS.

At the close of the long continental war, when the seas were clear of an enemy, and vessels were available for peaceful pursuits, the British government determined to resume an enterprise early projected, repeatedly attempted, but now long suspended—that of passing from the Atlantic to the Pacific by the north of America. Various facts placed beyond the possibility of doubt the existence of a north-west passage, particularly the striking circumstance, that whales breaking loose after being struck in the Greenland waters had been captured in Behring's Strait with the harpoons adhering to them. It only remained, therefore, to discover and follow if possible the line of communication.

To effect this object, Captain Ross, an officer of experience and reputation, was despatched in the *Isabella*, accompanied by Lieutenant Parry in the *Alexander*. The ships left the Thames on the 18th of April 1818, and by the close of the following month, they were sailing in the midst of lofty icebergs of the most varied forms and tints. The

commander made the round of Baffin's Bay, confirmed the general accuracy of the old navigator's delineation of it, and returned home with the conviction that it afforded no entrance into any western sea, but only examined very superficially several promising inlets in that direction, especially Lancaster Sound. At one point of the voyage, the strange spectacle was observed of a range of cliffs, 600 feet high, and 8 miles in length, covered with snow of a deep red colour, which, when thawed, had the appearance of muddy port wine. A portion was brought away for the purpose of being submitted to analysis. A substance, thus tinted, with which we never fail to associate ideas of the purest whiteness, naturally excited great interest. The peculiarity was found to be occasioned by the presence of multitudes of minute cryptogamic plants, which penetrate to a great depth in the snow, and vegetate in the severest weather.

The result of this voyage was very disappointing, but it did not dishearten. Owing to lack of ardour, or precipitancy in forming opinions without waiting for decisive evidence, it was clear that the commander had made no conclusive search of the shores visited. This was the judgment of his own officers, and especially of his second in command in relation to Lancaster Sound, who affirmed that he had seen no barrier to its navigation westward. No hesitation was therefore felt in placing him at the head of a second expedition; and Lieutenant Parry fully justified the confidence reposed in him, and established the correctness of his own views. He left the *Nore* on the 11th of May 1819, with the *Hecla* and *Griper*, and made the entrance of Lancaster Sound on the 30th of July. On advancing up the great inlet, a fresh easterly breeze carried the ships rapidly to the westward; and after sailing 150 miles from the mouth, it was still found to be a noble channel at least 50 miles broad. All eyes kept an anxious look-out for obstructions, but none appeared. The mast-heads were crowded with officers and men; and reports from the crow's-nest were in constant demand below. The sea continued deep, had the colour of the ocean, and being free from ice, our navigators began to entertain the hope with confidence of effecting the North-West Passage; and though doomed to be disappointed, they had compassed more than 30° of longitude since leaving Baffin's Bay, reaching the meridian of 110° W. by the 4th of September; by which they became entitled to the reward of £5000 promised by parliament to the first ship's company who should attain it.

The ships were now on the south coast of a large island, to which the name of Melville Island was given. The winter was rapidly approaching. Young ice began to form on the surface of the waters, retarded only by winds and swells, warning the commander to select a suitable station in which to moor his vessels for the dreary season. This was found in a roadstead called, from the use made of it, the Bay of the *Hecla* and *Griper*, at the head of which, about a cable's length from the beach, they were put into winter-quarters. The spot was indicated by the name of Winter Harbour. Certain of being confined for eight or nine months, during three of which the cheering light of the sun would be absent, Parry was indefatigable and ingenious in endeavouring to render the position of his crews as tolerable as possible. When prevented by the weather from leaving the vessel, exercise was enforced upon the men, who were led in a frolicksome way to run round the decks, keeping time to the music of an organ. Two or three hours daily, when practicable, the officers took a regular walk, but never proceeding further than a mile from the ships, lest they should be overtaken by snow-drift; and other necessary precautions were taken to secure their health, and preserve them from that depression of spirits which the want of customary employment, the long interval of gloom, the monotony of the scene, and the frequent

inability to take open-air exercise from the severity of the weather, were likely to produce; for now

‘The earth is rock—the heaven  
The dome of a greater palace of ice.’

—‘Dull light distils through frozen skies,  
Thickened and gross. Cold fancy droops her wings,  
And cannot range. In winding-sheets of snow  
Lies every thought of any pleasant thing.  
I have forgotten the green earth—  
My heart assumes the landscape of mine eyes,  
Moveless and white, chill blanched with heaviest rime.’

The vessels were roofed entirely over with thick wadding tilts, like those which are used for covering wagons; and the stores were removed to the beach, to provide more room for locomotion on the decks. As sailors are proverbially careless of themselves, the officers assembled them daily, to see that they took a quantity of lime-juice and sugar, as a preservative from scurvy. Their gums and shins were carefully examined, in order to detect the earliest symptoms of the disease. To amuse them, arrangements were made for the occasional performance of a play; and *Miss in her Teens*, with a Christmas piece composed for the occasion, was acted to the unbounded delight of the tars. For their own recreation, the officers started a manuscript publication, *The North Georgia Gazette and Winter Chronicle*, to which they contributed, and twenty-one numbers appeared, which were printed on the return of the expedition.

‘Thus passed the time  
Till, through the lucid chambers of the south,  
Looked out the joyous sun.’

As the winter set in with severity, most of the animal tribes left the frozen region. In the middle of October, the officers availed themselves of a fine day, though the thermometer was 47° below the freezing-point, to go out on a shooting-excursion. But not a deer, grouse, or any kind of game was met with; only a pack of wolves remained. The sun was expected to take his leave on the 6th of November, but by extraordinary refraction, the great orb was seen from the mast-head on the 11th. After the beginning of the new year, 1820, the seamen watched with pleasure the gradual brightening of the light at noon. At that hour, on the 28th of January, none of the fixed stars could be seen by the naked eye. With the commencement of February the sun was looked for, and was hailed on the 3d from the main-top of the *Hecla*. During that month the greatest cold was experienced. On the 15th, the thermometer descended to 55°, and remained for fifteen hours not higher than 54° below zero, equal to 86° below the freezing-point. On the 24th an incident occurred strangely contrasting with frozen mercury and icy scenery. A small building on shore, stored with valuable instruments, used as an observatory, was seen to be on fire, and all hands went to work to extinguish the flames, by heaping snow upon them. ‘The men’s faces at the fire presented a singular spectacle. Almost every nose and cheek was frostbitten, and became quite white in five minutes after being exposed to the weather; so that the medical men, with some others appointed to assist them, were obliged to go constantly round while the men were working at the fire, to rub with snow the parts affected, in order to restore animation. Captain Sabine’s servant, in his anxiety to save the dipping-needle from the observatory, ran out without his gloves. His fingers, in consequence, were so completely frozen that, his hands being plunged into a basin of cold water, the surface was immediately covered with a cake of ice, from the intensity of the cold thus communicated to it. But animation could not be restored in this instance, and it was found necessary to resort to amputation.’

With brightening scenery around, and active life in prospect, the North Georgian Theatre was closed in due form in the middle of March. But the temperature did not rise to the freezing-point, or, as it might be called, the thawing-point, till the close of April. This seemed like summer warmth to the crews. The first ptarmigan was seen on the 12th of May; the next morning one was shot; and soon afterwards three coveys presented themselves. The tracks of deer were likewise observed, which, from the impression left in the snow, seemed to be returning from their migration to the south. On the 24th, a shower of rain fell, and every one hastened on deck to witness the novelty. In June, pools were numerous; water flowed in streams, sometimes in torrents; cleared ground appeared; and the long dreariness of the landscape was at length relieved with patches of fine verdure, and the purple flower of a species of saxifrage. But it was not till the 2d of August that the ships effected their escape from Winter Harbour, when, after a fortnight spent in attempting to proceed to the westward, it was abandoned as impracticable, on account of the impenetrable aspect of the ice in that direction, and the lateness of the season. The furthest point reached by the expedition was in latitude  $74^{\circ} 26' 25''$ , and longitude  $113^{\circ} 46' 43''$ . After an absence of eighteen months, the vessels arrived in the Thames in November, having lost but one man during the interval, who died of a disease in no way referrible to the toils and privations of the voyage.

With great enthusiasm Parry was received by his countrymen, and being raised to the rank of captain, he undertook the command of the *Hecla* and *Fury* for renewed enterprise. His instructions were to examine the northern shores of Hudson's Bay, where there were inlets which had not been explored, in the hope of finding a passage to the northern ocean, and thus by reaching it in a more southerly latitude, diminish the risk of being baffled by ice in proceeding to the westward. He sailed on this mission on the 8th of May 1821, and was out for two winters. But the attempt to gain the Polar Sea by this route proved a failure; and the voyage only resulted in illustrating the desolate character of the lands on the north-eastern side of Hudson's Bay, and ascertaining their detachment from the American continent. A third voyage with the same vessels, in 1824-5, was still less successful. The ships now proceeded by the way of Lancaster Sound, as on the first occasion, and wintered on the eastern side of Prince Regent's Inlet, a broad opening to the south, which it was proposed to explore. But soon after the breaking-up of the ice allowed of active operations being resumed, the *Fury* was so much injured by collision with the floating masses, that she had to be abandoned; and this disaster enforced the return home of the *Hecla*. For want of room, the ship's stores were necessarily sacrificed. But a dépôt was formed on shore of the barrels of beef, beer, biscuit, sugar, and other articles of provision, with the coal, which, though then unlikely to afford aid to any human being, except the Esquimaux, escaped their notice, and proved of service thirty years afterwards to some of the searchers for Franklin.

While Parry was out upon his first voyage, a government expedition was making its way overland from the stations of the Hudson's Bay Company to the mouth of the Coppermine River, with the view of co-operating with the navigator, if opportunity offered; and of examining the coast-line of the Polar Sea. Lieutenant, afterwards the lamented Sir John Franklin, was at its head, and with him were associated Dr Richardson, as naturalist; two midshipmen, Messrs Hood and Back; two English seamen, and some Canadian hunters. But, owing to various hindrances, Parry had returned to England and departed again before the travellers arrived at their destination. In two frail canoes they traced the coast about five hundred miles eastward of the Coppermine River, when failing provisions compelled them to make the best of their way back to their last winter-quarters. This was a station formed for the occasion, named Fort Enterprise. Then commenced a journey

which has scarcely a parallel for extreme misery and horrible incidents. Some of the party died on the route of absolute famine and fatigue; while Franklin, who went with a few attendants ahead of the rest, in the hope of sending them relief, found the station, which, according to previous arrangement, ought to have been well stocked with stores, completely destitute of them. Eighteen days passed over him with no other food than the bones and skins of the deer which had been consumed the preceding winter, boiled down into a kind of soup. When the stragglers came up, a melancholy tale was told. Hood had been foully murdered by the surviving Canadian, with the view either of subsisting upon his body, or of getting rid of a burden; and Dr Richardson had to take the life of the miscreant by a pistol-shot, in order to preserve his own, and that of a comrade. Each was shocked at the emaciated appearance and hollow voice of the others. 'The doctor,' says Franklin, 'particularly remarked the sepulchral tone of our voices, which he requested us to make more cheerful if possible, not aware that his own partook of the same key.' A few hours would, in all likelihood, have terminated their existence, when the long-expected relief arrived. Instructed by dearly-bought experience to obviate the risk of such hardships by adequate previous preparation, the intrepid Franklin, with Dr Richardson, adventured to the same region in 1825. Descending the Mackenzie River to the Polar Ocean, a large extent of coast westward from its mouth was explored, and the whole space examined eastward to the Coppermine, while Captain Beechey, sailing in the *Blossom* frigate through Behring's Strait, very nearly connected himself with the overland expedition.

Information of high interest was accumulated by the parties to these enterprises in the far north illustrative of its fauna, flora, and meteorology. Unable to hunt down the moose and reindeer, the wolves were observed to have recourse to the expedient of driving them over precipices, which betrays an extraordinary degree of sagacity. While their victims were quietly grazing near the summit of some bold bluff, they formed themselves into a crescent around the herd, and cautiously lessened their distance from it, thereby approaching each other more closely. Having thus cut off retreat across the plain, they advanced with hideous yells to urge the animals to flight by the only open way, leading to the precipice, apparently knowing that when once at full speed, and panic-struck, the van must inevitably be driven over it by the pressure of the rearmost. The wolves then descended at leisure to feast upon the mangled carcasses. Dr Richardson was once waylaid in this manner. While sitting one evening on the edge of a cliff by the Coppermine River, he perceived nine white wolves creeping towards him posted like a crescent. He advanced boldly, and they allowed him to pass; but a poor deer, hemmed in at the same time, was shortly afterwards driven over the rock. During Franklin's winter residence at the hut put up by his party, called Fort Enterprise, it is remarkable that the cold was greater than that experienced by Parry in Melville Island, though it is situated nine degrees nearer to the pole. The atmosphere was generally calm during the intense colds, and the breath of a person, at a little distance, looked exactly like the smoke of a musket just fired. The trees in the neighbourhood, frozen to their very centres, became as hard as stones, and every attempt to fell them ended in the axes being broken. Fogs were of frequent occurrence, tantalising and perilous. After a long time had been spent in stealing upon some deer, while the hunters were congratulating themselves upon coming within shot, to their amazement the animals took wing and disappeared in the mist, with a scream and cackle which at once declared their genus, and seemed to deride the credulity of their pursuers. Often would the fog clear away, and permit of a point being seen in the right direction some miles distant. In a moment every hand was at work, the boats were launched, and the crews embarked; but before they could even leave the beach, the impenetrable

curtain of the mist returned, and compelled a retreat by enveloping earth and ocean in deeper gloom than before. The sun and moon were frequently seen surrounded with halos, or concentric rings of vapour, tinted with the brightest hues of the rainbow. Parhelia, or mock-suns, sometimes adorned with these accompaniments, shone at once in different quarters of the firmament, arising apparently from the refraction caused by the minute spiculæ of ice afloat in the atmosphere, in various forms and states of crystallisation. These were most brilliant at sunrise and sunset. During the winter retirement of the solar orb, the aurora borealis illumined and adorned the sky with rapid, vivid, and almost incessant coruscations. The meteor was observed to be more frequent, as well as to flash brighter, in the neighbourhood of the Arctic Circle than in higher latitudes. Its streams of light had the greatest variety and the quickest movement in stormy weather. The stars were not concealed by the display, but only obscured, as if a thin gauze veil had been drawn over them. No noises were heard, though intently listened for, as the sudden glare and explosive aspect of these wondrous showers of fire irresistibly suggested the idea of sound. But the authority of both native Indians and Siberians may be cited to prove that auroral exhibitions appeal to the ear as well as to the eye, by reports resembling the rustling of a flag in a strong breeze, or the crackling discharge of fireworks.

Abortive attempts had been made under the auspices of the government to reach the north pole of the earth in ships, first by Captain Phipps, afterwards Lord Mulgrave, in 1773, and then by Captain Buchan in 1818. A plan was now suggested to accomplish the object by another method—that of sailing to the polar ice-fields, and proceeding thence over the frozen surface of the ocean in sledges drawn by reindeer or dogs. This scheme originated with Mr Scoresby, who, while engaged in the whale-fishery, had discovered a considerable extent of the east coast of Greenland, and made the nearest approach to the pole that had as yet been fully authenticated, having, in 1806, gained the high latitude of  $81^{\circ} 30'$ . His views being deemed feasible, Captain Parry accepted the onerous task of conducting the bold undertaking. This was the last enterprise of the distinguished navigator. He sailed in April 1827; took on board eight reindeer from Norway, with a quantity of moss as their provender; and began an arduous journey over the ice from the north of Spitzbergen. The expeditionary party made the latitude of  $82^{\circ} 40'$ , the highest ever attained, only about 500 miles from the pole, when further progress was arrested by an insurmountable natural obstacle. At that point an invisible power interfered to counteract the movements of the adventurers; for after several days' laborious travelling, it was found that they had actually retrograded in relation to the north, owing to the southerly drift of the ice-fields. Great was the disappointment, but imperative the necessity, to relinquish further effort.

Two years later, with the North-west Passage in view, Captain Ross departed in the *Victory*, equipped by the munificence of Sir Felix Booth; and after enduring four successive Arctic winters, 1829—1832, emerged with his crew from the icy seas, when all hope of their return had been almost universally abandoned at home. While this voyage must be added to the catalogue of failures in relation to its immediate object, part of the northern seaboard of the American continent towards the eastern extremity was for the first time traced. Boothia Felix—a peninsula forming the most northerly portion of the mainland—was discovered, and named in honour of the patron of the expedition. Soon afterwards the exploration of the whole continental coast-line was rendered complete by the journeys of Captain Back, and Messrs Dease and Simpson, officers in the service of the Hudson's Bay Company. During an excursion made for the purpose, a nephew of the commander, afterwards Sir James Clarke Ross, very closely

approached the north magnetic pole. This was at eight o'clock in the morning of the 1st of June 1831, on the west coast of Boothia. The amount of the dip of the magnetic needle was here  $89^{\circ} 59'$ , being only one minute less than  $90^{\circ}$ , the vertical position, which would have precisely indicated the polar station. It was an unattractive site on a low flat shore, rising into ridges from fifty to sixty feet high, about a mile inland. The wish expressed by the discoverer, that a place so important had possessed more of mark or note, was natural; but nature had erected no monument to denote the spot which she had chosen as the centre of one of her 'great and dark powers.' A cairn of some magnitude was raised, upon which the British flag was planted, and underneath a canister was buried, containing a record of the interesting enterprise. Rather more than a quarter of a century afterwards, in February 1859, the place was visited by M'Clintock, while engaged in the search for Franklin, but no cairn was to be seen, the natives having probably displaced every stone, in the hope of finding spoil. He met with some of them in the neighbourhood, one of whom, an old man, called Ooblooria, distinctly remembered Sir James Ross, having served as his guide, and inquired after him by his Esquimaux name of Agglugga. M'Clintock asked for the man, who, having lost his leg, had been supplied with a wooden substitute by the carpenter of the *Victory*, for which his gratitude at the time was unbounded. A silence ensued. It was significant of his death, for the natives do not like to speak of a deceased acquaintance. They contented themselves with pointing out his daughter.

While British enterprise was thus enlarging our knowledge of the Arctic regions, the Antarctic Ocean was not overlooked. Though the idea of a southern continent, abounding in accessible mineral wealth, capable of sustaining vegetable life, and providing a new home for the human race, had been completely disproved by the voyages of Cook, it still remained an open question, whether an immense tract of land, or only a frozen ocean, lay between his limits and the south pole. To determine this point, if possible, separate expeditions sailed under the auspices of the French, American, and British governments. But before these national undertakings commenced, some interesting results had been attained in the field of south polar adventure, principally by merchant-seamen, pointing to the general conclusion since arrived at. In the year 1818, Captain Smith discovered the New South Shetlands, lying to the south-east of Cape Horn, consisting of twelve large islands and innumerable rocks, all bare of vegetation, but with prodigious numbers of the fur-seal, and the particular species called the sea-elephant, from the enormous size of the males. In 1821, Bellinghausen, the Russian navigator, found the island of Peter I., in latitude  $68^{\circ} 57'$ , the most southern land then known. In 1823, Weddell, in a small whaler, discovered the South Orkneys, a group with craggy towering peaks, resembling the mountain-tops of a sunken land; and afterwards penetrated to the latitude of  $74^{\circ} 15'$ , being the most southerly point then attained by man. South of the Cape of Good Hope, under the Antarctic Circle, Enderby's Land was discovered in 1831 by a whaler in the service of the Messrs Enderby; and sailing from New Zealand, in 1839, another of their agents met with a volcanic group, to which his own name, the Balleny Islands, was given, and also a coast-line called Sabrina Land, from the name of the accompanying cutter.

The first of the three government expeditions mentioned, the French, consisted of the *Astrolabe* and *Zélée*, under the command of Captain Dumont d'Urville, who was killed soon after his return home by a dreadful accident on the railway from Paris to Versailles. He sailed from Hobart Town on the 1st of January 1840, and found land on the nineteenth day, in the seas visited by Balleny, about the latitude of the Antarctic Circle. It was covered with snow, and marked with ravines, inlets, and projections, but had no

appearance of vegetation. It was coasted for 150 miles, was very obscurely seen, and named *Terre Adélie*; but the weak condition of the crews compelled a return to a milder climate. About the same period, the American expedition, under Lieutenant, now Admiral Wilkes, in the frigate *Vincennes*, made its appearance in the same seas, but entered them in a more eastern longitude. He also thought he had found a coast-line, and through a westward sail of four weeks, passed over the scene of Balleny's and D'Urville's operations, always having either land in sight or indications of it. If Balleny's Sabrina Land, D'Urville's *Terre Adélie*, and Wilkes's coast are continuous, forming the shore of an Antarctic continent, the honour of the discovery belongs to the former. The English expedition consisted of the *Erebus* and *Terror*, under the command of Sir James Clarke Ross—ships of mournful celebrity, afterwards lost in the north polar zone. Its results were more remarkable than any of the preceding, for while the French and American commanders did not reach a higher latitude than  $61^{\circ}$ , the English penetrated to  $78^{\circ}$ , or within  $12^{\circ}$  of the south pole, which is likely to remain the limit of human enterprise in that direction. The primary object was to make scientific and especially magnetic observations in the Southern Ocean, and ascertain the position of the south magnetic pole. Sir James Ross, already familiar with the icy regions of the north, and distinguished in Arctic adventure by discovering the north magnetic pole, was appropriately appointed to the command. Every suggestion of science and experience was employed in preparing the ships for arduous service, which extended over a period of nearly four years.

The vessels sailed from Margate Roads on the 30th of September 1839, and reached the Cape of Good Hope on the 17th of March 1840, long stoppages having been made at Madeira, St Paul's Rocks, Trinidad, and St Helena, for the purpose of making the required magnetic observations. While within the tropics, the planet Venus was seen near the zenith notwithstanding the brightness of the meridian sun, the sky being very clear; and a high stratum of clouds was observed to be moving in an exactly opposite direction to that of the surface-breeze, in exact accordance with the theory of the trade-winds. Captain Basil Hall witnessed the same circumstance from the summit of the Peak of Teneriffe; and Count Strelezeki, on ascending the volcano of Kirauea, in Hawaii, reached, at the height of 4000 feet, an elevation above that of the trade-wind, and experienced the influence of an opposite current of air, of a different hygrometric and thermometric condition. Crossing the equator, the Magellanic clouds and the Southern Cross marked the further prosecution of a southerly course by their increased altitude in the heavens. On approaching the magnetic equator, or the line of no dip, the gradual assumption by the needles of a perfectly horizontal position was carefully watched, and the signal for being on the exact point of no dip was hoisted from both ships at the same moment. The observation was of peculiar interest to the commander, who had, a few years previously, seen—what no human eye had seen before—the needle in a directly vertical position at the north magnetic pole; and who indulged the hope, in this expedition, of being permitted to see it again in a similar position at the south magnetic pole of the earth.

Leaving the Cape on the 6th of April, the vessels made Kerguelen Island on the 12th of May, remarkable for its rigorous climate and vegetable destitution. Though in a comparatively low latitude in the southern hemisphere, corresponding to that of midland Europe in the northern, absolute sterility seemed to reign upon its shores. Not a tree or shrub exists, and only a very few flowering-plants were observed. Yet this desolate region was once clothed with forests destroyed by successive overflowings of volcanic matter, whose remains, in fossil wood and seams of coal, are found in abundance imbedded in igneous rocks. No land animals were seen, but the footsteps of a pony or an ass were

traced in the snow till lost on reaching a space of rocky ground free from it. The animal had probably been cast ashore from some wrecked vessel. Out of a stay of sixty-eight days, it blew a gale of wind during forty-five, and there were only three days free from snow or rain. The gusts were so sudden and violent, that the seamen were obliged to throw themselves down to escape their force; and one whose duty it was to register the tide-gauge, was actually driven into the water by a squall, and nearly drowned.

The expedition reached Hobart Town on the 16th of August, then under the government of Sir John Franklin, destined in a few years to be mournfully connected with the *Erebus* and *Terror*. They sailed again towards the middle of November, the season of the falling stars, for which the instructions directed a careful look-out to be maintained, but none were seen, only some faint auroral coruscations, a phenomenon neither so common nor so brilliant as in the northern regions. Captain Cook saw the Aurora Australis for the first time on the 17th of February 1773, as a clear white light gradually spreading over the southern part of the sky, exhibiting none of the various tints and fiery terrors of the northern lights; but its first recorded observation was in the year 1745 by Don Antonio Ulloa off Cape Horn. The Auckland Isles, a group lying south of New Zealand, were reached November the 20th, the spring of the year, that month being there the equivalent of our own April. Two painted boards, erected upon poles in a conspicuous spot, immediately attracted attention. They proved to be records of the visits of the French and American expeditions. The first, a white board with black letters, stated: 'Les corvettes Françaises *L'Astrolabe* et la *Zélée* parties de Hobart Town le 25 Février 1840, mouillées ici le 11 Mars, et réparties le 20 du dit pour la New Zeland. Du 19 Janvier au 1 Février 1840, découverte de la Terre Adélie et détermination du pôle magnétique Austral!' The second, a black board with white letters, had the record: 'U.S. brig *Porpoise*, 73 days out from Sydney, New Holland, on her return from an exploring-cruise along the Antarctic Circle, all well, arrived the 7th and sailed again on the 10th March for the Bay of Islands, New Zealand.' The Auckland group was discovered by one of Messrs Enderby's agents, Captain Bristow, in 1806. It consists of one large and several small islands, divided by narrow channels, clothed with an abundant vegetation for the latitude, and well wooded, but with trees stunted by the continual heavy gales. No land animal was found; but the domestic pig, introduced by the discoverer, now occurred in great numbers in a wild state. As the station promised to be of value in the southern whale-fishery, the stock of useful animals was increased by introducing sheep, poultry, and rabbits; and several kinds of edible vegetables were sown and planted. The practice is strongly to be commended of introducing plants and animals serviceable to man, on shores which are destitute of, but capable of maintaining them. It is an easy mode of conferring a benefit of unknown importance. Perhaps some unfortunate shipwrecked crew, cast upon the Aucklands by the boisterous ocean which raves around them, may have reaped no mean advantage from the legacy left there by the British expedition. The cereals were conveyed by the Spaniards from the old to the new continent, thereby endowing it with wealth of incomparably greater value than its own silver and gold; and the earthen vessel in which the original wheat sown in its neighbourhood was brought to Quito, is still preserved as a precious relic. 'Why,' asks Humboldt, 'have not men preserved everywhere the names of those who, instead of ravaging the earth, have enriched it with plants useful to the human race?'

The next point of the expedition was Campbell Island, south of the Aucklands, about thirty miles in circumference, discovered by Captain Hazelburgh in the year 1810. The remains of some huts were found, and the graves of several seamen who had evidently been employed in the seal-fishery. Amongst them was that of a Frenchwoman, accidentally drowned by the upsetting of a boat. Here the outward voyage terminated, December the

14th, fourteen months and a half having been occupied by it, and the magnetic, tidal, and astronomical observations at the several stations visited. From this island, in latitude  $52^{\circ} 33' S.$ , and longitude  $169^{\circ} 8' E.$ , Ross determined to proceed directly southward along the meridian of  $170^{\circ} E.$  Christmas-day, although the midsummer-day of the southern hemisphere, and not in a very high latitude, was passed in a strong gale, with constant snow or rain. Soon afterwards the first icebergs were seen, which, unlike those of the Arctic seas, presented little variety of form, had tabular summits, in some instances amounting to two miles in circumference, on all sides bounded by perpendicular cliffs. On the first day of the new year, 1841, the ships crossed the

Erebus and Terror in the Pack Ice.—From Ross's Antarctic Voyage.  
(By permission.)

Antarctic Circle, and came to the edge of the pack-ice. After skirting it for some days in search of a favourable opening, it was entered, and the clear sea was lost sight of; from the mast-heads, nothing but icy masses being visible around, from which the vessels sustained some violent shocks, and were occasionally in danger. On the 5th day, the pack was passed through amid blinding snow and thick fog, which, on clearing away, revealed the cheering view of an open sea; and early in the morning of January the 11th, the officer of the watch reported land distinctly seen directly ahead of the ships.

A coast rose in lofty peaks, covered with perpetual snow, but at a great distance. The latitude was about the highest attained by Cook. More land speedily came in sight, consisting of mountainous ranges; and to the principal summits the names of eminent

individuals at home were given. Near views of the newly-discovered country are thus described: 'It was a beautifully clear evening; and we had a most enchanting view of the two magnificent ranges of mountains, whose lofty peaks, perfectly covered with eternal snow, rose to elevations varying from 7000 to 10,000 feet above the level of the ocean. The glaciers that filled their intervening valleys, and which descended from near the mountain-summits, projected in many places several miles into the sea, and terminated in lofty perpendicular cliffs. In a few places the rocks broke through their icy covering, by which alone we could be assured that land formed the nucleus of this, to appearance, enormous iceberg.' 'Early this morning [January 15th] we had a fine view of the magnificent chain of mountains that we had seen stretching away to the southward some days before, but then more imperfectly. With a moderate southerly wind, we had beautifully clear weather, and we now saw them to great advantage; and as we stood towards them, we gazed with feelings of indescribable delight upon a scene of grandeur far surpassing anything we had before seen, or could have conceived. These mountains also were completely covered to their sharply-pointed summits with snow, and the elevations that were measured roughly, varied from 12,000 to upwards of 14,000 feet. These were named after the eminent philosophers of the Royal Society and British Association, at whose recommendation the government was induced to send forth this expedition. Herschel, an imperishable name, was given to the most conspicuous.' 'New portions of land opened to our view as we proceeded to the southward. The sun shone forth with great brilliancy; and its beams were reflected from the now distant mountains in every variety of tone, and modification of light, which the different forms of their icy coverings exhibited.'

This discovery restored to Great Britain the honour of reaching the southernmost known land, which had previously belonged to Russia. Owing to the ice from the shore projecting into the sea, and the heavy surf, it was found impossible to perform the ceremony of taking possession upon the mainland. It transpired upon a small adjoining island, entirely composed of igneous rocks, which was called Possession Island. Not the slightest trace of vegetation appeared, but myriads of penguins, which densely covered the whole surface, the ledges of the precipices, and the summits of the hills, unaccustomed to human intrusion, and equal strangers to the fear and power of man, vigorously attacked the landing-party with their sharp beaks. This Antarctic region received the name of Victoria Land, in honour of the Queen. It was coasted up to latitude 78° S.; and near that point a most unexpected feature presented itself. This was a magnificent volcano, rising 12,000 feet above the level of the sea, emitting flame and smoke in splendid profusion, as represented on the opposite page, which the explorers called Mount Erebus, after the name of the leading ship, while that of the Terror was given to a lower extinct crater to the eastward. A singular incident occurred off the shore. An island seemed suddenly to have made its appearance at a spot occupied a few hours before by an iceberg. It was upwards of a hundred feet high, with the whole summit perfectly free from snow. The mystery was speedily dispelled. It seems that the berg had turned over unperceived from the ships, exposing to view a new surface covered with earth and stones, and the mass was still slightly oscillating from the effects. Icebergs of enormous extent were met with, sometimes laden with immense fragments of rock, to be deposited on their dissolution upon the floor of the ocean, far away from the original site of the transported material. This is one of the facts of common occurrence, upon which the geological theory is grounded, accounting for erratic blocks on land, which have no identity with the rocks of their immediate site, or with any to be found within perhaps hundreds of miles of them. Let but the bed of the sea, where the ice-borne fragments are strewn,

be elevated, so as to become dry land—a change which we know has taken place with reference to large tracts of the present surface of Europe—and erratic blocks would be exposed similar to those which now cover the sandy plains of Pomeranian Prussia, which are identical in mineral composition with the rocks of the Scandinavian Highlands.

The approach of the southern winter warned the party to retire to spend it in a lower latitude; and though on two successive seasons the south polar zone was re-entered, no results of public interest were obtained, owing to the unfavourable condition of the ice. Victoria Land, thus revealed, perhaps never to be seen again, seems to be entirely of modern volcanic character, while in Arctic regions the great mass of the land consists of primitive rocks and secondary sedimentary formations. Possession Island was found to be composed of volcanic conglomerate, vesicular lava, and basalt. A beautiful little recess in the prismatic columns of basalt presented a miniature picture of Fingal's Cave in Staffa. The main coast shewed nothing but jet-black lava or basalt, cropping out in its bold capes and promontories beneath a mantle of eternal frost. Aqueous formations may exist in the interior under its covering of snow, but the contour of the country, seen at a distance, exhibited the true volcanic outline. The Antarctic region, contrary to what is the case in

Mount Erebus and Beaufort Island.—From Ross's Antarctic Voyage.

(By permission.)

the opposite dark and outer boundary of the earth, appears to have no representative of the vegetable kingdom. The American trembling poplar reaches to the verge of the Arctic Circle; the birch survives to latitude  $70^{\circ}$  in Europe; shrubs and bushes linger on further north; and mosses and lichens defy the severest cold of the Arctic zone. Man has never yet gone north beyond the limits of vegetable life in this region; Captain Parry, wintering in Melville Island, found mixed with moss, under the snow, an abundance of

several kinds of sorrel, a valuable antidote against scurvy; but not the smallest trace of vegetation, so much as a lichen or piece of sea-weed growing on the rocks, was perceived in similarly high southern latitudes. The extreme south also differs from the far north in respect of animal life. The latter is inhabited by various tribes, white bears, reindeer, wolves, the polar hare, and Arctic fox, some of which seek no southerly migration to avoid the long rigorous winter. While Parry wintered at Melville Island, a pack of wolves nightly serenaded the crew, and a beautiful white fox was taken and domesticated. But no terrestrial quadrupeds of any kind appeared on the south polar shores. The oceanic birds—albatrosses, penguins, and petrels—occurred in great numbers, with seals reposing on the ice, and whales spouting in all directions in the open water. Before finally leaving the Antarctic Circle, a remarkable ray of light was seen on the evening of March 9, 1843, and entered in the log-book as a stationary beam of Aurora Australis. Its fixed character on the following nights led to a different opinion, and eventually it proved to be the tail of the great comet which shortly afterwards became visible in our own hemisphere, and occasioned so much surprise. In the September following, the expedition reached the shores of England.

The same vessels were almost immediately commissioned for another enterprise, but in an opposite direction. Though contrary to the judgment of many, who thought that sufficient hazard of life had been incurred in attempts to effect the North-West Passage of America, the government determined to make a further effort to solve if possible a geographical problem, certainly of interest, but of no practical importance. This task was intrusted to Sir John Franklin, in the *Erebus*, as commander, a veteran in polar service, who had for his second Captain Crozier, in the *Terror*, likewise an officer of great experience in the navigation of icy seas. He had charge of the same vessel under Ross in the Antarctic voyage, and had been out three times under Parry—in the *Fury* in 1821, in the *Hecla* in 1824, and in the celebrated boat-expedition to the pole in 1827. Officers and crews numbered 139. They were picked men, and included some of the choicest spirits in the royal navy, all ready to brave danger and death in the public service, and all destined to perish in attempting an object which the authorities of the kingdom deemed legitimate and praiseworthy. Fitzjames, the captain of the *Erebus*, had served in Syria and China; and thus departed to strongly-contrasting scenery and climate on sailing for the Arctic Circle. It was his first advance to the great zone of cold. He was specially commissioned to take charge of the magnetic observations. Gore, the first-lieutenant, was out in the fearful voyage of the *Terror* in 1836, under Sir George Back, to the north of Hudson's Bay, and also with Ross in the Antarctic regions. Fairholme, the third-lieutenant, was in the expedition to the Niger. Osmer, the purser, accompanied Captain Beechey to Behring's Strait. Stanley, the surgeon, had followed his vocation in China. Goodsir, the assistant-surgeon, a young Scot, had been curator of the Edinburgh Museum, and contributed several papers to the scientific journals, one of which, on the *Mode of Reproduction of Lost Parts in the Crustacea*, appeared in the year the expedition sailed. Ice-master Blenky was with Sir John Ross during his four years' imprisonment in high latitudes.

The ships left Sheerness on the 26th of May 1845, and at noon, on the 4th of June, while off the island of Rona, a western outlier of the Orkneys, the attendant steamers *Rattler* and *Blazer* parted company with them. They ranged successively alongside the discovery-vessels as closely as possible without touching; and prolonged cheers were exchanged by officers and men. In an hour or two the steamers were out of sight on their way homeward; and the rocky Rona, the sea, and sea-gulls were alone in view. On the 11th and 12th the ships were off the south of Iceland, with the sea exhibiting the most perfect

transparency, of a beautiful, delicate, cold-looking green, or ultramarine. Soon after the 22d, Davis's Strait was fairly entered, and a sensible decrease of temperature was observed. A monkey taken out was furnished by the sailors with a blanket, frock, and trousers. Icebergs were seen, and the west coast of Greenland sighted, looking rugged, but sparkling with snow, the ravines and shadows appearing as deep black marks upon it. The ice-master began now to speak of soon seeing the 'Huskimays.' On the evening of the 30th, at six o'clock, the Arctic Circle was crossed; but it was too cloudy to see the sun at midnight, just skirting the horizon. The night of July the 1st was fine, clear, and sunshiny. Splendid icebergs appeared in great numbers, and occasionally interrupted the solemn silence by toppling over with a report like thunder. The Danish settlement of Disco, on the west coast of Greenland, and the Whale Fish Islands in its bay, was now made, where the ships remained for a few days.

From this place, on the 9th, Franklin addressed a letter to Colonel Sabine, stating that the ships had on board provisions, fuel, clothing, and stores complete for three years from that date. They took out, of fresh provisions supplied by the Admiralty—preserved meat in tins, 32,018 lbs.; soup, 17,416 pints; gravy, 2176 pints; vegetables, 8076 lbs.; potatoes, 2632 lbs.; besides the usual rations of salt provisions for three years. He concluded as follows: 'I hope my dear wife and daughter will not be over-anxious if we should not return by the time they have fixed upon; and I must beg of you to give them the benefit of your advice and experience when that arrives; for you know well, that even after a second winter, without success in our object, we should wish to try some other channel, if the state of our provisions and the health of the crews justify it.' On the night of the 11th, Fitzjames wrote his last paragraph home: 'It is now eleven o'clock, and the sun shines brightly over the snowy peaks of Disco. From the top of one of the islands, the other day, I counted two hundred and eighty icebergs, and beautiful objects they are. Should you hear nothing till next June, send a letter, *via* Petersburg, to Petropaulovski, in Kamtchatka, where Osmer was in the *Blossom*, and had letters from England in three months. And now, God bless you, and everything belonging to you.' Franklin's last dispatch to the Admiralty was from the same spot, dated the 12th: 'I hope to be able to sail in the night. It is unnecessary for me to assure their lordships of the energy and zeal of Captain Crozier and Commander Fitzjames, and of the officers and men with whom I have the happiness of being employed on this service.'

The ships were spoken with on the 22d by Captain Martin of Peterhead, in the *Enterprise*, a whaler, in latitude 75° 10', longitude 66°, weather calm. They were alongside his vessel about fifteen minutes, during which he conversed with Franklin and the ice-master. Four days later, the 26th, they were seen by Captain Dannett, of the *Prince of Wales* whaler, moored to an iceberg, waiting an opening in the middle ice of Baffin's Bay, to cross through it to Lancaster Sound. The veil then dropped over the hapless *Erebus* and *Terror*, and what became of them and their crews was not known, though surmised, till fourteen anxious years had passed away. As the third winter approached without intelligence of the voyagers, uneasiness began to be felt respecting their safety, and the 'missing expedition' became an ominous and familiar phrase. It was the general impression that no time should be lost in endeavouring to discover and relieve them, if alive; and, accordingly, a series of attempts commenced with this purpose in view, or to ascertain their doom. Expedition after expedition departed on this errand of humanity and justice. The resources of government and the munificence of private individuals, both at home and abroad, were brought to bear upon the object; and the whole civilised world took interest in the task of ascertaining the fortunes of the gallant men who had disappeared from notice in the heart of the icy ocean. In the interval between the years 1848 and

1854 inclusive, twenty-four vessels sailed, and two land-journeys were made. The world never witnessed before a spectacle so exciting in its circumstances and scene as this long and arduous search, so full of wild grandeur and profound pathos. Countrymen and strangers invaded the dark depths of polar night, in the struggle to reach the lost. Friend yearned after friend, and brother strove to get at brother, amid the congealed masses of the ocean, with an ardour which no cold could chill or danger appal. The dreary solitudes of the Arctic zone were converted into a vast hunting-ground; and the voices of anxious bands roused its echoes, now cheering on each other in the endeavour to find the prison-house of the vanished crews, and now talking over their own perils, plans, hopes, fears, and hairbreadth escapes. Regions naturally desolate of human life were traversed by many a party intent upon the task of meeting with the trail of Franklin amid the bear-tracks of the north, rescuing any of the forlorn survivors, or wresting from the stern keeping of the ice-fields the secret of their fate, and honouring their remains.

Interesting and exciting incidents occurred during the quest, with some of a mournful nature. In 1849, Mr R. Goodsir went out in the *Advice* whaler, under Captain Penny, in the hope of gaining some tidings of his brother, the assistant-surgeon of the *Erebus*. The optical illusions common in the Arctic regions were on one occasion exemplified in a tantalising manner. While standing on the fore-castle in Lancaster Sound, examining with a telescope every part of the coast most anxiously, he recognised with a thrill of joy a flag-staff and ensign. He gazed earnestly at it, and so distinctly did it shew itself, that he could even make out the waving of the flag. Unwilling, however, to trust to his own vision only, he put the telescope into the hands of a man who was standing near him, that he might look at the point ahead. The man did so, and with a start exclaimed that a flag was flying. Mr Goodsir, overjoyed, snatched the glass back, and again applied it to his eye. For an instant—an instant only—he saw the wished-for signal. It then faded—was distorted into a broken and disjointed column—became changed into an inverted pyramid—till at last the image was resolved into its real form, that of a hummocky piece of ice. These illusory appearances, caused by extraordinary refraction, often perplex the Arctic explorer, and exceed the most marvellous deceptions of the desert mirage. The most mournful casualty of these voyages was the loss of Lieutenant Bellot of the French navy, a volunteer, who sailed with Mr Kennedy to Barrow's Strait, and again with Captain Inglefield to the head of Baffin's Bay, where he perished by slipping through a chasm in the ice. Just before leaving, he sent to Sir Edward Parry a parting-gift. This was a turn-screw, the handle of which was made out of the wood of his old ship, picked up by Bellot on Fury Beach twenty-seven years after the wreck. 'He sent me,' Parry observed in a speech, 'that little thing as a memento, and it will be handed down as an heir-loom to my son, who, I hope, will value it as I do.' An obelisk, in honour of the gallant Frenchman, appears appropriately in the front of Greenwich Hospital.

During the detention of the searching-ships in winter-quarters, travelling-parties scoured the surrounding country, and explored it in sledges, often to an immense distance from the locked-up vessels, while the thermometer indicated a temperature of 71° below the freezing-point; the chronometers stopped from excessive cold, though closely attached to the person; and bottles of water, carried at the breast, became bottles of ice. Over a smooth surface, large kites attached to the sledges, or sails hoisted, lessened the labour of the travellers when the wind was high. These parties were organised on an extensive scale out of Captain Austen's expedition in the winter of 1850-51, and commenced their tours as its rigour abated. Fourteen sledges, with one hundred and four officers and men, set out in different directions. They carried distinguishing flags with particular mottoes,

as: 'Onward to the rescue!' 'Persevere to the end!' 'Faithful and firm!' 'Endeavour to deserve!' 'The heart that can feel for another!' 'Our trust is in God!' and

'Gaze where some distant speck a sail implies,  
With all the thirsting gaze of enterprise!'

The tourists were absent from six to eighty days, travelling from forty-four to seven hundred and sixty miles. Often a bear, a wolf, or a musk-ox attracted attention, while remarkable parhelia glittered aloft in the heavens. Mock suns—arcs concentric or inverted—arcs shewing the brightest prismatic colours—were described with mathematical precision. These phenomena were most brilliant when the cold was most intense. Hence an observant tar remarked, that 'when them sun-dogs shews themselves, we always gets double allowance from Jack Frost.' The men cheerfully faced the biting gale, and sturdily advanced against the snow-drift. But it frequently lay deep and soft, with a crusted surface, through which the entire party sank, or the route was over ice of extraordinary difficulty, resembling long waves suddenly frozen, studded with hemispherical icy mounds. Some were frostbitten; others had snow-blindness in one or both eyes, caused by the glitter of the surface in the sun; and each division underwent immense fatigue, with suffering from aching limbs. Yet no man's heart shrank from the encounter with cold, pain, blindness, and peril of life.

In drawing the sledges, the snow-blind were placed in the rear, as vision was only needed in the leaders to see the way. Wine of opium was applied to the eyes of the afflicted with good effect, but caused excruciating pain. Often in drinking, the lips adhered to the edge of the vessels owing to the cold, and severe excoriations were produced in removing them; while the accumulation of ice to the beard was continually irritating the lips. No washing being practicable, countenances rapidly acquired a darkened complexion, being begrimed with dirt and soot from the cooking, till every visage was of sable hue. Some illustrative passages may be quoted from a parliamentary blue-book:

'Sledge *Reliance*.—Wm. Dove snow-blind in both eyes; one man slightly in one eye; two with sore faces from sun and frost.

Sledge *True Blue*.—Lieutenant Osborn snow-blind in both eyes; one bad diarrhoea and debilitated; four snow-blind in left eye.

Sledge *Succour*.—Four affected with snow-blindness; one bad frostbite.

Sledge *Adventure*.—Two snow-blindness in both eyes; one frostbite.

Frostbites were cured by early application of friction to restore the circulation, rubbing the part affected with spirits, and warmth in blanket-bags. Still one case terminated fatally, that of G. Malcolm, a native of Dundee, captain of the sledge *Excellent*, who, with a frostbitten foot, kept dragging at it the whole night, and rests in a grave beneath the chilled surface of Griffith Island. Captain Ommaney thus journalises:

'Sunday, 27th April.—Calm, extremely cold. At 3 h. A.M., the mercury in thermometer was found congealed and contracted to  $-44^{\circ}$ . No sleep; everything frozen in interior of tent and covered with frost. 5 h. 30 m., breakfast; read morning-service. Fearing to expose the men before the sun gained more influence, did not proceed until 8 h. A.M., when the temperature was  $-34^{\circ}$  in shade, and  $-16^{\circ}$  in sun; very clear weather, with a great deal of refraction.

Monday, 28th April.—3 h. A.M., therm.  $-24^{\circ}$ ; 40 m. 6 h., prayers and breakfast. Intensity of cold obliged me to wait for increase of temperature before proceeding. Medical officer advised that E. C. of my sledge should immediately return to the ship, his toe having assumed the appearance of mortification.

Tuesday, 29th April.—3 h. A.M., calm; therm.  $-39^{\circ}$ ; 6 h., prayers and breakfast. Cold most acute in taking sights. Very slow progress; men persevering to overcome the difficulties of our road with good-will; gained about four miles.

Friday, 2d May.—Continued gale throughout the day from S.E. with thick drift; unable to leave the tent.

Saturday, 3d May.—Gale continued with great violence, drift very thick; unable to shew out of tent; discomfort great; the limited space of tent being more confined from the side having been pressed in by an accumulation of snow. No room to move; limbs aching from lying so long cramped up.'

The journalist records being upon one occasion awoke from sleep by the barking of the dog, which was occasioned by a bear near the tent, whose growl was speedily heard. All roused up in confusion on finding such an unwelcome visitor close at hand. But brim's curiosity led him to poke his nose against the poles, which brought down the tent upon the top of the whole party. The position of the inmates was critical for the moment; but the beast paid for his temerity with his life.

The most remarkable journey was performed by Lieutenant, afterwards Captain M'Clintock, who reached one of the western points of Melville Island, distant from the winter-quarters 360 miles in a direct line, which required eighty days, going and returning, to accomplish. The indomitable spirit of his associates is well illustrated by his own statement, that the most disagreeable duty he had to perform was to enforce the return to the ships of those men who had received injuries—much greater than they themselves were aware of—and who evinced the strongest desire to proceed, even endeavouring to conceal from each other their frostbites, and the pain which labour occasioned them. He visited Winter Harbour, the spot where Parry passed the winter of 1820, and met with interesting traces of his sojourn there, after an interval of thirty-one years, during which the place had been abandoned to bears, foxes, musk-oxen, reindeer, and ptarmigans. At Bushman Cove, in the neighbourhood, the site of an encampment, everything was found as it had been left. There was a broken cart very little decayed, portions of which were brought away, and the rest used as fuel; the bones of ptarmigans, of which a sumptuous meal had been made, as recorded by Parry, which were merely bleached, and snapped like the bones of a bird recently killed; and pieces of cloth, canvas, rope, and twine were scattered about, which retained much of their original strength and colour, shewing the slow progress of decay in the climate. The most conspicuous object at Winter Harbour was a mass of sandstone at the entrance, ten feet high, twenty-two feet long, and seven or eight feet broad. It bore an inscription, still quite fresh, referring to Parry's sojourn, scarcely any of the minute black lichen which covers the rock having grown into the letters; and M'Clintock cut the date of his visit, 1851, on an adjoining part. In a hollow at the base of the mass, a hare had taken up her residence, and shewed no alarm whatever at man breaking in upon the solitude. A ptarmigan alighted on the summit and was shot, without in the least disturbing puss as she sat beneath it.

The first trace of the Franklin expedition which was discovered left its fate in complete obscurity. It was the good-fortune of Captain Ommaney, in the *Assistance*, to fall in with significant, though tantalising memorials of it. This was on the 23d of August 1850, at Cape Riley, and Beechey Island adjoining, on the eastern side of the entrance to Wellington Channel. At the former site, a high bluff headland, five tents had evidently been pitched; remains of human food were scattered about; and a piece of rope was found with the well-known Admiralty mark of a yellow strand. As no one had landed there since Parry sent an officer on shore to make observations in 1819, it was reasonably inferred that a party of Franklin's men had occupied the spot. But quite conclusive evidence of the fact was supplied by Beechey Island. There were three graves with inscriptions; hundreds of tin canisters used for containing preserved meat; a prostrate direction-post eight feet long; a smith's anvil-block; coal sacks and pieces of canvas; and many remnants of clothing. The graves were those of seamen, who, more fortunate than their comrades, died the common death of men, after experiencing humane attentions from survivors. One of the inscriptions ran as follows: 'Sacred to the memory of John Torrington, who departed this life January 1st, A. D. 1846, on board of Her Majesty's ship *Terror*, aged 20 years.' It was clear, from the dates, that Beechey Island had been the site of Franklin's first winter-quarters, while Cape Riley had probably been occupied

by a detachment as a look-out station. The sacks, canvas, and other articles of like description, were thoroughly bleached by exposure. The direction-post, doubtless one of a number erected as guides for the seamen on returning from exploring excursions, had either been intentionally upset on leaving, or overthrown by the blast. Careful search was made for some written document indicating the condition and intended course of the expedition, but none was discovered, and various circumstances led to the surmise that the place was quitted in haste, probably owing to the sudden breaking up of the ice. In the meanwhile, Winter Harbour had again become memorable. Captain M'Clure, engaged in the great quest, entered upon it from Behring's Strait, and made his way to the eastward, till his ship, the *Investigator*, was inextricably frozen up in the ice. At the head of a travelling-party, he himself reached Melville Island, and left there a record of his position in April 1852, which being found by a searching-party from the *Resolute*, under Captain Kellett, in the following year, was the means of rescuing him and his crew from an apparently hopeless position. They left their vessel to its fate, joined the *Resolute*, returned to England by Baffin's Bay; and are the only individuals who have compassed the northern shores of America, making in this instance a north-east passage.

No additional information was obtained till the year 1854, when Dr Rae learned from the Esquimaux of Boothia Felix that a party of whites had been seen some years before on the west coast of King William's Island, from whence they travelled to the mouth of the Great Fish River, where they all perished of starvation. Some relics obtained from these natives, and brought home, were proved to have belonged to Franklin and several of his associates. This led to the final search conducted by Captain M'Clintock, who sailed in the summer of 1857, in the *Fox*, a yacht purchased and equipped by private liberality. The first winter was passed in the pack-ice of Baffin's Bay, with which the vessel got entangled, was imprisoned eight months by it, and drifted back very nearly 1200 geographical miles. The second winter was spent in a snug harbour at the eastern entrance of Bellot Strait. The season was unusually cold and stormy. But scarcely had the sun begun to peep above the horizon, terminating the long darkness, when, in February 1859, in the course of a preparatory sledging tour, M'Clintock came upon the trail of the unfortunates. He was accompanied by Mr Carl Petersen, a Dane, thoroughly acquainted with the language of the Esquimaux. They proceeded in the direction of the north magnetic pole, and in its neighbourhood encountered four natives, one of whom had a naval button on his dress, which immediately attracted attention. It

Montreal Island, Mouth of the Great Fish River.

came, they were informed, from some white people who were starved upon an island where there are salmon—that is, in a river—an allusion to Montreal Island, at the mouth of the Great Fish River; and the iron of which their knives were made came from the

same place. On the next day, from another batch of natives, further memorials of the expedition were obtained, consisting of silver spoons and forks, a silver medal, several buttons, and part of a gold chain. None of these people had seen the whites, but one man had seen their bones on the island where they died. It was also stated distinctly that a ship with three masts had been crushed by the ice, and sunk, in a position answering to the west coast of King William's Island, but that all on board landed safely. One of the ships was thus accounted for. Excited by this intelligence, the party returned to the *Fox*, to prepare to follow up the clue by extensive spring journeys.

In the middle of April, from the people before communicated with, the fact was elicited that two ships had been seen, one of which sunk in deep water, while the other was forced on shore by the ice, and broken up by the natives. The body of a man of large size was found on board this vessel. It was said to be in the fall of the year, August or September, that the ships were destroyed, the crews having previously gone away to the large river, where, in the following winter, their bones were found. The party now divided. Captain M'Clintock proceeded towards the Great Fish River, while Lieutenant Hobson directed his course to the west coast of King William's Island, each with a sledge, dogs, and men. In and around deserted snow-huts, quantities of wood-chips were strewed, obtained by the inmates from the stranded ship; and from some Esquimaux, pieces of silver-plate were purchased, bearing the crests or initials of Franklin, Crozier, Fairholme, and M'Donald. They stated that very little of the wreck remained, their countrymen having carried almost everything away; and seemed to intimate that the masts had been burned through close to the deck in order to get them down. An old woman said that many of the white people *dropped by the way*, as they went to the Great River. M'Clintock reached its mouth, while it was 'snowing for a wager,' as the men expressed it, and searched Montreal Island for relics without any important result. But as he returned, he came upon a bleached human skeleton, with fragments of European clothing around it, lying upon the face. The body seemed to be that of a slightly-made young man, and, judging from the remains of the dress, probably that of a steward or officer's servant. This was on the 24th of May. On the 30th, the mournful spectacle presented itself of a boat containing two skeletons, a large quantity of clothing, and many miscellaneous articles. Two double-barrelled guns stood upright against the side, exactly as they were placed eleven years before. One barrel in each was loaded and cocked, and there was abundance of ammunition. No trace could be discovered by which to identify the bodies, but there were pieces of plate marked with the crests or initials of ten different officers—those of Franklin, Gore, Le Vesconte, Fairholme, Couch, and Goodsir, of the *Erebus*; and Crozier, Hornby, and Thomas, of the *Terror*.

A more interesting and quite decisive result was obtained by Lieutenant Hobson, from a large cairn on Point Victory. Lying among some loose stones which

had fallen from the top, a small tin case was found containing a paper inscribed as follows :

'28 of May } H.M. ships *Erebus* and *Terror* wintered in the ice in lat. 70° 05' N., long. 98° 23' W.  
1847.

Having wintered in 1846-7 [evidently a mistake for 1845-6] at Beechey Island, in lat. 74° 43' 28" N., long. 91° 39' 15" W., after having ascended Wellington Channel to lat. 77°, and returned by the west side of Cornwallis Island.

Sir John Franklin commanding the expedition.

All well.

Party consisting of 2 officers and 6 men left the ships on Monday 24th of May 1847.

G. M. GOBE, Lieut.

CHAS. F. DES VŒUX, Mate.'

But this document, inscribed with such words of hope and promise, had been taken up more than twelve months afterwards, to have written round the margin a very different record :

'April 25, 1848.—H.M. ships *Erebus* and *Terror* were deserted on the 22d of April, 5 leagues N.N.W. of this, having been beset since the 12th of September 1846. The officers and crews, consisting of 105 souls, under the command of Captain F. R. M. Crozier, landed here in lat. 69° 37' 42" N., long. 98° 41' W. Sir John Franklin died on the 11th of June 1847; and the total loss by deaths in the expedition has been to this date 9 officers and 15 men.

Signed.

F. R. M. CROZIER,  
Captain and Senior Officer.

Signed.

JAMES FITZJAMES,  
Captain H.M.S. *Erebus*.

\* And start to-morrow, 26th, for  
Back's Fish River.'

It thus appears that after being beleaguered by the ice through more than nineteen months, the ships were deliberately abandoned by their crews, hopeless of being extricated; and after the desertion, according to native reports, one was crushed and sunk, while the other, being driven ashore, proved a mine of almost inexhaustible wealth to the Esquimaux. Remarkably enough, Point Victory, close to the scene of disaster, was Sir James Ross's furthest in the year 1830, where two headlands within sight were named by him Cape Franklin and Cape Jane Franklin.

Thus closes a very melancholy story, doubtless the last of the kind which will have to be recorded. As a maritime nation, we must occasionally lose highly-accomplished naval officers and experienced seamen from the perils of the deep, but it ought henceforth to be on the broad commercial highway of the ocean, rather than in the region where its waters annually solidify, and Nature offers obstacles to progress too strong for man to overcome; or where, if any advance rewards the indomitable hardihood of the navigator, there is now no purpose of science to be answered by it, much less of commerce and humanity. The features of the polar zone have been so far illustrated as to render it needless to risk a single life in attempts to thread the mazes of an inhospitable archipelago; where the many-coloured auroras may be bright and beautiful aloft, but where below no cereals can ever flourish, no civilised population be planted, and only the hardest animals can live, whose cries occasionally mingle with the report of the splitting icebergs, and the sound of the passing gale. If the same amount of energy, skill, and money, expended upon north-western expeditions to dreary solitudes, had been devoted to the task of opening intercourse with the populous regions of interior Africa, its many millions might long ago have been enfranchised with the benefits of civilisation, while its cotton would have found its way to the quays of Liverpool and the factories of Lancashire, in sufficient abundance to render its enforced slave cultivation across the Atlantic unprofitable, or deliver us at least from the terrible hazard of depending upon a single source of supply

for the product. It will be of interest to add, that from the earliest polar researches of the Cabots at the close of the fifteenth century to the voyage of M'Clintock, there have been about one hundred and thirty northern expeditions, illustrated in two hundred and fifty volumes and printed documents, of which considerably more than one half have been issued in England. The expenditure must have amounted to several millions sterling. At Spilsby, in Lincolnshire, where Franklin was born, a memorial has been raised in honour of him; and a colossal statue of Crozier surmounts a picturesque pedestal at Banbridge, in the county of Down, the place of his birth.

Esquimaux Snow Huts.

Source of the Ganges.—From a Drawing by Lieutenant White.

## CHAPTER IX.

### CENTRAL ASIA, AFRICA, AND AUSTRALIA.

It was the earnest desire of Humboldt, after surveying the elevated regions of the New World in the Andes, to become familiar with the still loftier summits of the Old in the Himalayas. Difficulties interfered with the gratification of this wish, but though he never saw their colossal masses, in 1829, in company with Messrs Ehrenberg and Rose, he again took the pilgrim's staff in hand, and proceeded when a sexagenarian into Central Asia as far as the frontiers of Chinese Sangaria. His journeys in different hemispheres enabled him to compare the two auriferous deposits of the Ural Mountains and New Granada; the porphyry and trachyte formations of the Altai and Mexico; the steppes of Siberia and the llanos of Venezuela; the banks

of the Obi and of the Amazon. As an instance of his sagacity, it deserves mention that while at St Petersburg, before starting, he told the Empress of Russia she might expect some diamonds obtained from the dominions of the czar on his return, so convinced was he that the same district contained them which yielded platinum and gold. Accordingly, on reaching the Urals, he visited the gold-washing districts, and a diligent search for the precious gem was instituted. It was not crowned with immediate success, and the traveller pursued his course. But a few days after his departure, Paul Popoff, a boy of fourteen, one of Count Polier's serfs, found the prize in the mines of Bissersk, and obtained freedom as his reward. This was the first discovered Russian and European diamond, the mines being on the western side of the Ural Mountains. Another was soon procured at the same site, which, being forwarded to Humboldt, enabled him to fulfil his promise to the empress on returning to the capital. During the remaining thirty years of his life, geographical researches excited the liveliest interest in his mind, while the highest honours were paid him, at home and abroad, as undisputed monarch in the realm of physics. In the heyday of prosperity he did not forget, in his misfortunes, his former travelling-companion, Bonpland, with whom he had botanised on the slopes and in the valleys of the great American cordilleras. This eminent man had gone to Buenos Ayres in the year 1818 as professor of natural history, but was for some time lost to the knowledge of the civilised world, and no certain clue could be obtained as to his fate. At last, it was ascertained that in the course of a scientific expedition into Paraguay, he had been seized by a party of soldiers, under the orders of the tyrant Francia, and carried off a prisoner. He was confined chiefly in Santa Martha, but allowed to practise as a physician. Humboldt applied in vain for the liberation of his friend. It was not granted till the death of Francia in 1841, by which time Bonpland had become attached to the scene of his exile. Flowers, shrubs, and trees of his own planting had grown up, and were luxuriantly flourishing around his cabin. He resolved, therefore, to remain where he had lived so long, and survived to the summer of 1858, when Humboldt received a joyous letter from him. He died soon afterwards in his eighty-fifth year, and his old comrade, four years his senior, speedily joined him in the grave.

It was reserved for our countrymen, the masters of India, to be the first Europeans to ascend the passes, ascertain the height, and illustrate the character, of the stupendous wall of the Himalaya on its northern frontier, at first conceived to be simply a range of mountains, but really the outward face, or escarpment of a plateau-region, which occupies the whole of Central Asia, though not to an equal elevation. Early efforts were directed to trace the Ganges to its source on the southern slope, said by the natives to be inaccessible by man, as a spot where its presiding genius sits enthroned in everlasting snows. Two adventurers, Webb and Fraser, successively failed, stopping short at Gangotri, where the first work of man, a temple, appears on the banks of the sacred stream. But in 1817 Captain Hodgson, and in 1831 Lieutenant White, succeeded, after overcoming great natural difficulties, in tracing the Ganges to its real source, 13,800 feet above the level of the sea. 'It issues,' says White, 'from under a low arch, at the base of a vast mass of frozen snow, from which hoary icicles depend, whence has originated the fable of the goddess-river issuing from the hairs of Mahadee. No resemblance, however, is traceable of a cow's mouth either here or at Gungootree.' 'The height of the arch,' Captain Hodgson remarks, 'is only sufficient to let the stream flow under it. The mean breadth was twenty-seven feet, and the greatest depth at that place eighteen inches. The dazzling brilliancy of the snow was rendered more striking by its contrast with the dark-blue colour of the sky, which is caused by the thinness of the air; and at night the stars shone with a lustre which they have not in a denser atmosphere. It was curious, too,

to see them when rising appear like one sudden flash, as they emerged from behind the bright snowy summits close to us; and their disappearance, when setting behind the peaks, was as sudden as we generally observed it to be in their occultations by the moon. We were surrounded by gigantic peaks entirely cased in snow, and almost beyond the regions of animal and vegetable life; and an awful silence prevailed, except when broken by the thundering peals of falling avalanches. Nothing met our eyes resembling the scenery in the haunts of men. By moonlight all appeared cold, wild, and stupendous; and a pagan might aptly imagine the place a fit abode for demons. We did not see even bears, or musk-deer, or eagles, or any living creature, except some small birds.' The spot from which the river starts on its long and stately course, as represented in Lieutenant White's sketch at the head of this chapter, is at the elevation of 13,800 feet above the sea, between three mountains which rise 8000 feet higher.

The attention of the inquiring world was strongly directed to the Himalaya range by Mr Moorcroft's admirable narrative of his ascent of the Niti Pass—one of the great lines of communication between India and Thibet in 1812. He had the double end in view of obtaining specimens of the wool furnished by the flocks grazed on the interior tablelands, from which the celebrated shawls of Cashmere are made, as well as to survey the sacred Lake of Manasarowara, an object of the deepest veneration throughout the realm of Hindu superstition, in both of which he succeeded. The route lay through glens clothed with forests of pine, above which the mountains reared their summits covered with perpetual snow. Danger was continually encountered from the ravines and torrents crossed by bridges of ropes, the steepness of the precipices to be scaled, the abruptness of the slopes, the narrowness of the paths, and the quantities of stones and snow which occasionally descended from the heights. That difficult and quickened respiration connected with attaining a great elevation was also strongly felt, while the remarkable change of temperature in the course of twenty-four hours added to the suffering of the traveller. Before gaining the summit of the pass, 16,814 feet high, blood burst from his lips; giddiness seized him; and the party were obliged to stop at every three or four steps to take breath, and recover their strength. Yet the strange spectacle was witnessed of noble forests of pines, mingled with cypresses and cedars, clothing ridges on which human beings find it difficult to respire, while the somewhat perplexing problem was present, which all travellers have noticed, that on advancing in the Himalayas from south to north, the snow-line, and with it the vegetation, gains in altitude. The case was well stated by Captain Gerard, who visited several of the passes, accompanied by his brother, Dr Gerard, in 1821. 'It seems surprising,' he remarks, 'that the limit of vegetation should rise higher the further we proceed; but so it is. On ascending the southern slope of the snowy range, the extreme height of cultivation is 10,000 feet; and even there, the crops are frequently cut green. The highest habitation is 9500 feet; 11,800 feet may be reckoned the upper limit of forest; and 12,000 that of bushes, although, in a few sheltered situations, such as ravines, dwarf birches and small bushes are found at almost 13,000 feet. Advancing further, you find villages at 13,000 feet; cultivation at 13,600 feet; fine birch-trees at 14,000 feet; and tama-bushes, which furnish excellent firewood, at 17,000 feet.' This result, so contrary to theory and general experience, at first gave rise to the suspicion of error in the calculation of the heights. It was quite unfounded, and the anomaly is susceptible of satisfactory explanation. On the southern side, the Himalaya mountains rise suddenly and in a well-defined line to an enormous height above the plains of Bengal, while on the northern side, they are flanked by very elevated plateau-regions of immense extent; and as the atmosphere is warmed chiefly by the radiation of heat from the terrestrial

surface, it follows that the proximity of a vast mass of high ground on the north of the great peaks raises the temperature in that direction.

In a subsequent journey, in 1824, Mr Moorcroft traversed Afghanistan, crossed the Hindoo-Koosh, and descended into the plains of Turkestan, where his name was added to the long list of the victims to travel. After being robbed by a rapacious Uzbek chief, he died of fever, and his companions, Messrs Guthrie and Trebeck, were also cut off by the same malady. Their remains lie in a humble grave, under a mud wall, outside the ruined city of Balkh. Some years afterwards, every book belonging to the party was recovered, even to their daily cash-account, but no manuscript details of the journey were found. Lieutenant, afterwards the unfortunate Sir Alexander Burnes, in 1831, followed the same route, passed the Oxus, and remained some time at Bokhara, a city which soon acquired a mournful celebrity from the barbarous murder of Colonel Conolly and Captain Stoddart, who were executed there by order of the reigning Ameer. In the winter of 1837-1838, Lieutenant Wood ascended the Oxus valley, and traced the river to its source in a lake on the *Bam-i-Duniyah*, or 'Roof of the World,' at a height corresponding to that of Mont Blanc, a site which no European had visited since the days of Marco Polo and Benedict Goez. 'The aspect of the landscape was wintry in the extreme. Wherever the eye fell, one dazzling sheet of snow carpeted the ground, while the sky overhead was everywhere of a dark and angry hue. Clouds would have been a relief to the eye; but they were wanting. Not a breath moved along the surface of the lake; not a beast, not even a bird was visible. The sound of a human voice would have been music to the ear; but no one at this inhospitable season thinks of invading these gelid domains. Silence reigned around—silence so profound that it oppressed the heart; and as I contemplated the hoary summits of the everlasting mountains, where human foot had never trod, and where lay piled the snows of ages, my own dear country, and all the social blessings it contained, passed across my mind with a vividness of recollection that I had never felt before.—As early in the morning of Tuesday the 20th of February as the cold permitted we walked out upon the lake, and having cleared the snow from a portion of its surface, commenced breaking the ice to ascertain its depth. This was a matter of greater difficulty than it at first sight seemed, for the water was frozen to the depth of two feet and a half, and owing to the great rarity of the atmosphere, a few strokes of the pickaxe produced an exhaustion that stretched us upon the snow to recruit our breath. The human voice was sensibly affected, and conversation, especially if in a loud tone, could not be kept up without exhaustion. A run of fifty yards made the runner gasp for breath.' Explorers have since been numerous in Central Asia, including Dr Thomson, Dr W. Hooker, and Lord W. Hay, among our own countrymen; many Russian travellers, one of whom, M. Semiof, in 1857, was the first European to ascend the Thian-Shan, or Celestial Mountains; and the three German brothers, Adolphe, Herman, and Robert Schlagintweit. A melancholy fate befell the first of these in 1856, who, while pushing on alone, was seized by a robber-chief, and beheaded in front of Kashgar. The culminating-point of High Asia has not yet perhaps been ascertained with certainty. For some time, Dhwlagiri, or the White Mountain, 26,862 feet, was supposed to be the loftiest peak of the Himalayas; then Kunchinjinga, 28,117 feet; but in 1857 a higher mass was found, 29,000 feet, nearly due north of Calcutta, which, having no fixed name, received that of Mount Everest, in honour of a former surveyor-general in India.

We have seen, in a former chapter, that at the close of the eighteenth century, the great continent beyond the waters of the Atlantic, the very existence of which had only been known some three hundred years, was traversed from the icy borders of the Polar Ocean

to the volcanic cones of the Andes, and from the range of the buffalo, on the grassy prairies of the Mississippi, to the realm of the condor, on the snow-clad head of Chimborazo. But a vast part of the old world at this time remained to be explored. Africa—so comparatively contiguous and grand in history, with a name which has been stamped for ages upon its page—the scene of Greek and Roman prowess, under an Alexander, a Scipio, and a Cæsar—the prime emporium of oriental commerce after the fall of Tyre, and the great repository of literature under the Ptolemies—was, as to its interior regions, a land of mystery to the European, with millions of square miles of territory which his foot had never pressed, or his eye seen. Bruce, in 1770, at his own expense, reached the source of the Blue Nile in Abyssinia, the inferior branch of the great river, and a region within the bounds of ancient geographical knowledge. To endeavour to go beyond them, and solve the problem of Central Africa, a society was founded in 1778, with the name of the African Association, the mention of which revives the memory of many gallant-hearted men who lost their lives in its service, either falling victims to the climate, or to the hardships of their pilgrimage, or to the ferocity of the natives. John Ledyard, the first agent, was cut off by disease at the threshold of his journey at Cairo; Major Houghton died, or was murdered by the Moors in the basin of the Gambia; Frederick Hornemann succumbed to sickness south of the Great Desert; and Mungo Park, who made his way to the Niger, perished in the stream.

The latter, a truly admirable traveller, started from the west coast in 1795, reached the mysterious river, heard of from remote antiquity; and was the first European to gaze upon its waters. After undergoing great privations and barbarous treatment from the Moors, he was cheered by the cry from a negro companion, 'Geo affili!'—(See the water!) 'Looking forward,' says he, 'I saw with infinite pleasure the great object of my mission—the long-sought-for majestic Niger, glittering in the morning's sun, as broad as the Thames at Westminster, and flowing slowly to the eastward. I hastened to the brink, and having drank of the water, lifted up my fervent thanks in prayer to the Great Ruler of all things, for having thus far crowned my endeavours with success.' Being forbidden to cross the river, and regarded with fear and astonishment by the natives, he could get no one to entertain him; and was obliged to sit all day in the shade of a tree without food, with the prospect of spending the night in the open air, in a neighbourhood infested with wild beasts. A negro woman at last offered him shelter, supplied his hunger, provided him with a mat to sleep on, and then called to the female part of her family, who had stood gazing all the while in fixed astonishment, to resume their task of spinning cotton, in which they continued to employ themselves great part of the night. 'They lightened their labour,' he remarks, 'by songs, one of which was composed extempore, for I was myself the subject of it. It was sung by one of the young women, the rest joining in a sort of chorus. The air was sweet and plaintive, and the words, literally translated, were these:

"The winds roared, and the rains fell. The poor white man, faint and weary, came and sat under our tree. He has no mother to bring him milk, no wife to grind his corn. *Chorus.* Let us pity the white man, no mother has he, &c."

The only recompense the stranger could bestow in the morning consisted of four brass buttons from his waistcoat. Great sufferings and dangers awaited Park on making his way back to the coast. His clothes were in rags; he was often sick and weary; and from sheer exhaustion his horse fell, quite unable to proceed. 'I sat down,' he observes, 'for some time beside this worn-out associate of my adventures; but finding him still unable to rise, I took off the saddle and bridle, and placed a quantity of grass before him. I surveyed the poor animal as he lay panting on the ground, with sympathetic emotion, for I could not suppress the sad apprehension that I should myself, in a short

time, lie down and perish in the same manner, of fatigue and hunger. With this foreboding I left my poor horse.'

Being penniless, Park had to subsist upon the charity of the negroes, and was once stripped quite naked by the Moors, who, however, threw him back the worst of two shirts and his trousers. 'Whichever way I turned, nothing appeared but danger and difficulty. I saw myself in the midst of a vast wilderness, in the depths of the rainy season, naked and alone—surrounded by savage animals, and men still more savage. I was 500 miles away from the nearest European settlement. All these circumstances crowded at once on my recollection; and I confess that my spirits began to fail me. I considered my fate as certain, and that I had no alternative but to lie down and perish. The influence of religion, however, aided and supported me. I reflected that no human prudence or foresight could possibly avert my present sufferings. I was indeed a stranger in a strange land; yet I was still under the protecting eye of that Providence who has condescended to call himself the stranger's friend. At this moment, painful as my reflections were, the extraordinary beauty of a small moss, in fructification, irresistibly caught my eye. I mention this to shew from what trifling circumstances the mind will sometimes derive consolation; for though the whole plant was not larger than the top of one of my fingers, I could not contemplate the delicate conformation of its roots, leaves, and capsula, without admiration. Can that Being, thought I, who planted, watered, and brought into perfection, in this obscure part of the world, a thing which appears of so small importance, look with unconcern upon the situation and sufferings of creatures formed after his own image?—surely not! Reflections like these would not allow me to despair. I started up, and, disregarding both hunger and fatigue, travelled forwards, assured that relief was at hand; and I was not disappointed.' Park came back safely to the limits of civilisation, having accomplished the distance of 2200 miles, going and returning, between the mouth of the Gambia and Silla on the right bank of the Niger.

Nothing daunted by the hardships of his first journey, the traveller volunteered for another, and was despatched with thirty-six companions, carrying various articles to distribute as presents, and tools for the construction of boats with which to descend the river. He followed his former route, and on the 19th of August 1805, from the brow of a hill, he once more saw the Niger rolling its immense stream along the plain. But having journeyed in the rainy season, the mortality had been so great, that only seven of the party survived, and these were in an enfeebled state. He contrived, however, to construct a boat out of two old canoes, and embarked on the river. No tidings were from that time received from himself; but a negro attendant brought back his journal to the Gambia. It was ultimately ascertained, that at a difficult passage of the stream the natives on both banks were hostile; and the whites were either killed by their arrows, or drowned in attempting to effect their escape.

During the early part of the present century, numerous attempts were made to strike out paths into the interior of Africa, both from the west and north coasts, often attended with most mournful results, either from the climate or the barbarity of the inhabitants. With its commencement, Hornemann, a German, disappeared from notice on the borders of the Great Desert, but accomplished its passage, as was afterwards ascertained, and succumbed to sickness at Nyffé on the Niger. To remove the mystery respecting the embouchure of this long-known stream, an expedition was despatched under Captain Tuckey in 1816, to ascend the river Congo or Zaire, under the idea that it would prove its outlet. But after exploring it nearly 300 miles, in boats and on foot, fever assailed the party, and enforced a return, 'a terrible march,' in the words of the commander,

'worse to us than the retreat from Moscow!' Upon regaining the ship, all the scientific men perished one after another, and their leader did not long survive his comrades. Equally calamitous was a coincident attempt to reach the Niger by the old route of the Gambia, as three successive officers in command, Major Peddie, Captain Campbell, and Lieutenant Stockoe, were cut off by the fell fever of the country. The same fate befell Mr Ritchie in 1819, at Mourzouk, the capital of Fezzan, as he was about to start for the interior in company with a caravan. Many casualties of this kind might doubtless have been avoided by proper knowledge of the season of the year best adapted for travelling, with due attention to diet, clothing, and the resting-place at night.

The next adventurers in this direction were Major Denham, Captain Clapperton, and Dr Oudney, who achieved a signal success, though two of them ultimately sacrificed their lives to the love of enterprise. Proceeding from Tripoli to Mourzouk, they set out from thence on the 29th of November 1822, to cross the Sahara to the kingdom of Bornou, having heard that the route thither was as open as the road between London and Edinburgh. For days together, not a bird or insect was seen in the desert, nor a living thing apart from the *kafila*. After toilsome marching under a burning sun, the travellers were delighted with the silence and beauty of the night. The moon and stars shone out with peculiar brilliance; cool breezes succeeded to the heat of the day; and the movement of the blown sand seemed like the murmur of a gentle stream. The deep stillness rendered every noise doubly impressive, while the surrounding waste returned an echo to every sound. In some parts of the route from sixty to ninety human skeletons were passed each day; but the number was countless grouped around some particular wells. They were the bones of unhappy beings captured in the wars of the interior, who perished by the way, as they were dragged through the desert, destined to be fattened in Fezzan for the slave-market of Tripoli. At length, the face of the country began to improve every mile. Joyous valleys were entered clothed with herbage up to the horses' knees, gay with flowering plants diffusing aromatic odours, cheered by the melody of songsters, and enlivened by herds of large fawn-coloured antelopes, with numbers of guinea-fowl. But by far the most gratifying and inspiring sight was the great fresh-water lake Tchad, 'glowing with the golden rays of the sun in his strength,' first seen by European eyes on the 5th of February 1823. Reeds and tall grasses which overtopped the heads of the horsemen fringed the shores; birds of beautiful plumage appeared in the trees; elephants, hippopotami, and buffaloes crashed through the jungle; monkeys, the 'enchanted men' of the natives, chattered at the strangers with impudent familiarity; and multitudes of water-fowl evinced no alarm at the presence of the intruders. They visited Kouka, the chief town of Bornou, and were hospitably received by the chief and his subjects. Clapperton succeeded in reaching Soccatoo, the capital of the Fellatahs, on a tributary of the Niger, but had to mourn the death of his companion, Dr Oudney, by the way. Here provisions were regularly sent to him from the sultan's table, on pewter dishes bearing a London stamp; a piece of meat was served up in a white wash-hand basin of English manufacture; and during the journey he had purchased an English cotton umbrella. Having rejoined Denham, who had been left behind, they made good their passage northward through the desert to Tripoli.

In less than twelve months after his return home, Clapperton was equipped for a second journey, and commissioned to proceed by a shorter route to the populous regions of the interior. He chose for his starting-point the town of Badagry on the Gold Coast. During the first month, and on the same day, the deadly malaria cut off his two scientific companions, Captain Pierce and Dr Morrison. But he regained his old station at

Soccatoo, and by now reaching it from the south, as he had before done from the north, a complete itinerary was made of the continent between the shores of the Mediterranean and those of the Gulf of Guinea. This was the limit of his pilgrimage. Under the combined influence of depression from the loss of his friends, fatigue, and sickness, he wasted to a skeleton, and expired on the 13th of April 1827. A faithful servant watched over his last moments, Richard Lander, who made his way back to the coast, and brought his master's papers to England, but very nearly fell a victim to the vindictive jealousy of the Portuguese slavers at Badagry. They denounced him to the native king as a spy of the British government, and the chief men resolved to subject him to the ordeal of drinking a fetich. 'If you come to do bad,' said they, 'it will kill you; but if not, it cannot hurt you.' There was no alternative or escape. Poor Lander swallowed the contents of the bowl, and then walked hastily out of the hut, through the armed men who surrounded it, to his own lodgings, where he lost no time in getting rid of the drink by a powerful emetic. He afterwards learned that it almost always proves fatal. Finding him unharmed after five days, the natives treated him with great respect as being under the special protection of supernatural power.

About the same period, Major Laing perished by the hand of violence in the cause of African discovery. He left Tripoli with a caravan to cross the desert to Timbuctoo, a town long known by name, and of some importance, but magnified by report into a vast city of Moorish magnificence. Attacked by the banditti of the wilderness, our countryman received twenty-four wounds, and was left for dead. But he recovered to the surprise of his associates, and accomplished the main object of his mission. The last communications from him were dated from Timbuctoo, which he entered in August 1826, and where he remained upwards of a month. But upon leaving that place for the southward, he was foully murdered by a Moorish trader, for the sake, as was supposed, of gaining possession of his papers. Timbuctoo was visited shortly afterwards, in 1828, by René Caillié, a young Frenchman, who reached it from the west coast, remained about a fortnight, and returned through the Sahara into Marocco. His account of the town, as 'a heap of houses neither so large nor so well peopled as I expected,' received at first with suspicion, along with the entire narrative of his adventures, has since been verified.

To explore the lower course of the Niger, and ascertain its outlet, Richard Lander was employed in the year 1830, along with his brother John, who amply justified their selection for the undertaking. They reached the river by an overland journey at Boussa, the capital of one of the petty kingdoms on its banks, and the place near which Mungo Park met with his tragical death. Here, in September of the year named, a characteristic African scene was witnessed. 'The early part of the evening had been mild, serene, and remarkably pleasant. The moon had arisen with uncommon lustre, and, being at the full, her appearance was extremely delightful. It was the conclusion of the holidays, and many of the people were enjoying the delicious coolness of a serene night, and resting from the laborious exertions of the day. But when the moon became gradually obscured, fear overcame every one. As the eclipse increased, they became more terrified. All ran in great distress to inform their sovereign of the circumstance, for there was not a single cloud to cast so deep a shadow, and they could not comprehend the nature or meaning of an eclipse. Groups of men were blowing on trumpets, which produced a harsh and discordant sound: some were employed in beating old drums, others again were blowing on bullocks' horns. The diminished light, when the eclipse was complete, was just sufficient to enable us to distinguish the various groups of people, and contributed in no small degree to render the scene still more imposing. If an European, a stranger to Africa, had been placed on a sudden in the midst of the terror-struck people, he would have

imagined himself among a legion of demons, holding a revel over a fallen spirit.' The Landers solved a problem which had long perplexed geographers, by tracing the Niger downwards to its termination in the Bight of Benin. The river is the Quorra of the natives in the lower part of its course, and the Joliba in the upper. Ten years elapsed after the mouth of the great stream was thus opened to the knowledge of the civilised world before any attempt was made to establish commercial intercourse with the people on its banks. The first expedition for this purpose, from our own shores, was attended with a disastrous mortality which made the nation mourn. Three steamers were despatched by the government in 1841, the *Albert*, the *Wilberforce*, and the *Soudan*, in the hope of arresting the slave-trade by the introduction of legitimate traffic. But the fell malaria, engendered by the mangrove swamps, proved fatal to one-third of the crews, while the energies of the survivors were prostrated by its influence, and the design was defeated. Since that period, however, the river, along with its great affluent the Chadda, has been ascended a considerable distance by the whites, without the loss of a single life, owing to improvements in the treatment of African fever, and knowledge of the season when the banks are the least pestiferous.

Discovery made a very successful start with reference to Africa in the year 1849, since which period the veil has been lifted up from large tracts of country before unknown,

Bavian's Kloof, Genadendal, South Africa.

while others previously entered have been more fully illustrated. Entirely new ground was opened up, in the southern part of the continent, by Dr Livingstone, who went forth single handed into the wilderness, acquired a complete ascendancy over the natives with whom he associated, and displayed a courage combined with prudence which has been rarely equalled, never surpassed. This remarkable man first landed on African soil at Port Elizabeth in Algoa Bay, in the year 1840, in the service of the London Missionary Society. He had high objects in view and a brave heart, but little calculated at that time upon the perils and fatigue to be encountered in penetrating the unknown lands of a region 'whose soil is fire and wind a flame.' Suffering and danger from exposure to

intense heat, from length of way, from hostile and treacherous tribes, from wild animals and venomous snakes, from starvation, from the dire torment of thirst, from miasmatic swamps and disease in various forms, were confronted with a patient endurance which provokes admiration; the more so, as in his great journeys he had no European coadjutor, and the chief part of his track was through a country never before trod by European footsteps. Little can those who sit at ease in their homes, repose on downy beds, or move about in luxurious style upon the rail—passing rapidly over streams, marshes, and moors, without inconvenience—compassing hill and valley with no perceptible change of level—appreciate the self-sacrifice involved in exploring tours beyond the bounds of cultivated society. No home is known for months together, sometimes for years; and frequently no facilities for locomotion are enjoyed beyond pedestrianism, with now and then a canoe, an oft-jaded steed, or a bullock-wagon, though thousands of miles are accomplished over plains of untracked sand, through many a net-work of flooded streams, or wilds savage in appearance, difficult in reality, and dangerous from their inhabitants. Previous to the Cape of Good Hope becoming a permanent British possession, the country from thence to the Orange River had been explored by the Dutch, and information obtained by Lichtenstein of the southern Bechuanas beyond it. Burchell, the traveller, visited their capital, Lattakoo, in 1812, as did Campbell, the missionary, in 1813, who advanced northward to Kurrichaine in 1820. But his furthest north was exceeded by Dr Andrew Smith in 1834, and by Captain Alexander, among the Damaras, in 1837, though both fell short of the Tropic of Capricorn. Immediately on landing, Livingstone proceeded to Kuruman, the most northerly mission station, about a hundred and fifty miles beyond the frontier of the colony. This had been founded some twenty years previously by Messrs Hamilton and Moffat, and is often kindly mentioned by wayworn scientific travellers and gentleman-hunters, Dr Smith, Mr Methuen, Gordon Cumming, and others, for the hospitality of its inmates. Secluding himself from European society, he plunged for six months among the natives, in order to gain an exact knowledge of their language and habits; and after various locations, finally selected a new post in advance on the river Kolobeng, the name of which was given to the settlement. Here he erected the third house reared with his own hands. 'A native smith,' says he, 'taught me to weld iron; and having improved by scraps of information in that line from Mr Moffat, and also in carpentering and gardening, I was becoming handy at almost any trade, besides doctoring and preaching; and as my wife could make candles, soap, and clothes, we came nearly up to what may be considered indispensable in the accomplishments of a missionary family in Central Africa—namely, the husband to be a Jack-of-all-trades without doors, and the wife a maid-of-all-work within.' From this starting-point he opened a new world to the knowledge of his countrymen; but his principal object at first in travelling northward, was the discovery of a position to which the people under his care might remove, and be secure from the troublesome neighbourhood of the Dutch boers.

Leaving Kolobeng on the 1st of June 1849, and skirting the great Kalahiri Desert, Livingstone passed the Southern Tropic, and discovered Lake Ngami, a spacious but shallow expanse, in a country teeming with game of the largest size—elephants, rhinoceroses, buffaloes, hartebeests, zebras, gnus, and giraffes. After revisiting the lake region in a second journey, and penetrating northward in a third, he repaired to the Cape to prepare himself for lengthened exploration, a distance of 1300 miles going and returning, during which his home was destroyed by the boers, the settlement desolated, and the tribe scattered. He now determined to send his wife and children to England by the usual route, and find his own way through the unknown wilderness of interior Africa to the regions of civilisation. In the prosecution of this design, begun on the 15th

of January 1853, he gained the Leambye or Zambesi, in the central part of the country, ascended the river northerly for several hundred miles with an attached band of natives, then turned to the west, and emerged on the coast at the town of St Paul de Loando, in the Portuguese province of Angola, having gone through twenty-five degrees of latitude from the Cape. Retracing his steps to the Zambesi, he next followed the course of the stream, which, after flowing from the north, bends to the east; and reappeared in the summer of 1856 at its mouth on the east coast, within the Portuguese territory of Mozambique, having crossed the continent through twenty-two degrees of longitude. Great physical difficulties beset his course, especially at the outset, when he had only the assistance of a single companion. Not the least was the passage of streams lined with scarcely penetrable forests of reeds. 'It was not the reeds alone we had to pass through,' he states, in describing the crossing of the Chobe, 'a peculiar serrated grass, which at certain angles cut the hands like a razor, was mingled with the reed, and the climbing convolvulus, with stalks which felt as strong as whipcord, bound the mass together. We felt like pigmies in it, and often the only way we could get on was by both of us leaning against a part, and bending it down, till we could stand upon it. The perspiration streamed off our bodies, and as the sun rose high, there being no ventilation among the reeds, the heat was stifling, and the water, which was up to our knees, felt agreeably refreshing. After some hours' toil, we reached one of the islands. Here we met an old friend—the bramble-bush. My strong moleskins were quite worn through at the knees, and the leather trousers of my companion were torn, and his legs bleeding.'

While formidable carnivora and other animals were encountered in vast numbers, the most extraordinary living object, and one of the most dangerous, was met with in an insignificant creature—the tsetse-fly, *Glossina morsitans*. This was on approaching the tropic, though its range is chiefly beyond it, but not known as yet to extend to the equator. The insect, some specimens of which were first brought to England by Major Vardon in 1848, is not so large as our meat-fly, though with longer wings. But it is armed with a poison equal to that of the most deadly reptile, yet apparently of a very capricious nature. On man, its wound has no effect, more than that of a mosquito; but domesticated animals, in general, especially horses, oxen, and dogs, it surely kills. The strangest circumstance is, that all the wild quadrupeds, however analogous to its victims, as the zebras, buffaloes, and jackals, either bear its attack with perfect impunity, or are not assailed at all, as they feed at leisure in the localities of the insect. It is at present perfectly inexplicable what quality exists in domestication which renders domestic animals obnoxious to the poison, and why man should escape its evil influences, being the most domestic of all creatures. Travellers have lost all their draught-oxen and horses by the tsetse, and have thus not only had their journey marred, but their personal safety endangered, from the want of means of conveyance. Gordon Cumming was in this way completely stranded in the wilderness, and was indebted for his rescue to the timely arrival of assistance from Livingstone at Kolobeng, who heard of his predicament. 'One of my steeds,' says the bold hunter, 'died of the tsetse. The head and body of the poor animal swelled up in a most distressing manner; his eyes were so swollen that he could not see; and in darkness, he neighed for his comrades who stood feeding beside him.' In some instances, death takes place soon after the bite is inflicted; but more generally, it produces emaciation, loss of sight, and the animal perishes of exhaustion. The destructive pest is never or rarely found in the open country, but frequents hills, where there are bushes or reeds. It is fortunately confined to particular spots, and is never known to quit its haunts, so that cattle may graze securely on one side of a river, while

the opposite bank swarms with the insect. At the conclusion of his remarkable undertaking, Livingstone sailed from the mouth of the Zambesi for England, where he was received with universal enthusiasm; and has since returned at the head of an efficient party to the basin of the river, still further to illustrate its features. The rich cotton-growing valley of the Shire, one of its leading tributaries, has since been explored up to the Nyassa Lake, of which the stream is the outlet, an expanse trending northerly in the direction of the equator.

In Central Africa, careful and comprehensive researches, extending over an interval of six years, from February 1850 to September 1855, were conducted by Dr Barth, a German, appointed along with his countryman, Dr Overweg, as men of science, to accompany Mr Richardson, a political agent of the British government. The three travellers entered upon their mission at Tripoli, and crossed the Sahara through a remarkably stony portion of it, some distance westward of the general track, encountering great difficulty and danger on the way. They then separated to explore independently, intending to rejoin at Kouka, the capital of Bornou, but all three never met again. Fever carried off Mr Richardson in March 1851, and natives buried him in a grave well protected with thorny bushes, which the survivors visited. In the next year, after completing the survey of Lake Tchad, in a small boat which had been conveyed all the way from Malta, and was named the *Lord Palmerston*, exertion and the climate proved fatal to Dr Overweg, who had the comfort of his friend's presence in his last hours. Thus left alone in the heart of the continent, under such discouraging circumstances, Dr Barth pursued his labours with admirable perseverance and courage. He explored and mapped the central Niger; sojourned through seven weary months of duration at Timbuctoo; heard tidings there of Mungo Park and Major Laing; disclosed a region teeming with towns, villages, and tribes cursed by intestine wars to find victims for the slave-market; and returned to publish a narrative of his travels, during which he had traversed from first to last full 12,000 miles, passing over twenty-four degrees of latitude and twenty degrees of longitude. Before quitting the country, he was joined by Dr Vogel, a young Prussian astronomer, officially despatched by our government to render him assistance, who remained behind, desirous of adding his name to the list of African discoverers. He has probably perished, according to rumour, by violence; nothing certain has been heard of him since the date of his last letter, written at Kouka, December 5, 1855. After eight years of suspense, an affectionate tribute to his memory has appeared from the pen of his sister, entitled *Reminiscences of a Missing Man*.

Exploring from the west coast of equatorial Africa, where the Gaboon River enters the ocean, M. du Chaillu penetrated to a region of great interest from its fauna, not known to have been trod before by the white man's foot, and returned in 1860 to startle society by a narrative of surprising adventures. He had objects of natural history in view, and has probably done more than any single unassisted traveller to illustrate African zoology. Unfortunately for himself, not having been sufficiently exact in jotting down notes of his movements, discrepancies were detected, which roused suspicion, or provoked discredit in various quarters. But the accounts bear the impress of substantial truthfulness; and the traveller could point, in justification of them, to a large collection of huge anthropoid apes, quadrupeds, reptiles, and birds, many of which were quite novel, and are now in the British Museum. The scene of his eventful wanderings through nearly four years, extends from 2° north of the equator to the same distance on the south. It is partly mountainous and partly a plain, drenched with heavy rains through nine months of the year, and overgrown with difficult jungles and gloomy forests. This was the hunting-ground of the naturalist—ground where fever holds its court, surely assails the

Naples from Monte Martino

stranger, and makes him feel its power, even if no fatal result ensues. In one part north of the equator, a race of cannibals was met with; in other districts, the symbols of Mohammedanism appeared; but southward of the line, on this side of the continent, the faith of the Crescent does not seem to have been propagated. No lions or elands were encountered. But here the gorilla, an animal of gigantic strength and terrible ferocity, is 'lord of the forests.' It may be called the 'wild man of the woods,' as the creature in which the brute kingdom culminates, making the nearest approach of all the apes to the human subject. It was seen by the old Carthaginian voyagers (see p. 12); and then completely passed away from the knowledge of the civilised world, till, at a very recent date, a few skins and skeletons obtained by traders on the coast were brought to the museums of Europe. To M. du Chaillu the merit belongs of having invaded the forests in which lurks the formidable animal, and of illustrating the aspect, nature, and habits of the living examples.

From the east coast of Africa, the most recent and interesting additions to knowledge respecting the equatorial interior have been obtained. To Messrs Krapf, Rebmann, and Echart, agents of the Church Missionary Society, the credit belongs of having initiated geographical discovery in this direction. As the result of exploring tours from their station at Mombas, commencing in 1847, they announced the existence of snow-mountains nearly under the equator, but to the southward of it, Kilimanjaro and Kenia. This intelligence excited at first the liveliest interest as likely to afford a clue to the long-sought source of the Nile. For mountains in such a latitude to rise above the snow-line, they must have an elevation closely approaching 20,000 feet, and accordingly this was the altitude assigned to them. But the appearance of perpetual snow was thought by many to be an illusion occasioned by the whiteness of the rock, and the distance of the view; and the alleged discovery of the towering highlands was either discredited by them, or considered uncertain. All doubt, however, has been removed upon the point, after twelve years of suspense, by Baron von der Decken, who, accompanied by Mr R. Thornton, was at the spot in 1861. 'Mount Kilimanjaro,' he states, 'is 21,000 feet high, and covered with permanent snow. I have not been able to reach the top, but only an elevation of 8000 feet, many difficulties being this time in my way, as heavy rains and want of provisions. I carried a line of triangles from Mombas to the mountain by which I make its height 21,000 feet, subject to slight modification, after calculating all the elements. The uppermost 3000 feet are covered with snow. I have explored this stupendous mountain from three sides during nineteen days.' At the same time, along with the snow-mountains, the existence of a great inland lake region, long heard of from Arab traders, had been more distinctly certified by the missionaries.

In search of this lacustrine district, Captains Burton and Speke were out in 1857-1859, under the auspices of the Geographical Society of London. They started from Zanzibar, traversed 2700 miles of land going and returning, and passed through a region never before visited by Europeans. Lake Tanganyika, or 'the meeting-place of waters,' the picturesque meaning of its African name, was discovered some distance south of the equator, lying in the lap of the mountains, basking in the tropical sunshine, and was partially explored in two canoes. During the illness of his companion, Speke made his way to another large expanse further to the north, now called the Victoria Nyanza; and returned from its shores with the full conviction of its being the great reservoir from which the White Nile derives its waters—an idea which has proved to be correct.

The remarkable properties of the Nile, such as the regularity of its overflow, the fertilising influence of the inundation, the sweetness and salubrity of the water, contributed to fix attention upon it in early ages, and rouse curiosity respecting its origin. The

way by its two visitors, Captains Speke and Grant. Reversing the natural order of discovery, they had struck the fountain-head from the east coast, and thence descended upon the channel. Departing from the neighbourhood of Zanzibar, these gallant Anglo-Indian officers made for the lofty and extensive lacustrine plateau of the equatorial interior, reached the Victoria Nyanza, skirted its shores to the main outlet, and followed its course to the meeting with Mr Petherick at Gondokoro, thence proceeding by Khartum, Assouan, Thebes, and Cairo to Alexandria. They left the east coast in October 1860; disappeared in the wilds of the interior in September 1861; and nothing was heard of them till the pithy telegram was received at the Foreign Office, London, in May 1863, 'The Nile is settled.' The secret of ages is thus out at last; and it is a fair subject for congratulation that its disclosure has been effected by two of our own countrymen, who have accomplished a feat which baffled Egyptian kings and Roman emperors in the plenitude of their power.

'The mystery of Old Nile is solved: brave men  
Have through the lion-haunted inland passed,  
Dared all the perils of desert, gorge, and glen,  
Found the far source at last.'

The journey was performed on foot, and involved a walk of 1300 miles. From the middle of the northern boundary of the lake, the parent stream of the Nile issues with considerable width, and leaps over a fall of twelve feet in height. Though the main reservoir of the river, the Nyanza, has its feeders, among which the ultimate source remains to be detected.

First descried from the deck of the Dutch ship *Duyffen*, Australia was explored on its east coast by Cook in 1770. New South Wales, its first colony, from which most of the others have proceeded, was settled in 1788. After the settlement of the first English colony on its shores, Australian discovery was for some time confined to tracing out the sinuosities in its vicinity, and thus ascertaining the details of the coast-line. In this task, two young men were prominent, Messrs Bass and Flinders, the former a surgeon in the navy, the latter a midshipman, whose means were at first limited to a little boat eight feet long, which they called the *Tom Thumb*. The coves to the southward of Port Jackson were examined; the insulation of Van Diemen's Land was determined, the merit of which is chiefly due to Mr Bass, whose name was given to the separating strait; and jointly in a small schooner they circumnavigated that island, exploring its rivers and harbours. Having gained promotion, and being appointed by the home-government to the *Investigator*, a ship expressly fitted out for the service, Captain Flinders, during the years 1802 and 1803, minutely surveyed the southern and eastern coasts, with a large part of the northern, and was the first to introduce the appropriate name of Australia as a substitute for the old Dutch name of New Holland. He disclosed more fully the world-famous Port Philip, along which hosts of ships have gone up to Melbourne; discovered the great inlets of St Vincent's and Spencer's Gulfs, now included in the colony of South Australia; and landed on Kangaroo Island, which lies off the mouth of the latter, and protects it from the roll of the Southern Ocean, being probably the first human being that ever stepped upon the strand. This large island received its name from the number of the animals found there, which were at that time so tame as to allow the sailors to knock them down like sheep. 'On going towards the shore in a boat,' says Flinders, 'a number of dark-brown kangaroos were seen feeding upon a grass-plot by the side of a wood, and our landing gave them no disturbance. Never, perhaps, had the dominion possessed here by the kangaroos been invaded before this time. The seal shared equally the shores, but they seemed to dwell amicably together. It not

unfrequently happened that the report of a gun fired at a kangaroo near the beach, brought out two or three bellowing seals from under bushes considerably further from the water-side. The seal, indeed, seemed to be much the more discerning animal of the two, for its actions bespoke a knowledge of our not being kangaroos, whereas the kangaroos not unfrequently appeared to consider us to be seals.' Encounter Bay, to the eastward, was so called by the navigator as the spot where he met with M. Baudin, in command of the corvette *Géographe*, when a peaceful interview took place between the officers and crews in time of war. Surveying voyages successively prosecuted by Captains King, Wickham, Grey, Stokes, Stanley, and others, have since completed the illustration of the Australian coast-line, but down to a very recent date, portions of the north-western shores were only conjecturally delineated on our maps.

For twenty-five years after the first Australian colony, that of New South Wales, was started, nothing was known of the interior of the island-continent except at a comparatively short distance from the shores. The inhabitants of Sydney looked wistfully westward to the Blue Mountains, visible from the heights around, which long foiled every effort made by the government surveyors, as well as by enterprising settlers, to pass them, owing to their tortuous and profoundly deep defiles, bounded by vertical walls of rock, and often terminated by a similar perpendicular facing. Mr Bass succeeded in scaling several precipices by means of iron hooks fastened to his arms, and was let down by ropes

Volcanic Lakes and Mountains, South Australia.

into intervening chasms, but after fifteen days' exertion he relinquished the task as hopeless. The colonists had almost universally adopted the opinion, that the barrier was insurmountable, when a practicable passage was found in the year 1813, leading to the pastoral lands since known as the Bathurst gold-fields. This route was traversed by Governor Macquarie, with his lady, and a retinue of officers, in May 1815, and is now the great western road of the colony. In consequence of this discovery, a large extent of

country on the further side of the mountains was rapidly opened up by explorers and squatters. The Macquarie, Lachlan, and Darling Rivers were met with, and believed at first to flow into some vast inland sea, the existence of which in Central Australia was long a favourite notion with speculative geographers. Northward, in 1823, Mr Oxley surveyed the Moreton-Bay district, now Queensland, and named its principal stream the Brisbane. Southward, in 1824-5, Messrs Hovell and Hume, spirited sheep-farmers, pushed their way overland to the shores of Port Philip, and were the first Europeans to cross the greatest known Australian river, subsequently called the Murray. In 1830, this stream, which collects the western waters of New South Wales, was traced by Captain Sturt to its discharge into Lake Victoria, a shallow arm of the sea communicating by a narrow channel with the open ocean at Encounter Bay. Numbers of the aborigines were seen, who could scarcely be brought to believe that the discovering-party were of the same genus as themselves, and placed their hands against those of the strangers, in order to ascertain if the number of fingers on each corresponded. Nothing astonished them more than the act of taking off the hat, as they seem to have considered it an integral part of the bodies of their strange visitors. Sturt's representations of this region led to the first exploration of the Adelaide country, with a view to the establishment of a new colony, that of South Australia. Captain Barker, at the head of a party of eight persons, charged with this mission, perished in the execution of it. On reaching the narrow channel connecting Lake Victoria with the sea, he stripped himself, and swam across, for the purpose of looking out from a convenient site. 'Curiosity prompted me,' says a bystander, 'to time his crossing. The current was running out strong; but he accomplished the feat, at 9.58 A.M., in three minutes. On arriving at the opposite shore, he ascended the sandhill, gazed around for a few moments, and disappeared.' He was never seen afterwards. But it was ascertained that three natives speared him as he rushed into the water to escape from them, and the tide carried away his body.

Many lamentable incidents of a similar kind mark the history of adventure in Australia. In 1835, Major, afterwards Sir Thomas Mitchell, started from Bathurst on an exploring tour, with a numerous and well-equipped party, one of which was Mr Peter Cunningham, the indefatigable and accomplished botanist. Lured by his love of plants to wander from the main body, he disappeared in the interminable wilderness, and though carefully sought for, was never found. But from facts which subsequently came to light, he appears to have been murdered by the natives. An obelisk commemorates him in the Botanic Garden at Sydney. It was the custom of this estimable man to carry about with him in his excursions a bag of peach-stones, which he carefully planted in the sterile wilds for the benefit of future travellers, as well as of the aborigines. If a peach-stone is planted in the ground, in any part of this country where some supply of moisture is obtained, there will be a tree laden with fruit in three or four years, without any kind of culture. Peaches are now commonly met with wild in the woods, and yield a wholesome refreshment to the wayfarer, the more valued, as the native forests afford nothing whatever in the shape of fruit for the sustenance of man. 'I was much struck with this circumstance,' justly remarks a relator of it; 'and while I could not help commending, in my very heart, the pure and disinterested benevolence it evinced, I could not help inwardly regarding it as a lesson for myself in the future, and a reproof for the past. Alas! how many spots have we all passed unheeded in the wilderness of life, in which we might easily have sown good seed if we had so chosen. Such spots we may never revisit; and the opportunity of doing good, which was thus afforded us, but which was suffered to pass unimproved, will consequently never return.'

Early travellers in this remarkable country were sometimes embarrassed by the changed aspect of certain tracts, when revisited after no distant interval, which shewed an alteration upon a larger scale than that exhibited by the streams at different seasons of the year, which a colonial has described :

‘Exhausted by the summer sun,  
The schoolboy fords the broad Coquun ;  
For then the slow meandering stream  
Shrinks from the hot sun’s fiery beam,  
And, like a wounded serpent, crawls  
From Cumberoy to Maitland Falls ;  
But when the autumnal deluge swells  
Each little brook in yonder dells,  
And twice ten thousand torrents pour  
From cliff and rock with deafening roar  
Oh ! then he rolls with manly pride,  
Nor stream nor storm can stem his tide !’

Mr Oxley, in 1817, found a noble expanse near the Lachlan, which he called Regent’s Lake. When this was sought for by Sir T. Mitchell, in 1836, it was for the most part an extensive plain, covered with luxuriant grass. There was some water at one extremity scarcely a foot deep, the refuge of black swans and pelicans, the latter standing high upon their legs above the remains of the lake. That it had been a splendid expanse at no distant date, was evident from the water-line on the shores, while, within this former boundary, stood dead trees of a full-grown size, apparently killed by too much moisture. The site had thus been woodland, lake, and grassy plain. In 1828, Lake George was a fine sheet of water, seventeen miles in length by seven in breadth, extending into the counties of Argyle and Murray. But it was without fish, and surrounded by dead trees of the eucalyptus, some of them two feet in diameter, which also extended into it till they were wholly immersed. An old native female remembered the time when the whole was a forest, a statement supported by the presence of the lifeless timber. In October 1836, the entire lake was gone ; and its basin was a grassy meadow, similar to the adjoining Breadalbane plains. Alternating cycles of extreme moisture and drought, extending through considerable periods, offer perhaps the true explanation of the transitions.

Soon after the colony of South Australia was founded, its government despatched Mr Eyre from Adelaide overland to King George’s Sound. The long journey was accomplished in the year 1840, but the route only disclosed a thoroughly inhospitable region, in traversing which, all the party suffered severely from fatigue and privation, while some of its members perished by the way. The next year, the same explorer, who believed in the existence of a great central sea, was directed to strike northward into the interior, from Spencer’s Gulf, and if possible reach the Tropic of Capricorn. He failed in the latter object ; and instead of meeting with a grand inland reservoir, the singular horseshoe Lake Torrens was discovered, a huge serpentine tract of soft boggy ground or mud, covered in places with a shallow sheet of salt water, but often extensively converted by heat and drought into a desert of loose drifting sand. The next attempt to reach the heart of the country was made by Captain Sturt, in 1845, who succeeded in the object ; closely approached the southern tropic due north from Adelaide, under the meridian of 130° E. ; but narrowly escaped with life from a region wholly destitute of water, and rivalling in its sterility the worst parts of the African Sahara. The opinion was general from this date, till corrected by very recent experience, that the whole of Central Australia is a frightful wilderness, incapable of supporting life, and therefore unworthy of any hazard being encountered in the attempt to traverse

the dry and desolate waste. At the time when this adventure was in progress, an unobtrusive German naturalist, Dr Ludwig Leichardt, with seven companions, made the overland passage from Moreton Bay to Port Essington, during which he discovered and named the Burdekin, with other rivers, and returned by sea from the completion of the enterprise. Thus was an extraordinary journey of 1800 miles, through an unknown part of the country, performed in fifteen months; but as its direction did not lead him through the more interior districts, the conviction remained current that Dante's line might be applied to them,

'Abandon hope all ye who enter here.'

as consisting of a series of scorched, stony, sandy, and saline plains.

After resting a brief space in the settled districts, the intrepid Leichardt rallied a second band of adventurers around him, who had now reason to repose confidence in him as a leader, from his success in the expedition just named. His project was to proceed from east to west, or from New South Wales to the Swan River Settlement, a distance little short of 3000 miles in a direct line, hoping to find by the way a succession of oases, like those in the African or Arabian deserts, which would enable him to recruit his party on the journey. He started from the Darling Downs in the early part of the year 1848; and no certain tidings have ever transpired respecting the gallant band. One conclusion is sufficiently clear, either that they perished successively for want of provisions, or were cut off in some murderous attack of the natives. The latter melancholy fate befell the young and intelligent Mr Kennedy in the year of Leichardt's disappearance. The incidents accompanying his death strikingly illustrate the extremes of character in the Australian black, for while dogged and butchered by the natives in cold blood, he was defended to the last by a native attendant. Mr Kennedy, a government official, with his servant Jacky-Jacky, a black, and eleven whites, left Sydney on the 28th of April 1848, for the exploration of the country lying between Rockingham Bay and Cape York, the north-east extremity of Australia, a distance of not more than 500 miles. Obstructed by impassable scrubs and swamps, by disease, famine, and hostile savages, most of the travellers were completely disabled. Ultimately the leader and his man went on in advance, in order by forced marches to gain his destination, where a schooner was waiting for him, from which relief might be sent to the stragglers. The sequel may be stated in the words of the survivor. 'Now we went into a little bit of scrub, and I told Mr Kennedy to look behind always. Sometimes he would do so, and sometimes he would not look out for the blacks. Then a good many black fellows came behind in the scrub, and threw plenty of spears, and hit Mr Kennedy in the back first. He said to me: "Oh Jacky, Jacky, shoot 'em! shoot 'em!" Then I pulled out my gun, and hit one fellow over the face with buck-shot. Then I carried Mr Kennedy into the scrub. I asked him: "Are you going to leave me?" and he said: "Yes, my boy, I am going to leave you." He then said: "Give me paper, and I will write." I gave him paper and a pencil, and he tried to write, and then he fell back and died; and I caught him as he fell back, and held him. I then turned round myself, and cried. I was crying a good deal, till I got well, that was about an hour, and then I buried him. I dug up the ground with a tomahawk, and covered him over with logs, then grass, and my shirt and trousers. That night I left him near dark.' After enduring great misery, the black reached the schooner, and was the means of rescuing Mr Carron the botanist and another, when within an hour or two of inevitable death, the only survivors of the party.

At a date coincident with the African discoveries, a new era opened for Australia, by unfavourable impressions being corrected respecting its central regions, at first conceived to be a watery waste, and then a hideous wilderness. In 1858, Mr M'Douall Stuart proceeded

from South Australia into the interior under a more westerly meridian than that which had previously led Captain Sturt into an inhospitable desert, and traversed an extensive area available for sheep-pasture, with scenery pleasantly diversified by lakes and creeks of salt and fresh water. Encouraged by this success, he set out with only two followers, in March 1860, with the intention of crossing the country from sea to sea. The bold colonist very nearly succeeded in accomplishing his object, following generally the meridian of 134° E. Having gained the central region, where the name of Central Mount Stuart was bestowed upon a conspicuous hill, he proceeded thence to about latitude 18° 40' S., or within 250 miles of the Gulf of Carpentaria, suffering much by the way, chiefly from the want of water. Here the country was good. All difficulties seemed to be at an end, and success certain, when an obstacle arose not experienced before, which proved insurmountable. Owing to the number and determined hostility of the natives, he was compelled to desist from the enterprise, and return to Adelaide, which he regained in the following September. In the meantime a carefully-organised and well-equipped expedition had started from Melbourne with the same object in view, which enabled the sister-colony of Victoria to snatch from South Australia the distinction of being the first to open a path through the land from the southern to the northern seas. Large subscriptions were readily raised for the attempt; the aid of the local government was liberally afforded; and the sympathies of the entire community were warmly enlisted in the adventure. An exploration-committee of experienced persons superintended the outfit of the travellers, which included the necessary amount of stores for a long absence, with all kinds of instruments for scientific observation, and the novel addition of a troop of camels, twenty-seven in number, expressly imported from Asia. The party consisted of Robert O'Hara Burke, the leader; Mr Wills, as scientific observer; Dr Herman Becker, medical attendant and botanist; Ludwig Becker, artist and naturalist; Mr Landells, in charge of the camels; and thirteen subordinates, with horses, wagons, and every provision likely to insure success—the most gigantic expedition ever fitted out in the Australian colonies. Full of high hope, they set forth on the 20th of August 1860, amid the cheers of a vast multitude assembled in the Royal Park, Melbourne, to witness their departure.

According to the plan previously arranged, Cooper's Creek was fixed upon as a place of rendezvous and final starting-point, a well-known locality, a little to the east of Sturt's track in 1845, and about one-third of the distance across the country. Here a permanent dépôt was to be established as a basis for further operations. Very slow progress was made by the heavy-laden camels, and further time being lost on the way by unfortunate altercations, the leader went on in advance to the station with a small select body, leaving the rest to follow at leisure with the weightier stores. Arrived at Cooper's Creek, he divided the reduced party, and without delay left the dépôt in charge of Brahe, a petty officer, with verbal instructions to await his return for three months or longer, if provisions and other circumstances would permit. From this point Burke pursued his journey with only three companions, consisting of Wills, the scientific assistant, two men, King and Gray, taking along six camels, one horse, and three months' provisions. These were the real explorers, destined to accomplish a hazardous enterprise, and make a great discovery, with the melancholy result of only one of them surviving its performance.

The start from Cooper's Creek was made on the 16th of December. After a week's travelling, a halt for Christmas was taken under favourable circumstances. '*Monday, 24th December 1860.*—We took a day of rest on Gray's Creek (so called because Gray, having been detached from the party, had found good water there) to celebrate Christmas. This was doubly pleasant, as we had never in our most sanguine moments anticipated finding such a delightful oasis in the desert. Our camp was really an agreeable place, for

we had all the advantages of food and water attending the position of a large creek or river, and were at the same time free of the annoyance of the numberless ants, flies, and mosquitoes, that are invariably met with amongst timber or heavy scrub.' Proceeding nearly due north, and keeping generally to the meridian of 140° E., they passed day after day well-watered plains, with numerous lines of timber, and every evidence of a good grazing country. The 11th of February 1861 brought them to the tide-water of the Gulf of Carpentaria, which seems to have been struck in an extensive marsh connected with the Albert River, ascended for some distance in boats by Captain Stokes in the year 1841. In attempting to gain a view of the open sea, they were baffled completely by a long reach of boggy ground, but had conclusive proofs of having gained the verge of the Northern Ocean. On returning by a new route, to the east of the outward track, a region of the finest character for pastoral purposes was passed through, with every appearance of possessing a permanent supply of water. Early in April, the want of provisions began to tell upon the travellers, and it became necessary to kill the horse for support. 'We found it healthy and tender,' says the journal, 'but without the slightest trace of fat in any portion of the body.' Soon afterwards Gray died of sheer exhaustion. His companions had thought rather lightly beforehand of his complaints of distress; and as their own sufferings came on, Wills took occasion to enter an expression of regret in his note-book at the circumstance: 'The exertion required to get up a slight piece of rising-ground induces an indescribable sensation of pain and helplessness, and the general lassitude makes one unfit for anything. Poor Gray must have suffered very much many times when we thought him shamming.'

Worn down with arduous travel, afflicted with scurvy, almost without clothes, their six camels reduced to two, the survivors struggled manfully on; and with half-paralysed limbs regained their old quarters at Cooper's Creek on the 21st of April, after an absence of four months and five days. It was nightfall when they arrived; and rarely has human fortitude been put to a greater test than by the disappointment which awaited them. The station was deserted. The word 'Dig,' cut on an adjoining tree, directed them to a *cache* where some provisions were buried—a welcome refreshment—with a record to the effect that the party left in charge under Brahe had quitted the spot only *seven hours before* the staggering wayfarers reached it. Severe as was this misfortune, it was bravely borne, as a note written by Burke the next day, the last he ever penned, duly deposited in the *cache*, testifies. 'The return-party, from Carpentaria, consisting of myself, Mr Wills, and King (Gray dead) arrived here last night, and found that the *dépôt*-party had only started on the same day. We proceed on to-morrow slowly down the creek towards Adelaide by Mount Hopeless, and shall endeavour to follow Gregory's track, but we are very weak. The two camels are done up, and we shall not be able to travel further than four or five miles a day. Gray died on the road from exhaustion and fatigue. We have all suffered much from hunger. The provision left here will, I think, restore our strength. We have discovered a practicable route to Carpentaria, the chief portion of which lies on the 140th meridian of east longitude. There is some good country between this and the stony desert. From there to the tropic the country is dry and stony. Between the tropic and Carpentaria a considerable portion is rangy, but it is well watered and richly grassed. We reached the shores of Carpentaria on the 11th of February 1861. Greatly disappointed at finding the party here gone.—R. O'HARA BURKE, Leader.—P.S. The camels cannot travel, and we cannot walk, or we should follow the other party. We shall move very slowly down the creek.'

Mishaps attended the steps of the wanderers. Landa, one of the camels, having sunk in a bog, could not be extricated, and was shot as he lay. Rajah, the other, was killed

for food. After proceeding some distance in the direction indicated, their exhausted condition enforced a return to the *dépôt*, to which, by a scarcely conceivable mischance, Brahe had returned in the interim, and quitted finally without discovering a trace of their visit. Thus abandoned, life was preserved for some time by the seeds of the nardoo plant, which the natives make into bread; but it was too unnutritious to have any recruiting effect. Unable to crawl, Wills insisted upon being left, while the other two went in search of the blacks, as their last chance. Burke sunk on the way, and soon expired; and King, on returning to Wills, found him a corpse, stretched on the spot where he had separated from him. The sole survivor was fortunate enough to meet with natives, who kindly entertained him with their best fare, and among whom he was discovered by a relief-party from Melbourne on the 15th of September, wasted to a skeleton, and scarcely to be distinguished as a civilised being. By this party, the bodies of the two intrepid leaders were found, and committed with solemn sadness to the grave; but they were subsequently exhumed, removed to Melbourne, and honoured with a public funeral. Seldom has a catastrophe been precipitated by such a series of perfectly avoidable disasters, for the sacrifice of valuable lives seems to have been occasioned simply by misunderstanding and mismanagement. It has not, however, been made in vain. The men accomplished the main object of their mission, crossed and recrossed the great island-continent, discovering a fine habitable country where only desolation had been surmised.

In the following year, the veteran explorer, M'Douall Stuart, having started from Adelaide, reached Van Diemen's Bay, on the north coast, at the head of the first European party actually to catch sight of the bounding waves. The exclamation of one of his men, who was in advance, 'The sea!' elicited hearty cheers from his companions, and all hastened forwards to enjoy the spectacle. The leader dipped his feet, washed his face and hands in the Indian Ocean, and suitably commemorated the accomplishment of the great object of his journey. 'I had,' he remarks, 'an open space cleared, selected one of the tallest trees, stripped it of its lower branches, and on its highest fixed my flag, the Union Jack, with my name sewn in the centre of it. At one foot south from the foot of the tree is buried, about eight inches below the ground, an air-tight tin-case, in which is a paper with the following notice: 'South Australian Great Northern Exploring Expedition. The exploring-party under the command of John M'Douall Stuart arrived at this spot on the 25th of July 1862, having crossed the entire continent of Australia from the Southern to the Indian Ocean, passing through the centre. They left the city of Adelaide on the 26th day of October 1861, and the most northern station of the colony on the 21st of January 1862. To commemorate this happy event they have raised this flag. All well. God save the Queen!' More recently, Mr M'Kinlay crossed the country from Adelaide to the Gulf of Carpentaria, travelling thence to the east coast, and Mr Landsborough has intersected it southward from the shores of the gulf to the colony of Victoria. As the result of these journeys, Central Australia, instead of being the burning desert it was once supposed, is now known to comprise vast habitable tracts, destined at no distant date to be the nursery and home of flourishing communities.

Uralskaya Sopka, copied, by permission, from Sir R. I. Murchison's great work on Russian Geology.

## PART I.

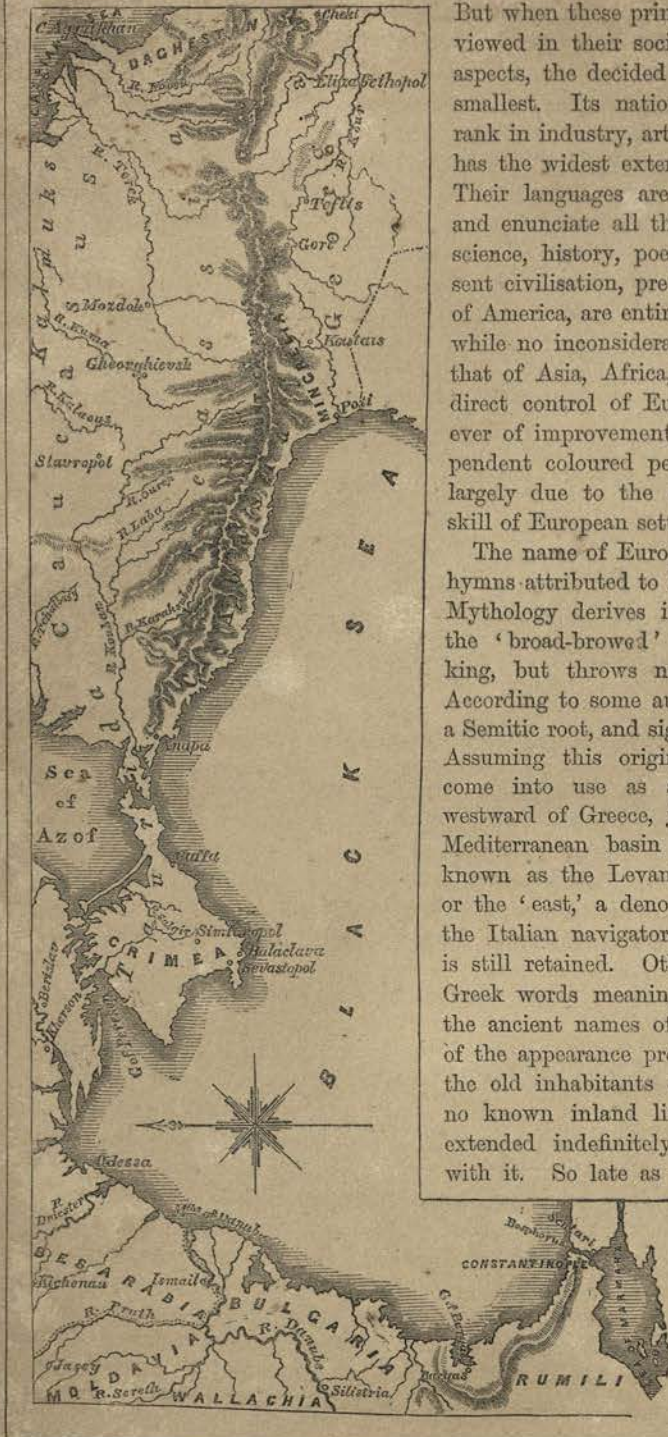

### DESCRIPTIVE GEOGRAPHY OF EUROPE.

#### INTRODUCTORY CHAPTER.—GENERAL VIEW OF EUROPE.

EUROPE, one of the principal divisions of the earth, commonly styled a continent, is more properly a north-western peninsula of the great eastern continent, or the Old World, as it is washed on three sides by the ocean and its arms, while of scanty area when compared with the mass of land more or less directly associated with it, apportioned to Asia and Africa. It has not only more contracted limits, but is far inferior to them in the magnitude of its rivers, the height of its mountains, the beauty, variety, and profusion of the forms of animal and vegetable life; and America—the western continent of the geographer, the New World of the historian—has immensely the superiority in extent, and in the development of physical features.

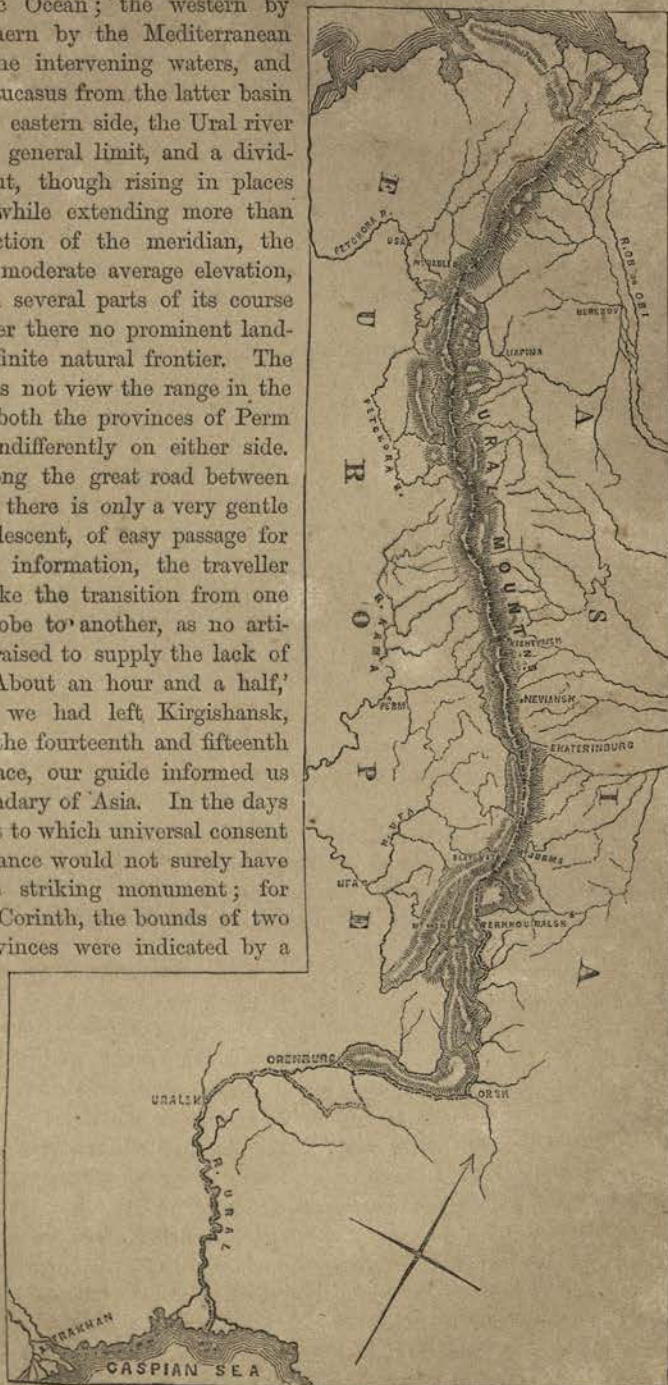

But when these prime divisions of the globe are viewed in their social, intellectual, and political aspects, the decided pre-eminence belongs to the smallest. Its nations are entitled to the first rank in industry, arts, and arms. Their influence has the widest extension and the greatest power. Their languages are the most widely diffused; and enunciate all that is valuable in philosophy, science, history, poetry, and religion. The present civilisation, predominant races, and tongues of America, are entirely of European origin; and while no inconsiderable portion of its area, with that of Asia, Africa, and Oceania, is under the direct control of European governments, whatever of improvement is exhibited by their independent coloured people and nomadic tribes, is largely due to the enterprise, intelligence, and skill of European settlers and visitors.

The name of Europe first occurs in one of the hymns attributed to Homer, addressed to Apollo. Mythology derives it from the nymph Europa, the 'broad-browed' daughter of a Phœnician king, but throws no light upon its meaning. According to some authorities, the word is from a Semitic root, and signifies 'the place of sunset.' Assuming this origin, it is supposed to have come into use as applicable to the country westward of Greece, just as that portion of the Mediterranean basin lying to the eastward is known as the Levant, the 'region of sunrise,' or the 'east,' a denomination which arose with the Italian navigators of the middle ages, and is still retained. Others refer the term to two Greek words meaning the 'broad land,' one of the ancient names of Thrace. It is descriptive of the appearance presented by that territory to the old inhabitants of Greece, to whom it had no known inland limit, and might be thence extended indefinitely to the lands continuous with it. So late as the Byzantine empire, one of the six dioceses of Thrace was called Europa, a vestige of the primitive designation of the entire country. This last explanation is the most probable.

The northern boundary

is formed by the Arctic Ocean; the western by the Atlantic; the southern by the Mediterranean and Black Seas, with the intervening waters, and the main ridge of the Caucasus from the latter basin to the Caspian. On the eastern side, the Ural river and mountains furnish a general limit, and a dividing-line from Asia. But, though rising in places upwards of 5000 feet, while extending more than 1200 miles in the direction of the meridian, the Ural chain has only a moderate average elevation, and is so interrupted in several parts of its course by depressions, as to offer there no prominent landmark to the eye, or definite natural frontier. The Russian government does not view the range in the light of a barrier, since both the provinces of Perm and Orenburg extend indifferently on either side. Proceeding across it along the great road between Perm and Ekaterinburg, there is only a very gentle and trifling ascent and descent, of easy passage for carriages; and, without information, the traveller would unconsciously make the transition from one grand division of the globe to another, as no artificial sign-post has been raised to supply the lack of a natural indication. 'About an hour and a half,' Erman observes, 'after we had left Kirgishansk, and as we were between the fourteenth and fifteenth verst-stone from that place, our guide informed us that we were on the boundary of Asia. In the days of ancient Greece, a point to which universal consent assigned so much importance would not surely have been left without some striking monument; for even on the Isthmus of Corinth, the bounds of two comparatively petty provinces were indicated by a pillar, having inscribed on one side, "This is Peloponnesus, and not Ionia;" and on the other, "This is Ionia, and not Peloponnesus." But the fact that, at the present day, the boundary between two great divisions of the earth is not thought worthy of any especial mark, may be hailed as a pleasing sign of the greater facility of movement which is

now enjoyed by mankind. Nevertheless, we left behind us, in a sportive mood, a memorial of our visit to this point, which, for the imagination of the geographer at least, is not without some interest. We enclosed in a bottle a paper containing the names of the travellers and the object of their journey, written in Latin, and buried it in the wood

Astrachan, at the Mouth of the Volga.

on the south side of the road.' In one part of the Ural Mountains, called Uralskaya Sopka, Sir R. I. Murchison tells us that the boundary-line is carried over a sharply-pointed precipitous rock, of somewhat difficult ascent, with scarcely standing-room for more than two individuals at the top. It was scaled by the present emperor of Russia, when grand-duke, who stood on the summit with one foot in Europe, the other in Asia; and this august example was followed by the learned president of the Geographical Society and his companions.

The European mainland ranges through thirty-five degrees of latitude, from the Punta da Tarifa, a headland on the Strait of Gibraltar, in  $36^{\circ} 1'$  north, to the Nordkyn, a cape at the further extremity of Norway, in  $71^{\circ} 6'$ , the extreme southern and northern points. A slightly higher latitude is reached by the celebrated North Cape, but that is a promontory of the adjoining island of Mageroe. The extent in longitude is through nearly seventy-eight degrees, from Cape Roca, a short distance from Lisbon, in  $9^{\circ} 28'$  west, to the mouth of the small River Kara, at the north-eastern extremity of Russia, in  $68^{\circ} 30'$  east. This longitudinal range involves a difference of about five hours of time between the eastern and western bounds. Hence, when the morning sunbeams are brightly lighting up the tops of the Urals, it is still dark night on the shores of France and Spain; and when it is high noon at the rock of Gibraltar, the day is approaching its decline in the steppes on the borders of the Caspian. The greatest distances that can be traversed in a straight line are 2400 miles, from north to south, or between the extremities of Norway and Greece; and 3400 miles, in a diagonal direction, between the south-western angle of Portugal and the north-eastern corner of Russia. Insular

adjuncts are very important features of Europe, and extend its limits in both latitude and longitude. Candia, a Turkish island, is more southerly than any part of the continental coast; the British Isles stretch to a more westerly meridian; and the Azores are much further out in the Atlantic. Including the mainland and islands, the area is

City of Tarifa.

moderately estimated at 3,700,000 square miles, equal to rather more than one-fifth of the magnitude of Asia, but less than one-third the size of Africa, and somewhat exceeding one-fourth the extent of America. The length of the coast-line falls very little short of 20,000 miles.

The contour of the mainland is much more elaborate in proportion to its area, than that of the other principal sections of the globe, and its populations have therefore a larger measure of maritime accommodation. This appears from a glance at the world's map, and a comparison of areas and coast-line.

|                          | Area in Square Miles. | Linear Miles of Coast. | Square Miles of Area for One Mile of Coast. |
|--------------------------|-----------------------|------------------------|---|
| Europe, . . . . .        | 3,700,000             | 19,500                 | 190   |
| Asia, . . . . .          | 17,500,000            | 35,000                 | 500   |
| Africa, . . . . .        | 12,000,000            | 16,000                 | 750   |
| North America, . . . . . | 8,600,000             | 24,500                 | 350   |
| South America, . . . . . | 7,000,000             | 14,500                 | 482   |
| Australia, . . . . .     | 3,000,000             | 10,000                 | 300   |

Thus, in proportion to the amount of surface, Europe has more than twice the extent of coast-line belonging to South America, nearly twice as much as North America, nearly three times as much as Asia, and about four times as much as Africa. This great amount of maritime frontier favours intercommunication and commercial traffic; contributes to render climate temperate; and has, in no slight degree, promoted the social and intellectual progress of Europeans. It arises from the number of inland seas which deeply penetrate the mainland, and fringe it with a series of large peninsulas. Of these, there are five principal basins, the White Sea on the north; the Baltic and the North Sea on the north-west; the Mediterranean, with its arms, the Adriatic and the Archipelago, on the

south; the Black Sea, with its branch the Sea of Azov, on the south-east. These expanses and the outlying ocean, give a shore to every European country, with the exception of Switzerland and some Germanic states; and bring every part of the surface, except in the heart of Russia, within 400 miles of a sea-beach.

A vast level, very slightly raised in any part above the sea, with two systems of mountains distinct from each other—a north-western or Scandinavian, and a southern or Alpine, in part central—are the prominent internal features of the continent.

The 'great plain,' as it is commonly styled, is equal in extent to two-thirds of the entire surface. It comprehends the whole of Russia, from the Black Sea and the Caucasus on the south, to the shores of the Arctic Ocean on the north, with all Poland, North Germany, Denmark, Holland, and the chief part of Belgium, terminating on the sandy coast of the North Sea, or, neglecting some minor irregularities, it may be said to sweep round the central highlands of France to the foot of the Pyrenees. The greater part of this plain may be compared to a triangle in shape, the base of which lies along the Ural Mountains, from whence it gradually diminishes in breadth westward, and reaches its apex in the Netherlands. At its western limit, the surface is depressed below high-water mark; and immense dykes or ramparts of stone and earth, raised on the coast, alone prevent destructive incursions of the sea, and the permanent submergence of extensive tracts of country. Hence the name of Holland, *hollow* or low land, with that of one of its districts, Waterland; and the general denomination of the whole region, formerly in more frequent use than at present, the Netherlands or Low Countries. By an almost imperceptible rise, the height of 1100 feet above the sea is attained in the Valdai Hills, in Russia, on the slope of which the Volga begins its course, a very trifling elevation for the source of a river which flows through more than 2000 miles. It would be possible for a traveller to leave London for Rotterdam or Hamburg, proceed by Berlin and Königsberg to Moscow, thence to the eastern frontier of Europe, without any alteration of level exceeding the height of the cross of St Paul's.

The great plain has a very varying aspect and character. Polished city populations and rude nomadic hordes appear within its limits, along with well-cultivated tracts of the highest fertility; natural forests which have not yet known the woodman's axe; and treeless landscapes not more monotonous than barren. Green meadows abound in Holland, Belgium, and Holstein. To these succeed, passing eastward, infertile sandy wastes, variously covered with heath, or interspersed with pine-woods and small lakes, strangely also bestrewn with erratic blocks of granite, varying in size from pebbles to enormous masses, which give to parts of Northern Germany the appearance of a country in ruins. Larger and denser forests clothe the surface of Poland, Lithuania, and Central Russia, with which extensive marshes and arable lands alternate. A deep stratum of dark vegetable mould, locally called 'black earth,' on which Moscow is seated, extends uniformly through a space three times larger than the area of France; and yields to cultivation, conducted with little labour and without any skill, the wheat which Russia pours into the granaries of Europe. Southward stretches the immense region of the steppes, apparently interminable, but bounded in that direction by the Black Sea and the Caucasus, yet continued easterly into the heart of Asia; of which it has been said, though with an obvious exaggeration, that a calf, beginning to graze at the base of the Carpathian Mountains, might eat its way to the wall of China, and arrive there a full-grown ox.

The word *steppe* is of Tartar origin, and strictly denotes a flat, open, and unwooded country, mantled with a rank, grassy, and herbaceous vegetation. This is the general character of the region thus denominated, but it includes extensive swamps, tracts of saline sand of the true desert description, small copses in a few favoured spots which

shelter game; and the surface is billowy or gently undulating, marvellously changing its aspect with successive seasons of the year. Yet the uniformity speedily becomes wearisome at every period, whether the ground is mantled with snow as in winter, or green with herbage and variegated with flowers as in spring, or appears a perfect desert of dust and ashes, arising from the baked and pulverised vegetation in the heat of summer. But the change from day to night in the steppes has always great effectiveness to the stranger. It transpires with a suddenness which is very impressive, and at first somewhat awful. In a country of woods and diversified levels, the shadows of the trees and hills, gradually elongating, give warning of the sun's approach to the western horizon. But on these great plains, where nothing intercepts his rays till the disk of the luminary touches their edge, there are no shadows projected premonitory of the universal gloom about to cover the face of nature. Earth and sky are in a blaze of light till the sunset actually commences. In a few minutes, the whole orb is below the line of the steppe; the bright glow is gone from the landscape; and the sombre curtains of the night are drawn. The suddenness and rapidity with which the transition is effected surprise the traveller, and invest a common incident with an air of supernatural majesty and strangeness.

Of the two mountain-systems, the north-western comprises the heights and table-lands which overspread nearly the whole of Norway, and slightly advance into Sweden. They are of moderate elevation, though rising far above the snow-line, owing to the high latitude; and, being of limited extent, confined to the western part of the Scandinavian peninsula, they have no connection with the main body of the continent. But by mineralogical composition, as well as by proximity, the erratic blocks of the great plain, which have no natural relationship to their present sites, are referrible to these northern highlands as their parent-bed, where precisely kindred rocks occur; and hence, with the increase of distance from that site, the travelled fragments gradually become less in number and of smaller dimensions.

The southern mountain-system embraces nearly the whole extent of Europe from west to east, or from Cape Finisterre on the coast of Spain to Cape Emineh on the shore of the Black Sea. It includes the grand ranges of the Alps, in the centre, winding from the Mediterranean round the north of Italy to the borders of Hungary; the line of the Balkan, eastward, running through Turkey parallel to the Danube; the chain of the Pyrenees, westward, a natural rampart between France and Spain; and the Asturian mountains, a continuation of the latter, extending along the shore of the Bay of Biscay to the open Atlantic. This series has but a single break to its continuity, of no great extent, offered by the Gulf of Lyons, between the Pyrenees and the Alps; and may be considered as a belt of gigantic highlands forming the dorsal ridge or backbone of the continent. On the northern side are the ranges of central France and Germany, with the Carpathians curving round the Hungarian plain; and on the southern side are the chains which traverse the Italian, Spanish, and Turkish peninsulas, which stand in the relation of offsets, spurs, and buttresses to the primary zone. The loftiest and most important portion of the series, the Alps, contain the highest peaks of Europe. In their bosom three of its principal rivers have their rise, the Rhine, the Rhone, and the Po, respectively flowing to widely-separate basins, the North Sea, the Mediterranean, and the Adriatic; while contributions are sent to the Black Sea by means of some of the principal affluents of the Danube which descend the eastern slopes.

Geographers divide the system of the Alps into distinct portions, to which particular names are attached. The Maritime Alps extend from the borders of the Gulf of Genoa to Mont Viso, about 100 miles; the Cottian Alps stretch from Mont Viso to Mont Cenis, about 60 miles; the Graian or Grecian include the heights between Mont Cenis and the

Col de Bonhomme, 50 miles; the Pennine proceed from the latter to Monte Rosa, 60 miles; the Helvetian continue from thence to Mont Bernardine, 50 miles; the Rhetian from thence to the Drey-Herren-Spitz, or Peak of the Three Lords, in the Tyrol, 140 miles; and the Noric Alps extend from thence to the neighbourhood of Vienna, about 200 miles. The Carnic, Julian, and Dinaric Alps denominate lower ranges spreading over the Austrian provinces of Carinthia, Carniola, and Dalmatia, where the Alpine system becomes connected with the western extremity of the Balkan. In the Pennine division there are the highest peaks, Mont Blanc, 15,750 feet, Monte Rosa, 15,152, and Mont Cervin, or the Matterhorn, 14,837, with the most extensive glaciers. The Helvetian, largely overspreading Switzerland, ranks next, containing the Dorn, or Graben-Horn, 15,440 feet; the Finster-Aar-Horn, 14,111; the Jungfrau, 13,718; and the Mönch, 13,498. No roads practicable for carriages cross the Pennine chain, but four lead over the Helvetian, and two traverse the Rhetian. One in the last division, by the Stelvio Pass, leading from the Tyrol into Lombardy, is the highest carriage-road in Europe, 9174 feet, constructed by the Austrian government chiefly for military purposes, and completed in the year 1824. The highest routes practicable for foot-passengers are the Col de Geant, 11,172 feet, and Mont Cervin, 11,096, both in the Pennine range. By far the most frequented carriage-road from France to Italy, across Mont Cenis, in the Grecian Alps, is now in process of being superseded by the construction of a tunnel for a railway through it.

Mont Blanc, the culminating-point of Europe, is somewhat singularly situated, being very nearly equidistant from the equator and the pole. Seen on the north and south, its shape is pyramidal; but from certain points of view it resembles the back of a dromedary, and hence *bossé de dromedaire* is one of its local names. From several sites, as the summit of the Flegère, in the Vale of Chamouni, of easy access, and the Val d'Aoste on the Italian side, the eye embraces the whole of its huge mass, and the mind responds to the truth of the description—

‘Mont Blanc is the monarch of mountains;  
They crowned him long ago,  
On a throne of rocks, in a robe of clouds,  
With a diadem of snow.’

Upwards of 7000 feet of the height of the mountain are within the region of perpetual snow and ice, as the snow-line is here met with at the elevation of about 8000 feet above the sea. Its mass is almost entirely of granite, with a ridge for the summit nearly 200 feet in length. The butterfly has been seen flying over it, an involuntary migrant, doubtless, from the realms below, drifted upwards and onwards by the winds, offering a flat contradiction to the sentiment—

‘No insect’s wing  
Flits o’er the herbless granite.’

Beetles are found at the height of 8500 feet; spiders at 10,000; and through the High Alps generally, the chamois ranges to the latter elevation, with the fox but little below him, and the bouquetin or wild-goat, now very rare, slightly in advance above. The eagle and the vulture soar far above the tallest pinnacle. The top was reached for the first time by Paccard and Jacques Balmat in August 1785. The latter, an adventurous chamois-hunter, perished in one of his daring excursions, half a century afterwards, at the age of seventy; and though the spot where he met his doom was known, the body could not be recovered. Saussure, the savant, made the second ascent in 1786, and remained five hours at the top conducting scientific experiments. Summer tourists now commonly stand on the hoary head of Mont Blanc, though not a little bodily vigour and self-possession are requisite for the achievement; and accidents of any kind have been rare in recent times, owing to the precautions taken by the authorities

to allow of none but efficient guides to exercise the vocation. Five ladies have accomplished the feat—Mademoiselle Paradis in 1809, Mademoiselle d'Angeville in 1838, Mrs Hamilton in 1854, Mademoiselle Formann in 1856, and Miss Walker in 1862. The second of these, when on the summit, ordered her guides to lift her as high as they could, that she might boast of having been higher than any other person in Europe.

The hydrography of Europe includes no rivers comparable in magnitude to the grand examples of the other continents. A limited area, and the deep indentations of the coast-line, forbid their development. But the streams of secondary and minor rank are extremely numerous, render every country well watered, and diffuse widely the benefits of inland navigation; while by means of canals, easily constructed and maintained, owing to the great extent of level surface, rivers running to different basins are connected, and far-distant seas are brought into communication. Thus, in Russia, the Caspian and Black Sea in the south are united to the Baltic and White Sea in the north by artificial channels between their tributaries; and similarly, in the south of France, the Atlantic and the Mediterranean are linked together. Two general slopes of the surface may be distinguished, the one inclined north-north-west, the other south-south-east, in which directions the main mass of the superficial drainage is conducted. The line of the water-parting, styled the great water-shed of Europe, is variously a ridge high as the Alps, and a very slight elevation of the ground, in places scarcely distinguishable. It runs from the Strait of Gibraltar through the Spanish peninsula, crosses the south-east of France, follows a very tortuous course through Switzerland and Germany, cuts the western part of the Carpathian Mountains, and proceeds through Russia to its north-eastern extremity. The southern slope is the most extensive, and considerably more than one-half of the total amount of flowing water is conveyed to southerly basins.

Representing the whole river-discharge of Europe by 100, the White Sea and Arctic Ocean are estimated to receive 6 parts; the North Sea, 11; the Baltic, 13; the Atlantic, 13; the Mediterranean, 14; the Caspian, 16; and the Black Sea, 27. The elements of the more important rivers are given in the table:

| Rivers.           | Length in Miles. | Area of Basin. Sq. Miles. | Embouchure.    | Principal Places from Mouth to Source on the Main Channels.                     |
|-------------------|------------------|---------------------------|----------------|---|
| Dwina (Northern), | 760              | 144,000                   | White Sea.     | Archangel, Vologda.   |
| Neva,             | 40               | 91,000                    | Baltic.        | St Petersburg.  |
| Dwina (Southern), | 550              | 45,000                    | "              | Riga, Vitebsk.  |
| Niemen,           | 400              | 43,000                    | "              | Tilsit.   |
| Vistula,          | 630              | 76,000                    | "              | Dantzic, Thorn, Warsaw, Cracow.   |
| Oder,             | 550              | 53,000                    | "              | Stettin, Frankfort, Breslau.  |
| Elbe,             | 690              | 57,000                    | North Sea.     | Hamburg, Altona, Magdeburg, Meissen, Dresden.                                   |
| Weser,            | 380              | 17,000                    | "              | Bremen, Minden.   |
| Rhine,            | 760              | 88,000                    | "              | Leyden, Cologne, Bonn, Coblantz, Mayence, Strasburg, Basle.                     |
| Meuse,            | 550              |                           |                |   |
| Thames,           | 215              | 6,160                     | "              | London, Windsor, Reading, Oxford.   |
| Seine,            | 430              | 30,000                    | Atlantic.      | Havre, Rouen, Paris.  |
| Loire,            | 570              | 48,000                    | "              | Nantes, Orleans, Nevers.  |
| Garonne,          | 350              | 33,000                    | "              | Bordeaux, Toulouse.   |
| Douro,            | 460              | 39,000                    | "              | Oporto, Zamora.   |
| Tagus,            | 510              | 34,000                    | "              | Lisbon, Abrantes, Talavera, Toledo.   |
| Guadiana,         | 450              | 26,000                    | "              | Badajoz, Merida.  |
| Guadalquivir,     | 290              | 20,000                    | "              | San Lucar, Seville, Cordova, Villafranca.                                       |
| Ebro,             | 420              | 34,000                    | Mediterranean. | Tortosa, Saragossa, Tudela.   |
| Rhone,            | 490              | 38,000                    | "              | Arles, Avignon, Lyon, Geneva.   |
| Po,               | 450              | 40,000                    | "              | Ferrara, Cremona, Piacenza, Turin.  |
| Danube,           | 1630             | 310,000                   | Black Sea.     | Silistria, Rustchuk, Widdin, Belgrade, Buda, Pesth, Presburg, Vienna, Ratisbon. |
| Dniester,         | 700              | 31,000                    | "              | Ovidiopol, Bender.  |
| Dnieper,          | 1200             | 200,000                   | "              | Kherson, Kiev.  |
| Don,              | 1100             | 205,000                   | "              | Azov, Tcherkask.  |
| Volga,            | 2200             | 520,000                   | Caspian.       | Astrachan, Sarepta, Saratov, Kasan, Nijni-Novgorod, Tver.                       |

In parts of their course, the Loire and the Seine flow through scenery of the most lovely and picturesque description. The Elbe, above Dresden, is also remarkable for striking landscapes; while the Rhine and Rhone, both born among the glaciers, are connected in their earlier stages with the grandest features of the Swiss highlands. But

Iron Gates of the Danube.

the former river, after quitting its mountain-cradle, in the middle portion of its course, between Bonn and Mayence, is a special point of attraction to tourists. There pleasant towns and villages appear nestling at the foot of vine-clad hills, while romantic valleys open out on either hand, and steep towering rocks at intervals closely hem in the channel, each with a mouldering fastness of feudal times, or a modern stronghold at the summit, presenting—

‘A blending of all beauties; streams and dells,  
Fruit, foliage, crag, wood, cornfield, mountain, vine;  
And chiefless castles, breathing stern farewells,  
From gray but leafy walls where ruin grimly dwells.’

The banks of the Danube, which have only become widely known since the introduction of steam navigation, are fully equal to those of the Rhine in natural scenery, vineyard cultivation, and monuments of feudalism, with the additional features of huge palace-like monasteries, and vast forests sweeping down from the top of bold heights to the water's edge. Steamers began to ply upon a portion of its surface in the year 1830. The first to take its departure from Vienna to Pesth, the *Nador*, started in 1836, with half the population of the Austrian capital in motion to witness the sight; and in the same year, the *Pannonia* made for the first time the passage of the Iron Gate, on the borders of Hungary and Wallachia, where rocks in the bed of the river, and encroaching mountains on either hand, give rise to a succession of rapids. Both the Danube and the Rhine are rife with historic memories of the Roman wars with the barbarians, the arms of Charlemagne and Gustavus Adolphus, the campaigns of Marlborough and Napoleon, while the former stream has been the scene of many a bloody struggle between the soldiers of the Crescent and the Cross.

Lakes accompany the great mountain-systems of Europe, but are not confined to them.

They may be arranged in two groups—northern and southern. The examples are the most numerous and of the largest class in the former, occupying depressions on the southern and eastern sides of the Scandinavian highlands, and in the closely-adjointing districts, while many of small size are at a high elevation on the table-lands. The Wener Lake, in Sweden, extends over more than 2000 square miles; the Saima, in Finland, has nearly equal dimensions; those of the Onega, in the government of Olonetz, considerably exceed them; and the Ladoga, in the neighbourhood of St Petersburg, the largest lake in Europe, spreads through upwards of 6000 square miles, an area greater than that of the whole kingdom of Saxony. Owing to their prodigious number and occasional magnitude, lacustrine formations are characteristic features of all the countries around the Baltic, especially of Finland, and hence its name of Suomemna, 'the region of lakes and swamps.' Fine scenery surrounds some of the Swedish expanses, but the Finnish and the Russian have commonly low rocky shores, void of picturesqueness, often very dreary. In summer they interfere with land travelling, by rendering it circuitous; but in winter, covered with ice, they form an easy pavement for the sledge. Hence the annual fairs of Finland are held in the latter season, when journeys are performed in one-horse sledges to exchange a few wares for household commodities, equal in extent to the distance between the Land's End and the Orkneys. The winter passage of some of these lakes is not always free from danger, for they are liable to violent underground swells, even in the calmest weather, and when the surface is coincidentally frozen, the ice cracks or parts asunder with a tremendous noise.

The lakes of the southern group are comparatively small, but are placed in the midst of some of nature's most charming or grandest scenes, occasionally exhibiting an aspect of savage sublimity. They include those of Geneva, Constance, Neufchatel, Lucerne, Zurich, and others, on the Swiss side of the Alps, with Lago Maggiore, the lakes of Como and Garda, on the opposite Italian slope. The latter are expanses smiling in a warm climate under a bright sky, have bold shores richly clothed with the vegetation of the south—thickets of orange-trees, olives, and myrtles—studded, too, with villas and palaces, of great classical interest. The former have also their bland features, but not far apart are the rugged; and the blue waters that wash a strand of simple beauty alternate with billows dark with the shadows of the rocks they chafe, which rise above them to a stupendous height, and with a steepness that is even terrible, as in the little bay of Uri, on Lake Lucerne, consecrated to a patriot's memory.

'That sacred lake withdrawn among the hills,  
Its depth of waters flanked, as with a wall  
Built by the giant race before the flood;  
Where not a cross or chapel but inspires  
Holy delight, lifting our thoughts to God  
From godlike men—  
That in the desert sowed the seeds of life,  
Training a band of small republics there,  
Which still exist, the envy of the world;  
Who would not land in each and tread the ground—  
Land where Tell leaped ashore?'

Mountain-lakes, generally of very small dimensions, occur in connection with the Pyrenees, the Apennines, the Balkan, and the range of Pindus. In addition to such fresh-water formations, there is the Platten See, a brackish expanse of considerable extent on the plain of Hungary; and the shallow but extremely salt Neusiedler See in the same region, on the shores of which large quantities of the sulphate, muriate, and carbonate of soda crystallise in summer. But of all salt water, not only in Europe, but in the world,

that of Lake Elton, in Russia, in the steppe east of the Volga, has the largest amount of saline impregnation. This remarkable sheet of brine is an oval, about eleven miles long by nearly nine broad, but nowhere exceeds fifteen inches in depth. In the height of summer, it appears as if covered with ice and snow, owing to the illusion produced by the crystallised salt along the banks and over the whole surface, vast quantities of which are annually collected for consumption in different parts of the empire. The lake is the Elton-Nor, or the 'Golden Elton' of the Mongols.

Primitive ungainly craft appear upon many of these inland waters, devoted chiefly to the transport of produce, as the old Noah's arks for passenger traffic have been largely superseded by steamers or railways. The Rhine is famous for its immense rafts of timber from the remote German forests, composed of logs drifted down the mountain-streams from the sites where the trees have grown. They are lashed together at some convenient station, and finally formed into a single fabric on the recipient river, which, with the wooden huts upon it for the accommodation of the boatmen, and its vast size, has the appearance of a floating village. On reaching Dortrecht, in Holland, the rafts are broken up, and the timber sold for ship-building and other purposes. The Danube has also its timber-floats, but of smaller dimensions; and it is not uncommon to see the peasantry descending the Drave, one of its largest tributaries, on rafts of barrels. Large quantities of wheat are brought down to Dantzic by the Vistula, from the upper parts of its basin, in open flats rudely constructed of fir, and covered with as rudely-made mats of straw. The grain is heaped upon them, and left exposed to the accidents of showers and sunshine. Owing to the tedious mode of navigation, and the length of the voyage—from four to five hundred miles, it lasts for several weeks, and even months. Upon rain falling, it soon causes the wheat to sprout, and the craft becomes like a little floating meadow. But the shooting fibres speedily form a thick mat, which prevents the moisture from penetrating to any depth, and protects the main bulk. Upon reaching the outport, the barges are broken up, and the crews return home on foot. A far longer river-voyage is performed in the transport westward of the mineral produce of the Urals. It commences towards the close of April, when the streams have lost their ice, but are swollen by the melting of the snow; and is carried on in flat-bottomed vessels terminating at both ends in a kind of obtuse triangle. From the town of Slatoust—the starting-point, the Ai is descended to its confluence with the Oufa, and that river is followed to its junction with the Bielaia, which takes the fleet into the Kama, an affluent of the Volga. Here the boats are properly fitted to toil against the current of the great stream up to Nijni-Novgorod, passing thence to St Petersburg aided by a very short artificial cutting which connects a tributary of the Volga with the basin of Lake Ladoga. The total length of the winding river-line is not less than 3000 miles.

With the exception of a small northerly section which passes within the polar circle, the whole of Europe enjoys the great climatic advantage of being in the temperate zone, while its most southerly point is somewhat more than twelve degrees removed from the torrid zone. But over a wide area of the surface, the climate is so favourably modified by various causes as to be rendered much milder than what is to be accounted for by latitude, the temperature being higher and more equable than in Asiatic and Trans-Atlantic districts under corresponding parallels. These causes, which specially affect the western countries, are the proximity of an immense expanse of the ocean in which the warm waters of the Gulf Stream circulate, the prevalence of south-west winds sweeping up from a tropical direction, with the frequent and deep intrusions of the sea consequent on a broken coastline, tending to diffuse over the land the comparatively uniform temperature of the waters. Hence in western Europe, exposed to these influences, the summers and winters

are not in such violent contrast as in the same latitudes in the heart of the continent, while the mean annual temperature is considerably higher. Edinburgh and Moscow are under nearly the same parallel, but while the Scotch capital has a cooler summer than the Russian, it has a much milder winter, and its annual amount of heat is much greater. The climate of Christiania and St Petersburg, of Geneva and Odessa, or any other places in western and eastern Europe, similarly situated as to latitude, not differing to any considerable extent in elevation above the sea, may be compared with the like result. In the southern countries the climate is affected, and rendered occasionally oppressive in summer, by exposure to the winds which sweep over the Mediterranean from the burning deserts of Africa; while the north-eastern regions, unprotected by a sufficiently high range of mountains, are chilled by the blasts which visit them from the Polar Ocean and the Siberian plain. Four principal climatic zones or regions may be distinguished—a southern, central, northern, and Arctic; which may be styled respectively, warm, temperate, cool, and cold.

The southern or warm zone lies to the south of the parallel of  $45^{\circ}$ , which runs between the mouths of the Garonne and the Danube, and therefore embraces the Spanish peninsula, the south of France, and the greater part of Italy, with Turkey and Greece. On the low grounds the winter is short; the frosts are slight; snow rarely falls, and rapidly disappears from the surface; and vegetation suffers but little interruption; while the summer heat is very great, especially when the southerly wind blows, called the solano in Spain, the sirocco in Italy and Sicily. The central or temperate region may be considered as extending generally between the parallels of  $45^{\circ}$  and  $55^{\circ}$ . It includes three-fourths of France, all Germany, Hungary, and the south of Russia, with England and Ireland. The four seasons are distinct in this district; but the winter is longer than the summer; snow is common over the whole area, with sharp frosts, occasionally of some duration; and proceeding from west to east, the reign of winter becomes more rigorous and protracted, while the heat of summer is more excessive. The northern or cool zone stretches from the preceding to the polar circle, and comprises nearly the whole of Sweden and Norway, with the north of Russia. Here the winter is constantly severe and lengthened; the ground is mantled with deep snow for months; the rivers and lakes are firmly frozen; the ports are blocked up with ice, which extends over entire bays and gulfs; and the thermometer frequently descends to  $28^{\circ}$  below zero at Stockholm, sometimes to  $54^{\circ}$  at St Petersburg. There is, however, a very warm though brief summer, which so rapidly follows the winter as almost to obliterate spring from the calendar of the seasons. Vegetation advances with astonishing rapidity during the change, as if the grasses, shrubs, and trees, had been suddenly enfranchised with independent life, instead of simply obeying the influence of warmth and moisture. In the neighbourhood of Uleaborg, towards the head of the Gulf of Bothnia, grain has been sown and reaped in the space of six weeks. Within the Arctic circle, which embraces the northern part of the Scandinavian peninsula, the year is made up of one long winter night and summer day, during which there is intense cold in the former, and considerable warmth in the latter, owing to the accumulation of heat from the continued presence of the sun above the horizon.

In relation to the rain-fall, it decreases in amount from west to east, or as the ocean is receded from. The annual precipitation is upwards of 100 inches on the coast of Portugal; 47 inches on the west coast of Ireland; 24 at London; and only 15 in the far east of Europe. Coimbra, in the valley of the Mondego, in Portugal, has a greater annual quantity than any other locality of the continent, said to exceed 200 inches. The number of rainy days in the year likewise diminishes from west to east.

Ireland has 208 days of rain in the year; the Netherlands 170; North Germany 152; and the plains of the Volga 90 days. In the most southerly districts, the rain falls chiefly in winter; in the western and north-western, in autumn; and in the central and eastern countries, in summer. Proceeding from south to north, the annual quantity of rain decreases, while that of snow increases. Malta is never touched by a snow-flake; Venice has an average of 5 days in the year on which snow falls; Paris of 12; Copenhagen of 30; and St Petersburg of 170 days.

In the European flora, there is probably not a single product peculiar to the surface, for while a direct prolongation of Asia, its southern peninsulas are in close proximity to Africa. But the vegetation is remarkably characterised by the prevalence of cruciferous and umbelliferous plants, which appear in greater abundance in the temperate and cool zones discriminated than in any other part of the globe. To the former class, the wallflower, stock, turnip, cabbage, and radish belong; to the latter, the lettuce, carrot, artichoke, hemlock, dandelion, and thistle. In this region the cornfields are the richest, and the meadows the most verdant, while the predominant trees are of the coniferous and amentaceous, or the cone and catkin-bearing families, as the various species of fir, the willow, poplar, hazel, lime, birch, alder, elm, oak, and beech. Of these, the beech is the first to pass away in a northerly direction, advancing to the parallel of  $60^{\circ}$ , in favourable situations, in Sweden; the oak, elm, and lime, reach to that of  $61^{\circ}$ ; the ash to  $62^{\circ}$ ; the hazel to  $64^{\circ}$ ; beyond which, firs, willows, and birches, enter the Arctic region, becoming of very diminutive size, till a few trailing shrubs, herbaceous and flowering plants, with mosses, lichens, and saxifrages, alone occupy the surface. In the extreme south, the warmer part of the warm zone, sub-tropical forêts occur in limited areas, as the dwarf-palm, cactus, banana, and sugar-cane; evergreens are largely blended in the woods with trees which periodically lose their foliage; a winter flora exists; extensive spaces are clothed with the orange, lemon, citron, fig, pomegranate, olive, and vine; but the pastures are not so luxuriant and freshly green as in the more temperate latitudes. Among the cereals, wheat is grown to the parallel of  $64^{\circ}$  in Norway; oats reach to  $65^{\circ}$ ; barley and rye pass within the polar circle; but none of these products are cultivable to so high a latitude in the east of Europe. Rice, which requires great heat and moisture, is confined to limited tracts in Greece, Italy, and Spain.

Two orders of the animal kingdom are entirely unrepresented in the zoology of Europe, the Marsupialia and Edentata, or pouched and toothless quadrupeds. A single species of the quadrumanous family occurs, the Barbary ape, which is restricted to the rock of Gibraltar; and one species of the pachydermatous tribe, the wild-boar, inhabits the central and southern forests. The white polar bear is limited to the far north; the common brown bear, in the wooded districts of the Alps and Pyrenees, as well as in Scandinavia and Russia, with the wolf, more numerous and widely diffused, are the only formidable animals, in process of reduction as to number by the spread of population and the habits of civilised life. Ruminants of many varieties and great interest occupy the plains, mountains, and woods: the reindeer and elk, in the extreme north; the stag, roebuck, and fallow-deer, in the central temperate zone; the ibex and chamois, scaling the snow-clad ridges of the grander highlands; the moufflon, in Corsica and Sardinia, formerly common in Spain, supposed by some to be the original stock of our domestic sheep; the auroch or bison, protected in imperial domains in Lithuania; and the Bactrian camel, on the steppes towards the Caspian and in the Crimea. Among the rodents, colonies of the beaver linger on the banks of some of the more solitary rivers, but will probably disappear as completely as they have vanished from the streams of Britain, where they were formerly well known. Birds are numerous both as to species and individuals, some of

which are summer visitors to very northerly regions, as the swallow, cuckoo, nightingale, and stork, retiring to the warm south to spend the winter, passing out of the limits of Europe into Africa or Asia. Aquatic birds, both waders and swimmers, are very abundant, owing to the profusion of lakes and streams. Reptiles are all of insignificant size, and none are formidable to man.

The native mineralogy of Europe is poor in relation to gold, silver, and precious stones, when compared with that of other sections of the globe. But it is just as rich in the possession of the metals and minerals which hourly appeal to the senses in the implements and machinery of civilised life, which exercise an influence the most important upon the comfort of human beings, and are essential to the prosperity of nations. These are found within its limits in apparently inexhaustible stores, and frequently occur in very convenient juxtaposition. The countries mentioned in connection with the economic minerals named, are in order distinguished for the amount of their produce.

Mining, in districts where it is still carried on, is probably of older date in England than in any other part of Europe. Tin was undoubtedly wrought by the ancient Britons in Cornwall, where their excavations are at present known by old British names; and lead by the Romans in Derbyshire. Saxony is entitled to rank as the cradle of scientific mining, and is still one of its principal schools.

Europe, in proportion to space, is the most populous of the great divisions of the globe, containing more than one-fourth of its entire estimated population, or upwards of 270,000,000. The aborigines are quite unknown. But the main mass of its people belong to that ethnological division of mankind called the Caucasian or Aryan, sometimes the Indo-European, distinguished by the features being symmetrical, the forehead high, the hair soft, and the form of the skull elliptical. They are chiefly referrible also to three branches of this great group of nations—the Celtic, Teutonic,

and Slavonian, who successively poured in from the parent hive in Asia, variously conquering, displacing, and intermingling. The immigrants who formed the Celtic races are believed to have come first, and to have been spread at one time extensively over the surface, but were afterwards overcome, reduced in numbers, and driven westward by fresh advancing colonies, permanently occupying the extreme west, where pure Celtic blood is found at present, as in Brittany, Wales, Ireland, and the Scottish Highlands. At a much later date the ancestors of the Teutonic nations arrived, and established the two principal divisions of the stock, or the Germanic, in the central parts of the continent, and the Scandinavian, in the countries around the Baltic, both extended eventually to Great Britain, but chiefly the former. The founders of the Slavonic tribes, or as they were originally called, the Scythians and Sarmatians, settled principally in the eastern and south-eastern countries, seem never to have passed the river Oder in their westerly migrations, and are now represented by the great body of the Russians, the Poles, and the people immediately south of the Lower Danube. By alliances of these three principal families with each other, and with aborigines of whom we know nothing beyond the probable fact of their existence, the nations of mixed blood were formed, or the Greco-Latins, of whom the important sections are the Greeks, Italians, French, Spanish, Portuguese, and Moldo-Wallachians. The proof of the common origin of all these peoples, whether purely Celtic, Teutonic, and Slavonic, or variously crossed, and of their claim to be considered *Indo-European*, rests mainly upon the radical conformity of their languages to the Sanscrit, the ancient, classical, and sacred tongue of India. In addition, there are races of the same type generally diffused, as the Jews and Gipsies, both late comers, especially the latter, whose appearance in western countries dates only from the fifteenth century, and are generally supposed to have migrated from the plains of the Ganges to escape the sword of the terrible Tamerlane. Europe also contains both tribes and nations distinct from the Caucasian group, belonging to the Mongolian division of mankind, similarly derived from Asia, but from its Altaic regions. They are natively distinguished by inferior stature, a broad flat face, lank hair, and the pyramidal form of the skull. To this variety belong the Lapps, Finns, and Samoiedes, in the northern countries; the Turks in the south-eastern peninsula; the Tartars and Kalmucks in the south and east of Russia; and the Magyars in Hungary and Transylvania. But since their arrival west of the Bosphorus, the Turks, owing to alliance with Georgian and Circassian females, and many of the Magyars, from intermarriage with Germans, and other causes, have deviated from the type of their ancestors, and correspond in conformation to the great body of Europeans. Dr Kombst makes the following estimate

## OF PURE BLOOD IN EUROPE :

|                     |            |                                |           |
|---------------------|------------|--------------------------------|-----------|
| Celtic, . . . . .   | 12,000,000 | Finns and Samoiedes, . . . . . | 3,000,000 |
| Teutonic, . . . . . | 52,000,000 | Tartar, . . . . .              | 2,000,000 |
| Slavonic, . . . . . | 50,000,000 | Jews, . . . . .                | 2,000,000 |
| Magyar, . . . . .   | 9,000,000  | Gipsies, . . . . .             | 600,000   |

A rather higher number will represent the people of mixed blood, Celtic in its various crosses, Teutonic-Celtic, Teutonic-Slavonian, Finnic-Slavonian, and other diversities.

The vast majority of the languages of Europe may be classified under the names of the four great races of people found within its limits. They consist of the Celtic dialects, vernacular in the west; the Teutonic, in the north, north-west, and centre; the Greco-Latin, in the south and south-west; the Slavonic, in eastern and midland districts. These groups have a common parent in the Sanscrit, and form part of the *Indo-European* linguistic family, which geographically ranges from the banks of the Ganges to the

western coasts of the Spanish peninsula. The first-named group, or the Celtic, though perhaps the most ancient, and once widely diffused, now occupies a very limited area, being restricted to the Erse or native Irish spoken in Ireland, the Gaelic in the north and west of Scotland, the Manx in the Isle of Man, the Welsh in the principality of Wales, and the Breton, or Armoric, in the old French province of Bretagne. These dialects have no important literature, and are everywhere in process of being gradually expunged from the list of living tongues by the encroachment of forms of speech more generally current, hence more convenient for the practical purposes of life, while richly freighted with stores of knowledge. The Teutonic languages, which include the English, German, Dutch, Flemish, Danish, and Swedish; and the Greco-Latin stock, comprising the modern Greek, the Italian, French, Spanish, and Portuguese, are eminently the exponents of literature, science, art, and public policy, several of which are extensively cultivated on that account in Europe, beyond the bounds of their native seat, while conveyed to far-distant regions, and firmly planted in them by commerce, conquest, and colonisation. The Italian is widely used on the eastern shores of the Mediterranean; the French is current in all European courts, in Algeria, and Lower Canada; the English, Dutch, and German have hold upon Southern Africa; English, Spanish, and Portuguese predominate in America; English is the prevailing speech of Australia, though, in a few villages, the German occupies that place. The Sclavonic languages, which comprehend the Russian, Lithuanian, Polish, Bohemian, Servian, Bulgarian, and others, are spread over a vast area, but remain confined to the sites they originally occupied, except the Russian, which conquest has extended to the north of Asia.

Of the languages not belonging to the Indo-European class, as the Finnic, and other Tshoudic dialects, with the Magyar, Turkish, Tartar, and Basque, the last is the most remarkable. It is spoken by the peasant population of the valleys on both sides of the Pyrenees, but chiefly on the Spanish, and has no relations at present positively known to any linguistic family. The people believe that it was not only the original language of Spain, but also of the world, from which all other tongues have been derived. So exceedingly difficult is its acquirement, that, according to a popular tradition, the devil once tried to learn Basque, and shut himself up for the purpose through seven years, but had to abandon the task in despair. The author of the first guide to it, gave to his work the title of *El Imposible Vencido*, 'The Impossible Conquered;' and so far has this now been effected, that under the eye of Prince Louis-Lucien Bonaparte, a translation of the Bible into this all but impracticable tongue has been executed in London. It is curious to remark, that our conglomerate language has a vulgar phrase used to strengthen an asseveration, once more current than at present, 'By Jingo,' or 'By the living Jingo,' which seems to have come to us from the Pyrenees, where *Jainko* is the Basque name for the Supreme Being. It will be remembered, that provinces immediately north of the mountains were under the rule of England in the time of the Plantagenet kings, and, while the Black Prince, son of Edward III., carried his arms to the southern side of the range, his great-grandfather, Edward I., had Basque mountaineers conveyed to England to take part in the reduction of Wales.

Though the primitive Europeans are wholly unknown, abundant remains have been found of a people who appear to have antedated the oldest of the existing races. Some of them were lake-dwellers, who occupied platform habitations sustained by piles driven into the beds of the waters. Upon drought or drainage exposing the bottom, memorials of these singular villages have appeared, consisting of the piles, with bones, rude pottery, implements, and other traces of human inhabitants. The implements are of stone, chiefly of flint, many specimens of which have likewise been gathered from sepulchral barrows, and refer to a period prior to the knowledge of metals.

The map of Europe comprises forty-eight independent states, varying in extent from more than half its area to less than the smallest of the English counties.

| States.                                       | Description.             | Area in Sq. Miles. | Population. | Capitals.                    |

Population returns from the *Almanach de Gotha*, 1863.

There are thus four empires, fourteen kingdoms, one electorate, seven grand duchies, seven duchies, eight principalities, one landgraviate, one ecclesiastical monarchy, and five republics, including the free cities.

Of the empires, the oldest is the Turkish or Ottoman, which dates from the fall of the Greek dominion by the Moslem capture of Constantinople, in the year 1453. The Russian was founded by Peter the Great, in the early part of the last century; the Austrian and French are of recent origin. The more ancient kingdoms are England, Spain, Denmark, and Sweden; the youngest are Belgium, Greece, Hanover, and Italy. States of the first rank are Great Britain, France, Prussia, Austria, and Russia, commonly

called the five great powers, whose concurrent voice is conclusive in the settlement of continental affairs, and whose separate influence is never overlooked. In the second rank are Spain, Turkey, Sweden, Holland, and Italy; and in the third, Belgium, Denmark, Switzerland, Bavaria, and Portugal. Population is the densest in Belgium, England, and Holland; and the thinnest in Norway, Sweden, and Russia. Hereditary monarchy is the universal form of government, except in Switzerland, the papal states, and the free cities; but in France, Belgium, Prussia, and Turkey, the succession is limited to the male line. In Russia, the papal states, and Turkey, the monarchy is perfectly absolute. In France and Austria it is so practically, though popular representation is nominally admitted. In Great Britain, and all other European countries, except those named, the supreme power is more or less vested in the sovereign and the estates of the realm, and the monarchies are constitutional. Each government has a standing army, varying in number, from the mere handful of men which the petty German powers are bound to furnish for federal purposes, to vast hosts of from 400,000 to 600,000, which is the usual complement maintained, or the peace establishment, in France, Austria, and Russia.

All the European nations profess Christianity, with the exception of a few millions, chiefly of Mohammedans and Jews. Though belonging to an endless number of religious sects, they may be reduced to three grand denominations: the Roman Catholic, Greek, and Protestant churches, each of which has a specific geographical distribution. As another general rule, the Celtic and Greco-Latin races are Roman Catholics, while the Slavonic tribes belong to the Greek communion, and the Teutonic nations are mostly Protestants. Romanism has the greatest number of adherents, amounting to more than the other two confessions taken together. But in point of general intelligence, the arts of civilised life, civil liberty, a comparatively satisfactory social and moral condition, the Protestant communities are eminently the advanced nations of Europe, owing their superiority mainly to that freedom of thought and speech, with an unfettered press, which their religious principles directly favour and enjoin.

Europa Point, Gibraltar.

## SECTION I.—THE BRITISH ISLES AND EUROPEAN DEPENDENCIES.

### CHAPTER I.

#### GENERAL VIEW OF THE BRITISH ISLES.

THE large island of Great Britain, of which England and Wales form the southern division and Scotland the northern, with the smaller insular mass of Ireland, and very numerous adjuncts closely investing their shores, constitute the United Kingdom, subject to the British crown, the home-territory and head-quarters of the most extensive and influential empire of the globe. The archipelago is situated to the westward of the European mainland, from which it is separated by the English Channel on the south, and the North Sea on the east. These are arms of the Atlantic Ocean, which directly

enclose it in other directions, where the power of the magnificent billows is strikingly proclaimed by the shattered and invaded aspect of the coasts. The most southerly point, one of the Scilly group, is in  $49^{\circ} 53'$  north latitude; and the most northerly, one of

the Shetland cluster, in  $60^{\circ} 49'$ . This range of latitude, amounting to  $10^{\circ} 56'$ , gives a resulting distance of rather more than 750 miles in the direction of the meridian, which is the entire extent of the insular series, north and south. But the great proportion of the territory, and the vast majority of the population, have a much smaller latitudinal range. Taking the parallel of  $55^{\circ}$  for a dividing-line, there are nearly equal portions of latitude to the north and south of it. The northern portion includes the main mass of Scotland, with its neighbouring isles, and very small sections of England and Ireland, while the southern embraces nearly the whole of Ireland and England, with Wales, and their adjacent islands. In the south division, the proportion of territory is more than two and a half to one, as compared with that in the north, while the amount of population is in the ratio of nearly eight to one. Lowestoft Ness, on the coast of Suffolk,  $1^{\circ} 46'$  east of Greenwich, and the Blasquet Isles off the coast of Kerry,  $10^{\circ} 30'$  west, define the extent of the archipelago in longitude. This amounts to  $12^{\circ} 16'$ , equivalent to a linear distance of 500 miles.

Sunrise and sunset visit the most easterly coasts full three-quarters of an hour before they are witnessed on the more westerly, owing to difference of longitude; and at the southern and northern extremities of the kingdom, there is a marked variation in the length of the days and nights at the solstices, occasioned by the range of latitude. In the south, the midsummer day extends to sixteen hours, eight minutes; and in the north, to eighteen hours, forty-eight minutes, leaving an interval varying from somewhat less than eight hours to rather more than five for the length of the night. But at both extremities, the sun then dips to such a small extent below the horizon, that his rays continue to reach the higher regions of the atmosphere, and the interval is one of twilight only. This is specially the case in the northern localities where the solar declension is the least, and hence, with a sky clear of clouds, there the midsummer night is day-like. In the Orkneys and Shetlands, reading, writing, and other delicate operations may be performed without artificial light, when the time-piece is marking the close of one day and the beginning of another. 'At midnight,' says a correspondent at Balta Sound, 'on the 21st of June, I have often read such print as *Chambers's Edinburgh Journal*.' The note of life from the animal creation, though less frequent than by day, is far from being interrupted. In their respective haunts may be heard the merry tune of the sedge-warbler, the bleating cry of the snipe, the whistle of widgeon and teal, the quack of the mallard, with a clamorous outburst at intervals from varieties of waders and water-fowl.

The geographical position of the British Isles is peculiar, interesting, and influential. They are so closely sea-girt, that no portion of territory is more than 120 miles from a shore; and there is only a very small area at this inconsiderable distance. The greater part of England, with the whole of Wales, Scotland, and Ireland, is within fifty miles of the salt-water line. Yet the central point of the hemisphere, which contains the greatest amount of the land-surface of the globe, falls within the limits of the archipelago, and is only a few miles from the port of Falmouth, in Cornwall. This land-hemisphere embraces the whole of Europe and Africa, all Asia and America, except the narrow peninsula of Malacca, and the tapering extremity of South America. A vast oceanic surface distinguishes the opposite hemisphere, in which, with the exceptions named, the land is wholly insular, and its collective area is quite insignificant in comparison with that of the great continents.

Great Britain is the largest of the European islands, the most important in the world, and the seventh in point of magnitude, ranking after Australia, Borneo, New Guinea, Nippon, Sumatra, and Madagascar. The nearest approach to the continent is made by the south-east corner of England, where the distance is little more than twenty miles to

the opposite shores of France. From the correspondence of the rocks on both sides of the intervening strait, and the existence of the same animals in historic times, as the bear, wolf, and beaver, with the comparatively shallow depth of the water, it is inferred that an isthmus here once connected the island with the continent as a peninsular projection, which the constant gnawing of the waves or some sudden irruption removed. This idea was current long before attention had been paid to the geology of the shores, and is mentioned by Sir Thomas More in his *Utopia*. To the westward, the separating English Channel gradually increases in breadth till the extremities of England and France in that direction are upwards of 100 miles asunder, while to the northward the North Sea expands to 400 miles between Scotland and Denmark.

The extreme points of the island are Dunnet Head, on the north, a high promontory in Caithness overlooking the Pentland Firth; the Lizard Point, on the south, a headland chiefly of serpentine in Cornwall, commonly the last land seen and the first observed by ships entering the Atlantic, and returning from it; Lowestoft Ness, on the east, a low cape adjoining that port in Suffolk; and Ardnamurchan Point, on the west, a projection of the county of Argyle. No line can be drawn intersecting the whole surface due north and south, owing to the general inclination of the land in the direction of the meridian being north by west. But a straight line, extended from Cape Wrath, in Sutherlandshire, to the coast of Sussex, or north-west and south-east, will measure about 600 miles, without cutting any portion of the sea. The greatest breadth, due east and west, is from St David's Head, in Pembrokeshire, to the Naze in Essex, and amounts to nearly 300 miles. But the contractions are numerous and marked, owing to the occurrence of far-penetrating inlets and firths. Generally, the island narrows from south to north, and hence its form is often described as rudely triangular. The idea originated with Julius Cæsar, who estimated the entire circuit at 2000 miles. But the actual extent of the coast-line, measuring inlets and estuaries up to the termination of their broader parts, is upwards of 3000 miles, distributed as follows:

|   | Miles. |
|---|--------|
| East Coast—from the South Foreland in Kent, to Duncansby Head in Caithness, | 1010   |
| North Coast—from Duncansby Head to Cape Wrath in Sutherlandshire, . . . . . | 103    |
| West Coast—from Cape Wrath to the Land's End in Cornwall, . . . . .         | 1546   |
| South Coast—from the Land's End to the South Foreland, . . . . .            | 448    |
|   | 3112   |

England has an area of 50,922 square miles; Wales, 7398; and Scotland, inclusive of islands, 30,685—making a total of 89,005 square miles. The respective proportions have been ingeniously illustrated by the Registrar-general. Adopting the figure of a perfect square, the area of England is equal to one of 226 miles to the side; Wales, to one of 86 miles; Scotland, to one of 177 miles; and the whole of Great Britain, to a square of 299 miles to the side. Or adopting the figure of a circle, the area of England is equal to one with a radius of 127 miles; Wales, to one of 49 miles; Scotland, to one of 100 miles; and the whole of Great Britain, to a circle with a radius of 169 miles. The surface varies in its level from below high-water mark in the fens of Lincolnshire, to the height of 4406 feet above the sea, in Ben Nevis, Inverness-shire.

Ireland, smaller, less important, and more compact, lies to the west of Great Britain, from which it is separated by the Irish Sea, and the straits by which that confined expanse communicates with the ocean, St George's Channel in the south, and the North Channel in the opposite direction. The two islands make their closest approach at the outlet of the northern channel, where the shores on either hand are within thirteen miles of each other, at Fairhead, in the county of Antrim, and the Mull of Cantire in Scotland.

Across the southern channel, the shortest distance is rather more than fifty miles, between Carnsore Point in Wexford, and St David's Head in Wales. The island extends in a northerly direction to about the latitude of the centre of Ayrshire in Scotland, and the town of Alnwick in England. Its southern extremity corresponds in latitude very nearly to that of Bristol and London. It rudely resembles in shape an oblique parallelogram, the longest diagonal of which runs from north-east to south-west, and measures somewhat more than 300 miles. But due north and south, the greatest extent is not more than 230 miles, from Horn Head in Donegal to near Poole Head in Cork; and due east and west, the greatest breadth is 180 miles, from Achris Point in Galway to the coast between Dublin and Drogheda. The breadth is contracted to little more than 100 miles, between the opposite Bays of Galway and Dublin; and to less than 90 miles between those of Donegal and Belfast. The extreme points of the mainland are the coast of Down on the east; Dunmore Head, in Kerry, on the west; Malin Head, in Donegal, on the north; and Mizen Head, in Cork, on the south. Cape Clear, more southerly, is a high promontory at the extremity of a small, wild, and romantic islet. Ireland has a coast-line estimated at upwards of 2000 miles, measuring the inlets, which are numerous and deep on the northern and western shores. The surface rises to 3404 feet above the sea in Carn Tual, one of the mountains of Kerry. Its superficial extent amounts to 32,513 square miles, which, added to that of Great Britain, gives a total of 121,518 square miles for the area of the United Kingdom.

The minor islands associated with the two larger sometimes occur singly, but are more generally arranged in groups, and are situated chiefly along the northern and western shores. Great Britain, for important examples, has the Orkneys and Shetlands on the north; the Inner and Outer Hebrides, Bute and Arran, the Isle of Man, Anglesea, and the Scilly Isles, on the west; the Isle of Wight on the south. Ireland has Rathlin and Tory Islands on the north, with those of Achill, Clare, Arran, the Blasquets, and Valentia on the west. The east coasts, in both instances, correspond in having very few and only insignificant insular tracts. The total number of small size has not been ascertained with exactness. But it must be very considerable, if those are included which, though not permanently inhabited by man, have patches of verdure, are visited by fowlers and fishermen in their boats, by shepherds in summer, and are the breeding-stations of vast flights of aquatic birds. Defining an island to be any piece of solid land surrounded by water, which affords sufficient vegetation to support one or more sheep, or which is occupied by man, the Census Commissioners, in 1861, found 787 such sites in connection with Scotland alone, of which 186 were inhabited on the census day. Some of these are of great extent, and supply pasturage to flocks of from 300 to 400 sheep, though without regular human tenants, while others are so small as to admit of only one sheep being left at once, which is removed when fattened, and its place supplied by another. The most isolated inhabited spot is the precipitous St Kilda, the outermost of the Outer Hebrides, with a village of bird-catchers and fishermen, 45 miles from the nearest neighbour. More solitary is Rockall; but it is simply a block of granite peering up above the waves, 184 miles from the last mentioned, the nearest land, and 260 miles from the north coast of Ireland. The rock is now a convenient guide-post to an important cod-fishery.

The enclosing seas,

'Which God hath given for a fence impregnable,'

vary greatly in their depth. The North Sea is comparatively shallow, except towards the Norwegian shores, for its mean depth for the whole basin does not exceed thirty-one fathoms. The depth in the centre is generally less than on the eastern and western sides,

except close to the coasts, owing to the accumulations of debris which encumber that part of its bed. One of these, the Dogger Bank, a well-known station for cod-fishing, but now greatly exhausted, extends upwards of 300 miles from off Flamborough Head towards the coast of Denmark, where it terminates almost in a point, though in various places not less than sixty miles broad. Another enormous bank, known to mariners as the Long Forties, trends more than 100 miles in a north-easterly direction from the Firth of Forth. It has been calculated that the solid contents of these shoals, with the minor ones, if evenly distributed over the surface of Great Britain, supposing it to be a level plain, would cover it with a stratum of soil twenty-eight feet in thickness. The shallowest part of the English Channel, about twenty-five fathoms, is at the narrow eastern extremity, between Romney Marsh and the opposite coast of France. From thence westward, the soundings increase to sixty-three fathoms at the oceanic entrance. In general, there is greater depth of water on the English than on the French shores, and the ports and harbours are better. The Irish Sea has considerable depth throughout, except towards the north-east corner, amounting to sixty-six fathoms between Holyhead and Dublin. But these depths are trifling in relation to that of the outlying ocean. The Atlantic, to the distance of about sixty miles from the west coasts of Ireland and Scotland, has a depth of 100 fathoms. It increases rapidly with a further distance, till, at under 200 miles, the plummet suddenly plunges to 1750 fathoms, or 10,500 feet, and the deep bed of the ocean begins. Hence it follows, that the comparatively shallow British seas occupy and conceal the gentle depressions and deeper dells of a plateau, of which the British Islands are the elevated and exposed portions.

The tides are very conspicuous on most of the shores, affect many of the rivers in a marked manner to a considerable distance inland, and give rise to some striking phenomena. On reaching our narrow seas, the ridge of the great oceanic tide-wave extends diagonally from the south-west coast of Ireland to the north-west projection of France, and sends off two branches owing to the interruption offered by the masses of land. An eastern branch enters the English Channel, and carries high-water to the opposite shores; a central branch runs up the Bristol Channel, and passes through St George's into the Irish Sea; while the main or oceanic wave continues its course with immense velocity along the western coasts of Ireland and Scotland. This last, after rounding the Orkneys and Shetlands, becomes a great wave from the north, traverses the whole extent of the North Sea, and determines high-water along the coast to the mouth of the Thames. The tidal rise varies in its height at different points owing to the varying configuration of the shores, the form of the bottom, and the direction of incidence of the wave, attaining its maximum where bays and estuaries have their openings turned towards its advance, and rapidly contract in their breadth. This condition is best fulfilled by the Bristol Channel, and accordingly there the ordinary rise of the tide is the greatest. It amounts to 30 feet in Swansea Bay, 38 feet at Cardiff, 40 feet at the mouth of the Bristol Avon, and occasionally to 60 feet at Chepstow on the Wye. In other places under similar circumstances, though not so marked, the tides rise as high as 22 feet at the entrance of Milford Haven, 26 feet at the mouth of the Mersey, 21 feet at the entrance of the Solway Firth, and 23 feet at the mouth of the Wash. Spring-tides, with coincident westerly gales, produce an immense accumulation of water in the upper part of the Bristol Channel, the estuary of the Severn. The flood remains pent up for a time by the narrowness of the river channel, till, having acquired sufficient power for disengagement, it violently breaks bounds, and rushes up the stream as a wall of water, with a crest of foam. Boatmen are warned of its approach, and thus enabled to secure

their craft, by hearing the distant roar. Precisely similar to this 'bore' of the Severn, and produced in the same manner, is the 'heygre' of the Trent.

Bold projecting cliffs, and narrow channels between islets or shoals and the main shores, by obstructing the tide-wave, originate impetuous currents on many points of the coasts, justly dreaded in the days of timid and unskilful seamanship. Around the peninsula of Portland in Dorsetshire, and between it and a shoal on the south bearing the ominous name of the Shambles, with Deadman's Bay in the neighbourhood; the tide rushes with extreme violence, raising furious eddies and a dangerous surf. This has obtained the name of the Race of Portland; and has the turbulence of its waters typified on old charts by a fierce-looking monster or sea-dragon lashing them into foam. The Roost of Sumburgh designates the strong and tumultuous tidal flow between the Orkneys and the Shetlands, so called from Sumburgh Head, at the southern extremity of the latter group, and the Scandinavian *roost*, the term applied to agitated and powerful sea-streams.

In the contracted Pentland Firth, between the Orkneys and the mainland of Caithness, the force of the tides and currents have, in many places, undermined the rocks, producing most fantastic shapes in the old red conglomerate—the prevailing formation of Pentland Firth. One of these fantastic forms, off the island of Hoy, is exhibited in the accompanying engraving, copied from a drawing made by Lord Bury, kindly lent to the publishers by the Earl of Caithness. All the softer portions of the headland have been washed away by the erosive action of the waves, leaving the harder conglomerate of gneiss and sandstone a beautiful example of stratification. In those narrow seas the navigation is dangerous throughout to small craft, from the force of the tide, and the strong eddies formed by currents on either side which run counter to the main stream. Vessels seldom venture to bring up,

The 'Old Man' of Hoy.

or if an anchor is let go, it is generally left at the bottom. The little isle of Stroma, on the southern side of the channel, has its Scylla and Charybdis: the one a whirlpool

called the Swalchie; the other, an expanse of broken water, boiling like a witch's caldron, termed the 'Merry Men of Mey;' the word *men* being here a corruption of *main*. Between the islands of Jura and Scarba, two of the Southern Hebrides, the remarkable intermittent whirlpool of Corrivreckin is formed by the collision of opposite tidal currents. It attains its maximum of disturbance at the fourth hour of the flood—boils, foams, and rolls away in successive whirls—throwing up everything from the bottom with strong ebullition. The name is said to be derived from a Danish prince who perished at the spot.

'Where the wave is tinged with red,  
And the russet sea-leaves grow,  
Mariners, with prudent dread,  
Shun the shelving rocks below.

As you pass through Jura's sound,  
Bend your course by Scarba's shore;  
Shun, O shun, the gulf profound,  
Where Corrivreckin's surges roar.'

On the low coasts, the tidal oscillations diurnally abridge and extend the area of the shore by submerging and leaving dry extensive tracts. This is specially observed around the Wash, where the permanent reclamation of 200,000 acres from the sea is contemplated, in the Solway, and in Morecambe Bay. The latter estuary interposes between the towns of Lancaster and Ulverstone. They are about twenty miles apart in a direct line, but twice that distance passing around the head of the bay. By the ebbing of the tide, the intervening space is left perfectly dry, except in the narrow channels of two small streams, the Kent and the Leven; and it is then traversed by travellers on horseback, and by vehicles. But the route of the 'Sands' has occasionally its perils, when dense fogs arise, or driving snow-storms come on, or when a strong westerly wind springs up, which accelerates the return of the waters, and gives great violence to their flow.

Both formidable and interesting animals, the bear, beaver, wolf, and wild-boar have become extinct within the limits of the kingdom since the dawn of authentic history. The bear was common in the Roman times, and conveyed to Rome for the sports of the amphitheatre. It existed in Scotland in the eleventh century, for in the year 1057 one of the Gordons was allowed to carry three bears' heads on his banner in honour of his valour in killing one. Several places in Wales retain the name of Pennarth, or the bear's head, indicating its presence in the principality. The wolf so infested the homesteads of the Anglo-Saxons in winter, that the month of January was called *Wolf-monat*. It was extirpated in England by systematic measures taken for its destruction by Edward I.; but remained in Scotland four centuries later, the last having been killed by Cameron of Lochiel in 1680. In Ireland, the last is said to have perished about the year 1710, in the county of Cork. A few examples of the wild-boar, once stringently protected for purposes of the chase, were in the New Forest down to the reign of Charles I. Wilberfel, or Wild-boar Fell, denominates a district in Westmoreland. The urus or wild-ox, a gigantic creature, roamed in the forests near London in the time of the first Plantagenet, and is mentioned at a much later date in other parts of the country. The beaver, the broad-tailed animal of the Welsh, was in the principality at the commencement of the thirteenth century, inhabiting the Teify. A few pools there bearing the name of *Llyn yr afangc*, 'the beaver lake,' preserve its memory, as does the name of Beverley in Yorkshire, 'the place of beavers.' Some birds have likewise disappeared, as the capercaillie, or cock of the wood, a splendid member of the grouse tribe, not uncommon in Scotland at the beginning of the last century; the great bustard, last seen in the eastern counties of England, in the early part of the present century; and the stork,

once a regular summer visitor from a warmer climate to the fenny districts, and still a migrant to Holland.

Fully exposed to the influence of those causes which elevate the temperature generally in Western Europe, mentioned in the preceding chapter, the climate of the kingdom is remarkably mild, considering its position in the northern half of the temperate zone. Those great extremes of winter cold and summer heat, which are experienced in corresponding continental latitudes, both eastward in Northern Germany and Central Russia, and westward in Trans-Atlantic regions, are unknown; while the average of temperature throughout the year is much higher. This absence of violent seasonal alternations is favourable alike to comfort and health. It specially applies to the southern and south-western shores of England, where the winters are so mild, that in sheltered bays, myrtles, citrons, camellias, hydrangeas, magnolias, cactuses, and other exotics, bear unharmed the open air without any protection but what is afforded by the neighbouring hills. The coldest district is an easterly section, extending from the Naze, in Essex, to the Firth of Forth, and stretching some distance inland. The warmest embraces the Isle of Wight, with parts of the counties of Hants, Dorset, Devon, Cornwall, Somerset, Gloucester, and Glamorgan. The hottest month in general is July, and the coldest January. Ireland has a milder winter than England, especially on the western side, but the summer is cooler, owing to the greater humidity of the atmosphere. While the rain-fall is abundant over the whole surface, it is more copious in western than in eastern localities—an obvious consequence of more immediate exposure to the vapours raised from the Atlantic, and the westerly position of the high lands and mountain-ranges. But though more westerly, Ireland is distinguished from Great Britain not so much by a larger amount of precipitation, as by its more equable distribution throughout the year, rendering the number of the rainy days greater. Hence, from this prevalent humidity, the face of the country has that freshly verdant aspect for which it is renowned. The pastures are never parched; the trees remain long in leaf—characteristics which have won for it the title of the 'Emerald Isle,' 'the green isle of Erin.' But the same circumstance limits the growth of the more important cereals, as well as the ripening of various kinds of fruits. Mists and frequent weather changes, with cold easterly winds in spring, are the principal defects of the British climate; but the measure of health enjoyed by the people, with the average duration of life, is not surpassed, if equalled, in any other country.

The vegetation of the British Isles varies with the several localities: in many respects the mountain vegetation differs widely from the vegetation of the plains and valleys. The flowers which deck the woods and fields have no representatives in mountain regions. Where a few hardy kinds do succeed in climbing to the summits of the Highland hills, a recent anonymous writer says, 'they assume strange forms which puzzle the eye, and become dwarfed and stunted by the severer climate and ungenial soil. All alpine plants found in the Highlands,' the same writer adds, 'are universally admitted to be of arctic or Scandinavian origin. Their primitive centres of distribution lie within the arctic circle, where they are found in profusion, constituting the sole flora of very extensive regions. From these northern centres they were gradually distributed southwards over the British hills during the glacial epoch, when the summits of these hills were low islands, or chains of islands, extending to the area of Norway through a glacial sea. This floral migration may be traced from the arctic regions to the higher ranges of the Alps.'

The mass of the vegetation is identical with that of the neighbouring continent. But a wanderer from afar appears on the west coast of Ireland and in the Hebrides, which has established itself from transatlantic regions, owing doubtless to seeds having been drifted thither by the Gulf-Stream, still retaining the power of germination. This is the jointed pipewort, a grass-like plant, growing in lakes which have a muddy bottom, and exhibiting small globular heads of flowers. But it bears little resemblance with us to its congeners in their more congenial natural habitation, which are shrubby, from four to six feet high, with leafy branches on their stems, and are prominent features of the vegetation in parts of South America. Another migrant, the three-toothed cinque-foil, abundant in the Rocky Mountains and Arctic America, occurs on a Forfarshire hill in Scotland, to which it is limited. A third intruder, of recent date, the water weed, *Anacharsis alsinastrum*, first observed in the year 1842, and now well known in the rivers, canals, and drains of the midland counties of England, is supposed to have sprung from seeds brought with timber from Canada during the construction of the railways.

The native flora may be divided into four groups—Germanic; Scandinavian; Asturian; and Armorican, so called from the continental localities where the same species are now found, and whence, in the opinion of Professor Forbes and other geologists, they originally came to our shores. I. The Germanic group comprise the principal components of vegetation, such as *Sibaldia procumbens* (a), *Arenaria rubella* (b), *Gentiana nivalis* (c), and all the widely diffused species—trees, shrubs, weeds, and wild-flowers—which belong equally, to the middle latitudes of Europe. II. The Scandinavian group is chiefly represented in the Highlands of Scotland, to a smaller extent on the loftier mountains and bleak moorlands of England and Wales, and very sparingly in Ireland. It consists of mosses, lichens, and grasses, some highly beautiful flowering plants, and prized berry-bearing shrubs, as the cranberry, bilberry, and cloudberry, which are abundant in Scandinavia, on alpine heights in general, and also in the arctic lowlands. Among those selected for illustration are, *Verbascum lychnides* (d), *Linum perenne*, common flax (e), *Rubus chamaemorus*, the cloudberry (f), *Gentiana pneumonanthe* (g), *Thlaspi*

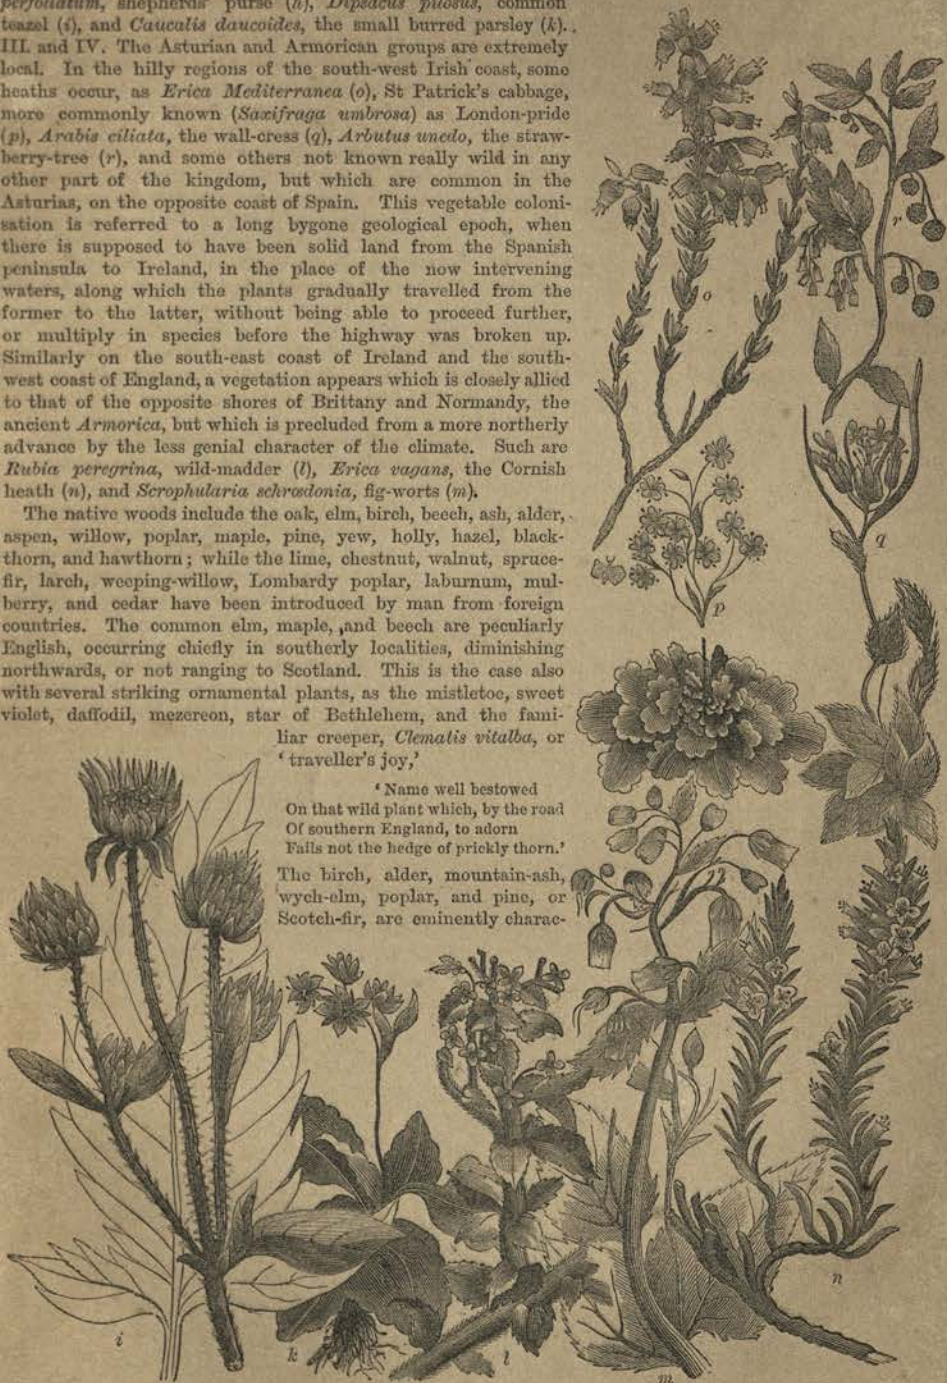

*perfoliatum*, shepherd's purse (*h*), *Dipsacus pilosus*, common teasel (*i*), and *Caucalis daucoides*, the small burred parsley (*k*). III and IV. The Asturian and Armoric groups are extremely local. In the hilly regions of the south-west Irish coast, some heaths occur, as *Erica Mediterranea* (*o*), St Patrick's cabbage, more commonly known (*Saxifraga umbrosa*) as London-pride (*p*), *Arabis ciliata*, the wall-ress (*q*), *Arbutus unedo*, the strawberry-tree (*r*), and some others not known really wild in any other part of the kingdom, but which are common in the Asturias, on the opposite coast of Spain. This vegetable colonisation is referred to a long bygone geological epoch, when there is supposed to have been solid land from the Spanish peninsula to Ireland, in the place of the now intervening waters, along which the plants gradually travelled from the former to the latter, without being able to proceed further, or multiply in species before the highway was broken up. Similarly on the south-east coast of Ireland and the south-west coast of England, a vegetation appears which is closely allied to that of the opposite shores of Brittany and Normandy, the ancient *Armorica*, but which is precluded from a more northerly advance by the less genial character of the climate. Such are *Rubia peregrina*, wild-madder (*l*), *Erica vagans*, the Cornish heath (*n*), and *Scrophularia sclerosonia*, fig-worts (*m*).

The native woods include the oak, elm, birch, beech, ash, alder, aspen, willow, poplar, maple, pine, yew, holly, hazel, black-thorn, and hawthorn; while the lime, chestnut, walnut, spruce-fir, larch, weeping-willow, Lombardy poplar, laburnum, mulberry, and cedar have been introduced by man from foreign countries. The common elm, maple, and beech are peculiarly English, occurring chiefly in southerly localities, diminishing northwards, or not ranging to Scotland. This is the case also with several striking ornamental plants, as the mistletoe, sweet violet, daffodil, mezeoreon, star of Bethlehem, and the familiar creeper, *Clematis vitalba*, or 'traveller's joy.'

'Name well bestowed

On that wild plant which, by the road  
Of southern England, to adorn  
Falls not the hedge of prickly thorn.'

The birch, alder, mountain-ash,  
wych-elm, poplar, and pine, or  
Scotch-fir, are eminently charac-

teristic of Scotland. There the latter is frequently a very noble object, altogether different to what it appears on the stiff clays of England, for the natural character of the pine is best developed in bleak situations, amid mountains, crags, and waterfalls, where

'Moor'd in the rifted rock,  
Proof to the tempest's shock,

Firmer he roots him the ruder it blows.'

Vast tracts of woodland have disappeared from the surface, owing to the increase of population, the extension of culture, and the demand for timber, with the abatement of the passion for the chase. Seventy-seven forests were once enumerated in England alone as the property of the crown. They were successively disafforested till the number was reduced to eleven; but only six of these have now any important extent—the New Forest, in the south-west, and Woolmer Forest, in the south-east of Hampshire; Dean Forest, between the Severn and the Wye; Whittlebury Forest, in the south-east of Northamptonshire; Windsor Forest, Berks; and Delamere Forest, Cheshire. Yet out of a total area somewhat exceeding a hundred thousand acres, little more than one-third is actually woodland. Many parts of the country still retain the denomination of forest, which have entirely lost that distinctive character, as Macclesfield Forest, Cheshire; Needwood Forest, Staffordshire; Charnwood Forest, Leicestershire; and the Forest of Arden, Warwickshire.

Among the wild native animals, the large examples are ruminants. They consist of the fallow-deer, semi-domesticated in parks; the red-deer, roaming the solitudes of the north of Scotland in herds, found also in a few retired localities in England and Ireland; the roebuck, limited to the Scottish Highlands; the goat, semi-wild in Wales; and the wild cattle preserved in the parks of the nobility, perhaps the descendants of a domesticated breed which broke from the homesteads in turbulent times, and returned to natural habits in the woods. The carnivorous race is represented by the fox, five of the weasel family, and the otter, formerly much more common than at present; the wild-cat and badger, both very scarce; the hedgehog, found in almost every part of our islands, but not numerous; the mole, very common in England, but not known in Ireland, or north of the Pentland Firth; and nine species of bat. Of the rodents, varieties of the hare and rabbit are generally diffused, as is the squirrel, in England and Scotland; but it has only recently been known in Ireland, by introduction to the county of Wicklow. The reptiles include the blindworm, ringed-snake, and adder, or common viper, the last of which alone is venomous,

but none of them occur in the sister-kingdom, nor does the common toad. According to popular superstition, St Patrick, the patron saint, cleared the island of the 'varmint' by a malediction. Of upwards of ten thousand British insects known to naturalists, and described by them, somewhat more than one-third range to Ireland. The glowworm is among the absentees, and some of the more splendid of the butterflies.

The feathered tribes number a very large proportion of species, considerably more than one-half of the total belonging to Europe; and individuals are equally numerous with species, notwithstanding much thoughtless destruction. An insular position invites the families of waders and swimmers to the shores, while the great extent of cultivated country, and the abundant vegetation, provide a supply of food for the smaller birds. Some are summer visitors from the southerly latitudes, which range over the entire kingdom, as the cuckoo and swallow; while the two splendid warblers, the nightingale and blackcap, are comparatively local. The nightingale does not visit Scotland, Ireland, or Wales, although M'Gilivray mentions instances of its being heard in the Lothians; nor is it known in Cornwall, the west of Devon, or much further north in England than about the neighbourhood of York. Examples noticed beyond these limits are accidental stragglers. The fig-eater, common in Italy and the south of France, is an annual migrant to the fig-orchards in the neighbourhood of Worthing, Sussex, about the time of the ripening of the fruit. Of the game-birds, the black grouse is found on moors in England and Scotland, but not in Ireland; the red grouse occurs generally, and is peculiar to the British islands; the white grouse, or ptarmigan, is only met with on the wildest and highest of the Scotch mountains. Most of the common domestic fowl, with the peacock, turkey, and pheasant, are of foreign origin. The seas, rivers, and lakes yield a supply of those varieties of fish in great quantities which are most serviceable for human sustenance—the salmon, cod, herring, mackerel, and pilchard. The last three periodically leave the deep water as the spawning-season approaches, and draw near to the shores in vast swarms, when the respective fisheries are prosecuted with great activity. The herring is the most diffused, though far more abundant on some points of the coast than others; the mackerel is chiefly taken on the southern and south-eastern shores of England; the pilchard shoals confine themselves to its south-western corner, the counties of Cornwall and Devon; the cod abounds on the western shores of Ireland.

In no part of the world is there known to be an amount of mineral wealth within the same area equal to that of the United Kingdom. Gold occurs; and the Romans conducted regular mining operations for it in Caermarthenshire, Wales. Stream-gold was found on the southern borders of Lanarkshire, Scotland, about the commencement of the sixteenth century; and towards the close of the eighteenth, in the rivers of Wicklow, Ireland. Both discoveries excited considerable expectation, but the search eventually proved unremunerative. Silver is also met with in a native or pure state, and it accompanies galena, a sulphuret of lead, frequently in sufficient quantity to render the extraction profitable. But the mineral stores of inestimable importance are those which are the prime producers of wealth and comfort in the hands of an instructed and industrious people; and these are possessed in vast abundance and convenient juxtaposition. They include iron, copper, lead, tin, zinc, coal, and salt, with other varieties of less consequence, as antimony, manganese, graphite, alum, and fuller's-earth, besides ample supplies of building stone, roofing-slate, marbles, and the clays which are suitable for the commonest ware and the finest porcelain. Tin and lead works are of the oldest date. The tin of Devon and Cornwall was wrought by the ancient Britons, whose mining labours in the latter county, at the extreme angle, are commemorated by the singular excavations, called the 'Pit,' the 'Land's End Hole,' and the 'Devil's Frying Pan.' Lead was certainly wrought by the Romans, as blocks of the metal bearing Latin inscriptions have been found on the moors of Derbyshire. Mineral waters, or springs impregnated with saline, chalybeate, and sulphureous compounds, variously cold, tepid, and warm, are numerous. But no warm springs occur in Scotland, nor are they known in England further north than the Derbyshire Peak.

The earliest record of the existence of the British Isles at a known date occurs in the writings of Aristotle, who, writing about 340 B. C., refers to them under the names of Albion and Ierne, which are described as the principal members of a group. The former name is supposed to signify the 'fair or white land,' in allusion to the appearance of the chalk-cliffs prominent on the southern coast of England; and the latter applied to Ireland, is commonly regarded as a relative designation, meaning the 'western island.' Rather more than half a century before the Christian era, Julius Cæsar landed on the shores intent on conquest, but made no stay, and accomplished no important result, with the exception of becoming acquainted to some extent with the inhabitants, character and resources of the region, and imparting his knowledge to the civilised world. About a century later, his enterprise was followed up by other leaders, and the larger part of Britain was gradually reduced to the condition of a Roman province. Four centuries later, the declining power of the empire enforced the retirement of the legions, and the aborigines were left independent. They consisted of numerous Celtic tribes belonging to two main branches of the family, the Gaelic and the Cymric, who migrated from the continent prior to the dawn of history, and spoke widely distinct languages, though offshoots of a common stock. The Gael seem to have come first, and to have been driven northward to the Scottish Highlands, and westward into Ireland by the intruding Cymri. With these last-named natives the Romans came chiefly in contact. After the departure of their masters, having largely lost the spirit of freedom by long subjection to them, they fell a prey to Teutonic invaders of the Germanic race, and numbers were reduced to servitude, finally coalescing with them; while others withdrew to the mountain fastnesses of Devon, Cornwall, Cumberland, and Wales, to preserve their liberty, and remained a distinct body. This expatriated class received the name of *Wilisc-men*, 'strangers' or 'foreigners,' expressive of their relation to the new-comers, while their territory was called *Wilisc-land*, terms from which *Welshman* and *Wales* have been formed. But the

Welsh proper have continued to the present day to distinguish themselves by the name of Cymri.

The conquering immigrants are historically known as Jutes, Angles, and Saxons. They came from the river-basins of the Eyder, Elbe, Weser, Ems, and Rhine. With the second of these tribes the denomination of England arose, which is only an abbreviation of *Angle-land*. After several separate states had co-existed, the larger and more powerful absorbed the small and weak, till all were included in a single Anglo-Saxon monarchy, about the year 823, which had an uninterrupted succession of sovereigns for very nearly two centuries. But during almost the whole of this term, the Danes and other Scandinavians, a different branch of the Teutonic family, infested the coasts. They seized the Orkneys, Shetlands, and Hebrides; occupied a considerable portion of the north of Scotland; acquired possession of the eastern and midland districts of England, which had the name of the *Danelagh*, or 'Dane-law,' from being formally ceded to them; and finally founded a short-lived Danish dynasty for the whole kingdom. Soon after its close, the Normans effected its conquest in 1066. A considerable number of that race continued to come over for a century and a half afterwards, or while Normandy and England were politically united; and during the period a broad distinction subsisted between the Norman and the Saxon part of the population. It was gradually effaced upon the separation of the two countries by association and alliances, till victors and vanquished were fused into one homogeneous people. Some leading epochs in the subsequent history of the British Isles are, the establishment of the English power in Ireland, during the reign of Henry II.; the conquest of Wales by Edward I.; the union of the kingdoms of England and Scotland under one crown in the person of James I.; their legislative union in one kingdom in 1707; and the similar incorporation of Ireland in 1799.

Existing nomenclature commemorates the Celt, the Roman, the Saxon, and the Dane. Commonly the enduring objects of nature, as rivers, lakes, mountains, and valleys, have names which are significant only in a Celtic dialect. Thus *afon* or *awan*, a running stream, appears as the denominative of numerous rivers, the Avons, five of which are in England, two in Wales, and three in Scotland, the latter sometimes called Aven. The Ouses and Esks, the Axe, Exe, Usk, and Wiske, are related to *uisge*, water, or to *isca*, the Latinised form of the word. As a prefix, *beinn*, *ben*, or *pen*, a mountain, hill, or promontory, is widely diffused. The examples are Ben Lomond, and numerous others in the Scotch Highlands; Penygent in Yorkshire; Pendle-hill in Lancashire; and Pen-maen-mawr, mountain of the great stones, one of the Snowdonian heights in Wales. The term *glen* or *glyn*, a narrow valley, with various affixes, is equally general, and the instances repeatedly occur, Glencoe in Scotland, Glendalough in Ireland, Glendon in England, and Glyntaf in Wales. Among ancient monuments, the grassy mounds or barrows common on downy heath-clad plains, in which no coins are found, but only human bones, with articles of the rudest description, may be regarded as belonging to the purely Celtic age.

Many names of inhabited sites are derived wholly or in part from the Latin, and bear witness to the presence of the Romans. Thus *coln*, the abbreviated form of *colonia*, a colony, appears in Lincoln; and *wich*, a derivative from *vicus*, a village, in Norwich, Greenwich. The word *strata*, a street or paved way, is a component in the many Stratfords, and occurs with slight alteration in Streatham, Stretton, and the names of many villages, even some solitary houses, on the line of the great Roman roads. From *castrum*, a camp, we have *chester*, *cester*, *caster*, and *caistor*, occurring alone, and in various combinations, forming both prefixes and terminals, as Chester, Chesterfield, Manchester, Cirencester, Tadcaster, and Caistor-St-Edmunds. The association of the word with the name of some adjoining river is frequent, as Lancaster, the camp on the Lune; Doncaster, the camp on the Don; Colchester, the camp on the Colne. Material memorials of the Roman age embrace coins and medals of the empire, inscribed blocks of tin and lead, tessellated pavements, and bronze statues; remains of highways, baths, villas, temples, amphitheatres, fortresses, and the great northern wall; with altars, urns, vases, weapons, domestic implements, and tombs.

Traces of the Danes and Northmen remain in the districts principally visited or occupied by them, where a nomenclature of Scandinavian origin is prevalent. Among the maritime examples are, *firth*, an estuary—Dornoch Firth, Solway Firth; and *ness*, a promontory—Tarbet Ness, Winterton Ness, of which the Naze, in Essex, is only an altered form. Inland sites have *dale*, a valley, frequent in the south of Scotland and north of England, ranging towards the midland counties—Tweeddale, Teesdale, Dovedale, and Dale Abbey; *fell*, a

mountain—Sea Fell, Cross Fell, Fountain's Fell; and *force*, a waterfall—Mickle Force on the Tees, Scale Force on a small Cumbrian stream. In the names of inhabited places, the occurrence of *toft*, a field, as Lowestoft, points to a Danish origin; but the instances of its use are limited, amounting to only twenty-two times in England, while absent entirely from Wales. A far more general terminal is *by* or *bigg*, signifying originally a single farm or dwelling, and then extended to a town, as Whitby, Derby, Denbigh. It occurs 195 times in Lincolnshire, 160 in Yorkshire, 63 in Leicestershire, and 42 in Cumberland, or altogether 570 times in England, and 8 in Wales, but not once in the counties of Middlesex, Berks, Oxford, Buckingham, Herts, Hants, Surrey, Sussex, Wilts, Dorset, Devon, Hereford, Worcester, Salop, Bedford, Huntingdon, Cambridge.

In the designation of inhabited places, names of Anglo-Saxon birth vastly predominate, and are most widely diffused, but are rare in Cornwall, Wales, the west and extreme north of Scotland. They include *hurst*, a wood—Chiselhurst, Peshurst; *ford*, the point of passage over a stream—Oxford, Brentford; *stead*, a station—Grimstead, Wanstead; *lea* or *ley*, a plain—Finchley, Bromley; *worth*, a manor—Isleworth, Handsworth; *burgh*, *burgh*, or *borough*, a regularly constituted or fortified town—Edinburgh, Gainsborough. Far more common is *ham*, a home—Waltham, Farnham. It thus occurs as a terminal 678 times in England, chiefly in the eastern and south-eastern counties, and only three times in Wales, besides being met with as a prefix, as in Hampstead, Hampshire. But *ton*, originally used to denote any enclosed space, or single farm-house, and thence extended to a collection of dwellings, village, or town, has an immense numerical majority of examples. The instances of its occurrence as a terminal, as in Stockton, Burton, Clifton, number 2798 in England, and 78 in Wales. It is most frequent in Yorkshire, and then successively in Cheshire, Somersetshire, Lancashire, the counties of Lincoln, Gloucester, and Wilts. In addition, the word *ham* forms a compound with *ing*, son of, or descendant, as in Rockingham, 'the home of the family of the Rock,' instances of which are not included in the above enumeration. Nor are those reckoned in which *ton* enters into the same combination, as in Bridlington, Islington. The information upon which the preceding statements are founded is derived from an unattractive but instructive table appended to the Census Returns of the year 1851, entitled 'Common Terminations of the Names of Places in England and Wales.'

The area in which Celtic blood at present prevails to a greater or less extent, though only comparatively pure in general, embraces Wales, Cornwall, the Isle of Man, the Highlands of Scotland, its Western Isles, and great part of Ireland, especially the west and south. In this region, the extant dialects of the Celtic stock are the Welsh, the Manx, the Gaelic, the Erse or Irish, but all declining rapidly as vernacular modes of speech; and a comparatively slender form, a volatile temperament, a quick perception, with a want of caution, providence, and perseverance, distinguish the purest representatives of the race. Another dialect, the Cornish, closely allied to the Welsh, formerly spoken in Cornwall and the adjoining part of Devon, stood its ground till the period of the Reformation, when the service of the church in English being introduced, the old language began gradually to give way before it. Carew, writing at the commencement of the seventeenth century, states, that though English was then generally understood, some of the people would affect ignorance of it, and reply to the question of a stranger, *Mee a navidra couza Sawzneck*, 'I can speak no Saxonage.' In villages towards the south-western extremity of the county, the Cornish was spoken in the reign of Queen Anne. It lingered longest in the neighbourhood of Mousehole, between Penzance and the Land's End, and was not finally blotted from the list of living languages till the middle of the last century. Specimens remain both in manuscript and print. The inhabitants of Cornwall now speak a remarkably pure English.

The region of Teutonic blood, more or less pure, derived from the immigrant Germanic and Scandinavian tribes, includes England generally, the Lowlands of Scotland, the maritime portion of its northern counties on the eastern side, the Orkneys and the Shetlands, with the north-east and east of Ireland. Great bodily strength distinguishes the people of the purest blood, with a disposition more inclined to the grave than the gay, a reserved manner to strangers, a slow but accurate perception, a preference of the useful to the brilliant, a strong desire for personal and political independence, a love of enterprise, and a common predilection for maritime occupations. The languages are the English, based upon the Anglo-Saxon; and the Lowland Scotch, a parallel and sister-dialect, derived from the same source, but marked with Norse or Scandinavian features,

now rapidly giving way to pure modern English. The Anglo-Saxon is believed to have been formed out of the respective dialects of the Jutes, Angles, and Saxons, when they became consolidated as one people in a common monarchy. It was spoken in its purity from the age of Alfred to the Norman Conquest, and was one of the earliest cultivated languages of modern Europe, made the vehicle of written laws, poetry, and history, before a single line had been penned in Italian, French, or Spanish. After the Conquest, it underwent a change to Semi-Saxon, influenced by that event, with various other causes; and subsequently passed through the successive stages of Early English and Middle English, into the beautiful and copious, but composite mother-tongue of the great mass of the population, which has gathered its vocabulary from almost every nation under heaven, and is now spoken in different countries by more than 50,000,000 of the human race. 'Not one hour of the twenty-four,' remarks an exponent, 'not one round of the minute-hand of the dial is allowed to pass, in which, on some portion of the surface of the globe, the air is not filled with accents that are ours. They are heard in the ordinary transactions of life; or in the administration of law—in the deliberations of the senate-house or council-chamber—in the offices of private devotion, or in the public observance of the rites and duties of a common faith.'

The Land's End, Cornwall.

Cornwall and Devonshire Coasts.

## CHAPTER II.

### ENGLAND AND WALES.

OUTH BRITAIN, comprehending England and Wales, by far the largest and most populous division of the island, is separated from the northern part, or Scotland, mainly by the lower course of the Tweed, the line of the Cheviot Hills, and some small streams which fall into the Solway Firth. In other directions the frontier is formed by the North Sea on the east, the English Channel on the south, the Irish Sea on the west, and the Atlantic on the south-west. While the coast-line is not so minutely varied as that of the northerly portion, it presents an almost uninterrupted series of curves, bays, estuaries, and headlands, but is the most irregular, and at the same time the boldest, on the western side. The more considerable inlets and projections on the east are the Wash, the estuaries of the Thames, the Humber, and the Tees, with the rounded protuberance formed by the county of Norfolk, the tapering Spurn Point, and the far-advancing promontory of Flamborough Head in Yorkshire. The shore is generally high and rocky to the

northward, but through the greater part of its extent southerly, low walls of chalk or clay form the strand, with flat marshy lands, and occasional sandy downs, where the spires or towers of churches are frequently the only distinguishable landmarks to the seaman. Its prime defect is the want of really good harbours, and the occurrence of shoals and sandbanks, which have often been the scenes of grave maritime disasters. On the south coast, the lowest and highest points are within the limits of Kent and Sussex, where Romney marsh, reclaimed from the sea, is preserved from submergence by an artificial embankment, and Beachy Head, nearly midway between Hastings and Brighton, formed of chalk-cliffs which overhang the beach, and are occasionally dislodged, rises upwards of 550 feet. The shore becomes extremely sinuous towards Hampshire, and forms the inlets of Portsmouth Harbour, Southampton Water, Studland, and Weymouth Bays, with the three broad openings of West Bay, Plymouth Sound, and Mount's Bay, each of which has minor indentations, and exhibits prominent headlands. The west coast, besides the deep and expanded Bristol Channel and Cardigan Bay, has the most extensive inlet of the sea within the circuit of the kingdom, formed between North Wales and South Scotland, containing the estuaries of the Dee, the Mersey, and the Ribble, with Morecambe Bay and the Solway. The finest shore scenery belongs to the north of Devon and Cornwall, and to Caernarvonshire, where the Snowdonian mountains advance to the water's edge, and rise almost perpendicularly from it to the height of 1500 feet.

The greatest extent of England, north and south, coincides with the meridian of  $2^{\circ}$  west, which intersects the country centrally from Berwick-upon-Tweed to St Alban's Head in Dorsetshire. The distance between these places measures 363 miles. This meridian, in its northerly extension, only touches the mainland of Scotland at its angular eastern extremity, and passes between the Orkneys and the Shetlands, Norway and the Farøe Isles. In the opposite direction, it intersects the peninsular part of Western France, the east of Spain, Western Africa, and passes eastward of the island of St Helena. A direct line drawn from south-west to north-east, connecting the Land's End in Cornwall with Winterton Ness in Norfolk, closely corresponds in length to the measurement north and south. The breadth, due east and west, attains its maximum near the parallel of  $52^{\circ}$ , and amounts to 280 miles, between the coast of Essex and that of Pembrokeshire. But owing to the deep estuaries on the eastern and western shores being frequently opposite to each other, or nearly so, as those of the Thames and the Severn, and the Humber and the Ribble, the contraction is very considerable at these points, and dwindles to little more than sixty miles between the outlets of the Northumbrian rivers and the head of the Solway. Further north, the width narrows till it finally becomes almost a point at Berwick.

Bold and rugged features are conspicuous on the western side of the country, and appear through its whole extent from north to south, subject only to a few interruptions, and making a close approach towards the central districts. They consist of elevated heathy moors, with rounded masses rising above the general level, where stone walls often take the place of hedgerows; and of properly mountainous tracts in the form of ranges and groups. Four distinct regions are thus constituted—the Pennine chain, the Cumbrian or Lake group, the Cambrian or Welsh ranges, and the south-western highlands.

The Pennine chain starts from the Scottish border, and is a continuation of the Cheviot Hills, the highest point of which, distinctively called the Cheviot, 2668 feet in elevation, is within the limits of Northumberland. From the western extremity of these hills, the range has a southerly course of upwards of 200 miles. It terminates in the central part of Derbyshire, thus advancing through the northern counties towards the

midland; and is locally styled, from its longitudinal extent, the 'backbone' of England. There is no well-defined continuous ridge, but a succession of high moors, from ten to thirty miles broad, upon which mountainous masses are irregularly interspersed. One material depression occurs, formerly traversed by the Roman Wall, now available for the passage of the Newcastle and Carlisle Railway. Several heights in the west of Yorkshire are considerably above 2000 feet; but the loftiest is in Cumberland, near its

Limestone Rocks, Dovedale.

convergence with the counties of Westmoreland and Durham. This is Cross Fell, the summit of which rises to 2927 feet above the sea, and long retains the winter's snow, feeding the South Tyne and the Tees, both of which have their sources on the eastern slope. The Pennine chain forms the great water-shed of the north of England, dividing the rivers which flow westerly to the Irish and easterly to the North Sea. It is entirely composed of rocks belonging to the carboniferous system, the mountain limestone, and millstone grit; and is remarkable for its picturesque dales, with numerous and extensive cavern formations.

The Cumbrian mountain group, though connected with the preceding range, is geologically distinct, rises higher, and has an entirely different and much grander character. It overspreads the south of Cumberland, a portion of Westmoreland, and a small part of the north of Lancashire, having an extent of about thirty-five miles from east to west, and the same from north to south, where the expansion is the greatest. Slate, rocks are the main constituents, steep, bold, and angular, well clothed with wood, and with the finest greensward on the lower slopes, associated with clear lakes in the long narrow valleys, and with numerous waterfalls, forming a combination of scenery which annually attracts a crowd of summer visitors. Sca Fell, in Cumberland, the principal elevation, has two summits separated from each other by a deep chasm, and differing but little in their height. The loftiest, styled the High Man, 3229 feet above the sea, is the highest point of England, from which the whole western coast may be seen stretching

from the island of Anglesey to the Mull of Galloway. Not a blade of grass appears at the top, but there are tufts of crisp brown moss, and splendidly-coloured lichens. Helvellyn, but little lower, 3055 feet, is much larger in bulk, yet is so closely invested with huge neighbours that there is scarcely a point of view from which the eye can embrace its full proportions. Skiddaw, the third in elevation, 3022 feet, is the most imposing member of the group, as it is so far isolated that the entire mass can be seen at once from base to summit.

The Cambrian Mountains, so called from the ancient name of Wales, consist of several ranges which occupy a large area of the principality, and are more or less connected, composed chiefly of rocks belonging to the Upper and Lower Silurian series. The principal chain is the Snowdonian in the north-west, which runs about twenty-four miles across Caernarvonshire, by an average breadth of eight miles, and contains the culminating-point of Britain south of the isthmus between the friths of the Clyde and the Forth. This is Snowdon proper, the 'snow-clad hill,' forty miles in circuit at the base, with three summits, the loftiest of which, called Wyddfa, the 'conspicuous summit,' attains the height of 3590 feet. There are several subject heights near, which, though giants of lesser growth, are not much inferior to the monarch. Cader Idris, to the southward, in Merionethshire, belonging to another range, has an altitude of 2959 feet. Plinlimmon, further south, at the head of a third, 2481 feet, is distinguished by its vast size, being also a remarkable hydrographical point, giving birth to five rivers, the Severn, the Wye, the Rheidol, the Llyffnant, and the Clevedoc. In South Wales, the principal range, in one part of its course, has the name of the Black Mountain, or Forest Fawr, from the dark appearance of the heather, when out of blossom, with which extensive tracts are clothed. The greatest height here is attained by the Beacons of Brecknock, which rise to 2862 feet, near the town of Brecon, formerly used as a station for fire-signals in the event of an enemy appearing. Outliers of the Welsh mountain-system appear in the English border districts, as the Wrekin, the Clee and Caradoc Hills, in Shropshire, with the Malvern Hills on the dividing-line between the counties of Hereford and Worcester. The latter are a short narrow ridge of moderate elevation, with a beautiful outline, and a rich appearance, forming one of the finest boundaries of the valley of the Severn on the western side.

The south-western highlands consist of a series of ranges and plateaus bordering on the estuary of the Severn and the Bristol Channel, and extending through the counties of Devon and Cornwall. They include the oolitic Cotswold Hills, in Gloucestershire, on the eastern slope of which the Thames has its principal source, named after the numerous sheep-cots upon them in former times; the Mendips, in the north-east of Somerset, chiefly of mountain limestone, with a flat summit, and rapidly sloping sides; the Quantock Hills and the Blackdowns, in the same county, forming the northern and southern boundaries of the vale of Taunton; the high tracts of Dartmoor and Exmoor in Devon; and some granitic heights irregularly distributed through Cornwall. Several points closely approach the altitude of 2000 feet, but only one exceeds it, Yes Tor on Dartmoor, 2050 feet, an elevation which no other part of England attains to the south of Yorkshire. Dartmoor is an extensive plateau, more than twenty miles across, lying between Exeter and Plymouth, bleak, woodless, and extremely wild, broken into numerous knolls, on many of which are blocks of granite of enormous dimensions, provincially termed *tors*, while intersected with rapid streams, torrent-like after heavy rains. Exmoor, in the north of the county, extending into Somersetshire, has similar features, and culminates in Dunkerry Beacon, 1688 feet. The Brown Willy, the loftiest of the Cornish heights, does not reach that altitude.

High grounds, not included in the preceding regions, are the eastern moorlands of Yorkshire, chiefly of oolite, which terminate on the shore in bold headlands; and the two chalk-ranges which diverge eastwardly from Wiltshire, and traverse the southern counties. The South Downs run through Hampshire into Sussex, gradually nearing the coast, and protecting it from cold north winds, extending to Beachy Head, where they meet the waters of the Channel. They are cut by transverse valleys into separate masses, have a remarkably smooth rounded outline, exhibit great bay-like openings, and are clothed with the short sweet herbage which renders them famed as a sheep-walk. The North Downs stretch through the north of Hampshire, intersect Surrey and Kent, terminating in the cliffs beyond Dover. The Inkpen Beacon, near the converging points of Wilts, Hants, and Berks, rises 1011 feet, and is the highest mass of chalk in the kingdom. A third chalk-range runs from the Thames, through Oxfordshire, Bucks, and Herts, under the name of the Chiltern Hills, and proceeds north-east to the coast of Norfolk, but with a greatly declining elevation.

The whole of the central and eastern districts of England, with large tracts in the northern, western, and southern counties, and portions of the Welsh principality, have a surface diversified occasionally with bluff hills, but more generally exhibiting gentle knolls and broad river-valleys, in connection with some entirely level lands. These form the country of the hawthorn-hedge, the daisied mead, and shaded homestead, in which

‘Corn-waving fields, and pasture green, and slope  
And swell alternate.’

The greatest extent of level land lies around the shores of the Wash. This is the district of the Fens, so called from the meres and marshes with which it was formerly overspread, now one of the most productive parts of the country, though unfortunately held by a somewhat precarious tenure. It comprehends portions of the counties of Lincoln, Norfolk, Cambridge, Huntingdon, and Northampton, but chiefly belongs to Lincolnshire; extends about fifty miles from north to south, by from twenty to thirty in the opposite direction; and embraces an area of 700,000 acres, where hedges are scarce, trees rare, the roads straight, drains and embankments multitudinous, while steam-engines for the movement of hydraulic machinery abound. By such means a vast area has been recovered from submergence; and their continued action is necessary to prevent the return of the flooding, owing to the region being below the high-water level of the Wash, while its flatness is opposed to a sufficient outfall for the numerous rivers.

From the principal highlands running north and south, while occupying a westerly position, it follows that the general slope of the country is from west to east, in which direction the more important rivers are formed, flowing to the North Sea, with the exception of the Severn. In the order of magnitude of their basins, they rank as follows:

| Rivers.        | Area of Basin<br>in Sq. Miles. | Length.<br>Miles. | Termination.     | Rivers.     | Area of Basin<br>in Sq. Miles. | Length.<br>Miles. | Termination.     |
|----------------|--------------------------------|-------------------|------------------|-------------|--------------------------------|-------------------|------------------|

| Tyne, . . . .  | 1100                           | 80                | "                | Towy, . . . | 506                            | 70                | Bristol Channel. |
| Witham, . .    | 1050                           | 70                | "                |             |                                |                   |                  |

The Humber includes the minor basins of the Trent and Yorkshire Ouse; the Severn comprises those of the Wye, Bristol Avon, and Usk; and the Thames that of the Medway.

The Humber is the largest not only of English but of British rivers in the area of its basin, though the name has a very restricted application, being confined to the estuary in which the Trent and Ouse unite their waters, thirty-five miles long, and from two to five miles broad, narrowed at its confluence with the sea by the projection of Spurn Point. The Severn has the greatest length, following a very circuitous route from its head-spring on Plinlimmon, which renders the distance by the channel about twice the direct distance from source to mouth. But the Thames is commercially the most important river on the face of the globe, and surpasses all others in the amount of wealth on its surface and banks. Its source is at Seven Springs, on the south-eastern side of the Cotswolds, in Gloucestershire, where there are seven separate outbursts of doubtless the same fountain, in a secluded dell overhung with a luxuriant canopy of foliage. 'The water gushes clear and pure as crystal out of the grassy fountain, and after whirling round a few times, starts off swiftly down the narrow stony channel it has scooped out for itself.' Under the name of the Churn, the stream flows to Cricklade, where it receives an affluent, and becomes the Thames, a border river through the remainder of its course, dividing the counties of Oxford and Bucks from Berkshire, next Middlesex from Surrey, then Essex from Kent. At London Bridge the river is 290 yards wide; at Woolwich, 490; at Gravesend, 800; at Coal House Point, three miles below, 1290 yards; and at the Nore, six miles. Between Greenwich and London, the depth in the fairway is upwards of twelve feet, while the tides have a mean range of seventeen feet, and an extreme rise of twenty-two feet. In the middle part of its course, the stream is rendered picturesque by little islands, locally called *aits*, occurring singly and in clusters, sheltering the water-hen and some tame swans. The general character of the current is accurately described in the couplet:

'Though deep, yet clear; though gentle, yet not dull;  
Strong without rage; without o'erflowing, full.'

Of all our rivers, the Thames has been historically known the longest. It was crossed by Julius Cæsar, at a point commonly believed to be near Chertsey, in Surrey, where the name of Conway Stakes is supposed to commemorate the stakes which the Britons drove into its bed to prevent the passage of the legions. One of its affluents, the Lea, which joins it in the neighbourhood of the East India Docks, was, in the time of Alfred, made part of the boundary between his dominions and the Danelagh, or the territory occupied by the Danes.

The Mersey, though of inconsiderable length, expands into a fine estuary, and ranks the second as a commercial water-way, forming the port of Liverpool. It receives the Irwell from Manchester, and the two have been aptly styled the 'hardest-worked rivers in the world,' flowing through the cotton manufacturing districts. The Tyne, Wear, and Tees are of vast importance in the lower part of their course as coal-shipping rivers, while connected with very striking scenery in their upper parts. The streams remarkable for their flow through wild, picturesque, and beautiful landscapes, include the rapid Wharfe, an affluent of the Yorkshire Ouse; the Dove, in Derbyshire, associated with Izaak Walton, his disciple Cotton, and Sir Humphrey Davy; the Welsh Dee, in its passage through the vale of Llangollen; the Wye, from its mouth into Herefordshire; the Towy, in South Wales; the Tamar, belonging equally to Devon and Cornwall; and the Duddon, celebrated by Wordsworth, with the Eden, Lune, and Derwent, during their passage through the Cumbrian Mountains. The latter district is the only part of England in which lakes, properly so called, are formed, all comparatively small, but numerous, occupying glens in the highlands, and possessing great scenic attractions. Windermere,

the largest, is nearly eleven miles long, and from one to two broad. Next in extent are Ullswater, Coniston-water, Derwentwater, and Bassenthwaite-water, mostly long and narrow, or oval-shaped expanses. Wales has only examples of any size in Bala Pool, on the course of the Dee, and the shallow Brecknock Mere, near the town of that name.

The superficial area of England amounts to 50,922 square miles, and that of Wales to 7398, making a total of 58,320 square miles. With the exception of a few tracts, the whole country consists geologically of sedimentary rocks, generally rich in organic remains, animal and vegetable, but of various ages, different mineral character, and diverse fossils. Passing from east to west, or from the coast of Suffolk to that of Pembrokeshire, and from south-east to north-west, or from the shores of Kent to those of the Solway Firth, all the great fossiliferous systems known to geologists are encountered in regular succession, with nearly all the subordinate members belonging to each group, containing those mineral masses which are best adapted to supply the wants and stimulate the energies of mankind. A line drawn from the mouth of the Exe in South Devon to Bath, and thence continued with moderate curvatures by Gloucester, Leicester, Nottingham, and Tadcaster to Stockton-upon-Tees, divides the surface into two principal sections differing in their natural aspect, geology, and social features. East of the line is an undulating region of the more recent secondary formations, largely oolitic and cretaceous, with tertiary strata; and on the western side is a district of hills and mountains, composed of the older secondary, transition, and primitive rocks. The same line separates generally the mining and specially manufacturing districts from the eminently agricultural, for all the coal deposits, with the metalliferous ores, except iron, lie to the westward of it. Including small detached tracts, seventeen distinct coal areas may be enumerated, five of which are of great national importance. These are the fields of Northumberland and Durham, the longest worked, that of Yorkshire and Derbyshire, of South Lancashire, South Staffordshire, and South Wales, the latter the least worked and the largest, embracing an area of 900 square miles. There are 1880 collieries in England and 310 in Wales, yielding a total produce exceeding 60,000,000 tons annually, in connection with which vast quantities of iron ore are raised from the coal-bearing strata, and smelted at the surface. Oxides and silicates of iron are also very abundant in the greensand of the cretaceous system, in the Weald of Kent, Surrey, and Sussex. This district, now a region of quiet sylvan scenes, was the great seat of the iron manufacture in the age of the Plantagenets, Tudors, and Stuarts, while wood converted into charcoal was alone used in the process of smelting. The first cannons cast in England were made at Buxted in Sussex, in the reign of Henry VIII.; and the balustrades around St Paul's Cathedral came from Lamberhurst furnace in the same county. Upon mineral fuel being substituted for wood, the manufacture was transferred to those localities where pit-coal and iron ore are in close proximity. Tin is almost exclusively found in Cornwall, where it occurs both as vein-tin traversing the granite and slaty rocks, and is obtained by regular mining, and as stream-tin in the superficial deposits of valleys and low grounds, from which the metallic particles are separated by washing, or stream-works. Cornwall also yields the largest supply of copper, but it is wrought in Devonshire, Staffordshire, Glamorganshire, and the Isle of Anglesey. Lead is procured in Devonshire, North Wales, and Derbyshire, but the most productive mines are in the high moorlands towards the convergence of the northern counties, Northumberland, Cumberland, and Durham. Owing to the immense amount of mineral wealth annually extracted from the soil, especially of coal, which is constantly and rapidly increasing, it becomes a highly-important and interesting question, How long will the supply last? Only a very dubious answer can be returned; yet it is satisfactory to know in general, that the time for nervous apprehension respecting its

failure is yet far distant, though it may become a costly article at a much earlier date, owing to the great waste which occurs at the pit's mouth, and to the enhanced price of production caused by the necessity of going to greater depths, and of opening more extensive workings.

In the variety, extent, and value of its manufactures, England surpasses every other country, while the products have a high character for excellence in all the markets of the world. This eminence is the joint result of moral, political, and physical causes. Much is undoubtedly due to the practical temperament and energy of the people, along with the mechanical genius of individuals. But the security attending the accumulation of property under a government which respects its rights, enters into the solution of the problem, as well as that immunity from foreign invasion which is the consequence of an insular position. At various times, skilled artisans have flocked to these shores in great numbers from the Netherlands and France, to escape from civil or religious oppression, and have introduced new industrial pursuits, or given the benefit of their experience and knowledge to existing handicrafts. But one of the main causes of the superiority is the possession of the vast mineral stores referred to—the natural implements of manufactures—with a convenient highway in the surrounding ocean along which to receive the raw material of other nations, and return the products of industry in their manufactured form.

England is divided into forty counties or shires of very varying dimensions, and Wales into twelve. With the exception of eight formed by Henry VIII., the other English counties were familiarly known in the Saxon age; but the date and circumstances of their origin are quite uncertain, though some very probably arose out of older divisions of the country, without precisely corresponding to their limits. Thus, Kent in general represents the first founded of the small Saxon kingdoms, as well as the old British principality of the Cantii. The word 'shire' is of Saxon origin, and denotes a share or division; while 'county' is derived from the counts or earls by whom the government of certain districts was originally administered, who had the Latin title of *Comes*. In the later Roman age, there was a Count of the Saxon shore in Britain, *Comes littoris Saxonici per Britanniam*, whose duty it was to superintend the eastern and south-eastern coasts, upon which some of the Germanic tribes had already then settled.

Most of the counties are distributed into *hundreds*, a minor division of long standing, being mentioned in Domesday Book. The name is supposed to refer originally to a hundred heads of families, and to have acquired a fixed territorial meaning owing to population being a fluctuating element. In the four northern counties, Northumberland, Cumberland, Westmoreland, and Durham, the subdivision is into *wards*, in allusion doubtless to the obligation of the inhabitants of the border districts to keep 'watch and ward' against the incursions of their northern neighbours. In Yorkshire, Lincolnshire, and Nottinghamshire, the corresponding subdivisions are styled *wapentakes*, a term said to be derived from the usage observed by the followers of a chieftain at his installation, who touched his *weapon* planted in the soil as a token of allegiance. Yorkshire has, besides, a special distribution into three large portions, called *ridings*, or more properly *thriflings*. Kent and Sussex have also similar intermediate sections, of five *lathes* in the former, and six *rapes* in the latter, both with subordinate hundreds. For ecclesiastical purposes, the division of the country is into two archiepiscopal provinces, that of Canterbury with twenty bishoprics, and that of York with six. The parochial distribution is into upwards of 18,000 parishes, and is as old as the tenth century. Large tracts of the surface still retain particular denominations, some of which allude to a physical condition which has wholly or for the most part passed away, and others to ancient

feudal divisions, as the Weald or woodland of Kent, Surrey, and Sussex; the Isle of Ely, in the north of Cambridgeshire; the Isle of Axholme, in the north-west of Lincolnshire; the peninsular district called Holderness in Yorkshire; Cleveland and Craven in the same county, with Hallamshire, which includes Sheffield and a portion of the neighbourhood.

High and Low Level Bridges,

For the purpose of detailed description, the counties may be conveniently arranged in groups, consisting of six northern, five north-midland, five western, five eastern, nine south-midland, ten southern, and twelve Welsh. In each of the lists given, the names of the county towns are placed first.

I. NORTHERN COUNTIES.

| Counties.                  | Area in Sq. Miles. | Principal Towns.  |
|----------------------------|--------------------|---|
| Northumberland, . . .      | 1952               | Newcastle, Tynemouth, North Shields, Morpeth, Alnwick, Berwick.                   |
| Durham, . . . . .          | 973                | Durham, Sunderland, Gateshead, South Shields, Stockton, Darlington, Hartlepool.   |
| Cumberland, . . . .        | 1564               | Carlisle, Whitehaven, Cockermouth.  |
| Westmoreland, . . .        | 758                | Appleby, Kendal.  |
| Lancashire, . . . .        | 1905               | Lancaster, Liverpool, Manchester and Salford, Preston, Bolton, Oldham, Blackburn. |
| Yorkshire, North Riding, } | 5983               | York, Scarborough, Whitby, Middlesborough, Richmond.                              |
| " East Riding, }           |                    | Hull, Beverley, Bridlington.  |
| " West Riding, }           |                    | Leeds, Bradford, Huddersfield, Halifax, Sheffield, Wakefield.                     |

This portion of the country, with the exception of the larger part of Northumberland, formed in the time of the Romans the sub-province of *Maxima Caesariensis*. Along its northern border, from the Tyne to the Solway Firth, ran the Roman Wall, nearly seventy miles in length, fortified with military stations, castles, and watch-towers, of which numerous and massive remains are extant. The village of Wallsend, just below

Newcastle-on-Tyne.

Newcastle, so well known by name from the vast quantity of 'Wallsend coal' sent to London, commemorates the rampart, and marks the site of its eastern terminus. In a later age, Northumberland, Durham, and Yorkshire formed two of the original Saxon kingdoms, *Bernicia* and *Deira*, till both merged in the single state of *Northumbria*, which extended along the eastern side of Scotland, up to the Firth of Forth, and preserved an independent existence to the commencement of the ninth century. The other three counties, Cumberland, Westmoreland, and Lancashire, formed the contemporary British kingdom of *Cumbria*, sometimes united with *Strath-Clyde*, or the west of Scotland up to the Firth of Clyde; and they were not incorporated fully in the monarchy of England till some time after the Norman Conquest.

**NORTHUMBERLAND**, the most northerly county, extends along the coast from the mouth of the Tyne to a little beyond that of the Tweed, so as to include the town of Berwick, which was formerly considered a neutral spot, not belonging to either England or Scotland. The round-topped Cheviot Hills appear on the north-west, clothed with beautiful green verdure, affording pasture for an excellent breed of sheep. But other high

grounds on the western side are dreary moorlands, covered with heath, peat, and morasses, some of which are the seat of important lead-mines. In the lowland districts, towards the coast and on the south, arable husbandry is prosecuted with success; but the prime industrial features of the county are connected with the great coal-field, continuous with that of Durham, which stretches twenty-five miles northward from the Tyne, has a breadth of eighteen miles from the sea, and dips to an unknown extent beneath its waves. The small streams are the Blythe, Wansbeck, Coquet, Aln, and Till, the latter an affluent of the Tweed. Off the mouth of the Coquet, is the little isle of that name, a tract of rich pasture, once the site of a fortress, now of a light-house. The river has Warkworth hermitage on the north bank, a secluded and highly-picturesque spot, founded at an uncertain date for a single hermit, the subject of a well-known ballad by Dr Percy. Holy Island, on the north part of the coast, two miles distant, but accessible by vehicles at low water, obtained its name from being a celebrated ecclesiastical site at an early period, the seat of a bishopric, finally transferred to Durham. It has a circuit of about nine miles, is occupied by fishermen, and contains imposing ruins of a priory church—

‘A solemn, huge, and dark-red pile,  
Placed on the margin of the isle.’

On the south-east, nearly opposite the basaltic headland of Bamborough Castle, are the Farne and Staples islets, seventeen in number, forming two groups, inner and outer. The largest contains about twelve acres. The down of the eider-duck, a winter-visitor, is obtained here in considerable quantities.

The town of *Newcastle*, ten miles from the mouth of the Tyne, extends upwards of two miles along the north bank; and has *Gateshead* opposite, a separate borough in Durham, but really a suburb, with which communication is maintained by a magnificent double bridge, for the accommodation of foot-passengers, ordinary vehicles, and railway transit. Few places have undergone such a complete change in appearance during the last half-century, amounting to a total reconstruction of a large portion of it in a very superior style. Though coal-shipping is the principal industry, sent coastwise and overseas, there are glass, earthenware, oil, lead, and chemical works, with engineering establishments, carried on upon a vast scale. The coal-trade has been in existence upwards of six centuries, as a grant relative to the right of digging for coal is dated in the year 1239, the reign of Henry III. *Newcastle* has its name from a castle built upon the site of an old fortress by Robert, son of William the Conqueror, the massive square keep of which still remains, and is a striking object in every point of view, being on rising-ground. The list of natives contains the names of Lords Eldon and Stowell, brothers and jurists, Admiral Lord Collingwood, Akenside the poet, and Hutton the mathematician. *Bewick*, the reviver of wood-engraving, was born in the neighbourhood, and long a resident, with the two Stephensons, father and son, in whose locomotive factory here the Rocket engine was constructed, which afforded the first example of great speed being attained with a heavy railway train. *Tynemouth*, as the name imports, is at the mouth of the river, frequented as a watering-place, and has a striking appearance on being approached by sea, owing to the numerous shipping outward and homeward bound, with its peninsula of stupendous rocks, crowned by a light-house and fine remains of an ancient priory. It forms a single town with *North Shields* by proximity, and for parliamentary purposes. At *Morpeth*, inland on the Wansbeck, the largest cattle-market in the north of England is held weekly, chiefly supplied with stock from the southern districts of Scotland. Further north, *Alnwick*, on the Aln, claims attention from its castle on the opposite bank of the stream, one of the seats of the Dukes of Northumberland, completely renovated at a recent date, and now exhibiting a model of a baronial residence in the days of border chivalry. *Berwick*, near the mouth of the Tweed, on the north bank, surrounded by walls, is the frontier town of England in this direction towards Scotland, and was of great military importance when the two kingdoms were separate. The river is here crossed by the Royal Border Bridge, a viaduct of twenty-eight noble arches, one of the finest structures of the railway age, opened by the Queen on her way to the Highlands in 1850. The principal trade of the town is the export of salmon caught in the Tweed, sent chiefly to London packed in ice. *Hexham*, near the junction of the north and south branches of the Tyne, the seat of an episcopate in early times, retains a memorial of its former ecclesiastical distinction, in a large abbey-church, used as the parish church, with other relics of monastic buildings. On the high western moors, where the winter's snow drifts deep and lies long, the hamlet of *Allenheads* is the centre of the populous lead-mining district of *Allendale*, where the residence of the overseer, 1400 feet above the sea, is said to be the highest inhabited house of its magnitude in Great Britain. In Northumberland, near the foot of the Cheviots, the fatal battle-field of *Flodden* is indicated, with that of *Otterburn*, which is commonly identified with the *Chevy Chase* of border minstrelsy.

DURHAM is the county immediately to the south. It extends from the Tyne to the Tees, and from the sea to the mountains and moorlands of the Pennine range. It has a large proportion of high, rugged, and heathy surface, but the valleys are fertile, and the great northern coal-field stretches through nearly its whole extent along the coast. Besides the border-rivers, the Wear intersects it somewhat centrally from west to east, and separates in the middle and upper part of its course the district of Weardale Forest on the north, from that of Teesdale Forest on the south, both of which are now bare of trees. The latter district is celebrated for its breed of short-horned cattle; but the prevailing occupations are connected with the subterranean products, coal and iron. *Durham*, a small episcopal city, occupies a series of rocky eminences, nearly surrounded

Durham Cathedral and Castle, from a Photograph by Dr Holden.

by the Wear, towards the heart of the county. It is distinguished by an ancient cathedral and a modern university. The cathedral, in the Norman style, with Early English insertions, is a singularly grand and massive edifice; and, standing on the loftiest of the summits on which the city is built, it is seen from a great distance, rising high above the horizon. The west front surmounts a steep declivity clothed with trees and gardens, at the foot of which flows the river. From the opposite bank of the stream, the façade and its battlemented towers, with the foliage below, descending to the water's edge, form a very striking picture. Neville's Cross, at a very short distance from the suburbs, on the west, marks the site of a decisive battle in which the Scots were defeated, and their king taken prisoner, while Edward III. was absent on the continent.

*Sunderland*, at the mouth of the Wear, Bishop-Wearmouth adjoining, and Monk-Wearmouth on the opposite bank, form a vast town, where ship-building, the export of coal, and various manufactures are extensively pursued. The river is crossed by a remarkable iron bridge, with a single arch of 237 feet span, and nearly a hundred feet above the surface of the water. Southward of Sunderland lies the largest colliery property in the world in the hands of one individual, a district of 12,000 acres, with an average annual produce of nearly 1,000,000 tons of coal, which the Marchioness of Londonderry brought to her husband as the heiress of the Vane-Tempest family. *Gateshead*, on the Tyne, opposite to Newcastle, corresponds to it generally, but is much smaller, while *South Shields* bears the same relation to North Shields, but is much larger. Between the two is the village of Jarrow, in the parish of which Venerable Bede was born, lived, and died. The southern part of the county contains *Stockton* and *Darlington*, the first places united by a railway for the conveyance of passengers. *Hartlepool*, on the coast, a fishing-port, is the provincial resort for sea-bathing. *Barnard Castle*, an inland town on the Tees, adjoins very striking scenery, extending some miles up the valley of the river, especially at the High or Mickle Force, where, surrounded with steeps and woods, the stream dashes down a perpendicular precipice of seventy feet, forming one of the noblest water-falls in the country.

CUMBERLAND, the most northerly of the English counties on the western side, lies along the Solway Firth and the Irish Sea, extending inland to the Pennine range, the highest point of which, Cross Fell, is comprised within its limits. It includes two principal natural divisions, an extensive plain on the north and north-west, with the rugged tract

Silver How and the Rothay, Grassmere.

mentioned on the east, and the mountains of the Lake district on the south. Sea Fell and Skiddaw are in the county, and the mighty Helvellyn on the border towards Westmoreland, whose heights have been given. The other principal elevations are, Great Gavel, 2925 feet; Pillar, 2893; Saddleback, 2787; Grassmere, 2756; Red Pike, 2750; and Grisedale Pike, 2680 feet. The lakes are Derwentwater, Bassenthwaite, Thirlmere, Buttermere, Crummock Water, Ennerdale, and Wast Water, with Ulleswater,

larger than any of the preceding, but equally shared by Westmoreland. The chief river is the Eden, which, after winding through the highlands, intersects the great plain, and discharges in the Solway. It affords one of the very few examples in England of an important river flowing mainly in a northerly direction. Next is the Derwent, remarkable for its limpid water and beautiful scenery, which carries to the sea the drainage of several lakes. But with the Duddon, which forms the border from Lancashire, it has no navigable value, both being almost entirely mountain-streams. The climate is extremely humid, the Lake region being one of the rainiest districts in Europe. At Whitehaven, on the coast, the average annual rainfall amounts to 52 inches; at Keswick, in the heart of the mountains, to 70 inches; and at Seathwaite, on Derwentwater, the extraordinary quantity of 140 inches has been registered. In consequence of this excessive moisture, the farmers attend chiefly to stock-husbandry, green crops, and dairy produce. The minerals are lead, coal, iron, plumbago, and slates. The principal lead-mines are towards the Northumberland border, in the district of Alston Moor, and were part of the estates of the Earl of Derwentwater, confiscated for his share in the Rebellion of 1715, and transferred to Greenwich Hospital.

The episcopal city of *Carlisle*, the 'bonny Carlisle' of border song, occupies a gentle eminence on the south bank of the Eden, and is the seat of considerable manufactures of cottons, woollens, and hardwares. But situated only a few miles from the Scottish frontier, its aspect was in former times that of an important military post, possessing a strong fortress, with embattled walls and gates. Part of the old castle remains, and the whole restored is now a conspicuous object. The names of English Street on the south and Scotch Street on the north, connected thoroughfares, indicate the position of the place, bordering the two countries. Equally prominent is the cathedral, standing on the highest ground within the city, a venerable edifice, containing the remains of the celebrated Paley. Carlisle sustained one of the most memorable sieges in our history, when held by the Royalists during the great civil war, an interesting narrative of which is among the Harleian manuscripts in the British Museum, written by a citizen. It commenced in October 1644, and lasted till June 25th of the following year, when famine enforced a surrender. *Whitehaven*, *Workington*, and *Maryport* are seaport towns, from which large quantities of coal are shipped to Ireland, and iron ore to South Wales. Around Whitehaven the coal is obtained from mines excavated under the town, and at other points they extend to a considerable distance beneath the sea. Fatal accidents have occurred from the irruption of the superincumbent water. *Cockermouth*, an inland town, at the junction of the Cocker with the Derwent, is distinguished as the birthplace of the poet Wordsworth. *Keswick*, the head-quarters of many Lake tourists, is beautifully situated in a fertile vale near the foot of Skiddaw, and on the margin of Derwentwater. The manufacture of the so-called black-lead pencils is one of its prevailing industries. The peculiar mineral employed, provincially termed 'wad,' a carburet of iron, of which fine specimens are very rare, is obtained from a mine a few miles to the southward, on the side of a mountain at the head of Borrowdale, but now in an exhausted condition.

WESTMORELAND, with the exception of a small south-western section which reaches the head of Morecambe Bay, is an inland region. It is generally elevated, rugged, and bleak; and contains the lowest average of population of any of the English counties. The mountains of the Cumbrian group appear on the western side, and those of the Pennine chain on the eastern, where the surface is either in natural pasture or under wood, except in the narrow romantic dales which have fertile soil. The Eden, the Kent, and the Lune, have their upper courses in the county; Hawes Water is wholly within its limits; Ulleswater and Windermere are on the western border.

*Appleby*, the smallest county town in England, consists of a single street, with the population of a moderate-sized village. *Kendal*, in the pleasant valley of the Kent, from which the name is derived, is the only place of importance, having a woollen manufacture founded by a colony of Flemish weavers in the reign of Edward III. Its green druggets were for several centuries the ordinary clothing of the lower classes, and became widely known under the name of Kendal-green. *Ambleside*, near the head of Windermere, and *Bowness*, on the eastern shore, depend upon summer excursionists and the neighbouring villas. The lake, about eleven miles long by one broad, is daily traversed by small steamers in the visiting-season, and has quiet beauty for the distinctive features of its scenery. The greater part of its margin belongs to Lancashire. A medicinal spring on the high moorland tract of Shap Fell has rendered one of the dreariest regions in the kingdom a place of considerable resort. Shap Abbey, the remains of which are in a lonely vale, belonged after the dissolution to the ancestors of Hogarth the painter.

LANCASHIRE, the chief seat of the cotton manufacture, extends along the coast of the Irish Sea, and consists of two portions, a small northerly section being detached by the intervention of Morecambe Bay. This isolated tract is the hundred of Furness, also termed 'North of the Sands,' an integral part of the Cumbrian mountain-region. It contains Coniston Water, the third of the lakes in size, with Coniston Old Man, 2577 feet in height, and the small port of Ulverstone. Walney Island, ten miles long, and nowhere more than a mile broad, being very narrow and low, lies off the shore, stretching south-south-east from the estuary of the Duddon. It contains a considerable extent of moss, the remains of an ancient forest. The remainder of the county has a coast-line broken with inlets, through which the Lune, Wyre, Ribble, and Mersey reach the sea; and a surface consisting of sandy maritime flats, numerous peat-mosses, and high grounds towards the

Panoramic View of Liverpool,

Yorkshire border. The prime natural feature of the county is the great coal-field, which ranges in the form of a crescent, from the central to the southern districts, wrought upon an extensive scale for the supply of the manufacturing establishments upon its surface, and the domestic use of the vast population congregated in the locality. Though now more densely peopled than any other part of the realm after Middlesex, and a wonderful theatre of invention and activity, nearly the whole region was once very desolate, where scarcely penetrable forests alternated with moors, either clothed with heather and brush-wood, or presenting a series of marshes and shaking bogs. In the time of James I., the antiquary Camden approached its frontier with dread, and commended himself to the Divine protection on entering its tangled wilds. In the early stages of parliamentary representation, through six successive reigns, the sheriffs made the return that there were no cities or boroughs within its bounds, from which 'any citizens or burgesses ought, or have been accustomed to come to parliament, by reason of their poverty.' Its many great towns and crowded parishes have been formed during the cotton-manufacturing era, and chiefly since the application of machinery and steam-power to production.

*Liverpool*, on the right bank of the Mersey, near the mouth of the river, which forms the harbour, is now second only to the metropolis in point of population. It is the chief port of entry for raw cotton, and of export for cotton fabrics, while carrying on a vast miscellaneous commerce with all parts of the kingdom, and every country of the globe. The public buildings are remarkable for magnitude and architectural execution, while the docks form a chain of basins extending from four to five miles along the river, with a total quay space fourteen miles in length. Seen from the bosom of the broad stream, the view of the forest of shipping, with the flags of all nations flying, with warehouses, churches, and other edifices, is in the highest degree imposing. It might be mistaken by a stranger for the capital of a powerful state, and is indeed excelled by few continental capitals, not merely in size and wealth, but in institutions as well for social and educational improvement, for the promotion of science, literature, and art. A Free Public Library, of recent foundation by one of its 'merchant princes,' has reached an average daily issue of several thousands of volumes. Few things are more surprising than the quick yet solid growth of its commercial greatness, with the increase of its inhabitants. According to the best accounts that can be obtained, the population somewhat exceeded five thousand at the commencement of the last century, and is now rapidly advancing

and the Mersey from Birkenhead.

to half a million. Liverpool shares with Manchester the distinction of having originated the First Grand British Experimental Railway, connecting the two places, opened September 15, 1830. The scheme was contemplated principally to facilitate the transit of raw produce and goods, which was so enormous, amounting to 1200 tons daily, that the canals and road wagons had long been utterly inadequate to accommodate manufacturers and merchants in reasonable time. Passenger traffic was a very subordinate consideration. In the execution of this work, Chat Moss, one of the most extensive and dangerous of the Lancashire bogs, deemed utterly irreclaimable, was drained. It consisted of a covering of long, coarse, sedgy grass and heath, overlying a spongy moss, in some places thirty feet deep, nearly the whole of which has now been turned to profitable account.

In the south-east quarter of the county, *Manchester* and *Salford*, though separate boroughs, form one continuous city, simply divided by the narrow stream of the Irwell, over which numerous bridges are thrown. The population falls slightly below that of Liverpool. Though of ancient date, having been a Roman station, if not an old British settlement, Manchester has no venerable structures, except a collegiate church, which became a cathedral by the constitution of the bishopric in 1847. But it is amply supplied with spacious streets, commodious commercial buildings, literary and benevolent institutes, and public parks, suitable to its character as a great industrial centre, the capital of the cotton-manufacturing district. Factories and warehouses are everywhere prominent. The latter are occasionally superb palatial structures, while the former are simply huge piles of brick studded with multitudinous windows, yet remarkable generally in the interior for cleanliness, ventilation, regulated temperature, and orderly economy. There are upwards of two hundred of the first-class, from five to eight stories in height. Besides cotton-mills; silk, flax, print, and

chemical works are numerous, with brass and iron foundries, and almost every branch of industry is represented. A recent experiment, that of Public Dining Rooms for artisans, promises to be a great social improvement. Manchester has not been connected with many events of historical importance; but the first blood that stained its streets was shed in the contest between Charles I. and the parliament. At the beginning of the Georgian era, it was described by Dr Stukeley as 'the largest, most rich, populous, and busy village in England.' There were then four cumbersome private carriages in the place. Its prosperity is mainly due to the introduction of machinery, and the proximity of a rich coal-field. The first steam-engine was set up in 1790. Dalton, the great chemist, was a native. In the immediate vicinity *Oldham* and *Ashton-under-Lyne* are remarkable for the rapidity with which they have advanced from small hamlets to great municipalities.

The other cotton towns have similar general features; but in a few instances, points of particular interest are attached to them. *Preston*, on the north bank of the Ribble, near the head of its estuary, is of great antiquity, said to have its name, originally *Priests Town*, from the number of religious houses which it once

Lancaster Castle.

contained. Guilds are celebrated every twenty years, when the trades meet, and hold a jubilee. Arkwright, the successful constructor of the water-frame, was a native, and made here his first attempt to improve the machinery. *Blackburn*, to the eastward, produced Hargreaves, the inventor of the spinning-jenny. *Bolton*, is similarly associated with Crompton, a poor weaver, who contrived the mule-jenny, after devoting every spare moment through five years to the task. He then occupied a garret at the Hall-in-the-Wood, an old manor-house, in a retired and beautiful spot, close to the town. During the great civil war Bolton suffered severely, especially when it was taken by storm by the Royalists under Prince Rupert and the Earl of Derby. In remembrance of this, the earl, when captured at the battle of Worcester, was removed to the town, and publicly beheaded. The production of woollen goods is largely combined with the staple manufacture of the county at *Bury* and *Rochdale*, with that of glass and small hardwares at *Warrington*. In connection with the former town, the first Sir Robert Peel made his fortune, and at Chamber Hall, in the neighbourhood, his son, the great statesman, was born. On a lofty adjoining height, commanding an extensive view, a monument to the memory of the latter has been erected. *Wigan*, *Burnley*

and *Staley Bridge* have large artizan populations. *Blackpool*, *Southport*, *Lytham*, and *Fleetwood* are watering-places on the coast, the latter of very recent date, its site having been a rabbit-warren when the age of railways commenced.

*Lancaster*, the county town, towards the north extremity of the county, on the south bank of the Lune, is of little importance in comparison with the hives of industry in the centre and south, but retains a fine feudal castle on a commanding site, which renders it a striking feature in the general view of the town.

YORKSHIRE, the largest county of England, and the third in point of population, lies on the North Sea, between the estuaries of the Tees and the Humber; and has an area exceeding that of the continental kingdom of Saxony. It consists generally of a long

York Minster, from a Photograph by Wilson.

central valley, stretching south-south-east from the northern frontier, and gradually widening till it terminates in a series of extensive and somewhat swampy levels. This valley is bounded by tracts of considerable elevation. Eastward are the York Moors and Yorkshire Wolds, separated by the vale of Pickering; and westward are the Pennine highlands, which rise in Wharfedale, Ingleborough, and Pennine, to the respective heights of 2384, 2361, and 2270 feet above the sea. Nearly the whole drainage of the surface is conducted by the Ouse through the central valley to the Humber. The river has its remotest and principal source at Swalehead, on the mountain of Shunnor Fell, near the border-line towards Westmoreland. It is formed by the junction of the Swale

and Yore below the town of Boroughbridge, and receives on its flow the Nidd from Knaresborough, the Wharfe from Tadcaster, the Aire from Leeds, the Derwent from Malton, and the Don from Sheffield. Tidal water ascends the channel to a lock about four miles below York. Several of the affluents are connected with scenes of great natural magnificence in the upper parts of their course. The county consists of three principal divisions, the North, East, and West Ridings. Agriculture is chiefly pursued in the two former. Manufactures and collieries distinguish the latter. Its coal-field

Scarborough from the Castle.

ranges from the north-east of Leeds southward into the counties of Derby and Nottingham, a distance of more than sixty miles. Iron ore in vast abundance is extracted from it, smelted at the spot, and worked up in great foundry establishments into massive hardwares. In addition to the large local consumption of the coal for this purpose, and for household use, it competes by means of the railways with sea-borne coal in the metropolitan market.

The city of *York*, on the banks of the Ouse, is centrally seated in the great river-valley, at the convergence of the three ridings, but is associated with the northern for electoral purposes. Founded in the earliest historic times of Britain, it was a metropolis under the Romans, where died the Emperors Severus and Constantius Chlorus, and where the son of the latter, Constantine the Great, was born. In the primitive Saxon age, it was the capital of Northumbria, became an archiepiscopal see, acquired continental fame as a seat of learning, possessed a library which had few rivals abroad at the period, and produced Alcuin, the best scholar of his day, the pupil of Bede and the counsellor of Charlemagne. It has since been conspicuous in most of the great epochs and events of the nation's annals, and is now the second city of the kingdom in point of ecclesiastical rank, as the seat of the northern archbishopric. The walls to a considerable extent remain, forming an agreeable promenade; and four principal gates, with a few of the posterns, are extant. The castle, a restoration on the site of the old fortress, used as a prison, contains 'Clifford's Tower' within its enclosure, a memento of the past preserved with the most scrupulous care. But the object of special interest is the minster or cathedral, commenced in its present form in the twelfth century, and completed in the fifteenth, the finest ecclesiastical edifice in the empire. Five miles to the south-west of the city is Marston Moor, where the Royalists were disastrously defeated by Cromwell at the close of a summer day in 1644. A few miles further on, in the same direction, lies the battle-field of Towton, the scene of a murderous conflict during the Wars of the Roses, fought in a snow-storm on Palm Sunday 1461. Small

agricultural towns are numerous in this division of the county, some of which, as *Richmond*, are surrounded with very striking scenery. On the coast, *Scarborough*, seated on an amphitheatre-like shore, combines the advantages of mineral springs with sea-bathing, a beach of the finest sand, and high rocks, one of which has remains of the historic castle. Further north, *Whitby*, the native place of Captain Cook, has an interesting natural history museum, and a long line of precipitous cliffs in its vicinity, abounding with alum-late, from which several thousands of tons of alum are annually manufactured. At the mouth of the Tees, *Middlesborough* is almost wholly of modern erection, called into existence to serve as an outlet for the mineral produce of the neighbourhood.

In the eastern and smallest division, *Hull* is the only town of importance, occupying low ground on the north bank of the Humber, about twenty miles above its mouth, from which there is a main channel available for ships of the largest size. It is one of the principal ports of the kingdom in relation to foreign commerce, ranking next after London, Liverpool, and Bristol, while remarkable for its inland trade, conducted by means of the far-spreading arms of the Ouse and Trent. The incorruptible patriot, Andrew Marvel, and also Wilberforce, were natives, both of whom received part of their education in the free grammar-school, and represented the town in parliament. A few miles to the north is *Beverley*, greatly

Ruins of Knaresborough Castle.

inferior, but of much older date, with a superb minster in the Perpendicular and Decorated styles. On the coast, *Bridlington*, frequented for sea-bathing, is in an interesting neighbourhood. At a short distance northward are the bold cliffs and dark caves of Flamborough Head, with the broad sands of Filey beyond, its noble bay and so-called Bridge, but recently a mere fishing-hamlet, it is now a favourite summer resort. The bridge is a ledge of rock which acts the part of a natural breakwater to the bay, runs out about half a mile into the main deep, covered by the tide, but to be explored to its extremity at low-water.

'On that wild causeway nature strews  
Rare shells, and plants of brilliant hues.'

From *Bridlington* southward to *Spurn Point*, a distance of thirty miles, the coast consists of low soft cliffs, upon which the sea is constantly encroaching, a process which has effected great changes in the lapse of centuries. Towns and villages have been swept away by the action of the waves in storms, and the regular grinding of the tidal currents. *Ravenspur*, a borough which sent members to parliament through several reigns, and a port at which *Bolingbroke* and after him *Edward IV.* landed, to contend for the crown, perished gradually and utterly from this cause. Much of the material of the wasted coast is carried by the flood-tide into the Humber, where it is deposited, forms shoals and mudbanks, extensive tracts of which along-shore have been reclaimed from the waters by human industry, and converted into cultivable land.

The western and largest division has an area greater than that of any of the counties except *Lincolnshire*, and a population next in number to *Lancashire* and *Middlesex*, devoted chiefly to woollen manufactures and hardwares.

*Leeds*, on the Aire, is the fourth of the provincial towns in extent, being only exceeded by Liverpool, Manchester, and Birmingham. It had formerly an uninviting appearance, but several elegant public buildings have been erected of late years, besides a magnificent town-hall, and many handsome streets have been laid out. While principally a cloth mart, flax and worsted spinning are extensively carried on, with the production of glass, earthenware, and machinery. One of the flax-mills consists of a single story, and a single room, but this extends over nearly two acres of ground, or includes five times as much space as Westminster Hall. Two weekly cloth-markets are held in two large and plain buildings or halls, one of which is for white or undyed cloths, and the other for coloured, where the goods are disposed of by manufacturers to merchants. The cloth-factories are immense piles, in which every process is conducted connected with the reduction of crude wool to finished cloth. But in the rural districts the domestic system of manufacture is extensively followed by persons of small means, who possess from one to three or four looms in their own dwellings, and are at the same time small farmers, or engaged in other avocations. Worsteds-spinning has its main seat at *Bradford*, nine miles distant, a borough which has made extraordinary progress during the last half-century, and is extending its buildings in all directions. It has very picturesque environs naturally, blurred with collieries and foundries. Some of the finest warehouses in the world may be seen in the town; and upon commercial prosperity social improvement has been grafted, of which evidence appears in the provision of the Peel Park for the people, and the erection of the noble St George's Hall. About four miles distant is 'Saltaire,' a kind of model manufacturing establishment upon a vast scale, opened in 1853. Already the nucleus of a rising town. The name is compounded of the founders, Mr Salt, and that of the river Aire on which it is situated. Between Bradford and Leeds are the splendid ruins of

Interior Views of York Minster.

Kirkstall Abbey, which offer a striking contrast to closely-adjointing industrial sites. Cloths, worsted and mixed party-coloured fabrics are made at *Halifax* and *Huddersfield*, blankets at *Dewsbury*, and linens at *Barnsley*, employments which large surrounding villages and townships share in common with them. In the parish of Halifax, one of the largest in the kingdom, of greater extent than the whole county of Rutland, some refugee Flemings settled at an early date, and stimulated the woollen manufacture in the district, if it did not originate with them. To a recent period, the dialect of the working-classes strikingly resembled that of the operatives in the Low Countries, especially in Friesland; and hence the rude commemorative distich:

'Goid brade, botter, and sheese,  
Is gooid Halifax, and gooid Friese.'

Magnificent scenery renders the site of the town scarcely inferior to that of any other in the kingdom, while it is second to none in the public gifts conferred by the munificence of its manufacturers, as the Crossley Park, the Ackroyd Almshouses, and All Souls' Church, a gem of Gothic architecture. The Town Hall, opened in 1863, a noble building, was designed by the late Sir C. Barry, his last work, carried into execution by his son. *Wakefield*, on the Calder, though smaller than many of the other towns, is the electoral head of the

West Riding. Besides sharing in the general industry of the district, it has become an emporium for corn and a mart for cattle. *Pontefract*, a few miles to the east, is one of the historic sites, with some remains of its ancient castle, the scene of many tragic events, especially of the murder of Richard II. Nurseries and gardens now surround the town, in which a considerable quantity of liquorice is raised. Northward of Leeds, the country is chiefly agricultural, and contains *Harrowgate*, widely famed for its chalybeate, sulphureous, and saline waters; *Knaresborough*, beautifully situated on the Nidd, on the bank of which, opposite the ruins of the castle, is the Dropping Well, a curious petrifying spring; and *Ripon*, in an interesting neighbourhood, on the Yore, with an ancient cathedral, was made a bishop's see in 1836. Within a few miles are the highly-attractive grounds of Studley, the grand remains of Fountain's Abbey, the deep-wooded glen of Hackfall, and the Brimham Rocks—perpendicular masses of grit on an elevated moorland, with tumuli dispersed among them.

Fifth on the list of the great towns is *Sheffield*, very finely situated towards the southern border of Yorkshire, being enclosed and overlooked on all sides except the north-east by an amphitheatre of hills, while five manageable streams converge towards it, and finally blend, the Rivelen, Loxley, Porter, Sheaf, and Don.

'Five rivers, like the fingers of a hand,  
Flung from black mountains, mingle, and are one  
Where sweetest valleys quit the wild and grand.'

Its industry is wholly distinct from that of the other places mentioned, consisting of cutlery in all its branches, plated goods, brassfounding, and metal wares in general, to which that of armour plates for ships of war has recently been added. The cutlery manufacture was in being here in the fourteenth century. Chaucer mentions in one of his poetical tales a 'Sheffield whittle,' or large knife, usually carried about the person for convenience and defence. The natural advantages of the site led to its establishment, and have contributed to its extension, abundance of iron ore and coal in the vicinity, suitable clay for firebricks, excellent grindstones, and the five rapid streams supplying water-power. Ironworks and collieries are prominent at *Rotherham*, lower down the Don; and on the same river, as its name implies, is *Doncaster*, well-known in the annals of horse-racing, and an important corn-market.

Derby from the Burton Road.

## II. NORTH-MIDLAND COUNTIES.

| Counties.                  | Area in Square Miles. | Principal Towns.   |
|----------------------------|-----------------------|--|
| Derbyshire, . . . . .      | 1029 . . . . .        | Derby, Belper, Chesterfield, Buxton, Ashbourne, Glossop. |
| Staffordshire, . . . . .   | 1138 . . . . .        | Stafford, Stoke, Wolverhampton, Walsall, West Bromwich.  |
| Nottinghamshire, . . . . . | 822 . . . . .         | Nottingham, Newark, Mansfield, Worksop.                  |
| Leicestershire, . . . . .  | 804 . . . . .         | Leicester, Loughborough, Hinckley, Ashby.                |
| Rutland, . . . . .         | 150 . . . . .         | Oakham, Uppingham.                                       |

DERBYSHIRE consists of a hilly region in the north, termed the High Peak; a less elevated tract in the centre, or the Low Peak; and a gently undulating level in the south. There is no single point answering to the name of Peak, but a series of high lands, with a few prominences, among which Kinder Scout, the loftiest, closely approaches the height of 2000 feet. Some of the village churches occupy more elevated ground than any others in the kingdom. Dales of an extremely romantic character are numerous, generally with streams flowing through them, and occasionally with grand caverns opening on their sides. The county has great mineral wealth, consisting of coal, iron, lead, zinc, and marbles. Nearly all the drainage is conducted into the Trent, which intersects the southern portion from west to east.

*Derby*, on both banks of the Derwent, one of its principal affluents—a great railway centre—has the silk-manufacture for its staple industry, with hosiery and lace. The first silk-mill in the kingdom was erected here on an island in the river in 1720; and the first cotton-mill which exhibited anything like a development of the factory system, appeared on the same stream, thirteen miles higher up, at Cromford, in 1771. Both buildings still exist, and are still devoted to their original purpose. At Derby, also, the first English calicoes

High Tor, Matlock.

were made, the first fireproof mill was built, and the first public park, called the Arboretum, was provided by an opulent manufacturer for the recreation of the working-classes. Linacre, founder of the Royal College of Physicians, was a native, with Flamstead the first astronomer-royal, Hutton the topographer, Richardson the novelist, and Wright the painter. The southerly advance of the Pretender in 1746 terminated here, though some scouts of the army pushed on to the Trent. *Belper*, on the Derwent, eight miles north, is a new, thriving, stone-built town, with extensive cotton-mills, and gives the title of Lord Belper to the present head of the firm to whom they belong. *Chesterfield*, towards the centre of the county, is connected with iron-works, collieries, and potteries. Its church-spire at once arrests the attention of a stranger, having a twisted appearance, and really deviating considerably from the perpendicular. Various places in Derbyshire annually attract visitors from a distance by their beautiful scenery, natural curiosities, and mineral springs, of which Matlock and Buxton are the principal centres.

*Matlock Bath*, in the district of the Low Peak, occupies a deep ravine about two miles long, lined on one side with high perpendicular limestone cliffs, while on the other are the richly-wooded slopes of loftier elevations, between which the Derwent winds its way with a placid and anon a fretful flow. The most striking natural object, the High Tor, at the north extremity, rises 400 feet above the river, with a slanting base covered with foliage, and a superstructure of bold, naked, precipitous rock. In Derbyshire, as well

as Devon and Cornwall, isolated rocks are commonly called 'tors,' a Saxon term, from which some derive the word 'tower.' Mineral springs, three in number, containing much carbonic acid gas, have planted a pleasing village in the glen, with first-class hotels, bathing establishments, and villa-like lodging-houses, some of which are picturesquely seated on the heights. Chatsworth, the stately seat of the Dukes of Devonshire, is within easy distance, as well as Haddon Hall, one of the most perfect examples remaining of an old baronial residence, the delight of antiquaries and artists. *Buxton*, surrounded by bleak hills and extensive moors, has long been celebrated for the medicinal value of its waters, which were visited occasionally by Mary Queen of Scots, during her long imprisonment at Sheffield. St Anne's Well rises at a temperature of 33° above that of the vicinity, and has a cold spring in very close contact with it. Objects of interest are numerous in the neighbourhood: Poole's Hole, a stalactital cavern; Axe Edge, from the summit of which the heights of North Wales may be seen on a favourable day; Chee Tor, a limestone cliff overhanging the valley of the Wye; Mam Tor, the shivering mountain, on the road to Castleton; and at the latter place, the Blue John Mine, the Speedwell Mine, and the Peak Cavern, one of the grandest formations of the kind in the kingdom. But the most charming scene in the county, Dovedale, is on the western side, where the Dove pours its waters between abrupt and vast rocks, now still, now murmuring, and anon dashing over the blocks and stones that have fallen from the heights into its bed, while miniature islands further diversify its course. The valley is nearly three miles long, but nowhere more than a quarter of a mile wide, and in some places the opposite cliffs approach so closely as scarcely to leave room for a pathway by the stream. The bounding walls are perforated with caves, and largely clothed with copses of hazel and the mountain-ash, while huge and lofty detached masses of rock occasionally appear in front of them. This dale is approached from the north through a narrower one, where a few cottagers dwell, who never see the sun in winter unless they go out of it; and when his beams begin to reach them as the spring advances, it is only at first for a brief interval after mid-day. Hence arose the phrase of the Narrow-dale noon, formerly in local use as a proverb for anything delayed. *Ashbourne*, in a fertile valley by the Dove, possesses an exquisite sculpture by Chantrey, that of the Sleeping Child, in the parish church. The sound of the bells suggested the lines 'Those evening bells' by Moore during his residence at Mayfield, an adjoining village, where much of *Lalla Rookh* was composed.

Matlock Church and Heights of Abraham.

STAFFORDSHIRE, one of the decidedly mining and manufacturing parts of the country, has high dreary moors in the north, a generally level surface in the centre, and some bold, bluff hills in the south. On the northern moorlands, the Trent commences its changing course. It flows thence southerly to Trentham Park, where the river expands into a noble pool, then bends gradually to the east, and turns to the north-east on the Derbyshire border, finally proceeding due north to its estuary. There are two distinct and very valuable coal-fields at opposite extremities of the county, one called, from the

locality, the North Staffordshire or Pottery Field, and the other the South Staffordshire or Dudley Field. The last is the most important, remarkable for its stores both of coal and iron, though of limited extent, having only a superficial area of about sixty square miles. One bed, distinguished as the Main or ten-yard coal, consists of thirteen distinct seams, so close together as to form almost a single stratum. These subterranean treasures have stimulated manufactures, and given to the county the largest average of population after the metropolitan and Lancashire.

*Stafford*, a centre of the shoe-trade, the native place of Izaak Walton, is situated intermediate to much more considerable northern and southern towns. *Stoke-upon-Trent* comprehends various townships and hamlets within its borough limits, or the region known by the name of the 'Potteries,' from the distinctive handicraft. This district, extending about ten miles in one direction by from two to three in the other, has nothing antique or ornamental in its appearance. The prominent features are huge cones of brick, forming the kilns or baking-ovens, with tall chimneys, volumes of smoke, and humbly-attired artisans, who produce wares varying from the ordinary and useful to the decorative and artistic. A statue of Josiah Wedgwood, the Father of the Potteries, who diffused the manufacture by rendering it ornamental, has recently been placed in the scene of his labours. In the opposite direction, *Wolverhampton*, *Walsall*, *West Bromwich*, and other closely-contiguous towns, compose the iron region or the black country, where foundries and collieries meet the eye on every hand. Its aspect is equally definite, and not a little striking to the stranger. Trees and hedges are rare, and the few are poverty stricken, apparently maintaining an almost hopeless struggle for existence by the side of dingy patches of grass and bits of garden. Houses are many where streets are wanting, being scattered around forges and steam-engines, amid piles of coke, and heaps of ore. Sinkings of the surface are continually met with, and dwellings declining from the perpendicular, either deserted as too dangerous to be occupied, or propped up to prevent their fall, owing to the subterranean excavations. By night, the tongues of flame from the chimneys of the ever-burning furnaces light up the sky, with startling effect to the visitor, and suggest the idea of a grand centre of volcanic action. Staffordshire, apart from these two districts, includes on the eastern side *Tamworth*, a capital of the Mercian kings in the Saxon age; *Lichfield*, the birthplace of Dr Johnson, with a beautiful cathedral; and *Burton*, with extensive breweries at the head of the Trent navigation, where the river is crossed by an old stone bridge of thirty-four arches, one of the longest in the kingdom. *Leek*, a silk-manufacturing town, and *Newcastle-under-Lyne*, are in the north. The appended phrase, 'under Lyne,' similarly attached to Ashton, on the southern border of Lancashire, refers to an ancient forest so called in the intervening county of Cheshire.

**NOTTINGHAMSHIRE**, without any prominent natural features, has a pleasingly varied surface, and a remarkably dry climate, probably owing to the moist westerly winds being intercepted by the hills of Derbyshire. It is intersected by the Trent from south-west to north-east, which is navigable throughout by barges, and by larger vessels up to Gainsborough, where the first bridge is met with on ascending the stream.

The town of *Nottingham*, populous and flourishing, occupies a hilly site a short distance from the northern bank, with cotton-hose and machine-lace for the principal manufactures. Its castle, entirely modern, and without a castellated appearance, stands on a perforated sandstone rock, the site of the old fortress in which Mortimer was seized by the friends of Edward III, who gained admission to it by a subterranean passage, still indicated under the name of 'Mortimer's Hole.' On an eminence within the grounds, Charles I. set up his standard at the commencement of the civil war, and Standard Hill is now the name of a street or terrace at the spot. The place was speedily in the hands of the parliament, and the famous Colonel Hutchinson became the governor. Beautiful and extensive views are obtained of the Trent valley from various points, in which the meadow crocus abounds, the violet colour of which in spring finely contrasts with the fresh green of the early grass. *Newark*, on the eastern side of the county, a principal mart for agricultural produce, was formerly an important military stronghold, in which the wretched King John ended his days. Warmly adhering to the fortunes of Charles I., the inhabitants and garrison successfully resisted two sieges, and the place was only given up on his voluntary surrender to the investing Scotch army in a neighbouring field. Extensive ruins of the castle remain, but are rendered unpicturesque by the proximity of inferior erections. Its enlargement at an early date, the 'New Work,' originated the name of the town. *Mansfield*, on the western side, is on the border of Sherwood Forest, in which Henry II. had a hunting-lodge, and met with the adventure commemorated in the old ballad of the *Miller of Mansfield*. The tract is now mostly bare of trees, but here and there huge gnarled and mossed oaks, battered and solitary, represent the ancient woodland in which Robin Hood disported with his men, and administered the Forest laws. *Newstead Abbey*, the fine inheritance of Lord Byron, and the scene of his early days, is in the neighbourhood. *Worksop*, on the north verge of the Forest region, had formerly four ducal residences in its vicinity, which procured for the district the name of the Dukery. There are at present two, Clumber Park and Welbeck Abbey, occupied by the Dukes of Newcastle and Portland.

LEICESTERSHIRE, a central county, contains the district of Charnwood Forest, which has lost its wooded aspect, but is still conspicuous from afar owing to its craggy pinnacles of sienitic granite. Though of no great height, they arrest attention by abruptly rising from a widely-extended level, with a very sharp and distinct outline. Bardon Hill, the loftiest point, has only a positive elevation of 853 feet; but from the great range of surrounding lowland, the view from the summit probably embraces as wide a sweep of landscape as can be observed from any other spot in the kingdom. The eye looks down upon Bradgate Park at the base, the birthplace of Lady Jane Grey; and may discern in clear weather Lincoln Cathedral and the Derbyshire Peak in one direction, the hills about Dunstable in another, with the Malverns in Worcestershire, the Wrekin in Shropshire, and even some eminences in Wales.

Through the greater part of the county grazing husbandry prevails, and a large amount of dairy produce is raised; but on the western side there is a small coal-field worked to a considerable extent. The central position of Leicestershire is indicated by its drainage being carried by the Soar through the Trent to the Humber, while minor portions are taken by the Welland to the Wash, and by the Avon to the Severn and the Bristol Channel. The Swift, a little affluent of the Avon, is connected with the memory of Wickliffe, rector of Lutterworth on its banks, whose bones were exhumed, burned, and the ashes cast into the stream. On a spacious plain close to Market Bosworth, the decisive battle was fought which changed the dynasty by the death of Richard III. The site of King Richard's Well, so called from a tradition that he drank of it during the heat of the action, is indicated by a monument with an inscription by Dr Parr. *Leicester*, on the banks of the Soar, is memorably associated with the fallen Cardinal Wolsey, who died soon after reaching the adjoining abbey of St Mary, and was buried in an unknown grave. It is the centre of the worsted hosiery district, and has a large population, but to some extent engaged in kindred and miscellaneous industries. The district includes the town of Loughborough, ten miles on the north, where also machine-lace is made; and that of Hinckley in the opposite direction, with a number of contiguous villages. *Ashby-de-la-Zouch*, in the centre of the coal-field, is of ancient date, and derives its distinctive name from an old Norman family, once lords of the manor. It was made widely known by Scott's brilliant novel of *Ivanhoe*, as the scene where he laid the famous passage of arms described, and has the ruins of a castle, with *Ivanhoe Baths*, plentifully supplied with strongly saline waters. *Melton Mowbray*, on the north-east, is one of the chief marts for *Stilton cheese*, first made at a village in the neighbourhood, and still largely produced. Owing to the openness of the country, and other circumstances, it has long been the head-quarters of a large number of sportsmen during the hunting season.

River Dove.

RUTLANDSHIRE, the smallest of the English counties, is a district of rich vales divided by gently swelling hills, entirely agricultural. With a single exception, it has the smallest of the county towns, *Oakham*, which numbers one of the most diminutive of men in the list of its natives, *Jeffrey Hudson*, the court dwarf in the reign of Charles II.

The town is pleasantly situated, has a fine old church, and a hall used for county business, one of the most beautiful specimens of the domestic architecture of the twelfth century. In this hall a number of horseshoes are suspended, to which the names of noble personages are attached, some of the blood-royal. By a curious custom of ancient date, the authorities exact a horseshoe from every peer of the realm on his first passing through the manor. This tribute is still strictly enforced, and was complied with by Lord Chief-Justice Campbell in March 1858. During the Wars of the Roses, a battle was fought at the village of Empingham, in which Edward IV. defeated some insurgents. A spot near the scene of the action still retains the name of Lose-Coat Field, where the fugitives threw away their coats-of-mail to facilitate their flight. Remains of the slain were turned up in the year 1851.

Hereford from Hastings Hill.

## III. WESTERN COUNTIES.

| Counties.                  | Area in Square Miles. | Principal Towns.                              |
|----------------------------|-----------------------|---|
| Cheshire, . . . . .        | 1105 . . . . .        | Chester, Stockport, Macclesfield, Birkenhead. |
| Shropshire, . . . . .      | 1291 . . . . .        | Shrewsbury, Madeley, Bridgenorth, Ludlow.     |
| Herefordshire, . . . . .   | 836 . . . . .         | Hereford, Leominster, Ross.                   |
| Monmouthshire, . . . . .   | 576 . . . . .         | Monmouth, Newport, Tredegar, Chepstow.        |
| Gloucestershire, . . . . . | 1258 . . . . .        | Gloucester, Bristol, Cheltenham, Stroud.      |

**CHESHIRE**, chiefly inland, has a small maritime portion on the Irish Sea, forming a long, narrow peninsula between the estuaries of the Dee and the Mersey. These rivers are boundary-lines in relation to the county, but an important affluent of the latter, the Weaver, is wholly within its limits. On the eastern side are high grounds, and elevations occur in other parts, but the surface is generally level, studded with many small pools. The South Lancashire coal-field passes the north-eastern border; lead, copper, and cobalt occur; but the important mineral produce is fossil or rock-salt, the supply of which seems

to be inexhaustible. It was discovered two centuries ago near Northwich, at the depth of from thirty to forty yards below the surface, and is reached by shafts in various parts of the surrounding country. There are two beds, one upper, the other lower, separated by a stratum of indurated marl. In the upper, the salt is of a dull reddish or brown sugar-candy colour, and has to be boiled down and purified to be fit for use. In the lower bed, which is chiefly excavated, and extends to an unknown depth, the pure, white, serviceable mineral occurs. The mines are agreeable places to enter, being clean, dry, and free from noxious gases, while their snowy walls and pillars present a remarkable appearance when lit up by a multitude of torches. They are hence often visited by picnic-parties. Canning, the statesman, was present at a ball given in the Marston mine, the principal vista of which has the name of Regent Street. The county, partly mining and manufacturing, is much more extensively agricultural; and dairy husbandry is the primary object, as the moist climate and rich soil favour the production of a luxuriant green-sward. Its cheese, long in high repute, is sent by thousands of tons annually into the market for export to foreign countries as well as for home consumption.

*Chester*, an episcopal city and port on the Dee, is a place of great antiquity and interest. It was a principal station of the Roman legions, and an important military stronghold in later times, from being proximate to the Welsh border. Much of its early aspect is still retained. The old wall remains entire, and forms the only perfect specimen of ancient fortification extant in the kingdom. It is from five to six feet broad, and nearly two miles in circuit, passed by four gates facing the cardinal points of the compass. This serves as a convenient promenade for the citizens, from which extensive and beautiful views are obtained. The interior of the city contains many examples of old domestic architecture, especially the elevated and covered footways, piazzas or 'rows' as they are called, let into the houses on the second story, with several very picturesque timber dwellings, now fast disappearing. Chester has little commerce as a port, and no important manufactures, but is the seat of considerable trade in the produce of the county, and the scene of great passenger and goods traffic, as the central terminus of several lines of railway. *Stockport*, the largest town, a few miles to the south of Manchester, shares its industry and features. A magnificent railway viaduct here spans the bed of the Mersey and the adjoining valley. The general Sunday school is remarkable for its magnitude, being regularly attended by upwards of 3000 children, who are accommodated in a single building erected by subscription for the purpose, with which district schools are connected. *Macclesfield*, second in population, has silk-throwing and the production of broad silks for its leading pursuits, which are also carried on at Congleton, and their respective neighbourhoods. *Birkenhead*, on the Mersey, opposite to Liverpool, with spacious docks, ship-building yards, squares, abattoirs, houses with special conveniences for the working-classes, and a public park, is one of the new towns, and has risen to importance with extraordinary rapidity. It occupies ground on which the fox has been hunted within memory of the living.

SHROPSHIRE, intersected by the Severn from west to south-east, is divided by the river into two nearly equal portions. It has an extremely varied surface, level in the north, but marked southerly both with detached masses, steep craggy ridges, and some round topped hills, between which are fertile pasture lands. There are several coal-fields, but only one of importance, that of Coalbrookdale, a district prolific in iron ore, containing many populous townships and hamlets, Madeley, Broseley, and Wellington, connected with collieries and ironworks. The dale itself is a beautiful valley winding between steep hills covered with trees towards their summits, and studded with cottages below. Here the Severn is crossed by an iron bridge, erected in 1779, the first that was ever constructed.

*Shrewsbury*, pleasantly situated on an elevated peninsula formed by a horseshoe bend of the river, has suburbs across the stream, one reached by the English Bridge, and another by the Welsh, so called from their respective directions. This fine old town is rendered picturesque by timber houses with antique gables and overhanging stories, with which many handsome modern erections are intermingled. While the centre of considerable inland trade, it is widely known for its royal free grammar-school, richly endowed, and raised to celebrity by distinguished masters. Few places have been more conspicuous in our history, partly owing to its position near the frontier of Wales. Edward I. made it his temporary residence, removed hither the public courts of justice, and held a parliament, at which the barons sat in judgment upon the Welsh prince David, while the commons met at Acton Burnel, a village seven miles distant, the

seat of the Chancellor Burnel. Farm-buildings occupy the site of the manor-house, but two ends of a barn are traditionally regarded as remnants of the hall in which the knights and burgesses assembled, and passed the Act for the Recovery of Debts which mainly governed proceedings till the present reign. The battle of Shrewsbury between the forces of Hotspur and Henry IV. was fought about three miles eastward of the walls, where the site is now called Battle-field, and has a ruined church built on behalf of the slain. In the vicinity is the village of Wroxeter, on the site of the Roman city of Uriconium, interesting remains of which have in our own day been discovered. *Bridgenorth*, a seat of the carpet manufacture, is divided into two portions by the Severn, the high and low towns, connected by a bridge. *Ludlow*, towards the southern verge of the county, is of interest from the remains of its castle, in which Milton's masque of *Comus* was first performed, and Butler wrote part of *Hudibras*. *Oswestry*, near the frontier of Wales, has its name from the Saxon king Oswald, who fell in battle at the spot, and is commemorated by a spring in the neighbourhood called Oswald's Well. Close to the Staffordshire border is Boscobel House, in the woods of which Charles II. was concealed, when a fugitive after the battle of Worcester. The oak he ascended for the purpose has passed away, but another reared from one of its acorns occupies the site.

HEREFORDSHIRE, traversed by the Wye in a very winding manner, with lovely scenery on its banks, exhibits a constant succession of hill and dale, in many parts richly wooded, especially with oak timber. While ordinary agriculture prevails, it is one of the chief districts in which hops are cultivated, and apple-orchards for cider. The latter give a remarkably beautiful appearance to the landscapes in spring when the trees are in blossom, and in summer when laden with fruit. They sometimes occupy fifty, sixty, and even a hundred acres, but the ground between the trees is occasionally ploughed and tilled. The orchards began to be planted with care, as to the quality of the fruit, in the reign of Charles I.; and cider was somewhat common in the time of Charles II. Its general use was strongly urged in order to exclude the wines of France during the subsequent wars with that country. But while a universal beverage with the rural population of the producing districts, the home consumption elsewhere has always been limited, though exported in considerable quantities to hot countries.

The county is famed for a breed of middle-horned dark-red cattle, inferior as milkers, but susceptible of being rapidly fattened, and of great strength. Hence oxen are commonly employed at the plough, and in general team-work, instead of horses. *Hereford*, centrally situated, on the north bank of the Wye, surrounded with garden-like scenery, has a cathedral remarkable for its extremely massive tower, profusely ornamented with bulb-work, and a much-admired Lady Chapel. The beautiful river meanders southerly by swelling hills, hop-grounds, orchards, and woods, to the small, quiet, cheerful-looking town of *Ross*, on an eminence of the left bank, immortalised by Pope's poetical commemoration of the 'Man of Ross.' This was John Kyrle, a resident during the reigns of William III., Anne, and George I., who planted the elms in the churchyard, laid out an adjoining avenue which overlooks a lovely prospect, and devoted a small fortune to objects of public utility. After visiting the house in which he lived, Coleridge wrote the lines beginning

'Richer than misers o'er their countless hoards,  
Nobler than kings, or king-polluted lords,  
Here dwelt the Man of Ross! O traveller, hear!  
Departed merit claims a reverent tear.'

*Leominster*, a mart for wool, hops, cider, and wheat, is in the north part of the county, where at the distance of a few miles a modern column marks the site of the battle of Mortimer's Cross, fought during the Wars of the Roses, which raised the Yorkist leader to the throne with the title of Edward IV.

MONMOUTHSHIRE, southerly on the Bristol Channel, has the Wye for its eastern boundary, and is centrally traversed by the Usk. The maritime portion is low, flat, and marshy, but the general surface is highly diversified, and becomes mountainous on the western side, which forms part of the coal-field of South Wales. Its mineral produce, coal and iron, is very considerable, while the soil in many parts is fertile, and large cereal crops are raised. Previous to the time of Henry VIII., the county was considered to be an integral part of Wales, and though it was then united to England, the administration of English law was not fully established till the year 1689, the first of William and Mary. Down to the present day, the habits and characteristics of the people in the rural districts, especially on the western side, are Welsh; the language

is extensively that of the principality; and old British prejudices relative to everything English or Saxon are not wholly extinct.

Many Roman relics are found at Caerleon and Caerwent, inconsiderable places at present, but once important cities, with the names of *Isca Silurum* and *Venta Silurum*. The remains of castles and abbeys are among the most extensive and picturesque in the kingdom; and holy wells are numerous, or springs formerly held sacred, believed to be endowed with supernatural virtue for the cure of diseases. *Monmouth*, the 'delightsome,' as Shakspeare calls it, still answers to the description, having an attractive aspect, a charming situation, and beautiful environs. But it is now simply a small, quiet, romantic place, with very few traces of its historic celebrity. The position on rising-ground by the Wye at its junction with the Munnow originated the name, a contraction of Monnow-mouth. Only inconsiderable fragments remain of the castle in which Henry V. was born, popularly known as Harry of Monmouth, and of the priory with which another native was long connected, the romancing chronicler, Geoffrey of Monmouth. *Newport*, much the largest town, but not long ago a mean village, is seated on the banks of the Usk, which is navigable for large vessels, and has risen to great commercial prosperity as the shipping port for the mineral and agricultural produce of the county. Principal ironworks are at Tredegar, Pontypool, and near Abergavenny. The latter town, close to the Welsh border, is finely surrounded with an amphitheatre of mountains of contrasted shape, the even ridge of the Blorence, the broken summit of the Skirrid, and the conical form of the Sugar Loaf, the highest point, 1682 feet above the sea. *Chepstow*, a considerable trading port, below which the Wye terminates its course, has a striking object in extensive remains of its castle on a cliff overhanging the stream, clasped by the ivy, and adorned with patches of wild-flowers. A few miles above, the river passes the glorious ruins of Tintern Abbey, and pursues its sinuous way to the Wyndcliff, a lofty mass of almost perpendicular rock bestrewn with thickets, but easily ascended by zigzag paths cut on its face. The view from the summit embraces the greater part of nine counties, with the Severn estuary, and the broad Bristol Channel expanding towards the ocean. A bridge of remarkable construction carries the South Wales Railway over the Wye at Chepstow, combining the suspension and tubular principles. The Taff Vale Extension line is conveyed across the valley of the Ebwy, a scene of picturesque beauty, by a lofty viaduct composed of open ironwork, of such magical lightness, as to seem a spider-like production upon a gigantic scale in the distant view.

GLOUCESTERSHIRE, a maritime county, intersected by the Severn from north to south, and divided by it into two unequal portions, consists of three naturally distinct regions—the chain of the Cotswold Hills, parallel to the river, on the eastern side; the elevated tract of the Forest of Dean on the western,

'The queen of forests all, that west of Severn lie;'

and the intervening river-valley, with luxuriant meadows on either hand, called the Vale of Gloucester above the city, and the Vale of Berkeley below. The forest district, once an extensive woodland, has still a considerable area devoted to the growth of timber for the navy, and a valuable coal-field, yielding also iron ore of superior quality. Another field is in the south of the county, supplying the wants of Bristol and its neighbourhood, and extending into Somersetshire. The cloth manufacture, particularly of the finer kinds, is a prominent industry; but agriculture is most general, and dairy produce the special object.

The city of *Gloucester*, a river-port on the east bank of the Severn, in command of considerable trade, shares a bishop's see with Bristol, and is distinguished by a cathedral of majestic proportions, with many splendid features. The tomb of Edward II., murdered in Berkeley Castle in the county, with his effigy, is one of the attractions of the interior. Near the pile, a monument has recently been erected in honour of the martyred prelate, Hooper, on the spot where he was consigned to the flames. The eloquent Whitfield was a native, and the benevolent Raikes, who originated Sunday-school instruction, commencing it in the place of his birth. *Bristol*, on the Avon, one of the most ancient cities of the west, and by far the largest as well as the most important seaport after London and Liverpool, is provided with docks for the reception of the largest vessels. Besides the foreign, coasting, and Irish shipping trade, the manufactures of glass, earthenware, sugar, leather, and other articles, are very extensive. It has an unusual proportion of public buildings, schools, hospitals, almshouses, and other charities, with a cathedral, and perhaps the finest parish church in the kingdom in that of St Mary Redcliffe. Sebastian Cabot, Chatterton, and Southey were natives. The city has a circuit of nearly ten miles including the suburbs, the most important of which, Clifton, seated on high rocky ground, as the name imports, forms a delightful retreat for the wealthy inhabitants, and attracts many visitors owing to its thermal waters, genial climate, and romantic situation. A chasm in the

rocks, 250 feet deep, 600 feet wide, through which the Avon flows on its way from Bristol to the Channel, is a very striking natural gorge, whether viewed from above or below, now in process of being spanned by the Hungerford Suspension-bridge, removed from London. *Cheltenham*, styled the 'Queen of Watering Places,' combines many advantages to vindicate the distinction. Seated at the base of the Cotswold Hills, it is sheltered from the cold winds, possesses highly-valued medicinal springs, has lovely environs, and intermingles the charms of rural scenery with elegant town architecture, noble trees being promiscuously distributed, or arranged in fine avenues, in connection with the streets, squares, and villas. *Stroud*, among

Bristol.

the declivities of the Cotswolds, is a central seat of the fine cloth manufacture, originally planted there owing to the excellent fleeces obtained from the local breeds of sheep, and the numerous streams of pure water available for purifying and dyeing purposes. *Tewkesbury*, at the confluence of the Upper Avon with the Severn, was the scene of a decisive battle in 1471, which firmly placed Edward IV. upon the throne, and has several monuments in memory of persons slain in the action in its parish church, a remarkably fine old structure.

## IV. EASTERN COUNTIES.

| Counties.                 | Area in Square Miles. | Principal Towns.                           |

| Essex, . . . . .          | 1657 . . . . .        | Chelmsford, Colchester, Harwich.           |

LINCOLNSHIRE, the second of the English counties in point of size, is a maritime district extending from the Humber to the Wash, and stretching inland to the Trent, which, after serving as a border-line, enters within its limits to terminate its course. But the Witham is locally the most important river, as nearly the whole of its flow of seventy

miles is in the county, while the navigation is connected with that of the Trent by the Foss Dyke, a work begun by the Romans, intended to answer the purpose of a canal and drain. With the exception of some chalk-downs on the north-eastern side, or the Wolds, and a ridge interior to them running north and south, known in one part of its course as Lincoln Heath, the surface is an uninterrupted plain, naturally exposed to inundation from the sea, being below its level, and to flooding from the streams, owing to the want of a sufficient outfall. The southerly portion of this tract once consisted of 'melancholy fens,' where shallow waters abounded in every direction, loading the air with fog, and afflicting the inhabitants with ague; but by scientific engineering at an immense cost, pools, marshes, and quagmires have been converted into dry and solid land, clothed with luxuriant grasses, or waving with golden harvests. The richness of the pastures renders grazing husbandry prominent.

*Lincoln*, on the banks of the Witham, occupies the base, slope, and summit of an eminence, on which stands the cathedral, one of the noblest in the kingdom, visible from afar over the level of the fen-country. Fuller remarks that the floor of this church is higher than the tops of most other churches. The west front is superb, and the stained glass and sculptured figures are among the very best examples of Early English art. As a place of importance under the Romans, the city retains a monument of their urban architecture in the semicircular arch of Newport Gate, which forms the entrance to it by the old north road. There are also very interesting mediæval remains. Various manufactures are now carried on, and horse, sheep, and cattle fairs of great magnitude are held. *Boston*, a considerable port on the same stream, a little above its outlet in the Wash, is distinguished by a very lofty and finely-proportioned church-steeple, which serves as a landmark to seamen on the adjoining waters, and is surmounted by an elegant octagonal lantern, apparently intended to be lighted up at night. Some of the early settlers in America, having belonged to this town, gave its name to the place founded near the point of their landing, now Boston, the large and opulent capital of Massachusetts. *Grimsbly*, an old port at the mouth of the Humber, after long decay, has been revived by the construction of convenient docks, and the extension of railway communication to it, by which means cargoes of fish from the North Sea are quickly conveyed to metropolitan and other distant markets. *Louth*, *Stanford*, *Spalding*, *Grantham*, and *Gainsborough*, are inland towns of local trade, with the exception of the latter, which shares in the important navigation of the Trent. Lincolnshire produced Sir Isaac Newton, born at Woolsthorpe manor-house, near Grantham—a cottage-like tenement, preserved as a venerated relic by the present owner. In the town the great philosopher is commemorated by a monument inaugurated by Lord Brougham. The two Wesleys were natives of Epworth, a small unimportant place to the north-west of Gainsborough. On Lincoln Heath, now a highly-cultivated district, a singular memorial remains of a by-gone condition, in Dunston Pillar. It was erected to serve the purpose of a light-house to guide the traveller at night through the sloughs of the trackless waste—the only land light-house that was ever raised.

CAMBRIDGESHIRE, wholly inland, but closely approaching the shores of the Wash, is crossed by the Ouse near its centre, running from west to north-east, and is divided by it generally into two naturally distinct districts. North of the river, the country belongs to the fen-region, and retains its old name, that of the Isle of Ely, where the few rising-grounds were once completely insulated by tracts of water, nearly the whole of which have been reclaimed for cultivation by artificial draining. The southern division is cretaceous, and has some grassy chalk-downs occasionally swelling into hills.

*Cambridge*, the seat of one of the two ancient universities of England, derives its name from the Cam, an affluent of the Ouse, on which it is placed. Occupying a very level site, with tall trees surrounding the principal buildings, its importance is not indicated by external appearances to the approaching visitor. Seventeen colleges compose the illustrious academical institution, with which the names of Erasmus, Bacon, Coke, Milton, Cowley, Newton, Barrow, Dryden, are imperishably associated. St Peter's, the oldest, dates from the year 1257. King's College possesses the distinguishing architectural feature in its glorious chapel. Trinity College, the largest and most eminent, entertains the sovereign during a royal visit. An observatory of recent origin occupies a gentle eminence out of the town, commanding a good north and south horizon. It boasts the great telescope of nearly twelve inches aperture, and twenty feet focal length, executed by M. Canchoix of Paris, and presented by the Duke of Northumberland. The Fitzwilliam Museum, equally modern, owes its origin to the noble whose name it bears, and is one of the most classical structures in the country. *Ely*, a small episcopal city on the Ouse, is of early date as an ecclesiastical site. Some lines attributed to Canute, but probably composed about him, and not older in their present form than the

thirteenth century, mention the delight with which he listened to the chanting of the monks while on the adjoining river :

‘Merrily (sweetly) sung the monks in Ely,  
When Canute the king rowed thereby;  
“Row, ye knights, near the land,  
And let us hear these monks’ song.”’

The cathedral is the longest Gothic church not only in England but in Europe, 535 feet, though several cover much more ground. It is of special interest and value to architectural students, from presenting an

Cambridge.

unbroken series of the various styles prevalent from the Early Norman to the Late Perpendicular, so nicely blended as to form a singularly noble whole. *Wisbeach*, a well-built old town on the *Nen*, possesses a museum of natural history and antiquities, in which are many objects found in the peat of the fens, as canoes, hatchets, and bronze swords, relics of the ancient Britons, with Roman remains.

**NORFOLK**, a maritime county, the fourth in point of extent, has a coast-line running eastward from the *Wash*, and then gradually curving to the south till it meets the *Suffolk* border. The two districts originally formed northern and southern divisions of the kingdom of the *East Angles*, who were called the *North-folk* and the *South-folk*, whence the present names. The *Ouse*, which has its lower course on the western side of the county, and the *Yare*, flowing from the centre to the east coast, are the principal rivers. Except some slight swells and depressions in limited spaces, the surface is flat, in many parts a dead level, without any prepossessing natural features, but exhibits on every hand that careful cultivation which has rendered it celebrated for successful agriculture. Besides the cereals, chiefly barley and green crops, vast quantities of turkeys and other poultry are reared for the markets of the metropolis.

*Norwich*, the capital of the eastern counties, and a bishop's see, stands on the *Wensum*, immediately above its junction with the *Yare*, and has an agreeable appearance from being interspersed with large spaces planted with trees, or cultivated as gardens. Its cathedral, outwardly meagre of embellishment, is of huge size, with a very lofty tower and spire. In the centre of the city, on a considerable eminence, the massive keep of the old castle remains externally entire, and is an impressive object both in the near and distant view. The manufactures are very extensive, consisting of shawls, crapes, bombazines, damasks, and

City of Norwich.

imitations of French fabrics, to which that of shoes has recently been added. The staple industry was established by immigrant Flemings, some of whom settled at *Worstead*, a neighbouring village, and hence the name of 'worsted' goods, first applied to their products. *Yarmouth*, on a slip of land between the *Yare* and the sea, has the river for its harbour, along which the quay stretches upwards of a mile in length. It is the principal seat of the English herring-fishery, which it formerly almost entirely monopolised. The fishing-ground extends upwards of forty miles to seaward, in from fifteen to twenty fathoms water, along a considerable range of the east coast. In the early part of the season, which commences in September, large quantities of herrings are disposed of fresh, and are sent far inland by the railways. But the main object is to obtain a supply for curing. The full-grown fish, which have not been injured by the nets, are selected from a cargo to form the well-known 'bloaters,' which are simply salted, while the rest are cured as red herrings by being salted and smoked. Off the town, parallel to the shore, extensive sand-banks form *Yarmouth Roads* in the intervening channel, which offer a natural harbour of refuge to vessels in distress. *Lynn*, on the *Ouse*, a few miles from its outlet, besides a general shipping trade, exports the fine siliceous sand suitable for glass-making, obtained from a district of some extent in the vicinity. *Sandringham Hall*, the hunting-seat of the Prince of Wales, is eight miles distant on the east. *Wymondham*, *Thetford*, and *East Dereham*, are the other chief market-towns, the latter containing the grave of *Cowper*. *Cromer*, the principal sea-bathing place, picturesquely situated, is without a harbour, and overlooks a bay so dangerous as to have acquired the name of the *Devil's Throat*. The village of *Burnham Thorpe* is distinguished as the native place of *Lord Nelson*, who is commemorated by a beautiful and lofty column at *Yarmouth*.

SUFFOLK extends southward from the Yare on the Norfolk border to the Stour, which defines the boundary from Essex, intermediate to which are the Deben and the Orwell, the latter forming a broad estuary navigable by vessels of considerable burden. The coast-line is remarkable at various points for the rapid manner in which the sea undermines the low cliffs, consisting of alternations of clay, sand, and gravel, and makes havoc with the shores. No high grounds anywhere mark the surface, and varied features are only occasionally met with, but the tameness of the landscape is generally relieved by skillful cultivation and luxuriant verdure. Tillage husbandry is most extensively pursued, and very rich crops are obtained.

The county possesses a valuable breed of horses for farm-service, short, active, and strong, adapted for heavy as well as light work; and its cows are famed for the extraordinary quantity of milk they yield. Suffolk, according to ancient local proverbs, is renowned for its milk, its maids, and its stiles. But of one product of the former made for domestic use, it has been said that, by having a hole bored through the centre, a cheese would become a good grindstone. The rural poet, Bloomfield, a native, attributes to this article the common properties of a post—

‘Too big to swallow, and too hard to bite.’

*Ipswich*, the site of a very extensive manufacture of agricultural implements, is on a gentle elevation rising up from the Orwell, the banks of which are well wooded, and abound with pleasing views. Cardinal Wolsey, born here in the parish of St Nicholas, commenced a college in the place of his nativity, but it fell with its founder. *Bury St Edmunds*, in the western division of the county, a very agreeable and interesting town, with excellent free schools, was once an ecclesiastical shrine of great celebrity, the site of one of the largest and wealthiest abbeys in the country, fine remains of which are extant. It was founded in honour of Edmund the Martyr, one of the kings of East Anglia, who was crowned at the spot. Before the high-altar, the confederate barons singly bound themselves by oath to compel King John to grant the Great Charter. *Lowestoft*, on the coast towards the northern border, the most easterly town in England, has become by modern improvements a bathing-place, and has trading communication with the opposite continental ports of Holland and Denmark. The herring-fishery is a principal pursuit, with that of mackerel, large quantities of which are sent to London. *Aldborough*, further south, the birthplace of Crabbe, the poetical painter of real life, is at one of those points of the shore which suffer from the encroachments of the sea. The old borough stood some distance eastward of its present representative, and twenty-four feet of water roll over its site. This is the case also with ancient Dunwich adjoining, once a parliamentary borough, with twelve churches, the seat of the first East Anglian bishopric. Almost every remnant of it has been engulfed; and but for the inhabitants retreating inland, and forming a village, the name itself would not now represent a single dwelling.

ESSEX, a continuation of the great eastern level to the Thames, is low and marshy in its maritime districts, but more inland, a pleasant alternation of gentle hill and dale is general. Several islands lie close off-shore, among which Canvey, Mersea, and Foulness are fertile and of some extent. Besides the Thames, Stour, and Lea, which are boundary rivers, the county contains the Colne, Blackwater, and Chelmer, forming considerable estuaries. The marsh-lands are excellent grazing-grounds; heavy crops of corn of the finest quality are yielded in the other districts; caraway and coriander seeds are raised; the teasle, or fuller's thistle, is also cultivated for the woollen cloth manufacture, though not to the same extent as formerly; and the saffron-yielding crocus is grown, the culture of which near the town of Saffron-Walden originated the name. Fine woodland scenery distinguishes the south-western division, the locality of Epping and Hainault forests, towards which the suburbs of the metropolis are rapidly advancing.

*Chelmsford*, in a beautiful valley between the Chelmer and the Cann, which here unite, has only local consequence as the county-town and an agricultural mart. *Colchester*, far larger, a few miles above the mouth of the Colne, has a coasting trade, and an oyster fishery in which a considerable number of the inhabitants are engaged. The oysters are bred in the estuaries of the rivers, and in the creeks between the islands and the main shore. The town is supposed to occupy the site of the Roman colony of *Camelodunum*, and very numerous antiquities have been gleaned from it. It was taken after a long siege by Fairfax in 1648, when one of the most melancholy episodes of the Civil War occurred—the military execution of the two royalist commanders, Sir Charles Lucas and Sir George Lisle. *Harwich*, on the coast, at the mouth of the

Stour, has one of the best harbours on the whole eastern sea-board, and is the only place between Yarmouth Roads and the Thames capable of affording refuge to vessels in easterly gales. It is now chiefly visited for sea-bathing, but was formerly a flourishing port, and the ordinary point of passage between England and the Netherlands. *Walton-on-the-Naze*, near the headland after which it is distinguished, and *Southend*, at the mouth of the Thames, are favourite summer resorts with metropolitans and provincials. Small towns are very numerous inland, and there are several villages of great interest. The little secluded hamlet of Greenstead, near Ongar, has a church the nave of which is of wood, worn by time and black with age, believed to be the genuine relic of an Anglo-Saxon wooden chapel. One of the very few round churches in England, after the model of that of the Holy Sepulchre at Jerusalem, is at Little Maplestead, built by the Knights-Hospitallers, the same as when it was erected, except the addition of a porch. Tilbury Fort, now a regular fortification, on the Thames opposite Gravesend, marks the site where Queen Elizabeth reviewed her troops in expectation of the arrival of the Spanish Armada.

V. SOUTH-MIDLAND COUNTIES.

|                             | Area in Square Miles. | Principal Towns.                           |

WORCESTERSHIRE, an inland district, belongs entirely to the basin of the Severn, by which it is traversed from north to south, nearly in the centre. It abounds with smiling

Worcester Cathedral.

valleys, and richly-wooded landscapes, overlooked on the western side by the fine eminences of the Malvern Hills. The county contains coal in the extreme north; and salt is made extensively from brine-springs at Droitwich, where the salt-pans have sent up their clouds of white vapour from the time of the Romans, who extracted heaps of the snowy mineral from the saliferous waters. In addition to the ordinary products of tillage, hops are largely cultivated, with apples and pears for cider and perry.

*Worcester*, an episcopal city, on the eastern side of the Severn, is the chief mart for the agricultural produce, and has manufactures of gloves and porcelain. The cathedral, externally a plain building, makes nevertheless a pleasing impression, being spacious and of light architecture, crowned at almost every angle with spire-like pinnacles. It contains the tomb of the inglorious King John. The battle of Worcester, in which Cromwell defeated the forces of Charles II., was fought partly in the south-eastern meadows, and in the streets of the city. Previous to the action, the king stood upon the roof of the cathedral to view the hostile preparations. *Dudley*, the largest town, occupies a detached portion of the county, wholly within the limits of South Staffordshire, and is prominent in that wonderful scene of activity, a principal centre of coal-mines and ironworks. But it possesses a very striking feature. Close to the town rises a somewhat lofty limestone hill, crowned by the remains of a feudal fortress, consisting of the keep, with fragments of walls, doors, and windows, partly surrounding a green, once the great courtyard, while clumps of trees clothe the hillside. The whole is enclosed for a protective purpose, but admission is granted to all visitors; and the contrast is striking in the extreme, turning from the smoking furnaces without to the sylvan solitude and the feudal relics within. *Kidderminster*, a principal seat of Brussels carpet-weaving, with tapestry and other fabrics, is in the northern section of the county, which includes *Bromsgrove* and *Stourbridge*, where various hardwares are produced. The large village of *Redditch* and its vicinity chiefly supply the domestic demand for needles, with an immense quantity for export, a manufacture in which young women are extensively employed. The total production in the district of these minute articles of convenience is estimated at 70,000,000 per week. *Evesham*, in the opposite section of the county, on the south-eastern border, is seated in a fertile valley, nearly encircled by the Avon, and surrounded by gardens, from which fruit and vegetables are sent to the great centres of population. The bell-tower remains of a once famous abbey, in possession of princely revenues, with some of the outbuildings. On the adjoining plain the battle was fought in 1265, which restored Henry III. to the throne, and proved fatal to his opponent, Simon de Montfort, the 'Sir Simon the Righteous' of the common people, and the real founder of popular representation. *Great Malvern*, on the south-western side, the head-quarters of hydropathy, is beautifully situated at the foot of the Worcestershire Beacon, the summit of which rises to the height of 1300 feet, overlooks a magnificent prospect, and is daily ascended by the summer visitors to the place. Two springs, *St Anne's* and the *Holy Well*, are distinguished by the extreme purity of their waters.

WARWICKSHIRE, to the eastward, while without any marked inequality of the surface, is diversified in almost all parts, and picturesque in some, watered by affluents of the Trent in the north, but chiefly by the Avon and its tributaries flowing to the Severn. In ancient times, it was comprehended in the great forest of Arden, and still retains abundance of fine timber both in hedgerows and plantations. A small but valuable coal-field lies within its limits, passing into Staffordshire. On the south-eastern side, where the Edge Hills form the border from Oxfordshire, the first battle between the king and the parliament was fought in the reign of Charles I. A plain, then known as the Vale of the Red Horse, on the Warwickshire side of the range, was the scene of the indecisive action, October 23, 1642. During the previous march of both armies through the county, the artisans of Birmingham refused to supply the royal troops with swords, but readily furnished them to the opposite party, while the blacksmiths left their homes to avoid shoeing the horses.

The town of *Warwick*, ancient and quiet, is seated on the right bank of the Avon. It has a striking feature in its old baronial castle, close to the river, still in perfect preservation, and the residence of the Earls of Warwick. The towers, the stream, the bridge, and fine trees around, form a very picturesque scene. *Leamington*, in the immediate vicinity, larger, fashionably arranged, and almost entirely modern, has been raised from obscurity by its mineral springs, twelve in number, consisting of the three varieties of saline, chalybeate, and sulphureous waters. A short excursion northward from both places leads to two memorable spots—the wooden knoll of Blacklow Hill, with its monumental stone, scene of the summary execution of Piers Gaveston by the barons in the time of Edward II.; and to Kenilworth, where splendid ivy-clad remains of castellated strength revive the memory of Queen Elizabeth, entertained within its walls, then standing in their pride, by her minion the Earl of Leicester. Further on in the same direction is *Coventry*, a city which shares a bishop's see with Lichfield, and was of high importance in the middle ages, long familiar with royal progresses and sacred pageants. Many narrow streets and overhanging timber houses remain as memorials of the past, with *St Mary's Hall*, now the town hall, of the time of Henry VI., and *St Michael's Church*, a master-piece of the lighter Gothic style. Few places have more frequently changed their industry. Under the Plantagenets, it was famous for caps and bonnets; under the Tudors, for woollen broadcloths, and a blue thread so celebrated for its permanent dye, that 'true as Coventry blue' became a proverbial expression; next followed the production of tammies, camlets, shalloons, and

calimancoes; then succeeded broad silks and ribbons, which last remains, in connection with watch-making. The county contains *Rugby*, a centre of railways, the seat of a popular and richly-endowed school; and *Stratford-upon-Avon*, revered as the birthplace of Shakspeare. But its consequence is mainly derived from *Birmingham*, the third of the provincial towns in population. This capital of the midlands is situated near the north-western border, towards the centre of England, on an insignificant stream, a sub-tributary of the Trent. It is the greatest seat of hardware production in the world, embracing articles remarkable for their diversity and discordance, the massive and the minute, the costly and the cheap, the domestic and the warlike, the ornamental and the useful, made of gold, silver, iron, copper, or a compound of metals, with plated and japanned wares. The premises of the largest firms are like villages for extent; their workmen are of the superior class as to habits and intelligence; and their show-rooms are wondrous repositories of beautiful objects. The manufacture of firearms was first introduced in the reign of William III., for whom some infantry muskets were made. During the Crimean war, three thousand Minié rifles were supplied to the government weekly, with the same number of bayonets. Priestley the philosopher, Hutton the historian, and Watt the improver of the steam-engine, were long associated with the town. Birmingham has no advantages of position and few attractive features, but it was one of the first places in the provinces to erect a civic building worthy of its own wealth and enterprise, adapted for corporate purposes, and the holding of large assemblies. This is essentially in the form of a classical temple, with ranges of majestic Corinthian columns along the sides and fronts; and being well placed, it is a very striking object. The free grammar-school, in the Tudor style, is also a beautiful structure; and a public park is a modern addition.

NORTHAMPTONSHIRE borders on the preceding county, and also on eight others, owing to its extent and irregular shape, which is narrow and elongated. It contains a succession of smooth waving hills and vales, amply watered, with the remnants of three ancient forests, Whittlebury, Salcey, and Rockingham. But the ground generally is elevated, and hence while streams are sent out into adjoining districts, none whatever are received from them. The highest land is on the north-western side, and forms the line of water-shed between the basins of opposite seas. Here, in the parish of Naseby, rises one branch of the Nen, the principal river, flowing to the Wash; and in the garden of the little inn opposite the village church is the source of the Avon, which descends to the Bristol Channel.

The field of Naseby, once a moor, now distributed into farms, was the scene of the decisive battle in which the royalists were defeated by Fairfax and Cromwell, and the cause of Charles I. received a blow from which it never recovered. He was soon afterwards a captive at Holdenby House in the county. While under tillage to a considerable extent, the greater part of the surface consists of luxuriant grass-lands. *Northampton*, pleasantly situated on the north bank of the Nen, has the boot and shoe manufacture for its staple, an industry shared to some extent by Wellingborough, Kettering, Daventry, and contiguous villages, giving employment to not less than 30,000 persons. Large orders are executed for the government and foreign export. The trade has here been localised for many centuries. When Cromwell's soldiers marched through the place nearly barefoot, the citizens were able to furnish them with fifteen hundred pairs of shoes. Further back, King John here bought his boots at a shilling a pair, and his slippers for sixpence. Fuller remarks, that 'the town of Northampton may be said to stand chiefly on other men's legs, where, if not the best, the most and cheapest boots and stockings are bought in England.' The stocking manufacture has ceased. Northampton contains an interesting example of the Norman style in St Peter's Church, and one of the round churches in St Sepulchre's, built by the Knights-Templars, with a few vestiges of the castle. There are large open grounds for recreation, and an extensive promenade between rows of lime-trees. The town was long the residence of Dr Doddridge, and for a brief period of Akenside and Colonel Gardiner. It is historically known as the scene of Thomas-à-Becket's final breach with the first Plantagenet, and has a spring called Becket's Well, from a tradition that he there knelt down to pray on escaping by night from the walls. A mile to the south, stands one of the beautiful crosses, the most perfect remaining, erected by Edward I. in honour of his queen Eleanor. In the meadows along the river, the Yorkists triumphed over the Lancastrians, in a battle fatal to numbers of the nobility. *Peterborough*, a small episcopal city, towards the north extremity of the county, possesses a noble object in its cathedral, charmingly secluded in a green close, with garden-flowers and shrubberies around it. The structure is remarkable for its massiveness, and has a west front unlike any other in the kingdom, and unequalled for simple grandeur and majestic beauty. It contains the tomb of Catherine of Aragon, and afforded a grave to Mary Queen, of Scots prior to the removal of her remains to Westminster. The same sexton officiated at the funerals of these two queens, though half a century intervened between them. His portrait hangs near the western entrance of the cathedral, representing him with the emblems of his vocation—a bunch of keys, a spade, a pickaxe, and a skull. In the southern division of the county are two costly and difficult works, a cutting and a tunnel, on the line of the London and North-Western Railway. The Blisworth cutting passes through limestone nearly as hard

as flint, with soft strata above and below. Where the excavation is confined to the limestone, the rock forms complete natural walls on both sides; but where it descends to the underlying blue shale, a portion of this had to be scooped out and replaced with artificial walls, continuing the natural ones to the required depth. Upwards of 800 labourers, aided by horse and steam power, were employed upon this work; more than 1,000,000 cubic yards of material were removed; 3000 barrels of gunpowder were used in blasting; and about £250,000 expended. The Kilsby tunnel, upwards of a mile and a quarter long, passes through shale of the lower oolite. But in the process of excavation, an extensive quicksand was tapped, practically a subterranean lake, from which the water poured out in apparently exhaustless quantities. Thirteen steam-engines, 200 horses, 1250 men, were engaged in carrying it off, which required eight months to be effected, though the drainage was conducted night and day, at the rate of 1800 gallons per minute. Two years and a half were occupied in completing the tunnel, at the cost of about £300,000. Thirty-six millions of bricks were consumed in the lining, which would nearly make a footpath a yard wide from London to Aberdeen.

HUNTINGDONSHIRE, of very limited extent, wholly agricultural, belongs partly to the level of the fens, and was the scene of the last great-work of drainage in that district in 1851, when the bed of Whittlesea-mere was laid dry. This was the largest English sheet of water apart from the lake district, two miles and a quarter long by one and a quarter broad, abounding with fish and aquatic fowl, much frequented by sporting-parties. It is now a succession of cornfields and pastures, intersected with hedges, and occupied with farm-buildings. Throughout the whole region of the Fens, both the flora and fauna have been largely affected by the removal of the surface-waters, and the reduction of spongy lands to firm ground. While reeds and sedge have given place to crops of corn, the wild-fowl they sheltered have been compelled to seek fresh nestling-places and feeding haunts. Curious birds found in solitary swamps are no longer met with. The edible frog, rare in England, but once common in this district, locally known as the 'Cambridgeshire nightingale' and the 'Whaddon organ,' from its musical croak, has become scarce; and the beautiful swallow-tailed butterfly, delighting in marshes, is a somewhat rare object.

*Huntingdon*, on the Ouse, and the line of the Great Northern Railway, consists of a single principal street, and is distinguished as the birthplace of Oliver Cromwell. At *St Ives*, equally small, lower down on the same river, he was a resident farmer, and acquired the popular title of Lord of the Fens from some displays of public spirit relative to their improvement. *St Neots*, higher up the stream, has a considerable paper manufacture. The best, richest, and highest-priced cheese in the market, called *Stilton*, has the name from a village in this county. It was not originally made at the place, nor is it at present. But it acquired the name from travellers on the great north road becoming acquainted with its quality at the village inn, the landlord of which obtained it from a relative in North Leicestershire, the first and still the chief site of production.

BEDFORDSHIRE; but little more extensive, belongs mostly to the basin of the Ouse, which runs through it from west to east in a very tortuous manner, answering to the descriptive touches of Cowper, long a resident by its banks—'Ouse's silent tide,'

'Slow winding through a level plain  
Of spacious meads with cattle sprinkled o'er.'

and fringed with flags and reeds. Chalk-hills vary the southern part of the county, and oolitic strata compose the surface in the northern. Between the two, there is a belt of iron-sand interposed, running from south-west to north-east, varying from one to five miles in breadth. This sandy tract is specially adapted for horticultural purposes, and on it, as well as the adjacent chalky soils, culinary vegetables are raised for the metropolitan and other markets.

*Bedford* occupies both banks of the Ouse, and attracts residents of moderate means for the educational term and permanently, owing to the advantages offered by excellent free-schools, with which other important benefactions are connected. The original endowment by Sir William Harpur, about three centuries ago, now yields a very large annual income, as it consists of land in the very heart of London. The schools, preparatory, commercial, and others, are included in a building in the Tudor style, and have exhibitions to the universities. The other charities comprise donations on going out to service, at the commencement and close of apprenticeship, with marriage-portions, almshouses, a hospital for poor children, and

miscellaneous distributions. Two imperishable names are associated with the town, John Bunyan—the author of the *Pilgrim's Progress*, who here lived, preached, and was imprisoned, many relics of whom are preserved—and John Howard, the philanthropist, whose seat was in the immediate neighbourhood. The Bedford Catalogue is a valuable and bulky record of observations of the stars made by Admiral Smyth at his private observatory while a resident. *Luton*, on the river Lea, near its source, is the principal seat of the straw-plait manufacture, in which a large number of females are engaged, both preparing the material and working it up into hats and bonnets. Besides the native wheat-straw and other grasses, confined to inferior articles for the humbler classes, Italian straw is imported, and Italian modes of treating it are adopted. *Dunstable*, in the centre of the chalk-hills, shares this branch of industry, and is noted also for the great quantities of larks taken in the vicinity, of large size, which are sent to the London market. The production of straw-plait, requiring no machinery, prevails extensively among the rural population of the county, and can be pursued in fine weather out of doors, while the younger members of families are competent to the work.

OXFORDSHIRE has the Thames for its frontier on the south, to which the general drainage of the surface is conducted by the Cherwell, the Isis, and other streams. The chalk-range of the Chiltern Hills, richly wooded, diversifies the south-eastern portion of the county, while on the north-western border rise the Edge Hills, belonging to the lias formation. Passing from the one to the other, different members of the oolitic series appear, several of which have local names, as characteristic simply of the sites referred to, and not confined to them. The Oxford clay, prominent in the valley of the Isis, generally of a deep-blue colour, is met with in the fenny districts of Lincolnshire, where it is known as the fen-clay, and has been bored through to the depth of 500 feet at Boston in sinking for water. Stonesfield slate, used for roofing, forms the hilly sides of a valley, near a village of the name in the county, and is of singular interest on account of its fossils, comprising land plants, insects, reptiles, and marsupial animals. From Wychwood Forest on the western side, still a wooded tract of some extent, the forest marble is obtained, a fissile limestone, often a congeries of dark-coloured shells susceptible of being polished. The great oolite or Bath stone is quarried near Burford, and the small old town is entirely built of it.

*Oxford*, a cathedral city, and the seat of one of the most celebrated universities in the world, is situated on an acclivity between the Cherwell and Isis, at the confluence of the streams, and but a short distance from the Thames. Towers, spires, turrets, and domes, intermingled with masses of foliage, render its appearance in the highest degree attractive from the surrounding meadows; and its principal thoroughfare, the High Street, long, broad, and gently curving, fronted by noble structures, with several quaint old houses and modern shops between them, is one of the finest in Europe. The university consists of nineteen colleges and five halls, many of them very magnificent buildings, in possession of charming seclusions. Merton College, the oldest, dates from the year 1267. Christ-church, the most extensive and splendid, furnishes the see with a cathedral in its private chapel; but St Mary's, in the High Street, is the university church, conspicuous from its richly-decorated tower and graceful spire. The establishments belonging to the general body of the university are important features of the city. They include the Bodleian Library, rich in books and manuscripts; the Radcliffe Library, a noble edifice; the Radcliffe Observatory, in the northern suburb; the Theatre, in which great meetings of the gowmsmen are held; the Clarendon, used for offices and lecture-rooms; the Public Schools, devoted to the examination of candidates for degrees; the Taylor and Randolph Institutes, founded for the exhibition of works of art and the teaching of modern languages, associated in a stately pile; the Botanic Garden, one of the oldest of the kind; and the Museum, containing the specimens of geology and mineralogy collected by Dr Buckland during his professorship. The Martyrs' Memorial, an elegant monument, erected close to the church of St Mary Magdalene, and near the spot where Cranmer, Latimer, and Ridley perished in the flames, is a recent and interesting addition. Oxford has been the scene of many stirring incidents and important historical events, repeatedly the residence of the court and the seat of parliaments. *Woodstock*, seven miles distant, of ancient date, was the residence of Chaucer during a considerable portion of his life, and his house remained till the beginning of the last century. The town is often visited on account of the adjacent palace and grounds of Blenheim, the present of the nation to the first Duke of Marlborough, and the inheritance of his descendants. The town has a manufacture of gloves. *Banbury*, for more than two centuries, has given its name to a well-known article of confectionary. *Chipping Norton* and *Winey* produce flannels and coarse woollens.

BUCKINGHAMSHIRE, of very irregular shape, extends from the Thames on the south to

the Ouse in the north, and has the Chilterns running through it in the direction of north-east and south-west, with the rich and spacious vale of Aylesbury in the centre. The metropolis is largely supplied with dairy produce from its homesteads, to the extent of from four to five millions of pounds of butter annually, with a vast amount of poultry, especially ducks, which are bred in greater quantities than in any other part of the kingdom.

Though chiefly an agricultural district, various branches of manufacture are carried on. Wooden wares of different kinds are made of the fine timber of the hills, beeches and elms; paper-mills are numerous upon the streams; straw-plait is produced; and hand-made lace is an industry, but has become limited, since the composition of machine-lace reduced earnings to a miserable pittance. The county does not contain a single town of any considerable size, and is barren of monuments of antiquity. *Buckingham* simply gives its name to the shire, as all public business is transacted at *Aylesbury*, while the largest group of population is at *High Wycombe*. But there are many sites of great general and literary interest. At *Hampden House*, eight miles south of *Aylesbury*, in a beautiful seclusion, lived the patriot of that name, who was buried in the parish-church, but in a grave which has not been positively identified. The 'Queen's Gap' is the name of an avenue on one of the adjoining hills, which was cut through the woods to facilitate the progress of Queen Elizabeth, while on a visit to one of *Hampden's* ancestors. At *Chalfont St Giles* the *Paradise Lost* of Milton was finished and the *Paradise Regained* begun. *Beaconsfield* possesses the remains of Waller the poet and Burke the statesman. The churchyard of *Gray's Elegy*, with the 'ivy-mantled tower,' the 'rugged elms,' and the 'yew-trees' shade,' where

'The rude forefathers of the hamlet sleep,'

is at *Stoke Pogis*, towards the southern verge of the county, where the poet also has his resting-place. At *Olney*, on the northern border, Cowper spent the greater part of his days, and versified for all generations. *Wolverton*, in this part of the county, on a site desolate within the memory of the living, has become a considerable township, and is in process of rapid extension, owing to the factories of the North-Western Railway Company. *Eton*, on the Thames, opposite Windsor, is celebrated for its college, founded by Henry VI., the highest in rank of the great public schools, where many of the upper classes receive their education before proceeding to the universities.

HERTFORDSHIRE, one of the smaller counties, immediately north of Middlesex, is chiefly a chalk district, well watered and timbered, with a great number of private mansions and ornamental plantations distributed over the surface. It contributes to the water-supply of the metropolis by means of the New River, constructed in the time of Charles I., the head springs of which are within its bounds. The principal stream, the Lea, after flowing through the centre from west to east, forms the boundary from Essex, and discharges into the Thames near the East India Docks. Paper-making has long been a distinguishing feature of its industry, and was certainly established in the county by the close of the fifteenth century. In a book of the date of 1495, by Wynkyn de Worde, mention is made of a paper-mill near Stevenage belonging to John Tate the younger. Both the mill and the person are named in Henry VII.'s *Household Book*. About the commencement of the present century, the machine for the manufacture of continuous paper was brought to perfection by the brothers Fourdrinier at their mill at Two Waters.

*Hertford*, a small, neat, and clean-looking town, on the banks of the Lea, is the county town, contains a blue-coat school, a branch of Christ's Hospital, and once possessed a castle in which two sovereigns were held in durance together, John of France and David of Scotland, in the reign of Edward III. *St Albans*, much more ancient, occupies an interesting site, close to that of the Roman Verulam, out of the ruins of which it arose. Its abbey church, part of a celebrated monastery made parochial at the Reformation, being on elevated ground, is an imposing object, with all the appearance of a cathedral. The tomb of Lord Bacon, who resided near the town, and derived his title from it, is in the church of St Michael. *St Albans* was the scene of the first battle fought during the Wars of the Roses, in 1455, in which the Lancastrians were defeated, and Henry VI., found concealed in the house of a tanner, was taken prisoner. A second battle at the same place in 1461, terminated to the disadvantage of the Yorkists. The town, a seat of the straw-plait trade, derives its name from St Alban, said to have been a native and a martyr in the Roman times, but on very doubtful authority. *Hemel Hempstead*, with a similar industry, has the manufacture of paper for its staple, and some of the largest paper-mills in the country are in the neighbourhood. At *Tring*, on the North-Western Railway, the largest cutting on the line occurs, passing through chalk strata. It extends

nearly two miles and a half; has an average depth of forty feet, but in some places amounting to sixty; and 1,400,000 cubic yards of chalk were removed in forming it. Three bridges, each of three arches, with a smaller one, are thrown across the gap. *Cheshunt* was the retreat of Richard Cromwell under a feigned name, and the scene of his death in the reign of Queen Anne. The *Rye House* remains by the Lea, now an inn and fishing-place, but once connected with a real or pretended plot for the assassination of Charles II.

MIDDLESEX, of very inferior extent, but distinguished as the metropolitan site, extends along the Thames between the counties of Essex and Bucks, with a gently-varied surface—in some places it is a dead level; the exception being the heights at Hampstead, Highgate, and Harrow, which, however, have only a moderate elevation. Its prominent features are meadows and pastures, nurseries and market-gardens, some extensive commons, with the seats and grounds of resident gentry, a few small towns, besides the capital of England and of the British Empire.

*London*, the largest, wealthiest, and most populous city in the world, is seated in the south-eastern quarter of Middlesex, on the north bank of the Thames, about forty miles above its mouth. The centre of the dome of St Paul's is in latitude 51° 30' 48" north, and longitude 0° 5' 38" west of Greenwich. That portion to which the phrase, 'the city,' properly belongs, is only a fractional part of the area occupied by the metropolis, which extends on the same side of the river in every direction around it, and over sections of the counties of Surrey and Kent on the opposite bank. The space, densely packed with dwellings, warehouses, churches, edifices of various kinds, streets and squares, stretches more than seven miles east and west, by nearly six in the opposite direction, including a superficial extent of fifty square miles. But the London of the census commissioners, which embraces the suburbs from Hampstead to Norwood, from Hammersmith to Woolwich, with only trifling breaks in the lines of houses, occupies an area of more than 115 square miles, and contains a population now closely approaching to 3,000,000 in number. The name is derived from the Londinium of the Romans, mentioned by Tacitus about 61 A.D., as a chief mart of commerce, which is probably the Latinised form of *Llyn dun*, 'city or town by the waters,' belonging to an old British settlement on the spot. It did not become the capital during the Saxon age, a distinction enjoyed by Winchester, nor did it rise to the rank of being the undisputed metropolis of the realm till the dynasty of the Plantagenets ascended the throne. Its vast magnitude is entirely modern, for down to the seventeenth century it lagged behind Lisbon and Paris in population. London and Westminster long remained distinct cities, separated by the open country. In the reign of James II., Red Lion Square was a field, and the site of the British Museum was occupied by a suburban mansion.

The Tower, a foundation of the Norman conqueror, may be regarded as the original nucleus of the modern city, and is one of the principal memorials of the past. It occupies an area of twelve acres, near the centre of which rises the keep of the ancient fortress, a conspicuous object from the river, but so altered by repairs that scarcely a feature can be approximately called primitive. Besides its military purpose, it has been used as a palace and a prison, has possessed a mint and a menagerie, and is now an arsenal containing the regalia. Westminster Hall, built by William Rufus, and rebuilt of the same dimensions by Richard II., is one of the largest enclosed rooms in Europe without pillars. Westminster Abbey, a noble Gothic structure, dating from the time of Henry III., is a chief point of historical interest, as the scene of coronations and the mausoleum of kings, containing the honorary monuments of illustrious subjects, many of whom lie interred within its walls. Whitehall, of the time of James I., is the beautiful fragment of an unfinished palace, the first example of the purely Italian style of architecture introduced into the country. St Paul's Cathedral, erected after the great fire of 1666, is a grand temple in the Grecian style, rises to the height of 404 feet from the ground, and is hence a prime feature in the view from various suburban elevations. Among other edifices worthy of notice may be mentioned, Somerset House, the Royal Exchange, the Bank, Mint, and Custom House, the British Museum, the Treasury, and the Houses of Parliament. The latter, a vast and magnificent pile in the Tudor Gothic, has a loftier square tower than any other structure, so elaborately embellished with chiseled kings and heraldic designs, as to be appropriately called a sculptured history of the nation—the 'monarchy in stone.'

While architecturally inferior to several continental capitals, having been built mainly to answer the purposes of commerce, London has the pre-eminence in many features. Its social conveniences are more complete, and involve substructions upon a gigantic scale for water-supply, gas-lighting, and sewerage, to which an underground railway is a recent addition, at present unique. The wealth in the shops is unparalleled, with the throng of passengers and vehicles in the streets, unceasing from the early dawn to late at night, and exhibiting a wonderful exemplification of orderly activity. The parks, numerous, extensive, and conveniently at hand, favoured by the climate, are freshly green through the summer, when the pastures of the continent are brown or ashy, parched with heat and drought; they excite the admiration of every foreigner. No city can present kindred places of agreeable suburban resort equal to the Zoological Gardens, Regent's Park, the Botanic Garden at Kew, and the Crystal Palace, while the highways across the river, Waterloo, Westminster, Southwark, and London bridges, are confessedly the finest structures of their

kind. The first named, with its level roadway, is deemed by many the most perfect bridge in the world, worth a journey from Rome to see it in the judgment of Canova, the great sculptor. But the highway under the river, or the Thames Tunnel, is commonly one of the first objects to which foreign visitors repair, as entirely unexampled. The Port of London, extending to Blackwall, with ranges of spacious docks and files of shipping on either hand, lines of wharfs and warehouses, in connection with intermediate traffic, exhibits a spectacle not to be witnessed elsewhere. In this part of its course, the Thames still retains the Saxon name of 'the Pool.' This was descriptive of its aspect in former times, that of a shallow expanse, spreading languidly without restraint to the hills which bound its basin, till changed by embankments into a deep and rapid stream. The charities of the metropolis are specially worthy of remark, as without precedent in their number, variety, and revenue. In 1861, they amounted to no less than 640 institutions, founded or supported by private benevolence, and enjoying an income of nearly £2,500,000 per annum. Estimated by three recent sales of sites in different districts, the value of land in central London may be reckoned at above £100,000 per acre. The roar of the metropolis, as heard by aeronauts in a balloon a mile above it, is a rich, deep, unceasing hum.

*Brentford*, the nominal capital of Middlesex, at the junction of the Brent with the Thames, is the place where the parliamentary elections for the county are held. *Staines*, lower down the river, marks the limit in that direction of the jurisdiction exercised over it by the corporation of London, and is supposed to derive its name from an ancient stone which defined the boundary. *Uxbridge*, towards the western border, is a considerable corn mart. *Enfield*, on the northern side, gives its name to rifles made at a great government factory in the vicinity. *Harrow*, on high ground rising out of a rich vale, is the seat of a public school, originally founded by a yeoman of the place for the poor, now chiefly a classical school for the sons of the nobility and gentry, the rival of Eton.

## VI. SOUTHERN COUNTIES.

| Area in Square Miles.            | Principal Towns.   |
|----------------------------------|--|
| Kent, . . . 1,627 . . .          | Maidstone, Canterbury, Rochester, Chatham, Greenwich, Dover. |
| Surrey, . . . 748 . . .          | Guildford, Croydon, Richmond.                                |
| Sussex, . . . 1,458 . . .        | Lewes, Brighton, Hastings, Chichester.                       |
| Hampshire, . . . 1,672 . . .     | Winchester, Portsmouth, Southampton, Newport.                |
| Berkshire, . . . 705 . . .       | Reading, Windsor, Newbury.                                   |
| Wiltshire, . . . 1,352 . . .     | Salisbury, Trowbridge, Bradford, Devizes.                    |
| Dorsetshire, . . . 988 . . .     | Dorchester, Weymouth, Poole, Bridport.                       |
| Somersetshire, . . . 1,636 . . . | Taunton, Bath, Bridgewater, Frome.                           |
| Devonshire, . . . 2,589 . . .    | Exeter, Plymouth, Devonport, Tiverton, Barnstaple.           |
| Cornwall, . . . 1,365 . . .      | Bodmin, Truro, Penzance, Falmouth.                           |

KENT, the south-east angle of England, has a northern, eastern, and southern coast-line, marked by the two high promontories of the North and South Forelands, with the flat projection of Dungeness. Off the east coast lie the Goodwin Sands, forming with the shore the well-known roadstead of the Downs. These sands are accumulated on blue clay and subjacent chalk. Left dry to a considerable extent at low water, they then become quite firm, so as to admit of a landing being made, but immediately loosen on the return of the tide. On the north coast, the Isle of Sheppey is separated from the mainland by a narrow branch of the Medway. But the Isle of Thanet, on the north-east, has entirely lost all appearance of insulation, though once detached by a ship channel, which is still traversed by the small stream of the Stour in one part, and reduced to a mere ditch in others. In the interior of the county, the surface has almost everywhere a very pleasing aspect, owing to the natural scenery originated by the chalk-range of the North Downs, which runs through it from west to east, added to its advanced agriculture. The principal river, the Medway, winds from the Sussex border to the north coast, and falls into the estuary of the Thames. Hops, linseed, canary-seed, cherries, filberts, and other fruits, are extensively cultivated.

*Maidstone*, the county town, centrally situated, is the chief seat of the hop trade, in which *Canterbury* also shares, while best known as the ecclesiastical capital of England, with an archbishop who ranks as the first peer of the realm after the blood-royal. The city, seated in the fertile vale of the Stour, surrounded with sylvan scenery, dates from ancient times, and has a cathedral with a very grand interior. It contains the tomb of the Black Prince in wonderful preservation, and is historically memorable as the scene of

Thomas-à-Becket's murder, whose shrine, still indicated, was annually visited by thousands of pilgrims previous to the Reformation, as Chaucer sings :

‘ And specially from every shire's end  
Of Engle-land to Canterbury they wend.’

The more ancient buildings include the ruined monastery of St Augustine, and the church of St Martin, still used, built of Roman brick, one of the oldest in the country. *Rochester*, an episcopal city, and *Chatham*, a modern continuation of it, are on the east bank of the Medway, at the head of its estuary. The latter is an important military depôt and naval establishment, with which *Sheerness* corresponds, on the adjoining island of Sheppey, commanding the mouth both of the Medway and the Thames, and the station of a port-admiral. *Greenwich*, a metropolitan suburb, is distinguished by its palatial hospital for the reception of seamen, and the Royal Observatory, the astronomical capital of the kingdom, on an eminence in the park; with its neighbours, *Deptford*, on the one hand, the site of a dock-yard, and *Woolwich*, on the other, the greatest warlike establishment of the nation, it forms a single borough for parliamentary purposes. Gravesend, a river-port, Margate, Ramsgate, Deal, Dover, and Folkstone, seaports, are resorted to as bathing-places. *Dover*, a considerable town, and a place of great antiquity, is of importance as the advanced post of England towards the continent, to and from which there is constant passenger-traffic. The celebrated castle, on a lofty chalk-cliff which has been hollowed out for barracks and stores, is a very picturesque and striking object, consisting of extensive buildings which spread over nearly thirty acres, of various ages and styles, now tending to ruin. ‘Shakspeare's Cliff,’ a short distance from the town, scarcely answers to the description of the one in the tragedy of *Lear*, which suggested the name, but it has suffered from immense landslips, some of recent occurrence, sufficient to account for the discrepancy. The summit no longer ‘looks fearfully in the confined deep,’ but rather recedes, though still a ‘dizzy height,’ commanding a magnificent view. Dover has naturally very defective maritime accommodation, but operations are in progress by the government to run out a gigantic pier, in order to protect the present harbour from the shingle which accumulates at the mouth during westerly gales, as well as provide a port of refuge. *Folkstone*, six miles distant, is another point of regular communication with the continent. Between the two towns runs the South-Eastern Railway, by and through the magnificent range of chalk, which there forms a bold escarpment on the coast from 200 to 400 feet in height. The large headlands are tunnelled, the smaller were blown down, while the line is carried by cuttings through chaotic masses of undercliff, and on sea-walls over pebbly beaches in the little bays formed by the landward recession of the rocks. *Tunbridge Wells*, on the Sussex border, visited for its strongly chalybeate springs, to which the town owes its origin and prosperity, occupies a site once supposed to resemble that of Jerusalem, which led to the application of the names Mounts Ephriam and Zion to two of the hills.

SURREY, wholly inland, lies on the south bank of the Thames, and contributes to it the Wey and the Mole. The latter river has been honoured by the notice of Milton, but is somewhat misrepresented by him, as ‘the sullen Mole, that runneth underneath,’ as well as by Pope, ‘the sullen Mole, that hides his diving flood.’ In very dry summers the stream is simply absorbed in places by its porous bed, and becomes a series of detached ponds. The North Downs are the main diversities of the surface, and form the wild region on the western side, called the Hog's Back, where they contract to a single narrow ridge.

Owing to the vicinity of the metropolis, mansions and parks occupy a considerable area, with market-gardens and orchards, but there are extensive tracts of almost barren heath, where the lower green-sand of the cretaceous formation comes to the surface. This sand, though commonly loose, is occasionally formed into sandstone by a calcareous cement, and appears at the elevation of nearly a thousand feet, in Leith Hill, in the neighbourhood of Dorking. Hops are objects of cultivation, with a great variety of medicinal and aromatic plants, as chamomile, poppy, horehound, wormwood, anise-seed, peppermint, and lavender. The common box-tree flourishes vigorously, and originated the name of Boxhill. Fuller's-earth, in request in all the clothing districts, has been dug up for centuries near the village of Nutfield, which is still the principal source of supply. The county contains the metropolitan boroughs of Southwark and Lambeth, with several populous suburban districts, but the separate towns are of small extent, though numerous and of ancient date. *Guildford*, seated on the Wey, ranks as the county town, but shares the assizes with Croydon and Kingston. It has a striking appearance from hill and valley combining in the site, which is overlooked by the keep of the old castle. *Croydon*, much enlarged by railway-connection, and its convenient distance from the metropolis, contains, in its parish-church, many interesting monuments of the archbishops of Canterbury, who once occupied a palace in connection with it. The archiepiscopal provincial residence is now at Addiscombe in the vicinity. *Kingston*, on the Thames, frequently in association with royalty in the Saxon times, as the name imports, has increased from the like cause. *Richmond*, higher up the river, offers one of the finest views in the kingdom from the brow of its hill, and is a thoroughfare for excursionists to the

palace and grounds of Hampton Court. Ascending the stream, within the parish of Egham, the Thames flows by a justly-famous site, that of Runnymede, where the barons compelled King John to sign the Great Charter. A little isle in its channel bears the name of Magna Charta Island, but an adjacent meadow was the real scene of the transaction. *Epsom*, a few miles from Croydon, of horse-racing celebrity, has a mineral spring from which the well-known Epsom salts were at one time manufactured. *Dorking*, in the pleasant valley of the Mole, has a peculiar breed of highly-prized poultry, with five claws to each foot, believed to have been brought over by the Romans. *Reigate*, higher up on the same stream, stands on a bed of fine white sand, much used in the manufacture of glass. *Farnham*, towards the Hampshire border, is widely known for the superior quality of its hops. Some picturesque ruins of the castle remain, with which the principal official residence of the bishops of Winchester is connected. The proper orthography of the name is *Fernham*, in allusion to the adjoining fern-growing heathy districts.

SUSSEX, on the south coast, is varied by the chain of the South Downs, which runs westward from Beachy Head for some distance along the shore, then diverges inland, passing into Hampshire, interior to which is the Forest Ridge, scarcely less elevated, but more broken. Both ranges originate a repeated succession of hill and dale. The county belongs chiefly to the old district of the Weald, or woodland, which embraced the adjacent parts of Surrey and Kent, was once an almost unbroken forest, and still possesses sylvan glades for a distinctive feature. The chief rivers are the Rother, the Ouse, the Adur, and the Arun, all falling into the English Channel.

Pastoral husbandry prevails over tillage; argillaceous iron-ore abounds; and a limestone, largely composed of fresh-water shells, susceptible of high polish, is quarried, and was extensively employed in the middle ages for ornamental purposes. *Lewes*, on the Ouse, navigable for river-craft, has Newhaven, at the mouth, for its port, a starting-point for steamers across the Channel. Its name occurs in history as the scene of the battle in the reign of Henry III., which transferred all power for a time from the crown to the barons, and led to the first parliament on record, consisting of the three estates. *Brighton*, on the coast, an insignificant fishing-place in the last century, has rapidly become an important municipality, and a splendidly-built town, under the patronage of fashion—in fact, a miniature representation of the west end of London. A chain-pier, stretching nearly a quarter of a mile into the sea, of light construction, passes over the site of houses belonging to the old town, now covered by the waves. A carriage-road and promenade, one of the finest in existence, runs a mile and a half along the cliffs, with noble houses on the one hand, open to the sea-breeze on the other, supported by a magnificent marine wall. The visiting season is the autumn and early winter. *Hastings*, a trading port, but chiefly a watering-place, on the eastern part of the coast-line, occupies a picturesque locality in an interesting neighbourhood. Westward is Pevensey Bay, the landing-point of the Norman conqueror, and northward the small town of Battle, which has its name from the contest which placed the crown of England upon his head, commonly called the battle of Hastings. This town, with Winchelsea and Rye, in the county, and Romney, Hythe, Dover, and Sandwich, in Kent, have the name of the Cinque Ports, and were formerly of great maritime importance, invested by the crown with peculiar privileges, but under obligation to render certain services in time of war. Some of them have suffered from natural causes. Old Winchelsea was destroyed by an influx of the sea, and its successor has been changed into an inland town by the encroachment of the land upon the sea. The harbour of Rye, in which a sixty-four gun ship could once ride in safety, will now scarcely admit a vessel of 200 tons. Westward in succession from Brighton are several places more or less frequented for sea-bathing, as *Shoreham*, a port of some commercial consequence, near the outfall of the Adur; *Worthing*, protected from bleak winds by the adjoining hills, where figs are grown and ripen properly; *Littlehampton*, at the mouth of the Arun, with Arundel Castle a short distance inland, the residence of the Dukes of Norfolk; and *Bognor*, the site of complete memorials of an extensive Roman villa, with rich mosaic pavements and painted walls, the colours of which are identical in composition with those employed in the houses of Herculaneum and Pompeii. *Chichester*, a few miles from the shore, towards the western border, possesses a cathedral distinguished by five aisles in the interior, and a campanile or lofty detached bell-tower, features shared by no other structure of the kind in the kingdom. It was also the only cathedral in England visible from the sea, and a noted landmark to mariners, till tower and spire fell, February 21, 1861, after a night of terrific tempests. Collins, bard of the *Passions*, a native of the place, lies buried in St Andrew's Church. At Eartham, a neighbouring village, Hayley long resided, and gathered the notables of his day to his charming villa—Gibbon the historian, Romney the painter, Flaxman the sculptor, Howard the philanthropist, Charlotte Smith, Miss Seward, Hurdis, Warton, Cowper, and Mrs Unwin. The property passed from him by sale to Huskisson the statesman.

HAMPSHIRE embraces a central part of the coast of the channel, marked by the inlets of Langston Harbour, Portsmouth Harbour, and Southampton Water; and has an insular

adjunct in the beautiful Isle of Wight. The mainland, watered by the Itchin, Anton, and Avon, is traversed by both ranges of the North and South Downs, which are connected by a transverse ridge, and both have their highest points within its limits. Though fertile in many parts, there is a considerable extent of heathy and wild woodland surface. The New Forest, an interesting tract of about twelve square miles, lies between the shore of the Channel, of Southampton Water, and the banks of the Avon, in which the supposed spot where the Red King, William Rufus, met his death from a chance arrow while hunting, is marked by a monumental stone. This district, which still produces a large quantity of oak and beech timber for the navy, presents landscapes combining woody scenes with vast sweeps of wild country, and distant marine views. The ancient practice of feeding swine in the forest is allowed to the borderers during the 'pannage' month, which commences towards the close of September, and lasts for six weeks. Besides these seasonal visitors, there is a semi-wild race in the more solitary parts, with half-wild horses of shaggy exterior and small dimensions, fallow and red-deer.

Winchester, in a valley between chalk-hills on the Itchin, is an episcopal city of very early origin and historic note, where sovereigns have been born, crowned, and buried. But its consequence belongs almost entirely to the past. The cathedral is spacious and singularly interesting. An old collegiate institution, connected with Winchester College, Oxford, furnishes preparatory training for the university, and is

Winchester Cathedral.

celebrated for its *Dulce Domum*, a vacation chant, at least two centuries old. Romsey, Petersfield, Andover, and Basingstoke, are other inland towns. The important places are maritime. *Portsmouth*, the grand naval arsenal of the kingdom, strongly fortified, is on the eastern shore of an inlet, which furnishes a safe, deep, and capacious harbour. The town, and its suburb *Portsea*, included within the same lines of defence, *Southsea* adjoining, and *Gosport* on the opposite side of the inlet, form one cluster of population, arranged in four divisions. The dock-yard, covering the great space of 120 acres; the gun-wharf, devoted to the accumulation of naval ordnance; the Royal Clarence victualling-yard, an immense provision storehouse and biscuit manufactory; Haslar Hospital, for the reception of sick and disabled seamen and marines; Nelson's old ship the *Victory*, moored in the harbour and carefully preserved; and the *Excellent*, with its gunnery-practice, are the sights of interest. New batteries and fortifications are in progress to meet the requirements of modern warfare. Numerous vessels always at anchor at Spithead, or going in and out of harbour, with military parades, bands, and salutes, render Portsmouth a scene of great animation.

*Southampton*, near the head of the estuary which bears its name, consists of a new town grafted on the old, in consequence of its extended commerce. Though perfectly blended, the line of division is marked by one of the ancient gates, which is now nearly central, and crosses the principal street. The position of the town in relation to the metropolis and the Atlantic, with docks capable of receiving the largest vessels, has made it the chief packet station for the West Indies and the Mediterranean. It contains a branch of the ordnance department, at which the maps of the national survey are executed. A public park, called the Watts Park, in honour of Dr Isaac Watts, a native, with a statue of him, is a recent addition. *Lymington* and *Christchurch* are watering-places near the south coast, along with *Bournemouth*, in a valley directly on the shore, distinguished as 'the evergreen valley,' 'the winter-garden of England,' from its tall firs and pines overshadowing a rich growth of the arbutus and rhododendron.

The insular part of the county, the Isle of Wight, is separated from the mainland by the channel of the Solent and the roadstead of Spithead, about four miles in average width, but contracted to a very narrow passage on the western side, by the projection of Hurst Castle shingle-bar. The greatest extent of the island is twenty-three miles from east to west, by fourteen from north to south, with a circuit of nearly sixty miles. The name occurs as *Wecht* or *Wiht* in *Domesday-Book*, a corrupt contraction of the *Vectis* of the Romans. High cliffs haunted by sea-fowl; caves hollowed out in them by the dash of the ocean; detached rocks, some arched, others needle-shaped or fantastically moulded; narrow chasms, locally called 'chines,' descended by streams, and clothed with copse-wood, are features of the coast scenery, with the 'undercliff' region, a long strip of the shore remarkable for its widely-broken surface, evidently formed by subsidence from heights in the background. Towards the narrow western extremity, the cliffs are among the loftiest on the English shores, from many of which samphire is gathered. In this direction are the well-known Needles, isolated rocks projecting above the waves, with Alum Bay, which presents a very extraordinary spectacle of variegated colours, from the strata on its side being impregnated with oxide of iron. The island is well watered, chiefly by the Medina, which divides it into eastern and western portions. It is also cut into two nearly equal parts, northern and southern, by a chain of hills and downs. *Newport*, the principal town, occupies a central position in the pleasant valley of the Medina, encircled with fertile hills, and has an interesting object adjoining in the ruins of Carisbrook Castle, in which Charles I. was confined. Part of the chamber he occupied remains, with a grated window through which he made an unsuccessful attempt to escape. *Cowes*, at the mouth of the river, on both shores of the estuary, is distinguished as the head-quarters of the Royal Yacht Club. Eastward on the coast is Osborne House, the marine residence of the Queen, with strictly-secluded grounds, and *Ryde*, offering animated sea-views to its crowds of summer visitors. *Ventnor*, on the south-eastern coast-line, the capital of the Undercliff, mostly modern, is famed for the mildness of its winter climate, exquisite scenery, and rich vegetation, which embraces myrtles and hydrangeas of large size, with tree-like fuchsias and geraniums.

**BERKSHIRE**, an inland district, with the Thames for its northern border, belongs entirely to the basin of that river, to which it contributes the Kennet, the Ock, and the Loddon. The valleys traversed by these affluents are renowned for their fertility; but on the eastern side of the county there is a considerable extent of waste surface, combined with woodlands. This is the locality of Windsor Forest and the Bagshot Sands. One of the most productive tracts, the spacious vale of the White Horse, has its name from a colossal figure of the animal, the emblem of the Saxon race, carved on the side of a bordering chalk-hill by incision of the material. This rude memorial was a well-known object soon after the Norman Conquest, and is supposed to have been formed to commemorate King Alfred's victory over the Danes, fought in the neighbourhood. The inhabitants of the vale have an ancient custom of assembling to 'scour the horse,' by removing the grass which tends to obliterate the figure.

*Reading*, on the Kennet, has a few manufactures, but is chiefly a mart for the agricultural products of the county. The burial-place of Henry I. and his queen is within the precincts of an abbey now in ruins. *Windsor*, on an acclivity rising up from the Thames opposite to Eton, has only interest derived from its palatial castle, the principal residence of British royalty, immediately east from the town. This magnificent structure occupies a commanding position, which renders it visible from afar, while from its battlements the eye ranges over a richly-varied and extensive prospect, embracing portions of twelve counties. The buildings and courts cover more than twelve acres, and are surrounded by a terrace, except on one side, nearly half a mile in length, said to be the finest walk of its kind in Europe. William the Conqueror planted a stronghold and hunting-lodge at the spot. Edward III., born at Windsor, raised a palace. Queen Elizabeth caused the north terrace to be constructed. But in its present state the castle is recent, having been rescued from dilapidation, thoroughly renovated, and provided with new accommodations since the year 1824. St George's Chapel, of Edward IV.'s time, within the precincts, is the largest, most varied, and elegant of the three chapels-royal. Henry VIII. and Charles I. slumber in the vaults without

monument or inscription, while in the tomb-house on the eastern side, constructed by George III., his remains repose, with those of his crowned sons, George IV. and William IV. Woodland scenes of exceeding beauty are in the Great Park, which is eighteen miles round; and Windsor Forest, fifty-six miles in circuit,

Windsor Castle.

abounds with glades which retain their primitive wildness and seclusion. *Newbury*, one of the historic towns, was the scene of two indecisive battles during the Civil War, 1643-44, in the first of which Lord Falkland fell. *Wantage*, is distinguished as the birthplace of Alfred the Great, where the event was commemorated by a gathering of people from various parts of the realm, October 25, 1849, a thousand years afterwards.

**WILTSHIRE**, to the westward, of a compact quadrangular shape, consists largely of upland tracts, which present the appearance of levels at a distance, but are traversed with downs, and furrowed with valleys. Thus Salisbury Plain, in the immediate neighbourhood of that city, is only properly so called with reference to the distant view, as it has almost everywhere a billowy surface, while intersected with numerous and extensive depressions. This remarkable region, about twenty miles long by fourteen broad, is an elevated, woodless, oval-shaped tract of chalk, clothed with a fine green-sward, in the midst of which, and on one of its most level sites, rises Stonehenge, a circle of enormous upright blocks, some of which must weigh thirty, and two at least seventy tons. Though commonly referred to the Druids, the monument remains a mystery as to its purpose. The county has for its principal rivers, the Kennet, flowing through Berks to the Thames; the Lower or Bristol Avon, descending to the estuary of the Severn; and the Salisbury Avon, travelling through Hants to the English Channel. Its general

superficial elevation may be inferred from the fact, that while there are no inflowing streams, the drainage is thus carried off in three different directions. A very considerable portion of the surface is in natural pasture, has never been touched by the plough, and is quite unenclosed. Hence the industry is chiefly pastoral, upon which manufactures in wool were early grafted.

*Salisbury*, an episcopal city, the offspring of the adjacent Old Sarum, which is now a deserted site, is situated near the confluence of two streams with the Avon. This copious water-supply led to the transference to a new position. Its cathedral, one of the purest specimens of the Early Gothic, has a spire rising 404 feet from the ground, the loftiest in the kingdom, remarkable for its lightness and rich ornamentation, 'a poem graved in stone.' The neighbourhood is associated with many names of eminence—as Addison, born at Millston, George Herbert, rector of Bemerton, and Sir Philip Sidney, who wrote his *Arcadia* at Wilton House. *Wilton*, from which the county derives its name, has long been a seat of the carpet manufacture. *Devizes*, centrally situated, produces silks, but is principally connected with agricultural products, and was celebrated for its market in the time of Henry VIII. *Trowbridge*, on the western side, with *Bradford*, *Melksham*, and adjacent places, have fine broad-cloths and other woollen goods for their staple. *Malmsbury*, in the same district, was at a very early date the seat of a celebrated monastery, and the birthplace of one of the best of English chroniclers, hence called William of Malmsbury. The nave of the church belonging to the ancient establishment is now one of the parish churches. *Marlborough*, on the north-east, in the midst of chalk-downs, has a supposed Druidical monument at Abury in the vicinity, similar to Stonehenge, with barrows or tumuli in the neighbourhood, one of which, Silbury Hill, evidently artificial, is the most enormous tumulus in Europe. If the barrows are funereal monuments, Wiltshire may be regarded as a vast grave-yard, as it is studded with them, of varying form and size, from low hillocks to colossal mounds.

The Chesil Bank from Portland.

DORSETSHIRE, a maritime county, has an interesting coast-line, marked by the indentations of Poole Harbour and Weymouth Bay, with the promontory of St Alban's Head,

and the so-called Isle of Portland, really a peninsula attached to the main shore by the Chesil Bank. This bond of union is the most extraordinary formation of the kind in Europe. It extends upwards of ten miles, running parallel with the mainland, and has a narrow arm of the sea on the eastern side, with the open deep on the other. It is generally about two hundred yards broad, occasionally a quarter of a mile, and rises with a slope about forty feet above high-water mark. The bank consists of shingle or pebbles loosely resting upon blue clay. These from south to north diminish from three or four inches in diameter to the size of horse-beans; and so regular is this diminution, that, on the darkest nights, the smugglers who used to land could tell precisely their position by examining the stones. On the coast westward, the cliffs are remarkable as a grand repository of the fossil saurians, which were here first exhumed. The interior of the county presents a succession of downs, some of which are crowned with small round clumps of hazel and other woods, locally called 'a hat of trees.' Its principal rivers are the Stour and the Frome.

*Dorchester*, on the latter stream, a few miles from the coast of the Channel, is of very ancient date and great interest, as the site of many British and Roman works, the most remarkable of which is an amphitheatre of vast dimensions in the immediate vicinity, the most perfect in the kingdom. *Shaftesbury*, the largest inland town, is towards the border of Wilts. *Poole*, a seaport, in command of one of the safest harbours on the Channel, an inlet of some extent, near its mouth, and *Wareham*, at the further extremity, are largely engaged in transmitting potter's clay to the seats of earthenware production. The clay, of very pure quality, is obtained from the adjoining isle or peninsula of Purbeck, which forms the south-eastern section of the county. *Weymouth*, on the western side of its semicircular bay, is chiefly a bathing-place, brought into

Weymouth from the North.

notoriety by the visits of royalty to it at the close of the last century. The beach consists of a long stretch of gently-sloping sand, smooth and firm at low water; the climate is mild and equable; and hence winter is the visiting season nearly as much as summer. Portland Island, as it is styled, in view from the esplanade, is a remarkable district, about nine miles in circuit, with steep rugged shores, consisting mainly of a mass of freestone, thrown up in the Verne Hill, at the north extremity, to the height of 458 feet. This stone has been extensively quarried for two centuries and a half, and used for many public buildings in the metropolis, Whitehall, St Paul's, and Somerset House. The island is now the seat of a great convict

establishment, with an immense breakwater projecting from the eastern side, recently completed by convict labour, and forming a harbour of refuge on the exposed coast, intended to be a principal naval station protected by formidable batteries on the Verne heights. There are several villages, all of stone, the largest of which, on the slope of the hill, has the name of Fortune's Well, from a copious spring. *Bridport* and *Lyme Regis* are trading ports on the western part of the coast-line. The latter, with striking environs, has become a fashionable watering-place, and is celebrated for its defence by Blake on behalf of the Parliament in 1644, and the landing of Monmouth in 1685. By Miss Anning, a native of the town, the fossil saurians were discovered in the lias cliffs of the neighbourhood.

SOMERSETSHIRE, extending along the southern shore of the Bristol Channel, embraces a large proportion of hilly and of lowland surface. The Mendips, a very definite ridge, rich in zinc and calamine, rise on the north-east; the Quantock Hills are western and more elevated; but the wild region of Exmoor, in the extreme west, contains the highest point of the county in the superb brown mountain of Dunkerry Beacon, 1706 feet above the sea-level. The hilly ranges are separated by spacious valleys, and there are also dividing tracts of very low flat land, marshes and fens in their natural condition, which is to some extent retained. One of these districts, where a piece of rising-ground covered with wood was insulated by flood-waters and a morass all but impassable, is memorable as the place to which King Alfred retreated in his misfortunes. It afterwards received the name of Athelney, or the Prince's Island. The spot can be identified in the parish of East Ling, though the natural features have mostly disappeared, and Athelney now names a station on the railway between Bridgewater and Yeovil. Nearly all the drainage of the county is carried to the Bristol Channel, chiefly by the Parret, and its affluent the Tone.

*Taunton*, the county town, on the latter stream, is situated in a beautiful valley, surrounded with orchards, gardens, and rich meadows, overlooked by the noble church of St Mary Magdalen, in the decorated and later English styles. The town has manufactures of silk and lace, but its business relates chiefly to agricultural produce. It suffered severely from the 'bloody assize' held by the notorious Jeffreys on account of Monmouth's insurrection. *Bath*, a large and splendid city, is situated in the deep valley of the Lower Avon, and on surrounding acclivities which display to great advantage its ranges of elegant houses, built of the white oolitic freestone of the vicinity. It owes its origin and importance to its thermal waters, and the beauty of the site, though not so popular at present with the fashionable world as in the last century, when it was the gayest place in the kingdom. The springs, three in number, differ slightly in their temperature, that of the Hot Bath being 117°, the King's Bath 114°, and the Cross Bath 109°. They were known in the time of the Romans, and the place is mentioned under the name of *Aque Solis* in the Antonine Itinerary. In the early Saxon period it was called *Achamunnum*, 'the city of the sick.' Bath is at the head of a diocese jointly with *Wells*, small, neat, and unpretending, but with a magnificent cathedral, situated at the southern base of the Mendip Hills. *Glastonbury*, a few miles distant, now a seat of the shoe trade, is one of the most ancient ecclesiastical sites in Britain, with interesting ruins of its famous abbey, the abbots of which lived in almost regal state, till the last was hanged in his robes for contumacy by order of Henry VIII. *Frome*, towards the Wiltshire border, has considerable woollen manufactures, and gloves are extensively made at *Yeovil*, on the verge of Dorset. *Bridgewater*, a shipping port on the Parret, near its mouth, produces the peculiar kind of red brick, sold under the name of Bath brick, and used for scouring purposes, composed of a mixture of clay and sand obtained from the river. To the eastward lies the field of Sedgemoor where Monmouth was defeated in the reign of James II, the last important battle fought on English soil. Northward on the coast from Bridgewater Bay are the small watering-places of *Weston-super-Mare* and *Clevedon*. The last was once the residence of Coleridge, and contains the graves of Hallam, the historian, and his family. The dialect of the county, passing into Devon and Dorset, now much modified and confined chiefly to the rural districts, is very peculiar. Its distinctive features are the use of obsolete Saxon or Danish terms, and of obsolete forms of speech, with a deep intonation, and a vicious mode of pronouncing some of the consonants. The *s* and *f* are converted into *z* and *v*, as in *Zummerzet* for 'Somerset' and *vather* for 'father.' The sound of *d* is frequently given to *th*—thread being pronounced *dread* or *dird*, and thrash *drash*. It is common to meet with *we'm*, *you'm*, *they'm*, for we are, you are, they are; *Iec* is substituted for *I*, *er* for *he*, *her* for *she*; and *war* always takes the place of *was* and *were*. In the *Exmoor Courtship*, a production of the last century intended to illustrate the dialect, Margery, having dismissed her suitor with disdain, calls him back with an ulterior object in view, but ostensibly to 'zup a zip o' zider.'

DEVONSHIRE, the third largest county, lying between the English Channel on the south

CITY OF MEXICO

Drawn by G. F. Sargent

Engraved by J. G. Smith

and the Bristol on the north, has generally steep rocky shores on both sides, abounding with extremely picturesque and impressive scenery. The southern coast-line is by far the most extensive, owing to the numerous inlets and projections. In the interior, the features of the surface are very varied, the soft and the stern, the fertile and the sterile, being equally prominent in its aspect. The high regions of Dartmoor and Exmoor, previously noticed, with their masses of granite, tracts of bog, and piercing winds, remarkably contrast with the luxuriant vale of Exeter, and with the bays of the south coast, where the winter climate is so mild that invalids, to whom a genial air is essential, are attracted to them from distant parts of the country. Rivers are numerous, chiefly flowing to the southward, as the Exe, Dart, Plym, Tavy, Teign, Sid, and Axe, which give their names to towns on their course, or at their mouths, *Exeter, Dartmouth, Plymouth, Tavistock, Teignmouth, Sidmouth, and Axminster*. The streams flowing to the opposite basin, or the Bristol Channel, are the Tawe and Torridge. Tin, copper, lead, and manganese, occur among the minerals, with granite quarried for building purposes, and potter's clay forwarded to the pottery districts. Rich dairy produce is extensively sent to the metropolis, and cider is produced from the apple-orchards, chiefly for the consumption of farm-labourers.

*Exeter*, the head of a diocese, is a large and handsome city, on the east bank of the Exe, some miles above its outlet. Though of great antiquity, it has a modern appearance, the old houses being chiefly in the by-streets. The cathedral, built at different periods, is yet of uniform architecture, and of an intermediate character, not being either ornate or plain, light or heavy, belonging to the Middle Gothic. *Exeter College, Oxford*, was founded by one of the prelates in the former part of the fourteenth century; and *Sir Thomas Bodley*, the founder of the Bodleian Library, was a native of the city. *Tiverton*, twelve miles higher up the

Dartmouth.

river, with lace manufactures; *Honiton*, in the eastern portion of the county, a centre of the same industry to a considerable district; and *Tavistock*, on the western side, the birthplace of Sir Francis Drake, producing woollen goods, are among the more important of the inland towns. The great group of population is at *Plymouth*, on the south-western coast, which, with *Devonport*, its neighbour, formerly called Plymouth Dock, forms one of the principal naval arsenals, strongly fortified. To the old dock-yard, scarcely less extensive than the one at Portsmouth, steam-docks have recently been added, extending over an area of seventy-three acres, at an adjoining site, for the outfit and repair of war-steamers. Three miles out in Plymouth Bay is

the breakwater, constructed for the protection of the harbour, nearly a mile long, which consumed upwards of 3,000,000 tons of stone in its formation, and yet seems only a thin dark line on the surface of the water, as seen from the shore. Fourteen miles distant, in the broad opening of the bay, is the Eddystone Light-house, fixed on a rock submerged by the waves at high water, which has withstood the shock of storms for more than a century. The South Devon coast is studded with small towns and large villages, some of which are beautifully situated in romantic bays, well protected by high lands from ungenial winds, where myrtles clothe the shores, lemon and orange trees bear flower and fruit in the gardens, and the mean winter temperature is as mild as in far more southerly latitudes. They are sought as watering-places in summer, and are the retreats of the delicate in winter. Passing from east to west, Sidmouth, Exmouth, Dawlish, Teignmouth, Torquay, Dartmouth, and Salcombe, answer generally to this description. *Torquay*, the largest, is interestingly seated on the northern shore of Torbay, a considerable inlet, celebrated as the landing-place of the Prince of Orange in 1688, and a point of the coast to which Napoleon was brought by an English man-of-war, prior to his final exile to St Helena. 'What a beautiful country!' he exclaimed, 'how much it resembles Porto Ferrajo in Elba!' North Devon has *Barnstaple*, on the river Tawe, for its principal port, with *Ilfracombe*, *Lynmouth*, and *Linton*, associated with very striking scenery, and rare forms of marine life, the summer resorts of many inland dwellers. Lundy Island, less than three miles long by one broad, and twelve miles off shore, at the mouth of the Bristol Channel, where it opens as if to receive the rolling billows and clearer waters of the Atlantic, belongs to the county. It is a sombre mass of granite with a few inhabitants, so guarded by steep or overhanging cliffs, and girded with insulated rocks, that according to a popular saying, 'there is no entrance but for friends.' The French effected a landing by stratagem in the reign of William and Mary, and remained for a few days the lords of the islanders and their rabbit-warrens.

**CORNWALL**, the south-west extremity of Britain, is a peninsula surrounded by the sea on all sides except the east, where it is bounded by Devon. The shores of the county are generally rocky and high, occasionally wild and stern, broken by bays, especially on the southern side, and marked with far advancing headlands. Among the latter, the Lizard, chiefly a mass of serpentine, is the most southerly point of the entire island, and the Land's End, a projection of granite, is the most westerly part of England. The former, lofty and precipitous, overlooks a long stretch of noble coast, with the ocean grandly in view, and is interesting to the botanist from the splendid heaths which flourish on the serpentine formation. The latter, with a name which at once excites the imagination, is not distinguished by any peculiarity from several neighbouring promontories; and the stranger reaches the particular ridge of rocks as the result of inquiry. But less than a mile distant, the district is indicated by a house bearing the inscription on one side, 'This is the first Inn in England,' and on the other, 'This is the last Inn in England,' a curious instance of the exclusive view taken by the inmates of the attributes of their locality. The country between the two remarkable headlands is indented by the beautiful expanse of Mount's Bay, the largest of the inlets, which derives its name from St Michael's Mount, an isolated conical rock, 250 feet high, on the northern side. It forms a semi-island, being completely insulated at high-water, but connected with the main shore by a causeway, which is left dry on the recession of the tide. From the summit, crowned by a castellated ecclesiastical structure fitted up as a private residence, the view is magnificent. In the interior of the county, the surface consists generally of slaty rocks, with a substratum of granite, which has burst through the covering at intervals, and appears in large detached masses. From the decomposition of the granite, beds of porcelain-clay have been formed, which is extensively shipped to the seats of porcelain production. The many singularly-shaped detached rocks, called 'hurlers,' 'rocking-stones,' and the fantastic 'Cheesewring,' have probably been fashioned by the decomposing process, assisted by the rains, which have removed the softer parts of their material, and left the hard skeletons remaining. Tin and copper are the important mineral products, but lead, silver, zinc, manganese, antimony, and cobalt, are also obtained, workings for which are occasionally conducted in very extraordinary sites.

The Botallack copper-mine is entered on the very verge of cliffs of the boldest character, which rise abruptly from a boisterous ocean; and, as the excavations are carried beneath its floor, the thunder of the

waves overhead is distinctly heard by the miners. The pilchard-fishery is also a leading industry, the value of which is indicated by the common toast of 'tin and pilchards.' *Bodmin*, conveniently situated in the centre of the county, ranks as the capital, but is of very moderate size, as are all the Cornish towns. *St Austell*, near a bay of the south coast, has a large tract of kaolin in its vicinity, and several stream-tin works, one of which, called the Happy Union, in the valley of Pentuan, has yielded for generations a considerable quantity of the metal. The valley contains an accumulation of gravel, sand, and clay, extending in places to the depth of sixty feet, below which is the tin-ground, resting on the solid rock. The ore occurs in the form of coarse sand, and of pebbles up to ten pounds' weight. *Truro* and *Redruth*, on the south-west, besides being among the most important towns, are the centres of a large but scattered population, being in the principal copper-mining district. In this neighbourhood, the natural aspect of the landscape is unattractive, consisting of moors enlivened only by the furze and heath, or of granite protuberances, bare of vegetation. But the transforming effects of industry appear on every hand, in cottages of stone with white-washed fronts, two or three together, or arranged in hamlet-like groups, possessing gardens in which vegetables are raised for use, and flowers for ornament. These are occupied by the miners. At the same time, tall engine-houses and still taller chimneys are prominent in the scenery. At the Consolidated Copper-mines, in the parish of Gwennap, the excavations have a total extent of sixty-three miles. *Falmouth*, on the shore of a south-western bay, often mentioned as the rendezvous of the fleet in time of war, and once a principal mail-packet station, has lost much of its importance in the last respect, having been superseded by other places, and is now chiefly a trading port. *St Ives*, on the north coast, and *Penzance* on the south, are the head-quarters of the pilchard-fishery. Millions are annually taken. A small proportion is sold fresh on the beach at a very cheap rate, but the greater part is cured, packed in hogsheads, and exported to Italy. *Penzance*, beautifully situated on the western side of Mount's Bay, is the most westerly English town, famed for the mildness of its climate. Sir Humphry Davy, born in the parish, served his apprenticeship in the town. On the opposite shore of the bay, *Marazion*, the 'Bitter Zion,' received its name from the Jews, who occupied the place, and farmed the tin-mines, till Edward I. banished the race from the kingdom. Between *Penzance* and the Land's End, a slight divergence from the road leads to the celebrated Loggan Stone. This is a mass of granite, estimated to weigh upwards of eighty tons, so delicately poised on the top of another rock that the strength of one man will suffice to set it in motion. It was once vulgarly supposed only to respond in this way to the touch of the innocent.

Coast near Teen, Cornwall.

' Firm as it seems,  
Such is its strange and virtuous property,  
It moves obsequious to the gentlest touch  
Of him whose breast is pure; but to a traitor,  
Though o'en a giant's prowess nerved his arm,  
It stands as fixed as Snowdon.'

On the extreme western horizon, looking out from the Land's End in ordinarily clear weather, the Scilly Islands may be seen, about thirty miles distant. They form a compact group of from one to two hundred islets and rocks, rise out of a deep sea, and with little exception are composed of granite, which the tempests have worn at various points into strange and striking shapes. So stormy is the climate that there are said to

be, on an average, not more than six really calm days in the year. Forty of the islands bear herbage, consisting of thin short grass intermixed with heath, dwarf-furze, fern, and moss. Twenty-seven have an area of an acre and upwards. Six are inhabited—St Mary, Treseo, St Martin, St Agnes, Bryher, and Samson. St Mary, the largest, has a circuit of from nine to ten miles. It contains *Hugh Town*, the little capital, on the western side, and has some timber and fruit-trees in a few sheltered spots. The names of the Piper's Hole, the Cow and Calf, the Hellwethers, Buzza Hill, the Dutchman's Carn, the Kettle and Pans, the Monk's Cowl, the Tooth, the Pulpit, the Hangman's Isle, and the Old Man cutting Turf, designate caves, reefs, and rocks. Groups of cabins may be occasionally met with, ambitiously styled Bristol and London. The inhabitants are fishermen, sailors, and pilots. In the year 1707, a fleet under Sir Cloudesley Shovel was driven in thick tempestuous weather upon the south-western members of the group, and totally wrecked, with the loss of 2000 lives. The body of the admiral was cast ashore on Porth Hellick, the 'cove of willows,' in Isle St Mary, and buried, but was subsequently removed to Westminster Abbey for interment.

Roman Wall, Northumberland.

Moel-Siabot from the Lleddwr Valley.

Wales, once an independent territory, was gradually encroached upon under the Norman sovereigns of England, by powerful nobles who were placed in charge of the border districts, or the Marches, with the title of Lords Warden, for the purpose of securing them from attack. But these aspiring barons soon added the work of incursion to the task of guardianship. With their own retainers, they sought aggrandisement from the Welsh; and, as their private enterprises added to the dominions of the crown, they were allowed to keep possession of the conquered lands, securing them with forts and castles. In this way, the whole maritime district of South Wales was wrested from its ancient occupiers, and formed a convenient highway to Ireland in the time of the first Plantagenet, who embarked at Milford Haven for the conquest of the sister-island. North Wales, or the principedom of Aberffraw, remained independent to the reign of Edward I, who effected its reduction; and began the division into counties and hundreds, in order to assimilate the

acquisition to his English dominions. Eight only of the counties were constituted by him. The remaining four, Radnor, Brecknock, Montgomery, and Denbigh, were created by Henry VIII., in whose reign the principality was fully incorporated with the kingdom.

ANGLESEY is separated from the mainland of Wales by the Menai Strait, but is connected with it by a suspension and a tubular bridge across the channel, both of which are justly classed with the most remarkable monuments of engineering skill. The insular county, about twenty miles long by seventeen broad, and upwards of eighty miles in circuit, is of great public importance as the nearest and most convenient point of communication with Dublin, traversed by the railway from Chester to Holyhead. Its general aspect is unattractive, being comparatively flat, and deficient in woodland scenery, but it possesses considerable mineral wealth. A gray marble is extensively quarried for building purposes, and a vast amount of copper has been obtained from the Parys mines. The island, a chief sanctuary of the Druids and their last stronghold, is rich in antiquities and memorials of their time. It was originally distinguished by the old British name of *Món*, signifying 'remote,' whence the *Mona* of the Romans, and received from the Saxons the present denomination, *Angles ey*, 'the isle of the Angles or English.' Priestholm or Puffin Island, close in shore at the north-east extremity, has the former name from a religious recluse of the sixth century, who made it his retreat, and the latter from vast swarms of the puffin- auk, which resort to it as a breeding-station. It was the scene of the melancholy wreck of the *Rothesay Castle* in 1831, since which period a light-house has been erected on the southern point. On the western side of Anglesey, lies the semi-island of Holyhead, detached by a sandy channel fordable at low water, and connected by an artificial embankment, with a bridge near the centre, through which the tide rushes with extreme violence. The northern coast scenery of this appendage is wild and rocky, marked with precipices and caverns, haunted by innumerable sea-fowl, while the falcon eagle wheels round the highest crags.

The insular capital, *Beaumaris*, a port with some coasting-trade, but chiefly dependent upon summer visitors, is pleasantly situated on the shore of a spacious bay, at the northern opening of the Menai, and commands fine views of the Caernarvonshire Mountains, overtopped by the majestic Snowdon. Ruins remain of a castle, the parent of the town, erected by Edward I., now ornamented with walks, shrubberies, and plantations, for public recreation. *Amlwch*, on the north coast, is indebted to the copper-mines in its vicinity, for its rise from a petty hamlet to a thriving town, and has a harbour excavated out of the solid rock as an outlet for their produce. The metallic wealth of the Parys slate-mountain was discovered March 2, 1768, a day which has ever since been observed as a festival. The site speedily became renowned for its productiveness, and the little expense involved in profiting by it. No shafts were necessary, but an immense mass of ore had simply to be quarried on the summit of a hill of moderate elevation. It added vast wealth to the family of the Marquis of Anglesey, and raised to opulence that of Mr Hughes, a Welsh curate, who was in part proprietor of the ground. The yield has long declined, but the mines are still worked, and are estimated to have furnished a grand total of 85,000 tons of pure copper, valued at the enormous sum of £7,650,000. *Aberffraw*, near the south coast, now a small village, was once the seat of the native princes of North Wales, in memory of whom the little inn, resorted to by anglers, has the name of Prince Llewellyn. *Holyhead*, on the northern side of its semi-island, the largest town, has become so by being made the government steam-packet station for Dublin, while brought into direct communication with London by railway. At great national cost, the harbour has been improved, and by the construction of a huge pier or breakwater, the exposed bay has been converted into a secure roadstead, available for vessels of the largest class, in all winds and all states of the tide. For the execution of this last work, material was at hand in the adjoining rocks, which were dislodged by means of gunpowder and the voltaic battery. On one of these blasting occasions in the year 1857, which attracted visitors from afar, a charge of 16,000 pounds of powder brought down not less than 120,000 tons of the hardest quartz, in masses of various sizes, not one of which was propelled a hundred yards from the face of the rock, while a goat browsing on the verge at the time, descended with the débris, but sustained no harm beyond the fright.

The Menai Strait is about twelve miles long, by from one-third to half a mile in average breadth, but has a contraction to less than 200 yards at one point, through which the tide flows with such violence as to resemble the rapids of a great river. It was crossed by the Roman general Suetonius, who passed his

infantry over in flat-bottomed boats, while the cavalry swam their horses. Previous to the erection of the first bridge, connection between the opposite shores was maintained by six ferries, while the herds of Anglesey cattle were compelled to effect the passage by swimming. The Suspension Bridge, a beautiful and durable specimen of engineering, towards the north extremity of the strait, has a total length of about one-third of a mile; a height of a hundred feet above high water; a weight, as to the iron-work, of upwards of 2000 tons; and for more than thirty years it has borne uninjured the crossing of heavy vehicles, and the strain of storms. It was completed in the early part of the year 1826, and on the morning of Monday, January 30, the London mail passed over it. About a mile to the southward, the channel is spanned by a bolder and more novel highway—the Britannia Tubular Bridge—constructed for carrying the Chester and

The Menai and Tubular Bridge.

Holyhead Railway. It consists of two lines of iron tubes, or hollow girders, each more than a quarter of a mile in length, which rest on three towers, besides the abutments on the shore, and are at the bottom rather more than a hundred feet above high water. These enormous corridors were put together on the land, conveyed by pontoons to the base of the towers, and raised to their final resting-place by means of hydraulic presses, considered to be the most gigantic mechanical operation ever performed. The first train passed through this extraordinary structure on March 6, 1850. Not only are the tubes strong enough to bear their own weight through the vast span between the towers, but a line-of-battle-ship might be suspended from them without danger. The most furious gales that sweep the strait cause only a trifling oscillation; but, like a huge snake, the iron bridge creeps backward and forward, dilates and contracts during the twenty-four hours, from half an inch to one or more, as the effect of change of temperature.

CAERNARVONSHIRE, part of the adjoining mainland and its north-western extremity, is the most elevated portion of Wales and of South Britain, largely overspread by the Snowdonian mountains. The rocks are of majestic proportions and sharp outline, disposed in the wildest manner, but are mostly bare of vegetation, except in hollows filled with peat or clay, where a coarse herbage grows, sustaining a hardy race of sheep and small black-cattle, with a number of goats. The principal heights are Carnedd Dafydd, Carnedd Llewellyn, and Snowdon, respectively 3429, 3469, and 3590 feet above the sea. Level and fertile tracts occur to a limited extent, especially in the vale of the Conway River, which forms for some distance the eastern border, and flows to the north coast, expanding into a considerable estuary. The Seiont and the Ogwen descend westward to the Menai, and the Glasslyn southward to Cardigan Bay. These and other

streams are connected with small but very charming highland lakes. Slates of the finest quality are wrought at Penrhyn and Nantle, where the quarries are of unsurpassed magnitude, give employment to thousands of workmen, and have transformed mountain-wastes into scenes of industry and prosperity.

Pass of Llanberis.

*Caernarvon*, at the mouth of the Seiont, near the southern entrance of the Menai, is a well-built town and considerable shipping port. It is also a place of great antiquarian and historical interest. The ancient walls remain, but the houses and streets pass far beyond their limits; and the stately castle is still externally entire, one of the most formidable fortresses of the middle ages. Edward II., commonly called Edward of Caernarvon, was born here, and became the first English Prince of Wales, a title which has ever since been bestowed upon the eldest son of the reigning sovereign. *Bangor*, at the northern opening of the strait, a small episcopal city, occupies a romantic valley between two rocky ridges, within easy distance of very fine scenery, and is a favourite place of summer resort. The cathedral, a plain but pleasing building, contains the graves of several Welsh princes and bishops. *Conway*, at the mouth of the river of that name, exhibits the ancient and the modern in close contact. The old fortifications, consisting of a wall, with towers, battlements, and gateways, are in a good state of preservation; the remains of the castle, once a noble stronghold, are extensive; while hard by, the river is crossed by a suspension and a tubular bridge, side by side. The pearl-muscle is found in the stream, and was abundant there in the time of the Romans. Coracles are in common use with the Conway fishermen, as in several other parts of Wales, identically the same in construction as the craft which floated the ancient Britons. They are made of wicker-work or laths, covered with skins or strong canvas coated with pitch, and are so small and light as to be readily carried upon the backs of their owners. *Llandudno*, a modern and elegant watering-place, is seated near the base of the Great Orme's Head, in a detached portion of the county, which forms its north-eastern extremity. In the opposite south-western direction several islands fringe the shore, the largest of which, Bardsey, was a favourite retreat of the bards, and hence obtained from the Saxons the name of *Bards-ey*, 'the isle of the

bards.' It was called by the Britons, *Ynys Erilli*, 'the island of the current,' from the strong tidal flow between it and the mainland, which often renders communication difficult and perilous.

Bangor.

DENBIGHSHIRE, the border county on the east, and the most populous division of North Wales, has a short northern coast-line, but considerable extension inland, with an extremely irregular shape. Though generally hilly and occasionally rugged, the elevations are not important, and there are many finely-contrasted scenes of quiet beauty, particularly in the lovely vales of Clwyd and Llangollen. The latter is traversed by the Dee, which passes through the county from west to east. The Conway flows along the western border, and the Clwyd along the eastern. Two noble aqueducts by Telford carry the Ellesmere Canal across the valley of the Dee and that of its affluent the Ceriog, but are now surpassed in extent and massive grandeur by two viaducts over the same streams for the Shrewsbury and Chester Railway. Coal-pits, ironworks, lead-mines, and slate-quarries are numerous, indicating the chief mineral produce of the district.

*Ruthin*, the assize town, occupies the slope and summit of a hill rising up from the right bank of the Clwyd, not far from the southern termination of its vale, in the midst of very pleasing scenery. Its Welsh name, *Rhudd-ddyn*, signifies the 'Red Fortress,' in allusion to a castle built by Edward I., so called from the colour of the stone of which it was constructed, now replaced by a corresponding modern edifice. *Denbigh*, a genteel town, is likewise on a steep hillside, about the centre of the vale, but some distance from the western bank of the river. Speaking of the valleys of Wales, Burke has remarked, that 'the Clwyd is the most rich; Llangollen, the most picturesque; Ffestiniog, the most abounding in beautiful and sublime combinations; the Glamorgan, the most rural; the Usk, the most graceful; and the Towy, by far the most adapted for a quiet and elegant retirement.' Fine ruins of Denbigh Castle crown the summit of the hill, once under the government of Richard Myddelton, father of Sir Hugh, the enterprising projector of the New River, London. *Wrexham*, the largest town, and *Ruabon*, a populous parish, are the principal centres of mining industry. In the neighbourhood of *Abergele*, a small seaport and bathing-place, Mrs Hemans spent many of her early years, and formed that attachment to Welsh scenery, music, and traditions, which

appears in her poems. *Llangollen*, a lively village in the excursion season, as a station for tourists and anglers, gives its name to the charming valley in which it is situated, through which the Dee flows with a rapid current. The high conical hill of Dinas Brân, crowned with the remains of a fortress, rises directly opposite, and Valle Crucis Abbey, is a striking ecclesiastical ruin in the immediate vicinity.

Snowdon from Capel Carig.

FLINTSHIRE, the smallest of the Welsh counties, but with a denser population than any other except Glamorganshire, consists of a narrow maritime tract between the mouth of the Clwyd and the estuary of the Dee, with a detached portion wholly inland. It corresponds to the preceding district in superficial features and mineral produce, has numerous antiquities, interesting historical relations, and a mixed race of inhabitants, partly Welsh and partly English, owing to its position on the frontier of England. Offa's Dyke, a ditch and rampart constructed in the eighth century by the powerful Saxon king of that name, to protect his territory against the Welsh, had here its northern termination, and extended thence southward to the outlet of the Wye. Some portions of it remain, and the line may be generally traced.

*Flint*, a small shipping port on the Dee estuary, simply gives its name to the county, having been superseded by *Mold*, on the Alyn, as the assize town. But *Holywell* is the chief manufacturing and mining centre. This place has its name from a spring early consecrated to St Winifred, the most copious in the kingdom. It is estimated to discharge upwards of twenty tons of water per minute, is very little affected by long droughts or excessive rains, varies but slightly in its temperature, and is so clear that the minutest object at the bottom of the basin may be readily perceived. In former times, afflicted pilgrims came from afar both to bathe in the well and drink of the water, which was believed to possess supernatural efficacy in

the removal of disease. It is now more usefully employed in driving the machinery of several factories. *St Asaph*, with the rank of a city, being the seat of an episcopate, has only village dimensions, but exhibits a picturesque appearance, occupying an eminence near the confluence of the Clwyd and Elwy. The see is of very ancient date, and numbers the distinguished prelates, Beveridge and Horsley, in the list of those who have presided over it. The name is derived from that of a pious scholar of the sixth century, *Asa* or *Asaph*, who became the first bishop. *Rhuddlan*, three miles to the northward, now an obscure town, was formerly a place of great importance, and retains memorials of it in massive fragments of a strong fortress. It was the grand military post of Edward I., and his magazine of provisions during the conquest of the principality. Here he held a parliament in 1283, which enacted the Statute of Rhuddlan, declaring formally the annexation of Wales to England, while charters of incorporation were granted to various towns, and old customs deemed detrimental were abolished in favour of others more advantageous. Part of the wall of the building in which the council sat is still standing, and is distinguished by a tablet bearing an appropriate inscription. *Morfa Rhuddlan*, or the marsh of Rhuddlan, denominates the lowland between the town and the sea, and is also the name of a sweetly-plaintive air composed on the occasion of a great slaughter of the Welsh in the district in the Saxon times. *Rhyl*, on the coast near the outlet of the Clwyd, with smooth firm sands adjoining, is a bathing-place wholly modern, having been called into existence by the Chester and Holyhead Railway, which affords easy access to it from the populous districts.

MERIONETHSHIRE, on the west coast, extends along the shore of Cardigan Bay, from the mouth of the Glasslyn on the north to that of the Dovey on the south. Besides these border rivers, it is watered by the Mawddach, the Dwyrid, the Disinwy, and the upper course of the Dee, with many torrents and cascades; contains Lake Bala, and a great number of pools dispersed among the hills; and is throughout a region of mountains and deep valleys, which present a constant succession of magnificent landscapes. The highest summits are Cader Berwyn, 2563 feet; Arrenig, 2816 feet; Arran Fowddy, 2955 feet; and Cader Idris, 2959 feet. Some of the valleys are remarkably fine, especially those of Ffestiniog and Dolgelly, and contain fertile tracts, but the soil is in general poor and only fit for pasturage. Cattle and sheep are fed upon the hills, and the small native ponies are reared, called Merlins, sure-footed and hardy, though not so common as formerly. Slates are quarried in various places; several lead-mines are worked; and some gold is obtained by crushing the auriferous veins which traverse the primary rocks.

This county is the only division of the principality which retains its old British name, *Merionydd*. It is very thinly peopled, contains but few antiquities, and has little historical interest, owing to its remoteness from the scene of action during the struggles of the Welsh with the Saxons, Normans, and early English. At the present date, there is no person of title resident within its limits—no borough, mayor, or corporation; and it is not uncommon for the county jail to be without a single tenant. *Dolgelly*, the principal town, has its name, which signifies 'the dale or vale of hazels,' from the wide and wooded valley in which it is situated, through which an affluent flows to the Mawddach. Mountains, lakes, and waterfalls distinguish the neighbourhood. Southward rises the majestic mass of Cader Idris, with its steep and frowning precipices, the summit of which is six miles distant. The view from it embraces Snowdon, with its dependent heights, on the northern horizon, and Plinlimmon on the southern, with the whole semicircular sweep of Cardigan Bay, while eastward the eye catches indistinctly the Wrekin, rising up dimly from the plain of Salop. The town has a manufacture of coarse woollens, and is a frequented station for tourists. It was for some time the head-quarters of Owen Glendower, during his unsuccessful rebellion in the reign of Henry IV., who survived to die a natural death, hid in various retreats, one of which still bears the name of *Og Owain*, or *Owen's Cave*. *Barmouth*, the only port, ten miles westward, a summer resort for sea-bathing, is beautifully situated on the northern shore of the Mawddach estuary, at the foot and on the side of a steep rocky acclivity. The route between the two places presents at every point the most splendid scenery. Nearly midway is the *Vigra* gold-mine, with its crushing mill, romantically seated on a mountain-stream. *Harlech*, near the coast northward, once an important borough, has dwindled to an insignificant village by the side of its ruined castle. *Bala*, at the lower extremity of the lake to which its name is given, clean and neat, is the assize town alternately with Dolgelly, while Harlech remains the head of the county for parliamentary purposes. The lake, often called *Pimble-mere*, is about four miles in length by half a mile in average breadth, has great depth, very pure water, and abounds with fish.

MONTGOMERYSHIRE, wholly inland, and of compact form, belongs almost entirely to the basin of the upper Severn, which descends from the side of Plinlimmon, on the south-western border. This mountain, 2481 feet in height, consists of three huge masses, the loftiest of which is further divided into two heads, each marked by a *carnedd*, or pile of stones. Natives of the principality rarely visit the summits without adding a stone to the

heaps. The general surface is rugged, yet well wooded, occupied with sheep-walks, except in the great river-valley, where the soil is fertile and under tillage, and the Welsh flannel manufacture has its principal seat.

*Montgomery*, a small borough close to the English border, has its name, and likewise the county, from Roger de Montgomery, Earl of Shrewsbury, in the time of William Rufus, who founded the castle, the remains of which crown an adjoining eminence. In the vicinity, the line of Offa's Dyke may be traced for a considerable distance. The famous Lord Herbert was born here, and also Dr Rees, the editor of the well-known cyclopædia which bears his name. *Welshpool*, *Newtown*, and *Llanidloes*, all on the Severn, are the populous towns, where woollen goods are produced, chiefly flannels, and extensively disposed of at fortnightly markets. Abundance of pure water, and the numerous sheep reared on the hilly tracts, led to the establishment of the manufacture. *Welshpool* has its name, properly *Pool*, from a small lake in the vicinity, to which the prefix is added to distinguish it from the English *Poole* in Dorsetshire.

**CARDIGANSHIRE**, on the curving shore of the spacious bay to which its name is given, extends from the outlet of the Dovey River on the north, to that of the Teify on the south; and is also watered by the Rheidol and Ystwith, with numerous streams often swollen into furious torrents. The greater part of the maritime region is level and fertile, but highlands largely overspread the interior, which being generally destitute of natural woods, clothed with peat and heather, have a bleak and dreary aspect. The population is spare; the manufactures insignificant; but the mineral wealth is very considerable, consisting of lead, copper, zinc, and slate, with a proportion of silver extracted from the lead ores. Hardy cereals are grown, with wheat of fine quality on the coast levels, and great numbers of sheep and black-cattle are reared on the uplands.

*Cardigan*, a small port on the Teify, a little above its mouth, engaged with the herring-fishery, derives its name, and also the county, from that of a native prince, *Caredig*, of which it is a slightly-corrupted form. *Aberystwith*, near the outfall of the conjoined Ystwith and Rheidol, is the principal town, with a good harbour, considerable coasting-trade, excellent accommodation for summer visitors, and pleasant adjoining heights, where the advantages of the mountain-air and the sea-breeze are combined. One of the chief points of attraction in Wales, the Devil's Bridge, is some eleven miles distant, the whole route to which is replete with interest. Two arches, one above the other, are here thrown across a tremendous chasm, the sides of which are well clothed with coppice-wood. Through this passage the Mynach rushes to join the Rheidol immediately below, while the latter stream hurries through a similar ravine to the junction, both leaping in a series of cascades. It is 'a scene to be feasted on, trembled at, and dreamed of, sleeping and waking; but not to be preconceived, painted, or described.' The lower arch is of ancient but uncertain date, traditionally referred to the monks of Strata Florida Abbey. The upper, of thirty feet span, with an improved roadway, was constructed in the middle of the last century. *Lampeter*, 'the Church of St Peter,' a town on the Teify, is the seat of St David's College, opened in 1827, for the training of candidates for holy orders, who are unable to meet the expenses of education at the old universities.

**PEMBROKESHIRE**, a peninsular district, enclosed on all sides by the sea except the east, forms the south-west extremity of the principality, and is indebted to this position for its more humid and genial climate, being fully exposed to the south-west winds of the Atlantic. Hence milder winters, cooler summers, and the greater rainfall. The coast is indented by the extensive inlets of Milford Haven and St Bride's Bay, with several others of minor dimensions; and presents romantic scenery and majestic headlands at various points. Agricultural produce is raised for export to the English markets, and the fisheries are of great value. The population is only partly Welsh. In the reign of Henry I., a number of Flemings applied to him for permission to settle in his dominions; and were planted

in the southern part of this county to secure possession of it for his crown. These colonists and their descendants, being viewed with dislike by the natives, did not amalgamate with them, but adopted the language and customs of the English; and the district they occupied received the name of Little England beyond Wales. The two classes are still to some extent distinct in speech and habits.

Milford Haven.

*Haverford-west*, on a small affluent flowing into the northern head of Milford Haven, is a flourishing town and river-port, anciently the principal station of the Flemish settlers. *Pembroke*, at the head of a creek on the southern side of the same great inlet, has a conspicuous feature in its dilapidated historic castle, the birthplace of Henry VII.; and acquires importance from the royal dockyard at a short distance, seated directly on the main shore. This is the youngest of the naval arsenals, having been formed within the present century. It occupies an area of eighty acres, and has sent out some of the finest ships of the navy. *Milford Haven*, so called after the small town of that name on the northern bank, is the grandest natural harbour of Great Britain, and was pronounced by Lord Nelson to be the finest in the world. It runs inland from west to east about ten miles, branches into a number of bays, creeks, and roadsteads, is in many parts two miles wide, has sufficient sea-room for the largest fleets, can be entered at all times of the tide without a pilot, and has sheltering-places from every wind that blows. *Tenby*, on the south-east coast, a popular watering-place, occupies a very picturesque locality, specially interesting to the lovers of natural history, from the various forms of marine life with which the rocks and sands abound. Oysters are taken in great quantities, with other sea-fish, and sent chiefly to the Bristol market. *Caldy Island*, two miles from the harbour, containing about 600 acres, abounding with sea-fowl, is often visited by boating-excursions. *St Margaret's Island*, only detached from it at high water, is celebrated for its caverns. *St Davids*, near the west coast, the seat of an episcopate, is a completely decayed place, containing farm-labourers and a few clergy for the performance of service in the old cathedral. Off the shore are seven remarkable rocks called the Bishop and his Clerks, with Ramsey Island, occupied by two or three families.

CAERMARTHENSHIRE, the largest division of Wales, lies on the northern shore of Caermarthen Bay, extends to a considerable distance inland, acquires proportionate expansion, and has the Tawe and Towy for its principal rivers, the latter being by far the most important. The valley in which it flows, through nearly fifty miles with an average breadth of two miles, is renowned for its fertility and beauty. Though generally hilly, embracing rugged tracts of moorland, long narrow valleys are more characteristic of the surface, sometimes contracting to deep wooded glens. A south-eastern section of the

county falls within the area of the great coal-field, in which both coal and ironstone are obtained. There are also some valuable lead-mines. But while ironworks and manufactures of other metal wares are carried on, the general industry is agricultural.

*Caermarthen*, pleasantly situated on the north bank of the Towy, nine miles above its outlet, has a flourishing shipping trade in the export of agricultural produce, and the import of articles for domestic consumption through an extensive district. An obelisk at the western entrance commemorates Sir Thomas Picton, who fell at Waterloo, a native of the town, and its representative in parliament. Sir Richard Steele, the chief founder of periodical literature, lies in the chancel of the church. The dwelling in which he died is now the principal inn; and that in which he resided in the immediate vicinity is a farmhouse. *Llandeilo*, higher up the river, is in one of the most attractive parts of its valley, with sites of special interest in the neighbourhood; the ruins of Dynevor Castle, long the residence of the native princes of South Wales; Golden Grove, the retreat of Jeremy Taylor in troubled times, where he wrote his *Liberty of Prophecy*; and Grongar Hill, the subject of a poem by Dyer, who was born on the estate. *Llanelli*, within the area of the great mineral district, occupies a creek of the coast, and is provided with a convenient harbour and docks for the export of coal, and the import of copper ore from Cornwall for smelting, while in connection by lines of railway with the centres of mining industry.

GLAMORGANSHIRE, the most populous of the Welsh counties, commercially also the most important, has an extensive coast-line on the Bristol Channel, marked by the fine opening of Swansea Bay, and by conspicuous headlands, some of which are fringed with detached rocks at the base. The interior has richly-varied natural features. The northern and especially the middle portion of the surface rises in bold hills, separated by river-valleys, while the southern division, ranging from the foot of the hills to the sea, is an undulating plain, popularly styled the 'Garden of South Wales,' from the richness and early development of its horticultural produce, consequent on the fertility of the soil and the mildness of the climate. But though tillage husbandry is pursued to a considerable extent, the main industry is mining and manufacturing, embracing the smelting of copper and other ores, with the production of various kinds of hardware. The county may be regarded as the greatest depôt of coal and ironstone in the empire, the working of which is conducted on a great scale, but has only hitherto contributed to illustrate the vastness of the store. Its principal rivers are the Taff, the Tawe, and the Neath.

*Cardiff*, near the outfall of the Taff, one of the chief shipping-ports of the mineral produce, is of ancient date, and combines much of the venerable in its aspect with the expressions of modern commercial enterprise, a ship-canal and docks, the Glamorgan Canal, the Taff Vale and South Wales railways. In its castle, superseded by a mansion of recent date, with the exception of the keep, Robert, Duke of Normandy, eldest son of the Conqueror, underwent a long imprisonment. *Llandaff*, two miles distant, the seat of a bishopric, is simply a hamlet with a cathedral, but without the service peculiar to such buildings, being used only as the church of a small rural parish. *Merthyr-Tydvil*, by far the largest town in Wales, situated in the wild northern part of the county, has advanced to consequence with extraordinary rapidity. It was a mere village at the commencement of the century, and now contains upwards of 60,000 inhabitants, with ironworks which rank with the largest in the kingdom. This prosperity dates from the development of the coal and iron mines in the neighbourhood, and is shared to some extent by Aberdare and other places in the circumjacent district. The name of the town is a corruption of *Martyr St Tydfil*, a native princess, traditionally said to have suffered death for her religion. *Swansea*, next in importance, at the mouth of the Tawe, is centrally seated on the shore of a spacious and beautiful bay, flatteringly compared by some to the Bay of Naples. It is a great steam-packet station, and has a vast traffic in minerals, as the chief locality for the smelting of copper ores, embracing not only those of Cornwall and other home-districts, but freights from distant parts of the world, as Chili and Australia. *Neath*, on the river of that name, a few miles above its outlet, is likewise distinguished by metal-works. The valley of the river abounds with highly-picturesque scenery, more especially in the upper part of its course. The south-western extremity of Glamorganshire forms a peninsula, called Gower, originally Gwyr, signifying 'crooked' or the 'crooked country,' in allusion to its irregular shape, containing ten or twelve parishes. Here some of the Flemings settled who came over in the time of Henry I.; and after the lapse of seven centuries and a half, their posterity are a distinct race, in dress, dialect, and even personal appearance. Their language, radically Saxon, includes a number of obsolete English words, sometimes Flemish, and the pure Welsh is very rarely heard. In the frontier parish of Llanrhyddian the distinction is curiously illustrated, the people being Welsh in one portion of it, and of foreign extraction in the other, with little intercourse subsisting between them.

BRECKNOCKSHIRE, an inland district to the northward, lying on the English border, is

occupied with several mountainous ranges and groups, some of which spread out into barren moors, and embrace a large proportion of the surface. The most definite chain is in the southern part of the county, runs west and east, is wild and rugged in the extreme, and has the name of the Forest Fawr in the central portion of its course, and that of the Black Mountains westwardly, from the dark appearance of the heather, when out of blossom, with which they are clothed. It contains the highest summits of South Wales. The greatest elevations are—Capellante, 2394 feet; Pen-y-Cader Fawr, or the Cradle Mountain, 2545 feet; and the Beacons of Brecon, 2862 feet. The latter are two peaks majestically seen from the town named. Fertile river-valleys are, however, numerous, the most extensive of which is that of the Usk. It intersects the county from west to east, and, with the valleys of its affluents, embraces most of the cultivable land. A few woollen manufactures are carried on; ironworks are conducted on the southern confines; but agriculture is the chief employment of the people, who have generally very neat farm-houses and buildings.

*Brecon*, centrally seated on the Usk, is one of the most attractive towns of the principality, rendered so by good streets and dwellings, interesting architectural remains, luxuriant groves, agreeable public-walks, and magnificent mountain scenery for a southern background. It was the birthplace of Mrs Siddons. *Crickhowel*, lower down the river, with vestiges of a castle of the time of Edward I, is in an equally beautiful locality, and forms a favourite station for sportsmen, fish being abundant in the stream, and game upon the hills. *Builth*, on the Wye, is at the point where its much-admired scenery commences on descending the river, and adjoins the Park Wells, three powerful mineral springs, respectively saline, sulphureous, and chalybeate. In a neighbouring dell, called Cwm Llewellyn, the unfortunate Welsh prince of that name, the last holder of the regal power, perished in a skirmish during the winter of 1282.

RADNORSHIRE, divided from the preceding county by the Wye, is traversed by several of its tributaries, and belongs almost entirely to its basin. Lofty uplands are prominent features of the surface, not forming ranges, or rising in peaks, but spreading out in broad moors, studded with bogs. Several of these tracts, though now bare, were once clothed with woods; and hence the name of Radnor Forest, still applied to a treeless district, the most elevated of all, 2163 feet above the sea. But artificial planting has been largely adopted by the proprietors of estates. Distinct traces remain of both British and Roman encampments; medicinal mineral springs are numerous; natural curiosities and striking landscapes might be indicated; but in every respect this division of Wales is of comparatively inferior interest, and is the least populous part of the whole country south of the Tweed. Pastoral husbandry is the chief occupation. The English language is prevalent, except among the few scattered peasantry on the western side who are wholly unacquainted with it.

The towns are extremely small. *New Radnor*, once fortified, consists of a mere handful of houses. *Presteign*, where the assizes are held, is pleasantly situated on the Lug, on the verge of Herefordshire, from which it is separated by the river. The graves of two distinguished statesmen of the present century are in the neighbourhood—Sir S. Romilly at Knill Court, and Sir G. C. Lewis at Harpton Court.

THE ISLE OF MAN, in the broader part of the Irish Sea, generally noticed in connection with England, occupies a singularly anomalous position. It is nearly equidistant from Wales, England, Ireland, and Scotland, though most proximate to the latter. It is in view from the nearer points of each of these sections of the kingdom in clear weather, and has portions of their shores in sight from the summit of its own highland range. Yet it forms no part of any of their counties, nor a county of itself; and while on the sea-road between Liverpool, Dublin, Belfast, and Glasgow, with upwards of 50,000 inhabitants, it has judicial institutions and revenue laws peculiar to itself, and is without representation in the imperial parliament. The island extends thirty miles from north to south, and has an average breadth of ten miles, except at the two extremities, where it narrows considerably. A chain of slate-mountains runs through it, in the direction of its length, the highest point of which, Sneafell, is nearly central, and rises to the height of

2004 feet above the sea. Lead, copper, iron, and zinc are the mineral products, but only the former is extensively obtained. Mines, fisheries, and agriculture furnish the chief employments. The natives are a Celtic race, speak the Manx language, but it is rapidly becoming obsolete, English being generally understood.

*Douglas*, the largest town, occupies the shore of a crescent-shaped bay of the east coast, and has a striking object in the ruins of Castle Mona. But *Castletown*, on the southern coast-line, ranks as the capital, being the residence of the governor, and the seat of the law-courts. King William's College, in the neighbourhood, opened in 1833, is for the training of candidates for holy orders. Towards the south-west extremity, a bold sea-cliff has the name of the Spanish Head, in memory of the destruction of part of the Spanish Armada in the vicinity. Off the main shore is the Calf of Man, a small rocky islet. *Peel*, with a dilapidated fortress, is on the west coast, made familiar by Sir Walter Scott's novel of *Peveril of the Peak*, as the scene of many of its incidents. The Isle of Man, after being successively subject to the Northmen and the Scotch, came into the hands of the English, and was held by the Earls of Derby from 1406 to 1736. It passed from them to the Dukes of Athol, who eventually disposed of their rights and patrimony to the crown. The government is now administered by a lieutenant, appointed by the sovereign, who is assisted by a local body of twenty-four principal landholders; but no enactment is law till it has received the royal assent.

Throughout England and Wales, except the central portion of the latter, the means of intercommunication are developed to an astonishing extent, and are conveniently within reach of the smaller groups of the population, both for their own transit, and that of commodities of every description. In this respect, the country is without a rival. The turnpike-roads have a total length of nearly 30,000 miles, and the cross-roads of 100,000, which, together, would form a line sufficient to describe five times the equatorial circumference of the globe. Improved by artificial means, the rivers have been rendered navigable to the united extent of about 2000 miles beyond that for which they are naturally adapted. Canals link together their respective basins, connect through them the opposite seas, or diverge into streamless districts, which have involved not less than 3000 miles of excavation. Railway communication stretches over a total of at least 7000 miles, permeating all the English counties, most of them in a very complete manner. It is extended also to most of the divisions of Wales, leaving only a central tract as yet untouched, or portions of the counties of Cardigan, Merioneth, Brecknock, and Radnor, where the surface is mountainous, and inhabitants are very sparingly distributed.

The country has considerably more than doubled its population in the course of the present century. At the date of the census of 1861, it amounted to 20,061,725, which, supposing equable distribution, will give an average of 344 persons to each square mile of the surface. No other part of Europe can shew so high a ratio, with the exception of Belgium. But the actual allotment to the square mile in the different counties strikingly varies, from 59 persons in Radnorshire, and 80 in Westmoreland, to 1275 in Lancashire, and 7822 in Middlesex. The vast and dense groups of population are found in the metropolitan area, the district which includes Liverpool and Manchester, the tract embracing Leeds and Bradford, the region around Birmingham, and the banks of the Tyne and Wear along their lower courses. In one of these sites, occupied by a crowd of cotton-manufacturing operatives, it has been exemplified, and for the first time in all history, that great aggregations of people, high-spirited and comparatively independent, can bear the trial of a bitter destitution, knowing it to be inevitable, and receiving under it the practical sympathy of the affluent, not only without senseless clamour and political insubordination, but with patience and dignity. Amid much ignorance and vice, appertaining to large communities, this fact decisively proves the co-existence of a preponderating amount of sound intelligence and healthy moral feeling.

## POPULATION OF THE PRINCIPAL TOWNS ACCORDING TO THE CENSUS OF 1861.

|                                    |         |                                  |        |                                  |         |                                     |           |   |         |

The Stack Rocks.

Edinburgh from the Calton Hill.

### CHAPTER III.

#### SCOTLAND.

COTLAND, the northern and smaller division of Great Britain, is bounded on the east by the North Sea, on the west and north by the Atlantic Ocean, on the south by England and the Irish Sea. It formerly constituted a separate kingdom, and is naturally, in various respects, a distinct district. The shores are much more broken than those of the southern portion of the island, present grander headlands, are in general more rocky, and have a distinguishing feature in the immense number of insular masses adjacent to them. Few of the broad open valleys and spacious undulating plains, distinctive of the English landscape, mark the interior; but in most parts, ranges of bold hills or mountains limit the view of the observer in one or several directions, often at no great distance.

The highlands of Scotland are not only more extensive but also loftier than those of England, and contain a far larger number of lakes. The two sections of the island also widely differ in their geology. Non-fossiliferous rocks, igneous or metamorphic, prevail

north of the Tweed, with scarcely any examples of secondary formations of late date, except in patches; and on the southern border, highly fossiliferous sedimentary strata predominate. Not only is the proportion of unproductive land in the former division vastly greater, but the soil and climate in the cultivable area are much less favourable to the progress of vegetation. The eastern coast of Scotland, however, bears a general resemblance to that of England, being more regular than the western, while the shores of both countries on the easterly side are remarkably free from islands, except a few of very small dimensions. Most of the important rivers likewise flow eastwardly to the basin of the North Sea.

The greatest extent of the mainland is north and south; and amounts to 287 miles, following a slightly diagonal line drawn from Dunnet Head to the Mull of Galloway, the northern and southern extremities. The breadth is extremely various, owing to the far-advancing inlets on the eastern and western sides, which produce contractions so remarkable as to suggest the idea of the country being about to fall into fragments. Where the maximum expansion occurs under the parallel of  $57^{\circ} 30'$ , between Buchan Ness, the most easterly point, and the west coast of Ross-shire, the distance measures about 140 miles. But on the south, under the parallel of  $56^{\circ}$ , the opposite salt waters of the Forth and the Clyde are not more than 32 miles apart, and further north, between the head of Loch Broom and the mouth of the Oykel River, the width is diminished to 24 miles. On the east coast, all the principal indentations are river-estuaries, termed 'firths' (from the Scandinavian 'fjord'), and include those of the Forth, Tay, Moray, Cromarty, and Dornoch, passing from south to north. The west coast has only the estuary of the Clyde, which, however, surpasses all the rest in commercial importance. But to the northward of it, there is a continued series of long winding inlets which the waves of the Atlantic have contributed to scoop out, somewhat unfortunately called lochs, as the same term is applied to the inland lakes, and is apt to create confusion. These sea-lochs, together with the firths, increase enormously the coast-line of Scotland, the entire length of which is not less than 2500 miles. They place also every part of the surface, even where it is most solid, within little more than forty miles of the salt water.

The interior of the country is commonly stated to consist of two distinct regions—the Highlands, generally in the north and west; and the Lowlands, in the south and east. The line of division between them is marked by a valley or plain, which extends across the entire island from north-east to south-west, or from the foot of the Grampians, where the range touches the shore of the North Sea, to the Clyde estuary, varying in width, and subject to hilly interruptions in its more southerly prolongation. This dividing-line is known in a principal part of its course as Strathmore, the 'great strath' or valley. The distinction of the surface into highland and lowland regions is of old historical date, and true to nature; but for descriptive purposes, it is more convenient to consider Scotland as distributed into three divisions, equally well marked by nature—southern, middle, and northern.

Southern Scotland comprehends the country extending from the narrow isthmus between the Clyde and Forth to the Irish Sea and the English border. It contains various tracts of gently undulating surface, cultivated with the highest degree of skill, but is also to some extent a hilly region, studded with isolated elevations, and traversed by continuous ranges, to which the name of the Southern Highlands is often applied. These ranges are distinguished generally by rounded or flat summits, gradual slopes, and a grassy clothing, features wholly distinct from the naked, precipitous, and frequently savage aspect of the Highlands proper. Towards the centre of the district rise the Lowther Hills, from which branches run north into Peeblesshire and Selkirkshire, and south through

Dumfriesshire and Kirkcudbrightshire, the Pentland, Moorfoot, and Lammermuir Hills, on the north and north-east, the Cheviots, forming in part the boundary between Scotland and England. The dales that lie between these ranges have their names from the streams flowing through them, as Tweeddale, Clydesdale, Nithsdale, and Annandale. They are celebrated in pastoral life and border song. The highest points are around the head waters of the Tweed and Clyde, where Queensberry Hill rises 2260 feet; Tinto Hill, 2316; Hart Fell, 2636; and Broadlaw, the loftiest summit, 2761 feet above the sea. In fine weather, from the green flat summit of Hart Fell, the view embraces Skiddaw in Cumberland on the south, and Ben Lomond on the north, at a direct distance of full seventy miles. The neighbourhood is remarkable for the Deil's Beef Tub, a wide hollow of great depth from which the infant stream of the Annan emerges. The mining village of Leadhills, where lead-mines have long been worked, and the native place of Allan Ramsay the poet, is said to be the highest inhabited spot in Great Britain, with exception of the huts of shepherds and gamekeepers in the Highlands, only occasionally occupied. Silurian rocks are extensively developed in the centre of this division, running too from coast to coast, with granite in the south-west, and the carboniferous formation on the north, in the basins of the Forth and Clyde, through which trap rocks have been variously erupted.

Middle Scotland, the main mass of the country, extends from the preceding district to Glenmore, or the 'great glen,' which stretches diagonally across the island from Fort William to Inverness, and is occupied by several lakes connected together by the Caledonian Canal, forming with it a bond of union between the Atlantic and the North Sea. In this region, the Sidlaw and Ochill Hills, ranges of moderate elevation, form the southern boundary of Strathmore; while on its northern and western sides tower the majestic Grampians, apparently an impassable barrier, in the recesses of which the old Caledonians found a secure asylum from the Roman legions. Formations of the old red sandstone and carboniferous series occupy the south and east, while the mountains in the opposite directions are composed chiefly of crystalline schists, with granite in the higher parts. The Grampians have a stern and desolate aspect, a broken and serrated outline, and seem solitudes of nature into which man and his labours may not intrude. In fact, it is only by following some of the streams which break through the rampart, that admission to its wilds is gained. Naked rocks, or rocks scantily clothed with brown heath and lichens; frowning precipices unsoftened by the hand of time, as if just rifted from equally angular masses; narrow glens where the dark-brown streams foam over a craggy bed; broad straths, where the torrent slumbers for a while in some deep black lake; and bleak moors only diversified by moss-grown stones and solitary tarns, with the scarlet crest and bright eye of the moorcock, are the leading features of the scenery. The Central Grampians, the highest elevations in the United Kingdom, stretch east and west from shore to shore, a length of nearly a hundred miles, and have a breadth varying from twelve to twenty-five miles, with an average height of from 2000 to 3000 feet. But many summits attain a much greater altitude. At the western extremity, Ben Nevis, the culminating-point of the Britannic system, rises to 4406 feet above the sea. From the western side of the central chain, the mountain masses are prolonged from north to south, reaching to the estuary of the Clyde, and are conveniently called the Southern Grampians, of which Ben Lomond (3192 feet) is the most southerly important member, well known from being contiguous to the great centres of population.

The monarch-mountain of the kingdom, Ben Nevis, has the advantage of being detached, and hence its entire outline is exhibited in a single view. On one side the base is almost washed by the tides of Loch Eil, while in other directions, river-valleys separate it from all the neighbouring highlands. It shoots up from the level of a moor,

has a circuit of more than twenty-four miles, and consists of two hills, geologically distinct, placed one upon the other. The lower, nearly 3000 feet high, is an oblong mass of granite, forming a generally flat plateau, on which lies a mossy tarn, plentifully fed by the mists from the western ocean, and the source of a torrent. The upper hill, or true vertex, is a naked irregular four-sided prism of black or dark-gray porphyry, with a zone of the subjacent granite completely surrounding its base. It forms a terrific precipice on the north-east, with a sheer descent of not less than 1500 feet from the summit. Though the line of perpetual congelation is not reached, it is very closely approached.

Entrance to the Pass of Glencoe.

Hence the higher portions of the Grampians long retain the winter's snow, and it often remains throughout the summer in beds and patches in the sheltered ravines. A northern offset of the main range consists of a group of mountains remarkable for huge proportions and great general altitude—Ben Avon, 3826 feet; Cairngorm, 4090; Cairntoul, 4245; Braeriach, 4280; and Ben Macdhui, 4295 feet. These are

'The grisly champions that guard  
The infant rills of Highland Dee.'

lying around the sources of the river. Ben Macdhui was ascended by the Queen in October 1857.

Northern Scotland includes the remainder of the country up to the Pentland Firth, and is a region of high moorlands, wild, barren, and desolate, covered with heath and bog, the platform of mountain-ranges, with some extent of productive soil on the eastern

shores. The great general elevation of the surface detracts from the apparent height of the summits, but Ben Wyvis, near Dingwall, attains 3422 feet, and Ben Attow 4000, on the borders of Ross and Inverness. In the two northern counties, the surface lowers from west to east, and the greater part of Caithness is a plain, largely clothed with stunted heath, properly belonging to the Scottish lowlands.

All the rivers of importance in Scotland carry their waters to the North Sea, with the exception of the Clyde. Arranged according to the magnitude of their basins, they rank in the following order :

| Rivers.          | Area of Basin.<br>Square Miles. | Length.<br>Miles. | Principal Places from Source to Mouth.        |
|------------------|---------------------------------|-------------------|---|
| Tay, . . . . .   | 2750 . . . . .                  | 130 . . . . .     | Kenmore, Dunkeld, Perth, Dundee.              |
| Tweed, . . . . . | 1870 . . . . .                  | 96 . . . . .      | Peebles, Melrose, Kelso, Coldstream, Berwick. |
| Clyde, . . . . . | 1580 . . . . .                  | 98 . . . . .      | Lanark, Glasgow, Dumbarton, Greenock.         |
| Spey, . . . . .  | 1190 . . . . .                  | 110 . . . . .     | Fochabers, Garmouth.                          |
| Dee, . . . . .   | 705 . . . . .                   | 90 . . . . .      | Braemar, Balmoral, Ballater, Aberdeen.        |
| Forth, . . . . . | 645 . . . . .                   | 60 . . . . .      | Stirling, Alloa, Queensferry.                 |
| Don, . . . . .   | 530 . . . . .                   | 62 . . . . .      | Alford, Inverary, Old Aberdeen.               |

The Tay, the most considerable river in the length of its course and its area of drainage, descends from the mountains on the western side of Perthshire, forms the beautiful, long, narrow expanse of Loch Tay, flows very circuitously through the county, receiving many feeders, and passes through an extensive estuary to the sea, ten miles below Dundee. Sands obstruct the mouth, and increase the difficulties of navigation by their shifting nature. The upper part of its course lies through a wild and highly-romantic country, and its basin is geologically interesting as supplying examples of everything connected with the action of running water, the erosion of rocks, the transport of soil, and the changes to which lakes and valleys are subject. In point of value the Tay stands at the head of the salmon rivers. Shoals of porpoises, numbering hundreds of individuals, haunt the mouth during the fishing-season on the look-out for their prey, and droves of watchful seals never leave the estuary. The stream is remarkable for the quantity of water it brings down, not owing to the depth or width of the channel, but the rapidity of the current, and the numerous feeders connected with cloudy mountain regions and long snow-clad heights. It exceeds in this respect every other river in the kingdom. The mean discharge, according to careful estimates, amounts to 273,117 cubic feet of water per minute, while that of the Thames is stated to be only 80,220, or less than one-third that of the Tay.

The historic Tweed and the commercial Clyde descend from the highland centre of Southern Scotland, and offer an example of streams having closely contiguous sources, and flowing off to opposite basins. The Tweed, pure and limpid, once famous for its strong square towers erected to keep the English borderers in check, on the top of which beacon-fires blazed as signals of alarm, travels eastward to the North Sea, which it enters at Berwick; while the Clyde, after some feeders have run at first towards the east, turns to the north-west, and joins the Atlantic through one of the great indentations of the western coast. This river remarkably changes its character, being an impetuous mountain-torrent in the upper part of its course, and having a calmly-flowing current covered with ships in the lower, on the surface of which the first steamer built in the United Kingdom was launched. It forms celebrated falls in the neighbourhood of Lanark, two above and two below the town. The uppermost, Bonnington Linn, is a perpendicular descent of thirty feet; the second and grandest, Corra Linn, is a fall of eighty-four feet, in three leaps; the third, Dundaff Linn, is small; the fourth, Stonebyres, is a descent of seventy-six feet, broken into three distinct falls by two projecting rocks. To the Spey, the

distinction belongs of being the wildest, most capricious, and rapid of all British rivers, with the peculiarity of the rapidity distinguishing the lower portions of its course. It issues from a small pool within a few miles of a western sea-loch, and after slumbering in dark mossy lakes, rushes on with headlong speed to an opposite north-eastern shore. The

Upper Fall of Foyers.

stream passes through the strath of the same name, Strathspey, one of the best wooded parts of the Highlands, and affords water-carriage for the timber, large quantities of which are floated down to the sea, entered below Fochabers. A peculiar feature also belongs to the Dee, that of descending from the highest spring in the British Islands. The Wells of-Dee are near the top of Braeriach, one of the Cairngorm group of mountains, at the height of 4060 feet above the sea. Dr Skene Keith, in the middle of July, the hottest month of the year, found the main source still running under an arch of snow.

The Forth is formed by the junction of two streams, both of which descend from the north-eastern slope of Ben Lomond, and come to a confluence at Aberfoyle. The river flows from thence through low alluvial plains to the magnificent firth on which Leith and Edinburgh are situated. It is

‘A lairdship in the bonnie Links o’ Forth  
Is better than an earldom o’ the North.’

The Firth of Forth is about fifty miles long by four to five miles broad from Leith to Burntisland, and has the small islands of Inchgarvie, Inchcolm, Inchkeith, and May in its basin.

The great superficial irregularities of the country render most of the rivers unnavigable, and originate numerous waterfalls, some of which form very effective scenery, with their accompaniments of wood and rock. Besides those of the Clyde, already noticed, the Grey Mare’s Tail, in the county of Dumfries, denominates a lofty cascade of the Moffat

Water, soon after its emergence from the small, dark, and lonesome Loch Skene, where the stream descends nearly 200 feet, and

‘White as the snowy charger’s tail,  
Drives down the pass of Moffatdale.’

The Falls of Foyers, adjoining the eastern margin of Loch Ness, form one of the grandest exhibitions of the kind in the kingdom after heavy rains; and steamers traversing the lake generally stop to afford passengers an opportunity of viewing them. They are situated in a ravine profusely clothed with birch, ash, and copsewood, nursed by the perpetual spray, which hangs like dew on every leaf in pearly drops, glittering in the sunbeams. The upper fall is a descent in three leaps of nearly seventy feet into a fearful gulf; and when the river is full, the lower and principal fall is a single leap of more than 200 feet. On the Beauly River, a few miles from Inverness, there are fine falls, but not so much remarkable for height as for breadth and quantity of water, with the long reach of the stream boiling and tumbling in its rocky bed, the banks of which are crowned with birch and pine. The falls of the Glomak, in Ross-shire, are said to be the highest in Scotland, falling upwards of 300 feet, in a gully, desolate and frightful beyond description, and of very difficult access. A good view can only be obtained from the bottom, which may be reached by wading when the water is low, but not without danger. The falls of the Moness, in a glen near Aberfeldy, so narrow that the trees on the opposite sides almost blend their branches, answer to the description of Burns:

‘The braes ascend like lofty wa’s,  
The foaming stream deep-roaring, fa’s,  
O’erhung wi’ fragrant spreading shaws,  
The Birks of Aberfeldy.’

The rivers which descend from the higher Grampians, or are fed by affluents from them, as the Dee, Don, Deveron, Findhorn, and Spey, besides being unnavigable, are liable to sudden and destructive inundations from the descent of rains on the highlands. The overflow of these streams occasioned the local deluge (known as the ‘Moray Floods’) which visited the counties of Aberdeen, Banff, Elgin, and Nairn in the summer of the year 1829, when roads, bridges, crops, stock, and buildings were swept away, while the features of the natural landscape were very strikingly altered. New ravines were cut out on the sides of the mountains, vast masses of rock were transferred to fresh sites by the transporting power of the currents, deep pools were converted into shallows by the amount of debris left in them on the subsidence of the waters, the sloping banks of streams and brooks were turned into vertical walls by the rush of the floods, and some of them were permanently diverted into freshly-excavated channels.

Inland lochs or lakes form a characteristic feature of the surface, and are estimated to cover an area of 500 square miles. They are almost all long and narrow, associated with the Highlands, and occupy glens closely pressed upon by the bordering heights. While many present fine combinations of beautiful and grand scenery, the shores of others are scarcely to be surpassed for wild and severe features. Loch Lomond, belonging to the counties of Dumbarton and Stirling, but chiefly to the former, is the largest example. It is twenty-one miles long, by five broad at the south extremity, from which it gradually narrows to less than one mile at the northern end. The lake is studded with islands, about thirty in number, ten of which are of some extent, and well clothed with wood. It is regularly traversed by steamers in the summer season, and has crowds of visitors, being only twenty miles from Glasgow. The fine mass of Ben Lomond, on the eastern side, is often scaled, being of easy ascent, and overlooking a wide panorama of sea and shore, winding river and smiling valley, bounded northwards by rival or loftier heights. Loch Ness, in the line of the Caledonian Canal, is distinguished by its great depth, amounting

in many places to 800 feet, and hence never freezes in the severest winters. Loch Avon, in the bosom of the Cairngorm group, is remarkable for its loneliness, difficult access, and the frightful steeps around it. The lake, a crystal sheet of water, nearly two miles long, and upwards of 1750 feet above the sea, is the most elevated expanse of any extent in the kingdom. Closely bordered by rugged and precipitous heights, the surface has no sunshine through several of the winter months; the banks have no tree or shrub; and few living creatures are ever seen except the eagle and the ptarmigan, or some straggling red deer from the forest of Mar. Loch Leven, in the county of Kinross, is the largest lake connected with the Lowlands, and contrasts with those in the Highlands, in not being elongated, but of rounded shape.

Owing to the rugged and mountainous character of Scotland, only a comparatively inconsiderable portion of the surface is or can be devoted to arable husbandry, chiefly in Berwickshire and the Lothians, in Perthshire and Forfarshire, which contain the rich alluvial carse or plain of Gowrie, and the fertile valleys of Strathmore and Strathearn. In no part of the country north of the Firth of Forth is the climate favourable to the growth of wheat, being subject to long intervals of bleak weather. It will not ripen except at the level of the sea in the latitude of Aberdeen; and the Dornoch Firth marks the northern limit of its growth under the most advantageous circumstances. Hence a coarse kind of barley, called here or big, and oats, the hardiest of the cereals, are the principal crops. Pastoral industry is extensively pursued in the upland districts, where some of the breeds of sheep, as the Cheviots, remarkably display the strange instinct of apprehending the coming snow-storm, and marching off to a known and approved shelter, even when the shepherd has not been able to recognise the slightest indication of a tempest. Of the mineral products, coal and iron are the most important. The great coal-field stretches with little interruption from the east to the west coast, on both sides of the Forth, and yields abundance of iron-ore. Lead is obtained from the Lanarkshire hills. Granite, of a fleshy colour, making a near approach to the red granite of the Egyptian obelisks, is extensively quarried for export on the precipitous coast of Aberdeenshire; noble serpentine for ornamental purposes is supplied by the adjoining county of Banff; and various precious stones are frequently found in the Highlands. Fisheries of salmon, herring, ling, cod, and haddock, give employment and subsistence to numbers of the maritime population. The great staple manufactures consist of cottons and silks at Glasgow and Paisley; linens at Dunfermline and Dundee; woollens at Galashiels, Hawick, Aberdeen, and Kilmarnock; hardwares at the Carron Ironworks near Falkirk, and other places; ships, steamers, steam-engines, and machinery of every description, on the banks of the Clyde.

Natural forests of pine, oak, birch, elm, ash, mountain-ash, hazel, and poplar, in which the red and roe deer freely roam, are still extensive in the Highland districts, though they were much reduced for building purposes during the long wars which marked the close of the last century and the commencement of the present, owing to the difficulty of procuring timber from abroad. Whole woodlands were then obliterated, as Glenmore, famed for the age and size of its trees, which clothed one of those romantic glens or passes intervening between the Cairngorm group of mountains and the river Spey, and formed a continuation of the forest of Rothiemurchus. This tract of timber was sold by the Duke of Gordon, the proprietor, to a merchant of Hull, who felled the trees, floated the logs down the river, and built a number of vessels at its mouth. Among the rest was a magnificent pine, long the pride of the forester, called the Lady of the Glen, supposed to be the largest ever cut down in Scotland, of which there is a plank in the entrance-hall of Gordon Castle, measuring six feet two inches in length, and five feet five inches in

breadth. It bears the inscription on a brass plate: 'In the year 1783, William Osbourne, Esq., purchased of the Duke of Gordon the forest of Glenmore, the whole of which he cut down in the space of twenty-two years, and built, during that time, at the mouth of the river Spey, where never vessel was built before, forty-seven sail of ships of upwards of 19,000 tons burden. This undertaking was completed at the expense (for labour only) of above £70,000. To his Grace the Duke of Gordon this plank is offered as a specimen of the growth of one of the trees.' During this process of reduction, landholders unwisely neglected planting timber, principally actuated by the consideration that a somewhat lengthened period must elapse before any income of moment can be derived from the growth. A more modern race, abandoning this narrow policy, and having in view at once the ornamentation of their estates, and the most profitable mode of occupying districts incapable of being grazed or cultivated, covered waste places with timber-trees, a rural improvement believed to have been stimulated by the advice of the dying laird to his son, as recorded in one of Scott's novels: 'Be aye sticking in a tree, Jock; it will be growing while ye are sleeping.' Thousands of statute acres in Perthshire have thus been covered with larch, spruce-fir, silver-fir, beech, and plane, the larches in particular attaining stately dimension. The frequent alternation of hill and dale in that county, with the opening of the glens and the exposure of the general surface to the south, supply that tree with a site similar to that of its native locality, the Tyrolese and Dalmatian Alps; and it now overtops all the other woods of the same age, rising over the dark pines, in the summer luxuriance of its bright-green leaves, like an obelisk of beryl.

The area of the mainland amounts to upwards of 26,000 square miles; and adding that of the adjoining islands, the total area of Scotland contains about 30,685 square miles. Of these islands, the Orkneys and Shetlands, on the north, have been thought of sufficient importance to form separate counties, and are hereafter noticed. This is the case also with Bute and Arran, on the south-west, in the Firth of Clyde. But the principal series, the Hebrides, or Western Isles, are distributed between three counties of the mainland, and hence a collective view of them may here be conveniently introduced.

The Hebrides, on the west coast, form two extensive ranges of islands denominated Inner and Outer, descriptive of their position in relation to the main shore, separated from each other by the channel of the Little Minch, which is about twelve miles wide in the narrowest part. Upwards of a hundred of the number are of sufficient size to be marked on an ordinary map, and about eighty are inhabited, chiefly on the coasts, houses being rarely met with more than a mile from the sea-mark. The Inner range immediately adjoins the mainland, and has scenes of incomparable magnificence. It includes the large island of Skye, forty-six miles long by from four and a half to twenty-three broad, belonging to the county of Inverness; Mull, Islay, Jura, Colonsay, and Tiree, of important size, portions of Argyle; Eig, Rum, Canna, Staffa, and Iona, of smaller dimensions, distinguished by natural curiosities and historical associations. These are the trap islands of the geologist, being composed chiefly of basaltic or trap rocks, frequently assuming the columnar structure, and rising to grand elevations. Ben More, in Mull, attains the height of 3185 feet, and is the culminating-point of insular Scotland. The Outer range forms a continued series, extending through upwards of 120 miles, so close together as to be considered one, popularly called the Long Island. Its largest and most northerly component, Lewis, is really united by a narrow isthmus to Harris, but the former belongs to the county of Ross, and the latter to that of Inverness, to which also the other principal members of the chain are attached, North and South Uist, Benbecula, and Barra. They are almost wholly formed of gneiss, and have a much less striking aspect than the sister-range, as gneissic districts have in general little variety of feature or strength of outline. But they are very

remarkable for tortuous sea-lochs, one of which, Loch Namaddy, on the eastern side of North Uist, with an entire area of only nine square miles, has a coast-line of more than 200 miles. One of the parishes of Lewis has a direct length of eighteen miles, but it measures eighty miles following the sinuosities of the shore. Upwards of fifty miles west from Harris is St Kilda, the outermost of the Outer Hebrides, the westernmost of the Western Isles, and the most solitary inhabited spot in the United Kingdom,

'Whose lonely race

Resign the setting sun to Indian wilds.'

It has a circuit of about six miles, and rises 1500 feet above the stormy ocean, with a margin of precipices so impracticable, that there are only two points at which a landing is possible. The few inhabitants are chiefly fowlers, occupying a cluster of beehive-looking cabins at the Village Bay, in possession of little plots of cultivable ground on which some garden vegetables are with difficulty raised. The Hebrides in remote times were subject to the kings of Norway. They subsequently formed the patrimony of a race of powerful chieftains, with the title of Lord of the Isles, who were at times practically independent, and the last of whom died without heirs in 1536. The heads of clans next exercised nearly sovereign rights till the abolition of all hereditary jurisdictions in the middle of the last century.

Dunnet Head.

Glasgow from the Broomielaw.

Scotland is divided into thirty-four counties, but practically the number is only thirty-two, owing to the Orkneys and Shetlands being associated in parliamentary representation, while Ross and Cromarty are so intermixed, that they are generally dealt with as a single district. There are no subdivisions corresponding to the English hundreds, but a distribution into parishes for civil and ecclesiastical purposes. In several instances, entire counties, with portions of one or more, retain denominations of long standing in common use, descriptive of physical features, or of their character as feudal holdings. Thus Tweeddale is the equivalent for Peeblesshire; East, West, and Mid Lothian similarly represent the counties of Haddington, Linlithgow, and Edinburgh. An extensive district in Inverness-shire bears the name of Badenoch, derived from a word signifying 'bushy,' in allusion to the ancient natural forests. Of the counties, fourteen are southern, nine middle, and nine northern.

I. SOUTHERN COUNTIES.

| Counties.      | Area in Square Miles. | Principal Towns.   |
|----------------|-----------------------|--|
| Edinburgh,     | 397 . . . .           | Edinburgh, Leith, Musselburgh, Portobello, Dalkeith.     |

EDINBURGHSHIRE, or Mid-Lothian, extends about twelve miles on the southern shores of the Firth of Forth, but gradually expands east and west on receding from them; and the surface, the maritime portion of which is level or only gently diversified, acquires a somewhat bolder character from the Moorfoot and Pentland Hills in the interior. It is traversed by several small streams, the Water of Leith, the North and South Esk, the banks of which are of great interest and beauty, and the Almond, separates the county for a considerable distance from Linlithgow. The hilly districts are pastoral; fertile lower grounds are distributed into large tillage farms, and numerous market-gardens occupy a considerable area. Coal is wrought in the valley of the Esk, where the bed is fifteen miles by eight in extent, and contains thirty-three seams varying from one foot to six feet in thickness. The sandstone quarry at Craigeith supplies a building material distinguished by durability and purity of colour, of which almost all the modern parts of the metropolis are built.

The city of EDINBURGH, the capital of Scotland, is situated in the north part of the county, within two miles of the coast, 325 miles in direct distance from London, and 399 by railway. Its centre is in latitude  $55^{\circ} 57' 20''$  north, and longitude  $3^{\circ} 10' 30''$  west of Greenwich. The picturesque blends with the elegant in its appearance, while the site is extremely fine, far surpassing that of other European capitals, with the exception, perhaps, of Naples, Lisbon, and Constantinople. From many high points in the neighbourhood,

‘Traced like a map the landscape lies  
In cultured beauty stretching wide;  
There Pentland’s green acclivities;  
There ocean, with its azure tide;  
There Arthur’s Seat; and gleaming through  
Thy southern wing, Dunedin blue!  
While in the orient, Lammer’s daughters,  
A distant giant range, are seen,  
North Berwick Law, with cone of green,  
And Bass amid the waters.’

Two ridges of hill, running east and west, parallel to each other, are respectively occupied, the northern by the New Town, and the southern by the Old. They are separated by a deep hollow, planted with gardens, across which communication is maintained by bridges and an earthen mound. No contrast can well be greater than between the modern portion, with its broad regular streets, handsome squares and crescents, on the spacious summit of the lower elevation, and the older part, the original Auld Reekie, distinguished by immense piles of lofty, irregular, antique houses, on the slopes and crest of the higher, more abrupt, and narrower ridge. At the opposite extremities of the latter are two prime objects of interest—the Castle, on the western side, occupying a bold rock, with an enclosure of several acres, containing accommodation for a numerous garrison; and Holyroodhouse, on the eastern extremity, anciently the residence of the Scottish sovereigns and the scene of tragical events connected with their history. Its site is a small plain or valley between the Calton Hill, a rounded summit rising 355 feet above the sea-level, and the majestic Arthur’s Seat, rising to the height of 822 feet, one of the most delightful resorts in the vicinity.

*Edinburgh*, the capital of the kingdom, is chiefly distinguished as the seat of the supreme courts of judicature, and of a university, founded in 1580, long raised to distinction by the eminence of its professors. It is also the place where the general ecclesiastical assemblies are held, and where the representative peers for Scotland are elected. It contains noble hospitals and charitable institutions, three great public libraries, and is extensively connected with the literature of the whole kingdom by many printing and publishing establishments of the first class. The population amounted to 168,000 at the last census. The city is supposed to derive its name from *Edwins-burg*, a fort or stronghold, founded on the spot by Edwin, king of Northumbria, 616–633, who extended his territory to the Firth of Forth. The Gaelic denomination of *Dun-Edin* or *Dunedin* is merely a translation

of the Saxon name. The poetical title of *Edina* was first employed by Buchanan. It is frequently styled the Modern Athens, owing to its literary fame, the taste displayed in its architecture, and the correspondence of the site to that of the renowned Greek city. *Leith*, at a short distance on the coast, is almost a suburb, and is the port of the capital. Fishing-places and sea-bathing resorts lie on the shore on either hand—Newhaven and Granton westward, Portobello and Musselburgh eastward. *Dalkeith*, a small inland town and local grain mart, six miles on the south-east of Edinburgh, has one of the principal residences of the Duke of Buccleuch, Dalkeith Palace, adjoining, below which the North and South Esk effect their junction. The former river, higher up, flows through a romantic and sequestered dell, by the mouldering castle and exquisite chapel of Roslin, and washes the base of the cliff on which stands Hawthornden, once the residence of the poet Drummond, the friend of Shakspeare and Ben Jonson.

LINLITHGOWSHIRE, or West Lothian, lies on the narrower part of the Firth of Forth, and has the small ports of Bo'ness and Queensferry on its shores, the latter sharing a considerable passenger-traffic to the opposite side of the estuary. The county—of very limited extent—has a surface pleasingly varied with knolls, and possesses abundance of coal and iron, with limestone and sandstone quarries.

*Linlithgow*, an old royal burgh, occupies an inland site, on the banks of a *lin*, or small sheet of water, and retains traces of antiquity in harmony with its historical notoriety. In the palace, overlooking the lake, the unfortunate Queen Mary was born; and in the long irregular main street the Regent Murray was shot down from one of the houses. The town, celebrated for its wells, possesses one elaborately constructed in this thoroughfare. *Bathgate*, five miles to the south, has some cotton and woollen manufactures, with coal, ironworks, and the famous Torbanehill mineral, in the vicinity.

HADDINGTONSHIRE, or East Lothian, at the entrance of the Firth of Forth into the North Sea, is remarkable for its advanced arable husbandry. There is also a maritime population largely engaged in fisheries, and pastoral industry is pursued on the Lammermuirs, which rise towards the southern border.

The town of *Haddington*, a few miles inland, on the little river Tyne, is a principal mart for agricultural produce, and is commonly referred to, but uncertainly, as the birthplace of the celebrated John Knox. An ancient Gothic church, still used, but partly in ruins, was formerly distinguished as the 'Lamp of Lothian.' *Dunbar*, a seaport extensively engaged in the herring-fishery, is of some celebrity in military history, owing to the successful defence of its castle against the English by 'Black Agnes,' Countess of March, and to Cromwell's decisive defeat of the Scotch army in the neighbourhood. *Prestonpans*, a village on the shore, is famous for the triumph of the Highlanders under Prince Charles Stuart over the royal forces, in 1745. The oysters dredged here are of great repute under the name of 'Pandores,' as being found near or by the door of the salt-pans. *North Berwick*, at the outlet of the Forth, frequented as a watering-place, is in an interesting neighbourhood. Eastward are the remains of Tantallon Castle, one of the prominent scenes in *Marmion*, opposite to which the Bass Rock rises precipitously from the waves to the height of 420 feet, with only one point where it is possible to land, on the side towards the main shore. The rock is a mass of granular greenstone, nearly round, about a mile in circumference, and two miles from the coast. It formerly possessed a fortress in which many of the leading Covenanters were imprisoned. The dungeons and cells are still to be seen. A spring on the upper surface supplied the garrison with water; and this stronghold was the last place on which the standard of the Stuarts waved after the Revolution. It is now grazed in summer by a few sheep, while the cliffs are occupied by immense numbers of sea-fowl, chiefly solan-geese, of which bird the Bass is the only breeding-station on the whole eastern coast. To make a bridge to the Bass, and to take Tantallon Castle, was once a current saying with the peasantry to express things impossible.

BERWICKSHIRE, to the southward, extends along the coast to the English border, and has a bold rocky shore, with St Abb's Head for the distinguishing promontory, in a wild and savage neighbourhood, which supplied the reality after which the imaginary 'Wolf's Crag' was sketched in the *Bride of Lammermoor*. The north part of the county contains the higher points of the Lammermuir Hills, but the greater portion of the surface belongs to the comparatively level region, called the Merse, a fertile and highly-cultivated district. The Tweed forms most of the south-eastern boundary, and receives several affluents from the interior, on which the small towns of *Greenlaw* and *Lauder* are seated.

*Coldstream*, on the Tweed, gives its name to a celebrated regiment, the Coldstream Guards, raised at the spot by General Monk, previous to his march southerly to effect the restoration of Charles II. *Dunse*, the largest town in the county, claims connection with John Duns Scotus, the famous schoolman;

Dr M'Crie, the historian, and Sir Joseph Paxton, were natives of the parish. Ruins of old castles, towers, abbeys, and priories are very numerous in Berwickshire. Dryburgh Abbey, on a richly-wooded peninsula formed by the Tweed, contains the remains of Scott and Lockhart, buried in St Mary's Aisle.

ROXBURGHSHIRE, an inland border county, mainly separated from England by the smooth, dry, and green ridge of the Cheviots, includes the middle portion of Tweeddale, the whole of Teviotdale, and the principal part of Liddesdale, pastoral districts of great interest.

*Jedburgh*, the small county town, surrounded with orchards in the valley of the Jed, has large remains of a celebrated abbey, part of which is fitted up as a parish church, and contains the grave of Lord Chancellor Campbell. In the south aisle, formerly used as a grammar-school, Thomson, the bard of the *Seasons*, received his early education, and he is said to have described the storm collecting on the mountain-top in his 'Winter' from the appearance presented by Ruberslaw, a conspicuous height in the vicinity. The proverb of 'Jedburgh justice,' the leading principle of which was to hang first and try afterwards, arose from the summary execution of border marauders. *Hawick*, a much more important place, surrounded with extensive nursery-grounds, has manufactures of woollen and worsted goods. Near it is Branksome Tower, the principal scene of the *Lay of the Last Minstrel*. *Kelso*, a centre of agricultural produce, near the junction of the Teviot with the Tweed, is distinguished by large remains of a magnificent abbey, one of the wealthiest foundations of the kind, and by singularly beautiful environs. The north part of the county includes Abbotsford, the far-famed residence of Sir Walter Scott, and Melrose Abbey, the finest ecclesiastical ruin in Scotland. In the extreme south is Yetholm, a village embosomed in the Cheviots, which has for nearly three centuries been a metropolis of the gipsies, and still contains a number of them, more regular in their habits than those of a bygone generation.

SELKIRKSHIRE is further inland and almost wholly a pastoral county. It contains part of upper Tweeddale, the whole of Ettrickdale, and the vale of the Yarrow, a district said to have given rise to more ballad and lyrical poetry than any other part of Scotland. Though now almost entirely bare of trees, the whole is supposed to have been once a woodland, and it is commonly referred to by old writers as the 'Forest,' or as 'Ettrick Forest,' from the name of the principal stream, of which the Yarrow is a tributary. The well-known song, 'The Flowers of the Forest,' refers to the fact of a considerable number of persons from this district being slain in the disastrous fight of Flodden Field. Towards the source of the river is Ettrick Pen, the highest point of the county, 2258 feet above the sea. Between Tushielaw and Ettrick Church, was born the poet James Hogg, commonly called the Ettrick Shepherd. In the valley he spent a great portion of his life, and he died on the banks of the neighbouring Yarrow. This stream emerges from a small lake, bordered with hills, and immediately passes by the ruined tower of Dryhope, once the home of Mary Scott, the 'Flower of Yarrow.' The lake bears the name of St Mary's Loch; an ancient burying-ground is pointed out as having belonged to a bygone religious house, St Mary's Kirk; and a place of entertainment, at the head of the lake, is popularly known as 'Tibbie Shiels's' Cottage.

*Selkirk*, on the Ettrick, below the confluence of the streams; and *Galashiels*, on the banks of the Gala, near its entrance into the Tweed, are the only towns, both seats of woollen manufactures. These are most extensively conducted at the latter place, and consist of goods of the finest texture and most brilliant colours, chiefly 'Tweeds,' so called after the river.

PEEBLESHIRE, the adjoining county to the westward, has a very irregular border-line, which embraces a surface more generally elevated and thinly peopled than any of the other southern counties. It contains the upper portion of the Tweed, with the source of the river, and contributes several minor streams to the main channel. The lofty heights of Broad Law, Dollar Law, and Scrape, fall within its bounds. The hills are rounded and grassy on their summits, and arable only on their lower slopes.

*Peebles*, a small ancient town, is pleasantly situated on a peninsula formed at the junction of the Eddleston Water with the Tweed. In the middle of the fourteenth century it was made a royal burgh, in acknowledgment of contributions towards the ransom of David II., taken prisoner by the English at the battle of Neville's Cross. The town, long secluded in a high pastoral region, is now approached by three railways, and has been much improved in recent years. In 1859, Mr W. Chambers presented it with

an Institution which combines a large library, a reading-room, museum, gallery of art, and a hall for lectures and public meetings. The village of *Inverleithen*, six miles distant, possesses a mineral spring, and is a place of resort in summer. It is popularly identified with Scott's *St Roman's Well*. The cottage occupied by David Ritchie, the undoubted original of his 'Black Dwarf,' is on Manor Water, in the county. Among the more remarkable antiquities are numerous British hill-forts, and mediæval border castles in ruins.

DUMFRIESHIRE, partly on the English border, but more extensively on the upper portion of the Solway Firth, embraces some low, swampy moorlands, but stretches northward to the Lowther Hills, and has some of the more elevated summits on its boundary-line, or wholly within its area. It is naturally divided into three districts, Eskdale, Annandale, and Nithsdale, so called from their respective rivers, all of which flow to the Solway. The industry of the county consists chiefly in the rearing of live-stock, with lead-mining in connection with the Lowther Hills on the north-west, in which direction coal is also worked.

*Dumfries*, an elegant and flourishing town, on the east bank of the Nith, nine miles above its mouth, is locally considered a kind of capital of the southern counties. The resting-place of the national poet, Burns, is in the burying-ground of the old church, with a monument to his memory, and the humble street in which he lived for some years before his death now bears his name. In front of the Savings Bank, a statue of Dr Duncan, the minister of a neighbouring parish, with whom those institutions originated, is appropriately placed. There are no manufactures of importance, but great trade is carried on at large weekly cattle-markets, and large quantities of stock and produce are despatched to England. At a village in the vicinity, was born William Paterson, the projector of the Bank of England, who, instead of gaining a recompense for his labours, had to petition the crown to save him and his family from utter beggary. Annandale, the central natural division of the county, has the seaport of *Annan* on the south, at the outlet of its river; and *Moffat*, in the mountain-region of *Har Fell*, at the north extremity, distinguished by mineral springs, sulphureous and saline. In the centre of the dale are *Lochnaben* and *Lockerby*. The former, nearly surrounded by several beautiful lakes, has remains hard by of a castle which belonged to Robert Bruce. The latter place annually witnesses a great gathering to its lamb fair, held in August, the largest of the kind in Scotland, to which farmers flock for business, and the peasantry for sport. *Gretna Green*, close to the English border, long celebrated for its summary marriages of runaway couples, is now simply a station on the line of the Caledonian Railway.

The Stewartry of KIRKCUDBRIGHT, as it is styled, and WIGTONSHIRE, districts of a hilly and pastoral character, compose the extreme southern portion of Scotland, and have spacious bays, conspicuous headlands, and numerous caverns along the shore, formerly the haunts of smugglers. The whole region is comprehended under the general name of Galloway, and once possessed a particular breed of small horses, hence called 'Galloways,' a name which has become common for steeds of similar stature. It still retains a race of high-valued hornless cattle, of a prevailing black colour, remarkable for gentleness and beauty, which are sent fattened in great numbers to the English markets. The Mull of Galloway, the most southerly point of the northern kingdom, is the extremity of a long, narrow peninsula, projecting into the Irish Sea, and consists of almost perpendicular rocks, from which the view stretches to the hills of the Isle of Man and the mountains of Ireland. Lakes are numerous, mostly small, and beautifully fringed with wood.

The principal river, the *Dee*, has the character of a Highland stream through the greater part of its course. The town of *Kirkcubright* is situated on the shore of its estuary, into which the peninsula of *St Mary's Isle* projects, luxuriantly clothed with trees, forming one of the most charming sylvan scenes in the southern counties. *Castle Douglas*, inland near the river, chiefly of modern erection, has its name from a neighbouring stronghold of the Douglasses, the remains of which are extant. Conspicuous among them is a main tower, with a block of granite projecting over the gateway, called the 'hanging stone,' of which these feudal lords of Galloway used to say, that 'the hanging stone never wanted its tassel.' *Gatehouse* and *Creetown* are shipping ports, the latter possessing valuable quarries of granite, of which the new docks of Liverpool are constructed. *Wigton* occupies an eminence on the western shore of the bay to which its name is given, a very fertile tract, near the outlet of the *Bladenoch*. Its old churchyard contains an interesting memorial of the two female martyrs who were drowned in the river in the year 1685. *Newton-Stewart*, surrounded with swelling-hills, is a larger place on the banks of the *Cree*, a seat of manufactures, with lead-mines in the vicinity. But both are considerably exceeded by *Stranraer*, the most important town of Wigtonshire, a seaport at the head of *Loch Ryan*. *Portpatrick* is one of the points most contiguous to the Irish coast, twenty-one miles distant, with which submarine telegraphic communication is maintained.

AYRSHIRE, the largest of the southern counties, and one of the finest, somewhat crescent-shaped, extends along the Firth of Clyde, and the channel intervening between it and the Irish Sea. It contains a considerable proportion of hilly surface, some high elevations towards the inland border-line, with spacious plains along the shores, and scenes of picturesque beauty on the rivers Ayr, Doon, Girvan, Irvine, and Garnock. Manufacturing and mining industry prevails in the north and middle portions of the district, where there are extensive beds of coal and ironstone. Agriculture is also pursued, but most extensively in the north.

*Ayr*, a very handsome and flourishing seaport, is at the mouth of the river of the same name, here crossed by two bridges, the 'Twa Brigs' of Burns, who was born near Alloway on the Doon, a small stream in the neighbourhood, celebrated by the poet. The country around Ayr is called 'The Land of Burns.' *Kilmarnock*, the principal town in size, wealth, and population, with the carpet manufacture for its staple, occupies an inland site, and is the centre of a number of populous places engaged in similar industries. Along the coast northward of Ayr are many fishing towns and ports, Troon, Irvine, Saltcoats, Ardrossan, and Largs, the first and the last two of which are frequented for sea-bathing. Troon and Ardrossan are the principal ports for shipping coal and iron to Ireland, England, and the Continent. *Irvine* once had large collieries on the banks of the Garnock, which here joins the Irvine River, till they were destroyed by an extraordinary accident in June 1833, happily involving no loss of life. The bed of the stream gave way; the water-rushed through the opening into one of the pits; all the excavations connected with it extending for several miles were soon flooded; and the pressure of the water in the pits became so great, that the confined air rent asunder the surface in various places, in the struggle to disengage itself, till the whole was set free. Off the southern coast of the county, opposite to *Girvan*, at the distance of nine or ten miles, *Ailsa Craig* rises, in complete isolation, abruptly from the sea to the height of 1097 feet. It is composed of compact felspar, and exhibits basaltic columns of extraordinary size. The mass has a circuit of two miles, is almost perpendicular on one side, everywhere steep, uninhabited by man, but tenanted by solan-geese and other wild-fowl, goats, and rabbits. The ruins of a tower crown the summit. The height and isolation of the rock render it a very striking object from the shore, and from the steamers proceeding to and from Glasgow.

LANARKSHIRE, traversed centrally by the Clyde from south-east to north-west, corresponds in its general limits to Clydesdale, and belongs almost entirely to the basin of the river. Three natural divisions are distinguished, upper, middle, and lower, varying in their features. The upper is a mountainous, pastoral, and lead-mining region, embracing Leadhills, where the principal veins have an average thickness of from four to ten feet. The middle portion, rich in coal and ironstone, is also a scene of pastoral and dairy husbandry, abounds with thriving plantations, and is celebrated for beautiful and fruitful orchards. The lower division has fertile alluvial tracts along the river, contains important stores of coal, iron, and other minerals, and is the great seat of manufactures and commerce in the country.

*Lanark*, the county town, near the right bank of the Clyde, in the middle part of its course, acquires its principal interest from being in the immediate vicinity of the celebrated Falls. *Glasgow*, on the lower portion of the river, the chief city of Scotland as respects extent and wealth, is distinguished as the third provincial city in the United Kingdom in point of population, ranking next to Liverpool and Manchester. It is the rival of the former in foreign commerce, and of the latter in manufactures. Though chiefly on the north bank of the Clyde, an important suburb lies on the southern side. The two sections are united by five bridges, to the lowermost of which, vessels of the largest class can come up, owing to improvements in the naturally encumbered bed of the stream. Besides the features common to a vast commercial emporium and manufacturing centre—as magnificent public edifices, a long line of quays, the ship-laden river, a host of spires, and clusters of tall chimneys in every direction—Glasgow has some points of special interest. These include the Cathedral, the only structure of that kind upon the mainland of Scotland spared entire by the zealots of the Reformation; the buildings of the University, founded in 1451, with much of the architectural appearance which belongs to the colleges of Oxford; the Trongate, forming with its continuations a line of streets three miles in length; and the public park close to the river and the city, an appendage of long standing, answering to its old popular name of the 'Green,' being a very extensive space of grassy ground, fitted with convenient walks, and planted with rows of trees. Formerly, the inhabitants were dependent upon the Clyde for their water-supply, but now obtain it from the purer source of Loch Katrine, from which it is conveyed by costly works through the intervening forty miles, which involved an immense amount of blasting, cutting, and tunnelling, from the rugged character of the country. The ceremony of 'tapping the loch' was performed by the Queen in person, in the autumn

of 1859. *Airdrie*, a considerable town to the east of Glasgow, has rapidly grown up from a village owing to collieries and ironworks. *Hamilton* is a small manufacturing town, near the junction of the Avon with the Clyde, two miles above Bothwell Bridge, where the Covenanters were defeated by the royal army under the Duke of Monmouth in 1679, of which a spirited sketch is given in *Old Mortality*. Near by is the palace of the Duke of Hamilton, with which a far-spreading domain of remarkable interest is connected, containing venerable oaks, flowery dells, and ivy-mantled ruins. The country thence along the river up to Lanark is exceedingly beautiful. Lanark was famous for its orchards as early as the time of the venerable Bede. They yielded early in the present century as much as £8000 yearly, but have latterly fallen off; and the ground is more profitably occupied in producing gooseberries, vegetables, &c. for the Glasgow market.

RENFREWESHIRE, on the west, extends inland from the Clyde estuary, and corresponds to the lower portion of Clydesdale in natural features and industrial employments.

*Renfrew*, the county town, near the southern bank, small and antiquated, gives the title of Baron Renfrew to the Prince of Wales, who travelled under this appellation in America. *Paisley*, further inland, the real capital, while equally ancient, has acquired great modern importance from the production of fancy goods of various descriptions and material, silk, cotton, linen, and velvet. The county contains other two populous manufacturing places, *Johnstone* and *Pollockshaws*; and two villages with historic names, *Elderslie*, near *Paisley*, where the great patriot, Sir William Wallace, was born, and *Langside*, in the vicinity of Glasgow, where the cause of Queen Mary was finally overthrown. *Greenock*, a principal seaport, near the great bend of the Clyde into the firth, is entirely of recent growth. It is distinguished as the birthplace of James Watt, the improver, if not the inventor, of the steam-engine. It has large ship-building establishments and sugar-refineries, extensive commerce across the Atlantic, and is the chief port for the embarkation of emigrants from Scotland to North America. The pier-head commands a delightful view of the hills in the opposite counties of *Dumbarton* and *Argyle*. *Port Glasgow*, a few miles eastward, founded by the merchants of the city for the convenience of commerce before the deepening of the river was thought of, enjoys considerable foreign trade, though its original design was superseded by the improvement of the navigation.

BUTESHIRE, an insular county, in the broader part of the firth, includes the island of that name, with *Arran*, the *Great* and *Little Cumbrays*, and several others of insignificant extent. *Bute*, separated from the mainland by a very narrow strait, is fifteen miles in length by five miles in the greatest breadth. It presents no striking features, but contains many scenes of quiet beauty, commands views of the magnificent adjoining shores, and is studded with several small lakes. From the mild and genial climate, it has been called the *Montpellier of Scotland*, and is hence resorted to by invalids.

*Rothesay*, the only town, cheerful and picturesque, is at the head of a deep bay on the north-eastern side, and is much visited both in winter and summer. It contains fine ruins of a castle in its midst, which was once a favourite residence with the Scottish sovereigns, and gives the title of Duke of Rothesay to the Prince of Wales. Six miles across the sea-channel to the south-west lies the much larger island of *Arran*, about twenty miles long by twelve broad, of an entirely different aspect, and deeply interesting from its geological character. The surface, generally high, is mountainous in the northern part, and the scenery sublime. Granite here protrudes through the stratified formations of mica-slate and sandstone; and forms a group of grandly picturesque serrated heights, distinguished by their spiry forms, stupendous precipices, and general destitution of vegetation. *Goatfell*, or, according to its Gaelic name, *Gaoth Bhein*, the 'Mountain of Winds' is the loftiest, rising 2874 feet, with an obtuse pyramid of granite for its summit, consisting of large blocks completely bare, or scantily spotted with lichens. In other parts of the island the open valley appears, the wooded glen, and the cultivated plain. The inhabitants speak the Gaelic tongue, and chiefly occupy the fishing villages of *Lamlash*, *Invercloy*, and *Corrie* on the east coast, which are much resorted to by summer tourists. The two *Cumbrays*, both of small dimensions, adjoin the north coast of *Ayrshire*. The lesser is said to have had a parish minister in the olden time, who, after praying for *Great* and *Little Cumbray*, was in the habit of adding, 'not forgetting the adjacent islands of *Great Britain* and *Ireland*.'

II. MIDDLE COUNTIES.

| Counties.                      | Area in Square Miles. | Principal Towns.   |

DUMBARTONSHIRE, on the north bank of the Clyde, extends from thence between the sea-lake of Loch Long, on the west, and the fresh-water expanse of Loch Lomond on the east. The northern part of the area consists of rugged mountains used for sheep-walks; southward are lower grounds under cultivation; and in the south-east, in the direction of Glasgow, cotton-printing and bleaching establishments appear, and industries corresponding to those of that city are followed. The principal river, the Leven, which issues from Loch Lomond, is the subject of an ode by Smollett, who was born upon its banks. Until contaminated by the refuse from various works on its banks, it is remarkably pure and limpid, and after a short flow, discharges itself into the Clyde.

On its left bank, just above the junction, is *Dumbarton*, of ancient date, with a new town rising up from an old suburb on the opposite side of the stream. The interest of the place centres in the Castle Rock, at the point of confluence. This is about a mile in circumference, 560 feet in height, terminating in two summits, one a little higher than the other. It was formerly a formidable stronghold, often used as a state prison, and is still kept up as a public fort, along with the Castles of Edinburgh, Stirling, and Blackness. The higher summit bears the name of Wallace's Seat, in memory of his feats of arms in connection with the fortress; a part of the castle is called Wallace's Tower; and a huge two-handed sword in the armoury is shewn as his weapon. Dumbarton, under the name of Alclud, was the capital of the old British kingdom of Strathclyde, with which that of Cumbria, embracing three of the northern counties of England, was occasionally united. *Kirkintilloch*, on the eastern verge of the county, is a small manufacturing town. *Helensburgh*, a favourite summer resort, is situated at the entrance to the Gareloch, opposite to Greenock.

STIRLINGSHIRE extends from Loch Lomond eastward to the estuary of the Forth, and comprises the lofty mass of Ben Lomond, rising with a green conical summit 3192 feet, on the western side; the Campsie Hills, with other high grounds, rise towards the centre; and fertile, highly-cultivated plains, or carse, eastward, where also the carboniferous formation is largely developed, and coal, iron, and limestone are extensively obtained.

*Stirling*, associated with many stirring events of Scottish history, occupies a commanding eminence by the winding Forth, at the head of the river navigation, and is conspicuous from afar owing to its castle-palace, still kept in repair, which crowns a high rock precipitously rising up from the adjoining plain. The view from the battlements, or from 'the Lady's Look-out,' a small opening in the parapet-wall of the garden, is remarkably fine, extending over several counties, and embracing twelve battle-fields. Two miles to the south, is *Bannockburn*, a village which takes its name from the small brook or burn on which it stands. Here in 1314 Bruce defeated, with immense slaughter, the English army commanded by Edward II., and thus secured the independence of his country. *Falkirk*, twelve miles to the south-east, also prominent in military annals, is now surrounded by ironworks, among which, those on the Carron, a small stream, rank with the largest establishments of the kind. Great cattle-fairs are held on a neighbouring moor three times a year, in August, September, and October, to which a vast number of black-cattle and sheep are brought from the Highlands and the Western Isles, and are disposed of chiefly to buyers for the English markets. The last is the most considerable, as the breeders must then part with all the stock which they do not intend to keep through the winter. The total number sold at the three fairs has amounted to 300,000 head of cattle and sheep. Iron ore for the Carron Ironworks is very largely obtained at *Kilsyth*, near the southern border of the county. In the north-east, the village of the Bridge of Allan has recently been modernised, and become one of the most fashionable of inland watering-places, owing to the adjoining saline springs of Airthrey. The neighbourhood is extremely beautiful, and remarkable for magnificent trees.

CLACKMANNAN, the smallest of the Scotch counties, lies on the north bank of the Forth, at the commencement of its estuary. It is only about ten miles in length by four in breadth; and is intersected by the Devon, a stream which forms a series of highly-romantic cascades, the Cauldron Linn and Rumbling Bridge, being just beyond the northern border. Within the limit, in that direction, rises the loftiest of the Ochill Hills, attaining the height of 2300 feet, from which the surface descends gradually southward to the level of the Forth, where it forms a very fertile plain. While a district of diminutive extent, it has not only varied natural features of great beauty, but is a scene of remarkable activity and enterprise. There are coal-mines and ironworks upon a great scale, with a number of large breweries and distilleries.

*Alloa*, the principal place, is a busy town and port, the outlet of the produce of its own breweries, and the general produce of the county. Woollen goods are made at *Tillicoultry*, in the valley of 'the clear winding

Devon,' as well as at *Dollar*, a place widely known for its excellent seminary, founded by Captain M'Nab, a native of the place, who left it as a poor ship-boy, and realised a very large fortune in London. He left £80,000 for the purpose.

KINROSS-SHIRE, the neighbouring county, wholly inland, is not much larger than the preceding. Their joint extent but slightly exceeds the area occupied by the British metropolis.

*Kinross*, the only town, is of interest from its pleasant situation on the western shore of the historic Loch Leven. The lake forms an irregular oval ten miles in circuit, and has four islands, of which the second in size is the Castle Island. It contains remains of the fortress in which Queen Mary was imprisoned, where she signed her abdication, and from which she escaped in a romantic manner, in 1568. The keys of the castle, which were thrown into the lake at the time of her flight, or what passed for such, were fished up at a recent date by an inhabitant of the town, and presented to the lord of the manor. Loch Leven is highly celebrated for the excellence and abundance of a peculiar kind of trout.

FIFE, a peninsula on the North Sea, between the Firths of Forth and Tay, is finely diversified with hill, valley, and plain, possesses great mineral wealth, its coal having been worked for many centuries, and is one of the chief seats of the Scottish linen manufacture. The principal river, the Eden, flows from the western side eastward to the sea, which it enters at St Andrews Bay. Its valley is a remarkably fertile tract, called the 'Howe (hollow) of Fife,' sometimes Strath Eden.

*Cupar*, the county town, in the centre of the vale of the Eden, on the north bank of the river, was a stronghold of the Macduffs, and the birthplace of Lord Chancellor Campbell, whose father was the parish minister. It gives the denomination of 'Cupar justice' to a system of law corresponding to that for which Jedburgh was proverbial. Wilkie, the great painter, was the son of a clergyman in the neighbourhood. *Dunfermline*, the most considerable town, in the south-western part of the county, a few miles from the Forth, produces unrivalled table-linens of every description, and kindred fabrics. It has great historical distinction, and possesses interesting antiquities. A few remains survive, close to a wooded romantic dell, of a royal palace in which Charles I. was born, and which was briefly occupied by Charles II. The Abbey Church, a modern building, but connected with portions of the ancient monastic edifice, contains the tomb of Robert Bruce, accidentally discovered in the year 1818, while digging for the foundation of the new erection. Royal interments within its precincts include eight kings, five queens, six princes, and two princesses of Scotland. The earliest mention of coal in North Britain occurs in a charter obtained by the monks of Dunfermline in 1291, allowing them to dig for it in the neighbourhood of their monastery. *Kirkcaldy*, a south-eastern port, has very extensive manufactures of coarse linens, and considerable trade in the export of coal and grain. *St Andrews*, a small city on the east coast, venerable, genteel, and quiet, is the seat of the oldest Scottish university, founded in 1411, and contains the ruins of a cathedral, with picturesque remains of a castle on a rock overlooking the sea, serving as a landmark to mariners.

FORFARSHIRE, a maritime county, north of the Firth of Tay, is centrally traversed by the great valley of Strathmore, extending from north-east to south-west, thirty-three miles in length, and from six to eight in breadth, with an undulating and highly cultivated aspect. On the inland side of this valley, the surface rises into highlands connected with the main chain of the Grampians, some high points of which are in the county. In the maritime direction are the Sidlaw Hills, only of moderate elevation, and often detached, with conical summits covered with heath. The chief rivers are the North and South Esk, both of which descend from the Grampians.

*Forfar*, the county town, in the central valley, of ancient date, preserves in its town hall a curious relic of bygone times, called 'the Witches' Bridle,' a kind of gag which was placed over the heads of the unfortunate creatures doomed to suffer at the stake for the imaginary crime. *Dundee*, on the north shore of the Firth of Tay, with beautiful green hills in the background, is the third largest town in Scotland, and one of its most important seaports, with spacious docks, quays, and other accommodation for shipping. Its staple trade is the production of coarse linen and hempen fabrics, intended extensively for foreign export, enormous quantities of which are sent to the greater ports for re-shipment to their final destination. The industry is common to the other towns and a great number of the villages. A convenient position in relation to the countries of the Baltic, from which the principal supply of flax and hemp is obtained, led to the establishment of the linen manufacture in this and the adjoining county of Fife. A public park, presented to the town by Sir David Baxter in 1863, bears his name. *Arbroath*, on the main coast, produces yarn, canvas, and sail-cloth, and is a considerable shipping port, with a Signal Tower for communicating with the Bell Rock Light-house, twelve miles distant on the south-east in the open sea. The name refers to a rock covered at

high-water, and to a bell which the abbots of Arbroath caused to be attached to it, which was rung by the action of the waves, and warned mariners of their danger. A magnificent light-house now surmounts the rock, visited by Sir Walter Scott in 1814, soon after its completion, which occasioned the lines from him :

‘ PHAROS LOQUITUR.

Far in the bosom of the deep  
O'er these wild shelves my watch I keep,  
A ruddy gem of changeful light  
Bound on the dusky brow of night.  
The seaman bids my lustre hail,  
And scorns to strike his timorous sail.'

*Montrose*, at the mouth of the South Esk, is a remarkably neat town, largely engaged in flax spinning and weaving, also an important seaport with the advantage of a convenient harbour. It was the native place of the gallant and unfortunate cavalier, James Graham, first Marquis of Montrose.

KINCARDINESHIRE, or the Mearns, an old territorial title, extends northward along the coast, and contains a considerable amount of sterile surface, being occupied on the north-west by a portion of the Grampians. But arable husbandry is pursued in a central fertile tract, called the Howe of the Mearns, really a northerly prolongation of Strathmore, while the cod, ling, and haddock fisheries contribute to sustain the population on the shores.

*Stonhaven*, a small port, resorted to for sea-bathing, is the county town. *Laurencekirk* is a borough of barony, with some linen-weaving. In a few neighbouring churchyards ‘Old Mortality’ made some of his latest appearances, engaged in his favourite occupation of renewing the inscriptions on the tombs of the Covenanters. Among the populous fishing villages, *Finnan* is celebrated for its dried fish, called ‘Finnan haddocks.’

PERTSHIRE, a large inland county, is the third in point of size, and the finest as respects natural scenery, presenting rare combinations of beauty and grandeur, wildness and luxuriance. It belongs chiefly to the basin of the Tay; and a portion extending on the north bank of its firth is maritime. In this direction, a considerable section of the county lies within the area of the Lowlands, and includes part of Strathmore, with the rich plain or carse of Gowrie, and the separating Sidlaw Hills, one of which, Dunsinane, has been immortalised by the genius of Shakspeare. Northward and westward are the Grampians, with their towering heights, deep glens, bounding streams, wooded valleys, and calm lakes, some of which are gloomy from the shadows of the mountains, while others lie open on all sides to the sunbeams. The highest mass, Ben Lawers, ‘echoing mountain,’ rises to 3984 feet, on the northern shore of Loch Tay, with a remarkably verdant surface, rife with alpine plants. From its summit, in the distance southerly, the eye catches Ben More, ‘great mountain,’ 3835 feet, and nearer on the northward is Schehallion, ‘female fairy,’ 3547 feet, of a beautifully simple and conical form. This last was selected by Maskelyne, the astronomer-royal and other scientific men, in 1773, for their experiments to determine the density of the earth. The extreme south-west of the county belongs to the basin of the Forth, and contains the striking defile of the Trosachs, with the lovely expanses of Lochs Katrine, Achray, and Vennachar. Wholly different features appear in the extreme north-west, the district of the Moor of Rannoch, an elevated table-land extending about twenty miles in every direction, and one of the most desolate wastes in the kingdom. It feeds no wild animals, is visited by few birds, has neither tree nor shrub, except a few firs on the margin of Loch Rannoch, but is largely overspread with moss and rushes, interspersed with blocks of granite. A few roads cross the wilderness, with houses at intervals for the accommodation of drovers, strongly built to withstand the rough winter storms.

*Perth*, beautifully situated on the right bank of the Tay, a few miles from the commencement of the firth, excites the admiration of every visitor from whatever quarter it is approached, owing to the charms of the landscape, and is in itself one of the best built cities in Scotland. It was formerly regarded as the capital, and retained the distinction down to the assassination of James I., in 1437, which led to the permanent

transference of the seat of government to Edinburgh. The kings lived at Scone Palace, about a mile up the river, on the opposite bank, not a trace of which remains, but a modern edifice of the same name occupies the site. They were crowned in the adjoining abbey, some inconsiderable relics of which are left; but the

Perth from below St John's Bridge.

famous 'stone of destiny' on which they are said to have been seated is now in Westminster Abbey, to which it was removed by Edward I. Apart from the city, the population of Perthshire is either grouped in comparatively small towns or considerable villages.

ARGYLE, on the west coast, the second largest county, is a region of peninsulas, one of which, that of Cantire, is the most remarkable in the British Isles. This projection is forty miles long, with an average breadth of about seven miles, terminated by the Mull, a high rock, within thirteen miles of the coast of Ireland. To the mainland of the county numerous islands are attached, which form nearly a third of its area. The surface is with little exception mountainous and rugged, rising in Ben Cruachan, the highest point, 3670 feet above the sea, a mass of vast dimensions, overlooking a singularly complicated intermixture of sea and land. Towering to the north of Loch Awe, this mountain is seen to great advantage on approaching the lake from the south, especially from a point which bears the name of 'Burke's view,' where once stood the author of the treatise on the *Sublime and Beautiful*, admiring the scene. Loch Awe is the second of the Scotch lakes in extent, with about twenty little islands within its circuit crowned with trees. The north part of the county contains 'dark Glencoe,' a valley or defile of savage grandeur, the scene of the barbarous massacre of the Macdonalds in 1692.

*Inverary*, the county town, a very small place, but long a seat of the Dukes of Argyle, is chiefly sustained by the herring fishery of Loch Fyne, near the head of which it is situated. *Campbeltown*, towards the south extremity of the peninsula of Cantire, the largest town, is noted for its distilleries and fisheries. *Dunoon*, on the shore of the Firth of Clyde, is one of the summer retreats of the citizens of Glasgow; and *Oban*, on the north-west coast, is a station for tourists bound for the islands, or for Inverness by the line of the Caledonian Canal.

Mull is the largest island, of very irregular shape, with basaltic cliffs and natural arches on the shores, and a mountainous but monotonous interior, owing to the rounded form of the masses, their covering of brown heath, and the absence of deep valleys. Eastward is Lismore, highly fertile, answering to the meaning of its name, 'the Great Garden,' in ancient times a distinguished ecclesiastical site, the residence of the Bishops of Argyle. Westward is the small isle of Staffa, with the basaltic Cave of Fingal on the southern shore, opening towards the ocean, and traversed by its waves, with the Clamshell or Boat Cave and the Cormorant's Cave in the neighbourhood, hardly less striking than Fingal's. Off the south-west extremity of Mull, separated by a narrow channel, lies Iona, three miles long by one and a half broad, once the residence of St Columba. It contains remains of a cathedral, nunnery, chapel, and monumental tombstones of abbots and chiefs. Further west, in the open ocean, are Coll and Tiree, with the Skerryvore Light-house about twelve miles from the nearest point of the latter, the boldest work of its class. It stands on a ledge of rocks over which the Atlantic dashes with tremendous fury, rises to the height of 138 feet, and contains a mass of masonry more than double that of the Bell Rock, and not much less than five times that of the Eddystone. A southerly group of islands embraces Colonsay, Islay, and Jura, the latter extremely wild and rugged, distinguished by its conical peaks, called the Paps of Jura, from 2000 to 3000 feet in height, which are well-known landmarks to mariners. Three of the principal bear the names of Ben-a-Chaoluis, 'the mountain of the sound' (or strait), Ben Sheeunta, 'the hallowed mountain,' and Ben-an-Air, 'the mountain of gold.' Argyleshire, both mainland and islands, has a very thin population, principally engaged in stock-rearing and fisheries, but annually decreasing in numbers as the poverty of the surface stimulates a departure to more favoured sites.

Basaltic Columns, Staffa.

Aberdeen from the Cross.

III. NORTHERN COUNTIES.

| Counties.                      | Area in Square Miles. | Principal Towns.                                  |

ABERDEENSHIRE, an extensive maritime county, includes that portion of the east coast which forms the rounded projection marked by Kinnaird's Head, where the general direction changes from north to west. It contains the most easterly point of Scotland, or Buchan Ness immediately below Peterhead, south of which are the Bullars (boilers) of Buchan, named from the peculiar bellowing noise of the waves in storms, as they rush through arched rocks and into caverns on the shore. While the interior is generally hilly, some of the grandest highlands of the kingdom rise on the south-west, noticed in the general description of the Grampians, but are partly on the borders of Inverness and Banff. In the same quarter are extensive woodlands belonging to the forest of Mar, containing magnificent specimens of the Scotch fir, and plentifully stocked with red and roe deer. The two chief rivers, the Dee and Don, run from west to east, enter the North Sea in close proximity, and though not navigable, are valuable for their salmon fisheries.

The high grounds are for the most parts moorish and mossy wastes, but on lower sites along the coast a considerable amount of ordinary agricultural produce is raised, except wheat, for which the climate is too cold.

*Aberdeen*, a very handsome and flourishing town and port, the fourth in point of population, is situated at the mouth of the Dee, on the south bank, contiguous to Old Aberdeen, on the south side of the Don, which may be considered its suburb. It is largely built of fine gray granite quarried in the immediate vicinity. This is the material not only of the public edifices and hotels, the pier and quays, but of the private houses, which form in the principal street a long and spacious avenue of granite, the effect of which is both pleasing and striking. The manufactures include cotton, wool, flax, and iron goods upon an extensive scale, with paper-mills and ship-building. Aberdeen is the seat of a university, originally consisting of King's College in the old town, founded by Bishop Elphinstone in 1500, and first called St Mary's College, and Marischal College, in the new, founded in 1593 by George Keith, fifth Earl Marischal of Scotland. *Peterhead*, northward on the coast, besides its herring fishery, has long taken a leading part in the northern whale fishery, possesses mineral springs which bring to it summer visitors, and ships vast quantities of granite for building and paving purposes quarried in the vicinity. *Fraserburgh*, a port adjoining Kinnaird's Head, is a principal seat of the herring fishery. Within the district of the Aberdeenshire highlands, the village of Ballater is a common tourist's station, in a neighbourhood with which Lord Byron was associated in early life, and at the distance of about nine miles from Balmoral, the summer residence of the Queen.

**BANFFSHIRE**, to the westward, extends from the coast in a south-westerly direction to the region of the higher Grampians, one of which, Cairngorm, 4090 feet above the sea, is wholly within its limits, while the border-line from Aberdeenshire crosses the shoulder of the loftier Ben Macdhuil (4295 feet). The former mountain is celebrated for its specimens of rock-crystal, hence popularly called Cairngorm stones, but which are of frequent occurrence in the highlands of primary districts, and have now become somewhat rare in this locality owing to the number abstracted. They are of various shades of colour, a rich light-yellow, white, pink, dark-brown, or almost black, and are often styled false topazes from their resemblance to the true example. From this elevated district, the stream of the Aven descends to join the Spey on the western side of the county, these two rivers flow with such singularly transparent water as to deceive the stranger respecting its depth, rendering it perilous for him to attempt to ford them. It receives a small affluent from Glenlivet, a woodless tract famed for the quality of its whisky. On the eastern side, partly along the border, flows the Deveron, with the Isla for a tributary.

The old town of *Banff* is beautifully situated at the mouth of the Deveron, largely modernised, but retaining some curious antique houses. Three Jameses have been conspicuously connected with it—James Sharp, the notorious Archbishop of St Andrews, born in its castle in 1613; James Graham, Marquis of Montrose, from whom the place suffered so severely in 1647, that the inhabitants, styling themselves 'Town of Banff Bodies,' addressed the parliament for relief; and James Macpherson, a noted Highland robber, executed in the last century, whose 'farewell' is the subject of a poem by Burns. The modern village of Macduff, a mile distant, on the opposite bank of the river, forms a kind of suburb. *Portsoy*, a small fishing town, is distinguished by mineralogical rarities in its vicinity. Serpentine is here quarried as marble, and contributed to the ornamentation of the palace of Versailles. A variety of granite also occurs composed of only two ingredients, felspar and quartz, which are so arranged, that upon the rock being polished, a slab appears as if inscribed with Hebrew characters on a white ground. It is hence termed graphite granite, and the slabs are commonly known as the Tablets of Moses.

**ELGINSHIRE**, further west, lies on the broader part of the opening of the Moray Firth, extending from the mouth of the Spey to beyond that of the Findhorn; and has an inland tract wholly separated from the larger maritime portion by a detached section of Inverness-shire. The district was formerly called Moray, and the name is still in use, signifying a 'marshy' or 'benty sea-coast.' This is a true description of the shore, except centrally, about Burgh Head, which consists of sandstone cliffs crowned with the remains of Danish fortifications. In other directions, sand-hills line the strand for several miles, the loosening of which in the seventeenth century, by the peasantry inconsiderately pulling up the bent, juniper, and other plants which bound each mass together, originated a grave disaster. The fine particles immediately began to drift under the action of the wind, and were blown over a district of more than ten square miles, chiefly included in

the barony of Culbaine, before renowned for extreme fertility. In the course of twenty years, it was turned into a dreary wilderness, depopulated as well as rendered sterile, and its manor-house, offices, and orchards, smothered by the drift. The desolation of this tract has remained to the present day, with the exception of some places where human industry has removed the sand-flood from the rich old soil of the barony. At a short distance from the sea, fine wheat-lands occur, and the general surface is productive, except in the extreme south, where there are highlands either clothed with native forests, or covered with furze and broom. The climate of the maritime lowlands is remarkably mild and dry for so high a latitude.

Besides the Spey and the Findhorn, chiefly on the eastern and western confines of the county, the Lossie flows intermediately to the sea, on the banks of which, a few miles from its mouth, the town of *Elgin* is situated. The name is said to be derived from Helgin, borne by a conquering Norwegian chief, and is so spelt on the seal of the burgh. The town was thrice burned in little more than half a century: by the notorious Wolf of Badenoch in 1390, by a son of the Lord of the Isles in 1402, and by the Earl of Huntly in 1452—this last calamity originating the proverb, 'Half done, as Elgin was burned.' Its principal feature is a dilapidated cathedral in the florid Gothic style, once the most magnificent in Scotland, proudly called 'The Lanthorn of the North,' and still majestic in ruins. The surrounding churchyard, crowded with tombs, is one of the most extensive of the old burying-grounds. *Forres*, on a sandy knoll near the Findhorn, towards its mouth, is remarkable for an antique monument, by the roadside eastward of the town, called the Forres Stone, a pillar upwards of twenty feet high, and believed to descend fourteen feet into the ground. It is carved with the figures of warriors and other objects; and is supposed to commemorate a pacification concluded at the place between Malcolm II. and Sweno, a Danish invader. The neighbourhood figures prominently in the tragedy of *Macbeth*. A spot marked by a clump of trees is traditionally regarded as the scene of his interview with the weird sisters. *Fochabers*, a very neat village on the Spey, adjoins Castle Gordon, the old 'Bog of Eight,' formerly the residence of the Dukes of Gordon, now the property of the Duke of Richmond.

NAIRNSHIRE lies on the narrower part of the Moray Firth, and has a detached tract in the Black Isle, the popular name of the peninsula on the northern side of the estuary. The main portion of the county is intersected by the Findhorn, with beautifully picturesque banks; and also by the Nairn, called in Gaelic *Kis-Nerane*, 'the water of alders.'

The town of *Nairn*, at the mouth of the latter stream, resorted to as a watering-place, consists chiefly of a single spacious street, at one extremity of which the Gaelic language is spoken, and at the other the English or Lowland Scotch. Cawdor Castle, in the neighbourhood, a well-preserved and striking baronial residence of the fifteenth century, still occupied, is of interest from the association of the site with Macbeth, who was Thane of Cawdor. In a part of the roof the hiding-place of Lord Lovat is shewn, where he remained concealed for some time after the battle of Culloden.

INVERNESS-SHIRE, the most extensive of the Scotch counties, and one of the most sparsely peopled, spans the country diagonally from sea to sea, from the Moray Firth to the waters of the Atlantic, and includes a considerable number of islands on the western side. The mainland is eminently a region of mountain and moor, of glen, lake, water-fall, and forest. It embraces several of the higher Grampians, with the loftiest of all, Ben Nevis, at the south-west extremity, and the long outlying range of the Monaghlea, or gray mountains, which form the water-shed between the Spey and the Findhorn. In addition to these rivers and the Nairn, which rise within the county, and flow beyond its borders, it contains the basin of the Spean, connected with the western ocean, and those of the Ness and Beaully, belonging to the Moray estuary. Among the many deep and narrow valleys which indent the surface, Glen Urquhart and Glen Moriston, on the western side of Loch Ness, are remarkable for their wild beauty. The former has been compared to the renowned Vale of Tempe. In the latter, scarcely its inferior in scenic attractions, Prince Charles Edward, after his defeat at Culloden, remained concealed for several weeks, entirely dependent upon the care of a few Highlanders to whom he was known, whose fidelity to him never wavered. Glen Roy, in the basin of the Spean, is distinguished by its Parallel Roads, once supposed to be of artificial construction,

and superstitiously viewed as the pathways of giants, but simply nature-formed terraces marking the successive level of ancient waters. The terraces are three in number, from ten to sixty feet broad, extending eight miles along both sides of the valley, and perfectly corresponding in their height above its bottom.

But the grand example of depression, properly styled the Great Glen, is a long and sublime valley stretching between the sea-loch Eil on the south-west to the Moray Firth on the north-east, and dividing the county into two nearly equal parts. In this valley, Lochs Lochy, Oich, Ness, and Dochfour form a chain of navigable waters which are connected by the Caledonian Canal, and joined to narrow arms of the sea on opposite sides of the country. The whole distance is rather more than sixty miles, of which thirty-seven and a half lie through the natural sheets of water, and twenty-three are by the artificial cuttings. The latter being intended to afford a passage to frigates of thirty-two guns, or merchant vessels of similar size, are 50 feet wide at the bottom, 110 feet at the surface, and 20 feet deep. Differences of level are overcome by twenty-eight locks. This great undertaking, executed under the direction of Mr Telford, was completed after the labour of eighteen years in 1823, at a total cost to the nation, including recent improvements, considerably exceeding £1,000,000 sterling. But it has not answered the expectations of the projectors, for instead of availing themselves of the route, seamen prefer the longer but more convenient course of rounding the northern extremity of the island. It is, however, extensively employed in summer for the transit of passengers and goods between the Clyde and Inverness. The summit-level of the canal, between Lochs Oich and Lochy, is ninety-four feet above the ordinary high-water mark on the east coast, and ninety feet above that on the west.

The town of *Inverness*, commonly regarded as the capital of the Northern Highlands, much frequented by tourists, is well built, and flourishing, situated in a rich, cultivated, and woody district, on both banks of the river Ness, at the north-east extremity of the Caledonian Canal. Though of great antiquity, the date of its origin is unknown, but a castle occupied an eminence to the south-east in the eleventh century, in which, according to tradition, King Duncan was murdered by Macbeth. English or Lowland Scotch is the ordinary language of the inhabitants, but the Gaelic is known to many, and is alone spoken or understood in the secluded glens of the county. A few miles to the eastward is Culloden Moor, where the army of Prince Charles was totally defeated in 1746, in little more than half an hour, and became the victims of an unsparing slaughter. The field is a desolate tract of table-land, traversed by a carriage-road, by the side of which two or three green mounds mark the spot where numbers of the slain were interred. Fort William and Fort George, at opposite extremities of the Great Glen, with Fort Augustus intermediate, were erected at different periods by the government to restrain the turbulence of the Highlanders. They are now of no military importance except as barracks for a few companies of troops, but are convenient stations for tourists. Fort William, on the shore of Loch Eil, and at the western base of Ben Nevis, was built in the reign of William III., and named after him, while an adjacent village received the name of Maryburgh, in honour of Queen Mary. The very considerable inequality of surface traversed by the Caledonian Canal is overcome by twenty-eight locks, to the largest of which the fanciful appellation of Neptune's Staircase has been given. Fort Augustus, at the south-west extremity of Loch Ness, close to the edge of the water, was built soon after the rebellion of 1715. Fort George, on a sandy projection into the Moray Firth, the largest fortress, with accommodation for 2000 men, was erected immediately after the suppression of the insurrection of 1745.

Portions of both the Outer and the Inner Hebrides belong to Inverness-shire. The most important member and the nearest to the mainland is the magnificent island of Skye. Many parts of the coast, composed of columnar trap, exhibit basaltic pillars scarcely inferior to those of the Giant's Causeway. Two caves are pointed out as hiding-places of Prince Charles. A third, the Spar Cave, has the appearance of being lined with marble from the beautiful stalactite formations. For wildness and sublimity few scenes rival Loch Coruisk, with its margin of broken rocks, tier above tier, rising up to the Cuchullin Hills, remarkable for their dark colouring and serrated outline, which girdle the lake on one side with an insurmountable barrier. Referring to this locality Sir Walter Scott remarked, 'Borrodale or even Glencoe is a jest to it.' The highest point of the mountain-wall, *Scur-na-Gillean*, 'the rock of the young men,' rises upwards of 3000 feet above the sea. Another peak, very little lower, has the strange name of *Scur-na-Banachtich*, 'the rock of the smallpox.' The eagle may often be seen wheeling around these heights, while the red deer descends from the mountain fastnesses to browse upon the scanty herbage on the margin of the lake. *Portree*, the only town of the island, is a small fishing

place on the east coast, with a spacious landlocked natural harbour, in regular communication by steamer with Glasgow during the summer months. Its name, signifying the 'King's Port,' was conferred in honour of a visit of James V. Southward from Skye lies the parish of the small isles, consisting of Canna, highly fertile, with a sea-cliff called the Compass Hill from its supposed magnetic influence; Rum, distinguished by sharp-peaked dark mountains, and a breed of horses said to have been originally introduced from a vessel belonging to the Spanish Armada; and Eig Isle, conspicuous from its Scur, a remarkably formed hill of dark porphyritic pitchstone shooting up in columnar precipices to a considerable height. This last isle was the scene of a tragedy in feudal times.

' On Scur-Eigg next a warning light,  
Summomed her warriors to the fight;  
A numerous race, ere stern Macleod  
O'er their bleak shores in vengeance strode,  
When all in vain the ocean gave  
Its refuge to his victims gave.  
The chief, relentless in his wrath,  
With blazing heath blockades the path;  
In dense and stifling volumes rolled,  
The vapour filled the caverned hold!  
The warrior-threat, the infant's plain,  
The mother's screams were heard in vain;  
The vengeful chief maintains his fires,  
Till in the vault a tribe expires.'

The cave to which these lines refer has nothing outwardly to distinguish it from an ordinary animal burrow, and can only be entered by creeping on hands and knees. It expands in the interior, and runs to a considerable distance into the bowels of the rock. Skulls, bones, and other human remains, found scattered on the floor—the relics altogether of 200 individuals—have borne melancholy witness to the barbarous vengeance of the Macleods of Skye on the islanders of Eigg.

ROSS and CROMARTY occupy the mainland from coast to coast, north of the preceding district, and have deeply-indented shores on both sides. They are taken together in all statistical documents, and viewed as a single political division, from the circumstance of the latter county consisting of not less than ten small detached portions, scattered chiefly through the northern half of the former. This arrangement is said to have originated with an Earl of Cromarty who wished to have all his lands wherever situated grouped together. The general surface is high, rugged, and barren, bestrewed with mountains rising to from 3000 to 4000 feet above the sea, many of which have the prefix 'Scur' attached to their names, signifying a precipitous eminence. The glens are equally numerous, and are mostly the beds of lakes. Loch Maree, the largest example, eighteen miles long, by from one to three broad, towards the west coast, is unsurpassed for savage grandeur. On the eastern shores, along the Dornoch and Cromarty Firths, there are lowlands, or moderately-elevated districts, with a fertile soil, where agriculture is pursued in connection with the fisheries. The rearing of black-cattle and sheep prevails in the interior, and gives a very scanty subsistence to a scattered peasant population engaged in folding and shepherding. These employments being of a desultory character, some of the cottars profitably occupy spare time in knitting socks and stockings while in the open air of the moors and mountains, an industry introduced into several Highland counties by a benevolent and enterprising employer at Inverness. The peasantry clean, comb, and otherwise prepare the wool with which they are supplied. They dye it themselves where colours are desired; brown, from a lichen called *crothal*; yellow, from the tops of young heather; black, from the bark of the alder; lemon, from furze flowers; and olive, from the roots of the water-lily. These substances are all at hand, and are well known. Articles of various patterns and colours, knitted from home-dyed self-coloured wools, have been exported as far as Hong Kong and Shanghai, but they are chiefly used at or near the sites of production.

*Dingwall* ('Law' or 'Court Hill'), the county town of Ross, at the head of Cromarty Firth, surrounded with rich and well-wooded lands, commands fine views of Ben Wyvis, and is within twelve miles of the summit. The ascent is commonly made from Strathpeffer, an intervening point frequented by a large

number of invalids, having strongly sulphureous mineral springs. White or Alpine hares, ptarmigan and other moorfowl, abound on the mountain, and rare wild plants are met with belonging to the true Alpine flora. A cairn distinguishes the highest point of the long horseshoe-shaped ridge, which very closely approaches the line of perpetual congelation; indeed, snow has never been known to be entirely absent from certain corries or ravines within living memory, except during the remarkably hot summer of 1826. Ben Wyvis was originally held by the principal proprietor from the crown, by the singular tenure of bringing from the mountain three wain-loads of snow whenever the king should desire. *Cromarty*, at the mouth of the firth, on the southern side, possesses one of the finest of natural harbours, capacious enough for the largest fleet, of easy access, completely landlocked and sheltered from every wind. An obelisk commemorates a native of the place, Hugh Miller, the author of *The Old Red Sandstone*, and other well-known works, who began his career as a stone mason in the neighbourhood. *Invergordon*, on the northern shore, furnished with a convenient pier, is entirely modern, and has become the chief emporium of the trade of the county. *Tain*, on the southern shore of the Dornoch Firth, an ancient burgh, retains some relics of antiquity, but has largely lost the advantages connected with a maritime position by the formation of sandbanks, which threaten to fill up the entire estuary.

The large island of Lewis (Norwegian, *Ljoðkhus*, 'Sounding House'), the most northerly of the Outer Hebrides, belongs to Ross-shire; it is sixty miles in extreme length, and thirty miles in extreme breadth. It is separated from the mainland by the broad channel of the Minch; and has been for twenty years in the hands of a single proprietor, Sir James Matheson, whose modern castellated residence overlooks Stornoway, the only town, on the east coast. Though the surface is generally high, and has its pleasant slopes and valleys, boggy moorlands predominate, with a rounded and tame outline, wholly destitute of trees, except in a few favoured spots. The fisheries of cod, ling, and herring are important, carried on by the natives, as well as by adventurers from a distance. Monumental cairns and conical tumuli are numerous in the island; but the most remarkable relics of long bygone time are the Standing Stones of Callanish, on the western shore. They are forty-eight in number, from seven to thirteen feet in height, arranged in a cruciform manner, with a circle at the intersection all resting on a causewayed base, forming a kind of temple devoted to some early system of worship.

**SUTHERLAND**, in the shape of an irregular square, embraces part of the extreme north of the mainland, and has an extensive western and northern coast, crowded with deep inlets and bold precipices, while a flat sandy shore stretches on the eastern side between the Dornoch Firth and the Ord of Caithness. Cape Wrath, at the north-west angle, far from human habitations, except those of the light-house keepers, presents grand fronts to the ocean, the currents of which are rendered tumultuous by desolate islets and sunken rocks in the vicinity. This headland, as well as the adjoining coast, is interesting to the geologist from its gneissic mass being permeated with injected granite, and crowned by Silurian deposits. In the interior of the county are pastoral valleys edged by chains of hills, most of which contain long narrow lakes, while majestic mountain forms occur detached, and acquire a severe and savage aspect towards the Atlantic coast-line. In this quarter, north and south of the fresh-water Loch Assynt, there is a remarkable series of lofty isolated masses, composed of Silurian rocks resting on a platform of gneiss, one of which, Suil-vean, or Sugar-Loaf, as seen from a distance to seaward, seems like a perfect sugar-loaf shaped cone, shooting up to the height of about 2400 feet. Macculloch, in his peculiar style, writes of these mountains, appearing 'as if they had tumbled down from the clouds, having nothing to do with the country or each other, either in shape, materials, position, or character, but looking very much as if they were wondering how they got there. Which of them all is most rocky and useless is probably known to the sheep; human organs distinguish little but stone; black precipices when the storm and rain are drifting by, and when the sun shines, cold bright summits that seem to rival the snow.' On the shore of Loch Assynt are the ruins of the Castle of Ardvreck, where the unfortunate Marquis of Montrose was confined by Macleod, chieftain of the district, and betrayed to his enemies. The largest lake, Loch Shin, eighteen miles long, by one in average breadth, lies towards the centre, has excellent fishing, and scenery of a soft character. With the exception of a narrow border of arable land on the east coast, the whole surface, five-sixths of which belong to the Sutherland family, is divided into immense sheep-farms, chiefly in the hands of large capitalists, from which the native

peasantry have been removed by various clearances, either to expatriate themselves, or reside along the coast in fishing villages and hamlets.

In the entire county there is no newspaper or printing-press, and no town except *Dornoch*, at the northern entrance of its firth, which is scarcely worthy of the name, having a very inconsiderable population. In former times it had the rank of a city as the seat of an episcopate, and it retains an old square tower belonging to the bishop's palace, with remains of the ancient cathedral repaired to serve as a parish church. *Golspie*, *Brora*, and *Helmsdale* are villages on the coast to the northward. Near the first is the vast pile of *Dunrobin Castle*, the residence of the Dukes of Sutherland, of which high towers and fretted pinnacles, in the style of a foreign chateau, are the conspicuous external features. Coal occurs in the oolite formation at *Brora*, but has no commercial value.

CAITHNESS, the north-easterly section of the mainland, is a generally level district, with a bleak and sterile aspect, owing to the absence of woodland scenery and the presence of peat-mosses; but it has a considerable area profitably devoted to agriculture. Its coast-line alone offers temptations to the tourist, and is very magnificent, distinguished by grand cliffs with the picturesque Castles of *Sinclair*, *Girnigo*, *Ackergill*, and *Keiss*, on the seaward verge, while 'stacks,' or detached pillars of sandstone rock, variously worn by the ocean, are characteristic of the shores. *Duncansby Head*, a confused mass of old red-sandstone strata, perforated by the sea in different parts, marks the north-east angle, and has several stacks in front detached from it by the action of the waves. Near this headland, a grassy knoll close to the beach is pointed out as the site of the famous *John O'Groat's house*, often quoted as the most northern inhabited point on the mainland of the kingdom. According to tradition, the name is a corruption of *John de Groot*, a Dutchman, who settled at the spot about the reign of *James IV.*, and arranged a dispute among his eight sons upon a point of precedence by opening eight doors in his dwelling, by which means they passed in and out without quarrel. Whatever may be the value of this tradition, there can be no doubt as to the existence of a *John Groot*, for in 1496 '*John Grot, son of Hugh Grot,*' had a grant of a penny land in *Duncansby* from *William, Earl of Caithness*. The family still exists.

*Wick*, the capital of the north-east herring fishery, is at the head of a bay on the east coast, with *Pulteney Town* for its suburb, completely modern, its site having been a huge sandbank little more than half a century ago, and would probably soon be so again without unremitting attention on the part of the harbour authorities. The tendency to *silt* in this and other bays on this coast opens up some interesting questions in physical geography; in all, the north is the deep side, and the roughest ground; and the ground, as *Mr Cleghorn* has shewn, in which the herring deposits its spawn, to which circumstance *Wick* owes its immense herring fishery. The fishing season commences towards the middle of July, and continues about eight weeks, during which the place exhibits animated scenes of excitement and energy. Numbers arrive from the western highlands to serve the masters of boats and nets as 'hired men,' depending upon their wages to pay the rent of the small holdings they occupy. A Babel-like confusion of languages may be heard on a Saturday evening, when the labours of the week are over—broad Scotch, Gaelic, Irish, Orcadian, Shetland, pure Caithness, rough Banff, and rougher Aberdeen, with the Fife or further Scotch dialect. As many as 1600 to 1800 boats are sometimes simultaneously engaged, and it has been calculated that in this district, which comprehends the shores southward to the county of Aberdeen, the netting daily set and hauled up by the boats employed would extend in a straight line nearly 600 miles, or stretch from Caithness across the North Sea to the mouth of the Elbe. Much of the cured produce is sent to Germany, Italy, and the West Indies. *Thurso*, or *Thor's Town*, on a secure and spacious bay of the north coast, is the most northerly town on the mainland of Great Britain, with the high rocks of *Dunnet Head* a few miles distant, the *Land's End* in that direction.

The insular counties of *ORKNEY* and *SHETLAND* lie to the north-east of Caithness, between which and the former is the turbulent and eddying *Pentland Firth*, a channel from five to eight miles wide. The Orkneys, *Orcades* of the ancients, visited by the Roman fleet in the time of *Agricola*, when the shores of Britain were first circumnavigated, consist of sixty-seven islands, thirteen of which are of some extent, and twenty-eight are usually inhabited, while several of the others are used as pasture-grounds in summer. They rise to no great elevation at any point, form level tabular masses in general, and consist of

rocks of the old red sandstone, with the exception of a small granitic tract. The Isle of Hoy contains the highest point, Wart Hill, 1556 feet above the sea, and is distinguished by a lofty detached rock, called the 'Old Man of Hoy.' In the interior of this island, there is a remarkable mass of sandstone hollowed into a kind of apartment, said to have been the work of a dwarf, and therefore styled the Dwarfie Stone. Assailed with fearful violence by the winds and storms of the Atlantic, which carry the ocean spray far and wide, no trees or shrubs grow except in a few sheltered places, though large roots and trunks found in the peat-mosses, with hazel-nuts and the horns of deer, attest the existence of ancient forests.

The largest island of the group, Pomona or Mainland, contains the town of *Kirkwall* on a bay of the eastern coast, in possession of an ancient cathedral remarkably well preserved, and still used as a place of worship, but wanting the original steeple which was destroyed by lightning. Close to the cathedral are the ruins of the Bishop's Palace and of the Earl's Palace, buildings described by Sir Walter Scott in his *Pirate*. *Stromness*, on the opposite side of the island, seated on a beautiful bay which forms a secure harbour, is the chief shipping port. Between the two towns, by the side of a sea-loch, are the 'Standing Stones of Stennis,' fifteen in number, most of which are from eight to fifteen feet in height, arranged in a circle, a monument of pre-historic times. The Orcadians raise a very limited amount of agricultural produce, chiefly oats and garden vegetables; rear cattle and sheep; prosecute the cod, ling, herring, and lobster fisheries. Females of the humbler class engage in the making of straw-plait, the material of which is the native rye-straw, with an imported portion of finer kind.

The Shetlands, supposed by some to be the *Ultima Thule* of the ancients, are separated from the preceding by a sea-channel of fifty miles, which has Fair Isle near its centre, as a kind of half-way house, where the flag-ship of the commander of the Spanish Armada was wrecked. The group consists of more than a hundred members, with excessively torn and craggy shores, aptly designated 'the skeleton of a departed country,' the more destructible portions of which have been worn away by the Atlantic. During the storms of every winter the coasts are battered by the waves with the force of real artillery; detached masses of rock are tossed to and fro like marbles on many a beach; some are ground down to pebbles; and fresh blocks supply their place by disruption from the cliffs. Twenty-seven of the series are inhabited, and several of the others are visited for pasturage.

The largest, or Mainland, is so repeatedly penetrated by 'voes,' or deep bays, that no portion of the interior is more than three miles from the sea. It contains *Lerwick*, the only town, on the east coast, between which and an opposite island a fine natural harbour is formed, the common rendezvous of vessels bound for the northern whale fishery. The inhabitants maintain themselves partly by fishing, and partly by the manufacture of woollen fabrics, of which the chief are the celebrated Shetland shawls. The islands are celebrated for a breed of half-wild ponies, known by the name of *shelties*, which are largely exported. Both the Shetlands and Orkneys were early seized by the Northmen and colonised by them, as well as the shores of Caithness and Sutherland, the latter, their 'southernland.' They long remained subject to the kings of Denmark and Norway, but were governed by practically independent earls or jarls. Upon the occasion of the marriage of Margaret of Denmark to James III. of Scotland, in 1468, both groups passed to the latter country. Their inhabitants being of Scandinavian origin formerly spoke the Norse language, but it has long been superseded by the Lowland Scotch.

The early history of Scotland is barren in events known with certainty, and invested with interest. The Romans entered the country under Agricola in 80 A.D., subdued the southern portion of it, and advanced to the foot of the Grampians. Traces of their presence are extant in camps, altars, weapons, coins, tablets, and mounds. To secure the conquest, a chain of forts was erected between the estuaries of the Clyde and Forth, which was afterwards converted into a continuous rampart, called the Wall of Antoninus, from the emperor under whom it was constructed. Some remains of the rampart are now known by the name of Grame's or Graham's Dyke. The Romans designated the region to the northward Caledonia, a word supposed to be derived from the old British, with the signification of 'land of forests;' but the primitive native name was Albin, still in

use among the Highlanders, apparently the same as Albion. In a subsequent age two groups of people are historically distinguished, the Picts and Scots, who were troublesome neighbours to the English. The Picts represented the ancient Caledonians or Albins. The Scots were immigrants from the north of Ireland, the original Scotia, who transferred the name to their new home, extended it to the whole country as they acquired the mastery, and under Kenneth Macalpin, in 843, founded the Scottish kingdom. After a long term of independence, Scotland and England were united under the same crown in 1603, but remained distinct kingdoms to the year 1707, when a common legislature was formed, and both were merged in a single state under the name of Great Britain.

At the last census Scotland contained a population of 3,062,964, consisting of a larger proportion of females to males than is to be found in any other part of the civilised world. This excess of the female population is satisfactorily explained by peculiarities of social life. The Scotch emigration to foreign countries is chiefly of males; a much greater proportionate number at home enter the mercantile marine in Scotland than in England; and the deaths by drowning are very numerous, which fall chiefly upon the males, whose pursuits require them to risk themselves in the dangerous channels of the sea in small boats, which are the only means of communication between one island and another, or between the islands and the main shores. During the years 1855-6-7, no fewer than 1263 males were drowned by accidents in the Shetlands, while only 238 females perished there from that cause in the same period.

In few countries has material improvement been so vigorously pursued, and such a large measure of social prosperity been gained, in the face of great physical disadvantages. Rapid rivers, rugged mountains, and savage glens are natural obstacles to intercommunication. These long contributed in Scotland to restrict intercourse between districts at no great distance apart, and to shackle commerce. The first attempt to grapple with these difficulties was made upon the suppression of the rebellion of 1745, when the troops stationed in the Highlands under General Wade were employed to open routes. But in a region thinly inhabited by a poor peasantry, unable to make needful repairs, the military works speedily suffered from neglect, and became to a great extent unserviceable. At the same time, in the extreme north, no roads of any kind existed; and to such a degree did the want of tolerable means of intercourse affect the administration of justice, that the counties of Sutherland and Caithness were expressly exempted from returning jurors to the northern circuit at Inverness. The remedy was applied by a government commission, which commenced its labours soon after the present century opened. Under its auspices, in the space of twenty-five years, about 1000 miles of new road were constructed, while 1200 bridges were thrown over large rivers and mountain streams. By these means, the mail-coach was enabled to proceed direct from London to Thurso, in the neighbourhood of John o' Groats, a distance by the route of 783 miles, which was justly styled the 'true Union of the Kingdoms.' The whole space, with the exception of a small northern portion, is now traversed by railways, one of which, between Perth and Inverness, opened in the summer of 1863, cuts through the Grampians by the Pass of Killiecrankie, a defile so apparently impracticable in its natural state, that during the campaign against Dundee in the reign of William III., the English troops came to a halt in it, and refused for a time to advance, appalled by its dangers.

POPULATION OF THE PRINCIPAL SCOTTISH CITIES AND TOWNS.  
FROM THE CENSUS RETURNS OF 1861.

Tumulus or Rath of New Grange.

#### CHAPTER IV.

##### IRELAND—THE UNITED KINGDOM.

IRELAND, the second island of Europe in population, corresponds to its larger neighbour, Great Britain, in having its eastern coast comparatively tame and unbroken, while the northern, western, and southern is generally bold, often fringed with gigantic cliffs, and very deeply invaded by the ocean. The eastern line of seaboard is also encumbered with sandbanks, bars, and sunken rocks, rendering careful navigation necessary, or interfering with it altogether, whereas in the other directions, the deep water of the Atlantic comes close to the strand, and the numerous inlets rank with the finest harbours in the world for easy access, capaciousness, and shelter. The eastern side of Ireland, like that of Great Britain, has few subordinate isles associated with it; but an immense number

stud the western shores, mostly small, yet thickly peopled, and situated at an inconsiderable distance from the mainland. Valentia Island, on the southern side of the entrance to Dingle Bay, was for some time held by the Spaniards, who were, however, finally expelled by Cromwell. During the period of their occupation, commercial intercourse was active between places on the adjoining shores and Spain, traces of which remain to the present day, in the names of many localities, and in the peculiar styles of building. The town of Galway has its open space called the Spanish Parade, and both there and at Dingle, are several old houses with enclosed courtyards after the Spanish fashion. Legends respecting 'green islands' rising out of the sea, 'enchanted islands' floating on the ocean, and 'fairy castles' appearing and vanishing to seaward, are common in the old Irish chronicles. They may be referred to optical illusions caused by the phenomenon of the mirage, similar to the Fata Morgana of Sicily, and now often observed in the strait between Rathlin Island and the coast of Antrim. In this neighbourhood the shores consist of magnificent ranges of basaltic columns, which form the cliffs and promontories of Fair Head, Bengore Head, and the Giant's Causeway. These polygonal pillars, made by nature herself, seem at a distance like grand monuments of human architecture, or occasionally like ruined edifices, surrounded by a wild waste of rocky fragments, which, in the course of centuries, have been dislodged by the gradual action of the elements, or wrenched away by the ocean in its storms.

The position, limits, linear extent, and area of Ireland, have already been given (see p. 145); but it may be added for easy remembrance, that the island is nearly one-eighth larger than Scotland, nearly two-fifths of the size of Great Britain, and more regular in shape than the contiguous mass. The structure of the surface is extremely simple, consisting of an extensive central plain skirted by imposing mountains. Its general aspect is less rugged than the north and west parts of Great Britain, but not so tame as the east.

The great central plain extends east and west from sea to sea, between the bays of Dublin and Galway; and from the shores of Lough Neagh on the north, to the confines of Waterford on the south. Though varied by swells, the highest ground within its limits, Moat-a-grenogue, in Westmeath, is little more than 300 feet above high-water mark. The foundation rock is carboniferous limestone, the same which has the name of the mountain limestone in England, from being developed there in ranges of considerable height and magnitude. Upon this substratum rest accumulations of clays and gravel, forming a rich cultivable soil, but through a vast proportion of the area it is overlaid with peat-bogs, a characteristic formation of Ireland. The bogs are not confined to the plain, but occur on the uplands, though to an inferior extent. They are estimated by Dr Kane to occupy one-seventh of the whole surface of the island. The largest is the famous Bog of Allen, which stretches in a vast plain across the centre of the island, or over a large portion of Kildare, Carlow, King's and Queen's Counties—having a superficial elevation of 280 feet. Extensive traces of deep wet bog also occur in Longford, Roscommon, Mayo, Galway, and other counties, and give a peculiarly dreary and desolate aspect to the scenery. They are composed of decayed and compressed vegetable matter, or peat, with an overgrowth of unproductive living vegetation, holding more or less stagnant water. They seem to have arisen from interruptions offered to the drainage by fallen timber, or the gravel ridges, whence shallow pools resulted, specially adapted for the growth of aquatic plants, as *Sphagnum palustre*, and other mosses, which luxuriated till a spongy mass of vegetation was formed, decaying, rotting, and compressing into peat below, while continuing to shoot out new plants above. The peat extends to the average depth of from twenty to twenty-five feet, though sometimes to forty feet; dried by the summer heat, it is in many districts the only available

fuel. The bogs of Ireland have no analogy to the fens of England, as they lie in all cases so far above the sea-level as to be readily susceptible of drainage and reclamation. Notwithstanding their moisture they are not insalubrious, owing to the large quantity of tannin which they contain; and such are their antiseptic properties, that bodies of men and animals have been taken out of them with but few symptoms of decay after the lapse of generations. Trunks of oak, yew, pine, and birch are met with at great depths, and remains of the gigantic horned elk are very abundant. Various ornamental articles are made of the bog-timber, that of the oak being generally as black and hard as ebony, while the colour of the yew is a rich brown approaching to chocolate.

The highlands which border the central plain do not form a continuous belt around it, but occur in detached groups or ranges of limited extent, generally close to the shores, and often forming the coast-line. They consist of primary strata, with various igneous rocks, which have protruded through the great pavement of carboniferous limestone, rising to considerable elevations above it. The loftiest masses on the eastern side are the Mourne Mountains, in the county of Down, which approach the height of 2800 feet, and those of Wicklow, which slightly exceed 3000. In the north-west and west, Donegal, Mayo, and the wild district of Connemara, have summits of nearly equal

Gap of Dunloe, County Kerry.

altitude, with stupendous sea-cliffs. But the most generally rugged district is the southwestern, chiefly the county of Kerry, where several ranges run parallel to each other,

between which the ocean far advances its waters, and is overlooked by the highest points of Ireland. Occupying a specially maritime site, in the peninsula north of Dingle Bay, Mount Brandon rises 3120 feet, but is surpassed by Carn Tual, 3404 feet, not far from its southern shore, one of Macgillicuddy's Reeks, a ridge running between the lakes of Killarney and the coast. The Reeks, or rocks, have smooth, sharp, conical summits; and are traditionally said to derive their specific name from that of an old extinct family in the neighbourhood. Carn Tual rises with a uniform slope on every side; and a very striking panorama is in view from it of winding inlets, estuaries, and peninsulas,

Muckross House, Middle Lake, Killarney.

whenever the volumes of mist and cloud which roll up from the Atlantic are withdrawn. Macaulay has eloquently described the district, now brought within reach of a vast number of excursionists. 'The mountains, the glens, the capes stretching far into the Atlantic, the crags on which the eagles build, the rivulets brawling down rocky passes, the lakes overhung by groves in which the wild deer find covert, attract every summer crowds of wanderers sated with the business and the pleasures of great cities. The landscape has a freshness and a warmth of colouring seldom found in our latitude. The myrtle loves the soil. The arbutus thrives better than even on the sunny shores of Calabria. The turf is of livelier hue than elsewhere; the hills glow with a brighter purple; the varnish of the holly and ivy is more glossy; and berries of a brighter red peep through foliage of a brighter green.' Besides these highlands, several groups are distributed over the southern counties, the Galty, Knockmeilidown, Silver Mine, and Slieve-Bloom Mountains, some of which range to an important altitude.

Ten principal river-systems are distinguished, which, though not of much value in a navigable point of view, except in the instance of the Shannon, supply an amount of water-power fitted for industrial purposes which few countries of the same extent possess, and are often associated with highly picturesque scenes, adding to the

beauty or impressiveness of the landscape by their placid flow, wild dash, or roaring cascades.

| Rivers.                               | Length in Miles. | Principal Places from Source to Mouth. |
|---------------------------------------|------------------|--|
| Shannon, . . . . .                    | 254 . . . . .    | Carrick, Athlone, Killaloe, Limerick.  |
| Barrow, . . . . .                     | 100 . . . . .    | Portarlinton, Athy, Carlow, New Ross.  |
| Blackwater, . . . . .                 | 100 . . . . .    | Mallow, Fermoy, Lismore, Youghal.      |
| Bann (Upper and Lower), . . . . .     | 65 . . . . .     | Portadown, Coleraine.                  |
| Boyne, . . . . .                      | 65 . . . . .     | Trim, Navan, Drogheda.                 |
| Slaney, . . . . .                     | 60 . . . . .     | Tullow, Enniscorthy, Wexford.          |
| Liffey, . . . . .                     | 50 . . . . .     | Leixlip, Dublin.                       |
| Bandon, . . . . .                     | 40 . . . . .     | Bandon, Kinsale.                       |
| Lee, . . . . .                        | 35 . . . . .     | Cork, Passage, Queenstown.             |
| Foyle (properly so called), . . . . . | 16 . . . . .     | Strabane, Lifford, Londonderry.        |

The Shannon is the third river of the United Kingdom in the extent of its basin, being only surpassed by the Humber and the Severn, while it is the first in rank as to the length of its navigation. It issues from a bog among the mountains of Cavan, called in the locality the 'Shannon Pot,' flows generally from north to south, forms Loughs Allen, Ree, and Derg, washes the shores of ten counties, meets the tide below Limerick, and then travels westerly to the Atlantic through a long and noble estuary, from one to eleven miles broad, answering to Spenser's description, 'the spacious Shenan, spreading like a sea.' Aided by a few lateral cuttings, the navigation is continuous through upwards of 200 miles, nearly the whole of its course. By one of these cuts the rapids of Doonas above Limerick, where the bed of the river becomes strongly inclined, are avoided, and the whole body of water, 300 yards wide and 40 feet deep, rushes over and through a succession of rocks for half a mile, forming a scene of great magnificence. The Barrow, next in importance, drains a south-eastern district, and includes in its system the Nore and Suir, popularly called the Three Sisters, from rising in the same neighbourhood, and after a long divergent course pouring their united waters through Waterford Harbour into the Atlantic. In the north, the Bann, divided into upper and lower by Lough Neagh, enters the sea below Coleraine; and the Foyle passes Londonderry to the large marine inlet of Lough Foyle. On the eastern side are the Boyne, celebrated for the battle fought on its banks between the forces of William III. and those of James II.; the Liffey, on which Dublin is situated; and the Slaney, which forms at its mouth the haven of Wexford. In the more southerly portion of the island, the Blackwater, designated the 'Irish Rhine' from its scenic attractions, discharges itself into Youghal Bay; the Lee forms the fine harbour of Cork; and the 'pleasant Bandon, crowned with many a wood,' terminates its course at Kinsale, but is now shorn of much of the timber it possessed when the author of the *Faery Queene* trod its banks.

Lakes are numerous distributed, and occupy a very considerable space in proportion to the whole extent of the surface, amounting to nearly 1000 square miles. They differ generally in form and position from the Scottish lakes; have their length and breadth more correspondent, occur in open districts, and, with one striking exception, have tame borders, level or marshy. Lough Neagh, the largest inland expanse in the kingdom, washes the shores of five counties in the province of Ulster, extends seventeen miles in length by ten in average breadth, covers an area of 150 square miles, is a navigable basin, and has waters celebrated for their incrusting quality. In Ireland the word *lough*, like the similar term *loch* in Scotland, is applied indifferently to fresh-water expanses, inlets of the sea, and the estuaries of rivers. Lough Corrib, in Connaught, is the next in magnitude, but much smaller. It maintains communication with Lough Mask, about three miles to the northward, by a subterranean channel through the intervening limestone isthmus. The connecting stream may be seen at various points in

its caverned bed through openings in the superincumbent strata, one of which, called the Pigeon's Hole, sixty feet deep, admits of being descended. Lough Derg, in Donegal, surrounded by dreary moorland hills, and disturbed by violent gusts of wind, has a number of small islands, one of which, called *Saint's Isle*, is the original seat of St Patrick's Purgatory. But the place of penance for some centuries has been on *Station Isle*, under an acre in extent, and with two chapels, which is now the most celebrated place of pilgrimage in Ireland, from 10,000 to 15,000 persons flocking to it annually, from 1st June to 15th August, for prayer, fasting, and vigils. The Lakes of Killarney, three in number, upper, middle, and lower, mutually connected, are exceptions to the ordinary scenery as to natural attractions, being enclosed by the loftiest of the Irish mountains, with vividly green woods and fine monastic ruins on their shores.

The mineral resources of Ireland are very considerable, but remain largely undeveloped. Coal occurs in ten counties, often in thin seams which detract from its value, or of inferior quality, consisting of anthracite or stone coal, which burns without flame. It was worked at an early period, for pits have been discovered which bear evidence, from the rude implements found in them, of having been sunk by a race anterior to historical records. The coal now used in the towns is chiefly imported from England and Scotland, while peat is exclusively used for fuel by the peasantry. Iron ore is abundant in the basin of the Shannon, and other places. It was extensively smelted in charcoal furnaces while the ancient forests lasted, but has been neglected since the supply of wood-fuel failed. Copper is obtained in the counties of Wicklow, Waterford, Cork, and Kerry, and sent for smelting to the coal districts of England and Wales. Lead is much more widely diffused, and worked to a greater extent. Small proportions of manganese, antimony, alum, fuller's-earth, and pottery clays are included in the other mineral produce, with roofing-slate and building-stone of the best description; and there is an extraordinary variety of ornamental marbles—white, black, ash-gray, dove-coloured, and green, the latter almost as bright in its hue as malachite. The Museum of Irish Industry in Dublin contains a fine collection, carefully classified, of all the geological products of the country. Towards the close of the last century, gold was discovered in connection with the mountain-streams of Wicklow, which raised high expectations respecting the auriferous wealth of the district. A schoolmaster, in his solitary walks, found the first 'nugget' in the Ballin Valley stream. He kept the secret to himself, and wandered in his leisure hours, early and late, in search of further treasure. Another party similarly fortunate was not so reserved; and crowds of peasantry were speedily at the spot digging up and washing the soil. The first gleaners made such considerable profits that the government interfered, and regular mining-works were established, till the rebellion of the year 1798 interrupted the enterprise. It was resumed in 1801, but soon abandoned as unremunerative. The stream-gold having been exhausted, and no auriferous veins being discovered in the adjoining rocks and mountains, it became evident that the whole supply had been gathered up. Altogether, the government collected about 944 ounces, valued at £3675, but the expenditure was more than three times this amount. Previously, the peasantry are supposed to have obtained upwards of £10,000 worth of gold, in pieces from the size of minute grains to lumps weighing twenty-two ounces.

The great staple manufacture, that of linen, is prosecuted in the north-eastern districts. It appears to have been long established in the country, for the principal garment worn by the ancient chieftains was a shirt made of many yards of linen cloth, and sumptuary laws were passed to limit the quantity which ostentation would have desired. For upwards of two centuries, or since the governor-generalship of Strafford, in the reign of Charles I. the industry has received marked support from the government, with

a view to its extension. While in England the custom of burying the dead in woollen shrouds was adopted to aid the woollen manufacture, in Ireland the use of linen hat-bands and scarfs at funerals was introduced for a similar purpose. Down to a recent date, the fabric was produced in the cottages, where the peasant, in the intervals of agricultural labour, wove by the handloom the yarn spun by the female and younger members of his family, sometimes working on his own account, though more generally for masters. But this system has been largely abandoned for factory labour, and at Belfast, Lurgan, and Donaghadee there are some of the largest and best conducted mills in the empire. The bulk of the native Irish are, however, by temperament averse to the restraint and continuous application which both the factory system and mining industry involve. The cotton manufacture is carried on to some extent in the same area. Coarse woollens and some fine broadcloths are produced at various places, with lace, embroidered muslin, and tabinets or poplins, a mixed fabric of silk and wool, the manufacture of which is almost entirely confined to Dublin. But except linen, all the other products fill but a limited space in the marts of the world, employ but a comparatively small amount of capital and labour, and in relation to manufactures Ireland occupies nearly the lowest place in the European scale.

The industry of the country is essentially agricultural, and upon the cultivation of the soil the mass of the people depend for their subsistence. Though improving, the general husbandry has long been in a backward state, owing to the minute divisions of the land, the system of subletting, and the undue dependence of tenants upon landowners or their representatives. To the effect of these circumstances in discouraging enterprise and paralysing effort, political agitation in time past contributed. Besides the cereal produce, of which oats form the largest crop, as suited to the moisture of the climate, a considerable extent of surface is devoted to the growth of flax for the linen trade, chiefly in the northern province of Ulster, with limited spaces in other quarters. The light calcareous soil, the softness of the climate, and the fresh breezes which fan the island from the Atlantic tempering the heat of the summer sun, conduce to the health and perfection of that delicate plant. It is usually sown in March or April, flowers about the beginning of July, and is considered ripe towards the close of August. Among the green crops, the potato holds the foremost place. The esculent was introduced by Sir Walter Raleigh about the year 1601 or 1602, who planted it in his garden near Youghal, from whence it gradually spread over the entire country. The Irish peasantry unfortunately made it their main dependence, attracted by the usually abundant yield, and the comparative facility of the cultivation. Hence a failure of the crop threatened their very existence. One failure in 1739 sent a fifth of the inhabitants to the grave. Famine, pestilence, and death resulted from the terrible failure of the year 1845, followed by an emigration of the survivors to such an extent as to deserve the name of the Irish Exodus. The calamity illustrated the folly of an entire nation depending upon a single precarious root, and has since stimulated the culture of the corn-bearing plants. Dairy produce and live-stock, consisting of cattle and swine, are raised for export to an immense extent upon the large and small grazing-farms. As 'the gentleman that pays the rent,' the pig is an inmate in almost every peasant's cabin, remarkably docile, and as carefully provided for as any member of the family. The animals are sent in great numbers to Liverpool and Bristol; and after supplying the local demands, the surplus stock, alive or cured, is transferred to the metropolitan and other interior markets.

The primitive inhabitants of Ireland are now believed to have been of the same race with the original population of Britain. Although Ireland, styled *Iernis*, (from the native Celtic name *Erin*) is mentioned in a Greek poem five centuries before Christ, and by the

names of *Hibernia* and *Juverna* in various foreign pagan writers, little is known with certainty of her inhabitants before the fourth century after Christ, when, under the appellation of *Scoti*, or inhabitants of *Scotia*, they became formidable by their descents upon the Roman province of Britain. These expeditions were continued and extended to the coasts of Gaul till the time of Laogaire MacNeill, monarch of Ireland (430 A.D.), in whose reign St Patrick attempted the conversion of the natives. Although Christianity had been previously introduced in some parts of the island, Patrick encountered great obstacles, and the new faith was not fully established in Ireland till about a century after his decease. The Irish were in the earliest times divided into a number of clans subject to respective chieftains, who were themselves the vassals of petty insular kings; when an expelled prince, with a view to his own re-instatement, instigated the English conquest. This was effected by Henry II., who landed at Waterford in 1172, and caused himself to be recognised as the lord-paramount. But for several centuries the authority of England was limited to a district around Dublin, which received the name of the English Pale, while the remainder of the country was in the hands of rude, factious, and turbulent nobles. Henry VIII. assumed the title of King of Ireland in 1541; and the strong government of Elizabeth did much to render the nominal sovereignty real, while under her successor, James I., the due administration of justice, with general civilisation, was promoted. In the reign of the latter, the estates of the northern earls, Tyrone and Tyrconnel, forfeited by their rebellion, which embraced a considerable portion of Ulster, were granted to English and Scotch colonists, whose descendants are prominent in the present population of that district. But Cromwell may be said to have been the first who reduced the entire island to a single sway (1649), unwelcome to the mass of the peasantry, and resisted by two abortive insurrections, the pretexts for which have only been removed by legislation within the memory of living men. On January 1, 1801, the legislative union of Great Britain with Ireland was consummated, and, from this period, the history of the country merges in that of Great Britain.

Highly interesting remains of antiquity abound on the surface, as cromlechs, cairns, and pillar-stones, while the peat-bogs have yielded bronze swords, spear-heads of the same mixed metal, rings composed of it, or of gold, the weapons, money, and ornaments of the old Celts. It is a remarkable fact, that a greater number and variety of antique golden articles of remote age have been found in Ireland than in any other part of Northern Europe; and the majority of the gold antiquities illustrative of British history, now preserved in the British Museum, are Irish. The cromlechs, though varying in form and size, consist generally of three upright stones, which support a horizontal slab, and form a kind of rude chamber devoted to a sepulchral purpose; that of New Grange, represented at the beginning of the chapter, is entered by a passage so low that the person entering must draw himself in by his hands, pushing with his feet; inside, the tallest man may stand upright. The cairns are piles of stones, forming artificial 'high places,' on the flat tops of which fires were lighted on the festival of the sun-god, and other special occasions, while all domestic fires were put out, and only rekindled from the sacred flame. Pillar-stones, both standing singly and in company, or arranged in circles, are believed to have been associated with forms of pagan worship; and hence the phrase of 'going to the stone' was in common use in after-times for going to church or chapel. But by far the most remarkable monuments are the Round Towers. These are tall and slender circular buildings, terminating, when perfect, in a conical roof, with four small windows near the top, generally looking to the cardinal points. There are 118 of these singular structures in different parts of the island, but of several only the foundations remain. Eighteen are entire, or nearly so, and retain the conical summit. They are invariably found near the remains of churches, varying in

height from 30 to 120 feet. Their design, after having given rise to endless speculation, still remains an unsolved problem. Ruins of churches of very early date are numerous, small, low, stone-roofed, and of great strength, with the peculiarity of the crypts being placed above, instead of under them; and fine remains of abbeys and monasteries are extant. Small castles—some perfect, others in various stages of decay—are profusely distributed. They are usually high square buildings, with towers at each corner, mostly raised to restrain the 'wild Irish' in the age of Elizabeth. Some palatial strongholds of earlier date are in good preservation, and still inhabited.

Ireland is nominally divided into four provinces, Leinster, Ulster, Connaught, and Munster, which are respectively eastern, northern, western, and southern; and coincide with the limits of former kingdoms. For the purpose of government, the present division is into thirty-two counties, of which Leinster contains twelve, Ulster nine, Connaught five, and Munster six.

| Queen's County, . . . . . | 664 . . . . .         | Maryborough, Portarlington.           |
| Kildare, . . . . .        | 654 . . . . .         | Athy, Naas, Kildare, Maynooth.        |
| Carlow, . . . . .         | 346 . . . . .         | Carlow, Bagenalstown, Tullow.         |
| Kilkenny, . . . . .       | 795 . . . . .         | Kilkenny, Callan, Castlecomer.        |

Seven of these counties—Dublin, Wexford, Meath, Louth, Kildare, Carlow, and Kilkenny—were constituted as early as the time of King John, but in some instances with different limits. The remaining five were laid out under Henry VIII. and his immediate successors.

DUBLIN, the metropolitan county, is centrally situated on the east coast, north and south of the Liffey, which discharges itself in Dublin Bay, the principal feature of the shore. This spacious semicircular basin, about eight miles in diameter, is remarkable for its picturesque beauty, though forming a perilous roadstead, owing to its shallowness and exposure to the winds. But by means of sea-walls along the course of the river, and frequent

dredging, the channel is ascended by vessels of moderate size to the quays of the capital. The Hill of Howth, a peninsular promontory, skirts the northern side of the bay, and is a noble object from its surface, while the view from the summit is attractive in the extreme, embracing the entire expanse, a wide stretch of the outlying sea, the whole extent of the city, and the Wicklow Mountains on the southern horizon. A small, rocky, and very charming islet, with the characteristic name of Ireland's Eye, lies a little to the north, within a mile of the strand, and is often visited by pleasure-parties, while a lofty precipitous rock, called the Baily of Howth, rises boldly from the waves off the extremity of the headland, crowned by a light-house. The interior of the county is level or gently undulating, except southerly, or in the direction of the highlands of Wicklow, where the surface becomes elevated, and has prominent heights on the border-line.

*Dublin* (Irish, *Dubh-linn*, 'blackpool,' the *Eblana* of Ptolemy), the metropolis of Ireland, in latitude 53° 20' north, and longitude 6° 17' west, occupies a plain on both banks of the Liffey, a little above its mouth, 34 miles north-west of London by the Holyhead route, 102 miles from Belfast, and 156 from Cork, the northern and southern commercial capitals. It is divided into two almost equal parts by the river, which is enclosed on both sides by granite quays, and crossed by numerous bridges, mostly of modern date. Containing nearly 300,000 inhabitants, it takes high rank among the capital cities of Europe in point of population, being in advance of Rome, Turin, Milan, Brussels, Amsterdam, Stockholm, and Lisbon, while upon a par with Madrid, and not much behind Moscow. Nor are its pretensions small to vie with them in appearance, from the number of its spacious streets and squares, and its splendid public edifices and private mansions; though the abodes of squalor and misery in its narrow lanes are lamentably abundant. Sackville Street, at right angles with the river, on the northern bank, is scarcely surpassed anywhere as a noble avenue; St Stephen's Green, well planted, on the southern side, is the largest square in the United Kingdom; and the Phoenix Park, close to the western suburbs, is without a rival in extent, containing ornamental drives and waters, with secluded glades, all but abandoned to the wildness of nature. Immense herds of deer find shelter amid its brushwood and timber. The public buildings, several of which are distinguished for their size and elegance, include the Castle, containing state apartments and government offices; the Bank of Ireland, formerly the Parliament House; the Law Courts, the Custom House, Post Office, Exchange, and Surgeon's Hall, with Trinity College, and two cathedrals, St Patrick's and Christ-Church. The College, a Protestant university, founded in the time of Queen Elizabeth, has a valuable library, and is usually attended by about 2000 students. St Patrick's Cathedral, from its monumental associations, may be styled the Westminster Abbey of Ireland. The city has few manufactures, but a great export trade. It is well supplied with scientific institutions, and with charitable establishments of every description, nowhere more needed, owing to the destitution of many of the lower classes. Dublin has risen during the English era, previous to which there were probably only a few huts of wood and basket-work on the site. *Kingstown*, at the southern entrance of the bay, is the port of the capital, about six miles distant, connected with it by railway. Formerly called *Dunleary*, and quite insignificant, it received its present name in commemoration of the landing of George IV. in 1821; and has been changed into a thriving town, since the construction of an artificial harbour rendered it the steam-packet station to Liverpool and Holyhead. Two noble piers, running out respectively 3500 and 4950 feet, composed of fine granite, and inclining towards each other at their extremities, form the basin, and supply agreeable promenades. The railway is in immediate connection with them, to receive what England may have sent, and bring what Ireland may despatch. *Howth*, a fishing village and favourite resort of the Dublin citizens, occupies the northern side of the famous hill, and has interesting remains of an abbey in its midst, in which was preserved the book of the Four Gospels, called the 'Garland of Howth,' long held in great veneration. The Hill of Howth is about three miles long by two broad and rises to 563 feet in height. It offers much to attract the botanist and geologist, while enjoying the prospect and the sea-breeze. *Malahide* and *Balbriggan* are further north on the coast, the former distinguished by Malahide Castle, a vast and imposing pile, with an interior of great interest, belonging to the Talbots.

WICKLOW, a maritime county dating from the time of James I., adjoins that of Dublin on the south, and is generally the first part of the country to which the stranger directs his steps after reaching the capital, owing to its finely diversified natural features. Nearly the whole surface is occupied by a group of granite mountains, largely overlaid with clay-slate, separated from each other by valleys or rather glens, in some of which, of the more open kind, small lovely lakes occur, while almost all are the beds of streams, rapid in their current, and occasionally forming striking waterfalls. The summits of the mountains have generally an elegantly-pointed form, here pyramidal, there sugar-loaf, and are quite bare, while their lower slopes in the watered vales are thickly covered with

noble oaks and beeches, the trunks of which are clothed with a luxuriant growth of ivy vividly green. The loftiest eminences are the Douce Mountain, which attains the height of 2384 feet; Thonelagee, 2683 feet; and Lugnaquilla, 3039 feet. Among the rivers, the Liffey and the Slaney rise in the county, and pass into bordering districts, while the Dargle, Vartry, and Ovoca have their whole course within its limits. Many are the scenes striking in themselves, very lonesome also, which are rendered singularly impressive by the occurrence of antiquities, as a round tower and ruined churches.

*Wicklow*, a small shipping port for mineral and other produce, is on the estuary of the Vartry. This river, in the lower part of its course, rushes through the Devil's Glen, a wild narrow pass, after having been precipitated into it by a magnificent cascade. In the upper part, it has recently been made by engineering skill to contribute to the water-supply of Dublin. *Arklow*, a somewhat larger town, is situated at the mouth of the Ovoca, a river flowing through the loveliest scenery, the subject of Moore's well-known lines:

'There is not in the wide world a valley so sweet,  
As that vale in whose bosom the bright waters meet.'

The Ovoca is formed by the junction of the Avonmore and Avonbeg, in a scene of great natural beauty,

Devil's Glen.

enclosed by high grounds covered with fine woods. This is the first 'Meeting of the Waters.' From the confluence, the stream flows between lofty banks adorned with an unbroken range of forest till it receives the Anghrim, which forms the second 'Meeting.' One of the tributaries of the Avonmore descends Glendalough, or the valley of the two lakes. At the foot of the lower and smaller lake lie the Seven Churches in lowly ruins, an ecclesiastical establishment referred to St Kevin in the sixth century, in the midst of which rises a round tower, 110 feet high, in fine preservation. *Bray*, at the outlet of the Dargle, on both its banks, is a beautiful little town, in a most attractive neighbourhood, with a bold headland to seaward. The Dark Glen, the meaning of the word 'Dargle,' is a long narrow, and densely-wooded ravine, through which the stream frots and brawls over the obstacles which impede its course, presenting at every turn some of the most picturesque combinations of rock, water, and foliage that the imagination can conceive. It is daily dotted through the summer with picnic parties from the capital. The famous Irish weapon, the shillelagh, has its name from one of the Wicklow woods near Arklow, celebrated for its growth of the best oaks and black them.

WEXFORD COUNTY, southward on the coast, includes the south-eastern extremity of Ireland, or Carnsore Point, about fifty-two miles from St David's Head, in Wales. The adjoining district is a peninsula,

forming the barony of Forth, in which Welsh colonists were planted, driven thither by

the early Anglo-Norman invaders, whose descendants long retained the use of their own language, and are still distinct in many respects from the rest of the population. The interior of the county is generally level, fertile, and well cultivated, largely devoted to arable husbandry, and has a pleasing appearance when the many trim furze hedges put forth their yellow blossoms. It is watered on the western border by the Barrow, but chiefly by the lower course of the Slaney.

*Wexford*, on the shore of the spacious haven formed by this last river, near its outlet, is an old town of narrow streets. Taken by the first English adventurers to Ireland in 1169, it is now in possession of many vessels employed in the export of agricultural produce, and the import of timber. Its long bridge, built over a narrow part of the haven, was the scene of an atrocity during the Irish rebellion of 1798, the murder of English and Protestant prisoners who were thrown from it into the water. *Enniscorthy*, twelve miles up the river, has Vinegar Hill in its immediate vicinity, where the rebels were finally defeated by the royal troops, and where some executions followed in retaliation for the massacre of Wexford Bridge. *New Ross*, seated on the left bank of the Barrow, in one of the most beautiful parts of its course, with a suburb on the opposite or Kilkenny side of the river, has considerable trade in the export of provisions and wool.

**MEATH**, directly north of Dublin, possesses a very limited extent of coast-line, but acquires considerable expansion inland. It belongs almost entirely to the great central plain, includes some of the richest grazing lands, and has nearly the whole course of the Boyne within its bounds.

*Trim*, on the left bank of the river, the county town; *Navan*, lower down, at its junction with the Black-water; and *Kells*, near the tributary, are small marts of local trade. At Dangan, near Trim, the Duke of Wellington was born. The Hill of Tara, celebrated in early Irish history as the spot where the kings, clergy, and bards assembled at a hall or palace, to consult on important occasions, is a few miles distant.

'The harp that once through Tara's halls  
The soul of music shed,  
Now hangs as mute on Tara's walls  
As if that soul were fled.'

The Hill was also a common place of rendezvous in time of war, and has been the scene of great political gatherings in our own times.

**LOUTH**, the smallest of the Irish counties, and the last of the maritime divisions of Leinster, extends along the coast from the outlet of the Boyne to Carlingford Lough. It lies within the manufacturing area of the north of Ireland, though the industry is chiefly agricultural.

*Dundalk*, at the head of a bay to which its name is given, has some important fisheries and a coasting-trade. *Drogheda*, on the Boyne, three miles above its mouth, shares in the linen and cotton manufactures, and is one of the old historic towns, with an antiquated appearance strikingly contrasting with the grand railway bridge and viaduct which has been thrown across the river-valley. It was successfully defended during the Irish rebellion in the reign of Charles I.; captured by Cromwell a few years later when held by a royalist force; and surrendered to William III., in 1690, the day after he defeated the army of James II. in the neighbourhood. This decisive battle was fought about two miles above the town, close to the river. An obelisk stands on a singular isolated rock, and marks the spot where one main incident of the action occurred. For some distance above Drogheda, the valley of the river is very remarkable for its tunnell, with vaulted chambers in the interior, which are supposed to go back to heathen times. A short excursion leads to Monasterboice, a corruption of the ancient name, the Monastery of St Boethius. This is a ruined ecclesiastical foundation, with two elaborately sculptured stone crosses, the one sixteen, and the other eighteen feet high, considered to be among the most ancient Christian relics in the country, and a round tower shattered at the top, as if by lightning.

**LONGFORD**, an inland district, constituted under Queen Elizabeth, has the Shannon for its western border, along with the northern part of Lough Ree, the shores of which are very tame, as are those of several small lakes within the county. The general surface belongs to the great agricultural plain of the interior.

*Longford*, a busy and flourishing little town, also a military station, stands on an affluent of the noble river, and communicates with the capital by a branch of the Great Western Railway. *Edgeworthstown*, within a few miles, is of greater interest, deriving its name from the Edgeworth family, two of whom, father and daughter, are so well known in the annals of literature. The family came over from England in the reign of Elizabeth, and became possessed of extensive domains, from one of which, the village of Pairymount, the Abbé Edgeworth, who attended Louis XVI. to the scaffold, acquired his Gallic name of M. de Firmount.

WESTMEATH, a corresponding tract, extends from the southern part of Lough Ree and the outflow of the Shannon, eastward to Meath, with which it was formerly connected, composing together the chief portion of an ancient kingdom.

*Mullingar*, the county town, towards its centre, is one of the great cattle marts, on the banks of the Royal Canal, and the line of the Western Railway. *Athlone*, on the Shannon, with its castle on the opposite or Connaught side of the river, is the chief government depot in the west of Ireland for troops and military stores.

KING'S and QUEEN'S COUNTIES, two adjoining districts, were organised in the reign of Queen Mary, and received their names in compliment to that sovereign, and her husband, Philip II. of Spain. The former belongs chiefly to the basin of the Shannon, and to the limestone plain, comprehending a considerable extent of bog land. The latter is wholly included in the basin of the Barrow and Nore, has a generally hilly surface, with the Slieve-Bloom Mountains partly within its limits, and on the border-line between the two divisions.

*Philipstown* and *Maryborough*, now places of inferior note, were so called after the sovereigns commemorated by the counties. *Portarlington*, the residence of a number of the upper classes, is in both districts seated on either bank of the Barrow. The name refers to the founder, Lord Arlington, in the reign of Charles II., and to the site having been used as a landing-place on the river. *Tullamore*, the county-town of King's County, is the centre of considerable commerce, being on the line of the Grand Canal, and connected by a branch with the South-Western Railway, but is inferior in size to *Parsonstown*, on a small affluent of the Shannon. This place, formerly called *Birr*, is distinguished by the adjoining seat of Lord Rosse, or *Birr Castle*, the site of his famous telescope. Ecclesiastical remains of great interest, called the Seven Churches of Cloonmacnoise, occupy a romantic position by the course of the Shannon. They consist of the ruins of an abbey, with monumental crosses, and a round tower, one of the largest in Ireland, with the unusual number of eight apertures in the upper story.

KILDARE, between the preceding counties and those of Wicklow and Dublin, is generally a table-land, dotted with bogs, which are comprehended in the great bog of *Allen*. It has the Barrow on its western border, and includes a large part of the basin of the *Liffey*.

*Atty*, on the former river, at the head of its navigation, shares the assizes with *Naas*, near the latter. *Kildare*, the ancient capital, now gone to decay, has a ruined cathedral, but the diocese is merged in that of Dublin. It has also a round tower, 130 feet high, which crowns the elevation on which the town is built, and is seen from a great distance. An extensive tract of several thousand acres in the neighbourhood, called the 'Curragh of Kildare,' is used in common as pasture-ground, and for public sports, and is also the station of a military camp. *Maynooth*, fifteen miles west of Dublin, is a small neat town, with striking remains of an old castle, belonging to the once powerful family of the Geraldines, but is best known as the site of St Patrick's College, the principal establishment for the training of candidates for the Roman Catholic priesthood. It was founded by act of the Irish parliament in 1795, and is subsidised by the British government. The academical year embraces ten out of the twelve months. The students usually number about 500, and remain eight years. *Leixlip*, nearer the Dublin border, is on the *Liffey*, in a very beautiful part of its course, where the river flows between steep and richly-wooded banks, pours over a series of rocky ledges, and forms the Salmon Leap, a striking cascade.

CARLOW, one of the smaller counties, on the south, lies between the Barrow and Slaney rivers, but small portions pass beyond both the streams. It is generally a highly fertile plain, so well cultivated as to have been termed the 'garden of Erin.' Cereal produce of fine quality is extensively raised. Corn-mills abound, moved by water-power, some of which are comparable to cotton factories in their magnitude. The landed proprietors are usually resident, representing many of the early English settlers, and a few of the ancient Irish families. It has been remarked that a large proportion of the former class have names beginning with the letter B; and hence the sayings were once current in the district, 'Beware of the Bs,' and 'The Bs of Carlow carry a sting,' in allusion apparently to high-handed proceedings.

*Carlow*, on the left bank of the Barrow, in a beautiful country, is modern in its general aspect, though with a castle of note in former times, erected in the twelfth century, in the Anglo-Norman style, now an extensive ruin. It also possesses a Roman Catholic Cathedral, and a theological college. *Bagenalstown*, lower down the river, is the site of some principal flour-works. The largest are, however, at *Milford*

intermediate, where the buildings are flat roofed, have a castellated aspect, and appear with striking effect in a distant view. The chief water-wheel, of iron, said to be the largest in the kingdom, takes the water on a breadth of twenty-one feet, and is equal to the power of 120 horses.

KILKENNY, westward of the Barrow, is traversed centrally by the Nore, and has the lower course of the Suir for its southern frontier. It is one of the principal mineral districts, possesses iron and manganese, with coal of the anthracite kind, which is wrought in various places, and a black marble crowded with madrepores and shells, which takes a high polish, and is extensively quarried.

*Kilkenny* (Gael. Church of St Kenny), on both banks of the Nore, is the largest town in Ireland wholly inland, and the only one of any importance in the county. But the population has been for some years decreasing, chiefly owing to the decline of the woollen manufactures. It is of ancient date, contains many castellated and monastic remains, and has interesting associations, as the scene of viceregal courts and parliaments in former times, and the place where Swift, Congreve, and Berkeley received the early part of their education. The environs are very pleasing, and the view from the bridge striking, commanding a fine serpentine sweep of the river, overhung by the noble mansion of the Ormond family.

## II. ULSTER.

| Counties.              | Area in Square Miles. | Principal Towns.                      |
|------------------------|-----------------------|---------------------------------------|
| Armagh, . . . . .      | 513 . . . . .         | Armagh, Lurgan, Portadown.            |
| Down, . . . . .        | 957 . . . . .         | Downpatrick, Newry, Donaghadee.       |
| Antrim, . . . . .      | 1190 . . . . .        | Belfast, Carrickfergus, Lisburn.      |
| Londonderry, . . . . . | 810 . . . . .         | Londonderry, Coleraine, Port Stewart. |
| Donegal, . . . . .     | 1865 . . . . .        | Lifford, Ballyshannon, Letterkenny.   |
| Fermanagh, . . . . .   | 714 . . . . .         | Enniskillen, Newton Butler.           |
| Tyrone, . . . . .      | 1260 . . . . .        | Omagh, Strabane, Dungannon.           |
| Monaghan, . . . . .    | 500 . . . . .         | Monaghan, Clones, Carrickmacross.     |
| Cavan, . . . . .       | 746 . . . . .         | Cavan, Belturbet.                     |

The final settlement of these counties took place in the early part of the reign of James I. At that period, a large proportion of Ulster, consisting of estates forfeited by the rebellion of the northern earls, was granted to the great companies of London, subject to certain conditions, as the introduction of colonists, with the view of forming a Protestant population. A considerable body of English, but a much larger number of the Scotch, owing to their proximity, took part in this 'plantation' of the province. Hence the prevalence of the Lowland Scotch language in the country districts at the present day, and of Presbyterianism in the north of Ireland, with the substitution, in the name of a town and county, of Londonderry for Derry, in honour of the metropolitan bodies corporate. At the same time, as many of the native Irish of the lower classes remained, the Celtic element survived in the district, and to some extent a race of mixed blood arose. Only a few of the companies retain now possession of their estates, managing them by resident agents.

ARMAGH, the most populous of the Irish counties in proportion to its area, after that of Dublin, is an inland district, extending from the Leinster border to the southern shore of Lough Neagh. Most of its drainage is carried to the great lake by the upper Bann, the Blackwater, and its affluent the Callan. While prominently hilly in some places, the general surface only gently undulates, and has often a very English aspect, owing to patches of wood and enclosures of quickset hedges.

The cathedral city of *Armagh* (*Ard-Magha*, 'the lofty field'), the county town, on the right bank of the Callan, is the ecclesiastical metropolis of Ireland, as the seat of the primate. It possesses every requisite of an agreeable place of residence, a beautiful neighbourhood, a good public library, a classical school or college, an astronomical observatory of distinction, and ornamental grounds for recreation. The cathedral, a plain building, has yet a commanding appearance, occupying elevated ground with its tower and spire. Close to the town is the archiepiscopal palace, of recent date, with a noble obelisk in the park, erected by Archbishop Robinson in the last century, ostensibly as a memorial of friendship, but really to give employment to labourers in a season of distress. To this prelate, Armagh is indebted for its observatory, and most of the advantages it enjoys. *Lurgan*, near Lough Neagh, and *Portadown*, on the Bann, have extensive manufactures of linen and other goods.

DOWN, a maritime county on the east coast, embraces the most easterly point of Ireland, and has a very extensive shore, stretching from Carlingford Lough on the south to Belfast Lough on the north, and including the deep inlet of Lough Strangford, with the broad one of Dundrum Bay. Grand scenery distinguishes the surface in its southerly extension, where the Mourne Mountains rise to a considerable altitude, and press closely to the sea-board, with fine woods filling the ravines and climbing towards the summits. The principal heights are Slieve Beg, 2384 feet; Slieve More, 2443 feet; and Slieve Donard, 2796 feet. These mountains enclose Carlingford Lough on one side, while kindred hills rise on the other. They render the inlet—which is about a mile and a half wide at the sea-gate, running up some 10 miles inland, with the accompaniments of neat villages and oak-clad slopes—one of the most charming of all marine nooks. It has been said that were it on the Mediterranean or the Baltic, English families would flock in crowds to occupy the site.

*Downpatrick* ('Mount of Patrick'), with a cathedral, near the shore of Lough Strangford, is traditionally regarded as the oldest city in Ireland, and was famous long before the arrival of St Patrick, who founded religious establishments here. The four holy wells of Struel or St Patrick,  $1\frac{1}{2}$  mile east of the town, where stood the saint's monastery, are resorted to by Roman Catholic pilgrims from all Ireland. *Newry*, much more considerable, is a busy river port with a striking aspect on the Armagh border. *Donaghadee*, a seaport, is important from its position, opposite to Portpatrick in Scotland, with which submarine telegraphic communication is maintained. Small thriving towns and villages are numerous, especially in the direction of Belfast, with bleaching-grounds, and otherwise sharing its industry; and many hamlets on the shores are visited for sea-bathing.

ANTRIM, on the north, embraces the north-east extremity of the island, overlooks from its bold and lofty promontories the coast of Scotland, extends inland to the shores of Lough Neagh, and is geologically one of the most remarkable districts in the empire. Nearly the whole surface is occupied by basaltic rocks and other members of the trap family, originally ejected from beneath in a fluid state, and spread over the pre-existing strata, which consist of chalk, greensand, and new red sandstone, now lying beneath them. The igneous rocks assume the columnar shape on the northern and eastern shores, appear as continuous bands or colonnades, to be measured by miles in the cliffs, or form isolated masses projecting into the sea, as at the Giant's Causeway. This far-famed spot is only one of a series of similar formations, locally indicated by the names of the Giant's Bed, the Giant's Chair, the Giant's Organ, the Giant's Loom, and the Giant's Gateway. Though a wonderful object to contemplate on account of its construction, invested with an overpowering charm and interest for the stranger, owing to the mysterious workings of those great forces of nature of which it is the monument, the site has little of scenic beauty or grandeur, in comparison with the magnificent ranges of columnar basalt, which extend for miles along the shore, imbedded in the cliffs and headlands. Deep narrow glens open to seaward from the interior of the county. Its general surface is mountainous, though without lofty elevations, and it contains a considerable amount of unproductive land; but, owing to the numerous sites of manufacturing industry, it has a high average of population.

*Belfast*, at the head of an inlet of the east coast which bears its name, and at the outfall of the Lagan, ranks as the second city of Ireland in extent, and the first in trade and manufactures. It possesses an excellent harbour, constantly occupied by shipping and steamers, with a crowd of linen, cotton, glass, and ironworks. The foreign trade is extensive, while vast quantities of live-stock and agricultural produce are sent to the ports of England and Scotland. The inhabitants have long been distinguished by a taste for letters and science, illustrated and promoted by a valuable public library, a botanic garden (occupying 17 acres), a museum rich in national antiquities, a natural history society, a royal academic institution, and one of the Queen's Colleges, in a spacious and elegant building, opened in 1849. The interests of the staple manufacture of the country are consulted by an association for the improvement and extension of home-grown flax. *Listburn*, a few miles up the river; *Carrickfergus*, on the shore of the bay; *Antrim*, at the north-east extremity of Lough Neagh; and *Ballymena*, near one of its affluents, the Main, are seats of

various branches of the linen trade. *Larne, Glenarm, and Cushendall*, small neat towns on the east coast, are connected by a carriage road lauded by all travellers, constructed by the government Board of Works. It runs twenty miles close upon the beach, at the base of some of the grandest cliffs in the world, and opens up a constant succession of new views of sea and shore, by retreating with the bays, and advancing with the headlands. *Portrush and Ballycastle*, on the north coast, are similarly connected by a sea-cliff road, and have the Giant's Causeway between them. Thousands of basaltic columns here form three piers, the longest of which runs out 720 feet into the sea. The columns are generally hexagonal, but vary from three to nine sides. It is said, however, that there are only three with nine sides, and only one with three. So close are they together that a knife-blade can scarcely be inserted between them. About four miles from the mainland, the crescent-shaped Rathlin Island is of basaltic formation, and shews the columnar arrangement. This spot was the retreat of Robert Bruce from Scotland. The islanders are a primitive and harmless race, strongly attached to their insular home, and said to be as indisposed to pay the county rate, for a jail they never see and roads they never travel.

LONDONDERRY, a westerly continuation for some distance of the great trap-field of Antrim, embraces the larger part of the sea-opening of Lough Foyle, the lower courses of the Foyle and Bann Rivers, and various high grounds which are most elevated on the southern border towards the county of Tyrone.

*Londonderry*, the capital, a large and handsome city, occupies the base and slope of a hill rising up from the left bank of the Foyle River, about four miles above its entrance into the lough, and is connected by a bridge with a suburb on the opposite bank. Vessels of considerable size come up to the quays. The cathedral, neat, plain, and modern, crowns the summit of the hill, overlooks the broad stream, and the arm of the sea to which it flows. Old Derry having been destroyed during the reign of James I. by native chiefs, who left little except the walls standing, its site, with about 6000 acres adjoining, was granted to the London Companies. Under their auspices the present city arose (whence its double name). As a fastness of Protestantism, it was long assailed by the army of James II. in 1689, and had nearly succumbed to famine, when relieving-ships broke through the boom placed by the besiegers across the mouth of the river, and brought provisions to the starving inhabitants. An aged clergyman, named Walker, whose memory is still honoured, contributed to their desperate resistance. 'Five generations,' says Macaulay, 'have since passed away, and still the wall of Londonderry is to the Protestants of Ulster what the trophy of Marathon was to the Athenians. A lofty pillar, rising from a bastion, which bore many weeks the heaviest fire of the enemy, is seen far up and down the Foyle. On the summit is the statue of Walker, such as when, in the last and most terrible emergency, his eloquence roused the fainting courage of his brethren. In one hand he grasps a Bible. The other, pointing down the river, seems to direct the eyes of his famished audience to the English topmasts in the distant bay. Such a monument was well deserved; yet it was scarcely needed; for in truth the whole city is to this day a monument of the great deliverance. The wall is carefully preserved. The summit of the ramparts forms a pleasant walk. The bastions have been turned into little gardens. Here and there, among the shrubs and flowers, may be seen the old culverins which scattered bricks, cased with lead, among the Irish ranks. One antique gun, the gift of the Fishmongers of London, was distinguished during the 105 memorable days, by the loudness of its report, and still bears the name of Roaring Meg. The cathedral is filled with relics and trophies.' The monument, erected in 1828 by public subscription, consists of a fine column, 82 feet in height, ascended within by a spiral staircase. *Coleraine*, on the Bann, four miles from the sea, has given its name to fine linens manufactured in the town, and is surrounded with large bleaching-grounds. *Port Stewart*, a watering-place on the coast, looks out upon the Bann estuary, and claims connection with Dr Adam Clark as a native of the neighbourhood. *Newtown-Limanaddy*, on the pleasant river Roe, is in the heart of the flax district, and carries on an active trade in the article.

DONEGAL, the largest of the Ulster counties, embraces the extreme north point of the island, or Malin Head, and also the north-west extremity, or the Bloody Foreland. Exposed to the full dash of the Atlantic, the shores are tortuous with inlets, and at the same time iron-bound in the intervening spaces, being lined with stupendous cliffs of primitive rock, which have resisted the shock of centuries of storms. The interior, though not without the picturesque, the beautiful, and cultivated, consists largely of dreary moors, black bogs, and barren mountains, comprising also scenes which for wild and savage sublimity rival any example of the kind presented by the Scottish Highlands. The loftiest summits are Slieve Snaght, 2019 feet; Muckish, 2190 feet; Bluestack, 2213 feet; and the cone of Erigal, 2462 feet. The towns are few and diminutive, but the scattered peasantry form a considerable body. Finely-coloured marbles, with the white marble of statuary, occur in the mountain districts, and the sea-fisheries are valuable.

*Lifford*, on the left bank of the Foyle, is the smallest of the Irish county towns, a mere village. *Lettickenny*, at the head of Lough Swilly, is pleasantly situated in a cultivated country, sprinkled with plantations and genteel residences. The lough is the longest of the sea inlets, running upwards of twenty-five miles from the north coast, with deep water throughout. *Donegal*, in the south-west, is at the head of a spacious bay to which its name is given, into which the Erne discharges. *Ballyshannon*, the largest town, just above the outlet of the river, is the seat of a salmon fishery. Railway communication newly extended to this point, and to *Bundoran*, a thriving little watering-place, will contribute to attract English visitors to the grand sea-cliffs of the north-west of Ireland, as it has done to the mountains and lakes of Kerry in the opposite direction. Many islets fringe the shores, two of which, Aran and Tory islands, are inhabited. It is within memory, that a boat's crew from the latter, seven miles distant, being driven by stress of weather into Ardes Bay, stepped for the first time on the mainland, and gazed with wonder upon its trees. Some took away twigs and branches to shew on returning to their treeless home.

FERMANAGH, an inland county, belongs chiefly to the basin of the Erne, which expands into two lakes, occupying a large portion of the centre, justly ranked among the finest in Ireland. The upper lake is more than eight miles in extreme length, by three in breadth, and is much inferior in size to the lower. Both are profusely studded with islands, the upper containing 90, and the lower 109. Both have shores rich with woods, green slopes, or cultivated fields, are bounded also in places by considerable hills, and want only the adjunct of towering mountains to render them equal to the grandest expanses in the kingdom. They are from four to five miles apart, and are united by the splendid river.

*Inniskillen*, the only town, is beautifully situated on a hilly island in the stream, and also on both the adjoining banks, which are connected by bridges. The name refers to the site, *ennis*, the correspondent of *innis* and *inch*, signifying an 'island' or 'waterland.' Being well built as well as placed, and in a delightful locality, the town has a striking appearance from any of the approaches to it. The inhabitants took an active part in the struggle between William III. and James II.; defeated some troops of the latter after the relief of Londonderry at *Newton Butler*, now a poor village; distinguished themselves also at the battle of the Boyne; and their name is at present borne by a celebrated regiment, the Inniskillens. *Devenish Island*, in the lower lake Erne, a rich pasture-ground, has ruins of a church and monastery which have remained as specimens of ornamental architecture, as well as a beautifully constructed round tower, apparently as strong as on the day it was built.

TYRONE, the most central portion of Ulster, divided between the basins of the Foyle and Lough Neagh, has a tame surface except towards the border-line on the side of Londonderry and Donegal. The same feature marks the two southern counties of MONAGHAN and CAVAN. Both have a considerable amount of bog-land, with numerous small loughs, belong chiefly to the basin of the Erne, and fall largely within the limits of the great plain.

*Omagh*, the county town of Tyrone, near its centre, has a handsome court-house; but *Strabane*, on a head stream of the Foyle, is larger and more important. *Newtown Stewart*, a small place, nearly midway between them, is distinguished by the hills called 'Bessy Bell' and 'Mary Gray,' in the immediate vicinity. *Dungannon*, in the low country towards Lough Neagh, a cultivated plain, has a coal-field of value in its neighbourhood, and is said to have been the chief residence of the O'Neils, the old kings of Ulster. *Monaghan*, on the canal which unites the two great loughs, Neagh and Erne, shares in the linen trade, but is principally an agricultural and live-stock mart. *Cavan*, entirely local in its traffic, is the seat of a Roman Catholic school, with a considerable endowment. The north-west corner of the county contains the small lake called the 'Shannon Pot'—the source of the Shannon.

### III. CONNAUGHT.

| Counties.            | Area in Square Miles. | Principal Towns.                       |
|----------------------|-----------------------|--|
| Leitrim, . . . . .   | 613 . . . . .         | Carrick-on-Shannon, Manor Hamilton.    |
| Roscommon, . . . . . | 950 . . . . .         | Roscommon, Boyle, Elphin.              |
| Sligo, . . . . .     | 721 . . . . .         | Sligo, Ballymote.                      |
| Mayo, . . . . .      | 2131 . . . . .        | Castlebar, Westport, Ballina, Killala. |
| Galway, . . . . .    | 2447 . . . . .        | Galway, Tuam, Loughrea, Ballinasloe.   |

Connaught is the smallest and least populous of the principal divisions of Ireland.

LEITRIM has a strip of coast-line on Donegal Bay, but is chiefly inland, extending from thence in a long narrow tract, in a direction from north-west to south-east. It is divided

into two nearly equal parts by Lough Allen, one of the expanses of the Shannon, and by the outflow of the river. The lake is of considerable extent, bounded on almost all sides by lofty hills. After a short course, the river forms the border-line between LETTRIM and ROSCOMMON, a wholly inland district, continued along the right bank of the stream, and the western shore of Lough Ree. Both counties have rich grazing-grounds, with the common features of the Irish landscape, bog and marsh alternating with luxuriant pastures and cultivated soil.

*Carrick-on-Shannon*, a 'rocky place,' or 'rock fort,' on the left bank, the county town of Leitrim, is little more than a village in size. *Roscommon* slightly exceeds it, but is inferior to *Boyle*, a manufacturing and trading town, of early celebrity, retaining the remains of an ancient abbey. *Elphin*, once a Protestant bishopric; the diocese is now annexed to the sees of Kilmore and Ardagh.

SLIGO, a maritime county, extends along the southern shore of Donegal Bay, and thence westward to the Bay of Killala, both of which are openings exposed to the full swell of the broad Atlantic, but in different directions. The interior consists of extensive tracts of highland and of level surface, and a large proportion of bog and moor appears within its limits, together with grazing-grounds and cultivated areas. Small loughs are copiously distributed, with some of considerable size, which have very picturesque shores, and are studded with wooded islands. Streams also abound, but with short courses and generally with rapid currents.

*Sligo*, the second town in Connaught in importance, and the only one in the county entitled to notice, is situated in a deep valley, on both banks of the Garogue, immediately above its entrance into the sea. Ships of moderate burden come up, and there is an active coasting trade, with some foreign commerce. Two bridges across the river connect the two portions of the place, which possesses two churches, a neat infirmary, and fine remains of an old abbey. In the adjoining bay, three vessels belonging to the Spanish Armada were cast ashore in 1588. The neighbourhood is mountainous, and has some very striking features. The traveller will not fail to remark the beautifully-shaped hill of Knocarea on the west, with the singular isolated rock at the summit, nor the equally graceful and higher Benbulbin on the north. At a short distance from the town, its river issues from Lough Gill, about four miles in length by two in breadth, one of the loveliest watery expanses in Ireland. The shores are steep and richly wooded; the islands, twenty in number, are mostly crowned with trees; and on one of them—Church Island—the foliage waves over some ancient ruins.

MAYO, the third of the Irish counties in size, embraces the north-western section of Connaught, and has a long range of shore which breasts the Atlantic in two directions, furrowed with inlets and fringed with islands. Achill Island, the largest, measuring fourteen miles from east to west, is mountainous, wild, barren, and boggy; and has its name, which signifies 'eagle,' from the number of those birds by which it was frequented. Clare Island rises up boldly from the waves in the centre of the entrance to Clew Bay, a locality remarkable for the prodigious number of isles and rocks with which the upper extremity is crowded, where they form a labyrinth altogether without example in any other part of the kingdom. The mainland at the head of this bay is the termination westward of the great plain of Ireland, to which a large portion of the county belongs, but those parts of it which lie immediately north and south of the splendid inlet are lofty mountain regions. Northward rise the Nephin heights, one of which, Slieve Car, attains 2368 feet; and the Great Nephin, another finely-shaped mass, quite isolated by its elevation, and visible at a great distance in all directions, rises 2646 feet. Southward are Ben Gorm, 2224 feet; Ben Bury, 2610 feet; and the grand Mulrea, 2685 feet, the highest point of the district. The north-western corner of the county is a singular peninsular tract called the Mullet, abounding with wild and noble scenery, attached to the main shore by an isthmus not half a mile across at the narrowest part. Until recent years, this district was very secluded, there being no road through the isthmus. Many of the inhabitants were strangers to various objects of very common occurrence elsewhere, such as a bridge, a tree, a flight of stairs, or a wheeled carriage of any kind. The first vehicle ever seen in the

Mullet, was taken in by the engineer while constructing the present road, where it was viewed by the young people with great curiosity and delight. But planks had to be laid down before it, step by step, to accomplish the passage of the bogs. Loughs Mask and Corrib, two extensive inland expanses, lie on the border of the county towards and partly within Galway—the former 27 miles long and from 1 to 6 broad; the latter 10 miles long by 4 broad; Lough Conn, about eight miles long, is wholly within its limits, connected by a narrow strait with Lough Cullin. The small lakes are very numerous.

*Castlebar*, centrally situated, is a considerable seat of the linen trade, partly shared by *Westport*, near the head of Clew Bay, the principal seaport. *Ballina*, the largest place, is seated on the left bank of the Moy, a few miles above its entrance into Killala Bay. The river dashes over bold rapids in the midst of the town, and has a valuable salmon-fishery, the produce of which is chiefly sent to Liverpool. *Killala*, ancient and decayed, but full of recollections, on the west shore of its bay, was held for thirty days by a French army, under General Humbert, sent in 1798 to aid the rebellion of that period.

**GALWAY**, the second of the counties in Ireland in its dimensions, comprehends the whole south of Connaught, from the Shannon, and its affluent, the Suck, on the east, to the Atlantic on the west. It has a coast-line estimated at about 400 miles in length, embracing the numerous inlets, some of which are narrow and mountain-girded, comparable to the Norwegian fiords, while almost all form excellent harbours. Many islands lie along the shores. The most important are the three south isles of Arran, which lie across the entrance to Galway Bay, and guard it as a natural breakwater from the fury of the ocean. Inishmore, the largest, is very remarkable for containing ruins of stone buildings, perfectly Cyclopean in their structure, chiefly military, which belong to the pre-historic age, and are reckoned among the most striking erections of the far past remaining in Europe. The largest is called Dun-Ængus, on a cliff of Inishmore, 220 feet high. Anciently, too, these islands formed an important ecclesiastical seat, containing at one time 20 churches and monasteries—the ruins of which are much visited by pilgrims. St Kenanach Church, built in the 7th century, still exists, all but its stone roof, as well as the stone oratories and little bee-hive stone-huts of the monks of the 6th and 7th centuries. Loughs Mask and Corrib, with their outlet, divide the county into two unequal portions. The eastern and more extensive portion is comparatively level, part of the interior is a plain, and has a rich soil. The western division has the reverse features of mountains and moors, bogs and morasses, with some singularly wild and romantic scenery. It includes the tract called Iar or Western Connaught, a granite plain on the north shore of Galway Bay; the district of Connemara, 'bays of the sea,' bordering the numerous inlets on the western coast; and Joyce's Country, further north, stretching from the shore to the great lakes Mask and Corrib. Connemara is distinguished by the beautiful mountain group of the Twelve Pins of Bunabola, the highest of which rises 2396 feet. Many more than a dozen peaks appear, but it is easy to reckon the twelve of superior dignity which give the name. They are said to occupy a space of twenty-four square miles, and rivet the attention of the traveller by their beautiful forms and change of relative position to one another as he proceeds.

*Galway*, at the outlet of the Corrib River, is an important town and port, occupying both its banks and two islands in the channel, fitted with docks and quays for extensive commerce. It is 130 miles west of Dublin, the terminus of the Midland Great Western Railway, which has a splendid hotel adjoining. The old town, eastward of the river, is poorly built, but has some Spanish-like houses, a memorial of the mercantile intercourse which once subsisted between Galway and Spain. One of these houses is marked with a skull and cross-bones, in memory of a circumstance without parallel in British history. It was the residence of the mayor, James Lynch Fitzstephen, in 1493, who, like another Brutus, condemned his own son to death for murder, and caused him to be executed from his own window in order to prevent a rescue. The new town, on the opposite bank, has spacious streets, and is the seat of one of the Queen's Colleges, a very handsome structure of beautiful gray limestone, opened in 1849. A large maritime suburb, called the Claddagh, consisting of low wretched cabins, is inhabited chiefly by fishermen who form a separate community. They speak the Irish language, have a nominal government of their own, elect annually a

so-called mayor, always intermarry among themselves, and are tenacious in maintaining exclusive right to their fishing-grounds. As the most westerly port of importance in the United Kingdom, while on the shore of a magnificent bay, with water deep enough for the largest vessels close to the quays, Galway is eminently fitted to be a principal station for the transatlantic passage. It is 1656 miles from St John's in Newfoundland, 2165 from Halifax, 2385 from Boston, and 2700 miles from New York. *Tuam*, a small ancient city on an affluent of Lough Corrib, is the seat of a Protestant bishopric, and a Roman Catholic archiepiscopate. *Ballinastoe*, on the border-river Suck, with a suburb in the county of Roscommon, is noted for its annual cattle and sheep fair, the largest in Ireland. In the neighbourhood of the town, the village of Aughrim was the scene of General Ginkel's victory over the army of James II. in 1691.

Ross Castle, Lower Lake, Killarney.

#### IV. MUNSTER.

| Counties.            | Area in Square Miles. | Principal Towns.                                      |
|----------------------|-----------------------|---|
| Clare, . . . . .     | 1294 . . . . .        | Ennis, Kilrush, Kilkee, Killaloe.                     |
| Limerick, . . . . .  | 1064 . . . . .        | Limerick, Rathkeale, Newcastle, Askeaton.             |
| Tipperary, . . . . . | 1659 . . . . .        | Clonmel, Nenagh, Tipperary, Carrick, Thurles, Cashel. |
| Waterford, . . . . . | 721 . . . . .         | Waterford, Dungarvon, Portlaw, Lismore.               |
| Cork, . . . . .      | 2885 . . . . .        | Cork, Queenstown, Youghal, Fermoy, Bandon, Kinsale.   |
| Kerry, . . . . .     | 1853 . . . . .        | Tralee, Killarney.                                    |

CLARE, a peninsular tract bordering on Galway, is enclosed by the Atlantic on the west, the noble estuary of the Shannon on the south, and the course of the river on the east. High steep cliffs form the greater part of the coast-line on the side of the ocean, against which tremendous seas roll up during continued winds from the west and south-west, while the few bays offer only imperfect shelter to shipping. The shores of the estuary are very fine. Sloping well-cultivated banks appear on either hand, adorned with wooded demesnes, in the midst of which some old ruin occasionally meets the eye; and the view of the grand mass of water is singularly beautiful, constantly altering its relation to the littoral landscape, widening and contracting, but everywhere preserving the aspect of tranquil power. The interior of the county contributes the Fergus and other affluents to the border stream, all of which are connected with small lakes. Its general surface is hilly, but not bold, and includes a large proportion of bog, with important mineral wealth—iron, lead, copper, manganese, marbles, and slates.

*Ennis*, a neat-looking trading town on the banks of the Fergus, is distinguished by fine remains of a monastery of the thirteenth century, founded by O'Brien, Prince of Thomond, an endowed classical school in the neighbourhood, called *Ennis College*, founded by Erasmus Smith, and some valuable quarries of black marble. It is the birthplace of Mulready, the painter. *Kilrush*, at the head of a bay of the Shannon, a fishing place, with some coasting trade, has the advantage of a secure harbour and convenient pier, protected by a sea-wall of immense strength. It is much resorted to for sea-bathing. Directly opposite, about a mile distant, is Scatterry Island, once a place of pilgrimage, and still revered by Roman Catholics. It is said to have been the residence of St Senanus, who jealously guarded his retreat against female intrusion, as commemorated by Moore :

'O! haste and leave this sacred isle,  
 Unholy bark, ere morning smile;  
 For on thy deck, though dark it be,  
     A female form I see;  
 And I have sworn this sainted sod  
 Shall ne'er by woman's feet be trod.'

Ecclesiastical remains abound on the island. *Kilkee*, a charming watering-place, in a beautiful little creek of the Atlantic, forms a semicircle of good villas and lodging-houses, with a stretch of fine smooth white sand for an esplanade. *Killaloe*, the seat of a bishopric, now a decayed place, is splendidly situated in the midst of bold hills, on the right bank of the Shannon, close to its outlet from Lough Derg. The river here forms a series of rapids, and an old bridge of a great number of arches is a picturesque object in the landscape.

LIMERICK, an inland county, extends along the southern shore of the Shannon, in the upper part of its estuary, and for a short distance along the left bank of the river. It belongs almost entirely to its basin, and contributes the Deel and the Maigne to its channel, the last of which has for two of its affluents the Cammogue and the Star rivers. In the tract between these streams lies the romantic and secluded Lough Gur, with one principal island and several smaller, rising up from its bosom. On the large island, and on the shores of the lake, are gigantic relics of the remote 'past—stone circles, pillar-stones, cromlechs, and other works of Cyclopean masonry—with strong square towers of the days of the Desmonds, a family once all-powerful in the district. The whole county is remarkable for monuments of barbaric art, as well as for the number of its castellated and religious remains. Most of the latter are referrible to the wealth and influence of the chieftains named. The aspect of the surface is generally flat; the soil is proverbially rich; and an easterly portion of it is so fertile as to have obtained the designation of the 'Golden Valley.' High grounds overlook the plain, especially towards Tipperary, where the loftiest point of the Galty Mountains marks the border-line, and has an elevation of 3000 feet.

*Limerick*, an ancient episcopal and historic city, the fourth in Ireland in order of population, is seated on the Shannon, at the head of the estuary, about sixty miles above its mouth. The older portion, divided into Irish Town and English Town, chiefly occupies King's Island in the river, and has very uninviting features. But the more modern part, called New Town or Newton Pery, on the left bank, is remarkably handsome, and there is an extensive suburb on the opposite side of the stream, in the county of Clare. Among the finest public buildings in Limerick are the new Roman Catholic Cathedral, and the church of the Redeemer Order. The city was once famous for its gloves, of such delicate material and fine workmanship, that a pair has been passed through a wedding-ring, but the manufacture has greatly declined. That of lace, introduced from Nottingham, is extensively carried on; and fish-hooks of the purest steel are largely made for the angler's use. The 'Limerick lasses' maintain their old reputation for beauty, a characteristic which belongs to the women of all ranks throughout the county. A considerable foreign and coasting trade is facilitated by deep water at the quays, and an unobstructed navigation to the Atlantic. No place in the island has been more prominent in Irish history. It was held by the Danes in the ninth and tenth centuries, reconquered by Brian Boroihme, fortified by King John (1210), and partly burned by Edward Bruce (1314). It surrendered to Ireton, the son-in-law of Cromwell (1651), after a long and brave resistance. It withstood the arms of William III. (1690), who was compelled to raise the siege, but it capitulated upon honourable terms to his general, Ginkel, in the following year. The city long retained a military aspect. In the middle of the last century, seventeen gates were in existence, which were regularly guarded and locked every night. All the other towns of the county are of unimportant size. *Kilmallock*, once a parliamentary borough, now a mass of ruins and hovels, has been called the 'Baalbec of Ireland,' is memorable as having been the chief seat of the Desmonds. According to a wild legend, the last powerful head of the family, who perished in the reign of Queen Elizabeth, still keeps his state under the waters of Lough Gur, before referred to, reappears fully armed on the morning of every seventh year, rides round

the lake, and will ultimately claim his own again. *Castle Connell*, a village beautifully placed on the river above Limerick, overlooking the rapids of Doonas, is visited by the citizens on account of its strongly chalybeate springs.

TIPPERARY, an extensive inland district eastward, is traversed by the Suir, and contains a large proportion of level or undulating country, with detached heights interspersed, and elevated ranges towards the borders. On the south and south-west rise the Knockmeiledown and Galty Mountains, with the Silver Mine range in the north, abounding with lead-ore from which a considerable quantity of silver is obtained. The county yields excellent slates, coal of the anthracite kind, has woollen and flax manufactures upon a small scale, but is principally a scene of grazing husbandry.

*Clonmel* ('Vale of Honey'), an agreeable and busy town, occupies the north bank of the Suir, over which a long bridge extends to a suburb on the opposite side, within the limits of Waterford. It has a large export trade in agricultural produce, and numerous flour-mills, owing to the convenient water-power derived from the river. The town was the birthplace of Sterne and Lady Blessington. *Carrick-on-Suir* has the remains of a castle built in 1309. *Cahir* and *Thurles* are higher up the same river, the latter a station on the Great South-Western Railway, possessing a Roman Catholic college and two episcopal palaces. *Tipperary*, well built, lies on an affluent, and on the line of the railway between Limerick and Waterford. *Nenagh*, more important, is connected with the Shannon by a river falling into Lough Derg. *Cashel*, an episcopal city, anciently the residence of the kings of Munster, is of little present note, and in an unattractive neighbourhood, a treeless and unpicturesque, but rich and well-cultivated plain, about midway between Clonmel and Thurles. Yet it has one prime object of interest, the Rock of Cashel, crowned with the largest and most celebrated assemblage of ruins in Ireland. The rock itself is remarkable for the abruptness with which it rises from the extensive plain in which it is situated. Around the southern and eastern slopes is the town, with a handsome Protestant cathedral of modern date, and noble gardens attached to the episcopal palace. On the summit are magnificent remains of varied structures, roofless, windowless, and greatly shattered, yet still standing in their original height. They include a cathedral, St Mary's Abbey, Cormac's Chapel, a castle, and a round tower (ninety feet high and fifty-six in circumference), forming a very effective whole. Tipperary has within its limits, but close to the borders of Cork, a great natural curiosity in a series of subterranean chambers or caves, the existence of which was not known half a century ago, and was discovered quite accidentally. The entrance is in an ordinary field, and is kept under lock and key. A narrow passage from the mouth, with a steep descent, leads to a number of great chinks in the limestone rock, at different depths, opening out into halls of various forms and dimensions, connected together by galleries. These are incrustated with stalactitic and stalagmitic formations, and have as usual received fanciful names—Adam's Organ, Queen Elizabeth's Ruff, the Tower of Babel, the £50 Pillar, from that sum having been refused for the mass, the House of Commons, the House of Lords, and Lord Kingston's Hall, after the owner of the ground. Twenty-four large chambers are enumerated, besides many smaller ones, and upwards of three miles of gallery have been traced.

WATERFORD, a maritime county on the south, is the smallest of the divisions of Munster, and one of the least interesting parts of the country, though comprising a few highly picturesque spots. The surface is generally bare of trees; the soil is naturally poor; the coast-line is inhospitable; and with one splendid exception, the bays and harbours are neither safe nor commodious. The Suir forms a border stream on the north, and a westerly section is traversed by the lower course of the Blackwater. In the centre of the county rise the Comeragh Mountains, well-known landmarks to mariners, hailed by them as the 'high lands of Dungarvon,' the highest of which, 2469 feet, forms a table-land at the summit, remarkable for three lakes well stocked with trout. Westward are the Knockmeiledowns, stretching into Tipperary, which attain a slightly higher elevation. Copper-mines are profitably worked at Knockmahon, close to the coast, the ores of which are sent to Swansea; and lead is also obtained.

*Waterford*, a large and flourishing city, stands on the south bank of the Suir, twelve miles above the sea, but has water deep enough for vessels of heavy burden to come up to the quay, which has few rivals in the kingdom, stretching a mile in length in a continuous line along the river. In allusion to its natural advantages, it is said to have been anciently called *Cuan-na-Grioth*, 'the Harbour of the Sun,' and to have received its present name from the Danes, supposed by some to be a corruption of *Vader Fiord*, 'the Fiord of the Father,' or 'the Great Haven.' The commerce with England is immense in the transit of passengers, the export of live-stock and dairy produce, chiefly sent to Bristol as the nearest considerable port. Waterford is celebrated in history as the landing-place of Henry II. in 1171, to receive the submission of the Irish chieftains, and for its resistance to Perkin Warbeck, the pretender to royalty in the reign of Henry VII.

*Dungarvon*, a seaport, depends upon its fisheries of hake and herring, with summer visitors to it as a bathing place. *Portlawn*, a small inland town, has risen from an insignificant village in the present century owing to the introduction of the cotton manufacture. *Lismore*, on the Blackwater, the gem of the county as to scenery, is distinguished by a noble castle, seated on a steep rock by the side of the river surrounded by a finely wooded domain. The estate was included in the grant made to Sir Walter Raleigh, and is now a seat of the Dukes of Devonshire.

CORK, the largest county in Ireland, and larger than any in England except Yorkshire, extends 110 miles from east to west; greatest breadth, 70; average, 34. The coast-line is of great extent, owing to the numerous bays and splendid sea-rivers formed by a series of long narrow peninsulas. It embraces the southernmost part of the mainland, or Mizen Head; and the extreme south point of Ireland or Clear Island, of which Cape Clear is the furthest projection to seaward, is close along shore. Among the extensive inlets, that of Bantry Bay is nowhere surpassed for natural advantages as a harbour combined with natural beauty. It extends twenty-seven miles inland, includes many minor bays, and furnishes from its bed vast quantities of coral sand, which forms an excellent manure. The highest point of the county, Hungry Hill, 2249 feet, in the extreme west, overlooks the noble expanse. From west to east the surface generally declines; and hence in this direction flow the principal rivers, the Blackwater, the Lee, and the Bandon, all of which have several affluents. It comprehends a considerable proportion of infertile ground, either barren mountain or bog, but productive tracts lie along the lower courses of the streams.

*Cork*, the third city in Ireland in population, is finely situated on both banks of the Lee, where it begins to open out into the large and splendid inlet of the sea which forms the harbour. The river is walled in by handsome granite quays, and crossed by numerous bridges, below which shipping and steamers crowd the surface of the stream. Ship-building and varied manufactures are carried on; the export of provisions and agricultural produce to England is very extensive; and the foreign commerce is second only to that of Belfast. The city is deficient in good public buildings. The most important are the Court House, an elegant Grecian structure, and the new Queen's College, a striking quadrangular edifice in the Tudor Gothic style. The streets are generally confined, and the number of poor dwellings is very large, as the merchants and principal traders have residences in the beautiful vicinity. But Cork has a cheerful prosperous aspect, and may vie with any place of the same size in the variety of its institutions, whether religious, charitable, educational, literary, or scientific. The harbour is a spacious expanse studded with islands, and perfectly landlocked, in which the largest vessels may ride in safety. Spike Island, a convict station with artillery barracks, at the inner entrance, acts as a natural breakwater to it. *Queenstown*, the principal port of Cork, stands on the southern shore of Great Island, and enjoys a mild climate during all seasons. Occupying a steep acclivity, the houses rise in terrace above terrace from the water's edge, and have an imposing appearance from its surface, while the heights overlook a superb view of the anchorage with its merchantmen, steamers, yachts, and splendid encircling shores. The place was formerly called Cove, and received its present name in honour of the Queen's visit in 1849. *Youghal*, on the west shore of the Blackwater outlet, is one of the Irish watering-places, trades in the salmon produce of the river, and is enduringly associated with the memory of Sir Walter Raleigh. It was his residence for a brief period, and his house is still indicated. An old collegiate church, part of which is used for service, but largely a ruin, is one of the finest structures of its kind, containing many sepulchral monuments of great interest. The town derives its name from *Eo-chaille*, 'the Yew Wood,' which once existed in the neighbourhood. *Fermoy*, a military station, and *Mallow*, with a hot mineral spring, are on the upper course of the Blackwater, a district celebrated by the muse of Spenser, in which the *Fairy Queen* was produced, during his residence at Kilcoleman Castle, now a desolate ruin. *Bandon*, a place of modern date, on the river of that name, is the central point of a fertile part of the county. *Kinsale*, near the mouth of the river, is ancient and quaint looking, with some Spanish-like features, having been several times in the occupation of the Spaniards. It was long the most frequented of the southern harbours, a distinction which passed to Cork; and is still a prosperous town sustained by extensive fisheries. The Old Head of Kinsale, the point nearest the sea, marked by a light-house, has for centuries been a noted landmark to mariners. *Bantry*, near the head of its famous bay, attracts summer visitors by the enchanting scenery of the vicinity, chiefly Glengariff, 'the rough glen,' on the opposite shore, a deep and narrow alpine valley, about three miles long, which presents at every step a remarkable combination of the lovely and the grand, the mighty rock and the secluded bower, the pleasant cove and the majestic mountain.

KERRY, southward of the mouth of the Shannon, is the fifth of the Irish counties in extent, and the most magnificent in its natural features, but has the lowest average of

population. It embraces the south-western section of the country, and contains the most westerly point of the mainland in Dunmore Head. The shores are distinguished by their peninsular arrangement and wild sublimity. In the interior, towards the Shannon and the Limerick border, the surface is comparatively open, and in several parts low, but the central and southern portions consist of huge mountain masses, separated by deep romantic glens in which lovely lakes are embosomed. These highlands embrace Carran-tual, 'the inverted sickle,' 3404 feet, loftiest of Macgillicuddy's Reeks, near Killarney, the culminating-point of Ireland; and Mount Brandon, 3126 feet, the next in elevation, on the northern side of Dingle Bay. This rugged district sheltered the wolf to a late period. In the early part of the last century, money was levied on presentments of the grand jury for the destruction of the animal in the county. Exposure to the south-west winds renders the climate singularly mild and moist. The last element often interferes with the pleasure of excursionists, either by soaking showers, or veiling the mountains from view in mist, and suddenly prohibiting all chance of a prospect from their summits. Owing to the mild and humid atmosphere, the vegetation includes plants peculiar to the district, while evergreen shrubs attain the size of trees, and the indigenous woods are clothed with the richest foliage. Many islands fringe the coast, the Blasquet group, Valentia, the pinnacled Skelligs, with Scariff and Dinish. The two latter are opposite Derrynane, the birthplace and seat of O'Connell, and were both his property.

*Tralee*, a considerable town, is the principal outlet of the produce of the county, consisting entirely of provisions. It is seated near the head of a bay with which connection is maintained by a canal navigable by vessels of considerable size, and has a chalybeate spring of some repute in the neighbourhood. *Killarney*, a mile distant from the lowermost of its far-famed lakes, contains an imposing Roman Catholic cathedral and a nunnery. It has little trade, and is sustained by the summer influx of pilgrims to their scenery, in which mountain, glen, water, island, foliage, and mouldering ruin, blend their various attractions. Toys and other articles of arbutus-wood are made in the town, and disposed of to visitors as souvenirs of their excursion. Though the arbutus flourishes in most parts of Ireland, it is nowhere seen in such profusion, or of so large a size, as in this neighbourhood. Stems, with a girth of several feet, and a height corresponding to that of the ash, are not uncommon. But visitors are liable to be imposed upon, here as elsewhere, by articles made of the cheaper bog-timber being substituted for those really of arbutus. *Dingle*, *Cahiriveen*, and *Kenmare* are small coast towns, the latter planted by Sir William Petty in 1670, the founder of the Lansdowne family. Among the insular parts of the county, the Blasquet Isles, thirteen in number, are the most westerly portions of the kingdom, separated from Dunmore Head by a sound of great depth. Valentia Island, on the southern side of the entrance to Dingle Bay, is close in shore, and has a noble harbour in the intervening channel. It possesses valuable slate quarries, a fertile soil, and has become of interest as the appointed site for transatlantic telegraphic communication, if that should become practicable. The Skelligs are two rocks to the southward, about eight miles out to sea. The Great Skellig rises to the height of 1000 feet above the ocean, as sharp as an alpine *aiguille*, and as elegant in form. Landing is impossible except in calm weather. The only occupants are the keepers of two light-houses, who are often in winter cut off for weeks from all communication with the main shore. The Lesser Skellig is lower, yet more difficult of access. It has never been inhabited by man, but is one of the six breeding stations of the gannet within the limits of the United Kingdom.

## POPULATION OF THE PRINCIPAL IRISH CITIES AND TOWNS.

FROM THE CENSUS RETURNS OF 1861.

|                         | POP.  |                                 | POP.    |                        | POP.   |                                  | POP.    |

Bowley Bay, Jersey.

## CHAPTER V.

### BRITISH EUROPEAN POSSESSIONS :

#### THE CHANNEL ISLANDS—MALTESE ISLANDS—GIBRALTAR—HELGOLAND.

**T**HE accession of William the Conqueror to the throne of England associated the kingdom politically with his own duchy of Normandy, which was practically an independent state, but feudally subject, with the adjoining province of Maine, which he had subdued, to the crown of France. To this continental territory, the fourth of his successors, Henry II., first of the Plantagenet sovereigns, added his own paternal inheritance of Anjou and Touraine, with the splendid patrimony of his queen, consisting of the earldom of Poitou and the great duchy of Aquitaine, the latter extending from the Loire to the Pyrenees. At this period therefore—the middle of the twelfth century—the sway of the English monarch embraced considerably more than a third of France. The whole was lost during the reign of his inglorious son John, with the exception of the principal portion of Aquitaine, or the important provinces of Gascony and Guienne. It was partly recovered by the brilliant victories of Edward III., and fully restored, with large accessions, by the successful wars of Henry V. But during the long minority of Henry VI. the course of events was adverse to the maintenance of a foreign dominion; and after the middle of the fifteenth century, or 1453, when Bordeaux surrendered, not a foot of ground remained to the English on the mainland of the continent, except the town and suburbs of Calais. This place was retained a century later, or till the reign of Queen Mary, 1558,

when it capitulated to the Duke of Guise. But the Channel or Norman Isles have continued to the present day uninterruptedly subject to the crown of England since the time of the Norman Conqueror. A form still observed by the House of Lords absurdly keeps up the memory of the long-severed political connection with the mainland across the sea. At the beginning of every parliament Receivers and Triers of Petitions from *Gascony* are appointed, and have their names in French entered in the journals.

The Channel Islands are situated in the Bay of Avranches, off the north-west coast of France, part of the old province of Normandy. They consist of three important members, Jersey, Guernsey, and Alderney, with three of much smaller extent, Sark, Herm, and Jethou. The mainland of the continent is distinctly visible from various points, with the churches and high buildings. Alderney makes the nearest approach to it, being within seven miles of Cape La Hague, and is at the same time the nearest of the group to England, distant about fifty-five miles almost due south of Portland Bill. Rocks in great numbers fringe the shores, some of which are always exposed to view, others only at the recession of the tide, while many are permanently submerged. They originate strong currents and eddies; render the approach to the islands dangerous to those who are not intimately acquainted with the navigation; and have contributed to preserve this isolated nook of the empire from attack in time of war. The islands are almost entirely of granitic formation, though schistose and slaty rocks occur. They have a very mild climate, for the heat of summer is tempered by the sea-breeze, while frost and snow in the opposite season are rare and transient. The prevailing winds are from the north and north-west; rain is frequent; and the dews are heavy. The flowers and fruits, wild and cultivated, are of the finest description; the chaumontelle pear attains a size and flavour rarely to be met with elsewhere; figs, melons, and grapes ripen to perfection without artificial heat; and tender exotics live through the winter in the open air. A breed of cattle, gentle and graceful, commonly referred to Alderney, but more properly belonging to Jersey, is so highly valued, that laws have been passed prohibiting the importation of any other kine, in order to preserve the purity of the race. No venomous reptiles exist, but toads are numerous, and the beautiful green lizard of the south of Europe has here its northern limit.

JERSEY, the largest island and the most southerly, extends in the form of a quadrangle ten miles in length by six in breadth, and is within sixteen miles of the French coast, where the cathedral of Coutance may be seen in clear weather from the heights on the eastern side. It is the most commercially important and attractive member of the group, with well-wooded and watered glens in the interior, broad circling bays and small coves along the shores, of which tranquil beauty is the general characteristic, though bold and striking features are not wanting, especially on the northern side. The whole is highly cultivated, divided into small farms, with tiny fields, orchards, and gardens, except westward, the direction of the violent storms, where there is a tract, once fertile but now perfectly barren, having been covered with sand raised from the shore by a tremendous tempest some three centuries ago, which the winds further distributed. The people, in common with the other islanders, having no lime or chalk, use the sea-weed for manure, as well as for fuel. It is plentifully produced on the rocks off shore from which the tide recedes, and is locally called *vraic*, a word derived from the Norman *varech*, corresponding to the English *wrack*. An old proverb refers to its use and importance, *Point de vraic point de hautgard*—'No sea-weed, no corn-yard.' This marine vegetation is not common property, but stringent regulations are in force, apportioning it to the neighbouring proprietors and occupiers of land, according to the extent of their holdings. Even the drift-weed which the waves throw upon the beach is guarded by a similar law. Nor can

it be gathered at any time, limited periods being appointed in summer and winter for the purpose. Its annual value to Guernsey alone is estimated at £30,000. A great quantity is burned for the manufacture of kelp and iodine. The seasons of the vraic harvest are high festive occasions, as well as times of unusual industrial activity.

*St Heliers*, the capital, on the southern side of the island, is a place of considerable commercial enterprise, as well as the retreat of many families from England with moderate means, and of transient visitors. The older part of the town occupies a valley opening into the Bay of St Aubin at its eastern extremity, while the surrounding hills are gay with modern terraces, villas, and gardens. Its appearance is remarkably pleasing from the seaward approach. Fort Regent, of recent date and great strength, defends the harbour, with the old fortress of Elizabeth Castle, at a short distance from the shore, but accessible at low water. In 1791 the town was for a few hours in the hands of the French. The party under the Baron de Rullecourt landed by night on the east coast, having been guided thither by a treacherous pilot. By dawn they were in the market-place, and induced the surprised governor to sign a capitulation. But this was repudiated by his subordinates, who rallied the military, assailed the enemy, and compelled them to surrender. Rullecourt fell in the action, as did the commanding English officer, Major Pierson. The latter has a monument in the old church; and his death is the subject of one of Copley's best paintings. Victoria College, a good public school for boys, was founded in commemoration of a royal visit in 1846, and two noble piers enclosing the harbour are respectively called the Victoria and Albert. From St Heliers, the shore of the bay on which it stands extends in a curve of six miles of broad firm sand to the little town of St Aubin, picturesquely seated at the westward extremity. From its bordering heights may be seen to the southward the remarkable Chausey archipelago, belonging to France. Fifteen islands, and about as many detached rocks, may be counted at high water, which seem to be almost on a level with the waves. As the tide ebbs the rocks become islets, while the islands grow sensibly larger, higher, and more important, till they merge in a single considerable mass, with those parts well clothed with marine vegetation which have been under water. At the same time, many rocks, before quite invisible, appear above the surface, some of which enlarge into islets. 'Blocks of every variety of form and size are grouped together in a thousand different ways, some rising into pyramids, others graduated and cut into irregular tiers of steps, others again heaped into confused masses, like the ruins of some giant structure; at one place appearing like colossal Druidical stones; at another, entangled together like the rude materials of some Cyclopean edifice, or else suspended, and so slightly poised that a breath of air seems sufficient to overthrow them.' The tide returns, and the archipelago gradually resumes its high-water aspect.

GUERNSEY, about twenty miles to the northward, is nine miles in length by six in breadth. It is undulating and fertile, but has not the striking beauties of its neighbour, though charming scenes abound. Nor is it so richly wooded, but excels in fruits and floral loveliness. Its famous lilies are not however indigenous, but of Japanese origin, derived from the wreck of a Dutch vessel freighted with the roots, which were cast ashore. Monuments of old Druidical times are numerous, the most remarkable of which, misnamed the Druid's Temple, is a cromlech. It consists of five vast capstones standing within an indistinct circle of smaller stones, and overlooks the sea at L'Ancrese Bay. The small isles of Sark, Herm, and Jethou diversify the view from the eastern shores. ALDERNEY, fifteen miles further north, with a circumference of eight miles, is separated from the French coast by a channel dangerous in stormy weather owing to strong eddying currents, hence called the Race of Alderney. A harbour of refuge in process for ships of war, with strong fortifications for its defence, is apparently intended to be a counterpoise to Cherbourg, on the adjoining continental peninsula.

*St Peter's Port*, on the east coast of Guernsey, the only town, is well placed on a hill, with the old streets and houses on the lower slope, and new erections above, in connection with delightful environs. It has a valuable educational institution in Elizabeth College, a foundation of the queen of that name. The chaumontelle pears of the island are often of very extraordinary size. The largest on record was grown at Laporte in the year 1849. It measured  $6\frac{1}{2}$  inches in length,  $14\frac{1}{2}$  inches in girth, and weighed close upon 2½ pounds avoirdupois. Four were gathered from a single tree in 1861 which weighed together 7½ pounds. The minor isles have considerable natural interest. *Sark*, on the eastern side of Guernsey, is about three miles long by one and a half broad, but is remarkably contracted at one point, where the two divisions of Great and Little Sark are formed. These portions are not perfectly detached, but united by an extraordinary natural causeway, or ridge of rock, called the *Couplée*. This is a terrible passage of 150 yards, being not more than from four to eight feet in breadth, while as high above the sea as is St Paul's Cathedral above the pavement. On one side the descent is sloping, but on the other a stone dropped over the edge falls into the water. The island is an impregnable natural fortress, so girded by precipitous cliffs on every hand, that the

only access to the interior is through a tunnel cut in the rock. The French obtained entrance in the reign of Edward IV., and held possession till the time of Queen Mary, when it was recovered by stratagem. A vessel appeared, the captain of which stated that he had a dead man on board, who had expressed the wish to be buried ashore. "Would the commander let them land and bury him? "If you bring no arms with you—not so much as a penknife—yes." So a coffin was landed, taken into the church, and opened. Instead of a dead body, it was filled with arms. The mourners and attendants provided themselves accordingly, sallied out, fought, and won. Meanwhile, a boatful of Frenchmen had been carried aboard the ship to receive some presents as a burial fee. They remained there as prisoners.' Sark has one parish church, a Wesleyan chapel, a comfortable inn for visitors, but no village. Its manorial rights are at present held by the resident clergyman. *Herm*, an adjoining islet, attracts conchologists by a shell-beach extending from half to three-quarters of a mile. It is composed of small perfect shells, and fragments of larger ones, without the least intermixture of sand or pebbles. *Jethou*, scarcely two miles round, is government property, and consists chiefly of gneiss, which has been largely used in constructing the harbour of refuge at Alderney. In 1861, the population of the islands stood as follows: Jersey, 55,613; Guernsey (with Herm and Jethou), 20,850; Alderney, 4932; Sark, 583: total, 90,978.

The Channel Islands constitute two lieutenant-governorships, one including Jersey, the other Guernsey and its dependencies. They ecclesiastically belong to the see of Winchester. The governors are appointed by the crown for five years, and are supreme in all military affairs. But peculiar civil laws and institutions are in force, derived from the old customary law of Normandy; and, unless specially mentioned, the islands are not included in acts of the Imperial Parliament. Norman French is the language of the lower classes; pure French is used in judicial and other public proceedings; but some knowledge of English is very general with the natives.

## II. MALTESE ISLANDS.

These closely-adjointing islands, a small but important colony of Great Britain, are situated in the Mediterranean, about fifty miles to the south of Sicily, and more than three times that distance from the nearest point of Africa. *Malta*, the southernmost and the largest, was known to the ancients under the name of *Melita*, and is commonly identified with the island so called, which was the scene of the shipwreck of St Paul on his memorable voyage to Rome—an event commemorated by various local traditions. It forms an irregular oval, is seventeen miles long by nine broad, has an area of ninety-five square miles, and is about one-third less than the Isle of Wight, but more densely inhabited than any part of the United Kingdom, with exception of the metropolitan districts and Lancashire. The coast on the side towards Sicily is indented with bays and inlets, but sweeps in an almost unbroken curve in the opposite direction. Though nowhere high, the surface is diversified with hills and furrowed with valleys, while the industry of the people has given both picturesqueness and fertility to the naturally barren calcareous mass. *Gozo*, separated from Malta by a channel from four to five miles wide, is much smaller, but rises higher, and has bold cliffy shores, abounding with caves. *Comino*, between the two, is smaller still; and *Cominotto*, adjoining, with a few rocks, completes the group. The climate of the islands is almost tropical. During the summer, the great heat is often distressingly aggravated by hot gusts from the coast of Africa, usually of short duration. In the autumn, called the 'little summer,' the air is agreeably cooled with showers, and becomes invigorating. Hail falls frequently in winter, but snow is never seen except as an article of luxury imported from the heights of Etna. Ophthalmia, a prevalent complaint, often ending in blindness as the consequence of neglect, is supposed to be occasioned by the sun-glare reflected by the calcareous rocks, and the clouds of dust raised by the winds. Cotton and corn are principal objects of culture; grapes, figs, oranges, and lemons are raised, and bee-hives are numerously kept, supplying honey of the finest flavour. The total population amounts to upwards of 140,000, consisting of a very mixed race, almost all Roman Catholics in religion. A

*patois* compounded of Arabic, Italian, and other dialects, is the popular language, in which the former element so far preponderates, that it is said to be intelligible to natives of the opposite shores of Africa. Pure Italian is spoken by the upper and mercantile classes, but a knowledge of English is becoming prevalent, promoted by schools under English direction. The siesta, or mid-day sleep, is universally observed in the summer season.

*Valetta*, the capital of the group, on the northern coast of Malta, derives its name from the founder, La Valette, one of the grand-masters of the Knights of St John, by whom it was begun and completed, 1556-71, with the aid of the principal powers of Europe, as it was designed to be the bulwark of Christendom against the Turks. The town occupies a neck of land running out into a bay, and dividing it into two harbours, one of which is used for quarantine purposes, while the other, and the larger, is the great port. The citadel of St Elmo, with a light-house, stands at the extremity of the projection. Fortifications crown the adjoining slopes, and are supposed to render the place impregnable. It serves as the headquarters of the Mediterranean fleet, a calling station for steamers on the line of the overland route to India, and a dépôt for articles of British commerce intended for the countries of Eastern Europe and the Levant. The houses are of stone, and flat-roofed, the terraces of which are used to enjoy the cool breath of morning and evening; and the streets are well paved and lighted. Most of the public buildings date from the time of the knights, but those devoted to government purposes have undergone great alterations. The residence of the governor was the palace of the grand-masters. The Royal Naval Hospital was originally a house built for a private member of the Order, but has been re-modelled and enlarged for its present object. It has an imposing appearance, seated on high ground on the left of the great harbour, on entering. A few miles to the westward of Valetta, a small inlet on the coast has the name of *Porto de San Paolo*, or the Port of St Paul, as the supposed point where the vessel which carried him was driven ashore. *Citta Vecchia*, on a hill towards the centre of the island, once its capital (when it was called Medina), and still the seat of the bishopric, has a cathedral which tradition places on the site of the house of Publius, the Roman governor, at the time of the apostle's arrival. A cave in the vicinity, called St Paul's Grotto, seems to have been used as a church.

The history of the Maltese Islands is singularly checkered with change of masters. In ancient times they were successively possessed by the Phœnicians, the Greeks, the Carthaginians, and the Romans. They passed under the rule of the Vandals and Goths, were next subject to the Arabs, then to the Norman lords of Sicily, and were eventually given up to the emperors of Germany. In 1530, Charles V. presented them to the Knights of St John upon their expulsion from Rhodes, who successfully defended their stronghold against the Turks in 1565, during a long and terrible siege, under their grand-master, La Valette. The Order retained their tenure upwards of two centuries and a half, or till the year 1798, when they were compelled to submit to the French. But, two years afterwards, these new-comers surrendered the islands to the British as the result of a close blockade.

### III. GIBRALTAR.

The rock of Gibraltar—simply styled the 'Rock' in Mediterranean waters from its remarkable prominence, and familiarly called 'Old Gib' by seamen—is a projection from the southern part of the mainland of Spain, wanting only a further extension of about five miles in order to rival its neighbour, Cape Tarifa, in being the most southerly point of the European continent. The bold promontory is a mass of gray primary limestone, attached by a low isthmus of sand to the general coast-line of Andalusia. It is three miles in length from north to south, nowhere exceeds three quarters of a mile in breadth, and has a circuit of about seven miles. The north front of the grand headland rises up almost perpendicularly from the isthmus; the east side is full of craggy precipices, and nearly inaccessible; the south extremity consists of rapid slopes, terminating in Europa Point; the west side, though interspersed with steep rugged declivities, has flats or terraces on which the town is built, and affords the only landing-places. The summit is a sharp wavy ridge, rising 1350 feet at the Rock Gun on the north, 1276 feet at the Signal House in the centre, and 1439 feet at the Sugar Loaf on the south, the highest elevation. Westward lies the circular sweep of Gibraltar Bay, an important

naval station, but a defective roadstead, formed between the promontory and the Spanish main, which the former completely commands. Eastward rolls the Mediterranean. Southward is the famous channel which connects the landlocked sea with the Atlantic, and beyond it the mountainous coast of Africa is distinctly visible. The strait, at the western entrance, the narrowest part, is about fifteen miles across.

Algesiras and Bay of Gibraltar from the old Moorish Castle.

The rock of Gibraltar is the Mount Calpe of the Greeks, corrupted by them from the name Alube, given it by the Phœnician navigators. Directly opposite, on the African shore, is the classical Mount Abyla, now called Jebel Muza by the Moors. These are the two Pillars of Hercules, which, according to mythological fable, the hero-god piled to commemorate a victory. 'Of the two hills or pillars,' says a graphic describer, 'the most remarkable, when viewed from afar, is the African one. It is the tallest and bulkiest, and is visible at a greater distance; but scan them both from near, and you feel that all your wonder is engrossed by the European column. Jebel Muza is an immense shapeless mass, a wilderness of rocks, with here and there a few trees and shrubs nodding from the clefts of its precipices; it is uninhabited, save by wolves, wild swine, and chattering monkeys, whilst, on the contrary, Gibraltar, not to speak of the strange city which covers a part of it, a city inhabited by men of all nations and tongues, its batteries and excavations, all of them miracles of art, is the most singular-looking mountain in the world—a mountain which can neither be described by pen nor pencil, and at which the eye is never satisfied with gazing.' But like its opposite

neighbour, it has a colony of fawn-coloured monkeys, the only example of the animal wild in Europe, identical with the Barbary ape, and doubtless originally an importation from that country. They usually live among the inaccessible precipices on the eastern side of the rock, where there is a scanty store of monkey-grass for their subsistence, but take refuge from a strong east wind on the western side, where they may be seen from below, leaping from bush to bush, boxing each other's ears, and indulging in all kinds of antics. When disturbed, they scamper off with the utmost rapidity, the young ones jumping upon the backs, and putting their arms round the necks of the old, but are so extremely wary, that it is scarcely ever possible to get near them. Being quite inoffensive, they are protected by the garrison. Though apparently void of vegetation when seen from the sea, the variety of wild and cultivated plants is considerable for so rugged a spot, of such limited extent. Grasses, shrubs, and brambles are found in nooks of the mountain; some noble trees appear in gardens; geraniums and other flowers flourish in profusion; and culinary vegetables, with various fruits, are raised. Caverns and fissures are numerous, several of which have yielded interesting fossil remains. The largest example, the Cave of St Michael, is entered by a yawning cleft at the height of 1000 feet, and thence descends by a succession of chambers and passages to an immense depth, the limit of which has not been reached owing to the difficulties and perils attendant upon the exploration.

The town of *Gibraltar* lies at the base of the north-western face of the rock. It consists of a principal street about a mile in length, with two others much shorter parallel to it. Barracks, and the suburban residences of the chief officers and merchants, stretch away southward from the town, along the shore of the bay to the seaward extremity of the rock. The population, exclusive of the military, amounts to about 15,000, and is of a very miscellaneous description, with varied costumes, which seamen and visitors from vessels in the bay are constantly rendering more motley. Almost any day there may be seen, in close proximity, the turbaned Moor, the black-capped Barbary Jew, the dark-whiskered Spaniard, the sharp Greek, the lively Genoese, with Scotch and English, some of whom are 'rock-lizards,' a soubriquet for persons born of British parents beneath its shadow. The Roman Catholics, the most numerous body, have a bishop and a cathedral; the Jews possess four synagogues; the Episcopalian Protestants have a church, and likewise a bishop, whose diocese embraces all British posts in the Mediterranean; and the Wesleyans have a chapel. The public functionaries include a governor appointed by the crown, a magistrate, and a competent police force; but in all important civil causes appeals lie to the privy-council. From July to November the heat is great, and very fatal epidemics have raged in the sultry season. To guard against this danger, cleanliness is enforced by strict police regulations, and attention is paid to efficient drainage. The greatest natural disadvantage is the want of springs of fresh water, which renders the inhabitants entirely dependent upon the rain-fall. Every drop is carefully collected from the roofs for private use, as well as from the general surface, to be stored in huge reservoirs for public purposes.

The name, *Gibraltar*, is a corruption of *Gebel-Tarif*, the 'Hill of Tarif,' derived from Tarif, *cbn Zarca*, the general who, in 711, led the Saracens into Spain from the coast of Africa, and who is also nominally commemorated by the neighbouring cape and town of *Tarifa*. The invaders fortified the spot as a base of operations, and a convenient point for receiving reinforcements, or effecting a retreat. A tower belonging to the old castle remains. In 1309 it was captured by the army of Ferdinand of Castile, regained by the Moors in 1333, and finally recovered by the Christian power in 1462. The Spaniards reconstructed the fortifications by the most eminent engineers, and the place was deemed impregnable. Oliver Cromwell contemplated its reduction in order to obtain a hold of the Mediterranean, but the admirals, Blake and Montagu, commissioned to survey its defences, deemed them too strong for the force at their disposal. But it succumbed to an English squadron under Sir George Rooke in 1704, and has since that period remained uninterruptedly a British possession, though not without several desperate efforts for its recovery, with the peaceful offer on the part of Spain of two millions sterling for its restitution. In June 1779 commenced one of the famous sieges of history, in which the combined forces of France and Spain were engaged, by land and sea, while Great Britain was occupied with her revolted North American colonies. For three years, seven months, and twelve days, the garrison under General Elliot, afterwards Lord Heathfield, repulsed every attack of the beleaguering host, when the siege was raised upon the conclusion of a general peace. The besieged beat the enemy with 90 guns. There may be now perhaps a thousand guns mounted of very different calibre, with batteries hewn in the solid stone, while the rock is honeycombed with immense excavations for stores and munitions of war, and there is always a strong garrison keeping watch and ward with jealous care. An eminence across the bay, near the small town of *St Roque*, bears the name of the Queen of Spain's Seat, from a local legend, that when Gibraltar fell into the hands of the English, the queen of Spain sat

there disconsolate for three days. Though not of the slightest value in itself, and a costly possession to Great Britain, while its loss is a source of constant irritation to the Spanish people, it has been properly called a post of power, of superiority, of connection, and of commerce; and will doubtless be retained with all the might which the proprietary nation can command. With the firing of the evening-gun, Gibraltar is closed for the night, and no entrance is allowed without special permission.

#### IV. HELIGOLAND.

This islet-speck in the North Sea, which may be rounded by the pedestrian in little more than half an hour, is situated about thirty-five miles from the mouth of the Elbe, and is somewhat nearer to that of the Eider. It very slightly exceeds two miles and a half in circuit, has been largely diminished in extent by the action of the sea, which old maps render apparent; and is still in process of reduction from the same cause. The principal mass is the 'Oberland,' elevated about 200 feet above the sea, on which most of the inhabitants are settled. The lower portion, called 'Sandy Island,' occupied by a few dwellings, communicates with the 'Oberland' by a flight of 173 steps. The natives are a race of tall and hardy Frisians, very primitive in their manners and simple in their habits, who delight in seafaring, are admirable sailors, and maintain themselves chiefly by fishing and pilotage. They pride themselves on being 'Englishmen.' With them are associated a few merchants, mostly Hamburgers or Danes. Lobsters and haddocks are the principal produce of the fisheries. In the summer season, a number of continentals arrive to enjoy the fresh breezes and excellent sea-bathing. A British superintendent is at the head of affairs, but all internal concerns are managed by a council of the islanders. The total population of the 'Oberland' amounts to 2800, occupying 350 houses, most of which are grouped, forming a little town; with a light-house serviceable to passing shipping, and a jail which is rarely used.

Heligoland, the 'Holy Land' of the rough North Sea, was in ancient times a stronghold of Saxon paganism, deemed sacred to the goddess Hertha, the Earth, who had a temple at the spot. In proof of its having been once much larger than at present, we may mention that on a map discovered by Sir William Gell, the situation of many temples, villages, and large tracts of country are delineated, all of which were swallowed up by the sea between A.D. 700 and 1200, according to D'Anville. Christianity was first preached here by St Willibrod in the seventh century. It was long held by Denmark, but was seized by Great Britain in 1807, and finally ceded to the latter power in 1814. In the time of the first Napoleon, when British goods were excluded from the continent, it served the purpose of a *dépôt*, from which they were smuggled into the foreign markets.

Heligoland.

Bird's-eye View of Paris from over the Cité.

## SECTION II.—CENTRAL EUROPE.

### CHAPTER I.

#### FRANCE.

RANCE, the most westerly portion of Central Europe, occupies a geographical position highly favourable to political and commercial interests, possessing a large and nearly co-extensive amount of maritime and land frontier, both of which are eminently adapted—the first for communication, and the last for defence. It is directly connected with three sea-basins, the Atlantic on the west, the English Channel on the north-west, and the Mediterranean on the south-east, by means of which intercourse is conveniently commanded with the countries of Western and Southern Europe, the shores of Africa, transatlantic regions, and all the coast lands of the eastern hemisphere. The Pyrenees form the boundary from Spain on the south-west;

the Alps and Jura mountains rise on the frontier towards Italy and Switzerland; the Rhine forms the north-eastern border from Basle to Carlsruhe. Only on the north-east, towards Belgium and the Rhenish province of Prussia, is there no natural feature to constitute a well-marked division; there an artificial line, running north-west from Carlsruhe to Dunkirk, is adopted, which is under the protection of a chain of fortresses and a European guarantee to Belgium. The coast on the north is generally irregular, has the Channel Islands of Great Britain near its most prominent peninsula, and acquires a bold rocky character towards its western extremity, the peninsula of Bretagne. From this point, southward to the Pyrenees, it curves inland, forms one side of the Bay of Biscay, becomes low and dreary, extensively fringed with salt-marshes and sandy downs. Here in succession, from north to south, occur the small islands of Ushant, Belleisle, Noirmoutier, D'Yeu, Ré, and Oléron. The Mediterranean shores form the Gulf of Lyon, *Golfe du Lion*, so called from its violent storms; and, except towards the Italian border, are monotonous flats, characterised by lagoons. The only islands are the Hyères group, six in number, immediately eastward of Toulon. The larger island of Corsica, geographically related to Italy, belongs to France, and forms one of the departments.

The general outline of the country resembles an irregular hexagon, three sides of which are land and three water. Its greatest extent, due north and south, amounts to about 620 miles, between Dunkirk and the Col de Falguères, in the Pyrenees; and due east and west, the distance between the Rhine and the extremity of Bretagne is 570 miles. The whole area, including the newly-acquired Savoy provinces, and the Corsican island, is computed at 204,928 square miles. The mainland lies between latitude  $42^{\circ} 20'$  and  $51^{\circ} 5'$  north, and between  $4^{\circ} 50'$  west and  $8^{\circ} 15'$  east longitude.

'*La belle France!*'—a current native expression in relation to it—is not justified through a vast range of the surface, if understood with reference to scenical appearances, though it may be appropriate if considered to intimate the favourable character of the soil and climate. Englishmen have specially taken exception to the phrase—Captain Basil Hall, Mr Laing, and Mr Inglis among others—whose knowledge was not confined to the path so beaten by their countrymen, the uninteresting route from Calais or Boulogne to the capital. Beautiful, in many parts, are the river-valleys of the Seine, the Loire, the Garonne, the Rhone, and the Moselle; scenery of the grandest description appears on approaching the Alps and Pyrenees; and wild and striking are portions of the interior and coast region of Bretagne. But these districts are collectively of small extent in comparison with the general face of the country, a very large proportion of which has no pleasant diversity, no picturesque or even cheerful features. For league after league the landscape is tame, and frequently becomes tiresome from spreading out as an unenclosed expanse, wanting not only the green net-work of hedges, but the old trees, single or in groups, and the thriving plantations, which relieve the natural monotony of the level tracts of England. Over an extensive space, stretching nearly 200 miles from the mouth of the Garonne to that of the Adour, and running 70 miles inland from the coast, the country is a wilderness of white sand, black pine-woods, and vast plains of furze and heather, interspersed with shallow sombre pools and marshes bearing giant rushes and water-weeds, with here and there the rude huts of a scanty peasantry. This is the region of the Landes, which surprises by its strangeness, and awakens an interest in the mind of the traveller, which the unhedged levels submitted to cultivation fail to excite.

The highest mountains of France are near or on the borders. Before the recent cessions of territory, the most elevated was the Grand Pelvoux, 13,440 feet, to the

south-west of Briançon, in the department of the High Alps. Its loftiest peak was for the first time scaled by Mr E. Whymper in 1862. But Mont Blanc, the culminating-point of Europe, now forms the frontier, along with two of the principal passes of the Alps, the Little St Bernard and Mont Cenis. The Jura range, upon the Swiss border, an outlier of the Alpine system, has only a comparatively moderate elevation, and belongs chiefly to Switzerland. Of the Pyrenean heights, within French limits, the loftiest, Mont Perdu, attains to 10,994 feet. Among the mountains proper to France, from having an interior position, the most important are the Cevenno-Vosgian, a long chain stretching from the north-east far to the southward, with which westerly ranges are connected. The Vosges run parallel to the Rhine, separate its valley from that of the Moselle, and have vine-clad slopes, round-shaped forms, to which the prefix, *ballon*, attached to the names of several refers. They rise the highest in the Ballon de Sultz, 4690 feet, and are connected by a plateau tract with the Cevennes, which extend generally from north to south, divide the basin of the Loire from that of the Rhone, and reach the height of 5794 feet in Mont Mezen, near the source of the former river. During the invasion of Gaul by Julius Cæsar he crossed this narrow ridge in winter, with the snow lying in places six feet deep on the ground. It abounds with natural strongholds—defiles, gorges, caves, and woods—which were bravely held by the persecuted Protestants against the armies of Louis XIV., upon the revocation of the Edict of Nantes. Connected with the southern portion of the Cevennes, the mountains of Auvergne follow a divergent course to the north-west, separate the river system of the Loire from that of the Garonne, and ramify over the central departments in a series of detached groups. These are the loftiest highlands of France apart from the borders, rising to the height of 6180 feet in the Puy de Sancy, one of the group of Mont Dor. They constitute also its most remarkable natural curiosity, as having the true volcanic character, scathed craters, lava streams, and tracts of ashes, referring to a period of igneous eruption long prior to the age of history. This region of extinct fiery action occupies a considerable area, and has been repeatedly subject to careful geological examination. Primary rocks form the skeleton of the frontier mountains, and appear in the outlying districts of Bretagne, Normandy, and the Ardennes. The space intervening between them and the central volcanic nucleus is occupied with secondary and tertiary formations, among which an extensive area around the capital, known as the tertiary Paris basin, is remarkable for its remains of extinct quadrupeds, and celebrated as the field in which Cuvier made his paleontological discoveries.

Twenty-one considerable rivers are enumerated. But among these the Rhine is simply a dividing-line from Germany, entered by a few small affluents on the French side, while the Meuse, Scheldt, and Moselle flow beyond the limits of the country into adjoining districts. On the other hand, the Rhone is received from Switzerland, bringing with it the efflux of the Lake of Geneva. Upon crossing the frontier, rocks contract the channel, till the stream altogether disappears beneath them, and flows for a short distance through a caverned bed, which it has probably worn through the limestone mass. This happens when the water is low. Under different circumstances, it occupies the natural tunnel, and passes over the roof as well, open to the daylight. After a westerly course to Lyon, where it is joined by the Saone, the river proceeds impetuously southward to the Mediterranean, into which it discharges by several mouths, through a wilderness of salt swamps, dead flats, and huge bulrushes. The Rhone frequently overflows its banks, and spreads out in destructive inundations. In the south-west, the Garonne is likewise cradled beyond the frontier, or on the Spanish side of the Pyrenees, and has similarly a subterranean pathway. Its principal source is fed by the snows of Mount Maladetta, at

the base of which it issues copiously from a series of cavities, called Ojos de Garonna, 'the Garonne's Eye.' The river descends from thence north-east to Toulouse, bends north-west to Bordeaux, below which it receives the Dordogne, and forms the broad estuary of the Gironde, through which it enters the Atlantic. At its mouth, on the little rocky islet of Cordouan, stands a celebrated light-house, begun by Henry IV. in 1584 on the site of one of English erection, completed in 1611, and enlarged in 1727, the first structure of the kind in which a revolving light was exhibited.

Among the rivers which specially belong to France, having their rise, course, and termination within its bounds, the Loire, Vilaine, Charente, and Adour flow direct to the Atlantic; while the Seine, Somme, and Orne are connected with it through the English Channel. The Loire is distinguished by beautiful scenery on its banks, and affords an extensive line of navigation. It rises in a wild and dreary part of the Cevennes, at the height of 4550 feet above the sea, winds from thence through the central districts, at first northerly, then it turns to the west, and passes Orleans, Blois, Tours, Saumur, and Nantes, on its course to the sea. It is navigable upwards of 400 miles above the mouth, but its utility is often impaired by the opposite extremes of floods and shallows, changes which led one of the democrats of the last century to remark upon the revolutionary tendencies of the river: '*Quel torrent révolutionnaire que cette Loire!*' During the drought of summer, the stream does not cover in many places half the width of the channel, and the bridges are seen bestriding unsightly tracts of clay or gravel. In the harvesting of 1863, farmers on the Middle Loire, holding lands on both the banks, were able to cart their produce across the bed as safely as on dry land. But in winter and spring the shoals are deeply covered, the whole channel is full, and the river occasionally becomes a terrible enemy to life and property, as in 1846 and 1856, when the country, through hundreds of square miles, was covered by its inundations. The Seine descends from the high lands connected with the Vosges, passes by Paris and Rouen to Havre, and is remarkable for its tranquil flow, serpentine windings, and numerous islands, clothed with groves of poplar and willow, beautiful landscapes lying generally on both the banks. By means of its rivers, France has a total inland navigation of 5500 miles, which the canals connecting them, or forming independent lines of water-communication, extend to a length of 8400 miles. The *Canal du Midi* links the Garonne with the Mediterranean; the *Canal du Centre* unites the Loire and the Rhone; the *Canal du Rhone au Rhin* effects the junction of the two streams; and the *Canal de Bourgogne* connects the Rhone with the Seine. The country is singularly destitute of lakes, not containing a single important example, but lagoons or salt-marshes, called *etangs*, are numerous and extensive in the southern departments.

The climate is one of the finest in Europe, though not without its disadvantages in particular localities. It varies in different parts of the country, in a somewhat marked manner, owing to great range of latitude, and difference of position in relation to the sea. A northern, central, and southern zone may be distinguished. In the north, along the coasts of the Channel, and through the basin of the Seine, the temperature and the rain-fall correspond generally to experience in the south of England, but with warmer summers and colder winters in the more continental districts on the north-east. Passing to the central zone, embracing the valley of the Loire, there is a sensible increment in the temperature. The sky is less clouded, the atmosphere more clear, and the weather more stable. The winter is mild and brief, the summer dry and hot, while violent hail-storms are of common occurrence in the sultry season, and often very destructive to the crops. These characteristics become more decided in the southern region, which embraces the basins of the Garonne and Rhone, where sub-tropical vegetation appears. The climate

not only varies from north to south, but from west to east, as the result of proceeding inland from the sea. Owing to cooler summers on the western coast, the culture of the vine has there its northern limit about the mouth of the Loire, in latitude  $47^{\circ}$ , but it is extended three degrees further north on the opposite eastern or continental side; and for the same reason, maize is not grown to the north of the mouth of the Garonne on the west, in latitude  $46^{\circ}$ , while raised near Strasburg on the east, in latitude  $48\frac{1}{2}^{\circ}$ . Towards the Mediterranean, mosquitoes are apt to be a pest in the autumnal months, while a north-westerly wind occasionally blows down the valley of the Rhone, known as the *mistral*, dry, gusty, and piercingly cold, a great drawback upon personal comfort, while a cause of injury to the fields and gardens. Madame de Sevigné has described this aerial visitant as *le tourbillon, l'ouragan, tous les diables déchainés qui veulent bien emporter votre chateau*. Nor does the description seem to be overdrawn, though at variance with popular notions of the balmy, sunny south of France. 'The wind seemed poisonous,' observes one of our own tourists, Mr Reach, who goes on to affirm 'that the coldest, harshest, and most rheumatic easterly gale which ever whistled the fogs from Essex marshes over the dripping and shivering streets of London, is a genial, balmy, and ambrosial zephyr, compared with the 'mistral.' One benefit is conferred by the visitor, for with its first breath the mosquitoes vanish. The same region is exposed at times to another plague, that of a burning breeze from the south, heated on its passage over the deserts of Africa.

Vast forests clothed the face of the country when Caesar marched the Roman legions into Gaul. They are still very extensive, especially in the central, eastern, and south-western districts, where they may be traversed for miles, notwithstanding improvident management down to a recent date, and the immense consumption of wood for fuel. About one-seventh of the entire area is covered with timber. The common trees are the oak, elm, beech, ash, chestnut, and varieties of the pine. The wild animals include the brown and black bear in the upper part of the Pyrenees, but fast diminishing; the lynx, also in the high mountain-ranges, though comparatively rare, with the chamois and wild goat; the wolf, numerous in the central forests and other wooded districts, with the wild boar, wild cat, and roebuck; the fox, weasel, and pole-cat generally diffused. The wolf is the dread of the peasantry in many parts of the land, preying upon their flocks, and menacing even household life in severe winters, when hunger inspires them with courage and quickens ferocity. Recourse is had to periodical *battues*, to diminish the number of such dangerous neighbours; and during the year 1863, the experiment was tried in Poitou of wolf-hunting with English fox-hounds, but not with much success. Small singing-birds are remarkably scarce, owing to wanton destruction, now in process of being restrained by municipal interference, in order to prevent the alarming increase of noxious insects. Birds rare or not known at all in England are commonly met with, as the fig-eater, the ortolan, quail, bustard, flamingo, and hoopoe. Vipers are extremely numerous in various districts. The sea-fish are the same with those which visit our own coasts, with the addition of the tunny and anchovy, taken off the Mediterranean shore. Neither in point of numbers or quality are the domestic animals in proportion to the extent and resources of the country, or upon a par with the English breeds, though great improvement has been made in the native stock since the close of the long continental war, by the introduction of the best foreign races.

Without possessing districts so exuberantly fertile as the rich meadows of Belgium, the polders of Holland, and the fen-lands of England, the general soil of France is sufficiently good and varied to be adapted to almost every kind of culture, while the climate is friendly to great diversity of produce. An immense proportion of the surface is under cultivation, and the arts of husbandry have recently made rapid progress, though still

in a backward condition as compared with the advanced agriculture of some neighbouring states. Scientific principles are utterly unknown to the great majority of cultivators, who cleave to primitive methods, retain in use the rude implements of their forefathers, and are in general small proprietors of land, without capital for enterprise, even supposing improvement to be contemplated. Besides the ordinary cereals, the objects of culture embrace beet-root for sugar, tobacco, madder, chicory, saffron, and maize; rice, on the shores of the Mediterranean; the vine, mulberry, and olive, extensively; and more partially, the orange, lemon, and pistachio-nut. The vine has, from a very early period, constituted one of the principal sources of agricultural wealth in France. It is grown in five great regions, the valleys of the Moselle and Meuse, of the Seine and Marne, of the Loire and its affluents, of the Saone and Rhone, with those of the Garonne, Charente, and Adour. The vintage usually falls in September or October, according to the latitude; and is a season of merriment and song, just as described by the wine-loving bard of Greece:

‘Lo! the vintage now is done!  
And purpled with the autumnal sun,  
The grapes gay youths and virgins bear,  
The sweetest product of the year!—  
Meantime the mirthful song they raise,  
Io! Bacchus, to thy praise!’

As in the most primitive ages also, the practice prevails of treading out the grapes with the human foot. This is the ‘wine dance,’ in which strong active young men are employed. Champagne and Rhone wines are generally made by machine pressing. The mulberry for the support of the silkworm is chiefly cultivated in the departments of Gard, Drome, Ardeche, and Vaucuse, where there are probably not less than 15,000,000 trees, nearly half of which are in the first-named district. Of late years, the silkworms have been subject to a fatal disease, referred by practical men to a blight which has attacked the mulberry-tree; and experiments are in process both to raise them on other leaves, and introduce species from Japan accustomed to a different vegetation. The olive is principally grown in the tract between Grenoble and Narbonne. Though one of the romantic trees, rife with interesting associations, it does not improve the landscapes of Dauphiné, nor the mulberry either those of Languedoc, according to the impressions of Mr Reach. ‘I was miserably disappointed,’ says he, ‘with the olive. What claim has it to beauty? The tree has no picturesqueness—no variety. It is not high enough to be grand, and not irregular enough to be graceful. Put it beside the birch, the beech, the elm, or the oak, and you will see the poetry of the forest and its poorest and most meagre prose. So also, to a great extent, of the mulberry. I had a vague sort of respect for the latter tree, because one of the champions of Christendom—St James of Spain, I think—delivered out of the trunk of a mulberry an enchanted princess; but the enforced lodgings of the captive form just as shabby and priggish-looking a tree as the olive. The general shape—that of a mop—is the same, and a natural want of variety and picturesqueness afflict, with the curse of hopeless ugliness, both silk and oil trees.’ The mulberry was first planted in France near Tours in the fifteenth century.

In extent, variety, and value of manufactures, France takes high rank, and is in some departments unrivalled, but suffers in competition with England as to amount of production, owing to the comparative scarcity of coal which cripples the employment of steam-power. The fabrics which involve artistic design, minuteness of detail, elegance of finish, and the application of chemical knowledge, are superior to those of any other nation. Scientific instruments, tapestry, clocks, watches, articles of *vertu*, and other costly products, are made in great perfection at Paris, with porcelain and glass at Sèvres

in the vicinity. Rich silks have their great centre at Lyon; ribbons at St Etienne; fine woollens at Rheims and Amiens; cottons at Rouen; linens at St Quentin; laces at Lille, Arras, Caen, and Bayeux; carpets at Abbeville; and paper at Annonay. But France specially deserves honourable mention in relation to manufacturing industry, for having long provided means to adjust those disputes between masters and workmen, which in England have so often led to 'strikes' and 'lock-outs,' disastrous to both parties. With this object in view, a *Conseil de Prud'hommes*, 'Council of Experienced Men,' was established at Lyon by decree of Napoleon I., in the year 1806. It provided for the erection of similar tribunals wherever they might be required; and in 1807, Rouen and Nismes obtained them. Paris long remained without one, chiefly on account of the practical difficulties which it was expected would arise from the great variety of its industries. But there are now several in the capital, and from seventy to eighty in the whole of the provinces. Napoleon extended the same institutions to Ghent, Bruges, Aix-la-Chapelle, Cologne, and other towns in different parts of what was then the French empire, where they still exist. These councils are composed of equal proportions of masters and artisans, popularly elected, with a president and vice-president appointed by the government, who need not belong to either class. They proceed, in the first instance, simply as courts of conciliation, suggesting arrangements, but have power to adjudicate, and enforce decisions.

France is vastly inferior to England in mineral produce, but has till recently been considerably in advance in organisation to develop its resources. Paris has its *Ecole des Mines*, founded in 1783, a school in which instruction is given in practical mining, metallurgy, and other branches of allied knowledge; a second was established in 1816 at St Etienne, in the department of the Loire; and a third in 1845 at Alais, in the department of Gard, each of which has its mineralogical collection. From the proficient in the schools, the officers of the *Corps des Mines* are selected, a body of engineers appointed for various purposes, but chiefly to examine the country in relation to its geological structure and mineral wealth; to guide the labours of those engaged in mines; and to watch over the solidity of the works and the safety of the workmen. They likewise travel occasionally to obtain information respecting the discoveries made by, and the facts observed in, other countries; and publish records under the title of *Annales des Mines*, devoted to the illustration of their department. Iron of excellent quality is abundant, but the distance of the mines from the fuel necessary for the working of the mineral detracts from their value. Coal occurs extensively, but many of the beds are small, besides being inconveniently situated, and both coal and iron are imported. Argentiferous galena, copper, lead, manganese, and antimony occur, yet only to a very limited extent. The neighbourhood of the capital supplies the gypsum better known as 'plaster of Paris;' admirable building-stone has long been quarried at Caen in Normandy, of which some of the old churches of England are constructed; extensive slate quarries are situated near Cherbourg and St Lô; basalt and lava for pavements are supplied by the mountains of Auvergne. Fossil or rock salt is obtained from the Jura and Vosges Mountains; and likewise by means of evaporation from the lagoons and swamps which line the shores about Rochelle on the west coast, and those of the Gulf of Lyon. Mineral springs of various kinds are extremely numerous, of which nearly 1000 are said to be in use, a very large proportion of them being in the Pyrenees, while numbers have not yet been employed for purposes of health. France possesses seven mints, each of which is designated by a particular mark upon its coinage. Thus the coins of the Paris mint bear the letter A; Rouen, B; Lyon, D; Bordeaux, K; Strasbourg, BB; Marseille, MM; Lille, W. But Paris is the only mint which keeps up an uninterrupted supply of

gold and silver money, the provincial establishments being chiefly concerned with the copper coinage.

Before the revolution, towards the close of the last century, the country was divided into thirty-three provinces, mostly coincident in extent with territorial possessions held by the great feudal lords in the middle ages. At that epoch of change, the present division into departments was adopted, which are very conveniently named after some river, mountain, or natural feature connected with them. The departments, eighty-nine in number, are much more uniform in size than the English counties; and are further divided into arrondissements, cantons, and communes or parishes. Though no longer recognised in legal documents, the old provinces retain their place in history, and are therefore given in connection with their present representatives.

The ILE DE FRANCE, an inland district, obtained an insular denomination from being intersected by numerous rivers, the Seine, and its affluents, the Marne, Yonne, and Oise, in the same manner as inland parts of England, as the Isle of Ely, acquired, and still retain a similar style. It was the original appanage of the French sovereigns, at first held by a race of nobles, with the title of Dukes of France, one of whom, Hugh Capet, founded the Capetian dynasty. Long afterwards, when the royal domains included the Orleanais and Picardy, the powerful barons who held part of the intermediate territory could interfere with communication as they chose, and the kings had to travel with a sufficient armed force in order to pass securely from one part to the other of their own dominions.

Paris, the capital of the empire, is the second city of Europe in point of extent and wealth, ranking next to London; but is the first in the world as respects material splendour combined with literary treasures and pleasurable facilities. It contains a population of about 1,700,000; occupies both banks of the Seine and two islands in the channel; and is situated in 48° 50' north latitude, 2° 20' east longitude, about 210 miles in a direct line south-south-east of the British metropolis, and 250 miles by the Dover and Calais route. One of the islands, on which stands the cathedral of Notre Dame, with the prison of the Conciergerie and the Palais de Justice, has the style of *La Cité*, is nearly central in the capital, and may be regarded as the original nucleus around which it has been grouped. This spot, in the time of Cæsar, was covered with huts belonging to the tribe of the Parisii, whose name was subsequently transferred to the entire site. The adjoining islet, which includes the Hotel Lambert and the Church of St Louis, was formerly called *Ile de Vaches*, or Island of the Cows, in allusion to the animals once pastured upon it. As a further memorial of striking change, the name of the Louvre is commonly referred to the wolves, *louvres* (Lat. *Lupus*), which swarmed in the neighbouring woods, when a hunting-ledge occupied its place. The Seine flows through the heart of Paris, and divides it into two nearly equal parts, northern and southern. Twenty-seven bridges cross the river, the banks of which are lined with spacious quays, forming very agreeable promenades, being planted almost throughout with trees. On either hand are sumptuous palaces and public edifices—squares, gardens, fountains, columns, and triumphal arches—with noble houses and imposing streets. These form the more obvious attractions, which must be seen in order to be appreciated. But greater lustre is derived from the extent and richness of the artistic, literary, and scientific collections. The Imperial Library (*Bibliothèque Imperiale*), the largest in the world, has seventeen miles of shelves occupied by books, which number 1,800,000 printed volumes, and 200,000 manuscripts. Fifteen museums of painting, sculpture, and antiquities are congregated in the Louvre. Mineral and zoological collections, besides botanical rarities, are comprehended in the Jardin des Plantes. But while possessing strong claims to be considered the head-quarters of intellectual culture, with manifold adaptations to please the votaries of luxury and pleasure, the city is not without large blocks of buildings with tall chimneys in certain parts, indicating the existence of extensive manufacturing establishments. In addition to these, the domestic system of manufacture, conducted by workmen in their own dwellings, with the aid of their families or apprentices, is very prevalent. The famous carpet and tapestry factory, called the Gobelins, after the name of the founder, as well as the porcelain establishment at Sèvres in the neighbourhood, on the road to Versailles, is carried on by the government.

The metropolitan cathedral of Notre Dame, the grandest of the churches, recently restored, was commenced by Louis VII. in 1163, and carried on by his son and successor Philip Augustus. But the magnificence of Paris dates from a long subsequent era, or from the time of Francis I., who introduced the fine arts, and began the Louvre in 1541. In the next reign, Catherine de Medicis founded the Tuileries, which obtained that name from some tile-kilns at the spot. Henry IV. laid out several squares, provided quays on the river, and completed the Pont-Neuf. Under his successor, Louis XIII., or rather Marie de Medicis and Cardinal Richelieu, the Luxembourg arose, with the Palais-Royal, and the Jardin des Plantes. Louis XIV. added new buildings and churches, originated the Observatory, the Institute, the Invalides, and the Gobelins, planted the Champs-Élysées, razed the old walls, and substituted in their place the promenades, which have retained the name of boulevards, or bulwarks, from their site. But Napoleon I. did more than all his predecessors in the way of adornment, at the same time combining in a high degree, works of a useful kind with splendid monuments. Under Louis-Philippe the present fortifications were begun, which extend round the city in a circle of thirty miles, consisting of a rampart, ditch, and strong detached forts. The present emperor, Napoleon III., has carried out improvements on a grand scale, superseding tortuous alleys with broad streets of palatial architecture, the most celebrated of which is perhaps the Rue de Rivoli, while not neglecting equally costly but more unobtrusive improvements, better paving, drainage, and water-supply, in which Paris still lags far behind London. But in multiplying wide and regular thoroughfares, the strategic object has also been kept in view of rendering military operations more available, should they be required by insurrectionary movements. The French capital, with its circuit of sixteen forts, thirty interior barracks, and large permanent garrison, has thus become a superb cage in which the citizens are cooped, with little chance of succeeding in any revolt against its keepers.

A considerable portion of the city on the south bank of the Seine overlies vast catacombs, not originally designed to accommodate the dead, but appropriated to that purpose from convenience. They extend under

some of the more important public buildings, as the Luxembourg, Pantheon, and Observatory. These excavations were quarries, out of which the stone used in the superficial erections was obtained. When the old grave-yards became overcrowded, they were all cleared out, and the bones, after being cleaned and carefully arranged, were deposited in the subterranean passages, and hollows formed by the quarrymen. It is supposed, as a moderate estimate, that they contain the remains of 3,000,000 human beings. Inscriptions indicate the quarters whence they were removed. Accidents having occurred by persons losing their way in the dark retreats, the catacombs are now closed to the public, but are regularly inspected by appointed officers. Three great cemeteries are in use at present, with several of minor extent. The most important, that of Père-la-Chaise, on the eastern side of the capital, contains the graves of many illustrious men, and has monuments of a very magnificent character. It derives its name from an ecclesiastic who formerly owned the ground.

Several principal lines of railway radiate from Paris as a centre, and pass to the frontiers of the country. That of the north, the great thoroughfare to England, connects itself with the Belgic lines, and thence communicates with the greater part of the continent. Its station, entirely new, is a highly imposing structure, ornamented with statuary executed by sculptors of distinction. The centre of the principal façade is surmounted by a statue representing the capital, and on either hand are eight other statues personifying the principal cities to which the railway serves as a means of intercommunication—London, Vienna, Berlin, Cologne, Brussels, St Petersburg, Amsterdam, and Frankfort.

Among the places of interest in the environs, *St Denis*, a small town on the north, claims attention by its splendid abbey-church, in which the French sovereigns were interred down to the time of the revolution, when the tombs were rifled. *Vincennes*, immediately east of the city, is an ancient fortress with an adjoining woodland, once a royal residence, now used as a great military arsenal and state prison. *St Cloud*, an imperial chateau, is on the west, a favourite resort of Maria Antoinette and Napoleon I., frequently occupied by the present emperor. *Versailles*, on the south-west, a considerable town, is best known by the vast palace of somewhat melancholy grandeur, with its ornamental grounds and remarkable water-works, on which Louis XIV. lavished the resources of his kingdom. *St Germain*, west by north, a decayed place with a gloomy castle, which sheltered the dethroned James II. of England till his death, has a fine feature in a terrace upwards of a mile and a half long, running along the brow of a hill, commanding a noble prospect of the winding Seine.

At a greater distance from the capital than the preceding, *Fontainebleau*, on the south-east, is celebrated for its extensive forest, once an attractive hunting-ground; and for its royal chateau, where two memorable documents were signed, the revocation of the Edict of Nantes, and the abdication of the first Napoleon. The name is a contraction of *Fontaine belle Eau*, referring to a spring which cannot now be identified. Ponds in the grounds swarm with carp, some of which are among the oldest and largest members of the family in Europe. *Meaux*, east by north, the corn-mart of Paris, boasts of the tomb of Bossuet—its most eminent bishop, called, from the style of his eloquence, 'the Eagle of Meaux'—in its noble cathedral. *Compiègne*, on the north-east, names a town, forest, and palace, the latter splendidly fitted up by Napoleon III. as his hunting-seat. Joan of Arc, the Maid of Orleans, was here taken prisoner, during a sortie from the town, at a spot still pointed out. *Soissons*, old and historic, the first capital of Clovis, yet modern-looking owing to renovations, is in the same general direction; with *Laon*, finely seated on a hill rising up from a plain which a grand cathedral surmounts; and *St Quentin*, a large and flourishing centre of the cotton manufacture. *Beauvais*, north by west, is also an important industrial site, with cloth and cotton mills, a government tapestry establishment, and a cathedral distinguished above all others by the loftiness of its choir.

The ancient and extensive province of CHAMPAGNE, formerly governed by Counts, adjoins the Isle of France on the east, and is watered chiefly by the Seine and its two principal affluents, the Marne and Aube. Numerous plains are the principal natural features, and originated the name of the district. The landscapes are therefore unpicturesque, sometimes positively dreary, except on the north, towards Belgium, where part of the hilly and wooded region is embraced, known from early times as the Forest of Ardennes. Champagne has acquired a world-wide celebrity from the excellence of its sparkling wines, the produce of small and extremely sweet grapes. But much wine is sold as champagne which is not the genuine production of the district. Some of the largest dealers have cellars excavated in the chalk-rock, with compartments and passages having a total extent of several miles. They are furnished with tramways, ventilated and lighted by shafts, and usually contain thousands of pipes and millions of bottles in stock. One merchant, for example, M. Jaqueson has ordinarily about 5,000,000 bottles in stock, and his corks alone cost £6000 per annum.

*Troyes*, on the Seine, the old capital of the Counts, is a considerable town, though not so populous as in

the middle ages. It contains a first-class cathedral, in which, before the high-altar, Henry V. of England, the victor of Agincourt, was affianced to the Princess Catherine of France. The marriage took place in the now dilapidated Church of St Jean. By the treaty of Troyes, signed May 21, 1420, the crowns of the two countries were destined to be united on the head of the husband, an arrangement happily frustrated by his death. An English standard measure (that used by goldsmiths and jewellers), derived from the town, bears its name—our Troy-weight. *Rheims*, or Reims, more important, with 51,000 inhabitants, is an ancient and noble archiepiscopal city, for a long period the ecclesiastical metropolis of France, where the sovereigns were crowned from Philip Augustus in 1180 to Charles X. in 1825, with the exceptions of Henry IV., Napoleon I., and Louis XVIII. It possesses some fine fragments of Roman date, a colossal cathedral accounted one of the most sumptuous specimens of Gothic architecture, and an archbishop's palace, in which the kings lodged at their coronations. Here Clovis was baptized, 496, after his victory at Tolbiac, and France received her first 'Christian' monarch. But the city has now acquired quite a modern air, is a principal seat of the woollen manufacture, and has a vast wine establishment sustained by the vineyards of the vicinity. *Châlons* and *Epernay*, both southward on the banks of the Marne, are also head-quarters of champagne wines. On the plains near the former town, the great battle was fought by the combined Roman and Gothic armies with the innumerable host of Attila, in the fifth century, in which the latter was defeated, and compelled to withdraw across the Rhine. *Mezières* and *Sedan*, towards the Belgic border, have strong frontier fortresses; and the latter is a principal place for the production of fine black cloths.

**LORRAINE**, a duchy down to the middle of the last century, extends eastward to the Vosges Mountains, which separate it from the valley of the Rhine. It includes the upper courses of the Meuse and the Moselle, both of which flow through beautiful scenery. This district gave Joan of Arc to France. This damsel was born at Domrémy, now an insignificant village, where her peasant home is preserved, subject to reparations. In consequence of her services, the villagers were exempted from every kind of tax to the state, an arrangement in force till very recent times. Stanislas Leczinski, the last Duke of Lorraine, was a Pole, who had been raised to the throne of his native country. Upon abdicating, he was put in possession of the dukedom, by Louis XV., and held it till his death in 1766, when the territory lapsed to the French crown.

*Nancy*, the ducal capital, seated on the Meurthe, is one of the best built cities of France, and has a considerable number of artisans engaged in manufactures of cotton, woollen, and embroidery. It contains many memorials of the Polish ruler, who contributed much to its architectural improvement, as the Porte Stanislas, the Rue Stanislas, and the Place Stanislas, in which his statue stands. It was taken by Charles the Bold, Duke of Burgundy, in 1475, who lost his life while besieging it in 1477. *Metz*, a much larger city, with a population of 44,000, including many Jews, is on the Moselle, very strongly fortified, and possessing a great arsenal, is an important military post towards Germany. It has extensive manufactures of lace, army-clothing, flannels, pins, brushes, canes, &c., many noble buildings, a magnificent cathedral, with a spire 373 feet in height, six barracks, an hospital said to be the most beautiful in France, and capable of containing 1800 patients, seventeen handsome bridges and quays, with delightful public gardens along the river. *Verdun*, on the Meuse, with one of Vauban's fortresses, guards the line of the stream, and has an old historic name, as the scene of the treaty, in 843, which made a triple division of the vast empire of Charlemagne. *Epinal*, a small neat town, is beautifully seated on the head waters of the Moselle, surrounded with the declivities of the Vosges. *Plombières*, famous for medicinal springs, hot and cold, is similarly situated, and has become a place of fashionable resort under the patronage of the present imperial court.

**ALSACE**, a long narrow tract, generally level, except on the west, extends along the west bank of the Rhine, was long a part of the German Empire, but ultimately came into the possession of the French in the time of Louis XIV. It is richly cultivated, abounds with proofs of enterprise, and is largely occupied by people of the Germanic family, who speak the German language, and differ in habits and costume from the French.

*Strasbourg*, the old capital, with a population of 56,000, stands near the majestic river, but on its little affluent, the Ill. Above a maze of narrow streets, lined with high many-windowed houses, towers the cathedral, originally founded in 504, famous for its spire, the loftiest in Europe, which rises 466 feet from the pavement; and also for its colossal clock, which shews puppet-images at mid-day, and indicates various epochs besides the passing time. It was made by Isaac Habrech in 1574, but reconstructed and improved by M. Schwilge, from 1838 to 1842, after a stoppage of more than half a century. The city contains an immense arsenal, and forms one of the strongest fortresses in Europe. By means of sluices, the surrounding country can be laid under water. It has long been a principal thoroughfare between France and Germany, by means of a bridge of boats across the Rhine; but there is now an iron railway bridge, completed in 1861, the two centre arches of which are removable in the event of war. Strasbourg produces

CITY OF NEW YORK

a turpentine which bears its name, made from the resin of the silver firs of the Hochwald, one of the forests of the Vosges, where the tree attains huge dimensions. The section of a trunk is shown in the natural history museum with a diameter of eight feet. Near the Hochwald is the Ban de la Roche, scene of the unobtrusive and useful labours of Pastor Oberlin. *Colmar* and *Mulhouse*, in the southern part of Alsace, are both seats of extensive manufactures, especially the latter, which has become a kind of miniature Manchester from the number of its large factories and tall chimneys. Printed cottons, silks, and muslins are produced, celebrated for the excellence of their designs and colours.

The districts formerly styled **FLANDERS**, **ARTOIS**, and **PICARDY**, embrace the extreme north of France, and that portion of the coast which makes the nearest approach to the shores of England, from which *Cæsar* and *William the Conqueror* made their famous passages across the Channel. The ground has long been familiar to our travelling countrymen, comprising some of the most frequented ports on continental visits, and is well known also nominally to mere readers, from the numerous sites it contains mentioned in English history—towns, battle-fields, and scenes of tournaments.

*Lille* (*D'Isle*; originally *Isle*, the island, so called from the marshes that formerly surrounded it), on the river *Deule*, once the capital of French Flanders, contiguous to the Belgian border, is now a first-class fortress, a well-built city, and great industrial centre, with a population of 123,438, but has few features of special interest. The *Hôtel de Ville* has, however, a famous collection of drawings by *Raphael* and other masters. Flax and cotton spinning are extensively carried on, with the manufacture of sugar from beet-root, and the extraction of oils from rape and linseed. *Valenciennes*, a fortified town, much smaller and inferior, is near the same frontier, on the *Scheldt*, celebrated for its lace. It was the birthplace of *Froissart*, and contains a statue of the chronicler. *Cambrai*, higher up the stream, the episcopal see of *Fenelon*, produces the fine muslin to which its name is applied in the slightly altered form of *Cambrie*. In the basin of the river, but on its affluent the *Scarpe*, *Douai* is situated, of bygone scholastic celebrity; and *Arras*, the former capital of Artois, a very handsome and thriving town, gave name to the tapestries of the middle ages. It is the birthplace of *Robespierre*. *St Omer*, in the midst of marshes, is the seat of a seminary chiefly for the education of English and Irish Catholics. *Amiens*, on the banks of the *Somme*, with 50,000 inhabitants, has extensive woollen and cotton manufactures, with a cathedral admired as a master-piece of Gothic architecture. In the *Hôtel de Ville* the treaty of peace between Great Britain and France was signed in 1802. *Abbeville*, with similar industries, but a very inferior town, is lower down the river. Not far distant are several historic sites, as *St Valery*, at the mouth of the *Somme*, the little port from which the Norman Conqueror sailed; the ford of *Blanchetagne* intermediate, where the army of *Edward III.* crossed the stream; and the villages, woods, and battle-fields of *Cressy* and *Agincourt* on the north, which are not more than twenty miles apart from each other. The town of *Peronne*, connected with the fortunes of *Louis XI.* and *Charles the Bold*, as described in *Quentin Durward*, is on the river above *Amiens*, as is also that of *Ham*, the fortress of which was the state-prison of *Prince Louis Napoleon* from 1840 to 1846, after his attempt on *Boulogne*.

The chief maritime places have all large colonies of British. *Dunkirk*, the most northerly town of France, is a fortified and considerable commercial port, with very agreeable features as a residence. It was taken by the English in the time of *Oliver Cromwell*, when held by the Spaniards, and sold by *Charles II.* to the French King *Louis XIV.* The name refers to the *dunes*, or sand-hills, which line the shore in the neighbourhood. *Calais*, is a trading and fishing port, with a lace manufacture of modern introduction. It exports annually nearly 60,000,000 of eggs to England. From its pier and promenades the white cliffs of *Dover* are distinctly visible, to and from which government mail-steamers and other vessels are daily passing. The two towns are also connected by a submarine telegraph. The town, taken by *Edward III.* in 1347, after a long siege, was retained 211 years, or till the reign of *Queen Mary* in 1558, when it was captured by the Duke of *Guise*. During this long period it became completely English, was a great wool mart, acquired considerable opulence, and returned two members to parliament, one chosen by the governor and council, the other by the mayor and commonalty. The small town of *Guines* and several villages were included within the English pale. Upon being recovered by the French, the district was styled *Le Pays Reconquis*. The principal church of *Calais* dates from the time of the English occupation. *Boulogne*, after *Havre*, the largest town on the French side of the Channel, a very flourishing port and bathing-place, is seated at the mouth of the little river *Liane*, in daily communication with *Folkstone* on the opposite coast. It consists of two parts: the old or high town, on the summit of a hill, with gates and ramparts; the new or low town, on the slopes and the border of the harbour, the seat of trade, commerce, and amusement. The conspicuous architectural feature is the column on the heights, surmounted by a statue of *Napoleon I.*, begun by the army in 1804, when encamped at the spot, with the view of commemorating the contemplated invasion of England. The column rises 164 feet; the statue is 16 feet. *Boulogne* possesses a valuable museum and public library, splendid bathing establishments, and has very pleasant environs. It is much resorted to by English people, who form a large section of the population. On the coast towards *Calais* is *Ambletouse*; a poor village, the landing-place of *James II.* on his flight from England, and the hamlet *Ouessant*, or *Witsand*, supposed by many to represent the *Portus Itius*, the point of *Cæsar's* embarkation.

NORMANDY, an extensive district on a central part of the north coast, stretches inland to within forty miles of Paris, and embraces the lower course of the Seine, with the peninsula of Cotentin adjacent to the English Channel Islands. It forms one of the most important and attractive portions of France, and is of special interest to Englishmen, owing to its former connection with their own country, memorials of which survive in the names of places and families, which the Norman conquest of England transferred to its shores. In the town of *St Sauveur*, inhabited by provincial gentry, Mr Gally Knight met with an Abbé de *Perci*, a descendant of the Norman branch of that family which acquired such distinction in England. 'It was striking,' he observes, 'to find this remnant of a noble line, after the lapse of so many centuries, still in existence on the native soil. At two leagues' distance from *St Sauveur*, is the hamlet of *Pierrepont*, the cradle of another ennobled English family. Remembrances of this kind abound in Normandy, and give its old castles and abbeys a peculiar interest in the eyes of an Englishman. Everything in that country is connected with the history of his own, and even with families of whom he has heard all his life.

*Rouen*, a first-class city, with 94,000 inhabitants, occupies a picturesque situation on the Seine, seventy miles from the sea, and is finely overlooked from the brow of *Mont St Catherine*. It contains a noble and venerable cathedral, numerous churches, of which the abbey-church of *St Quen*, with its glorious windows and majestic towers, is the finest, Gothic fountains, specimens of domestic medieval architecture, now fast disappearing, a rich museum of antiquities, a *Linen Hall*, a *Palais de Justice*, and the *Hôtel Dieu*, one of the largest in France, and has become distinguished as the principal seat of the French cotton manufacture. It is the birthplace of *Fontenelle* and of *Corneille*. Many memorable events have transpired here. *William the Conqueror* died in a convent without the walls. *Joan of Arc*, the prisoner of the English, perished at the stake in the open space which bears her name—*Place de la Pucelle*, May 30, 1431. The blame of the deed belongs equally to the two countries. She was not arraigned as a political enemy, but for sorcery and heresy; the *Bishop of Beauvais* was one of her most active persecutors; the doctors of the university of *Paris* demanded her trial; the entire inquisition was conducted by Frenchmen; and the court of *Rome* approved of the proceedings. *Caen*, on the *Orne*, now a considerable lace-manufacturing town, has great antiquarian interest. It formerly contributed a building-stone from its quarries to England, much used in the southern counties for public edifices, before native resources were developed. The central tower of *Canterbury Cathedral*, *St George's Chapel (Windsor)*, and *Henry VII's Chapel (Westminster)*, are of this material. The *Conqueror* was interred at *Caen*, his favourite residence, in the *Church of St Stephen*. In 1542, the tomb was opened by the *Bishop of Bayeux*, when appearances justified the reports of chroniclers respecting his tall stature. *Falaise*, his birthplace, one of the small towns, has an equestrian statue of him, inaugurated by *M. Guizot* in the year 1851. *Bayeux*, is celebrated for the tapestry, preserved in a room of the public library, which represents by needle-work various incidents connected with the invasion of England. *Evreux* and *Alençon* are places of merely local note. From the name of the former, that of a noble English family, the *Devereux*, *Viscounts Hereford*, is derived. The latter produces the linen cloths called *Toiles d'Alençon*; and the quartz crystals are found in the vicinity known as *Diamants d'Alençon*.

Among the maritime towns, the most important is *Le Havre*, an abbreviation of the original name *Le Havre de notre Dame de Grace* ('The Port of our Lady of Grace'), situated at the mouth of the Seine, the seaport of *Rouen* and *Paris*, the *Liverpool* of France, as the principal site of communication with transatlantic countries, containing a population of 74,000. It receives three-fourths of all the cotton imported into France, and also ships most of the French exports to America. The sum-total of its imports and exports is about £52,000,000. *Rouen* has magnificent docks, wet and dry, and extensive manufactures of tobacco, oil, ropes, machinery, &c., amounting in all to an annual value of £2,500,000. Its public buildings and institutions are excellent, especially its *Royal School of Navigation* and *School of Applied Geometry*. Close by, *Henry V.* landed on his invasion of the country, and captured *Harfleur*, now an unimportant town, on the river a little above the modern entrepot. *Dieppe*, a fishing-port, watering-place, and packet-station to *Brighton*, and *Fecamp*, are on the easterly part of the coast. *Cherbourg*, westwardly, a great naval stronghold, is seated at the extremity of the *Cotentin peninsula*, opposite the *Isle of Wight* and *Portsmouth*; and is furnished with extensive docks, a harbour formed by an immense artificial breakwater, and fortifications for mounting 3000 guns. The completion of these works, which extended, with interruptions, over considerably more than half a century, was celebrated by the present emperor in 1858, and was attended by *Queen Victoria*, with a powerful fleet. *Granville*, on the western side of the peninsula, has the island of *Jersey* in sight. Southward is *Avranches*, beautifully placed on a hill overlooking the sea, with a *Huet Square*, named in memory of its learned and excellent bishop of that name, at the close of the seventeenth century. The insulated castled *Mont St Michael*

is a conspicuous object in the view, three miles distant, but nearer to other points of the shore, which, after being a royal residence, and held by ecclesiastics, is now the site of a village and an extensive prison. The rock may be approached on foot across the sands at low-water, but great caution is requisite in making the transit, from the extreme rapidity with which the tide returns and the sudden fogs. Our Henry II. kept his court here in the winter of 1166, and in Avranches received the papal absolution on account of the murder of Thomas-à-Becket, after swearing on his knees before the legate that he had not instigated or desired his death. *Barfleur*, towards the north-east corner of the peninsula, wholly decayed, was a common point of passage in early times between Normandy and England. Prince William, only son of Henry I., with a retinue of young nobles, sailed from it in the *White Ship*, which was stranded on a rock soon after leaving the harbour, and only a butcher of Rouen regained the shore. *La Hogue*, a small adjoining seaport, is celebrated as the scene of the naval action in which the French fleet was almost entirely destroyed by the English, under Admirals Russell and Rooke, in 1692. Cape la Hague, often confounded with this site, is quite distinct, forming the north-western extremity of the Cotentin.

BRITTANY, or Bretagne, anciently a ducal territory, embraces the north-west corner of France, and is watered by the Ille and Vilaine, the Aulne, and the lower course of the Loire. It forms a peninsular region directly opposite to Cornwall, the south-western peninsula of England. Both districts have many features in common; bold and rugged coast-lines; extensive moors of heath, furze, and broom, with the naked granite projecting above the general surface in gigantic tors; and rude, unhewn, monumental masses—cairns, cromlechs, and rocking-stones—whose objects, age, and uses have never been satisfactorily explained. There are localities also in both with corresponding names. Brittany has a tract called *Cornouaille*, or Cornwall, noted for wrestlers and wreckers; a Land's End—*Finisterre*; and Mont St Michael, off the north-east angle, is the counterpart, on a larger scale, of St Michael's Mount, near Penzance. Traditions of King Arthur, with his knights, and of the enchanter Merlin, belong equally to the opposite sides of the Channel. The Bretons, too, are a Celtic race, and speak a dialect akin to the extinct Cornish and the existing Welsh. Their peasantry are the least civilised portion of the French population, remarkable for quaintness of attire bordering on the grotesque, primitive manners, intense veneration for the Roman Catholic religion, but are addicted to superstitions derived from old heathen times. They possess an unusual number of large churches, among which, one near Treguier is probably unique in Christendom, a chapel dedicated to 'Our Lady of Hatred,' as an avenging power.

*Rennes*, once the capital of the province, is seated at the confluence of the Ille and Vilaine, and contains a population of 34,000. It is almost entirely modern, owing to a conflagration in the last century, which raged a whole week, and destroyed most of the public buildings, but spared the ancient gate, through which the dukes made their public entry upon their accession. Rennes has a cathedral, an arsenal, schools of law, and medicine, a tribunal of commerce, and trade in butter, honey, and wax. *Nantes*, one of the largest and most pleasing cities of France, with 108,000 inhabitants, is also a flourishing port, situated on the north bank of the Loire, 40 miles above its mouth, and 269 miles west of Paris by the railway. Quays bordered with handsome houses line the river, on the margin of which stands the massive castle, in which many sovereigns have for a time resided. Within its walls, Henry IV., in 1598, signed the decree in favour of the Protestants, hence called the Edict of Nantes. From this port the Young Pretender sailed in disguise in 1745, on his expedition to Scotland. In one of the houses near the castle, the Duchess of Berri remained concealed for five months in 1832, after stimulating insurrectionary movements in the neighbouring country. During the first revolution, the city was the scene of scarcely credible atrocities, perpetrated by the infamous Carrere, in which great numbers of women and children perished. Ship-building and sugar-refining, the manufacture of glass, cotton-goods, and machinery are extensively carried on, and the export trade in brandy, wines, and fruit is immense. *Brest*, a town of 51,000 inhabitants, a first-class fortress, dock-yard, naval arsenal, and *bagne* (affording accommodation to about 4000 galley-slaves), stands near the head of a closely landlocked inlet, the northern side of which is formed by the great promontory of Finisterre. Vessels can only enter from the roadstead by passing close to the guns of formidable batteries. This port was the landing-place of Mary Queen of Scots, in 1548, when a mere child; she was soon afterwards affianced to the French Dauphin; off the isle of *Ushant*, at the extremity of the promontory, the French fleet, under Admiral Villaret Joyeuse, was defeated by the English under Lord Howe in 1794, during the war of the Revolution.

The other maritime places include *L'Orient* (a principal station of the French navy), which owes its origin to the French East India Company, who built an establishment here in 1666 for the purpose of trading to the East, whence its name, *Vannes*, and *Quimper*, on the south coast; and *Morlaix*, *St Brieuc*, and *St Malo*, on the northern. They have no particular interest except the latter. *St Malo*, a small fortified town, occupies a rocky islet attached by a long causeway to the mainland. It has long been celebrated for its skilful and daring seamen, one of whom, Jacques Cartier, was the first to ascend the St Lawrence, and fix upon the site of Quebec. During the long wars of the last century it was called *Le Ville de Corsaires*, from the number and activity of its privateers. The illustrious Chateaubriand was a native, born in a house overlooking the sea, now occupied as an inn; he is also interred in a little adjoining islet. Cape Finisterre, the extreme west point of Brittany, the Land's End of France, about fifteen miles from Brest, consists of bleak and savage granitic cliffs, almost constantly wrapped in mists, and assailed by raving winds. The Abbey of St Mathieu, a ruin, crowns the headland, off which are several islands, and a multitude of rocks. The largest, most to seaward, is Ouessant, better known to English readers as Ushant, inhabited by a few fishermen, whose ancestors were idolaters little more than two centuries ago. Belle Isle, nearly opposite the mouth of the Loire, has a fortress used as a convict prison. It was taken in 1761, and held for about two years by a British force.

POITOU, a maritime tract extending from the coast to a considerable distance inland, southward of the Loire, comprises a large part of the courses of the Sèvre and Vienne, two of its principal affluents. It has an uninviting general aspect, consisting of sands, salt-marshes, and ponds along the shore; of thickets and woods without the dignity of forests in the interior; and of rugged heaths. There are few towns of important size, but the sites memorably associated with decisive battles and exterminating wars are numerous. In the western department of La Vendée, the brave peasantry adhered to the cause of royalty at the Revolution, and were cut off after a desperate resistance by the republican armies, who horribly desolated the country, and 'left behind nothing but ashes and piles of dead.' Madame Larochejacquelin, an eye-witness, compares the final flight of the unhappy inhabitants from their homes, old men, women, and children, to the awful spectacle that the world must behold at the Day of Judgment. Poitou formed an earldom, which was held by Henry II. of England, and lost to the English crown during the reign of his son John. It was recovered by Edward, the Black Prince, and retained to the time of Henry VI.

*Poitiers*, from which the province received its name, occupies a hill by the side of the winding Clain, a tributary of the Vienne, in a picturesque neighbourhood of woody ravines, and contains a population of 25,000. It is a city of steep, narrow, dull streets, without manufactures or commerce of any consequence, but of considerable antiquarian interest and historic fame. The site was occupied by the Romans, and has remains of an amphitheatre, the sides of which are partly converted into houses, while the oval centre is the garden of an inn. The cathedral was founded by Henry II.; and several of the churches are of very early date. About five miles westward the battle was fought, September 10, 1356, won by the army of the Black Prince against fearful odds, in which the French King John was taken prisoner. Between Poitiers and Tours the great struggle took place in 732 between the Christian army under Charles Martel and the Saracens from Spain, in which the latter were defeated with terrible slaughter. *Chatellerault*, a cutlery town on the Vienne, gives the title of Duke in the French peerage to the noble Scotch family of Hamilton, originally conferred upon the Regent Hamilton for his services in promoting the marriage of Mary, Queen of Scots, to the Dauphin of France. The present Duke of Hamilton is the fifteenth Duke of Chatellerault. *Lusignan*, a village and railway-station on the south-west of Poitiers, was the feudal stronghold of the noble house bearing its name, which became royal for a time by the elevation of its crusading chiefs to the throne of Jerusalem. *Napoleon Vendée*, founded after the desolation of that district by the republicans, and intended by Napoleon I. to become important, has never prospered. *Niort*, on the Sèvre, in a pleasant wine-growing country, pretty closely marks the north limit of vine cultivation on the west coast of France.

The small territory of AUNIS, southward on the coast, with the bordering inland districts of SAINTONGE and ANGOUMOIS, comprehend the basin of the Charente, the name of which is given to the two departments constituted out of them. In the valley of the river the cultivation of the vine is general; and the greater part of the produce is made into brandy for exportation. Off the mouth of the stream are the two islands of Oléron and Ré, both of which have a place in English history. The former is connected with naval ordinances issued by Richard I. previous to his crusading expedition to the Holy

Land. They are known to all jurists as the Laws of Oléron, lie at the foundation of the maritime jurisprudence of modern Europe, and are cited as an authority at the present day on both sides of the Atlantic. A little to the north, the island of Ré was the scene, in the reign of Charles I., of the disgraceful failure of the Duke of Buckingham. He was sent at the head of an expedition to aid the cause of the French Protestants, and was baffled in an attempt to take the insular town of St Martin.

*La Rochelle*, a commercial port, at the head of a deep bay, once the bulwark of Protestantism, sustained a long and terrible siege on that account from the armies of Louis XIII. in 1628. It succumbed to the pressure of famine after a close blockade of fourteen months. Little more than one-fifth of the inhabitants then survived, and the town has now only 14,000 inhabitants. It has a cathedral and several important public institutions; the streets are bordered in many cases by arcades. For some late years its buildings have been infested with white ants, an inadvertent importation from India. *Rochefort*, somewhat larger, with 21,000 inhabitants, is a modern town on the south, one of the chief naval stations, with a dockyard, arsenal, and convict prison. It lies on the Charente, a few miles above its mouth, and may be reached by the largest vessels. Here Napoleon I., after Waterloo, gave himself up to Captain Maitland of the *Bellerophon*. *Saintes*, higher up the river, represents the Roman *Santonum*, and has a well-preserved Arch of Triumph, with remains of an amphitheatre. *Cognac*, on the ascending course of the stream, is a small place with a well-known name, given to the brandy manufactured from the produce of its vineyards. *Angoulême*, on the still upward banks of the river, is finely situated on a hill, in a district of paper-mills, and has many pleasant features, with a prominent place in history. It was the residence of the Black Prince after the battle of Poitiers, and retained to the present century a Chandos gate, built by Lord Chandos, a leader in the battle. The town was the refuge of Calvin, and the birthplace of the accomplished Margaret of Valois. Two assassins, likewise, figure in the list of natives—Poltrot, who shot the Duke of Guise before the walls of Orleans, and Ravaillac, who stabbed Henry IV. in the streets of Paris.

The inland provinces of MAINE, ANJOU, TOURAINE, and ORLEANNAIS, include a highly-favoured portion of the country, centrally traversed by the Loire from east to west, which receives within its limits the Cher, Indre, and Vienne, on the left bank, with the confluent Mayenne and Sarthe on the right. It is studded with important towns and cities, rich in cornfields, acacia-hedges, and beautiful landscapes along the course of the leading river, and rife with memories of the past, often connected with picturesque old castles more or less dilapidated. Some of the tributaries of the Loire flow through tracts clothed with heath and broom, the very plant, *genista* (Fr. *genêt*), which originated the name of Plantagenet, from a sprig having been worn by Geoffrey, Earl of Anjou, father of our Henry II., the founder of the dynasty in England.

*Le Mans*, once the capital of Maine, is seated on the Sarthe, and has a population of 31,000, engaged in manufactures, but more largely in exporting agricultural produce and poultry to the metropolis. Its cathedral, of mixed Gothic and Romanesque architecture, contains the tomb of Berengaria of Sicily, wife of Richard Cœur de Lion, and a few other antiquities. *Laval* and *Mayenne*, both on the river Mayenne, are smaller, but more manufacturing, producing linen and cotton goods. *Angers*, the former capital of Anjou, with 41,000 inhabitants, occupies a very favourable position, being situated on the united streams of the Mayenne and Sarthe, just below their junction, and near their confluence with the Loire. It has been extensively modernised, but retains many buildings of the middle ages, churches and timber-framed houses, with an old castle of vast dimensions, now used as a prison, a barrack, and store for ammunition. A respectable public library, museum of painting and sculpture, and a cabinet of natural history, with a botanic garden and pleasant walks, are modern appointments. Margaret of Anjou, the indomitable queen of Henry VI. of England, was interred in the cathedral, but the tomb has been destroyed. Lord Chatham and the Duke of Wellington, in the early part of their career, were connected as students with a military academy in the city. Extensive nursery-grounds distinguish the vicinity, and vast slate-quarries, the produce of which is sent to almost all parts of France. The local use of the material originated the epithet of 'black Angers,' in allusion to its sombre hue, but in recent times a different building-stone has relieved its aspect. *Saumur*, on the south-east, stands directly on the Loire, and is one of its most cheerful-looking towns, being built of a very pure white stone, and situated in a district of vines, orchards, walnut-trees, and luxuriant corn-fields. It lost its industrious Protestant artisans by the revocation of the Edict of Nantes, and has now little more than half the population it possessed two centuries ago. Monuments of huge unhewn blocks, supposed to be Druidical, and among the most remarkable of the kind in Europe, are found in the neighbourhood.

*Tours*, from which the province of Touraine derived its name, a duchy bestowed as an appanage on Mary Queen of Scots and her French husband, occupies the south bank of the Loire at the influx of the Cher, and has long been a favourite place of abode with the English, having a considerable number of good houses. The population, 35,000, is vastly inferior to what it was before the intolerance of Louis XIV. drove the

Huguenots away, many of whom were silk-weavers, who emigrated to England, and settled in Spitalfields. The town is of ancient date. It had St Martin of Tours for the first metropolitan in the fourth century, who founded a vast cathedral, in which Gregory of Tours, another prelate, was buried. Only two of its towers remain; the others were destroyed at the Revolution. In the middle ages, the concourse of pilgrims to the place was so great, that the town was increased to ten times its ordinary inhabitants. The newer cathedral of St Gatien is richly decorated. The stronghold of Plessis-les-Tours, described in *Quentin Durward*, where lived and died the politic and astute Louis XI., is a few miles distant, but reduced to a fragment. At Metray, also a contiguous site, a voluntary establishment for the reform of juvenile offenders has deservedly acquired great repute. *Amboise*, a small old town, higher up the river, retains its historic castle, long a royal residence, inherited by Louis-Philippe, and made the prison of the renowned Abd-el-Kader. *Chinon*, on the Vienne, has a castle of equal interest, which has been styled the French Windsor of the early Plantagenets, now a huge ruin, with but few remains of their date except some substructions. It occupies a commanding height, and overlooks a fine view of the river sweeping round its base, and onward towards its junction with the Loire, with a wide extent of diversified country. This was the favourite continental residence of Henry II.; here he ended his days, and was interred in the great Abbey of Fontevrault, situated in a picturesque dell in the direction of Saumur. A recumbent effigy was placed on the tomb; similar monuments were subsequently raised for his queen, for Richard Cœur de Lion, and for the queen of John, who were buried at the same place. The exterior of the abbey remains entire, but the interior is wholly changed, having been converted into a prison. The royal tombs are no longer in their original position, and the monumental effigies, though still preserved and of great interest, have been more or less defaced by wanton violence.

*Orleans*, of Roman origin and high celebrity, ranking for a time as the capital of the French monarchy, is seated on the north bank of the Loire; seventy-six miles south by west of Paris. The city contains a population of 43,000, and is a centre of extensive trade, but has few objects of attraction or interest in keeping with its historic distinction. The great event in its annals is the appearance of Joan of Arc for its relief, April 29, 1429, when beleaguered by the English; she compelled them to raise the siege, and acquired thereby the style of the Maid of Orleans. The tide of foreign conquest which had been advancing into the heart of the land under the Bedfords and Talbots, was then and there checked, and constrained gradually to recede from the whole country. Memorials of the heroine in this the scene of her first triumph are unimportant. *Blois*, venerable and decayed, is lower down the river, and has a partially restored castle presented by the municipality to the Prince Imperial, and accepted for him by Napoleon III. Popes, kings, princes, and cardinals have resided in it; assassinations have been authorised and executed within its walls; and it has been used in the present century as a barrack. *Chartres*, on the banks of the Eure, is in the heart of the corn-growing plain of La Beauce, and has one of the largest corn-markets in France. The cathedral is equally distinguished by its vast size and elegance. At Breigny, an adjoining village, the treaty was concluded in 1360, by which Edward III. renounced all title to the French crown, but retained his conquests.

The limits of the ancient NIVERNAIS, BOURBONNAIS, BERRY, MARCHE, LIMOUSIN, and AUVERGNE, include a considerable part of Central France, traversed by the upper Loire and its affluent the Allier, with the tributary waters of the Cher, Indre, Creuse, and Vienne, and also by streams descending southerly to the basin of the Garonne. This region is intersected by elevated and rugged mountains, studded with extinct volcanic cones, and comprises varied scenery, bold, romantic, quiet, and pastoral. The towns are mostly of very moderate size, invested with but little historical notoriety, and generally of mere local influence.

*Nevers*, on the Loire, produces pottery and ironwares; and has a cannon foundry for the navy. *Moulins*, on the Allier, was the residence of Lord Clarendon in exile, where he wrote part of his *History of the Rebellion*; the birthplace of Marshal Villars, the opponent of Marlborough; and is the scene in which Sterne has laid his story of Maria. *Vichy*, a much-frequented watering-place, with eight principal mineral-springs alkaline and acidulous, occupies a beautiful valley higher up the same stream. *Bourges*, an ancient, dull, and genteel city, on rising ground between the Evre and Auron, which here unite, contains 20,000 inhabitants, and has a remarkably fine cathedral and Hotel de Ville, the latter formerly the private residence of a citizen. *Chateauroux*, on the Indre, an industrial site, has extensive manufactures of cloth sustained chiefly by the fleeces of the neighbourhood. *Limoges*, the largest town of the whole district, with a population of 41,000, is seated on the upper course of the Vienne. The production of porcelain, made of the kaolin or pure white porcelain clay obtained in the vicinity, gives employment here to great numbers; and horses are reared on the pastures for the use of the French army. Vergniaud, the leader of the Gironde, who became one of Robespierre's victims, was a native of the town, so were Marshals Jourdan and Bugeaud, and the celebrated surgeon Dupuytren. The town was taken by storm in the wars of the Black Prince, who sullied his name by giving no quarter to the inhabitants. At *Chalus*, an adjoining place, while besieging it, Richard Cœur de Lion met with his mortal wound. *Clermont*, with 29,000 inhabitants, is chiefly of interest from its situation, in the heart of the volcanic region of Auvergne, at the foot of the Puy de Dôme. It is built of the dark-coloured lava quarried in the vicinity, the sombreness of which is to some extent concealed by whitewash. One of

the squares has a monument in honour of General Desaix, a native. Pascal and Delille are also commemorated, born in the neighbourhood. The town is celebrated for the great council held in it in 1095, convened by Pope Urban II., who presided, which led to the Crusades.

The LYONNAIS comprises a small section of the country on the west bank of the Rhone, extending from thence beyond the Loire, intersected from south to north by the narrow chain of the Cevennes Mountains. Within its limits the first-named river receives its most important affluent, the Saône; and makes the great bend in its course from west to south, flowing to the sea through a rich and sunny valley, comparable to that of the Rhine for beauty and variety of scenery. Great names were associated with the district in the remote past; among them the Emperors Augustus and Severus by residence, of Germanicus and Claudius by birth. In the second century of Christianity, it was the scene of the life, labours, and martyrdom of Irenæus and Pothinus, both Asiatic Greeks, and disciples of the apostles, whose sufferings are related in a document of the period—the Epistle of the Churches of Lyon and Vienne to the Brethren in Asia and Phrygia, of unquestionable authenticity. In the middle ages, it was the frequent home of Charlemagne, the camping-ground of his Paladins and the army. The Lyonnais was the head province of Celtic Gaul during the Roman period, and is now the principal provincial seat of French industry and art.

*Lyon*, the second city of France in extent and commercial enterprise, and the first in manufactures, supplied the territory with a name. It is splendidly situated at the confluence of the Rhone and Saône, 316 miles south-east of Paris by railway, and 218 miles north by west of Marseille. It occupies both banks of either river, but the largest portion lies in the space intervening between them; and contains a population of more than 300,000, including the suburbs. Seven bridges cross the Rhone, and twelve lead over the Saône. Its quays, 28 in number, are among the most remarkable in Europe. Directly on the right bank of the Saône rise the heights of Fourrières, at the base of which the stream describes a grand segment of a circle. The abrupt eminence, crowned by the Church of Notre Dame, is generally the first spot to which every new-comer directs his steps, on account of the magnificent view to be obtained therefrom. The vast city is spread out at the feet of the spectator, whose eye can follow the rivers to their junction. Immediately beyond are suburban residences, backed by the plains of Dauphiné and the hills of Savoy, while on the far eastern horizon, in clear weather, the hoary head of Mont Blanc may be discerned, at the distance of nearly a hundred miles. Lyon, though of ancient date, with the name of *Lugdunum* in Roman times, is essentially the creation of a recent era, as most of the buildings were reduced to ruins, and the inhabitants literally exterminated in 1793, for opposing the Terrorists of the Revolution. It has also suffered much from the inundations of 1840 and 1856, and from the riots of the operatives in 1831 and 1834. It possesses the best provincial library in France (130,000 vols.), a well-arranged museum, numerous charitable institutions, three great public squares, several new spacious streets after the Paris fashion, with many narrow, irregular, and dirty thoroughfares in the manufacturing quarter. Like the capital, it is encircled with detached forts, eighteen in number, raised in consequence of the revolts of the workmen in 1831 and 1834. The circle of the fortifications is thirteen miles. Its staple industry, the silk manufacture, embraces the production of the richest and the most current fabrics; and employs 100,000 hands; but cotton, woollen, and other goods are also made, with jewellery, silver and gold lace, and chemical preparations. The silk-weavers work in their own houses, and live chiefly in a suburb by themselves, but there are important factories in the environs. The men have the soubriquet of *canuts*, the origin of which is uncertain, but referred by some to the word *cannelle*, signifying a bobbin. A workwoman is a *canuse*. Jacquard, the inventor of the silk-loom called after him, was a native of the city. The manufacture was formally naturalised in France by letters-patent of Louis XI., dated from Orleans, December 22, 1466; and took up its abode at Lyon in the early part of the following century, owing to the settlement there of some Italian refugees. *St Etienne*, on the south-west, in a region of coal-mines, is a prosperous town of 71,000 inhabitants, but only distinguished by the extent of its industries and their dissimilar nature. It is the great seat of the production of ribbons and firearms. The ribbon-manufactories contain 30,000 looms, and the annual value of their produce is £2,375,000. Its firearms manufactory supplies most of the muskets of the French army. It has also extensive manufactures of bayonets, scythes, nails, saw-blades, foils, anvils, &c.

The territory of BURGUNDY, formerly a duchy, now distributed into four departments, is on the north of the preceding district, and belongs largely to the river-basin of the Saône, also to a small extent to that of the Loire, embracing also the upper waters of the Seine, and nearly the whole course of its affluent, the Yonne. It has little variety of surface, but includes the northern extremity of the Cevennes, with the range of the Cote d'Or, a link

connecting them with the Vosges. This range has only a very moderate elevation, and is wholly devoid of picturesqueness, terminating upward in a table-land. But it is very celebrated for its vineyards, to the rich produce of which the name may refer, or to the golden colour of the soil, the prevailing hue being a yellowish red. Burgundy has long been famous for its fine wines, both red and white growths, besides producing a large quantity of ordinary quality. The red wines are distinguished by their brilliant colour, delicate flavour, strength, and rich bouquet. Cherry, almond, and walnut trees are sprinkled in many of the vineyards, and crops of clover and maize are raised.

*Dijon*, the old capital of the duchy, occupies a plain at the confluence of two small affluents of the Saône, and numbers 32,000 inhabitants. Its principal features are numerous churches, several of which have lost their proper office, and are exclusively devoted to secular purposes; the ducal palace, now the *Hôtel de Ville*, contains a very rich museum; a public park, designed by Le Nôtre for the great Condé; and extensive promenades which environ the whole place with a belt of trees. Some of the best Burgundian wines are produced in the neighbourhood, especially at Vougeot. The vineyard here originally belonged to the adjoining Abbey of Cîteaux, and was cultivated by the monks for their own use. The site of this famed ecclesiastical establishment, the head-quarters of the Cistercian order, where St Bernard assumed the cowl, is about twelve miles south of Dijon. In the days of its prosperity it possessed more than 3000 dependent convents, and gave four popes to Rome. The buildings remain, but are appropriated to the reform of juvenile offenders. *Chalon-sur-Saône*, a small neat town, is at the head of the steam-navigation of the river, here connected with the Loire by the *Canal du Centre*. *Macon*, lower down the stream, the birthplace of Lamartine, is the centre of an extensive wine trade. *Bourg*, on an affluent, claims the astronomer Lalande for a native. *Autun*, pleasantly situated on a stream which joins the Loire, was for a time the diocese of the celebrated Talleyrand. The town is of Roman origin, and contains many ancient remains. *Auxerre*, on the left bank of the Yonne, and *Sens*, lower on the river, have both cathedrals which are much admired. The Yonne is largely used in the transport of the wines of Burgundy to Paris. Some of its sources lie in the high grounds of Le Morven, an extensive tract of forest, the home of many wild animals; the timber of which is floated down the river to the Seine, and supplies the capital with fuel. This woodland tract includes upwards of 200,000 acres, and contains shallow and extensive meres, or pools of water. During the great heats of summer, animal life is still in the woods by day, but no sooner have the shades of evening gathered, than their wild inhabitants—especially wolves, wolverines, and wild-boars—slake their thirst and look out for food. *Vezelay*, on the northern skirts of the forest, now a poor decayed place, gave birth to Theodore Beza, the theologian and reformer; and Vauban, the great military engineer, was born in a village of the woodland region. At the town named, St Bernard preached the second crusade, in an open field, in which Louis VII. and his nobles engaged, in 1146. Philip Augustus and Richard Cœur de Lion repaired to the same spot in 1190 formally to devote themselves to a similar enterprise.

The adjoining district of FRANCHE COMTE lies on the eastern frontier of France, and formerly belonged to the Germanic empire. It embraces the valley of the Upper Saône, the course of the Doubs, its principal tributary, and the western side of the Jura Mountains, which form the dividing-line from Switzerland. These natural features give names to the three departments. The highest peaks of the Jura rise to 6000 feet, and are clothed with magnificent pine-woods. The range is composed of a peculiar limestone, which abounds with caves, containing stalactital formations and the remains of extinct animals. Its slope, the gentlest on the French side, gives rise to scenes of great natural beauty, and yields abundance of grass. Hence, grazing husbandry is the main pursuit of the inhabitants, who associate in small companies to convert their milk and cream into cheese at a common central establishment, and proportionably divide the product. In other parts of the territory the wine and mineral produce is considerable.

*Besançon*, the only town of importance, a fortress of the first class, contains 31,000 inhabitants, largely engaged in watch-making, an industry imported from Switzerland. It stands on the Doubs, which, at this point, and in other parts of its course, is a doubling or winding river answering to the descriptive name. The stream nearly encloses the old portion of the place, and was accurately represented by Cæsar as curving like a horseshoe round the ancient Vesontio. Besançon is the see of an archbishop, has a cathedral, a large public library (80,000 volumes), an arsenal, military and medical schools, and an hospital. *Lons-le-Saulnier* and *Salines*, as the names indicate, are distinguished by brine-springs and salt-works. *Pontarlier*, near the Swiss frontier, occupies an elevated site on the Jura, beyond which is the defile leading through the chain, commanded by a strong fort. Within its walls the unfortunate Toussaint L'Overture, carried off from St Domingo by order of Napoleon I., was immured in a miserable cell till his death.

Amphitheatre at Nîmes.

GUIENNE, an extensive maritime region on the south-west, favoured with a warm atmosphere and sunny sky, originally formed a principal part of the 'fair duchy' of

Aquitaine, of which name Guienne is a corruption, and was long connected with the English crown, to which it became attached by the marriage of Eleanor of Aquitaine to Henry II. Plantagenet, in 1152. It is generally a highly-cultivated and well-watered plain, traversed from south-east to north-west by the great stream of the Garonne, and intersected by its most important tributaries, the Dordogne, Lot, and Tarn, which respectively give names to the modern departments. Vines clothe the banks of the rivers, and old castles in ruins, associated with many a siege and foray in the middle ages, are numerous along their course. Besides a large quantity of ordinary wines, the best clarets are here produced, in the apparently unpromising district of Medoc, a long narrow strip of country in the peninsula formed between the estuary of the Garonne and the Atlantic, slightly raised above the level of the river, and abounding with shallow pools which render it unhealthy. The soil, consisting only of sand and pebbles, seems incapable of sustaining vegetation of any kind, yet it favours the vine and is said to retain the solar heat about the roots, after sunset, thereby promoting fructification by night as well as by day. But so uncertain is the adaptation of the ground, or capricious the plant, that it flourishes and degenerates in the locality within a very circumscribed space. In average seasons the total produce of Medoc amounts to 150,000 hogsheads and upwards.

*Bordeaux*, the capital of the ancient duchy, is the second port of France, and its fourth city in point of population, it contains 149,000 inhabitants, is seated on the left bank of the Garonne, about 70 miles from the Atlantic, and 360 south-west of Paris. The noble river, upwards of a quarter of a mile broad, and deep enough to receive first-class vessels, describes a curve at the spot, which gives a crescent-shaped outline to the city, with three miles of magnificent quays lined with houses, chiefly in the Italian style, indicative of great opulence. It is crossed by a stone bridge of seventeen arches, the finest in France, completed by a public company in 1821, and by another for the railway opened in 1861. It is the see of an archbishop, the seat of a national court, has a public library of about 130,000 volumes, and several important educational institutions. Though essentially a great trading mart, the place has quite as much of a courtly as a commercial air. It consists of two parts. The modern and northern town follows the line of the river, and is built in a very splendid manner. The other, ancient and southern, is separated from it by streets generally running east and west. Passing from the former to the latter, the squares and terraces of the current epoch are left for the narrow streets of the fourteenth century, containing houses with peaked gables, projecting eaves and balconies, covered with quaint carvings—'the true middle-age tenements, dreadfully rickety, but gloriously picturesque—charming to look at, but woeful to live in.' Wines, brandy, and dried fruits are the principal exports, sent in immense quantities to the northern European and transatlantic countries. England is the great market for the highest priced wines. Those of inferior quality go to Holland, or are retained for home consumption. The cellars of the chief merchants are of enormous extent, and always have several thousands of casks in stock. Bordeaux, while in the hands of the English, had a splendid viceregal court under Edward, the Black Prince. Here he entertained the fugitive Don Pedro from Spain, whose two daughters married the prince's brothers, John of Gaunt and the Earl of Cambridge. His own son, afterwards Richard II. of England, styled Richard of Bordeaux, was born here and baptized in the cathedral. The city, in 1553, had Montaigne; the essayist, for its mayor, and possesses in the public library a copy of the essays with annotations from his own hand. It sent some of the most eloquent and virtuous members to the national assemblies during the Revolution, who obtained the name of Girondists from that of the department.

*Libourne*, in the neighbourhood, on the Dordogne, neatly built, was one of the Bastides or free towns, often called English towns, from having been founded chiefly by Edward I. A little lower down the valley of this river the battle was fought in 1453, in which the aged Lord Talbot, 'the Frenchman's only dread, their kingdom's terror,' while contending with a vastly superior force, was defeated and slain. The event led to the surrender of Bordeaux, and the expulsion of the English from Guienne. *Perigueux*, seated on the Isle, produces the pâtés prized by gourmands, made of partridges and truffles. *Agen*, agreeably situated on the Garonne, surrounded with plum orchards, supplies Europe with their dried produce so well known under the name of prunes. Sealiger, the younger, renowned for his learning, was born here, with Palissy, an inventor in pottery, and Lacépède the naturalist. *Cahors*, on the river Lot, is conspicuous in the career of Henry of Navarre, for its surprise and capture by him after a very desperate resistance. It was once governed by prince-bishops, and possesses a beautiful cathedral. *Montauban*, the largest town of the district after Bordeaux, contains 17,000 inhabitants, engaged in woollen and other manufactures. It has long been distinguished as one of the principal strongholds of Protestantism in France, and contains a Protestant college. From the banks of the Tarn on which it is situated, a wide rich plain extends to the foot of the Pyrenees, the snowy tops of which are seen on the southern horizon.

The district once known as GASCONY occupies the south-west corner of France (except

the nook of the Basses Pyrenees), reaching as far inland on its southern base as the Central Pyrenees. It embraces several tributaries of the Adour and the Garonne, has rich plains towards the mountains, but its principal feature is the flat, strange, wild, and melancholy-looking Landes—a region of furze, heather, white sand, pine and fir trees, occupying the sea-shore, with an interior breadth varying from narrow limits to an extension of from forty to fifty miles. This singular country is dotted with pools and streaked with ditches of stagnant water; interspersed also at intervals with patches of barley and maize; and towards the boundary-lines, its aspect is varied and improved by a sprinkling of alder-trees and acacias. Its animal tenants are flocks of ill-conditioned sheep, some black goats, and a few cows, shewing little more than skin and bone. Human habitations in this wilderness are few and far between, all of very primitive construction, mere skeletons, indeed little superior to the huts and wigwams of savage tribes.

*Mont-de-Marsan*, head of the department of the Landes, enjoys some commerce, but is wholly unimportant. In the district the peasantry are shepherds, clad in sheepskins, or wearing woollen garbs of the coarsest kind. They exhibit an odd phase of life to the stranger, that of being mounted on stilts when abroad, by which means they stalk over the prickly bushes and drifting sands without inconvenience, and gain a sufficient elevation which enable them to overlook their sheep at a distance. These stilt-walkers can, with little exertion, describe distances in the same time as a horse kept at a quick trot; and by the aid of a long pole stuck in the ground as a support for the back, they can rest, knitting stockings the while, for hours together. They are of diminutive stature, inferior intellect, endure severe privations, but are contented with their lot. 'France,' it has been said, 'may vibrate with revolution—the shepherds of the Landes feel no shock, take no heed, but pursue the daily life of their ancestors, perfectly happy in their ignorance, driving their sheep or notching their trees in the wilderness.' The timber and rosin of the pine-woods are valuable; and large vacant spaces in the sandy waste have been planted by the government. *Auch*, on the Gers, flowing into the Garonne, is seated on the slopes of an eminence which commands a fine view of the Pyrenees. *Tarbes*, on the Adour, has 13,000 inhabitants, and crowds of summer visitors passing on to the mountains, which are in full view from the town. *Bagnères-en-Bigorre*, higher up on the river, at the base of noble peaks, is one of the principal Pyrenean watering-places, and nearly doubles its population in the visiting season, from the close of June to the end of September. The town, very pleasing in itself, is surrounded with luxuriant verdure and splendid scenery, and has hot saline waters, with a chalybeate spring in the vicinity, a rare occurrence in the district. Beautiful marbles, green, flesh-coloured, and blood-red, are worked up into tables, chimney-pieces, vases, and other ornamental objects. Most of the females are employed in knitting useful and fancy articles for sale. *Barèges*, in a mountain valley, 4180 feet above the sea, is the loftiest of the Pyrenean bathing-places, the most celebrated for the curative virtue of its mineral springs, but is a very cheerless spot owing to the elevation. Upon the approach of winter the greater portion of the inhabitants withdraw, and return in spring to find their houses deeply imbedded in snow from the avalanches. Southward, *Mont Perdu* rises to the height of 11,168 feet, and on the south-west, *Vignemale* attains a nearly equal altitude. The material for ladies' dresses which bears the name of the place, *barèges*, is not made there, but in other towns of the department.

Gascony, the ancient *Vasconia*, acquired the name from its inhabitants, the Vasques or Basques, a portion of whom, being driven out of Spain, were here subdued by the Franks. The habit of vain boasting, characteristic of the people, led to the term Gascon being employed in French to denote a braggart, whence *gasconade*, significant of extravagant speech, which has become a naturalised expression in our own language. Many anecdotes are current of this propensity. 'Ah,' said one, on being shewn the colonnade of the Louvre, 'it's not bad; it resembles pretty closely the back part of the stables at my father's castle!'

BEARN and NAVARRE comprise the south-western angle of France between the river Adour, the Pyrenees, and the sea. It once constituted a small kingdom, the sovereign of which fought his way to the French throne, and became the 'Bon Roi,' Henry IV.

'A single field hath turned the chance of war,  
Hurrah! hurrah! for Ivry, and Henry of Navarre.'

The Nivelle flows within its limits to the ocean; the Gave-de-Pau passes by Orthez to join the Adour; the Bidassoa forms part of the frontier from Spain; all streams which were the scenes of severe fighting and masterly strategy in the campaigns of Wellington.

*Pau*, formerly a seat of royalty, is now a small town, very splendidly situated on the wooded banks of the Gave, with some of the grandest masses and highest peaks of the mountain-chain contiguous to it. The dry mild climate renders it a favourite winter residence with invalids. It is distinguished as the birthplace of Henry IV., and of Bernadotte, king of Sweden. The former, a prince of the younger line of the Bourbons,

was born in the castle, which remains at present the principal building. The latter, the son of a poor tradesman, began life in a mean house of an obscure street. Of these two natives, by a curious coincidence, Henry recanted Protestantism and became a Catholic in order to gain a crown, while Bernadotte renounced Catholicism, and became a Protestant, with the same object in view. The two bathing establishments of Eaux-Bonnes and Eaux-Chaudes, small but fashionable, nestle near each other in the lap of the mountains, about twenty-five miles to the south of Pau. They have hot sulphureous waters, and are frequented by many visitors from Spain. The thermal springs of the Pyrenees issue generally near the junction of primitive rocks with secondary formations. They were known to the Romans and used by them. *Bayonne*, a seaport on the left bank of the Adour, near its mouth, contains a population of 19,000, including a suburb on the opposite side of the river, in the department of the Landes, where there is a large number of Jews. It is very strongly fortified, commanding the western passes across the mountains into Spain, and has considerable commerce with that country in the import of wool. A military weapon, the bayonet, obtained its name from Bayonne, where it was first made by the armourers. But the idea originated with some Basque soldiers, who, in an action with the Spaniards, when their ammunition was spent, used their long knives thrust into the barrels of their muskets. *Biarritz*, five miles distant, directly on the coast, not long ago an insignificant hamlet, which no wheeled vehicle had ever reached owing to the sand-hills, has now its beaten highway, first-class hotels, and Villa Eugénie, as the marine retreat of the imperial court. French, Spanish, English, German, and Russian families are in residence during the season. The place has naturally neither trees nor grass; but it has the charm of seclusion, a smooth sandy beach, and a delightful climate, as the sea-breeze constantly modifies the summer heat. Chalk-cliffs overlook a vast range of the ocean, and rocks project far out to sea from the shore, against which the waves dash with magnificent effect.

FOIX and ROUSILLON are two small provinces which divided the country between them at the base of the eastern division of the Pyrenees. The former was feudally held by a chivalric line of nobles from the middle of the eleventh to the beginning of the sixteenth century. The latter was long a possession of the kings of Arragon. From the slope of the mountains the Ariège flows northerly to join the Garonne, and the Tet eastwardly to enter the Mediterranean.

*Foix*, on the first-named river, a very small place, with ironworks in the vicinity, retains the castellated stronghold of its counts, picturesquely seated on an isolated rock, three towers of which are well preserved. Gaston de Foix, the third of the race, called, on account of the beauty of his person, *Phœbus*, distinguished himself in the war of the *Jacquerie*, an insurrection of the peasants. He was inordinately attached to the chase, and is said to have kept 1600 dogs. He also wrote a work on the subject, entitled *Miroir de Phœbus des devoirs de la Chasse des Bestes Sauvages et des Oyseaux de Proye*, which was very popular in the sixteenth and seventeenth centuries. He likewise entertained Froissart, and supplied him with materials for his chronicles. The last and most brilliant of the line, of the same name, triumphed against the Swiss, the Venetians, the Pope, and the Spaniards, acquired the title of the 'Thunderbolt of Italy,' and fell in the hour of victory at the great battle of Ravenna in 1512, when only twenty-three years of age. *Perpignan*, on the Tet, a few miles from the Mediterranean, of Spanish origin and structure, with 18,000 inhabitants, is only distinguished by a fortress of great strength, guarding the eastern passes of the Pyrenees. Arago, the celebrated astronomer, born in the neighbourhood, watched the great solar eclipse of 1842 from the citadel, with a band of *savans* from Paris.

The valley of the Ariège ascends the heights nearly to the crest of the main chain, which is crossed by a pass leading into the territory of Andorre, in Spain, belonging to the basin of the Ebro, but a semi-independent district. It consists of three mountain valleys, the inhabitants of which have a republican form of government, and have enjoyed it since the days of Charlemagne. They are ecclesiastically subject to the Spanish Bishop of Urgel, but are under the protection of the sovereigns of France, to whom a small annual tribute is paid. The little capital, *Andorre*, is a mere village; the total population of the valleys is about 8000; the area of the state amounts to 190 square miles; the produce consists of wood and iron, which the mountaineers exchange for corn and other necessaries of life.

The great plain of LANGUEDOC, subject in the middle ages to the powerful Counts of Toulouse, extends from the borders of the Pyrenees to the volcanic region of Central France. It belongs chiefly to the basins of the Garonne and Rhone, but embraces the upper waters of the Loire, and has a coast-line on the Mediterranean. Nearly the whole district is highly fertile, carefully cultivated and thickly peopled, abounding with corn-fields, orchards, vineyards, olive and mulberry plantations. But the landscape is in many parts excessively monotonous, and in the heat of summer its aspect becomes perfectly arid. Every patch of green disappears, except where there is copious irrigation, while the slightest breeze loads the atmosphere with dust, which besides distressing the wayfarer, covers every object with its dull uniform livery.

*Toulouse* (ancient *Tolosa*), a large but not a handsome or interesting city, lies in a very flat country, occupying both banks of the Garonne, close to the junction of the Canal du Midi with the river, and contains a population of 91,000. It is the centre of extensive provincial trade, has large steel-works, a cannon foundry, manufactures of woollen and other fabrics, with markets abundantly supplied with rich fruits, bearing witness to the fertility of the neighbourhood. Toulouse has a national court, a tribunal of commerce, a school of artillery, a famous academy of 'floral games,' and a great variety of educational institutions. In the immediate environs, within view of the inhabitants, the severely-contested battle between Wellington and Soult was fought, April 10, 1814. An obelisk of brick on the field commemorates those who fell on the French side. Colonel Forbes has also a monument on the site, and several tablets bearing English names are in the Protestant church of the city. *Cette*, an enterprising town and port of the Mediterranean, is the shipping place for the produce of Languedoc, connected with the Canal du Midi, which was constructed for the purpose of bringing it down to the sea. This great work, 150 miles in length, was commenced in 1666, nearly a century before any similar design was entertained in England, and executed in less than twenty years. A railway now runs nearly parallel with it, passing *Carcassonne*,

La Puy.

a busy clothing town, with a tall church-tower on the meridian of the Paris Observatory, about midway. *Beziers* and *Narbonne* are also on the railway, but in the maritime district. The latter, one of the earliest Roman colonies planted in Gaul, of great renown in history, has no ancient remains of consequence or appearance answering to its former importance. It is now celebrated for its honey. *Montpellier*, five miles from the sea, but artificially connected with it, contains 39,600 inhabitants, and long attracted invalids to a residence by the fame of its position and climate, advantages which were exaggerated. It has fine features in the suburbs and walks, various literary and scientific establishments containing objects of interest, but is essentially a manufacturing town, specially excelling in the preparation of chemicals. Large ornamental houses and wide streets have risen up towards the railway-station.

*Nîmes*, further inland on the north-east, contains a population of 50,000, and is actively commercial, producing silk and cotton goods, possessing also print and dye works, and trading in the oil and wine produce of Languedoc. It has a cathedral, and fifteen churches, and a fine library. But the prime feature of the city is the number and extent of its remains of antiquity, as the Nemausus of the Romans. They include a large amphitheatre in which bull-fights have recently been held, a Grecian temple in very pure style, ruins of a Nymphæum connected with adjoining baths, two of the original Roman gates, and the Pont du Gard, a magnificent aqueduct of three tiers of arches spanning a rocky valley in the neighbourhood, which conveyed the water of two springs to the ancient citizens. M. Guizot the statesman was born at Nîmes, where his father was guillotined during the Revolution. M. Linné, the astronomer, another native, gave the old name of his birthplace, Nemausus, to the fifty-second minor planet, which he discovered, January 22, 1858. About fourteen miles to the eastward, the charming picturesque town of *Beaucaire* occupies the right bank of the Rhone, here crossed by two new beautiful bridges, one for the railway, the other for general traffic. The river-side is the site of an annual fair, still one of the largest in Europe, though declining. It is held between the 1st and the 28th of July, when it terminates at midnight; and assembles an average number of 80,000 persons, who mostly occupy a town of wood and canvas put up for the occasion. Armenians arrive from the Levant, and Moors from Africa. Among the still more inland places, *Annonay* is in repute all over France for its paper; and *Le Puy* is remarkable for its position. It occupies the base and slope of a volcanic rock, the summit of which has a tabular mass of the same material, crowned by the ruins of an old castle, and surmounted since 1860 by a colossal bronze statue of the Virgin, 50 feet high. This was presented by the Emperor, made out of 213 cannon taken at Sebastopol. 'Our Lady of Puy' has been famous for ages, represented by a reputed wonder-working image in the cathedral, of small stature and negro complexion, destroyed at the Revolution, but since replaced. Kings and popes were once devotees at the shrine, and the peasantry still make pilgrimages. Another isolated volcanic rock rises up to a great height above the houses, and gives the name of *L'Aiguille* to the suburb from its needle shape.

PROVENCE, of which the old Troubadours sung as a kind of terrestrial paradise, designated the extreme south-eastern section of the country. It may be defined as ranging along the coast of the Mediterranean from the Rhone to the old Italian frontier, extending inland high up the course of the Durance, a turbulent and fickle feeder of the great river, dependent upon the snows of the Cottian Alps. After the fall of the Roman empire, this district was subject, first to the Kings of Arles, then to the Counts of Provence, who patronised literature, and gave occasion to the term Provençal being applied to the entire dialect of Southern France. A large part of the area is exposed to the climatic disadvantage of scorching heat alternating in summer with the bitterly cold, dry, stormy breath of the *mistral*, or north-west wind, never more violently experienced at Marseille and in the Rhone valley than in 1863. But protected by a chain of hills from the unkindly visitor, while open to the sea-breeze, the climate of the coast region eastward of Toulon is peculiarly delightful throughout the year, and its vegetable productions are richly luxuriant, while tropical in their character. This portion of the surface, which includes nearly the whole department of Var, is a natural garden, to which the eulogies of the Troubadours will apply. As a striking contrast, on the opposite side of the province, the railway from Arles to Marseille crosses for about fifteen miles the singular stony desert of Le Crau, a plain covered with rounded pebbles, some of which are as large as a man's head, but of all sizes less, while the shingle of the sea-beach is scarcely more destitute of vegetation.

*Marseille*, the principal seaport of France, and its third city in population (219,000), is situated at the corner of a bay of the Mediterranean, with some little islets in front, 410 miles in a direct line, and 530 miles by railway south-south-east of Paris. Its history dates from the sixth century before the Christian era, when it was founded by a colony of Phœceans, with the name of Massalia (Lat. *Massilia*), which became one of the most opulent and literary cities of the Roman empire. No ancient buildings remain, nor any vestiges of them. Recent erections and transformations, still in progress, have also effaced much of its aspect in comparatively late times, and ally the place with the present age. It has a natural and an artificial harbour, the former, an inlet of the sea running eastward into the heart of the city, the latter, named *La Joliette*, formed by a detached breakwater 1224 yards long, running seaward parallel to the shore at the distance of 1312 feet from it; a third, named after the present emperor, is in process of construction. The old town has narrow streets and high piled houses, and quays lined with blocks of handsome houses, on which passengers appear in very varied costumes; cafés which rival those of the capital in splendour; a new exchange, with arrangements similar to those of the

Paris Bourae; a new cathedral in the Italian style; a Prado which is three miles long by the shore; and is enclosed by hills, sprinkled with country-houses, called *Bastides*, of which there are about 9000 in the vicinity, overlooking the city, the port, the curving coast, and the deeply blue waters of the Mediterranean. Marseille has schools of hydrography, medicine, drawing, and music; five

Port of Marseille.

hospitals, an observatory, various learned societies, and institutions. An ample supply of fresh-water for domestic use, as well as for the irrigation of the vicinity, is brought from the Durance by a canal sixty miles long; a stupendous work, commenced in 1830. Lines of steamers are established with the ports of Spain, Algeria, and Italy, and with Alexandria, Smyrna, and Constantinople. The manufactures are very various, and include perhaps most extensively the diverse articles of soap and steam-engines. In 1720, the plague raged at Marseille, and cut off half the population. The citizens welcomed the Revolution with enthusiasm, of which the hymn of Rouget de Lisle, commonly known as the *Marseillaise*, is a lasting expression. A castle on one of the little isles off the port was the prison of Mirabeau, of the Duke of Orleans (*Egalité*), and his younger son.

*Toulon*, thirty miles to the south-east, is seated on a spacious inlet protected by a ridge of bare heights, and is a first-class naval arsenal, being to France in relation to the Mediterranean what Brest is to the Atlantic, and Cherbourg to the English Channel. It possesses the best of the French dockyards, in which the labourers, who are convicts, generally number full 6000. The town contains 47,000 inhabitants, exclusive of the garrison. It is surrounded by ramparts, ditches, and bastions, has a strong citadel, with forts and redoubts scattered over the heights. Napoleon I. first displayed his military genius at its siege by the republicans in 1793, while a subordinate officer of artillery. *Hyères*, in view of the sea, but three miles from it, marks the commencement of the garden of Provence, on proceeding eastward from Toulon. The orange, fig, aloe, cactus, pistachio, pomegranate, cypress, and date-palm flourish in the open air; and the mild winter climate attracts many from their northern homes to a residence through the season.

*Aix*, eighteen miles north of Marseille, formerly the capital of Provence, is still a thriving town of 19,000

inhabitants, with a trade in olive-oil, fruits, the produce of surrounding plantations, and warm mineral springs. It originated with the Romans, and received the name of *Aque Sextie*, in allusion to the founder and its waters, of which the present name is a contraction. Here Marius, 102 B.C., annihilated in battle two whole barbaric nations—the Teutones and Ambrones, and saved Italy from devastation and Rome from pillage. There are various antiquities of the period in the museum, and monuments remain of the middle ages, in which period Aix, under the Counts of Toulouse, was the literary capital of Southern France. The public library contains 100,000 volumes. Among many eminent natives, Tournefort and Adanson, the botanists, are

Toulon.

numbered, with Mignet, the historian. *Arles*, also inland, near the head of the delta of the Rhone, is likewise of Roman origin, and was once a very celebrated city. It retains many memorials of former greatness; an amphitheatre larger than the one at Nimes, though not so well preserved; it must have been capable of holding from 20,000 to 30,000 spectators; a vast cemetery dating from pagan and used in early Christian times; with numerous friezes, statues, altars, and sarcophagi in the museum. An archbishop of Arles consecrated St Augustine, who became the apostle of Christianity to the Anglo-Saxons. Its chief present distinction is the beauty of the women, well set off by a picturesque costume.

The small territory of AVIGNON, once the property of the popes, and that of ORANGE, an independent principality, are both on the left bank of the Rhone, immediately above its junction with the Durance. Both are included in the single department of Vaucluse, but do not fill up its area. The noble summit of Mont Ventoux, 6427 feet, an outpost of the Alps of Dauphiné, covered with snow for half the year, is everywhere the conspicuous object within its limits, from which, on a clear day, the distant Mediterranean is visible. The district is the principal seat of madder cultivation.

*Avignon*, the capital of the papacy in the fourteenth century under seven pontiffs, is seated directly on the Rhone, with its cathedral on the top of a bluff rock (Rocher des Dons) rising up from the river. Though a shrunk city in comparison with its former state, it contains a population of 25,000, and is still distinguished by the numerous spires and bell-towers which led Rabelais to call it 'La Ville sonnante.' The palace of the popes, a vast and massive pile, half castle and half convent, is pre-eminent over all other buildings, and whether seen from afar or near at hand, never fails to make a deep and lasting impression. It was commenced under Benedict XII., and is now partly a prison and partly a barrack, sufficiently ample to accommodate a regiment. Avignon has manufactures of silk, tanning, &c., and a great trade in garden produce. The corn, wine, honey, olives, oranges, and lemons of the district are celebrated. Seventeen miles eastward is Vaucluse, a village, valley, and fountain, the scene of unnumbered pilgrimages in honour of Petrarch, who resided at the spot. A few miles up the river, the village of Roquemaure is

supposed to mark the point where Hannibal crossed, with his troops and elephants, on his way to Italy. *Orange*, a small and poor town, at a short distance from the stream, is remarkable for its monuments of Roman architecture. A triumphal arch, covered with bas-reliefs, and built of a deeply yellow stone, is the best preserved, and may be seen from the railway. The petty principality, of which the town was for many centuries the head, eventually became the possession of the Nassau family, and originated the title of Prince of Orange, retained by the eldest son of the kings of Holland.

DAUPHINE, formerly subject to the Counts of Vienne, extends from the Rhone to the Alps, and is a region of plains on the side of the river, but extensively Alpine in the opposite direction. It embraces the main part of the course of the Isère, and the upper waters of the Durance. Exquisitely lovely valleys occur among the lower declivities of the mountains, with scenes of scarcely surpassed grandeur in the uplands; but the more elevated have a sterile savage magnificence, and are clothed with glaciers. In the high valleys, where the bits of pasture are scarcely accessible to sheep, and in some seasons even rye will not ripen, are many Protestants, shepherds living in poor detached huts, or little clusters, snowed up in the winter, among whom Pastor Neff pursued his pious labours.

Grenoble.

*Grenoble*, the largest town, contains 26,000 inhabitants, engaged principally in the manufacture of leather gloves, in which women, and also machinery, are employed. It is seated on both banks of the Isère, a full and rapid stream, in a superb neighbourhood. The palace of the old Dauphins is an object of interest; and has in front a colossal statue of Bayard, the pride of chivalry, 'sans peur et sans reproche,' who was born in a château higher up the river-valley, now in ruins. Grenoble was the first place of importance to which

Napoleon repaired on his return from Elba, when the citizens and soldiers immediately declared for him. In the vicinity lies the village of Chartreuse, from which the Carthusian monks derive their name, and where they originated. *Vienne*, on the Rhone, the capital of Dauphine, dating from the Roman times, is still a considerable industrial town, with paper, cloth, and ironworks. But it is distinguished by many ancient remains, and of interest as an early scene of western Christianity, whose professors here were associated with those at Lyon in the great persecution of the second century. The ecclesiastical council which condemned the Order of the Templars in 1307 was held at Vienne. *Valence*, lower down the river, trades in the sparkling St Pery wine produced on the opposite bank of the stream. *Gap*, the birthplace of Farel, the reformer, and *Embrunn*, formerly visited by royal and plebeian pilgrims to an image of the Virgin, are small towns in the valley of the Durance. *Briançon*, a first-class fortress, and the loftiest town in France, is on its head waters, at the height of 4285 feet above the sea. Forts crown the adjoining rocks to a much greater altitude, and guard the pass into Italy by the Mont Genève, forming a kind of inland Gibraltar. The winter here is long and rigorous. On the south-west rise the peaks of Mont Pelvoux, the highest of which reaches to 13,468 feet, and is the loftiest summit in the great range between Mont Blanc and the Mediterranean. The department is hence appropriately named Hautes Alpes.

The name, Dauphin, was a title of the Counts of Vienne which passed to their territory. It is derived from *delphinus*, dolphin, which they carried as their coat of arms. The origin of the insignia is quite unknown. Upon Count Humbert II. making a voluntary surrender of his domain to Philippe de Valois, he stipulated that it should be the appanage of the heir-apparent, the title of Dauphin going along with it. This was observed down to the Revolution. The cession was made in consequence of the death of his only son while a child, who sprung from his nurse's arms, fell into the Isère, and was drowned.

The newly-acquired district of SAVOY, long incorporated with the Italian kingdom of Sardinia, is properly a portion of France by geographical and ethnological relations. The position, surface, climate, people, and language have a much greater affinity to Gaul than to Italy. It lies wholly on the northern side of the main Alpine chain, and extends from it to the Lake of Geneva, the Rhone, and Dauphiné. Within these limits the natives are generally of French extraction, speak the language; and the entire drainage is conducted into France. The Isère follows a devious course through the province from east to west, starting from the foot of the Little St Bernard. The Arve, child of the glaciers, born on the Col de Balme, intersects it in the same general direction, but makes a more direct cut to the Rhone, entering just below its emergence from the Genevan Lake, in the Swiss canton. On the eastern border rises Mont Blanc, the monarch-mountain of Europe, with several principal summits of the Graian and Cottian Alps to the southward, Mont Iseran, 13,274 feet, and Mont Cenis, 11,460 feet. A pass adjoining the latter, long one of the most frequented routes between Savoy and Italy, culminates at the height of 6780 feet; and at a neighbouring site, the great railway-tunnel through the chain is in process of execution. The Savoyards are a hardy, frugal, and industrious race. Many wander far away to pick up earnings by music and shows in the streets of foreign cities, and then return to their native mountains.

*Chamberry*, the principal town, the seat of an archbishop, is on the western side, nearly equidistant from Lyon and Geneva. It contains about 13,000 inhabitants, produces silk gauze, and is on the railway leading to the Mont Cenis tunnel. *Annecy*, midway towards Geneva, on the shore of a considerable lake, though much smaller, is more industrial, with glass, cotton, and bleaching works; and is said to be one of the oldest manufacturing sites in Europe. *Chamouni*, a village, in a valley of the same name, is at the northern foot of Mont Blanc, 3150 feet above the sea. Few places so small are so widely known, as the point from which travellers of all countries start for the ascent of the mountain. *Modane*, a hamlet, about eighteen miles from Mont Cenis, marks the northern opening of the great tunnel, seen on the side of the mountain upwards of 300 feet above the ordinary road. This vast work was authorised by the Sardinian legislature in 1857 at its sole expense, but since the cession of Savoy to France, a large portion of it will have to be borne by the French government. The total length will be rather more than  $7\frac{1}{2}$  miles, cut through extremely hard rock. It is expected to be completed in the spring of 1875. At the beginning of 1863 there remained  $6\frac{1}{2}$  miles of tunnelling to be accomplished; but much time was necessarily spent in overcoming preliminary difficulties. Savoy was ceded to France by Sardinia in 1861, in compensation for military services in the war with Austria in 1859.

The principality of NICE, acquired at the same time from the Sardinian crown, lies on the Mediterranean, and occupies the space between its waters and the Maritime Alps. This cession advanced the French frontier from the river Var to the stream of the Roya,

which descends from the mountains to the sea; and the included tract was incorporated with the old adjoining *arrondissement* of Grasse to form a new department.

*Nice* (Ital. *Nizza*), a seaport, pleasantly situated at the foot of an amphitheatre of hills, contains a population estimated at 38,000, engaged in the manufacture of silk, oil, perfumery, and other products, occupied also with visitors, of whom the great proportion are English, attracted to it as a winter residence. It has a palace, a cathedral, convents, and hospitals, and various bath establishments. Its reputation for salubrity has, however, declined, as piercing blasts occasionally descend from the snow-crowned Alps. Cassini, the astronomer, was a native, and so is Garibaldi—the hero, par excellence, of modern Italy. *Mentone*, eastward on the coast, a small town, is rising into notice as preferable for invalids, being well sheltered from cold winds, and open to the sea, with delightful scenery. *Cannes*, westward, is similarly distinguished. Its single street is the centre of an English colony, some members of which, as Lord Brougham, have villas of their own in the vicinity. Close to this small port Napoleon landed on his return from Elba. In a little woody island off shore, the Man in the Iron Mask underwent part of his long imprisonment, in the reign of Louis XIV. *Grasse*, nine miles inland from Cannes, receives from its nursery-grounds, and others, a vast quantity of aromatic herbs and odoriferous flowers for the supply of its perfume distilleries. More essences, scents, and pomades are said to be made here than in any other European town except Paris.

CORSICA (Fr. *Corse*), an island in the western basin of the Mediterranean, is incorporated with France as one of its departments, but belongs to Italy by proximity and the descent of the people. It extends rather more than 100 miles from north to south, by about half the distance where the breadth is the greatest, and is traversed in the line of its length by mountain-ranges, which attain the height of 9068 feet in the porphyritic mass of the Monte Rotondo. Forests of oak, pine, beech, and chestnut largely clothe the surface, with brushwood of arbutus, cistus, oleander, and myrtle, while the orange, citron, vine, olive, and mulberry flourish in the cultivated districts. The woods have for ages been the hiding-place of outlaws, or criminals escaped from justice, adopting the life of brigands, a class not yet extinct, and are in certain parts numerous inhabited by the wild boar. On the higher points the moufflon still exists, as well as in the neighbouring island of Sardinia, but is not known elsewhere in Europe. The animal, a species of wild sheep, is supposed by some to be the original stock whence sprung the domesticated race. Nearly half the surface lies waste, and the low grounds are unhealthy from the prevalence of malaria. The island is rich in minerals, but they are not wrought.

*Ajaccio*, the capital, with 12,000 inhabitants, founded by the Genoese, is pleasantly situated on a promontory of the west coast. Its great and only distinction is that of being the birthplace of the first Napoleon. He was born in a modest-looking house, not now inhabited, but indicated by an inscription, and in the care of a custodian. *Bastia*, the largest town, with 17,000 inhabitants, is on the north-east coast, at the commencement of the finger-like projection which forms the north extremity. It has a small but convenient harbour; exports olive-oil, fruits, wine, fish, and the mineral produce of the island; imports corn and general merchandise.

In ancient times the Phœnicians and Romans successively held the island. The Moors, German emperors, the Pisan and Genoese republics had possession of it in the middle ages. The latter retained it to the middle of the last century, when they were succeeded by the French, but for a short time afterwards it was in the hands of Great Britain. The islanders are an Italian race, and speak a dialect allied to the Sicilian.

The foreign territories of France are distributed in every quarter of the globe, but with one or two exceptions, they are not singly of important extent or value. The African possessions consist of Algeria, settlements on the Senegal and dependencies, the island of Bourbon or Réunion, in the Indian Ocean, the isles of St Mary, Nosse-Be, and Mayotte, on the north-west of Madagascar; the Asiatic, are Pondicherry and various small districts on the coast of India, with a newly-acquired maritime part of Cochin China; the American, comprise French Guiana, the islands of Guadaloupe, Martinique, with dependencies, in the West Indies, and the isles of St Pierre and Miquilon, near Newfoundland; and in Oceania, the Marquesas, Society, Gambier, and Wallis groups, with New Caledonia.

France, anciently called Gallia or Gaul by its Roman conquerors, acquired the present name from the Franks (perhaps 'freemen'), a confederation of Germanic tribes, who invaded the country in the 5th century after Christ. Their leader was called Merwig or

Merovaens, but the real founder of the Merovingian dynasty was Clovis or Chlodwig (the modern German *Ludwig* and French *Louis*). The Merovingian dynasty ceased to rule in 752, and was succeeded by the Carolingian, the most famous sovereigns, of which line were its founder Pepin *le Bref*, and his son Charlemagne; Charles Martel and Pepin d'Heristall, the predecessors of these two, belonged to the same family, and were virtually, but not formally, the rulers of the Frankish states in Gaul. The Carolingian gave way in 987 to the allied Capetian dynasty, founded by Hugo Capet, the most powerful nobleman of his day in France. This, in its turn, became extinct on the death of Charles IV., *le Bel*, in 1328, when the crown of France passed to his cousin Philip of Valois. The Valois dynasty next became extinct in 1589 by the assassination of Henry III., who was succeeded by his brother-in-law Henry IV., the first of the Bourbons, who ruled uninterruptedly, with absolute power, down to the Revolution, a period of exactly 200 years. That far-famed and terrible event, the French Revolution, was largely caused by the profligate selfishness of the court, the clergy, and nobility. The present imperial constitution, dating from the year 1852, ratified by the popular vote, practically invests the emperor with supreme power in the direction of affairs, and has hitherto been associated with an unwonted measure of public prosperity.

The population of France somewhat exceeds 37,000,000. It advances at a very slow rate, and has recently in some single years positively retrograded, the deaths having exceeded the births. The greatest number of large towns is in the northern half of the country, which is generally more populous than the southern. The French proper are a mixed race, partly Teutonic, but chiefly Celtic. They form the vast majority of the people, speak the French language, which is founded upon a Gallo-Romanic idiom of the Latin tongue, and greatly modified by subsequent additions. It early branched into two characteristic dialects—the French spoken on the north of the Loire, or the *Langue d'Oïl*, and the Romance, or *Langue d'Oc*, also called the Provençal. The latter dialect, though the vehicle of the joyous songs of the troubadours, was gradually supplanted by the former, as the northern power extended itself into the provinces of Provence and Languedoc. Its decline was accelerated by the ban of the church, which proscribed the popular poetry for espousing the cause of liberty in the religious wars, especially in the crusade against the persecuted Albigenses. In the districts towards the Rhine and Belgium, there are a considerable number of Germans and Flemings using their respective native tongues, while the Bretons in Brittany, and the Basques adjoining the Pyrenees, offer other varieties of race and speech. The Jews form an aggregate of 156,000, and the resident English average 60,000. The great bulk of the people belong to the Roman Catholic Church, or 35,700,000, who are under the ecclesiastical jurisdiction of sixteen archbishops and sixty-five bishops, six of whom are cardinals appointed by the pope on the presentation of the emperor. There are about 1,500,000 Protestants of the Lutheran and Reformed communions, the former chiefly in the north-eastern departments, and the latter in the southern. Their ministers are subject to some crippling restrictions, but are paid by the state and exempt from military service, like the Catholic clergy and the Jewish rabbis. General instruction is promoted by collegiate institutions, superior normal schools, and primary communal schools, the expenses of which are partly defrayed by public funds, and the remainder by the departments. They are under the direction of a special branch of the government, and regularly inspected; but nevertheless great ignorance prevails, especially among the peasantry. The annals of French literature and science are adorned with numerous names brilliant in every branch. The people are temperate yet impulsive, patterns of courtesy in urban life, fond of pleasure, show, and spectacle, and passionately enamoured of military distinction.

Brussels.

## CHAPTER II.

### BELGIUM.

BELGIUM is one of the youngest kingdoms and smallest countries of Europe, but second to none in point of industrial enterprise and social prosperity. It is also at the head of all in the average of population to the area, so thickly studded with cities, towns, and villages, that a former master, Philip II. of Spain, remarked on passing through it, 'This is only one great town.' It occupies likewise a very conspicuous place in the military annals of the continent. The names of Antwerp, Ostend, and Namur, revive the memory of famous sieges, while those of Oudenarde, Ramillies, Fontenoy, Fleurus, Jemappes, Ligny, Quatres Bras, and Waterloo, are indissolubly associated in history with great battles. Owing to careful cultivation, and the oft blood-stained soil, Belgium has been aptly described as at once the 'garden' and the 'cockpit' of Europe. It lies on the North Sea, which forms the western boundary, and is enclosed by France on the south, Rhenish Prussia on the

east, and Holland on the north. The coast-line measures little more than forty miles; the greatest extent of the surface, east and west, is only about 160 miles, by two-thirds of the distance north and south; and the area of 11,366 square miles falls short of being equal in area to twice the size of Yorkshire. The latitudinal limits are the parallels of  $49^{\circ} 40'$  and  $51^{\circ} 30'$  north; the longitudinal are the meridians of  $2^{\circ} 33'$  and  $6^{\circ} 5'$  east. Yet though of such scant dimensions, the natural resources are very considerable, owing to intersecting navigable rivers, and varied mineral wealth, the value of which is extensively developed by the industry of the people.

The greater part of the surface, especially the western and northern districts, is almost a dead level, very slightly raised above high-water mark, and in various places depressed below it. Artificial means are therefore adopted to guard against inundation from the rivers by banks and dykes along their channels, while sand-hills on the coast, piled by the winds, form a natural barrier against the encroachments of the sea. These hills or downs vary in breadth from one to three miles, rise to the height of fifty or sixty feet, and are largely clothed with pine-woods. Shallows, owing to sand-banks, extend to some distance from the shores, and render the navigation intricate and perilous. In the eastern and southern districts the surface is generally rugged, very wildly broken at intervals, but has no elevation above the height of 2000 feet. Barren moors occur in this direction, with extensive tracts of natural forest; remnants of the old Forest of Ardennes stretching into France; and highly-beautiful scenery distinguishes the river-valleys, in which are limestone escarpments, caverns and other natural curiosities, side by side with evidences of high cultivation, and of mining and manufacturing activity. The two most important rivers, the Scheldt in the west, and the Meuse in the east, enter the country from the French territory, and flow through it northward into Holland. Within its limits, the former receives the Lys, Dender, and Rupel; the latter, the Sambre and the Ourthe. Antwerp, on the Scheldt, the principal port of Belgium, has no natural communication with the sea but by its channel, both banks of which are from thence to its mouth in the Dutch province of Zeeland, but the free navigation is guaranteed by treaty. The navigable rivers, lines of canals, and macadamised common roads, with a system of railways planned and executed by the government, supply means of internal communication perhaps cheaper and more convenient than are enjoyed in any other part of the world.

The rugged portion of Belgium, the south and south-east, is the site of its mineral treasures, consisting of coal, iron, zinc, and lead, marble, building-stone, and slate, with alum and minor produce. More coal is annually raised than in any other part of the continent, and one-half of all the zinc used in Europe is furnished by Belgian mines. The coal-fields, two in number, are in the provinces of Hainault, Namur, and Liège, and have a united area of about 500 square miles. In 1857, the number of coal-pits was 205, and the amount of coal 'put out' was 8,383,902 tons, valued at upwards of £4,000,000. Iron ore occurs in close proximity to the coal, but is not interstratified with it: the amount annually obtained is between one and two million tons. The coal-seams are very numerous, but generally thin, and have been subject to such violent derangement from disturbing causes—contorted in every possible manner—as to occasion peculiar difficulty in working them. All mining and metallurgical works are under a system of regular government inspection; and their produce has now risen to an annual value of more than £10,000,000 sterling. While the working of metals is thus carried on in the south and east, woollen, lace, and linen manufactures are extensively conducted in the north and west, with those of cotton and silk in a more limited degree, agricultural occupations being more or less common in both districts. The soil is not naturally

fertile, as it consists largely of either sand or clay, and would have been a heath if left untouched by the hand of man. But by careful husbandry it has become singularly productive, and through a wide area of the surface, the summer landscape is that of a rich and beautiful garden. Little science, but much persevering industry, exhibited in the application of ordinary manures, and the employment of hand-labour, has contributed to this result. Flax, celebrated for its superior quality, is a principal object of cultivation; the common cereals are raised in far larger quantity than is required for home consumption; hops, chicory, and beet-root for sugar are grown, with woad and madder for dyes, and fields of clover are almost everywhere to be seen, the seed of which is exported to England. The system of small farming prevails, for the vast majority of the holdings consist of only a few acres, held by a class of peasant-farmers, who by application and frugality respectably maintain themselves and families, and invest their premises with an air of comfort.

The country is distributed into nine provinces, which are subdivided into arrondissements, communes, and cantons, after the French model. It was long held by the Spanish and Austrian monarchy, under the government of viceroys; then incorporated with France by the first Napoleon; next annexed to Holland as the south division of the kingdom of the Netherlands; and finally rendered by a revolution in 1831 a separate monarchy with liberal institutions.

| Provinces.                      | Principal Towns.  |
|---------------------------------|---|
| South Brabant, . . . . .        | Brussels, Louvain, Tirlemont, Vilvorde, Nivelles, Waterloo. |
| Antwerp, . . . . .              | Antwerp, Mechlin, Turnhout, Geel.                           |
| East Flanders, . . . . .        | 'Ghent, Lokeren, St Nicholas, Beveren, Alost, Termonde.     |
| West Flanders, . . . . .        | Bruges, Ostend, Courtray, Ypres.                            |
| Hainault, . . . . .             | Mons, Charleroi, Tournay, Fontenoy, Jemappes.               |
| Namur, . . . . .                | Namur, Dinant.  |
| Liège, . . . . .                | Liège, Heristal, Huy, Verviers, Spa.                        |
| Limburg (part of), . . . . .    | Hasselt, Tongres, St Trond.                                 |
| Luxembourg (part of), . . . . . | Arlon, Bouillon, St Hubert.                                 |

SOUTH BRABANT, a central division of the kingdom containing the metropolis, belongs to the basin of the Scheldt, but is not touched by the river itself, maintaining communication with it by several small tributaries and a canal. It is for the most part a highly-cultivated plain, but includes the old Forest of Soignies, about eight miles long by seven broad, a somewhat gloomy tract, on the skirts of which—

'Where the woods receding from the road,  
Have left an open space on either hand  
For fields and gardens, and for man's abode,  
Stands Waterloo.'

*Brussels*, the capital, once styled the 'Queen of the Netherlands,' is a very beautiful stone-built city, with claims to be considered a kind of Paris in miniature, from which it is 150 miles distant, and 88 from Ostend. It occupies both banks of the Senne, a small river which ultimately finds its way to the Scheldt; and consists of a lower and an upper town, in the former of which Flemish and Walloon are spoken, in the latter, French. The lower town is on the plain through which the river flows, and is the ancient portion, the seat of the mercantile community, with some narrow thoroughfares, and many fine old buildings, public and private, formerly belonging to the Brabant nobility. The upper is an extension of it on the slope and summit of a gentle eminence, almost entirely modern, the site of fashion, of the offices of government, and the court end of the metropolis, containing the palaces. The park, on a small scale, immediately adjoins, with some noble trees, flowering shrubs, thickets, lawns, and ponds; here the most severe fighting between the Dutch and the Belgians took place at the revolution. In the lower town, the Cathedral of St Gudule, and the many-windowed Hotel de Ville, are the principal objects of attraction. The latter is one of the grandest of the municipal palaces erected in the middle ages, in the Lombardo-Gothic style, surmounted by a tower and spire rising to the height of 364 feet, of very light and elegant workmanship. In its great hall, in 1555, Charles V. of Germany, surrounded by a splendid court, surrendered a portion of his dominions to his son. Brussels has almost lost the old and celebrated staple

industry, its carpet manufacture; but lace of the costliest description is produced, printing and publishing are carried on upon a great scale, and the general trade is very extensive. Brussels has a university, founded in 1334, besides numerous educational, charitable, and benevolent institutions. It contains a population of 177,000, which has long included a considerable number of resident English, attracted to the place by its agreeable aspect, the tone of society, and considerations of economy. The usual residence of the sovereign is at Lacken in the vicinity, a chateau celebrated as the place in which Napoleon signed his fatal declaration of war against Russia. The field of Waterloo, the scene of his final overthrow, is about nine miles distant from the city. *Louvain*, sixteen miles east-north-east of Brussels, though still a considerable town, is only the shadow of what it was in the fourteenth century, when it is said to have contained 200,000 inhabitants and 4000 cloth manufactories, but retains, among other memorials of opulence and splendour, a Gothic town-hall remarkable for its richly-embellished masonry. The university, once famed for its learning throughout Europe, which attracted thousands of students, is now a mere theological seminary for the education of candidates for the Roman Catholic priesthood. *Vilvoorde*, a small ancient town on the route from Brussels to Malines, witnessed the martyrdom of Tindal, in 1536, the first English translator of the Bible, here strangled and burned as a heretic. A great penitentiary, visited by persons interested in criminal reform, occupies the site of his prison.

The province of ANTWERP, directly on the north, embraces two extremely dissimilar districts. Westward, the surface has great luxuriance, and though perfectly flat, excites interest, from every little patch of ground being cultivated with the utmost care, while the homesteads are neat, and church-steeple appear rising up from the midst of clumps of trees. But eastward, stretching beyond the limits of the province, there is a region of striking sterility, called the Campine, consisting chiefly of barren sand, marsh, and peat-bog. In this natural waste some colonies are planted, consisting of free labourers paid by the government, and of convicts, employed in the work of reclamation, who have converted part of it into an oasis around their settlements. In this district a large number of insane persons are distributed under the superintendence of heads of families.

*Antwerp*, in French *Anvers*, formerly one of the wealthiest and most important mercantile marts of Europe, is still a large city, containing 114,000 inhabitants, defended by a strong citadel, and the chief emporium of Belgian commerce. It stands on the right bank of the Scheldt, sixty miles from the sea, and twenty-seven north of Brussels. The river, as broad as the Thames at Blackwall, has sufficient depth to allow of large vessels coming up to the quays, with a tidal rise of twelve feet, and brackish water. Extensive docks, constructed by the direction of Napoleon, who wished to make Antwerp the rival of London, are convenient for the shipping in winter when large masses of ice descend the stream. The town is a somewhat bewildering maze of tortuous streets, abounding with quaint high houses of the olden time, adorned with curious tracery, with which the picturesque dress of the peasant-women who come in on market-days well accords. Its Bourse, with a central court and piazzas, frequented by merchants for centuries, is of interest from having been chosen by Sir Thomas Gresham as the model for the first Royal Exchange of London, in the reign of Queen Elizabeth. The cathedral, with a spire running up to the height of 446 feet, is a wonderful example of exquisite lightness and perfect-symmetry. Napoleon compared it to a piece of Mechlin lace, and the emperor Charles V. of Germany remarked that it ought to be kept in a case. In the interior hangs the 'Descent from the Cross' by Rubens, and other works of the great master, with which the whole civilised world is familiar by means of innumerable prints. Rubens lived and died at Antwerp. Teniers, Vandyke, Jordans, and Quentin Matsys, were either natives or born in the neighbourhood. Among other public institutions are the Academy of Sciences, the Academy of Painting and Sculpture, a medical and surgical school, a naval arsenal, museum, and zoological gardens. The prosperity of the city culminated in the sixteenth century. Its population was then perhaps double the present number, while thousands of vessels annually visited the port, and the merchants were princes. The persecutions of the Spaniards drove many away; its capture by the Duke of Parma in 1585, after a siege of fourteen months, was a terrible blow; and the closing of the Scheldt in favour of the Dutch by the Peace of Westphalia, in 1648, completed its commercial ruin. The French cleared away the obstructions, and reopened the river; and since the guarantee of free navigation in 1831, with the establishment of the railway system, the fortunes of Antwerp have been in the ascending scale. *Mechlin*, or *Malines*, a picturesque old Flemish city, with 33,000 inhabitants, is situated on both banks of the Dyle, an affluent of the Scheldt, and has long been well known from the manufacture of the fine lace which bears its name. It is equidistant about fourteen miles from Antwerp, Brussels, and Louvain; and is the central station of the Belgian railways. An obelisk marks the point where the several lines diverge. The city is the see of an archbishop, who is the primate of all Belgium; and has a cathedral, St Romuald, remarkable for its size, covering nearly two acres, and for the height of its massive tower, loftier than the cross of St Paul's. The interior contains numerous fine pictures by Rubens and other artists.

EAST FLANDERS, a north-west section of the country extending to the Dutch province of Zeeland, has the distinction of being the most densely-peopled section of the most

populous European state in proportion to the area. It contains an average of 690 persons to the square mile; and is distinguished both for its agricultural and manufacturing products. On passing through this district, cultivation meets the eye in every direction, and villages enclosed with trees appear in quick succession.

*Ghent* (Fr. *Gand*, Flem. *Gend*), in the centre of the province, is situated on a rich plain, at the junction of two rivers, the Lys and Lieve, with the Scheldt. These streams so wind and interlace in passing through it as to form nearly thirty islands, which are connected by not less than 270 bridges. It is the second city in the kingdom in population, 120,000, and, as the principal seat of the cotton manufacture, may be called 'the Manchester of Belgium.' It has upwards of sixty cotton mills. Not a little strange does it appear to the English visitor to meet with factories moved by steam-power, and tall brick chimneys sending up their black smoke, in close association with Gothic civic buildings and churches of the middle ages. The manufacture, introduced in the early part of the present century by the importation of workmen and machinery from England, has succeeded in a remarkable manner. Floriculture is carried on to a great extent. In the environs of the town there are no fewer than 400 hot-houses. By the great canal which flows into the Scheldt, it is united with the sea, and it can receive into its docks vessels bearing eighteen feet of water. In the fourteenth century the artisans were chiefly clothiers, distinguished by their independent spirit, and also occasionally by their turbulence, sufficiently numerous to furnish an army of 50,000 men. Our Edward III. courted an alliance with them, and was a visitor, with his queen, when his third son, who is commonly called after the town, John of Gaunt, was born. The emperor Charles V. was likewise born at Ghent; the compact of the provinces of the Netherlands against the tyranny of Spain, in 1578, was drawn up within its walls; and here the treaty of peace was signed between Great Britain and the United States, after the brief war of 1814. One of its most curious features is the *Béguinage*, a little town of itself, consisting of a square surrounded with houses, a church in the centre, with several streets, the whole of which are enclosed, and entered by a single gateway. The houses are inhabited by the *Béguins*, who officiate as sisters of charity, some of whom are in possession of considerable wealth, but all wear the same livery. They are not strictly nuns, and not being bound by any vow, they may leave when they like, contract marriage, and even return again in widowhood. *Lokeren*, *St Nicholas*, and *Beveren*, on the railway between Ghent and Antwerp, are manufacturing sites of considerable size, situated in the Pays de Waes, a district scarcely to be surpassed for its garden-like aspect and productiveness. The name refers to a village. *Alost*, 'to the east,' is near the eastern frontier of the province, a cloth and hop mart, with a collegiate church containing one of the best efforts of Rabens. The town is on the river Dender, which merges with the Scheldt at *Termonde*, or *Dendermonde*, a name referring to the affluent, which Smollett made familiar by 'my uncle Toby's' allusions to its siege. *Oudenarde*, south by west of Ghent, figures in history as the scene of one of Marlborough's victories in 1708, gained chiefly by his own prowess.

WEST FLANDERS, the only maritime province, is less fertile than its inland eastern neighbour, owing to the sand blown up in tempests from the sand-hills of the shore, and besprinkled upon its fields. But it shares the same careful husbandry by means of hand-tools, attention to the rotation of crops, and manuring the soil. Both districts produce large quantities of flax for the home linen and lace manufactures, and the foreign market. The best kind used in fabricating the finest Brussels lace is of very local growth, and is said without exaggeration to be worth its weight in gold. Flanders has long been celebrated for a breed of strong horses for purposes of draught, which are reared for export.

*Bruges*, eight miles from the coast, owes its name to the numerous bridges over the canals by which it is intersected, formed by the large commercial population it contained in long bygone times. Formerly travellers from Ostend reached the place by canal, as Southey tells us :

'Four horses, aided by the favouring breeze,  
Drew our gay vessel, slow, and sleek, and large.  
Crack goes the whip; the steersman at his ease  
Directs the way, and steady went the barge.  
Ere evening closed, to Bruges thus we came.'

The railway now cuts through a suburb. It is connected with the sea by the canals of Ghent, L'Ecluse, and Ostend. Bruges is surrounded by walls pierced by seven gates. In the fifteenth century, Bruges was one of the most famous cities of the Hanseatic League, visited by the merchants of Genoa and Venice, by kings and queens in their need. Though decayed, it still contains nearly a population of 50,000, puts on a gay and animated appearance on fete-days, when the peasantry flock in from the neighbourhood, and has considerable lace manufactures. Antique buildings are numerous; among which may be mentioned the town-hall, with its lofty tower and celebrated set of forty-eight bells; the churches are rich in works of art; and historic memories invest the city with interest. Here died John Van Eyck, the painter, with whom oil painting as an art originated. The

invention of decimal arithmetic is ascribed to another inhabitant. Here was buried Charles the Bold, the last Duke of Burgundy, and his daughter, whose monuments remain in the Church of Notre Dame. Here resided for a time during his exile Charles II. of England, in a house of the Grande Place. *Ostend*, westward on the coast, is a strongly-fortified port, next in rank to Antwerp, and a summer watering-place, in possession of one of the finest marine parades in Europe. It is the western terminus of the canals and railways of the kingdom, the principal seat of its herring-fishery, and the mail-packet station for England. Its long defence against the Spaniards under Spinola, who besieged it for more than three years, from 1601 to 1604, is celebrated in history. *Courtray*, on the Lys, twenty-seven miles south-west of Ghent, has very extensive linen manufactures, and is known throughout Europe by its products. Large bleaching-grounds surround the town, and flax-growing is a principal object in the neighbourhood. *Ypres*, a few miles distant, has the same industry; but it was carried on some centuries ago to a much greater extent than at present. The kind of linen made here received a distinctive name from that of the town, *diaper*, which is merely a corrupted form of *d'Ypres*. Jansen, who originated in the Romish Church the sect called after him Jansenists, was its bishop in the early part of the seventeenth century. His tomb is in the cathedral.

**HAINAULT**, a province on the French border, derives its name from the river Hane, which flows through its western portion to join the Scheldt, while the Sambre traverses the eastern side on its way to the Meuse. A large part of the surface, on the north and west, is a fruitful level like the preceding districts. But hills rise on the south and south-east, while a smoky atmosphere and roads black with coal-dust indicate the great mineral region of Belgium. Towards the frontier of France are the battle-fields of Fontenoy, Fleurus, and Jemappes; and in that direction the towns are strongly fortified to guard against invasion.

*Mons*, strongly fortified, with 26,000 inhabitants, is within ten miles of French territory, surrounded with coal and iron mines and with many populous mining villages. *Charleroi*, much smaller, lying eastward on the Sambre, has the same features. *Tournay*, on the western side of the province, occupies both banks of the Scheldt, and has modern fortifications raised at great cost. It is a large town, an important seat of manufactures, where the so-called Brussels carpets are chiefly made, producing also fine porcelain. The cathedral, founded by one of the Merovingian sovereigns, is reputed to be the oldest in the country. Tournay is frequently mentioned in English history. It was taken by Henry VIII.; and Perkin Warbeck, the pretender of the previous reign, is said to have referred to it as his birthplace; its name occurs also in the Marlborough wars.

The province of **NAMUR**, further eastward, is a diversified district watered by the Meuse, which is here joined by the Sambre. The river-valley has many striking combinations of bold rock, wooded height, ruined stronghold, narrow gorge, with the flowing stream, which are specially delightful after the eye has been confined to views of the neighbouring levels. The vine is cultivated in the district, but produces only an indifferent wine. Its true wealth is not naturally open to observation, but lies deep below the surface, in the carboniferous strata and its accompaniments.

*Namur*, beautifully situated at the junction of the two rivers, both of which are navigable, is defended by a citadel built on the summit of a commanding rock, and contains a population of 26,000. It is the Sheffield of the country, producing cutlery goods and firearms, with other hardwares; possessing also glass-works and tanning establishments. Coal, iron, and lead mines, with marble quarries, are in the vicinity. The town is often mentioned in military history. Don John of Austria, the conqueror of the Turks in the naval battle of Lepanto, was buried here, having died in camp in the environs. It was taken by the French under Louis XIV. in person, in 1692, who strengthened the fortifications, and caused to be inscribed over one of the gates the sentence in Latin: 'It may be surrendered—it cannot be captured.' In less than three years it was retaken by the English under William III., in the presence of the whole French army. *Dinant*, a little town higher up the river in a romantic situation, often visited owing to the attractions of the scenery, has its citadel, being within hail of France.

The province of **LIEGE**, once a prince-bishopric, belongs to a lower part of the basin of the Meuse, which receives the Ourthe within its bounds. It is an equally picturesque district, embraces many wooded heights, parts of the old Forest of Ardennes, and includes some moorlands on which the heathcock is said to linger, its only asylum in continental Europe.

The town of *Liège* is very finely seated at the junction of the Meuse with the Ourthe, surrounded with hills and foliage. It occupies the third place after the capital in amount of population, 97,500, but has large villages in the immediate vicinity connected with the coal, iron, lead, and alum mines, the slate and marble

quarries of the district. Busy streets, tall engine chimneys, volumes of smoke, dusky artisans and houses give it a peculiarly English appearance; and from the extensive production of firearms, it has been styled the Birmingham of Belgium. It possesses one of the largest cannon foundries in Europe, belonging to the government; but steam-engines, machinery, and almost all kinds of ironwork, are produced. The firearms are extensively executed for Prussia and Germany; and vast quantities of nails are sent into France and Holland. At *Seraing*, a few miles up the river, the palace of the old prince-bishops, greatly altered and enlarged, has become a machine-factory of the first class as to magnitude and workmanship, founded by an Englishman. In the days of their greatness, the prelates ruled over 52 baronies, 18 walled cities or towns, 400 villages, and were able to maintain an army of 8000 men. But the Liégeois were bold burghers; and troubles were incessant till the conquest of the country by the French in the last century put an end to the incongruous ecclesiastical rule. In Sir Walter Scott's *Quentin Durward* graphic descriptions are given of revolts and contests in the fifteenth century, but without strict attention to historical accuracy.

A Street in Liège.

The old episcopal palace still stands in the more ancient part of the town, and is now used as the provincial court of justice. Immediately in front was the cathedral which the French republican forces utterly destroyed. A university of modern date occupies a handsome edifice, and possesses a museum rich in fossils from the neighbourhood. Sir John Mandeville, the romancing English traveller of the middle ages, was buried in a convent without the walls. The village of *Chaufontaine*, 'warm fountain,' five miles distant, is much visited in summer, having the attraction of mineral waters, and a beautiful situation. *Heristal*, almost a suburb, inhabited by miners and artisans, contains a few remains of the castle in which Pepin was born, the grandfather of Charlemagne. *Huy*, a thriving town strikingly placed on both banks of the Meuse, between Liège and Namur, commands the river by a strong citadel, which crowns the top of a bold rock rising up from the water. It once possessed a convent founded by the famous preacher of the first crusade, Peter the Hermit, in which he was interred. At a short distance resided William de la Marke, the Wild Boar of the Ardennes, conspicuous in the romance of *Quentin Durward*. *Verviers*, large and flourishing, on the Great Eastern Railway leading to the Prussian territory, indicates its character as the Leeds of Belgium, by factories, dye-works, and acres of cloth hung up to dry. *Spa*, connected with the main line by a short branch, is distinguished for its chalybeate springs, in the town and the vicinity, the strongest in Europe,

being impregnated with carbonic acid. Besides attracting invalid visitors, the waters are extensively bottled for export. This was formerly one of the most fashionable watering-places on the continent, and enjoyed a kind of practical neutrality even in time of war, but easy access to the brunnens of Germany has caused its summer gatherings to decline, both in numbers and rank.

LIMBURG, part of an ancient duchy, forms the north-east extremity of the kingdom, and is bordered in that direction by the remaining portion of it which is attached to Holland. The district lies chiefly along the left bank of the Meuse, and has infertile features belonging to the tract of the Campine, before referred to, which it shares in common with the adjoining province of Antwerp. In other parts, the rearing of cattle and the culture of bees are prevailing industries. The old capital of the duchy, of the same name, now reduced to insignificance, towards the Prussian frontier, is included in the province of Liége. The towns are of very minor rank.

*Hasselt*, on an affluent of the Scheldt, has distilleries and manufactures of linen, lace, and tobacco. *Tongres*, on a tributary of the Meuse, is of very ancient date, the name being derived from the Tungri, the first Germanic tribe who crossed the Rhine, and settled in the vicinity. A mineral spring described by Pliny as ferruginous still retains its properties. The church is reputed to have been the first north of the Alps which was dedicated to the Virgin. *St Trond*, the largest place, bears the name of the founder of a convent around which the town was gathered. Near it the men of Liége were signally defeated by Charles the Bold of Burgundy in 1467.

LUXEMBURG, similarly a duchy, part of which is annexed to Holland—the king being Grand Duke—forms a south-eastern section of the country. The Belgian portion, by far the most extensive, yet thinly peopled, consists chiefly of the high grounds of the Ardennes, wooded and pastoral, on which a considerable number of horses are reared for the supply of the army and for export. Many sylvan scenes of great beauty are found in the woodland region, especially the tract around St Hubert, with which Shakspeare's 'Forest of Arden' is commonly identified, the scene of the fine comedy, *As You Like It*. The trees are chiefly of oak, many of which are of enormous size—

'Whose boughs are mossed with age,  
And high top bald with dry antiquity—  
Whose antique roots peep out  
Upon the brook that brawls along the wood.'

Young plantations are raised by the government in the natural forest for public purposes. Besides the valuable timber obtained, the oak-bark is sufficient to supply the home tanneries, and leave a surplus for export to England. While deer are general, the wild boar and wolf lurk in the denser and more solitary glades.

*Arlon*, the head of the province, a small neat trading town, is only of local note as a grain mart. *Bouillon*, once the capital of a duchy, has historic distinction from its connection with the chivalrous crusader, Godfrey de Bouillon. After succeeding to the government of his patrimony in 1076, he mortgaged it to defray the expenses of his expedition, and was proclaimed king of Jerusalem upon its capture. Ruins of the ducal castle occupy a commanding height above the town. *St Hubert*, in a forest district, completely poverty-stricken, retains a Gothic abbey-church remarkable for its elaborate adornment. The name refers to the patron of hunting and sportsmen, who would not refrain from his pastime on Sundays or even Good-Friday, but reformed his manners, founded the abbey, and became famous for sanctity.

Belgium is supposed to have been originally occupied by Celtic inhabitants, but derives its name from the Belgæ, a Germanic tribe, who intruded upon the natives, reduced them to subjection, and extended their incursions to the southern shores of England. The present population, 4,782,000, is not homogeneous, but belongs to these two distinct stocks. In the northern provinces the people are of Germanic origin, therefore Belgians proper, formerly called Flemings, and the lower classes speak the Flemish language, which is merely a form of the Dutch. In the southern districts they are Walloons, of mixed Celtic extraction like the French, and use the Walloon tongue, which is precisely the same as the French of the thirteenth century. But pure French is uniformly the language of the government, of literature, of educated society, and is

generally understood except in remote rural situations; while pure German is spoken in places adjoining the frontier of that country. Both races, though with little real sympathy between them, agree on various points. They are almost universally Roman Catholics in religion, but all other sects are tolerated. They have generally a profound veneration for the clergy, and will devoutly observe rites and ceremonies in which the priests take part, which surprise the stranger by their extreme puerility. While at no period eminent for literature, they have carried the fine arts to a high degree of perfection in the departments of painting and architecture. The artists of the early Flemish school, founded by Van Eyck, excelled in brilliancy of colouring and the faithful imitation of nature, to which those of a later school, represented by Rubens, added nobleness of design, combined with freedom of execution and harmony of parts. In architecture, the fine examples of Gothic are not confined to the churches, but include town-halls, with other civic buildings, and some private dwelling-houses raised by the opulent burghers of bygone times. All classes are distinguished by a passionate attachment to civil liberty; yet patriotism, owing to repeated change of masters, fluctuating territorial limits, and correspondences to bordering communities, can scarcely be said to exist, in the ordinary sense of the term. Local attachments refer to the town or village of birth rather than to the country.

The popular fondness for spectacles has descended from very ancient times, and though not carried to the same extravagant length as formerly, the exhibitions on festival-days, sure to please the public, are not a little grotesque. A score of towns might be mentioned familiar with wicker-work giants and giantesses, which figure in processions on holidays; and stilt-walkers still appear in the streets of Namur on occasions of general merriment, conducting themselves, however, more soberly than their predecessors a century ago. At carnival-time, in the preceding age, it was usual for the young men of the town to assemble in the square of St Remigius, mounted on stilts. They formed themselves into two battalions representing two distinct quarters, hoisted separate colours, red and white, gold and sand-yellow cockades, and had regular leaders. At a given signal, with drums and fifes playing, the armies joined battle, each striving to discomfit the other by crossing stilts and vigorous elbowing; but angry passions were frequently roused, leading to more violent modes of warfare, and the magistrates at last prohibited the display. Marshal Saxe, an eye-witness in 1748, affirmed that 'if two armies exhibited as much bravery at the moment of coming into collision as these young men did, it would no longer be a battle but a frightful butchery.' Peter the Great and Napoleon were severally treated with the spectacle. The last stilt-fight took place in honour of the entry of the Prince of Orange into Namur in 1814. A strong taste for music is universal; this is evinced by frequent assemblies of amateur performers, many of whom belong to the labouring-classes; and by the chimes from the towers of the town-halls and the church-steeple, which are constantly pouring forth their notes on the passing breeze. In the great towns a salaried musical professor is retained to amuse the citizens daily by playing upon the bells.

Antwerp.

Amsterdam.

### CHAPTER III.

#### THE NETHERLANDS OR HOLLAND.

HOLLAND is the name commonly in use among us to denote one of the most singular portions of the continent, an extensive portion of which is depressed below the level of the sea, occupied by a people who have bravely struggled to gain the ground beneath them from the waves, and are still compelled to maintain vast artificial ramparts to preserve it from the threatening surge, while remarkable themselves for public spirit, commercial enterprise, and household thrift. This territory is naturally a continuation of Belgium, by which it is bounded on the south; the North Sea washes the western and northern sides; eastward lie the dominions of Hanover and Prussia. It has an extreme extent of about 160 miles in a direct line from north to south, by 120 miles from east to west, and contains a superficial area of 12,600 miles, situated between

latitude  $50^{\circ} 43'$  and  $53^{\circ} 21'$  north, longitude  $3^{\circ} 24'$  and  $7^{\circ} 12'$  east. These limits do not include Luxemburg, a completely isolated district, connected with the crown, but a state of the Germanic Confederation. The coast-line of the country is interrupted at its south-west extremity by the estuaries of the Scheldt and the Maas, the Dutch form of the French Meuse, which have a group of flat low islands in their channels, Walcheren, the two Bevelands, Tholen, Schouwen, Overflakkee, and Voorne. On the north occurs the deep indentation of the Zuyder Zee, or South Sea, so called to define its relative position to the North Sea. This is a broad shallow expanse, with an islet chain running from off its mouth parallel to the main shore, consisting of Texel, Vlieland, Ter Schelling, and Ameland, sandy tracts, subject to changes of outline from the action of the billows. The north-east corner is marked by the smaller inlet of the Gulf of Dollart, the estuary of the Ems from Germany. No rock, hill, or natural forest, of any importance, appears in the interior. Though waters abound upon the surface, there are few examples of running streams except in the south, owing to the general flatness, while a considerable portion of the area is from twenty to thirty feet below the level of high tide. The distinctive names applied to the region refer to this peculiar conformation. The term Holland signifies a low, concave, or hollow tract, to which the Netherlands, *Nederlanden*, of the natives exactly corresponds in meaning, and which the French express by *Les Pays Bas*, or the Low Countries.

In ancient accounts of the country, it is described as an extensive marsh diurnally submerged and abandoned by the tidal waters, with the exception of some slightly elevated grounds susceptible of being occupied by man. With astonishing energy the inhabitants maintained through successive centuries a contest with the floods, reclaimed lands from inundation, protected them by embankments; and nature aided human industry in accomplishing the object, although occasionally defeating it. Broad sand-hills raised by the sea-winds along shore defend the low-lying interior where they exist from the invasion of the watery element; and to prevent the drifting inland of their material, the sand-downs are planted with fir-trees and bent grass, the roots of which render the masses compact and fixed. Where natural agencies have not been favourable to the formation of such barriers, as on the coast of the Zuyder Zee and in the island province of Zeeland, artificial mounds or dykes guard the country. They are constructed of earth, sand, and clay, faced with willow boughs; are sometimes lined with masonry towards the base, while fringed to seaward with huge blocks of stone indiscriminately thrown together, and further protected by piles driven into the ground, intended to break the force of the advancing waves. The quarries and forests of Norway have contributed much of the material for these erections, some of which are of enormous magnitude. Both sides of the rivers are also extensively defended with the same bulwarks, as their beds are in many places above the general level of the surface; in addition to which, the breaking up of the winter always brings with it the great danger of a sudden thaw and a high tide being concurrent events. The sea and the river-walls slope towards the water, form roads at the top, which are usually planted with double rows of trees, relieving the monotony of the landscape. All these protective works are under official superintendance with a view to their security; watchmen are posted at every weak point when peril is anticipated; labourers are in readiness to adopt measures to avert a disruption; and if a dyke-break occurs, the thunder of cannon conveys the ominous intelligence to the neighbouring towns and villages. Whatever damage occurs, the people address themselves with invincible resolution to the task of making the necessary repairs, however great the cost. Hence, with good reason, one of the provinces adopted for its coat of arms the figure of a lion swimming, with the motto in Latin, 'I strive, and keep my head above water.'

Many changes and calamities caused by the beleaguering floods mark the history of Holland—

‘A country that draws fifty feet of water,  
In which men live as in the hold of nature,  
And when the sea does in upon them break,  
And drowns a province, does but spring a leak.’

In the Roman times, where the Zuyder Zee now rolls its waves, there was dry land, occupied by a lake, from which a river issued with a course of fifty miles to the sea. But in the thirteenth century successive storms impelled the ‘tall ocean’ against the coast, which forced its way through a broad isthmus, obliterated the ancient lake, and converted it, with a large space of the surrounding country, into the existing expanse. In the year 1421, a high tide raised by a violent tempest, and driven up the estuary of the Maas, ruptured a dam, and occasioned a terrible inundation. Seventy-two villages were swept away; many thousands of the inhabitants perished; and the watery waste of the Biesbosch near Dort was formed, since recovered to some extent from submergence. Repeated inroads of the sea in the fifteenth and sixteenth centuries originated the great Lake of Haarlem, which took the place of meadows, gardens, and the populous village of Nieuwienkirk. Upon the drainage of this lake by gigantic steam-power—an event of the present day—remains of the unhappy village were found, with bones of the inhabitants. Several recent years have been eminently disastrous. In January 1861, during a thaw, the masses of ice brought down by the rivers from Germany blocked up their channels, burst the dykes by their pressure, and laid the fields far and wide under water. The fertile district of Bommelerwaard, an island enclosed by the Waal and Maas, was the chief scene of the catastrophe. Sixteen villages were inundated, 18,000 persons were driven from their homes, and forty lost their lives. Some days afterwards severe frost returned, and the deluged country became a sea of ice, with houses, churches, and trees standing up above it at half their height. A skater entered the church of Gameren by one of the windows, passed over the pulpit, and made his exit by a window on the opposite side of the building. Occasionally in time of war, the people have cut the dams and opened the sluices in order to get rid of an enemy, upon the principle of choosing the lesser of two evils. This was done in 1574 when Leyden was reduced to extremity by the besieging Spaniards, and it compelled them to retire.

The lower courses of the Scheldt and Maas, both from Belgium, but originating in France, lie within the limits of Holland, with that of the Rhine from Prussia, all of which reach the North Sea on the west coast. The Scheldt enters the country at the head of its estuary, where it immediately divides into two principal branches which enclose the islands of South Beveland and Walcheren. The Maas crosses the frontier a short distance above Maestricht, receives large contributions from the Rhine, and separates towards its mouth into three great branches which encircle the islands of Overflakkee and Voorne. The Rhine passes the border 2000 feet wide, not far above the town of Arnheim, and rapidly undergoes a remarkable reduction in its volume by the successive surrender of its waters. A large branch, the Waal, flows from it westward and joins the Maas; another, the Yssel, is next sent off northward to the Zuyder Zee; a third division, the Lech, is then despatched to fall into the Maas above Rotterdam. The stream, retaining the name of the Old Rhine, but no longer entitled to be called the ‘exulting and abounding river,’ pursues its way to Utrecht, where a fourth bifurcation takes place, and the Vecht departs from it for an estuary of the Zuyder Zee. Sluggishly, with the aspect of a canal, it passes Leyden, and eight miles below, a wholly artificial channel, provided with sluices, enables the once mighty Rhine to effect a passage to the sea, through the vast beds of sand which line the coast. Deprived of its natural outlet by a tempest which blocked it up, the

stream remained without one for nearly a thousand years, and was lost in the sands, or formed marshes, till engineering efforts at the beginning of the present century furnished the new water-course. No natural contrast can well be more complete and striking than the one between the physical circumstances of the infant and the expiring Rhine—the Alps and glaciers in the one case—the sand-hills of the North Sea shore in the other. Yet it is interesting to note with an acute observer, that the two small populations at the two extremities, though far apart and in totally different external conditions, are morally and nationally very much alike. ‘The Swiss,’ observes Mr Laing, ‘are the Dutchmen of the mountains. They are the same cold, unimaginative, money-seeking, yet vigorous, determined, energetic people as the Dutch at the mouths of the Rhine. In private household life the same order and cleanliness, attention to small things, plodding, persevering industry, and addiction to gain, predominate in the character of both; and as citizens, the same reverence for law, and common sense, the same zeal for the public good, the same intense love of country, and, hidden under a phlegmatic exterior, the same capability of great energy, and the same readiness to make sacrifices for it.’

The surface of Holland is numerously sprinkled with lakes or meres, chiefly found in the more maritime districts, generally small and shallow, hence favourable for drainage. In the course of the last two centuries a considerable number have been reclaimed for cultivation, or as pasture land, yielding rich crops of herbage, and are of high importance in husbandry. Upwards of 300 square miles have been added in this way to the extent of the productive area. The sites of the exhausted meres, called *polders*, are carefully dyked, being very low, in order to prevent the return of submergence, while the undue accumulation of water by slow filtering is checked by hydraulic machinery, employed to raise it into adjoining canals. Wind-mills supply the motive-power for this purpose, though steam-engines are partially in action, but from the want of coal it is not probable that the former, which at once arrest the attention of the stranger by their number and size, will speedily lose their prominence in the landscape. Yet it is not uncommon to meet with extensive polders, as lacustrine as ever, being completely under water, the remnants of some direful inundation which require lengthened and costly labour to remove. Canals constructed for drainage, and answering the general objects of intercommunication, intersect the country in every direction, fringed on both sides with rows of poplars and willows. Being generally frozen over for a considerable time in winter, a great part of the population betake themselves to skating on them for business or pleasure. Provisions of various kinds are brought by women skaters from remote villages and hamlets to the markets of the towns, who attain great speed when the wind is in their favour. It is on record that two young females at Groningen compassed thirty miles in two hours. Long straight lines of canals, dykes, and rows of trees, with the interspersing wind-mills, compose much of the scenery, which rarely fails to interest the foreigner by its strangeness to him; and while very enjoyable under a bright sky, with the vegetable profusion of summer bursting forth in its full glory, the mind acquires a sense of freedom, elevation, and elasticity, as the eye overlooks from one of the higher embankments the great surrounding level ranging to the far-distant horizon.

The soil consists of the most recent marine and fluvial deposits, yielding no economic mineral produce except potters-clay, brick-clay, fuller's-earth, and peat for fuel. Owing to the large quantity of inland water, with complete exposure to the sea, and prevalent east winds in winter, the climate is remarkably humid and foggy, often severely cold through eight months of the year, while the four summer months are frequently intensely hot, and insalubrious to foreigners, from the exhalations of the marsh-lands. Being without natural woods, though plantations are by no means rare, the wild animals are wholly unimportant;

and the people depend for their timber upon the produce of the forests of Germany brought down in enormous rafts by the Rhine. Aquatic plants are rendered numerous and varied by the abundant drains and meres, which foster the smaller reptiles, and invite aquatic birds; the stork is a constant summer visitor, to be seen in all the towns and villages, where it is secured by law in the enjoyment of complete protection as a useful scavenger. Fish of various kinds abound on the coasts; and a considerable number of the maritime population engage in fisheries off shore, and also in the more distant seas. Ship-building, distillation, horticulture, pottery, the manufacture of toys, wooden clocks, and tobacco, are prevailing industries, but grazing husbandry and commerce are the main sources of the national wealth. Fine cattle sustained by rich meadows are extremely numerous; dairy produce is exported in enormous quantities; the import into Europe and other parts of the products of the Spice Islands—cloves, nutmegs, and mace—exclusively belongs to Holland; and a large share of the carrying-trade in the productions of various countries is enjoyed by her merchants. The internal trade has long been carried on by the canals; but the common roads running along the embankments are excellent; and railways now connect the important places, and link the country with the great railway system of the continent. The famous ship-canal from Amsterdam to the Helder, designed to avoid the shallows of the Zuyder Zee, is nearly fifty miles in length. It was constructed at an immense expense, and of sufficient depth and breadth to carry the largest merchantman, and admit of two frigates passing abreast. But it has not answered expectation. Besides being annually stopped by the ice for three months, accumulations of mud and aquatic plants render the passage of large vessels difficult and tedious; and hence it has been gradually deserted by the deep-sea trade in favour of the channels to Rotterdam, since Antwerp ceased to be a Dutch port.

Foreign oppression in its utmost rigour, with political vicissitudes of almost every diversity, have been experienced in this singular region, while desperate struggles for independence have been witnessed within its limits, which were not made in vain, nor was the success abused. It formed part of the empire of Charles V. of Germany, and passed from him to his son Philip, becoming an appendage to the crown of Spain. Civil exactions followed intended to abridge liberty, and religious persecution to extirpate Protestantism, were sustained by the presence of a powerful army to quell resistance. The Dutch, as the people are called, rose in arms under William of Nassau, Prince of Orange. The inhabitants of Holland, Zeeland, of the lordship of Utrecht, the northern portion of the duchy of Guelders, the county of Zutphen, the lordship of Overijssel, Groningen, and Friesland formed themselves into the Republic of the Seven United Provinces in 1579, and after a severe contest, gained the prize of freedom for which they fought, the Prince of Orange being placed at the head of the state as stadtholder, or guardian of the country. In the following century they rose to great national distinction, became the leading maritime and commercial power in Europe, acquired colonies, and raised fleets which contended with England for the supremacy on the narrow seas. Their influence declined, owing to the successful rivalry of other states. In 1747 the form of government became monarchical by the stadtholdership being declared hereditary. The French revolutionary armies poured in and established the Batavian Republic, after the name of an aboriginal tribe. In 1806 it was made a kingdom by Napoleon, and given to his brother Louis. It was incorporated with France in 1810; then connected with Belgium, and constituted into the Kingdom of the Netherlands in 1815, an arrangement which subsisted till 1831, when the two became separate monarchies, the union being found utterly incompatible. The Dutch retained possession of all the colonies.

Holland consists of eleven provinces, and has the Germanic duchy of Luxemburg, held by the sovereign as grand-duke, associated with it, which gives him a vote in the councils of the Germanic Confederation.

| Provinces.               | Principal Towns.                           |
|--------------------------|--|
| North Holland, . . . . . | Amsterdam, Haarlem, Alkmaar, Saardam.      |
| South Holland, . . . . . | The Hague, Rotterdam, Leyden, Dort, Delft. |
| Zeeland, . . . . .       | Middelburg, Flushing.                      |
| North Brabant, . . . . . | Bois-le-Duc, Breda, Bergen-op-Zoom.        |
| Utrecht, . . . . .       | Utrecht, Amersfort.                        |
| Gelderland, . . . . .    | Arnheim, Nimeguen, Zutphen.                |
| Overyssel, . . . . .     | Zwolle, Deventer, Kempen.                  |
| Drenthe, . . . . .       | Assel, Meppen.                             |
| Friesland, . . . . .     | Leeuwarden, Harlingen.                     |
| Groningen, . . . . .     | Groningen, Delfzyl.                        |
| Limburg, . . . . .       | Maestricht, Ruremonde, Venloo.             |
| Luxemburg, . . . . .     | Luxemburg.                                 |

The foreign possessions are of considerable value. They include—in Africa, settlements on the Guinea coast; in America, Dutch Guiana, the islands of Eustathius, Curaçoa, and others in the West Indies; in Asia, parts of Sumatra, Java, the Celebes, part of the coast of Borneo, and Timor, with the Moluccas, Banca, and Rhiau, near Singapore.

The province of NORTH HOLLAND is a peninsula projecting between the North Sea and the Zuyder Zee, terminating with a tongue of land not more than two miles broad, off which are the islands of Texel and Vlieland. The shore at this narrow point is defended from the inroads of the sea by the great dyke of the Helder, constructed entirely of blocks of Norwegian granite, squared and smoothed like a pavement. It is six miles in length, forty feet broad at the top, along which a good road is carried, and has a slope to the sea of 200 feet, inclined at an angle of about 40°. The lowest tides are far from shewing the base, and the highest fall equally below the summit. Enormous buttresses project at intervals from the rampart for its protection. Sand-downs form the greater part of the west shore, one of the highest of which, Camperdown, is composed of extremely fine, pure, and white sand, used in the manufacture of glass. It overlooks the scene of the naval battle to which the name is given, in which the Dutch were defeated by Admiral Duncan in 1797. The interior of the peninsula contains marshy districts, many small ponds, with lands rendered highly productive by drainage, as the site of the Haarlem Lake, drained by an English company, where more than 40,000 acres are now divided into farms under tillage or pasturage.

*Amsterdam*, the commercial capital of the kingdom, and its largest city, is seated on the southern side of an inlet of the Zuyder Zee, at the junction with it of the little river Amstel, in latitude 52° 22' north, longitude 4° 53' east. The name refers to the position, properly Amsteldam, 'dam of the Amstel.' The site being naturally a morass, piles of wood have been driven to secure a foundation for the houses and buildings. This led Erasmus to remark on visiting it, 'that he was in a town where the inhabitants lived, like rocks, on the tops of trees.' The circumstance also induced the magistrates to lay a tax upon carriages, in order to restrict their use, under the idea that the movement of the wheels produced a dangerous concussion of the piles, but the regulation has been long rescinded, and seems to have been superfluous, as heavy goods are almost entirely transported along the canals. Still, the precaution pointed to a real danger, for dwellings now decline from the perpendicular, owing to the want of a firmer basis, and overloaded warehouses have sunk down below the general level from the same cause. The city was popularly said in former times to be built on herring-bones, as the fisheries then contributed largely to the immense wealth of the merchants. It forms a large semicircle, the curve of which is directed inland, while the straight side is on the sea-inlet, called the Y or Ij (pronounced Eye), which is in places nearly a mile broad, and affords deep water up to the quays. A rampart with bastions, now laid out in walks, and crowned with twenty-six wind-mills, describes the landward circuit. Interior to this, and running parallel with it, are three principal streets, of great breadth, and at least two miles long, each with a canal in the centre, between rows of trees. Inner streets and canals form the heart of the town, which is one of the most singular in Europe, once familiarly styled the Venice of the North, in allusion to its numerous water-courses, with the opulence and power of the citizens. The canals are said to cut up the ground into ninety-five distinct blocks or

islands, connected with each other by 290 bridges. All the houses of the city are of brick, painted in various colours, with door-steps and pavements of stone, imported for the purpose; but the streets, except the three referred to, have an inferior appearance. The principal building, formerly called the Stadthouse, and occupied by the States-general, is now the palace of the sovereign during his temporary visits; it is a stone structure of vast dimensions and magnificent character, resting upon not less than 13,659 piles. The interior is adorned with a profusion of white and veined marble, of which many of the floors, walls, and doorways are wholly composed; and has one apartment, the grand hall, rarely equalled in size and splendour, which formed the waiting-room of those who attended the levees of the burgomasters. Besides the churches—one of which, called the *Nieuwe Kerk* (New Church), is reckoned by the patriotic Dutch the finest ecclesiastical structure in Europe—town-hall, exchange, and dockyard, the other public establishments include several literary and philosophical societies, a remarkable number of benevolent institutions, a national picture-gallery, devoted chiefly to productions of the Dutch school, and the recently-opened Fodor Museum, located in a handsome building. This last originated with a merchant of the same name, who, in 1860, bequeathed his valuable collection of works of art to the city, together with his residence and adjoining warehouses, on the condition of a suitable edifice being erected on the site. The *chef-d'œuvre* is Scheffer's 'Christus Consolator,' purchased at the sale of the Duchess of Orleans's collection, for £2100. Amsterdam contains a population of 233,000, dependent entirely for fresh water upon tanks supplied from the clouds, and water-barges which convey it from a distance. Another disadvantage is the offensive effluvia from the canals in the heat of summer.

*Saardam*, a ship-building town, occupies a site on the opposite shore of the *Ai*, and is conspicuous from afar by a long line of enormous wind-mills connected with it. The place has become widely known from Peter the Great having made a short stay here, working in one of the building-yards. The cottage in which he resided is preserved with care, and has had many distinguished visitors. *Broeck*, similarly situated, but a few miles inland, a mere village in size, has acquired great notoriety as the cleanest place in the world. The houses are all bright with paint of gaudy colours, the little gardens are gay with flowers; and paved alleys, not wide enough to admit a carriage, are the only streets, scrupulously kept clear of every unsightly speck. The interiors correspond with the exterior in purity. It is a specimen of Dutch neatness and cleanliness carried to an extravagant excess. *Haarlem*, twelve miles west of the capital, is, after it, the largest place in North Holland, containing 28,000 inhabitants. Bleach-works and various manufactures are carried on, but the principal trade is in flower seeds and bulbous roots, tulips and hyacinths, which are raised in extensive nursery-grounds, and sent to all parts of Europe. *St Bavon's*, the principal church, is famous for its organ, with 5000 pipes, 60 stops, and 4 rows of keys, built in the fifteenth century, and, till a recent period, the largest of its kind. In the square adjoining, stands the statue of Coster, to whom the Dutch persist in ascribing the invention of the art of printing. The town endured a seven months' siege from the Spaniards in 1573, remarkable for the resistance offered by the people, and the perfidy with which they were treated upon capitulating. A newspaper, the *Courant*, has existed since the year 1650. *Alkmaar*, on the line of the ship-canal, has the largest cheese market in the country, held weekly, and is the scene of an annual swan fair. *Hoorn*, a decayed place on the *Zuyder Zee*, gave birth to the mariner Schouten, who first rounded Cape Horn, and so named it after his native town; and to Tasman, who discovered Van Diemen's Land, now called after him, Tasmania. The large nets used in the herring-fishery were first constructed here. *Helder*, an important port, is at the north extremity of the peninsula, with an artificial harbour, very strongly fortified, upon which Napoleon expended an immense sum, with the intention of making it a northern Gibraltar, but left the works unfinished. The channel between it and Texel Island is the principal entrance into the *Zuyder Zee*, and almost the only part of the coast which has deep water; the accumulation of sand being prevented by the strong tidal current.

**SOUTH HOLLAND**, exclusively on the North Sea, comprehends the country around the mouths of the Rhine and the Maas, which the latter river cuts up into the islands of *Ysselmonde*, *Voorne*, *Overflakkee*, and several others. It contains many important towns, and highly productive districts, and enjoys a large share of the national wealth and commerce. The surface has also some agreeable natural features, especially around the Hague, and from thence to *Leyden*, where almost the only relics remaining of the primeval forest are met with. Good roads, paved with bricks, besides the railway, traverse the woodland; and occasionally a rope appears stretched from tree to tree at a considerable height over them, on which a lamp is suspended, sufficiently indicative of the handiwork of man. But the trees are left to grow according to their will, without the training to which the Dutch are partial; and pleasant glades are at hand of a thoroughly rustic character.

*Rotterdam*, the second city of the kingdom, with a population of 111,400, stands on the north bank of the principal outlet of the Maas, about twenty miles from the sea, and forty miles south-south-west of Amsterdam; its port receives the largest merchant-ships, while smaller vessels pass by canals into the

leading streets. It has also canal communication with most of the larger Dutch towns, and with Germany by the Rhine. It forms a triangle, the base line of which is on the river, a mile and a half in length. The open country lies on the one side beyond the stream, and a range of lofty houses occupies the other, with a row of fine trees in front, and a thoroughfare to which the misnomer of *Boompjes*, 'little trees,' is applied. The foreign commerce is very extensive as well as the inland traffic by the river. A bronze statue of Erasmus, a native of the city, stands in the principal market-place. The house in which he was born, indicated by an inscription, is now a shop for the sale of effervescing drinks. The house occupied for a time by Bayle, the author of the Dictionary, is also pointed out. Another dwelling has the ominous name of *Duizend Vreesen*, or 'Thousand Fears,' from the circumstance that during a massacre by the Spanish soldiers the inmates saved their lives by stratagem. They slew the cats, sprinkled the blood at the entrance, and left the door open, which led the murderers who passed by to suppose they had been anticipated by their comrades in the work of death. The principal public edifices are the Cathedral Church of St Laurence, the exchange, the town-hall, and the palace of justice. The chief prison of the Netherlands is here. Rotterdam never fails to interest the stranger, as it is commonly the place where a first acquaintance is made with Dutch scenes and usages.

*Schiedam*, a few miles on the west, is the chief seat of the manufacture of the gin called *Hollands*. *Dord*, or *Dordrecht*, on the south-east, the rendezvous of the rafts of timber floated down from the Swiss and German forests by the rivers, has great historic distinction. It was the first gathering-place of the States-general, in 1572, after the declaration of independence; and the scene of the ecclesiastical synod, in 1618, which, attended by some Anglican divines, condemned the doctrines of Arminius. *Gouda*, on the north-east, is a large cheese-mart and tobacco-pipe manufactory, and has in its Church of St John many windows of painted glass, some of which are of very large size, and accounted the finest in Europe. *Brielle*, a little town on the island of *Voorne*, near the mouth of the *Maas*, is the first place that comes into view on passing from the sea into the river. The name literally signifies a pair of spectacles, and means figuratively, in allusion to its site, the outlook of Holland. It was the birthplace of the Admirals Van Tromp and De Witt. *Hellevoetsluis*, on the south side of the island, is a fortified port and chief station of the navy, the place from which the Prince of Orange sailed to become William III. of England by effecting the Revolution of 1688.

*The Hague*, three miles from the shore of the North Sea, is the political capital, the seat of the court, of the government, and the supreme judicial tribunals. It contains a population of 82,600. The name is a contraction of *S' Gravenhagen*, the 'Count's haugh or meadow,' in allusion to a seat at the place of the old counts of Holland. It has an air of elegance which does not belong to the other Dutch towns; possesses handsome streets, houses, shops, and avenues of linden-trees; contains a picture-gallery of unrivalled excellence in productions of the Dutch school; and a museum located in the same building, with apartments stored with valuables and curiosities from China and Japan. In one of the public offices are deposited the archives and state papers which have been preserved by the republican and regal governments of the country for 400 years. The royal residence in the vicinity, '*Huis in 't Bosch*,' 'House in the Wood,' is a charming retreat; but, indeed, the environs are quite covered with handsome villas. To *Scheveningen*, a large village on the neighbouring coast, reached through a beautiful avenue of trees, the court and notables repair in summer for sea-bathing. William III. of England, and Huyghens the mathematician, were born at the Hague. *Delft*, southward in the direction of Rotterdam, an antique and decayed-looking town, was formerly famous for its pottery, hence called '*delf*,' a name once more familiar with English ears than at present; but the manufacture is now unimportant. The churches have objects of interest in the tombs of the first Prince of Orange, assassinated in the town in 1584; of Grotius, a native; and of Van Tromp, the victor in thirty-three naval battles. *Leyden* (Fr. *Leyde*, the *Lugdunum Batavorum* of the Romans, originally *Luijkduin*, from *Luijk*, an 'end,' and *dun*, a 'hill,' during the middle ages *Lugdun* or *Leydis*), northward on the railway to Haarlem, the literary capital of the kingdom, as the seat of a celebrated university, is situated on the canal-like channel of the Old Rhine, six miles from the sea. Though containing 37,000 inhabitants, it has little trade or commerce; the streets are extremely dull and quiet, but have an unusual proportion of good houses, in harmony with its renown for eminent professors, grave jurists, and ponderous divines. The city is said to be the oldest in Holland, and in 1640 had nearly thrice its present population. The story of its siege by the Spaniards in 1574 is of romantic interest, and forms one of the brightest chapters in the annals of Holland. It was closely beleaguered for several months, during which no bread was seen through seven weeks, while horses, dogs, roots, and weeds were eagerly devoured. Pestilence was added to famine, but failed to subdue the determination of the citizens not to surrender. To relieve them, the Prince of Orange caused the dykes on the coast to be broken down, and laid the country under water. But it did not rise high enough to dislodge the enemy, or allow of the passage of boats laden with provisions. At last the wind changed. It blew from the North Sea, drove the water up the rivers, and while the great overflow carried destruction to the Spaniards, it transported food to the gates of Leyden. This deliverance is still gratefully commemorated on its anniversary, the 3d of October. In reward for their heroism, the government offered the inhabitants their choice of an exemption from all taxes for a stated period, or the foundation of a university, and much to their honour they chose the latter. The names of Grotius, Gomarus, Scaliger, Descartes, and Boerhaave occur in the list of its professors or scholars, with those of many of our countrymen, Evelyn, Goldsmith, and Fielding. It has an excellent botanical

garden, and an unrivalled Japanese museum. The latter was not shewn to the Japanese ambassadors recently in Holland, as the objects had been obtained by merchants and consuls contrary to the laws of the country.

ZEELAND, 'sea-land,' according to the name, is an eminently maritime province in position, and has the waves rising high above a large portion of the surface at every tide. It embraces the islands in the estuary of the Scheldt, and a portion of the mainland on the southern bank of the river, bordering on Belgium. In the spring and autumnal months the insular sites are very unhealthy, especially to strangers, owing to the marsh fever, from which the English army suffered severely during the ill-conducted expedition to Walcheren in 1809, under the Earl of Chatham. The seaward side of that island, where a breach occurs in the line of sand-downs, is protected by one of the most stupendous of the dykes, 4700 yards long, and 30 feet high, the disruption of which would submerge the greater part of the province. It gave way in the year 1808; the sea poured in; and the water rose in the streets of Middelburg to the roofs of the houses.

*Middelburg*, near the centre of Walcheren, is a considerable town, to which, by a happy accident which befell a spectacle-maker, the invention of the telescope is traced. *Flushing*, on the south coast, a fortified port, has extensive docks and arsenals; and with two forts on the opposite shore of the Scheldt commands the mouth of the river. The Admiral De Ruyter, who sailed up the Medway, burned the English fleet at Chatham, and alarmed London, in the reign of Charles II, was a native of the town.

NORTH BRABANT, the largest province, is washed by the tidal waters of the Scheldt and Maas, but belongs chiefly to the basin of the latter river. It forms the northern border of Belgium, and is principally distinguished by strong fortresses. *UTRECHT*, the smallest province, has a coast-line on the Zuyder Zee, and a considerable portion of surface, which agreeably contrasts with the adjoining districts, in being slightly raised above their level. It is therefore devoted to tillage as well as pasturage, and further diversified with streams not requiring embankments, and with clumps of trees and copsewood.

*Bois-le-Duc*, the French translation of the native *S'Hertogenbosch*, 'the Duke's Wood,' occupies the site of a hunting-seat of the old Dukes of Brabant, to which the name alludes. It is a fortified trading town, at the confluence of two tributaries of the Maas, and has undergone several sieges. It possesses a cathedral, an academy of arts, an arsenal, &c., and has manufactures of various kinds. *Breda*, the scene of congresses, with a military academy and arsenal, forms a fortress of the first class, which may be rendered inaccessible to an enemy, as the surrounding country admits of being laid under water. *Bergen-op-Zoom*, equally strong, fortified by Cohorn, is considered almost impregnable, and was unsuccessfully besieged by the British in 1813. *Utrecht*, the fourth most important city of the kingdom, with a population of 55,500, stands on the Old Rhine, at the point of the departure of the Vecht from the decayed stream, about 23 miles south-east of Amsterdam. It has the advantage of a healthy site and beautiful environs, the ground being somewhat elevated, and the country well wooded with fine trees. It is the seat of a university, founded in 1636, has charming walks, and a church tower, from the summit of which, in clear weather, the eye may overlook nearly all the Netherlands. A Roman station existed at the spot, called *Trajectus ad Rhenum*, 'Ford on the Rhine,' for which *Ultra Trajectum* was substituted in the middle ages, the original of the present name. The city has been the scene of several important historical events. The compact of the states against Spain was here subscribed, as was the treaty which gave peace to Europe in 1713, hence styled the Treaty of Utrecht. *Amersfort*, on the north-east, deserves mention as the native place of the patriot Barneveldt, who, after a life spent in securing the independence of his country, fell a victim to the enmity of Prince Maurice, and was beheaded at the Hague in 1618, at the age of seventy-two.

GELDERLAND and OVERYSSEL, connected with the east coast of the Zuyder Zee, extend from it to the frontier of Germany, and are traversed by the Rhine, with its branches, the Waal and the Yssel. The former province is the finest part of Holland, portions of which bear the name of the 'Dutch Paradise,' being studded with country-seats, parks, and gardens, while the eye is conscious that the rivers flow, and do not stagnate.

*Arnheim*, the capital of Gelderland, is the largest town of the two districts, with 25,400 inhabitants, pleasantly placed on the Rhine, soon after it leaves Prussian territory, and enjoys a considerable river trade. *Zutphen*, on the Yssel, is enduringly associated with the memory of Sir Philip Sydney, who there received his death-wound in the battle of 1586. *Nimeguen*, on the Waal, strongly defended, gives its name in history to the treaty of 1678 between Holland, France, and Spain, which was signed in the town-hall. Some distance below the town, the Waal bifurcates with the Maas before finally falling into it. They form together the

river-island of Bommel, at the western end of which stands the Castle of Loevestein, a site of celebrity. This was the prison of Grotius for twenty months in 1619, where he wrote the greater part of his treatise *Jus Belli et Pacis*. It was also the scene of his wife's devoted fidelity. She romantically effected his escape, aided by a trusty maid, by having him conveyed away in a chest used for the transport of books, while she remained behind to conceal as long as possible his departure. *Zwolle* and *Deventer*, both flourishing towns in Overijssel, are associated with the widely-known Thomas-à-Kempis. In the latter he studied; and in a convent near the former, he spent the greater part of his life, and died in 1471.

GRONINGEN, FRIESLAND, and DRENTHÉ, are the most northerly portions of the kingdom, the two former being maritime, on the North Sea, and the latter wholly inland. The first-named province has excellent arable land under cultivation, but the general surface of the three is either sandy or marshy, very numerously sprinkled with lakes and ponds, around which are pasture-lands sustaining large numbers of horses and cattle. Extensive peat-beds occur, and as there is no coal nearer than the carboniferous basins of Belgium, the article is of high service as fuel in domestic economy. Some of the beds quiver perpetually, and hence the common saying, *Het land leeft*, 'the land is alive.' The country being flat and low has to be guarded from the irruptions of the sea, and is intersected with a net-work of canals for drainage, serving also for traffic, as the ordinary roads are bad, and railways have not yet put in an appearance. The chronicles of Friesland are especially rife with calamities from the attacks of the stormy deep. It contains a monument without example in the kingdom, raised in honour of a Spanish governor near Harlingen, who introduced an improved method of constructing the sea-walls. The people are a Frisian race, fishermen on the shores, whose ancestors joined the Angles and Saxons in their migration to Britain, but have lost all distinctive characteristics by contact with their present neighbours.

*Groningen*, a fortified and flourishing town of 36,000 inhabitants, the largest in the north-east of Holland, at some distance from the sea, communicates with it by a canal navigable by large vessels. It is the seat of a university founded in 1615, furnished with a good library, museum, and botanic garden. The market-place is the finest square in the whole kingdom, and the principal church has one of its highest towers, rising 343 feet. *Leeuwarden*, the capital of Friesland, is a great canal centre, connected by a grand trunk with the *Zayder Zee*, on the west, and the Gulf of Dollart on the east, passing by Groningen. It contains the tombs of the Princes of Orange in one of the churches.

LIMBURG, a long narrow tract traversed from south to north by the Maas, borders on North Brabant, but is chiefly enclosed by Prussian and Belgian ground. The grand duchy of LUXEMBURG, wholly isolated, lies on the Moselle, which forms the eastern frontier, surrounded by Prussia, Belgium, and France. As a state of the Germanic Confederation, it gives the king of Holland three votes in the general council of the diet at Frankfort.

*Maestricht*, the capital of Limburg, a town of 28,000 inhabitants and first-class fortress, lies on the left bank of the Maas, close to the Belgian frontier. Vast stone quarries perforate the hill of the citadel, now called St Pierre, formerly *Mons Hunnorum* in memory of Attila, consisting of subterranean passages, which embrace a total length of many miles. In time of war, the inhabitants of the surrounding country have occupied them as a place of refuge, with their cattle. They are not fully known to any of the labourers, and inexperienced persons entering alone would soon be bewildered in the labyrinth. Among other fossils, have been found in these workings two heads of the gigantic *Mosasaurus*. *Luxemburg*, a small town on an affluent of the Moselle, is one of the best fortified places in Europe, with a garrison maintained by the Germanic Confederation. Strong by nature, it has been made additionally so by art, and is reckoned to be impregnable. The site has been compared to that of Jerusalem. A lower part of the town, on the margin of the Alsette, communicates with an upper by flights of steps and zigzag streets which are cut in the face of steeply-escarped rocks.

The population of the kingdom, 3,618,000, consists mainly of Hollanders or Dutch, a branch of the Germanic family speaking a dialect of the German language. More than a half of the number are Protestants of the Calvinistic Church, founded on the decrees of the Synod of Dort in 1618. The remainder are chiefly Roman Catholics, though there are Lutherans, and other denominations, with many Jews in the large towns,

especially in Amsterdam. The national clergy are paid by the state, which contributes also to the support of the ministers of different communions. They attend to the religious education of children at stated times during the week, while secular instruction is provided by the government. Many of the churches have four services on the Sunday, the first early in the morning; and it is not uncommon for the officials to go round to receive offerings for the poor three times during a single service. Excellent elementary schools are established, in which the poorest are taught free, and only a small payment is required from those who are in better circumstances. The public treasury likewise sustains the three universities, Leyden, Utrecht, and Groningen, their order in point of importance. The system of Forecasting the Weather is adopted by authority, based upon readings of the barometer, taken for every day of the year and every hour of the day, at Flushing, Maestricht, Groningen, and Helder. The first telegraphic warning of a storm was given on the 1st of June 1860. French is spoken fluently by the upper classes, who are also generally proficient in English. Some knowledge of our mother-tongue is common with the middle and lower grades of the people; and after a little experience, the Englishman and the Dutchman, only accomplished in their native speech, may communicate as to everyday wants without much difficulty, owing to similar forms of expression. 'Brood en Koekbakker,' 'Koffy en Thee te Koop,' inscriptions over shop-doors, cannot long remain a puzzle, though not quite so intelligible as 'Tabak, Snuif, en Sigaren.'

The Dutch are intensely national, so much so as to be not a little vainglorious of moderate achievements among themselves. They are patterns of industry, frugality, and cleanliness; strongly attached to civil and religious liberty, exemplary in their domestic relations, and extremely charitable to the poor; while of phlegmatic temperament, they are strongly prejudiced on behalf of rules and usages which found favour with their grandsires, hence slow to admit improvements, and obstinate to excess. Perhaps not more than to most other mercantile nations are the lines of Canning applicable:

'In matters of commerce, the fault of the Dutch  
Is giving too little, and asking too much.'

They have excelled in the fine arts and various branches of learning, and been distinguished for their enterprise, but seem now deficient in genius and energy, and are not entitled to be considered one of the advancing nations. In jurisprudence and philology, the great names are Grotius, Heinsius, Leusden, Schrevelius, Burman, Gronovius; in natural science, Huyghens, Boerhaave, Leeuwenhoeck, Camper, Swammerdam; in criticism and theology, Erasmus, Arminius, Gomarus, Erpenius, Vitringa, Limborch; in painting, Rembrandt, Teniers, Wouvermans, Vandervelde, Ruysdael, and numerous others. While customs are met with at every turn different to our own, many provoke a smile by their oddity. A birth announced in the newspapers will often have the appendage of 'a prosperous delivery;' or a 'well-formed infant;' and a death will be dolorously proclaimed by a newly-made widow's hand, with the record that 'Tabak, Snuif, en Sigaren' continue to be sold. Of piquant appearance are the garden-houses of well-to-do traders in the suburbs of the towns, or those connected with the villas of wealthy retired merchants, shining with paints of divers hues, surrounded with trim hedges, closely-shaven grass-plots, and tidy flower-beds. Each has its motto in front, in painted or gilt letters, such as 'My Delight,' 'Beyond Expectation,' 'Rural Felicity,' 'Our Contentment,' 'Sweet Solitude,' 'My Desire is Satisfied,' which serve to amuse the stranger, however disposed to question the taste of the proprietors.

## CHAPTER IV.

### GERMANY.

ERMANY, from the Latin *Germania*, is the English name of the country which the natives call *Deutschland*, and the French *Allemagne*. It occupies the central portions of Europe, is a region of high historic renown and great political importance, embracing within its limits the principal possessions of two first-class powers, the Austrian and Prussian monarchies, with several minor kingdoms, and a multitude of states of subordinate rank, all united in the bonds of a common confederation. The shores of the North Sea and the Baltic, with the Danish peninsula, form the northern boundary; the confines of Switzerland and Italy, with the head of the Adriatic, mark the southerly extent; France, Belgium, and Holland lie on the western frontier; and from thence the country stretches to Prussian, Russian, and

Austrian Poland, and to Hungary and Croatia. The territory thus enclosed, lies between latitude  $44^{\circ} 50'$  and  $54^{\circ} 50'$  north, and between longitude  $6^{\circ} 20'$  and  $20^{\circ} 10'$  east. Its extreme length, north and south, amounts to 680 miles; the greatest breadth is somewhat less, or 615 miles; the circuit measures 2700 miles, of which only a comparatively small proportion is sea-coast; and the area contains 280,000 square miles. Complete uncertainty rests upon the origin and meaning of the classical denomination; but it is conjectured by some to have been borrowed by the Romans from the Gauls, who denoted a loud cry by the word *gairm*, out of which the epithet might be formed in allusion to the war-shout of the tribes, like the Homeric *boen agathos*, 'good at the war-shout.' Another derivation gives to the term German the signification of 'war-man,' from *ger*, the root of the French *guerre*, and the Spanish *guerra*, 'war.' The *Allemagne* of the French is derived from the *Alemanni*, 'all men,' a powerful confederacy of the populations who vigorously assailed the Roman Empire, and were eventually mastered by the Franks. The first part of the native name, *Deutschland*, is formed from the old Gothic word *thiudisk* or *diutisc*, 'people,' referring to the popular tongue, and has its equivalent meaning in 'fatherland,' a favourite phrase with the present inhabitants.

Three natural divisions may be recognised in this extensive territory, northern, central, and southern, differing in their superficial aspect. From the sea-margins on the north, extending to a distance inland, varying from 100 to 300 miles, the country is generally low and level, part of the great European plain. It consists of a series of sands, heaths, peat-moors, pine-woods, and small lakes, with cultivable tracts along the courses of the rivers; and would be, to a large extent, almost a desert, were it not for the abundant rainfall and the industry of the people. Exposed to winds from the northern seas, the climate is humid and variable; fogs and storms are common; while the winters are persistently severe, deep snow covering the ground through three or four months of the season.

The central region is beautifully diversified by hills, forming groups and ranges, some of which acquire the character of mountains, and enclose romantic valleys. They never fail to inspire the north Germans, accustomed to the wearisome monotony of nearly a dead level, with enthusiasm, though the general elevation is not considerable. The *Harzgebirge*, 'pine-resin mountains,' rise on the south of Hanover; the *Böhmerwald*, or Bohemian Forest Chain, the *Erzgebirge*, 'ore mountains,' and the *Riesengebirge*, 'giant mountains,' wall in the basin-shaped valley of Bohemia; the *Thuringerwald* over-spreads the Saxon duchies; the *Odenwald*, continued southward by the *Schwartzwald*, or 'Black Forest,' forms the Rhenish highland system, running parallel to the course of the Rhine. These, and other elevated tracts, are sometimes collectively called the *Hercynian Mountains*, from the name of the immense forest, the *Hercynia Silva* of Tacitus, which once covered a large portion of the country, and was estimated by Cæsar at sixty days' journey in length, and nine in breadth. *Schneekoppe*, 'snow-cap,' the highest point, one of the summits of the *Riesengebirge*, over which passes the frontier line between Prussia and Austria, rises 5235 feet above the sea. Removed to a distance from the coast, while protected by hills from the sea-winds, the climate in Central Germany is much drier than in the northern division; the sky is usually serene; and the temperature less liable to sudden variations.

The southern region embraces the high plateau or table-land of Bavaria, with the chains of the *Rhætian* and *Noric Alps* in the background, which extend in enormous masses over the *Tyrol* and the other adjoining provinces of Austria. The elevation here checks the climatic effect of the southerly latitude; and except in the close deep valleys and at great heights, where the opposite extremes of heat and cold are experienced, the temperature is

moderate. Germany is thus in its conformation an ascent, by successive steps, from the low shifting sand-hills of the northern shores, to the snows and glaciers of the high Alps. The loftiest summit is the Ortler Spitz, 12,850 feet above the sea, a magnificent mountain, close to the Italian and Swiss frontiers. It overlooks a house on the crest of the Stelvio Pass, occupied by the inspector of the road, at the elevation of more than 9000 feet, the highest permanent human habitation and carriage-route in Europe; and has at its northern base the 'Bears' Playground,' a level tract so called from the former frequent appearance of these animals at the spot, since rendered rare by the rifles of the Tyrolese. The peak of the Ortler was scaled for the first time in the year 1804 by three peasants, in consequence of a reward offered for the achievement by a member of the Austrian royal family.

Four sea-basins receive the superficial drainage of Germany. A small part finds its way, chiefly by the rapid Adige, southward from the Tyrol to the Adriatic; a large proportion is carried eastward by the Danube to the Black Sea; the greatest quantity is conducted northward by the Elbe, Weser, Ems, and Rhine, to the North Sea, and by the Oder to the Baltic. Minute descriptions of the hydrography enumerate fifty navigable streams. The noble Danube intersects the country nearly from west to east. It descends from the slopes of the Schwartzwald in Baden, passes by Ulm, Ratisbon, Passau, and Linz to Vienna, below which its waters quit the land of their birth. Within these limits, the important tributaries are the Iller, Lech, Altmuhl, Isar, and Inn on the right bank; with the Wornitz, Naab, and March or Morava, on the left. A rapid current, with many islands in the channel, dividing it into several branches—a flow through expanded valleys and deep defiles, between vine-clad hills and forest-clothed mountains, villages and convents peeping up above the woods, and old castles crowning the heights—are features which distinguish the course of the stream, the finer scenes occurring at somewhat distant intervals. While the Danube is born in the country, the Rhine is received from Switzerland, and remains a border river from it and from France to some distance below Strasburg. It then separates the Palatinate from Baden, intersects Hesse-Darmstadt, flows by Mayence careeringly through a glorious gorge, to become wholly Prussian near Coblentz, passes Cologne with a gradually relaxing pace to the frontier of Holland. Its principal affluents in the Germanic part of its course are the Neckar and the Main on the right bank, the Moselle on the left.

From source to mouth, the Elbe (Lat. *Albis*, i. e. the 'White River') is entirely German, and is the largest river answering to that condition. It is formed in the central region, at the foot of Schneekoppe, on the north-eastern border of Bohemia, at the height of more than 4000 feet above the sea. After receiving the Moldau on the left bank, it escapes from the confined Bohemian basin, through a wild gorge in the enclosing mountains, descends to Dresden, and passes thence with a tranquil flow, through scenes of industry and fertility, by Magdeburg and Hamburg, to its embouchure at Cuxhaven. The stream has an expansion of more than ten miles at its mouth, and experiences there a tidal rise of twelve feet. In the early part of its course, while effecting the passage of the mountains, it flows between high battlements of sandstone rock, cut at intervals with smooth-walled defiles, so deep and narrow as not to be reached by the direct sunbeams, forming the district commonly styled the Saxon Switzerland. While traversing the northern plain, it receives the Mulde and the Saale on the left bank, the Havel on the right. As an infant river, the Oder belongs to Austria, rising at the base of the Carpathians, but it speedily enters Prussia, and is confined to it, passing by Breslau and Frankfurt to Stettin, below which it forms one of the *haffe*, or fresh-water expanses, which mark the shores of the Baltic. Having nearly

its whole course through a great level, the stream is extensively capable of navigation, but the current is so feeble that a north wind will arrest its flow, and sometimes reverse it, by driving the waters of the sea into the channel. The lakes of Germany have no important magnitude or points of interest, though extremely numerous in both the northern and southern countries.

The great northern plain consists of tertiary strata overlaid with very recent sand and mud, besprinkled with erratic blocks. A very extensive area south of the Danube is also occupied by the same strata, but often highly altered by the intrusion of the granitic masses of the Alps, and elevated on the mountain-slopes. Secondary rocks compose the central region, from the Danube northwards to Hanover, dislocated, elevated, and modified in character by the intruded granite which forms the higher portions of the Harz, Erzgebirge, and Reisingebirge. Basalts, trachytes, and other volcanic products, with numerous extinct craters, many of which are filled with pools, appear in the Eifel district, in the western division of Rhenish Prussia. Metals of almost every kind are obtained in abundance from the mountain-ranges; and nowhere is mining conducted with greater economy and skill. The southern countries possess vast deposits of rock-salt. Four true carboniferous beds distinguish the central, with lignites of a more modern age, but except in a few places no considerable amount of coal is raised. Clays and earthenware used in arts and manufactures abound, and are articles of export, particularly the dull yellow limestone employed in lithography, of which nearly all the supply comes from Bavaria. Mineral springs occur in great numbers and remarkable variety, many of which have been visited from very early times for sanitary purposes. Woodland districts, often indicated by the word *wald*, 'wood,' as a terminal in their names, still answer to the denomination, as the Thuringerwald, Bohmerwald, and Schwartzwald, remnants of the old Hercynian forest. The common pine prevails in the north-east; the oak, beech, and ash in the centre; the Siberian pine, and larches of enormous dimensions, in the Alpine region. In most of the states, the large forests are the property of the government, and are under careful superintendence, the timber being of great commercial value in the foreign trade, while they are the main dependence at home of millions of people for fuel. The woods supply abundance of game for field-sports, commonly sheltering the wild boar, red deer, and wolf, with the black bear and lynx in the high mountain districts. A small burrowing animal, the hamster, occurs in various parts in prodigious numbers, though an exterminating warfare is waged with it as a pest to the crops.

Germany has been appropriately styled the labyrinth of geographers, owing to the number of its political divisions; their diminutive size in many instances; fragmentary character and involved distribution in others; while several are connected with non-Germanic countries. It contains not less than thirty-four separate states, which form a confederation for the purpose of preserving the external and internal security of the country, with the independence and integrity of the component parts. They may be arranged in three groups, consisting of twelve northern, seventeen central, and five southern states. To the leading powers, Austria and Prussia, distinct chapters in this volume are devoted, while Holstein-Lauenburg associated with Denmark, and Luxemburg with Holland, are noticed in those connections. Their names are therefore simply inserted in the enumerations given. For the population of the minor states, see Table of Europe, p. 140.

| " Lübeck, . . . . .                          | Lübeck, Travemünde.                                    |

The kingdom of HANOVER consists of two detached tracts, the largest of which lies on the North Sea, but is itself nearly divided into two parts by the enclosed territory of Oldenburg. The Elbe forms the boundary for upwards of a hundred miles on the north-east; the interior is traversed by the Weser and the Ems; and the surface belongs entirely to the great northern plain. It abounds with poor or unproductive soil—marsh-lands, peat-moors, and sandy heaths—but has fertile districts along the banks of the rivers. The smaller portion of the kingdom lies on the south, detached by part of the Brunswick duchy, and has a different aspect, being overspread with the Harz Mountains, rich in minerals, clothed with forests of pine and oak. Their highest summit, 3543 feet, the Brocken, famous for its spectral illusions, which gave birth to many a wild tale in the middle ages, is just beyond the frontier, on Prussian ground. The meteorological exhibition occurs chiefly in the autumnal months, but is very occasional, depending upon a rare juncture of circumstances. At sunrise or sunset, when the opposite horizon is clothed with mist, the form of the mountain, the inn at the summit, and the figures of spectators, appear delineated in cloud-land, but in colossal proportions. Gold, silver, lead, zinc, and copper are obtained from the mines, and in some instances from the same mountain. They are partly in the hands of the government, as are entirely the railways and telegraph-lines throughout the country. The great majority of the population, who, in 1861, amounted to 1,880,000, are Protestants of the Lutheran communion.

*Hanover*, the capital, a city of 71,100 inhabitants, including the suburbs, is situated on the banks of the *Leine*, an affluent of the *Weser*, and on the main line of railway between *Cologne* and *Berlin*, in the midst of a sandy plain. Since 1837, when it became a royal residence, great improvements have taken place in its appearance, and a new town has risen up near the railway station. The old part contains specimens of quaint medieval architecture. Its principal buildings are the town-hall, the theatre (one of the largest in Germany), the king's palace, the museum, the gallery of pictures, and its numerous benevolent and educational institutions, of which the most noted is the *Georgianum*, a college for the sons of the nobility. Two palaces in the immediate environs, *Herrenhausen* and *Montbrillant*, have very beautiful gardens and grounds. The city was the scene of the deaths of *Leibnitz* and *Zimmerman*, and of the birth of the elder *Herschel*. *Leibnitz's* house is indicated, and his arm-chair is preserved in the royal library. This collection contains 100,000 volumes, in addition to which there is a public library of 40,000. Hanover was the first city in Germany lighted with gas (1826). *Celle* or *Zell*, a manufacturing town, is on the north-east; and *Hildesheim*, an episcopal city, on the south-east. *Osnabrück*, towards the south-western border, produces the coarse linens called *Osnaburghs* from the site. *Emden*, at the outlet of the *Ems*, is the principal seaport, in a low situation requiring dykes for protection from inundations of the sea. *Lüneburg*, on a small affluent of the *Elbe*, gives its name to the most extensive of the heaths, used as a sheep-walk, and much resorted to by the keepers of bees when the heather is in bloom. There are upwards of 200,000 hives in the district, yielding honey of the annual value of £40,000. *Göttingen*, in the small detached district, is the seat of a university, celebrated for books and duels. It was founded by the Elector, *George II.* of England, in 1734, and speedily acquired reputation, but has declined since seven of the professors were deprived of their chairs in 1837 for holding liberal political opinions. Yet, in 1855, it had as many as 107 professors and 713 students. The library contains upwards of 300,000 volumes and 5000 manuscripts. *Clausthal*, the chief town in the mining district, occupies

a high bleak situation in connection with the Harz, and has a school of mines, with a mint for the coinage of the precious metals.

The kingdom dates from the year 1815, having previously been an electorate. In 1714, the country became connected with Great Britain, by the second Elector, George, succeeding to Queen Anne as her nearest Protestant relative, the great-grandson of James I. The connection subsisted till the accession of Queen Victoria in 1837, when females being excluded from the Hanoverian succession, that crown passed to her uncle, Ernest-Augustus, Duke of Cumberland, and put an end to one cause of English entanglement with continental politics.

OLDENBURG, a grand duchy, embraces a district on the North Sea, wholly surrounded in other directions by Hanover, with two detached tracts in Holstein, and a third in Rhenish Prussia. Their united area does not equal that of Devonshire. The country is wholly agricultural, and very thinly peopled. A small corner of the coast has passed to Prussia by purchase, and forms the territory of *Iadhe*, a naval station, on the eastern shore of the gulf of that name. The two states of MECKLENBURG-SCHWERIN and STRELITZ border each other on the coast of the Baltic, and are held by branches of the same family, associated in the making of laws and the imposition of taxes, while separate grand duchies. Their joint area falls short of that of Yorkshire. The surface is for the most part a sandy plain, interspersed with pine forests and a prodigious number of small lakes, with some remarkable banks of stone and shingle on the shore.

*Oldenburg*, with the grand ducal palace, is a small unimportant town on an affluent of the Weser, to the westward of Bremen.

*Schwerin*, the capital of Mecklenburg-Schwerin, with a population of 22,900, is pleasantly situated on the side of a lake, with the old ducal castle on an island near the shore. *Rostock*, the largest town, containing 28,300 inhabitants, is seated upon the Warnow, a river nearly half a mile broad which forms the harbour, and enters the Baltic about nine miles below. It is the seat of a university founded in 1419, with which Kepler was for a time connected. The principal church, St Peter's, has a spire rising 420 feet, which forms a useful sea-mark. In the centre of the chief square stands the bronze statue of Blucher, a native of the town. The house in which he was born, in 1742, still exists. Another house is likewise pointed out as the one in which Grotius breathed his last; and the spot is marked in St Mary's Church where his body was interred, afterwards removed to Delft. *Wismar*, a commercial port, is at the head of an extensive bay, which forms an excellent harbour. *Dobberan*, a favourite sea-bathing resort of the north Germans, contains the summer residence of the grand duke, surrounded with pleasant beech-woods. The *Helige-dam*, or 'holy dyke,' is on the shore, a mound of stones raised to serve as a barrier against the sea, of unknown date, and therefore once superstitiously regarded. It is more than two miles in length, fifteen yards in breadth, and from twelve to sixteen feet high. In the sister-state, *New Strelitz*, the capital, and other places, are of minor note. The House of Mecklenburg is the oldest of the European reigning families.

The duchy of BRUNSWICK consists of three unconnected districts, with several others of trifling extent, chiefly interposed between the dominions of Hanover and Prussian Saxony, the total area of which is inferior to that of the county of Kent. Between Hanover and Rhenish Prussia lie the two principalities of LIPPE-DETMOLD and SCHAUMBURG-LIPPE, slightly exceeding the area of the county of Hertford. They are on opposite sides of the Weser, overspread with well-wooded hills belonging to the Teutoburger Wald, a range historically connected with the signal defeat of the Romans by the revolted Germanic tribes in the age of Augustus.

*Brunswick*, in the northernmost and largest section of the duchy, is an ancient city of about 40,000 inhabitants, situated on the Oker, and on the railway from Hanover to Berlin. The old buildings and narrow streets have much picturesque architecture; the cathedral, of great antiquity, contains the tombs of members of the ducal house, some of whom had English connections; the museum has paintings by Jan Seens, Albert Dürer, Holbein, Rembrandt, Raphael, Guido Ruysdael, Michael Angelo, and Cellini. On a fine site afforded by the levelled ramparts rises an obelisk, sixty feet high, commemorating the two dukes, father and son, who successively fell in the battles of Jena and Quatre Bras. The ducal house descends from Henry the Lion, whose effigy, and that of his wife, an English princess, the sister of Cœur de Lion, recline upon a tomb in the cathedral. The family became divided into two principal branches, the Dukes of Brunswick-Lüneburg, subsequently Electors of Hanover, and the Dukes of Brunswick-Wolfenbüttel, the present dynasty. *Wolfenbüttel*, a few miles on the south, is celebrated for its library of 200,000 volumes, containing an extensive collection of Bibles. Among them is Luther's with notes in his own handwriting.

*Detmold* and *Buckeburg*, the capitals of the Lippe principalities, are only small towns. Not far from the former, on the highest point of the Teutoburger Wald, stands a colossal statue, raised by the German princes in honour of Hermann or Arminius, the champion of German independence, who triumphed over the Romans in the battle fought at the *Saltus Teutobergiensis* in the year 10 A. D.

The free cities of BREMEN, HAMBURG, and LUBECK retain the name of the Hanse Towns, a term derived from the old German word *Hansa*, signifying a company or association for mutual support. They were so styled in the Treaty of Vienna in 1815. In early mediæval times, when commerce was insecure by land and sea, owing to unscrupulous nobles, bandits, and pirates, the great trading centres combined to protect their interests from depredation, and formed the Hanseatic League. It gradually became a most formidable body, negotiated with sovereigns, levied troops, waged war, and proceeded to maintain a rigorous monopoly of the entire trade of Northern Europe. At one period eighty-five cities belonged to the confederacy. These were distributed into four classes or circles. Lübeck was at the head of the first circle, and had under it Hamburg, Bremen, Rostock, Wismar, and other places. Cologne was at the head of the second circle, with twenty-nine towns under it. Brunswick presided over the third, consisting of thirteen towns; and Dantzic over the fourth, which included eight towns in its vicinity, and others more remote. The supreme authority of the alliance was vested in the deputies of the towns assembled in congress. To this office any one might be elected. Hence the assembly embraced politicians, artists, lawyers, clergymen, as well as merchants, though the latter predominated. The League was at the height of its prosperity and power in the fifteenth century. It declined in the sixteenth, and was dissolved in the seventeenth, owing to the growth of order and influence in adjoining states, and the successful attacks of rival traders upon its exclusive pretensions.

*Bremen* is situated on both banks of the Weser, about fifty miles above its mouth, and has a domain adjoining, chiefly pasture-ground, of about 100 square miles, surrounded by the territories of Hanover and Oldenburg. The town, clean and pleasant, contains a population of 67,200. It is a principal place for the embarkation of German emigrants, has regular communication with America by a line of packets, and very extensive trade in tobacco and cigars made at the spot. From America alone, in 1862, it imported produce valued at 11,000,000 dollars, exporting in return goods to the value of 12,000,000. In the same year the total value of its imports was 67,856,000 dollars, and its exports 63,216,000. Its governing body has the style of *Die Wütheit*, 'The Wisdom.' The old town-hall, a beautiful Gothic building, has opposite to it, in the market-place, a singular statue, eighteen feet high, to which the name of Roland is given, a hero of romance. Olbers, the physician and amateur-astronomer, who discovered the small planets Vesta and Pallas, was a native of Bremen, as well as Heeren the historian. For the convenience of vessels too large to come up the Weser, a strip of ground was obtained from Hanover at the mouth of the river. Here a harbour has been constructed, opened in 1830, and the town of *Bremerhaven*, with 6000 inhabitants, has risen up.

*Hamburg*, the greatest commercial emporium of Germany, as well as of the continent, occupies the north or right bank of the Elbe, at the junction of the Alster with it, some seventy miles up the river, and is the head of a small adjoining territory. It possesses also several islands, a few detached inland tracts, and the port of *Cuxhaven* at the mouth of the Elbe. This is the stopping place of vessels of the largest class, where others also lie at anchor awaiting favourable winds, and is resorted to by the Hamburgers in summer for sea-bathing. The public interests are presided over by a senate, the members of which are elected for life, and must serve, or quit the territory, at the same time paying a considerable fine. Till recently, external appearances in the city were not generally in harmony with its wealth and reputation, and but little was there to arrest attention besides varied costumes on passing along the streets. No grand old buildings met the eye, but several imposing structures, with a magnificent exchange, have been erected since the fire of 1842. That terrible conflagration is estimated to have destroyed property of the value of £8,000,000 sterling, and is supposed to have cost 300 lives. But as it ravaged the older and unsightly parts of the town, the opportunity was embraced to occupy the space made vacant with handsome houses and streets. Its chief buildings are the Church of St Michael, with one of the loftiest steeples in Europe; the Exchange, one of the most commodious in the world; the Johanneum, a collegiate school, with a library of 200,000 volumes, and 5000 MSS.; two magnificent theatres; the Jewish Hospital; and the Seaman's Home. The celebrity of Hamburg rests upon the vastness of its trade, the enterprise and hospitality of its merchants, and the number of its munificently supported charitable institutions. In 1862, its imports reached £48,000,000; its exports since 1837, when vessels ceased to be obliged to give notice of clearing, have not been ascertained. During the present century, it has put on a peaceful aspect, by walls and ramparts being levelled, and their space devoted to walks and gardens. But the gates remain, and are not to be passed after nightfall without

paying toll. Within the memory of present inhabitants, ingress and egress were alike prohibited after midnight. This usage took its rise in those times when bandits were abroad in such force, that the magistrates of Hamburg and Lübeck maintained forty horsemen for the protection of merchants and goods through the thirty-eight miles between the two cities. Including the suburbs of St George and St Paul, the population amounts to 176,000.

Lübeck stands on a moderate eminence encircled by the winding Trave, ten miles above its entrance into the Baltic, and has *Travemünde* for its shipping port, a small town and bathing-place, situated at the mouth of the river, as the name imports. Though shorn completely of its former consequence, when, as the head of the Hanseatic League, its fleets commanded the sea, its voice decided in the affairs of kingdoms, while far-extended commercial relations rendered it the Carthage of the north; the city still possesses a considerable transit trade, has opulent burghers, and retains many striking memorials of its past importance. Historical associations—houses, old, lofty, and picturesque, with their gable-ends facing the streets—church towers and spires out of the perpendicular—an antique cathedral and town-hall—rich wood-carvings and examples of feudal fortification—invest the place with peculiar interest. The Dom, or Cathedral, and the Marienkirche, St Mary's Church, contain many curious objects. The latter is one of the finest churches of Northern Germany, in elegantly pointed Gothic, and has an astronomical clock behind the high-altar, one of those ingenious and fantastic devices in which the mechanicians of the middle ages delighted to display their craft. Every day at noon figures of the emperor and seven electors strut forth, make a reverential obeisance before the statue of our Saviour, and then retire. The town-hall or senate-house, though defaced by modern repairs, is a striking turreted structure, in ancient Gothic, with several noble halls, in one of which, now divided into compartments, the deputies of the Hanse Towns held their sessions. These meetings were almost always convened at Lübeck, triennially at Whitsuntide; and the archives were kept in the city. One of its burgomasters presided; and during the recess, its magistrates had the principal direction of the affairs of the League. The first general assembly within its walls met in the year 1260. The last was held in 1630, when the deputies merely appeared to subscribe an act of dissolution. Still the authorities keep up the memory of former consequence in their style and title, the common councillors being the 'well wise sirs,' the syndics 'high wise,' and the head burgomaster 'your magnificence.' Of the old fortifications four gates remain. The Holstein Gate is an eminently beautiful specimen of ancient feudal architecture. Huge ramparts of earth, planted with trees and laid out with walks and drives, contribute to the ornament of the town and the convenience of the inhabitants, about 30,000 in number. In the market-place a stone is pointed out, upon which Mark Meyer, an admiral, was beheaded, for cowardice in shunning an encounter with the Danish fleet. Sir Godfrey Kneller, Overbeck, and Ostade, the painters, with Mosheim, the ecclesiastical historian, were natives of Lübeck.

## II. CENTRAL STATES.

SAXONY, a small kingdom, about the extent of Yorkshire, but a fine and fertile region, is chiefly enclosed by the dominions of Austria and Prussia, with Bavaria and the Saxon duchies on the western side. It is traversed by the Elbe from south-east to north-west, and divided by the river into two not very unequal portions. The country is generally level in the whole northern district, and presents a pleasing succession of orchards and vineyards, with the pastures on which the sheep are bred which furnish the wool so long celebrated for the quality of its fibre. But southerly it rises towards the ridge of the

Erzgebirge, or ore mountains, which separate it from Bohemia, and has beautifully picturesque features in some parts, with the sternly desolate in others, where the granite of the range forms the surface. The sterile tract is remarkable for the variety of its mineral wealth, consisting of silver, lead, copper, tin, iron, zinc, cobalt, bismuth, and arsenic; and is occupied by a hardy and intelligent mining population. Agriculture, the manufacture of fine woollen cloth and of porcelain, are prominent industries in other parts of the kingdom. The picturesque region lies on the Elbe above Dresden. For some miles from the city, the railway for Bohemia follows the course of the river, which flows between abrupt walls of sandstone, in the material of which the space for the line has been cut. Luxuriant woods intermingle with the rocky masses, and overhang the stream. Its course is very devious, and opens up at every turn some new vista of grandeur or beauty. This is the district styled the Saxon Switzerland, extending on either side some miles from the margin of the river. The remarkable points are the narrow and deeply-cut lines between the rocks; the disjointed masses which start up at once from the ground, sometimes at considerable distances from each other, as if lords in possession of particular domains; and their singular forms, that of huge regular columns capped with projecting blocks, or table-mountains with perfectly perpendicular sides, or truncated cones and inverted pyramids, the latter seeming as if a gust of wind would capsize them. One of the giants of the territory, the Königstein, rises 800 feet above the Elbe, with a spacious tabular summit, and is surrounded on all sides by precipitous escarpments of several hundred feet, while so isolated as not to be within the range of ordinary artillery from any other height. It is therefore a fortress, the access to which is wholly artificial; and one of the few citadels which has never been taken. Water is obtained for the garrison in abundance from a well sunk to an immense depth through the rock; extensive excavations serve as storehouses for provisions; and several vacant acres around the fortifications admit of cultivation. The population of the kingdom in 1861 was 2,225,240.

*Dresden*, the capital, is seated on the Elbe, which separates the old town from the new, and is crossed by two bridges. The city contains a population of 128,000, and has very pleasing environs. Without possessing any first-class public buildings, it has several remarkably rich in works of art; a picture gallery, the best out of Italy; museums of arms, natural history, antiquities, engravings, and porcelain; a library of 300,000 volumes; and the oddly-named Green Vaults, a suite of vaulted apartments on the ground-floor of the royal palace, crowded with articles of vertu, of precious stones, and of gold and silver ornaments, valued at several millions sterling. It has therefore been called the German Florence, but lacks the historical and literary distinction, the fine scenery, and the bright blue sky of the Italian city. Its finest churches are the *Frauenkirche*, the Roman Catholic church, with a splendid organ, the *Sophienkirche*, and the *Kreuzkirche*. No particular branch of industry is prominent, as the porcelain so widely known and universally admired under the name of Dresden china is chiefly made at *Meissen*, a town on the Elbe fourteen miles below. This was the first seat of the production of the ware in Europe. The art is referred to a local apothecary or alchemist, who is said to have stumbled upon the mode of transmuting clay into china while aspiring to produce the precious metals from the baser. The discovery proved a source of great wealth to Saxony, which enjoyed for many years the monopoly of the manufacture. The old Castle of Meissen, perched on a rock, has somewhat incongruously been converted into a porcelain factory. Hahnemann, the founder of homœopathy, a native, was the son of a porcelain painter.

*Leipsic* (Ger. *Leipzig*, formerly *Libiziki*, said to mean 'the home of the linden-trees,' from the Slavic, *lip* or *Upa*, a linden-tree), second in population, 78,500, is situated on a fertile plain traversed by the small streams of the Elster and Pleisse, 70 miles by rail north-west of Dresden. It is the seat of a university of distinction, founded in 1409; and the centre of the German book-trade; and, indeed, in this respect, ranks third among the cities of the world, coming immediately after London and Paris. Besides a considerable number of resident booksellers, who have an Exchange of their own, there is always a large influx at the three annual fairs. These are held at Michaelmas, the New Year, and Easter, each lasting for three weeks. The town, ordinarily dull, then exhibits a very animated appearance, as the concourse of traders and visitors, many from foreign parts, especially at Easter (including even Turkey, Greece, Armenia, Persia, and even of late, it is said, China), amounts generally to more than 50,000. Transactions to the extent of £10,000,000 take place at Easter. Leipsic has consequently become the chief seat of type-founding in Germany. Without any particular attractions, Leipsic has great historical celebrity, but chiefly as the scene of the terrible three days' conflict, in October 1813, between Napoleon and the Allies, which issued in his

defeat, and the deliverance of Germany. This 'battle of nations,' as it is justly called, from the numbers engaged and the consequences, was fought on the plain in the environs, and partly in the streets. On the fiftieth anniversary, commemorated October 19, 1863, by veteran survivors and an immense multitude, the foundation stone of a memorial was laid on the Thonberg, a low flat hill, the principal station of Napoleon during the fight. *Chemnitz*, the most important manufacturing town, with 45,000 inhabitants, has many operatives in a superior condition, possessing freehold cottages, with gardens, which they cultivate when other work is slack. *Freiburg*, the capital of the mining district, is celebrated for its mining school and rich mineralogical museum. The institution, founded by Prince Xavier in 1765, was placed under the care of Werner, and has had Humboldt, Von Buch, Jamieson, and many other eminent naturalists connected with it. The town is seated upon the metalliferous gneiss, pierced by dykes of porphyry, and is within a short walk of an extraordinary variety of geological formations. In a circle round it, with a radius of about three miles, there are nearly 100 mines of silver, copper, lead, and cobalt, where about 200 shafts, 71,000 fathoms of adit or water-course, and 250,000 fathoms of level or gallery, exhibit every species of timbering and masonry used in mining. In the neighbouring valley of the Mulda, the ores are daily roasted and smelted in twenty or thirty furnaces of various construction, and the beautiful process of separation is always to be seen in action. Of late years the produce of the mines has greatly fallen off, owing to the exhaustion of the richest veins, or their descent to a depth from which the water cannot be drained. The town is ancient, and contains a population of 17,000, much reduced since the seventeenth century, when the silver-mines were most prolific, the first of which was discovered about the year 1190.

The Saxon House consists of two branches descended from Ernest and Albert, the sons of Frederick the Gentle, who divided his possessions between them. The elder or Ernestine branch is ducal, represented by the Princes of Saxe-Weimar, Saxe-Coburg-Gotha, and other lines. The younger or Albertine branch was made royal by Napoleon, and adhered to his fortunes when Germany in general rose in arms against him. The Saxon sovereign was in consequence deprived of a large portion of territory by the Congress of Vienna, which was transferred to Prussia.

The electorate of HESSE-CASSEL consists of one large and several isolated districts of very insignificant size. The main portion is a long irregular tract, extending from the territory of Hanover on the north to that of Frankfurt on the south. It is traversed centrally by the Fulda River, an affluent of the Weser, which forms the north-eastern frontier, while the Maine flows along the southern border. The surface is generally hilly, in some parts mountainous, well wooded, and abundantly fruitful; but for a lengthened period there has been no harmony between the people and the government, owing to a succession of unworthy rulers.

*Cassel*, the electoral capital, is pleasantly seated on both banks of the Fulda, connected by railway with Hanover on the north, Leipsic on the east, Cologne on the west, and Frankfurt on the south. It contains 38,000 inhabitants, and has various manufactures planted or fostered by Flemish and French settlers, driven into exile by religious persecution. The gardens, conservatories, fountains, and the colossal statue of Hercules, within the hollow of whose club eight persons can stand, around the Wilhelmshöhe, or summer palace of the elector in the neighbourhood, have acquired for it the name of the German Versailles. It has a square called Friedrichs-Platz, the largest in any German town. Cassel was the capital of the ephemeral kingdom of Westphalia, which Napoleon created, and bestowed upon his brother Jerome. *Hanau*, on the Maine, twelve miles from Frankfurt, is eminent for its jewellery, gold and silver wares, woollen and other manufactures, founded by Protestant refugees from Belgium. In the vicinity, Napoleon, on his retreat from Leipsic, fought his last battles in Germany, October 30 and 31, 1813, in which he was victorious. *Fulda*, on the river of that name, chiefly a Roman Catholic town, boasts the shrine of the Anglo-Saxon missionary, St Boniface, in its cathedral, where his body is said to have been interred after his murder by the Frisians in 754. *Marburg*, on the Lahn, possesses a Protestant university, the first that was founded after the Reformation, and was the scene of theological discussion between Luther and Zuinglius, who occupied two houses said to be still extant. *Schmalkald*, in one of the detached tracts lying between the duchies of Meiningen and Gotha, is memorable for the great Protestant League of 1531, the articles of which were drawn up there by Luther and his associates, and signed by princes and divines in one of the inns. The town is small, ancient, and little altered, consisting of timber-built houses with high-pointed gables, the occupants of which are mostly connected with iron-mines, forges, and smithies. It lies in a valley in the heart of the Thuringian Forest, a region in which the villagers love the singing of birds, and employ their leisure in teaching them to imitate certain strains, the chaffinch being a prime favourite, soon learning in captivity a variety of short airs. Bechstein has given several of these acquired ditties of the Thuringian finches, as the Wine Song.

*'Fritz, Fritz, Fritz! willst du mit zum Wein gehen?'*

*'Fred, Fred, Fred! wilt thou go with us to the wine?'*

HESSE-DARMSTADT, a grand duchy, includes two principal portions, northern and southern, of nearly equal extent, separated by a strip of land belonging to Frankfurt and

Hesse-Cassel. Taken together, along with some small adjuncts, they form a region about twice the size of Lancashire. The northern district is mountainous, being intersected by the range of the Vogelsberg, consisting entirely of trap-rock, which rises to the height of 3000 feet. The southern is generally level, except on the eastern side, which is occupied by the beautiful hills of the Odenwald, of moderate elevation, with fine beech woods on their slopes. This last district is traversed by the Rhine, and formed by it into unequal eastern and western divisions. From the loftiest summit of the Odenwald, the conical granitic mass of Melibocus, surmounted by a white tower, the eye looks down upon villages, gardens, orchards, and vineyards, traces the winding river, marks the junction of the Neckar with it; Mainz, Worms, Mannheim, and Spires being embraced in the field of view.

*Darmstadt*, on the little river Darn, consists of a confined old town, and an agreeable new one spread over a considerable space, forming a small capital of 28,000 inhabitants. The residences of the reigning family are unpretending mansions; yet one of them contains a library of 200,000 volumes. Its principal buildings are the arsenal, barracks, and churches, one of which is crowned by a dome supported upon twenty-eight large columns. Liebig, the distinguished chemist, was born here soon after the commencement of the century. *Mainz* (French Mayence), more important, stands on the left bank of the Rhine, near the junction of the Maine with it, and marks the extreme upper limit of the fine part of its course till Switzerland is gained. The city is a great commercial centre and military station, defended by a citadel and outworks; is reckoned the strongest fortress of the German Confederation; and is garrisoned by a large number of Austrian and Prussian troops. The commandant is alternately chosen from each nation, and serves for five years. Independent of the soldiery, the population amounts to 41,000. A bridge of boats crosses the river, with one of iron for the railway route to Vienna. Mainz dates from Roman times, when it was called *Moguntiacum*, and was raised to ecclesiastical distinction by Charlemagne. Its archbishops were princes of the German empire, and claimed the right of placing the crown upon the head of the emperors. Notwithstanding railway and steam-boat traffic, commercial activity, and the music of military bands, its general aspect belongs to the past. Gutenberg, the inventor of printing, was a native and resident. His dwelling no longer exists, but its site is indicated, and a statue of him by Thorwaldsen occupies one of the open spaces. *Worms*, on the same side of the river to the south, is an ancient imperial city, once of great consequence, but now a melancholy scene of utter decay, with only 11,000 inhabitants. It has a name in history as the scene of the diet in 1531, at which Luther appeared, and denounced the corruptions of the Church of Rome. The neighbourhood was celebrated by the old minstrels as the 'Land of Joy,' and produces some of the best Rhenish wine. *Bingen*, a small frontier town on the Rhine towards Prussian territory, is the centre of highly-attractive scenery, and a common halting-place with summer tourists. Some of the most celebrated vintages of the Rheingau lie between it and Mainz. *Giessen* is the chief town of Upper Hesse, or the northern division, and the seat of a university.

The House of Hesse, of which there are two main branches, descends from two sons of Philip the Magnanimous, who died in 1567, and allotted his possessions to his family. William, the elder, obtained the largest share, with Cassel for his capital, while George obtained Darmstadt. Of this younger line the Hesse-Homburg family is a branch, holding a territory which will return to it on the failure of heirs.

SAXE-WEIMAR-EISENACH, a grand duchy, consists of not less than fifteen fragments, lying between Hesse-Cassel and Saxony, with a total extent inferior to that of the county of Sussex. The two principal portions are separated chiefly by the territory of Gotha, which has the Weimar division on the eastern side, and that of Eisenach on the western. Sites celebrated in the history of religion, literature, and war are within their limits. The surface is everywhere pleasantly diversified, has a productive soil, and embraces noble remains of the old Thuringian woodland.

*Weimar*, fifty miles south-west of Leipsic, is now simply a small plain town, but deriving interest from its former residents, Schiller, Goethe, Herder, and Wieland. The houses of the two first named are pointed out, and also their graves. Its opera-house is famous, and it has a library of 140,000 volumes. *Jena*, twelve miles distant, beautifully placed in a valley on the Saale, is the seat of a very eminent university, supported by the Saxon states. Its name is given to the great battle in the neighbourhood, gained by Napoleon on the 14th of October 1806, which made him master of Prussia and Northern Germany for several years. The spot where the aged Duke of Brunswick fell is marked by a monument. *Eisenach*, well-built, thriving, and industrial, is distinguished by the Castle of Wartburg in the immediate vicinity, very strikingly placed on a steep and lofty eminence, surrounded by forests. This was formerly a residence of the landgraves of Thuringia. It became what Luther called his 'Patmos,' as the place to which he was conveyed by the friendly violence of the Elector of Saxony, in order to screen him from his enemies on

returning from the diet of Worms. The room he occupied for ten months is shown, with the chapel in which he preached, and both are carefully preserved. A magnificent tree in the forest, eight feet in diameter, bears the name of 'Luther's Beech,' from the tradition that it marks the place of his friendly arrest. Another tree not far from Worms has the name of 'Luther's Elm,' from the tradition that he reposed at the spot while on his way to attend the diet.

The Saxon duchies of COBURG-GOTHA, MEININGEN, and ALTENBURG adjoin the preceding district, and form three states, each composed of detached tracts, but so small that their aggregate area is considerably less than that of Devonshire. On the northward lies the ducal territory of ANHALT, a little larger than the county of Warwick, and almost entirely environed by the province of Prussian Saxony. It is traversed by the Elbe, which receives the Mulde within its limits, and is intersected by another important affluent, the Saalle, which joins the main river a short distance beyond the frontier.

*Coburg*, on the small stream of the Itz, which flows into the Maine, has a very widely-known name, from the connection of the reigning House with the British royal family, but the place is small, containing only 10,000 inhabitants. The ducal palace of the Ehrenburg, 'burg of honour,' a simple and chaste building, occupies three sides of the principal square, and contains the government offices, a library of 30,000 volumes, and a collection of objects of natural history, with coins and prints. The environs of the town are very beautiful. Perched on a commanding eminence which immediately overhangs it, stands the old ducal castle which afforded an asylum to Luther, and was besieged unsuccessfully by Wallenstein. *Gotha*, the alternate capital of the duchy and residence of the court with Coburg, is seated on an eminence, at the foot of which winds the Leine, a tributary of the Werra; and is about midway on the railway-route between Leipsic and Cassel. It is the larger town of the two, has various manufactures, a literary and scientific character, with a geographical publishing establishment of the first class, that of M. Perthes. The house issues the celebrated *Almanach de Gotha*, which completed the century of its existence in the year 1863, and then appeared with a brief historical notice of its career. The ducal residence has an imposing appearance from its position, on the crown of the height on which the town is built. It contains a library of 150,000 volumes, and 6000 MSS., among which are 2000 Arabic, and from 300 to 400 Persian and Turkish, a valuable cabinet of engravings, and one of the best collections of coins and medals in Germany, numbering in all 93,000. The country districts are to a large extent hilly forest lands, clothed with pines, often rising to the height of nearly 300 feet, famed as hunting-grounds for red deer and other game, while the timber obtained for building purposes yields an important revenue to the state.

*Meiningen*, on the Werra River, the capital of a duchy which gave Queen Adelaide to the British throne, its largest town, has scarcely 7000 inhabitants. *Sonneberg*, about half the size, is a remarkable industrial site, where the wares are extensively made which are sold throughout the world under the name of 'Dutch toys.'

*Altenburg*, near the Pleisse, which flows to Leipsic, upwards of twenty miles to the northward, is a well-built commercial town, with a population of 16,800, among whom the antique costume of long bygone days is prevalent. *Eisenberg*, 'iron mountain,' also a manufacturing town, produces woollens, porcelain, and earthenware.

*Dessau*, the capital of Anhalt, is very pleasantly situated on the Mulde, near its confluence with the Elbe, in a richly-cultivated district. This town, with Koethen and Bernburg, formerly represented three distinct duchies. That of Koethen was united to Dessau in 1853; and that of Bernburg lapsed to it in 1863, by the failure of its ducal line. *Alexisbad*, a small watering-place, with strong chalybeate springs, has its name from the late Alexander Charles, Duke of Anhalt-Bernburg, who caused most of the buildings for visitors to be erected, and had a villa at the spot.

NASSAU, a ducal state, consists of a single territory of compact form, somewhat smaller in size than Lancashire. It extends along the right bank of the Rhine, from the junction of the Maine with it to the neighbourhood of Ehrenbrietstein, opposite Coblentz, and is almost wholly environed by Prussia and Hesse-Darmstadt. It embraces the eastern side of the grand defile of the Rheingau, through which the river flows full to the brim, and vigorous in its current, between castle-crowned crags, sloping vine-clad hills; towns and villages by the score lying on the banks, full of life and animation, sobered, yet rendered doubly interesting by the hues of antiquity. The interior is traversed from east to west by the Lahn, which divides it into two nearly equal portions, northern and southern, having its course through a valley of rich woods and verdant pastures. Northward rise the heights of the Westerwald, bleak and pastoral; southward lies the range of Taunus, rich with sylvan scenes and industrious cultivation. The country is

very remarkable for the number of its mineral springs and fashionable watering-places. They vary greatly in their properties and temperature, some being quite cold, while others are strongly heated. The district possesses a large amount of mineral wealth, consisting of copper, iron, and manganese of superior quality, chiefly obtained from mines in the basin of the Lahn.

*Wiesbaden*, the residence of the duke, the seat of government, and principal resort of visitors, is a handsomely-built town of modern appearance, in which hotels, lodging-houses, saloons, and gardens are conspicuous, with a throng of upper-class strangers from June to September. The resident population is about 20,000, but during the aforesaid months it is greatly increased. It is situated within a short distance of the Rhine, twenty-six miles by rail west of Frankfurt, in a delightful valley open towards the south, but enclosed on the other sides by the swelling hills of Taunus, which serve as a screen from the cold winds, and render it a suitable place of abode for delicate persons in winter. There are fifteen mineral springs of the same alkaline quality, closely corresponding also in their temperature, and hence believed to be the outpourings of a common source. The principal, called *Kochbrunnen*, 'boiling spring,' has a cloud of vapour resting upon the surface of the water, and is in a state of ebullition, with the heat of 156 degrees of Fahrenheit. The town occupies the site of a Roman station, of which remains are constantly turned up in the process of digging for the foundation of buildings. *Ems*, in the valley of the Lahn, was likewise known to the Romans as a bathing-place, who called it *Embasis*, the 'washing-tub,' from which the present name is derived. The other waters in the most repute are those of *Schwalbach*, *Schlangenbad*, and *Selters*. Sir F. Head remarks, that should his 'reader be consumptive, or, what is much more probable, be dyspeptic, let him hurry to Ems; if he wishes to instil iron into his system, and to brace up his muscles, let him go to *Langen-Schwalbach*; if his brain should require calming, his nerves soothing, and his skin softening, let him glide onwards to *Schlangenbad*; but if he be rheumatic in his limbs, or if mercury should be running riot in his system, let him hasten "body and bones" to *Wiesbaden*, where, they say, by being parboiled in the *Kochbrunnen*, all his troubles will evaporate.' The far-famed *Selters* or *Seltzer* water, drunk as a luxury through the whole civilised world, is obtained from a spring near the village, so called at the base of the *Westerwald*. More than a million and a half of bottles of it are stated to be exported annually.

The duchy derives its name from the picturesque Castle of Nassau, an extensive ruin on the summit of a conical wooded height by the *Lahn*, which has the small, ancient, and decayed town of Nassau on the opposite bank. It is a conspicuous and romantic object in the landscape. From the feudal proprietor of this stronghold in the middle ages the ducal house descends, and forms the elder branch of a family the younger of which is represented by the kings of Holland.

The five principalities, *Waldeck*, *Reuss* elder and younger, and the two *Schwarzburgs*, with the landgraviate of *Hesse-Homburg*, are of very trifling extent, as their united area does not equal that of the county of Northumberland. With the free city of *Frankfurt*, they complete the list of the Central German States.

*Pyrmont*, in a small northern division of *Waldeck*, though not the capital of the principedom, is the largest town, yet with only 7000 inhabitants. It lies close to the Hanoverian border, and is distinguished as one of the oldest watering-places in Europe, to which Charlemagne repaired, visited downwards from his time, at present by reduced numbers, but of the highest rank. The springs are variously chalybeate, saline, and acidulous, some of which are so strongly impregnated with carbonic acid gas, that the water effervesces like champagne. A large quantity is bottled and exported. The vicinity of the town is remarkable for the *Dunst Höhle*, a cavity in the sandstone rock, emitting a deadly vapour, the same as the choke-damp of mines, therefore enclosed to prevent injury from incautious exposure to it. Small animals are killed in a few minutes.

*Homburg*, nine miles north of *Frankfurt*, the little capital of the smallest Hessian state, is charmingly placed amid the forest-clad hills of *Taunus*, and attracts by curative springs in addition to the lovely scenery, while the inglorious distinction belongs to it of surpassing all the other gambling dens of Germany in the magnitude of its transactions.

*Frankfurt*, an ancient imperial free city, in possession of a small adjoining territory of thirty-nine square miles, is seated on the north bank of the *Maine*, about twenty miles above its junction with the *Rhine*, and contains a population of 75,000. A suburb, called *Sachsenhausen*, lies on the south bank of the river; both sides are lined with quays; and are connected by an old stone bridge. It is the capital of the Germanic Confederation, as the place where the diet holds its sessions, and the residence of the foreign ministers. Without possessing any public buildings of striking architectural merit, the general appearance is very noble. The streets are spacious in the newer portions; the houses in them are palaces, occupied by merchants, bankers, and diplomatists; and signs of opulence are everywhere apparent in the environs. Great historical celebrity belongs to the city. Occupying a central position, it was early made the site of national assemblies; and was afterwards the place in which through several centuries the emperors of Germany were elected. The *Hotel de Ville* contains the *Hall of Election*, where the deliberations were

carried on and the suffrages given; and also the Imperial Hall, in which the newly-chosen sovereign gave his first public banquet, hung round with portraits of the potentates. In the adjoining cathedral they were crowned. Frankfurt has long been the seat of great inland commerce, and a centre of banking transactions for the continent. Its inhabitants have always included a large number of Jews, among whom the Rothschilds here acquired their wealth and influence. The house occupied by the founder of their fortunes is indicated in the *Juden-gasse*, or Jews Street, to which members of the persuasion were formerly restricted. This street was formerly closed at either end with gates; which were locked at an early hour every night, and no ingress or egress allowed till the morning. The Jews now reside in any quarter they choose, and possess a very handsome synagogue. Goethe was born in the city, and has a statue in one of the squares. Museums, libraries, galleries of art, and charitable institutions are numerous.

### III. SOUTHERN STATES.

| States.                                     | Principal Towns.                                 |

BAVARIA is by far the most important of the minor German states in extent of territory, population, and political influence. It consists of two divisions of unequal size, eastern and western, separated by the possessions of Wurtemberg, Baden, and Hesse-Darmstadt. The eastern portion, much the largest, is called the Territory of the Danube and Main, being watered by those rivers. The western is the Territory of the Rhine, lying along its left bank, and is also styled the Palatinate. It was formerly part of an extensive district governed by Electors Palatine of the Bavarian house, one of whom, Frederic V., married the Princess Elizabeth, a daughter of James I, whose great-grandson ascended the throne of England as George I. The area of the two divisions is inferior to that of Scotland. Population (in 1861), 4,689,800.

The eastern, or main portion of the kingdom, comprising seven of the eight provinces, is extensively bordered by the Austrian empire, and divided into northern and southern sections by the Danube, which flows through it from west to east. That river is fully formed as a noble stream within its limits. It becomes navigable at Ulm on the western frontier, and receives on its onward passage the Iller, Lech, Isar, and Inn on the right, with the Altmuhl, Nab, and Regen on the left. Two fine monuments raised in honour of the German nation grace its banks. Six miles below Ratisbon, on a rock rising up boldly from the river, stands the Walhalla, a splendid Doric temple, erected by the late king to receive the busts and statues of distinguished Germans, completed and inaugurated in 1842. On the Michaelsberg, a high rock at the junction of the Altmuhl, which marks the eastern end of a grand gorge, the Temple of Liberation rises in majestic proportions, a memorial of the deliverance of Germany from a foreign yoke obtained by the battle of Leipsic. It was opened with great ceremony on the fiftieth anniversary of the conflict in 1863. The names of the different races who fought and conquered, with those of eighteen of the principal commanders, Austrians, Prussians, Bavarians, and others, are inscribed on tablets. Of the commanders only one survived at the period of the opening—the king of Wurtemberg. Over the entrance are the words in bronzed zinc: 'To the German Warriors of the War of Liberation, Ludwig I, King of Bavaria, 1863.' The Michaelsberg rises to the height of 374 feet, and the temple ascends 204 feet above the summit.

South of the Danube the country is a high undulating plain or table-land, penetrated by spurs of the Tyrolese Alps, and overspread with numerous lakes, of which the Chiemsee is the largest, and the Konigsee, close to the Austrian frontier, the most beautiful. North of the river, the surface is diversified by the wooded ranges of the

Bohmerwald on the eastern frontier, the Fichtelgebirge on the north-east, the Speissart on the north-west, and the romantic region of the Franconian Switzerland in the centre. The group of the Fichtelgebirge, 'pine-bearing mountains,' is a prominent hydrographical point on the great water-shed of Europe, separating streams which flow from it in opposite directions, and ultimately reach different seas. The White Maine rises within its limits, at the base of Schnesberg, and flows westward to the Rhine; the Eger emerges from the cluster, and travels eastward to the Elbe; the Saalle runs northward to the same channel; and the Naab southward to the Danube. These four rivers, having their sources and early course connected with an area of limited extent, led to the region being compared to the Garden of Eden with its quadruple streams. The central district, called the Franconian Switzerland, is included between the towns of Nuremberg, Bamberg, and Baireuth. The name refers to the picturesque natural scenery, and to the early colonists of the country, the Franks, who originated the old territorial division of Franconia, now forming three circles or provinces of Bavaria. It consists of a high plain cut with deep valleys or dells in which the interest of the region centres. The dells are the beds of trout-streams, adorned with rich clumps of vegetation, and lined with limestone rocks, between which at intervals neat villages nestle, and on which the remains of feudal castles, turrets, and watch-towers appear. The rocks are very remarkable for the number and extent of their chambered caverns, in which immense quantities of the bones and teeth of bears, hyænas, and other animals of extinct species have been found, now largely rifled of their contents. The Cave of Kùhloch, which resembles in size and proportions the interior of a large church, contained upon its floor, covering it to the depth of six feet, hundreds of cart-loads of black animal dust, mingled with teeth, principally proceeding from mouldering bones. Dr Buckland estimated the amount to be equal to at least 2500 individuals of the cavern-bear. The country, among its living animals, retains the stag, roebuck, fallow deer, wild boar, wild cat, and chamois. Otters are found in almost all the rivers, and the beaver lingers on some solitary streams. Specimens of the latter, taken on a small tributary of the Isar, are in the museum of natural objects at Munich. The lynx and bear are supposed now to be extinct. The last bear seen was killed in 1835, and the last lynx in 1846, both in the mountains bordering on the Tyrol. Wolves likewise are nearly exterminated in the forests. One was killed in 1837, near the Tegern-see; three in 1848, in the Palatinate; one in 1852, in the Upper Palatinate; and one in 1859, in Lower Franconia.

The Bavarians, far beyond any other German people, are addicted to the beer-drinking habit. Inordinate quantities are taken daily by all classes. The state derives a large portion of its revenue from this propensity, and the country has no little resemblance to an enormous brewery, from the number and size of the establishments created to meet the national demand. 'Listen,' says Mr Wilberforce, a recent visitor, 'to the conversation of Bavarians, it turns on beer. See to what the thoughts of the exile recur, to the beer of his country. Sit down in a coffee-house or eating-house, and the waiter brings you beer unorderd, and when you have emptied your glass replenishes it without a summons. Tell a doctor the climate of Munich does not agree with you, and he will ask if you drink enough beer. Arrive at a place before the steamer, or train is due, and you are told you have so long to drink beer. Go to balls, and you find that it replaces champagne with the rich, and dancing with the poor. I once went to a servants' ball and stayed there some time; but when I came away, dancing had not begun, and all the society was sitting as still as ever drinking beer.' By an iniquitous and absurd law, marriage is not allowed till a couple have what is called assured means of subsistence; and as the authorities are the sole judges in the case, the permission is delayed for years, in order to obtain the fees

attendant on each application. Social immorality is hence the natural result, and a number of illegitimate births sometimes exceeding that of the legitimate. In a south-eastern section of the kingdom, an old popular custom maintains its ground in spite of gens d'armes and fines, quite foreign to the orderly movements of German life, akin to the American system of lynch-law, and apparently a lingering trace of the judicial visitations for which secret societies were organised in the middle ages. Upon an individual becoming obnoxious by his avarice, usury, or any offence not cognizable by law, he receives warning to amend his manners. If his misdeeds are continued, a band of men is collected by private summons from a distance, who appear in disguise, surround his house at night, armed with every instrument capable of making a discordant noise—pans, bells, horns, trumpets, and whips. After a hideous uproar, the culprit is called out, and dares not disobey. A dispatch is then read to him by torchlight, as if coming from the Emperor Charlemagne, which sets forth his crimes, and admonishes him to reform on pain of further proceedings. The ceremony closes with a renewal of the uproar, in which jeers and yells mingle with every kind of clang and bang. Charlemagne is the great traditional hero of the peasantry, and is claimed by the Bavarians as their countryman. A quiet spot in a valley on the south-west of Munich, marked by a corn-mill and a few neat buildings, is referred to as the place of his birth.

The population consists very generally of Roman Catholics, distinguished in the rural districts especially by a profound respect for relics and the devout observance of pilgrimages, for whom the manufacture of sacred images is a flourishing trade in several villages. In the small town of Altötting, near the river Inn, the shrine of the Black Virgin constitutes it the Loretto of Bavaria. The figure, over the high-altar in the church, is of undoubted antiquity, eastern origin, and sable complexion. For more than 1000 years devotees have flocked to the sanctuary, and still come annually in crowds, seeking some cure of disease, or other benefit, from the dark-hued object of their veneration. At Ammergau, towards the frontier of the Tyrol, the dramatic representation of the story of the Passion is a decennial performance. The name of the village refers to its position in the *gau* or valley of the *Anmer*, which descends from the highlands through it to join the Isar on the plains. In 1633, after a famine and pestilence, a portion of the inhabitants made a vow that thenceforth they would perform every tenth year the Passion of Christ in a sacred play; and since that time the pledge has been kept with the slight variation that in 1680 the year was changed so as to accord with the recurring decennial periods of the century. Such spectacles were common in the middle ages, under the name of 'mysteries' or 'moralities,' and received the sanction of Protestantism in its early stages. But the practice has very properly been generally abandoned, and the Ammergau play is now the principal surviving example of it. A rustic edifice is raised for the occasion in the vicinity; the stage scenery and the dresses are the work of the villagers; and the actors are all inhabitants of the place. The last representation took place on the 30th of September 1860, in the presence of the king of Bavaria, and of several English visitors, who bore testimony to the perfect decorum of the peasantry, performers and spectators, yet strongly felt the utter inapplicability of such a scene to other times and places than its own. The representation will next occur in 1870.

*Munich*, the capital, called by the Germans München, 'monkstown,' lies on the banks of the Isar, and contains a population of 148,000. It was founded in 962, and walled in 1157. Seated on the Bavarian table-land, it occupies a more elevated position than any European city after Madrid, and being on a naked plain, it suffers alternately from exposure to biting blasts from the Tyrolean Alps in winter and spring, and to a burning sun without shade in summer. The city consists of an old town of narrow thoroughfares huddled close to the river, and of a new one far spread in every direction around it, distinguished by spacious streets and squares, chastely magnificent public edifices, statues, and monuments, extensive pleasure-

grounds, walks, and drives. This last and principal portion has been formed during the present century, and was mainly the work of the late king, who did his best at once to embellish his capital and corrupt its inhabitants. The Glyptothek or sculpture-gallery, and the Pinakothek or picture-gallery, with no fewer than 300,000 engravings; the Odeum, devoted to music; the royal library, of vast extent, with 800,000 volumes, 18,600 MSS., and many rarities—contained in noble buildings, annually attract a large number of the votaries of art and taste from various countries. The university, founded in 1826, is one of the most respectable in

Royal Palace, Munich.

Germany. But Munich is not without a list of disagreeables. Its heat, glare, dust, and shadelessness, in summer, are painful; its splashy mud in wet weather, and its keen winds in cold, are not pleasant; its beer-drinking is excessive; its formal salutations are interminable; and the full salute to royalty in the streets, which is required, is ludicrous. Outside the city, a colossal bronze female figure, 84 feet high, intended to personify Bavaria, stands upon a pedestal of marble. The statue is hollow, and may be ascended by a spiral staircase to have a look-out from the eyes. The city is noted for its manufacture of telescopes and mathematical instruments. Twenty miles to the east, lies the village of Hohenlinden—the scene of the battle (celebrated by Campbell's ode) in which Moreau triumphed over the Austrians in the first year of the century.

*Augsburg*, seated on the Lech, on the north-west, is ancient and very picturesque, with evidence in the vast size of many dwelling-houses of the wealth, in former days, of its citizens, who were 'merchant-princes,' managing the exchanges of Europe. An inn, with the sign of the Three Moors, mentioned in records of the year 1364, is still extant, after an existence of five centuries. The old episcopal palace remains, in the hall of which the Protestant declaration of faith drawn up by Luther and Melancthon was presented to the Emperor Charles V. in 1530, hence called the Confession of Augsburg, is now devoted to public business. Though decayed, the city still contains 45,000 inhabitants, and issues the most influential and widely

circulated of the continental newspapers, the *Allgemeine Zeitung*. Transactions of great magnitude are conducted in banking, jewellery, horology, cotton, and other manufactures. *Ratisbon*, equally celebrated in the past, but now much more reduced, occupies the south bank of the Danube, nearly opposite to the influx of the Regen, and has hence the German name of Regensburg. It marks the western limit of the incursions of the Turks in Europe, some of their advanced parties having appeared in the neighbourhood during the famous siege of Vienna in 1683. The imperial diets were held for a long period in the town-hall, beneath which the hideous dungeons are shewn in which prisoners were immured, and the torture-chamber in which attempts were made to extort confessions. There are manufactures of porcelain, steel goods, leather, and tobacco. The astronomer Kepler died at Ratisbon, and was buried in an unmarked grave. *Passau*, on the eastern frontier, occupies a remarkable position, built on the tongue of land formed between the Danube and the Inn at their junction, while on the opposite or north bank the dark stream of the Ilz enters, and around lies an amphitheatre of crags and mountains. Near the opposite or western frontier, and close to the great river, is the village of Blenheim, the scene of Marlborough's decisive defeat of the French in 1704.

*Nuremberg* (Ger. *Nürnberg*), next to the capital in population, 62,700, is seated on the Pegnitz, a tributary of the Main, which divides it into two nearly equal parts, and is crossed by fourteen bridges. The town was founded in 905, and in 938 became the seat of the first German diet. It was raised to distinction at an early period by the ingenuity of its natives in various handicrafts, and it retains perhaps more than any other place the aspect it wore in the middle ages. There are feudal walls, turrets, and watch-towers—irregular streets—houses with acutely-pointed gables facing them—projecting oriel windows—palatial stone dwellings with beautifully-sculptured fronts, erected by the leading citizens when their commerce was so extensive as to find expression in the proverb, 'Nuremberg's hand—goes through every land.' Numerous inventions in the mechanical arts originated here, as copperplate engraving, the gun-lock, the air-gun, the clarinet, a machine for wire-drawing, the combination of metals now adopted in the manufacture of brass, and watches, not made round, but oval-shaped, hence called 'Nuremberg eggs.' Albert Durer, painter, sculptor, and engraver, 1471—1528, was a native, as well as Hans Sachs, the cobbler and poet, a contemporary. Their houses remain; their graves are indicated; and both have streets named after them. After falling from a highly-prosperous condition into sad decay, chiefly through the calamities of war, the town has again become an important seat of manufacture and trade. It produces cloths, metal-wares, mirrors, and furniture; exports immense quantities of the so-called Dutch toys, the workmanship of the Thuringian villagers; and serves as a general depôt for goods passing between northern and southern districts. *Bamberg* on the north, *Baireuth* on the north-east, and *Wurzburg* on the north-west, are considerable industrial sites. *Kissengen*, thirty miles north of the latter, is the principal Bavarian watering-place, with acidulous and chalybeate springs, to which many English annually repair, and the water is largely exported.

*Spire* (Ger. *Speyer*), the chief town in the Palatinate, or Rhenish Bavaria, stands on the left bank of the Rhine, and is of high antiquity, historical interest, and mournful celebrity. Princes once took counsel within its walls, and eight emperors were buried in its cathedral. At the diet held here in 1529, the protestation of the Reformed leaders against its decree originated the distinctive name of Protestants for the followers of Luther. It has the remains of an ancient palace, in which 49 diets were held. The citizens once enjoyed a monopoly of the carrying trade on the river, and were distinguished for their military as well as commercial spirit. But the army of Louis XIV. of France, in 1683, reduced the town to a dismal ruin. Upon its capture, the inhabitants had notice to quit by an appointed day on pain of death; the place was set on fire; and a conflagration of three days and nights ensued. In little more than a century afterwards, 1794, when beginning to recover from this blow, the French revolutionary army renewed the desolation. Spire is now the mere skeleton of its former self, with only about 9000 inhabitants. The cathedral, restored by the government, is one of the noblest in Europe, remarkable for the simple, colossal, and symmetrical grandeur of the design, with the advantage of standing detached in a plot of ornamental ground, like our own cathedrals, a feature which attends few foreign ecclesiastical edifices.

The reigning family of Bavaria descends from Otto of Wittelsbach, 1180. After being ducal and electoral, it was made regal by Napoleon in 1806.

**WURTEMBERG**, a small regal state, inferior in extent to the Welsh principality, lies between Bavaria on the east and Baden on the west, and is enclosed by them, except on the south, where it touches the Lake of Constance, and nearly surrounds the Prussian patrimony of Hohenzollern. The Danube, as an infant river, crosses the southern part of the country from west to east; but the Neckar is the characteristic stream, flowing from the centre northward to the Rhine, through a rich and beautiful valley, a scene of vine cultivation. The bold heights of the Schwarzwald rise on the side towards Baden, and a rugged plateau occupies a central area, apart from which the surface exhibits gentle hills and valleys in the highest degree fertile, and industriously cultivated.

*Stuttgart*, the capital, seated on the Nesenbach, which joins the Neckar, contains a population of 56,000. Hills closely surround the town, thickly clothed with vineyards, which give a rich and beautiful appearance to the environs in summer, and may be seen from all the streets. The charm of the situation, with mineral

springs in the neighbourhood, and the moderate cost of living, invite strangers to a temporary residence. The public library is distinguished by its collection of Bibles, one of the largest in the world, consisting of more than 8000, in sixty different languages. Danneker, the sculptor, whose *Ariadne* is the pride of Frankfurt, was a native, became professor of the Fine Arts in the Academy, and remained a resident till his death in 1841. Stuttgart is the seat of an important book-trade. *Heilbronn*, on the lower course of the Neckar, an industrial town, is the centre of the principal vintage district. *Tübingen*, on its upper banks, contains the university of the kingdom, founded in 1477, which had among its earliest professors Melancthon and Reuchlin. Its most celebrated professor in modern times is Baur, the founder of the well-known 'Tübingen school' of theology. Uhland, the lyric poet, recently deceased, resided here; Wieland composed his *Oberon* in the neighbourhood; and Schiller was born at a village lower down the stream. *Ulm*, on the Danube, at its entrance into Bavaria, ancient and dull, possesses a cathedral of the first class, now devoted to the service of Protestantism. The town is a fortress of the Germanic Confederation, of inglorious notoriety from the surrender, within its walls, in 1805, of General Mack to Napoleon, with the entire Austrian army under his command, without striking a blow.

BADEN, a grand duchy, is a long narrow territory on the right bank of the Rhine, extending along its course from the Swiss frontier to the border of Hesse-Darmstadt. It is traversed from north to south by the granitic range of the Schwartzwald, or Black Forest, so called from the dark hue of the pines which clothe the lower slopes and the enclosed valleys of the upper region. The highest point, the Feldberg, rises to 4675 feet above the sea, and long bears the winter's flakes upon its head. In spring the melting of the snow along the whole crest of the ridge swells an endless number of streams, which often set out from very closely-contiguous points, and travel in opposite directions, some by the Rhine to the North Sea, others by the Danube to the Black Sea. It has been said that the droppings from different sides of the same house-roof, in some instances, take these courses; and thus pass to basins a thousand miles apart from each other. Very striking scenery marks many parts of the range, as in the valley of the Treisam, a defile by which it is crossed from Freiburg to Schafhausen. This is locally called the Höllenthal, or Valley of Hell, but it has nothing infernal, or even savage, in its aspect, though with wild and sublime features. The pass is celebrated in military history for the successful retreat of Moreau and his army through it in 1796. On gaining the summit, and looking out on the opposite side, the waters of the Lake of Constance may be discerned, and a wide panorama is unfolded, to which the name of the Kingdom of Heaven has been given. The Neckar crosses the northern part of the duchy on its way to the Rhine. The Danube rises within its limits, in the southern portion. A fountain in the castle-garden of the village of Donaueschingen is the nominal source; but two rills descending the eastern slopes of the Schwartzwald are better entitled to the distinction. Mountain scenery, extensive woods, numerous streams, a mild climate, and a fertile soil, have won for Baden the epithet of *Das Eden Deutschlands*, 'The Paradise of Germany.' It produces rich crops of the ordinary cereals, with tobacco, maize, hops, flax, hemp, wine, and oil. In the Black Forest district the villagers manufacture a large number of wooden clocks, polish crystals, and rear singing-birds.

*Carlsruhe*, the capital, is a small, elegant, but dull place, of modern origin and formal appearance, situated a few miles east of the Rhine. Population, 27,000. It contains the grand-ducal palace, from which all the principal streets, thirty-two in number, diverge like the rays of a fan, and has a few other buildings praised for their architecture. The principal are, besides the grand-ducal palace, the palace of the old margrave, the polytechnic school, the schools of science and the fine arts, churches, the mint, barracks, hospitals, and arsenal. The site was formerly a forest, large remains of which are still in the environs. Here the Margrave Charles had a hunting-seat, called Carl's-ruhe, 'Charles's Rest,' which became the nucleus of the city, and supplied it with a name, in the early part of the last century. *Baden-Baden*, on the south, in high repute as a visiting-place from its warm mineral waters, offers various attractions to mere pleasure-seekers, with whom it is thronged in the summer months. Not the least is the charming locality, encircled by hills, offshoots of the Black Forest, which abound with murmuring streams and delicious woodland shades. The springs were known to the Romans, who planted a colony at the spot, with the name of *Civitas Aurelia Aquensis*. The hottest has a temperature of 153° Fahrenheit. Twelve others rise near it, and render the soil so warm that snow never lies on the ground in the coldest weather.

*Mannheim*, situated at the confluence of the Neckar with the Rhine, the largest town in the duchy, with 27,100 inhabitants, is also the chief seat of commerce. It is very regularly built, has spacious streets crossing each other at right angles, and quite a modern air, having been almost entirely reconstructed since the close of the last century, when the French were compelled to surrender it to the Austrians, after a bombardment which laid the greater part in ruins. Being easy of access, as well as pleasant and cheap as a place of residence, it has a considerable colony of English.

*Heidelberg*, an antique-looking town, thirteen miles to the eastward, with 16,000 inhabitants, occupies the south bank of the Neckar, and the slope of a hill rising up from it, where the valley of the river opens into the spacious valley of the Rhine. The richness and beauty of the country, with various memorials of the past, and the unfortunate history of the place, combine to render it full of interest. Formerly the capital of the Palatinate, a state now merged in adjoining territories, it underwent all the cruel vicissitudes of that district in the seventeenth century—bombardments, pillage, fire, and sword, first from the imperialists, next from the French. The conspicuous object is the palatial castle of the old Electors, which, after being restored from the ravages of war, was fired by lightning in 1764, and reduced to desolation. The grand ruin stands on a wooded height, and commands one of the finest views of its kind in the world, embracing the winding Neckar and the gleaming Rhine; with towns, villages, church-towers, and vineyards, bounded by the distant heights of the Vosges Mountains in France. In a cellar beneath the castle is the famous Tun, capable of holding 800 hogsheads, the largest of all wine-casks, but inferior in size to many of the porter-vats of London. St Peter's Church is memorably connected with Jerome of Prague, who nailed to its door a summary of the reformed doctrine which he preached to a multitude in the churchyard. Heidelberg is the seat of a university, the oldest in Germany proper, having been founded in 1386. It has a library of 150,000 volumes, and a large manuscript collection, and is much resorted to by students from England and Scotland. The German students are notoriously addicted to duelling, beer-drinking, and boisterous revelry in the streets at night. *Freiburg*, in the southern part of the duchy, possesses one of the finest Gothic cathedrals in Germany, the tower of which, surmounted by a spire, is 380 feet high, remarkable for its lightness and elegance. The town stands on the Treisam, a few miles from its descent through the Valley of Hell from the Black Forest; and is the seat of the Roman Catholic university for the duchy. It has many other educational institutions besides manufactures of chemical products, soap and starch, with foundries, bleaching-works, &c. A statue of Schwarz, a native and resident monk, one of the inventors of gunpowder, who is believed to have lost his life while pursuing the study about the year 1354, has recently been erected in the Augustine Place. *Constance*, at the western extremity of the lake of that name, now a reduced place, has a name in history as the scene of the ecclesiastical council, 1414-1418, which deposed two rival popes, elected a successor, condemned the doctrines of Wickliff, and consigned John Huss and Jerome of Prague to the flames. The field in which they suffered is pointed out in the suburbs, and the very spot of their martyrdom into which the stake was driven. England was represented at the council by a deputation under the Bishop of Salisbury, who died during its sittings, and has a grave marked by a brass plate before the high-altar in the cathedral.

*LICHTENSTEIN*, a principality, the smallest state of the Germanic Confederation, lies to the south of the Lake of Constance, on the right bank of the Rhine, enclosed by Switzerland and the Tyrol. It is about equal in area to one-third of the county of Rutland, and has a town of the same name for its capital, with a village population as to numbers.

The Prince of Lichtenstein resides at Vienna, where his palace, with a picture-gallery, is one of the show-places. The state was till very recently governed in much the same manner as his own immense private domains in Moravia. But in 1862, the handful of inhabitants made a quiet movement, and obtained a constitution. According to its articles, the seat of government is transferred from Vienna to Lichtenstein; representatives are to vote the budget; and the administration is to be 'radically different and separate from that of the prince's domains.' Soon afterwards the first number of the *Lichtenstein Gazette* appeared, but as there was no press in the principality, it was printed at Feldkirch, a small town in the Tyrol.

Germany was included in the vast dominions of Charlemagne, who was crowned by the hands of the pope Emperor of the West in the year 800. With him began the long line of emperors of Germany extending through a thousand years, or till the commencement of the present century. But his dynasty becoming extinct in 911, the different provincial chiefs, consisting of seculars and ecclesiastics, who at one time amounted to 300, constituted themselves into a national assembly, assumed the right of electing the sovereign, and placed members of various houses upon the imperial throne by their suffrages. This arrangement subsisted till the year 1806, when the victories of Napoleon, and the defection of subordinate princes to him, induced Francis II. to resign the German crown, and assume the title simply of Francis I., Emperor of Austria. Then

followed the short-lived 'Confederation of the Rhine,' in which those states were included whose rulers were subservient to the views of France. This was succeeded by the 'Germanic Confederation,' established by the Congress of Vienna in 1815, consisting of the minor powers, with Austria and Prussia at their head, united for the purpose of mutual protection and defence, which maintains its existence, but has always been in a very precarious condition. The general administration is conducted by a Diet sitting at Frankfurt, composed of representatives chosen by the governments—not by the people, in which the plenipotentiary of Austria always presides, and has a casting voice. Each state is bound to furnish a military contingent to the federal army according to its amount of population, while the fortresses of Mayence, Ulm, Luxemburg, Landau, Rastadt, and Ingoldstadt are garrisoned by federal troops. In their internal economy the several states are quite independent, and adopt various forms of government, but in all, constitutional principles are more or less distinctly recognised, though with great reluctance in several instances by the ruling powers. Besides the reigning houses, upwards of a hundred princes and counts of the old empire remain who have been 'mediatised,' or deprived of sovereign rights, but are permitted to retain their titles and estates.

Internal communication is in a highly-efficient condition, by means of an extensive system of railways, and the numerous rivers susceptible of steam navigation. Manufactures, though varied, are only conducted upon a great scale at a few points, but are very general in relation to articles necessary or common in domestic life; these are largely made by the peasantry themselves at intervals of leisure from other pursuits. Agriculture is the principal employment, and embraces the growth of rye to a much greater amount than wheat for the bread of the people. Commerce, formerly shackled by the exaction of dues on goods passing the frontier of each petty state, is now nearly relieved from this incumbrance by the incorporation of most of the states in the Customs Union, or *Zollverein*, which renders all merchandise free throughout the League after one levy. Hamburg, Bremen, Lubeck, and Emden are the chief seats of the foreign commerce. Frankfurt, Nuremberg, Augsburg, Munich, Cassel, Brunswick, Leipsic, and Stuttgart rank as principal centres of the inland trade, extensively carried on by means of periodical fairs. The two last-named cities are the only places in Europe at which book-fairs are held. Leipsic supplies the north of Germany with literature, and Stuttgart the south. The business is conducted entirely upon the system of exchange. 'The bookseller, perhaps, from Kiel on the Baltic, meets and exchanges publications with the bookseller, perhaps, from Zurich; gives so many copies of his publication—a dull sermon possibly—for so many of the others, perhaps an entertaining novel. Each gets an assortment of goods by this traffic, such as he knows will suit his customers, out of a publication of which he could not perhaps sell a score of copies within his own circle; but a score sold in every bookselling circle in Germany gets rid of an edition.' Public libraries are large and numerous; elementary instruction is efficiently provided for in most of the states; and universities are sufficiently well endowed to render classical and scientific knowledge cheaply attainable.

The subjects of the Germanic Confederation form an aggregate number exceeding 44,000,000, but excluding the inhabitants of the Prussian and Austrian portions, the total population of the minor states, to which this chapter is devoted, is little more than 17,000,000. This last number is composed almost entirely of people of the Teutonic race, speaking two principal dialects—the *Hoch Deutsch*, or High German, distinguished by its rough and guttural sounds, prevalent in the southern and central districts; and the *Nieder Deutsch*, or Low German, characterised by a softer enunciation, the popular speech in the northern states. The High German was the mother-tongue of Luther, and the

language into which he translated the Bible. It hence became the universal vehicle of literature, and is the medium of intercourse among the educated classes in all parts of the country, generally understood, as alone taught in the schools. Both High and Low Germans are very similar in habits, character, and disposition. They are phlegmatic, thrifty, and plodding—qualities very ordinary in themselves, but which, when allied with genius, taste, and discernment, contribute to elevate those endowed with the combination to the highest rank in the departments of polite literature, the fine arts, and natural science. Poetry has been nobly represented by Klopstock, Goethe, Schiller, Körner, Arndt, and Uhland; music by Handel, Haydn, Beethoven, Mozart, Weber, and Mendelssohn; physical science by Werner, Humboldt, Von Buch, Berghaus, Bessel, Struve, Gauss, Mädler, Encke, Ritter, and Liebig; and no nation can furnish such a host of writers eminent in mental philosophy and jurisprudence, in philology and archaeology, in historical research, biblical criticism, and sacred literature in general. In the present century, Germans have distinguished themselves as intrepid travellers, and have enduringly associated their names with various fields of adventure—Humboldt with South America and Russian Asia, Tschudi with Peru, Martius with Brazil, Lepsius with Egypt, Schomburgk with British Guiana and Burmah, Gutzlaff with China, Siebold with Japan, the brothers Schlagentweit with Central Asia, Barth, Owerveg, and Vogel with Central Africa, and Leichardt with Central Australia.

In relation to religion, the greater proportion of the people in the northern and central states are Protestants, divided into Lutherans and Calvinists or Reformed, the former of which are the most numerous. There are minor sects, as the Moravian Brethren, whose mother-colony at Herrnhut, 'the watch of the Lord,' in Saxony, founded in 1722, has planted offshoots in almost all parts of the world. Saxony has also some adherents of the Greek Church. In the southern countries Roman Catholics form a decided majority of the population. The modern seceders from the Romish Church, styling themselves Christian Catholics, who were chiefly provoked to the secession by the exhibition of the Holy Coat at Treves in 1844, are found in various parts, but in gradually diminishing numbers. Having become democrats in politics, and freethinkers in general on religious subjects, several governments imposed vexatious restrictions upon them with a view to their suppression, prohibited their public meetings, withdrew the rights of citizenship, or went to the extreme of enforcing banishment.

By the general body of both Protestants and Catholics little distinction is drawn between Sunday and week-days, except that great part of the former is the favoured time for recreation in the public gardens and houses of entertainment in the environs of the towns. Both communions agree in a regard for old customs, a respect for anniversaries, and a fondness for festivals, carefully attending to every observance in their celebration which time has hallowed. All over Germany on Christmas-eve, every house, belonging to either rich or poor, has its gaily-decked Christmas-tree, sometimes called *Christbaum*, or 'Christ's tree;' and wherever Germans go, as emigrants to the remotest parts of the globe, as artist-students to Rome, as resident merchants to London or New-York, at every recurrence of the season, the tree makes its appearance in the domestic circle, at once the symbol of their faith and the emblem of their nationality.

The Royal Palace, Berlin.

## CHAPTER V.

### PRUSSIA.

THE region around the mouth of the Vistula was anciently occupied by a people called the Prucei, from whom the name of Prussia is derived. Their territory embraced only the district stretching from thence to the Niemen, and is still known as Prussia Proper, which, together with the adjoining province of Posen, lies beyond the pale of Germany, and was formerly part of the kingdom of Poland. The name of Prussia has, however, since been extended from a small territory to the dominions of a great monarchy, the vast proportion of which is Germanic, and acquired its present extension in 1815, at the close of the long Napoleonic wars. Prussia thus constituted, consists of two principal divisions of very unequal size, entirely separated from each other. They may be called Eastern and Western from their relative position, and Maritime and Rhenish from their respective

positions. The total area, 107,960 square miles, is inferior to that of the United Kingdom by considerably more than the extent of Wales.

#### I. EASTERN OR MARITIME PRUSSIA.

This main division of the kingdom, comprising five-sixths of the whole area, extends along the Baltic from the frontier of Mecklenburg to that of Russia; embraces a large part of the north of Germany; and stretches inland to the Austrian territories. The coast-line, along the shore of the Baltic, very nearly 500 miles in length, exhibits a succession of sand-hills through the greater part of its course, and is monotonous and dreary in the extreme. But eastward, it is distinguished by the formation of tongues of sand, called *nehrungs*, of extraordinary length in proportion to their breadth, variously flat or undulating with hillocks which the winds have piled, and enclosing expanses of fresh water, called *haffs* or bays. The latter are the estuaries of rivers, shallow, but of considerable extent, communicating with the sea, but rendered lake-like by the narrowness of the outlets and the fluviatile quality of the water. Thus the mouth of the Vistula is enclosed on the north-western side by a sandy promontory, eighteen miles long by only a quarter of a mile broad, terminating in the well-known Hela of Dantzic, marked by a revolving light. Another of these singular tracts commences eastward of the corn-exporting city, thirty-eight miles long by less than one mile broad. It bounds the Frische-haff, so named from its freshness, the estuary of the Pregel, which has an area of 250 square miles, and opens to the sea by a narrow strait, half a mile wide. A third sandy ridge lies immediately to the north, fifty-two miles long by one and a quarter in average breadth, almost entirely destitute of vegetation, but occupied by a few scattered hamlets. It encloses the Curische-haff, or Bay of the Cures, an ancient people who dwelt upon its banks. The Niemen discharges itself into this watery expanse of 470 square miles, connected with the sea by the Memel Deep, a passage about 300 yards wide.

This part of the coast is remarkable for its produce of amber, the carbonaceous mineral so well known for its electrical properties, and so prized for ornamental purposes. Though found along the western shores of Prussia, the chief source of the supply is between Dantzic and Memel. After high north winds have agitated the sea, shoals of sea-weed are washed towards the strand, among which the article is found, adhering to the mass, or entangled in it. As soon as a cargo arrives within convenient distance, the amber fishers enter the water to secure it, haul the prize upon the beach, and examine its contents. The amber occurs in nodules, varying in size from that of a nut to that of a man's head, though the latter size is very rare. It has also been obtained by regular mining in the sands, and divers have been employed to search for it at the bottom of the sea, but neither plan proved remunerative, and the billows are now the sole agents of the supply. About 150 hogsheads are annually collected, an amount which has been steadily maintained for three centuries. But the occupation is strictly closed to individual enterprise. The Grand-masters of the Teutonic Order, during their reign upon the coast, took possession of the trade, and derived a considerable revenue from it. It afterwards became a royal monopoly. An officer of the government superintended the collection, and disposed of the proceeds by public auction. Watchmen, or 'strand-riders,' kept guard on the coast; gallows were erected *in terrorem* along the shore; and any person detected collecting on his own account was liable to capital punishment. Since the commencement of the present century, the right of collecting has been let by the government to contractors, who pay an annual rental, and have the monopoly of the produce. Though the former severe laws are not in force, yet detaining a piece of amber accidentally found, renders the party liable to a prosecution for theft; and in the use of the beach, persons

going beyond certain limits are subject to a penalty for the trespass. Amber is a resin of vegetable origin, supposed to be yielded by an extinct species of pine, exuding like the gum which we see issue from trees in the orchards of the present day, but indurated and mineralised. Hence we may assume that in places where the waters now freely sport, forests of amber pines once waved to the winds, and were either slowly submerged by encroachments of the sea, or suddenly engulfed by some grand catastrophe of nature. Insects are often found imbedded in the mineral. Pope says of flies in amber :

‘The things themselves are neither rich nor rare,  
The wonder’s how the devil they got there.’

But the fact is obviously susceptible of very easy explanation. Some of the insects appear evidently to have struggled after being entangled in the originally viscous mass. Occasionally a leg or wing is found at a distance from the body, which had been detached in the effort to escape, or a limb appears alone, plainly broken off in the partially successful attempt at disengagement. The highly-interesting substance is chiefly sent to Turkey, where it is used, as well as in Germany, to form mouth-pieces for tobacco-pipes. The largest known specimen, weighing eighteen pounds, is in the Royal Museum, Berlin. But a total quantity of 800 pounds was collected after a storm on the 1st of January 1848.

A few islands closely adjoin the western part of the main shores. Those of Usedom and Wollin, level and wooded, enclose the Stettiner-haff, or Bay of Stettin, and form three channels connected with the adjacent coast, by which it communicates with the Baltic; but the ordinary line of navigation is the central passage. Gustavus Adolphus, at the commencement of his memorable campaign, landed on the former island with his army, and set his troops an instructive example, by falling upon his knees on the beach in prayer, rising to work with his own hands in throwing up intrenchments. Rügen, more to the west, the largest island belonging to Germany, is separated from the mainland by a strait about a mile in breadth, and is supposed to have been torn from it in the early part of the fourteenth century, during one of the most violent hurricanes on record. It is of very singular form, being cut up by indentations of the sea into a series of peninsulas, but presents a surface pleasingly diversified with hill and dale, well-wooded slopes, and wild romantic ravines. Its scenery, of which beauty and softness are the prevailing features, render it a great point of attraction in summer for sea-bathing with the inhabitants of North Germany, as its chalk-cliffs and flowery glens so strikingly contrast with their own sandy plains and swampy heaths. The highest point of one of the promontories, composed of grotesquely-grouped masses of chalk, is called the Königstuhl, ‘King’s Chair,’ or ‘King Frederick William’s Chair,’ from which a flight of 600 steps, cut in the rock, leads down to the strand. But Rügen is historically interesting as one of the last strongholds of paganism in the north of Europe, still containing the sites of temples, stone coffins, jars full of bones and ashes, tumuli, and cromlechs. These are traces of a barbarous people, whom Odoacer, king of the Rügii, fourteen centuries ago, led from this remote spot, and the neighbouring shores of Pomerania, to the conquest of Rome and Italy. The island was considered sacred to the goddess Hertha. Tacitus describes the site of her worship. An ancient beech forest, containing an oval-shaped pond, called the Black Lake, from the sombre shade of the adjoining trees, is still regarded with feelings of superstition, and believed to be identical with the place described by the historian. The present islanders are a very creditable race, long familiar with humane regulations respecting wrecks, which provide for the security of stranded property and the relief of distressed seamen.

Inland Prussia, to a considerable distance from the shores, except towards the Vistula,

is a flat uninteresting country, for the most part a great plain of sand, with rounded fragments of slate and granite rocks scattered over it, torn from the primitive mountains of Scandinavia, and transported to their present site by some unchronicled deluge. Small lakes, morasses, pine woods, and heathy moors are very numerous. One of the largest of the latter, the Tuchler Heide, or Heath of Tuchel, in the central province of Brandenburg, extends fifty miles in length, by from twenty-five to thirty in breadth, and is a collection of drift sand, incapable of cultivation, producing only heathery plants, a few shrubs, and pines. On the south-west the surface is diversified by a portion of the Harz Mountains, which stretch in an east-south-east direction from Goslar, in Hanover, to Mansfeld, in Prussian Saxony; in which direction the slopes of the Riesengebirge abound with striking scenes. This range forms the boundary between the Prussian and Austrian territories. A small chapel at the summit of Schneekoppe stands on the frontier-line. This is the highest point of the chain, 5235 feet above the sea, the 'prince of German mountains,' so called as the loftiest of its elevations apart from the Alps. It appears higher than it really is on the approach from the north, rising at once from the plain, without being diminished in its altitude by any intervening ridges of lower elevation. The prospect from the crest is very extensive when fine weather is commanded, embracing the fertile plains of Silesia, studded with towns and villages, on the one hand, with rugged glens, wild and steep precipices, on the other, the side towards Bohemia. Within twenty minutes' walk of the top, the humble inn or chalet of Hampebaude, provided for the accommodation of travellers, at the altitude of 4300 feet, is the highest inhabited house in Prussia.

There is no important river entirely Prussian from source to mouth. The Oder answers the most closely to this condition, having only a slight portion of its upper course within the Austrian empire, and then passing centrally through the heart of the country to the Bay of Stettin. On the south-west, the Elbe winds over the surface from the Saxon to the Hanoverian border. Eastward the lower course of the Vistula is embraced, from the frontier of Poland to its discharge in the Gulf of Dantzic. On the north-east the Niemen is received from Russia, and flows to the Curische-haff. Between the two last named is the Pregel, entirely confined to the province of Prussia Proper, which terminates in the Frische-haff, but is only a stream of subordinate rank. In this province lakes are the most numerous, and embrace the largest examples. The total number throughout the country is reckoned at upwards of 1000, some of which are from ten to twenty miles in length, but the majority are very small. None have any attractive features, but they are generally well stocked with fish. The numerous lakes and marshes have been formed by the rivers, which, travelling languidly owing to the very slight fall of the surface, are unable to discharge their waters after heavy rains, or when the snows melt, and hence speedily overflow their banks. Lakes and rivers are firmly frozen over in the winter months; and the snow lies long and deep upon the ground, especially in the north-eastern districts. The Silesian province yields calamine, the ore from which zinc is derived, in great abundance, and has zinc-works upon the largest scale, which extensively supply the foreign market with the product. In Prussian Saxony, mines of lead and iron are wrought in the Harz Mountains, which yield also in various parts of the range marble, alabaster, and granite, giving employment to an industrial population of about 70,000; and in Pomerania, near Stettin, the important discovery has very recently been made of vast beds of rock-salt of the purest quality. The northern part of the Rhine province has rich coal and iron mines, and the river-valleys are rich wine-producing districts.

The eastern section of Prussia consists of six provinces, which are divided into regencies and subdivided into circles.

| Provinces.                             | Cities and Towns.                                  |
|--|--|
| Germanic—Brandenburg, . . . . .        | Berlin, Potsdam, Frankfurt, Brandenburg.           |
| " Silesia, . . . . .                   | Breslau, Gorlitz, Neisse, Glogau, Brieg.           |
| " Prussian Saxony, . . . . .           | Magdeburg, Halle, Erfurt, Naumburg.                |
| " Pomerania, . . . . .                 | Stettin, Stralsund, Griefswald, Rugen.             |
| Non-Germanic—Prussia Proper, . . . . . | Königsberg, Dantzic, Elbing, Tilsit, Memel, Thorn. |
| " Posen, . . . . .                     | Posen, Lissa, Rawitsch, Bromberg.                  |

The reigning house is a younger branch of the family of Hohenzollern, who held the comparatively humble office of burgraves or stadtholders of the city of Nuremberg in Bavaria. In 1415 one of them obtained, by purchase from the Emperor Sigismund, the sovereignty of Brandenburg, with the dignity of elector. In 1618 the dukedom of Prussia Proper fell to the electorate by the failure of its male line; and the state was raised to power and consequence by Frederick-William, 1640-1688, commonly called the Great Elector. His son obtained the title of king from the Emperor Leopold, by a bribe administered to the imperial confessor, and put the crown upon his own head as Frederick I., at Königsberg in 1701. The kingdom, enlarged by the wars of Frederick the Great and the partition of Poland, was conquered by Napoleon, but reconstituted with additional possessions by the Congress of Vienna in 1815. Since that period the little territory of Jähde, on the North Sea, has been obtained by purchase from Oldenburg, as previously mentioned; and the two states of Hohenzollern, the patrimony of the elder branch of the reigning family, formerly members of the Germanic Confederation, have been incorporated in the monarchy. This last arrangement, by which Prussia acquired a footing in Southern Germany, took effect in the year 1848, and the princes were compensated by pensions for the surrender of their rights.

BRANDENBURG, an inland province, is intersected by the Oder on the eastern side in the middle part of its course, and contributes on the western several affluents to the Elbe. It has a considerable extent of infertile surface, a low average of population, but acquires importance from being the nucleus of the monarchy, containing the capital.

*Berlin*, the metropolis of the kingdom, is seated in the centre of a flat sandy plain, on both banks of the Spree, in latitude 52° 30' north, longitude 13° 18' east, and contains a population of 547,000, including the military. The river winds with a sluggish current circuitously through it, and is crossed by thirty-seven bridges within its limits, finally joining the Havel, which discharges into the Elbe. The city has an elegant yet formal appearance; remarkably broad streets, and numerous spacious squares, the latter adorned with statues; but being entirely of modern date, called into existence chiefly by the will of Frederick the Great, it fails to excite that interest which much smaller places inspire by venerable structures and picturesque dwellings, 'historical stone and lime.' It possesses, however, one feature finer than anything of the kind in Europe, the street called *Unter den Linden*, 'beneath the lime-trees,' reaching in a straight line from the royal palace to the triumphal arch of the Brandenburg Gate, the principal entrance into the capital, and a very imposing portal. This noble thoroughfare has four rows of trees, consisting of limes, chestnuts, aspens, acacias, and plantains, which form a central walk for pedestrians, and a road for carriages on each side, where the fashionable and the wealthy exhibit themselves and their equipages. Palaces and public buildings are on either hand—the Museum, the Opera, the University, the Arsenal, and the Academy of Arts—which combine with the varied foliage to render this a superb architectural vista. Berlin is well supplied with literary, scientific, and educational institutions; it possesses a royal library of 500,000 volumes; and may be regarded as the centre of intellectual development in the north of Germany. Its charitable institutions are also numerous, the most important being the two magnificent hospitals of the Charité and the Bethunien. The university, founded in 1810, has risen to great distinction, and numbers among its former and present professors many illustrious names, as those of Neander, Schleiermacher, and Hengstenberg, the theologians; Fichte, Hegel, and Schelling the metaphysicians; Encke the astronomer; Humboldt and Ritter the geographers; Raumer the historian; Savigny the jurist; Bekker, Zumpt, and Bopp, the philologists; Dove the physicist; and Ehrenberg the naturalist. But with all their civilisation, the Berliners have not yet supplied themselves with the social conveniences of many an ordinary English village as to drainage and water-supply, so essential to cleanliness and health. Though unfavourably situated for commerce, having no easy communication with the sea, yet still the manufactures are important and varied, embracing woollen, cotton, and silk goods; paper, porcelain, and earthenware; and the beautifully executed cast-iron articles for use and ornament which have obtained the name of 'Berlin jewellery.'

*Potsdam*, eighteen miles on the south-west, occupies a pleasant site on the north bank of the Havel, which appears the more agreeable in contrast with the dreariness of nature immediately around the capital. The river here expands into a lake, and has well-wooded sloping shores. The town is a principal station of the army, and the frequent residence of the sovereign, with four palaces in and about it. Population, 41,700. In one of the squares is an obelisk of marble 76 feet high. A plain sarcophagus in the church of the garrison, containing the remains of Frederick the Great, surmounted by captured flags, and his retreat in the vicinity

of *Sans Souci*, 'without care,' where he died, are the objects of interest to strangers. Potsdam is the birthplace of Alexander Von Humboldt. *Spandau*, a small town regularly fortified, stands at the junction of the Spree with the Havel, and can be strengthened by the inundation of the environs. Its citadel has often received prisoners of state. *Frankfurt*, on the Oder, 50 miles east of Berlin, undistinguished save by the commerce commanded by its position, is seated on a navigable river which serves as an outlet for the mining and manufacturing produce of Silesia, and is connected by canals with the Elbe and the Vistula. It has three great fairs annually, much frequented by Poles and Silesians, and considerable manufactures. About four and a half miles distant is Kunersdorf, where Frederick the Great was defeated by the Austro-Russian forces in 1759.

SILESIA, a south-eastern district, watered by the upper course of the Oder, borders on the dominions of Austria, and formerly belonged to the empire. It was conquered by the arms of the great Frederick, and is distinguished in military history as the scene of many decisive battles, not only during the struggle for its possession, but in the wars of Napoleon. The province is now the most populous and prosperous portion of Prussia, a region of fertile and well-cultivated fields, of bleaching-grounds like acres of snow, of manufacturing and mining industry, and of beautiful scenery. On entering from the north, hamlets, villages, and towns multiply as the interior is penetrated, while the view of monotonous plains is exchanged for that of undulating hills, which become bolder, till the high range of the Riesengebirge appears on the southern horizon.

*Breslau* (Pol. *Wracklaw*), centrally placed, occupies both banks of the Oder, and ranks after Berlin in point of population, 145,000, consisting of a considerable number of Catholics, but with a decided majority of Protestants. The signs of opulence appear in the environs in numerous villas and ornamental grounds; and as the chief mart for the corn, metals, and linens of the province, the streets are the scenes of great animation and traffic. It has important manufactures, and upwards of 100 distilleries. At Easter, when the principal wool-fair is held, the largest of the kind on the continent, the town is thronged with merchants, many of whom are far-comers, appearing in oriental costumes. It possesses a library of 300,000 volumes, and is the seat of a university founded in 1702. The Church of St Elizabeth has the loftiest tower in Prussia, 364 feet high. One of the principal squares, the *Blucher-platz*, contains a colossal bronze statue of the warrior, who gained his great victory over the French, in 1813, at the *Katzbach*, a few miles to the westward, at the age of seventy-one, and died tranquilly at an adjoining village in 1819. His tomb is by the high-road, marked by a granite monument, shaded by three linden-trees. On the approach to *Breslau* from the north, the great Frederick gained the battle of *Lissa*, in which he defeated a triple force of the Austrians. The other provincial towns are numerous, highly industrial, but are not separately large, and have no historical importance.

PRUSSIAN SAXONY, a western district, includes part of the middle course of the Elbe, and a portion of the Harz Mountains, with the highest point of the group, the celebrated *Brocken*. Detached tracts are associated with it, and some of the smaller German states are almost wholly impacted within its limits. Prussia obtained the southern part of this province at the expense of the kingdom of Saxony. That state was deemed lawful spoil by the Congress of Vienna, justly amenable to an entirely new appropriation, owing to the adherence of its sovereign to the cause of Napoleon. But after lengthened discussions, he was permitted to retain his patrimony, reduced in its dimensions by a partial surrender of territory. Copper and other mines are wrought extensively in the Harz; and extensive corn-lands occur, highly fertile, but very monotonous, being without enclosing hedgerows, and rarely dotted by a tree. This portion of the kingdom was the cradle of the Reformation, as the scene of the birth, education, and death of Luther. It has been the theatre also of many battles and sieges.

*Magdeburg*, a large commercial and manufacturing town on the Elbe and some islands in its channel, situated eighty miles south-westward of Berlin. It is a fortress of the first class, with a citadel on one of the river-islands, and contains a population, including the suburbs, of 78,000, besides the garrison. The citadel is used as a state prison, and was the scene of Baron *Trenck's* long captivity. The town is the focus of four of the principal lines of railway in Germany, and has manufactures of silk, cotton and woollen goods, gloves, ribbons, &c., with extensive breweries and distilleries. The cathedral, built between 1208 and 1363, is a noble building, with many interesting monuments and objects in the interior, such as the tomb of the Emperor *Otho*, the founder of the city, and of his wife, the Saxon Princess *Editha*. Pleasant public gardens are laid out by the side of the river beyond the fortifications. An inscription, 'Remember the 10th of May 1631,' recorded on one of the houses, marks a terrible incident in the history of *Magdeburg*.

On its capture by the imperialists under Tilly during the Thirty Years' War, the commandant was executed, and the inhabitants, to the number of 30,000 men, women, and children were butchered. Tidings of this horrible deed were announced to the emperor by the dispatch, that 'since the destruction of Jerusalem and Troy such a victory has not been.' The ferocious Tilly lies buried near the shrine of the Black Virgin of Altötting in Bavaria, before referred to. *Halberstadt* and *Quedlinburg*, the latter the birthplace of Klopstock, are on the south-west. *Halle*, with 41,000 inhabitants, is more important, rapidly advancing also as a railway centre, is situated on the Saale, and is the seat of a university, founded in 1694, with which many great names are associated, and of the Francke Institution, embracing an orphan-house and schools. The town is distinguished by the activity of its printing-presses. The name derived from *Hall*, an old word for 'salt,' refers to the brine-springs of the place and its neighbourhood, from which a large quantity of salt (from 200,000 to 300,000 hundredweights annually) is made by a peculiar class of workmen called the 'Halleores.' Further to the south, the village of *Lutzen* gives its name to the battle in which Gustavus Adolphus fell in 1632, at a spot now marked by an erratic block called the Stone of the Swede. It was the scene also of an engagement in 1813, in which Napoleon was victorious over the allies, previous to the battle of Leipsic. A few miles distant is the field of Rossbach, where Frederick the Great achieved his great triumph over the combined French and Austrians in 1757.

*Eisleben*, a small place about twenty miles west of Halle, with manufactures of potash and tobacco, and in the vicinity copper and silver mines and smelting-works, is famous as the scene of Luther's birth in 1483. Portions of the house remain. Here also he died in 1546. In the Church of St Andrew are the cap, cloak, and other relics of the great Reformer. *Erfurt*, in the extreme south of the province, a fortified and considerable town, contains Luther's Cell, in the Augustine monastery, now converted into an asylum for destitute children. He became a monk in 1505, and resided there several years. *Wittenberg*, on the Elbe, is distinguished as the place where he openly proclaimed the Reformation. It contains his tomb, with that of Melanethon. A statue of him in the market-place bears the inscription in German, 'Is it God's work? then will it endure. Is it man's? then will it perish.'

POMERANIA, a maritime region, extends along the shores of the Baltic from the territory of Mecklenburg nearly to the Gulf of Dantzic, and has the island of Rugen towards the western extremity. It embraces the lower course of the Oder, with a large extent of dreary sterile surface, and is one of the most thinly-peopled portions of the kingdom. The western part of the province, conquered by Gustavus Adolphus, long remained connected with Sweden, and was usually styled Swedish Pomerania. By the arrangements of the Congress of Vienna, it was finally ceded to Prussia, while the Swedish crown was aggrandised by the annexation of Norway.

*Stettin*, a fortified town and flourishing shipping port, with 64,000 inhabitants, including the military, is seated chiefly on the left bank of the Oder, but has a suburb on the opposite side. Its commerce is very extensive in the export of corn, wool, and other produce brought down by the river. Two Russian empresses were natives of the place—Catherine, surnamed the Great, and Maria Feodorowna, the wife of the Emperor Paul, and the mother of Alexander and Nicholas. Their respective fathers were the local governors at the time of their birth. Below the town the river expands into a spacious bay, the *Stettiner-haff*, and finally discharges into the Baltic by three channels formed by two islands and the mainland. *Swinemünde*, a small seaport, on the largest island, *Usedom*, marks the principal line of navigation, or the central channel. On this island the great Gustavus landed with his army in 1630, to take part, on the side of Protestantism, in the religious war then raging in Germany. The same spot speedily witnessed the disembarkation of a large band of English and Scotch auxiliaries, one of whom, Munro, who wrote an account of the campaigns of his chief, was supposed to be the original of the Captain Dugald Dalgetty, who so amusingly figures in Sir Walter Scott's *Legend of Montrose*. *Stralsund*, a strongly-fortified port, is seated on the mainland opposite the Rugen island, and was formerly the capital of Swedish Pomerania. It is celebrated for its long siege by Wallenstein at the head of the imperialists in 1628, who had sworn to take it, 'even though it were fastened by chains to heaven,' but was compelled to retire with great loss. It was also the scene of one of Charles XII.'s romantic adventures. Upon escaping from Turkey, and returning to his own dominions, he reached the place so overcome with fatigue, that he was found asleep without the walls by a sentinel on duty. The stone on which he laid his head is preserved in the town-hall. *Griefswald*, on an adjoining part of the coast, with 15,600 inhabitants, has a small university. *Putbus*, a beautiful sea-bathing resort, and *Bergen*, a small town, are in the isle of Rugen.

PRUSSIA PROPER extends along the coast from the preceding province to the frontier of Russia, and embraces the lower courses of the Vistula and Niemen, with the intervening basin of the Pregel. Along the borders of the first-named river are fertile arable lands, but the greater part of the surface exhibits an alternation of lakes, swamps, sandy wastes, and dark pine-woods. Though including two of the most populous cities of the

kingdom, the proportion of inhabitants to the area is small. The winter climate is severe, distinguished by wild and pitiless snow-storms, popularly called 'Courland weather,' coming from the direction of the Russian province of that name. This part of the country was long subject to the Teutonic knights, an order of military priests founded in Palestine during the Crusades, but there obscured and kept in abeyance by the more powerful Templars and Hospitallers. Summoned in the 13th century to the aid of Christian Poland against the barbarous Prucezi, and other heathen neighbours, they gladly hastened to the eastern shores of the Baltic, mastered the territory, erected strongholds, built castles, and enforced their faith upon the natives with the sword. The knights had their Masters at Königsberg and other places, while the Grand-masters were established at Marienburg on the Vistula, where the palace they occupied still exists. Albert of Brandenburg, the last chief of the Order, embraced Lutheranism and renounced his vows, when the district was constituted into the duchy of Prussia, and made hereditary in his family. Upon the failure of his line in 1618, the duchy lapsed to the Electors of Brandenburg, who assumed the regal style in the following century.

*Königsberg*, the fourth city of the kingdom, with a population of 91,000, including 7400 military, and an important commercial port, occupies both banks of the Pregel, and an island in the river, a short distance above its entrance into the Frische-haff. Vessels too large for the shallow water of the lake discharge and receive cargoes at Pillau, on the narrow channel by which communication is maintained with the Baltic. Like Rome, it is built on seven hills; it has also seven gates and seven bridges—discriminating circumstances by which to test the integrity of a professed native in foreign parts—and in addition, there is a head over the clock on the town-hall which puts out its tongue at every stroke of the clapper. The city spreads over a wide area, as it includes a considerable extent of water-surface, many gardens and shrubberies, and no less than thirty public squares and market-places, some of them very spacious. It is the seat of a university, founded in 1544, with a library of 160,000 volumes, and an observatory on an old bastion, rendered famous by the labours of the late Professor Bessel, who, after watching through three years the star 61 Cygni, announced its annual parallax in the year 1838, which was the first approximation to a measurement of the distance of stellar bodies. The oldest and busiest portion of the city is on the river-island, the site of the cathedral, which contains the grave of Kant, the metaphysician, who lived at a still existing house, No. 3 in the Prinzessin Strasse. Königsberg was founded by Ottokar, king of Bohemia in 1255, who erected a wooden fort on a spot now occupied by a cavalry barrack; and hence in 1855 the city held a jubilee commemorating the completion of the 6th century of its existence. Next arose a more durable stronghold of stone, surrounded with walls and a moat, furnished with towers and drawbridges, which, after undergoing repeated alterations, is now the schloss or palace, devoted to government offices. It was the refuge of the royal family of Prussia when driven by Napoleon from Berlin, and contains an apartment of interest, called the Amber Chamber, adorned with the carbonaceous mineral obtained from the neighbouring shores. The battle-fields of Friedland and Eylau are in the adjoining country. *Tilsit*, on the stream of the Tilse, an affluent of the Niemen, is very unimportant, but known to fame as the scene of Napoleon's fantastic interview with the Emperor Alexander in 1807. *Memel*, at the outlet of the Curische-haff, the most northerly town in the Prussian dominions, with a population of 17,600, is the central point of the Baltic timber trade, brought down by the Niemen from the Lithuanian forests. Its quays and streets exhibit a lively scene and a motley throng during the trading season, or while the navigation is open. There are German and Russian merchants—English, French, and Dutch captains and sailors—Lithuanian boatmen, foresters, and farmers—Jew dealers and pedlers—and occasionally some country people of singular appearance and costume are seen, the Samaitish inhabitants of the adjoining tract of Samogitia, a branch of the Finnish race, of low stature, wearing the mean-looking ash-coloured woollen cloak of their ancestors. The town is noted for its ship-building. It is two years older than Königsberg, having been founded by the Livonian order of knights in 1253. North of Memel the country is a desert of loose sand—the sea on one side, and pine-forests, interspersed with cultivated tracts, on the other. At about twelve miles distance, a barrier defines the Prussian border, beyond which lies a tract of neutral ground leading to another barrier, which marks the Russian frontier.

*Dantzic*, the most important port of the kingdom, and a first-class fortress, with 82,000 inhabitants, including 10,000 soldiers, is situated on the western main arm of the Vistula, about three miles above its entrance into the sea. Ramparts, bastions, redoubts, and wet ditches, with gigantic works to lay the adjoining country under water, render it as impregnable as any position can be made by artificial means. Lines of chestnuts and other trees give a pleasant appearance to the suburbs in summer; country-houses are suggestive of citizen opulence and comfort; but the interior is mostly a maze of narrow streets and somewhat gloomy antique dwellings, with few public buildings deserving notice besides the cathedral and exchange. Commercially the city ranks with the greatest corn-shipping ports in the world, besides exporting timber, linseed, hemp, flax, and

other produce of the countries watered by the Vistula. The granaries are on an island formed by two arms of the Mottlau, a tributary of the river, called Speicherinsel, or 'Magazine Island.' They are buildings of six or seven stories, furnished with an ample allowance of windows, which are left open in dry weather to ventilate the corn. No person is allowed to live upon the island, and, as a precaution against fire, no lights are ever admitted. Drawbridges connect it with the streets, which are raised at night. Ships are loaded with remarkable dispatch by gangs of porters, who will complete a cargo of 500 quarters of wheat in three or four hours. Dantzic was long one of the principal Hanse Towns, but accepted, with certain limitations, the protection of the kings of Poland. Various attempts were made by the Poles to become its real masters. In repelling their attacks, the citizens received such important aid from a number of Scotch residents, whose ancestors had settled in the place as weavers, that they were invested with the privileges of freemen. The district where they resided still bears the name of Schottland. The city was taken by the French in 1807 under Marshal Lefebvre, whom Napoleon created Duke of Dantzic; it was recaptured after an obstinate defence in 1813. Fahrenheit, the optician, who invented the thermometer bearing his name, and Hevelius, the astronomer, were natives. *Marienburg*, on the eastern arm of the Vistula, is distinguished by its castle-palace, erected by the Teutonic knights as their head-quarters, partly re-edified by the Prussian government. Subterranean dungeons are memorials of the power and tyranny of the order. *Thorn*, on the river close to the Russian frontier, strongly fortified, was the birthplace of Copernicus. *Frauenburg*, overlooking the Frische-haff, was the scene of his residence and death. In a house on the hill of the cathedral he wrote his famous treatise on the motions of the heavenly bodies, and founded the system of modern astronomy. A simple tablet in the cathedral in which he held a canonry, marked with a rude sphere and a half-effaced name, indicates his grave.

POSEN, an inland province eastward of the Oder, borders on Russian Poland, and was formerly part of the Polish monarchy, acquired by Prussia upon the iniquitous partition of that unfortunate country at the close of the last century. The district is intersected from east to west by the river Warta, the principal tributary of the Oder, which it joins within the limits of Brandenburg. Agriculture is the prevailing industry of the people, who consist mainly of Poles, but with a considerable number of Germans and Jews. There are few towns of any important size besides the capital; and villages appear in many parts only at distant intervals, separated by monotonous spaces of flat cultivated fields or dreary pine-woods, often of very wretched appearance, but in harmony with the down-trod social condition of the numerically-predominant race. The Polish part of the population, supposed to be under-estimated in the government returns, is considered to be in the proportion of eight to five of the German and Jewish.

*Posen*, at one time the capital of Poland, is centrally seated on the Warta, and contains 51,000 inhabitants, among whom Jew pedlars figure conspicuously in the streets, with long flowing beards, dressed in their oriental costume. It is strongly fortified, possesses a cathedral distinguished by the noble simplicity of its style, with twenty-three churches, all Roman Catholic except two, which are Protestant, and a striking town-hall. The trade is extensive in the export of corn, hemp, flax, tobacco, and hops, raised in the province. *Bromberg*, on the north-east, is a frontier town of 21,000 inhabitants, on the railway between Berlin and Warsaw. A few miles beyond it the Prussian train stops, and delivers over its passengers to the searching scrutiny of Russian officials.

Prussia has carefully avoided the open violence of Russia and Austria in governing her Polish subjects. But covert means have been as carefully adopted to extinguish if possible their nationality, chiefly by the system of 'obscurantism.' Throughout Posen it seems as if the desponding exclamation of Kosciuszko, *Finis Poloniae*, had been realised. In every department under government control, which embraces the whole internal administration of the province, no Pole need apply for employment. The mayors appointed to Polish villages are Germans. The district counsellors, *landrathe*, elected in the rest of Prussia, are in Posen named by the government, and are generally Germans. A knowledge of Polish is not required of any of these functionaries, though the persons with whom they are chiefly in contact are Polish peasants. In the prefecture there are two interpreters, but not one official who understands Polish. German inscriptions are over all the public offices. The clerks at the railway-stations, the conductors, and even the stokers are Germans. The entire history of Poland is a proscribed subject in the schools; and no Polish school is allowed unless instruction in three out of six classes is given in German. Hence the Poles are accustomed to say that 'Russia is a bear, Austria a hyena, and Prussia a fox—a fox with a large liberal tail which she loves to exhibit to the eyes of Europe, but a cunning, fraudulent, and destructive fox nevertheless.'

While sharing in the spoil of Poland, the infamy belongs to Prussia of being the first to propose the dismemberment. It was Frederick-William who despatched his brother Prince Henry to St Petersburg to lay before the Empress Catherine the plan of partition, and urge an assent to it. 'Gain Austria,' was the final reply, 'and let her amuse France; England I will flatter; Turkey I will frighten.' The first partition treaty was signed in August 1772. So completely were English statesmen hoodwinked, that in a letter from Chatham to Shelburne, in October 1773, he remarked, 'Your lordship knows I am quite a Russ.'

Celebrated Sites on the Rhine.

II. WESTERN OR RHENISH PRUSSIA.

The smaller detached portion of the kingdom is separated from the larger chiefly by the territories of Hesse-Cassel, Brunswick, and Hanover. It consists of two provinces which rank with its most populous and flourishing districts, and have generally more varied superficial features than the greater part of the principal division, while embracing the grand part of the Rhine channel.

| Provinces.                      | Cities and Towns.                                    |
|---------------------------------|--|
| Westphalian Province, . . . . . | Münster, Hamm, Iserlohn, Bielefeld, Minden.          |
| Rhine Province, . . . . .       | Cologne, Bonn, Coblenz, Düsseldorf, Aix-la-Chapelle. |

WESTPHALIA is bordered by the above-named territories, with those of Waldeck, Darmstadt, and Nassau, a part of Holland, and the sister-province. It belongs on the eastern side to the basin of the Weser, and on the northern to that of the Ems, but is chiefly included in the valley of the Rhine, to which it contributes two tributaries, the Ruhr and the Lippe. Several ranges of hills appear in the south, with part of the Tentoburger Wald in the north. But the surface is mostly level, devoted to the inferior kinds of grain, and to the rearing of live-stock, while a portion is included in the mining district of Northern Germany. It is eminently the country of rye-bread, consumed by high and low, man and horse; and also of smoked hams for export, which are cured over fires made of the twigs of juniper. In former days it was the chief seat of the *Vehmgericht*, or Secret Tribunal, which, however, held its meetings openly, and exercised a jurisdiction distinct from that provided for by due course of law, arising out of its inefficiency and partial administration.

*Münster*, a short distance from the left bank of the Ems, the largest town, with 27,000 inhabitants, including the military, is well built, and contains some antique beautiful structures, and various objects of curiosity. It

has a name in history connected with John of Leyden and his Anabaptist followers (1535-1536), who took possession of the place, proclaimed it to be the New Jerusalem, and enjoyed a short-lived triumph. The house of the fanatic, marked with quaint carving, is still shewn in the market-place; and the iron cage in which he was cruelly put to be tortured by the populace prior to execution, is kept in the church of St Lambert's. In the town-hall, the Treaty of Westphalia was signed in 1648, which terminated the Thirty Years' War, and secured religious liberty to the Protestants. Portraits of the high contracting parties are preserved, with the seats on which they sat. *Hamm*, on the south, the residence for a time of the exiled Bourbon princes, is a small manufacturing town benefiting by its position, at the intersection of four lines of railway, to Münster, Cologne, Minden, and Cassel. *Iserlohn*, further south, is distinguished by the variety of its hardware products, of iron, copper, and brass, made in the vicinity, which has very picturesque natural features, to which ruined castles lend their attractions, now intermingled with forges, workshops, and mills. *Bielefeld*, eastward of Münster, with delightful environs, is the principal seat of the Westphalian linen and thread trade. *Minden*, on the north-east, is strongly fortified on the Weser, the name of which is given to the battle in which the French were defeated in 1759, by the allied British and Brunswickers. But the action was fought at a village a few miles distant to the northward.

The RHINE PROVINCE, the most populous portion of the monarchy after Silesia, lies west of the preceding district, and is bordered by Holland, Belgium, France, Bavaria, and Nassau. It is intersected by the great river from south to north; and the principal part of the population is found within a few miles of it, on either bank. It includes also the lower course of its affluent, the winding and lovely Moselle. Away from the river-valleys, there is a large extent of high dreary country, where the climate is bleak, the soil barren, and the inhabitants are few, rude, ignorant, and excessively superstitious, while in patches of forest the howl of the wolf is not yet extinct. This applies to the table-land of the Hunsrück, or the 'dog's-back' hills, south of the Moselle, to nearly the whole district bordering on Belgium, and to the region of the Eifel-gebirge, which intervenes between it and the Rhine, naturally remarkable for its extinct volcanoes, deep crateriform lakes, and noxious vapours.

*Cologne* (Ger. Köln, the *Colonia Agrippina* of the Romans), next to Berlin and Breslau in population, 120,500, inclusive of 7000 soldiers, is a fortified city of the first rank, on the left bank of the Rhine, connected with the opposite side of the river by an old bridge of boats, and a tubular structure for the railway. It preserves a memorial of its Roman origin in its name, which is only a corrupt form of *Colonia*. Besides the cathedral and some specimens of ancient church architecture, there is nothing in its external aspect to arrest attention, but the view of its numerous towers and steeples, as seen athwart the river, is extremely imposing. The interior is chiefly a maze of narrow irregular streets and lanes, the odour of which, from want of drainage, is in striking contrast with that of its staple manufacture, the aromatic liquid with the well-known name of *Eau de Cologne*, of which millions of flasks are annually exported. The cathedral, close to the railway station and the tubular bridge, was founded more than six centuries ago, then long suspended, and is not yet finished, but commands admiration as one of the most perfect specimens of Gothic architecture extant. Though in process, it will not be completed according to the whole of the original design. The church of St Ursula is noted as the place where, according to tradition, are preserved the bones of 11,000 virgins, companions of St Ursula, who were slaughtered by the Huns because they refused to break their vows of chastity. Rubens was a native of Cologne, and presented to St Peter's Church, in which he was baptized, one of his best paintings, representing the Martyrdom of the Apostle. *Bonn*, on the same side of the river, in the ascending direction, is a celebrated seat of learning, and attracts a number of English residents by its educational advantages. The names of Niebuhr and Schlegel occur in connection with the university. In the square near the cathedral, a monument of Beethoven, who was born and resided in a house pointed out in one of the streets, has recently been placed. The town stands near the entrance of the Rhine gorge, and commands fine views of the Siebengebirge, or Seven Mountains, which form the portal, bold and rough volcanic masses, castle-crowned, and vine-clad, wherever terraces can be formed admitting of being planted. *Coblenz*, containing 28,000 inhabitants, including military, who are always here in considerable force, is finely situated higher up the Rhine, on the triangular point of land formed by the confluence of the Moselle. It derives its name from the junction of the two rivers, a corruption of the *Confluentia* of the Romans. The site is one of great natural beauty, the seat also of warlike demonstrations. Forts rise on every hand. One is specially conspicuous in every point of view, the rock-fortress of Ehrenbreitstein, 'broad stone of honour,' on the opposite side of the river, the battlements of which overlook a landscape that will well repay the fatigue of ascending the heights. Being contiguous to the wine districts, the town has an extensive trade in the export of their produce, as also of the Seltzer waters of Nassau, a territory which commences immediately above it on the right bank of the stream. An old church stands at the confluence of the rivers, originally built in the year 836, within which the grandsons of Charlemagne met, and divided his vast empire into Germany, France, and Italy.

*Düsseldorf*, singularly neat and regularly built, with pleasant gardens and walks on the site of its old ramparts, occupies the right bank of the Rhine, on its lower course through the province, where the current is sluggish, and the banks are unromantic. It is a flourishing shipping port for the produce of a great industrial district, contains a population of 41,000, and is the seat of a modern school of historical painting of celebrity, the founders of which were Cornelius and Schadow. A few miles to the eastward, *Elberfeld*, and its neighbour *Barmen*, united by a bridge across the Wupper, form the Manchester of Prussia, containing between them upwards of 100,000 inhabitants. Linen, silk, and cotton goods are produced in great quantities, and dyeing is extensively conducted with the beautiful colour called Turkey red, of local manufacture. *Cleves*, in the country westward of the Rhine, one of the historic towns, formerly the capital of a duchy, has declined; while *Crefeld*, wholly without place in any chronicle, has risen up from obscurity to a population of 50,000, engaged with silks and velvets. *Essen*, also a modern industrial site, but a town of very ancient date, twenty miles north-east of Düsseldorf, is indebted to the coal and iron of the neighbourhood for its prosperity. It is distinguished by tall engine-chimneys, large ironworks, and the vast steel manufactory of M. Krupp, the products of which were represented at the International Exhibition, London, by a solid cylindrical mass of steel eight feet long by nearly four feet wide. At this establishment, wheel-tyres for railway and other purposes, of wonderful strength, are made, with which many of the English railway companies are supplied.\*

*Aix-la-Chapelle*, on the railway between Belgium and the Rhine, close to the frontier of the former, is a city both of ancient fame and present importance, with nearly 60,000 inhabitants, splendid houses, and manufactures of cloths, watches, jewellery, needles, glass-pins, and other articles, for which it has long been distinguished. It has warm mineral springs, of sulphureous quality, known from the time of the Romans, which annually attract a great number of visitors, and rise at the high temperature of 143° Fahrenheit. Its history embraces the assembling of several congresses, one in 1668 to conclude peace between France and Spain; another in 1748, to negotiate a general peace in Europe; and a third in 1818, to decide upon the evacuation of France by the allied armies. On the last occasion, Sir Thomas Lawrence attended to paint the portraits of the sovereigns and statesmen assembled for the Windsor Gallery. Charlemagne made it his residence, and the capital of his dominions north of the Alps; it became also the scene of his death. His tomb is in the cathedral, marked with the inscription CAROLO MAGNO. It was opened in 1861, in the presence of the whole chapter, government officials, civic notables, and several physicians, when the remains were found intact, in excellent preservation, in wrappers of a beautiful silken tissue. The cathedral contains a large collection of relics, which are publicly shewn to the people once every seven years, through a whole week in July, and attract crowds from a distance. In few parts of Europe are the lower classes, especially the peasantry, more superstitious than in Rhenish Prussia. *Treves*, in the valley of the Moselle, of the highest antiquity, once very populous, is now decayed, having only about 21,000 inhabitants. It is distinguished by fine remains of Roman greatness, and a very lovely neighbourhood. But the 'Holy Coat' in the cathedral, believed to be the seamless coat of our Saviour, is deemed the greatest treasure of the city, and regarded with the profoundest reverence. It was formerly exhibited at regular intervals to the public gaze. This spectacle, after being long suspended, was revived in 1810, when vast multitudes, estimated at more than a quarter of a million persons, collected to honour the relic. It was repeated in 1844, and attended by a greater crowd, some of whom were alleged to have been miraculously cured of disease by a sight of the garment. But the folly disgusted many of the more intelligent Roman Catholics, and led to the secession of Rongé and his followers from the Romish Church. At Treves the Moselle is crossed by a bridge mentioned by Tacitus, originally founded in the reign of the Emperor Augustus. But having been blown up by the French during the wars of Louis XIV., the piers are now the only remains of Roman work.

The territory of Hohenzollern, incorporated in the Prussian monarchy during the present age, is in the south of Germany, wholly enclosed by the estates of Wurtemberg and Baden, making a close approach to the north-west extremity of the Lake of Constance. It consists of a narrow tract of land, diversified by the eastern offsets of the Black Forest range, crossed by the Danube in the south, and by the Neckar in the north. It was formerly divided into two independent principalities, held by two branches of the elder line of the Hohenzollerns. But by a private compact, the king of Prussia, who represented the more fortunate younger line, was declared the head of the family; and to him the princes resigned their sovereign rights in 1849, retaining their estates and receiving pensions. The entire district corresponds in size to one of the smaller English counties. It contains an almost exclusively Roman Catholic population, and belongs ecclesiastically to the archbishopric of Freiburg, in the duchy of Baden.

*Hechingen*, once the capital, is a very small town on an affluent of the Neckar, containing a Roman Catholic college. The old castle, the cradle of the Prussian royal House, ruined, but partly restored, remains in the environs, seated on the Zollern heights, and hence the patronymic of Hohenzollern. *Sigmaringen*, on the Danube, is little more than a village, but has been made the seat of the Prussian provincial government.

The district of Jahde, at the other extremity of the monarchy, on the estuary of the river of that name, flowing into the North Sea, obtained for the purpose of forming a naval dépôt, has not yet a thousand inhabitants.

The Prussian dominions contain a population of 18,200,000, three-fourths of whom are Germans, High or Low, according to their locality. The remainder are chiefly races of Slavonic origin, found in Prussia Proper, Posen, and Silesia, using various dialects belonging to that stock of languages, the Polish, Wendish, and Slovak, all in process of being superseded by the German. A kindred tongue was spoken by the original Pruzi, but it has been long extinct, and representatives of that people are not now distinguishable. Protestantism is the prevailing religious profession, except in the Polish and Rhenish provinces, where the Roman Catholics form a very decided majority. Agricultural pursuits everywhere predominate, conducted with little skill, but with such unwearied industry, that crops are raised from a naturally poor soil in sufficient abundance to meet the home consumption, and leave an important surplus for export. Domestic manufactures of coarse linens and woollens are very general, while the factory-system is applied to production in portions of Silesia and on the Rhine. Complete provision for national instruction is made; and all parents are bound by law to avail themselves of its advantages for their children, unless it can be shewn that they are receiving a proper education from another source. The kingdom enjoys a constitutional form of government; but a strong party exists among the upper classes, who interfere with its free working, being in favour of a return to arbitrary power, and a rigorous censorship of the press.

Railway Bridge at Cologne.

Durrenstein on the Danube.

## CHAPTER VI.

### THE AUSTRIAN EMPIRE.

**A**USTRIA, the name of an archduchy, also denominates an empire of which that province is the nucleus, occupying the second place among the states of Europe in point of extent, being next to Russia in area, though vastly inferior to it, and holding the fourth rank among the five great powers. It is distinguished by striking superficial features and fine natural resources, as well as by political influence; and consists principally of an inland region circling round the head of the Adriatic Sea, thence extending chiefly northward and eastward, so as to include large central and south-eastern portions of the continent. Saxony, Prussia, and Russian Poland lie on the north; Bavaria, Switzerland, and Italy on the west; Russia and Turkey on the east; Italy below the Po, the Adriatic, and Turkey on the south. While embracing within these bounds numerous nationalities differing from each other in race, language, customs, religion, and degree of civilisation, with great diversity of soil and climate, the Austrian dominions form in the main a compact oblong territory, with well-defined natural frontiers in general, consisting of chains of mountains, great rivers, and the sea. A narrow southerly projection along the east coast of the Adriatic, or Dalmatia, is the chief interruption offered to the regularity of the outline. The major axis of the oblong runs east and west, and has an extreme length of 800 miles; the average extent, north and south, may be taken at 450 miles; the total area includes 254,000 square miles, equal to more than twice the magnitude of the British Islands, and exceeding by one-fourth the size of France. The entire frontier-line is estimated to measure not less than 5000 miles, of which only a comparatively small portion consists of sea-coast. This limited maritime accommodation, with

the fact of high mountain-ranges intervening between the greater part of the productive area and the shores, is the main natural disadvantage of the empire. The whole country is situated between the parallels of  $42^{\circ}$  and  $51^{\circ}$  north latitude, and between the meridians of  $9^{\circ} 20'$  and  $26^{\circ} 20'$  east longitude.

The Austrian territory comprehends great superficial diversities. Within its limits are the vast flats of Hungary, the undulating levels of Bohemia, Moravia, and Galicia, with part of the fertile plain of Northern Italy. But towering highlands and hilly ranges are more prominent, occupying full three-fourths of the area. The chains of the Rhetian, Noric, Carnic, Julian, and Dinaric Alps overspread the south-western districts; the ridges of the Riesengebirge, Erzgebirge, Böhmerwald, and Marische-gebirge form a rampart around Bohemia, separating it from the rest of Germany; the Sudetic Mountains divide Moravia from Silesia; and the Carpathians sweep in a huge semicircle around the north of Hungary, leaving the Danube near Presburg, and after performing the curve, returning through Transylvania again to the river on the Wallachian frontier. The respective features of the highlands and lowlands are noticed in the detailed account of the several provinces, along with the mineral wealth and vegetable products of the different regions. But the general remark may here be introduced, that Austria yields to no portion of the continent in the abundance and variety of its mineral stores. Besides furnishing a valuable proportion of gold and silver, all the useful metals occur, except platina, generally in profusion, while there are beds of rock-salt and coal of immense extent, though the latter have not been thoroughly explored, are not much worked, and the produce is often of inferior quality. Mineral and thermal springs are numerous distributed, frequented for sanitary purposes, among which those of Carlsbad, Marienbad, Eger, Toplitz, Sedlitz, and Baden enjoy a European reputation.

The climate varies considerably, along with the cultivated vegetation, owing to the extent and diversity of the surface. Three zones may be generally distinguished—southern, central, and northern. In the warm southern zone, between latitude  $42^{\circ}$  and  $46^{\circ}$ , the vine and maize flourish throughout, with rice, myrtles, olives, oranges, and lemons in the more favourable situations. In the central temperate zone, between  $46^{\circ}$  and  $49^{\circ}$ , which embraces the largest proportion of the area, maize and wine are still raised in perfection, but do not succeed in the northern zone, or above  $49^{\circ}$ , except in a few localities. This last is specially the region of grain, fruit, hops, hemp, and flax. Natural forests of oak, beech, and elm extensively clothe the lower grounds, with birch, larch, and pine on the uplands, supplying timber, tar, potash, charcoal, bark, and cork, though there are great tracts of country, both low and elevated, without a tree or a bush. The wild animals include the bear, wolf, lynx, and jackal, but reduced in number during the present century in consequence of rewards offered for their destruction by the public authorities, while the beaver, otter, marmot, chamois, and wild goat, are similarly diminished by the chase.

Among its rivers, the empire comprises the upper courses of the Elbe, Oder, and Vistula, which flow out of it to the northward; the upper Dniester and the central Danube, which pass the frontier to the eastward; the Isonzo, Piave, Brenta, and Adige, confined to its limits, descending southward to the Adriatic, with the lower course of the Po discharging in the same basin. The Danube, with its mighty arms, is the prime hydrographical feature, having a total flow of 850 miles in the Austrian dominions, navigable through the whole extent, and traversed by a large number of steamers and tugs. It crosses the border from Bavaria below Passau, with a contracted width, but with great depth, at that point, runs easterly by Vienna into the heart of Hungary, where, at Pesth, it has a breadth of 2000 feet. Having made an abrupt bend, it flows nearly

due south to the Turkish frontier, and from thence proceeds eastward again, forming the boundary-line to Orsova, where it quits the empire at the ravine of the Iron Gate. The Morava or March, Waag, and Theiss enter the great water-course on the left bank, with the Inn, Enns, Raab, Drave, and Save on the right. In winter the river is usually frozen over, and is the occasion of great disasters on the return of spring, if the thaw is rapid and coincident rains descend. The great body of water brought into its channel from the melted snow furiously breaks up the ice with explosions resembling the discharge of artillery, tosses immense masses to and fro like straws, carries them ashore, and inundates the country for miles on either bank. In the spring of 1862 the whole region between Vienna and Pesth was thus destructively visited. Towns had to be abandoned in haste by the inhabitants to save their lives; cattle and flocks were drowned; houses and cottages fell from the flood sapping their foundations, or loosening the ill-cemented materials of their walls; the winter seed was washed out of the ground; the drifted ice accumulated in places up to the roofs of the dwellings; and so suddenly did the inundation subside as to leave quantities of the large Danubian fish in pools behind it, and the peasants went fishing in the fields. Mountain lakes abound in connection with the Alps and Carpathians; two large but shallow expanses occupy the great plain of Western Hungary; and examples of minor dimensions occur in almost all parts of the country.

The political divisions of the empire consist of twenty provinces, called crown-lands, of very varying extent, which may be arranged in four principal groups—the Germanic, Polish, Hungarian, and Italian.

|                            | Provinces.                  | Cities and Towns.                              |
|----------------------------|-----------------------------|--|
| Germanic Provinces, . . .  | Lower Austria, . . .        | Vienna, Wiener-Neustadt, Krems, Baden.         |

#### I. GERMANIC PROVINCES.

AUSTRIA PROPER, an archduchy, extends along both banks of the Danube, between the frontiers of Bavaria and Hungary, and consists of two provinces, Lower and Upper, respectively eastern and western, separated in part by the stream of the Enns, one of the smaller affluents of the great river. This district received the German name of *Oesterreich*, whence Austria, signifying 'eastern state,' as it formed the eastern border of the dominions of Charlemagne. It is the hereditary patrimony of the reigning house, the cradle and nucleus of the empire, to which other possessions have been gradually attached by treaty, marriage, or descent, very few additions having been made by conquest.

Upper Austria is chiefly a rugged tract overspread with branches of the Alps. They likewise intrude into the Lower division, and form the beautiful chain of the Wiener Wald, which makes a close approach to Vienna, and abruptly descends to the Danube in its vicinity. Romantic valleys intersect this range; fine woods clothe the slopes; villas and châteaux are on every hand; and picturesque ruins of ancient castles occasionally appear, monuments of feudal times, which add to the charms of the landscape. Being at an inconsiderable distance from the heart of the city, the hill-tops are often visited by crowds of the inhabitants, to enjoy the fresh air and the noble prospects. The loftiest summit, called the Kahlenberg, is historically famous in its annals. During the last siege of the capital by the Turks, when the people were sore pressed and in despair of relief, rockets were seen one night to rise from it, the appointed signals of the approach of a friendly army, whose banners were beheld the next morning waving to the breeze on its crest. Though of no great elevation, being under a thousand feet, the view embraces a vast stretch of country, and a great variety of interesting objects. There is the metropolis, with the graceful spire of its cathedral in the centre rising beautifully against the sky. The towers of Presburg, forty miles off, may be seen, and in clear weather a glimpse of the more distant Carpathian Mountains may be caught. At the base rolls the Danube, with its steamers, barges, and floats of timber, winding between wooded islets; and for many a mile the eye can follow the course of the monarch of strictly European rivers—now partly concealed from view by dense forests, and anon exposed in broad sheets reflecting the sunbeams. The sites also of several great battles, such as Aspern, Essling, and Wagram, fought among the islands of the stream and on its banks, are overlooked.

Vienna, the capital of the empire, locally called the 'Emperor's City,' *Kaiserstadt*, is situated on the south side of the Danube, but apart from the stream itself, with which it communicates by an insignificant branch. The city is in latitude  $48^{\circ} 10'$  north, longitude  $16^{\circ} 20'$  east, and contains a population of about 560,000, including the environs. It dates from the middle of the twelfth century, when Duke Henry II, father of the Leopold of inglorious memory, who treacherously seized and imprisoned Richard Cœur de Lion while passing through his dominions, made the spot his residence. The site was then largely a dense forest, occupied by the bear, wolf, wild ox, and deer, while the beaver constructed its dam in the adjoining waters. The

The Danube from Vienna to Linz.

Viennese of the present day have living remains of the primeval woodland at the far extremity of the Prater, which is their Hyde Park, extending over several low islands formed by arms of the Danube. There are fine aged trees towering over thickets so tranquil that a rambler might fancy himself many a league away from the busy crowd. The city is very regularly built. It consists of an inner circle—the old town, exterior to which is an environing open grassy space, planted with trees, laid out with walks and roads, while enclosed by an outer circle, formed by a broad band of suburbs of comparatively modern date. In the centre of the whole, as a radiating point for the streets, stands St Stephen's Cathedral, with its steeple rising to the height of 465 feet, combining all that is beautiful and imposing in Gothic architecture, reputed to be the largest church in Germany. Comparing Vienna with other important places, it has been said that there is much more regularity in Berlin, a more frequent intermixture of showy edifices in Dresden, more lightness and airiness of effect in the best parts of Munich, a greater profusion of olden-time memorials in Augsburg and Nuremberg, but in none is there so much of that sober and solid stateliness, without gloom, which is perhaps the most fitting style of building for a large city.

Dwelling-houses of vast extent distinguish Vienna, intended for the accommodation of several families, to whom they are let in stories or flats; or a single story is often capacious enough to be divided into three or four tenements. A house-master or porter has charge of the common door, which is closed at night at ten o'clock, and only opened afterwards on payment of a fee. Some of these masses of building used for dwellings are of enormous dimensions, and may have a population equal to that of a large village or small town under one roof. The capital is the greatest seat of manufactures in the empire, and the centre of its inland commerce. Silk goods, gold and silver lace, hardwares, porcelain, jewellery, musical instruments, carriages, furniture, and paper are extensively produced. Libraries, museums, cabinets, and picture-galleries are numerous, and remarkably rich in literary treasures, curiosities, and works of art, to which strangers are readily admitted. Since the dawn of the railway age, movement and progress have been very evident in the outward appearance of the capital. The great event in its history is the taking down of the high walls and projecting bastions which environed the old or inner city, by which a wide belt of land is secured for building, decorative, and recreative purposes. Blocks of costly houses have been erected, French in character, with bay-windows, ornamented friezes and pilasters, and statues in the niches. A new arsenal, comprising barracks, armoury, chapel, and storehouses, is an enormous pile. A Votive Church, on the glacis or esplanade, subscribed for in all parts of the empire as a monument of gratitude for the preservation of the emperor's life from attempted assassination, commenced in 1856, and still in process, will be one of the best reproductions of pointed architecture in Germany. But a dark shadow rests upon the place, if the official report of its annual death-rate is correct. In London, an average of 24 persons out of every 1000 die each year; and this is greatly in excess of some of the healthiest parts of England. But in Vienna the annual average is 49 persons out of every 1000, so that according to the given estimate of the population, 12,500 human beings perish every year merely because they reside on the banks of the Danube instead of those of the Thames.

Vienna has been the scene of many historical events. It was twice unsuccessfully besieged by the Turks, the first time under Soliman the Magnificent in 1529. The second and most famous siege was commenced by the grand vizier, Kara Mustapha, on the 14th of July 1683, and lasted to the 12th of September following, when the city was relieved from imminent hazard of capture by the Poles under the renowned John Sobieski. Numerous memorials remain of this struggle. The *Turkenschanze*, a rampart thrown up by the Turks, is still pointed out near the village of Währing, on the way from the city to the Kahlenberg. In one of the suburbs the Church of Maria Frost, built in 1721, marks the site of the grand vizier's tent. His head is in the town arsenal, also the cord by which he was strangled on returning from the disastrous expedition, and his shirt or shroud covered with Arabic inscriptions. These were deciphered by Von Hammer, and found to be chiefly passages from the Koran. Upon the Austrian capture of Belgrade, his body was disinterred, the head separated from it, and transferred to Vienna. The green standard of the Prophet is preserved in the imperial arsenal. George Kolshitzki, a Pole, who had succeeded in passing the Turkish lines to communicate with the relieving army, was afterwards permitted to open a coffee-house, as a reward for the service, the first in Christian Europe; and long afterwards every keeper of a café in the city was required to have his portrait hung up in his establishment. Vienna was twice occupied by the French under Napoleon, in 1805 and 1809; and here was held the famous congress upon his first abdication, which sat from November 3, 1814 to June 9, 1815, to re-arrange the map of Europe.

*Schönbrunn*, the usual summer residence of the emperor, about two miles from the city, derives its name from a spring in the grounds, *Schöne Brunnen*, the 'beautiful fountain.' The palace is crowded with portraits of the Hapsburgs, few of which excite interest except those of females, Maria Theresa, and the unfortunate Maria Antoinette. It was the abode of Napoleon while in possession of the capital; and also the residence of his son, the Duke of Reichstadt, who died in the same apartment which his father had occupied, and lies in the burial-vault of the imperial family, attached to the Capuchin Church in the city. This vault contains upwards of seventy metal coffins. Maria Theresa descended into it every Friday, for fourteen years after the death of her husband Francis, to pray by his remains. Beyond the Danube, nearly opposite Vienna, the villages of Aspern, Essling, and Wagram give their names to great battles between the Austrians and the French. Some miles higher up the river, on the same bank, stands the ruined Castle of Dürrenstein,

magnificently placed at the end of a long ridge of hills, with jagged peaks of rock around, and cottages below. In this robber-stronghold of the middle ages the lion-hearted Richard of England was imprisoned. *Baden*, a place of baths, inns, and lodging-houses, fifteen miles south of Vienna, has a summer throng attracted by its warm sulphureous springs, impregnated with carbonic acid gas, and the beauty of the neighbourhood.

Ebensee on the Traun.

*Linz*, the capital of Upper Austria, with 27,000 inhabitants, is chiefly distinguished by its fine situation on the south bank of the Danube, a singularly extensive market-place, an encircling chain of thirty-two round towers which form the new fortifications, and the snow-clad tops of the Styrian Alps on the southern horizon. *Ebensee*, at the southern extremity of the Traun see, is only remarkable for its salt-works, and the extensive view obtained from the mountain on the west of the village.

BOHEMIA, a north-west section of the empire, once a separate kingdom, is one of its most important divisions in point of extent, population, and resources. It is a basin-shaped territory, drained by the Elbe and its tributaries, the Moldau and the Eger, and very nearly enclosed by a mountain-wall, through an opening of which, on the north, the river finds its way out of the district, and descends into the plain of Northern Germany. The bounding ranges consist of the Böhmerwald, or Bohemian Forest, on the south-west; the Erzgebirge, or Ore Mountains, on the north-west; the Riesengebirge, or Giant Mountains, on the north-east; and the Marische-gebirge, or Moravian Mountains, on the south-east. With these highlands very striking scenery is connected, and one of the most extraordinary natural sites in Europe—the Rock Labyrinth of Adersbach—on the north-east frontier. This is a valley more than six miles long by three broad, containing an assemblage of detached masses of sandstone, of immense size and varying shape—that of pillars, towers, battlements, obelisks, and inverted cones—appearing at a distance like a city of gigantic architecture in ruins, the interstices between the rocks being converted by no great stretch of fancy into lanes, streets, and squares. The Sugar Loaf, the Watch Tower, the Pulpit, the Emperor's Throne, are names given to the more conspicuous or singular forms. This nature-made labyrinth is kept under lock and key, and requires a guide to be explored without the hazard of being lost. It seems to have been constructed by the action of powerful currents of water which wore away the softer parts of the originally compact sandstone. Apart from its borders the country is not at all picturesque, but a plain, simply relieved from monotony by occasional swells and gentle

undulations, with here and there an isolated hill. The Germans call it the 'Kettle-land' from its basin shape, and the number of its hot steaming springs. Viewed in connection with the encircling heights, it seems as if the surface had once been the bed of an extensive lake, which was drained upon a rupture occurring in the northern barrier, through which the Elbe now finds an outlet. The soil is highly fertile, and the landscapes have a rich appearance in summer, resembling an interminable garden, fruit-trees lining the roads, vineyards, orchards, hop-grounds, and cornfields alternating with each other. The most productive district, around the little town of Leitmeritz, where the best wines are made, is popularly called the paradise of Bohemia and the corn-magazine of Saxony. The manufactures of ornamental glass are in high repute, and mining is conducted on the southern slopes of the Ore Mountains. At Joachimsthal, situated in a very striking pass, there is a silver-mine which is said to be the oldest in Europe, and the first for which mining laws were framed. Here also the first silver dollars were coined, called *thalers* or 'valley pieces,' a contraction of the name of the town, Joachimsthaler.

*Prague*, the capital, next to Vienna in population, 142,000, is very finely situated nearly in the centre of the country, on both sides of the Moldau, which follows a winding course through it from south to north. Hills and rocky eminences ascend from the water's edge, the slopes of which are covered with houses rising one above another, intermingled with noble trees, and overtopped by sixty towers, spires, and domes belonging to the public edifices. The old town is the largest portion, on the right bank of the river, the district of trade. The opposite side is the aristocratic quarter, containing the palace of the old Bohemian kings, the palace of Wallenstein, and those of present noble families, mostly unoccupied. The two divisions are connected by a celebrated stone bridge of ancient date, and by a very chaste chain bridge, both of which afford fine views of the place and its environs. Prague is the seat of the oldest university in Germany, the head of an archiepiscopate, and a principal centre of manufacturing industry, connected by railway with Vienna and Dresden. It contains a very large number of Jews, who form one of the oldest colonies of that people in Europe, and perhaps the most distinct, as they have municipal institutions peculiar to themselves. Many eminent names appear in the history of the city, those of John Huss, Jerome of Prague, and Ziska the blind Hussite chief, of Tycho Brahe and Kepler, Frederic V. and his queen, Elizabeth of England, Wallenstein, and Gustavus Adolphus. Autograph writings of Huss are preserved in the library of the Clementinum, and in that of the museum.

The provincial towns are numerous, but not of important size, or special interest, though several attract great numbers of summer visitors by their mineral waters. *Eger*, close to the Bavarian frontier, has a place in history as the scene of Wallenstein's murder, in the year 1634. The burgomaster's house, in which the foul deed was committed, stands in the market-place, and the bedroom is shewn in which he was slain. *Carlsbad*, or Charles's Bath, eighty miles to the west of Prague, has its name from the Emperor Charles IV., who is said to have accidentally discovered the peculiarity of the site while hunting in the forest, by one of the dogs falling into the scalding water. The town is perhaps the most strictly aristocratic watering-place in Europe. It lies in a narrow romantic valley, on the margin of a small stream, surrounded by hills richly clothed with foliage, and traversed by serpentine footpaths leading to spots which command varied and extensive prospects. The houses are almost all intended for the reception of summer guests. They are not known so much by streets and numbers, as by signs like inns, inscribed upon them, usually in French for the guidance of foreigners. Some of the indications are sufficiently fantastical, as 'The Eye of God,' 'The Lap of the Virgin,' 'The Nest of the Seven Wise Swallows,' 'The Arms of the Beautiful Mermaid,' and even 'This Night thou shalt sleep in Paradise.' The principal spring pours forth its water in jets from four to five feet high, repeated many times every minute. It has a temperature of 165° Fahrenheit, boils eggs hard, and ranks with the hottest mineral waters of Europe. Some springs, discovered in 1858, have the property, from the quantity of silver contained in the waters, of converting into a hard red-coloured stone anything that is immersed in them for a short time. Examples of vases, statuettes, and other objects, originally of soft clay, which had been thus treated, were in the Great Exhibition, London, 1861. The first, and at present the only English church erected in the Austrian empire is at Carlsbad. *Töplitz*, near the border of Saxony, at the base of the Ore Mountains, has seventeen springs of varying temperature, the hottest being 120° Fahrenheit, which annually collect an aristocratic company to the bathing-houses. It is seated upon the small stream of the Saubach, or 'Swine Rivulet,' so called from a swineherd making the discovery of the springs, to which he was led by the sagacity of one of his pigs. During the great earthquake of Lisbon in 1755, it was observed that the waters of Töplitz became turbid, then ceased to flow for a time, and subsequently returned in an increased quantity of a blood-red colour. Those of Carlsbad were similarly affected.

The Bohemians were governed by their own sovereigns till the early part of the 16th century, when the crown reverted by marriage to the House of Austria. In the century following, it was nearly snatched from the imperial grasp. Strongly attached to the Reformed faith, and having had their liberties assailed, the

people revolted, elected a king, Frederick V., the Palatine of the Rhine, son-in-law of James I. of England, who accepted the dignity, but was unable to retain it. Totally defeated by the imperialists at the battle of the White Hill, near Prague, in 1620, his adherents speedily felt the full weight of the imperial vengeance. Wholesale executions followed; Protestantism was proscribed; and by relentless persecution, with the voluntary expatriation of thousands, its profession became extinct in the land of Huss. The Bohemians of the present day belong almost exclusively to the Romish Church, the Jews forming the chief exceptions.

The peasantry are singularly superstitious. According to popular belief, the festivals of the Virgin used to be held sacred even by animals; and birds, for instance, took particular care not to work at their nests on those days. The cuckoo, having infringed that custom, was cursed, and obliged to wander perpetually without ever having a nest of its own. But St John Nepomuk fairly shares the honour of public veneration with the Virgin. Originally an obscure priest, his bronze statue stands upon the bridge of Prague, at the spot where legend says he was thrown into the river by the order of a pagan king, when a miracle was wrought for the recovery of the body. Centuries elapsed before notice was taken of his name and merits. But in 1729 he was canonised, and his shrine in the cathedral, of solid silver, said to weigh 27 cwt., is now one of the most splendid in Europe. As the patron of bridges, his effigy appears upon many a structure of the kind. Every year, on the 16th of May, his festival is kept, and generally lasts eight days. Prague is then so full that the peasantry encamp in the streets. The bridge is stopped for vehicles, in order that the thousands of foot-passengers may the more readily throng it. Portraits of the saint appear in the windows; cannon thunder from the heights; confessions and offerings are received by a retinue of priests from morning till night; and all over the country the devotees address themselves with unflinching ardour to songs and waltzes.

MORAVIA, the adjoining district on the east, apart from its borders, is an extensive, fertile, and highly-cultivated plain, celebrated for its grain crops and fruitful orchards, chiefly included in the basin of the March or Morava. Though the name is given to an interesting Protestant sect, it would be vain to look for any of the so-called Moravians or United Brethren within its limits, as the founders of the community were constrained by persecution to quit the country in the former part of the last century. The Sudetic Mountains separate the province from that of Austrian SILESIA on the north-east, a narrow tract contiguous to the large Prussian territory of the same name, which Frederick the Great wrested from the empire. It contributes some affluents to the Oder, and contains the source of the Vistula, which issues from a morass towards the eastern frontier.

*Brünn*, the capital of Moravia, with 53,000 inhabitants, is centrally situated, about ninety miles nearly due north of Vienna, connected with it by railway, and likewise with Prague. It is the head of an archiepiscopate, and a great manufacturing town, so distinguished for its woollen cloths as to be called the Austrian Leeds. But silk, cotton, linen, glass, soap, tobacco, leather, and dyeing works are carried on. Two hills render it conspicuous, one of which is surmounted by the cathedral, and the other by the Castle of Spielberg, used as a prison for political offenders, in which were confined Baron Trenck, General Mack, and Silvio Pellico. An insignificant place in itself, *Austerlitz*, is about twelve miles on the east, the scene of the great battle in which the Austrian and Russian armies under their respective emperors were signally defeated by the French, in 1805, under Napoleon. It is therefore sometimes called the Battle of the Three Emperors. *Olmütz*, on the north-east, only of moderate extent, is strongly fortified, and the seat of a modern university. *Troppau*, the chief town in Austrian Silesia, about the same size, is noted for the manufacture of firearms. From the neighbourhood of Vienna, through Moravia to the Silesian frontier, a distance of nearly 200 miles, the country is almost without interruption the private property of Prince Lichtenstein, one of the Viennese nobles.

The small province of SALZBURG, constituted at a recent date, lies on the Bavarian border between Upper Austria and Tyrol. It is almost entirely a mountainous district, occupied by branches of the Noric Alps, and the valley of the Salza, a torrent-like affluent of the river Inn. Salt is obtained in large quantities from the mines of Durrenberg, which have been wrought upwards of six centuries, and an important amount of gold was once procured in the high valley of Gastein. The territory was formerly the patrimony of a prince-bishop of the German empire, and had a considerable Protestant population till the early part of the last century, when many thousands left their homes and country for ever, rather than submit to the dictation of the Jesuits and abjure their faith.

The town of *Salzburg*, on both sides of the rapid Salza, surrounded by splendid mountains covered with verdure, is said to occupy the finest site of any place in Europe. In addition to the charming position, it possesses a noble cathedral, and is distinguished by its connection with Mozart. Two houses are marked

prominently with the great composer's name; the one in which he was born, and another in which he resided for a time after his return from London. A good bronze statue of him stands in the principal square. Salzburg is a centre for many interesting excursions, but the town is one of very minor rank as to trade and population. *Wildbad-Gastein*, so called in allusion to the wild country around it and its baths, is a watering-place 3000 feet above the sea, in the vicinity of the Gross Glockner. The warm mineral springs were visited centuries ago by the emperors and princes of Germany, and are still frequented by the upper classes, though the site is most secluded, and the manners of the inhabitants very primitive. They range in temperature from 115° to 120° Fahrenheit, and owe their value to the combination of the chemical ingredients, various salts, not to their separate strength. At this spot the small river Ache forms a splendid water-fall, descending in three leaps about 300 feet.

The TYROL, immediately adjoining Switzerland, is an easterly continuation of its natural features, exhibited in a somewhat less imposing manner, yet with an aspect of great grandeur, embracing mountain masses whitened with the perpetual snow, immense glaciers, deep narrow valleys into which the avalanche descends and the cascade falls, the sloping sides of which are densely clothed with woods. The charm of the scenery is not a little heightened by its association with a peasantry of frank manners and hospitable spirit, without a tinge of Swiss sordidness in the more upland districts, though its development may be expected in proportion as travellers become numerous who have a money equivalent ready on every occasion for the most trivial service. The main chain of the Alps crosses the country from west to east, and sends off secondary ranges within its limits in various directions, rendering the province a mountain-citadel, which a handful of determined men might successfully defend against an army in the narrow passes. On the eastern border rises the Gross Glockner, or Big Bell, 12,563 feet, so called from the fancied resemblance of the highest peak to that instrument. On the western frontier towers the Ortler Spitz, 12,850 feet, the highest point of the Austrian empire. Between the two is the Drei Herrn Spitz, or Three Lords' Peak, 10,122 feet, so named from the old Counts of Tyrol and Görz, with the Archbishop of Salzburg, being accustomed to assemble their retainers at the spot. On opposite sides of the main chain are the two principal river-valleys, that of the Inn, on the northern, stretching generally from west to east, and that of the Adige, on the southern, running from north to south. They are connected by the Brenner Pass, one of the lowest of the carriage-roads across the Alps, 6788 feet, but remarkable for the number of castellated forts which crown the heights on either hand, erected during the middle ages to guard the country from invasion. The tract called the VORARLBERG is on the north-western side of the province, and borders the eastern extremity of the Lake of Constance. The Tyrolese are imbued with strong religious feelings, and are devotedly attached to their country, though numbers are compelled to migrate from it in search of subsistence, becoming pedlers and servants, owing to the impossibility of obtaining support in a region where the pasturage is so limited, and the absolutely sterile ground so extensive. They are fond of music, dancing, festivals, and athletic exercises, are admirable marksmen and expert chamois hunters, loyal to the Austrian House, but unwilling to engage in military service except in defence of their native hills and valleys.

*Innsbruck*, the seat of the provincial estates, is a very handsome town of 14,000 inhabitants, occupying both banks of the Inn, which are united by an old wooden bridge, whence the name, *Brücke*, a bridge, and also by a recent suspension one. The situation is magnificent, as the river-valley is 1800 feet above the sea, and is enclosed by mountains which rise from 6000 to 9000 feet, upon which the snow glistens in the summer's sun. Manufactures of woollen and silk goods are carried on, with carved work, and the transit trade is important. The town possesses a university, with which a national museum is connected, chiefly devoted to objects illustrating the arts and natural history of the Tyrol. It contains also the grave and statue of Hofer, the brave peasant-general who so nobly defended his country against the French in 1809, till betrayed by one of his associates, and shot at Mantua by order of Napoleon. The principal church is remarkable for the tomb of the Emperor Maximilian I., one of the most splendid and elaborate monuments in Europe, with the singular distinction, that though constructed by his direction it never received his remains. *Hall*, a few miles distant, is distinguished by salt-mines, from which the province derives its supply of the mineral.

*Brizen, Botzen, and Trent* are on the southern side of the Alps, in the basin of the Adige, where, with every advance towards the Italian frontier, the country becomes less rugged, the vegetation more varied and luxuriant, and the people losing their northern characteristics, begin to exhibit those of the southern stock in complexion, habits, and speech. Trent, in a district of wine, mulberry-trees, and silkworms, is an ancient but decaying place, chiefly Italian, often mentioned from having been the seat of the great ecclesiastical council, convened, in consequence of the Reformation, to determine disputed points of doctrine, which held its sessions from 1545 to 1563 in the Church of Santa Maria Maggiore.

STYRIA, on the south of Austria Proper, is extensively occupied by chains of the Alpine system; but the surface gradually becomes depressed eastward, till it sinks down into the great plain of Hungary, by which it is bordered in that direction. The Save forms the southern frontier of the province; the Drave intersects it from west to east; the Mur, one of its tributaries, chiefly waters the centre; and by these channels, with that of the Enns, the entire drainage is conducted to the Danube. The mountain region is covered with forests of firs and larches, which abound with game, are haunted by the wolf and bear, are still vast and dense, though long subject to reduction to supply fuel for the smelting-furnaces in a highly metalliferous district. Iron is the principal product, and hardwares the staple manufacture. The ore, a very rich carbonate, far superior to English and Swedish kinds, occurs in enormous quantities. It forms the main mass of some entire mountains, and is obtained by open excavations like stone from the quarry. Captain Basil Hall mentions a tradition of long standing among the miners. It relates that when the barbarians from the regions north of the Danube drove the Romans from Styria, then called Noricum, the Genius of the Mountains, willing to do the new inhabitants a favour, appeared to the conquerors, and said: 'Take your choice: will you have gold-mines for a year?—silver for twenty years?—or iron for ever?' 'The wise ancestors of the Styrians, who had just begun to learn the true relative value of the precious metals, by ascertaining practically that their rude swords were an overmatch for all the wealth of the Romans, at once decided to accept iron for ever.' The province is traversed by the Vienna and Trieste Railway, which crosses the Styrian Alps at the Semmering Mountain, by many curves, bridges, and tunnels, attaining the height of 2872 feet above the sea. The mountaineers are, like the Tyrolese, excellent marksmen and intrepid hunters. The dress of both males and females is very picturesque, exhibiting various hues, among which green is the most common.

*Graz*, the capital, 140 miles southward of Vienna by rail, is finely seated on the Mur, and only inferior in beauty of situation to Salzburg and Prague. It is a large and important mercantile town, with 63,000 inhabitants, the residence of a bishop, the seat of a university, possesses various manufactures of textile fabrics and hardware goods, and is reputed to be the cheapest place in Europe for provisions. The name is derived from the Slavonic, *Miemetz-ki-Grad*, referring to a fortified hill in the centre of the town. This was crowned by a citadel which the French battered down in 1809. The distinguishing feature is now the Johanneum, so called after its founder the Archduke John, an institution for the promotion of science, art, and industry, which contains a valuable library and museum. Von Hammer, the historian, was a native. Here likewise the persecuting and infamous Emperor Ferdinand II. was born, who caused many thousands of Protestant books to be burned in Graz, and indulged for years in the chase of the 'heretic boars,' *Ketzer-Sauen*, as he was pleased to call their owners, till they became extinct.

All the other towns of Styria are of very inferior note. But *Eisenerz* claims attention from its site in the great mining district, surrounded with fir-clad mountains, which resound with the clang of hammers, and are lighted up at night by the fires of charcoal-burners and the glare of furnaces. The place is small and ancient. It lies at the base of the Erzeberg, or Ore Mountain, which has a circuit of about five miles, a height of 2840 feet, and has yielded iron ore from time immemorial, being literally a mass of the metal. The mines are worked partly by the Austrian government and partly by a private company. Another place of interest, but of a different kind, is *Mariazell*, 'Mary in the Cell,' a village famous for a miracle-working image of the Virgin, which constitutes it the Loretto of Austria. The image is very old and very ugly, but the vicinity is most romantic, the church handsome and the shrine gorgeous, enriched from the offerings of devotees who annually go in procession on pilgrimage to it from different towns of the empire. St Stephen's Cathedral, Vienna, is the starting-point of the pilgrims from that city, who have a journey of some fifty miles before them. Previous to the appointed day, a proclamation is fixed to the great gate, bearing the imperial sanction, inviting all pious subjects to the enterprise, in order to implore from the Virgin such personal and

domestic comforts as they need, and supplicate continued prosperity to the House of Hapsburg. It is now conducted in a more orderly manner than formerly, for the village being small, beds few, and pilgrims many, they used to spend the night in the neighbouring woods, drinking, singing songs, dancing, and squabbling. The scandal has been somewhat obviated by the two principal processions taking place at different periods, the one from Vienna on the 2d of July, and the other from Gratz on the 12th of August. Mariazel is surrounded with iron-mines and furnaces; and has near it the principal cannon foundry of the Austrian government.

The three districts of Carinthia, Carniola, and The Littoral lie between North-western Styria and the Adriatic, and are largely overspread by the chains of the Carnic and Julian Alps, with their subordinate highlands. They formed the chief part of the kingdom of Illyria, founded by decree of Napoleon in the year 1809, and were after his fall re-united as a kingdom to the Austrian empire, till the present arrangement into three provinces was adopted in 1849. CARINTHIA, the most northerly, belongs to the basin of the upper Drave, and is both bordered and intersected by high limestone ranges. It contains the most valuable lead-mines in the Austrian dominions; and has for an article of export the aromatic herb, called Speik, a species of spikenard, *Valeriana celtica*. This plant, though found on most of the eastern Alps, is so characteristic of a particular mountain in Carinthia, as to have originated its name, the Speik-kogle. The peasants pluck it up by the roots, and after being dried, it is sent in barrels to Trieste, from whence it is exported to the Levantine countries, where it forms a considerable object of commerce, being used to flavour tobacco, and also for pastiles. The Wendish or Slavonic part of the population are of melancholy temperament, shy, and diffident, some misunderstanding of which perhaps originated the idea of inhospitality, as mentioned by Goldsmith,

‘The rude Carinthian boor  
Against the houseless stranger shuts the door.’

CARNIOLA, on the south, traversed by the Save, is distinguished by the immense number of caverns in its limestone mountains, as well as by the intermittent Lake of Zirknitz, and the quicksilver-mines of Idria. THE LITTORAL, or coast region, at the head of the Adriatic, is subdivided into the four districts of Görz, and Gradiska, with the territory of Trieste, and the peninsula of Istria. A complete change marks the vegetation on descending the seaward slope of the Alps to its margin. The pines, firs, and larches of the loftier uplands are left behind; the beech and oak disappear; the singular region of the Karst is entered, a high and extensive limestone plateau, almost without the scantiest shrub, over which the Bora wind rushes with tremendous fury, terminating abruptly a few miles from Trieste. From the edge of the desolate table-land, the eye overlooks shores lined with vineyards, olive-groves, and rice-grounds, where the mulberry-tree flourishes, and the silkworm is reared.

*Klagenfurth*, the chief place in Carinthia, is a town of moderate size, with an air of prosperity, possessing manufactures of cloth, silk, and muslin, and very agreeable environs. Westward lies the Wörthsee, a beautiful lake, enclosed by a landscape of green fields, wooded heights, and ruined castles. Beyond is *Villach*, a small town on the Drave, the scene of one of the first great defeats suffered by the Turks, in 1492, while attempting to reach the heart of Christendom. A few miles further west is *Bleiberg*, with the extensive and productive lead-mines adjoining. A sacred mountain rises in the neighbourhood, with two pilgrimage chapels at the summit. It is said to have been ascended by the pope himself, who, with all due formality, dedicated it to the Virgin. This was as a preservative from the repetition of a dreadful catastrophe in 1345, when the larger portion of its mass gave way, and sixteen villages, with their inhabitants, were entombed by the debris.

*Laybach*, the capital of Carniola, stands at a short distance from the south bank of the Save, and has 17,000 inhabitants. It was on two occasions the residence for some months of Sir Humphry Davy, and the seat of the Congress in 1820-1821, which was fatal for a time to Italian liberty. The great sights of the province are on the western side, and at no considerable distance from each other. In one of the valleys lies the Lake of Zirknitz, which varies in size from four or five to seven or eight leagues in circuit, and sometimes entirely disappears, leaving its bed dry, a phenomenon apparently dependent upon subterranean cavities

which receive a redundant or scant supply of water according to the season. Among the numerous caverns, that of Adelsberg is remarkable for its vast extent, stalactical formations, and the entrance into it of the river Peuka which does not reappear. In its dark waters, and in a few similar places in the neighbourhood, the *Proteus anguinus* is found. This curious creature is of an eel-like form, a pale fleshy colour, very impatient of light, and seems capable of living for years without aliment by a simple change of the water in which it is placed. The quicksilver-mine at Idria, in the same region, is one of the most productive in the world, worked in the service of the government. The small town occupies a deep valley; and its inhabitants indicate by their pale countenances the pernicious atmosphere they inhale, impregnated by the vapours of various preparations of mercury manufactured in the place. The whole district is said to be so affected that cattle cannot be reared, and neither fruit nor grain will ripen. Formerly criminals were deported to the mine as workmen, but now free labourers are employed, tempted by high wages.

Trieste.

*Trieste*, an important city and the principal seaport of the empire, is seated on the shore of a gulf at the head of the Adriatic, within eight hours' steaming distance of Venice, and contains a population of 65,000. It is the residence of consuls of most commercial nations, maintains a large mercantile marine, and is to the south of Germany as Hamburg to the north, the great port of entry and of export. Steamers of the Austrian Lloyd's Company proceed hence regularly to Alexandria, Smyrna, Constantinople, and most parts of the Eastern Mediterranean. Besides ship-building establishments, there are extensive sugar-refineries, soap-works, rope-walks, and other manufactures. The old town is somewhat inland, on the slope of a hill crowned by the castle with the cathedral, an ancient building in the Byzantine style, near it. It is connected with the new town adjoining the harbour by the Corso, the principal street, which contains handsome edifices, elegant shops, and gay coffee-houses. The chief traders and merchants are foreigners, among whom may be found a considerable number of our own countrymen, sufficient to support a neat church. Greeks and Jews are also numerous. The great body of the middle classes are Italians, who speak the Italian, which is the language of the theatres and courts of justice. The lower orders, especially the peasantry who attend the markets, are Wends, who use a Slavonic dialect. German is the language of the imperial authorities. Trieste has a summer climate remarkable for its great and abrupt changes. The ordinary heat is intense, owing to the reflection of the rays of the burning sun from the rocky adjacent hills, while there is a general want of shade, with the occasional visits of the *sirocco*, a hot and oppressive south-east wind. This alternates with the *Bora* wind from the north-east, so piercingly cold, sudden in its onset, and so powerful that vehicles

and passengers are overturned by its gusts. *Capo d'Istria*, formerly a dependency of the Venetian Republic, occupies an island a few miles to the southward, connected with the main shore by a causeway, and produces large quantities of salt by the evaporation of the sea-water. *Pola*, at the extremity of the Istrian peninsula, is a small town in command of an excellent harbour, but is most distinguished as a place of the highest antiquity, retaining fine remains of Roman architecture, consisting of temples, a triumphal arch, and an enormous amphitheatre in a nearly perfect state of preservation. 'We entered the harbour in a felucca,' remarks Sir Humphry Davy, 'as the sun was setting, and I know no scene more splendid than the amphitheatre seen from the sea in this light. It appears not as a building in ruin, but like a newly-erected work; and the reflection of the colours of its brilliant marbles and beautiful form, seen upon the calm surface of the waters, gave to it a double effect—that of a glorious production of art, and a magnificent picture.' *Pola* has attained considerable importance since the Austrian government has made it a naval station and port for war-vessels. Its harbour is both safe and commodious, having water for the largest ships-of-war close inshore, and room enough for the whole British navy, and easily accessible.

## II. POLISH PROVINCES.

**GALICIA**, a north-east section of the empire, is an extensive district on the northern side of the Carpathian Mountains, and consists of a high terrace at their base, traversed by a few low ranges of hills, from which the surface declines into vast plains, the characteristic features of the region. It is watered on the west by the Vistula and its affluents, but belongs eastwardly to the basins of the Danube and the Dniester. Near the mountains the country is overspread with forests, which still harbour the wolf and bear, though systematic measures have long been in action to effect their extermination. Stimulated by rewards offered by the government, the peasantry destroyed, in little more than two years, 41 bears and 4938 wolves. The plains yield vast quantities of wheat, which is sent by the Vistula on rafts to Dantzic for export, besides barley and oats, used for domestic distillation. Flax, hemp, hops, and tobacco are likewise grown. Rock-salt is the important mineral, quarried in various places, but principally at *Wielicza*, where there is one of the most extensive and productive mines in the world. The province was annexed to the empire upon the unrighteous partition of Poland in the last century; and in 1846, the city of **CRACOW**, with the small territory belonging to it, till that time a free state, was absorbed with the consent of the other partitioning powers. In the western portion of the country the people are Poles, and in the eastern, Ruthenians, a closely-allied Slavonic race. Jews are everywhere numerous, and are almost universally the village inn-keepers. There is great divergency in the views of the people throughout the province, which separates them into two hostile political parties, to the delight of the Austrian authorities. The nobles, landed proprietors, citizens, and all the educated classes are in favour of a revived Poland, while the ignorant peasants, under the influence of the priests, are on the side of a Roman Catholic concordat-loving emperor. In Russian Poland, the Catholic clergy are patriots because Russia is schismatic. In Austrian Poland, they have no sympathy with the feeling for independence, because Vienna is Papal. But the peasants are urged by another, and perhaps a stronger motive to political subserviency. Emancipated from serfdom, and endowed with lands by the government, in reward for their loyalty during the insurrection of 1846, when they rose against and massacred the insurgent masters, they cherish the idea of obtaining fresh forests and pastures by adhering to the existing order of things. National considerations are therefore subordinated to personal and imperial interests. The **BUKOWINA**, a small district on the south-east, was formerly part of Moldavia, ceded by the Turks to Austria in the year 1777. It is a forest region, traversed by the *Sereth* and the *Pruth*, affluents of the Danube.

*Lemberg*, the capital of Galicia, centrally placed on an affluent of the Bug, contains a population of 70,000, a considerable proportion of whom are Jews, who have one of the finest synagogues in the Austrian dominions. The remainder belong chiefly to the Roman Catholic, Armenian, and Greek communions, each of which has a resident archbishop. The town is the seat of a university, and possesses a public library rich in Polish literature. Many of the Jews are wealthy merchants. They have the trade principally in their

hands, which is very extensive in corn and cattle, largely carried on at annual fairs. Peasants from the neighbourhood injured by wolves are frequently brought in to the hospital. *Halicz* or *Galicz*, situated on the Dniester, from which Galicia has derived its name, is simply now its oldest town, dating from the twelfth century, and distinguished by the ruins of a hill-seated fortress, the scene of many a bloody struggle. It was at the head of a grand-duchy, which included the eastern part of the province, with Volhynia, and was long governed by Varangian or Russo-Norman princes.

*Cracow*, seated on the Vistula, is a venerable, curious, and interesting city, the ancient capital of Poland, with a striking aspect in the distant view, owing to the spires and towers of numerous churches, and the old palace-castle placed upon a rock, now used as a barrack and hospital. But the streets are gloomy and deserted, yet have at once the impress of better days and fallen fortunes. The inhabitants number 41,000. The cathedral, high-seated by the ancient royal castle, is the interesting spot, containing the tombs of many of the sovereigns, some with recumbent effigies. The inscriptions connected with them read like a history of Poland. That of Casimir the Great is of red marble, enclosed by an iron railing. A record on the tomb of Sigismund I. proclaims him 'King of Poland, Grand-duke of Lithuania, Conqueror of the Tartars, of the Wallachians, of the Russians and Prussians!' In a separate crypt below the church, repose the remains of John Sobieski, Poniatowski, and Kosciusko. The latter has a monument in the neighbourhood of the city, consisting of a conical mound of earth on an eminence, rising from a base of 300 feet in diameter to the height of 175 feet. It was erected in 1819, by the voluntary labour of the people, of earth collected from his battle-fields, some of which was brought by crippled soldiers in their helmets, and by women in their slippers. Cracow was the residence of the sovereigns down to the time of Sigismund III. in 1610. They were crowned before the high-altar in the cathedral. The regalia remained to the year 1794. The university, of ancient foundation, possesses a statue of Copernicus, who was for a time one of the professors, executed by Thorwaldsen. From the rising-grounds to the north, a fine view of the town is obtained with all its towers; the valley of the Vistula, and the range of the Carpathians, in the loftiest and most unbroken part of the chain: the *Eisthaler-Thurm*—the highest of the *Tátra* group—presenting an aspect truly Alpine.

*Wieliczka*, a small town on the south-east of Cracow, is celebrated for its salt-mines, which are worked by the Austrian government, and have been in operation upwards of six centuries. They are mentioned in Polish annals as early as 1237, under Boleslaus the Chaste, and then not as a new discovery. The excavations completely underlie the town, the streets of which are without men in the daytime, who are toiling in the underground world. They descend to the depth of 1200 feet; extend through a space more than half a league in length by a quarter in breadth; and require from four to five hours to be explored. The works include three stories, each of which corresponds to a bed of compact rock-salt; and consist of galleries or passages and chambers of vast magnitude formed by the removal of the mineral. Some of the chambers are supported by immense pillars of salt left by the workmen; others are adorned with obelisks and statues of salt; most of them are inscribed with particular names cut in the salt; and one contains a salt-lake which is crossed in a flat-bottomed boat. The spot of greatest interest is a chapel dedicated to St Anthony, who is traditionally said to have brought about the discovery of the mines. It is supposed to have been constructed more than four centuries ago. The columns, with their ornamented capitals, the arches, the images of the Saviour, the Virgin, and the saints, the figures of two priests represented at prayers before the shrine, the altar and the pulpit with their decorations, are all carved out of the rock-salt. In this chapel high-mass is regularly celebrated once every year, and attended by all the miners.

*Calvarya*, a village and monastery south-west of Cracow, among the roots of the Carpathians, is one of the Holy Places of the Poles, deriving its name from the supposed resemblance of the site to Mount Calvary. It is the scene of a vast gathering in the month of August, when an annual indulgence is proclaimed to those who visit the spot. The place then assumes the dimensions and population of a large city, and the appearance of an immense camp. Besides pilgrims to the number of 60,000 on the average, who are chiefly peasants, at least one-third more consist of spectators and traders. Streets are formed of wooden booths and huts of the most primitive construction, which serve the purpose of houses and shops, and are adapted to the hot summer weather. The peasants arrive village by village, each group with its leader, and its standard emblazoned with particular devices. They come from hundreds of miles, out of all parts of Poland, many from Posen, are dressed in holiday attire, carry long thick staves to help them on the way, and sing religious chants along the line of march. On reaching their destination, the standards are planted in the ground, and serve as gathering-points to those who may have been separated from their party. In the courtyard before the church of the monastery are two long rows of confessionals, one on each side, and in front is a balcony, from which the monks give absolution and preach to the people. Calvarya was founded by one of the old Palatines of Cracow, and subsequently endowed by the Czartoryskis. In its immediate neighbourhood, the Mount of *Landskrona* was the last stronghold of the last band of heroes who resisted the Austrians and Russians after the insurrection of Kosciusko.

The district of the *Bukowina* derives its name from the Slavonic *buckow*, an oak, in allusion to the forests. *Czerwonitz*, the chief town, situated on the Pruth, has manufactures of clocks and hardwares.

Buda-Pesth.

### III. HUNGARIAN PROVINCES.

HUNGARY, styled a kingdom, once an independent and powerful state, is an eastern portion of the empire, its largest and most important member. As a province, according to the restricted limits adopted since the abortive insurrection of 1848-1849, it lies enclosed by the Carpathian Mountains on the north; Transylvania on the east; the Banat and Slavonia on the south; Styria, Lower Austria, and Moravia on the west. Within Hungarian limits, the Carpathians culminate in the peak of Lomnitz, about the longitude of Cracow, at the height of 8,636 feet above the sea, which appears to be the loftiest summit of the whole range. The country consists chiefly of an immense plain, and possesses a soil of extraordinary fertility, but along the rivers extensive swamps are formed by their low borders being readily overflowed. There are also in various parts tracts of deep sand, locally called *puszta*, interspersed with soda-lakes, which dry up in summer, and leave their beds incrustated with the mineral. But the extent of the unprofitable surface is small in comparison with the productive or cultivable area; and both the swampy and sandy tracts are in process of reduction by works energetically conducted for their reclamation. The Danube runs from west to east towards the central region, where the general breadth of the river amounts to 2000 feet. Bending abruptly to the south, it preserves that course to the junction of the Drave with it, on the northern border of Slavonia; and then proceeds south-east to its confluence with the Save, having previously received another of its principal tributaries, the Theiss, by which the whole of Hungary is intersected from north to south. The Raab, also an important affluent, joins the noble stream in the western portion of the country. In this district the two largest

lakes occur, the Neusiedler-See, which may be seen from the hills in the neighbourhood of Vienna, and the Platten-See, at a greater distance from the frontier. The water of the former is brackish, and the latter intensely salt. Both are shallow, surrounded by marshes, and fluctuate much in their extent. In the Hansag-marsh, connected with the Neusiedler-See, the 'wild boy' was discovered in 1749; he was supposed to be about ten years of age, long refused to wear clothes, or eat cooked victuals, but at last conformed to domestic habits, though it was found impossible to teach him to articulate a single syllable.

Besides its rich dark vegetable mould, the forests are extensive, and the mineral wealth varied and abundant. But the development of these natural resources has been largely restrained by imperfect means of internal communication, and an illiberal commercial policy; and though great progress has been made of late years in promoting traffic by the introduction of steam-navigation and the opening of several important lines of railway, yet political dissatisfaction remains to exert its invariably depressing influence upon public industry. Gold, silver, quicksilver, copper, lead, iron, coal, and rock-salt are yielded. Of three adjoining towns in the north-west, among offsets of the Carpathian range, a proverb of long standing states that Kremnitz is surrounded with walls of gold, Schemnitz with walls of silver, and Neusohl with walls of copper, in allusion to their supply of the respective metals. The gold and silver mines are still worked, but are in an exhausted condition. Schemnitz has a mining academy founded in the reign of the Empress Maria Theresa, for the purpose of educating officers to superintend all the mining and smelting works throughout the empire. The veins here are of gigantic dimensions, from 20 to 200 feet wide, but worked with great difficulty and expense, owing to the rock decomposing rapidly, which renders it necessary to case the galleries with wood. Water carefully collected in reservoirs is employed to move the machinery, while fuel for smelting is supplied by the thick forests of oak, pine, and beech which clothe the hills. The drainage of all the mines in the neighbourhood is conducted to a common level, 600 feet below the surface, from whence it is conveyed to the point of discharge by an adit or gallery, twelve miles long, excavated through a mountain-ridge, a work remarkable for boldness of project and skill in execution. The old town of Eperies has extensive salt-works; and also a mine in the vicinity from which the precious or noble opal is obtained, a gem of great beauty and value, distinguished by its brilliant interchange of colours.

But Hungary is essentially agricultural in its industry. With little tillage the prolific soil yields abundant harvests of all kinds of grain, some of which, as wheat of the finest quality, is known in the French and English markets. Tobacco is also extensively cultivated, with the vine for wines, which resemble the best produce of Burgundy and the Rhine, but have greater body and strength, and are said to possess a particular restorative virtue from the phosphoric acid which they contain. The average yearly production is estimated at 400,000,000 gallons, of which at least one-third is available for export, which would be largely increased, as well as the tobacco and corn crops, by free trade, political security, and greater facilities for transport. Upon the pasture-lands immense numbers of live-stock are reared, with swine in the woods. At the International Exhibition of the year 1862, a few fleeces were shewn, with some pieces of bacon and lard, as the representatives of more than 15,000,000 sheep and 8,000,000 hogs. At the same time, the productions of the porcelain manufactory of Herénd were displayed, and admired as very successful imitations of Chinese and Japanese fancy articles. But manufactures are generally limited to the weaving of coarse woollen cloth by the peasantry, and the production of household wares for their own use.

The Hungarians proper, who form the main body of the population, call themselves

Magyars, and belong to the Mongolian family, but the peculiarities of personal appearance distinctive of the stock have been widely obliterated, especially among the upper classes, by intermarriage with members of the Caucasian race. They migrated from the countries beyond the Uralian Mountains and the Caspian Sea to their present seat in the ninth century; founded a powerful state, governed at first by chiefs of the House of Arpád, and then by kings of the same line. The first of the latter, commonly called St Stephen, from the renunciation of heathenism by the nation in his reign, received investiture from the pope, Sylvester II., in the year 1000, with a crown sent for the purpose, which is still extant. The male line of the Arpáds failed in 1301, and was followed by sovereigns of different foreign families till 1526, when, by free election, the Austrian House was placed upon the throne. But the Turks invaded and held possession of the greater part of the country for upwards of a century. The Austrian princes became kings of Hungary, subject to certain stipulations ratified by treaty, the notorious violation of which led to the recent gallant but ill-fated struggle for national independence. St Stephen's crown, a much-venerated relic, after being kept at Presburg, was removed to Vienna by the Emperor Joseph II., who sought to centralise his dominions, but was soon afterwards restored to appease the general dissatisfaction, and thenceforward preserved at Buda. During the late insurrection it was given up to Kossuth and his friends by the keeper, saying: 'Here I deliver you the Holy Crown wherewith more than fifty kings have been crowned.' Upon perceiving that the revolutionary leaders remained covered while receiving it, the spectators cried out: 'Take the hat off! take the hat off!' During their flight into Turkey, the custodians secreted it in the earth, in the midst of a clump of trees growing in a sequestered spot, not far from the frontier of Wallachia, where it was discovered in 1853, after a long search by officers of the Austrian government.

The Magyars retain their national language, which belongs to the great Finnic linguistic family, subject to slight modifications owing to long-continued contact with other forms of speech. Its vowels are resolved into two classes, one of which, a, o, u, denotes the masculine, and the other, e, i, ö, ii, the feminine. The words are so formed that a masculine and feminine vowel never meet in the same vocable, whether simple or compound. Another peculiarity is that the Christian name is always mentioned last, as Hunyady János, instead of John Hunyady. The language is the vehicle of interesting historic annals and popular poetry. Various productions in it were supposed to be irrecoverably lost with the library of Matthias Corvinus, the greatest of the Hungarian kings, who reigned from 1458 to 1490. This prince, distinguished by his love of learning, spared no expense in procuring books, and possessed a library at Buda, at the time of his death, of 50,000 volumes, the finest collection then in existence. It was neglected and diminished by his successors, who were in the habit of making presents from it to foreign courts, in an age when books were scarce; and when, in 1541, Buda was captured by the Turks under Sultan Soliman the Magnificent, the library disappeared from notice. Repeated inquiries were made respecting it, after the expulsion of the Turks, but without effect, though the hope was strongly entertained by many that it might be found by careful search at Constantinople. Its discovery by a commission appointed for the purpose in the Old Seraglio was announced in 1863, a short time before that building was destroyed by fire, but whether it perished, or was rescued, and what it contains, has not been reported.

Besides the dominant Magyars, who are largely Protestants as well as Roman Catholics, there are a considerable number of Slovaks, Wallachs, Serbs, and other Slavonic races belonging to the Greek Church, with German colonists, Jews, and gipsies. Great variety of costume distinguishes the people, even of the same stock, and occupying closely

adjoining districts. This was very happily shewn by photographs at the International Exhibition. They represented the herdsman of the plains of the Theiss in his sheep-skin coat, the shepherd of the forests of Bakony in his felted cloak trimmed with red, the peasant of the Lower Danube in his blue tight-fitting Sunday-dress, the horseman of Cumania in his wide linen trousers, the Rouman woman in her embroidered gown and ornamental head-dress, and the sturdy German colonists who have adopted with but slight variation the attire distinctive of their locality.

*Buda-Pesth*, the modern capital, consists of two towns on opposite sides of the Danube, at the distance of about 135 miles to the south-east of Vienna, with which communication is maintained by railway and steamers. The river, 2000 feet wide and 27 feet deep, of a clear green colour, flows with a strong current, but is usually covered with ice from December to March. It is spanned by a huge suspension-bridge erected by Mr Tierney Clark, the engineer of Hammersmith Bridge, near London, which connects the two towns, and was severely tested at its opening by the retreat of the patriot Hungarian army across it before the Austrians. Buda, on the right bank, called *Ofen*, 'oven,' by the Germans, in allusion to its hot springs, contains a population of 55,000, and is of ancient date and appearance. It occupies the base and slopes of picturesque hills, one of which is crowned by a stern feudal citadel, directly overlooking the place in which the regalia of Hungary were formerly preserved; while another, up which the houses creep, rises higher in the vicinity, commands a fine view of the river and the plains for an immense distance, and has an observatory at the summit. The hot springs issue from the foot of the hills at various points. They are sulphureous, have a temperature of 118° Fahrenheit, and are used as baths—a purpose to which they were applied by the Romans and the Turks. The town, during the rule of the latter, which lasted from 1541 to 1686, was the seat of a governor-general or vizier, who had several pashas under him. Many mosques were erected with lofty minarets, and destroyed upon the expulsion of the Moslem. Pesth, much larger, containing 131,000 inhabitants, is the opposite of its neighbour, seated on level ground, almost wholly modern, and regularly built, with many handsome houses and spacious streets. It possesses a national university, museum, and theatre, is a great trading centre in the agricultural produce of the country, and puts on a very animated appearance at the annual fairs which bring together a vast concourse of strangers. Several newspapers in the Magyar language are published. At a short distance up the river, the village of *All-Buda* occupies the site of a Roman station, that of Aquincum, indicated by various remains, where, at a subsequent date, the terrible Attila established his head-quarters. Further on, the ruins of *Wissegrad* appear on the summit of a hill, a palatial castle, the favourite residence of Matthias Corvinus and other native sovereigns.

*Presburg*, the ancient capital, the scene of the coronations and of the assembly of the Diet, is situated just within the frontier, on the north bank of the Danube, 41 miles by rail from Vienna. Though a decayed place, it possesses considerable trade, contains 43,000 inhabitants, and has a name in history. Here, in 1741, the young Empress Maria Theresa, assailed by a host of enemies, summoned the Hungarian nobles to meet her, and by a brief recital of her wrongs, while she appeared clad in deep mourning, with St Stephen's crown upon her head, and his sword by her side, roused them to adopt her cause enthusiastically. Here also, in 1805, the treaty was signed between the Austrian Emperor Francis and Napoleon, which ceded Venice to the French, and the Tyrol to the Bavarians. Outside the town, is an artificial mound, called the *Konigsberg*, to which every new king of Hungary repaired on horseback on the day of his coronation, and waved St Stephen's sword to the four cardinal points, in token of his purpose to defend the country from enemies from whatever quarter they might come. *Komorn*, lower down the river, a town of some size, is best known by its fortress, supposed to be impregnable. It was held during the late insurrection by General Klapka against the Austrians, and given up to them on honourable terms when the struggle had ceased elsewhere. *Oedenburg*, near the Neusiedler-See, is distinguished by its wine produce, and has one of the principal seats of the Esterhazy family in the vicinity. *Stuhlweissenburg*, about forty miles south-west of Buda, a considerable place inhabited almost exclusively by Magyars, is one of their oldest towns, and served as a capital under the early sovereigns, twelve of whom, including Matthias Corvinus, were here interred. *Mohacs*, a village on the Danube as it approaches the Drave, is of fatal celebrity in the history of the nation, as the scene of the decisive triumph of the Turks in 1526, which soon afterwards brought the country into subjection to them. The flower of the nobles perished; the king, Lewis II., while escaping from the battle-field, was drowned in a swamp; and his death opened the way for the election of the first Austrian ruler.

*Debrecin*, eastward of the Theiss, in the heart of the kingdom, is one of the chief seats of manufactures and commerce, with a population of 36,000. It consists of scattered one-storied houses, has wide, rambling, unpaved streets, appears more like an aggregate of hamlets than a town, and has therefore been styled the largest village in Europe. There is a Protestant college upon an extensive scale. This place was for a time the seat of the national diet under Kossuth, after Pesth had fallen into the hands of the Austrians, and was subsequently the scene of many summary executions, in which several eminent men were involved. *Eyrlau*, on the north-east of Pesth, the seat of an ancient bishopric, founded by St Stephen, is enclosed with walls, and has a pleasant appearance, being surrounded with vine-clad hills, and containing many good public buildings. The inhabitants are engaged with vineyards. The best red wines are made in the neighbourhood.

for which there is a growing demand in the foreign market. *Tokay*, on the banks of the Theiss, gives its name to a dessert wine in high repute, obtained from dry grapes. The general excellence of the wines, both red and white, is ascribed to the species of grape, the peculiarities of the soil, to the strongly-contrasted summer and winter seasons, and to the vineyards occupying sunny slopes of considerable elevation. It deserves remark that Hungary and Greece are the only countries of any consequence which have hitherto escaped the recent vine disease.

Presburg.

By treaty, when the nobles of Hungary rallied round the Empress Maria Theresa, it was provided that the government of the country was to be confided to natives only. Articles agreed upon in 1790-1791 declared that 'the power of making, changing, and interpreting laws in the kingdom of Hungary belongs to the sovereign legitimately crowned, together with the Diet legally convened; that the Diet has the right of voting taxes and fixing the number of recruits; that it shall be convened at least once every three years; that nothing can be done in Hungary by means of royal letters-patent.' The infringement of these provisions led to the unsuccessful attempt to throw off the yoke of Austria in 1848-1849. But while stipulating for an independent internal administration, the old Hungarian constitution was radically defective. It made the nobles a privileged class, bearing no share of the public burdens, and exempt even from military service, except at their own option. It reduced the whole of the peasantry to a state of serfdom. These anomalies were, however, abolished by the national Diet at the outbreak of the war.

THE BANAT, a recently-constituted province, embraces the southern part of the Hungarian plain, and is extensively a region of marshes, especially towards the Danube, though great works of drainage have been executed. It is however an important granary, intersected by several canals, one of which, connecting the rivers Beja and Temes, is upwards of eighty miles in length, and was originally constructed by the Romans. During the summer heats the swampy tracts are plagued with myriads of flies or gnats, which form perfect clouds, attack the cattle, horses, and swine, often with fatal effect from their numbers. The peasants protect themselves by lighting great fires of materials which burn slowly and make much smoke, to which the animals fly for refuge.

These insects are believed to be identical with the species called *Furia infernalis* by Linnæus.

*Temesvar*, the provincial capital, has various manufactures, and is strongly fortified, provided with accommodation for a garrison of 10,000 men. The name refers to the Temes on which it is situated, in a very unhealthy locality. This river descends to the Danube, which it enters a few miles below Belgrade. *Theresianopol*, or *Maria-Theresianstadt*, is the most populous place, containing 53,400 inhabitants, but has the aspect of an aggregation of villages rather than of a town.

TRANSYLVANIA, the south-eastern portion of the empire, is enclosed by Hungary on the west, the Bukowina on the north, and the nominal dominions of Turkey on the east and south, or the provinces of Moldavia and Wallachia. It is altogether a highland region, bordered by the Southern Carpathians, and overspread by offsets of the range. The district contains much wild scenery, many difficult gorges and defiles, with only levels of inconsiderable extent along the rivers, the principal of which are the Aluta and Maros, belonging to the system of the Danube. It thus forms a natural fastness, and bears much the same relation to the plain of Hungary as Wales to England. Long and severe winters, with very heavy falls of snow, alternate with short warm summers. The population is composed of a medley of races, but consists mainly of Magyars, once the politically dominant class; German colonists, established for centuries in the country, who take the lead in industry, commerce, and general civilisation; and Roumans or Wallachs, the strongest in numbers, but very ignorant and abject, as the consequence of ages of ill-treatment. Formerly denied all political rights by their neighbours, the boon had no value in their esteem when offered it by the Hungarian patriots in 1848; and they were readily induced to take part with the House of Austria in the great struggle of the period. Transylvania possesses considerable mineral wealth, and was once styled the gold-mine of Europe from its supply of the precious metal, which is still obtained in various places.

*Klausenburg*, seated on an affluent of the Theiss, near the centre of the province, ranks as the capital, but is not the largest place. It is surrounded by walls passed by six gates; has a Roman Catholic and Protestant college, manufactures of woollens, china, and paper; and gave Matthew Corvinus, a native, to the throne of Hungary. *Karlsburg*, on the Maros, is a small fortified town, with a cathedral, in the neighbourhood of the most valuable gold-mines. *Hermanstadt*, in the south of the province, within the district known as the Military Frontier; is the military capital, strongly fortified, the see of a Greek bishop, and has Roman Catholic and Lutheran seminaries, with a good national museum. A few miles on the south, the Aluta River crosses the Carpathian Mountains by the fine pass of the Rother-thurm, and descends into the plains of Wallachia. Mount Negoi, east of the pass, the principal elevation, rises to the height of 8338 feet. *Kronstadt*, the nearest town to the Turkish frontier, is the most populous and commercial place, with 29,800 inhabitants, among whom are several opulent Greek merchants, who chiefly carry on the trade with the adjoining Principalities. Printing and the paper-manufacture are leading industries.

As a mountain stronghold admirably adapted as a base for military operations, the warlike Turkish sultans of former days coveted Transylvania, or influence in it, in order to secure possession of Hungary, and ultimately succeeded. They intrigued with native pretenders to the Hungarian throne, one of whom, John Zepelya, was placed upon it, by whom the whole of the peasantry were reduced to a state of serfdom; and the kingdom, weakened by the fiercest civil dissensions, fell at length beneath their power.

SLAVONIA, a long narrow tract, generally level, lies between the Danube and its two great tributaries, the Drave on the north and the Save on the south. The latter river forms the boundary from Turkish territory. AUSTRIAN CROATIA, chiefly mountainous, is a westerly continuation of the country to the coast of the Adriatic. Both districts were formerly incorporated in the kingdom of Hungary, and now jointly form a single province of the Austrian empire.

*Peterwardein*, in Slavonia, on the south bank of the Danube, is a small poor town, but a very strong military post, with a fortress on a rocky eminence, projecting abruptly into the river, by which it is surrounded on three sides. It was the scene of one of Prince Eugene's victories over the Turks in 1716. The name of the place is said to commemorate Peter the Hermit, who marshalled his army of Crusaders at the spot. The citadel long continues in sight, owing to its high position and the windings of the river, which flows on to *Karlowitz*, a trading town, somewhat picturesque, with a name in history. The treaty was here

concluded in 1699, under English and Dutch mediation, which separated Slavonia, Hungary, and Transylvania from Turkey, and made them over to Austria. It is the residence of the metropolitan of the Greek church in the Austrian dominions. *Sentin*, small and mean, a stopping-place for steamers, is important as a frontier town, well known from its position, on the tongue of land formed by the junction of the Save with the Danube; opposite to it is Belgrade, still Turkish in its celebrated fortress, the garrison, and a few of the inhabitants.

Peterwardein.

*Agram*, in Croatia, with about 14,000 inhabitants, is the capital of the united districts, the residence of the Ban or viceroy, and the seat of the high civil tribunals. It is pleasantly situated in a hilly and wooded district two miles from the north bank of the Save, but above the point where the river begins to be navigable for steamers. An upper town, well built, occupied by the higher classes, crowns the summit of a hill, and contains the government house, the national casino, which includes reading-rooms and a museum. A lower town forms a distinct poor quarter, adjoining which, but separate, is the abbey-town, where the cathedral and episcopal palace are situated. Both German and Slavic newspapers are published. *Carlstadt*, a small town on the banks of the Kulpa, an affluent of the Save, receives the corn of the Banat by it in long narrow boats, whence it is conveyed to the coast at Fiume along the Louisen-Strasse. This celebrated road, named after the Archduchess Maria Louisa, eighty-six miles long, was executed in the early part of the century. It traverses a very wild mountain region, and involved great engineering difficulties in its construction. *Fiume*, a seaport on a gulf of the Adriatic, is a handsome trading and manufacturing town, formerly connected with Hungary, and its only port, but severed from it in 1849 with the adjacent territory. It suffers from the vicinity of Trieste, forty miles distant on the north-west, across the Istrian peninsula, as well as from the intervention of the Julian Alps between it and the great corn and wine producing districts. Ship-building is a principal industry, for which the splendid mountain forests afford the greatest facilities; there is also one of the largest paper-making establishments in the empire. The people are Italian and Slavic, with a sprinkling of Magyars.

**DALMATIA**, nominally a kingdom, comprises a long and narrow territory on the Adriatic, terminating southward almost in a point, bounded inland by the provinces of Turkey. Many elongated islands extend parallel to the shores, and closely fringe them, forming numerous landlocked anchorages in which productive fisheries are conducted. These insular tracts are beautiful, populous, and fertile, extensively clothed with olive-groves and almond-plantations, as well as with vines, while the climate in the best localities admits of the growth of indigo. There is much less of vegetation and culture on the mainland, as it is rugged and mountainous, overspread with offsets of the Dinaric Alps, a chain running parallel to the coast, at no great distance from it, and forming the Turkish

border. The mass of the people are of Slavic origin, but those on the shores have many traces of Venetian civilisation, while the peasantry in the interior correspond not a little in appearance to the Turks, wearing the red fez on the head, with huge pistols in the belt. In the islands the men are addicted to maritime occupations, and make the best seamen in the Adriatic, while all rustic work is performed by the women during their absence on fishing and trading voyages. Dalmatia was a province of the Roman empire, and gave a native to the imperial throne in the person of Diocletian. In modern times it has been more or less Hungarian and Turkish, but was chiefly Venetian down to the fall of that republic, when it became Austrian. For some years it was held by the French, and governed by Marshal Marmont, created Duke of Ragusa, the name of one of its towns, but reverted to Austria upon the fall of Napoleon.

*Zara*, the seat of the provincial government, is a small port shut in by fortifications, but has a considerable village population in the neighbourhood. It possesses a secure and convenient harbour, has some Roman remains, and consists of dwellings chiefly in the Venetian style. The trade includes the import of manufactures from Trieste, and the export of maraschino, anchovies, almonds, and other productions of the vicinity. Maraschino is a liqueur made from the black cherry, in the preparation of which several distilleries are engaged. The notable event in the history of the place is its capture in 1346, in a daring assault by Marino Faliero, which opened the way for him to the chief magistracy of Venice, to become the only Doge ever formally executed for crimes against the state. *Spalatro*, southward on the coast, the largest town and principal seat of commerce, contains 10,000 inhabitants, and is of interest as the retreat of the Roman Emperor Diocletian upon his voluntary resignation of the imperial throne. Fine and vast remains of his palace accommodate a large number of the people with habitations. *Ragusa*, likewise maritime, has an agreeable appearance, the site being picturesque, the houses of solid stone, the streets clean and well paved, while several public buildings are handsome. The place was formerly the head of a small commercial republic, the weak but resolute opponent of Venice, and therefore the ally of Genoa, befriended by the Porte. It has now an active coasting trade, exports the raw produce brought from the Turkish province of Herzegovina, and imports manufactures which are exchanged for it. Earthquakes more or less violent have frequently occurred, one of which, in 1667, destroyed half the population. *Cattaro*, the most southerly port, is the utmost limit of the Austrian empire in that direction, being close to the Turkish provinces of Albania and Montenegro. The small town, strongly fortified by nature and art, is magnificently seated at the upper extremity of a long, winding, lake-like inlet, surrounded by towering mountains. Villages and isolated villas line the edge of the water. Rich vineyards, with citron and olive grounds, slope rapidly upward to a considerable distance; and above the line of vegetation, tremendous bare rocks rise suddenly and precipitously to an Alpine elevation. Outside the gate of the town, under a rude roof and some trees adjoining a market is held, at which the Montenegrins barter their agricultural and pastoral produce for salt, arms, ammunition, and coarse manufactures. They reach the place from their highland territory by the ladder of Cattaro, one of the most remarkable roads ever constructed. It is cut in the face of a mountain from 3000 to 4000 feet high, and consists of a series of zigzags of very steep inclination, rising one above the other, not unlike a coil of ropes as seen from above or below.

The small island of *Lissa*, a member of the Dalmatian archipelago, was a *dépôt* for British goods during the period of their exclusion from the continent by the decrees of Napoleon I.; and from this spot they were smuggled through Turkish territory into the very heart of Germany. Such was the prosperity of the trade that the population rose from 4000 to 12,000. A swarm of boats from the sounds and creeks of the mainland brought provisions, and took back the fabrics of Manchester and Leeds, the hardwares of Sheffield and Birmingham. The French attempted its capture by a naval expedition from Ancona, but were defeated by the gallant Hoste. A small fort was constructed, the towers of which still retain the names they bore, those of Wellington, Bentinck, and Robertson, the latter from the civil and military governor.

The district called THE MILITARY FRONTIER consists of a belt of country on the Turkish border, which was set apart exclusively for military purposes at a time when the Turks were formidable to the powers of Christendom. It extends from Dalmatia to Transylvania, through the southernmost part of Croatia, Slavonia, and Hungary, a distance of 900 miles, and has an average breadth of about thirty miles. This region is occupied by a chain of strong fortresses, among which that of Peterwardein, is the most important, while the Danube is lined at regular intervals with guard-houses. All the male population are under the obligation of military service in lieu of ground-rent and taxes, and are disciplined for it, attending drill, doing duty at appointed periods as sentinels, and otherwise as their superiors may determine, while liable to be employed

at a distance as the exigencies of the empire may require. The administration of civil affairs is conducted by the officers of the frontier corps; and the divisions of the territory are not by provinces, districts, or parishes, but by regiments, battalions, and companies, as indicated by sign-posts at their respective boundaries. This arrangement originated in the reign of the Empress Maria Theresa, at the suggestion of Prince Eugene; and has been maintained to the present period, subject to various modifications, as a training-school from which to recruit the regular standing army.

VENETIA, the Italian province, held in impatient subjection to the rule of Austria by fortresses and a large military force, is noticed in its geographical connection with Italy.

The empire contains a total population exceeding 37,000,000, consisting of various races of distinct origin, restricted in intercommunication by difference of language, great intervening distances, and lines of formidable mountains. Races of a common Slavonic stock, but exhibiting many diversities, compose nearly one-half of the people. Next in number are the Germans, who form about one-fifth of the aggregate, but occupy the first place in point of intelligence, industry, and political influence. The third class in numerical importance are Greco-Latins, who include the Italians of Venetia and the southern part of the Tyrol, with the Wallachs or Roumans of Transylvania and Hungary. The Magyars constitute the fourth conspicuous portion of the population. Nearly three-fourths of the subjects of Austria belong to the Roman Catholic communion, and have a parochial clergy largely independent of the civil power, except with the consent of the high ecclesiastical authorities. The form of government has long been an avowed autocratic tyranny, hereditary in the House of Hapsburg. But in recent years, under the pressure of difficulties, a constitutional form has been assumed by the establishment of the Reichsrath, a parliament composed of two houses, in which the dominant German element is chiefly represented. Entire nationalities, as the Hungarians and Venetians, refuse to recognise Vienna as the central seat of public policy, and are only retained as parts of the empire by overwhelming armaments, the cost of which exhausts its exchequer, and has to some extent damaged its credit in all European financial circles.

German Peasants at Market.

Falls of the Aar at Handek.

## CHAPTER VII.

### SWITZERLAND.

SWITZERLAND, one of the smallest states of Europe, and almost the only one of celebrity without some maritime frontier, is the seat of its grandest natural scenery, the cradle of two of its most famous rivers, the Rhine and the Rhone, and has been distinguished in its annals for centuries as the stronghold of freedom, while it is also the centre of attraction at present to travellers of all nations, for the purpose of paying homage to its mountains and glaciers, its lakes, torrents, and water-falls. The name is derived from that of one of the cantons, Schwytz, the inhabitants of which took a leading part in the emancipation of the country from the Austrian yoke, in the early part of the fourteenth century. It was anciently called Helvetia, from its primitive Celtic population, the Helvetii, who entered upon aggressive wars with the Romans, in which they suffered so severely as to become almost extinct as a separate people. The ancient name was revived in the Helvetic Republic, one of the political arrangements which fell with the overthrow of Napoleon. The country is enclosed by Germany on the north and east; by France on the west; and Italy on the south. Its northern border is defined generally by the Rhine and the Lake of

Constance; the eastern by the Rhine and diverging ranges of the Alps; the western by the course of the Doubs and the ridges of the Jura; the southern by the grand chain of the High Alps, embracing the Pennine, Lepontine, and Rhetian divisions. Between these limits lies the elliptical area of Switzerland, extending rather more than 200 miles from east to west in its greatest length, by 156 miles from north to south, a surface slightly exceeding the half of Scotland in its dimensions.

The southern and south-eastern districts, including two-thirds of the area, belong to the proper Alpine region. This part of the country exhibits every variety of mountain and valley, naked precipice and wooded slope, crystal stream and roaring torrent, with a vast extent of perpetual snow on the loftier elevations, and of glacial ice-fields creeping down from them deep into the glens, in strange contrast with their fresh green-sward, fruitful orchards, and pleasant cottages. The remainder of the surface consists chiefly of a comparatively lowland tract, though really a high plateau, diversified with ridges, on which all the principal lakes and the important towns are situated. It extends north-east and south-west between the Lakes of Geneva and Constance, and has the Jura range on its north-western border, stretching in parallel ridges along the frontier between the Rhone and the Rhine, which present a totally different aspect to that of the Alpine masses; nowhere reaching the elevation of perpetual snow, and clothed from base to summit with magnificent pine-woods. Primitive rocks, granite, gneiss, and slates compose the upper parts of the Alps. These are flanked by secondary formations, the equivalents of our own oolitic limestones, which occur at great heights, and serve to mark the comparatively recent date of the alpine upheaval. Similar limestones form the entire mass of the Jura range, and indicate its age. The intervening plateau consists generally of tertiary strata, comprising alternations of soft limestones and sandstones, with clays and marls. Besides ordinary building materials and iron, the mineral produce of the country is much less important than might be inferred from its mountainous structure, but its resources in this respect are by no means fully known. Mineral springs are, however, extremely numerous, some of which are of great medicinal celebrity, resorted to by foreign visitors. Those of Leuk, in the canton of the Valais, upwards of 4500 feet above the sea, have the temperature of 124° Fahrenheit, and are much frequented by the French.

The main chain of the Alps reaches Switzerland eastward of Mont Blanc, and runs along the southern frontier through half of its extent, or to the St Gothard, which forms an immense central mountain-knot or nucleus. It becomes interior at this point, and overspreads from the border-line the canton of the Grisons eastward to the Tyrol. The loftiest masses, Monte Rosa, 15,152 feet, and Mont Cervin or the Matterhorn, 14,837 feet, have a divided nationality, being Swiss on one side and Italian on the other. The former has been scaled, an achievement of recent date, but the latter has defied every attempt to reach the peak, and appears to be invincible from its obelisk shape. From the St Gothard a great branch diverges into the interior, westward, called the Bernese Alps, as the dividing-line between the cantons of Berne and Valais. It rises as a northern wall to the valley of the Rhone, and forms the magnificent region of the Oberland. This range is distinguished by a family of giants, the sharply-defined Finster-Aar-Horn, or 'Peak of Darkness;' the Mönch, or 'Monk;' the Eiger, or 'Giant;' the Jungfrau, or 'Virgin;' the Schreckhorn, or 'Peak of Terror;' the Wetterhorn, or 'Peak of Tempests;' the Engleshorn, or 'Peak of Angels;' and others of the noble brotherhood. Their snowy summits, the 'billows of a granite sea,' tower from 13,000 to near 15,000 feet, and overlook broad subjacent streams of ice. These heights have all been recently scaled, and for the first time by members of the British Alpine Club, except the Jungfrau, the

crest of which was gained by the brothers Meyer of Aarau, in 1812. It was again ascended by Professors Forbes and Agassiz in 1841, and has lately been trod by the foot of an English lady, Mrs Winkworth. By means of gorges which cleave the mountains to the depth of several thousand feet, in many instances mere rents and the beds of torrents, the main chains are crossed. Several of the routes are good carriage-roads, made with immense labour by blasting the rocks, tunnelling through them, and bridging the

The Matterhorn and Zermatt.

chasms; but the greater number, from forty to fifty altogether, are either simply footways or bridle-paths, often winding through terrific scenery, seldom travelled except in summer, being blocked up with snow through the winter months. The principal passes are enumerated proceeding along the main range from west to east, with their heights, and the places they connect.

|  | Height in Feet. |
|--|-----------------|
| The Great St Bernard, leading from Martigny, in the Lower Valais, to Aosta, in Piedmont, | 8,185           |
| The Cervin, or Matterhorn, from Zermatt, in the Valais, to Chatillon, in Piedmont,       | 11,000          |
| The Simplon, from Brieg, in the Upper Valais, to Domo d'Ossola, in Lombardy,             | 6,592           |
| The St Gothard, from Altorf, on the Reuss, to Bellinzona, on the Ticino,                 | 7,087           |
| The Splugen, from the Grisons to Chiavenna, in Lombardy,                                 | 6,939           |
| The Gemmi, through the Bernese Alps, connecting the cantons of Berne and Valais,         | 7,596           |
| The Grimsel, through the same chain, in the upper part of the Hasli Valley,              | 7,126           |

The Pass of St Gothard, traversed by diligences; long an important commercial thoroughfare, is the only road carried over the crest of the mountains, all the others being conducted through the deep gorges. The Simplon road, executed by Napoleon, at the commencement of the century, was the work of six years, though at one time

30,000 men were employed in its construction. It extends about 30 miles, has an average width of 25 feet, and embraces several extensive tunnels, with 611 bridges. The Cervin Pass is the highest in Europe, but is only a mule-path. That of the Great St Bernard is also not practicable throughout for wheels. It is celebrated for having been traversed by Napoleon and his army in the year 1800, and is annually crossed by an average number of more than 10,000 passengers. The hospice at the summit, a large stone building, the highest permanent habitation in Europe, is occupied by some Benedictine monks, engaged in the entertainment of ordinary travellers, and the relief of wayfarers arrested and endangered by the snow-storms, and is celebrated for its noble-looking sagacious dogs. It contains a dead-house, in which are kept the entire bodies of those who have been frozen to death, or killed by the avalanches, and never claimed, rigid as marble, withered up, but preserved from putrefying by the icy cold of the climate. The monks are all young men, generally entering upon their duties about the age of eighteen, and removing to establishments in more genial localities after a term of years, as the human system could not long support exposure to the dry, keen, cold, and rarefied air of the St Bernard.

All the High Alps are snow-mountains, and are the scenes of terrible phenomena from avalanches or snow falls, frequently destructive to life and property in the adjoining valleys. Accumulating in immense quantities in the upper regions, the snowy masses become detached from the steep declivities by their own weight, or are loosened by the solar heat, and thence descend, acquiring greater dimensions and increased speed on their course, till finally arrested in the subjacent valleys. Rocks are broken into fragments by the rushing avalanches, woods are swept away in their path, the beds of streams are filled up, thereby occasioning floods; hospices, farmhouses, and entire villages have been buried. More dangerous, but of rarer occurrence, are landslips; masses of earth and rock are detached by the action of various natural causes, which carry desolation and death into the regions below, such as overwhelmed the ill-fated hamlet of Pleurs in 1618, and that of Goldau in 1806, and buried their inhabitants. Professor Tyndall, the first to conquer the Weisshorn in 1861, witnessed a landslip upon a small scale while effecting the descent. 'A deep and confused roar,' says he, 'attracted our attention. From a point near the summit a rock had been discharged. It plunged down a dry couloir, raising a cloud of dust at each bump against the mountain. A hundred similar ones were immediately in motion, while the spaces between the larger masses were filled by an innumerable flight of smaller stones. Each of them shakes its quantum of dust in the air, until finally the avalanche is enveloped in a vast cloud. The clatter of this devil's cavalry was stunning. Black masses of rock emerged here and there from the cloud, and sped through the air like flying fiends. Their motion was not one of translation merely, but they whizzed and vibrated in their flight as if urged by wings. The clang of echoes resounded from side to side, from the Schallenberg to the Weisshorn and back, until finally the whole troop came to rest, after many a deep-sounding thud in the snow, at the bottom of the mountain. This stone avalanche was one of the most extraordinary things I had ever witnessed.' By the dislodgment of an immense mass from Monte Conto, on a September night in 1618, the little town of Pleurs was overwhelmed. Its 2000 inhabitants perished while asleep in their beds; and sixty feet of earth, stones, and rubbish now lie over the site, shaded by a forest of chestnuts. The fall of the Rossberg in 1806 destroyed the village of Goldau, with more than 500 persons, who lie buried beneath mounds which nature has rendered ornamental, being green with grass and gay with wild-flowers.

Glaciers are the most remarkable features in the physiognomy of the Alps. They are appendages to the snow mountains, bearing much the same relation to them as icicles to

the roof of a house ; and are formed by the partial thawing of the snowy masses, with subsequent congelation, about the line where, on descending from the higher regions, the temperature begins its annual oscillations above and below the freezing-point. The icy product, apparently rigid, but really semi-fluid, is urged down into the valleys by the pressure of its particles, and the inclination of its bed, and, while wasted below, is recruited from above. The singular spectacle is hence exhibited in the full glory of summer of enormous masses of ice existing in close connection with fruitful orchards, smiling gardens, fields ripening for the harvest, and the hum of bees. Four hundred glaciers are reckoned in the space between Mont Blanc and the Tyrol, varying greatly in their magnitude, but estimated to cover a total area of more than 1000 square miles. They differ likewise in external appearance, but have the general aspect of streams suddenly arrested in their headlong course down the declivities, and congealed.

‘Torrents, methinks, that heard a mighty Voice,  
And stopped at once, amidst their maddest plunge !  
Motionless torrents ! silent cataracts !’

Two great rivers, the Rhine and the Rhone, originate in this waste of glaciers, though, within the limits of Switzerland, neither is available as a channel of communication.

The Rhine embraces in its basin the greater portion of the country. The principal source is on the eastern side of the vast mountain nucleus of the St Gothard ; but the river is formed by the junction of two main branches in the canton of the Grisons. It thence flows northward to the Lake of Constance, and after its outlet, is confined chiefly to the northern frontier. A large proportion of the interior drainage is conveyed to its channel by the Aar, the most important tributary, which receives by various affluents the surplus waters of the Lakes of Zurich, Zug, Lucerne, Neufchatel, and Bienna. The Rhone descends from a glacier at the base of Mont Furca, on the western side of the St Gothard. It runs centrally through the entire canton of the Valais, passes through the Lake of Geneva, receives the Arve soon after its emergence, and speedily enters France. A visit to the confluence of the two strongly-contrasted rivers—the Rhone, blue, clear, and stately ; the Arve, muddy, brawling, and torrent-like—is one of the pleasantest excursions that can be made from Geneva. The eastern part of the Grisons is traversed by the Upper Inn, a feeder of the Danube ; flowing through the grand valley called the Engadine, while the southern canton of Tessin contributes the Ticino to the system of the Po. Thus the superficial drainage is carried off by the rivers to four distinct basins, those of the North Sea, the Mediterranean, the Black Sea, and the Adriatic. Descending from high elevations, and traversing a rugged country, the streams exhibit numerous water-falls which form a striking feature of the scenery. The Rhine has a total descent of from seventy to eighty feet near Schaffhausen, making it in three leaps, rendered very imposing by the great volume of water. The Staubbach, in the valley of Lauterbrunnen, acquires interest and beauty from an opposite element ; the thinness of the stream, in connection with the great height of the rocky rampart from which it is precipitated, being not far short of 1000 feet. Long before reaching the bottom, the water is broken up into spray, and hence the name, which signifies ‘dust-fall.’ The appearance is commonly illustrated by that of a long lace veil suspended from the summit, and waving as it hangs ; but it suggested to Byron another striking imagination :

‘Like the pale courser’s tail,  
The giant steed to be bestrode by Death,  
As told in the Apocalypse.’

Lakes characterise the country more than any other part of continental Europe, with the exception of Sweden and Finland, and have shores very remarkable for their loveliness or

their grandeur. Besides those named, which are on the northern side of the Alps, portions of the Lago Maggiore and Lago Lugano, on the southern slope, are Swiss. The largest example, the crescent-shaped Lake of Geneva, extends about fifty miles following the outer line of the curve, by six miles in its greatest breadth, and has in various places a very profound depth. It was called by the Romans *Lacus Lemanus*, and is often referred to under that name.

‘Clear, placid Leman! thy contrasted lake,  
With the wild world I dwell in, is a thing  
Which warns me, with its stillness, to forsake  
Earth’s troubled waters for a purer spring.  
This quiet sail is as a noiseless wing  
To waft me from distraction.’

The shores command views of the High Alps, which are very magnificent, especially at sunset, when the hues of the summits change from the dazzling white to the deep rich crimson, from the crimson to the pink, from the pink to the cold gray, till the colour and outline are lost in the dimness of evening.

Great differences in the elevation of the surface give rise to very different climates within narrow bounds, the cold of the polar zone on the mountain-tops co-existing with a moderate temperature at a subjacent level, greater mildness below, and oppressive summer heat in the deep and close valleys, owing to the confinement of the air, and excessive radiation from the high rocky walls on either side. Hence the vegetation varies ascendingly. The characteristic floras of all countries from the Mediterranean to the Arctic zone are met with in successive belts on passing from a lowland to a highland position. In the lower valleys, on the banks of rivers and lakes, the vine is cultivated, up to the height of about 1800 feet above the sea. The oak ascends to 2800 feet; walnuts and chestnuts to 3000 feet; beeches to 4000 feet; the birch, alder, and pine to 7000 feet. Above this, on the verge of snow-fields and glaciers, just where vegetation is about to expire, it becomes most ornamental, consisting of blue-bells and hyacinths, lilies and gentians, with which bushes of the lovely red rhododendron are intermingled on the velvet turf. Higher still are lichens, and then the desolation of eternal frost. The wild animals exist, like the plants, in successive zones along the sides of the mountains; among them are found, at the greater heights, the ibex or rock-goat, now very scarce, the chamois, also thinned by the hunter, and the marmot, of common occurrence, whose shrill whistle often breaks the silence of the upper solitudes. The marmots, valued for their fur, associate in families, form burrows in the ground, and pass the winter in a state of lethargy. In the upland forests are the wolf and bear, but now rarely heard of, especially the latter, except in the severest winters.

Switzerland is divided into twenty-two cantons or provinces, which form a confederation of twenty-five distinct republics, as three of the number, Berne, Appenzell, and Unterwalden are each politically distributed into two separate states. The independence of the country dates from the year 1307, when three of the cantons, Schwytz, Uri, and Unterwalden, combined to assert their freedom; and eight years later, on the 15th of November 1315, signally defeated a large Austrian army on the field of Morgarten. The general interests of the federation are under the direction of a Diet, composed of deputies from all the states, who appoint a president and the principal executive officers. Its sessions are successively held at Berne, Zurich, and Lucerne; but the former is the permanent seat of the government, the residence of the foreign ministers, and is therefore considered the capital. Of the cantons, seven are western, twelve are north-eastern, and three are southern.

The High Street, Berne.

| " " . . . . .                    | Coire, Bernhardin, Splügen.                  |

The canton of **BERNE**, the second in point of extent, comprehends a large portion of the plain of Switzerland. It extends from the Jura Mountains on the north, to the Bernese Alps on the south, where the region of the Oberland, remarkable for its multitudinous snow-crowned peaks, is formed, and group of glaciers. In the included space are the Lakes of Brienz, Thun, and Biemme, with a portion of that of Neufchatel, and the greater part of the course of the Aar, the only navigable river of any consequence in the whole country.

*Berne*, the capital of the confederation, but not the largest town, contains a population of 29,000. It is handsomely built of stone, and is seated on a sandstone platform at the height of 1700 feet above the sea, on the left bank of the Aar, by which it is nearly surrounded. It possesses a good public library and museum; many ornamental fountains in the streets; charitable institutions admirably regulated; and commands fine views of the mountains on the southern horizon—the Jungfrau, Finster-Aar-Horn, and their brethren, from various terraces. Haller, the illustrious physician and naturalist, was a native, and died in the place of his birth. *Berne* is said to derive its name from the old German *bären*, signifying 'a bear.' The figure of the animal is conspicuous in the armorial bearings of the canton; and stuffed specimens of all ages are in the museum. *Brain* is represented in stone along the thoroughfares; and a number of living bears are kept in an enclosure for exhibition at the public expense. In 1862 an unfortunate English visitor, looking into the bear-pit, lost his balance, fell among the brutes, and perished after a dreadful struggle with them. At Hofwyl, a few miles on the north, the late M. Fellenberg founded the still celebrated industrial and educational establishment on the Pestalozzian principle. *Thun*, near the outlet of the Aar from its lake, contains the military school of the confederation. The situation is extremely lovely, and the town is rendered picturesque by old bridges, a venerable church, and a feudal castle of the twelfth century on the summit of a steep house-clad hill in its centre. The lake, about ten miles long, has neat villas and hamlets on its borders, and is traversed by steamers, crowded in summer with travellers bound for the tour of the Oberland, or returning from it. *Interlachen*, delightfully situated between the Lakes of Thun and Brienz, consists chiefly of boarding-houses, shaded by enormous walnut-trees, where the natives carry on a profitable trade with visitors in beautiful wood carvings. *Lauterbrunnen*, a village on the south, derives its name, signifying 'nothing but fountains,' from the number of little streams that leap into the valley from the bordering heights. The 'sky-born water-fall' of the Staubbach is its great attraction, with contiguity to the Wengern Alp, the avalanches of the Jungfrau, and the glaciers of the Grindelwald.

**FRIBOURG**, the adjoining canton on the west, is mountainous on the southern border, almost everywhere finely diversified with hills, but without heights reaching to the snow-line. It is traversed by the Savine through nearly its whole extent from south to north, flowing in part of its

Glacier of Grindelwald.

course through a singularly romantic gorge, and finally uniting with the Aar. Excellent meadow-lands sustain large numbers of cattle, the best breeds in the country; and dairy husbandry, especially cheesemaking, is extensively pursued, and in high repute for the quality of the produce. The cheese called Gruyères, from a place in the valley of the Upper Savine, where it is made, is exported to all parts of the world.

*Fribourg*, with a population of 10,000, on the Savine, consists of a lower town built by the side of the river, but chiefly of an upper occupying the declivity of a rock that lines the stream, along which the houses are arranged in terraces, while some are at the summit, on the very edge of the precipice. Ancient fortifications, consisting of embattled walls, watch-towers, and gateways, remain in a perfect state, which, with the inequality of the ground, render the distant view highly imposing. The gorge through which the river winds is crossed by several bridges, one of which, on the suspension principle, is 175 feet above the stream, and remarkable for its great length, 906 feet, being the longest bridge of a single span ever constructed. The Roman Catholic Cathedral possesses an organ, built by a native, said to be the richest toned instrument in the world; it has the finest peal of bells, with the highest spire, of any church in Switzerland. *Morat*, on the east shore of the small lake of that name, is a celebrated site with the Swiss, as the scene of the battle in which they totally defeated the invading army of Charles the Bold, Duke of Burgundy, in 1476.

'There is a spot should not be passed in vain—  
Morat! the proud, the patriot field! where man  
May gaze on ghastly trophies of the slain,  
Nor blush for those who conquered on that plain.'

The bodies of thousands of the enemy were left unburied where they fell. Some bones remained strewed about to a recent date, but all relics have been collected and interred at a spot surmounted by an obelisk. The Place des Tilleuls, or Limes, in Fribourg, has its name from an existing lime or linden tree, which, according to tradition, was immediately planted in honour of the victory.

The canton of VAUD extends along the northern shore of the Lake of Geneva, and fills up the space intervening between it and the French frontier, embracing the southern part of the Lake of Neuchâtel. It formed part of Savoy down to the year 1536, then became

Lausanne.

a dependency of Berne by conquest, and was admitted into the confederation as a separate member in 1798.

*Lausanne*, on the Geneva lake, is distinguished by the exceeding beauty of its situation, occupying three hills belonging to the lower slope of Mont Jorat, with the intervening valleys. It contains a population of 20,500, chiefly engaged in making watches, chronometers, and jewellery; possesses a cathedral, college, and museum; and is associated with the memory of several literary celebrities. Kemble, the tragedian, lies in the adjoining cemetery of Pierre de Plain. Gibbon completed his *History of the Decline and Fall of the Roman Empire* in a house still extant, but changed, and now the Hotel Gibbon. 'It was on the day, or rather the night, of the 27th of June 1787,' according to his own account, 'between the hours of eleven and twelve, that I wrote the last line of the last page in a summer-house in my garden. After laying down my pen, I took several turns in a herceau, or covered-walk of acacias, which commands a prospect of the country, the lake, and the mountains. The air was temperate, the sky was serene, the silver orb of the moon was reflected from the waves, and all nature was silent.' *Vevey*, eastward on the lake, at the opening of a gorge, is a small but highly-attractive place, in the centre of orchards and vineyards. Two of the regicides, Ludlow and Broughton, who took part in sentencing Charles I. to the scaffold, resided here as exiles, and are interred in St Martin's Church. At the extremity of the lake, stands the Castle of Chillon, on a rock close inshore, rendered memorable by Lord Byron's poem, the *Prisoner of Chillon*. The castle is now used as a magazine for munitions of war.

The canton of GENEVA, one of the smallest of the federal states, but the most distinguished in history, extends around the western extremity of its lake, and makes a slight advance on either side, but is wholly cut off on the southern by France, and very nearly so on the northern, from communication by land with the sister-republics. It is watered by the Rhone, which passes westward through it into the French territory after receiving the Arve from Savoy.

*Geneva*, the largest and most flourishing town of Switzerland, contains 41,000 inhabitants, distinguished for their industry and enterprise, attachment to liberty, and literary predilections. Watches, chronometers, musical boxes, mathematical instruments, and articles of jewellery are the staple manufactures, exhibited in many attractive shops, and extensively exported. It is situated at the efflux of the Rhone from the lake, which rushes through it clear as glass and blue as indigo, forms two islands on its passage, on one of which stands a group of antiquated buildings, while the other is laid out as a public pleasure-ground. Few places have undergone a more marked improvement of late years, embracing the removal of the ancient ramparts, the provision of quays and a harbour for the accommodation of steamers, a new stone bridge across the river, a *jardin Anglaise* close to the lake, with walks, trees, and fountains, an English church, with several large and splendid hotels. No town, perhaps, of the same size can boast of such a list of illustrious names associated with it, either as natives, exiles, or voluntary residents, Farel, Calvin, Beza, Crammer, John Knox, Casaubon, Lefort, Rousseau, Voltaire, Neckar, De Luc, Saussure, Bonnet, Huber, De Candolle, Josephine, Marie Louise, Sir Humphry Davy, Sismondi, and Merle d'Aubigné. Calvin settled in Geneva as public teacher of theology in 1541, and died there in 1564. He acquired complete ascendancy over the inhabitants, founded the college now possessing a library of 40,000 volumes, attracted the Protestant youth from all quarters to the place for educational purposes, and thereby made it a centre of influence to Germany, France, England, Scotland, and other countries. The cathedral church of St Peter contains his pulpit. Many charming excursions may be made from the town, and fine views are obtained from various points, both in and around it of Mont Blanc, distinctly visible in clear weather, at the distance of about fifty miles. *Ferney*, a village within the French frontier, but close to the Swiss border, where Voltaire resided nearly twenty years, and built a chateau, two rooms of which are shewn in much the same state as they were when occupied by him.

The territories of NEUCHÂTEL and SOLEURE, separated by an intervening portion of Berne, are of limited dimensions, and correspond in being traversed by ridges of the Jura, and the long parallel valleys they enclose. From the northern slope of the range the small canton of BASLE extends to the Rhine, consisting chiefly of a fertile and populous plain.

The town of *Neuchâtel*, on the western side of its lake, is a place of considerable trade in the export of wine, the produce of neighbouring vineyards, and of watches made in villages of the canton, which are mostly sent to Geneva. The workmen pursue their handicraft in their own dwellings, and confine themselves to one particular part of the mechanism. In the ancient church the doctrines of the Reformation were preached as early as the year 1530. Farel, the reformer, was buried at an adjoining site, but the spot has not been indicated. A museum contains an interesting collection of geological specimens from the Jura, arranged by the celebrated Agassiz, a native. On the slope of a hill in the background of the town lies the largest of the erratic blocks strewn over the face of the limestone range. It is 62 feet long by 48 broad, and consists of granite similar to that of the Alps. *Soleure*, on the Aar, likewise contains a collection of Jura

fossils in its museum, and possesses an arsenal in which curious armour of the old Switzers and Burgundians is stored. Kosciusko, the Polish patriot, died here in 1817. *Basle*, once a free imperial city, is seated on the Rhine, principally on the left or western bank, at the point where the stream makes its great bend to the north. It commands a very considerable commerce, being close to the frontiers of France and Germany, at the head of the steam navigation of the river, and a great centre of railways. It ranks next to Geneva in population, 37,000, contains a once famous university, many benevolent and educational institutions, with a good public library and museum, and is said to be the wealthiest city in Switzerland. Erasmus, whose tomb is in the cathedral, was connected with it as a professor, as well as the two mathematicians, Euler and Bernouilli, who were born in the city. Holbein, the painter, was likewise a native. *Basle* is often named in church histories, as it was the seat of a great ecclesiastical council in the former part of the 15th century. A singular practice prevailed down to near the close of the last century, that of the clocks being kept an hour in advance of the proper time, the origin of which is obscure. One explanation is, that a design to deliver the town to the enemy at a certain appointed hour was defeated by the town-clock, which was to have given the signal, striking an hour in advance, which led the conspirators to suppose that they were too late, and quashed the movement. Therefore the clocks were afterwards kept wrong in grateful remembrance of the means of deliverance. The custom was abandoned, after strenuous opposition, in 1795; and true railway time has now, for some years, been kept at *Basle*.

Among the central states, those of *LUCERNE*, *UNTERWALDEN*, *URI*, and *SCHWYTZ* are distinguished as the Four Forest Cantons. They form together the shores of the tortuous Lake of *Lucerne*, one of the most beautiful sheets of water in the world, begirt with strikingly varied scenes. Sloping hills, smiling with verdure, studded with small towns, hamlets, and dwellings, lie around the north-west extremity, above which Mount *Pilatus* grandly towers, standing as a kind of sentry in advance of the Alps, whose clear or cloud-capped brow is a weather-index to the boatmen, shepherds, and villagers below. High mountain-barriers press in upon the waters in the opposite direction, which alternately advance in the boldest projections and recede to form closely-landlocked bays, where stupendous precipices rise sheer upright from the basin as its brim, or overhang it threateningly, or have little strips of verdant pasture on which a few cottages can nestle at their base. This region is of interest from its associations, as the land of *Tell*, containing many sites connected with his personal history, and the early struggles of the people for independence. *Zug*, the smallest of the Swiss states, encloses the larger part of the lake bearing its name, the southern portion of which projects into *Schwytz*, and has at its termination the isolated and well-known Mount *Righi*, overlooking both the Lakes of *Zug* and *Lucerne*, and a wonderful panorama. The territory of *Glarus*, adjoining that of *Schwytz* on the east, embraces a bold mountainous surface, with the valley of the *Linth* in the centre, a river which traverses with torrent-like speed its whole extent from south to north, and falls into the fine Lake of *Wallenstadt* on the northern border.

*Lucerne*, at the outlet of the *Reuss* from its lake, is one of the three towns where the federal Diet holds its sessions, and may be considered the Roman Catholic capital of Switzerland, from nearly all the population, 11,500, belonging to that communion, while it is the ordinary residence of the papal nuncio. Three old bridges cross the river, curiously decorated with paintings of legendary, historical, and sacred subjects, forming, in the words of Wordsworth, 'lessons for every heart, a Bible for all eyes.' The town retains its feudal fortifications, possesses an arsenal containing some ancient military trophies of interest, and has, in a quiet seclusion in the vicinity, a monument designed by *Thorwaldsen*, consisting of a colossal wounded lion, in honour of the Swiss guards who perished at *Paris* while defending the *Tuileries* in 1792. There are no particular manufactures; but the transit trade, carried on with *Italy* by means of steamers across the Lake and the Pass of the *St Gothard*, is considerable. *Sempach*, a village eight miles on the north-west, on the shore of a small lake, marks the site of the second great victory of the Swiss over the Duke of *Burgundy*, in 1386. It was gained by means of the self-devotion of *Arnold von Winkelried*, who rushed upon the spears of the enemy, grasped as many of them as he could in his arms, and thus opened a gap in the mail-clad ranks for his compatriots to rush in.

*Stans*, a small town in the cantonal division of the *Niedem-wald*, 'Lower Woods,' of which the heroic *Arnold* was a native, contains a statue of him in the market-place; he is represented with the bundle of spears in his arms. A tablet in the parish church commemorates the unfortunate people whom the French massacred for defending their homes in 1798, while the survivors became exiles. *Sarnen*, in the *Obdem-wald*, the 'Upper Woods,' is a pastoral village pleasantly situated on the shore of a small lake. On the border of *Unterwalden* and *Lucerne*, belonging to both cantons, rises the dark form of Mount *Pilatus*, 7000 feet above the sea, fringed with forests. It was once an object of dread to the peasantry.

The name is said to be derived from a wild legend, that Pontius Pilate, being banished into Gaul by the Emperor Tiberius, wandered hither, and while conscience-stricken, flung himself into a black lake at the summit. A small pool, formed by the melting of the winter's snow, occupies there a hollow, but becomes exhausted in the summer. *Alpmach*, a village at the base, has its name connected with the famous 'Slide,' described by Professor Playfair, constructed and used for the passage of timber from the mountain, in the early part of the century. This was an inclined trough composed of nearly 30,000 trees, which descended from the height of 2500 feet down to the edge of the Lake of Lucerne, a distance of eight miles. Enormous trunks, having been previously prepared, were discharged into the lake by their own momentum in the short space of about six minutes. It is, however, no longer in use.

*Altorf*, the chief place in the canton of Uri, but only a village, is of interest from its traditional connection with the legend of Tell, as the spot where he shot the apple from his child's head. A stone fountain in the open square, surmounted by figures of the father and the boy, commemorates the incident. *Bürglen*, a beautiful rural hamlet hard by, adorned with luxuriant vegetation, claims the patriot as a native. A little chapel stands on the spot occupied by his house, covered with very rude paintings descriptive of various scenes of his life, accompanied with sentences from Scripture. On the front of the chapel is the text, 'We are called unto liberty—but by love serve one another.' Between Bürglen and Altorf a rapid stream is crossed, in which Tell is said to have lost his life in old age in endeavouring to

save a child from drowning when the waters were high. These sites adjoin the southern extremity of the Lucerne Lake, and are close to the influx into it of the Reuss. The river-valley thence ascends through a series of magnificent gorges from 30 to 40 miles up to the heights of the St Gothard, accompanied by the high-road which repeatedly crosses the stream by bridges, passes through tunnels, follows zigzag terraces, while its roar is

Fluellen in Uri.

incessantly heard as it dashes along, or tumbles in cataracts, in the ravine below. In this valley, up to the point of the perpetual snows, French, Austrian, and Russian armies marched, manoeuvred, and fought, in the year 1799.

*Schwytz*, from which comes the name, Switzerland, is a town of 5000 inhabitants, the head of a canton containing a spot held in the greatest reverence by the Roman Catholics of the country, and those of adjoining districts. This is at *Einsiedlen*, a village of inns and alehouses for the reception of pilgrims to the shrine of the 'Black Lady of Switzerland,' in the neighbouring Benedictine abbey—one of the finest in Switzerland. The site is a high, bleak, and sterile plain. In the church is a shrine of black marble, where a little ebony figure of the Virgin and Child, gaudily adorned, is exhibited. Thousands are attracted to it, particularly on the great annual festival, or virginal levee, which is held in September, and lasts for a fortnight. Confessions are heard in German, Italian, French, or Romansch; while trade flourishes out of doors, in the sale of images, pictures, and various knickknacks in honour of the Virgin.

*Zug*, small and antiquated, is pleasantly seated at the north-east extremity of its lake, the shores of which present a rich appearance from numerous gardens, orchards, and vineyards. The defile of Morgarten is on the border of the canton towards Schwytz, where 20,000 Austrians were defeated in 1315 by a small body of Swiss mountaineers.

*Glarus*, on the Linth, in a secluded valley overhung with high rocks, is the seat of important cotton and cloth manufactures, and exports large quantities of the green cheese for which the canton is celebrated. Its

Gothic church is used by both Catholic and Protestant congregations. Zuinglius was the pastor from 1506 to 1516. *Näfels*, a village a few miles on the north, was the scene of the third great triumph of the peasantry over the Austrians in 1388. The event is annually commemorated by a festival, when a sermon is preached by the Protestant and Catholic ministers on alternate years.

Three of the north-eastern cantons, AARGAU, ZURICH, and SCHAFFHAUSEN, border on the Rhine in the western part of its flow, and belong to the region of the Swiss plain, though their surface is generally varied with hills of moderate height. THURGAU, likewise a district chiefly of rich levels and broad open valleys, extends along the shore of the Lake of Constance. St GALL touches the southern extremity of the lake, and circles thence round the entire canton of APPENZEL to the Rhine, as it runs from south to north.

*Aarau*, the chief town of Aargau, is a small manufacturing place on the Aar, at the south base of the Jura. *Brugg*, lower down on the river, ancient, walled, and diminutive, the birthplace of Zimmerman, is in an interesting locality. At a short distance are the baths of Schintznach, a frequented watering-place, with the tall square keep adjoining of the Castle of Hapsburg, from which its owner, Rudolph, was called, in the 13th century, to sway the sceptre of Charlemagne, and become the founder of the Austrian House. Below Brugg, in the plain, the Aar is joined by the Reuss from Lucerne, and the Limmat from Zurich, the joint streams shortly afterwards discharging into the Rhine. At and around the meeting of the waters stood *Vindonissa*, a great Helvetic settlement and stronghold of the Romans, the substructions of which have been traced, with other remains, over a wide extent of ground. *Baden*, on the Limmat, has warm sulphureous springs which have been visited by invalids from very early times.

Zurich.

*Zurich*, at the north extremity of its lake, where the Limmat gushes from it with a broad impetuous current, is built along both banks of the river in a valley hemmed in by mountains. It is a seat of the federal Diet, and the most important manufacturing town in the country, producing silk and cotton goods, with machinery. The inhabitants, 19,700, have long been distinguished for their literary as well as commercial spirit. Owing to the activity of its press, at the time of the Reformation, and the number of learned Protestant refugees who found here an asylum from persecution, it acquired the name of the Athens of Switzerland. Coverdale's Bible, the first entire English version of the Scriptures, is presumed to have

been printed at Zurich in 1535. In the cathedral, a massive venerable structure, Zuinglius preached for the last six years of his life. He perished while attending his flock on the field of battle at Cappel, in 1531. At the close of the last century, Lavater, the physiognomist, a native, was for twenty-three years minister of St Peter's Church, and fell in the streets by the shot of a French soldier, in 1799, close to his own door. In the town library, containing 40,000 volumes, are three Latin letters in the handwriting of the unfortunate Lady Jane Grey addressed to Bullinger. The university library possesses original manuscripts of many of the early reformers, the valuable portion of which has been published in the present age. The Lake of Zurich, thirty miles long by one and a half in medium breadth, has no grand mountains on its borders, though their outline is visible in the distance. Its shores are distinguished by quiet beauty, cultivated landscapes, and neat villages, which appear to great advantage, rising with their church steeples and tiled roofs up the hillsides around its waters.

*Schaffhausen*, on the right or north bank of the Rhine, has little interest but a celebrated name, as it is given to the grand Falls of the river at a short distance below the town. *Frauenfeld*, the little capital of Thurgau, is a scene of industry in connection with cotton-mills and dye-works. *St Gall*, ancient and historically distinguished, within ten miles of the Lake of Constance, is a busy manufacturing town of 14,500 inhabitants, engaged with bleacheries, cotton-spinning, and the production of embroidered muslins. This place was a seat of learning and centre of civilisation in rude ages, owing to its abbey, the monks of which officiated as teachers, attracted scholars from distant parts of Europe, and employed themselves in transcribing the classical authors, some of whose writings are indebted to them for their rescue from oblivion. The abbey-church is now the cathedral, and the other buildings are devoted to secular uses. *Pfeffers*, with slightly saline hot springs, some bath-houses, and a chapel, is very remarkable from its site. This is a mountain-split through which the stream of the Tamina furiously dashes. The sides of the half gorge and half cavern are dark, savage, and jagged, approaching so closely overhead as only to allow of scanty daylight entering, and narrow strips of the sky to be visible. *Appenzell*, at the head of one division of its canton, called Inner Rhoden, is little more than a slovenly village. The name is derived from *Abbatia Cella*, referring to a country-house of the old abbots of St Gall at the spot. *Herisau*, the chief place in the other cantonal division, or Outer Rhoden, a little larger, is neat and flourishing, with manufactures of cotton, muslin, and silk, the employment of a large number of persons in the neighbourhood.

**VALAIS**, a south-western district, embraces the valley of the Upper Rhone, and consists of an enormous trough, seventy miles long, but narrow at the base, through which the river descends from its glacial source at the one extremity to its entrance into the Lake of Geneva at the other. The Bernese Alps rise on the northern side, crossed by the strangely sublime Pass of the Gemmi. The higher Pennine and Lepontine Alps form the southern wall, which include Monte Rosa and the Matterhorn, with the routes of the Great St Bernard and the Simplon. Many subsidiary valleys are connected laterally with the main trench. In this region the most striking contrasts are exhibited—luxuriant vegetation below and utter sterility aloft—the most oppressive heat in summer at the one point, and perpetual ice-fields at the other—nature in all her magnificence, and man subject to hideous infirmity and complete abasement. Here the most numerous examples are met with of the two terrible diseases to which the inhabitants of the Swiss mountain valleys are exposed—goitre, a malformation of the neck, and cretinism, a form of idiocy—the causes of which are obscure. **TESSIN**, central among the southern cantons, embraces the country descending from the crest of the St Gothard to the Lago Maggiore, and is for the most part Italian, as well in its position and scenery, as in the language and manners of the people. The **GRISONS**, a south-eastern district, the largest and least populous of the cantons, includes the valleys traversed by the two great arms of the Rhine, from their sources to the confluence, with the valley of the Inn, forming the Engadine, and many intersecting chains of the higher Alps. The name is derived from that of a popular league against the nobles, constituted in the early part of the fifteenth century, called the 'Gray League,' *via Grischia*, from the gray homespun dress of the confederate peasants.

*Sion*, the chief town of Valais, seated on the north bank of the Rhone, is very inconsiderable, as are all the other places in the canton. But it presents an exceedingly picturesque appearance at a distance, having three extensive old castles on successive craggy peaks. *Leuk*, a village higher up the river, on the same bank, gives its name to a hamlet with warm springs, Leukerbad, a few miles distant, at the foot of the Gemmi Pass. This cluster of wooden dwellings is upwards of 4500 feet above the sea. Its bathing-houses are thronged with visitors in the height of summer, but wholly abandoned and shut up from October to May. Three

times since their establishment in the sixteenth century they have been overwhelmed by avalanches. The hottest spring rises at a temperature of 124° Fahrenheit, with the volume of a rivulet. *St Gingough*, on the borders of the Lake of Geneva, lies at the entrance of a deep ravine, which divides Savoy from the Valais.

St Gingough.

*Brieg*, in the Upper Valais, on the south side of the Rhone, marks the commencement of the ascent of the Simplon route into Italy, and is a halting-place for travellers about to cross, or having made the journey. *Martigny*, in the Lower Valais, twenty-four miles south-south-east of the east end of the Lake of Geneva, near the entrance of the torrent-like Drance into the Rhone, occupies the same position with reference to the road across the Great St Bernard, and contains a convent, from the inmates of which those of the mountain monastery are recruited. *Zermatt*, a village of clean wooden houses, with a neat church at the upper extremity of the Val St Nicholas, is a principal station, with high Alpine climbers, 5400 feet above the sea, set in, perhaps, the grandest spot in Europe. It stands at the junction of three valleys, each with its characteristic glacier, overlooked by Monte Rosa from one side, and the Matterhorn from another.

*Bellinzona*, on the left bank of the Ticino, one of the chief towns of Tessin, is feudal in its aspect, from three old adjoining castles, and Italian in the style of its dwellings. It is the entrepôt of a considerable transit trade between Switzerland and Italy, and the seat of the cantonal government for six years alternately with *Locarno*, at the north extremity of the Lago Maggiore, and with Lugano, similarly situated with reference to the lake to which its name is given.

*Coire*, an ancient town of 5000 inhabitants, the principal place in the Grisons, stands near the right bank of the Upper Rhine, and enjoys commercial advantages by its position at the junction of various roads, and on the highway of travel from Italy, through Switzerland, into Germany. *Reichenau*, a hamlet higher up the Rhine, has an inn, formerly a chateau, which was converted into a school in the last century, in which Louis Philippe officiated as a teacher in the days of his adversity. His rank and name were known to the master alone. *Splügen*, a little village, is remarkable for the approach to it from Coire, through the *Via Mala*, a tremendous defile, and its own position, 4700 feet above the sea, at the point where the two roads for Italy diverge, which respectively follow the Passes of the Splügen and Bernardin.

The illustration of the High Alps is a task to which our countrymen have addressed themselves of late years with remarkable zeal and success, amply vindicating their claim to be considered a keen-eyed, sure-footed, and clear-headed race, not to be deterred from an object by danger or fatigue. The Swiss, in imitation of the British Alpine Club, have formed an association at Berne, under the title of 'Schweizerische Alpen Club,' for the purpose of encouraging, as far as possible, the exploration of untrodden peaks, and of building huts for shelter and scientific observation in the more desolate and interesting localities. But excursionists will do well to bear in mind, that while all honour belongs to the men who knowingly venture their lives in the cause of science, like Saussure,

Agassiz, and Forbes, society will not fail to connect censure with regret, in the event of fatal accidents occurring in the attempt to scale the 'iced mountain's top,' with no higher object in view than that of standing where human footstep never stood before.

Switzerland contained in 1860 a population of 2,510,000, belonging mainly to two distinct stocks, the German or Teutonic, and the Latin. The Germans are by far the most numerous, occupying the central, northern, and eastern cantons, and their language is officially adopted by the general government. The Latins consist of French in the western, and Italians in the southern districts. About three-fifths of the people are Protestants, and two-fifths Roman Catholics. Only a few cantons contain within their limits considerable proportions of the two communions. In those of Lucerne, Uri, Schwytz, Unterwalden, Zug, Tessin, and Valais, nearly all the inhabitants are Catholics. Thus differing in creed, race, and language, harmony has not always been maintained in the internal political relations of the confederacy, but the menace of foreign aggression has never failed to strengthen the bond of union. Agriculture is the prevailing pursuit, most carefully conducted entirely by hand-labour; but many of the German Swiss are silk and cotton manufacturers, while the French Swiss are occupied largely with jewellery, horology, and artistic productions. Public education is in a highly-advanced state, especially in the Protestant cantons, where also are to be seen the neatest homesteads, the best husbandry, with other evidences of general intelligence and domestic comfort. The people are hardy, industrious, and temperate in the main; brave, patriotic, and virtuous, but imbued with an excessive love of money, betrayed in exorbitant charges to travellers, which the thoughtless extravagance of some of their wealthy visitors has not failed to strengthen. Though enthusiastically attached to their native land, they seem incapable of appreciating the sublime or beautiful in nature, and will unceremoniously exclude the most glorious landscape from view by a cattle-shed, which might as conveniently be placed in a position which would leave it open to the eye from their thresholds.

Swiss Milkman.

Court of Lions, Alhambra.

### SECTION III.—SOUTHERN EUROPE.

#### CHAPTER I.

##### SPAIN.

THE south-western extremity of Europe, occupied by the kingdoms of Spain and Portugal, forms a peninsula, commonly styled the Spanish, from that power being in possession of the greater part of the area. It was known to the Greeks and Romans as the Hesperian from its western position, and also as the Iberian from the name of one of the principal rivers, the Iberus or modern Ebro. The peninsula is connected with the main mass of the continent by a comparatively broad isthmus on the north-east, intersected by the Pyrenees; and is bounded in other directions by the waters of the Atlantic and the Mediterranean. It differs remarkably in shape from the other two peninsulas of Southern Europe, the elongated and slender Italian, and the tapering Turko-Hellenic. The ancients compared the country to a bull's hide on account of its configuration, a rude but not inapt resemblance, as it forms a compact irregular square, and possesses a very extensive margin, chiefly of sea-coast, from which large portions of the interior are removed

to a considerable distance. It is upwards of 500 miles from north to south, and more than 600 miles from east to west, while the area includes about 212,000 square miles, of which the lion's share belongs to Spain. Stirring memories are associated with the soil. It was the scene of the campaigns of Hannibal and Scipio, formed an important part of the Roman empire, gave Trajan to the imperial throne, and added Lucan, Martial, and Seneca to the list of the Latin classics. For a long period in the middle ages, while largely under the dominion of the Moors, it was almost the only seat of art, science, and literary culture in Europe. From its ports, at a little later date, Bartholomew Diaz went out to reach the southern extremity of Africa, followed by Columbus to discover a Transatlantic world, by Vasco di Gama to open a maritime route to India, and by Magellan to circumnavigate the globe. In recent times, British valour signalised itself in connection with its shores, towns, and landscapes, by the naval triumphs of St Vincent and Trafalgar, the sieges of Gibraltar, Badajoz, and St Sebastian, the battles of Salamanca, Talavera, and Vittoria. One of the most universally popular books, the *Don Quixote* of Cervantes, emanated from Spain, and a melancholy notoriety belongs to its abolished judicial institution, the secret tribunal of the Inquisition.

The Spanish monarchy embraces five-sixths of the peninsula, or 176,000 square miles, and includes its insular dependencies, the Balearic Isles, on the eastern side. Its general boundaries are the Atlantic and Portugal on the west; the Bay of Biscay, an arm of the ocean, and France, on the north; the Mediterranean and the Strait of Gibraltar, on the east and south. These limits include the southernmost point of the European continent, Cape Tarifa; likewise its highest mountain apart from the Alps, or the Cerro de Mulhagen, towering to 11,665 feet above the sea; its most elevated railway, carried across the Asturian chain, ascending 3053 feet above the mean tidal rise at Bilbao; its loftiest-seated capital city, Madrid, 2175 feet; and two royal palaces at a greater altitude, the Escorial, 3520 feet, only a trifle lower than the top of Snowdon, and La Granja, 3943 feet, higher than the summit of Vesuvius.

The Pyrenees, crowned with snow, form a well-defined border from France. They intersect the connecting isthmus from the Gulf of Lyon to the Bay of Biscay; and the highlands are thence continued by the lower range of the Asturias through the whole north of Spain to its western extremity, the bluff headland of Cape Finisterre. The frontier mountains are the most precipitous and the grandest on the Spanish side, which includes also the highest point, the Pic de Nethou, rising to the elevation of 11,426 feet, first scaled by a Russian officer, with a French companion and guides, in 1842. The peak is an eastern summit of Mont Maladetta, or the 'Accursed,' perhaps so called from its dreary nakedness, as if 'the ghost of some mountain belonging to a departed world.' This aspect is all the more striking as the Pyrenees are remarkable for vast forests of pine, oak, and beech, while the lower slopes and floors of the valleys are carpeted with the greenest grass. The chain is from forty to fifty miles broad; and is cut at great heights by passes, locally styled *puertos*, ports or gates, which serve as lines of communication. They are commonly mere gaps, only a few feet wide, through which the wind rushes with great power, howling dismally. Of the Port de Venasque, a thoroughfare from the Spanish town of that name, it is proverbially said, that in it 'a father will not look back at his son, nor a son wait for his father.' Another notch near Mont Perdu, called the Brèche de Roland, bears the name of the brave Paladin of Charlemagne, who is traditionally said to have cut it with his sword; and was himself cut off by the mountaineers in that of Roncesvaux. Most of the passes are practicable on horseback, and two for carriages are respectively at the eastern and western extremities. Hannibal and Cæsar

led armies across the Pyrenees in ancient times; Charlemagne and Edward the Black Prince in the medieval; Napoleon and Wellington in the modern age.

The central region of the country is an extensive table-land or plateau, with a mean altitude of 2000 feet, which descends abruptly towards the Mediterranean, but has a long gradual slope westward towards Portugal and the Atlantic, in which direction most of the rivers travel. The plateau is bounded on the north by the Asturian prolongation of the Pyrenees; traversed centrally from east to west in a deviating manner by the Sierra de Guadarama and the Sierra de Toledo; and walled on the south by the Sierra Morena. This last ridge overlooks the valley of the Guadalquivir, beyond which rises the Sierra Nevada, with the silvery head of the Cerro de Mulhacen on the north-east of Granada, far above the snow-line, the culminating point of Spain. In the nomenclature of the mountains their respective forms are referred to—*sierra* denoting a saw-like or serrated range; *pic*, a pointed height; and *cerro*, a hog-backed hill. The high plains between the central ridges are generally treeless, arid, and dreary, to which the name of *despoblado*, or desert, is given, and appropriately so, when viewed in contrast with the luxuriant aspect of the lowlands by which the plateau is skirted. Owing to elevation and exposure, they are swept by piercing winds in winter, while scorched by a burning sun in summer; and hence the climate of Madrid, seated on one of them, is said to consist of nine months of winter and three of hell! The *gallego*, a cold wind, nipping and injurious, blows from the north-west; and a hot blast, the *solano*, from the south-east, exciting fever and producing enervation. Forests appear on the slopes of this high region, in which the cork-tree, the evergreen-oak, the kermes-oak, the sumach-tree, the chestnut, and hazel are conspicuous, while the maritime lowlands on the south and east abound with the choicest vegetable productions, and appear like a garden in perpetual bloom. Here orange-trees flourish thirty feet high, laden with golden fruit; groves of the myrtle, lemon, and mulberry are common; the olive, fig, vine, almond, and sugar-cane are cultivated; extensive rice-grounds appear, and the date-palm indicates a climate of almost tropical heat.

The country is deficient in its river system, owing to the dryness of the climate on the great central table-land; the rivers formed are not for that reason proportionate to the magnitude of the area. Nor are they available to any considerable extent for the purposes of navigation, suffering from want of water during the summer droughts, while swollen into impetuous torrents by the melting of the snows on the mountain-ranges. The most important are the Douro, northern; the Tagus, central; the Guadiana and the Guadalquivir, southern. These have a westerly flow to the Atlantic, but the first two named pass out of the country, and have the lower parts of their course, where their commercial value is the greatest, entirely confined to Portugal. The Guadiana also quits Spain for Portugal, but returns to it again to form the frontier between the two countries at its mouth. In the Spanish part of its course, this stream disappears among swamps, and has a subterranean flow of nearly thirty miles, but throws up numerous pools at the surface, called *los ojos*, 'the eyes,' *de la Guadiana*. Among the rivers discharging into the Mediterranean, the Ebro is the largest, and one of the most considerable which Europe contributes to its basin. It drains the southern slope of the Pyrenees, and has its source near the crest of the chain. The syllable *guadi*, a component in the names of several Spanish streams, and of other localities, is a corruption of the Arabic *wady*, 'a river' or 'river-valley,' introduced into the country by the Moors, and adopted from them. It appears in Guadiana, the 'River Ana,' and in Guadalquivir, an altered form of *Wady-al-Kebir*, 'the great river,' as the stream would seem to the Africans when compared with the scant water-courses of their native land. The Spaniards took the word with them to the New World, where it figures in the names of sites in Mexico.

Among the wild animals, the chamois and ibex, the bear and wolf, are found on the heights and in the forests of the Pyrenees, but in diminishing numbers, from the exterminating war waged against them by chasseurs and peasantry. The wolf is the black variety, or *lobo* of Spain, general in the rocky and elevated ranges throughout the country, stronger than the common species, shy and ferocious, haunting the passes, watching for an opportunity to seize a victim from a string of mules. 'A dangerous person is the wolf,' remarked a shepherd in the hearing of Mr Borrow, 'and cunning as dangerous: who knows more than he? He knows the vulnerable point of every animal; see, for example, how he flies at the neck of a bullock, tearing open the veins with his grim teeth and claws. But does he attack a horse in this manner? I trow not.' 'Not he,' said another shepherd, 'he is too good a judge; but he fastens on the haunches, and hamstringing him in a moment. Oh the fear of the horse when he comes near the dwelling of the wolf!' 'Yet the mares know occasionally how to balk him,' replied his companion. 'See them feeding in the campo with their young eria about them; presently the alarm is given that the wolf is drawing near; they start wildly, and run about for a moment, but it is only for a moment; again they gather together, forming themselves into a circle, in the centre of which they place the foals. Onward comes the wolf, hoping to make his dinner on horseflesh; he is mistaken, however, the mares have balked him, and are as cunning as himself; not a tail is to be seen—not a hinder quarter—but there stand the whole troop, their fronts towards him ready to receive him; and as he runs round them barking and howling, they rise successively on their hind-legs, ready to stamp him to the earth, should he attempt to hurt their eria or themselves.' The lynx and boar are common to various localities; the Barbary ape inhabits the rock of Gibraltar; and several insects are of economic value, the gall-nut fly, the cantharides, and the kermes, besides the bee and silkworm. Of the domesticated animals, the horses of Andalusia, descended from Arab steeds, are a noble race; the mules and asses are superior breeds, strong, active, and sure-footed, used for transit on the mountain-roads; and the merino-sheep, reared to the number of from five to six millions, produce the fine wool which has led to the introduction of the stock into most European countries and Australia.

The peninsula was the Mexico of the ancient world, rich in the precious metals, which invited the Phœnicians and Carthaginians to establish colonies on the shores, till the Romans came in and took up possession of the whole country, with the remaining part of the spoil that was readily accessible. Lying exposed at the surface, or to be reached by slight excavations, and washings of the soil, the gold was speedily exhausted. So abundant was the silver, however, that some of the commonest implements of the inhabitants were composed of it. The Phœnicians obtained the metal in such quantities, that they are said to have laden their vessels with it to the water's edge, and used it for their ordinary utensils. Spain is still remarkable for the vastness and variety of its mineral stores, but the political distractions of the country, with the apathy of the people, have interfered with the development of its buried treasures. Mines are, however, worked in various districts, and will be more extensively as railways open a convenient mode of transit, and thereby invite the introduction of foreign enterprise. Silver-mines are wrought with success in Andalusia; tin and cobalt are obtained in Galicia; iron ores occur abundantly in the Asturian Mountains, where there is also pit-coal for smelting; and lead is diffused generally in astonishing quantities, and in every combination. The galenas, or argenteriferous lead ores, frequently contain silver in the largest proportion. An important supply of quicksilver is drawn from enormous veins of cinnabar at Almaden, a town on the table-land north of the Sierra Morena, where the mines have been open since the time of the Romans. They are supposed to be the richest in the metal of any known

sites, and are the property of the government. The hills of Cardona, at the base of the Pyrenees, abound with rock-salt.

Spain, including the Balearic Isles, is divided into forty-eight provinces, all of which are named after their principal towns; an arrangement of the present century, dating from the year 1833. It was formerly distributed into fourteen great districts, several of which were once independent kingdoms, principalities, and lordships. Their names are well known from the records of history, while often referred to in the present day. They are hence inserted in connection with the existing divisions in the enumerations given.

I. INTERIOR REGION.

| Old Divisions.     | New Provinces.     | Cities and Towns.              |
|--------------------|--------------------|--------------------------------|
| NEW CASTILE, . . . | Madrid, . . .      | Madrid, El Escorial, Chinchon. |
| " . . .            | Toledo, . . .      | Toledo, Aranjuez, Talavera.    |

| " . . .            | Ternel, . . .      | Ternel.                        |
| NAVARRÉ, . . .     | Pamplona, . . .    | Pamplona.                      |

NEW CASTILE, an extensive district in the heart of the peninsula, embraces elevated plains intersected centrally by the ridge of the Sierra de Toledo, and bordered northward by the range of the Sierra de Guaderama and its connected heights. The upper courses of the Tagus and the Guadiana are within its limits, which are divided from each other by the central ridge, while the northern range forms the boundary from Old Castile. New Castile produces olives, corn, pulse, and saffron, but flocks of sheep constitute the chief wealth of extensive tracts of land. The commerce carried on by means of long trains of mules reminds the tourist of the caravan-traffic over eastern deserts. The Castilians have even more than the general haughtiness of Spaniards. Their language is that of literature and of all the educated classes in Spain.

*Madrid*, the metropolis of the monarchy, was so constituted by Philip II., in the sixteenth century, from its position being supposed to mark the centre of Spain, though far removed from the sea, distant from a navigable river, apart also from the productive districts, and without easy communication with them till the engineer came with the railway to connect it with the southern coast. The city, in latitude 40° 25' north, longitude 3° 40' west, stands on the left bank of the Manzanares, an unimportant affluent of the Tagus, usually dried up in the summer months. The site is singularly unfavourable, a high barren plain, with scarcely a garden, tree, or tract of pasture for miles around, except along the course of the stream where there are some woods and orchards; but verdant mountains appear in the more distant environs. It is surrounded by a brick wall, about eight miles in circuit, pierced by sixteen gates. A remarkably fine street extends from an open space in the centre to an eastern gate, on which side lies the Prado, a long and spacious walk between rows of trees, adorned with several fountains, the evening resort in summer of all classes of the inhabitants. On the opposite side, by the Manzanares, stands the palace, a vast square edifice of white stone, each front of which is 100 feet high, and 470 feet long, enclosing an open central area. The royal public library contains 200,000 volumes, and the national picture-gallery is a vast collection of rare excellence. The royal armoury is one of the finest in the world; the Toledo blades, the artistic armour and shields from Augsburg and Milan are superb. Madrid has numerous churches and convents for nuns, 17 hospitals, 14 barracks, nearly 100 elementary schools, a university, 8 theatres, 25 daily newspapers, and numerous literary and artistic institutions. Madrid has been much improved in its aspect by the removal of several monasteries (forty-four were suppressed in 1836), which rendered the streets gloomy by their small grated windows. The population is supposed to exceed 300,000, consisting mostly of Spaniards, but collected to a considerable extent from different parts of the country. The capital is about 680 miles south-south-west of Paris, and 265 miles north-east of Lisbon.

About thirty miles to the north-west is the small town and convent-palace of the *Escorial*, the latter a

stupendous fabric, little less than a mile in circuit. It was erected by Philip II., in fulfilment of a vow made at the battle of St Quentin, which he gained on the day of St Lawrence, the martyr, August 10, 1557. The buildings are arranged in the form of a gridiron, in honour of the saint, who is said to have suffered death by being roasted on an instrument of that kind. The royal apartments form the handle, the conventual the bars, and long courts indicate the interstices. There is a richly-decorated church, with a mausoleum containing some of the Austrian and Bourbon sovereigns of Spain, and a library which the French pillaged of many valuables. The entire pile, according to current accounts, has 48 wine-cellars, 80 staircases, 800 columns, 73 fountains, 1860 rooms, 11,000 windows, 14,000 doors, and cost 6,000,000 ducats. It is now with difficulty kept up in a very forlorn condition by grants from the state. *Chinchon*, a poor place, has a memorable name. The grandee derived his title from it, whose wife, the Countess of Chinchon or Cinchon, while vice-queen of Peru, derived benefit from the use of Peruvian bark, and brought it to Spain as early as 1640. It was hence called the 'Countess's Bark,' and the trees yielding it form the genus *Cinchona*, the source of quinine.

*Toledo*, forty miles south by west of Madrid, connected with it by railway, occupies a steep rocky hill washed by the Tagus, and nearly enclosed by it. It is of ancient date, being famous in the time of the Romans, when it was called *Toletum*, and possessing some relics of the classic ages, as a ruined amphitheatre, walls, &c., was the capital of the country under the Goths, but belongs to the class of decayed cities, though retaining ecclesiastical pre-eminence, the archbishop being the primate of all Spain. It has a university and four colleges, with hospitals, asylums, and a mint. The name often occurs in connection with the manufacture of sword-blades, which were so celebrated in long bygone times as to be despatched as merchandise to all parts of Europe. A factory of arms, where swords are made for the government, is still carried on near the river, the sand and water of which are believed to be essential to their proper tempering. It was visited by Mr Borrow, from whose experience it would seem that the modern Toledo blades may be accounted equal to the ancient. 'I asked,' says he, 'some of the principal workmen whether, at the present day, they could manufacture weapons of equal value to those of former days, or whether the secret had been lost. "Ca!" said they, "the swords of Toledo were never so good as those which we are daily making. It is ridiculous enough to see strangers coming here to purchase old swords, the greater part of which are mere rubbish, and never made at Toledo, yet for such they will give a large price, whilst they would grudge two dollars for this jewel, which was made but yesterday;" thereupon putting into my hand a middle-sized rapier. "Your honour," said they, "seems to have a strong arm, prove its temper against the stone wall—thrust boldly, and fear not." I have a strong arm, and dashed the point with my utmost force against the solid granite: my arm was numbed to the shoulder from the violence of the concussion, and continued so for nearly a week, but the sword appeared not to be at all blunted, or to have suffered in any respect. "A better sword than that," said an ancient workman, a native of Old Castile, "never transfixing Moor out yonder on the *sagra*."

*Aranjuez*, higher up the Tagus, in a fertile locality, is the site of a royal residence in a lovely spot, surrounded with gardens containing groups of noble elms, cedars, and plantains. *Talavera*, lower down the river, has a well-known name from the victory gained near it by the British under Wellington over the French in 1809. *Ciudad Real*, south of the Guadiana, is the chief place in the old district of La Mancha, in which Don Quixote is represented as having commenced his adventures. *Almagro*, in the same neighbourhood, produces a rich black lace, one of the few articles of Spanish manufacture which offers any temptation to the traveller. *Cuenca*, close to the eastern border of New Castile, is in a scene of great natural beauty, on the banks of the Xucar, with high walls, a stately cathedral, and striking Moorish features. It was once celebrated for arts, literature, and industry, but its glory has now quite departed. *Guadalajara*, north-east of Madrid, a small cloth-manufacturing town, is on the Henares, a stream which flows to the Tagus, passing by *Alcala*, the birthplace of Cervantes.

LEON, formerly a distinct kingdom, is a north-western district, watered by the Upper Douro and its affluents. The surface is largely mountainous or rugged, in some parts sterile. The towns are not of present importance, though several are of historic note. The people exhibit decided differences, a portion of them forming the singular class of the Maragatos, or Moorish Goths, descended from those natives of the peninsula who took part with the Moors on their invasion of Spain, and became assimilated to them. They never intermarry with the ordinary Spaniards; are distinct in dress, habits, and temperament; and have for their home a tract of barren and rocky country in the neighbourhood of Astorga. But they are known far and wide, in the capital and the populous cities, at the inns and on the high-roads. As their soil ill rewards the task of cultivation, the men travel as *arrieros* or carriers, and almost deem it a disgrace to follow any other profession. In all respects they are the same as their original ancestry, except in their calling and religion, if indeed their forefathers so far conformed to the Moors as to embrace their faith.

Olive Gardens of Oliveras.

*Leon*, near the base of the Asturian Mountains, is ancient, gloomy-looking, dirty, crowded with beggars, possesses many churches, with a remarkably fine cathedral—a specimen of the purest Gothic, containing the tombs of many sovereigns of Leon, saints and martyrs. The environs are fertile and beautiful, abounding with trees, and with streams running down from the mountains in the background. *Astorga*, a small walled town thirty miles distant, may be deemed the capital of the Maragatos. A colossal figure of lead appears on the roof of the cathedral, the statue of one of them, a carrier, in his distinctive dress, who contributed a large sum to its endowment. *Villafranca*, towards the border of Galicia, is strikingly placed in a deep hollow with surrounding heights close at hand, near the grand Pass of Fuencebadon leading into the Galician province. This is an ascent of nine miles from the entrance to the summit by the side of a profound ravine. Trees grow luxuriantly wherever there is a slope—oaks, poplars, and chestnuts. Meadows of rich grass hang on the steeps, where mowers ply their scythes, though it seems scarcely possible for them to secure a footing. Everything here is at once wild, strange, and beautiful. *Salamanca*, long celebrated as the seat of a university of renown in Europe, and called the ‘Mother of Virtue, Science, and Art’ (which, in the fifteenth century, had 8000 students, but in 1850, only 500), is now best remembered in connection with Wellington’s defeat of Marmont in the vicinity in 1812. It stands on the Tormes, an affluent of the Douro, is surrounded by walls pierced by nine gates, contains twenty-five churches, many convents, and the largest public square in Spain, employed as a bull-ring, and capable of accommodating from 16,000 to 20,000 spectators. Population about 14,000. ‘A melancholy town is Salamanca; the days of its collegiate glory are long since gone by, never more to return.’ The bridge referred to, outside the gate *del Rio*, has twenty-seven arches, and is of unknown date, but undoubtedly of Roman origin.

*ESTREMADURA*, a western province bordering on Portugal, is intersected by the Tagus and the Guadiana. Though a westerly continuation of the central table-lands, the general elevation is much lower; and being well watered, the valleys are clothed with rich pastures, while the sloping hills are adorned with woods. But the greater part of the country is uncultivated, and has lain desolate ever since the expulsion of the Moors, while the people are mostly poor and miserable. The system of Spanish sheep-farming supplies the reason. It is almost entirely a monopoly in the hands of nobles, persons in power, and dignified ecclesiastics, some of whom have as many as 40,000 sheep. They form an incorporated company, possess and exercise the right of depasturing their flocks on all lands throughout the kingdom at their pleasure, to the detriment of the community. In summer the sheep are on the high grounds of Castile and Leon; but on the approach of

winter they are driven down to the lower levels of Estremadura and Andalusia. Proprietors of enclosed lands on the route are obliged by law to leave spaces clear for the passage, nor can the owners of the pasture-grounds turn up a sod for cultivation without the consent of those interested to prevent it.

*Badajos*, close to the Portuguese frontier, is seated on the Guadiana, here a tolerably wide but shallow and sluggish stream, winding through a country of brown moors relieved by the sight of blue mountains in the distance. The town has a few coarse manufactures, and is the seat of extensive contraband dealings with the adjoining kingdom. It is strongly fortified, and acquired a historic name during the Peninsular War in 1812, when it was taken by storm by the British army under Wellington. In the previous year, the village of *Albuera*, on the south, was the scene of a hard-won victory obtained by the combined British and Spanish over the French under Marshal Soult. *Merida*, higher up the Guadiana, now of small importance, represents a large ancient city, the *Emerita Augusta* of the Romans.

ARAGON and NAVARRE, north-eastern districts, once distinct kingdoms, border each other along the Pyrenees, and are therefore highly-diversified regions. The former extends from the crest of the chain to the Ebro, and passes to a considerable distance southward of the river. The latter is a much smaller tract, chiefly confined to the slope and immediate base of the mountains, at the western extremity of the range.

*Saragossa*, the capital of the old monarchy of Aragon, is a large ancient city of 82,000 inhabitants, situated on the Ebro which divides it into two portions connected by a striking stone bridge. It existed as a native town in the early Roman age, and being rebuilt by the Emperor Augustus, was called after him *Cæsar Augusta*, of which the present name is a corruption. It is the head of an archbishopric, contains two cathedrals, a university, and has manufactures of silks and cloths. The heroic resistance offered by the inhabitants to the French in 1808—1809, in which the 'Maid of Saragossa' was conspicuous, is the famous episode in its annals, when 'war to the knife's point' was the reply to every summons to surrender. It had a seasonable and decided effect in rousing the national spirit in other parts of the country against the invaders. *Pamplona*, or *Pampeluna*, at the base of the Pyrenees, is an important military position, with a strong fortress, to guard the frontier. Its bull-ring is capable of accommodating 10,000 spectators. On the north-east lies the Pass of *Roncesvaux*, in which the army of Charlemagne was checked by the mountaineers, upon its advance into Spain in 778. Further east are the baths of *Panticosa*, a village about 5000 feet above the sea, in a basin-shaped valley surrounded by naked rocks and tremendous precipices, visited by Spaniards of the upper class for a short time in the height of summer. *Tudela*, a small town on the Ebro, has its name connected with the celebrated Jewish traveller of the middle ages, commonly called Benjamin of Tudela.

BISCAY, an ancient lordship, is a small rugged territory on the shore of the Bay of Biscay, immediately adjoining France, from which it is divided by the Bidassoa River. It is the seat of the Basque population, a distinct race from the Spaniards proper, who speak a peculiar language, the Euscarra, which has no relation to any of the known linguistic families. They believe it to have been once prevalent throughout Spain, and are by some considered to represent the aborigines of the peninsula. In person they are active and athletic, have in general fair complexions and handsome features, while of frank, lively, sociable, fiery, and generous temper; brave to a proverb, making excellent soldiers. There is no class of nobility among them, nor will any one acknowledge a superior. Hence they recoil from servitude, and though compelled to seek employment out of their own country, it is rarely accepted except in situations which involve confidence, and enable them to meet masters upon somewhat equal terms. But the women, who are generally considered inferiors by the men, often become domestic

servants in the towns, and are highly valued. The Basques are fond of music, and excel in musical composition, but they have no poetry except of the trivial kind, and the words which accompany the strains are usually very commonplace, or without any definite meaning whatever.

*Bilbao*, the principal northern port of the kingdom, and one of its most commercial towns, is situated on

Bilbao.

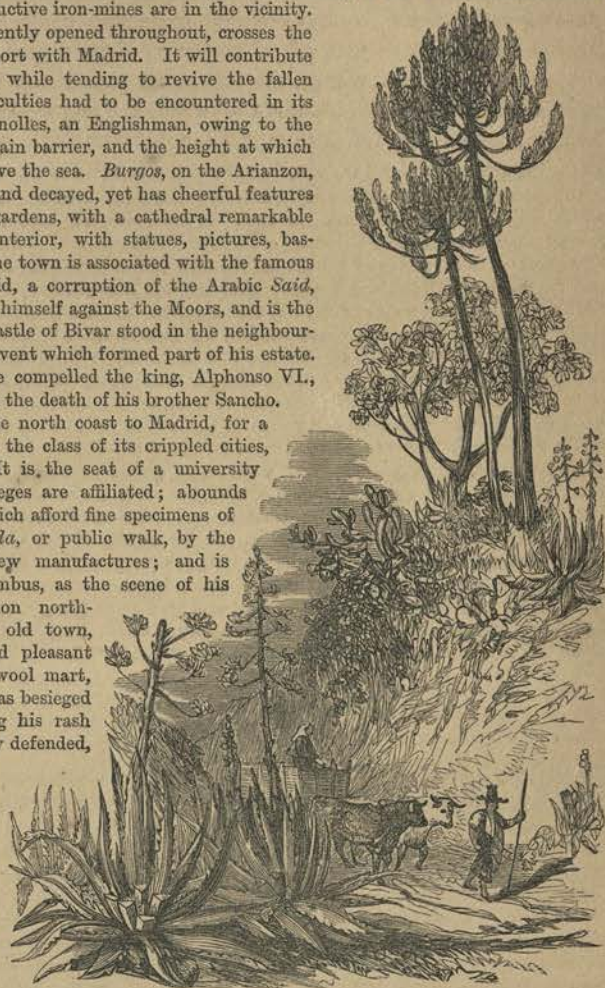

the river Nervion, eight or nine miles from the sea, and contains about 10,000 inhabitants. It has convenient quays and ship-building docks, with iron and copper mines in the neighbourhood, and is the chief emporium for the export of Spanish wool. The windings of the narrow picturesque river are 'The Bilboes' of our ancient mariners, in which they feared to be penned, and to whose entanglements the marriage-noose is compared in Beaumont and Fletcher. A shallow and dangerous bar marks the mouth of the stream, but higher up the channel has tolerable depth, and vessels of considerable burden ascend to a short distance from the town, and the smaller reach its centre at high-water, going alongside a handsome quay which forms part of the public promenade. Here is the station of the railway which crosses the Cantabrian Pyrenees to the Ebro, passing through the grandest scenery, and connects itself with the east coast by the line to Barcelona. In 1860, the English astronomers, professional and amateur, were conveyed to Bilbao, by the government screw-steamer the *Himalaya*, who observed at various inland stations the great solar eclipse of that year. *St Sebastian*, a fortified seaport on the east, within easy visiting distance from Biarritz and Bayonne in France, contains the graves of many of our countrymen, officers and soldiers, who fell when it was taken by storm by the British army in 1812. *Irun* and *Fuentarabia*, small frontier places near the outlet of the Bidassoa, have the fords between them, only passable at low-water, of which Wellington was informed by some native fishermen. He was thus enabled to throw part of his army across, thereby gaining the first permanent footing on the French territory. *Vitoria*, a pleasant inland town, has obtained distinction as the scene of the last great victory of his troops on Spanish soil. The astronomers, M. Madlar of Dorpat, M. D'Arrest of Copenhagen, and M. Goldsmidt of Paris, made it their head-quarters during the eclipse. The astronomer-royal, with M. Otto Struve of Pultowa, observed on the southern slope of the mountains, not far from Miranda on the Ebro.

OLD CASTILE occupies a narrow strip of the coast westward, but extends inland from it to the centre of the kingdom, and embraces the upper part of the course of the Douro, with the Sierra Guadarama which forms the water-shed between it and the basin of the Tagus. There are only a few places of present importance within its limits, but the names of many are prominent in the past history of the country, once splendid and populous, now reduced, retaining little beyond the memorials and traditions of former greatness.

*Santander*, a seaport, and one of the largest towns, contains a population of 20,000, and is a flourishing seat of commerce of modern date, exporting agricultural produce from the Castiles, and engrossing the greater part of the trade with the Spanish West Indies. It stands on a magnificent bay, and is accessible at all times of the tide to the largest vessels. A tobacco and cigar manufactory is one of the most extensive buildings, formerly a convent. Productive iron-mines are in the vicinity. A railway, the highest in Europe, recently opened throughout, crosses the Cantabrian chain, and connects the port with Madrid. It will contribute to the commercial advance of both, while tending to revive the fallen fortunes of Old Castile. Great difficulties had to be encountered in its construction by the engineer, Mr Vignolles, an Englishman, owing to the ruggedness of the intervening mountain barrier, and the height at which it could alone be passed, 3053 feet above the sea. *Burgos*, on the Arrianzon, a tributary of the Douro, is ancient and decayed, yet has cheerful features in shaded promenades and pleasant gardens, with a cathedral remarkable for the profuse decoration of the interior, with statues, pictures, bas-reliefs, and stained-glass windows. The town is associated with the famous Don Rodrigo, better known as the Cid, a corruption of the Arabic *Said*, 'lord' or 'master,' who distinguished himself against the Moors, and is the great hero of Spanish ballads. His Castle of Bivar stood in the neighbourhood, and his tomb is shewn in a convent which formed part of his estate. In one of the churches of Burgos he compelled the king, Alphonso VI., to swear that he had taken no part in the death of his brother Sancho.

*Valladolid*, on the railway from the north coast to Madrid, for a time the capital of Spain, belongs to the class of its crippled cities, though still a considerable place. It is the seat of a university with which English and Scotch colleges are affiliated; abounds with deserted convents, some of which afford fine specimens of architecture; has a beautiful *alameda*, or public walk, by the little river Esgueva; possesses a few manufactures; and is associated with the career of Columbus, as the scene of his death in 1506. *Palencia*, a station northward on the railway, is a striking old town, with a light, elegant cathedral, and pleasant environs. It has importance as a wool mart, producing also woollen fabrics. It was besieged by Edward the Black Prince during his rash adventure into Spain, and so bravely defended, particularly by the women, that they were authorised to wear a golden band around their hair, in acknowledgment of their courage. *Medina del Campo*, the 'City of the Plain,' on the south-west of Valladolid, was formerly large and prosperous, but has utterly fallen; yet immense ruins around it in every direction attest its bygone greatness. *Segovia*, at the northern base of the Sierra Guadarama, noted for its sheep-pastures, and once for its cloth-works, has also dwindled, though not so completely, and a remnant of the manufacture survives. Its principal feature is a grand Roman aqueduct (supposed to belong to the reign of Trajan) of 161 arches which spans the valley, and rises to the height of 100 feet above it; but the town has also a cathedral, a mint, several hospitals, and a barracks. *La Granja*, a small town on the slope of the mountains, a few miles distant, has the summer palace of the Spanish sovereigns adjoining, at the height of nearly 4000 feet above the sea. It occupies a beautiful recess, screened from the burning sun, and open to the refreshing breezes from the north, with a pine-clad mountain rising like a cone behind it. Within memory of the living, when the palace was unoccupied, owing to the political distractions of the country, the wild boars from the woods freely roamed the gardens, and rubbed their tusks against the pillars of the porticoes.

Spanish Vegetation.

The *ASTURIAS* and *GALICIA* are westward continuations of the north mountain region to the open and broad waters of the Atlantic. But in the last-named district, the coast-line bends gradually round to the south, and in that direction connects itself with the

sea-board of Portugal. It includes the most northerly point of Spain, or Cape Ortegal, and the most westerly, or Cape Finisterre. The latter is a bluff headland of granite, stern and savage, projecting from an iron-bound coast, but broken at intervals by bays and firths running far into the land, containing space and depth of water for the largest fleets. Though the interior country is almost everywhere rugged, the sides of the mountains are clothed with luxuriant woods, the valleys are abundantly fruitful, and streams with short courses are numerous, which serve to irrigate the soil, though not susceptible of navigation. The principal river, the Minho, flowing between high, precipitous, forest-clothed banks in the upper part of its course, forms in the lower the boundary from Portugal.

*Oviedo*, the chief town of Asturias, is about nine miles from the coast, where *Gijon* forms its port, from which shipments are made of local produce. It has a cathedral, a university attended by about 500 students, several other educational institutions, a theatre, eleven public fountains, and two aqueducts. When nearly all Spain was in the hands of the Moors, the Christian clergy found an asylum here. *Corunna*, a fortified seaport, on the north Galician coast, occupies one side of a spacious bay, and contains 20,000 inhabitants, but has suffered in its commerce by the rise of Santander. A tobacco manufactory here employs upwards of 2000 hands, chiefly women, and produces annually 300 tons of cigars. The town is of interest to Englishmen from the battle fought on the adjoining heights in 1809, in which the French were defeated by the troops under Sir John Moore, who fell in the hour of victory. His tomb, marked by a chaste monument, is in the centre of an old battery, now a planted enclosure. *Ferrol*, on the opposite side of the bay, is one of the principal naval arsenals, with vast docks and basins of noble execution. They are of little present use, except to tell of the bygone maritime power of Spain, when armadas sailed from her ports, and war-galleons brought into them the wealth of Mexico and Peru. *Pontevedra*, on the west coast, surrounded with groves of fruit-trees, contains splendid convents and public edifices, but all in a state of great decay. *Vigo*, to the southward, is distinguished by one of the finest natural harbours in the world, protected by lofty and steep hills on all sides except the west, the outlet to the Atlantic. In the middle of this channel rises a huge rocky island, which breaks the swell of the ocean, prevents the billows from pouring through it in their full violence, admits of the largest ships passing on either side, while the interior waters are deep, still, and lake-like. *Santiago de Compostella*, once the capital of Galicia, and still its largest town, with a population of 29,000, occupies an inland site. It is famed for a venerable and majestic cathedral, the reputed resting-place of St James the Elder, the patron saint of Spain, and the subject of many a wild tale recorded in prose and verse.

' When terrible wars had nigh wasted our force,  
All bright 'midst the battle we saw thee on horse,  
Fierce scattering the hosts, whom their fury proclaim  
To be warriors of Islam victorious Saint James !'

The Galicians, commonly called Gallegos, are a robust and industrious race, accustomed to travel in search of employment. Many are found in Madrid acting as water-carriers and general porters.

Cape Finisterre.

CATALONIA, a north-eastern district, extends from the Pyrenees along the coast of the Mediterranean to below the Ebro, embraces the lower course and mouth of the river, and is bordered westward by Aragon. The main route over the mountains from the French side, by the Col de Perthus, though less wildly picturesque than most of the other passes, abounds with striking scenery, in which steeps crowned with ruined strongholds are

prominent, and stone-pines clothing the lower slopes. Pompey led the Roman legions across it, and was soon afterwards followed by Cæsar with his army. Both erected commemorative trophies, but no trace of them remains. A mountain stream, a stone bridge, two white posts on either side of the road, some wild-looking douaniers and their tenements, mark the frontier. On descending the Spanish slope, cork-trees are everywhere abundant, and wide-spread plains are overlooked extending along the shores containing rice-grounds and varied cultivation, while the whistle of the railway from Barcelona is heard. This is destined eventually to meet the French line on its advance from Perpignan, and will so far realise the object which invading armies attempted in vain to achieve, to which political ambition gave expression in the vain boast, 'The Pyrenees are no more.'

*Barcelona*, the second city of the kingdom in population, 252,000, is seated on the Mediterranean, has been for ages a place of importance, and is at present distinguished by extensive commerce and manufactures. It is in regular steam-communication with the other Spanish ports, the Balearic Islands, and Marseille. The site is a rich plain watered by many small streams, surrounded by swelling hills, with a delightful climate. From the port, the Rambla extends through the centre of the town, a beautiful street nearly a mile long, bordered with trees and seats, and lined on each side with the best shops, the principal hotels, and public offices. Narrow tortuous thoroughfares radiate from it, occasionally opening upon small plazas with fountains, at which groups of peasants may be seen watering their mules, or carrying off the contents in elegant-shaped earthen vessels on their heads for domestic use. Woollen mantas are worn by men of the middle classes, striped with rich and brilliant colours, scarlet predominating. Ladies appear in dark silk dresses, occasionally with French bonnets, but Spanish eyes are not yet accustomed to hats for females. A few in the streets, worn by travelling-parties, have been viewed with mute astonishment. Beautiful lace is made in the surrounding villages in pieces, which are sewn together in the town establishments. Barcelona is the see of a bishop, possesses a university, eight colleges, several scientific institutions, and four public libraries, one of which is very rich in MSS., archives of the kingdom of Arragon. The town received its name from its founder, or restorer, Hamilcar Barca. *Mataro*, a seaport northward, with the inland towns of *Sabadell*, *Manresa*, and *Lerida*, all on the railway from Barcelona to Saragossa, are prosperous manufacturing sites. Crowds travel the railway in summer as far as the Monistrol Station, intent upon a visit to the holy mountain, *Montserrat*, some impelled by curiosity, the majority on pilgrimage. Its singularly beautiful mass rises abruptly out of an undulating country, covered with pines and brushwood. It is remarkable for its jagged peaks, to which the name refers, and also for its flora, the lower part being clothed with myrtle, arbutus, and boxwood, redolent with lavender, wild rosemary, and thyme. The ascent commands grand and extensive views. At the height of 3000 feet stands the far-famed and much-revered monastery, named after the mountain, now in ruins, except a part occupied by some Benedictine monks, who keep a school for children of the higher ranks, and the church. A black image of the Madonna, with a splendid dress and wardrobe, is the grand attraction, visited daily by from 200 to 300 pilgrims in fine summer weather. *Gerona*, a fortified inland town, north-east of Barcelona, distinguished by its gallant resistance to the French in 1809, is graced by a grand cathedral on the summit of its hill, approached by a flight of eighty-six steps, but is otherwise dreary and dilapidated. *Tarragona* and *Tortosa*, seaports in the southern part of the province, are of ancient date, with remains of the Roman age in their vicinity.

**VALENCIA** and **MURCIA**, two provinces in succession southerly, consist chiefly of a series of rich and extensive plains, which, from ample irrigation, being watered by the Guadalaviar, Xucar, Segura, and other streams, are under a rotation of crops all the year round. Oranges, olives, lemons, figs, grapes, and pomegranates are cultivated; groves of date-palms adorn the surface; and fields of maize, with rice-grounds, are numerous. But some of the most fruitful tracts are fever haunted, from the prevalence of malaria; and hundreds of the inhabitants annually fall victims to it.

The city of *Valencia* is delightfully situated on the banks of the Guadalaviar, three miles above its entrance into a spacious bay, from the surface of which its aspect is quite oriental, owing to the number of the domed churches and campaniles. It is one of the finest and busiest places in Spain, contains a population of 145,000, possesses extensive silk and cloth manufactories, with printing establishments, and has the most frequented university in the kingdom. Moorish walls remain, which are passed by eight massive gateways. The streets, narrow and winding, are smoothly paved and kept beautifully clean, two rare features in the economy of the towns. Some of the best examples of Juanes, the Valencian painter, are in the cathedral, from the bell-tower of which a fine view of the city and its environs is obtained. An adjoining chapel, dedicated to Our Lady of the Unprotected, *Nuestra Señora de los Desemparados*, contains an image of the Virgin blazing with jewels. In the *Glorietta*, an attractive public garden, all the beauty and fashion of Valencia appear daily towards sunset. The markets are of special interest. Mules and donkeys decked out with worsted

tassels and trappings of every hue, carrying panniers of golden fruit, form, with the attendant peasants, picturesque groups for the artist. *Peníscola*, *Castellón*, and *Murviédro* are northern seaports, the latter on the site of Saguntum, a Roman town, destroyed by Hannibal on his march through the country. *Alicante*, on the south, has a striking appearance from the sea, being situated at the base of a high rock crowned by a citadel. It is in direct railway communication with Madrid, 230 miles distant, forms its port, and is increasing thereby in commercial importance. Palm-forests appear in connection with *Elche*, about eighteen miles inland. The date-palm is here cultivated for its fruit; and is so profitable that the plantation is rapidly extending, already spread over an area of ten square miles. The trees are mostly set in rows around squares of ground about a quarter of an acre each, in which corn, lucerne, and pomegranates are raised. Some are arranged in beautiful avenues, with a broad footpath between the rows. A portion of the produce is now exported to England and elsewhere as African dates.

*Murcia*, an inland city, is seated on the Segura River, and contains 109,000 inhabitants, a cathedral, episcopal palace, and three colleges, with establishments of the government for the preparation of saltpetre and gunpowder. *Cartagena*, or Carthage, a principal naval arsenal, is situated on one of the most land-locked harbours of the Mediterranean, now comparatively deserted. The name originated with its Carthaginian founders, who called it New Carthage, but the offspring never bore any resemblance in extent and commerce to the mother-city. In the background of the town two remarkable round-topped hills rise from the plain, famous as the positions of Scipio and Asdrubal, at the head of Roman and Carthaginian armies, during a sanguinary battle.

GRANADA, the last of the Moorish kingdoms in the peninsula, and ANDALUSIA, in which it is now included, form an extensive province on the south coast, which has towards its centre the projection occupied by the rock-fortress and town of Gibraltar, a colony of Great Britain. The interior, belonging principally to the basin of the Guadalquivir, has the Sierra Morena on its northern border, and the snow-covered peaks of the Sierra Nevada in the more maritime region. It is rich in minerals, varied vegetation, interesting sites, and historical associations, while containing several important cities of the present day. Andalusia is an Arabic softening of Vandalusia, the name given to the south of Spain upon its conquest by the Vandals.

The city of *Granada*, with its Moorish towers, gateways, narrow streets, and wild-looking gypsies among the population, stands on the arrowy Darro, at its junction with the Xenil, and contains about 100,000 inhabitants. The site is a plain renowned for its beauty and fertility, at the height of 2000 feet above the sea, bordered on the southern side by the snow-mountains, which are in full view at the distance of twenty miles, and contribute to the richness of the vegetation by the streams they originate. The cathedral, built on the site of an ancient mosque, has a chapel containing the splendid alabaster monuments of Ferdinand and Isabella, side by side, who wrested Granada from the Moors in 1492, and the equally beautiful monuments of their daughter Juana, and her husband Philip of Burgundy. The far-famed Alhambra, the palace of the Moorish sovereigns, a mile and a half from the city, is its great charm and point of interest, recently admirably repaired. This congeries of buildings, remarkable for interior decorations, is placed on a bluff rock, the ascent of which is through groves of oranges and poplars. The Xeneralife, a kind of pleasure-house, is half a mile distant, in the midst of grounds furnished with streams, tanks, fountains, and avenues of ancient cypresses. Among the gypsies of Granada, who occupy a particular quarter, and are troublesome beggars, the women are distinguished by their shining coal-black hair, polished mahogany-tinted skins, and picturesque attire. *Malaga*, on the coast, highly commercial, with a population of 113,000, and a balmy winter climate, is situated at the head of a bay, surrounded by a country producing wines and raisins, almonds and other fruits, in the exportation of which its trade principally consists. Vine-clad hills appear in the neighbourhood, with the farms of the peasantry, and the yards or floors on which the raisins are prepared. These yards are small spaces surrounded by a wall a foot high, placed on a slope facing the sun. The inside is strewn with sand, and divided into compartments by narrow footpaths, between which the bunches of grapes are laid to dry, after being previously allowed to wither a little, by having the stalk half cut through on the parent stem before being gathered. They require from ten to fourteen days to dry, and are then sent packed in boxes to the merchants in the town. Christmas is a time of high festivity at Malaga. Turkeys are the fare of all families who can afford it, large flocks of which are driven in by the peasants with long bamboo-canes in their hands. The scene in the cathedral on Christmas-eve changes from the solemn to the ludicrous. After midnight mass has been celebrated, the organ peals forth, and successively imitates the sounds in the manger—an infant's cry, the cock's crow, the donkey's bray, and the ox's low.

*Seville*, the chief city of Andalusia, and the third in Spain in population, 152,000, is seated on the left bank of the Guadalquivir, about 45 miles above its mouth, 212 miles south-south-west of Madrid, and has steam navigation to the Atlantic. An iron bridge across the river leads to the suburb of Triano, chiefly occupied by gypsies and the lower classes. In this suburb the founders of the Inquisition fixed their first tribunal, in 1481. On the flat adjoining plain remains of a square platform may be traced, the *Quemadero*,

or burning-place, scene of many a tragic *auto-da-fé*. Seville is the residence of many old families of nobles, gentry, and merchants, who appear in handsome equipages on fine evenings on the drive along the river. It contains a vast cathedral, in which are some of Murillo's best paintings, an immense palace of the Moorish kings, a spacious arena for bull-fights, and the beautiful new residence of the Infanta, and her husband, the Duke de Montpensier. Its importance in popular esteem appears from the proverb, *Quien no ha visto Sevilla no ha visto maravilla*—('He who has not seen Seville has not seen a wonder'). The chief trade is the export of oranges, and the manufacture of tobacco. The latter, a government monopoly, as elsewhere throughout Spain, is conducted in an establishment employing several thousand persons, and turns out an enormous quantity of cigars. There is also a government factory for making rifled cannon, fitted up with machinery imported from England. *Cordova*, 70 miles higher up the Guadalquivir, old and renowned, now decayed yet interesting, was once the capital of the Mohammedan dominions in Spain, the seat of a rival califate to those of Bagdad and Cairo. A fine Roman bridge crosses the river, and a Moorish mosque forms the cathedral, the interior of which is profusely decorated with coloured marbles, sculptured and gilt. The place was formerly celebrated for the manufacture of a superior kind of leather, called *Cordovan* from the site, whence the French *cordonnier*, and the English *cordwainer*, applied to the shoemaker.

Cadiz.

*Cadiz*, a fortified seaport, is seated upon a projection of the Isle de Leon, close to the coast of the Atlantic, between the mouth of the Guadalquivir and the Strait of Gibraltar. Though not so important since Spain lost her American colonies, there is still much life and bustle in the streets, considerable commerce in the export of wines, and a population of 71,000. It is one of the oldest towns in Europe, having been built by the Phœnicians, under the name of Gaddir, about 1100 B.C.—nearly a century before the time of David, king of Israel. From the Carthaginians, it passed into the hands of the Romans, who called it *Sades*, whence its modern name. Southward lies Cape Trafalgar, a bluff headland, not of any great height, the scene of Nelson's naval victory and death. Northward is the port of *San Lucar*, from which Magellan sailed on the first voyage of circumnavigation; and the little town of *Palos*, a more memorable spot, from which Columbus set out to discover transatlantic realms. From the latter may be seen the belfry of a convent in ruins rising above a clump of pines, before the porch of which, in the earlier part of his life, Columbus stood, faint and weary, to ask bread and water of the inmates. *Xeres*, thirty miles

inland from Cadiz, remarkably well built, is a principal *dépôt* for the wines called sherries, from the name of the town, which is pronounced *Shares*. The cellars of the chief merchants are of immense extent, and have a constant stock of several thousands of pipes, arranged in rows like streets. The wines are of various quality and age, amounting in some instances to upwards of a century. Owing to the railways, large quantities of wine are now brought down from the interior of the country to Xeres, to be turned into sherry for the English market, by the admixture of spirits, with other treatment. *Algesiraz*, a dilapidated Moorish town, with a half-deserted port, is known from its position, which overlooks the Bay of Gibraltar from the western side.

The BALEARIC ISLANDS, forming one of the modern provinces of the kingdom, lie off the east coast, and have regular steam communication with Barcelona and Valencia. They consist of Majorca, centrally placed; Minorca, on the north-east; Ivica, on the south-west; and Formentera, adjacent to it, with several others of insignificant extent. They are rich in olive and orange groves, produce various other fruits in abundance, and have a temperate and healthy climate. The inhabitants are cleanly in their habits, and favourably disposed towards the English, having been under the control of Great Britain in the last century. Many of them speak English, and it is still taught in several of the schools.

Majorca, the largest island, about the size of the county of Wilts, has a hilly surface, and is wholly overlooked from the northern side by the Silla de Torillos, which rises to 5000 feet above the sea. *Palma*, the chief town, on a bay of the south coast, contains 40,000 inhabitants, has some silk and woollen manufactures, with a huge palace in the vicinity formerly occupied by the Inquisition. But *Port Mahon*, on the eastern side of Minorca, a much smaller place, is the residence of the military governor, possesses regular fortifications, and a splendid harbour.

The Canary Islands, off the south-west coast of Marocco, are considered an integral portion of the monarchy, and form one of its modern provinces, making the total number forty-nine. In this volume they are noticed in connection with Africa, being among its insular appendages.

The Spanish foreign possessions consist of Ceuta and its dependencies on the Barbary coast, to which criminals and political offenders are deported; Cuba, Porto Rico, with a portion of Haiti, and two of the Virgin Isles, in the West Indies; part of the Philippine and the Ladrone Islands in Oceania.

The original inhabitants of the peninsula are supposed to have been Celtic tribes from Gaul. But more than a thousand years before the Christian era its southern shores were known to the Phœnicians, who planted colonies upon them, and were followed at a later date by the Carthaginians. The latter overrun a considerable portion of the interior, but were mastered by the Romans, who incorporated the whole country in their empire. Upon the fall of the imperial power, the Vandals, Suevi, and Visigoths successively appeared as conquerors within its limits, founding various monarchies, till the Moors or Saracens came over from Africa in the early part of the eighth century, or the year 711. The newcomers drove the Goths to the northern mountains, took possession of the southern and central provinces, introduced the arts and sciences of Arabia, and remained more or less dominant through seven centuries, but were gradually weakened by civil wars, voluptuous indulgence, and the arms of their northern neighbours. At length, by the union of the two principal Christian kingdoms through the marriage of Ferdinand of Aragon with Isabella of Castile, a confederacy was formed too powerful to be resisted. The Moors were deprived of their last stronghold, Granada, in 1492, and were afterwards compelled by edict to quit the country. Ferdinand gave political unity to Spain, becoming its monarch from the Pyrenees to the Gibraltar Rock. He witnessed its external aggrandisement by the acquisition of transatlantic possessions through the discoveries of Columbus, and promoted religious intolerance internally by the establishment of the Inquisition. From the foundation of the kingdom to the present century, the infamous tribunal reigned in all its terrors; and the form of government remained perfectly absolute, yet subservient to a host of monks and priests, who monopolised the wealth of the country without contributing to its welfare. After various struggles and vicissitudes, in 1833 a constitution was adopted, which, subsequently modified, now vests the right of legislation in the

sovereign and the Cortes, or national assembly, while the convents have been suppressed, the Inquisition abolished, the property of the church confiscated, and the clergy made stipendiaries of the state. But the Roman Catholic religion is still the only tolerated form of faith; penalties are inflicted upon natives dissenting from it; and foreign Protestant residents have with difficulty obtained the concession of the ordinary rites of sepulture. Public instruction only exists to a very limited extent, but is advancing through the efforts of the government and voluntary associations; and after a long period of depression, the general interests of the country are now in the ascending scale, a result to which the introduction of railways has contributed, though lagging far behind the majority of European states in the march of improvement.

Spain contains a population of rather more than 15,000,000, only a small number in comparison with the extensiveness of its area. The people are very unequally distributed, chiefly found in the north, east, and south-east maritime regions, while a large proportion of the high central tract is as solitary as the wilderness. Four distinct families may be discriminated—the Spaniards proper, who form the main mass of the people; the Biscayans or Basques, previously noticed, on the western skirts of the Pyrenees; some remnants of the Moors in the southern provinces; and the Gypsies or Gitanos, in various localities, numbering about 40,000, who have fixed habitations and employments, though addicted to temporary wandering. The Jews, who once formed a considerable body, were banished the kingdom by Ferdinand of Castile on religious grounds, and compelled to scatter themselves over Europe, many of whom finally settled at Constantinople, but a few have reappeared in the British colony of Gibraltar.

The Spaniards proper are a mixed race, descended from the original Celtic tribes, intermingled with Carthaginian, Roman, Gothic, and Moorish blood. They differ therefore to some extent provincially in dialect, appearance, temperament, and habits. The standard Spanish language is the tongue of Castile, spoken there in its purity; but so widely known as to have become national, being now taught in all the schools throughout the peninsula, while instruction in the provincial dialects is strictly prohibited by the central government. It is the idiom of the court and of literature, manifestly derived from the Latin, but with a considerable admixture of Gothic, and more especially of Arabic words. The sixteenth century, which produced Cervantes, the author of *Don Quixote*, and Lope de Vega, the dramatist, was the flourishing age of literature in Spain, after the golden era of Arabic learning. In Catalonia, Valencia, and the Balearic Isles the dialect of the lower classes corresponds somewhat to the language of the old troubadours in the south of France. In Galicia, the popular speech occupies a middle place between its parent, the Spanish, and its offspring, the Portuguese.

Great variety distinguishes the inhabitants of the peninsula in temperament and manners, with not a little discordance. The Castilians are characteristically proud and taciturn, formal in their deportment, temperate in their diet, piquing themselves upon their high sense of honour. Those of fair complexion are deemed the purest Spaniards, being without the dark or Moorish tinge. They constitute the class called *hidalgos*, and are entitled to the appellation of 'Don,' with other privileges. The Asturians, Biscayans, and Catalans are of lively, social, fiery, and independent spirit, free and easy in their manners, placing themselves upon a perfect equality with the members of every company. A common labourer or mechanic, with a handkerchief around his brow, or hempen sandals on his feet, will ask a light for his cigar from the most fashionably dressed on the public promenade, as a matter of course. Until a recent date, the Catalans were notoriously given to smuggling and brigandage, accustomed to lie in wait for *grandeos* and merchants of Barcelona, kidnapping them in order to exact a ransom.

Frugality and honest industry are features of the Galicians; indolence and insincerity of the Estremadurans and Murcians; while the Valencians and Andalusians are imaginative, vain, and vivacious, careless, though reduced to poverty, prone to plotting, and vindictive. But however differing in national character, the great body of the people are united by a variety of common tastes, and an appetite for the same amusements. Singing, music, and dancing are in favour with all classes, often conducted by the peasantry in shady sequestered spots, as an interlude amid the toils of the day, or a recreation at eventide when labour is over. The charming climate admits of much indulgence of this kind out of doors. It has been said that if the *bolero*, a national dance, were to be struck up in any of the churches and courts of law, the very clergy and judges could not refrain from joining in it.

High and low, young and old, male and female, are passionately attached to the bull-fight, a brutalising sport derived from the Romans, and one of the dark blots upon the Spanish character. Every town of consequence has its arena for the so-called combat, in which the animal has no more chance with his numerous assailants than a rat turned out to be worried by a pack of dogs. Great effect is given to the spectacle by the gay and gorgeous dresses worn by the parties engaged, at which even the priests appear, though not, as formerly, in full canonicals, but in disguise. The suit of the matadors or killers is usually made of one colour, either crimson, pale sea-green, violet, or blue, according to taste, adorned with gold and silver braid, spangles and tassels. Sunday and Monday are the great bull-days.

Elvas.

Lisbon.

## CHAPTER II.

### PORTUGAL.

PORTUGAL, the most westerly portion of the European mainland, once of high rank among its states, now one of the least influential of its kingdoms, has a very limited area, not much exceeding that of Ireland, enclosed by Spain on the north and east, and by the Atlantic on the west and south. The inland frontier is defined by artificial lines and the larger rivers in parts of their courses, but chiefly by insignificant streams, according to the indication of the national poet, Camoens in the *Lusiad* :

‘ And scarce a name distinguisheth the brook,  
Though rival kingdoms press its verdant sides.’

The country is about 360 miles in length from north to south, but nowhere reaches 150 miles in breadth, while the area only slightly exceeds 35,000 square miles. Its shores are historically celebrated as the starting-point of the expeditions which first explored the western coast of Africa, disclosed the maritime highway to India, and effected the discovery of Brazil, which long remained a Portuguese colony. Among the prominent headlands, Cape Roca, a well-known sea-mark

a little to the north of the mouth of the Tagus, has the distinction of being the extremity of the continent of Europe to the westward; while Cape St Vincent, a promontory in the south-west, has given the title of an English earldom, in honour of the victory of Sir John Jervis over the Spanish fleet in 1797, in its neighbourhood. Salt-marshes form part of the coast-line, but it is generally bold and rocky, has few inlets of consequence, and the harbours formed by the estuaries of the rivers are all obstructed by dangerous bars at their mouths. The general surface is agreeably diversified, and exhibits very striking landscapes in many places, rich, too, with fruits, foliage, and flowers, though extensive tracts occur, both of hill and plain, which have a very desolate appearance from the want of grass, the neglect of cultivation, and the presence of no other trees but the monotonous and melancholy-looking olive.

Three chains of mountains cross the frontier from Spain, and follow a diverging course to the sea, occupying considerable spaces with their offsets. The most northerly of these, called the Sierra d'Estrella, 'starry mountain-range,' attains the greatest height, but probably nowhere exceeds the elevation of 7000 feet. In the maritime district it forms the hills of Torres Vedras, memorable in the campaigns of Wellington, with the precipitous granite crags of Cintra, one of which is crowned by the convent of La Pena, 'Our Lady of the Height,' now a royal abode, and terminates on the coast in Cape Roca. A central range forms the southern boundary of the basin of the Tagus, and meets the ocean at Cape Espichel. A southern chain, connected by offsets with the preceding, is a continuation westward of the Sierra Morena of Spain, and breasts the Atlantic at Cape St Vincent. Three principal rivers likewise enter the country from the sister-kingdom, the Tagus, Douro, and Guadiana, the two former passing to the west coast, and the latter flowing to a southern strand. On the north, the Minho forms part of the frontier from the Spanish province of Galicia, and has the chief part of its course beyond the border. The Mondego, the most considerable stream entirely Portuguese, drains a portion of the country immediately north of the Sierra d'Estrella; and the Sadao, similarly native, traverses a southern district between the mountain-chain of the south coast and the Bay of Setubal.

In its climate and botany Portugal corresponds generally to Spain, but has a greater rain-fall, especially in the lower part of the Mondego valley, and from thence southward to Mafra, where the showers in autumn rival for copiousness those which descend within the tropics. But through the greater part of the year the face of nature has everywhere a brown, sunburnt, and sombre appearance. Among the vegetable products, the vine, olive, orange, lemon, citron, aloe, and fig, with orchard fruits and water-melons, are found throughout the country; the stone pine and cork oak are characteristic trees in many districts; aromatic plants are numerous; and in the extreme south the date-palm appears and flourishes. Solitary dwellings of peasants, low and gloomy like those in eastern lands, are often seen attended by a single fig-tree of huge size. Hedges of aloes commonly separate the vineyards, and fence the cultivated fields, sending up at intervals a tree-like stem, crowned with a flower. The vine is the prime object of industrial care, trained around poplars and oaks planted for the purpose, from the branches of which it hangs in graceful festoons, after the beautiful manner adopted by the ancients. It is also trellised at the height of ten or twelve feet from the ground, and forms delightful walks and arbours in the gardens of towns and villages, which offer a shady retreat during the heat of the day. But in the great wine-producing district, the plant is raised on terraces and carefully kept low, the branches being tied to stakes; and it is likewise grown extensively without support, and with little care in rows in the fields, where it is left chiefly to the direction of nature. In this case, when loaded with fruit,

much of it inevitably lies upon the ground, and contracts a peculiar earthy taste. The principal wine region is on the Upper Douro, and extends along both its banks upwards of forty miles by a general breadth of twelve miles, where the climate is cold in winter, but excessively hot in summer. In the vintage season, which usually begins towards the close of September and lasts about a month, the fruit is cut by women and children of the neighbourhood, but Gallegos annually pour in from Spain, to the number of several thousands, by whom the grapes are trodden. They also migrate into the district at the period when labour is required to turn up the soil around the vines. The olive is next to the vine in prominence, its oil figuring in the daily fare of the people, and maize is the general crop for their bread.

In point of mineral wealth Portugal ranks high, possessing stores of iron ore, copper, lead, tin, quicksilver, and antimony, with carboniferous strata; but these elements of national prosperity are only turned to account to a very insignificant extent. In fact, in almost all the great branches of industry, whether mining, manufacturing, or agricultural, the country lags behind every other European state. To this result many causes have contributed, as the selfishness of the government, the pride of the upper classes, the ignorance of the people, the general misery consequent on repeated political convulsions, and the abundance in which productions are raised with little labour—fruits, wine, and garden vegetables—owing to the fertile soil and delicious climate. In former ages, the nobility were prohibited from engaging in commercial pursuits as degrading to their order—a rule observed wherever feudalism was established. But in Portugal it was carried to such a ridiculous extreme, that persons of rank were not to reside longer than three days in any trading city or port, on pain of summary ejection by officers of the law. Though a new race of nobles has now risen up, the offspring of the civil wars, who deal freely in the wine trade and monetary transactions, yet the representatives of the old stock keep aloof from such proceedings, and while the two classes mingle in society, they do not amalgamate. Both the upper and the middle ranks, divided into hostile political factions, on the side of constitutionalism and arbitrary power, have been too much absorbed with their respective party interests to attend to public improvements, even if sufficiently well informed to apprehend their value. Hence the backward condition of the kingdom, almost everywhere stupidly surrendered to the rule of custom. Implements of husbandry remain of the rudest description; drainage, manurés, ordinary ploughs, the rotation of crops, and other appliances of modern agriculture, are wholly unknown; more than half the land is uncultivated; and most of the native vine-growers prefer to produce an inferior class of wines, when those of better quality might be obtained by attention to the art of culture in relation to the soil, the plant, and its position.

Till very recent years, Portugal was entirely without tolerable means of internal communication, except for short distances in the neighbourhood of the two chief cities, Lisbon and Oporto. Several lines of railway now diverge from the capital, and are in process of extension. But in other parts of the country there are no high-roads, or public conveyances of any kind; and travellers can only move from place to place on mules or on horseback, or in sedan-chairs suspended between the animals. Canals being also unknown, heavy goods are conveyed in bullock-carts, and the lighter either on mules or the backs of Gallegos. Navigation by the rivers can scarcely be said to exist, except on the Douro, where, however, it is obstructed by rocks, sand-banks, and the rapid current; and on the lower course of the Tagus, which is ascended up to a little above Lisbon by the largest merchant-vessels and men-of-war.

For administrative and electoral purposes Portugal, exclusive of its insular, African, and Asiatic possessions, is distributed into nineteen districts, but six principal geographical

divisions or provinces have long been recognised, and are commonly referred to in familiar intercourse by natives as well as foreigners.

| Provinces.                     | Chief Towns.                                      |
|--------------------------------|---|
| Estremadura, . . . . .         | Lisbon, Cintra, Torres Vedras, Santarem, Setubal. |
| Alemtejo, . . . . .            | Evora, Elvas, Castello de Vide, Estremoz.         |
| Algarve, . . . . .             | Faro, Portimao, Lagos, Sagres.                    |
| Beira, . . . . .               | Coimbra, Lamego, Viseu.                           |
| Entre Douro e Minho, . . . . . | Oporto, Braga, Penafiel, Viana.                   |
| Tras-os-Montes, . . . . .      | Braganza, Chaves, Villareal.                      |

ESTREMADURA, the second largest province, is a maritime district extending nearly 200 miles along the Atlantic. It embraces the lower part of the basin of the Tagus, and the country for some distance both north and south of its mouth, with the valleys of several affluents. The surface is in general finely diversified, in many parts extremely fertile, producing wine, oil, fruits, corn, and cork, while various flowering and fragrant plants, the cistus, rosemary, and myrtle, flourish on the uncultivated sandy tracts. Earthquake shocks of the slighter kind have often been experienced, and the whole of the coast region was specially convulsed by the terrible visitation of the last century which laid the capital in ruins.

*Lisbon* (called by the Lusitanians, *Olisipo* or *Ulisippo*, and by the Moors *Lishbuna* or *Ashbuna*), the metropolis of the kingdom, is finely placed on hills lining the northern shore of the estuary of the Tagus, and in their intervening valleys, in latitude 38° 40' north, longitude 9° 10' west. It contains a population of 275,000, extends from two to three miles, or, including the suburbs, about five miles, along the river, retreats about half the distance from its margin, and has a very striking appearance from its position, in which the Castle of St George, on the loftiest hill, is the conspicuous object. The stream, at its mouth, is not more than a mile in width, and has a bar at the entrance dangerous to be passed except under skilful pilotage. But above the city it is for some distance a magnificent expanse, and forms a harbour equally secure and spacious, capable of containing all the fleets of Europe. The newer portions of Lisbon, or those erected since the earthquake of 1755, consist of broad regular streets faced with good houses. Many residences of the nobility are huge, massive, and picturesque; and the dwellings of the rich merchants are handsome. But there are no attractive public buildings, and the main part of the capital is a maze of narrow, dirty, winding thoroughfares, crowded with miserable habitations, where 'hut and palace shew like filthily.' Cats are as numerous in the streets as dogs in Constantinople, and do the work of public scavengers. Every house of any size has its little garden or grape-terrace, with the vines trained on trellis-work. Wine and spirit shops abound; likewise those of jewellers and money-changers; and lottery-offices are very numerous. The manufactures are unimportant, except jewellery, wares of the precious metals, and trinkets. The water-supply is brought by an aqueduct—the Aleantara—from the Cintra Hills, a distance of seventeen miles, which crosses a valley close to the city on lofty arches, and discharges its contents in a beautiful edifice called the Mother of the Waters. This was completed in 1743, and will bear comparison with the greatest Roman works of the kind. It remained uninjured at the time of the great earthquake. The graves of Doddridge the divine, and Fielding the novelist, are in the English cemetery. In May 1853 the sod for the first railway in Portugal was cut by the queen, in the presence of the king and court, with a silver spade, at a spot in the vicinity on the margin of the Tagus. *Belem*, near the mouth of the river, a kind of fashionable suburb, where many opulent citizens reside, has a magnificent church in the mixed Gothic and Arabic styles, containing tombs of members of the royal family. It was erected by King Emanuel in 1499, in honour of the first voyage to India by Vasco di Gama, and is said to occupy the site of a humble chapel to which he repaired previous to his embarkation. Belem Castle, a massive tower on the margin of the river, Fort St Julian, and other defences, protect the seaward approach to the capital.

The great earthquake of Lisbon, on the 1st of November 1755, occurred about half-past nine in the morning. Three shocks were felt in quick succession, accompanied by three refluxes and fluxes of the sea. The whole interval was reckoned at from five to seven minutes. The king and royal family were at the time at Belem. The palace and public buildings fell with the first shock. At least 50,000 persons perished. The supposed point of greatest intensity was in the Atlantic, about 100 miles from shore. The area of concussion, or the space through which the shocks were propagated, formed an ellipse, the longer axis of which extended 2000 miles, from the Canary Islands to Abo in Finland. The shorter axis stretched from the north-west of Ireland to the head of the Adriatic. Memorials of the earthquake, chiefly ruins of churches and convents, are still to be seen in Lisbon.

*Cintra*, north-west of Lisbon, called the Portuguese Paradise, is celebrated for its beautiful scenes, comprising a town, palace, country villas, crags, stream, shady groves, and Moorish ruin. Here, Aug. 22, 1808, a convention was concluded between the French and English, by which the former agreed to evacuate Portugal. *Mafra*, further north, a large village, is distinguished by a palace, convent, and church, forming

a single edifice, the finest in the kingdom, erected by King John V., containing the most extensive library in Portugal. The convent is 730 feet in length, 690 broad, contains in all 866 rooms, and 200 windows, with about as many doors, and it is said 10,000 men could be reviewed on its roof. This vast building, however, now exhibits an air of desolation. The entrance is doorless; the rain patters in through the broken windows; suites of rooms are either vacant or very poorly furnished; and piles of wood encumber the spacious courts. *Torres Vedras*, a small town a few miles distant, gives its name to the heights fortified by Wellington in 1810, where he successfully resisted the approach of the French, and saved the capital. *Vimiera*, the scene of his first victory in the peninsula, is a village in the neighbourhood. *Setubal*, a maritime town, in the country south of the Tagus, with 15,000 inhabitants, is a place of shipment for wines, fruit, and salt.

**ALEMTEJO**, the most extensive division, is slightly washed by the Atlantic, but has its principal extension along the Spanish frontier, and forms naturally a rich portion of the kingdom, but is one of the least cultivated, and most sparsely peopled. In ancient times it was styled the Sicily of Spain, and it figured as the granary of Portugal in the middle ages. A few ranges of hills are clothed with chestnuts and other trees; but wood is generally scarce, and even shrubs, while plains covered with brown heath, lavender, and other aromatic plants, are characteristic of the surface. In the valleys, the cork oak, the evergreen oak, and the stone pine luxuriate, the latter having the greatest prevalence. The live-stock, for which the province was once renowned—embracing swine, goats, and sheep, and to a less extent horned cattle, asses, and mules—now exist in very diminished numbers, owing more to the paucity of population than to any failure of the pasture-grounds.

*Evora*, the chief town, very beautifully situated, about eighty miles east of Lisbon, is walled, entered by five gates, but could not resist a siege a single day. It is the see of an archbishop, has a cathedral founded in 1186, and a library of 50,000 volumes, with manufactures of hardware and leather, but possesses no present importance, though of interest as existing in the time of the Romans, when it was called *Ebora*, retaining many monuments of their age. These include a temple of Diana, with beautiful Corinthian columns, used till lately as a slaughter-house; an aqueduct; and a brick tower at its extremity, in very perfect preservation, decorated with Ionic columns and pilasters. *Elvas*, the largest town, with about 12,000 inhabitants, is reputed to be the strongest place in the whole country, situated near the Spanish border, within a few miles of Badajoz, of which it may be considered the military rival. It is perched on the top of a precipitous hill, surrounded by walls, a glacis, and covered-way, and further protected by formidable forts on adjoining eminences. An immense Moorish aqueduct, consisting of four tiers of arches built upon one another, the whole rising to the height of 250 feet, conveys water from a source three miles distant. Arms and jewellery are made, but the chief trade is the smuggling of British goods across the frontier into Spain, from which considerable wealth is derived. It was in 1659 the scene of a famous battle between the Spanish and Portuguese, called the Lines of Elvas, in which the latter were victorious. *Estremoz*, also a stronghold in the neighbouring country, but of inferior rank, is the seat of an earthenware manufacture, continued from the Roman times, the products of which preserve a purely classical design. Elegantly-shaped vessels, made of a porous clay, have the property of keeping water singularly cool, and are in use throughout the peninsula.

**ALGARVE**, the smallest and most southerly district, was once an independent kingdom of the Moors, but much more extensive than its present limits, comprehending a portion of Spain beyond the Guadiana, which forms the frontier. The name is Arabic, and signifies 'a land lying to the west.' It ceased to be a separate state in the middle of the thirteenth century, but its old style is retained in the designation of the existing monarchy, the kingdom of Portugal and Algarve. Being specially maritime, the climate is delightful, as the heat natural to the southerly position is mitigated by the cool sea-breezes. Fine fruits are raised, even dates and plantains; fisheries are prosecuted, and salt is manufactured. The spare population are reputed to be the best sailors and truest friends in the kingdom.

*Faro*, a small episcopal city and seaport, at the mouth of the Feroso, is the centre of an active fishery, and exports anchovies, fresh and dried fruit, wine, cork, and sumach. Blind persons are very commonly met with among the inhabitants, an affliction said to be occasioned by the light sandy soil of the neighbourhood. *Sagres*, an unimportant place, is of interest from its site, near the headland of Cape St Vincent, and as the residence of the prince, Don Henry, in the fifteenth century, the great promoter of discovery along the shores of Africa.

**BEIRA**, a province on the Atlantic, embraces the country in its entire breadth, extending

between the Tagus on the south and the Douro on the north, and includes centrally the whole basin of the Mondego. The surface is largely mountainous; plains of sandy soil occur far from fertile; but still an important supply of valuable produce is raised, with little labour and less skill, consisting of corn, wine, olive oil, flax, and various fruits. The culture of bees is also a prevailing industry, the honey and wax from which furnish many with their principal means of subsistence. A part of the province, lying along the bank of the Upper Douro, belongs to the port-wine district. There are no manufactures of the slightest consequence, but salt is made on the coast by the evaporation of the sea-water, and small quantities of iron, coal, and marble are wrought.

*Coimbra*, an episcopal city, picturesquely built round a conical hill rising abruptly from the right bank of the Mondego, is the largest place in the province, contains about 13,000 inhabitants, and is 110 miles north-north-east of Lisbon. It is the seat of a university, founded in 1537, the only one in the kingdom, which has eighteen colleges, with a library, museum, and observatory. It was attended in 1853 by 970 students, a large number of whom were Brazilians. The city was originally built by the Goths, from whom it passed into the hands of the Moors, and was finally taken in 1064 by Fernando the Great, aided by the gallant Cid. On the erection of Portugal into an independent kingdom, Coimbra was made the capital, and continued such for two centuries and a half. The average rain-fall in this locality exceeds that of any other place in Europe. The scene of Wellington's repulse of the French under Massena in 1810, at the village of Busaco, is about eighteen miles distant.

The most northerly maritime province, *ENTRE DOURO E MINHO*, 'between Douro and Minho,' has its position defined by the name. In proportion to its area it is the most populous portion of the country, the most fertile, and the best cultivated. It is also renowned for the beauty of its scenery, whence it has been called the *Paradise of Portugal*. A portion of the vale of the Lima is said to form the loveliest landscape in the world. Almost all the varieties of the agricultural produce are yielded within its limits; live-stock and game abound; and profitable fisheries are carried on along the shores and in the rivers. The Minho is celebrated for its fine salmon.

*Oporto*, on the north bank of the Douro, about two miles above its mouth, ranks next to Lisbon in population and commercial importance, but excels it in the extent and variety of its manufactures. It consists of well-built streets of white-washed houses; squares lined with trees, refreshed and adorned with fountains; and is connected by a handsome suspension-bridge with a suburb on the opposite side of the stream. The inhabitants number 80,000, and include a larger proportion of enlightened and liberal Portuguese than the capital. Hats, silk and linen goods, pottery, roperies, and ship-building are the prominent branches of manufacturing industry; but the main trade and dependence of the city is the export of wine, white and red, chiefly the latter, which has the name of *port* from that of the place, properly *Porto*. It is brought from the region of the Upper Douro, the great wine country, in flat-bottomed boats containing from thirty to seventy pipes each, which are stowed away in immense vaults for exportation. The vineyard proprietors and merchants are manufacturers rather than simply producers and exporters of wine, superadding to the juice of the grape a system of mixing and fortifying with spirit, which tends to produce an intoxicating rather than a purely exhilarating beverage. Even after its arrival in the Thames, the wine is often made to keep company with Masdiou, Benecario, Red Sicilian, and Red Cape before it enters the market with the pseudonym of port. Its consumption in this country is gradually lessening, and thereby manifests the more refined habits of the present age, and the altered style of our social customs. *Braga*, thirty-five miles north-east of Oporto, is a considerable town of 17,000 inhabitants, with manufactures of hats, jewellery, cutlery, and firearms. It is the residence of the primate of Portugal, who has a palace here. In the time of the Romans it was called *Bracara Augusta*, and the ruins of a temple, an amphitheatre, and an aqueduct still remain.

*TRAS-OS-MONTES*, 'beyond the mountains,' interior to the preceding district, is so called in relation to the Sierra d'Estrella range. It is the only principal division of the country

San Joas de Foy, Oporto.

which is entirely inland, and belongs on its southern border to the great region of the vine culture. Though the cradle of the existing royal family, this portion of the kingdom is very little known apart from its outskirts, being rarely entered by travellers, as there is scarcely a convenient route within its limits. But it is said to be replete with natural beauties of a high order, and abounds with wild animals, the boar, wolf, and wild cat, while birds of prey are numerous, with storks and herons.

*Braganza*, a small ancient city, with two castles, and manufactures of silk and velvet, gives its name as a title to the reigning royal family, descended from John, Duke of Braganza, who was raised to the throne in 1640. *Chaves*, a fortified town, possesses hot saline springs, with a temperature of 129° Fahrenheit, which were known to the Romans under the name of *Aqua Flavia*.

The AZORES, or Western Islands, situated in the Atlantic Ocean, belong to Portugal, form an insular province, and are accounted a part of Europe, as the nearest mainland, though about 800 miles distant from it. The group consists of San Miguel or St Michael, Terceira, Pico, San Jorgo, Flores, Fayal, Santa Maria, Gracioso, and Corvo, containing an area of 700 square miles, and a population estimated at 240,000. The islands are of volcanic origin, and subject to violent earthquakes. The coasts are steep and rugged; the surface is diversified with lofty mountains and deep ravines; the climate is temperate and healthy; and the soil almost everywhere extremely productive. The 'peak' of Pico, the loftiest summit, rises to the height of 7613 feet above the sea. In the sixteenth century the meridian of Terceira, 29° 10' west, was adopted by the Spaniards and Portuguese as their starting-point for the reckoning of longitudes. Columbus, previous to his great voyage of discovery, visited the Azores, and was confirmed in his conviction that there must be land across the Atlantic within accessible distance, from the drift of strange objects to the shores, and plants which could not be identified with the productions of any known district.

*Angra*, in the island of Terceira, is the seat of government, and possesses a military college, with various educational establishments and scientific and literary societies. But *Ponta Delgada*, in St Michael, is the commercial capital and the larger town, containing 16,000 inhabitants.

The principal products of the Azores are wines, oranges and lemons, maize, coffee, sugar, and tobacco. Both Terceira and Fayal annually export a considerable quantity of oranges, but St Michael is the great mart, and supplies the finest kinds. More than half the oranges imported into Great Britain come from the Azores, in exchange for textile fabrics and other manufactured articles. A single tree, on arriving at maturity, will produce annually, on an average, a crop of from 12,000 to 16,000; but growers have been known to pick as many as 26,000. The trees bloom in March and April; the fruit is gathered for the London market as early as November; and more than half the crop is shipped in that month and the following. But the natives never eat the produce till the end of January, by which time it possesses its full flavour. In 1859 it was estimated that the island of St Michael produced 252,000,000 of oranges and 40,000,000 of lemons. The total value of the fruit exported from thence to England in the year mentioned amounted to £84,000. But the orange trade of the Azores has been for some years severely depressed, owing to the low prices obtained in the foreign market.

The Foreign Possessions of the monarchy consist of the Madeiras and Cape Verd Islands, on the north-west coast of Africa; St Thomas and Prince's Islands in the Gulf of Guinea; the districts of Congo, Angola, and Benguela, on the western side of Southern Africa, with Mozambique on the eastern; Goa, Diu, and Damaum, small stations in India; Macao, in the neighbourhood of Canton in China; and a few settlements in different parts of the Malay Archipelago.

The kingdom dates from the year 1139, when Don Alphonso Henrique, after a signal overthrow of the Moors, was proclaimed by the army the first independent sovereign, under whose descendants the country attained its greatest political, commercial, and literary eminence. Brazil was occupied, the African coast was explored, the sea-route to India was traversed, and Camoens, the epic poet of the nation, flourished. The royal line failing in 1580, a short union with Spain followed, till a revolution placed the House of Braganza on the throne. The form of government, long absolute, is now constitutional, but with less power belonging to the crown than is usual with limited monarchies; and from various causes, some of which were unavoidable, as the attacks of the French, the

loss of colonies, and the rise of other European nations, the state has lapsed completely from its former consequence. Portugal, exclusive of its insular and foreign possessions, contained in 1863 a population of 3,693,000; but including these possessions, a population calculated at 7,720,000. The people are of the same lineage as the Spaniards, and speak a dialect originally of the same language, but now exhibiting so many peculiarities as to be more than dialectically distinct, including words, supposed to be derived from the vocabulary of Northern Africa, of which there are no traces in the Spanish. They are universally Roman Catholics in religion, subject to a clergy who, though deprived of the secular power and vast estates they once possessed, are still influential with the masses. The moral character of the Portuguese has been very unfavourably represented, and perhaps not untruly as it respects the town-dwellers. But the rural classes eminently exemplify the virtue of patience as a redeeming quality for their shortcomings. They are intensely poor; miserably clad, ill-housed, and wretchedly fed; rarely tasting animal food throughout the year; toil hard bareheaded in the burning sun; yet are attached to their employers, and bear their burden with content and cheerfulness.

Portuguese Peasants.

Lake Como.

### CHAPTER III.

#### ITALY.

**I**TALY, the seat of ancient, and the mother-country of modern, civilisation, embraces the central peninsula of Southern Europe, with part of the mass of the continent, and many islands, several of which are of considerable size, of great natural interest, and economic value. Its northern boundary is formed by France, Switzerland, and the Tyrol, where the frontier is strongly defined by the grand chain of the Alps, while on the west and south rolls the Mediterranean, with its great arm the Adriatic on the east. The peninsular portion is a long projection inclining from north-west to south-east, comparatively narrow, and bifurcating at the south extremity into two much smaller straggling projections, between which lies the Gulf of Taranto. This outline of the country corresponds to that of a high-heeled boot, with the toe advanced towards Sicily, and the heel pointed towards Turkey. The coast-line is but slightly indented, except in the south, where also the shores are the most elevated

and rocky. Both on the eastern and western sides large maritime tracts are low and insalubrious. The country, measuring from the Alps, has an extreme length of about 700 miles, by a breadth of 300 miles in the north, or specially continental portion; but the average width of the peninsula is not more than 100 miles, which dwindles to 20 miles in the so-called heel and toe. The islands include Corsica, a department of France, noticed in connection with that country; Sardinia, Sicily, the Lipari Isles, Elba, and others of minor dimensions, are incorporated in the new Italian Kingdom; and the Maltese group, a colony of Great Britain, described under the head of British European Possessions. Mainland and islands are comprised between latitude  $35^{\circ} 40'$  and  $46^{\circ} 30'$  north; between longitude  $6^{\circ} 30'$  and  $18^{\circ} 35'$  east; and contain a total area of 121,000 square miles.

The High Alps environ the entire north with a mountain-girdle, clad with everlasting snow, which has a steeper inclination on the Italian than on the Swiss side of the chain. It presents to view from the plains of Piedmont the lofty summits of Mont Blanc, Monte Viso, Monte Rosa, the Matterhorn, and numerous others, strikes its roots into the interior to some extent, and originates a very varied landscape. But the Apennines form the characteristic highland system of the country. Starting from the extremity of the Maritime Alps, and winding round the Gulf of Genoa, the range traverses the whole peninsula to its southernmost point, somewhat centrally as its backbone, though with curvatures, which give it an entire length of not less than 700 miles. None of the summits reach the line of perpetual congelation, but the higher points are white with snow from October to June. The loftiest, Monte Corno, called also the *Gran Sasso d'Italia*, or 'Great Rock of Italy,' attains the elevation of 9500 feet, and is a fine object from the plain of Rome. Limestone is the predominant formation, often passing into marble, and granite appears in the south. About the latitude of Naples, the Apennines divide into two branches, one of which runs through the eastern prolongation of the peninsula to its termination in Cape di Leuca, while the other extends through the western to Cape Spartivento. This last branch reappears in Sicily, and forms its mountain system, where the volcanic cone of Etna rises to the snow-line, 10,874 feet above the Mediterranean, and is the highest point of Italy. Vesuvius, the twin volcano, is an outlier of the continental chain, rising up from the surface of a fertile plain, and overlooking the Bay of Naples.

The extent of level country is very considerable, but invested with opposite features in the two principal tracts. In the north, between the Alps and the Apennines, is the plain of Piedmont and Lombardy, continued by that of Venetia to the Adriatic, having a length of 250 miles from east to west, by a breadth of 50 miles, nearly a dead-level through a large portion of its area. Watered by the Po and its numerous affluents from the mountains on either hand, this region is extremely fertile, highly cultivated, and thickly peopled. On the other hand, along the Mediterranean, through Tuscany, and the Papal territory, a series of low districts extends for nearly 200 miles, varying in breadth from 12 to 40 miles, the whole of which is unhealthy, and comparatively deserted through the summer months. The northernmost or Tuscan portion is called the Maremma; the central, around Rome, the Campagna; and the southern, the Pontine Marshes. Dry pasture-lands in the latter intermingle with the marshy surface. A rank vegetation is luxuriantly produced; and hence malaria prevails, which renders even travelling through the fever-haunted region unsafe, except in the winter season. There are a few fixed inhabitants whose appearance, comparable at the best to that of convalescents in the grounds of an hospital, betrays the insalubrity of the site. But as soon as the fierce heat is over, and the fresh autumn breezes begin to blow, removing the scourge, the peasantry

from the Alban Hills, and other bordering heights, come down to the low grounds with their flocks to pasture them till May renews the danger, lodging in temporary huts of straw and reeds. This district has been stamped with its fatal peculiarity in consequence of ages of neglect, for in ancient times it was thickly studded with Etruscan and Volscian towns. Ruins of aqueducts, arches of demolished buildings, broken fountains, and masses of rubbish are scattered in every direction, the monuments of bygone life, where now the sounds and signs of human industry are few and far between.

Italy is distinguished from the rest of the continent by a volcanic zone on its southwestern side, which includes three active summits—Vesuvius on the mainland, Etna in Sicily, and Stromboli in the Lipari Islands; the last of which has never been known to extinguish its torch, and is the great light-house of the adjoining Mediterranean. The activity of Etna has been noted the longest. Its earliest recorded eruption took place under Hiero, in the second year of the 75th Olympiad, or 476 B.C., and is mentioned in the *Prometheus* of Æschylus, and the first Pythian Ode of Pindar. It reposed for several centuries in the middle ages, but has been in frequent and violent action in more modern times. On the last occasion, in 1852, vast torrents of lava were ejected, one of which was two miles broad, with immense clouds of ash-gray dust, which covered the whole of the surrounding country. Vesuvius was not known to be active before the year 79 A.D., when the cities of Herculaneum and Pompeii were overwhelmed by its products, and only discovered in the first half of the last century. From that period to the year 1138 eight eruptions are recorded; none occurred afterwards till 1306; a pause followed of more than three centuries with but one slight outbreak; but since 1666 the volcano has only been at rest for very brief intervals. Dormant craters are numerous in connection with the lower slope of the Apennines as far north as Tuscany, several of which are now occupied by small lakes. The Romans obtained their cement from the pozzuolana or volcanic earth of their neighbourhood. In excavating for it, as well as for materials to enlarge and beautify the city, the subterranean galleries were formed, which afterwards served as places of refuge for the early Christians during the persecutions, and were also used for the burial of their dead. Violent earthquakes occasionally disturb the southern region, and would doubtless be more frequent and severe but for the volcanic vents.

Owing to the configuration of the country, only one river of considerable magnitude is formed, the Po, which intersects the surface in the line of its greatest breadth, from the Cottian Alps to the Adriatic. It flows with but few windings of any importance, passes fifty cities and towns, and receives numerous affluents. The Ticino, Adda, and Mincio enter on the left bank; the Tanaro, Trebbia, and Secchia on the right. The river has a powerful current, subject to sudden and frequent changes, which interfere with its navigation. It brings down large quantities of sand and mud, which, by deposition, have formed an extensive delta, and very sensibly advanced the coast-line, during the historic period, on both sides of its mouth. In the age of Augustus, the town of Adria, from which the Adriatic has its name, was a seaport, and a station for the Roman fleet, but is now fifteen miles from the nearest point of the shore; and the city of Ravenna, which was once maritime, is now a few miles inland. The sediment has also contributed to raise the bed of the river in the lower part of its course considerably above the level of the surrounding country, so that in the plain of Ferrara the surface of the water is thirty-five feet higher than the streets of the town, which are preserved from inundation by huge artificial embankments. Another important river, the Adige, descends from the Tyrol, and enters the Adriatic between the mouth of the Po and Venice, similarly charged with sediment. It has operated with the like effect, formed islets and sand-banks, on a group of which the former Queen of the Ocean, aptly described as a 'city risen from the sea,' is planted. In the

peninsula, owing to its narrowness, and the central position of the Apennines, the rivers have necessarily short courses, and are chiefly mountain-streams, in several instances invested with classical interest. The largest are on the western side, the Arno, Ombrone, Tiber, and Volturno. To provide efficient water-communication for commerce, as well as to promote irrigation, the construction of canals was commenced in Italy much earlier than in any other European country, dating from the beginning of the twelfth century. The great northern plain is overspread with a net-work of artificial channels, which have advanced the interests of agriculture, and are adapted for vessels of large burden.

At the foot of the Alps the most extensive of the lakes are formed, Maggiore, Como, and Garda, famed for their picturesque beauty. The first of these is partly Swiss; the two latter are wholly Italian, except that the Lake of Garda touches the Tyrol at its north extremity. This is the largest expanse, extending thirty miles in length by ten in its greatest breadth; it is bordered by grand Alpine spurs, between which lie fertile valleys, scenes of vine cultivation. It has long had a bad reputation from being swept by violent winds, which, owing to the extensive surface, give it the appearance of a sea. On a projecting neck of land at the south end are Roman ruins, which have been associated with the name of Catullus, as remains of the poet's country-house, an idea not at all supported by their extent and traces of former magnificence. The Mincio is the outlet. Greater attractions belong to the Lake of Como, on the shores of which the younger Pliny had a rural retreat, and refers to it in his letters. Though not without the wilder outlines of bare mountain-tops, yet more characteristic of the scenery are steep hills and rocky headlands clothed with noble trees, lovely gardens, neat hamlets, tiny church-spires, scattered white dwellings, and many beautiful villas. The lake discharges by the Adda. In the central part of the peninsula are the Lakes of Perugia and Fucino, with many of small size occupying the craters of extinct volcanoes in the Roman and Neapolitan

Grotto of Puzzuolè.

territory. The Alban Lake, one of the latter class, about fourteen miles from Rome, is on the summit of a hill or mountain at a considerable elevation, and vies in the rich deep blue of its waters with the colour of the Italian sky above. A medieval palace on its shores, the Castle Gondolfi, is one of the country-seats of the pope.

With the exception of iron, the metals of Italy are few; but other mineral produce is abundant, as marbles, alum, and salt, with the valuable volcanic products, sulphur and boracic acid. From Southern Italy, or the old Kingdom of the Two Sicilies, the markets of Europe have long received their principal supply of sulphur, though a considerable and increasing quantity is now obtained from Iceland. The monopoly of this article led to the application of the *sobriquet*, the 'brimstone king,' to a former sovereign, apt to rely upon gunpowder as a means of government. It occurs in the district around Naples, but most plentifully in Sicily, where the sulphur-beds are in the tertiary strata, and occupy great part of the centre and south of the island. Many mines are worked by companies of English and other foreigners. Boracic acid is procured from a remarkable spot near Volterra, in Tuscany, where it was discovered in the latter part of the last century, which has since been the main source of supply to the European manufacturers. Here a large extent of the surface is occupied with borax lagoons, apparently consisting of an endless number of tiny volcanoes and springs, which are in a state of violent ebullition. The ground shakes beneath the foot, and steams in evidence of the fiery activity below. By subjecting the vapours to a peculiar process, the acid is deposited in crystals. Mineral and warm springs are numerous throughout the volcanic zone; and at certain spots noxious gases are generated, which prove fatal to animal life if long exposed to their influence. The most famous example is the Grotto del Cane, in the vicinity of Naples, and close to the Lago d'Agnano, the bed of which is the crater of an extinct volcano. The name refers to the dogs upon which experiments are chiefly tried to gratify the curious.

Deep-blue cloudless skies, and a very transparent atmosphere, are characteristic of Italy. The climate differs owing to the range of the latitude, difference of position in relation to the mountains, and to the influence of the sea. But very hot summers and mild winters are general; and insalubrity is confined to the malarious districts. Occasionally the summer heat is aggravated by the *sirocco*, or hot wind from Africa, which enfeebles and fevers the human frame, and blights the vegetation. This is specially felt in the southern localities, while an opposite evil is experienced in the northern, that of the *tramontana*, or mountain-wind, which blows cold and piercingly from the direction of the Alps. The vine flourishes on the lower levels throughout the country; the olive, orange, citron, lemon, pomegranate, myrtle, and other fruits and evergreens grow luxuriantly in the central and southern region; a varied and brilliant flora distinguishes the sub-apennine valleys; and in Sicily, in the extreme south, a tropical vegetation appears, in the sugar-cane, cotton-plant, and date-palm. On the higher grounds are oaks, chestnuts, beeches, and pines. Nowhere is the Silver Fir seen to greater advantage, amply meriting the name, *pulcherrima*, 'most beautiful,' applied to it by the ancients. The classical writers frequently refer to the uses made of the tree, for javelins and the masts of ships; and the position in which it luxuriates, as in lines scattered through the pages of Virgil:

'Whose breast exposed the long fir-spear transpierced.'

'The fir about to brave the dangers of the sea.'

'Hills clad with fir, to guard the hallowed bound,  
Rise in the majesty of darkness round.'

The Stone Pine, a comparative dwarf in England, is also a fine object in Italian scenery, often associated with classic ruins, and frequently introduced into the landscapes of

Claude. It rises to a great height perfectly clear of branches, with a spreading head in the form of a parasol. The tree is prominent in the pine-forest of Ravenna, on the east coast, perhaps the most ancient woodland now in Italy, certainly the most interesting, being associated with the names of Dante, Boccaccio, and Byron. It supplied the old Romans with timber for their fleets, and in more modern times furnished the Venetians with masts for their war-galleys and argosies. The forest extends about twenty-five miles along the shore, covering a flat sandy tract from one to three miles wide. It may be traversed over the turf through a vast succession of lovely avenues and glades. But the pine does not entirely monopolise the site, as noticed by Leigh Hunt :

' Various the trees and passing foliage there,  
Wild pear and oak, and dusky juniper,  
With briony between in trails of white,

And ivy, with the suckle's streaky light—  
And still the pine, long haired, and dark, and tall,  
In lordly right, predominant o'er all.'

The produce of the cones yields a considerable annual revenue. In the more southern woods, the wolf, boar, and lynx are found, and are the principal wild animals. The buffalo occurs domesticated, and also the camel. But the latter is limited to the plain of Pisa, where a colony has been perpetuated from the time of the Crusades, originally introduced by the Knights Hospitallers. Noxious reptiles, as the scorpion and tarantula, are extremely numerous in the south. The birds include the vulture, ibis, flamingo, and pelican, with interesting examples of the smaller species, the blue thrush, the rose-coloured starling, the hoopoe, ortolan, and fig-eater. Shore fisheries yield the tunny, pilchard, and mackerel, with anchovies and sardines. The two latter are exported in immense quantities.

The political map of Italy, as arranged by the Congress of Vienna, recognised seven principal divisions, or the two kingdoms of Sardinia and Naples, the States of the Church, the Grand Duchy of Tuscany, the Duchies of Parma and Modena, with Lombardy and Venice assigned to Austria. It has since 1859 been largely remodelled, partly by the arms of the French emperor and the Sardinian king, in part also by the daring enterprise of Garibaldi, and the determination of the people. The map now embraces three principal divisions : the Kingdom of Italy—a reduced Papal Territory—and Austrian Italy, limited to Venetia.

The Tarantula.

Bardonnèche Mouth of the Mount Cenis Tunnel.

#### I. KINGDOM OF ITALY.

The newly-formed Italian Kingdom consists of the old Sardinian monarchy, with the exception of the principality of Nice and the duchy of Savoy ceded to France; but is more largely composed of territories which comprehend nearly the whole of the peninsula, obtained partly by voluntary annexation, partly by force of arms. This aggrandisement of a state formerly of very limited extent dates from the early part of the year 1860, a period too recent to allow of authority being firmly established over the whole area, occupied as it is by many favourable to the fallen dynasties, and by not a few politically indifferent, but friendly to any agitation likely to enable them to subsist with impunity by rapine. For administrative purposes the kingdom is distributed into sixty provinces. These are referrible to nine principal districts, the names of which are given, as of long standing, and therefore familiar. Those of the provinces are taken generally from important cities and towns within their limits, the seats of the local government.

## Cities and Towns.

|                               |   |
|-------------------------------|---|
| Piedmont, . . . . .           | Turin, Alessandria, Asti, Novara, Cuneo, Genoa, Port Maurice.               |
| Lombardy, . . . . .           | Milan, Pavia, Cremona, Brescia, Bergamo, Como, Sondrio.                     |
| Æmilia, . . . . .             | Parma, Piacenza, Modena, Carrara, Reggio, Bologna, Ferrara, Ravenna, Forli. |
| The Marches, . . . . .        | Ancona, Ascoli, Macerata, Urbino, Pesaro.                                   |
| Umbria, . . . . .             | Perugia.  |
| Tuscany, . . . . .            | Florence, Leghorn, Pisa, Sienna, Arezzo, Lucca.                             |
| Neapolitan Territory,         | Naples, Puzzuoli, Castellamare, Gaeta, Reggio, Taranto, Foggia.             |
| Island of Sicily, . . . . .   | Palermo, Messina, Catania, Marsala, Siragusa, Girgenti.                     |
| Island of Sardinia, . . . . . | Cagliari, Sassari, Oristano.  |

The total area amounts to 98,000 square miles, equal to considerably more than three-fourths of the whole country, containing a population of nearly 22,000,000. The advantages of the constitutional form of government, adopted by Sardinia in 1848, are equally enjoyed by the incorporated states, where formerly religious freedom was unknown, and the liberty of the subject was at the mercy of arbitrary power. The common parliament assembles at Turin, but the anticipation is indulged, that by the annexation of the Papal Territory its sessions will be transferred to Rome.

PIEDMONT, a north-western section, lies on the Mediterranean, and consists chiefly of a beautifully-varied plain, well watered and fertile. The surface becomes nearly a dead-level on the eastern side, but rises gradually in other directions towards the Alps, which run in a grand semicircular chain around it, and throw off spurs into the interior. They comprise the Maritime, Cottian, Graian, and Pennine ranges, with part of the Lepontine, and form the boundary from France and Switzerland. The position of the country at their base originated the name, compounded of *pied*, 'foot,' and *mont*, 'mountain.' The Po intersects it from west to east, descending from the slope of Monte Viso; and receiving almost the whole drainage by numerous affluents into its channel. Fruits, wine, grain, hemp, flax, and silk are raised, and the olive is a principal object of culture. Railways connect the leading towns with the capital, for one of which running between Turin and Susa, the great tunnel is in process through the range of Mont Cenis, which will complete the line of communication between Italy and France. When this work is finished, there will be unbroken railway transit from Calais to one of the southern ports of the Adriatic, which will probably render it a more eligible route for the Anglo-Indian mail than the one to Marseille, owing to the diminished length of the voyage to Alexandria.

*Turin* (Ital. *Torino*), the capital, centrally situated on the north bank of the Po, in a very charming locality, contains a population of 204,000. It is chiefly a brick-built city, distinguished by the number of its churches, possesses a flourishing university, with a library of 110,000 volumes, and many literary, artistic, and scientific institutions, which entitle it to rank as one of the principal seats of learning on the southern side of the Alps. The silk manufacture is the staple industry. In the Carignan Palace, formerly a royal residence, the Italian parliament meets. This is a huge pile, with an unprepossessing exterior, but many of the rooms are very splendid. The one appropriated to the deputies, the scene of the triumphs of Cavour, is magnificent. The seats rise one above the other from a semicircular floor, in the centre of which are placed tables for the official short-hand writers; and on the extreme verge, with their faces to the house, behind a long table, sit the ministers. The press has a gallery at its service, placed in a convenient position; the diplomatic corps and municipal authorities are provided for; and there is separate accommodation for ladies and a miscellaneous crowd of spectators. Cavour, returned for the first electoral college of Turin, early in 1848, was first heard under the domed roof of this apartment, remonstrating against the folly of proceeding single-handed against Austria, which led to the fatal defeat of Novara in 1849. The silvery summits of the Alps are finely seen from the capital. Three of the mountain valleys on the south-west are occupied by the Vaudois, a Protestant community, on behalf of whose ancestors, under a barbarous persecution, Cromwell interfered, and Milton wrote the noble sonnet beginning—

'Avenge, O Lord, thy slaughtered saints, whose bones  
Lie scattered on the Alpine mountains cold.'

The Vaudois occupy a small town and a number of scattered villages. *Susa*, at the foot of the Cottian Alps, and on the road across Mont Cenis, where the railway from Turin in that direction now terminates, is twenty-five miles from the Italian end of the great tunnel, near the village of Bardonnèche. This spot is at least

fourteen miles from the French end at Modane, following the route over the mountain, but the distance will be little more than seven miles through the shaft. *Alessandria*, eastward of Turin, a considerable manufacturing town, has a strong modern citadel for its prominent object, was of great importance as a bulwark to Piedmont when it was immediately bordered by Austrian territory. The battle-field of Marengo, the scene of Napoleon's decisive victory in the year 1800, is a few miles distant. *Asti*, on the rail nearly midway between Turin and *Alessandria*, surrounded with a wine-producing district, boasts of the poet Alfieri as a native, born about the middle of the last century.

Genoa.

*Genoa* (Ital. *Genova*, Fr. *Gênes*), on a gulf of the Mediterranean to which its name is given, is the principal port and naval arsenal, with strong fortifications and a spacious harbour. Though fallen from its high estate in the middle ages, it still contains 128,000 inhabitants, has great shipping trade, and various manufactures of silk, velvets, damasks, with filigree-works in gold and silver gilt. The appearance of the city from the sea justifies the title bestowed upon it, *La Superba*. Hills rise up from the shore, the slopes of which are covered with churches, palaces, and houses, finely relieved by intermingling groves of oranges, pomegranate-trees, and vines. But the interior disappoints. The richly-decorated marble dwellings of the merchant-princes of bygone days are in narrow streets, only to be seen from without with difficulty, while comparatively few belong to parties in possession of sufficient means to be their occupants. The majority are hotels, or public offices, or places of business, or devoted to still humbler uses, the lower rooms being let out to small shopkeepers, or tenants of the labouring class. Yet a passing visit to *Genoa* will never fail to excite interest, the place where Columbus was born, the capital of a sovereign commercial republic for several centuries, the rival and at times the superior of Venice, the mother of colonies on the shores of the Black Sea and the Levant. It was taken by the French in 1797, and ceded to Sardinia by the Congress of Vienna in 1815. The city possesses a grand ancient cathedral, a university, several splendid theatres, and is remarkable for the number and magnitude of its philanthropic foundations. The Genoese are expert mariners and shrewd commercialists, to be seen in all the important ports of the Mediterranean.

LOMBARDY, entirely inland, extends from the Rhaetian Alps on the north to the banks of the Po on the south, between Piedmont on the west, and Austrian Italy on the east, where the frontier is defined generally by the line of the Mincio River. The northern part of this district, at the base of the mountain-barrier, diversified by its offsets, is distinguished by splendid scenery, and contains the exquisitely lovely Lago di Como, and part of the Lago di Garda, scarcely less beautiful. The southern portion is a level plain renowned for its exuberant fertility and populousness. Rich dairy produce is raised, especially the celebrated and misnamed Parmesan cheese, which is made in the district

between Milan, Pavia, and Lodi. The corn crops of the finest quality are abundant, and the white mulberry is extensively cultivated for the silk-worm, to the number of at least 17,000,000 trees.

*Milan* (Ital. *Milano*), the principal city, ancient, populous, and highly attractive, is seated on a plain between the Ticino and Adda Rivers, and contains a population of 219,000, including the suburbs. It has a circular outline, is enclosed with walls nearly eight miles in circuit, and entered by eleven gates, some of which are remarkable for massive proportions and architectural design, while invested with interesting traditional recollections. The streets are generally spacious, and the public buildings elegant, including palaces and churches rich in paintings. The white marble Duomo, or cathedral, which is profusely adorned on the exterior with statues, now in process of being multiplied to complete the original design, excites universal admiration. The opera-house, Della Scala, opened in 1799, is said to be the finest in the world. Scientific bodies have large and valuable literary and art collections, as well as some private individuals. The academy has a library of 100,000 volumes; the Ambrosian contains 60,000; and both have extensive stores of MSS. The schools of surgery and medicine, especially that of veterinary practice, and the Conservatory are celebrated; so are the charitable and benevolent institutions, whose aggregate property is worth £7,000,000. The *Conso*, or chief street of Milan, is the universal fashionable promenade, and the famous arcade, or *Galleria di Cristofers*, with its brilliant shops and cafés, is also a favourite place of evening resort, and on account of its gay appearance has been called 'Little Paris.' The manufactures include weapons, arms, and ironwork of all descriptions; but Milan is chiefly distinguished as the seat of the trade between Northern Italy and Central Europe. It is favourably situated for this purpose, as the point to which the great routes across the Alps converge, by the Simplón, the St Gothard, the Splügen, and the Stelvio, while now connected by railway with the leading Italian cities. The city has experienced many vicissitudes. It flourished under the Roman emperors, was successively plundered by the Huns and Goths, rose to distinction under the sway of Charlemagne, but was entirely desolated by a confederacy of adjoining powers in the middle of the twelfth century. It was speedily rebuilt, became the capital of an independent duchy, and after passing under various rulers, was incorporated with Austria in 1815, and remained in impatient subjection till 1859, when it was entered by the allied French and Sardinian army. The poet Virgil studied at Milan, and St Ambrose was long its bishop.

*Pavia*, southward, on the Ticino, is a decayed place, though containing 30,000 inhabitants, and still the seat of a university, once celebrated, in which Volta and Spallanzani were professors. Its name is given to the battle fought in the neighbourhood in 1525, when the French were defeated, and their king, Francis, was taken prisoner by the army of the Emperor Charles V. *Lodi*, on the Adda, forming a triangle with Milan and Pavia, now busy with its dairy produce, was the scene of Napoleon's terrible passage of the bridge, and decisive victory over the Austrians in 1796. *Brescia*, on the east of Milan, is a prosperous manufacturing town, with 40,000 inhabitants. It contains many Roman antiquities and interesting modern objects, as a town-hall entirely of marble of the richest description; a noble cathedral, also of marble; with churches and private galleries stored with many of the best works of the old masters. On the south-east, about twenty miles distant, is the small town of *Solferino*, the scene of the final victory obtained by the French and Sardinians in 1859, which led to the peace of Villafranca, and delivered Lombardy from the Austrians.

*Bergamo*, north-east of Milan, in a delightful country, has extensive silk manufactures, and a population of 33,700. It was the birthplace of Bernardo Tasso, and Tiraboschi. An annual fair, held here in August for a fortnight, attracts a crowd of visitors from a distance, intent upon both business and pleasure. Its principal scene is a huge stone building which contains 600 shops, and is ranged round a court adorned with fountains. *Como*, at the south-west extremity of its lake, the native place of the younger Pliny, has 18,000 inhabitants, engaged in silk and cloth manufactures. The neighbouring country is the home of a class of travelling peddlers, who go out into the world to make their fortune, visit Paris, London, and other cities, disposing of stucco figures, bird-cages, barometers, and similar small-wares. They are often absent ten or twelve years, but many return with savings sufficient to buy a cottage and patch of land by the side of their native lake. According to Mr Laing, they are a very interesting class of shrewd observing men, well worth getting acquainted with, having seen various phases of life in different countries.

EMILIA lies immediately southward of the Po, and embraces the country between the main ridge of the Apennines and the Adriatic. It includes the old duchies of Parma and Modena, with the northern part of the territory formerly under the Papal dominion, comprehending the legations of Bologna, Ferrara, Ravenna, and other adjoining districts, the affairs of which were once administered by Papal legates. The present name is derived from the *Via Emilia*, a great highway constructed by the Romans, which passed through the region from Rimini on the coast to Piacenza on the Po, and had its designation transferred to the province during the Roman period. This road was a continuation of the *Via Flaminia*, which ran between Rimini and Rome, and was the first regular route opened in the north of the peninsula. Along it civilisation travelled

towards the Alps, and reached the heart of Europe beyond them, when military power had cleared a passage across the barrier.

*Parma*, the capital of the former duchy, is situated on a stream of the same name flowing northward to the Po, and contains a population of 47,000. It is of ancient date, having been established as a Roman colony 183 B.C. The city has a handsome appearance, is the seat of a university, and possesses small but valuable collections of paintings and antiquities. The cathedral, a fine pile of the eleventh century, has its interior adorned with frescoes, the most important of which are on the cupola, by Correggio. *Piacenza*, with 39,000 inhabitants, immediately adjoins the Po, on the right bank, and goes back also to the Roman period, when it was founded, 219 B.C., to serve as a protective position against the Gauls. Its principal square is one of the finest in Italy.

*Modena*, a former ducal capital, occupies a plain between the Po and the Apennines, possesses colleges of theology, law, medicine, &c., a botanic garden, cabinets of natural history, a library of 100,000 volumes, with many manuscripts. The campanile, or belfry, is one of the great towers of Italy, 315 feet high. The population numbers 55,000. *Reggio*, a few miles distant, was the birthplace of Ariosto in 1474, and of Correggio in 1494, has a population of 50,000. *Carrara*, on the western side of the Apennines, near the Mediterranean shore, is famous for its quarries of statuary marble opened in the face of some lofty, picturesquely-shaped, woodless mountains. More than 1200 men are here constantly employed, and the supply seems inexhaustible.

*Bologna*, the largest of the *Emilian cities*, two miles in length by one in breadth, entered by twelve gates contains 109,000 inhabitants, and occupies a plain carpeted with the beautiful hemp-plant. Arched colonnades extend over the foot-pavements on both sides of the streets, which are convenient owing to the frequent rains, but have a very gloomy effect. The manufactures are considerable, comprising silks, glass, chemical preparations, and instruments. Bologna has more than seventy churches, many of which are rich in the master-pieces of Italian art. Its ancient university, founded in 1119, is remarkable for having had a few female professors of distinction. It has a library of 105,000 volumes, with 6000 manuscripts. The painters Guido, Domenichino, and the three Caracci were natives, as well as Galvani, the physician, whose name has acquired wide celebrity by a purely accidental discovery, in which originated the science of galvanism, born in 1737. The present inhabitants are generally distinguished by their intelligence and independent spirit. Bologna (the *Bononia* of the ancients), after having given six popes to Rome and nearly a hundred cardinals, instantly threw off the Papal yoke upon the withdrawal of the Austrian troops in 1800. *Ferrara*, in the delta of the Po, a few miles from the main channel, is surrounded by walls, and has a population of 25,000, scarcely one-fourth of the number it possessed in the middle ages, when it was the seat of a splendid ducal court, and the most important commercial emporium in Italy. It now wears a very melancholy aspect. Grass grows in the streets, while the palaces are deserted and crumbling. But the churches are numerous, of striking architecture, and rich in paintings. The university also retains celebrity as a school of medicine and jurisprudence; and the public library of 80,000 volumes is of great interest from its missals and manuscripts. Among the latter are works in the handwriting of Ariosto and Tasso. Here Ariosto was buried, and Tasso was imprisoned. His prison is shewn in the hospital of St Anna, a room below the ground-floor, lighted by a grated window from the yard, and inscribed with the names of distinguished visitors, those of Lord Byron and Lamartine among others. Ferrara was long the seat of the Dukes of Este, from whom the House of Brunswick and the royal family of England derive their direct descent.

*Ravenna*, one of the famed historic sites, with a population of 57,000, is now about five miles from the sea, but was once washed by its waves, and was a principal station of the Roman fleet. The deposit of sediment brought down by the Po accounts for the change. By means of a canal alone is communication maintained with the Adriatic. The emperors made the city their residence when Italy was threatened by the barbarians. It was afterwards the capital of the Lombard Kingdom, and the head of an independent district through the middle ages. Ravenna is now only of interest to the lovers of medieval art, remains of which are very numerous and striking; and to pilgrims to poetic shrines, as the scene of the death of Dante. Banished from Florence, he accepted the hospitality of its feudal ruler, and spent the last years of his life in the city. The 'Poet Sire of Italy' often wandered in the pine-forest before referred to. A particular part of it now bears the name of *Vicolo de Poeti*, from a tradition that at the spot he loved to meditate. His sketch of the terrestrial paradise in the *Purgatorio* is drawn from the scenery on a sunny breezy morn, 'the sweet hours of prime,' when the birds 'their several arts pursued among the trees,' while the leaves 'kept harmonious murmur with their notes.' Dante's mausoleum, a square edifice, is behind the Church of S. Francesco, and has had many a notable visitor. Chateaubriand knelt bareheaded at the door before he entered; Byron placed a copy of the poet's works upon the tomb; and Alfieri prostrated himself, and embodied his emotions in one of his finest sonnets. Byron, who spent two years in Ravenna, has commemorated the wood, and the changes of the shore.

'Sweet hour of twilight!—in the solitude  
Of the pine forest, and the silent shore,  
Which bounds Ravenna's immemorial wood,  
Rooted where once the Adrian wave flowed o'er,  
To where the last Caesarian fortress stood,  
Evergreen forest!'

*Rimini*, an episcopal city and seaport on the south, represents the ancient *Ariminum*, and has an object

of interest in the triumphal arch of Augustus, with valuable silver-mines in its vicinity. Population, 33,000.

THE MARCHES, southward on the coast, form a small district extending to the northern border of the old kingdom of Naples, and with UMBRIA, an inland province, on the opposite side of the Apennines, embracing the upper basin of the Tiber, were formerly included in the States of the Church.

*Ancona*, a busy commercial town and fortified seaport, is one of the most important places on the Adriatic, about 130 miles south-east of Venice, and the same distance north-east of Rome. It possesses various manufactures, and contains 46,000 inhabitants, among whom are many Jews, Greeks, and Moslems. The town is built in the form of an amphitheatre on the slope of two hills rising from the shore. It has an excellent harbour formed by a breakwater on one side, and a fine pier on the other, 2000 feet in length, 100 feet in breadth, and 65 feet above the water, shewing a revolving light at the extremity. A triumphal arch of Trajan is one of the most admired Roman remains extant. *Loretto*, a celebrated shrine of the Virgin, is a few miles to the south, with a magnificent church, once rich with offerings from crowds of devotees. *Urbino* is of interest as the birthplace of Raphael, and as the spot where most of the beautiful specimens of painted pottery, called *Majolica*, were produced.

*Perugia*, the chief town in the Umbrian province, with about 18,000 inhabitants, is seated on the left bank of the Tiber, ninety miles north of Rome. It is the seat of a university, and possesses some silk manufactures. During the Roman period it was an important city, long defied the power of the Goths; and in the neighbourhood some of the most interesting Etruscan antiquities have been found. The Lake of Perugia, the ancient *Thrasimenus*, is a few miles distant, on the shores of which Hannibal obtained his famous victory over the consul Flaminius, 217 B. C.

TUSCANY, formerly a grand duchy, extends along the Mediterranean, and from thence inland to the Apennines. The mountains, receding from the shore, leave a spacious district intermediate, from seventy to eighty miles in its greatest width, through which the Arno, Ombrone, and some other streams travel to the sea. The more maritime portion of this tract is a plain, and belongs largely to the malarious region, called the Maremma. It is however fertile, yields a variety of mineral substances, and the desolate expanses were in ancient times densely peopled, shewing that the cessation of industry for centuries in cultivating the soil, rather than any inevitable operation of nature, has provoked the brooding pestilence. A considerable proportion of hilly surface borders the Apennines, and approaches the sea in the north, wholly free from the enemy, where the scenery is beautiful, the people actively industrial, working quarries of marble, mines of copper, and prosecuting agricultural occupations. The olive is extensively cultivated, and the best olive-oil is here produced from the fruit. The preparation of straw-plait, with the manufacture of straw-hats, is also a prevailing employment. Tuscany corresponds in its general limits to the Etruria Proper of antiquity, which was held by twelve sovereign cantons, one of which cradled the Tarquins, so prominent in the early annals of Rome. The island of Elba, celebrated for having been the scene of Napoleon's exile in 1814, surrounded by a number of rocky islets, lies about five miles off the coast.

Falls of Valambrossa.

*Florence* (Ital. *Firenze*, now *Firenze*), the capital of the former grand duchy, called *la bella*, 'the beautiful,' is delightfully situated in the garden-valley of the Arno, about 50 miles inland, and contains a population of 114,500. It occupies both banks of the river, which is crossed by four fine bridges, is surrounded by walls six miles in circuit, and communicates by eight gates with thickly-peopled suburbs. The city is remarkable for the number of its castellated palaces of the middle ages, its gorgeous churches, rich galleries of art, large libraries, and stores of valuable manuscript, which, with the intelligence of the inhabitants, and the loveliness of the environs, attract many foreigners to it as a residence. Inscriptions in English on many sign-boards indicate their presence. The cathedral, founded in 1293, is a splendid edifice, the cupola of which was taken as a model for that of St Peter's at Rome. It has in recent times put on a singular appearance; for while the exterior, under the control of civil authorities,

Florence.

has been brilliantly illuminated in honour of the restored Italian nationality, the clergy, who command the interior, have kept it in utter darkness. The Church of Santa Croce is of interest as the Westminster Abbey of Florence, containing monuments of illustrious Florentines or Tuscans; those of Dante, Galileo, Michael Angelo, and Machiavelli, among others. The Palazzo Pitti, recently the grand ducal residence, possesses a superb gallery of paintings, and a library of 70,000 volumes. Silks, carpets, straw-hats, mosaic-work, porcelain, and jewellery are the principal manufactures. Below the city, by the side of the Arno, is the Casino, or Hyde Park of the fashionables; a long narrow plantation of trees, where they assemble on summer evenings to drive and ride. Florence, in the thirteenth century, was a chief scene of the struggle between the rival factions of the Guelphs and the Ghibellines. It afterwards adopted a republican constitution, rose to great prosperity, and, though often disturbed, popular institutions were maintained till August 8, 1530. The city was then taken by the imperialists, and the grand duchy of Tuscany constituted. Arezzo, on the south-east, at the foot of the Apennines, of very ancient date, is now a decayed town, but with many memorials of former importance, as extensive walls and numerous churches. It was one of the twelve Etruscan cities, and is remarkable for its long list of distinguished natives, which includes, among others, Mæcenas, the patron of letters in the Augustan age, Petrarch, Aretino, Guido, Redi, and Vasari. Michael Angelo was also born in the immediate vicinity. Pistoja, on the north-west, small but highly industrial, produces firearms, cutlery, with general hardwares, and claims the invention and first manufacture of pistols.

*Leghorn* (Ital. *Livorno*), the principal seaport, with 96,000 inhabitants, embraces all the foreign trade of Tuscany, and ranks as the greatest commercial emporium in Italy. A fine light-house stands prominently on an isolated rock in the sea. The town is well built, paved, and lighted, has spacious squares, regular streets, with wide footpaths on either side, and is one of the most improving places on the continent. Ship-building and the other industries of a great port are carried on. Great numbers of visitors arrive in the summer season from Rome, Florence, Bologna, Sienna, and other inland sites, to benefit by the sea-breeze. The grave of Smollett is in the English cemetery. Tuscan straw-plait, commonly called Leghorn, acquired the name from the place of export. *Pisa*, on the Arno, a few miles above its mouth, once the head of a powerful commercial republic, is now a comparatively decayed city, but contains many noble edifices; and its ancient university is still a principal centre of education. Population, 51,000. The remarkable object is the 'leaning tower,' a circular structure 188 feet high, which diverges fifteen feet from the perpendicular, but whether from accident or design is not known. *Lucca*, on the north of Pisa, in the valley of the Secchio, is a pleasant and thriving town, very agreeably situated, being encompassed by an amphitheatre of hills covered with olive groves, in a highly-cultivated country. The baths of Lucca, about fifteen miles distant, are in a valley of picturesque villages and villas, shaded by mountains covered with chestnut-trees, so steep and high that the sun appears two hours later in the morning, and is lost sight of two hours earlier in the evening, thus curtailing the length of the natural day, and checking the accumulation of heat. The mineral waters, the lovely scenery, and the coolness, render the place an agreeable summer residence, and a favourite resort, especially with the English, who have a handsome church. Population, 65,000. *Sienna*, thirty miles south of Florence, has lost the importance it once possessed, though still a considerable place, and the seat of a university, with many objects of interest. It was formerly the capital of an independent republic, had a celebrated school of painting to which its name is given. The citizens are celebrated for their pure Italian speech.

The island of Elba, celebrated as the scene of Napoleon's first banishment, separated from the mainland by the channel of Piombino, is eighteen miles long, but at one point only about three broad, owing to inlets on the opposite sides. The shores are rocky, and the interior is mountainous, the higher part of which is bare and sterile, but the lower grounds and valleys have the vine, olive, mulberry, and other trees. Iron ore, of very rich quality, occurs in profusion, and mines have been worked since the early part of the Roman period. A hill, 500 feet high, and two miles in circuit, consists almost entirely of ore. *Porto Ferrajo*, the chief town, is of small size, on the north coast. The island has a total population of about 21,000.

Carrara.

Gaeta, from the Sea.

The NEAPOLITAN PROVINCES embrace part of the centre and the whole south of the peninsula. This region includes the highest points and wildest scenery of the Apennines, which, with their banditti, largely occupied the pencil of Salvator Rosa. Recent political changes have rendered brigandage more common than ever, under the plea of serving the cause of the fallen dynasty. The country possesses great natural advantages, a fine climate, a soil overflowing almost spontaneously with the choicest productions for the use of man. But the mass of the people are wretched objects to observers from northerly latitudes, ill clad and ill housed, partly owing to maladministration under a long absolute government, and partly to their own indolence. With little labour a supply of vegetable and farinaceous food is secured—olives, wine, Indian corn, legumes, and fruit—to which small fish found in shoals along the shores is readily added. Fuel is not needed except for preparing meals, where the sun furnishes the requisite warmth for personal comfort; the same cause offers an excuse for indifference to clothing and house accommodation; and thus the very bounty of nature is turned into a curse by a population indisposed to industry, to whom it is the height of enjoyment to lounge and gossip in the thoroughfares, bask in the sunbeams, or slumber in the shade. The provinces contain many sites of great scenic beauty and classical interest, unique remains of ancient civilisation, found in the cities which have been exhumed from the load of volcanic ashes under which they were buried for centuries, Herculaneum and Pompeii. With Sicily, the south-western portions form the earthquake region of Italy, visited by shocks of tremendous violence in the last century, commencing in 1783, when chasms were opened in the ground, streams were diverted into fresh channels, and all buildings near the focus of disturbance were levelled, to the destruction of thousands of lives.

*Naples* (Ital. *Napoli*), the largest of the Italian cities, containing a population of 447,000, is seated on the shore of a splendid bay of the Mediterranean, besprinkled with towns, hamlets, and villas, olive and orange groves, orchards and vineyards, while mountains rise high in the clear blue sky, clothed with forests on their

slopes, and carpeted with deep green grass-fields at their base. The scenery has been enthusiastically styled 'a piece of heaven let down upon the earth.' In connection with the climate it originated the saying, *Vedi Napoli e poi muori*—'See Naples, and then die.' The city rises in the form of an amphitheatre on the slope of a range of hills. It has no land-defences, and is but feebly protected to seaward by the Castle of St Elmo and two forts. Most of the houses are lofty and the streets narrow. The open spaces or squares are few, and not large, except in one or two instances; and besides a multitude of churches, an immense palace, and a magnificent theatre, the public buildings are not remarkable. But the National Museum, as it is now called, much improved in its arrangements since the recent political change, contains an unrivalled collection of vases, bronzes, gems, and other relics of antiquity; a picture gallery, fresco paintings, a library of 150,000 volumes, with papyri found in Herculaneum. The people with whom the principal streets are crowded, are the noticeable objects out of doors, but it is necessary to avoid contact with them. Scarcely a tithe of the number are intent upon any serious business, mostly belonging to the class of lazzaroni, mendicants, and pilferers. They are active with voice and gesture, assuming every variety of attitude, squatting on the ground, lounging at the doorways, or grouped at corners. Naples has been called a 'wonderful den of human animals—the St Giles's of Europe.' The principal industry is the production of silk goods and the fishery along-shore, with the making of macaroni and vermicelli for the daily fare of the populace. *Capua*, strongly fortified, on the north of Naples, covers the approach to it in that direction.

Street of the Tombs, Pompeii.

Across part of the bay, on the south-east, and three miles from the opposite shore, the graceful form of Vesuvius rises to the height of 3792 feet, seeming much nearer than it is through the transparent atmosphere. It is the first object to which the stranger directs his gaze. No other mountain has had so many eyes turned to it at the same time as this, for no other volcano has a city so vast in its neighbourhood. Vineyards clothe the lower slopes, which, with the dwellings of the peasantry, are unfailingly renewed as often as they are ravaged by eruptions, yielding a delicious wine. The railway takes the visitor to the village of Portici, from which the ascent of Vesuvius is made. Half-way up, at the limit of the cultivated ground, is the Hermitage, a house for refreshment, reached by mules and donkeys. The other half consists of lava, scorie, and volcanic rubbish, which for months retains the heat after an explosion. At the seaward base of the mountain are the ill-fated cities of Herculaneum and Pompeii, partially uncovered and still partly buried, which have revealed more of the private life of the ancients than all other remains put together. Herculaneum was discovered in its volcanic tomb in 1711, by a peasant while deepening a well. It lies at the depth of from 70 to 120 feet below the surface, and has yielded a vast number of art treasures, now in the museum at Naples, while several of its buildings have been uncovered. The site of Pompeii was not identified till some time afterwards. It has been much more completely cleared of the superincumbent material. In 1748, the Amphitheatre was brought to light; 1763, the Gate of Hercules; 1764, Theatres and Temple of Isis; 1811, the House of Pansa; 1813, the Forum;

1818, the Temples of Mercury and Venus; 1825, the House of the Tragic Poet; 1826, the Street of Mercury; 1829, the Street of Fortune; 1841, the Street of Merchants; 1845, the Quadrivium; and 1847, the House of Lucrezio. It is said that about 600 skeletons have been discovered in the ruins, but records can hardly be found for half the number. The systematic excavations now in progress reveal almost daily new and important discoveries.

Near the north-west extremity of the bay stands *Puzzuoli*, a small town, which represents Puteoli, the landing-place of St Paul, on his journey to Rome; also *Baia*, the Brighton of the Roman nobility; and *Cuma*, inland, now consisting of a few scattered farmhouses, with immense ruins covered with a wilderness of shrubs. At a short distance from the shore lies the island of *Ischia*, with mineral waters, rich fruits, and enchanting scenery, the seat of volcanic action in ancient and modern times, but not recently. *Castellamare*, at the south-east angle of the bay, is a considerable manufacturing town and port. The small isle of Capri is at the southern entrance of the bay, the scene of the guilt and gloom of the Emperor Tiberius, remarkable for its Sapphire Grot, a cave by the sea, the roof and sides of which are of the deepest azure hue.

Northward on the coast is *Gaieta*, an important stronghold, of ancient foundation, the Cajeta of the Romans, and of recent notoriety, as the refuge of Pope Pius IX. in 1848, when revolution drove him from his capital; it was the last place held by the Neapolitan Bourbon dynasty in 1860. It occupies a far projecting promontory with a bold termination, connected by a low narrow isthmus with the mainland, overlooks a beautiful bay, has many remains of classical interest in the vicinity, is very strongly fortified, and contains about 14,000 inhabitants. The Tower of Orlando, on the highest point of the headland, a circular building, is said to have been erected as a mausoleum for a friend of the Roman Emperor Augustus. In the citadel the tomb of the Constable Bourbon, killed at the capture of Rome, while scaling the walls, in 1527, is shewn. The Roman town was the scene of Cicero's assassination, 43 B. C. *Fondi*, a few miles inland, near the Papal Territory, has only interest from its position on the Appian Way, which forms the principal street, and the fruitful adjoining plain, which produced the celebrated Cæcuban wine of the classic age. On the coast southward of the Bay of Naples stands *Salerno*, connected with the capital by railway, the seat of a university once famed for its school of medicine. It is a considerable commercial site, possesses silk-works, has rice-ground in the neighbourhood, passed by the traveller on his way to the majestic ruins of Paestum. Population, 29,000. *Reggio*, on the continental side of the Strait of Messina, a larger town, with upwards of 30,000 inhabitants, represents ancient Rhegium, one of the most renowned of the Græco-Italian cities, the birthplace of many distinguished men, touched at by St Paul on his voyage to Rome. The Greek language was spoken here down to a late period of the middle ages.

*Taranto*, between the projections of Southern Italy, on the shore of the gulf which bears its name, contains a population of 27,000, but has fallen completely from its historical consequence. Founded by emigrants from Sparta, seven centuries before the Christian era, it acquired immense wealth by commerce, maintained a large number of mercenary troops, and was nominally at the head of all the Greek colonies in the peninsula. *Gallipoli*, a much smaller town, of similar origin, on the eastern side of the gulf, is finely situated on a steep insulated rock, connected by a bridge with the mainland, is rendered by nature and fortifications a very strong military position. It is remarkable for its cisterns excavated in the limestone rock, in which the olive oil of the province is deposited and clarified for exportation.

On the Adriatic side of the country, *Brindisi* is the impoverished representative of Brundisium, so often mentioned in Roman history as the ordinary point of passage between Italy and Greece. *Bari* and *Barletta* are now the chief ports, both considerable places. *Foggia*, the largest inland town, with 34,000 inhabitants, in the fertile Apulian plain, is well built, and the centre of great trade in corn, cattle, wool, cheese, wine, oil, and capers. *Aquila*, the birthplace of Sallust, and *Sulmona*, of Ovid, the first named a commercial mart of consequence, are in the mountainous province of Abruzzo Ultra, within view of the highest and most rugged portion of the Apennines. *Arpino*, the native place of Cicero, Marius, and Agrippa, is a town of some size towards the Papal frontier, and contains monuments which go back to their age. *Nola*, eastward of Naples, has its name historically noted as the scene of the death of the Emperor Augustus, and the spot where bells are said to have been first used in churches.

Castellamare.

Messina.

SICILY, separated from the south-western part of the mainland by a narrow channel, is a large and lovely island, extending upwards of 160 miles from east to west on the northern side, and from thence contracting southward so as to assume the general form of a triangle. Its coast-line embraces many excellent harbours; the interior is watered by numerous small rivers; and while the scenery is splendid and the soil fertile, the vegetation is luxuriant, and the climate favourable to the growth of tropical plants on the lowlands. A range of mountains of moderate elevation runs parallel to the northern shore, and diversifies the greater part of the surface with its offsets, but the eastern side is distinguished by the enormous volcanic cone of Etna, the great natural feature of the island. The mountain, now called Monte Gibello by the natives, ascends considerably above the range of vegetable life, and rises up from a base of more than eighty miles in circuit. It is completely isolated from the coast-chain by a valley, as well as from heights in other directions. The shores for many miles on either hand are formed of dark lava streams, which have descended its slopes, poured into the sea, and been suddenly cooled by it, which give to the strand a singular appearance, as if formed by the accumulation of millions of tons of coal. Around the base of the mountain, and ascending to some height, is a cultivated district, producing corn, wine, oil, fruit, and aromatic plants, studded with towns, villages, and farms. This is the Fertile region, above which lies a Woody zone of considerable breadth, consisting of forests of oak, beech, chestnut, poplar, and pine, with interspersing pastures for flocks and herds. The uppermost region is a dreary desert plain, covered with black lava, scorice, ashes, ice, and snow, in the centre of which rises the crater-bearing cone. Etna may be ascended without any extraordinary difficulty. The travelling distance to the summit from Catania is about twenty-four miles. Sicily produces silk, the greater part of which is manufactured into ordinary silk stuffs; a small quantity of cotton is raised; the coral, tunny, and other fisheries are extensively prosecuted; the sulphur-mines are of great value; and various minerals peculiar to

volcanic districts occur, as chrysolite, zeolite, selenite, alum, nitre, vitriol, mercury, and spicular iron. The Lipari Isles, about twelve in number, are grouped off the north-east coast.

*Palermo*, on the northern shore, 190 miles south by west of Naples, ranks with the principal cities of Europe in size and appearance, containing a population of 194,000. The streets are spacious, the squares numerous, the flat-roofed balconied houses and public buildings handsome, and the sea-views beautiful, particularly the one from the Marina, a long promenade by the shore. It is the see of an archbishop, the seat of a university, possesses a botanic garden and an astronomical observatory from which Piazzi discovered the planet Ceres, so named after the tutelal goddess of Sicily. At Palermo the dreadful massacre of the Sicilian Vespers commenced in 1282, caused by an insult offered by a Frenchman to a lady, which ended in the entire destruction of his countrymen throughout the island. Around the city stretches a spacious, fertile, and well-cultivated plain, called by the semi-oriental natives *La Conca d'Oro*—'The Golden Shell,' bounded by mountains, remarkable for the aloes by the waysides, the stems of which start up to the height of twenty feet, and are as thick as a small tree. The swelling hills enclose the small town of Monreale, the 'Royal Mount,' about four miles distant, distinguished by one of the most splendid and costly painted churches in Europe.

*Messina*, a busy seaport on the north-east coast, with 103,000 inhabitants, presents an equally fine appearance, having many good buildings, picturesque fortifications, and mountains in the background. It has one of the best harbours in Europe, forming a curve along which runs a noble quay two miles in length. The Strait of Messina, or the channel between Sicily and the mainland, is rather more than two miles and a quarter in width at the narrowest part. In the immediate neighbourhood of the city, about a quarter of a mile from the shore, and in the middle of a kind of bay, there is a spot of agitated water from seventy to ninety fathoms deep, circling in rapid eddies. This is the whirlpool of Charybdis, so much dreaded by the ancient mariners, apparently caused by the meeting of some local lateral currents with the main current which runs through the strait. Small-craft are occasionally endangered; even large vessels of war may be turned round; but no peril need be apprehended if proper caution is exercised. The rocks of Scylla, the twin danger with Charybdis to the old navigators, are situated on the Italian side of the channel, a few miles northward of the whirlpool. They lie partly under water at the foot of the bold headland on which the Castle of Scylla is built, a precipitous cliff, in places positively overhanging the sea. The two spots became proverbial for peril on either hand, or a choice of evils, but they present no difficulties to modern seamanship.

Catania.

*Catania*, the third place in importance, with 68,000 inhabitants, is a seaport at the southern foot of Etna, with silk manufactures and a large export trade in corn, fruits, wine, and snow from the mountain. The houses are built and the streets paved with lava. It has repeatedly suffered from earthquakes and eruptions of the volcano. In 1669 a lava stream reached the walls, which were pertinaciously heightened and strengthened to stop its flow, but the fiery torrent poured over them at last, covered part of the city, and entered the sea. *Marsala*, towards the west extremity of the island, is celebrated for the wine which bears its name, the export of which is very considerable. Population, 31,000. *Bronte*, a town at the western base of Mount Etna, about twenty-two miles north-north-west of Catania, possesses woollen and paper manufactures, and produces oil, almonds, and wine; but is chiefly interesting to us as the dukedom with which the Neapolitan government rewarded the services of Admiral Lord Nelson.

Sicily, during the middle ages, was held successively by the Goths, the Moors, the Normans, the French, and the Spaniards. In ancient times, Greek colonists had at first the mastery, but were compelled to share it with Carthaginian settlers, till both eventually submitted to the power of the Romans. Of the old foundations, *Syracuse*, a city of five regions, occupying a triangle more than twelve miles in compass, on the shore of a

Bronte.

noble bay, had the precedence in date, fame, and splendour; the magnificent harbour remains, on the east coast, to the south of Catania; but is used only by a few coasting barks. The small fortified town of *Siragusa*, with narrow and dirty streets, mean public buildings, stands on part of the ancient site, but the vestiges of pagan antiquity are few and unimportant. There are catacombs of the early Christian age, wide and lofty passages hewn in the rock, with deep arched recesses on each side, stuccoed and painted walls, some of which have had gates and locks. Ancient *Syracuse* was the birthplace of Archimedes, Theocritus, and Moschus; and for a time the residence of Plato, Zeno, Simonides, and Cicero. On the south-west coast, *Agrigentum* has been more fortunate, for its ruins, beside the insignificant modern town of *Girgenti*, are among the most magnificent of all classical monuments. Here are remains of the forum, circus, camps, aqueducts, and reservoir; columns of a beautifully proportioned temple, called that of Juno, in the midst of carob and olive trees; entire columns of another temple, named that of Concord, with the entablature and pediments of both fronts nearly complete; and huge piles of ruins styled the Temple of the Giants, which vouch for the correctness of the description given of the shrine of Jupiter Olympius at the site, but which was wholly disbelieved till the vast mass of fallen fragments was discovered. This structure was the largest temple ever erected by the Greeks, at home or abroad. Its dimensions are ascertained from the remaining wrecks; and the modern measurements prove the ancient assertion to be strictly true, that a man could hide himself in one of the flutings of the columns. Another spot, *Enna*, is rapturously spoken of by the classical writers, who describe it as an impregnable fastness, the seat of a stately temple of Ceres, a flowery meadow around it, with a lake adjoining, as well as luxuriant woods and pasturages, where the odour of the violets was sufficiently strong to throw dogs off the scent. Milton seized upon its reported beauty as an emblem of the Garden of Eden.

‘That fair field

Of Enna, where Proserpine gathering flowers,  
Herself a fairer flower, by gloomy Dis  
Was gathered, which cost Ceres all that pain  
To seek her through the world.’

This place, of which other features are given, is identified with *Castro Giovanni*, a hill-town in the heart of the island. But the fastness, a ridge with precipitous sides, has no trees, flowers, or verdure; the lake is a marsh four miles in circuit; the temple has disappeared; and a Saracenic castle in ruins crowns one of the heights.

The deep rocky valley of *Ipsaca*, on the south coast, westward of *Cape Passaro*, is perhaps the most anciently occupied site in Sicily, or in Europe, which still retains inhabitants. This valley has on one side a wall of perpendicular rock, which presents a prodigious number of small excavated chambers, arranged over each other in several stories, of ten or twelve feet each, the opposite side exhibiting the same appearance, but to a less extent. There are as many doors as chambers, all of the same size and workmanship, almost all of

the same form, and evidently designed for the same purpose. Each chamber forms a square with obtuse angles, eighteen feet long by six wide, and as many in height. The valley presents this appearance for the length of three miles, and was therefore once the seat of a numerous population. In some instances a second chamber occurs behind the first; and occasionally the upper communicate with the lower by round apertures, where doubtless temporary ladders were placed, serving instead of staircases. The dwellings were evidently constructed by a very rustic people, for not a straight line appears, nor a right angle, nor an arched roof, nor a smooth surface. The origin of this curious troglodytic city, now the abode of a few peasants, is involved in complete obscurity.

SARDINIA, somewhat exceeding Sicily in size, but inferior in wealth and importance, while much less known, ranks as the largest island in the Mediterranean, and measures about 160 miles from north to south, by an average breadth of seventy miles. It lies to the south of Corsica, from which it is separated by the Strait of Bonifacio. The shores abound with spacious and beautiful bays; the interior is extensively mountainous, especially in the north; but none of the summits equal the Corsican in height. Woods of chestnut, cork, ilex, and wild cherry, with an undergrowth of myrtle, arbutus, and brilliant flowers, densely clothe the sides of the hills, sheltering the wild-boar, deer, quails, partridges, and other game-birds. Along the southern and western coasts are plains, in many parts highly cultivated, rich with vineyards, olive and orange groves, intersected with hedges entirely composed of cactus. But the lower grounds in these districts are marshy, and for months during the summer heats the exhalations are very fatal to strangers, and deleterious to the natives. Hence the old Romans regarded the island with mingled feelings of satisfaction and dread. They profited by its fertility, and it became one of their granaries, while they shunned a sojourn for any length of time on its shores, deporting to them criminals and political foes. Sardinia possesses a spare population, generally uncultivated and prone to indolence, cunning and revengeful, but courteous and hospitable, with a number of outlaws in the mountain-fastnesses, either bandits by birth, or offenders against the laws who have absconded from the pursuit of justice.

*Cagliari*, the capital, is finely placed on a commanding hill of the south coast, overlooking a spacious bay, and contains a population of 30,900. It possesses a cathedral, many churches, a well-attended university, and several public seminaries. Its narrow steep streets are scenes of great animation by day, except for about two hours at noon, when every one retires to rest; for the inhabitants commonly follow their callings before their own thresholds, carpenters, tailors, tinnmen, shoemakers, and young women spinning with spindle and distaff. The 1st of May is their grand holiday, the festival of St Eufisio, the patron saint, when guns fire, flags fly, bells ring, and the image of the saint, large as life, in full canonicals, is conducted to the place of his martyrdom, about fifteen miles distant, attended by a procession of priests and people. *Sassari*, the rival town, in the north division of the island, with a population of 25,000, has also a university, with considerable trade in tobacco and fruits. *Oristano*, on the west coast, exports corn, salt, and fish; and has the remarkable orange-groves of Milis in its vicinity, several miles in extent. 'Do not imagine,' says a visitor, 'a group of orange-trees here and there, the perfume of which comes and goes as you approach, and as you leave it; but try to realise the idea of a wood—a veritable forest! As far as the eye can reach under this balmy forest it meets with nothing but oranges.'

Sardinia was early colonised by the Phœnicians, Greeks, and Carthaginians. The Romans wrested the mastery from the latter, and retained it till the fall of the empire. In the middle ages, the rival republics of Genoa and Pisa contended for its possession, but referring their respective claims to the pope, he decided for neither, and attached it to the crown of Aragon, to be held as a fief of the papacy. In 1720 it passed from Spanish rule to that of the House of Savoy and Piedmont, and gave the title of King of Sardinia to the reigning princes, till the monarchy merged in the new Kingdom of Italy.

The Sards betray their composite origin by differences of language, dress, and manners. Besides Italian, nearly pure Spanish is spoken in some districts, and a mixture of the two, interlarded with oriental forms of speech, in others. The festal fare of the people is unique. It consists of a huge wild-boar, inside the carcass of which is placed a kid, and within the kid a sucking-pig, with a quail or some other game-bird still more interior. The whole mass is roasted in a hole of the ground, lined well on all sides with branches of myrtle, between embers of charcoal above and below. The flavour imparted by the myrtle is said to be exquisite. Monuments of antiquity, called *Noraghe*, are profusely scattered over the surface of the island. These are stone towers of conical form, often placed on the summit of hills, in various states of preservation, but generally of prodigious strength. They are probably prehistoric, of unknown design, though considered by some to have been places of sepulture to the earlier colonists.

Castle of St Angelo and St Peter's.

## II. ROMAN OR PONTIFICAL TERRITORY.

The reduced domain of the Church lies on the western coast of Italy, between the Neapolitan and Tuscan provinces of the Italian Kingdom, but has only an inconsiderable extension inland. The total area very slightly exceeds 4500 square miles, and would be immediately free from ecclesiastical rule by the suffrages of its inhabitants, were it not for the presence of a foreign soldiery. It is traversed by the lower course of the Tiber, and of its affluent the Teverone, consists of a plain studded here and there with low volcanic hills, comprehending a large extent of dry pasture-ground, without trees or habitations, but thickly studded with shapeless remains of buildings. Though naturally fertile, and once productive, yet under the joint influence of neglect, social disorganisation, and malaria, the district has degenerated largely into a desert, one of the least-peopled portions of the peninsula, which the traveller would refrain from entering but for associations with the past, and the attractions of the Eternal City. In the extreme south are the Pontine Marshes, which extend about twenty-four miles along the coast, by six in breadth, formed by a number of streams which have no sufficient outlet, or descent adequate to carry off their waters. Attempts at the drainage have been often made, but not with much success, and the whole tract is highly insalubrious. The Pontifical Territory contains only a population of 690,000, all of whom are impatient of their political condition, except clergy, mercenaries, and brigands.

*Rome* (Ital. *Roma*), the mistress of the ancient world, the capital of Papal Christendom, and the proper metropolis of Italy, is situated on both banks of the Tiber, about sixteen miles above its mouth, in latitude  $41^{\circ} 50'$  north, longitude  $12^{\circ} 30'$  east, and contains a population of 197,000. The river is narrow, but deep, rapid, and turbid; and has the greater part of the city on the left or east bank. Its densest portion extends over the old Campus Martius, and three of the renowned Seven Hills, the other four, or the Palatine, Esquiline, Caelian, and Aventine Mounts, being comparatively deserted sites. The walls, which have a circuit of fifteen miles, include a large extent of ground consisting of public fields, gardens, and vineyards, interspersed with ruins. The Corso, the principal street, long and spacious, and a few other places, are scenes of bustle. But most of the thoroughfares are winding, narrow, dirty, and unpaved. Miserable dwellings often appear close beside

the finest palaces; which, with the mouldering remains of bygone grandeur, render many parts of Rome peculiarly sad and desolate. But highly picturesque are the ruins often rendered by intermingling groves of cypresses and pomegranates, overspreading fig-trees, while ivy twines around broken columns, clusters of rich grapes hang from imperial archways, and bowers of roses serve

\* To gild Destruction with a smile, and beautify Decay.

On the right bank of the river are the Vatican, St Peter's, and the Castle of St Angelo. The former, the winter residence of the popes, is an immense pile of more than 4000 halls, chambers, and galleries, besides courts and gardens. It contains a celebrated library of 100,000 volumes, with 23,000 manuscripts, in almost all languages, and rich collections of ancient and modern art. In summer, the unhealthy season, the Papal residence is a palace on the ancient Quirinal Mount, or a country-seat among the hills. The Cathedral of St Peter's, adjoining the Vatican, is the largest of all temples dedicated to religion, and without a rival in its internal decorations, though considered by many inferior to St Paul's in outward appearance. But the distinction of being the metropolitan church belongs to that of St John Lateran, in which the popes are crowned, and of which they are the official ministers. So numerous are the churches, that it has been boasted the pontiff might say mass in a different one every day in the year. But many are either constantly closed, or only opened once a year on a festival-day. About eighty palaces are enumerated. The Protestant burying-ground, on the southern side of the city, close to the walls and the pyramid of Caius Cestius, contains the graves of many English, who are always numerous as art students or winter residents, with other foreigners. The English church occupies a site adjacent, but outside the gate of San Paulo. Rome is the seat of a university, one of the oldest in Europe, founded in 1244, well attended, with an astronomical observatory of distinction attached to it.

Ponte Lugano.

The Campagna, for a wide space round Rome, consists of undulating prairies, green and fertile in the extreme. At a distance it appears to be a vast level surface, but this surface is full of sudden depressions, and it is traversed by numerous water-courses, as at Ponte Lugano on the Via Tiburtina. The monuments of imperial times, more or less ruined, include the Colosseum or Flavian amphitheatre, commenced by Vespasian and completed by Titus; the column of Trajan, erected by the senate in honour of his Dacian victories; the arch of Titus, commemorating his conquest of Judea; the arch of Septimius Severus, a memorial of his successes against the Parthians; the baths of Diocletian, Titus, and Caracalla; the Pantheon, most beautiful of heathen fanes, converted into a Christian church; and the arch of Constantine, raised upon the occasion of his becoming sole emperor of the west. The most remarkable of these, the Colosseum, near the centre of the ancient city, but beyond the range of the modern dwellings, is an oval building, more than one-third of a mile in circuit, 157 feet in height, the remains of which form a gigantic monument of power and barbarity. A crucifix now occupies the centre, and extends its guardianship over the pile, while noble walls have been built to sustain the tottering portions of the fabric, tangled with grass and shrubs. It encloses an area of five acres, capable of containing 80,000 spectators of the cruel sports of the circus. 'Of all that Rome includes it should be seen alone, and by moonlight. No other human

monument speaks so strongly to the moral sense of man. The deep and lonely silence of the moonlight hour within its vast walls is broken only by the chirping of the solitary cricket in the grass of that arena which has resounded with the shrieks of human beings, the wild yells of ferocious beasts tearing them, and the acclamations of 80,000 spectators rejoicing in the butchery.' This mighty fragment is immediately eastward of the Palatine, the most famous of the Seven Hills, site of the palaces of the Caesars, nearly the whole of which belongs by purchase to the Emperor of the French, whose agents have made extensive excavations, and been rewarded by the discovery of many antiquities.

Great interest belongs to subterranean Rome, or the Catacombs, which served as places of refuge and worship for the early Christians in times of persecution, and also of burial. They consist of gloomy underground galleries formed in quarrying materials to extend the ancient city, and also in obtaining pozzuolana for cement. These galleries turn and twist in the most capricious manner, have a total extent of several miles, but can only now be very partially explored owing to obstructions from the falling in of the roofs and sides. The passages are generally about eight feet high and five wide. Three tiers of cells, used as graves, run along them on either hand; and at certain intervals, several passages opening into one another form large vaulted chambers with a church-like appearance. The Catacombs, after remaining long neglected and almost forgotten, were re-opened in the fifteenth century, and examined by Bosio and other antiquaries. Their most interesting inscriptions, sepulchral tablets, bas-reliefs, and other monuments, are in the museums of Rome, and principally in the Galleria Lapidaria of the Vatican.

*Ostia*, the port of ancient Rome, on the southern branch into which the Tiber divides at its mouth, is now comparatively deserted from the unhealthiness of the site. *Terracina*, on the southern border of the Pontine Marshes, is a small fishing town scourged by malaria. *Civita Vecchia*, the principal port, forty miles northwest of the capital, connected with it by railway, contains 10,000 inhabitants. It is of importance as the portal through which most travellers enter Southern Italy, regularly touched at by the steamers passing to and fro between Naples and Marseille, and the station of the French government packets communicating with the French troops in Rome. Among the inland towns, somewhat larger, are *Viterbo*, an episcopal see, in the northern part of the province; and *Velletri*, in the southern, which represents the ancient Velitrae where Augustus was born, 63 B.C. *Tivoli*, eighteen miles eastward of Rome, is delightfully seated in the valley of the Teverone, of interest from its picturesque cascade and classic ruins, comprising fine remains of the temple of Vesta, with those of the villas of Mecenas and the Emperor Hadrian.

Falls of Tivoli.

Grand Canal, Venice.

### III. AUSTRIAN ITALY.

VENETIA, a province of the Austrian Empire, held by a precarious tenure, embraces a north-eastern section of the mainland, lying between the Tyrol and the Adriatic, and divided from the remainder of Italy by the lower course of the Po and the stream of the Mincio, one of its principal affluents. The territory thus enclosed has an area of 9500 square miles, with a strikingly-contrasted superficial aspect. On the northern border rise the Alps, which throw spurs far into the interior, with deep and beautiful valleys between them; but from thence to the sea and the river frontier, the country is a low and level plain, finely fertile and highly cultivated. Besides the bounding rivers, it is watered by the Adige, the Brenta, the Piave, and the Tagliamento, but, as in Lombardy, the inland water-communication is chiefly carried on by means of canals. The streams are generally rapid, loaded with sediment, which, by deposition in the course of ages, has advanced the shores in various places, or fringed them with low islands enclosing lagoons. The whole of the maritime district, with a considerable interior territory, formed the celebrated republic of Venice, which originated in the fifth century with refugees from the incursions of the terrible Attila, who fled for safety to the marshes and islets of the coast. It gradually rose in the middle ages to be the first maritime and commercial power in the world, acquired extensive foreign possessions, and was courted for its wealth and influence by all the leading states of Europe. But the chief-magistrate, or doge (a corruption of *dux*, 'duke'), at first popularly elected, became eventually the puppet of an oligarchy, arbitrary in their measures, secret in their counsels, guilty of every species of terrorism,

espionage, and bad government. After a long interval of decline, the independence of the nominal republic was terminated by the arms of Napoleon I., and upon his overthrow the territory was formally annexed to the Austrian possessions by the Congress of Vienna. For half a century, subject to a brief interruption, the proper natives have been treated by their foreign masters in much the same despotic manner as the powerful among their forefathers dealt with the humbler and defenceless classes of their countrymen. Venetia has a population of 2,446,000.

*Venice*, situated on the north-western side of the Adriatic, containing a population of 118,000, is one of the most remarkable and interesting cities in the world. It occupies a cluster of seventy-two small low islands, in the midst of a shallow lagoon, or salt-water lake, separated generally from the sea by a long narrow bar of firm sand, but communicating with it by passages through the barrier, the principal of which are guarded by strong fortifications. On the side of the mainland the lagoon is now crossed by an immense railway bridge, of more than 200 arches, which links the city with the continent, and renders the otherwise pertinent description in one point inaccurate:

'The sea is in the broad, the narrow streets,  
Ebbing and flowing; and the salt sea-weed  
Clings to the marble of her palaces.  
No track of men, no footsteps to and fro,  
Lead to her gates. The path lies o'er the sea,  
Invincible; and from the land we went,  
As to a floating city—steering in,  
And gliding up her streets as in a dream.'

In all other respects the poetical description is accurate. The salt water penetrates every part of the strangely-situated city. The channels separating the islets are now canals, crossed by a multitude of steep bridges, and answer the purpose of streets, while gondolas serve as substitutes for carriages and cabs. No natural land is visible, owing to the close clustering of the buildings. Hence it has been remarked that there might be natives wholly unacquainted with meadows and cornfields, the lark's song, and the varied scenes of rural life. There are indeed streets, properly so called, and every dwelling may be reached on foot. But they are not wider than twelve feet from house to house, and mostly much narrower, so that locomotion is chiefly carried on by water. The change of level in the water-streets from the ebb and flow is very regular, and amounts to a fall and rise of from two to three feet. Spring-time is the most suitable season for a visit to Venice, when there are no stonches from the canals, or mosquitoes astir, as during the summer heats, and no bitterly cold winds from the snow-crowned Alps, which are common during the winter months. But a visit has at any period its disagreeables in the presence of artillery, foreign troops, and police spies. Among the citizens, the annual number of deaths has long largely exceeded that of the births, from the young and enterprising quitting the place, whenever it has been practicable, to settle permanently beyond Austrian rule. An enormous taxation, and the risk of arrest for an incautious expression, are everywhere powerful motives to emigration.

The great square of St Mark, the patron saint, in the heart of the city, is the first spot to which the

Church of Santa Maria Gloriosa dei Frari, Venice.

stranger usually repairs, and to which he most frequently returns. The cathedral occupies one side, a singular but brilliant combination of the Gothic and Oriental styles, with a lofty detached Campanile or bell-tower, and the celebrated bronze horses obtained as plunder at the sack of Constantinople in the fourth Crusade. Over elaborately-ornamented pedestals in front of the church, three gonfalons of silk and gold once waved to the breeze, symbolising the triple dominions of the old republic—Venice, Cyprus, and the Morea. The former palace of the doges, their actual residence down to the close of the sixteenth century, subsequently appropriated to offices of government, forms the east side of an adjoining oblong area. Portraits of them compose a long frieze round the hall of the grand council, with one space left blank, where that of Marino Falieri should have appeared, beheaded for treason in 1355. Angelo Participazio, the first doge, in 809, was followed by seventy-one successors in the dignity down to October 1797, when Manin, who closed the long line of magnates, had to take the oath of allegiance to a foreign power. Behind the ducal palace, a bridge over a narrow canal connects it with the state prisons, across which criminals condemned to die were led to hear their sentences read. Hence its name :

‘I stood in Venice on the Bridge of Sighs,  
A palace and a prison on each hand.’

The city retains its arsenal and dockyard, surrounded by battlemented walls about two miles in circuit, in which 16,000 workmen were once employed upon the armaments of the republic. This place now tells a story of departed glory, being more of a storehouse and museum than devoted to ship-building and launches. The same tale is told by the aspect of many a palace, and the condition of many a long ennobled family.

*Padua*, twenty-three miles west of Venice, connected with it by railway, is a fine ancient city of 53,500 inhabitants, the seat of a university possessing the oldest anatomical and botanic garden in Europe. Galileo was associated with it as professor of mathematics; Tasso, Columbus, and Gustavus Adolphus as students. Passing *Vicenza*, on the north-west, a silk-manufacturing town, of which the architect, Palladio, was a native, the railway leads to *Verona*, which contains a population of 59,000, noted for its dyeing, silk-works, beautiful situation, military importance, and historical interest. It stands upon both banks of the rapid Adige, subject to floods which are occasionally very destructive. The surrounding landscape is dotted with cypresses, villas, and old feudal castles, while the blue hills and mountains of the Alps form the northern background, from which the breeze comes always fresh, and sometimes biting. The city is remarkable for its magnificent monuments of ancient days, consisting of Roman gateways, and a nearly perfect amphitheatre still used for horsemanship, fireworks, and other popular exhibitions. It has an enduring hold upon remembrance as the locality of Shakspeare's *Romeo and Juliet*. The celebrated quadrilateral, the strength of which induced Napoleon III., in 1859, to propose the peace of Villafranca, has Verona at the north-east angle, Legnago at the south-east, Peschiera at the north-west, and Mantua at the south-west, all strongly fortified. The two former command the line of the Adige, and the two latter that of the Mincio. *Mantua*, the native place of Virgil, is surrounded with lakes and marshes which add considerably to the strength of its defensive works. It succumbed to the arms of the first Napoleon in 1796, but only in the prospect of famine, after a long and severe blockade. The place has under 30,000 inhabitants, and exhibits a decaying aspect, the grass growing in the streets at the outskirts. *Chioggia*, on an island in the lagoon of Venice, south of the city, is a fortified seaport with considerable commerce. *Treviso*, inland, on the north, surrounded with elegant villas, and containing many handsome buildings, has varied manufactures of silk, cloth, paper, and cutlery. *Bassano*, on the north-west, seated on the Brenta, and enclosed with beautiful environs, produces the finer straw-hats, and has its name connected with the defeat of the Austrians by Napoleon in the campaign of 1796. *Udine*, close to the eastern frontier of Austrian Italy, is a flourishing industrial town, with good public buildings, and one of the most beautiful cemeteries in Europe.

Italy contains a total population of rather more than 25,000,000, destined shortly in all likelihood to form a single political body, by the Papal and Austrian territories being wrested from their present rulers, and annexed to the Italian Kingdom. The people are a very mixed race, descended from aboriginal inhabitants and the foreigners who have at different times poured into the country as colonists and conquerors, Greeks, Gauls, Goths, Arabs, and others, moulded by time into general homogeneousness, corresponding in personal appearance, habits, tastes, and temperament. Their language, a branch of the Græco-Latin family, soft and musical, is based mainly upon the ancient Latin. It is distinguished by a great number of dialects, very widely differing from each other, caused by the different infusion of foreign elements in particular districts; long-standing political divisions, and varying interests. The Tuscan is considered to be the purest and most harmonious idiom. It is consequently the language of the educated classes, irrespective of locality, and has been for a long period the ordinary vehicle of literature. The list of the great painters includes Raphael, Titian, Correggio, Caracci, Guido, Paolo Veronese, Leonardo da Vinci, and Salvator Rosa; of the sculptors, Michael Angelo and Canova;

of the poets, Dante, Petrarch, Ariosto, Tasso, Metastasio, and Alfieri; of the natural philosophers, Galileo, Torricelli, Volta, and Galvani.

The Roman Catholic religion is almost universal. Nowhere are the churches so splendid, the ceremonies so pompous, and the clergy so numerous; but whatever reverence may be paid by the people to the rites of the church, its official ministers have not secured their good-will, but are personally viewed with aversion. Except in Piedmont, and to a less extent in Lombardy and Tuscany, public education is neglected, and the popular ignorance is deplorable. The Italians are generally a handsome and lively race, of quick apprehensions, marked by strong passions, enthusiasts in the fine arts, but regardless of moral restraints, of indolent temperament, especially in the south, where indifference to household comforts has been grafted upon the bounty of nature. Many blemishes of the national character may be traced to the despotisms which so long prohibited the exercise of the understanding on public affairs, and consigned high and low alike to political slavery. Whether constitutionalism will remove the blots, and make the social and moral condition of society in some degree reflect the brightness of the skies and the beauty of the landscapes, is a problem for the future to solve.

Whit-Sunday Fête at Naples.

Constantinople, from the Cemetery of Galata.

## CHAPTER IV.

### EUROPEAN TURKEY.

THE Turkish Empire is the only sovereign state in Europe which professes Mohammedanism, and the only one which embraces within its limits an extensive area in each great division of the mainland in the Western Hemisphere. It includes a large portion of Southern Europe, of Western Asia, and of Northern Africa—countries which are among the best situated, most beautiful, most naturally fertile, and historically renowned of the continents to which they belong. It is washed by the waters of seven seas, the Mediterranean, the Adriatic, the Ægean or Archipelago, the Sea of Marmora, the Black Sea, the Red Sea, and a small part of the Persian Gulf. The empire has the name of Ottoman from its founder Othman or Osman, at the commencement of the fourteenth century; and the dominant race invariably style themselves after him Ottomans or Osmanli, rejecting the name of Turks with disdain as synonymous with barbarian. The first ruler, a shepherd, freebooter, and warrior, confirmed his power over the north-west of Asia Minor, and bequeathed his double-pointed sword to his successors, with which, as the recognised symbol of sovereignty, they have been girded on ascending the throne—a ceremony now performed in the Mosque of Eyub at Constantinople. Their sway became European as well as Asiatic under Amurath I., who captured Adrianople in 1361, and

made it his capital. Under Selim I., in 1517, it became African likewise by the conquest of Egypt, to which the next two sultans, Soliman the Magnificent and Selim II., added Tunis and Tripoli. But all the African territories, and some of the European, though acknowledging subordination to the imperial government, are very slightly connected with it, having affairs of internal economy completely under the control of native authorities; and hence far more closely resemble separate states than provincial dependencies.

Turkey in Europe consists of the greater part of its south-eastern peninsula, and an adjoining portion of the main mass of the continent, embraced between latitude  $39^{\circ}$  and  $48^{\circ} 20'$  north, longitude  $15^{\circ} 40'$  and  $30^{\circ}$  east, with the large island of Candia, and several others of small dimensions. The Hungarian provinces of Austria and part of Russia form the boundary on the north; the Black Sea lies on the east; the Archipelago and the kingdom of Greece are on the south; the Mediterranean, the Adriatic, and Austrian Dalmatia on the west. Within these limits, the greatest extent is east and west, about 700 miles, between the mouths of the Danube and Western Croatia; the extreme distance north and south is nearly the same; but the average length and breadth are considerably less, owing to the southerly contraction of the peninsula. The area of the country comprises rather more than 200,000 square miles. On the west, the coast-line stretches from the Castle of St Stephens, below Cattaro, in Dalmatia, to the sandy promontory of La Punta, at the south entrance of the Gulf of Arta, of celebrity as the scene of the naval battle of Actium between Augustus and Mark Antony, 31 B.C., which secured to the former the dominion of the Roman world. On the east, the maritime frontier extends from the northernmost mouth of the Danube to the Gulf of Volo, and makes a close approach to the shores of Asia at the channel of Constantinople, or the old Thracian Bosphorus, and at the famous strait of the Dardanelles, the Hellespont of early times. Between the two straits is the Propontis of the ancients, a small, deep, and beautiful expanse of water, now called the Sea of Marmora, from an island of that name situated in it, celebrated for its marble. These narrow waters have been the scene of great military and commercial movements, from a period long anterior to the Christian era to the present day. They were crossed by the armies of Darius and Xerxes intent upon the invasion of the west, and by that of Alexander contemplating the conquest of the east, while they were navigated by vessels freighted with corn for Athens. In the middle ages they were traversed by the merchant-galleys of Venice, Genoa, and Pisa, till the Turks established their dominion on both sides of the channel, and closed the entrance to the flags of the western nations. In our own time, their waves have borne one of the mightiest armaments ever collected, British, French, and Sardinian, despatched to preserve the Ottoman rule on the soil of Europe, to expel which, four centuries ago, conclaves were held and crusades projected—a striking, but not uncommon, instance of revolution in public policy.

The interior of Turkey has for its principal superficial feature an extensive central nucleus of highlands and plateaus, under the meridian of 21 degrees, which culminate in the peak of Tshar-dagh, covered with snow nearly all the year; and form a kind of mountain-knot, from which various ranges diverge in different directions. North-westward stretch the Dinaric Alps, which join the great Alpine system of Europe. Eastward, the chain of the Balkan, ancient *Hemus*, extends to the bold headland of Cape Emeneh, on the shore of the Black Sea. South-eastward, a loftier ridge, the Despoto-dagh, runs into the plains which border the north coasts of the Archipelago. Southward, the range of Pindus follows the direction of the peninsula into Greece, of which, the classical mountains, Olympus, Pelion, and Ossa are offsets on the Gulf of Salonica. These chains, to a

considerable extent, render communication between contiguous provinces rare and difficult in a country where art has not been employed to soften the features of nature owing to the apathy of the present inhabitants; and where the engineering works of its ancient

masters—Greek and Roman—have suffered largely from the ravages of war as well as from the dilapidations of time, with scarcely an effort to repair them. The only route across the Balkan to which much attention is paid, is on the line of communication between Constantinople and Vienna, which bears the name of *Porta Trajani*, in memory of the emperor who rendered the pass a practicable thoroughfare. A few of the Turkish mountains attain the elevation of from 9000 to near 10,000 feet, as Olympus, the loftiest, 9754 feet; but they are generally much below that altitude. The lowlands are chiefly maritime, and are not separately of any great extent, except on the north-east, where vast marshy levels lie on both sides of the Lower Danube.

The Balkan Mountains, protecting the heart of the country, are of great importance as a line of military defence in the event of invasion from the north. They form an undulating range separating Roumelia from Bulgaria; and the waters which flow to the Archipelago from those which fall into the Danube. Their height gradually diminishes from west to east. Towards the Black Sea it is inconsiderable, and here the fortified positions of Shumla and Varna close three of the passes. In the opposite direction it rarely exceeds 4000 feet. Mount Merrikon, the culminating-point, rises 6395 feet, and does not lose its snow at the summit till the summer is somewhat advanced. The tops and sides of the chain are clothed with thick woods through almost the whole of its course, and it is only along the declivities of valleys and gorges that any extent of bare rock appears. A range of hills along the base, intersected with ravines, is also so densely covered with brushwood as to be scarcely penetrable. The difficulty of leading an invading army across these mountains is not owing to the height of the passes; the forests are the chief obstacles, with the want of roads better than the rudest mule-paths. When the Russians, under Marshal Diebitsch, effected the passage in July 1829, pioneers were sent in advance to hew ways through the woods and jungle. The soldiers marched in caps, linen trousers, and uniform. Each carried a knapsack containing provisions for ten days, and a change of linen. Baggage of every other kind was left behind. The Turks themselves rendered this operation successful, Varna having been surrendered by the treachery of the governor, while, as if bewildered by its audacity, not a hand was lifted to oppose the passage of the enemy. Yet, under these favourable circumstances, it was with extreme difficulty, after the lapse of a month, that a remnant of the invaders staggered on to Adrianople; and had not their commander carefully masked the condition of his troops, and the infatuation of his opponents blinded them, they would only have accomplished the feat to become prisoners of war. The Russian line of march was by the defiles parallel to the sea-coast from Iowan Derwish to Misivria; which seems to have been the route taken, but inversely from south to north, by Darius. Alexander probably forced one of the westerly passes. He found the barbarians in arms to defend their mountains. They were strongly posted on the summit of a steep acclivity, guarded by precipices on each side. Their front was protected by a line of wagons which served as a rampart, and were also intended to be rolled down so as to break the phalanx as it advanced up the height. But anticipating this design, the general provided against it. On seeing the machines put in motion, the

phalanx opened its ranks, where the ground admitted of the operation, and where it was impracticable, the soldiers lay down under the shelter of their interlinked shields. Thus the vehicles either passed harmlessly through the spaces suddenly opened to admit them, or with little injury rolled over the bodies of the troops defended by a solid brazen canopy.

The northern provinces are watered by the Danube, which receives many important tributaries from each, the Morava from Servia, the Isker from Bulgaria, the Aluta and Jalomnitz from Wallachia, the Sereth and Pruth from Moldavia. This noble stream has long been navigated by rafts similar to those of the Rhine, and is now, by steamers, an important channel of communication between Turkey and the rest of Europe. It acquires great expansion at intervals, and is often split into several channels by numerous small islands, which, with the occurrence of sand-banks and rapids, render the navigation intricate. Soon after reaching the Wallachian frontier, the river enters the Iron Gate, a defile bordered on both sides by steep and lofty cliffs, which contract its bed, and encumber it with rocks. The confined waters rush through the pass with great violence, and form a succession of rapids. Towards its termination, the aspect of the stream is remarkably different—as unpicturesque as possible. It flows through a vast flat of swampy ground, covered with bulrushes, of which pelicans and other large birds, frogs and reptiles, are almost the only inhabitants, but is rife with mosquitoes in hot weather, and choked with immense accumulations of mud and sand. The course of the Danube is singularly

Sulina Mouth of the Danube.

tortuous through the Turkish dominions. After a long curving sweep from west to east, it approaches to within forty miles of Kustendij on the Black Sea, then makes a great bend to the north, turns again to the east, and adds nearly 200 miles to its length by this detour. It finally discharges by three principal channels—the northern, called Kilia; the central or the Sulina; and the southern or St George's. The two former are the most used by shipping, but both are much obstructed by sand-bars, and the temporary or permanent stranding of vessels on them is a common incident. Since the year 1858, under the auspices of a commission constituted in pursuance of the Treaty of Paris at the close of

the Russo-Turkish war, the Sulina mouth has been much improved. The peninsula formed by the great northern bend is the Dobrudscha, a well-known swampy and pestilential tract, formerly crossed by an embankment, traces of which remain, under the name of Trajan's Wall. A railway now intersects it, connecting Tchernavado on the Danube with the port of Kustendij, by means of which passengers are spared the most tedious part of the river navigation. Rivers are numerous in other parts of the country, but are not of important size, or of much navigable value. Some of classical interest are reduced to threads in the summer heat. The Maritza, ancient *Hebrus*; the Struma or *Strymon*, which anciently formed the boundary between Macedonia and Thrace; the Vardar or *Axius*, and the Salembria or *Peneus*, flow into the Archipelago; and a considerable number with short courses descend from the mountains westward into the Adriatic. The Lakes of Scutari, Ochrida, and Janina are spacious expanses in the highland region of Albania.

Great diversity marks the climate, owing to the varying elevation and exposure of the surface. On the extensive plains of the Lower Danube the winters are intensely cold, and the summers correspondingly hot. The Romans were astonished at the severity of the former season in this region. In the age of Augustus, the poet Ovid, banished from Rome by the edict of the emperor, and ordered to reside at Tomi, a colony near the mouth of the river, had some years' acquaintance with the spot, then on the confines of civilisation. Poetical epistles sent home to his friends are crowded with complaints of everything—the land, water, and sky—the air, the people, and especially the winter. 'The snow lies deep; and as it lies, neither sun nor rain can melt it. Boreas hardens it, and makes it endure for ever. Hence, when the former ice has not yet melted, fresh succeeds, and in many a place it is wont to last for two years. I have seen the vast sea frozen with ice, and a slippery crust covered over the unmoved waters. To have seen it is not enough. I have trod upon the hardened ocean, and the surface of the water was under my feet, not wetted by it.' The thermometer now sometimes descends to 15 degrees below zero, and the sledge is used for travelling. But probably in former times the winter was in more violent antagonism to the summer than at present. Only the most northerly ports of the Black Sea are now annually ice-bound; but in 401 A.D., large tracts of it were strongly frozen, and when the weather broke up, such mountains of ice drifted by Constantinople that the inhabitants were terrified. In the reign of Constantine Copronymus also, people walked across the Bosphorus on the ice, from the European to the Asiatic shore. Either of these events would now be quite a phenomenon. At Constantinople the mean annual temperature is lower than that of places in Italy and Spain at the same latitude; and great changes are suddenly experienced from the shifting of the wind to opposite quarters, north and south. But in all the inland districts south of the Balkan, except at high elevations, and on the shores both of the Archipelago and Adriatic, the climate is delightful, and the vegetation has a southern luxuriance.

The northern provinces have extensive woodlands: whole forests of apple, pear, cherry, and apricot trees, with the oak, beech, lime, and ash. South of the mountains, these trees are confined to their slopes, while the lowlands are clothed with the almond, walnut, chestnut, maple, and mulberry, cypresses, and sycamores of enormous dimensions, besides the myrtle, laurel, box, and other evergreens. In spring the surface is gay with flowers, among which the narcissus, violet, and hyacinth appear in profusion, with gardens of roses, jasmine, and wild lilac. In the extreme south the olive becomes the most common fruit-tree, while the orange and fig are abundant. The vine is grown generally, but the grapes raised on the banks of the Danube are far inferior to those grown on the coasts of the Archipelago. In Bosnia the plum takes its place, and a favourite beverage, *slivovitza*, is made from its juice. Melons, cucumbers, peas, beans,

and cabbages, which form a principal part of the ordinary food of the Turks, are raised in great quantities; but some of our common vegetables are scarcely known, and the potato has a very restricted cultivation. The grain crops—maize, wheat, rye, barley, and millet—are sufficiently abundant, not only for the home demand, but for exportation, and ten times the produce might be gained by skilful husbandry. Roumelia is one great garden, in which, however, the weeds contend with the fruits of the earth, for the mastery. Rice is grown in the southern provinces, where there are marshy tracts of limited extent; but the supply being insufficient for home consumption, this is the only grain which is imported. Tobacco, flax, hemp, cotton, and silk are other products of the soil. Both agriculture and horticulture are everywhere in a very backward state, the implements being of the rudest description, while the long unsettled state of society has so far checked industrial efforts, that a vast proportion of the surface is not brought under any kind of cultivation. Herds of oxen, flocks of sheep and goats, with bees producing large quantities of wax and honey, constitute the chief wealth of the inhabitants in Wallachia and Moldavia; and, to a less extent, that of the mountaineers in Albania and Bosnia.

For purposes of internal government the country is divided into eyalets or provinces, which are subdivided into districts of smaller dimensions. But Turkey is best known by old geographical divisions, those of Roumelia, Thessaly, and Albania; Montenegro, Bosnia, Herzegovina, and Croatia; Servia, Wallachia, Moldavia, and Bulgaria.

| Divisions.                         | Cities and Towns.   |
|------------------------------------|---|
| Roumelia or Rumili, . . . . .      | Constantinople, Adrianople, Gallipoli, Cavalla, Saloniki. |
| Thessaly, . . . . .                | Larissa, Trikhala.  |
| Albania, . . . . .                 | Janina, Scutari, Durazzo.                                 |
| Montenegro, . . . . .              | Cettigne.   |
| Bosnia, . . . . .                  | Bosna-Serai, Travnik, Novi-Bazar.                         |
| Herzegovina and Croatia, . . . . . | Mostar.   |
| Servia, . . . . .                  | Belgrade, Kragojevatz, Nissa.                             |
| Wallachia, . . . . .               | Bukharest, Giurgevo, Ibrail, Krajova.                     |
| Moldavia, . . . . .                | Jassy, Galatz, Ismail.                                    |
| Bulgaria, . . . . .                | Sophia, Shumla, Varna, Widdin, Silistria.                 |

ROUMELIA comprises the country between the Balkan Mountains on the north and the Archipelago on the south, and corresponds in its limits to ancient Thrace and Macedonia. It contains the capital, and is the only province in which the Turks are found in large compact bodies. The points of natural interest are the shores, particularly those of the two narrow straits, the Bosphorus and the Dardanelles, where the European portion of the empire closely approaches the Asiatic part of the territory.

The Bosphorus connects the Black Sea and the Sea of Marmora. It extends about eighteen miles, between receding and advancing shores, which form seven bays, with corresponding promontories opposite, and cause the breadth to vary from rather less than half a mile to two miles. This fine natural canal is bounded by ranges of undulating hills, crossed at intervals by sloping valleys of delicious verdure, clothed with oriental trees and flowering plants. Being the resort of the wealthy classes from the capital, the sides of the hills are thickly studded with their residences, surrounded with gardens and plantations, in which the orange, plantain, vine, and fig-tree are intermixed with flowers of every hue. On the shores of the Bay of Buyukdere, which lie open to the fresh and cooling breezes of the Black Sea, are the summer palaces of the British, French, and Russian ambassadors, with the Giant's Mountain, the highest hill on the channel, nearly opposite on the Asiatic side. In the midst of these charming retreats, castellated ruins occur here and there, which tell of the struggles and vicissitudes of the past, and give picturesqueness to the beautiful landscape. Nearly midway, at the narrowest part of the strait, are the Castles of Europe and Asia, so called in relation to the continents on which

they stand and also styled the Castles of Roumelia and Anatolia, in allusion to the provinces in which they are situated. The fortifications were erected to secure a point constituted by nature the high-road for both continents, where Darius made his bridge of boats when he marched against the Scythians, and the Ottoman armies crossed in like manner prior to the fall of Constantinople. During the rule of the Janissaries, the Castle of Europe was the prison to which refractory members of that body were committed. An embrasure on the lower rampart is still filled by the large gun, which was fired on the execution of great criminals, to announce the event to the sultan in the capital. The Castle of Asia was the prison of the Bostanjis, or guards of the palace, who were immured or executed within its walls according to the nature of their offences. The term Bosphorus signifies the 'passage of the ox' — *Oxford*.

The channel of the Dardanelles connects the Sea of Marmora with the Archipelago, and has its name primarily from the city of Dardanus, on the Asiatic side. Two forts are at the southern entrance, one in Europe and the other in Asia, called the New Castles; two more, or the Old Castles, are similarly situated about midway through the strait; and between their sites are strong modern fortifications mounting guns of immense calibre. The strait extends about forty miles in length, by a breadth varying from four miles to less than one; and has always a strong current running through it from the Sea of Marmora. Close to the Old Castle on the European side is the barrow of Hecuba, where the Athenians erected a trophy after their victory towards the end of the Peloponnesian war. A

Bosphorus, with Plan of Constantinople.

little to the north, the site of Sestos is usually placed, to which, according to the legend, young Leander nightly swam from Abydos, on the opposite shore, to visit Hero. The breadth of the channel is at this point a mile and a half. Lord Byron performed one part of the exploit, after being an hour and ten minutes in the water, but did not attempt the other part, that of swimming back again. Near the northern extremity of the strait, the Turks effected their first passage into Europe, about a century before the fall of Constantinople. Soliman, the eldest son of the second sultan, having been appointed governor of the province on the opposite Asiatic shore, visited the spot where the populous and wealthy maritime city of Cyzicus had flourished. Its broken columns and marble edifices in ruins, scattered over the turf, filled him with awe and admiration. He loved to wander on the beach, lost in reverie, amid the remains of what seemed wondrous palaces built by the genii of the air. One evening, as he sat wrapped in contemplation, he beheld the pillars and porticoes of the desolate temples of Jupiter, Proserpine, and Cybele reflected by the light of the moon in the tranquil waters, while a few fleecy vapours hung over the waves. It seemed to him as if the city were emerging from the deep, restored to former beauty, girdled with the white sails of its ancient fleet. The murmuring waves and whispering winds broke upon his ear as mysterious voices from invisible beings, while the moon appeared to unite with her beams the opposite coasts of Asia and Europe. Immediately the purpose was formed to have both sides of the strait blended in his own inheritance. With a chosen band, on the following night, he crossed the channel on a raft, and seized the Castle of Tzympe, now Chini, near Gallipoli. In memory of the landing, a rocky strand or mole still bears the name of the Victor's Harbour; and at a little distance, a hill crowned with a scanty ruin is said to be the spot where the Turkish standard was first planted on the shore.

*Constantinople*, the capital of the empire, in latitude  $41^{\circ}$  north, longitude  $28^{\circ} 55'$  east, commemorates by its name the founder, Constantine the Great, the first Christian emperor of the Roman world, who commenced the city on the site of Byzantium, 323 A.D. It fell into the hands of the Turks in 1453, and is invariably called by them Stamboul. No situation can be finer, washed on three sides by gleaming waters, the shores of which are hilly, studded with kiosks, and clothed with the freshest verdure. The city extends over the seven hills and intervening valleys of a triangular-shaped area, at the junction of the Bosphorus with the Sea of Marmora. An arm of the strait, called the Golden Horn, from its beauty and curving outline, which runs inland nearly five miles, forms the harbour. It has depth of water sufficient for the largest men-of-war, close inshore, and space for a thousand sail. The harbour separates the city from the suburb of Galata, the principal seat of commerce, and from that of Pera, which is mainly a continuation of it, the head-quarters of diplomacy, where the ambassadors and consuls reside. Across the Bosphorus is the Asiatic suburb of Scutari, the great rendezvous of caravans bound for inland Asia. Triple walls, rising one above the other, now largely dilapidated, enclose the city proper. Seven gates lead into it from the Sea of Marmora; seven from the Golden Horn; and six from the land. One of the latter, the Top Kapoussi, or Cannon Gate, formerly bore the name of St Romanus, and marks the spot where the last of the Paleologi fell in the defence of his capital, and where his conqueror, Mohammed I., entered.

Though in itself a confused mass of narrow, winding, dirty streets and wooden houses, the appearance of Constantinople at a distance is singularly imposing, as the principal mosques crown the summits of the seven hills; while the surrounding scenery is beautiful in the extreme. From the Seraskier's Tower in the city, or the Tower of Galata, or the heights above Scutari, the eye overlooks a fanciful mixture of domes, minarets, and cypress groves; glittering mosques, ruined aqueducts, and solemn cemeteries; graceful slopes and castled crags; with the windings of the blue and brilliant sea, over which thousands of boats are gliding; while eastward, the grand panorama is bounded by the hills of Mysia and Bithynia, amid which, and above all, rises the lofty head of the snow-crowned Olympus. The principal mosque, that of St Sophia, occupies the summit of the first of the seven hills reckoning from the Bosphorus, and adjoins the Seraglio. It was originally a Christian church, founded by the Emperor Constantine; re-erected in its present form in the reign of Justinian, and has preserved its principal features unaltered during thirteen centuries. It is a huge square building, surmounted with cupolas and a very flat dome, with a beautiful minaret at each of the four corners, added by the Turks, along with some highly-gilded crescents. The interior of the dome is inscribed with the text from the Koran in Arabic characters, 'God is the Light of the Heavens and the Earth.' During the nights of the sacred month Ramazan, this verse is illuminated by a sea of rays from some thousands of lamps. The flooring of the church is of waved marble, in imitation of the rolling of the sea. The interior

is covered with the richest Turkey and Persian carpets, and along the walls are recesses with white curtain screens, where the devout Turk can retire for prayer; while scattered here and there are small raised pulpits, where learned doctors expound the Koran. Six other mosques are dignified with the style of imperial. That of Sultan Achmet I. may be regarded as the Mohammedan cathedral of the city, for to it the sultans generally repair on the great festivals, with the officers of state. The Seraglio, or old imperial palace, a group of structures directly overlooking the Bosphorus, built at different times by successive rulers, was almost completely destroyed by fire in 1863. Its principal entrance, the Gate, where public business was formerly transacted, according to usage with the orientals, originated the name of the Sublime Porte, distinctive of the Turkish court. A new palace, similarly situated, erected by the late sultan, Abdul Medjid, is remarkable for being in the modern classical style, but not without blendings of oriental features.

Fountains are very numerous in the city, sometimes highly ornamental, often inscribed with a verse from the Koran. Baths abound for persons of all classes, with khans or inns for the reception of strangers, homely buildings suited to their purpose; and of coffee-houses there is no lack. Manufactures are chiefly limited to morocco leather, saddlery, shoes, and meerschaums. Trade is carried on in long covered streets of shops, or bazaars, each of which is appropriated to some particular merchandise. These are the principal scenes of life and bustle, along with the harbour, which presents a very animated spectacle, crowded with ships, steamers, and caiques, or wherries which ply for hire. The latter are the ordinary passage-boats of Constantinople, as the gondolas are of Venice. Of these there are said to be not less than 80,000 on the waters in and around the city. They are of extremely light construction, built of thin planks of walnut-wood, polished, carved, and in parts gilt. Skimming the surface of the water, they are easily propelled with wonderful rapidity. The oars have a large bulb or swelling near the handle, the weight of which assists the rower in raising them. Passengers do not sit on cross-benches, but at the bottom upon cushions or carpets. The state-caique, in which the sultan is conveyed to the mosques, is gilt and painted with gandy colours, and has the figure of a large peacock at the prow. Here sits the sword-bearer; while in the stern, beneath a splendid canopy, is the magnate, with his body-guard behind him. The barge is propelled at a very swift rate by twenty-six caiques, or boatmen, in picturesque dresses, pulling a stroke of thirty seconds' interval. Every Friday, the Mohammedan Sabbath, the sultan attends the *namaz*, or noontide prayer, at one of the mosques, with the ministers of state and the great officers of the household. This is a religious duty imposed upon the sovereign for the time being, from which under no pretence, except that of dangerous illness, can he be exempt. About ten o'clock the particular mosque to be visited becomes known; and the road from the water-side is crowded by numbers of the faithful, and of foreigners in the city. The show by water, amid military music and the fire of artillery, is very imposing. Not less so is the spectacle by land, as the chief of Islamism and his grandees proceed slowly on richly-caparisoned steeds led by attendants, while the multitude maintain the most perfect silence. But perhaps the most delightful hours of the sojourner are those devoted to gliding up the winding haven, and visiting the Valley of Sweet Waters, which is only a short walk from its further end. This is a quiet and shady glen, with deep green grass and stately trees, much resorted to by pleasure-parties in the summer season, and occasionally the retreat of the sultan, who has here a kiosk. A stream flows through it in a canal lined with marble, the work of Achmet III., who also laid out the grounds. An enormous plane-tree rises in the centre of the valley, the trunk of which is 47 yards in circumference, while the branches afford a shade for 130 yards around it.

Among the European capitals, Constantinople ranks after London and Paris in the number of its inhabitants. Though not known with certainty, the population is probably not less than 700,000, including that of all the suburbs. After the Turks, the most numerous body are the Armenians, next the Jews, then the Greeks, with a very motley assemblage of Ionians, Germans, Italians, Maltese, Austrians, French, Russians, British, and Americans. What Lady Mary Wortley Montagu wrote at the spot more than a century ago is true of it at present. 'I live in a place,' said she, 'that very well resembles the Tower of Babel. In Pera they speak Turkish, Greek, Hebrew, Armenian, Arabic, Persian, Russian, Slavonian, Wallachian, German, Dutch, Italian, French, Hungarian, English; and what is worse, there are ten of these languages spoken in my own family.' The Turks are chiefly found in the city, though they are numerous also in the suburbs. The Armenians, Jews, and Greeks occupy distinct quarters in the capital, while diffused to some extent through it, and forming a considerable element without the walls. The Turks have their newspapers, of which the *Jerideh Hawadas*, the Record of News, is the most important, conducted by an Englishman. The Armenians have likewise their weekly chronicle, the *Mejmooi Hawadas*, the Collection of News. There is for the English the *Levant Herald*, and for the French the *Journal de Constantinople*.

However intermingled in life, each of the principal nations has a separate resting-place in death; and very extensive, beautiful, and picturesque sites are the cemeteries. The Turks plant the evergreen cypress, *Cupressus sempervirens*, near every new grave, and do not allow it to be employed for the same purpose by the other races. They adopted the practice from the conquered Greeks, who derived it from their ancestors, by whom the tree was considered an emblem of immortality, on account of its reputed longevity, and the durability of the wood. Their cemeteries have become in some instances extensive forest-like tracts, owing to the invariable usage of opening a new grave for every fresh corpse. The common memorials are truncated pillars, surmounted with sculptured representations of the turban or of the fez to distinguish the men; and inscriptions in Arabic letters, generally richly gilt, setting forth the name, titles, and merits of the deceased. The most important burial-grounds on the

European side of the Bosphorus are near Pera and at Eyub, close to the upper extremity of the harbour. But the great home of the dead is on the Asiatic shore, in the immediate vicinity of Scutari, where a magnificent forest slants towards the sea, and stretches away inland for miles, the cypresses of which have grown to an extraordinary size, while multitudes are still in their infancy. It is divided into various parts by alleys running through it, which present at almost every turn picturesque views of land and water. Great numbers of turtle-doves frequent these wooded abodes of departed generations, and hold a joint sway in them with owls and bats. This vast necropolis has been vividly described by the author of *Anastasis*. The Constantinopolitan Turks have a predilection for interment on the Asiatic shore, as the soil that was their fathers previous to the European conquest; the country of the Prophet, and of the cities deemed specially sacred by all true believers, Mecca, Medina, Jerusalem, and Damascus; and owing also to a presentiment that they are doomed one day to be driven out of Europe, when they will have secured their bones from disturbance by the hands of the infidels if buried across the water.

*Adrianople*, the capital of European Turkey from 1366 to 1453, north-west of Constantinople, ranks after it in extent and consequence, containing about 140,000 inhabitants. The name commemorates its founder, the Roman Emperor Hadrian. It stands on a beautiful plain, watered by the Maritza, and celebrated for its plantations of roses, from which a considerable quantity of attar of roses is made. The city is a collection of wooden houses and narrow streets, the latter darkened by projections from the opposite dwellings, and the whole besprinkled with mosques, baths, khans, bazaars, and gardens. Among the bazaars, that of Ali Pasha is remarkable for its size, being 300 yards long, built of alternate red and white bricks, and devoted to the sale of the more costly commodities, as shawls, muslins, and jewellery. Among the forty mosques, that of Sultan Selim is pre-eminent, one of the largest and most beautiful edifices of Mohammedanism, a monument of its founder's partiality for the city. It has four lofty fluted minarets of very elegant construction, ascended by spiral staircases, 1000 windows, and an exterior court paved with large slabs of white marble. Long after Adrianople ceased to be the capital, several of the sultans made it their residence, as Mohammed IV., Mustapha II., and Achmet III., a preference which so exasperated the Janissaries, that it was one considerable cause of the rebellions which led to their suppression. There are several towns of considerable size in this part of the country, but without any features of special interest, except a few on the coast which

Gallipoli.

are historical sites. *Gallipoli*, a port near the northern extremity of the Dardanelles, the Callipolis of ancient geography, is 130 miles west-south-west of Constantinople, and has a shipping trade in corn, wine, and oil, with manufactures of morocco leather. The town was the first European conquest of the Ottomans, and here, during the late Crimean war, the British and French troops first encamped on Turkish soil. In the town and neighbourhood are seen many remains of ancient sculpture and architecture, the most noteworthy of which are the magazine and cellars built by Justinian. *Cavalla*, a small port on the north coast of the Archipelago, is the ancient Neapolis, the landing-place of St Paul on his voyage to Macedonia. Here Mohammed Ali was born, who, after being engaged in its shipping trade, the export of cotton and tobacco, rose to be Pasha

of Egypt, and acquired such power that the intervention of the Western Powers was necessary to prevent him from subverting the Turkish empire. Ten miles inland is the plain which witnessed the memorable defeat of Brutus and Cassius by Augustus and Mark Antony, 42 B.C. A wretched village and a few ruins here represent Philippi, a city founded by Philip of Macedon, the scene of the Apostle's imprisonment, and the first place in Europe where Christianity was proclaimed. *Saloniki*, at the head of the gulf of that name, represents Thessalonica, associated with his life and labours; and now ranks after Adrianople in the number of its population, 70,000, and is next to Constantinople in the extent of its commerce. Monuments go back to primitive Christian times, and to the prior age of Greek and Roman heathenism. It has an imposing appearance from the sea, mosques, minarets, and domes rise up from the shore, tier above tier, to the summit of a hill, capped by a strongly-built citadel. Nearly half the population are Jews, who have a large scholastic establishment, numbering 1000 pupils. Greeks also are numerous. Previous to the Turkish capture of the city under Amurath II. many of the inhabitants left it, and, anticipating the permanent conquest of the country, they settled themselves in other lands. Among these refugees was the celebrated Theodore Gaza, who repaired to Italy, rapidly acquired the Latin language, became rector of the university of Ferrara, and contributed to the revival of letters in Western Europe.

A very remarkable region bounds the Gulf of Saloniki on the eastern side. This is a peninsula projecting into the Archipelago, which forms three minor peninsulas at its termination, advancing like a trident into the sea. The easternmost prong is of great interest, as the *Hagion Oros*, or Holy Mountain of the Greeks, the *Monte Santo* of the Italians, otherwise Mount Athos, the denomination, properly speaking, only of the high peak at the extremity. This minor peninsula is about forty miles in length, and on an average four miles in breadth. It is connected with the larger by a low narrow isthmus, through which Xerxes cut a canal for his fleet, to save some tedious and dangerous navigation, a few traces of which are still distinctly visible. From the isthmus the ground rises in undulations, until it forms a steep central ridge, which runs like a backbone through the entire tract. Towards the southern end it attains an elevation of about 4000 feet, and then, after a slight depression, suddenly throws up the vast conical peak of Mount Athos, 6400 feet high, the base of which is washed on three sides by the sea. Lateral valleys and deep gorges run down from the central ridge to the coast, with magnificent vegetation clothing their slopes. Above are forests of beech and chestnut; below are oaks and plane-trees, with the olive, cyprus, and arbutus, upon which luxuriant creepers have fastened, and hang in festoons from their branches. 'The peak itself,' says a recent visitor, 'is, from its height and solitary position, its conical form and delicate colour, a most impressive mountain. It rises several thousand feet above the region of firs in a steep mass of white marble, which, from exposure to the atmosphere, assumes a faint tender tint of gray, of the strange beauty of which some idea may be formed by those who have seen the dolomite peaks of the Tyrol. I have seen its pyramidal outline from the plains of Troy, nearly 100 miles off, towering up from the horizon, like a vast spirit of the waters, when the rest of the peninsula was concealed below. So great is the distance that it is only visible at sunset, when the faintness of the light allows it to appear. From its isolated position, it is a centre of attraction to the storms in the north of the *Ægean*; in consequence of which the Greek sailors have so great a dread of rounding it in winter, that it would be no unreasonable speculation for an enterprising government to renew the work of Xerxes.' Mount Athos was one of the stations of the fire-beacons which carried Agamemnon's telegram to Clytemnestra. The architect Dinocrates proposed to carve the huge peak into a statue of Alexander. Pliny reported that when the sun is going down, the shadow of the mountain stretched as far as Myrrhina in Lemnos; and the island of Skiathos is stated to derive its name from the fact that at the summer solstice, at sunrise, the shadow is projected to it over the intervening sea.

From a remote period this singular peninsula has been occupied by a large number of Greek monks, who discreetly came to terms with the sultans, prior to the conquest of Constantinople, and have ever since been tolerated in the exclusive possession of the territory, on payment of a tax (£4000 per annum), which a Turkish officer, the only Mohammedan within its bounds, collects. There are twenty monasteries, most of which have fine sea-views, and have far more the appearance of feudal strongholds than religious houses. They have libraries stored with manuscripts, abandoned to dust and neglect, from which hopes have been entertained, but have not yet been realised, of the recovery of literary treasures supposed to be lost. In the middle ages Mount Athos was the centre of Greek learning, and of Byzantine art. The monks, who follow the rule of Basilus, number about 8000. The general interests of the communities are governed by a representative body, with an annually elected president at its head, who has the style during his term of office of the 'First Man of Athos.' No woman is allowed on any account to step into the district; and the restriction is extended to female creatures of every kind. Not a hen, cow, sow, mare, or she-cat is tolerated; but all the monasteries have huge tom-cats, procured of course from the outlying world. Visitors who pass the night in the dormitories have unquestionable evidence of the fact that certain insects defy the prohibition, breed and multiply in alarming numbers to the disturbance of all rest. The communities are kept up by the admission of members from without, and as some of these have entered the peninsula in very early life, and have never quitted it, the image of womankind has faded completely from recollection. Mr Bowen, in 1850, was gravely asked by one of the fraternity: 'What sort of human creatures are women?' It was elicited from the inquirer that he had seen only his mother, and had forgotten even her appearance, as he had been placed when four years old under the care of an uncle in one of the monasteries, and had not since mingled with the outer world, a period of twenty-four years. The monks never eat meat, but subsist on fish, fruit, and vegetables. They are

engaged in agriculture, gardening, and the care of bees; and a considerable trade is carried on in amulets, images, crucifixes, and small articles of furniture, all of their own manufacture. These are also the pursuits of a fluctuating body of seculars, who seldom amount to less than 3000. They form the population of Karyæes, or 'The Hazels,' the only village in the district, centrally situated in the midst of gardens and vineyards, and certainly the only place in the world with the resemblance of a town where no marriage is celebrated, no birth occurs, the inhabitants being all bachelors. Here resides the Turkish officer who collects the annual tribute for the government, but even he is not allowed to have his wife with him. Once a year, on the festival of the Transfiguration, some of the monks go up Mount Athos, and celebrate mass at the summit. The peak rises to so sharp a point as only to have room for a little chapel on one side, from which the crags descend in tremendous precipices, and for a small platform on the other, a few feet wide, from which again the cliffs fall away rapidly.

THESSALY, on the western side of the Archipelago, is a spacious and luxuriant basin-shaped plain surrounded with grand highland barriers. On the north rise the Cambunian Mountains, on the west is the chain of Pindus, on the south are the ridges of Othrys and Ceta, on the east lies the sea, with the bold forms of Pelion and Ossa. At the north-east corner, the encircling heights are broken by the Vale of Tempe, which affords the only road from the plain northwards, which does not lead over a mountain-pass. This spot, so renowned for its beauty, is not a valley but a defile, separating the masses of Olympus and Ossa, through which the Salembria or Peneus flows to the Archipelago. It is about five miles long, lined on both sides with towering precipitous cliffs, which alternately advance and retreat, and leave only room for a narrow passage on the right bank of the stream, in the formation of which the rocks at various points have been cut away. The scenery has recalled the remembrance of Killiecrankie in Scotland and Dovedale in Derbyshire, but is upon a much grander scale. Ledges of the cliffs are covered with wood, and wherever space is afforded by the water-side, ivy-clad planes, oaks, and other forest-trees appear, of very remarkable size, which throw their branches over the river, and at intervals almost hide it from view. Mount Olympus, famous in antiquity as the fabled habitation of the gods, where Jupiter sat shrouded in mists and clouds from the eyes of mortals, rises to the height of 9754 feet. Fine woods of chestnut, beech, oak, and plane clothe the lower slopes, and dark forests of pines the upper. The brow is bare, and scarcely ever entirely free from snow. Once a year, on St John's Day, the 24th of June, some Greek priests from the neighbourhood go up to a small chapel near the highest point to perform mass.

*Larissa* (Turk. *Yenitschir*), the chief town of Thessaly, is delightfully situated towards the centre of the plain, environed with groves of oranges, lemons, citrons, and pomegranates, from which arise the slender and dazlingly white minarets of numerous mosques. It carries on an important transit-trade, with manufactures of silk and cotton goods, and Turkey-red dye-works. Population, 25,000. Twenty miles to the south, *Fersala*, a small place, represents Pharsalus, where Pompey was overthrown by Cæsar, 48 B.C., and did not rein in his steed in fleeing from the battle-field until he gained the Vale of Tempe. The Thessalian plain is still as celebrated for its breed of horses as when Alexander the Great received his famous charger, Bucephalus, from its pastures.

Remarkable monasteries, at Meteora, occupy a high lying valley on the eastern slope of the range of Pindus. Here a number of isolated rocks occur, which have a character perfectly unique to the eye, as if formed by the art of man, rather than by the more varied and irregular operations of nature. Some are quite conical in shape; others are single pillars of great height and very small diameter; others are nearly rhomboidal, and actually incline over their base; not a few are perfect oblongs, with perpendicular sides and level summits. They rise from the midst of splendid vegetation, which also partly fills up the intervals between them. Their elevation varies from 200 to 300 feet. It is on the tops of these pinnacles and towers, which seem unapproachable by the foot of man, that the religious houses are placed; and in some instances they so entirely cover them, that the precipices descend from every side of the buildings into the deep wooded hollows below. The only mode of gaining access to these aerial dwellings is either by nets in which the visitor is drawn up from above, or by ladders of wood and rope, made in separate joints, and let down over the face of the cliff. Mr Bowen preferred the former method, the least hazardous, though not without its trial to the nerves. 'I fired off a pistol,' he writes, 'to attract the attention of the monks, when long before the echo, reverberated by the cliffs around, had died away over Pindus, two or three cowed heads were thrust out from under the covered platform projecting from the summit of the rock, and which resembles the shed on the top story of a lofty London warehouse. The rope, too, is worked in a similar way, by a pulley and windlass. After reconnoitring us for a moment, and seeing that we were not strong enough to carry

their monastery by a *coup de main*, the monks threw down what seemed to be a strong cabbage-net, lowering at the same time a thick rope, with an iron hook at its end. My guide spread the net on the ground, and I seated myself in it cross-legged. He then gathered the meshes together over my head, and hung them on the hook. The monks above then worked their windlass, and in about three minutes and a half I reached the summit, a distance of between 200 and 300 feet, swinging to and fro in the breeze, and turning like a joint of meat before a slow fire. These remarkable rocks appear to have been known to the ancients, but are supposed to have undergone a considerable change in their size and form within a comparatively recent period. Formerly, twenty-four of the strangely-situated monastic dwellings were numbered, but not half of them exist at present, and only about four or five are inhabited. These are destined to perish in the lapse of time, as the rocks on which they are built are composed of a loose conglomerate, extremely liable to dilapidation and decay.

The province of ALBANIA, on the coast of the Adriatic, answers to the meaning of its name, 'mountain-region,' being traversed by a bold chain from north to south, intersected with gorges of extraordinary grandeur, sometimes gloomy and terrible. Gibbon wrote of this district as 'a country within sight of Italy less known than the interior of America.' But since his day it has been amply illustrated by the descriptive traveller, the classical antiquarian, the landscape painter, and the poet. Agriculture is not much prosecuted in spite of the excellence both of the climate and the soil, but herds of cattle and sheep are numerous, and the olive and mulberry are common. The inhabitants, mostly descended from the ancient Illyrians, mixed with Greeks and Slaves, are as rude as their native hills; of frank bearing, but of haughty, excitable, and vindictive temperament; with a picturesque costume. They are commonly called Arnauts, but they call themselves Skypetars, and generally profess Mohammedanism, but have never been scrupulous in the observance of its precepts, while they have ever been turbulent subjects of the sultan.

*Janina*, in the south, once a large and flourishing city, seated on the shore of a spacious mountain-lake of the same name, recalls to the memory of many European visitors the famous rebel governor Ali Pasha, at the commencement of the century, who made it his capital and stronghold. Commerce and population have both greatly declined. It has numerous mosques and Greek churches, and manufactures gold-brocade, gold-lace, morocco leather, and silk and cotton goods. The temple and grove of Dodona, the most famous oracle of antiquity, destroyed before the Christian era, stood at the south extremity of the lake. *Scutari*, in the north, is at present the principal town, and has considerable manufactures of firearms and cotton goods. *Durazzo*, a small fortified port on a rocky peninsula, is of interest as the Dyrrachium of the Romans, where Pompey was beleaguered by Cæsar, and where passengers ordinarily landed from Brundisium, in Italy, on their way to Greece. Brundisium and Dyrrachium have been appositely styled the Dover and Calais of antiquity.

A small but remarkable territory lies immediately on the north, with the Italian name of MONTENEGRO, but called Kara-tagh by the Turks, and Tzernagora by the natives. The three terms have the same meaning, 'black mountain,' alluding to the dark pine-forests which once almost entirely clothed the surface, some traces of which remain. It is only about sixty miles in length, by rather more than thirty in breadth, and corresponds in its area to that of our county of Westmoreland. The population does not exceed 100,000, all Slavonians, and members of the Greek Church. Yet such is the difficult nature of the country, that this small community, scarcely affording 20,000 men capable of bearing arms, successfully maintained its independence down to the present period. Only under the reigning sultan has the acknowledgment of allegiance been enforced by a powerful Turkish army. The surface presents a succession of wild limestone ridges, occasionally diversified with lofty peaks, but resembling in most parts a sea of enormous waves turned into stone. Its rugged aspect may be inferred from the traditions of the people, who say that 'when God was in the act of distributing stones over the earth, the bag that held them burst and let them all fall upon Montenegro.' There are fissures in the rocks like those of a glacier, which no horse could pass over without breaking its legs. Trees and bushes grow among the crags, and afford shelter for the inhabitants against an invading foe.

The government is vested in hereditary chieftains of the family of Petrovich, who take the title of Vladika, a 'prince' or 'ruler,' and are assisted by a council of elders. This dignity, instead of descending from father to son, has generally gone from uncle to nephew, in consequence of the prince being usually also the metropolitan bishop, and therefore incapable of contracting marriage. But in 1851, when a new chief succeeded, he refused to take holy orders, and the bishopric was conferred upon another member of the family. Except in times of public peril, the people have little respect for authority, but do that which is right in their own eyes, and are specially prompt to redress injuries with the strong hand. It is deemed imperative upon the eldest son to avenge the murder or violent death of a father. If of tender years, he is trained to consider himself the minister of retribution, to be executed on reaching maturity. The Montenegrins are a tall, good-looking race, excellent marksmen, and brave to excess. In cases of emergency, even the cripples are carried on the backs of women, and lodged behind bits of rock where they can load and discharge their guns. War is waged with most revolting ferocity, the heads of slain and wounded enemies being invariably cut off, and exhibited as trophies. *Cettigne*, or *Cettinje*, the residence of the Vladika, is a mountain village, a few miles to

Montenegro.

the south-east of the Austrian port of Cattaro. Sir Gardiner Wilkinson here counted upon a tower the heads of twenty Turks fixed upon stakes round the parapet. Below, scattered upon the rock, were the fragments of other skulls which had fallen to pieces—a strange spectacle in a Christian country, in Europe, and in the immediate vicinity of a convent and a bishop's palace.'

BOSNIA, with that part of CROATIA which belongs to Turkey, and the HERZEGOVINA, a district so called from the title of its ancient princes, *Herzog*, 'duke,' forms an eyalet of the empire, and is its most north-westerly section. It is largely traversed by more or less elevated ranges of the Dinaric Alps, and inhabited by a rude population, who, though Slavonians, profess Mohammedanism to the extent of about one-half their number. Like the Albanians, they adopted the religion of their conquerors from political motives, to preserve their social importance; and, like them, they have not been dutiful subjects either of the Sultan or the Prophet. Their women are less secluded than is common under the Moslem law, and have long enjoyed the liberty of appearing in public very slightly veiled. Still, while allowing themselves every licence that is convenient, the Mohammedan Bosniaks are much more intolerant to others than the Turks themselves; and have fiercely opposed the project of the government to put all subjects upon an equal

footing irrespective of race and religion. It was in quelling an insurrection in this district, in 1851, caused by the reforming policy of the authorities, that Omar Pasha first obtained prominence.

*Bosna-Serai*, the capital, nearly 500 miles north-west of Constantinople, and 122 south of Belgrade, stands on both sides of the Miglizza, an affluent of the Bosna, and contains 70,000 inhabitants, engaged in trade and various manufactures. Four handsome stone bridges cross the stream. A vast number of fine trees mingle with the houses, and give that garden-like aspect to the town which has caused it to be styled the Damascus of the North. Not less than 122 mosques, with their gilded domes and minarets, further orientalise the view which the eye commands from the lofty rock of the old castle. This building, now in ruins, was erected by the Hungarians prior to the Turkish conquest. Important iron-mines and mineral baths are in the neighbourhood. *Travnik*, a small town on the north-west, is the head-quarters of the military and the usual residence of the pasha, as the most central and advantageous position in the whole province. It is approached by a pretty glen, stands on a rapid stream, from which the high rock of the citadel rises up boldly, and possesses the gaudy tomb of Djelaludin Pasha, who, being defeated by the anti-reforming Mussulmans, destroyed himself by poison. An instance of suicide has rarely occurred in the past history of Turkey, and is very unusual in Mohammedan society anywhere.

The principality of *SERVIA*, nearly independent, lies along the south bank of the Danube, and embraces almost the whole basin of the Morava, one of its principal affluents. The surface has fine upland scenery, and presents a glorious panorama from the highest peak of the Kopaunik, being overlooked in nearly its whole extent from Bosnia to Bulgaria, from Roumelia to Hungary. There is also great sylvan beauty, even where habitations and enclosures are entirely wanting, the country looking like a garden in one place, a trim lawn and park in another. The people, Servians or Serbs, form one of the many branches of the Slavonic family, and have preserved their nationality in its full integrity. Mostly peasants, they occupy villages in the gorges of the mountains, or in the depths of the woods; rear their own dwellings, manufacture their own implements, and draw from the land the food they require, voluntarily assisting each other in getting in the grain as soon as it is ready, without fee or reward. The common fruit-tree is the plum, from which a kind of brandy, *slivovitza*, the ordinary beverage of the country, is made. Almost every village has a large plantation in its vicinity. Vast numbers of swine are reared, which fatten to an enormous size in the woods, and are sent to the markets of Pesth and Vienna. The people possess an extensive collection of popular songs, and a native literature of high class has been created in the present century.

After being an independent kingdom, the Turks obtained the mastery of Servia, under Amrath I., by the battle of Kossova, in 1363. But many of the people took refuge in the more difficult highlands, where they became freebooters, rather than submit to the foreign yoke. A race of outlaws was thus perpetuated by them under the name of *haiducks*, who successfully defied the whole power of the government to root them out of their retreats. They infested the roads and passes, levied contributions upon travellers of the dominant class, and found shelter in the cabins of the peasantry, with whom they were connected by the ties of a common descent and religion, during the severity of winter. One of this number, soon after the commencement of the present century, George Petrowitsch, commonly called Kara, or Black George, by the Turks, put himself at the head of a national party against them; and though temporarily overcome in the struggle for liberty, the object was eventually gained. In 1830 the country was constituted a principality, electing its own ruler and managing its internal affairs, but acknowledging the supremacy of the sultan by a small annual tribute, and submitting external relations to his control. Alexander, son of Kara George, reigned as third prince from 1842 to 1858. *Kragojevatz*, a small central town, is the principal seat of the government. The Turks retain the right of garrisoning some frontier places, and are in force at *Belgrade*, on account of the strategic importance of the site, at the confluence of the Save with the Danube, the most advanced post of the Mohammedan power in the direction of the heart of Europe. This city, of historic celebrity as the scene of many a bloody struggle between the soldiers of the Cross and the Crescent, though now decayed, still contains a population of 30,000. It has Servian and Turkish quarters, the former sloping down to the Save, and the latter to the Danube, with a strong fortress jutting out exactly at the point of confluence of the rivers, of which a pasha is the commandant, who represents the suzerainty of the Porte. A singular-looking street, the Lange Gasse, composed of dilapidated houses of ornamental architecture, commemorates the Austrian occupation of twenty-two years at the beginning of the last century. Most of the turbaned race lingering in the town are poor, and follow humble occupations—wood-splitting, water-carrying, portage on the quay, and boating on the river. They are also, with few exceptions, the barbers, and have that

superior dexterity which distinguishes the craft in the east. Belgrade has its name from the Slavonic *bielo*, 'white,' and *grad* or *grad*, a 'fort' or 'town;' but the Turks call it *Darol-Jihad*, the 'House of the Holy War,' in allusion to their repeated contests for its possession with the powers of Christendom. It has suffered from the extension of steam navigation on the Danube; for instead of being the stopping-place as formerly, proceeding overland to Constantinople, they go on by the great river and the Black Sea to the capital.

The two provinces of WALLACHIA and MOLDAVIA, frequently called the *Danubian Principalities*, situated north of the Danube, are enclosed in other directions by the Austrian and Russian dominions; and, like the preceding district, are little more than nominally subject to the Porte. They contribute a large number of tributaries to the frontier river, the Shyl, Aluta, Argish, Jalomnitza, Sereth, and Pruth, the last of which forms part of the boundary between Moldavia and the Russian province of Bessarabia. While intruded upon by the Carpathian Mountains on the side of Austria, they are chiefly great levels, including forests and pasture-lands, are abundantly fertile, and are capable of becoming one of the principal granaries of Europe. These provinces are identical in their inhabitants, language, and unfortunate history. The peasantry, who compose the

Bukharest.

bulk of the people, call themselves Roumani or Romans, style their native country *Tsara Roumaneska*, 'Roman Land.' They are a Greco-Latin race, descended from the ancient Dacians and the Roman colonists who settled in the region upon its conquest by the Emperor Trajan. Their language is derived from the Latin to the extent of more than half its words. The territorial proprietors, boyars or nobles, are of Slavonic origin, and obtained possession as conquerors. Gypsies, who travel as musicians, and are in constant attendance at all the fairs, are very numerous. The established religion is that of the Greek Church, but all forms of Christianity are tolerated, and their professors enjoy equal political rights. Monasteries are excessively numerous, and an immense amount of property is in the hands of the priesthood, which at present (1864) the government of Prince Couza is endeavouring to have secularised. The fate of these fine provinces has been wretched in the extreme, owing to their occupation by large Russian

armies during the frequent wars with Turkey. They are now politically united under the name of RUMANIA, have a native prince and a representative assembly, in which the great landholders have the complete ascendancy; though the unsettled condition of the principalities, and the slow but ceaseless spread of liberal opinions, render it doubtful how long they will be able to coerce the mass of the people. While perfectly independent in affairs of internal administration, the Sultan is recognised as the lord-paramount.

*Bukharest*, the capital of Wallachia and of the united provinces, about forty miles north of the Danube, contains a population of 60,000. The name, signifying 'city of enjoyment,' alludes to the agreeable environs; but the place is said to be one of the most dissolute in Europe; all classes being inveterate gamblers. It covers an immense area, owing to the houses straggling, and having large gardens interspersed among them. The trees, many-coloured roofs, with the towers and domes of more than sixty churches, render the distant view extremely pleasing. It is, however, mainly a collection of wooden tenements and mud hovels, divided by irregular and ill-paved streets, with very few dwellings of the better class, and scarcely a public building of importance except the churches. The commerce is extensive in the export of timber, grain, wool, salt, wax, and other raw produce, for which manufactures are received, chiefly from Germany. In 1812 the treaty by which Turkey ceded the province of Bessarabia to Russia was signed at Bukharest. *Giurgevo*, its port, a trading town on the Danube, opposite Rustchuk, is one of the principal steam-boat stations on the Wallachian side of the river. It was originally a Genoese mercantile settlement, called St George, whence the present name. Annually, on St Peter's Day, a great fair is held in the neighbourhood, upon a vast barren plain,

Giurgevo, opposite Rustchuk.

without verdure or shade. Coarse cloths, furs, and other articles of attire, with all descriptions of food, are the chief commodities with which the stalls are furnished, but pleasure is quite as much the object in view as business. This gathering presents a very wild scene, strikingly illustrative of the varieties of costume and habits among the inhabitants of the Danubian provinces. Whole towns and villages pour in their thousands to mix with gypsy musicians and mountebanks in rude hilarity. At Giurgevo the Russians were defeated by the Turks during the late war, in 1854, as also at Oltenitza, lower down the river, in the previous year. *Ibrail* or *Brahilova*, the chief shipping port for the native produce, is a fortified Danubian town towards the Moldavian frontier. *Krajova*, near the Shyl, in the opposite part of the province, is a handsome town, containing many residences of the boyars, and is commercial likewise, with an active trade in salt. It is considered the capital of Western or Little Wallachia.

*Jassy*, the Moldavian capital, a few miles from the Pruth and the Bessarabian frontier, is picturesquely seated on a steep slope of the Kopoberg Mountains, and presents an agreeable appearance to the approaching traveller, with its white houses in the midst of gardens, shining spires, and high buildings with green roofs. The churches are numerous. A few residences of the rich boyars are mansions, but the most wretched huts are to be seen in their immediate vicinity. The population is 70,000, nearly one-half of whom are Jews, who are the money-changers, brokers, and business-people, with all sorts of English and German hardwares, woollen goods, and stuffs in their shops. Large dealings take place in the agricultural produce of

the province. *Galatz*, the only port, of great commercial consequence, is situated on the Danube, about midway between the discharge into it of the Pruth and the Sereth. These streams bring down the grain from the interior, chiefly wheat, in the export of which a fleet of foreign merchantmen is employed. Nearly the whole business is in the hands of Greeks, who are generally under the protection of Greek, Russian, Austrian, or English passports. The place has no attractions, besides being very unhealthy through the summer-months, owing to exhalations from the adjoining marshes. Corn speculations offer the only inducement to a residence. By a simple arrangement ships are loaded and cleared while yet in quarantine. For half a mile in front of one portion of the town a brick wall separates it from the river. This is pierced by a number of holes through which the grain is thrown by means of spouts, and received in bags held by quarantine porters, who carry their loads through the shallows of the river to the vessels. *Ismail*, a fortified town, on the northern or Kilia mouth of the Danube, is of tragic notoriety, from its capture by the Russians under Suwarrow, in 1790, who mercilessly put the garrison to the sword, with many of the inhabitants, not sparing even the women and children. This cruelty procured for him the name of Muley Ismail, in allusion to the Emperor of Marocco so called, one of the most sanguinary monsters that ever existed. The town reverted to Turkey by the treaty of Paris in 1856, along with an adjoining portion of Bessarabia north of the Danube and east of the Pruth. Russia was thereby excluded from all command of the Danube.

Considering their fine natural advantages, in possession of a vast extent of fertile soil and ample river irrigation, few parts of Europe are in such a backward condition as the Molda-Wallachian provinces. This is the joint effect of frequent occupation by foreign armies, a long period of political insecurity, and exclusive attention to the interests of their class by the landholders. The roads are everywhere bad. Travelling is performed in the rudest manner, and is almost impracticable in unfavourable weather. The peasantry are hardy, inured to the most opposite extremes of temperature, but are in a very low social condition. In some parts they are semi-subterranean in their dwellings, living in holes scooped out of the ground, roofed over with branches of trees and earth. The existence of such villages is chiefly indicated to the traveller by the smoke rising from them.

Guard-House in a Pass of the Balkan.

BULGARIA, an integral portion of the empire, representing the ancient *Mæsia Inferior*, extends from the Servian frontier to the Black Sea, between the southern bank of the

Danube and the range of the Balkan. The surface descends from the mountains by a succession of terraces, and assumes the character of a plain towards both the river and the sea. The majority of the population are of Tartar origin, analogous to that of the Turks. They migrated originally from the banks of the Volga, but have completely lost their nationality, and become Slavonised in customs, language, and religion, except that a number have recently abandoned Greek for Latin Christianity.

*Sophia*, the capital, in the western part of the province, is a handsome town of 30,000 inhabitants, environed with the northern declivities of the Balkan. It has manufactures of silks, woollens, leather, and tobacco; is well supplied with luxurious hot baths; and contains numerous khans, being nearly midway on the great route between Belgrade and Constantinople. The whole distance, 627 miles, was accomplished with post-horses in 1842, by Mr Layard, in the extraordinarily short space of five days, to the great admiration of the Turks, as the ordinary government couriers occupied seven in the journey. Traffic along this thoroughfare has since been extensively diminished by the Danubian steamers. *Shumla*, on the eastern side of the province, occupies an important strategic position, at the head of the valley which debouches into the Bay of Varna, and at the northern opening of the great pass through the Balkan, leading from Silistria or Rustchuk to Constantinople. It is therefore very strongly fortified, and has more than once arrested the progress of the Russians. Hence the Turks call it *Ghazi* or 'victorious' Shumla. The town is placed at the base of heights beautifully clothed with wood, and is the seat of flourishing manufactures in metals. *Varna*, the principal Turkish port on the Black Sea, is also a fortified town, the rendezvous of the Anglo-French armies in 1854, from which they sailed on the memorable expedition to Sebastopol. One of the great contests between Christian and Moslem took place in its neighbourhood in 1444, when the Turks, under Amurath II., signally defeated a large army of the Hungarians, led by their king, Ladislaus, who fell in the action. *Widdin*, *Rustchuk*, and *Silistria*, commercial places and strong fortresses on the Danube, guard the line of the river, and are often mentioned in the history of the wars with Russia.

The islands belonging to European Turkey consist of Thaso, Samothraki, Imbros, Lemnos, and a few others, situated in the northern part of the Archipelago, forming a separate province; and of Candia, with some bordering islets, at its entrance on the south, to which similar provincial distinctness belongs. The last-named island is the only one of important magnitude, as will be seen in the accompanying sketch-map of the

Mediterranean basin. *CANDIA* (the ancient *Crete*, called by the Turks *Kiri'd*), extends about 160 miles east and west, but is narrow throughout, and contracted in places to less than ten miles in breadth. It is traversed by a chain of high mountains, one of which,

Mount Ida (now called *Upsilorites*), near the centre, rises to 7600 feet above the sea, and is mythologically associated with Jupiter as the scene in which he passed his youth. The soil is fertile; springs are very numerous for its irrigation; and a considerable quantity of grain and fruits of various kinds is raised, with olive oil, wax, and honey. During the present century, owing to civil distractions, the population has greatly decreased, and does not now number more than 150,000, most of whom are Greeks. In the rural districts many of the Greeks are Mohammedans, their ancestors having embraced the creed of the conquerors in order to secure the temporal advantages connected with it.

The town of *Candia*, the capital, contains about 12,000 inhabitants, and has fortifications raised by the Venetians. It is situated on the north coast, along with *Retimo* and *Canca*, the only other places above the rank of villages. Interesting sites are on the south coast, where the harbour of Lutro and that of Kalos Limenas correspond to the *Phenice* and the *Fair Havens* of St Paul's voyage in the Mediterranean. The island came into the possession of the Venetians in 1204, and was held through four centuries and a half. It was finally wrested from them by the capture of the capital in 1669, after the garrison had endured with heroic firmness a close blockade of two years and six months. The siege was conducted in person by Ahmed Kuprili, the greatest of all the Turkish grand-viziers. But the whole war lasted over a period of twenty-four years. A short time before its commencement, Cyril Lucar, a native, who had risen to the patriarchate of Constantinople, presented the Codex Alexandrinus to Charles I. of England, through the medium of the British ambassador. This is now one of the rarities in the library of the British Museum.

Mount Ida is a mass of gray limestone, scantily clothed with shrubs, and has a hill at its base in which are some curious excavations. They appear to correspond to the labyrinth for which ancient Crete was famed, often referred to by the classical writers, as by Virgil in the *Æneid*:

'As the Cretan labyrinth of old,  
With wand'ring ways, and many a winding fold,  
Involved the weary feet without redress,  
In a round error which denied recess.'
